

RUN YOUR JAVA CODE ON CLOUD FOUNDRY

Andy Piper - @andypiper

Cloud Foundry Developer Advocate, Pivotal

SOFTWARE DEVELOPMENT

CONFERENCE

Hello

I'm Andy

Developer Advocate @ Cloud Foundry social web enthusiast

maker, educator, LEGO fan OSS contributor

Eclipse Project Lead (Paho / MQTT) excited by "what's next", Internet of Things, etc.

@andypiper
apiper@gopivotal.com

Developer Advocate?

hellz to the yeah!

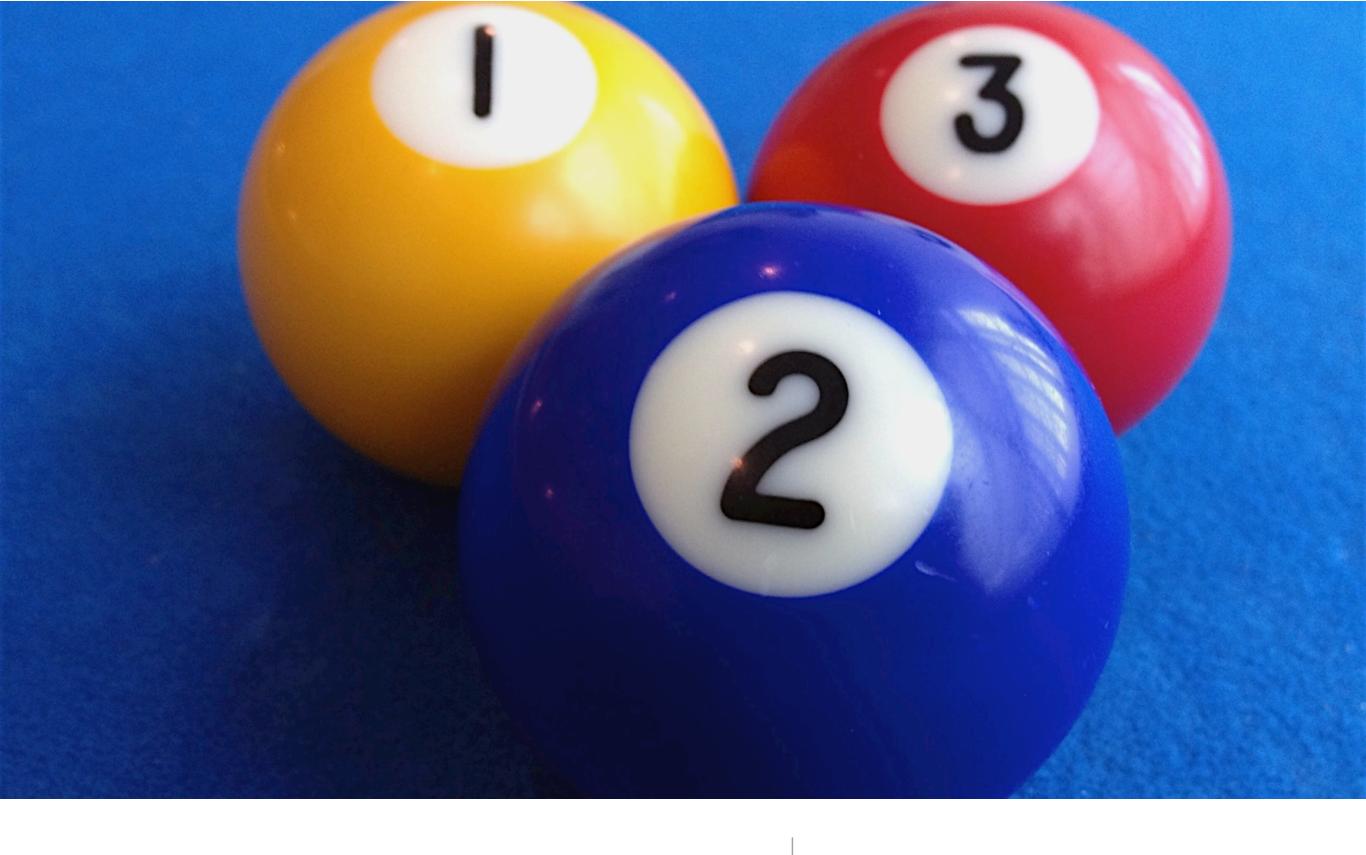

@andypiper

3 themes

openness, cloud computing, and Java

- 1. Why be / do / think Open?
- 2. Why is an Open Cloud Platform important?
- 3. Why run Java on an open cloud?

