 InstanceFleetType=MASTER,TargetOnDemandCapacity=1,InstanceTypeConfigs=['{InstanceType=m4.la
 InstanceFleetType=CORE,TargetSpotCapacity=11,InstanceTypeConfigs=['{InstanceType=m4.large,B
```

**Example 4: To create a cluster with default roles**

The following `create-cluster` example uses the `--use-default-roles` parameter to specify the default service role and instance profile.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

**Example 5: To create a cluster and specify the applications to install**

The following `create-cluster` example uses the `--applications` parameter to specify the applications that Amazon EMR installs. This example installs Hadoop, Hive and Pig.

```
aws emr create-cluster \
    --applications Name=Hadoop Name=Hive Name=Pig \
    --release-label emr-5.9.0 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

**Example 6: To create a cluster that includes Spark**

The following example installs Spark.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --applications Name=Spark \
    --ec2-attributes KeyName=myKey \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

**Example 7: To specify a custom AMI to use for cluster instances**

The following `create-cluster` example creates a cluster instance based on the Amazon Linux AMI with ID `ami-a518e6df`.

```
aws emr create-cluster \
```

```
    --name "Cluster with My Custom AMI" \
    --custom-ami-id ami-a518e6df \
    --ebs-root-volume-size 20 \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-count 2 \
    --instance-type m4.large
```

**Example 8: To customize application configurations**

The following examples use the `--configurations` parameter to specify a JSON configuration file that contains application customizations for Hadoop. For more information, see Configuring Applications in the *Amazon EMR Release Guide*.

Contents of `configurations.json`:

```
[
    {
       "Classification": "mapred-site",
       "Properties": {
           "mapred.tasktracker.map.tasks.maximum": 2
       }
    },
    {
        "Classification": "hadoop-env",
        "Properties": {},
        "Configurations": [
            {
                "Classification": "export",
                "Properties": {
                    "HADOOP_DATANODE_HEAPSIZE": 2048,
                    "HADOOP_NAMENODE_OPTS": "-XX:GCTimeRatio=19"
                }
            }
        ]
    }
]
```

The following example references `configurations.json` as a local file.

```
aws emr create-cluster \
    --configurations file://configurations.json \
    --release-label emr-5.9.0 \
```

```
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

The following example references `configurations.json` as a file in Amazon S3.

```
aws emr create-cluster \
    --configurations https://s3.amazonaws.com/myBucket/configurations.json \
    --release-label emr-5.9.0 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

**Example 9: To create a cluster with master, core, and task instance groups**

The following `create-cluster` example uses `--instance-groups` to specify the type and number of EC2 instances to use for master, core, and task instance groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --instance-groups
 Name=Master,InstanceGroupType=MASTER,InstanceType=m4.large,InstanceCount=1
 Name=Core,InstanceGroupType=CORE,InstanceType=m4.large,InstanceCount=2
 Name=Task,InstanceGroupType=TASK,InstanceType=m4.large,InstanceCount=2
```

**Example 10: To specify that a cluster should terminate after completing all steps**

The following `create-cluster` example uses `--auto-terminate` to specify that the cluster should shut down automatically after completing all steps.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

**Example 11: To specify cluster configuration details such as the Amazon EC2 key pair, network configuration, and security groups**

The following `create-cluster` example creates a cluster with the Amazon EC2 key pair named `myKey` and a customized instance profile named `myProfile`. Key pairs are used to

authorize SSH connections to cluster nodes, most often the master node. For more information, see Use an Amazon EC2 Key Pair for SSH Credentials in the *Amazon EMR Management Guide*.

```
aws emr create-cluster \
    --ec2-attributes KeyName=myKey,InstanceProfile=myProfile \
    --release-label emr-5.9.0 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

The following example creates a cluster in an Amazon VPC subnet.

```
aws emr create-cluster \
    --ec2-attributes SubnetId=subnet-xxxxx \
    --release-label emr-5.9.0 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

The following example creates a cluster in the `us-east-1b` availability zone.

```
aws emr create-cluster \
    --ec2-attributes AvailabilityZone=us-east-1b \
    --release-label emr-5.9.0 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies only the Amazon EMR-managed security groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-
master1,EmrManagedSlaveSecurityGroup=sg-slave1 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies only additional Amazon EC2 security groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,AdditionalMasterSecurityGroups=[sg-
addMaster1,sg-addMaster2,sg-addMaster3,sg-
addMaster4],AdditionalSlaveSecurityGroups=[sg-addSlave1,sg-addSlave2,sg-
addSlave3,sg-addSlave4] \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies the EMR-Managed security groups, as well as additional security groups.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-
master1,EmrManagedSlaveSecurityGroup=sg-slave1,AdditionalMasterSecurityGroups=[sg-
addMaster1,sg-addMaster2,sg-addMaster3,sg-
addMaster4],AdditionalSlaveSecurityGroups=[sg-addSlave1,sg-addSlave2,sg-
addSlave3,sg-addSlave4] \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster in a VPC private subnet and use a specific Amazon EC2 security group to enable Amazon EMR service access, which is required for clusters in private subnets.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes InstanceProfile=myRole,ServiceAccessSecurityGroup=sg-service-
access,EmrManagedMasterSecurityGroup=sg-master,EmrManagedSlaveSecurityGroup=sg-slave
 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example specifies security group configuration parameters using a JSON file named `ec2_attributes.json` that is stored locally. NOTE: JSON arguments must include options and values as their own items in the list.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role myServiceRole \
    --ec2-attributes file://ec2_attributes.json  \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Contents of `ec2_attributes.json`:

```
[
    {
        "SubnetId": "subnet-xxxxx",
        "KeyName": "myKey",
        "InstanceProfile":"myRole",
        "EmrManagedMasterSecurityGroup": "sg-master1",
        "EmrManagedSlaveSecurityGroup": "sg-slave1",
        "ServiceAccessSecurityGroup": "sg-service-access",
        "AdditionalMasterSecurityGroups": ["sg-addMaster1","sg-addMaster2","sg-
addMaster3","sg-addMaster4"],
        "AdditionalSlaveSecurityGroups": ["sg-addSlave1","sg-addSlave2","sg-
addSlave3","sg-addSlave4"]
    }
]
```

**Example 12: To enable debugging and specify a log URI**

The following `create-cluster` example uses the `--enable-debugging` parameter, which allows you to view log files more easily using the debugging tool in the Amazon EMR console. The `--log-uri` parameter is required with `--enable-debugging`.

```
aws emr create-cluster \
    --enable-debugging \
    --log-uri s3://myBucket/myLog \
    --release-label emr-5.9.0 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

**Example 13: To add tags when creating a cluster**

Tags are key-value pairs that help you identify and manage clusters. The following `create-cluster` example uses the `--tags` parameter to create three tags for a cluster, one with the

key name `name` and the value `Shirley Rodriguez`, a second with the key name `age` and the value 29, and a third tag with the key name `department` and the value `Analytics`.

```
aws emr create-cluster \
    --tags name="Shirley Rodriguez" age=29 department="Analytics" \
    --release-label emr-5.32.0 \
    --instance-type m5.xlarge \
    --instance-count 3 \
    --use-default-roles
```

The following example lists the tags applied to a cluster.

```
aws emr describe-cluster \
    --cluster-id j-XXXXXXYY \
    --query Cluster.Tags
```

**Example 14: To use a security configuration that enables encryption and other security features**

The following `create-cluster` example uses the `--security-configuration` parameter to specify a security configuration for an EMR cluster. You can use security configurations with Amazon EMR version 4.8.0 or later.

```
aws emr create-cluster \
    --instance-type m4.large \
    --release-label emr-5.9.0 \
    --security-configuration mySecurityConfiguration
```

**Example 15: To create a cluster with additional EBS storage volumes configured for the instance groups**

When specifying additional EBS volumes, the following arguments are required: `VolumeType`, `SizeInGB` if `EbsBlockDeviceConfigs` is specified.

The following `create-cluster` example creates a cluster with multiple EBS volumes attached to EC2 instances in the core instance group.

```
aws emr create-cluster \
    --release-label emr-5.9.0  \
    --use-default-roles \
```

```
    --instance-groups
 InstanceGroupType=MASTER,InstanceCount=1,InstanceType=d2.xlarge
 'InstanceGroupType=CORE,InstanceCount=2,InstanceType=d2.xlarge,EbsConfiguration={EbsOptimiz
{VolumeSpecification={VolumeType=io1,SizeInGB=100,Iops=100},VolumesPerInstance=4}]}'
 \
    --auto-terminate
```

The following example creates a cluster with multiple EBS volumes attached to EC2 instances in the master instance group.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --use-default-roles \
    --instance-groups 'InstanceGroupType=MASTER, InstanceCount=1,
 InstanceType=d2.xlarge, EbsConfiguration={EbsOptimized=true,
 EbsBlockDeviceConfigs=[{VolumeSpecification={VolumeType=io1, SizeInGB=100,
 Iops=100}},
{VolumeSpecification={VolumeType=standard,SizeInGB=50},VolumesPerInstance=3}]}'
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=d2.xlarge \
    --auto-terminate
```

**Example 16: To create a cluster with an automatic scaling policy**

You can attach automatic scaling policies to core and task instance groups using Amazon EMR version 4.0 and later. The automatic scaling policy dynamically adds and removes EC2 instances in response to an Amazon CloudWatch metric. For more information, see Using Automatic Scaling in Amazon EMR <https://docs.aws.amazon.com/emr/latest/ManagementGuide/emr-automatic-scaling.html>`_ in the *Amazon EMR Management Guide*.

When attaching an automatic scaling policy, you must also specify the default role for automatic scaling using `--auto-scaling-role EMR_AutoScaling_DefaultRole`.

The following `create-cluster` example specifies the automatic scaling policy for the `CORE` instance group using the `AutoScalingPolicy` argument with an embedded JSON structure, which specifies the scaling policy configuration. Instance groups with an embedded JSON structure must have the entire collection of arguments enclosed in single quotes. Using single quotes is optional for instance groups without an embedded JSON structure.

```
aws emr create-cluster
    --release-label emr-5.9.0 \
    --use-default-roles --auto-scaling-role EMR_AutoScaling_DefaultRole \
```

```
    --instance-groups
 InstanceGroupType=MASTER,InstanceType=d2.xlarge,InstanceCount=1
 'InstanceGroupType=CORE,InstanceType=d2.xlarge,InstanceCount=2,AutoScalingPolicy={Constrain
```

The following example uses a JSON file, `instancegroupconfig.json`, to specify the configuration of all instance groups in a cluster. The JSON file specifies the automatic scaling policy configuration for the core instance group.

```
aws emr create-cluster \
    --release-label emr-5.9.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-groups file://myfolder/instancegroupconfig.json \
    --auto-scaling-role EMR_AutoScaling_DefaultRole
```

Contents of `instancegroupconfig.json`:

```
[
    {
        "InstanceCount": 1,
        "Name": "MyMasterIG",
        "InstanceGroupType": "MASTER",
        "InstanceType": "m4.large"
    },
    {
        "InstanceCount": 2,
        "Name": "MyCoreIG",
        "InstanceGroupType": "CORE",
        "InstanceType": "m4.large",
        "AutoScalingPolicy": {
            "Constraints": {
                "MinCapacity": 2,
                "MaxCapacity": 10
            },
            "Rules": [
                {
                    "Name": "Default-scale-out",
                    "Description": "Replicates the default scale-out rule in the
 console for YARN memory.",
                    "Action": {
                        "SimpleScalingPolicyConfiguration": {
                            "AdjustmentType": "CHANGE_IN_CAPACITY",

                            "ScalingAdjustment": 1,
                            "CoolDown": 300
                        }
                    },
                    "Trigger": {
                        "CloudWatchAlarmDefinition": {
                            "ComparisonOperator": "LESS_THAN",
                            "EvaluationPeriods": 1,
                            "MetricName": "YARNMemoryAvailablePercentage",
                            "Namespace": "AWS/ElasticMapReduce",
                            "Period": 300,
                            "Threshold": 15,
                            "Statistic": "AVERAGE",
                            "Unit": "PERCENT",
                            "Dimensions": [
                                {
                                    "Key": "JobFlowId",
                                    "Value": "${emr.clusterId}"
                                }
                            ]
                        }
                    }
                }
            ]
        }
    }
]
```

**Example 17: Add custom JAR steps when creating a cluster**

The following `create-cluster` example adds steps by specifying a JAR file stored in Amazon S3. Steps submit work to a cluster. The main function defined in the JAR file executes after EC2 instances are provisioned, any bootstrap actions have executed, and applications are installed. The steps are specified using `Type=CUSTOM_JAR`.

Custom JAR steps require the `Jar=` parameter, which specifies the path and file name of the JAR. Optional parameters are `Type`, `Name`, `ActionOnFailure`, `Args`, and `MainClass`. If main class is not specified, the JAR file should specify `Main-Class` in its manifest file.

```
aws emr create-cluster \
    --steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://
myBucket/mytest.jar,Args=arg1,arg2,arg3
```

```
 Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://myBucket/
mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3  \
    --release-label emr-5.3.1 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

**Example 18: To add streaming steps when creating a cluster**

The following `create-cluster` examples add a streaming step to a cluster that terminates after all steps run. Streaming steps require parameters `Type` and `Args`. Streaming steps optional parameters are `Name` and `ActionOnFailure`.

The following example specifies the step inline.

```
aws emr create-cluster \
    --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-
files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-
mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/
wordcount/input,-output,s3://mybucket/wordcount/output] \
    --release-label emr-5.3.1 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

The following example uses a locally stored JSON configuration file named `multiplefiles.json`. The JSON configuration specifies multiple files. To specify multiple files within a step, you must use a JSON configuration file to specify the step. JSON arguments must include options and values as their own items in the list.

```
aws emr create-cluster \
    --steps file://./multiplefiles.json \
    --release-label emr-5.9.0  \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

Contents of `multiplefiles.json`:

```
[
    {
```

```
        "Name": "JSON Streaming Step",
        "Args": [
            "-files",
            "s3://elasticmapreduce/samples/wordcount/wordSplitter.py",
            "-mapper",
            "wordSplitter.py",
            "-reducer",
            "aggregate",
            "-input",
            "s3://elasticmapreduce/samples/wordcount/input",
            "-output",
            "s3://mybucket/wordcount/output"
        ],
        "ActionOnFailure": "CONTINUE",
        "Type": "STREAMING"
    }
]
```

**Example 19: To add Hive steps when creating a cluster**

The following example add Hive steps when creating a cluster. Hive steps require parameters `Type` and `Args`. Hive steps optional parameters are `Name` and `ActionOnFailure`.

```
aws emr create-cluster \
    --steps Type=HIVE,Name='Hive
 program',ActionOnFailure=CONTINUE,ActionOnFailure=TERMINATE_CLUSTER,Args=[-
f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://
elasticmapreduce/samples/hive-ads/tables,-d,OUTPUT=s3://mybucket/hive-ads/
output/2014-04-18/11-07-32,-d,LIBS=s3://elasticmapreduce/samples/hive-ads/libs] \
    --applications Name=Hive \
    --release-label emr-5.3.1 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

**Example 20: To add Pig steps when creating a cluster**

The following example adds Pig steps when creating a cluster. Pig steps required parameters are `Type` and `Args`. Pig steps optional parameters are `Name` and `ActionOnFailure`.

```
aws emr create-cluster \
    --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://
elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/
samples/pig-apache/input,-p,OUTPUT=s3://mybucket/pig-apache/output] \
```

```
    --applications Name=Pig \
    --release-label emr-5.3.1 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

**Example 21: To add bootstrap actions**

The following `create-cluster` example runs two bootstrap actions defined as scripts that are stored in Amazon S3.

```
aws emr create-cluster \
    --bootstrap-actions Path=s3://mybucket/
myscript1,Name=BootstrapAction1,Args=[arg1,arg2] Path=s3://mybucket/
myscript2,Name=BootstrapAction2,Args=[arg1,arg2] \
    --release-label emr-5.3.1 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
    --auto-terminate
```

**Example 22: To enable EMRFS consistent view and customize the RetryCount and RetryPeriod settings**

The following `create-cluster` example specifies the retry count and retry period for EMRFS consistent view. The `Consistent=true` argument is required.

```
aws emr create-cluster \
    --instance-type m4.large \
    --release-label emr-5.9.0 \
    --emrfs Consistent=true,RetryCount=6,RetryPeriod=30
```

The following example specifies the same EMRFS configuration as the previous example, using a locally stored JSON configuration file named `emrfsconfig.json`.

```
aws emr create-cluster \
    --instance-type m4.large \
    --release-label emr-5.9.0 \
    --emrfs file://emrfsconfig.json
```

Contents of `emrfsconfig.json`:

```
{
```

```
    "Consistent": true,
    "RetryCount": 6,
    "RetryPeriod": 30
}
```

**Example 23: To create a cluster with Kerberos configured**

The following `create-cluster` examples create a cluster using a security configuration with Kerberos enabled, and establishes Kerberos parameters for the cluster using `--kerberos-attributes`.

The following command specifies Kerberos attributes for the cluster inline.

```
aws emr create-cluster \
    --instance-type m3.xlarge \
    --release-label emr-5.10.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --security-configuration mySecurityConfiguration \
    --kerberos-attributes
 Realm=EC2.INTERNAL,KdcAdminPassword=123,CrossRealmTrustPrincipalPassword=123
```

The following command specifies the same attributes, but references a locally stored JSON file named `kerberos_attributes.json`. In this example, the file is saved in the same directory where you run the command. You can also reference a configuration file saved in Amazon S3.

```
aws emr create-cluster \
    --instance-type m3.xlarge \
    --release-label emr-5.10.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --security-configuration mySecurityConfiguration \
    --kerberos-attributes file://kerberos_attributes.json
```

Contents of `kerberos_attributes.json`:

```
{
    "Realm": "EC2.INTERNAL",
    "KdcAdminPassword": "123",
    "CrossRealmTrustPrincipalPassword": "123",
}
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration and has a managed scaling policy.

```
aws emr create-cluster \
    --release-label emr-5.30.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
    --managed-scaling-policy
 ComputeLimits='{MinimumCapacityUnits=2,MaximumCapacityUnits=4,UnitType=Instances}'
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--log-encryption-kms-key-id" to define KMS key ID utilized for Log encryption.

```
aws emr create-cluster \
    --release-label emr-5.30.0 \
    --log-uri s3://myBucket/myLog \
    --log-encryption-kms-key-id arn:aws:kms:us-east-1:110302272565:key/
dd559181-283e-45d7-99d1-66da348c4d33 \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--placement-group-configs" configuration to place master nodes in a high-availability (HA) cluster within an EC2 placement group using SPREAD placement strategy.

```
aws emr create-cluster \
    --release-label emr-5.30.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-groups
 InstanceGroupType=MASTER,InstanceCount=3,InstanceType=m4.largeInstanceGroupType=CORE,Instan
 \
    --placement-group-configs InstanceRole=MASTER
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--auto-termination-policy" configuration to place an automatic idle termination threshold for the cluster.

```
aws emr create-cluster \
```

```
    --release-label emr-5.34.0 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=1,InstanceType=m4.large \
    --auto-termination-policy IdleTimeout=100
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "--os-release-label" to define an Amazon Linux release for cluster launch

```
aws emr create-cluster \
    --release-label emr-6.6.0 \
    --os-release-label 2.0.20220406.1 \
    --service-role EMR_DefaultRole \
    --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
    --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
 InstanceGroupType=CORE,InstanceCount=1,InstanceType=m4.large
```

**Example 24: To specify an EBS root volume attributes: size, iops and throughput for cluster instances created with EMR releases 6.15.0 and later**

The following `create-cluster` example creates an Amazon EMR cluster that uses root volume attributes to configure root volumes specifications for the EC2 instances.

```
aws emr create-cluster \
    --name "Cluster with My Custom AMI" \
    --custom-ami-id ami-a518e6df \
    --ebs-root-volume-size 20 \
    --ebs-root-volume-iops 3000 \
    --ebs-root-volume-throughput 125 \
    --release-label emr-6.15.0 \
    --use-default-roles \
    --instance-count 2 \
    --instance-type m4.large
```

- For API details, see CreateClusterExamples in *AWS CLI Command Reference*.

## `create-default-roles`

The following code example shows how to use `create-default-roles`.

## AWS CLI

### 1. To create the default IAM role for EC2

Command:

```
aws emr create-default-roles
```

Output:

```
If the role already exists then the command returns nothing.

If the role does not exist then the output will be:

[
    {

### `create-security-configuration`

The following code example shows how to use `create-security-configuration`.

#### AWS CLI

**1. To create a security configuration with in-transit encryption enabled with PEM for certificate provider, and at-rest encryption enabled with SSE-S3 for S3 encryption and AWS-KMS for local disk key provider**

Command:

```
 aws emr create-security-configuration --name MySecurityConfig --security-
configuration '{
        "EncryptionConfiguration": {
                "EnableInTransitEncryption" : true,
                "EnableAtRestEncryption" : true,
                "InTransitEncryptionConfiguration" : {
                        "TLSCertificateConfiguration" : {
                                "CertificateProviderType" : "PEM",
                                "S3Object" : "s3://mycertstore/artifacts/
MyCerts.zip"
                        }
                },
                "AtRestEncryptionConfiguration" : {
                        "S3EncryptionConfiguration" : {
                                "EncryptionMode" : "SSE-S3"
                        },
```

```
                        "LocalDiskEncryptionConfiguration" : {
                                "EncryptionKeyProviderType" : "AwsKms",
                                "AwsKmsKey" : "arn:aws:kms:us-
east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
                        }
                }
        }
}'
```

Output:

```
{
"CreationDateTime": 1474070889.129,
"Name": "MySecurityConfig"
}
```

JSON equivalent (contents of security_configuration.json):

```
{
    "EncryptionConfiguration": {
        "EnableInTransitEncryption": true,
        "EnableAtRestEncryption": true,
        "InTransitEncryptionConfiguration": {
            "TLSCertificateConfiguration": {
                "CertificateProviderType": "PEM",
                "S3Object": "s3://mycertstore/artifacts/MyCerts.zip"
            }
        },
        "AtRestEncryptionConfiguration": {
            "S3EncryptionConfiguration": {
                "EncryptionMode": "SSE-S3"
            },
            "LocalDiskEncryptionConfiguration": {
                "EncryptionKeyProviderType": "AwsKms",
                "AwsKmsKey": "arn:aws:kms:us-
east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
            }
        }
    }
}
```

Command (using security_configuration.json):

```
aws emr create-security-configuration --name "MySecurityConfig" --security-
configuration file://./security_configuration.json
```

Output:

```
{
"CreationDateTime": 1474070889.129,
"Name": "MySecurityConfig"
}
```

**2. To create a security configuration with Kerberos enabled using cluster-dedicated KDC and cross-realm trust**

Command:

```
 aws emr create-security-configuration --name MySecurityConfig --security-
configuration '{
     "AuthenticationConfiguration": {
         "KerberosConfiguration": {
             "Provider": "ClusterDedicatedKdc",
             "ClusterDedicatedKdcConfiguration": {
                 "TicketLifetimeInHours": 24,
                 "CrossRealmTrustConfiguration": {
                   "Realm": "AD.DOMAIN.COM",
                   "Domain": "ad.domain.com",
                   "AdminServer": "ad.domain.com",
                   "KdcServer": "ad.domain.com"
                 }
             }
         }
     }
}'
```

Output:

```
{
"CreationDateTime": 1490225558.982,
"Name": "MySecurityConfig"
}
```

JSON equivalent (contents of security_configuration.json):

```
{
    "AuthenticationConfiguration": {
        "KerberosConfiguration": {
            "Provider": "ClusterDedicatedKdc",
            "ClusterDedicatedKdcConfiguration": {
                "TicketLifetimeInHours": 24,
                "CrossRealmTrustConfiguration": {
                    "Realm": "AD.DOMAIN.COM",
                    "Domain": "ad.domain.com",
                    "AdminServer": "ad.domain.com",
                    "KdcServer": "ad.domain.com"
                }
            }
        }
    }
}
```

Command (using security_configuration.json):

```
aws emr create-security-configuration --name "MySecurityConfig" --security-
configuration file://./security_configuration.json
```

Output:

```
{
"CreationDateTime": 1490225558.982,
"Name": "MySecurityConfig"
}
```

- For API details, see CreateSecurityConfiguration in *AWS CLI Command Reference*.

### `delete-security-configuration`

The following code example shows how to use `delete-security-configuration`.

#### AWS CLI

**To delete a security configuration in the current region**

Command:

```
aws emr delete-security-configuration --name MySecurityConfig
```

Output:

```
None
```

- For API details, see DeleteSecurityConfiguration in *AWS CLI Command Reference*.

### `describe-cluster`

The following code example shows how to use `describe-cluster`.

#### AWS CLI

Command:

```
aws emr describe-cluster --cluster-id j-XXXXXXXX
```

Output:

```
For release-label based uniform instance groups cluster:

        {
            "Cluster": {
                "Status": {
                    "Timeline": {
                        "ReadyDateTime": 1436475075.199,
                        "CreationDateTime": 1436474656.563,
                    },
                    "State": "WAITING",
                    "StateChangeReason": {
                        "Message": "Waiting for steps to run"
                    }
                },
                "Ec2InstanceAttributes": {
                    "ServiceAccessSecurityGroup": "sg-xxxxxxxx",
                    "EmrManagedMasterSecurityGroup": "sg-xxxxxxxx",
                    "IamInstanceProfile": "EMR_EC2_DefaultRole",
                    "Ec2KeyName": "myKey",
                    "Ec2AvailabilityZone": "us-east-1c",
                    "EmrManagedSlaveSecurityGroup": "sg-yyyyyyyyy"
```

```
                },
                "Name": "My Cluster",
                "ServiceRole": "EMR_DefaultRole",
                "Tags": [],
                "TerminationProtected": true,
                "UnhealthyNodeReplacement": true,
                "ReleaseLabel": "emr-4.0.0",
                "NormalizedInstanceHours": 96,
                "InstanceGroups": [
                    {
                        "RequestedInstanceCount": 2,
                        "Status": {
                            "Timeline": {
                                "ReadyDateTime": 1436475074.245,

        }
    }
```

- For API details, see DescribeCluster in *AWS CLI Command Reference*.

### `describe-step`

The following code example shows how to use `describe-step`.

#### AWS CLI

The following command describes a step with the step ID `s-3LZC0QUT43AM` in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr describe-step --cluster-id j-3SD91U2E1L2QX --step-id s-3LZC0QUT43AM
```

Output:

```
{
    "Step": {
        "Status": {
            "Timeline": {
                "EndDateTime": 1433200470.481,
                "CreationDateTime": 1433199926.597,
                "StartDateTime": 1433200404.959
            },
            "State": "COMPLETED",
            "StateChangeReason": {}
        },
        "Config": {
            "Args": [
```

```
                "s3://us-west-2.elasticmapreduce/libs/hive/hive-script",
                "--base-path",
                "s3://us-west-2.elasticmapreduce/libs/hive/",
                "--install-hive",
                "--hive-versions",
                "0.13.1"
            ],
            "Jar": "s3://us-west-2.elasticmapreduce/libs/script-runner/script-
runner.jar",
            "Properties": {}
        },
        "Id": "s-3LZC0QUT43AM",
        "ActionOnFailure": "TERMINATE_CLUSTER",
        "Name": "Setup hive"
    }
}
```

- For API details, see DescribeStep in *AWS CLI Command Reference*.

### `get`

The following code example shows how to use `get`.

#### AWS CLI

The following downloads the `hadoop-examples.jar` archive from the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr get --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src /
home/hadoop-examples.jar --dest ~
```

- For API details, see Get in *AWS CLI Command Reference*.

### `list-clusters`

The following code example shows how to use `list-clusters`.

#### AWS CLI

The following command lists all active EMR clusters in the current region:

```
aws emr list-clusters --active
```

Output:

```
{
    "Clusters": [
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1433200405.353,
                    "CreationDateTime": 1433199926.596
                },
                "State": "WAITING",
                "StateChangeReason": {
                    "Message": "Waiting after step completed"
                }
            },
            "NormalizedInstanceHours": 6,
            "Id": "j-3SD91U2E1L2QX",
            "Name": "my-cluster"
        }
    ]
}
```

- For API details, see ListClusters in *AWS CLI Command Reference*.

### `list-instance-fleets`

The following code example shows how to use `list-instance-fleets`.

#### AWS CLI

**To get configuration details of instance fleets in a cluster**

This example lists the details of instance fleets in the cluster specified.

Command:

```
list-instance-fleets --cluster-id 'j-12ABCDEFGHI34JK'
```

Output:

```
{
  "InstanceFleets": [
      {
          "Status": {
              "Timeline": {
                  "ReadyDateTime": 1488759094.637,
                  "CreationDateTime": 1488758719.817
              },
              "State": "RUNNING",
              "StateChangeReason": {
                  "Message": ""
              }
          },
          "ProvisionedSpotCapacity": 6,
          "Name": "CORE",
          "InstanceFleetType": "CORE",
          "LaunchSpecifications": {
              "SpotSpecification": {
                  "TimeoutDurationMinutes": 60,
                  "TimeoutAction": "TERMINATE_CLUSTER"
              }
          },
          "ProvisionedOnDemandCapacity": 2,
          "InstanceTypeSpecifications": [
              {
                  "BidPrice": "0.5",
                  "InstanceType": "m3.xlarge",
                  "WeightedCapacity": 2
              }
          ],
          "Id": "if-1ABC2DEFGHIJ3"
      },
      {
          "Status": {
              "Timeline": {
                  "ReadyDateTime": 1488759058.598,
                  "CreationDateTime": 1488758719.811
              },
              "State": "RUNNING",
              "StateChangeReason": {
                  "Message": ""
              }
          },
```

```
            "ProvisionedSpotCapacity": 0,
            "Name": "MASTER",
            "InstanceFleetType": "MASTER",
            "ProvisionedOnDemandCapacity": 1,
            "InstanceTypeSpecifications": [
                {
                    "BidPriceAsPercentageOfOnDemandPrice": 100.0,
                    "InstanceType": "m3.xlarge",
                    "WeightedCapacity": 1
                }
            ],
           "Id": "if-2ABC4DEFGHIJ4"
        }
    ]
}
```

- For API details, see ListInstanceFleets in *AWS CLI Command Reference*.

### `list-instances`

The following code example shows how to use `list-instances`.

#### AWS CLI

The following command lists all of the instances in a cluster with the cluster ID `j-3C6XNQ39VR9WL`:

```
aws emr list-instances --cluster-id j-3C6XNQ39VR9WL
```

Output:

```
For a uniform instance group based cluster
  {
    "Instances": [
         {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1433200400.03,
                    "CreationDateTime": 1433199960.152
                },
                "State": "RUNNING",
                "StateChangeReason": {}
```

```
            },
            "Ec2InstanceId": "i-f19ecfee",
            "PublicDnsName": "ec2-52-52-41-150.us-west-2.compute.amazonaws.com",
            "PrivateDnsName": "ip-172-21-11-216.us-west-2.compute.internal",
            "PublicIpAddress": "52.52.41.150",
            "Id": "ci-3NNHQUQ2TWB6Y",
            "PrivateIpAddress": "172.21.11.216"
        },
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1433200400.031,
                    "CreationDateTime": 1433199949.102
                },
                "State": "RUNNING",
                "StateChangeReason": {}
            },
            "Ec2InstanceId": "i-1feee4c2",
            "PublicDnsName": "ec2-52-63-246-32.us-west-2.compute.amazonaws.com",
            "PrivateDnsName": "ip-172-31-24-130.us-west-2.compute.internal",
            "PublicIpAddress": "52.63.246.32",
            "Id": "ci-GAOCMKNKDCV7",
            "PrivateIpAddress": "172.21.11.215"
        },
        {
            "Status": {
                "Timeline": {
                    "ReadyDateTime": 1433200400.031,
                    "CreationDateTime": 1433199949.102
                },
                "State": "RUNNING",
                "StateChangeReason": {}
            },
            "Ec2InstanceId": "i-15cfeee3",
            "PublicDnsName": "ec2-52-25-246-63.us-west-2.compute.amazonaws.com",
            "PrivateDnsName": "ip-172-31-24-129.us-west-2.compute.internal",
            "PublicIpAddress": "52.25.246.63",
            "Id": "ci-2W3TDFFB47UAD",
            "PrivateIpAddress": "172.21.11.214"
        }
    ]
}
```

```
For a fleet based cluster:
   {
      "Instances": [
          {
              "Status": {
                  "Timeline": {
                      "ReadyDateTime": 1487810810.878,
                      "CreationDateTime": 1487810588.367,
                      "EndDateTime": 1488022990.924
                  },
                  "State": "TERMINATED",
                  "StateChangeReason": {
                      "Message": "Instance was terminated."
                  }
              },
              "Ec2InstanceId": "i-xxxxx",
              "InstanceFleetId": "if-xxxxx",
              "EbsVolumes": [],
              "PublicDnsName": "ec2-xx-xxx-xxx-xxx.compute-1.amazonaws.com",
              "InstanceType": "m3.xlarge",
              "PrivateDnsName": "ip-xx-xx-xxx-xx.ec2.internal",
              "Market": "SPOT",
              "PublicIpAddress": "xx.xx.xxx.xxx",
              "Id": "ci-xxxxx",
              "PrivateIpAddress": "10.47.191.80"
          }
      ]
  }
```

- For API details, see ListInstances in *AWS CLI Command Reference*.

## `list-security-configurations`

The following code example shows how to use `list-security-configurations`.

### AWS CLI

#### To list security configurations in the current region

Command:

```
aws emr list-security-configurations
```

Output:

```
{
    "SecurityConfigurations": [
        {
            "CreationDateTime": 1473889697.417,
            "Name": "MySecurityConfig-1"
        },
        {
            "CreationDateTime": 1473889697.417,
            "Name": "MySecurityConfig-2"
        }
    ]
}
```

- For API details, see ListSecurityConfigurations in *AWS CLI Command Reference*.

### `list-steps`

The following code example shows how to use `list-steps`.

#### AWS CLI

The following command lists all of the steps in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr list-steps --cluster-id j-3SD91U2E1L2QX
```

- For API details, see ListSteps in *AWS CLI Command Reference*.

### `modify-cluster-attributes`

The following code example shows how to use `modify-cluster-attributes`.

#### AWS CLI

The following command sets the visibility of an EMR cluster with the ID `j-301CDNY0J5XM4` to all users:

```
aws emr modify-cluster-attributes --cluster-id j-301CDNY0J5XM4 --visible-to-all-
users
```

- For API details, see ModifyClusterAttributes in *AWS CLI Command Reference*.

### `modify-instance-fleet`

The following code example shows how to use `modify-instance-fleet`.

**AWS CLI**

**To change the target capacites of an instance fleet**

This example changes the On-Demand and Spot target capacities to 1 for the instance fleet specified.

Command:

```
aws emr modify-instance-fleet --cluster-id 'j-12ABCDEFGHI34JK' --instance-fleet
 InstanceFleetId='if-2ABC4DEFGHIJ4',TargetOnDemandCapacity=1,TargetSpotCapacity=1
```

- For API details, see ModifyInstanceFleet in *AWS CLI Command Reference*.

### `put`

The following code example shows how to use `put`.

**AWS CLI**

The following command uploads a file named `healthcheck.sh` to the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr put --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src ~/
scripts/healthcheck.sh --dest /home/hadoop/bin/healthcheck.sh
```

- For API details, see Put in *AWS CLI Command Reference*.

### `remove-tags`

The following code example shows how to use `remove-tags`.

**AWS CLI**

The following command removes a tag with the key `prod` from a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr remove-tags --resource-id j-3SD91U2E1L2QX --tag-keys prod
```

- For API details, see RemoveTags in *AWS CLI Command Reference*.

### `schedule-hbase-backup`

The following code example shows how to use `schedule-hbase-backup`.

**AWS CLI**

**Note: This command can only be used with HBase on AMI version 2.x and 3.x**

**1. To schedule a full HBase backup** >>>>>>> 06ab6d6e13564b5733d75abaf3b599f93cf39a23

Command:

```
aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type full --dir
s3://myBucket/backup --interval 10 --unit hours --start-time
2014-04-21T05:26:10Z --consistent
```

Output:

```
None
```

**2. To schedule an incremental HBase backup**

Command:

```
aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type incremental
 --dir s3://myBucket/backup --interval 30 --unit minutes --start-time
2014-04-21T05:26:10Z --consistent
```

Output:

```
None
```

- For API details, see ScheduleHbaseBackup in *AWS CLI Command Reference*.

### socks

The following code example shows how to use `socks`.

#### AWS CLI

The following command opens a socks connection with the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr socks --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

- For API details, see Socks in *AWS CLI Command Reference*.

### ssh

The following code example shows how to use `ssh`.

#### AWS CLI

The following command opens an ssh connection with the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr ssh --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

Output:

```
ssh -o StrictHostKeyChecking=no -o ServerAliveInterval=10 -i /home/local/user/.ssh/
mykey.pem hadoop@ec2-52-52-41-150.us-west-2.compute.amazonaws.com
Warning: Permanently added 'ec2-52-52-41-150.us-
west-2.compute.amazonaws.com,52.52.41.150' (ECDSA) to the list of known hosts.

Run "sudo yum update" to apply all updates.

--------------------------------------------------------------------------------

Welcome to Amazon Elastic MapReduce running Hadoop and Amazon Linux.

Hadoop is installed in /home/hadoop. Log files are in /mnt/var/log/hadoop. Check
/mnt/var/log/hadoop/steps for diagnosing step failures.

The Hadoop UI can be accessed via the following commands:

  ResourceManager    lynx http://ip-172-21-11-216:9026/
  NameNode           lynx http://ip-172-21-11-216:9101/

--------------------------------------------------------------------------------

[hadoop@ip-172-31-16-216 ~]$
```

- For API details, see Ssh in *AWS CLI Command Reference*.

## Amazon EMR on EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR on EKS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `update-role-trust-policy`

The following code example shows how to use `update-role-trust-policy`.

**AWS CLI**

**To update the trust policy of an IAM Role to be used with Amazon EMR on EKS**

This example command updates the trust policy of a role named **example_iam_role** such that it can be used with Amazon EMR on EKS with **example_namespace** namespace from an EKS cluster named **example_cluster**.

Command:

```
aws emr-containers update-role-trust-policy \
    --cluster example_cluster \
    --namespace example_namespace \
    --role-name example_iam_role
```

Output:

```
If the trust policy has already been updated, then the output will be:
Trust policy statement already exists for role example_iam_role. No
changes were made!

If the trust policy has not been updated yet, then the output will be:
Successfully updated trust policy of role example_iam_role.
```

- For API details, see UpdateRoleTrustPolicy in *AWS CLI Command Reference*.

## EventBridge examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with EventBridge.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

**Actions**

### `delete-rule`

The following code example shows how to use `delete-rule`.

**AWS CLI**

**To delete a CloudWatch Events rule**

This example deletes the rule named EC2InstanceStateChanges:

```
aws events delete-rule --name "EC2InstanceStateChanges"
```

- For API details, see DeleteRule in *AWS CLI Command Reference*.

### `describe-rule`

The following code example shows how to use `describe-rule`.

**AWS CLI**

**To display information about a CloudWatch Events rule**

This example displays information about the rule named DailyLambdaFunction:

```
aws events describe-rule --name "DailyLambdaFunction"
```

- For API details, see DescribeRule in *AWS CLI Command Reference*.

### `disable-rule`

The following code example shows how to use `disable-rule`.

**AWS CLI**

**To disable a CloudWatch Events rule**

This example disables the rule named DailyLambdaFunction. The rule is not deleted:

```
aws events disable-rule --name "DailyLambdaFunction"
```

- For API details, see DisableRule in *AWS CLI Command Reference*.

### `enable-rule`

The following code example shows how to use `enable-rule`.

**AWS CLI**

**To enable a CloudWatch Events rule**

This example enables the rule named DailyLambdaFunction, which had been previously disabled:

```
aws events enable-rule --name "DailyLambdaFunction"
```

- For API details, see EnableRule in *AWS CLI Command Reference*.

### `list-rule-names-by-target`

The following code example shows how to use `list-rule-names-by-target`.

**AWS CLI**

**To display all the rules that have a specified target**

This example displays all rules that have the Lambda function named "MyFunctionName" as the target:

```
aws events list-rule-names-by-target --target-arn "arn:aws:lambda:us-
east-1:123456789012:function:MyFunctionName"
```

- For API details, see ListRuleNamesByTarget in *AWS CLI Command Reference*.

### `list-rules`

The following code example shows how to use `list-rules`.

**AWS CLI**

**To display a list of all CloudWatch Events rules**

This example displays all CloudWatch Events rules in the region:

```
aws events list-rules
```

**To display a list of CloudWatch Events rules beginning with a certain string.**

This example displays all CloudWatch Events rules in the region that have a name starting with "Daily":

```
aws events list-rules --name-prefix "Daily"
```

- For API details, see ListRules in *AWS CLI Command Reference*.

### `list-targets-by-rule`

The following code example shows how to use `list-targets-by-rule`.

**AWS CLI**

**To display all the targets for a CloudWatch Events rule**

This example displays all the targets of the rule named DailyLambdaFunction:

```
aws events list-targets-by-rule --rule  "DailyLambdaFunction"
```

- For API details, see ListTargetsByRule in *AWS CLI Command Reference*.

### `put-events`

The following code example shows how to use `put-events`.

**AWS CLI**

**To send a custom event to CloudWatch Events**

This example sends a custom event to CloudWatch Events. The event is contained within the putevents.json file:

```
aws events put-events --entries file://putevents.json
```

Here are the contents of the putevents.json file:

```
[
  {
    "Source": "com.mycompany.myapp",
    "Detail": "{ \"key1\": \"value1\", \"key2\": \"value2\" }",
    "Resources": [
      "resource1",
      "resource2"
    ],
    "DetailType": "myDetailType"
  },
  {
    "Source": "com.mycompany.myapp",
    "Detail": "{ \"key1\": \"value3\", \"key2\": \"value4\" }",
    "Resources": [
      "resource1",
      "resource2"
    ],
    "DetailType": "myDetailType"
   }
]
```

- For API details, see PutEvents in *AWS CLI Command Reference*.

## `put-rule`

The following code example shows how to use `put-rule`.

**AWS CLI**

**To create CloudWatch Events rules**

This example creates a rule that triggers every day at 9:00am (UTC). If you use put-targets to add a Lambda function as a target of this rule, you could run the Lambda function every day at the specified time:

```
aws events put-rule --name "DailyLambdaFunction" --schedule-expression "cron(0 9 *
 * ? *)"
```

This example creates a rule that triggers when any EC2 instance in the region changes state:

```
aws events put-rule --name "EC2InstanceStateChanges" --event-pattern "{\"source\":
[\"aws.ec2\"],\"detail-type\":[\"EC2 Instance State-change Notification\"]}"  --
role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example creates a rule that triggers when any EC2 instance in the region is stopped or terminated:

```
aws events put-rule --name "EC2InstanceStateChangeStopOrTerminate" --event-
pattern "{\"source\":[\"aws.ec2\"],\"detail-type\":[\"EC2 Instance State-change
 Notification\"],\"detail\":{\"state\":[\"stopped\",\"terminated\"]}}" --role-arn
 "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

- For API details, see PutRule in *AWS CLI Command Reference*.

### `put-targets`

The following code example shows how to use `put-targets`.

**AWS CLI**

**To add targets for CloudWatch Events rules**

This example adds a Lambda function as the target of a rule:

```
aws events put-targets --rule DailyLambdaFunction --targets
 "Id"="1","Arn"="arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

This example sets an Amazon Kinesis stream as the target, so that events caught by this rule are relayed to the stream:

```
aws events put-targets --rule EC2InstanceStateChanges --targets
 "Id"="1","Arn"="arn:aws:kinesis:us-east-1:123456789012:stream/
MyStream","RoleArn"="arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example sets two Amazon Kinesis streams as targets for one rule:

```
aws events put-targets --rule DailyLambdaFunction --targets
 "Id"="Target1","Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/
MyStream1","RoleArn"="arn:aws:iam::379642911888:role/ MyRoleToAccessLambda"
  "Id"="Target2"," Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/
MyStream2","RoleArn"="arn:aws:iam::379642911888:role/MyRoleToAccessLambda"
```

- For API details, see PutTargets in *AWS CLI Command Reference*.

### `remove-targets`

The following code example shows how to use `remove-targets`.

**AWS CLI**

**To remove a target for an event**

This example removes the Amazon Kinesis stream named MyStream1 from being a target of the rule DailyLambdaFunction. When DailyLambdaFunction was created, this stream was set as a target with an ID of Target1:

```
aws events remove-targets --rule "DailyLambdaFunction" --ids "Target1"
```

- For API details, see RemoveTargets in *AWS CLI Command Reference*.

### `test-event-pattern`

The following code example shows how to use `test-event-pattern`.

**AWS CLI**

**To check whether an event pattern matches a specified event**

This example tests whether the pattern "source:com.mycompany.myapp" matches the specified event. In this example, the output would be "true":

```
aws events test-event-pattern --event-pattern "{\"source\":[\"com.mycompany.myapp
\"]}" --event "{\"id\":\"1\",\"source\":\"com.mycompany.myapp\",\"detail-type\":
\"myDetailType\",\"account\":\"123456789012\",\"region\":\"us-east-1\",\"time\":
\"2017-04-11T20:11:04Z\"}"
```

- For API details, see TestEventPattern in *AWS CLI Command Reference*.

## Firewall Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firewall Manager.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `associate-admin-account`

The following code example shows how to use `associate-admin-account`.

#### AWS CLI

**To set the Firewall Manager administrator account**

The following `associate-admin-account` example sets the administrator account for Firewall Manager.

```
aws fms associate-admin-account \
    --admin-account 123456789012
```

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see AssociateAdminAccount in *AWS CLI Command Reference*.

### `delete-notification-channel`

The following code example shows how to use `delete-notification-channel`.

**AWS CLI**

**To remove the SNS topic information for Firewall Manager logs**

The following `delete-notification-channel` example removes the SNS topic information.

```
aws fms delete-notification-channel
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteNotificationChannel in *AWS CLI Command Reference*.

### `delete-policy`

The following code example shows how to use `delete-policy`.

**AWS CLI**

**To delete a Firewall Manager policy**

The following `delete-policy` example removes the policy with the specified ID, along with all of its resources.

```
aws fms delete-policy \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --delete-all-policy-resources
```

This command produces no output.

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

### `disassociate-admin-account`

The following code example shows how to use `disassociate-admin-account`.

**AWS CLI**

**To remove the Firewall Manager administrator account**

The following `disassociate-admin-account` example removes the current administrator account association from Firewall Manager.

```
aws fms disassociate-admin-account
```

This command produces no output.

For more information, see Set the AWS Firewall Manager Administrator Account in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateAdminAccount in *AWS CLI Command Reference*.

### `get-admin-account`

The following code example shows how to use `get-admin-account`.

**AWS CLI**

**To retrieve the Firewall Manager administrator account**

The following `get-admin-account` example retrieves the administrator account.

```
aws fms get-admin-account
```

Output:

```
{
    "AdminAccount": "123456789012",
    "RoleStatus": "READY"
```

```
}
```

For more information, see AWS Firewall Manager Prerequisites in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetAdminAccount in *AWS CLI Command Reference*.

### `get-compliance-detail`

The following code example shows how to use `get-compliance-detail`.

**AWS CLI**

**To retrieve the compliance information for an account**

The following `get-compliance-detail` example retrieves compliance information for the specified policy and member account.

```
aws fms get-compliance-detail \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --member-account 123456789012
```

Output:

```
{
    "PolicyComplianceDetail": {
    "EvaluationLimitExceeded": false,
    "IssueInfoMap": {},
    "MemberAccount": "123456789012",
    "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "PolicyOwner": "123456789012",
    "Violators": []
}
```

For more information, see Viewing Resource Compliance with a Policy in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetComplianceDetail in *AWS CLI Command Reference*.

### `get-notification-channel`

The following code example shows how to use `get-notification-channel`.

**AWS CLI**

**To retrieve the SNS topic information for Firewall Manager logs**

The following `get-notification-channel` example retrieves the SNS topic information.

```
aws fms get-notification-channel
```

Output:

```
{
    "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:us-west-2-fms",
    "SnsRoleName": "arn:aws:iam::123456789012:role/aws-service-role/
fms.amazonaws.com/AWSServiceRoleForFMS"
}
```

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetNotificationChannel in *AWS CLI Command Reference*.

## `get-policy`

The following code example shows how to use `get-policy`.

**AWS CLI**

**To retrieve a Firewall Manager policy**

The following `get-policy` example retrieves the policy with the specified ID.

```
aws fms get-policy \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Policy": {
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PolicyName": "test",
        "PolicyUpdateToken": "1:p+2RpKR4wPFx7mcrL1UOQQ==",
        "SecurityServicePolicyData": {
```

```
            "Type": "SECURITY_GROUPS_COMMON",
            "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_COMMON\",
\"revertManualSecurityGroupChanges\":true,\"exclusiveResourceSecurityGroupManagement
\":false,\"securityGroups\":[{\"id\":\"sg-045c43ccc9724e63e\"}]}"
        },
        "ResourceType": "AWS::EC2::Instance",
        "ResourceTags": [],
        "ExcludeResourceTags": false,
        "RemediationEnabled": false
    },
    "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/d1ac59b8-938e-42b3-
b2e0-7c620422ddc2"
}
```

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

## `list-compliance-status`

The following code example shows how to use `list-compliance-status`.

### AWS CLI

#### To retrieve the policy compliance information for member accounts

The following `list-compliance-status` example retrieves member account compliance information for the specified policy.

```
aws fms list-compliance-status \
    --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "PolicyComplianceStatusList": [
        {
            "PolicyOwner": "123456789012",
            "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PolicyName": "test",
            "MemberAccount": "123456789012",
```

```
            "EvaluationResults": [
                {
                    "ComplianceStatus": "COMPLIANT",
                    "ViolatorCount": 0,
                    "EvaluationLimitExceeded": false
                },
                {
                    "ComplianceStatus": "NON_COMPLIANT",
                    "ViolatorCount": 2,
                    "EvaluationLimitExceeded": false
                }
            ],
            "LastUpdated": 1576283774.0,
            "IssueInfoMap": {}
        }
    ]
}
```

For more information, see Viewing Resource Compliance with a Policy in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListComplianceStatus in *AWS CLI Command Reference*.

### `list-member-accounts`

The following code example shows how to use `list-member-accounts`.

#### AWS CLI

**To retrieve the member accounts in the organization**

The following `list-member-accounts` example lists all of the member accounts that are in the Firewall Manager administrator's organization.

```
aws fms list-member-accounts
```

Output:

```
{
    "MemberAccounts": [
        "222222222222",
        "333333333333",
```

```
        "444444444444"
    ]
}
```

For more information, see AWS Firewall Manager in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListMemberAccounts in *AWS CLI Command Reference*.

## `list-policies`

The following code example shows how to use `list-policies`.

### AWS CLI

#### To retrieve all Firewall Manager policies

The following `list-policies` example retrieves the list of policies for the account. In this example, the output is limited to two results per request. Each call returns a `NextToken` that can be used as the value for the `--starting-token` parameter in the next `list-policies` call to get the next set of results for the list.

```
aws fms list-policies \
    --max-items 2
```

Output:

```
{
    "PolicyList": [
        {
            "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "PolicyName": "test",
            "ResourceType": "AWS::EC2::Instance",
            "SecurityServiceType": "SECURITY_GROUPS_COMMON",
            "RemediationEnabled": false
        },
        {
            "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "PolicyId": "457c9b21-fc94-406c-ae63-21217395ba72",
```

```
            "PolicyName": "test",
            "ResourceType": "AWS::EC2::Instance",
            "SecurityServiceType": "SECURITY_GROUPS_COMMON",
            "RemediationEnabled": false
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

### `put-notification-channel`

The following code example shows how to use `put-notification-channel`.

#### AWS CLI

**To set the SNS topic information for Firewall Manager logs**

The following `put-notification-channel` example sets the SNS topic information.

```
aws fms put-notification-channel \
    --sns-topic-arn arn:aws:sns:us-west-2:123456789012:us-west-2-fms \
    --sns-role-name arn:aws:iam::123456789012:role/aws-service-role/
fms.amazonaws.com/AWSServiceRoleForFMS
```

This command produces no output.

For more information, see Configure Amazon SNS Notifications and Amazon CloudWatch Alarms in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see PutNotificationChannel in *AWS CLI Command Reference*.

### `put-policy`

The following code example shows how to use `put-policy`.

#### AWS CLI

**To create a Firewall Manager policy**

The following `put-policy` example creates a Firewall Manager security group policy.

```
aws fms put-policy \
    --cli-input-json file://policy.json
```

Contents of `policy.json`:

```
{
    "Policy": {
        "PolicyName": "test",
        "SecurityServicePolicyData": {
            "Type": "SECURITY_GROUPS_USAGE_AUDIT",
            "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_USAGE_AUDIT\",
\"deleteUnusedSecurityGroups\":false,\"coalesceRedundantSecurityGroups\":true}"
        },
        "ResourceType": "AWS::EC2::SecurityGroup",
        "ResourceTags": [],
        "ExcludeResourceTags": false,
        "RemediationEnabled": false
    },
    "TagList": [
        {
            "Key": "foo",
            "Value": "foo"
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "PolicyName": "test",
        "PolicyUpdateToken": "1:X9QGexP7HASDlsFp+G31Iw==",
        "SecurityServicePolicyData": {
            "Type": "SECURITY_GROUPS_USAGE_AUDIT",
            "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_USAGE_AUDIT\",
\"deleteUnusedSecurityGroups\":false,\"coalesceRedundantSecurityGroups\":true,
\"optionalDelayForUnusedInMinutes\":null}"
        },
        "ResourceType": "AWS::EC2::SecurityGroup",
```

```
        "ResourceTags": [],
        "ExcludeResourceTags": false,
        "RemediationEnabled": false
    },
    "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

For more information, see Working with AWS Firewall Manager Policies in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see PutPolicy in *AWS CLI Command Reference*.

## AWS FIS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS FIS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `create-experiment-template`

The following code example shows how to use `create-experiment-template`.

#### AWS CLI

**To create an experiment template**

The following `create-experiment-template` example creates an experiment template in your AWS FIS account.

```
aws fis create-experiment-template \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "description": "experimentTemplate",
    "stopConditions": [
        {
            "source": "aws:cloudwatch:alarm",
            "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
        }
    ],
    "targets": {
        "Instances-Target-1": {
            "resourceType": "aws:ec2:instance",
            "resourceArns": [
                "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"
            ],
            "selectionMode": "ALL"
        }
    },
    "actions": {
        "reboot": {
            "actionId": "aws:ec2:reboot-instances",
            "description": "reboot",
            "parameters": {},
            "targets": {
                "Instances": "Instances-Target-1"
            }
        }
    },
    "roleArn": "arn:aws:iam::123456789012:role/myRole"
}
```

Output:

```
{
    "experimentTemplate": {
```

```
        "id": "ABCDE1fgHIJkLmNop",
        "description": "experimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "description": "reboot",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "aws:cloudwatch:alarm",
                "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
            }
        ],
        "creationTime": 1616434850.659,
        "lastUpdateTime": 1616434850.659,
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "tags": {}
    }
}
```

For more information, see Create an experiment template in the *AWS Fault Injection Simulator User Guide*.

- For API details, see CreateExperimentTemplate in *AWS CLI Command Reference*.

### `delete-experiment-template`

The following code example shows how to use `delete-experiment-template`.

## AWS CLI

### To delete an experiment template

The following `delete-experiment-template` example deletes the specified experiment template.

```
aws fis delete-experiment-template \
    --id ABCDE1fgHIJkLmNop
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017859.607,
        "roleArn": "arn:aws:iam::123456789012:role/FISRole"
```

```
    }
}
```

For more information, see Delete an experiment template in the *AWS Fault Injection Simulator User Guide*.

- For API details, see DeleteExperimentTemplate in *AWS CLI Command Reference*.

### `get-action`

The following code example shows how to use `get-action`.

#### AWS CLI

**To get action details**

The following `get-action` example gets the details of the specified action.

```
aws fis get-action \
    --id aws:ec2:stop-instances
```

Output:

```
{
    "action": {
        "id": "aws:ec2:stop-instances",
        "description": "Stop the specified EC2 instances.",
        "parameters": {
            "startInstancesAfterDuration": {
                "description": "The time to wait before restarting the instances
 (ISO 8601 duration).",
                "required": false
            }
        },
        "targets": {
            "Instances": {
                "resourceType": "aws:ec2:instance"
            }
        },
        "tags": {}
    }
}
```

For more information, see Actions in the *AWS Fault Injection Simulator User Guide*.

- For API details, see GetAction in *AWS CLI Command Reference*.

### `get-experiment-template`

The following code example shows how to use `get-experiment-template`.

#### AWS CLI

**To get experiment template details**

The following `get-experiment-template` example gets the details of the specified experiment template.

```
aws fis get-experiment-template \
    --id ABCDE1fgHIJkLmNop
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
```

```
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017331.51,
        "roleArn": "arn:aws:iam::123456789012:role/FISRole",
        "tags": {
        "key: "value"
        }
    }
}
```

For more information, see Experiment templates in the *AWS Fault Injection Simulator User Guide*.

- For API details, see GetExperimentTemplate in *AWS CLI Command Reference*.

### `get-experiment`

The following code example shows how to use `get-experiment`.

#### AWS CLI

**To get experiment details**

The following `get-experiment` example gets the details of the specified experiment.

```
aws fis get-experiment \
    --id ABC12DeFGhI3jKLMNOP
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "completed",
            "reason": "Experiment completed."
        },
```

```
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                },
                "state": {
                    "status": "completed",
                    "reason": "Action was completed."
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616432509.662,
        "startTime": 1616432509.962,
        "endTime": 1616432522.307,
        "tags": {}
    }
}
```

For more information, see Experiments for AWS FIS in the *AWS Fault Injection Simulator User Guide*.

- For API details, see GetExperiment in *AWS CLI Command Reference*.

### `list-actions`

The following code example shows how to use `list-actions`.

## AWS CLI

### To list actions

The following `list-actions` example lists the available actions.

```
aws fis list-actions
```

Output:

```
{
    "actions": [
        {

                    "resourceType": "aws:ec2:instance"
                }
            },
```

```
            "tags": {}
        }
    ]
}
```

For more information, see Actions in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListActions in *AWS CLI Command Reference*.

### `list-experiment-templates`

The following code example shows how to use `list-experiment-templates`.

**AWS CLI**

**To list experiment templates**

The following `list-experiment-templates` example lists the experiment templates in your AWS account.

```
aws fis list-experiment-templates
```

Output:

```
{
    "experimentTemplates": [
        {
            "id": "ABCDE1fgHIJkLmNop",
            "description": "myExperimentTemplate",
            "creationTime": 1616017191.124,
            "lastUpdateTime": 1616017191.124,
            "tags": {
                "key": "value"
            }
        }
    ]
}
```

For more information, see Experiment templates in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListExperimentTemplates in *AWS CLI Command Reference*.

### `list-experiments`

The following code example shows how to use `list-experiments`.

**AWS CLI**

**To list experiments**

The following `list-experiments` example lists the experiments in your AWS account.

```
aws fis list-experiments
```

Output:

```
{
    "experiments": [
        {
            "id": "ABCdeF1GHiJkLM23NO",
            "experimentTemplateId": "ABCDE1fgHIJkLmNop",
            "state": {
                "status": "running",
                "reason": "Experiment is running."
            },
            "creationTime": 1616017341.197,
            "tags": {
            "key": "value"
            }
        }
    ]
}
```

For more information, see Experiments in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListExperiments in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for a resource**

The following `list-tags-for-resource` example lists the tags for the specified resource.

```
aws fis list-tags-for-resource \
    --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
```

Output:

```
{
    "tags": {
        "key1": "value1",
        "key2": "value2"
    }
}
```

For more information, see Tag your AWS FIS resources in the *AWS Fault Injection Simulator User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `start-experiment`

The following code example shows how to use `start-experiment`.

#### AWS CLI

**To start an experiment**

The following `start-experiment` example starts the specified experiment.

```
aws fis start-experiment \
    --experiment-template-id ABCDE1fgHIJkLmNop
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "initiating",
            "reason": "Experiment is initiating."
```

```
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                },
                "state": {
                    "status": "pending",
                    "reason": "Initial state"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616432464.025,
        "startTime": 1616432464.374,
        "tags": {}
    }
}
```

For more information, see Experiments for AWS FIS in the *AWS Fault Injection Simulator User Guide*.

- For API details, see StartExperiment in *AWS CLI Command Reference*.

### `stop-experiment`

The following code example shows how to use `stop-experiment`.

## AWS CLI

### To stop an experiment

The following `stop-experiment` example stops the specified experiment from running.

```
aws fis stop-experiment \
    --id ABC12DeFGhI3jKLMNOP
```

Output:

```
{
    "experiment": {
        "id": "ABC12DeFGhI3jKLMNOP",
        "experimentTemplateId": "ABCDE1fgHIJkLmNop",
        "roleArn": "arn:aws:iam::123456789012:role/myRole",
        "state": {
            "status": "stopping",
            "reason": "Stopping Experiment."
        },
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "reboot": {
                "actionId": "aws:ec2:reboot-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                },
                "startAfter": [
                    "wait"
                ],
                "state": {
                    "status": "pending",
                    "reason": "Initial state."
```

```
                }
            },
            "wait": {
                "actionId": "aws:fis:wait",
                "parameters": {
                    "duration": "PT5M"
                },
                "state": {
                    "status": "running",
                    "reason": ""
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616432680.927,
        "startTime": 1616432681.177,
        "tags": {}
    }
}
```

For more information, see Experiments for AWS FIS in the *AWS Fault Injection Simulator User Guide*.

- For API details, see StopExperiment in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To tag a resource**

The following `tag-resource` example tags the specified resource.

```
aws fis tag-resource \
    --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
 \
    --tags key1=value1,key2=value2
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the *AWS Fault Injection Simulator User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To untag a resource**

The following `untag-resource` example removes the tags from the specified resource.

```
aws fis untag-resource \
    --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
```

This command produces no output.

For more information, see Tag your AWS FIS resources in the *AWS Fault Injection Simulator User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-experiment-template`

The following code example shows how to use `update-experiment-template`.

**AWS CLI**

**To update an experiment template**

The following `update-experiment-template` example updates the description of the specified experiment template.

```
aws fis update-experiment-template \
    --id ABCDE1fgHIJkLmNop \
```

```
    ---description myExperimentTemplate
```

Output:

```
{
    "experimentTemplate": {
        "id": "ABCDE1fgHIJkLmNop",
        "description": "myExperimentTemplate",
        "targets": {
            "Instances-Target-1": {
                "resourceType": "aws:ec2:instance",
                "resourceArns": [
                    "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
                ],
                "selectionMode": "ALL"
            }
        },
        "actions": {
            "testaction": {
                "actionId": "aws:ec2:stop-instances",
                "parameters": {},
                "targets": {
                    "Instances": "Instances-Target-1"
                }
            }
        },
        "stopConditions": [
            {
                "source": "none"
            }
        ],
        "creationTime": 1616017191.124,
        "lastUpdateTime": 1616017859.607,
        "roleArn": "arn:aws:iam::123456789012:role/FISRole",
        "tags": {
            "key": "value"
        }
    }
}
```

For more information, see Update an experiment template in the *AWS Fault Injection Simulator User Guide*.

- For API details, see UpdateExperimentTemplate in *AWS CLI Command Reference*.

## Amazon GameLift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon GameLift.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `create-build`

The following code example shows how to use `create-build`.

#### AWS CLI

**Example1: To create a game build from files in an S3 bucket**

The following `create-build` example creates a custom game build resource. It uses zipped files that are stored in an S3 location in an AWS account that you control. This example assumes that you've already created an IAM role that gives Amazon GameLift permission to access the S3 location. Since the request does not specify an operating system, the new build resource defaults to WINDOWS_2012.

```
aws gamelift create-build \
    --storage-location file://storage-loc.json \
    --name MegaFrogRaceServer.NA \
    --build-version 12345.678
```

Contents of `storage-loc.json`:

```
{
    "Bucket":"MegaFrogRaceServer_NA_build_files"
    "Key":"MegaFrogRaceServer_build_123.zip"
    "RoleArn":"arn:aws:iam::123456789012:role/gamelift"
}
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA",
        "OperatingSystem": "WINDOWS_2012",
        "SizeOnDisk": 479303,
        "Status": "INITIALIZED",
        "Version": "12345.678"
    },
    "StorageLocation": {
        "Bucket": "MegaFrogRaceServer_NA_build_files",
        "Key": "MegaFrogRaceServer_build_123.zip"
    }
}
```

**Example2: To create a game build resource for manually uploading files to GameLift**

The following `create-build` example creates a new build resource. It also gets a storage location and temporary credentials that allow you to manually upload your game build to the GameLift location in Amazon S3. Once you've successfully uploaded your build, the GameLift service validates the build and updates the new build's status.

```
aws gamelift create-build \
    --name MegaFrogRaceServer.NA \
    --build-version 12345.678 \
    --operating-system AMAZON_LINUX
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA",
        "OperatingSystem": "AMAZON_LINUX",
        "SizeOnDisk": 0,
        "Status": "INITIALIZED",
        "Version": "12345.678"
    },
    "StorageLocation": {
        "Bucket": "gamelift-builds-us-west-2",
        "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    "UploadCredentials": {
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
        "SessionToken": "AgoGb3JpZ2luENz...EXAMPLETOKEN=="
    }
}
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see CreateBuild in *AWS CLI Command Reference*.

## `create-fleet`

The following code example shows how to use `create-fleet`.

### AWS CLI

#### Example 1: To create a basic Linux fleet

The following `create-fleet` example creates a minimally configured fleet of on-demand Linux instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```
aws gamelift create-fleet \
    --name MegaFrogRaceServer.NA.v2 \
```

```
    --description 'Hosts for v2 North America' \
    --build-id build-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
    --certificate-configuration 'CertificateType=GENERATED' \
    --ec2-instance-type c4.large \
    --fleet-type ON_DEMAND \
    --runtime-configuration 'ServerProcesses=[{LaunchPath=/local/game/release-na/
MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```
{
    "FleetAttributes": {
        "BuildId": "build-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        },
        "CreationTime": 1496365885.44,
        "Description": "Hosts for v2 North America",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "ON_DEMAND",
        "InstanceType": "c4.large",
        "MetricGroups": ["default"],
        "Name": "MegaFrogRace.NA.v2",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "OperatingSystem": "AMAZON_LINUX",
        "ServerLaunchPath": "/local/game/release-na/MegaFrogRace_Server.exe",
        "Status": "NEW"
    }
}
```

**Example 2: To create a basic Windows fleet**

The following `create-fleet` example creates a minimally configured fleet of spot Windows instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```
aws gamelift create-fleet \
    --name MegaFrogRace.NA.v2 \
    --description 'Hosts for v2 North America' \
    --build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff  \
    --certificate-configuration 'CertificateType=GENERATED' \
```

```
    --ec2-instance-type c4.large \
    --fleet-type SPOT \
    --runtime-configuration 'ServerProcesses=[{LaunchPath=C:\game
\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```
{
    "FleetAttributes": {
        "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        },
        "CreationTime": 1496365885.44,
        "Description": "Hosts for v2 North America",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "SPOT",
        "InstanceType": "c4.large",
        "MetricGroups": ["default"],
        "Name": "MegaFrogRace.NA.v2",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "OperatingSystem": "WINDOWS_2012",
        "ServerLaunchPath": "C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe",
        "Status": "NEW"
    }
}
```

**Example 3: To create a fully configured fleet**

The following `create-fleet` example creates a fleet of Spot Windows instances for a custom server build, with most commonly used configuration settings provided.

```
aws gamelift create-fleet \
    --name MegaFrogRace.NA.v2 \
    --description 'Hosts for v2 North America' \
    --build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff \
    --certificate-configuration 'CertificateType=GENERATED' \
    --ec2-instance-type c4.large \
    --ec2-inbound-permissions
 'FromPort=33435,ToPort=33435,IpRange=10.24.34.0/23,Protocol=UDP' \
```

```
    --fleet-type SPOT \
    --new-game-session-protection-policy FullProtection \
    --runtime-configuration file://runtime-config.json \
    --metric-groups default \
    --instance-role-arn 'arn:aws:iam::444455556666:role/GameLiftS3Access'
```

Contents of `runtime-config.json`:

```
GameSessionActivationTimeoutSeconds=300,
 MaxConcurrentGameSessionActivations=2,
 ServerProcesses=[
   {LaunchPath=C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,Parameters=-
debug,ConcurrentExecutions=1},
   {LaunchPath=C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]
```

Output:

```
{
    "FleetAttributes": {
        "InstanceRoleArn": "arn:aws:iam::444455556666:role/GameLiftS3Access",
        "Status": "NEW",
        "InstanceType": "c4.large",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "Description": "Hosts for v2 North America",
        "FleetType": "SPOT",
        "OperatingSystem": "WINDOWS_2012",
        "Name": "MegaFrogRace.NA.v2",
        "CreationTime": 1569309011.11,
        "MetricGroups": [
            "default"
        ],
        "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",
        "ServerLaunchParameters": "abc",
        "ServerLaunchPath": "C:\\game\\Bin64.Release.Dedicated\
\MegaFrogRace_Server.exe",
        "NewGameSessionProtectionPolicy": "FullProtection",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        }
    }
```

```
}
```

**Example 4: To create a Realtime Servers fleet**

The following `create-fleet` example creates a fleet of Spot instances with a Realtime configuration script that has been uploaded to Amazon GameLift. All Realtime servers are deployed onto Linux machines. For the purposes of this example, assume that the uploaded Realtime script includes multiple script files, with the `Init()` function located in the script file called `MainScript.js`. As shown, this file is identified as the launch script in the runtime configuration.

```
aws gamelift create-fleet \
    --name MegaFrogRace.NA.realtime \
    --description 'Mega Frog Race Realtime fleet' \
    --script-id script-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
    --ec2-instance-type c4.large \
    --fleet-type SPOT \
    --certificate-configuration 'CertificateType=GENERATED' --runtime-configuration
 'ServerProcesses=[{LaunchPath=/local/game/MainScript.js,Parameters=+map
 Winter444,ConcurrentExecutions=5}]'
```

Output:

```
{
    "FleetAttributes": {
        "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "Status": "NEW",
        "CreationTime": 1569310745.212,
        "InstanceType": "c4.large",
        "NewGameSessionProtectionPolicy": "NoProtection",
        "CertificateConfiguration": {
            "CertificateType": "GENERATED"
        },
        "Name": "MegaFrogRace.NA.realtime",
        "ScriptId": "script-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
        "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
        "FleetType": "SPOT",
        "MetricGroups": [
            "default"
        ],
        "Description": "Mega Frog Race Realtime fleet",
```

```
        "OperatingSystem": "AMAZON_LINUX"
    }
}
```

- For API details, see CreateFleet in *AWS CLI Command Reference*.

### `create-game-session-queue`

The following code example shows how to use `create-game-session-queue`.

**AWS CLI**

**Example1: To set up an ordered game session queue**

The following `create-game-session-queue` example creates a new game session queue with destinations in two regions. It also configures the queue so that game session requests time out after waiting 10 minutes for placement. Since no latency policies are defined, GameLift attempts to place all game sessions with the first destination listed.

```
aws gamelift create-game-session-queue \
    --name MegaFrogRaceServer-NA \
    --destinations file://destinations.json \
    --timeout-in-seconds 600
```

Contents of `destinations.json`:

```
{
    "Destinations": [
        {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" },
        {"DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" }
    ]
}
```

Output:

```
{
    "GameSessionQueues": [
        {
            "Name": "MegaFrogRaceServer-NA",
```

```
            "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:123456789012:gamesessionqueue/MegaFrogRaceServer-NA",
            "TimeoutInSeconds": 600,
            "Destinations": [
                {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"},
                {"DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"}
            ]
        }
    ]
}
```

**Example2: To set up a game session queue with player latency policies**

The following `create-game-session-queue` example creates a new game session queue with two player latency policies. The first policy sets a 100ms latency cap that is enforced during the first minute of a game session placement attempt. The second policy raises the latency cap to 200ms until the placement request times out at 3 minutes.

```
aws gamelift create-game-session-queue \
    --name MegaFrogRaceServer-NA \
    --destinations file://destinations.json \
    --player-latency-policies file://latency-policies.json \
    --timeout-in-seconds 180
```

Contents of `destinations.json`:

```
{
    "Destinations": [
        { "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" },
        { "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" }
    ]
}
```

Contents of `latency-policies.json`:

```
{
    "PlayerLatencyPolicies": [
```

```
        {"MaximumIndividualPlayerLatencyMilliseconds": 200},
        {"MaximumIndividualPlayerLatencyMilliseconds": 100, "PolicyDurationSeconds":
 60}
    ]
}
```

Output:

```
{
    "GameSessionQueue": {
        "Name": "MegaFrogRaceServer-NA",
        "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:111122223333:gamesessionqueue/MegaFrogRaceServer-NA",
        "TimeoutInSeconds": 600,
        "PlayerLatencyPolicies": [
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 100,
                "PolicyDurationSeconds": 60
            },
            {
                "MaximumIndividualPlayerLatencyMilliseconds": 200
            }
        ]
        "Destinations": [
            {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"},
            {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"}
        ],
    }
}
```

For more information, see Create a Queue in the *Amazon GameLift Developer Guide*.

- For API details, see CreateGameSessionQueue in *AWS CLI Command Reference*.

## `delete-build`

The following code example shows how to use `delete-build`.

### AWS CLI

#### To delete a custom game build

The following `delete-build` example removes a build from your Amazon GameLift account. After the build is deleted, you cannot use it to create new fleets. This operation cannot be undone.

```
aws gamelift delete-build \
   --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

- For API details, see DeleteBuild in *AWS CLI Command Reference*.

### `delete-fleet`

The following code example shows how to use `delete-fleet`.

**AWS CLI**

**To delete a fleet that is no longer in use**

The following `delete-fleet` example removes a fleet that has been scaled down to zero instances. If the fleet capacity is greater than zero, the request fails with an HTTP 400 error.

```
aws gamelift delete-fleet \
   --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Manage GameLift Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DeleteFleet in *AWS CLI Command Reference*.

### `delete-game-session-queue`

The following code example shows how to use `delete-game-session-queue`.

**AWS CLI**

**To delete a game session queue**

The following `delete-game-session-queue` example deletes a specified game session queue.

```
aws gamelift delete-game-session-queue \
    --name MegaFrogRace-NA
```

This command produces no output.

- For API details, see DeleteGameSessionQueue in *AWS CLI Command Reference*.

### `describe-build`

The following code example shows how to use `describe-build`.

**AWS CLI**

**To get information on a custom game build**

The following `describe-build` example retrieves properties for a game server build resource.

```
aws gamelift describe-build \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "My_Game_Server_Build_One",
        "OperatingSystem": "AMAZON_LINUX",
        "SizeOnDisk": 1304924,
        "Status": "READY",
        "Version": "12345.678"
    }
}
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeBuild in *AWS CLI Command Reference*.

### `describe-ec2-instance-limits`

The following code example shows how to use `describe-ec2-instance-limits`.

**AWS CLI**

**To retrieve service limits for an EC2 instance type**

The following `describe-ec2-instance-limits` example displays the maximum allowed instances and current instances in use for the specified EC2 instance type in the current Region. The result indicates that only five of the allowed twenty instances are being used.

```
aws gamelift describe-ec2-instance-limits \
    --ec2-instance-type m5.large
```

Output:

```
{
    "EC2InstanceLimits": [
        {
            "EC2InstanceType": ""m5.large",
            "CurrentInstances": 5,
            "InstanceLimit": 20
        }
    ]
}
```

For more information, see Choose Computing Resources in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeEc2InstanceLimits in *AWS CLI Command Reference*.

### `describe-fleet-attributes`

The following code example shows how to use `describe-fleet-attributes`.

**AWS CLI**

**Example1: To view attributes for a list of fleets**

The following `describe-fleet-attributes` example retrieves fleet attributes for two specified fleets. As shown, the requested fleets are deployed with the same build, one for On-Demand instances and one for Spot instances, with some minor configuration differences.

```
aws gamelift describe-fleet-attributes \
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "FleetAttributes": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "FleetType": "ON_DEMAND",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
            "Name": "MegaFrogRaceServer.NA.v2-od",
            "CreationTime": 1568836191.995,
            "Status": "ACTIVE",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
            "ServerLaunchParameters": "+gamelift_start_server",
            "NewGameSessionProtectionPolicy": "NoProtection",
            "OperatingSystem": "WINDOWS_2012",
            "MetricGroups": [
                "default"
            ],
            "CertificateConfiguration": {
                "CertificateType": "DISABLED"
            }
        },
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "FleetType": "SPOT",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
```

```
            "Name": "MegaFrogRaceServer.NA.v2-spot",
            "CreationTime": 1568838275.379,
            "Status": "ACTIVATING",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
            "NewGameSessionProtectionPolicy": "NoProtection",
            "OperatingSystem": "WINDOWS_2012",
                "MetricGroups": [
                "default"
            ],
            "CertificateConfiguration": {
                "CertificateType": "GENERATED"
            }
        }
    ]
}
```

**Example2: To request attributes for all fleets**

The following `describe-fleet-attributes` returns fleet attributes for all fleets with any status. This example illustrates the use of pagination parameters to return one fleet at a time.

```
aws gamelift describe-fleet-attributes \
    --limit 1
```

Output:

```
{
    "FleetAttributes": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "FleetType": "SPOT",
            "InstanceType": "c4.large",
            "Description": "On-demand hosts for v2 North America",
            "Name": "MegaFrogRaceServer.NA.v2-spot",
            "CreationTime": 1568838275.379,
            "Status": "ACTIVATING",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
```

```
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
            "ServerLaunchPath": "C:\\game\\MegaFrogRace_Server.exe",
            "NewGameSessionProtectionPolicy": "NoProtection",
            "OperatingSystem": "WINDOWS_2012",
            "MetricGroups": [
                "default"
            ],
            "CertificateConfiguration": {
                "CertificateType": "GENERATED"
            }
        }
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
}
```

The output includes a `NextToken` value that you can use when you call the command a second time. Pass the value to the `--next-token` parameter to specify where to pick up the output. The following command returns the second result in the output.

```
aws gamelift describe-fleet-attributes \
    --limit 1 \
    --next-token
 eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS1
```

Repeat until the response doesn't include a `NextToken` value.

For more information, see Setting Up GameLift Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetAttributes in *AWS CLI Command Reference*.

### `describe-fleet-capacity`

The following code example shows how to use `describe-fleet-capacity`.

#### AWS CLI

**To view capacity status for a list of fleets**

The following `describe-fleet-capacity` example retrieves current capacity for two specified fleets.

```
aws gamelift describe-fleet-capacity \
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "FleetCapacity": [
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "InstanceType": "c5.large",
            "InstanceCounts": {
                "DESIRED": 10,
                "MINIMUM": 1,
                "MAXIMUM": 20,
                "PENDING": 0,
                "ACTIVE": 10,
                "IDLE": 3,
                "TERMINATING": 0
            }
        },
        {
            "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "InstanceType": "c5.large",
            "InstanceCounts": {
                "DESIRED": 13,
                "MINIMUM": 1,
                "MAXIMUM": 20,
                "PENDING": 0,
                "ACTIVE": 15,
                "IDLE": 2,
                "TERMINATING": 2
            }
        }

    ]
}
```

For more information, see GameLift Metrics for Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetCapacity in *AWS CLI Command Reference*.

## `describe-fleet-events`

The following code example shows how to use `describe-fleet-events`.

### AWS CLI

#### To request events for a specified time span

The following `describe-fleet-events` example diplays details of all fleet-related events that occurred during the specified time span.

```
aws gamelift describe-fleet-events \
    --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 \
    --start-time 1579647600 \
    --end-time 1579649400 \
    --limit 5
```

Output:

```
{
    "Events": [
        {
            "EventId": "a37b6892-5d07-4d3b-8b47-80244ecf66b9",
            "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "EventCode": "FLEET_STATE_ACTIVE",
            "Message": "Fleet fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 changed
 state to ACTIVE",
            "EventTime": 1579649342.191
        },
        {
            "EventId": "67da4ec9-92a3-4d95-886a-5d6772c24063",
            "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "EventCode": "FLEET_STATE_ACTIVATING",
            "Message": "Fleet fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 changed
 state to ACTIVATING",
            "EventTime": 1579649321.427
        },
        {
            "EventId": "23813a46-a9e6-4a53-8847-f12e6a8381ac",
            "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "EventCode": "FLEET_STATE_BUILDING",
```

```
            "Message": "Fleet fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 changed
 state to BUILDING",
            "EventTime": 1579649321.243
        },
        {
            "EventId": "3bf217d0-1d44-42f9-9202-433ed475d2e8",
            "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "EventCode": "FLEET_STATE_VALIDATING",
            "Message": "Fleet fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 changed
 state to VALIDATING",
            "EventTime": 1579649197.449
        },
        {
            "EventId": "2ecd0130-5986-44eb-99a7-62df27741084",
            "ResourceId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "EventCode": "FLEET_VALIDATION_LAUNCH_PATH_NOT_FOUND",
            "Message": "Failed to find a valid path",
            "EventTime": 1569319075.839,

```

For more information, see Debug GameLift Fleet Issues in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetEvents in *AWS CLI Command Reference*.

### `describe-fleet-port-settings`

The following code example shows how to use `describe-fleet-port-settings`.

**AWS CLI**

**To view inbound connection permissions for a fleet**

The following `describe-fleet-port-settings` example retrieves connection settings for a specified fleet.

```
aws gamelift describe-fleet-port-settings \
    --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111
```

Output:

```
{
    "InboundPermissions": [
        {
            "FromPort": 33400,
            "ToPort": 33500,
            "IpRange": "0.0.0.0/0",
            "Protocol": "UDP"
        },
        {
            "FromPort": 1900,
            "ToPort": 2000,
            "IpRange": "0.0.0.0/0",
            "Protocol": "TCP"
        }
    ]
}
```

For more information, see Setting Up GameLift Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetPortSettings in *AWS CLI Command Reference*.

### `describe-fleet-utilization`

The following code example shows how to use `describe-fleet-utilization`.

#### AWS CLI

**Example1: To view usage data for a list of fleets**

The following `describe-fleet-utilization` example retrieves current usage information for one specified fleet.

```
aws gamelift describe-fleet-utilization \
    --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111
```

Output:

```
{
    "FleetUtilization": [
        {
        "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "ActiveServerProcessCount": 100,
        "ActiveGameSessionCount": 62,
        "CurrentPlayerSessionCount": 329,
        "MaximumPlayerSessionCount": 1000
        }
    ]
}
```

**Example2: To request usage data for all fleets**

The following `describe-fleet-utilization` returns fleet usage data for all fleets with any status. This example uses pagination parameters to return data for two fleets at a time.

```
aws gamelift describe-fleet-utilization \
    --limit 2
```

Output:

```
{
    "FleetUtilization": [
        {
            "FleetId": "fleet-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
            "ActiveServerProcessCount": 100,
            "ActiveGameSessionCount": 13,
            "CurrentPlayerSessionCount": 98,
            "MaximumPlayerSessionCount": 1000
        },
        {
            "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
            "ActiveServerProcessCount": 100,
            "ActiveGameSessionCount": 62,
            "CurrentPlayerSessionCount": 329,
            "MaximumPlayerSessionCount": 1000
        }
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
}
```

Call the command a second time, passing the `NextToken` value as the argument to the `--next-token` parameter to see the next two results.

```
aws gamelift describe-fleet-utilization \
    --limit 2 \
    --next-token
 eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS1
```

Repeat until the response no longer includes a `NextToken` value in the output.

For more information, see GameLift Metrics for Fleets in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeFleetUtilization in *AWS CLI Command Reference*.

### `describe-game-session-queues`

The following code example shows how to use `describe-game-session-queues`.

#### AWS CLI

**To view game session queues**

The following `describe-game-session-queues` example retrieves properties for two specified queues.

```
aws gamelift describe-game-session-queues \
    --names MegaFrogRace-NA MegaFrogRace-EU
```

Output:

```
{
    "GameSessionQueues": [{
            "Destinations": [{
                    "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
                },
                {
                    "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
                }
            ],
            "Name": "MegaFrogRace-NA",
            "TimeoutInSeconds": 600,
            "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/
MegaFrogRace-NA",
            "PlayerLatencyPolicies": [{
                    "MaximumIndividualPlayerLatencyMilliseconds": 200
                },
                {
                    "MaximumIndividualPlayerLatencyMilliseconds": 100,
                    "PolicyDurationSeconds": 60
                }
            ],
            "FilterConfiguration": {
                "AllowedLocations": ["us-west-2", "ap-south-1", "us-east-1"]
            },
            "PriorityConfiguration": {
                "PriorityOrder": ["LOCATION", "FLEET_TYPE", "DESTINATION"],
                "LocationOrder": ["us-west-2", "ap-south-1", "us-east-1"]
            }
        },
        {
            "Destinations": [{
                "DestinationArn": "arn:aws:gamelift:eu-west-3::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

```
            }],
            "Name": "MegaFrogRace-EU",
            "TimeoutInSeconds": 600,
            "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/
MegaFrogRace-EU"
        }
    ]
}
```

For more information, see Using Multi-Region Queues in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeGameSessionQueues in *AWS CLI Command Reference*.

### `describe-runtime-configuration`

The following code example shows how to use `describe-runtime-configuration`.

#### AWS CLI

**To request the runtime configuration for a fleet**

The following `describe-runtime-configuration` example retrieves details about the current runtime configuration for a specified fleet.

```
aws gamelift describe-runtime-configuration \
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RuntimeConfiguration": {
        "ServerProcesses": [
            {
                "LaunchPath": "C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe",
                "Parameters": "+gamelift_start_server",
                "ConcurrentExecutions": 3
            },
            {
                "LaunchPath": "C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe",
                "Parameters": "+gamelift_start_server +debug",
```

```
                "ConcurrentExecutions": 1
            }
        ],
        "MaxConcurrentGameSessionActivations": 2147483647,
        "GameSessionActivationTimeoutSeconds": 300
    }
}
```

For more information, see Run Multiple Processes on a Fleet in the *Amazon GameLift Developer Guide*.

- For API details, see DescribeRuntimeConfiguration in *AWS CLI Command Reference*.

### `list-builds`

The following code example shows how to use `list-builds`.

#### AWS CLI

**Example1: To get a list of custom game builds**

The following `list-builds` example retrieves properties for all game server builds in the current Region. The sample request illustrates how to use the pagination parameters, `Limit` and `NextToken`, to retrieve the results in sequential sets. The first command retrieves the first two builds. Because there are more than two available, the response includes a `NextToken` to indicate that more results are available.

```
aws gamelift list-builds \
    --limit 2
```

Output:

```
{
    "Builds": [
        {
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "CreationTime": 1495664528.723,
            "Name": "My_Game_Server_Build_One",
            "OperatingSystem": "WINDOWS_2012",
```

```
            "SizeOnDisk": 8567781,
            "Status": "READY",
            "Version": "12345.678"
        },
        {
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTime": 1495528748.555,
            "Name": "My_Game_Server_Build_Two",
            "OperatingSystem": "AMAZON_LINUX_2",
            "SizeOnDisk": 8567781,
            "Status": "FAILED",
            "Version": "23456.789"
        }
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
}
```

You can then call the command again with the `--next-token` parameter as follows to see the next two builds.

```
aws gamelift list-builds \
    --limit 2
    --next-token
 eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS1
```

Repeat until the response doesn't include a `NextToken` value.

**Example2: To get a list of custom game builds in failure status**

The following `list-builds` example retrieves properties for all game server builds in the current region that currently have status FAILED.

```
aws gamelift list-builds \
    --status FAILED
```

Output:

```
{
```

```
    "Builds": [
        {
            "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
            "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "CreationTime": 1495528748.555,
            "Name": "My_Game_Server_Build_Two",
            "OperatingSystem": "AMAZON_LINUX_2",
            "SizeOnDisk": 8567781,
            "Status": "FAILED",
            "Version": "23456.789"
        }
    ]
}
```

- For API details, see ListBuilds in *AWS CLI Command Reference*.

### `list-fleets`

The following code example shows how to use `list-fleets`.

#### AWS CLI

**Example1: To get a list of all fleets in a Region**

The following `list-fleets` example displays the fleet IDs of all fleets in the current Region. This example uses pagination parameters to retrieve two fleet IDs at a time. The response includes a `next-token` attribute, which indicates that there are more results to retrieve.

```
aws gamelift list-fleets \
    --limit 2
```

Output:

```
{
    "FleetIds": [
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    ],
    "NextToken":
 "eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS
```

```
}
```

You can pass the `NextToken` value from the previous response in the next command, as shown here to get the next two results.

```
aws gamelift list-fleets \
    --limit 2 \
    --next-token
 eyJhd3NBY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC00NDRlZjQxZS1
```

**Example2: To get a list of all fleets in a Region with a specific build or script**

The following `list-builds` example retrieves the IDs of fleets that are deployed with the specified game build. If you're working with Realtime Servers, you can provide a script ID in place of a build ID. Because this example does not specify the limit parameter, the results can include up to 16 fleet IDs.

```
aws gamelift list-fleets \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "FleetIds": [
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
        "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"
    ]
}
```

- For API details, see ListFleets in *AWS CLI Command Reference*.

## `request-upload-credentials`

The following code example shows how to use `request-upload-credentials`.

### AWS CLI

**To refresh access credentials for uploading a build**

The following `create-build` example obtains new, valid access credentials for uploading a GameLift build file to an Amazon S3 location. Credentials have a limited life span. You get the build ID from the response to the original `CreateBuild` request.

```
aws gamelift request-upload-credentials \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "StorageLocation": {
        "Bucket": "gamelift-builds-us-west-2",
        "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    "UploadCredentials": {
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
        "SessionToken": "AgoGb3JpZ2luENz...EXAMPLETOKEN=="
    }
}
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see RequestUploadCredentials in *AWS CLI Command Reference*.

## `start-fleet-actions`

The following code example shows how to use `start-fleet-actions`.

### AWS CLI

#### To restart fleet automatic scaling activity

The following `start-fleet-actions` example resumes the use of all scaling policies that are defined for the specified fleet but were stopped by calling ``stop-fleet-actions``. After starting, the scaling policies immediately begin tracking their respective metrics.

```
aws gamelift start-fleet-actions \
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --actions AUTO_SCALING
```

This command produces no output.

- For API details, see StartFleetActions in *AWS CLI Command Reference*.

### `stop-fleet-actions`

The following code example shows how to use `stop-fleet-actions`.

#### AWS CLI

**To stop a fleet's automatic scaling activity**

The following `stop-fleet-actions` example stops the use of all scaling policies that are defined for the specified fleet. After the policies are suspended, fleet capacity remains at the same active instance count unless you adjust it manually.

```
aws gamelift start-fleet-actions \
    --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --actions AUTO_SCALING
```

This command produces no output.

- For API details, see StopFleetActions in *AWS CLI Command Reference*.

### `update-build`

The following code example shows how to use `update-build`.

#### AWS CLI

**To update a custom game build**

The following `update-build` example changes the name and version information that is associated with a specified build resource. The returned build object verifies that the changes were made successfully.

```
aws gamelift update-build \
    --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --name MegaFrogRaceServer.NA.east \
    --build-version 12345.east
```

Output:

```
{
    "Build": {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "CreationTime": 1496708916.18,
        "Name": "MegaFrogRaceServer.NA.east",
        "OperatingSystem": "AMAZON_LINUX_2",
        "SizeOnDisk": 1304924,
        "Status": "READY",
        "Version": "12345.east"
    }
}
```

For more information, see Update Your Build Files in the *Amazon GameLift Developer Guide*.

- For API details, see UpdateBuild in *AWS CLI Command Reference*.

### `update-game-session-queue`

The following code example shows how to use `update-game-session-queue`.

#### AWS CLI

**To update a game session queue configuration**

The following `update-game-session-queue` example adds a new destination and updates the player latency policies for an existing game session queue.

```
aws gamelift update-game-session-queue \
    --name MegaFrogRace-NA \
    --destinations file://destinations.json \
    --player-latency-policies file://latency-policies.json
```

Contents of `destinations.json`:

```
{
    "Destinations": [
        {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/
fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
        {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/
fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
```

```
        {"DestinationArn": "arn:aws:gamelift:us-east-1::alias/
alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"}
    ]
}
```

Contents of `latency-policies.json`:

```
{
    "PlayerLatencyPolicies": [
        {"MaximumIndividualPlayerLatencyMilliseconds": 200},
        {"MaximumIndividualPlayerLatencyMilliseconds": 150, "PolicyDurationSeconds":
 120},
        {"MaximumIndividualPlayerLatencyMilliseconds": 100, "PolicyDurationSeconds":
 120}
    ]
}
```

Output:

```
{
    "GameSessionQueue": {
        "Destinations": [
            {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/
fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
            {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/
fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
            {"DestinationArn": "arn:aws:gamelift:us-east-1::alias/
alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"}
        ],
        "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:111122223333:gamesessionqueue/MegaFrogRace-NA",
        "Name": "MegaFrogRace-NA",
        "TimeoutInSeconds": 600,
        "PlayerLatencyPolicies": [
            {"MaximumIndividualPlayerLatencyMilliseconds": 200},
            {"MaximumIndividualPlayerLatencyMilliseconds": 150,
 "PolicyDurationSeconds": 120},
            {"MaximumIndividualPlayerLatencyMilliseconds": 100,
 "PolicyDurationSeconds": 120}
        ]
    }
}
```

For more information, see Using Multi-Region Queues in the *Amazon GameLift Developer Guide*.

- For API details, see UpdateGameSessionQueue in *AWS CLI Command Reference*.

### `upload-build`

The following code example shows how to use `upload-build`.

#### AWS CLI

**Example1: To upload a Linux game server build**

The following `upload-build` example uploads Linux game server build files from a file directory to the GameLift service and creates a build resource.

```
aws gamelift upload-build \
    --name MegaFrogRaceServer.NA \
    --build-version 2.0.1 \
    --build-root ~/MegaFrogRace_Server/release-na \
    --operating-system AMAZON_LINUX_2
    --server-sdk-version 4.0.2
```

Output:

```
Uploading ~/MegaFrogRace_Server/release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading ~/MegaFrogRace_Server/release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading ~/MegaFrogRace_Server/release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading ~/MegaFrogRace_Server/release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading ~/MegaFrogRace_Server/release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded ~/MegaFrogRace_Server/release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

**Example2: To upload a Windows game server build**

The following `upload-build` example uploads Windows game server build files from a directory to the GameLift service and creates a build record.

```
aws gamelift upload-build \
    --name MegaFrogRaceServer.NA \
    --build-version 2.0.1 \
    --build-root C:\MegaFrogRace_Server\release-na \
    --operating-system WINDOWS_2012
```

```
    --server-sdk-version 4.0.2
```

Output:

```
Uploading C:\MegaFrogRace_Server\release-na:  16.0 KiB / 74.6 KiB (21.45%)
Uploading C:\MegaFrogRace_Server\release-na:  32.0 KiB / 74.6 KiB (42.89%)
Uploading C:\MegaFrogRace_Server\release-na:  48.0 KiB / 74.6 KiB (64.34%)
Uploading C:\MegaFrogRace_Server\release-na:  64.0 KiB / 74.6 KiB (85.79%)
Uploading C:\MegaFrogRace_Server\release-na:  74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded C:\MegaFrogRace_Server\release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

For more information, see Upload a Custom Server Build to GameLift in the *Amazon GameLift Developer Guide*.

- For API details, see UploadBuild in *AWS CLI Command Reference*.

## Global Accelerator examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Global Accelerator.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `add-custom-routing-endpoints`

The following code example shows how to use `add-custom-routing-endpoints`.

**AWS CLI**

**To add a VPC subnet endpoint to an endpoint group for a custom routing accelerator**

The following `add-custom-routing-endpoints` example adds a VPC subnet endpoint to an endpoint group for a custom routing accelerator.

```
aws globalaccelerator add-custom-routing-endpoints \
    --endpoint-group-arn
 arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd \
    --endpoint-configurations "EndpointId=subnet-1234567890abcdef0"
```

Output:

```
{
    "EndpointDescriptions": [
        {
            "EndpointId": "subnet-1234567890abcdef0"
        }
    ],

 "EndpointGroupArn":"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd"
}
```

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see AddCustomRoutingEndpoints in *AWS CLI Command Reference*.

## `advertise-byoip-cidr`

The following code example shows how to use `advertise-byoip-cidr`.

**AWS CLI**

**To advertise an address range**

The following `advertise-byoip-cidr` example requests AWS to advertise an address range that you've provisioned for use with your AWS resources.

```
aws globalaccelerator advertise-byoip-cidr \
```

```
    --cidr 198.51.100.0/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "198.51.100.0/24",
        "State": "PENDING_ADVERTISING"
    }
}
```

For more information, see Bring Your Own IP Address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see AdvertiseByoipCidr in *AWS CLI Command Reference*.

### `allow-custom-routing-traffic`

The following code example shows how to use `allow-custom-routing-traffic`.

**AWS CLI**

**To allow traffic to specific Amazon EC2 instance destinations in a VPC subnet for a custom routing accelerator**

The following `allow-custom-routing-traffic` example specifies that traffic is allowed to certain Amazon EC2 instance (destination) IP addresses and ports for a VPC subnet endpoint in a custom routing accelerator can receive traffic.

```
aws globalaccelerator allow-custom-routing-traffic \
    --endpoint-group-arn
 arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example \
    --endpoint-id subnet-abcd123example \
    --destination-addresses "172.31.200.6" "172.31.200.7" \
    --destination-ports 80 81
```

This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see AllowCustomRoutingTraffic in *AWS CLI Command Reference*.

### `create-accelerator`

The following code example shows how to use `create-accelerator`.

**AWS CLI**

**To create an accelerator**

The following `create-accelerator` example creates an accelerator with two tags with two BYOIP static IP addresses. You must specify the US-West-2 (Oregon) Region to create or update an accelerator.

```
aws globalaccelerator create-accelerator \
    --name ExampleAccelerator \
    --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
    --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847.0,
        "LastModifiedTime": 1542394847.0
```

```
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateAccelerator in *AWS CLI Command Reference*.

### `create-custom-routing-accelerator`

The following code example shows how to use `create-custom-routing-accelerator`.

**AWS CLI**

**To create a custom routing accelerator**

The following `create-custom-routing-accelerator` example creates a custom routing accelerator with the tags `Name` and `Project`.

```
aws globalaccelerator create-custom-routing-accelerator \
    --name ExampleCustomRoutingAccelerator \
    --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \
    --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
```

```
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847.0,
        "LastModifiedTime": 1542394847.0
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateCustomRoutingAccelerator in *AWS CLI Command Reference*.

### `create-custom-routing-endpoint-group`

The following code example shows how to use `create-custom-routing-endpoint-group`.

**AWS CLI**

**To create an endpoint group for a custom routing accelerator**

The following `create-custom-routing-endpoint-group` example creates an endpoint group for a custom routing accelerator.

```
aws globalaccelerator create-custom-routing-endpoint-group \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --endpoint-group-region us-east-2 \
    --destination-configurations "FromPort=80,ToPort=81,Protocols=TCP,UDP"
```

Output:

```
{
    "EndpointGroup": {
        "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd",
        "EndpointGroupRegion": "us-east-2",
        "DestinationDescriptions": [
            {
                "FromPort": 80,
                "ToPort": 81,
```

```
                "Protocols": [
                    "TCP",
                    "UDP"
                ]
            }
        ],
        "EndpointDescriptions": []
    }
}
```

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateCustomRoutingEndpointGroup in *AWS CLI Command Reference*.

### `create-custom-routing-listener`

The following code example shows how to use `create-custom-routing-listener`.

#### AWS CLI

**To create a listener for a custom routing accelerator**

The following `create-custom-routing-listener` example creates a listener with a port range from 5000 to 10000 for a custom routing accelerator.

```
aws globalaccelerator create-custom-routing-listener \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
    --port-ranges FromPort=5000,ToPort=10000
```

Output:

```
{
    "Listener": {
        "PortRange": [
            "FromPort": 5000,
            "ToPort": 10000
        ],
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/0123vxyz"
```

```
    }
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateCustomRoutingListener in *AWS CLI Command Reference*.

### `create-endpoint-group`

The following code example shows how to use `create-endpoint-group`.

**AWS CLI**

**To create an endpoint group**

The following `create-endpoint-group` example creates an endpoint group with one endpoint.

```
aws globalaccelerator create-endpoint-group \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --endpoint-group-region us-east-1 \
    --endpoint-configurations EndpointId=i-1234567890abcdef0,Weight=128
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100.0,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "i-1234567890abcdef0"
            }
        ],
        "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/098765zyxwvu",
        "EndpointGroupRegion": "us-east-1"
    }
```

```
}
```

For more information, see Endpoint groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateEndpointGroup in *AWS CLI Command Reference*.

### `create-listener`

The following code example shows how to use `create-listener`.

#### AWS CLI

**To create a listener**

The following `create-listener` example creates a listener with two ports.

```
aws globalaccelerator create-listener \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
    --port-ranges FromPort=80,ToPort=80 FromPort=81,ToPort=81 \
    --protocol TCP
```

Output:

```
{
    "Listener": {
        "PortRanges": [
            {
                "ToPort": 80,
                "FromPort": 80
            },
            {
                "ToPort": 81,
                "FromPort": 81
            }
        ],
        "ClientAffinity": "NONE",
        "Protocol": "TCP",
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz"
```

```
    }
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see CreateListener in *AWS CLI Command Reference*.

### `deny-custom-routing-traffic`

The following code example shows how to use `deny-custom-routing-traffic`.

#### AWS CLI

**To specify a destination address that cannot receive traffic in a custom routing accelerator**

The following `deny-custom-routing-traffic` example specifies destination address or addresses in a subnet endpoint that cannot receive traffic for a custom routing accelerator. To specify more than one destination address, separate the addresses with a space. There's no response for a successful deny-custom-routing-traffic call.

```
aws globalaccelerator deny-custom-routing-traffic \
    --endpoint-group-arn
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example" \
    --endpoint-id "subnet-abcd123example" \
    --destination-addresses "198.51.100.52"
```

This command produces no output.

For more information, see VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DenyCustomRoutingTraffic in *AWS CLI Command Reference*.

### `deprovision-byoip-cidr`

The following code example shows how to use `deprovision-byoip-cidr`.

#### AWS CLI

**To deprovision an address range**

The following `deprovision-byoip-cidr` example releases the specified address range that you provisioned to use with your AWS resources.

```
aws globalaccelerator deprovision-byoip-cidr \
    --cidr "198.51.100.0/24"
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "198.51.100.0/24",
        "State": "PENDING_DEPROVISIONING"
    }
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DeprovisionByoipCidr in *AWS CLI Command Reference*.

### `describe-accelerator-attributes`

The following code example shows how to use `describe-accelerator-attributes`.

**AWS CLI**

**To describe an accelerator's attributes**

The following `describe-accelerator-attributes` example retrieves the attribute details for an accelerator.

```
aws globalaccelerator describe-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": true
```

```
        "FlowLogsS3Bucket": flowlogs-abc
        "FlowLogsS3Prefix": bucketprefix-abc
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeAcceleratorAttributes in *AWS CLI Command Reference*.

### `describe-accelerator`

The following code example shows how to use `describe-accelerator`.

#### AWS CLI

**To describe an accelerator**

The following `describe-accelerator` example retrieves the details about the specified accelerator.

```
aws globalaccelerator describe-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
```

```
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847,
        "LastModifiedTime": 1542395013
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeAccelerator in *AWS CLI Command Reference*.

### `describe-custom-routing-accelerator-attributes`

The following code example shows how to use `describe-custom-routing-accelerator-attributes`.

**AWS CLI**

**To describe a custom routing accelerator's attributes**

The following `describe-custom-routing-accelerator-attributes` example describes the attributes for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-accelerator-attributes \
   --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "AcceleratorAttributes": {
    "FlowLogsEnabled": false
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingAcceleratorAttributes in *AWS CLI Command Reference*.

### `describe-custom-routing-accelerator`

The following code example shows how to use `describe-custom-routing-accelerator`.

**AWS CLI**

**To describe a custom routing accelerator**

The following `describe-custom-routing-accelerator` example retrieves the details about the specified custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAccelerator",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1542394847,
        "LastModifiedTime": 1542395013
    }
```

```
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingAccelerator in *AWS CLI Command Reference*.

### `describe-custom-routing-endpoint-group`

The following code example shows how to use `describe-custom-routing-endpoint-group`.

**AWS CLI**

**To describe an endpoint group for a custom routing accelerator**

The following `describe-custom-routing-endpoint-group` example describes an endpoint group for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-endpoint-group \
    --endpoint-group-arn
 arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example
```

Output:

```
{
    "EndpointGroup": {
        "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example",
        "EndpointGroupRegion": "us-east-2",
        "DestinationDescriptions": [
            {
                "FromPort": 5000,
                "ToPort": 10000,
                "Protocols": [
                    "UDP"
                ]
            }
        ],
        "EndpointDescriptions": [
            {
```

```
                "EndpointId": "subnet-1234567890abcdef0"
            }
        ]
    }
}
```

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingEndpointGroup in *AWS CLI Command Reference*.

### `describe-custom-routing-listener`

The following code example shows how to use `describe-custom-routing-listener`.

#### AWS CLI

**To describe a listener for a custom routing accelerator**

The following `describe-custom-routing-listener` example describes a listener for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
    "Listener": {
        "PortRanges": [
            "FromPort": 5000,
            "ToPort": 10000
        ],
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234"
    }
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeCustomRoutingListener in *AWS CLI Command Reference*.

### `describe-endpoint-group`

The following code example shows how to use `describe-endpoint-group`.

**AWS CLI**

**To describe an endpoint group**

The following `describe-endpoint-group` example retrieves details about an endpoint group with the following endpoints: an Amazon EC2 instance, an ALB, and an NLB.

```
aws globalaccelerator describe-endpoint-group \
    --endpoint-group-arn
 arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/
ab88888example
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100.0,
        "EndpointDescriptions": [
        {
            "Weight": 128,
            "EndpointId": "i-1234567890abcdef0"
        },
        {
            "Weight": 128,
            "EndpointId": "arn:aws:elasticloadbalancing:us-
east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
        },
        {
            "Weight": 128,
            "EndpointId": "arn:aws:elasticloadbalancing:us-
east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"
        }
        ],
        "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
```

```
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-
group/4321abcd-abcd-4321-abcd-4321abcdefg",
        "EndpointGroupRegion": "us-east-1"
    }
}
```

For more information, see Endpoint groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeEndpointGroup in *AWS CLI Command Reference*.

### `describe-listener`

The following code example shows how to use `describe-listener`.

#### AWS CLI

**To describe a listener**

The following `describe-listener` example describes a listener.

```
aws globalaccelerator describe-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
    "Listener": {
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234",
        "PortRanges": [
            {
                "FromPort": 80,
                "ToPort": 80
            }
        ],
        "Protocol": "TCP",
        "ClientAffinity": "NONE"
    }
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see DescribeListener in *AWS CLI Command Reference*.

### `list-accelerators`

The following code example shows how to use `list-accelerators`.

**AWS CLI**

**To list your accelerators**

The following `list-accelerators` example lists the accelerators in your AWS account. This account has two accelerators.

```
aws globalaccelerator list-accelerators
```

Output:

```
{
    "Accelerators": [
        {
            "AcceleratorArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-
abcd-5555EXAMPLE1",
            "Name": "TestAccelerator",
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.250",
                        "198.51.100.52"
                    ]
                }
            ],
            "DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1552424416.0,
            "LastModifiedTime": 1569375641.0
```

```
        },
        {
            "AcceleratorArn":
 "arn:aws:globalaccelerator::888888888888:accelerator/8888abcd-abcd-8888-
abcd-8888EXAMPLE2",
            "Name": "ExampleAccelerator",
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.100",
                        "198.51.100.10"
                    ]
                }
            ],
            "DnsName": "6a6a6a6a6a6a6a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1575585564.0,
            "LastModifiedTime": 1579809243.0
        },
    ]
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListAccelerators in *AWS CLI Command Reference*.

## `list-byoip-cidr`

The following code example shows how to use `list-byoip-cidr`.

### AWS CLI

#### To list your address ranges

The following `list-byoip-cidr` example list the bring your own IP address (BYOIP) address ranges that you've provisioned for use with Global Accelerator.

```
aws globalaccelerator list-byoip-cidrs
```

Output:

```
{
    "ByoipCidrs": [
        {
            "Cidr": "198.51.100.0/24",
            "State": "READY"
        }
        {
            "Cidr": "203.0.113.25/24",
            "State": "READY"
        }
    ]
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListByoipCidr in *AWS CLI Command Reference*.

### `list-custom-routing-accelerators`

The following code example shows how to use `list-custom-routing-accelerators`.

#### AWS CLI

**To list your custom routing accelerators**

The following `list-custom-routing-accelerators` example lists the custom routing accelerators in an AWS account.

```
aws globalaccelerator list-custom-routing-accelerators
```

Output:

```
{
    "Accelerators": [
        {
            "AcceleratorArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-
abcd-5555EXAMPLE1",
            "Name": "TestCustomRoutingAccelerator",
```

```
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.250",
                        "198.51.100.52"
                    ]
                }
            ],
            "DnsName": "5a5a5a5a5a5a5a5a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1552424416.0,
            "LastModifiedTime": 1569375641.0
        },
        {
            "AcceleratorArn":
 "arn:aws:globalaccelerator::888888888888:accelerator/8888abcd-abcd-8888-
abcd-8888EXAMPLE2",
            "Name": "ExampleCustomRoutingAccelerator",
            "IpAddressType": "IPV4",
            "Enabled": true,
            "IpSets": [
                {
                    "IpFamily": "IPv4",
                    "IpAddresses": [
                        "192.0.2.100",
                        "198.51.100.10"
                    ]
                }
            ],
            "DnsName": "6a6a6a6a6a6a6a6a.awsglobalaccelerator.com",
            "Status": "DEPLOYED",
            "CreatedTime": 1575585564.0,
            "LastModifiedTime": 1579809243.0
        },
    ]
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingAccelerators in *AWS CLI Command Reference*.

### `list-custom-routing-endpoint-groups`

The following code example shows how to use `list-custom-routing-endpoint-groups`.

**AWS CLI**

**To list endpoint groups for a listener in a custom routing accelerator**

The following `list-custom-routing-endpoint-groups` example lists the endpoint groups for a listener in a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-endpoint-groups \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
    "EndpointGroups": [
        {
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
            "EndpointGroupRegion": "eu-central-1",
            "DestinationDescriptions": [
                {
                    "FromPort": 80,
                    "ToPort": 80,
                    "Protocols": [
                        "TCP",
                        "UDP"
                    ]
                }
            ]
            "EndpointDescriptions": [
                {
                    "EndpointId": "subnet-abcd123example"
                }
            ]
        }
    ]
}
```

For more information, see Endpoint groups for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingEndpointGroups in *AWS CLI Command Reference*.

### `list-custom-routing-listeners`

The following code example shows how to use `list-custom-routing-listeners`.

#### AWS CLI

**To list listeners for custom routing accelerators**

The following `list-custom-routing-listeners` example lists the listeners for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-listeners \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh/listener/abcdef1234",
            "PortRanges": [
                {
                    "FromPort": 5000,
                    "ToPort": 10000
                }
            ],
            "Protocol": "TCP"
        }
    ]
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingListeners in *AWS CLI Command Reference*.

### `list-custom-routing-port-mappings-by-destination`

The following code example shows how to use `list-custom-routing-port-mappings-by-destination`.

**AWS CLI**

**To list the port mappings for a specific custom routing accelerator destination**

The following `list-custom-routing-port-mappings-by-destination` example provides the port mappings for a specific destination EC2 server (at the destination address) for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings-by-destination \
    --endpoint-id subnet-abcd123example \
    --destination-address 198.51.100.52
```

Output:

```
{
    "DestinationPortMappings": [
        {
            "AcceleratorArn":
 "arn:aws:globalaccelerator::402092451327:accelerator/24ea29b8-
d750-4489-8919-3095f3c4b0a7",
                "AcceleratorSocketAddresses": [
                    {
                        "IpAddress": "192.0.2.250",
                        "Port": 65514
                    },
                    {
                        "IpAddress": "192.10.100.99",
                        "Port": 65514
                    }
                ],
                "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab88888example",
                "EndpointId": "subnet-abcd123example",
                "EndpointGroupRegion": "us-west-2",
                "DestinationSocketAddress": {
                    "IpAddress": "198.51.100.52",
```

```
                    "Port": 80
                },
                "IpAddressType": "IPv4",
                "DestinationTrafficState": "ALLOW"
        }
    ]
}
```

For more information, see How custom routing accelerators work in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingPortMappingsByDestination in *AWS CLI Command Reference*.

### `list-custom-routing-port-mappings`

The following code example shows how to use `list-custom-routing-port-mappings`.

**AWS CLI**

**To list the port mappings in a custom routing accelerator**

The following `list-custom-routing-port-mappings` example provides a partial list of the port mappings in a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "PortMappings": [
        {
            "AcceleratorPort": 40480,
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/098765zyxwvu",
            "EndpointId": "subnet-1234567890abcdef0",
            "DestinationSocketAddress": {
                "IpAddress": "192.0.2.250",
                "Port": 80
```

```
            },
            "Protocols": [
                "TCP",
                "UDP"
            ],
            "DestinationTrafficState": "ALLOW"
        }
        {
            "AcceleratorPort": 40481,
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/098765zyxwvu",
            "EndpointId": "subnet-1234567890abcdef0",
            "DestinationSocketAddress": {
               "IpAddress": "192.0.2.251",
              "Port": 80
            },
            "Protocols": [
                "TCP",
                "UDP"
            ],
            "DestinationTrafficState": "ALLOW"
        }
    ]
}
```

For more information, see How custom routing accelerators work in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListCustomRoutingPortMappings in *AWS CLI Command Reference*.

### `list-endpoint-groups`

The following code example shows how to use `list-endpoint-groups`.

#### AWS CLI

**To list endpoint groups**

The following `list-endpoint-groups` example lists the endpoint groups for a listener. This listener has two endpoint groups.

```
aws globalaccelerator --region us-west-2 list-endpoint-groups \
```

```
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
    "EndpointGroups": [
        {
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",
            "EndpointGroupRegion": "eu-central-1",
            "EndpointDescriptions": [],
            "TrafficDialPercentage": 100.0,
            "HealthCheckPort": 80,
            "HealthCheckProtocol": "TCP",
            "HealthCheckIntervalSeconds": 30,
            "ThresholdCount": 3
        }
        {
            "EndpointGroupArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab99999example",
            "EndpointGroupRegion": "us-east-1",
            "EndpointDescriptions": [],
            "TrafficDialPercentage": 50.0,
            "HealthCheckPort": 80,
            "HealthCheckProtocol": "TCP",
            "HealthCheckIntervalSeconds": 30,
            "ThresholdCount": 3
        }
    ]
}
```

For more information, see Endpoint Groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListEndpointGroups in *AWS CLI Command Reference*.

### `list-listeners`

The following code example shows how to use `list-listeners`.

**AWS CLI**

**To list listeners**

The following `list-listeners` example lists the listeners for an accelerator.

```
aws globalaccelerator list-listeners \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Listeners": [
        {
            "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234",
            "PortRanges": [
                {
                    "FromPort": 80,
                    "ToPort": 80
                }
            ],
            "Protocol": "TCP",
            "ClientAffinity": "NONE"
        }
    ]
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListListeners in *AWS CLI Command Reference*.

## `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for an accelerator**

The following `list-tags-for-resource` example lists the tags for a specific accelerator.

```
aws globalaccelerator list-tags-for-resource \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
    "Tags": [
        {
            "Key": "Project",
            "Value": "A123456"
        }
    ]
}
```

For more information, see Tagging in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `provision-byoip-cidr`

The following code example shows how to use `provision-byoip-cidr`.

#### AWS CLI

**To provision an address range**

The following `provision-byoip-cidr` example provisions the specified address range to use with your AWS resources.

```
aws globalaccelerator provision-byoip-cidr \
    --cidr 192.0.2.250/24 \
    --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```
{
```

```
    "ByoipCidr": {
        "Cidr": "192.0.2.250/24",
        "State": "PENDING_PROVISIONING"
    }
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see ProvisionByoipCidr in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag an accelerator**

The following `tag-resource` example adds tags Name and Project to an accelerator, along with corresponding values for each.

```
aws globalaccelerator tag-resource \
    --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
    --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag from an accelerator**

The following `untag-resource` example removes the tags Name and Project from an accelerator.

```
aws globalaccelerator untag-resource \
    --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
    --tag-keys Key="Name" Key="Project"
```

This command produces no output.

For more information, see Tagging in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-accelerator-attributes`

The following code example shows how to use `update-accelerator-attributes`.

#### AWS CLI

**To update an accelerator's attributes**

The following `update-accelerator-attributes` example updates an accelerator to enable flow logs. You must specify the `US-West-2 (Oregon)` Region to create or update accelerator attributes.

```
aws globalaccelerator update-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
    --flow-logs-enabled \
    --flow-logs-s3-bucket flowlogs-abc \
    --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": true
        "FlowLogsS3Bucket": flowlogs-abc
        "FlowLogsS3Prefix": bucketprefix-abc
    }
```

```
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateAcceleratorAttributes in *AWS CLI Command Reference*.

### `update-accelerator`

The following code example shows how to use `update-accelerator`.

#### AWS CLI

**To update an accelerator**

The following `update-accelerator` example modifies an accelerator to change the accelerator name to `ExampleAcceleratorNew`. You must specify the `US-West-2 (Oregon)` Region to create or update accelerators.

```
aws globalaccelerator update-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
    --name ExampleAcceleratorNew
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn": "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleAcceleratorNew",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
```

```
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
        "CreatedTime": 1232394847,
        "LastModifiedTime": 1232395654
    }
}
```

For more information, see Accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateAccelerator in *AWS CLI Command Reference*.

### `update-custom-routing-accelerator-attributes`

The following code example shows how to use `update-custom-routing-accelerator-attributes`.

#### AWS CLI

**To update a custom routing accelerator's attributes**

The following `update-custom-routing-accelerator-attributes` example updates a custom routing accelerator to enable flow logs.

```
aws globalaccelerator update-custom-routing-accelerator-attributes \
    --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
    --flow-logs-enabled \
    --flow-logs-s3-bucket flowlogs-abc \
    --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```
{
    "AcceleratorAttributes": {
        "FlowLogsEnabled": true
        "FlowLogsS3Bucket": flowlogs-abc
        "FlowLogsS3Prefix": bucketprefix-abc
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateCustomRoutingAcceleratorAttributes in *AWS CLI Command Reference*.

### `update-custom-routing-accelerator`

The following code example shows how to use `update-custom-routing-accelerator`.

#### AWS CLI

**To update a custom routing accelerator**

The following `update-custom-routing-accelerator` example modifies a custom routing accelerator to change the accelerator name.

```
aws globalaccelerator --region us-west-2 update-custom-routing-accelerator \
    --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh \
    --name ExampleCustomRoutingAcceleratorNew
```

Output:

```
{
    "Accelerator": {
        "AcceleratorArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-abcd-1234abcdefgh",
        "IpAddressType": "IPV4",
        "Name": "ExampleCustomRoutingAcceleratorNew",
        "Enabled": true,
        "Status": "IN_PROGRESS",
        "IpSets": [
            {
                "IpAddresses": [
                    "192.0.2.250",
                    "198.51.100.52"
                ],
                "IpFamily": "IPv4"
            }
        ],
        "DnsName":"a1234567890abcdef.awsglobalaccelerator.com",
```

```
        "CreatedTime": 1232394847,
        "LastModifiedTime": 1232395654
    }
}
```

For more information, see Custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateCustomRoutingAccelerator in *AWS CLI Command Reference*.

### `update-custom-routing-listener`

The following code example shows how to use `update-custom-routing-listener`.

#### AWS CLI

**To update a listener for a custom routing accelerator**

The following `update-custom-routing-listener` example updates a listener to change the port range.

```
aws globalaccelerator update-custom-routing-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --port-ranges FromPort=10000,ToPort=20000
```

Output:

```
{
    "Listener": {
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz
        "PortRanges": [
            {
                "FromPort": 10000,
                "ToPort": 20000
            }
        ],
        "Protocol": "TCP"
    }
}
```

For more information, see Listeners for custom routing accelerators in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateCustomRoutingListener in *AWS CLI Command Reference*.

### `update-endpoint-group`

The following code example shows how to use `update-endpoint-group`.

#### AWS CLI

**To update an endpoint group**

The following `update-endpoint-group` example adds three endpoints to an endpoint group: an Elastic IP address, an ALB, and an NLB.

```
aws globalaccelerator update-endpoint-group \
    --endpoint-group-arn
 arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/
ab88888example \
    --endpoint-configurations \
        EndpointId=eipalloc-eip01234567890abc,Weight=128 \
        EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/
app/ALBTesting/alb01234567890xyz,Weight=128 \
        EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/
net/NLBTesting/alb01234567890qrs,Weight=128
```

Output:

```
{
    "EndpointGroup": {
        "TrafficDialPercentage": 100,
        "EndpointDescriptions": [
            {
                "Weight": 128,
                "EndpointId": "eip01234567890abc"
            },
            {
                "Weight": 128,
                "EndpointId": "arn:aws:elasticloadbalancing:us-
east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
            },
```

```
            {
                "Weight": 128,
                "EndpointId": "arn:aws:elasticloadbalancing:us-
east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"
            }
        ],
        "EndpointGroupArn":
 "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-
group/4321abcd-abcd-4321-abcd-4321abcdefg",
        "EndpointGroupRegion": "us-east-1"
    }
}
```

For more information, see Endpoint groups in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateEndpointGroup in *AWS CLI Command Reference*.

### `update-listener`

The following code example shows how to use `update-listener`.

#### AWS CLI

**To update a listener**

The following `update-listener` example updates a listener to change the port to 100.

```
aws globalaccelerator update-listener \
    --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
    --port-ranges FromPort=100,ToPort=100
```

Output:

```
{
    "Listener": {
        "ListenerArn":
 "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz
        "PortRanges": [
```

```
            {
                "FromPort": 100,
                "ToPort": 100
            }
        ],
        "Protocol": "TCP",
        "ClientAffinity": "NONE"
    }
}
```

For more information, see Listeners in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see UpdateListener in *AWS CLI Command Reference*.

### `withdraw-byoip-cidr`

The following code example shows how to use `withdraw-byoip-cidr`.

#### AWS CLI

**To withdraw an address range**

The following `withdraw-byoip-cidr` example withdraws an address range from AWS Global Accelerator that you previously advertised for use with your AWS resources.

```
aws globalaccelerator withdraw-byoip-cidr \
    --cidr 192.0.2.250/24
```

Output:

```
{
    "ByoipCidr": {
        "Cidr": "192.0.2.250/24",
        "State": "PENDING_WITHDRAWING"
    }
}
```

For more information, see Bring your own IP address in AWS Global Accelerator in the *AWS Global Accelerator Developer Guide*.

- For API details, see WithdrawByoipCidr in *AWS CLI Command Reference*.

## AWS Glue examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Glue.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

### Actions

#### `batch-stop-job-run`

The following code example shows how to use `batch-stop-job-run`.

#### AWS CLI

##### To stop job runs

The following `batch-stop-job-run` example stops a job runs.

```
aws glue batch-stop-job-run \
    --job-name "my-testing-job" \
    --job-run-id jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f
```

Output:

```
{
    "SuccessfulSubmissions": [
        {
            "JobName": "my-testing-job",
            "JobRunId":
 "jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f"
```

```
        }
    ],
    "Errors": [],
    "ResponseMetadata": {
        "RequestId": "66bd6b90-01db-44ab-95b9-6aeff0e73d88",
        "HTTPStatusCode": 200,
        "HTTPHeaders": {
            "date": "Fri, 16 Oct 2020 20:54:51 GMT",
            "content-type": "application/x-amz-json-1.1",
            "content-length": "148",
            "connection": "keep-alive",
            "x-amzn-requestid": "66bd6b90-01db-44ab-95b9-6aeff0e73d88"
        },
        "RetryAttempts": 0
    }
}
```

For more information, see Job Runs in the *AWS Glue Developer Guide*.

- For API details, see BatchStopJobRun in *AWS CLI Command Reference*.

### `create-connection`

The following code example shows how to use `create-connection`.

#### AWS CLI

**To create a connection for AWS Glue data stores**

The following `create-connection` example creates a connection in the AWS Glue Data Catalog that provides connection information for a Kafka data store.

```
aws glue create-connection \
    --connection-input '{ \
        "Name":"conn-kafka-custom", \
        "Description":"kafka connection with ssl to custom kafka", \
        "ConnectionType":"KAFKA",  \
        "ConnectionProperties":{  \
            "KAFKA_BOOTSTRAP_SERVERS":"<Kafka-broker-server-url>:<SSL-Port>", \
            "KAFKA_SSL_ENABLED":"true", \
            "KAFKA_CUSTOM_CERT": "s3://bucket/prefix/cert-file.pem" \
        }, \
        "PhysicalConnectionRequirements":{ \
```

```
            "SubnetId":"subnet-1234", \
            "SecurityGroupIdList":["sg-1234"], \
            "AvailabilityZone":"us-east-1a"} \
    }' \
    --region us-east-1
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining Connections in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see CreateConnection in *AWS CLI Command Reference*.

### `create-database`

The following code example shows how to use `create-database`.

**AWS CLI**

**To create a database**

The following `create-database` example creates a database in the AWS Glue Data Catalog.

```
aws glue create-database \
    --database-input "{\"Name\":\"tempdb\"}" \
    --profile my_profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining a Database in Your Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see CreateDatabase in *AWS CLI Command Reference*.

### `create-job`

The following code example shows how to use `create-job`.

**AWS CLI**

**To create a job to transform data**

The following `create-job` example creates a streaming job that runs a script stored in S3.

```
aws glue create-job \
    --name my-testing-job \
    --role AWSGlueServiceRoleDefault \
    --command '{ \
        "Name": "gluestreaming", \
        "ScriptLocation": "s3://DOC-EXAMPLE-BUCKET/folder/" \
    }' \
    --region us-east-1 \
    --output json \
    --default-arguments '{ \
        "--job-language":"scala", \
        "--class":"GlueApp" \
    }' \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

Contents of `test_script.scala`:

```
import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite
import com.amazonaws.services.glue.util.GlueArgParser
import com.amazonaws.services.glue.util.Job
import com.amazonaws.services.glue.util.JsonOptions
import org.apache.spark.SparkContext
import scala.collection.JavaConverters._

object GlueApp {
    def main(sysArgs: Array[String]) {
        val spark: SparkContext = new SparkContext()
        val glueContext: GlueContext = new GlueContext(spark)
        // @params: [JOB_NAME]
        val args = GlueArgParser.getResolvedOptions(sysArgs,
 Seq("JOB_NAME").toArray)
        Job.init(args("JOB_NAME"), glueContext, args.asJava)
        // @type: DataSource
        // @args: [database = "tempdb", table_name = "s3-source", transformation_ctx
 = "datasource0"]
        // @return: datasource0
```

```
        // @inputs: []
        val datasource0 = glueContext.getCatalogSource(database = "tempdb",
 tableName = "s3-source", redshiftTmpDir = "", transformationContext =
 "datasource0").getDynamicFrame()
        // @type: ApplyMapping
        // @args: [mapping = [("sensorid", "int", "sensorid", "int"),
 ("currenttemperature", "int", "currenttemperature", "int"), ("status", "string",
 "status", "string")], transformation_ctx = "applymapping1"]
        // @return: applymapping1
        // @inputs: [frame = datasource0]
        val applymapping1 = datasource0.applyMapping(mappings = Seq(("sensorid",
 "int", "sensorid", "int"), ("currenttemperature", "int", "currenttemperature",
 "int"), ("status", "string", "status", "string")), caseSensitive = false,
 transformationContext = "applymapping1")
        // @type: SelectFields
        // @args: [paths = ["sensorid", "currenttemperature", "status"],
 transformation_ctx = "selectfields2"]
        // @return: selectfields2
        // @inputs: [frame = applymapping1]
        val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid",
 "currenttemperature", "status"), transformationContext = "selectfields2")
        // @type: ResolveChoice
        // @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-
s3-sink", transformation_ctx = "resolvechoice3"]
        // @return: resolvechoice3
        // @inputs: [frame = selectfields2]
        val resolvechoice3 = selectfields2.resolveChoice(choiceOption =
 Some(ChoiceOption("MATCH_CATALOG")), database = Some("tempdb"), tableName =
 Some("my-s3-sink"), transformationContext = "resolvechoice3")
        // @type: DataSink
        // @args: [database = "tempdb", table_name = "my-s3-sink",
 transformation_ctx = "datasink4"]
        // @return: datasink4
        // @inputs: [frame = resolvechoice3]
        val datasink4 = glueContext.getCatalogSink(database = "tempdb",
 tableName = "my-s3-sink", redshiftTmpDir = "", transformationContext =
 "datasink4").writeDynamicFrame(resolvechoice3)
        Job.commit()
    }
}
```

Output:

```
{
    "Name": "my-testing-job"
}
```

For more information, see Authoring Jobs in AWS Glue in the *AWS Glue Developer Guide*.

- For API details, see CreateJob in *AWS CLI Command Reference*.

### `create-table`

The following code example shows how to use `create-table`.

#### AWS CLI

**Example 1: To create a table for a Kinesis data stream**

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kinesis data stream.

```
aws glue create-table \
    --database-name tempdb \
    --table-input  '{"Name":"test-kinesis-input", "StorageDescriptor":{ \
            "Columns":[ \
                {"Name":"sensorid", "Type":"int"}, \
                {"Name":"currenttemperature", "Type":"int"}, \
                {"Name":"status", "Type":"string"} \
            ], \
            "Location":"my-testing-stream", \
            "Parameters":{ \
                "typeOfData":"kinesis","streamName":"my-testing-stream", \
                "kinesisUrl":"https://kinesis.us-east-1.amazonaws.com" \
            }, \
            "SerdeInfo":{ \
                "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"} \
        }, \
        "Parameters":{ \
            "classification":"json"} \
        }' \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

**Example 2: To create a table for a Kafka data store**

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kafka data store.

```
aws glue create-table \
    --database-name tempdb \
    --table-input  '{"Name":"test-kafka-input", "StorageDescriptor":{ \
            "Columns":[ \
                {"Name":"sensorid", "Type":"int"}, \
                {"Name":"currenttemperature", "Type":"int"}, \
                {"Name":"status", "Type":"string"} \
            ], \
            "Location":"glue-topic", \
            "Parameters":{ \
                "typeOfData":"kafka","topicName":"glue-topic", \
                "connectionName":"my-kafka-connection" \
            }, \
            "SerdeInfo":{ \
                "SerializationLibrary":"org.apache.hadoop.hive.serde2.OpenCSVSerde"}
 \
        }, \
        "Parameters":{ \
            "separatorChar":","} \
        }' \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

**Example 3: To create a table for a AWS S3 data store**

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a AWS Simple Storage Service (AWS S3) data store.

```
aws glue create-table \
```

```
    --database-name tempdb \
    --table-input  '{"Name":"s3-output", "StorageDescriptor":{ \
            "Columns":[ \
                {"Name":"s1", "Type":"string"}, \
                {"Name":"s2", "Type":"int"}, \
                {"Name":"s3", "Type":"string"} \
            ], \
            "Location":"s3://bucket-path/", \
            "SerdeInfo":{ \
                "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"} \
        }, \
        "Parameters":{ \
            "classification":"json"} \
        }' \
    --profile my-profile \
    --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see CreateTable in *AWS CLI Command Reference*.

## `delete-job`

The following code example shows how to use `delete-job`.

### AWS CLI

#### To delete a job

The following `delete-job` example deletes a job that is no longer needed.

```
aws glue delete-job \
    --job-name my-testing-job
```

Output:

```
{
    "JobName": "my-testing-job"
}
```

For more information, see Working with Jobs on the AWS Glue Console in the *AWS Glue Developer Guide*.

- For API details, see DeleteJob in *AWS CLI Command Reference*.

### `get-databases`

The following code example shows how to use `get-databases`.

#### AWS CLI

**To list the definitions of some or all of the databases in the AWS Glue Data Catalog**

The following `get-databases` example returns information about the databases in the Data Catalog.

```
aws glue get-databases
```

Output:

```
{
    "DatabaseList": [
        {
            "Name": "default",
            "Description": "Default Hive database",
            "LocationUri": "file:/spark-warehouse",
            "CreateTime": 1602084052.0,
            "CreateTableDefaultPermissions": [
                {
                    "Principal": {
                        "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
                    },
                    "Permissions": [
                        "ALL"
                    ]
                }
            ],
            "CatalogId": "111122223333"
        },
        {
            "Name": "flights-db",
            "CreateTime": 1587072847.0,
            "CreateTableDefaultPermissions": [
```

```
                {
                    "Principal": {
                        "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
                    },
                    "Permissions": [
                        "ALL"
                    ]
                }
            ],
            "CatalogId": "111122223333"
        },
        {
            "Name": "legislators",
            "CreateTime": 1601415625.0,
            "CreateTableDefaultPermissions": [
                {
                    "Principal": {
                        "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
                    },
                    "Permissions": [
                        "ALL"
                    ]
                }
            ],
            "CatalogId": "111122223333"
        },
        {
            "Name": "tempdb",
            "CreateTime": 1601498566.0,
            "CreateTableDefaultPermissions": [
                {
                    "Principal": {
                        "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
                    },
                    "Permissions": [
                        "ALL"
                    ]
                }
            ],
            "CatalogId": "111122223333"
        }
    ]
}
```

For more information, see Defining a Database in Your Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see GetDatabases in *AWS CLI Command Reference*.

### `get-job-run`

The following code example shows how to use `get-job-run`.

#### AWS CLI

**To get information about a job run**

The following `get-job-run` example retrieves information about a job run.

```
aws glue get-job-run \
    --job-name "Combine legistators data" \
    --run-id jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e
```

Output:

```
{
    "JobRun": {
        "Id": "jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",
        "Attempt": 0,
        "JobName": "Combine legistators data",
        "StartedOn": 1602873931.255,
        "LastModifiedOn": 1602874075.985,
        "CompletedOn": 1602874075.985,
        "JobRunState": "SUCCEEDED",
        "Arguments": {
            "--enable-continuous-cloudwatch-log": "true",
            "--enable-metrics": "",
            "--enable-spark-ui": "true",
            "--job-bookmark-option": "job-bookmark-enable",
            "--spark-event-logs-path": "s3://aws-glue-assets-111122223333-us-east-1/
sparkHistoryLogs/"
        },
        "PredecessorRuns": [],
        "AllocatedCapacity": 10,
        "ExecutionTime": 117,
        "Timeout": 2880,
        "MaxCapacity": 10.0,
```

```
        "WorkerType": "G.1X",
        "NumberOfWorkers": 10,
        "LogGroupName": "/aws-glue/jobs",
        "GlueVersion": "2.0"
    }
}
```

For more information, see Job Runs in the *AWS Glue Developer Guide*.

- For API details, see GetJobRun in *AWS CLI Command Reference*.

### `get-job-runs`

The following code example shows how to use `get-job-runs`.

#### AWS CLI

**To get information about all job runs for a job**

The following `get-job-runs` example retrieves information about job runs for a job.

```
aws glue get-job-runs \
    --job-name "my-testing-job"
```

Output:

```
{
    "JobRuns": [
        {
            "Id":
 "jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",
            "Attempt": 0,
            "JobName": "my-testing-job",

For more information, see Job Runs in the *AWS Glue Developer Guide*.

- For API details, see GetJobRuns in *AWS CLI Command Reference*.

## `get-job`

The following code example shows how to use `get-job`.

### AWS CLI

#### To retrieve information about a job

The following `get-job` example retrieves information about a job.

```
aws glue get-job \
```

```
    --job-name my-testing-job
```

Output:

```
{
    "Job": {
        "Name": "my-testing-job",
        "Role": "Glue_DefaultRole",
        "CreatedOn": 1602805698.167,
        "LastModifiedOn": 1602805698.167,
        "ExecutionProperty": {
            "MaxConcurrentRuns": 1
        },
        "Command": {
            "Name": "gluestreaming",
            "ScriptLocation": "s3://janetst-bucket-01/Scripts/test_script.scala",
            "PythonVersion": "2"
        },
        "DefaultArguments": {
            "--class": "GlueApp",
            "--job-language": "scala"
        },
        "MaxRetries": 0,
        "AllocatedCapacity": 10,
        "MaxCapacity": 10.0,
        "GlueVersion": "1.0"
    }
}
```

For more information, see Jobs in the *AWS Glue Developer Guide*.

- For API details, see GetJob in *AWS CLI Command Reference*.

### `get-plan`

The following code example shows how to use `get-plan`.

#### AWS CLI

**To get the generated code for mapping data from source tables to target tables**

The following `get-plan` retrieves the generated code for mapping columns from the data source to the data target.

```
aws glue get-plan --mapping '[ \
    { \
        "SourcePath":"sensorid", \
        "SourceTable":"anything", \
        "SourceType":"int", \
        "TargetPath":"sensorid", \
        "TargetTable":"anything", \
        "TargetType":"int" \
    }, \
    { \
        "SourcePath":"currenttemperature", \
        "SourceTable":"anything", \
        "SourceType":"int", \
        "TargetPath":"currenttemperature", \
        "TargetTable":"anything", \
        "TargetType":"int" \
    }, \
    { \
        "SourcePath":"status", \
        "SourceTable":"anything", \
        "SourceType":"string", \
        "TargetPath":"status", \
        "TargetTable":"anything", \
        "TargetType":"string" \
    }]' \
    --source '{ \
        "DatabaseName":"tempdb", \
        "TableName":"s3-source" \
    }' \
    --sinks '[ \
        { \
            "DatabaseName":"tempdb", \
            "TableName":"my-s3-sink" \
        }]' \
    --language "scala" \
    --endpoint https://glue.us-east-1.amazonaws.com \
    --output "text"
```

Output:

```
import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec
```

```
import com.amazonaws.services.glue.ResolveSpec
import com.amazonaws.services.glue.errors.CallSite
import com.amazonaws.services.glue.util.GlueArgParser
import com.amazonaws.services.glue.util.Job
import com.amazonaws.services.glue.util.JsonOptions
import org.apache.spark.SparkContext
import scala.collection.JavaConverters._

object GlueApp {
  def main(sysArgs: Array[String]) {
    val spark: SparkContext = new SparkContext()
    val glueContext: GlueContext = new GlueContext(spark)
    // @params: [JOB_NAME]
    val args = GlueArgParser.getResolvedOptions(sysArgs, Seq("JOB_NAME").toArray)
    Job.init(args("JOB_NAME"), glueContext, args.asJava)
    // @type: DataSource
    // @args: [database = "tempdb", table_name = "s3-source", transformation_ctx =
 "datasource0"]
    // @return: datasource0
    // @inputs: []
    val datasource0 = glueContext.getCatalogSource(database = "tempdb",
 tableName = "s3-source", redshiftTmpDir = "", transformationContext =
 "datasource0").getDynamicFrame()
    // @type: ApplyMapping
    // @args: [mapping = [("sensorid", "int", "sensorid", "int"),
 ("currenttemperature", "int", "currenttemperature", "int"), ("status", "string",
 "status", "string")], transformation_ctx = "applymapping1"]
    // @return: applymapping1
    // @inputs: [frame = datasource0]
    val applymapping1 = datasource0.applyMapping(mappings = Seq(("sensorid",
 "int", "sensorid", "int"), ("currenttemperature", "int", "currenttemperature",
 "int"), ("status", "string", "status", "string")), caseSensitive = false,
 transformationContext = "applymapping1")
    // @type: SelectFields
    // @args: [paths = ["sensorid", "currenttemperature", "status"],
 transformation_ctx = "selectfields2"]
    // @return: selectfields2
    // @inputs: [frame = applymapping1]
    val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid",
 "currenttemperature", "status"), transformationContext = "selectfields2")
    // @type: ResolveChoice
    // @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-s3-
sink", transformation_ctx = "resolvechoice3"]
    // @return: resolvechoice3
```

```
    // @inputs: [frame = selectfields2]
    val resolvechoice3 = selectfields2.resolveChoice(choiceOption =
 Some(ChoiceOption("MATCH_CATALOG")), database = Some("tempdb"), tableName =
 Some("my-s3-sink"), transformationContext = "resolvechoice3")
    // @type: DataSink
    // @args: [database = "tempdb", table_name = "my-s3-sink", transformation_ctx =
 "datasink4"]
    // @return: datasink4
    // @inputs: [frame = resolvechoice3]
    val datasink4 = glueContext.getCatalogSink(database = "tempdb",
 tableName = "my-s3-sink", redshiftTmpDir = "", transformationContext =
 "datasink4").writeDynamicFrame(resolvechoice3)
    Job.commit()
  }
}
```

For more information, see Editing Scripts in AWS Glue in the *AWS Glue Developer Guide*.

- For API details, see GetPlan in *AWS CLI Command Reference*.

## `get-tables`

The following code example shows how to use `get-tables`.

### AWS CLI

#### To list the definitions of some or all of the tables in the specified database

The following `get-tables` example returns information about the tables in the specified database.

```
aws glue get-tables --database-name 'tempdb'
```

Output:

```
{
    "TableList": [
        {
            "Name": "my-s3-sink",
            "DatabaseName": "tempdb",
            "CreateTime": 1602730539.0,
            "UpdateTime": 1602730539.0,
            "Retention": 0,
```

```

        }
    ]
}
```

For more information, see Defining Tables in the AWS Glue Data Catalog in the *AWS Glue Developer Guide*.

- For API details, see GetTables in *AWS CLI Command Reference*.

## `start-crawler`

The following code example shows how to use `start-crawler`.

### AWS CLI

#### To start a crawler

The following `start-crawler` example starts a crawler.

```
aws glue start-crawler --name my-crawler
```

Output:

```
None
```

For more information, see Defining Crawlers in the *AWS Glue Developer Guide*.

- For API details, see StartCrawler in *AWS CLI Command Reference*.

### `start-job-run`

The following code example shows how to use `start-job-run`.

**AWS CLI**

**To start running a job**

The following `start-job-run` example starts a job.

```
aws glue start-job-run \
    --job-name my-job
```

Output:

```
{
    "JobRunId":
 "jr_22208b1f44eb5376a60569d4b21dd20fcb8621e1a366b4e7b2494af764b82ded"
}
```

For more information, see Authoring Jobs in the *AWS Glue Developer Guide*.

- For API details, see StartJobRun in *AWS CLI Command Reference*.

## GuardDuty examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with GuardDuty.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `accept-invitation`

The following code example shows how to use `accept-invitation`.

**AWS CLI**

**To accept an invitation to become a GuardDuty member account in the current region**

The following `accept-invitation` example shows how to accept an invitation to become a GuardDuty member account in the current region.

```
aws guardduty accept-invitation  \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --master-id 123456789111 \
    --invitation-id d6b94fb03a66ff665f7db8764example
```

This command produces no output.

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

- For API details, see AcceptInvitation in *AWS CLI Command Reference*.

### `archive-findings`

The following code example shows how to use `archive-findings`.

**AWS CLI**

**To archive findings in the current region**

This example shows how to archive findings in the current region.

```
aws guardduty archive-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-ids d6b94fb03a66ff665f7db8764example 3eb970e0de00c16ec14e6910fexample
```

This command produces no output.

For more information, see Managing GuardDuty Accounts by Invitation in the *GuardDuty User Guide*.

- For API details, see ArchiveFindings in *AWS CLI Command Reference*.

### `create-detector`

The following code example shows how to use `create-detector`.

#### AWS CLI

**To enable GuardDuty in the current region**

This example shows how to create a new detector, which enables GuardDuty, in the current region.:

```
aws guardduty create-detector \
    --enable
```

Output:

```
{
    "DetectorId": "b6b992d6d2f48e64bc59180bfexample"
}
```

For more information, see Enable Amazon GuardDuty in the *GuardDuty User Guide*.

- For API details, see CreateDetector in *AWS CLI Command Reference*.

### `create-filter`

The following code example shows how to use `create-filter`.

#### AWS CLI

**To create a new filter for the current region**

This example creates a filter that matches all portscan findings for instance created from a specific image.:

```
aws guardduty create-filter \
```

```
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --action ARCHIVE \
    --name myFilter \
    --finding-criteria '{"Criterion": {"type": {"Eq": ["Recon:EC2/
Portscan"]},"resource.instanceDetails.imageId": {"Eq": ["ami-0a7a207083example"]}}}'
```

Output:

```
{
    "Name": "myFilter"
}
```

For more information, see Filtering findings in the *GuardDuty User Guide*.

- For API details, see CreateFilter in *AWS CLI Command Reference*.

### `create-ip-set`

The following code example shows how to use `create-ip-set`.

#### AWS CLI

**To create a trusted IP set**

The following `create-ip-set` example creates and activates a trusted IP set in the current region.

```
aws guardduty create-ip-set \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --name new-ip-set \
    --format TXT
    --location s3://AWSDOC-EXAMPLE-BUCKET/customtrustlist.csv
    --activate
```

Output:

```
{
    "IpSetId": "d4b94fc952d6912b8f3060768example"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.

- For API details, see CreateIpSet in *AWS CLI Command Reference*.

### `create-members`

The following code example shows how to use `create-members`.

**AWS CLI**

**To associate a new member with your GuardDuty master account in the current region.**

This example shows how to associate member accounts to be managed by the current account as the GuardDuty master.

```
aws guardduty create-members
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --account-details AccountId=111122223333,Email=first+member@example.com
 AccountId=111111111111 ,Email=another+member@example.com
```

Output:

```
{
   "UnprocessedAccounts": []
}
```

For more information, see Managing multiple accounts in the GuardDuty User Guide.

- For API details, see CreateMembers in *AWS CLI Command Reference*.

### `create-publishing-destination`

The following code example shows how to use `create-publishing-destination`.

**AWS CLI**

**To create a publishing destination to export GuardDuty findings in the current region to.**

This example shows how to create a publishing destination for GuardDuty findings.

```
aws guardduty create-publishing-destination \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --destination-type S3 \
```

```
    --destination-properties
 DestinationArn=arn:aws:s3:::yourbucket,KmsKeyArn=arn:aws:kms:us-
west-1:111122223333:key/84cee9c5-dea1-401a-ab6d-e1de7example
```

Output:

```
{
    "DestinationId": "46b99823849e1bbc242dfbe3cexample"
}
```

For more information, see Exporting findings in the *GuardDuty User Guide*.

- For API details, see CreatePublishingDestination in *AWS CLI Command Reference*.

### `create-sample-findings`

The following code example shows how to use `create-sample-findings`.

#### AWS CLI

**To create sample GuardDuty findings in the current region.**

This example shows how to create a sample finding of the provided types.

```
aws guardduty create-sample-findings \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --finding-types UnauthorizedAccess:EC2/TorClient UnauthorizedAccess:EC2/TorRelay
```

This command produces no output.

For more information, see Sample findings in the *GuardDuty User Guide*.

- For API details, see CreateSampleFindings in *AWS CLI Command Reference*.

### `create-threat-intel-set`

The following code example shows how to use `create-threat-intel-set`.

#### AWS CLI

**To create a new threat intel set in the current region.**

This example shows how to upload a threat intel set to GuardDuty and activate it immediately.

```
aws guardduty create-threat-intel-set \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --name myThreatSet \
    --format TXT \
    --location s3://EXAMPLEBUCKET/threatlist.csv \
    --activate
```

Output:

```
{
    "ThreatIntelSetId": "20b9a4691aeb33506b808878cexample"
}
```

For more information, see Trusted IP and threat lists in the *GuardDuty User Guide*.

- For API details, see CreateThreatIntelSet in *AWS CLI Command Reference*.

### `decline-invitations`

The following code example shows how to use `decline-invitations`.

#### AWS CLI

**To decline an invitation to have Guardduty managed by another account in the current region.**

This example shows how to decline a membership invitation.

```
aws guardduty decline-invitations \
    --account-ids 111122223333
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing GuardDuty accounts by invitation in the GuardDuty User Guide.

- For API details, see DeclineInvitations in *AWS CLI Command Reference*.

### `delete-detector`

The following code example shows how to use `delete-detector`.

#### AWS CLI

**To delete a detector, and disable GuardDuty, in the current region.**

This example shows how to delete a detector, if successful, this will disable GuardDuty in the region associated with that detector.

```
aws guardduty delete-detector \
    --detector-id b6b992d6d2f48e64bc59180bfexample
```

This command produces no output.

For more information, see Suspending or disabling GuardDuty in the *GuardDuty User Guide*.

- For API details, see DeleteDetector in *AWS CLI Command Reference*.

### `delete-filter`

The following code example shows how to use `delete-filter`.

#### AWS CLI

**To delete an existing filter in the current region**

This example shows how to create delete a filter.

```
aws guardduty delete-filter \
    --detector-id b6b992d6d2f48e64bc59180bfexample \
    --filter-name byebyeFilter
```

This command produces no output.

For more information, see Filtering findings in the GuardDuty User Guide.

- For API details, see DeleteFilter in *AWS CLI Command Reference*.

### `disable-organization-admin-account`

The following code example shows how to use `disable-organization-admin-account`.

**AWS CLI**

**To remove an account as the delegated administrator for GuardDuty within your organization**

This example shows how to remove an account as the delegated administrator for GuardDuty.

```
aws guardduty disable-organization-admin-account \
    --admin-account-id 111122223333
```

This command produces no output.

For more information, see Managing accounts with AWS organizations in the *GuardDuty User Guide*.

- For API details, see DisableOrganizationAdminAccount in *AWS CLI Command Reference*.

### `disassociate-from-master-account`

The following code example shows how to use `disassociate-from-master-account`.

**AWS CLI**

**To disassociate from your current master account in the current region**

The following `disassociate-from-master-account` example dissassociates your account from the current GuardDuty master account in the current AWS region.

```
aws guardduty disassociate-from-master-account \
    --detector-id d4b040365221be2b54a6264dcexample
```

This command produces no output.

For more information, see Understanding the Relationship between GuardDuty Master and Member Accounts in the GuardDuty User Guide.

- For API details, see DisassociateFromMasterAccount in *AWS CLI Command Reference*.

### `get-detector`

The following code example shows how to use `get-detector`.

**AWS CLI**

**To retrieve details of a specific detector**

The following `get-detector` example displays the configurations details of the specified detector.

```
aws guardduty get-detector \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "Status": "ENABLED",
    "ServiceRole": "arn:aws:iam::111122223333:role/aws-service-role/
guardduty.amazonaws.com/AWSServiceRoleForAmazonGuardDuty",
    "Tags": {},
    "FindingPublishingFrequency": "SIX_HOURS",
    "UpdatedAt": "2018-11-07T03:24:22.938Z",
    "CreatedAt": "2017-12-22T22:51:31.940Z"
}
```

For more information, see Concepts and Terminology in the GuardDuty User Guide.

- For API details, see GetDetector in *AWS CLI Command Reference*.

### `get-findings`

The following code example shows how to use `get-findings`.

**AWS CLI**

**Example 1: To retrieve the details of a specific finding**

The following `get-findings` example retrieves the full JSON finding details of the specified finding.

