OFFERS THE STORY OF SUCCESS

centuries, landlords in central and southern China had an almost completely hands-off relationship with their tenants: they would collect a fixed rent and let framers go about their business.

"The think about we rice farming is, not only do you need phenomenal amounts of labor, but it's very exacting," says the historian Kenneth Pomeranz. "You have to care. It really matters that the field is perfectly leveled before you flood it getting it close to level but not quite right makes a big difference in terms of your yield."

T-Mobile Services

T-Mobile's New, Expanding Super-Fast HSPA+ Network

As of June, 2010, T-Mobile has upgraded its traditional 3G network to HSPA+ in 25 major metropolitan areas across the U.S., and it plans to continue rolling out this network upgrade to over 100 metropolitan cities and up to 185 million people by the end of 2010. HSPA+ provides our fastest data speeds, up to 3 times faster than AT&T and Verizon's standard 3G networks, while allowing simultaneous voice and data capabilities for the ultimate wireless voice and data experience.

You'll enjoy 4G-like speeds with HSPA+ enabled areas, with a theoretical capability of up to 21 Mbps peak download speeds (and typical download speeds averaging between 5 and 8 Mbps).

While T-Mobile doesn't currently offer mobile phones with HSPA+ compatibility, many 3G devices can benefit from enhanced speeds when they're on the HSPA+ network today--including the Samsung Vibrant.

High-Speed Data Connectivity via T-Mobile's 3G Network

In addition to its quad-band GSM connectivity, this phone is also compatible with T-Mobile's UMTS/HSDPA 3G network, which operates on the 1700/2100 MHz AWS spectrum. This phone is designed to automatically connect to the best available network (3G or GSM/GPRS/EDGE) to provide faster data speeds when accessing the Web.

In areas where the 3G network is not available, you'll continue to receive service on the via T-Mobile's EDGE network (which stands for "Enhanced Data Rates for Global Evolution"). This high-speed, mobile data and Internet access technology is fast enough to support a wide range of advanced data services (with average data speeds between 75-135kbps), including full picture and video messaging, high-speed color Internet access, and e-mail on the go.

While this phone is optimized for use with T-Mobile's high-speed 3G network, many of its functions will also work well on the moderate-speed EDGE network. If you plan to access the Internet extensively on your phone, 3G network coverage may serve you best.

Activities that work well on EDGE or 3G networks:

- E-mail, instant messaging, and texting
- Downloading ringtones, CallerTunes, wallpaper, light data files
- Sending photographs via e-mail or picture messaging
- Viewing content-heavy websites (lots of images or videos playing)
- Viewing YouTube and other video files they will play on EDGE, but require loading time
- Uploading large files (photos, videos, presentations) to sharing websites
- Downloading large files from an e-mail or a website

T-Mobile's 3G network is currently available in more than 220 cities nationwide and covers more than 160 million people.

★★★★★ T-Mobile Finally Gets a Great Android Phone!
By dilis VINE™ VOICE

July 15, 2010

T-mobile, the first carrier to even have an android phone (the G1), blew its lead with the OS on a stream of mediocre handsets. While the other carriers got newer and better devices, T-mobile lagged behind, until now. Finally, at long last, a quality handset has arrived: the Vibrant. With its good looks, blazing fast speed, and quality OS, T-mobile customers can finally upgrade to a great phone.

Hardware

The Good:

- The first thing you notice about the Vibrant is its big beautiful screen. The 480x800 AMOLED screen is sharp and beautiful, easy to type on, and shows plenty of detail.
- The phone itself is thin and light, with a nice curve near the bottom to hold onto.
- 1 GHz Samsung Hummingbird processor is faster in benchmarks than a 1 GHz Snapdragon and offers enhanced graphics processing
- The buttons are not buttons but touch sensitive surfaces, like a flat screen TV.
- 16gb of onboard storage is awesome. Add a 32gb microsdhc card and you've got 48gb, more than the iPhone.

