

Indices

I.1 Unicode Names Index

The Unicode Names index contains three types of entries.

- Formal character names—all uppercase
- Alternative character names (aliases)—all lowercase
- Character group names—mixed case (titlecase)

Formal character names are unmodified from the character names lists, although the name strings may be indexed by different words in the names. Alternative character names and character group names are occasionally modified slightly to make them understandable out of context (for example, from “boot” to “armenian boot”).

Not every character is indexed. Large groups of similar characters, including CJK ideographs, Korean Hangeul syllables, and compatibility characters, are indexed by their character group names, such as block names, subblocks, alphabet names, relevant standards, or group summaries (for example, “Roman Numerals”).

Neighboring paired characters (such as capital/small case pairs, mathematical symbols and their negations, and left/right brackets) are generally indexed under only one member of the pair.