```
aws guardduty get-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-id 1ab92989eaf0e742df4a014d5example
```

Output:

```
{
    "Findings": [
        {
            "Resource": {
                "ResourceType": "AccessKey",
                "AccessKeyDetails": {
                    "UserName": "testuser",
                    "UserType": "IAMUser",
                    "PrincipalId": "AIDACKCEVSQ6C2EXAMPLE",
                    "AccessKeyId": "ASIASZ4SI7REEEXAMPLE"
                }
            },
            "Description": "APIs commonly used to discover the users, groups,
 policies and permissions in an account, was invoked by IAM principal testuser under
 unusual circumstances. Such activity is not typically seen from this principal.",

            "AccountId": "111122223333"
        }
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.

- For API details, see GetFindings in *AWS CLI Command Reference*.

## `get-ip-set`

The following code example shows how to use `get-ip-set`.

### AWS CLI

#### To list get details on a specified trusted IP set

The following `get-ip-set` example shows the status and details of the specifiifed trusted IP set.

```
aws guardduty get-ip-set \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --ip-set-id d4b94fc952d6912b8f3060768example
```

Output:

```
{
    "Status": "ACTIVE",
    "Location": "s3://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/
customlist.csv",
    "Tags": {},
    "Format": "TXT",
    "Name": "test-ip-set"
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.

- For API details, see GetIpSet in *AWS CLI Command Reference*.

### `get-master-account`

The following code example shows how to use `get-master-account`.

**AWS CLI**

**To retrieve details about your master account in the current region**

The following `get-master-account` example displays the status and details of the master account associated with your detector in the current region.

```
aws guardduty get-master-account \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "Master": {
        "InvitationId": "04b94d9704854a73f94e061e8example",
        "InvitedAt": "2020-06-09T22:23:04.970Z",
        "RelationshipStatus": "Enabled",
        "AccountId": "123456789111"
    }
}
```

For more information, see Understanding the Relationship between GuardDuty Master and Member Accounts in the GuardDuty User Guide.

- For API details, see GetMasterAccount in *AWS CLI Command Reference*.

### `list-detectors`

The following code example shows how to use `list-detectors`.

**AWS CLI**

**To list the available detectors in the current region**

The following `list-detectors` example lists the available detectors in your current AWS region.

```
aws guardduty list-detectors
```

Output:

```
{
    "DetectorIds": [
        "12abc34d567e8fa901bc2d34eexample"
    ]
}
```

For more information, see Concepts and Terminology in the GuardDuty User Guide.

- For API details, see ListDetectors in *AWS CLI Command Reference*.

### `list-findings`

The following code example shows how to use `list-findings`.

**AWS CLI**

**Example 1: To list all findings for the current region**

The following `list-findings` example displays a list of all findingIds for the current region sorted by severity from highest to lowest.

```
aws guardduty list-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --sort-criteria '{"AttributeName": "severity","OrderBy":"DESC"}'
```

Output:

```
{
    "FindingIds": [
        "04b8ab50fd29c64fc771b232dexample",
        "5ab8ab50fd21373735c826d3aexample",
        "90b93de7aba69107f05bbe60bexample",
        ...
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.

**Example 2: To list findings for the current region matching a specific finding criteria**

The following `list-findings` example displays a list of all findingIds that match a specified finding type.

```
aws guardduty list-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-criteria  '{"Criterion":{"type": {"Eq":["UnauthorizedAccess:EC2/
SSHBruteForce"]}}}'
```

Output:

```
{
    "FindingIds": [
        "90b93de7aba69107f05bbe60bexample",
        "6eb9430d7023d30774d6f05e3example",
        "2eb91a2d060ac9a21963a5848example",
        "44b8ab50fd2b0039a9e48f570example",
        "9eb8ab4cd2b7e5b66ba4f5e96example",
        "e0b8ab3a38e9b0312cc390ceeexample"
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.

**Example 3: To list findings for the current region matching a specific set of finding criteria defined within a JSON file**

The following `list-findings` example displays a list of all findingIds that are not archived, and involve the IAM user named "testuser", as specified in a JSON file.

```
aws guardduty list-findings \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --finding-criteria  file://myfile.json
```

Contents of `myfile.json`:

```
{"Criterion": {
    "resource.accessKeyDetails.userName":{
                "Eq":[
                    "testuser"
                    ]
                },
    "service.archived": {
                "Eq": [
                    "false"
                ]
            }
        }
}
```

Output:

```
{
    "FindingIds": [
        "1ab92989eaf0e742df4a014d5example"
    ]
}
```

For more information, see Findings in the GuardDuty User Guide.

- For API details, see ListFindings in *AWS CLI Command Reference*.

## `list-invitations`

The following code example shows how to use `list-invitations`.

**AWS CLI**

**To list details on your invitations to become a member account in the current region**

The following `list-invitations` example lists details and statuses on your invitations to become a GuardDuty member account in the current region.

```
aws guardduty list-invitations
```

Output:

```
{
    "Invitations": [
        {
            "InvitationId": "d6b94fb03a66ff665f7db8764example",
            "InvitedAt": "2020-06-10T17:56:38.221Z",
            "RelationshipStatus": "Invited",
            "AccountId": "123456789111"
        }
    ]
}
```

For more information, see Managing GuardDuty Accounts by Invitation in the GuardDuty User Guide.

- For API details, see ListInvitations in *AWS CLI Command Reference*.

## `list-ip-sets`

The following code example shows how to use `list-ip-sets`.

**AWS CLI**

**To list trusted IP sets in the current region**

The following `list-ip-sets` example lists the trusted IP sets in your current AWS region.

```
aws guardduty list-ip-sets \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "IpSetIds": [
        "d4b94fc952d6912b8f3060768example"
    ]
}
```

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.

- For API details, see ListIpSets in *AWS CLI Command Reference*.

### `list-members`

The following code example shows how to use `list-members`.

**AWS CLI**

**To list all members in the current region**

The following `list-members` example lists all member accounts and their details for the current region.

```
aws guardduty list-members \
    --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
    "Members": [
        {
            "RelationshipStatus": "Enabled",
            "InvitedAt": "2020-06-09T22:49:00.910Z",
            "MasterId": "123456789111",
            "DetectorId": "7ab8b2f61b256c87f793f6a86example",
            "UpdatedAt": "2020-06-09T23:08:22.512Z",
            "Email": "your+member@example.com",
            "AccountId": "123456789222"
        }
    ]
}
```

For more information, see Understanding the Relationship between GuardDuty Master and Member Accounts in the GuardDuty User Guide.

- For API details, see ListMembers in *AWS CLI Command Reference*.

### `update-ip-set`

The following code example shows how to use `update-ip-set`.

**AWS CLI**

**To update a trusted IP set**

The following `update-ip-set` example shows how to update the details of a trusted IP set.

```
aws guardduty update-ip-set \
    --detector-id 12abc34d567e8fa901bc2d34eexample \
    --ip-set-id d4b94fc952d6912b8f3060768example \
    --location https://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/
customtrustlist2.csv
```

This command produces no output.

For more information, see Working with Trusted IP Lists and Threat Lists in the GuardDuty User Guide.

- For API details, see UpdateIpSet in *AWS CLI Command Reference*.

## AWS Health examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Health.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

## Actions

### `describe-affected-entities`

The following code example shows how to use `describe-affected-entities`.

**AWS CLI**

**To list the entities that are affected by a specified AWS Health event**

The following `describe-affected-entities` example lists the entities that are affected by the specified AWS Health event. This event is a billing notification for the AWS account.

```
aws health describe-affected-entities \
    --filter "eventArns=arn:aws:health:global::event/BILLING/
AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-
EXAMPLE11145" \
    --region us-east-1
```

Output:

```
{
    "entities": [
        {
            "entityArn": "arn:aws:health:global:123456789012:entity/
EXAMPLEimSMoULmWHpb",
            "eventArn": "arn:aws:health:global::event/BILLING/
AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-
EXAMPLE11145",
            "entityValue": "AWS_ACCOUNT",
            "awsAccountId": "123456789012",
            "lastUpdatedTime": 1588356454.08
        }
    ]
}
```

For more information, see Event log in the *AWS Health User Guide*.

- For API details, see DescribeAffectedEntities in *AWS CLI Command Reference*.

### `describe-event-details`

The following code example shows how to use `describe-event-details`.

**AWS CLI**

**To list information about an AWS Health event**

The following `describe-event-details` example lists information about the specified AWS Health event.

```
aws health describe-event-details \
    --event-arns "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/
AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111" \
    --region us-east-1
```

Output:

```
{
    "successfulSet": [
        {
            "event": {
                "arn": "arn:aws:health:us-east-1::event/EC2/
AWS_EC2_OPERATIONAL_ISSUE/AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
                "service": "EC2",
                "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
                "eventTypeCategory": "issue",
                "region": "us-east-1",
                "startTime": 1587462325.096,
                "endTime": 1587464204.774,
                "lastUpdatedTime": 1587464204.865,
                "statusCode": "closed"
            },
            "eventDescription": {
                "latestDescription": "[RESOLVED] Increased API Error Rates and
 Latencies\n\n[02:45 AM PDT] We are investigating increased API error rates and
 latencies in the US-EAST-1 Region.\n\n[03:16 AM PDT] Between 2:10 AM and 2:59 AM
 PDT we experienced increased API error rates and latencies in the US-EAST-1 Region.
 The issue has been resolved and the service is operating normally."
            }
        }
    ],
    "failedSet": []
```

```
}
```

For more information, see Event details pane in the *AWS Health User Guide*.

- For API details, see DescribeEventDetails in *AWS CLI Command Reference*.

### `describe-events`

The following code example shows how to use `describe-events`.

#### AWS CLI

**Example 1: To list AWS Health events**

The following `describe-events` example lists recent AWS Health events.

```
aws health describe-events \
    --region us-east-1
```

Output:

```
{
    "events": [
        {
            "arn": "arn:aws:health:us-west-1::event/ECS/AWS_ECS_OPERATIONAL_ISSUE/
AWS_ECS_OPERATIONAL_ISSUE_KWQPY_EXAMPLE111",
            "service": "ECS",
            "eventTypeCode": "AWS_ECS_OPERATIONAL_ISSUE",
            "eventTypeCategory": "issue",
            "region": "us-west-1",
            "startTime": 1589077890.53,
            "endTime": 1589086345.597,
            "lastUpdatedTime": 1589086345.905,
            "statusCode": "closed",
            "eventScopeCode": "PUBLIC"
        },
        {
            "arn": "arn:aws:health:global::event/BILLING/AWS_BILLING_NOTIFICATION/

        }
    ]
}
```

For more information, see Getting started with the AWS Personal Health Dashboard in the *AWS Health User Guide*.

**Example 2: To list AWS Health events by service and event status code**

The following `describe-events` example lists AWS Health events for Amazon Elastic Compute Cloud (Amazon EC2) where the event status is closed.

```
aws health describe-events \
    --filter "services=EC2,eventStatusCodes=closed"
```

Output:

```
{
    "events": [
        {
            "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/
AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",
```

```
            "service": "EC2",
            "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
            "eventTypeCategory": "issue",
            "region": "us-east-1",
            "startTime": 1587462325.096,
            "endTime": 1587464204.774,
            "lastUpdatedTime": 1587464204.865,
            "statusCode": "closed",
            "eventScopeCode": "PUBLIC"
        },
        {
            "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/

            "lastUpdatedTime": 1583885057.052,
            "statusCode": "closed",
            "eventScopeCode": "PUBLIC"
        }
    ]
}
```

For more information, see Getting started with the AWS Personal Health Dashboard in the *AWS Health User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

# HealthImaging examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthImaging.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

## Topics

## Actions

### `copy-image-set`

The following code example shows how to use `copy-image-set`.

#### AWS CLI

**Example 1: To copy an image set without a destination.**

The following `copy-image-set` code example makes a duplicate copy of an image set without a destination.

```
aws medical-imaging copy-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" } }'
```

Output:

```
{
    "destinationImageSetProperties": {
```

```
        "latestVersionId": "2",
        "imageSetWorkflowStatus": "COPYING",
        "updatedAt": 1680042357.432,
        "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
        "imageSetState": "LOCKED",
        "createdAt": 1680042357.432
    },
    "sourceImageSetProperties": {
        "latestVersionId": "1",
        "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
        "updatedAt": 1680042357.432,
        "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
        "imageSetState": "LOCKED",
        "createdAt": 1680027126.436
    },
    "datastoreId": "12345678901234567890123456789012"
}
```

**Example 2: To copy an image set with a destination.**

The following `copy-image-set` code example makes a duplicate copy of an image set with a destination.

```
aws medical-imaging copy-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" },
 "destinationImageSet": { "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
 "latestVersionId": "1"} }'
```

Output:

```
{
    "destinationImageSetProperties": {
        "latestVersionId": "2",
        "imageSetWorkflowStatus": "COPYING",
        "updatedAt": 1680042505.135,
        "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
        "imageSetState": "LOCKED",
        "createdAt": 1680042357.432
    },
    "sourceImageSetProperties": {
        "latestVersionId": "1",
```

```
        "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
        "updatedAt": 1680042505.135,
        "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
        "imageSetState": "LOCKED",
        "createdAt": 1680027126.436
    },
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Copying an image set in the *AWS HealthImaging Developer Guide*.

- For API details, see CopyImageSet in *AWS CLI Command Reference*.

### `create-datastore`

The following code example shows how to use `create-datastore`.

#### AWS CLI

**To create a data store**

The following `create-datastore` code example creates a data store with the name `my-datastore`.

```
aws medical-imaging create-datastore \
    --datastore-name "my-datastore"
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "datastoreStatus": "CREATING"
}
```

For more information, see Creating a data store in the *AWS HealthImaging Developer Guide*.

- For API details, see CreateDatastore in *AWS CLI Command Reference*.

### `delete-datastore`

The following code example shows how to use `delete-datastore`.

**AWS CLI**

**To delete a data store**

The following `delete-datastore` code example deletes a data store.

```
aws medical-imaging delete-datastore \
    --datastore-id "12345678901234567890123456789012"
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "datastoreStatus": "DELETING"
}
```

For more information, see Deleting a data store in the *AWS HealthImaging Developer Guide*.

- For API details, see DeleteDatastore in *AWS CLI Command Reference*.

## `delete-image-set`

The following code example shows how to use `delete-image-set`.

**AWS CLI**

**To delete an image set**

The following `delete-image-set` code example deletes an image set.

```
aws medical-imaging delete-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```
{
    "imageSetWorkflowStatus": "DELETING",
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "datastoreId": "12345678901234567890123456789012"
```

```
}
```

For more information, see Deleting an image set in the *AWS HealthImaging Developer Guide*.

- For API details, see DeleteImageSet in *AWS CLI Command Reference*.

### `get-datastore`

The following code example shows how to use `get-datastore`.

#### AWS CLI

**To get a data store's properties**

The following `get-datastore` code example gets a data store's properties.

```
aws medical-imaging get-datastore \
    --datastore-id 12345678901234567890123456789012
```

Output:

```
{
    "datastoreProperties": {
        "datastoreId": "12345678901234567890123456789012",
        "datastoreName": "TestDatastore123",
        "datastoreStatus": "ACTIVE",
        "datastoreArn": "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012",
        "createdAt": "2022-11-15T23:33:09.643000+00:00",
        "updatedAt": "2022-11-15T23:33:09.643000+00:00"
    }
}
```

For more information, see Getting data store properties in the *AWS HealthImaging Developer Guide*.

- For API details, see GetDatastore in *AWS CLI Command Reference*.

### `get-dicom-import-job`

The following code example shows how to use `get-dicom-import-job`.

### AWS CLI

#### To get a dicom import job's properties

The following `get-dicom-import-job` code example gets a dicom import job's properties.

```
aws medical-imaging get-dicom-import-job \
    --datastore-id "12345678901234567890123456789012" \
    --job-id "09876543210987654321098765432109"
```

Output:

```
{
    "jobProperties": {
        "jobId": "09876543210987654321098765432109",
        "jobName": "my-job",
        "jobStatus": "COMPLETED",
        "datastoreId": "12345678901234567890123456789012",
        "dataAccessRoleArn": "arn:aws:iam::123456789012:role/
ImportJobDataAccessRole",
        "endedAt": "2022-08-12T11:29:42.285000+00:00",
        "submittedAt": "2022-08-12T11:28:11.152000+00:00",
        "inputS3Uri": "s3://medical-imaging-dicom-input/dicom_input/",
        "outputS3Uri": "s3://medical-imaging-output/
job_output/12345678901234567890123456789012-
DicomImport-09876543210987654321098765432109/"
    }
}
```

For more information, see Getting import job properties in the *AWS HealthImaging Developer Guide*.

- For API details, see GetDICOMImportJob in *AWS CLI Command Reference*.

## `get-image-frame`

The following code example shows how to use `get-image-frame`.

### AWS CLI

#### To get image set pixel data

The following `get-image-frame` code example gets an image frame.

```
aws medical-imaging get-image-frame \
    --datastore-id "12345678901234567890123456789012" \
    --image-set-id "98765412345612345678907890789012" \
    --image-frame-information imageFrameId=3abf5d5d7ae72f80a0ec81b2c0de3ef4 \
    imageframe.jph
```

Note: This code example does not include output because the GetImageFrame action returns a stream of pixel data to the imageframe.jph file. For information about decoding and viewing image frames, see HTJ2K decoding libraries.

For more information, see Getting image set pixel data in the *AWS HealthImaging Developer Guide*.

- For API details, see GetImageFrame in *AWS CLI Command Reference*.

### `get-image-set-metadata`

The following code example shows how to use `get-image-set-metadata`.

**AWS CLI**

**Example 1: To get image set metadata without version**

The following `get-image-set-metadata` code example gets metadata for an image set without specifying a version.

Note: `outfile` is a required parameter

```
aws medical-imaging get-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    studymetadata.json.gz
```

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```
{
    "contentType": "application/json",
```

```
    "contentEncoding": "gzip"
}
```

**Example 2: To get image set metadata with version**

The following `get-image-set-metadata` code example gets metadata for an image set with a specified version.

Note: `outfile` is a required parameter

```
aws medical-imaging get-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --version-id 1 \
    studymetadata.json.gz
```

The returned metadata is compressed with gzip and stored in the studymetadata.json.gz file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```
{
    "contentType": "application/json",
    "contentEncoding": "gzip"
}
```

For more information, see Getting image set metadata in the *AWS HealthImaging Developer Guide*.

- For API details, see GetImageSetMetadata in *AWS CLI Command Reference*.

## `get-image-set`

The following code example shows how to use `get-image-set`.

### AWS CLI

**To get image set properties**

The following `get-image-set` code example gets the properties for an image set.

```
aws medical-imaging get-image-set \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id 18f88ac7870584f58d56256646b4d92b \
    --version-id 1
```

Output:

```
{
    "versionId": "1",
    "imageSetWorkflowStatus": "COPIED",
    "updatedAt": 1680027253.471,
    "imageSetId": "18f88ac7870584f58d56256646b4d92b",
    "imageSetState": "ACTIVE",
    "createdAt": 1679592510.753,
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Getting image set properties in the *AWS HealthImaging Developer Guide*.

- For API details, see GetImageSet in *AWS CLI Command Reference*.

### `list-datastores`

The following code example shows how to use `list-datastores`.

**AWS CLI**

**To list data stores**

The following `list-datastores` code example lists available data stores.

```
aws medical-imaging list-datastores
```

Output:

```
{
    "datastoreSummaries": [
        {
            "datastoreId": "12345678901234567890123456789012",
```

```
            "datastoreName": "TestDatastore123",
            "datastoreStatus": "ACTIVE",
            "datastoreArn": "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012",
            "createdAt": "2022-11-15T23:33:09.643000+00:00",
            "updatedAt": "2022-11-15T23:33:09.643000+00:00"
        }
    ]
}
```

For more information, see Listing data stores in the *AWS HealthImaging Developer Guide*.

- For API details, see ListDatastores in *AWS CLI Command Reference*.

## `list-dicom-import-jobs`

The following code example shows how to use `list-dicom-import-jobs`.

### AWS CLI

#### To list dicom import jobs

The following `list-dicom-import-jobs` code example lists dicom import jobs.

```
aws medical-imaging list-dicom-import-jobs \
    --datastore-id "12345678901234567890123456789012"
```

Output:

```
{
    "jobSummaries": [
        {
            "jobId": "09876543210987654321098765432109",
            "jobName": "my-job",
            "jobStatus": "COMPLETED",
            "datastoreId": "12345678901234567890123456789012",
            "dataAccessRoleArn": "arn:aws:iam::123456789012:role/
ImportJobDataAccessRole",
            "endedAt": "2022-08-12T11:21:56.504000+00:00",
            "submittedAt": "2022-08-12T11:20:21.734000+00:00"
        }
    ]
```

```
}
```

For more information, see Listing import jobs in the *AWS HealthImaging Developer Guide*.

- For API details, see ListDICOMImportJobs in *AWS CLI Command Reference*.

### `list-image-set-versions`

The following code example shows how to use `list-image-set-versions`.

#### AWS CLI

**To list image set versions**

The following `list-image-set-versions` code example lists the version history for an image set.

```
aws medical-imaging list-image-set-versions \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```
{
    "imageSetPropertiesList": [
        {
            "ImageSetWorkflowStatus": "UPDATED",
            "versionId": "4",
            "updatedAt": 1680029436.304,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "createdAt": 1680027126.436
        },
        {
            "ImageSetWorkflowStatus": "UPDATED",
            "versionId": "3",
            "updatedAt": 1680029163.325,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "createdAt": 1680027126.436
        },
        {
```

```
            "ImageSetWorkflowStatus": "COPY_FAILED",
            "versionId": "2",
            "updatedAt": 1680027455.944,
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "message": "INVALID_REQUEST:  Series of SourceImageSet and
 DestinationImageSet don't match.",
            "createdAt": 1680027126.436
        },
        {
            "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
            "imageSetState": "ACTIVE",
            "versionId": "1",
            "ImageSetWorkflowStatus": "COPIED",
            "createdAt": 1680027126.436
        }
    ]
}
```

For more information, see Listing image set versions in the *AWS HealthImaging Developer Guide*.

- For API details, see ListImageSetVersions in *AWS CLI Command Reference*.

## `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

### AWS CLI

#### Example 1: To list resource tags for a data store

The following `list-tags-for-resource` code example lists tags for a data store.

```
aws medical-imaging list-tags-for-resource \
    --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012"
```

Output:

```
{
    "tags":{
        "Deployment":"Development"
```

```
    }
}
```

**Example 2: To list resource tags for an image set**

The following `list-tags-for-resource` code example lists tags for an image set.

```
aws medical-imaging list-tags-for-resource \
    --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012/
imageset/18f88ac7870584f58d56256646b4d92b"
```

Output:

```
{
    "tags":{
        "Deployment":"Development"
    }
}
```

For more information, see Tagging resources with AWS HealthImaging in the *AWS HealthImaging Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

## `search-image-sets`

The following code example shows how to use `search-image-sets`.

### AWS CLI

**Example 1: To search image sets with an EQUAL operator**

The following `search-image-sets` code example uses the EQUAL operator to search image sets based on a specific value.

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
    --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```
{
    "filters": [{
        "values": [{"DICOMPatientId" : "SUBJECT08701"}],
        "operator": "EQUAL"
    }]
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
             "DICOMPatientSex": "F",
             "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
             "DICOMPatientBirthDate": "19201120",
             "DICOMStudyDescription": "UNKNOWN",
             "DICOMPatientId": "SUBJECT08701",
             "DICOMPatientName": "Melissa844 Huel628",
             "DICOMNumberOfStudyRelatedInstances": 1,
             "DICOMStudyTime": "140728",
             "DICOMNumberOfStudyRelatedSeries": 1
            },
        "updatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

**Example 2: To search image sets with a BETWEEN operator using DICOMStudyDate and DICOMStudyTime**

The following `search-image-sets` code example searches for image sets with DICOM Studies generated between January 1, 1990 (12:00 AM) and January 1, 2023 (12:00 AM).

Note: DICOMStudyTime is optional. If it is not present, 12:00 AM (start of the day) is the time value for the dates provided for filtering.

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
```

```
    --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```
{
    "filters": [{
        "values": [{
            "DICOMStudyDateAndTime": {
                "DICOMStudyDate": "19900101",
                "DICOMStudyTime": "000000"
            }
        },
        {
            "DICOMStudyDateAndTime": {
                "DICOMStudyDate": "20230101",
                "DICOMStudyTime": "000000"
            }
        }],
        "operator": "BETWEEN"
    }]
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "updatedAt": "2022-12-06T21:40:59.429000+00:00"
```

```
    }]
}
```

**Example 3: To search image sets with a BETWEEN operator using createdAt (time studies were previously persisted)**

The following `search-image-sets` code example searches for image sets with DICOM Studies persisted in HealthImaging between the time ranges in UTC time zone.

Note: Provide createdAt in example format ("1985-04-12T23:20:50.52Z").

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
    --search-criteria  file://search-criteria.json
```

Contents of `search-criteria.json`

```
{
    "filters": [{
        "values": [{
            "createdAt": "1985-04-12T23:20:50.52Z"
        },
        {
            "createdAt": "2022-04-12T23:20:50.52Z"
        }],
        "operator": "BETWEEN"
    }]
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
```

```
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "lastUpdatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

**Example 4: To search image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field**

The following `search-image-sets` code example searches for image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field.

Note: Provide updatedAt in example format ("1985-04-12T23:20:50.52Z").

```
aws medical-imaging search-image-sets \
    --datastore-id 12345678901234567890123456789012 \
    --search-criteria  file://search-criteria.json
```

Contents of `search-criteria.json`

```
{
    "filters": [{
        "values": [{
            "updatedAt": "2024-03-11T15:00:05.074000-07:00"
        }, {
            "updatedAt": "2024-03-11T16:00:05.074000-07:00"
        }],
        "operator": "BETWEEN"
    }, {
        "values": [{
            "DICOMSeriesInstanceUID": "1.2.840.99999999.84710745.943275268089"
        }],
        "operator": "EQUAL"
    }],
    "sort": {
```

```
        "sortField": "updatedAt",
        "sortOrder": "ASC"
    }
}
```

Output:

```
{
    "imageSetsMetadataSummaries": [{
        "imageSetId": "09876543210987654321098765432109",
        "createdAt": "2022-12-06T21:40:59.429000+00:00",
        "version": 1,
        "DICOMTags": {
            "DICOMStudyId": "2011201407",
            "DICOMStudyDate": "19991122",
            "DICOMPatientSex": "F",
            "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
            "DICOMPatientBirthDate": "19201120",
            "DICOMStudyDescription": "UNKNOWN",
            "DICOMPatientId": "SUBJECT08701",
            "DICOMPatientName": "Melissa844 Huel628",
            "DICOMNumberOfStudyRelatedInstances": 1,
            "DICOMStudyTime": "140728",
            "DICOMNumberOfStudyRelatedSeries": 1
        },
        "lastUpdatedAt": "2022-12-06T21:40:59.429000+00:00"
    }]
}
```

For more information, see Searching image sets in the *AWS HealthImaging Developer Guide*.

- For API details, see SearchImageSets in *AWS CLI Command Reference*.

### `start-dicom-import-job`

The following code example shows how to use `start-dicom-import-job`.

#### AWS CLI

##### To start a dicom import job

The following `start-dicom-import-job` code example starts a dicom import job.

```
aws medical-imaging start-dicom-import-job \
    --job-name "my-job" \
    --datastore-id "12345678901234567890123456789012" \
    --input-s3-uri "s3://medical-imaging-dicom-input/dicom_input/" \
    --output-s3-uri "s3://medical-imaging-output/job_output/" \
    --data-access-role-arn "arn:aws:iam::123456789012:role/ImportJobDataAccessRole"
```

Output:

```
{
    "datastoreId": "12345678901234567890123456789012",
    "jobId": "09876543210987654321098765432109",
    "jobStatus": "SUBMITTED",
    "submittedAt": "2022-08-12T11:28:11.152000+00:00"
}
```

For more information, see Starting an import job in the *AWS HealthImaging Developer Guide*.

- For API details, see StartDICOMImportJob in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**Example 1: To tag a data store**

The following `tag-resource` code examples tags a data store.

```
aws medical-imaging tag-resource \
  --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012" \
  --tags '{"Deployment":"Development"}'
```

This command produces no output.

**Example 2: To tag an image set**

The following `tag-resource` code examples tags an image set.

```
aws medical-imaging tag-resource \
    --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012/
imageset/18f88ac7870584f58d56256646b4d92b" \
    --tags '{"Deployment":"Development"}'
```

This command produces no output.

For more information, see Tagging resources with AWS HealthImaging in the *AWS HealthImaging Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**Example 1: To untag a data store**

The following `untag-resource` code example untags a data store.

```
aws medical-imaging untag-resource \
    --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012" \
    --tag-keys '["Deployment"]'
```

This command produces no output.

**Example 2: To untag an image set**

The following `untag-resource` code example untags an image set.

```
aws medical-imaging untag-resource \
    --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012/
imageset/18f88ac7870584f58d56256646b4d92b" \
    --tag-keys '["Deployment"]'
```

This command produces no output.

For more information, see Tagging resources with AWS HealthImaging in the *AWS HealthImaging Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-image-set-metadata`

The following code example shows how to use `update-image-set-metadata`.

**AWS CLI**

**To insert or update an attribute in image set metadata**

The following `update-image-set-metadata` code example inserts or updates an attribute in image set metadata.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --latest-version-id 1 \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```
{
    "DICOMUpdates": {
        "updatableAttributes":
 "eyJTY2hlbWFWZXJzaW9uIjoxLjEsIlBhdGllbnQiOnsiRElDT00iOnsiUGF0aWVudE5hbWUiOiJNWF5NWCJ9fX0="
    }
}
```

Note: `updatableAttributes` is a Base64 encoded JSON string. Here is the unencoded JSON string.

{"SchemaVersion":1.1,"Patient":{"DICOM":{"PatientName":"MX^MX"}}}

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
```

```
    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "1234567890123456789012345678901 2"
}
```

**To remove an attribute from image set metadata**

The following `update-image-set-metadata` code example removes an attribute from image set metadata.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 1234567890123456789012345678901 2 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --latest-version-id 1 \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```
{
    "DICOMUpdates": {
        "removableAttributes":
 "e1NjaGVtYVZlcnNpb246MS4xLFN0dWR5OntESUNPTTp7U3R1ZHlEZXNjcmlwdGlvbjpDSEVTVH19fQo="
    }
}
```

Note: `removableAttributes` is a Base64 encoded JSON string. Here is the unencoded JSON string. The key and value must match the attribute to be removed.

{"SchemaVersion":1.1,"Study":{"DICOM":{"StudyDescription":"CHEST"}}}

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
```

```
    "datastoreId": "12345678901234567890123456789012"
}
```

**To remove an instance from image set metadata**

The following `update-image-set-metadata` code example removes an instance from image set metadata.

```
aws medical-imaging update-image-set-metadata \
    --datastore-id 12345678901234567890123456789012 \
    --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
    --latest-version-id 1 \
    --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```
{
    "DICOMUpdates": {
        "removableAttributes":
 "eezEuMS4xLjEuMS4xLjEyMzQ1LjEyMzQ1Njc4OTAxMi4xMjMuMTIzNDU2Nzg5MDEyMzQuMTp7SW5zdGFuY2VzOnsxL
    }
}
```

Note: `removableAttributes` is a Base64 encoded JSON string. Here is the unencoded JSON string.

{"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1":{"Instances":
{"1.1.1.1.1.1.12345.123456789012.123.12345678901234.1":{}}}}}

Output:

```
{
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "UPDATING",
    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see Updating image set metadata in the *AWS HealthImaging Developer Guide*.

- For API details, see UpdateImageSetMetadata in *AWS CLI Command Reference*.

## HealthLake examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthLake.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `create-fhir-datastore`

The following code example shows how to use `create-fhir-datastore`.

#### AWS CLI

**To create a FHIR Data Store.**

The following `create-fhir-datastore` example demonstrates how to create a new Data Store in Amazon HealthLake.

```
aws healthlake create-fhir-datastore \
    --region us-east-1 \
    --datastore-type-version R4 \
    --datastore-type-version R4 \
```

```
    --datastore-name "FhirTestDatastore"
```

Output:

```
{
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
(Datastore ID)/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/
(Datastore ID)",
    "DatastoreStatus": "CREATING",
    "DatastoreId": "(Datastore ID)"
}
```

For more information, see Creating and monitoring a FHIR Data Store in the *Amazon HealthLake Developer Guide*.

- For API details, see CreateFhirDatastore in *AWS CLI Command Reference*.

### `delete-fhir-datastore`

The following code example shows how to use `delete-fhir-datastore`.

#### AWS CLI

**To delete a FHIR Data Store**

The following `delete-fhir-datastore` example demonstrates how to delete a Data Store and all of its contents in Amazon HealthLake.

```
aws healthlake delete-fhir-datastore \
    --datastore-id (Data Store ID) \
    --region us-east-1
```

Output:

```
{
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
(Datastore ID)/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/
(Datastore ID)",
    "DatastoreStatus": "DELETING",
```

```
    "DatastoreId": "(Datastore ID)"
}
```

For more information, see Creating and monitoring a FHIR Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/working-with-FHIR-healthlake.html> in the *Amazon HealthLake Developer Guide*.

- For API details, see DeleteFhirDatastore in *AWS CLI Command Reference*.

### `describe-fhir-datastore`

The following code example shows how to use `describe-fhir-datastore`.

#### AWS CLI

**To describe a FHIR Data Store**

The following `describe-fhir-datastore` example demonstrates how to find the properties of a Data Store in Amazon HealthLake.

```
aws healthlake describe-fhir-datastore \
    --datastore-id "1f2f459836ac6c513ce899f9e4f66a59" \
    --region us-east-1
```

Output:

```
{
    "DatastoreProperties": {
        "PreloadDataConfig": {
            "PreloadDataType": "SYNTHEA"
        },
        "DatastoreName": "FhirTestDatastore",
        "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/
(Datastore ID)",
        "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
(Datastore ID)/r4/",
        "DatastoreStatus": "CREATING",
        "DatastoreTypeVersion": "R4",
        "DatastoreId": "(Datastore ID)"
    }
}
```

For more information, see Creating and monitoring a FHIR Data Stores in the *Amazon HealthLake Developer Guide*.

- For API details, see DescribeFhirDatastore in *AWS CLI Command Reference*.

### `describe-fhir-export-job`

The following code example shows how to use `describe-fhir-export-job`.

**AWS CLI**

**To describe a FHIR export job**

The following `describe-fhir-export-job` example shows how to find the properties of a FHIR export job in Amazon HealthLake.

```
aws healthlake describe-fhir-export-job \
    --datastore-id (Datastore ID) \
    --job-id 9b9a51943afaedd0a8c0c26c49135a31
```

Output:

```
{
    "ExportJobProperties": {
        "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
        "JobStatus": "IN_PROGRESS",
        "JobId": "9009813e9d69ba7cf79bcb3468780f16",
        "SubmitTime": 1609175692.715,
        "OutputDataConfig": {
            "S3Uri": "s3://(Bucket Name)/(Prefix
 Name)/59593b2d0367ce252b5e66bf5fd6b574-
FHIR_EXPORT-9009813e9d69ba7cf79bcb3468780f16/"
        },
        "DatastoreId": "(Datastore ID)"
    }
}
```

For more information, see Exporting files from a FHIR Data Store in the *Amazon HealthLake Developer Guide*.

- For API details, see DescribeFhirExportJob in *AWS CLI Command Reference*.

### `describe-fhir-import-job`

The following code example shows how to use `describe-fhir-import-job`.

#### AWS CLI

##### To describe a FHIR import job

The following `describe-fhir-import-job` example shows how to learn the properties of a FHIR import job using Amazon HealthLake.

```
aws healthlake describe-fhir-import-job \
    --datastore-id (Datastore ID) \
    --job-id c145fbb27b192af392f8ce6e7838e34f \
    --region us-east-1
```

Output:

```
{
    "ImportJobProperties": {
    "InputDataConfig": {
        "S3Uri": "s3://(Bucket Name)/(Prefix Name)/"
        { "arrayitem2": 2 }
    },
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
    "JobStatus": "COMPLETED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f",
    "SubmitTime": 1606272542.161,
    "EndTime": 1606272609.497,
    "DatastoreId": "(Datastore ID)"
    }
}
```

For more information, see Importing files to a FHIR Data Store in the *Amazon HealthLake Developer Guide*.

- For API details, see DescribeFhirImportJob in *AWS CLI Command Reference*.

### `list-fhir-datastores`

The following code example shows how to use `list-fhir-datastores`.

**AWS CLI**

**To list FHIR Data Stores**

The following `list-fhir-datastores` example shows to how to use the command and how users can filter results based on Data Store status in Amazon HealthLake.

```
aws healthlake list-fhir-datastores \
    --region us-east-1 \
    --filter DatastoreStatus=ACTIVE
```

Output:

```
{
    "DatastorePropertiesList": [
    {
        "PreloadDataConfig": {
            "PreloadDataType": "SYNTHEA"
        },
        "DatastoreName": "FhirTestDatastore",
        "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/
<Datastore ID>",
        "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
<Datastore ID>/r4/",
        "DatastoreStatus": "ACTIVE",
        "DatastoreTypeVersion": "R4",
        "CreatedAt": 1605574003.209,
        "DatastoreId": "<Datastore ID>"
    },
    {
        "DatastoreName": "Demo",
        "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/
<Datastore ID>",
        "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
<Datastore ID>/r4/",
        "DatastoreStatus": "ACTIVE",
        "DatastoreTypeVersion": "R4",
        "CreatedAt": 1603761064.881,
        "DatastoreId": "<Datastore ID>"
    }
    ]
}
```

For more information, see Creating and monitoring a FHIR Data Store in the *Amazon HealthLake Developer Guide*.

- For API details, see ListFhirDatastores in *AWS CLI Command Reference*.

### `list-fhir-export-jobs`

The following code example shows how to use `list-fhir-export-jobs`.

**AWS CLI**

**To list all FHIR export jobs**

The following `list-fhir-export-jobs` example shows how to use the command to view a list of export jobs associated with an account.

```
aws healthlake list-fhir-export-jobs \
    --datastore-id (Datastore ID) \
    --submitted-before (DATE like 2024-10-13T19:00:00Z)\
    --submitted-after (DATE like 2020-10-13T19:00:00Z )\
    --job-name "FHIR-EXPORT" \
    --job-status SUBMITTED  \
    --max-results (Integer between 1 and 500)
```

Output:

```
{
    "ExportJobProperties": {
        "OutputDataConfig": {
            "S3Uri": "s3://(Bucket Name)/(Prefix Name)/"
                "S3Configuration": {
                "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
                "KmsKeyId" : "(KmsKey Id)"
        },
    },
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
    "JobStatus": "COMPLETED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f",
    "JobName" "FHIR-EXPORT",
    "SubmitTime": 1606272542.161,
    "EndTime": 1606272609.497,
    "DatastoreId": "(Datastore ID)"
```

```
    }
}
"NextToken": String
```

For more information, see Exporting files from a FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see ListFhirExportJobs in *AWS CLI Command Reference*.

### `list-fhir-import-jobs`

The following code example shows how to use `list-fhir-import-jobs`.

**AWS CLI**

**To list all FHIR import jobs**

The following `list-fhir-import-jobs` example shows how to use the command to view a list of all import jobs associated with an account.

```
aws healthlake list-fhir-import-jobs \
    --datastore-id (Datastore ID) \
    --submitted-before (DATE like 2024-10-13T19:00:00Z) \
    --submitted-after (DATE like 2020-10-13T19:00:00Z ) \
    --job-name "FHIR-IMPORT" \
    --job-status SUBMITTED  \
    -max-results (Integer between 1 and 500)
```

Output:

```
{
    "ImportJobProperties": {
        "OutputDataConfig": {
            "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
                "S3Configuration": {
                    "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
                    "KmsKeyId" : "(KmsKey Id)"
    },
    },
        "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
        "JobStatus": "COMPLETED",
```

```
        "JobId": "c145fbb27b192af392f8ce6e7838e34f",
        "JobName" "FHIR-IMPORT",
        "SubmitTime": 1606272542.161,
        "EndTime": 1606272609.497,
        "DatastoreId": "(Datastore ID)"
    }
}
"NextToken": String
```

For more information, see Importing files to FHIR Data Store in the Amazon HealthLake Developer Guide.

- For API details, see ListFhirImportJobs in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list tags for a Data Store**

The following `list-tags-for-resource` example lists the tags associated with the specified Data Store.:

```
aws healthlake list-tags-for-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datastore/
fhir/0725c83f4307f263e16fd56b6d8ebdbe" \
    --region us-east-1
```

Output:

```
{
    "tags": {
        "key": "value",
        "key1": "value1"
    }
}
```

For more information, see Tagging resources in Amazon HealthLake in the Amazon HealthLake Developer Guide.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `start-fhir-export-job`

The following code example shows how to use `start-fhir-export-job`.

**AWS CLI**

**To start a FHIR export job**

The following `start-fhir-export-job` example shows how to start a FHIR export job using Amazon HealthLake.

```
aws healthlake start-fhir-export-job \
    --output-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \
    --datastore-id (Datastore ID) \
    --data-access-role-arn arn:aws:iam::(AWS Account ID):role/(Role Name)
```

Output:

```
{
    "DatastoreId": "(Datastore ID)",
    "JobStatus": "SUBMITTED",
    "JobId": "9b9a51943afaedd0a8c0c26c49135a31"
}
```

For more information, see Exporting files from a FHIR Data Store in the *Amazon HealthLake Developer Guide*.

- For API details, see StartFhirExportJob in *AWS CLI Command Reference*.

### `start-fhir-import-job`

The following code example shows how to use `start-fhir-import-job`.

**AWS CLI**

**To start a FHIR import job**

The following `start-fhir-import-job` example shows how to start a FHIR import job using Amazon HealthLake.

```
aws healthlake start-fhir-import-job \
    --input-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \
    --datastore-id (Datastore ID) \
    --data-access-role-arn "arn:aws:iam::(AWS Account ID):role/(Role Name)" \
    --region us-east-1
```

Output:

```
{
    "DatastoreId": "(Datastore ID)",
    "JobStatus": "SUBMITTED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f"
}
```

For more information, see Importing files to a FHIR Data Store 'https://docs.aws.amazon.com/healthlake/latest/devguide/import-datastore.html in the *Amazon HeatlhLake Developer Guide*.

- For API details, see StartFhirImportJob in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To add a tag to Data Store**

The following `tag-resource` example shows how to add a tag to a Data Store.

```
aws healthlake tag-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:691207106566:datastore/
fhir/0725c83f4307f263e16fd56b6d8ebdbe" \
    --tags '[{"Key": "key1", "Value": "value1"}]' \
    --region us-east-1
```

This command produces no output.

For more information, see 'Adding a tag to a Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/add-a-tag.html>'__ in the *Amazon HealthLake Developer Guide.*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To remove tags from a Data Store.**

The following `untag-resource` example shows how to remove tags from a Data Store.

```
aws healthlake untag-resource \
    --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datastore/fhir/
b91723d65c6fdeb1d26543a49d2ed1fa" \
    --tag-keys '["key1"]' \
    --region us-east-1
```

This command produces no output.

For more information, see Removing tags from a Data Store in the *Amazon HealthLake Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

## HealthOmics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthOmics.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

#### Topics

- Actions

### Actions

#### `abort-multipart-read-set-upload`

The following code example shows how to use `abort-multipart-read-set-upload`.

**AWS CLI**

**To stop a multipart read set upload**

The following `abort-multipart-read-set-upload` example stops a multipart read set upload into your HealthOmics sequence store.

```
aws omics abort-multipart-read-set-upload \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455
```

This command produces no output.

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see AbortMultipartReadSetUpload in *AWS CLI Command Reference*.

#### `accept-share`

The following code example shows how to use `accept-share`.

**AWS CLI**

**To accept a share of analytics store data**

The following `accept-share` example accepts a share of HealthOmics analytics store data.

```
aws omics accept-share \
    ----share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "status": "ACTIVATING"
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see AcceptShare in *AWS CLI Command Reference*.

### `batch-delete-read-set`

The following code example shows how to use `batch-delete-read-set`.

**AWS CLI**

**To delete multiple read sets**

The following `batch-delete-read-set` example deletes two read sets.

```
aws omics batch-delete-read-set \
    --sequence-store-id 1234567890 \
    --ids 1234567890 0123456789
```

If there is an error deleting any of the specified read sets, the service returns an error list.

```
{
    "errors": [
        {
            "code": "",
            "id": "0123456789",
            "message": "The specified readset does not exist."
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see BatchDeleteReadSet in *AWS CLI Command Reference*.

### `cancel-annotation-import-job`

The following code example shows how to use `cancel-annotation-import-job`.

**AWS CLI**

**To cancel an annotation import job**

The following `cancel-annotation-import-job` example cancels an annotation import job with ID `04f57618-xmpl-4fd0-9349-e5a85aefb997`.

```
aws omics cancel-annotation-import-job \
    --job-id 04f57618-xmpl-4fd0-9349-e5a85aefb997
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see CancelAnnotationImportJob in *AWS CLI Command Reference*.

### `cancel-run`

The following code example shows how to use `cancel-run`.

#### AWS CLI

**To cancel a run**

The following `cancel-run` example cancels a run with ID `1234567`.

```
aws omics cancel-run \
    --id 1234567
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see CancelRun in *AWS CLI Command Reference*.

### `cancel-variant-import-job`

The following code example shows how to use `cancel-variant-import-job`.

#### AWS CLI

**To cancel a variant import job**

The following `cancel-variant-import-job` example cancels a variant import job with ID `69cb65d6-xmpl-4a4a-9025-4565794b684e`.

```
aws omics cancel-variant-import-job \
    --job-id 69cb65d6-xmpl-4a4a-9025-4565794b684e
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see CancelVariantImportJob in *AWS CLI Command Reference*.

### `complete-multipart-read-set-upload`

The following code example shows how to use `complete-multipart-read-set-upload`.

**AWS CLI**

**To conclude a multipart upload once you have uploaded all of the components.**

The following `complete-multipart-read-set-upload` example concludes a multipart upload into a sequence store once all of the components have been uploaded.

```
aws omics complete-multipart-read-set-upload \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455 \
    --parts '[{"checksum":"gaCBQMe+rpCFZxLpoP6gydBoXaKKDA/
Vobh5zBDb4W4=","partNumber":1,"partSource":"SOURCE1"}]'
```

Output:

```
{
    "readSetId": "0000000001"
    "readSetId": "0000000002"
    "readSetId": "0000000003"
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see CompleteMultipartReadSetUpload in *AWS CLI Command Reference*.

### `create-annotation-store-version`

The following code example shows how to use `create-annotation-store-version`.

**AWS CLI**

**To create a new version of an annotation store**

The following `create-annotation-store-version` example creates a new version of an annotation store.

```
aws omics create-annotation-store-version \
    --name my_annotation_store \
    --version-name my_version
```

Output:

```
{
    "creationTime": "2023-07-21T17:15:49.251040+00:00",
    "id": "3b93cdef69d2",
    "name": "my_annotation_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:555555555555:referenceStore/6505293348/reference/5987565360"
    },
    "status": "CREATING",
    "versionName": "my_version"
}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see CreateAnnotationStoreVersion in *AWS CLI Command Reference*.

### `create-annotation-store`

The following code example shows how to use `create-annotation-store`.

#### AWS CLI

**Example 1: To create a VCF annotation store**

The following `create-annotation-store` example creates a VCF format annotation store.

```
aws omics create-annotation-store \
    --name my_ann_store \
    --store-format VCF \
    --reference referenceArn=arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890
```

Output:

```
{
```

```
    "creationTime": "2022-11-23T22:48:39.226492Z",
    "id": "0a91xmplc71f",
    "name": "my_ann_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING",
    "storeFormat": "VCF"
}
```

**Example 2: To create a TSV annotation store**

The following `create-annotation-store` example creates a TSV format annotation store.

```
aws omics create-annotation-store \
    --name tsv_ann_store \
    --store-format TSV \
    --reference referenceArn=arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890 \
    --store-options file://tsv-store-options.json
```

`tsv-store-options.json` configures format options for annotations.

```
{
    "tsvStoreOptions": {
        "annotationType": "CHR_START_END_ZERO_BASE",
        "formatToHeader": {
            "CHR": "chromosome",
            "START": "start",
            "END": "end"
        },
        "schema": [
            {
                "chromosome": "STRING"
            },
            {
                "start": "LONG"
            },
            {
                "end": "LONG"
            },
            {
```

```
                "name": "STRING"
            }
        ]
    }
}
```

Output:

```
{
    "creationTime": "2022-11-30T01:28:08.525586Z",
    "id": "861cxmpl96b0",
    "name": "tsv_ann_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING",
    "storeFormat": "TSV",
    "storeOptions": {
        "tsvStoreOptions": {
            "annotationType": "CHR_START_END_ZERO_BASE",
            "formatToHeader": {
                "CHR": "chromosome",
                "END": "end",
                "START": "start"
            },
            "schema": [
                {
                    "chromosome": "STRING"
                },
                {
                    "start": "LONG"
                },
                {
                    "end": "LONG"
                },
                {
                    "name": "STRING"
                }
            ]
        }
    }
}
```

For more information, see Omics Analytics in the Amazon Omics Developer Guide.

- For API details, see CreateAnnotationStore in *AWS CLI Command Reference*.

### `create-multipart-read-set-upload`

The following code example shows how to use `create-multipart-read-set-upload`.

**AWS CLI**

**To begin a multipart read set upload.**

The following `create-multipart-read-set-upload` example initiates a multipart read set upload.

```
aws omics create-multipart-read-set-upload \
    --sequence-store-id 0123456789 \
    --name HG00146 \
    --source-file-type FASTQ \
    --subject-id mySubject\
    --sample-id mySample\
    --description "FASTQ for HG00146"\
    --generated-from "1000 Genomes"
```

Output:

```
{
    "creationTime": "2022-07-13T23:25:20Z",
    "description": "FASTQ for HG00146",
    "generatedFrom": "1000 Genomes",
    "name": "HG00146",
    "sampleId": "mySample",
    "sequenceStoreId": "0123456789",
    "sourceFileType": "FASTQ",
    "subjectId": "mySubject",
    "uploadId": "1122334455"
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see CreateMultipartReadSetUpload in *AWS CLI Command Reference*.

### `create-reference-store`

The following code example shows how to use `create-reference-store`.

#### AWS CLI

##### To create a reference store

The following `create-reference-store` example creates a reference store `my-ref-store`.

```
aws omics create-reference-store \
    --name my-ref-store
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
    "creationTime": "2022-11-22T22:13:25.947Z",
    "id": "1234567890",
    "name": "my-ref-store"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see CreateReferenceStore in *AWS CLI Command Reference*.

### `create-run-group`

The following code example shows how to use `create-run-group`.

#### AWS CLI

##### To create a run group

The following `create-run-group` example creates a run group named `cram-converter`.

```
aws omics create-run-group \
    --name cram-converter \
    --max-cpus 20 \
    --max-duration 600
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
    "id": "1234567",
    "tags": {}
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see CreateRunGroup in *AWS CLI Command Reference*.

### `create-sequence-store`

The following code example shows how to use `create-sequence-store`.

#### AWS CLI

**To create a sequence store**

The following `create-sequence-store` example creates a sequence store.

```
aws omics create-sequence-store \
    --name my-seq-store
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890",
    "creationTime": "2022-11-23T01:24:33.629Z",
    "id": "1234567890",
    "name": "my-seq-store"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see CreateSequenceStore in *AWS CLI Command Reference*.

### `create-share`

The following code example shows how to use `create-share`.

**AWS CLI**

**To create a share of a HealthOmics analytics store**

The following `create-share` example shows how to create a share of a HealthOmics analytics store that can be accepted by a subscriber outside the account.

```
aws omics create-share \
    --resource-arn "arn:aws:omics:us-west-2:555555555555:variantStore/
omics_dev_var_store" \
    --principal-subscriber "123456789012" \
    --name "my_Share-123"
```

Output:

```
{
    "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",
    "name": "my_Share-123",
    "status": "PENDING"
}
```

For more information, see Cross-acount sharing in the *AWS HealthOmics User Guide*.

- For API details, see CreateShare in *AWS CLI Command Reference*.

## `create-variant-store`

The following code example shows how to use `create-variant-store`.

**AWS CLI**

**To create a variant store**

The following `create-variant-store` example creates a variant store named `my_var_store`.

```
aws omics create-variant-store \
    --name my_var_store \
    --reference referenceArn=arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890
```

Output:

```
{
    "creationTime": "2022-11-23T22:09:07.534499Z",
    "id": "02dexmplcfdd",
    "name": "my_var_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see CreateVariantStore in *AWS CLI Command Reference*.

### `create-workflow`

The following code example shows how to use `create-workflow`.

#### AWS CLI

**To create a workflow**

The following `create-workflow` example creates a WDL workflow.

```
aws omics create-workflow \
    --name cram-converter \
    --engine WDL \
    --definition-zip fileb://workflow-crambam.zip \
    --parameter-template file://workflow-params.json
```

`workflow-crambam.zip` is a ZIP archive containing a workflow definition. `workflow-params.json` defines runtime parameters for the workflow.

```
{
    "ref_fasta" : {
        "description": "Reference genome fasta file",
        "optional": false
    },
    "ref_fasta_index" : {
        "description": "Index of the reference genome fasta file",
```

```
        "optional": false
    },
    "ref_dict" : {
        "description": "dictionary file for 'ref_fasta'",
        "optional": false
    },
    "input_cram" : {
        "description": "The Cram file to convert to BAM",
        "optional": false
    },
    "sample_name" : {
        "description": "The name of the input sample, used to name the output BAM",
        "optional": false
    }
}
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
    "id": "1234567",
    "status": "CREATING",
    "tags": {}
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see CreateWorkflow in *AWS CLI Command Reference*.

### `delete-annotation-store-versions`

The following code example shows how to use `delete-annotation-store-versions`.

#### AWS CLI

**To delete an annotation store version**

The following `delete-annotation-store-versions` example deletes an annotation store version.

```
aws omics delete-annotation-store-versions \
    --name my_annotation_store \
```

```
    --versions my_version
```

Output:

```
{
    "errors": []
}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see DeleteAnnotationStoreVersions in *AWS CLI Command Reference*.

### `delete-annotation-store`

The following code example shows how to use `delete-annotation-store`.

**AWS CLI**

**To delete an annotation store**

The following `delete-annotation-store` example deletes an annotation store named `my_vcf_store`.

```
aws omics delete-annotation-store \
    --name my_vcf_store
```

Output:

```
{
    "status": "DELETING"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see DeleteAnnotationStore in *AWS CLI Command Reference*.

### `delete-reference-store`

The following code example shows how to use `delete-reference-store`.

**AWS CLI**

**To delete a reference store**

The following `delete-reference-store` example deletes a reference store with ID `1234567890`.

```
aws omics delete-reference-store \
    --id 1234567890
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see DeleteReferenceStore in *AWS CLI Command Reference*.

### `delete-reference`

The following code example shows how to use `delete-reference`.

**AWS CLI**

**To delete a reference**

The following `delete-reference` example deletes a reference.

```
aws omics delete-reference \
    --reference-store-id 1234567890 \
    --id 1234567890
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see DeleteReference in *AWS CLI Command Reference*.

### `delete-run-group`

The following code example shows how to use `delete-run-group`.

**AWS CLI**

**To delete a run group**

The following `delete-run-group` example deletes a run group with ID `1234567`.

```
aws omics delete-run-group \
    --id 1234567
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see DeleteRunGroup in *AWS CLI Command Reference*.

### `delete-run`

The following code example shows how to use `delete-run`.

**AWS CLI**

**To delete a workflow run**

The following `delete-run` example deletes a run with ID `1234567`.

```
aws omics delete-run \
    --id 1234567
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see DeleteRun in *AWS CLI Command Reference*.

### `delete-sequence-store`

The following code example shows how to use `delete-sequence-store`.

**AWS CLI**

**To delete a sequence store**

The following `delete-sequence-store` example deletes a sequence store with ID `1234567890`.

```
aws omics delete-sequence-store \
    --id 1234567890
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see DeleteSequenceStore in *AWS CLI Command Reference*.

### `delete-share`

The following code example shows how to use `delete-share`.

**AWS CLI**

**To delete a share of HealthOmics analytics data**

The following `delete-share` example deletes a cross-account share of analytics data.

```
aws omics delete-share \
    --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "status": "DELETING"
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see DeleteShare in *AWS CLI Command Reference*.

### `delete-variant-store`

The following code example shows how to use `delete-variant-store`.

**AWS CLI**

**To delete a variant store**

The following `delete-variant-store` example deletes a variant store named `my_var_store`.

```
aws omics delete-variant-store \
    --name my_var_store
```

Output:

```
{
    "status": "DELETING"
```

```
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see DeleteVariantStore in *AWS CLI Command Reference*.

### `delete-workflow`

The following code example shows how to use `delete-workflow`.

#### AWS CLI

**To delete a workflow**

The following `delete-workflow` example deletes a workflow with ID `1234567`.

```
aws omics delete-workflow \
    --id 1234567
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see DeleteWorkflow in *AWS CLI Command Reference*.

### `get-annotation-import-job`

The following code example shows how to use `get-annotation-import-job`.

#### AWS CLI

**To view an annotation import job**

The following `get-annotation-import-job` example gets details about an annotation import job.

```
aws omics get-annotation-import-job \
    --job-id 984162c7-xmpl-4d23-ab47-286f7950bfbf
```

Output:

```
{
    "creationTime": "2022-11-30T01:40:11.017746Z",
```

```
    "destinationName": "tsv_ann_store",
    "id": "984162c7-xmpl-4d23-ab47-286f7950bfbf",
    "items": [
        {
            "jobStatus": "COMPLETED",
            "source": "s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz"
        }
    ],
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "runLeftNormalization": false,
    "status": "COMPLETED",
    "updateTime": "2022-11-30T01:42:39.134009Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetAnnotationImportJob in *AWS CLI Command Reference*.

### `get-annotation-store-version`

The following code example shows how to use `get-annotation-store-version`.

#### AWS CLI

**To retrieve the metadata for an annotation store version**

The following `get-annotation-store-version` example retrieves the metadata for the requested annotation store version.

```
aws omics get-annotation-store-version \
    --name my_annotation_store \
    --version-name my_version
```

Output:

```
{
    "storeId": "4934045d1c6d",
    "id": "2a3f4a44aa7b",
    "status": "ACTIVE",
    "versionArn": "arn:aws:omics:us-west-2:555555555555:annotationStore/
my_annotation_store/version/my_version",
```

```
    "name": "my_annotation_store",
    "versionName": "my_version",
    "creationTime": "2023-07-21T17:15:49.251040+00:00",
    "updateTime": "2023-07-21T17:15:56.434223+00:00",
    "statusMessage": "",
    "versionSizeBytes": 0
}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see GetAnnotationStoreVersion in *AWS CLI Command Reference*.

### `get-annotation-store`

The following code example shows how to use `get-annotation-store`.

#### AWS CLI

**To view an annotation store**

The following `get-annotation-store` example gets details about an annotation store named `my_ann_store`.

```
aws omics get-annotation-store \
    --name my_ann_store
```

Output:

```
{
    "creationTime": "2022-11-23T22:48:39.226492Z",
    "id": "0a91xmplc71f",
    "name": "my_ann_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },

    "tags": {}
```

```
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetAnnotationStore in *AWS CLI Command Reference*.

### `get-read-set-activation-job`

The following code example shows how to use `get-read-set-activation-job`.

#### AWS CLI

**To view a read set activation job**

The following `get-read-set-activation-job` example gets details about a read set activation job.

```
aws omics get-read-set-activation-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "completionTime": "2022-12-06T22:33:42.828Z",
    "creationTime": "2022-12-06T22:32:45.213Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "sources": [
        {
            "readSetId": "1234567890",
            "status": "FINISHED",
            "statusMessage": "No activation needed as read set is already in
 ACTIVATING or ACTIVE state."
        }
    ],
    "status": "COMPLETED",
    "statusMessage": "The job completed successfully."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetActivationJob in *AWS CLI Command Reference*.

### `get-read-set-export-job`

The following code example shows how to use `get-read-set-export-job`.

#### AWS CLI

**To view a read set export job**

The following `get-read-set-export-job` example gets details about a read set export job.

```
aws omics get-read-set-export-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "completionTime": "2022-12-06T22:39:14.491Z",
    "creationTime": "2022-12-06T22:37:18.612Z",
    "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "status": "COMPLETED",
    "statusMessage": "The job is submitted and will start soon."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetExportJob in *AWS CLI Command Reference*.

### `get-read-set-import-job`

The following code example shows how to use `get-read-set-import-job`.

#### AWS CLI

**To view a read set import job**

The following `get-read-set-import-job` example gets details about a read set import job.

```
aws omics get-read-set-import-job \
    --sequence-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "creationTime": "2022-11-23T01:36:38.158Z",
    "id": "1234567890",

        }
    ],
    "status": "IN_PROGRESS",
    "statusMessage": "The job is currently in progress."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetImportJob in *AWS CLI Command Reference*.

## `get-read-set-metadata`

The following code example shows how to use `get-read-set-metadata`.

### AWS CLI

#### To view a read set

The following `get-read-set-metadata` example gets details about a read set's files.

```
aws omics get-read-set-metadata \
    --sequence-store-id 1234567890 \
```

```
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890/
readSet/1234567890",
    "creationTime": "2022-11-23T21:55:00.515Z",
    "fileType": "FASTQ",
    "files": {
        "source1": {
            "contentLength": 310054739,
            "partSize": 104857600,
            "totalParts": 3
        },
        "source2": {
            "contentLength": 307846621,
            "partSize": 104857600,
            "totalParts": 3
        }
    },
    "id": "1234567890",
    "name": "HG00146",
    "referenceArn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/
reference/1234567890",
    "sampleId": "fastq-sample",
    "sequenceInformation": {
        "alignment": "UNALIGNED",
        "totalBaseCount": 677717384,
        "totalReadCount": 8917334
    },
    "sequenceStoreId": "1234567890",
    "status": "ACTIVE",
    "subjectId": "fastq-subject"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSetMetadata in *AWS CLI Command Reference*.

### `get-read-set`

The following code example shows how to use `get-read-set`.

**AWS CLI**

**To download a read set**

The following `get-read-set` example downloads part 3 of a read set as `1234567890.3.bam`.

```
aws omics get-read-set \
    --sequence-store-id 1234567890 \
    --id 1234567890 \
    --part-number 3  1234567890.3.bam
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReadSet in *AWS CLI Command Reference*.

## `get-reference-import-job`

The following code example shows how to use `get-reference-import-job`.

**AWS CLI**

**To view a reference import job**

The following `get-reference-import-job` example example gets details about a reference import job.

```
aws omics get-reference-import-job \
    --reference-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "creationTime": "2022-11-22T22:25:41.124Z",
    "id": "1234567890",
    "referenceStoreId": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "sources": [
        {
            "name": "assembly-38",
            "sourceFile": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta",
```

```
            "status": "IN_PROGRESS",
            "statusMessage": "The source job is currently in progress."
        }
    ],
    "status": "IN_PROGRESS",
    "statusMessage": "The job is currently in progress."
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReferenceImportJob in *AWS CLI Command Reference*.

### `get-reference-metadata`

The following code example shows how to use `get-reference-metadata`.

#### AWS CLI

**To view a reference**

The following `get-reference-metadata` example gets details about a reference.

```
aws omics get-reference-metadata \
    --reference-store-id 1234567890 \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/
reference/1234567890",
    "creationTime": "2022-11-22T22:27:09.033Z",
    "files": {
        "index": {
            "contentLength": 160928,
            "partSize": 104857600,
            "totalParts": 1
        },
        "source": {
            "contentLength": 3249912778,
            "partSize": 104857600,
            "totalParts": 31
        }
```

```
    },
    "id": "1234567890",
    "md5": "7ff134953dcca8c8997453bbb80b6b5e",
    "name": "assembly-38",
    "referenceStoreId": "1234567890",
    "status": "ACTIVE",
    "updateTime": "2022-11-22T22:27:09.033Z"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReferenceMetadata in *AWS CLI Command Reference*.

### `get-reference-store`

The following code example shows how to use `get-reference-store`.

#### AWS CLI

**To view a reference store**

The following `get-reference-store` example gets details about a reference store.

```
aws omics get-reference-store \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
    "creationTime": "2022-09-23T23:27:20.364Z",
    "id": "1234567890",
    "name": "my-rstore-0"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReferenceStore in *AWS CLI Command Reference*.

### `get-reference`

The following code example shows how to use `get-reference`.

**AWS CLI**

**To download a genome reference**

The following `get-reference` example downloads part 1 of a genome as `hg38.1.fa`.

```
aws omics get-reference \
    --reference-store-id 1234567890 \
    --id 1234567890 \
    --part-number 1 hg38.1.fa
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetReference in *AWS CLI Command Reference*.

## `get-run-group`

The following code example shows how to use `get-run-group`.

**AWS CLI**

**To view a run group**

The following `get-run-group` example gets details about a run group.

```
aws omics get-run-group \
    --id 1234567
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
    "creationTime": "2022-12-01T00:58:42.915219Z",
    "id": "1234567",
    "maxCpus": 20,
    "maxDuration": 600,
    "name": "cram-convert",
    "tags": {}
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see GetRunGroup in *AWS CLI Command Reference*.

### `get-run-task`

The following code example shows how to use `get-run-task`.

#### AWS CLI

**To view a task**

The following `get-run-task` example gets details about a workflow task.

```
aws omics get-run-task \
    --id 1234567 \
    --task-id 1234567
```

Output:

```
{
    "cpus": 1,
    "creationTime": "2022-11-30T23:13:00.718651Z",
    "logStream": "arn:aws:logs:us-west-2:123456789012:log-group:/aws/omics/
WorkflowLog:log-stream:run/1234567/task/1234567",
    "memory": 15,
    "name": "CramToBamTask",
    "startTime": "2022-11-30T23:17:47.016Z",
    "status": "COMPLETED",
    "stopTime": "2022-11-30T23:18:21.503Z",
    "taskId": "1234567"
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see GetRunTask in *AWS CLI Command Reference*.

### `get-run`

The following code example shows how to use `get-run`.

#### AWS CLI

**To view a workflow run**

The following `get-run` example gets details about a workflow run.

```
aws omics get-run \
    --id 1234567
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
    "creationTime": "2022-11-30T22:58:22.615865Z",
    "digest":

    "workflowType": "PRIVATE"
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see GetRun in *AWS CLI Command Reference*.

### `get-sequence-store`

The following code example shows how to use `get-sequence-store`.

**AWS CLI**

**To view a sequence store**

The following `get-sequence-store` example gets details about a sequence store with ID `1234567890`.

```
aws omics get-sequence-store \
    --id 1234567890
```

Output:

```
{
    "arn": "arn:aws:omics:us-east-1:123456789012:sequenceStore/1234567890",
    "creationTime": "2022-11-23T19:55:48.376Z",
    "id": "1234567890",
    "name": "my-seq-store"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see GetSequenceStore in *AWS CLI Command Reference*.

### `get-share`

The following code example shows how to use `get-share`.

**AWS CLI**

**To retrieves the metadata about a share of a HealthOmics analytics data**

The following `get-share` example retrieves the metadata for a cross-account share of analytics data.

```
aws omics get-share \
    --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{
    "share": {
        "shareId": "495c21bedc889d07d0ab69d710a6841e-
dd75ab7a1a9c384fa848b5bd8e5a7e0a",
        "name": "my_Share-123",
        "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/
omics_dev_var_store",
        "principalSubscriber": "123456789012",
        "ownerId": "555555555555",
        "status": "PENDING"
    }
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see GetShare in *AWS CLI Command Reference*.

### `get-variant-import-job`

The following code example shows how to use `get-variant-import-job`.

#### AWS CLI

##### To view a variant import job

The following `get-variant-import-job` example gets details about a variant import job.

```
aws omics get-variant-import-job \
    --job-id edd7b8ce-xmpl-47e2-bc99-258cac95a508
```

Output:

```
{
    "creationTime": "2022-11-23T22:42:50.037812Z",
    "destinationName": "my_var_store",
    "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
    "items": [
```

```
        {

}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetVariantImportJob in *AWS CLI Command Reference*.

### `get-variant-store`

The following code example shows how to use `get-variant-store`.

#### AWS CLI

**To view a variant store**

The following `get-variant-store` example gets details about a variant store.

```
aws omics get-variant-store \
    --name my_var_store
```

Output:

```
{
    "creationTime": "2022-11-23T22:09:07.534499Z",
    "id": "02dexmplcfdd",
    "name": "my_var_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "CREATING",
    "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/my_var_store",
    "storeSizeBytes": 0,
```

```
    "tags": {},
    "updateTime": "2022-11-23T22:09:24.931711Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see GetVariantStore in *AWS CLI Command Reference*.

### `get-workflow`

The following code example shows how to use `get-workflow`.

#### AWS CLI

**To view a workflow**

The following `get-workflow` example gets details about a workflow with ID 1234567.

```
aws omics get-workflow \
    --id 1234567
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
    "creationTime": "2022-11-30T22:33:16.225368Z",
    "digest":

    "tags": {},
    "type": "PRIVATE"
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see GetWorkflow in *AWS CLI Command Reference*.

### `list-annotation-import-jobs`

The following code example shows how to use `list-annotation-import-jobs`.

#### AWS CLI

**To get a list of annotation import jobs**

The following `list-annotation-import-jobs` gets a list of annotation import jobs.

```
aws omics list-annotation-import-jobs
```

Output:

```
{
    "annotationImportJobs": [
        {
            "creationTime": "2022-11-30T01:39:41.478294Z",
            "destinationName": "gff_ann_store",
            "id": "18a9e792-xmpl-4869-a105-e5b602900444",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "COMPLETED",
```

```
            "updateTime": "2022-11-30T01:47:09.145178Z"
        },
        {
            "creationTime": "2022-11-30T00:45:58.007838Z",
            "destinationName": "my_ann_store",
            "id": "4e9eafc8-xmpl-431e-a0b2-3bda27cb600a",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "FAILED",
            "updateTime": "2022-11-30T00:47:01.706325Z"
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListAnnotationImportJobs in *AWS CLI Command Reference*.

### `list-annotation-store-versions`

The following code example shows how to use `list-annotation-store-versions`.

#### AWS CLI

**To list all the versions of an annotation store.**

The following `list-annotation-store-versions` example lists all versions that exist of an annotation store.

```
aws omics list-annotation-store-versions \
    --name my_annotation_store
```

Output:

```
{
    "annotationStoreVersions": [
        {
        "storeId": "4934045d1c6d",
        "id": "2a3f4a44aa7b",
        "status": "CREATING",
        "versionArn": "arn:aws:omics:us-west-2:555555555555:annotationStore/
my_annotation_store/version/my_version_2",
```

```
        "name": "my_annotation_store",
        "versionName": "my_version_2",
        "creation Time": "2023-07-21T17:20:59.380043+00:00",
        "versionSizeBytes": 0
},
{
     "storeId": "4934045d1c6d",
     "id": "4934045d1c6d",
     "status": "ACTIVE",
     "versionArn": "arn:aws:omics:us-west-2:555555555555:annotationStore/
my_annotation_store/version/my_version_1",
     "name": "my_annotation_store",
     "versionName": "my_version_1",
     "creationTime": "2023-07-21T17:15:49.251040+00:00",
     "updateTime": "2023-07-21T17:15:56.434223+00:00",
     "statusMessage": "",
     "versionSizeBytes": 0
     }

}
```

For more information, see Creating new versions of annotation stores in the *AWS HealthOmics User Guide*.

- For API details, see ListAnnotationStoreVersions in *AWS CLI Command Reference*.

### `list-annotation-stores`

The following code example shows how to use `list-annotation-stores`.

#### AWS CLI

**To get a list of annotation stores**

The following `list-annotation-stores` example gets a list of annotation stores.

```
aws omics list-annotation-stores
```

Output:

```
{
    "annotationStores": [
```

```
        {
            "creationTime": "2022-11-23T22:48:39.226492Z",
            "id": "0a91xmplc71f",
            "name": "my_ann_store",
            "reference": {
                "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
            },
            "status": "ACTIVE",
            "statusMessage": "",
            "storeArn": "arn:aws:omics:us-west-2:123456789012:annotationStore/
my_ann_store",
            "storeFormat": "VCF",
            "storeSizeBytes": 0,
            "updateTime": "2022-11-23T22:53:27.372840Z"
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListAnnotationStores in *AWS CLI Command Reference*.

### `list-multipart-read-set-uploads`

The following code example shows how to use `list-multipart-read-set-uploads`.

**AWS CLI**

**To list all multipart read set uploads and their statuses.**

The following `list-multipart-read-set-uploads` example lists all multipart read set uploads and their statuses.

```
aws omics list-multipart-read-set-uploads \
    --sequence-store-id 0123456789
```

Output:

```
{
"uploads":
    [
```

```
        {
           "sequenceStoreId": "0123456789",
           "uploadId": "8749584421",
           "sourceFileType": "FASTQ",
            "subjectId": "mySubject",
            "sampleId": "mySample",
            "generatedFrom": "1000 Genomes",
            "name": "HG00146",
            "description": "FASTQ for HG00146",
            "creationTime": "2023-11-29T19:22:51.349298+00:00"
        },
        {
            "sequenceStoreId": "0123456789",
            "uploadId": "5290538638",
            "sourceFileType": "BAM",
            "subjectId": "mySubject",
            "sampleId": "mySample",
            "generatedFrom": "1000 Genomes",
            "referenceArn": "arn:aws:omics:us-
west-2:845448930428:referenceStore/8168613728/reference/2190697383",
            "name": "HG00146",
            "description": "BAM for HG00146",
            "creationTime": "2023-11-29T19:23:33.116516+00:00"
        },
        {
            "sequenceStoreId": "0123456789",
            "uploadId": "4174220862",
            "sourceFileType": "BAM",
            "subjectId": "mySubject",
            "sampleId": "mySample",
            "generatedFrom": "1000 Genomes",
            "referenceArn": "arn:aws:omics:us-
west-2:845448930428:referenceStore/8168613728/reference/2190697383",
            "name": "HG00147",
            "description": "BAM for HG00147",
            "creationTime": "2023-11-29T19:23:47.007866+00:00"
        }
    ]
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see ListMultipartReadSetUploads in *AWS CLI Command Reference*.

### `list-read-set-activation-jobs`

The following code example shows how to use `list-read-set-activation-jobs`.

**AWS CLI**

**To get a list of read set activation jobs**

The following `list-read-set-activation-jobs` example gets a list of activation jobs for a sequence store with id `1234567890`.

```
aws omics list-read-set-activation-jobs \
    --sequence-store-id 1234567890
```

Output:

```
{
    "activationJobs": [
        {
            "completionTime": "2022-12-06T22:33:42.828Z",
            "creationTime": "2022-12-06T22:32:45.213Z",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED"
        },
        {
            "creationTime": "2022-12-06T22:35:10.100Z",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "IN_PROGRESS"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSetActivationJobs in *AWS CLI Command Reference*.

### `list-read-set-export-jobs`

The following code example shows how to use `list-read-set-export-jobs`.

**AWS CLI**

**To gets a list of read set export jobs**

The following `list-read-set-export-jobs` example gets a list of export jobs for a sequence store with id `1234567890`.

```
aws omics list-read-set-export-jobs \
    --sequence-store-id 1234567890
```

Output:

```
{
    "exportJobs": [
        {
            "completionTime": "2022-12-06T22:39:14.491Z",
            "creationTime": "2022-12-06T22:37:18.612Z",
            "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED"
        },
        {
            "creationTime": "2022-12-06T22:38:04.871Z",
            "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
            "id": "1234567890",
            "sequenceStoreId": "1234567890",
            "status": "IN_PROGRESS"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSetExportJobs in *AWS CLI Command Reference*.

## `list-read-set-import-jobs`

The following code example shows how to use `list-read-set-import-jobs`.

**AWS CLI**

**To get a list of read set import jobs**

The following `list-read-set-import-jobs` example gets a list of import jobs for a sequence store with id `1234567890`.

```
aws omics list-read-set-import-jobs \
    --sequence-store-id 1234567890
```

Output:

```
{
    "importJobs": [
        {
            "completionTime": "2022-11-29T18:17:49.244Z",
            "creationTime": "2022-11-29T17:32:47.700Z",
            "id": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED"
        },
        {
            "completionTime": "2022-11-23T22:01:34.090Z",
            "creationTime": "2022-11-23T21:52:43.289Z",
            "id": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "sequenceStoreId": "1234567890",
            "status": "COMPLETED_WITH_FAILURES"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSetImportJobs in *AWS CLI Command Reference*.

### `list-read-set-upload-parts`

The following code example shows how to use `list-read-set-upload-parts`.

#### AWS CLI

**To list all parts in a requested multipart upload for a sequence store.**

The following `list-read-set-upload-parts` example list all parts in a requested multipart upload for a sequence store.

```
aws omics list-read-set-upload-parts \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455 \
    --part-source SOURCE1
```

Output:

```
{
    "parts": [
        {
            "partNumber": 1,
            "partSize": 94371840,
            "file": "SOURCE1",
            "checksum":
 "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
            "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
        }
        {
            "partNumber": 2,
            "partSize": 10471840,
            "file": "SOURCE1",
            "checksum":
 "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",
            "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"
        }
      ]

}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see ListReadSetUploadParts in *AWS CLI Command Reference*.

### `list-read-sets`

The following code example shows how to use `list-read-sets`.

**AWS CLI**

**To get a list of read sets**

The following `list-read-sets` example gets a list of read sets for a sequence store with id 1234567890.

```
aws omics list-read-sets \
    --sequence-store-id 1234567890
```

Output:

```
{
    "readSets": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890/
readSet/1234567890",
            "creationTime": "2022-11-23T21:55:00.515Z",
            "fileType": "FASTQ",
            "id": "1234567890",
            "name": "HG00146",
            "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890",
            "sampleId": "fastq-sample",
            "sequenceStoreId": "1234567890",
            "status": "ACTIVE",
            "subjectId": "fastq-subject"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReadSets in *AWS CLI Command Reference*.

## `list-reference-import-jobs`

The following code example shows how to use `list-reference-import-jobs`.

**AWS CLI**

**To get a list of reference import jobs**

The following `list-reference-import-jobs` example gets a list of reference import jobs for a reference store with id `1234567890`.

```
aws omics list-reference-import-jobs \
    --reference-store-id 1234567890
```

Output:

```
{
    "importJobs": [
        {
            "completionTime": "2022-11-23T19:54:58.204Z",
            "creationTime": "2022-11-23T19:53:20.729Z",
            "id": "1234567890",
            "referenceStoreId": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "status": "COMPLETED"
        },
        {
            "creationTime": "2022-11-23T20:34:03.250Z",
            "id": "1234567890",
            "referenceStoreId": "1234567890",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "status": "IN_PROGRESS"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReferenceImportJobs in *AWS CLI Command Reference*.

## `list-reference-stores`

The following code example shows how to use `list-reference-stores`.

### AWS CLI

#### To get a list of reference stores

The following `list-reference-stores` example gets a list of reference stores.

```
aws omics list-reference-stores
```

Output:

```
{
    "referenceStores": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
            "creationTime": "2022-11-22T22:13:25.947Z",
            "id": "1234567890",
            "name": "my-ref-store"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReferenceStores in *AWS CLI Command Reference*.

### `list-references`

The following code example shows how to use `list-references`.

#### AWS CLI

**To get a list of references**

The following `list-references` example gets a list of genome references for a reference store with id `1234567890`.

```
aws omics list-references \
    --reference-store-id 1234567890
```

Output:

```
{
    "references": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/
reference/1234567890",
```

```
            "creationTime": "2022-11-22T22:27:09.033Z",
            "id": "1234567890",
            "md5": "7ff134953dcca8c8997453bbb80b6b5e",
            "name": "assembly-38",
            "referenceStoreId": "1234567890",
            "status": "ACTIVE",
            "updateTime": "2022-11-22T22:27:09.033Z"
        }
    ]
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListReferences in *AWS CLI Command Reference*.

### `list-run-groups`

The following code example shows how to use `list-run-groups`.

#### AWS CLI

**To get a list of run groups**

The following `list-run-groups` example gets a list of run groups.

```
aws omics list-run-groups
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
            "creationTime": "2022-12-01T00:58:42.915219Z",
            "id": "1234567",
            "maxCpus": 20,
            "maxDuration": 600,
            "name": "cram-convert"
        }
    ]
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see ListRunGroups in *AWS CLI Command Reference*.

## `list-run-tasks`

The following code example shows how to use `list-run-tasks`.

### AWS CLI

#### To get a list of tasks

The following `list-run-tasks` example gets a list of tasks for a workflow run.

```
aws omics list-run-tasks \
    --id 1234567
```

Output:

```
{
    "items": [
        {
            "cpus": 1,
            "creationTime": "2022-11-30T23:13:00.718651Z",
            "memory": 15,
            "name": "CramToBamTask",
            "startTime": "2022-11-30T23:17:47.016Z",
            "status": "COMPLETED",
            "stopTime": "2022-11-30T23:18:21.503Z",
            "taskId": "1234567"
        },
        {
            "cpus": 1,
            "creationTime": "2022-11-30T23:18:32.315606Z",
            "memory": 4,
            "name": "ValidateSamFile",
            "startTime": "2022-11-30T23:23:40.165Z",
            "status": "COMPLETED",
            "stopTime": "2022-11-30T23:24:14.766Z",
            "taskId": "1234567"
        }
    ]
```

```
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see ListRunTasks in *AWS CLI Command Reference*.

### `list-runs`

The following code example shows how to use `list-runs`.

#### AWS CLI

**To get a list of workflow runs**

The following `list-runs` example gets a list of workflow runs.

```
aws omics list-runs
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
            "creationTime": "2022-12-02T23:20:01.202074Z",
            "id": "1234567",
            "name": "cram-to-bam",
            "priority": 1,
            "startTime": "2022-12-02T23:29:18.115Z",
            "status": "COMPLETED",
            "stopTime": "2022-12-02T23:57:54.428812Z",
            "storageCapacity": 10,
            "workflowId": "1234567"
        },
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
            "creationTime": "2022-12-03T00:16:57.180066Z",
            "id": "1234567",
            "name": "cram-to-bam",
            "priority": 1,
            "startTime": "2022-12-03T00:26:50.233Z",
            "status": "FAILED",
```

```
            "stopTime": "2022-12-03T00:37:21.451340Z",
            "storageCapacity": 10,
            "workflowId": "1234567"
        },
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
            "creationTime": "2022-12-05T17:57:08.444817Z",
            "id": "1234567",
            "name": "cram-to-bam",
            "status": "STARTING",
            "workflowId": "1234567"
        }
    ]
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see ListRuns in *AWS CLI Command Reference*.

## `list-sequence-stores`

The following code example shows how to use `list-sequence-stores`.

### AWS CLI

#### To get a list of sequence stores

The following `list-sequence-stores` example gets a list of sequence stores.

```
aws omics list-sequence-stores
```

Output:

```
{
    "sequenceStores": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890",
            "creationTime": "2022-11-23T01:24:33.629Z",
            "id": "1234567890",
            "name": "my-seq-store"
        }
    ]
```

```
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see ListSequenceStores in *AWS CLI Command Reference*.

### `list-shares`

The following code example shows how to use `list-shares`.

#### AWS CLI

**To list the available shares of a HealthOmics analytics data**

The following `list-shares` example lists all shares that have been created for a resource-owner.

```
aws omics list-shares \
    --resource-owner SELF
```

Output:

```
{
    "shares": [
        {
            "shareId": "595c1cbd-a008-4eca-a887-954d30c91c6e",
            "name": "myShare",
            "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/
store_1",
            "principalSubscriber": "123456789012",
            "ownerId": "555555555555",
            "status": "PENDING"
        }
        {
            "shareId": "39b65d0d-4368-4a19-9814-b0e31d73c10a",
            "name": "myShare3456",
            "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/
store_2",
            "principalSubscriber": "123456789012",
            "ownerId": "555555555555",
            "status": "ACTIVE"
        },
```

```
        {
            "shareId": "203152f5-eef9-459d-a4e0-a691668d44ef",
            "name": "myShare4",
            "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/
store_3",
            "principalSubscriber": "123456789012",
            "ownerId": "555555555555",
            "status": "ACTIVE"
        }
    ]
}
```

For more information, see Cross-account sharing in the *AWS HealthOmics User Guide*.

- For API details, see ListShares in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To get a list of tags**

The following `list-tags-for-resource` example gets a list of tags for a workflow with id 1234567.

```
aws omics list-tags-for-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567
```

Output:

```
{
    "tags": {
        "department": "analytics"
    }
}
```

For more information, see Tagging resources in Amazon Omics in the *Amazon Omics Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `list-variant-import-jobs`

The following code example shows how to use `list-variant-import-jobs`.

**AWS CLI**

**To get a list of variant import jobs**

The following `list-variant-import-jobs` example gets a list of variant import jobs.

```
aws omics list-variant-import-jobs
```

Output:

```
{
    "variantImportJobs": [
        {
            "creationTime": "2022-11-23T22:47:02.514002Z",
            "destinationName": "my_var_store",
            "id": "69cb65d6-xmpl-4a4a-9025-4565794b684e",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "COMPLETED",
            "updateTime": "2022-11-23T22:49:17.976597Z"
        },
        {
            "creationTime": "2022-11-23T22:42:50.037812Z",
            "destinationName": "my_var_store",
            "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
            "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W8O1XMPL7QZ",
            "runLeftNormalization": false,
            "status": "COMPLETED",
            "updateTime": "2022-11-23T22:45:26.009880Z"
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListVariantImportJobs in *AWS CLI Command Reference*.

## `list-variant-stores`

The following code example shows how to use `list-variant-stores`.

### AWS CLI

#### To get a list of variant stores

The following `list-variant-stores` example gets a list of variant stores.

```
aws omics list-variant-stores
```

Output:

```
{
    "variantStores": [
        {
            "creationTime": "2022-11-23T22:09:07.534499Z",
            "id": "02dexmplcfdd",
            "name": "my_var_store",
            "reference": {
                "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
            },
            "status": "CREATING",
            "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/
my_var_store",
            "storeSizeBytes": 0,
            "updateTime": "2022-11-23T22:09:24.931711Z"
        },
        {
            "creationTime": "2022-09-23T23:00:09.140265Z",
            "id": "8777xmpl1a24",
            "name": "myvstore0",
            "status": "ACTIVE",
            "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/
myvstore0",
            "storeSizeBytes": 0,
            "updateTime": "2022-09-23T23:03:26.013220Z"
        }
    ]
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see ListVariantStores in *AWS CLI Command Reference*.

### `list-workflows`

The following code example shows how to use `list-workflows`.

#### AWS CLI

**To get a list of workflows**

The following `list-workflows` example gets a list of workflows.

```
aws omics list-workflows
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
            "creationTime": "2022-09-23T23:08:22.041227Z",
            "digest": "nSCNo/qMWFxmplXpUdokXJnwgneOaxyyc2YOxVxrJTE=",
            "id": "1234567",
            "name": "my-wkflow-0",
            "status": "ACTIVE",
            "type": "PRIVATE"
        },
        {
            "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
            "creationTime": "2022-11-30T22:33:16.225368Z",
            "digest":
 "sha256:c54bxmpl742dcc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",
            "id": "1234567",
            "name": "cram-converter",
            "status": "ACTIVE",
            "type": "PRIVATE"
        }
    ]
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see ListWorkflows in *AWS CLI Command Reference*.

### `start-annotation-import-job`

The following code example shows how to use `start-annotation-import-job`.

**AWS CLI**

**To import annotations**

The following `start-annotation-import-job` example imports annotations from Amazon S3.

```
aws omics start-annotation-import-job \
    --destination-name tsv_ann_store \
    --no-run-left-normalization \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ \
    --items source=s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz
```

Output:

```
{
    "jobId": "984162c7-xmpl-4d23-ab47-286f7950bfbf"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see StartAnnotationImportJob in *AWS CLI Command Reference*.

### `start-read-set-activation-job`

The following code example shows how to use `start-read-set-activation-job`.

**AWS CLI**

**To activate an archived read set**

The following `start-read-set-activation-job` example activates two read sets.

```
aws omics start-read-set-activation-job \
```

```
    --sequence-store-id 1234567890 \
    --sources readSetId=1234567890 readSetId=1234567890
```

Output:

```
{
    "creationTime": "2022-12-06T22:35:10.100Z",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReadSetActivationJob in *AWS CLI Command Reference*.

### `start-read-set-export-job`

The following code example shows how to use `start-read-set-export-job`.

#### AWS CLI

**To export a read set**

The following `start-read-set-export-job` example exports two read sets to Amazon S3.

```
   aws omics start-read-set-export-job \
       --sequence-store-id 1234567890 \
       --sources readSetId=1234567890 readSetId=1234567890 \
       --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ
\
       --destination s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/
```

Output:

```
{
    "creationTime": "2022-12-06T22:37:18.612Z",
    "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",
    "id": "1234567890",
    "sequenceStoreId": "1234567890",
```

```
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReadSetExportJob in *AWS CLI Command Reference*.

### `start-read-set-import-job`

The following code example shows how to use `start-read-set-import-job`.

**AWS CLI**

**To import a read set**

The following `start-read-set-import-job` example imports a read set.

```
aws omics start-read-set-import-job \
    --sequence-store-id 1234567890 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ \
    --sources file://readset-sources.json
```

readset-sources.json is a JSON document with the following content.

```
[
    {
        "sourceFiles":
        {
            "source1": "s3://omics-artifacts-01d6xmpl4e72dd32/
HG00100.chrom20.ILLUMINA.bwa.GBR.low_coverage.20101123.bam"
        },
        "sourceFileType": "BAM",
        "subjectId": "bam-subject",
        "sampleId": "bam-sample",
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890",
        "name": "HG00100"
    }
]
```

Output:

```
{
    "creationTime": "2022-11-23T01:36:38.158Z",
    "id": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "sequenceStoreId": "1234567890",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReadSetImportJob in *AWS CLI Command Reference*.

### `start-reference-import-job`

The following code example shows how to use `start-reference-import-job`.

#### AWS CLI

**To import a reference genome**

The following `start-reference-import-job` example imports a reference genome from Amazon S3.

```
aws omics start-reference-import-job \
    --reference-store-id 1234567890 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ \
    --sources sourceFile=s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta,name=assembly-38
```

Output:

```
{
    "creationTime": "2022-11-22T22:25:41.124Z",
    "id": "1234567890",
    "referenceStoreId": "1234567890",
    "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ",
    "status": "SUBMITTED"
}
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see StartReferenceImportJob in *AWS CLI Command Reference*.

### `start-run`

The following code example shows how to use `start-run`.

#### AWS CLI

**To run a workflow**

The following `start-run` example runs a workflow with ID 1234567.

```
aws omics start-run \
    --workflow-id 1234567 \
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W8O1XMPL7QZ \
    --name 'cram-to-bam' \
    --output-uri s3://omics-artifacts-01d6xmpl4e72dd32/workflow-output/ \
    --run-group-id 1234567 \
    --priority 1 \
    --storage-capacity 10 \
    --log-level ALL \
    --parameters file://workflow-inputs.json
```

workflow-inputs.json is a JSON document with the following content.

```
{
    "sample_name": "NA12878",
    "input_cram": "s3://omics-artifacts-01d6xmpl4e72dd32/NA12878.cram",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.dict",
    "ref_fasta": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta",
    "ref_fasta_index": "omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta.fai"
}
```

Output:

```
{
```

```
    "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
    "id": "1234567",
    "status": "PENDING",
    "tags": {}
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

**To load source files from Amazon Omics**

You can also load source files from Amazon Omics storage, by using service-specific URIs. The following example workflow-inputs.json file uses Amazon Omics URIs for read set and reference genome sources.

```
{
    "sample_name": "NA12878",
    "input_cram": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/
readSet/1234567890/source1",
    "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.dict",
    "ref_fasta": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/
reference/1234567890",
    "ref_fasta_index": "omics://123456789012.storage.us-
west-2.amazonaws.com/1234567890/reference/1234567890/index"
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see StartRun in *AWS CLI Command Reference*.

## `start-variant-import-job`

The following code example shows how to use `start-variant-import-job`.

### AWS CLI

**To import a variant file**

The following `start-variant-import-job` example imports a VCF format variant file.

```
aws omics start-variant-import-job \
    --destination-name my_var_store \
    --no-run-left-normalization  \
```

```
    --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ \
    --items source=s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.known_indels.vcf.gz
```

Output:

```
{
    "jobId": "edd7b8ce-xmpl-47e2-bc99-258cac95a508"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see StartVariantImportJob in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To tag a resource**

The following `tag-resource` example adds a `department` tag to a workflow with id `1234567`.

```
aws omics tag-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
    --tags department=analytics
```

For more information, see Tagging resources in Amazon Omics in the *Amazon Omics Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To remove a tag from a resource**

The following `untag-resource` example removes the `department` tag from a workflow.

```
aws omics untag-resource \
    --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
    --tag-keys department
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-annotation-store`

The following code example shows how to use `update-annotation-store`.

#### AWS CLI

**To update an annotation store**

The following `update-annotation-store` example updates the description of an annotation store named `my_vcf_store`.

```
aws omics update-annotation-store \
    --name my_vcf_store \
    --description "VCF annotation store"
```

Output:

```
{
    "creationTime": "2022-12-05T18:00:56.101860Z",
    "description": "VCF annotation store",
    "id": "bd6axmpl2444",
    "name": "my_vcf_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "ACTIVE",
    "storeFormat": "VCF",
    "updateTime": "2022-12-05T18:13:16.100051Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see UpdateAnnotationStore in *AWS CLI Command Reference*.

### `update-run-group`

The following code example shows how to use `update-run-group`.

**AWS CLI**

**To update a run group**

The following `update-run-group` example updates the settings of a run group with id `1234567`.

```
aws omics update-run-group \
    --id 1234567 \
    --max-cpus 10
```

Output:

```
{
    "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
    "creationTime": "2022-12-01T00:58:42.915219Z",
    "id": "1234567",
    "maxCpus": 10,
    "maxDuration": 600,
    "name": "cram-convert",
    "tags": {}
}
```

For more information, see Omics Workflows in the *Amazon Omics Developer Guide*.

- For API details, see UpdateRunGroup in *AWS CLI Command Reference*.

### `update-variant-store`

The following code example shows how to use `update-variant-store`.

**AWS CLI**

**To update a variant store**

The following `update-variant-store` example updates the description of a variant store named `my_var_store`.

```
aws omics update-variant-store \
    --name my_var_store \
    --description "variant store"
```

Output:

```
{
    "creationTime": "2022-11-23T22:09:07.534499Z",
    "description": "variant store",
    "id": "02dexmplcfdd",
    "name": "my_var_store",
    "reference": {
        "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
    },
    "status": "ACTIVE",
    "updateTime": "2022-12-05T18:23:37.686402Z"
}
```

For more information, see Omics Analytics in the *Amazon Omics Developer Guide*.

- For API details, see UpdateVariantStore in *AWS CLI Command Reference*.

### `update-workflow`

The following code example shows how to use `update-workflow`.

#### AWS CLI

##### To update a workflow

The following `update-workflow` example updates the description of a workflow with ID 1234567.

```
aws omics update-workflow \
    --id 1234567 \
    --description "copy workflow"
```

For more information, see Omics Storage in the *Amazon Omics Developer Guide*.

- For API details, see UpdateWorkflow in *AWS CLI Command Reference*.

### `upload-read-set-part`

The following code example shows how to use `upload-read-set-part`.

**AWS CLI**

**To upload a read set part.**

The following `upload-read-set-part` example uploads a specified part of a read set.

```
aws omics upload-read-set-part \
    --sequence-store-id 0123456789 \
    --upload-id 1122334455 \
    --part-source SOURCE1 \
    --part-number 1 \
    --payload /path/to/file/read_1_part_1.fastq.gz
```

Output:

```
{
    "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635"
}
```

For more information, see Direct upload to a sequence store in the *AWS HealthOmics User Guide*.

- For API details, see UploadReadSetPart in *AWS CLI Command Reference*.

## IAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `add-client-id-to-open-id-connect-provider`

The following code example shows how to use `add-client-id-to-open-id-connect-provider`.

**AWS CLI**

**To add a client ID (audience) to an Open-ID Connect (OIDC) provider**

The following `add-client-id-to-open-id-connect-provider` command adds the client ID `my-application-ID` to the OIDC provider named `server.example.com`.

```
aws iam add-client-id-to-open-id-connect-provider \
    --client-id my-application-ID \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

This command produces no output.

To create an OIDC provider, use the `create-open-id-connect-provider` command.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see AddClientIdToOpenIdConnectProvider in *AWS CLI Command Reference*.

#### `add-role-to-instance-profile`

The following code example shows how to use `add-role-to-instance-profile`.

**AWS CLI**

**To add a role to an instance profile**

The following `add-role-to-instance-profile` command adds the role named `S3Access` to the instance profile named `Webserver`.

```
aws iam add-role-to-instance-profile \
    --role-name S3Access \
    --instance-profile-name Webserver
```

This command produces no output.

To create an instance profile, use the `create-instance-profile` command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *AWS IAM User Guide*.

- For API details, see AddRoleToInstanceProfile in *AWS CLI Command Reference*.

### `add-user-to-group`

The following code example shows how to use `add-user-to-group`.

**AWS CLI**

**To add a user to an IAM group**

The following `add-user-to-group` command adds an IAM user named Bob to the IAM group named `Admins`.

```
aws iam add-user-to-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the *AWS IAM User Guide*.

- For API details, see AddUserToGroup in *AWS CLI Command Reference*.

### `attach-group-policy`

The following code example shows how to use `attach-group-policy`.

**AWS CLI**

**To attach a managed policy to an IAM group**

The following `attach-group-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM group named `Finance`.

```
aws iam attach-group-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --group-name Finance
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachGroupPolicy in *AWS CLI Command Reference*.

### `attach-role-policy`

The following code example shows how to use `attach-role-policy`.

**AWS CLI**

**To attach a managed policy to an IAM role**

The following `attach-role-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM role named `ReadOnlyRole`.

```
aws iam attach-role-policy \
    --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \
    --role-name ReadOnlyRole
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachRolePolicy in *AWS CLI Command Reference*.

### `attach-user-policy`

The following code example shows how to use `attach-user-policy`.

**AWS CLI**

**To attach a managed policy to an IAM user**

The following `attach-user-policy` command attaches the AWS managed policy named `AdministratorAccess` to the IAM user named `Alice`.

```
aws iam attach-user-policy \
    --policy-arn arn:aws:iam::aws:policy/AdministratorAccess \
    --user-name Alice
```

This command produces no output.

For more information, see Managed policies and inline policies in the *AWS IAM User Guide*.

- For API details, see AttachUserPolicy in *AWS CLI Command Reference*.

### `change-password`

The following code example shows how to use `change-password`.

**AWS CLI**

**To change the password for your IAM user**

To change the password for your IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains your old and new passwords. Using this method, you can use strong passwords with non-alphanumeric characters. It can be difficult to use passwords with non-alphanumeric characters when you pass them as command line parameters. To use the `--cli-input-json` parameter, start by using the `change-password` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam change-password \
    --generate-cli-skeleton > change-password.json
```

The previous command creates a JSON file called change-password.json that you can use to fill in your old and new passwords. For example, the file might look like the following.

```
{
    "OldPassword": "3s0K_;xh4~8XXI",
```

```
    "NewPassword": "]35d/{pB9Fo9wJ"
}
```

Next, to change your password, use the `change-password` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `change-password` command uses the `--cli-input-json` parameter with a JSON file called change-password.json.

```
aws iam change-password \
    --cli-input-json file://change-password.json
```

This command produces no output.

This command can be called by IAM users only. If this command is called using AWS account (root) credentials, the command returns an `InvalidUserType` error.

For more information, see How an IAM user changes their own password in the *AWS IAM User Guide*.

- For API details, see ChangePassword in *AWS CLI Command Reference*.

### `create-access-key`

The following code example shows how to use `create-access-key`.

#### AWS CLI

**To create an access key for an IAM user**

The following `create-access-key` command creates an access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam create-access-key \
    --user-name Bob
```

Output:

```
{
    "AccessKey": {
        "UserName": "Bob",
```

```
        "Status": "Active",
        "CreateDate": "2015-03-09T18:39:23.411Z",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
        "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
    }
}
```

Store the secret access key in a secure location. If it is lost, it cannot be recovered, and you must create a new access key.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see CreateAccessKey in *AWS CLI Command Reference*.

### `create-account-alias`

The following code example shows how to use `create-account-alias`.

**AWS CLI**

**To create an account alias**

The following `create-account-alias` command creates the alias `examplecorp` for your AWS account.

```
aws iam create-account-alias \
    --account-alias examplecorp
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see CreateAccountAlias in *AWS CLI Command Reference*.

### `create-group`

The following code example shows how to use `create-group`.

**AWS CLI**

**To create an IAM group**

The following `create-group` command creates an IAM group named `Admins`.

```
aws iam create-group \
    --group-name Admins
```

Output:

```
{
    "Group": {
        "Path": "/",
        "CreateDate": "2015-03-09T20:30:24.940Z",
        "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    }
}
```

For more information, see Creating IAM user groups in the *AWS IAM User Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

### `create-instance-profile`

The following code example shows how to use `create-instance-profile`.

#### AWS CLI

**To create an instance profile**

The following `create-instance-profile` command creates an instance profile named `Webserver`.

```
aws iam create-instance-profile \
    --instance-profile-name Webserver
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AIPAJMBYC7DLSPEXAMPLE",
```

```
        "Roles": [],
        "CreateDate": "2015-03-09T20:33:19.626Z",
        "InstanceProfileName": "Webserver",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:instance-profile/Webserver"
    }
}
```

To add a role to an instance profile, use the `add-role-to-instance-profile` command.

For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *AWS IAM User Guide*.

- For API details, see CreateInstanceProfile in *AWS CLI Command Reference*.

## `create-login-profile`

The following code example shows how to use `create-login-profile`.

### AWS CLI

#### To create a password for an IAM user

To create a password for an IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the password. Using this method, you can create a strong password with non-alphanumeric characters. It can be difficult to create a password with non-alphanumeric characters when you pass it as a command line parameter.

To use the `--cli-input-json` parameter, start by using the `create-login-profile` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-login-profile \
    --generate-cli-skeleton > create-login-profile.json
```

The previous command creates a JSON file called create-login-profile.json that you can use to fill in the information for a subsequent `create-login-profile` command. For example:

```
{
    "UserName": "Bob",
    "Password": "&1-3a6u:RA0djs",
    "PasswordResetRequired": true
```

```
}
```

Next, to create a password for an IAM user, use the `create-login-profile` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-login-profile` command uses the `--cli-input-json` parameter with a JSON file called create-login-profile.json.

```
aws iam create-login-profile \
    --cli-input-json file://create-login-profile.json
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2015-03-10T20:55:40.274Z",
        "PasswordResetRequired": true
    }
}
```

If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

To change the password for a user that already has one, use `update-login-profile`. To set a password policy for the account, use the `update-account-password-policy` command.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see CreateLoginProfile in *AWS CLI Command Reference*.

### `create-open-id-connect-provider`

The following code example shows how to use `create-open-id-connect-provider`.

#### AWS CLI

**To create an OpenID Connect (OIDC) provider**

To create an OpenID Connect (OIDC) provider, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the required parameters. When you create an OIDC provider, you must pass the URL of the provider, and the URL must begin with `https://`. It can be difficult to pass the URL as a command line parameter, because the colon (:) and forward slash (/) characters have special meaning in some command line environments. Using the `--cli-input-json` parameter gets around this limitation.

To use the `--cli-input-json` parameter, start by using the `create-open-id-connect-provider` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-open-id-connect-provider \
    --generate-cli-skeleton > create-open-id-connect-provider.json
```

The previous command creates a JSON file called create-open-id-connect-provider.json that you can use to fill in the information for a subsequent `create-open-id-connect-provider` command. For example:

```
{
    "Url": "https://server.example.com",
    "ClientIDList": [
        "example-application-ID"
    ],
    "ThumbprintList": [
        "c3768084dfb3d2b68b7897bf5f565da8eEXAMPLE"
    ]
}
```

Next, to create the OpenID Connect (OIDC) provider, use the `create-open-id-connect-provider` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-open-id-connect-provider` command uses the `--cli-input-json` parameter with a JSON file called create-open-id-connect-provider.json.

```
aws iam create-open-id-connect-provider \
    --cli-input-json file://create-open-id-connect-provider.json
```

Output:

```
{
```

```
    "OpenIDConnectProviderArn": "arn:aws:iam::123456789012:oidc-provider/
server.example.com"
}
```

For more information about OIDC providers, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

For more information about obtaining thumbprints for an OIDC provider, see Obtaining the thumbprint for an OpenID Connect Identity Provider in the *AWS IAM User Guide*.

- For API details, see CreateOpenIdConnectProvider in *AWS CLI Command Reference*.

### `create-policy-version`

The following code example shows how to use `create-policy-version`.

#### AWS CLI

**To create a new version of a managed policy**

This example creates a new v2 version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version.

```
aws iam create-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --policy-document file://NewPolicyVersion.json \
    --set-as-default
```

Output:

```
{
    "PolicyVersion": {
        "CreateDate": "2015-06-16T18:56:03.721Z",
        "VersionId": "v2",
        "IsDefaultVersion": true
    }
}
```

For more information, see Versioning IAM policies in the *AWS IAM User Guide*.

- For API details, see CreatePolicyVersion in *AWS CLI Command Reference*.

### `create-policy`

The following code example shows how to use `create-policy`.

**AWS CLI**

**Example 1: To create a customer managed policy**

The following command creates a customer managed policy named `my-policy`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy
```

The file `policy` is a JSON document in the current folder that grants read only access to the `shared` folder in an Amazon S3 bucket named `my-bucket`.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:Get*",
                "s3:List*"
            ],
            "Resource": [
                "arn:aws:s3:::my-bucket/shared/*"
            ]
        }
    ]
}
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "CreateDate": "2015-06-01T19:31:18.620Z",
        "AttachmentCount": 0,
        "IsAttachable": true,
```

```
        "PolicyId": "ZXR6A36LTYANPAI7NJ5UV",
        "DefaultVersionId": "v1",
        "Path": "/",
        "Arn": "arn:aws:iam::0123456789012:policy/my-policy",
        "UpdateDate": "2015-06-01T19:31:18.620Z"
    }
}
```

For more information on using files as input for string parameters, see Specify parameter values for the AWS CLI in the *AWS CLI User Guide*.

**Example 2: To create a customer managed policy with a description**

The following command creates a customer managed policy named `my-policy` with an immutable description:

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json \
    --description "This policy grants access to all Put, Get, and List actions for
 my-bucket"
```

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `my-bucket`.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                 "s3:ListBucket*",
                 "s3:PutBucket*",
                 "s3:GetBucket*"
             ],
             "Resource": [
                 "arn:aws:s3:::my-bucket"
             ]
         }
     ]
 }
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDPEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T22:38:47+00:00",
        "UpdateDate": "2023-05-24T22:38:47+00:00"
    }
}
```

For more information on Idenity-based Policies, see Identity-based policies and resource-based policies in the *AWS IAM User Guide*.

**Example 3: To Create a customer managed policy with tags**

The following command creates a customer managed policy named `my-policy` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-policy \
    --policy-name my-policy \
    --policy-document file://policy.json \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `my-bucket`.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
```

```
            "Action": [
                "s3:ListBucket*",
                "s3:PutBucket*",
                "s3:GetBucket*"
             ],
             "Resource": [
                "arn:aws:s3:::my-bucket"
             ]
         }
     ]
 }
```

Output:

```
{
    "Policy": {
        "PolicyName": "my-policy",
        "PolicyId": "ANPAWGSUGIDPEXAMPLE",
        "Arn": "arn:aws:iam::12345678012:policy/my-policy",
        "Path": "/",
        "DefaultVersionId": "v1",
        "AttachmentCount": 0,
        "PermissionsBoundaryUsageCount": 0,
        "IsAttachable": true,
        "CreateDate": "2023-05-24T23:16:39+00:00",
        "UpdateDate": "2023-05-24T23:16:39+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
                "Key": "Location",
                "Value": "Seattle"
            {

        ]
    }
}
```

For more information on Tagging policies, see Tagging customer managed policies in the *AWS IAM User Guide*.

- For API details, see CreatePolicy in *AWS CLI Command Reference*.

### `create-role`

The following code example shows how to use `create-role`.

**AWS CLI**

**Example 1: To create an IAM role**

The following `create-role` command creates a role named `Test-Role` and attaches a trust policy to it.

```
aws iam create-role \
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Output:

```
{
    "Role": {
        "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "CreateDate": "2013-06-07T20:43:32.821Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To attach a permissions policy to a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

**Example 2: To create an IAM role with specified maximum session duration**

The following `create-role` command creates a role named `Test-Role` and sets a maximum session duration of 7200 seconds (2 hours).

```
aws iam create-role \
```

```
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --max-session-duration 7200
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:role/Test-Role",
        "CreateDate": "2023-05-24T23:50:25+00:00",
        "AssumeRolePolicyDocument": {
            "Version": "2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::12345678012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        }
    }
}
```

For more information, see Modifying a role maximum session duration (AWS API) in the *AWS IAM User Guide*.

**Example 3: To create an IAM Role with tags**

The following command creates an IAM Role `Test-Role` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-role \
```

```
    --role-name Test-Role \
    --assume-role-policy-document file://Test-Role-Trust-Policy.json \
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "Test-Role",
        "RoleId": "AKIAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/Test-Role",
        "CreateDate": "2023-05-25T23:29:41+00:00",
        "AssumeRolePolicyDocument": {
            "Version": "2012-10-17",
            "Statement": [
                {
                    "Sid": "Statement1",
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole"
                }
            ]
        },
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see Tagging IAM roles in the *AWS IAM User Guide*.

- For API details, see CreateRole in *AWS CLI Command Reference*.

### `create-saml-provider`

The following code example shows how to use `create-saml-provider`.

**AWS CLI**

**To create a SAML provider**

This example creates a new SAML provider in IAM named `MySAMLProvider`. It is described by the SAML metadata document found in the file `SAMLMetaData.xml`.

```
aws iam create-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --name MySAMLProvider
```

Output:

```
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/MySAMLProvider"
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see CreateSAMLProvider in *AWS CLI Command Reference*.

### `create-service-linked-role`

The following code example shows how to use `create-service-linked-role`.

**AWS CLI**

**To create a service-linked role**

The following `create-service-linked-role` example creates a service-linked role for the specified AWS service and attaches the specified description.

```
aws iam create-service-linked-role \
    --aws-service-name lex.amazonaws.com \
    --description "My service-linked role to support Lex"
```

Output:

```
{
    "Role": {
        "Path": "/aws-service-role/lex.amazonaws.com/",
        "RoleName": "AWSServiceRoleForLexBots",
        "RoleId": "AROA1234567890EXAMPLE",
        "Arn": "arn:aws:iam::1234567890:role/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots",
        "CreateDate": "2019-04-17T20:34:14+00:00",
        "AssumeRolePolicyDocument": {
            "Version": "2012-10-17",
            "Statement": [
                {
                    "Action": [
                        "sts:AssumeRole"
                    ],
                    "Effect": "Allow",
                    "Principal": {
                        "Service": [
                            "lex.amazonaws.com"
                        ]
                    }
                }
            ]
        }
    }
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see CreateServiceLinkedRole in *AWS CLI Command Reference*.

## `create-service-specific-credential`

The following code example shows how to use `create-service-specific-credential`.

### AWS CLI

#### Create a set of service-specific credentials for a user

The following `create-service-specific-credential` example creates a username and password that can be used to access only the configured service.

```
aws iam create-service-specific-credential \
```

```
    --user-name sofia \
    --service-name codecommit.amazonaws.com
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServicePassword": "k1zPZM6uVxMQ3oxqgoYlNuJPyRTZ1vREs76zTQE3eJk=",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see CreateServiceSpecificCredential in *AWS CLI Command Reference*.

### `create-user`

The following code example shows how to use `create-user`.

#### AWS CLI

##### Example 1: To create an IAM user

The following `create-user` command creates an IAM user named Bob in the current account.

```
aws iam create-user \
    --user-name Bob
```

Output:

```
{
    "User": {
        "UserName": "Bob",
        "Path": "/",
```

```
        "CreateDate": "2023-06-08T03:20:41.270Z",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:user/Bob"
    }
}
```

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

**Example 2: To create an IAM user at a specified path**

The following `create-user` command creates an IAM user named Bob at the specified path.

```
aws iam create-user \
    --user-name Bob \
    --path /division_abc/subdivision_xyz/
```

Output:

```
{
    "User": {
        "Path": "/division_abc/subdivision_xyz/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/division_abc/subdivision_xyz/Bob",
        "CreateDate": "2023-05-24T18:20:17+00:00"
    }
}
```

For more information, see IAM identifiers in the *AWS IAM User Guide*.

**Example 3: To Create an IAM User with tags**

The following `create-user` command creates an IAM user named Bob with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-user \
    --user-name Bob \
```

```
    --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
 "Value": "Seattle"}'
```

Output:

```
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-25T17:14:21+00:00",
        "Tags": [
            {
                "Key": "Department",
                "Value": "Accounting"
            },
            {
                "Key": "Location",
                "Value": "Seattle"
            }
        ]
    }
}
```

For more information, see Tagging IAM users in the *AWS IAM User Guide*.

**Example 3: To create an IAM user with a set permissions boundary**

The following `create-user` command creates an IAM user named Bob with the permissions boundary of AmazonS3FullAccess.

```
aws iam create-user \
    --user-name Bob \
    --permissions-boundary arn:aws:iam::aws:policy/AmazonS3FullAccess
```

Output:

```
{
    "User": {
        "Path": "/",
        "UserName": "Bob",
```

```
        "UserId": "AIDAIOSFODNN7EXAMPLE",
        "Arn": "arn:aws:iam::12345678012:user/Bob",
        "CreateDate": "2023-05-24T17:50:53+00:00",
        "PermissionsBoundary": {
        "PermissionsBoundaryType": "Policy",
        "PermissionsBoundaryArn": "arn:aws:iam::aws:policy/AmazonS3FullAccess"
        }
    }
}
```

For more information, see Permissions boundaries for IAM entities in the *AWS IAM User Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

### `create-virtual-mfa-device`

The following code example shows how to use `create-virtual-mfa-device`.

#### AWS CLI

**To create a virtual MFA device**

This example creates a new virtual MFA device called `BobsMFADevice`. It creates a file that contains bootstrap information called `QRCode.png` and places it in the `C:/` directory. The bootstrap method used in this example is `QRCodePNG`.

```
aws iam create-virtual-mfa-device \
    --virtual-mfa-device-name BobsMFADevice \
    --outfile C:/QRCode.png \
    --bootstrap-method QRCodePNG
```

Output:

```
{
    "VirtualMFADevice": {
        "SerialNumber": "arn:aws:iam::210987654321:mfa/BobsMFADevice"
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see CreateVirtualMfaDevice in *AWS CLI Command Reference*.

### `deactivate-mfa-device`

The following code example shows how to use `deactivate-mfa-device`.

**AWS CLI**

**To deactivate an MFA device**

This command deactivates the virtual MFA device with the ARN `arn:aws:iam::210987654321:mfa/BobsMFADevice` that is associated with the user Bob.

```
aws iam deactivate-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see DeactivateMfaDevice in *AWS CLI Command Reference*.

### `decode-authorization-message`

The following code example shows how to use `decode-authorization-message`.

**AWS CLI**

**To decode a authorization failure message**

The following `decode-authorization-message` example decodes the message returned by the EC2 console when attempting to launch an instance without the required permissions.

```
aws sts decode-authorization-message \
    --encoded-message lxzA8VEjEvu-s0TTt3PgYCXik9YakOqsrFJGRZR98xNcyWAxwRq14xIvd-
npzbgTevuufCTbjeBAaDARg9cbTK1rJbg3awM33o-Vy3ebPErE2-
mWR9hVYdvX-0zKgVOWF9pWjZaJSMqxB-aLXo-I_8TTvBq88x8IFPbMArNdpu0IjxDjzf22PF3SOE3XvIQ-
_PEO0aUqHCCcsSrFtvxm6yQD1nbm6VTIVrfa0Bzy8lsoMo7SjIaJ2r5vph6SY5vCCwg6o2JKe3hIHTa8zRrDbZSFMkcX
Xx9AYAAIr6bhcis7C__bZh4dlAAWooHFGKgfoJcWGwgdzgbu9hWyVvKTpeot5hsb8qANYjJRCPXTKpi6PZfdijIkwb6g
```

The output is formatted as a single-line string of JSON text that you can parse with any JSON text processor.

```
{
    "DecodedMessage": "{\"allowed\":false,\"explicitDeny\":false,\"matchedStatements
\":{\"items\":[]},\"failures\":{\"items\":[]},\"context\":{\"principal
\":{\"id\":\"AIDAV3ZUEFP6J7GY7O6LO\",\"name\":\"chain-user\",\"arn\":

}
```

For more information, see How can I decode an authorization failure message after receiving an "UnauthorizedOperation" error during an EC2 instance launch? in *AWS re:Post*.

- For API details, see DecodeAuthorizationMessage in *AWS CLI Command Reference*.

## `delete-access-key`

The following code example shows how to use `delete-access-key`.

### AWS CLI

#### To delete an access key for an IAM user

The following `delete-access-key` command deletes the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam delete-access-key \
    --access-key-id AKIDPMS9RO4H3FEXAMPLE \
```

```
    --user-name Bob
```

This command produces no output.

To list the access keys defined for an IAM user, use the `list-access-keys` command.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteAccessKey in *AWS CLI Command Reference*.

### `delete-account-alias`

The following code example shows how to use `delete-account-alias`.

**AWS CLI**

**To delete an account alias**

The following `delete-account-alias` command removes the alias `mycompany` for the current account.

```
aws iam delete-account-alias \
    --account-alias mycompany
```

This command produces no output.

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see DeleteAccountAlias in *AWS CLI Command Reference*.

### `delete-account-password-policy`

The following code example shows how to use `delete-account-password-policy`.

**AWS CLI**

**To delete the current account password policy**

The following `delete-account-password-policy` command removes the password policy for the current account.

```
aws iam delete-account-password-policy
```

This command produces no output.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteAccountPasswordPolicy in *AWS CLI Command Reference*.

### `delete-group-policy`

The following code example shows how to use `delete-group-policy`.

#### AWS CLI

**To delete a policy from an IAM group**

The following `delete-group-policy` command deletes the policy named `ExamplePolicy` from the group named `Admins`.

```
aws iam delete-group-policy \
    --group-name Admins \
    --policy-name ExamplePolicy
```

This command produces no output.

To see the policies attached to a group, use the `list-group-policies` command.

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see DeleteGroupPolicy in *AWS CLI Command Reference*.

### `delete-group`

The following code example shows how to use `delete-group`.

#### AWS CLI

**To delete an IAM group**

The following `delete-group` command deletes an IAM group named `MyTestGroup`.

```
aws iam delete-group \
    --group-name MyTestGroup
```

This command produces no output.

For more information, see Deleting an IAM user group in the *AWS IAM User Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

### `delete-instance-profile`

The following code example shows how to use `delete-instance-profile`.

#### AWS CLI

**To delete an instance profile**

The following `delete-instance-profile` command deletes the instance profile named `ExampleInstanceProfile`.

```
aws iam delete-instance-profile \
    --instance-profile-name ExampleInstanceProfile
```

This command produces no output.

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see DeleteInstanceProfile in *AWS CLI Command Reference*.

### `delete-login-profile`

The following code example shows how to use `delete-login-profile`.

#### AWS CLI

**To delete a password for an IAM user**

The following `delete-login-profile` command deletes the password for the IAM user named Bob.

```
aws iam delete-login-profile \
    --user-name Bob
```

This command produces no output.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see DeleteLoginProfile in *AWS CLI Command Reference*.

### `delete-open-id-connect-provider`

The following code example shows how to use `delete-open-id-connect-provider`.

**AWS CLI**

**To delete an IAM OpenID Connect identity provider**

This example deletes the IAM OIDC provider that connects to the provider `example.oidcprovider.com`.

```
aws iam delete-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see DeleteOpenIdConnectProvider in *AWS CLI Command Reference*.

### `delete-policy-version`

The following code example shows how to use `delete-policy-version`.

**AWS CLI**

**To delete a version of a managed policy**

This example deletes the version identified as `v2` from the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeletePolicyVersion in *AWS CLI Command Reference*.

### `delete-policy`

The following code example shows how to use `delete-policy`.

**AWS CLI**

**To delete an IAM policy**

This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

### `delete-role-permissions-boundary`

The following code example shows how to use `delete-role-permissions-boundary`.

**AWS CLI**

**To delete a permissions boundary from an IAM role**

The following `delete-role-permissions-boundary` example deletes the permissions boundary for the specified IAM role. To apply a permissions boundary to a role, use the `put-role-permissions-boundary` command.

```
aws iam delete-role-permissions-boundary \
    --role-name lambda-application-role
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteRolePermissionsBoundary in *AWS CLI Command Reference*.

### `delete-role-policy`

The following code example shows how to use `delete-role-policy`.

**AWS CLI**

**To remove a policy from an IAM role**

The following `delete-role-policy` command removes the policy named `ExamplePolicy` from the role named `Test-Role`.

```
aws iam delete-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see DeleteRolePolicy in *AWS CLI Command Reference*.

### `delete-role`

The following code example shows how to use `delete-role`.

**AWS CLI**

**To delete an IAM role**

The following `delete-role` command removes the role named `Test-Role`.

```
aws iam delete-role \
    --role-name Test-Role
```

This command produces no output.

Before you can delete a role, you must remove the role from any instance profile (`remove-role-from-instance-profile`), detach any managed policies (`detach-role-policy`) and delete any inline policies that are attached to the role (`delete-role-policy`).

For more information, see Creating IAM roles and Using instance profiles in the *AWS IAM User Guide*.

- For API details, see DeleteRole in *AWS CLI Command Reference*.

### `delete-saml-provider`

The following code example shows how to use `delete-saml-provider`.

**AWS CLI**

**To delete a SAML provider**

This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider`.

```
aws iam delete-saml-provider \
--saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFSProvider
```

This command produces no output.

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see DeleteSAMLProvider in *AWS CLI Command Reference*.

### `delete-server-certificate`

The following code example shows how to use `delete-server-certificate`.

**AWS CLI**

**To delete a server certificate from your AWS account**

The following `delete-server-certificate` command removes the specified server certificate from your AWS account.

```
aws iam delete-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

This command produces no output.

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteServerCertificate in *AWS CLI Command Reference*.

### `delete-service-linked-role`

The following code example shows how to use `delete-service-linked-role`.

**AWS CLI**

**To delete a service-linked role**

The following `delete-service-linked-role` example deletes the specified service-linked role that you no longer need. The deletion happens asynchronously. You can check the status of the deletion and confirm when it is done by using the `get-service-linked-role-deletion-status` command.

```
aws iam delete-service-linked-role \
    --role-name AWSServiceRoleForLexBots
```

Output:

```
{
    "DeletionTaskId": "task/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE"
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see DeleteServiceLinkedRole in *AWS CLI Command Reference*.

### `delete-service-specific-credential`

The following code example shows how to use `delete-service-specific-credential`.

**AWS CLI**

**Example 1: Delete a service-specific credential for the requesting user**

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the user making the request. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

```
aws iam delete-service-specific-credential \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

**Example 2: Delete a service-specific credential for a specified user**

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the specified user. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

```
aws iam delete-service-specific-credential \
    --user-name sofia \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see DeleteServiceSpecificCredential in *AWS CLI Command Reference*.

## `delete-signing-certificate`

The following code example shows how to use `delete-signing-certificate`.

### AWS CLI

**To delete a signing certificate for an IAM user**

The following `delete-signing-certificate` command deletes the specified signing certificate for the IAM user named Bob.

```
aws iam delete-signing-certificate \
    --user-name Bob \
    --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE
```

This command produces no output.

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see DeleteSigningCertificate in *AWS CLI Command Reference*.

### `delete-ssh-public-key`

The following code example shows how to use `delete-ssh-public-key`.

**AWS CLI**

**To delete an SSH public keys attached to an IAM user**

The following `delete-ssh-public-key` command deletes the specified SSH public key attached to the IAM user `sofia`.

```
aws iam delete-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA123456789EXAMPLE
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*.

- For API details, see DeleteSshPublicKey in *AWS CLI Command Reference*.

### `delete-user-permissions-boundary`

The following code example shows how to use `delete-user-permissions-boundary`.

**AWS CLI**

**To delete a permissions boundary from an IAM user**

The following `delete-user-permissions-boundary` example deletes the permissions boundary attached to the IAM user named `intern`. To apply a permissions boundary to a user, use the `put-user-permissions-boundary` command.

```
aws iam delete-user-permissions-boundary \
    --user-name intern
```

This command produces no output.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see DeleteUserPermissionsBoundary in *AWS CLI Command Reference*.

### `delete-user-policy`

The following code example shows how to use `delete-user-policy`.

**AWS CLI**

**To remove a policy from an IAM user**

The following `delete-user-policy` command removes the specified policy from the IAM user named Bob.

```
aws iam delete-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy
```

This command produces no output.

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

- For API details, see DeleteUserPolicy in *AWS CLI Command Reference*.

### `delete-user`

The following code example shows how to use `delete-user`.

**AWS CLI**

**To delete an IAM user**

The following `delete-user` command removes the IAM user named Bob from the current account.

```
aws iam delete-user \
    --user-name Bob
```

This command produces no output.

For more information, see Deleting an IAM user in the *AWS IAM User Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

### `delete-virtual-mfa-device`

The following code example shows how to use `delete-virtual-mfa-device`.

**AWS CLI**

**To remove a virtual MFA device**

The following `delete-virtual-mfa-device` command removes the specified MFA device from the current account.

```
aws iam delete-virtual-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/MFATest
```

This command produces no output.

For more information, see Deactivating MFA devices in the *AWS IAM User Guide*.

- For API details, see DeleteVirtualMfaDevice in *AWS CLI Command Reference*.

### `detach-group-policy`

The following code example shows how to use `detach-group-policy`.

**AWS CLI**

**To detach a policy from a group**

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group called `Testers`.

```
aws iam detach-group-policy \
    --group-name Testers \
    --policy-arn arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

This command produces no output.

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see DetachGroupPolicy in *AWS CLI Command Reference*.

### `detach-role-policy`

The following code example shows how to use `detach-role-policy`.

**AWS CLI**

**To detach a policy from a role**

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy` from the role called `FedTesterRole`.

```
aws iam detach-role-policy \
    --role-name FedTesterRole \
    --policy-arn arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see DetachRolePolicy in *AWS CLI Command Reference*.

### `detach-user-policy`

The following code example shows how to use `detach-user-policy`.

**AWS CLI**

**To detach a policy from a user**

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterPolicy` from the user Bob.

```
aws iam detach-user-policy \
    --user-name Bob \
    --policy-arn arn:aws:iam::123456789012:policy/TesterPolicy
```

This command produces no output.

For more information, see Changing permissions for an IAM user in the *AWS IAM User Guide*.

- For API details, see DetachUserPolicy in *AWS CLI Command Reference*.

### `enable-mfa-device`

The following code example shows how to use `enable-mfa-device`.

#### AWS CLI

**To enable an MFA device**

After you use the `create-virtual-mfa-device` command to create a new virtual MFA device, you can assign the MFA device to a user. The following `enable-mfa-device` example assigns the MFA device with the serial number `arn:aws:iam::210987654321:mfa/BobsMFADevice` to the user Bob. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
aws iam enable-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
    --authentication-code1 123456 \
    --authentication-code2 789012
```

This command produces no output.

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the *AWS IAM User Guide*.

- For API details, see EnableMfaDevice in *AWS CLI Command Reference*.

### `generate-credential-report`

The following code example shows how to use `generate-credential-report`.

#### AWS CLI

**To generate a credential report**

The following example attempts to generate a credential report for the AWS account.

```
aws iam generate-credential-report
```

Output:

```
{
    "State":  "STARTED",
    "Description": "No report exists. Starting a new report generation task"
}
```

For more information, see Getting credential reports for your AWS account in the *AWS IAM User Guide*.

- For API details, see GenerateCredentialReport in *AWS CLI Command Reference*.

### `generate-organizations-access-report`

The following code example shows how to use `generate-organizations-access-report`.

**AWS CLI**

**Example 1: To generate an access report for a root in an organization**

The following `generate-organizations-access-report` example starts a background job to create an access report for the specified root in an organization. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb
```

Output:

```
{
    "JobId": "a8b6c06f-aaa4-8xmp-28bc-81da71836359"
}
```

**Example 2: To generate an access report for an account in an organization**

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID `123456789012` in the organization `o-4fxmplt198`. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb/123456789012
```

Output:

```
{
    "JobId": "14b6c071-75f6-2xmp-fb77-faf6fb4201d2"
}
```

**Example 3: To generate an access report for an account in an organizational unit in an organization**

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID `234567890123` in organizational unit `ou-c3xb-lmu7j2yg` in the organization `o-4fxmplt198`. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
    --entity-path o-4fxmplt198/r-c3xb/ou-c3xb-lmu7j2yg/234567890123
```

Output:

```
{
    "JobId": "2eb6c2e6-0xmp-ec04-1425-c937916a64af"
}
```

To get details about roots and organizational units in your organization, use the `organizations list-roots` and `organizations list-organizational-units-for-parent` commands.

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GenerateOrganizationsAccessReport in *AWS CLI Command Reference*.

### `generate-service-last-accessed-details`

The following code example shows how to use `generate-service-last-accessed-details`.

**AWS CLI**

**Example 1: To generate a service access report for a custom policy**

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with a custom policy named `intern-boundary`. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \
    --arn arn:aws:iam::123456789012:policy/intern-boundary
```

Output:

```
{
    "JobId": "2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc"
}
```

**Example 2: To generate a service access report for the AWS managed AdministratorAccess policy**

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with the AWS managed `AdministratorAccess` policy. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \
    --arn arn:aws:iam::aws:policy/AdministratorAccess
```

Output:

```
{
    "JobId": "78b6c2ba-d09e-6xmp-7039-ecde30b26916"
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GenerateServiceLastAccessedDetails in *AWS CLI Command Reference*.

### `get-access-key-last-used`

The following code example shows how to use `get-access-key-last-used`.

**AWS CLI**

**To retrieve information about when the specified access key was last used**

The following example retrieves information about when the access key ABCDEXAMPLE was last used.

```
aws iam get-access-key-last-used \
    --access-key-id ABCDEXAMPLE
```

Output:

```
{
    "UserName":  "Bob",
    "AccessKeyLastUsed": {
        "Region": "us-east-1",
        "ServiceName": "iam",
        "LastUsedDate": "2015-06-16T22:45:00Z"
    }
}
```

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see GetAccessKeyLastUsed in *AWS CLI Command Reference*.

### `get-account-authorization-details`

The following code example shows how to use `get-account-authorization-details`.

**AWS CLI**

**To list an AWS accounts IAM users, groups, roles, and policies**

The following `get-account-authorization-details` command returns information about all IAM users, groups, roles, and policies in the AWS account.

```
aws iam get-account-authorization-details
```

Output:

```
{
    "RoleDetailList": [
        {
            "AssumeRolePolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Sid": "",
                        "Effect": "Allow",
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "RoleId": "AROA1234567890EXAMPLE",
            "CreateDate": "2014-07-30T17:09:20Z",
            "InstanceProfileList": [
                {
                    "InstanceProfileId": "AIPA1234567890EXAMPLE",
                    "Roles": [
                        {
                            "AssumeRolePolicyDocument": {
                                "Version": "2012-10-17",
                                "Statement": [
                                    {
                                        "Sid": "",

For more information, see AWS security audit guidelines in the *AWS IAM User Guide*.

- For API details, see GetAccountAuthorizationDetails in *AWS CLI Command Reference*.

## `get-account-password-policy`

The following code example shows how to use `get-account-password-policy`.

### AWS CLI

#### To see the current account password policy

The following `get-account-password-policy` command displays details about the password policy for the current account.

```
aws iam get-account-password-policy
```

Output:

```
{
    "PasswordPolicy": {
        "AllowUsersToChangePassword": false,
        "RequireLowercaseCharacters": false,
        "RequireUppercaseCharacters": false,
        "MinimumPasswordLength": 8,
        "RequireNumbers": true,
        "RequireSymbols": true
    }
}
```

If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see GetAccountPasswordPolicy in *AWS CLI Command Reference*.

### `get-account-summary`

The following code example shows how to use `get-account-summary`.

#### AWS CLI

**To get information about IAM entity usage and IAM quotas in the current account**

The following `get-account-summary` command returns information about the current IAM entity usage and current IAM entity quotas in the account.

```
aws iam get-account-summary
```

Output:

```
{
    "SummaryMap": {
```

```
        "UsersQuota": 5000,
        "GroupsQuota": 100,
        "InstanceProfiles": 6,
        "SigningCertificatesPerUserQuota": 2,
        "AccountAccessKeysPresent": 0,
        "RolesQuota": 250,
        "RolePolicySizeQuota": 10240,
        "AccountSigningCertificatesPresent": 0,
        "Users": 27,
        "ServerCertificatesQuota": 20,
        "ServerCertificates": 0,
        "AssumeRolePolicySizeQuota": 2048,
        "Groups": 7,
        "MFADevicesInUse": 1,
        "Roles": 3,
        "AccountMFAEnabled": 1,
        "MFADevices": 3,
        "GroupsPerUserQuota": 10,
        "GroupPolicySizeQuota": 5120,
        "InstanceProfilesQuota": 100,
        "AccessKeysPerUserQuota": 2,
        "Providers": 0,
        "UserPolicySizeQuota": 2048
    }
}
```

For more information about entity limitations, see IAM and AWS STS quotas in the *AWS IAM User Guide*.

- For API details, see GetAccountSummary in *AWS CLI Command Reference*.

## `get-context-keys-for-custom-policy`

The following code example shows how to use `get-context-keys-for-custom-policy`.

### AWS CLI

#### Example 1: To list the context keys referenced by one or more custom JSON policies provided as a parameter on the command line

The following `get-context-keys-for-custom-policy` command parses each supplied policy and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the policy simulator commands

`simulate-custom-policy` and `simulate-custom-policy`. You can also retrieve the list of context keys used by all policies associated by an IAM user or role by using the `get-context-keys-for-custom-policy` command. Parameter values that begin with `file://` instruct the command to read the file and use the contents as the value for the parameter instead of the file name itself.

```
aws iam get-context-keys-for-custom-policy \
    --policy-input-list '{"Version":"2012-10-17","Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/${aws:username}","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

**Example 2: To list the context keys referenced by one or more custom JSON policies provided as a file input**

The following `get-context-keys-for-custom-policy` command is the same as the previous example, except that the policies are provided in a file instead of as a parameter. Because the command expects a JSON list of strings, and not a list of JSON structures, the file must be structured as follows, although you can collapse it into one one.

```
[
    "Policy1",
    "Policy2"
]
```

So for example, a file that contains the policy from the previous example must look like the following. You must escape each embedded double-quote inside the policy string by preceding it with a backslash ".

```
[ "{\"Version\": \"2012-10-17\", \"Statement\": {\"Effect\": \"Allow\", \"Action
\": \"dynamodb:*\", \"Resource\": \"arn:aws:dynamodb:us-west-2:128716708097:table/
```

```
${aws:username}\", \"Condition\": {\"DateGreaterThan\": {\"aws:CurrentTime\":
 \"2015-08-16T12:00:00Z\"}}}}" ]
```

This file can then be submitted to the following command.

```
aws iam get-context-keys-for-custom-policy \
    --policy-input-list file://policyfile.json
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the *AWS IAM User Guide*.

- For API details, see GetContextKeysForCustomPolicy in *AWS CLI Command Reference*.

### `get-context-keys-for-principal-policy`

The following code example shows how to use `get-context-keys-for-principal-policy`.

#### AWS CLI

**To list the context keys referenced by all policies associated with an IAM principal**

The following `get-context-keys-for-principal-policy` command retrieves all policies that are attached to the user `saanvi` and any groups she is a member of. It then parses each and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the `simulate-custom-policy` and `simulate-principal-policy` commands. You can also retrieve the list of context keys used by an arbitrary JSON policy by using the `get-context-keys-for-custom-policy` command.

```
aws iam get-context-keys-for-principal-policy \
   --policy-source-arn arn:aws:iam::123456789012:user/saanvi
```

Output:

```
{
    "ContextKeyNames": [
        "aws:username",
        "aws:CurrentTime"
    ]
}
```

For more information, see Using the IAM Policy Simulator (AWS CLI and AWS API) in the *AWS IAM User Guide*.

- For API details, see GetContextKeysForPrincipalPolicy in *AWS CLI Command Reference*.

### `get-credential-report`

The following code example shows how to use `get-credential-report`.

**AWS CLI**

**To get a credential report**

This example opens the returned report and outputs it to the pipeline as an array of text lines.

```
aws iam get-credential-report
```

Output:

```
{
    "GeneratedTime":  "2015-06-17T19:11:50Z",
    "ReportFormat": "text/csv"
}
```

For more information, see Getting credential reports for your AWS account in the *AWS IAM User Guide*.

- For API details, see GetCredentialReport in *AWS CLI Command Reference*.

### `get-group-policy`

The following code example shows how to use `get-group-policy`.

### AWS CLI

#### To get information about a policy attached to an IAM group

The following `get-group-policy` command gets information about the specified policy attached to the group named `Test-Group`.

```
aws iam get-group-policy \
    --group-name Test-Group \
    --policy-name S3-ReadOnly-Policy
```

Output:

```
{
    "GroupName": "Test-Group",
    "PolicyDocument": {
        "Statement": [
            {
                "Action": [
                    "s3:Get*",
                    "s3:List*"
                ],
                "Resource": "*",
                "Effect": "Allow"
            }
        ]
    },
    "PolicyName": "S3-ReadOnly-Policy"
}
```

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see GetGroupPolicy in *AWS CLI Command Reference*.

## `get-group`

The following code example shows how to use `get-group`.

### AWS CLI

#### To get an IAM group

This example returns details about the IAM group `Admins`.

```
aws iam get-group \
    --group-name Admins
```

Output:

```
{
    "Group": {
        "Path": "/",
        "CreateDate": "2015-06-16T19:41:48Z",
        "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:group/Admins",
        "GroupName": "Admins"
    },
    "Users": []
}
```

For more information, see IAM Identities (users, user groups, and roles) in the *AWS IAM User Guide*.

- For API details, see GetGroup in *AWS CLI Command Reference*.

### `get-instance-profile`

The following code example shows how to use `get-instance-profile`.

#### AWS CLI

**To get information about an instance profile**

The following `get-instance-profile` command gets information about the instance profile named `ExampleInstanceProfile`.

```
aws iam get-instance-profile \
    --instance-profile-name ExampleInstanceProfile
```

Output:

```
{
    "InstanceProfile": {
        "InstanceProfileId": "AID2MAB8DPLSRHEXAMPLE",
        "Roles": [
```

```
            {
                "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                "RoleId": "AIDGPMS9RO4H3FEXAMPLE",
                "CreateDate": "2013-01-09T06:33:26Z",
                "RoleName": "Test-Role",
                "Path": "/",
                "Arn": "arn:aws:iam::336924118301:role/Test-Role"
            }
        ],
        "CreateDate": "2013-06-12T23:52:02Z",
        "InstanceProfileName": "ExampleInstanceProfile",
        "Path": "/",
        "Arn": "arn:aws:iam::336924118301:instance-profile/ExampleInstanceProfile"
    }
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see GetInstanceProfile in *AWS CLI Command Reference*.

### `get-login-profile`

The following code example shows how to use `get-login-profile`.

#### AWS CLI

**To get password information for an IAM user**

The following `get-login-profile` command gets information about the password for the IAM user named Bob.

```
aws iam get-login-profile \
    --user-name Bob
```

Output:

```
{
    "LoginProfile": {
        "UserName": "Bob",
        "CreateDate": "2012-09-21T23:03:39Z"
    }
}
```

The `get-login-profile` command can be used to verify that an IAM user has a password. The command returns a `NoSuchEntity` error if no password is defined for the user.

You cannot view a password using this command. If the password is lost, you can reset the password (`update-login-profile`) for the user. Alternatively, you can delete the login profile (`delete-login-profile`) for the user and then create a new one (`create-login-profile`).

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see GetLoginProfile in *AWS CLI Command Reference*.

### `get-mfa-device`

The following code example shows how to use `get-mfa-device`.

#### AWS CLI

**To retrieve information about a FIDO security key**

The following `get-mfa-device` command example retrieves information about the specified FIDO security key.

```
aws iam get-mfa-device \
    --serial-number arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-
EXAMPLEBN5FHTECLFG7EXAMPLE
```

Output:

```
{
    "UserName": "alice",
    "SerialNumber": "arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-
EXAMPLEBN5FHTECLFG7EXAMPLE",
    "EnableDate": "2023-09-19T01:49:18+00:00",
    "Certifications": {
        "FIDO": "L1"
    }
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see GetMfaDevice in *AWS CLI Command Reference*.

### `get-open-id-connect-provider`

The following code example shows how to use `get-open-id-connect-provider`.

**AWS CLI**

**To return information about the specified OpenID Connect provider**

This example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/server.example.com`.

```
aws iam get-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

Output:

```
{
    "Url": "server.example.com"
        "CreateDate": "2015-06-16T19:41:48Z",
        "ThumbprintList": [
        "12345abcdefghijk67890lmnopqrst987example"
        ],
        "ClientIDList": [
        "example-application-ID"
        ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see GetOpenIdConnectProvider in *AWS CLI Command Reference*.

### `get-organizations-access-report`

The following code example shows how to use `get-organizations-access-report`.

**AWS CLI**

**To retrieve an access report**

The following `get-organizations-access-report` example displays a previously generated access report for an AWS Organizations entity. To generate a report, use the `generate-organizations-access-report` command.

```
aws iam get-organizations-access-report \
    --job-id a8b6c06f-aaa4-8xmp-28bc-81da71836359
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-09-30T06:53:36.187Z",
    "JobCompletionDate": "2019-09-30T06:53:37.547Z",
    "NumberOfServicesAccessible": 188,
    "NumberOfServicesNotAccessed": 171,
    "AccessDetails": [
        {
            "ServiceName": "Alexa for Business",
            "ServiceNamespace": "a4b",
            "TotalAuthenticatedEntities": 0
        },
        ...
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetOrganizationsAccessReport in *AWS CLI Command Reference*.

### `get-policy-version`

The following code example shows how to use `get-policy-version`.

#### AWS CLI

**To retrieve information about the specified version of the specified managed policy**

This example returns the policy document for the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`.

```
aws iam get-policy-version \
```

```
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

Output:

```
{
    "PolicyVersion": {
        "Document": {
            "Version": "2012-10-17",
            "Statement": [
                {
                    "Effect": "Allow",
                    "Action": "iam:*",
                    "Resource": "*"
                }
            ]
        },
        "VersionId": "v2",
        "IsDefaultVersion": true,
        "CreateDate": "2023-04-11T00:22:54+00:00"
    }
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetPolicyVersion in *AWS CLI Command Reference*.

### `get-policy`

The following code example shows how to use `get-policy`.

#### AWS CLI

**To retrieve information about the specified managed policy**

This example returns details about the managed policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam get-policy \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
    "Policy": {
        "PolicyName": "MySamplePolicy",
        "CreateDate": "2015-06-17T19:23;32Z",
        "AttachmentCount": 0,
        "IsAttachable": true,
        "PolicyId": "Z27SI6FQMGNQ2EXAMPLE1",
        "DefaultVersionId": "v1",
        "Path": "/",
        "Arn": "arn:aws:iam::123456789012:policy/MySamplePolicy",
        "UpdateDate": "2015-06-17T19:23:32Z"
    }
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

### `get-role-policy`

The following code example shows how to use `get-role-policy`.

#### AWS CLI

**To get information about a policy attached to an IAM role**

The following `get-role-policy` command gets information about the specified policy attached to the role named `Test-Role`.

```
aws iam get-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy
```

Output:

```
{
  "RoleName": "Test-Role",
  "PolicyDocument": {
      "Statement": [
          {
              "Action": [
                  "s3:ListBucket",
```

```
                "s3:Put*",
                "s3:Get*",
                "s3:*MultipartUpload*"
            ],
            "Resource": "*",
            "Effect": "Allow",
            "Sid": "1"
        }
    ]
  }
  "PolicyName": "ExamplePolicy"
}
```

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see GetRolePolicy in *AWS CLI Command Reference*.

## `get-role`

The following code example shows how to use `get-role`.

### AWS CLI

#### To get information about an IAM role

The following `get-role` command gets information about the role named `Test-Role`.

```
aws iam get-role \
    --role-name Test-Role
```

Output:

```
{
    "Role": {
        "Description": "Test Role",
        "AssumeRolePolicyDocument":"<URL-encoded-JSON>",
        "MaxSessionDuration": 3600,
        "RoleId": "AROA1234567890EXAMPLE",
        "CreateDate": "2019-11-13T16:45:56Z",
        "RoleName": "Test-Role",
        "Path": "/",
        "RoleLastUsed": {
```

```
            "Region": "us-east-1",
            "LastUsedDate": "2019-11-13T17:14:00Z"
        },
        "Arn": "arn:aws:iam::123456789012:role/Test-Role"
    }
}
```

The command displays the trust policy attached to the role. To list the permissions policies attached to a role, use the `list-role-policies` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see GetRole in *AWS CLI Command Reference*.

### `get-saml-provider`

The following code example shows how to use `get-saml-provider`.

**AWS CLI**

**To retrieve the SAML provider metadocument**

This example retrieves the details about the SAML 2.0 provider whose ARM is `arn:aws:iam::123456789012:saml-provider/SAMLADFS`. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```
aws iam get-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
    "SAMLMetadataDocument": "...SAMLMetadataDocument-XML...",
    "CreateDate": "2017-03-06T22:29:46+00:00",
    "ValidUntil": "2117-03-06T22:29:46.433000+00:00",
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
```

```
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see GetSamlProvider in *AWS CLI Command Reference*.

### `get-server-certificate`

The following code example shows how to use `get-server-certificate`.

**AWS CLI**

**To get details about a server certificate in your AWS account**

The following `get-server-certificate` command retrieves all of the details about the specified server certificate in your AWS account.

```
aws iam get-server-certificate \
    --server-certificate-name myUpdatedServerCertificate
```

Output:

```
{
    "ServerCertificate": {
        "ServerCertificateMetadata": {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/
myUpdatedServerCertificate",
            "UploadDate": "2019-04-22T21:13:44+00:00",
            "Expiration": "2019-10-15T22:23:16+00:00"
        },
        "CertificateBody": "-----BEGIN CERTIFICATE-----
            MIICiTCCAfICCQD6m7oRw0uXOjANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMC

            EDmFJl0ZxBHjJnyp378OD8uTs7fLvjx79LjS;TbNYiytVbZPQUQ5Yaxu2jXnimvw
            3rrszlaEWEG5vb25lQGFtsYXpvbiEXAMPLE=\n-----END CERTIFICATE-----"
    }
}
```

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see GetServerCertificate in *AWS CLI Command Reference*.

### `get-service-last-accessed-details-with-entities`

The following code example shows how to use `get-service-last-accessed-details-with-entities`.

#### AWS CLI

**To retrieve a service access report with details for a service**

The following `get-service-last-accessed-details-with-entities` example retrieves a report that contains details about IAM users and other entities that accessed the specified service. To generate a report, use the `generate-service-last-accessed-details` command. To get a list of services accessed with namespaces, use `get-service-last-accessed-details`.

```
aws iam get-service-last-accessed-details-with-entities \
    --job-id 78b6c2ba-d09e-6xmp-7039-ecde30b26916 \
    --service-namespace lambda
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:55:41.756Z",
    "JobCompletionDate": "2019-10-01T03:55:42.533Z",
    "EntityDetailsList": [
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/admin",
                "Name": "admin",
                "Type": "USER",
                "Id": "AIDAIO2XMPLENQEXAMPLE",
                "Path": "/"
            },
            "LastAuthenticated": "2019-09-30T23:02:00Z"
        },
        {
            "EntityInfo": {
                "Arn": "arn:aws:iam::123456789012:user/developer",
                "Name": "developer",
                "Type": "USER",
                "Id": "AIDAIBEYXMPL2YEXAMPLE",
                "Path": "/"
            },
            "LastAuthenticated": "2019-09-16T19:34:00Z"
        }
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetServiceLastAccessedDetailsWithEntities in *AWS CLI Command Reference*.

### `get-service-last-accessed-details`

The following code example shows how to use `get-service-last-accessed-details`.

**AWS CLI**

**To retrieve a service access report**

The following `get-service-last-accessed-details` example retrieves a previously generated report that lists the services accessed by IAM entities. To generate a report, use the `generate-service-last-accessed-details` command.

```
aws iam get-service-last-accessed-details \
    --job-id 2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc
```

Output:

```
{
    "JobStatus": "COMPLETED",
    "JobCreationDate": "2019-10-01T03:50:35.929Z",
    "ServicesLastAccessed": [
        ...
        {
            "ServiceName": "AWS Lambda",
            "LastAuthenticated": "2019-09-30T23:02:00Z",
            "ServiceNamespace": "lambda",
            "LastAuthenticatedEntity": "arn:aws:iam::123456789012:user/admin",
            "TotalAuthenticatedEntities": 6
        },
    ]
}
```

For more information, see Refining permissions in AWS using last accessed information in the *AWS IAM User Guide*.

- For API details, see GetServiceLastAccessedDetails in *AWS CLI Command Reference*.

### `get-service-linked-role-deletion-status`

The following code example shows how to use `get-service-linked-role-deletion-status`.

**AWS CLI**

**To check the status of a request to delete a service-linked role**

The following `get-service-linked-role-deletion-status` example displays the status of a previously request to delete a service-linked role. The delete operation occurs asynchronously. When you make the request, you get a `DeletionTaskId` value that you provide as a parameter for this command.

```
aws iam get-service-linked-role-deletion-status \
    --deletion-task-id task/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE
```

Output:

```
{
"Status": "SUCCEEDED"
}
```

For more information, see Using service-linked roles in the *AWS IAM User Guide*.

- For API details, see GetServiceLinkedRoleDeletionStatus in *AWS CLI Command Reference*.

### `get-ssh-public-key`

The following code example shows how to use `get-ssh-public-key`.

**AWS CLI**

**Example 1: To retrieve an SSH public key attached to an IAM user in SSH encoded form**

The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user `sofia`. The output is in SSH encoding.

```
aws iam get-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA123456789EXAMPLE \
```

```
    --encoding SSH
```

Output:

```
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA123456789EXAMPLE",
        "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
        "SSHPublicKeyBody": "ssh-rsa <<long encoded SSH string>>",
        "Status": "Inactive",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

**Example 2: To retrieve an SSH public key attached to an IAM user in PEM encoded form**

The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user `sofia`. The output is in PEM encoding.

```
aws iam get-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA123456789EXAMPLE \
    --encoding PEM
```

Output:

```
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA123456789EXAMPLE",
        "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
        "SSHPublicKeyBody": ""-----BEGIN PUBLIC KEY-----\n<<long encoded PEM
 string>>\n-----END PUBLIC KEY-----\n"",
        "Status": "Inactive",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*.

- For API details, see GetSshPublicKey in *AWS CLI Command Reference*.

### `get-user-policy`

The following code example shows how to use `get-user-policy`.

**AWS CLI**

**To list policy details for an IAM user**

The following `get-user-policy` command lists the details of the specified policy that is attached to the IAM user named Bob.