1. Why be / do / think Open?

1991

An important year in software

From: torvalds@klaava.Helsinki.FI

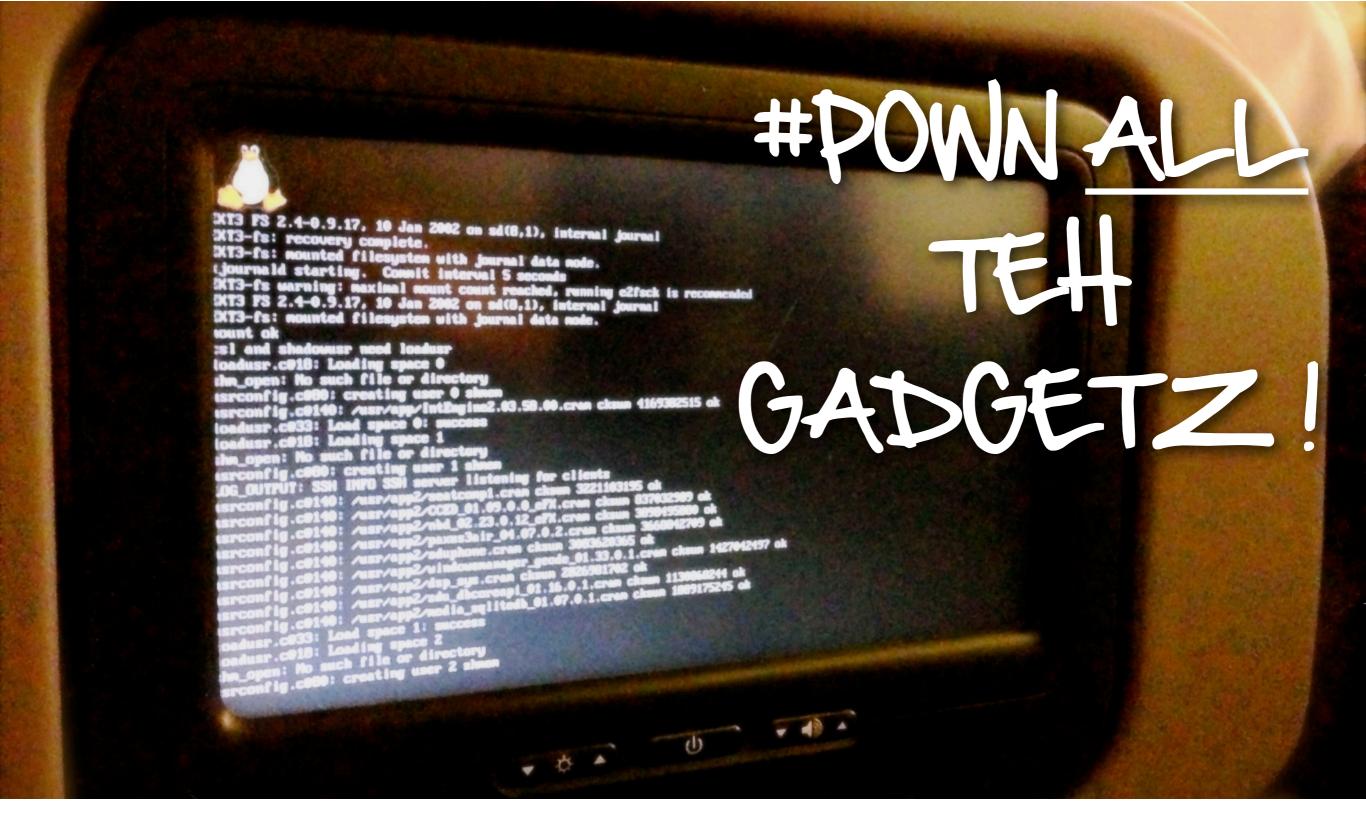

Newsgroups: comp.os.minix Date: 25 Aug 91 20:57:08 GMT

Organization: University of Helsinki

Hello everybody out there using minix -

I'm doing a (free) operating system (just a hobby, won't be big and professional like gnu) for 386(486) AT clones.

~21 years later: Linux has won

Linux runs everywhere

(even old versions, on crashy airline entertainment systems...)

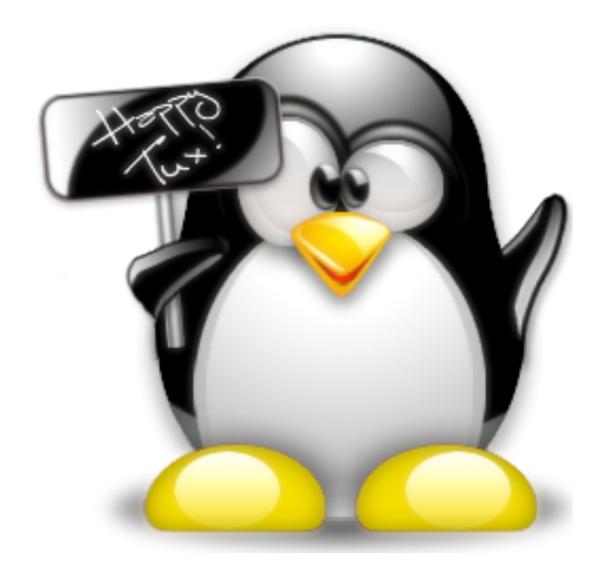

The Penguin is triumphant!

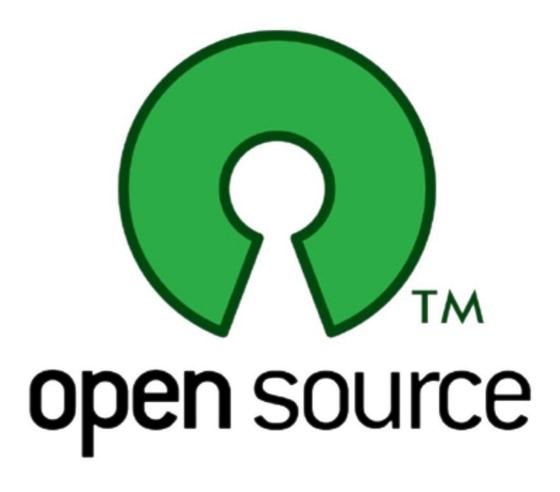

(maybe not this one...)

