Richard Coppen (coppen@uk.ibm.com), IBM

Editors:

Andrew Banks (andrew_banks@uk.ibm.com), IBM
Ed Briggs (edbriggs@microsoft.com), Microsoft
Ken Borgendale (kwb@us.ibm.com), IBM
Rahul Gupta (rahul.gupta@us.ibm.com), IBM

Related work:

This specification replaces or supersedes:

- *MQTT Version 3.1.1*. Edited by Andrew Banks and Rahul Gupta. 29 October 2014. OASIS Standard. <http://docs.oasis-open.org/mqtt/mqtt/v3.1.1/os/mqtt-v3.1.1-os.html>.

This specification is related to:

- *MQTT and the NIST Cybersecurity Framework Version 1.0*. Edited by Geoff Brown and Louis-Philippe Lamoureux. Latest version: <http://docs.oasis-open.org/mqtt/mqtt-nist-cybersecurity/v1.0/mqtt-nist-cybersecurity-v1.0.html>.

Abstract:

MQTT is a Client Server publish/subscribe messaging transport protocol. It is light weight, open, simple, and designed to be easy to implement. These characteristics make it ideal for use in many situations, including constrained environments such as for communication in Machine to Machine (M2M) and Internet of Things (IoT) contexts where a small code footprint is required and/or network bandwidth is at a premium.

The protocol runs over TCP/IP, or over other network protocols that provide ordered, lossless, bi-directional connections. Its features include:

- Use of the publish/subscribe message pattern which provides one-to-many message distribution and decoupling of applications.
- A messaging transport that is agnostic to the content of the payload.
- Three qualities of service for message delivery:
 - "At most once", where messages are delivered according to the best efforts of the operating environment. Message loss can occur. This level could be used, for example, with ambient sensor data where it does not matter if an individual reading is lost as the next one will be published soon after.
 - "At least once", where messages are assured to arrive but duplicates can occur.
 - "Exactly once", where messages are assured to arrive exactly once. This level could be used, for example, with billing systems where duplicate or lost messages could lead to incorrect charges being applied.
- A small transport overhead and protocol exchanges minimized to reduce network traffic.
- A mechanism to notify interested parties when an abnormal disconnection occurs.

Status:

This document was last revised or approved by the OASIS Message Queuing Telemetry Transport (MQTT) TC on the above date. The level of approval is also listed above. Check the "Latest version" location noted above for possible later revisions of this document. Any other numbered Versions and other technical work produced by the Technical Committee (TC) are listed at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=mqtt#technical.

TC members should send comments on this specification to the TC's email list. Others should send comments to the TC's public comment list, after subscribing to it by following the instructions at the "Send A Comment" button on the TC's web page at <https://www.oasis-open.org/committees/mqtt/>.

This specification is provided under the [Non-Assertion](#) Mode of the [OASIS IPR Policy](#), the mode chosen when the Technical Committee was established. For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC's web page (<https://www.oasis-open.org/committees/mqtt/ipr.php>).

Note that any machine-readable content ([Computer Language Definitions](#)) declared Normative for this Work Product is provided in separate plain text files. In the event of a discrepancy between any such plain text file and display content in the Work Product's prose narrative document(s), the content in the separate plain text file prevails.

1 Introduction

1.0 Intellectual property rights policy

This specification is provided under the [Non-Assertion](#) Mode of the [OASIS IPR Policy](#), the mode chosen when the Technical Committee was established. For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC's web page (<https://www.oasis-open.org/committees/mqtt/ipr.php>).

1.1 Organization of the MQTT specification

The specification is split into seven chapters:

- [Chapter 1 - Introduction](#)
- [Chapter 2 - MQTT Control Packet format](#)
- [Chapter 3 - MQTT Control Packets](#)
- [Chapter 4 - Operational behavior](#)
- [Chapter 5 - Security](#)
- [Chapter 6 - Using WebSocket as a network transport](#)
- [Chapter 7 - Conformance Targets](#)

1.2 Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as described in IETF RFC 2119 [[RFC2119](#)], except where they appear in text that is marked as non-normative.

Network Connection:

A construct provided by the underlying transport protocol that is being used by MQTT.

- It connects the Client to the Server.
- It provides the means to send an ordered, lossless, stream of bytes in both directions.

Refer to [section 4.2](#) Network Connection for non-normative examples.

Application Message:

The data carried by the MQTT protocol across the network for the application. When an Application Message is transported by MQTT it contains payload data, a Quality of Service (QoS), a collection of Properties, and a Topic Name.

Client:

A program or device that uses MQTT. A Client:

- opens the Network Connection to the Server
- publishes Application Messages that other Clients might be interested in.
- subscribes to request Application Messages that it is interested in receiving.
- unsubscribes to remove a request for Application Messages.
- closes the Network Connection to the Server.

42

43 **Server:**

44 A program or device that acts as an intermediary between Clients which publish Application Messages
45 and Clients which have made Subscriptions. A Server:

- 46 • accepts Network Connections from Clients.
- 47 • accepts Application Messages published by Clients.
- 48 • processes Subscribe and Unsubscribe requests from Clients.
- 49 • forwards Application Messages that match Client Subscriptions.
- 50 • closes the Network Connection from the Client.

51

52 **Session:**

53 A stateful interaction between a Client and a Server. Some Sessions last only as long as the Network
54 Connection, others can span multiple consecutive Network Connections between a Client and a Server.

55

56 **Subscription:**

57 A Subscription comprises a Topic Filter and a maximum QoS. A Subscription is associated with a single
58 Session. A Session can contain more than one Subscription. Each Subscription within a Session has a
59 different Topic Filter.

60

61 **Shared Subscription:**

62 A Shared Subscription comprises a Topic Filter and a maximum QoS. A Shared Subscription can be
63 associated with more than one Session to allow a wider range of message exchange patterns. An
64 Application Message that matches a Shared Subscription is only sent to the Client associated with one of
65 these Sessions. A Session can subscribe to more than one Shared Subscription and can contain both
66 Shared Subscriptions and Subscriptions which are not shared.

67

68 **Wildcard Subscription:**

69 A Wildcard Subscription is a Subscription with a Topic Filter containing one or more wildcard characters.
70 This allows the subscription to match more than one Topic Name. Refer to [section 4.7](#) for a description of
71 wildcard characters in a Topic Filter.

72

73 **Topic Name:**

74 The label attached to an Application Message which is matched against the Subscriptions known to the
75 Server.

76

77 **Topic Filter:**

78 An expression contained in a Subscription to indicate an interest in one or more topics. A Topic Filter can
79 include wildcard characters.

80

81 **MQTT Control Packet:**

82 A packet of information that is sent across the Network Connection. The MQTT specification defines
83 fifteen different types of MQTT Control Packet, for example the PUBLISH packet is used to convey
84 Application Messages.

85

86 **Malformed Packet:**

87 A control packet that cannot be parsed according to this specification. Refer to [section 4.13](#) for
88 information about error handling.

89
90 **Protocol Error:**
91 An error that is detected after the packet has been parsed and found to contain data that is not allowed by
92 the protocol or is inconsistent with the state of the Client or Server. Refer to [section 4.13](#) for information
93 about error handling.

94
95 **Will Message:**
96 An Application Message which is published by the Server after the Network Connection is closed in cases
97 where the Network Connection is not closed normally. Refer to [section 3.1.2.5](#) for information about Will
98 Messages.

99
100 **Disallowed Unicode code point:**
101 The set of Unicode Control Codes and Unicode Noncharacters which should not be included in a UTF-8
102 Encoded String. Refer to [section 1.5.4](#) for more information about the Disallowed Unicode code points.

238

239 **1.5 Data representation**

240 **1.5.1 Bits**

241 Bits in a byte are labelled 7 to 0. Bit number 7 is the most significant bit, the least significant bit is
242 assigned bit number 0.
243

244 **1.5.2 Two Byte Integer**

245 Two Byte Integer data values are 16-bit unsigned integers in big-endian order: the high order byte
246 precedes the lower order byte. This means that a 16-bit word is presented on the network as Most
247 Significant Byte (MSB), followed by Least Significant Byte (LSB).
248

249 **1.5.3 Four Byte Integer**

250 Four Byte Integer data values are 32-bit unsigned integers in big-endian order: the high order byte
251 precedes the successively lower order bytes. This means that a 32-bit word is presented on the network
252 as Most Significant Byte (MSB), followed by the next most Significant Byte (MSB), followed by the next
253 most Significant Byte (MSB), followed by Least Significant Byte (LSB).
254

255 **1.5.4 UTF-8 Encoded String**

256 Text fields within the MQTT Control Packets described later are encoded as UTF-8 strings. UTF-8
257 [\[RFC3629\]](#) is an efficient encoding of Unicode [\[Unicode\]](#) characters that optimizes the encoding of ASCII
258 characters in support of text-based communications.
259

260 Each of these strings is prefixed with a Two Byte Integer length field that gives the number of bytes in a
 261 UTF-8 encoded string itself, as illustrated in [Figure 1.1 Structure of UTF-8 Encoded Strings](#) below.
 262 Consequently, the maximum size of a UTF-8 Encoded String is 65,535 bytes.

263
 264 Unless stated otherwise all UTF-8 encoded strings can have any length in the range 0 to 65,535 bytes.

265
 266 Figure 1-1 Structure of UTF-8 Encoded Strings

Bit	7	6	5	4	3	2	1	0
byte 1	String length MSB							
byte 2	String length LSB							
byte 3	UTF-8 encoded character data, if length > 0.							

267
 268 The character data in a UTF-8 Encoded String MUST be well-formed UTF-8 as defined by the Unicode
 269 specification [[Unicode](#)] and restated in RFC 3629 [[RFC3629](#)]. In particular, the character data MUST NOT
 270 include encodings of code points between U+D800 and U+DFFF [[MQTT-1.5.4-1](#)]. If the Client or Server
 271 receives an MQTT Control Packet containing ill-formed UTF-8 it is a Malformed Packet. Refer to [section](#)
 272 [4.13](#) for information about handling errors.

273
 274 A UTF-8 Encoded String MUST NOT include an encoding of the null character U+0000. [[MQTT-1.5.4-2](#)].
 275 If a receiver (Server or Client) receives an MQTT Control Packet containing U+0000 it is a Malformed
 276 Packet. Refer to [section 4.13](#) for information about handling errors.

277
 278 The data SHOULD NOT include encodings of the Unicode [[Unicode](#)] code points listed below. If a
 279 receiver (Server or Client) receives an MQTT Control Packet containing any of them it MAY treat it as a
 280 Malformed Packet. These are the Disallowed Unicode code points. Refer to [section 5.4.9](#) for more
 281 information about handling Disallowed Unicode code points.

- 282
- 283 • U+0001..U+001F control characters
 - 284 • U+007F..U+009F control characters
 - 285 • Code points defined in the Unicode specification [[Unicode](#)] to be non-characters (for example
 286 U+0FFFF)

287
 288 A UTF-8 encoded sequence 0xEF 0xBB 0xBF is always interpreted as U+FEFF ("ZERO WIDTH NO-
 289 BREAK SPACE") wherever it appears in a string and MUST NOT be skipped over or stripped off by a
 290 packet receiver [[MQTT-1.5.4-3](#)].

291
 292 **Non-normative example**

293 For example, the string A𠄎 which is LATIN CAPITAL Letter A followed by the code point U+2A6D4
 294 (which represents a CJK IDEOGRAPH EXTENSION B character) is encoded as follows:

295
 296 Figure 1-2 UTF-8 Encoded String non-normative example

Bit	7	6	5	4	3	2	1	0
byte 1	String Length MSB (0x00)							
	0	0	0	0	0	0	0	0

byte 2	String Length LSB (0x05)							
	0	0	0	0	0	1	0	1
byte 3	'A' (0x41)							
	0	1	0	0	0	0	0	1
byte 4	(0xF0)							
	1	1	1	1	0	0	0	0
byte 5	(0xAA)							
	1	0	1	0	1	0	1	0
byte 6	(0x9B)							
	1	0	0	1	1	0	1	1
byte 7	(0x94)							
	1	0	0	1	0	1	0	0

297

298 1.5.5 Variable Byte Integer

299 The Variable Byte Integer is encoded using an encoding scheme which uses a single byte for values up
300 to 127. Larger values are handled as follows. The least significant seven bits of each byte encode the
301 data, and the most significant bit is used to indicate whether there are bytes following in the
302 representation. Thus, each byte encodes 128 values and a "continuation bit". The maximum number of
303 bytes in the Variable Byte Integer field is four. **The encoded value MUST use the minimum number of**
304 **bytes necessary to represent the value [MQTT-1.5.5-1].** This is shown in Table 1-1 Size of Variable Byte
305 Integer.

306

307 Table 1-1 Size of Variable Byte Integer

Digits	From	To
1	0 (0x00)	127 (0x7F)
2	128 (0x80, 0x01)	16,383 (0xFF, 0x7F)
3	16,384 (0x80, 0x80, 0x01)	2,097,151 (0xFF, 0xFF, 0x7F)
4	2,097,152 (0x80, 0x80, 0x80, 0x01)	268,435,455 (0xFF, 0xFF, 0xFF, 0x7F)

308

309 Non-normative comment

310 The algorithm for encoding a non-negative integer (X) into the Variable Byte Integer encoding
311 scheme is as follows:

312

```

313 do
314     encodedByte = X MOD 128
315     X = X DIV 128
316     // if there are more data to encode, set the top bit of this byte
317     if (X > 0)

```

```
318         encodedByte = encodedByte OR 128
319     endif
320     'output' encodedByte
321 while (X > 0)
```

322

323 Where MOD is the modulo operator (% in C), DIV is integer division (/ in C), and OR is bit-wise or
324 (| in C).

325

326 **Non-normative comment**

327 The algorithm for decoding a Variable Byte Integer type is as follows:

328

```
329 multiplier = 1
330 value = 0
331 do
332     encodedByte = 'next byte from stream'
333     value += (encodedByte AND 127) * multiplier
334     if (multiplier > 128*128*128)
335         throw Error(Malformed Variable Byte Integer)
336     multiplier *= 128
337 while ((encodedByte AND 128) != 0)
```

338

339 where AND is the bit-wise and operator (& in C).

340

341 When this algorithm terminates, value contains the Variable Byte Integer value.

342

343 **1.5.6 Binary Data**

344 Binary Data is represented by a Two Byte Integer length which indicates the number of data bytes,
345 followed by that number of bytes. Thus, the length of Binary Data is limited to the range of 0 to 65,535
346 Bytes.

347

348 **1.5.7 UTF-8 String Pair**

349 A UTF-8 String Pair consists of two UTF-8 Encoded Strings. This data type is used to hold name-value
350 pairs. The first string serves as the name, and the second string contains the value.

351

352 **Both strings MUST comply with the requirements for UTF-8 Encoded Strings [MQTT-1.5.7-1].** If a receiver
353 (Client or Server) receives a string pair which does not meet these requirements it is a Malformed Packet.
354 Refer to [section 4.13](#) for information about handling errors.

355

356 **1.6 Security**

357 MQTT Client and Server implementations SHOULD offer Authentication, Authorization and secure
358 communication options, such as those discussed in Chapter 5. Applications concerned with critical
359 infrastructure, personally identifiable information, or other personal or sensitive information are strongly
360 advised to use these security capabilities.

361

362 **1.7 Editing convention**

363 Text highlighted in **Yellow** within this specification identifies conformance statements. Each conformance
364 statement has been assigned a reference in the format **[MQTT-x.x.x-y]** where **x.x.x** is the section number
365 and **y** is a statement counter within the section.

366

367 **1.8 Change history**

368 **1.8.1 MQTT v3.1.1**

369 MQTT v3.1.1 was the first OASIS standard version of MQTT **[MQTTV311].**[MQTTV311].

370 MQTT v3.1.1 is also standardized as ISO/IEC 20922:2016 **[ISO20922]**.

371

372 **1.8.2 MQTT v5.0**

373 MQTT v5.0 adds a significant number of new features to MQTT while keeping much of the core in place.

374 The major functional objectives are:

- 375 • Enhancements for scalability and large scale systems
- 376 • Improved error reporting
- 377 • Formalize common patterns including capability discovery and request response
- 378 • Extensibility mechanisms including user properties
- 379 • Performance improvements and support for small clients

380

381 Refer to [Appendix C](#) for a summary of changes in MQTT v5.0.

382

383 2 MQTT Control Packet format

384 2.1 Structure of an MQTT Control Packet

385 The MQTT protocol operates by exchanging a series of MQTT Control Packets in a defined way. This
386 section describes the format of these packets.

387
388 An MQTT Control Packet consists of up to three parts, always in the following order as shown below.
389

390 Figure 2-1 Structure of an MQTT Control Packet

Fixed Header, present in all MQTT Control Packets
Variable Header, present in some MQTT Control Packets
Payload, present in some MQTT Control Packets

391

392 2.1.1 Fixed Header

393 Each MQTT Control Packet contains a Fixed Header as shown below.

394

395 *Figure 2-2 Fixed Header format*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type				Flags specific to each MQTT Control Packet type			
byte 2...	Remaining Length							

396

397 2.1.2 MQTT Control Packet type

398 **Position:** byte 1, bits 7-4.

399 Represented as a 4-bit unsigned value, the values are shown below.

400

401 Table 2-1 MQTT Control Packet types

Name	Value	Direction of flow	Description
Reserved	0	Forbidden	Reserved
CONNECT	1	Client to Server	Connection request
CONNACK	2	Server to Client	Connect acknowledgment
PUBLISH	3	Client to Server or Server to Client	Publish message
PUBACK	4	Client to Server or Server to Client	Publish acknowledgment (QoS 1)

PUBREC	5	Client to Server or Server to Client	Publish received (QoS 2 delivery part 1)
PUBREL	6	Client to Server or Server to Client	Publish release (QoS 2 delivery part 2)
PUBCOMP	7	Client to Server or Server to Client	Publish complete (QoS 2 delivery part 3)
SUBSCRIBE	8	Client to Server	Subscribe request
SUBACK	9	Server to Client	Subscribe acknowledgment
UNSUBSCRIBE	10	Client to Server	Unsubscribe request
UNSUBACK	11	Server to Client	Unsubscribe acknowledgment
PINGREQ	12	Client to Server	PING request
PINGRESP	13	Server to Client	PING response
DISCONNECT	14	Client to Server or Server to Client	Disconnect notification
AUTH	15	Client to Server or Server to Client	Authentication exchange

402

403 2.1.3 Flags

404 The remaining bits [3-0] of byte 1 in the Fixed Header contain flags specific to each MQTT Control Packet
 405 type as shown below. Where a flag bit is marked as "Reserved", it is reserved for future use and **MUST**
 406 **be set to the value listed [MQTT-2.1.3-1]**. If invalid flags are received it is a Malformed Packet. Refer to
 407 [section 4.13](#) for details about handling errors.

408

409 Table 2-2 Flag Bits

MQTT Control Packet	Fixed Header flags	Bit 3	Bit 2	Bit 1	Bit 0
CONNECT	Reserved	0	0	0	0
CONNACK	Reserved	0	0	0	0
PUBLISH	Used in MQTT v5.0	DUP	QoS		RETAIN
PUBACK	Reserved	0	0	0	0
PUBREC	Reserved	0	0	0	0
PUBREL	Reserved	0	0	1	0
PUBCOMP	Reserved	0	0	0	0
SUBSCRIBE	Reserved	0	0	1	0
SUBACK	Reserved	0	0	0	0
UNSUBSCRIBE	Reserved	0	0	1	0

UNSUBACK	Reserved	0	0	0	0
PINGREQ	Reserved	0	0	0	0
PINGRESP	Reserved	0	0	0	0
DISCONNECT	Reserved	0	0	0	0
AUTH	Reserved	0	0	0	0

410

411 DUP = Duplicate delivery of a PUBLISH packet

412 QoS = PUBLISH Quality of Service

413 RETAIN = PUBLISH retained message flag

414 Refer to [section 3.3.1](#) for a description of the DUP, QoS, and RETAIN flags in the PUBLISH packet.

415

416 2.1.4 Remaining Length

417 **Position:** starts at byte 2.

418

419 The Remaining Length is a Variable Byte Integer that represents the number of bytes remaining within
 420 the current Control Packet, including data in the Variable Header and the Payload. The Remaining Length
 421 does not include the bytes used to encode the Remaining Length. The packet size is the total number of
 422 bytes in an MQTT Control Packet, this is equal to the length of the Fixed Header plus the Remaining
 423 Length.

424

425 2.2 Variable Header

426 Some types of MQTT Control Packet contain a Variable Header component. It resides between the Fixed
 427 Header and the Payload. The content of the Variable Header varies depending on the packet type. The
 428 Packet Identifier field of Variable Header is common in several packet types.

429

430 2.2.1 Packet Identifier

431 The Variable Header component of many of the MQTT Control Packet types includes a Two Byte Integer
 432 Packet Identifier field. These MQTT Control Packets are PUBLISH (where QoS > 0), PUBACK, PUBREC,
 433 PUBREL, PUBCOMP, SUBSCRIBE, SUBACK, UNSUBSCRIBE, UNSUBACK.

434

435 MQTT Control Packets that require a Packet Identifier are shown below:

436

437 *Table 2-3 MQTT Control Packets that contain a Packet Identifier*

MQTT Control Packet	Packet Identifier field
CONNECT	NO
CONNACK	NO
PUBLISH	YES (If QoS > 0)

PUBACK	YES
PUBREC	YES
PUBREL	YES
PUBCOMP	YES
SUBSCRIBE	YES
SUBACK	YES
UNSUBSCRIBE	YES
UNSUBACK	YES
PINGREQ	NO
PINGRESP	NO
DISCONNECT	NO
AUTH	NO

438

439 A PUBLISH packet MUST NOT contain a Packet Identifier if its QoS value is set to 0 [MQTT-2.2.1-2].

440

441 Each time a Client sends a new SUBSCRIBE, UNSUBSCRIBE, or PUBLISH (where QoS > 0) MQTT
442 Control Packet it MUST assign it a non-zero Packet Identifier that is currently unused [MQTT-2.2.1-3].

443

444 Each time a Server sends a new PUBLISH (with QoS > 0) MQTT Control Packet it MUST assign it a non
445 zero Packet Identifier that is currently unused [MQTT-2.2.1-4].

446

447 The Packet Identifier becomes available for reuse after the sender has processed the corresponding
448 acknowledgement packet, defined as follows. In the case of a QoS 1 PUBLISH, this is the corresponding
449 PUBACK; in the case of QoS 2 PUBLISH it is PUBCOMP or a PUBREC with a Reason Code of 128 or
450 greater. For SUBSCRIBE or UNSUBSCRIBE it is the corresponding SUBACK or UNSUBACK.

451

452 Packet Identifiers used with PUBLISH, SUBSCRIBE and UNSUBSCRIBE packets form a single, unified
453 set of identifiers separately for the Client and the Server in a Session. A Packet Identifier cannot be used
454 by more than one command at any time.

455

456 A PUBACK, PUBREC, PUBREL, or PUBCOMP packet MUST contain the same Packet Identifier as the
457 PUBLISH packet that was originally sent [MQTT-2.2.1-5]. A SUBACK and UNSUBACK MUST contain the
458 Packet Identifier that was used in the corresponding SUBSCRIBE and UNSUBSCRIBE packet
459 respectively [MQTT-2.2.1-6].

460

461 The Client and Server assign Packet Identifiers independently of each other. As a result, Client-Server
462 pairs can participate in concurrent message exchanges using the same Packet Identifiers.

463

464 **Non-normative comment**

465 It is possible for a Client to send a PUBLISH packet with Packet Identifier 0x1234 and then
466 receive a different PUBLISH packet with Packet Identifier 0x1234 from its Server before it
467 receives a PUBACK for the PUBLISH packet that it sent.

468
 469 Client Server
 470 PUBLISH Packet Identifier=0x1234 →→
 471 ←← PUBLISH Packet Identifier=0x1234
 472 PUBACK Packet Identifier=0x1234 →→
 473 ←← PUBACK Packet Identifier=0x1234
 474
 475

476 2.2.2 Properties

477 The last field in the Variable Header of the CONNECT, CONNACK, PUBLISH, PUBACK, PUBREC,
 478 PUBREL, PUBCOMP, SUBSCRIBE, SUBACK, UNSUBACK, DISCONNECT, and AUTH packet is a set
 479 of Properties. In the CONNECT packet there is also an optional set of Properties in the Will Properties
 480 field with the Payload.

481
 482 The set of Properties is composed of a Property Length followed by the Properties.
 483

484 2.2.2.1 Property Length

485 The Property Length is encoded as a Variable Byte Integer. The Property Length does not include the
 486 bytes used to encode itself, but includes the length of the Properties. **If there are no properties, this MUST**
 487 **be indicated by including a Property Length of zero [MQTT-2.2.2-1].**
 488

489 2.2.2.2 Property

490 A Property consists of an Identifier which defines its usage and data type, followed by a value. The
 491 Identifier is encoded as a Variable Byte Integer. A Control Packet which contains an Identifier which is not
 492 valid for its packet type, or contains a value not of the specified data type, is a Malformed Packet. If
 493 received, use a CONNACK or DISCONNECT packet with Reason Code 0x81 (Malformed Packet) as
 494 described in [section 4.13](#) Handling errors. There is no significance in the order of Properties with different
 495 Identifiers.

496
 497 *Table 2-4 - Properties*

Identifier		Name (usage)	Type	Packet / Will Properties
Dec	Hex			
1	0x01	Payload Format Indicator	Byte	PUBLISH, Will Properties
2	0x02	Message Expiry Interval	Four Byte Integer	PUBLISH, Will Properties
3	0x03	Content Type	UTF-8 Encoded String	PUBLISH, Will Properties
8	0x08	Response Topic	UTF-8 Encoded String	PUBLISH, Will Properties
9	0x09	Correlation Data	Binary Data	PUBLISH, Will Properties
11	0x0B	Subscription Identifier	Variable Byte Integer	PUBLISH, SUBSCRIBE
17	0x11	Session Expiry Interval	Four Byte Integer	CONNECT, CONNACK, DISCONNECT

18	0x12	Assigned Client Identifier	UTF-8 Encoded String	CONNACK
19	0x13	Server Keep Alive	Two Byte Integer	CONNACK
21	0x15	Authentication Method	UTF-8 Encoded String	CONNECT, CONNACK, AUTH
22	0x16	Authentication Data	Binary Data	CONNECT, CONNACK, AUTH
23	0x17	Request Problem Information	Byte	CONNECT
24	0x18	Will Delay Interval	Four Byte Integer	Will Properties
25	0x19	Request Response Information	Byte	CONNECT
26	0x1A	Response Information	UTF-8 Encoded String	CONNACK
28	0x1C	Server Reference	UTF-8 Encoded String	CONNACK, DISCONNECT
31	0x1F	Reason String	UTF-8 Encoded String	CONNACK, PUBACK, PUBREC, PUBREL, PUBCOMP, SUBACK, UNSUBACK, DISCONNECT, AUTH
33	0x21	Receive Maximum	Two Byte Integer	CONNECT, CONNACK
34	0x22	Topic Alias Maximum	Two Byte Integer	CONNECT, CONNACK
35	0x23	Topic Alias	Two Byte Integer	PUBLISH
36	0x24	Maximum QoS	Byte	CONNACK
37	0x25	Retain Available	Byte	CONNACK
38	0x26	User Property	UTF-8 String Pair	CONNECT, CONNACK, PUBLISH, Will Properties, PUBACK, PUBREC, PUBREL, PUBCOMP, SUBSCRIBE, SUBACK, UNSUBSCRIBE, UNSUBACK, DISCONNECT, AUTH
39	0x27	Maximum Packet Size	Four Byte Integer	CONNECT, CONNACK
40	0x28	Wildcard Subscription Available	Byte	CONNACK
41	0x29	Subscription Identifier Available	Byte	CONNACK
42	0x2A	Shared Subscription Available	Byte	CONNACK

498
499
500
501
502

Non-normative comment

Although the Property Identifier is defined as a Variable Byte Integer, in this version of the specification all of the Property Identifiers are one byte long.

503 **2.3 Payload**

504 Some MQTT Control Packets contain a Payload as the final part of the packet. In the PUBLISH packet
505 this is the Application Message

506

507 Table 2-5 - MQTT Control Packets that contain a Payload

MQTT Control Packet	Payload
CONNECT	Required
CONNACK	None
PUBLISH	Optional
PUBACK	None
PUBREC	None
PUBREL	None
PUBCOMP	None
SUBSCRIBE	Required
SUBACK	Required
UNSUBSCRIBE	Required
UNSUBACK	Required
PINGREQ	None
PINGRESP	None
DISCONNECT	None
AUTH	None

508

509 **2.4 Reason Code**

510 A Reason Code is a one byte unsigned value that indicates the result of an operation. Reason Codes less
 511 than 0x80 indicate successful completion of an operation. The normal Reason Code for success is 0.
 512 Reason Code values of 0x80 or greater indicate failure.

513

514 The CONNACK, PUBACK, PUBREC, PUBREL, PUBCOMP, DISCONNECT and AUTH Control Packets
 515 have a single Reason Code as part of the Variable Header. The SUBACK and UNSUBACK packets
 516 contain a list of one or more Reason Codes in the Payload.

517

518 The Reason Codes share a common set of values as shown below.

519

520 Table 2-6 - Reason Codes

Reason Code		Name	Packets
Decimal	Hex		
0	0x00	Success	CONNACK, PUBACK, PUBREC, PUBREL, PUBCOMP, UNSUBACK, AUTH
0	0x00	Normal disconnection	DISCONNECT

0	0x00	Granted QoS 0	SUBACK
1	0x01	Granted QoS 1	SUBACK
2	0x02	Granted QoS 2	SUBACK
4	0x04	Disconnect with Will Message	DISCONNECT
16	0x10	No matching subscribers	PUBACK, PUBREC
17	0x11	No subscription existed	UNSUBACK
24	0x18	Continue authentication	AUTH
25	0x19	Re-authenticate	AUTH
128	0x80	Unspecified error	CONNACK, PUBACK, PUBREC, SUBACK, UNSUBACK, DISCONNECT
129	0x81	Malformed Packet	CONNACK, DISCONNECT
130	0x82	Protocol Error	CONNACK, DISCONNECT
131	0x83	Implementation specific error	CONNACK, PUBACK, PUBREC, SUBACK, UNSUBACK, DISCONNECT
132	0x84	Unsupported Protocol Version	CONNACK
133	0x85	Client Identifier not valid	CONNACK
134	0x86	Bad User Name or Password	CONNACK
135	0x87	Not authorized	CONNACK, PUBACK, PUBREC, SUBACK, UNSUBACK, DISCONNECT
136	0x88	Server unavailable	CONNACK
137	0x89	Server busy	CONNACK, DISCONNECT
138	0x8A	Banned	CONNACK
139	0x8B	Server shutting down	DISCONNECT
140	0x8C	Bad authentication method	CONNACK, DISCONNECT
141	0x8D	Keep Alive timeout	DISCONNECT
142	0x8E	Session taken over	DISCONNECT
143	0x8F	Topic Filter invalid	SUBACK, UNSUBACK, DISCONNECT
144	0x90	Topic Name invalid	CONNACK, PUBACK, PUBREC, DISCONNECT
145	0x91	Packet Identifier in use	PUBACK, PUBREC, SUBACK, UNSUBACK
146	0x92	Packet Identifier not found	PUBREL, PUBCOMP
147	0x93	Receive Maximum exceeded	DISCONNECT
148	0x94	Topic Alias invalid	DISCONNECT
149	0x95	Packet too large	CONNACK, DISCONNECT
150	0x96	Message rate too high	DISCONNECT

151	0x97	Quota exceeded	CONNACK, PUBACK, PUBREC, SUBACK, DISCONNECT
152	0x98	Administrative action	DISCONNECT
153	0x99	Payload format invalid	CONNACK, PUBACK, PUBREC, DISCONNECT
154	0x9A	Retain not supported	CONNACK, DISCONNECT
155	0x9B	QoS not supported	CONNACK, DISCONNECT
156	0x9C	Use another server	CONNACK, DISCONNECT
157	0x9D	Server moved	CONNACK, DISCONNECT
158	0x9E	Shared Subscriptions not supported	SUBACK, DISCONNECT
159	0x9F	Connection rate exceeded	CONNACK, DISCONNECT
160	0xA0	Maximum connect time	DISCONNECT
161	0xA1	Subscription Identifiers not supported	SUBACK, DISCONNECT
162	0xA2	Wildcard Subscriptions not supported	SUBACK, DISCONNECT

521

522

Non-normative comment

523

For Reason Code 0x91 (Packet identifier in use), the response to this is either to try to fix the state, or to reset the Session state by connecting using Clean Start set to 1, or to decide if the Client or Server implementations are defective.

524

525

526

527 3 MQTT Control Packets

528

529 3.1 CONNECT – Connection Request

530 After a Network Connection is established by a Client to a Server, the first packet sent from the Client to
531 the Server MUST be a CONNECT packet [MQTT-3.1.0-1].

532

533 A Client can only send the CONNECT packet once over a Network Connection. The Server MUST
534 process a second CONNECT packet sent from a Client as a Protocol Error and close the Network
535 Connection [MQTT-3.1.0-2]. Refer to section 4.13 for information about handling errors.

536

537 The Payload contains one or more encoded fields. They specify a unique Client identifier for the Client, a
538 Will Topic, Will Payload, User Name and Password. All but the Client identifier can be omitted and their
539 presence is determined based on flags in the Variable Header.

540

541 3.1.1 CONNECT Fixed Header

542 *Figure 3-1 - CONNECT packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (1)				Reserved			
	0	0	0	1	0	0	0	0
byte 2...	Remaining Length							

543

544 Remaining Length field

545 This is the length of the Variable Header plus the length of the Payload. It is encoded as a Variable Byte
546 Integer.

547

548 3.1.2 CONNECT Variable Header

549 The Variable Header for the CONNECT Packet contains the following fields in this order: Protocol Name,
550 Protocol Level, Connect Flags, Keep Alive, and Properties. The rules for encoding Properties are
551 described in section 2.2.2.

552

553 3.1.2.1 Protocol Name

554 *Figure 3-2 - Protocol Name bytes*

	Description	7	6	5	4	3	2	1	0
Protocol Name									
byte 1	Length MSB (0)	0	0	0	0	0	0	0	0
byte 2	Length LSB (4)	0	0	0	0	0	1	0	0

byte 3	'M'	0	1	0	0	1	1	0	1
byte 4	'Q'	0	1	0	1	0	0	0	1
byte 5	'T'	0	1	0	1	0	1	0	0
byte 6	'T'	0	1	0	1	0	1	0	0

555

556 The Protocol Name is a UTF-8 Encoded String that represents the protocol name “MQTT”, capitalized as
557 shown. The string, its offset and length will not be changed by future versions of the MQTT specification.

558

559 A Server which support multiple protocols uses the Protocol Name to determine whether the data is
560 MQTT. The protocol name MUST be the UTF-8 String "MQTT". If the Server does not want to accept the
561 CONNECT, and wishes to reveal that it is an MQTT Server it MAY send a CONNACK packet with
562 Reason Code of 0x84 (Unsupported Protocol Version), and then it MUST close the Network Connection
563 [MQTT-3.1.2-1].

564

Non-normative comment

565 Packet inspectors, such as firewalls, could use the Protocol Name to identify MQTT traffic.

567

3.1.2.2 Protocol Version

568

569 *Figure 3-3 - Protocol Version byte*

	Description	7	6	5	4	3	2	1	0
Protocol Level									
byte 7	Version(5)	0	0	0	0	0	1	0	1

570

571 The one byte unsigned value that represents the revision level of the protocol used by the Client. The
572 value of the Protocol Version field for version 5.0 of the protocol is 5 (0x05).

573

574 A Server which supports multiple versions of the MQTT protocol uses the Protocol Version to determine
575 which version of MQTT the Client is using. If the Protocol Version is not 5 and the Server does not want
576 to accept the CONNECT packet, the Server MAY send a CONNACK packet with Reason Code 0x84
577 (Unsupported Protocol Version) and then MUST close the Network Connection [MQTT-3.1.2-2].

578

3.1.2.3 Connect Flags

579

580 The Connect Flags byte contains several parameters specifying the behavior of the MQTT connection. It
581 also indicates the presence or absence of fields in the Payload.