```
aws iam get-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy
```

Output:

```
{
    "UserName": "Bob",
    "PolicyName": "ExamplePolicy",
    "PolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
            {
                "Action": "*",
                "Resource": "*",
                "Effect": "Allow"
            }
        ]
    }
}
```

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see GetUserPolicy in *AWS CLI Command Reference*.

### `get-user`

The following code example shows how to use `get-user`.

**AWS CLI**

**To get information about an IAM user**

The following `get-user` command gets information about the IAM user named `Paulo`.

```
aws iam get-user \
    --user-name Paulo
```

Output:

```
{
    "User": {
        "UserName": "Paulo",
        "Path": "/",
        "CreateDate": "2019-09-21T23:03:13Z",
        "UserId": "AIDA123456789EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:user/Paulo"
    }
}
```

For more information, see Managing IAM users in the *AWS IAM User Guide*.

- For API details, see GetUser in *AWS CLI Command Reference*.

## `list-access-keys`

The following code example shows how to use `list-access-keys`.

**AWS CLI**

**To list the access key IDs for an IAM user**

The following `list-access-keys` command lists the access keys IDs for the IAM user named Bob.

```
aws iam list-access-keys \
    --user-name Bob
```

Output:

```
{
```

```
    "AccessKeyMetadata": [
        {
            "UserName": "Bob",
            "Status": "Active",
            "CreateDate": "2013-06-04T18:17:34Z",
            "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"
        },
        {
            "UserName": "Bob",
            "Status": "Inactive",
            "CreateDate": "2013-06-06T20:42:26Z",
            "AccessKeyId": "AKIAI44QH8DHBEXAMPLE"
        }
    ]
}
```

You cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys using the `create-access-keys` command.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see ListAccessKeys in *AWS CLI Command Reference*.

### `list-account-aliases`

The following code example shows how to use `list-account-aliases`.

#### AWS CLI

**To list account aliases**

The following `list-account-aliases` command lists the aliases for the current account.

```
aws iam list-account-aliases
```

Output:

```
{
    "AccountAliases": [
    "mycompany"
    ]
}
```

For more information, see Your AWS account ID and its alias in the *AWS IAM User Guide*.

- For API details, see ListAccountAliases in *AWS CLI Command Reference*.

### `list-attached-group-policies`

The following code example shows how to use `list-attached-group-policies`.

**AWS CLI**

**To list all managed policies that are attached to the specified group**

This example returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account.

```
aws iam list-attached-group-policies \
    --group-name Admins
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedGroupPolicies in *AWS CLI Command Reference*.

### `list-attached-role-policies`

The following code example shows how to use `list-attached-role-policies`.

**AWS CLI**

**To list all managed policies that are attached to the specified role**

This command returns the names and ARNs of the managed policies attached to the IAM role named `SecurityAuditRole` in the AWS account.

```
aws iam list-attached-role-policies \
    --role-name SecurityAuditRole
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedRolePolicies in *AWS CLI Command Reference*.

## `list-attached-user-policies`

The following code example shows how to use `list-attached-user-policies`.

**AWS CLI**

**To list all managed policies that are attached to the specified user**

This command returns the names and ARNs of the managed policies for the IAM user named Bob in the AWS account.

```
aws iam list-attached-user-policies \
    --user-name Bob
```

Output:

```
{
    "AttachedPolicies": [
        {
            "PolicyName": "AdministratorAccess",
            "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
        },
        {
            "PolicyName": "SecurityAudit",
            "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListAttachedUserPolicies in *AWS CLI Command Reference*.

### `list-entities-for-policy`

The following code example shows how to use `list-entities-for-policy`.

#### AWS CLI

**To list all users, groups, and roles that the specified managed policy is attached to**

This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
aws iam list-entities-for-policy \
    --policy-arn arn:aws:iam::123456789012:policy/TestPolicy
```

Output:

```
{
    "PolicyGroups": [
        {
            "GroupName": "Admins",
            "GroupId": "AGPACKCEVSQ6C2EXAMPLE"
        }
    ],
```

```
    "PolicyUsers": [
        {
            "UserName": "Alice",
            "UserId": "AIDACKCEVSQ6C2EXAMPLE"
        }
    ],
    "PolicyRoles": [
        {
            "RoleName": "DevRole",
            "RoleId": "AROADBQP57FF2AEXAMPLE"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListEntitiesForPolicy in *AWS CLI Command Reference*.

### `list-group-policies`

The following code example shows how to use `list-group-policies`.

#### AWS CLI

**To list all inline policies that are attached to the specified group**

The following `list-group-policies` command lists the names of inline policies that are attached to the IAM group named `Admins` in the current account.

```
aws iam list-group-policies \
    --group-name Admins
```

Output:

```
{
    "PolicyNames": [
        "AdminRoot",
        "ExamplePolicy"
    ]
}
```

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see ListGroupPolicies in *AWS CLI Command Reference*.

### `list-groups-for-user`

The following code example shows how to use `list-groups-for-user`.

**AWS CLI**

**To list the groups that an IAM user belongs to**

The following `list-groups-for-user` command displays the groups that the IAM user named Bob belongs to.

```
aws iam list-groups-for-user \
    --user-name Bob
```

Output:

```
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:18:08Z",
            "GroupId": "AKIAIOSFODNN7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admin",
            "GroupName": "Admin"
        },
        {
            "Path": "/",
            "CreateDate": "2013-05-06T01:37:28Z",
            "GroupId": "AKIAI44QH8DHBEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/s3-Users",
            "GroupName": "s3-Users"
        }
    ]
}
```

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see ListGroupsForUser in *AWS CLI Command Reference*.

### `list-groups`

The following code example shows how to use `list-groups`.

**AWS CLI**

**To list the IAM groups for the current account**

The following `list-groups` command lists the IAM groups in the current account.

```
aws iam list-groups
```

Output:

```
{
    "Groups": [
        {
            "Path": "/",
            "CreateDate": "2013-06-04T20:27:27.972Z",
            "GroupId": "AIDACKCEVSQ6C2EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/Admins",
            "GroupName": "Admins"
        },
        {
            "Path": "/",
            "CreateDate": "2013-04-16T20:30:42Z",
            "GroupId": "AIDGPMS9RO4H3FEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/S3-Admins",
            "GroupName": "S3-Admins"
        }
    ]
}
```

For more information, see Managing IAM user groups in the *AWS IAM User Guide*.

- For API details, see ListGroups in *AWS CLI Command Reference*.

### `list-instance-profile-tags`

The following code example shows how to use `list-instance-profile-tags`.

**AWS CLI**

**To list the tags attached to an instance profile**

The following `list-instance-profile-tags` command retrieves the list of tags associated with the specified instance profile.

```
aws iam list-instance-profile-tags \
    --instance-profile-name deployment-role
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfileTags in *AWS CLI Command Reference*.

## `list-instance-profiles-for-role`

The following code example shows how to use `list-instance-profiles-for-role`.

**AWS CLI**

**To list the instance profiles for an IAM role**

The following `list-instance-profiles-for-role` command lists the instance profiles that are associated with the role `Test-Role`.

```
aws iam list-instance-profiles-for-role \
    --role-name Test-Role
```

Output:

```
{
    "InstanceProfiles": [
        {
            "InstanceProfileId": "AIDGPMS9RO4H3FEXAMPLE",
            "Roles": [
                {
                    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
                    "RoleId": "AIDACKCEVSQ6C2EXAMPLE",
                    "CreateDate": "2013-06-07T20:42:15Z",
                    "RoleName": "Test-Role",
                    "Path": "/",
                    "Arn": "arn:aws:iam::123456789012:role/Test-Role"
                }
            ],
            "CreateDate": "2013-06-07T21:05:24Z",
            "InstanceProfileName": "ExampleInstanceProfile",
            "Path": "/",
            "Arn": "arn:aws:iam::123456789012:instance-profile/
ExampleInstanceProfile"
        }
    ]
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfilesForRole in *AWS CLI Command Reference*.

## `list-instance-profiles`

The following code example shows how to use `list-instance-profiles`.

### AWS CLI

#### To lists the instance profiles for the account

The following `list-instance-profiles` command lists the instance profiles that are associated with the current account.

```
aws iam list-instance-profiles
```

Output:

```
{
    "InstanceProfiles": [
        {
            "Path": "/",
            "InstanceProfileName": "example-dev-role",
            "InstanceProfileId": "AIPAIXEU4NUHUPEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:instance-profile/example-dev-role",
            "CreateDate": "2023-09-21T18:17:41+00:00",
            "Roles": [
                {
                    "Path": "/",
                    "RoleName": "example-dev-role",
                    "RoleId": "AROAJ52OTH4H7LEXAMPLE",
                    "Arn": "arn:aws:iam::123456789012:role/example-dev-role",
                    "CreateDate": "2023-09-21T18:17:40+00:00",
                    "AssumeRolePolicyDocument": {
                        "Version": "2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
                                "Principal": {
                                    "Service": "ec2.amazonaws.com"
                                },
                                "Action": "sts:AssumeRole"
                            }
                        ]
                    }
                }
            ]
        },
        {
            "Path": "/",
            "InstanceProfileName": "example-s3-role",
            "InstanceProfileId": "AIPAJVJVNRIQFREXAMPLE",
            "Arn": "arn:aws:iam::123456789012:instance-profile/example-s3-role",

```

```
                    "AssumeRolePolicyDocument": {
                        "Version": "2012-10-17",
                        "Statement": [
                            {
                                "Effect": "Allow",
                                "Principal": {
                                    "Service": "ec2.amazonaws.com"
                                },
                                "Action": "sts:AssumeRole"
                            }
                        ]
                    }
                }
            ]
        }
    ]
}
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see ListInstanceProfiles in *AWS CLI Command Reference*.

### `list-mfa-device-tags`

The following code example shows how to use `list-mfa-device-tags`.

**AWS CLI**

**To list the tags attached to an MFA device**

The following `list-mfa-device-tags` command retrieves the list of tags associated with the specified MFA device.

```
aws iam list-mfa-device-tags \
    --serial-number arn:aws:iam::123456789012:mfa/alice
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
```

```
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListMfaDeviceTags in *AWS CLI Command Reference*.

### `list-mfa-devices`

The following code example shows how to use `list-mfa-devices`.

#### AWS CLI

**To list all MFA devices for a specified user**

This example returns details about the MFA device assigned to the IAM user Bob.

```
aws iam list-mfa-devices \
    --user-name Bob
```

Output:

```
{
    "MFADevices": [
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Bob",
            "EnableDate": "2019-10-28T20:37:09+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "GAKT12345678",
            "EnableDate": "2023-02-18T21:44:42+00:00"
        },
        {
            "UserName": "Bob",
```

```
            "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey1-7XNL7NFNLZ123456789EXAMPLE",
            "EnableDate": "2023-09-19T02:25:35+00:00"
        },
        {
            "UserName": "Bob",
            "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey2-VDRQTDBBN5123456789EXAMPLE",
            "EnableDate": "2023-09-19T01:49:18+00:00"
        }
    ]
}
```

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see ListMfaDevices in *AWS CLI Command Reference*.

### `list-open-id-connect-provider-tags`

The following code example shows how to use `list-open-id-connect-provider-tags`.

#### AWS CLI

**To list the tags attached to an OpenID Connect (OIDC)-compatible identity provider**

The following `list-open-id-connect-provider-tags` command retrieves the list of tags associated with the specified OIDC identity provider.

```
aws iam list-open-id-connect-provider-tags \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
```

```
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListOpenIdConnectProviderTags in *AWS CLI Command Reference*.

### `list-open-id-connect-providers`

The following code example shows how to use `list-open-id-connect-providers`.

**AWS CLI**

**To list information about the OpenID Connect providers in the AWS account**

This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

```
aws iam list-open-id-connect-providers
```

Output:

```
{
    "OpenIDConnectProviderList": [
        {
            "Arn": "arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com"
        }
    ]
}
```

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see ListOpenIdConnectProviders in *AWS CLI Command Reference*.

### `list-policies-granting-service-access`

The following code example shows how to use `list-policies-granting-service-access`.

**AWS CLI**

**To list the policies that grant a principal access to the specified service**

The following `list-policies-granting-service-access` example retrieves the list of policies that grant the IAM user `sofia` access to AWS CodeCommit service.

```
aws iam list-policies-granting-service-access \
    --arn arn:aws:iam::123456789012:user/sofia \
    --service-namespaces codecommit
```

Output:

```
{
    "PoliciesGrantingServiceAccess": [
        {
            "ServiceNamespace": "codecommit",
            "Policies": [
                {
                    "PolicyName": "Grant-Sofia-Access-To-CodeCommit",
                    "PolicyType": "INLINE",
                    "EntityType": "USER",
                    "EntityName": "sofia"
                }
            ]
        }
    ],
    "IsTruncated": false
}
```

For more information, see Using IAM with CodeCommit: Git credentials, SSH keys, and AWS access keys in the *AWS IAM User Guide*.

- For API details, see ListPoliciesGrantingServiceAccess in *AWS CLI Command Reference*.

## `list-policies`

The following code example shows how to use `list-policies`.

**AWS CLI**

**To list managed policies that are available to your AWS account**

This example returns a collection of the first two managed policies available in the current AWS account.

```
aws iam list-policies \
    --max-items 3
```

Output:

```
{
    "Policies": [
        {
            "PolicyName": "AWSCloudTrailAccessPolicy",
            "PolicyId": "ANPAXQE2B5PJ7YEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:policy/AWSCloudTrailAccessPolicy",
            "Path": "/",
            "DefaultVersionId": "v1",
            "AttachmentCount": 0,
            "PermissionsBoundaryUsageCount": 0,
            "IsAttachable": true,
            "CreateDate": "2019-09-04T17:43:42+00:00",
            "UpdateDate": "2019-09-04T17:43:42+00:00"
        },
        {
            "PolicyName": "AdministratorAccess",
            "PolicyId": "ANPAIWMBCKSKIEE64ZLYK",
            "Arn": "arn:aws:iam::aws:policy/AdministratorAccess",
            "Path": "/",
            "DefaultVersionId": "v1",
            "AttachmentCount": 6,
            "PermissionsBoundaryUsageCount": 0,
            "IsAttachable": true,
            "CreateDate": "2015-02-06T18:39:46+00:00",
            "UpdateDate": "2015-02-06T18:39:46+00:00"
        },
        {
            "PolicyName": "PowerUserAccess",
            "PolicyId": "ANPAJYRXTHIB4FOVS3ZXS",
            "Arn": "arn:aws:iam::aws:policy/PowerUserAccess",
            "Path": "/",
            "DefaultVersionId": "v5",
            "AttachmentCount": 1,
            "PermissionsBoundaryUsageCount": 0,
            "IsAttachable": true,
```

```
            "CreateDate": "2015-02-06T18:39:47+00:00",
            "UpdateDate": "2023-07-06T22:04:00+00:00"
        }
    ],
    "NextToken": "EXAMPLErZXIiOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiA4fQ=="
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

### `list-policy-tags`

The following code example shows how to use `list-policy-tags`.

#### AWS CLI

**To list the tags attached to a managed policy**

The following `list-policy-tags` command retrieves the list of tags associated with the specified managed policy.

```
aws iam list-policy-tags \
    --policy-arn arn:aws:iam::123456789012:policy/billing-access
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListPolicyTags in *AWS CLI Command Reference*.

### `list-policy-versions`

The following code example shows how to use `list-policy-versions`.

#### AWS CLI

**To list information about the versions of the specified managed policy**

This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam list-policy-versions \
    --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
    "IsTruncated": false,
    "Versions": [
        {
        "VersionId": "v2",
        "IsDefaultVersion": true,
        "CreateDate": "2015-06-02T23:19:44Z"
        },
        {
        "VersionId": "v1",
        "IsDefaultVersion": false,
        "CreateDate": "2015-06-02T22:30:47Z"
        }
    ]
}
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see ListPolicyVersions in *AWS CLI Command Reference*.

### `list-role-policies`

The following code example shows how to use `list-role-policies`.

#### AWS CLI

**To list the policies attached to an IAM role**

The following `list-role-policies` command lists the names of the permissions policies for the specified IAM role.

```
aws iam list-role-policies \
    --role-name Test-Role
```

Output:

```
{
    "PolicyNames": [
        "ExamplePolicy"
    ]
}
```

To see the trust policy attached to a role, use the `get-role` command. To see the details of a permissions policy, use the `get-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see ListRolePolicies in *AWS CLI Command Reference*.

### `list-role-tags`

The following code example shows how to use `list-role-tags`.

#### AWS CLI

**To list the tags attached to a role**

The following `list-role-tags` command retrieves the list of tags associated with the specified role.

```
aws iam list-role-tags \
    --role-name production-role
```

Output:

```
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
```

```
        },
        {
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListRoleTags in *AWS CLI Command Reference*.

### `list-roles`

The following code example shows how to use `list-roles`.

#### AWS CLI

**To list IAM roles for the current account**

The following `list-roles` command lists IAM roles for the current account.

```
aws iam list-roles
```

Output:

```
{
    "Roles": [
        {
            "Path": "/",
            "RoleName": "ExampleRole",
            "RoleId": "AROAJ52OTH4H7LEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:role/ExampleRole",
            "CreateDate": "2017-09-12T19:23:36+00:00",
            "AssumeRolePolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Sid": "",
                        "Effect": "Allow",
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
```

```
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "MaxSessionDuration": 3600
        },
        {
            "Path": "/example_path/",
            "RoleName": "ExampleRoleWithPath",
            "RoleId": "AROAI4QRP7UFT7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:role/example_path/
ExampleRoleWithPath",
            "CreateDate": "2023-09-21T20:29:38+00:00",
            "AssumeRolePolicyDocument": {
                "Version": "2012-10-17",
                "Statement": [
                    {
                        "Sid": "",
                        "Effect": "Allow",
                        "Principal": {
                            "Service": "ec2.amazonaws.com"
                        },
                        "Action": "sts:AssumeRole"
                    }
                ]
            },
            "MaxSessionDuration": 3600
        }
    ]
}
```

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see ListRoles in *AWS CLI Command Reference*.

## `list-saml-provider-tags`

The following code example shows how to use `list-saml-provider-tags`.

### AWS CLI

#### To list the tags attached to a SAML provider

The following `list-saml-provider-tags` command retrieves the list of tags associated with the specified SAML provider.

```
aws iam list-saml-provider-tags \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListSamlProviderTags in *AWS CLI Command Reference*.

## `list-saml-providers`

The following code example shows how to use `list-saml-providers`.

### AWS CLI

#### To list the SAML providers in the AWS account

This example retrieves the list of SAML 2.0 providers created in the current AWS account.

```
aws iam list-saml-providers
```

Output:

```
{
    "SAMLProviderList": [
```

```
        {
            "Arn": "arn:aws:iam::123456789012:saml-provider/SAML-ADFS",
            "ValidUntil": "2015-06-05T22:45:14Z",
            "CreateDate": "2015-06-05T22:45:14Z"
        }
    ]
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see ListSAMLProviders in *AWS CLI Command Reference*.

### `list-server-certificate-tags`

The following code example shows how to use `list-server-certificate-tags`.

**AWS CLI**

**To list the tags attached to a server certificate**

The following `list-server-certificate-tags` command retrieves the list of tags associated with the specified server certificate.

```
aws iam list-server-certificate-tags \
    --server-certificate-name ExampleCertificate
```

Output:

```
{
    "Tags": [
        {
            "Key": "DeptID",
            "Value": "123456"
        },
        {
            "Key": "Department",
            "Value": "Accounting"
        }
    ]
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListServerCertificateTags in *AWS CLI Command Reference*.

### `list-server-certificates`

The following code example shows how to use `list-server-certificates`.

**AWS CLI**

**To list the server certificates in your AWS account**

The following `list-server-certificates` command lists all of the server certificates stored and available for use in your AWS account.

```
aws iam list-server-certificates
```

Output:

```
{
    "ServerCertificateMetadataList": [
        {
            "Path": "/",
            "ServerCertificateName": "myUpdatedServerCertificate",
            "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/
myUpdatedServerCertificate",
            "UploadDate": "2019-04-22T21:13:44+00:00",
            "Expiration": "2019-10-15T22:23:16+00:00"
        },
        {
            "Path": "/cloudfront/",
            "ServerCertificateName": "MyTestCert",
            "ServerCertificateId": "ASCAEXAMPLE456EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:server-certificate/Org1/Org2/
MyTestCert",
            "UploadDate": "2015-04-21T18:14:16+00:00",
            "Expiration": "2018-01-14T17:52:36+00:00"
        }
    ]
}
```

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see ListServerCertificates in *AWS CLI Command Reference*.

## `list-service-specific-credential`

The following code example shows how to use `list-service-specific-credential`.

### AWS CLI

#### Example 1: List the service-specific credentials for a user

The following `list-service-specific-credentials` example displays all service-specific credentials assigned to the specified user. Passwords are not included in the response.

```
aws iam list-service-specific-credentials \
    --user-name sofia
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

#### Example 2: List the service-specific credentials for a user filtered to a specified service

The following `list-service-specific-credentials` example displays the service-specific credentials assigned to the user making the request. The list is filtered to include only those credentials for the specified service. Passwords are not included in the response.

```
aws iam list-service-specific-credentials \
    --service-name codecommit.amazonaws.com
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
```

```
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see ListServiceSpecificCredential in *AWS CLI Command Reference*.

## `list-service-specific-credentials`

The following code example shows how to use `list-service-specific-credentials`.

### AWS CLI

#### To retrieve a list of credentials

The following `list-service-specific-credentials` example lists the credentials generated for HTTPS access to AWS CodeCommit repositories for a user named `developer`.

```
aws iam list-service-specific-credentials \
    --user-name developer \
    --service-name codecommit.amazonaws.com
```

Output:

```
{
    "ServiceSpecificCredentials": [
        {
            "UserName": "developer",
            "Status": "Inactive",
            "ServiceUserName": "developer-at-123456789012",
            "CreateDate": "2019-10-01T04:31:41Z",
            "ServiceSpecificCredentialId": "ACCAQFODXMPL4YFHP7DZE",
            "ServiceName": "codecommit.amazonaws.com"
        },
        {
            "UserName": "developer",
```

```
            "Status": "Active",
            "ServiceUserName": "developer+1-at-123456789012",
            "CreateDate": "2019-10-01T04:31:45Z",
            "ServiceSpecificCredentialId": "ACCAQFOXMPL6VW57M7AJP",
            "ServiceName": "codecommit.amazonaws.com"
        }
    ]
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see ListServiceSpecificCredentials in *AWS CLI Command Reference*.

### `list-signing-certificates`

The following code example shows how to use `list-signing-certificates`.

#### AWS CLI

**To list the signing certificates for an IAM user**

The following `list-signing-certificates` command lists the signing certificates for the IAM user named Bob.

```
aws iam list-signing-certificates \
    --user-name Bob
```

Output:

```
{
    "Certificates": [
        {
            "UserName": "Bob",
            "Status": "Inactive",
            "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----
END CERTIFICATE-----",
            "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
            "UploadDate": "2013-06-06T21:40:08Z"
        }
    ]
}
```

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see ListSigningCertificates in *AWS CLI Command Reference*.

### `list-ssh-public-keys`

The following code example shows how to use `list-ssh-public-keys`.

**AWS CLI**

**To list the SSH public keys attached to an IAM user**

The following `list-ssh-public-keys` example lists the SSH public keys attached to the IAM user `sofia`.

```
aws iam list-ssh-public-keys \
    --user-name sofia
```

Output:

```
{
    "SSHPublicKeys": [
        {
            "UserName": "sofia",
            "SSHPublicKeyId": "APKA1234567890EXAMPLE",
            "Status": "Inactive",
            "UploadDate": "2019-04-18T17:04:49+00:00"
        }
    ]
}
```

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*

- For API details, see ListSshPublicKeys in *AWS CLI Command Reference*.

### `list-user-policies`

The following code example shows how to use `list-user-policies`.

**AWS CLI**

**To list policies for an IAM user**

The following `list-user-policies` command lists the policies that are attached to the IAM user named Bob.

```
aws iam list-user-policies \
    --user-name Bob
```

Output:

```
{
    "PolicyNames": [
        "ExamplePolicy",
        "TestPolicy"
    ]
}
```

For more information, see Creating an IAM user in your AWS account in the *AWS IAM User Guide*.

- For API details, see ListUserPolicies in *AWS CLI Command Reference*.

### `list-user-tags`

The following code example shows how to use `list-user-tags`.

#### AWS CLI

**To list the tags attached to a user**

The following `list-user-tags` command retrieves the list of tags associated with the specified IAM user.

```
aws iam list-user-tags \
    --user-name alice
```

Output:

```
{
    "Tags": [
        {
            "Key": "Department",
            "Value": "Accounting"
        },
        {
```

```
            "Key": "DeptID",
            "Value": "12345"
        }
    ],
    "IsTruncated": false
}
```

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see ListUserTags in *AWS CLI Command Reference*.

### `list-users`

The following code example shows how to use `list-users`.

#### AWS CLI

**To list IAM users**

The following `list-users` command lists the IAM users in the current account.

```
aws iam list-users
```

Output:

```
{
    "Users": [
        {
            "UserName": "Adele",
            "Path": "/",
            "CreateDate": "2013-03-07T05:14:48Z",
            "UserId": "AKIAI44QH8DHBEXAMPLE",
            "Arn": "arn:aws:iam::123456789012:user/Adele"
        },
        {
            "UserName": "Bob",
            "Path": "/",
            "CreateDate": "2012-09-21T23:03:13Z",
            "UserId": "AKIAIOSFODNN7EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:user/Bob"
        }
    ]
}
```

For more information, see Listing IAM users in the *AWS IAM User Guide*.

- For API details, see ListUsers in *AWS CLI Command Reference*.

### `list-virtual-mfa-devices`

The following code example shows how to use `list-virtual-mfa-devices`.

#### AWS CLI

**To list virtual MFA devices**

The following `list-virtual-mfa-devices` command lists the virtual MFA devices that have been configured for the current account.

```
aws iam list-virtual-mfa-devices
```

Output:

```
{
    "VirtualMFADevices": [
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/ExampleMFADevice"
        },
        {
            "SerialNumber": "arn:aws:iam::123456789012:mfa/Fred"
        }
    ]
}
```

For more information, see Enabling a virtual multi-factor authentication (MFA) device in the *AWS IAM User Guide*.

- For API details, see ListVirtualMfaDevices in *AWS CLI Command Reference*.

### `put-group-policy`

The following code example shows how to use `put-group-policy`.

#### AWS CLI

**To add a policy to a group**

The following `put-group-policy` command adds a policy to the IAM group named `Admins`.

```
aws iam put-group-policy \
    --group-name Admins \
    --policy-document file://AdminPolicy.json \
    --policy-name AdminRoot
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see Managing IAM policies in the *AWS IAM User Guide*.

- For API details, see PutGroupPolicy in *AWS CLI Command Reference*.

### `put-role-permissions-boundary`

The following code example shows how to use `put-role-permissions-boundary`.

**AWS CLI**

**Example 1: To apply a permissions boundary based on a custom policy to an IAM role**

The following `put-role-permissions-boundary` example applies the custom policy named `intern-boundary` as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --role-name lambda-application-role
```

This command produces no output.

**Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM role**

The following `put-role-permissions-boundary` example applies the AWS managed `PowerUserAccess` policy as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
```

```
    --role-name x-account-admin
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see PutRolePermissionsBoundary in *AWS CLI Command Reference*.

### `put-role-policy`

The following code example shows how to use `put-role-policy`.

**AWS CLI**

**To attach a permissions policy to an IAM role**

The following `put-role-policy` command adds a permissions policy to the role named `Test-Role`.

```
aws iam put-role-policy \
    --role-name Test-Role \
    --policy-name ExamplePolicy \
    --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

To attach a trust policy to a role, use the `update-assume-role-policy` command.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see PutRolePolicy in *AWS CLI Command Reference*.

### `put-user-permissions-boundary`

The following code example shows how to use `put-user-permissions-boundary`.

**AWS CLI**

**Example 1: To apply a permissions boundary based on a custom policy to an IAM user**

The following `put-user-permissions-boundary` example applies a custom policy named `intern-boundary` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \
    --user-name intern
```

This command produces no output.

**Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM user**

The following `put-user-permissions-boundary` example applies the AWS managed pollicy named `PowerUserAccess` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \
    --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \
    --user-name developer
```

This command produces no output.

For more information, see Adding and removing IAM identity permissions in the *AWS IAM User Guide*.

- For API details, see PutUserPermissionsBoundary in *AWS CLI Command Reference*.

## `put-user-policy`

The following code example shows how to use `put-user-policy`.

### AWS CLI

**To attach a policy to an IAM user**

The following `put-user-policy` command attaches a policy to the IAM user named Bob.

```
aws iam put-user-policy \
    --user-name Bob \
    --policy-name ExamplePolicy \
    --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see Adding and removing IAM identity permissions in the *AWS IAM User Guide*.

- For API details, see PutUserPolicy in *AWS CLI Command Reference*.

### `remove-client-id-from-open-id-connect-provider`

The following code example shows how to use `remove-client-id-from-open-id-connect-provider`.

**AWS CLI**

**To remove the specified client ID from the list of client IDs registered for the specified IAM OpenID Connect provider**

This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
aws iam remove-client-id-from-open-id-connect-provider
    --client-id My-TestApp-3 \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see RemoveClientIdFromOpenIdConnectProvider in *AWS CLI Command Reference*.

### `remove-role-from-instance-profile`

The following code example shows how to use `remove-role-from-instance-profile`.

**AWS CLI**

**To remove a role from an instance profile**

The following `remove-role-from-instance-profile` command removes the role named `Test-Role` from the instance profile named `ExampleInstanceProfile`.

```
aws iam remove-role-from-instance-profile \
    --instance-profile-name ExampleInstanceProfile \
    --role-name Test-Role
```

For more information, see Using instance profiles in the *AWS IAM User Guide*.

- For API details, see RemoveRoleFromInstanceProfile in *AWS CLI Command Reference*.

### `remove-user-from-group`

The following code example shows how to use `remove-user-from-group`.

**AWS CLI**

**To remove a user from an IAM group**

The following `remove-user-from-group` command removes the user named Bob from the IAM group named Admins.

```
aws iam remove-user-from-group \
    --user-name Bob \
    --group-name Admins
```

This command produces no output.

For more information, see Adding and removing users in an IAM user group in the *AWS IAM User Guide*.

- For API details, see RemoveUserFromGroup in *AWS CLI Command Reference*.

### `reset-service-specific-credential`

The following code example shows how to use `reset-service-specific-credential`.

**AWS CLI**

**Example 1: Reset the password for a service-specific credential attached to the user making the request**

The following `reset-service-specific-credential` example generates a new cryptographically strong password for the specified service-specific credential attached to the user making the request.

```
aws iam reset-service-specific-credential \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcOzGcKOayTmE3LnAmAmH4=",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
        "Status": "Active"
    }
}
```

**Example 2: Reset the password for a service-specific credential attached to a specified user**

The following `reset-service-specific-credential` example generates a new cryptographically strong password for a service-specific credential attached to the specified user.

```
aws iam reset-service-specific-credential \
    --user-name sofia \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{
    "ServiceSpecificCredential": {
        "CreateDate": "2019-04-18T20:45:36+00:00",
        "ServiceName": "codecommit.amazonaws.com",
        "ServiceUserName": "sofia-at-123456789012",
        "ServicePassword": "+oaFsNk7tLco+C/obP9GhhcOzGcKOayTmE3LnAmAmH4=",
        "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
        "UserName": "sofia",
```

```
        "Status": "Active"
    }
}
```

For more information, see Create Git credentials for HTTPS connections to CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see ResetServiceSpecificCredential in *AWS CLI Command Reference*.

### `resync-mfa-device`

The following code example shows how to use `resync-mfa-device`.

**AWS CLI**

**To synchronize an MFA device**

The following `resync-mfa-device` example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/BobsMFADevice` with an authenticator program that provided the two authentication codes.

```
aws iam resync-mfa-device \
    --user-name Bob \
    --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
    --authentication-code1 123456 \
    --authentication-code2 987654
```

This command produces no output.

For more information, see Using multi-factor authentication (MFA) in AWS in the *AWS IAM User Guide*.

- For API details, see ResyncMfaDevice in *AWS CLI Command Reference*.

### `set-default-policy-version`

The following code example shows how to use `set-default-policy-version`.

**AWS CLI**

**To set the specified version of the specified policy as the policy's default version.**

This example sets the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```
aws iam set-default-policy-version \
    --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
    --version-id v2
```

For more information, see Policies and permissions in IAM in the *AWS IAM User Guide*.

- For API details, see SetDefaultPolicyVersion in *AWS CLI Command Reference*.

### `set-security-token-service-preferences`

The following code example shows how to use `set-security-token-service-preferences`.

**AWS CLI**

**To set the global endpoint token version**

The following `set-security-token-service-preferences` example configures Amazon STS to use version 2 tokens when you authenticate against the global endpoint.

```
aws iam set-security-token-service-preferences \
    --global-endpoint-token-version v2Token
```

This command produces no output.

For more information, see Managing AWS STS in an AWS Region in the *AWS IAM User Guide*.

- For API details, see SetSecurityTokenServicePreferences in *AWS CLI Command Reference*.

### `simulate-custom-policy`

The following code example shows how to use `simulate-custom-policy`.

**AWS CLI**

**Example 1: To simulate the effects of all IAM policies associated with an IAM user or role**

The following `simulate-custom-policy` shows how to provide both the policy and define variable values and simulate an API call to see if it is allowed or denied. The following example shows a policy that enables database access only after a specified date and time. The simulation

succeeds because the simulated actions and the specified `aws:CurrentTime` variable all match the requirements of the policy.

```
aws iam simulate-custom-policy \
    --policy-input-list '{"Version":"2012-10-17","Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
{"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}}' \
    --action-names dynamodb:CreateBackup \
    --context-entries
 "ContextKeyName='aws:CurrentTime',ContextKeyValues='2019-04-25T11:00:00Z',ContextKeyType=da
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "dynamodb:CreateBackup",
            "EvalResourceName": "*",
            "EvalDecision": "allowed",
            "MatchedStatements": [
                {
                    "SourcePolicyId": "PolicyInputList.1",
                    "StartPosition": {
                        "Line": 1,
                        "Column": 38
                    },
                    "EndPosition": {
                        "Line": 1,
                        "Column": 167
                    }
                }
            ],
            "MissingContextValues": []
        }
    ]
}
```

**Example 2: To simulate a command that is prohibited by the policy**

The following `simulate-custom-policy` example shows the results of simulating a command that is prohibited by the policy. In this example, the provided date is before that required by the policy's condition.

```
aws iam simulate-custom-policy \
    --policy-input-list '{"Version":"2012-10-17","Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
{"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}}' \
    --action-names dynamodb:CreateBackup \
    --context-entries
 "ContextKeyName='aws:CurrentTime',ContextKeyValues='2014-04-25T11:00:00Z',ContextKeyType=da
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "dynamodb:CreateBackup",
            "EvalResourceName": "*",
            "EvalDecision": "implicitDeny",
            "MatchedStatements": [],
            "MissingContextValues": []
        }
    ]
}
```

For more information, see Testing IAM policies with the IAM policy simulator in the *AWS IAM User Guide*.

- For API details, see SimulateCustomPolicy in *AWS CLI Command Reference*.

### `simulate-principal-policy`

The following code example shows how to use `simulate-principal-policy`.

**AWS CLI**

**Example 1: To simulate the effects of an arbitrary IAM policy**

The following `simulate-principal-policy` shows how to simulate a user calling an API action and determining whether the policies associated with that user allow or deny the action. In the following example, the user has a policy that allows only the `codecommit:ListRepositories` action.

```
aws iam simulate-principal-policy \
```

```
    --policy-source-arn arn:aws:iam::123456789012:user/alejandro \
    --action-names codecommit:ListRepositories
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "codecommit:ListRepositories",
            "EvalResourceName": "*",
            "EvalDecision": "allowed",
            "MatchedStatements": [
                {
                    "SourcePolicyId": "Grant-Access-To-CodeCommit-ListRepo",
                    "StartPosition": {
                        "Line": 3,
                        "Column": 19
                    },
                    "EndPosition": {
                        "Line": 9,
                        "Column": 10
                    }
                }
            ],
            "MissingContextValues": []
        }
    ]
}
```

**Example 2: To simulate the effects of a prohibited command**

The following `simulate-custom-policy` example shows the results of simulating a command that is prohibited by one of the user's policies. In the following example, the user has a policy that permits access to a DynamoDB database only after a certain date and time. The simulation has the user attempting to access the database with an `aws:CurrentTime` value that is earlier than the policy's condition permits.

```
aws iam simulate-principal-policy \
    --policy-source-arn arn:aws:iam::123456789012:user/alejandro \
    --action-names dynamodb:CreateBackup \
    --context-entries
 "ContextKeyName='aws:CurrentTime',ContextKeyValues='2018-04-25T11:00:00Z',ContextKeyType=da
```

Output:

```
{
    "EvaluationResults": [
        {
            "EvalActionName": "dynamodb:CreateBackup",
            "EvalResourceName": "*",
            "EvalDecision": "implicitDeny",
            "MatchedStatements": [],
            "MissingContextValues": []
        }
    ]
}
```

For more information, see Testing IAM policies with the IAM policy simulator in the *AWS IAM User Guide*.

- For API details, see SimulatePrincipalPolicy in *AWS CLI Command Reference*.

### `tag-instance-profile`

The following code example shows how to use `tag-instance-profile`.

#### AWS CLI

**To add a tag to an instance profile**

The following `tag-instance-profile` command adds a tag with a Department name to the specified instance profile.

```
aws iam tag-instance-profile \
    --instance-profile-name deployment-role \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagInstanceProfile in *AWS CLI Command Reference*.

### `tag-mfa-device`

The following code example shows how to use `tag-mfa-device`.

**AWS CLI**

**To add a tag to an MFA device**

The following `tag-mfa-device` command adds a tag with a Department name to the specified MFA device.

```
aws iam tag-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/alice \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagMfaDevice in *AWS CLI Command Reference*.

### `tag-open-id-connect-provider`

The following code example shows how to use `tag-open-id-connect-provider`.

**AWS CLI**

**To add a tag to an OpenID Connect (OIDC)-compatible identity provider**

The following `tag-open-id-connect-provider` command adds a tag with a Department name to the specified OIDC identity provider.

```
aws iam tag-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagOpenIdConnectProvider in *AWS CLI Command Reference*.

### `tag-policy`

The following code example shows how to use `tag-policy`.

**AWS CLI**

**To add a tag to a customer managed policy**

The following `tag-policy` command adds a tag with a Department name to the specified customer managed policy.

```
aws iam tag-policy \
    --policy-arn arn:aws:iam::123456789012:policy/billing-access \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagPolicy in *AWS CLI Command Reference*.

### `tag-role`

The following code example shows how to use `tag-role`.

**AWS CLI**

**To add a tag to a role**

The following `tag-role` command adds a tag with a Department name to the specified role.

```
aws iam tag-role --role-name my-role \
    --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagRole in *AWS CLI Command Reference*.

### `tag-saml-provider`

The following code example shows how to use `tag-saml-provider`.

**AWS CLI**

**To add a tag to a SAML provider**

The following `tag-saml-provider` command adds a tag with a Department name to the specified SAML provider.

```
aws iam tag-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagSamlProvider in *AWS CLI Command Reference*.

### `tag-server-certificate`

The following code example shows how to use `tag-server-certificate`.

**AWS CLI**

**To add a tag to a server certificate**

The following `tag-saml-provider` command adds a tag with a Department name to the specified sever certificate.

```
aws iam tag-server-certificate \
    --server-certificate-name ExampleCertificate \
    --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagServerCertificate in *AWS CLI Command Reference*.

### `tag-user`

The following code example shows how to use `tag-user`.

**AWS CLI**

**To add a tag to a user**

The following `tag-user` command adds a tag with the associated Department to the specified user.

```
aws iam tag-user \
    --user-name alice \
    --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see TagUser in *AWS CLI Command Reference*.

### `untag-instance-profile`

The following code example shows how to use `untag-instance-profile`.

**AWS CLI**

**To remove a tag from an instance profile**

The following `untag-instance-profile` command removes any tag with the key name 'Department' from the specified instance profile.

```
aws iam untag-instance-profile \
    --instance-profile-name deployment-role \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagInstanceProfile in *AWS CLI Command Reference*.

### `untag-mfa-device`

The following code example shows how to use `untag-mfa-device`.

**AWS CLI**

**To remove a tag from an MFA device**

The following `untag-mfa-device` command removes any tag with the key name 'Department' from the specified MFA device.

```
aws iam untag-mfa-device \
    --serial-number arn:aws:iam::123456789012:mfa/alice \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagMfaDevice in *AWS CLI Command Reference*.

### `untag-open-id-connect-provider`

The following code example shows how to use `untag-open-id-connect-provider`.

#### AWS CLI

**To remove a tag from an OIDC identity provider**

The following `untag-open-id-connect-provider` command removes any tag with the key name 'Department' from the specified OIDC identity provider.

```
aws iam untag-open-id-connect-provider \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagOpenIdConnectProvider in *AWS CLI Command Reference*.

### `untag-policy`

The following code example shows how to use `untag-policy`.

#### AWS CLI

**To remove a tag from a customer managed policy**

The following `untag-policy` command removes any tag with the key name 'Department' from the specified customer managed policy.

```
aws iam untag-policy \
    --policy-arn arn:aws:iam::452925170507:policy/billing-access \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagPolicy in *AWS CLI Command Reference*.

### `untag-role`

The following code example shows how to use `untag-role`.

#### AWS CLI

**To remove a tag from a role**

The following `untag-role` command removes any tag with the key name 'Department' from the specified role.

```
aws iam untag-role \
    --role-name my-role \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagRole in *AWS CLI Command Reference*.

### `untag-saml-provider`

The following code example shows how to use `untag-saml-provider`.

#### AWS CLI

**To remove a tag from a SAML provider**

The following `untag-saml-provider` command removes any tag with the key name 'Department' from the specified instance profile.

```
aws iam untag-saml-provider \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagSamlProvider in *AWS CLI Command Reference*.

### `untag-server-certificate`

The following code example shows how to use `untag-server-certificate`.

#### AWS CLI

**To remove a tag from a server certificate**

The following `untag-server-certificate` command removes any tag with the key name 'Department' from the specified server certificate.

```
aws iam untag-server-certificate \
    --server-certificate-name ExampleCertificate \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagServerCertificate in *AWS CLI Command Reference*.

### `untag-user`

The following code example shows how to use `untag-user`.

#### AWS CLI

**To remove a tag from a user**

The following `untag-user` command removes any tag with the key name 'Department' from the specified user.

```
aws iam untag-user \
    --user-name alice \
    --tag-keys Department
```

This command produces no output.

For more information, see Tagging IAM resources in the *AWS IAM User Guide*.

- For API details, see UntagUser in *AWS CLI Command Reference*.

### `update-access-key`

The following code example shows how to use `update-access-key`.

**AWS CLI**

**To activate or deactivate an access key for an IAM user**

The following `update-access-key` command deactivates the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam update-access-key \
    --access-key-id AKIAIOSFODNN7EXAMPLE \
    --status Inactive \
    --user-name Bob
```

This command produces no output.

Deactivating the key means that it cannot be used for programmatic access to AWS. However, the key is still available and can be reactivated.

For more information, see Managing access keys for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateAccessKey in *AWS CLI Command Reference*.

### `update-account-password-policy`

The following code example shows how to use `update-account-password-policy`.

**AWS CLI**

**To set or change the current account password policy**

The following `update-account-password-policy` command sets the password policy to require a minimum length of eight characters and to require one or more numbers in the password.

```
aws iam update-account-password-policy \
    --minimum-password-length 8 \
    --require-numbers
```

This command produces no output.

Changes to an account's password policy affect any new passwords that are created for IAM users in the account. Password policy changes do not affect existing passwords.

For more information, see Setting an account password policy for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateAccountPasswordPolicy in *AWS CLI Command Reference*.

### `update-assume-role-policy`

The following code example shows how to use `update-assume-role-policy`.

**AWS CLI**

**To update the trust policy for an IAM role**

The following `update-assume-role-policy` command updates the trust policy for the role named `Test-Role`.

```
aws iam update-assume-role-policy \
    --role-name Test-Role \
    --policy-document file://Test-Role-Trust-Policy.json
```

This command produces no output.

The trust policy is defined as a JSON document in the *Test-Role-Trust-Policy.json* file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To update the permissions policy for a role, use the `put-role-policy` command.

For more information, see Creating IAM roles in the *AWS IAM User Guide*.

- For API details, see UpdateAssumeRolePolicy in *AWS CLI Command Reference*.

### `update-group`

The following code example shows how to use `update-group`.

**AWS CLI**

**To rename an IAM group**

The following `update-group` command changes the name of the IAM group `Test` to `Test-1`.

```
aws iam update-group \
    --group-name Test \
    --new-group-name Test-1
```

This command produces no output.

For more information, see Renaming an IAM user group in the *AWS IAM User Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

### `update-login-profile`

The following code example shows how to use `update-login-profile`.

**AWS CLI**

**To update the password for an IAM user**

The following `update-login-profile` command creates a new password for the IAM user named Bob.

```
aws iam update-login-profile \
    --user-name Bob \
    --password <password>
```

This command produces no output.

To set a password policy for the account, use the `update-account-password-policy` command. If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

Store the password in a secure place. If the password is lost, it cannot be recovered, and you must create a new one using the `create-login-profile` command.

For more information, see Managing passwords for IAM users in the *AWS IAM User Guide*.

- For API details, see UpdateLoginProfile in *AWS CLI Command Reference*.

### `update-open-id-connect-provider-thumbprint`

The following code example shows how to use `update-open-id-connect-provider-thumbprint`.

**AWS CLI**

**To replace the existing list of server certificate thumbprints with a new list**

This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint.

```
aws iam update-open-id-connect-provider-thumbprint \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com \
    --thumbprint-list 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

This command produces no output.

For more information, see Creating OpenID Connect (OIDC) identity providers in the *AWS IAM User Guide*.

- For API details, see UpdateOpenIdConnectProviderThumbprint in *AWS CLI Command Reference*.

### `update-role-description`

The following code example shows how to use `update-role-description`.

**AWS CLI**

**To change an IAM role's description**

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role`.

```
aws iam update-role-description \
    --role-name production-role \
    --description 'Main production role'
```

Output:

```
{
    "Role": {
        "Path": "/",
        "RoleName": "production-role",
        "RoleId": "AROA1234567890EXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/production-role",
        "CreateDate": "2017-12-06T17:16:37+00:00",
        "AssumeRolePolicyDocument": {
            "Version": "2012-10-17",
            "Statement": [
                {
                    "Effect": "Allow",
                    "Principal": {
                        "AWS": "arn:aws:iam::123456789012:root"
                    },
                    "Action": "sts:AssumeRole",
                    "Condition": {}
                }
            ]
        },
        "Description": "Main production role"
    }
}
```

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see UpdateRoleDescription in *AWS CLI Command Reference*.

### `update-role`

The following code example shows how to use `update-role`.

**AWS CLI**

**To change an IAM role's description or session duration**

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role` and sets the maximum session duration to 12 hours.

```
aws iam update-role \
    --role-name production-role \
    --description 'Main production role' \
    --max-session-duration 43200
```

This command produces no output.

For more information, see Modifying a role in the *AWS IAM User Guide*.

- For API details, see UpdateRole in *AWS CLI Command Reference*.

### `update-saml-provider`

The following code example shows how to use `update-saml-provider`.

**AWS CLI**

**To update the metadata document for an existing SAML provider**

This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`.

```
aws iam update-saml-provider \
    --saml-metadata-document file://SAMLMetaData.xml \
    --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
    "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/SAMLADFS"
}
```

For more information, see Creating IAM SAML identity providers in the *AWS IAM User Guide*.

- For API details, see UpdateSamlProvider in *AWS CLI Command Reference*.

### `update-server-certificate`

The following code example shows how to use `update-server-certificate`.

**AWS CLI**

**To change the path or name of a server certificate in your AWS account**

The following `update-server-certificate` command changes the name of the certificate from `myServerCertificate` to `myUpdatedServerCertificate`. It also changes the path to `/cloudfront/` so that it can be accessed by the Amazon CloudFront service. This command produces no output. You can see the results of the update by running the `list-server-certificates` command.

```
aws-iam update-server-certificate \
    --server-certificate-name myServerCertificate \
    --new-server-certificate-name myUpdatedServerCertificate \
    --new-path /cloudfront/
```

This command produces no output.

For more information, see Managing server certificates in IAM in the *AWS IAM User Guide*.

- For API details, see UpdateServerCertificate in *AWS CLI Command Reference*.

### `update-service-specific-credential`

The following code example shows how to use `update-service-specific-credential`.

**AWS CLI**

**Example 1: To update the status of the requesting user's service-specific credential**

The following `update-service-specific-credential` example changes the status for the specified credential for the user making the request to `Inactive`.

```
aws iam update-service-specific-credential \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \
    --status Inactive
```

This command produces no output.

**Example 2: To update the status of a specified user's service-specific credential**

The following `update-service-specific-credential` example changes the status for the credential of the specified user to Inactive.

```
aws iam update-service-specific-credential \
    --user-name sofia \
    --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \
    --status Inactive
```

This command produces no output.

For more information, see Create Git Credentials for HTTPS Connections to CodeCommit in the *AWS CodeCommit User Guide*

- For API details, see UpdateServiceSpecificCredential in *AWS CLI Command Reference*.

## `update-signing-certificate`

The following code example shows how to use `update-signing-certificate`.

### AWS CLI

**To activate or deactivate a signing certificate for an IAM user**

The following `update-signing-certificate` command deactivates the specified signing certificate for the IAM user named Bob.

```
aws iam update-signing-certificate \
    --certificate-id TA7SMP42TDN5Z26OBPJE7EXAMPLE \
    --status Inactive \
    --user-name Bob
```

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see Manage signing certificates in the *Amazon EC2 User Guide*.

- For API details, see UpdateSigningCertificate in *AWS CLI Command Reference*.

### `update-ssh-public-key`

The following code example shows how to use `update-ssh-public-key`.

#### AWS CLI

**To change the status of an SSH public key**

The following `update-ssh-public-key` command changes the status of the specified public key to `Inactive`.

```
aws iam update-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-id APKA1234567890EXAMPLE \
    --status Inactive
```

This command produces no output.

For more information, see Use SSH keys and SSH with CodeCommit in the *AWS IAM User Guide*.

- For API details, see UpdateSshPublicKey in *AWS CLI Command Reference*.

### `update-user`

The following code example shows how to use `update-user`.

#### AWS CLI

**To change an IAM user's name**

The following `update-user` command changes the name of the IAM user Bob to `Robert`.

```
aws iam update-user \
    --user-name Bob \
    --new-user-name Robert
```

This command produces no output.

For more information, see Renaming an IAM user group in the *AWS IAM User Guide*.

- For API details, see UpdateUser in *AWS CLI Command Reference*.

### `upload-server-certificate`

The following code example shows how to use `upload-server-certificate`.

**AWS CLI**

**To upload a server certificate to your AWS account**

The following **upload-server-certificate** command uploads a server certificate to your AWS account. In this example, the certificate is in the file `public_key_cert_file.pem`, the associated private key is in the file `my_private_key.pem`, and the the certificate chain provided by the certificate authority (CA) is in the `my_certificate_chain_file.pem` file. When the file has finished uploading, it is available under the name *myServerCertificate*. Parameters that begin with `file://` tells the command to read the contents of the file and use that as the parameter value instead of the file name itself.

```
aws iam upload-server-certificate \
    --server-certificate-name myServerCertificate \
    --certificate-body file://public_key_cert_file.pem \
    --private-key file://my_private_key.pem \
    --certificate-chain file://my_certificate_chain_file.pem
```

Output:

```
{
    "ServerCertificateMetadata": {
        "Path": "/",
        "ServerCertificateName": "myServerCertificate",
        "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
        "Arn": "arn:aws:iam::1234567989012:server-certificate/myServerCertificate",
        "UploadDate": "2019-04-22T21:13:44+00:00",
        "Expiration": "2019-10-15T22:23:16+00:00"
    }
}
```

For more information, see Creating, Uploading, and Deleting Server Certificates in the *Using IAM* guide.

- For API details, see UploadServerCertificate in *AWS CLI Command Reference*.

### `upload-signing-certificate`

The following code example shows how to use `upload-signing-certificate`.

**AWS CLI**

**To upload a signing certificate for an IAM user**

The following `upload-signing-certificate` command uploads a signing certificate for the IAM user named Bob.

```
aws iam upload-signing-certificate \
    --user-name Bob \
    --certificate-body file://certificate.pem
```

Output:

```
{
    "Certificate": {
        "UserName": "Bob",
        "Status": "Active",
        "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END
 CERTIFICATE-----",
        "CertificateId": "TA7SMP42TDN5Z26OBPJE7EXAMPLE",
        "UploadDate": "2013-06-06T21:40:08.121Z"
    }
}
```

The certificate is in a file named *certificate.pem* in PEM format.

For more information, see Creating and Uploading a User Signing Certificate in the *Using IAM* guide.

- For API details, see UploadSigningCertificate in *AWS CLI Command Reference*.

### `upload-ssh-public-key`

The following code example shows how to use `upload-ssh-public-key`.

**AWS CLI**

**To upload an SSH public key and associate it with a user**

The following `upload-ssh-public-key` command uploads the public key found in the file `sshkey.pub` and attaches it to the user `sofia`.

```
aws iam upload-ssh-public-key \
    --user-name sofia \
    --ssh-public-key-body file://sshkey.pub
```

Output:

```
{
    "SSHPublicKey": {
        "UserName": "sofia",
        "SSHPublicKeyId": "APKA1234567890EXAMPLE",
        "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
        "SSHPublicKeyBody": "ssh-rsa <<long string generated by ssh-keygen
 command>>",
        "Status": "Active",
        "UploadDate": "2019-04-18T17:04:49+00:00"
    }
}
```

For more information about how to generate keys in a format suitable for this command, see SSH and Linux, macOS, or Unix: Set up the public and private keys for Git and CodeCommit or SSH and Windows: Set up the public and private keys for Git and CodeCommit in the *AWS CodeCommit User Guide*.

- For API details, see UploadSshPublicKey in *AWS CLI Command Reference*.

## IAM Access Analyzer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM Access Analyzer.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `apply-archive-rule`

The following code example shows how to use `apply-archive-rule`.

**AWS CLI**

**To apply an archive rule to existing findings that meet the archive rule criteria**

The following `apply-archive-rule` example applies an archive rule to existing findings that meet the archive rule criteria.

```
aws accessanalyzer apply-archive-rule \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyArchiveRule
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see ApplyArchiveRule in *AWS CLI Command Reference*.

#### `cancel-policy-generation`

The following code example shows how to use `cancel-policy-generation`.

**AWS CLI**

**To cancel the requested policy generation**

The following `cancel-policy-generation` example cancels the requested policy generation job id.

```
aws accessanalyzer cancel-policy-generation \
    --job-id 923a56b0-ebb8-4e80-8a3c-a11ccfbcd6f2
```

This command produces no output.

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see CancelPolicyGeneration in *AWS CLI Command Reference*.

### `check-access-not-granted`

The following code example shows how to use `check-access-not-granted`.

#### AWS CLI

**To check whether the specified access isn't allowed by a policy**

The following `check-access-not-granted` example checks whether the specified access isn't allowed by a policy.

```
aws accessanalyzer check-access-not-granted \
    --policy-document file://myfile.json \
    --access actions="s3:DeleteBucket","s3:GetBucketLocation" \
    --policy-type IDENTITY_POLICY
```

Contents of `myfile.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
```

```
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
            ]
        }
    ]
}
```

Output:

```
{
    "result": "PASS",
    "message": "The policy document does not grant access to perform the listed
 actions."
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CheckAccessNotGranted in *AWS CLI Command Reference*.

### `check-no-new-access`

The following code example shows how to use `check-no-new-access`.

#### AWS CLI

**To check whether new access is allowed for an updated policy when compared to the existing policy**

The following `check-no-new-access` example checks whether new access is allowed for an updated policy when compared to the existing policy.

```
aws accessanalyzer check-no-new-access \
    --existing-policy-document file://existing-policy.json \
    --new-policy-document file://new-policy.json \
    --policy-type IDENTITY_POLICY
```

Contents of `existing-policy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
```

```
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
            ]
        }
    ]
}
```

Contents of `new-policy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:GetObjectAcl",
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
                "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
            ]
        }
    ]
}
```

Output:

```
{
    "result": "FAIL",
    "message": "The modified permissions grant new access compared to your existing
 policy.",
    "reasons": [
        {
            "description": "New access in the statement with index: 0.",
```

```
            "statementIndex": 0
        }
    ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CheckNoNewAccess in *AWS CLI Command Reference*.

### `create-access-preview`

The following code example shows how to use `create-access-preview`.

**AWS CLI**

**To create an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions**

The following `create-access-preview` example creates an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions in your AWS account.

```
aws accessanalyzer create-access-preview \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --configurations file://myfile.json
```

Contents of `myfile.json`:

```
{
    "arn:aws:s3:::DOC-EXAMPLE-BUCKET": {
        "s3Bucket": {
            "bucketPolicy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Principal\":{\"AWS\":[\"arn:aws:iam::111122223333:root\"]},\"Action
\":[\"s3:PutObject\",\"s3:PutObjectAcl\"],\"Resource\":\"arn:aws:s3:::DOC-EXAMPLE-
BUCKET/*\"}]}",
            "bucketPublicAccessBlock": {
                "ignorePublicAcls": true,
                "restrictPublicBuckets": true
            },
            "bucketAclGrants": [
```

```
                {
                    "grantee": {
                        "id":
 "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
                    },
                    "permission": "READ"
                }
            ]
        }
    }
}
```

Output:

```
{
    "id": "3c65eb13-6ef9-4629-8919-a32043619e6b"
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see CreateAccessPreview in *AWS CLI Command Reference*.

### `create-analyzer`

The following code example shows how to use `create-analyzer`.

#### AWS CLI

**To create an analyzer**

The following `create-analyzer` example creates an analyzer in your AWS account.

```
aws accessanalyzer create-analyzer \
    --analyzer-name example \
    --type ACCOUNT
```

Output:

```
{
    "arn": "arn:aws:access-analyzer:us-east-2:111122223333:analyzer/example"
```

```
}
```

For more information, see Getting started with AWS Identity and Access Management Access Analyzer findings in the *AWS IAM User Guide*.

- For API details, see CreateAnalyzer in *AWS CLI Command Reference*.

### `create-archive-rule`

The following code example shows how to use `create-archive-rule`.

**AWS CLI**

**To create an archive rule for the specified analyzer**

The following `create-archive-rule` example creates an archive rule for the specified analyzer in your AWS account.

```
aws accessanalyzer create-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyRule \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see CreateArchiveRule in *AWS CLI Command Reference*.

### `delete-analyzer`

The following code example shows how to use `delete-analyzer`.

**AWS CLI**

**To delete the specified analyzer**

The following `delete-analyzer` example deletes the specified analyzer in your AWS account.

```
aws accessanalyzer delete-analyzer \
    --analyzer-name example
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see DeleteAnalyzer in *AWS CLI Command Reference*.

### `delete-archive-rule`

The following code example shows how to use `delete-archive-rule`.

**AWS CLI**

**To delete the specified archive rule**

The following `delete-archive-rule` example deletes the specified archive rule in your AWS account.

```
aws accessanalyzer delete-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyRule
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see DeleteArchiveRule in *AWS CLI Command Reference*.

### `get-access-preview`

The following code example shows how to use `get-access-preview`.

**AWS CLI**

**To retrieves information about an access preview for the specified analyzer**

The following `get-access-preview` example retrieves information about an access preview for the specified analyzer in your AWS account.

```
aws accessanalyzer get-access-preview \
    --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "accessPreview": {
        "id": "3c65eb13-6ef9-4629-8919-a32043619e6b",
        "analyzerArn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
        "configurations": {
            "arn:aws:s3:::DOC-EXAMPLE-BUCKET": {
                "s3Bucket": {
                    "bucketPolicy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":[\"arn:aws:iam::111122223333:root\"]},
\"Action\":[\"s3:PutObject\",\"s3:PutObjectAcl\"],\"Resource\":\"arn:aws:s3:::DOC-
EXAMPLE-BUCKET/*\"}]}",
                    "bucketAclGrants": [
                        {
                            "permission": "READ",
                            "grantee": {
                                "id":
 "79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
                            }
                        }
                    ],
                    "bucketPublicAccessBlock": {
                        "ignorePublicAcls": true,
                        "restrictPublicBuckets": true
                    }
                }
            }
        },
        "createdAt": "2024-02-17T00:18:44+00:00",
        "status": "COMPLETED"
    }
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see GetAccessPreview in *AWS CLI Command Reference*.

### `get-analyzed-resource`

The following code example shows how to use `get-analyzed-resource`.

**AWS CLI**

**To retrieve information about a resource that was analyzed**

The following `get-analyzed-resource` example retrieves information about a resource that was analyzed in your AWS account.

```
aws accessanalyzer get-analyzed-resource \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --resource-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET
```

Output:

```
{
    "resource": {
        "analyzedAt": "2024-02-15T18:01:53.002000+00:00",
        "isPublic": false,
        "resourceArn": "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
        "resourceOwnerAccount": "111122223333",
        "resourceType": "AWS::S3::Bucket"
    }
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see GetAnalyzedResource in *AWS CLI Command Reference*.

### `get-analyzer`

The following code example shows how to use `get-analyzer`.

**AWS CLI**

**To retrieve information about the specified analyzer**

The following `get-analyzer` example retrieves information about the specified analyzer in your AWS account.

```
aws accessanalyzer get-analyzer \
    --analyzer-name ConsoleAnalyzer-account
```

Output:

```
{
    "analyzer": {
        "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
        "createdAt": "2019-12-03T07:28:17+00:00",
        "lastResourceAnalyzed": "arn:aws:sns:us-west-2:111122223333:config-topic",
        "lastResourceAnalyzedAt": "2024-02-15T18:01:53.003000+00:00",
        "name": "ConsoleAnalyzer-account",
        "status": "ACTIVE",
        "tags": {
            "auto-delete": "no"
        },
        "type": "ACCOUNT"
    }
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see GetAnalyzer in *AWS CLI Command Reference*.

### `get-archive-rule`

The following code example shows how to use `get-archive-rule`.

#### AWS CLI

**To retrieve information about an archive rule**

The following `get-archive-rule` example retrieves information about an archive rule in your AWS account.

```
aws accessanalyzer get-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyArchiveRule
```

Output:

```
{
```

```
    "archiveRule": {
        "createdAt": "2024-02-15T00:49:27+00:00",
        "filter": {
            "resource": {
                "contains": [
                    "Cognito"
                ]
            },
            "resourceType": {
                "eq": [
                    "AWS::IAM::Role"
                ]
            }
        },
        "ruleName": "MyArchiveRule",
        "updatedAt": "2024-02-15T00:49:27+00:00"
    }
}
```

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see GetArchiveRule in *AWS CLI Command Reference*.

### `get-finding-v2`

The following code example shows how to use `get-finding-v2`.

#### AWS CLI

**To retrieve information about the specified finding**

The following `get-finding-v2` example etrieves information about the specified finding in your AWS account.

```
aws accessanalyzer get-finding-v2 \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-organization \
    --id 0910eedb-381e-4e95-adda-0d25c19e6e90
```

Output:

```
{
```

```
    "findingDetails": [
        {
            "externalAccessDetails": {
                "action": [
                    "sts:AssumeRoleWithWebIdentity"
                ],
                "condition": {
                    "cognito-identity.amazonaws.com:aud": "us-
west-2:EXAMPLE0-0000-0000-0000-000000000000"
                },
                "isPublic": false,
                "principal": {
                    "Federated": "cognito-identity.amazonaws.com"
                }
            }
        }
    ],
    "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
    "status": "ACTIVE",
    "error": null,
    "createdAt": "2021-02-26T21:17:50.905000+00:00",
    "resourceType": "AWS::IAM::Role",
    "findingType": "ExternalAccess",
    "resourceOwnerAccount": "111122223333",
    "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
    "id": "0910eedb-381e-4e95-adda-0d25c19e6e90",
    "updatedAt": "2021-02-26T21:17:50.905000+00:00"
}
```

For more information, see Reviewing findings in the *AWS IAM User Guide*.

- For API details, see GetFindingV2 in *AWS CLI Command Reference*.

## `get-finding`

The following code example shows how to use `get-finding`.

### AWS CLI

#### To retrieve information about the specified finding

The following `get-finding` example etrieves information about the specified finding in your AWS account.

```
aws accessanalyzer get-finding \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-organization \
    --id 0910eedb-381e-4e95-adda-0d25c19e6e90
```

Output:

```
{
    "finding": {
        "id": "0910eedb-381e-4e95-adda-0d25c19e6e90",
        "principal": {
            "Federated": "cognito-identity.amazonaws.com"
        },
        "action": [
            "sts:AssumeRoleWithWebIdentity"
        ],
        "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
        "isPublic": false,
        "resourceType": "AWS::IAM::Role",
        "condition": {
            "cognito-identity.amazonaws.com:aud": "us-
west-2:EXAMPLE0-0000-0000-0000-000000000000"
        },
        "createdAt": "2021-02-26T21:17:50.905000+00:00",
        "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
        "updatedAt": "2021-02-26T21:17:50.905000+00:00",
        "status": "ACTIVE",
        "resourceOwnerAccount": "111122223333"
    }
}
```

For more information, see Reviewing findings in the *AWS IAM User Guide*.

- For API details, see GetFinding in *AWS CLI Command Reference*.

### `get-generated-policy`

The following code example shows how to use `get-generated-policy`.

#### AWS CLI

**To retrieve the policy that was generated using the `StartPolicyGeneration` API**

The following `get-generated-policy` example retrieves the policy that was generated using the StartPolicyGeneration API in your AWS account.

```
aws accessanalyzer get-generated-policy \
    --job-id c557dc4a-0338-4489-95dd-739014860ff9
```

Output:

```
{
    "generatedPolicyResult": {
        "generatedPolicies": [
            {
                "policy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Sid\":\"SupportedServiceSid0\",\"Effect\":\"Allow\",\"Action\":
[\"access-analyzer:GetAnalyzer\",\"access-analyzer:ListAnalyzers\",
\"access-analyzer:ListArchiveRules\",\"access-analyzer:ListFindings
\",\"cloudtrail:DescribeTrails\",\"cloudtrail:GetEventDataStore\",
\"cloudtrail:GetEventSelectors\",\"cloudtrail:GetInsightSelectors
\",\"cloudtrail:GetTrailStatus\",\"cloudtrail:ListChannels\",
\"cloudtrail:ListEventDataStores\",\"cloudtrail:ListQueries\",\"cloudtrail:ListTags
\",\"cloudtrail:LookupEvents\",\"ec2:DescribeRegions\",\"iam:GetAccountSummary
\",\"iam:GetOpenIDConnectProvider\",\"iam:GetRole\",\"iam:ListAccessKeys\",
\"iam:ListAccountAliases\",\"iam:ListOpenIDConnectProviders\",\"iam:ListRoles
\",\"iam:ListSAMLProviders\",\"kms:ListAliases\",\"s3:GetBucketLocation\",
\"s3:ListAllMyBuckets\"],\"Resource\":\"*\"}]}"
            }
        ],
        "properties": {
            "cloudTrailProperties": {
                "endTime": "2024-02-14T22:44:40+00:00",
                "startTime": "2024-02-13T00:30:00+00:00",

}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see GetGeneratedPolicy in *AWS CLI Command Reference*.

### `list-access-preview-findings`

The following code example shows how to use `list-access-preview-findings`.

#### AWS CLI

**To retrieve a list of access preview findings generated by the specified access preview**

The following `list-access-preview-findings` example retrieves a list of access preview findings generated by the specified access preview in your AWS account.

```
aws accessanalyzer list-access-preview-findings \
    --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "findings": [
        {
            "id": "e22fc158-1c87-4c32-9464-e7f405ce8d74",
            "principal": {
                "AWS": "111122223333"
            },
            "action": [
                "s3:PutObject",
                "s3:PutObjectAcl"
            ],
```

```
            "condition": {},
            "resource": "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
            "isPublic": false,
            "resourceType": "AWS::S3::Bucket",
            "createdAt": "2024-02-17T00:18:46+00:00",
            "changeType": "NEW",
            "status": "ACTIVE",
            "resourceOwnerAccount": "111122223333",
            "sources": [
                {
                    "type": "POLICY"
                }
            ]
        }
    ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see ListAccessPreviewFindings in *AWS CLI Command Reference*.

### `list-access-previews`

The following code example shows how to use `list-access-previews`.

#### AWS CLI

**To retrieve a list of access previews for the specified analyzer**

The following `list-access-previews` example retrieves a list of access previews for the specified analyzer in your AWS account.

```
aws accessanalyzer list-access-previews \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "accessPreviews": [
        {
```

```
            "id": "3c65eb13-6ef9-4629-8919-a32043619e6b",
            "analyzerArn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
            "createdAt": "2024-02-17T00:18:44+00:00",
            "status": "COMPLETED"
        }
    ]
}
```

For more information, see Previewing access with IAM Access Analyzer APIs in the *AWS IAM User Guide*.

- For API details, see ListAccessPreviews in *AWS CLI Command Reference*.

### `list-analyzed-resources`

The following code example shows how to use `list-analyzed-resources`.

#### AWS CLI

**To list the available widgets**

The following `list-analyzed-resources` example lists the available widgets in your AWS account.

```
aws accessanalyzer list-analyzed-resources \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --resource-type AWS::IAM::Role
```

Output:

```
{
    "analyzedResources": [
        {
            "resourceArn": "arn:aws:sns:us-west-2:111122223333:Validation-Email",
            "resourceOwnerAccount": "111122223333",
            "resourceType": "AWS::SNS::Topic"
        },
        {
            "resourceArn": "arn:aws:sns:us-west-2:111122223333:admin-alerts",
            "resourceOwnerAccount": "111122223333",
```

```
            "resourceType": "AWS::SNS::Topic"
        },
        {
            "resourceArn": "arn:aws:sns:us-west-2:111122223333:config-topic",
            "resourceOwnerAccount": "111122223333",
            "resourceType": "AWS::SNS::Topic"
        },
        {
            "resourceArn": "arn:aws:sns:us-west-2:111122223333:inspector-topic",
            "resourceOwnerAccount": "111122223333",
            "resourceType": "AWS::SNS::Topic"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListAnalyzedResources in *AWS CLI Command Reference*.

### `list-analyzers`

The following code example shows how to use `list-analyzers`.

#### AWS CLI

**To retrieve a list of analyzers**

The following `list-analyzers` example retrieves a list of analyzers in your AWS account.

```
aws accessanalyzer list-analyzers
```

Output:

```
{
    "analyzers": [
        {
            "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
UnusedAccess-ConsoleAnalyzer-organization",
            "createdAt": "2024-02-15T00:46:40+00:00",
            "name": "UnusedAccess-ConsoleAnalyzer-organization",
            "status": "ACTIVE",
```

```
            "tags": {
                "auto-delete": "no"
            },
            "type": "ORGANIZATION_UNUSED_ACCESS"
        },
        {
            "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-organization",
            "createdAt": "2020-04-25T07:43:28+00:00",
            "lastResourceAnalyzed": "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
            "lastResourceAnalyzedAt": "2024-02-15T21:51:56.517000+00:00",
            "name": "ConsoleAnalyzer-organization",
            "status": "ACTIVE",
            "tags": {
                "auto-delete": "no"
            },
            "type": "ORGANIZATION"
        },
        {
            "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
            "createdAt": "2019-12-03T07:28:17+00:00",
            "lastResourceAnalyzed": "arn:aws:sns:us-west-2:111122223333:config-
topic",
            "lastResourceAnalyzedAt": "2024-02-15T18:01:53.003000+00:00",
            "name": "ConsoleAnalyzer-account",
            "status": "ACTIVE",
            "tags": {
                "auto-delete": "no"
            },
            "type": "ACCOUNT"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListAnalyzers in *AWS CLI Command Reference*.

### `list-archive-rules`

The following code example shows how to use `list-archive-rules`.

**AWS CLI**

**To retrieve a list of archive rules created for the specified analyzer**

The following `list-archive-rules` example retrieves a list of archive rules created for the specified analyzer in your AWS account.

```
aws accessanalyzer list-archive-rules \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization
```

Output:

```
{
    "archiveRules": [
        {
            "createdAt": "2024-02-15T00:49:27+00:00",
            "filter": {
                "resource": {
                    "contains": [
                        "Cognito"
                    ]
                },
                "resourceType": {
                    "eq": [
                        "AWS::IAM::Role"
                    ]
                }
            },
            "ruleName": "MyArchiveRule",
            "updatedAt": "2024-02-15T00:49:27+00:00"
        },
        {
            "createdAt": "2024-02-15T23:27:45+00:00",
            "filter": {
                "findingType": {
                    "eq": [
                        "UnusedIAMUserAccessKey"
                    ]
                }
            },
            "ruleName": "ArchiveRule-56125a39-e517-4ff8-afb1-ef06f58db612",
            "updatedAt": "2024-02-15T23:27:45+00:00"
        }
```

```
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListArchiveRules in *AWS CLI Command Reference*.

### `list-findings-v2`

The following code example shows how to use `list-findings-v2`.

**AWS CLI**

**To retrieve a list of findings generated by the specified analyzer**

The following `list-findings-v2` example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains `Cognito`.

```
aws accessanalyzer list-findings-v2 \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

Output:

```
{
    "findings": [
        {
            "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
            "createdAt": "2021-02-26T21:17:24.710000+00:00",
            "id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
            "resource": "arn:aws:iam::111122223333:role/
Cognito_testpoolUnauth_Role",
            "resourceType": "AWS::IAM::Role",
            "resourceOwnerAccount": "111122223333",
            "status": "ACTIVE",
            "updatedAt": "2021-02-26T21:17:24.710000+00:00",
            "findingType": "ExternalAccess"
        },
```

```
        {
            "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
            "createdAt": "2021-02-26T21:17:50.905000+00:00",
            "id": "ce0e221a-85b9-4d52-91ff-d7678075442f",
            "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
            "resourceType": "AWS::IAM::Role",
            "resourceOwnerAccount": "111122223333",
            "status": "ACTIVE",
            "updatedAt": "2021-02-26T21:17:50.905000+00:00",
            "findingType": "ExternalAccess"
        }
    ]
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListFindingsV2 in *AWS CLI Command Reference*.

## `list-findings`

The following code example shows how to use `list-findings`.

### AWS CLI

#### To retrieve a list of findings generated by the specified analyzer

The following `list-findings` example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains `Cognito`.

```
aws accessanalyzer list-findings \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

Output:

```
{
    "findings": [
        {
```

```
            "id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
            "principal": {
                "Federated": "cognito-identity.amazonaws.com"
            },
            "action": [
                "sts:AssumeRoleWithWebIdentity"
            ],
            "resource": "arn:aws:iam::111122223333:role/
Cognito_testpoolUnauth_Role",
            "isPublic": false,
            "resourceType": "AWS::IAM::Role",
            "condition": {
                "cognito-identity.amazonaws.com:aud": "us-
west-2:EXAMPLE0-0000-0000-0000-000000000000"
            },
            "createdAt": "2021-02-26T21:17:24.710000+00:00",
            "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
            "updatedAt": "2021-02-26T21:17:24.710000+00:00",
            "status": "ACTIVE",
            "resourceOwnerAccount": "111122223333"
        },
        {
            "id": "ce0e221a-85b9-4d52-91ff-d7678075442f",
            "principal": {
                "Federated": "cognito-identity.amazonaws.com"
            },
            "action": [
                "sts:AssumeRoleWithWebIdentity"
            ],
            "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
            "isPublic": false,
            "resourceType": "AWS::IAM::Role",
            "condition": {
                "cognito-identity.amazonaws.com:aud": "us-
west-2:EXAMPLE0-0000-0000-0000-000000000000"
            },
            "createdAt": "2021-02-26T21:17:50.905000+00:00",
            "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
            "updatedAt": "2021-02-26T21:17:50.905000+00:00",
            "status": "ACTIVE",
            "resourceOwnerAccount": "111122223333"
        }
    ]
```

```
}
```

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see ListFindings in *AWS CLI Command Reference*.

### `list-policy-generations`

The following code example shows how to use `list-policy-generations`.

**AWS CLI**

**To list all of the policy generations requested in the last seven days**

The following `list-policy-generations` example lists all of the policy generations requested in the last seven days in your AWS account.

```
aws accessanalyzer list-policy-generations
```

Output:

```
{
    "policyGenerations": [
        {
            "completedOn": "2024-02-14T23:43:38+00:00",
            "jobId": "923a56b0-ebb8-4e80-8a3c-a11ccfbcd6f2",
            "principalArn": "arn:aws:iam::111122223333:role/Admin",
            "startedOn": "2024-02-14T23:43:02+00:00",
            "status": "CANCELED"
        },
        {
            "completedOn": "2024-02-14T22:47:01+00:00",
            "jobId": "c557dc4a-0338-4489-95dd-739014860ff9",
            "principalArn": "arn:aws:iam::111122223333:role/Admin",
            "startedOn": "2024-02-14T22:44:41+00:00",
            "status": "SUCCEEDED"
        }
    ]
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see ListPolicyGenerations in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To retrieve a list of tags applied to the specified resource**

The following `list-tags-for-resource` example retrieves a list of tags applied to the specified resource in your AWS account.

```
aws accessanalyzer list-tags-for-resource \
    --resource-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
    "tags": {
        "Zone-of-trust": "Account",
        "Name": "ConsoleAnalyzer"
    }
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `start-policy-generation`

The following code example shows how to use `start-policy-generation`.

**AWS CLI**

**To start a policy generation request**

The following `start-policy-generation` example starts a policy generation request in your AWS account.

```
aws accessanalyzer start-policy-generation \
    --policy-generation-details '{"principalArn":"arn:aws:iam::111122223333:role/
Admin"}' \
    --cloud-trail-details file://myfile.json
```

Contents of `myfile.json`:

```
{
    "accessRole": "arn:aws:iam::111122223333:role/service-role/
AccessAnalyzerMonitorServiceRole",
    "startTime": "2024-02-13T00:30:00Z",
    "trails": [
        {
            "allRegions": true,
            "cloudTrailArn": "arn:aws:cloudtrail:us-west-2:111122223333:trail/my-
trail"
        }
    ]
}
```

Output:

```
{
    "jobId": "c557dc4a-0338-4489-95dd-739014860ff9"
}
```

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see StartPolicyGeneration in *AWS CLI Command Reference*.

### `start-resource-scan`

The following code example shows how to use `start-resource-scan`.

#### AWS CLI

**To immediately start a scan of the policies applied to the specified resource**

The following `start-resource-scan` example mmediately starts a scan of the policies applied to the specified resource in your AWS account.

```
aws accessanalyzer start-resource-scan \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --resource-arn arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role
```

This command produces no output.

For more information, see IAM Access Analyzer policy generation in the *AWS IAM User Guide*.

- For API details, see StartResourceScan in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag to the specified resource**

The following `tag-resource` example adds a tag to the specified resource in your AWS account.

```
aws accessanalyzer tag-resource \
    --resource-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --tags Environment=dev,Purpose=testing
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from the specified resources**

The following `untag-resource` example removes tags from the specified resource in your AWS account.

```
aws accessanalyzer untag-resource \
    --resource-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
    --tag-keys Environment Purpose
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-archive-rule`

The following code example shows how to use `update-archive-rule`.

**AWS CLI**

**To update the criteria and values for the specified archive rule**

The following `update-archive-rule` example updates the criteria and values for the specified archive rule in your AWS account.

```
aws accessanalyzer update-archive-rule \
    --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
    --rule-name MyArchiveRule \
    --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
 ["AWS::IAM::Role"]}}'
```

This command produces no output.

For more information, see Archive rules in the *AWS IAM User Guide*.

- For API details, see UpdateArchiveRule in *AWS CLI Command Reference*.

### `update-findings`

The following code example shows how to use `update-findings`.

**AWS CLI**

**To update the status for the specified findings**

The following `update-findings` example updates the status for the specified findings in your AWS account.

```
aws accessanalyzer update-findings \
    --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
UnusedAccess-ConsoleAnalyzer-organization \
    --ids 4f319ac3-2e0c-4dc4-bf51-7013a086b6ae 780d586a-2cce-4f72-aff6-359d450e7500
 \
    --status ARCHIVED
```

This command produces no output.

For more information, see Using AWS Identity and Access Management Access Analyzer in the *AWS IAM User Guide*.

- For API details, see UpdateFindings in *AWS CLI Command Reference*.

## `validate-policy`

The following code example shows how to use `validate-policy`.

**AWS CLI**

**To request the validation of a policy and returns a list of findings**

The following `validate-policy` example requests the validation of a policy and returns a list of findings. The policy in the example is a role trust policy for an Amazon Cognito role used for web identity federation. The findings generated from the trust policy relate to an empty `Sid` element value and a mismatched policy principal due to the incorrect assume role action being used, `sts:AssumeRole`. The correct assume role action for use with Cognito is `sts:AssumeRoleWithWebIdentity`.

```
aws accessanalyzer validate-policy \
    --policy-document file://myfile.json \
    --policy-type RESOURCE_POLICY
```

Contents of `myfile.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "",
            "Effect": "Allow",
            "Principal": {
                "Federated": "cognito-identity.amazonaws.com"
            },
            "Action": [
                "sts:AssumeRole",
                "sts:TagSession"
            ],
            "Condition": {
                "StringEquals": {
                    "cognito-identity.amazonaws.com:aud": "us-west-2_EXAMPLE"
                }
            }
        }
    ]
}
```

Output:

```
{
    "findings": [
        {
            "findingDetails": "Add a value to the empty string in the Sid element.",
            "findingType": "SUGGESTION",

                            "value": "cognito-identity.amazonaws.com:aud"
                        }
                    ],
                    "span": {
                        "end": {
                            "column": 79,
                            "line": 16,
                            "offset": 464
                        },
                        "start": {
                            "column": 58,
                            "line": 16,
                            "offset": 443
                        }
                    }
                }
            ]
        }
    ]
}
```

For more information, see Checks for validating policies in the *AWS IAM User Guide*.

- For API details, see ValidatePolicy in *AWS CLI Command Reference*.

## Image Builder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Image Builder.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `create-component`

The following code example shows how to use `create-component`.

**AWS CLI**

**To create a component**

The following `create-component` example creates a component that uses a JSON document file and references a component document in YAML format that is uploaded to an Amazon S3 bucket.

```
aws imagebuilder create-component \
    --cli-input-json file://create-component.json
```

Contents of `create-component.json`:

```
{
    "name": "MyExampleComponent",
    "semanticVersion": "2019.12.02",
    "description": "An example component that builds, validates and tests an image",
    "changeDescription": "Initial version.",
    "platform": "Windows",
    "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```
{
```

```
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/examplecomponent/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateComponent in *AWS CLI Command Reference*.

### `create-distribution-configuration`

The following code example shows how to use `create-distribution-configuration`.

#### AWS CLI

**To create a distribution configuration**

The following `create-distribution-configuration` example creates a distribution configuration using a JSON file.

```
aws imagebuilder create-distribution-configuration \
    --cli-input-json file:/create-distribution-configuration.json
```

Contents of `create-distribution-configuration.json`:

```
{
    "name": "MyExampleDistribution",
    "description": "Copies AMI to eu-west-1",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references",
                "amiTags": {
                    "KeyName": "{{ssm:parameter_name}}"
                },
                "launchPermission": {
                    "userIds": [
                        "123456789012"
```

```
                    ]
                }
            }
        },
        {
            "region": "eu-west-1",
            "amiDistributionConfiguration": {
                "name": "My {{imagebuilder:buildVersion}} image
 {{imagebuilder:buildDate}}",
                "amiTags": {
                    "KeyName": "Value"
                },
                "launchPermission": {
                    "userIds": [
                        "123456789012"
                    ]
                }
            }
        }
    ]
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateDistributionConfiguration in *AWS CLI Command Reference*.

### `create-image-pipeline`

The following code example shows how to use `create-image-pipeline`.

#### AWS CLI

**To create an image pipeline**

The following `create-image-pipeline` example creates an image pipeline using a JSON file.

```
aws imagebuilder create-image-pipeline \
    --cli-input-json file://create-image-pipeline.json
```

Contents of `create-image-pipeline.json`:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateImagePipeline in *AWS CLI Command Reference*.

## create-image-recipe

The following code example shows how to use create-image-recipe.

### AWS CLI

#### To create a recipe

The following create-image-recipe example creates an image recipe using a JSON file. Components are installed in the order in which they are specified.

```
aws imagebuilder create-image-recipe \
    --cli-input-json file://create-image-recipe.json
```

Contents of create-image-recipe.json:

```
{
    "name": "MyBasicRecipe",
    "description": "This example image recipe creates a Windows 2016 image.",
    "semanticVersion": "2019.12.03",
    "components":
    [
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
myexamplecomponent/2019.12.02/1"
        },
        {
            "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
myimportedcomponent/1.0.0/1"
        }
    ],
    "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/windows-server-2016-
english-full-base-x86/xxxx.x.x"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03"
```

```
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateImageRecipe in *AWS CLI Command Reference*.

### `create-image`

The following code example shows how to use `create-image`.

**AWS CLI**

**To create an image**

The following `create-image` example creates an image.

```
aws imagebuilder create-image \
    --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03 \
    --infrastructure-configuration-arn arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateImage in *AWS CLI Command Reference*.

### `create-infrastructure-configuration`

The following code example shows how to use `create-infrastructure-configuration`.

## AWS CLI

### To create an infrastructure configuration

The following `create-infrastructure-configuration` example creates an infrastructure configuration using a JSON file.

```
aws imagebuilder create-infrastructure-configuration \
    --cli-input-json file://create-infrastructure-configuration.json
```

Contents of `create-infrastructure-configuration.json`:

```
{
    "name": "MyExampleInfrastructure",
    "description": "An example that will retain instances of failed builds",
    "instanceTypes": [
        "m5.large", "m5.xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageBuilder",
    "securityGroupIds": [
        "sg-a1b2c3d4"
    ],
    "subnetId": "subnet-a1b2c3d4",
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"
        }
    },
    "keyPair": "key-pair-name",
    "terminateInstanceOnFailure": false,
    "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-topic-name"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see CreateInfrastructureConfiguration in *AWS CLI Command Reference*.

### `delete-component`

The following code example shows how to use `delete-component`.

**AWS CLI**

**To delete a component**

The following `delete-component` example deletes a component build version by specifying its ARN.

```
aws imagebuilder delete-component \
    --component-build-version-arn arn:aws:imagebuilder:us-
west-2:123456789012:component/myexamplecomponent/2019.12.02/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/myexamplecomponent/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteComponent in *AWS CLI Command Reference*.

### `delete-image-pipeline`

The following code example shows how to use `delete-image-pipeline`.

**AWS CLI**

**To delete an image pipeline**

The following `delete-image-pipeline` example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-image-pipeline \
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
my-example-pipeline
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteImagePipeline in *AWS CLI Command Reference*.

### `delete-image-recipe`

The following code example shows how to use `delete-image-recipe`.

#### AWS CLI

**To delete an image recipe**

The following `delete-image-recipe` example deletes an image recipe by specifying its ARN.

```
aws imagebuilder delete-image-recipe \
    --image-recipe-arn arn:aws:imagebuilder:us-east-1:123456789012:image-recipe/
mybasicrecipe/2019.12.03
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteImageRecipe in *AWS CLI Command Reference*.

### `delete-image`

The following code example shows how to use `delete-image`.

**AWS CLI**

**To delete an image**

The following `delete-image` example deletes an image build version by specifying its ARN.

```
aws imagebuilder delete-image \
    --image-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/my-example-image/2019.12.02/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/mybasicrecipe/2019.12.03/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteImage in *AWS CLI Command Reference*.

### `delete-infrastructure-configuration`

The following code example shows how to use `delete-infrastructure-configuration`.

**AWS CLI**

**To delete an infrastructure configuration**

The following `delete-infrastructure-configuration` example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-infrastructure-configuration \
    --infrastructure-configuration-arn arn:aws:imagebuilder:us-
east-1:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see DeleteInfrastructureConfiguration in *AWS CLI Command Reference*.

### `get-component-policy`

The following code example shows how to use `get-component-policy`.

#### AWS CLI

**To get component policy details**

The following `get-component-policy` example lists the details of a component policy by specifying its ARN.

```
aws imagebuilder get-component-policy \
    --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/my-
example-component/2019.12.03/1
```

Output:

```
{
    "Policy": "{ "Version": "2012-10-17", "Statement": [ { "Effect":
 "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":
 [ "imagebuilder:GetComponent", "imagebuilder:ListComponents" ], "Resource":
 [ "arn:aws:imagebuilder:us-west-2:123456789012:component/my-example-
component/2019.12.03/1" ] } ] }"
```

```
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI <https://docs.aws.amazon.com/imagebuilder/latest/userguide/managing-image-builder-cli.html>`__ in the *EC2 Image Builder Users Guide*.

- For API details, see GetComponentPolicy in *AWS CLI Command Reference*.

### `get-component`

The following code example shows how to use `get-component`.

**AWS CLI**

**To get component details**

The following `get-component` example lists the details of a component by specifying its ARN.

```
aws imagebuilder get-component \
    --component-build-version-arn arn:aws:imagebuilder:us-
west-2:123456789012:component/component-name/1.0.0/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "component": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-
name/1.0.0/1",
        "name": "component-name",
        "version": "1.0.0",
        "type": "TEST",
        "platform": "Linux",
        "owner": "123456789012",
        "data": "name: HelloWorldTestingDocument\ndescription: This is hello world
 testing document.\nschemaVersion: 1.0\n\nphases:\n  - name: test\n    steps:\n
   - name: HelloWorldStep\n        action: ExecuteBash\n        inputs:\n
 commands:\n            - echo \"Hello World! Test.\"\n",
        "encrypted": true,
        "dateCreated": "2020-01-27T20:43:30.306Z",
        "tags": {}
    }
```

```
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetComponent in *AWS CLI Command Reference*.

### `get-distribution-configuration`

The following code example shows how to use `get-distribution-configuration`.

#### AWS CLI

**To get the details of a distribution configuration**

The following `get-distribution-configuration` example displays the details of a distribution configuration by specifying its ARN.

```
aws imagebuilder get-distribution-configuration \
    --distribution-configuration-arn arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "distributionConfiguration": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-
configuration/myexampledistribution",
        "name": "MyExampleDistribution",
        "description": "Copies AMI to eu-west-1 and exports to S3",
        "distributions": [
            {
                "region": "us-west-2",
                "amiDistributionConfiguration": {
                    "name": "Name {{imagebuilder:buildDate}}",
                    "description": "An example image name with parameter
 references",
                    "amiTags": {
                        "KeyName": "{{ssm:parameter_name}}"
                    },
                    "launchPermission": {
                        "userIds": [
```

```
                            "123456789012"
                        ]
                    }
                }
            },
            {
                "region": "eu-west-1",
                "amiDistributionConfiguration": {
                    "name": "My {{imagebuilder:buildVersion}} image
 {{imagebuilder:buildDate}}",
                    "amiTags": {
                        "KeyName": "Value"
                    },
                    "launchPermission": {
                        "userIds": [
                            "123456789012"
                        ]
                    }
                }
            }
        ],
        "dateCreated": "2020-02-19T18:40:10.529Z",
        "tags": {}
    }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetDistributionConfiguration in *AWS CLI Command Reference*.

### `get-image-pipeline`

The following code example shows how to use `get-image-pipeline`.

#### AWS CLI

**To get image pipeline details**

The following `get-image-pipeline` example lists the details of an image pipeline by specifying its ARN.

```
aws imagebuilder get-image-pipeline \
```

```
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imagePipeline": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
        "name": "MyWindows2016Pipeline",
        "description": "Builds Windows 2016 Images",
        "platform": "Windows",
        "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
        "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
        "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
        "imageTestsConfiguration": {
            "imageTestsEnabled": true,
            "timeoutMinutes": 60
        },
        "schedule": {
            "scheduleExpression": "cron(0 0 * * SUN)",
            "pipelineExecutionStartCondition":
 "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
        },
        "status": "ENABLED",
        "dateCreated": "2020-02-19T19:04:01.253Z",
        "dateUpdated": "2020-02-19T19:04:01.253Z",
        "tags": {}
    }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetImagePipeline in *AWS CLI Command Reference*.

### `get-image-policy`

The following code example shows how to use `get-image-policy`.

**AWS CLI**

**To get image policy details**

The following `get-image-policy` example lists the details of an image policy by specifying its ARN.

```
aws imagebuilder get-image-policy \
    --image-arn arn:aws:imagebuilder:us-west-2:123456789012:image/my-example-
image/2019.12.03/1
```

Output:

```
{
    "Policy": "{ "Version": "2012-10-17", "Statement": [ { "Effect": "Allow",
 "Principal": { "AWS": [ "123456789012" ] }, "Action": [ "imagebuilder:GetImage",
 "imagebuilder:ListImages" ], "Resource": [ "arn:aws:imagebuilder:us-
west-2:123456789012:image/my-example-image/2019.12.03/1" ] } ] }"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetImagePolicy in *AWS CLI Command Reference*.

## `get-image-recipe-policy`

The following code example shows how to use `get-image-recipe-policy`.

**AWS CLI**

**To get image recipe policy details**

The following `get-image-recipe-policy` example lists the details of an image recipe policy by specifying its ARN.

```
aws imagebuilder get-image-recipe-policy \
    --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/my-
example-image-recipe/2019.12.03/1
```

Output:

```
{
    "Policy": "{ "Version": "2012-10-17", "Statement": [ { "Effect":
 "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":
 [ "imagebuilder:GetImageRecipe", "imagebuilder:ListImageRecipes" ], "Resource":
 [ "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/my-example-image-
recipe/2019.12.03/1" ] } ] }"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetImageRecipePolicy in *AWS CLI Command Reference*.

### `get-image`

The following code example shows how to use `get-image`.

#### AWS CLI

**To get image details**

The following `get-image` example lists the details of an image by specifying its ARN.

```
aws imagebuilder get-image \
    --image-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "image": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1",
        "name": "MyBasicRecipe",
        "version": "2019.12.03/1",
        "platform": "Windows",
        "state": {
            "status": "BUILDING"
        },
        "imageRecipe": {
```

```
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
            "name": "MyBasicRecipe",
            "description": "This example image recipe creates a Windows 2016
 image.",
            "platform": "Windows",
            "version": "2019.12.03",
            "components": [
                {
                    "componentArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/myexamplecomponent/2019.12.02/1"
                },
                {
                    "componentArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/myimportedcomponent/1.0.0/1"
                }
            ],
            "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/windows-
server-2016-english-full-base-x86/2019.12.17/1",
            "dateCreated": "2020-02-14T19:46:16.904Z",
            "tags": {}
        },
        "infrastructureConfiguration": {

- For API details, see GetImage in *AWS CLI Command Reference*.

## `get-infrastructure-configuration`

The following code example shows how to use `get-infrastructure-configuration`.

### AWS CLI

#### To get infrastructure configuration details

The following `get-infrastructure-configuration` example lists the details of an infrastructure configuration by specifying its ARN.

```
aws imagebuilder get-infrastructure-configuration \
    --infrastructure-configuration-arn arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfiguration": {
        "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-
configuration/myexampleinfrastructure",
```

```
        "name": "MyExampleInfrastructure",
        "description": "An example that will retain instances of failed builds",
        "instanceTypes": [
            "m5.large",
            "m5.xlarge"
        ],
        "instanceProfileName": "EC2InstanceProfileForImageBuilder",
        "securityGroupIds": [
            "sg-a48c95ef"
        ],
        "subnetId": "subnet-a48c95ef",
        "logging": {
            "s3Logs": {
                "s3BucketName": "bucket-name",
                "s3KeyPrefix": "bucket-path"
            }
        },
        "keyPair": "Name",
        "terminateInstanceOnFailure": false,
        "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name",
        "dateCreated": "2020-02-19T19:11:51.858Z",
        "tags": {}
    }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see GetInfrastructureConfiguration in *AWS CLI Command Reference*.

### `import-component`

The following code example shows how to use `import-component`.

#### AWS CLI

##### To import a component

The following `import-component` example imports a preexisting script using a JSON file.

```
aws imagebuilder import-component \
    --cli-input-json file://import-component.json
```

Contents of `import-component.json`:

```
{
    "name": "MyImportedComponent",
    "semanticVersion": "1.0.0",
    "description": "An example of how to import a component",
    "changeDescription": "First commit message.",
    "format": "SHELL",
    "platform": "Windows",
    "type": "BUILD",
    "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "componentBuildVersionArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/myimportedcomponent/1.0.0/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ImportComponent in *AWS CLI Command Reference*.

### `list-component-build-versions`

The following code example shows how to use `list-component-build-versions`.

#### AWS CLI

**To list component build versions**

The following `list-component-build-versions` example lists the component build versions with a specific semantic version.

```
aws imagebuilder list-component-build-versions --component-version-arn
 arn:aws:imagebuilder:us-west-2:123456789012:component/myexamplecomponent/2019.12.02
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
myexamplecomponent/2019.12.02/1",
            "name": "MyExampleComponent",
            "version": "2019.12.02",
            "platform": "Windows",
            "type": "BUILD",
            "owner": "123456789012",
            "description": "An example component that builds, validates and tests an
 image",
            "changeDescription": "Initial version.",
            "dateCreated": "2020-02-19T18:53:45.940Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListComponentBuildVersions in *AWS CLI Command Reference*.

## `list-components`

The following code example shows how to use `list-components`.

### AWS CLI

#### To list all of the component semantic versions

The following `list-components` example lists all of the component semantic versions to which you have access. You can optionally filter on whether to list components owned by you, by Amazon, or that have been shared with you by other accounts.

```
aws imagebuilder list-components
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentVersionList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-
name/1.0.0",
            "name": "component-name",
            "version": "1.0.0",
            "platform": "Linux",
            "type": "TEST",
            "owner": "123456789012",
            "dateCreated": "2020-01-27T20:43:30.306Z"
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListComponents in *AWS CLI Command Reference*.

### `list-distribution-configurations`

The following code example shows how to use `list-distribution-configurations`.

#### AWS CLI

**To list distributions**

The following `list-distribution-configurations` example lists all of your distributions.

```
aws imagebuilder list-distribution-configurations
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "distributionConfigurationSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-
configuration/myexampledistribution",
            "name": "MyExampleDistribution",
```

```
            "description": "Copies AMI to eu-west-1 and exports to S3",
            "dateCreated": "2020-02-19T18:40:10.529Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListDistributionConfigurations in *AWS CLI Command Reference*.

### `list-image-build-versions`

The following code example shows how to use `list-image-build-versions`.

#### AWS CLI

**To list image build versions**

The following `list-image-build-versions` example lists all of the image build versions with a semantic version.

```
aws imagebuilder list-image-build-versions \
    --image-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/7",
            "name": "MyBasicRecipe",
            "version": "2019.12.03/7",
            "platform": "Windows",
            "state": {
                "status": "FAILED",
```

```
                "reason": "Can't start SSM Automation for arn
 arn:aws:imagebuilder:us-west-2:123456789012:image/mybasicrecipe/2019.12.03/7 during
 building. Parameter \"iamInstanceProfileName\" has a null value."
            },
            "owner": "123456789012",

### `list-image-pipeline-images`

The following code example shows how to use `list-image-pipeline-images`.

#### AWS CLI

**To list image pipeline pipeline images**

The following `list-image-pipeline-images` example lists all images that were created by a specific image pipeline.

```
aws imagebuilder list-image-pipeline-images \
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imagePipelineList": [
        {
```

```
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
            "name": "MyWindows2016Pipeline",
            "description": "Builds Windows 2016 Images",
            "platform": "Windows",
            "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-
recipe/mybasicrecipe/2019.12.03",
            "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",

```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListImagePipelineImages in *AWS CLI Command Reference*.

### `list-image-recipes`

The following code example shows how to use `list-image-recipes`.

#### AWS CLI

**To list image recipes**

The following `list-image-recipes` example lists all of your image recipes.

```
aws imagebuilder list-image-recipes
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageRecipeSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
            "name": "MyBasicRecipe",
            "platform": "Windows",
            "owner": "123456789012",
            "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/windows-
server-2016-english-full-base-x86/2019.x.x",
            "dateCreated": "2020-02-19T18:54:25.975Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        },
        {
```

```
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/recipe-
name-a1b2c3d45678/1.0.0",
            "name": "recipe-name-a1b2c3d45678",
            "platform": "Linux",
            "owner": "123456789012",
            "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/amazon-linux-2-
x86/2019.11.21",
            "dateCreated": "2019-12-16T18:19:00.120Z",
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListImageRecipes in *AWS CLI Command Reference*.

### `list-images`

The following code example shows how to use `list-images`.

#### AWS CLI

**To list images**

The following `list-images` example lists all of the semantic versions you have access to.

```
aws imagebuilder list-images
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageVersionList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03",
            "name": "MyBasicRecipe",
            "version": "2019.12.03",
            "platform": "Windows",
```

```
            "owner": "123456789012",
            "dateCreated": "2020-02-14T21:29:18.810Z"
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListImages in *AWS CLI Command Reference*.

### `list-infrastructure-configurations`

The following code example shows how to use `list-infrastructure-configurations`.

**AWS CLI**

**To list infrastructure configurations**

The following `list-infrastructure-configurations` example lists all of your infrastructure configurations.

```
aws imagebuilder list-infrastructure-configurations
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "infrastructureConfigurationSummaryList": [
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-
configuration/myexampleinfrastructure",
            "name": "MyExampleInfrastructure",
            "description": "An example that will retain instances of failed builds",
            "dateCreated": "2020-02-19T19:11:51.858Z",
            "tags": {}
        },
        {
            "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-
configuration/infrastructureconfiguration-name-a1b2c3d45678",
            "name": "infrastructureConfiguration-name-a1b2c3d45678",
            "dateCreated": "2019-12-16T18:19:01.038Z",
```

```
            "tags": {
                "KeyName": "KeyValue"
            }
        }
    ]
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListInfrastructureConfigurations in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list tags for a specific resource**

The following `list-tags-for-resource` example lists all of the tags for a specific resource.

```
aws imagebuilder list-tags-for-resource \
    --resource-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
    "tags": {
        "KeyName": "KeyValue"
    }
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `put-component-policy`

The following code example shows how to use `put-component-policy`.

**AWS CLI**

**To apply a resource policy to a component**

The following `put-component-policy` command applies a resource policy to a build component to enable cross-account sharing of build components. We recommend you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-component-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-component-policy \
    --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/
examplecomponent/2019.12.02/1 \
    --policy '{ "Version": "2012-10-17", "Statement": [ { "Effect":
 "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":
 [ "imagebuilder:GetComponent", "imagebuilder:ListComponents" ],
 "Resource": [ "arn:aws:imagebuilder:us-west-2:123456789012:component/
examplecomponent/2019.12.02/1" ] } ] }'
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/
examplecomponent/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see PutComponentPolicy in *AWS CLI Command Reference*.

### `put-image-policy`

The following code example shows how to use `put-image-policy`.

**AWS CLI**

**To apply a resource policy to an image**

The following `put-image-policy` command applies a resource policy to an image to enable cross-account sharing of images. We recommend you use the RAM CLI command create-resource-share. If you use the EC2 Image Builder CLI command put-image-policy, you must also use the RAM CLI command promote-resource-share-create-from-policy in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-policy \
    --image-arn arn:aws:imagebuilder:us-west-2:123456789012:image/example-
image/2019.12.02/1 \
    --policy '{ "Version": "2012-10-17", "Statement": [ { "Effect": "Allow",
 "Principal": { "AWS": [ "123456789012" ] }, "Action": [ "imagebuilder:GetImage",
 "imagebuilder:ListImages" ], "Resource": [ "arn:aws:imagebuilder:us-
west-2:123456789012:image/example-image/2019.12.02/1" ] } ] }'
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/example-
image/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see PutImagePolicy in *AWS CLI Command Reference*.

### `put-image-recipe-policy`

The following code example shows how to use `put-image-recipe-policy`.

#### AWS CLI

**To apply a resource policy to an image recipe**

The following `put-image-recipe-policy` command applies a resource policy to an image recipe to enable cross-account sharing of image recipes. We recommend that you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-image-recipe-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-recipe-policy \
    --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
example-image-recipe/2019.12.02 \
    --policy '{ "Version": "2012-10-17", "Statement": [ { "Effect":
 "Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":
 [ "imagebuilder:GetImageRecipe", "imagebuilder:ListImageRecipes" ], "Resource":
 [ "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/example-image-
recipe/2019.12.02" ] } ] }'
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
example-image-recipe/2019.12.02/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see PutImageRecipePolicy in *AWS CLI Command Reference*.

### `start-image-pipeline-execution`

The following code example shows how to use `start-image-pipeline-execution`.

#### AWS CLI

**To start an image pipeline manually**

The following `start-image-pipeline-execution` example manually starts an image pipeline.

```
aws imagebuilder start-image-pipeline-execution \
    --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
```

```
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see StartImagePipelineExecution in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a resource**

The following `tag-resource` example adds and tags a resource to EC2 Image Builder using a JSON file.

```
aws imagebuilder tag-resource \
    --cli-input-json file://tag-resource.json
```

Contents of `tag-resource.json`:

```
{
    "resourceArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
    "tags": {
        "KeyName: "KeyValue"
    }
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

##### To remove a tag from a resource

The following `untag-resource` example removes a tag from a resource using a JSON file.

```
aws imagebuilder untag-resource \
    --cli-input-json file://tag-resource.json
```

Contents of `untag-resource.json`:

```
{
    "resourceArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
    "tagKeys": [
        "KeyName"
    ]
}
```

This command produces no output.

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-distribution-configuration`

The following code example shows how to use `update-distribution-configuration`.

#### AWS CLI

##### To update a distribution configuration

The following `update-distribution-configuration` example updates a distribution configuration using a JSON file.

```
aws imagebuilder update-distribution-configuration \
```

```
    --cli-input-json file://update-distribution-configuration.json
```

Contents of `update-distribution-configuration.json`:

```
{
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
    "description": "Copies AMI to eu-west-2 and exports to S3",
    "distributions": [
        {
            "region": "us-west-2",
            "amiDistributionConfiguration": {
                "name": "Name {{imagebuilder:buildDate}}",
                "description": "An example image name with parameter references"
            }
        },
        {
            "region": "eu-west-2",
            "amiDistributionConfiguration": {
                "name": "My {{imagebuilder:buildVersion}} image
 {{imagebuilder:buildDate}}"
            }
        }
    ]
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see UpdateDistributionConfiguration in *AWS CLI Command Reference*.

### `update-image-pipeline`

The following code example shows how to use `update-image-pipeline`.

### AWS CLI

#### To update an image pipeline

The following `update-image-pipeline` example updates an image pipeline using a JSON file.

```
aws imagebuilder update-image-pipeline \
    --cli-input-json file://update-image-pipeline.json
```

Contents of `update-image-pipeline.json`:

```
{
    "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
    "imageTestsConfiguration": {
        "imageTestsEnabled": true,
        "timeoutMinutes": 120
    },
    "schedule": {
        "scheduleExpression": "cron(0 0 * * MON)",
        "pipelineExecutionStartCondition":
 "EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
    },
    "status": "DISABLED"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see UpdateImagePipeline in *AWS CLI Command Reference*.

## update-infrastructure-configuration

The following code example shows how to use update-infrastructure-configuration.

### AWS CLI

#### To update an infrastructure configuration

The following update-infrastructure-configuration example updates an infrastructure configuration using a JSON file.

```
aws imagebuilder update-infrastructure-configuration \
    --cli-input-json file:/update-infrastructure-configuration.json
```

Contents of update-infrastructure-configuration.json:

```
{
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
    "description": "An example that will terminate instances of failed builds",
    "instanceTypes": [
        "m5.large", "m5.2xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageFactory",
    "securityGroupIds": [
        "sg-a48c95ef"
    ],
    "subnetId": "subnet-a48c95ef",
    "logging": {
        "s3Logs": {
            "s3BucketName": "bucket-name",
            "s3KeyPrefix": "bucket-path"
        }
    },
    "terminateInstanceOnFailure": true,
    "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name"
}
```

Output:

```
{
    "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

```
}
```

For more information, see Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI in the *EC2 Image Builder Users Guide*.

- For API details, see UpdateInfrastructureConfiguration in *AWS CLI Command Reference*.

## Incident Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `create-replication-set`

The following code example shows how to use `create-replication-set`.

#### AWS CLI

**To create the replication set**

The following `create-replication-set` example creates the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account. This example uses the us-east-1 and us-east-2 Regions while creating the replication set.

```
aws ssm-incidents create-replication-set \
```

```
    --regions '{"us-east-1": {"sseKmsKeyId": "arn:aws:kms:us-
east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"}, "us-east-2":
 {"sseKmsKeyId": "arn:aws:kms:us-
east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"}}'
```

Output:

```
{
    "replicationSetArns": [
        "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-
bb3f-413c-08df53673b57"
    ]
}
```

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see CreateReplicationSet in *AWS CLI Command Reference*.

### `create-response-plan`

The following code example shows how to use `create-response-plan`.

#### AWS CLI

**To create a response plan**

The following `create-response-plan` example creates a response plan with the specified details.

```
aws ssm-incidents create-response-plan \
    --chat-channel '{"chatbotSns": ["arn:aws:sns:us-
east-1:111122223333:Standard_User"]}' \
    --display-name "Example response plan" \
    --incident-template '{"impact": 5, "title": "example-incident"}' \
    --name "example-response" \
    --actions '[{"ssmAutomation": {"documentName": "AWSIncidents-
CriticalIncidentRunbookTemplate", "documentVersion": "$DEFAULT",
 "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-
incidents.amazonaws.com/AWSServiceRoleForIncidentManager", "targetAccount":
 "RESPONSE_PLAN_OWNER_ACCOUNT"}}]' \
    --engagements '["arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"]'
```

Output:

```
{
    "arn": "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
}
```

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see CreateResponsePlan in *AWS CLI Command Reference*.

### `create-timeline-event`

The following code example shows how to use `create-timeline-event`.

**AWS CLI**

**Example 1: To create a custom timeline event**

The following `create-timeline-event` example creates a custom timeline event at the specified time on the specified incident.

```
aws ssm-incidents create-timeline-event \
    --event-data "\"example timeline event\"" \
    --event-time 2022-10-01T20:30:00.000 \
    --event-type "Custom Event" \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
```

Output:

```
{
    "eventId": "c0bcc885-a41d-eb01-b4ab-9d2deEXAMPLE",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```

**Example 2: To create a timeline event with an incident note**

The following `create-timeline-event` example creates a timeline event that is listed in the 'Incident notes' panel.

```
aws ssm-incidents create-timeline-event \
```

```
    --event-data "\"New Note\"" \
    --event-type "Note" \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE" \
    --event-time 2023-06-20T12:06:00.000 \
    --event-references '[{"resource":"arn:aws:ssm-incidents::111122223333:incident-
record/Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE"}]'
```

Output:

```
{
    "eventId": "a41dc885-c0bc-b4ab-eb01-de9d2EXAMPLE",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see CreateTimelineEvent in *AWS CLI Command Reference*.

### `delete-incident-record`

The following code example shows how to use `delete-incident-record`.

#### AWS CLI

**To delete an incident record**

The following `delete-incident-record` example deletes the specified incident record.

```
aws ssm-incidents delete-incident-record \
    --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-
Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see Incident tracking in the *Incident Manager User Guide*.

- For API details, see DeleteIncidentRecord in *AWS CLI Command Reference*.

### `delete-replication-set`

The following code example shows how to use `delete-replication-set`.

**AWS CLI**

**To delete the replication set**

The following `delete-replication-set` example deletes the replication set from your Amazon Web Services account. Deleting the replication set also deletes all Incident Manager data. This can't be undone.

```
aws ssm-incidents delete-replication-set \
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-
bb3f-413c-08df53673b57"
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see DeleteReplicationSet in *AWS CLI Command Reference*.

## `delete-resource-policy`

The following code example shows how to use `delete-resource-policy`.

**AWS CLI**

**To delete a resource policy**

The following `delete-resource-policy` example deletes a resource policy from a response plan. This will revoke access from the principal or organization that the response plan was shared with.

```
aws ssm-incidents delete-resource-policy \
    --policy-id "be8b57191f0371f1c6827341aa3f0a03" \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan"
```

This command produces no output.

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see DeleteResourcePolicy in *AWS CLI Command Reference*.

### `delete-response-plan`

The following code example shows how to use `delete-response-plan`.

**AWS CLI**

**To delete a response plan**

The following `delete-response-plan` example deletes the specified response plan.

```
aws ssm-incidents delete-response-plan \
    --arn "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
```

This command produces no output.

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see DeleteResponsePlan in *AWS CLI Command Reference*.

### `delete-timeline-event`

The following code example shows how to use `delete-timeline-event`.

**AWS CLI**

**To delete a timeline event**

The following `delete-timeline-event` example deletes a custom timeline event from the specified incident record.

```
aws ssm-incidents delete-timeline-event \
    --event-id "c0bcc885-a41d-eb01-b4ab-9d2de193643c" \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see DeleteTimelineEvent in *AWS CLI Command Reference*.

### `get-incident-record`

The following code example shows how to use `get-incident-record`.

#### AWS CLI

**To get an incident record**

The following `get-incident-record` example gets details about the specified incident record.

```
aws ssm-incidents get-incident-record \
    --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-
Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
    "incidentRecord": {
        "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-
Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
        "automationExecutions": [],
        "creationTime": "2021-05-21T18:16:57.579000+00:00",
        "dedupeString": "c4bcc812-85e7-938d-2b78-17181176ee1a",
        "impact": 5,
        "incidentRecordSource": {
            "createdBy": "arn:aws:iam::111122223333:user/draliatp",
            "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
            "source": "aws.ssm-incidents.custom"
        },
        "lastModifiedBy": "arn:aws:iam::111122223333:user/draliatp",
        "lastModifiedTime": "2021-05-21T18:16:59.149000+00:00",
        "notificationTargets": [],
        "status": "OPEN",
        "title": "Example-Incident"
    }
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see GetIncidentRecord in *AWS CLI Command Reference*.

### `get-replication-set`

The following code example shows how to use `get-replication-set`.

#### AWS CLI

##### To get the replication set

The following `get-replication-set` example gets the details of the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account.

```
aws ssm-incidents get-replication-set \
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-
bb3f-413c-08df53673b57"
```

Output:

```
{
    "replicationSet": {
        "createdBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
        "createdTime": "2021-05-14T17:57:22.010000+00:00",
        "deletionProtected": false,
        "lastModifiedBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",
        "lastModifiedTime": "2021-05-14T17:57:22.010000+00:00",
        "regionMap": {
            "us-east-1": {
                "sseKmsKeyId": "DefaultKey",
                "status": "ACTIVE"
            },
            "us-east-2": {
                "sseKmsKeyId": "DefaultKey",
                "status": "ACTIVE",
                "statusMessage": "Tagging inaccessible"
            }
        },
        "status": "ACTIVE"
    }
}
```

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see GetReplicationSet in *AWS CLI Command Reference*.

### `get-resource-policies`

The following code example shows how to use `get-resource-policies`.

**AWS CLI**

**To list resource policies for a response plan**

The following `command-name` example lists the resource policies associated with the specified response plan.

```
aws ssm-incidents get-resource-policies \
--resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```
{
    "resourcePolicies": [
        {
            "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"d901b37a-dbb0-458a-8842-75575c464219-external-principals\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::222233334444:root\"},\"Action\":[\"ssm-incidents:GetResponsePlan\",\"ssm-incidents:StartIncident\",\"ssm-incidents:UpdateIncidentRecord\",\"ssm-incidents:GetIncidentRecord\",\"ssm-incidents:CreateTimelineEvent\",\"ssm-incidents:UpdateTimelineEvent\",\"ssm-incidents:GetTimelineEvent\",\"ssm-incidents:ListTimelineEvents\",\"ssm-incidents:UpdateRelatedItems\",\"ssm-incidents:ListRelatedItems\"],\"Resource\":[\"arn:aws:ssm-incidents:*:111122223333:response-plan/Example-Response-Plan\",\"arn:aws:ssm-incidents:*:111122223333:incident-record/Example-Response-Plan/*\"]}]}",
            "policyId": "be8b57191f0371f1c6827341aa3f0a03",
            "ramResourceShareRegion": "us-east-1"
        }
    ]
}
```

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see GetResourcePolicies in *AWS CLI Command Reference*.

### `get-response-plan`

The following code example shows how to use `get-response-plan`.

**AWS CLI**

**To get details of a response plan**

The following `command-name` example gets details about a specified response plan in your AWS account.

```
aws ssm-incidents get-response-plan \
    --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```
{
    "actions": [
        {
            "ssmAutomation": {
                "documentName": "AWSIncidents-CriticalIncidentRunbookTemplate",
                "documentVersion": "$DEFAULT",
                "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-
incidents.amazonaws.com/AWSServiceRoleForIncidentManager",
                "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"
            }
        }
    ],
    "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-
Plan",
    "chatChannel": {
        "chatbotSns": [
            "arn:aws:sns:us-east-1:111122223333:Standard_User"
        ]
    },
    "displayName": "Example response plan",
    "engagements": [
        "arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"
    ],
    "incidentTemplate": {
        "impact": 5,
        "title": "Example-Incident"
    },
```

```
    "name": "Example-Response-Plan"
}
```

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see GetResponsePlan in *AWS CLI Command Reference*.

### `get-timeline-event`

The following code example shows how to use `get-timeline-event`.

#### AWS CLI

**To get details of a timeline event**

The following `get-timeline-event` example returns details of the specified timeline event.

```
aws ssm-incidents get-timeline-event \
    --event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
    "event": {
        "eventData": "\"Incident Started\"",
        "eventId": "20bcc812-8a94-4cd7-520c-0ff742111424",
        "eventTime": "2021-05-21T18:16:57+00:00",
        "eventType": "Custom Event",
        "eventUpdatedTime": "2021-05-21T18:16:59.944000+00:00",
        "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
    }
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see GetTimelineEvent in *AWS CLI Command Reference*.

### `list-incident-records`

The following code example shows how to use `list-incident-records`.

**AWS CLI**

**To list incident records**

The following command-name example lists the incident records in your Amazon Web Services account.

```
aws ssm-incidents list-incident-records
```

Output:

```
{
    "incidentRecordSummaries": [
        {
            "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-
Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
            "creationTime": "2021-05-21T18:16:57.579000+00:00",
            "impact": 5,
            "incidentRecordSource": {
                "createdBy": "arn:aws:iam::111122223333:user/draliatp",
                "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
                "source": "aws.ssm-incidents.custom"
            },
            "status": "OPEN",
            "title": "Example-Incident"
        }
    ]
}
```

For more information, see Incident list in the *Incident Manager User Guide*.

- For API details, see ListIncidentRecords in *AWS CLI Command Reference*.

## `list-related-items`

The following code example shows how to use `list-related-items`.

**AWS CLI**

**To list related items**

The following `list-related-items` example lists the related items of the specified incident.

```
aws ssm-incidents list-related-items \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
    "relatedItems": [
        {
            "identifier": {
                "type": "OTHER",
                "value": {
                    "url": "https://console.aws.amazon.com/systems-manager/opsitems/
oi-8ef82158e190/workbench?region=us-east-1"
                }
            },
            "title": "Example related item"
        },
        {
            "identifier": {
                "type": "PARENT",
                "value": {
                    "arn": "arn:aws:ssm:us-east-1:111122223333:opsitem/
oi-8084126392ac"
                }
            },
            "title": "parentItem"
        }
    ]
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see ListRelatedItems in *AWS CLI Command Reference*.

## `list-replication-sets`

The following code example shows how to use `list-replication-sets`.

### AWS CLI

#### To list the replication set

The following `list-replication-set` example lists the replication set Incident Manager uses to replicate and encrypt data in your AWS account.

```
aws ssm-incidents list-replication-sets
```

Output:

```
{
    "replicationSetArns": [
        "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-
bb3f-413c-08df53673b57"
    ]
}
```

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see ListReplicationSets in *AWS CLI Command Reference*.

### `list-response-plans`

The following code example shows how to use `list-response-plans`.

#### AWS CLI

**To list the available response plans**

The following `list-response-plans` example lists the available response plans in your Amazon Web Services account.

```
aws ssm-incidents list-response-plans
```

Output:

```
{
    "responsePlanSummaries": [
        {
            "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan",
            "displayName": "Example response plan",
            "name": "Example-Response-Plan"
```

```
        }
    ]
}
```

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see ListResponsePlans in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for a response plan**

The following `list-tags-for-resource` example lists the tags associated with the specified response plan.

```
aws ssm-incidents list-tags-for-resource \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan"
```

Output:

```
{
    "tags": {
    "group1": "1"
    }
}
```

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `list-timeline-events`

The following code example shows how to use `list-timeline-events`.

**AWS CLI**

**To list timeline events of an incident**

The following command-name example lists the timeline events of the specified incident.

```
aws ssm-incidents list-timeline-events \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
    "eventSummaries": [
        {
            "eventId": "8cbcc889-35e1-a42d-2429-d6f100799915",
            "eventTime": "2021-05-21T22:36:13.766000+00:00",
            "eventType": "SSM Incident Record Update",
            "eventUpdatedTime": "2021-05-21T22:36:13.766000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-
record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        },
        {
            "eventId": "a2bcc825-aab5-1787-c605-f9bb2640d85b",
            "eventTime": "2021-05-21T18:58:46.443000+00:00",
            "eventType": "SSM Incident Record Update",
            "eventUpdatedTime": "2021-05-21T18:58:46.443000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-
record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        },
        {
            "eventId": "5abcc812-89c0-b0a8-9437-1c74223d4685",
            "eventTime": "2021-05-21T18:16:59.149000+00:00",
            "eventType": "SSM Incident Record Update",
            "eventUpdatedTime": "2021-05-21T18:16:59.149000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-
record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        },
        {
            "eventId": "06bcc812-8820-405e-4065-8d2b14d29b92",
            "eventTime": "2021-05-21T18:16:58+00:00",
            "eventType": "SSM Automation Execution Start Failure for Incident",
            "eventUpdatedTime": "2021-05-21T18:16:58.689000+00:00",
            "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-
record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        },
        {
```

record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
        }
    ]
}
```

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see ListTimelineEvents in *AWS CLI Command Reference*.

### `put-resource-policy`

The following code example shows how to use `put-resource-policy`.

#### AWS CLI

**To share a response plan and incidents**

The following `command-name` example adds a resource policy to the Example-Response-Plan that shares the response plan and associated incidents with the specified principal.

```
aws ssm-incidents put-resource-policy \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan" \
    --policy "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"ExampleResourcePolciy\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":
\"arn:aws:iam::222233334444:root\"},\"Action\":[\"ssm-incidents:GetResponsePlan
\",\"ssm-incidents:StartIncident\",\"ssm-incidents:UpdateIncidentRecord
\",\"ssm-incidents:GetIncidentRecord\",\"ssm-incidents:CreateTimelineEvent
\",\"ssm-incidents:UpdateTimelineEvent\",\"ssm-incidents:GetTimelineEvent
\",\"ssm-incidents:ListTimelineEvents\",\"ssm-incidents:UpdateRelatedItems
```

```
\",\"ssm-incidents:ListRelatedItems\"],\"Resource\":[\"arn:aws:ssm-
incidents:*:111122223333:response-plan/Example-Response-Plan\",\"arn:aws:ssm-
incidents:*:111122223333:incident-record/Example-Response-Plan/*\"]}]}"
```

Output:

```
{
    "policyId": "be8b57191f0371f1c6827341aa3f0a03"
}
```

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see PutResourcePolicy in *AWS CLI Command Reference*.

### `start-incident`

The following code example shows how to use `start-incident`.

**AWS CLI**

**To start an incident**

The following `start-incident` example starts an incident using the specified response plan.

```
aws ssm-incidents start-incident \
    --response-plan-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan"
```

Output:

```
{
    "incidentRecordArn": "arn:aws:ssm-incidents::682428703967:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
}
```

For more information, see Incident creation in the *Incident Manager User Guide*.

- For API details, see StartIncident in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a response plan**

The following `tag-resource` example tags a specified response plan with the provided tag key-value pair.

```
aws ssm-incidents tag-resource \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan" \
    --tags '{"group1":"1"}'
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a response plan**

The following `untag-resource` example removes the specified tags from the response plan.

```
aws ssm-incidents untag-resource \
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan" \
    --tag-keys '["group1"]'
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-deletion-protection`

The following code example shows how to use `update-deletion-protection`.

**AWS CLI**

**To update replication set deletion protection**

The following `update-deletion-protection` example updates the deletion protection in your account to protect you from deleting the last Region in your replication set.

```
aws ssm-incidents update-deletion-protection \
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/
a2bcc5c9-0f53-8047-7fef-c20749989b40" \
    --deletion-protected
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see UpdateDeletionProtection in *AWS CLI Command Reference*.

### `update-incident-record`

The following code example shows how to use `update-incident-record`.

**AWS CLI**

**To update an incident record**

The following `command-name` example resolves the specified incident.

```
aws ssm-incidents update-incident-record \
    --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-
Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
    --status "RESOLVED"
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see UpdateIncidentRecord in *AWS CLI Command Reference*.

### `update-related-items`

The following code example shows how to use `update-related-items`.

#### AWS CLI

**To update an incidents related item**

The following `update-related-item` example removes a related item from the specified incident record.

```
aws ssm-incidents update-related-items \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
    --related-items-update '{"itemToRemove": {"type": "OTHER", "value": {"url":
 "https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?
region=us-east-1"}}}'
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see UpdateRelatedItems in *AWS CLI Command Reference*.

### `update-replication-set`

The following code example shows how to use `update-replication-set`.

#### AWS CLI

**To update a replication set**

The following `command-name` example deletes the us-east-2 Region from the replication set.

```
aws ssm-incidents update-replication-set \
    --arn "arn:aws:ssm-incidents::111122223333:replication-set/
a2bcc5c9-0f53-8047-7fef-c20749989b40" \
    --actions '[{"deleteRegionAction": {"regionName": "us-east-2"}}]'
```

This command produces no output.

For more information, see Using the Incident Manager replication set in the *Incident Manager User Guide*.

- For API details, see UpdateReplicationSet in *AWS CLI Command Reference*.

### `update-response-plan`

The following code example shows how to use `update-response-plan`.

**AWS CLI**

**To update a response plan**

The following `update-response-plan` example removes a chat channel from the specified response plan.

```
aws ssm-incidents update-response-plan \
    --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
 \
    --chat-channel '{"empty":{}}'
```

This command produces no output.

For more information, see Incident preparation in the *Incident Manager User Guide*.

- For API details, see UpdateResponsePlan in *AWS CLI Command Reference*.

### `update-timeline-event`

The following code example shows how to use `update-timeline-event`.

**AWS CLI**

**To update a timeline event**

The following `update-timeline-event` example updates the time that the event occurred.

```
aws ssm-incidents update-timeline-event \
    --event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \
    --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \
    --event-time "2021-05-21T18:10:57+00:00"
```

This command produces no output.

For more information, see Incident details in the *Incident Manager User Guide*.

- For API details, see UpdateTimelineEvent in *AWS CLI Command Reference*.

## Incident Manager Contacts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager Contacts.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `accept-page`

The following code example shows how to use `accept-page`.

#### AWS CLI

**To accept a page during and engagement**

The following `accept-page` example uses an accept code sent to the contact channel to accept a page.

```
aws ssm-contacts accept-page \
    --page-id "arn:aws:ssm-contacts:us-east-2:682428703967:page/
akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3" \
    --accept-type READ \
    --accept-code 425440
```

This command produces no output

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see AcceptPage in *AWS CLI Command Reference*.

### `activate-contact-channel`

The following code example shows how to use `activate-contact-channel`.

**AWS CLI**

**Activate a contact's contact channel**

The following `activate-contact-channel` example activates a contact channel and makes it usable as part of an incident.

```
aws ssm-contacts activate-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d" \
    --activation-code "466136"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ActivateContactChannel in *AWS CLI Command Reference*.

### `command-name`

The following code example shows how to use `command-name`.

**AWS CLI**

**To delete a contact**

The following `command-name` example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```
aws ssm-contacts delete-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-1:682428703967:contact/alejr"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see CommandName in *AWS CLI Command Reference*.

### `create-contact-channel`

The following code example shows how to use `create-contact-channel`.

#### AWS CLI

**To create a contact channel**

Creates a contact channel of type SMS for the contact Akua Mansa. Contact channels can be created of type SMS, EMAIL, or VOICE.

```
aws ssm-contacts create-contact-channel \
    --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
    --name "akuas sms-test" \
    --type SMS \
    --delivery-address '{"SimpleAddress": "+15005550199"}'
```

Output:

```
{
    "ContactChannelArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact-
channel/akuam/02f506b9-ea5d-4764-af89-2daa793ff024"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see CreateContactChannel in *AWS CLI Command Reference*.

### `create-contact`

The following code example shows how to use `create-contact`.

#### AWS CLI

**To create a contact**

The following `create-contact` example creates a contact in your environment with a blank plan. The plan can be updated after creating contact channels. Use the create-contact-channel command with the output ARN of this command. After you have created contact channels for this contact use update-contact to update the plan.

```
aws ssm-contacts create-contact \
    --alias "akuam" \
    --display-name "Akua Mansa" \
    --type PERSONAL \
    --plan '{"Stages": []}'
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see CreateContact in *AWS CLI Command Reference*.

### `deactivate-contact-channel`

The following code example shows how to use `deactivate-contact-channel`.

**AWS CLI**

**To deactivate a contact channel**

The following `deactivate-contact-channel` example deactivates a contact channel. Deactivating a contact channel means the contact channel will no longer be paged during an incident. You can also reactivate a contact channel at any time using the `activate-contact-channel` command.

```
aws ssm-contacts deactivate-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-
channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DeactivateContactChannel in *AWS CLI Command Reference*.

### `delete-contact-channel`

The following code example shows how to use `delete-contact-channel`.

**AWS CLI**

**To delete a contact channel**

The following `delete-contact-channel` example deletes a contact channel. Deleting a contact channel ensures the contact channel will not be paged during an incident.

```
aws ssm-contacts delete-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/13149bad-52ee-45ea-ae1e-45857f78f9b2"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DeleteContactChannel in *AWS CLI Command Reference*.

### `delete-contact`

The following code example shows how to use `delete-contact`.

**AWS CLI**

**To delete a contact**

The following `delete-contact` example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```
aws ssm-contacts delete-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/alejr"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DeleteContact in *AWS CLI Command Reference*.

### `describe-engagement`

The following code example shows how to use `describe-engagement`.

**AWS CLI**

**To describe the details of an engagement**

The following `describe-engagement` example lists the details of an engagement to a contact or escalation plan. The subject and content are sent to the contact channels.

```
aws ssm-contacts describe-engagement \
    --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
    "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356",
    "Sender": "cli",
    "Subject": "cli-test",
    "Content": "Testing engagements via CLI",
    "PublicSubject": "cli-test",
    "PublicContent": "Testing engagements va CLI",
    "StartTime": "2021-05-18T18:25:41.151000+00:00"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DescribeEngagement in *AWS CLI Command Reference*.

### `describe-page`

The following code example shows how to use `describe-page`.

**AWS CLI**

**To list the details of a page to a contact channel**

The following `describe-page` example lists details of a page to a contact channel. The page will include the subject and content provided.

```
aws ssm-contacts describe-page \
    --page-id "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/ad0052bd-e606-498a-861b-25726292eb93"
```

Output:

```
{
    "PageArn": "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/ad0052bd-e606-498a-861b-25726292eb93",
    "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "Sender": "cli",
    "Subject": "cli-test",
    "Content": "Testing engagements via CLI",
    "PublicSubject": "cli-test",
    "PublicContent": "Testing engagements va CLI",
    "SentTime": "2021-05-18T18:43:29.301000+00:00",
    "ReadTime": "2021-05-18T18:43:55.708000+00:00",
    "DeliveryTime": "2021-05-18T18:43:55.265000+00:00"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see DescribePage in *AWS CLI Command Reference*.

## `get-contact-channel`

The following code example shows how to use `get-contact-channel`.

### AWS CLI

#### To list the details of a contact channel

The following `get-contact-channel` example lists the details of a contact channel.

```
aws ssm-contacts get-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-
channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
    "Name": "akuas sms",
    "Type": "SMS",
    "DeliveryAddress": {
        "SimpleAddress": "+15005550199"
    },
    "ActivationStatus": "ACTIVATED"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see GetContactChannel in *AWS CLI Command Reference*.

### `get-contact-policy`

The following code example shows how to use `get-contact-policy`.

#### AWS CLI

**To list the resource policies of a contact**

The following `get-contact-policy` example lists the resource policies associated with the specified contact.

```
aws ssm-contacts get-contact-policy \
    --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam",
    "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"SharePolicyForDocumentationDralia\",\"Effect\":\"Allow\",\"Principal\":
{\"AWS\":\"222233334444\"},\"Action\":[\"ssm-contacts:GetContact\",\"ssm-
contacts:StartEngagement\",\"ssm-contacts:DescribeEngagement\",\"ssm-
contacts:ListPagesByEngagement\",\"ssm-contacts:StopEngagement\"],\"Resource
\":[\"arn:aws:ssm-contacts:*:111122223333:contact/akuam\",\"arn:aws:ssm-
contacts:*:111122223333:engagement/akuam/*\"]}]}"
```

```
}
```

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see GetContactPolicy in *AWS CLI Command Reference*.

### `get-contact`

The following code example shows how to use `get-contact`.

#### AWS CLI

**Example 1: To describe a contact plan**

The following `get-contact` example describes a contact.

```
aws ssm-contacts get-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
    "Alias": "akuam",
    "DisplayName": "Akua Mansa",
    "Type": "PERSONAL",
    "Plan": {
        "Stages": [
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ChannelTargetInfo": {
                            "ContactChannelId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65",
                            "RetryIntervalInMinutes": 1
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 5,
```

```
                "Targets": [
                    {
                        "ChannelTargetInfo": {
                            "ContactChannelId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad",
                            "RetryIntervalInMinutes": 1
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ChannelTargetInfo": {
                            "ContactChannelId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/77d4f447-f619-4954-afff-85551e369c2a",
                            "RetryIntervalInMinutes": 1
                        }
                    }
                ]
            }
        ]
    }
}
```

**Example 2: To describe an escalation plan**

The following `get-contact` example describes an escalation plan.

```
aws ssm-contacts get-contact \
--contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation"
```

Output:

```
{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
    "Alias": "example_escalation",
    "DisplayName": "Example Escalation",
    "Type": "ESCALATION",
    "Plan": {
```

```
        "Stages": [
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ContactTargetInfo": {
                            "ContactId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact/akuam",
                            "IsEssential": true
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 5,
                "Targets": [
                    {
                        "ContactTargetInfo": {
                            "ContactId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact/alejr",
                            "IsEssential": false
                        }
                    }
                ]
            },
            {
                "DurationInMinutes": 0,
                "Targets": [
                    {
                        "ContactTargetInfo": {
                            "ContactId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact/anasi",
                            "IsEssential": false
                        }
                    }
                ]
            }
        ]
    }
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see GetContact in *AWS CLI Command Reference*.

### `list-contact-channels`

The following code example shows how to use `list-contact-channels`.

**AWS CLI**

**To list the contact channels of a contact**

The following `list-contact-channels` example lists the available contact channels of the specified contact.

```
aws ssm-contacts list-contact-channels \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
    [
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Name": "akuas email",
            "Type": "EMAIL",
            "DeliveryAddress": {
                "SimpleAddress": "akuam@example.com"
            },
            "ActivationStatus": "NOT_ACTIVATED"
        },
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Name": "akuas sms",
            "Type": "SMS",
            "DeliveryAddress": {
                "SimpleAddress": "+15005550100"
            },
            "ActivationStatus": "ACTIVATED"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListContactChannels in *AWS CLI Command Reference*.

### `list-contacts`

The following code example shows how to use `list-contacts`.

**AWS CLI**

**To list all escalation plans and contacts**

The following `list-contacts` example lists the contacts and escalation plans in your account.

```
aws ssm-contacts list-contacts
```

Output:

```
{
    "Contacts": [
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Alias": "akuam",
            "DisplayName": "Akua Mansa",
            "Type": "PERSONAL"
        },
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
alejr",
            "Alias": "alejr",
            "DisplayName": "Alejandro Rosalez",
            "Type": "PERSONAL"
        },
        {
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
anasi",
            "Alias": "anasi",
            "DisplayName": "Ana Carolina Silva",
            "Type": "PERSONAL"
        },
        {
```

```
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
            "Alias": "example_escalation",
            "DisplayName": "Example Escalation",
            "Type": "ESCALATION"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListContacts in *AWS CLI Command Reference*.

### `list-engagements`

The following code example shows how to use `list-engagements`.

#### AWS CLI

**To list all engagements**

The following `list-engagements` example lists engagements to escalation plans and contacts. You can also list engagements for a single incident.

```
aws ssm-contacts list-engagements
```

Output:

```
{
    "Engagements": [
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/91792571-0b53-4821-9f73-d25d13d9e529",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Sender": "cli",
            "StartTime": "2021-05-18T20:37:50.300000+00:00"
        },
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
```

```
            "Sender": "cli",
            "StartTime": "2021-05-18T18:40:26.666000+00:00"
        },
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
            "Sender": "cli",
            "StartTime": "2021-05-18T18:25:41.151000+00:00"
        },
        {
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/607ced0e-e8fa-4ea7-8958-a237b8803f8f",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Sender": "cli",
            "StartTime": "2021-05-18T18:20:58.093000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListEngagements in *AWS CLI Command Reference*.

## `list-page-receipts`

The following code example shows how to use `list-page-receipts`.

### AWS CLI

#### To list page receipts

The following `command-name` example lists whether a page was received or not by a contact.

```
aws ssm-contacts list-page-receipts \
    --page-id "arn:aws:ssm-contacts:us-east-2:111122223333:page/
akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3"
```

Output:

```
{
    "Receipts": [
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
            "ReceiptType": "DELIVERED",
            "ReceiptInfo": "425440",
            "ReceiptTime": "2021-05-18T20:42:57.485000+00:00"
        },
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
            "ReceiptType": "READ",
            "ReceiptInfo": "425440",
            "ReceiptTime": "2021-05-18T20:42:57.907000+00:00"
        },
        {
            "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
            "ReceiptType": "SENT",
            "ReceiptInfo": "SM6656c19132f1465f9c9c1123a5dde7c9",
            "ReceiptTime": "2021-05-18T20:40:52.962000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListPageReceipts in *AWS CLI Command Reference*.

## `list-pages-by-contact`

The following code example shows how to use `list-pages-by-contact`.

### AWS CLI

#### To list pages by contact

The following `list-pages-by-contact` example lists all pages to the specified contact.

```
aws ssm-contacts list-pages-by-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
    "Pages": [
        {
            "PageArn": "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/
ad0052bd-e606-498a-861b-25726292eb93",
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Sender": "cli",
            "SentTime": "2021-05-18T18:43:29.301000+00:00",
            "DeliveryTime": "2021-05-18T18:43:55.265000+00:00",
            "ReadTime": "2021-05-18T18:43:55.708000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListPagesByContact in *AWS CLI Command Reference*.

### `list-pages-by-engagement`

The following code example shows how to use `list-pages-by-engagement`.

#### AWS CLI

**To list pages to contact channels started from an engagement.**

The following `list-pages-by-engagement` example lists the pages that occurred while engaging the defined engagement plan.

```
aws ssm-contacts list-pages-by-engagement \
    --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
akuam/78a29753-3674-4ac5-9f83-0468563567f0"
```

Output:

```
{
    "Pages": [
```

```
        {
            "PageArn": "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/
ad0052bd-e606-498a-861b-25726292eb93",
            "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
            "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
            "Sender": "cli",
            "SentTime": "2021-05-18T18:40:27.245000+00:00"
        }
    ]
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see ListPagesByEngagement in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list tags for a contact**

The following `list-tags-for-resource` example lists the tags of the specified contact.

```
aws ssm-contacts list-tags-for-resource \
    --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```
{
    "Tags": [
        {
            "Key": "group1",
            "Value": "1"
        }
    ]
}
```

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `put-contact-policy`

The following code example shows how to use `put-contact-policy`.

**AWS CLI**

**To share a contact and engagements**

The following `put-contact-policy` example adds a resource policy to the contact Akua that shares the contact and related engagements with the principal.

```
aws ssm-contacts put-contact-policy \
    --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
    --policy "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"ExampleResourcePolicy\",\"Action\":[\"ssm-contacts:GetContact\",\"ssm-
contacts:StartEngagement\",\"ssm-contacts:DescribeEngagement\",\"ssm-
contacts:ListPagesByEngagement\",\"ssm-contacts:StopEngagement\"],
\"Principal\":{\"AWS\":\"222233334444\"},\"Effect\":\"Allow\",\"Resource
\":[\"arn:aws:ssm-contacts:*:111122223333:contact\/akuam\",\"arn:aws:ssm-
contacts:*:111122223333:engagement\/akuam\/*\"]}]}"
```

This command produces no output.

For more information, see Working with shared contacts and response plans in the *Incident Manager User Guide*.

- For API details, see PutContactPolicy in *AWS CLI Command Reference*.

### `send-activation-code`

The following code example shows how to use `send-activation-code`.

**AWS CLI**

**To send an activation code**

The following `send-activation-code` example sends an activation code and message to the specified contact channel.

```
aws ssm-contacts send-activation-code \
```

```
    --contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-
channel/akuam/8ddae2d1-12c8-4e45-b852-c8587266c400"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see SendActivationCode in *AWS CLI Command Reference*.

### `start-engagement`

The following code example shows how to use `start-engagement`.

**AWS CLI**

**Example 1: To page a contact's contact channels**

The following `start-engagement` pages contact's contact channels. Sender, subject, public-subject, and public-content are all free from fields. Incident Manager sends the subject and content to the provided VOICE or EMAIL contact channels. Incident Manager sends the public-subject and public-content to the provided SMS contact channels. Sender is used to track who started the engagement.

```
aws ssm-contacts start-engagement \
    --contact-id  "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam" \
    --sender "cli" \
    --subject "cli-test" \
    --content "Testing engagements via CLI" \
    --public-subject "cli-test" \
    --public-content "Testing engagements va CLI"
```

Output:

```
{
    "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
akuam/607ced0e-e8fa-4ea7-8958-a237b8803f8f"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

**Example 2: To page a contact in the provided escalation plan.**

The following `start-engagement` engages contact's through an escalation plan. Each contact is paged according to their engagement plan.

```
aws ssm-contacts start-engagement \
    --contact-id  "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation" \
    --sender "cli" \
    --subject "cli-test" \
    --content "Testing engagements via CLI" \
    --public-subject "cli-test" \
    --public-content "Testing engagements va CLI"
```

Output:

```
{
    "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
}
```

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see StartEngagement in *AWS CLI Command Reference*.

### `stop-engagement`

The following code example shows how to use `stop-engagement`.

#### AWS CLI

**To stop an engagement**

The following `stop-engagement` example stops an engagement from paging further contacts and contact channels.

```
aws ssm-contacts stop-engagement \
    --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see StopEngagement in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a contact**

The following `tag-resource` example tags a specified contact with the provided tag key value pair.

```
aws ssm-contacts tag-resource \
    --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
    --tags '[{"Key":"group1","Value":"1"}]'
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a contact**

The following `untag-resource` example removes the group1 tag from the specified contact.

```
aws ssm-contacts untag-resource \
    --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
    --tag-keys "group1"
```

This command produces no output.

For more information, see Tagging in the *Incident Manager User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-contact-channel`

The following code example shows how to use `update-contact-channel`.

**AWS CLI**

**To update a contact channel**

The following `update-contact-channel` example updates the name and delivery address of a contact channel.

```
aws ssm-contacts update-contact-channel \
    --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-
channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad" \
    --name "akuas voice channel" \
    --delivery-address '{"SimpleAddress": "+15005550198"}'
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see UpdateContactChannel in *AWS CLI Command Reference*.

### `update-contact`

The following code example shows how to use `update-contact`.

**AWS CLI**

**To update the engagement plan of contact**

The following `update-contact` example updates the engagement plan of the contact Akua to include the three types of contacts channels. This is done after creating contact channels for Akua.

```
aws ssm-contacts update-contact \
    --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam" \
    --plan '{"Stages": [{"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo":
 {"ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-
channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65","RetryIntervalInMinutes":
 1 }}]}, {"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo":
{"ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/
akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad", "RetryIntervalInMinutes": 1}}]},
```

```
 {"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo": {"ContactChannelId":
 "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/77d4f447-
f619-4954-afff-85551e369c2a","RetryIntervalInMinutes": 1 }}]}]}'
```

This command produces no output.

For more information, see Contacts in the *Incident Manager User Guide*.

- For API details, see UpdateContact in *AWS CLI Command Reference*.

## Amazon Inspector examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Inspector.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `add-attributes-to-findings`

The following code example shows how to use `add-attributes-to-findings`.

#### AWS CLI

##### To add attributes to findings

The following `add-attribute-to-finding` command assigns an attribute with the key of `Example` and value of `example` to the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU`:

```
aws inspector add-attributes-to-findings --finding-arns arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-
T8yM9mEU --attributes key=Example,value=example
```

Output:

```
{
    "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see AddAttributesToFindings in *AWS CLI Command Reference*.

### `create-assessment-target`

The following code example shows how to use `create-assessment-target`.

**AWS CLI**

**To create an assessment target**

The following `create-assessment-target` command creates an assessment target named `ExampleAssessmentTarget` using the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv`:

```
aws inspector create-assessment-target --assessment-target-name
 ExampleAssessmentTarget --resource-group-arn arn:aws:inspector:us-
west-2:123456789012:resourcegroup/0-AB6DMKnv
```

Output:

```
{
    "assessmentTargetArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX"
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see CreateAssessmentTarget in *AWS CLI Command Reference*.

### `create-assessment-template`

The following code example shows how to use `create-assessment-template`.

**AWS CLI**

**To create an assessment template**

The following `create-assessment-template` command creates an assessment template called `ExampleAssessmentTemplate` for the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX`:

```
aws inspector create-assessment-template --assessment-target-arn
 arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX --assessment-template-
name ExampleAssessmentTemplate --duration-in-seconds 180 --rules-package-arns
 arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p --user-attributes-
for-findings key=ExampleTag,value=examplevalue
```

Output:

```
{
    "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-it5r2S4T"
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see CreateAssessmentTemplate in *AWS CLI Command Reference*.

### `create-resource-group`

The following code example shows how to use `create-resource-group`.

**AWS CLI**

**To create a resource group**

The following `create-resource-group` command creates a resource group using the tag key of `Name` and value of `example`:

```
aws inspector create-resource-group --resource-group-tags key=Name,value=example
```

Output:

```
{
   "resourceGroupArn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-
AB6DMKnv"
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see CreateResourceGroup in *AWS CLI Command Reference*.

### `delete-assessment-run`

The following code example shows how to use `delete-assessment-run`.

**AWS CLI**

**To delete an assessment run**

The following `delete-assessment-run` command deletes the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe`:

```
aws inspector delete-assessment-run --assessment-run-arn arn:aws:inspector:us-
west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see DeleteAssessmentRun in *AWS CLI Command Reference*.

### `delete-assessment-target`

The following code example shows how to use `delete-assessment-target`.

**AWS CLI**

**To delete an assessment target**

The following `delete-assessment-target` command deletes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
aws inspector delete-assessment-target --assessment-target-arn arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see DeleteAssessmentTarget in *AWS CLI Command Reference*.

### `delete-assessment-template`

The following code example shows how to use `delete-assessment-template`.

#### AWS CLI

**To delete an assessment template**

The following `delete-assessment-template` command deletes the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`:

```
aws inspector delete-assessment-template --assessment-template-arn
 arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see DeleteAssessmentTemplate in *AWS CLI Command Reference*.

### `describe-assessment-runs`

The following code example shows how to use `describe-assessment-runs`.

#### AWS CLI

**To describe assessment runs**

The following `describe-assessment-run` command describes an assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`:

```
aws inspector describe-assessment-runs --assessment-run-arns arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
        "assessmentRuns": [
          {
                "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE",
                "assessmentTemplateArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw",
                "completedAt": 1458680301.4,
                "createdAt": 1458680170.035,
                "dataCollected": true,
                "durationInSeconds": 3600,
                "name": "Run 1 for ExampleAssessmentTemplate",
                "notifications": [],
                "rulesPackageArns": [
                  "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-X1KXtawP"
                ],
                "startedAt": 1458680170.161,
                "state": "COMPLETED",
                "stateChangedAt": 1458680301.4,
                "stateChanges": [
                  {
                        "state": "CREATED",
                        "stateChangedAt": 1458680170.035
                  },
                  {
                        "state": "START_DATA_COLLECTION_PENDING",
                        "stateChangedAt": 1458680170.065
                  },
                  {
                        "state": "START_DATA_COLLECTION_IN_PROGRESS",
                        "stateChangedAt": 1458680170.096
                  },
                  {
                        "state": "COLLECTING_DATA",
                        "stateChangedAt": 1458680170.161
                  },
                  {
                        "state": "STOP_DATA_COLLECTION_PENDING",
                        "stateChangedAt": 1458680239.883
                  },
                  {
                        "state": "DATA_COLLECTED",
```

```
                        "stateChangedAt": 1458680299.847
                    },
                    {
                        "state": "EVALUATING_RULES",
                        "stateChangedAt": 1458680300.099
                    },
                    {
                        "state": "COMPLETED",
                        "stateChangedAt": 1458680301.4
                    }
                ],
                "userAttributesForFindings": []
            }
        ],
        "failedItems": {}
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see DescribeAssessmentRuns in *AWS CLI Command Reference*.

### `describe-assessment-targets`

The following code example shows how to use `describe-assessment-targets`.

#### AWS CLI

**To describe assessment targets**

The following `describe-assessment-targets` command describes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
aws inspector describe-assessment-targets --assessment-target-arns
 arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
      "assessmentTargets": [
        {
              "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq",
```

```
            "createdAt": 1458074191.459,
            "name": "ExampleAssessmentTarget",
            "resourceGroupArn": "arn:aws:inspector:us-
west-2:123456789012:resourcegroup/0-PyGXopAI",
            "updatedAt": 1458074191.459
        }
      ],
      "failedItems": {}
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see DescribeAssessmentTargets in *AWS CLI Command Reference*.

### `describe-assessment-templates`

The following code example shows how to use `describe-assessment-templates`.

#### AWS CLI

**To describe assessment templates**

The following `describe-assessment-templates` command describes the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw`:

```
aws inspector describe-assessment-templates --assessment-template-arns
 arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw
```

Output:

```
{
      "assessmentTemplates": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw",
            "assessmentTargetArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq",
            "createdAt": 1458074191.844,
            "durationInSeconds": 3600,
            "name": "ExampleAssessmentTemplate",
            "rulesPackageArns": [
```

```
                "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-X1KXtawP"
            ],
            "userAttributesForFindings": []
        }
    ],
    "failedItems": {}
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see DescribeAssessmentTemplates in *AWS CLI Command Reference*.

