

Appendix I Unicode 1.1 Character List

The following lists the names of all Unicode 1.1 characters, including Unicode 1.0 characters. The name list does not include ideograph names or CJK compatibility ideograph names, since those can be computed algorithmically from the code point. The names of the Han Ideographic characters are “CJK UNIFIED IDEOGRAPH-xxxx”, and the names of the Han Ideographic Compatibility characters are “CJK COMPATIBILITY IDEOGRAPH-xxxx”, where xxxx is the Unicode number.

The list includes the code-points, new name, old name (if it differed), and maximal decomposition (if it exists). The list consists of 12,963 characters: 9,340 of them have a maximal decomposition, and 1,948 have new names.

☞ *The Hangul syllable blocks U+3400 → U+3D2D were not named in Unicode 1.0.*

I.1 Format

```
[nnnn]*    new-name (comment)
           {old-name}
           {decomposition}
```

I.2 Key

nnnn: This is the Unicode code number, in hex.

*****: This is a single mark indicating the origin of the character:

* = Unicode 1.0 character

◇ = Unicode 1.0 character (unnamed Hangul syllable block)

† = Unicode 1.0.1 character (moved from the 1.0 position)

‡ = Unicode 1.1 character

new-name: This is the Unicode 1.1 name, which is identical to the ISO/IEC 10646 name. In many cases, the names differ trivially. For example, the ISO names insert WITH, as in LATIN CAPITAL LETTER A WITH GRAVE vs. the Unicode 1.0 LATIN CAPITAL LETTER A GRAVE. The ISO names also use British English spellings, such as OPEN CENTRE CROSS vs. the Unicode 1.0 OPEN CENTER CROSS. In some cases, a name was retained for compatibility with existing ISO standards, even though it is less clear or inaccurate:

APOSTROPHE {old: APOSTROPHE-QUOTE}

LEFT PARENTHESIS {old: OPENING PARENTHESIS}

PILCROW SIGN {old: PARAGRAPH SIGN}

LATIN SMALL LETTER CLOSED REVERSED OPEN E

{old: LATIN SMALL LETTER CLOSED REVERSED EPSILON}

☞ *These names are important, since the ISO/IEC names are used for the identification of characters across different standards. However, names are not always sufficient to identify character usage: you should reference the Unicode 1.0 name, cross references and aliases for clarity.*

comment: (optional) This is the comment from ISO/IEC 10646.

old-name: (optional) This is the Unicode 1.0 name, where it differs from the new name.

decomposition: (optional) This is the canonical decomposition of the Unicode character, where it exists. This is used to determine character equivalency, as per Section 4.4, p. 10. The maximal decomposition normally consists of a sequence of characters separated by “&”. Curly brackets (braces) may be used to indicate that a character is optional.⁸ There may also be indicators in angle brackets, which show that a substitution is dependent on context, or that a particular format is indicated. These are listed below.

It is very important to realize that the decompositions are for the purposes of the character equivalency, and does not imply that the character on the left is preferred to the characters on the right. In particular, there are a few halves of characters included for compatibility, such as the following:

[3032]* VERTICAL KANA REPEAT WITH VOICED SOUND MARK
 = [3034]* VERTICAL KANA REPEAT WITH VOICED SOUND MARK UPPER HALF
 & [3035]* VERTICAL KANA REPEAT MARK LOWER HALF

For the purpose of the canonical equivalence algorithm, it is simplest to view the whole character as the sequence of the two parts.

1.3 Format Indicators

- <+sup>X<-sup>..... superscript
- <+sub>X<-sub>..... subscript
- <join>..... zero-width joiner
- <no-join> zero-width non-joiner
- <break> zero-width space
- <no-break> zero-width non-breaking space
- specialized font variation
- <+circled>X<-circled>..... circled characters (single characters may use U+20DD)

The superscript and subscript indicators show that if the compatibility characters are replaced by the corresponding nominal forms, they should be put into that format. The form <+x> indicates the start of the format; while the form <-x> indicates the end. In determining canonical equivalency, as per Section 4.4, p. 10, the whether or not to distinguish between characters with and characters without formatting information is left up to the implementation.

The <join> and <no-join> indicators show that it may be necessary to add a ZERO-WIDTH NON-JOINER or ZERO-WIDTH JOINER:

[200C] ZERO WIDTH NON-JOINER
 [200D] ZERO WIDTH JOINER

This can be simplified as follows:

X<join><join>Y	====> X<join>Y
X<no-join><no-join>Y	====> X<no-join>Y
X<join>Y	====> XY if X and Y would join anyway under contextual analysis
X<no-join>Y	====> XY if X and Y would not join anyway under contextual analysis

The <break> and <no-break> indicators show that it may be necessary to add a ZERO-WIDTH SPACE or ZERO-WIDTH NO-BREAK SPACE:

[200B] ZERO WIDTH SPACE

8. E.g. [00AA]* FEMININE ORDINAL INDICATOR
 = <+sup> [0061] LATIN SMALL LETTER A (& [0331] COMBINING MACRON BELOW) <-sup>

[FEFF] ZERO WIDTH NO-BREAK SPACE (BYTE ORDER MARK)

This can be simplified as follows:

X<no-break><no-break>	⇒	X<no-break>Y	
X<break><break>Y	⇒	X<break>Y	
X<no-break>Y	⇒	XY	if X and Y would not have a word break between them anyway
X<break>Y	⇒	XY	if X and Y would have a word break between them anyway

Characters which are specialized font variants may be marked with an indicator if they differ significantly from the nominal form in shape, position or width. (Characters in the compatibility zone are generally subject to such differences, and are not specially marked.)

☞ *The Unicode Standard, Version 1.1 does not provide decompositions for mathematical operators. The Unicode Standard generally avoids coding the negated operations such as [2260] NOT EQUAL TO, since they can be composed using the non-spacing mark [0338] COMBINING LONG SOLIDUS OVERLAY⁹. Some precomposed negated operators were encoded, however, for compatibility. Dingbats and APL symbols are also treated as atomic.*

⁹ This character is used to express negation, and may change its appearance (slope, length, position and weight) depending on the shape of the modified operation. To reflect a specific glyphic variant of a negated operator in special cases, other non-spacing slashes may be used.