Linux is ubiquitous

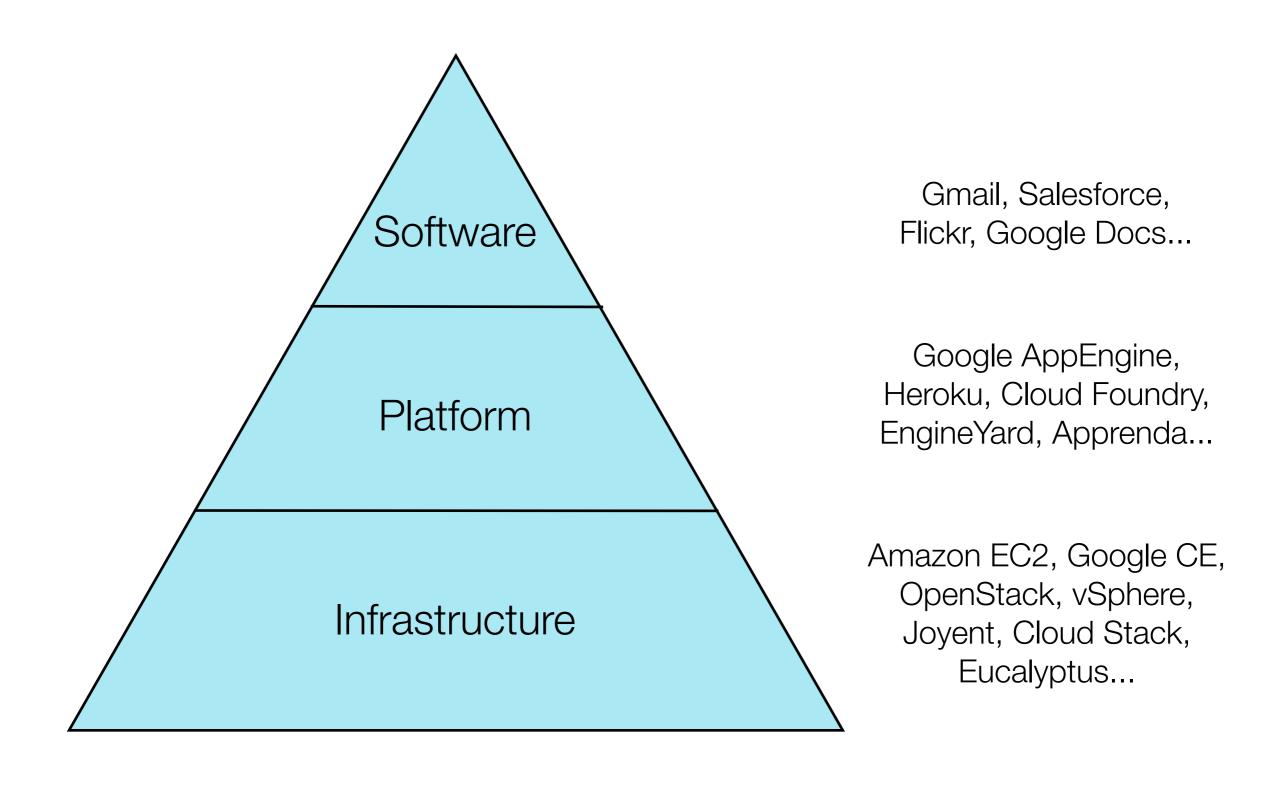

(but often invisible)

It works.