### `describe-cross-account-access-role`

The following code example shows how to use `describe-cross-account-access-role`.

**AWS CLI**

**To describe the cross account access role**

The following `describe-cross-account-access-role` command describes the IAM role that enables Amazon Inspector to access your AWS account:

```
aws inspector describe-cross-account-access-role
```

Output:

```
{
        "registeredAt": 1458069182.826,
        "roleArn": "arn:aws:iam::123456789012:role/inspector",
        "valid": true
}
```

For more information, see Setting up Amazon Inspector in the *Amazon Inspector* guide.

- For API details, see DescribeCrossAccountAccessRole in *AWS CLI Command Reference*.

### `describe-findings`

The following code example shows how to use `describe-findings`.

## AWS CLI

### To describe findings

The following `describe-findings` command describes the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4`:

```
aws inspector describe-findings --finding-arns arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-
HwPnsDm4
```

Output:

```
{
      "failedItems": {},
      "findings": [
        {
              "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
              "assetAttributes": {
                "ipv4Addresses": [],
                "schemaVersion": 1
              },
              "assetType": "ec2-instance",
              "attributes": [],
              "confidence": 10,
              "createdAt": 1458680301.37,
              "description": "Amazon Inspector did not find any potential security
 issues during this assessment.",
              "indicatorOfCompromise": false,
              "numericSeverity": 0,
              "recommendation": "No remediation needed.",
              "schemaVersion": 1,
              "service": "Inspector",
              "serviceAttributes": {
                "assessmentRunArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
                "rulesPackageArn": "arn:aws:inspector:us-
west-2:758058086616:rulespackage/0-X1KXtawP",
                "schemaVersion": 1
              },
              "severity": "Informational",
```

```
            "title": "No potential security issues found",
            "updatedAt": 1458680301.37,
            "userAttributes": []
        }
    ]
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see DescribeFindings in *AWS CLI Command Reference*.

### `describe-resource-groups`

The following code example shows how to use `describe-resource-groups`.

#### AWS CLI

**To describe resource groups**

The following `describe-resource-groups` command describes the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI`:

```
aws inspector describe-resource-groups --resource-group-arns arn:aws:inspector:us-
west-2:123456789012:resourcegroup/0-PyGXopAI
```

Output:

```
{
    "failedItems": {},
    "resourceGroups": [
        {
            "arn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-
PyGXopAI",
            "createdAt": 1458074191.098,
            "tags": [
                {
                    "key": "Name",
                    "value": "example"
                }
            ]
        }
    ]
```

```
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see DescribeResourceGroups in *AWS CLI Command Reference*.

### `describe-rules-packages`

The following code example shows how to use `describe-rules-packages`.

#### AWS CLI

**To describe rules packages**

The following `describe-rules-packages` command describes the rules package with the ARN of `arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p`:

```
aws inspector describe-rules-packages --rules-package-arns arn:aws:inspector:us-
west-2:758058086616:rulespackage/0-9hgA516p
```

Output:

```
{
      "failedItems": {},
      "rulesPackages": [
        {
              "arn": "arn:aws:inspector:us-
west-2:758058086616:rulespackage/0-9hgA516p",
              "description": "The rules in this package help verify whether the EC2
 instances in your application are exposed to Common Vulnerabilities and
              Exposures (CVEs). Attacks can exploit unpatched vulnerabilities to
 compromise the confidentiality, integrity, or availability of your service
              or data. The CVE system provides a reference for publicly known
 information security vulnerabilities and exposures. For more information, see
              [https://cve.mitre.org/](https://cve.mitre.org/). If a particular CVE
 appears in one of the produced Findings at the end of a completed
              Inspector assessment, you can search [https://cve.mitre.org/](https://
cve.mitre.org/) using the CVE's ID (for example, \"CVE-2009-0021\") to
              find detailed information about this CVE, its severity, and how to
 mitigate it. ",
              "name": "Common Vulnerabilities and Exposures",
              "provider": "Amazon Web Services, Inc.",
              "version": "1.1"
```

```
        }
      ]
}
```

For more information, see Amazon Inspector Rules Packages and Rules in the *Amazon Inspector* guide.

- For API details, see DescribeRulesPackages in *AWS CLI Command Reference*.

### `get-telemetry-metadata`

The following code example shows how to use `get-telemetry-metadata`.

**AWS CLI**

**To get the telemetry metadata**

The following `get-telemetry-metadata` command generates information about the data that is collected for the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`:

```
aws inspector get-telemetry-metadata --assessment-run-arn arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
      "telemetryMetadata": [
        {
              "count": 2,
              "dataSize": 345,
              "messageType": "InspectorDuplicateProcess"

### `list-assessment-run-agents`

The following code example shows how to use `list-assessment-run-agents`.

**AWS CLI**

**To list assessment run agents**

The following `list-assessment-run-agents` command lists the agents of the assessment run with the specified ARN.

```
aws inspector list-assessment-run-agents \
    --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
    "assessmentRunAgents": [
        {
            "agentHealth": "HEALTHY",
            "agentHealthCode": "HEALTHY",
            "agentId": "i-49113b93",
            "assessmentRunArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
            "telemetryMetadata": [
                {
                    "count": 2,
                    "dataSize": 345,
                    "messageType": "InspectorDuplicateProcess"
                },
                {
                    "count": 3,
                    "dataSize": 255,
                    "messageType": "InspectorTimeEventMsg"
                },
                {
                    "count": 4,
```

```
                    "dataSize": 1082,
                    "messageType": "InspectorNetworkInterface"
                },
                {
                    "count": 2,

                    "dataSize": 4593,
                    "messageType": "InspectorGroup"
                },
                {
                    "count": 1,
                    "dataSize": 184,
                    "messageType": "InspectorTcpV4ListeningPort"
                },
                {
                    "count": 1159,
                    "dataSize": 3146579,
                    "messageType": "Total"
                },
                {
                    "count": 5,
                    "dataSize": 0,
                    "messageType": "InspectorSplitMsgEnd"
                },
                {
                    "count": 1,
                    "dataSize": 612,
                    "messageType": "InspectorLoadImageInProcess"
```

```
                }
            ]
        }
    ]
}
```

For more information, see AWS Agents in the *Amazon Inspector User Guide*.

- For API details, see ListAssessmentRunAgents in *AWS CLI Command Reference*.

### `list-assessment-runs`

The following code example shows how to use `list-assessment-runs`.

**AWS CLI**

**To list assessment runs**

The following `list-assessment-runs` command lists all existing assessment runs.

```
aws inspector list-assessment-runs
```

Output:

```
{
    "assessmentRunArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-v5D6fI3v"
    ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector User Guide*.

- For API details, see ListAssessmentRuns in *AWS CLI Command Reference*.

### `list-assessment-targets`

The following code example shows how to use `list-assessment-targets`.

**AWS CLI**

**To list assessment targets**

The following `list-assessment-targets` command lists all existing assessment targets:

```
aws inspector list-assessment-targets
```

Output:

```
{
       "assessmentTargetArns": [
       "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq"
       ]
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see ListAssessmentTargets in *AWS CLI Command Reference*.

## `list-assessment-templates`

The following code example shows how to use `list-assessment-templates`.

**AWS CLI**

**To list assessment templates**

The following `list-assessment-templates` command lists all existing assessment templates:

```
aws inspector list-assessment-templates
```

Output:

```
{
       "assessmentTemplateArns": [
       "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw",
       "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-
Uza6ihLh"
       ]
```

```
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see ListAssessmentTemplates in *AWS CLI Command Reference*.

### `list-event-subscriptions`

The following code example shows how to use `list-event-subscriptions`.

**AWS CLI**

**To list event subscriptions**

The following `list-event-subscriptions` command lists all the event subscriptions for the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`:

```
aws inspector list-event-subscriptions --resource-arn arn:aws:inspector:us-
west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0
```

Output:

```
{
      "subscriptions": [
        {
              "eventSubscriptions": [
                {
                      "event": "ASSESSMENT_RUN_COMPLETED",
                      "subscribedAt": 1459455440.867
                }
              ],
              "resourceArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-7sbz2Kz0",
              "topicArn": "arn:aws:sns:us-west-2:123456789012:exampletopic"
        }
      ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see ListEventSubscriptions in *AWS CLI Command Reference*.

### `list-findings`

The following code example shows how to use `list-findings`.

**AWS CLI**

**To list findings**

The following `list-findings` command lists all of the generated findings:

```
aws inspector list-findings
```

Output:

```
{
        "findingArns": [
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
        "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-v5D6fI3v/finding/0-tyvmqBLy"
      ]
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see ListFindings in *AWS CLI Command Reference*.

### `list-rules-packages`

The following code example shows how to use `list-rules-packages`.

**AWS CLI**

**To list rules packages**

The following `list-rules-packages` command lists all available Inspector rules packages:

```
aws inspector list-rules-packages
```

Output:

```
{
       "rulesPackageArns": [
         "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p",
         "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-H5hpSawc",
         "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-JJOtZiqQ",
         "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-vg5GGHSD"
       ]
 }
```

For more information, see Amazon Inspector Rules Packages and Rules in the *Amazon Inspector* guide.

- For API details, see ListRulesPackages in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list tags for resource**

The following `list-tags-for-resource` command lists all tags associated with the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu`:

```
aws inspector list-tags-for-resource --resource-arn arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu
```

Output:

```
{
      "tags": [
        {
              "key": "Name",
              "value": "Example"
        }
      ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `preview-agents`

The following code example shows how to use `preview-agents`.

**AWS CLI**

**To preview agents**

The following `preview-agents` command previews the agents installed on the EC2 instances that are part of the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
aws inspector preview-agents --preview-agents-arn arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
      "agentPreviews": [
        {
              "agentId": "i-49113b93"
        }
      ]
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see PreviewAgents in *AWS CLI Command Reference*.

### `register-cross-account-access-role`

The following code example shows how to use `register-cross-account-access-role`.

**AWS CLI**

**To register the cross account access role**

The following `register-cross-account-access-role` command registers the IAM role with the ARN of `arn:aws:iam::123456789012:role/inspector` that Amazon Inspector uses to list your EC2 instances at the start of the assessment run of when you call the preview-agents command:

```
aws inspector register-cross-account-access-role --role-arn
 arn:aws:iam::123456789012:role/inspector
```

For more information, see Setting up Amazon Inspector in the *Amazon Inspector* guide.

- For API details, see RegisterCrossAccountAccessRole in *AWS CLI Command Reference*.

### `remove-attributes-from-findings`

The following code example shows how to use `remove-attributes-from-findings`.

**AWS CLI**

**To remove attributes from findings**

The following `remove-attributes-from-finding` command removes the attribute with the key of `Example` and value of `example` from the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU`:

```
aws inspector remove-attributes-from-findings --finding-arns arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-8l1VIE0D/run/0-Z02cjjug/finding/0-
T8yM9mEU --attribute-keys key=Example,value=example
```

Output:

```
{
      "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see RemoveAttributesFromFindings in *AWS CLI Command Reference*.

### `set-tags-for-resource`

The following code example shows how to use `set-tags-for-resource`.

**AWS CLI**

**To set tags for a resource**

The following `set-tags-for-resource` command sets the tag with the key of `Example` and value of `example` to the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`:

```
aws inspector set-tags-for-resource --resource-arn arn:aws:inspector:us-
west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 --tags
 key=Example,value=example
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see SetTagsForResource in *AWS CLI Command Reference*.

### `start-assessment-run`

The following code example shows how to use `start-assessment-run`.

**AWS CLI**

**To start an assessment run**

The following `start-assessment-run` command starts the assessment run named `examplerun` using the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`:

```
aws inspector start-assessment-run --assessment-run-name examplerun --assessment-
template-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-
it5r2S4T
```

Output:

```
{
      "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-it5r2S4T/run/0-jOoroxyY"
```

```
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see StartAssessmentRun in *AWS CLI Command Reference*.

### `stop-assessment-run`

The following code example shows how to use `stop-assessment-run`.

**AWS CLI**

**To stop an assessment run**

The following `stop-assessment-run` command stops the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-jOoroxyY`:

```
aws inspector stop-assessment-run --assessment-run-arn arn:aws:inspector:us-
west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-jOoroxyY
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see StopAssessmentRun in *AWS CLI Command Reference*.

### `subscribe-to-event`

The following code example shows how to use `subscribe-to-event`.

**AWS CLI**

**To subscribe to an event**

The following example enables the process of sending Amazon SNS notifications about the `ASSESSMENT_RUN_COMPLETED` event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`

```
aws inspector subscribe-to-event \
    --event ASSESSMENT_RUN_COMPLETED \
```

```
    --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/
template/0-7sbz2Kz0 \
    --topic-arn arn:aws:sns:us-west-2:123456789012:exampletopic
```

This command produces no output.

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see SubscribeToEvent in *AWS CLI Command Reference*.

### `unsubscribe-from-event`

The following code example shows how to use `unsubscribe-from-event`.

#### AWS CLI

**To unsubscribe from an event**

The following `unsubscribe-from-event` command disables the process of sending Amazon SNS notifications about the `ASSESSMENT_RUN_COMPLETED` event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`:

```
aws inspector unsubscribe-from-event --event ASSESSMENT_RUN_COMPLETED --resource-arn
 arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 --
topic arn:aws:sns:us-west-2:123456789012:exampletopic
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see UnsubscribeFromEvent in *AWS CLI Command Reference*.

### `update-assessment-target`

The following code example shows how to use `update-assessment-target`.

#### AWS CLI

**To update an assessment target**

The following `update-assessment-target` command updates the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX` and

the name of `Example`, and the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-yNbgL5Pt`:

```
aws inspector update-assessment-target --assessment-target-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX --assessment-target-name Example --resource-group-arn arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-yNbgL5Pt
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see UpdateAssessmentTarget in *AWS CLI Command Reference*.

## AWS IoT examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `accept-certificate-transfer`

The following code example shows how to use `accept-certificate-transfer`.

#### AWS CLI

**To accept a device certificate transferred from a different AWS account**

The following `accept-certificate-transfer` example accepts a device certificate transferred from another AWS account. The certificate is identified by its ID.

```
aws iot accept-certificate-transfer \
    --certificate-id
 488b6a7f2acdeb00a77384e63c4e40b18bEXAMPLEe57b7272ba44c45e3448142
```

This command does not produce any output.

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see AcceptCertificateTransfer in *AWS CLI Command Reference*.

### `add-thing-to-billing-group`

The following code example shows how to use `add-thing-to-billing-group`.

**AWS CLI**

**Example 1: To add a thing by name to a billing group**

The following `add-thing-to-billing-group` example adds the thing named `MyLightBulb` to the billing group named `GroupOne`.

```
aws iot add-thing-to-billing-group \
    --billing-group-name GroupOne \
    --thing-name MyLightBulb
```

This command produces no output.

**Example 2: To add a thing by ARN to a billing group**

The following `add-thing-to-billing-group` example adds a thing with a specified ARN to a billing group with the specified ARN. Specifying an ARN is helpful if you work with multiple AWS Regions or accounts. It can help ensure that you are adding to the right Region and account.

```
aws iot add-thing-to-thing-group \
    --billing-group-arn "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne" \
    --thing-arn "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb"
```

This command produces no output.

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see AddThingToBillingGroup in *AWS CLI Command Reference*.

### `add-thing-to-thing-group`

The following code example shows how to use `add-thing-to-thing-group`.

**AWS CLI**

**To add a thing to a group**

The following `add-thing-to-thing-group` example adds the specified thing to the specified thing group.

```
aws iot add-thing-to-thing-group \
    --thing-name MyLightBulb \
    --thing-group-name LightBulbs
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see AddThingToThingGroup in *AWS CLI Command Reference*.

### `associate-targets-with-job`

The following code example shows how to use `associate-targets-with-job`.

**AWS CLI**

**To associate a thing group with a continuous job**

The following `associate-targets-with-job` example associates the specified thing group with the specified continuous job.

```
aws iot associate-targets-with-job \
    --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --job-id "example-job-04"
```

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-04",
    "jobId": "example-job-04",
    "description": "example continuous job"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see AssociateTargetsWithJob in *AWS CLI Command Reference*.

### `attach-policy`

The following code example shows how to use `attach-policy`.

**AWS CLI**

**Example 1: To attach a policy to a thing group**

The following `attach-policy` example attaches the specified policy to a thing group identified by its ARN.

```
aws iot attach-policy \
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --policy-name "UpdateDeviceCertPolicy"
```

This command does not produce any output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

**Example 2: To attach a policy to a certificate**

The following `attach-policy` example attaches the policy `UpdateDeviceCertPolicy` to the principal specified by a certificate.

```
aws iot attach-policy \
    --policy-name UpdateDeviceCertPolicy \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

This command does not produce any output.

For more information, see Attach an AWS IoT Policy to a Device Certificate in the *AWS IoT Developers Guide*.

- For API details, see AttachPolicy in *AWS CLI Command Reference*.

### `attach-security-profile`

The following code example shows how to use `attach-security-profile`.

**AWS CLI**

**To associate a security profile with all unregistered devices**

The following `attach-security-profile` example associates the AWS IoT Device Defender security profile named `Testprofile` with all unregistered devices in the `us-west-2` region for this AWS account.

```
aws iot attach-security-profile \
    --security-profile-name Testprofile \
    --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/
unregistered-things"
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see AttachSecurityProfile in *AWS CLI Command Reference*.

### `attach-thing-principal`

The following code example shows how to use `attach-thing-principal`.

**AWS CLI**

**To attach a certificate to your thing**

The following `attach-thing-principal` example attaches a certificate to the MyTemperatureSensor thing. The certificate is identified by an ARN. You can find the ARN for a certificate in the AWS IoT console.

```
aws iot attach-thing-principal \
```

```
    --thing-name MyTemperatureSensor \
    --principal arn:aws:iot:us-
west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8
```

This command produces no output.

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see AttachThingPrincipal in *AWS CLI Command Reference*.

### `cancel-audit-mitigation-actions-task`

The following code example shows how to use `cancel-audit-mitigation-actions-task`.

**AWS CLI**

**To cancel an audit mitigation actions task**

The following `cancel-audit-mitigations-action-task` example cancels the application of mitigation actions for the specified task. You cannot cancel tasks that are already completed.

```
aws iot cancel-audit-mitigation-actions-task
    --task-id "myActionsTaskId"
```

This command produces no output.

For more information, see CancelAuditMitigationActionsTask (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see CancelAuditMitigationActionsTask in *AWS CLI Command Reference*.

### `cancel-audit-task`

The following code example shows how to use `cancel-audit-task`.

**AWS CLI**

**To cancel an audit task**

The following `cancel-audit-task` example cancels an audit task with the specified task ID. You cannot cancel a task that is complete.

```
aws iot cancel-audit-task \
    --task-id a3aea009955e501a31b764abe1bebd3d
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see CancelAuditTask in *AWS CLI Command Reference*.

### `cancel-certificate-transfer`

The following code example shows how to use `cancel-certificate-transfer`.

#### AWS CLI

**To cancel the transfer a certificate to a different AWS account**

The following `cancel-certificate-transfer` example cancels the transfer of the specified certificate transfer. The certificate is identified by a certificate ID. You can find the ID for a certificate in the AWS IoT console.

```
aws iot cancel-certificate-transfer \
    --certificate-id
 f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78addd5e605d630e05c7fc8
```

This command produces no output.

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see CancelCertificateTransfer in *AWS CLI Command Reference*.

### `cancel-job-execution`

The following code example shows how to use `cancel-job-execution`.

#### AWS CLI

**To cancel a job execution on a device**

The following `cancel-job-execution` example cancels the execution of the specified job on a device. If the job is not in the QUEUED state, you must add the `--force` parameter.

```
aws iot cancel-job-execution \
    --job-id "example-job-03" \
    --thing-name "MyRPi"
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see CancelJobExecution in *AWS CLI Command Reference*.

### `cancel-job`

The following code example shows how to use `cancel-job`.

#### AWS CLI

**To cancel a job**

The following `cancel-job` example cancels the specified job.

```
aws iot cancel-job \
    --job-job "example-job-03"
```

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-03",
    "jobId": "example-job-03",
    "description": "example job test"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see CancelJob in *AWS CLI Command Reference*.

### `clear-default-authorizer`

The following code example shows how to use `clear-default-authorizer`.

#### AWS CLI

**To clear the default authorizer**

The following `clear-default-authorizer` example clears the currently configured default custom authorizer. After you run this command, there is no default authorizer. When you use a custom authorizer, you must specify it by name in the HTTP request headers.

```
aws iot clear-default-authorizer
```

This command produces no output.

For more information, see ClearDefaultAuthorizer in the *AWS IoT API Reference*.

- For API details, see ClearDefaultAuthorizer in *AWS CLI Command Reference*.

### `confirm-topic-rule-destination`

The following code example shows how to use `confirm-topic-rule-destination`.

**AWS CLI**

**To confirm a topic rule destination**

The following `confirm-topic-rule-destination` example confirms a topic rule destination with a confirmation token received at an HTTP endpoint.

```
aws iot confirm-topic-rule-destination \
    --confirmation-token "AYADeIcmtq-
ZkxfpiWIQqHWM5ucAXwABABVhd3MtY3J5cHRvLXB1YmxpYy1rZXkAREFxY1E0UmlGeDg0V21BZWZ1VjZtZWFRVUJJUkt
aywpPqg8YEsa1lD4B40aJ2s1wEHKMybiF1RoOZzYisI0IvslzQY5UmCkqq3tV-3f7-
nKfosgIAAAADAAAEAAAAAAAAAAAAAAAAAi9RMgy-
V19V9m6Iw2xfbw_____wAAAAEAAAAAAAAAAAAAAEAAAB1hw4SokgUcxiJ3gTO6n50NLJVpzyQR1UmPIj5sShqXEQGcO
iufgrzTePl8RZYOWr0O6Aj9DiVzJZx-1iD6Pu-
G6PUw1kaO7Knzs2B4AD0qfrHUF4pYRTvyUgBnMGUCMQC8ZRmhKqntd_c6Kgrow3bMUDBvNqo2qZr8Z8Jm2rzgseROlAn
PIetJ803Z4IlIlF8xXlcdPGP-PV1dOXFemyL8g"
```

This command produces no output.

For more information, see Confirming a topic rule destination in the *AWS IoT Developer Guide*.

- For API details, see ConfirmTopicRuleDestination in *AWS CLI Command Reference*.

### `create-audit-suppression`

The following code example shows how to use `create-audit-suppression`.

**AWS CLI**

**To create an audit finding suppression**

The following `create-audit-suppression` example creates an audit finding suppression for a policy named "virtualMachinePolicy" that has been flagged for being overly permissive.

```
aws iot create-audit-suppression \
    --check-name IOT_POLICY_OVERLY_PERMISSIVE_CHECK \
    --resource-identifier
 policyVersionIdentifier={"policyName"="virtualMachinePolicy","policyVersionId"="1"}
 \
    --no-suppress-indefinitely \
    --expiration-date 2020-10-20
```

This command produces no output.

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see CreateAuditSuppression in *AWS CLI Command Reference*.

## `create-authorizer`

The following code example shows how to use `create-authorizer`.

**AWS CLI**

**To create a custom authorizer**

The following `create-authorizer` example creates a custom authorizer that uses the specified Lambda function as part of a custom authentication service.

```
   aws iot create-authorizer \
       --authorizer-name "CustomAuthorizer" \
       --authorizer-function-arn "arn:aws:lambda:us-
west-2:123456789012:function:CustomAuthorizerFunction" \
       --token-key-name "MyAuthToken" \
       --status ACTIVE \
       --token-signing-public-keys FIRST_KEY="-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZfIwo

zwOBKPeic0asNJpqT8PkBbRaKyleJh5oo81NDHHmVtbBm5A5YiJjqYXLaVAowKzZ
```

```
+GqsNvAQ9Jy1wI2VrEa1OfL8flDB/BJLm7zjpfPOHDJQgID0XnZwAlNnZcOhCwIx
50g2LW2Oy9R/dmqtDmJiVP97Z4GykxPvwlYHrUXY0iW1R3AR/Ac1NhCTGZMwVDB1
lQIDAQAB
-----END PUBLIC KEY-----"
```

Output:

```
{
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
}
```

For more information, see CreateAuthorizer in the *AWS IoT API Reference*.

- For API details, see CreateAuthorizer in *AWS CLI Command Reference*.

### `create-billing-group`

The following code example shows how to use `create-billing-group`.

#### AWS CLI

**To create a billing group**

The following `create-billing-group` example creates a simple billing group named `GroupOne`.

```
aws iot create-billing-group \
    --billing-group-name GroupOne
```

Output:

```
{
    "billingGroupName": "GroupOne",
    "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
    "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562"
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see CreateBillingGroup in *AWS CLI Command Reference*.

### `create-certificate-from-csr`

The following code example shows how to use `create-certificate-from-csr`.

**AWS CLI**

**To create a device certificate from a certificate signing request (CSR)**

The following `create-certificate-from-csr` example creates a device certificate from a CSR. You can use the `openssl` command to create a CSR.

```
aws iot create-certificate-from-csr \
    --certificate-signing-request=file://certificate.csr
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/
c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
        "certificateId":
 "c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9",
        "certificatePem": "<certificate-text>"
}
```

For more information, see CreateCertificateFromCSR in the *AWS IoT API Reference*.

- For API details, see CreateCertificateFromCsr in *AWS CLI Command Reference*.

### `create-custom-metric`

The following code example shows how to use `create-custom-metric`.

**AWS CLI**

**To create a custom metric published by your devices to Device Defender**

The following `create-custom-metric` example creates a custom metric that measures battery percentage.

```
aws iot create-custom-metric \
    --metric-name "batteryPercentage" \
    --metric-type "number" \
```

```
    --display-name "Remaining battery percentage." \
    --region us-east-1 \
    --client-request-token "02ccb92b-33e8-4dfa-a0c1-35b181ed26b0"
```

Output:

```
{
    "metricName": "batteryPercentage",
    "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/
batteryPercentage"
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see CreateCustomMetric in *AWS CLI Command Reference*.

### `create-dimension`

The following code example shows how to use `create-dimension`.

#### AWS CLI

**To create a dimension**

The following `create-dimension` creates a dimension with a single topic filter called `TopicFilterForAuthMessages`.

```
aws iot create-dimension \
    --name TopicFilterForAuthMessages \
    --type TOPIC_FILTER \
    --string-values device/+/auth
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "arn": "arn:aws:iot:eu-west-2:123456789012:dimension/TopicFilterForAuthMessages"
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see CreateDimension in *AWS CLI Command Reference*.

### `create-domain-configuration`

The following code example shows how to use `create-domain-configuration`.

**AWS CLI**

**To create a domain configuration**

The following `create-domain-configuration` example creates an AWS-managed domain configuration with a service type of DATA.

```
aws iot create-domain-configuration \
    --domain-configuration-name "additionalDataDomain" \
    --service-type "DATA"
```

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see CreateDomainConfiguration in *AWS CLI Command Reference*.

### `create-dynamic-thing-group`

The following code example shows how to use `create-dynamic-thing-group`.

**AWS CLI**

**To create a dynamic thing group**

The following `create-dynamic-thing-group` example creates a dynamic thing group that contains any thing with a temperature attribute that is greater than 60 degrees. You must enable AWS IoT fleet indexing before you can use dynamic thing groups.

```
aws iot create-dynamic-thing-group \
    --thing-group-name "RoomTooWarm" \
    --query-string "attributes.temperature>60"
```

Output:

```
{
    "thingGroupName": "RoomTooWarm",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/RoomTooWarm",
    "thingGroupId": "9d52492a-fc87-43f4-b6e2-e571d2ffcad1",
    "indexName": "AWS_Things",
    "queryString": "attributes.temperature>60",
    "queryVersion": "2017-09-30"
}
```

For more information, see Dynamic Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see CreateDynamicThingGroup in *AWS CLI Command Reference*.

## `create-job`

The following code example shows how to use `create-job`.

### AWS CLI

#### Example 1: To create a job

The following `create-job` example creates a simple AWS IoT job that sends a JSON document to the `MyRaspberryPi` device.

```
aws iot create-job \
    --job-id "example-job-01" \
    --targets "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi" \
    --document file://example-job.json \
    --description "example job test" \
    --target-selection SNAPSHOT
```

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
    "jobId": "example-job-01",
    "description": "example job test"
}
```

#### Example 2: To create a continuous job

The following `create-job` example creates a job that continues to run after the things specified as targets have completed the job. In this example, the target is a thing group, so when new devices are added to the group, the continuous job runs on those new things.

aws iot create-job --job-id "example-job-04" --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/DeadBulbs" --document file://example-job.json --description "example continuous job" --target-selection CONTINUOUS

Output:

```
{
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-04",
    "jobId": "example-job-04",
    "description": "example continuous job"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see CreateJob in *AWS CLI Command Reference*.

## `create-keys-and-certificate`

The following code example shows how to use `create-keys-and-certificate`.

### AWS CLI

#### To create an RSA key pair and issue an X.509 certificate

The following `create-keys-and-certificate` creates a 2048-bit RSA key pair and issues an X.509 certificate using the issued public key. Because this is the only time that AWS IoT provides the private key for this certificate, be sure to keep it in a secure location.

```
aws iot create-keys-and-certificate \
    --certificate-pem-outfile "myTest.cert.pem" \
    --public-key-outfile "myTest.public.key" \
    --private-key-outfile "myTest.private.key"
```

Output:

```
{
```

```
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
    "certificateId":
 "9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
    "certificatePem": "

}
```

For more infomration, see Create and Register an AWS IoT Device Certificate in the **AWS IoT Developer Guide**.

- For API details, see CreateKeysAndCertificate in *AWS CLI Command Reference*.

### `create-mitigation-action`

The following code example shows how to use `create-mitigation-action`.

**AWS CLI**

**To create a mitigation action**

The following `create-mitigation-action` example defines a mitigation action named `AddThingsToQuarantineGroup1Action` that, when applied, moves things into the thing group named `QuarantineGroup1`. This action overrides dynamic thing groups.

```
aws iot create-mitigation-action --cli-input-json file::params.json
```

Contents of `params.json`:

```
{
    "actionName": "AddThingsToQuarantineGroup1Action",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": [
                "QuarantineGroup1"
            ],
            "overrideDynamicGroups": true
        }
    },
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MoveThingsToQuarantineGroupRole"
}
```

Output:

```
{
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroup1Action",
    "actionId": "992e9a63-a899-439a-aa50-4e20c52367e1"
}
```

For more information, see CreateMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see CreateMitigationAction in *AWS CLI Command Reference*.

## `create-ota-update`

The following code example shows how to use `create-ota-update`.

**AWS CLI**

**To create an OTA update for use with Amazon FreeRTOS**

The following `create-ota-update` example creates an AWS IoT OTAUpdate on a target group of things or groups. This is part of an Amazon FreeRTOS over-the-air update which makes it possible for you to deploy new firmware images to a single device or a group of devices.

```
aws iot create-ota-update \
    --cli-input-json file://create-ota-update.json
```

Contents of `create-ota-update.json`:

```
{
    "otaUpdateId": "ota12345",
    "description": "A critical update needed right away.",
    "targets": [
        "device1",
        "device2",
        "device3",
        "device4"
    ],
    "targetSelection": "SNAPSHOT",
    "awsJobExecutionsRolloutConfig": {
        "maximumPerMinute": 10
    },
    "files": [
        {
          "fileName": "firmware.bin",
          "fileLocation": {
            "stream": {
              "streamId": "004",
              "fileId":123
            }
          },
          "codeSigning": {
            "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
          }
        }
    ]
    "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role"
}
```

Output:

```
{
     "otaUpdateId": "ota12345",
     "awsIotJobId": "job54321",
     "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/itsaupdate",
     "awsIotJobArn": "arn:aws:iot:us-west-2:123456789012:job/itsajob",
     "otaUpdateStatus": "CREATE_IN_PROGRESS"
}
```

For more information, see CreateOTAUpdate in the *AWS IoT API Reference*.

- For API details, see CreateOtaUpdate in *AWS CLI Command Reference*.

### `create-policy-version`

The following code example shows how to use `create-policy-version`.

#### AWS CLI

**To update a policy with a new version**

The following `create-policy-version` example updates a policy definition, creating a new policy version. This example also makes the new version the default.

```
aws iot create-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-document file://policy.json \
    --set-as-default
```

Contents of `policy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action":  "iot:UpdateCertificate",
            "Resource": "*"
        }
    ]
}
```

Output:

```
{
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
    "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Action\":  \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
    "policyVersionId": "2",
    "isDefaultVersion": true
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see CreatePolicyVersion in *AWS CLI Command Reference*.

## `create-policy`

The following code example shows how to use `create-policy`.

### AWS CLI

#### To create an AWS IoT policy

The following `create-policy` example creates an AWS IoT policy named TemperatureSensorPolicy. The `policy.json` file contains statements that allow AWS IoT policy actions.

```
aws iot create-policy \
    --policy-name TemperatureSensorPolicy \
    --policy-document file://policy.json
```

Contents of `policy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "iot:Publish",
                "iot:Receive"
            ],
            "Resource": [
```

```
                "arn:aws:iot:us-west-2:123456789012:topic/topic_1",
                "arn:aws:iot:us-west-2:123456789012:topic/topic_2"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "iot:Subscribe"
            ],
            "Resource": [
                "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_1",
                "arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "iot:Connect"
            ],
            "Resource": [
                "arn:aws:iot:us-west-2:123456789012:client/basicPubSub"
            ]
        }
    ]
}
```

Output:

```
{
    "policyName": "TemperatureSensorPolicy",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TemperatureSensorPolicy",
    "policyDocument": "{
        \"Version\": \"2012-10-17\",
        \"Statement\": [
            {
                \"Effect\": \"Allow\",
                \"Action\": [
                    \"iot:Publish\",
                    \"iot:Receive\"
                ],
                \"Resource\": [
                    \"arn:aws:iot:us-west-2:123456789012:topic/topic_1\",
```

```
                    \"arn:aws:iot:us-west-2:123456789012:topic/topic_2\"
                ]
            },
            {
                \"Effect\": \"Allow\",
                \"Action\": [
                    \"iot:Subscribe\"
                ],
                \"Resource\": [
                    \"arn:aws:iot:us-west-2:123456789012:topicfilter/topic_1\",
                    \"arn:aws:iot:us-west-2:123456789012:topicfilter/topic_2\"
                ]
            },
            {
                \"Effect\": \"Allow\",
                \"Action\": [
                    \"iot:Connect\"
                ],
                \"Resource\": [
                    \"arn:aws:iot:us-west-2:123456789012:client/basicPubSub\"
                ]
            }
        ]
    }",
    "policyVersionId": "1"
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see CreatePolicy in *AWS CLI Command Reference*.

## `create-provisioning-claim`

The following code example shows how to use `create-provisioning-claim`.

### AWS CLI

#### To create a provisioning claim

The following `create-provisioning-claim` example creates a provisioning claim from a provisioning template.

```
aws iot create-provisioning-claim \
```

```
    --template-name MyTestProvisioningTemplate
```

Output:

```
{
    "certificateId":
 "78de02184b2ce80cf8fb709bda59e62b19fb83513590483eb0434589476ab09f",

- For API details, see CreateProvisioningClaim in *AWS CLI Command Reference*.

### `create-provisioning-template-version`

The following code example shows how to use `create-provisioning-template-version`.

#### AWS CLI

**To create a provisioning template version**

The following example creates a version for the specified provisioning template. The body of the new version is supplied in the file `template.json`.

```
aws iot create-provisioning-template-version \
    --template-name widget-template \
    --template-body file://template.json
```

Contents of `template.json`:

```
{
    "Parameters" : {
        "DeviceLocation": {
            "Type": "String"
        }
    },
    "Mappings": {
        "LocationTable": {
            "Seattle": {
                "LocationUrl": "https://example.aws"
            }
        }
    },
    "Resources" : {
        "thing" : {
            "Type" : "AWS::IoT::Thing",
            "Properties" : {
                "AttributePayload" : {
                    "version" : "v1",
                    "serialNumber" : "serialNumber"
```

```
                },
                "ThingName" : {"Fn::Join":["",["ThingPrefix_",
{"Ref":"SerialNumber"}]]},
                "ThingTypeName" : {"Fn::Join":["",["ThingTypePrefix_",
{"Ref":"SerialNumber"}]]},
                "ThingGroups" : ["widgets", "WA"],
                "BillingGroup": "BillingGroup"
            },
            "OverrideSettings" : {
                "AttributePayload" : "MERGE",
                "ThingTypeName" : "REPLACE",
                "ThingGroups" : "DO_NOTHING"
            }
        },
        "certificate" : {
            "Type" : "AWS::IoT::Certificate",
            "Properties" : {
                "CertificateId": {"Ref": "AWS::IoT::Certificate::Id"},
                "Status" : "Active"
            }
        },
        "policy" : {
            "Type" : "AWS::IoT::Policy",
            "Properties" : {
                "PolicyDocument" : {
                    "Version": "2012-10-17",
                    "Statement": [{
                        "Effect": "Allow",
                        "Action":["iot:Publish"],
                        "Resource": ["arn:aws:iot:us-east-1:123456789012:topic/foo/
bar"]
                    }]
                }
            }
        }
    },
    "DeviceConfiguration": {
        "FallbackUrl": "https://www.example.com/test-site",
        "LocationUrl": {
            "Fn::FindInMap": ["LocationTable",{"Ref": "DeviceLocation"},
 "LocationUrl"]}
        }
    }
```

```
}
```

Output:

```
{
    "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-
template",
    "templateName": "widget-template",
    "versionId": 2,
    "isDefaultVersion": false
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see CreateProvisioningTemplateVersion in *AWS CLI Command Reference*.

### `create-provisioning-template`

The following code example shows how to use `create-provisioning-template`.

#### AWS CLI

**To create a provisioning template**

The following `create-provisioning-template` example creates a provisioning template as defined by the file `template.json`.

```
aws iot create-provisioning-template \
    --template-name widget-template \
    --description "A provisioning template for widgets" \
    --provisioning-role-arn arn:aws:iam::123456789012:role/Provision_role \
    --template-body file://template.json
```

Contents of `template.json`:

```
{
    "Parameters" : {
        "DeviceLocation": {
            "Type": "String"
        }
    },
    "Mappings": {
```

```
        "LocationTable": {
            "Seattle": {
                "LocationUrl": "https://example.aws"
            }
        }
    },
    "Resources" : {
        "thing" : {
            "Type" : "AWS::IoT::Thing",
            "Properties" : {
                "AttributePayload" : {
                    "version" : "v1",
                    "serialNumber" : "serialNumber"
                },
                "ThingName" : {"Fn::Join":["",["ThingPrefix_",
{"Ref":"SerialNumber"}]]},
                "ThingTypeName" : {"Fn::Join":["",["ThingTypePrefix_",
{"Ref":"SerialNumber"}]]},
                "ThingGroups" : ["widgets", "WA"],
                "BillingGroup": "BillingGroup"
            },
            "OverrideSettings" : {
                "AttributePayload" : "MERGE",
                "ThingTypeName" : "REPLACE",
                "ThingGroups" : "DO_NOTHING"
            }
        },
        "certificate" : {
            "Type" : "AWS::IoT::Certificate",
            "Properties" : {
                "CertificateId": {"Ref": "AWS::IoT::Certificate::Id"},
                "Status" : "Active"
            }
        },
        "policy" : {
            "Type" : "AWS::IoT::Policy",
            "Properties" : {
                "PolicyDocument" : {
                    "Version": "2012-10-17",
                    "Statement": [{
                        "Effect": "Allow",
                        "Action":["iot:Publish"],
                        "Resource": ["arn:aws:iot:us-east-1:504350838278:topic/foo/
bar"]
```

```
                    }]
                }
            }
        }
    },
    "DeviceConfiguration": {
        "FallbackUrl": "https://www.example.com/test-site",
        "LocationUrl": {
            "Fn::FindInMap": ["LocationTable",{"Ref": "DeviceLocation"},
 "LocationUrl"]}
        }
    }
}
```

Output:

```
{
    "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-
template",
    "templateName": "widget-template",
    "defaultVersionId": 1
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see CreateProvisioningTemplate in *AWS CLI Command Reference*.

### `create-role-alias`

The following code example shows how to use `create-role-alias`.

#### AWS CLI

**To create a role alias**

The following `create-role-alias` example creates a role alias called `LightBulbRole` for the specified role.

```
aws iot create-role-alias \
    --role-alias LightBulbRole \
    --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:

```
{
    "roleAlias": "LightBulbRole",
    "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}
```

For more information, see CreateRoleAlias in the *AWS IoT API Reference*.

- For API details, see CreateRoleAlias in *AWS CLI Command Reference*.

### `create-scheduled-audit`

The following code example shows how to use `create-scheduled-audit`.

**AWS CLI**

**To create a scheduled audit**

The following `create-scheduled-audit` example creates a scheduled audit that runs weekly, on Wednesday, to check if CA certificates or device certificates are expiring.

```
aws iot create-scheduled-audit \
    --scheduled-audit-name WednesdayCertCheck \
    --frequency WEEKLY \
    --day-of-week WED \
    --target-check-names CA_CERTIFICATE_EXPIRING_CHECK
 DEVICE_CERTIFICATE_EXPIRING_CHECK
```

Output:

```
{
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
WednesdayCertCheck"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see CreateScheduledAudit in *AWS CLI Command Reference*.

### `create-security-profile`

The following code example shows how to use `create-security-profile`.

**AWS CLI**

**To create a security profile**

The following `create-security-profile` example creates a security profile that checks if cellular bandwidth exceeds a threshold or if more than 10 authorization failures occur within a five-minute period.

```
aws iot create-security-profile \
    --security-profile-name PossibleIssue \
    --security-profile-description "Check to see if authorization fails 10 times in
 5 minutes or if cellular bandwidth exceeds 128"  \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"less-than\",\"value\":{\"count\":10},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}}]"
```

Output:

```
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
PossibleIssue"
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see CreateSecurityProfile in *AWS CLI Command Reference*.

## `create-stream`

The following code example shows how to use `create-stream`.

**AWS CLI**

**To create a stream for delivering one or more large files in chunks over MQTT**

The following `create-stream` example creates a stream for delivering one or more large files in chunks over MQTT. A stream transports data bytes in chunks or blocks packaged as MQTT messages from a source like S3. You can have one or more files associated with a stream.

```
aws iot create-stream \
    --cli-input-json file://create-stream.json
```

Contents of `create-stream.json`:

```
{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "files": [
        {
            "fileId": 123,
            "s3Location": {
                "bucket":"codesign-ota-bucket",
                "key":"48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
            }
        }
    ],
    "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
}
```

Output:

```
{
     "streamId": "stream12345",
     "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
     "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
     "streamVersion": "1"
}
```

For more information, see CreateStream in the *AWS IoT API Reference*.

- For API details, see CreateStream in *AWS CLI Command Reference*.

## `create-thing-group`

The following code example shows how to use `create-thing-group`.

### AWS CLI

#### Example 1: To create a thing group

The following `create-thing-group` example creates a thing group named `LightBulbs` with a description and two attributes.

```
aws iot create-thing-group \
    --thing-group-name LightBulbs \
    --thing-group-properties "thingGroupDescription=\"Generic bulb group\",
 attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```
{
    "thingGroupName": "LightBulbs",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs",
    "thingGroupId": "9198bf9f-1e76-4a88-8e8c-e7140142c331"
}
```

**Example 2: To create a thing group that's part of a parent group**

The following `create-thing-group` creates a thing group named `HalogenBulbs` that has a parent thing group named `LightBulbs`.

```
aws iot create-thing-group \
    --thing-group-name HalogenBulbs \
    --parent-group-name LightBulbs
```

Output:

```
{
    "thingGroupName": "HalogenBulbs",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs",
    "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e"
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see CreateThingGroup in *AWS CLI Command Reference*.

### `create-thing-type`

The following code example shows how to use `create-thing-type`.

**AWS CLI**

**To define a thing type**

The following `create-thing-type` example defines a thing type and associated attributes.

```
aws iot create-thing-type \
    --thing-type-name "LightBulb" \
    --thing-type-properties "thingTypeDescription=light bulb type,
 searchableAttributes=wattage,model"
```

Output:

```
{
    "thingTypeName": "LightBulb",
    "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
    "thingTypeId": "ce3573b0-0a3c-45a7-ac93-4e0ce14cd190"
}
```

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see CreateThingType in *AWS CLI Command Reference*.

## `create-thing`

The following code example shows how to use `create-thing`.

**AWS CLI**

**Example 1: To create a thing record in the registry**

The following `create-thing` example creates an entry for a device in the AWS IoT thing registry.

```
aws iot create-thing \
    --thing-name SampleIoTThing
```

Output:

```
{
    "thingName": "SampleIoTThing",
```

```
    "thingArn": "arn:aws:iot:us-west-2: 123456789012:thing/SampleIoTThing",
    "thingId": " EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE "
}
```

**Example 2: To define a thing that is associated with a thing type**

The following `create-thing` example create a thing that has the specified thing type and its attributes.

```
aws iot create-thing \
    --thing-name "MyLightBulb" \
    --thing-type-name "LightBulb" \
    --attribute-payload "{"attributes": {"wattage":"75", "model":"123"}}"
```

Output:

```
{
    "thingName": "MyLightBulb",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "thingId": "40da2e73-c6af-406e-b415-15acae538797"
}
```

For more information, see How to Manage Things with the Registry and Thing Types in the *AWS IoT Developers Guide*.

- For API details, see CreateThing in *AWS CLI Command Reference*.

## `create-topic-rule-destination`

The following code example shows how to use `create-topic-rule-destination`.

### AWS CLI

**To create a topic rule destination**

The following `create-topic-rule-destination` example creates a topic rule destination for an HTTP endpoint.

```
aws iot create-topic-rule-destination \
    --destination-configuration httpUrlConfiguration={confirmationUrl=https://
example.com}
```

Output:

```
{
    "topicRuleDestination": {
        "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "status": "IN_PROGRESS",
        "statusReason": "Awaiting confirmation. Confirmation message sent on
 2020-07-09T22:47:54.154Z; no response received from the endpoint.",
        "httpUrlProperties": {
            "confirmationUrl": "https://example.com"
        }
    }
}
```

For more information, see Creating a topic rule destination in the *AWS IoT Developer Guide*.

- For API details, see CreateTopicRuleDestination in *AWS CLI Command Reference*.

## `create-topic-rule`

The following code example shows how to use `create-topic-rule`.

### AWS CLI

#### To create a rule that sends an Amazon SNS alert

The following `create-topic-rule` example creates a rule that sends an Amazon SNS message when soil moisture level readings, as found in a device shadow, are low.

```
aws iot create-topic-rule \
    --rule-name "LowMoistureRule" \
    --topic-rule-payload file://plant-rule.json
```

The example requires the following JSON code to be saved to a file named `plant-rule.json`:

```
{
    "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE
 state.reported.moisture = 'low'\n",
    "description": "Sends an alert whenever soil moisture level readings are too
 low.",
    "ruleDisabled": false,
```

```
    "awsIotSqlVersion": "2016-03-23",
    "actions": [{
            "sns": {
                "targetArn": "arn:aws:sns:us-
west-2:123456789012:MyRPiLowMoistureTopic",
                "roleArn": "arn:aws:iam::123456789012:role/service-role/
MyRPiLowMoistureTopicRole",
                "messageFormat": "RAW"
            }
    }]
}
```

This command produces no output.

For more information, see Creating an AWS IoT Rule in the *AWS IoT Developers Guide*.

- For API details, see CreateTopicRule in *AWS CLI Command Reference*.

### `delete-account-audit-configuration`

The following code example shows how to use `delete-account-audit-configuration`.

#### AWS CLI

**To disable all audit checks for your AWS account**

The following `delete-account-audit-configuration` example restores the default settings for AWS IoT Device Defender for this account, disabling all audit checks and clearing configuration data. It also deletes any scheduled audits for this account. **Use this command with caution.**

```
aws iot delete-account-audit-configuration \
    --delete-scheduled-audits
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteAccountAuditConfiguration in *AWS CLI Command Reference*.

### `delete-audit-suppression`

The following code example shows how to use `delete-audit-suppression`.

**AWS CLI**

**To delete an audit finding suppression**

The following `delete-audit-suppression` example deletes an audit finding suppression for DEVICE_CERTIFICATE_EXPIRING_CHECK.

```
aws iot delete-audit-suppression \
    --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
    --resource-identifier deviceCertificateId="c7691e<shortened>"
```

This command produces no output.

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see DeleteAuditSuppression in *AWS CLI Command Reference*.

## `delete-authorizer`

The following code example shows how to use `delete-authorizer`.

**AWS CLI**

**To delete a custom authorizer**

The following `delete-authorizer` example deletes the authorizer named `CustomAuthorizer`. A custom authorizer must be in the `INACTIVE` state before you can delete it.

```
aws iot delete-authorizer \
    --authorizer-name CustomAuthorizer
```

This command produces no output.

For more information, see DeleteAuthorizer in the *AWS IoT Developer Guide*.

- For API details, see DeleteAuthorizer in *AWS CLI Command Reference*.

## `delete-billing-group`

The following code example shows how to use `delete-billing-group`.

**AWS CLI**

**To delete a billing group**

The following `delete-billing-group` example deletes the specified billing group. You can delete a billing group even if it contains one or more things.

```
aws iot delete-billing-group \
    --billing-group-name BillingGroupTwo
```

This command does not produce any output.

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see DeleteBillingGroup in *AWS CLI Command Reference*.

## `delete-ca-certificate`

The following code example shows how to use `delete-ca-certificate`.

**AWS CLI**

**To delete a CA certificate**

The following `delete-ca-certificate` example deletes the CA certificate with the specified certificate ID.

```
aws iot delete-ca-certificate \
    --certificate-id
 f4efed62c0142f16af278166f61962501165c4f05362952074264600 58cd1467
```

This command produces no output.

For more information, see DeleteCACertificate in the *AWS IoT API Reference*.

- For API details, see DeleteCaCertificate in *AWS CLI Command Reference*.

## `delete-certificate`

The following code example shows how to use `delete-certificate`.

**AWS CLI**

**To delete a device certificate**

The following `delete-certificate` example deletes the device certificate with the specified ID.

```
aws iot delete-certificate \
    --certificate-id
 c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbee1428d216d54d53ac9
```

This command produces no output.

For more information, see DeleteCertificate in the *AWS IoT API Reference*.

- For API details, see DeleteCertificate in *AWS CLI Command Reference*.

## `delete-custom-metric`

The following code example shows how to use `delete-custom-metric`.

**AWS CLI**

**To delete a custom metric**

The following `delete-custom-metric` example deletes a custom metric.

```
aws iot delete-custom-metric \
    --metric-name batteryPercentage \
    --region us-east-1
```

Output:

```
HTTP 200
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see DeleteCustomMetric in *AWS CLI Command Reference*.

## `delete-dimension`

The following code example shows how to use `delete-dimension`.

**AWS CLI**

**To delete a dimension**

The following `delete-dimension` example deletes a dimension called `TopicFilterForAuthMessages`.

```
aws iot delete-dimension \
    --name TopicFilterForAuthMessages
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteDimension in *AWS CLI Command Reference*.

### `delete-domain-configuration`

The following code example shows how to use `delete-domain-configuration`.

**AWS CLI**

**To delete a domain configuration**

The following `delete-domain-configuration` example deletes a domain configuration named `additionalDataDomain` from your AWS account.

```
aws iot delete-domain-configuration \
    --domain-configuration-name "additionalDataDomain" \
    --domain-configuration-status "OK"
```

This command produces no output.

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see DeleteDomainConfiguration in *AWS CLI Command Reference*.

### `delete-dynamic-thing-group`

The following code example shows how to use `delete-dynamic-thing-group`.

**AWS CLI**

**To delete a dynamic thing group**

The following `delete-dynamic-thing-group` example deletes the specified dynamic thing group.

```
aws iot delete-dynamic-thing-group \
    --thing-group-name "RoomTooWarm"
```

This command produces no output.

For more information, see Dynamic Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see DeleteDynamicThingGroup in *AWS CLI Command Reference*.

### `delete-job-execution`

The following code example shows how to use `delete-job-execution`.

**AWS CLI**

**To delete a job execution**

The following `delete-job-execution` example deletes the job execution of the specified job on a device. Use `describe-job-execution` to get the execution number.

```
aws iot delete-job-execution
    --job-id "example-job-02"
    --thing-name "MyRaspberryPi"
    --execution-number 1
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DeleteJobExecution in *AWS CLI Command Reference*.

### `delete-job`

The following code example shows how to use `delete-job`.

**AWS CLI**

**To delete a job**

The following `delete-job` example deletes the specified job. By specifying the `--force` option, the job is deleted even if the status is `IN_PROGRESS`.

```
aws iot delete-job \
    --job-id "example-job-04" \
    --force
```

This command produces no output.

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DeleteJob in *AWS CLI Command Reference*.

### `delete-mitigation-action`

The following code example shows how to use `delete-mitigation-action`.

**AWS CLI**

**To delete a mitigation action**

The following `delete-mitigation-action` example deletes the specified mitigation action.

```
aws iot delete-mitigation-action \
    --action-name AddThingsToQuarantineGroup1Action
```

This command produces no output.

For more information, see DeleteMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see DeleteMitigationAction in *AWS CLI Command Reference*.

### `delete-ota-update`

The following code example shows how to use `delete-ota-update`.

**AWS CLI**

**To delete an OTA update**

The following `delete-ota-update` example deletes the specified OTA update.

```
aws iot delete-ota-update \
    --ota-update-id ota12345 \
    --delete-stream \
    --force-delete-aws-job
```

This command produces no output.

For more information, see DeleteOTAUpdate in the *AWS IoT API Reference*.

- For API details, see DeleteOtaUpdate in *AWS CLI Command Reference*.

## `delete-policy-version`

The following code example shows how to use `delete-policy-version`.

**AWS CLI**

**To delete a version of policy**

The following `delete-policy-version` example deletes version 2 of the specified policy from your AWS account.

```
aws iot delete-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-version-id 2
```

This command produces no output.

For more information, see AWS IoT Policies in the *AWS IoT Developer Guide*.

- For API details, see DeletePolicyVersion in *AWS CLI Command Reference*.

## `delete-policy`

The following code example shows how to use `delete-policy`.

**AWS CLI**

**To delete a policy**

The following `delete-policy` example deletes the specified policy from your AWS account.

```
aws iot delete-policy --policy-name UpdateDeviceCertPolicy
```

This command produces no output.

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

### `delete-provisioning-template-version`

The following code example shows how to use `delete-provisioning-template-version`.

**AWS CLI**

**To delete a provisioning template version**

The following `delete-provisioning-template-version` example deletes version 2 of the specified provisioning template.

```
aws iot delete-provisioning-template-version \
    --version-id 2 \
    --template-name "widget-template"
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see DeleteProvisioningTemplateVersion in *AWS CLI Command Reference*.

### `delete-provisioning-template`

The following code example shows how to use `delete-provisioning-template`.

**AWS CLI**

**To delete a provisioning template**

The following `delete-provisioning-template` example deletes the specified provisioning template.

```
aws iot delete-provisioning-template \
    --template-name widget-template
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see DeleteProvisioningTemplate in *AWS CLI Command Reference*.

### `delete-registration-code`

The following code example shows how to use `delete-registration-code`.

#### AWS CLI

**To delete your registration cod**

The following `delete-registration-code` example deletes an AWS IoT account-specific registration code.

```
aws iot delete-registration-code
```

This command produces no output.

For more information, see Use Your Own Certificate in the *AWS IoT Developer Guide*.

- For API details, see DeleteRegistrationCode in *AWS CLI Command Reference*.

### `delete-role-alias`

The following code example shows how to use `delete-role-alias`.

#### AWS CLI

**To delete an AWS IoT role alias**

The following `delete-role-alias` example deletes an AWS IoT role alias named `LightBulbRole`.

```
aws iot delete-role-alias \
```

```
    --role-alias LightBulbRole
```

This command produces no output.

For more information, see Authorizing Direct Calls to AWS Services in the *AWS IoT Developer Guide*.

- For API details, see DeleteRoleAlias in *AWS CLI Command Reference*.

### `delete-scheduled-audit`

The following code example shows how to use `delete-scheduled-audit`.

**AWS CLI**

**To delete a scheduled audit**

The following `delete-scheduled-audit` example deletes the AWS IoT Device Defender scheduled audit named `AWSIoTDeviceDefenderDailyAudit`.

```
aws iot delete-scheduled-audit \
    --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteScheduledAudit in *AWS CLI Command Reference*.

### `delete-security-profile`

The following code example shows how to use `delete-security-profile`.

**AWS CLI**

**To delete a security profile**

The following `delete-security-profile` example deletes a security profile named `PossibleIssue`.

```
aws iot delete-security-profile \
    --security-profile-name PossibleIssue
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DeleteSecurityProfile in *AWS CLI Command Reference*.

### `delete-stream`

The following code example shows how to use `delete-stream`.

#### AWS CLI

**To delete a stream**

The following `delete-stream` example deletes the specified stream.

```
aws iot delete-stream \
    --stream-id stream12345
```

This command produces no output.

For more information, see DeleteStream in the *AWS IoT API Reference*.

- For API details, see DeleteStream in *AWS CLI Command Reference*.

### `delete-thing-group`

The following code example shows how to use `delete-thing-group`.

#### AWS CLI

**To delete a thing group**

The following `delete-thing-group` example deletes the specified thing group. You cannot delete a thing group if it contains child thing groups.

```
aws iot delete-thing-group \
    --thing-group-name DefectiveBulbs
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see DeleteThingGroup in *AWS CLI Command Reference*.

### `delete-thing-type`

The following code example shows how to use `delete-thing-type`.

**AWS CLI**

**Example 1: To delete a thing type**

The following `delete-thing-type` example deletes a deprecated thing type.

```
aws iot delete-thing-type \
    --thing-type-name "obsoleteThingType"
```

This command produces no output.

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see DeleteThingType in *AWS CLI Command Reference*.

### `delete-thing`

The following code example shows how to use `delete-thing`.

**AWS CLI**

**To display detailed information about a thing**

The following `delete-thing` example deletes a thing from the AWS IoT registry for your AWS account.

aws iot delete-thing --thing-name "FourthBulb"

This command produces no output.

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see DeleteThing in *AWS CLI Command Reference*.

### `delete-topic-rule-destination`

The following code example shows how to use `delete-topic-rule-destination`.

**AWS CLI**

**To delete a topic rule destination**

The following `delete-topic-rule-destination` example deletes the specified topic rule destination.

```
aws iot delete-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

This command produces no output.

For more information, see Deleting a topic rule destination in the *AWS IoT Developer Guide*.

- For API details, see DeleteTopicRuleDestination in *AWS CLI Command Reference*.

### `delete-topic-rule`

The following code example shows how to use `delete-topic-rule`.

**AWS CLI**

**To delete a rule**

The following `delete-topic-rule` example deletes the specified rule.

```
aws iot delete-topic-rule \
    --rule-name "LowMoistureRule"
```

This command produces no output.

For more information, see Deleting a Rule in the *AWS IoT Developers Guide*.

- For API details, see DeleteTopicRule in *AWS CLI Command Reference*.

### `delete-v2-logging-level`

The following code example shows how to use `delete-v2-logging-level`.

**AWS CLI**

**To delete the logging level for a thing group**

The following `delete-v2-logging-level` example deletes the logging level for the specified thing group.

```
aws iot delete-v2-logging-level \
    --target-type THING_GROUP \
    --target-name LightBulbs
```

This command produces no output.

- For API details, see DeleteV2LoggingLevel in *AWS CLI Command Reference*.

### `deprecate-thing-type`

The following code example shows how to use `deprecate-thing-type`.

#### AWS CLI

**Example 1: To deprecate a thing type**

The following `deprecate-thing-type` example deprecates a thing type so that users can't associate any new things with it.

```
aws iot deprecate-thing-type \
    --thing-type-name "obsoleteThingType"
```

This command produces no output.

**Example 2: To reverse the deprecation of a thing type**

The following `deprecate-thing-type` example reverses the deprecation of a thing type, which makes it possible for users to associate new things with it again.

```
aws iot deprecate-thing-type \
    --thing-type-name "obsoleteThingType" \
    --undo-deprecate
```

This command produces no output.

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see DeprecateThingType in *AWS CLI Command Reference*.

### `describe-account-audit-configuration`

The following code example shows how to use `describe-account-audit-configuration`.

**AWS CLI**

**To view current audit configuration settings**

The following `describe-account-audit-configuration` example lists the current settings for your AWS IoT Device Defender audit configuration.

```
aws iot describe-account-audit-configuration
```

Output:

```
{
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
AWSIoTDeviceDefenderAudit_1551201085996",
    "auditNotificationTargetConfigurations": {
        "SNS": {
            "targetArn": "arn:aws:sns:us-west-2:123456789012:ddaudits",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/
AWSIoTDeviceDefenderAudit",
            "enabled": true
        }
    },
    "auditCheckConfigurations": {
        "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
            "enabled": true
        },
        "CA_CERTIFICATE_EXPIRING_CHECK": {
            "enabled": true
        },
        "CONFLICTING_CLIENT_IDS_CHECK": {
            "enabled": true
        },
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "enabled": true
        },
        "DEVICE_CERTIFICATE_SHARED_CHECK": {
            "enabled": true
        },
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": {
```

```
            "enabled": true
        },
        "LOGGING_DISABLED_CHECK": {
            "enabled": true
        },
        "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK": {
            "enabled": true
        },
        "REVOKED_DEVICE_CERTIFICATE_STILL_ACTIVE_CHECK": {
            "enabled": true
        },
        "UNAUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
            "enabled": true
        }
    }
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeAccountAuditConfiguration in *AWS CLI Command Reference*.

### `describe-audit-finding`

The following code example shows how to use `describe-audit-finding`.

#### AWS CLI

**To list details for an audit finding**

The following `describe-audit-finding` example lists the details for the specified AWS IoT Device Defender audit finding. An audit can produce multiple findings. Use the `list-audit-findings` command to get a list of the findings from an audit to get the `findingId`.

```
aws iot describe-audit-finding \
    --finding-id "ef4826b8-e55a-44b9-b460-5c485355371b"
```

Output:

```
{
    "finding": {
        "findingId": "ef4826b8-e55a-44b9-b460-5c485355371b",
```

```
        "taskId": "873ed69c74a9ec8fa9b8e88e9abc4661",
        "checkName": "IOT_POLICY_OVERLY_PERMISSIVE_CHECK",
        "taskStartTime": 1576012045.745,
        "findingTime": 1576012046.168,
        "severity": "CRITICAL",
        "nonCompliantResource": {
            "resourceType": "IOT_POLICY",
            "resourceIdentifier": {
                "policyVersionIdentifier": {
                    "policyName": "smp-ggrass-group_Core-policy",
                    "policyVersionId": "1"
                }
            }
         },
        "reasonForNonCompliance": "Policy allows broad access to IoT data plane
 actions: [iot:Subscribe, iot:Connect, iot:GetThingShadow, iot:DeleteThingShadow,
 iot:UpdateThingShadow, iot:Publish].",
        "reasonForNonComplianceCode":
 "ALLOWS_BROAD_ACCESS_TO_IOT_DATA_PLANE_ACTIONS"
    }
}
```

For more information, see Check Audit Results (Audit Commands) in the *AWS IoT Developer Guide*.

- For API details, see DescribeAuditFinding in *AWS CLI Command Reference*.

### `describe-audit-mitigation-actions-task`

The following code example shows how to use `describe-audit-mitigation-actions-task`.

#### AWS CLI

**To show the details of an audit mitigation actions task**

The following `describe-audit-mitigation-actions-task` example shows the details for the specified task, where the `ResetPolicyVersionAction` was applied to a finding. The results include when the task started and ended, how many findings were targeted (and the outcome), and the definition of the action that is applied as part of this task.

```
aws iot describe-audit-mitigation-actions-task \
    --task-id ResetPolicyTask01
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "startTime": "2019-12-10T15:13:19.457000-08:00",
    "endTime": "2019-12-10T15:13:19.947000-08:00",
    "taskStatistics": {
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": {
            "totalFindingsCount": 1,
            "failedFindingsCount": 0,
            "succeededFindingsCount": 1,
            "skippedFindingsCount": 0,
            "canceledFindingsCount": 0
        }
    },
    "target": {
        "findingIds": [
            "ef4826b8-e55a-44b9-b460-5c485355371b"
        ]
    },
    "auditCheckToActionsMapping": {
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": [
            "ResetPolicyVersionAction"
        ]
    },
    "actionsDefinition": [
        {
            "name": "ResetPolicyVersionAction",
            "id": "1ea0b415-bef1-4a01-bd13-72fb63c59afb",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/
ReplacePolicyVersionRole",
            "actionParams": {
                "replaceDefaultPolicyVersionParams": {
                    "templateName": "BLANK_POLICY"
                }
            }
        }
    ]
}
```

For more information, see DescribeAuditMitigationActionsTask (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see DescribeAuditMitigationActionsTask in *AWS CLI Command Reference*.

### `describe-audit-suppression`

The following code example shows how to use `describe-audit-suppression`.

#### AWS CLI

**To get details about an audit finding suppression**

The following `describe-audit-suppression` example lists details about an audit finding suppression.

```
aws iot describe-audit-task \
    --task-id "787ed873b69cb4d6cdbae6ddd06996c5"
```

Output:

```
{
    "taskStatus": "COMPLETED",
    "taskType": "SCHEDULED_AUDIT_TASK",
    "taskStartTime": 1596168096.157,
    "taskStatistics": {
        "totalChecks": 1,
        "inProgressChecks": 0,
        "waitingForDataCollectionChecks": 0,
        "compliantChecks": 0,
        "nonCompliantChecks": 1,
        "failedChecks": 0,
        "canceledChecks": 0
    },
    "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
    "auditDetails": {
        "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
            "checkRunStatus": "COMPLETED_NON_COMPLIANT",
            "checkCompliant": false,
            "totalResourcesCount": 195,
            "nonCompliantResourcesCount": 2
        }
    }
}
```

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see DescribeAuditSuppression in *AWS CLI Command Reference*.

## `describe-audit-task`

The following code example shows how to use `describe-audit-task`.

### AWS CLI

#### To get information about an audit instance

The following `describe-audit-task` example gets information about an instance of an AWS IoT Device Defender audit. If the audit is complete, summary statistics for the run are included in the results.

```
aws iot describe-audit-task \
    --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```
{
   "taskStatus": "COMPLETED",
   "taskType": "ON_DEMAND_AUDIT_TASK",
   "taskStartTime": 1560356923.434,
   "taskStatistics": {
       "totalChecks": 3,
       "inProgressChecks": 0,
       "waitingForDataCollectionChecks": 0,
       "compliantChecks": 3,
       "nonCompliantChecks": 0,
       "failedChecks": 0,
       "canceledChecks": 0
   },
   "auditDetails": {
       "CA_CERTIFICATE_EXPIRING_CHECK": {
           "checkRunStatus": "COMPLETED_COMPLIANT",
           "checkCompliant": true,
           "totalResourcesCount": 0,
           "nonCompliantResourcesCount": 0
       },
       "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
           "checkRunStatus": "COMPLETED_COMPLIANT",
           "checkCompliant": true,
           "totalResourcesCount": 6,
           "nonCompliantResourcesCount": 0
```

```
        },
        "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK": {
            "checkRunStatus": "COMPLETED_COMPLIANT",
            "checkCompliant": true,
            "totalResourcesCount": 0,
            "nonCompliantResourcesCount": 0
        }
    }
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeAuditTask in *AWS CLI Command Reference*.

### `describe-authorizer`

The following code example shows how to use `describe-authorizer`.

#### AWS CLI

**To get information about a custom authorizer**

The following `describe-authorizer` example displays details for the specified custom authorizer.

```
aws iot describe-authorizer \
    --authorizer-name CustomAuthorizer
```

Output:

```
{
    "authorizerDescription": {
        "authorizerName": "CustomAuthorizer",
        "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer",
        "authorizerFunctionArn": "arn:aws:lambda:us-
west-2:123456789012:function:CustomAuthorizerFunction",
        "tokenKeyName": "MyAuthToken",
        "tokenSigningPublicKeys": {
            "FIRST_KEY": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA1uJOB4lQPgG/lM6ZfIwo
\nZ+7ENxAio9q6QD4FFqjGZsvjtYwjoe1RKK0U8Eq9xb5O3kRSmyIwTzwzm/f4Gf0Y
```

```
\nZUloJ+t3PUUwHrmbYTAgTrCUgRFygjfgVwGCPs5ZAX4Eyqt5cr+AIHIiUDbxSa7p
\nzwOBKPeic0asNJpqT8PkBbRaKyleJh5oo81NDHHmVtbBm5A5YiJjqYXLaVAowKzZ\n

dmqtDmJiVP97Z4GykxPvwlYHrUXY0iW1R3AR/Ac1NhCTGZMwVDB1\nlQIDAQAB\n-----END PUBLIC
 KEY-----"
        },
        "status": "ACTIVE",
        "creationDate": 1571245658.069,
        "lastModifiedDate": 1571245658.069
    }
}
```

For more information, see DescribeAuthorizer in the *AWS IoT API Reference*.

- For API details, see DescribeAuthorizer in *AWS CLI Command Reference*.

### `describe-billing-group`

The following code example shows how to use `describe-billing-group`.

#### AWS CLI

**To get information about a billing group**

The following `describe-billing-group` example gets information for the specified billing group.

```
aws iot describe-billing-group --billing-group-name GroupOne
```

Output:

```
{
    "billingGroupName": "GroupOne",
    "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562",
    "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
    "version": 1,
    "billingGroupProperties": {},
    "billingGroupMetadata": {
        "creationDate": 1560199355.378
    }
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see DescribeBillingGroup in *AWS CLI Command Reference*.

### `describe-ca-certificate`

The following code example shows how to use `describe-ca-certificate`.

#### AWS CLI

**To get details about a CA certificate**

The following `describe-ca-certificate` example displays the details for the specified CA certificate.

```
aws iot describe-ca-certificate \
    --certificate-id
 f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467
```

Output:

```
{
    "certificateDescription": {
        "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/

```

For more information, see DescribeCACertificate in the *AWS IoT API Reference*.

- For API details, see DescribeCaCertificate in *AWS CLI Command Reference*.

### `describe-certificate`

The following code example shows how to use `describe-certificate`.

#### AWS CLI

**To get information about a certificate**

The following `describe-certificate` example displays the details for the specified certificate.

```
aws iot describe-certificate \
    --certificate-id
 "4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

Output:

```
{
    "certificateDescription": {
        "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e",
        "certificateId":

            "notAfter": 2524607999.0
        }
    }
}
```

For more information, see DescribeCertificate in the *AWS IoT API Reference*.

- For API details, see DescribeCertificate in *AWS CLI Command Reference*.

### `describe-custom-metric`

The following code example shows how to use `describe-custom-metric`.

#### AWS CLI

**To get information about a Device Defender custom metric**

The following `describe-custom-metric` example gets information about a custom metric named `myCustomMetric`.

```
aws iot describe-custom-metric \
    --metric-name myCustomMetric
```

Output:

```
{
    "metricName": "myCustomMetric",
    "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/myCustomMetric",
    "metricType": "number",
    "displayName": "My custom metric",
    "creationDate": 2020-11-17T23:02:12.879000-09:00,
    "lastModifiedDate": 2020-11-17T23:02:12.879000-09:00
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see DescribeCustomMetric in *AWS CLI Command Reference*.

### `describe-default-authorizer`

The following code example shows how to use `describe-default-authorizer`.

#### AWS CLI

**To get information about the default custom authorizer**

The following `describe-default-authorizer` example displays details for the default custom authorizer.

```
aws iot describe-default-authorizer
```

Output:

```
{
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
}
```

For more information, see DescribeDefaultAuthorizer in the *AWS IoT API Reference*.

- For API details, see DescribeDefaultAuthorizer in *AWS CLI Command Reference*.

### `describe-dimension`

The following code example shows how to use `describe-dimension`.

**AWS CLI**

**To get information about a dimension**

The following `describe-dimension` example gets information about a dimension named `TopicFilterForAuthMessages`.

```
aws iot describe-dimension \
    --name TopicFilterForAuthMessages
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "arn": "arn:aws:iot:eu-west-2:123456789012:dimension/
TopicFilterForAuthMessages",
    "type": "TOPIC_FILTER",
    "stringValues": [
        "device/+/auth"
    ],
    "creationDate": 1578620223.255,
    "lastModifiedDate": 1578620223.255
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeDimension in *AWS CLI Command Reference*.

### `describe-domain-configuration`

The following code example shows how to use `describe-domain-configuration`.

**AWS CLI**

**To describe a domain configuration**

The following `describe-domain-configuration` example displays details about the specified domain configuration.

```
aws iot describe-domain-configuration \
    --domain-configuration-name "additionalDataDomain"
```

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-
east-1:758EXAMPLE143:domainconfiguration/additionalDataDomain/norpw",
    "domainName": "d055exampleed74y71zfd-ats.beta.us-east-1.iot.amazonaws.com",
    "serverCertificates": [],
    "domainConfigurationStatus": "ENABLED",
    "serviceType": "DATA",
    "domainType": "AWS_MANAGED",
    "lastStatusChangeDate": 1601923783.774
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see DescribeDomainConfiguration in *AWS CLI Command Reference*.

### `describe-endpoint`

The following code example shows how to use `describe-endpoint`.

#### AWS CLI

**Example 1: To get your current AWS endpoint**

The following `describe-endpoint` example retrieves the default AWS endpoint to which all commands are applied.

```
aws iot describe-endpoint
```

Output:

```
{
    "endpointAddress": "abc123defghijk.iot.us-west-2.amazonaws.com"
}
```

For more information, see DescribeEndpoint in the *AWS IoT Developer Guide*.

**Example 2: To get your ATS endpoint**

The following `describe-endpoint` example retrieves the Amazon Trust Services (ATS) endpoint.

```
aws iot describe-endpoint \
    --endpoint-type iot:Data-ATS
```

Output:

```
{
    "endpointAddress": "abc123defghijk-ats.iot.us-west-2.amazonaws.com"
}
```

For more information, see X.509 Certificates and AWS IoT in the *AWS IoT Developer Guide*.

- For API details, see DescribeEndpoint in *AWS CLI Command Reference*.

## `describe-event-configurations`

The following code example shows how to use `describe-event-configurations`.

### AWS CLI

**To show which event types are published**

The following `describe-event-configurations` example lists the configuration that controls which events are generated when something is added, updated, or deleted.

```
aws iot describe-event-configurations
```

Output:

```
{
    "eventConfigurations": {
        "CA_CERTIFICATE": {
            "Enabled": false
        },
        "CERTIFICATE": {
            "Enabled": false
        },
```

```
        "JOB": {
            "Enabled": false
        },
        "JOB_EXECUTION": {
            "Enabled": false
        },
        "POLICY": {
            "Enabled": false
        },
        "THING": {
            "Enabled": false
        },
        "THING_GROUP": {
            "Enabled": false
        },
        "THING_GROUP_HIERARCHY": {
            "Enabled": false
        },
        "THING_GROUP_MEMBERSHIP": {
            "Enabled": false
        },
        "THING_TYPE": {
            "Enabled": false
        },
        "THING_TYPE_ASSOCIATION": {
            "Enabled": false
        }
    }
}
```

For more information, see Event Messages in the *AWS IoT Developer Guide*.

- For API details, see DescribeEventConfigurations in *AWS CLI Command Reference*.

### `describe-index`

The following code example shows how to use `describe-index`.

#### AWS CLI

**To retrieve the current status of the thing index**

The following `describe-index` example retrieves the current status of the thing index.

```
aws iot describe-index \
    --index-name "AWS_Things"
```

Output:

```
{
    "indexName": "AWS_Things",
    "indexStatus": "ACTIVE",
    "schema": "REGISTRY_AND_SHADOW_AND_CONNECTIVITY_STATUS"
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developer Guide*.

- For API details, see DescribeIndex in *AWS CLI Command Reference*.

### `describe-job-execution`

The following code example shows how to use `describe-job-execution`.

#### AWS CLI

**To get execution details for a job on a device**

The following `describe-job-execution` example gets execution details for the specified job.

```
aws iot describe-job-execution \
    --job-id "example-job-01" \
    --thing-name "MyRaspberryPi"
```

Output:

```
{
    "execution": {
        "jobId": "example-job-01",
        "status": "QUEUED",
        "statusDetails": {},
        "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi",
        "queuedAt": 1560787023.636,
        "lastUpdatedAt": 1560787023.636,
        "executionNumber": 1,
        "versionNumber": 1
    }
```

```
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DescribeJobExecution in *AWS CLI Command Reference*.

### `describe-job`

The following code example shows how to use `describe-job`.

#### AWS CLI

**To get detailed status for a job**

The following `describe-job` example gets detailed status for the job whose ID is `example-job-01`.

```
aws iot describe-job \
    --job-id "example-job-01"
```

Output:

```
{
    "job": {
        "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
        "jobId": "example-job-01",
        "targetSelection": "SNAPSHOT",
        "status": "IN_PROGRESS",
        "targets": [
            "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi"
        ],
        "description": "example job test",
        "presignedUrlConfig": {},
        "jobExecutionsRolloutConfig": {},
        "createdAt": 1560787022.733,
        "lastUpdatedAt": 1560787026.294,
        "jobProcessDetails": {
            "numberOfCanceledThings": 0,
            "numberOfSucceededThings": 0,
            "numberOfFailedThings": 0,
            "numberOfRejectedThings": 0,
            "numberOfQueuedThings": 1,
```

```
            "numberOfInProgressThings": 0,
            "numberOfRemovedThings": 0,
            "numberOfTimedOutThings": 0
        },
        "timeoutConfig": {}
    }
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see DescribeJob in *AWS CLI Command Reference*.

### `describe-mitigation-action`

The following code example shows how to use `describe-mitigation-action`.

#### AWS CLI

**To view the details for a defined mitigation action**

The following `describe-mitigation-action` example displays details for the specified mitigation action.

```
aws iot describe-mitigation-action \
    --action-name AddThingsToQuarantineGroupAction
```

Output:

```
{
    "actionName": "AddThingsToQuarantineGroupAction",
    "actionType": "ADD_THINGS_TO_THING_GROUP",
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
    "actionId": "2fd2726d-98e1-4abf-b10f-09465ccd6bfa",
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MoveThingsToQuarantineGroupRole",
    "actionParams": {
        "addThingsToThingGroupParams": {
            "thingGroupNames": [
                "QuarantineGroup1"
            ],
            "overrideDynamicGroups": true
        }
```

```
    },
    "creationDate": "2019-12-10T11:09:35.999000-08:00",
    "lastModifiedDate": "2019-12-10T11:09:35.999000-08:00"
}
```

For more information, see DescribeMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see DescribeMitigationAction in *AWS CLI Command Reference*.

### `describe-provisioning-template-version`

The following code example shows how to use `describe-provisioning-template-version`.

#### AWS CLI

**To describe a provisioning template version**

The following `describe-provisioning-template-version` example describes a provisioning template version.

```
aws iot describe-provisioning-template-version \
    --template-name MyTestProvisioningTemplate \
    --version-id 1
```

Output:

```
{
    "versionId": 1,
    "creationDate": 1589308310.574,
    "templateBody": "{
        \"Parameters\":{
            \"SerialNumber\":{
                \"Type\":\"String\"
            },
            \"AWS::IoT::Certificate::Id\":{
                \"Type\":\"String\"
            }
        },
        \"Resources\":{
            \"certificate\":{
                \"Properties\":{
```

```
                    \"CertificateId\":{
                        \"Ref\":\"AWS::IoT::Certificate::Id\"
                    },
                    \"Status\":\"Active\"
                },
                \"Type\":\"AWS::IoT::Certificate\"
            },
            \"policy\":{
                \"Properties\":{
                    \"PolicyName\":\"MyIotPolicy\"
                },
                \"Type\":\"AWS::IoT::Policy\"
            },
            \"thing\":{
                \"OverrideSettings\":{
                    \"AttributePayload\":\"MERGE\",
                    \"ThingGroups\":\"DO_NOTHING\",
                    \"ThingTypeName\":\"REPLACE\"
                },
                \"Properties\":{
                    \"AttributePayload\":{},
                    \"ThingGroups\":[],
                    \"ThingName\":{
                        \"Fn::Join\":[
                            \"\",
                            [
                                \"DemoGroup_\",
                                {\"Ref\":\"SerialNumber\"}
                            ]
                        ]
                    },
                    \"ThingTypeName\":\"VirtualThings\"
                },
                \"Type\":\"AWS::IoT::Thing\"
            }
        }
    }",
    "isDefaultVersion": true
}
```

For more information, see Provisioning devices that don't have device certificates using fleet provisioning in the *AWS IoT Core Developers Guide*.

- For API details, see DescribeProvisioningTemplateVersion in *AWS CLI Command Reference*.

## describe-provisioning-template

The following code example shows how to use `describe-provisioning-template`.

### AWS CLI

#### To describe a provisioning template

The following `describe-provisioning-template` example describes a provisioning template.

```
aws iot describe-provisioning-template \
    --template-name MyTestProvisioningTemplate
```

Output:

```
{
    "templateArn": "arn:aws:iot:us-west-2:57EXAMPLE833:provisioningtemplate/
MyTestProvisioningTemplate",
    "templateName": "MyTestProvisioningTemplate",
    "creationDate": 1589308310.574,
    "lastModifiedDate": 1589308345.539,
    "defaultVersionId": 1,
    "templateBody": "{
        \"Parameters\":{
            \"SerialNumber\":{
                \"Type\":\"String\"
            },
            \"AWS::IoT::Certificate::Id\":{
                \"Type\":\"String\"
            }
        },
        \"Resources\":{
            \"certificate\":{
                \"Properties\":{
                    \"CertificateId\":{
                        \"Ref\":\"AWS::IoT::Certificate::Id\"
                    },
                    \"Status\":\"Active\"
                },
                \"Type\":\"AWS::IoT::Certificate\"
            },
            \"policy\":{
```

```
                \"Properties\":{
                    \"PolicyName\":\"MyIotPolicy\"
                },
                \"Type\":\"AWS::IoT::Policy\"
            },
            \"thing\":{
                \"OverrideSettings\":{
                    \"AttributePayload\":\"MERGE\",
                    \"ThingGroups\":\"DO_NOTHING\",
                    \"ThingTypeName\":\"REPLACE\"
                },
                \"Properties\":{
                    \"AttributePayload\":{},
                    \"ThingGroups\":[],
                    \"ThingName\":{
                        \"Fn::Join\":[
                            \"\",
                            [
                                \"DemoGroup_\",
                                {\"Ref\":\"SerialNumber\"}
                            ]
                        ]
                    },
                    \"ThingTypeName\":\"VirtualThings\"
                },
                \"Type\":\"AWS::IoT::Thing\"
            }
        }
    }",
    "enabled": true,
    "provisioningRoleArn": "arn:aws:iam::571032923833:role/service-role/IoT_access"
}
```

For more information, see Provisioning devices that don't have device certificates using fleet provisioning in the *AWS IoT Core Developers Guide*.

- For API details, see DescribeProvisioningTemplate in *AWS CLI Command Reference*.

### `describe-role-alias`

The following code example shows how to use `describe-role-alias`.

### AWS CLI

#### To get information about an AWS IoT role alias

The following `describe-role-alias` example displays details for the specified role alias.

```
aws iot describe-role-alias \
    --role-alias LightBulbRole
```

Output:

```
{
    "roleAliasDescription": {
        "roleAlias": "LightBulbRole",
        "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/
LightBulbRole",
        "roleArn": "arn:aws:iam::123456789012:role/light_bulb_role_001",
        "owner": "123456789012",
        "credentialDurationSeconds": 3600,
        "creationDate": 1570558643.221,
        "lastModifiedDate": 1570558643.221
    }
}
```

For more information, see DescribeRoleAlias in the *AWS IoT API Reference*.

- For API details, see DescribeRoleAlias in *AWS CLI Command Reference*.

## `describe-scheduled-audit`

The following code example shows how to use `describe-scheduled-audit`.

### AWS CLI

#### To get information about a scheduled audit

The following `describe-scheduled-audit` example gets detailed information about an AWS IOT Device Defender scheduled audit named `AWSIoTDeviceDefenderDailyAudit`.

```
aws iot describe-scheduled-audit \
    --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

Output:

```
{
    "frequency": "DAILY",
    "targetCheckNames": [
        "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK",
        "CONFLICTING_CLIENT_IDS_CHECK",
        "DEVICE_CERTIFICATE_SHARED_CHECK",
        "IOT_POLICY_OVERLY_PERMISSIVE_CHECK",
        "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK",
        "UNAUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK"
    ],
    "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSIoTDeviceDefenderDailyAudit"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeScheduledAudit in *AWS CLI Command Reference*.

### `describe-security-profile`

The following code example shows how to use `describe-security-profile`.

#### AWS CLI

**To get information about a security profile**

The following `describe-security-profile` example gets information about the AWS IoT Device Defender security profile named `PossibleIssue`.

```
aws iot describe-security-profile \
    --security-profile-name PossibleIssue
```

Output:

```
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
PossibleIssue",
    "securityProfileDescription": "check to see if authorization fails 10 times in 5
 minutes or if cellular bandwidth exceeds 128",
    "behaviors": [
```

```
        {
            "name": "CellularBandwidth",
            "metric": "aws:message-byte-size",
            "criteria": {
                "comparisonOperator": "greater-than",
                "value": {
                    "count": 128
                },
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        },
        {
            "name": "Authorization",
            "metric": "aws:num-authorization-failures",
            "criteria": {
                "comparisonOperator": "greater-than",
                "value": {
                    "count": 10
                },
                "durationSeconds": 300,
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        }
    ],
    "version": 1,
    "creationDate": 1560278102.528,
    "lastModifiedDate": 1560278102.528
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DescribeSecurityProfile in *AWS CLI Command Reference*.

## `describe-stream`

The following code example shows how to use `describe-stream`.

### AWS CLI

#### To get information about a stream

The following `describe-stream` example displays the details about the specified stream.

```
aws iot describe-stream \
    --stream-id stream12345
```

Output:

```
{
    "streamInfo": {
        "streamId": "stream12345",
        "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
        "streamVersion": 1,
        "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
        "files": [
            {
                "fileId": "123",
                "s3Location": {
                    "bucket":"codesign-ota-bucket",
                    "key":"48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
                }
            }
        ],
        "createdAt": 1557863215.995,
        "lastUpdatedAt": 1557863215.995,
        "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"
    }
}
```

For more information, see DescribeStream in the *AWS IoT API Reference*.

- For API details, see DescribeStream in *AWS CLI Command Reference*.

### `describe-thing-group`

The following code example shows how to use `describe-thing-group`.

#### AWS CLI

**To get information about a thing group**

The following `describe-thing-group` example gets information about the thing group named `HalogenBulbs`.

```
aws iot describe-thing-group \
```

```
    --thing-group-name HalogenBulbs
```

Output:

```
{
    "thingGroupName": "HalogenBulbs",
    "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e",
    "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs",
    "version": 1,
    "thingGroupProperties": {},
    "thingGroupMetadata": {
        "parentGroupName": "LightBulbs",
        "rootToParentThingGroups": [
            {
                "groupName": "LightBulbs",
                "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
LightBulbs"
            }
        ],
        "creationDate": 1559927609.897
    }
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see DescribeThingGroup in *AWS CLI Command Reference*.

### `describe-thing-type`

The following code example shows how to use `describe-thing-type`.

#### AWS CLI

**To get information about a thing type**

The following `describe-thing-type` example display information about the specified thing type defined in your AWS account.

```
aws iot describe-thing-type \
    --thing-type-name "LightBulb"
```

Output:

```
{
    "thingTypeName": "LightBulb",
    "thingTypeId": "ce3573b0-0a3c-45a7-ac93-4e0ce14cd190",
    "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
    "thingTypeProperties": {
        "thingTypeDescription": "light bulb type",
        "searchableAttributes": [
            "model",
            "wattage"
        ]
    },
    "thingTypeMetadata": {
        "deprecated": false,
        "creationDate": 1559772562.498
    }
}
```

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see DescribeThingType in *AWS CLI Command Reference*.

### `describe-thing`

The following code example shows how to use `describe-thing`.

#### AWS CLI

**To display detailed information about a thing**

The following `describe-thing` example display information about a thing (device) that is defined in the AWS IoT registry for your AWS account.

aws iot describe-thing --thing-name "MyLightBulb"

Output:

```
{
    "defaultClientId": "MyLightBulb",
    "thingName": "MyLightBulb",
    "thingId": "40da2e73-c6af-406e-b415-15acae538797",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "thingTypeName": "LightBulb",
    "attributes": {
```

```
        "model": "123",
        "wattage": "75"
    },
    "version": 1
}
```

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see DescribeThing in *AWS CLI Command Reference*.

### `detach-policy`

The following code example shows how to use `detach-policy`.

#### AWS CLI

**Example 1: To detach an AWS IoT policy from a thing group**

The following `detach-policy` example detaches the specified policy from a thing group and, by extension, from all things in that group and any of the group's child groups.

```
aws iot detach-policy \
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
    --policy-name "MyFirstGroup_Core-policy"
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

**Example 2: To detach an AWS IoT policy from a device certificate**

The following `detach-policy` example detaches the TemperatureSensorPolicy policy from a device certificate identified by ARN.

```
aws iot detach-policy \
    --policy-name TemperatureSensorPolicy \
    --target arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

This command produces no output.

- For API details, see DetachPolicy in *AWS CLI Command Reference*.

### `detach-security-profile`

The following code example shows how to use `detach-security-profile`.

#### AWS CLI

**To disassociate a security profile from a target**

The following `detach-security-profile` example removes the association between the AWS IoT Device Defender security profile named `Testprofile` and the all registered things target.

```
aws iot detach-security-profile \
    --security-profile-name Testprofile \
    --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/
registered-things"
```

This command produces no output.

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see DetachSecurityProfile in *AWS CLI Command Reference*.

### `detach-thing-principal`

The following code example shows how to use `detach-thing-principal`.

#### AWS CLI

**To detach a certificate/principal from a thing**

The following `detach-thing-principal` example removes a certificate that represents a principal from the specified thing.

```
aws iot detach-thing-principal \
    --thing-name "MyLightBulb" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36"
```

This command produces no output.

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see DetachThingPrincipal in *AWS CLI Command Reference*.

### `disable-topic-rule`

The following code example shows how to use `disable-topic-rule`.

**AWS CLI**

**To disable a topic rule**

The following `disable-topic-rule` example disables the specified topic rule.

```
aws iot disable-topic-rule \
    --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see Viewing Your Rules in the *AWS IoT Developer Guide*.

- For API details, see DisableTopicRule in *AWS CLI Command Reference*.

### `enable-topic-rule`

The following code example shows how to use `enable-topic-rule`.

**AWS CLI**

**To enable a topic rule**

The following `enable-topic-rule` example enables (or re-enables) the specified topic rule.

```
aws iot enable-topic-rule \
    --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see Viewing Your Rules in the *AWS IoT Developer Guide*.

- For API details, see EnableTopicRule in *AWS CLI Command Reference*.

### `get-behavior-model-training-summaries`

The following code example shows how to use `get-behavior-model-training-summaries`.

## AWS CLI

### To list a Device Defender's ML Detect Security Profile training model's status

The following `get-behavior-model-training-summaries` example lists model training status for the configured behaviors in the chosen Security Profile. For each behavior, the name, model status, and percentage of datapoints collected are listed.

```
aws iot get-behavior-model-training-summaries \
    --security-profile-name MySecuirtyProfileName
```

Output:

```
{
    "summaries": [
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Messages_sent_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Messages_received_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Authorization_failures_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Message_size_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySecuirtyProfileName",
            "behaviorName": "Connection_attempts_ML_behavior",
            "modelStatus": "PENDING_BUILD",
```

```
            "datapointsCollectionPercentage": 0.0
        },
        {
            "securityProfileName": "MySPNoALerts",
            "behaviorName": "Disconnects_ML_behavior",
            "modelStatus": "PENDING_BUILD",
            "datapointsCollectionPercentage": 0.0
        }
    ]
}
```

For more information, see GetBehaviorModelTrainingSummaries (Detect Commands) in the *AWS IoT Developer Guide*.

- For API details, see GetBehaviorModelTrainingSummaries in *AWS CLI Command Reference*.

### `get-cardinality`

The following code example shows how to use `get-cardinality`.

#### AWS CLI

**To return the approximate count of unique values that match the query**

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 3 attributes.

```
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
Racks=(Rack1 Rack1 Rack2 Rack2 Rack3 Rack4 Rack5 Rack6 Rack6 Rack6)
IsNormal=(true true true true true true false false false false)
for ((i=0; i<10 ; i++))
do
  thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
 attributes="{temperature=${Temperatures[i]},rackId=${Racks[i]},stateNormal=
${IsNormal[i]}}")
  aws iot describe-thing --thing-name "TempSensor$i"
done
```

Example output of the setup script:

```
{
    "version": 1,
```

```
    "thingName": "TempSensor0",
    "defaultClientId": "TempSensor0",
    "attributes": {
        "rackId": "Rack1",
        "stateNormal": "true",
        "temperature": "70"
    },
    "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/TempSensor0",
    "thingId": "example1-90ab-cdef-fedc-ba987example"
}
```

The following `get-cardinality` example queries the 10 sensors created by the setup script and returns the number of racks that have temperature sensors reporting abnormal temperature values. If the temperature value is below 60 or above 80, the temperature sensor is in an abnormal state.

```
aws iot get-cardinality \
    --aggregation-field "attributes.rackId" \
    --query-string "thingName:TempSensor* AND attributes.stateNormal:false"
```

Output:

```
{
    "cardinality": 2
}
```

For more information, see Querying for Aggregate Data<https://docs.aws.amazon.com/iot/latest/developerguide/index-aggregate.html> in the *AWS IoT Developer Guide*.

- For API details, see GetCardinality in *AWS CLI Command Reference*.

## `get-effective-policies`

The following code example shows how to use `get-effective-policies`.

### AWS CLI

#### To list the policies that effect a thing

The following `get-effective-policies` example lists the policies that effect the specified thing, including policies attached to any groups to which it belongs.

```
aws iot get-effective-policies \
    --thing-name TemperatureSensor-001 \
    --principal arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

Output:

```
{
    "effectivePolicies": [
        {
            "policyName": "TemperatureSensorPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TemperatureSensorPolicy",
            "policyDocument": "{
                \"Version\": \"2012-10-17\",
                \"Statement\": [
                    {
                        \"Effect\": \"Allow\",
                        \"Action\": [
                            \"iot:Publish\",
                            \"iot:Receive\"
                        ],
                        \"Resource\": [
                            \"arn:aws:iot:us-west-2:123456789012:topic/topic_1\",
                            \"arn:aws:iot:us-west-2:123456789012:topic/topic_2\"
                        ]
                    },
                    {
                        \"Effect\": \"Allow\",
                        \"Action\": [
                            \"iot:Subscribe\"
                        ],
                        \"Resource\": [
                            \"arn:aws:iot:us-west-2:123456789012:topicfilter/
topic_1\",
                            \"arn:aws:iot:us-west-2:123456789012:topicfilter/
topic_2\"
                        ]
                    },
                    {
                        \"Effect\": \"Allow\",
                        \"Action\": [
                            \"iot:Connect\"
```

```
                        ],
                        \"Resource\": [
                            \"arn:aws:iot:us-west-2:123456789012:client/basicPubSub
\"
                        ]
                    }
                ]
            }"
        }
    ]
}
```

For more information, see Get Effective Policies for a Thing in the *AWS IoT Developers Guide*.

- For API details, see GetEffectivePolicies in *AWS CLI Command Reference*.

### `get-indexing-configuration`

The following code example shows how to use `get-indexing-configuration`.

#### AWS CLI

**To get the thing indexing configuration**

The following `get-indexing-configuration` example gets the current configuration data for AWS IoT fleet indexing.

```
aws iot get-indexing-configuration
```

Output:

```
{
    "thingIndexingConfiguration": {
        "thingIndexingMode": "OFF",
        "thingConnectivityIndexingMode": "OFF"
    },
    "thingGroupIndexingConfiguration": {
        "thingGroupIndexingMode": "OFF"
    }
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developers Guide*.

- For API details, see GetIndexingConfiguration in *AWS CLI Command Reference*.

### `get-job-document`

The following code example shows how to use `get-job-document`.

**AWS CLI**

**To retrieve the document for a job**

The following `get-job-document` example displays details about the document for the job whose ID is `example-job-01`.

```
aws iot get-job-document \
    --job-id "example-job-01"
```

Output:

```
{
    "document": "\n{\n    \"operation\":\"customJob\",\n    \"otherInfo\":
\"someValue\"\n}\n"
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see GetJobDocument in *AWS CLI Command Reference*.

### `get-logging-options`

The following code example shows how to use `get-logging-options`.

**AWS CLI**

**To get the logging options**

The following `get-logging-options` example gets the current logging options for your AWS account.

```
aws iot get-logging-options
```

Output:

```
{
    "roleArn": "arn:aws:iam::123456789012:role/service-role/iotLoggingRole",
    "logLevel": "ERROR"
}
```

For more information, see title in the *AWS IoT Developer Guide*.

- For API details, see GetLoggingOptions in *AWS CLI Command Reference*.

### `get-ota-update`

The following code example shows how to use `get-ota-update`.

#### AWS CLI

**To retrieve information about an OTA Update**

The following `get-ota-update` example displays details about the specified OTA Update.

```
aws iot get-ota-update \
    --ota-update-id ota12345
```

Output:

```
{
    "otaUpdateInfo": {
        "otaUpdateId": "ota12345",
        "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/itsaupdate",
        "creationDate": 1557863215.995,
        "lastModifiedDate": 1557863215.995,
        "description": "A critical update needed right away.",
        "targets": [
           "device1",
           "device2",
           "device3",
           "device4"
        ],
        "targetSelection": "SNAPSHOT",
        "protocols": ["HTTP"],
        "awsJobExecutionsRolloutConfig": {
```

```
            "maximumPerMinute": 10
        },
        "otaUpdateFiles": [
            {
                "fileName": "firmware.bin",
                "fileLocation": {
                    "stream": {
                        "streamId": "004",
                        "fileId":123
                    }
                },
                "codeSigning": {
                    "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
                }
            }
        ],
        "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role"
        "otaUpdateStatus": "CREATE_COMPLETE",
        "awsIotJobId": "job54321",
        "awsIotJobArn": "arn:aws:iot:us-west-2:123456789012:job/job54321",
        "errorInfo": {
        }
    }
}
```

For more information, see GetOTAUpdate in the *AWS IoT API Reference*.

- For API details, see GetOtaUpdate in *AWS CLI Command Reference*.

### `get-percentiles`

The following code example shows how to use `get-percentiles`.

#### AWS CLI

**To group the aggregated values that match the query into percentile groupings**

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 1 attribute.

```
# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
for ((i=0; i<10 ; i++))
```

```
do
    thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
 attributes="{temperature=${Temperatures[i]}}")
    aws iot describe-thing --thing-name "TempSensor$i"
done
```

Example output of the setup script:

```
{
    "version": 1,
    "thingName": "TempSensor0",
    "defaultClientId": "TempSensor0",
    "attributes": {
        "temperature": "70"
    },
    "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/TempSensor0",
    "thingId": "example1-90ab-cdef-fedc-ba987example"
}
```

The following `get-percentiles` example queries the 10 sensors created by the setup script and returns a value for each percentile group specified. The percentile group "10" contains the aggregated field value that occurs in approximately 10 percent of the values that match the query. In the following output, {"percent": 10.0, "value": 67.7} means approximately 10.0% of the temperature values are below 67.7.

```
aws iot get-percentiles \
    --aggregation-field "attributes.temperature" \
    --query-string "thingName:TempSensor*" \
    --percents 10 25 50 75 90
```

Output:

```
{
    "percentiles": [
        {
            "percent": 10.0,
            "value": 67.7
        },
        {
            "percent": 25.0,
            "value": 71.25
```

```
        },
        {
            "percent": 50.0,
            "value": 73.5
        },
        {
            "percent": 75.0,
            "value": 91.5
        },
        {
            "percent": 90.0,
            "value": 98.1
        }
    ]
}
```

For more information, see Querying for Aggregate Data in the *AWS IoT Developer Guide*.

- For API details, see GetPercentiles in *AWS CLI Command Reference*.

### `get-policy-version`

The following code example shows how to use `get-policy-version`.

#### AWS CLI

**To get information about a specific version of a policy**

The following `get-policy-version` example gets information about the first version of the specified policy.

```
aws iot get-policy \
    --policy-name UpdateDeviceCertPolicy
    --policy-version-id "1"
```

Output:

```
{
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
    "policyName": "UpdateDeviceCertPolicy",
    "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Action\":  \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
```

```
    "policyVersionId": "1",
    "isDefaultVersion": false,
    "creationDate": 1559925941.924,
    "lastModifiedDate": 1559926175.458,
    "generationId":
 "5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see GetPolicyVersion in *AWS CLI Command Reference*.

### `get-policy`

The following code example shows how to use `get-policy`.

#### AWS CLI

**To get information about the default version of a policy**

The following `get-policy` example retrieves information about the default version of the specified policy.

```
aws iot get-policy \
    --policy-name UpdateDeviceCertPolicy
```

Output:

```
{
    "policyName": "UpdateDeviceCertPolicy",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
    "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
 \"Allow\", \"Action\":  \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
    "defaultVersionId": "2",
    "creationDate": 1559925941.924,
    "lastModifiedDate": 1559925941.924,
    "generationId":
 "5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

### `get-registration-code`

The following code example shows how to use `get-registration-code`.

**AWS CLI**

**To get your AWS account-specific registration code**

The following `get-registration-code` example retrieves your AWS account-specific registration code.

```
aws iot get-registration-code
```

Output:

```
{
    "registrationCode":
 "15c51ae5e36ba59ba77042df1115862076bea4bd15841c838fcb68d5010a614c"
}
```

For more information, see Use Your Own Certificate in the *AWS IoT Developer Guide*.

- For API details, see GetRegistrationCode in *AWS CLI Command Reference*.

### `get-statistics`

The following code example shows how to use `get-statistics`.

**AWS CLI**

**To search the device index for aggregate data**

The following `get-statistics` example returns the number of things that have a property called `connectivity.connected` set to `false` (that is, the number of devices that are not connected) in their device shadow.

```
aws iot get-statistics \
    --index-name AWS_Things \
    --query-string "connectivity.connected:false"
```

Output:

```
{
    "statistics": {
        "count": 6
    }
}
```

For more information, see Getting Statistics About Your Device Fleet in the *AWS IoT Developer Guide*.

- For API details, see GetStatistics in *AWS CLI Command Reference*.

### `get-topic-rule-destination`

The following code example shows how to use `get-topic-rule-destination`.

#### AWS CLI

**To get a topic rule destination**

The following `get-topic-rule-destination` example gets information about a topic rule destination.

```
aws iot get-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```
{
    "topicRuleDestination": {
        "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
        "status": "DISABLED",
        "httpUrlProperties": {
            "confirmationUrl": "https://example.com"
        }
    }
}
```

For more information, see Working with topic rule destinations in the *AWS IoT Developer Guide*.

- For API details, see GetTopicRuleDestination in *AWS CLI Command Reference*.

### `get-topic-rule`

The following code example shows how to use `get-topic-rule`.

#### AWS CLI

##### To get information about a rule

The following `get-topic-rule` example gets information about the specified rule.

```
aws iot get-topic-rule \
    --rule-name MyRPiLowMoistureAlertRule
```

Output:

```
{
    "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/MyRPiLowMoistureAlertRule",
    "rule": {
        "ruleName": "MyRPiLowMoistureAlertRule",
        "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE
 state.reported.moisture = 'low'\n                    ",
        "description": "Sends an alert whenever soil moisture level readings are too
 low.",
        "createdAt": 1558624363.0,
        "actions": [
            {
                "sns": {
                    "targetArn": "arn:aws:sns:us-
west-2:123456789012:MyRPiLowMoistureTopic",
                    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MyRPiLowMoistureTopicRole",
                    "messageFormat": "RAW"
                }
            }
        ],
        "ruleDisabled": false,
        "awsIotSqlVersion": "2016-03-23"
    }
}
```

For more information, see Viewing Your Rules in the *AWS IoT Developers Guide*.

- For API details, see GetTopicRule in *AWS CLI Command Reference*.

### `get-v2-logging-options`

The following code example shows how to use `get-v2-logging-options`.

**AWS CLI**

**To list the current logging options**

The following `get-v2-logging-options` example lists the current logging options for AWS IoT.

```
aws iot get-v2-logging-options
```

Output:

```
{
    "roleArn": "arn:aws:iam::094249569039:role/service-role/iotLoggingRole",
    "defaultLogLevel": "WARN",
    "disableAllLogs": false
}
```

For more information, see title in the *AWS IoT Developer Guide*.

- For API details, see GetV2LoggingOptions in *AWS CLI Command Reference*.

### `list-active-violations`

The following code example shows how to use `list-active-violations`.

**AWS CLI**

**To list the active violations**

The following `list-active-violations` example lists all violations for the specified security profile.

```
aws iot list-active-violations \
    --security-profile-name Testprofile
```

Output:

```
{
    "activeViolations": [
        {
            "violationId": "174db59167fa474c80a652ad1583fd44",
            "thingName": "iotconsole-1560269126751-1",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",
                "metric": "aws:num-authorization-failures",
                "criteria": {
                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 10
                    },
                    "durationSeconds": 300,
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
            "lastViolationValue": {
                "count": 0
            },
            "lastViolationTime": 1560293700.0,
            "violationStartTime": 1560279000.0
        },
        {
            "violationId": "c8a9466a093d3b7b35cd44ca58bdbeab",
            "thingName": "TvnQoEoU",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "CellularBandwidth",
                "metric": "aws:message-byte-size",
                "criteria": {
                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 128
                    },
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
            "lastViolationValue": {
```

```
                "count": 110
            },
            "lastViolationTime": 1560369000.0,
            "violationStartTime": 1560276600.0
        },
        {
            "violationId": "74aa393adea02e6648f3ac362beed55e",
            "thingName": "iotconsole-1560269232412-2",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",
                "metric": "aws:num-authorization-failures",
                "criteria": {
                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 10
                    },

            "violationStartTime": 1560276600.0
        }
    ]
}
```

- For API details, see ListActiveViolations in *AWS CLI Command Reference*.

### `list-attached-policies`

The following code example shows how to use `list-attached-policies`.

**AWS CLI**

**Example 1: To list the policies attached to a group**

The following `list-attached-policies` example lists the policies that are attached to the specified group.

```
aws iot list-attached-policies \
    --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
```

Output:

```
{
    "policies": [
        {
            "policyName": "UpdateDeviceCertPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
UpdateDeviceCertPolicy"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

**Example 2: To list the policies attached to a device certificate**

The following `list-attached-policies` example lists the AWS IoT policies attached to the device certificate. The certificate is identified by its ARN.

```
aws iot list-attached-policies \
    --target arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

Output:

```
{
    "policies": [
        {
            "policyName": "TemperatureSensorPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TemperatureSensorPolicy"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListAttachedPolicies in *AWS CLI Command Reference*.

### `list-audit-findings`

The following code example shows how to use `list-audit-findings`.

#### AWS CLI

**Example 1: To list all findings from an audit**

The following `list-audit-findings` example lists all findings from an AWS IoT Device Defender audit with a specified task ID.

```
aws iot list-audit-findings \
    --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```
{
    "findings": []
```

```
}
```

**Example 2: To list findings for an audit check type**

The following `list-audit-findings` example shows findings from AWS IoT Device Defender audits that ran between June 5, 2019 and June 19, 2019 in which devices are sharing a device certificate. When you specify a check name, you must provide a start and end time.

```
aws iot list-audit-findings \
    --check-name DEVICE_CERTIFICATE_SHARED_CHECK \
    --start-time 1559747125 \
    --end-time 1560962028
```

Output:

```
{
    "findings": [
        {
            "taskId": "eeef61068b0eb03c456d746c5a26ee04",
            "checkName": "DEVICE_CERTIFICATE_SHARED_CHECK",
            "taskStartTime": 1560161017.172,
            "findingTime": 1560161017.592,
            "severity": "CRITICAL",
            "nonCompliantResource": {
                "resourceType": "DEVICE_CERTIFICATE",
                "resourceIdentifier": {
                    "deviceCertificateId":
 "b193ab7162c0fadca83246d24fa090300a1236fe58137e121b011804d8ac1d6b"
                }
            },
            "relatedResources": [
                {

            "reasonForNonCompliance": "Certificate shared by one or more devices.",
            "reasonForNonComplianceCode": "CERTIFICATE_SHARED_BY_MULTIPLE_DEVICES"
        }
    ]
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see ListAuditFindings in *AWS CLI Command Reference*.

### `list-audit-mitigation-actions-executions`

The following code example shows how to use `list-audit-mitigation-actions-executions`.

#### AWS CLI

**To list the details of an audit mitigation action execution**

An audit mitigation action task applies a mitigation action to one or more findings from an AWS IoT Device Defender audit. The following `list-audit-mitigation-actions-executions` example lists the details for the mitigation action task with the specified `taskId` and for the specified finding.

```
aws iot list-audit-mitigation-actions-executions \
    --task-id myActionsTaskId \
    --finding-id 0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464
```

Output:

```
{
    "actionsExecutions": [
        {
            "taskId": "myActionsTaskId",
            "findingId": "0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464",
            "actionName": "ResetPolicyVersionAction",
            "actionId": "1ea0b415-bef1-4a01-bd13-72fb63c59afb",
```

```
            "status": "COMPLETED",
            "startTime": "2019-12-10T15:19:13.279000-08:00",
            "endTime": "2019-12-10T15:19:13.337000-08:00"
        }
    ]
}
```

For more information, see ListAuditMitigationActionsExecutions (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListAuditMitigationActionsExecutions in *AWS CLI Command Reference*.

### `list-audit-mitigation-actions-tasks`

The following code example shows how to use `list-audit-mitigation-actions-tasks`.

#### AWS CLI

**To list audit mitigation action tasks**

The following `list-audit-mitigation-actions-tasks` example lists the mitigation actions that were applied to findings within the specified time period.

```
aws iot list-audit-mitigation-actions-tasks \
    --start-time 1594157400 \
    --end-time 1594157430
```

Output:

```
{
    "tasks": [
        {
                "taskId": "0062f2d6-3999-488f-88c7-bef005414103",
                "startTime": "2020-07-07T14:30:15.172000-07:00",
            "taskStatus": "COMPLETED"
        }
    ]
}
```

For more information, see ListAuditMitigationActionsTasks (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListAuditMitigationActionsTasks in *AWS CLI Command Reference*.

### `list-audit-suppressions`

The following code example shows how to use `list-audit-suppressions`.

**AWS CLI**

**To list all audit finding suppressions**

The following `list-audit-suppressions` example lists all active audit finding suppressions.

```
aws iot list-audit-suppressions
```

Output:

```
{
    "suppressions": [
        {
        "checkName": "DEVICE_CERTIFICATE_EXPIRING_CHECK",
            "resourceIdentifier": {
                "deviceCertificateId": "c7691e<shortened>"
            },
        "expirationDate": 1597881600.0,
        "suppressIndefinitely": false
        }
    ]
}
```

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see ListAuditSuppressions in *AWS CLI Command Reference*.

### `list-audit-tasks`

The following code example shows how to use `list-audit-tasks`.

**AWS CLI**

**To list all findings from an audit**

The following `list-audit-tasks` example lists the audit tasks that ran between June 5, 2019 and June 12, 2019.

```
aws iot list-audit-tasks \
    --start-time 1559747125 \
    --end-time 1560357228
```

Output:

```
{
    "tasks": [
        {
            "taskId": "a3aea009955e501a31b764abe1bebd3d",
            "taskStatus": "COMPLETED",
            "taskType": "ON_DEMAND_AUDIT_TASK"
        },
        {
            "taskId": "f76b4b5102b632cd9ae38a279c266da1",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "51d9967d9f9ff4d26529505f6d2c444a",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "eeef61068b0eb03c456d746c5a26ee04",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "041c49557b7c7b04c079a49514b55589",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "82c7f2afac1562d18a4560be73998acc",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "bade6b5efd2e1b1569822f6021b39cf5",
```

```
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "c23f6233ba2d35879c4bb2810fb5ffd6",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        },
        {
            "taskId": "ac9086b7222a2f5e2e17bb6fd30b3aeb",
            "taskStatus": "COMPLETED",
            "taskType": "SCHEDULED_AUDIT_TASK"
        }
    ]
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see ListAuditTasks in *AWS CLI Command Reference*.

## `list-authorizers`

The following code example shows how to use `list-authorizers`.

### AWS CLI

#### To list your custom authorizer

The following `list-authorizers` example lists the custom authorizers in your AWS account.

```
aws iot list-authorizers
```

Output:

```
{
    "authorizers": [
        {
            "authorizerName": "CustomAuthorizer",
            "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
        },
        {
```

```
            "authorizerName": "CustomAuthorizer2",
            "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
        },
        {
            "authorizerName": "CustomAuthorizer3",
            "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer3"
        }
    ]
}
```

For more information, see ListAuthorizers in the *AWS IoT API Reference*.

- For API details, see ListAuthorizers in *AWS CLI Command Reference*.

### `list-billing-groups`

The following code example shows how to use `list-billing-groups`.

#### AWS CLI

**To list the billing groups for your AWS account and region**

The following `list-billing-groups` example lists all billing groups that are defined for your AWS account and AWS Region.

```
aws iot list-billing-groups
```

Output:

```
{
    "billingGroups": [
        {
            "groupName": "GroupOne",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne"
        }
    ]
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListBillingGroups in *AWS CLI Command Reference*.

### `list-ca-certificates`

The following code example shows how to use `list-ca-certificates`.

**AWS CLI**

**To list the CA certificates registered in your AWS account**

The following `list-ca-certificates` example lists the CA certificates registered in your AWS account.

```
aws iot list-ca-certificates
```

Output:

```
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/
f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467",

            "creationDate": 1569365372.053
        }
    ]
}
```

For more information, see Use Your Own Certificate in the *AWS IoT Developer Guide*.

- For API details, see ListCaCertificates in *AWS CLI Command Reference*.

### `list-certificates-by-ca`

The following code example shows how to use `list-certificates-by-ca`.

**AWS CLI**

**To list all device certificates signed with a CA certificate**

The following `list-certificates-by-ca` example lists all device certificates in your AWS account that are signed with the specified CA certificate.

```
aws iot list-certificates-by-ca \
    --ca-certificate-id
 f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467
```

Output:

```
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "certificateId":
 "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "status": "ACTIVE",
            "creationDate": 1569363250.557
        }
    ]
}
```

For more information, see ListCertificatesByCA in the *AWS IoT API Reference*.

- For API details, see ListCertificatesByCa in *AWS CLI Command Reference*.

## `list-certificates`

The following code example shows how to use `list-certificates`.

### AWS CLI

#### Example 1: To list the certificates registered in your AWS account

The following `list-certificates` example lists all certificates registered in your account. If you have more than the default paging limit of 25, you can use the `nextMarker` response value from this command and supply it to the next command to get the next batch of results. Repeat until `nextMarker` returns without a value.

```
aws iot list-certificates
```

Output:

```
{
    "certificates": [
        {
            "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
            "certificateId":
 "604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
            "status": "ACTIVE",
            "creationDate": 1556810537.617
        },
        {
            "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/262a1ac8a7d8aa72f6e96e365480f7313aa9db74b8339ec65d34dc3074e1c31e",
            "certificateId":

            "certificateId":
 "4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e",
            "status": "ACTIVE",
            "creationDate": 1541022751.983
        }
    ]
}
```

- For API details, see ListCertificates in *AWS CLI Command Reference*.

### `list-custom-metrics`

The following code example shows how to use `list-custom-metrics`.

#### AWS CLI

**To list your custom metrics**

The following `list-custom-metrics` example lists all of your custom metrics.

```
aws iot list-custom-metrics \
    --region us-east-1
```

Output:

```
{
    "metricNames": [
        "batteryPercentage"
    ]
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see ListCustomMetrics in *AWS CLI Command Reference*.

### `list-dimensions`

The following code example shows how to use `list-dimensions`.

**AWS CLI**

**To list the dimensions for your AWS account**

The following `list-dimensions` example lists all AWS IoT Device Defender dimensions that are defined in your AWS account.

```
aws iot list-dimensions
```

Output:

```
{
    "dimensionNames": [
        "TopicFilterForAuthMessages",
        "TopicFilterForActivityMessages"
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListDimensions in *AWS CLI Command Reference*.

### `list-domain-configurations`

The following code example shows how to use `list-domain-configurations`.

**AWS CLI**

**To list domain configurations**

The following `list-domain-configurations` example lists the domain configurations in your AWS account that have the specified service type.

```
aws iot list-domain-configurations \
    --service-type "DATA"
```

Output:

```
{
    "domainConfigurations":
```

```
    [
        {
            "domainConfigurationName": "additionalDataDomain",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh",
            "serviceType": "DATA"
        },

        {
            "domainConfigurationName": "iot:Jobs",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:Jobs",
            "serviceType": "JOBS"
        },
        {
            "domainConfigurationName": "iot:Data-ATS",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:Data-ATS",
            "serviceType": "DATA"
        },
        {
            "domainConfigurationName": "iot:CredentialProvider",
            "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:CredentialProvider",
            "serviceType": "CREDENTIAL_PROVIDER"
        }
    ]
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see ListDomainConfigurations in *AWS CLI Command Reference*.

## `list-indices`

The following code example shows how to use `list-indices`.

### AWS CLI

#### To list the configured search indices

The following `list-indices` example lists all configured search indices in your AWS account. If you have not enabled thing indexing, you might not have any indices.

```
aws iot list-indices
```

Output:

```
{
    "indexNames": [
        "AWS_Things"
    ]
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developer Guide*.

- For API details, see ListIndices in *AWS CLI Command Reference*.

### `list-job-executions-for-job`

The following code example shows how to use `list-job-executions-for-job`.

**AWS CLI**

**To list the jobs in your AWS account**

The following `list-job-executions-for-job` example lists all job executions for a job in your AWS account, specified by the jobId.

```
aws iot list-job-executions-for-job \
    --job-id my-ota-job
```

Output:

```
{
     "executionSummaries": [
         {
             "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/my_thing",
             "jobExecutionSummary": {
                 "status": "QUEUED",
                 "queuedAt": "2022-03-07T15:58:42.195000-08:00",
                 "lastUpdatedAt": "2022-03-07T15:58:42.195000-08:00",
                 "executionNumber": 1,
                 "retryAttempt": 0
```

```
            }
        }
    ]
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see ListJobExecutionsForJob in *AWS CLI Command Reference*.

### `list-job-executions-for-thing`

The following code example shows how to use `list-job-executions-for-thing`.

**AWS CLI**

**To list the jobs that were executed for a thing**

The following `list-job-executions-for-thing` example lists all jobs that were executed for the thing named `MyRaspberryPi`.

```
aws iot list-job-executions-for-thing \
    --thing-name "MyRaspberryPi"
```

Output:

```
{
    "executionSummaries": [
        {
            "jobId": "example-job-01",
            "jobExecutionSummary": {
                "status": "QUEUED",
                "queuedAt": 1560787023.636,
                "lastUpdatedAt": 1560787023.636,
                "executionNumber": 1
            }
        }
    ]
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see ListJobExecutionsForThing in *AWS CLI Command Reference*.

### `list-jobs`

The following code example shows how to use `list-jobs`.

**AWS CLI**

**To list the jobs in your AWS account**

The following `list-jobs` example lists all jobs in your AWS account, sorted by the job status.

```
aws iot list-jobs
```

Output:

```
{
    "jobs": [
        {
            "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
            "jobId": "example-job-01",
            "targetSelection": "SNAPSHOT",
            "status": "IN_PROGRESS",
            "createdAt": 1560787022.733,
            "lastUpdatedAt": 1560787026.294
        }
    ]
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see ListJobs in *AWS CLI Command Reference*.

### `list-mitigation-actions`

The following code example shows how to use `list-mitigation-actions`.

**AWS CLI**

**To list all defined mitigation actions**

The following `list-mitigation-actions` example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.

```
aws iot list-mitigation-actions
```

Output:

```
{
    "actionIdentifiers": [
        {
            "actionName": "DeactivateCACertAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
DeactivateCACertAction",
            "creationDate": "2019-12-10T11:12:47.574000-08:00"
        },
        {
            "actionName": "ResetPolicyVersionAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
ResetPolicyVersionAction",
            "creationDate": "2019-12-10T11:11:48.920000-08:00"
        },
        {
            "actionName": "PublishFindingToSNSAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
PublishFindingToSNSAction",
            "creationDate": "2019-12-10T11:10:49.546000-08:00"
        },
        {
            "actionName": "AddThingsToQuarantineGroupAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
            "creationDate": "2019-12-10T11:09:35.999000-08:00"
        },
        {
            "actionName": "UpdateDeviceCertAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
UpdateDeviceCertAction",
            "creationDate": "2019-12-10T11:08:44.263000-08:00"
        },
        {
            "actionName": "SampleMitigationAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
SampleMitigationAction",
            "creationDate": "2019-12-10T11:03:41.840000-08:00"
        }
    ]
```

```
}
```

For more information, see ListMitigationActions (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListMitigationActions in *AWS CLI Command Reference*.

### `list-mitigations-actions`

The following code example shows how to use `list-mitigations-actions`.

#### AWS CLI

**To list all defined mitigation actions**

The following `list-mitigations-actions` example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.

```
aws iot list-mitigation-actions
```

Output:

```
{
    "actionIdentifiers": [
        {
            "actionName": "DeactivateCACertAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
DeactivateCACertAction",
            "creationDate": "2019-12-10T11:12:47.574000-08:00"
        },
        {
            "actionName": "ResetPolicyVersionAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
ResetPolicyVersionAction",
            "creationDate": "2019-12-10T11:11:48.920000-08:00"
        },
        {
            "actionName": "PublishFindingToSNSAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
PublishFindingToSNSAction",
            "creationDate": "2019-12-10T11:10:49.546000-08:00"
        },
        {
```

```
            "actionName": "AddThingsToQuarantineGroupAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
            "creationDate": "2019-12-10T11:09:35.999000-08:00"
        },
        {
            "actionName": "UpdateDeviceCertAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
UpdateDeviceCertAction",
            "creationDate": "2019-12-10T11:08:44.263000-08:00"
        },
        {
            "actionName": "SampleMitigationAction",
            "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
SampleMitigationAction",
            "creationDate": "2019-12-10T11:03:41.840000-08:00"
        }
    ]
}
```

For more information, see ListMitigationActions (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see ListMitigationsActions in *AWS CLI Command Reference*.

## `list-ota-updates`

The following code example shows how to use `list-ota-updates`.

### AWS CLI

#### To list OTA Updates for the account

The following `list-ota-updates` example lists the available OTA updates.

```
aws iot list-ota-updates
```

Output:

```
{
    "otaUpdates": [
        {
            "otaUpdateId": "itsaupdate",
```

```
            "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/
itsaupdate",
            "creationDate": 1557863215.995
        }
    ]
}
```

For more information, see ListOTAUpdates in the *AWS IoT API Reference*.

- For API details, see ListOtaUpdates in *AWS CLI Command Reference*.

### `list-outgoing-certificates`

The following code example shows how to use `list-outgoing-certificates`.

#### AWS CLI

**To list certificates being transferred to a different AWS account**

The following `list-outgoing-certificates` example lists all device certificates that are in the process of being transferred to a different AWS account using the `transfer-certificate` command.

```
aws iot list-outgoing-certificates
```

Output:

```
{
    "outgoingCertificates": [
        {
            "certificateArn": "arn:aws:iot:us-
west-2:030714055129:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "certificateId":
 "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
            "transferredTo": "030714055129",
            "transferDate": 1569427780.441,
            "creationDate": 1569363250.557
        }
    ]
}
```

For more information, see ListOutgoingCertificates in the *AWS IoT API Reference*.

- For API details, see ListOutgoingCertificates in *AWS CLI Command Reference*.

### `list-policies`

The following code example shows how to use `list-policies`.

**AWS CLI**

**To list the policies defined in your AWS account**

The following `list-policies` example lists all policies defined in your AWS account.

```
aws iot list-policies
```

Output:

```
{
    "policies": [
        {
            "policyName": "UpdateDeviceCertPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
UpdateDeviceCertPolicy"
        },
        {
            "policyName": "PlantIoTPolicy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/PlantIoTPolicy"
        },
        {
            "policyName": "MyPiGroup_Core-policy",
            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/MyPiGroup_Core-
policy"
        }
    ]
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

### `list-policy-versions`

The following code example shows how to use `list-policy-versions`.

**AWS CLI**

**Example 1: To see all versions of a policy**

The following `list-policy-versions` example lists all versions of the specified policy and their creation dates.

```
aws iot list-policy-versions \
    --policy-name LightBulbPolicy
```

Output:

```
{
    "policyVersions": [
        {
            "versionId": "2",
            "isDefaultVersion": true,
            "createDate": 1559925941.924
        },
        {
            "versionId": "1",
            "isDefaultVersion": false,
            "createDate": 1559925941.924
        }
    ]
}
```

For more information, see AWS IoT Policies in the *AWS IoT Developers Guide*.

- For API details, see ListPolicyVersions in *AWS CLI Command Reference*.

## `list-principal-things`

The following code example shows how to use `list-principal-things`.

**AWS CLI**

**To list the things attached with a principal**

The following `list-principal-things` example lists the things attached to the principal specified by an ARN.

```
aws iot list-principal-things \
    --principal arn:aws:iot:us-
west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8
```

Output:

```
{
    "things": [
        "DeskLamp",
        "TableLamp"
    ]
}
```

For more information, see ListPrincipalThings in the *AWS IoT API Reference*.

- For API details, see ListPrincipalThings in *AWS CLI Command Reference*.

### `list-provisioning-template-versions`

The following code example shows how to use `list-provisioning-template-versions`.

#### AWS CLI

**To list provisioning template versions**

The following `list-provisioning-template-versions` example lists the available versions of the specified provisioning template.

```
aws iot list-provisioning-template-versions \
    --template-name "widget-template"
```

Output:

```
{
    "versions": [
        {
            "versionId": 1,
            "creationDate": 1574800471.339,
            "isDefaultVersion": true
        },
        {
```

```
            "versionId": 2,
            "creationDate": 1574801192.317,
            "isDefaultVersion": false
        }
    ]
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see ListProvisioningTemplateVersions in *AWS CLI Command Reference*.

### `list-provisioning-templates`

The following code example shows how to use `list-provisioning-templates`.

#### AWS CLI

**To list provisioning templates**

The following `list-provisioning-templates` example lists all of the provisioning templates in your AWS account.

```
aws iot list-provisioning-templates
```

Output:

```
{
    "templates": [
        {
            "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/
widget-template",
            "templateName": "widget-template",
            "description": "A provisioning template for widgets",
            "creationDate": 1574800471.367,
            "lastModifiedDate": 1574801192.324,
            "enabled": false
        }
    ]
}
```

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see ListProvisioningTemplates in *AWS CLI Command Reference*.

### `list-role-aliases`

The following code example shows how to use `list-role-aliases`.

**AWS CLI**

**To list the AWS IoT role aliases in your AWS account**

The following `list-role-aliases` example lists the AWS IoT role aliases in your AWS account.

```
aws iot list-role-aliases
```

Output:

```
{
    "roleAliases": [
        "ResidentAlias",
        "ElectricianAlias"
    ]
}
```

For more information, see ListRoleAliases in the *AWS IoT API Reference*.

- For API details, see ListRoleAliases in *AWS CLI Command Reference*.

### `list-scheduled-audits`

The following code example shows how to use `list-scheduled-audits`.

**AWS CLI**

**To list the scheduled audits for your AWS account**

The following `list-scheduled-audits` example lists any audits scheduled for your AWS account.

```
aws iot list-scheduled-audits
```

Output:

```
{
    "scheduledAudits": [
        {
            "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
            "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSIoTDeviceDefenderDailyAudit",
            "frequency": "DAILY"
        },
        {
            "scheduledAuditName": "AWSDeviceDefenderWeeklyAudit",
            "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSDeviceDefenderWeeklyAudit",
            "frequency": "WEEKLY",
            "dayOfWeek": "SUN"
        }
    ]
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see ListScheduledAudits in *AWS CLI Command Reference*.

### `list-security-profiles-for-target`

The following code example shows how to use `list-security-profiles-for-target`.

#### AWS CLI

**To list the security profiles attached to a target**

The following `list-security-profiles-for-target` example lists the AWS IoT Device Defender security profiles that are attached to unregistered devices.

```
aws iot list-security-profiles-for-target  \
    --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/
unregistered-things"
```

Output:

```
{
    "securityProfileTargetMappings": [
        {
```

```
            "securityProfileIdentifier": {
                "name": "Testprofile",
                "arn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
Testprofile"
            },
            "target": {
                "arn": "arn:aws:iot:us-west-2:123456789012:all/unregistered-things"
            }
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListSecurityProfilesForTarget in *AWS CLI Command Reference*.

### `list-security-profiles`

The following code example shows how to use `list-security-profiles`.

#### AWS CLI

**To list the security profiles for your AWS account**

The following `list-security-profiles` example lists all AWS IoT Device Defender security profiles that are defined in your AWS account.

```
aws iot list-security-profiles
```

Output:

```
{
    "securityProfileIdentifiers": [
        {
            "name": "Testprofile",
            "arn": "arn:aws:iot:us-west-2:123456789012:securityprofile/Testprofile"
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListSecurityProfiles in *AWS CLI Command Reference*.

### `list-streams`

The following code example shows how to use `list-streams`.

**AWS CLI**

**To list the streams in the account**

The following `list-streams` example lists all of the streams in your AWS account.

```
aws iot list-streams
```

Output:

```
{
    "streams": [
        {
            "streamId": "stream12345",
            "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
            "streamVersion": 1,
            "description": "This stream is used for Amazon FreeRTOS OTA Update
 12345."
        },
        {
            "streamId": "stream54321",
            "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream54321",
            "streamVersion": 1,
            "description": "This stream is used for Amazon FreeRTOS OTA Update
 54321."
        }
    ]
}
```

For more information, see ListStreams in the *AWS IoT API Reference*.

- For API details, see ListStreams in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To display the tags and their values associated with a resource**

The following `list-tags-for-resource` example displays the tags and values associated with the thing group `LightBulbs`.

```
aws iot list-tags-for-resource \
    --resource-arn "arn:aws:iot:us-west-2:094249569039:thinggroup/LightBulbs"
```

Output:

```
{
    "tags": [
        {
            "Key": "Assembly",
            "Value": "Fact1NW"
        },
        {
            "Key": "MyTag",
            "Value": "777"
        }
    ]
}
```

For more information, see Tagging Your AWS IoT Resources in the *AWS IoT Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

## `list-targets-for-policy`

The following code example shows how to use `list-targets-for-policy`.

**AWS CLI**

**To list the principals associated with an AWS IoT policy**

The following `list-targets-for-policy` example lists the device certificates to which the specified policy is attached.

```
aws iot list-targets-for-policy \
```

```
    --policy-name UpdateDeviceCertPolicy
```

Output:

```
{
    "targets": [
        "arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
        "arn:aws:iot:us-west-2:123456789012:cert/
d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be"
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListTargetsForPolicy in *AWS CLI Command Reference*.

### `list-targets-for-security-profile`

The following code example shows how to use `list-targets-for-security-profile`.

#### AWS CLI

**To list the targets to which a security profile is applied**

The following `list-targets-for-security-profile` example lists the targets to which the AWS IoT Device Defender security profile named `PossibleIssue` is applied.

```
aws iot list-targets-for-security-profile \
    --security-profile-name Testprofile
```

Output:

```
{
    "securityProfileTargets": [
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:all/unregistered-things"
        },
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:all/registered-things"
        }
    ]
```

```
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListTargetsForSecurityProfile in *AWS CLI Command Reference*.

### `list-thing-groups-for-thing`

The following code example shows how to use `list-thing-groups-for-thing`.

**AWS CLI**

**To list the groups that a thing belongs to**

The following `list-thing-groups-for-thing` example lists the groups to which the specified thing belongs.

```
aws iot list-thing-groups-for-thing \
    --thing-name MyLightBulb
```

Output:

```
{
    "thingGroups": [
        {
            "groupName": "DeadBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/DeadBulbs"
        },
        {
            "groupName": "LightBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingGroupsForThing in *AWS CLI Command Reference*.

### `list-thing-groups`

The following code example shows how to use `list-thing-groups`.

**AWS CLI**

**To list the thing groups defined in your AWS account**

The following `describe-thing-group` example lists all thing groups defined in your AWS account.

```
aws iot list-thing-groups
```

Output:

```
{
    "thingGroups": [
        {
            "groupName": "HalogenBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs"
        },
        {
            "groupName": "LightBulbs",
            "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
        }
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingGroups in *AWS CLI Command Reference*.

## `list-thing-principals`

The following code example shows how to use `list-thing-principals`.

**AWS CLI**

**To list the principals associated with a thing**

The following `list-thing-principals` example lists the principals (X.509 certificates, IAM users, groups, roles, Amazon Cognito identities, or federated identities) associated with the specified thing.

```
aws iot list-thing-principals \
    --thing-name MyRaspberryPi
```

Output:

```
{
    "principals": [
        "arn:aws:iot:us-
west-2:123456789012:cert/33475ac865079a5ffd5ecd44240640349293facc760642d7d8d5dbb6b4c86893"
    ]
}
```

For more information, see ListThingPrincipals in the *AWS IoT API Reference*.

- For API details, see ListThingPrincipals in *AWS CLI Command Reference*.

### `list-thing-types`

The following code example shows how to use `list-thing-types`.

#### AWS CLI

**To list the defined thing types**

The following `list-thing-types` example displays a list of thing types defined in your AWS account.

```
aws iot list-thing-types
```

Output:

```
{
    "thingTypes": [
        {
            "thingTypeName": "LightBulb",
            "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/
LightBulb",
            "thingTypeProperties": {
                "thingTypeDescription": "light bulb type",
                "searchableAttributes": [
                    "model",
                    "wattage"
                ]
            },
            "thingTypeMetadata": {
```

```
            "deprecated": false,
            "creationDate": 1559772562.498
            }
        }
    ]
}
```

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see ListThingTypes in *AWS CLI Command Reference*.

### `list-things-in-billing-group`

The following code example shows how to use `list-things-in-billing-group`.

**AWS CLI**

**To list the things in a billing group**

The following `list-things-in-billing-group` example lists the things that are in the specified billing group.

```
aws iot list-things-in-billing-group \
    --billing-group-name GroupOne
```

Output:

```
{
    "things": [
        "MyOtherLightBulb",
        "MyLightBulb"
    ]
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingsInBillingGroup in *AWS CLI Command Reference*.

### `list-things-in-thing-group`

The following code example shows how to use `list-things-in-thing-group`.

**AWS CLI**

**To list the things that belong to a group**

The following `list-things-in-thing-group` example lists the things that belong to the specified thing group.

```
aws iot list-things-in-thing-group \
    --thing-group-name LightBulbs
```

Output:

```
{
    "things": [
        "MyLightBulb"
    ]
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see ListThingsInThingGroup in *AWS CLI Command Reference*.

## `list-things`

The following code example shows how to use `list-things`.

**AWS CLI**

**Example 1: To list all things in the registry**

The following `list-things` example lists the things (devices) that are defined in the AWS IoT registry for your AWS account.

```
aws iot list-things
```

Output:

```
{
    "things": [
        {
            "thingName": "ThirdBulb",
            "thingTypeName": "LightBulb",
```

```
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/ThirdBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 2
        },
        {
            "thingName": "MyOtherLightBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 3
        },
        {
            "thingName": "MyLightBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 1
        },
        {
        "thingName": "SampleIoTThing",
        "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/SampleIoTThing",
        "attributes": {},
        "version": 1
        }
    ]
}
```

**Example 2: To list the defined things that have a specific attribute**

The following `list-things` example displays a list of things that have an attribute named `wattage`.

```
aws iot list-things \
    --attribute-name wattage
```

Output:

```
{
    "things": [
        {
            "thingName": "MyLightBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 1
        },
        {
            "thingName": "MyOtherLightBulb",
            "thingTypeName": "LightBulb",
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "version": 3
        }
    ]
}
```

For more information, see How to Manage Things with the Registry in the *AWS IoT Developers Guide*.

- For API details, see ListThings in *AWS CLI Command Reference*.

## `list-topic-rule-destinations`

The following code example shows how to use `list-topic-rule-destinations`.

### AWS CLI

#### To list your topic rule destinations

The following `list-topic-rule-destinations` example lists all topic rule destinations that you have defined in the current AWS Region.

```
aws iot list-topic-rule-destinations
```

Output:

```
{
    "destinationSummaries": [
        {
            "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "status": "ENABLED",
            "httpUrlSummary": {
                "confirmationUrl": "https://example.com"
            }
        }
    ]
}
```

For more information, see Working with topic rule destinations in the *AWS IoT Developer Guide*.

- For API details, see ListTopicRuleDestinations in *AWS CLI Command Reference*.

### `list-topic-rules`

The following code example shows how to use `list-topic-rules`.

#### AWS CLI

**To list your rules**

The following `list-topic-rules` example lists all rules that you have defined.

```
aws iot list-topic-rules
```

Output:

```
{
    "rules": [
        {
            "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/
MyRPiLowMoistureAlertRule",
            "ruleName": "MyRPiLowMoistureAlertRule",
            "topicPattern": "$aws/things/MyRPi/shadow/update/accepted",
```

```
            "createdAt": 1558624363.0,
            "ruleDisabled": false
        },
        {
            "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/
MyPlantPiMoistureAlertRule",
            "ruleName": "MyPlantPiMoistureAlertRule",
            "topicPattern": "$aws/things/MyPlantPi/shadow/update/accepted",
            "createdAt": 1541458459.0,
            "ruleDisabled": false
        }
    ]
}
```

For more information, see Viewing Your Rules in the *AWS IoT Developers Guide*.

- For API details, see ListTopicRules in *AWS CLI Command Reference*.

### `list-v2-logging-levels`

The following code example shows how to use `list-v2-logging-levels`.

#### AWS CLI

**To list logging levels**

The following `list-v2-logging-levels` example lists the configured logging levels. If logging levels were not set, a `NotConfiguredException` occurs when you run this command.

```
aws iot list-v2-logging-levels
```

Output:

```
{
    "logTargetConfigurations": [
        {
            "logTarget": {
                "targetType": "DEFAULT"
            },
            "logLevel": "ERROR"
        }
    ]
```

```
}
```

- For API details, see ListV2LoggingLevels in *AWS CLI Command Reference*.

### `list-violation-events`

The following code example shows how to use `list-violation-events`.

**AWS CLI**

**To list the security profile violations during a time period**

The following `list-violation-events` example lists violations that occurred between June 5, 2019 and June 12, 2019 for all AWS IoT Device Defender security profiles for the current AWS account and AWS Region.

```
aws iot list-violation-events \
    --start-time 1559747125 \
    --end-time 1560351925
```

Output:

```
{
    "violationEvents": [
        {
            "violationId": "174db59167fa474c80a652ad1583fd44",
            "thingName": "iotconsole-1560269126751-1",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",
                "metric": "aws:num-authorization-failures",
                "criteria": {
                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 10
                    },
                    "durationSeconds": 300,
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
            "metricValue": {
```

```
                "count": 0
            },
            "violationEventType": "in-alarm",
            "violationEventTime": 1560279000.0
        },
        {

                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 128
                    },
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
            "metricValue": {
                "count": 110
            },
            "violationEventType": "in-alarm",
            "violationEventTime": 1560276600.0
        },
        {
            "violationId": "74aa393adea02e6648f3ac362beed55e",
            "thingName": "iotconsole-1560269232412-2",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",
                "metric": "aws:num-authorization-failures",
                "criteria": {
                    "comparisonOperator": "greater-than",
                    "value": {
                        "count": 10
                    },
                    "durationSeconds": 300,
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
```

```
            "metricValue": {
                "count": 0
            },
            "violationEventType": "in-alarm",
            "violationEventTime": 1560276600.0
        },
        {
            "violationId": "1e6ab5f7cf39a1466fcd154e1377e406",
            "thingName": "TvnQoEoU",
            "securityProfileName": "Testprofile",
            "behavior": {
                "name": "Authorization",
                "metric": "aws:num-authorization-failures",
                "criteria": {
                    "comparisonOperator": "greater-than",

                    },
                    "durationSeconds": 300,
                    "consecutiveDatapointsToAlarm": 1,
                    "consecutiveDatapointsToClear": 1
                }
            },
            "metricValue": {
                "count": 0
            },
            "violationEventType": "in-alarm",
            "violationEventTime": 1560276600.0
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ListViolationEvents in *AWS CLI Command Reference*.

## `register-ca-certificate`

The following code example shows how to use `register-ca-certificate`.

### AWS CLI

#### To register a certificate authority (CA) certificate

The following `register-ca-certificate` example registers a CA certificate. The command supplies the CA certificate and a key verification certificate that proves you own the private key associated with the CA certificate.

```
aws iot register-ca-certificate \
    --ca-certificate file://rootCA.pem \
    --verification-cert file://verificationCert.pem
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/
f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467",
    "certificateId":
 "f4efed62c0142f16af278166f61962501165c4f053629520742646005 8cd1467"
 }
```

For more information, see RegisterCACertificate in the *AWS IoT API Reference*.

- For API details, see RegisterCaCertificate in *AWS CLI Command Reference*.

## `register-certificate`

The following code example shows how to use `register-certificate`.

### AWS CLI

#### To register a self signed device certificate

The following `register-certificate` example registers the `deviceCert.pem` device certificate signed by the `rootCA.pem` CA certificate. The CA certificate must be registered before you use it to register a self-signed device certificate. The self-signed certificate must be signed by the same CA certificate you pass to this command.

```
aws iot register-certificate \
    --certificate-pem file://deviceCert.pem \
    --ca-certificate-pem file://rootCA.pem
```

Output:

```
{
```

```
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
    "certificateId":
 "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142"
 }
```

For more information, see RegisterCertificate in the *AWS IoT API Reference*.

- For API details, see RegisterCertificate in *AWS CLI Command Reference*.

### `register-thing`

The following code example shows how to use `register-thing`.

#### AWS CLI

**To register a thing**

The following `register-thing` example registers a thing using a provisioning template.

```
aws iot register-thing \
    --template-body '{"Parameters":{"ThingName":
{"Type":"String"},"AWS::IoT::Certificate::Id":{"Type":"String"}},"Resources":
 {"certificate":{"Properties":{"CertificateId":
{"Ref":"AWS::IoT::Certificate::Id"},"Status":"Active"},"Type":"AWS::IoT::Certificate"},"poli
{"Properties":{"PolicyName":"MyIotPolicy"},"Type":"AWS::IoT::Policy"},"thing":
{"OverrideSettings":
{"AttributePayload":"MERGE","ThingGroups":"DO_NOTHING","ThingTypeName":"REPLACE"},"Propertie
{"AttributePayload":{},"ThingGroups":[],"ThingName":
{"Ref":"ThingName"},"ThingTypeName":"VirtualThings"},"Type":"AWS::IoT::Thing"}}}' \
    --parameters '{"ThingName":"Register-thing-
trial-1","AWS::IoT::Certificate::Id":"799a9ea048a1e6aea42b55EXAMPLEf8697b4bafcd77a318a3068e3
```

Output:

```
{
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCCAkGgAwIBAgIUYLk81I35cIppobpw

        "thing": "arn:aws:iot:us-west-2:571032923833:thing/Register-thing-trial-1"
    }
}
```

For more information, see Provisioning by trusted user in the *AWS IoT Core Developers Guide*.

- For API details, see RegisterThing in *AWS CLI Command Reference*.

## `reject-certificate-transfer`

The following code example shows how to use `reject-certificate-transfer`.

### AWS CLI

#### To reject a certificate transfer

The following `reject-certificate-transfer` example rejects the transfer of the specified device certificate from another AWS account.

```
aws iot reject-certificate-transfer \
    --certificate-id
 f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78addd5e605d630e05c7fc8
```

This command produces no output.

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see RejectCertificateTransfer in *AWS CLI Command Reference*.

### `remove-thing-from-billing-group`

The following code example shows how to use `remove-thing-from-billing-group`.

**AWS CLI**

**To remove a thing from a billing group**

The following `remove-thing-from-billing-group` example removes the specified thing from a billing group.

```
aws iot remove-thing-from-billing-group \
    --billing-group-name GroupOne \
    --thing-name MyOtherLightBulb
```

This command produces no output.

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see RemoveThingFromBillingGroup in *AWS CLI Command Reference*.

### `remove-thing-from-thing-group`

The following code example shows how to use `remove-thing-from-thing-group`.

**AWS CLI**

**To remove a thing from a thing group**

The following `remove-thing-from-thing-group` example removes the specified thing from a thing group.

```
aws iot remove-thing-from-thing-group \
    --thing-name bulb7 \
    --thing-group-name DeadBulbs
```

This command produces no output.

For more information, see Thing Groups <https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html > in the *AWS IoT Developer Guide*.

- For API details, see RemoveThingFromThingGroup in *AWS CLI Command Reference*.

### `replace-topic-rule`

The following code example shows how to use `replace-topic-rule`.

**AWS CLI**

**To update a topic's rule definition**

The following `replace-topic-rule` example updates the specified rule to send an SNS alert when soil moisture level readings are too low.

```
aws iot replace-topic-rule \
    --rule-name MyRPiLowMoistureAlertRule \
    --topic-rule-payload "{\"sql\": \"SELECT * FROM '$aws/things/MyRPi/shadow/
update/accepted' WHERE state.reported.moisture = 'low'\", \"description\": \"Sends
 an alert when soil moisture level readings are too low.\",\"actions\": [{\"sns
\":{\"targetArn\":\"arn:aws:sns:us-west-2:123456789012:MyRPiLowMoistureTopic\",
\"roleArn\":\"arn:aws:iam::123456789012:role/service-role/MyRPiLowMoistureTopicRole
\",\"messageFormat\": \"RAW\"}}],\"ruleDisabled\": false,\"awsIotSqlVersion\":
\"2016-03-23\"}"
```

This command produces no output.

For more information, see Creating an AWS IoT Rule in the *AWS IoT Developer Guide*.

- For API details, see ReplaceTopicRule in *AWS CLI Command Reference*.

### `search-index`

The following code example shows how to use `search-index`.

## AWS CLI

### To query the thing index

The following `search-index` example queries the `AWS_Things` index for things that have a type of `LightBulb`.

```
aws iot search-index \
    --index-name "AWS_Things" \
    --query-string "thingTypeName:LightBulb"
```

Output:

```
{
    "things": [
        {
            "thingName": "MyLightBulb",
            "thingId": "40da2e73-c6af-406e-b415-15acae538797",
            "thingTypeName": "LightBulb",
            "thingGroupNames": [
                "LightBulbs",
                "DeadBulbs"
            ],
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        },
        {
            "thingName": "ThirdBulb",
            "thingId": "615c8455-33d5-40e8-95fd-3ee8b24490af",
            "thingTypeName": "LightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        },
```

```
        {
            "thingName": "MyOtherLightBulb",
            "thingId": "6dae0d3f-40c1-476a-80c4-1ed24ba6aa11",
            "thingTypeName": "LightBulb",
            "attributes": {
                "model": "123",
                "wattage": "75"
            },
            "connectivity": {
                "connected": false
            }
        }
    ]
}
```

For more information, see Managing Thing Indexing in the *AWS IoT Developer Guide*.

- For API details, see SearchIndex in *AWS CLI Command Reference*.

### `set-default-authorizer`

The following code example shows how to use `set-default-authorizer`.

#### AWS CLI

**To set a default authorizer**

The following `set-default-authorizer` example sets the custom authorizer named `CustomAuthorizer` as the default authorizer.

```
aws iot set-default-authorizer \
    --authorizer-name CustomAuthorizer
```

Output:

```
{
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
}
```

For more information, see CreateDefaultAuthorizer in the *AWS IoT API Reference*.

- For API details, see SetDefaultAuthorizer in *AWS CLI Command Reference*.

### `set-default-policy-version`

The following code example shows how to use `set-default-policy-version`.

**AWS CLI**

**To set the default version for a policy**

The following `set-default-policy-version` example sets the default version to 2 for the policy named `UpdateDeviceCertPolicy`.

```
aws iot set-default-policy-version \
    --policy-name UpdateDeviceCertPolicy \
    --policy-version-id 2
```

This command produces no output.

- For API details, see SetDefaultPolicyVersion in *AWS CLI Command Reference*.

### `set-v2-logging-level`

The following code example shows how to use `set-v2-logging-level`.

**AWS CLI**

**To set the logging level for a thing group**

The following `set-v2-logging-level` example sets the logging level to log warnings for the specified thing group.

```
aws iot set-v2-logging-level \
    --log-target "{\"targetType\":\"THING_GROUP\",\"targetName\":\"LightBulbs\"}" \
    --log-level WARN
```

This command produces no output.

- For API details, see SetV2LoggingLevel in *AWS CLI Command Reference*.

### `set-v2-logging-options`

The following code example shows how to use `set-v2-logging-options`.

**AWS CLI**

**To set the logging options**

The following `set-v2-logging-options` example sets the default logging verbosity level to ERROR and specifies the ARN to use for logging.

```
aws iot set-v2-logging-options \
    --default-log-level ERROR \
    --role-arn "arn:aws:iam::094249569039:role/service-role/iotLoggingRole"
```

This command produces no output.

- For API details, see SetV2LoggingOptions in *AWS CLI Command Reference*.

### `start-audit-mitigation-actions-task`

The following code example shows how to use `start-audit-mitigation-actions-task`.

**AWS CLI**

**To apply a mitigation action to the findings from an audit**

The following `start-audit-mitigation-actions-task` example applies the `ResetPolicyVersionAction` action (which clears the policy) to the specified single finding.

```
aws iot start-audit-mitigation-actions-task \
    --task-id "myActionsTaskId" \
    --target "findingIds=[\"0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464\"]" \
    --audit-check-to-actions-mapping
 "IOT_POLICY_OVERLY_PERMISSIVE_CHECK=[\"ResetPolicyVersionAction\"]" \
    --client-request-token "adhadhahda"
```

Output:

```
{
    "taskId": "myActionsTaskId"
```

```
}
```

For more information, see StartAuditMitigationActionsTask (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see StartAuditMitigationActionsTask in *AWS CLI Command Reference*.

### `start-on-demand-audit-task`

The following code example shows how to use `start-on-demand-audit-task`.

#### AWS CLI

**To start an audit right away**

The following `start-on-demand-audit-task` example starts an AWS IoT Device Defender audit and performs three certificate checks.

```
aws iot start-on-demand-audit-task \
    --target-check-names CA_CERTIFICATE_EXPIRING_CHECK
 DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK
```

Output:

```
{
    "taskId": "a3aea009955e501a31b764abe1bebd3d"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see StartOnDemandAuditTask in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To specify a tag key and value for a resource**

The following `tag-resource` example applies the tag with a key `Assembly` and the value `Fact1NW` to the thing group `LightBulbs`.

```
aws iot tag-resource \
    --tags Key=Assembly,Value="Fact1NW" \
    --resource-arn "arn:aws:iot:us-west-2:094249569039:thinggroup/LightBulbs"
```

This command produces no output.

For more information, see Tagging Your AWS IoT Resources in the *AWS IoT Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `test-authorization`

The following code example shows how to use `test-authorization`.