582 *Figure 3-4 - Connect Flag bits*

Bit	7	6	5	4	3	2	1	0
	User Name Flag	Password Flag	Will Retain	Will QoS		Will Flag	Clean Start	Reserved
byte 8	X	X	X	X	X	X	X	0

583 The Server MUST validate that the reserved flag in the CONNECT packet is set to 0 [MQTT-3.1.2-3]. If
584 the reserved flag is not 0 it is a Malformed Packet. Refer to section 4.13 for information about handling
585 errors.

586

587 3.1.2.4 Clean Start

588 **Position:** bit 1 of the Connect Flags byte.

589

590 This bit specifies whether the Connection starts a new Session or is a continuation of an existing Session.
591 Refer to section 4.1 for a definition of the Session State.

592

593 If a CONNECT packet is received with Clean Start is set to 1, the Client and Server MUST discard any
594 existing Session and start a new Session [MQTT-3.1.2-4]. Consequently, the Session Present flag in
595 CONNACK is always set to 0 if Clean Start is set to 1.

596

597 If a CONNECT packet is received with Clean Start set to 0 and there is a Session associated with the Client
598 Identifier, the Server MUST resume communications with the Client based on state from the existing
599 Session [MQTT-3.1.2-5]. If a CONNECT packet is received with Clean Start set to 0 and there is no Session
600 associated with the Client Identifier, the Server MUST create a new Session [MQTT-3.1.2-6].

601

602 3.1.2.5 Will Flag

603 **Position:** bit 2 of the Connect Flags.

604

605 If the Will Flag is set to 1 this indicates that a Will Message MUST be stored on the Server and associated
606 with the Session [MQTT-3.1.2-7]. The Will Message consists of the Will Properties, Will Topic, and Will
607 Payload fields in the CONNECT Payload. The Will Message MUST be published after the Network
608 Connection is subsequently closed and either the Will Delay Interval has elapsed or the Session ends,
609 unless the Will Message has been deleted by the Server on receipt of a DISCONNECT packet with
610 Reason Code 0x00 (Normal disconnection) or a new Network Connection for the ClientID is opened
611 before the Will Delay Interval has elapsed [MQTT-3.1.2-8].

612 Situations in which the Will Message is published include, but are not limited to:

613

- An I/O error or network failure detected by the Server.

614

- The Client fails to communicate within the Keep Alive time.

615

- The Client closes the Network Connection without first sending a DISCONNECT packet with a Reason Code 0x00 (Normal disconnection).

616

617

- The Server closes the Network Connection without first receiving a DISCONNECT packet with a Reason Code 0x00 (Normal disconnection).

618

619

620 If the Will Flag is set to 1, the Will Properties, Will Topic, and Will Payload fields MUST be present in the
621 Payload [MQTT-3.1.2-9]. The Will Message MUST be removed from the stored Session State in the
622 Server once it has been published or the Server has received a DISCONNECT packet with a Reason
623 Code of 0x00 (Normal disconnection) from the Client [MQTT-3.1.2-10].

624

625 The Server SHOULD publish Will Messages promptly after the Network Connection is closed and the Will
626 Delay Interval has passed, or when the Session ends, whichever occurs first. In the case of a Server
627 shutdown or failure, the Server MAY defer publication of Will Messages until a subsequent restart. If this
628 happens, there might be a delay between the time the Server experienced failure and when the Will
629 Message is published.

630
631 Refer to [section 3.1.3.2](#) for information about the Will Delay Interval.

632
633 **Non-normative comment**

634 The Client can arrange for the Will Message to notify that Session Expiry has occurred by setting
635 the Will Delay Interval to be longer than the Session Expiry Interval and sending DISCONNECT
636 with Reason Code 0x04 (Disconnect with Will Message).

637

638 **3.1.2.6 Will QoS**

639 **Position:** bits 4 and 3 of the Connect Flags.

640
641 These two bits specify the QoS level to be used when publishing the Will Message.

642

643 If the Will Flag is set to 0, then the Will QoS MUST be set to 0 (0x00) [MQTT-3.1.2-11].

644 If the Will Flag is set to 1, the value of Will QoS can be 0 (0x00), 1 (0x01), or 2 (0x02) [MQTT-3.1.2-12]. A
645 value of 3 (0x03) is a Malformed Packet. Refer to [section 4.13](#) for information about handling errors.

646

647 **3.1.2.7 Will Retain**

648 **Position:** bit 5 of the Connect Flags.

649
650 This bit specifies if the Will Message is to be retained when it is published.

651

652 If the Will Flag is set to 0, then Will Retain MUST be set to 0 [MQTT-3.1.2-13]. If the Will Flag is set to 1
653 and Will Retain is set to 0, the Server MUST publish the Will Message as a non-retained message

654 [MQTT-3.1.2-14]. If the Will Flag is set to 1 and Will Retain is set to 1, the Server MUST publish the Will
655 Message as a retained message [MQTT-3.1.2-15].

656

657 **3.1.2.8 User Name Flag**

658 **Position:** bit 7 of the Connect Flags.

659

660 If the User Name Flag is set to 0, a User Name MUST NOT be present in the Payload [MQTT-3.1.2-16]. If
661 the User Name Flag is set to 1, a User Name MUST be present in the Payload [MQTT-3.1.2-17].

662

663 **3.1.2.9 Password Flag**

664 **Position:** bit 6 of the Connect Flags.

665

666 If the Password Flag is set to 0, a Password MUST NOT be present in the Payload [MQTT-3.1.2-18]. If
667 the Password Flag is set to 1, a Password MUST be present in the Payload [MQTT-3.1.2-19].

668

669 **Non-normative comment**

670 This version of the protocol allows the sending of a Password with no User Name, where MQTT
671 v3.1.1 did not. This reflects the common use of Password for credentials other than a password.

672

673 3.1.2.10 Keep Alive

674 *Figure 3-5 - Keep Alive bytes*

Bit	7	6	5	4	3	2	1	0
byte 9	Keep Alive MSB							
byte 10	Keep Alive LSB							

675

676 The Keep Alive is a Two Byte Integer which is a time interval measured in seconds. It is the maximum
 677 time interval that is permitted to elapse between the point at which the Client finishes transmitting one
 678 MQTT Control Packet and the point it starts sending the next. It is the responsibility of the Client to ensure
 679 that the interval between MQTT Control Packets being sent does not exceed the Keep Alive value. **If
 680 Keep Alive is non-zero and in the absence of sending any other MQTT Control Packets, the Client MUST
 681 send a PINGREQ packet [MQTT-3.1.2-20].**

682

683 **If the Server returns a Server Keep Alive on the CONNACK packet, the Client MUST use that value
 684 instead of the value it sent as the Keep Alive [MQTT-3.1.2-21].**

685

686 The Client can send PINGREQ at any time, irrespective of the Keep Alive value, and check for a
 687 corresponding PINGRESP to determine that the network and the Server are available.

688

689 **If the Keep Alive value is non-zero and the Server does not receive an MQTT Control Packet from the
 690 Client within one and a half times the Keep Alive time period, it MUST close the Network Connection to
 691 the Client as if the network had failed [MQTT-3.1.2-22].**

692

693 If a Client does not receive a PINGRESP packet within a reasonable amount of time after it has sent a
 694 PINGREQ, it SHOULD close the Network Connection to the Server.

695

696 A Keep Alive value of 0 has the effect of turning off the Keep Alive mechanism. If Keep Alive is 0 the
 697 Client is not obliged to send MQTT Control Packets on any particular schedule.

698

699 **Non-normative comment**

700 The Server may have other reasons to disconnect the Client, for instance because it is shutting
 701 down. Setting Keep Alive does not guarantee that the Client will remain connected.

702

703 **Non-normative comment**

704 The actual value of the Keep Alive is application specific; typically, this is a few minutes. The
 705 maximum value of 65,535 is 18 hours 12 minutes and 15 seconds.

706

707 3.1.2.11 CONNECT Properties

708 3.1.2.11.1 Property Length

709 The length of the Properties in the CONNECT packet Variable Header encoded as a Variable Byte
 710 Integer.

711

712 **3.1.2.11.2 Session Expiry Interval**

713 **17 (0x11) Byte**, Identifier of the Session Expiry Interval.

714 Followed by the Four Byte Integer representing the Session Expiry Interval in seconds. It is a Protocol
715 Error to include the Session Expiry Interval more than once.

716

717 If the Session Expiry Interval is absent the value 0 is used. If it is set to 0, or is absent, the Session ends
718 when the Network Connection is closed.

719

720 If the Session Expiry Interval is 0xFFFFFFFF (UINT_MAX), the Session does not expire.

721

722 The Client and Server MUST store the Session State after the Network Connection is closed if the
723 Session Expiry Interval is greater than 0 [MQTT-3.1.2-23].

724

725 **Non-normative comment**

726 The clock in the Client or Server may not be running for part of the time interval, for instance
727 because the Client or Server are not running. This might cause the deletion of the state to be
728 delayed.

729

730 Refer to [section 4.1](#) for more information about Sessions. Refer to [section 4.1.1](#) for details and limitations
731 of stored state.

732

733 When the Session expires the Client and Server need not process the deletion of state atomically.

734

735 **Non-normative comment**

736 Setting Clean Start to 1 and a Session Expiry Interval of 0, is equivalent to setting CleanSession
737 to 1 in the MQTT Specification Version 3.1.1. Setting Clean Start to 0 and no Session Expiry
738 Interval, is equivalent to setting CleanSession to 0 in the MQTT Specification Version 3.1.1.

739

740 **Non-normative comment**

741 A Client that only wants to process messages while connected will set the Clean Start to 1 and
742 set the Session Expiry Interval to 0. It will not receive Application Messages published before it
743 connected and has to subscribe afresh to any topics that it is interested in each time it connects.

744

745 **Non-normative comment**

746 A Client might be connecting to a Server using a network that provides intermittent connectivity.
747 This Client can use a short Session Expiry Interval so that it can reconnect when the network is
748 available again and continue reliable message delivery. If the Client does not reconnect, allowing
749 the Session to expire, then Application Messages will be lost.

750

751 **Non-normative comment**

752 When a Client connects with a long Session Expiry Interval, it is requesting that the Server
753 maintain its MQTT session state after it disconnects for an extended period. Clients should only
754 connect with a long Session Expiry Interval if they intend to reconnect to the Server at some later
755 point in time. When a Client has determined that it has no further use for the Session it should
756 disconnect with a Session Expiry Interval set to 0.

757

758 **Non-normative comment**

759 The Client should always use the Session Present flag in the CONNACK to determine whether
760 the Server has a Session State for this Client.

761

762 **Non-normative comment**

763 The Client can avoid implementing its own Session expiry and instead rely on the Session
764 Present flag returned from the Server to determine if the Session had expired. If the Client does
765 implement its own Session expiry, it needs to store the time at which the Session State will be
766 deleted as part of its Session State.

767

768 **3.1.2.11.3 Receive Maximum**

769 **33 (0x21) Byte**, Identifier of the Receive Maximum.

770 Followed by the Two Byte Integer representing the Receive Maximum value. It is a Protocol Error to
771 include the Receive Maximum value more than once or for it to have the value 0.

772

773 The Client uses this value to limit the number of QoS 1 and QoS 2 publications that it is willing to process
774 concurrently. There is no mechanism to limit the QoS 0 publications that the Server might try to send.

775

776 The value of Receive Maximum applies only to the current Network Connection. If the Receive Maximum
777 value is absent then its value defaults to 65,535.

778

779 Refer to [section 4.9](#) Flow Control for details of how the Receive Maximum is used.

780

781 **3.1.2.11.4 Maximum Packet Size**

782 **39 (0x27) Byte**, Identifier of the Maximum Packet Size.

783 Followed by a Four Byte Integer representing the Maximum Packet Size the Client is willing to accept. If
784 the Maximum Packet Size is not present, no limit on the packet size is imposed beyond the limitations in
785 the protocol as a result of the remaining length encoding and the protocol header sizes.

786

787 It is a Protocol Error to include the Maximum Packet Size more than once, or for the value to be set to
788 zero.

789

790 **Non-normative comment**

791 It is the responsibility of the application to select a suitable Maximum Packet Size value if it
792 chooses to restrict the Maximum Packet Size.

793

794 The packet size is the total number of bytes in an MQTT Control Packet, as defined in [section 2.1.4](#). The
795 Client uses the Maximum Packet Size to inform the Server that it will not process packets exceeding this
796 limit.

797

798 **The Server MUST NOT send packets exceeding Maximum Packet Size to the Client [MQTT-3.1.2-24].** If
799 a Client receives a packet whose size exceeds this limit, this is a Protocol Error, the Client uses
800 DISCONNECT with Reason Code 0x95 (Packet too large), as described in [section 4.13](#).

801

802 Where a Packet is too large to send, the Server MUST discard it without sending it and then behave as if
803 it had completed sending that Application Message [MQTT-3.1.2-25].

804

805 In the case of a Shared Subscription where the message is too large to send to one or more of the Clients
806 but other Clients can receive it, the Server can choose either discard the message without sending the
807 message to any of the Clients, or to send the message to one of the Clients that can receive it.

808

809 **Non-normative comment**

810 Where a packet is discarded without being sent, the Server could place the discarded packet on a
811 'dead letter queue' or perform other diagnostic action. Such actions are outside the scope of this
812 specification.

813

814 **3.1.2.11.5 Topic Alias Maximum**

815 **34 (0x22) Byte**, Identifier of the Topic Alias Maximum.

816 Followed by the Two Byte Integer representing the Topic Alias Maximum value. It is a Protocol Error to
817 include the Topic Alias Maximum value more than once. If the Topic Alias Maximum property is absent,
818 the default value is 0.

819

820 This value indicates the highest value that the Client will accept as a Topic Alias sent by the Server. The
821 Client uses this value to limit the number of Topic Aliases that it is willing to hold on this Connection. **The**
822 **Server MUST NOT send a Topic Alias in a PUBLISH packet to the Client greater than Topic Alias**
823 **Maximum [MQTT-3.1.2-26].** A value of 0 indicates that the Client does not accept any Topic Aliases on
824 this connection. **If Topic Alias Maximum is absent or zero, the Server MUST NOT send any Topic Aliases**
825 **to the Client [MQTT-3.1.2-27].**

826

827 **3.1.2.11.6 Request Response Information**

828 **25 (0x19) Byte**, Identifier of the Request Response Information.

829 Followed by a Byte with a value of either 0 or 1. It is Protocol Error to include the Request Response
830 Information more than once, or to have a value other than 0 or 1. If the Request Response Information is
831 absent, the value of 0 is used.

832

833 The Client uses this value to request the Server to return Response Information in the CONNACK. **A**
834 **value of 0 indicates that the Server MUST NOT return Response Information [MQTT-3.1.2-28].** If the
835 value is 1 the Server MAY return Response Information in the CONNACK packet.

836

837 **Non-normative comment**

838 The Server can choose not to include Response Information in the CONNACK, even if the Client
839 requested it.

840

841 Refer to [section 4.10](#) for more information about Request / Response.

842

843 **3.1.2.11.7 Request Problem Information**

844 **23 (0x17) Byte**, Identifier of the Request Problem Information.

845 Followed by a Byte with a value of either 0 or 1. It is a Protocol Error to include Request Problem
846 Information more than once, or to have a value other than 0 or 1. If the Request Problem Information is
847 absent, the value of 1 is used.

848
849 The Client uses this value to indicate whether the Reason String or User Properties are sent in the case
850 of failures.

851
852 If the value of Request Problem Information is 0, the Server MAY return a Reason String or User
853 Properties on a CONNACK or DISCONNECT packet, but MUST NOT send a Reason String or User
854 Properties on any packet other than PUBLISH, CONNACK, or DISCONNECT [MQTT-3.1.2-29]. If the
855 value is 0 and the Client receives a Reason String or User Properties in a packet other than PUBLISH,
856 CONNACK, or DISCONNECT, it uses a DISCONNECT packet with Reason Code 0x82 (Protocol Error)
857 as described in [section 4.13](#) Handling errors.

858
859 If this value is 1, the Server MAY return a Reason String or User Properties on any packet where it is
860 allowed.

861

862 **3.1.2.11.8 User Property**

863 **38 (0x26) Byte**, Identifier of the User Property.

864 Followed by a UTF-8 String Pair.

865
866 The User Property is allowed to appear multiple times to represent multiple name, value pairs. The same
867 name is allowed to appear more than once.

868
869 **Non-normative comment**

870 User Properties on the CONNECT packet can be used to send connection related properties from
871 the Client to the Server. The meaning of these properties is not defined by this specification.

872

873 **3.1.2.11.9 Authentication Method**

874 **21 (0x15) Byte**, Identifier of the Authentication Method.

875 Followed by a UTF-8 Encoded String containing the name of the authentication method used for
876 extended authentication .It is a Protocol Error to include Authentication Method more than once.

877 If Authentication Method is absent, extended authentication is not performed. Refer to [section 4.12](#).

878
879 If a Client sets an Authentication Method in the CONNECT, the Client MUST NOT send any packets other
880 than AUTH or DISCONNECT packets until it has received a CONNACK packet [MQTT-3.1.2-30].

881

882 **3.1.2.11.10 Authentication Data**

883 **22 (0x16) Byte**, Identifier of the Authentication Data.

884 Followed by Binary Data containing authentication data. It is a Protocol Error to include Authentication
885 Data if there is no Authentication Method. It is a Protocol Error to include Authentication Data more than
886 once.

887

888 The contents of this data are defined by the authentication method. Refer to [section 4.12](#) for more
 889 information about extended authentication.

890

891 **3.1.2.12 Variable Header non-normative example**

892 *Figure 3-6 - Variable Header example*

	Description	7	6	5	4	3	2	1	0
Protocol Name									
byte 1	Length MSB (0)	0	0	0	0	0	0	0	0
byte 2	Length LSB (4)	0	0	0	0	0	1	0	0
byte 3	'M'	0	1	0	0	1	1	0	1
byte 4	'Q'	0	1	0	1	0	0	0	1
byte 5	'T'	0	1	0	1	0	1	0	0
byte 6	'T'	0	1	0	1	0	1	0	0

byte 13	Session Expiry Interval (10)	0	0	0	0	0	0	0	0
byte 14		0	0	0	0	0	0	0	0

byte 15		0	0	0	0	0	0	0	0
byte 16		0	0	0	0	1	0	1	0

893

894 3.1.3 CONNECT Payload

895 The Payload of the CONNECT packet contains one or more length-prefixed fields, whose presence is
 896 determined by the flags in the Variable Header. These fields, if present, MUST appear in the order Client
 897 Identifier, Will Properties, Will Topic, Will Payload, User Name, Password [MQTT-3.1.3-1].

898

899 3.1.3.1 Client Identifier (ClientID)

900 The Client Identifier (ClientID) identifies the Client to the Server. Each Client connecting to the Server has
 901 a unique ClientID. The ClientID MUST be used by Clients and by Servers to identify state that they hold
 902 relating to this MQTT Session between the Client and the Server [MQTT-3.1.3-2]. Refer to section 4.1 for
 903 more information about Session State.

904

905 The ClientID MUST be present and is the first field in the CONNECT packet Payload [MQTT-3.1.3-3].

906

907 The ClientID MUST be a UTF-8 Encoded String as defined in section 1.5.4 [MQTT-3.1.3-4].

908

909 The Server MUST allow ClientID's which are between 1 and 23 UTF-8 encoded bytes in length, and that
 910 contain only the characters

911 "0123456789abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ" [MQTT-3.1.3-5].

912

913 The Server MAY allow ClientID's that contain more than 23 encoded bytes. The Server MAY allow
 914 ClientID's that contain characters not included in the list given above.

915

916 A Server MAY allow a Client to supply a ClientID that has a length of zero bytes, however if it does so the
 917 Server MUST treat this as a special case and assign a unique ClientID to that Client [MQTT-3.1.3-6]. It
 918 MUST then process the CONNECT packet as if the Client had provided that unique ClientID, and MUST
 919 return the Assigned Client Identifier in the CONNACK packet [MQTT-3.1.3-7].

920

921 If the Server rejects the ClientID it MAY respond to the CONNECT packet with a CONNACK using
 922 Reason Code 0x85 (Client Identifier not valid) as described in section 4.13 Handling errors, and then it
 923 MUST close the Network Connection [MQTT-3.1.3-8].

924

925 Non-normative comment

926 A Client implementation could provide a convenience method to generate a random ClientID.
 927 Clients using this method should take care to avoid creating long-lived orphaned Sessions.

928

929 3.1.3.2 Will Properties

930 If the Will Flag is set to 1, the Will Properties is the next field in the Payload. The Will Properties field
 931 defines the Application Message properties to be sent with the Will Message when it is published, and
 932 properties which define when to publish the Will Message. The Will Properties consists of a Property
 933 Length and the Properties.

934

935 **3.1.3.2.1 Property Length**

936 The length of the Properties in the Will Properties encoded as a Variable Byte Integer.

937

938 **3.1.3.2.2 Will Delay Interval**

939 **24 (0x18) Byte**, Identifier of the Will Delay Interval.

940 Followed by the Four Byte Integer representing the Will Delay Interval in seconds. It is a Protocol Error to
941 include the Will Delay Interval more than once. If the Will Delay Interval is absent, the default value is 0
942 and there is no delay before the Will Message is published.

943

944 The Server delays publishing the Client's Will Message until the Will Delay Interval has passed or the
945 Session ends, whichever happens first. **If a new Network Connection to this Session is made before the
946 Will Delay Interval has passed, the Server MUST NOT send the Will Message [MQTT-3.1.3-9].**

947

948 **Non-normative comment**

949 One use of this is to avoid publishing Will Messages if there is a temporary network disconnection
950 and the Client succeeds in reconnecting and continuing its Session before the Will Message is
951 published.

952

953 **Non-normative comment**

954 If a Network Connection uses a Client Identifier of an existing Network Connection to the Server,
955 the Will Message for the exiting connection is sent unless the new connection specifies Clean
956 Start of 0 and the Will Delay is greater than zero. If the Will Delay is 0 the Will Message is sent at
957 the close of the existing Network Connection, and if Clean Start is 1 the Will Message is sent
958 because the Session ends.

959

960 **3.1.3.2.3 Payload Format Indicator**

961 **1 (0x01) Byte**, Identifier of the Payload Format Indicator.

962 Followed by the value of the Payload Format Indicator, either of:

- 963
- 964 • 0 (0x00) Byte Indicates that the Will Message is unspecified bytes, which is equivalent to not
965 sending a Payload Format Indicator.
 - 966 • 1 (0x01) Byte Indicates that the Will Message is UTF-8 Encoded Character Data. The UTF-8 data
967 in the Payload MUST be well-formed UTF-8 as defined by the Unicode specification
968 [\[Unicode\]](#) and restated in RFC 3629 [\[RFC3629\]](#).

969 It is a Protocol Error to include the Payload Format Indicator more than once. The Server MAY validate
970 that the Will Message is of the format indicated, and if it is not send a CONNACK with the Reason Code
971 of 0x99 (Payload format invalid) as described in section 4.13.

972

973 **3.1.3.2.4 Message Expiry Interval**

974 **2 (0x02) Byte**, Identifier of the Message Expiry Interval.

975 Followed by the Four Byte Integer representing the Message Expiry Interval. It is a Protocol Error to
976 include the Message Expiry Interval more than once.

977

978 If present, the Four Byte value is the lifetime of the Will Message in seconds and is sent as the
979 Publication Expiry Interval when the Server publishes the Will Message.

980

981 If absent, no Message Expiry Interval is sent when the Server publishes the Will Message.

982

983 **3.1.3.2.5 Content Type**

984 **3 (0x03)** Identifier of the Content Type.

985 Followed by a UTF-8 Encoded String describing the content of the Will Message. It is a Protocol Error to
986 include the Content Type more than once. The value of the Content Type is defined by the sending and
987 receiving application.

988

989 **3.1.3.2.6 Response Topic**

990 **8 (0x08) Byte**, Identifier of the Response Topic.

991 Followed by a UTF-8 Encoded String which is used as the Topic Name for a response message. It is a
992 Protocol Error to include the Response Topic more than once. The presence of a Response Topic
993 identifies the Will Message as a Request.

994

995 Refer to [section 4.10](#) for more information about Request / Response.

996

997 **3.1.3.2.7 Correlation Data**

998 **9 (0x09) Byte**, Identifier of the Correlation Data.

999 Followed by Binary Data. The Correlation Data is used by the sender of the Request Message to identify
1000 which request the Response Message is for when it is received. It is a Protocol Error to include
1001 Correlation Data more than once. If the Correlation Data is not present, the Requester does not require
1002 any correlation data.

1003

1004 The value of the Correlation Data only has meaning to the sender of the Request Message and receiver
1005 of the Response Message.

1006

1007 Refer to [section 4.10](#) for more information about Request / Response

1008

1009 **3.1.3.2.8 User Property**

1010 **38 (0x26) Byte**, Identifier of the User Property.

1011 Followed by a UTF-8 String Pair. The User Property is allowed to appear multiple times to represent
1012 multiple name, value pairs. The same name is allowed to appear more than once.

1013

1014 **The Server MUST maintain the order of User Properties when publishing the Will Message [MQTT-3.1.3-**
1015 **10].**

1016

1017 **Non-normative comment**

1018 This property is intended to provide a means of transferring application layer name-value tags
1019 whose meaning and interpretation are known only by the application programs responsible for
1020 sending and receiving them.

1021

1022 3.1.3.3 Will Topic

1023 If the Will Flag is set to 1, the Will Topic is the next field in the Payload. The Will Topic MUST be a UTF-8
1024 Encoded String as defined in section 1.5.4 [MQTT-3.1.3-11].

1025

1026 3.1.3.4 Will Payload

1027 If the Will Flag is set to 1 the Will Payload is the next field in the Payload. The Will Payload defines the
1028 Application Message Payload that is to be published to the Will Topic as described in section 3.1.2.5. This
1029 field consists of Binary Data.

1030

1031 3.1.3.5 User Name

1032 If the User Name Flag is set to 1, the User Name is the next field in the Payload. The User Name MUST
1033 be a UTF-8 Encoded String as defined in section 1.5.4 [MQTT-3.1.3-12]. It can be used by the Server for
1034 authentication and authorization.

1035

1036 3.1.3.6 Password

1037 If the Password Flag is set to 1, the Password is the next field in the Payload. The Password field is
1038 Binary Data. Although this field is called Password, it can be used to carry any credential information.

1039

1040 3.1.4 CONNECT Actions

1041 Note that a Server MAY support multiple protocols (including other versions of the MQTT protocol) on the
1042 same TCP port or other network endpoint. If the Server determines that the protocol is MQTT v5.0 then it
1043 validates the connection attempt as follows.

1044

- 1045 1. If the Server does not receive a CONNECT packet within a reasonable amount of time after the
1046 Network Connection is established, the Server SHOULD close the Network Connection.
- 1047 2. The Server MUST validate that the CONNECT packet matches the format described in section
1048 3.1 and close the Network Connection if it does not match [MQTT-3.1.4-1]. The Server MAY send
1049 a CONNACK with a Reason Code of 0x80 or greater as described in section 4.13 before closing
1050 the Network Connection.
- 1051 3. The Server MAY check that the contents of the CONNECT packet meet any further restrictions and
1052 SHOULD perform authentication and authorization checks. If any of these checks fail, it MUST
1053 close the Network Connection [MQTT-3.1.4-2]. Before closing the Network Connection, it MAY
1054 send an appropriate CONNACK response with a Reason Code of 0x80 or greater as described in
1055 section 3.2 and section 4.13.

1056

1057 If validation is successful, the Server performs the following steps.

1058

- 1059 1. If the ClientID represents a Client already connected to the Server, the Server sends a
1060 DISCONNECT packet to the existing Client with Reason Code of 0x8E (Session taken over) as
1061 described in section 4.13 and MUST close the Network Connection of the existing Client [MQTT-
1062 3.1.4-3]. If the existing Client has a Will Message, that Will Message is published as described in
1063 section 3.1.2.5.

1109
1110
1111

Non-normative comment

If the Will Delay Interval of the existing Network Connection is 0 and there is a Will Message, it will be sent because the Network Connection is closed. If the Session Expiry Interval of the existing Network Connection is 0, or the new Network Connection has Clean Start set to 1 then if the existing Network Connection has a Will Message it will be sent because the original Session is ended on the takeover.

2. The Server MUST perform the processing of Clean Start that is described in section 3.1.2.4 [MQTT-3.1.4-4].
3. The Server MUST acknowledge the CONNECT packet with a CONNACK packet containing a 0x00 (Success) Reason Code [MQTT-3.1.4-5].

Non-normative comment

It is recommended that authentication and authorization checks be performed if the Server is being used to process any form of business critical data. If these checks succeed, the Server responds by sending CONNACK with a 0x00 (Success) Reason Code. If they fail, it is suggested that the Server does not send a CONNACK at all, as this could alert a potential attacker to the presence of the MQTT Server and encourage such an attacker to launch a denial of service or password-guessing attack.

4. Start message delivery and Keep Alive monitoring.

Clients are allowed to send further MQTT Control Packets immediately after sending a CONNECT packet; Clients need not wait for a CONNACK packet to arrive from the Server. If the Server rejects the CONNECT, it MUST NOT process any data sent by the Client after the CONNECT packet except AUTH packets [MQTT-3.1.4-6].

Non-normative comment

Clients typically wait for a CONNACK packet, However, if the Client exploits its freedom to send MQTT Control Packets before it receives a CONNACK, it might simplify the Client implementation as it does not have to police the connected state. The Client accepts that any data that it sends before it receives a CONNACK packet from the Server will not be processed if the Server rejects the connection.

Non-normative comment

Clients that send MQTT Control Packets before they receive CONNACK will be unaware of the Server constraints and whether any existing Session is being used.

Non-normative comment

The Server can limit reading from the Network Connection or close the Network Connection if the Client sends too much data before authentication is complete. This is suggested as a way of avoiding denial of service attacks.

3.2 CONNACK – Connect acknowledgement

The CONNACK packet is the packet sent by the Server in response to a CONNECT packet received from a Client. The Server MUST send a CONNACK with a 0x00 (Success) Reason Code before sending any

1112 Packet other than AUTH [MQTT-3.2.0-1]. The Server MUST NOT send more than one CONNACK in a
1113 Network Connection [MQTT-3.2.0-2].

1114
1115 If the Client does not receive a CONNACK packet from the Server within a reasonable amount of time, the
1116 Client SHOULD close the Network Connection. A "reasonable" amount of time depends on the type of
1117 application and the communications infrastructure.

1119 3.2.1 CONNACK Fixed Header

1120 The Fixed Header format is illustrated in Figure 3-7.

1121 *Figure 3-7 – CONNACK packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet Type (2)				Reserved			
	0	0	1	0	0	0	0	0
byte 2	Remaining Length							

1122
1123 **Remaining Length field**
1124 This is the length of the Variable Header encoded as a Variable Byte Integer.

1126 3.2.2 CONNACK Variable Header

1127 The Variable Header of the CONNACK Packet contains the following fields in the order: Connect
1128 Acknowledge Flags, Connect Reason Code, and Properties. The rules for encoding Properties are
1129 described in [section 2.2.2](#).

1131 3.2.2.1 Connect Acknowledge Flags

1132 Byte 1 is the "Connect Acknowledge Flags". Bits 7-1 are reserved and MUST be set to 0 [MQTT-3.2.2-1].

1133
1134 Bit 0 is the Session Present Flag.

1136 3.2.2.1.1 Session Present

1137 Position: bit 0 of the Connect Acknowledge Flags.

1138
1139 The Session Present flag informs the Client whether the Server is using Session State from a previous
1140 connection for this ClientID. This allows the Client and Server to have a consistent view of the Session
1141 State.

1142
1143 If the Server accepts a connection with Clean Start set to 1, the Server MUST set Session Present to 0 in
1144 the CONNACK packet in addition to setting a 0x00 (Success) Reason Code in the CONNACK packet
1145 [MQTT-3.2.2-2].

1146
1147 If the Server accepts a connection with Clean Start set to 0 and the Server has Session State for the
1148 ClientID, it MUST set Session Present to 1 in the CONNACK packet, otherwise it MUST set Session

1149 Present to 0 in the CONNACK packet. In both cases it MUST set a 0x00 (Success) Reason Code in the
1150 CONNACK packet [MQTT-3.2.2-3].

1151
1152 If the value of Session Present received by the Client from the Server is not as expected, the Client
1153 proceeds as follows:

- 1154 • If the Client does not have Session State and receives Session Present set to 1 it MUST close
1155 the Network Connection [MQTT-3.2.2-4]. If it wishes to restart with a new Session the Client can
1156 reconnect using Clean Start set to 1.
- 1157 • If the Client does have Session State and receives Session Present set to 0 it MUST discard its
1158 Session State if it continues with the Network Connection [MQTT-3.2.2-5].

1159
1160
1161 If a Server sends a CONNACK packet containing a non-zero Reason Code it MUST set Session Present
1162 to 0 [MQTT-3.2.2-6].

1163

1164 3.2.2.2 Connect Reason Code

1165 Byte 2 in the Variable Header is the Connect Reason Code.

1166

1167 The values the Connect Reason Code are shown below. If a well formed CONNECT packet is received
1168 by the Server, but the Server is unable to complete the Connection the Server MAY send a CONNACK
1169 packet containing the appropriate Connect Reason code from this table. If a Server sends a CONNACK
1170 packet containing a Reason code of 128 or greater it MUST then close the Network Connection [MQTT-
1171 3.2.2-7].

1172

1173 Table 3-1 - Connect Reason Code values

Value	Hex	Reason Code name	Description
0	0x00	Success	The Connection is accepted.
128	0x80	Unspecified error	The Server does not wish to reveal the reason for the failure, or none of the other Reason Codes apply.
129	0x81	Malformed Packet	Data within the CONNECT packet could not be correctly parsed.
130	0x82	Protocol Error	Data in the CONNECT packet does not conform to this specification.
131	0x83	Implementation specific error	The CONNECT is valid but is not accepted by this Server.
132	0x84	Unsupported Protocol Version	The Server does not support the version of the MQTT protocol requested by the Client.
133	0x85	Client Identifier not valid	The Client Identifier is a valid string but is not allowed by the Server.
134	0x86	Bad User Name or Password	The Server does not accept the User Name or Password specified by the Client
135	0x87	Not authorized	The Client is not authorized to connect.
136	0x88	Server unavailable	The MQTT Server is not available.

137	0x89	Server busy	The Server is busy. Try again later.
138	0x8A	Banned	This Client has been banned by administrative action. Contact the server administrator.
140	0x8C	Bad authentication method	The authentication method is not supported or does not match the authentication method currently in use.
144	0x90	Topic Name invalid	The Will Topic Name is not malformed, but is not accepted by this Server.
149	0x95	Packet too large	The CONNECT packet exceeded the maximum permissible size.
151	0x97	Quota exceeded	An implementation or administrative imposed limit has been exceeded.
153	0x99	Payload format invalid	The Will Payload does not match the specified Payload Format Indicator.
154	0x9A	Retain not supported	The Server does not support retained messages, and Will Retain was set to 1.
155	0x9B	QoS not supported	The Server does not support the QoS set in Will QoS.
156	0x9C	Use another server	The Client should temporarily use another server.
157	0x9D	Server moved	The Client should permanently use another server.
159	0x9F	Connection rate exceeded	The connection rate limit has been exceeded.

1174

1175 The Server sending the CONNACK packet MUST use one of the Connect Reason Code values [T-3.2.2-
1176 8].

1177

1178 **Non-normative comment**

1179 Reason Code 0x80 (Unspecified error) may be used where the Server knows the reason for the
1180 failure but does not wish to reveal it to the Client, or when none of the other Reason Code values
1181 applies.

1182

1183 The Server may choose to close the Network Connection without sending a CONNACK to
1184 enhance security in the case where an error is found on the CONNECT. For instance, when on a
1185 public network and the connection has not been authorized it might be unwise to indicate that this
1186 is an MQTT Server.