2. What about Cloud?

3 layers

laaS, PaaS, SaaS

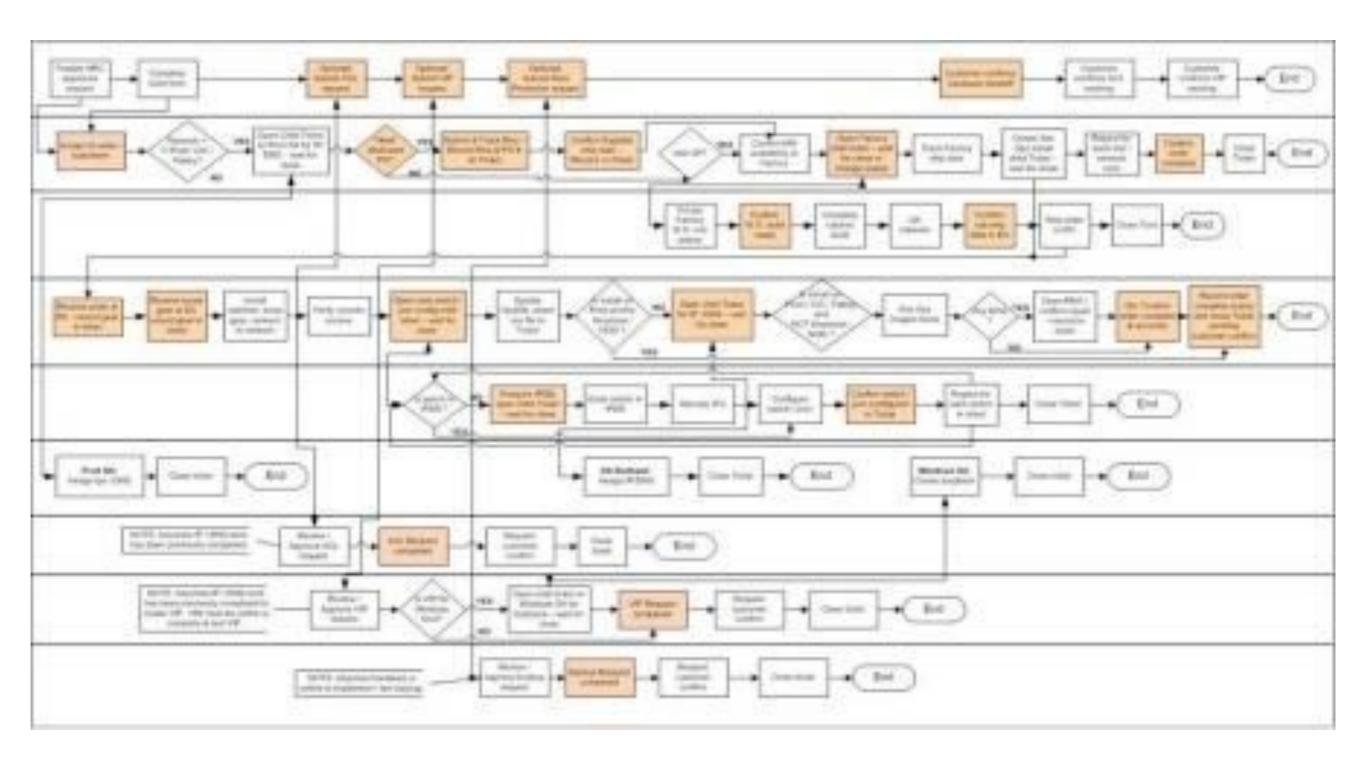

How did we get here?

Infrastructure Clouds

- consumer web companies built out according to their own needs to support *Software*

But - still need to build & manage *Platform*

Why is it so hard...?

A real deployment flow (!)

OPERATOR

DEVELOPER

cf-iaas.yml
provision <my cloud>
add_capacity <my cloud>

target <my cloud>
push <my app>
create <my services>
bind <my services>
scale <my app> +100

Cloud Deployment: 2-4 hours

App Deployment: 30-90 seconds

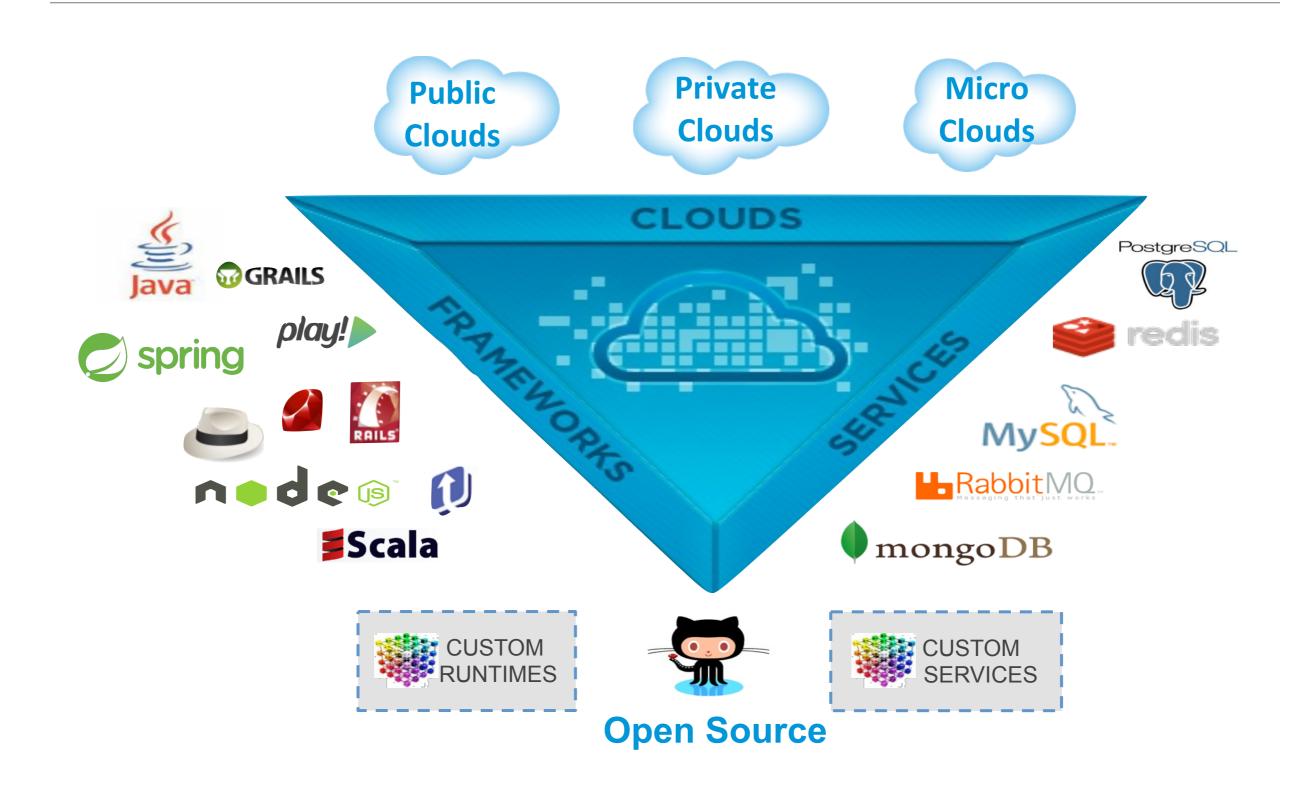

An alternative approach...