#### AWS CLI

**To test your AWS IoT policies**

The following `test-authorization` example tests the AWS IoT policies associated with the specified principal.

```
aws iot test-authorization \
    --auth-infos actionType=CONNECT,resources=arn:aws:iot:us-
east-1:123456789012:client/client1 \
    --principal arn:aws:iot:us-west-2:123456789012:cert/
aab1068f7f43ac3e3cae4b3a8aa3f308d2a750e6350507962e32c1eb465d9775
```

Output:

```
{
    "authResults": [
        {
            "authInfo": {
                "actionType": "CONNECT",
                "resources": [
                    "arn:aws:iot:us-east-1:123456789012:client/client1"
                ]
            },
            "allowed": {
                "policies": [
                    {
                        "policyName": "TestPolicyAllowed",
```

```
                        "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyAllowed"
                    }
                ]
            },
            "denied": {
                "implicitDeny": {
                    "policies": [
                        {
                            "policyName": "TestPolicyDenied",
                            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyDenied"
                        }
                    ]
                },
                "explicitDeny": {
                    "policies": [
                        {
                            "policyName": "TestPolicyExplicitDenied",
                            "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyExplicitDenied"
                        }
                    ]
                }
            },
            "authDecision": "IMPLICIT_DENY",
            "missingContextValues": []
        }
    ]
}
```

For more information, see TestAuthorization in the *AWS IoT API Reference*.

- For API details, see TestAuthorization in *AWS CLI Command Reference*.

## `test-invoke-authorizer`

The following code example shows how to use `test-invoke-authorizer`.

### AWS CLI

#### To test your custom authorizer

The following `test-invoke-authorizer` example testS your custom authorizer.

```
aws iot test-invoke-authorizer \
    --authorizer-name IoTAuthorizer \
    --token allow \
    --token-signature "mE0GvaHqy9nER/
FdgtJX5lXYEJ3b3vE7t1gEszc0TKGgLKWXTnPkb2AbKnOAZ8lGyoN5dVtWDWVmr25m7+
+zjbYIMk2TBvyGXhOmvKFBPkdgyA43KL6SiZy0cTqlPMcQDsP7VX2rXr7CTowCxSNKphGXdQe0/
I5dQ+JO6KUaHwCmupt0/MejKtaNwiia064j6wprOAUwG5S1IYFuRd0X
+wfo8pb0DubAIX1Ua705kuhRUcTx4SxUShEYKmN4IDEvLB6FsIr0B2wvB7y4iPmcajxzGl02ExvyCUNctCV9dYlRRGJj
```

Output:

```
{
    "isAuthenticated": true,
    "principalId": "principalId",
    "policyDocuments": [
        "{"Version":"2012-10-17","Statement":
[{"Action":"iot:Publish","Effect":"Allow","Resource":"arn:aws:iot:us-
west-2:123456789012:topic/customauthtesting"}]}"
    ],
    "refreshAfterInSeconds": 600,
    "disconnectAfterInSeconds": 3600
}
```

For more information, see TestInvokeAuthorizer in the *AWS IoT API Reference*.

- For API details, see TestInvokeAuthorizer in *AWS CLI Command Reference*.

### `transfer-certificate`

The following code example shows how to use `transfer-certificate`.

#### AWS CLI

**To transfer a device certificate to a different AWS account**

The following `transfer-certificate` example transfers a device certificate to another AWS account. The certificate and AWS account are identified by ID.

```
aws iot transfer-certificate \
    --certificate-id
 488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142 \
    --target-aws-account 030714055129
```

Output:

```
{
    "transferredCertificateArn": "arn:aws:iot:us-
west-2:030714055129:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142"
}
```

For more information, see Transfer a certificate to another account in the *AWS IoT Core Developer Guide*.

- For API details, see TransferCertificate in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag key from a resource**

The following `untag-resource` example removes the tag `MyTag` and its value from the thing group `LightBulbs`.

```
command
```

This command produces no output.

For more information, see Tagging Your AWS IoT Resources in the *AWS IoT Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-account-audit-configuration`

The following code example shows how to use `update-account-audit-configuration`.

**AWS CLI**

**Example 1: To enable Amazon SNS notifications for audit notifications**

The following `update-account-audit-configuration` example enables Amazon SNS notifications for AWS IoT Device Defender audit notifications, specifying a target and the role used to write to that target.

```
aws iot update-account-audit-configuration \
    --audit-notification-target-configurations "SNS={targetArn=\"arn:aws:sns:us-
west-2:123456789012:ddaudits\",roleArn=\"arn:aws:iam::123456789012:role/service-
role/AWSIoTDeviceDefenderAudit\",enabled=true}"
```

This command produces no output.

**Example 2: To enable an audit check**

The following `update-account-audit-configuration` example enables the AWS IoT Device Defender audit check named `AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK`. You cannot disable an audit check if it is part of the `targetCheckNames` for one or more scheduled audits for the AWS account.

```
aws iot update-account-audit-configuration \
    --audit-check-configurations
 "{\"AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK\":{\"enabled\":true}}"
```

This command produces no output.

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see UpdateAccountAuditConfiguration in *AWS CLI Command Reference*.

## `update-audit-suppression`

The following code example shows how to use `update-audit-suppression`.

### AWS CLI

**To update an audit finding suppression**

The following `update-audit-suppression` example updates an audit finding suppression's expiration date to 2020-09-21.

```
aws iot update-audit-suppression \
    --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \
    --resource-identifier deviceCertificateId=c7691e<shortened> \
    --no-suppress-indefinitely \
    --expiration-date 2020-09-21
```

This command produces no output.

For more information, see Audit finding suppressions in the *AWS IoT Developers Guide*.

- For API details, see UpdateAuditSuppression in *AWS CLI Command Reference*.

### `update-authorizer`

The following code example shows how to use `update-authorizer`.

**AWS CLI**

**To update a custom authorizer**

The following `update-authorizer` example he state of `CustomAuthorizer2` to `INACTIVE`.

```
aws iot update-authorizer \
    --authorizer-name CustomAuthorizer2 \
    --status INACTIVE
```

Output:

```
{
    "authorizerName": "CustomAuthorizer2",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
}
```

For more information, see UpdateAuthorizer in the *AWS IoT API Reference*.

- For API details, see UpdateAuthorizer in *AWS CLI Command Reference*.

### `update-billing-group`

The following code example shows how to use `update-billing-group`.

**AWS CLI**

**To update information about a billing group**

The following `update-billing-group` example updates the description for the specified billing group.

```
aws iot update-billing-group \
    --billing-group-name GroupOne \
    --billing-group-properties "billingGroupDescription=\"Primary bulb billing group
\""
```

Output:

```
{
    "version": 2
}
```

For more information, see Billing Groups in the *AWS IoT Developers Guide*.

- For API details, see UpdateBillingGroup in *AWS CLI Command Reference*.

### `update-ca-certificate`

The following code example shows how to use `update-ca-certificate`.

**AWS CLI**

**To update a certificate authority (CA) certificate**

The following `update-ca-certificate` example sets the specified CA certificate to ACTIVE status.

```
aws iot update-ca-certificate \
    --certificate-id
 f4efed62c0142f16af278166f61962501165c4f05362952074264600 58cd1467 \
    --new-status ACTIVE
```

This command produces no output.

For more information, see UpdateCACertificate in the *AWS IoT API Reference*.

- For API details, see UpdateCaCertificate in *AWS CLI Command Reference*.

### `update-certificate`

The following code example shows how to use `update-certificate`.

**AWS CLI**

**To update a device certificate**

The following `update-certificate` example sets the specified device certificate to INACTIVE status.

```
aws iot update-certificate \
    --certificate-id
 d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be \
    --new-status INACTIVE
```

This command produces no output.

For more information, see UpdateCertificate in the *AWS IoT API Reference*.

- For API details, see UpdateCertificate in *AWS CLI Command Reference*.

### `update-custom-metric`

The following code example shows how to use `update-custom-metric`.

**AWS CLI**

**To update a custom metric**

The following `update-custom-metric` example updates a custom metric to have a new `display-name`.

```
aws iot update-custom-metric \
    --metric-name batteryPercentage \
    --display-name 'remaining battery percentage on device' \
    --region us-east-1
```

Output:

```
{
    "metricName": "batteryPercentage",
    "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/
batteryPercentage",
    "metricType": "number",
```

```
    "displayName": "remaining battery percentage on device",
    "creationDate": "2020-11-17T23:01:35.110000-08:00",
    "lastModifiedDate": "2020-11-17T23:02:12.879000-08:00"
}
```

For more information, see Custom metrics in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateCustomMetric in *AWS CLI Command Reference*.

### `update-dimension`

The following code example shows how to use `update-dimension`.

**AWS CLI**

**To update a dimension**

The following `update-dimension` example updates a dimension.

```
aws iot update-dimension \
    --name TopicFilterForAuthMessages \
    --string-values device/${iot:ClientId}/auth
```

Output:

```
{
    "name": "TopicFilterForAuthMessages",
    "lastModifiedDate": 1585866222.317,
    "stringValues": [
        "device/${iot:ClientId}/auth"
    ],
    "creationDate": 1585854500.474,
    "type": "TOPIC_FILTER",
    "arn": "arn:aws:iot:us-west-2:1234564789012:dimension/
TopicFilterForAuthMessages"
}
```

For more information, see Scoping metrics in security profiles using dimensions in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateDimension in *AWS CLI Command Reference*.

### update-domain-configuration

The following code example shows how to use update-domain-configuration.

#### AWS CLI

##### To update a domain configuration

The following update-domain-configuration example disables the specified domain configuration.

```
aws iot update-domain-configuration \
    --domain-configuration-name "additionalDataDomain" \
    --domain-configuration-status "DISABLED"
```

Output:

```
{
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"
}
```

For more information, see Configurable Endpoints in the *AWS IoT Developer Guide*.

- For API details, see UpdateDomainConfiguration in *AWS CLI Command Reference*.

### update-dynamic-thing-group

The following code example shows how to use update-dynamic-thing-group.

#### AWS CLI

##### To update a dynamic thing group

The following update-dynamic-thing-group example updates the specified dynamic thing group. It provides a description and updates the query string to change the group membership criteria.

```
aws iot update-dynamic-thing-group \
    --thing-group-name "RoomTooWarm"
```

```
    --thing-group-properties "thingGroupDescription=\"This thing group contains
 rooms warmer than 65F.\"" \
    --query-string "attributes.temperature>65"
```

Output:

```
{
    "version": 2
}
```

For more information, see Dynamic Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see UpdateDynamicThingGroup in *AWS CLI Command Reference*.

### `update-event-configurations`

The following code example shows how to use `update-event-configurations`.

**AWS CLI**

**To show which event types are published**

The following `update-event-configurations` example updates the configuration to enable messages when the CA certificate is added, updated, or deleted.

```
aws iot update-event-configurations \
    --event-configurations "{\"CA_CERTIFICATE\":{\"Enabled\":true}}"
```

This command produces no output.

For more information, see Event Messages in the *AWS IoT Developer Guide*.

- For API details, see UpdateEventConfigurations in *AWS CLI Command Reference*.

### `update-indexing-configuration`

The following code example shows how to use `update-indexing-configuration`.

**AWS CLI**

**To enable thing indexing**

The following `update-indexing-configuration` example enables thing indexing to support searching registry data, shadow data, and thing connectivity status using the AWS_Things index.

```
aws iot update-indexing-configuration
    --thing-indexing-configuration
 thingIndexingMode=REGISTRY_AND_SHADOW,thingConnectivityIndexingMode=STATUS
```

This command produces no output.

For more information, see Managing Thing Indexing in the *AWS IoT Developers Guide*.

- For API details, see UpdateIndexingConfiguration in *AWS CLI Command Reference*.

### `update-job`

The following code example shows how to use `update-job`.

#### AWS CLI

**To get detailed status for a job**

The following `update-job` example gets detailed status for the job whose ID is `example-job-01`.

```
aws iot describe-job \
    --job-id "example-job-01"
```

Output:

```
{
    "job": {
        "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
        "jobId": "example-job-01",
        "targetSelection": "SNAPSHOT",
        "status": "IN_PROGRESS",
        "targets": [
            "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi"
        ],
        "description": "example job test",
        "presignedUrlConfig": {},
```

```
        "jobExecutionsRolloutConfig": {},
        "createdAt": 1560787022.733,
        "lastUpdatedAt": 1560787026.294,
        "jobProcessDetails": {
            "numberOfCanceledThings": 0,
            "numberOfSucceededThings": 0,
            "numberOfFailedThings": 0,
            "numberOfRejectedThings": 0,
            "numberOfQueuedThings": 1,
            "numberOfInProgressThings": 0,
            "numberOfRemovedThings": 0,
            "numberOfTimedOutThings": 0
        },
        "timeoutConfig": {}
    }
}
```

For more information, see Creating and Managing Jobs (CLI) in the *AWS IoT Developer Guide*.

- For API details, see UpdateJob in *AWS CLI Command Reference*.

### `update-mitigation-action`

The following code example shows how to use `update-mitigation-action`.

#### AWS CLI

**To update a mitigation action**

The following `update-mitigation-action` example updates the specified mitigation action named `AddThingsToQuarantineGroupAction`, changes the thing group name, and sets `overrideDynamicGroups` to `false`. You can verify your changes by using the `describe-mitigation-action` command.

```
aws iot update-mitigation-action \
    --cli-input-json "{ \"actionName\": \"AddThingsToQuarantineGroupAction\",
 \"actionParams\": { \"addThingsToThingGroupParams\": {\"thingGroupNames\":
[\"QuarantineGroup2\"],\"overrideDynamicGroups\": false}}}"
```

Output:

```
{
```

```
    "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
    "actionId": "2fd2726d-98e1-4abf-b10f-09465ccd6bfa"
}
```

For more information, see UpdateMitigationAction (Mitigation Action Commands) in the *AWS IoT Developer Guide*.

- For API details, see UpdateMitigationAction in *AWS CLI Command Reference*.

### `update-provisioning-template`

The following code example shows how to use `update-provisioning-template`.

**AWS CLI**

**To update a provisioning template**

The following `update-provisioning-template` example modifies the description and role arn for the specified provisioning template and enables the template.

```
aws iot update-provisioning-template \
    --template-name widget-template \
    --enabled \
    --description "An updated provisioning template for widgets" \
    --provisioning-role-arn arn:aws:iam::504350838278:role/Provision_role
```

This command produces no output.

For more information, see AWS IoT Secure Tunneling in the *AWS IoT Core Developer Guide*.

- For API details, see UpdateProvisioningTemplate in *AWS CLI Command Reference*.

### `update-role-alias`

The following code example shows how to use `update-role-alias`.

**AWS CLI**

**To update a role alias**

The following `update-role-alias` example updates the `LightBulbRole` role alias.

```
aws iot update-role-alias \
    --role-alias LightBulbRole \
    --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:

```
{
    "roleAlias": "LightBulbRole",
    "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}
```

For more information, see UpdateRoleAlias in the *AWS IoT API Reference*.

- For API details, see UpdateRoleAlias in *AWS CLI Command Reference*.

### `update-scheduled-audit`

The following code example shows how to use `update-scheduled-audit`.

#### AWS CLI

**To update a scheduled audit definition**

The following `update-scheduled-audit` example changes the target check names for an AWS IoT Device Defender scheduled audit.

```
aws iot update-scheduled-audit \
    --scheduled-audit-name WednesdayCertCheck \
    --target-check-names CA_CERTIFICATE_EXPIRING_CHECK
 DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK
```

Output:

```
{
    "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
WednesdayCertCheck"
}
```

For more information, see Audit Commands in the *AWS IoT Developer Guide*.

- For API details, see UpdateScheduledAudit in *AWS CLI Command Reference*.

### `update-security-profile`

The following code example shows how to use `update-security-profile`.

**AWS CLI**

**To change a security profile**

The following `update-security-profile` example updates both the description and the behaviors for an AWS IoT Device Defender security profile.

```
aws iot update-security-profile \
    --security-profile-name PossibleIssue \
    --security-profile-description "Check to see if authorization fails 12 times in
 5 minutes or if cellular bandwidth exceeds 128"  \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"less-than\",\"value\":{\"count\":12},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}}]"
```

Output:

```
{
    "securityProfileName": "PossibleIssue",
    "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
PossibleIssue",
    "securityProfileDescription": "check to see if authorization fails 12 times in 5
 minutes or if cellular bandwidth exceeds 128",
    "behaviors": [
        {
            "name": "CellularBandwidth",
            "metric": "aws:message-byte-size",
            "criteria": {
                "comparisonOperator": "greater-than",
                "value": {
                    "count": 128
                },
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        },
```

```
        {
            "name": "Authorization",
            "metric": "aws:num-authorization-failures",
            "criteria": {
                "comparisonOperator": "less-than",
                "value": {
                    "count": 12
                },
                "durationSeconds": 300,
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        }
    ],
    "version": 2,
    "creationDate": 1560278102.528,
    "lastModifiedDate": 1560352711.207
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see UpdateSecurityProfile in *AWS CLI Command Reference*.

### `update-stream`

The following code example shows how to use `update-stream`.

#### AWS CLI

##### To update a stream

The following `update-stream` example updates an existing stream. The stream version is incremented by one.

```
aws iot update-stream \
    --cli-input-json file://update-stream.json
```

Contents of `update-stream.json`:

```
{
    "streamId": "stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "files": [
```

```
        {
            "fileId": 123,
            "s3Location": {
                "bucket":"codesign-ota-bucket",
                "key":"48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
            }
        }
    ]
    "roleArn": "arn:aws:iam:us-west-2:123456789012:role/service-role/
my_ota_stream_role"
}
```

Output:

```
{
    "streamId": "stream12345",
    "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
    "streamVersion": 2
}
```

For more information, see UpdateStream in the *AWS IoT API Reference*.

- For API details, see UpdateStream in *AWS CLI Command Reference*.

### `update-thing-group`

The following code example shows how to use `update-thing-group`.

#### AWS CLI

**To update the definition for a thing group**

The following `update-thing-group` example updates the definition for the specified thing group, changing the description and two attributes.

```
aws iot update-thing-group \
    --thing-group-name HalogenBulbs \
    --thing-group-properties "thingGroupDescription=\"Halogen bulb group\",
 attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```
{
    "version": 2
}
```

For more information, see Thing Groups in the *AWS IoT Developers Guide*.

- For API details, see UpdateThingGroup in *AWS CLI Command Reference*.

### `update-thing-groups-for-thing`

The following code example shows how to use `update-thing-groups-for-thing`.

#### AWS CLI

**To change the groups to which a thing belongs**

The following `update-thing-groups-for-thing` example removes the thing named `MyLightBulb` from the group named `DeadBulbs` and adds it to the group named `replaceableItems` at the same time.

```
aws iot update-thing-groups-for-thing \
    --thing-name MyLightBulb \
    --thing-groups-to-add "replaceableItems" \
    --thing-groups-to-remove "DeadBulbs"
```

This command produces no output.

For more information, see Thing Groups in the *AWS IoT Developer Guide*.

- For API details, see UpdateThingGroupsForThing in *AWS CLI Command Reference*.

### `update-thing`

The following code example shows how to use `update-thing`.

#### AWS CLI

**To associate a thing with a thing type**

The following `update-thing` example associates a thing in the AWS IoT registry with a thing type. When you make the association, you provide values for the attributes defined by the thing type.

```
aws iot update-thing \
    --thing-name "MyOtherLightBulb" \
    --thing-type-name "LightBulb" \
    --attribute-payload "{"attributes": {"wattage":"75", "model":"123"}}"
```

This command does not produce output. Use the `describe-thing` command to see the result.

For more information, see Thing Types in the *AWS IoT Developers Guide*.

- For API details, see UpdateThing in *AWS CLI Command Reference*.

### `update-topic-rule-destination`

The following code example shows how to use `update-topic-rule-destination`.

#### AWS CLI

**Example 1: To enable a topic rule destination**

The following `update-topic-rule-destination` example enables traffic to a topic rule destination.

```
aws iot update-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
    --status ENABLED
```

This command produces no output.

For more information, see Enabling a topic rule destination in the *AWS IoT Developer Guide*.

**Example 2: To disable a topic rule destination**

The following `update-topic-rule-destination` example disables traffic to a topic rule destination.

```
aws iot update-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
    --status DISABLED
```

This command produces no output.

For more information, see Disabling a topic rule destination in the *AWS IoT Developer Guide*.

**Example 3: To send a new confirmation message**

The following `update-topic-rule-destination` example sends a new confirmation message for a topic rule destination.

```
aws iot update-topic-rule-destination \
    --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
    --status IN_PROGRESS
```

This command produces no output.

For more information, see Sending a new confirmation message in the *AWS IoT Developer Guide*.

- For API details, see UpdateTopicRuleDestination in *AWS CLI Command Reference*.

## `validate-security-profile-behaviors`

The following code example shows how to use `validate-security-profile-behaviors`.

**AWS CLI**

**Example 1: To validate the behaviors parameters for a security profile**

The following `validate-security-profile-behaviors` example validates a well-formed and correct set of behaviors for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":12},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}}]"
```

Output:

```
{
    "valid": true,
```

```
    "validationErrors": []
}
```

**Example 2: To validate incorrect behaviors parameters for a security profile**

The following `validate-security-profile-behaviors` example validates a set of behaviors that contains an error for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors \
    --behaviors "[{\"name\":\"CellularBandwidth\",\"metric\":\"aws:message-byte-size
\",\"criteria\":{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":128},
\"consecutiveDatapointsToAlarm\":1,\"consecutiveDatapointsToClear\":1}},{\"name
\":\"Authorization\",\"metric\":\"aws:num-authorization-failures\",\"criteria\":
{\"comparisonOperator\":\"greater-than\",\"value\":{\"count\":12},\"durationSeconds
\":300,\"consecutiveDatapointsToAlarm\":100000,\"consecutiveDatapointsToClear
\":1}}]"
```

Output:

```
{
    "valid": false,
    "validationErrors": [
        {
            "errorMessage": "Behavior Authorization is malformed.
 consecutiveDatapointsToAlarm 100000 should be in range[1,10]"
        }
    ]
}
```

For more information, see Detect Commands in the *AWS IoT Developer Guide*.

- For API details, see ValidateSecurityProfileBehaviors in *AWS CLI Command Reference*.

## AWS IoT 1-Click Devices examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT 1-Click Devices.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `claim-devices-by-claim-code`

The following code example shows how to use `claim-devices-by-claim-code`.

**AWS CLI**

**To claim one or more AWS IoT 1-Click devices using a claim code**

The following `claim-devices-by-claim-code` example claims the specified AWS IoT 1-Click device using a claim code (instead of a device ID).

```
aws iot1click-devices claim-devices-by-claim-code \
    --claim-code C-123EXAMPLE
```

Output:

```
{
   "Total": 9
   "ClaimCode": "C-123EXAMPLE"
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see ClaimDevicesByClaimCode in *AWS CLI Command Reference*.

#### `describe-device`

The following code example shows how to use `describe-device`.

**AWS CLI**

**To describe a device**

The following `describe-device` example describes the specified device.

```
aws iot1click-devices describe-device \
    --device-id G030PM0123456789
```

Output:

```
{
    "DeviceDescription": {
        "Arn": "arn:aws:iot1click:us-west-2:012345678901:devices/G030PM0123456789",
        "Attributes": {
            "projectRegion": "us-west-2",
            "projectName": "AnytownDumpsters",
            "placementName": "customer217",
            "deviceTemplateName": "empty-dumpster-request"
        },
        "DeviceId": "G030PM0123456789",
        "Enabled": false,
        "RemainingLife": 99.9,
        "Type": "button",
        "Tags": {}
    }
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see DescribeDevice in *AWS CLI Command Reference*.

## `finalize-device-claim`

The following code example shows how to use `finalize-device-claim`.

**AWS CLI**

**To finalize a claim request for an AWS IoT 1-Click device using a device ID**

The following `finalize-device-claim` example finalizes a claim request for the specified AWS IoT 1-Click device using a device ID (instead of a claim code).

```
aws iot1click-devices finalize-device-claim \
    --device-id G030PM0123456789
```

Output:

```
{
    "State": "CLAIMED"
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see FinalizeDeviceClaim in *AWS CLI Command Reference*.

### `get-device-methods`

The following code example shows how to use `get-device-methods`.

#### AWS CLI

**To list the available methods for a device**

The following `get-device-methods` example lists the available methods for a device.

```
aws iot1click-devices get-device-methods \
    --device-id G030PM0123456789
```

Output:

```
{
    "DeviceMethods": [
        {
            "MethodName": "getDeviceHealthParameters"
        },
        {
            "MethodName": "setDeviceHealthMonitorCallback"
        },
        {
            "MethodName": "getDeviceHealthMonitorCallback"
        },
        {
```

```
            "MethodName": "setOnClickCallback"
        },
        {
            "MethodName": "getOnClickCallback"
        }
    ]
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see GetDeviceMethods in *AWS CLI Command Reference*.

### `initiate-device-claim`

The following code example shows how to use `initiate-device-claim`.

#### AWS CLI

**To initiate a claim request for an AWS IoT 1-Click device using a device ID**

The following `initiate-device-claim` example initiates a claim request for the specified AWS IoT 1-Click device using a device ID (instead of a claim code).

```
aws iot1click-devices initiate-device-claim \
    --device-id G030PM0123456789
```

Output:

```
{
    "State": "CLAIM_INITIATED"
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see InitiateDeviceClaim in *AWS CLI Command Reference*.

### `invoke-device-method`

The following code example shows how to use `invoke-device-method`.

**AWS CLI**

**To invoke a device method on a device**

The following `invoke-device-method` example invokes the specified method on a device.

```
aws iot1click-devices invoke-device-method \
    --cli-input-json file://invoke-device-method.json
```

Contents of `invoke-device-method.json`:

```
{
    "DeviceId": "G030PM0123456789",
    "DeviceMethod": {
        "DeviceType": "device",
        "MethodName": "getDeviceHealthParameters"
    }
}
```

Output:

```
{
    "DeviceMethodResponse": "{\"remainingLife\": 99.8}"
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see InvokeDeviceMethod in *AWS CLI Command Reference*.

## `list-device-events`

The following code example shows how to use `list-device-events`.

**AWS CLI**

**To list a device's events for a specified time range**

The following `list-device-events` example lists the specified device's events for the specified time range.

```
aws iot1click-devices list-device-events \
    --device-id G030PM0123456789 \
    --from-time-stamp 2019-07-17T15:45:12.880Z --to-time-stamp
 2019-07-19T15:45:12.880Z
```

Output:

```
{
    "Events": [
        {
            "Device": {
                "Attributes": {},
                "DeviceId": "G030PM0123456789",
                "Type": "button"
            },
            "StdEvent": "{\"clickType\": \"SINGLE\",
 \"reportedTime\": \"2019-07-18T23:47:55.015Z\", \"certificateId\":
 \"fe8798a6c97c62ef8756b80eeefdcf2280f3352f82faa8080c74cc4f4a4d1811\",
 \"remainingLife\": 99.85000000000001, \"testMode\": false}"
        },
        {
            "Device": {
                "Attributes": {},
                "DeviceId": "G030PM0123456789",
                "Type": "button"
            },
            "StdEvent": "{\"clickType\": \"DOUBLE\",
 \"reportedTime\": \"2019-07-19T00:14:41.353Z\", \"certificateId\":
 \"fe8798a6c97c62ef8756b80eeefdcf2280f3352f82faa8080c74cc4f4a4d1811\",
 \"remainingLife\": 99.8, \"testMode\": false}"
        }
    ]
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see ListDeviceEvents in *AWS CLI Command Reference*.

### `list-devices`

The following code example shows how to use `list-devices`.

**AWS CLI**

**To list the devices of a specified type**

The following `list-devices` example lists the devices of a specified type.

```
aws iot1click-devices list-devices \
    --device-type button
```

This command produces no output.

Output:

```
{
    "Devices": [
        {
            "remainingLife": 99.9,
            "attributes": {
                "arn": "arn:aws:iot1click:us-west-2:123456789012:devices/
G030PM0123456789",
                "type": "button",
                "deviceId": "G030PM0123456789",
                "enabled": false
            }
        }
    ]
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see ListDevices in *AWS CLI Command Reference*.

## `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags for a device**

The following `list-tags-for-resource` example list the tags for the specified device.

```
aws iot1click-devices list-tags-for-resource \
    --resource-arn "arn:aws:iot1click:us-west-2:012345678901:devices/
G030PM0123456789"
```

Output:

```
{
    "Tags": {
        "Driver Phone": "123-555-0199",
        "Driver": "Jorge Souza"
    }
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To add tags to a device AWS resource**

The following `tag-resource` example adds two tags to the specified resource.

```
aws iot1click-devices tag-resource \
    --cli-input-json file://devices-tag-resource.json
```

Contents of `devices-tag-resource.json`:

```
{
    "ResourceArn": "arn:aws:iot1click:us-west-2:123456789012:devices/
G030PM0123456789",
    "Tags": {
        "Driver": "Jorge Souza",
        "Driver Phone": "123-555-0199"
    }
```

```
}
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `unclaim-device`

The following code example shows how to use `unclaim-device`.

**AWS CLI**

**To unclaim (deregister) a device from your AWS account**

The following `unclaim-device` example unclaims (deregisters) the specified device from your AWS account.

```
aws iot1click-devices unclaim-device \
    --device-id G030PM0123456789
```

Output:

```
{
    "State": "UNCLAIMED"
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see UnclaimDevice in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a device AWS resource**

The following `untag-resource` example removes the tags with the names `Driver Phone` and `Driver` from the specified device resource.

```
aws iot1click-devices untag-resource \
    --resource-arn "arn:aws:iot1click:us-west-2:123456789012:projects/
AnytownDumpsters" \
    --tag-keys "Driver Phone" "Driver"
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-device-state`

The following code example shows how to use `update-device-state`.

**AWS CLI**

**To update the ``enabled`` state for a device**

The following `update-device-state` sets the state of the specified device to `enabled`.

```
aws iot1click-devices update-device-state \
    --device-id G030PM0123456789 \
    --enabled
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see UpdateDeviceState in *AWS CLI Command Reference*.

## AWS IoT 1-Click Projects examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT 1-Click Projects.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `associate-device-with-placement`

The following code example shows how to use `associate-device-with-placement`.

**AWS CLI**

**To associate an AWS IoT 1-Click device with an existing placement**

The following `associate-device-with-placement` example associates the specified AWS IoT 1-Click device with an existing placement.

```
aws iot1click-projects associate-device-with-placement \
    --project-name AnytownDumpsters \
    --placement-name customer217 \
    --device-template-name empty-dumpster-request \
    --device-id G030PM0123456789
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see AssociateDeviceWithPlacement in *AWS CLI Command Reference*.

#### `create-placement`

The following code example shows how to use `create-placement`.

**AWS CLI**

**To create an AWS IoT 1-Click placement for a project**

The following `create-placement` example create an AWS IoT 1-Click placement for the specified project.

```
aws iot1click-projects create-placement \
    --project-name AnytownDumpsters \
    --placement-name customer217 \
    --attributes "{"location": "123 Any Street Anytown, USA 10001", "phone":
 "123-456-7890"}"
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see CreatePlacement in *AWS CLI Command Reference*.

## `create-project`

The following code example shows how to use `create-project`.

**AWS CLI**

**To create an AWS IoT 1-Click project for zero or more placements**

The following `create-project` example creates an AWS IoT 1-Click project for a placement.

aws iot1click-projects create-project --cli-input-json file://create-project.json

Contents of `create-project.json`:

```
{
     "projectName": "AnytownDumpsters",
     "description": "All dumpsters in the Anytown region.",
     "placementTemplate": {
         "defaultAttributes": {
             "City" : "Anytown"
         },
         "deviceTemplates": {
             "empty-dumpster-request" : {
```

```
                "deviceType": "button"
            }
        }
    }
}
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see CreateProject in *AWS CLI Command Reference*.

### `delete-placement`

The following code example shows how to use `delete-placement`.

#### AWS CLI

**To delete a placement from a project**

The following `delete-placement` example deletes the specified placement from a project.

```
aws iot1click-projects delete-placement \
    --project-name AnytownDumpsters \
    --placement-name customer217
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see DeletePlacement in *AWS CLI Command Reference*.

### `delete-project`

The following code example shows how to use `delete-project`.

#### AWS CLI

**To delete a project from your AWS account**

The following `delete-project` example deletes the specified project from your AWS account.

```
aws iot1click-projects delete-project \
    --project-name AnytownDumpsters
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see DeleteProject in *AWS CLI Command Reference*.

### `describe-placement`

The following code example shows how to use `describe-placement`.

#### AWS CLI

**To describe a placement for a project**

The following `describe-placement` example describes a placement for the specified project.

```
aws iot1click-projects describe-placement \
    --project-name AnytownDumpsters \
    --placement-name customer217
```

Output:

```
{
    "placement": {
        "projectName": "AnytownDumpsters",
        "placementName": "customer217",
        "attributes": {
            "phone": "123-555-0110",
            "location": "123 Any Street Anytown, USA 10001"
        },
        "createdDate": 1563488454,
        "updatedDate": 1563488454
    }
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see DescribePlacement in *AWS CLI Command Reference*.

### `describe-project`

The following code example shows how to use `describe-project`.

**AWS CLI**

**To describe an AWS IoT 1-Click project**

The following `describe-project` example describes the specified AWS IoT 1-Click project.

```
aws iot1click-projects describe-project \
    --project-name AnytownDumpsters
```

Output:

```
{
    "project": {
        "arn": "arn:aws:iot1click:us-west-2:012345678901:projects/AnytownDumpsters",
        "projectName": "AnytownDumpsters",
        "description": "All dumpsters in the Anytown region.",
        "createdDate": 1563483100,
        "updatedDate": 1563483100,
        "placementTemplate": {
            "defaultAttributes": {
                "City": "Anytown"
            },
            "deviceTemplates": {
                "empty-dumpster-request": {
                    "deviceType": "button",
                    "callbackOverrides": {}
                }
            }
        },
        "tags": {}
    }
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see DescribeProject in *AWS CLI Command Reference*.

### `disassociate-device-from-placement`

The following code example shows how to use `disassociate-device-from-placement`.

**AWS CLI**

**To disassociate a device from a placement**

The following `disassociate-device-from-placement` example disassociates the specified device from a placement.

```
aws iot1click-projects disassociate-device-from-placement \
    --project-name AnytownDumpsters \
    --placement-name customer217 \
    --device-template-name empty-dumpster-request
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see DisassociateDeviceFromPlacement in *AWS CLI Command Reference*.

### `get-devices-in-placement`

The following code example shows how to use `get-devices-in-placement`.

**AWS CLI**

**To list all devices in a placement contained in a project**

The following `get-devices-in-placement` example lists all devices in a the specified placement contained in the specified project.

```
aws iot1click-projects get-devices-in-placement \
    --project-name AnytownDumpsters \
    --placement-name customer217
```

Output:

```
{
    "devices": {
        "empty-dumpster-request": "G030PM0123456789"
    }
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see GetDevicesInPlacement in *AWS CLI Command Reference*.

### `list-placements`

The following code example shows how to use `list-placements`.

#### AWS CLI

**To list all AWS IoT 1-Click placements for a project**

The following `list-placements` example lists all AWS IoT 1-Click placements for the specified project.

```
aws iot1click-projects list-placements \
    --project-name AnytownDumpsters
```

Output:

```
{
    "placements": [
        {
            "projectName": "AnytownDumpsters",
            "placementName": "customer217",
            "createdDate": 1563488454,
            "updatedDate": 1563488454
        }
    ]
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see ListPlacements in *AWS CLI Command Reference*.

### `list-projects`

The following code example shows how to use `list-projects`.

**AWS CLI**

**To list all AWS IoT 1-Click projects**

The following `list-projects` example list all AWS IoT 1-Click projects in your account.

```
aws iot1click-projects list-projects
```

Output:

```
{
    "projects": [
        {
            "arn": "arn:aws:iot1click:us-west-2:012345678901:projects/
AnytownDumpsters",
            "projectName": "AnytownDumpsters",
            "createdDate": 1563483100,
            "updatedDate": 1563483100,
            "tags": {}
        }
    ]
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see ListProjects in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags for a project resource**

The following `list-tags-for-resource` example list the tags for the specified project resource.

```
aws iot1click-projects list-tags-for-resource \
    --resource-arn "arn:aws:iot1click:us-west-2:123456789012:projects/
AnytownDumpsters"
```

Output:

```
{
    "tags": {
        "Manager": "Li Juan",
        "Account": "45215"
    }
}
```

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To add tags to a project resource**

The following `tag-resource` example adds two tags to the specified project resource.

```
aws iot1click-projects tag-resource \
    --cli-input-json file://devices-tag-resource.json
```

Contents of `devices-tag-resource.json`:

```
{
    "resourceArn": "arn:aws:iot1click:us-west-2:123456789012:projects/
AnytownDumpsters",
    "tags": {
        "Account": "45215",
        "Manager": "Li Juan"
    }
}
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a project resource**

The following `untag-resource` example removes the tag with the key name `Manager` from the specified project.

```
aws iot1click-projects untag-resource \
    --resource-arn "arn:aws:iot1click:us-west-2:123456789012:projects/
AnytownDumpsters" \
    --tag-keys "Manager"
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-placement`

The following code example shows how to use `update-placement`.

**AWS CLI**

**To update the "attributes" key-value pairs of a placement**

The following `update-placement` example update the "attributes" key-value pairs of a placement.

```
aws iot1click-projects update-placement \
```

```
    --cli-input-json file://update-placement.json
```

Contents of `update-placement.json`:

```
{
    "projectName": "AnytownDumpsters",
    "placementName": "customer217",
    "attributes": {
        "phone": "123-456-7890",
        "location": "123 Any Street Anytown, USA 10001"
    }
}
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see UpdatePlacement in *AWS CLI Command Reference*.

### `update-project`

The following code example shows how to use `update-project`.

#### AWS CLI

**To update settings for a project**

The following `update-project` example updates the description for a project.

```
aws iot1click-projects update-project \
    --project-name AnytownDumpsters \
    --description "All dumpsters (yard waste, recycling, garbage) in the Anytown
 region."
```

This command produces no output.

For more information, see Using AWS IoT 1-Click with the AWS CLI in the *AWS IoT 1-Click Developer Guide*.

- For API details, see UpdateProject in *AWS CLI Command Reference*.

# AWS IoT Analytics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Analytics.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

## Topics

## Actions

### `batch-put-message`

The following code example shows how to use `batch-put-message`.

#### AWS CLI

**To send a message to a channel**

The following `batch-put-message` example sends a message to the specified channel.

```
aws iotanalytics batch-put-message \
    --cli-binary-format raw-in-base64-out \
    --cli-input-json file://batch-put-message.json
```

Contents of `batch-put-message.json`:

```
{
    "channelName": "mychannel",
    "messages": [
        {
            "messageId": "0001",
            "payload": "eyAidGVtcGVyYXR1cmUiOiAyMCB9"
```

```
        }
    ]
}
```

Output:

```
{
    "batchPutMessageErrorEntries": []
}
```

For more information, see BatchPutMessage in the *AWS IoT Analytics API Reference*.

- For API details, see BatchPutMessage in *AWS CLI Command Reference*.

### `cancel-pipeline-reprocessing`

The following code example shows how to use `cancel-pipeline-reprocessing`.

**AWS CLI**

**To cancel the reprocessing of data through a pipeline**

The following `cancel-pipeline-reprocessing` example cancels the reprocessing of data through the specified pipeline.

```
aws iotanalytics cancel-pipeline-reprocessing \
    --pipeline-name mypipeline \
    --reprocessing-id "6ad2764f-fb13-4de3-b101-4e74af03b043"
```

This command produces no output.

For more information, see CancelPipelineReprocessing in the *AWS IoT Analytics API Reference*.

- For API details, see CancelPipelineReprocessing in *AWS CLI Command Reference*.

### `create-channel`

The following code example shows how to use `create-channel`.

**AWS CLI**

**To create a channel**

The following `create-channel` example creates a channel with the specified configuration. A channel collects data from an MQTT topic and archives the raw, unprocessed messages before publishing the data to a pipeline.

```
aws iotanalytics create-channel \
    --cli-input-json file://create-channel.json
```

Contents of `create-channel.json`:

```
{
    "channelName": "mychannel",
    "retentionPeriod": {
        "unlimited": true
    },
    "tags": [
        {
            "key": "Environment",
            "value": "Production"
        }
    ]
}
```

Output:

```
{
    "channelArn": "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel",
    "channelName": "mychannel",
    "retentionPeriod": {
        "unlimited": true
    }
}
```

For more information, see CreateChannel in the *AWS IoT Analytics API Reference*.

- For API details, see CreateChannel in *AWS CLI Command Reference*.

### `create-dataset-content`

The following code example shows how to use `create-dataset-content`.

**AWS CLI**

**To create the content of a dataset**

The following `create-dataset-content` example creates the content of the specified dataset by applying a `queryAction` (an SQL query) or a `containerAction` (executing a containerized application).

```
aws iotanalytics create-dataset-content \
    --dataset-name mydataset
```

Output:

```
{
    "versionId": "d494b416-9850-4670-b885-ca22f1e89d62"
}
```

For more information, see CreateDatasetContent in the *AWS IoT Analytics API Reference*.

- For API details, see CreateDatasetContent in *AWS CLI Command Reference*.

## `create-dataset`

The following code example shows how to use `create-dataset`.

**AWS CLI**

**To create a dataset**

The following `create-dataset` example creates a dataset. A dataset stores data retrieved from a data store by applying a `queryAction` (a SQL query) or a `containerAction` (executing a containerized application). This operation creates the skeleton of a dataset. You can populate the dataset manually by calling `CreateDatasetContent` or automatically according to a `trigger` you specify.

```
aws iotanalytics create-dataset \
    --cli-input-json file://create-dataset.json
```

Contents of `create-dataset.json`:

```
{
    "datasetName": "mydataset",
    "actions": [
        {
            "actionName": "myDatasetAction",
            "queryAction": {
                "sqlQuery": "SELECT * FROM mydatastore"
            }
        }
    ],
    "retentionPeriod": {
        "unlimited": true
    },
    "tags": [
        {
            "key": "Environment",
            "value": "Production"
        }
    ]
}
```

Output:

```
{
    "datasetName": "mydataset",
    "retentionPeriod": {
        "unlimited": true
    },
    "datasetArn": "arn:aws:iotanalytics:us-west-2:123456789012:dataset/mydataset"
}
```

For more information, see CreateDataset in the *AWS IoT Analytics API Reference*.

- For API details, see CreateDataset in *AWS CLI Command Reference*.

### `create-datastore`

The following code example shows how to use `create-datastore`.

#### AWS CLI

**To create a data store**

The following `create-datastore` example creates a data store, which is a repository for messages.

```
aws iotanalytics create-datastore \
    --cli-input-json file://create-datastore.json
```

Contents of `create-datastore.json`:

```
{
    "datastoreName": "mydatastore",
    "retentionPeriod": {
        "numberOfDays": 90
    },
    "tags": [
        {
            "key": "Environment",
            "value": "Production"
        }
    ]
}
```

Output:

```
{
    "datastoreName": "mydatastore",
    "datastoreArn": "arn:aws:iotanalytics:us-west-2:123456789012:datastore/
mydatastore",
    "retentionPeriod": {
        "numberOfDays": 90,
        "unlimited": false
    }
}
```

For more information, see CreateDatastore in the *AWS IoT Analytics API Reference*.

- For API details, see CreateDatastore in *AWS CLI Command Reference*.

### `create-pipeline`

The following code example shows how to use `create-pipeline`.

## AWS CLI

### Create an IoT Analytics Pipeline

The following `create-pipeline` example creates a pipeline. A pipeline consumes messages from a channel and allows you to process the messages before storing them in a data store. You must specify both a channel and a data store activity and, optionally, as many as 23 additional activities in the `pipelineActivities` array.

```
aws iotanalytics create-pipeline \
    --cli-input-json file://create-pipeline.json
```

Contents of `create-pipeline.json`:

```
{
    "pipelineName": "mypipeline",
    "pipelineActivities": [
        {
            "channel": {
                "name": "myChannelActivity",
                "channelName": "mychannel",
                "next": "myMathActivity"
            }
        },
        {
            "datastore": {
                "name": "myDatastoreActivity",
                "datastoreName": "mydatastore"
            }
        },
        {
            "math": {
                "name": "myMathActivity",
                "math": "((temp - 32) * 5.0) / 9.0",
                "attribute": "tempC",
                "next": "myDatastoreActivity"
            }
        }
    ],
    "tags": [
        {
            "key": "Environment",
            "value": "Beta"
```

```
        }
    ]
}
```

Output:

```
{
    "pipelineArn": "arn:aws:iotanalytics:us-west-2:123456789012:pipeline/
mypipeline",
    "pipelineName": "mypipeline"
}
```

For more information, see CreatePipeline in the *AWS IoT Analytics API Reference*.

- For API details, see CreatePipeline in *AWS CLI Command Reference*.

## `delete-channel`

The following code example shows how to use `delete-channel`.

### AWS CLI

#### Delete an IoT Analytics Channel

The following `delete-channel` example deletes the specified channel.

```
aws iotanalytics delete-channel \
    --channel-name mychannel
```

This command produces no output.

For more information, see DeleteChannel in the *AWS IoT Analytics API Reference*.

- For API details, see DeleteChannel in *AWS CLI Command Reference*.

## `delete-dataset-content`

The following code example shows how to use `delete-dataset-content`.

### AWS CLI

#### To delete dataset content

The following `delete-dataset-content` example deletes the content of the specified dataset.

```
aws iotanalytics delete-dataset-content \
    --dataset-name mydataset
```

This command produces no output.

For more information, see DeleteDatasetContent in the *AWS IoT Analytics API Reference*.

- For API details, see DeleteDatasetContent in *AWS CLI Command Reference*.

### `delete-dataset`

The following code example shows how to use `delete-dataset`.

#### AWS CLI

**To delete a dataset**

The following `delete-dataset` example deletes the specified dataset. You don't have to delete the content of the dataset before you perform this operation.

```
aws iotanalytics delete-dataset \
    --dataset-name mydataset
```

This command produces no output.

For more information, see DeleteDataset in the *AWS IoT Analytics API Reference*.

- For API details, see DeleteDataset in *AWS CLI Command Reference*.

### `delete-datastore`

The following code example shows how to use `delete-datastore`.

#### AWS CLI

**To delete a data store**

The following `delete-datastore` example deletes the specified data store.

```
aws iotanalytics delete-datastore \
    --datastore-name mydatastore
```

This command produces no output.

For more information, see DeleteDatastore in the *AWS IoT Analytics API Reference*.

- For API details, see DeleteDatastore in *AWS CLI Command Reference*.

### `delete-pipeline`

The following code example shows how to use `delete-pipeline`.

#### AWS CLI

**To delete a pipeline**

The following `delete-pipeline` example deletes the specified pipeline.

```
aws iotanalytics delete-pipeline \
    --pipeline-name mypipeline
```

This command produces no output.

For more information, see DeletePipeline in the *AWS IoT Analytics API Reference*.

- For API details, see DeletePipeline in *AWS CLI Command Reference*.

### `describe-channel`

The following code example shows how to use `describe-channel`.

#### AWS CLI

**To retrieve information about a channel**

The following `describe-channel` example displays details, including statistics, for the specified channel.

```
aws iotanalytics describe-channel \
    --channel-name mychannel \
    --include-statistics
```

Output:

```
{
    "statistics": {
        "size": {
            "estimatedSizeInBytes": 402.0,
            "estimatedOn": 1561504380.0
        }
    },
    "channel": {
        "status": "ACTIVE",
        "name": "mychannel",
        "lastUpdateTime": 1557860351.001,
        "creationTime": 1557860351.001,
        "retentionPeriod": {
            "unlimited": true
        },
        "arn": "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel"
    }
}
```

For more information, see DescribeChannel in the *AWS IoT Analytics API Reference*.

- For API details, see DescribeChannel in *AWS CLI Command Reference*.

### `describe-dataset`

The following code example shows how to use `describe-dataset`.

#### AWS CLI

**To retrieve information about a dataset**

The following `describe-dataset` example displays details for the specified dataset.

```
aws iotanalytics describe-dataset \
    --dataset-name mydataset
```

Output:

```
{
    "dataset": {
```

```
        "status": "ACTIVE",
        "contentDeliveryRules": [],
        "name": "mydataset",
        "lastUpdateTime": 1557859240.658,
        "triggers": [],
        "creationTime": 1557859240.658,
        "actions": [
            {
                "actionName": "query_32",
                "queryAction": {
                    "sqlQuery": "SELECT * FROM mydatastore",
                    "filters": []
                }
            }
        ],
        "retentionPeriod": {
            "numberOfDays": 90,
            "unlimited": false
        },
        "arn": "arn:aws:iotanalytics:us-west-2:123456789012:dataset/mydataset"
    }
}
```

For more information, see DescribeDataset in the *AWS IoT Analytics API Reference*.

- For API details, see DescribeDataset in *AWS CLI Command Reference*.

### `describe-datastore`

The following code example shows how to use `describe-datastore`.

#### AWS CLI

**To retrieve information about a data store**

The following `describe-datastore` example displays details, including statistics, for the specified data store.

```
aws iotanalytics describe-datastore \
    --datastore-name mydatastore \
    --include-statistics
```

Output:

```
{
    "datastore": {
        "status": "ACTIVE",
        "name": "mydatastore",
        "lastUpdateTime": 1557858971.02,
        "creationTime": 1557858971.02,
        "retentionPeriod": {
            "unlimited": true
        },
        "arn": "arn:aws:iotanalytics:us-west-2:123456789012:datastore/mydatastore"
    },
    "statistics": {
        "size": {
            "estimatedSizeInBytes": 397.0,
            "estimatedOn": 1561592040.0
        }
    }
}
```

For more information, see DescribeDatastore in the *AWS IoT Analytics API Reference*.

- For API details, see DescribeDatastore in *AWS CLI Command Reference*.

### `describe-logging-options`

The following code example shows how to use `describe-logging-options`.

#### AWS CLI

**To retrieve the current logging options**

The following `describe-logging-options` example displays the current AWS IoT Analytics logging options.

```
aws iotanalytics describe-logging-options
```

This command produces no output. Output:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/service-role/myIoTAnalyticsRole",
        "enabled": true,
```

```
        "level": "ERROR"
    }
}
```

For more information, see DescribeLoggingOptions in the *AWS IoT Analytics API Reference*.

- For API details, see DescribeLoggingOptions in *AWS CLI Command Reference*.

### `describe-pipeline`

The following code example shows how to use `describe-pipeline`.

#### AWS CLI

**To retrieve information about a pipeline**

The following `describe-pipeline` example displays details for the specified pipeline.

```
aws iotanalytics describe-pipeline \
    --pipeline-name mypipeline
```

Output:

```
{
    "pipeline": {
        "activities": [
            {
                "channel": {
                    "channelName": "mychannel",
                    "name": "mychannel_28",
                    "next": "mydatastore_29"
                }
            },
            {
                "datastore": {
                    "datastoreName": "mydatastore",
                    "name": "mydatastore_29"
                }
            }
        ],
        "name": "mypipeline",
        "lastUpdateTime": 1561676362.515,
        "creationTime": 1557859124.432,
```

```
        "reprocessingSummaries": [
            {
                "status": "SUCCEEDED",
                "creationTime": 1561676362.189,
                "id": "6ad2764f-fb13-4de3-b101-4e74af03b043"
            }
        ],
        "arn": "arn:aws:iotanalytics:us-west-2:123456789012:pipeline/mypipeline"
    }
}
```

For more information, see DescribePipeline in the *AWS IoT Analytics API Reference*.

- For API details, see DescribePipeline in *AWS CLI Command Reference*.

### `get-dataset-content`

The following code example shows how to use `get-dataset-content`.

#### AWS CLI

**To retrieve the contents of a dataset**

The following `get-dataset-content` example retrieves the contents of a dataset as presigned URIs.

```
aws iotanalytics get-dataset-content --dataset-name mydataset
```

Output:

```
{
    "status": {
        "state": "SUCCEEDED"
    },
    "timestamp": 1557863215.995,
    "entries": [
        {
            "dataURI": "https://aws-radiant-
dataset-12345678-1234-1234-1234-123456789012.s3.us-west-2.amazonaws.com/
results/12345678-e8b3-46ba-b2dd-efe8d86cf385.csv?X-Amz-Security-Token=...-Amz-
Algorithm=AWS4-HMAC-SHA256&X-Amz-Date=20190628T173437Z&X-Amz-SignedHeaders=host&X-
Amz-Expires=7200&X-Amz-Credential=...F20190628%2Fus-west-2%2Fs3%2Faws4_request&X-
Amz-Signature=..."
```

```
        }
    ]
}
```

For more information, see GetDatasetContent in the *guide*.

- For API details, see GetDatasetContent in *AWS CLI Command Reference*.

### `list-channels`

The following code example shows how to use `list-channels`.

#### AWS CLI

**To retrieve a list of channels**

The following `list-channels` example displays summary information for the available channels.

```
aws iotanalytics list-channels
```

Output:

```
{
    "channelSummaries": [
        {
            "status": "ACTIVE",
            "channelName": "mychannel",
            "creationTime": 1557860351.001,
            "lastUpdateTime": 1557860351.001
        }
    ]
}
```

For more information, see ListChannels in the *AWS IoT Analytics API Reference*.

- For API details, see ListChannels in *AWS CLI Command Reference*.

### `list-dataset-contents`

The following code example shows how to use `list-dataset-contents`.

**AWS CLI**

**To list information about dataset contents**

The following `list-dataset-contents` example lists information about dataset contents that have been created.

```
aws iotanalytics list-dataset-contents \
    --dataset-name mydataset
```

Output:

```
{
    "datasetContentSummaries": [
        {
            "status": {
                "state": "SUCCEEDED"
            },
            "scheduleTime": 1557863215.995,
            "version": "b10ea2a9-66c1-4d99-8d1f-518113b738d0",
            "creationTime": 1557863215.995
        }
    ]
}
```

For more information, see ListDatasetContents in the *AWS IoT Analytics API Reference*.

- For API details, see ListDatasetContents in *AWS CLI Command Reference*.

## `list-datasets`

The following code example shows how to use `list-datasets`.

**AWS CLI**

**To retrieve information about datasets**

The following `list-datasets` example lists summary information about available datasets.

```
aws iotanalytics list-datasets
```

Output:

```
{
    "datasetSummaries": [
        {
            "status": "ACTIVE",
            "datasetName": "mydataset",
            "lastUpdateTime": 1557859240.658,
            "triggers": [],
            "creationTime": 1557859240.658,
            "actions": [
                {
                    "actionName": "query_32",
                    "actionType": "QUERY"
                }
            ]
        }
    ]
}
```

For more information, see ListDatasets in the *AWS IoT Analytics API Reference*.

- For API details, see ListDatasets in *AWS CLI Command Reference*.

### `list-datastores`

The following code example shows how to use `list-datastores`.

#### AWS CLI

**To retrieve a list of data stores**

The following `list-datastores` example displays summary information about the available data stores.

```
aws iotanalytics list-datastores
```

Output:

```
{
    "datastoreSummaries": [
        {
            "status": "ACTIVE",
            "datastoreName": "mydatastore",
```

```
            "creationTime": 1557858971.02,
            "lastUpdateTime": 1557858971.02
        }
    ]
}
```

For more information, see ListDatastores in the *AWS IoT Analytics API Reference*.

- For API details, see ListDatastores in *AWS CLI Command Reference*.

### `list-pipelines`

The following code example shows how to use `list-pipelines`.

#### AWS CLI

**To retrieve a list of pipelines**

The following `list-pipelines` example displays a list of available pipelines.

```
aws iotanalytics list-pipelines
```

Output:

```
{
    "pipelineSummaries": [
        {
            "pipelineName": "mypipeline",
            "creationTime": 1557859124.432,
            "lastUpdateTime": 1557859124.432,
            "reprocessingSummaries": []
        }
    ]
}
```

For more information, see ListPipelines in the *AWS IoT Analytics API Reference*.

- For API details, see ListPipelines in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for a resource**

The following `list-tags-for-resource` example Lists the tags that you have attached to the specified resource.

```
aws iotanalytics list-tags-for-resource \
    --resource-arn "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel"
```

Output:

```
{
    "tags": [
        {
            "value": "bar",
            "key": "foo"
        }
    ]
}
```

For more information, see ListTagsForResource in the *AWS IoT Analytics API Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `put-logging-options`

The following code example shows how to use `put-logging-options`.

**AWS CLI**

**To set or update logging options**

The following `put-logging-options` example sets or updates the AWS IoT Analytics logging options. If you update the value of any `loggingOptions` field, it can take up to one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the "roleArn" field (for example, to correct an invalid policy) it can take up to five minutes for that change to take effect.

```
aws iotanalytics put-logging-options \
```

```
    --cli-input-json file://put-logging-options.json
```

Contents of `put-logging-options.json`:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/service-role/myIoTAnalyticsRole",
        "level": "ERROR",
        "enabled": true
    }
}
```

This command produces no output.

For more information, see PutLoggingOptions in the *AWS IoT Analytics API Reference*.

- For API details, see PutLoggingOptions in *AWS CLI Command Reference*.

### `run-pipeline-activity`

The following code example shows how to use `run-pipeline-activity`.

#### AWS CLI

**To simulate a pipeline activity**

The following `run-pipeline-activity` example simulates the results of running a pipeline activity on a message payload.

```
aws iotanalytics run-pipeline-activity \
    --pipeline-activity file://maths.json \
    --payloads file://payloads.json
```

Contents of `maths.json`:

```
{
    "math": {
        "name": "MyMathActivity",
        "math": "((temp - 32) * 5.0) / 9.0",
        "attribute": "tempC"
    }
```

```
}
```

Contents of `payloads.json`:

```
[
    "{\"humidity\": 52, \"temp\": 68 }",
    "{\"humidity\": 52, \"temp\": 32 }"
]
```

Output:

```
{
    "logResult": "",
    "payloads": [
        "eyJodW1pZGl0eSI6NTIsInRlbXAiOjY4LCJ0ZW1wQyI6MjB9",
        "eyJodW1pZGl0eSI6NTIsInRlbXAiOjMyLCJ0ZW1wQyI6MH0="
    ]
}
```

For more information, see RunPipelineActivity in the *AWS IoT Analytics API Reference*.

- For API details, see RunPipelineActivity in *AWS CLI Command Reference*.

### `sample-channel-data`

The following code example shows how to use `sample-channel-data`.

#### AWS CLI

**To retrieve sample messages from a channel**

The following `sample-channel-data` example retrieves a sample of messages from the specified channel ingested during the specified timeframe. You can retrieve up to 10 messages.

```
aws iotanalytics sample-channel-data \
    --channel-name mychannel
```

Output:

```
{
```

```
    "payloads": [
        "eyAidGVtcGVyYXR1cmUiOiAyMCB9",
        "eyAiZm9vIjogImJhciIgfQ=="
    ]
}
```

For more information, see SampleChannelData in the *AWS IoT Analytics API Reference*.

- For API details, see SampleChannelData in *AWS CLI Command Reference*.

### `start-pipeline-reprocessing`

The following code example shows how to use `start-pipeline-reprocessing`.

**AWS CLI**

**To start pipeline reprocessing**

The following `start-pipeline-reprocessing` example starts the reprocessing of raw message data through the specified pipeline.

```
aws iotanalytics start-pipeline-reprocessing \
    --pipeline-name mypipeline
```

Output:

```
{
    "reprocessingId": "6ad2764f-fb13-4de3-b101-4e74af03b043"
}
```

For more information, see StartPipelineReprocessing in the *AWS IoT Analytics API Reference*.

- For API details, see StartPipelineReprocessing in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add or modify tags for a resource**

The following `tag-resource` example adds to or modifies the tags attached to the specified resource.

```
aws iotanalytics tag-resource \
    --resource-arn "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel" \
    --tags "[{\"key\": \"Environment\", \"value\": \"Production\"}]"
```

This command produces no output.

For more information, see TagResource in the *AWS IoT Analytics API Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To remove tags from a resource**

The following `untag-resource` example removes the tags with the specified key names from the specified resource.

```
aws iotanalytics untag-resource \
    --resource-arn "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel" \
    --tag-keys "[\"Environment\"]"
```

This command produces no output.

For more information, see UntagResource <https://docs.aws.amazon.com/iotanalytics/latest/APIReference/API_UntagResource.html > in the *AWS IoT Analytics API Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-channel`

The following code example shows how to use `update-channel`.

#### AWS CLI

**To modify a channel**

The following `update-channel` example modifies the settings for the specified channel.

```
aws iotanalytics update-channel \
    --cli-input-json file://update-channel.json
```

Contents of `update-channel.json`:

```
{
    "channelName": "mychannel",
    "retentionPeriod": {
        "numberOfDays": 92
    }
}
```

This command produces no output.

For more information, see UpdateChannel in the *AWS IoT Analytics API Reference*.

- For API details, see UpdateChannel in *AWS CLI Command Reference*.

### `update-dataset`

The following code example shows how to use `update-dataset`.

#### AWS CLI

**To update a dataset**

The following `update-dataset` example modifies the settings of the specified dataset.

```
aws iotanalytics update-dataset \
    --cli-input-json file://update-dataset.json
```

Contents of `update-dataset.json`:

```
{
    "datasetName": "mydataset",
    "actions": [
        {
            "actionName": "myDatasetUpdateAction",
            "queryAction": {
                "sqlQuery": "SELECT * FROM mydatastore"
```

```
            }
        }
    ],
    "retentionPeriod": {
        "numberOfDays": 92
    }
}
```

This command produces no output.

For more information, see UpdateDataset <https://docs.aws.amazon.com/iotanalytics/latest/APIReference/API_UpdateDataset.html > in the *AWS IoT Analytics API Reference*.

- For API details, see UpdateDataset in *AWS CLI Command Reference*.

### `update-datastore`

The following code example shows how to use `update-datastore`.

#### AWS CLI

**To update a data store**

The following `update-datastore` example modifies the settings of the specified data store.

```
aws iotanalytics update-datastore \
    --cli-input-json file://update-datastore.json
```

Contents of update-datastore.json:

```
{
    "datastoreName": "mydatastore",
    "retentionPeriod": {
        "numberOfDays": 93
    }
}
```

This command produces no output.

For more information, see UpdateDatastore in the *AWS IoT Analytics API Reference*.

- For API details, see UpdateDatastore in *AWS CLI Command Reference*.

### update-pipeline

The following code example shows how to use update-pipeline.

#### AWS CLI

##### To update a pipeline

The following update-pipeline example modifies the settings of the specified pipeline. You must specify both a channel and a data store activity and, optionally, as many as 23 additional activities, in the pipelineActivities array.

```
aws iotanalytics update-pipeline \
    --cli-input-json file://update-pipeline.json
```

Contents of update-pipeline.json:

```
{
    "pipelineName": "mypipeline",
    "pipelineActivities": [
        {
            "channel": {
                "name": "myChannelActivity",
                "channelName": "mychannel",
                "next": "myMathActivity"
            }
        },
        {
            "datastore": {
                "name": "myDatastoreActivity",
                "datastoreName": "mydatastore"
            }
        },
        {
            "math": {
                "name": "myMathActivity",
                "math": "(((temp - 32) * 5.0) / 9.0) + 273.15",
                "attribute": "tempK",
                "next": "myDatastoreActivity"
            }
        }
    ]
```

```
}
```

This command produces no output.

For more information, see UpdatePipeline in the *AWS IoT Analytics API Reference*.

- For API details, see UpdatePipeline in *AWS CLI Command Reference*.

## Device Advisor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Device Advisor.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `create-suite-definition`

The following code example shows how to use `create-suite-definition`.

#### AWS CLI

**Example 1: To create an IoT Device Advisor test suite**

The following `create-suite-definition` example creates a device advisor test suite in the AWS IoT with the specified suite definition configuration.

```
aws iotdeviceadvisor create-suite-definition \
    --suite-definition-configuration '{ \
```

```
        "suiteDefinitionName": "TestSuiteName", \
        "devices": [{"thingArn":"arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"}], \
        "intendedForQualification": false, \
        "rootGroup": "{\"configuration\":{},\"tests\":[{\"name\":\"MQTT Connect\",
\"configuration\":{\"EXECUTION_TIMEOUT\":120},\"tests\":[{\"name\":\"MQTT_Connect\",
\"configuration\":{},\"test\":{\"id\":\"MQTT_Connect\",\"testCase\":null,\"version
\":\"0.0.0\"}}]}]}", \
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "0jtsgio7yenu",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
east-1:123456789012:suitedefinition/0jtsgio7yenu",
    "suiteDefinitionName": "TestSuiteName",
    "createdAt": "2022-12-02T11:38:13.263000-05:00"
}
```

For more information, see Create a test suite definition in the *AWS IoT Core Developer Guide*.

**Example 2: To create an IoT Device Advisor Latest Qualification test suite**

The following `create-suite-definition` example creates a device advisor qualification test suite with the latest version in the AWS IoT with the specified suite definition configuration.

```
aws iotdeviceadvisor create-suite-definition \
    --suite-definition-configuration '{ \
        "suiteDefinitionName": "TestSuiteName", \
        "devices": [{"thingArn":"arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"}], \
        "intendedForQualification": true, \
        "rootGroup": "", \
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "txgsuolk2myj",
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
east-1:123456789012:suitedefinition/txgsuolk2myj",
```

```
    "suiteDefinitionName": "TestSuiteName",
    "createdAt": "2022-12-02T11:38:13.263000-05:00"
}
```

For more information, see Create a test suite definition in the *AWS IoT Core Developer Guide*.

- For API details, see CreateSuiteDefinition in *AWS CLI Command Reference*.

### `delete-suite-definition`

The following code example shows how to use `delete-suite-definition`.

**AWS CLI**

**To delete the IoT Device Advisor test suite**

The following `delete-suite-definition` example deletes the device advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor delete-suite-definition \
    --suite-definition-id 0jtsgio7yenu
```

This command produces no output.

For more information, see DeleteSuiteDefinition in the *AWS IoT API Reference*.

- For API details, see DeleteSuiteDefinition in *AWS CLI Command Reference*.

### `get-endpoint`

The following code example shows how to use `get-endpoint`.

**AWS CLI**

**Example 1: To get the information about an IoT Device Advisor Account-level endpoint**

The following `get-endpoint` example gets the information about a device advisor Account-level test endpoint.

```
aws iotdeviceadvisor get-endpoint
```

Output:

```
{
    "endpoint": "t6y4c143x9sfo.deviceadvisor.iot.us-east-1.amazonaws.com"
}
```

**Example 2: To get the information about an IoT Device Advisor Device-level endpoint**

The following `get-endpoint` example gets the information about a device advisor device-level test endpoint with the specified thing-arn or certificate-arn.

```
aws iotdeviceadvisor get-endpoint \
    --thing-arn arn:aws:iot:us-east-1:123456789012:thing/MyIotThing
```

Output:

```
{
    "endpoint": "tdb7719be5t6y4c143x9sfo.deviceadvisor.iot.us-east-1.amazonaws.com"
}
```

For more information, see Get a test endpoint in the *AWS IoT Core Developer Guide*.

- For API details, see GetEndpoint in *AWS CLI Command Reference*.

### `get-suite-definition`

The following code example shows how to use `get-suite-definition`.

**AWS CLI**

**To get the information about an IoT Device Advisor test suite**

The following `get-suite-definition` example get the information about a aevice advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor get-suite-definition \
    --suite-definition-id qqcsmtyyjabl
```

Output:

```
{
    "suiteDefinitionId": "qqcsmtyyjabl",
```

```
    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
east-1:123456789012:suitedefinition/qqcsmtyyjabl",
    "suiteDefinitionVersion": "v1",
    "latestVersion": "v1",
    "suiteDefinitionConfiguration": {
        "suiteDefinitionName": "MQTT connection",
        "devices": [],
        "intendedForQualification": false,
        "isLongDurationTest": false,
        "rootGroup": "{\"configuration\":{},\"tests\":[{\"id\":\"uta5d9j1kvwc\",
\"name\":\"Test group 1\",\"configuration\":{},\"tests\":[{\"id\":\"awr8pq5vc9yp\",
\"name\":\"MQTT Connect\",\"configuration\":{},\"test\":{\"id\":\"MQTT_Connect\",
\"testCase\":null,\"version\":\"0.0.0\"}}]}]}",
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole",
        "protocol": "MqttV3_1_1"
    },
    "createdAt": "2022-11-11T22:28:52.389000-05:00",
    "lastModifiedAt": "2022-11-11T22:28:52.389000-05:00",
    "tags": {}
}
```

For more information, see Get a test suite definition in the *AWS IoT Core Developer Guide*.

- For API details, see GetSuiteDefinition in *AWS CLI Command Reference*.

### `get-suite-run-report`

The following code example shows how to use `get-suite-run-report`.

#### AWS CLI

**To get the information about an IoT Device Advisor qualifying test suite run report**

The following `get-suite-run-report` example gets the report download link for a successful device advisor qualifying test suite run with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor get-suite-run-report \
    --suite-definition-id ztvb5aek4w4x \
    --suite-run-id p6awv83nre6v
```

Output:

```
{
```

```
    "qualificationReportDownloadUrl": "https://senate-apn-reports-us-east-1-
prod.s3.amazonaws.com/report.downloadlink"
}
```

For more information, see Get a qualification report for a successful qualification test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see GetSuiteRunReport in *AWS CLI Command Reference*.

### `get-suite-run`

The following code example shows how to use `get-suite-run`.

#### AWS CLI

**To get the information about an IoT Device Advisor test suite run status**

The following `get-suite-run` example gets the information about a device advisor test suite run status with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor get-suite-run \
    --suite-definition-id qqcsmtyyjabl \
    --suite-run-id nzlfyhaa18oa
```

Output:

```
{
    "suiteDefinitionId": "qqcsmtyyjabl",
    "suiteDefinitionVersion": "v1",
    "suiteRunId": "nzlfyhaa18oa",
    "suiteRunArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suiterun/
qqcsmtyyjabl/nzlfyhaa18oa",
    "suiteRunConfiguration": {
        "primaryDevice": {
            "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIotThing",
            "certificateArn": "arn:aws:iot:us-east-1:123456789012:cert/certFile"
        },
        "parallelRun": false
    },
    "testResult": {
        "groups": [
            {
                "groupId": "uta5d9j1kvwc",
```

```
                "groupName": "Test group 1",
                "tests": [
                    {

    "status": "PASS",
    "tags": {}
}
```

For more information, see Get a test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see GetSuiteRun in *AWS CLI Command Reference*.

## `list-suite-definitions`

The following code example shows how to use `list-suite-definitions`.

### AWS CLI

#### Example 1: To list the IoT Device Advisor test suites you created

The following `list-suite-definitions` example lists up to 25 device advisor test suites you created in AWS IoT. If you have more than 25 test suites, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suites you created.

```
aws iotdeviceadvisor list-suite-definitions
```

Output:

```
{
    "suiteDefinitionInformationList": [
        {
            "suiteDefinitionId": "3hsn88h4p2g5",
            "suiteDefinitionName": "TestSuite1",
            "defaultDevices": [
                {
                    "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"
                }
            ],
            "intendedForQualification": false,
            "isLongDurationTest": false,
            "protocol": "MqttV3_1_1",
            "createdAt": "2022-11-17T14:15:56.830000-05:00"
        },
        {
            ......
        }
    ],
    "nextToken": "nextTokenValue"
}
```

**Example 2: To list the IoT Device Advisor test suites you created with the specified settings**

The following `list-suite-definitions` example lists device advisor test suites you created in AWS IoT with the specified max-result number. If you have more test suites than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suites you created that weren't shown before.

```
aws iotdeviceadvisor list-suite-definitions \
    --max-result 1 \
    --next-token "nextTokenValue"
```

Output:

```
{
    "suiteDefinitionInformationList": [
        {
            "suiteDefinitionId": "ztvb5aew4w4x",
```

```
            "suiteDefinitionName": "TestSuite2",
            "defaultDevices": [],
            "intendedForQualification": true,
            "isLongDurationTest": false,
            "protocol": "MqttV3_1_1",
            "createdAt": "2022-11-17T14:15:56.830000-05:00"
        }
    ],
    "nextToken": "nextTokenValue"
}
```

For more information, see ListSuiteDefinitions in the *AWS IoT API Reference*.

- For API details, see ListSuiteDefinitions in *AWS CLI Command Reference*.

### `list-suite-runs`

The following code example shows how to use `list-suite-runs`.

**AWS CLI**

**Example 1: To list all information about the specified IoT Device Advisor test suite runs status**

The following `list-suite-runs` example lists all information about a device advisor test suite runs status with the specified suite definition ID. If you have more than 25 test suite runs, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suite runs.

```
aws iotdeviceadvisor list-suite-runs \
    --suite-definition-id ztvb5aew4w4x
```

Output:

```
{
    "suiteRunsList": [
        {
            "suiteDefinitionId": "ztvb5aew4w4x",
            "suiteDefinitionVersion": "v1",
            "suiteDefinitionName": "TestSuite",
            "suiteRunId": "p6awv89nre6v",
```

```
            "createdAt": "2022-12-01T16:33:14.212000-05:00",
            "startedAt": "2022-12-01T16:33:15.710000-05:00",
            "endAt": "2022-12-01T16:42:03.323000-05:00",
            "status": "PASS",
            "passed": 6,
            "failed": 0
        }
    ]
}
```

**Example 2: To list information about the specified IoT Device Advisor test suite runs status with the specified settings**

The following `list-suite-runs` example lists information about a device advisor test suite runs status with the specified suite definition ID and the specified max-result number. If you have more test suite runs than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suite runs that weren't shown before.

```
aws iotdeviceadvisor list-suite-runs \
    --suite-definition-id qqcsmtyyjaml \
    --max-result 1 \
    --next-token "nextTokenValue"
```

Output:

```
{
    "suiteRunsList": [
        {
            "suiteDefinitionId": "qqcsmtyyjaml",
            "suiteDefinitionVersion": "v1",
            "suiteDefinitionName": "MQTT connection",
            "suiteRunId": "gz9vm2s6d2jy",
            "createdAt": "2022-12-01T20:10:27.079000-05:00",
            "startedAt": "2022-12-01T20:10:28.003000-05:00",
            "endAt": "2022-12-01T20:10:45.084000-05:00",
            "status": "STOPPED",
            "passed": 0,
            "failed": 0
        }
    ],
    "nextToken": "nextTokenValue"
```

```
}
```

For more information, see ListSuiteRuns in the *AWS IoT API Reference*.

- For API details, see ListSuiteRuns in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags attached to an IoT Device Advisor resource**

The following `list-tags-for-resource` example lists the tags attached to a device advisor resource. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor list-tags-for-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/
ba0uyjpg38ny
```

Output:

```
{
    "tags": {
        "TestTagKey": "TestTagValue"
    }
}
```

For more information, see ListTagsForResource in the *AWS IoT API Reference* and Resource types defined by AWS IoT Core Device Advisor in the *Service Authorization Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `start-suite-run`

The following code example shows how to use `start-suite-run`.

**AWS CLI**

**To start an IoT Device Advisor test suite run**

The following `start-suite-run` example lists the available widgets in your AWS account.

```
aws iotdeviceadvisor start-suite-run \
    --suite-definition-id qqcsmtyyjabl \
    --suite-definition-version v1 \
    --suite-run-configuration '{"primaryDevice":{"thingArn": "arn:aws:iot:us-
east-1:123456789012:thing/MyIotThing","certificateArn":"arn:aws:iot:us-
east-1:123456789012:cert/certFile"}}'
```

Output:

```
{
    "suiteRunId": "pwmucgw7lt9s",
    "suiteRunArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suiterun/
qqcsmtyyjabl/pwmucgw7lk9s",
    "createdAt": "2022-12-02T15:43:05.581000-05:00"
}
```

For more information, see Start a test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see StartSuiteRun in *AWS CLI Command Reference*.

### `stop-suite-run`

The following code example shows how to use `stop-suite-run`.

#### AWS CLI

**To stop an IoT Device Advisor test suite that is currently running**

The following `stop-suite-run` example stops a device advisor test suite that is currently running with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor stop-suite-run \
    --suite-definition-id qqcsmtyyjabl \
    --suite-run-id nzlfyhaa18oa
```

This command produces no output.

For more information, see Stop a test suite run in the *AWS IoT Core Developer Guide*.

- For API details, see StopSuiteRun in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add to and modify the existing tags of an IoT Device Advisor resource**

The following `tag-resource` example adds to and modifies the existing tags of a device advisor resource with the specified resource arn and tags. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor tag-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/
ba0uyjpg38ny \
    --tags '{"TagKey": "TagValue"}'
```

This command produces no output.

For more information, see TagResource in the *AWS IoT API Reference* and Resource types defined by AWS IoT Core Device Advisor in the *Service Authorization Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove the existing tags from an IoT Device Advisor resource**

The following `untag-resource` example removes the existing tags from a device advisor resource with the specified resource arn and tag key. The device advisor resource can be a Suitedefinition-Arn or a Suiterun-Arn.

```
aws iotdeviceadvisor untag-resource \
    --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/
ba0uyjpg38ny \
    --tag-keys "TagKey"
```

This command produces no output.

For more information, see UntagResource in the *AWS IoT API Reference* and Resource types defined by AWS IoT Core Device Advisor in the *Service Authorization Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-suite-definition`

The following code example shows how to use `update-suite-definition`.

#### AWS CLI

**Example 1: To update an IoT Device Advisor test suite**

The following `update-suite-definition` example updates a device advisor test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```
aws iotdeviceadvisor update-suite-definition \
    --suite-definition-id 3hsn88h4p2g5 \
    --suite-definition-configuration '{ \
        "suiteDefinitionName": "TestSuiteName", \
        "devices": [{"thingArn":"arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"}], \
        "intendedForQualification": false, \
        "rootGroup": "{\"configuration\":{},\"tests\":[{\"name\":\"MQTT Connect\",
\"configuration\":{\"EXECUTION_TIMEOUT\":120},\"tests\":[{\"name\":\"MQTT_Connect\",
\"configuration\":{},\"test\":{\"id\":\"MQTT_Connect\",\"testCase\":null,\"version
\":\"0.0.0\"}}]}]}", \
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "3hsn88h4p2g5",
    "suiteDefinitionName": "TestSuiteName",
    "suiteDefinitionVersion": "v3",
    "createdAt": "2022-11-17T14:15:56.830000-05:00",
    "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

**Example 2: To update an IoT Device Advisor Qualification test suite**

The following `update-suite-definition` example updates a device advisor qualification test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```
aws iotdeviceadvisor update-suite-definition \
    --suite-definition-id txgsuolk2myj \
    --suite-definition-configuration '{
        "suiteDefinitionName": "TestSuiteName", \
        "devices": [{"thingArn":"arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"}], \
        "intendedForQualification": true, \
        "rootGroup": "", \
        "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{
    "suiteDefinitionId": "txgsuolk2myj",
    "suiteDefinitionName": "TestSuiteName",
    "suiteDefinitionVersion": "v3",
    "createdAt": "2022-11-17T14:15:56.830000-05:00",
    "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

For more information, see UpdateSuiteDefinition in the *AWS IoT API Reference*.

- For API details, see UpdateSuiteDefinition in *AWS CLI Command Reference*.

## AWS IoT data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT data.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `delete-thing-shadow`

The following code example shows how to use `delete-thing-shadow`.

**AWS CLI**

**To delete a device's shadow document**

The following `delete-thing-shadow` example deletes the entire shadow document for the device named `MyRPi`.

```
aws iot-data delete-thing-shadow \
    --thing-name MyRPi \
    "output.txt"
```

The command produces no output on the display, but `output.txt` contains information that confirms the version and timestamp of the shadow document that you deleted.

```
{"version":2,"timestamp":1560270384}
```

For more information, see Using Shadows in the *AWS IoT Developers Guide*.

- For API details, see DeleteThingShadow in *AWS CLI Command Reference*.

### `get-thing-shadow`

The following code example shows how to use `get-thing-shadow`.

**AWS CLI**

**To get a thing shadow document**

The following `get-thing-shadow` example gets the thing shadow document for the specified IoT thing.

```
aws iot-data get-thing-shadow \
```

```
    --thing-name MyRPi \
    output.txt
```

The command produces no output on the display, but the following shows the contents of `output.txt`:

```
{
  "state":{
    "reported":{
    "moisture":"low"
    }
  },
  "metadata":{
    "reported":{
      "moisture":{
        "timestamp":1560269319
      }
    }
  },
  "version":1,"timestamp":1560269405
}
```

For more information, see Device Shadow Service Data Flow in the *AWS IoT Developers Guide*.

- For API details, see GetThingShadow in *AWS CLI Command Reference*.

### `update-thing-shadow`

The following code example shows how to use `update-thing-shadow`.

#### AWS CLI

##### To update a thing shadow

The following `update-thing-shadow` example modifies the current state of the device shadow for the specified thing and saves it to the file `output.txt`.

```
aws iot-data update-thing-shadow \
    --thing-name MyRPi \
    --payload "{"state":{"reported":{"moisture":"okay"}}}" \
    "output.txt"
```

The command produces no output on the display, but the following shows the contents of `output.txt`:

```
{
    "state": {
        "reported": {
            "moisture": "okay"
        }
    },
    "metadata": {
        "reported": {
            "moisture": {
                "timestamp": 1560270036
            }
        }
    },
    "version": 2,
    "timestamp": 1560270036
}
```

For more information, see Device Shadow Service Data Flow in the *AWS IoT Developers Guide*.

- For API details, see UpdateThingShadow in *AWS CLI Command Reference*.

## AWS IoT Events examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Events.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `batch-put-message`

The following code example shows how to use `batch-put-message`.

#### AWS CLI

**To send messages (inputs) to AWS IoT Events**

The following `batch-put-message` example sends a set of messages to the AWS IoT Events system. Each message payload is transformed into the input you specify ( `inputName` ) and ingested into any detectors that monitor that input. If multiple messages are sent, the order in which the messages are processed isn't guaranteed. To guarantee ordering, you must send messages one at a time and wait for a successful response.

```
aws iotevents-data batch-put-message \
    --cli-input-json file://highPressureMessage.json
```

Contents of `highPressureMessage.json`:

```
{
    "messages": [
        {
            "messageId": "00001",
            "inputName": "PressureInput",
            "payload": "{\"motorid\": \"Fulton-A32\", \"sensorData\": {\"pressure\":
 80, \"temperature\": 39} }"
        }
    ]
}
```

Output:

```
{
    "BatchPutMessageErrorEntries": []
}
```

For more information, see BatchPutMessage in the *AWS IoT Events API Reference*.

- For API details, see BatchPutMessage in *AWS CLI Command Reference*.

### `batch-update-detector`

The following code example shows how to use `batch-update-detector`.

**AWS CLI**

**To update a detector (instance)**

The following `batch-update-detector` example updates the state, variable values, and timer settings of one or more detectors (instances) of a specified detector model.

```
aws iotevents-data batch-update-detector \
    --cli-input-json file://budFulton-A32.json
```

Contents of budFulton-A32.json:

```
{
    "detectors": [
        {
            "messageId": "00001",
            "detectorModelName": "motorDetectorModel",
            "keyValue": "Fulton-A32",
            "state": {
                "stateName": "Normal",
                "variables": [
                    {
                        "name": "pressureThresholdBreached",
                        "value": "0"
                    }
                ],
                "timers": [
                ]
            }
        }
    ]
}
```

Output:

```
{
    "batchUpdateDetectorErrorEntries": []
}
```

For more information, see BatchUpdateDetector in the *AWS IoT Events API Reference*.

- For API details, see BatchUpdateDetector in *AWS CLI Command Reference*.

### `create-detector-model`

The following code example shows how to use `create-detector-model`.

#### AWS CLI

**To create a detector model**

The following `create-detector-model` example creates a detector model with its configuration specified by a parameter file.

```
aws iotevents create-detector-model  \
    --cli-input-json file://motorDetectorModel.json
```

Contents of `motorDetectorModel.json`:

```
{

    }
}
```

For more information, see CreateDetectorModel in the *AWS IoT Events API Reference*.

- For API details, see CreateDetectorModel in *AWS CLI Command Reference*.

## `create-input`

The following code example shows how to use `create-input`.

### AWS CLI

#### To create an input

The following `create-input` example creates an input.

```
aws iotevents create-input  \
    --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor",
    "inputDefinition": {
        "attributes": [
            { "jsonPath": "sensorData.pressure" },
            { "jsonPath": "motorid" }
        ]
    }
}
```

Output:

```
{
    "inputConfiguration": {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1560795312.542,
        "creationTime": 1560795312.542,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see CreateInput in the *AWS IoT Events API Reference*.

- For API details, see CreateInput in *AWS CLI Command Reference*.

## `delete-detector-model`

The following code example shows how to use `delete-detector-model`.

### AWS CLI

#### To delete a detector model

The following `delete-detector-model` example deletes the specified detector model. Any active instances of the detector model are also deleted.

```
aws iotevents delete-detector-model \
    --detector-model-name motorDetectorModel
```

This command produces no output.

For more information, see DeleteDetectorModel in the *AWS IoT Events API Reference*.

- For API details, see DeleteDetectorModel in *AWS CLI Command Reference*.

### `delete-input`

The following code example shows how to use `delete-input`.

#### AWS CLI

**To delete an input**

The following `delete-input` example deletes the specified input.

```
aws iotevents delete-input \
    --input-name PressureInput
```

This command produces no output.

For more information, see DeleteInput in the *AWS IoT Events API Reference*.

- For API details, see DeleteInput in *AWS CLI Command Reference*.

### `describe-detector-model`

The following code example shows how to use `describe-detector-model`.

#### AWS CLI

**To get information about a detector model**

The following `describe-detector-model` example displays details for the specified detector model. Because the `version` parameter is not specified, information about the latest version is returned.

```
aws iotevents describe-detector-model \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorModel": {
        "detectorModelConfiguration": {
            "status": "ACTIVE",
            "lastUpdateTime": 1560796816.077,

                                            "targetArn": "arn:aws:sns:us-
east-1:123456789012:underPressureAction"
                                        }
                                    }
                                ],
                                "condition": "$variable.pressureThresholdBreached >
 1"
                            }
                        ]
                    },
                    "onExit": {
                        "events": [
                            {
                                "eventName": "Normal Pressure Restored",
                                "actions": [
```

```
                                    {
                                        "sns": {
                                            "targetArn": "arn:aws:sns:us-
east-1:123456789012:pressureClearedAction"
                                        }
                                    }
                                ],
                                "condition": "true"
                            }
                        ]
                    }
                }
            ],
            "initialStateName": "Normal"
        }
    }
}
```

For more information, see DescribeDetectorModel in the *AWS IoT Events API Reference*.

- For API details, see DescribeDetectorModel in *AWS CLI Command Reference*.

### `describe-detector`

The following code example shows how to use `describe-detector`.

#### AWS CLI

**To get information about a detector (instance).**

The following `describe-detector` example displays details for the specified detector (instance).

```
aws iotevents-data describe-detector \
    --detector-model-name motorDetectorModel \
    --key-value "Fulton-A32"
```

Output:

```
{
    "detector": {
        "lastUpdateTime": 1560797852.776,
        "creationTime": 1560797852.775,
```

```
        "state": {
            "variables": [
                {
                    "name": "pressureThresholdBreached",
                    "value": "3"
                }
            ],
            "stateName": "Dangerous",
            "timers": []
        },
        "keyValue": "Fulton-A32",
        "detectorModelName": "motorDetectorModel",
        "detectorModelVersion": "1"
    }
}
```

For more information, see DescribeDetector in the *AWS IoT Events API Reference*.

- For API details, see DescribeDetector in *AWS CLI Command Reference*.

### `describe-input`

The following code example shows how to use `describe-input`.

#### AWS CLI

**To get information about an input**

The following `describe-input` example displays details for the specified input.

```
aws iotevents describe-input \
    --input-name PressureInput
```

Output:

```
{
    "input": {
        "inputConfiguration": {
            "status": "ACTIVE",
            "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/
PressureInput",
            "lastUpdateTime": 1560795312.542,
            "creationTime": 1560795312.542,
```

```
            "inputName": "PressureInput",
            "inputDescription": "Pressure readings from a motor"
        },
        "inputDefinition": {
            "attributes": [
                {
                    "jsonPath": "sensorData.pressure"
                },
                {
                    "jsonPath": "motorid"
                }
            ]
        }
    }
}
```

For more information, see DescribeInput in the *AWS IoT Events API Reference*.

- For API details, see DescribeInput in *AWS CLI Command Reference*.

### `describe-logging-options`

The following code example shows how to use `describe-logging-options`.

#### AWS CLI

**To get information about logging settings**

The following `describe-logging-options` example retrieves the current settings of the AWS IoT Events logging options.

```
aws iotevents describe-logging-options
```

Output:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "enabled": false,
        "level": "ERROR"
    }
}
```

For more information, see DescribeLoggingOptions in the *AWS IoT Events API Reference*.

- For API details, see DescribeLoggingOptions in *AWS CLI Command Reference*.

### `list-detector-model-versions`

The following code example shows how to use `list-detector-model-versions`.

#### AWS CLI

**To get information about versions of a detector model**

The following `list-detector-model-versions` example Lists all the versions of a detector model. Only the metadata associated with each detector model version is returned.

```
aws iotevents list-detector-model-versions \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorModelVersionSummaries": [
        {
            "status": "ACTIVE",
            "lastUpdateTime": 1560796816.077,
            "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
            "creationTime": 1560796816.077,
            "detectorModelArn": "arn:aws:iotevents:us-
west-2:123456789012:detectorModel/motorDetectorModel",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        }
    ]
}
```

For more information, see ListDetectorModelVersions in the *AWS IoT Events API Reference*.

- For API details, see ListDetectorModelVersions in *AWS CLI Command Reference*.

### `list-detector-models`

The following code example shows how to use `list-detector-models`.

**AWS CLI**

**To get a list of your detector models**

The following `list-detector-models` example Lists the detector models you have created. Only the metadata associated with each detector model is returned.

```
aws iotevents list-detector-models
```

Output:

```
{
    "detectorModelSummaries": [
        {
            "detectorModelName": "motorDetectorModel",
            "creationTime": 1552072424.212
            "detectorModelDescription": "Detect overpressure in a motor."
        }
    ]
}
```

For more information, see ListDetectorModels in the *AWS IoT Events API Reference*.

- For API details, see ListDetectorModels in *AWS CLI Command Reference*.

## `list-detectors`

The following code example shows how to use `list-detectors`.

**AWS CLI**

**To get a list of detectors for a detector model**

The following `list-detectors` example lists the detectors (the instances of a detector model) in your account.

```
aws iotevents-data list-detectors \
    --detector-model-name motorDetectorModel
```

Output:

```
{
```

```
    "detectorSummaries": [
        {
            "lastUpdateTime": 1558129925.2,
            "creationTime": 1552073155.527,
            "state": {
                "stateName": "Normal"
            },
            "keyValue": "Fulton-A32",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        }
    ]
}
```

For more information, see ListDetectors in the *AWS IoT Events API Reference*.

- For API details, see ListDetectors in *AWS CLI Command Reference*.

## `list-inputs`

The following code example shows how to use `list-inputs`.

### AWS CLI

#### To list inputs

The following `list-inputs` example lists the inputs you have created in your account.

```
aws iotevents list-inputs
```

This command produces no output. Output:

```
{
    {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1551742986.768,
        "creationTime": 1551742986.768,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see ListInputs in the *AWS IoT Events API Reference*.

- For API details, see ListInputs in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags assigned to a resource.**

The following `list-tags-for-resource` example lists the tag key names and values you have assigned to the resource.

```
aws iotevents list-tags-for-resource \
    --resource-arn "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput"
```

Output:

```
{
    "tags": [
        {
            "value": "motor",
            "key": "deviceType"
        }
    ]
}
```

For more information, see ListTagsForResource in the *AWS IoT Events API Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `put-logging-options`

The following code example shows how to use `put-logging-options`.

**AWS CLI**

**To set logging options**

The following `put-logging-options` example sets or updates the AWS IoT Events logging options. If you update the value of any `loggingOptions` field, it can take up to

one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the ``roleArn field (for example, to correct an invalid policy) it can take up to five minutes for that change to take effect.

```
aws iotevents put-logging-options \
    --cli-input-json file://logging-options.json
```

Contents of `logging-options.json`:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "level": "DEBUG",
        "enabled": true,
        "detectorDebugOptions": [
            {
                "detectorModelName": "motorDetectorModel",
                "keyValue": "Fulton-A32"
            }
        ]
    }
}
```

This command produces no output.

For more information, see PutLoggingOptions in the *AWS IoT Events API Reference*.

- For API details, see PutLoggingOptions in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To add tags to a resource**

The following `tag-resource` example adds or modifies (if key `deviceType` already exists) the tag attached the specified resource.

```
aws iotevents tag-resource \
    --cli-input-json file://pressureInput.tag.json
```

Contents of `pressureInput.tag.json`:

```
{
    "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "tags": [
        {
            "key": "deviceType",
            "value": "motor"
        }
    ]
}
```

This command produces no output.

For more information, see TagResource in the *AWS IoT Events API Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To remove tags from a resource**

The following `untag-resource` example removes the tag with the specified key name from the specified resource.

```
aws iotevents untag-resource \
    --resource-arn arn:aws:iotevents:us-west-2:123456789012:input/PressureInput \
    --tagkeys deviceType
```

This command produces no output.

For more information, see UntagResource in the *AWS IoT Events API Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-detector-model`

The following code example shows how to use `update-detector-model`.

## AWS CLI

### To update a detector model

The following `update-detector-model` example updates the specified detector model. Detectors (instances) spawned by the previous version are deleted and then re-created as new inputs arrive.

```
aws iotevents update-detector-model \
    --cli-input-json file://motorDetectorModel.update.json
```

Contents of `motorDetectorModel.update.json`:

```
{
    "detectorModelName": "motorDetectorModel",
    "detectorModelDefinition": {
        "states": [
            {
                "stateName": "Normal",
                "onEnter": {
                    "events": [
                        {
                            "eventName": "init",
                            "condition": "true",
                            "actions": [
                                {
                                    "setVariable": {
                                        "variableName": "pressureThresholdBreached",
                                        "value": "0"
                                    }
                                }
                            ]
                        }
                    ]
                },
                "onInput": {
                    "transitionEvents": [
                        {
                            "eventName": "Overpressurized",
                            "condition": "$input.PressureInput.sensorData.pressure >
 70",
                            "actions": [
                                {
```

```
                                    "setVariable": {
                                        "variableName": "pressureThresholdBreached",
                                        "value":
 "$variable.pressureThresholdBreached + 3"
                                    }
                                }
                            ],
                            "nextState": "Dangerous"
                        }
                    ]
                }
            },
            {
                "stateName": "Dangerous",
                "onEnter": {
                    "events": [
                        {
                            "eventName": "Pressure Threshold Breached",
                            "condition": "$variable.pressureThresholdBreached > 1",
                            "actions": [
                                {

                            "condition": "true",
                            "actions": [
                                {
                                    "sns": {
                                        "targetArn": "arn:aws:sns:us-
east-1:123456789012:pressureClearedAction"
                                    }
                                }
                            ]
                        }
                    ]
                }
            }
        ],
        "initialStateName": "Normal"
```

```
    },
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole"
}
```

Output:

```
{
    "detectorModelConfiguration": {
        "status": "ACTIVATING",
        "lastUpdateTime": 1560799387.719,
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "creationTime": 1560799387.719,
        "detectorModelArn": "arn:aws:iotevents:us-west-2:123456789012:detectorModel/
motorDetectorModel",
        "key": "motorid",
        "detectorModelName": "motorDetectorModel",
        "detectorModelVersion": "2"
    }
}
```

For more information, see UpdateDetectorModel in the *AWS IoT Events API Reference*.

- For API details, see UpdateDetectorModel in *AWS CLI Command Reference*.

### `update-input`

The following code example shows how to use `update-input`.

#### AWS CLI

**To update an input**

The following `update-input` example updates the specified input with a new description and definition.

```
aws iotevents update-input \
    --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
    "inputName": "PressureInput",
```

```
    "inputDescription": "Pressure readings from a motor",
    "inputDefinition": {
        "attributes": [
            { "jsonPath": "sensorData.pressure" },
            { "jsonPath": "motorid" }
        ]
    }
}
```

Output:

```
{
    "inputConfiguration": {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1560795976.458,
        "creationTime": 1560795312.542,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see UpdateInput in the *AWS IoT Events API Reference*.

- For API details, see UpdateInput in *AWS CLI Command Reference*.

## AWS IoT Events-Data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Events-Data.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

### `batch-put-message`

The following code example shows how to use `batch-put-message`.

### AWS CLI

#### To send messages (inputs) to AWS IoT Events

The following `batch-put-message` example sends a set of messages to the AWS IoT Events system. Each message payload is transformed into the input you specify ( `inputName` ) and ingested into any detectors that monitor that input. If multiple messages are sent, the order in which the messages are processed isn't guaranteed. To guarantee ordering, you must send messages one at a time and wait for a successful response.

```
aws iotevents-data batch-put-message \
    --cli-binary-format raw-in-base64-out \
    --cli-input-json file://highPressureMessage.json
```

Contents of `highPressureMessage.json`:

```
{
    "messages": [
        {
            "messageId": "00001",
            "inputName": "PressureInput",
            "payload": "{\"motorid\": \"Fulton-A32\", \"sensorData\": {\"pressure\":
 80, \"temperature\": 39} }"
        }
    ]
}
```

Output:

```
{
    "BatchPutMessageErrorEntries": []
}
```

For more information, see BatchPutMessage in the *AWS IoT Events Developer Guide**.

- For API details, see BatchPutMessage in *AWS CLI Command Reference*.

### `batch-update-detector`

The following code example shows how to use `batch-update-detector`.

#### AWS CLI

**To update a detector (instance)**

The following `batch-update-detector` example updates the state, variable values, and timer settings of one or more detectors (instances) of a specified detector model.

```
aws iotevents-data batch-update-detector \
    --cli-input-json file://budFulton-A32.json
```

Contents of budFulton-A32.json:

```
{
    "detectors": [
        {
            "messageId": "00001",
            "detectorModelName": "motorDetectorModel",
            "keyValue": "Fulton-A32",
            "state": {
                "stateName": "Normal",
                "variables": [
                    {
                        "name": "pressureThresholdBreached",
                        "value": "0"
                    }
                ],
                "timers": [
                ]
            }
        }
    ]
}
```

Output:

```
{
    "batchUpdateDetectorErrorEntries": []
}
```

For more information, see BatchUpdateDetector in the *AWS IoT Events Developer Guide**.

- For API details, see BatchUpdateDetector in *AWS CLI Command Reference*.

### `create-detector-model`

The following code example shows how to use `create-detector-model`.

#### AWS CLI

**To create a detector model**

The following `create-detector-model` example creates a detector model.

```
aws iotevents create-detector-model \
    --cli-input-json file://motorDetectorModel.json
```

Contents of `motorDetectorModel.json`:

```
{
    "detectorModelName": "motorDetectorModel",
    "detectorModelDefinition": {
        "states": [
            {
                "stateName": "Normal",
                "onEnter": {
                    "events": [
                        {
                            "eventName": "init",
                            "condition": "true",
                            "actions": [
                                {
                                    "setVariable": {
                                        "variableName": "pressureThresholdBreached",
                                        "value": "0"
                                    }
                                }
                            ]
                        }
```

```
                    ]
                },
                "onInput": {
                    "transitionEvents": [
                        {
                            "eventName": "Overpressurized",
                            "condition": "$input.PressureInput.sensorData.pressure
 &gt; 70",
                            "actions": [
                                {
                                    "setVariable": {
                                        "variableName": "pressureThresholdBreached",
                                        "value":
 "$variable.pressureThresholdBreached + 3"
                                    }
                                }
                            ],
                            "nextState": "Dangerous"
                        }
                    ]
                }
            },
            {
                "stateName": "Dangerous",
                "onEnter": {
                    "events": [
                        {
                            "eventName": "Pressure Threshold Breached",
                            "condition": "$variable.pressureThresholdBreached &gt;
 1",
                            "actions": [
                                {

```

```
                                        "targetArn": "arn:aws:sns:us-
east-1:123456789012:pressureClearedAction"
                                    }
                                }
                            ]
                        }
                    ]
                }
            }
        ],
        "initialStateName": "Normal"
    },
    "key": "motorid",
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole"
}
```

Output:

```
{
    "detectorModelConfiguration": {
        "status": "ACTIVATING",
        "lastUpdateTime": 1560796816.077,
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "creationTime": 1560796816.077,
        "detectorModelArn": "arn:aws:iotevents:us-west-2:123456789012:detectorModel/
motorDetectorModel",
        "key": "motorid",
        "detectorModelName": "motorDetectorModel",
        "detectorModelVersion": "1"
    }
}
```

For more information, see CreateDetectorModel in the *AWS IoT Events Developer Guide**.

- For API details, see CreateDetectorModel in *AWS CLI Command Reference*.

## `create-input`

The following code example shows how to use `create-input`.

### AWS CLI

#### To create an input

The following `create-input` example creates an input.

```
aws iotevents create-input \
    --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor",
    "inputDefinition": {
        "attributes": [
                { "jsonPath": "sensorData.pressure" },
                { "jsonPath": "motorid" }
            ]
    }
}
```

Output:

```
{
    "inputConfiguration": {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1560795312.542,
        "creationTime": 1560795312.542,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see CreateInput in the *AWS IoT Events Developer Guide**.

- For API details, see CreateInput in *AWS CLI Command Reference*.

## `delete-detector-model`

The following code example shows how to use `delete-detector-model`.

### AWS CLI

#### To delete a detector model

The following `delete-detector-model` example deletes a detector model. Any active instances of the detector model are also deleted.

```
aws iotevents delete-detector-model \
    --detector-model-name motorDetectorModel*
```

This command produces no output.

For more information, see DeleteDetectorModel in the *AWS IoT Events Developer Guide**.

- For API details, see DeleteDetectorModel in *AWS CLI Command Reference*.

### `delete-input`

The following code example shows how to use `delete-input`.

**AWS CLI**

**To delete an input**

The following `delete-input` example deletes an input.

```
aws iotevents delete-input \
    --input-name PressureInput
```

This command produces no output.

For more information, see DeleteInput in the *AWS IoT Events Developer Guide**.

- For API details, see DeleteInput in *AWS CLI Command Reference*.

### `describe-detector-model`

The following code example shows how to use `describe-detector-model`.

**AWS CLI**

**To get information about a detector model**

The following `describe-detector-model` example describes a detector model. If the `version` parameter is not specified, the command returns information about the latest version.

```
aws iotevents describe-detector-model \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorModel": {
        "detectorModelConfiguration": {
            "status": "ACTIVE",
            "lastUpdateTime": 1560796816.077,
            "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
            "creationTime": 1560796816.077,
            "detectorModelArn": "arn:aws:iotevents:us-
west-2:123456789012:detectorModel/motorDetectorModel",
            "key": "motorid",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        },
        "detectorModelDefinition": {
            "states": [
                {
                    "onInput": {
                        "transitionEvents": [
                            {
                                "eventName": "Overpressurized",
                                "actions": [
                                    {
                                        "setVariable": {
                                            "variableName":
 "pressureThresholdBreached",
                                            "value":
 "$variable.pressureThresholdBreached + 3"
                                        }
                                    }
                                ],
                                "condition":
 "$input.PressureInput.sensorData.pressure > 70",
                                "nextState": "Dangerous"
                            }
                        ],
                        "events": []
                    },
                    "stateName": "Normal",
```

```
                    "onEnter": {

                                ],
                                "condition": "true"
                            }
                        ]
                    }
                }
            ],
            "initialStateName": "Normal"
        }
    }
}
```

For more information, see DescribeDetectorModel in the *AWS IoT Events Developer Guide**.

- For API details, see DescribeDetectorModel in *AWS CLI Command Reference*.

### `describe-detector`

The following code example shows how to use `describe-detector`.

#### AWS CLI

**To get information about a detector (instance)**

The following `describe-detector` example returns information about the specified detector (instance).

```
aws iotevents-data describe-detector \
    --detector-model-name motorDetectorModel \
    --key-value "Fulton-A32"
```

Output:

```
{
    "detector": {
        "lastUpdateTime": 1560797852.776,
        "creationTime": 1560797852.775,
```

```
        "state": {
            "variables": [
                {
                    "name": "pressureThresholdBreached",
                    "value": "3"
                }
            ],
            "stateName": "Dangerous",
            "timers": []
        },
        "keyValue": "Fulton-A32",
        "detectorModelName": "motorDetectorModel",
        "detectorModelVersion": "1"
    }
}
```

For more information, see DescribeDetector in the *AWS IoT Events Developer Guide**.

- For API details, see DescribeDetector in *AWS CLI Command Reference*.

### `describe-input`

The following code example shows how to use `describe-input`.

#### AWS CLI

**To get information about an input**

The following `describe-input` example retrieves the details of an input.

```
aws iotevents describe-input \
    --input-name PressureInput
```

Output:

```
{
    "input": {
        "inputConfiguration": {
            "status": "ACTIVE",
            "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/
PressureInput",
            "lastUpdateTime": 1560795312.542,
            "creationTime": 1560795312.542,
```

```
            "inputName": "PressureInput",
            "inputDescription": "Pressure readings from a motor"
        },
        "inputDefinition": {
            "attributes": [
                {
                    "jsonPath": "sensorData.pressure"
                },
                {
                    "jsonPath": "motorid"
                }
            ]
        }
    }
}
```

For more information, see DescribeInput in the *AWS IoT Events Developer Guide**.

- For API details, see DescribeInput in *AWS CLI Command Reference*.

### `describe-logging-options`

The following code example shows how to use `describe-logging-options`.

#### AWS CLI

**To get information about logging settings**

The following `describe-logging-options` example retrieves the current AWS IoT Events logging options.

```
aws iotevents describe-logging-options
```

Output:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "enabled": false,
        "level": "ERROR"
    }
}
```

For more information, see DescribeLoggingOptions in the *AWS IoT Events Developer Guide*.

- For API details, see DescribeLoggingOptions in *AWS CLI Command Reference*.

### `list-detector-model-versions`

The following code example shows how to use `list-detector-model-versions`.

#### AWS CLI

**To get information about versions of a detector model**

The following `list-detector-model-versions` example lists all the versions of a detector model. Only the metadata associated with each detector model version is returned.

```
aws iotevents list-detector-model-versions \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorModelVersionSummaries": [
        {
            "status": "ACTIVE",
            "lastUpdateTime": 1560796816.077,
            "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
            "creationTime": 1560796816.077,
            "detectorModelArn": "arn:aws:iotevents:us-
west-2:123456789012:detectorModel/motorDetectorModel",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        }
    ]
}
```

For more information, see ListDetectorModelVersions in the *AWS IoT Events Developer Guide*.

- For API details, see ListDetectorModelVersions in *AWS CLI Command Reference*.

### `list-detector-models`

The following code example shows how to use `list-detector-models`.

**AWS CLI**

**To get a list of your detector models**

The following `list-detector-models` example lists the detector models you have created. Only the metadata associated with each detector model is returned.

```
aws iotevents list-detector-models
```

Output:

```
{
    "detectorModelSummaries": [
        {
            "detectorModelName": "motorDetectorModel",
            "creationTime": 1552072424.212
            "detectorModelDescription": "Detect overpressure in a motor."
        }
    ]
}
```

For more information, see ListDetectorModels in the *AWS IoT Events Developer Guide**.

- For API details, see ListDetectorModels in *AWS CLI Command Reference*.

## `list-detectors`

The following code example shows how to use `list-detectors`.

**AWS CLI**

**To get a list of detectors for a detector model**

The following `list-detectors` example lists detectors (the instances of a detector model).

```
aws iotevents-data list-detectors \
    --detector-model-name motorDetectorModel
```

Output:

```
{
    "detectorSummaries": [
```

```
        {
            "lastUpdateTime": 1558129925.2,
            "creationTime": 1552073155.527,
            "state": {
                "stateName": "Normal"
            },
            "keyValue": "Fulton-A32",
            "detectorModelName": "motorDetectorModel",
            "detectorModelVersion": "1"
        }
    ]
}
```

For more information, see ListDetectors in the *AWS IoT Events Developer Guide**.

- For API details, see ListDetectors in *AWS CLI Command Reference*.

### `list-inputs`

The following code example shows how to use `list-inputs`.

#### AWS CLI

**To list inputs**

The following `list-inputs` example lists the inputs that you've created.

```
aws iotevents list-inputs
```

Output:

```
{
    "status": "ACTIVE",
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "lastUpdateTime": 1551742986.768,
    "creationTime": 1551742986.768,
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor"
}
```

For more information, see ListInputs in the *AWS IoT Events Developer Guide**.

- For API details, see ListInputs in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags assigned to a resource**

The following `list-tags-for-resource` example lists the tags (metadata) you have assigned to the resource.

```
aws iotevents list-tags-for-resource \
    --resource-arn "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput"
```

Output:

```
{
    "tags": [
        {
            "value": "motor",
            "key": "deviceType"
        }
    ]
}
```

For more information, see ListTagsForResource in the *AWS IoT Events Developer Guide**.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `put-logging-options`

The following code example shows how to use `put-logging-options`.

**AWS CLI**

**To set logging options**

The following `list-tags-for-resource` example sets or updates the AWS IoT Events logging options. If you update the value of any `loggingOptions` field, it takes up to one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the `roleArn` field (for example, to correct an invalid policy) it takes up to five minutes for that change to take effect.

```
aws iotevents put-logging-options \
    --cli-input-json file://logging-options.json
```

Contents of `logging-options.json`:

```
{
    "loggingOptions": {
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "level": "DEBUG",
        "enabled": true,
        "detectorDebugOptions": [
            {
                "detectorModelName": "motorDetectorModel",
                "keyValue": "Fulton-A32"
            }
        ]
    }
}
```

This command produces no output.

For more information, see PutLoggingOptions in the *AWS IoT Events Developer Guide**.

- For API details, see PutLoggingOptions in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To add tags to a resource**

The following `tag-resource` example adds to or modifies the tags of the given resource. Tags are metadata that can be used to manage a resource.

```
aws iotevents tag-resource \
    --cli-input-json file://pressureInput.tag.json
```

Contents of `pressureInput.tag.json`:

```
{
```

```
    "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "tags": [
        {
            "key": "deviceType",
            "value": "motor"
        }
    ]
}
```

This command produces no output.

For more information, see TagResource in the *AWS IoT Events Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To remove tags from a resource**

The following `untag-resource` example removes the specified tags from the resource.

```
aws iotevents untag-resource \
    --cli-input-json file://pressureInput.untag.json
```

Contents of `pressureInput.untag.json`:

```
{
    "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "tagKeys": [
            "deviceType"
    ]
}
```

This command produces no output.

For more information, see UntagResource in the *AWS IoT Events Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-detector-model`

The following code example shows how to use `update-detector-model`.

**AWS CLI**

**To update a detector model**

The following `update-detector-model` example updates a detector model. Detectors (instances) spawned by the previous version are deleted and then re-created as new inputs arrive.

```
aws iotevents update-detector-model \
    --cli-input-json file://motorDetectorModel.update.json
```

Contents of motorDetectorModel.update.json:

```
{
  "detectorModelName": "motorDetectorModel",
  "detectorModelDefinition": {
    "states": [
      {
        "stateName": "Normal",
        "onEnter": {
          "events": [
            {
              "eventName": "init",
              "condition": "true",
              "actions": [
                {
                  "setVariable": {
                    "variableName": "pressureThresholdBreached",
                    "value": "0"
                  }
                }
              ]
            }
          ]
        },
        "onInput": {
          "transitionEvents": [
            {
              "eventName": "Overpressurized",
```

```
              "condition": "$input.PressureInput.sensorData.pressure > 70",
              "actions": [
                {
                  "setVariable": {
                    "variableName": "pressureThresholdBreached",
                    "value": "$variable.pressureThresholdBreached + 3"
                  }
                }
              ],
              "nextState": "Dangerous"
            }
          ]
        }
      },
      {
        "stateName": "Dangerous",
        "onEnter": {
          "events": [
            {
              "eventName": "Pressure Threshold Breached",
              "condition": "$variable.pressureThresholdBreached > 1",
              "actions": [
                {
                  "sns": {
                    "targetArn": "arn:aws:sns:us-
east-1:123456789012:underPressureAction"
                  }
                }
              ]
            }
          ]
        },
        "onInput": {
          "events": [
            {

          }
        ]
      }
    }
  ],
  "initialStateName": "Normal"
},
```

```
  "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole"
}
```

Output:

```
{
    "detectorModelConfiguration": {
        "status": "ACTIVATING",
        "lastUpdateTime": 1560799387.719,
        "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
        "creationTime": 1560799387.719,
        "detectorModelArn": "arn:aws:iotevents:us-west-2:123456789012:detectorModel/
motorDetectorModel",
        "key": "motorid",
        "detectorModelName": "motorDetectorModel",
        "detectorModelVersion": "2"
    }
}
```

For more information, see UpdateDetectorModel in the *AWS IoT Events Developer Guide**.

- For API details, see UpdateDetectorModel in *AWS CLI Command Reference*.

### `update-input`

The following code example shows how to use `update-input`.

#### AWS CLI

##### To update an input

The following `update-input` example updates an input.

```
aws iotevents update-input \
    --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor",
```

```
    "inputDefinition": {
        "attributes": [
            { "jsonPath": "sensorData.pressure" },
            { "jsonPath": "motorid" }
        ]
    }
}
```

Output:

```
{
    "inputConfiguration": {
        "status": "ACTIVE",
        "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
        "lastUpdateTime": 1560795976.458,
        "creationTime": 1560795312.542,
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    }
}
```

For more information, see UpdateInput in the *AWS IoT Events Developer Guide**.

- For API details, see UpdateInput in *AWS CLI Command Reference*.

## AWS IoT Greengrass examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `associate-role-to-group`

The following code example shows how to use `associate-role-to-group`.

**AWS CLI**

**To associate a role with a Greengrass group**

The following `associate-role-to-group` example associates the specified IAM role with a Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services. For example, your group role might grant permissions required for CloudWatch Logs integration.

```
aws greengrass associate-role-to-group \
    --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b \
    --role-arn arn:aws:iam::123456789012:role/GG-Group-Role
```

Output:

```
{
    "AssociatedAt": "2019-09-10T20:03:30Z"
}
```

For more information, see Configure the Group Role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see AssociateRoleToGroup in *AWS CLI Command Reference*.

#### `associate-service-role-to-account`

The following code example shows how to use `associate-service-role-to-account`.

**AWS CLI**

**To associate a service role with your AWS account**

The following `associate-service-role-to-account` example associates an IAM service role, specified by its ARN, with AWS IoT Greengrass in your AWS account. You must have

previously created the service role in IAM, and you must associate a policy document with it that allows AWS IoT Greengrass to assume this role.

```
aws greengrass associate-service-role-to-account \
    --role-arn "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
```

Output:

```
{
    "AssociatedAt": "2019-06-25T18:12:45Z"
}
```

For more information, see Greengrass Service Role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see AssociateServiceRoleToAccount in *AWS CLI Command Reference*.

### `create-connector-definition-version`

The following code example shows how to use `create-connector-definition-version`.

**AWS CLI**

**To create a connector definition version**

The following `create-connector-definition-version` example creates a connector definition version and associates it with the specified connector definition. All connectors in a version define values for their parameters.

```
aws greengrass create-connector-definition-version \
    --connector-definition-id "55d0052b-0d7d-44d6-b56f-21867215e118" \
    --connectors "[{\"Id\": \"MyTwilioNotificationsConnector\",
 \"ConnectorArn\": \"arn:aws:greengrass:us-west-2::/connectors/
TwilioNotifications/versions/2\", \"Parameters\": {\"TWILIO_ACCOUNT_SID
\": \"AC1a8d4204890840d7fc482aab38090d57\", \"TwilioAuthTokenSecretArn\":
 \"arn:aws:secretsmanager:us-west-2:123456789012:secret:greengrass-TwilioAuthToken-
ntSlp6\", \"TwilioAuthTokenSecretArn-ResourceId\": \"TwilioAuthToken\",
 \"DefaultFromPhoneNumber\": \"4254492999\"}}]"
```

Output:

```
{
```

```
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/55d0052b-0d7d-44d6-b56f-21867215e118/versions/33f709a0-c825-49cb-9eea-
dc8964fbd635",
    "CreationTimestamp": "2019-06-24T20:46:30.134Z",
    "Id": "55d0052b-0d7d-44d6-b56f-21867215e118",
    "Version": "33f709a0-c825-49cb-9eea-dc8964fbd635"
}
```

- For API details, see CreateConnectorDefinitionVersion in *AWS CLI Command Reference*.

### `create-connector-definition`

The following code example shows how to use `create-connector-definition`.

#### AWS CLI

**To create a connector definition**

The following `create-connector-definition` example example creates a connector definition and an initial connector definition version. The initial version contains one connector. All connectors in a version define values for their parameters.

```
aws greengrass create-connector-definition \
    --name MySNSConnector \
    --initial-version "{\"Connectors\": [{\"Id\":\"MySNSConnector\",\"ConnectorArn
\":\"arn:aws:greengrass:us-west-2::/connectors/SNS/versions/1\",\"Parameters\":
 {\"DefaultSNSArn\":\"arn:aws:sns:us-west-2:123456789012:GGConnectorTopic\"}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "CreationTimestamp": "2019-06-19T19:30:01.300Z",
    "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
    "LatestVersion": "63c57963-c7c2-4a26-a7e2-7bf478ea2623",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-
c7c2-4a26-a7e2-7bf478ea2623",
    "Name": "MySNSConnector"
```

```
}
```

For more information, see Getting Started with Greengrass Connectors (CLI) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see CreateConnectorDefinition in *AWS CLI Command Reference*.

### `create-core-definition-version`

The following code example shows how to use `create-core-definition-version`.

**AWS CLI**

**To create a core definition version**

The following `create-core-definition-version` example creates a core definition version and associates it with the specified core definition. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition-version` command.

Create the AWS IoT thing that corresponds to the core device:

```
aws iot create-thing \
    --thing-name "MyCoreDevice"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
    "thingName": "MyCoreDevice",
    "thingId": "cb419a19-9099-4515-9cec-e9b0e760608a"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myCore.cert.pem" \
```

```
    --public-key-outfile "myCore.public.key" \
    --private-key-outfile "myCore.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```
aws iot create-policy \
    --policy-name "Core_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "Core_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/Core_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
```

```
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
    --policy-name "Core_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate:

```
aws iot attach-thing-principal \
    --thing-name "MyCoreDevice" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Create the core definition version:

```
aws greengrass create-core-definition-version \
    --core-definition-id "582efe12-b05a-409e-9a24-a2ba1bcc4a12" \
    --cores "[{\"Id\":\"MyCoreDevice\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/MyCoreDevice\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz
\",\"SyncShadow\":true}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12/versions/3fdc1190-2ce5-44de-b98b-
eec8f9571014",
    "Version": "3fdc1190-2ce5-44de-b98b-eec8f9571014",
    "CreationTimestamp": "2019-09-18T00:15:09.838Z",
```

```
    "Id": "582efe12-b05a-409e-9a24-a2ba1bcc4a12"
}
```

For more information, see Configure the AWS IoT Greengrass Core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateCoreDefinitionVersion in *AWS CLI Command Reference*.

### `create-core-definition`

The following code example shows how to use `create-core-definition`.

**AWS CLI**

**Example 1: To create an empty core definition**

The following `create-core-definition` example creates an empty (no initial version) Greengrass core definition. Before the core is usable, you must use the `create-core-definition-version` command to provide the other parameters for the core.

```
aws greengrass create-core-definition \
    --name cliGroup_Core
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/
b5c08008-54cb-44bd-9eec-c121b04283b5",
    "CreationTimestamp": "2019-06-25T18:23:22.106Z",
    "Id": "b5c08008-54cb-44bd-9eec-c121b04283b5",
    "LastUpdatedTimestamp": "2019-06-25T18:23:22.106Z",
    "Name": "cliGroup_Core"
}
```

**Example 2: To create a core definition with an initial version**

The following `create-core-definition` example creates a core definition that contains an initial core definition version. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition` command.

Create the AWS IoT thing that corresponds to the core device:

```
aws iot create-thing \
    --thing-name "MyCoreDevice"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
    "thingName": "MyCoreDevice",
    "thingId": "cb419a19-9099-4515-9cec-e9b0e760608a"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myCore.cert.pem" \
    --public-key-outfile "myCore.public.key" \
    --private-key-outfile "myCore.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

```
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```
aws iot create-policy \
    --policy-name "Core_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "Core_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/Core_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
    --policy-name "Core_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate:

```
aws iot attach-thing-principal \
    --thing-name "MyCoreDevice" \
```

```
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Create the core definition:

```
aws greengrass create-core-definition \
    --name "MyCores" \
    --initial-version "{\"Cores\":[{\"Id\":\"MyCoreDevice\",\"ThingArn\":
\"arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice\",\"CertificateArn\":
\"arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz
\",\"SyncShadow\":true}]}"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12/versions/
cc87b5b3-8f4b-465d-944c-1d6de5dbfcdb",
    "Name": "MyCores",
    "LastUpdatedTimestamp": "2019-09-18T00:11:06.197Z",
    "LatestVersion": "cc87b5b3-8f4b-465d-944c-1d6de5dbfcdb",
    "CreationTimestamp": "2019-09-18T00:11:06.197Z",
    "Id": "582efe12-b05a-409e-9a24-a2ba1bcc4a12",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12"
}
```

For more information, see Configure the AWS IoT Greengrass Core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateCoreDefinition in *AWS CLI Command Reference*.

### `create-deployment`

The following code example shows how to use `create-deployment`.

#### AWS CLI

**To create a deployment for a version of a Greengrass group**

The following `create-deployment` example deploys the specified version of a Greengrass group.

```
aws greengrass create-deployment \
    --deployment-type NewDeployment \
    --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \
    --group-version-id "dc40c1e9-e8c8-4d28-a84d-a9cad5f599c9"
```

Output:

```
{
    "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca/deployments/bfceb608-4e97-45bc-
af5c-460144270308",
    "DeploymentId": "bfceb608-4e97-45bc-af5c-460144270308"
}
```

For more information, see Getting Started with Connectors (CLI) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateDeployment in *AWS CLI Command Reference*.

### `create-device-definition-version`

The following code example shows how to use `create-device-definition-version`.

#### AWS CLI

**To create a device definition version**

The following `create-device-definition-version` example creates a device definition version and associates it with the specified device definition. The version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device:

```
aws iot create-thing \
    --thing-name "InteriorTherm"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/InteriorTherm",
    "thingName": "InteriorTherm",
    "thingId": "01d4763c-78a6-46c6-92be-7add080394bf"
}
```

Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command:

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myDevice.cert.pem" \
    --public-key-outfile "myDevice.public.key" \
    --private-key-outfile "myDevice.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:

```
aws iot create-policy \
```

```
    --policy-name "GG_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "GG_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/GG_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
    --policy-name "GG_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

Attach the thing to the certificate

```
aws iot attach-thing-principal \
    --thing-name "InteriorTherm" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

After you create and configure the IoT thing as shown above, use the `ThingArn` and `CertificateArn` from the first two commands in the following example.

```
aws greengrass create-device-definition-version \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \
```

```
    --devices "[{\"Id\":\"InteriorTherm\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/InteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92\",
\"SyncShadow\":true},{\"Id\":\"ExteriorTherm\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/ExteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/6c52ce1b47bde88a637e9ccdd45fe4e4c2c0a75a6866f8f63d980ee22fa51e02\",
\"SyncShadow\":true}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/83c13984-6fed-447e-84d5-5b8aa45d5f71",
    "Version": "83c13984-6fed-447e-84d5-5b8aa45d5f71",
    "CreationTimestamp": "2019-09-11T00:15:09.838Z",
    "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
}
```

- For API details, see CreateDeviceDefinitionVersion in *AWS CLI Command Reference*.

### `create-device-definition`

The following code example shows how to use `create-device-definition`.

**AWS CLI**

**To create a device definition**

The following `create-device-definition` example creates a device definition that contains an initial device definition version. The initial version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device:

```
aws iot create-thing \
    --thing-name "InteriorTherm"
```

Output:

```
{
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/InteriorTherm",
    "thingName": "InteriorTherm",
    "thingId": "01d4763c-78a6-46c6-92be-7add080394bf"
}
```

Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command:

```
aws iot create-keys-and-certificate \
    --set-as-active \
    --certificate-pem-outfile "myDevice.cert.pem" \
    --public-key-outfile "myDevice.public.key" \
    --private-key-outfile "myDevice.private.key"
```

Output:

```
{
    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
    "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
 CERTIFICATE-----\n",
    "keyPair": {
        "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
 PUBLIC KEY-----\n",
        "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbMXDcNOK4rMCxDR...fvY4+te\n-----END
 RSA PRIVATE KEY-----\n"
    },
    "certificateId":
 "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:

```
aws iot create-policy \
```

```
    --policy-name "GG_Devices" \
    --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}"
```

Output:

```
{
    "policyName": "GG_Devices",
    "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/GG_Devices",
    "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":
[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
\":[\"*\"]}]}",
    "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
    --policy-name "GG_Devices" \
    --target "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

Attach the thing to the certificate

```
aws iot attach-thing-principal \
    --thing-name "InteriorTherm" \
    --principal "arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

After you create and configure the IoT thing as shown above, use the `ThingArn` and `CertificateArn` from the first two commands in the following example.

```
aws greengrass create-device-definition \
```

```
    --name "Sensors" \
    --initial-version "{\"Devices\":[{\"Id\":\"InteriorTherm
\",\"ThingArn\":\"arn:aws:iot:us-west-2:123456789012:thing/
InteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92\",
\"SyncShadow\":true},{\"Id\":\"ExteriorTherm\",\"ThingArn\":\"arn:aws:iot:us-
west-2:123456789012:thing/ExteriorTherm\",\"CertificateArn\":\"arn:aws:iot:us-
west-2:123456789012:cert/6c52ce1b47bde88a637e9ccdd45fe4e4c2c0a75a6866f8f63d980ee22fa51e02\",
\"SyncShadow\":true}]}"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/3b5cc510-58c1-44b5-9d98-4ad858ffa795",
    "Name": "Sensors",
    "LastUpdatedTimestamp": "2019-09-11T00:11:06.197Z",
    "LatestVersion": "3b5cc510-58c1-44b5-9d98-4ad858ffa795",
    "CreationTimestamp": "2019-09-11T00:11:06.197Z",
    "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd"
}
```

- For API details, see CreateDeviceDefinition in *AWS CLI Command Reference*.

### `create-function-definition-version`

The following code example shows how to use `create-function-definition-version`.

**AWS CLI**

**To create a version of the function definition**

The following `create-function-definition-version` example creates a new version of the specified function definition. This version specifies a single function whose ID is `Hello-World-function`, allows access to the file system, and specifies a maximum memory size and timeout period.

```
aws greengrass create-function-definition-version \
```

```
    --cli-input-json "{\"FunctionDefinitionId\": \"e626e8c9-3b8f-4bf3-9cdc-
d26ecdeb9fa3\",\"Functions\": [{\"Id\": \"Hello-World-function\", \"FunctionArn\":
 \""arn:aws:lambda:us-
west-2:123456789012:function:Greengrass_HelloWorld_Counter:gghw-alias"\",
\"FunctionConfiguration\": {\"Environment\": {\"AccessSysfs\": true},\"Executable\":
 \"greengrassHelloWorldCounter.function_handler\",\"MemorySize\": 16000,\"Pinned\":
 false,\"Timeout\": 25}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/functions/e626e8c9-3b8f-4bf3-9cdc-d26ecdeb9fa3/
versions/74abd1cc-637e-4abe-8684-9a67890f4043",
    "CreationTimestamp": "2019-06-25T22:03:43.376Z",
    "Id": "e626e8c9-3b8f-4bf3-9cdc-d26ecdeb9fa3",
    "Version": "74abd1cc-637e-4abe-8684-9a67890f4043"
}
```

- For API details, see CreateFunctionDefinitionVersion in *AWS CLI Command Reference*.

### `create-function-definition`

The following code example shows how to use `create-function-definition`.

**AWS CLI**

**To create a Lambda function definition**

The following `create-function-definition` example creates a Lambda function definition and an initial version by providing a list of Lambda functions (in this case, a list of just one function named `TempMonitorFunction`) and their configurations. Before you can create the function definition, you need the Lambda function ARN. To create the function and its alias, use Lambda's `create-function` and `publish-version` commands. Lambda's `create-function` command requires the ARN of the execution role, even though AWS IoT Greengrass doesn't use that role because permissions are specified in the Greengrass group role. You can use the IAM `create-role` command to create an empty role to get an ARN to use with Lambda's `create-function` or you can use an existing execution role.

```
aws greengrass create-function-definition \
```

```
    --name MyGreengrassFunctions \
    --initial-version "{\"Functions\": [{\"Id\": \"TempMonitorFunction\",
 \"FunctionArn\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\", \"FunctionConfiguration
\": {\"Executable\": \"temp_monitor.function_handler\", \"MemorySize\": 16000,
\"Timeout\": 5}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
functions/3b0d0080-87e7-48c6-b182-503ec743a08b",
    "CreationTimestamp": "2019-06-19T22:24:44.585Z",
    "Id": "3b0d0080-87e7-48c6-b182-503ec743a08b",
    "LastUpdatedTimestamp": "2019-06-19T22:24:44.585Z",
    "LatestVersion": "67f918b9-efb4-40b0-b87c-de8c9faf085b",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/versions/67f918b9-
efb4-40b0-b87c-de8c9faf085b",
    "Name": "MyGreengrassFunctions"
}
```

For more information, see How to Configure Local Resource Access Using the AWS Command Line Interface in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateFunctionDefinition in *AWS CLI Command Reference*.

### `create-group-certificate-authority`

The following code example shows how to use `create-group-certificate-authority`.

#### AWS CLI

**To create a certificate authority (CA) for a group**

The following `create-group-certificate-authority` example creates or rotates a CA for the specified group.

```
aws greengrass create-group-certificate-authority \
    --group-id "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1"
```

Output:

```
{
    "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/8eaadd72-ce4b-4f15-892a-0cc4f3a343f1/certificateauthorities/
d31630d674c4437f6c5dbc0dca56312a902171ce2d086c38e509c8EXAMPLEcc5"
}
```

For more information, see AWS IoT Greengrass Security in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateGroupCertificateAuthority in *AWS CLI Command Reference*.

### `create-group-version`

The following code example shows how to use `create-group-version`.

**AWS CLI**

**To create a version of a Greengrass group**

The following `create-group-version` example creates a group version and associates it with the specified group. The version references the core, resource, connector, function, and subscription versions that contain the entities to include in this group version. You must create these entities before you can create the group version.

To create a resource definition with an initial version, use the `create-resource-definition` command.To create a connector definition with an initial version, use the `create-connector-definition` command.To create a function definition with an initial version, use the `create-function-definition` command.To create a subscription definition with an initial version, use the `create-subscription-definition` command.To retrieve the ARN of the latest core definition version, use the `get-group-version` command and specify the ID of the latest group version.

```
aws greengrass create-group-version \
    --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \
    --core-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/cores/6a630442-8708-4838-ad36-eb98849d975e/
versions/6c87151b-1fb4-4cb2-8b31-6ee715d8f8ba" \
    --resource-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/
a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1" \
```

```
    --connector-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/connectors/55d0052b-0d7d-44d6-b56f-21867215e118/
versions/78a3331b-895d-489b-8823-17b4f9f418a0" \
    --function-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/
versions/67f918b9-efb4-40b0-b87c-de8c9faf085b" \
    --subscription-definition-version-arn "arn:aws:greengrass:us-
west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-
feccbdd69112/versions/aa645c47-ac90-420d-9091-8c7ffa4f103f"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/
ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca/versions/e10b0459-4345-4a09-88a4-1af1f5d34638",
    "CreationTimestamp": "2019-06-20T18:42:47.020Z",
    "Id": "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca",
    "Version": "e10b0459-4345-4a09-88a4-1af1f5d34638"
}
```

For more information, see Overview of the AWS IoT Greengrass Group Object Model in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateGroupVersion in *AWS CLI Command Reference*.

### `create-group`

The following code example shows how to use `create-group`.

#### AWS CLI

**To create a Greeengrass group**

The following `create-group` example creates a group named `cli-created-group`.

```
aws greengrass create-group \
    --name cli-created-group
```

Output:

```
{
```

```
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/4e22bd92-898c-436b-ade5-434d883ff749",
    "CreationTimestamp": "2019-06-25T18:07:17.688Z",
    "Id": "4e22bd92-898c-436b-ade5-434d883ff749",
    "LastUpdatedTimestamp": "2019-06-25T18:07:17.688Z",
    "Name": "cli-created-group"
}
```

For more information, see Overview of the AWS IoT Greengrass Group Object Model in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

### `create-logger-definition-version`

The following code example shows how to use `create-logger-definition-version`.

**AWS CLI**

**To create a logger definition version**

The following `create-logger-definition-version` example creates a logger definition version and associates it with a logger definition. The version defines four logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, 3) system component logs in Amazon CloudWatch Logs, and 4) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```
aws greengrass create-logger-definition-version \
    --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0" \
    --loggers "[{\"Id\":\"1\",\"Component\":\"GreengrassSystem\",\"Level\":\"ERROR
\",\"Space\":10240,\"Type\":\"FileSystem\"},{\"Id\":\"2\",\"Component\":\"Lambda
\",\"Level\":\"INFO\",\"Space\":10240,\"Type\":\"FileSystem\"},{\"Id\":\"3\",
\"Component\":\"GreengrassSystem\",\"Level\":\"WARN\",\"Type\":\"AWSCloudWatch\"},
{\"Id\":\"4\",\"Component\":\"Lambda\",\"Level\":\"INFO\",\"Type\":\"AWSCloudWatch
\"}]"
```

Output:

```
{
```

```
 "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/
a454b62a-5d56-4ca9-bdc4-8254e1662cb0/versions/49aedb1e-01a3-4d39-9871-3a052573f1ea",
 "Version": "49aedb1e-01a3-4d39-9871-3a052573f1ea",
 "CreationTimestamp": "2019-07-24T00:04:48.523Z",
 "Id": "a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
}
```

For more information, see Monitoring with AWS IoT Greengrass Logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateLoggerDefinitionVersion in *AWS CLI Command Reference*.

### `create-logger-definition`

The following code example shows how to use `create-logger-definition`.

#### AWS CLI

**To create a logger definition**

The following `create-logger-definition` example creates a logger definition that contains an initial logger definition version. The initial version defines three logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, and 3) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```
aws greengrass create-logger-definition \
    --name "LoggingConfigs" \
    --initial-version "{\"Loggers\":[{\"Id\":\"1\",\"Component\":\"GreengrassSystem
\",\"Level\":\"ERROR\",\"Space\":10240,\"Type\":\"FileSystem\"},{\"Id\":
\"2\",\"Component\":\"Lambda\",\"Level\":\"INFO\",\"Space\":10240,\"Type\":
\"FileSystem\"},{\"Id\":\"3\",\"Component\":\"Lambda\",\"Level\":\"INFO\",\"Type\":
\"AWSCloudWatch\"}]}"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/loggers/a454b62a-5d56-4ca9-bdc4-8254e1662cb0/versions/de1d9854-1588-4525-
b25e-b378f60f2322",
```

```
    "Name": "LoggingConfigs",
    "LastUpdatedTimestamp": "2019-07-23T23:52:17.165Z",
    "LatestVersion": "de1d9854-1588-4525-b25e-b378f60f2322",
    "CreationTimestamp": "2019-07-23T23:52:17.165Z",
    "Id": "a454b62a-5d56-4ca9-bdc4-8254e1662cb0",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
loggers/a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
}
```

For more information, see Monitoring with AWS IoT Greengrass Logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateLoggerDefinition in *AWS CLI Command Reference*.

### `create-resource-definition-version`

The following code example shows how to use `create-resource-definition-version`.

#### AWS CLI

**To create a version of a resource definition**

The following `create-resource-definition-version` example creates a new version of a TwilioAuthToken.

```
aws greengrass create-resource-definition-version \
    --resource-definition-id "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38" \
    --resources "[{\"Id\": \"TwilioAuthToken\",\"Name\": \"MyTwilioAuthToken
\",\"ResourceDataContainer\": {\"SecretsManagerSecretResourceData\": {\"ARN\":
 \"arn:aws:secretsmanager:us-west-2:123456789012:secret:greengrass-TwilioAuthToken-
ntSlp6\"}}}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/b3bcada0-5fb6-42df-
bf0b-1ee4f15e769e",
    "CreationTimestamp": "2019-06-24T21:17:25.623Z",
    "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
    "Version": "b3bcada0-5fb6-42df-bf0b-1ee4f15e769e"
}
```

- For API details, see CreateResourceDefinitionVersion in *AWS CLI Command Reference*.

### `create-resource-definition`

The following code example shows how to use `create-resource-definition`.

**AWS CLI**

**To create a resource definition**

The following `create-resource-definition` example creates a resource definition that contains a list of resources to be used in a Greengrass group. In this example, an initial version of the resource definition is included by providing a list of resources. The list includes one resource for a Twilio authorization token and the ARN for a secret stored in AWS Secrets Manager. You must create the secret before you can create the resource definition.

```
aws greengrass create-resource-definition \
    --name MyGreengrassResources \
    --initial-version "{\"Resources\": [{\"Id\": \"TwilioAuthToken
\",\"Name\": \"MyTwilioAuthToken\",\"ResourceDataContainer\":
 {\"SecretsManagerSecretResourceData\": {\"ARN\": \"arn:aws:secretsmanager:us-
west-2:123456789012:secret:greengrass-TwilioAuthToken-ntSlp6\"}}}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
    "CreationTimestamp": "2019-06-19T21:51:28.212Z",
    "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
    "LastUpdatedTimestamp": "2019-06-19T21:51:28.212Z",
    "LatestVersion": "a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/a5f94d0b-
f6bc-40f4-bb78-7a1c5fe13ba1",
    "Name": "MyGreengrassResources"
}
```

For more information, see How to Configure Local Resource Access Using the AWS Command Line Interface in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateResourceDefinition in *AWS CLI Command Reference*.

### `create-software-update-job`

The following code example shows how to use `create-software-update-job`.

**AWS CLI**

**To create a software update job for a core**

The following `create-software-update-job` example creates an over-the-air (OTA) update job to update the AWS IoT Greengrass Core software on the core whose name is `MyFirstGroup_Core`. This command requires an IAM role that allows access to software update packages in Amazon S3 and includes `iot.amazonaws.com` as a trusted entity.

```
aws greengrass create-software-update-job \
    --update-targets-architecture armv7l \
    --update-targets [\"arn:aws:iot:us-west-2:123456789012:thing/MyFirstGroup_Core
\"] \
    --update-targets-operating-system raspbian \
    --software-to-update core \
    --s3-url-signer-role arn:aws:iam::123456789012:role/OTA_signer_role \
    --update-agent-log-level WARN
```

Output:

```
{
    "IotJobId": "GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",
    "IotJobArn": "arn:aws:iot:us-west-2:123456789012:job/
GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",
    "PlatformSoftwareVersion": "1.9.3"
}
```

For more information, see OTA Updates of AWS IoT Greengrass Core Software in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateSoftwareUpdateJob in *AWS CLI Command Reference*.

### `create-subscription-definition-version`

The following code example shows how to use `create-subscription-definition-version`.

**AWS CLI**

**To create a new version of a subscription definition**

The following `create-subscription-definition-version` example creates a new version of a subscription definition that contains three subscriptions: a trigger notification, a temperature input, and an output status.

```
aws greengrass create-subscription-definition-version \
    --subscription-definition-id "9d611d57-5d5d-44bd-a3b4-feccbdd69112" \
    --subscriptions "[{\"Id\": \"TriggerNotification\", \"Source\":
 \"arn:aws:lambda:us-west-2:123456789012:function:TempMonitor:GG_TempMonitor
\", \"Subject\": \"twilio/txt\", \"Target\": \"arn:aws:greengrass:us-west-2::/
connectors/TwilioNotifications/versions/1\"},{\"Id\": \"TemperatureInput\", \"Source
\": \"cloud\", \"Subject\": \"temperature/input\", \"Target\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\"},{\"Id\": \"OutputStatus
\", \"Source\": \"arn:aws:greengrass:us-west-2::/connectors/TwilioNotifications/
versions/1\", \"Subject\": \"twilio/message/status\", \"Target\": \"cloud\"}]"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/7b65dfae-50b6-4d0f-
b3e0-27728bfb0620",
    "CreationTimestamp": "2019-06-24T21:21:33.837Z",
    "Id": "9d611d57-5d5d-44bd-a3b4-feccbdd69112",
    "Version": "7b65dfae-50b6-4d0f-b3e0-27728bfb0620"
}
```

- For API details, see CreateSubscriptionDefinitionVersion in *AWS CLI Command Reference*.

### `create-subscription-definition`

The following code example shows how to use `create-subscription-definition`.

**AWS CLI**

**To create a subscription definition**

The following `create-subscription-definition` example creates a subscription definition and specifies its initial version. The initial version contains three subscriptions: one for the

MQTT topic to which the connector subscribes, one to allow a function to receive temperature readings from AWS IoT, and one to allow AWS IoT to receive status information from the connector. The example provides the ARN for the Lambda function alias that was created earlier by using Lambda's `create-alias` command.

```
aws greengrass create-subscription-definition \
    --initial-version "{\"Subscriptions\": [{\"Id\":
 \"TriggerNotification\", \"Source\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\", \"Subject\":
 \"twilio/txt\", \"Target\": \"arn:aws:greengrass:us-west-2::/connectors/
TwilioNotifications/versions/1\"},{\"Id\": \"TemperatureInput\", \"Source\":
 \"cloud\", \"Subject\": \"temperature/input\", \"Target\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\"},{\"Id\": \"OutputStatus
\", \"Source\": \"arn:aws:greengrass:us-west-2::/connectors/TwilioNotifications/
versions/1\", \"Subject\": \"twilio/message/status\", \"Target\": \"cloud\"}]}"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112",
    "CreationTimestamp": "2019-06-19T22:34:26.677Z",
    "Id": "9d611d57-5d5d-44bd-a3b4-feccbdd69112",
    "LastUpdatedTimestamp": "2019-06-19T22:34:26.677Z",
    "LatestVersion": "aa645c47-ac90-420d-9091-8c7ffa4f103f",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/aa645c47-
ac90-420d-9091-8c7ffa4f103f"
}
```

For more information, see Getting Started with Connectors (CLI) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see CreateSubscriptionDefinition in *AWS CLI Command Reference*.

## `delete-connector-definition`

The following code example shows how to use `delete-connector-definition`.

### AWS CLI

#### To delete a connector definition

The following `delete-connector-definition` example deletes the specified Greengrass connector definition. If you delete a connector definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-connector-definition \
    --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

This command produces no output.

- For API details, see DeleteConnectorDefinition in *AWS CLI Command Reference*.

### `delete-core-definition`

The following code example shows how to use `delete-core-definition`.

**AWS CLI**

**To delete a core definition**

The following `delete-core-definition` example deletes the specified Greengrass core definition, including all versions. If you delete a core that is associated with a Greengrass group, that group can't be deployed successfully.

```
aws greengrass delete-core-definition \
    --core-definition-id "ff36cc5f-9f98-4994-b468-9d9b6dc52abd"
```

This command produces no output.

- For API details, see DeleteCoreDefinition in *AWS CLI Command Reference*.

### `delete-device-definition`

The following code example shows how to use `delete-device-definition`.

**AWS CLI**

**To delete a device definition**

The following `delete-device-definition` example deletes the specified device definition, including all of its versions. If you delete a device definition version that is used by a group version, the group version cannot be deployed successfully.

```
aws greengrass delete-device-definition \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
```

This command produces no output.

- For API details, see DeleteDeviceDefinition in *AWS CLI Command Reference*.

### `delete-function-definition`

The following code example shows how to use `delete-function-definition`.

**AWS CLI**

**To delete a function definition**

The following `delete-function-definition` example deletes the specified Greengrass function definition. If you delete a function definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-function-definition \
    --function-definition-id "fd4b906a-dff3-4c1b-96eb-52ebfcfac06a"
```

This command produces no output.

- For API details, see DeleteFunctionDefinition in *AWS CLI Command Reference*.

### `delete-group`

The following code example shows how to use `delete-group`.

**AWS CLI**

**To delete a group**

The following `delete-group` example deletes the specified Greengrass group.

```
aws greengrass delete-group \
    --group-id "4e22bd92-898c-436b-ade5-434d883ff749"
```

This command produces no output.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

### `delete-logger-definition`

The following code example shows how to use `delete-logger-definition`.

**AWS CLI**

**To delete a logger definition**

The following `delete-logger-definition` example deletes the specified logger definition, including all logger definition versions. If you delete a logger definition version that is used by a group version, the group version cannot be deployed successfully.

```
aws greengrass delete-logger-definition \
    --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
```

This command produces no output.

For more information, see Monitoring with AWS IoT Greengrass Logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DeleteLoggerDefinition in *AWS CLI Command Reference*.

### `delete-resource-definition`

The following code example shows how to use `delete-resource-definition`.

**AWS CLI**

**To delete a resource definition**

The following `delete-resource-definition` example deletes the specified resource definition, including all resource versions. If you delete a resource definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-resource-definition \
    --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

This command produces no output.

- For API details, see DeleteResourceDefinition in *AWS CLI Command Reference*.

### `delete-subscription-definition`

The following code example shows how to use `delete-subscription-definition`.

**AWS CLI**

**To delete a subscription definition**

The following `delete-subscription-definition` example deletes the specified Greengrass subscription definition. If you delete a subscription that is being used by a group, that group can't be deployed successfully.

```
aws greengrass delete-subscription-definition \
    --subscription-definition-id "cd6f1c37-d9a4-4e90-be94-01a7404f5967"
```

This command produces no output.

- For API details, see DeleteSubscriptionDefinition in *AWS CLI Command Reference*.

### `disassociate-role-from-group`

The following code example shows how to use `disassociate-role-from-group`.

**AWS CLI**

**To disassociate the role from a Greengrass group**

The following `disassociate-role-from-group` example disassociates the IAM role from the specified Greengrass group.

```
aws greengrass disassociate-role-from-group \
    --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b
```

Output:

```
{
    "DisassociatedAt": "2019-09-10T20:05:49Z"
```

```
}
```

For more information, see Configure the Group Role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see DisassociateRoleFromGroup in *AWS CLI Command Reference*.

### `disassociate-service-role-from-account`

The following code example shows how to use `disassociate-service-role-from-account`.

**AWS CLI**

**To disassociate a service role from your AWS account**

The following `disassociate-service-role-from-account` example removes the service role that is associated with your AWS account. If you are not using the service role in any AWS Region, use the `delete-role-policy` command to detach the `AWSGreengrassResourceAccessRolePolicy` managed policy from the role, and then use the `delete-role` command to delete the role.

```
aws greengrass disassociate-service-role-from-account
```

Output:

```
{
    "DisassociatedAt": "2019-06-25T22:12:55Z"
}
```

For more information, see Greengrass Service Role in the **AWS IoT Greengrass Developer Guide**.

- For API details, see DisassociateServiceRoleFromAccount in *AWS CLI Command Reference*.

### `get-associated-role`

The following code example shows how to use `get-associated-role`.

**AWS CLI**

**To get the role associated with a Greengrass group**

The following `get-associated-role` example gets the IAM role that's associated with the specified Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services.

```
aws greengrass get-associated-role \
    --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b
```

Output:

```
{
    "RoleArn": "arn:aws:iam::123456789012:role/GG-Group-Role",
    "AssociatedAt": "2019-09-10T20:03:30Z"
}
```

For more information, see Configure the Group Role in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetAssociatedRole in *AWS CLI Command Reference*.

### `get-bulk-deployment-status`

The following code example shows how to use `get-bulk-deployment-status`.

#### AWS CLI

**To check the status of your bulk deployment**

The following `get-bulk-deployment-status` example retrieves status information for the specified bulk deployment operation. In this example, the file that specified the groups to be deployed has an invalid input record.

```
aws greengrass get-bulk-deployment-status \
    --bulk-deployment-id "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
```

Output:

```
{
    "BulkDeploymentMetrics": {
        "InvalidInputRecords": 1,
        "RecordsProcessed": 1,
        "RetryAttempts": 0
    },
```

```
    "BulkDeploymentStatus": "Completed",
    "CreatedAt": "2019-06-25T16:11:33.265Z",
    "tags": {}
}
```

For more information, see Create Bulk Deployments for Groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetBulkDeploymentStatus in *AWS CLI Command Reference*.

### `get-connectivity-info`

The following code example shows how to use `get-connectivity-info`.

#### AWS CLI

**To get the connectivity information for a Greengrass core**

The following `get-connectivity-info` example displays the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata.

```
aws greengrass get-connectivity-info \
    --thing-name "MyGroup_Core"
```

Output:

```
{
    "ConnectivityInfo": [
        {
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "127.0.0.1",
            "Id": "AUTOIP_127.0.0.1_0"
        },
        {
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "192.168.1.3",
            "Id": "AUTOIP_192.168.1.3_1"
        },
        {
```

```
            "Metadata": "",
            "PortNumber": 8883,
            "HostAddress": "::1",
            "Id": "AUTOIP_::1_2"
        },
        {
            "Metadata": "",
            "PortNumber": 8883,

### `get-connector-definition-version`

The following code example shows how to use `get-connector-definition-version`.

#### AWS CLI

**To retreive information about a specific version of a connector definition**

The following `get-connector-definition-version` example retrieves information about the specified version of the specified connector definition. To retrieve the IDs of all versions of the connector definition, use the `list-connector-definition-versions` command. To retrieve the ID of the last version added to the connector definition, use the `get-connector-definition` command and check the `LatestVersion` property.

```
aws greengrass get-connector-definition-version \
    --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8" \
    --connector-definition-version-id "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-
a7e2-7bf478ea2623",
    "CreationTimestamp": "2019-06-19T19:30:01.300Z",
```

```
    "Definition": {
        "Connectors": [
            {
                "ConnectorArn": "arn:aws:greengrass:us-west-2::/connectors/SNS/
versions/1",
                "Id": "MySNSConnector",
                "Parameters": {
                    "DefaultSNSArn": "arn:aws:sns:us-
west-2:123456789012:GGConnectorTopic"
                }
            }
        ]
    },
    "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "Version": "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
}
```

For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the **AWS IoT Greengrass Developer Guide**.

- For API details, see GetConnectorDefinitionVersion in *AWS CLI Command Reference*.

### `get-connector-definition`

The following code example shows how to use `get-connector-definition`.

#### AWS CLI

**To retrieve information about a connector definition**

The following `get-connector-definition` example retrieves information about the specified connector definition. To retrieve the IDs of your connector definitions, use the `list-connector-definitions` command.

```
aws greengrass get-connector-definition \
    --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
```

```
    "CreationTimestamp": "2019-06-19T19:30:01.300Z",
    "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",

    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-
c7c2-4a26-a7e2-7bf478ea2623",
    "Name": "MySNSConnector",
    "tags": {}
}
```

For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the **AWS IoT Greengrass Developer Guide**.

- For API details, see GetConnectorDefinition in *AWS CLI Command Reference*.

### `get-core-definition-version`

The following code example shows how to use `get-core-definition-version`.

#### AWS CLI

**To retrieve details about a specific version of the Greengrass core definition**

The following `get-core-definition-version` example retrieves information about the specified version of the specified core definition. To retrieve the IDs of all versions of the core definition, use the `list-core-definition-versions` command. To retrieve the ID of the last version added to the core definition, use the `get-core-definition` command and check the `LatestVersion` property.