★★★★★ Broken GPS, missing Froyo in 2010, and lack of support equals a...
Could be very good phone but broken

The Bad:
-The big compromise here is the camera. While the EVO and Incredible have 8MP cameras, the Vibrant has only 5MP. Flash and Front Facing Camera are glaring omissions from this otherwise high end phone.
-The plastic feels a bit cheap, but this is the case with most phones these days.
-Garish T-mobile and Samsung logos distract from the smooth appearance.

Software

The Good:
-Android 2.1 is stock on the phone with a promised upgrade to 2.2 in the near future. The latest versions of android are fast, more battery efficient, and have fewer "force close" errors. Some highlights include animated wallpapers, 7 home screens, and support for flash in web browsing.

-The interface is fast and smooth.

-Samsung has managed not to screw up the interface to this phone like it did on the Behold 2. The customizations are useful and unobtrusive.

Included Accessories

The Good:
-2gb MicroSD card is a bit lame compared to the 16gb internal memory, but easily upgradable.
-Nice gelly earphones are higher quality than most phones.
-Charger is a solid usb/wall combo.
-Avatar movie shows off the phone's beautiful screen.
-Free Sims 3 game is a fun way to kill some time.

The Bad:

-2gb MicroSD card is a bit lame compared to the 16gb internal memory, but easily upgradable.

Overall this is a great phone. Some hardware compromises prevent it from being the best Android phone ever, but it is still the best Android phone for T-mobile, and is the phone many customers, including myself, have been waiting for. The phone looks great, is blazingly fast, and has plenty of bells and whistles.

★★★★★ Goodbye Pullout Keyboard, Swipe on the Vibrant is incredible!

By Amy Gray

I was a die-hard pull-out keyboard junky, but using Swype on the Vibrant changed my mind forever. I could type 30+ words per minute on my G1 (my previous phone), and I'm a tad slower on the Vibrant using Swype, but that's just because there's a little bit of a learning curve. I'm convinced that I'll be just as fast on the Vibrant by this time next week. [Read more](#)

In all respects, this phone is an incredible leap forward from the G1, and is light, sleek, and fast. The 7 customizable home screens make it easy to categorize my apps and widgets. The camera on this phone, in comparison to the G1's, is extremely usable and the results are comparable to point-and-shoot photos, even without a flash. Who likes "flashy" pictures, anyway? The screen is everything everyone has said. Coupled with the speedy processor, I can flip through photos in my Picasa or Flickr accounts in a flash.

I'm not jealous of my friends' iPhones anymore.

★★★★★ One of the best phones you can buy, but...e

By ViBu

I'll try to keep this as brief and to the point as possible.

The Samsung Vibrant .

The form factor - great as it's not too big, not too small with a 4 inch screen. If you're coming from a nexus one or a droid then you may not like the amount of plastic that's in the phone or the light feel. But even though it's a plastic build, it's a compact solid build. At first glance it will remind you of a Iphone. Again, it may be a turn off depending on your tastes.

Screen - hands down one of the best portable screens you'll ever see. Uses Samsung's Super AMOLED technology which they seem to be keeping for their own products these days. Avatar as a pack in for the device is a great move. Seeing the clarity of that film running on a Vibrant is awe - inspiring. The screen is responsive and accurate. I've had no problems with it in that regard. Resolution is 480x800.

Software - the Vibrant is running android 2.1 which is good, but 2.2 on this phone would have been amazing. But to be fair the update is coming in september. It runs with a custom user interface (ui) layer on top of android called touchwiz 3.0. It adds some interesting features to stock android but at the end of the day, I found it to be totally unnecessary. I've found similar and better features in the Android marketplace for the solutions that Samsung has tried to incorporate here. There are some glaring missing features though. The user dictionary that's standard in stock android is missing here. Also the ability to add custom ringtones to your contact list entries is also missing. Both functions can be easily added by downloading User dictionary from the market as well as Ringo lite. The phone ships with Swype virtual keyboard and its enabled by default. It also ships with Samsung's own keyboard as well as the stock android keyboard. Swype has been my keyboard of choice since it was in beta, it's very intuitive and is a great choice by samsung.