Cloud Foundry can make it simpler!

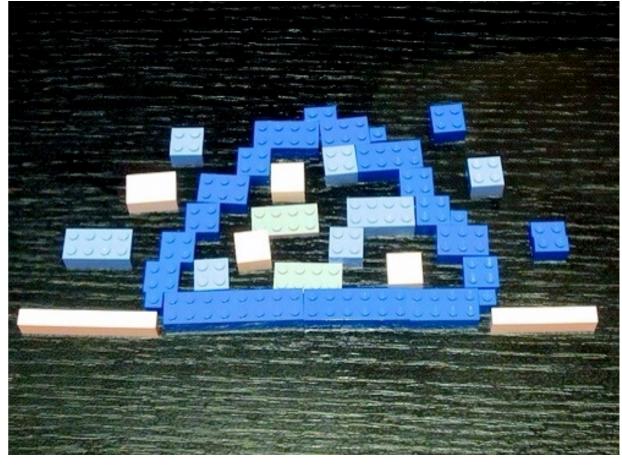

cloud foundry Demo

Cloud Foundry - the Open PaaS

All the pieces to make your own!

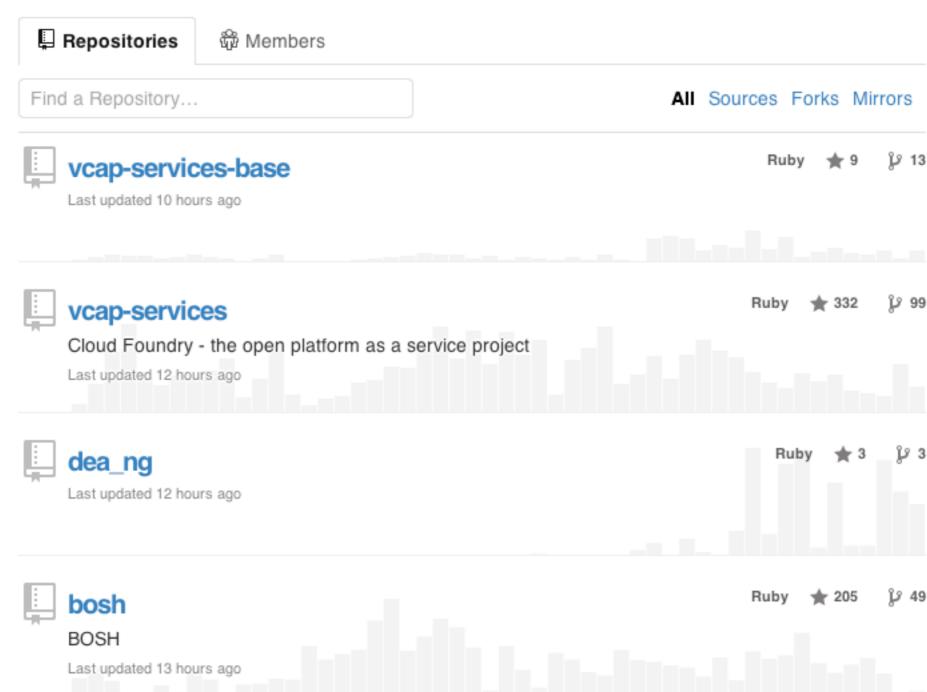

"if you can't open it, you don't own it" (O'Reilly MAKE)

The open platformas-a-service project cloudfoundry

Open & public from the start

Code all on Github

Google AppEngine,
Heroku, Cloud Foundry,
OpenShift, Stackato,
Cloudbees, AppFog,
Elastic Beanstalk,
anyNines, Apprenda...

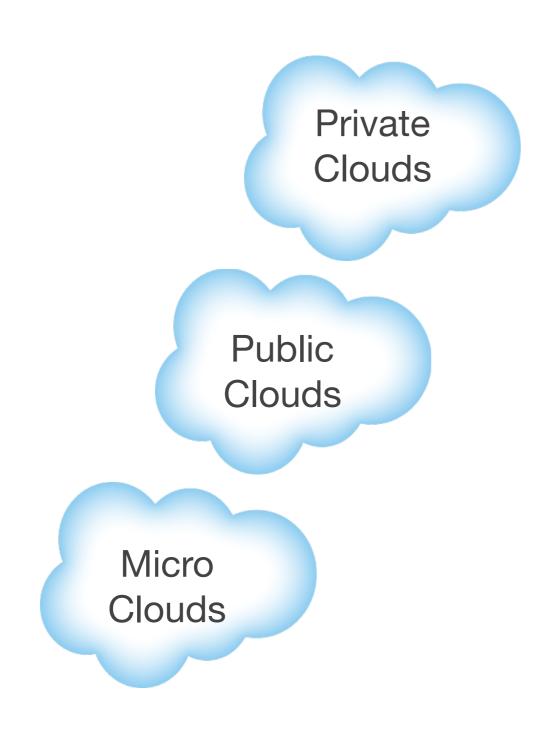

BUILD OWN HEROKU WITH CLOUD FOUNDRY

Dr Nic Williams Stark & Wayne LLC Odrnic

Not all PaaSes are created equal...

