

Appendix E

Han Unification History

Efforts to create a unified Han character encoding are at least as venerable as the existing national standards. The Chinese Character Code for Information Interchange (CCCII) developed in Taiwan has been in use since 1980. It contains characters for use in China, Taiwan, and Japan. In somewhat modified form, it has been adopted for use in the United States as ANSI Z39.64-1989, also known as the East Asian Character Code (EACC) for bibliographic use. In 1981, Takahashi Tokutaro of Japan's National Diet Library proposed standardization of a character set for common use among East Asian countries.

The Unicode Han character set began with a project to create a Han character cross-reference database at Xerox in 1986. In 1988, a parallel effort began at Apple based on the Research Libraries Information Network's CJK Thesaurus, which is used to maintain EACC. The merger of the Apple and Xerox databases in 1989 led to the first draft of the Unicode Han character set. At the September, 1989 meeting of X3L2 (an accredited standards committee for codes and character sets operating under the procedures of the American National Standards Institute), the Unicode Working Group proposed this set for inclusion in ISO 10646.

The primary difference between the Unicode Han character repertoire and earlier efforts was that the Unicode Han character set extended the bibliographic sets to guarantee complete coverage of industry and newer national standards. The unification criteria employed in this original Unicode Han character repertoire were based on rules used by JIS and on a set of Han character identity principles (*rentong yuanze*) being developed in China by experts working with the Association for a Common Chinese Code (ACCC). An important principle was to preserve all character distinctions within existing and proposed national and industry standards.

The Unicode Han proposal stimulated interest in a unified Han set for inclusion in ISO 10646, which led to the first ISO *ad hoc* meeting to discuss the issue of unification, held in Beijing in October 1989. The October 1989 meeting was the beginning of informal cooperation between the Unicode Working Group and the ACCC to exchange information on each group's proposals for Han unification.

A second ISO *ad hoc* meeting on Han Unification was held in Seoul in February 1990. At this meeting, the Korean delegation proposed the establishment of a group composed of the East Asian countries and other interested organizations to study a unified Han encoding. From this informal meeting emerged the Chinese/Japanese/Korean Joint Research Group (hereafter referred to as the CJK-JRG).

A second draft of the Unicode Han character repertoire was sent out for widespread review in December 1990 to coincide with the announcement of the formation of the Unicode Consortium. The December 1990 draft of the Unicode Han character set differed from the first in that it used the principle of *KangXi* radical/stroke ordering of the characters. In order to verify independently the soundness and accuracy of the unification, the Consortium arranged to have this draft reviewed in detail by East Asian scholars at the University of Toronto.

In the meantime, China announced that it was about to complete its own proposal for a Han Character Set, GB 13000. Concluding that the two drafts were similar in content and philosophy, the Unicode Consortium and the Center for Computer and Information Development Research, Ministry of Machinery and Electronic Industry (CCID, China's computer standards body) agreed to merge the two efforts into a single proposal. Each added missing characters from the other set and agreed upon a method for ordering the characters using the four-dictionary ordering scheme described in *Section 6.4, CJK Ideographs Area*. Both proposals benefited greatly from programmatic comparisons of the two databases.

As a result of the agreement to merge the Unicode Standard and ISO 10646, the Unicode Consortium agreed to adopt the unified Han character repertoire that was to be developed by the CJK-JRG.

The first CJK-JRG meeting was held in Tokyo, in July 1991. The group recognized that there was a compelling requirement for unification of the existing CJK ideographic characters into one coherent coding standard. Two basic decisions were made: to use GB 13000 (previously merged with the Unicode Han repertoire) as the basis for what would be termed "The Unified Repertoire and Ordering," and to verify the unification results based on rules that had been developed by professor Miyazawa Akira and other members of the Japanese delegation.

The formal review of GB 13000 began immediately. Subsequent meetings were held in Beijing and Hong Kong. On March 27, 1992 the CJK-JRG completed the *Unified Repertoire and Ordering (URO), Version 2.0*. This repertoire was subsequently published both by the Unicode Consortium in The Unicode Standard, Version 1.0, Volume 2 and by ISO in ISO/IEC 10646-1:1993.

In October 1993, the CJK-JRG became a formal subgroup of ISO/IEC JTC1/SC2/WG2 and was renamed to the Ideographic Rapporteur Group (IRG). The IRG now has the formal responsibility of developing extensions to the URO 2.0 in order to expand the encoded repertoire of unified CJK ideographs. The Unicode Consortium participates in this group as a liaison member of ISO.

In its second meeting in Hanoi in February 1994, the IRG agreed to include Vietnamese Chữ Nôm ideographs in a future version of the URO and to add a fifth reference dictionary to the ordering scheme.

At the present time (November, 1995), the IRG is considering a total of 21,252 additional CJKV ideographs submitted by China, Japan, Korea, Taiwan, and Vietnam as extensions to the URO 2.0. The actual number of new ideographs to be added to the URO is expected to be smaller than this number once the unification process has been performed on these additions. The actual encoded positions of any extensions will be determined by ISO SC2/WG2, and not by the IRG.