1187

1188 **3.2.2.3 CONNACK Properties**

1189 **3.2.2.3.1 Property Length**

1190 This is the length of the Properties in the CONNACK packet Variable Header encoded as a Variable Byte
1191 Integer.

1192

1193 **3.2.2.3.2 Session Expiry Interval**

1194 **17 (0x11) Byte**, Identifier of the Session Expiry Interval.

1195 Followed by the Four Byte Integer representing the Session Expiry Interval in seconds. It is a Protocol
1196 Error to include the Session Expiry Interval more than once.

1197

1198 If the Session Expiry Interval is absent the value in the CONNECT Packet used. The server uses this
1199 property to inform the Client that it is using a value other than that sent by the Client in the CONNACK.
1200 Refer to section 3.1.2.11.2 for a description of the use of Session Expiry Interval.

1201

1202 **3.2.2.3.3 Receive Maximum**

1203 **33 (0x21) Byte**, Identifier of the Receive Maximum.

1204 Followed by the Two Byte Integer representing the Receive Maximum value. It is a Protocol Error to
1205 include the Receive Maximum value more than once or for it to have the value 0.

1206

1207 The Server uses this value to limit the number of QoS 1 and QoS 2 publications that it is willing to
1208 process concurrently for the Client. It does not provide a mechanism to limit the QoS 0 publications that
1209 the Client might try to send.

1210

1211 If the Receive Maximum value is absent, then its value defaults to 65,535.

1212

1213 Refer to [section 4.9](#) Flow Control for details of how the Receive Maximum is used.

1214

1215 **3.2.2.3.4 Maximum QoS**

1216 **36 (0x24) Byte**, Identifier of the Maximum QoS.

1217 Followed by a Byte with a value of either 0 or 1. It is a Protocol Error to include Maximum QoS more than
1218 once, or to have a value other than 0 or 1. If the Maximum QoS is absent, the Client uses a Maximum
1219 QoS of 2.

1220

1221 If a Server does not support QoS 1 or QoS 2 PUBLISH packets it MUST send a Maximum QoS in the
1222 CONNACK packet specifying the highest QoS it supports [\[MQTT-3.2.2-9\]](#). A Server that does not support
1223 QoS 1 or QoS 2 PUBLISH packets MUST still accept SUBSCRIBE packets containing a Requested QoS
1224 of 0, 1 or 2 [\[MQTT-3.2.2-10\]](#).

1225

1226 If a Client receives a Maximum QoS from a Server, it MUST NOT send PUBLISH packets at a QoS level
1227 exceeding the Maximum QoS level specified [\[MQTT-3.2.2-11\]](#). It is a Protocol Error if the Server receives
1228 a PUBLISH packet with a QoS greater than the Maximum QoS it specified. In this case use
1229 DISCONNECT with Reason Code 0x9B (QoS not supported) as described in [section 4.13](#) Handling
1230 errors.

1231

1232 If a Server receives a CONNECT packet containing a Will QoS that exceeds its capabilities, it MUST
1233 reject the connection. It SHOULD use a CONNACK packet with Reason Code 0x9B (QoS not supported)
1234 as described in [section 4.13](#) Handling errors, and MUST close the Network Connection [\[MQTT-3.2.2-12\]](#).

1235

1236 **Non-normative comment**

1237 A Client does not need to support QoS 1 or QoS 2 PUBLISH packets. If this is the case, the
1238 Client simply restricts the maximum QoS field in any SUBSCRIBE commands it sends to a value
1239 it can support.

1240

1241 **3.2.2.3.5 Retain Available**

1242 **37 (0x25) Byte**, Identifier of Retain Available.

1243 Followed by a Byte field. If present, this byte declares whether the Server supports retained messages. A
1244 value of 0 means that retained messages are not supported. A value of 1 means retained messages are
1245 supported. If not present, then retained messages are supported. It is a Protocol Error to include Retain
1246 Available more than once or to use a value other than 0 or 1.

1247

1248 If a Server receives a CONNECT packet containing a Will Message with the Will Retain set to 1, and it
1249 does not support retained messages, the Server MUST reject the connection request. It SHOULD send
1250 CONNACK with Reason Code 0x9A (Retain not supported) and then it MUST close the Network
1251 Connection [MQTT-3.2.2-13].

1252

1253 A Client receiving Retain Available set to 0 from the Server MUST NOT send a PUBLISH packet with the
1254 RETAIN flag set to 1 [MQTT-3.2.2-14]. If the Server receives such a packet, this is a Protocol Error. The
1255 Server SHOULD send a DISCONNECT with Reason Code of 0x9A (Retain not supported) as described
1256 in section 4.13.

1257

1258 **3.2.2.3.6 Maximum Packet Size**

1259 **39 (0x27) Byte**, Identifier of the Maximum Packet Size.

1260 Followed by a Four Byte Integer representing the Maximum Packet Size the Server is willing to accept. If
1261 the Maximum Packet Size is not present, there is no limit on the packet size imposed beyond the
1262 limitations in the protocol as a result of the remaining length encoding and the protocol header sizes.

1263

1264 It is a Protocol Error to include the Maximum Packet Size more than once, or for the value to be set to
1265 zero.

1266

1267 The packet size is the total number of bytes in an MQTT Control Packet, as defined in section 2.1.4. The
1268 Server uses the Maximum Packet Size to inform the Client that it will not process packets whose size
1269 exceeds this limit.

1270

1271 The Client MUST NOT send packets exceeding Maximum Packet Size to the Server [MQTT-3.2.2-15]. If
1272 a Server receives a packet whose size exceeds this limit, this is a Protocol Error, the Server uses
1273 DISCONNECT with Reason Code 0x95 (Packet too large), as described in section 4.13.

1274

1275 **3.2.2.3.7 Assigned Client Identifier**

1276 **18 (0x12) Byte**, Identifier of the Assigned Client Identifier.

1277 Followed by the UTF-8 string which is the Assigned Client Identifier. It is a Protocol Error to include the
1278 Assigned Client Identifier more than once.

1279

1280 The Client Identifier which was assigned by the Server because a zero length Client Identifier was found
1281 in the CONNECT packet.

1282

1283 If the Client connects using a zero length Client Identifier, the Server MUST respond with a CONNACK
1284 containing an Assigned Client Identifier. The Assigned Client Identifier MUST be a new Client Identifier
1285 not used by any other Session currently in the Server [MQTT-3.2.2-16].

1286

1287 **3.2.2.3.8 Topic Alias Maximum**

1288 **34 (0x22) Byte**, Identifier of the Topic Alias Maximum.

1289 Followed by the Two Byte Integer representing the Topic Alias Maximum value. It is a Protocol Error to
1290 include the Topic Alias Maximum value more than once. If the Topic Alias Maximum property is absent,
1291 the default value is 0.

1292
1293 This value indicates the highest value that the Server will accept as a Topic Alias sent by the Client. The
1294 Server uses this value to limit the number of Topic Aliases that it is willing to hold on this Connection. **The**
1295 **Client MUST NOT send a Topic Alias in a PUBLISH packet to the Server greater than this value [MQTT-**
1296 **3.2.2-17].** A value of 0 indicates that the Server does not accept any Topic Aliases on this connection. **If**
1297 **Topic Alias Maximum is absent or 0, the Client MUST NOT send any Topic Aliases on to the Server**
1298 **[MQTT-3.2.2-18].**

1299

1300 **3.2.2.3.9 Reason String**

1301 **31 (0x1F) Byte** Identifier of the Reason String.

1302 Followed by the UTF-8 Encoded String representing the reason associated with this response. This
1303 Reason String is a human readable string designed for diagnostics and SHOULD NOT be parsed by the
1304 Client.

1305

1306 The Server uses this value to give additional information to the Client. **The Server MUST NOT send this**
1307 **property if it would increase the size of the CONNACK packet beyond the Maximum Packet Size specified**
1308 **by the Client [MQTT-3.2.2-19].** It is a Protocol Error to include the Reason String more than once.

1309

1310 **Non-normative comment**

1311 Proper uses for the reason string in the Client would include using this information in an exception
1312 thrown by the Client code, or writing this string to a log.

1313

1314 **3.2.2.3.10 User Property**

1315 **38 (0x26) Byte**, Identifier of User Property.

1316 Followed by a UTF-8 String Pair. This property can be used to provide additional information to the Client
1317 including diagnostic information. **The Server MUST NOT send this property if it would increase the size of**
1318 **the CONNACK packet beyond the Maximum Packet Size specified by the Client [MQTT-3.2.2-20].** The
1319 User Property is allowed to appear multiple times to represent multiple name, value pairs. The same
1320 name is allowed to appear more than once.

1321

1322 The content and meaning of this property is not defined by this specification. The receiver of a CONNACK
1323 containing this property MAY ignore it.

1324

1325 **3.2.2.3.11 Wildcard Subscription Available**

1326 **40 (0x28) Byte**, Identifier of Wildcard Subscription Available.

1327 Followed by a Byte field. If present, this byte declares whether the Server supports Wildcard
1328 Subscriptions. A value is 0 means that Wildcard Subscriptions are not supported. A value of 1 means
1329 Wildcard Subscriptions are supported. If not present, then Wildcard Subscriptions are supported. It is a
1330 Protocol Error to include the Wildcard Subscription Available more than once or to send a value other
1331 than 0 or 1.

1332

1333 If the Server receives a SUBSCRIBE packet containing a Wildcard Subscription and it does not support
1334 Wildcard Subscriptions, this is a Protocol Error. The Server uses DISCONNECT with Reason Code 0xA2
1335 (Wildcard Subscriptions not supported) as described in [section 4.13](#).

1336
1337 If a Server supports Wildcard Subscriptions, it can still reject a particular subscribe request containing a
1338 Wildcard Subscription. In this case the Server MAY send a SUBACK Control Packet with a Reason Code
1339 0xA2 (Wildcard Subscriptions not supported).

1340

1341 **3.2.2.3.12 Subscription Identifiers Available**

1342 **41 (0x29) Byte**, Identifier of Subscription Identifier Available.

1343 Followed by a Byte field. If present, this byte declares whether the Server supports Subscription
1344 Identifiers. A value is 0 means that Subscription Identifiers are not supported. A value of 1 means
1345 Subscription Identifiers are supported. If not present, then Subscription Identifiers are supported. It is a
1346 Protocol Error to include the Subscription Identifier Available more than once, or to send a value other
1347 than 0 or 1.

1348

1349 If the Server receives a SUBSCRIBE packet containing Subscription Identifier and it does not support
1350 Subscription Identifiers, this is a Protocol Error. The Server uses DISCONNECT with Reason Code of
1351 0xA1 (Subscription Identifiers not supported) as described in [section 4.13](#).

1352

1353 **3.2.2.3.13 Shared Subscription Available**

1354 **42 (0x2A) Byte**, Identifier of Shared Subscription Available.

1355 Followed by a Byte field. If present, this byte declares whether the Server supports Shared Subscriptions.
1356 A value is 0 means that Shared Subscriptions are not supported. A value of 1 means Shared
1357 Subscriptions are supported. If not present, then Shared Subscriptions are supported. It is a Protocol
1358 Error to include the Shared Subscription Available more than once or to send a value other than 0 or 1.

1359

1360 If the Server receives a SUBSCRIBE packet containing Shared Subscriptions and it does not support
1361 Shared Subscriptions, this is a Protocol Error. The Server uses DISCONNECT with Reason Code 0x9E
1362 (Shared Subscriptions not supported) as described in [section 4.13](#).

1363

1364 **3.2.2.3.14 Server Keep Alive**

1365 **19 (0x13) Byte**, Identifier of the Server Keep Alive.

1366 Followed by a Two Byte Integer with the Keep Alive time assigned by the Server. If the Server sends a
1367 Server Keep Alive on the CONNACK packet, the Client MUST use this value instead of the Keep Alive
1368 value the Client sent on CONNECT [MQTT-3.2.2-21]. If the Server does not send the Server Keep Alive,
1369 the Server MUST use the Keep Alive value set by the Client on CONNECT [MQTT-3.2.2-22]. It is a
1370 Protocol Error to include the Server Keep Alive more than once.

1371

1372 **Non-normative comment**

1373 The primary use of the Server Keep Alive is for the Server to inform the Client that it will
1374 disconnect the Client for inactivity sooner than the Keep Alive specified by the Client.

1375

1376 **3.2.2.3.15 Response Information**

1377 **26 (0x1A) Byte**, Identifier of the Response Information.

1378 Followed by a UTF-8 Encoded String which is used as the basis for creating a Response Topic. The way
1379 in which the Client creates a Response Topic from the Response Information is not defined by this
1380 specification. It is a Protocol Error to include the Response Information more than once.

1381
1382 If the Client sends a Request Response Information with a value 1, it is OPTIONAL for the Server to send
1383 the Response Information in the CONNACK.

1384
1385 **Non-normative comment**

1386 A common use of this is to pass a globally unique portion of the topic tree which is reserved for
1387 this Client for at least the lifetime of its Session. This often cannot just be a random name as both
1388 the requesting Client and the responding Client need to be authorized to use it. It is normal to use
1389 this as the root of a topic tree for a particular Client. For the Server to return this information, it
1390 normally needs to be correctly configured. Using this mechanism allows this configuration to be
1391 done once in the Server rather than in each Client.

1392
1393 Refer to [section 4.10](#) for more information about Request / Response.

1394
1395 **3.2.2.3.16 Server Reference**

1396 **28 (0x1C) Byte**, Identifier of the Server Reference.

1397 Followed by a UTF-8 Encoded String which can be used by the Client to identify another Server to use. It
1398 is a Protocol Error to include the Server Reference more than once.

1399
1400 The Server uses a Server Reference in either a CONNACK or DISCONNECT packet with Reason code
1401 of 0x9C (Use another server) or Reason Code 0x9D (Server moved) as described in [section 4.13](#).

1402
1403 Refer to [section 4.11](#) Server redirection for information about how Server Reference is used.

1404
1405 **3.2.2.3.17 Authentication Method**

1406 **21 (0x15) Byte**, Identifier of the Authentication Method.

1407 Followed by a UTF-8 Encoded String containing the name of the authentication method. It is a Protocol
1408 Error to include the Authentication Method more than once. Refer to [section 4.12](#) for more information
1409 about extended authentication.

1410
1411 **3.2.2.3.18 Authentication Data**

1412 **22 (0x16) Byte**, Identifier of the Authentication Data.

1413 Followed by Binary Data containing authentication data. The contents of this data are defined by the
1414 authentication method and the state of already exchanged authentication data. It is a Protocol Error to
1415 include the Authentication Data more than once. Refer to [section 4.12](#) for more information about
1416 extended authentication.

1418 **3.2.3 CONNACK Payload**

1419 The CONNACK packet has no Payload.
1420

1421 **3.3 PUBLISH – Publish message**

1422 A PUBLISH packet is sent from a Client to a Server or from a Server to a Client to transport an
1423 Application Message.
1424

1425 **3.3.1 PUBLISH Fixed Header**

1426 *Figure 3-8 – PUBLISH packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (3)				DUP flag	QoS level		RETAIN
	0	0	1	1	X	X	X	X
byte 2...	Remaining Length							

1427

1428 **3.3.1.1 DUP**

1429 **Position:** byte 1, bit 3.

1430 If the DUP flag is set to 0, it indicates that this is the first occasion that the Client or Server has attempted
1431 to send this PUBLISH packet. If the DUP flag is set to 1, it indicates that this might be re-delivery of an
1432 earlier attempt to send the packet.

1433

1434 **The DUP flag MUST be set to 1 by the Client or Server when it attempts to re-deliver a PUBLISH packet**
1435 **[MQTT-3.3.1-1]. The DUP flag MUST be set to 0 for all QoS 0 messages [MQTT-3.3.1-2].**

1436

1437 The value of the DUP flag from an incoming PUBLISH packet is not propagated when the PUBLISH
1438 packet is sent to subscribers by the Server. **The DUP flag in the outgoing PUBLISH packet is set**
1439 **independently to the incoming PUBLISH packet, its value MUST be determined solely by whether the**
1440 **outgoing PUBLISH packet is a retransmission [MQTT-3.3.1-3].**

1441

1442 **Non-normative comment**

1443 The receiver of an MQTT Control Packet that contains the DUP flag set to 1 cannot assume that
1444 it has seen an earlier copy of this packet.

1445

1446 **Non-normative comment**

1447 It is important to note that the DUP flag refers to the MQTT Control Packet itself and not to the
1448 Application Message that it contains. When using QoS 1, it is possible for a Client to receive a
1449 PUBLISH packet with DUP flag set to 0 that contains a repetition of an Application Message that
1450 it received earlier, but with a different Packet Identifier. [Section 2.2.1](#) provides more information
1451 about Packet Identifiers.

1452

1453 **3.3.1.2 QoS**

1454 **Position:** byte 1, bits 2-1.

1455 This field indicates the level of assurance for delivery of an Application Message. The QoS levels are
1456 shown below.

1457

1458 Table 3-2 - QoS definitions

QoS value	Bit 2	bit 1	Description
0	0	0	At most once delivery
1	0	1	At least once delivery
2	1	0	Exactly once delivery
-	1	1	Reserved – must not be used

1459

1460 If the Server included a Maximum QoS in its CONNACK response to a Client and it receives a PUBLISH
1461 packet with a QoS greater than this, then it uses DISCONNECT with Reason Code 0x9B (QoS not
1462 supported) as described in [section 4.13](#) Handling errors.

1463

1464 A PUBLISH Packet MUST NOT have both QoS bits set to 1 [MQTT-3.3.1-4]. If a Server or Client receives
1465 a PUBLISH packet which has both QoS bits set to 1 it is a Malformed Packet. Use DISCONNECT with
1466 Reason Code 0x81 (Malformed Packet) as described in [section 4.13](#).

1467

1468 **3.3.1.3 RETAIN**

1469 **Position:** byte 1, bit 0.

1470

1471 If the RETAIN flag is set to 1 in a PUBLISH packet sent by a Client to a Server, the Server MUST replace
1472 any existing retained message for this topic and store the Application Message [MQTT-3.3.1-5], so that it
1473 can be delivered to future subscribers whose subscriptions match its Topic Name. If the Payload contains
1474 zero bytes it is processed normally by the Server but any retained message with the same topic name
1475 MUST be removed and any future subscribers for the topic will not receive a retained message [MQTT-
1476 3.3.1-6]. A retained message with a Payload containing zero bytes MUST NOT be stored as a retained
1477 message on the Server [MQTT-3.3.1-7].

1478

1479 If the RETAIN flag is 0 in a PUBLISH packet sent by a Client to a Server, the Server MUST NOT store the
1480 message as a retained message and MUST NOT remove or replace any existing retained message
1481 [MQTT-3.3.1-8].

1482

1483 If the Server included Retain Available in its CONNACK response to a Client with its value set to 0 and it
1484 receives a PUBLISH packet with the RETAIN flag is set to 1, then it uses the DISCONNECT Reason
1485 Code of 0x9A (Retain not supported) as described in [section 4.13](#).

1486

1487 When a new Non-shared Subscription is made, the last retained message, if any, on each matching topic
1488 name is sent to the Client as directed by the Retain Handling Subscription Option. These messages are
1489 sent with the RETAIN flag set to 1. Which retained messages are sent is controlled by the Retain
1490 Handling Subscription Option. At the time of the Subscription:

- 1491
- 1492
- 1493
- 1494
- 1495
- 1496
- 1497
- If Retain Handling is set to 0 the Server MUST send the retained messages matching the Topic Filter of the subscription to the Client [MQTT-3.3.1-9].
 - If Retain Handling is set to 1 then if the subscription did not already exist, the Server MUST send all retained message matching the Topic Filter of the subscription to the Client, and if the subscription did exist the Server MUST NOT send the retained messages. [MQTT-3.3.1-10].
 - If Retain Handling is set to 2, the Server MUST NOT send the retained messages [MQTT-3.3.1-11].

1498

1499 Refer to [section 3.8.3.1](#) for a definition of the Subscription Options.

1500

1501 If the Server receives a PUBLISH packet with the RETAIN flag set to 1, and QoS 0 it SHOULD store the
1502 new QoS 0 message as the new retained message for that topic, but MAY choose to discard it at any
1503 time. If this happens there will be no retained message for that topic.

1504

1505 If the current retained message for a Topic expires, it is discarded and there will be no retained message
1506 for that topic.

1507

1508 The setting of the RETAIN flag in an Application Message forwarded by the Server from an established
1509 connection is controlled by the Retain As Published subscription option. Refer to [section 3.8.3.1](#) for a
1510 definition of the Subscription Options.

1511

- 1512
- 1513
- 1514
- 1515
- 1516
- If the value of Retain As Published subscription option is set to 0, the Server MUST set the RETAIN flag to 0 when forwarding an Application Message regardless of how the RETAIN flag was set in the received PUBLISH packet [MQTT-3.3.1-12].
 - If the value of Retain As Published subscription option is set to 1, the Server MUST set the RETAIN flag equal to the RETAIN flag in the received PUBLISH packet [MQTT-3.3.1-13].

1517

1518 **Non-normative comment**

1519 Retained messages are useful where publishers send state messages on an irregular basis. A new
1520 non-shared subscriber will receive the most recent state.

1521

1522 **3.3.1.4 Remaining Length**

1523 This is the length of Variable Header plus the length of the Payload, encoded as a Variable Byte Integer.

1524

1525 **3.3.2 PUBLISH Variable Header**

1526 The Variable Header of the PUBLISH Packet contains the following fields in the order: Topic Name,
1527 Packet Identifier, and Properties. The rules for encoding Properties are described in [section 2.2.2](#).

1528

1529 **3.3.2.1 Topic Name**

1530 The Topic Name identifies the information channel to which Payload data is published.

1531

1532 The Topic Name MUST be present as the first field in the PUBLISH packet Variable Header. It MUST be
1533 a UTF-8 Encoded String as defined in [section 1.5.4](#) [MQTT-3.3.2-1].

1534

1535 The Topic Name in the PUBLISH packet MUST NOT contain wildcard characters [MQTT-3.3.2-2].

1536

1537 The Topic Name in a PUBLISH packet sent by a Server to a subscribing Client MUST match the
1538 Subscription's Topic Filter according to the matching process defined in section 4.7 [MQTT-3.3.2-3].

1539 However, as the Server is permitted to map the Topic Name to another name, it might not be the same as
1540 the Topic Name in the original PUBLISH packet.

1541

1542 To reduce the size of the PUBLISH packet the sender can use a Topic Alias. The Topic Alias is described
1543 in section 3.3.2.3.4. It is a Protocol Error if the Topic Name is zero length and there is no Topic Alias.

1544

1545 3.3.2.2 Packet Identifier

1546 The Packet Identifier field is only present in PUBLISH packets where the QoS level is 1 or 2. Section
1547 2.2.1 provides more information about Packet Identifiers.

1548

1549 3.3.2.3 PUBLISH Properties

1550 3.3.2.3.1 Property Length

1551 The length of the Properties in the PUBLISH packet Variable Header encoded as a Variable Byte Integer.

1552

1553 3.3.2.3.2 Payload Format Indicator

1554 1 (0x01) Byte, Identifier of the Payload Format Indicator.

1555 Followed by the value of the Payload Format Indicator, either of:

- 1556 • 0 (0x00) Byte Indicates that the Payload is unspecified bytes, which is equivalent to not sending a
1557 Payload Format Indicator.
- 1558 • 1 (0x01) Byte Indicates that the Payload is UTF-8 Encoded Character Data. The UTF-8 data in
1559 the Payload MUST be well-formed UTF-8 as defined by the Unicode specification [Unicode]
1560 and restated in RFC 3629 [RFC3629].

1561

1562 A Server MUST send the Payload Format Indicator unaltered to all subscribers receiving the Application
1563 Message [MQTT-3.3.2-4]. The receiver MAY validate that the Payload is of the format indicated, and if it
1564 is not send a PUBACK, PUBREC, or DISCONNECT with Reason Code of 0x99 (Payload format invalid)
1565 as described in section 4.13. Refer to section 5.4.9 for information about security issues in validating the
1566 payload format.

1567

1568 3.3.2.3.3 Message Expiry Interval

1569 2 (0x02) Byte, Identifier of the Message Expiry Interval.

1570 Followed by the Four Byte Integer representing the Message Expiry Interval.

1571

1572 If present, the Four Byte value is the lifetime of the Application Message in seconds. If the Message
1573 Expiry Interval has passed and the Server has not managed to start onward delivery to a matching
1574 subscriber, then it MUST delete the copy of the message for that subscriber [MQTT-3.3.2-5].

1575

1576 If absent, the Application Message does not expire.

1577
1578 The PUBLISH packet sent to a Client by the Server MUST contain a Message Expiry Interval set to the
1579 received value minus the time that the Application Message has been waiting in the Server [MQTT-3.3.2-
1580 6]. Refer to section 4.1 for details and limitations of stored state.

1581

1582 3.3.2.3.4 Topic Alias

1583 **35 (0x23) Byte**, Identifier of the Topic Alias.

1584 Followed by the Two Byte integer representing the Topic Alias value. It is a Protocol Error to include the
1585 Topic Alias value more than once.

1586

1587 A Topic Alias is an integer value that is used to identify the Topic instead of using the Topic Name. This
1588 reduces the size of the PUBLISH packet, and is useful when the Topic Names are long and the same
1589 Topic Names are used repetitively within a Network Connection.

1590

1591 The sender decides whether to use a Topic Alias and chooses the value. It sets a Topic Alias mapping by
1592 including a non-zero length Topic Name and a Topic Alias in the PUBLISH packet. The receiver
1593 processes the PUBLISH as normal but also sets the specified Topic Alias mapping to this Topic Name.

1594

1595 If a Topic Alias mapping has been set at the receiver, a sender can send a PUBLISH packet that contains
1596 that Topic Alias and a zero length Topic Name. The receiver then treats the incoming PUBLISH as if it
1597 had contained the Topic Name of the Topic Alias.

1598

1599 A sender can modify the Topic Alias mapping by sending another PUBLISH in the same Network
1600 Connection with the same Topic Alias value and a different non-zero length Topic Name.

1601

1602 Topic Alias mappings exist only within a Network Connection and last only for the lifetime of that Network
1603 Connection. A receiver MUST NOT carry forward any Topic Alias mappings from one Network
1604 Connection to another [MQTT-3.3.2-7].

1605

1606 A Topic Alias of 0 is not permitted. A sender MUST NOT send a PUBLISH packet containing a Topic
1607 Alias which has the value 0 [MQTT-3.3.2-8].

1608

1609 A Client MUST NOT send a PUBLISH packet with a Topic Alias greater than the Topic Alias Maximum
1610 value returned by the Server in the CONNACK packet [MQTT-3.3.2-9]. A Client MUST accept all Topic
1611 Alias values greater than 0 and less than or equal to the Topic Alias Maximum value that it sent in the
1612 CONNECT packet [MQTT-3.3.2-10].

1613

1614 A Server MUST NOT send a PUBLISH packet with a Topic Alias greater than the Topic Alias Maximum
1615 value sent by the Client in the CONNECT packet [MQTT-3.3.2-11]. A Server MUST accept all Topic Alias
1616 values greater than 0 and less than or equal to the Topic Alias Maximum value that it returned in the
1617 CONNACK packet [MQTT-3.3.2-12].

1618

1619 The Topic Alias mappings used by the Client and Server are independent from each other. Thus, when a
1620 Client sends a PUBLISH containing a Topic Alias value of 1 to a Server and the Server sends a PUBLISH
1621 with a Topic Alias value of 1 to that Client they will in general be referring to different Topics.

1622

1623 3.3.2.3.5 Response Topic

1624 **8 (0x08) Byte**, Identifier of the Response Topic.

1625 Followed by a UTF-8 Encoded String which is used as the Topic Name for a response message. The
1626 Response Topic MUST be a UTF-8 Encoded String as defined in section 1.5.4 [MQTT-3.3.2-13]. The
1627 Response Topic MUST NOT contain wildcard characters [MQTT-3.3.2-14]. It is a Protocol Error to include
1628 the Response Topic more than once. The presence of a Response Topic identifies the Message as a
1629 Request.

1630

1631 Refer to section 4.10 for more information about Request / Response.

1632

1633 The Server MUST send the Response Topic unaltered to all subscribers receiving the Application
1634 Message [MQTT-3.3.2-15].

1635

1636 **Non-normative comment:**

1637 The receiver of an Application Message with a Response Topic sends a response by using the
1638 Response Topic as the Topic Name of a PUBLISH. If the Request Message contains a
1639 Correlation Data, the receiver of the Request Message should also include this Correlation Data
1640 as a property in the PUBLISH packet of the Response Message.

1641

1642 3.3.2.3.6 Correlation Data

1643 **9 (0x09) Byte**, Identifier of the Correlation Data.

1644 Followed by Binary Data. The Correlation Data is used by the sender of the Request Message to identify
1645 which request the Response Message is for when it is received. It is a Protocol Error to include
1646 Correlation Data more than once. If the Correlation Data is not present, the Requester does not require
1647 any correlation data.

1648

1649 The Server MUST send the Correlation Data unaltered to all subscribers receiving the Application
1650 Message [MQTT-3.3.2-16]. The value of the Correlation Data only has meaning to the sender of the
1651 Request Message and receiver of the Response Message.

1652

1653 **Non-normative comment**

1654 The receiver of an Application Message which contains both a Response Topic and a Correlation
1655 Data sends a response by using the Response Topic as the Topic Name of a PUBLISH. The
1656 Client should also send the Correlation Data unaltered as part of the PUBLISH of the responses.

1657

1658 **Non-normative comment**

1659 If the Correlation Data contains information which can cause application failures if modified by the
1660 Client responding to the request, it should be encrypted and/or hashed to allow any alteration to
1661 be detected.

1662

1663 Refer to section 4.10 for more information about Request / Response

1664

1665 3.3.2.3.7 User Property

1666 **38 (0x26) Byte**, Identifier of the User Property.

1667 Followed by a UTF-8 String Pair. The User Property is allowed to appear multiple times to represent
1668 multiple name, value pairs. The same name is allowed to appear more than once.

1669
 1670 The Server MUST send all User Properties unaltered in a PUBLISH packet when forwarding the
 1671 Application Message to a Client [MQTT-3.3.2-17]. The Server MUST maintain the order of User
 1672 Properties when forwarding the Application Message [MQTT-3.3.2-18].

1673
 1674 **Non-normative comment**

1675 This property is intended to provide a means of transferring application layer name-value tags
 1676 whose meaning and interpretation are known only by the application programs responsible for
 1677 sending and receiving them.

1678
 1679 **3.3.2.3.8 Subscription Identifier**

1680 **11 (0x0B)**, Identifier of the Subscription Identifier.
 1681 Followed by a Variable Byte Integer representing the identifier of the subscription.

1682
 1683 The Subscription Identifier can have the value of 1 to 268,435,455. It is a Protocol Error if the
 1684 Subscription Identifier has a value of 0. Multiple Subscription Identifiers will be included if the publication
 1685 is the result of a match to more than one subscription, in this case their order is not significant.
 1686

1687 **3.3.2.3.9 Content Type**

1688 **3 (0x03)** Identifier of the Content Type.
 1689 Followed by a UTF-8 Encoded String describing the content of the Application Message. The Content
 1690 Type MUST be a UTF-8 Encoded String as defined in section 1.5.4 [MQTT-3.3.2-19].
 1691 It is a Protocol Error to include the Content Type more than once. The value of the Content Type is
 1692 defined by the sending and receiving application.
 1693

1694 A Server MUST send the Content Type unaltered to all subscribers receiving the Application Message
 1695 [MQTT-3.3.2-20].

1696
 1697 **Non-normative comment**

1698 The UTF-8 Encoded String may use a MIME content type string to describe the contents of the
 1699 Application message. However, since the sending and receiving applications are responsible for
 1700 the definition and interpretation of the string, MQTT performs no validation of the string except to
 1701 insure it is a valid UTF-8 Encoded String.

1702 **Non-normative example**

1703 Figure 3-9 shows an example of a PUBLISH packet with the Topic Name set to “a/b”, the Packet
 1704 Identifier set to 10, and having no properties.
 1705

1706
 1707 Figure 3-9 - PUBLISH packet Variable Header non-normative example

	Description	7	6	5	4	3	2	1	0
Topic Name									
byte 1	Length MSB (0)	0	0	0	0	0	0	0	0
byte 2	Length LSB (3)	0	0	0	0	0	0	1	1
byte 3	'a' (0x61)	0	1	1	0	0	0	0	1
byte 4	'/' (0x2F)	0	0	1	0	1	1	1	1

byte 5	'b' (0x62)	0	1	1	0	0	0	1	0
Packet Identifier									
byte 6	Packet Identifier MSB (0)	0	0	0	0	0	0	0	0
byte 7	Packet Identifier LSB (10)	0	0	0	0	1	0	1	0
Property Length									
byte 8	No Properties	0	0	0	0	0	0	0	0

1708

1709 3.3.3 PUBLISH Payload

1710 The Payload contains the Application Message that is being published. The content and format of the
 1711 data is application specific. The length of the Payload can be calculated by subtracting the length of the
 1712 Variable Header from the Remaining Length field that is in the Fixed Header. It is valid for a PUBLISH
 1713 packet to contain a zero length Payload.

1714

1715 3.3.4 PUBLISH Actions

1716 The receiver of a PUBLISH Packet MUST respond with the packet as determined by the QoS in the
 1717 PUBLISH Packet [MQTT-3.3.4-1].

1718

1719 Table 3-3 Expected PUBLISH packet response

QoS Level	Expected Response
QoS 0	None
QoS 1	PUBACK packet
QoS 2	PUBREC packet

1720

1721 The Client uses a PUBLISH packet to send an Application Message to the Server, for distribution to
 1722 Clients with matching subscriptions.

1723

1724 The Server uses a PUBLISH packet to send an Application Message to each Client which has a matching
 1725 subscription. The PUBLISH packet includes the Subscription Identifier carried in the SUBSCRIBE packet,
 1726 if there was one.

1727

1728 When Clients make subscriptions with Topic Filters that include wildcards, it is possible for a Client's
 1729 subscriptions to overlap so that a published message might match multiple filters. In this case the Server
 1730 MUST deliver the message to the Client respecting the maximum QoS of all the matching subscriptions
 1731 [MQTT-3.3.4-2]. In addition, the Server MAY deliver further copies of the message, one for each
 1732 additional matching subscription and respecting the subscription's QoS in each case.

1733

1734 If a Client receives an unsolicited Application Message (not resulting from a subscription) which has a
 1735 QoS greater than Maximum QoS, it uses a DISCONNECT packet with Reason Code 0x9B (QoS not
 1736 supported) as described in section 4.13 Handling errors.

1737

1738 If the Client specified a Subscription Identifier for any of the overlapping subscriptions the Server MUST
1739 send those Subscription Identifiers in the message which is published as the result of the subscriptions
1740 [MQTT-3.3.4-3]. If the Server sends a single copy of the message it MUST include in the PUBLISH
1741 packet the Subscription Identifiers for all matching subscriptions which have a Subscription Identifiers,
1742 their order is not significant [MQTT-3.3.4-4]. If the Server sends multiple PUBLISH packets it MUST send,
1743 in each of them, the Subscription Identifier of the matching subscription if it has a Subscription Identifier
1744 [MQTT-3.3.4-5].

1745

1746 It is possible that the Client made several subscriptions which match a publication and that it used the
1747 same identifier for more than one of them. In this case the PUBLISH packet will carry multiple identical
1748 Subscription Identifiers.

1749

1750 It is a Protocol Error for a PUBLISH packet to contain any Subscription Identifier other than those
1751 received in SUBSCRIBE packet which caused it to flow. A PUBLISH packet sent from a Client to a Server
1752 MUST NOT contain a Subscription Identifier [MQTT-3.3.4-6].

1753

1754 If the subscription was shared, then only the Subscription Identifiers that were present in the SUBSCRIBE
1755 packet from the Client which is receiving the message are returned in the PUBLISH packet.

1756

1757 The action of the recipient when it receives a PUBLISH packet depends on the QoS level as described in
1758 [section 4.3](#).