The Vibrant also ships with a version of Rock Player. This is significant. Rock Player allows standard and some not-so-standard video codecs to run natively on Android phones. Xvid, divx, wmv, mov, mpev 1/2/3, FLV..its serious. Android always had terrible video codec support but now, the days of encoding video are over thanks to Rock Player. The player is also available in the marketplace but doesn't seem to be as polished. The GPS software is glitchy. There's a fix for it that has been discussed on many forums but Samsung is preparing an update for it.

Camera - the good news is the Vibrant takes great photos and videos. Videos can be recorded in "720p" but the phone doesn't have a flash. This was a major concern for me initially until I actually used the camera. In well lit areas, the Vibrant took great images. Night time shots were great too if ample light was available. If not, there's a night mode. It works for the most part but it left a good number of my pics a tad blurry.

Video worked as one would expect. I was happy to see consistent smooth frame rate and no pauses or glitches in the videos I took with the device.

Hardware - this is what ultimately sold me on the Vibrant. It has a 1ghz Hummingbird (Cortex A8 core) cpu developed by Intrinsic with a PowerVR SGX540 GPU (graphics processor). What this means is this CPU/GPU combo gives the Vibrant better graphics/games performance than any other smartphone of its class. I didn't quite believe it at first coming from a nexus one with Android 2.2 (which I still own) but after comparing the Vibrant to the Droid, the N1, the Incredible, iPhone 3gs, and the DroidX, I noticed 3D intensive games ran smoother on the Vibrant. Consistently so at 60 frames per second. I did some research and found out why. That material is too much to post here. I'll leave it to you to Google it. But in short, the Vibrant is capable of processing 90 million triangles a second.

The Droid with a TI OMAP3430 CPU and a PowerVR SGX530 - 7 to 14 million triangles a second

Nexus one with a Qualcomm QSD8x50 (snapdragon) and a Adreno 200 - 22 million triangles a second.

Iphone 3gs 600mhz cortex A8 with a Power VR SGX535 - 7 million triangles a second.

Also, the Vibrant ships with 16gb of internal storage and can use 32gb microsd cards. 1.7 gbs of that storage can be used for apps which is more than enough space and eliminates the need for saving apps to sd card. Avatar is a little less than 2gb on the sd card that ships with the phone but it can be transferred to internal memory and run from there. The phone lacks a trackball but there are virtual arrow keys in swype and the Samsung keyboard that help to make up for the loss. The camera is a 5 mega pixel camera without flash as was mentioned. The face buttons are virtual buttons and work most of the time but there were times when the phone didn't seem to recognize my press. I'm not sure if this is from Android or the phone itself, but it is worth mentioning.

Phone - I've experienced no problems with phone calls on the device. Calls were clear on my end and the other end of the line. bluetooth worked as it should and pairing a headset was as easy as one would expect. There's no noise cancellation mic but the speaker on the phone is very loud for videos, music and speakerphone.

Battery life - This has been a topic of great debate and for good reason. My Vibrant has lasted an entire day with moderate use on a 1500mah battery. A day and a half with light use. It lasted about 6 to 7 hours with heavy use. That's watching Avatar for a bit, surfing the web, taking calls, downloading from the market, playing games here and there. It lasted my entire shift at work with me constantly configuring it, running it, using it. By comparison, my Nexus one with Android 2.2 cannot last the day with moderate use. I can get 5 hours out of it maybe 6 before I have to recharge. Heavy use with my n1 will net me four hours maybe 5. To be fair there might be a particular app or even Android 2.2 causing the drain because it wasn't that bad when I first bought it, but it is what it is at this point.

Final thoughts, the Samsung Vibrant is one of the best Android phones released thus far but it has some issues that are strange and keeps it from being the best. Missing utilities that are standard in stock Android and have been since Android debuted is very strange. No flash will undoubtedly turn off a few people as well as the lack of Android 2.2 in an environment that calls for it. But what the Vibrant does well, it does extremely well and solves some key issues for some older Android devices. Internal storage that's more than enough to hold any apps you desire as well as gbs worth of content, a screen that's drop dead gorgeous and easier to navigate, fantastic video codec support and a better cpu/gpu combo for superior performance especially with gaming. The Vibrant is the best phone you can buy at Tmobile if you don't need a physical qwerty keyboard. I'm happy with the device and eagerly await Android 2.2 for it.