```
aws greengrass get-core-definition-version \
    --core-definition-id "c906ed39-a1e3-4822-a981-7b9bd57b4b46"  \
    --core-definition-version-id "42aeeac3-fd9d-4312-a8fd-ffa9404a20e0"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/

            }
        ]
    },
    "Id": "c906ed39-a1e3-4822-a981-7b9bd57b4b46",
    "Version": "42aeeac3-fd9d-4312-a8fd-ffa9404a20e0"
}
```

- For API details, see GetCoreDefinitionVersion in *AWS CLI Command Reference*.

### `get-core-definition`

The following code example shows how to use `get-core-definition`.

#### AWS CLI

**To retrieve details for a Greengrass core definition**

The following `get-core-definition` example retrieves information about the specified core definition. To retrieve the IDs of your core definitions, use the `list-core-definitions` command.

```
aws greengrass get-core-definition \
    --core-definition-id "c906ed39-a1e3-4822-a981-7b9bd57b4b46"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
cores/237d6916-27cf-457f-ba0c-e86cfb5d25cd",
    "CreationTimestamp": "2018-10-18T04:47:06.721Z",
    "Id": "237d6916-27cf-457f-ba0c-e86cfb5d25cd",
    "LastUpdatedTimestamp": "2018-10-18T04:47:06.721Z",
    "LatestVersion": "bd2cd6d4-2bc5-468a-8962-39e071e34b68",
```

```
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/

    "tags": {}
}
```

- For API details, see GetCoreDefinition in *AWS CLI Command Reference*.

### `get-deployment-status`

The following code example shows how to use `get-deployment-status`.

**AWS CLI**

**To retrieve the status of a deployment**

The following `get-deployment-status` example retrieves the status for the specified deployment of the specified Greengrass group. To get the deployment ID, use the `list-deployments` command and specify the group ID.

```
aws greengrass get-deployment-status \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731" \
    --deployment-id "1065b8a0-812b-4f21-9d5d-e89b232a530f"
```

Output:

```
{
    "DeploymentStatus": "Success",
    "DeploymentType": "NewDeployment",
    "UpdatedAt": "2019-06-18T17:04:44.761Z"
}
```

- For API details, see GetDeploymentStatus in *AWS CLI Command Reference*.

### `get-device-definition-version`

The following code example shows how to use `get-device-definition-version`.

**AWS CLI**

**To get a device definition version**

The following `get-device-definition-version` example retrieves information about the specified version of the specified device definition. To retrieve the IDs of all versions of the device definition, use the `list-device-definition-versions` command. To retrieve the ID of the last version added to the device definition, use the `get-device-definition` command and check the `LatestVersion` property.

```
aws greengrass get-device-definition-version \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \
    --device-definition-version-id "83c13984-6fed-447e-84d5-5b8aa45d5f71"
```

Output:

```
{
    "Definition": {
        "Devices": [
            {
                "CertificateArn": "arn:aws:iot:us-

versions/83c13984-6fed-447e-84d5-5b8aa45d5f71"
}
```

- For API details, see GetDeviceDefinitionVersion in *AWS CLI Command Reference*.

### `get-device-definition`

The following code example shows how to use `get-device-definition`.

**AWS CLI**

**To get a device definition**

The following `get-device-definition` example retrieves information about the specified device definition. To retrieve the IDs of your device definitions, use the `list-device-definitions` command.

```
aws greengrass get-device-definition \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
```

Output:

```
{
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/

    "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd"
}
```

- For API details, see GetDeviceDefinition in *AWS CLI Command Reference*.

### `get-function-definition-version`

The following code example shows how to use `get-function-definition-version`.

**AWS CLI**

**To retrieve details about a specific version of a Lambda function**

The following `get-function-definition-version` retrieves information about the specified version of the specified function definition. To retrieve the IDs of all versions of the function definition, use the `list-function-definition-versions` command. To retrieve the ID of the last version added to the function definition, use the `get-function-definition` command and check the `LatestVersion` property.

```
aws greengrass get-function-definition-version \
    --function-definition-id "063f5d1a-1dd1-40b4-9b51-56f8993d0f85" \
    --function-definition-version-id "9748fda7-1589-4fcc-ac94-f5559e88678b"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
functions/063f5d1a-1dd1-40b4-9b51-56f8993d0f85/versions/9748fda7-1589-4fcc-ac94-

```
            }
        ]
    },
    "Id": "063f5d1a-1dd1-40b4-9b51-56f8993d0f85",
    "Version": "9748fda7-1589-4fcc-ac94-f5559e88678b"
}
```

- For API details, see GetFunctionDefinitionVersion in *AWS CLI Command Reference*.

### `get-function-definition`

The following code example shows how to use `get-function-definition`.

**AWS CLI**

**To retrieve a function definition**

The following `get-function-definition` example displays details for the specified function definition. To retrieve the IDs of your function definitions, use the `list-function-definitions` command.

```
aws greengrass get-function-definition \
    --function-definition-id "063f5d1a-1dd1-40b4-9b51-56f8993d0f85"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
functions/063f5d1a-1dd1-40b4-9b51-56f8993d0f85",
    "CreationTimestamp": "2019-06-18T16:21:21.431Z",
    "Id": "063f5d1a-1dd1-40b4-9b51-56f8993d0f85",

    "tags": {}
}
```

- For API details, see GetFunctionDefinition in *AWS CLI Command Reference*.

### `get-group-certificate-authority`

The following code example shows how to use `get-group-certificate-authority`.

**AWS CLI**

**To retrieve the CA associated with a Greengrass group**

The following `get-group-certificate-authority` example retrieves the certificate authority (CA) that is associated with the specified Greengrass group. To get the certificate authority ID, use the `list-group-certificate-authorities` command and specify the group ID.

```
aws greengrass get-group-certificate-authority \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731" \
    --certificate-authority-id
 "f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6"
```

Output:

```
{
    "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/certificateauthorities/

```

```
}
```

- For API details, see GetGroupCertificateAuthority in *AWS CLI Command Reference*.

### `get-group-certificate-configuration`

The following code example shows how to use `get-group-certificate-configuration`.

**AWS CLI**

**To retrieve the configuration for the certificate authority used by the Greengrass group**

The following `get-group-certificate-configuration` example retrieves the configuration for the certificate authority (CA) used by the specified Greengrass group.

```
aws greengrass get-group-certificate-configuration \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
    "CertificateAuthorityExpiryInMilliseconds": 2524607999000,
    "CertificateExpiryInMilliseconds": 604800000,
    "GroupId": "1013db12-8b58-45ff-acc7-704248f66731"
}
```

- For API details, see GetGroupCertificateConfiguration in *AWS CLI Command Reference*.

### `get-group-version`

The following code example shows how to use `get-group-version`.

**AWS CLI**

**To retrieve information about a version of a Greengrass group**

The following `get-group-version` example retrieves information about the specified version of the specified group. To retrieve the IDs of all versions of the group, use the `list-group-versions` command. To retrieve the ID of the last version added to the group, use the `get-group` command and check the `LatestVersion` property.

```
aws greengrass get-group-version \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731"  \
    --group-version-id "115136b3-cfd7-4462-b77f-8741a4b00e5e"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

### `get-group`

The following code example shows how to use `get-group`.

### AWS CLI

#### To retrieve information about a Greengrass group

The following `get-group` example retrieves information about the specified Greengrass group. To retrieve the IDs of your groups, use the `list-groups` command.

```
aws greengrass get-group \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/1013db12-8b58-45ff-acc7-704248f66731",
    "CreationTimestamp": "2019-06-18T16:21:21.457Z",
    "Id": "1013db12-8b58-45ff-acc7-704248f66731",
    "LastUpdatedTimestamp": "2019-06-18T16:21:21.457Z",
    "LatestVersion": "115136b3-cfd7-4462-b77f-8741a4b00e5e",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-
b77f-8741a4b00e5e",
    "Name": "GGGroup4Pi3",
    "tags": {}
}
```

- For API details, see GetGroup in *AWS CLI Command Reference*.

### `get-logger-definition-version`

The following code example shows how to use `get-logger-definition-version`.

#### AWS CLI

**To retrieve information about a version of a logger definition**

The following `get-logger-definition-version` example retrieves information about the specified version of the specified logger definition. To retrieve the IDs of all versions of the logger definition, use the `list-logger-definition-versions` command. To retrieve the ID of the last version added to the logger definition, use the `get-logger-definition` command and check the `LatestVersion` property.

```
aws greengrass get-logger-definition-version \
    --logger-definition-id "49eeeb66-f1d3-4e34-86e3-3617262abf23" \
    --logger-definition-version-id "5e3f6f64-a565-491e-8de0-3c0d8e0f2073"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23/versions/5e3f6f64-
a565-491e-8de0-3c0d8e0f2073",
```

```
    "CreationTimestamp": "2019-05-08T16:10:13.866Z",
    "Definition": {
        "Loggers": []
    },
    "Id": "49eeeb66-f1d3-4e34-86e3-3617262abf23",
    "Version": "5e3f6f64-a565-491e-8de0-3c0d8e0f2073"
}
```

- For API details, see GetLoggerDefinitionVersion in *AWS CLI Command Reference*.

### `get-logger-definition`

The following code example shows how to use `get-logger-definition`.

**AWS CLI**

**To retrieve information about a logger definition**

The following `get-logger-definition` example retrieves information about the specified logger definition. To retrieve the IDs of your logger definitions, use the `list-logger-definitions` command.

```
aws greengrass get-logger-definition \
    --logger-definition-id "49eeeb66-f1d3-4e34-86e3-3617262abf23"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23",
    "CreationTimestamp": "2019-05-08T16:10:13.809Z",
    "Id": "49eeeb66-f1d3-4e34-86e3-3617262abf23",

    "tags": {}
}
```

- For API details, see GetLoggerDefinition in *AWS CLI Command Reference*.

### `get-resource-definition-version`

The following code example shows how to use `get-resource-definition-version`.

**AWS CLI**

**To retrieve information about a specific version of a resource definition**

The following `get-resource-definition-version` example retrieves information about the specified version of the specified resource definition. To retrieve the IDs of all versions of the resource definition, use the `list-resource-definition-versions` command. To retrieve the ID of the last version added to the resource definition, use the `get-resource-definition` command and check the `LatestVersion` property.

```
aws greengrass get-resource-definition-version \
    --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658" \
    --resource-definition-version-id "26e8829a-491a-464d-9c87-664bf6f6f2be"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658/
versions/26e8829a-491a-464d-9c87-664bf6f6f2be",
    "CreationTimestamp": "2019-06-19T16:40:59.392Z",
    "Definition": {
        "Resources": [
            {
                "Id": "26ff3f7b-839a-4217-9fdc-a218308b3963",
                "Name": "usb-port",

                    "LocalDeviceResourceData": {
                        "GroupOwnerSetting": {
                            "AutoAddGroupOwner": false
                        },
                        "SourcePath": "/dev/bus/usb"
                    }
                }
            }
        ]
    },
    "Id": "ad8c101d-8109-4b0e-b97d-9cc5802ab658",
```

```
    "Version": "26e8829a-491a-464d-9c87-664bf6f6f2be"
}
```

- For API details, see GetResourceDefinitionVersion in *AWS CLI Command Reference*.

### `get-resource-definition`

The following code example shows how to use `get-resource-definition`.

**AWS CLI**

**To retrieve information about a resource definition**

The following `get-resource-definition` example retrieves information about the specified resource definition. To retrieve the IDs of your resource definitions, use the `list-resource-definitions` command.

```
aws greengrass get-resource-definition \
    --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658",
    "CreationTimestamp": "2019-06-19T16:40:59.261Z",
    "Id": "ad8c101d-8109-4b0e-b97d-9cc5802ab658",
    "LastUpdatedTimestamp": "2019-06-19T16:40:59.261Z",
    "LatestVersion": "26e8829a-491a-464d-9c87-664bf6f6f2be",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658/
versions/26e8829a-491a-464d-9c87-664bf6f6f2be",
    "tags": {}
}
```

- For API details, see GetResourceDefinition in *AWS CLI Command Reference*.

### `get-service-role-for-account`

The following code example shows how to use `get-service-role-for-account`.

**AWS CLI**

**To retrieve the details for the service role that is attached to your account**

The following `get-service-role-for-account` example retrieves information about the service role that is attached to your AWS account.

```
aws greengrass get-service-role-for-account
```

Output:

```
{
    "AssociatedAt": "2018-10-18T15:59:20Z",
    "RoleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see Greengrass Service Role in the **AWS IoT Greengrass Developer Guide**.

- For API details, see GetServiceRoleForAccount in *AWS CLI Command Reference*.

## `get-subscription-definition-version`

The following code example shows how to use `get-subscription-definition-version`.

**AWS CLI**

**To retrieve information about a specific version of a subscription definition**

The following `get-subscription-definition-version` example retrieves retrieves information about the specified version of the specified subscription definition. To retrieve the IDs of all versions of the subscription definition, use the `list-subscription-definition-versions` command. To retrieve the ID of the last version added to the subscription definition, use the `get-subscription-definition` command and check the `LatestVersion` property.

```
aws greengrass get-subscription-definition-version \
    --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152" \
    --subscription-definition-version-id "88ae8699-12ac-4663-ba3f-4d7f0519140b"
```

Output:

```
{
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/versions/88ae8699-12ac-4663-
ba3f-4d7f0519140b",
    "CreationTimestamp": "2019-06-18T17:03:52.499Z",
    "Definition": {
        "Subscriptions": [
            {
                "Id": "692c4484-d89f-4f64-8edd-1a041a65e5b6",
                "Source": "arn:aws:lambda:us-
west-2:123456789012:function:Greengrass_HelloWorld:GG_HelloWorld",
                "Subject": "hello/world",
                "Target": "cloud"
            }
        ]
    },
    "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
    "Version": "88ae8699-12ac-4663-ba3f-4d7f0519140b"
}
```

- For API details, see GetSubscriptionDefinitionVersion in *AWS CLI Command Reference*.

### `get-subscription-definition`

The following code example shows how to use `get-subscription-definition`.

#### AWS CLI

**To retrieve information about a subscription definition**

The following `get-subscription-definition` example retrieves information about the specified subscription definition. To retrieve the IDs of your subscription definitions, use the `list-subscription-definitions` command.

```
aws greengrass get-subscription-definition \
    --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152"
```

Output:

```
{
```

```
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152",
    "CreationTimestamp": "2019-06-18T17:03:52.392Z",
    "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
    "LastUpdatedTimestamp": "2019-06-18T17:03:52.392Z",
    "LatestVersion": "88ae8699-12ac-4663-ba3f-4d7f0519140b",
    "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/
versions/88ae8699-12ac-4663-ba3f-4d7f0519140b",
    "tags": {}
}
```

- For API details, see GetSubscriptionDefinition in *AWS CLI Command Reference*.

### `get-thing-runtime-configuration`

The following code example shows how to use `get-thing-runtime-configuration`.

**AWS CLI**

**To retrieve the runtime configuration of a Greengrass core**

The following `get-thing-runtime-configuration` example retrieves the runtime configuration of a Greengrass core. Before you can retrieve the runtime configuration, you must use the `update-thing-runtime-configuration` command to create a runtime configuration for the core.

```
aws greengrass get-thing-runtime-configuration \
    --thing-name SampleGreengrassCore
```

Output:

```
{
    "RuntimeConfiguration": {
        "TelemetryConfiguration": {
            "ConfigurationSyncStatus": "OutOfSync",
            "Telemetry": "On"
        }
    }
}
```

For more information, see Configuring telemetry settings in the *AWS IoT Greengrass Developer Guide*.

- For API details, see GetThingRuntimeConfiguration in *AWS CLI Command Reference*.

### `list-bulk-deployment-detailed-reports`

The following code example shows how to use `list-bulk-deployment-detailed-reports`.

**AWS CLI**

**To list information about individual deployments in a bulk deployment**

The following `list-bulk-deployment-detailed-reports` example displays information about the individual deployments in a bulk deployment operation, including status.

```
aws greengrass list-bulk-deployment-detailed-reports \
    --bulk-deployment-id 42ce9c42-489b-4ed4-b905-8996aa50ef9d
```

Output:

```
{
    "Deployments": [
        {
            "DeploymentType": "NewDeployment",
            "DeploymentStatus": "Success",
            "DeploymentId": "123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333/
deployments/123456789012:123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333/
versions/123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "CreatedAt": "2020-01-21T21:34:16.501Z"
        },
        {
            "DeploymentType": "NewDeployment",
            "DeploymentStatus": "InProgress",
            "DeploymentId": "123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555/
deployments/123456789012:123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
```

```
            "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/a1b2c3d4-5678-90ab-cdef-EXAMPLE55555/versions/a1b2c3d4-5678-90ab-cdef-
EXAMPLE66666",
            "CreatedAt": "2020-01-21T21:34:16.486Z"
        },
        ...
    ]
}
```

For more information, see Create Bulk Deployments for Groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ListBulkDeploymentDetailedReports in *AWS CLI Command Reference*.

### `list-bulk-deployments`

The following code example shows how to use `list-bulk-deployments`.

#### AWS CLI

**To list bulk deployments**

The following `list-bulk-deployments` example lists all bulk deployments.

```
aws greengrass list-bulk-deployments
```

Output:

```
{
    "BulkDeployments": [
        {
            "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/bulk/deployments/870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
            "BulkDeploymentId": "870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
            "CreatedAt": "2019-06-25T16:11:33.265Z"
        }
    ]
}
```

For more information, see Create Bulk Deployments for Groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ListBulkDeployments in *AWS CLI Command Reference*.

### `list-connector-definition-versions`

The following code example shows how to use `list-connector-definition-versions`.

**AWS CLI**

**To list the versions that are available for a connector definition**

The following `list-connector-definition-versions` example lists the versions that are available for the specified connector definition. Use the `list-connector-definitions` command to get the connector definition ID.

```
aws greengrass list-connector-definition-versions \
    --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-
c7c2-4a26-a7e2-7bf478ea2623",
            "CreationTimestamp": "2019-06-19T19:30:01.300Z",
            "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
            "Version": "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
        }
    ]
}
```

For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the **AWS IoT Greengrass Developer Guide**.

- For API details, see ListConnectorDefinitionVersions in *AWS CLI Command Reference*.

### `list-connector-definitions`

The following code example shows how to use `list-connector-definitions`.

**AWS CLI**

**To list the Greengrass connectors that are defined**

The following `list-connector-definitions` example lists all of the Greengrass connectors that are defined for your AWS account.

```
aws greengrass list-connector-definitions
```

Output:

```
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
            "CreationTimestamp": "2019-06-19T19:30:01.300Z",
            "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
            "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
            "LatestVersion": "63c57963-c7c2-4a26-a7e2-7bf478ea2623",
            "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/
versions/63c57963-c7c2-4a26-a7e2-7bf478ea2623",
            "Name": "MySNSConnector"
        }
    ]
}
```

For more information, see Integrate with Services and Protocols Using Greengrass Connectors in the **AWS IoT Greengrass Developer Guide**.

- For API details, see ListConnectorDefinitions in *AWS CLI Command Reference*.

### `list-core-definition-versions`

The following code example shows how to use `list-core-definition-versions`.

#### AWS CLI

**To list the versions of a Greengrass core definition**

The following `list-core-definitions` example lists all versions of the specied Greengrass core definition. You can use the `list-core-definitions` command to get the version ID.

```
aws greengrass list-core-definition-versions \
```

```
    --core-definition-id "eaf280cb-138c-4d15-af36-6f681a1348f7"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/cores/eaf280cb-138c-4d15-af36-6f681a1348f7/versions/467c36e4-c5da-440c-
a97b-084e62593b4c",
            "CreationTimestamp": "2019-06-18T16:14:17.709Z",
            "Id": "eaf280cb-138c-4d15-af36-6f681a1348f7",
            "Version": "467c36e4-c5da-440c-a97b-084e62593b4c"
        }
    ]
}
```

- For API details, see ListCoreDefinitionVersions in *AWS CLI Command Reference*.

### `list-core-definitions`

The following code example shows how to use `list-core-definitions`.

**AWS CLI**

**To list Greengrass core definitions**

The following `list-core-definitions` example lists all of the Greengrass core definitions for your AWS account.

```
aws greengrass list-core-definitions
```

Output:

```
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

        }
    ]
}
```

- For API details, see ListCoreDefinitions in *AWS CLI Command Reference*.

### `list-deployments`

The following code example shows how to use `list-deployments`.

**AWS CLI**

**To list the deployments for a Greengrass group**

The following `list-deployments` example lists the deployments for the specified Greengrass group. You can use the `list-groups` command to look up your group ID.

```
aws greengrass list-deployments \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
    "Deployments": [
        {
            "CreatedAt": "2019-06-18T17:04:32.702Z",
            "DeploymentId": "1065b8a0-812b-4f21-9d5d-e89b232a530f",
            "DeploymentType": "NewDeployment",
            "GroupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/1013db12-8b58-45ff-acc7-704248f66731/versions/115136b3-cfd7-4462-
b77f-8741a4b00e5e"
        }
    ]
}
```

- For API details, see ListDeployments in *AWS CLI Command Reference*.

### `list-device-definition-versions`

The following code example shows how to use `list-device-definition-versions`.

**AWS CLI**

**To list the versions of a device definition**

The following `list-device-definition-versions` example displays the device definition versions associated with the specified device definition.

```
aws greengrass list-device-definition-versions \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
```

Output:

```
{
    "Versions": [
        {
            "Version": "83c13984-6fed-447e-84d5-5b8aa45d5f71",
            "CreationTimestamp": "2019-09-11T00:15:09.838Z",
            "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/83c13984-6fed-447e-84d5-5b8aa45d5f71"
        },
        {
            "Version": "3b5cc510-58c1-44b5-9d98-4ad858ffa795",
            "CreationTimestamp": "2019-09-11T00:11:06.197Z",
            "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd",
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/
versions/3b5cc510-58c1-44b5-9d98-4ad858ffa795"
        }
    ]
}
```

- For API details, see ListDeviceDefinitionVersions in *AWS CLI Command Reference*.

## `list-device-definitions`

The following code example shows how to use `list-device-definitions`.

### AWS CLI

#### To list your device definitions

The following `list-device-definitions` example displays details about the device definitions in your AWS account in the specified AWS Region.

```
aws greengrass list-device-definitions \
    --region us-west-2
```

Output:

```
{
    "Definitions": [
        {
            "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/

        }
    ]
}
```

- For API details, see ListFunctionDefinitions in *AWS CLI Command Reference*.

### `list-group-certificate-authorities`

The following code example shows how to use `list-group-certificate-authorities`.

**AWS CLI**

**To list the current CAs for a group**

The following `list-group-certificate-authorities` example lists the current certificate authorities (CAs) for the specified Greengrass group.

```
aws greengrass list-group-certificate-authorities \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
    "GroupCertificateAuthorities": [
        {
            "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-
west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/
certificateauthorities/
f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6",
            "GroupCertificateAuthorityId":
 "f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6"
        }
    ]
}
```

- For API details, see ListGroupCertificateAuthorities in *AWS CLI Command Reference*.

## `list-group-versions`

The following code example shows how to use `list-group-versions`.

**AWS CLI**

**To list the versions of a Greengrass group**

The following `list-group-versions` example lists the versions of the specified Greengrass group.

```
aws greengrass list-group-versions \
    --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

### `list-logger-definition-versions`

The following code example shows how to use `list-logger-definition-versions`.

**AWS CLI**

**To get a list of versions of a logger definition**

The following `list-logger-definition-versions` example gets a list of all versions of the specified logger definition.

```
aws greengrass list-logger-definition-versions \
    --logger-definition-id "49eeeb66-f1d3-4e34-86e3-3617262abf23"
```

Output:

```
{
    "Versions": [
        {
```

```
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

            "CreationTimestamp": "2019-05-08T16:10:13.809Z",
            "Id": "49eeeb66-f1d3-4e34-86e3-3617262abf23",
            "Version": "3ec6d3af-eb85-48f9-a16d-1c795fe696d7"
        }
    ]
}
```

- For API details, see ListLoggerDefinitionVersions in *AWS CLI Command Reference*.

### `list-logger-definitions`

The following code example shows how to use `list-logger-definitions`.

#### AWS CLI

**To get a list of logger definitions**

The following `list-logger-definitions` example lists all of the logger definitions for your AWS account.

```
aws greengrass list-logger-definitions
```

Output:

```
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/loggers/49eeeb66-f1d3-4e34-86e3-3617262abf23",
            "CreationTimestamp": "2019-05-08T16:10:13.809Z",
```

```
            "Id": "49eeeb66-f1d3-4e34-86e3-3617262abf23",
            "LastUpdatedTimestamp": "2019-05-08T16:10:13.809Z",

        }
    ]
}
```

- For API details, see ListLoggerDefinitions in *AWS CLI Command Reference*.

### `list-resource-definition-versions`

The following code example shows how to use `list-resource-definition-versions`.

#### AWS CLI

**To list the versions of a resource definition**

The following `list-resource-definition-versions` example lists the versions for the specified Greengrass resource.

```
aws greengrass list-resource-definition-versions \
    --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/

versions/432d92f6-12de-4ec9-a704-619a942a62aa",
```

```
            "CreationTimestamp": "2019-06-19T16:40:59.261Z",
            "Id": "ad8c101d-8109-4b0e-b97d-9cc5802ab658",
            "Version": "432d92f6-12de-4ec9-a704-619a942a62aa"
        }
    ]
}
```

- For API details, see ListResourceDefinitionVersions in *AWS CLI Command Reference*.

### `list-resource-definitions`

The following code example shows how to use `list-resource-definitions`.

#### AWS CLI

**To list the resources that are defined**

The following `list-resource-definitions` example lists the resources that are defined for AWS IoT Greengrass to use.

```
aws greengrass list-resource-definitions
```

Output:

```
{
    "Definitions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

### `list-subscription-definition-versions`

The following code example shows how to use `list-subscription-definition-versions`.

**AWS CLI**

**To list the versions of a subscription definition**

The following `list-subscription-definition-versions` example lists all versions of the specified subscription. You can use the `list-subscription-definitions` command to look up the subscription ID.

```
aws greengrass list-subscription-definition-versions \
    --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152"
```

Output:

```
{
    "Versions": [
        {
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/
versions/88ae8699-12ac-4663-ba3f-4d7f0519140b",
            "CreationTimestamp": "2019-06-18T17:03:52.499Z",
            "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
            "Version": "88ae8699-12ac-4663-ba3f-4d7f0519140b"
        },
        {
```

```
            "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/versions/7e320ba3-

versions/086d1b08-b25a-477c-a16f-6f9b3a9c295a"
        }
    ]
}
```

- For API details, see ListSubscriptionDefinitions in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list the tags attached to a resource**

The following `list-tags-for-resource` example lists the tags and their values that are attached to the specified resource.

```
aws greengrass list-tags-for-resource \
    --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

Output:

```
{
    "tags": {
        "ResourceSubType": "USB",
        "ResourceType": "Device"
    }
}
```

For more information, see Tagging Your Greengrass Resources in the **AWS IoT Greengrass Developer Guide**.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `reset-deployments`

The following code example shows how to use `reset-deployments`.

**AWS CLI**

**To clean up deployment information for a Greengrass group**

The following `reset-deployments` example cleans up deployment information for the specified Greengrass group. When you add the `--force option`, the deployment information is reset without waiting for the core device to respond.

```
aws greengrass reset-deployments \
    --group-id "1402daf9-71cf-4cfe-8be0-d5e80526d0d8" \
    --force
```

Output:

```
{
    "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/1402daf9-71cf-4cfe-8be0-d5e80526d0d8/
deployments/7dd4e356-9882-46a3-9e28-6d21900c011a",
    "DeploymentId": "7dd4e356-9882-46a3-9e28-6d21900c011a"
}
```

For more information, see Reset Deployments in the *AWS IoT Greengrass Developer Guide*.

- For API details, see ResetDeployments in *AWS CLI Command Reference*.

### `start-bulk-deployment`

The following code example shows how to use `start-bulk-deployment`.

**AWS CLI**

**To start a bulk deployment operation**

The following `start-bulk-deployment` example starts a bulk deployment operation, using a file stored in an S3 bucket to specify the groups to be deployed.

```
aws greengrass start-bulk-deployment \
    --cli-input-json "{\"InputFileUri\":\"https://gg-group-deployment1.s3-us-
west-2.amazonaws.com/MyBulkDeploymentInputFile.txt\", \"ExecutionRoleArn\":
\"arn:aws:iam::123456789012:role/ggCreateDeploymentRole\",\"AmznClientToken\":
\"yourAmazonClientToken\"}"
```

Output:

```
{
    "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
bulk/deployments/870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
    "BulkDeploymentId": "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
}
```

For more information, see Create Bulk Deployments for Groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see StartBulkDeployment in *AWS CLI Command Reference*.

### `stop-bulk-deployment`

The following code example shows how to use `stop-bulk-deployment`.

**AWS CLI**

**To stop a bulk deployment**

The following `stop-bulk-deployment` example stops the specified bulk deployment. If you try to stop a bulk deployment that is complete, you receive an error: `InvalidInputException: Cannot change state of finished execution.`

```
aws greengrass stop-bulk-deployment \
    --bulk-deployment-id "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
```

This command produces no output.

For more information, see Create Bulk Deployments for Groups in the *AWS IoT Greengrass Developer Guide*.

- For API details, see StopBulkDeployment in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To apply tags to a resource**

The following `tag-resource` example applies two tags, `ResourceType` and `ResourceSubType`, to the specified Greengrass resource. This operation can both add new tags and values or update the value for existing tags. Use the `untag-resource` command to remove a tag.

```
aws greengrass tag-resource \
    --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658" \
    --tags "ResourceType=Device,ResourceSubType=USB"
```

This command produces no output.

For more information, see Tagging Your Greengrass Resources in the **AWS IoT Greengrass Developer Guide**.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag and its value from a resource**

The following `untag-resource` example removes the tag whose key is `Category` from the specified Greengrass group. If the key `Category` does not exist for the specified resource, no error is returned.

```
aws greengrass untag-resource \
    --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/1013db12-8b58-45ff-acc7-704248f66731" \
    --tag-keys "Category"
```

This command produces no output.

For more information, see Tagging Your Greengrass Resources in the **AWS IoT Greengrass Developer Guide**.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-connectivity-info`

The following code example shows how to use `update-connectivity-info`.

**AWS CLI**

**To update the connectivity information for a Greengrass core**

The following `update-connectivity-info` example changes the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata. You might need to update connectivity information when the local network changes.

```
aws greengrass update-connectivity-info \
    --thing-name "MyGroup_Core" \
    --connectivity-info "[{\"Metadata\":\"\",\"PortNumber\":8883,\"HostAddress\":
\"127.0.0.1\",\"Id\":\"localhost_127.0.0.1_0\"},{\"Metadata\":\"\",\"PortNumber
\":8883,\"HostAddress\":\"192.168.1.3\",\"Id\":\"localIP_192.168.1.3\"}]"
```

Output:

```
{
    "Version": "312de337-59af-4cf9-a278-2a23bd39c300"
}
```

- For API details, see UpdateConnectivityInfo in *AWS CLI Command Reference*.

### `update-connector-definition`

The following code example shows how to use `update-connector-definition`.

**AWS CLI**

**To update the name for a connector definition**

The following `update-connector-definition` example updates the name for the specified connector definition. If you want to update the details for the connector, use the `create-connector-definition-version` command to create a new version.

```
aws greengrass update-connector-definition \
    --connector-definition-id "55d0052b-0d7d-44d6-b56f-21867215e118" \
    --name "GreengrassConnectors2019"
```

For more information, see Integrate with Services and Protocols Using Connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateConnectorDefinition in *AWS CLI Command Reference*.

### `update-core-definition`

The following code example shows how to use `update-core-definition`.

**AWS CLI**

**To update a core definition**

The following `update-core-definition` example changes the name of the specified core definition. You can update only the `name` property of a core definition.

```
aws greengrass update-core-definition \
    --core-definition-id "582efe12-b05a-409e-9a24-a2ba1bcc4a12" \
    --name "MyCoreDevices"
```

This command produces no output.

For more information, see Configure the AWS IoT Greengrass Core in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateCoreDefinition in *AWS CLI Command Reference*.

### `update-device-definition`

The following code example shows how to use `update-device-definition`.

**AWS CLI**

**To update a device definition**

The following `update-device-definition` example changes the name of the specified device definition. You can only update the `name` property of a device definition.

```
aws greengrass update-device-definition \
    --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \
    --name "TemperatureSensors"
```

This command produces no output.

- For API details, see UpdateDeviceDefinition in *AWS CLI Command Reference*.

### `update-function-definition`

The following code example shows how to use `update-function-definition`.

**AWS CLI**

**To update the name for a function definition**

The following `update-function-definition` example updates the name for the specified function definition. If you want to update the details for the function, use the `create-function-definition-version` command to create a new version.

```
aws greengrass update-function-definition \
    --function-definition-id "e47952bd-dea9-4e2c-a7e1-37bbe8807f46" \
    --name ObsoleteFunction
```

This command produces no output.

For more information, see Run Local Lambda Functions in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateFunctionDefinition in *AWS CLI Command Reference*.

### `update-group-certificate-configuration`

The following code example shows how to use `update-group-certificate-configuration`.

**AWS CLI**

**To update the expiry of a group's certificates**

The following `update-group-certificate-configuration` example sets a 10-day expiry for the certificates generated for the specified group.

```
aws greengrass update-group-certificate-configuration \
    --group-id "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1" \
    --certificate-expiry-in-milliseconds 864000000
```

Output:

```
{
    "CertificateExpiryInMilliseconds": 864000000,
    "CertificateAuthorityExpiryInMilliseconds": 2524607999000,
    "GroupId": "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1"
}
```

For more information, see AWS IoT Greengrass Security in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateGroupCertificateConfiguration in *AWS CLI Command Reference*.

### `update-group`

The following code example shows how to use `update-group`.

**AWS CLI**

**To update the group name**

The following `update-group` example updates the name of the specified Greengrass group. If you want to update the details for the group, use the `create-group-version` command to create a new version.

```
aws greengrass update-group \
    --group-id "1402daf9-71cf-4cfe-8be0-d5e80526d0d8" \
    --name TestGroup4of6
```

For more information, see Configure AWS IoT Greengrass on AWS IoT in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

### `update-logger-definition`

The following code example shows how to use `update-logger-definition`.

**AWS CLI**

**To update a logger definition**

The following `update-logger-definition` example changes the name of the specified logger definition. You can only update the `name` property of a logger definition.

```
aws greengrass update-logger-definition \
    --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0" \
    --name "LoggingConfigsForSensors"
```

This command produces no output.

For more information, see Monitoring with AWS IoT Greengrass Logs in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateLoggerDefinition in *AWS CLI Command Reference*.

### `update-resource-definition`

The following code example shows how to use `update-resource-definition`.

**AWS CLI**

**To update the name for a resource definition**

The following `update-resource-definition` example updates the name for the specified resource definition. If you want to change the details for the resource, use the `create-resource-definition-version` command to create a new version.

```
aws greengrass update-resource-definition \
    --resource-definition-id "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38" \
    --name GreengrassConnectorResources
```

This command produces no output.

For more information, see Access Local Resources with Lambda Functions and Connectors in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateResourceDefinition in *AWS CLI Command Reference*.

### `update-subscription-definition`

The following code example shows how to use `update-subscription-definition`.

**AWS CLI**

**To update the name for a subscription definition**

The following `update-subscription-definition` example updates the name for the specified subscription definition. If you want to change details for the subscription, use the `create-subscription-definition-version` command to create a new version.

```
aws greengrass update-subscription-definition \
    --subscription-definition-id "fa81bc84-3f59-4377-a84b-5d0134da359b" \
    --name "ObsoleteSubscription"
```

This command produces no output.

For more information, see title in the *guide*.

- For API details, see UpdateSubscriptionDefinition in *AWS CLI Command Reference*.

### `update-thing-runtime-configuration`

The following code example shows how to use `update-thing-runtime-configuration`.

**AWS CLI**

**To turn on telemetry in the runtime configuration of a Greengrass core**

The following `update-thing-runtime-configuration` example updates the runtime configuration of a Greengrass core to turn on telemetry.

```
aws greengrass update-thing-runtime-configuration \
    --thing-name SampleGreengrassCore \
    --telemetry-configuration {\"Telemetry\":\"On\"}
```

This command produces no output.

For more information, see Configuring telemetry settings in the *AWS IoT Greengrass Developer Guide*.

- For API details, see UpdateThingRuntimeConfiguration in *AWS CLI Command Reference*.

## AWS IoT Greengrass V2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass V2.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `associate-service-role-to-account`

The following code example shows how to use `associate-service-role-to-account`.

#### AWS CLI

**To associate the Greengrass service role to your AWS account**

The following `associate-service-role-to-account` example associates a service role with AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 associate-service-role-to-account \
    --role-arn arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole
```

Output:

```
{
    "associatedAt": "2022-01-19T19:21:53Z"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see AssociateServiceRoleToAccount in *AWS CLI Command Reference*.

### `batch-associate-client-device-with-core-device`

The following code example shows how to use `batch-associate-client-device-with-core-device`.

#### AWS CLI

**To associate client devices with a core device**

The following `batch-associate-client-device-with-core-device` example associates two client devices with a core device.

```
aws greengrassv2 batch-associate-client-device-with-core-device \
  --core-device-thing-name MyGreengrassCore \
  --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```
{
    "errorEntries": []
}
```

For more information, see Interact with local IoT devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see BatchAssociateClientDeviceWithCoreDevice in *AWS CLI Command Reference*.

### `batch-disassociate-client-device-from-core-device`

The following code example shows how to use `batch-disassociate-client-device-from-core-device`.

**AWS CLI**

**To disassociate client devices from a core device**

The following `batch-disassociate-client-device-from-core-device` example disassociates two client devices from a core device.

```
aws greengrassv2 batch-disassociate-client-device-from-core-device \
  --core-device-thing-name MyGreengrassCore \
  --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```
{
    "errorEntries": []
}
```

For more information, see Interact with local IoT devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see BatchDisassociateClientDeviceFromCoreDevice in *AWS CLI Command Reference*.

### `cancel-deployment`

The following code example shows how to use `cancel-deployment`.

**AWS CLI**

**To cancel a deployment**

The following `cancel-deployment` example stops a continuous deployment to a thing group.

```
aws greengrassv2 cancel-deployment \
    --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "message": "SUCCESS"
}
```

For more information, see Cancel deployments in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see CancelDeployment in *AWS CLI Command Reference*.

### `create-component-version`

The following code example shows how to use `create-component-version`.

**AWS CLI**

**Example 1: To create a component version from a recipe**

The following `create-component-version` example creates a version of a Hello World component from a recipe file.

```
aws greengrassv2 create-component-version \
    --inline-recipe fileb://com.example.HelloWorld-1.0.0.json
```

Contents of `com.example.HelloWorld-1.0.0.json`:

```
{
    "RecipeFormatVersion": "2020-01-25",
    "ComponentName": "com.example.HelloWorld",
    "ComponentVersion": "1.0.0",
    "ComponentDescription": "My first AWS IoT Greengrass component.",
    "ComponentPublisher": "Amazon",
    "ComponentConfiguration": {
        "DefaultConfiguration": {
            "Message": "world"
        }
    },
    "Manifests": [
```

```
        {
            "Platform": {
                "os": "linux"
            },
            "Lifecycle": {
                "Run": "echo 'Hello {configuration:/Message}'"
            }
        }
    ]
}
```

Output:

```
{
    "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0",
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "creationTimestamp": "2021-01-07T16:24:33.650000-08:00",
    "status": {
        "componentState": "REQUESTED",
        "message": "NONE",
        "errors": {}
    }
}
```

For more information, see Create custom components and Upload components to deploy in the *AWS IoT Greengrass V2 Developer Guide*.

**Example 2: To create a component version from an AWS Lambda function**

The following `create-component-version` example creates a version of a Hello World component from an AWS Lambda function.

```
aws greengrassv2 create-component-version \
    --cli-input-json file://lambda-function-component.json
```

Contents of `lambda-function-component.json`:

```
{
    "lambdaFunction": {
```

```
        "lambdaArn": "arn:aws:lambda:us-
west-2:123456789012:function:HelloWorldPythonLambda:1",
        "componentName": "com.example.HelloWorld",
        "componentVersion": "1.0.0",
        "componentLambdaParameters": {
            "eventSources": [
                {
                    "topic": "hello/world/+",
                    "type": "IOT_CORE"
                }
            ]
        }
    }
}
```

Output:

```
{
    "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0",
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "creationTimestamp": "2021-01-07T17:05:27.347000-08:00",
    "status": {
        "componentState": "REQUESTED",
        "message": "NONE",
        "errors": {}
    }
}
```

For more information, see Run AWS Lambda functions in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see CreateComponentVersion in *AWS CLI Command Reference*.

## `create-deployment`

The following code example shows how to use `create-deployment`.

### AWS CLI

#### Example 1: To create a deployment

The following `create-deployment` example deploys the AWS IoT Greengrass Command Line Interface to a core device.

```
aws greengrassv2 create-deployment \
    --cli-input-json file://cli-deployment.json
```

Contents of `cli-deployment.json`:

```
{
    "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",
    "deploymentName": "Deployment for MyGreengrassCore",
    "components": {
        "aws.greengrass.Cli": {
            "componentVersion": "2.0.3"
        }
    },
    "deploymentPolicies": {
        "failureHandlingPolicy": "DO_NOTHING",
        "componentUpdatePolicy": {
            "timeoutInSeconds": 60,
            "action": "NOTIFY_COMPONENTS"
        },
        "configurationValidationPolicy": {
            "timeoutInSeconds": 60
        }
    },
    "iotJobConfiguration": {}
}
```

Output:

```
{
    "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create deployments in the *AWS IoT Greengrass V2 Developer Guide*.

**Example 2: To create a deployment that updates component configurations**

The following `create-deployment` example deploys the AWS IoT Greengrass nucleus component to a group of core devices. This deployment applies the following configuration updates for the nucleus component:

Reset the target devices' proxy settings to their default no proxy settings.Reset the target devices' MQTT settings to their defaults.Sets the JVM options for the nucleus' JVM.Sets the logging level for the nucleus.

```
aws greengrassv2 create-deployment \
    --cli-input-json file://nucleus-deployment.json
```

Contents of `nucleus-deployment.json`:

```
{
    "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
    "deploymentName": "Deployment for MyGreengrassCoreGroup",
    "components": {
        "aws.greengrass.Nucleus": {
            "componentVersion": "2.0.3",
            "configurationUpdate": {
                "reset": [
                    "/networkProxy",
                    "/mqtt"
                ],
                "merge": "{\"jvmOptions\":\"-Xmx64m\",\"logging\":{\"level\":\"WARN
\"}}"
            }
        }
    },
    "deploymentPolicies": {
        "failureHandlingPolicy": "ROLLBACK",
        "componentUpdatePolicy": {
            "timeoutInSeconds": 60,
            "action": "NOTIFY_COMPONENTS"
        },
        "configurationValidationPolicy": {
            "timeoutInSeconds": 60
        }
    },
    "iotJobConfiguration": {}
}
```

Output:

```
{
```

```
    "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222"
}
```

For more information, see Create deployments and Update component configurations in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see CreateDeployment in *AWS CLI Command Reference*.

### `delete-component`

The following code example shows how to use `delete-component`.

#### AWS CLI

**To delete a component version**

The following `delete-component` example deletes a Hello World component.

```
aws greengrassv2 delete-component \
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0
```

This command produces no output.

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DeleteComponent in *AWS CLI Command Reference*.

### `delete-core-device`

The following code example shows how to use `delete-core-device`.

#### AWS CLI

**To delete a core device**

The following `delete-core-device` example deletes an AWS IoT Greengrass core device.

```
aws greengrassv2 delete-core-device \
    --core-device-thing-name MyGreengrassCore
```

This command produces no output.

For more information, see Uninstall the AWS IoT Greengrass Core software in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DeleteCoreDevice in *AWS CLI Command Reference*.

### `describe-component`

The following code example shows how to use `describe-component`.

#### AWS CLI

**To describe a component version**

The following `describe-component` example describes a Hello World component.

```
aws greengrassv2 describe-component \
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0
```

Output:

```
{
    "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0",
    "componentName": "com.example.HelloWorld",
    "componentVersion": "1.0.0",
    "creationTimestamp": "2021-01-07T17:12:11.133000-08:00",
    "publisher": "Amazon",
    "description": "My first AWS IoT Greengrass component.",
    "status": {
        "componentState": "DEPLOYABLE",
        "message": "NONE",
        "errors": {}
    },
    "platforms": [
        {
            "attributes": {
                "os": "linux"
            }
        }
    ]
```

```
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DescribeComponent in *AWS CLI Command Reference*.

### `disassociate-service-role-from-account`

The following code example shows how to use `disassociate-service-role-from-account`.

**AWS CLI**

**To disassociate the Greengrass service role from your AWS account**

The following `disassociate-service-role-from-account` example disassociates the Greengrass service role from AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 disassociate-service-role-from-account
```

Output:

```
{
    "disassociatedAt": "2022-01-19T19:26:09Z"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see DisassociateServiceRoleFromAccount in *AWS CLI Command Reference*.

### `get-component-version-artifact`

The following code example shows how to use `get-component-version-artifact`.

**AWS CLI**

**To get a URL to download a component artifact**

The following `get-component-version-artifact` example gets a URL to download the local debug console component's JAR file.

```
aws greengrassv2 get-component-version-artifact \
```

```
    --arn arn:aws:greengrass:us-
west-2:aws:components:aws.greengrass.LocalDebugConsole:versions:2.0.3 \
    --artifact-name "Uvt6ZEzQ9TKiAuLbfXBX_APdY0TWks3uc46tHFHTzBM=/
aws.greengrass.LocalDebugConsole.jar"
```

Output:

```
{
    "preSignedUrl": "https://evergreencomponentmanageme-
artifactbucket7410c9ef-g18n1iya8kwr.s3.us-west-2.amazonaws.com/public/
aws.greengrass.LocalDebugConsole/2.0.3/s3/ggv2-component-releases-prod-pdx/
EvergreenHttpDebugView/2ffc496ba41b39568968b22c582b4714a937193ee7687a45527238e696672521/
aws.greengrass.LocalDebugConsole/aws.greengrass.LocalDebugConsole.jar?X-Amz-
Security-Token=KwfLKSdEXAMPLE..."
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetComponentVersionArtifact in *AWS CLI Command Reference*.

### `get-component`

The following code example shows how to use `get-component`.

#### AWS CLI

**Example 1: To download a component's recipe in YAML format (Linux, macOS, or Unix)**

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command does the following:

Uses the `--output` and `--query` parameters to control the command's output. These parameters extract the recipe blob from the command's output. For more information about controlling output, see Controlling Command Output in the *AWS Command Line Interface User Guide*.Uses the `base64` utility. This utility decodes the extracted blob to the original text. The blob that is returned by a successful `get-component` command is base64-encoded text. You must decode this blob to obtain the original text.Saves the decoded text to a file. The final section of the command (`> com.example.HelloWorld-1.0.0.json`) saves the decoded text to a file.

```
aws greengrassv2 get-component \
```

```
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0 \
    --recipe-output-format YAML \
    --query recipe \
    --output text | base64 --decode > com.example.HelloWorld-1.0.0.json
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

**Example 2: To download a component's recipe in YAML format (Windows CMD)**

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command uses the `certutil` utility.

```
aws greengrassv2 get-component ^
    --arn arn:aws:greengrass:us-
west-2:675946970638:components:com.example.HelloWorld:versions:1.0.0 ^
    --recipe-output-format YAML ^
    --query recipe ^
    --output text > com.example.HelloWorld-1.0.0.yaml.b64

certutil -decode com.example.HelloWorld-1.0.0.yaml.b64
 com.example.HelloWorld-1.0.0.yaml
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

**Example 3: To download a component's recipe in YAML format (Windows PowerShell)**

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command uses the `certutil` utility.

```
aws greengrassv2 get-component `
    --arn arn:aws:greengrass:us-
west-2:675946970638:components:com.example.HelloWorld:versions:1.0.0 `
    --recipe-output-format YAML `
    --query recipe `
    --output text > com.example.HelloWorld-1.0.0.yaml.b64

certutil -decode com.example.HelloWorld-1.0.0.yaml.b64
 com.example.HelloWorld-1.0.0.yaml
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetComponent in *AWS CLI Command Reference*.

### `get-connectivity-info`

The following code example shows how to use `get-connectivity-info`.

#### AWS CLI

**To get the connectivity information for a Greengrass core device**

The following `get-connectivity-info` example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```
aws greengrassv2 get-connectivity-info \
    --thing-name MyGreengrassCore
```

Output:

```
{
    "connectivityInfo": [
        {
            "id": "localIP_192.0.2.0",
            "hostAddress": "192.0.2.0",
            "portNumber": 8883
        }
    ]
}
```

For more information, see Manage core device endpoints in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetConnectivityInfo in *AWS CLI Command Reference*.

### `get-core-device`

The following code example shows how to use `get-core-device`.

#### AWS CLI

**To get a core device**

The following `get-core-device` example gets information about an AWS IoT Greengrass core device.

```
aws greengrassv2 get-core-device \
    --core-device-thing-name MyGreengrassCore
```

Output:

```
{
    "coreDeviceThingName": "MyGreengrassCore",
    "coreVersion": "2.0.3",
    "platform": "linux",
    "architecture": "amd64",
    "status": "HEALTHY",
    "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00",
    "tags": {}
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetCoreDevice in *AWS CLI Command Reference*.

### `get-deployment`

The following code example shows how to use `get-deployment`.

#### AWS CLI

**To get a deployment**

The following `get-deployment` example gets information about the deployment of the AWS IoT Greengrass nucleus component to a group of core devices.

```
aws greengrassv2 get-deployment \
    --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
    "revisionId": "14",
```

```
    "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "deploymentName": "Deployment for MyGreengrassCoreGroup",
    "deploymentStatus": "ACTIVE",
    "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
    "components": {
        "aws.greengrass.Nucleus": {
            "componentVersion": "2.0.3",
            "configurationUpdate": {
                "merge": "{\"jvmOptions\":\"-Xmx64m\",\"logging\":{\"level\":\"WARN
\"}}",
                "reset": [
                    "/networkProxy",
                    "/mqtt"
                ]
            }
        }
    },
    "deploymentPolicies": {
        "failureHandlingPolicy": "ROLLBACK",
        "componentUpdatePolicy": {
            "timeoutInSeconds": 60,
            "action": "NOTIFY_COMPONENTS"
        },
        "configurationValidationPolicy": {
            "timeoutInSeconds": 60
        }
    },
    "iotJobConfiguration": {},
    "creationTimestamp": "2021-01-07T17:21:20.691000-08:00",
    "isLatestForTarget": false,
    "tags": {}
}
```

For more information, see Deploy components to devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetDeployment in *AWS CLI Command Reference*.

### `get-service-role-for-account`

The following code example shows how to use `get-service-role-for-account`.

**AWS CLI**

**To get the Greengrass service role for your AWS account**

The following `get-service-role-for-account` example gets the service role that's associated with AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 get-service-role-for-account
```

Output:

```
{
    "associatedAt": "2022-01-19T19:21:53Z",
    "roleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see Greengrass service role in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see GetServiceRoleForAccount in *AWS CLI Command Reference*.

## `list-client-devices-associated-with-core-device`

The following code example shows how to use `list-client-devices-associated-with-core-device`.

**AWS CLI**

**To list the client devices associated with a core device**

The following `list-client-devices-associated-with-core-device` example lists all client devices associated with a core device.

```
aws greengrassv2 list-client-devices-associated-with-core-device \
  --core-device-thing-name MyTestGreengrassCore
```

Output:

```
{
    "associatedClientDevices": [
```

```
        {
            "thingName": "MyClientDevice2",
            "associationTimestamp": "2021-07-12T16:33:55.843000-07:00"
        },
        {
            "thingName": "MyClientDevice1",
            "associationTimestamp": "2021-07-12T16:33:55.843000-07:00"
        }
    ]
}
```

For more information, see Interact with local IoT devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListClientDevicesAssociatedWithCoreDevice in *AWS CLI Command Reference*.

### `list-component-versions`

The following code example shows how to use `list-component-versions`.

#### AWS CLI

**To list the versions of a component**

The following `list-component-versions` example lists all versions of a Hello World component.

```
aws greengrassv2 list-component-versions \
    --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld
```

Output:

```
{
    "componentVersions": [
        {
            "componentName": "com.example.HelloWorld",
            "componentVersion": "1.0.1",
            "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.1"
        },
```

```
        {
            "componentName": "com.example.HelloWorld",
            "componentVersion": "1.0.0",
            "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0"
        }
    ]
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListComponentVersions in *AWS CLI Command Reference*.

### `list-components`

The following code example shows how to use `list-components`.

#### AWS CLI

**To list components**

The following `list-components` example lists each component and its latest version defined in your AWS account in the current Region.

```
aws greengrassv2 list-components
```

Output:

```
{
    "components": [
        {
            "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld",
            "componentName": "com.example.HelloWorld",
            "latestVersion": {
                "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.1",
                "componentVersion": "1.0.1",
                "creationTimestamp": "2021-01-08T16:51:07.352000-08:00",
                "description": "My first AWS IoT Greengrass component.",
                "publisher": "Amazon",
                "platforms": [
```

```
                    {
                        "attributes": {
                            "os": "linux"
                        }
                    }
                ]
            }
        }
    ]
}
```

For more information, see Manage components in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListComponents in *AWS CLI Command Reference*.

### `list-core-devices`

The following code example shows how to use `list-core-devices`.

#### AWS CLI

**To list core devices**

The following `list-core-devices` example lists the AWS IoT Greengrass core devices in your AWS account in the current Region.

```
aws greengrassv2 list-core-devices
```

Output:

```
{
    "coreDevices": [
        {
            "coreDeviceThingName": "MyGreengrassCore",
            "status": "HEALTHY",
            "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00"
        }
    ]
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListCoreDevices in *AWS CLI Command Reference*.

### `list-deployments`

The following code example shows how to use `list-deployments`.

**AWS CLI**

**To list deployments**

The following `list-deployments` example lists the latest revision of each deployment defined in your AWS account in the current Region.

```
aws greengrassv2 list-deployments
```

Output:

```
{
    "deployments": [
        {
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
            "revisionId": "14",
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "deploymentName": "Deployment for MyGreengrassCoreGroup",
            "creationTimestamp": "2021-01-07T17:21:20.691000-08:00",
            "deploymentStatus": "ACTIVE",
            "isLatestForTarget": false
        },
        {
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/
MyGreengrassCore",
            "revisionId": "1",
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "deploymentName": "Deployment for MyGreengrassCore",
            "creationTimestamp": "2021-01-06T16:10:42.407000-08:00",
            "deploymentStatus": "COMPLETED",
            "isLatestForTarget": false
        }
    ]
}
```

For more information, see Deploy components to devices in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListDeployments in *AWS CLI Command Reference*.

### `list-effective-deployments`

The following code example shows how to use `list-effective-deployments`.

#### AWS CLI

**To list deployment jobs**

The following `list-effective-deployments` example lists the deployments that apply to an AWS IoT Greengrass core device.

```
aws greengrassv2 list-effective-deployments \
    --core-device-thing-name MyGreengrassCore
```

Output:

```
{
    "effectiveDeployments": [
        {
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "deploymentName": "Deployment for MyGreengrassCore",
            "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/
MyGreengrassCore",
            "coreDeviceExecutionStatus": "COMPLETED",
            "reason": "SUCCESSFUL",
            "creationTimestamp": "2021-01-06T16:10:42.442000-08:00",
            "modifiedTimestamp": "2021-01-08T17:21:27.830000-08:00"
        },
        {
            "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "deploymentName": "Deployment for MyGreengrassCoreGroup",
            "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",
            "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-
cdef-EXAMPLE44444",
            "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
MyGreengrassCoreGroup",
            "coreDeviceExecutionStatus": "SUCCEEDED",
```

```
            "reason": "SUCCESSFUL",
            "creationTimestamp": "2021-01-07T17:19:20.394000-08:00",
            "modifiedTimestamp": "2021-01-07T17:21:20.721000-08:00"
        }
    ]
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListEffectiveDeployments in *AWS CLI Command Reference*.

### `list-installed-components`

The following code example shows how to use `list-installed-components`.

#### AWS CLI

**To list components installed on a core device**

The following `list-installed-components` example lists the components that are installed on an AWS IoT Greengrass core device.

```
aws greengrassv2 list-installed-components \
    --core-device-thing-name MyGreengrassCore
```

Output:

```
{
    "installedComponents": [
        {
            "componentName": "aws.greengrass.Cli",
            "componentVersion": "2.0.3",
            "lifecycleState": "RUNNING",
            "isRoot": true
        },
        {
            "componentName": "aws.greengrass.Nucleus",
            "componentVersion": "2.0.3",
            "lifecycleState": "FINISHED",
            "isRoot": true
        }
```

```
    ]
}
```

For more information, see Check core device status in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListInstalledComponents in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list tags for a resource**

The following `list-tags-for-resource` example lists all tags for an AWS IoT Greengrass core device.

```
aws greengrassv2 list-tags-for-resource \
    --resource-arn arn:aws:greengrass:us-
west-2:123456789012:coreDevices:MyGreengrassCore
```

Output:

```
{
    "tags": {
        "Owner": "richard-roe"
    }
}
```

For more information, see Tag your resources in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To add a tag to a resource**

The following `tag-resource` example adds an owner tag to an AWS IoT Greengrass core device. You can use this tag to control access to the core device based on who owns it.

```
aws greengrassv2 tag-resource \
    --resource-arn arn:aws:greengrass:us-
west-2:123456789012:coreDevices:MyGreengrassCore \
    --tags Owner=richard-roe
```

This command produces no output.

For more information, see Tag your resources in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To remove a tag from a resource**

The following `untag-resource` example removes an owner tag from an AWS IoT Greengrass core device.

```
aws iotsitewise untag-resource \
    --resource-arn arn:aws:greengrass:us-
west-2:123456789012:coreDevices:MyGreengrassCore \
    --tag-keys Owner
```

This command produces no output.

For more information, see Tag your resources in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-connectivity-info`

The following code example shows how to use `update-connectivity-info`.

#### AWS CLI

**To update connectivity information for a Greengrass core device**

The following `update-connectivity-info` example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```
aws greengrassv2 update-connectivity-info \
    --thing-name MyGreengrassCore \
    --cli-input-json file://core-device-connectivity-info.json
```

Contents of `core-device-connectivity-info.json`:

```
{
    "connectivityInfo": [
        {
            "hostAddress": "192.0.2.0",
            "portNumber": 8883,
            "id": "localIP_192.0.2.0"
        }
    ]
}
```

Output:

```
{
    "version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Manage core device endpoints in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see UpdateConnectivityInfo in *AWS CLI Command Reference*.

## AWS IoT Jobs SDK release examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Jobs SDK release.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `describe-job-execution`

The following code example shows how to use `describe-job-execution`.

**AWS CLI**

**To get the details of a job execution**

The following `describe-job-execution` example retrieves the details of the latest execution of the specified job and thing.

```
aws iot-jobs-data describe-job-execution \
    --job-id SampleJob \
    --thing-name MotionSensor1 \
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "execution": {
        "approximateSecondsBeforeTimedOut": 88,
        "executionNumber": 2939653338,
        "jobId": "SampleJob",
        "lastUpdatedAt": 1567701875.743,
        "queuedAt": 1567701902.444,
        "status": "QUEUED",
        "thingName": "MotionSensor1 ",
        "versionNumber": 3
   }
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see DescribeJobExecution in *AWS CLI Command Reference*.

### `get-pending-job-executions`

The following code example shows how to use `get-pending-job-executions`.

#### AWS CLI

**To get a list of all jobs that are not in a terminal status for a thing**

The following `get-pending-job-executions` example displays a list of all jobs that aren't in a terminal state for the specified thing.

```
aws iot-jobs-data get-pending-job-executions \
    --thing-name MotionSensor1
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "inProgressJobs": [
    ],
    "queuedJobs": [
        {
            "executionNumber": 2939653338,
            "jobId": "SampleJob",
            "lastUpdatedAt": 1567701875.743,
            "queuedAt": 1567701902.444,
            "versionNumber": 3
      }
    ]
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see GetPendingJobExecutions in *AWS CLI Command Reference*.

### `start-next-pending-job-execution`

The following code example shows how to use `start-next-pending-job-execution`.

**AWS CLI**

**To get and start the next pending job execution for a thing**

The following `start-next-pending-job-execution` example retrieves and starts the next job execution whose status is IN_PROGRESS or QUEUED for the specified thing.

```
aws iot-jobs-data start-next-pending-job-execution \
    --thing-name MotionSensor1
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "execution": {
        "approximateSecondsBeforeTimedOut": 88,
        "executionNumber": 2939653338,
        "jobId": "SampleJob",
        "lastUpdatedAt": 1567714853.743,
        "queuedAt": 1567701902.444,
        "startedAt": 1567714871.690,
        "status": "IN_PROGRESS",
        "thingName": "MotionSensor1 ",
        "versionNumber": 3
   }
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see StartNextPendingJobExecution in *AWS CLI Command Reference*.

### `update-job-execution`

The following code example shows how to use `update-job-execution`.

**AWS CLI**

**To update the status of a job execution**

The following `update-job-execution` example updates the status of the specified job and thing.

```
aws iot-jobs-data update-job-execution \
```

```
    --job-id SampleJob \
    --thing-name MotionSensor1 \
    --status REMOVED \
    --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{
    "executionState": {
        "status": "REMOVED",
        "versionNumber": 3
    },
}
```

For more information, see Devices and Jobs in the *AWS IoT Developer Guide*.

- For API details, see UpdateJobExecution in *AWS CLI Command Reference*.

## AWS IoT SiteWise examples using AWS CLI

### Actions

#### `associate-assets`

The following code example shows how to use `associate-assets`.

**AWS CLI**

**To associate a child asset to a parent asset**

The following `associate-assets` example associates a wind turbine asset to a wind farm asset, where the wind turbine asset model exists as a hierarchy in the wind farm asset model.

```
aws iotsitewise associate-assets \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
    --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE \
    --child-asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

This command produces no output.

For more information, see Associating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see AssociateAssets in *AWS CLI Command Reference*.

## `batch-associate-project-assets`

The following code example shows how to use `batch-associate-project-assets`.

**AWS CLI**

**To associate an asset to a project**

The following `batch-associate-project-assets` example associates a wind farm asset to a project.

```
aws iotsitewise batch-associate-project-assets \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
    --asset-ids a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

This command produces no output.

For more information, see Adding assets to projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see BatchAssociateProjectAssets in *AWS CLI Command Reference*.

## `batch-disassociate-project-assets`

The following code example shows how to use `batch-disassociate-project-assets`.

**AWS CLI**

**To disassociate an asset from a project**

The following `batch-disassociate-project-assets` example disassociates a wind farm asset from a project.

```
aws iotsitewise batch-disassociate-project-assets \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
    --asset-ids a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

This command produces no output.

For more information, see Adding assets to projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see BatchDisassociateProjectAssets in *AWS CLI Command Reference*.

## `batch-put-asset-property-value`

The following code example shows how to use `batch-put-asset-property-value`.

**AWS CLI**

**To send data to asset properties**

The following `batch-put-asset-property-value` example sends power and temperature data to the asset properties identified by property aliases.

```
aws iotsitewise batch-put-asset-property-value \
    --cli-input-json file://batch-put-asset-property-value.json
```

Contents of `batch-put-asset-property-value.json`:

```
{
    "entries": [
        {
            "entryId": "1575691200-company-windfarm-3-turbine-7-power",
            "propertyAlias": "company-windfarm-3-turbine-7-power",
            "propertyValues": [
                {
                    "value": {
                        "doubleValue": 4.92
```

```
                    },
                    "timestamp": {
                        "timeInSeconds": 1575691200
                    },
                    "quality": "GOOD"
                }
            ]
        },
        {
            "entryId": "1575691200-company-windfarm-3-turbine-7-temperature",
            "propertyAlias": "company-windfarm-3-turbine-7-temperature",
            "propertyValues": [
                {
                    "value": {
                        "integerValue": 38
                    },
                    "timestamp": {
                        "timeInSeconds": 1575691200
                    }
                }
            ]
        }
    ]
}
```

Output:

```
{
    "errorEntries": []
}
```

For more information, see Ingesting data using the AWS IoT SiteWise API in the *AWS IoT SiteWise User Guide*.

- For API details, see BatchPutAssetPropertyValue in *AWS CLI Command Reference*.

## `create-access-policy`

The following code example shows how to use `create-access-policy`.

### AWS CLI

#### Example 1: To grant a user administrative access to a portal

The following `create-access-policy` example creates an access policy that grants a user administrative access to a web portal for a wind farm company.

```
aws iotsitewise create-access-policy \
    --cli-input-json file://create-portal-administrator-access-policy.json
```

Contents of `create-portal-administrator-access-policy.json`:

```
{
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyPermission": "ADMINISTRATOR",
    "accessPolicyResource": {
        "portal": {
            "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"
        }
    }
}
```

Output:

```
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
    "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/
a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE"
}
```

For more information, see Adding or removing portal administrators in the *AWS IoT SiteWise User Guide*.

**Example 2: To grant a user read-only access to a project**

The following `create-access-policy` example creates an access policy that grants a user read-only access to a wind farm project.

```
aws iotsitewise create-access-policy \
    --cli-input-json file://create-project-viewer-access-policy.json
```

Contents of `create-project-viewer-access-policy.json`:

```
{
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyPermission": "VIEWER",
    "accessPolicyResource": {
        "project": {
            "id": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE"
        }
    }
}
```

Output:

```
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE",
    "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/
a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE"
}
```

For more information, see Assigning project viewers in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see CreateAccessPolicy in *AWS CLI Command Reference*.

### `create-asset-model`

The following code example shows how to use `create-asset-model`.

#### AWS CLI

**To create an asset model**

The following `create-asset-model` example creates an asset model that defines a wind turbine with the following properties:

Serial number - The serial number of a wind turbineGenerated power - The generated power data stream from a wind turbineTemperature C - The temperature data stream from a wind

turbine in CelsiusTemperature F - The mapped temperature data points from Celsius to Fahrenheit

```
aws iotsitewise create-asset-model \
    --cli-input-json file://create-wind-turbine-model.json
```

Contents of `create-wind-turbine-model.json`:

```
{
    "assetModelName": "Wind Turbine Model",
    "assetModelDescription": "Represents a wind turbine",
    "assetModelProperties": [
        {
            "name": "Serial Number",
            "dataType": "STRING",
            "type": {
                "attribute": {}
            }
        },
        {
            "name": "Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "measurement": {}
            }
        },
        {
            "name": "Temperature C",
            "dataType": "DOUBLE",
            "unit": "Celsius",
            "type": {
                "measurement": {}
            }
        },
        {
            "name": "Temperature F",
            "dataType": "DOUBLE",
            "unit": "Fahrenheit",
            "type": {
                "transform": {
                    "expression": "temp_c * 9 / 5 + 32",
                    "variables": [
```

```
                        {
                            "name": "temp_c",
                            "value": {
                                "propertyId": "Temperature C"
                            }
                        }
                    ]
                }
            }
        },
        {
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "metric": {
                    "expression": "sum(power)",
                    "variables": [
                        {
                            "name": "power",
                            "value": {
                                "propertyId": "Generated Power"
                            }
                        }
                    ],
                    "window": {
                        "tumbling": {
                            "interval": "1h"
                        }
                    }
                }
            }
        }
    ]
}
```

Output:

```
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "assetModelStatus": {
```

```
        "state": "CREATING"
    }
}
```

For more information, see Defining asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateAssetModel in *AWS CLI Command Reference*.

### `create-asset`

The following code example shows how to use `create-asset`.

#### AWS CLI

**To create an asset**

The following `create-asset` example creates a wind turbine asset from a wind turbine asset model.

```
aws iotsitewise create-asset \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
    --asset-name "Wind Turbine 1"
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
    "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
    "assetStatus": {
        "state": "CREATING"
    }
}
```

For more information, see Creating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateAsset in *AWS CLI Command Reference*.

### `create-dashboard`

The following code example shows how to use `create-dashboard`.

## AWS CLI

### To create a dashboard

The following `create-dashboard` example creates a dashboard with a line chart that displays total generated power for a wind farm.

```
aws iotsitewise create-dashboard \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
    --dashboard-name "Wind Farm" \
    --dashboard-definition file://create-wind-farm-dashboard.json
```

Contents of `create-wind-farm-dashboard.json`:

```
{
    "widgets": [
        {
            "type": "monitor-line-chart",
            "title": "Generated Power",
            "x": 0,
            "y": 0,
            "height": 3,
            "width": 3,
            "metrics": [
                {
                    "label": "Power",
                    "type": "iotsitewise",
                    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
                    "propertyId": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"
                }
            ]
        }
    ]
}
```

Output:

```
{
    "dashboardId": "a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
    "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/
a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE"
}
```

For more information, see Creating dashboards (CLI) in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateDashboard in *AWS CLI Command Reference*.

### `create-gateway`

The following code example shows how to use `create-gateway`.

**AWS CLI**

**To create a gateway**

The following `create-gateway` example creates a gateway that runs on AWS IoT Greengrass.

```
aws iotsitewise create-gateway \
    --gateway-name ExampleCorpGateway \
    --gateway-platform greengrass={groupArn=arn:aws:greengrass:us-
west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-1b1b1EXAMPLE}
```

Output:

```
{
    "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
    "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/
a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE"
}
```

For more information, see Configuring a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see CreateGateway in *AWS CLI Command Reference*.

### `create-portal`

The following code example shows how to use `create-portal`.

**AWS CLI**

**To create a portal**

The following `create-portal` example creates a web portal for a wind farm company. You can create portals only in the same Region where you enabled AWS Single Sign-On.

```
aws iotsitewise create-portal \
    --portal-name WindFarmPortal \
    --portal-description "A portal that contains wind farm projects for Example
 Corp." \
    --portal-contact-email support@example.com \
    --role-arn arn:aws:iam::123456789012:role/service-role/
MySiteWiseMonitorServiceRole
```

Output:

```
{
    "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/
a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-
aaaaaEXAMPLE.app.iotsitewise.aws",
    "portalStatus": {
        "state": "CREATING"
    },
    "ssoApplicationId": "ins-a1b2c3d4-EXAMPLE"
}
```

For more information, see Getting started with AWS IoT SiteWise Monitor in the *AWS IoT SiteWise User Guide* and Enabling AWS SSO in the *AWS IoT SiteWise User Guide*..

- For API details, see CreatePortal in *AWS CLI Command Reference*.

## `create-project`

The following code example shows how to use `create-project`.

### AWS CLI

#### To create a project

The following `create-project` example creates a wind farm project.

```
aws iotsitewise create-project \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE \
    --project-name "Wind Farm 1" \
    --project-description "Contains asset visualizations for Wind Farm #1 for
 Example Corp."
```

Output:

```
{
    "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
    "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/
a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE"
}
```

For more information, see Creating projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see CreateProject in *AWS CLI Command Reference*.

### `delete-access-policy`

The following code example shows how to use `delete-access-policy`.

**AWS CLI**

**To revoke a user's access to a project or portal**

The following `delete-access-policy` example deletes an access policy that grants a user administrative access to a portal.

```
aws iotsitewise delete-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE
```

This command produces no output.

For more information, see Adding or removing portal administrators in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteAccessPolicy in *AWS CLI Command Reference*.

### `delete-asset-model`

The following code example shows how to use `delete-asset-model`.

**AWS CLI**

**To delete an asset model**

The following `delete-asset-model` example deletes a wind turbine asset model.

```
aws iotsitewise delete-asset-model \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
    "assetModelStatus": {
        "state": "DELETING"
    }
}
```

For more information, see Deleting asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteAssetModel in *AWS CLI Command Reference*.

## `delete-asset`

The following code example shows how to use `delete-asset`.

### AWS CLI

#### To delete an asset

The following `delete-asset` example deletes a wind turbine asset.

```
aws iotsitewise delete-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```
{
    "assetStatus": {
        "state": "DELETING"
    }
}
```

For more information, see Deleting assets in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteAsset in *AWS CLI Command Reference*.

### `delete-dashboard`

The following code example shows how to use `delete-dashboard`.

**AWS CLI**

**To delete a dashboard**

The following `delete-dashboard` example deletes a wind turbine dashboard.

```
aws iotsitewise delete-dashboard \
    --dashboard-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE
```

This command produces no output.

For more information, see Deleting dashboards in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DeleteDashboard in *AWS CLI Command Reference*.

### `delete-gateway`

The following code example shows how to use `delete-gateway`.

**AWS CLI**

**To delete a gateway**

The following `delete-gateway` example deletes a gateway.

```
aws iotsitewise delete-gateway \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
```

This command produces no output.

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see DeleteGateway in *AWS CLI Command Reference*.

### `delete-portal`

The following code example shows how to use `delete-portal`.

#### AWS CLI

**To delete a portal**

The following `delete-portal` example deletes a web portal for a wind farm company.

```
aws iotsitewise delete-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{
    "portalStatus": {
        "state": "DELETING"
    }
}
```

For more information, see Deleting a portal in the *AWS IoT SiteWise User Guide*.

- For API details, see DeletePortal in *AWS CLI Command Reference*.

### `delete-project`

The following code example shows how to use `delete-project`.

#### AWS CLI

**To delete a project**

The following `delete-project` example deletes a wind farm project.

```
aws iotsitewise delete-project \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

This command produces no output.

For more information, see Deleting projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DeleteProject in *AWS CLI Command Reference*.

### `describe-access-policy`

The following code example shows how to use `describe-access-policy`.

**AWS CLI**

**To describe an access policy**

The following `describe-access-policy` example describes an access policy that grants a user administrative access to a web portal for a wind farm company.

```
aws iotsitewise describe-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE
```

Output:

```
{
    "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
    "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/
a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyResource": {
        "portal": {
            "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"
        }
    },
    "accessPolicyPermission": "ADMINISTRATOR",
    "accessPolicyCreationDate": "2020-02-20T22:35:15.552880124Z",
    "accessPolicyLastUpdateDate": "2020-02-20T22:35:15.552880124Z"
}
```

For more information, see Adding or removing portal administrators in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAccessPolicy in *AWS CLI Command Reference*.

### `describe-asset-model`

The following code example shows how to use `describe-asset-model`.

#### AWS CLI

##### To describe an asset model

The following `describe-asset-model` example describes a wind farm asset model.

```
aws iotsitewise describe-asset-model \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-22222EXAMPLE
```

Output:

```
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelName": "Wind Farm Model",
    "assetModelDescription": "Represents a wind farm that comprises many wind
 turbines",
    "assetModelProperties": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "metric": {
                    "expression": "sum(power)",
                    "variables": [
                        {
                            "name": "power",
                            "value": {
                                "propertyId": "a1b2c3d4-5678-90ab-
cdef-66666EXAMPLE",
                                "hierarchyId": "a1b2c3d4-5678-90ab-
cdef-77777EXAMPLE"
                            }
                        }
                    ],
                    "window": {
```

```
                        "tumbling": {
                            "interval": "1h"
                        }
                    }
                }
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-88888EXAMPLE",
            "name": "Region",
            "dataType": "STRING",
            "type": {
                "attribute": {
                    "defaultValue": " "
                }
            }
        }
    ],
    "assetModelHierarchies": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
            "name": "Wind Turbines",
            "childAssetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
        }
    ],
    "assetModelCreationDate": 1575671284.0,
    "assetModelLastUpdateDate": 1575671988.0,
    "assetModelStatus": {
        "state": "ACTIVE"
    }
}
```

For more information, see Describing a specific asset model in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAssetModel in *AWS CLI Command Reference*.

## `describe-asset-property`

The following code example shows how to use `describe-asset-property`.

### AWS CLI

#### To describe an asset property

The following `describe-asset-property` example describes a wind farm asset's total generated power property.

```
aws iotsitewise describe-asset-property \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-99999EXAMPLE
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
    "assetName": "Wind Farm 1",
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetProperty": {
        "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
        "name": "Total Generated Power",
        "notification": {
            "topic": "$aws/sitewise/asset-models/a1b2c3d4-5678-90ab-
cdef-22222EXAMPLE/assets/a1b2c3d4-5678-90ab-cdef-44444EXAMPLE/properties/
a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "state": "DISABLED"
        },
        "dataType": "DOUBLE",
        "unit": "kW",
        "type": {
            "metric": {
                "expression": "sum(power)",
                "variables": [
                    {
                        "name": "power",
                        "value": {
                            "propertyId": "a1b2c3d4-5678-90ab-cdef-66666EXAMPLE",
                            "hierarchyId": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE"
                        }
                    }
                ],
                "window": {
                    "tumbling": {
                        "interval": "1h"
                    }
                }
            }
        }
```

```
    }
}
```

For more information, see Describing a specific asset property in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAssetProperty in *AWS CLI Command Reference*.

### `describe-asset`

The following code example shows how to use `describe-asset`.

#### AWS CLI

**To describe an asset**

The following `describe-asset` example describes a wind farm asset.

```
aws iotsitewise describe-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

Output:

```
{
    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
    "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
    "assetName": "Wind Farm 1",
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetProperties": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-88888EXAMPLE",
            "name": "Region",
            "dataType": "STRING"
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW"
        }
    ],
```

```
    "assetHierarchies": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
            "name": "Wind Turbines"
        }
    ],
    "assetCreationDate": 1575672453.0,
    "assetLastUpdateDate": 1575672453.0,
    "assetStatus": {
        "state": "ACTIVE"
    }
}
```

For more information, see Describing a specific asset in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeAsset in *AWS CLI Command Reference*.

### `describe-dashboard`

The following code example shows how to use `describe-dashboard`.

#### AWS CLI

**To describe a dashboard**

The following `describe-dashboard` example describes the specified wind farm dashboard.

```
aws iotsitewise describe-dashboard \
    --dashboard-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE
```

Output:

```
{
    "dashboardId": "a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
    "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/
a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
    "dashboardName": "Wind Farm",
    "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
    "dashboardDefinition": "{\"widgets\":[{\"type\":\"monitor-line-chart\",\"title
\":\"Generated Power\",\"x\":0,\"y\":0,\"height\":3,\"width\":3,\"metrics\":
[{\"label\":\"Power\",\"type\":\"iotsitewise\",\"assetId\":\"a1b2c3d4-5678-90ab-
cdef-44444EXAMPLE\",\"propertyId\":\"a1b2c3d4-5678-90ab-cdef-99999EXAMPLE\"}]}]}",
    "dashboardCreationDate": "2020-05-01T20:32:12.228476348Z",
```

```
    "dashboardLastUpdateDate": "2020-05-01T20:32:12.228476348Z"
}
```

For more information, see Viewing dashboards in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DescribeDashboard in *AWS CLI Command Reference*.

### `describe-gateway-capability-configuration`

The following code example shows how to use `describe-gateway-capability-configuration`.

**AWS CLI**

**To describe a gateway capability**

The following `describe-gateway-capability-configuration` example describes an OPC-UA source capability.

```
aws iotsitewise describe-gateway-capability-configuration \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
    --capability-namespace "iotsitewise:opcuacollector:1"
```

Output:

```
{
    "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
    "capabilityNamespace": "iotsitewise:opcuacollector:1",
    "capabilityConfiguration": "{\"sources\":[{\"name\":\"Wind Farm #1\",
\"endpoint\":{\"certificateTrust\":{\"type\":\"TrustAny\"},\"endpointUri
\":\"opc.tcp://203.0.113.0:49320\",\"securityPolicy\":\"BASIC256\",
\"messageSecurityMode\":\"SIGN_AND_ENCRYPT\",\"identityProvider\":
{\"type\":\"Username\",\"usernameSecretArn\":\"arn:aws:secretsmanager:us-
east-1:123456789012:secret:greengrass-factory1-auth-3QNDmM\"},\"nodeFilterRules\":
[]},\"measurementDataStreamPrefix\":\"\"}]}",
    "capabilitySyncStatus": "IN_SYNC"
}
```

For more information, see Configuring data sources in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeGatewayCapabilityConfiguration in *AWS CLI Command Reference*.

### `describe-gateway`

The following code example shows how to use `describe-gateway`.

#### AWS CLI

##### To describe a gateway

The following `describe-gateway` example describes a gateway.

```
aws iotsitewise describe-gateway \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
```

Output:

```
{
    "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
    "gatewayName": "ExampleCorpGateway",
    "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/
a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
    "gatewayPlatform": {
        "greengrass": {
            "groupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/a1b2c3d4-5678-90ab-cdef-1b1b1EXAMPLE"
        }
    },
    "gatewayCapabilitySummaries": [
        {
            "capabilityNamespace": "iotsitewise:opcuacollector:1",
            "capabilitySyncStatus": "IN_SYNC"
        }
    ],
    "creationDate": 1588369971.457,
    "lastUpdateDate": 1588369971.457
}
```

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeGateway in *AWS CLI Command Reference*.

### `describe-logging-options`

The following code example shows how to use `describe-logging-options`.

**AWS CLI**

**To retrieve the current AWS IoT SiteWise logging options**

The following `describe-logging-options` example retrieves the current AWS IoT SiteWise logging options for your AWS account in the current Region.

```
aws iotsitewise describe-logging-options
```

Output:

```
{
    "loggingOptions": {
        "level": "INFO"
    }
}
```

For more information, see Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribeLoggingOptions in *AWS CLI Command Reference*.

## `describe-portal`

The following code example shows how to use `describe-portal`.

**AWS CLI**

**To describe a portal**

The following `describe-portal` example describes a web portal for a wind farm company.

```
aws iotsitewise describe-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{
    "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/
a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "portalName": "WindFarmPortal",
```

```
    "portalDescription": "A portal that contains wind farm projects for Example
 Corp.",
    "portalClientId": "E-a1b2c3d4e5f6_a1b2c3d4e5f6EXAMPLE",
    "portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-
aaaaaEXAMPLE.app.iotsitewise.aws",
    "portalContactEmail": "support@example.com",
    "portalStatus": {
        "state": "ACTIVE"
    },
    "portalCreationDate": "2020-02-04T23:01:52.90248068Z",
    "portalLastUpdateDate": "2020-02-04T23:01:52.90248078Z",
    "roleArn": "arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole"
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see DescribePortal in *AWS CLI Command Reference*.

### `describe-project`

The following code example shows how to use `describe-project`.

#### AWS CLI

**To describe a project**

The following `describe-project` example describes a wind farm project.

```
aws iotsitewise describe-project \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

Output:

```
{
    "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
    "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/
a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
    "projectName": "Wind Farm 1",
    "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
    "projectDescription": "Contains asset visualizations for Wind Farm #1 for
 Example Corp.",
    "projectCreationDate": "2020-02-20T21:58:43.362246001Z",
    "projectLastUpdateDate": "2020-02-20T21:58:43.362246095Z"
```

```
}
```

For more information, see Viewing project details in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see DescribeProject in *AWS CLI Command Reference*.

### `disassociate-assets`

The following code example shows how to use `disassociate-assets`.

**AWS CLI**

**To disassociate a child asset from a parent asset**

The following `disassociate-assets` example disassociates a wind turbine asset from a wind farm asset.

```
aws iotsitewise disassociate-assets \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
    --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE \
    --child-asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

This command produces no output.

For more information, see Associating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see DisassociateAssets in *AWS CLI Command Reference*.

### `get-asset-property-aggregates`

The following code example shows how to use `get-asset-property-aggregates`.

**AWS CLI**

**To retrieve an asset property's aggregated average and count values**

The following `get-asset-property-aggregates` example retrieves a wind turbine asset's average total power and count of total power data points for a 1 hour period in time.

```
aws iotsitewise get-asset-property-aggregates \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
```

```
    --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \
    --start-date 1580849400 \
    --end-date 1580853000 \
    --aggregate-types AVERAGE COUNT \
    --resolution 1h
```

Output:

```
{
    "aggregatedValues": [
        {
            "timestamp": 1580850000.0,
            "quality": "GOOD",
            "value": {
                "average": 8723.46538886233,
                "count": 12.0
            }
        }
    ]
}
```

For more information, see Querying asset property aggregates in the *AWS IoT SiteWise User Guide*.

- For API details, see GetAssetPropertyAggregates in *AWS CLI Command Reference*.

### `get-asset-property-value-history`

The following code example shows how to use `get-asset-property-value-history`.

#### AWS CLI

**To retrieve an asset property's historical values**

The following `get-asset-property-value-history` example retrieves a wind turbine asset's total power values for a 20 minute period in time.

```
aws iotsitewise get-asset-property-value-history \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \
    --start-date 1580851800 \
    --end-date 1580853000
```

Output:

```
{
    "assetPropertyValueHistory": [
        {
            "value": {
                "doubleValue": 7217.787046814844
            },
            "timestamp": {
                "timeInSeconds": 1580852100,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6941.242811875451
            },
            "timestamp": {
                "timeInSeconds": 1580852400,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6976.797662266717
            },
            "timestamp": {
                "timeInSeconds": 1580852700,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        },
        {
            "value": {
                "doubleValue": 6890.8677520453875
            },
            "timestamp": {
                "timeInSeconds": 1580853000,
                "offsetInNanos": 0
            },
            "quality": "GOOD"
        }
```

```
    ]
}
```

For more information, see Querying historical asset property values in the *AWS IoT SiteWise User Guide*.

- For API details, see GetAssetPropertyValueHistory in *AWS CLI Command Reference*.

### `get-asset-property-value`

The following code example shows how to use `get-asset-property-value`.

**AWS CLI**

**To retrieve an asset property's current value**

The following `get-asset-property-value` example retrieves a wind turbine asset's current total power.

```
aws iotsitewise get-asset-property-value \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE
```

Output:

```
{
    "propertyValue": {
        "value": {
            "doubleValue": 6890.8677520453875
        },
        "timestamp": {
            "timeInSeconds": 1580853000,
            "offsetInNanos": 0
        },
        "quality": "GOOD"
    }
}
```

For more information, see Querying current asset property values in the *AWS IoT SiteWise User Guide*.

- For API details, see GetAssetPropertyValue in *AWS CLI Command Reference*.

### `list-access-policies`

The following code example shows how to use `list-access-policies`.

#### AWS CLI

**To list all access policies**

The following `list-access-policies` example lists all access policies for a user who is a portal administrator.

```
aws iotsitewise list-access-policies \
    --identity-type USER \
    --identity-id a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE
```

Output:

```
{
    "accessPolicySummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",
            "identity": {
                "user": {
                    "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
                }
            },
            "resource": {
                "portal": {
                    "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"
                }
            },
            "permission": "ADMINISTRATOR"
        }
    ]
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAccessPolicies in *AWS CLI Command Reference*.

### `list-asset-models`

The following code example shows how to use `list-asset-models`.

**AWS CLI**

**To list all asset models**

The following `list-asset-models` example lists all asset models that are defined in your AWS account in the current Region.

```
aws iotsitewise list-asset-models
```

Output:

```
{
    "assetModelSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
            "name": "Wind Farm Model",
            "description": "Represents a wind farm that comprises many wind
 turbines",
            "creationDate": 1575671284.0,
            "lastUpdateDate": 1575671988.0,
            "status": {
                "state": "ACTIVE"
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "name": "Wind Turbine Model",
            "description": "Represents a wind turbine manufactured by Example Corp",
            "creationDate": 1575671207.0,
            "lastUpdateDate": 1575686273.0,
            "status": {
                "state": "ACTIVE"
            }
        }
    ]
}
```

For more information, see Listing all asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAssetModels in *AWS CLI Command Reference*.

### `list-assets`

The following code example shows how to use `list-assets`.

**AWS CLI**

**Example 1: To list all top-level assets**

The following `list-assets` example lists all assets that are top-level in the asset hierarchy tree and defined in your AWS account in the current Region.

```
aws iotsitewise list-assets \
    --filter TOP_LEVEL
```

Output:

```
{
    "assetSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
            "name": "Wind Farm 1",
            "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
            "creationDate": 1575672453.0,
            "lastUpdateDate": 1575672453.0,
            "status": {
                "state": "ACTIVE"
            },
            "hierarchies": [
                {
                    "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
                    "name": "Wind Turbines"
                }
            ]
        }
    ]
}
```

For more information, see Listing assets in the *AWS IoT SiteWise User Guide*.

**Example 2: To list all assets based on an asset model**

The following `list-assets` example lists all assets based on an asset model and defined in your AWS account in the current Region.

```
aws iotsitewise list-assets \
    --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
    "assetSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
            "name": "Wind Turbine 1",
            "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "creationDate": 1575671550.0,
            "lastUpdateDate": 1575686308.0,
            "status": {
                "state": "ACTIVE"
            },
            "hierarchies": []
        }
    ]
}
```

For more information, see Listing assets in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAssets in *AWS CLI Command Reference*.

## `list-associated-assets`

The following code example shows how to use `list-associated-assets`.

### AWS CLI

**To list all assets associated to an asset in a specific hierarchy**

The following `list-associated-assets` example lists all wind turbine assets associated to the specified wind farm asset.

```
aws iotsitewise list-associated-assets \
    --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \
    --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE
```

Output:

```
{
    "assetSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
            "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
            "name": "Wind Turbine 1",
            "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "creationDate": 1575671550.0,
            "lastUpdateDate": 1575686308.0,
            "status": {
                "state": "ACTIVE"
            },
            "hierarchies": []
        }
    ]
}
```

For more information, see Listing assets associated to a specific asset in the *AWS IoT SiteWise User Guide*.

- For API details, see ListAssociatedAssets in *AWS CLI Command Reference*.

## `list-dashboards`

The following code example shows how to use `list-dashboards`.

### AWS CLI

#### To list all dashboards in a project

The following `list-dashboards` example lists all dashboards that are defined in a project.

```
aws iotsitewise list-dashboards \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

Output:

```
{
    "dashboardSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
            "name": "Wind Farm",
            "creationDate": "2020-05-01T20:32:12.228476348Z",
            "lastUpdateDate": "2020-05-01T20:32:12.228476348Z"
        }
    ]
}
```

For more information, see Viewing dashboards in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see ListDashboards in *AWS CLI Command Reference*.

### `list-gateways`

The following code example shows how to use `list-gateways`.

#### AWS CLI

**To list all gateways**

The following `list-gateways` example lists all gateways that are defined in your AWS account in the current Region.

```
aws iotsitewise list-gateways
```

Output:

```
{
    "gatewaySummaries": [
        {
            "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
            "gatewayName": "ExampleCorpGateway",
            "gatewayCapabilitySummaries": [
                {
                    "capabilityNamespace": "iotsitewise:opcuacollector:1",
                    "capabilitySyncStatus": "IN_SYNC"
```

```
                }
            ],
            "creationDate": 1588369971.457,
            "lastUpdateDate": 1588369971.457
        }
    ]
}
```

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see ListGateways in *AWS CLI Command Reference*.

### `list-portals`

The following code example shows how to use `list-portals`.

#### AWS CLI

**To list all portals**

The following `list-portals` example lists all portals that are defined in your AWS account in the current Region.

```
aws iotsitewise list-portals
```

Output:

```
{
    "portalSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
            "name": "WindFarmPortal",
            "description": "A portal that contains wind farm projects for Example
 Corp.",
            "startUrl": "https://a1b2c3d4-5678-90ab-cdef-
aaaaaEXAMPLE.app.iotsitewise.aws",
            "creationDate": "2020-02-04T23:01:52.90248068Z",
            "lastUpdateDate": "2020-02-04T23:01:52.90248078Z",
            "roleArn": "arn:aws:iam::123456789012:role/service-role/
MySiteWiseMonitorServiceRole"
        }
    ]
```

```
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see ListPortals in *AWS CLI Command Reference*.

### `list-project-assets`

The following code example shows how to use `list-project-assets`.

#### AWS CLI

**To list all assets associated to a project**

The following `list-project-assets` example lists all assets that are associated to a wind farm project.

```
aws iotsitewise list-projects \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE
```

Output:

```
{
    "assetIds": [
        "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE"
    ]
}
```

For more information, see Adding assets to projects in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see ListProjectAssets in *AWS CLI Command Reference*.

### `list-projects`

The following code example shows how to use `list-projects`.

#### AWS CLI

**To list all projects in a portal**

The following `list-projects` example lists all projects that are defined in a portal.

```
aws iotsitewise list-projects \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{
    "projectSummaries": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE",
            "name": "Wind Farm 1",
            "description": "Contains asset visualizations for Wind Farm #1 for
 Example Corp.",
            "creationDate": "2020-02-20T21:58:43.362246001Z",
            "lastUpdateDate": "2020-02-20T21:58:43.362246095Z"
        }
    ]
}
```

For more information, see Viewing project details in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see ListProjects in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list all tags for a resource**

The following `list-tags-for-resource` example lists all tags for a wind turbine asset.

```
aws iotsitewise list-tags-for-resource \
    --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```
{
    "tags": {
```

```
        "Owner": "richard-roe"
    }
}
```

For more information, see Tagging your resources in the *AWS IoT SiteWise User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `put-logging-options`

The following code example shows how to use `put-logging-options`.

**AWS CLI**

**To specify the level of logging**

The following `put-logging-options` example enables `INFO` level logging in AWS IoT SiteWise. Other levels include `DEBUG` and `OFF`.

```
aws iotsitewise put-logging-options \
    --logging-options level=INFO
```

This command produces no output.

For more information, see Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs in the *AWS IoT SiteWise User Guide*.

- For API details, see PutLoggingOptions in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag to a resource**

The following `tag-resource` example adds an owner tag to a wind turbine asset. This lets you control access to the asset based on who owns it.

```
aws iotsitewise tag-resource \
```

```
    --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --tags Owner=richard-roe
```

This command produces no output.

For more information, see Tagging your resources in the *AWS IoT SiteWise User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag from a resource**

The following `untag-resource` example removes an owner tag from a wind turbine asset.

```
aws iotsitewise untag-resource \
    --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --tag-keys Owner
```

This command produces no output.

For more information, see Tagging your resources in the *AWS IoT SiteWise User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-access-policy`

The following code example shows how to use `update-access-policy`.

**AWS CLI**

**To grant a project viewer ownership of a project**

The following `update-access-policy` example updates an access policy that grants a project viewer ownership of a project.

```
aws iotsitewise update-access-policy \
    --access-policy-id a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE \
    --cli-input-json file://update-project-viewer-access-policy.json
```

Contents of `update-project-viewer-access-policy.json`:

```
{
    "accessPolicyIdentity": {
        "user": {
            "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
        }
    },
    "accessPolicyPermission": "ADMINISTRATOR",
    "accessPolicyResource": {
        "project": {
            "id": "a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE"
        }
    }
}
```

This command produces no output.

For more information, see Assigning project owners in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see UpdateAccessPolicy in *AWS CLI Command Reference*.

### `update-asset-model`

The following code example shows how to use `update-asset-model`.

#### AWS CLI

**To update an asset model**

The following `update-asset-model` example updates a wind farm asset model's description. This example includes the model's existing IDs and definitions, because `update-asset-model` overwrites the existing model with the new model.

```
aws iotsitewise update-asset-model \
    --cli-input-json file://update-wind-farm-model.json
```

Contents of `update-wind-farm-model.json`:

```
{
    "assetModelName": "Wind Farm Model",
    "assetModelDescription": "Represents a wind farm that comprises many wind
 turbines",
    "assetModelProperties": [
        {
            "id": "a1b2c3d4-5678-90ab-cdef-88888EXAMPLE",
            "name": "Region",
            "dataType": "STRING",
            "type": {
                "attribute": {}
            }
        },
        {
            "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
            "name": "Total Generated Power",
            "dataType": "DOUBLE",
            "unit": "kW",
            "type": {
                "metric": {
                    "expression": "sum(power)",
                    "variables": [
                        {
                            "name": "power",
                            "value": {
                                "hierarchyId": "a1b2c3d4-5678-90ab-
cdef-77777EXAMPLE",
                                "propertyId": "a1b2c3d4-5678-90ab-cdef-66666EXAMPLE"
                            }
                        }
                    ],
                    "window": {
                        "tumbling": {
                            "interval": "1h"
                        }
                    }
                }
            }
        }
    ],
    "assetModelHierarchies": [
        {
```

```
            "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
            "name": "Wind Turbines",
            "childAssetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
        }
    ]
}
```

Output:

```
{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/
a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
    "assetModelStatus": {
        "state": "CREATING"
    }
}
```

For more information, see Updating asset models in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateAssetModel in *AWS CLI Command Reference*.

### `update-asset-property`

The following code example shows how to use `update-asset-property`.

#### AWS CLI

**Example 1: To update an asset property's alias**

The following `update-asset-property` example updates a wind turbine asset's power property alias.

```
aws iotsitewise update-asset-property \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-55555EXAMPLE \
    --property-alias "/examplecorp/windfarm/1/turbine/1/power" \
    --property-notification-state DISABLED
```

This command produces no output.

For more information, see Mapping industrial data streams to asset properties in the *AWS IoT SiteWise User Guide*.

**Example 2: To enable asset property notifications**

The following `update-asset-property` example enables asset property update notifications for a wind turbine asset's power property. Property value updates are published to the MQTT topic `$aws/sitewise/asset-models/<assetModelId>/assets/<assetId>/properties/<propertyId>`, where each ID is replaced by the property, asset, and model ID of the asset property.

```
aws iotsitewise update-asset-property \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \
    --property-notification-state ENABLED \
    --property-alias "/examplecorp/windfarm/1/turbine/1/power"
```

This command produces no output.

For more information, see Interacting with other services in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateAssetProperty in *AWS CLI Command Reference*.

## `update-asset`

The following code example shows how to use `update-asset`.

### AWS CLI

**To update an asset's name**

The following `update-asset` example updates a wind turbine asset's name.

```
aws iotsitewise update-asset \
    --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
    --asset-name "Wind Turbine 2"
```

Output:

```
{
    "assetStatus": {
```

```
        "state": "UPDATING"
    }
}
```

For more information, see Updating assets in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateAsset in *AWS CLI Command Reference*.

### `update-dashboard`

The following code example shows how to use `update-dashboard`.

#### AWS CLI

**To update a dashboard**

The following `update-dashboard` example changes the title of a dashboard's line chart that displays total generated power for a wind farm.

```
aws iotsitewise update-dashboard \
    --project-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE \
    --dashboard-name "Wind Farm" \
    --dashboard-definition file://update-wind-farm-dashboard.json
```

Contents of `update-wind-farm-dashboard.json`:

```
{
    "widgets": [
        {
            "type": "monitor-line-chart",
            "title": "Total Generated Power",
            "x": 0,
            "y": 0,
            "height": 3,
            "width": 3,
            "metrics": [
                {
                    "label": "Power",
                    "type": "iotsitewise",
                    "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
                    "propertyId": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"
                }
```

```
            ]
        }
    ]
}
```

This command produces no output.

For more information, see Creating dashboards (CLI) in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateDashboard in *AWS CLI Command Reference*.

### `update-gateway-capability-configuration`

The following code example shows how to use `update-gateway-capability-configuration`.

**AWS CLI**

**To update a gateway capability**

The following `update-gateway-capability-configuration` example configures an OPC-UA source with the following properties:

Trusts any certificate.Uses the Basic256 algorithm to secure messages.Uses the SignAndEncrypt mode to secure connections.Uses authentication credentials stored in an AWS Secrets Manager secret.

```
aws iotsitewise update-gateway-capability-configuration \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
    --capability-namespace "iotsitewise:opcuacollector:1" \
    --capability-configuration file://opc-ua-capability-configuration.json
```

Contents of `opc-ua-capability-configuration.json`:

```
{
    "sources": [
        {
            "name": "Wind Farm #1",
            "endpoint": {
                "certificateTrust": {
                    "type": "TrustAny"
                },
                "endpointUri": "opc.tcp://203.0.113.0:49320",
```

```
                "securityPolicy": "BASIC256",
                "messageSecurityMode": "SIGN_AND_ENCRYPT",
                "identityProvider": {
                    "type": "Username",
                    "usernameSecretArn": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:greengrass-windfarm1-auth-1ABCDE"
                },
                "nodeFilterRules": []
            },
            "measurementDataStreamPrefix": ""
        }
    ]
}
```

Output:

```
{
    "capabilityNamespace": "iotsitewise:opcuacollector:1",
    "capabilitySyncStatus": "OUT_OF_SYNC"
}
```

For more information, see Configuring data sources in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateGatewayCapabilityConfiguration in *AWS CLI Command Reference*.

### `update-gateway`

The following code example shows how to use `update-gateway`.

#### AWS CLI

**To update a gateway's name**

The following `update-gateway` example updates a gateway's name.

```
aws iotsitewise update-gateway \
    --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
    --gateway-name ExampleCorpGateway1
```

This command produces no output.

For more information, see Ingesting data using a gateway in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdateGateway in *AWS CLI Command Reference*.

### `update-portal`

The following code example shows how to use `update-portal`.

**AWS CLI**

**To update a portal's details**

The following `update-portal` example updates a web portal for a wind farm company.

```
aws iotsitewise update-portal \
    --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE \
    --portal-name WindFarmPortal \
    --portal-description "A portal that contains wind farm projects for Example
 Corp." \
    --portal-contact-email support@example.com \
    --role-arn arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole
```

Output:

```
{
    "portalStatus": {
        "state": "UPDATING"
    }
}
```

For more information, see Administering your portals in the *AWS IoT SiteWise User Guide*.

- For API details, see UpdatePortal in *AWS CLI Command Reference*.

### `update-project`

The following code example shows how to use `update-project`.

**AWS CLI**

**To update a project's details**

The following `update-project` example updates a wind farm project.

```
aws iotsitewise update-project \
    --project-id a1b2c3d4-5678-90ab-cdef-eeeeeEXAMPLE \
    --project-name "Wind Farm 1" \
    --project-description "Contains asset visualizations for Wind Farm #1 for
 Example Corp."
```

This command produces no output.

For more information, see Changing project details in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see UpdateProject in *AWS CLI Command Reference*.

## AWS IoT Things Graph examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Things Graph.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `associate-entity-to-thing`

The following code example shows how to use `associate-entity-to-thing`.

#### AWS CLI

**To associate a thing with a device**

The following `associate-entity-to-thing` example associates a thing with a device. The example uses a motion sensor device that is in the public namespace.

```
aws iotthingsgraph associate-entity-to-thing \
    --thing-name "MotionSensorName" \
    --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

This command produces no output.

For more information, see Creating and Uploading Models in the *AWS IoT Things Graph User Guide*.

- For API details, see AssociateEntityToThing in *AWS CLI Command Reference*.

### `create-flow-template`

The following code example shows how to use `create-flow-template`.

#### AWS CLI

**To create a flow**

The following `create-flow-template` example creates a flow (workflow). The value of `MyFlowDefinition` is the GraphQL that models the flow.

```
aws iotthingsgraph create-flow-template \
    --definition language=GRAPHQL,text="MyFlowDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559248067.545,
        "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
        "revisionNumber": 1
    }
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see CreateFlowTemplate in *AWS CLI Command Reference*.

### `create-system-instance`

The following code example shows how to use `create-system-instance`.

#### AWS CLI

**To create a system instance**

The following `create-system-instance` example creates a system instance. The value of `MySystemInstanceDefinition` is the GraphQL that models the system instance.

```
aws iotthingsgraph create-system-instance -\
    -definition language=GRAPHQL,text="MySystemInstanceDefinition" \
    --target CLOUD \
    --flow-actions-role-arn myRoleARN
```

Output:

```
{
    "summary": {
        "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/default/
Room218",
        "status": "NOT_DEPLOYED",
        "target": "CLOUD",
        "createdAt": 1559249315.208,
        "updatedAt": 1559249315.208
    }
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see CreateSystemInstance in *AWS CLI Command Reference*.

### `create-system-template`

The following code example shows how to use `create-system-template`.

#### AWS CLI

**To create a system**

The following `create-system-template` example creates a system. The value of MySystemDefinition is the GraphQL that models the system.

```
aws iotthingsgraph create-system-template \
    --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559249776.254,
        "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MySystem",
        "revisionNumber": 1
    }
}
```

For more information, see Creating Systems in the *AWS IoT Things Graph User Guide*.

- For API details, see CreateSystemTemplate in *AWS CLI Command Reference*.

## `delete-flow-template`

The following code example shows how to use `delete-flow-template`.

### AWS CLI

#### To delete a flow

The following `delete-flow-template` example deletes a flow (workflow).

```
aws iotthingsgraph delete-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeleteFlowTemplate in *AWS CLI Command Reference*.

### `delete-namespace`

The following code example shows how to use `delete-namespace`.

**AWS CLI**

**To delete a namespace**

The following `delete-namespace` example deletes a namespace.

```
aws iotthingsgraph delete-namespace
```

Output:

```
{
   "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
   "namespaceName": "us-west-2/123456789012/default"
}
```

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeleteNamespace in *AWS CLI Command Reference*.

### `delete-system-instance`

The following code example shows how to use `delete-system-instance`.

**AWS CLI**

**To delete a system instance**

The following `delete-system-instance` example deletes a system instance.

```
aws iotthingsgraph delete-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeleteSystemInstance in *AWS CLI Command Reference*.

### `delete-system-template`

The following code example shows how to use `delete-system-template`.

**AWS CLI**

**To delete a system**

The following `delete-system-template` example deletes a system.

```
aws iotthingsgraph delete-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeleteSystemTemplate in *AWS CLI Command Reference*.

### `deploy-system-instance`

The following code example shows how to use `deploy-system-instance`.

**AWS CLI**

**To deploy a system instance**

The following `delete-system-template` example deploys a system instance.

```
aws iotthingsgraph deploy-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{
   "summary": {
      "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment:Room218",
      "createdAt": 1559249776.254,
      "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
```

```
        "status": "DEPLOYED_IN_TARGET",
        "target": "CLOUD",
        "updatedAt": 1559249776.254
    }
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see DeploySystemInstance in *AWS CLI Command Reference*.

### `deprecate-flow-template`

The following code example shows how to use `deprecate-flow-template`.

**AWS CLI**

**To deprecate a flow**

The following `deprecate-flow-template` example deprecates a flow (workflow).

```
aws iotthingsgraph deprecate-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeprecateFlowTemplate in *AWS CLI Command Reference*.

### `deprecate-system-template`

The following code example shows how to use `deprecate-system-template`.

**AWS CLI**

**To deprecate a system**

The following `deprecate-system-template` example deprecates a system.

```
aws iotthingsgraph deprecate-system-template \
```

```
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

This command produces no output.

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see DeprecateSystemTemplate in *AWS CLI Command Reference*.

### `describe-namespace`

The following code example shows how to use `describe-namespace`.

**AWS CLI**

**To get a description of your namespace**

The following `describe-namespace` example gets a description of your namespace.

```
aws iotthingsgraph describe-namespace
```

Output:

```
{
    "namespaceName": "us-west-2/123456789012/default",
    "trackingNamespaceName": "aws",
    "trackingNamespaceVersion": 1,
    "namespaceVersion": 5
}
```

For more information, see Namespaces in the *AWS IoT Things Graph User Guide*.

- For API details, see DescribeNamespace in *AWS CLI Command Reference*.

### `dissociate-entity-from-thing`

The following code example shows how to use `dissociate-entity-from-thing`.

**AWS CLI**

**To dissociate a thing from a device**

The following `dissociate-entity-from-thing` example dissociates a thing from a device.

```
aws iotthingsgraph dissociate-entity-from-thing \
    --thing-name "MotionSensorName" \
    --entity-type "DEVICE"
```

This command produces no output.

For more information, see Creating and Uploading Models in the *AWS IoT Things Graph User Guide*.

- For API details, see DissociateEntityFromThing in *AWS CLI Command Reference*.

## `get-entities`

The following code example shows how to use `get-entities`.

### AWS CLI

#### To get definitions for entities

The following `get-entities` example gets a definition for a device model.

```
aws iotthingsgraph get-entities \
    --ids "urn:tdm:aws/examples:DeviceModel:MotionSensor"
```

Output:

```
{
    "descriptions": [
        {
            "id": "urn:tdm:aws/examples:DeviceModel:MotionSensor",
            "type": "DEVICE_MODEL",
            "createdAt": 1559256190.599,
            "definition": {
                "language": "GRAPHQL",
                "text": "##\n# Specification of motion sensor devices interface.\n##
\ntype MotionSensor @deviceModel(id: \"urn:tdm:aws/examples:deviceModel:MotionSensor
\",\n        capability: \"urn:tdm:aws/examples:capability:MotionSensorCapability\")
 {ignore:void}"
            }
        }
```

```
    ]
}
```

For more information, see Creating and Uploading Models in the *AWS IoT Things Graph User Guide*.

- For API details, see GetEntities in *AWS CLI Command Reference*.

### `get-flow-template-revisions`

The following code example shows how to use `get-flow-template-revisions`.

**AWS CLI**

**To get revision information about a flow**

The following `get-flow-template-revisions` example gets revision information about a flow (workflow).

```
aws iotthingsgraph get-flow-template-revisions \
    --id urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        }
    ]
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see GetFlowTemplateRevisions in *AWS CLI Command Reference*.

### `get-flow-template`

The following code example shows how to use `get-flow-template`.

## AWS CLI

### To get a flow definition

The following `get-flow-template` example gets a definition for a flow (workflow).

```
aws iotthingsgraph get-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

Output:

```
{
    "description": {
        "summary": {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        },
        "definition": {
            "language": "GRAPHQL",
            "text": "{\nquery MyFlow($camera: string!, $screen: string!)
 @workflowType(id: \"urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow\")
 @annotation(type: \"tgc:FlowEvent\", id: \"sledged790c1b2bcd949e09da0c9bfc077f79d
\", x: 1586, y: 653) @triggers(definition: \"{MotionSensor(description:
 \\\"\\\") @position(x: 1045, y: 635.6666564941406) {\\n  condition(expr:
 \\\"devices[name == \\\\\\\"motionSensor\\\\\\\"].events[name == \\\
\\\"StateChanged\\\\\\\"].lastEvent\\\")\\n  action(expr: \\\"\\\")\
\n}}\") {\n  variables {\n    cameraResult @property(id: \"urn:tdm:aws/
examples:property:CameraStateProperty\")\n  }\n  steps {\n    step(name: \"Camera
\", outEvent: [\"sledged790c1b2bcd949e09da0c9bfc077f79d\"]) @position(x: 1377,
 y: 638.6666564941406) {\n      DeviceActivity(deviceModel: \"urn:tdm:aws/
examples:deviceModel:Camera\", out: \"cameraResult\", deviceId: \"${camera}\")
 {\n        capture\n      }\n    }\n    step(name: \"Screen\", inEvent:
 [\"sledged790c1b2bcd949e09da0c9bfc077f79d\"]) @position(x: 1675.6666870117188,
 y: 637.9999847412109) {\n      DeviceActivity(deviceModel: \"urn:tdm:aws/
examples:deviceModel:Screen\", deviceId: \"${screen}\") {\n        display(imageUrl:
 \"${cameraResult.lastClickedImage}\")\n      }\n    }\n  }\n}\n}"
        },
        "validatedNamespaceVersion": 5
    }
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see GetFlowTemplate in *AWS CLI Command Reference*.

### `get-namespace-deletion-status`

The following code example shows how to use `get-namespace-deletion-status`.

**AWS CLI**

**To get the status of the namespace deletion task**

The following `get-namespace-deletion-status` example gets the status of the namespace deletion task.

```
aws iotthingsgraph get-namespace-deletion-status
```

Output:

```
{
   "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
   "namespaceName": "us-west-2/123456789012/default"
   "status": "SUCCEEDED "
}
```

For more information, see Namespaces in the *AWS IoT Things Graph User Guide*.

- For API details, see GetNamespaceDeletionStatus in *AWS CLI Command Reference*.

### `get-system-instance`

The following code example shows how to use `get-system-instance`.

**AWS CLI**

**To get a system instance**

The following `get-system-instance` example gets a definition for a system instance.

```
aws iotthingsgraph get-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{
    "description": {
        "summary": {
            "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218",
            "status": "NOT_DEPLOYED",
            "target": "CLOUD",
            "createdAt": 1559249315.208,
            "updatedAt": 1559249315.208
        },
        "definition": {
            "language": "GRAPHQL",
            "text": "{\r\nquery Room218 @deployment(id: \"urn:tdm:us-
west-2/123456789012/default:Deployment:Room218\", systemId: \"urn:tdm:us-
west-2/123456789012/default:System:SecurityFlow\") {\r\n    motionSensor(deviceId:
 \"MotionSensorName\")\r\n    screen(deviceId: \"ScreenName\")\r\n
 camera(deviceId: \"CameraName\") \r\n    triggers {MotionEventTrigger(description:
 \"a trigger\") {  \r\n    condition(expr: \"devices[name ==
 'motionSensor'].events[name == 'StateChanged'].lastEvent\") \r\n    action(expr:
 \"ThingsGraph.startFlow('SecurityFlow', bindings[name == 'camera'].deviceId,
 bindings[name == 'screen'].deviceId)\")\r\n    }\r\n   }\r\n  }\r\n  }"
        },
        "metricsConfiguration": {
            "cloudMetricEnabled": false
        },
        "validatedNamespaceVersion": 5,
        "flowActionsRoleArn": "arn:aws:iam::123456789012:role/ThingsGraphRole"
    }
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see GetSystemInstance in *AWS CLI Command Reference*.

## `get-system-template-revisions`

The following code example shows how to use `get-system-template-revisions`.

### AWS CLI

**To get revision information about a system**

The following `get-system-template-revisions` example gets revision information about a system.

```
aws iotthingsgraph get-system-template-revisions \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MySystem",
            "revisionNumber": 1,
            "createdAt": 1559247540.656
        }
    ]
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see GetSystemTemplateRevisions in *AWS CLI Command Reference*.

### `get-system-template`

The following code example shows how to use `get-system-template`.

#### AWS CLI

**To get a system**

The following `get-system-template` example gets a definition for a system.

```
aws iotthingsgraph get-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```
{
    "description": {
```

```
        "summary": {
            "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.656
        },
        "definition": {
            "language": "GRAPHQL",
            "text": "{\ntype MySystem @systemType(id: \"urn:tdm:us-
west-2/123456789012/default:System:MySystem\", description: \"\") {\n  camera:
 Camera @thing(id: \"urn:tdm:aws/examples:deviceModel:Camera\")\n  screen:
 Screen @thing(id: \"urn:tdm:aws/examples:deviceModel:Screen\")\n  motionSensor:
 MotionSensor @thing(id: \"urn:tdm:aws/examples:deviceModel:MotionSensor
\")\n  MyFlow: MyFlow @workflow(id: \"urn:tdm:us-west-2/123456789012/
default:Workflow:MyFlow\")\n}\n}"
        },
        "validatedNamespaceVersion": 5
    }
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see GetSystemTemplate in *AWS CLI Command Reference*.

### `get-upload-status`

The following code example shows how to use `get-upload-status`.

#### AWS CLI

**To get the status of your entity upload**

The following `get-upload-status` example gets the status of your entity upload operation. The value of `MyUploadId` is the ID value returned by the `upload-entity-definitions` operation.

```
aws iotthingsgraph get-upload-status \
    --upload-id "MyUploadId"
```

Output:

```
{
    "namespaceName": "us-west-2/123456789012/default",
    "namespaceVersion": 5,
    "uploadId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",
    "uploadStatus": "SUCCEEDED"
}
```

For more information, see Modeling Entities in the *AWS IoT Things Graph User Guide*.

- For API details, see GetUploadStatus in *AWS CLI Command Reference*.

### `list-flow-execution-messages`

The following code example shows how to use `list-flow-execution-messages`.

#### AWS CLI

**To get information about events in a flow execution**

The following `list-flow-execution-messages` example gets information about events in a flow execution.

```
aws iotthingsgraph list-flow-execution-messages \
    --flow-execution-id "urn:tdm:us-west-2/123456789012/
default:Workflow:SecurityFlow_2019-05-11T19:39:55.317Z_MotionSensor_69b151ad-
a611-42f5-ac21-fe537f9868ad"
```

Output:

```
{
    "messages": [
        {
         "eventType": "EXECUTION_STARTED",
         "messageId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",
         "payload": "Flow execution started",
         "timestamp": 1559247540.656
        }
    ]
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see ListFlowExecutionMessages in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list all tags for a resource**

The following `list-tags-for-resource` example list all tags for an AWS IoT Things Graph resource.

```
aws iotthingsgraph list-tags-for-resource \
    --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218"
```

Output:

```
{
   "tags": [
      {
         "key": "Type",
         "value": "Residential"
      }
   ]
}
```

For more information, see Tagging Your AWS IoT Things Graph Resources in the *AWS IoT Things Graph User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `search-entities`

The following code example shows how to use `search-entities`.

**AWS CLI**

**To search for entities**

The following `search-entities` example searches for all entities of type EVENT.

```
aws iotthingsgraph search-entities \
    --entity-types "EVENT"
```

Output:

```
{
    "descriptions": [
        {
            "id": "urn:tdm:aws/examples:Event:MotionSensorEvent",
            "type": "EVENT",
            "definition": {
                "language": "GRAPHQL",
                "text": "##\n# Description of events emitted by motion
 sensor.\n##\ntype MotionSensorEvent @eventType(id: \"urn:tdm:aws/
examples:event:MotionSensorEvent\",\n            payload: \"urn:tdm:aws/
examples:property:MotionSensorStateProperty\") {ignore:void}"
            }
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Event:CameraClickedEventV2",
            "type": "EVENT",
            "definition": {
                "language": "GRAPHQL",
                "text": "type CameraClickedEventV2 @eventType(id: \"urn:tdm:us-
west-2/123456789012/default:event:CameraClickedEventV2\",\r\npayload:
 \"urn:tdm:aws:Property:Boolean\"){ignore:void}"
            }
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Event:MotionSensorEventV2",
            "type": "EVENT",
            "definition": {
                "language": "GRAPHQL",
                "text": "# Event emitted by the motion sensor.\r\ntype
 MotionSensorEventV2 @eventType(id: \"urn:tdm:us-west-2/123456789012/
default:event:MotionSensorEventV2\",\r\npayload: \"urn:tdm:us-west-2/123456789012/
default:property:MotionSensorStateProperty2\") {ignore:void}"
            }
        }
    ],
    "nextToken": "urn:tdm:us-west-2/123456789012/default:Event:MotionSensorEventV2"
```

```
}
```

For more information, see AWS IoT Things Graph Data Model Reference in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchEntities in *AWS CLI Command Reference*.

### `search-flow-executions`

The following code example shows how to use `search-flow-executions`.

**AWS CLI**

**To search for flow executions**

The following `search-flow-executions` example search for all executions of a flow in a specified system instance.

```
aws iotthingsgraph search-flow-executions \
    --system-instance-id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{
   "summaries": [
      {
         "createdAt": 1559247540.656,
         "flowExecutionId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",
         "flowTemplateId": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
         "status": "RUNNING ",
         "systemInstanceId": "urn:tdm:us-west-2/123456789012/
default:System:MySystem",
         "updatedAt": 1559247540.656
      }
   ]
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchFlowExecutions in *AWS CLI Command Reference*.

### `search-flow-templates`

The following code example shows how to use `search-flow-templates`.

**AWS CLI**

**To search for flows (or workflows)**

The following `search-flow-templates` example searches for all flows (workflows) that contain the Camera device model.

```
aws iotthingsgraph search-flow-templates \
    --filters name="DEVICE_MODEL_ID",value="urn:tdm:aws/examples:DeviceModel:Camera"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
            "revisionNumber": 1,
            "createdAt": 1559247540.292
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/default:Workflow:SecurityFlow",
            "revisionNumber": 3,
            "createdAt": 1548283099.27
        }
    ]
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchFlowTemplates in *AWS CLI Command Reference*.

### `search-system-instances`

The following code example shows how to use `search-system-instances`.

**AWS CLI**

**To search for system instances**

The following `search-system-instances` example searches for all system instances that contain the specified system.

```
aws iotthingsgraph search-system-instances \
    --filters name="SYSTEM_TEMPLATE_ID",value="urn:tdm:us-west-2/123456789012/
default:System:SecurityFlow"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Deployment:DeploymentForSample",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/DeploymentForSample",
            "status": "NOT_DEPLOYED",
            "target": "GREENGRASS",
            "greengrassGroupName": "ThingsGraphGrnGr",
            "createdAt": 1555716314.707,
            "updatedAt": 1555716314.707
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/
default:Deployment:MockDeployment",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/MockDeployment",
            "status": "DELETED_IN_TARGET",
            "target": "GREENGRASS",
            "greengrassGroupName": "ThingsGraphGrnGr",
            "createdAt": 1549416462.049,
            "updatedAt": 1549416722.361,
            "greengrassGroupId": "01d04b07-2a51-467f-9d03-0c90b3cdcaaf",
            "greengrassGroupVersionId": "7365aed7-2d3e-4d13-aad8-75443d45eb05"
        },
        {
            "id": "urn:tdm:us-west-2/123456789012/

default/Room218",
            "status": "NOT_DEPLOYED",
            "target": "CLOUD",
            "createdAt": 1559249315.208,
            "updatedAt": 1559249315.208
        }
    ]
}
```

For more information, see Working with Systems and Flow Configurations in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchSystemInstances in *AWS CLI Command Reference*.

## `search-system-templates`

The following code example shows how to use `search-system-templates`.

### AWS CLI

#### To search for system

The following `search-system-templates` example searches for all systems that contain the specified flow.

```
aws iotthingsgraph search-system-templates \
    --filters name="FLOW_TEMPLATE_ID",value="urn:tdm:us-west-2/123456789012/
default:Workflow:SecurityFlow"
```

Output:

```
{
    "summaries": [
        {
            "id": "urn:tdm:us-west-2/123456789012/default:System:SecurityFlow",
            "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
SecurityFlow",
            "revisionNumber": 1,
            "createdAt": 1548283099.433
        }
    ]
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchSystemTemplates in *AWS CLI Command Reference*.

### `search-things`

The following code example shows how to use `search-things`.

#### AWS CLI

**To search for things associated with devices and device models**

The following `search-things` example searches for all things that are associated with the HCSR501MotionSensor device.

```
aws iotthingsgraph search-things \
    --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

Output:

```
{
    "things": [
```

```
        {
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MotionSensor1",
            "thingName": "MotionSensor1"
        },
        {
            "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/TG_MS",
            "thingName": "TG_MS"
        }
    ]
}
```

For more information, see Creating and Uploading Models in the *AWS IoT Things Graph User Guide*.

- For API details, see SearchThings in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To create a tag for a resource**

The following `tag-resource` example creates a tag for the specified resource.

```
aws iotthingsgraph tag-resource \
    --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218" \
    --tags key="Type",value="Residential"
```

This command produces no output.

For more information, see Tagging Your AWS IoT Things Graph Resources in the *AWS IoT Things Graph User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `undeploy-system-instance`

The following code example shows how to use `undeploy-system-instance`.

**AWS CLI**

**To undeploy a system instance from its target**

The following `undeploy-system-instance` example removes a system instance from its target.

```
aws iotthingsgraph undeploy-system-instance \
    --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room215"
```

Output:

```
{
    "summary": {
        "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room215",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/default/
Room215",
        "status": "PENDING_DELETE",
        "target": "GREENGRASS",
        "greengrassGroupName": "ThingsGraphGrnGr",
        "createdAt": 1553189694.255,
        "updatedAt": 1559344549.601,
        "greengrassGroupId": "01d04b07-2a51-467f-9d03-0c90b3cdcaaf",
        "greengrassGroupVersionId": "731b371d-d644-4b67-ac64-3934e99b75d7"
    }
}
```

For more information, see Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments in the *AWS IoT Things Graph User Guide*.

- For API details, see UndeploySystemInstance in *AWS CLI Command Reference*.

## `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag for a resource**

The following `untag-resource` example removes a tag for the specified resource.

```
aws iotthingsgraph untag-resource \
    --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218" \
    --tag-keys "Type"
```

This command produces no output.

For more information, see Tagging Your AWS IoT Things Graph Resources in the *AWS IoT Things Graph User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-flow-template`

The following code example shows how to use `update-flow-template`.

**AWS CLI**

**To update a flow**

The following `update-flow-template` example updates a flow (workflow). The value of `MyFlowDefinition` is the GraphQL that models the flow.

```
aws iotthingsgraph update-flow-template \
    --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow" \
    --definition language=GRAPHQL,text="MyFlowDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559248067.545,
        "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
        "revisionNumber": 2
    }
}
```

For more information, see Working with Flows in the *AWS IoT Things Graph User Guide*.

- For API details, see UpdateFlowTemplate in *AWS CLI Command Reference*.

### update-system-template

The following code example shows how to use update-system-template.

#### AWS CLI

**To update a system**

The following update-system-template example updates a system. The value of MySystemDefinition is the GraphQL that models the system.

```
aws iotthingsgraph update-system-template \
    --id "urn:tdm:us-west-2/123456789012/default:System:MySystem" \
    --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```
{
    "summary": {
        "createdAt": 1559249776.254,
        "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
        "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/
MySystem",
        "revisionNumber": 2
    }
}
```

For more information, see Creating Systems in the *AWS IoT Things Graph User Guide*.

- For API details, see UpdateSystemTemplate in *AWS CLI Command Reference*.

### upload-entity-definitions

The following code example shows how to use upload-entity-definitions.

#### AWS CLI

**To upload entity definitions**

The following upload-entity-definitions example uploads entity definitions to your namespace. The value of MyEntityDefinitions is the GraphQL that models the entities.

```
aws iotthingsgraph upload-entity-definitions \
```

```
    --document language=GRAPHQL,text="MyEntityDefinitions"
```

Output:

```
{
    "uploadId": "f6294f1e-b109-4bbe-9073-f451a2dda2da"
}
```

For more information, see Modeling Entities in the *AWS IoT Things Graph User Guide*.

- For API details, see UploadEntityDefinitions in *AWS CLI Command Reference*.

## AWS IoT Wireless examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Wireless.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `associate-aws-account-with-partner-account`

The following code example shows how to use `associate-aws-account-with-partner-account`.

#### AWS CLI

**To associate a partner account with your AWS account**

The following `associate-aws-account-with-partner-account` example associates the following Sidewalk account credentials with your AWS account.

```
aws iotwireless associate-aws-account-with-partner-account \
    --sidewalk
 AmazonId="12345678901234",AppServerPrivateKey="a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78
```

Output:

```
{
    "Sidewalk": {
        "AmazonId": "12345678901234",
        "AppServerPrivateKey":
 "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
    }
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see AssociateAwsAccountWithPartnerAccount in *AWS CLI Command Reference*.

### `associate-wireless-device-with-thing`

The following code example shows how to use `associate-wireless-device-with-thing`.

**AWS CLI**

**To associate a thing to a wireless device**

The following `associate-wireless-device-with-thing` example associates a thing to your wireless device that has the specified ID.

```
aws iotwireless associate-wireless-device-with-thing \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --thing-arn "arn:aws:iot:us-east-1:123456789012:thing/MyIoTWirelessThing"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see AssociateWirelessDeviceWithThing in *AWS CLI Command Reference*.

### `associate-wireless-gateway-with-certificate`

The following code example shows how to use `associate-wireless-gateway-with-certificate`.

**AWS CLI**

**To associate the certificate with the wireless gateway**

The following `associate-wireless-gateway-with-certificate` associates a wireless gateway with a certificate.

```
aws iotwireless associate-wireless-gateway-with-certificate \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --iot-certificate-id
 "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
```

Output:

```
{
    "IotCertificateId":
 "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
}
```

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see AssociateWirelessGatewayWithCertificate in *AWS CLI Command Reference*.

### `associate-wireless-gateway-with-thing`

The following code example shows how to use `associate-wireless-gateway-with-thing`.

**AWS CLI**

**To associate a thing to a wireless gateway**

The following `associate-wireless-gateway-with-thing` example associates a thing to a wireless gateway.

```
aws iotwireless associate-wireless-gateway-with-thing \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --thing-arn "arn:aws:iot:us-east-1:123456789012:thing/MyIoTWirelessThing"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see AssociateWirelessGatewayWithThing in *AWS CLI Command Reference*.

### `create-destination`

The following code example shows how to use `create-destination`.

**AWS CLI**

**To create an IoT wireless destination**

The following `create-destination` example creates a destination for mapping a device message to an AWS IoT rule. Before you run this command, you must have created an IAM role that gives AWS IoT Core for LoRaWAN the permissions necessary to send data to the AWS IoT rule.

```
aws iotwireless create-destination \
    --name IoTWirelessDestination \
    --expression-type RuleName \
    --expression IoTWirelessRule \
    --role-arn arn:aws:iam::123456789012:role/IoTWirelessDestinationRole
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination",
    "Name": "IoTWirelessDestination"
}
```

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateDestination in *AWS CLI Command Reference*.

### `create-device-profile`

The following code example shows how to use `create-device-profile`.

**AWS CLI**

**To create a new device profile**

The following `create-device-profile` example creates a new IoT wireless device profile.

```
aws iotwireless create-device-profile
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateDeviceProfile in *AWS CLI Command Reference*.

### `create-service-profile`

The following code example shows how to use `create-service-profile`.

**AWS CLI**

**To create a new service profile**

The following `create-service-profile` example creates a new IoT wireless service profile.

```
aws iotwireless create-service-profile
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateServiceProfile in *AWS CLI Command Reference*.

### `create-wireless-device`

The following code example shows how to use `create-wireless-device`.

#### AWS CLI

**To create an IoT wireless device**

The following `create-wireless-device` example creates a wireless device resource of the type LoRaWAN.

```
aws iotwireless create-wireless-device \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "Description": "My LoRaWAN wireless device"
    "DestinationName": "IoTWirelessDestination"
    "LoRaWAN": {
        "DeviceProfileId": "ab0c23d3-b001-45ef-6a01-2bc3de4f5333",
        "ServiceProfileId": "fe98dc76-cd12-001e-2d34-5550432da100",
        "OtaaV1_1": {
            "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",
            "JoinEui": "b4c231a359bc2e3d",
            "NwkKey": "01c3f004a2d6efffe32c4eda14bcd2b4"
        },
        "DevEui": "ac12efc654d23fc2"
    },
    "Name": "SampleIoTWirelessThing"
```

```
    "Type": LoRaWAN
}
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f",
    "Id": "1ffd32c8-8130-4194-96df-622f072a315f"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateWirelessDevice in *AWS CLI Command Reference*.

### `create-wireless-gateway-task-definition`

The following code example shows how to use `create-wireless-gateway-task-definition`.

**AWS CLI**

**To create a wireless gateway task definition**

The following `create-wireless-gateway-task-definition` automatically creates tasks using this task definition for all gateways with the specified current version.

```
aws iotwireless create-wireless-gateway-task-definition \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "AutoCreateTasks": true,
    "Name": "TestAutoUpdate",
    "Update":{
        "UpdateDataSource" : "s3://cupsalphagafirmwarebin/station",
        "UpdateDataRole" : "arn:aws:iam::001234567890:role/SDK_Test_Role",
        "LoRaWAN" :{
            "CurrentVersion" :{
                "PackageVersion" : "1.0.0",
```

```
                "Station" : "2.0.5",
                "Model" : "linux"
            },
            "UpdateVersion" :{
                "PackageVersion" : "1.0.1",
                "Station" : "2.0.5",
                "Model" : "minihub"
            }
        }
    }
}
```

Output:

```
{
    "Id": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateWirelessGatewayTaskDefinition in *AWS CLI Command Reference*.

### `create-wireless-gateway-task`

The following code example shows how to use `create-wireless-gateway-task`.

#### AWS CLI

**To create the task for a wireless gateway**

The following `create-wireless-gateway-task` example creates a task for a wireless gateway.

```
aws iotwireless create-wireless-gateway-task \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --wireless-gateway-task-definition-id "aa000102-0304-b0cd-ef56-a1b23cde456a"
```

Output:

```
{
```

```
    "WirelessGatewayTaskDefinitionId": "aa204003-0604-30fb-ac82-a4f95aaf450a",
    "Status": "Success"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateWirelessGatewayTask in *AWS CLI Command Reference*.

### `create-wireless-gateway`

The following code example shows how to use `create-wireless-gateway`.

**AWS CLI**

**To create a wireless gateway**

The following `create-wireless-gateway` example creates a wireless LoRaWAN device gateway.

```
aws iotwireless create-wireless-gateway \
    --lorawan GatewayEui="a1b2c3d4567890ab",RfRegion="US915" \
    --name "myFirstLoRaWANGateway" \
    --description "Using my first LoRaWAN gateway"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessGateway/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see CreateWirelessGateway in *AWS CLI Command Reference*.

### `delete-destination`

The following code example shows how to use `delete-destination`.

**AWS CLI**

**To delete an IoT wireless destination**

The following `delete-destination` example deletes the wireless destination resource with the name `IoTWirelessDestination` that you created.

```
aws iotwireless delete-destination \
    --name "IoTWirelessDestination"
```

This command produces no output.

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteDestination in *AWS CLI Command Reference*.

### `delete-device-profile`

The following code example shows how to use `delete-device-profile`.

**AWS CLI**

**To delete a device profile**

The following `delete-device-profile` example deletes a device profile with the specified ID that you created.

```
aws iotwireless delete-device-profile \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteDeviceProfile in *AWS CLI Command Reference*.

### `delete-service-profile`

The following code example shows how to use `delete-service-profile`.

**AWS CLI**

**To delete a service profile**

The following `delete-service-profile` example deletes a service profile with the specified ID that you created.

```
aws iotwireless delete-service-profile \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteServiceProfile in *AWS CLI Command Reference*.

### `delete-wireless-device`

The following code example shows how to use `delete-wireless-device`.

**AWS CLI**

**To delete a wireless device**

The following `delete-wireless-device` example deletes a wireless device that has the specified ID.

```
aws iotwireless delete-wireless-device \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessDevice in *AWS CLI Command Reference*.

### `delete-wireless-gateway-task-definition`

The following code example shows how to use `delete-wireless-gateway-task-definition`.

**AWS CLI**

**To delete a wireless gateway task definition**

The following `delete-wireless-gateway-task-definition` example deletes the wireless gateway task definition that you created with the following ID.

```
aws iotwireless delete-wireless-gateway-task-definition \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessGatewayTaskDefinition in *AWS CLI Command Reference*.

## `delete-wireless-gateway-task`

The following code example shows how to use `delete-wireless-gateway-task`.

**AWS CLI**

**To delete a wireless gateway task**

The following `delete-wireless-gateway-task` example deletes the wireless gateway task that has the specified ID.

```
aws iotwireless delete-wireless-gateway-task \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessGatewayTask in *AWS CLI Command Reference*.

## `delete-wireless-gateway`

The following code example shows how to use `delete-wireless-gateway`.

**AWS CLI**

**To delete a wireless gateway**

The following `delete-wireless-gateway` example deletes a wireless gateway that has the specified ID.

```
aws iotwireless delete-wireless-gateway \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DeleteWirelessGateway in *AWS CLI Command Reference*.

### `disassociate-aws-account-from-partner-account`

The following code example shows how to use `disassociate-aws-account-from-partner-account`.

**AWS CLI**

**To disassociate the partner account from the AWS account**

The following `disassociate-aws-account-from-partner-account` example disassociates a partner account from your currently associated AWS account.

```
aws iotwireless disassociate-aws-account-from-partner-account \
    --partner-account-id "12345678901234" \
    --partner-type "Sidewalk"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateAwsAccountFromPartnerAccount in *AWS CLI Command Reference*.

### `disassociate-wireless-device-from-thing`

The following code example shows how to use `disassociate-wireless-device-from-thing`.

**AWS CLI**

**To disassociate the thing from the wireless device**

The following `disassociate-wireless-device-from-thing` example disassociates a wireless device from its currently associated thing.

```
aws iotwireless disassociate-wireless-device-from-thing \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateWirelessDeviceFromThing in *AWS CLI Command Reference*.

### `disassociate-wireless-gateway-from-certificate`

The following code example shows how to use `disassociate-wireless-gateway-from-certificate`.

**AWS CLI**

**To disassociate the certificate from the wireless gateway**

The following `disassociate-wireless-gateway-from-certificate` disassociates a wireless gateway from its currently associated certificate.

```
aws iotwireless disassociate-wireless-gateway-from-certificate \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateWirelessGatewayFromCertificate in *AWS CLI Command Reference*.

### `disassociate-wireless-gateway-from-thing`

The following code example shows how to use `disassociate-wireless-gateway-from-thing`.

**AWS CLI**

**To disassociate the thing from the wireless gateway**

The following `disassociate-wireless-gateway-from-thing` example disassociates a wireless gateway from its currently associated thing.

```
aws iotwireless disassociate-wireless-gateway-from-thing \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see Add your gateways and wireless devices to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see DisassociateWirelessGatewayFromThing in *AWS CLI Command Reference*.

### `get-destination`

The following code example shows how to use `get-destination`.

**AWS CLI**

**To get information about an IoT wireless destination**

The following `get-destination` example gets information about the destination resource with the name `IoTWirelessDestination` that you created.

```
aws iotwireless get-destination \
    --name "IoTWirelessDestination"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination",
    "Name": "IoTWirelessDestination",
    "Expression": "IoTWirelessRule",
    "ExpressionType": "RuleName",
    "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
}
```

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetDestination in *AWS CLI Command Reference*.

### `get-device-profile`

The following code example shows how to use `get-device-profile`.

#### AWS CLI

**To get information about a device profile**

The following `get-device-profile` example gets information about the device profile with the specified ID that you created.

```
aws iotwireless get-device-profile \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
    "LoRaWAN": {
    "MacVersion": "1.0.3",
    "MaxDutyCycle": 10,
    "Supports32BitFCnt": false,
    "RegParamsRevision": "RP002-1.0.1",
    "SupportsJoin": true,
    "RfRegion": "US915",
```

```
    "MaxEirp": 13,
    "SupportsClassB": false,
    "SupportsClassC": false
    }
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetDeviceProfile in *AWS CLI Command Reference*.

### `get-partner-account`

The following code example shows how to use `get-partner-account`.

#### AWS CLI

**To get the partner account information**

The following `get-partner-account` example gets information about your Sidewalk account that has the following ID.

```
aws iotwireless get-partner-account \
    --partner-account-id "12345678901234" \
    --partner-type "Sidewalk"
```

Output:

```
{
    "Sidewalk": {
        "AmazonId": "12345678901234",
        "Fingerprint":
 "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
    },
    "AccountLinked": false
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see GetPartnerAccount in *AWS CLI Command Reference*.

### `get-service-endpoint`

The following code example shows how to use `get-service-endpoint`.

#### AWS CLI

##### To get the service endpoint

The following `get-service-endpoint` example gets the account-specific endpoint for CUPS protocol.

```
aws iotwireless get-service-endpoint
```

Output:

```
{
    "ServiceType": "CUPS",
    "ServiceEndpoint": "https://A1RMKZ37ACAGOT.cups.lorawan.us-
east-1.amazonaws.com:443",
    "ServerTrust": "-----BEGIN CERTIFICATE-----\n

}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetServiceEndpoint in *AWS CLI Command Reference*.

### `get-service-profile`

The following code example shows how to use `get-service-profile`.

#### AWS CLI

**To get information about a service profile**

The following `get-service-profile` example gets information about the service profile with the specified ID that you created.

```
aws iotwireless get-service-profile \
    --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

Output:

```
{
    "Arn": "arn:aws:iotwireless:us-east-1:651419225604:ServiceProfile/538185bb-
d7e7-4b95-96a0-c51aa4a5b9a0",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
    "LoRaWAN": {
        "HrAllowed": false,
        "NwkGeoLoc": false,
        "DrMax": 15,
        "UlBucketSize": 4096,
        "PrAllowed": false,
        "ReportDevStatusBattery": false,
        "DrMin": 0,
        "DlRate": 60,
        "AddGwMetadata": false,
        "ReportDevStatusMargin": false,
        "MinGwDiversity": 1,
        "RaAllowed": false,
        "DlBucketSize": 4096,
        "DevStatusReqFreq": 24,
```

```
        "TargetPer": 5,
        "UlRate": 60
    }
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetServiceProfile in *AWS CLI Command Reference*.

### `get-wireless-device-statistics`

The following code example shows how to use `get-wireless-device-statistics`.

#### AWS CLI

**To get operating information about a wireless device**

The following `get-wireless-device-statistics` example gets operating information about a wireless device.

```
aws iotwireless get-wireless-device-statistics \
    --wireless-device-id "1ffd32c8-8130-4194-96df-622f072a315f"
```

Output:

```
{
    "WirelessDeviceId": "1ffd32c8-8130-4194-96df-622f072a315f"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessDeviceStatistics in *AWS CLI Command Reference*.

### `get-wireless-device`

The following code example shows how to use `get-wireless-device`.

#### AWS CLI

**To get information about the wireless device**

The following `get-wireless-device` example lists the available widgets in your AWS account.

```
aws iotwireless get-wireless-device \
    --identifier "1ffd32c8-8130-4194-96df-622f072a315f" \
    --identifier-type WirelessDeviceID
```

Output:

```
{
    "Name": "myLoRaWANDevice",
    "ThingArn": "arn:aws:iot:us-east-1:123456789012:thing/44b87eb4-9bce-423d-
b5fc-973f5ecc358b",
    "DestinationName": "IoTWirelessDestination",
    "Id": "1ffd32c8-8130-4194-96df-622f072a315f",
    "ThingName": "44b87eb4-9bce-423d-b5fc-973f5ecc358b",
    "Type": "LoRaWAN",
    "LoRaWAN": {
        "DeviceProfileId": "ab0c23d3-b001-45ef-6a01-2bc3de4f5333",
        "ServiceProfileId": "fe98dc76-cd12-001e-2d34-5550432da100",
        "OtaaV1_1": {
            "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",
            "JoinEui": "b4c231a359bc2e3d",
            "NwkKey": "01c3f004a2d6efffe32c4eda14bcd2b4"
        },
        "DevEui": "ac12efc654d23fc2"
    },
    "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f",
    "Description": "My LoRaWAN wireless device"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessDevice in *AWS CLI Command Reference*.

### `get-wireless-gateway-certificate`

The following code example shows how to use `get-wireless-gateway-certificate`.

**AWS CLI**

**To get the ID of a certificate associated with a wireless gateway**

The following `get-wireless-gateway-certificate` example gets the certificate ID associated with a wireless gateway that has the specified ID.

```
aws iotwireless get-wireless-gateway-certificate \
    --id "6c44ab31-8b4d-407a-bed3-19b6c7cda551"
```

Output:

```
{
    "IotCertificateId":
 "8ea4aeae3db34c78cce75d9abd830356869ead6972997e0603e5fd032c804b6f"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayCertificate in *AWS CLI Command Reference*.

## `get-wireless-gateway-firmware-information`

The following code example shows how to use `get-wireless-gateway-firmware-information`.

**AWS CLI**

**To get firmware information about a wireless gateway**

The following `get-wireless-gateway-firmware-information` example gets firmware version and other information about a wireless gateway.

```
aws iotwireless get-wireless-gateway-firmware-information \
    --id "3039b406-5cc9-4307-925b-9948c63da25b"
```

Output:

```
{
    "LoRaWAN" :{
```

```
        "CurrentVersion" :{
            "PackageVersion" : "1.0.0",
            "Station" : "2.0.5",
            "Model" : "linux"
        }
    }
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayFirmwareInformation in *AWS CLI Command Reference*.

### `get-wireless-gateway-statistics`

The following code example shows how to use `get-wireless-gateway-statistics`.

**AWS CLI**

**To get operating information about a wireless gateway**

The following `get-wireless-gateway-statistics` example gets operating information about a wireless gateway.

```
aws iotwireless get-wireless-gateway-statistics \
    --wireless-gateway-id "3039b406-5cc9-4307-925b-9948c63da25b"
```

Output:

```
{
    "WirelessGatewayId": "3039b406-5cc9-4307-925b-9948c63da25b"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayStatistics in *AWS CLI Command Reference*.

### `get-wireless-gateway-task-definition`

The following code example shows how to use `get-wireless-gateway-task-definition`.

**AWS CLI**

**To get information about a wireless gateway task definition**

The following `get-wireless-gateway-task-definition` example gets information about the wireless task definition with the specified ID.

```
aws iotwireless get-wireless-gateway-task-definition \
    --id "b7d3baad-25c7-35e7-a4e1-1683a0d61da9"
```

Output:

```
{
    "AutoCreateTasks": true,
    "Name": "TestAutoUpdate",
    "Update":{
        "UpdateDataSource" : "s3://cupsalphagafirmwarebin/station",
        "UpdateDataRole" : "arn:aws:iam::001234567890:role/SDK_Test_Role",
        "LoRaWAN" :{
            "CurrentVersion" :{
                "PackageVersion" : "1.0.0",
                "Station" : "2.0.5",
                "Model" : "linux"
            },
            "UpdateVersion" :{
                "PackageVersion" : "1.0.1",
                "Station" : "2.0.5",
                "Model" : "minihub"
            }
        }
    }
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayTaskDefinition in *AWS CLI Command Reference*.

## `get-wireless-gateway-task`

The following code example shows how to use `get-wireless-gateway-task`.

**AWS CLI**

**To get information about the wireless gateway task**

The following `get-wireless-gateway-task` example gets information about the wireless gateway task with the specified ID.

```
aws iotwireless get-wireless-gateway-task \
    --id "11693a46-6866-47c3-a031-c9a616e7644b"
```

Output:

```
{
    "WirelessGatewayId": "6c44ab31-8b4d-407a-bed3-19b6c7cda551",
    "WirelessGatewayTaskDefinitionId": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",
    "Status": "Success"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGatewayTask in *AWS CLI Command Reference*.

### `get-wireless-gateway`

The following code example shows how to use `get-wireless-gateway`.

**AWS CLI**

**To get information about a wireless gateway**

The following `get-wireless-gateway` example gets information about the wireless gateway `myFirstLoRaWANGateway`.

```
aws iotwireless get-wireless-gateway \
    --identifier "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
    --identifier-type WirelessGatewayId
```

Output:

```
{
```

```
    "Description": "My first LoRaWAN gateway",
    "ThingArn": "arn:aws:iot:us-east-1:123456789012:thing/a1b2c3d4-5678-90ab-
cdef-12ab345c67de",
    "LoRaWAN": {
        "RfRegion": "US915",
        "GatewayEui": "a1b2c3d4567890ab"
    },
    "ThingName": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
    "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
    "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessGateway/6c44ab31-8b4d-407a-bed3-19b6c7cda551",
    "Name": "myFirstLoRaWANGateway"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see GetWirelessGateway in *AWS CLI Command Reference*.

### `list-destinations`

The following code example shows how to use `list-destinations`.

#### AWS CLI

**To list the wireless destinations**

The following `list-destinations` example lists the available destinations registered to your AWS account.

```
aws iotwireless list-destinations
```

Output:

```
{
    "DestinationList": [
        {
            "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination",
            "Name": "IoTWirelessDestination",
            "Expression": "IoTWirelessRule",
```

```
            "Description": "Destination for messages processed using
 IoTWirelessRule",
            "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
        },
        {
            "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination2",
            "Name": "IoTWirelessDestination2",
            "Expression": "IoTWirelessRule2",
            "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
        }
    ]
}
```

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListDestinations in *AWS CLI Command Reference*.

### `list-device-profiles`

The following code example shows how to use `list-device-profiles`.

**AWS CLI**

**To list the device profiles**

The following `list-device-profiles` example lists the available device profiles registered to your AWS account.

```
aws iotwireless list-device-profiles
```

Output:

```
{
    "DeviceProfileList": [
        {
            "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
            "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:DeviceProfile/12345678-a1b2-3c45-67d8-e90fa1b2c34d"
        },
```

```
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
            "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/
a1b2c3d4-5678-90ab-cdef-12ab345c67de"
        }
    ]
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListDeviceProfiles in *AWS CLI Command Reference*.

### `list-partner-accounts`

The following code example shows how to use `list-partner-accounts`.

**AWS CLI**

**To list the partner accounts**

The following `list-partner-accounts` example lists the available partner accounts associated with your AWS account.

```
aws iotwireless list-partner-accounts
```

Output:

```
{
    "Sidewalk": [
        {
            "AmazonId": "78965678771228",
            "Fingerprint":
 "bd96d8ef66dbfd2160eb60e156849e82ad7018b8b73c1ba0b4fc65c32498ee35"
        },
        {
            "AmazonId": "89656787651228",
            "Fingerprint":
 "bc5e99e151c07be14be7e6603e4489c53f858b271213a36ebe3370777ba06e9b"
        }
    ]
```

```
}
```

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see ListPartnerAccounts in *AWS CLI Command Reference*.

### `list-service-profiles`

The following code example shows how to use `list-service-profiles`.

**AWS CLI**

**To list the service profiles**

The following `list-service-profiles` example lists the available service profiles registered to your AWS account.

```
aws iotwireless list-service-profiles
```

Output:

```
{
    "ServiceProfileList": [
        {
            "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
            "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:ServiceProfile/538185bb-d7e7-4b95-96a0-c51aa4a5b9a0"
        },
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
            "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/
ea8bc823-5d13-472e-8d26-9550737d8100"
        }
    ]
}
```

For more information, see Add profiles to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListServiceProfiles in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags assigned to the resource**

The following `list-tags-for-resource` example lists the tags assigned to a wireless destination resource.

```
aws iotwireless list-tags-for-resource \
    --resource-arn "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination"
```

Output:

```
{
    "Tags": [
        {
            "Value": "MyValue",
            "Key": "MyTag"
        }
    ]
}
```

For more information, see Describe your AWS IoT Core for LoRaWAN resources in the *AWS IoT Developers Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `list-wireless-devices`

The following code example shows how to use `list-wireless-devices`.

**AWS CLI**

**To list the available wireless devices**

The following `list-wireless-devices` example lists the available wireless devices registered to your AWS account.

```
aws iotwireless list-wireless-devices
```

Output:

```
{
    "WirelessDeviceList": [
        {
            "Name": "myLoRaWANDevice",
            "DestinationName": "IoTWirelessDestination",
            "Id": "1ffd32c8-8130-4194-96df-622f072a315f",
            "Type": "LoRaWAN",
            "LoRaWAN": {
                "DevEui": "ac12efc654d23fc2"
            },
            "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f"
        }
    ]
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListWirelessDevices in *AWS CLI Command Reference*.

### `list-wireless-gateway-task-definitions`

The following code example shows how to use `list-wireless-gateway-task-definitions`.

#### AWS CLI

**To list the wireless gateway task definitions**

The following `list-wireless-gateway-task-definitions` example lists the available wireless gateway task definitions registered to your AWS account.

```
aws iotwireless list-wireless-gateway-task-definitions
```

Output:

```
{
```

```
    "TaskDefinitions": [
        {
            "Id": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",
            "LoRaWAN" :
                {
                "CurrentVersion" :{
                    "PackageVersion" : "1.0.0",
                    "Station" : "2.0.5",
                    "Model" : "linux"
                },
                "UpdateVersion" :{
                    "PackageVersion" : "1.0.1",
                    "Station" : "2.0.5",
                    "Model" : "minihub"
                }
            }
        }
    ]
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListWirelessGatewayTaskDefinitions in *AWS CLI Command Reference*.

### `list-wireless-gateways`

The following code example shows how to use `list-wireless-gateways`.

#### AWS CLI

**To list the wireless gateways**

The following `list-wireless-gateways` example lists the available wireless gateways in your AWS account.