1759

1760 If the PUBLISH packet contains a Topic Alias, the receiver processes it as follows:

- 1761 1) A Topic Alias value of 0 or greater than the Maximum Topic Alias is a Protocol Error, the receiver
1762 uses DISCONNECT with Reason Code of 0x94 (Topic Alias invalid) as described in [section 4.13](#).
1763
- 1764 2) If the receiver has already established a mapping for the Topic Alias, then
1765 a) If the packet has a zero length Topic Name, the receiver processes it using the Topic Name that
1766 corresponds to the Topic Alias
1767 b) If the packet contains a non-zero length Topic Name, the receiver processes the packet using
1768 that Topic Name and updates its mapping for the Topic Alias to the Topic Name from the
1769 incoming packet
1770
- 1771 3) If the receiver does not already have a mapping for this Topic Alias
1772 a) If the packet has a zero length Topic Name field it is a Protocol Error and the receiver uses
1773 DISCONNECT with Reason Code of 0x82 (Protocol Error) as described in [section 4.13](#).
1774 b) If the packet contains a Topic Name with a non-zero length, the receiver processes the packet
1775 using that Topic Name and sets its mappings for the Topic Alias to Topic Name from the
1776 incoming packet.

1777

1778 **Non-normative Comment**

1779 If the Server distributes Application Messages to Clients at different protocol levels (such as
1780 MQTT V3.1.1) which do not support properties or other features provided by this specification,
1781 some information in the Application Message can be lost, and applications which depend on this
1782 information might not work correctly.

1783

1784 The Client MUST NOT send more than Receive Maximum QoS 1 and QoS 2 PUBLISH packets for which
1785 it has not received PUBACK, PUBCOMP, or PUBREC with a Reason Code of 128 or greater from the
1786 Server [MQTT-3.3.4-7]. If it receives more than Receive Maximum QoS 1 and QoS 2 PUBLISH packets
1787 where it has not sent a PUBACK or PUBCOMP in response, the Server uses a DISCONNECT packet

1788 with Reason Code 0x93 (Receive Maximum exceeded) as described in [section 4.13](#) Handling errors.
1789 Refer to [section 4.9](#) for more information about flow control.

1790
1791 The Client MUST NOT delay the sending of any packets other than PUBLISH packets due to having sent
1792 Receive Maximum PUBLISH packets without receiving acknowledgements for them [MQTT-3.3.4-8]. The
1793 value of Receive Maximum applies only to the current Network Connection.

1794
1795 **Non-normative comment**

1796 The Client might choose to send fewer than Receive Maximum messages to the Server without
1797 receiving acknowledgement, even if it has more than this number of messages available to send.

1798
1799 **Non-normative comment**

1800 The Client might choose to suspend the sending of QoS 0 PUBLISH packets when it suspends
1801 the sending of QoS 1 and QoS 2 PUBLISH packets.

1802
1803 **Non-normative comment**

1804 If the Client sends QoS 1 or QoS 2 PUBLISH packets before it has received a CONNACK packet,
1805 it risks being disconnected because it has sent more than Receive Maximum publications.

1806
1807 The Server MUST NOT send more than Receive Maximum QoS 1 and QoS 2 PUBLISH packets for
1808 which it has not received PUBACK, PUBCOMP, or PUBREC with a Reason Code of 128 or greater from
1809 the Client [MQTT-3.3.4-9]. If it receives more than Receive Maximum QoS 1 and QoS 2 PUBLISH
1810 packets where it has not sent a PUBACK or PUBCOMP in response, the Client uses DISCONNECT with
1811 Reason Code 0x93 (Receive Maximum exceeded) as described in [section 4.13](#) Handling errors. Refer to
1812 [section 4.9](#) for more information about flow control.

1813
1814 The Server MUST NOT delay the sending of any packets other than PUBLISH packets due to having
1815 sent Receive Maximum PUBLISH packets without receiving acknowledgements for them [MQTT-3.3.4-
1816 10].

1817
1818 **Non-normative comment**

1819 The Server might choose to send fewer than Receive Maximum messages to the Client without
1820 receiving acknowledgement, even if it has more than this number of messages available to send.

1821
1822 **Non-normative comment**

1823 The Server might choose to suspend the sending of QoS 0 PUBLISH packets when it suspends
1824 the sending of QoS 1 and QoS 2 PUBLISH packets.

1825

1826 3.4 PUBACK – Publish acknowledgement

1827 A PUBACK packet is the response to a PUBLISH packet with QoS 1.

1828

1829 3.4.1 PUBACK Fixed Header

1830 *Figure 3-10 - PUBACK packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
-----	---	---	---	---	---	---	---	---

byte 1	MQTT Control Packet type (4)				Reserved			
	0	1	0	0	0	0	0	0
byte 2	Remaining Length							

1831

1832 **Remaining Length field**

1833 This is the length of the Variable Header, encoded as a Variable Byte Integer.

1834

1835 **3.4.2 PUBACK Variable Header**

1836 The Variable Header of the PUBACK Packet contains the following fields in the order: Packet Identifier
 1837 from the PUBLISH packet that is being acknowledged, PUBACK Reason Code, Property Length, and the
 1838 Properties. The rules for encoding Properties are described in [section 2.2.2](#).

1839

1840 Figure 3-11 – PUBACK packet Variable Header

Bit	7	6	5	4	3	2	1	0
byte 1	Packet Identifier MSB							
byte 2	Packet Identifier LSB							
byte 3	PUBACK Reason Code							
byte 4	Property Length							

1841

1842 **3.4.2.1 PUBACK Reason Code**

1843 Byte 3 in the Variable Header is the PUBACK Reason Code. If the Remaining Length is 2, then there is
 1844 no Reason Code and the value of 0x00 (Success) is used.

1845

1846 Table 3-4 - PUBACK Reason Codes

Value	Hex	Reason Code name	Description
0	0x00	Success	The message is accepted. Publication of the QoS 1 message proceeds.
16	0x10	No matching subscribers	The message is accepted but there are no subscribers. This is sent only by the Server. If the Server knows that there are no matching subscribers, it MAY use this Reason Code instead of 0x00 (Success).
128	0x80	Unspecified error	The receiver does not accept the publish but either does not want to reveal the reason, or it does not match one of the other values.
131	0x83	Implementation specific error	The PUBLISH is valid but the receiver is not willing to accept it.
135	0x87	Not authorized	The PUBLISH is not authorized.

144	0x90	Topic Name invalid	The Topic Name is not malformed, but is not accepted by this Client or Server.
145	0x91	Packet identifier in use	The Packet Identifier is already in use. This might indicate a mismatch in the Session State between the Client and Server.
151	0x97	Quota exceeded	An implementation or administrative imposed limit has been exceeded.
153	0x99	Payload format invalid	The payload format does not match the specified Payload Format Indicator.

1847

1848 The Client or Server sending the PUBACK packet MUST use one of the PUBACK Reason Codes [MQTT-
 1849 3.4.2-1]. The Reason Code and Property Length can be omitted if the Reason Code is 0x00 (Success)
 1850 and there are no Properties. In this case the PUBACK has a Remaining Length of 2.

1851

1852 3.4.2.2 PUBACK Properties

1853 3.4.2.2.1 Property Length

1854 The length of the Properties in the PUBACK packet Variable Header encoded as a Variable Byte Integer.
 1855 If the Remaining Length is less than 4 there is no Property Length and the value of 0 is used.

1856

1857 3.4.2.2.2 Reason String

1858 **31 (0x1F) Byte**, Identifier of the Reason String.

1859 Followed by the UTF-8 Encoded String representing the reason associated with this response. This
 1860 Reason String is a human readable string designed for diagnostics and is not intended to be parsed by
 1861 the receiver.

1862

1863 The sender uses this value to give additional information to the receiver. The sender MUST NOT send
 1864 this property if it would increase the size of the PUBACK packet beyond the Maximum Packet Size
 1865 specified by the receiver [MQTT-3.4.2-2]. It is a Protocol Error to include the Reason String more than
 1866 once.

1867

1868 3.4.2.2.3 User Property

1869 **38 (0x26) Byte**, Identifier of the User Property.

1870 Followed by UTF-8 String Pair. This property can be used to provide additional diagnostic or other
 1871 information. The sender MUST NOT send this property if it would increase the size of the PUBACK
 1872 packet beyond the Maximum Packet Size specified by the receiver [MQTT-3.4.2-3]. The User Property is
 1873 allowed to appear multiple times to represent multiple name, value pairs. The same name is allowed to
 1874 appear more than once.

1875

1876 3.4.3 PUBACK Payload

1877 The PUBACK packet has no Payload.

1878

1879 **3.4.4 PUBACK Actions**

1880 This is described in [section 4.3.2](#).

1881

1882 **3.5 PUBREC – Publish received (QoS 2 delivery part 1)**

1883 A PUBREC packet is the response to a PUBLISH packet with QoS 2. It is the second packet of the QoS 2
1884 protocol exchange.

1885

1886 **3.5.1 PUBREC Fixed Header**

1887 *Figure 3-12 - PUBREC packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (5)				Reserved			
	0	1	0	1	0	0	0	0
byte 2	Remaining Length							

1888

1889 **Remaining Length field**

1890 This is the length of the Variable Header, encoded as a Variable Byte Integer.

1891

1892 **3.5.2 PUBREC Variable Header**

1893 The Variable Header of the PUBREC Packet consists of the following fields in the order: the Packet
1894 Identifier from the PUBLISH packet that is being acknowledged, PUBREC Reason Code, and Properties.
1895 The rules for encoding Properties are described in [section 2.2.2](#).

1896

1897 *Figure 3-13 - PUBREC packet Variable Header*

Bit	7	6	5	4	3	2	1	0
byte 1	Packet Identifier MSB							
byte 2	Packet Identifier LSB							
byte 3	PUBREC Reason Code							
byte 4	Property Length							

1898

1899 **3.5.2.1 PUBREC Reason Code**

1900 Byte 3 in the Variable Header is the PUBREC Reason Code. If the Remaining Length is 2, then the
1901 Publish Reason Code has the value 0x00 (Success).

1902

1903 **Table 3-5 – PUBREC Reason Codes**

Value	Hex	Reason Code name	Description
-------	-----	------------------	-------------

0	0x00	Success	The message is accepted. Publication of the QoS 2 message proceeds.
16	0x10	No matching subscribers.	The message is accepted but there are no subscribers. This is sent only by the Server. If the Server knows that there are no matching subscribers, it MAY use this Reason Code instead of 0x00 (Success).
128	0x80	Unspecified error	The receiver does not accept the publish but either does not want to reveal the reason, or it does not match one of the other values.
131	0x83	Implementation specific error	The PUBLISH is valid but the receiver is not willing to accept it.
135	0x87	Not authorized	The PUBLISH is not authorized.
144	0x90	Topic Name invalid	The Topic Name is not malformed, but is not accepted by this Client or Server.
145	0x91	Packet Identifier in use	The Packet Identifier is already in use. This might indicate a mismatch in the Session State between the Client and Server.
151	0x97	Quota exceeded	An implementation or administrative imposed limit has been exceeded.
153	0x99	Payload format invalid	The payload format does not match the one specified in the Payload Format Indicator.

1904

1905 **The Client or Server sending the PUBREC packet MUST use one of the PUBREC Reason Code values.**

1906 **[MQTT-3.5.2-1].** The Reason Code and Property Length can be omitted if the Reason Code is 0x00
 1907 (Success) and there are no Properties. In this case the PUBREC has a Remaining Length of 2.

1908

1909 3.5.2.2 PUBREC Properties

1910 3.5.2.2.1 Property Length

1911 The length of the Properties in the PUBREC packet Variable Header encoded as a Variable Byte Integer.
 1912 If the Remaining Length is less than 4 there is no Property Length and the value of 0 is used.

1913

1914 3.5.2.2.2 Reason String

1915 **31 (0x1F) Byte**, Identifier of the Reason String.

1916 Followed by the UTF-8 Encoded String representing the reason associated with this response. This
 1917 Reason String is human readable, designed for diagnostics and SHOULD NOT be parsed by the
 1918 receiver.

1919

1920 The sender uses this value to give additional information to the receiver. **The sender MUST NOT send**
 1921 **this property if it would increase the size of the PUBREC packet beyond the Maximum Packet Size**
 1922 **specified by the receiver [MQTT-3.5.2-2].** It is a Protocol Error to include the Reason String more than
 1923 once.

1924

1925 **3.5.2.2.3 User Property**

1926 **38 (0x26) Byte**, Identifier of the User Property.

1927 Followed by UTF-8 String Pair. This property can be used to provide additional diagnostic or other
1928 information. **The sender MUST NOT send this property if it would increase the size of the PUBREC**
1929 **packet beyond the Maximum Packet Size specified by the receiver [MQTT-3.5.2-3].** The User Property is
1930 allowed to appear multiple times to represent multiple name, value pairs. The same name is allowed to
1931 appear more than once.

1933 **3.5.3 PUBREC Payload**

1934 The PUBREC packet has no Payload.

1935 **3.5.4 PUBREC Actions**

1936 This is described in [section 4.3.3](#).

1938 **3.6 PUBREL – Publish release (QoS 2 delivery part 2)**

1939 A PUBREL packet is the response to a PUBREC packet. It is the third packet of the QoS 2 protocol
1940 exchange.

1942 **3.6.1 PUBREL Fixed Header**

1943 *Figure 3-14 – PUBREL packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (6)				Reserved			
	0	1	1	0	0	0	1	0
byte 2	Remaining Length							

1944
1945 **Bits 3,2,1 and 0 of the Fixed Header in the PUBREL packet are reserved and MUST be set to 0,0,1 and 0**
1946 **respectively. The Server MUST treat any other value as malformed and close the Network Connection**
1947 **[MQTT-3.6.1-1].**

1949 **Remaining Length field**

1950 This is the length of the Variable Header, encoded as a Variable Byte Integer.

1952 **3.6.2 PUBREL Variable Header**

1953 The Variable Header of the PUBREL Packet contains the following fields in the order: the Packet
1954 Identifier from the PUBREC packet that is being acknowledged, PUBREL Reason Code, and Properties.
1955 The rules for encoding Properties are described in [section 2.2.2](#).

1957 *Figure 3-15 – PUBREL packet Variable Header*

Bit	7	6	5	4	3	2	1	0

byte 1	Packet Identifier MSB
byte 2	Packet Identifier LSB
byte 3	PUBREL Reason Code
byte 4	Property Length

1958

1959 3.6.2.1 PUBREL Reason Code

1960 Byte 3 in the Variable Header is the PUBREL Reason Code. If the Remaining Length is 2, the value of
1961 0x00 (Success) is used.

1962

1963 Table 3-6 - PUBREL Reason Codes

Value	Hex	Reason Code name	Description
0	0x00	Success	Message released.
146	0x92	Packet Identifier not found	The Packet Identifier is not known. This is not an error during recovery, but at other times indicates a mismatch between the Session State on the Client and Server.

1964

1965 **The Client or Server sending the PUBREL packet MUST use one of the PUBREL Reason Code values**
1966 **[MQTT-3.6.2-1].** The Reason Code and Property Length can be omitted if the Reason Code is 0x00
1967 (Success) and there are no Properties. In this case the PUBREL has a Remaining Length of 2.

1968

1969 3.6.2.2 PUBREL Properties

1970 3.6.2.2.1 Property Length

1971 The length of the Properties in the PUBREL packet Variable Header encoded as a Variable Byte Integer.
1972 If the Remaining Length is less than 4 there is no Property Length and the value of 0 is used.

1973

1974 3.6.2.2.2 Reason String

1975 **31 (0x1F) Byte**, Identifier of the Reason String.

1976 Followed by the UTF-8 Encoded String representing the reason associated with this response. This
1977 Reason String is human readable, designed for diagnostics and SHOULD NOT be parsed by the
1978 receiver.

1979

1980 The sender uses this value to give additional information to the receiver. **The sender MUST NOT send**
1981 **this Property if it would increase the size of the PUBREL packet beyond the Maximum Packet Size**
1982 **specified by the receiver [MQTT-3.6.2-2].** It is a Protocol Error to include the Reason String more than
1983 once.

1984

1985 3.6.2.2.3 User Property

1986 **38 (0x26) Byte**, Identifier of the User Property.

1987 Followed by UTF-8 String Pair. This property can be used to provide additional diagnostic or other
 1988 information for the PUBREL. The sender MUST NOT send this property if it would increase the size of the
 1989 PUBREL packet beyond the Maximum Packet Size specified by the receiver [MQTT-3.6.2-3]. The User
 1990 Property is allowed to appear multiple times to represent multiple name, value pairs. The same name is
 1991 allowed to appear more than once.

1992

1993 3.6.3 PUBREL Payload

1994 The PUBREL packet has no Payload.

1995

1996 3.6.4 PUBREL Actions

1997 This is described in [section 4.3.3](#).

1998

1999 3.7 PUBCOMP – Publish complete (QoS 2 delivery part 3)

2000 The PUBCOMP packet is the response to a PUBREL packet. It is the fourth and final packet of the QoS 2
 2001 protocol exchange.

2002

2003 3.7.1 PUBCOMP Fixed Header

2004 *Figure 3-16 – PUBCOMP packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control packet type (7)				Reserved			
	0	1	1	1	0	0	0	0
byte 2	Remaining Length							

2005

2006 Remaining Length field

2007 This is the length of the Variable Header, encoded as a Variable Byte Integer.

2008

2009 3.7.2 PUBCOMP Variable Header

2010 The Variable Header of the PUBCOMP Packet contains the following fields in the order: Packet Identifier
 2011 from the PUBREL packet that is being acknowledged, PUBCOMP Reason Code, and Properties. The
 2012 rules for encoding Properties are described in [section 2.2.2](#).

2013

2014 *Figure 3-17 - PUBCOMP packet Variable Header*

Bit	7	6	5	4	3	2	1	0
byte 1	Packet Identifier MSB							
byte 2	Packet Identifier LSB							
byte 3	PUBCOMP Reason Code							

byte 4	Property Length
--------	-----------------

2015

2016 **3.7.2.1 PUBCOMP Reason Code**

2017 Byte 3 in the Variable Header is the PUBCOMP Reason Code. If the Remaining Length is 2, then the
 2018 value 0x00 (Success) is used.

2019

2020 Table 3-7 – PUBCOMP Reason Codes

Value	Hex	Reason Code name	Description
0	0x00	Success	Packet Identifier released. Publication of QoS 2 message is complete.
146	0x92	Packet Identifier not found	The Packet Identifier is not known. This is not an error during recovery, but at other times indicates a mismatch between the Session State on the Client and Server.

2021

2022 The Client or Server sending the PUBCOMP packet MUST use one of the PUBCOMP Reason Code
 2023 values [MQTT-3.7.2-1]. The Reason Code and Property Length can be omitted if the Reason Code is
 2024 0x00 (Success) and there are no Properties. In this case the PUBCOMP has a Remaining Length of 2.

2025

2026 **3.7.2.2 PUBCOMP Properties**

2027 **3.7.2.2.1 Property Length**

2028 The length of the Properties in the PUBCOMP packet Variable Header encoded as a Variable Byte
 2029 Integer. If the Remaining Length is less than 4 there is no Property Length and the value of 0 is used.

2030

2031 **3.7.2.2.2 Reason String**

2032 **31 (0x1F) Byte**, Identifier of the Reason String.

2033 Followed by the UTF-8 Encoded String representing the reason associated with this response. This
 2034 Reason String is a human readable string designed for diagnostics and SHOULD NOT be parsed by the
 2035 receiver.

2036

2037 The sender uses this value to give additional information to the receiver. The sender MUST NOT send
 2038 this Property if it would increase the size of the PUBCOMP packet beyond the Maximum Packet Size
 2039 specified by the receiver [MQTT-3.7.2-2]. It is a Protocol Error to include the Reason String more than
 2040 once.

2041

2042 **3.7.2.2.3 User Property**

2043 **38 (0x26) Byte**, Identifier of the User Property.

2044 Followed by UTF-8 String Pair. This property can be used to provide additional diagnostic or other
 2045 information. The sender MUST NOT send this property if it would increase the size of the PUBCOMP
 2046 packet beyond the Maximum Packet Size specified by the receiver [MQTT-3.7.2-3]. The User Property is
 2047 allowed to appear multiple times to represent multiple name, value pairs. The same name is allowed to
 2048 appear more than once.

2049

2050 3.7.3 PUBCOMP Payload

2051 The PUBCOMP packet has no Payload.

2052

2053 3.7.4 PUBCOMP Actions

2054 This is described in [section 4.3.3](#).

2055

2056 3.8 SUBSCRIBE - Subscribe request

2057 The SUBSCRIBE packet is sent from the Client to the Server to create one or more Subscriptions. Each
2058 Subscription registers a Client’s interest in one or more Topics. The Server sends PUBLISH packets to
2059 the Client to forward Application Messages that were published to Topics that match these Subscriptions.
2060 The SUBSCRIBE packet also specifies (for each Subscription) the maximum QoS with which the Server
2061 can send Application Messages to the Client.

2062

2063 3.8.1 SUBSCRIBE Fixed Header

2064 *Figure 3-18 SUBSCRIBE packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (8)				Reserved			
	1	0	0	0	0	0	1	0
byte 2	Remaining Length							

2065

2066 Bits 3,2,1 and 0 of the Fixed Header of the SUBSCRIBE packet are reserved and MUST be set to 0,0,1
2067 and 0 respectively. The Server MUST treat any other value as malformed and close the Network
2068 Connection [\[MQTT-3.8.1-1\]](#).

2069

2070 Remaining Length field

2071 This is the length of Variable Header plus the length of the Payload, encoded as a Variable Byte Integer.

2072

2073 3.8.2 SUBSCRIBE Variable Header

2074 The Variable Header of the SUBSCRIBE Packet contains the following fields in the order: Packet
2075 Identifier, and Properties. [Section 2.2.1](#) provides more information about Packet Identifiers. The rules for
2076 encoding Properties are described in [section 2.2.2](#).

2077

2078 Non-normative example

2079 Figure 3-19 shows an example of a SUBSCRIBE variable header with a Packet Identifier of 10
2080 and no properties.

2081

2082 Figure 3-19 – SUBSCRIBE Variable Header example

	Description	7	6	5	4	3	2	1	0
Packet Identifier									
byte 1	Packet Identifier MSB (0)	0	0	0	0	0	0	0	0
byte 2	Packet Identifier LSB (10)	0	0	0	0	1	0	1	0
byte 3	Property Length (0)	0	0	0	0	0	0	0	0

2083

2084 **3.8.2.1 SUBSCRIBE Properties**

2085 **3.8.2.1.1 Property Length**

2086 The length of Properties in the SUBSCRIBE packet Variable Header encoded as a Variable Byte Integer.

2087

2088 **3.8.2.1.2 Subscription Identifier**

2089 **11 (0x0B) Byte**, Identifier of the Subscription Identifier.

2090 Followed by a Variable Byte Integer representing the identifier of the subscription. The Subscription
2091 Identifier can have the value of 1 to 268,435,455. It is a Protocol Error if the Subscription Identifier has a
2092 value of 0. It is a Protocol Error to include the Subscription Identifier more than once.

2093

2094 The Subscription Identifier is associated with any subscription created or modified as the result of this
2095 SUBSCRIBE packet. If there is a Subscription Identifier, it is stored with the subscription. If this property is
2096 not specified, then the absence of a Subscription Identifier is stored with the subscription.

2097

2098 Refer to [section 3.8.3.1](#) for more information about the handling of Subscription Identifiers.

2099

2100 **3.8.2.1.3 User Property**

2101 **38 (0x26) Byte**, Identifier of the User Property.

2102 Followed by a UTF-8 String Pair.

2103

2104 The User Property is allowed to appear multiple times to represent multiple name, value pairs. The same
2105 name is allowed to appear more than once.

2106

2107 **Non-normative comment**

2108 User Properties on the SUBSCRIBE packet can be used to send subscription related properties
2109 from the Client to the Server. The meaning of these properties is not defined by this specification.

2110

2111 **3.8.3 SUBSCRIBE Payload**

2112 The Payload of a SUBSCRIBE packet contains a list of Topic Filters indicating the Topics to which the
2113 Client wants to subscribe. **The Topic Filters MUST be a UTF-8 Encoded String [MQTT-3.8.3-1]**. Each
2114 Topic Filter is followed by a Subscription Options byte.

2115

2116 The Payload MUST contain at least one Topic Filter and Subscription Options pair [MQTT-3.8.3-2]. A
2117 SUBSCRIBE packet with no Payload is a Protocol Error. Refer to section 4.13 for information about
2118 handling errors.

2119

2120 3.8.3.1 Subscription Options

2121 Bits 0 and 1 of the Subscription Options represent Maximum QoS field. This gives the maximum QoS
2122 level at which the Server can send Application Messages to the Client. It is a Protocol Error if the
2123 Maximum QoS field has the value 3.

2124

2125 Bit 2 of the Subscription Options represents the No Local option. If the value is 1, Application Messages
2126 MUST NOT be forwarded to a connection with a ClientID equal to the ClientID of the publishing
2127 connection [MQTT-3.8.3-3]. It is a Protocol Error to set the No Local bit to 1 on a Shared Subscription
2128 [MQTT-3.8.3-4].

2129

2130 Bit 3 of the Subscription Options represents the Retain As Published option. If 1, Application Messages
2131 forwarded using this subscription keep the RETAIN flag they were published with. If 0, Application
2132 Messages forwarded using this subscription have the RETAIN flag set to 0. Retained messages sent
2133 when the subscription is established have the RETAIN flag set to 1.

2134

2135 Bits 4 and 5 of the Subscription Options represent the Retain Handling option. This option specifies
2136 whether retained messages are sent when the subscription is established. This does not affect the
2137 sending of retained messages at any point after the subscribe. If there are no retained messages
2138 matching the Topic Filter, all of these values act the same. The values are:

2139 0 = Send retained messages at the time of the subscribe

2140 1 = Send retained messages at subscribe only if the subscription does not currently exist

2141 2 = Do not send retained messages at the time of the subscribe

2142 It is a Protocol Error to send a Retain Handling value of 3.

2143

2144 Bits 6 and 7 of the Subscription Options byte are reserved for future use. The Server MUST treat a
2145 SUBSCRIBE packet as malformed if any of Reserved bits in the Payload are non-zero [MQTT-3.8.3-5].

2146

2147 **Non-normative comment**

2148 The No Local and Retain As Published subscription options can be used to implement bridging
2149 where the Client is sending the message on to another Server.

2150

2151 **Non-normative comment**

2152 Not sending retained messages for an existing subscription is useful when a reconnect is done
2153 and the Client is not certain whether the subscriptions were completed in the previous connection
2154 to the Session.

2155

2156 **Non-normative comment**

2157 Not sending stored retained messages because of a new subscription is useful where a Client
2158 wishes to receive change notifications and does not need to know the initial state.

2159

2160 **Non-normative comment**

2161 For a Server that indicates it does not support retained messages, all valid values of Retain As
 2162 Published and Retain Handling give the same result which is to not send any retained messages
 2163 at subscribe and to set the RETAIN flag to 0 for all messages.

2164

2165 Figure 3-20– SUBSCRIBE packet Payload format

Description	7	6	5	4	3	2	1	0
Topic Filter								
byte 1	Length MSB							
byte 2	Length LSB							
bytes 3..N	Topic Filter							
Subscription Options								
	Reserved		Retain Handling		RAP	NL	QoS	
byte N+1	0	0	X	X	X	X	X	X

2166 RAP means Retain as Published.

2167 NL means No Local.

2168

Non-normative example

2170 Figure 3.21 show the SUBSCRIBE Payload example with two Topic Filters. The first is “a/b” with
 2171 QoS 1, and the second is “c/d” with QoS 2.

2172

2173 Figure 3-21 - Payload byte format non-normative example

	Description	7	6	5	4	3	2	1	0

byte 9	'c' (0x63)	0	1	1	0	0	0	1	1
byte 10	'/' (0x2F)	0	0	1	0	1	1	1	1
byte 11	'd' (0x64)	0	1	1	0	0	1	0	0

Subscription Options									
byte 12	Subscription Options (2)	0	0	0	0	0	0	1	0

2174

2175 3.8.4 SUBSCRIBE Actions

2176 When the Server receives a SUBSCRIBE packet from a Client, the Server MUST respond with a
 2177 SUBACK packet [MQTT-3.8.4-1]. The SUBACK packet MUST have the same Packet Identifier as the
 2178 SUBSCRIBE packet that it is acknowledging [MQTT-3.8.4-2].

2179

2180 The Server is permitted to start sending PUBLISH packets matching the Subscription before the Server
 2181 sends the SUBACK packet.

2182

2183 If a Server receives a SUBSCRIBE packet containing a Topic Filter that is identical to a Non-shared
 2184 Subscription's Topic Filter for the current Session, then it MUST replace that existing Subscription with a
 2185 new Subscription [MQTT-3.8.4-3]. The Topic Filter in the new Subscription will be identical to that in the
 2186 previous Subscription, although its Subscription Options could be different. If the Retain Handling option
 2187 is 0, any existing retained messages matching the Topic Filter MUST be re-sent, but Application
 2188 Messages MUST NOT be lost due to replacing the Subscription [MQTT-3.8.4-4].

2189

2190 If a Server receives a Non-shared Topic Filter that is not identical to any Topic Filter for the current
 2191 Session, a new Non-shared Subscription is created. If the Retain Handling option is not 2, all matching
 2192 retained messages are sent to the Client.

2193

2194 If a Server receives a Topic Filter that is identical to the Topic Filter for a Shared Subscription that already
 2195 exists on the Server, the Session is added as a subscriber to that Shared Subscription. No retained
 2196 messages are sent.

2197

2198 If a Server receives a Shared Subscription Topic Filter that is not identical to any existing Shared
 2199 Subscription's Topic Filter, a new Shared Subscription is created. The Session is added as a subscriber
 2200 to that Shared Subscription. No retained messages are sent.

2201

2202 Refer to [section 4.8](#) for more details on Shared Subscriptions.

2203

2204 If a Server receives a SUBSCRIBE packet that contains multiple Topic Filters it MUST handle that packet
 2205 as if it had received a sequence of multiple SUBSCRIBE packets, except that it combines their responses
 2206 into a single SUBACK response [MQTT-3.8.4-5].

2207

2208 The SUBACK packet sent by the Server to the Client MUST contain a Reason Code for each Topic
 2209 Filter/Subscription Option pair [MQTT-3.8.4-6]. This Reason Code MUST either show the maximum QoS
 2210 that was granted for that Subscription or indicate that the subscription failed [MQTT-3.8.4-7]. The Server
 2211 might grant a lower Maximum QoS than the subscriber requested. The QoS of Application Messages sent
 2212 in response to a Subscription MUST be the minimum of the QoS of the originally published message and
 2213 the Maximum QoS granted by the Server [MQTT-3.8.4-8]. The server is permitted to send duplicate
 2214 copies of a message to a subscriber in the case where the original message was published with QoS 1
 2215 and the maximum QoS granted was QoS 0.

2216

2217 Non-normative comment

2218 If a subscribing Client has been granted maximum QoS 1 for a particular Topic Filter, then a

2219 QoS 0 Application Message matching the filter is delivered to the Client at QoS 0. This means
2220 that at most one copy of the message is received by the Client. On the other hand, a QoS 2
2221 Message published to the same topic is downgraded by the Server to QoS 1 for delivery to the
2222 Client, so that Client might receive duplicate copies of the Message.
2223

2224 **Non-normative comment**

2225 If the subscribing Client has been granted maximum QoS 0, then an Application Message
2226 originally published as QoS 2 might get lost on the hop to the Client, but the Server should never
2227 send a duplicate of that Message. A QoS 1 Message published to the same topic might either get
2228 lost or duplicated on its transmission to that Client.

2229

2230 **Non-normative comment**

2231 Subscribing to a Topic Filter at QoS 2 is equivalent to saying "I would like to receive Messages
2232 matching this filter at the QoS with which they were published". This means a publisher is
2233 responsible for determining the maximum QoS a Message can be delivered at, but a subscriber is
2234 able to require that the Server downgrades the QoS to one more suitable for its usage.

2235

2236 The Subscription Identifiers are part of the Session State in the Server and are returned to the Client
2237 receiving a matching PUBLISH packet. They are removed from the Server's Session State when the
2238 Server receives an UNSUBSCRIBE packet, when the Server receives a SUBSCRIBE packet from the
2239 Client for the same Topic Filter but with a different Subscription Identifier or with no Subscription Identifier,
2240 or when the Server sends Session Present 0 in a CONNACK packet.

2241

2242 The Subscription Identifiers do not form part of the Client's Session State in the Client. In a useful
2243 implementation, a Client will associate the Subscription Identifiers with other Client side state, this state is
2244 typically removed when the Client unsubscribes, when the Client subscribes for the same Topic Filter with
2245 a different identifier or no identifier, or when the Client receives Session Present 0 in a CONNACK
2246 packet.

2247

2248 The Server need not use the same set of Subscription Identifiers in the retransmitted PUBLISH packet.
2249 The Client can remake a Subscription by sending a SUBSCRIBE packet containing a Topic Filter that is
2250 identical to the Topic Filter of an existing Subscription in the current Session. If the Client remade a
2251 subscription after the initial transmission of a PUBLISH packet and used a different Subscription Identifier,
2252 then the Server is allowed to use the identifiers from the first transmission in any
2253 retransmission. Alternatively, the Server is allowed to use the new identifiers during a retransmission. The
2254 Server is not allowed to revert to the old identifier after it has sent a PUBLISH packet containing the new
2255 one.

2256

2257 **Non-normative comment**

2258 Usage scenarios, for illustration of Subscription Identifiers.

2259 • The Client implementation indicates via its programming interface that a publication matched
2260 more than one subscription. The Client implementation generates a new identifier each time
2261 a subscription is made. If the returned publication carries more than one Subscription
2262 Identifier, then the publication matched more than one subscription.
2263

2264 • The Client implementation allows the subscriber to direct messages to a callback associated
2265 with the subscription. The Client implementation generates an identifier which uniquely maps
2266 the identifier to the callback. When a publication is received it uses the Subscription Identifier
2267 to determine which callback is driven.
2268

2269 • The Client implementation returns the topic string used to make the subscription to the
2270 application when it delivers the published message. To achieve this the Client generates an
2271 identifier which uniquely identifies the Topic Filter. When a publication is received the

2272 Client implementation uses the identifiers to look up the original Topic Filters and return them
 2273 to the Client application.
 2274
 2275 • A gateway forwards publications received from a Server to Clients that have made
 2276 subscriptions to the gateway. The gateway implementation maintains a map of each unique
 2277 Topic Filter it receives to the set of ClientID, Subscription Identifier pairs that it also
 2278 received. It generates a unique identifier for each Topic Filter that it forwards to the Server.
 2279 When a publication is received, the gateway uses the Subscription Identifiers it received from
 2280 the Server to look up the Client Identifier, Subscription Identifier pairs associated with them. It
 2281 adds these to the PUBLISH packets it sends to the Clients. If the upstream Server sent
 2282 multiple PUBLISH packets because the message matched multiple subscriptions, then this
 2283 behavior is mirrored to the Clients.
 2284

2285 **3.9 SUBACK – Subscribe acknowledgement**

2286 A SUBACK packet is sent by the Server to the Client to confirm receipt and processing of a SUBSCRIBE
 2287 packet.
 2288

2289 A SUBACK packet contains a list of Reason Codes, that specify the maximum QoS level that was
 2290 granted or the error which was found for each Subscription that was requested by the SUBSCRIBE.
 2291

2292 **3.9.1 SUBACK Fixed Header**

2293 *Figure 3-22 - SUBACK Packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (9)				Reserved			
	1	0	0	1	0	0	0	0
byte 2	Remaining Length							

2294
 2295 **Remaining Length field**
 2296 This is the length of Variable Header plus the length of the Payload, encoded as a Variable Byte Integer.
 2297

2298 **3.9.2 SUBACK Variable Header**

2299 The Variable Header of the SUBACK Packet contains the following fields in the order: the Packet
 2300 Identifier from the SUBSCRIBE Packet that is being acknowledged, and Properties.
 2301

2302 **3.9.2.1 SUBACK Properties**

2303 **3.9.2.1.1 Property Length**

2304 The length of Properties in the SUBACK packet Variable Header encoded as a Variable Byte Integer
 2305

2306 **3.9.2.1.2 Reason String**
 2307 **31 (0x1F) Byte**, Identifier of the Reason String.
 2308 Followed by the UTF-8 Encoded String representing the reason associated with this response. This
 2309 Reason String is a human readable string designed for diagnostics and SHOULD NOT be parsed by the
 2310 Client.