Run on: AWS, OpenStack, vSphere... more to come!

All about Choice

Build your own from github.com/cloudfoundry, buy from Pivotal, or run a compatible private version

At run.pivotal.io or <u>any Cloud Foundry-powered PaaS</u>

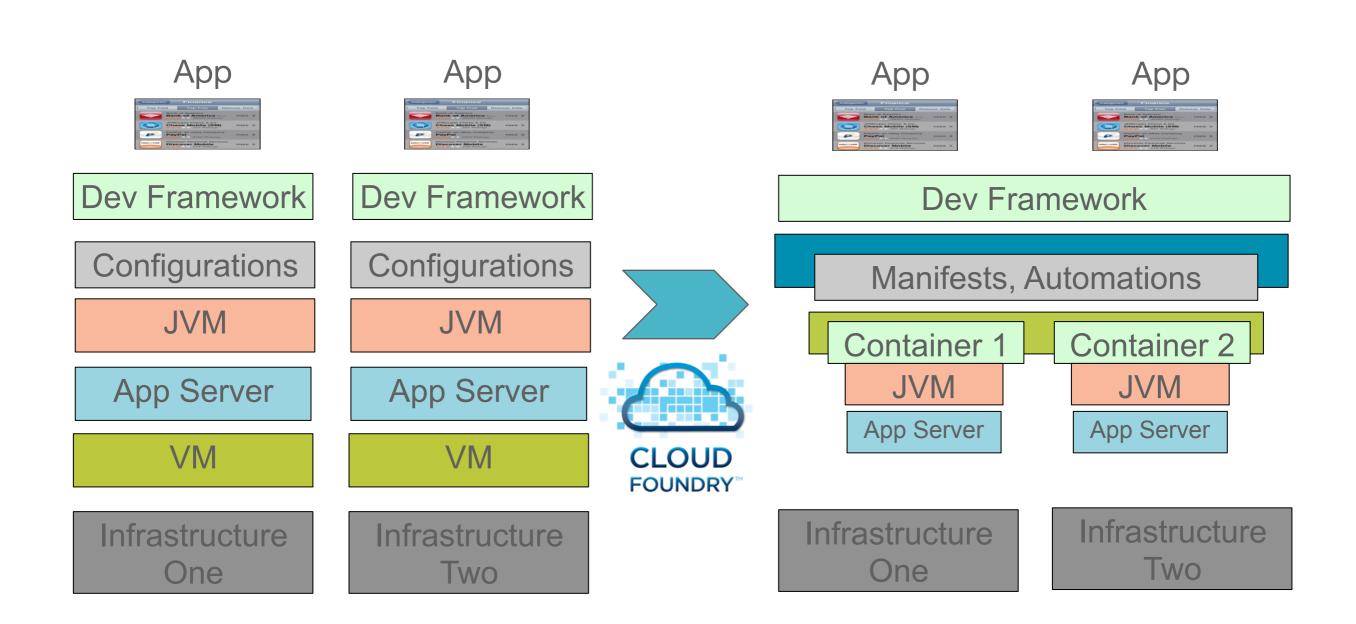

Run in a local virtual machine with identical services and runtimes (MCF, Vagrant) (pause)