```
aws iotwireless list-wireless-gateways
```

Output:

```
{
    "WirelessGatewayList": [
```

```
        {
            "Description": "My first LoRaWAN gateway",
            "LoRaWAN": {
                "RfRegion": "US915",
                "GatewayEui": "dac632ebc01d23e4"
            },
            "Id": "3039b406-5cc9-4307-925b-9948c63da25b",
            "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessGateway/3039b406-5cc9-4307-925b-9948c63da25b",
            "Name": "myFirstLoRaWANGateway"
        },
        {
            "Description": "My second LoRaWAN gateway",
            "LoRaWAN": {
                "RfRegion": "US915",
                "GatewayEui": "cda123fffe92ecd2"
            },
            "Id": "3285bdc7-5a12-4991-84ed-dadca65e342e",
            "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessGateway/3285bdc7-5a12-4991-84ed-dadca65e342e",
            "Name": "mySecondLoRaWANGateway"
        }
    ]
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see ListWirelessGateways in *AWS CLI Command Reference*.

### `send-data-to-wireless-device`

The following code example shows how to use `send-data-to-wireless-device`.

#### AWS CLI

**To send data to the wireless device**

The following `send-data-to-wireless-device` example sends a decrypted application data frame to the wireless device.

```
aws iotwireless send-data-to-wireless-device \
    --id "11aa5eae-2f56-4b8e-a023-b28d98494e49" \
```

```
    --transmit-mode "1" \
    --payload-data "SGVsbG8gVG8gRGV2c2lt" \
    --wireless-metadata LoRaWAN={FPort=1}
```

Output:

```
{
    MessageId: "6011dd36-0043d6eb-0072-0008"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see SendDataToWirelessDevice in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To specify a tag key and value for a resource**

The following `tag-resource` example tags the wireless destination `IoTWirelessDestination` with the key `MyTag` and value `MyValue`.

```
aws iotwireless tag-resource \
    --resource-arn "arn:aws:iotwireless:us-east-1:651419225604:Destination/
IoTWirelessDestination" \
    --tags Key="MyTag",Value="MyValue"
```

This command produces no output.

For more information, see Describe your AWS IoT Core for LoRaWAN resources in the *AWS IoT Developers Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `test-wireless-device`

The following code example shows how to use `test-wireless-device`.

**AWS CLI**

**To test the wireless device**

The following `test-wireless-device` example sends uplink data of `Hello` to a device with specified ID.

```
aws iotwireless test-wireless-device \
    --id "11aa5eae-2f56-4b8e-a023-b28d98494e49"
```

Output:

```
{
    Result: "Test succeeded. one message is sent with payload: hello"
}
```

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see TestWirelessDevice in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove one or more tags from a resource**

The following `untag-resource` example removes the tag `MyTag` and its value from the wireless destination `IoTWirelessDestination`.

```
aws iotwireless untag-resource \
    --resource-arn "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination" \
    --tag-keys "MyTag"
```

This command produces no output.

For more information, see Describe your AWS IoT Core for LoRaWAN resources in the *AWS IoT Developers Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-destination`

The following code example shows how to use `update-destination`.

**AWS CLI**

**To update the properties of a destination**

The following `update-destination` example updates the description property of a wireless destination.

```
aws iotwireless update-destination \
    --name "IoTWirelessDestination" \
    --description "Destination for messages processed using IoTWirelessRule"
```

This command produces no output.

For more information, see Add destinations to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see UpdateDestination in *AWS CLI Command Reference*.

### `update-partner-account`

The following code example shows how to use `update-partner-account`.

**AWS CLI**

**To update the properties of a partner account**

The following `update-partner-account` updates the `AppServerPrivateKey` for the account that has the specified ID.

```
aws iotwireless update-partner-account \
    --partner-account-id "78965678771228" \
    --partner-type "Sidewalk" \
    --sidewalk
 AppServerPrivateKey="f798ab4899346a88599180fee9e14fa1ada7b6df989425b7c6d2146dd6c815bb"
```

This command produces no output.

For more information, see Amazon Sidewalk Integration for AWS IoT Core in the *AWS IoT Developers Guide*.

- For API details, see UpdatePartnerAccount in *AWS CLI Command Reference*.

### `update-wireless-device`

The following code example shows how to use `update-wireless-device`.

**AWS CLI**

**To update the properties of a wireless device**

The following `update-wireless-device` example updates the properties of a wireless device registered to your AWS account.

```
aws iotwireless update-wireless-device \
    --id "1ffd32c8-8130-4194-96df-622f072a315f" \
    --destination-name IoTWirelessDestination2 \
    --description "Using my first LoRaWAN device"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see UpdateWirelessDevice in *AWS CLI Command Reference*.

### `update-wireless-gateway`

The following code example shows how to use `update-wireless-gateway`.

**AWS CLI**

**To update the wireless gateway**

The following `update-wireless-gateway` example updates the description of your wireless gateway.

```
aws iotwireless update-wireless-gateway \
    --id "3285bdc7-5a12-4991-84ed-dadca65e342e" \
    --description "Using my LoRaWAN gateway"
```

This command produces no output.

For more information, see Connecting devices and gateways to AWS IoT Core for LoRaWAN in the *AWS IoT Developers Guide*.

- For API details, see UpdateWirelessGateway in *AWS CLI Command Reference*.

## Amazon IVS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `batch-get-channel`

The following code example shows how to use `batch-get-channel`.

#### AWS CLI

##### To get channel configuration information about multiple channels

The following `batch-get-channel` example lists information about the specified channels.

```
aws ivs batch-get-channel \
    --arns arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
        arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "authorized": false,
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "insecureIngest": false,
            "latencyMode": "LOW",
            "name": "channel-1",
            "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/
api/video/v1/us-west-2.123456789012.channel-1.abcdEFGH.m3u8",
            "preset": "",
            "playbackRestrictionPolicyArn": "",
            "recordingConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABCD12cdEFgh",
            "srt": {
                "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
                "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
            },
            "tags": {},
            "type": "STANDARD"
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl",
            "authorized": false,
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "insecureIngest": true,
            "latencyMode": "LOW",
            "name": "channel-2",
            "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/
api/video/v1/us-west-2.123456789012.channel-2.abcdEFGH.m3u8",
            "preset": "",
            "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ"",
            "recordingConfigurationArn": "",
            "srt": {
                "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
                "passphrase":
 "BA1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
            },
            "tags": {},
```

```
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see BatchGetChannel in *AWS CLI Command Reference*.

### `batch-get-stream-key`

The following code example shows how to use `batch-get-stream-key`.

#### AWS CLI

**To get information about multiple stream keys**

The following `batch-get-stream-key` example gets information about the specified stream keys.

```
aws ivs batch-get-stream-key \
    --arns arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh \
       arn:aws:ivs:us-west-2:123456789012:stream-key/skSKIJKLmnop
```

Output:

```
{
    "streamKeys": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh",
            "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKIJKLmnop",
            "value": "sk_us-west-2_abcdABCDefgh_567890ghijkl",
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "tags": {}
        }
     ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see BatchGetStreamKey in *AWS CLI Command Reference*.

### `batch-start-viewer-session-revocation`

The following code example shows how to use `batch-start-viewer-session-revocation`.

**AWS CLI**

**To revoke viewer sessions for multiple channel-ARN and viewer-ID pairs**

The following `batch-start-viewer-session-revocation` example performs session revocation on multiple channel-ARN and viewer-ID pairs simultaneously. The request may complete normally but return values in the errors field if the caller does not have permission to revoke specified session.

```
aws ivs batch-start-viewer-session-revocation \
    --viewer-sessions '[{"channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh1","viewerId":"abcdefg1","viewerSessionVersionsLessThanOrEqualTo":1234567890},
 \
      {"channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh2","viewerId":"abcdefg2","viewerSessionVersionsLessThanOrEqualTo":1234567890}]'
```

Output:

```
{
    "errors": [
        {
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh1",
            "viewerId": "abcdefg1",
            "code": "403",
            "message": "not authorized",
        },
        {
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh2",
            "viewerId": "abcdefg2",
            "code": "403",
            "message": "not authorized",
        }
```

```
    ]
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see BatchStartViewerSessionRevocation in *AWS CLI Command Reference*.

### `create-channel`

The following code example shows how to use `create-channel`.

**AWS CLI**

**Example 1: To create a channel with no recording**

The following `create-channel` example creates a new channel and an associated stream key to start streaming.

```
aws ivs create-channel \
    --name "test-channel" \
    --no-insecure-ingest
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "authorized": false,
        "name": "test-channel",
        "latencyMode": "LOW",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
```

```
        "preset": "",
        "tags": {},
        "type": "STANDARD"
    },
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

**Example 2: To create a channel with recording enabled, using the RecordingConfiguration resource specified by its ARN**

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up recording for the channel.

```
aws ivs create-channel \
    --name test-channel-with-recording \
    --insecure-ingest \
    --recording-configuration-arn "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh"
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",

configuration/ABCD12cdEFgh",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "BA1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
```

```
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": true,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {},
        "type": "STANDARD"
    },
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

**Example 3: To create a channel with a playback restriction policy specified by its ARN**

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up a playback restriction policy for the channel.

```
aws ivs create-channel \
    --name test-channel-with-playback-restriction-policy \
    --insecure-ingest \
    --playback-restriction-policy-arn "arn:aws:ivs:us-west-2:123456789012:playback-
restriction-policy/ABcdef34ghIJ"
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-playback-restriction-policy",
        "latencyMode": "LOW",
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
        "recordingConfigurationArn": "",
        "srt": {
```

```
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2edfGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": true,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {},
        "type": "STANDARD"
    },
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see CreateChannel in *AWS CLI Command Reference*.

### `create-playback-restriction-policy`

The following code example shows how to use `create-playback-restriction-policy`.

#### AWS CLI

**To create a playback restriction policy**

The following `create-playback-restriction-policy` example creates a new playback resriction policy.

```
aws ivs create-playback-restriction-policy \
    --name "test-playback-restriction-policy" \
    --enable-strict-origin-enforcement \
    --tags "key1=value1, key2=value2" \
    --allowed-countries US MX \
    --allowed-origins https://www.website1.com https://www.website2.com
```

Output:

```
{
    "playbackRestrictionPolicy": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": true,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see CreatePlaybackRestrictionPolicy in *AWS CLI Command Reference*.

## `create-recording-configuration`

The following code example shows how to use `create-recording-configuration`.

### AWS CLI

#### To create a RecordingConfiguration resource

The following `create-recording-configuration` example creates a RecordingConfiguration resource to enable recording to Amazon S3.

```
aws ivs create-recording-configuration \
    --name "test-recording-config" \
    --recording-reconnect-window-seconds 60 \
    --tags "key1=value1, key2=value2" \
```

```
    --rendition-configuration renditionSelection="CUSTOM",renditions="HD" \
    --thumbnail-configuration
 recordingMode="INTERVAL",targetIntervalSeconds=1,storage="LATEST",resolution="LOWEST_RESOLU
 \
    --destination-configuration s3={bucketName=demo-recording-bucket}
```

Output:

```
{
    "recordingConfiguration": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
        "name": "test-recording-config",
        "destinationConfiguration": {
            "s3": {
                "bucketName": "demo-recording-bucket"
            }
        },
        "state": "CREATING",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        },
        "thumbnailConfiguration": {
            "recordingMode": "INTERVAL",
            "targetIntervalSeconds": 1,
            "resolution": "LOWEST_RESOLUTION",
            "storage": [
                "LATEST"
            ]
        },
        "recordingReconnectWindowSeconds": 60,
        "renditionConfiguration": {
            "renditionSelection": "CUSTOM",
            "renditions": [
                "HD"
            ]
        }
    }
}
```

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateRecordingConfiguration in *AWS CLI Command Reference*.

### `create-stream-key`

The following code example shows how to use `create-stream-key`.

**AWS CLI**

**To create a stream key**

The following `create-stream-key` example creates a stream key for a specified ARN (Amazon Resource Name).

```
aws ivs create-stream-key \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see CreateStreamKey in *AWS CLI Command Reference*.

### `delete-channel`

The following code example shows how to use `delete-channel`.

**AWS CLI**

**To delete a channel and its associated stream keys**

The following `delete-channel` example deletes the channel with the specified ARN (Amazon Resource Name).

```
aws ivs delete-channel \
    --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see DeleteChannel in *AWS CLI Command Reference*.

### `delete-playback-key-pair`

The following code example shows how to use `delete-playback-key-pair`.

**AWS CLI**

**To delete a specified playback key pair**

The following `delete-playback-key-pair` example returns the fingerprint of the specified key pair.

```
aws ivs delete-playback-key-pair \
    --arn arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh
```

This command produces no output.

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeletePlaybackKeyPair in *AWS CLI Command Reference*.

### `delete-playback-restriction-policy`

The following code example shows how to use `delete-playback-restriction-policy`.

**AWS CLI**

**To delete a playback restriction policy**

The following `delete-playback-restriction-policy` example deletes the playback resriction policy with the specified policy ARN (Amazon Resource Name).

```
aws ivs delete-playback-restriction-policy \
```

```
    --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ"
```

This command produces no output.

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see DeletePlaybackRestrictionPolicy in *AWS CLI Command Reference*.

### `delete-recording-configuration`

The following code example shows how to use `delete-recording-configuration`.

**AWS CLI**

**To delete the RecordingConfiguration resource specified by its ARN**

The following `delete-recording-configuration` example deletes the RecordingConfiguration resource with the specified ARN.

```
aws ivs delete-recording-configuration \
    --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

This command produces no output.

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteRecordingConfiguration in *AWS CLI Command Reference*.

### `delete-stream-key`

The following code example shows how to use `delete-stream-key`.

**AWS CLI**

**To delete a stream key**

The following `delete-stream-key` example deletes the stream key for a specified ARN (Amazon Resource Name), so it can no longer be used to stream.

```
aws ivs delete-stream-key \
```

```
    --arn arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see DeleteStreamKey in *AWS CLI Command Reference*.

### `get-channel`

The following code example shows how to use `get-channel`.

#### AWS CLI

**To get a channel's configuration information**

The following `get-channel` example gets the channel configuration for a specified channel ARN (Amazon Resource Name).

```
aws ivs get-channel \
    --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "channel-1",
        "latencyMode": "LOW",
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "preset": "",
        "recordingConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
```

```
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see GetChannel in *AWS CLI Command Reference*.

### `get-playback-key-pair`

The following code example shows how to use `get-playback-key-pair`.

#### AWS CLI

**To get a specified playback key pair**

The following `get-playback-key-pair` example returns the fingerprint of the specified key pair.

```
aws ivs get-playback-key-pair \
    --arn arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh
```

Output:

```
{
    "keyPair": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
        "name": "my-playback-key",
        "fingerprint": "0a:1b:2c:ab:cd:ef:34:56:70:b1:b2:71:01:2a:a3:72",
        "tags": {}
    }
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetPlaybackKeyPair in *AWS CLI Command Reference*.

### `get-playback-restriction-policy`

The following code example shows how to use `get-playback-restriction-policy`.

**AWS CLI**

**To get a playback restriction policy's configuration information**

The following `get-playback-restriction-policy` example gets the playback restriciton policy configuration with the specified policy ARN (Amazon Resource Name).

```
aws ivs get-playback-restriction-policy \
    --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ"
```

Output:

```
{
    "playbackRestrictionPolicy": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": true,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see GetPlaybackRestrictionPolicy in *AWS CLI Command Reference*.

## `get-recording-configuration`

The following code example shows how to use `get-recording-configuration`.

## AWS CLI

### To get information about a RecordingConfiguration resource

The following `get-recording-configuration` example gets information about the RecordingConfiguration resource for the specified ARN.

```
aws ivs get-recording-configuration \
    --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

Output:

```
{
    "recordingConfiguration": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
        "destinationConfiguration": {
            "s3": {
                "bucketName": "demo-recording-bucket"
            }
        },
        "name": "test-recording-config",
        "recordingReconnectWindowSeconds": 60,
        "state": "ACTIVE",
        "tags": {
            "key1" : "value1",
            "key2" : "value2"
        },
        "thumbnailConfiguration": {
            "recordingMode": "INTERVAL",
            "targetIntervalSeconds": 1,
            "resolution": "LOWEST_RESOLUTION",
            "storage": [
                "LATEST"
            ]
        },
        "renditionConfiguration": {
            "renditionSelection": "CUSTOM",
            "renditions": [
                "HD"
            ]
        }
    }
```

```
}
```

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetRecordingConfiguration in *AWS CLI Command Reference*.

### `get-stream-key`

The following code example shows how to use `get-stream-key`.

#### AWS CLI

**To get information about a stream**

The following `get-stream-key` example gets information about the specified stream key.

```
aws ivs get-stream-key \
    --arn arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh --region=us-
west-2
```

Output:

```
{
    "streamKey": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh",
        "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "tags": {}
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see GetStreamKey in *AWS CLI Command Reference*.

### `get-stream-session`

The following code example shows how to use `get-stream-session`.

#### AWS CLI

**To get metadata for a specified stream**

The following `get-stream-session` example gets the metadata configuration for the specified channel ARN (Amazon Resource Name) and the specified stream; if streamId is not provided, the most recent stream for the channel is selected.

```
aws ivs get-stream-session \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --stream-id "mystream"
```

Output:

```
{
    "streamSession": {
        "streamId": "mystream1",
        "startTime": "2023-06-26T19:09:28+00:00",
        "channel": {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "name": "mychannel",
            "latencyMode": "LOW",
            "type": "STANDARD",
            "recordingConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABcdef34ghIJ",
            "srt": {
                "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
                "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
            },
            "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
            "playbackUrl": "url-string",
            "authorized": false,
            "insecureIngest": false,
            "preset": ""
        },
        "ingestConfiguration": {
            "video": {
                "avcProfile": "Baseline",
                "avcLevel": "4.2",
                "codec": "avc1.42C02A",
                "encoder": "Lavf58.45.100",
                "targetBitrate": 8789062,
                "targetFramerate": 60,
                "videoHeight": 1080,
                "videoWidth": 1920
            },
```

```
            "audio": {
                "codec": "mp4a.40.2",
                "targetBitrate": 46875,
                "sampleRate": 8000,
                "channels": 2
            }
        },
        "recordingConfiguration": {
            "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
            "name": "test-recording-config",
            "destinationConfiguration": {
                "s3": {
                    "bucketName": "demo-recording-bucket"
                }
            },
            "state": "ACTIVE",
            "tags": {
                "key1": "value1",
                "key2": "value2"
            },
            "thumbnailConfiguration": {
                "recordingMode": "INTERVAL",
                "targetIntervalSeconds": 1,
                "resolution": "LOWEST_RESOLUTION",
                "storage": [
                    "LATEST"
                ]
            },
            "recordingReconnectWindowSeconds": 60,
            "renditionConfiguration": {
                "renditionSelection": "CUSTOM",
                "renditions": [
                    "HD"
                ]
            }
        },
        "truncatedEvents": [
            {
                "name": "Recording Start",
                "type": "IVS Recording State Change",
                "eventTime": "2023-06-26T19:09:35+00:00"
            },
            {
```

```
                "name": "Stream Start",
                "type": "IVS Stream State Change",
                "eventTime": "2023-06-26T19:09:34+00:00"
            },
            {
                "name": "Session Created",
                "type": "IVS Stream State Change",
                "eventTime": "2023-06-26T19:09:28+00:00"
            }
        ]
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see GetStreamSession in *AWS CLI Command Reference*.

### `get-stream`

The following code example shows how to use `get-stream`.

#### AWS CLI

**To get information about a stream**

The following `get-stream` example gets information about the stream for the specified channel.

```
aws ivs get-stream \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "stream": {
        "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "startTime": "2020-05-05T21:55:38Z",
        "state": "LIVE",
        "health": "HEALTHY",
        "streamId": "st-ABCDEfghij01234KLMN5678",
```

```
        "viewerCount": 1
    }
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see GetStream in *AWS CLI Command Reference*.

### `import-playback-key-pair`

The following code example shows how to use `import-playback-key-pair`.

#### AWS CLI

**To import the public portion of a new key pair**

The following `import-playback-key-pair` example imports the specified public key (specified as a string in PEM format) and returns the arn and fingerprint of the new key pair.

```
aws ivs import-playback-key-pair \
    --name "my-playback-key" \
    --public-key-material "G1lbnQxOTA3BgNVBAMMMFdoeSBhcmUgeW91IGRl..."
```

Output:

```
{
    "keyPair": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
        "name": "my-playback-key",
        "fingerprint": "0a:1b:2c:ab:cd:ef:34:56:70:b1:b2:71:01:2a:a3:72",
        "tags": {}
    }
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see ImportPlaybackKeyPair in *AWS CLI Command Reference*.

### `list-channels`

The following code example shows how to use `list-channels`.

## AWS CLI

### Example 1: To get summary information about all channels

The following `list-channels` example lists all channels for your AWS account.

```
aws ivs list-channels
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "name": "channel-1",
            "latencyMode": "LOW",
            "authorized": false,
            "insecureIngest": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "",
            "recordingConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABCD12cdEFgh",
            "tags": {},
            "type": "STANDARD"
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl",
            "name": "channel-2",
            "latencyMode": "LOW",
            "authorized": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
            "recordingConfigurationArn": "",
            "tags": {},
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

**Example 2: To get summary information about all channels, filtered by the specified RecordingConfiguration ARN**

The following `list-channels` example lists all channels for your AWS account, that are associated with the specified RecordingConfiguration ARN.

```
aws ivs list-channels \
    --filter-by-recording-configuration-arn "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABCD12cdEFgh"
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "name": "channel-1",
            "latencyMode": "LOW",
            "authorized": false,
            "insecureIngest": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "",
            "recordingConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABCD12cdEFgh",
            "tags": {},
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

**Example 3: To get summary information about all channels, filtered by the specified PlaybackRestrictionPolicy ARN**

The following `list-channels` example lists all channels for your AWS account, that are associated with the specified PlaybackRestrictionPolicy ARN.

```
aws ivs list-channels \
    --filter-by-playback-restriction-policy-arn "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ"
```

Output:

```
{
    "channels": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl",
            "name": "channel-2",
            "latencyMode": "LOW",
            "authorized": false,
            "preset": "",
            "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
            "recordingConfigurationArn": "",
            "tags": {},
            "type": "STANDARD"
        }
    ]
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see ListChannels in *AWS CLI Command Reference*.

### `list-playback-key-pairs`

The following code example shows how to use `list-playback-key-pairs`.

#### AWS CLI

**To get summary information about all playback key pairs**

The following `list-playback-key-pairs` example returns information about all key pairs.

```
aws ivs list-playback-key-pairs
```

Output:

```
{
    "keyPairs": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
            "name": "test-key-0",
            "tags": {}
```

```
        },
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/ijkl5678mnop",
            "name": "test-key-1",
            "tags": {}
        }
    ]
}
```

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListPlaybackKeyPairs in *AWS CLI Command Reference*.

## `list-playback-restriction-policies`

The following code example shows how to use `list-playback-restriction-policies`.

### AWS CLI

#### To get summary information about all playback restriction policies

The following `list-playback-restriction-policies` example lists all playback restriction policies for your AWS account.

```
aws ivs list-playback-restriction-policies
```

Output:

```
{
    "playbackRestrictionPolicies": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
            "allowedCountries": [
                "US",
                "MX"
            ],
            "allowedOrigins": [
                "https://www.website1.com",
                "https://www.website2.com"
            ],
```

```
            "enableStrictOriginEnforcement": true,
            "name": "test-playback-restriction-policy",
            "tags": {
                "key1": "value1",
                "key2": "value2"
            }
        }
    ]
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see ListPlaybackRestrictionPolicies in *AWS CLI Command Reference*.

### `list-recording-configurations`

The following code example shows how to use `list-recording-configurations`.

#### AWS CLI

**To list all the RecordingConfiguration resources created in this account**

The following `list-recording-configurations` example gets information about all RecordingConfiguration resources in your account.

```
aws ivs list-recording-configurations
```

Output:

```
{
    "recordingConfigurations": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
            "name": "test-recording-config-1",
            "destinationConfiguration": {
                "s3": {
                    "bucketName": "demo-recording-bucket-1"
                }
            },
            "state": "ACTIVE",
            "tags": {}
        },
```

```
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
CD12abcdGHIJ",
            "name": "test-recording-config-2",
            "destinationConfiguration": {
                "s3": {
                    "bucketName": "demo-recording-bucket-2"
                }
            },
            "state": "ACTIVE",
            "tags": {}
        }
    ]
}
```

For more information, see Record to Amazon S3 in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListRecordingConfigurations in *AWS CLI Command Reference*.

### `list-stream-keys`

The following code example shows how to use `list-stream-keys`.

#### AWS CLI

**To get a list of stream keys**

The following `list-stream-keys` example lists all stream keys for a specified ARN (Amazon Resource Name).

```
aws ivs list-stream-keys \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{
    "streamKeys": [
        {
            "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "tags": {}
```

```
        }
    ]
}
```

FFor more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see ListStreamKeys in *AWS CLI Command Reference*.

### `list-stream-sessions`

The following code example shows how to use `list-stream-sessions`.

#### AWS CLI

**To get a summary of current and previous streams for a specified channel in the current AWS region**

The following `list-stream-sessions` example reports summary information for streams for a specified channel ARN (Amazon Resource Name).

```
aws ivs list-stream-sessions \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --max-results 25 \
    --next-token ""
```

Output:

```
{
    "nextToken": "set-2",
    "streamSessions": [
        {
            "startTime": 1641578182,
            "endTime": 1641579982,
            "hasErrorEvent": false,
            "streamId": "mystream"
        }
        ...
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see ListStreamSessions in *AWS CLI Command Reference*.

### `list-streams`

The following code example shows how to use `list-streams`.

#### AWS CLI

**To get a list of live streams and their state**

The following `list-streams` example lists all live streams for your AWS account.

```
aws ivs list-streams
```

Output:

```
{
   "streams": [
        {
            "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
            "state": "LIVE",
            "health": "HEALTHY",
            "streamId": "st-ABCDEfghij01234KLMN5678",
            "viewerCount": 1
        }
    ]
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see ListStreams in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list all tags for an AWS resource (for example: channel, stream key)**

The following `list-tags-for-resource` example lists all tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs list-tags-for-resource \
    --resource-arn arn:aws:ivs:us-west-2:12345689012:channel/abcdABCDefgh
```

Output:

```
{
    "tags":
    {
        "key1": "value1",
        "key2": "value2"
    }
}
```

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `put-metadata`

The following code example shows how to use `put-metadata`.

**AWS CLI**

**To insert metadata into the active stream for a specified channel**

The following `put-metadata` example inserts the given metadata into the stream for the specified channel.

```
aws ivs put-metadata \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --metadata '{"my": "metadata"}'
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see PutMetadata in *AWS CLI Command Reference*.

### `start-viewer-session-revocation`

The following code example shows how to use `start-viewer-session-revocation`.

**AWS CLI**

**To revoke a viewer session for a given multiple channel-ARN and viewer-ID pair**

The following `start-viewer-session-revocation` example starts the process of revoking the viewer session associated with a specified channel ARN and viewer ID, up to and including the specified session version number. If the version is not provided, it defaults to 0.

```
aws ivs batch-start-viewer-session-revocation \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --viewer-id abcdefg \
    --viewer-session-versions-less-than-or-equal-to 1234567890
```

This command produces no output.

For more information, see Setting Up Private Channels in the *Amazon Interactive Video Service User Guide*.

- For API details, see StartViewerSessionRevocation in *AWS CLI Command Reference*.

### `stop-stream`

The following code example shows how to use `stop-stream`.

**AWS CLI**

**To stop a specified stream**

The following `stop-stream` example stops the stream on the specified channel.

```
aws ivs stop-stream \
    --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

This command produces no output.

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

- For API details, see StopStream in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add or update tags for an AWS resource (for example: channel, stream key)**

The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs tag-resource \
    --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --tags "tagkey1=tagvalue1, tagkey2=tagvalue2"
```

This command produces no output.

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags for an AWS resource (for example: channel, stream key)**

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs untag-resource \
    --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-channel`

The following code example shows how to use `update-channel`.

**AWS CLI**

**Example 1: To update a channel's configuration information**

The following `update-channel` example updates the channel configuration for a specified channel ARN to change the channel name. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
    --name "channel-1" \
    --insecure-ingest
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "channel-1",
        "latencyMode": "LOW",
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": true,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
}
```

For more information, see Create a Channel in the *IVS Low-Latency User Guide*.

**Example 2: To update a channel's configuration to enable recording**

The following `update-channel` example updates the channel configuration for a specified channel ARN to enable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
```

```
    --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
    --no-insecure-ingest \
    --recording-configuration-arn "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh"
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "BA1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

**Example 3: To update a channel's configuration to disable recording**

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
    --recording-configuration-arn ""
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-recording",
        "latencyMode": "LOW",
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2edfGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Record to Amazon S3 in the *IVS Low-Latency User Guide*.

**Example 4: To update a channel's configuration to enable playback restriction**

The following `update-channel` example updates the channel configuration for a specified channel ARN to apply a playback restriction policy. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
    --no-insecure-ingest \
    --playback-restriction-policy-arn "arn:aws:ivs:us-west-2:123456789012:playback-
restriction-policy/ABcdef34ghIJ"
```

Output:

```
{
```

```
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-playback-restriction-policy",
        "latencyMode": "LOW",
        "type": "STANDARD",
        "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaCBDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

**Example 5: To update a channel's configuration to disable playback restriction**

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable playback restriction. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
    --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
    --playback-restriction-policy-arn ""
```

Output:

```
{
    "channel": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
        "name": "test-channel-with-playback-restriction-policy",
        "latencyMode": "LOW",
        "type": "STANDARD",
```

```
        "playbackRestrictionPolicyArn": "",
        "recordingConfigurationArn": "",
        "srt": {
            "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
            "passphrase":
 "AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDeFghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
        },
        "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
        "insecureIngest": false,
        "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
        "preset": "",
        "authorized": false,
        "tags": {}
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see UpdateChannel in *AWS CLI Command Reference*.

### `update-playback-restriction-policy`

The following code example shows how to use `update-playback-restriction-policy`.

#### AWS CLI

**To update a playback restriction policy**

The following `update-playback-restriction-policy` example updates the playback restriction policy with the specified policy ARN to disable strict origin enforcement. This does not affect an ongoing stream of the associated channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-playback-restriction-policy \
    --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ" \
    --no-enable-strict-origin-enforcement
```

Output:

```
{
```

```
    "playbackRestrictionPolicy": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
        "allowedCountries": [
            "US",
            "MX"
        ],
        "allowedOrigins": [
            "https://www.website1.com",
            "https://www.website2.com"
        ],
        "enableStrictOriginEnforcement": false,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
}
```

For more information, see Undesired Content and Viewers in the *IVS Low-Latency User Guide*.

- For API details, see UpdatePlaybackRestrictionPolicy in *AWS CLI Command Reference*.

## Amazon IVS Chat examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Chat.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `create-chat-token`

The following code example shows how to use `create-chat-token`.

**AWS CLI**

**To create a chat token**

The following `create-chat-token` example creates an encrypted chat token that is used to establish an individual WebSocket connection to a room. The token is valid for one minute, and a connection (session) established with the token is valid for the specified duration.

```
aws ivschat create-chat-token \
    --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6", \
    --userId" "11231234" \
    --capabilities "SEND_MESSAGE", \
    --sessionDurationInMinutes" 30
```

Output:

```
{
    "token": "ACEGmnoq#1rstu2...BDFH3vxwy!4hlm!#5",
    "sessionExpirationTime": "2022-03-16T04:44:09+00:00"
    "state": "CREATING",
    "tokenExpirationTime": "2022-03-16T03:45:09+00:00"
}
```

For more information, see Step 3: Authenticate and Authorize Chat Clients in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateChatToken in *AWS CLI Command Reference*.

#### `create-logging-configuration`

The following code example shows how to use `create-logging-configuration`.

**AWS CLI**

**To create a chat LoggingConfiguration resource**

The following `create-logging-configuration` example creates a LoggingConfiguration resource that allows clients to store and record sent messages.

```
aws ivschat create-logging-configuration \
    --destination-configuration s3={bucketName=demo-logging-bucket} \
    --name "test-logging-config" \
    --tags "key1=value1, key2=value2"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
    "createTime": "2022-09-14T17:48:00.653000+00:00",
    "destinationConfiguration": {
        "s3": {
            "bucketName": "demo-logging-bucket"
        }
    },
    "id": "ABcdef34ghIJ",
    "name": "test-logging-config",
    "state": "ACTIVE",
    "tags": { "key1" : "value1", "key2" : "value2" },
    "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateLoggingConfiguration in *AWS CLI Command Reference*.

### `create-room`

The following code example shows how to use `create-room`.

#### AWS CLI

##### To create a room

The following `create-room` example creates a new room.

```
aws ivschat create-room \
```

```
    --name "test-room-1" \
    --logging-configuration-identifiers "arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
    --maximum-message-length 256 \
    --maximum-message-rate-per-second 5
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "id": "g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "test-room-1",
    "tags": {}
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see Step 2: Create a Chat Room in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateRoom in *AWS CLI Command Reference*.

## `delete-logging-configuration`

The following code example shows how to use `delete-logging-configuration`.

### AWS CLI

#### To delete a chat LoggingConfiguration resource

The following `delete-logging-configuration` example deletes the LoggingConfiguration resource for the specified ARN.

```
aws ivschat delete-logging-configuration \
    --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteLoggingConfiguration in *AWS CLI Command Reference*.

### `delete-message`

The following code example shows how to use `delete-message`.

**AWS CLI**

**To delete messages from a specified room**

The following `delete-message` example sends an even to the specified room, which directs clients to delete the specified message: that is, unrender it from view and delete it from the client's chat history.

```
aws ivschat delete-message \
    --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --id "ABC123def456" \
    --reason "Message contains profanity"
```

Output:

```
{
    "id": "12345689012"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteMessage in *AWS CLI Command Reference*.

### `delete-room`

The following code example shows how to use `delete-room`.

**AWS CLI**

**To delete a room**

The following `delete-room` example deletes the specified room. Connected clients are disconnected. On success it returns HTTP 204 with an empty response body.

```
aws ivschat delete-room \
    --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteRoom in *AWS CLI Command Reference*.

### `disconnect-user`

The following code example shows how to use `disconnect-user`.

**AWS CLI**

**To disconnect a user from a room**

The following `disconnect-user` example disconnects all connections for the specified user from the specified room. On success it returns HTTP 200 with an empty response body.

```
aws ivschat disconnect-user \
    --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --userId "ABC123def456" \
    --reason "Violated terms of service"
```

This command produces no output.

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see DisconnectUser in *AWS CLI Command Reference*.

### `get-logging-configuration`

The following code example shows how to use `get-logging-configuration`.

### AWS CLI

#### To get information about a LoggingConfiguration resource

The following `get-logging-configuration` example gets information about the LoggingConfiguration resource for the specified ARN.

```
aws ivschat get-logging-configuration \
    --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
    "createTime": "2022-09-14T17:48:00.653000+00:00",
    "destinationConfiguration": {
        "s3": {
            "bucketName": "demo-logging-bucket"
        }
    },
    "id": "ABcdef34ghIJ",
    "name": "test-logging-config",
    "state": "ACTIVE",
    "tags": { "key1" : "value1", "key2" : "value2" },
    "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetLoggingConfiguration in *AWS CLI Command Reference*.

## `get-room`

The following code example shows how to use `get-room`.

### AWS CLI

#### To get the specified room

The following `get-room` example gets information about the specified room.

```
aws ivschat get-room \
    --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "id": "g1H2I3j4k5L6",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "test-room-1",
    "tags": {},
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetRoom in *AWS CLI Command Reference*.

### `list-logging-configurations`

The following code example shows how to use `list-logging-configurations`.

#### AWS CLI

**To get summary information about all logging configurations for the user in the AWS region where the API request is processed**

The following `list-logging-configurations` example lists information about all LoggingConfiguration resources for the user in the AWS region where the API request is processed.

```
aws ivschat list-logging-configurations \
    --max-results 2 \
    --next-token ""
```

Output:

```
{
    "nextToken": "set-2",
    "loggingConfigurations": [
        {
            "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
            "createTime": "2022-09-14T17:48:00.653000+00:00",
            "destinationConfiguration": {
                "s3": {
                    "bucketName": "demo-logging-bucket"
                }
            },
            "id": "ABcdef34ghIJ",
            "name": "test-logging-config",
            "state": "ACTIVE",
            "tags": { "key1" : "value1", "key2" : "value2" },
            "updateTime": "2022-09-14T17:48:01.104000+00:00"
        }
        ...
    ]
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListLoggingConfigurations in *AWS CLI Command Reference*.

### `list-rooms`

The following code example shows how to use `list-rooms`.

#### AWS CLI

**To get summary information about all your rooms in the current region**

The following `list-rooms` example gets summary information about all the rooms in the AWS region where the request is processed. Results are sorted in descending order of updateTime.

```
aws ivschat list-rooms \
    --logging-configuration-identifier "arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
    --max-results 10 \
```

```
    --next-token ""
```

Output:

```
{
    "nextToken": "page3",
    "rooms": [
        {
            "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
            "createTime": "2022-03-16T04:44:09+00:00",
            "id": "g1H2I3j4k5L6",
            "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
            "name": "test-room-1",
            "tags": {},
            "updateTime": "2022-03-16T07:22:09+00:00"
        }
    ]
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListRooms in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list all tags for an AWS resource (for example: Room)**

The following `list-tags-for-resource` example lists all tags for a specified resource ARN (Amazon Resource Name).

```
aws ivschat list-tags-for-resource \
    --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6
```

Output:

```
{
```

```
    "tags":
    {
        "key1": "value1",
        "key2": "value2"
    }
}
```

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `send-event`

The following code example shows how to use `send-event`.

#### AWS CLI

**To send an event to a room**

The following `send-event` example sends the given event to the specified room.

```
aws ivschat send-event \
    --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --eventName "SystemMessage" \
    --attributes \
        "msgType"="user-notification", \
        "msgText"="This chat room will close in 15 minutes."
```

Output:

```
{
    "id": "12345689012"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see SendEvent in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add or update tags for an AWS resource (for example: Room)**

The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```
aws ivschat tag-resource \
    --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \
    --tags "tagkey1=tagkeyvalue1, tagkey2=tagkeyvalue2"
```

This command produces no output.

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags for an AWS resource (for example: Room)**

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```
aws ivschat untag-resource \
    --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \
    --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see Tagging in the *Amazon Interactive Video Service API Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-logging-configuration`

The following code example shows how to use `update-logging-configuration`.

### AWS CLI

#### To update a room's logging configuration

The following `update-logging-configuration` example updates a LoggingConfiguration resource with the given data.

```
aws ivschat update-logging-configuration \
    --destination-configuration s3={bucketName=demo-logging-bucket} \
    --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ" \
    --name "test-logging-config"
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
    "createTime": "2022-09-14T17:48:00.653000+00:00",
    "destinationConfiguration": {
        "s3": {
            "bucketName": "demo-logging-bucket"
        }
    },
    "id": "ABcdef34ghIJ",
    "name": "test-logging-config",
    "state": "ACTIVE",
    "tags": { "key1" : "value1", "key2" : "value2" },
    "updateTime": "2022-09-14T17:48:01.104000+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see UpdateLoggingConfiguration in *AWS CLI Command Reference*.

## `update-room`

The following code example shows how to use `update-room`.

### AWS CLI

#### To update a room's configuration

The following `update-room` example updates the specified room's configuration with the given data.

```
aws ivschat update-room \
    --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
    --logging-configuration-identifiers "arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
    --name "chat-room-a" \
    --maximum-message-length 256 \
    --maximum-message-rate-per-second 5
```

Output:

```
{
    "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
    "createTime": "2022-03-16T04:44:09+00:00",
    "id": "g1H2I3j4k5L6",
    "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ"],
    "maximumMessageLength": 256,
    "maximumMessageRatePerSecond": 5,
    "name": "chat-room-a",
    "tags": {},
    "updateTime": "2022-03-16T07:22:09+00:00"
}
```

For more information, see Getting Started with Amazon IVS Chat in the *Amazon Interactive Video Service User Guide*.

- For API details, see UpdateRoom in *AWS CLI Command Reference*.

## Amazon IVS Real-Time Streaming examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Real-Time Streaming.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `create-encoder-configuration`

The following code example shows how to use `create-encoder-configuration`.

**AWS CLI**

**To create a composition encoder configuration**

The following `create-encoder-configuration` example creates a composition encoder configuration with the specified properties.

```
aws ivs-realtime create-encoder-configuration \
    --name test-ec --video bitrate=3500000,framerate=30.0,height=1080,width=1920
```

Output:

```
{
    "encoderConfiguration": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
ABabCDcdEFef",
        "name": "test-ec",
        "tags": {},
        "video": {
            "bitrate": 3500000,
            "framerate": 30,
            "height": 1080,
            "width": 1920
        }
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateEncoderConfiguration in *AWS CLI Command Reference*.

### `create-participant-token`

The following code example shows how to use `create-participant-token`.

**AWS CLI**

**To create a stage participant token**

The following `create-participant-token` example creates a participant toke for the specified stage.

```
aws ivs-realtime create-participant-token \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --user-id bob
```

Output:

```
{
    "participantToken": {
        "expirationTime": "2023-03-07T09:47:43+00:00",
        "participantId": "ABCDEfghij01234KLMN6789",
        "token": "abcd1234defg5678"
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateParticipantToken in *AWS CLI Command Reference*.

### `create-stage`

The following code example shows how to use `create-stage`.

**AWS CLI**

**To create a stage**

The following `create-stage` example creates a stage and stage participant token for a specified user.

```
aws ivs-realtime create-stage \
    --name stage1 \
    --participant-token-configurations userId=alice
```

Output:

```
{
    "participantTokens": [
        {
            "participantId": "ABCDEfghij01234KLMN5678",
            "token": "a1b2c3d4567890ab",
            "userId": "alice"
        }
    ],
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "name": "stage1",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateStage in *AWS CLI Command Reference*.

### `create-storage-configuration`

The following code example shows how to use `create-storage-configuration`.

#### AWS CLI

**To create a composition storage configuration**

The following `create-storage-configuration` example creates a composition storage configuration with the specified properties.

```
aws ivs-realtime create-storage-configuration \
    --name "test-sc" --s3 "bucketName=test-bucket-name"
```

Output:

```
{
    "storageConfiguration": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
ABabCDcdEFef",
        "name": "test-sc",
        "s3": {
            "bucketName": "test-bucket-name"
        },
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see CreateStorageConfiguration in *AWS CLI Command Reference*.

### `delete-encoder-configuration`

The following code example shows how to use `delete-encoder-configuration`.

#### AWS CLI

**To delete a composition encoder configuration**

The following `delete-encoder-configuration` deletes the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-encoder-configuration \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
ABabCDcdEFef"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteEncoderConfiguration in *AWS CLI Command Reference*.

### `delete-stage`

The following code example shows how to use `delete-stage`.

**AWS CLI**

**To delete a stage**

The following `delete-stage` example deletes the specified stage.

```
aws ivs-realtime delete-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteStage in *AWS CLI Command Reference*.

## `delete-storage-configuration`

The following code example shows how to use `delete-storage-configuration`.

**AWS CLI**

**To delete a composition storage configuration**

The following `delete-storage-configuration` deletes the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-storage-configuration \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
ABabCDcdEFef"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DeleteStorageConfiguration in *AWS CLI Command Reference*.

## `disconnect-participant`

The following code example shows how to use `disconnect-participant`.

**AWS CLI**

**To disconnect a stage participant**

The following `disconnect-participant` example disconnects the specified participant from the specified stage.

```
aws ivs-realtime disconnect-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --participant-id ABCDEfghij01234KLMN5678
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see DisconnectParticipant in *AWS CLI Command Reference*.

## `get-composition`

The following code example shows how to use `get-composition`.

**AWS CLI**

**Example 1: To get a composition with default layout settings**

The following `get-composition` example gets the composition for the ARN (Amazon Resource Name) specified.

```
aws ivs-realtime get-composition \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg",
```

```
                        "encoderConfigurationArn": "arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "startTime": "2023-10-16T23:26:00+00:00",
                "state": "ACTIVE"
            },
            {
                "configuration": {
                    "name": "",
                    "s3": {
                        "encoderConfigurationArns": [
                            "arn:aws:ivs:arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                        ],
                        "recordingConfiguration": {
                            "format": "HLS"
                        },
                        "storageConfigurationArn": "arn:arn:aws:ivs:ap-
northeast-1:123456789012:storage-configuration/FefABabCDcdE"
                    }
                },
                "detail": {
                    "s3": {
                        "recordingPrefix": "aBcDeFgHhGfE/AbCdEfGhHgFe/GHFabcgefABC/
composite"
                    }
                },
                "id": "GHFabcgefABC",
                "startTime": "2023-10-16T23:26:00+00:00",
                "state": "STARTING"
            }
        ],
        "layout": {
            "grid": {
                "featuredParticipantAttribute": ""
                "gridGap": 2,
                "omitStoppedVideo": false,
                "videoAspectRatio": "VIDEO",
                "videoFillMode": ""               }
        },
        "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
```

```
        "startTime": "2023-10-16T23:24:00+00:00",
        "state": "ACTIVE",
        "tags": {}
    }
}
```

For more information, see Composite Recording (Real-Time Streaming) in the *Amazon Interactive Video Service User Guide*.

**Example 2: To get a composition with PiP layout**

The following `get-composition` example gets the composition for the ARN (Amazon Resource Name) specified, which uses PiP layout.

```
aws ivs-realtime get-composition \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs"
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "startTime": "2023-10-16T23:26:00+00:00",
                "state": "ACTIVE"
            },
            {
                "configuration": {
                    "name": "",
                    "s3": {
                        "encoderConfigurationArns": [
```

```
                            "arn:aws:ivs:arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                        ],
                        "recordingConfiguration": {
                            "format": "HLS"
                        },
                        "storageConfigurationArn": "arn:arn:aws:ivs:ap-
northeast-1:123456789012:storage-configuration/FefABabCDcdE"
                    }
                },
                "detail": {
                    "s3": {
                        "recordingPrefix": "aBcDeFgHhGfE/AbCdEfGhHgFe/GHFabcgefABC/
composite"
                    }
                },
                "id": "GHFabcgefABC",
                "startTime": "2023-10-16T23:26:00+00:00",
                "state": "STARTING"
            }
        ],
        "layout": {
            "pip": {
                "featuredParticipantAttribute": "abcdefg",
                "gridGap": 0,
                "omitStoppedVideo": false,
                "pipBehavior": "STATIC",
                "pipOffset": 0,
                "pipParticipantAttribute": "",
                "pipPosition": "BOTTOM_RIGHT",
                "videoFillMode": "COVER"
            }
        },
        "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
        "startTime": "2023-10-16T23:24:00+00:00",
        "state": "ACTIVE",
        "tags": {}
    }
}
```

For more information, see Composite Recording (Real-Time Streaming) in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetComposition in *AWS CLI Command Reference*.

### `get-encoder-configuration`

The following code example shows how to use `get-encoder-configuration`.

**AWS CLI**

**To get a composition encoder configuration**

The following `get-encoder-configuration` example gets the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime get-encoder-configuration \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
abcdABCDefgh"
```

Output:

```
{
    "encoderConfiguration": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
abcdABCDefgh",
        "name": "test-ec",
        "tags": {},
        "video": {
            "bitrate": 3500000,
            "framerate": 30,
            "height": 1080,
            "width": 1920
        }
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetEncoderConfiguration in *AWS CLI Command Reference*.

### `get-participant`

The following code example shows how to use `get-participant`.

**AWS CLI**

**To get a stage participant**

The following `get-participant` example gets the stage participant for a specified participant ID and session ID in the specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-participant \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "participant": {
        "browserName", "Google Chrome",
        "browserVersion", "116",
        "firstJoinTime": "2023-04-26T20:30:34+00:00",
        "ispName", "Comcast",
        "osName", "Microsoft Windows 10 Pro",
        "osVersion", "10.0.19044",
        "participantId": "abCDEf12GHIj",
        "published": true,
        "sdkVersion", "",
        "state": "DISCONNECTED",
        "userId": ""
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetParticipant in *AWS CLI Command Reference*.

## `get-stage-session`

The following code example shows how to use `get-stage-session`.

**AWS CLI**

**To get a stage session**

The following `get-stage-session` example gets the stage session for a specified session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-stage-session \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
    "stageSession": {
        "endTime": "2023-04-26T20:36:29+00:00",
        "sessionId": "st-a1b2c3d4e5f6g",
        "startTime": "2023-04-26T20:30:29.602000+00:00"
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetStageSession in *AWS CLI Command Reference*.

### `get-stage`

The following code example shows how to use `get-stage`.

#### AWS CLI

**To get a stage's configuration information**

The following `get-stage` example gets the stage configuration for a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{
    "stage": {
        "activeSessionId": "st-a1b2c3d4e5f6g",
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
```

```
        "name": "test",
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetStage in *AWS CLI Command Reference*.

### `get-storage-configuration`

The following code example shows how to use `get-storage-configuration`.

#### AWS CLI

**To get a composition storage configuration**

The following `get-storage-configuration` example gets the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime get-storage-configuration \
    --name arn "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
abcdABCDefgh"
```

Output:

```
{
    "storageConfiguration": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
abcdABCDefgh",
        "name": "test-sc",
        "s3": {
            "bucketName": "test-bucket-name"
        },
        "tags": {}
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see GetStorageConfiguration in *AWS CLI Command Reference*.

## `list-compositions`

The following code example shows how to use `list-compositions`.

### AWS CLI

#### To get a list of compositions

The following `list-compositions` lists all compositions for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-compositions
```

Output:

```
{
    "compositions": [
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/
abcdABCDefgh",
            "destinations": [
                {
                    "id": "AabBCcdDEefF",
                    "startTime": "2023-10-16T23:25:23+00:00",
                    "state": "ACTIVE"
                }
            ],
            "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/
defgABCDabcd",
            "startTime": "2023-10-16T23:25:21+00:00",
            "state": "ACTIVE",
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/
ABcdabCDefgh",
            "destinations": [
                {
                    "endTime": "2023-10-16T23:25:00.786512+00:00",
                    "id": "aABbcCDdeEFf",
                    "startTime": "2023-10-16T23:24:01+00:00",
                    "state": "STOPPED"
                },
```

```
                {
                    "endTime": "2023-10-16T23:25:00.786512+00:00",
                    "id": "deEFfaABbcCD",
                    "startTime": "2023-10-16T23:24:01+00:00",
                    "state": "STOPPED"
                }
            ],
            "endTime": "2023-10-16T23:25:00+00:00",
            "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/
efghabcdABCD",
            "startTime": "2023-10-16T23:24:00+00:00",
            "state": "STOPPED",
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListCompositions in *AWS CLI Command Reference*.

## `list-encoder-configurations`

The following code example shows how to use `list-encoder-configurations`.

### AWS CLI

#### To list composition encoder configurations

The following `list-encoder-configurations` lists all composition encoder configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-encoder-configurations
```

Output:

```
{
    "encoderConfigurations": [
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
abcdABCDefgh",
            "name": "test-ec-1",
```

```
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
ABCefgEFGabc",
            "name": "test-ec-2",
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListEncoderConfigurations in *AWS CLI Command Reference*.

### `list-participant-events`

The following code example shows how to use `list-participant-events`.

#### AWS CLI

**To get a list of stage participant events**

The following `list-participant-events` example lists all participant events for a specified participant ID and session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-participant-events \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g \
    --participant-id abCDEf12GHIj
```

Output:

```
{
    "events": [
        {
            "eventTime": "2023-04-26T20:36:28+00:00",
            "name": "LEFT",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2023-04-26T20:36:28+00:00",
```

```
            "name": "PUBLISH_STOPPED",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2023-04-26T20:30:34+00:00",
            "name": "JOINED",
            "participantId": "abCDEf12GHIj"
        },
        {
            "eventTime": "2023-04-26T20:30:34+00:00",
            "name": "PUBLISH_STARTED",
            "participantId": "abCDEf12GHIj"
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListParticipantEvents in *AWS CLI Command Reference*.

### `list-participants`

The following code example shows how to use `list-participants`.

#### AWS CLI

**To get a list of stage participants**

The following `list-participants` example lists all participants for a specified session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-participants \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --session-id st-a1b2c3d4e5f6g
```

Output:

```
{
    "participants": [
        {
            "firstJoinTime": "2023-04-26T20:30:34+00:00",
            "participantId": "abCDEf12GHIj"
```

```
            "published": true,
            "state": "DISCONNECTED",
            "userId": ""
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListParticipants in *AWS CLI Command Reference*.

### `list-stage-sessions`

The following code example shows how to use `list-stage-sessions`.

#### AWS CLI

**To get a list of stage sessions**

The following `list-stage-sessions` example lists all sessions for a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-stage-sessions \
    --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{
    "stageSessions": [
        {
            "endTime": "2023-04-26T20:36:29+00:00",
            "sessionId": "st-a1b2c3d4e5f6g",
            "startTime": "2023-04-26T20:30:29.602000+00:00"
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListStageSessions in *AWS CLI Command Reference*.

### `list-stages`

The following code example shows how to use `list-stages`.

#### AWS CLI

**To get summary information about all stages**

The following `list-stages` example lists all stages for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-stages
```

Output:

```
{
    "stages": [
        {
            "activeSessionId": "st-a1b2c3d4e5f6g",
            "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
            "name": "stage1",
            "tags": {}
        },
        {
            "activeSessionId": "st-a123bcd456efg",
            "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcd1234ABCD",
            "name": "stage2",
            "tags": {}
        },
        {
            "activeSessionId": "st-abcDEF1234ghi",
            "arn": "arn:aws:ivs:us-west-2:123456789012:stage/ABCD1234efgh",
            "name": "stage3",
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListStages in *AWS CLI Command Reference*.

### `list-storage-configurations`

The following code example shows how to use `list-storage-configurations`.

#### AWS CLI

##### To list composition storage configurations

The following `list-storage-configurations` lists all composition storage configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-storage-configurations
```

Output:

```
{
    "storageConfigurations": [
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
abcdABCDefgh",
            "name": "test-sc-1",
            "s3": {
                "bucketName": "test-bucket-1-name"
            },
            "tags": {}
        },
        {
            "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
ABCefgEFGabc",
            "name": "test-sc-2",
            "s3": {
                "bucketName": "test-bucket-2-name"
            },
            "tags": {}
        }
    ]
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see ListStorageConfigurations in *AWS CLI Command Reference*.

### `start-composition`

The following code example shows how to use `start-composition`.

**AWS CLI**

**Example 1: To start a composition with default layout settings**

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations.

```
aws ivs-realtime start-composition \
    --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd \
    --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg", \
        "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-
configuration/ABabCDcdEFef"}}, \
        {"s3":{"encoderConfigurationArns":["arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"], \
        "storageConfigurationArn":"arn:aws:ivs:ap-northeast-1:123456789012:storage-
configuration/FefABabCDcdE"}}]'
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "state": "STARTING"
            },
            {
                "configuration": {
```

```
                    "name": "",
                    "s3": {
                        "encoderConfigurationArns": [
                            "arn:aws:ivs:arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                        ],
                        "recordingConfiguration": {
                            "format": "HLS"
                        },
                        "storageConfigurationArn": "arn:arn:aws:ivs:ap-
northeast-1:123456789012:storage-configuration/FefABabCDcdE"
                    }
                },
                "detail": {
                    "s3": {
                        "recordingPrefix": "aBcDeFgHhGfE/AbCdEfGhHgFe/GHFabcgefABC/
composite"
                    }
                },
                "id": "GHFabcgefABC",
                "state": "STARTING"
            }
        ],
        "layout": {
            "grid": {
                "featuredParticipantAttribute": ""
                "gridGap": 2,
                "omitStoppedVideo": false,
                "videoAspectRatio": "VIDEO",
                "videoFillMode": ""
            }
        },
        "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
        "startTime": "2023-10-16T23:24:00+00:00",
        "state": "STARTING",
        "tags": {}
    }
}
```

For more information, see Composite Recording (Real-Time Streaming) in the *Amazon Interactive Video Service User Guide*.

**Example 2: To start a composition with PiP layout**

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations using PiP layout.

```
aws ivs-realtime start-composition \
    --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd \
    --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg", \
        "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-
configuration/ABabCDcdEFef"}}, \
        {"s3":{"encoderConfigurationArns":["arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"], \
        "storageConfigurationArn":"arn:aws:ivs:ap-northeast-1:123456789012:storage-
configuration/FefABabCDcdE"}}]' \
    --layout pip='{featuredParticipantAttribute="abcdefg"}'
```

Output:

```
{
    "composition": {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs",
        "destinations": [
            {
                "configuration": {
                    "channel": {
                        "channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg",
                        "encoderConfigurationArn": "arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                    },
                    "name": ""
                },
                "id": "AabBCcdDEefF",
                "state": "STARTING"
            },
            {
                "configuration": {
                    "name": "",
                    "s3": {
                        "encoderConfigurationArns": [
                            "arn:aws:ivs:arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
                        ],
                        "recordingConfiguration": {
```

```
                            "format": "HLS"
                        },
                        "storageConfigurationArn": "arn:arn:aws:ivs:ap-
northeast-1:123456789012:storage-configuration/FefABabCDcdE"
                    }
                },
                "detail": {
                    "s3": {
                        "recordingPrefix": "aBcDeFgHhGfE/AbCdEfGhHgFe/GHFabcgefABC/
composite"
                    }
                },
                "id": "GHFabcgefABC",
                "state": "STARTING"
            }
        ],
        "layout": {
            "pip": {
                "featuredParticipantAttribute": "abcdefg",
                "gridGap": 0,
                "omitStoppedVideo": false,
                "pipBehavior": "STATIC",
                "pipOffset": 0,
                "pipParticipantAttribute": "",
                "pipPosition": "BOTTOM_RIGHT",
                "videoFillMode": "COVER"
            }
        },
        "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
        "startTime": "2023-10-16T23:24:00+00:00",
        "state": "STARTING",
        "tags": {}
    }
}
```

For more information, see Composite Recording (Real-Time Streaming) in the *Amazon Interactive Video Service User Guide*.

- For API details, see StartComposition in *AWS CLI Command Reference*.

### `stop-composition`

The following code example shows how to use `stop-composition`.

**AWS CLI**

**To stop a composition**

The following `stop-composition` stops the composition specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime stop-composition \
    --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

This command produces no output.

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see StopComposition in *AWS CLI Command Reference*.

### `update-stage`

The following code example shows how to use `update-stage`.

**AWS CLI**

**To update a stage's configuration**

The following `update-stage` example updates a stage for a specified stage ARN to update the stage name.

```
aws ivs-realtime update-stage \
    --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
    --name stage1a
```

Output:

```
{
    "stage": {
        "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
        "name": "stage1a"
    }
}
```

For more information, see Enabling Multiple Hosts on an Amazon IVS Stream in the *Amazon Interactive Video Service User Guide*.

- For API details, see UpdateStage in *AWS CLI Command Reference*.

## Amazon Kendra examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Kendra.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- Actions

### Actions

#### `create-data-source`

The following code example shows how to use `create-data-source`.

#### AWS CLI

**To create an Amazon Kendra data source connector**

The following `create-data-source` creates and configures an Amazon Kendra data source connector. You can use `describe-data-source` to view the status of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra create-data-source \
```

```
    --name "example data source 1" \
    --description "Example data source 1 for example index 1 contains the first set
 of example documents" \
    --tags '{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources",
 "Value": "aws"}' \
    --role-arn "arn:aws:iam::my-account-id:role/
KendraRoleForS3TemplateConfigDataSource" \
    --index-id exampleindex1 \
    --language-code "es" \
    --schedule "0 0 18 ? * TUE,MON,WED,THU,FRI,SAT *" \
    --configuration '{"TemplateConfiguration": {"Template": file://
s3schemaconfig.json}}' \
    --type "TEMPLATE" \
    --custom-document-enrichment-configuration '{"PostExtractionHookConfiguration":
 {"LambdaArn": "arn:aws:iam::my-account-id:function/my-function-ocr-docs",
 "S3Bucket": "s3://my-s3-bucket/scanned-image-text-example-docs"}, "RoleArn":
 "arn:aws:iam:my-account-id:role/KendraRoleForCDE"}' \
    --vpc-configuration '{"SecurityGroupIds": ["sg-1234567890abcdef0"], "SubnetIds":
 ["subnet-1c234","subnet-2b134"]}'
```

Output:

```
{
    "Id": "exampledatasource1"
}
```

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see CreateDataSource in *AWS CLI Command Reference*.

### `create-index`

The following code example shows how to use `create-index`.

#### AWS CLI

**To create an Amazon Kendra index**

The following `create-index` creates and configures an Amazon Kendra index. You can use `describe-index` to view the status of an index, and read any error messages if the status shows an index "FAILED" to completely create.

```
aws kendra create-index \
    --name "example index 1" \
    --description "Example index 1 contains the first set of example documents" \
    --tags '{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources",
 "Value": "aws"}' \
    --role-arn "arn:aws:iam::my-account-id:role/KendraRoleForExampleIndex" \
    --edition "DEVELOPER_EDITION" \
    --server-side-encryption-configuration '{"KmsKeyId": "my-kms-key-id"}' \
    --user-context-policy "USER_TOKEN" \
    --user-token-configurations '{"JsonTokenTypeConfiguration":
 {"GroupAttributeField": "groupNameField", "UserNameAttributeField":
 "userNameField"}}'
```

Output:

```
{
   "Id": index1
}
```

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see CreateIndex in *AWS CLI Command Reference*.

### `describe-data-source`

The following code example shows how to use `describe-data-source`.

#### AWS CLI

**To get information about an Amazon Kendra data source connector**

The following `describe-data-source` gets information about an Amazon Kendra data soource connector. You can view the configuration of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra describe-data-source \
    --id exampledatasource1 \
    --index-id exampleindex1
```

Output:

```
{
    "Configuration": {
        "TemplateConfiguration": {
            "Template": {
                "connectionConfiguration": {
                    "repositoryEndpointMetadata": {
                        "BucketName": "my-bucket"
                    }
                },
                "repositoryConfigurations": {
                    "document":{
                        "fieldMappings": [
                            {
                                "indexFieldName":"_document_title",
                                "indexFieldType":"STRING",
                                "dataSourceFieldName": "title"
                            },
                            {
                                "indexFieldName":"_last_updated_at",
                                "indexFieldType":"DATE",
                                "dataSourceFieldName": "modified_date"
                            }
                        ]
                    }
                },
                "additionalProperties": {
                    "inclusionPatterns": [
                        "*.txt",
                        "*.doc",

            }
        }
    ]
}
```

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see DescribeIndex in *AWS CLI Command Reference*.

### `update-data-source`

The following code example shows how to use `update-data-source`.

#### AWS CLI

**To update an Amazon Kendra data source connector**

The following `update-data-source` updates the configuration of an Amazon Kendra data source connector. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use `describe-data-source` to view the configuration and status of a data source connector.

```
aws kendra update-data-source \
```

```
    --id exampledatasource1 \
    --index-id exampleindex1 \
    --name "new name for example data source 1" \
    --description "new description for example data source 1" \
    --role-arn arn:aws:iam::my-account-id:role/KendraNewRoleForExampleDataSource \
    --configuration '{"TemplateConfiguration": {"Template": file://
s3schemanewconfig.json}}' \
    --custom-document-enrichment-configuration '{"PostExtractionHookConfiguration":
 {"LambdaArn": "arn:aws:iam::my-account-id:function/my-function-ocr-docs",
 "S3Bucket": "s3://my-s3-bucket/scanned-image-text-example-docs"}, "RoleArn":
 "arn:aws:iam:my-account-id:role/KendraNewRoleForCDE"}' \
    --language-code "es" \
    --schedule "0 0 18 ? * MON,WED,FRI *" \
    --vpc-configuration '{"SecurityGroupIds": ["sg-1234567890abcdef0"], "SubnetIds":
 ["subnet-1c234","subnet-2b134"]}'
```

This command produces no output.

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see UpdateDataSource in *AWS CLI Command Reference*.

### `update-index`

The following code example shows how to use `update-index`.

#### AWS CLI

**To update an Amazon Kendra index**

The following `update-index` updates the configuration of an Amazon Kendra index. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use `describe-index` to view the configuration and status of an index.

```
aws kendra update-index \
    --id enterpriseindex1 \
    --name "new name for Enterprise Edition index 1" \
    --description "new description for Enterprise Edition index 1" \
    --role-arn arn:aws:iam::my-account-id:role/KendraNewRoleForEnterpriseIndex \
    --capacity-units '{"QueryCapacityUnits": 2, "StorageCapacityUnits": 1}' \
```

```
   --document-metadata-configuration-updates '{"Name": "_document_title",
"Relevance": {"Importance": 6}}, {"Name": "_last_updated_at", "Relevance":
{"Importance": 8}}' \
   --user-context-policy "USER_TOKEN" \
   --user-token-configurations '{"JsonTokenTypeConfiguration":
{"GroupAttributeField": "groupNameField", "UserNameAttributeField":
"userNameField"}}'
```

This command produces no output.

For more information, see Getting started with an Amazon Kendra index and data source connector in the *Amazon Kendra Developer Guide*.

- For API details, see UpdateIndex in *AWS CLI Command Reference*.

## Kinesis examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Kinesis.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `add-tags-to-stream`

The following code example shows how to use `add-tags-to-stream`.

#### AWS CLI

**To add tags to a data stream**

The following `add-tags-to-stream` example assigns a tag with the key `samplekey` and value `example` to the specified stream.

```
aws kinesis add-tags-to-stream \
    --stream-name samplestream \
    --tags samplekey=example
```

This command produces no output.

For more information, see Tagging Your Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see AddTagsToStream in *AWS CLI Command Reference*.

### `create-stream`

The following code example shows how to use `create-stream`.

**AWS CLI**

**To create a data stream**

The following `create-stream` example creates a data stream named samplestream with 3 shards.

```
aws kinesis create-stream \
    --stream-name samplestream \
    --shard-count 3
```

This command produces no output.

For more information, see Creating a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see CreateStream in *AWS CLI Command Reference*.

### `decrease-stream-retention-period`

The following code example shows how to use `decrease-stream-retention-period`.

**AWS CLI**

**To decrease data stream retention period**

The following `decrease-stream-retention-period` example decreases the retention period (the length of time data records are accessible after they are added to the stream) of a stream named samplestream to 48 hours.

```
aws kinesis decrease-stream-retention-period \
    --stream-name samplestream \
    --retention-period-hours 48
```

This command produces no output.

For more information, see Changing the Data Retention Period in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DecreaseStreamRetentionPeriod in *AWS CLI Command Reference*.

### `delete-stream`

The following code example shows how to use `delete-stream`.

**AWS CLI**

**To delete a data stream**

The following `delete-stream` example deletes the specified data stream.

```
aws kinesis delete-stream \
    --stream-name samplestream
```

This command produces no output.

For more information, see Deleting a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DeleteStream in *AWS CLI Command Reference*.

### `deregister-stream-consumer`

The following code example shows how to use `deregister-stream-consumer`.

**AWS CLI**

**To deregister a data stream consumer**

The following `deregister-stream-consumer` example deregisters the specified consumer from the specified data stream.

```
aws kinesis deregister-stream-consumer \
    --stream-arn arn:aws:kinesis:us-west-2:123456789012:stream/samplestream \
    --consumer-name KinesisConsumerApplication
```

This command produces no output.

For more information, see Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DeregisterStreamConsumer in *AWS CLI Command Reference*.

### `describe-limits`

The following code example shows how to use `describe-limits`.

**AWS CLI**

**To describe shard limits**

The following `describe-limits` example displays the shard limits and usage for the current AWS account.

```
aws kinesis describe-limits
```

Output:

```
{
    "ShardLimit": 500,
    "OpenShardCount": 29
}
```

For more information, see Resharding a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeLimits in *AWS CLI Command Reference*.

### `describe-stream-consumer`

The following code example shows how to use `describe-stream-consumer`.

**AWS CLI**

**To describe a data stream consumer**

The following `describe-stream-consumer` example returns the description of the specified consumer, registered with the specified data stream.

```
aws kinesis describe-stream-consumer \
    --stream-arn arn:aws:kinesis:us-west-2:012345678912:stream/samplestream \
    --consumer-name KinesisConsumerApplication
```

Output:

```
{
    "ConsumerDescription": {
        "ConsumerName": "KinesisConsumerApplication",
        "ConsumerARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream/
consumer/KinesisConsumerApplication:1572383852",
        "ConsumerStatus": "ACTIVE",
        "ConsumerCreationTimestamp": 1572383852.0,
        "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream"
    }
}
```

For more information, see Reading Data from Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeStreamConsumer in *AWS CLI Command Reference*.

### `describe-stream-summary`

The following code example shows how to use `describe-stream-summary`.

**AWS CLI**

**To describe a data stream summary**

The following `describe-stream-summary` example provides a summarized description (without the shard list) of the specified data stream.

```
aws kinesis describe-stream-summary \
    --stream-name samplestream
```

Output:

```
{
    "StreamDescriptionSummary": {
        "StreamName": "samplestream",
        "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream",
        "StreamStatus": "ACTIVE",
        "RetentionPeriodHours": 48,
        "StreamCreationTimestamp": 1572297168.0,
        "EnhancedMonitoring": [
            {
                "ShardLevelMetrics": []
            }
        ],
        "EncryptionType": "NONE",
        "OpenShardCount": 3,
        "ConsumerCount": 0
    }
}
```

For more information, see Creating and Managing Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeStreamSummary in *AWS CLI Command Reference*.

### `describe-stream`

The following code example shows how to use `describe-stream`.

#### AWS CLI

##### To describe a data stream

The following `describe-stream` example returns the details of the specified data stream.

```
aws kinesis describe-stream \
```

```
    --stream-name samplestream
```

Output:

```
{
    "StreamDescription": {
        "Shards": [
            {
                "ShardId": "shardId-000000000000",
                "HashKeyRange": {
                    "StartingHashKey": "0",
                    "EndingHashKey": "113427455640312821154458202477256070484"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber":
 "496008716829570364423650249261910734372510605801286533 14"
                }
            },
            {
                "ShardId": "shardId-000000000001",
                "HashKeyRange": {
                    "StartingHashKey": "113427455640312821154458202477256070485",
                    "EndingHashKey": "226854911280625642308916404954512140969"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber":
 "496008716829793371875635555493326091555237089416346337 46"
                }
            },
            {
                "ShardId": "shardId-000000000002",
                "HashKeyRange": {
                    "StartingHashKey": "226854911280625642308916404954512140970",
                    "EndingHashKey": "340282366920938463463374607431768211455"
                },
                "SequenceNumberRange": {
                    "StartingSequenceNumber":
 "496008716830016379327620861724741448737963573031406141 78"
                }
            }
        ],
        "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream",
        "StreamName": "samplestream",
```

```
        "StreamStatus": "ACTIVE",
        "RetentionPeriodHours": 24,
        "EnhancedMonitoring": [
            {
                "ShardLevelMetrics": []
            }
        ],
        "EncryptionType": "NONE",
        "KeyId": null,
        "StreamCreationTimestamp": 1572297168.0
    }
}
```

For more information, see Creating and Managing Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DescribeStream in *AWS CLI Command Reference*.

### `disable-enhanced-monitoring`

The following code example shows how to use `disable-enhanced-monitoring`.

#### AWS CLI

**To disable enhanced monitoring for shard-level metrics**

The following `disable-enhanced-monitoring` example disables enhanced Kinesis data stream monitoring for shard-level metrics.

```
aws kinesis disable-enhanced-monitoring \
    --stream-name samplestream --shard-level-metrics ALL
```

Output:

```
{
    "StreamName": "samplestream",
    "CurrentShardLevelMetrics": [
        "IncomingBytes",
        "OutgoingRecords",
        "IteratorAgeMilliseconds",
        "IncomingRecords",
        "ReadProvisionedThroughputExceeded",
```

```
        "WriteProvisionedThroughputExceeded",
        "OutgoingBytes"
    ],
    "DesiredShardLevelMetrics": []
}
```

For more information, see Monitoring Streams in Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see DisableEnhancedMonitoring in *AWS CLI Command Reference*.

### `enable-enhanced-monitoring`

The following code example shows how to use `enable-enhanced-monitoring`.

**AWS CLI**

**To enable enhanced monitoring for shard-level metrics**

The following `enable-enhanced-monitoring` example enables enhanced Kinesis data stream monitoring for shard-level metrics.

```
aws kinesis enable-enhanced-monitoring \
    --stream-name samplestream \
    --shard-level-metrics ALL
```

Output:

```
{
    "StreamName": "samplestream",
    "CurrentShardLevelMetrics": [],
    "DesiredShardLevelMetrics": [
        "IncomingBytes",
        "OutgoingRecords",
        "IteratorAgeMilliseconds",
        "IncomingRecords",
        "ReadProvisionedThroughputExceeded",
        "WriteProvisionedThroughputExceeded",
        "OutgoingBytes"
    ]
}
```

For more information, see Monitoring Streams in Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see EnableEnhancedMonitoring in *AWS CLI Command Reference*.

### `get-records`

The following code example shows how to use `get-records`.

**AWS CLI**

**To obtain records from a shard**

The following `get-records` example gets data records from a Kinesis data stream's shard using the specified shard iterator.

```
aws kinesis get-records \
    --shard-iterator AAAAAAAAAAF7/0mWD7IuHj1yGv/
TKuNgx2ukD5xipCY4cy4gU96orWwZwcSXh3K9tAmGYeOZyLZrvzzeOFVf9iN99hUPw/w/
b0YWYeehfNvnf1DYt5XpDJghLKr3DzgznkTmMymDP3R+3wRKeuEw6/kdxY2yKJH0veaiekaVc4N2VwK/
GvaGP2Hh9Fg7N++q0Adg6fIDQPt4p8RpavDbk+A4sL9SWGE1
```

Output:

```
{
    "Records": [],
    "MillisBehindLatest": 80742000
}
```

For more information, see Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see GetRecords in *AWS CLI Command Reference*.

### `get-shard-iterator`

The following code example shows how to use `get-shard-iterator`.

**AWS CLI**

**To obtain a shard iterator**

The following `get-shard-iterator` example uses the `AT_SEQUENCE_NUMBER` shard iterator type and generates a shard iterator to start reading data records exactly from the position denoted by the specified sequence number.

```
aws kinesis get-shard-iterator \
    --stream-name samplestream \
    --shard-id shardId-000000000001 \
    --shard-iterator-type LATEST
```

Output:

```
{
    "ShardIterator": "AAAAAAAAAAFEvJjIYI+3jw/4aqgH9FifJ+n48XWTh/
IFIsbILP6o5eDueD39NXNBfpZ10WL5K6ADXk8w+5H+Qhd9cFA9k268CPXCz/kebq1TGYI7Vy
+lUkA9BuN3xvATxMBGxRY3zYK05gqgvaIRn94O8SqeEqwhigwZxNWxID3Ej7YYYcxQi8Q/fIrCjGAy/
n2r5Z9G864YpWDfN9upNNQAR/iiOWKs"
}
```

For more information, see Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see GetShardIterator in *AWS CLI Command Reference*.

## `increase-stream-retention-period`

The following code example shows how to use `increase-stream-retention-period`.

### AWS CLI

#### To increase data stream retention period

The following `increase-stream-retention-period` example increases the retention period (the length of time data records are accessible after they are added to the stream) of the specified stream to 168 hours.

```
aws kinesis increase-stream-retention-period \
    --stream-name samplestream \
    --retention-period-hours 168
```

This command produces no output.

For more information, see Changing the Data Retention Period in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see IncreaseStreamRetentionPeriod in *AWS CLI Command Reference*.

### `list-shards`

The following code example shows how to use `list-shards`.

**AWS CLI**

**To list shards in a data stream**

The following `list-shards` example lists all shards in the specified stream starting with the shard whose ID immediately follows the specified `exclusive-start-shard-id` of `shardId-000000000000`.

```
aws kinesis list-shards \
    --stream-name samplestream \
    --exclusive-start-shard-id shardId-000000000000
```

Output:

```
{
    "Shards": [
        {
            "ShardId": "shardId-000000000001",
            "HashKeyRange": {
                "StartingHashKey": "113427455640312821154458202477256070485",
                "EndingHashKey": "226854911280625642308916404954512140969"
            },
            "SequenceNumberRange": {
                "StartingSequenceNumber":
 "496008716829793371875635555493326091555237089416346337 46"
            }
        },
        {
            "ShardId": "shardId-000000000002",
            "HashKeyRange": {
                "StartingHashKey": "226854911280625642308916404954512140970",
                "EndingHashKey": "340282366920938463463374607431768211455"
            },
```

```
            "SequenceNumberRange": {
                "StartingSequenceNumber":
 "496008716830016379327620861724741448737963573031406141 78"
            }
        }
    ]
}
```

For more information, see Listing Shards in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see ListShards in *AWS CLI Command Reference*.

### `list-streams`

The following code example shows how to use `list-streams`.

**AWS CLI**

**To list data streams**

The following `list-streams` example lists all active data streams in the current account and region.

```
aws kinesis list-streams
```

Output:

```
{
    "StreamNames": [
        "samplestream",
        "samplestream1"
    ]
}
```

For more information, see Listing Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see ListStreams in *AWS CLI Command Reference*.

### `list-tags-for-stream`

The following code example shows how to use `list-tags-for-stream`.

**AWS CLI**

**To list tags for a data stream**

The following `list-tags-for-stream` example lists the tags attached to the specified data stream.

```
aws kinesis list-tags-for-stream \
    --stream-name samplestream
```

Output:

```
{
    "Tags": [
        {
            "Key": "samplekey",
            "Value": "example"
        }
    ],
    "HasMoreTags": false
}
```

For more information, see Tagging Your Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see ListTagsForStream in *AWS CLI Command Reference*.

### `merge-shards`

The following code example shows how to use `merge-shards`.

**AWS CLI**

**To merge shards**

The following `merge-shards` example merges two adjacent shards with IDs of shardId-000000000000 and shardId-000000000001 in the specified data stream and combines them into a single shard.

```
aws kinesis merge-shards \
    --stream-name samplestream \
    --shard-to-merge shardId-000000000000 \
```

```
    --adjacent-shard-to-merge shardId-000000000001
```

This command produces no output.

For more information, see Merging Two Shards in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see MergeShards in *AWS CLI Command Reference*.

### `put-record`

The following code example shows how to use `put-record`.

#### AWS CLI

**To write a record into a data stream**

The following `put-record` example writes a single data record into the specified data stream using the specified partition key.

```
aws kinesis put-record \
    --stream-name samplestream \
    --data sampledatarecord \
    --partition-key samplepartitionkey
```

Output:

```
{
    "ShardId": "shardId-000000000009",
    "SequenceNumber": "49600902273357540915989931256901506243878407835297513618",
    "EncryptionType": "KMS"
}
```

For more information, see Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see PutRecord in *AWS CLI Command Reference*.

### `put-records`

The following code example shows how to use `put-records`.

**AWS CLI**

**To write multiple records into a data stream**

The following `put-records` example writes a data record using the specified partition key and another data record using a different partition key in a single call.

```
aws kinesis put-records \
    --stream-name samplestream \
    --records Data=blob1,PartitionKey=partitionkey1
 Data=blob2,PartitionKey=partitionkey2
```

Output:

```
{
    "FailedRecordCount": 0,
    "Records": [
        {
            "SequenceNumber":
 "49600883331171471519674795588238531498465399900093808706",
            "ShardId": "shardId-000000000004"
        },
        {
            "SequenceNumber":
 "49600902273357540915989931256902715169698037101720764562",
            "ShardId": "shardId-000000000009"
        }
    ],
    "EncryptionType": "KMS"
}
```

For more information, see Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see PutRecords in *AWS CLI Command Reference*.

## `register-stream-consumer`

The following code example shows how to use `register-stream-consumer`.

**AWS CLI**

**To register a data stream consumer**

The following `register-stream-consumer` example registers a consumer called `KinesisConsumerApplication` with the specified data stream.

```
aws kinesis register-stream-consumer \
    --stream-arn arn:aws:kinesis:us-west-2:012345678912:stream/samplestream \
    --consumer-name KinesisConsumerApplication
```

Output:

```
{
    "Consumer": {
        "ConsumerName": "KinesisConsumerApplication",
        "ConsumerARN": "arn:aws:kinesis:us-west-2: 123456789012:stream/samplestream/
consumer/KinesisConsumerApplication:1572383852",
        "ConsumerStatus": "CREATING",
        "ConsumerCreationTimestamp": 1572383852.0
    }
}
```

For more information, see Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see RegisterStreamConsumer in *AWS CLI Command Reference*.

### `remove-tags-from-stream`

The following code example shows how to use `remove-tags-from-stream`.

#### AWS CLI

**To remove tags from a data stream**

The following `remove-tags-from-stream` example removes the tag with the specified key from the specified data stream.

```
aws kinesis remove-tags-from-stream \
    --stream-name samplestream \
    --tag-keys samplekey
```

This command produces no output.

For more information, see Tagging Your Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see RemoveTagsFromStream in *AWS CLI Command Reference*.

### `split-shard`

The following code example shows how to use `split-shard`.

**AWS CLI**

**To split shards**

The following `split-shard` example splits the specified shard into two new shards using a new starting hash key of 10.

```
aws kinesis split-shard \
    --stream-name samplestream \
    --shard-to-split shardId-000000000000 \
    --new-starting-hash-key 10
```

This command produces no output.

For more information, see Splitting a Shard in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see SplitShard in *AWS CLI Command Reference*.

### `start-stream-encryption`

The following code example shows how to use `start-stream-encryption`.

**AWS CLI**

**To enable data stream encryption**

The following `start-stream-encryption` example enables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis start-stream-encryption \
    --encryption-type KMS \
```

```
    --key-id arn:aws:kms:us-west-2:012345678912:key/a3c4a7cd-728b-45dd-
b334-4d3eb496e452 \
    --stream-name samplestream
```

This command produces no output.

For more information, see Data Protection in Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see StartStreamEncryption in *AWS CLI Command Reference*.

### `stop-stream-encryption`

The following code example shows how to use `stop-stream-encryption`.

**AWS CLI**

**To disable data stream encryption**

The following `stop-stream-encryption` example disables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis start-stream-encryption \
    --encryption-type KMS \
    --key-id arn:aws:kms:us-west-2:012345678912:key/a3c4a7cd-728b-45dd-
b334-4d3eb496e452 \
    --stream-name samplestream
```

This command produces no output.

For more information, see Data Protection in Amazon Kinesis Data Streams in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see StopStreamEncryption in *AWS CLI Command Reference*.

### `update-shard-count`

The following code example shows how to use `update-shard-count`.

**AWS CLI**

**To update the shard count in a data stream**

The following `update-shard-count` example updates the shard count of the specified data stream to 6. This example uses uniform scaling, which creates shards of equal size.

```
aws kinesis update-shard-count \
    --stream-name samplestream \
    --scaling-type UNIFORM_SCALING \
    --target-shard-count 6
```

Output:

```
{
    "StreamName": "samplestream",
    "CurrentShardCount": 3,
    "TargetShardCount": 6
}
```

For more information, see Resharding a Stream in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see UpdateShardCount in *AWS CLI Command Reference*.

## AWS KMS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS KMS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `cancel-key-deletion`

The following code example shows how to use `cancel-key-deletion`.

**AWS CLI**

**To cancel the scheduled deletion of a customer managed KMS key**

The following `cancel-key-deletion` example cancels the scheduled deletion of a customer managed KMS key.

```
aws kms cancel-key-deletion \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

When the `cancel-key-deletion` command succeeds, the scheduled deletion is canceled. However, the key state of the KMS key is `Disabled`, so you can't use the KMS key in cryptographic operations. To restore its functionality, use the `enable-key` command .

For more information, see Scheduling and canceling key deletion in the *AWS Key Management Service Developer Guide*.

- For API details, see CancelKeyDeletion in *AWS CLI Command Reference*.

#### `connect-custom-key-store`

The following code example shows how to use `connect-custom-key-store`.

**AWS CLI**

**To connect a custom key store**

The following `connect-custom-key-store` example reconnects the specified custom key store. You can use a command like this one to connect a custom key store for the first time or to reconnect a key store that was disconnected.

You can use this command to connect an AWS CloudHSM key store or an external key store.

```
aws kms connect-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0
```

This command does not return any output. To verify that the command was effective, use the `describe-custom-key-stores` command.

For information about connecting an AWS CloudHSM key store, see Connecting and disconnecting an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

For information about connecting an external key store, see Connecting and disconnecting an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see ConnectCustomKeyStore in *AWS CLI Command Reference*.

### `create-alias`

The following code example shows how to use `create-alias`.

**AWS CLI**

**To create an alias for a KMS key**

The following `create-alias` command creates an alias named `example-alias` for the KMS key identified by key ID `1234abcd-12ab-34cd-56ef-1234567890ab`.

Alias names must begin with `alias/`. Do not use alias names that begin with `alias/aws`; these are reserved for use by AWS.

```
aws kms create-alias \
    --alias-name alias/example-alias \
    --target-key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command doesn't return any output. To see the new alias, use the `list-aliases` command.

For more information, see Using aliases in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

### `create-custom-key-store`

The following code example shows how to use `create-custom-key-store`.

**AWS CLI**

**Example 1: To create an AWS CloudHSM key store**

The following `create-custom-key-store` example creates an AWS CloudHSM key store backed by an AWS CloudHSM cluster using the required parameters. You can also add the `custom-key-store-type``parameter with the default value: ``AWS_CLOUDHSM`.

To specify the file input for the `trust-anchor-certificate` command in the AWS CLI, the `file://` prefix is required.

```
aws kms create-custom-key-store \
    --custom-key-store-name ExampleCloudHSMKeyStore \
    --cloud-hsm-cluster-id cluster-1a23b4cdefg \
    --key-store-password kmsPswd \
    --trust-anchor-certificate file://customerCA.crt
```

Output:

```
{
    "CustomKeyStoreId": cks-1234567890abcdef0
}
```

For more information, see Creating an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

**Example 2: To create an external key store with public endpoint connectivity**

The following `create-custom-key-store` example creates an external key store (XKS) that communicates with AWS KMS over the internet.

In this example, the `XksProxyUriPath` uses an optional prefix of `example-prefix`.

NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the XksProxyUriEndpoint parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \
    --custom-key-store-name ExamplePublicEndpointXKS \
    --custom-key-store-type EXTERNAL_KEY_STORE \
    --xks-proxy-connectivity PUBLIC_ENDPOINT \
    --xks-proxy-uri-endpoint "https://myproxy.xks.example.com" \
    --xks-proxy-uri-path "/example-prefix/kms/xks/v1" \
    --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
 RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

Output:

```
{
    "CustomKeyStoreId": cks-2234567890abcdef0
}
```

For more information, see Creating an external key store in the *AWS Key Management Service Developer Guide*.

**Example 3: To create an external key store with VPC endpoint service connectivity**

The following `create-custom-key-store` example creates an external key store (XKS) that uses an Amazon VPC endpoint service to communicate with AWS KMS.

NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the XksProxyUriEndpoint parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \
```

```
    --custom-key-store-name ExampleVPCEndpointXKS \
    --custom-key-store-type EXTERNAL_KEY_STORE \
    --xks-proxy-connectivity VPC_ENDPOINT_SERVICE \
    --xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \
    --xks-proxy-uri-path "/kms/xks/v1" \
    --xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-east-1.vpce-svc-
example1" \
    --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
 RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

Output:

```
{
    "CustomKeyStoreId": cks-3234567890abcdef0
}
```

For more information, see Creating an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateCustomKeyStore in *AWS CLI Command Reference*.

### `create-grant`

The following code example shows how to use `create-grant`.

#### AWS CLI

**To create a grant**

The following `create-grant` example creates a grant that allows the `exampleUser` user to use the `decrypt` command on the `1234abcd-12ab-34cd-56ef-1234567890ab` example KMS key. The retiring principal is the `adminRole` role. The grant uses the `EncryptionContextSubset` grant constraint to allow this permission only when the encryption context in the `decrypt` request includes the `"Department": "IT"` key-value pair.

```
aws kms create-grant \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --grantee-principal arn:aws:iam::123456789012:user/exampleUser \
    --operations Decrypt \
    --constraints EncryptionContextSubset={Department=IT} \
    --retiring-principal arn:aws:iam::123456789012:role/adminRole
```

Output:

```
{
    "GrantId": "1a2b3c4d2f5e69f440bae30eaec9570bb1fb7358824f9ddfa1aa5a0dab1a59b2",
    "GrantToken": "<grant token here>"
}
```

To view detailed information about the grant, use the `list-grants` command.

For more information, see Grants in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateGrant in *AWS CLI Command Reference*.

### `create-key`

The following code example shows how to use `create-key`.

#### AWS CLI

**Example 1: To create a customer managed KMS key in AWS KMS**

The following `create-key` example creates a symmetric encryption KMS key.

To create the basic KMS key, a symmetric encryption key, you do not need to specify any parameters. The default values for those parameters create a symmetric encryption key.

Because this command doesn't specify a key policy, the KMS key gets the default key policy for programmatically created KMS keys. To view the key policy, use the `get-key-policy` command. To change the key policy, use the `put-key-policy` command.

```
aws kms create-key
```

The `create-key` command returns the key metadata, including the key ID and ARN of the new KMS key. You can use these values to identify the KMS key in other AWS KMS operations. The output does not include the tags. To view the tags for a KMS key, use the `list-resource-tags command`.

Output:

```
{
    "KeyMetadata": {
```

```
        "AWSAccountId": "111122223333",
        "Arn": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "CreationDate": "2017-07-05T14:04:55-07:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "Description": "",
        "Enabled": true,
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "AWS_KMS"
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ]
    }
}
```

Note: The `create-key` command does not let you specify an alias, To create an alias for the new KMS key, use the `create-alias` command.

For more information, see Creating keys in the *AWS Key Management Service Developer Guide*.

**Example 2: To create an asymmetric RSA KMS key for encryption and decryption**

The following `create-key` example creates a KMS key that contains an asymmetric RSA key pair for encryption and decryption.

```
aws kms create-key \
   --key-spec RSA_4096 \
   --key-usage ENCRYPT_DECRYPT
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2021-04-05T14:04:55-07:00",
        "CustomerMasterKeySpec": "RSA_4096",
```

```
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "RSAES_OAEP_SHA_1",
            "RSAES_OAEP_SHA_256"
        ],
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "RSA_4096",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "AWS_KMS"
    }
}
```

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

**Example 3: To create an asymmetric elliptic curve KMS key for signing and verification**

To create an asymmetric KMS key that contains an asymmetric elliptic curve (ECC) key pair for signing and verification. The `--key-usage` parameter is required even though `SIGN_VERIFY` is the only valid value for ECC KMS keys.

```
aws kms create-key \
    --key-spec ECC_NIST_P521 \
    --key-usage SIGN_VERIFY
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2019-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "ECC_NIST_P521",
        "Description": "",
        "Enabled": true,
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
```

```
        "KeySpec": "ECC_NIST_P521",
        "KeyState": "Enabled",
        "KeyUsage": "SIGN_VERIFY",
        "MultiRegion": false,
        "Origin": "AWS_KMS",
        "SigningAlgorithms": [
            "ECDSA_SHA_512"
        ]
    }
}
```

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

**Example 4: To create an HMAC KMS key**

The following `create-key` example creates a 384-bit HMAC KMS key. The `GENERATE_VERIFY_MAC` value for the `--key-usage` parameter is required even though it's the only valid value for HMAC KMS keys.

```
aws kms create-key \
    --key-spec HMAC_384 \
    --key-usage GENERATE_VERIFY_MAC
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2022-04-05T14:04:55-07:00",
        "CustomerMasterKeySpec": "HMAC_384",
        "Description": "",
        "Enabled": true,
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "HMAC_384",
        "KeyState": "Enabled",
        "KeyUsage": "GENERATE_VERIFY_MAC",
        "MacAlgorithms": [
            "HMAC_SHA_384"
```

```
        ],
        "MultiRegion": false,
        "Origin": "AWS_KMS"
    }
}
```

For more information, see HMAC keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

**Example 4: To create a multi-Region primary KMS key**

The following `create-key` example creates a multi-Region primary symmetric encryption key. Because the default values for all parameters create a symmetric encryption key, only the `--multi-region` parameter is required for this KMS key. In the AWS CLI, to indicate that a Boolean parameter is true, just specify the parameter name.

```
aws kms create-key \
    --multi-region
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-west-2:111122223333:key/
mrk-1234abcd12ab34cd56ef12345678990ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2021-09-02T016:15:21-09:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
          "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "mrk-1234abcd12ab34cd56ef12345678990ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": true,
        "MultiRegionConfiguration": {
            "MultiRegionKeyType": "PRIMARY",
            "PrimaryKey": {
```

```
                "Arn": "arn:aws:kms:us-west-2:111122223333:key/
mrk-1234abcd12ab34cd56ef12345678990ab",
                "Region": "us-west-2"
            },
            "ReplicaKeys": []
        },
        "Origin": "AWS_KMS"
    }
}
```

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

**Example 5: To create a KMS key for imported key material**

The following `create-key` example creates a creates a KMS key with no key material. When the operation is complete, you can import your own key material into the KMS key. To create this KMS key, set the `--origin` parameter to EXTERNAL.

```
aws kms create-key \
    --origin EXTERNAL
```

Output:

```
{
     "KeyMetadata": {
         "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
         "AWSAccountId": "111122223333",
         "CreationDate": "2019-12-02T07:48:55-07:00",
         "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
         "Description": "",
         "Enabled": false,
         "EncryptionAlgorithms": [
             "SYMMETRIC_DEFAULT"
         ],
         "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
         "KeyManager": "CUSTOMER",
         "KeySpec": "SYMMETRIC_DEFAULT",
         "KeyState": "PendingImport",
         "KeyUsage": "ENCRYPT_DECRYPT",
         "MultiRegion": false,
         "Origin": "EXTERNAL"
```

```
    }
}
```

For more information, see Importing key material in AWS KMS keys in the *AWS Key Management Service Developer Guide*.

**Example 6: To create a KMS key in an AWS CloudHSM key store**

The following `create-key` example creates a creates a KMS key in the specified AWS CloudHSM key store. The operation creates the KMS key and its metadata in AWS KMS and creates the key material in the AWS CloudHSM cluster associated with the custom key store. The `--custom-key-store-id` and `--origin` parameters are required.

```
aws kms create-key \
    --origin AWS_CLOUDHSM \
    --custom-key-store-id cks-1234567890abcdef0
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CloudHsmClusterId": "cluster-1a23b4cdefg",
        "CreationDate": "2019-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "CustomKeyStoreId": "cks-1234567890abcdef0",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "AWS_CLOUDHSM"
    }
}
```

For more information, see AWS CloudHSM key stores in the *AWS Key Management Service Developer Guide*.

**Example 7: To create a KMS key in an external key store**

The following `create-key` example creates a creates a KMS key in the specified external key store. The `--custom-key-store-id`, `--origin`, and `--xks-key-id` parameters are required in this command.

The `--xks-key-id` parameter specifies the ID of an existing symmetric encryption key in your external key manager. This key serves as the external key material for the KMS key.The value of the `--origin` parameter must be `EXTERNAL_KEY_STORE`.The `custom-key-store-id` parameter must identify an external key store that is connected to its external key store proxy.

```
aws kms create-key \
    --origin EXTERNAL_KEY_STORE \
    --custom-key-store-id cks-9876543210fedcba9 \
    --xks-key-id bb8562717f809024
```

Output:

```
{
    "KeyMetadata": {
        "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "AWSAccountId": "111122223333",
        "CreationDate": "2022-12-02T07:48:55-07:00",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "CustomKeyStoreId": "cks-9876543210fedcba9",
        "Description": "",
        "Enabled": true,
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "KeyManager": "CUSTOMER",
        "KeySpec": "SYMMETRIC_DEFAULT",
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "MultiRegion": false,
        "Origin": "EXTERNAL_KEY_STORE",
        "XksKeyConfiguration": {
```

```
            "Id": "bb8562717f809024"
        }
    }
}
```

For more information, see External key stores in the *AWS Key Management Service Developer Guide*.

- For API details, see CreateKey in *AWS CLI Command Reference*.

### `decrypt`

The following code example shows how to use `decrypt`.

**AWS CLI**

**Example 1: To decrypt an encrypted message with a symmetric KMS key (Linux and macOS)**

The following `decrypt` command example demonstrates the recommended way to decrypt data with the AWS CLI. This version shows how to decrypt data under a symmetric KMS key.

Provide the ciphertext in a file.In the value of the `--ciphertext-blob` parameter, use the `fileb://` prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see Loading AWS CLI parameters from a file <https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html> in the *AWS Command Line Interface User Guide* and Best Practices for Local File Parameters<https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/> in the *AWS Command Line Tool Blog*.Specify the KMS key to decrypt the ciphertext.The `--key-id` parameter is not required when decrypting with a symmetric KMS key. AWS KMS can get the key ID of the KMS key that was used to encrypt the data from the metadata in the ciphertext. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust.Request the plaintext output as a text value.The `--query` parameter tells the CLI to get only the value of the `Plaintext` field from the output. The `--output` parameter returns the output as text.Base64-decode the plaintext and save it in a file.The following example pipes (|) the value of the `Plaintext` parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the `ExamplePlaintext` file.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --output text \
    --query Plaintext | base64 \
    --decode > ExamplePlaintextFile
```

This command produces no output. The output from the `decrypt` command is base64-decoded and saved in a file.

For more information, see Decrypt in the *AWS Key Management Service API Reference*.

**Example 2: To decrypt an encrypted message with a symmetric KMS key (Windows command prompt)**

The following example is the same as the previous one except that it uses the `certutil` utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt ^
    --ciphertext-blob fileb://ExampleEncryptedFile ^
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab ^
    --output text ^
    --query Plaintext > ExamplePlaintextFile.base64
```

Run the `certutil` command.

```
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see Decrypt in the *AWS Key Management Service API Reference*.

**Example 3: To decrypt an encrypted message with an asymmetric KMS key (Linux and macOS)**

The following `decrypt` command example shows how to decrypt data encrypted under an RSA asymmetric KMS key.

When using an asymmetric KMS key, the `encryption-algorithm` parameter, which specifies the algorithm used to encrypt the plaintext, is required.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
    --encryption-algorithm RSAES_OAEP_SHA_256 \
    --output text \
    --query Plaintext | base64 \
    --decode > ExamplePlaintextFile
```

This command produces no output. The output from the `decrypt` command is base64-decoded and saved in a file.

For more information, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see Decrypt in *AWS CLI Command Reference*.

## `delete-alias`

The following code example shows how to use `delete-alias`.

### AWS CLI

**To delete an AWS KMS alias**

The following `delete-alias` example deletes the alias `alias/example-alias`. The alias name must begin with alias/.

```
aws kms delete-alias \
```

```
    --alias-name alias/example-alias
```

This command produces no output. To find the alias, use the `list-aliases` command.

For more information, see Deleting an alias in the *AWS Key Management Service Developer Guide*.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

### `delete-custom-key-store`

The following code example shows how to use `delete-custom-key-store`.

**AWS CLI**

**To delete a custom key store**

The following `delete-custom-key-store` example deletes the specified custom key store.

Deleting an AWS CloudHSM key store has no effect on the associated CloudHSM cluster. Deleting an external key store has no effect on the associated external key store proxy, external key manager, or external keys.

**NOTE:** Before you can delete a custom key store, you must schedule the deletion of all KMS keys in the custom key store and then wait for those KMS keys to be deleted. Then, you must disconnect the custom key store. For help finding the KMS keys in your custom key store, see Delete an AWS CloudHSM key store (API) in the *AWS Key Management Service Developer Guide*.

```
delete-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0
```

This command does not return any output. To verify that the custom key store is deleted, use the `describe-custom-key-stores` command.

For information about deleting an AWS CloudHSM key stores, see Deleting an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

For information about deleting external key stores, see Deleting an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see DeleteCustomKeyStore in *AWS CLI Command Reference*.

### `delete-imported-key-material`

The following code example shows how to use `delete-imported-key-material`.

**AWS CLI**

**To delete imported key material from a KMS key**

The following `delete-imported-key-material` example deletes key material that had been imported into a KMS key.

```
aws kms delete-imported-key-material \
   --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that the key material is deleted, use the `describe-key` command to look for a key state of `PendingImport` or `PendingDeletion`.

For more information, see Deleting imported key material<https://docs.aws.amazon.com/kms/latest/developerguide/importing-keys-delete-key-material.html> in the *AWS Key Management Service Developer Guide*.

- For API details, see DeleteImportedKeyMaterial in *AWS CLI Command Reference*.

### `describe-custom-key-stores`

The following code example shows how to use `describe-custom-key-stores`.

**AWS CLI**

**Example 1: To get details about an AWS CloudHSM key store**

The following `describe-custom-key-store` example displays details about the specified AWS CloudHSM key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
    --custom-key-store-name ExampleCloudHSMKeyStore
```

The output of this command includes useful details about the AWS CloudHSM key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
    "CustomKeyStores": [
        {
            "CloudHsmClusterId": "cluster-1a23b4cdefg",
            "ConnectionState": "CONNECTED",
            "CreationDate": "2022-04-05T14:04:55-07:00",
            "CustomKeyStoreId": "cks-1234567890abcdef0",
            "CustomKeyStoreName": "ExampleExternalKeyStore",
            "TrustAnchorCertificate": "<certificate appears here>"
        }
    ]
}
```

For more information, see Viewing an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

**Example 2: To get details about an external key store with public endpoint connectivity**

The following `describe-custom-key-store` example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
    --custom-key-store-id cks-9876543210fedcba9
```

The output of this command includes useful details about the external key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
    "CustomKeyStores": [
        {
            "CustomKeyStoreId": "cks-9876543210fedcba9",
            "CustomKeyStoreName": "ExampleXKS",
            "ConnectionState": "CONNECTED",
            "CreationDate": "2022-12-02T07:48:55-07:00",
            "CustomKeyStoreType": "EXTERNAL_KEY_STORE",
            "XksProxyConfiguration": {
                "AccessKeyId": "ABCDE12345670EXAMPLE",
                "Connectivity": "PUBLIC_ENDPOINT",
                "UriEndpoint": "https://myproxy.xks.example.com",
                "UriPath": "/example-prefix/kms/xks/v1"
            }
        }
    ]
}
```

For more information, see Viewing an external key store in the *AWS Key Management Service Developer Guide*.

**Example 3: To get details about an external key store with VPC endpoint service connectivity**

The following `describe-custom-key-store` example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
    --custom-key-store-id cks-2234567890abcdef0
```

The output of this command includes useful details about the external key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
    "CustomKeyStores": [
        {
            "CustomKeyStoreId": "cks-3234567890abcdef0",
            "CustomKeyStoreName": "ExampleVPCExternalKeyStore",
            "ConnectionState": "CONNECTED",
            "CreationDate": "2022-12-22T07:48:55-07:00",
            "CustomKeyStoreType": "EXTERNAL_KEY_STORE",
            "XksProxyConfiguration": {
                "AccessKeyId": "ABCDE12345670EXAMPLE",
                "Connectivity": "VPC_ENDPOINT_SERVICE",
                "UriEndpoint": "https://myproxy-private.xks.example.com",
                "UriPath": "/kms/xks/v1",
                "VpcEndpointServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-
example1"
            }
        }
    ]
}
```

For more information, see Viewing an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see DescribeCustomKeyStores in *AWS CLI Command Reference*.

### `describe-key`

The following code example shows how to use `describe-key`.

#### AWS CLI

**Example 1: To find detailed information about a KMS key**

The following `describe-key` example gets detailed information about the AWS managed key for Amazon S3 in the example account and Region. You can use this command to find details about AWS managed keys and customer managed keys.

To specify the KMS key, use the `key-id` parameter. This example uses an alias name value, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```
aws kms describe-key \
    --key-id alias/aws/s3
```

Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "846764612917",
        "KeyId": "b8a9477d-836c-491f-857e-07937918959b",
        "Arn": "arn:aws:kms:us-west-2:846764612917:key/
b8a9477d-836c-491f-857e-07937918959b",
        "CreationDate": 2017-06-30T21:44:32.140000+00:00,
        "Enabled": true,
        "Description": "Default KMS key that protects my S3 objects when no other
 key is defined",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "KeyState": "Enabled",
        "Origin": "AWS_KMS",
        "KeyManager": "AWS",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ]
    }
}
```

For more information, see Viewing keys in the *AWS Key Management Service Developer Guide*.

**Example 2: To get details about an RSA asymmetric KMS key**

The following `describe-key` example gets detailed information about an asymmetric RSA KMS key used for signing and verification.

```
aws kms describe-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "111122223333",
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "Arn": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "CreationDate": "2019-12-02T19:47:14.861000+00:00",
        "CustomerMasterKeySpec": "RSA_2048",
```

```
        "Enabled": false,
        "Description": "",
        "KeyState": "Disabled",
        "Origin": "AWS_KMS",
        "MultiRegion": false,
        "KeyManager": "CUSTOMER",
        "KeySpec": "RSA_2048",
        "KeyUsage": "SIGN_VERIFY",
        "SigningAlgorithms": [
            "RSASSA_PKCS1_V1_5_SHA_256",
            "RSASSA_PKCS1_V1_5_SHA_384",
            "RSASSA_PKCS1_V1_5_SHA_512",
            "RSASSA_PSS_SHA_256",
            "RSASSA_PSS_SHA_384",
            "RSASSA_PSS_SHA_512"
        ]
    }
}
```

**Example 3: To get details about a multi-Region replica key**

The following `describe-key` example gets metadata for a multi-Region replica key. This multi-Region key is a symmetric encryption key. The output of a `describe-key` command for any multi-Region key returns information about the primary key and all of its replicas.

```
aws kms describe-key \
    --key-id arn:aws:kms:ap-northeast-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab
```

Output:

```
{
    "KeyMetadata": {
        "MultiRegion": true,
        "AWSAccountId": "111122223333",
        "Arn": "arn:aws:kms:ap-northeast-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
        "CreationDate": "2021-06-28T21:09:16.114000+00:00",
        "Description": "",
        "Enabled": true,
        "KeyId": "mrk-1234abcd12ab34cd56ef1234567890ab",
        "KeyManager": "CUSTOMER",
```

```
        "KeyState": "Enabled",
        "KeyUsage": "ENCRYPT_DECRYPT",
        "Origin": "AWS_KMS",
        "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
        "EncryptionAlgorithms": [
            "SYMMETRIC_DEFAULT"
        ],
        "MultiRegionConfiguration": {
            "MultiRegionKeyType": "PRIMARY",
            "PrimaryKey": {
                "Arn": "arn:aws:kms:us-west-2:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                "Region": "us-west-2"
            },
            "ReplicaKeys": [
                {
                    "Arn": "arn:aws:kms:eu-west-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                    "Region": "eu-west-1"
                },
                {
                    "Arn": "arn:aws:kms:ap-northeast-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                    "Region": "ap-northeast-1"
                },
                {
                    "Arn": "arn:aws:kms:sa-east-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
                    "Region": "sa-east-1"
                }
            ]
        }
    }
}
```

**Example 4: To get details about an HMAC KMS key**

The following `describe-key` example gets detailed information about an HMAC KMS key.

```
aws kms describe-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyMetadata": {
        "AWSAccountId": "123456789012",
        "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
        "Arn": "arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",
        "CreationDate": "2022-04-03T22:23:10.194000+00:00",
        "Enabled": true,
        "Description": "Test key",
        "KeyUsage": "GENERATE_VERIFY_MAC",
        "KeyState": "Enabled",
        "Origin": "AWS_KMS",
        "KeyManager": "CUSTOMER",
        "CustomerMasterKeySpec": "HMAC_256",
        "MacAlgorithms": [
            "HMAC_SHA_256"
        ],
        "MultiRegion": false
    }
}
```

- For API details, see DescribeKey in *AWS CLI Command Reference*.

### `disable-key-rotation`

The following code example shows how to use `disable-key-rotation`.

#### AWS CLI

**To disable automatic rotation of a KMS key**

The following `disable-key-rotation` example disables automatic rotation of a customer managed KMS key. To reenable automatic rotation, use the `enable-key-rotation` command.

```
aws kms disable-key-rotation \
    --key-id arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that automatic rotation is disable for the KMS key, use the `get-key-rotation-status` command.

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see DisableKeyRotation in *AWS CLI Command Reference*.

### `disable-key`

The following code example shows how to use `disable-key`.

**AWS CLI**

**To temporarily disable a KMS key**

The following example uses the `disable-key` command to disable a customer managed KMS key. To re-enable the KMS key, use the `enable-key` command.

```
aws kms disable-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output.

For more information, see Enabling and Disabling Keys in the *AWS Key Management Service Developer Guide*.

- For API details, see DisableKey in *AWS CLI Command Reference*.

### `disconnect-custom-key-store`

The following code example shows how to use `disconnect-custom-key-store`.

**AWS CLI**

**To disconnect a custom key store**

The following `disconnect-custom-key-store` example disconnects a custom key store from its AWS CloudHSM cluster. You might disconnect a key store to troubleshoot a problem, to update its settings, or to prevent KMS keys in the keystore from being used in cryptographic operations.

This command is the same for all custom key stores, including AWS CloudHSM key stores and external key stores.

Before running this command, replace the example custom key store ID with a valid one.

```
$ aws kms disconnect-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0
```

This command produces no output. verify that the command was effective, use the `describe-custom-key-stores` command.

For more information about disconnecting an AWS CloudHSM key store, see Connecting and disconnecting an AWS CloudHSM key store in the *AWS Key Management Service Developer Guide*.

For more information about disconnecting an external key store, see Connecting and disconnecting an external key store in the *AWS Key Management Service Developer Guide*.

- For API details, see DisconnectCustomKeyStore in *AWS CLI Command Reference*.

### `enable-key-rotation`

The following code example shows how to use `enable-key-rotation`.

**AWS CLI**

**To enable automatic rotation of a KMS key**

The following `enable-key-rotation` example enables automatic rotation of a customer managed KMS key with a rotation period of 180 days. The KMS key will be rotated one year (approximate 365 days) from the date that this command completes and every year thereafter.

The `--key-id` parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key.The `--rotation-period-in-days` parameter specifies the number of days between each rotation date. Specify a value between 90 and 2560 days. If no value is specified, the default value is 365 days.

```
aws kms enable-key-rotation \
    --key-id arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --rotation-period-in-days 180
```

This command produces no output. To verify that the KMS key is enabled, use the `get-key-rotation-status` command.

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see EnableKeyRotation in *AWS CLI Command Reference*.

### `enable-key`

The following code example shows how to use `enable-key`.

**AWS CLI**

**To enable a KMS key**

The following `enable-key` example enables a customer managed key. You can use a command like this one to enable a KMS key that you temporarily disabled by using the `disable-key` command. You can also use it to enable a KMS key that is disabled because it was scheduled for deletion and the deletion was canceled.

To specify the KMS key, use the `key-id` parameter. This example uses an key ID value, but you can use a key ID or key ARN value in this command.

Before running this command, replace the example key ID with a valid one.

```
aws kms enable-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that the KMS key is enabled, use the `describe-key` command. See the values of the `KeyState` and `Enabled` fields in the `describe-key` output.

For more information, see Enabling and Disabling Keys in the *AWS Key Management Service Developer Guide*.

- For API details, see EnableKey in *AWS CLI Command Reference*.

### `encrypt`

The following code example shows how to use `encrypt`.

**AWS CLI**

**Example 1: To encrypt the contents of a file on Linux or MacOS**

The following `encrypt` command demonstrates the recommended way to encrypt data with the AWS CLI.

```
aws kms encrypt \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --plaintext fileb://ExamplePlaintextFile \
    --output text \
    --query CiphertextBlob | base64 \
    --decode > ExampleEncryptedFile
```

The command does several things:

Uses the `--plaintext` parameter to indicate the data to encrypt. This parameter value must be base64-encoded.The value of the `plaintext` parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.If the file is not in the current directory, type the full path to file. For example: `fileb:///var/tmp/ExamplePlaintextFile` or `fileb://C:\Temp\ExamplePlaintextFile`. For more information about reading AWS CLI parameter values from a file, see Loading Parameters from a File in the *AWS Command Line Interface User Guide* and Best Practices for Local File Parameters on the AWS Command Line Tool Blog.Uses the `--output` and `--query` parameters to control the command's output.These parameters extract the encrypted data, called the *ciphertext*, from the command's output.For more information about controlling output, see Controlling Command Output in the *AWS Command Line Interface User Guide*.Uses the `base64` utility to decode the extracted output into binary data.The ciphertext that is returned by a successful `encrypt` command is base64-encoded text. You must decode this text before you can use the AWS CLI to decrypt it.Saves the binary ciphertext to a file.The final part of the command (`> ExampleEncryptedFile`) saves the binary ciphertext to a file to make decryption easier. For an example command that uses the AWS CLI to decrypt data, see the decrypt examples.

**Example 2: Using the AWS CLI to encrypt data on Windows**

This example is the same as the previous one, except that it uses the `certutil` tool instead of `base64`. This procedure requires two commands, as shown in the following example.

```
aws kms encrypt \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --plaintext fileb://ExamplePlaintextFile \
    --output text \
    --query CiphertextBlob > C:\Temp\ExampleEncryptedFile.base64
```

```
certutil -decode C:\Temp\ExampleEncryptedFile.base64 C:\Temp\ExampleEncryptedFile
```

**Example 3: Encrypting with an asymmetric KMS key**

The following `encrypt` command shows how to encrypt plaintext with an asymmetric KMS key. The `--encryption-algorithm` parameter is required. As in all `encrypt` CLI commands, the `plaintext` parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

```
aws kms encrypt \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --encryption-algorithm RSAES_OAEP_SHA_256 \
    --plaintext fileb://ExamplePlaintextFile \
    --output text \
    --query CiphertextBlob | base64 \
    --decode > ExampleEncryptedFile
```

This command produces no output.

- For API details, see Encrypt in *AWS CLI Command Reference*.

### `generate-data-key-pair-without-plaintext`

The following code example shows how to use `generate-data-key-pair-without-plaintext`.

**AWS CLI**

**To generate an ECC NIST P384 asymmetric data key pair**

The following `generate-data-key-pair-without-plaintext` example requests an ECC NIST P384 key pair for use outside of AWS.

The command returns a plaintext public key and a copy of the private key encrypted under the specified KMS key. It does not return a plaintext private key. You can safely store the encrypted private key with the encrypted data, and call AWS KMS to decrypt the private key when you need to use it.

To request an ECC NIST P384 asymmetric data key pair, use the `key-pair-spec` parameter with a value of `ECC_NIST_P384`.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a KeySpec value of SYMMETRIC_DEFAULT.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair-without-plaintext \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --key-pair-spec ECC_NIST_P384
```

Output:

```
{
    "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdKl2aJTzkK6FbhOtQkMlQJJH3PdtHvS/y
+hAFFxmiD134doUDzMGmfCEtcAAAHaTCCB2UGCSqGSIb3DQEHBqCCB1...",
    "PublicKey":
 "MIIBojANBgkqhkiG9w0BAQEFAAOCAY8AMIIBigKCAYEA3A3eGMyPrvSn7+LdlJE1oUoQV5HpEuHAVbdOyND
+NmYDH/mL1OSIEuLrcdZ5hrMH4pk83r40l...",
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyPairSpec": "ECC_NIST_P384"
}
```

The PublicKey and PrivateKeyCiphertextBlob are returned in base64-encoded format.

For more information, see Data key pairs in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKeyPairWithoutPlaintext in *AWS CLI Command Reference*.

### `generate-data-key-pair`

The following code example shows how to use `generate-data-key-pair`.

#### AWS CLI

**To generate an 2048-bit RSA asymmetric data key pair**

The following `generate-data-key-pair` example requests a 2048-bit RSA asymmetric data key pair for use outside of AWS. The command returns a plaintext public key and a plaintext private key for immediate use and deletion, and a copy of the private key encrypted under the specified KMS key. You can safely store the encrypted private key with the encrypted data.

To request a 2048-bit RSA asymmetric data key pair, use the `key-pair-spec` parameter with a value of `RSA_2048`.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a `KeySpec` value of `SYMMETRIC_DEFAULT`.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --key-pair-spec RSA_2048
```

Output:

```
{
    "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdKl2aJTzkK6FbhOtQkMlQJJH3PdtHvS/y
+hAFFxmiD134doUDzMGmfCEtcAAAHaTCCB2UGCSqGSIb3DQEHBqCCB1...",
    "PrivateKeyPlaintext": "MIIG/
QIBADANBgkqhkiG9w0BAQEFAASCBucwggbjAgEAAoIBgQDcDd4YzI
+u9Kfv4t2UkTWhShBXkekS4cBVt07I0P42ZgMf+YvU5IgS4ut...",
    "PublicKey":
 "MIIBojANBgkqhkiG9w0BAQEFAAOCAY8AMIIBigKCAYEA3A3eGMyPrvSn7+LdlJE1oUoQV5HpEuHAVbdOyND
+NmYDH/mL1OSIEuLrcdZ5hrMH4pk83r40l...",
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyPairSpec": "RSA_2048"
}
```

The `PublicKey`, `PrivateKeyPlaintext`, and `PrivateKeyCiphertextBlob` are returned in base64-encoded format.

For more information, see Data key pairs in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKeyPair in *AWS CLI Command Reference*.

### `generate-data-key-without-plaintext`

The following code example shows how to use `generate-data-key-without-plaintext`.

#### AWS CLI

**To generate a 256-bit symmetric data key without a plaintext key**

The following `generate-data-key-without-plaintext` example requests an encrypted copy of a 256-bit symmetric data key for use outside of AWS. You can call AWS KMS to decrypt the data key when you are ready to use it.

To request a 256-bit data key, use the `key-spec` parameter with a value of `AES_256`. To request a 128-bit data key, use the `key-spec` parameter with a value of `AES_128`. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

```
aws kms generate-data-key-without-plaintext \
    --key-id "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab" \
    --key-spec AES_256
```

Output:

```
{
    "CiphertextBlob":
 "AQEDAHjRYf5WytIc0C857tFSnBaPn2F8DgfmThbJlGfR8P3WlwAAAH4wfAYJKoZIhvcNAQcGoG8wbQIBADBoBgkqhk
    "KeyId": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

The `CiphertextBlob` (encrypted data key) is returned in base64-encoded format.

For more information, see Data keys in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKeyWithoutPlaintext in *AWS CLI Command Reference*.

### `generate-data-key`

The following code example shows how to use `generate-data-key`.

#### AWS CLI

**Example 1: To generate a 256-bit symmetric data key**

The following `generate-data-key` example requests a 256-bit symmetric data key for use outside of AWS. The command returns a plaintext data key for immediate use and deletion,

and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a 256-bit data key, use the `key-spec` parameter with a value of `AES_256`. To request a 128-bit data key, use the `key-spec` parameter with a value of `AES_128`. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

```
aws kms generate-data-key \
    --key-id alias/ExampleAlias \
    --key-spec AES_256
```

Output:

```
{
    "Plaintext": "VdzKNHGzUAzJeRBVY+uUmofUGGiDzyB3+i9fVkh3piw=",
    "KeyId": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "CiphertextBlob":
 "AQEDAHjRYf5WytIc0C857tFSnBaPn2F8DgfmThbJlGfR8P3WlwAAAH4wfAYJKoZIhvcNAQcGoG8wbQIBADBoBgkqhk
+YdhV8MrkBQPeac0ReRVNDt9qleAt+SHgIRF8P0H+7U="
}
```

The `Plaintext` (plaintext data key) and the `CiphertextBlob` (encrypted data key) are returned in base64-encoded format.

For more information, see Data keys <https://docs.aws.amazon.com/kms/latest/developerguide/concepts.html#data-keys in the *AWS Key Management Service Developer Guide*.

**Example 2: To generate a 512-bit symmetric data key**

The following `generate-data-key` example requests a 512-bit symmetric data key for encryption and decryption. The command returns a plaintext data key for immediate use and deletion, and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a key length other than 128 or 256 bits, use the `number-of-bytes` parameter. To request a 512-bit data key, the following example uses the `number-of-bytes` parameter with a value of 64 (bytes).

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of SYMMETRIC_DEFAULT.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --number-of-bytes 64
```

Output:

```
{
    "CiphertextBlob": "AQIBAHi6LtupRpdKl2aJTzkK6FbhOtQkMlQJJH3PdtHvS/y+hAEnX/
QQNmMwDfg2korNMEc8AAACaDCCAmQGCSqGSIb3DQEHBqCCAlUwggJRAgEAMIICSgYJKoZ...",
    "Plaintext": "ty8Lr0Bk6OF07M2BWt6qbFdNB
+G00ZLtf5MSEb4al3R2UKWGOp06njAwy2n72VRm2m7z/
Pm9Wpbvttz6a4lSo9hgPvKhZ5y6RTm4OovEXiVfBveyX3DQxDzRSwbKDPk/...",
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

The `Plaintext` (plaintext data key) and `CiphertextBlob` (encrypted data key) are returned in base64-encoded format.

For more information, see Data keys <https://docs.aws.amazon.com/kms/latest/developerguide/concepts.html#data-keys in the *AWS Key Management Service Developer Guide*.

- For API details, see GenerateDataKey in *AWS CLI Command Reference*.

### `generate-random`

The following code example shows how to use `generate-random`.

#### AWS CLI

**Example 1: To generate a 256-bit random byte string (Linux or macOs)**

The following `generate-random` example generates a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the random file.

When you run this command, you must use the `number-of-bytes` parameter to specify the length of the random value in bytes.

You don't specify a KMS key when you run this command. The random byte string is unrelated to any KMS key.

By default, AWS KMS generates the random number. However, if you specify a custom key store<https://docs.aws.amazon.com/kms/latest/developerguide/custom-key-store-overview.html>, the random byte string is generated in the AWS CloudHSM cluster associated with the custom key store.

This example uses the following parameters and values:

It uses the required `--number-of-bytes` parameter with a value of `32` to request a 32-byte (256-bit) string.It uses the `--output` parameter with a value of `text` to direct the AWS CLI to return the output as text, instead of JSON.It uses the `--query parameter` to extract the value of the `Plaintext` property from the response.It pipes ( | ) the output of the command to the `base64` utility, which decodes the extracted output.It uses the redirection operator ( > ) to save decoded byte string to the `ExampleRandom` file.It uses the redirection operator ( > ) to save the binary ciphertext to a file.

```
aws kms generate-random \
    --number-of-bytes 32 \
    --output text \
    --query Plaintext | base64 --decode > ExampleRandom
```

This command produces no output.

For more information, see GenerateRandom in the *AWS Key Management Service API Reference*.

**Example 2: To generate a 256-bit random number (Windows Command Prompt)**

The following example uses the `generate-random` command to generate a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the random file. This example is the same as the previous example, except that it uses the `certutil` utility in Windows to base64-decode the random byte string before saving it in a file.

First, generate a base64-encoded random byte string and saves it in a temporary file, `ExampleRandom.base64`.

```
aws kms generate-random \
    --number-of-bytes 32 \
    --output text \
    --query Plaintext > ExampleRandom.base64
```

Because the output of the `generate-random` command is saved in a file, this example produces no output.

Now use the `certutil -decode` command to decode the base64-encoded byte string in the `ExampleRandom.base64` file. Then, it saves the decoded byte string in the `ExampleRandom` file.

```
certutil -decode ExampleRandom.base64 ExampleRandom
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see GenerateRandom in the *AWS Key Management Service API Reference*.

- For API details, see GenerateRandom in *AWS CLI Command Reference*.

### `get-key-policy`

The following code example shows how to use `get-key-policy`.

#### AWS CLI

**To copy a key policy from one KMS key to another KMS key**

The following `get-key-policy` example gets the key policy from one KMS key and saves it in a text file. Then, it replaces the policy of a different KMS key using the text file as the policy input.

Because the `--policy` parameter of `put-key-policy` requires a string, you must use the `--output text` option to return the output as a text string instead of JSON.

```
aws kms get-key-policy \
    --policy-name default \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --query Policy \
    --output text > policy.txt

aws kms put-key-policy \
    --policy-name default \
```

```
    --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
    --policy file://policy.txt
```

This command produces no output.

For more information, see PutKeyPolicy in the *AWS KMS API Reference*.

- For API details, see GetKeyPolicy in *AWS CLI Command Reference*.

### `get-key-rotation-status`

The following code example shows how to use `get-key-rotation-status`.

#### AWS CLI

**To retrieve the rotation status for a KMS key.**

The following `get-key-rotation-status` example returns information about the rotation status of the specified KMS key, including whether automatic rotation is enabled, the rotation period, and the next scheduled rotation date. You can use this command on customer managed KMS keys and AWS managed KMS keys. However, all AWS managed KMS keys are automatically rotated every year.

```
aws kms get-key-rotation-status \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyRotationEnabled": true,
    "NextRotationDate": "2024-02-14T18:14:33.587000+00:00",
    "RotationPeriodInDays": 365
}
```

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see GetKeyRotationStatus in *AWS CLI Command Reference*.

### `get-parameters-for-import`

The following code example shows how to use `get-parameters-for-import`.

**AWS CLI**

**To get the items required to import key material into a KMS key**

The following `get-parameters-for-import` example gets the public key and import token that you need to import key material into a KMS key. When you use the `import-key-material` command, be sure to use the import token and key material encrypted by the public key that were returned in the same `get-parameters-for-import` command. Also, the wrapping algorithm that you specify in this command must be one that you use to encrypt the key material with the public key.

To specify the KMS key, use the `key-id` parameter. This example uses an key ID, but you can use a key ID or key ARN in this command.

```
aws kms get-parameters-for-import \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --wrapping-algorithm RSAES_OAEP_SHA_256 \
    --wrapping-key-spec RSA_2048
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "PublicKey": "<public key base64 encoded data>",
    "ImportToken": "<import token base64 encoded data>",
    "ParametersValidTo": 1593893322.32
}
```

For more information, see Download the public key and import token in the *AWS Key Management Service Developer Guide*.

- For API details, see GetParametersForImport in *AWS CLI Command Reference*.

## `get-public-key`

The following code example shows how to use `get-public-key`.

**AWS CLI**

**Example 1: To download the public key of an asymmetric KMS key**

The following `get-public-key` example downloads the public key of an asymmetric KMS key.

In addition to returning the public key, the output includes information that you need to use the public key safely outside of AWS KMS, including the key usage and supported encryption algorithms.

```
aws kms get-public-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "PublicKey": "jANBgkqhkiG9w0BAQEFAAOCAg8AMIICCgKCAgEAl5epvg1/
QtJhxSi2g9SDEVg8QV/...",
    "CustomerMasterKeySpec": "RSA_4096",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "EncryptionAlgorithms": [
        "RSAES_OAEP_SHA_1",
        "RSAES_OAEP_SHA_256"
    ]
}
```

For more information about using asymmetric KMS keys in AWS KMS, see Using Symmetric and Asymmetric Keys in the *AWS Key Management Service API Reference*.

**Example 2: To convert a public key to DER format (Linux and macOS)**

The following `get-public-key` example downloads the public key of an asymmetric KMS key and saves it in a DER file.

When you use the `get-public-key` command in the AWS CLI, it returns a DER-encoded X.509 public key that is Base64-encoded. This example gets the value of the `PublicKey` property as text. It Base64-decodes the `PublicKey` and saves it in the `public_key.der` file. The `output` parameter returns the output as text, instead of JSON. The `--query` parameter gets only the `PublicKey` property, not the properties that you need to use the public key safely outside of AWS KMS.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms get-public-key \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --output text \
    --query PublicKey | base64 --decode > public_key.der
```

This command produces no output.

For more information about using asymmetric KMS keys in AWS KMS, see Using Symmetric and Asymmetric Keys in the *AWS Key Management Service API Reference*.

- For API details, see GetPublicKey in *AWS CLI Command Reference*.

### `import-key-material`

The following code example shows how to use `import-key-material`.

**AWS CLI**

**To import key material into a KMS key**

The following `import-key-material` example uploads key material into a KMS key that was created with no key material. The key state of the KMS key must be `PendingImport`.

This command uses key material that you encrypted with the public key that the `get-parameters-for-import` command returned. It also uses the import token from the same `get-parameters-for-import` command.

The `expiration-model` parameter indicates that the key material automatically expires on the date and time specified by the `valid-to` parameter. When the key material expires, AWS KMS deletes the key material, the key state of the KMS key changes to `Pending import` and the KMS key becomes unusable. To restore the KMS key, you must reimport the same key material. To use different key material, you must create a new KMS key.

Before running this command, replace the example key ID with a valid key ID or key ARN from your AWS account.

```
aws kms import-key-material \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --encrypted-key-material fileb://EncryptedKeyMaterial.bin \
    --import-token fileb://ImportToken.bin \
    --expiration-model KEY_MATERIAL_EXPIRES \
```

```
    --valid-to 2021-09-21T19:00:00Z
```

This command produces no output.

For more information about importing key material, see Importing Key Material in the *AWS Key Management Service Developer Guide*.

- For API details, see ImportKeyMaterial in *AWS CLI Command Reference*.

### `list-aliases`

The following code example shows how to use `list-aliases`.

#### AWS CLI

**Example 1: To list all aliases in an AWS account and Region**

The following example uses the `list-aliases` command to list all aliases in the default Region of the AWS account. The output includes aliases associated with AWS managed KMS keys and customer managed KMS keys.

```
aws kms list-aliases
```

Output:

```
{
    "Aliases": [
        {
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/testKey",
            "AliasName": "alias/testKey",
            "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
        },
        {
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/FinanceDept",
            "AliasName": "alias/FinanceDept",
            "TargetKeyId": "0987dcba-09fe-87dc-65ba-ab0987654321"
        },
        {
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/aws/dynamodb",
            "AliasName": "alias/aws/dynamodb",
            "TargetKeyId": "1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d"
        },
        {
```

```
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/aws/ebs",
            "AliasName": "alias/aws/ebs",
            "TargetKeyId": "0987ab65-43cd-21ef-09ab-87654321cdef"
        },
        ...
    ]
}
```

**Example 2: To list all aliases for a particular KMS key**

The following example uses the `list-aliases` command and its `key-id` parameter to list all aliases that are associated with a particular KMS key.

Each alias is associated with only one KMS key, but a KMS key can have multiple aliases. This command is very useful because the AWS KMS console lists only one alias for each KMS key. To find all aliases for a KMS key, you must use the `list-aliases` command.

This example uses the key ID of the KMS key for the `--key-id` parameter, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```
aws kms list-aliases --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "Aliases": [
        {
            "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/oregon-test-key",
            "AliasName": "alias/oregon-test-key"
        },
        {
            "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
            "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/project121-test",
            "AliasName": "alias/project121-test"
        }
    ]
}
```

For more information, see Working with Aliases in the *AWS Key Management Service Developer Guide*.

- For API details, see ListAliases in *AWS CLI Command Reference*.

### `list-grants`

The following code example shows how to use `list-grants`.

**AWS CLI**

**To view the grants on an AWS KMS key**

The following `list-grants` example displays all of the grants on the specified AWS managed KMS key for Amazon DynamoDB in your account. This grant allows DynamoDB to use the KMS key on your behalf to encrypt a DynamoDB table before writing it to disk. You can use a command like this one to view the grants on the AWS managed KMS keys and customer managed KMS keys in the AWS account and Region.

This command uses the `key-id` parameter with a key ID to identify the KMS key. You can use a key ID or key ARN to identify the KMS key. To get the key ID or key ARN of an AWS managed KMS key, use the `list-keys` or `list-aliases` command.

```
aws kms list-grants \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

The output shows that the grant gives Amazon DynamoDB permission to use the KMS key for cryptographic operations, and gives it permission to view details about the KMS key (`DescribeKey`) and to retire grants (`RetireGrant`). The `EncryptionContextSubset` constraint limits these permission to requests that include the specified encryption context pairs. As a result, the permissions in the grant are effective only on specified account and DynamoDB table.

```
{
    "Grants": [
        {
            "Constraints": {
                "EncryptionContextSubset": {
                    "aws:dynamodb:subscriberId": "123456789012",
                    "aws:dynamodb:tableName": "Services"
                }
            },
            "IssuingAccount": "arn:aws:iam::123456789012:root",
            "Name": "8276b9a6-6cf0-46f1-b2f0-7993a7f8c89a",
            "Operations": [
                "Decrypt",
```

```
                "Encrypt",
                "GenerateDataKey",
                "ReEncryptFrom",
                "ReEncryptTo",
                "RetireGrant",
                "DescribeKey"
            ],
            "GrantId":
 "1667b97d27cf748cf05b487217dd4179526c949d14fb3903858e25193253fe59",
            "KeyId": "arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",
            "RetiringPrincipal": "dynamodb.us-west-2.amazonaws.com",
            "GranteePrincipal": "dynamodb.us-west-2.amazonaws.com",
            "CreationDate": "2021-05-13T18:32:45.144000+00:00"
        }
    ]
}
```

For more information, see Grants in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see ListGrants in *AWS CLI Command Reference*.

### `list-key-policies`

The following code example shows how to use `list-key-policies`.

**AWS CLI**

**To get the names of key policies for a KMS key**

The following `list-key-policies` example gets the names of the key policies for a customer managed key in the example account and Region. You can use this command to find the names of key policies for AWS managed keys and customer managed keys.

Because the only valid key policy name is `default`, this command is not useful.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms list-key-policies \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "PolicyNames": [
    "default"
    ]
}
```

For more information about AWS KMS key policies, see Using Key Policies in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see ListKeyPolicies in *AWS CLI Command Reference*.

### `list-key-rotations`

The following code example shows how to use `list-key-rotations`.

#### AWS CLI

**To retrieve information about all completed key material rotations**

The following `list-key-rotations` example lists information about all completed key material rotations for the specified KMS key.

```
aws kms list-key-rotations \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "Rotations": [
        {
            "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
            "RotationDate": "2024-03-02T10:11:36.564000+00:00",
            "RotationType": "AUTOMATIC"
        },
        {
            "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
            "RotationDate": "2024-04-05T15:14:47.757000+00:00",
            "RotationType": "ON_DEMAND"
        }
```

```
    ],
    "Truncated": false
}
```

For more information, see Rotating keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ListKeyRotations in *AWS CLI Command Reference*.

## `list-keys`

The following code example shows how to use `list-keys`.

### AWS CLI

#### To get the KMS keys in an account and Region

The following `list-keys` example gets the KMS keys in an account and Region. This command returns both AWS managed keys and customer managed keys.

```
aws kms list-keys
```

Output:

```
{
    "Keys": [
        {
            "KeyArn": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
            "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
        },
        {
            "KeyArn": "arn:aws:kms:us-
west-2:111122223333:key/0987dcba-09fe-87dc-65ba-ab0987654321",
            "KeyId": "0987dcba-09fe-87dc-65ba-ab0987654321"
        },
        {
            "KeyArn": "arn:aws:kms:us-
east-2:111122223333:key/1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d",
            "KeyId": "1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d"
        }
    ]
}
```

For more information, see Viewing Keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ListKeys in *AWS CLI Command Reference*.

### `list-resource-tags`

The following code example shows how to use `list-resource-tags`.

**AWS CLI**

**To get the tags on a KMS key**

The following `list-resource-tags` example gets the tags for a KMS key. To add or replace resource tags on KMS keys, use the `tag-resource` command. The output shows that this KMS key has two resource tags, each of which has a key and value.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms list-resource-tags \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "Tags": [
    {
        "TagKey": "Dept",
        "TagValue": "IT"
    },
    {
        "TagKey": "Purpose",
        "TagValue": "Test"
    }
    ],
    "Truncated": false
}
```

For more information about using tags in AWS KMS, see Tagging keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ListResourceTags in *AWS CLI Command Reference*.

### `list-retirable-grants`

The following code example shows how to use `list-retirable-grants`.

**AWS CLI**

**To view the grants that a principal can retire**

The following `list-retirable-grants` example displays all of the grants that the `ExampleAdmin` user can retire on the KMS keys in an AWS account and Region. You can use a command like this one to view the grants that any account principal can retire on KMS keys in the AWS account and Region.

The value of the required `retiring-principal` parameter must be the Amazon Resource Name (ARN) of an account, user, or role.

You cannot specify a service for the value of `retiring-principal` in this command, even though a service can be the retiring principal. To find the grants in which a particular service is the retiring principal, use the `list-grants` command.

The output shows that `ExampleAdmin` user has permission to retire grants on two different KMS keys in the account and region. In addition to the retiring principal, the account has permission to retire any grant in the account.

```
aws kms list-retirable-grants \
    --retiring-principal arn:aws:iam::111122223333:user/ExampleAdmin
```

Output:

```
{
    "Grants": [
        {
            "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
            "GrantId":
 "156b69c63cb154aa21f59929ff19760717be8d9d82b99df53e18b94a15a5e88e",
            "Name": "",
            "CreationDate": 2021-01-14T20:17:36.419000+00:00,
            "GranteePrincipal": "arn:aws:iam::111122223333:user/ExampleUser",
            "RetiringPrincipal": "arn:aws:iam::111122223333:user/ExampleAdmin",
            "IssuingAccount": "arn:aws:iam::111122223333:root",
            "Operations": [
```

```
                "Encrypt"
            ],
            "Constraints": {
                "EncryptionContextSubset": {
                    "Department": "IT"
                }
            }
        },
        {
            "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/0987dcba-09fe-87dc-65ba-ab0987654321",
            "GrantId":
 "8c94d1f12f5e69f440bae30eaec9570bb1fb7358824f9ddfa1aa5a0dab1a59b2",
            "Name": "",
            "CreationDate": "2021-02-02T19:49:49.638000+00:00",
            "GranteePrincipal": "arn:aws:iam::111122223333:role/ExampleRole",
            "RetiringPrincipal": "arn:aws:iam::111122223333:user/ExampleAdmin",
            "IssuingAccount": "arn:aws:iam::111122223333:root",
            "Operations": [
                "Decrypt"
            ],
            "Constraints": {
                "EncryptionContextSubset": {
                    "Department": "IT"
                }
            }
        }
    ],
    "Truncated": false
}
```

For more information, see Grants in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see ListRetirableGrants in *AWS CLI Command Reference*.

### `put-key-policy`

The following code example shows how to use `put-key-policy`.

#### AWS CLI

**To change the key policy for a KMS key**

The following `put-key-policy` example changes the key policy for a customer managed key.

To begin, create a key policy and save it in a local JSON file. In this example, the file is `key_policy.json`. You can also specify the key policy as a string value of the `policy` parameter.

The first statement in this key policy gives the AWS account permission to use IAM policies to control access to the KMS key. The second statement gives the `test-user` user permission to run the `describe-key` and `list-keys` commands on the KMS key.

Contents of `key_policy.json`:

```
{
    "Version" : "2012-10-17",
    "Id" : "key-default-1",
    "Statement" : [
        {
            "Sid" : "Enable IAM User Permissions",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::111122223333:root"
            },
            "Action" : "kms:*",
            "Resource" : "*"
        },
        {
            "Sid" : "Allow Use of Key",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::111122223333:user/test-user"
            },
            "Action" : [
                "kms:DescribeKey",
                "kms:ListKeys"
            ],
            "Resource" : "*"
        }
    ]
}
```

To identify the KMS key, this example uses the key ID, but you can also use a key ARN. To specify the key policy, the command uses the `policy` parameter. To indicate that the policy

is in a file, it uses the required `file://` prefix. This prefix is required to identify files on all supported operating systems. Finally, the command uses the `policy-name` parameter with a value of `default`. If no policy name is specified, the default value is `default`. The only valid value is `default`.

```
aws kms put-key-policy \
    --policy-name default \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --policy file://key_policy.json
```

This command does not produce any output. To verify that the command was effective, use the `get-key-policy` command. The following example command gets the key policy for the same KMS key. The `output` parameter with a value of `text` returns a text format that is easy to read.

```
aws kms get-key-policy \
    --policy-name default \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --output text
```

Output:

```
{
    "Version" : "2012-10-17",
    "Id" : "key-default-1",
    "Statement" : [
        {
            "Sid" : "Enable IAM User Permissions",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::111122223333:root"
            },
            "Action" : "kms:*",
            "Resource" : "*"
            },
            {
            "Sid" : "Allow Use of Key",
            "Effect" : "Allow",
            "Principal" : {
                "AWS" : "arn:aws:iam::111122223333:user/test-user"
            },
```

```
            "Action" : [ "kms:Describe", "kms:List" ],
            "Resource" : "*"
        }
    ]
}
```

For more information, see Changing a Key Policy in the *AWS Key Management Service Developer Guide*.

- For API details, see PutKeyPolicy in *AWS CLI Command Reference*.

### `re-encrypt`

The following code example shows how to use `re-encrypt`.

**AWS CLI**

**Example 1: To re-encrypt an encrypted message under a different symmetric KMS key (Linux and macOS).**

The following `re-encrypt` command example demonstrates the recommended way to re-encrypt data with the AWS CLI.

Provide the ciphertext in a file.In the value of the `--ciphertext-blob` parameter, use the `fileb://` prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see Loading AWS CLI parameters from a file <https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html> in the *AWS Command Line Interface User Guide* and Best Practices for Local File Parameters<https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/> in the *AWS Command Line Tool Blog*.Specify the source KMS key, which decrypts the ciphertext.The `--source-key-id` parameter is not required when decrypting with symmetric encryption KMS keys. AWS KMS can get the KMS key that was used to encrypt the data from the metadata in the ciphertext blob. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust.Specify the destination KMS key, which re-encrypts the data.The `--destination-key-id` parameter is always required. This example uses a key ARN, but you can use any valid key identifier.Request the plaintext output as a text value.The `--query` parameter tells the CLI to get only the value of the `Plaintext` field from the output. The `--output` parameter returns the output as text.Base64-decode

the plaintext and save it in a file.The following example pipes (|) the value of the `Plaintext` parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the `ExamplePlaintext` file.

Before running this command, replace the example key IDs with valid key identifiers from your AWS account.

```
aws kms re-encrypt \
    --ciphertext-blob fileb://ExampleEncryptedFile \
    --source-key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --destination-key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
    --query CiphertextBlob \
    --output text | base64 --decode > ExampleReEncryptedFile
```

This command produces no output. The output from the `re-encrypt` command is base64-decoded and saved in a file.

For more information, see ReEncrypt <https://docs.aws.amazon.com/kms/latest/APIReference/API_ReEncrypt.html in the *AWS Key Management Service API Reference*.

**Example 2: To re-encrypt an encrypted message under a different symmetric KMS key (Windows command prompt).**

The following `re-encrypt` command example is the same as the previous one except that it uses the `certutil` utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms re-encrypt ^
    --ciphertext-blob fileb://ExampleEncryptedFile ^
    --source-key-id 1234abcd-12ab-34cd-56ef-1234567890ab ^
    --destination-key-id 0987dcba-09fe-87dc-65ba-ab0987654321 ^
    --query CiphertextBlob ^
    --output text > ExampleReEncryptedFile.base64
```

Then use the `certutil` utility

```
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see ReEncrypt <https://docs.aws.amazon.com/kms/latest/APIReference/API_ReEncrypt.html in the *AWS Key Management Service API Reference*.

- For API details, see ReEncrypt in *AWS CLI Command Reference*.

### `retire-grant`

The following code example shows how to use `retire-grant`.

**AWS CLI**

**To retire a grant on a customer master key**

The following `retire-grant` example deletes a grant from a KMS key.

The following example command specifies the `grant-id` and the `key-id` parameters. The value of the `key-id` parameter must be the key ARN of the KMS key.

```
aws kms retire-grant \
    --grant-id 1234a2345b8a4e350500d432bccf8ecd6506710e1391880c4f7f7140160c9af3 \
    --key-id arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To confirm that the grant was retired, use the `list-grants` command.

For more information, see Retiring and revoking grants in the *AWS Key Management Service Developer Guide*.

- For API details, see RetireGrant in *AWS CLI Command Reference*.

### `revoke-grant`

The following code example shows how to use `revoke-grant`.

**AWS CLI**

**To revoke a grant on a customer master key**

The following `revoke-grant` example deletes a grant from a KMS key. The following example command specifies the `grant-id` and the `key-id` parameters. The value of the `key-id` parameter can be the key ID or key ARN of the KMS key.

```
aws kms revoke-grant \
    --grant-id 1234a2345b8a4e350500d432bccf8ecd6506710e1391880c4f7f7140160c9af3 \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To confirm that the grant was revoked, use the `list-grants` command.

For more information, see Retiring and revoking grants in the *AWS Key Management Service Developer Guide*.

- For API details, see RevokeGrant in *AWS CLI Command Reference*.

### `rotate-key-on-demand`

The following code example shows how to use `rotate-key-on-demand`.

**AWS CLI**

**To perform on-demand rotation of a KMS key**

The following `rotate-key-on-demand` example immediately initiates rotation of the key material for the specified KMS key.

```
aws kms rotate-key-on-demand \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

For more information, see How to perform on-demand key rotation in the *AWS Key Management Service Developer Guide*.

- For API details, see RotateKeyOnDemand in *AWS CLI Command Reference*.

### `schedule-key-deletion`

The following code example shows how to use `schedule-key-deletion`.

**AWS CLI**

**To schedule the deletion of a customer managed KMS key.**

The following `schedule-key-deletion` example schedules the specified customer managed KMS key to be deleted in 15 days.

The `--key-id` parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key.The `--pending-window-in-days` parameter specifies the length of the 7-30 day waiting period. By default, the waiting period is 30 days. This example specifies a value of 15, which tells AWS to permanently delete the KMS key 15 days after the command completes.

```
aws kms schedule-key-deletion \
    --key-id arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --pending-window-in-days 15
```

The response includes the key ARN, key state, waiting period (`PendingWindowInDays`), and the deletion date in Unix time. To view the deletion date in local time, use the AWS KMS console. KMS keys in the `PendingDeletion` key state cannot be used in cryptographic operations.

```
{
    "KeyId": "arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "DeletionDate": "2022-06-18T23:43:51.272000+00:00",
    "KeyState": "PendingDeletion",
    "PendingWindowInDays": 15
}
```

For more information, see Deleting keys in the *AWS Key Management Service Developer Guide*.

- For API details, see ScheduleKeyDeletion in *AWS CLI Command Reference*.

### `sign`

The following code example shows how to use `sign`.

**AWS CLI**

**Example 1: To generate a digital signature for a message**

The following `sign` example generates a cryptographic signature for a short message. The output of the command includes a base-64 encoded `Signature` field that you can verify by using the `verify` command.

You must specify a message to sign and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms for your KMS key, use the `describe-key` command.

In AWS CLI 2.0, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of SIGN_VERIFY.

```
msg=(echo 'Hello World' | base64)

aws kms sign \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://UnsignedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "Signature": "ABCDEFhpyVYyTxbafE74ccSvEJLJr3zuoV1Hfymz4qv+/
fxmxNLA7SE1SiF8lHw80fKZZ3bJ...",
    "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
```

```
}
```

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

**Example 2: To save a digital signature in a file (Linux and macOs)**

The following `sign` example generates a cryptographic signature for a short message stored in a local file. The command also gets the `Signature` property from the response, Base64-decodes it and saves it in the ExampleSignature file. You can use the signature file in a `verify` command that verifies the signature.

The `sign` command requires a Base64-encoded message and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms that your KMS key supports, use the `describe-key` command.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of SIGN_VERIFY.

```
echo 'hello world' | base64 > EncodedMessage

aws kms sign \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://EncodedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \
    --output text \
    --query Signature | base64 --decode > ExampleSignature
```

This command produces no output. This example extracts the `Signature` property of the output and saves it in a file.

For more information about using asymmetric KMS keys in AWS KMS, see Asymmetric keys in AWS KMS in the *AWS Key Management Service Developer Guide*.

- For API details, see Sign in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag to a KMS key**

The following `tag-resource` example adds `"Purpose":"Test"` and `"Dept":"IT"` tags to a customer managed KMS key. You can use tags like these to label KMS keys and create categories of KMS keys for permissions and auditing.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms tag-resource \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --tags TagKey='Purpose',TagValue='Test' TagKey='Dept',TagValue='IT'
```

This command produces no output. To view the tags on an AWS KMS KMS key, use the `list-resource-tags` command.

For more information about using tags in AWS KMS, see Tagging keys in the *AWS Key Management Service Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To delete a tag from a KMS key**

The following `untag-resource` example deletes the tag with the `"Purpose"` key from a customer managed KMS key.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command. Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms untag-resource \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --tag-key 'Purpose'
```

This command produces no output. To view the tags on an AWS KMS KMS key, use the `list-resource-tags` command.

For more information about using tags in AWS KMS, see Tagging keys in the *AWS Key Management Service Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-alias`

The following code example shows how to use `update-alias`.

**AWS CLI**

**To associate an alias with a different KMS key**

The following `update-alias` example associates the alias `alias/test-key` with a different KMS key.

The `--alias-name` parameter specifies the alias. The alias name value must begin with `alias/`.The `--target-key-id` parameter specifies the KMS key to associate with the alias. You don't need to specify the current KMS key for the alias.

```
aws kms update-alias \
    --alias-name alias/test-key \
    --target-key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To find the alias, use the `list-aliases` command.

For more information, see Updating aliases in the *AWS Key Management Service Developer Guide*.

- For API details, see UpdateAlias in *AWS CLI Command Reference*.

### `update-custom-key-store`

The following code example shows how to use `update-custom-key-store`.

**AWS CLI**

**Example 1: To edit the friendly name of a custom key store**

The following `update-custom-key-store` example changes the name of the custom key store. This example works for an AWS CloudHSM key store or an external key store.

Use the `custom-key-store-id` to identify the key store. Use the `new-custom-key-store-name` parameter to specify the new friendly name.

To update the friendly name of an AWS CloudHSM key store, you must first disconnect the key store, such as by using the `disconnect-custom-key-store` command. You can update the friendly name of an external key store while it is connected or disconnected. To find the connection state of your custom key store, use the `describe-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --new-custom-key-store-name ExampleKeyStore
```

This command does not return any data. To verify that the command worked, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the *AWS Key Management Service Developer Guide*.

For more information about updating an external key store, see Editing external key store properties in the *AWS Key Management Service Developer Guide*.

**Example 2: To edit the kmsuser password of an AWS CloudHSM key store**

The following `update-custom-key-store` example updates the value of the `kmsuser` password to the current password for the `kmsuser` in the CloudHSM cluster associated with the specified key store. This command doesn't change the `kmsuser` password it the cluster. It just tells AWS KMS the current password. If KMS doesn't have the current `kmsuser` password, it cannot connect to the AWS CloudHSM key store.

**NOTE:** Before updating an AWS CloudHSM key store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --key-store-password ExamplePassword
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the *AWS Key Management Service Developer Guide*.

**Example 3: To edit the AWS CloudHSM cluster of an AWS CloudHSM key store**

The following example changes the AWS CloudHSM cluster that is associated with an AWS CloudHSM key store to a related cluster, such as a different backup of the same cluster.

**NOTE:** Before updating an AWS CloudHSM key store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --cloud-hsm-cluster-id cluster-1a23b4cdefg
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see Editing AWS CloudHSM key store settings in the *AWS Key Management Service Developer Guide*.

**Example 4: To edit the proxy authentication credential of an external key store**

The following example updates the proxy authentication credential for your external key store. You must specify both the `raw-secret-access-key` and the `access-key-id`, even if you are changing only one of the values. You can use this feature to fix an invalid credential or to change the credential when the external key store proxy rotates it.

Establish the proxy authentication credential for AWS KMS on your external key store. Then use this command to provide the credential to AWS KMS. AWS KMS uses this credential to sign its requests to your external key store proxy.

You can update the proxy authentication credential while the external key store is connected or disconnected. To find the connection state of your custom key store, use the `describe-custom-key-store` command.