2311
 2312 The Server uses this value to give additional information to the Client. **The Server MUST NOT send this**
 2313 **Property if it would increase the size of the SUBACK packet beyond the Maximum Packet Size specified**
 2314 **by the Client [MQTT-3.9.2-1].** It is a Protocol Error to include the Reason String more than once.

2316 **3.9.2.1.3 User Property**

2317 **38 (0x26) Byte**, Identifier of the User Property.
 2318 Followed by UTF-8 String Pair. This property can be used to provide additional diagnostic or other
 2319 information. **The Server MUST NOT send this property if it would increase the size of the SUBACK packet**
 2320 **beyond the Maximum Packet Size specified by Client [MQTT-3.9.2-2].** The User Property is allowed to
 2321 appear multiple times to represent multiple name, value pairs. The same name is allowed to appear more
 2322 than once.

2324 Figure 3-23 SUBACK packet Variable Header

Bit	7	6	5	4	3	2	1	0
byte 1	Packet Identifier MSB							
byte 2	Packet Identifier LSB							

2325

2326 **3.9.3 SUBACK Payload**

2327 The Payload contains a list of Reason Codes. Each Reason Code corresponds to a Topic Filter in the
 2328 SUBSCRIBE packet being acknowledged. **The order of Reason Codes in the SUBACK packet MUST**
 2329 **match the order of Topic Filters in the SUBSCRIBE packet [MQTT-3.9.3-1].**

2330

2331 Table 3-8 - Subscribe Reason Codes

Value	Hex	Reason Code name	Description
0	0x00	Granted QoS 0	The subscription is accepted and the maximum QoS sent will be QoS 0. This might be a lower QoS than was requested.
1	0x01	Granted QoS 1	The subscription is accepted and the maximum QoS sent will be QoS 1. This might be a lower QoS than was requested.
2	0x02	Granted QoS 2	The subscription is accepted and any received QoS will be sent to this subscription.
128	0x80	Unspecified error	The subscription is not accepted and the Server either does not wish to reveal the reason or none of the other Reason Codes apply.
131	0x83	Implementation specific error	The SUBSCRIBE is valid but the Server does not accept it.

135	0x87	Not authorized	The Client is not authorized to make this subscription.
143	0x8F	Topic Filter invalid	The Topic Filter is correctly formed but is not allowed for this Client.
145	0x91	Packet Identifier in use	The specified Packet Identifier is already in use.
151	0x97	Quota exceeded	An implementation or administrative imposed limit has been exceeded.
158	0x9E	Shared Subscriptions not supported	The Server does not support Shared Subscriptions for this Client.
161	0xA1	Subscription Identifiers not supported	The Server does not support Subscription Identifiers; the subscription is not accepted.
162	0xA2	Wildcard Subscriptions not supported	The Server does not support Wildcard Subscriptions; the subscription is not accepted.

2332

2333 The Server sending a SUBACK packet MUST use one of the Subscribe Reason Codes for each Topic
 2334 Filter received [MQTT-3.9.3-2].

2335

2336 **Non-normative comment**

2337 There is always one Reason Code for each Topic Filter in the corresponding SUBSCRIBE
 2338 packet. If the Reason Code is not specific to a Topic Filters (such as 0x91 (Packet Identifier in
 2339 use)) it is set for each Topic Filter.

2340

2341 **3.10 UNSUBSCRIBE – Unsubscribe request**

2342 An UNSUBSCRIBE packet is sent by the Client to the Server, to unsubscribe from topics.

2343

2344 **3.10.1 UNSUBSCRIBE Fixed Header**

2345 *Figure 3.28 – UNSUBSCRIBE packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (10)				Reserved			
	1	0	1	0	0	0	1	0
byte 2	Remaining Length							

2346

2347 Bits 3,2,1 and 0 of the Fixed Header of the UNSUBSCRIBE packet are reserved and MUST be set to
 2348 0,0,1 and 0 respectively. The Server MUST treat any other value as malformed and close the Network
 2349 Connection [MQTT-3.10.1-1].

2350

2351 **Remaining Length field**

2352 This is the length of Variable Header (2 bytes) plus the length of the Payload, encoded as a Variable Byte
 2353 Integer.

2354

2355 **3.10.2 UNSUBSCRIBE Variable Header**

2356 The Variable Header of the UNSUBSCRIBE Packet contains the following fields in the order: Packet
 2357 Identifier, and Properties. [Section 2.2.1](#) provides more information about Packet Identifiers. The rules for
 2358 encoding Properties are described in [section 2.2.2](#).

2359

2360 **3.10.2.1 UNSUBSCRIBE Properties**

2361 **3.10.2.1.1 Property Length**

2362 The length of Properties in the SUBSCRIBE packet Variable Header encoded as a Variable Byte Integer.

2363

2364 **3.10.2.1.2 User Property**

2365 **38 (0x26) Byte**, Identifier of the User Property.

2366 Followed by a UTF-8 String Pair.

2367

2368 The User Property is allowed to appear multiple times to represent multiple name, value pairs. The same
 2369 name is allowed to appear more than once.

2370

2371 **Non-normative comment**

2372 User Properties on the UNSUBSCRIBE packet can be used to send subscription related
 2373 properties from the Client to the Server. The meaning of these properties is not defined by this
 2374 specification.

2375

2376 **3.10.3 UNSUBSCRIBE Payload**

2377 The Payload for the UNSUBSCRIBE packet contains the list of Topic Filters that the Client wishes to
 2378 unsubscribe from. **The Topic Filters in an UNSUBSCRIBE packet MUST be UTF-8 Encoded Strings**
 2379 **[MQTT-3.10.3-1]** as defined in [section 1.5.4](#), packed contiguously.

2380

2381 **The Payload of an UNSUBSCRIBE packet MUST contain at least one Topic Filter [MQTT-3.10.3-2].** An
 2382 UNSUBSCRIBE packet with no Payload is a Protocol Error. Refer to [section 4.13](#) for information about
 2383 handling errors.

2384

2385 **Non-normative example**

2386 Figure 3.30 shows the Payload for an UNSUBSCRIBE packet with two Topic Filters “a/b” and “c/d”.

2387

2388 Figure 3.30 - Payload byte format non-normative example

	Description	7	6	5	4	3	2	1	0
Topic Filter									
byte 1	Length MSB (0)	0	0	0	0	0	0	0	0
byte 2	Length LSB (3)	0	0	0	0	0	0	1	1
byte 3	'a' (0x61)	0	1	1	0	0	0	0	1

byte 4	'/' (0x2F)	0	0	1	0	1	1	1	1
byte 5	'b' (0x62)	0	1	1	0	0	0	1	0
Topic Filter									
byte 6	Length MSB (0)	0	0	0	0	0	0	0	0
byte 7	Length LSB (3)	0	0	0	0	0	0	1	1
byte 8	'c' (0x63)	0	1	1	0	0	0	1	1
byte 9	'/' (0x2F)	0	0	1	0	1	1	1	1
byte 10	'd' (0x64)	0	1	1	0	0	1	0	0

2389

2390 3.10.4 UNSUBSCRIBE Actions

2391 The Topic Filters (whether they contain wildcards or not) supplied in an UNSUBSCRIBE packet MUST be
 2392 compared character-by-character with the current set of Topic Filters held by the Server for the Client. If
 2393 any filter matches exactly then its owning Subscription MUST be deleted [MQTT-3.10.4-1], otherwise no
 2394 additional processing occurs.
 2395

2396 When a Server receives UNSUBSCRIBE :

- 2397 • It MUST stop adding any new messages which match the Topic Filters, for delivery to the Client
 2398 [MQTT-3.10.4-2].
- 2399 • It MUST complete the delivery of any QoS 1 or QoS 2 messages which match the Topic Filters
 2400 and it has started to send to the Client [MQTT-3.10.4-3].
- 2401 • It MAY continue to deliver any existing messages buffered for delivery to the Client.

2402
 2403 The Server MUST respond to an UNSUBSCRIBE request by sending an UNSUBACK packet [MQTT-
 2404 3.10.4-4]. The UNSUBACK packet MUST have the same Packet Identifier as the UNSUBSCRIBE packet.
 2405 Even where no Topic Subscriptions are deleted, the Server MUST respond with an UNSUBACK [MQTT-
 2406 3.10.4-5].

2407
 2408 If a Server receives an UNSUBSCRIBE packet that contains multiple Topic Filters, it MUST process that
 2409 packet as if it had received a sequence of multiple UNSUBSCRIBE packets, except that it sends just one
 2410 UNSUBACK response [MQTT-3.10.4-6].

2411
 2412 If a Topic Filter represents a Shared Subscription, this Session is detached from the Shared Subscription.
 2413 If this Session was the only Session that the Shared Subscription was associated with, the Shared
 2414 Subscription is deleted. Refer to section 4.8.2 for a description of Shared Subscription handling.

2415

2416 3.11 UNSUBACK – Unsubscribe acknowledgement

2417 The UNSUBACK packet is sent by the Server to the Client to confirm receipt of an UNSUBSCRIBE
 2418 packet.

2419

2420 3.11.1 UNSUBACK Fixed Header

2421 *Figure 3.31 – UNSUBACK packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (11)				Reserved			
	1	0	1	1	0	0	0	0
byte 2	Remaining Length							

2422

2423 **Remaining Length field**

2424 This is the length of the Variable Header plus the length of the Payload, encoded as a Variable Byte
2425 Integer.

2426

2427 **3.11.2 UNSUBACK Variable Header**

2428 The Variable Header of the UNSUBACK Packet the following fields in the order: the Packet Identifier from
2429 the UNSUBSCRIBE Packet that is being acknowledged, and Properties. The rules for encoding
2430 Properties are described in [section 2.2.2](#).

2431

2432 Figure 3.32 – UNSUBACK packet Variable Header

Bit	7	6	5	4	3	2	1	0
byte 1	Packet Identifier MSB							
byte 2	Packet Identifier LSB							

2433

2434 **3.11.2.1 UNSUBACK Properties**

2435 **3.11.2.1.1 Property Length**

2436 The length of the Properties in the UNSUBACK packet Variable Header encoded as a Variable Byte
2437 Integer.

2438

2439 **3.11.2.1.2 Reason String**

2440 **31 (0x1F) Byte**, Identifier of the Reason String.

2441 Followed by the UTF-8 Encoded String representing the reason associated with this response. This
2442 Reason String is a human readable string designed for diagnostics and SHOULD NOT be parsed by the
2443 Client.

2444

2445 The Server uses this value to give additional information to the Client. **The Server MUST NOT send this**
2446 **Property if it would increase the size of the UNSUBACK packet beyond the Maximum Packet Size**
2447 **specified by the Client [MQTT-3.11.2-1].** It is a Protocol Error to include the Reason String more than
2448 once.

2449

2450 **3.11.2.1.3 User Property**

2451 **38 (0x26) Byte**, Identifier of the User Property.

2452 Followed by UTF-8 String Pair. This property can be used to provide additional diagnostic or other
 2453 information. The Server MUST NOT send this property if it would increase the size of the UNSUBACK
 2454 packet beyond the Maximum Packet Size specified by the Client [MQTT-3.11.2-2]. The User Property is
 2455 allowed to appear multiple times to represent multiple name, value pairs. The same name is allowed to
 2456 appear more than once.

2457

2458 3.11.3 UNSUBACK Payload

2459 The Payload contains a list of Reason Codes. Each Reason Code corresponds to a Topic Filter in the
 2460 UNSUBSCRIBE packet being acknowledged. The order of Reason Codes in the UNSUBACK packet
 2461 MUST match the order of Topic Filters in the UNSUBSCRIBE packet [MQTT-3.11.3-1].

2462

2463 The values for the one byte unsigned Unsubscribe Reason Codes are shown below. The Server sending
 2464 an UNSUBACK packet MUST use one of the Unsubscribe Reason Code values for each Topic Filter
 2465 received [MQTT-3.11.3-2].

2466

2467 Table 3-9 - Unsubscribe Reason Codes

Value	Hex	Reason Code name	Description
0	0x00	Success	The subscription is deleted.
17	0x11	No subscription existed	No matching Topic Filter is being used by the Client.
128	0x80	Unspecified error	The unsubscribe could not be completed and the Server either does not wish to reveal the reason or none of the other Reason Codes apply.
131	0x83	Implementation specific error	The UNSUBSCRIBE is valid but the Server does not accept it.
135	0x87	Not authorized	The Client is not authorized to unsubscribe.
143	0x8F	Topic Filter invalid	The Topic Filter is correctly formed but is not allowed for this Client.
145	0x91	Packet Identifier in use	The specified Packet Identifier is already in use.

2468

2469 Non-normative comment

2470 There is always one Reason Code for each Topic Filter in the corresponding UNSUBSCRIBE
 2471 packet. If the Reason Code is not specific to a Topic Filters (such as 0x91 (Packet Identifier in
 2472 use)) it is set for each Topic Filter.

2473

2474 3.12 PINGREQ – PING request

2475 The PINGREQ packet is sent from a Client to the Server. It can be used to:

- 2476 • Indicate to the Server that the Client is alive in the absence of any other MQTT Control Packets being
 2477 sent from the Client to the Server.
- 2478 • Request that the Server responds to confirm that it is alive.
- 2479 • Exercise the network to indicate that the Network Connection is active.

2480

2481 This packet is used in Keep Alive processing. Refer to [section 3.1.2.10](#) for more details.

2482

2483 3.12.1 PINGREQ Fixed Header

2484 *Figure 3.33 – PINGREQ packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (12)				Reserved			
	1	1	0	0	0	0	0	0
byte 2	Remaining Length (0)							
	0	0	0	0	0	0	0	0

2485

2486 3.12.2 PINGREQ Variable Header

2487 The PINGREQ packet has no Variable Header.

2488

2489 3.12.3 PINGREQ Payload

2490 The PINGREQ packet has no Payload.

2491

2492 3.12.4 PINGREQ Actions

2493 The Server MUST send a PINGRESP packet in response to a PINGREQ packet [MQTT-3.12.4-1].

2494

2495 3.13 PINGRESP – PING response

2496 A PINGRESP Packet is sent by the Server to the Client in response to a PINGREQ packet. It indicates
2497 that the Server is alive.

2498

2499 This packet is used in Keep Alive processing. Refer to [section 3.1.2.10](#) for more details.

2500

2501 3.13.1 PINGRESP Fixed Header

2502 *Figure 3.34 – PINGRESP packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (13)				Reserved			
	1	1	0	1	0	0	0	0
byte 2	Remaining Length (0)							
	0	0	0	0	0	0	0	0

2503

2504 **3.13.2 PINGRESP Variable Header**

2505 The PINGRESP packet has no Variable Header.

2506

2507 **3.13.3 PINGRESP Payload**

2508 The PINGRESP packet has no Payload.

2509

2510 **3.13.4 PINGRESP Actions**

2511 The Client takes no action on receiving this packet

2512

2513 **3.14 DISCONNECT – Disconnect notification**

2514 The DISCONNECT packet is the final MQTT Control Packet sent from the Client or the Server. It
2515 indicates the reason why the Network Connection is being closed. The Client or Server MAY send a
2516 DISCONNECT packet before closing the Network Connection. If the Network Connection is closed
2517 without the Client first sending a DISCONNECT packet with Reason Code 0x00 (Normal disconnection)
2518 and the Connection has a Will Message, the Will Message is published. Refer to [section 3.1.2.5](#) for
2519 further details.

2520

2521 A Server MUST NOT send a DISCONNECT until after it has sent a CONNACK with Reason Code of less
2522 than 0x80 [[MQTT-3.14.0-1](#)].

2523

2524 **3.14.1 DISCONNECT Fixed Header**

2525 *Figure 3.35 – DISCONNECT packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (14)				Reserved			
	1	1	1	0	0	0	0	0
byte 2	Remaining Length							

2526 The Client or Server MUST validate that reserved bits are set to 0. If they are not zero it sends a
2527 DISCONNECT packet with a Reason code of 0x81 (Malformed Packet) as described in [section 4.13](#)
2528 [[MQTT-3.14.1-1](#)].

2529

2530 **Remaining Length field**

2531 This is the length of the Variable Header encoded as a Variable Byte Integer.

2532

2533 **3.14.2 DISCONNECT Variable Header**

2534 The Variable Header of the DISCONNECT Packet contains the following fields in the order: Disconnect
2535 Reason Code, and Properties. The rules for encoding Properties are described in [section 2.2.2](#).

2536

2537 **3.14.2.1 Disconnect Reason Code**

2538 Byte 1 in the Variable Header is the Disconnect Reason Code. If the Remaining Length is less than 1 the
 2539 value of 0x00 (Normal disconnection) is used.

2540

2541 The values for the one byte unsigned Disconnect Reason Code field are shown below.

2542

2543 Table 3-10 – Disconnect Reason Code values

Value	Hex	Reason Code name	Sent by	Description
0	0x00	Normal disconnection	Client or Server	Close the connection normally. Do not send the Will Message.
4	0x04	Disconnect with Will Message	Client	The Client wishes to disconnect but requires that the Server also publishes its Will Message.
128	0x80	Unspecified error	Client or Server	The Connection is closed but the sender either does not wish to reveal the reason, or none of the other Reason Codes apply.
129	0x81	Malformed Packet	Client or Server	The received packet does not conform to this specification.
130	0x82	Protocol Error	Client or Server	An unexpected or out of order packet was received.
131	0x83	Implementation specific error	Client or Server	The packet received is valid but cannot be processed by this implementation.
135	0x87	Not authorized	Server	The request is not authorized.
137	0x89	Server busy	Server	The Server is busy and cannot continue processing requests from this Client.
139	0x8B	Server shutting down	Server	The Server is shutting down.
141	0x8D	Keep Alive timeout	Server	The Connection is closed because no packet has been received for 1.5 times the Keepalive time.
142	0x8E	Session taken over	Server	Another Connection using the same ClientID has connected causing this Connection to be closed.
143	0x8F	Topic Filter invalid	Server	The Topic Filter is correctly formed, but is not accepted by this Sever.
144	0x90	Topic Name invalid	Client or Server	The Topic Name is correctly formed, but is not accepted by this Client or Server.
147	0x93	Receive Maximum exceeded	Client or Server	The Client or Server has received more than Receive Maximum publication for which it has not sent PUBACK or PUBCOMP.
148	0x94	Topic Alias invalid	Client or Server	The Client or Server has received a PUBLISH packet containing a Topic Alias which is greater than the Maximum Topic Alias it sent in the CONNECT or CONNACK packet.

149	0x95	Packet too large	Client or Server	The packet size is greater than Maximum Packet Size for this Client or Server.
150	0x96	Message rate too high	Client or Server	The received data rate is too high.
151	0x97	Quota exceeded	Client or Server	An implementation or administrative imposed limit has been exceeded.
152	0x98	Administrative action	Client or Server	The Connection is closed due to an administrative action.
153	0x99	Payload format invalid	Client or Server	The payload format does not match the one specified by the Payload Format Indicator.
154	0x9A	Retain not supported	Server	The Server has does not support retained messages.
155	0x9B	QoS not supported	Server	The Client specified a QoS greater than the QoS specified in a Maximum QoS in the CONNACK.
156	0x9C	Use another server	Server	The Client should temporarily change its Server.
157	0x9D	Server moved	Server	The Server is moved and the Client should permanently change its server location.
158	0x9E	Shared Subscriptions not supported	Server	The Server does not support Shared Subscriptions.
159	0x9F	Connection rate exceeded	Server	This connection is closed because the connection rate is too high.
160	0xA0	Maximum connect time	Server	The maximum connection time authorized for this connection has been exceeded.
161	0xA1	Subscription Identifiers not supported	Server	The Server does not support Subscription Identifiers; the subscription is not accepted.
162	0xA2	Wildcard Subscriptions not supported	Server	The Server does not support Wildcard Subscriptions; the subscription is not accepted.

2544

2545 The Client or Server sending the DISCONNECT packet MUST use one of the DISCONNECT Reason
2546 Code values [MQTT-3.14.2-1]. The Reason Code and Property Length can be omitted if the Reason
2547 Code is 0x00 (Normal disconnect) and there are no Properties. In this case the DISCONNECT has a
2548 Remaining Length of 0.

2549

2550 **Non-normative comment**

2551 The DISCONNECT packet is used to indicate the reason for a disconnect for cases where there
2552 is no acknowledge packet (such as a QoS 0 publish) or when the Client or Server is unable to
2553 continue processing the Connection.

2554

2555 **Non-normative comment**

2556 The information can be used by the Client to decide whether to retry the connection, and how
2557 long it should wait before retrying the connection.

2558

2559 **3.14.2.2 DISCONNECT Properties**

2560 **3.14.2.2.1 Property Length**

2561 The length of Properties in the DISCONNECT packet Variable Header encoded as a Variable Byte
2562 Integer. If the Remaining Length is less than 2, a value of 0 is used.

2563

2564 **3.14.2.2.2 Session Expiry Interval**

2565 **17 (0x11) Byte**, Identifier of the Session Expiry Interval.

2566 Followed by the Four Byte Integer representing the Session Expiry Interval in seconds. It is a Protocol
2567 Error to include the Session Expiry Interval more than once.

2568

2569 If the Session Expiry Interval is absent, the Session Expiry Interval in the CONNECT packet is used.

2570

2571 **The Session Expiry Interval MUST NOT be sent on a DISCONNECT by the Server [MQTT-3.14.2-2].**

2572

2573 If the Session Expiry Interval in the CONNECT packet was zero, then it is a Protocol Error to set a non-
2574 zero Session Expiry Interval in the DISCONNECT packet sent by the Client. If such a non-zero Session
2575 Expiry Interval is received by the Server, it does not treat it as a valid DISCONNECT packet. The Server
2576 uses DISCONNECT with Reason Code 0x82 (Protocol Error) as described in [section 4.13](#).

2577

2578 **3.14.2.2.3 Reason String**

2579 **31 (0x1F) Byte**, Identifier of the Reason String.

2580 Followed by the UTF-8 Encoded String representing the reason for the disconnect. This Reason String is
2581 human readable, designed for diagnostics and SHOULD NOT be parsed by the receiver.

2582

2583 **The sender MUST NOT send this Property if it would increase the size of the DISCONNECT packet**
2584 **beyond the Maximum Packet Size specified by the receiver [MQTT-3.14.2-3].** It is a Protocol Error to
2585 include the Reason String more than once.

2586

2587 **3.14.2.2.4 User Property**

2588 **38 (0x26) Byte**, Identifier of the User Property.

2589 Followed by UTF-8 String Pair. This property may be used to provide additional diagnostic or other
2590 information. **The sender MUST NOT send this property if it would increase the size of the DISCONNECT**
2591 **packet beyond the Maximum Packet Size specified by the receiver [MQTT-3.14.2-4].** The User Property is
2592 allowed to appear multiple times to represent multiple name, value pairs. The same name is allowed to
2593 appear more than once.

2594

2595 **3.14.2.2.5 Server Reference**

2596 **28 (0x1C) Byte**, Identifier of the Server Reference.

2597 Followed by a UTF-8 Encoded String which can be used by the Client to identify another Server to use. It
2598 is a Protocol Error to include the Server Reference more than once.

2599
 2600 The Server sends DISCONNECT including a Server Reference and Reason Code 0x9C (Use another
 2601 server) or 0x9D (Server moved) as described in [section 4.13](#).

2602
 2603 Refer to [section 4.11](#) Server Redirection for information about how Server Reference is used.
 2604

2605 Figure 3-24 DISCONNECT packet Variable Header non-normative example

	Description	7	6	5	4	3	2	1	0
Disconnect Reason Code									
byte 1		0	0	0	0	0	0	0	0
Properties									
byte 2	Length (5)	0	0	0	0	0	1	1	1
byte 3	Session Expiry Interval identifier (17)	0	0	0	1	0	0	0	1
byte 4	Session Expiry Interval (0)	0	0	0	0	0	0	0	0
byte 5		0	0	0	0	0	0	0	0
byte 6		0	0	0	0	0	0	0	0
byte 7		0	0	0	0	0	0	0	0

2606
 2607 **3.14.3 DISCONNECT Payload**
 2608 The DISCONNECT packet has no Payload.
 2609

2610 **3.14.4 DISCONNECT Actions**

- 2611 After sending a DISCONNECT packet the sender:
- 2612 • MUST NOT send any more MQTT Control Packets on that Network Connection [MQTT-3.14.4-1].
 - 2613 • MUST close the Network Connection [MQTT-3.14.4-2].

- 2614
- 2615 On receipt of DISCONNECT with a Reason Code of 0x00 (Success) the Server:
- 2616 • MUST discard any Will Message associated with the current Connection without publishing it
 - 2617 [MQTT-3.14.4-3], as described in [section 3.1.2.5](#).

- 2618
- 2619 On receipt of DISCONNECT, the receiver:
- 2620 • SHOULD close the Network Connection.

2621

2622 **3.15 AUTH – Authentication exchange**

2623 An AUTH packet is sent from Client to Server or Server to Client as part of an extended authentication
 2624 exchange, such as challenge / response authentication. It is a Protocol Error for the Client or Server to
 2625 send an AUTH packet if the CONNECT packet did not contain the same Authentication Method.

2626

2627 3.15.1 AUTH Fixed Header

2628 *Figure 3.35 – AUTH packet Fixed Header*

Bit	7	6	5	4	3	2	1	0
byte 1	MQTT Control Packet type (15)				Reserved			
	1	1	1	1	0	0	0	0
byte 2	Remaining Length							

2629

2630 Bits 3,2,1 and 0 of the Fixed Header of the AUTH packet are reserved and MUST all be set to 0. The
2631 Client or Server MUST treat any other value as malformed and close the Network Connection [MQTT-
2632 3.15.1-1].

2633

2634 Remaining Length field

2635 This is the length of the Variable Header encoded as a Variable Byte Integer.

2636

2637 3.15.2 AUTH Variable Header

2638 The Variable Header of the AUTH Packet contains the following fields in the order: Authenticate Reason
2639 Code, and Properties. The rules for encoding Properties are described in [section 2.2.2](#).

2640

2641 3.15.2.1 Authenticate Reason Code

2642 Byte 0 in the Variable Header is the Authenticate Reason Code. The values for the one byte unsigned
2643 Authenticate Reason Code field are shown below. The sender of the AUTH Packet MUST use one of the
2644 Authenticate Reason Codes [MQTT-3.15.2-1].

2645

2646 Table 3-11 Authenticate Reason Codes

Value	Hex	Reason Code name	Sent by	Description
0	0x00	Success	Server	Authentication is successful
24	0x18	Continue authentication	Client or Server	Continue the authentication with another step
25	0x19	Re-authenticate	Client	Initiate a re-authentication

2647 The Reason Code and Property Length can be omitted if the Reason Code is 0x00 (Success) and there
2648 are no Properties. In this case the AUTH has a Remaining Length of 0.

2649

2650 3.15.2.2 AUTH Properties

2651 3.15.2.2.1 Property Length

2652 The length of Properties in the AUTH packet Variable Header encoded as a Variable Byte Integer.

2653

2654 **3.15.2.2.2 Authentication Method**

2655 **21 (0x15) Byte**, Identifier of the Authentication Method.

2656 Followed by a UTF-8 Encoded String containing the name of the authentication method. It is a Protocol
2657 Error to omit the Authentication Method or to include it more than once. Refer to [section 4.12](#) for more
2658 information about extended authentication.

2659

2660 **3.15.2.2.3 Authentication Data**

2661 **22 (0x16) Byte**, Identifier of the Authentication Data.

2662 Followed by Binary Data containing authentication data. It is a Protocol Error to include Authentication
2663 Data more than once. The contents of this data are defined by the authentication method. Refer to
2664 [section 4.12](#) for more information about extended authentication.

2665

2666 **3.15.2.2.4 Reason String**

2667 **31 (0x1F) Byte**, Identifier of the Reason String.

2668 Followed by the UTF-8 Encoded String representing the reason for the disconnect. This Reason String is
2669 human readable, designed for diagnostics and SHOULD NOT be parsed by the receiver.

2670

2671 The sender MUST NOT send this property if it would increase the size of the AUTH packet beyond the
2672 Maximum Packet Size specified by the receiver [MQTT-3.15.2-2]. It is a Protocol Error to include the
2673 Reason String more than once.

2674

2675 **3.15.2.2.5 User Property**

2676 **38 (0x26) Byte**, Identifier of the User Property.

2677 Followed by UTF-8 String Pair. This property may be used to provide additional diagnostic or other
2678 information. The sender MUST NOT send this property if it would increase the size of the AUTH packet
2679 beyond the Maximum Packet Size specified by the receiver [MQTT-3.15.2-3]. The User Property is
2680 allowed to appear multiple times to represent multiple name, value pairs. The same name is allowed to
2681 appear more than once.

2682

2683 **3.15.3 AUTH Payload**

2684 The AUTH packet has no Payload.

2685

2686 **3.15.4 AUTH Actions**

2687 Refer to [section 4.12](#) for more information about extended authentication.

2688 4 Operational behavior

2689 4.1 Session State

2690 In order to implement QoS 1 and QoS 2 protocol flows the Client and Server need to associate state with
2691 the Client Identifier, this is referred to as the Session State. The Server also stores the subscriptions as
2692 part of the Session State.

2693
2694 The session can continue across a sequence of Network Connections. It lasts as long as the latest
2695 Network Connection plus the Session Expiry Interval.

2696
2697 The Session State in the Client consists of:

- 2698 • QoS 1 and QoS 2 messages which have been sent to the Server, but have not been completely
2699 acknowledged.
- 2700 • QoS 2 messages which have been received from the Server, but have not been completely
2701 acknowledged.

2702
2703 The Session State in the Server consists of:

- 2704 • The existence of a Session, even if the rest of the Session State is empty.
- 2705 • The Clients subscriptions, including any Subscription Identifiers.
- 2706 • QoS 1 and QoS 2 messages which have been sent to the Client, but have not been completely
2707 acknowledged.
- 2708 • QoS 1 and QoS 2 messages pending transmission to the Client and OPTIONALLY QoS 0 messages
2709 pending transmission to the Client.
- 2710 • QoS 2 messages which have been received from the Client, but have not been completely
2711 acknowledged. The Will Message and the Will Delay Interval
- 2712 • If the Session is currently not connected, the time at which the Session will end and Session State will
2713 be discarded.

2714
2715 Retained messages do not form part of the Session State in the Server, they are not deleted as a result of
2716 a Session ending.

2717

2718 4.1.1 Storing Session State

2719 The Client and Server MUST NOT discard the Session State while the Network Connection is open
2720 [MQTT-4.1.0-1]. The Server MUST discard the Session State when the Network Connection is closed and
2721 the Session Expiry Interval has passed [MQTT-4.1.0-2].

2722

2723 Non-normative comment

2724 The storage capabilities of Client and Server implementations will of course have limits in terms
2725 of capacity and may be subject to administrative policies. Stored Session State can be discarded
2726 as a result of an administrator action, including an automated response to defined conditions.

2727 This has the effect of terminating the Session. These actions might be prompted by resource
2728 constraints or for other operational reasons. It is possible that hardware or software failures may
2729 result in loss or corruption of Session State stored by the Client or Server. It is prudent to
2730 evaluate the storage capabilities of the Client and Server to ensure that they are sufficient.

2731

2732 **4.1.2 Session State non-normative examples**

2733 For example, an electricity meter reading solution might use QoS 1 messages to protect the readings
2734 against loss over the network. The solution developer might have determined that the power supply is
2735 sufficiently reliable that, in this case, the data in the Client and Server can be stored in volatile memory
2736 without too much risk of its loss.

2737

2738 Conversely a parking meter payment application provider might decide that the payment messages
2739 should never be lost due to a network or Client failure. Thus, they require that all data be written to non-
2740 volatile memory before it is transmitted across the network.

2741

2742 **4.2 Network Connections**

2743 The MQTT protocol requires an underlying transport that provides an ordered, lossless, stream of bytes
2744 from the Client to Server and Server to Client. This specification does not require the support of any
2745 specific transport protocol. A Client or Server MAY support any of the transport protocols listed here, or
2746 any other transport protocol that meets the requirements of this [section](#).

2747

2748 A Client or Server MUST support the use of one or more underlying transport protocols that provide an
2749 ordered, lossless, stream of bytes from the Client to Server and Server to Client [\[MQTT-4.2-1\]](#).

2750

2751 **Non-normative comment**

2752 TCP/IP as defined in [\[RFC0793\]](#) can be used for MQTT v5.0. The following transport protocols
2753 are also suitable:

- 2754 • TLS [\[RFC5246\]](#)
- 2755 • WebSocket [\[RFC6455\]](#)

2756

2757 **Non-normative comment**

2758 TCP ports 8883 and 1883 are registered with IANA for MQTT TLS and non-TLS communication
2759 respectively.

2760

2761 **Non-normative comment**

2762 Connectionless network transports such as User Datagram Protocol (UDP) are not suitable on
2763 their own because they might lose or reorder data.

2764

2765 **4.3 Quality of Service levels and protocol flows**

2766 MQTT delivers Application Messages according to the Quality of Service (QoS) levels defined in the
2767 following sections. The delivery protocol is symmetric, in the description below the Client and Server can
2768 each take the role of either sender or receiver. The delivery protocol is concerned solely with the delivery
2769 of an application message from a single sender to a single receiver. When the Server is delivering an
2770 Application Message to more than one Client, each Client is treated independently. The QoS level used
2771 to deliver an Application Message outbound to the Client could differ from that of the inbound Application
2772 Message.

2773

2774 **4.3.1 QoS 0: At most once delivery**

2775 The message is delivered according to the capabilities of the underlying network. No response is sent by
 2776 the receiver and no retry is performed by the sender. The message arrives at the receiver either once or
 2777 not at all.

2778
 2779 In the QoS 0 delivery protocol, the sender

- 2780 • MUST send a PUBLISH packet with QoS 0 and DUP flag set to 0 [MQTT-4.3.1-1].

2781
 2782 In the QoS 0 delivery protocol, the receiver

- 2783 • Accepts ownership of the message when it receives the PUBLISH packet.

2784
 2785 Figure 4.1 – QoS 0 protocol flow diagram, non-normative example

Sender Action	Control Packet	Receiver Action
PUBLISH QoS 0, DUP=0		
	----->	
		Deliver Application Message to appropriate onward recipient(s)

2786
 2787 **4.3.2 QoS 1: At least once delivery**

2788 This Quality of Service level ensures that the message arrives at the receiver at least once. A QoS 1
 2789 PUBLISH packet has a Packet Identifier in its Variable Header and is acknowledged by a PUBACK packet.
 2790 Section 2.2.1 provides more information about Packet Identifiers.

2791
 2792 In the QoS 1 delivery protocol, the sender

- 2793 • MUST assign an unused Packet Identifier each time it has a new Application Message to publish
 2794 [MQTT-4.3.2-1].
- 2795 • MUST send a PUBLISH packet containing this Packet Identifier with QoS 1 and DUP flag set to
 2796 0 [MQTT-4.3.2-2].
- 2797 • MUST treat the PUBLISH packet as “unacknowledged” until it has received the corresponding
 2798 PUBACK packet from the receiver. Refer to section 4.4 for a discussion of unacknowledged
 2799 messages [MQTT-4.3.2-3].

2800
 2801 The Packet Identifier becomes available for reuse once the sender has received the PUBACK packet.

2802
 2803 Note that a sender is permitted to send further PUBLISH packets with different Packet Identifiers while it is
 2804 waiting to receive acknowledgements.

2805
 2806 In the QoS 1 delivery protocol, the receiver

- 2807 • MUST respond with a PUBACK packet containing the Packet Identifier from the incoming
 2808 PUBLISH packet, having accepted ownership of the Application Message [MQTT-4.3.2-4].

- After it has sent a PUBACK packet the receiver MUST treat any incoming PUBLISH packet that contains the same Packet Identifier as being a new Application Message, irrespective of the setting of its DUP flag [MQTT-4.3.2-5].