44 years since Mach 1

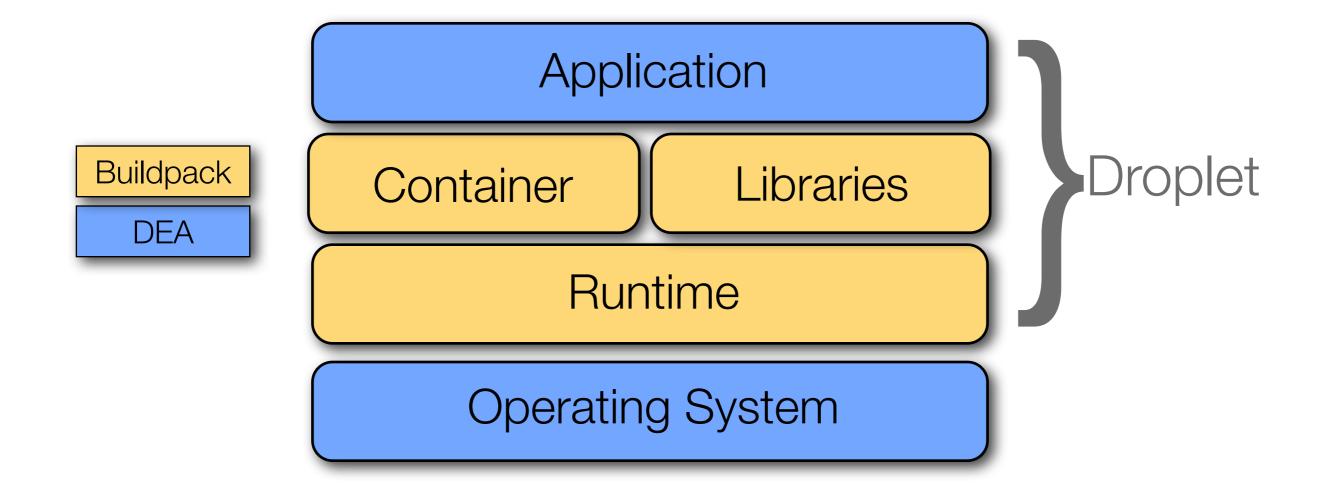

3.	What about Java and the	JVM?	

From VM-centric to Application Centric

Buildpacks

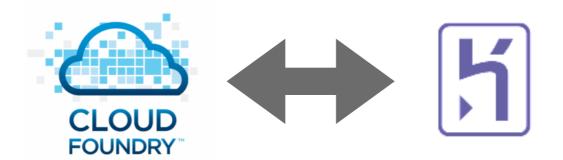

Buildpacks are responsible for preparing the machine image for an application

Compatibility

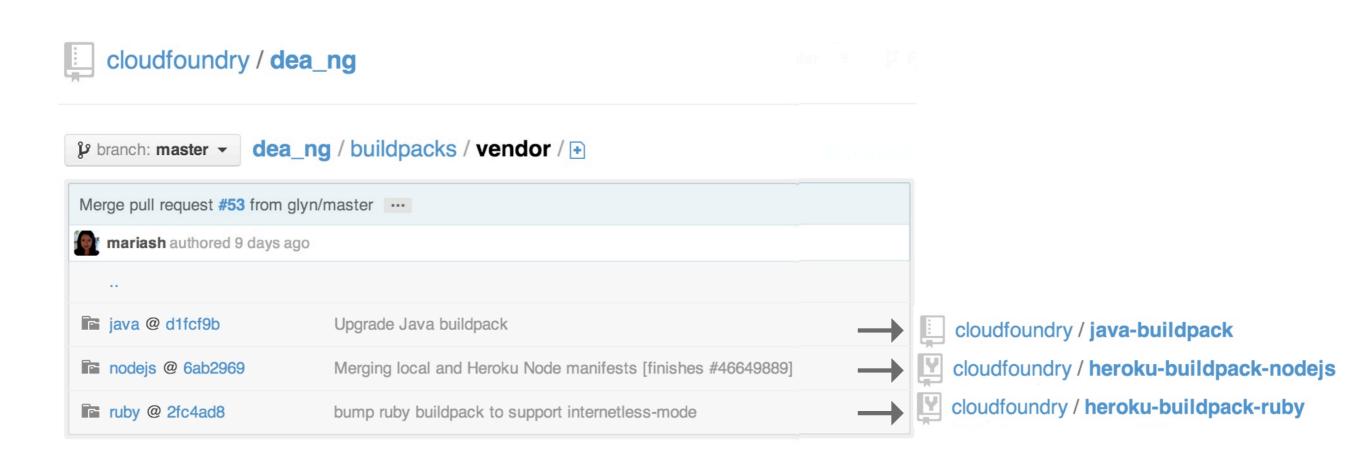

Cloud Foundry buildpacks follow the Heroku buildpack design

Cloud Foundry and Heroku buildpacks are compatible (if you take care to make them compatible)

Other PaaS providers are adopting the buildpack design - emerging convention

Built-in Buildpacks

Tested Buildpacks

https://github.com/cloudfoundry-community/cf-docs-contrib/wiki/Buildpacks

Containers

Languages

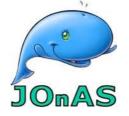

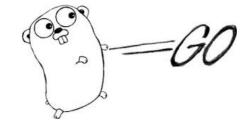

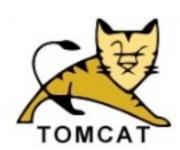

Java Buildpack

Supports a variety of JVM languages, containers, and frameworks with a modular, configurable, and extensible design

Java Buildpack Concepts

Containers

Java main ()
Tomcat

Groovy
Spring Boot CLI

Play

Frameworks

Spring config
Play config
Play JPA config
New Relic

JREs

OpenJDK, etc.

Container Detection Criteria

Java main()	META-INF/MANIFEST.MF exists with Main-class attribute set
Tomcat	WEB-INF directory exists
Groovy	.groovy file with a main() method, or .groovy file with no classes, or .groovy file with a shebang (#!) declaration
Spring Boot CLI	one or more POGO .groovy files with no main() method, and no WEB-INF directory
Play	start and lib/play.play_*.jar exist

Choose zero or one

Framework Detection Criteria

Spring	spring-core*.jar exists
Play config	Play application detected
Play JPA config	play-java-jpa plugin exists in app
New Relic	New Relic service bound to app

Choose all that apply

Customization

Two ways to customize the Java buildpack

Configure artifacts used by standard JREs, Containers, and Frameworks

Extend the buildpack with your own JREs, Containers, and Frameworks

Customization is done by forking the buildpack

Choice!

- IBM donated WebSphere Liberty Buildpack
- http://blog.cloudfoundry.com/2013/09/09/ibmwebsphere-liberty-buildpack-contributed-to-cloudfoundry/

BUILD ANYTHING

Write clean, testable code against the infrastructure components of your choice and accomplish any task without re-inventing the wheel.

RUN ANYWHERE

Keep it portable - Spring-based apps run anywhere the JVM does. Deploy standalone, in an app server, on a PaaS or all of the above.