Figure 4.2 – QoS 1 protocol flow diagram, non-normative example

Sender Action	MQTT Control Packet	Receiver action
Store message		
Send PUBLISH QoS 1, DUP=0, <Packet Identifier>	----->	
		Initiate onward delivery of the Application Message ¹
	<-----	Send PUBACK <Packet Identifier>
Discard message		

¹ The receiver does not need to complete delivery of the Application Message before sending the PUBACK. When its original sender receives the PUBACK packet, ownership of the Application Message is transferred to the receiver.

4.3.3 QoS 2: Exactly once delivery

This is the highest Quality of Service level, for use when neither loss nor duplication of messages are acceptable. There is an increased overhead associated with QoS 2.

A QoS 2 message has a Packet Identifier in its Variable Header. Section 2.2.1 provides more information about Packet Identifiers. The receiver of a QoS 2 PUBLISH packet acknowledges receipt with a two-step acknowledgement process.

In the QoS 2 delivery protocol, the sender:

- MUST assign an unused Packet Identifier when it has a new Application Message to publish [MQTT-4.3.3-1].
- MUST send a PUBLISH packet containing this Packet Identifier with QoS 2 and DUP flag set to 0 [MQTT-4.3.3-2].
- MUST treat the PUBLISH packet as “unacknowledged” until it has received the corresponding PUBREC packet from the receiver [MQTT-4.3.3-3]. Refer to section 4.4 for a discussion of unacknowledged messages.
- MUST send a PUBREL packet when it receives a PUBREC packet from the receiver with a Reason Code value less than 0x80. This PUBREL packet MUST contain the same Packet Identifier as the original PUBLISH packet [MQTT-4.3.3-4].
- MUST treat the PUBREL packet as “unacknowledged” until it has received the corresponding PUBCOMP packet from the receiver [MQTT-4.3.3-5].
- MUST NOT re-send the PUBLISH once it has sent the corresponding PUBREL packet [MQTT-4.3.3-6].
- MUST NOT apply Message expiry if a PUBLISH packet has been sent [MQTT-4.3.3-7].

2844 The Packet Identifier becomes available for reuse once the sender has received the PUBCOMP packet or
 2845 a PUBREC with a Reason Code of 0x80 or greater.

2846
 2847 Note that a sender is permitted to send further PUBLISH packets with different Packet Identifiers while it is
 2848 waiting to receive acknowledgements, subject to flow control as described in [section 4.9](#).

2849
 2850 **In the QoS 2 delivery protocol, the receiver:**

- 2851 • MUST respond with a PUBREC containing the Packet Identifier from the incoming PUBLISH
 2852 packet, having accepted ownership of the Application Message [\[MQTT-4.3.3-8\]](#).
- 2853 • If it has sent a PUBREC with a Reason Code of 0x80 or greater, the receiver MUST treat any
 2854 subsequent PUBLISH packet that contains that Packet Identifier as being a new Application
 2855 Message [\[MQTT-4.3.3-9\]](#).
- 2856 • Until it has received the corresponding PUBREL packet, the receiver MUST acknowledge any
 2857 subsequent PUBLISH packet with the same Packet Identifier by sending a PUBREC. It MUST
 2858 NOT cause duplicate messages to be delivered to any onward recipients in this case [\[MQTT-
 2859 4.3.3-10\]](#).
- 2860 • MUST respond to a PUBREL packet by sending a PUBCOMP packet containing the same
 2861 Packet Identifier as the PUBREL [\[MQTT-4.3.3-11\]](#).
- 2862 • After it has sent a PUBCOMP, the receiver MUST treat any subsequent PUBLISH packet that
 2863 contains that Packet Identifier as being a new Application Message [\[MQTT-4.3.3-12\]](#).
- 2864 • MUST continue the QoS 2 acknowledgement sequence even if it has applied message expiry
 2865 [\[MQTT-4.3.3-13\]](#).

2866
 2867 **4.4 Message delivery retry**

2868 When a Client reconnects with Clean Start set to 0 and a session is present, both the Client and Server
 2869 MUST resend any unacknowledged PUBLISH packets (where QoS > 0) and PUBREL packets using their
 2870 original Packet Identifiers. This is the only circumstance where a Client or Server is REQUIRED to resend
 2871 messages. Clients and Servers MUST NOT resend messages at any other time [\[MQTT-4.4.0-1\]](#).

2872
 2873 If PUBACK or PUBREC is received containing a Reason Code of 0x80 or greater the corresponding
 2874 PUBLISH packet is treated as acknowledged, and MUST NOT be retransmitted [\[MQTT-4.4.0-2\]](#).

2875
 2876 Figure 4.3 – QoS 2 protocol flow diagram, non-normative example

Sender Action	MQTT Control Packet	Receiver Action
Store message		
PUBLISH QoS 2, DUP=0 <Packet Identifier>		
	----->	
		Store <Packet Identifier> then Initiate onward delivery of the Application Message ¹
		PUBREC <Packet Identifier><Reason Code>

	←-----	
Discard message, Store PUBREC received <Packet Identifier>		
PUBREL <Packet Identifier>		
	----->	
		Discard <Packet Identifier>
		Send PUBCOMP <Packet Identifier>
	←-----	
Discard stored state		

2877
2878
2879
2880
2881
2882
2883
2884

¹ The receiver does not need to complete delivery of the Application Message before sending the PUBREC or PUBCOMP. When its original sender receives the PUBREC packet, ownership of the Application Message is transferred to the receiver. However, the receiver needs to perform all checks for conditions which might result in a forwarding failure (e.g. quota exceeded, authorization, etc.) before accepting ownership. The receiver indicates success or failure using the appropriate Reason Code in the PUBREC.

2885 4.5 Message receipt

2886 When a Server takes ownership of an incoming Application Message it MUST add it to the Session State
2887 for those Clients that have matching Subscriptions [MQTT-4.5.0-1]. Matching rules are defined in section
2888 4.7.

2889 Under normal circumstances Clients receive messages in response to Subscriptions they have created. A
2890 Client could also receive messages that do not match any of its explicit Subscriptions. This can happen if
2891 the Server automatically assigned a subscription to the Client. A Client could also receive messages
2892 while an UNSUBSCRIBE operation is in progress. The Client MUST acknowledge any Publish packet it
2893 receives according to the applicable QoS rules regardless of whether it elects to process the Application
2894 Message that it contains [MQTT-4.5.0-2].

2896

2897 4.6 Message ordering

2898 The following these rules apply to the Client when implementing the protocol flows defined in section 4.3.

- 2899 • When the Client re-sends any PUBLISH packets, it MUST re-send them in the order in which the
2900 original PUBLISH packets were sent (this applies to QoS 1 and QoS 2 messages) [MQTT-4.6.0-
2901 1]
- 2902 • The Client MUST send PUBACK packets in the order in which the corresponding PUBLISH
2903 packets were received (QoS 1 messages) [MQTT-4.6.0-2]
- 2904 • The Client MUST send PUBREC packets in the order in which the corresponding PUBLISH
2905 packets were received (QoS 2 messages) [MQTT-4.6.0-3]
- 2906 • The Client MUST send PUBREL packets in the order in which the corresponding PUBREC
2907 packets were received (QoS 2 messages) [MQTT-4.6.0-4]

2908

2909 An Ordered Topic is a Topic where the Client can be certain that the Application Messages in that Topic
2910 from the same Client and at the same QoS are received are in the order they were published. When a
2911 Server processes a message that has been published to an Ordered Topic, it MUST send PUBLISH
2912 packets to consumers (for the same Topic and QoS) in the order that they were received from any given
2913 Client [MQTT-4.6.0-5]. This is addition to the rules listed above.

2914
2915 By default, a Server MUST treat every Topic as an Ordered Topic when it is forwarding messages on
2916 Non-shared Subscriptions. [MQTT-4.6.0-6]. A Server MAY provide an administrative or other mechanism
2917 to allow one or more Topics to not be treated as an Ordered Topic.

2918
2919 **Non-normative comment**
2920 The rules listed above ensure that when a stream of messages is published and subscribed to an
2921 Ordered Topic with QoS 1, the final copy of each message received by the subscribers will be in
2922 the order that they were published. If the message is re-sent the duplicate message can be
2923 received after one of the earlier messages is received. For example, a publisher might send
2924 messages in the order 1,2,3,4 but the subscriber might receive them in the order 1,2,3,2,3,4 if
2925 there is a network disconnection after message 3 has been sent.

2926
2927 If both Client and Server set Receive Maximum to 1, they make sure that no more than one
2928 message is "in-flight" at any one time. In this case no QoS 1 message will be received after any
2929 later one even on re-connection. For example a subscriber might receive them in the order
2930 1,2,3,3,4 but not 1,2,3,2,3,4. Refer to section 4.9 Flow Control for details of how the Receive
2931 Maximum is used.

2932

2933 4.7 Topic Names and Topic Filters

2934 4.7.1 Topic wildcards

2935 The topic level separator is used to introduce structure into the Topic Name. If present, it divides the
2936 Topic Name into multiple "topic levels".

2937 A subscription's Topic Filter can contain special wildcard characters, which allow a Client to subscribe to
2938 multiple topics at once.

2939 The wildcard characters can be used in Topic Filters, but MUST NOT be used within a Topic Name
2940 [MQTT-4.7.0-1].

2941

2942 4.7.1.1 Topic level separator

2943 The forward slash (' U+002F) is used to separate each level within a topic tree and provide a hierarchical
2944 structure to the Topic Names. The use of the topic level separator is significant when either of the two
2945 wildcard characters is encountered in Topic Filters specified by subscribing Clients. Topic level separators
2946 can appear anywhere in a Topic Filter or Topic Name. Adjacent Topic level separators indicate a zero-
2947 length topic level.

2948

2949 4.7.1.2 Multi-level wildcard

2950 The number sign ('# U+0023) is a wildcard character that matches any number of levels within a topic.
2951 The multi-level wildcard represents the parent and any number of child levels. The multi-level wildcard
2952 character MUST be specified either on its own or following a topic level separator. In either case it MUST
2953 be the last character specified in the Topic Filter [MQTT-4.7.1-1].

Non-normative comment

For example, if a Client subscribes to “sport/tennis/player1/#”, it would receive messages published using these Topic Names:

- “sport/tennis/player1”
- “sport/tennis/player1/ranking
- “sport/tennis/player1/score/wimbledon”

Non-normative comment

- “sport/#” also matches the singular “sport”, since # includes the parent level.
- “#” is valid and will receive every Application Message
- “sport/tennis/#” is valid
- “sport/tennis#” is not valid
- “sport/tennis##/ranking” is not valid

4.7.1.3 Single-level wildcard

The plus sign (‘+’ U+002B) is a wildcard character that matches only one topic level.

The single-level wildcard can be used at any level in the Topic Filter, including first and last levels. Where it is used, it MUST occupy an entire level of the filter [MQTT-4.7.1-2]. It can be used at more than one level in the Topic Filter and can be used in conjunction with the multi-level wildcard.

Non-normative comment

For example, “sport/tennis/+” matches “sport/tennis/player1” and “sport/tennis/player2”, but not “sport/tennis/player1/ranking”. Also, because the single-level wildcard matches only a single level, “sport/+” does not match “sport” but it does match “sport/”.

- “+” is valid
- “+/tennis/#” is valid
- “sport+” is not valid
- “sport+/player1” is valid
- “/finance” matches “+/+” and “/+”, but not “+”

4.7.2 Topics beginning with \$

The Server MUST NOT match Topic Filters starting with a wildcard character (# or +) with Topic Names beginning with a \$ character [MQTT-4.7.2-1]. The Server SHOULD prevent Clients from using such Topic Names to exchange messages with other Clients. Server implementations MAY use Topic Names that start with a leading \$ character for other purposes.

Non-normative comment

- \$SYS/ has been widely adopted as a prefix to topics that contain Server-specific information or control APIs
- Applications cannot use a topic with a leading \$ character for their own purposes

3042

3043 4.8 Subscriptions

3044 MQTT provides two kinds of Subscription, Shared and Non-shared.

3045

3046 **Non-normative comment**

3047 In earlier versions of MQTT all Subscriptions are Non-shared.

3048

3049 4.8.1 Non-shared Subscriptions

3050 A Non-shared Subscription is associated only with the MQTT Session that created it. Each Subscription
3051 includes a Topic Filter, indicating the topic(s) for which messages are to be delivered on that Session,
3052 and Subscription Options. The Server is responsible for collecting messages that match the filter and
3053 transmitting them on the Session's MQTT connection if and when that connection is active.

3054

3055 A Session cannot have more than one Non-shared Subscription with the same Topic Filter, so the Topic
3056 Filter can be used as a key to identify the subscription within that Session.

3057

3058 If there are multiple Clients, each with its own Non-shared Subscription to the same Topic, each Client
3059 gets its own copy of the Application Messages that are published on that Topic. This means that the
3060 Non-shared Subscriptions cannot be used to load-balance Application Messages across multiple
3061 consuming Clients as in such cases every message is delivered to every subscribing Client.

3062

3063 4.8.2 Shared Subscriptions

3064 A Shared Subscription can be associated with multiple subscribing MQTT Sessions. Like a Non-shared
3065 Subscription, it has a Topic Filter and Subscription Options; however, a publication that matches its Topic
3066 Filter is only sent to one of its subscribing Sessions. Shared Subscriptions are useful where several
3067 consuming Clients share the processing of the publications in parallel.

3068

3069 A Shared Subscription is identified using a special style of Topic Filter. The format of this filter is:

3070

3071 `$share/{ShareName}/{filter}`

- 3072 • `$share` is a literal string that marks the Topic Filter as being a Shared Subscription Topic Filter.
- 3073 • `{ShareName}` is a character string that does not include `/`, `+` or `#`
- 3074 • `{filter}` The remainder of the string has the same syntax and semantics as a Topic Filter in a non-
3075 shared subscription. Refer to [section 4.7](#).

3076

3077 A Shared Subscription's Topic Filter MUST start with `$share/` and MUST contain a ShareName that is at
3078 least one character long [\[MQTT-4.8.2-1\]](#). The ShareName MUST NOT contain the characters `/`, `+` or
3079 `#`, but MUST be followed by a `/` character. This `/` character MUST be followed by a Topic Filter
3080 [\[MQTT-4.8.2-2\]](#) as described in [section 4.7](#).

3081

3082 **Non-normative comment**

3083 Shared Subscriptions are defined at the scope of the MQTT Server, rather than of a Session. A
3084 ShareName is included in the Shared Subscription's Topic Filter so that there can be more than
3085 one Shared Subscription on a Server that has the same `{filter}` component. Typically, applications
3086 use the ShareName to represent the group of subscribing Sessions that are sharing the

3087 subscription.

3088

3089

Examples:

3090

- Shared subscriptions "\$share/consumer1/sport/tennis/+" and "\$share/consumer2/sport/tennis/+" are distinct shared subscriptions and so can be associated with different groups of Sessions. Both of them match the same topics as a non-shared subscription to sport/tennis/ .

3091

3092

3093

3094

3095

3096

3097

3098

3099

3100

If a message were to be published that matches sport/tennis/+ then a copy would be sent to exactly one of the Sessions subscribed to \$share/consumer1/sport/tennis/+ , a separate copy of the message would be sent to exactly one of the Sessions subscribed to \$share/consumer2/sport/tennis/+ and further copies would be sent to any Clients with non-shared subscriptions to sport/tennis/+

3101

- Shared subscription "\$share/consumer1//finance" matches the same topics as a non-shared subscription to /finance.

3102

3103

3104

3105

3106

3107

Note that "\$share/consumer1//finance" and "\$share/consumer1/sport/tennis/+" are distinct shared subscriptions, even though they have the same ShareName. While they might be related in some way, no specific relationship between them is implied by them having the same ShareName.

3108

3109

A Shared Subscription is created by using a Shared Subscription Topic Filter in a SUBSCRIBE request. So long as only one Session subscribes to a particular Shared Subscription, the shared subscription behaves like a non-shared subscription, except that:

3110

3111

3112

3113

- The \$share and {ShareName} portions of the Topic Filter are not taken into account when matching against publications.

3114

3115

3116

- No Retained Messages are sent to the Session when it first subscribes. It will be sent other matching messages as they are published.

3117

3118

3119

Once a Shared Subscription exists, it is possible for other Sessions to subscribe with the same Shared Subscription Topic Filter. The new Session is associated with the Shared Subscription as an additional subscriber. Retained messages are not sent to this new subscriber. Each subsequent Application Message that matches the Shared Subscription is now sent to one and only one of the Sessions that are subscribed to the Shared Subscription.

3120

3121

3122

3123

3124

3125

A Session can explicitly detach itself from a Shared Subscription by sending an UNSUBSCRIBE Packet that contains the full Shared Subscription Topic Filter. Sessions are also detached from the Shared Subscription when they terminate.

3126

3127

3128

3129

A Shared Subscription lasts for as long as it is associated with at least one Session (i.e. a Session that has issued a successful SUBSCRIBE request to its Topic Filter and that has not completed a corresponding UNSUBSCRIBE). A Shared Subscription survives when the Session that originally created it unsubscribes, unless there are no other Sessions left when this happens. A Shared Subscription ends, and any undelivered messages associated with it are deleted, when there are no longer any Sessions subscribed to it.

3130

3131

3132

3133

3134

3135

3136

Notes on Shared Subscriptions

3137

- If there's more than one Session subscribed to the Shared Subscription, the Server implementation is free to choose, on a message by message basis, which Session to use and what criteria it uses to

3138

- 3139 make this selection.
- 3140
- 3141 • Different subscribing Clients are permitted to ask for different Requested QoS levels in their
- 3142 SUBSCRIBE packets. The Server decides which Maximum QoS to grant to each Client, and it is
- 3143 permitted to grant different Maximum QoS levels to different subscribers. When sending an
- 3144 Application Message to a Client, the Server MUST respect the granted QoS for the Client's
- 3145 subscription [MQTT-4.8.2-3], in the same that it does when sending a message to a -Subscriber.
- 3146
- 3147 • If the Server is in the process of sending a QoS 2 message to its chosen subscribing Client and the
- 3148 connection to the Client breaks before delivery is complete, the Server MUST complete the delivery
- 3149 of the message to that Client when it reconnects [MQTT-4.8.2-4] as described in section 4.3.3. If the
- 3150 Client's Session terminates before the Client reconnects, the Server MUST NOT send the Application
- 3151 Message to any other subscribed Client [MQTT-4.8.2-5].
- 3152
- 3153 • If the Server is in the process of sending a QoS 1 message to its chosen subscribing Client and the
- 3154 connection to that Client breaks before the Server has received an acknowledgement from the Client,
- 3155 the Server MAY wait for the Client to reconnect and retransmit the message to that Client. If the
- 3156 Client's Session terminates before the Client reconnects, the Server SHOULD send the Application
- 3157 Message to another Client that is subscribed to the same Shared Subscription. It MAY attempt to
- 3158 send the message to another Client as soon as it loses its connection to the first Client.
- 3159
- 3160 • If a Client responds with a PUBACK or PUBREC containing a Reason Code of 0x80 or greater to a
- 3161 PUBLISH packet from the Server, the Server MUST discard the Application Message and not attempt
- 3162 to send it to any other Subscriber [MQTT-4.8.2-6].
- 3163
- 3164 • A Client is permitted to submit a second SUBSCRIBE request to a Shared Subscription on a Session
- 3165 that's already subscribed to that Shared Subscription. For example, it might do this to change the
- 3166 Requested QoS for its subscription or because it was uncertain that the previous subscribe
- 3167 completed before the previous connection was closed. This does not increase the number of times
- 3168 that the Session is associated with the Shared Subscription, so the Session will leave the Shared
- 3169 Subscription on its first UNSUBSCRIBE.
- 3170
- 3171 • Each Shared Subscription is independent from any other. It is possible to have two Shared
- 3172 Subscriptions with overlapping filters. In such cases a message that matches both Shared
- 3173 Subscriptions will be processed separately by both of them. If a Client has a Shared Subscription and
- 3174 a Non-shared Subscription and a message matches both of them, the Client will receive a copy of the
- 3175 message by virtue of it having the Non-shared Subscription. A second copy of the message will be
- 3176 delivered to one of the subscribers to the Shared Subscription, and this could result in a second copy
- 3177 being sent to this Client.

3178

3179 4.9 Flow Control

3180 Clients and Servers control the number of unacknowledged PUBLISH packets they receive by using a

3181 Receive Maximum value as described in section 3.1.2.11.4 and section 3.2.2.3.2. The Receive Maximum

3182 establishes a send quota which is used to limit the number of PUBLISH QoS > 0 packets which can be

3183 sent without receiving an PUBACK (for QoS 1) or PUBCOMP (for QoS 2). The PUBACK and PUBCOMP

3184 replenish the quota in the manner described below.

3185

3186 The Client or Server MUST set its initial send quota to a non-zero value not exceeding the Receive

3187 Maximum [MQTT-4.9.0-1].

3188

3189 Each time the Client or Server sends a PUBLISH packet at QoS > 0, it decrements the send quota. If the

3190 send quota reaches zero, the Client or Server MUST NOT send any more PUBLISH packets with QoS >

3191 0 [MQTT-4.9.0-2]. It MAY continue to send PUBLISH packets with QoS 0, or it MAY choose to suspend

3192 sending these as well. The Client and Server MUST continue to process and respond to all other MQTT
3193 Control Packets even if the quota is zero [MQTT-4.9.0-3].

3194

3195 The send quota is incremented by 1:

- 3196 • Each time a PUBACK or PUBCOMP packet is received, regardless of whether the PUBACK or
3197 PUBCOMP carried an error code.
- 3198 • Each time a PUBREC packet is received with a Return Code of 0x80 or greater.

3199

3200 The send quota is not incremented if it is already equal to the initial send quota. The attempt to increment
3201 above the initial send quota might be caused by the re-transmission of a PUBREL packet after a new
3202 Network Connection is established.

3203

3204 Refer to [section 3.3.4](#) for a description of how Clients and Servers react if they are sent more PUBLISH
3205 packets than the Receive Maximum allows.

3206

3207 The send quota and Receive Maximum value are not preserved across Network Connections, and are re-
3208 initialized with each new Network Connection as described above. They are not part of the session state.

3209

3210 **4.10 Request / Response**

3211 Some applications or standards might wish to run a Request/Response interaction over MQTT. This
3212 version of MQTT includes three properties that can be used for this purpose:

- 3213 • Response Topic, described in [section 3.3.2.3.5](#)
- 3214 • Correlation Data, described in [section 3.3.2.3.6](#)
- 3215 • Request Response Information, described in [section 3.1.2.11.7](#)
- 3216 • Response Information, described in [section 3.2.2.3.14](#)

3217 The following non-normative sections describe how these properties can be used.

3218

3219 A Client sends a Request Message by publishing an Application Message which has a Response Topic
3220 set as described in [section 3.3.2.3.5](#). The Request can include a Correlation Data property as described
3221 in [section 3.3.2.3.6](#).

3222

3223 **4.10.1 Basic Request Response (non-normative)**

3224 Request/Response interaction proceeds as follows:

- 3225 1. An MQTT Client (the Requester) publishes a Request Message to a topic. A Request Message
3226 is an Application Message with a Response Topic.
- 3227 2. Another MQTT Client (the Responder) has subscribed to a Topic Filter which matches the Topic
3228 Name used when the Request Message was published. As a result, it receives the Request
3229 Message. There could be multiple Responders subscribed to this Topic Name or there could be
3230 none.
- 3231 3. The Responder takes the appropriate action based on the Request Message, and then publishes
3232 a Response Message to the Topic Name in the Response Topic property that was carried in the
3233 Request Message.
- 3234 4. In typical usage the Requester has subscribed to the Response Topic and thereby receives the
3235 Response Message. However, some other Client might be subscribed to the Response Topic in
3236 which case the Response Message will also be received and processed by that Client. As with
3237 the Request Message, the topic on which the Response Message is sent could be subscribed to
3238 by multiple Clients, or by none.

3239
3240 If the Request Message contains a Correlation Data property, the Responder copies this property into the
3241 Response Message and this is used by the receiver of the Response Message to associate the
3242 Response Message with the original request. The Response Message does not include a Response
3243 Topic property.

3244
3245 The MQTT Server forwards the Response Topic and Correlation Data Property in the Request Message
3246 and the Correlation Data in the Response Message. The Server treats the Request Message and the
3247 Response Message like any other Application Message.

3248
3249 The Requester normally subscribes to the Response Topic before publishing a Request Message. If there
3250 are no subscribers to the Response Topic when the Response Message is sent, the Response Message
3251 will not be delivered to any Client.

3252
3253 The Request Message and Response Message can be of any QoS, and the Responder can be using a
3254 Session with a non-zero Session Expiry Interval. It is common to send Request Messages at QoS 0 and
3255 only when the Responder is expected to be connected. However, this is not necessary.

3256
3257 The Responder can use a Shared Subscription to allow for a pool of responding Clients. Note however
3258 that when using Shared Subscriptions that the order of message delivery is not guaranteed between
3259 multiple Clients.

3260
3261 It is the responsibility of the Requester to make sure it has the necessary authority to publish to the
3262 request topic, and to subscribe to the Topic Name that it sets in the Response Topic property. It is the
3263 responsibility of the Responder to make sure it has the authority to subscribe to the request topic and
3264 publish to the Response Topic. While topic authorization is outside of this specification, it is
3265 recommended that Servers implement such authorization.

3266

3267 **4.10.2 Determining a Response Topic value (non-normative)**

3268 Requesters can determine a Topic Name to use as their Response Topic in any manner they choose
3269 including via local configuration. To avoid clashes between different Requesters, it is desirable that the
3270 Response Topic used by a Requester Client be unique to that Client. As the Requester and Responder
3271 commonly need to be authorized to these topics, it can be an authorization challenge to use a random
3272 Topic Name.

3273
3274 To help with this problem, this specification defines a property in the CONNACK packet called Response
3275 Information. The Server can use this property to guide the Client in its choice for the Response Topic to
3276 use. This mechanism is optional for both the Client and the Server. At connect time, the Client requests
3277 that the Server send a Response Information by setting the Request Response Information property in
3278 the CONNECT packet. This causes the Server to insert a Response Information property (a UTF-8
3279 Encoded String) sent in the CONNACK packet.

3280
3281 This specification does not define the contents of the Response Information but it could be used to pass a
3282 globally unique portion of the topic tree which is reserved for that Client for at least the lifetime of its
3283 Session. Using this mechanism allows this configuration to be done once in the Server rather than in
3284 each Client.

3285
3286 Refer to [section 3.1.2.11.7](#) for the definition of the Response Information.

3287

3288 4.11 Server redirection

3289 A Server can request that the Client uses another Server by sending CONNACK or DISCONNECT with
3290 Reason Codes 0x9C (Use another server), or 0x9D (Server moved) as described in [section 4.13](#). When
3291 sending one of these Reason Codes, the Server MAY also include a Server Reference property to
3292 indicate the location of the Server or Servers the Client SHOULD use.

3293

3294 The Reason Code 0x9C (Use another server) specifies that the Client SHOULD temporarily switch to
3295 using another Server. The other Server is either already known to the Client, or is specified using a
3296 Server Reference.

3297

3298 The Reason Code 0x9D (Server moved) specifies that the Client SHOULD permanently switch to using
3299 another Server. The other Server is either already known to the Client, or is specified using a Server
3300 Reference.

3301

3302 The Server Reference is a UTF-8 Encoded String. The value of this string is a space separated list of
3303 references. The format of references is not specified here.

3304

3305 **Non-normative comment**

3306 It is recommended that each reference consists of a name optionally followed by a colon and a
3307 port number. If the name contains a colon the name string can be enclosed within square
3308 brackets (“[” and ”]”). A name enclosed by square brackets cannot contain the right square
3309 bracket (“]”) character. This is used to represent an IPv6 literal address which uses colon
3310 separators. This is a simplified version of an URI authority as described in [\[RFC3986\]](#).

3311

3312 **Non-normative comment**

3313 The name within a Server Reference commonly represents a host name, DNS name [\[RFC1035\]](#),
3314 SRV name [\[RFC2782\]](#) , or literal IP address. The value following the colon separator is commonly
3315 a port number in decimal. This is not needed where the port information comes from the name
3316 resolution (such as with SRV) or is defaulted.

3317

3318 **Non-normative comment**

3319 If multiple references are given, the expectation is that that Client will choose one of them.

3320

3321 **Non-normative comment**

3322 Examples of the Server Reference are:

3323 `myserver.xyz.org`

3324 `myserver.xyz.org:8883`

3325 `10.10.151.22:8883 [fe80::9610:3eff:fe1c]:1883`

3326

3327 The Server is allowed to not ever send a Server Reference, and the Client is allowed to ignore a Server
3328 Reference. This feature can be used to allow for load balancing, Server relocation, and Client
3329 provisioning to a Server.

3330

3331 4.12 Enhanced authentication

3332 The MQTT CONNECT packet supports basic authentication of a Network Connection using the User
3333 Name and Password fields. While these fields are named for a simple password authentication, they can
3334 be used to carry other forms of authentication such as passing a token as the Password.

3335
3336 Enhanced authentication extends this basic authentication to include challenge / response style
3337 authentication. It might involve the exchange of AUTH packets between the Client and the Server after
3338 the CONNECT and before the CONNACK packets.

3339
3340 To begin an enhanced authentication, the Client includes an Authentication Method in the CONNECT
3341 packet. This specifies the authentication method to use. If the Server does not support the Authentication
3342 Method supplied by the Client, it MAY send a CONNACK with a Reason Code of 0x8C (Bad
3343 authentication method) or 0x87 (Not Authorized) as described in section 4.13 and MUST close the
3344 Network Connection [MQTT-4.12.0-1].

3345
3346 The Authentication Method is an agreement between the Client and Server about the meaning of the data
3347 sent in the Authentication Data and any of the other fields in CONNECT, and the exchanges and
3348 processing needed by the Client and Server to complete the authentication.

3349
3350 **Non-normative comment**

3351 The Authentication Method is commonly a SASL mechanism, and using such a registered name
3352 aids interchange. However, the Authentication Method is not constrained to using registered
3353 SASL mechanisms.

3354
3355 If the Authentication Method selected by the Client specifies that the Client sends data first, the Client
3356 SHOULD include an Authentication Data property in the CONNECT packet. This property can be used to
3357 provide data as specified by the Authentication Method. The contents of the Authentication Data are
3358 defined by the authentication method.

3359
3360 If the Server requires additional information to complete the authentication, it can send an AUTH packet
3361 to the Client. This packet MUST contain a Reason Code of 0x18 (Continue authentication) [MQTT-4.12.0-
3362 2]. If the authentication method requires the Server to send authentication data to the Client, it is sent in
3363 the Authentication Data.

3364
3365 The Client responds to an AUTH packet from the Server by sending a further AUTH packet. This packet
3366 MUST contain a Reason Code of 0x18 (Continue authentication) [MQTT-4.12.0-3]. If the authentication
3367 method requires the Client to send authentication data for the Server, it is sent in the Authentication Data.

3368
3369 The Client and Server exchange AUTH packets as needed until the Server accepts the authentication by
3370 sending a CONNACK with a Reason Code of 0. If the acceptance of the authentication requires data to
3371 be sent to the Client, it is sent in the Authentication Data.

3372
3373 The Client can close the connection at any point in this process. It MAY send a DISCONNECT packet
3374 before doing so. The Server can reject the authentication at any point in this process. It MAY send a
3375 CONNACK with a Reason Code of 0x80 or above as described in section 4.13, and MUST close the
3376 Network Connection [MQTT-4.12.0-4].

3377

15 May 2018
Page 107 of 137

3378 If the initial CONNECT packet included an Authentication Method property then all AUTH packets, and
3379 any successful CONNACK packet MUST include an Authentication Method Property with the same value
3380 as in the CONNECT packet [MQTT-4.12.0-5].

3381
3382 The implementation of enhanced authentication is OPTIONAL for both Clients and Servers. If the Client
3383 does not include an Authentication Method in the CONNECT, the Server MUST NOT send an AUTH
3384 packet, and it MUST NOT send an Authentication Method in the CONNACK packet [MQTT-4.12.0-6]. If
3385 the Client does not include an Authentication Method in the CONNECT, the Client MUST NOT send an
3386 AUTH packet to the Server [MQTT-4.12.0-7].

3387
3388 If the Client does not include an Authentication Method in the CONNECT packet, the Server SHOULD
3389 authenticate using some or all of the information in the CONNECT packet, TLS session, and Network
3390 Connection.

3391

3392 **Non-normative example showing a SCRAM challenge**

- 3393 • Client to Server: CONNECT Authentication Method="SCRAM-SHA-1" Authentication
3394 Data=client-first-data
- 3395 • Server to Client: AUTH rc=0x18 Authentication Method="SCRAM-SHA-1" Authentication
3396 Data=server-first-data
- 3397 • Client to Server AUTH rc=0x18 Authentication Method="SCRAM-SHA-1" Authentication
3398 Data=client-final-data
- 3399 • Server to Client CONNACK rc=0 Authentication Method="SCRAM-SHA-1" Authentication
3400 Data=server-final-data

3401

3402 **Non-normative example showing a Kerberos challenge**

- 3403 • Client to Server CONNECT Authentication Method="GS2-KRB5"
- 3404 • Server to Client AUTH rc=0x18 Authentication Method="GS2-KRB5"
- 3405 • Client to Server AUTH rc=0x18 Authentication Method="GS2-KRB5" Authentication
3406 Data=initial context token
- 3407 • Server to Client AUTH rc=0x18 Authentication Method="GS2-KRB5" Authentication
3408 Data=reply context token
- 3409 • Client to Server AUTH rc=0x18 Authentication Method="GS2-KRB5"
- 3410 • Server to Client CONNACK rc=0 Authentication Method="GS2-KRB5" Authentication
3411 Data=outcome of authentication

3412

3413 **4.12.1 Re-authentication**

3414 If the Client supplied an Authentication Method in the CONNECT packet it can initiate a re-authentication
3415 at any time after receiving a CONNACK. It does this by sending an AUTH packet with a Reason Code of
3416 0x19 (Re-authentication). The Client MUST set the Authentication Method to the same value as the
3417 Authentication Method originally used to authenticate the Network Connection [MQTT-4.12.1-1]. If the
3418 authentication method requires Client data first, this AUTH packet contains the first piece of
3419 authentication data as the Authentication Data.

3420

3421 The Server responds to this re-authentication request by sending an AUTH packet to the Client with a
3422 Reason Code of 0x00 (Success) to indicate that the re-authentication is complete, or a Reason Code of
3423 0x18 (Continue authentication) to indicate that more authentication data is needed. The Client can
3424 respond with additional authentication data by sending an AUTH packet with a Reason Code of 0x18
3425 (Continue authentication). This flow continues as with the original authentication until the re-
3426 authentication is complete or the re-authentication fails.

3427

3428 If the re-authentication fails, the Client or Server SHOULD send DISCONNECT with an appropriate
3429 Reason Code as described in [section 4.13](#), and MUST close the Network Connection [[MQTT-4.12.1-2](#)].

3430

3431 During this re-authentication sequence, the flow of other packets between the Client and Server can
3432 continue using the previous authentication.

3433

3434 **Non-normative comment**

3435 The Server might limit the scope of the changes the Client can attempt in a re-authentication by
3436 rejecting the re-authentication. For instance, if the Server does not allow the User Name to be
3437 changed it can fail any re-authentication attempt which changes the User Name.

3438

3439 **4.13 Handling errors**

3440 **4.13.1 Malformed Packet and Protocol Errors**

3441 Definitions of Malformed Packet and Protocol Errors are contained in [section 1.2](#) Terminology, some but
3442 not all, of these error cases are noted throughout the specification. The rigor with which a Client or Server
3443 checks an MQTT Control Packet it has received will be a compromise between:

- 3444 • The size of the Client or Server implementation.
- 3445 • The capabilities that the implementation supports.
- 3446 • The degree to which the receiver trusts the sender to send correct MQTT Control Packets.
- 3447 • The degree to which the receiver trusts the network to deliver MQTT Control Packets correctly.
- 3448 • The consequences of continuing to process a packet that is incorrect.

3449

3450 If the sender is compliant with this specification it will not send Malformed Packets or cause Protocol
3451 Errors. However, if a Client sends MQTT Control Packets before it receives CONNACK, it might cause a
3452 Protocol Error because it made an incorrect assumption about the Server capabilities. Refer to [section](#)
3453 [3.1.4](#) CONNECT Actions.

3454

3455 The Reason Codes used for Malformed Packet and Protocol Errors are:

- 3456 • 0x81 Malformed Packet
- 3457 • 0x82 Protocol Error
- 3458 • 0x93 Receive Maximum exceeded
- 3459 • 0x95 Packet too large
- 3460 • 0x9A Retain not supported
- 3461 • 0x9B QoS not supported
- 3462 • 0x9E Shared Subscriptions not supported
- 3463 • 0xA1 Subscription Identifiers not supported
- 3464 • 0xA2 Wildcard Subscriptions not supported

3465

3466 When a Client detects a Malformed Packet or Protocol Error, and a Reason Code is given in the
3467 specification, it SHOULD close the Network Connection. In the case of an error in a AUTH packet it MAY
3468 send a DISCONNECT packet containing the reason code, before closing the Network Connection. In the
3469 case of an error in any other packet it SHOULD send a DISCONNECT packet containing the reason code
3470 before closing the Network Connection. Use Reason Code 0x81 (Malformed Packet) or 0x82 (Protocol
3471 Error) unless a more specific Reason Code has been defined in [section 3.14.2.1](#) [Disconnect Reason](#)
3472 [Code](#).

3473

3474 When a Server detects a Malformed Packet or Protocol Error, and a Reason Code is given in the
3475 specification, it MUST close the Network Connection [MQTT-4.13.1-1]. In the case of an error in a
3476 CONNECT packet it MAY send a CONNACK packet containing the Reason Code, before closing the
3477 Network Connection. In the case of an error in any other packet it SHOULD send a DISCONNECT packet
3478 containing the Reason Code before closing the Network Connection. Use Reason Code 0x81 (Malformed
3479 Packet) or 0x82 (Protocol Error) unless a more specific Reason Code has been defined in [section 3.2.2.2](#)
3480 - [Connect Reason Code](#) or in [section 3.14.2.1 – Disconnect Reason Code](#). There are no consequences
3481 for other Sessions.

3482

3483 If either the Server or Client omits to check some feature of an MQTT Control Packet, it might fail to
3484 detect an error, consequently it might allow data to be damaged.

3485

3486 4.13.2 Other errors

3487 Errors other than Malformed Packet and Protocol Errors cannot be anticipated by the sender because the
3488 receiver might have constraints which it has not communicated to the sender. A receiving Client or Server
3489 might encounter a transient error, such as a shortage of memory, that prevents successful processing of
3490 an individual MQTT Control Packet.

3491

3492 Acknowledgment packets PUBACK, PUBREC, PUBREL, PUBCOMP, SUBACK, UNSUBACK with a
3493 Reason Code of 0x80 or greater indicate that the received packet, identified by a Packet Identifier, was in
3494 error. There are no consequences for other Sessions or other Packets flowing on the same Session.

3495

3496 The CONNACK and DISCONNECT packets allow a Reason Code of 0x80 or greater to indicate that the
3497 Network Connection will be closed. If a Reason Code of 0x80 or greater is specified, then the Network
3498 Connection MUST be closed whether or not the CONNACK or DISCONNECT is sent [MQTT-4.13.2-1].
3499 Sending of one of these Reason Codes does not have consequence for any other Session.

3500

3501 If the Control Packet contains multiple errors the receiver of the Packet can validate the Packet in any
3502 order and take the appropriate action for any of the errors found.

3503

3504 Refer to [section 5.4.9](#) for information about handling Disallowed Unicode code points.

3505 5 Security (non-normative)

3506 5.1 Introduction

3507 MQTT is a transport protocol specification for message transmission, allowing implementers a choice of
3508 network, privacy, authentication and authorization technologies. Since the exact security technologies
3509 chosen will be context specific, it is the implementer's responsibility to include the appropriate features as
3510 part of their design.

3511
3512 MQTT Implementations will likely need to keep pace with an evolving security landscape.

3513
3514 This Chapter provides general implementation guidance so as not to restrict choices available and is
3515 therefore non-normative. This should not detract from its importance.

3516
3517 It is strongly recommended that Server implementations that offer TLS [\[RFC5246\]](#) should use TCP port
3518 8883 (IANA service name: secure-mqtt).

3519
3520 There are a number of threats that solution providers should consider. For example:

- 3521 • Devices could be compromised
- 3522 • Data at rest in Clients and Servers might be accessible
- 3523 • Protocol behaviors could have side effects (e.g. "timing attacks")
- 3524 • Denial of Service (DoS) attacks
- 3525 • Communications could be intercepted, altered, re-routed or disclosed
- 3526 • Injection of spoofed MQTT Control Packets

3527
3528 MQTT solutions are often deployed in hostile communication environments. In such cases,
3529 implementations will often need to provide mechanisms for:

- 3530 • Authentication of users and devices
- 3531 • Authorization of access to Server resources
- 3532 • Integrity of MQTT Control Packets and application data contained therein
- 3533 • Privacy of MQTT Control Packets and application data contained therein

3534
3535 In addition to technical security issues there could also be geographic (e.g. U.S.-EU Privacy Shield
3536 Framework [\[USEUPRIVSH\]](#)), industry specific (e.g. PCI DSS [\[PCIDSS\]](#)) and regulatory considerations
3537 (e.g. Sarbanes-Oxley [\[SARBANES\]](#)).

3538

3539 5.2 MQTT solutions: security and certification

3540 An implementation might want to provide conformance with specific industry security standards such as
3541 NIST Cyber Security Framework [\[NISTCSF\]](#), PCI-DSS [\[PCIDSS\]](#), FIPS-140-2 [\[FIPS1402\]](#) and NSA Suite
3542 B [\[NSAB\]](#).

3543
3544 Guidance on using MQTT within the NIST Cyber Security Framework [\[NISTCSF\]](#) can be found in the
3545 MQTT supplemental publication, MQTT and the NIST Framework for Improving Critical Infrastructure
3546 Cybersecurity [\[MQTTNIST\]](#). The use of industry proven, independently verified and certified technologies
3547 will help meet compliance requirements.

3548

3549 **5.3 Lightweight cryptography and constrained devices**

3550 Advanced Encryption Standard [[AES](#)] is the most widely adopted encryption algorithm. There is hardware
3551 support for AES in many processors, but not commonly for embedded processors. The encryption
3552 algorithm ChaCha20 [[CHACHA20](#)] encrypts and decrypts much faster in software, but is not as widely
3553 available as AES.

3554

3555 ISO 29192 [[ISO29192](#)] makes recommendations for cryptographic primitives specifically tuned to perform
3556 on constrained “low end” devices.

3557

3558 **5.4 Implementation notes**

3559 There are many security concerns to consider when implementing or using MQTT. The following section
3560 should not be considered a “check list”.

3561

3562 An implementation might want to achieve some, or all, of the following:

3563

3564 **5.4.1 Authentication of Clients by the Server**

3565 The CONNECT packet contains User Name and Password fields. Implementations can choose how to
3566 make use of the content of these fields. They may provide their own authentication mechanism, use an
3567 external authentication system such as LDAP [[RFC4511](#)] or OAuth [[RFC6749](#)] tokens, or leverage
3568 operating system authentication mechanisms.

3569

3570 MQTT v5.0 provides an enhanced authentication mechanism as described in [section 4.12](#). Using this
3571 requires support for it in both the Client and Server.

3572

3573 Implementations passing authentication data in clear text, obfuscating such data elements or requiring no
3574 authentication data should be aware this can give rise to Man-in-the-Middle and replay attacks. [Section](#)
3575 [5.4.5](#) introduces approaches to ensure data privacy.

3576

3577 A Virtual Private Network (VPN) between the Clients and Servers can provide confidence that data is only
3578 being received from authorized Clients.

3579

3580 Where TLS [[RFC5246](#)] is used, TLS Certificates sent from the Client can be used by the Server to
3581 authenticate the Client.

3582

3583 An implementation might allow for authentication where the credentials are sent in an Application
3584 Message from the Client to the Server.

3585

3586 **5.4.2 Authorization of Clients by the Server**

3587 If a Client has been successfully authenticated, a Server implementation should check that it is authorized
3588 before accepting its connection.

3589

3590 Authorization may be based on information provided by the Client such as User Name, the hostname/IP
3591 address of the Client, or the outcome of authentication mechanisms.

3592

3593 In particular, the implementation should check that the Client is authorized to use the Client Identifier as
3594 this gives access to the MQTT Session State (described in [section 4.1](#)). This authorization check is to
3595 protect against the case where one Client, accidentally or maliciously, provides a Client Identifier that is
3596 already being used by some other Client.

3597

3598 An implementation should provide access controls that take place after CONNECT to restrict the Clients
3599 ability to publish to particular Topics or to subscribe using particular Topic Filters. An implementation
3600 should consider limiting access to Topic Filters that have broad scope, such as the # Topic Filter.

3601

3602 **5.4.3 Authentication of the Server by the Client**

3603 The MQTT protocol is not trust symmetrical. When using basic authentication, there is no mechanism for
3604 the Client to authenticate the Server. Some forms of extended authentication do allow for mutual
3605 authentication.

3606

3607 Where TLS [\[RFC5246\]](#) is used, TLS Certificates sent from the Server can be used by the Client to
3608 authenticate the Server. Implementations providing MQTT service for multiple hostnames from a single IP
3609 address should be aware of the Server Name Indication extension to TLS defined in section 3 of
3610 [\[RFC6066\]](#). This allows a Client to tell the Server the hostname of the Server it is trying to connect to.

3611

3612 An implementation might allow for authentication where the credentials are sent in an Application
3613 Message from the Server to the Client. MQTT v5.0 provides an enhanced authentication mechanism as
3614 described in [section 4.12.](#), which can be used to Authenticate the Server to the Client. Using this requires
3615 support for it in both the Client and Server.

3616

3617 A VPN between Clients and Servers can provide confidence that Clients are connecting to the intended
3618 Server.

3619

3620 **5.4.4 Integrity of Application Messages and MQTT Control Packets**

3621 Applications can independently include hash values in their Application Messages. This can provide
3622 integrity of the contents of Publish packets across the network and at rest.

3623

3624 TLS [\[RFC5246\]](#) provides hash algorithms to verify the integrity of data sent over the network.

3625

3626 The use of VPNs to connect Clients and Servers can provide integrity of data across the section of the
3627 network covered by a VPN.

3628

3629 **5.4.5 Privacy of Application Messages and MQTT Control Packets**

3630 TLS [\[RFC5246\]](#) can provide encryption of data sent over the network. There are valid TLS cipher suites
3631 that include a NULL encryption algorithm that does not encrypt data. To ensure privacy Clients and
3632 Servers should avoid these cipher suites.

3633

3634 An application might independently encrypt the contents of its Application Messages. This could provide
3635 privacy of the Application Message both over the network and at rest. This would not provide privacy for
3636 other Properties of the Application Message such as Topic Name.

3637
3638 Client and Server implementations can provide encrypted storage for data at rest such as Application
3639 Messages stored as part of a Session.

3640
3641 The use of VPNs to connect Clients and Servers can provide privacy of data across the section of the
3642 network covered by a VPN.

3643

3644 **5.4.6 Non-repudiation of message transmission**

3645 Application designers might need to consider appropriate strategies to achieve end to end non-
3646 repudiation.

3647

3648 **5.4.7 Detecting compromise of Clients and Servers**

3649 Client and Server implementations using TLS [[RFC5246](#)] should provide capabilities to ensure that any
3650 TLS certificates provided when initiating a TLS connection are associated with the hostname of the Client
3651 connecting or Server being connected to.

3652

3653 Client and Server implementations using TLS can choose to provide capabilities to check Certificate
3654 Revocation Lists (CRLs [[RFC5280](#)]) and Online Certificate Status Protocol (OCSP) [[RFC6960](#)] to prevent
3655 revoked certificates from being used.

3656

3657 Physical deployments might combine tamper-proof hardware with the transmission of specific data in
3658 Application Messages. For example, a meter might have an embedded GPS to ensure it is not used in an
3659 unauthorized location. [[IEEE8021AR](#)] is a standard for implementing mechanisms to authenticate a
3660 device's identity using a cryptographically bound identifier.

3661

3662 **5.4.8 Detecting abnormal behaviors**

3663 Server implementations might monitor Client behavior to detect potential security incidents. For example:

- 3664
- 3665 • Repeated connection attempts
 - 3666 • Repeated authentication attempts
 - 3667 • Abnormal termination of connections
 - 3668 • Topic scanning (attempts to send or subscribe to many topics)
 - 3669 • Sending undeliverable messages (no subscribers to the topics)
 - 3670 • Clients that connect but do not send data

3671 Server implementations might close the Network Connection of Clients that breach its security rules.
3672

3673 Server implementations detecting unwelcome behavior might implement a dynamic block list based on
3674 identifiers such as IP address or Client Identifier.

3675

3676 Deployments might use network-level controls (where available) to implement rate limiting or blocking
3677 based on IP address or other information.

3678

3679 **5.4.9 Handling of Disallowed Unicode code points**

3680 **Section** 1.5.4 describes the Disallowed Unicode code points, which should not be included in a UTF-8
3681 Encoded String. A Client or Server implementation can choose whether to validate that these code points
3682 are not used in UTF-8 Encoded Strings such as the Topic Name or Properties.

3683

3684 If the Server does not validate the code points in a UTF-8 Encoded String but a subscribing Client does,
3685 then a second Client might be able to cause the subscribing Client to close the Network Connection by
3686 publishing on a Topic Name or using Properties that contain a Disallowed Unicode code point. This
3687 section recommends some steps that can be taken to prevent this problem.

3688

3689 A similar problem can occur when the Client validates that the payload matches the Payload Format
3690 Indicator and the Server does not. The considerations and remedies for this are similar to those for
3691 handling Disallowed Unicode code points.

3692

3693 **5.4.9.1 Considerations for the use of Disallowed Unicode code points**

3694 An implementation would normally choose to validate UTF-8 Encoded strings, checking that the
3695 Disallowed Unicode code points are not used. This avoids implementation difficulties such as the use of
3696 libraries that are sensitive to these code points, it also protects applications from having to process them.

3697

3698 Validating that these code points are not used removes some security exposures. There are possible
3699 security exploits which use control characters in log files to mask entries in the logs or confuse the tools
3700 which process log files. The Unicode Noncharacters are commonly used as special markers and allowing
3701 them into UTF-8 Encoded Strings could permit such exploits.

3702

3703 **5.4.9.2 Interactions between Publishers and Subscribers**

3704 The publisher of an Application Message normally expects that the Servers will forward the message to
3705 subscribers, and that these subscribers are capable of processing the messages.

3706 These are some conditions under which a publishing Client can cause the subscribing Client to close the
3707 Network Connection. Consider a situation where:

- 3708 • A Client publishes an Application Message using a Topic Name containing one of the Disallowed
3709 Unicode code points.
- 3710 • The publishing Client library allows the Disallowed Unicode code point to be used in a Topic
3711 Name rather than rejecting it.
- 3712 • The publishing Client is authorized to send the publication.
- 3713 • A subscribing Client is authorized to use a Topic Filter which matches the Topic Name. Note that
3714 the Disallowed Unicode code point might occur in a part of the Topic Name matching a wildcard
3715 character in the Topic Filter.
- 3716 • The Server forwards the message to the matching subscriber rather than disconnecting the
3717 publisher.
- 3718 • In this case the subscribing Client might:
 - 3719 ○ Close the Network Connection because it does not allow the use of Disallowed Unicode
3720 code points, possibly sending a DISCONNECT before doing so. For QoS 1 and QoS 2
3721 messages this might cause the Server to send the message again, causing the Client to
3722 close the Network Connection again.

- 3723 ○ Reject the Application Message by sending a Reason Code greater than or equal to 0x80
3724 in a PUBACK (QoS 1) or PUBREC (QoS 2).
3725 ○ Accept the Application Message but fail to process it because it contains one of the
3726 Disallowed Unicode code points.
3727 ○ Successfully process the Application Message.

3728

3729 The potential for the Client to close the Network Connection might go unnoticed until a publisher uses one
3730 of the Disallowed Unicode code points.

3731

3732 **5.4.9.3 Remedies**

3733 If there is a possibility that a Disallowed Unicode code point could be included in a Topic Name or other
3734 Properties delivered to a Client, the solution owner can adopt one of the following suggestions:

- 3735 1) Change the Server implementation to one that rejects UTF-8 Encoded Strings containing a
3736 Disallowed Unicode code point either by sending a Reason Code greater than or equal to 0x80 or
3737 closing the Network Connection.
3738 2) Change the Client library used by the subscribers to one that tolerates the use of Disallowed
3739 Code points. The client can either process or discard messages with UTF-8 Encoded Strings that
3740 contain Disallowed Unicode code points so long as it continues the protocol.

3741

3742 **5.4.10 Other security considerations**

3743 If Client or Server TLS certificates are lost or it is considered that they might be compromised they should
3744 be revoked (utilizing CRLs [\[RFC5280\]](#) and/or OSCP [\[RFC6960\]](#)).

3745

3746 Client or Server authentication credentials, such as User Name and Password, that are lost or considered
3747 compromised should be revoked and/or reissued.

3748

3749 In the case of long lasting connections:

- 3750 • Client and Server implementations using TLS [\[RFC5246\]](#) should allow for session renegotiation to
3751 establish new cryptographic parameters (replace session keys, change cipher suites, change
3752 authentication credentials).
3753 • Servers may close the Network Connection of Clients and require them to re-authenticate with new
3754 credentials.
3755 • Servers may require their Client to reauthenticate periodically using the mechanism described in
3756 [section 4.12.1](#).

3757

3758 Constrained devices and Clients on constrained networks can make use of TLS [\[RFC5246\]](#) session
3759 resumption, in order to reduce the costs of reconnecting TLS [\[RFC5246\]](#) sessions.

3760

3761 Clients connected to a Server have a transitive trust relationship with other Clients connected to the same
3762 Server and who have authority to publish data on the same topics.

3763

3764 **5.4.11 Use of SOCKS**

3765 Implementations of Clients should be aware that some environments will require the use of SOCKSv5
3766 [\[RFC1928\]](#) proxies to make outbound Network Connections. Some MQTT implementations could make

3767 use of alternative secured tunnels (e.g. SSH) through the use of SOCKS. Where implementations choose
3768 to use SOCKS, they should support both anonymous and User Name, Password authenticating SOCKS
3769 proxies. In the latter case, implementations should be aware that SOCKS authentication might occur in
3770 plain-text and so should avoid using the same credentials for connection to a MQTT Server.

3771

3772 **5.4.12 Security profiles**

3773 Implementers and solution designers might wish to consider security as a set of profiles which can be
3774 applied to the MQTT protocol. An example of a layered security hierarchy is presented below.

3775

3776 **5.4.12.1 Clear communication profile**

3777 When using the clear communication profile, the MQTT protocol runs over an open network with no
3778 additional secure communication mechanisms in place.

3779

3780 **5.4.12.2 Secured network communication profile**

3781 When using the secured network communication profile, the MQTT protocol runs over a physical or virtual
3782 network which has security controls e.g., VPNs or physically secure network.

3783

3784 **5.4.12.3 Secured transport profile**

3785 When using the secured transport profile, the MQTT protocol runs over a physical or virtual network and
3786 using TLS [\[RFC5246\]](#) which provides authentication, integrity and privacy.

3787

3788 TLS [\[RFC5246\]](#) Client authentication can be used in addition to – or in place of – MQTT Client
3789 authentication as provided by the User Name and Password fields.

3790

3791 **5.4.12.4 Industry specific security profiles**

3792 It is anticipated that the MQTT protocol will be designed into industry specific application profiles, each
3793 defining a threat model and the specific security mechanisms to be used to address these threats.

3794 Recommendations for specific security mechanisms will often be taken from existing works including:

3795

3796 [\[NISTCSF\]](#) NIST Cyber Security Framework

3797 [\[NIST7628\]](#) NISTIR 7628 Guidelines for Smart Grid Cyber Security

3798 [\[FIPS1402\]](#) Security Requirements for Cryptographic Modules (FIPS PUB 140-2)

3799 [\[PCIDSS\]](#) PCI-DSS Payment Card Industry Data Security Standard

3800 [\[NSAB\]](#) NSA Suite B Cryptography

3801

3802

6 Using WebSocket as a network transport

3803

If MQTT is transported over a WebSocket [RFC6455] connection, the following conditions apply:

3804
3805

- MQTT Control Packets MUST be sent in WebSocket binary data frames. If any other type of data frame is received the recipient MUST close the Network Connection [MQTT-6.0.0-1].

3806
3807
3808

- A single WebSocket data frame can contain multiple or partial MQTT Control Packets. The receiver MUST NOT assume that MQTT Control Packets are aligned on WebSocket frame boundaries [MQTT-6.0.0-2].

3809

- The Client MUST include “mqtt” in the list of WebSocket Sub Protocols it offers [MQTT-6.0.0-3].

3810
3811

- The WebSocket Subprotocol name selected and returned by the Server MUST be “mqtt” [MQTT-6.0.0-4].

3812

- The WebSocket URI used to connect the Client and Server has no impact on the MQTT protocol.

3813

3814

6.1 IANA considerations

3815

This specification requests IANA to modify the registration of the WebSocket MQTT sub-protocol under the “WebSocket Subprotocol Name” registry with the following data:

3816

3817

3818

Figure 6.6-1 - IANA WebSocket Identifier

Subprotocol Identifier	mqtt
Subprotocol Common Name	mqtt
Subprotocol Definition	http://docs.oasis-open.org/mqtt/mqtt/v5.0/os/mqtt-v5.0-os.html

3819

3820 7 Conformance

3821 The MQTT specification defines conformance for MQTT Client implementations and MQTT Server
3822 implementations. An MQTT implementation can conform as both an MQTT Client and an MQTT Server.
3823

3824 7.1 Conformance clauses

3825 7.1.1 MQTT Server conformance clause

3826 Refer to [Server](#) in the Terminology section for a definition of Server.

3827

3828 An MQTT Server conforms to this specification only if it satisfies all the statements below:

- 3829 1. The format of all MQTT Control Packets that the Server sends matches the format described in
3830 [Chapter 2](#) and [Chapter 3](#).
- 3831 2. It follows the Topic matching rules described in [section 4.7](#) and the Subscription rules in [section 4.8](#).
- 3832 3. It satisfies the MUST level requirements in the following chapters that are identified except for those
3833 that only apply to the Client:
- 3834 • [Chapter 1 - Introduction](#)
 - 3835 • [Chapter 2 - MQTT Control Packet format](#)
 - 3836 • [Chapter 3 - MQTT Control Packets](#)
 - 3837 • [Chapter 4 - Operational behavior](#)
 - 3838 • [Chapter 6 - Using WebSocket as a network transport](#)
- 3839 4. It does not require the use of any extensions defined outside of the specification in order to
3840 interoperate with any other conformant implementation.

3841

3842 7.1.2 MQTT Client conformance clause

3843 Refer to [Client](#) in the Terminology section for a definition of Client.

3844

3845 An MQTT Client conforms to this specification only if it satisfies all the statements below:

- 3846 1. The format of all MQTT Control Packets that the Client sends matches the format described in
3847 [Chapter 2](#) and [Chapter 3](#).
- 3848 2. It satisfies the MUST level requirements in the following chapters that are identified except for those
3849 that only apply to the Server:
- 3850 • [Chapter 1 - Introduction](#)
 - 3851 • [Chapter 2 - MQTT Control Packet format](#)
 - 3852 • [Chapter 3 - MQTT Control Packets](#)
 - 3853 • [Chapter 4 - Operational behavior](#)
 - 3854 • [Chapter 6 - Using WebSocket as a network transport](#)
- 3855 3. It does not require the use of any extensions defined outside of the specification in order to
3856 interoperate with any other conformant implementation.

3857

3858

Appendix A. Acknowledgments

3859 The TC owes special thanks to Dr. Andy Stanford-Clark and Arlen Nipper as the original inventors of the
3860 MQTT protocol and for their continued support with the standardization process.

3861

3862 The following individuals were members of the OASIS Technical Committee during the creation of this
3863 specification and their contributions are gratefully acknowledged:

3864

3865 **Participants:**

- 3866 • Senthil Nathan Balasubramaniam (Infiswift)
- 3867 • Dr. Andrew Banks, editor (IBM)
- 3868 • Ken Borgendale, editor (IBM)
- 3869 • Ed Briggs, editor (Microsoft)
- 3870 • Raphael Cohn (Individual)
- 3871 • Richard Coppen, chairman (IBM)
- 3872 • William Cox (Individual)
- 3873 • Ian Craggs , secretary (IBM)
- 3874 • Konstantin Dotchkoff (Microsoft)
- 3875 • Derek Fu (IBM)
- 3876 • Rahul Gupta, editor (IBM)
- 3877 • Stefan Hagen (Individual)
- 3878 • David Horton (Solace Systems)
- 3879 • Alex Kritikos (Software AG, Inc.)
- 3880 • Jonathan Levell (IBM)
- 3881 • Shawn McAllister (Solace Systems)
- 3882 • William McLane (TIBCO Software Inc.)
- 3883 • Peter Niblett (IBM)
- 3884 • Dominik Obermaier (dc-square GmbH)
- 3885 • Nicholas O'Leary (IBM)
- 3886 • Brian Raymor, chairman (Microsoft)
- 3887 • Andrew Schofield (IBM)
- 3888 • Tobias Sommer (Cumulocity)
- 3889 • Joe Speed (IBM)
- 3890 • Dr Andy Stanford-Clark (IBM)
- 3891 • Allan Stockdill-Mander (IBM)
- 3892 • Stehan Vaillant (Cumulocity)

3893

3894 For a list of those who contributed to earlier versions of MQTT refer to Appendix A in the MQTT v3.1.1
3895 specification **[MQTTV311]**.

3896

3897
3898

Appendix B. Mandatory normative statement (non-normative)

3899 This Appendix is non-normative and is provided as a convenient summary of the numbered conformance
3900 statements found in the main body of this document. Refer to [Chapter 7](#) for a definitive list of
3901 conformance requirements.
3902

Normative Statement Number	Normative Statement
[MQTT-1.5.4-1]	The character data in a UTF-8 Encoded String MUST be well-formed UTF-8 as defined by the Unicode specification [Unicode] and restated in RFC 3629 [RFC3629]. In particular, the character data MUST NOT include encodings of code points between U+D800 and U+DFFF.
[MQTT-1.5.4-2]	A UTF-8 Encoded String MUST NOT include an encoding of the null character U+0000.
[MQTT-1.5.4-3]	A UTF-8 encoded sequence 0xEF 0xBB 0xBF is always interpreted as U+FEFF ("ZERO WIDTH NO-BREAK SPACE") wherever it appears in a string and MUST NOT be skipped over or stripped off by a packet receiver.
[MQTT-1.5.5-1]	The encoded value MUST use the minimum number of bytes necessary to represent the value.
[MQTT-1.5.7-1]	Both strings MUST comply with the requirements for UTF-8 Encoded Strings.
[MQTT-2.1.3-1]	Where a flag bit is marked as "Reserved" it is reserved for future use and MUST be set to the value listed.
[MQTT-2.2.1-2]	A PUBLISH packet MUST NOT contain a Packet Identifier if its QoS value is set to 0.
[MQTT-2.2.1-3]	Each time a Client sends a new SUBSCRIBE, UNSUBSCRIBE, or PUBLISH (where QoS > 0) MQTT Control Packet it MUST assign it a non-zero Packet Identifier that is currently unused.
[MQTT-2.2.1-4]	Each time a Server sends a new PUBLISH (with QoS > 0) MQTT Control Packet it MUST assign it a non zero Packet Identifier that is currently unused.
[MQTT-2.2.1-5]	A PUBACK, PUBREC, PUBREL, or PUBCOMP packet MUST contain the same Packet Identifier as the PUBLISH packet that was originally sent.
[MQTT-2.2.1-6]	A SUBACK and UNSUBACK MUST contain the Packet Identifier that was used in the corresponding SUBSCRIBE and UNSUBSCRIBE packet respectively.
[MQTT-2.2.2-1]	If there are no properties, this MUST be indicated by including a Property Length of zero.
[MQTT-3.1.0-1]	After a Network Connection is established by a Client to a Server, the first packet sent from the Client to the Server MUST be a CONNECT packet.

[MQTT-3.1.0-2]	The Server MUST process a second CONNECT packet sent from a Client as a Protocol Error and close the Network Connection.
[MQTT-3.1.2-1]	The protocol name MUST be the UTF-8 String "MQTT". If the Server does not want to accept the CONNECT, and wishes to reveal that it is an MQTT Server it MAY send a CONNACK packet with Reason Code of 0x84 (Unsupported Protocol Version), and then it MUST close the Network Connection.
[MQTT-3.1.2-2]	If the Protocol Version is not 5 and the Server does not want to accept the CONNECT packet, the Server MAY send a CONNACK packet with Reason Code 0x84 (Unsupported Protocol Version) and then MUST close the Network Connection
[MQTT-3.1.2-3]	The Server MUST validate that the reserved flag in the CONNECT packet is set to 0.
[MQTT-3.1.2-4]	If a CONNECT packet is received with Clean Start is set to 1, the Client and Server MUST discard any existing Session and start a new Session.
[MQTT-3.1.2-5]	If a CONNECT packet is received with Clean Start set to 0 and there is a Session associated with the Client Identifier, the Server MUST resume communications with the Client based on state from the existing Session.
[MQTT-3.1.2-6]	If a CONNECT packet is received with Clean Start set to 0 and there is no Session associated with the Client Identifier, the Server MUST create a new Session.
[MQTT-3.1.2-7]	If the Will Flag is set to 1 this indicates that, a Will Message MUST be stored on the Server and associated with the Session.
[MQTT-3.1.2-8]	The Will Message MUST be published after the Network Connection is subsequently closed and either the Will Delay Interval has elapsed or the Session ends, unless the Will Message has been deleted by the Server on receipt of a DISCONNECT packet with Reason Code 0x00 (Normal disconnection) or a new Network Connection for the ClientID is opened before the Will Delay Interval has elapsed.
[MQTT-3.1.2-9]	If the Will Flag is set to 1, the Will QoS and Will Retain fields in the Connect Flags will be used by the Server, and the Will Properties, Will Topic and Will Message fields MUST be present in the Payload.
[MQTT-3.1.2-10]	The Will Message MUST be removed from the stored Session State in the Server once it has been published or the Server has received a DISCONNECT packet with a Reason Code of 0x00 (Normal disconnection) from the Client.
[MQTT-3.1.2-11]	If the Will Flag is set to 0, then the Will QoS MUST be set to 0 (0x00).
[MQTT-3.1.2-12]	If the Will Flag is set to 1, the value of Will QoS can be 0 (0x00), 1 (0x01), or 2 (0x02).
[MQTT-3.1.2-13]	If the Will Flag is set to 0, then Will Retain MUST be set to 0.
[MQTT-3.1.2-14]	If the Will Flag is set to 1 and Will Retain is set to 0, the Server MUST publish the Will Message as a non-retained message.
[MQTT-3.1.2-15]	If the Will Flag is set to 1 and Will Retain is set to 1, the Server MUST publish the Will Message as a retained message.
[MQTT-3.1.2-16]	If the User Name Flag is set to 0, a User Name MUST NOT be present in the Payload.

[MQTT-3.1.2-17]	If the User Name Flag is set to 1, a User Name MUST be present in the Payload.
[MQTT-3.1.2-18]	If the Password Flag is set to 0, a Password MUST NOT be present in the Payload.
[MQTT-3.1.2-19]	If the Password Flag is set to 1, a Password MUST be present in the Payload.
[MQTT-3.1.2-20]	If Keep Alive is non-zero and in the absence of sending any other MQTT Control Packets, the Client MUST send a PINGREQ packet.
[MQTT-3.1.2-21]	If the Server returns a Server Keep Alive on the CONNACK packet, the Client MUST use that value instead of the value it sent as the Keep Alive.
[MQTT-3.1.2-22]	If the Keep Alive value is non-zero and the Server does not receive an MQTT Control Packet from the Client within one and a half times the Keep Alive time period, it MUST close the Network Connection to the Client as if the network had failed.
[MQTT-3.1.2-23]	The Client and Server MUST store the Session State after the Network Connection is closed if the Session Expiry Interval is greater than 0.
[MQTT-3.1.2-24]	The Server MUST NOT send packets exceeding Maximum Packet Size to the Client.
[MQTT-3.1.2-25]	Where a Packet is too large to send, the Server MUST discard it without sending it and then behave as if it had completed sending that Application Message.
[MQTT-3.1.2-26]	The Server MUST NOT send a Topic Alias in a PUBLISH packet to the Client greater than Topic Alias Maximum.
[MQTT-3.1.2-27]	If Topic Alias Maximum is absent or zero, the Server MUST NOT send any Topic Aliases to the.
[MQTT-3.1.2-28]	A value of 0 indicates that the Server MUST NOT return Response Information.
[MQTT-3.1.2-29]	If the value of Request Problem Information is 0, the Server MAY return a Reason String or User Properties on a CONNACK or DISCONNECT packet, but MUST NOT send a Reason String or User Properties on any packet other than PUBLISH, CONNACK, or DISCONNECT.
[MQTT-3.1.2-30]	If a Client sets an Authentication Method in the CONNECT, the Client MUST NOT send any packets other than AUTH or DISCONNECT packets until it has received a CONNACK packet.
[MQTT-3.1.3-1]	The Payload of the CONNECT packet contains one or more length-prefixed fields, whose presence is determined by the flags in the Variable Header. These fields, if present, MUST appear in the order Client Identifier, Will Topic, Will Message, User Name, Password.
[MQTT-3.1.3-2]	The ClientID MUST be used by Clients and by Servers to identify state that they hold relating to this MQTT Session between the Client and the Server.
[MQTT-3.1.3-3]	The ClientID MUST be present and is the first field in the CONNECT packet Payload.
[MQTT-3.1.3-4]	The ClientID MUST be a UTF-8 Encoded String.

[MQTT-3.1.3-5]	The Server MUST allow ClientID's which are between 1 and 23 UTF-8 encoded bytes in length, and that contain only the characters "0123456789abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ".
[MQTT-3.1.3-6]	A Server MAY allow a Client to supply a ClientID that has a length of zero bytes, however if it does so the Server MUST treat this as a special case and assign a unique ClientID to that Client.
[MQTT-3.1.3-7]	It MUST then process the CONNECT packet as if the Client had provided that unique ClientID, and MUST return the Assigned Client Identifier in the CONNACK packet.
[MQTT-3.1.3-8]	If the Server rejects the ClientID it MAY respond to the CONNECT packet with a CONNACK using Reason Code 0x85 (Client Identifier not valid) as described in section 4.13 Handling errors, and then it MUST close the Network Connection.
[MQTT-3.1.3-9]	If a new Network Connection to this Session is made before the Will Delay Interval has passed, the Server MUST NOT send the Will Message.
[MQTT-3.1.3-10]	The Server MUST maintain the order of User Properties when forwarding the Application Message.
[MQTT-3.1.3-11]	The Will Topic MUST be a UTF-8 Encoded String.
[MQTT-3.1.3-12]	If the User Name Flag is set to 1, the User Name is the next field in the Payload. The User Name MUST be a UTF-8 Encoded String.
[MQTT-3.1.4-1]	The Server MUST validate that the CONNECT packet matches the format described in section 3.1 and close the Network Connection if it does not match.
[MQTT-3.1.4-2]	The Server MAY check that the contents of the CONNECT packet meet any further restrictions and SHOULD perform authentication and authorization checks. If any of these checks fail, it MUST close the Network Connection.
[MQTT-3.1.4-3]	If the ClientID represents a Client already connected to the Server, the Server sends a DISCONNECT packet to the existing Client with Reason Code of 0x8E (Session taken over) as described in section 4.13 and MUST close the Network Connection of the existing Client.
[MQTT-3.1.4-4]	The Server MUST perform the processing of Clean Start.
[MQTT-3.1.4-5]	The Server MUST acknowledge the CONNECT packet with a CONNACK packet containing a 0x00 (Success) Reason Code.
[MQTT-3.1.4-6]	If the Server rejects the CONNECT, it MUST NOT process any data sent by the Client after the CONNECT packet except AUTH packets.
[MQTT-3.2.0-1]	The Server MUST send a CONNACK with a 0x00 (Success) Reason Code before sending any Packet other than AUTH.
[MQTT-3.2.0-2]	The Server MUST NOT send more than one CONNACK in a Network Connection.
[MQTT-3.2.2-1]	Byte 1 is the "Connect Acknowledge Flags". Bits 7-1 are reserved and MUST be set to 0.