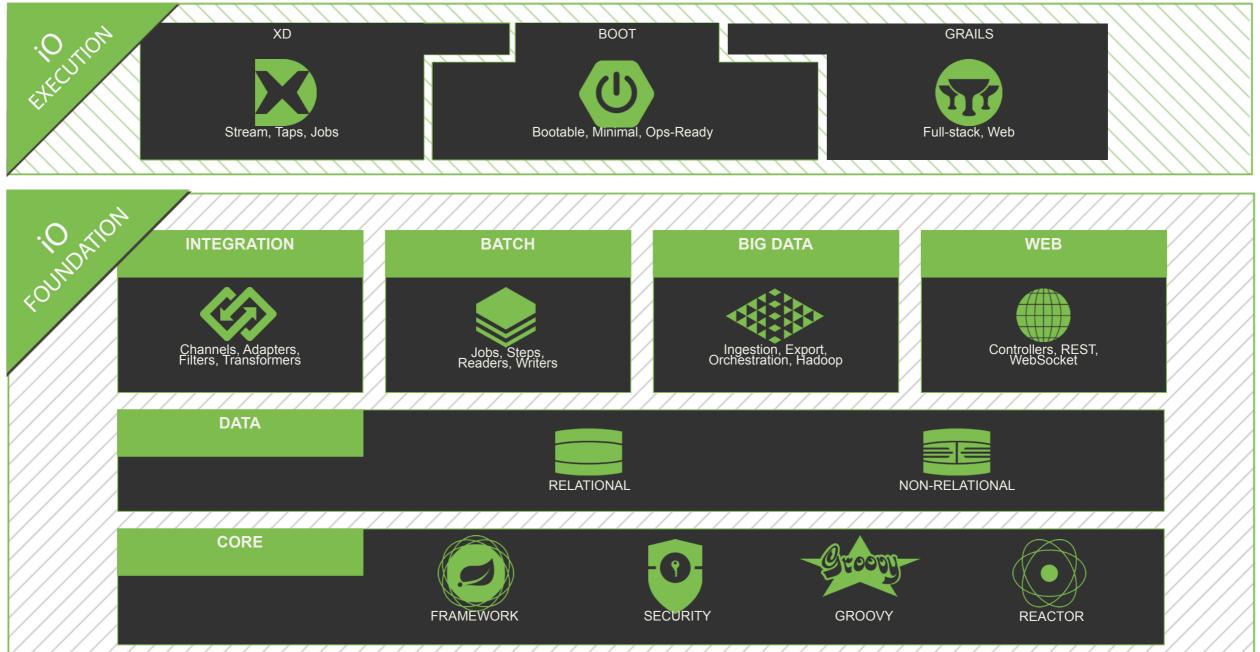

REST ASSURED

Code with confidence - Spring provides an open programming model that is comprehensive, cohesive, widely understood and well-

the new Spring

spring.io

Groovy and Spring Boot

```
Rob Winch
@rob_winch

@Controller
class ThisWillActuallyRun {
    @RequestMapping("/")
    @ResponseBody
    String home() {
        "Hello World!"
    }
}
```

Groovy and Spring Boot

```
Gregg Bolinger

@rob_winch @glaforge @controller
class ThisWillActuallyRunController {
  def home() {
    render "Hello World!"
  }
}
#Grails #FTW
```

Groovy and Spring Boot

```
Dave Syer
@david_syer

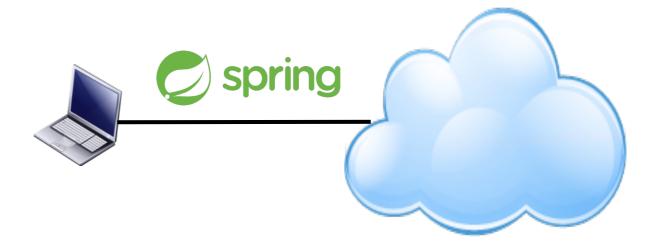

@rob_winch:
// JSON example
@RestController
class AndThis {

@RequestMapping("/")
def home() {

[hello: "world"]
}
}
```

Spring and the Cloud

- Goal: deploy Spring apps to the cloud without changing a single line of code
- Cloud Foundry automatically re-configures bean definitions to bind to cloud services
- Works with Spring and Grails

Following

Portability

Announcing spring-cloud github.com/spring-project... #spring #cloudfoundry #heroku

Usage pattern: Application Developers

Create a <u>CloudFactory</u> instance. Creation of a <u>CloudFactory</u> instance is a bit expensive, so caching such an instance is recommended. If you are using a dependency inject frameworks such as Spring, creating a bean for <u>CloudFactory</u> will achieve the caching effect.

```
CloudFactory cloudFactory = new CloudFactory();
```

Obtain a suitable Cloud for the environment in which the application is running.

```
Cloud cloud = cloudFactory.getCloud();
```

Use the Cloud instance to get access to application info, service infos, and create service connectors.

```
// ServiceInfo has all the information necessary to connect to the underlying service
cloud.getServiceInfos();
```

```
// Alternatively, let the cloud create a service connector for you
DataSource ds = cloud.getServiceConnector("inventory-db", DataSource.class, null /* default config */);
```

SPRING

Demo

4. ... the end?

Want to Contribute to Cloud Foundry? Come on in!

Posted on May 16, 2013 by Andy Piper

Cloud Foundry is an Open Platform-as-a-Service, and an Open Source project. It has attracted phenomenal interest from the community - including partners, companies using the code internally, and those individual developers with a passion for getting involved. You can find the source code on Github. Community contributions are what help to make the platform so extensible. We are always happy when we receive a Github pull request to offer new functionality or fixes! We also appreciate bug reports submitted through Github Issues.

Looking at the Cloud Foundry project as a whole though... where should you start?

Join us!

... a pull request is all it takes!