[MQTT-3.2.2-2]	If the Server accepts a connection with Clean Start set to 1, the Server MUST set Session Present to 0 in the CONNACK packet in addition to setting a 0x00 (Success) Reason Code in the CONNACK packet.
[MQTT-3.2.2-3]	If the Server accepts a connection with Clean Start set to 0 and the Server has Session State for the ClientID, it MUST set Session Present to 1 in the CONNACK packet, otherwise it MUST set Session Present to 0 in the CONNACK packet. In both cases it MUST set a 0x00 (Success) Reason Code in the CONNACK packet.
[MQTT-3.2.2-4]	If the Client does not have Session State and receives Session Present set to 1 it MUST close the Network Connection.
[MQTT-3.2.2-5]	If the Client does have Session State and receives Session Present set to 0 it MUST discard its Session State if it continues with the Network Connection.
[MQTT-3.2.2-6]	If a Server sends a CONNACK packet containing a non-zero Reason Code it MUST set Session Present to 0.
[MQTT-3.2.2-7]	If a Server sends a CONNACK packet containing a Reason code of 0x80 or greater it MUST then close the Network Connection.
[MQTT-3.2.2-8]	The Server sending the CONNACK packet MUST use one of the Connect Reason Code values.
[MQTT-3.2.2-9]	If a Server does not support QoS 1 or QoS 2 PUBLISH packets it MUST send a Maximum QoS in the CONNACK packet specifying the highest QoS it supports.
[MQTT-3.2.2-10]	A Server that does not support QoS 1 or QoS 2 PUBLISH packets MUST still accept SUBSCRIBE packets containing a Requested QoS of 0, 1 or 2.
[MQTT-3.2.2-11]	If a Client receives a Maximum QoS from a Server, it MUST NOT send PUBLISH packets at a QoS level exceeding the Maximum QoS level specified.
[MQTT-3.2.2-12]	If a Server receives a CONNECT packet containing a Will QoS that exceeds its capabilities, it MUST reject the connection. It SHOULD use a CONNACK packet with Reason Code 0x9B (QoS not supported) as described in section 4.13 Handling errors, and MUST close the Network Connection.
[MQTT-3.2.2-13]	If a Server receives a CONNECT packet containing a Will Message with the Will Retain 1, and it does not support retained messages, the Server MUST reject the connection request. It SHOULD send CONNACK with Reason Code 0x9A (Retain not supported) and then it MUST close the Network Connection.
[MQTT-3.2.2-14]	A Client receiving Retain Available set to 0 from the Server MUST NOT send a PUBLISH packet with the RETAIN flag set to 1.
[MQTT-3.2.2-15]	The Client MUST NOT send packets exceeding Maximum Packet Size to the Server.
[MQTT-3.2.2-16]	If the Client connects using a zero length Client Identifier, the Server MUST respond with a CONNACK containing an Assigned Client Identifier. The Assigned Client Identifier MUST be a new Client Identifier not used by any other Session currently in the Server.
[MQTT-3.2.2-17]	The Client MUST NOT send a Topic Alias in a PUBLISH packet to the Server greater than this value.
[MQTT-3.2.2-18]	Topic Alias Maximum is absent, the Client MUST NOT send any Topic Aliases on to the Server.

[MQTT-3.2.2-19]	The Server MUST NOT send this property if it would increase the size of the CONNACK packet beyond the Maximum Packet Size specified by the Client.
[MQTT-3.2.2-20]	The Server MUST NOT send this property if it would increase the size of the CONNACK packet beyond the Maximum Packet Size specified by the Client.
[MQTT-3.2.2-21]	If the Server sends a Server Keep Alive on the CONNACK packet, the Client MUST use this value instead of the Keep Alive value the Client sent on CONNECT.
[MQTT-3.2.2-22]	If the Server does not send the Server Keep Alive, the Server MUST use the Keep Alive value set by the Client on CONNECT.
[MQTT-3.3.1-1]	The DUP flag MUST be set to 1 by the Client or Server when it attempts to re-deliver a PUBLISH packet.
[MQTT-3.3.1-2]	The DUP flag MUST be set to 0 for all QoS 0 messages.
[MQTT-3.3.1-3]	The DUP flag in the outgoing PUBLISH packet is set independently to the incoming PUBLISH packet, its value MUST be determined solely by whether the outgoing PUBLISH packet is a retransmission.
[MQTT-3.3.1-4]	A PUBLISH Packet MUST NOT have both QoS bits set to 1.
[MQTT-3.3.1-5]	If the RETAIN flag is set to 1 in a PUBLISH packet sent by a Client to a Server, the Server MUST replace any existing retained message for this topic and store the Application Message.
[MQTT-3.3.1-6]	If the Payload contains zero bytes it is processed normally by the Server but any retained message with the same topic name MUST be removed and any future subscribers for the topic will not receive a retained message.
[MQTT-3.3.1-7]	A retained message with a Payload containing zero bytes MUST NOT be stored as a retained message on the Server.
[MQTT-3.3.1-8]	If the RETAIN flag is 0 in a PUBLISH packet sent by a Client to a Server, the Server MUST NOT store the message as a retained message and MUST NOT remove or replace any existing retained message.
[MQTT-3.3.1-9]	If Retain Handling is set to 0 the Server MUST send the retained messages matching the Topic Filter of the subscription to the Client.
[MQTT-3.3.1-10]	If Retain Handling is set to 1 then if the subscription did already exist, the Server MUST send all retained message matching the Topic Filter of the subscription to the Client, and if the subscription did not exist, the Server MUST NOT send the retained messages.
[MQTT-3.3.1-11]	If Retain Handling is set to 2, the Server MUST NOT send the retained
[MQTT-3.3.1-12]	If the value of Retain As Published subscription option is set to 0, the Server MUST set the RETAIN flag to 0 when forwarding an Application Message regardless of how the RETAIN flag was set in the received PUBLISH packet.
[MQTT-3.3.1-13]	If the value of Retain As Published subscription option is set to 1, the Server MUST set the RETAIN flag equal to the RETAIN flag in the received PUBLISH packet.
[MQTT-3.3.2-1]	The Topic Name MUST be present as the first field in the PUBLISH packet Variable Header. It MUST be a UTF-8 Encoded String.

[MQTT-3.3.2-2]	The Topic Name in the PUBLISH packet MUST NOT contain wildcard characters.
[MQTT-3.3.2-3]	The Topic Name in a PUBLISH packet sent by a Server to a subscribing Client MUST match the Subscription's Topic Filter.
[MQTT-3.3.2-4]	A Server MUST send the Payload Format Indicator unaltered to all subscribers receiving the message.
[MQTT-3.3.2-5]	If the Message Expiry Interval has passed and the Server has not managed to start onward delivery to a matching subscriber, then it MUST delete the copy of the message for that subscriber.
[MQTT-3.3.2-6]	The PUBLISH packet sent to a Client by the Server MUST contain a Message Expiry Interval set to the received value minus the time that the message has been waiting in the Server.
[MQTT-3.3.2-7]	A receiver MUST NOT carry forward any Topic Alias mappings from one Network Connection to another.
[MQTT-3.3.2-8]	A sender MUST NOT send a PUBLISH packet containing a Topic Alias which has the value 0.
[MQTT-3.3.2-9]	A Client MUST NOT send a PUBLISH packet with a Topic Alias greater than the Topic Alias Maximum value returned by the Server in the CONNACK packet.
[MQTT-3.3.2-10]	A Client MUST accept all Topic Alias values greater than 0 and less than or equal to the Topic Alias Maximum value that it sent in the CONNECT packet.
[MQTT-3.3.2-11]	A Server MUST NOT send a PUBLISH packet with a Topic Alias greater than the Topic Alias Maximum value sent by the Client in the CONNECT packet.
[MQTT-3.3.2-12]	A Server MUST accept all Topic Alias values greater than 0 and less than or equal to the Topic Alias Maximum value that it returned in the CONNACK packet.
[MQTT-3.3.2-13]	The Response Topic MUST be a UTF-8 Encoded String.
[MQTT-3.3.2-14]	The Response Topic MUST NOT contain wildcard characters.
[MQTT-3.3.2-15]	The Server MUST send the Response Topic unaltered to all subscribers receiving the Application Message.
[MQTT-3.3.2-16]	The Server MUST send the Correlation Data unaltered to all subscribers receiving the Application Message.
[MQTT-3.3.2-17]	The Server MUST send all User Properties unaltered in a PUBLISH packet when forwarding the Application Message to a Client.
[MQTT-3.3.2-18]	The Server MUST maintain the order of User Properties when forwarding the Application Message.
[MQTT-3.3.2-19]	The Content Type MUST be a UTF-8 Encoded String.
[MQTT-3.3.2-20]	A Server MUST send the Content Type unaltered to all subscribers receiving the Application Message.

[MQTT-3.3.4-1]	The receiver of a PUBLISH Packet MUST respond with the packet as determined by the QoS in the PUBLISH Packet.
[MQTT-3.3.4-2]	In this case the Server MUST deliver the message to the Client respecting the maximum QoS of all the matching subscriptions.
[MQTT-3.3.4-3]	If the Client specified a Subscription Identifier for any of the overlapping subscriptions the Server MUST send those Subscription Identifiers in the message which is published as the result of the subscriptions.
[MQTT-3.3.4-4]	If the Server sends a single copy of the message it MUST include in the PUBLISH packet the Subscription Identifiers for all matching subscriptions which have a Subscription Identifiers, their order is not significant.
[MQTT-3.3.4-5]	If the Server sends multiple PUBLISH packets it MUST send, in each of them, the Subscription Identifier of the matching subscription if it has a Subscription Identifier.
[MQTT-3.3.4-6]	A PUBLISH packet sent from a Client to a Server MUST NOT contain a Subscription Identifier.
[MQTT-3.3.4-7]	The Client MUST NOT send more than Receive Maximum QoS 1 and QoS 2 PUBLISH packets for which it has not received PUBACK, PUBCOMP, or PUBREC with a Reason Code of 128 or greater from the Server.
[MQTT-3.3.4-8]	The Client MUST NOT delay the sending of any packets other than PUBLISH packets due to having sent Receive Maximum PUBLISH packets without receiving acknowledgements for them.
[MQTT-3.3.4-9]	The Server MUST NOT send more than Receive Maximum QoS 1 and QoS 2 PUBLISH packets for which it has not received PUBACK, PUBCOMP, or PUBREC with a Reason Code of 128 or greater from the Client.
[MQTT-3.3.4-10]	The Server MUST NOT delay the sending of any packets other than PUBLISH packets due to having sent Receive Maximum PUBLISH packets without receiving acknowledgements for them.
[MQTT-3.4.2-1]	The Client or Server sending the PUBACK packet MUST use one of the PUBACK Reason Codes.
[MQTT-3.4.2-2]	The sender MUST NOT send this property if it would increase the size of the PUBACK packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-3.4.2-3]	The sender MUST NOT send this property if it would increase the size of the PUBACK packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-3.5.2-1]	The Client or Server sending the PUBREC packet MUST use one of the PUBREC Reason Codes.
[MQTT-3.5.2-2]	The sender MUST NOT send this property if it would increase the size of the PUBREC packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-3.5.2-3]	The sender MUST NOT send this property if it would increase the size of the PUBREC packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-3.6.1-1]	Bits 3,2,1 and 0 of the Fixed Header in the PUBREL packet are reserved and MUST be set to 0,0,1 and 0 respectively. The Server MUST treat any other value as malformed and close the Network Connection.

[MQTT-3.6.2-1]	The Client or Server sending the PUBREL packet MUST use one of the PUBREL Reason Codes.
[MQTT-3.6.2-2]	The sender MUST NOT send this Property if it would increase the size of the PUBREL packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-3.6.2-3]	The sender MUST NOT send this property if it would increase the size of the PUBREL packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-3.7.2-1]	The Client or Server sending the PUBCOMP packets MUST use one of the PUBCOMP Reason Codes.
[MQTT-3.7.2-2]	The sender MUST NOT use this Property if it would increase the size of the PUBCOMP packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-3.7.2-3]	The sender MUST NOT send this property if it would increase the size of the PUBCOMP packet beyond the Maximum Packet Size specified by receiver.
[MQTT-3.8.1-1]	Bits 3,2,1 and 0 of the Fixed Header of the SUBSCRIBE packet are reserved and MUST be set to 0,0,1 and 0 respectively. The Server MUST treat any other value as malformed and close the Network Connection
[MQTT-3.8.3-1]	The Topic Filters MUST be a UTF-8 Encoded String.
[MQTT-3.8.3-2]	The Payload MUST contain at least one Topic Filter and Subscription Options pair.
[MQTT-3.8.3-3]	Bit 2 of the Subscription Options represents the No Local option. If the value is 1, Application Messages MUST NOT be forwarded to a connection with a ClientID equal to the ClientID of the publishing connection.
[MQTT-3.8.3-4]	It is a Protocol Error to set the No Local bit to 1 on a Shared Subscription.
[MQTT-3.8.3-5]	The Server MUST treat a SUBSCRIBE packet as malformed if any of Reserved bits in the Payload are non-zero.
[MQTT-3.8.4-1]	When the Server receives a SUBSCRIBE packet from a Client, the Server MUST respond with a SUBACK packet.
[MQTT-3.8.4-2]	The SUBACK packet MUST have the same Packet Identifier as the SUBSCRIBE packet that it is acknowledging.
[MQTT-3.8.4-3]	If a Server receives a SUBSCRIBE packet containing a Topic Filter that is identical to a Non-shared Subscription's Topic Filter for the current Session then it MUST replace that existing Subscription with a new Subscription.
[MQTT-3.8.4-4]	If the Retain Handling option is 0, any existing retained messages matching the Topic Filter MUST be re-sent, but Application Messages MUST NOT be lost due to replacing the Subscription.
[MQTT-3.8.4-5]	If a Server receives a SUBSCRIBE packet that contains multiple Topic Filters it MUST handle that packet as if it had received a sequence of multiple SUBSCRIBE packets, except that it combines their responses into a single SUBACK response.
[MQTT-3.8.4-6]	The SUBACK packet sent by the Server to the Client MUST contain a Reason Code for each Topic Filter/Subscription Option pair.

[MQTT-3.8.4-7]	This Reason Code MUST either show the maximum QoS that was granted for that Subscription or indicate that the subscription failed.
[MQTT-3.8.4-8]	The QoS of Payload Messages sent in response to a Subscription MUST be the minimum of the QoS of the originally published message and the Maximum QoS granted by the Server.
[MQTT-3.9.2-1]	The Server MUST NOT send this Property if it would increase the size of the SUBACK packet beyond the Maximum Packet Size specified by the Client.
[MQTT-3.9.2-2]	The Server MUST NOT send this property if it would increase the size of the SUBACK packet beyond the Maximum Packet Size specified by the Client.
[MQTT-3.9.3-1]	The order of Reason Codes in the SUBACK packet MUST match the order of Topic Filters in the SUBSCRIBE packet.
[MQTT-3.9.3-2]	The Server sending the SUBACK packet MUST send one of the Subscribe Reason Code values for each Topic Filter received.
[MQTT-3.10.1-1]	Bits 3,2,1 and 0 of the Fixed Header of the UNSUBSCRIBE packet are reserved and MUST be set to 0,0,1 and 0 respectively. The Server MUST treat any other value as malformed and close the Network Connection
[MQTT-3.10.3-1]	The Topic Filters in an UNSUBSCRIBE packet MUST be UTF-8 Encoded Strings.
[MQTT-3.10.3-2]	The Payload of an UNSUBSCRIBE packet MUST contain at least one Topic Filter.
[MQTT-3.10.4-1]	The Topic Filters (whether they contain wildcards or not) supplied in an UNSUBSCRIBE packet MUST be compared character-by-character with the current set of Topic Filters held by the Server for the Client. If any filter matches exactly then its owning Subscription MUST be deleted.
[MQTT-3.10.4-2]	When a Server receives UNSUBSCRIBE It MUST stop adding any new messages which match the Topic Filters, for delivery to the Client.
[MQTT-3.10.4-3]	When a Server receives UNSUBSCRIBE It MUST complete the delivery of any QoS 1 or QoS 2 messages which match the Topic Filters and it has started to send to the Client.
[MQTT-3.10.4-4]	The Server MUST respond to an UNSUBSCRIBE request by sending an UNSUBACK packet.
[MQTT-3.10.4-5]	The UNSUBACK packet MUST have the same Packet Identifier as the UNSUBSCRIBE packet. Even where no Topic Subscriptions are deleted, the Server MUST respond with an UNSUBACK.
[MQTT-3.10.4-6]	If a Server receives an UNSUBSCRIBE packet that contains multiple Topic Filters, it MUST process that packet as if it had received a sequence of multiple UNSUBSCRIBE packets, except that it sends just one UNSUBACK response.
[MQTT-3.11.2-1]	The Server MUST NOT send this Property if it would increase the size of the UNSUBACK packet beyond the Maximum Packet Size specified by the Client.
[MQTT-3.11.2-2]	The Server MUST NOT send this property if it would increase the size of the UNSUBACK packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-3.11.3-1]	The order of Reason Codes in the UNSUBACK packet MUST match the order of Topic Filters in the UNSUBSCRIBE packet.

[MQTT-3.11.3-2]	The Server sending the UNSUBACK packet MUST use one of the UNSUBSCRIBE Reason Code values for each Topic Filter received.
[MQTT-3.12.4-1]	The Server MUST send a PINGRESP packet in response to a PINGREQ packet.
[MQTT-3.14.0-1]	A Server MUST NOT send a DISCONNECT until after it has sent a CONNACK with Reason Code of less than 0x80.
[MQTT-3.14.1-1]	The Client or Server MUST validate that reserved bits are set to 0. If they are not zero it sends a DISCONNECT packet with a Reason code of 0x81 (Malformed Packet).
[MQTT-3.14.2-1]	The Client or Server sending the DISCONNECT packet MUST use one of the DISCONNECT Reason Codes.
[MQTT-3.14.2-2]	The Session Expiry Interval MUST NOT be sent on a DISCONNECT by the Server.
[MQTT-3.14.2-3]	The sender MUST NOT use this Property if it would increase the size of the DISCONNECT packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-3.14.2-4]	The sender MUST NOT send this property if it would increase the size of the DISCONNECT packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-3.14.4-1]	After sending a DISCONNECT packet the sender MUST NOT send any more MQTT Control Packets on that Network Connection.
[MQTT-3.14.4-2]	After sending a DISCONNECT packet the sender MUST close the Network Connection.
[MQTT-3.14.4-3]	On receipt of DISCONNECT with a Reason Code of 0x00 (Success) the Server MUST discard any Will Message associated with the current Connection without publishing it.
[MQTT-3.15.1-1]	Bits 3,2,1 and 0 of the Fixed Header of the AUTH packet are reserved and MUST all be set to 0. The Client or Server MUST treat any other value as malformed and close the Network Connection.
[MQTT-3.15.2-1]	The sender of the AUTH Packet MUST use one of the Authenticate Reason Codes.
[MQTT-3.15.2-2]	The sender MUST NOT send this property if it would increase the size of the AUTH packet beyond the Maximum Packet Size specified by the receiver
[MQTT-3.15.2-3]	The sender MUST NOT send this property if it would increase the size of the AUTH packet beyond the Maximum Packet Size specified by the receiver.
[MQTT-4.1.0-1]	The Client and Server MUST NOT discard the Session State while the Network Connection is open.
[MQTT-4.2.0-1]	A Client or Server MUST support the use of one or more underlying transport protocols that provide an ordered, lossless, stream of bytes from the Client to Server and Server to Client.
[MQTT-4.1.0-2]	The Server MUST discard the Session State when the Network Connection is closed and the Session Expiry Interval has passed.
[MQTT-4.3.1-1]	In the QoS 0 delivery protocol, the sender MUST send a PUBLISH packet with QoS 0 and DUP flag set to 0.

[MQTT-4.3.2-1]	In the QoS 1 delivery protocol, the sender MUST assign an unused Packet Identifier each time it has a new Application Message to publish.
[MQTT-4.3.2-2]	In the QoS 1 delivery protocol, the sender MUST send a PUBLISH packet containing this Packet Identifier with QoS 1 and DUP flag set to 0.
[MQTT-4.3.2-3]	In the QoS 1 delivery protocol, the sender MUST treat the PUBLISH packet as “unacknowledged” until it has received the corresponding PUBACK packet from the receiver.
[MQTT-4.3.2-4]	In the QoS 1 delivery protocol, the receiver MUST respond with a PUBACK packet containing the Packet Identifier from the incoming PUBLISH packet, having accepted ownership of the Application Message.
[MQTT-4.3.2-5]	In the QoS 1 delivery protocol, the receiver after it has sent a PUBACK packet the receiver MUST treat any incoming PUBLISH packet that contains the same Packet Identifier as being a new Application Message, irrespective of the setting of its DUP flag.
[MQTT-4.3.3-1]	In the QoS 2 delivery protocol, the sender MUST assign an unused Packet Identifier when it has a new Application Message to publish.
[MQTT-4.3.3-2]	In the QoS 2 delivery protocol, the sender MUST send a PUBLISH packet containing this Packet Identifier with QoS 2 and DUP flag set to 0.
[MQTT-4.3.3-3]	In the QoS 2 delivery protocol, the sender MUST treat the PUBLISH packet as “unacknowledged” until it has received the corresponding PUBREC packet from the receiver.
[MQTT-4.3.3-4]	In the QoS 2 delivery protocol, the sender MUST send a PUBREL packet when it receives a PUBREC packet from the receiver with a Reason Code value less than 0x80. This PUBREL packet MUST contain the same Packet Identifier as the original PUBLISH packet.
[MQTT-4.3.3-5]	In the QoS 2 delivery protocol, the sender MUST treat the PUBREL packet as “unacknowledged” until it has received the corresponding PUBCOMP packet from the receiver.
[MQTT-4.3.3-6]	In the QoS 2 delivery protocol, the sender MUST NOT re-send the PUBLISH once it has sent the corresponding PUBREL packet.
[MQTT-4.3.3-7]	In the QoS 2 delivery protocol, the sender MUST NOT apply Application Message expiry if a PUBLISH packet has been sent.
[MQTT-4.3.3-8]	In the QoS 2 delivery protocol, the receiver MUST respond with a PUBREC containing the Packet Identifier from the incoming PUBLISH packet, having accepted ownership of the Application Message.
[MQTT-4.3.3-9]	In the QoS 2 delivery protocol, the receiver if it has sent a PUBREC with a Reason Code of 0x80 or greater, the receiver MUST treat any subsequent PUBLISH packet that contains that Packet Identifier as being a new Application Message.
[MQTT-4.3.3-10]	In the QoS 2 delivery protocol, the receiver until it has received the corresponding PUBREL packet, the receiver MUST acknowledge any subsequent PUBLISH packet with the same Packet Identifier by sending a PUBREC. It MUST NOT cause duplicate messages to be delivered to any onward recipients in this case.
[MQTT-4.3.3-11]	In the QoS 2 delivery protocol, the receiver MUST respond to a PUBREL packet by sending a PUBCOMP packet containing the same Packet Identifier as the PUBREL.

[MQTT-4.3.3-12]	In the QoS 2 delivery protocol, the receiver After it has sent a PUBCOMP, the receiver MUST treat any subsequent PUBLISH packet that contains that Packet Identifier as being a new Application Message.
[MQTT-4.3.3-13]	In the QoS 2 delivery protocol, the receiver MUST continue the QoS 2 acknowledgement sequence even if it has applied Application Message expiry.
[MQTT-4.4.0-1]	When a Client reconnects with Clean Start set to 0 and a session is present, both the Client and Server MUST resend any unacknowledged PUBLISH packets (where QoS > 0) and PUBREL packets using their original Packet Identifiers. This is the only circumstance where a Client or Server is REQUIRED to resend messages. Clients and Servers MUST NOT resend messages at any other time.
[MQTT-4.4.0-2]	If PUBACK or PUBREC is received containing a Reason Code of 0x80 or greater the corresponding PUBLISH packet is treated as acknowledged, and MUST NOT be retransmitted.
[MQTT-4.5.0-1]	When a Server takes ownership of an incoming Application Message it MUST add it to the Session State for those Clients that have matching Subscriptions.
[MQTT-4.5.0-2]	The Client MUST acknowledge any Publish packet it receives according to the applicable QoS rules regardless of whether it elects to process the Application Message that it contains.
[MQTT-4.6.0-1]	When the Client re-sends any PUBLISH packets, it MUST re-send them in the order in which the original PUBLISH packets were sent (this applies to QoS 1 and QoS 2 messages).
[MQTT-4.6.0-2]	The Client MUST send PUBACK packets in the order in which the corresponding PUBLISH packets were received (QoS 1 messages).
[MQTT-4.6.0-3]	The Client MUST send PUBREC packets in the order in which the corresponding PUBLISH packets were received (QoS 2 messages).
[MQTT-4.6.0-4]	The Client MUST send PUBREL packets in the order in which the corresponding PUBREC packets were received (QoS 2 messages).
[MQTT-4.6.0-5]	When a Server processes a message that has been published to an Ordered Topic, it MUST send PUBLISH packets to consumers (for the same Topic and QoS) in the order that they were received from any given Client.
[MQTT-4.6.0-6]	A Server MUST treat every, Topic as an Ordered Topic when it is forwarding messages on Non-shared Subscriptions.
[MQTT-4.7.0-1]	The wildcard characters can be used in Topic Filters, but MUST NOT be used within a Topic Name.
[MQTT-4.7.1-1]	The multi-level wildcard character MUST be specified either on its own or following a topic level separator. In either case it MUST be the last character specified in the Topic Filter.
[MQTT-4.7.1-2]	The single-level wildcard can be used at any level in the Topic Filter, including first and last levels. Where it is used, it MUST occupy an entire level of the filter.
[MQTT-4.7.2-1]	The Server MUST NOT match Topic Filters starting with a wildcard character (# or +) with Topic Names beginning with a \$ character.

[MQTT-4.7.3-1]	All Topic Names and Topic Filters MUST be at least one character long.
[MQTT-4.7.3-2]	Topic Names and Topic Filters MUST NOT include the null character (Unicode U+0000).
[MQTT-4.7.3-3]	Topic Names and Topic Filters are UTF-8 Encoded Strings; they MUST NOT encode to more than 65,535 bytes.
[MQTT-4.7.3-4]	When it performs subscription matching the Server MUST NOT perform any normalization of Topic Names or Topic Filters, or any modification or substitution of unrecognized characters.
[MQTT-4.8.2-1]	A Shared Subscription's Topic Filter MUST start with \$share/ and MUST contain a ShareName that is at least one character long.
[MQTT-4.8.2-2]	The ShareName MUST NOT contain the characters "/", "+" or "#", but MUST be followed by a "/" character. This "/" character MUST be followed by a Topic Filter.
[MQTT-4.8.2-3]	The Server MUST respect the granted QoS for the Clients subscription.
[MQTT-4.8.2-4]	The Server MUST complete the delivery of the message to that Client when it reconnects.
[MQTT-4.8.2-5]	If the Clients Session terminates before the Client reconnects, the Server MUST NOT send the Application Message to any other subscribed Client.
[MQTT-4.8.2-6]	If a Client responds with a PUBACK or PUBREC containing a Reason Code of 0x80 or greater to a PUBLISH packet from the Server, the Server MUST discard the Application Message and not attempt to send it to any other Subscriber.
[MQTT-4.9.0-1]	The Client or Server MUST set its initial send quota to a non-zero value not exceeding the Receive Maximum.
[MQTT-4.9.0-2]	Each time the Client or Server sends a PUBLISH packet at QoS > 0, it decrements the send quota. If the send quota reaches zero, the Client or Server MUST NOT send any more PUBLISH packets with QoS > 0.
[MQTT-4.9.0-3]	The Client and Server MUST continue to process and respond to all other MQTT Control Packets even if the quota is zero.
[MQTT-4.12.0-1]	If the Server does not support the Authentication Method supplied by the Client, it MAY send a CONNACK with a Reason Code of 0x8C (Bad authentication method) or 0x87 (Not Authorized) as described in section 4.13 and MUST close the Network Connection.
[MQTT-4.12.0-2]	If the Server requires additional information to complete the authorization, it can send an AUTH packet to the Client. This packet MUST contain a Reason Code of 0x18 (Continue authentication).
[MQTT-4.12.0-3]	The Client responds to an AUTH packet from the Server by sending a further AUTH packet. This packet MUST contain a Reason Code of 0x18 (Continue authentication).
[MQTT-4.12.0-4]	The Server can reject the authentication at any point in this process. It MAY send a CONNACK with a Reason Code of 0x80 or above as described in section 4.13, and MUST close the Network Connection.

[MQTT-4.12.0-5]	If the initial CONNECT packet included an Authentication Method property then all AUTH packets, and any successful CONNACK packet MUST include an Authentication Method Property with the same value as in the CONNECT packet.
[MQTT-4.12.0-6]	If the Client does not include an Authentication Method in the CONNECT, the Server MUST NOT send an AUTH packet, and it MUST NOT send an Authentication Method in the CONNACK packet.
[MQTT-4.12.0-7]	If the Client does not include an Authentication Method in the CONNECT, the Client MUST NOT send an AUTH packet to the Server.
[MQTT-4.12.1-1]	If the Client supplied an Authentication Method in the CONNECT packet it can initiate a re-authentication at any time after receiving a CONNACK. It does this by sending an AUTH packet with a Reason Code of 0x19 (Re-authentication). The Client MUST set the Authentication Method to the same value as the Authentication Method originally used to authenticate the Network Connection.
[MQTT-4.12.1-2]	If the re-authentication fails, the Client or Server SHOULD send DISCONNECT with an appropriate Reason Code and MUST close the Network Connection.
[MQTT-4.13.1-1]	When a Server detects a Malformed Packet or Protocol Error, and a Reason Code is given in the specification, it MUST close the Network Connection.
[MQTT-4.13.2-1]	The CONNACK and DISCONNECT packets allow a Reason Code of 0x80 or greater to indicate that the Network Connection will be closed. If a Reason Code of 0x80 or greater is specified, then the Network Connection MUST be closed whether or not the CONNACK or DISCONNECT is sent.
[MQTT-6.0.0-1]	MQTT Control Packets MUST be sent in WebSocket binary data frames. If any other type of data frame is received the recipient MUST close the Network Connection.
[MQTT-6.0.0-2]	A single WebSocket data frame can contain multiple or partial MQTT Control Packets. The receiver MUST NOT assume that MQTT Control Packets are aligned on WebSocket frame boundaries.
[MQTT-6.0.0-3]	The Client MUST include “mqtt” in the list of WebSocket Sub Protocols it offers.
[MQTT-6.0.0-4]	The WebSocket Subprotocol name selected and returned by the Server MUST be “mqtt”.

3903

3904 **Appendix C. Summary of new features in MQTT v5.0**
3905 **(non-normative)**

3906 The following new features are added to MQTT v5.0
3907

- 3908 • Session expiry
3909 Split the Clean Session flag into a Clean Start flag which indicates that the session should start
3910 without using an existing session, and a Session Expiry interval which says how long to retain the
3911 session after a disconnect. The session expiry interval can be modified at disconnect. Setting of
3912 Clean Start to 1 and Session Expiry Interval to 0 is equivalent in MQTT v3.1.1 of setting Clean
3913 Session to 1.
3914
- 3915 • Message expiry
3916 Allow an expiry interval to be set when a message is published.
3917
- 3918 • Reason code on all ACKs
3919 Change all response packets to contain a reason code. This include CONNACK, PUBACK, PUBREC,
3920 PUBREL, PUBCOMP, SUBACK, UNSUBACK, DISCONNECT, and AUTH. This allows the invoker to
3921 determine whether the requested function succeeded.
3922
- 3923 • Reason string on all ACKs
3924 Change most packets with a reason code to also allow an optional reason string. This is designed for
3925 problem determination and is not intended to be parsed by the receiver.
3926
- 3927 • Server disconnect
3928 Allow DISCONNECT to be sent by the Server to indicate the reason the connection is closed.
3929
- 3930 • Payload format and content type
3931 Allow the payload format (binary, text) and a MIME style content type to be specified when a
3932 message is published. These are forwarded on to the receiver of the message.
3933
- 3934 • Request / Response
3935 Formalize the request/response pattern within MQTT and provide the Response Topic and
3936 Correlation Data properties to allow response messages to be routed back to the publisher of a
3937 request. Also, add the ability for the Client to get configuration information from the Server about how
3938 to construct the response topics.
3939
- 3940 • Shared Subscriptions
3941 Add shared subscription support allowing for load balanced consumers of a subscription
3942
- 3943 • Subscription ID
3944 Allow a numeric subscription identifier to be specified on a SUBSCRIBE, and returned on the
3945 message when it is delivered. This allows the Client to determine which subscription or subscriptions
3946 caused the message to be delivered.
3947
- 3948 • Topic Alias
3949 Decrease the size of the MQTT packet overhead by allowing the topic name to be abbreviated to a
3950 small integer. The Client and Server independently specify how many topic aliases they allow.
3951
- 3952 • Flow control
3953 Allow the Client and Server to independently specify the number of outstanding reliable messages
3954 (QoS>0) they allow. The sender pauses sending such messages to stay below this quota. This is
3955 used to limit the rate of reliable messages, and to limit how many are in flight at one time.

3956

3957 • User properties

3958 Add User Properties to most packets. User properties on PUBLISH are included with the message

3959 and are defined by the Client applications. The user properties on PUBLISH and Will Properties are

3960 forwarded by the Server to the receiver of the message. User properties on the CONNECT,

3961 SUBSCRIBE, and UNSUBSCRIBE packets are defined by the Server implementation. The user

3962 properties on CONNACK PUBACK, PUBREC, PUBREL, PUBCOMP, SUBACK, UNSUBACK and

3963 AUTH packets are defined by the sender, and are unique to the sender implementation. The meaning

3964 of user properties is not defined by MQTT.

3965

3966 • Maximum Packet Size

3967 Allow the Client and Server to independently specify the maximum packet size they support. It is an

3968 error for the session partner to send a larger packet.

3969

3970 • Optional Server feature availability

3971 Define a set of features which the Server does not allow and provide a mechanism for the Server to

3972 specify this to the Client. The features which can be specified in this way are: Maximum QoS, Retain

3973 Available, Wildcard Subscription Available, Subscription Identifier Available, and Shared Subscription

3974 Available. It is an error for the Client to use features that the Server has declared are not available.

3975

3976 It is possible in earlier versions of MQTT for a Server to not implement a feature by declaring that the

3977 Client is not authorized for that function. This feature allows such optional behavior to be declared

3978 and adds specific Reason Codes when the Client uses one of these features anyway.

3979

3980 • Enhanced authentication

3981 Provide a mechanism to enable challenge/response style authentication including mutual

3982 authentication. This allows SASL style authentication to be used if supported by both Client and

3983 Server, and includes the ability for a Client to re-authenticate within a connection.

3984

3985 • Subscription options

3986 Provide subscription options primarily defined to allow for message bridge applications. These include

3987 an option to not send messages originating on this Client (noLocal), and options for handling retained

3988 messages on subscribe.

3989

3990 • Will delay

3991 Add the ability to specify a delay between the end of the connection and sending the will message.

3992 This is designed so that if a connection to the session is re-established then the will message is not

3993 sent. This allows for brief interruptions of the connection without notification to others.

3994

3995 • Server Keep Alive

3996 Allow the Server to specify the value it wishes the Client to use as a keep alive. This allows the

3997 Server to set a maximum allowed keepalive and still have the Client honor it.

3998

3999 • Assigned ClientID

4000 In cases where the ClientID is assigned by the Server, return the assigned ClientID. This also lifts the

4001 restriction that Server assigned ClientIDs can only be used with Clean Session=1 connections.

4002

4003 • Server reference

4004 Allow the Server to specify an alternate Server to use on CONNACK or DISCONNECT. This can be

4005 used as a redirect or to do provisioning.

4006