```
aws kms update-custom-key-store \
```

```
    --custom-key-store-id cks-1234567890abcdef0 \
    --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
 RawSecretAccessKey=DXjSUawnel2fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see Editing external key store properties in the *AWS Key Management Service Developer Guide*.

**Example 5: To edit the proxy connectivity of an external key store**

The following example changes the external key store proxy connectivity option from public endpoint connectivity to VPC endpoint service connectivity. In addition to changing the `xks-proxy-connectivity` value, you must change the `xks-proxy-uri-endpoint` value to reflect the private DNS name associated with the VPC endpoint service. You must also add an `xks-proxy-vpc-endpoint-service-name` value.

**NOTE:** Before updating the proxy connectivity of an external store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the external key store by using the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \
    --custom-key-store-id cks-1234567890abcdef0 \
    --xks-proxy-connectivity VPC_ENDPOINT_SERVICE \
    --xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \
    --xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-east-1.vpce-svc-
example"
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see Editing external key store properties in the *AWS Key Management Service Developer Guide*.

- For API details, see UpdateCustomKeyStore in *AWS CLI Command Reference*.

### `update-key-description`

The following code example shows how to use `update-key-description`.

## AWS CLI

### Example 1: To add or change a description to a customer managed KMS key

The following `update-key-description` example adds a description to a customer managed KMS key. You can use the same command to change an existing description.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ARN value, but you can use either the key ID or the key ARN of the KMS key.The `--description` parameter specifies the new description. The value of this parameter replaces the current description of the KMS key, if any.

```
aws kms update-key-description \
    --key-id arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --description "IT Department test key"
```

This command produces no output. To view the description of a KMS key, use the `describe-key` command.

For more information, see UpdateKeyDescription in the *AWS Key Management Service API Reference*.

### Example 2: To delete the description of a customer managed KMS key

The following `update-key-description` example deletes the description to a customer managed KMS key.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ID value, but you can use either the key ID or the key ARN of the KMS key.The `--description` parameter with an empty string value ('') deletes the existing description.

```
aws kms update-key-description \
    --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \
    --description ''
```

This command produces no output. To view the description of a KMS key, use the the describe-key command.

For more information, see UpdateKeyDescription in the *AWS Key Management Service API Reference*.

- For API details, see UpdateKeyDescription in *AWS CLI Command Reference*.

### `verify`

The following code example shows how to use `verify`.

**AWS CLI**

**To verify a digital signature**

The following `verify` example verifies a cryptographic signature for a short, Base64-encoded message. The key ID, message, message type, and signing algorithm must be same ones that were used to sign the message. The signature that you specify cannot be base64-encoded. For help decoding the signature that the `sign` command returns, see the `sign` command examples.

The output of the command includes a Boolean `SignatureValid` field that indicates that the signature was verified. If the signature validation fails, the `verify` command fails, too.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms verify \
    --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
    --message fileb://EncodedMessage \
    --message-type RAW \
    --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \
    --signature fileb://ExampleSignature
```

Output:

```
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "SignatureValid": true,
    "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
}
```

For more information about using asymmetric KMS keys in AWS KMS, see Using asymmetric keys in the *AWS Key Management Service Developer Guide*.

- For API details, see Verify in *AWS CLI Command Reference*.

## Lake Formation examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lake Formation.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `add-lf-tags-to-resource`

The following code example shows how to use `add-lf-tags-to-resource`.

**AWS CLI**

**To attach one or more LF-tags to an existing resource**

The following `add-lf-tags-to-resource` example attaches given LF-tag to the table resource.

```
aws lakeformation add-lf-tags-to-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
```

```
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    },
    "LFTags": [{
        "CatalogId": "123456789111",
        "TagKey": "usergroup",
        "TagValues": [
            "analyst"
        ]
    }]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see Assigning LF-Tags to Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see AddLfTagsToResource in *AWS CLI Command Reference*.

## `batch-grant-permissions`

The following code example shows how to use `batch-grant-permissions`.

### AWS CLI

#### To bulk grant permissions on resources to the principals

The following `batch-grant-permissions` example bulk grants access on specified resources to the principals.

```
aws lakeformation batch-grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Entries": [{
            "Id": "1",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
        {
            "Id": "2",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_customer"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
```

```
        {
            "Id": "3",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
business-analyst"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
        {
            "Id": "4",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "DataCellsFilter": {
                    "TableCatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "TableName": "dl_tpc_item",
                    "Name": "developer_item"
                }
            },
            "Permissions": [
                "SELECT"
            ],
            "PermissionsWithGrantOption": []
        }
    ]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see BatchGrantPermissions in *AWS CLI Command Reference*.

### `batch-revoke-permissions`

The following code example shows how to use `batch-revoke-permissions`.

**AWS CLI**

**To bulk revoke permissions on resources from the principals**

The following `batch-revoke-permissions` example bulk revokes access on specified resources from the principals.

```
aws lakeformation batch-revoke-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Entries": [{
            "Id": "1",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
```

```
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        },
        {
            "Id": "2",
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
business-analyst"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "tpc",
                    "Name": "dl_tpc_promotion"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": [
                "ALL"
            ]
        }
    ]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see BatchRevokePermissions in *AWS CLI Command Reference*.

### `cancel-transaction`

The following code example shows how to use `cancel-transaction`.

**AWS CLI**

**To cancel a transaction**

The following `cancel-transaction` example cancels the transaction.

```
aws lakeformation cancel-transaction \
    --transaction-id='b014d972ca8347b89825e33c5774aec4'
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see CancelTransaction in *AWS CLI Command Reference*.

### `commit-transaction`

The following code example shows how to use `commit-transaction`.

**AWS CLI**

**To commit transaction**

The following `commit-transaction` example commits the transaction.

```
aws lakeformation commit-transaction \
    --transaction-id='b014d972ca8347b89825e33c5774aec4'
```

Output:

```
{
    "TransactionStatus": "committed"
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see CommitTransaction in *AWS CLI Command Reference*.

## `create-data-cells-filter`

The following code example shows how to use `create-data-cells-filter`.

### AWS CLI

#### Example 1: To create data cell filter

The following `create-data-cells-filter` example creates a data cell filter to allow one to grant access to certain columns based on row condition.

```
aws lakeformation create-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableData": {
        "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],
        "DatabaseName": "tpc",
        "Name": "developer_promotion",
        "RowFilter": {
            "FilterExpression": "p_promo_name='ese'"
        },
        "TableCatalogId": "123456789111",
        "TableName": "dl_tpc_promotion"
    }
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

#### Example 2: To create column filter

The following `create-data-cells-filter` example creates a data filter to allow one to grant access to certain columns.

```
aws lakeformation create-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableData": {
        "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],
        "DatabaseName": "tpc",
        "Name": "developer_promotion_allrows",
        "RowFilter": {
            "AllRowsWildcard": {}
        },
        "TableCatalogId": "123456789111",
        "TableName": "dl_tpc_promotion"
    }
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

**Example 3: To create data filter with exclude columns**

The following `create-data-cells-filter` example creates a data filter to allow one to grant access all except the mentioned columns.

```
aws lakeformation create-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableData": {
        "ColumnWildcard": {
            "ExcludedColumnNames": ["p_channel_details", "p_start_date_sk"]
        },
        "DatabaseName": "tpc",
        "Name": "developer_promotion_excludecolumn",
        "RowFilter": {
            "AllRowsWildcard": {}
        },
        "TableCatalogId": "123456789111",
        "TableName": "dl_tpc_promotion"
    }
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

- For API details, see CreateDataCellsFilter in *AWS CLI Command Reference*.

### `create-lf-tag`

The following code example shows how to use `create-lf-tag`.

#### AWS CLI

**To create LF-Tag**

The following `create-lf-tag` example creates an LF-Tag with the specified name and values.

```
aws lakeformation create-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup' \
    --tag-values '["developer","analyst","campaign"]'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see CreateLfTag in *AWS CLI Command Reference*.

### `delete-data-cells-filter`

The following code example shows how to use `delete-data-cells-filter`.

#### AWS CLI

**To delete data cell filter**

The following `delete-data-cells-filter` example deletes given data cell filter.

```
aws lakeformation delete-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "TableCatalogId": "123456789111",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_promotion",
    "Name": "developer_promotion"
}
```

This command produces no output.

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

- For API details, see DeleteDataCellsFilter in *AWS CLI Command Reference*.

### `delete-lf-tag`

The following code example shows how to use `delete-lf-tag`.

#### AWS CLI

**To delete LF-Tag definition**

The following `delete-lf-tag` example deletes LF-Tag definition.

```
aws lakeformation delete-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see DeleteLfTag in *AWS CLI Command Reference*.

### `delete-objects-on-cancel`

The following code example shows how to use `delete-objects-on-cancel`.

#### AWS CLI

**To delete object when transaction is cancelled**

The following `delete-objects-on-cancel` example deletes the listed s3 object when the transaction is cancelled.

```
aws lakeformation delete-objects-on-cancel \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "012345678901",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_household_demographics_gov",
    "TransactionId": "1234d972ca8347b89825e33c5774aec4",
    "Objects": [{
        "Uri": "s3://lf-data-lake-012345678901/target/
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-
ff26b17504414fe88b302cd795eabd00.parquet",
        "ETag": "1234ab1fc50a316b149b4e1f21a73800"
    }]
}
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see DeleteObjectsOnCancel in *AWS CLI Command Reference*.

## `deregister-resource`

The following code example shows how to use `deregister-resource`.

### AWS CLI

#### To deregister data lake storage

The following `deregister-resource` example deregisters the resource as managed by the Lake Formation.

```
aws lakeformation deregister-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123"
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see DeregisterResource in *AWS CLI Command Reference*.

### `describe-transaction`

The following code example shows how to use `describe-transaction`.

#### AWS CLI

**To retrieve a transaction details**

The following `describe-transaction` example returns the details of a single transaction.

```
aws lakeformation describe-transaction \
    --transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

Output:

```
{
    "TransactionDescription": {
        "TransactionId": "12345972ca8347b89825e33c5774aec4",
        "TransactionStatus": "committed",
        "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
        "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
    }
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see DescribeTransaction in *AWS CLI Command Reference*.

### `extend-transaction`

The following code example shows how to use `extend-transaction`.

**AWS CLI**

**To extend a transaction**

The following `extend-transaction` example extends the transaction.

```
aws lakeformation extend-transaction \
    --transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see ExtendTransaction in *AWS CLI Command Reference*.

### `get-data-lake-settings`

The following code example shows how to use `get-data-lake-settings`.

**AWS CLI**

**To retrieve AWS Lake Formation-managed data lake settings**

The following `get-data-lake-settings` example retrieves the list of data lake administrators and other data lake settings.

```
aws lakeformation get-data-lake-settings \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111"
}
```

Output:

```
{
    "DataLakeSettings": {
        "DataLakeAdmins": [{
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
        }],
        "CreateDatabaseDefaultPermissions": [],
        "CreateTableDefaultPermissions": [
                {
                        "Principal": {
                            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
                        },
                        "Permissions": [
                            "ALL"
                        ]
                }
        ],
        "TrustedResourceOwners": [],
        "AllowExternalDataFiltering": true,
        "ExternalDataFilteringAllowList": [{
            "DataLakePrincipalIdentifier": "123456789111"
        }],
        "AuthorizedSessionTagValueList": [
            "Amazon EMR"
        ]
    }
}
```

For more information, see Changing the default security settings for your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see GetDataLakeSettings in *AWS CLI Command Reference*.

## `get-effective-permissions-for-path`

The following code example shows how to use `get-effective-permissions-for-path`.

### AWS CLI

#### To retrieve permissions on resources located at specific path

The following `get-effective-permissions-for-path` example returns the Lake Formation permissions for a specified table or database resource located at a path in Amazon S3.

```
aws lakeformation get-effective-permissions-for-path \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111"
}
```

Output:

```
{
    "Permissions": [{
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
campaign-manager"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "DESCRIBE"
            ],
            "PermissionsWithGrantOption": []
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/EMR-
RuntimeRole"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "ALL"
            ],
            "PermissionsWithGrantOption": []
```

```
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:saml-
provider/oktaSAMLProvider:user/emr-developer"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "ALL",
                "DESCRIBE"
            ],
            "PermissionsWithGrantOption": []
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "ALL",
                "ALTER",
                "CREATE_TABLE",
                "DESCRIBE",
                "DROP"
            ],
            "PermissionsWithGrantOption": [
                "ALL",
                "ALTER",
                "CREATE_TABLE",
                "DESCRIBE",
                "DROP"
            ]
        },
        {
            "Principal": {
```

```
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/LF-
GlueServiceRole"
            },
            "Resource": {
                "Database": {
                    "Name": "tpc"
                }
            },
            "Permissions": [
                "CREATE_TABLE"
            ],
            "PermissionsWithGrantOption": []
        }
    ],
    "NextToken":
 "E5SlJDSTZleUp6SWpvaU9UQTNORE0zTXpFeE5Ua3pJbjE5TENKbGVIQnBjbUYwYVc5dUlqcDdJbk5sWTI5dVpITWlP
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

- For API details, see GetEffectivePermissionsForPath in *AWS CLI Command Reference*.

### `get-lf-tag`

The following code example shows how to use `get-lf-tag`.

#### AWS CLI

**To retrieve LF-tag definition**

The following `get-lf-tag` example retrieves LF-tag definition.

```
aws lakeformation get-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup'
```

Output:

```
{
    "CatalogId": "123456789111",
    "TagKey": "usergroup",
    "TagValues": [
```

```
        "analyst",
        "campaign",
        "developer"
    ]
}
```

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see GetLfTag in *AWS CLI Command Reference*.

### `get-query-state`

The following code example shows how to use `get-query-state`.

#### AWS CLI

**To retrieve state of a submitted query**

The following `get-query-state` example returns the state of a query previously submitted.

```
aws lakeformation get-query-state \
    --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{
    "State": "FINISHED"
}
```

For more information, see Transactional data operations in the *AWS Lake Formation Developer Guide*.

- For API details, see GetQueryState in *AWS CLI Command Reference*.

### `get-query-statistics`

The following code example shows how to use `get-query-statistics`.

#### AWS CLI

**To retrieve query statistics**

The following `get-query-statistics` example retrieves statistics on the planning and execution of a query.

```
aws lakeformation get-query-statistics \
    --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{
    "ExecutionStatistics": {
        "AverageExecutionTimeMillis": 0,
        "DataScannedBytes": 0,
        "WorkUnitsExecutedCount": 0
    },
    "PlanningStatistics": {
        "EstimatedDataToScanBytes": 43235,
        "PlanningTimeMillis": 2377,
        "QueueTimeMillis": 440,
        "WorkUnitsGeneratedCount": 1
    },
    "QuerySubmissionTime": "2022-08-11T02:14:38.641870+00:00"
}
```

For more information, see Transactional data operations in the *AWS Lake Formation Developer Guide*.

- For API details, see GetQueryStatistics in *AWS CLI Command Reference*.

## `get-resource-lf-tags`

The following code example shows how to use `get-resource-lf-tags`.

### AWS CLI

#### To list LF-tags

The following `list-lf-tags` example returns list of LF-tags that the requester has permission to view.

```
aws lakeformation list-lf-tags \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "ResourceShareType": "ALL",
    "MaxResults": 2
}
```

Output:

```
{
"LFTags": [{
        "CatalogId": "123456789111",
        "TagKey": "category",
        "TagValues": [
            "private",
            "public"
        ]
    },
    {
        "CatalogId": "123456789111",
        "TagKey": "group",
        "TagValues": [
            "analyst",
            "campaign",
            "developer"
        ]
    }],
    "NextToken": "kIiwiZXhwaXJhdGlvbiI6eyJzZWNvbmRzIjoxNjYwMDY4dCI6ZmFsc2V9"
}
```

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see GetResourceLfTags in *AWS CLI Command Reference*.

### `get-table-objects`

The following code example shows how to use `get-table-objects`.

#### AWS CLI

**To list objects of governed table**

The following `get-table-objects` example returns the set of Amazon S3 objects that make up the specified governed table.

```
aws lakeformation get-table-objects \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "012345678901",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_household_demographics_gov",
    "QueryAsOfTime": "2022-08-10T15:00:00"
}
```

Output:

```
{
    "Objects": [{
        "PartitionValues": [],
        "Objects": [{
            "Uri": "s3://lf-data-lake-012345678901/target/
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-
ff26b17504414fe88b302cd795eabd00.parquet",
            "ETag": "12345b1fc50a316b149b4e1f21a73800",
            "Size": 43235
        }]
    }]
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see GetTableObjects in *AWS CLI Command Reference*.

### `get-work-unit-results`

The following code example shows how to use `get-work-unit-results`.

#### AWS CLI

**To retrieve work units of given query**

The following `get-work-unit-results` example returns the work units resulting from the query.

```
aws lakeformation get-work-units \
    --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b' \
    --work-unit-id '0' \
    --work-unit-token 'B2fMSdmQXe9umX8Ux8XCo4=' outfile
```

Output:

```
outfile with Blob content.
```

For more information, see Transactional data operations in the *AWS Lake Formation Developer Guide*.

- For API details, see GetWorkUnitResults in *AWS CLI Command Reference*.

### `get-work-units`

The following code example shows how to use `get-work-units`.

#### AWS CLI

**To retrieve work units**

The following `get-work-units` example retrieves the work units generated by the StartQueryPlanning operation.

```
aws lakeformation get-work-units \
    --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{
    "WorkUnitRanges": [{
        "WorkUnitIdMax": 0,
        "WorkUnitIdMin": 0,
        "WorkUnitToken":

    }],
    "QueryId": "1234273f-4a62-4cda-8d98-69615ee8be9b"
}
```

For more information, see Transactional data operations in the *AWS Lake Formation Developer Guide*.

- For API details, see GetWorkUnits in *AWS CLI Command Reference*.

## `grant-permissions`

The following code example shows how to use `grant-permissions`.

### AWS CLI

#### Example 1: To grant permissions to the principal on resources using LF-Tags

The following `grant-permissions` example grants ALL permissions to the principal on database resource that matches the LF-Tag policy.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
    },
    "Resource": {
        "LFTagPolicy": {
            "CatalogId": "123456789111",
            "ResourceType": "DATABASE",
            "Expression": [{
```

```
                "TagKey": "usergroup",
                "TagValues": [
                    "analyst",
                    "developer"
                ]
            }]
        }
    },
    "Permissions": [
        "ALL"
    ],
    "PermissionsWithGrantOption": [
        "ALL"
    ]
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

**Example 2: To grant column level permissions to the principal**

The following `grant-permissions` example grants permission to select specific column to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "TableWithColumns": {
            "CatalogId": "123456789111",
            "ColumnNames": ["p_end_date_sk"],
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
```

```
        }
    },
    "Permissions": [
        "SELECT"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

**Example 3: To grant table permissions to the principal**

The following `grant-permissions` example grants select permission on all tables of given database to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "TableWildcard": {}
        }
    },
    "Permissions": [
        "SELECT"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

**Example 4: To grant permissions on LF-Tags to the principal**

The following `grant-permissions` example grants associate permission on LF-Tags to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "LFTag": {
            "CatalogId": "123456789111",
            "TagKey": "category",
            "TagValues": [
                "private", "public"
            ]
        }

    },
    "Permissions": [
        "ASSOCIATE"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

**Example 5: To grant permissions on data locations to the principal**

The following `grant-permissions` example grants permission on data location to the principal.

```
aws lakeformation grant-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "DataLocation": {
            "CatalogId": "123456789111",
            "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111"
        }
    },
    "Permissions": [
        "DATA_LOCATION_ACCESS"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see GrantPermissions in *AWS CLI Command Reference*.

## `list-data-cells-filter`

The following code example shows how to use `list-data-cells-filter`.

### AWS CLI

#### To list data cell filters

The following `list-data-cells-filter` example list data cell filter for given table.

```
aws lakeformation list-data-cells-filter \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "MaxResults": 2,
    "Table": {
        "CatalogId": "123456789111",
        "DatabaseName": "tpc",
        "Name": "dl_tpc_promotion"
    }
}
```

Output:

```
{
    "DataCellsFilters": [{
            "TableCatalogId": "123456789111",
            "DatabaseName": "tpc",
            "TableName": "dl_tpc_promotion",
            "Name": "developer_promotion",
            "RowFilter": {
                "FilterExpression": "p_promo_name='ese'"
            },
            "ColumnNames": [
                "p_channel_details",
                "p_start_date_sk",
                "p_purpose",
                "p_promo_id",
                "p_promo_name",
                "p_end_date_sk",
                "p_discount_active"
            ]
        },
        {
            "TableCatalogId": "123456789111",
            "DatabaseName": "tpc",
            "TableName": "dl_tpc_promotion",
            "Name": "developer_promotion_allrows",
            "RowFilter": {
                "FilterExpression": "TRUE",
                "AllRowsWildcard": {}
            },
            "ColumnNames": [
                "p_channel_details",
```

```
                "p_start_date_sk",
                "p_promo_name"
            ]
        }
    ],
    "NextToken": "2MDA2MTgwNiwibmFub3MiOjE0MDAwMDAwMH19"
}
```

For more information, see Data filtering and cell-level security in Lake Formation in the *AWS Lake Formation Developer Guide*.

- For API details, see ListDataCellsFilter in *AWS CLI Command Reference*.

## `list-permissions`

The following code example shows how to use `list-permissions`.

### AWS CLI

#### Example 1: To retrieve list of principal permissions on the resource

The following `list-permissions` example returns a list of principal permissions on the database resources.

```
aws lakeformation list-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "ResourceType": "DATABASE",
    "MaxResults": 2
}
```

Output:

```
{
    "PrincipalResourcePermissions": [{
        "Principal": {
            "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
campaign-manager"
```

```
        },
        "Resource": {
            "Database": {
                "CatalogId": "123456789111",
                "Name": "tpc"
            }
        },
        "Permissions": [
            "DESCRIBE"
        ],
        "PermissionsWithGrantOption": []
    }],
    "NextToken":
 "E5SlJDSTZleUp6SWpvaU9UQTNORE0zTXpFeE5Ua3pJbjE5TENKbGVIQnBjbUYwYVc5dUlqcDdJbk5sWTI5dVpITWlP
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

**Example 2: To retrieve list of principal permissions on the table with data filters**

The following `list-permissions` example list the permissions on the table with related data filters granted to the principal.

```
aws lakeformation list-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_customer"
        }
    },
    "IncludeRelated": "TRUE",
    "MaxResults": 10
}
```

Output:

```
{
    "PrincipalResourcePermissions": [{
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/
Admin"
            },
            "Resource": {
                "Table": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "customer",
                    "Name": "customer_invoice"
                }
            },
            "Permissions": [
                "ALL",
                "ALTER",
                "DELETE",
                "DESCRIBE",
                "DROP",
                "INSERT"
            ],
            "PermissionsWithGrantOption": [
                "ALL",
                "ALTER",
                "DELETE",
                "DESCRIBE",
                "DROP",
                "INSERT"
            ]
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/
Admin"
            },
            "Resource": {
                "TableWithColumns": {
                    "CatalogId": "123456789111",
                    "DatabaseName": "customer",
                    "Name": "customer_invoice",
                    "ColumnWildcard": {}
                }
```

```
            },
            "Permissions": [
                "SELECT"
            ],
            "PermissionsWithGrantOption": [
                "SELECT"
            ]
        },
        {
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/
Admin"
            },
            "Resource": {
                "DataCellsFilter": {
                    "TableCatalogId": "123456789111",
                    "DatabaseName": "customer",
                    "TableName": "customer_invoice",
                    "Name": "dl_us_customer"
                }
            },
            "Permissions": [
                "DESCRIBE",
                "SELECT",
                "DROP"
            ],
            "PermissionsWithGrantOption": []
        }
    ],
    "NextToken": "VyeUFjY291bnRQZXJtaXNzaW9ucyI6ZmFsc2V9"
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

**Example 3: To retrieve list of principal permissions on the LF-Tags**

The following `list-permissions` example list the permissions on the LF-Tags granted to the principal.

```
aws lakeformation list-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "LFTag": {
            "CatalogId": "123456789111",
            "TagKey": "category",
            "TagValues": [
                "private"
            ]
        }
    },
    "MaxResults": 10
}
```

Output:

```
{
    "PrincipalResourcePermissions": [{
            "Principal": {
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
            },
            "Resource": {
                "LFTag": {
                    "CatalogId": "123456789111",
                    "TagKey": "category",
                    "TagValues": [
                        "*"
                    ]
                }
            },
            "Permissions": [
                "DESCRIBE"
            ],
            "PermissionsWithGrantOption": [
                "DESCRIBE"
            ]
        },
        {
            "Principal": {
```

```
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
            },
            "Resource": {
                "LFTag": {
                    "CatalogId": "123456789111",
                    "TagKey": "category",
                    "TagValues": [
                        "*"
                    ]
                }
            },
            "Permissions": [
                "ASSOCIATE"
            ],
            "PermissionsWithGrantOption": [
                "ASSOCIATE"
            ]
        }
    ],
    "NextToken": "EJwY21GMGFXOXVJanA3SW5Ocm1pc3Npb25zIjpmYWxzZX0="
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

- For API details, see ListPermissions in *AWS CLI Command Reference*.

### `list-resources`

The following code example shows how to use `list-resources`.

#### AWS CLI

**To lists the resources managed by the Lake Formation**

The following `list-resources` example lists the resources matching the condition that is managed by the Lake Formation.

```
aws lakeformation list-resources \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "FilterConditionList": [{
        "Field": "ROLE_ARN",
        "ComparisonOperator": "CONTAINS",
        "StringValueList": [
            "123456789111"
        ]
    }],
    "MaxResults": 10
}
```

Output:

```
{
    "ResourceInfoList": [{
            "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111",
            "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole",
            "LastModified": "2022-07-21T02:12:46.669000+00:00"
        },
        {
            "ResourceArn": "arn:aws:s3:::lf-emr-test-123456789111",
            "RoleArn": "arn:aws:iam::123456789111:role/EMRLFS3Role",
            "LastModified": "2022-07-29T16:22:03.211000+00:00"
        }
    ]
}
```

For more information, see Managing Lake Formation permissions in the *AWS Lake Formation Developer Guide*.

- For API details, see ListResources in *AWS CLI Command Reference*.

## `list-transactions`

The following code example shows how to use `list-transactions`.

### AWS CLI

#### To list all transactions details

The following `list-transactions` example returns metadata about transactions and their status.

```
aws lakeformation list-transactions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "StatusFilter": "ALL",
    "MaxResults": 3
}
```

Output:

```
{
    "Transactions": [{
            "TransactionId": "1234569f08804cb790d950d4d0fe485e",
            "TransactionStatus": "committed",
            "TransactionStartTime": "2022-08-10T14:32:29.220000+00:00",
            "TransactionEndTime": "2022-08-10T14:32:33.751000+00:00"
        },
        {
            "TransactionId": "12345972ca8347b89825e33c5774aec4",
            "TransactionStatus": "committed",
            "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
            "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
        },
        {
            "TransactionId": "12345daf6cb047dbba8ad9b0414613b2",
            "TransactionStatus": "committed",
            "TransactionStartTime": "2022-08-10T13:56:51.261000+00:00",
            "TransactionEndTime": "2022-08-10T13:56:51.547000+00:00"
        }
    ],
    "NextToken": "77X1ebypsI7os+X2lhHsZLGNCDK3nNGpwRdFpicSOHgcX1/
QMoniUAKcpR3kj3ts3PVdMA=="
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see ListTransactions in *AWS CLI Command Reference*.

### `put-data-lake-settings`

The following code example shows how to use `put-data-lake-settings`.

**AWS CLI**

**To set AWS Lake Formation-managed data lake settings**

The following `put-data-lake-settings` example sets the list of data lake administrators and other data lake settings.

```
aws lakeformation put-data-lake-settings \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "DataLakeSettings": {
        "DataLakeAdmins": [{
                "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
            }
        ],
        "CreateDatabaseDefaultPermissions": [],
        "CreateTableDefaultPermissions": [],
        "TrustedResourceOwners": [],
        "AllowExternalDataFiltering": true,
        "ExternalDataFilteringAllowList": [{
            "DataLakePrincipalIdentifier ": "123456789111"
        }],
        "AuthorizedSessionTagValueList": ["Amazon EMR"]
    }
}
```

This command produces no output.

For more information, see Changing the default security settings for your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see PutDataLakeSettings in *AWS CLI Command Reference*.

## `register-resource`

The following code example shows how to use `register-resource`.

### AWS CLI

#### Example 1: To register data lake storage using Service Linked Role

The following `register-resource` example registers the resource as managed by the Lake Formation using Service linked role.

```
aws lakeformation register-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123",
    "UseServiceLinkedRole": true
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the *AWS Lake Formation Developer Guide*.

#### Example 2: To register data lake storage using custom role

The following `register-resource` example registers the resource as managed by the Lake Formation using custom role.

```
aws lakeformation register-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123",
    "UseServiceLinkedRole": false,
    "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole"
}
```

This command produces no output.

For more information, see Adding an Amazon S3 location to your data lake in the *AWS Lake Formation Developer Guide*.

- For API details, see RegisterResource in *AWS CLI Command Reference*.

### `remove-lf-tags-from-resource`

The following code example shows how to use `remove-lf-tags-from-resource`.

**AWS CLI**

**To remove LF-Tag from a resource**

The following `remove-lf-tags-from-resource` example removes the LF-Tag association with the table resource.

```
aws lakeformation remove-lf-tags-from-resource \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    },
    "LFTags": [{
        "CatalogId": "123456789111",
        "TagKey": "usergroup",
        "TagValues": [
            "developer"
        ]
    }]
}
```

Output:

```
{
    "Failures": []
}
```

For more information, see Assigning LF-Tags to Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see RemoveLfTagsFromResource in *AWS CLI Command Reference*.

### `revoke-permissions`

The following code example shows how to use `revoke-permissions`.

#### AWS CLI

**To revoke permissions on resources from the principal**

The following `revoke-permissions` example revoke principal access to specific table of a given database.

```
aws lakeformation revoke-permissions \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "123456789111",
    "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
    },
    "Resource": {
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_promotion"
        }
    },
    "Permissions": [
        "ALL"
    ],
    "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see Granting and revoking permissions on Data Catalog resources in the *AWS Lake Formation Developer Guide*.

- For API details, see RevokePermissions in *AWS CLI Command Reference*.

### `search-databases-by-lf-tags`

The following code example shows how to use `search-databases-by-lf-tags`.

#### AWS CLI

**To search on database resources by LFTags**

The following `search-databases-by-lf-tags` example search on database resources matching LFTag expression.

```
aws lakeformation search-databases-by-lf-tags \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "MaxResults": 1,
    "CatalogId": "123456789111",
    "Expression": [{
        "TagKey": "usergroup",
        "TagValues": [
            "developer"
        ]
    }]
}
```

Output:

```
{
    "DatabaseList": [{
        "Database": {
            "CatalogId": "123456789111",
            "Name": "tpc"
        },
```

```
        "LFTags": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
        }]
    }]
}
```

For more information, see Viewing the resources that a LF-Tag is assigned to in the *AWS Lake Formation Developer Guide*.

- For API details, see SearchDatabasesByLfTags in *AWS CLI Command Reference*.

### `search-tables-by-lf-tags`

The following code example shows how to use `search-tables-by-lf-tags`.

**AWS CLI**

**To search on table resources by LFTags**

The following `search-tables-by-lf-tags` example search on table resources matching LFTag expression.

```
aws lakeformation search-tables-by-lf-tags \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "MaxResults": 2,
    "CatalogId": "123456789111",
    "Expression": [{
        "TagKey": "usergroup",
        "TagValues": [
            "developer"
        ]
    }]
}
```

Output:

```
{
    "NextToken": "c2VhcmNoQWxsVGFnc0luVGFibGVzIjpmYWxzZX0=",
    "TableList": [{
        "Table": {
            "CatalogId": "123456789111",
            "DatabaseName": "tpc",
            "Name": "dl_tpc_item"
        },
        "LFTagOnDatabase": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
        }],
        "LFTagsOnTable": [{
            "CatalogId": "123456789111",
            "TagKey": "usergroup",
            "TagValues": [
                "developer"
            ]
        }],
        "LFTagsOnColumns": [{
                "Name": "i_item_desc",
                "LFTags": [{
                    "CatalogId": "123456789111",
                    "TagKey": "usergroup",
                    "TagValues": [
                        "developer"
                    ]
                }]
            },
            {
                "Name": "i_container",
                "LFTags": [{
                    "CatalogId": "123456789111",
                    "TagKey": "usergroup",
                    "TagValues": [
                        "developer"
                    ]
                }]
            },
```

```
            {
                "Name": "i_wholesale_cost",
                "LFTags": [{
                    "CatalogId": "123456789111",
                    "TagKey": "usergroup",
                    "TagValues": [
                        "developer"
                    ]
                }]
            },
            {
                "Name": "i_manufact_id",
                "LFTags": [{
                    "CatalogId": "123456789111",
                    "TagKey": "usergroup",
                    "TagValues": [
                        "developer"
                    ]
                }]
            },
            {
                "Name": "i_brand_id",
                "LFTags": [{

                    "TagValues": [
```

```
                        "developer"
                    ]
                }]
            },
            {
                "Name": "i_color",
                "LFTags": [{
                    "CatalogId": "123456789111",
                    "TagKey": "usergroup",
                    "TagValues": [
                        "developer"
                    ]
                }]
            },
            {
                "Name": "i_product_name",
                "LFTags": [{
                    "CatalogId": "123456789111",
                    "TagKey": "usergroup",
                    "TagValues": [
                        "developer"
                    ]
                }]
            }
        ]
    }]
}
```

For more information, see Viewing the resources that a LF-Tag is assigned to in the *AWS Lake Formation Developer Guide*.

- For API details, see SearchTablesByLfTags in *AWS CLI Command Reference*.

### `start-query-planning`

The following code example shows how to use `start-query-planning`.

#### AWS CLI

**To process query statement**

The following `start-query-planning` example submits a request to process a query statement.

```
aws lakeformation start-query-planning \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "QueryPlanningContext": {
        "CatalogId": "012345678901",
        "DatabaseName": "tpc"
    },
    "QueryString": "select * from dl_tpc_household_demographics_gov where
 hd_income_band_sk=9"
}
```

Output:

```
{
    "QueryId": "772a273f-4a62-4cda-8d98-69615ee8be9b"
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see StartQueryPlanning in *AWS CLI Command Reference*.

### `start-transaction`

The following code example shows how to use `start-transaction`.

#### AWS CLI

**To start new transaction**

The following `start-transaction` example starts a new transaction and returns its transaction ID.

```
aws lakeformation start-transaction \
    --transaction-type = 'READ_AND_WRITE'
```

Output:

```
{
    "TransactionId": "b014d972ca8347b89825e33c5774aec4"
}
```

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see StartTransaction in *AWS CLI Command Reference*.

### `update-lf-tag`

The following code example shows how to use `update-lf-tag`.

**AWS CLI**

**To update LF-Tag definition**

The following `update-lf-tag` example updates LF-Tag definition.

```
aws lakeformation update-lf-tag \
    --catalog-id '123456789111' \
    --tag-key 'usergroup' \
    --tag-values-to-add '["admin"]'
```

This command produces no output.

For more information, see Managing LF-Tags for metadata access control in the *AWS Lake Formation Developer Guide*.

- For API details, see UpdateLfTag in *AWS CLI Command Reference*.

### `update-table-objects`

The following code example shows how to use `update-table-objects`.

**AWS CLI**

**To modify objects of governed table**

The following `update-table-objects` example adds provided S3 objects to the specified governed table.

```
aws lakeformation update-table-objects \
    --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
    "CatalogId": "012345678901",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_household_demographics_gov",
    "TransactionId": "12347a9f75424b9b915f6ff201d2a190",
    "WriteOperations": [{
        "AddObject": {
            "Uri": "s3://lf-data-lake-012345678901/target/
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-
ff26b17504414fe88b302cd795eabd00.parquet",

        }
    }]
}
```

This command produces no output.

For more information, see Reading from and writing to the data lake within transactions in the *AWS Lake Formation Developer Guide*.

- For API details, see UpdateTableObjects in *AWS CLI Command Reference*.

## Lambda examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lambda.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

## Actions

### `add-layer-version-permission`

The following code example shows how to use `add-layer-version-permission`.

**AWS CLI**

**To add permissions to a layer version**

The following `add-layer-version-permission` example grants permission for the specified account to use version 1 of the layer `my-layer`.

```
aws lambda add-layer-version-permission \
    --layer-name my-layer \
    --statement-id xaccount \
    --action lambda:GetLayerVersion  \
    --principal 123456789012 \
    --version-number 1
```

Output:

```
{
    "RevisionId": "35d87451-f796-4a3f-a618-95a3671b0a0c",
    "Statement":
    {
        "Sid":"xaccount",
        "Effect":"Allow",
        "Principal":{
            "AWS":"arn:aws:iam::210987654321:root"
        },
        "Action":"lambda:GetLayerVersion",
        "Resource":"arn:aws:lambda:us-east-2:123456789012:layer:my-layer:1"
    }
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see AddLayerVersionPermission in *AWS CLI Command Reference*.

### `add-permission`

The following code example shows how to use `add-permission`.

**AWS CLI**

**To add permissions to an existing Lambda function**

The following `add-permission` example grants the Amazon SNS service permission to invoke a function named `my-function`.

```
aws lambda add-permission \
    --function-name my-function \
    --action lambda:InvokeFunction \
    --statement-id sns \
    --principal sns.amazonaws.com
```

Output:

```
{
    "Statement":
    {
        "Sid":"sns",
        "Effect":"Allow",
        "Principal":{
            "Service":"sns.amazonaws.com"
        },
        "Action":"lambda:InvokeFunction",
        "Resource":"arn:aws:lambda:us-east-2:123456789012:function:my-function"
    }
}
```

For more information, see Using Resource-based Policies for AWS Lambda in the *AWS Lambda Developer Guide*.

- For API details, see AddPermission in *AWS CLI Command Reference*.

### `create-alias`

The following code example shows how to use `create-alias`.

**AWS CLI**

**To create an alias for a Lambda function**

The following `create-alias` example creates an alias named `LIVE` that points to version 1 of the `my-function` Lambda function.

```
aws lambda create-alias \
    --function-name my-function \
    --description "alias for live version of function" \
    --function-version 1 \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "1",
    "Name": "LIVE",
    "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",
    "RevisionId": "873282ed-4cd3-4dc8-a069-d0c647e470c6",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

### `create-event-source-mapping`

The following code example shows how to use `create-event-source-mapping`.

**AWS CLI**

**To create a mapping between an event source and an AWS Lambda function**

The following `create-event-source-mapping` example creates a mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda create-event-source-mapping \
    --function-name my-function \
```

```
    --batch-size 5 \
    --event-source-arn arn:aws:sqs:us-west-2:123456789012:mySQSqueue
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
    "BatchSize": 5,
    "State": "Creating",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see CreateEventSourceMapping in *AWS CLI Command Reference*.

### `create-function`

The following code example shows how to use `create-function`.

#### AWS CLI

**To create a Lambda function**

The following `create-function` example creates a Lambda function named `my-function`.

```
aws lambda create-function \
    --function-name my-function \
    --runtime nodejs18.x \
    --zip-file fileb://my-function.zip \
    --handler my-function.handler \
    --role arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-tges6bf4
```

Contents of `my-function.zip`:

```
This file is a deployment package that contains your function code and any
 dependencies.
```

Output:

```
{
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "PFn4S+er27qk+UuZSTKEQfNKG/XNn7QJs90mJgq6oH8=",
    "FunctionName": "my-function",
    "CodeSize": 308,
    "RevisionId": "873282ed-4cd3-4dc8-a069-d0c647e470c6",
    "MemorySize": 128,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-
zgur6bf4",
    "Timeout": 3,
    "LastModified": "2023-10-14T22:26:11.234+0000",
    "Handler": "my-function.handler",
    "Runtime": "nodejs18.x",
    "Description": ""
}
```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see CreateFunction in *AWS CLI Command Reference*.

## `delete-alias`

The following code example shows how to use `delete-alias`.

### AWS CLI

#### To delete an alias of a Lambda function

The following `delete-alias` example deletes the alias named `LIVE` from the `my-function` Lambda function.

```
aws lambda delete-alias \
    --function-name my-function \
    --name LIVE
```

This command produces no output.

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

### `delete-event-source-mapping`

The following code example shows how to use `delete-event-source-mapping`.

**AWS CLI**

**To delete the mapping between an event source and an AWS Lambda function**

The following `delete-event-source-mapping` example deletes the mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda delete-event-source-mapping \
    --uuid  a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569285870.271,
    "BatchSize": 5,
    "State": "Deleting",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see DeleteEventSourceMapping in *AWS CLI Command Reference*.

### `delete-function-concurrency`

The following code example shows how to use `delete-function-concurrency`.

**AWS CLI**

**To remove the reserved concurrent execution limit from a function**

The following `delete-function-concurrency` example deletes the reserved concurrent execution limit from the `my-function` function.

```
aws lambda delete-function-concurrency \
    --function-name  my-function
```

This command produces no output.

For more information, see Reserving Concurrency for a Lambda Function in the *AWS Lambda Developer Guide*.

- For API details, see DeleteFunctionConcurrency in *AWS CLI Command Reference*.

## `delete-function-event-invoke-config`

The following code example shows how to use `delete-function-event-invoke-config`.

**AWS CLI**

**To delete an asynchronous invocation configuration**

The following `delete-function-event-invoke-config` example deletes the asynchronous invocation configuration for the `GREEN` alias of the specified function.

```
aws lambda delete-function-event-invoke-config --function-name my-function:GREEN
```

- For API details, see DeleteFunctionEventInvokeConfig in *AWS CLI Command Reference*.

## `delete-function`

The following code example shows how to use `delete-function`.

**AWS CLI**

**Example 1: To delete a Lambda function by function name**

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's name.

```
aws lambda delete-function \
    --function-name my-function
```

This command produces no output.

**Example 2: To delete a Lambda function by function ARN**

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's ARN.

```
aws lambda delete-function \
    --function-name arn:aws:lambda:us-west-2:123456789012:function:my-function
```

This command produces no output.

**Example 3: To delete a Lambda function by partial function ARN**

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's partial ARN.

```
aws lambda delete-function \
    --function-name 123456789012:function:my-function
```

This command produces no output.

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see DeleteFunction in *AWS CLI Command Reference*.

## `delete-layer-version`

The following code example shows how to use `delete-layer-version`.

**AWS CLI**

**To delete a version of a Lambda layer**

The following `delete-layer-version` example deletes version 2 of the layer named `my-layer`.

```
aws lambda delete-layer-version \
    --layer-name my-layer \
    --version-number 2
```

This command produces no output.

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see DeleteLayerVersion in *AWS CLI Command Reference*.

### `delete-provisioned-concurrency-config`

The following code example shows how to use `delete-provisioned-concurrency-config`.

**AWS CLI**

**To delete a provisioned concurrency configuration**

The following `delete-provisioned-concurrency-config` example deletes the provisioned concurrency configuration for the `GREEN` alias of the specified function.

```
aws lambda delete-provisioned-concurrency-config \
    --function-name my-function \
    --qualifier GREEN
```

- For API details, see DeleteProvisionedConcurrencyConfig in *AWS CLI Command Reference*.

### `get-account-settings`

The following code example shows how to use `get-account-settings`.

**AWS CLI**

**To retrieve details about your account in an AWS Region**

The following `get-account-settings` example displays the Lambda limits and usage information for your account.

```
aws lambda get-account-settings
```

Output:

```
{
    "AccountLimit": {
       "CodeSizeUnzipped": 262144000,
       "UnreservedConcurrentExecutions": 1000,
       "ConcurrentExecutions": 1000,
       "CodeSizeZipped": 52428800,
       "TotalCodeSize": 80530636800
    },
    "AccountUsage": {
       "FunctionCount": 4,
       "TotalCodeSize": 9426
    }
}
```

For more information, see AWS Lambda Limits in the *AWS Lambda Developer Guide*.

- For API details, see GetAccountSettings in *AWS CLI Command Reference*.

### `get-alias`

The following code example shows how to use `get-alias`.

#### AWS CLI

**To retrieve details about a function alias**

The following `get-alias` example displays details for the alias named `LIVE` on the `my-function` Lambda function.

```
aws lambda get-alias \
    --function-name my-function \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "3",
    "Name": "LIVE",
    "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",
    "RevisionId": "594f41fb-b85f-4c20-95c7-6ca5f2a92c93",
    "Description": "alias for live version of function"
```

```
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see GetAlias in *AWS CLI Command Reference*.

### `get-event-source-mapping`

The following code example shows how to use `get-event-source-mapping`.

**AWS CLI**

**To retrieve details about an event source mapping**

The following `get-event-source-mapping` example displays the details for the mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda get-event-source-mapping \
    --uuid "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
    "BatchSize": 5,
    "State": "Enabled",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see GetEventSourceMapping in *AWS CLI Command Reference*.

### `get-function-concurrency`

The following code example shows how to use `get-function-concurrency`.

**AWS CLI**

**To view the reserved concurrency setting for a function**

The following `get-function-concurrency` example retrieves the reserved concurrency setting for the specified function.

```
aws lambda get-function-concurrency \
    --function-name my-function
```

Output:

```
{
    "ReservedConcurrentExecutions": 250
}
```

- For API details, see GetFunctionConcurrency in *AWS CLI Command Reference*.

### `get-function-configuration`

The following code example shows how to use `get-function-configuration`.

**AWS CLI**

**To retrieve the version-specific settings of a Lambda function**

The following `get-function-configuration` example displays the settings for version 2 of the `my-function` function.

```
aws lambda get-function-configuration \
    --function-name  my-function:2
```

Output:

```
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
    "MemorySize": 256,
    "Version": "2",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
```

```
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "CodeSize": 304,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:2",
    "Handler": "index.handler"
}
```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see GetFunctionConfiguration in *AWS CLI Command Reference*.

### `get-function-event-invoke-config`

The following code example shows how to use `get-function-event-invoke-config`.

#### AWS CLI

**To view an asynchronous invocation configuration**

The following `get-function-event-invoke-config` example retrieves the asynchronous invocation configuration for the BLUE alias of the specified function.

```
aws lambda get-function-event-invoke-config \
    --function-name my-function:BLUE
```

Output:

```
{
    "LastModified": 1577824396.653,
    "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:BLUE",
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
```

```
    "DestinationConfig": {
        "OnSuccess": {},
        "OnFailure": {
            "Destination": "arn:aws:sqs:us-east-2:123456789012:failed-invocations"
        }
    }
}
```

- For API details, see GetFunctionEventInvokeConfig in *AWS CLI Command Reference*.

### `get-function`

The following code example shows how to use `get-function`.

#### AWS CLI

**To retrieve information about a function**

The following `get-function` example displays information about the `my-function` function.

```
aws lambda get-function \
    --function-name  my-function
```

Output:

```
{
    "Concurrency": {
        "ReservedConcurrentExecutions": 100
    },
    "Code": {
        "RepositoryType": "S3",
        "Location": "https://awslambda-us-west-2-tasks.s3.us-west-2.amazonaws.com/
snapshots/123456789012/my-function..."
    },
    "Configuration": {
        "TracingConfig": {
            "Mode": "PassThrough"
        },
        "Version": "$LATEST",
        "CodeSha256": "5tT2qgzYUHoqwR616pZ2dpkn/0J1FrzJmlKidWaaCgk=",
        "FunctionName": "my-function",
        "VpcConfig": {
```

```
            "SubnetIds": [],
            "VpcId": "",
            "SecurityGroupIds": []
        },
        "MemorySize": 128,
        "RevisionId": "28f0fb31-5c5c-43d3-8955-03e76c5c1075",
        "CodeSize": 304,
        "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
        "Handler": "index.handler",
        "Role": "arn:aws:iam::123456789012:role/service-role/helloWorldPython-role-
uy3l9qyq",
        "Timeout": 3,
        "LastModified": "2019-09-24T18:20:35.054+0000",
        "Runtime": "nodejs10.x",
        "Description": ""
    }
}
```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see GetFunction in *AWS CLI Command Reference*.

### `get-layer-version-by-arn`

The following code example shows how to use `get-layer-version-by-arn`.

#### AWS CLI

**To retrieve information about a Lambda layer version**

The following `get-layer-version-by-arn` example displays information about the layer version with the specified Amazon Resource Name (ARN).

```
aws lambda get-layer-version-by-arn \
    --arn "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-Python311-
SciPy1x:2"
```

Output:

```
{
    "LayerVersionArn": "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-
Python311-SciPy1x:2",
```

```
    "Description": "AWS Lambda SciPy layer for Python 3.11 (scipy-1.1.0,
 numpy-1.15.4) https://github.com/scipy/scipy/releases/tag/v1.1.0 https://
github.com/numpy/numpy/releases/tag/v1.15.4",
    "CreatedDate": "2023-10-12T10:09:38.398+0000",
    "LayerArn": "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-Python311-
SciPy1x",
    "Content": {
        "CodeSize": 41784542,
        "CodeSha256": "GGmv8ocUw4cly0T8HL0Vx/f5V4RmSCGNjDIslY4VskM=",
        "Location": "https://awslambda-us-west-2-layers.s3.us-west-2.amazonaws.com/
snapshots/123456789012/..."
    },
    "Version": 2,
    "CompatibleRuntimes": [
        "python3.11"
    ],
    "LicenseInfo": "SciPy: https://github.com/scipy/scipy/blob/main/LICENSE.txt,
 NumPy: https://github.com/numpy/numpy/blob/main/LICENSE.txt"
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see GetLayerVersionByArn in *AWS CLI Command Reference*.

### `get-layer-version-policy`

The following code example shows how to use `get-layer-version-policy`.

#### AWS CLI

**To retrieve the permissions policy for a Lambda layer version**

The following `get-layer-version-policy` example displays policy information about version 1 for the layer named `my-layer`.

```
aws lambda get-layer-version-policy \
    --layer-name my-layer \
    --version-number 1
```

Output:

```
{
```

```
    "Policy": {
        "Version":"2012-10-17",
        "Id":"default",
        "Statement":
        [
            {
                "Sid":"xaccount",
                "Effect":"Allow",
                "Principal": {"AWS":"arn:aws:iam::123456789012:root"},
                "Action":"lambda:GetLayerVersion",
                "Resource":"arn:aws:lambda:us-west-2:123456789012:layer:my-layer:1"
            }
        ]
    },
    "RevisionId": "c68f21d2-cbf0-4026-90f6-1375ee465cd0"
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see GetLayerVersionPolicy in *AWS CLI Command Reference*.

### `get-layer-version`

The following code example shows how to use `get-layer-version`.

#### AWS CLI

**To retrieve information about a Lambda layer version**

The following `get-layer-version` example displays information for version 1 of the layer named `my-layer`.

```
aws lambda get-layer-version \
    --layer-name my-layer \
    --version-number 1
```

Output:

```
{
    "Content": {

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see GetLayerVersion in *AWS CLI Command Reference*.

### `get-policy`

The following code example shows how to use `get-policy`.

#### AWS CLI

**To retrieve the resource-based IAM policy for a function, version, or alias**

The following `get-policy` example displays policy information about the `my-function` Lambda function.

```
aws lambda get-policy \
    --function-name my-function
```

Output:

```
{
    "Policy": {
        "Version":"2012-10-17",
        "Id":"default",
        "Statement":
        [
            {
                "Sid":"iot-events",
```

```
                "Effect":"Allow",
                "Principal": {"Service":"iotevents.amazonaws.com"},
                "Action":"lambda:InvokeFunction",
                "Resource":"arn:aws:lambda:us-west-2:123456789012:function:my-
function"
            }
        ]
    },
    "RevisionId": "93017fc9-59cb-41dc-901b-4845ce4bf668"
}
```

For more information, see Using Resource-based Policies for AWS Lambda in the *AWS Lambda Developer Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

### `get-provisioned-concurrency-config`

The following code example shows how to use `get-provisioned-concurrency-config`.

**AWS CLI**

**To view a provisioned concurrency configuration**

The following `get-provisioned-concurrency-config` example displays details for the provisioned concurrency configuration for the BLUE alias of the specified function.

```
aws lambda get-provisioned-concurrency-config \
    --function-name my-function \
    --qualifier BLUE
```

Output:

```
{
    "RequestedProvisionedConcurrentExecutions": 100,
    "AvailableProvisionedConcurrentExecutions": 100,
    "AllocatedProvisionedConcurrentExecutions": 100,
    "Status": "READY",
    "LastModified": "2019-12-31T20:28:49+0000"
}
```

- For API details, see GetProvisionedConcurrencyConfig in *AWS CLI Command Reference*.

### `invoke`

The following code example shows how to use `invoke`.

#### AWS CLI

##### Example 1: To invoke a Lambda function synchronously

The following `invoke` example invokes the `my-function` function synchronously. The `cli-binary-format` option is required if you're using AWS CLI version 2. For more information, see AWS CLI supported global command line options in the *AWS Command Line Interface User Guide*.

```
aws lambda invoke \
    --function-name my-function \
    --cli-binary-format raw-in-base64-out \
    --payload '{ "name": "Bob" }' \
    response.json
```

Output:

```
{
    "ExecutedVersion": "$LATEST",
    "StatusCode": 200
}
```

For more information, see Synchronous Invocation in the *AWS Lambda Developer Guide*.

##### Example 2: To invoke a Lambda function asynchronously

The following `invoke` example invokes the `my-function` function asynchronously. The `cli-binary-format` option is required if you're using AWS CLI version 2. For more information, see AWS CLI supported global command line options in the *AWS Command Line Interface User Guide*.

```
aws lambda invoke \
    --function-name my-function \
    --invocation-type Event \
    --cli-binary-format raw-in-base64-out \
    --payload '{ "name": "Bob" }' \
    response.json
```

Output:

```
{
    "StatusCode": 202
}
```

For more information, see Asynchronous Invocation in the *AWS Lambda Developer Guide*.

- For API details, see Invoke in *AWS CLI Command Reference*.

## `list-aliases`

The following code example shows how to use `list-aliases`.

### AWS CLI

#### To retrieve the list of aliases for a Lambda function

The following `list-aliases` example displays a list of the aliases for the `my-function` Lambda function.

```
aws lambda list-aliases \
    --function-name my-function
```

Output:

```
{
    "Aliases": [
        {
            "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:BETA",
            "RevisionId": "a410117f-ab16-494e-8035-7e204bb7933b",
            "FunctionVersion": "2",
            "Name": "BETA",
            "Description": "alias for beta version of function"
        },
        {
            "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:LIVE",
            "RevisionId": "21d40116-f8b1-40ba-9360-3ea284da1bb5",
            "FunctionVersion": "1",
            "Name": "LIVE",
            "Description": "alias for live version of function"
```

```
        }
    ]
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see ListAliases in *AWS CLI Command Reference*.

### `list-event-source-mappings`

The following code example shows how to use `list-event-source-mappings`.

#### AWS CLI

**To list the event source mappings for a function**

The following `list-event-source-mappings` example displays a list of the event source mappings for the `my-function` Lambda function.

```
aws lambda list-event-source-mappings \
    --function-name my-function
```

Output:

```
{
    "EventSourceMappings": [
        {
            "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
            "StateTransitionReason": "USER_INITIATED",
            "LastModified": 1569284520.333,
            "BatchSize": 5,
            "State": "Enabled",
            "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function",
            "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
        }
    ]
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see ListEventSourceMappings in *AWS CLI Command Reference*.

### `list-function-event-invoke-configs`

The following code example shows how to use `list-function-event-invoke-configs`.

#### AWS CLI

**To view a list of asynchronous invocation configurations**

The following `list-function-event-invoke-configs` example lists the asynchronous invocation configurations for the specified function.

```
aws lambda list-function-event-invoke-configs \
    --function-name my-function
```

Output:

```
{
    "FunctionEventInvokeConfigs": [
        {
            "LastModified": 1577824406.719,
            "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:GREEN",
            "MaximumRetryAttempts": 2,
            "MaximumEventAgeInSeconds": 1800
        },
        {
            "LastModified": 1577824396.653,
            "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:BLUE",
            "MaximumRetryAttempts": 0,
            "MaximumEventAgeInSeconds": 3600
        }
    ]
}
```

- For API details, see ListFunctionEventInvokeConfigs in *AWS CLI Command Reference*.

### `list-functions`

The following code example shows how to use `list-functions`.

## AWS CLI

### To retrieve a list of Lambda functions

The following `list-functions` example displays a list of all of the functions for the current user.

```
aws lambda list-functions
```

Output:

```
{
    "Functions": [
        {
            "TracingConfig": {
                "Mode": "PassThrough"
            },
            "Version": "$LATEST",
            "CodeSha256": "dBG9m8SGdmlEjw/JYXlhhvCrAv5TxvXsbL/RMr0fT/I=",

```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see ListFunctions in *AWS CLI Command Reference*.

### `list-layer-versions`

The following code example shows how to use `list-layer-versions`.

#### AWS CLI

**To list the versions of an AWS Lambda layer**

The following `list-layers-versions` example displays information about the versions for the layer named `my-layer`.

```
aws lambda list-layer-versions \
    --layer-name my-layer
```

Output:

```
{
    "Layers": [
        {
            "LayerVersionArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-
layer:2",
            "Version": 2,
            "Description": "My layer",
            "CreatedDate": "2023-11-15T00:37:46.592+0000",
            "CompatibleRuntimes": [
                "python3.10",
```

```
                "python3.11"
            ]
        }
    ]
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see ListLayerVersions in *AWS CLI Command Reference*.

### `list-layers`

The following code example shows how to use `list-layers`.

#### AWS CLI

**To list the layers that are compatible with your function's runtime**

The following `list-layers` example displays information about layers that are compatible with the Python 3.11 runtime.

```
aws lambda list-layers \
    --compatible-runtime python3.11
```

Output:

```
{
    "Layers": [
        {
            "LayerName": "my-layer",
            "LayerArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-layer",
            "LatestMatchingVersion": {
                "LayerVersionArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-
layer:2",
                "Version": 2,
                "Description": "My layer",
                "CreatedDate": "2023-11-15T00:37:46.592+0000",
                "CompatibleRuntimes": [
                    "python3.10",
                    "python3.11"
                ]
            }
        }
```

```
    ]
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see ListLayers in *AWS CLI Command Reference*.

### `list-provisioned-concurrency-configs`

The following code example shows how to use `list-provisioned-concurrency-configs`.

#### AWS CLI

**To get a list of provisioned concurrency configurations**

The following `list-provisioned-concurrency-configs` example lists the provisioned concurrency configurations for the specified function.

```
aws lambda list-provisioned-concurrency-configs \
    --function-name my-function
```

Output:

```
{
    "ProvisionedConcurrencyConfigs": [
        {
            "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:GREEN",
            "RequestedProvisionedConcurrentExecutions": 100,
            "AvailableProvisionedConcurrentExecutions": 100,
            "AllocatedProvisionedConcurrentExecutions": 100,
            "Status": "READY",
            "LastModified": "2019-12-31T20:29:00+0000"
        },
        {
            "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:BLUE",
            "RequestedProvisionedConcurrentExecutions": 100,
            "AvailableProvisionedConcurrentExecutions": 100,
            "AllocatedProvisionedConcurrentExecutions": 100,
            "Status": "READY",
            "LastModified": "2019-12-31T20:28:49+0000"
        }
```

```
    ]
}
```

- For API details, see ListProvisionedConcurrencyConfigs in *AWS CLI Command Reference*.

### `list-tags`

The following code example shows how to use `list-tags`.

**AWS CLI**

**To retrieve the list of tags for a Lambda function**

The following `list-tags` example displays the tags attached to the `my-function` Lambda function.

```
aws lambda list-tags \
    --resource arn:aws:lambda:us-west-2:123456789012:function:my-function
```

Output:

```
{
    "Tags": {
        "Category": "Web Tools",
        "Department": "Sales"
    }
}
```

For more information, see Tagging Lambda Functions in the *AWS Lambda Developer Guide*.

- For API details, see ListTags in *AWS CLI Command Reference*.

### `list-versions-by-function`

The following code example shows how to use `list-versions-by-function`.

**AWS CLI**

**To retrieve a list of versions of a function**

The following `list-versions-by-function` example displays the list of versions for the `my-function` Lambda function.

```
aws lambda list-versions-by-function \
    --function-name my-function
```

Output:

```
{
    "Versions": [
        {
            "TracingConfig": {
                "Mode": "PassThrough"
            },
            "Version": "$LATEST",
            "CodeSha256": "sU0cJ2/hOZevwV/lTxCuQqK3gDZP3i8gUoqUUVRmY6E=",
            "FunctionName": "my-function",
            "VpcConfig": {
                "SubnetIds": [],
                "VpcId": "",
                "SecurityGroupIds": []
            },
            "MemorySize": 256,
            "RevisionId": "93017fc9-59cb-41dc-901b-4845ce4bf668",
            "CodeSize": 266,
            "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:$LATEST",
            "Handler": "index.handler",
            "Role": "arn:aws:iam::123456789012:role/service-role/helloWorldPython-
role-uy3l9qyq",

- For API details, see ListVersionsByFunction in *AWS CLI Command Reference*.

### `publish-layer-version`

The following code example shows how to use `publish-layer-version`.

**AWS CLI**

**To create a Lambda layer version**

The following `publish-layer-version` example creates a new Python library layer version. The command retrieves the layer content a file named `layer.zip` in the specified S3 bucket.

```
aws lambda publish-layer-version \
    --layer-name my-layer \
    --description "My Python layer" \
    --license-info "MIT" \
    --content S3Bucket=lambda-layers-us-west-2-123456789012,S3Key=layer.zip \
    --compatible-runtimes python3.10 python3.11
```

Output:

```
{
    "Content": {
        "Location": "https://awslambda-us-west-2-layers.s3.us-west-2.amazonaws.com/
snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?
versionId=27iWyA73cCAYqyH...",
        "CodeSha256": "tv9jJO+rPbXUUXuRKi7CwHzKtLDkDRJLB3cC3Z/ouXo=",
        "CodeSize": 169
    },
    "LayerArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-layer",
    "LayerVersionArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-layer:1",
    "Description": "My Python layer",
    "CreatedDate": "2023-11-14T23:03:52.894+0000",
    "Version": 1,
    "LicenseInfo": "MIT",
    "CompatibleRuntimes": [
        "python3.10",
        "python3.11"
```

```
    ]
}
```

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see PublishLayerVersion in *AWS CLI Command Reference*.

### `publish-version`

The following code example shows how to use `publish-version`.

#### AWS CLI

**To publish a new version of a function**

The following `publish-version` example publishes a new version of the `my-function` Lambda function.

```
aws lambda publish-version \
    --function-name my-function
```

Output:

```
{
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "dBG9m8SGdmlEjw/JYXlhhvCrAv5TxvXsbL/RMr0fT/I=",
    "FunctionName": "my-function",
    "CodeSize": 294,
    "RevisionId": "f31d3d39-cc63-4520-97d4-43cd44c94c20",
    "MemorySize": 128,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:3",
    "Version": "2",
    "Role": "arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-
zgur6bf4",
    "Timeout": 3,
    "LastModified": "2019-09-23T18:32:33.857+0000",
    "Handler": "my-function.handler",
    "Runtime": "nodejs10.x",
    "Description": ""
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see PublishVersion in *AWS CLI Command Reference*.

### `put-function-concurrency`

The following code example shows how to use `put-function-concurrency`.

**AWS CLI**

**To configure a reserved concurrency limit for a function**

The following `put-function-concurrency` example configures 100 reserved concurrent executions for the `my-function` function.

```
aws lambda put-function-concurrency \
    --function-name  my-function  \
    --reserved-concurrent-executions 100
```

Output:

```
{
    "ReservedConcurrentExecutions": 100
}
```

For more information, see Reserving Concurrency for a Lambda Function in the *AWS Lambda Developer Guide*.

- For API details, see PutFunctionConcurrency in *AWS CLI Command Reference*.

### `put-function-event-invoke-config`

The following code example shows how to use `put-function-event-invoke-config`.

**AWS CLI**

**To configure error handling for asynchronous invocation**

The following `put-function-event-invoke-config` example sets a maximum event age of one hour and disables retries for the specified function.

```
aws lambda put-function-event-invoke-config \
    --function-name my-function \
    --maximum-event-age-in-seconds 3600 \
    --maximum-retry-attempts 0
```

Output:

```
{
    "LastModified": 1573686021.479,
    "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-function:
$LATEST",
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
    "DestinationConfig": {
        "OnSuccess": {},
        "OnFailure": {}
    }
}
```

- For API details, see PutFunctionEventInvokeConfig in *AWS CLI Command Reference*.

### `put-provisioned-concurrency-config`

The following code example shows how to use `put-provisioned-concurrency-config`.

#### AWS CLI

**To allocate provisioned concurrency**

The following `put-provisioned-concurrency-config` example allocates 100 provisioned concurrency for the BLUE alias of the specified function.

```
aws lambda put-provisioned-concurrency-config \
    --function-name my-function \
    --qualifier BLUE \
    --provisioned-concurrent-executions 100
```

Output:

```
{
    "Requested ProvisionedConcurrentExecutions": 100,
```

```
    "Allocated ProvisionedConcurrentExecutions": 0,
    "Status": "IN_PROGRESS",
    "LastModified": "2019-11-21T19:32:12+0000"
}
```

- For API details, see PutProvisionedConcurrencyConfig in *AWS CLI Command Reference*.

### `remove-layer-version-permission`

The following code example shows how to use `remove-layer-version-permission`.

**AWS CLI**

**To delete layer-version permissions**

The following `remove-layer-version-permission` example deletes permission for an account to configure a layer version.

```
aws lambda remove-layer-version-permission \
    --layer-name my-layer \
    --statement-id xaccount \
    --version-number 1
```

This command produces no output.

For more information, see AWS Lambda Layers in the *AWS Lambda Developer Guide*.

- For API details, see RemoveLayerVersionPermission in *AWS CLI Command Reference*.

### `remove-permission`

The following code example shows how to use `remove-permission`.

**AWS CLI**

**To remove permissions from an existing Lambda function**

The following `remove-permission` example removes permission to invoke a function named `my-function`.

```
aws lambda remove-permission \
    --function-name my-function \
```

```
    --statement-id sns
```

This command produces no output.

For more information, see Using Resource-based Policies for AWS Lambda in the *AWS Lambda Developer Guide*.

- For API details, see RemovePermission in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To add tags to an existing Lambda function**

The following `tag-resource` example adds a tag with the key name `DEPARTMENT` and a value of `Department A` to the specified Lambda function.

```
aws lambda tag-resource \
    --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \
    --tags "DEPARTMENT=Department A"
```

This command produces no output.

For more information, see Tagging Lambda Functions in the *AWS Lambda Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To remove tags from an existing Lambda function**

The following `untag-resource` example removes the tag with the key name `DEPARTMENT` tag from the `my-function` Lambda function.

```
aws lambda untag-resource \
    --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \
```

```
    --tag-keys DEPARTMENT
```

This command produces no output.

For more information, see Tagging Lambda Functions in the *AWS Lambda Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-alias`

The following code example shows how to use `update-alias`.

#### AWS CLI

**To update a function alias**

The following `update-alias` example updates the alias named `LIVE` to point to version 3 of the `my-function` Lambda function.

```
aws lambda update-alias \
    --function-name my-function \
    --function-version 3 \
    --name LIVE
```

Output:

```
{
    "FunctionVersion": "3",
    "Name": "LIVE",
    "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",
    "RevisionId": "594f41fb-b85f-4c20-95c7-6ca5f2a92c93",
    "Description": "alias for live version of function"
}
```

For more information, see Configuring AWS Lambda Function Aliases in the *AWS Lambda Developer Guide*.

- For API details, see UpdateAlias in *AWS CLI Command Reference*.

### `update-event-source-mapping`

The following code example shows how to use `update-event-source-mapping`.

**AWS CLI**

**To update the mapping between an event source and an AWS Lambda function**

The following `update-event-source-mapping` example updates the batch size to 8 in the specified mapping.

```
aws lambda update-event-source-mapping \
    --uuid  "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \
    --batch-size 8
```

Output:

```
{
    "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "StateTransitionReason": "USER_INITIATED",
    "LastModified": 1569284520.333,
    "BatchSize": 8,
    "State": "Updating",
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
}
```

For more information, see AWS Lambda Event Source Mapping in the *AWS Lambda Developer Guide*.

- For API details, see UpdateEventSourceMapping in *AWS CLI Command Reference*.

### `update-function-code`

The following code example shows how to use `update-function-code`.

**AWS CLI**

**To update the code of a Lambda function**

The following `update-function-code` example replaces the code of the unpublished ($LATEST) version of the `my-function` function with the contents of the specified zip file.

```
aws lambda update-function-code \
    --function-name  my-function \
```

```
    --zip-file fileb://my-function.zip
```

Output:

```
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
    "MemorySize": 256,
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "CodeSize": 304,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "Handler": "index.handler"
}
```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see UpdateFunctionCode in *AWS CLI Command Reference*.

### `update-function-configuration`

The following code example shows how to use `update-function-configuration`.

#### AWS CLI

**To modify the configuration of a function**

The following `update-function-configuration` example modifies the memory size to be 256 MB for the unpublished ($LATEST) version of the `my-function` function.

```
aws lambda update-function-configuration \
    --function-name  my-function \
    --memory-size 256
```

Output:

```
{
    "FunctionName": "my-function",
    "LastModified": "2019-09-26T20:28:40.438+0000",
    "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
    "MemorySize": 256,
    "Version": "$LATEST",
    "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qyq",
    "Timeout": 3,
    "Runtime": "nodejs10.x",
    "TracingConfig": {
        "Mode": "PassThrough"
    },
    "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
    "Description": "",
    "VpcConfig": {
        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "CodeSize": 304,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "Handler": "index.handler"
}
```

For more information, see AWS Lambda Function Configuration in the *AWS Lambda Developer Guide*.

- For API details, see UpdateFunctionConfiguration in *AWS CLI Command Reference*.

## `update-function-event-invoke-config`

The following code example shows how to use `update-function-event-invoke-config`.

### AWS CLI

#### To update an asynchronous invocation configuration

The following `update-function-event-invoke-config` example adds an on-failure destination to the existing asynchronous invocation configuration for the specified function.

```
aws lambda update-function-event-invoke-config \
    --function-name my-function \
    --destination-config '{"OnFailure":{"Destination": "arn:aws:sqs:us-
east-2:123456789012:destination"}}'
```

Output:

```
{
    "LastModified": 1573687896.493,
    "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-function:
$LATEST",
    "MaximumRetryAttempts": 0,
    "MaximumEventAgeInSeconds": 3600,
    "DestinationConfig": {
        "OnSuccess": {},
        "OnFailure": {
            "Destination": "arn:aws:sqs:us-east-2:123456789012:destination"
        }
    }
}
```

- For API details, see UpdateFunctionEventInvokeConfig in *AWS CLI Command Reference*.

## License Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with License Manager.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `create-license-configuration`

The following code example shows how to use `create-license-configuration`.

**AWS CLI**

**Example 1: To create a license configuration**

The following `create-license-configuration` example creates a license configuration with a hard limit of 10 cores.

```
aws license-manager create-license-configuration --name my-license-configuration \
    --license-counting-type Core \
    --license-count 10 \
    --license-count-hard-limit
```

Output:

```
{
  "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE1111"
}
```

**Example 2: To create a license configuration**

The following `create-license-configuration` example creates a license configuration with a soft limit of 100 vCPUs. It uses a rule to enable vCPU optimization.

```
aws license-manager create-license-configuration --name my-license-configuration
    --license-counting-type vCPU \
    --license-count 100 \
    --license-rules "#honorVcpuOptimization=true"
```

Output:

```
{
  "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE2222"
}
```

- For API details, see CreateLicenseConfiguration in *AWS CLI Command Reference*.

### `delete-license-configuration`

The following code example shows how to use `delete-license-configuration`.

**AWS CLI**

**To delete a license configuration**

The following `delete-license-configuration` example deletes the specified license configuration.

```
aws license-manager delete-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see DeleteLicenseConfiguration in *AWS CLI Command Reference*.

### `get-license-configuration`

The following code example shows how to use `get-license-configuration`.

**AWS CLI**

**To get license configuration information**

The following `get-license-configuration` example displays details for the specified license configuration.

```
aws license-manager get-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
    "LicenseConfigurationId": "lic-38b658717b87478aaa7c00883EXAMPLE",
    "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE",
    "Name": "my-license-configuration",
    "LicenseCountingType": "vCPU",
    "LicenseRules": [],
    "LicenseCountHardLimit": false,
    "ConsumedLicenses": 0,
    "Status": "AVAILABLE",
    "OwnerAccountId": "123456789012",
    "ConsumedLicenseSummaryList": [
        {
            "ResourceType": "EC2_INSTANCE",
            "ConsumedLicenses": 0
        },
        {
            "ResourceType": "EC2_HOST",
            "ConsumedLicenses": 0
        },
        {
            "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
            "ConsumedLicenses": 0
        }
    ],
    "ManagedResourceSummaryList": [
        {
            "ResourceType": "EC2_INSTANCE",
            "AssociationCount": 0
        },
        {
            "ResourceType": "EC2_HOST",
            "AssociationCount": 0
        },
        {
            "ResourceType": "EC2_AMI",
            "AssociationCount": 2
        },
        {
            "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
            "AssociationCount": 0
        }
```

```
    ]
}
```

- For API details, see GetLicenseConfiguration in *AWS CLI Command Reference*.

### `get-service-settings`

The following code example shows how to use `get-service-settings`.

**AWS CLI**

**To get the License Manager settings**

The following `get-service-settings` example displays the service settings for License Manager in the current Region.

```
aws license-manager get-service-settings
```

The following shows example output if cross-account resource discovery is disabled.

```
{
    "OrganizationConfiguration": {
        "EnableIntegration": false
    },
    "EnableCrossAccountsDiscovery": false
}
```

The following shows example output if cross-account resource discovery is enabled.

```
{
    "S3BucketArn": "arn:aws:s3:::aws-license-manager-service-c22d6279-35c4-47c4-bb",
    "OrganizationConfiguration": {
        "EnableIntegration": true
    },
    "EnableCrossAccountsDiscovery": true
}
```

- For API details, see GetServiceSettings in *AWS CLI Command Reference*.

### `list-associations-for-license-configuration`

The following code example shows how to use `list-associations-for-license-configuration`.

**AWS CLI**

**To get associations for a license configuration**

The following `list-associations-for-license-configuration` example displays detailed information for the associations of the specified license configuration.

```
aws license-manager list-associations-for-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
    "LicenseConfigurationAssociations": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0",
            "ResourceType": "EC2_AMI",
            "ResourceOwnerId": "123456789012",
            "AssociationTime": 1568825118.617
        },
        {
            "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-0abcdef1234567890",
            "ResourceType": "EC2_AMI",
            "ResourceOwnerId": "123456789012",
            "AssociationTime": 1568825118.946
        }
    ]
}
```

- For API details, see ListAssociationsForLicenseConfiguration in *AWS CLI Command Reference*.

### `list-license-configurations`

The following code example shows how to use `list-license-configurations`.

## AWS CLI

### Example 1: To list all of your license configurations

The following `list-license-configurations` example lists all your license configurations.

```
aws license-manager list-license-configurations
```

Output:

```
{
    "LicenseConfigurations": [
        {
            "LicenseConfigurationId": "lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
            "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
            "Name": "my-license-configuration",
            "LicenseCountingType": "Core",
            "LicenseRules": [],
            "LicenseCount": 10,
            "LicenseCountHardLimit": true,
            "ConsumedLicenses": 0,
            "Status": "AVAILABLE",
            "OwnerAccountId": "123456789012",
            "ConsumedLicenseSummaryList": [
                {
                    "ResourceType": "EC2_INSTANCE",
                    "ConsumedLicenses": 0
                },
                {
                    "ResourceType": "EC2_HOST",
                    "ConsumedLicenses": 0
                },
                {
                    "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
                    "ConsumedLicenses": 0
                }
            ],
            "ManagedResourceSummaryList": [
                {
                    "ResourceType": "EC2_INSTANCE",
                    "AssociationCount": 0
                },
```

```
                {
                    "ResourceType": "EC2_HOST",
                    "AssociationCount": 0
                },
                {
                    "ResourceType": "EC2_AMI",
                    "AssociationCount": 0
                },
                {
                    "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
                    "AssociationCount": 0
                }
            ]
        },
        {
            ...
        }
    ]
}
```

**Example 2: To list a specific license configuration**

The following `list-license-configurations` example lists only the specified license configuration.

```
aws license-manager list-license-configurations \
    --license-configuration-arns arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

- For API details, see ListLicenseConfigurations in *AWS CLI Command Reference*.

## `list-license-specifications-for-resource`

The following code example shows how to use `list-license-specifications-for-resource`.

### AWS CLI

**To list the license configurations for a resource**

The following `list-license-specifications-for-resource` example lists the license configurations associated with the specified Amazon Machine Image (AMI).

```
aws license-manager list-license-specifications-for-resource \
    --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0
```

Output:

```
{
    "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE"
}
```

- For API details, see ListLicenseSpecificationsForResource in *AWS CLI Command Reference*.

### `list-resource-inventory`

The following code example shows how to use `list-resource-inventory`.

#### AWS CLI

**To list resources in the resource inventory**

The following `list-resource-inventory` example lists the resources managed using Systems Manager inventory.

```
aws license-manager list-resource-inventory
```

Output:

```
{
    "ResourceInventoryList": [
        {
            "Platform": "Red Hat Enterprise Linux Server",
            "ResourceType": "EC2Instance",
            "PlatformVersion": "7.4",
            "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-05d3cdfb05bd36376",
            "ResourceId": "i-05d3cdfb05bd36376",
            "ResourceOwningAccountId": "1234567890129"
        },
        {
            "Platform": "Amazon Linux",
```

```
            "ResourceType": "EC2Instance",
            "PlatformVersion": "2",
            "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-0b1d036cfd4594808",
            "ResourceId": "i-0b1d036cfd4594808",
            "ResourceOwningAccountId": "1234567890129"
        },
        {
            "Platform": "Microsoft Windows Server 2019 Datacenter",
            "ResourceType": "EC2Instance",
            "PlatformVersion": "10.0.17763",
            "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-0cdb3b54a2a8246ad",
            "ResourceId": "i-0cdb3b54a2a8246ad",
            "ResourceOwningAccountId": "1234567890129"
        }
    ]
}
```

- For API details, see ListResourceInventory in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list the tags for a license configuration**

The following `list-tags-for-resource` example lists the tags for the specified license configuration.

```
aws license-manager list-tags-for-resource \
    --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

Output:

```
{
    "Tags": [
        {
```

```
            "Key": "project",
            "Value": "lima"
        }
    ]
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `list-usage-for-license-configuration`

The following code example shows how to use `list-usage-for-license-configuration`.

**AWS CLI**

**To list the licenses in use for a license configuration**

The following `list-usage-for-license-configuration` example lists information about the resources using licenses for the specified license configuration. For example, if the license type is vCPU, any instances consume one license per vCPU.

```
aws license-manager list-usage-for-license-configuration \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
    "LicenseConfigurationUsageList": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-04a636d18e83cfacb",
            "ResourceType": "EC2_INSTANCE",
            "ResourceStatus": "running",
            "ResourceOwnerId": "123456789012",
            "AssociationTime": 1570892850.519,
            "ConsumedLicenses": 2
        }
    ]
}
```

- For API details, see ListUsageForLicenseConfiguration in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag a license configuration**

The following `tag-resource` example adds the specified tag (key name and value) to the specified license configuration.

```
aws license-manager tag-resource \
    --tags Key=project,Value=lima \
    --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a license configuration**

The following `untag-resource` example removes the specified tag (key name and resource) from the specified license configuration.

```
aws license-manager untag-resource \
    --tag-keys project \
    --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-license-configuration`

The following code example shows how to use `update-license-configuration`.

**AWS CLI**

**To update a license configuration**

The following `update-license-configuration` example updates the specified license configuration to remove the hard limit.

```
aws license-manager update-license-configuration \
    --no-license-count-hard-limit \
    --license-configuration-arn arn:aws:license-manager:us-
west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

The following `update-license-configuration` example updates the specified license configuration to change its status to `DISABLED`.

```
aws license-manager update-license-configuration \
    --license-configuration-status DISABLED
    --license-configuration-arn arn:aws:license-manager:us-
west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see UpdateLicenseConfiguration in *AWS CLI Command Reference*.

## `update-license-specifications-for-resource`

The following code example shows how to use `update-license-specifications-for-resource`.

**AWS CLI**

**To update the license configurations for a resource**

The following `update-license-specifications-for-resource` example replaces the license configuration associated with the specified Amazon Machine Image (AMI) by removing one license configuration and adding another.

```
aws license-manager update-license-specifications-for-resource \
    --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0 \
```

```
    --remove-license-specifications LicenseConfigurationArn=arn:aws:license-
manager:us-west-2:123456789012:license-
configuration:lic-38b658717b87478aaa7c00883EXAMPLE \
    --add-license-specifications LicenseConfigurationArn=arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-42b6deb06e5399a980d555927EXAMPLE
```

This command produces no output.

- For API details, see UpdateLicenseSpecificationsForResource in *AWS CLI Command Reference*.

### `update-service-settings`

The following code example shows how to use `update-service-settings`.

#### AWS CLI

**To update the License Manager settings**

The following `update-service-settings` example enables cross-account resource discovery for License Manager in the current AWS Region. The Amazon S3 bucket is the Resource Data Sync required for Systems Manager inventory.

```
aws license-manager update-service-settings \
    --organization-configuration EnableIntegration=true \
    --enable-cross-accounts-discovery \
    --s3-bucket-arn arn:aws:s3:::aws-license-manager-service-abcd1234EXAMPLE
```

This command produces no output.

- For API details, see UpdateServiceSettings in *AWS CLI Command Reference*.

## Lightsail examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lightsail.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

## Actions

### `allocate-static-ip`

The following code example shows how to use `allocate-static-ip`.

**AWS CLI**

**To create a static IP**

The following `allocate-static-ip` example creates the specified static IP, which can be attached to an instance.

```
aws lightsail allocate-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
    "operations": [
        {
            "id": "b5d06d13-2f19-4683-889f-dEXAMPLEed79",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571071325.076,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "AllocateStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571071325.274
        }
    ]
}
```

- For API details, see AllocateStaticIp in *AWS CLI Command Reference*.

### `attach-disk`

The following code example shows how to use `attach-disk`.

**AWS CLI**

**To attach a block storage disk to an instance**

The following `attach-disk` example attaches disk `Disk-1` to instance `WordPress_Multisite-1` with the disk path of `/dev/xvdf`

```
aws lightsail attach-disk \
    --disk-name Disk-1 \
    --disk-path /dev/xvdf \
    --instance-name WordPress_Multisite-1
```

Output:

```
{
    "operations": [
        {
            "id": "10a08267-19ce-43be-b913-6EXAMPLE7e80",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1571071465.472,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "WordPress_Multisite-1",
            "operationType": "AttachDisk",
            "status": "Started",
            "statusChangedAt": 1571071465.472
        },
        {
            "id": "2912c477-5295-4539-88c9-bEXAMPLEd1f0",
            "resourceName": "WordPress_Multisite-1",
            "resourceType": "Instance",
            "createdAt": 1571071465.474,
            "location": {
```

```
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "Disk-1",
            "operationType": "AttachDisk",
            "status": "Started",
            "statusChangedAt": 1571071465.474
        }
    ]
}
```

- For API details, see AttachDisk in *AWS CLI Command Reference*.

### `attach-instances-to-load-balancer`

The following code example shows how to use `attach-instances-to-load-balancer`.

#### AWS CLI

**To attach instances to a load balancer**

The following `attach-instances-to-load-balancer` example attaches instances `MEAN-1`, `MEAN-2`, and `MEAN-3` to the load balancer `LoadBalancer-1`.

```
aws lightsail attach-instances-to-load-balancer \
    --instance-names {"MEAN-1","MEAN-2","MEAN-3"} \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "8055d19d-abb2-40b9-b527-1EXAMPLE3c7b",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1571071699.892,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
```

```
            "isTerminal": false,
            "operationDetails": "MEAN-2",
            "operationType": "AttachInstancesToLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1571071699.892
        },
        {
            "id": "c35048eb-8538-456a-a118-0EXAMPLEfb73",
            "resourceName": "MEAN-2",
            "resourceType": "Instance",
            "createdAt": 1571071699.887,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "LoadBalancer-1",
            "operationType": "AttachInstancesToLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1571071699.887
        },
        {
            "id": "910d09e0-adc5-4372-bc2e-0EXAMPLEd891",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1571071699.882,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"

        },
        {
            "id": "fb62536d-2a98-4190-a6fc-4EXAMPLE7470",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1571071699.885,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "MEAN-1",
            "operationType": "AttachInstancesToLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1571071699.885
        },
        {
            "id": "787dac0d-f98d-46c3-8571-3EXAMPLE5a85",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571071699.901,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "LoadBalancer-1",
            "operationType": "AttachInstancesToLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1571071699.901
        }
    ]
}
```

- For API details, see AttachInstancesToLoadBalancer in *AWS CLI Command Reference*.

## attach-load-balancer-tls-certificate

The following code example shows how to use attach-load-balancer-tls-certificate.

### AWS CLI

#### To attach a TLS certificate to a load balancer

The following attach-load-balancer-tls-certificate example attaches the load balancer TLS certificate Certificate2 to the load balancer LoadBalancer-1.

```
aws lightsail attach-load-balancer-tls-certificate \
    --certificate-name Certificate2 \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "cf1ad6e3-3cbb-4b8a-a7f2-3EXAMPLEa118",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1571072255.416,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "Certificate2",
            "operationType": "AttachLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1571072255.416
        },
        {
            "id": "dae1bcfb-d531-4c06-b4ea-bEXAMPLEc04e",
            "resourceName": "Certificate2",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1571072255.416,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
```

```
            "isTerminal": true,
            "operationDetails": "LoadBalancer-1",
            "operationType": "AttachLoadBalancerTlsCertificate",

            "statusChangedAt": 1571072255.416
        }
    ]
}
```

- For API details, see AttachLoadBalancerTlsCertificate in *AWS CLI Command Reference*.

### `attach-static-ip`

The following code example shows how to use `attach-static-ip`.

#### AWS CLI

##### To attach a static IP to an instance

The following `attach-static-ip` example attaches static IP `StaticIp-1` to instance `MEAN-1`.

```
aws lightsail attach-static-ip \
    --static-ip-name StaticIp-1 \
    --instance-name MEAN-1
```

Output:

```
{
    "operations": [
        {
            "id": "45e6fa13-4808-4b8d-9292-bEXAMPLE20b2",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571072569.375,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "MEAN-1",
            "operationType": "AttachStaticIp",
```

```
            "status": "Succeeded",
            "statusChangedAt": 1571072569.375
        },
        {
            "id": "9ee09a17-863c-4e51-8a6d-3EXAMPLE5475",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571072569.376,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "StaticIp-1",
            "operationType": "AttachStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571072569.376
        }
    ]
}
```

- For API details, see AttachStaticIp in *AWS CLI Command Reference*.

### `close-instance-public-ports`

The following code example shows how to use `close-instance-public-ports`.

#### AWS CLI

**To close firewall ports for an instance**

The following `close-instance-public-ports` example closes TCP port 22 on instance `MEAN-2`.

```
aws lightsail close-instance-public-ports \
    --instance-name MEAN-2 \
    --port-info fromPort=22,protocol=TCP,toPort=22
```

Output:

```
{
    "operation": {
```

```
        "id": "4f328636-1c96-4649-ae6d-1EXAMPLEf446",
        "resourceName": "MEAN-2",
        "resourceType": "Instance",
        "createdAt": 1571072845.737,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationDetails": "22/tcp",
        "operationType": "CloseInstancePublicPorts",
        "status": "Succeeded",
        "statusChangedAt": 1571072845.737
    }
}
```

- For API details, see CloseInstancePublicPorts in *AWS CLI Command Reference*.

### `copy-snapshot`

The following code example shows how to use `copy-snapshot`.

#### AWS CLI

**Example 1: To copy a snapshot within the same AWS Region**

The following `copy-snapshot` example copies instance snapshot `MEAN-1-1571075291` as instance snapshot `MEAN-1-Copy` within the same AWS Region `us-west-2`.

```
aws lightsail copy-snapshot \
    --source-snapshot-name MEAN-1-1571075291 \
    --target-snapshot-name MEAN-1-Copy \
    --source-region us-west-2
```

Output:

```
{
    "operations": [
        {
            "id": "ced16fc1-f401-4556-8d82-1EXAMPLEb982",
            "resourceName": "MEAN-1-Copy",
            "resourceType": "InstanceSnapshot",
```

```
            "createdAt": 1571075581.498,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:MEAN-1-1571075291",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571075581.498
        }
    ]
}
```

For more information, see Copying snapshots from one AWS Region to another in Amazon Lightsail in the *Lightsail Dev Guide*.

**Example 2: To copy a snapshot from one AWS Region to another**

The following `copy-snapshot` example copies instance snapshot `MEAN-1-1571075291` as instance snapshot `MEAN-1-1571075291-Copy` from AWS Region `us-west-2` to `us-east-1`.

```
aws lightsail copy-snapshot \
    --source-snapshot-name MEAN-1-1571075291 \
    --target-snapshot-name MEAN-1-1571075291-Copy \
    --source-region us-west-2 \
    --region us-east-1
```

Output:

```
{
    "operations": [
        {
            "id": "91116b79-119c-4451-b44a-dEXAMPLEd97b",
            "resourceName": "MEAN-1-1571075291-Copy",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571075695.069,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-east-1"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:MEAN-1-1571075291",
```

```
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571075695.069
        }
    ]
}
```

For more information, see Copying snapshots from one AWS Region to another in Amazon Lightsail in the *Lightsail Dev Guide*.

**Example 3: To copy an automatic snapshot within the same AWS Region**

The following `copy-snapshot` example copies automatic snapshot `2019-10-14` of instance `WordPress-1` as a manual snapshot `WordPress-1-10142019` in the AWS Region `us-west-2`.

```
aws lightsail copy-snapshot \
    --source-resource-name WordPress-1 \
    --restore-date 2019-10-14 \
    --target-snapshot-name WordPress-1-10142019 \
    --source-region us-west-2
```

Output:

```
{
    "operations": [
        {
            "id": "be3e6754-cd1d-48e6-ad9f-2EXAMPLE1805",
            "resourceName": "WordPress-1-10142019",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571082412.311,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:WordPress-1",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571082412.311
        }
    ]
}
```

For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

**Example 4: To copy an automatic snapshot from one AWS Region to another**

The following `copy-snapshot` example copies automatic snapshot `2019-10-14` of instance `WordPress-1` as a manual snapshot `WordPress-1-10142019` from the AWS Region `us-west-2` to `us-east-1`.

```
aws lightsail copy-snapshot \
    --source-resource-name WordPress-1 \
    --restore-date 2019-10-14 \
    --target-snapshot-name WordPress-1-10142019 \
    --source-region us-west-2 \
    --region us-east-1
```

Output:

```
{
    "operations": [
        {
            "id": "dffa128b-0b07-476e-b390-bEXAMPLE3775",
            "resourceName": "WordPress-1-10142019",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1571082493.422,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-east-1"
            },
            "isTerminal": false,
            "operationDetails": "us-west-2:WordPress-1",
            "operationType": "CopySnapshot",
            "status": "Started",
            "statusChangedAt": 1571082493.422
        }
    ]
}
```

For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see CopySnapshot in *AWS CLI Command Reference*.

### `create-disk-from-snapshot`

The following code example shows how to use `create-disk-from-snapshot`.

#### AWS CLI

**To create a create a disk from a disk snapshot**

The following `create-disk-from-snapshot` example creates a block storage disk named `Disk-2` from the specified block storage disk snapshot. The disk is created in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```
aws lightsail create-disk-from-snapshot \
    --disk-name Disk-2 \
    --disk-snapshot-name Disk-1-1566839161 \
    --availability-zone us-west-2a \
    --size-in-gb 32
```

Output:

```
{
    "operations": [
        {
            "id": "d42b605d-5ef1-4b4a-8791-7a3e8b66b5e7",
            "resourceName": "Disk-2",
            "resourceType": "Disk",
            "createdAt": 1569624941.471,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateDiskFromSnapshot",
            "status": "Started",
            "statusChangedAt": 1569624941.791
        }
    ]
}
```

For more information, see Creating a block storage disk from a snapshot in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDiskFromSnapshot in *AWS CLI Command Reference*.

## `create-disk-snapshot`

The following code example shows how to use `create-disk-snapshot`.

### AWS CLI

#### Example 1: To create a snapshot of a disk

The following `create-disk-snapshot` example creates a snapshot named `DiskSnapshot-1` of the specified block storage disk.

```
aws lightsail create-disk-snapshot \
    --disk-name Disk-1 \
    --disk-snapshot-name DiskSnapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "fa74c6d2-03a3-4f42-a7c7-792f124d534b",
            "resourceName": "DiskSnapshot-1",
            "resourceType": "DiskSnapshot",
            "createdAt": 1569625129.739,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "Disk-1",
            "operationType": "CreateDiskSnapshot",
            "status": "Started",
            "statusChangedAt": 1569625129.739
        },
        {
            "id": "920a25df-185c-4528-87cd-7b85f5488c06",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569625129.739,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
```

```
            "isTerminal": false,
            "operationDetails": "DiskSnapshot-1",
            "operationType": "CreateDiskSnapshot",
            "status": "Started",
            "statusChangedAt": 1569625129.739
        }
    ]
}
```

**Example 2: To create a snapshot of an instance's system disk**

The following `create-disk-snapshot` example creates a snapshot of the specified instance's system disk.

```
aws lightsail create-disk-snapshot \
    --instance-name WordPress-1 \
    --disk-snapshot-name SystemDiskSnapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "f508cf1c-6597-42a6-a4c3-4aebd75af0d9",
            "resourceName": "SystemDiskSnapshot-1",
            "resourceType": "DiskSnapshot",
            "createdAt": 1569625294.685,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "WordPress-1",
            "operationType": "CreateDiskSnapshot",
            "status": "Started",
            "statusChangedAt": 1569625294.685
        },
        {
            "id": "0bb9f712-da3b-4d99-b508-3bf871d989e5",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1569625294.685,
            "location": {
```

```
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "SystemDiskSnapshot-1",
            "operationType": "CreateDiskSnapshot",
            "status": "Started",
            "statusChangedAt": 1569625294.685
        }
    ]
}
```

For more information, see Snapshots in Amazon Lightsail and Creating a snapshot of an instance root volume in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDiskSnapshot in *AWS CLI Command Reference*.

### `create-disk`

The following code example shows how to use `create-disk`.

#### AWS CLI

**To create a block storage disk**

The following `create-disk` example creates a block storage disk `Disk-1` in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```
aws lightsail create-disk \
    --disk-name Disk-1 \
    --availability-zone us-west-2a \
    --size-in-gb 32
```

Output:

```
{
    "operations": [
        {
            "id": "1c85e2ec-86ba-4697-b936-77f4d3dc013a",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569449220.36,
            "location": {
```

```
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateDisk",
            "status": "Started",
            "statusChangedAt": 1569449220.588
        }
    ]
}
```

- For API details, see CreateDisk in *AWS CLI Command Reference*.

### `create-domain-entry`

The following code example shows how to use `create-domain-entry`.

#### AWS CLI

**To create a domain entry (DNS record)**

The following `create-domain-entry` example creates a DNS record (A) for the apex of the specified domain that points to an instance's IP address.

**Note:** Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail create-domain-entry \
    --region us-east-1 \
    --domain-name example.com \
    --domain-entry name=example.com,type=A,target=192.0.2.0
```

Output:

```
{
    "operation": {
        "id": "5be4494d-56f4-41fc-8730-693dcd0ef9e2",
        "resourceName": "example.com",
        "resourceType": "Domain",
        "createdAt": 1569865296.519,
        "location": {
```

```
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "CreateDomainEntry",
        "status": "Succeeded",
        "statusChangedAt": 1569865296.519
    }
}
```

For more information, see DNS in Amazon Lightsail and Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDomainEntry in *AWS CLI Command Reference*.

### `create-domain`

The following code example shows how to use `create-domain`.

#### AWS CLI

**To create a domain (DNS zone)**

The following `create-domain` example creates a DNS zone for the specified domain.

**Note:** Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail create-domain \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "operation": {

For more information, see DNS in Amazon Lightsail and Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail in the *Lightsail Developer Guide*.

- For API details, see CreateDomain in *AWS CLI Command Reference*.

### `create-instance-snapshot`

The following code example shows how to use `create-instance-snapshot`.

#### AWS CLI

**To create a snapshot of an instance**

The following `create-instance-snapshot` example creates a snapshot from the specified instance.

```
aws lightsail create-instance-snapshot \
    --instance-name WordPress-1 \
    --instance-snapshot-name WordPress-Snapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "4c3db559-9dd0-41e7-89c0-2cb88c19786f",
            "resourceName": "WordPress-Snapshot-1",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1569866438.48,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
```

```
            "operationDetails": "WordPress-1",
            "operationType": "CreateInstanceSnapshot",
            "status": "Started",
            "statusChangedAt": 1569866438.48
        },
        {
            "id": "c04fdc45-2981-488c-88b5-d6d2fd759a6a",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1569866438.48,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "WordPress-Snapshot-1",
            "operationType": "CreateInstanceSnapshot",
            "status": "Started",
            "statusChangedAt": 1569866438.48
        }
    ]
}
```

- For API details, see CreateInstanceSnapshot in *AWS CLI Command Reference*.

### `create-instances-from-snapshot`

The following code example shows how to use `create-instances-from-snapshot`.

#### AWS CLI

**To create an instance from a snapshot**

The following `create-instances-from-snapshot` example creates an instance from the specified instance snapshot, in the specified AWS Region and Availability Zone, using the $10 USD bundle.

**Note:** The bundle that you specify must be equal to or greater in specifications than the bundle of the original source instance used to create the snapshot.

```
aws lightsail create-instances-from-snapshot \
    --instance-snapshot-name WordPress-1-1569866208 \
    --instance-names WordPress-2 \
```

```
    --availability-zone us-west-2a \
    --bundle-id medium_2_0
```

Output:

```
{
    "operations": [
        {
            "id": "003f8271-b711-464d-b9b8-7f3806cb496e",
            "resourceName": "WordPress-2",
            "resourceType": "Instance",
            "createdAt": 1569865914.908,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstancesFromSnapshot",
            "status": "Started",
            "statusChangedAt": 1569865914.908
        }
    ]
}
```

- For API details, see CreateInstancesFromSnapshot in *AWS CLI Command Reference*.

### `create-instances`

The following code example shows how to use `create-instances`.

#### AWS CLI

**Example 1: To create a single instance**

The following `create-instances` example creates an instance in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the $3.50 USD bundle.

```
aws lightsail create-instances \
    --instance-names Instance-1 \
    --availability-zone us-west-2a \
    --blueprint-id wordpress_5_1_1_2 \
    --bundle-id nano_2_0
```

Output:

```
{
    "operations": [
        {
            "id": "9a77158f-7be3-4d6d-8054-cf5ae2b720cc",
            "resourceName": "Instance-1",
            "resourceType": "Instance",
            "createdAt": 1569447986.061,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstance",
            "status": "Started",
            "statusChangedAt": 1569447986.061
        }
    ]
}
```

**Example 2: To create multiple instances at one time**

The following `create-instances` example creates three instances in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the $3.50 USD bundle.

```
aws lightsail create-instances \
    --instance-names {"Instance1","Instance2","Instance3"} \
    --availability-zone us-west-2a \
    --blueprint-id wordpress_5_1_1_2 \
    --bundle-id nano_2_0
```

Output:

```
{
    "operations": [
        {
            "id": "5492f015-9d2e-48c6-8eea-b516840e6903",
            "resourceName": "Instance1",
            "resourceType": "Instance",
            "createdAt": 1569448780.054,
            "location": {
                "availabilityZone": "us-west-2a",
```

```
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstance",
            "status": "Started",
            "statusChangedAt": 1569448780.054
        },
        {
            "id": "c58b5f46-2676-44c8-b95c-3ad375898515",
            "resourceName": "Instance2",
            "resourceType": "Instance",
            "createdAt": 1569448780.054,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstance",
            "status": "Started",
            "statusChangedAt": 1569448780.054
        },
        {
            "id": "a5ad8006-9bee-4499-9eb7-75e42e6f5882",
            "resourceName": "Instance3",
            "resourceType": "Instance",
            "createdAt": 1569448780.054,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateInstance",
            "status": "Started",
            "statusChangedAt": 1569448780.054
        }
    ]
}
```

- For API details, see CreateInstances in *AWS CLI Command Reference*.

### `create-key-pair`

The following code example shows how to use `create-key-pair`.

## AWS CLI

### To create a key pair

The following `create-key-pair` example creates a key pair that you can use to authenticate and connect to an instance.

```
aws lightsail create-key-pair \
    --key-pair-name MyPersonalKeyPair
```

The output provides the private key base64 value that you can use to authenticate to instances that use the created key pair. **Note:** Copy and paste the private key base64 value to a safe location because you cannot retrieve it later.

```
{
    "keyPair": {
        "name": "MyPersonalKeyPair",

### `create-load-balancer-tls-certificate`

The following code example shows how to use `create-load-balancer-tls-certificate`.

**AWS CLI**

**To create a TLS certificate for a load balancer**

The following `create-load-balancer-tls-certificate` example creates a TLS certificate that is attached to the specified load balancer. The certificate created applies to the specified domains. **Note:** Only two certificates can be created for a load balancer.

```
aws lightsail create-load-balancer-tls-certificate \
    --certificate-alternative-names abc.example.com \
    --certificate-domain-name example.com \
    --certificate-name MySecondCertificate \
    --load-balancer-name MyFirstLoadBalancer
```

Output:

```
{
    "operations": [
        {
            "id": "be663aed-cb46-41e2-9b23-e2f747245bd4",
            "resourceName": "MySecondCertificate",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569867364.971,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "MyFirstLoadBalancer",
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867365.219
        },
        {
            "id": "f3dfa930-969e-41cc-ac7d-337178716f6d",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569867364.971,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "MySecondCertificate",
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867365.219
        }
    ]
}
```

- For API details, see CreateLoadBalancerTlsCertificate in *AWS CLI Command Reference*.

### `create-load-balancer`

The following code example shows how to use `create-load-balancer`.

## AWS CLI

### To create a load balancer

The following `create-load-balancer` example creates a load balancer with a TLS certificate. The TLS certificate applies to the specified domains, and routes traffic to instances on port 80.

```
aws lightsail create-load-balancer \
    --certificate-alternative-names www.example.com test.example.com \
    --certificate-domain-name example.com \
    --certificate-name Certificate-1 \
    --instance-port 80 \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "cc7b920a-83d8-4762-a74e-9174fe1540be",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1569867169.406,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateLoadBalancer",
            "status": "Started",
            "statusChangedAt": 1569867169.406
        },
        {
            "id": "658ed43b-f729-42f3-a8e4-3f8024d3c98d",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569867170.193,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "LoadBalancer-1",
```

```
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867170.54
        },
        {

            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1569867170.193,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "Certificate-1",
            "operationType": "CreateLoadBalancerTlsCertificate",
            "status": "Succeeded",
            "statusChangedAt": 1569867170.54
        }
    ]
}
```

For more information, see Lightsail load balancers in the *Lightsail Developer Guide*.

- For API details, see CreateLoadBalancer in *AWS CLI Command Reference*.

### `create-relational-database-from-snapshot`

The following code example shows how to use `create-relational-database-from-snapshot`.

#### AWS CLI

**To create a managed database from a snapshot**

The following `create-relational-database-from-snapshot` example creates a managed database from the specified snapshot in the specified AWS Region and Availability Zone, using the $15 USD standard database bundle. **Note:** The bundle that you specify must be equal to or greater in specifications than the bundle of the original source database used to create the snapshot.

```
aws lightsail create-relational-database-from-snapshot \
    --relational-database-snapshot-name Database-Oregon-1-1566839359 \
```

```
    --relational-database-name Database-1 \
    --availability-zone us-west-2a \
    --relational-database-bundle-id micro_1_0 \
    --no-publicly-accessible
```

Output:

```
{
    "operations": [
        {
            "id": "ad6d9193-9d5c-4ea1-97ae-8fe6de600b4c",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1569867916.938,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateRelationalDatabaseFromSnapshot",
            "status": "Started",
            "statusChangedAt": 1569867918.643
        }
    ]
}
```

- For API details, see CreateRelationalDatabaseFromSnapshot in *AWS CLI Command Reference*.

## `create-relational-database-snapshot`

The following code example shows how to use `create-relational-database-snapshot`.

### AWS CLI

#### To create a snapshot of a managed database

The following `create-relational-database-snapshot` example creates a snapshot of the specified managed database.

```
aws lightsail create-relational-database-snapshot \
    --relational-database-name Database1 \
    --relational-database-snapshot-name RelationalDatabaseSnapshot1
```

Output:

```
{
    "operations": [
        {
            "id": "853667fb-ea91-4c02-8d20-8fc5fd43b9eb",
            "resourceName": "RelationalDatabaseSnapshot1",
            "resourceType": "RelationalDatabaseSnapshot",
            "createdAt": 1569868074.645,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "Database1",
            "operationType": "CreateRelationalDatabaseSnapshot",
            "status": "Started",
            "statusChangedAt": 1569868074.645
        },
        {

        }
    ]
}
```

- For API details, see CreateRelationalDatabaseSnapshot in *AWS CLI Command Reference*.

### `create-relational-database`

The following code example shows how to use `create-relational-database`.

### AWS CLI

#### To create a managed database

The following `create-relational-database` example creates a managed database in the specified AWS Region and Availability Zone, using the MySQL 5.6 database engine (mysql_5_6), and the $15 USD standard database bundle (micro_1_0). The managed database is pre-populated a master user name, and is not publicly accessible.

```
aws lightsail create-relational-database \
    --relational-database-name Database-1 \
    --availability-zone us-west-2a \
    --relational-database-blueprint-id mysql_5_6 \
    --relational-database-bundle-id micro_1_0 \
    --master-database-name dbmaster \
    --master-username user \
    --no-publicly-accessible
```

Output:

```
{
    "operations": [
        {
            "id": "b52bedee-73ed-4798-8d2a-9c12df89adcd",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1569450017.244,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "CreateRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1569450018.637
        }
    ]
}
```

- For API details, see CreateRelationalDatabase in *AWS CLI Command Reference*.

### `delete-auto-snapshot`

The following code example shows how to use `delete-auto-snapshot`.

#### AWS CLI

##### To delete an automatic snapshot

The following `delete-auto-snapshot` example deletes the automatic snapshot `2019-10-10` of instance `WordPress-1`.

```
aws lightsail delete-auto-snapshot \
    --resource-name WordPress-1 \
    --date 2019-10-10
```

Output:

```
{
    "operations": [
        {
            "id": "31c36e09-3d52-46d5-b6d8-7EXAMPLE534a",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1571088141.501,
            "location": {
                "availabilityZone": "us-west-2",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "DeleteAutoSnapshot-2019-10-10",
            "operationType": "DeleteAutoSnapshot",
            "status": "Succeeded"
        }
    ]
}
```

For more information, see Deleting automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see DeleteAutoSnapshot in *AWS CLI Command Reference*.

### `delete-disk-snapshot`

The following code example shows how to use `delete-disk-snapshot`.

#### AWS CLI

##### To delete a snapshot of a block storage disk

The following `delete-disk-snapshot` example deletes the specified snapshot of a block storage disk

```
aws lightsail delete-disk-snapshot \
    --disk-snapshot-name DiskSnapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "d1e5766d-b81e-4595-ad5d-02afbccfcd5d",
            "resourceName": "DiskSnapshot-1",
            "resourceType": "DiskSnapshot",
            "createdAt": 1569873552.79,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteDiskSnapshot",
            "status": "Succeeded",
            "statusChangedAt": 1569873552.79
        }
    ]
}
```

- For API details, see DeleteDiskSnapshot in *AWS CLI Command Reference*.

### `delete-disk`

The following code example shows how to use `delete-disk`.

**AWS CLI**

**To delete a block storage disk**

The following `delete-disk` example deletes the specified block storage disk.

```
aws lightsail delete-disk \
    --disk-name Disk-1
```

Output:

```
{
    "operations": [
        {
            "id": "6378c70f-4d75-4f7a-ab66-730fca0bb2fc",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569872887.864,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteDisk",
            "status": "Succeeded",
            "statusChangedAt": 1569872887.864
        }
    ]
}
```

- For API details, see DeleteDisk in *AWS CLI Command Reference*.

## `delete-domain-entry`

The following code example shows how to use `delete-domain-entry`.

**AWS CLI**

**To delete a domain entry (DNS record)**

The following `delete-domain-entry` example deletes the specified domain entry from an existing domain.

**Note:** Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail delete-domain-entry \
    --region us-east-1 \
    --domain-name example.com \
    --domain-entry name=123.example.com,target=192.0.2.0,type=A
```

Output:

```
{
    "operation": {
        "id": "06eacd01-d785-420e-8daa-823150c7dca1",
        "resourceName": "example.com ",
        "resourceType": "Domain",
        "createdAt": 1569874157.005,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "DeleteDomainEntry",
        "status": "Succeeded",
        "statusChangedAt": 1569874157.005
    }
}
```

- For API details, see DeleteDomainEntry in *AWS CLI Command Reference*.

### `delete-domain`

The following code example shows how to use `delete-domain`.

#### AWS CLI

**To delete a domain (DNS zone)**

The following `delete-domain` example deletes the specified domain and all of the entries in the domain (DNS records).

**Note:** Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail delete-domain \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "operation": {
        "id": "fcef5265-5af1-4a46-a3d7-90b5e18b9b32",
        "resourceName": "example.com",
        "resourceType": "Domain",
        "createdAt": 1569873788.13,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "isTerminal": true,
        "operationType": "DeleteDomain",
        "status": "Succeeded",
        "statusChangedAt": 1569873788.13
    }
}
```

- For API details, see DeleteDomain in *AWS CLI Command Reference*.

### `delete-instance-snapshot`

The following code example shows how to use `delete-instance-snapshot`.

#### AWS CLI

**title**

The following `delete-instance-snapshot` example deletes the specified snapshot of an instance.

```
aws lightsail delete-instance-snapshot \
```

```
    --instance-snapshot-name WordPress-1-Snapshot-1
```

Output:

```
{
    "operations": [
        {
            "id": "14dad182-976a-46c6-bfd4-9480482bf0ea",
            "resourceName": "WordPress-1-Snapshot-1",
            "resourceType": "InstanceSnapshot",
            "createdAt": 1569874524.562,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteInstanceSnapshot",
            "status": "Succeeded",
            "statusChangedAt": 1569874524.562
        }
    ]
}
```

- For API details, see DeleteInstanceSnapshot in *AWS CLI Command Reference*.

### `delete-instance`

The following code example shows how to use `delete-instance`.

#### AWS CLI

**To delete an instance**

The following `delete-instance` example deletes the specified instance.

```
aws lightsail delete-instance \
    --instance-name WordPress-1
```

Output:

```
{
    "operations": [
```

```
        {
            "id": "d77345a3-8f80-4d2e-b47d-aaa622718df2",
            "resourceName": "Disk-1",
            "resourceType": "Disk",
            "createdAt": 1569874357.469,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "WordPress-1",
            "operationType": "DetachDisk",
            "status": "Started",
            "statusChangedAt": 1569874357.469
        },
        {
            "id": "708fa606-2bfd-4e48-a2c1-0b856585b5b1",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1569874357.465,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "Disk-1",
            "operationType": "DetachDisk",
            "status": "Started",
            "statusChangedAt": 1569874357.465
        },
        {
            "id": "3187e823-8acb-405d-b098-fad5ceb17bec",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1569874357.829,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteInstance",
            "status": "Succeeded",
            "statusChangedAt": 1569874357.829
        }
```

```
    ]
}
```

- For API details, see DeleteInstance in *AWS CLI Command Reference*.

### `delete-key-pair`

The following code example shows how to use `delete-key-pair`.

#### AWS CLI

**To delete a key pair**

The following `delete-key-pair` example deletes the specified key pair.

```
aws lightsail delete-key-pair \
    --key-pair-name MyPersonalKeyPair
```

Output:

```
{
    "operation": {
        "id": "81621463-df38-4810-b866-6e801a15abbf",
        "resourceName": "MyPersonalKeyPair",
        "resourceType": "KeyPair",
        "createdAt": 1569874626.466,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationType": "DeleteKeyPair",
        "status": "Succeeded",
        "statusChangedAt": 1569874626.685
    }
}
```

- For API details, see DeleteKeyPair in *AWS CLI Command Reference*.

### `delete-known-host-keys`

The following code example shows how to use `delete-known-host-keys`.

**AWS CLI**

**To delete known host keys from an instance**

The following `delete-known-host-keys` example deletes the known host key from the specified instance.

```
aws lightsail delete-known-host-keys \
    --instance-name Instance-1
```

Output:

```
{
    "operations": [
        {
            "id": "c61afe9c-45a4-41e6-a97e-d212364da3f5",
            "resourceName": "Instance-1",
            "resourceType": "Instance",
            "createdAt": 1569874760.201,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteKnownHostKeys",
            "status": "Succeeded",
            "statusChangedAt": 1569874760.201
        }
    ]
}
```

For more information, see Troubleshooting connection issues with the Amazon Lightsail browser-based SSH or RDP client in the *Lightsail Dev Guide*.

- For API details, see DeleteKnownHostKeys in *AWS CLI Command Reference*.

## `delete-load-balancer-tls-certificate`

The following code example shows how to use `delete-load-balancer-tls-certificate`.

**AWS CLI**

**To delete a TLS certificate for a load balancer**

The following `delete-load-balancer-tls-certificate` example deletes the specifie TLS certificate from the specified load balancer.

```
aws lightsail delete-load-balancer-tls-certificate \
    --load-balancer-name MyFirstLoadBalancer \
    --certificate-name MyFirstCertificate
```

Output:

```
{
    "operations": [
        {
            "id": "50bec274-e45e-4caa-8a69-b763ef636583",
            "resourceName": "MyFirstCertificate",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569874989.48,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569874989.48
        },
        {
            "id": "78c58cdc-a59a-4b27-8213-500638634a8f",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569874989.48,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569874989.48
        }
    ]
}
```

- For API details, see DeleteLoadBalancerTlsCertificate in *AWS CLI Command Reference*.

## `delete-load-balancer`

The following code example shows how to use `delete-load-balancer`.

### AWS CLI

#### To delete a load balancer

The following `delete-load-balancer` example deletes the specified load balancer and any associated TLS certificates.

```
aws lightsail delete-load-balancer \
    --load-balancer-name MyFirstLoadBalancer
```

Output:

```
{
    "operations": [
        {
            "id": "a8c968c7-72a3-4680-a714-af8f03eea535",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569875092.125,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "DeleteLoadBalancer",
            "status": "Succeeded",
            "statusChangedAt": 1569875092.125
        },
        {
            "id": "f91a29fc-8ce3-4e69-a227-ea70ca890bf5",
            "resourceName": "MySecondCertificate",
            "resourceType": "LoadBalancerTlsCertificate",
            "createdAt": 1569875091.938,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
```

```
            "status": "Started",
            "statusChangedAt": 1569875091.938
        },
        {
            "id": "cf64c060-154b-4eb4-ba57-84e2e41563d6",
            "resourceName": "MyFirstLoadBalancer",
            "resourceType": "LoadBalancer",
            "createdAt": 1569875091.94,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteLoadBalancerTlsCertificate",
            "status": "Started",
            "statusChangedAt": 1569875091.94
        }
    ]
}
```

For more information, see title in the *guide*.

- For API details, see DeleteLoadBalancer in *AWS CLI Command Reference*.

### `delete-relational-database-snapshot`

The following code example shows how to use `delete-relational-database-snapshot`.

#### AWS CLI

**To delete a snapshot of a managed database**

The following `delete-relational-database-snapshot` example deletes the specified snapshot of a managed database.

```
aws lightsail delete-relational-database-snapshot \
    --relational-database-snapshot-name Database-Oregon-1-1566839359
```

Output:

```
{
    "operations": [
```

```
        {
            "id": "b99acae8-735b-4823-922f-30af580e3729",

        }
    ]
}
```

- For API details, see DeleteRelationalDatabaseSnapshot in *AWS CLI Command Reference*.

### `delete-relational-database`

The following code example shows how to use `delete-relational-database`.

#### AWS CLI

**To delete a managed database**

The following `delete-relational-database` example deletes the specified managed database.

```
aws lightsail delete-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "3b0c41c1-053d-46f0-92a3-14f76141dc86",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
```

```
            "createdAt": 1569875210.999,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "DeleteRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1569875210.999
        },
        {
            "id": "01ddeae8-a87a-4a4b-a1f3-092c71bf9180",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",

        }
    ]
}
```

- For API details, see DeleteRelationalDatabase in *AWS CLI Command Reference*.

### `detach-static-ip`

The following code example shows how to use `detach-static-ip`.

#### AWS CLI

##### To detach a static IP from an instance

The following `detach-static-ip` example detaches static IP `StaticIp-1` from any attached instance.

```
aws lightsail detach-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
    "operations": [
        {
            "id": "2a43d8a3-9f2d-4fe7-bdd0-eEXAMPLE3cf3",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571088261.999,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "MEAN-1",
            "operationType": "DetachStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571088261.999
        },
        {
            "id": "41a7d40c-74e8-4d2e-a837-cEXAMPLEf747",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571088262.022,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
```

```
            "operationDetails": "StaticIp-1",
            "operationType": "DetachStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571088262.022
        }
    ]
}
```

- For API details, see DetachStaticIp in *AWS CLI Command Reference*.

### `get-active-names`

The following code example shows how to use `get-active-names`.

#### AWS CLI

**To get active resource names**

The following `get-active-names` example returns the active resource names in the configured AWS Region.

```
aws lightsail get-active-names
```

Output:

```
{
    "activeNames": [
        "WordPress-1",
        "StaticIp-1",
        "MEAN-1",
        "Plesk_Hosting_Stack_on_Ubuntu-1"
    ]
}
```

- For API details, see GetActiveNames in *AWS CLI Command Reference*.

### `get-auto-snapshots`

The following code example shows how to use `get-auto-snapshots`.

## AWS CLI

### To get the available automatic snapshots for an instance

The following `get-auto-snapshots` example returns the available automatic snapshots for instance `WordPress-1`.

```
aws lightsail get-auto-snapshots \
    --resource-name WordPress-1
```

Output:

```
{
    "resourceName": "WordPress-1",
    "resourceType": "Instance",
    "autoSnapshots": [
        {
            "date": "2019-10-14",
            "createdAt": 1571033872.0,
            "status": "Success",
            "fromAttachedDisks": []
        },
        {
            "date": "2019-10-13",
            "createdAt": 1570947473.0,
            "status": "Success",
            "fromAttachedDisks": []
        },
        {
            "date": "2019-10-12",
            "createdAt": 1570861072.0,
            "status": "Success",
            "fromAttachedDisks": []
        },
        {
            "date": "2019-10-11",
            "createdAt": 1570774672.0,
            "status": "Success",
            "fromAttachedDisks": []
        }
    ]
}
```

For more information, see Keeping automatic snapshots of instances or disks in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see GetAutoSnapshots in *AWS CLI Command Reference*.

### `get-blueprints`

The following code example shows how to use `get-blueprints`.

#### AWS CLI

**To get the blueprints for new instances**

The following `get-blueprints` example displays details about all of the available blueprints that can be used to create new instances in Amazon Lightsail.

```
aws lightsail get-blueprints
```

Output:

```
{
    "blueprints": [
        {
            "blueprintId": "wordpress",
            "name": "WordPress",
            "group": "wordpress",
            "type": "app",
            "description": "Bitnami, the leaders in application packaging, and
 Automattic, the experts behind WordPress, have teamed up to offer this official
 WordPress image. This image is a pre-configured, ready-to-run image for running
 WordPress on Amazon Lightsail. WordPress is the world's most popular content
 management platform. Whether it's for an enterprise or small business website, or
 a personal or corporate blog, content authors can easily create content using its
 new Gutenberg editor, and developers can extend the base platform with additional
 features. Popular plugins like Jetpack, Akismet, All in One SEO Pack, WP Mail,
 Google Analytics for WordPress, and Amazon Polly are all pre-installed in this
 image. Let's Encrypt SSL certificates are supported through an auto-configuration
 script.",

### `get-bundles`

The following code example shows how to use `get-bundles`.

#### AWS CLI

**To get the bundles for new instances**

The following `get-bundles` example displays details about all of the available bundles that can be used to create new instances in Amazon Lightsail.

```
aws lightsail get-bundles
```

Output:

```
{
    "bundles": [
        {
            "price": 3.5,
            "cpuCount": 1,
            "diskSizeInGb": 20,

                "LINUX_UNIX"
            ]
        },
        ...
        }
    ]
}
```

- For API details, see [GetBundles](#) in *AWS CLI Command Reference*.

### `get-cloud-formation-stack-records`

The following code example shows how to use `get-cloud-formation-stack-records`.

**AWS CLI**

**To get the CloudFormation stack records and their associated stacks**

The following `get-cloud-formation-stack-records` example displays details about the CloudFormation stack records and their associated stacks used to create Amazon EC2 resources from exported Amazon Lightsail snapshots.

```
aws lightsail get-cloud-formation-stack-records
```

Output:

```
{
    "cloudFormationStackRecords": [
        {
            "name": "CloudFormationStackRecord-588a4243-
e2d1-490d-8200-3a7513ecebdf",
            "arn": "arn:aws:lightsail:us-
west-2:111122223333:CloudFormationStackRecord/28d646ab-27bc-48d9-a422-1EXAMPLE6d37",

ba28-11e9-838b-0EXAMPLE8b00",
```

```
                "service": "Aws::CloudFormation::Stack"
            }
        }
    ]
}
```

- For API details, see GetCloudFormationStackRecords in *AWS CLI Command Reference*.

### `get-disk-snapshot`

The following code example shows how to use `get-disk-snapshot`.

**AWS CLI**

**To get information about a disk snapshot**

The following `get-disk-snapshot` example displays details about the disk snapshot `Disk-1-1566839161`.

```
aws lightsail get-disk-snapshot \
    --disk-snapshot-name Disk-1-1566839161
```

Output:

```
{
    "diskSnapshot": {
        "name": "Disk-1-1566839161",
        "arn": "arn:aws:lightsail:us-west-2:111122223333:DiskSnapshot/
e2d0fa53-8ee0-41a0-8e56-0EXAMPLE1051",
        "supportCode": "6EXAMPLE3362/snap-0EXAMPLE06100d09",
        "createdAt": 1566839163.749,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "DiskSnapshot",
        "tags": [],
        "sizeInGb": 8,
        "state": "completed",
        "progress": "100%",
        "fromDiskName": "Disk-1",
```

```
        "fromDiskArn": "arn:aws:lightsail:us-west-2:111122223333:Disk/
c21cfb0a-07f2-44ae-9a23-bEXAMPLE8096",
        "isFromAutoSnapshot": false
    }
}
```

For more information, see title in the *guide*.

- For API details, see GetDiskSnapshot in *AWS CLI Command Reference*.

### `get-disk-snapshots`

The following code example shows how to use `get-disk-snapshots`.

#### AWS CLI

**To get information about all disk snapshots**

The following `get-disk-snapshots` example displays details about all of the disk snapshots in the configured AWS Region.

```
aws lightsail get-disk-snapshots
```

Output:

```
{
    "diskSnapshots": [
        {
            "name": "Disk-2-1571090588",
            "arn": "arn:aws:lightsail:us-
west-2:111122223333:DiskSnapshot/32e889a9-38d4-4687-9f21-eEXAMPLE7839",
            "supportCode": "6EXAMPLE3362/snap-0EXAMPLE1ca192a4",

### `get-disk`

The following code example shows how to use `get-disk`.

#### AWS CLI

**To get information about a block storage disk**

The following `get-disk` example displays details about the disk `Disk-1`.

```
aws lightsail get-disk \
    --disk-name Disk-1
```

Output:

```
{
    "disk": {
        "name": "Disk-1",
        "arn": "arn:aws:lightsail:us-west-2:111122223333:Disk/

        "attachedTo": "WordPress_Multisite-1",
        "isAttached": true,
        "attachmentState": "attached"
    }
}
```

For more information, see title in the *guide*.

- For API details, see GetDisk in *AWS CLI Command Reference*.

## `get-disks`

The following code example shows how to use `get-disks`.

### AWS CLI

#### To get information about all block storage disks

The following `get-disks` example displays details about all of the disks in the configured AWS Region.

```
aws lightsail get-disks
```

Output:

```
{
    "disks": [
        {
            "name": "Disk-2",
            "arn": "arn:aws:lightsail:us-
west-2:111122223333:Disk/6a343ff8-6341-422d-86e2-bEXAMPLE16c2",

            "isAttached": true,
            "attachmentState": "attached"
        }
```

```
    ]
}
```

- For API details, see GetDisks in *AWS CLI Command Reference*.

### `get-domain`

The following code example shows how to use `get-domain`.

**AWS CLI**

**To get information about a domain**

The following `get-domain` example displays details about the domain `example.com`.

**Note:** Lightsail's domain-related API operations are available in only the `us-east-1` AWS Region. If your CLI profile is configured to use a different Region, you must include the`` --region us-east-1`` parameter or the command fails.

```
aws lightsail get-domain \
    --domain-name example.com \
    --region us-east-1
```

Output:

```
{
    "domain": {
        "name": "example.com",
        "arn":
 "arn:aws:lightsail:global:111122223333:Domain/28cda903-3f15-44b2-9baf-3EXAMPLEb304",
        "supportCode": "6EXAMPLE3362//hostedzone/ZEXAMPLEONGSC1",
        "createdAt": 1570728588.6,
        "location": {
            "availabilityZone": "all",
            "regionName": "global"
        },
        "resourceType": "Domain",
        "tags": [],
        "domainEntries": [
            {
                "id": "-1682899164",
                "name": "example.com",
```

```
                "target": "192.0.2.0",
                "isAlias": false,
                "type": "A"
            },
            {
                "id": "1703104243",
                "name": "example.com",

### `get-export-snapshot-record`

The following code example shows how to use `get-export-snapshot-record`.

#### AWS CLI

**To get the records of snapshots exported to Amazon EC2**

The following `get-export-snapshot-record` example displays details about Amazon Lightsail instance or disk snapshots exported to Amazon EC2.

```
aws lightsail get-export-snapshot-records
```

Output:

```
{
    "exportSnapshotRecords": [
        {
            "name": "ExportSnapshotRecord-d2da10ce-0b3c-4ae1-ab3a-2EXAMPLEa586",

### `get-instance-metric-data`

The following code example shows how to use `get-instance-metric-data`.

**AWS CLI**

**To get metric data for an instance**

The following `get-instance-metric-data` example returns the average percent of `CPUUtilization` every `7200` seconds (2 hours) between `1571342400` and `1571428800` for instance `MEAN-1`.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-instance-metric-data \
    --instance-name MEAN-1 \
    --metric-name CPUUtilization \
    --period 7200 \
    --start-time 1571342400 \
    --end-time 1571428800 \
    --unit Percent \
    --statistics Average
```

Output:

```
{
    "metricName": "CPUUtilization",
    "metricData": [
        {
            "average": 0.26113718770120725,
            "timestamp": 1571342400.0,
            "unit": "Percent"
        },
        {
            "average": 0.26861268928111953,
            "timestamp": 1571392800.0,
            "unit": "Percent"
        },
        {
            "average": 0.28187475104748777,
            "timestamp": 1571378400.0,
            "unit": "Percent"
        },
```

```
        {
            "average": 0.2651936960458352,
            "timestamp": 1571421600.0,

### `get-instance-port-states`

The following code example shows how to use `get-instance-port-states`.

#### AWS CLI

**To get firewall information for an instance**

The following `get-instance-port-states` example returns the firewall ports configured for instance `MEAN-1`.

```
aws lightsail get-instance-port-states \
    --instance-name MEAN-1
```

Output:

```
{
    "portStates": [
        {
            "fromPort": 80,
            "toPort": 80,
            "protocol": "tcp",
            "state": "open"
        },
        {
            "fromPort": 22,
            "toPort": 22,
            "protocol": "tcp",
            "state": "open"
        },
        {
            "fromPort": 443,
            "toPort": 443,
            "protocol": "tcp",
            "state": "open"
        }
```

```
    ]
}
```

- For API details, see GetInstancePortStates in *AWS CLI Command Reference*.

### `get-instance-snapshot`

The following code example shows how to use `get-instance-snapshot`.

**AWS CLI**

**To get information about a specified instance snapshot**

The following `get-instance-snapshot` example displays details about the specified instance snapshot.

```
aws lightsail get-instance-snapshot \
    --instance-snapshot-name MEAN-1-1571419854
```

Output:

```
{
    "instanceSnapshot": {
        "name": "MEAN-1-1571419854",
        "arn": "arn:aws:lightsail:us-west-2:111122223333:InstanceSnapshot/
ac54700c-48a8-40fd-b065-2EXAMPLEac8f",
        "supportCode": "6EXAMPLE3362/ami-0EXAMPLE67a73020d",
        "createdAt": 1571419891.927,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "InstanceSnapshot",
        "tags": [],
        "state": "available",
        "fromAttachedDisks": [],
        "fromInstanceName": "MEAN-1",
        "fromInstanceArn": "arn:aws:lightsail:us-west-2:111122223333:Instance/

        "fromBlueprintId": "mean_4_0_9",
        "fromBundleId": "medium_2_0",
        "isFromAutoSnapshot": false,
```

```
        "sizeInGb": 80
    }
}
```

- For API details, see GetInstanceSnapshot in *AWS CLI Command Reference*.

### `get-instance-snapshots`

The following code example shows how to use `get-instance-snapshots`.

#### AWS CLI

**To get information about all of your instance snapshots**

The following `get-instance-snapshots` example displays details about all of the instance snapshots in the configured AWS Region.

```
aws lightsail get-instance-snapshots
```

Output:

```
{
    "instanceSnapshots": [
        {
            "name": "MEAN-1-1571421498",
            "arn": "arn:aws:lightsail:us-west-2:111122223333:InstanceSnapshot/

            "sizeInGb": 80
        }
    ]
}
```

- For API details, see GetInstanceSnapshots in *AWS CLI Command Reference*.

### `get-instance-state`

The following code example shows how to use `get-instance-state`.

#### AWS CLI

##### To get information about the state of an instance

The following `get-instance-state` example returns the state of the specified instance.

```
aws lightsail get-instance-state \
    --instance-name MEAN-1
```

Output:

```
{
    "state": {
        "code": 16,
        "name": "running"
    }
}
```

- For API details, see GetInstanceState in *AWS CLI Command Reference*.

### `get-instance`

The following code example shows how to use `get-instance`.

#### AWS CLI

**To get information about an instance**

The following `get-instance` example displays details about the instance `MEAN-1`.

```
aws lightsail get-instance \
    --instance-name MEAN-1
```

Output:

```
{
    "instance": {
        "name": "MEAN-1",
        "arn": "arn:aws:lightsail:us-west-2:111122223333:Instance/bd470fc5-

### `get-key-pair`

The following code example shows how to use `get-key-pair`.

#### AWS CLI

**To get information about a key pair**

The following `get-key-pair` example displays details about the specified key pair.

```
aws lightsail get-key-pair \
    --key-pair-name MyKey1
```

Output:

```
{
    "keyPair": {
        "name": "MyKey1",
        "arn": "arn:aws:lightsail:us-
west-2:111122223333:KeyPair/19a4efdf-3054-43d6-91fd-eEXAMPLE21bf",
        "supportCode": "6EXAMPLE3362/MyKey1",
```

```
        "createdAt": 1571255026.975,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "KeyPair",
        "tags": [],
        "fingerprint": "00:11:22:33:44:55:66:77:88:99:aa:bb:cc:dd:ee:ff:gg:hh:ii:jj"
    }
}
```

- For API details, see GetKeyPair in *AWS CLI Command Reference*.

### `get-key-pairs`

The following code example shows how to use `get-key-pairs`.

#### AWS CLI

**To get information about all key pairs**

The following `get-key-pairs` example displays details about all of the key pairs in the configured AWS Region.

```
aws lightsail get-key-pairs
```

Output:

```
{
    "keyPairs": [
        {
            "name": "MyKey1",
            "arn": "arn:aws:lightsail:us-
west-2:111122223333:KeyPair/19a4efdf-3054-43d6-91fd-eEXAMPLE21bf",
            "supportCode": "6EXAMPLE3362/MyKey1",
            "createdAt": 1571255026.975,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "resourceType": "KeyPair",
```

```
            "tags": [],
            "fingerprint":
 "00:11:22:33:44:55:66:77:88:99:aa:bb:cc:dd:ee:ff:gg:hh:ii:jj"
        }
    ]
}
```

- For API details, see GetKeyPairs in *AWS CLI Command Reference*.

### `get-load-balancer-tls-certificates`

The following code example shows how to use `get-load-balancer-tls-certificates`.

**AWS CLI**

**To get information about TLS certificates for a load balancer**

The following `get-load-balancer-tls-certificates` example displays details about the TLS certificates for the specified load balancer.

```
aws lightsail get-load-balancer-tls-certificates \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "tlsCertificates": [
        {
            "name": "example-com",
            "arn": "arn:aws:lightsail:us-

}
```

- For API details, see GetLoadBalancerTlsCertificates in *AWS CLI Command Reference*.

## `get-load-balancer`

The following code example shows how to use `get-load-balancer`.

### AWS CLI

#### To get information about a load balancer

The following `get-load-balancer` example displays details about the specified load balancer.

```
aws lightsail get-load-balancer \
    --load-balancer-name LoadBalancer-1
```

Output:

```
{
    "loadBalancer": {
        "name": "LoadBalancer-1",
        "arn": "arn:aws:lightsail:us-
west-2:111122223333:LoadBalancer/40486b2b-1ad0-4152-83e4-cEXAMPLE6f4b",

        "instancePort": 80,
        "instanceHealthSummary": [
            {
                "instanceName": "MEAN-3",
                "instanceHealth": "healthy"
            },
            {
                "instanceName": "MEAN-1",
                "instanceHealth": "healthy"
            },
            {
                "instanceName": "MEAN-2",
                "instanceHealth": "healthy"
            }
        ],
        "tlsCertificateSummaries": [
            {
                "name": "example-com",
                "isAttached": false
```

```
            }
        ],
        "configurationOptions": {
            "SessionStickinessEnabled": "false",
            "SessionStickiness_LB_CookieDurationSeconds": "86400"
        }
    }
}
```

- For API details, see GetLoadBalancer in *AWS CLI Command Reference*.

### `get-load-balancers`

The following code example shows how to use `get-load-balancers`.

#### AWS CLI

**To get information about all load balancers**

The following `get-load-balancers` example displays details about all of the load balancers in the configured AWS Region.

```
aws lightsail get-load-balancers
```

Output:

```
{
    "loadBalancers": [
        {
            "name": "LoadBalancer-1",
            "arn": "arn:aws:lightsail:us-

                }
            ],
            "configurationOptions": {
                "SessionStickinessEnabled": "false",
                "SessionStickiness_LB_CookieDurationSeconds": "86400"
            }
        }
    ]
}
```

- For API details, see GetLoadBalancers in *AWS CLI Command Reference*.

### `get-operation`

The following code example shows how to use `get-operation`.

**AWS CLI**

**To get information about a single operation**

The following `get-operation` example displays details about the specified operation.

```
aws lightsail get-operation \
    --operation-id e5700e8a-daf2-4b49-bc01-3EXAMPLE910a
```

Output:

```
{
    "operation": {
        "id": "e5700e8a-daf2-4b49-bc01-3EXAMPLE910a",
        "resourceName": "Instance-1",
        "resourceType": "Instance",
        "createdAt": 1571679872.404,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationType": "CreateInstance",
        "status": "Succeeded",
        "statusChangedAt": 1571679890.304
    }
}
```

- For API details, see GetOperation in *AWS CLI Command Reference*.

## `get-operations-for-resource`

The following code example shows how to use `get-operations-for-resource`.

**AWS CLI**

**To get all operations for a resource**

The following `get-operations-for-resource` example displays details about all operations for the specified resource.

```
aws lightsail get-operations-for-resource \
```

```
    --resource-name LoadBalancer-1
```

Output:

```
{
    "operations": [
        {
            "id": "e2973046-43f8-4252-a4b4-9EXAMPLE69ce",
            "resourceName": "LoadBalancer-1",
            "resourceType": "LoadBalancer",
            "createdAt": 1571678786.071,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "MEAN-1",
            "operationType": "DetachInstancesFromLoadBalancer",
            "status": "Succeeded",
            "statusChangedAt": 1571679087.57
        },
        {
            "id": "2d742a18-0e7f-48c8-9705-3EXAMPLEf98a",

```

- For API details, see GetOperations in *AWS CLI Command Reference*.

### `get-regions`

The following code example shows how to use `get-regions`.

**AWS CLI**

**To get all AWS Regions for Amazon Lightsail**

The following `get-regions` example displays details about all of the AWS Regions for Amazon Lightsail.

```
aws lightsail get-regions
```

Output:

```
{
    "regions": [
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the eastern
 United States",
            "displayName": "Virginia",
            "name": "us-east-1",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
        },
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the eastern
 United States",
            "displayName": "Ohio",
            "name": "us-east-2",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
        },
        {
            "continentCode": "NA",
            "description": "This region is recommended to serve users in the
 northwestern United States, Alaska, and western Canada",
            "displayName": "Oregon",
            "name": "us-west-2",
            "availabilityZones": [],
            "relationalDatabaseAvailabilityZones": []
```

```
        },
        ...
        }
    ]
}
```

- For API details, see GetRegions in *AWS CLI Command Reference*.

### `get-relational-database-blueprints`

The following code example shows how to use `get-relational-database-blueprints`.

**AWS CLI**

**To get the blueprints for new relational databases**

The following `get-relational-database-blueprints` example displays details about all of the available relational database blueprints that can be used to create new relational databases in Amazon Lightsail.

```
aws lightsail get-relational-database-blueprints
```

Output:

```
{
    "blueprints": [
        {
            "blueprintId": "mysql_5_6",
            "engine": "mysql",
            "engineVersion": "5.6.44",
            "engineDescription": "MySQL Community Edition",
            "engineVersionDescription": "MySQL 5.6.44",
            "isEngineDefault": false
        },
        {
            "blueprintId": "mysql_5_7",
            "engine": "mysql",
            "engineVersion": "5.7.26",
            "engineDescription": "MySQL Community Edition",
            "engineVersionDescription": "MySQL 5.7.26",
            "isEngineDefault": true
```

```
        },
        {
            "blueprintId": "mysql_8_0",
            "engine": "mysql",
            "engineVersion": "8.0.16",
            "engineDescription": "MySQL Community Edition",
            "engineVersionDescription": "MySQL 8.0.16",
            "isEngineDefault": false
        },
        {
            "blueprintId": "postgres_9_6",
            "engine": "postgres",
            "engineVersion": "9.6.15",
            "engineDescription": "PostgreSQL",
            "engineVersionDescription": "PostgreSQL 9.6.15-R1",
            "isEngineDefault": false
        },
        {
            "blueprintId": "postgres_10",
            "engine": "postgres",
            "engineVersion": "10.10",
            "engineDescription": "PostgreSQL",
            "engineVersionDescription": "PostgreSQL 10.10-R1",
            "isEngineDefault": false
        },
        {
            "blueprintId": "postgres_11",
            "engine": "postgres",
            "engineVersion": "11.5",
            "engineDescription": "PostgreSQL",
            "engineVersionDescription": "PostgreSQL 11.5-R1",
            "isEngineDefault": true
        }
    ]
}
```

- For API details, see GetRelationalDatabaseBlueprints in *AWS CLI Command Reference*.

### `get-relational-database-bundles`

The following code example shows how to use `get-relational-database-bundles`.

**AWS CLI**

**To get the bundles for new relational databases**

The following `get-relational-database-bundles` example displays details about all of the available relational database bundles that can be used to create new relational databases in Amazon Lightsail. Note that the response does not include inactive bundles because the `--include-inactive` flag is not specified in the command. You cannot use inactive bundles to create new relational databases.

```
aws lightsail get-relational-database-bundles
```

Output:

```
{
    "bundles": [
        {
            "bundleId": "micro_2_0",
            "name": "Micro",
            "price": 15.0,
            "ramSizeInGb": 1.0,
            "diskSizeInGb": 40,
            "transferPerMonthInGb": 100,
            "cpuCount": 2,
            "isEncrypted": true,
            "isActive": true
        },
        {
            "bundleId": "micro_ha_2_0",
            "name": "Micro with High Availability",
            "price": 30.0,
            "ramSizeInGb": 1.0,
            "diskSizeInGb": 40,
            "transferPerMonthInGb": 100,
            "cpuCount": 2,
            "isEncrypted": true,
            "isActive": true
        },
        {
            "bundleId": "small_2_0",
            "name": "Small",
            "price": 30.0,
            "ramSizeInGb": 2.0,
```

```
            "diskSizeInGb": 80,
            "transferPerMonthInGb": 100,
            "cpuCount": 2,
            "isEncrypted": true,
            "isActive": true
        },
        {
            "bundleId": "small_ha_2_0",
            "name": "Small with High Availability",
            "price": 60.0,
            "ramSizeInGb": 2.0,
            "diskSizeInGb": 80,
            "transferPerMonthInGb": 100,
            "cpuCount": 2,
            "isEncrypted": true,
            "isActive": true
        },
        {
            "bundleId": "medium_2_0",
            "name": "Medium",
            "price": 60.0,
            "ramSizeInGb": 4.0,
            "diskSizeInGb": 120,
            "transferPerMonthInGb": 100,
            "cpuCount": 2,
            "isEncrypted": true,
            "isActive": true
        },
        {
            "bundleId": "medium_ha_2_0",
            "name": "Medium with High Availability",
            "price": 120.0,
            "ramSizeInGb": 4.0,
            "diskSizeInGb": 120,
            "transferPerMonthInGb": 100,
            "cpuCount": 2,
            "isEncrypted": true,
            "isActive": true
        },
        {
            "bundleId": "large_2_0",
            "name": "Large",
            "price": 115.0,
            "ramSizeInGb": 8.0,
```

```
            "diskSizeInGb": 240,
            "transferPerMonthInGb": 200,
            "cpuCount": 2,
            "isEncrypted": true,
            "isActive": true
        },
        {
            "bundleId": "large_ha_2_0",
            "name": "Large with High Availability",
            "price": 230.0,
            "ramSizeInGb": 8.0,
            "diskSizeInGb": 240,
            "transferPerMonthInGb": 200,
            "cpuCount": 2,
            "isEncrypted": true,
            "isActive": true
        }
    ]
}
```

For more information, see Creating a database in Amazon Lightsail in the *Amazon Lightsail Developer Guide*.

- For API details, see GetRelationalDatabaseBundles in *AWS CLI Command Reference*.

### `get-relational-database-events`

The following code example shows how to use `get-relational-database-events`.

#### AWS CLI

**To get the events for a relational database**

The following `get-relational-database-events` example displays details about events in the last 17 hours (1020 minutes) for the specified relational database.

```
aws lightsail get-relational-database-events \
    --relational-database-name Database-1 \
    --duration-in-minutes 1020
```

Output:

```
{
```

```
    "relationalDatabaseEvents": [
        {
            "resource": "Database-1",
            "createdAt": 1571654146.553,
            "message": "Backing up Relational Database",
            "eventCategories": [
                "backup"
            ]
        },
        {
            "resource": "Database-1",
            "createdAt": 1571654249.98,
            "message": "Finished Relational Database backup",
            "eventCategories": [
                "backup"
            ]
        }
    ]
}
```

- For API details, see GetRelationalDatabaseEvents in *AWS CLI Command Reference*.

### `get-relational-database-log-events`

The following code example shows how to use `get-relational-database-log-events`.

**AWS CLI**

**To get log events for a relational database**

The following `get-relational-database-log-events` example displays details about the specified log between `1570733176` and `1571597176` for relational database `Database1`. The information returned is configured to start from `head`.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-relational-database-log-events \
    --relational-database-name Database1 \
    --log-stream-name error \
    --start-from-head \
    --start-time 1570733176 \
    --end-time 1571597176
```

Output:

```
{
    "resourceLogEvents": [
        {
            "createdAt": 1570820267.0,
            "message": "2019-10-11 18:57:47 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Name or service not known"
        },
        {
            "createdAt": 1570860974.0,
            "message": "2019-10-12 06:16:14 20969 [Warning] IP address '8192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860977.0,
            "message": "2019-10-12 06:16:17 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860979.0,
            "message": "2019-10-12 06:16:19 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860981.0,
            "message": "2019-10-12 06:16:21 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860982.0,
            "message": "2019-10-12 06:16:22 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860984.0,
            "message": "2019-10-12 06:16:24 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
        {
            "createdAt": 1570860986.0,
            "message": "2019-10-12 06:16:26 20969 [Warning] IP address '192.0.2.0'
 could not be resolved: Temporary failure in name resolution"
        },
```

```
        ...
        }
    ],
    "nextBackwardToken":
 "eEXAMPLEZXJUZXh0IjoiZnRWb3F3cUpRSlQ5NndMYThxelRUZlFhR3J6c2dKWEEvM2kvajZMZzVVVWpqRDN0YjFXTj

 "eEXAMPLEZXJUZXh0IjoiT09Lb0Z6ZFRJbHhaNEQ5N2tPbkkwRmwwNUxPZjFTbFFwUklQbzlSaWgvMWVXbEk4aG56VH
}
```

- For API details, see GetRelationalDatabaseLogEvents in *AWS CLI Command Reference*.

### `get-relational-database-log-streams`

The following code example shows how to use `get-relational-database-log-streams`.

#### AWS CLI

**To get the log streams for a relational database**

The following `get-relational-database-log-streams` example returns all of the available log streams for the specified relational database.

```
aws lightsail get-relational-database-log-streams \
--relational-database-name Database1
```

Output:

```
{
    "logStreams": [
        "audit",
        "error",
        "general",
        "slowquery"
    ]
}
```

- For API details, see GetRelationalDatabaseLogStreams in *AWS CLI Command Reference*.

### `get-relational-database-master-user-password`

The following code example shows how to use `get-relational-database-master-user-password`.

**AWS CLI**

**To get the master user password for a relational database**

The following `get-relational-database-master-user-password` example returns information about the master user password for the specified relational database.

```
aws lightsail get-relational-database-master-user-password \
    --relational-database-name Database-1
```

Output:

```
{
    "masterUserPassword": "VEXAMPLEec.9qvx,_t<)Wkf)kwboM,>2",
    "createdAt": 1571259453.959
}
```

- For API details, see GetRelationalDatabaseMasterUserPassword in *AWS CLI Command Reference*.

### `get-relational-database-metric-data`

The following code example shows how to use `get-relational-database-metric-data`.

**AWS CLI**

**To get metric data for a relational database**

The following `get-relational-database-metric-data` example returns the count sum of the metric `DatabaseConnections` over the period of 24 hours (`86400` seconds) between `1570733176` and `1571597176` for relational database `Database1`.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-relational-database-metric-data \
    --relational-database-name Database1 \
```

```
    --metric-name DatabaseConnections \
    --period 86400 \
    --start-time 1570733176 \
    --end-time 1571597176 \
    --unit Count \
    --statistics Sum
```

Output:

```
{
    "metricName": "DatabaseConnections",
    "metricData": [
        {
            "sum": 1.0,
            "timestamp": 1571510760.0,
            "unit": "Count"
        },
        {
            "sum": 1.0,
            "timestamp": 1570733160.0,
            "unit": "Count"
        },
        {
            "sum": 1.0,
            "timestamp": 1570992360.0,
            "unit": "Count"
        },
        {
            "sum": 0.0,
            "timestamp": 1571251560.0,
            "unit": "Count"
        },
        {
            "sum": 721.0,
            "timestamp": 1570819560.0,
            "unit": "Count"
        },
        {
            "sum": 1.0,
            "timestamp": 1571078760.0,
            "unit": "Count"
        },
        {
```

```
            "sum": 2.0,
            "timestamp": 1571337960.0,
            "unit": "Count"
        },
        {
            "sum": 684.0,
            "timestamp": 1570905960.0,
            "unit": "Count"
        },
        {
            "sum": 0.0,
            "timestamp": 1571165160.0,
            "unit": "Count"
        },
        {
            "sum": 1.0,
            "timestamp": 1571424360.0,
            "unit": "Count"
        }
    ]
}
```

- For API details, see GetRelationalDatabaseMetricData in *AWS CLI Command Reference*.

### `get-relational-database-parameters`

The following code example shows how to use `get-relational-database-parameters`.

#### AWS CLI

**To get parameters for a relational database**

The following `get-relational-database-parameters` example returns information about all of the available parameters for the specified relational database.

```
aws lightsail get-relational-database-parameters \
    --relational-database-name Database-1
```

Output:

```
{
    "parameters": [
```

```
        {
            "allowedValues": "0,1",
            "applyMethod": "pending-reboot",
            "applyType": "dynamic",
            "dataType": "boolean",
            "description": "Automatically set all granted roles as active after the
user has authenticated successfully.",
            "isModifiable": true,
            "parameterName": "activate_all_roles_on_login",
            "parameterValue": "0"
        },
        {
            "allowedValues": "0,1",
            "applyMethod": "pending-reboot",
            "applyType": "static",
            "dataType": "boolean",
            "description": "Controls whether user-defined functions that have only
an xxx symbol for the main function can be loaded",
            "isModifiable": false,
            "parameterName": "allow-suspicious-udfs"
        },
        {
            "allowedValues": "0,1",
            "applyMethod": "pending-reboot",
            "applyType": "dynamic",
            "dataType": "boolean",
            "description": "Sets the autocommit mode",
            "isModifiable": true,
            "parameterName": "autocommit"
        },
        {
            "allowedValues": "0,1",
            "applyMethod": "pending-reboot",
            "applyType": "static",
            "dataType": "boolean",
            "description": "Controls whether the server autogenerates SSL key and
certificate files in the data directory, if they do not already exist.",
            "isModifiable": false,
            "parameterName": "auto_generate_certs"
        },
        ...
        }
    ]
```

```
}
```

For more information, see Updating database parameters in Amazon Lightsail in the *Lightsail Dev Guide*.

- For API details, see GetRelationalDatabaseParameters in *AWS CLI Command Reference*.

### `get-relational-database-snapshot`

The following code example shows how to use `get-relational-database-snapshot`.

**AWS CLI**

**To get information about a relational database snapshot**

The following `get-relational-database-snapshot` example displays details about the specified relational database snapshot.

```
aws lightsail get-relational-database-snapshot \
    --relational-database-snapshot-name Database-1-1571350042
```

Output:

```
{
    "relationalDatabaseSnapshot": {
        "name": "Database-1-1571350042",
        "arn": "arn:aws:lightsail:us-

        "fromRelationalDatabaseBundleId": "micro_1_0",
        "fromRelationalDatabaseBlueprintId": "mysql_8_0"
    }
}
```

- For API details, see GetRelationalDatabaseSnapshot in *AWS CLI Command Reference*.

### `get-relational-database-snapshots`

The following code example shows how to use `get-relational-database-snapshots`.

#### AWS CLI

**To get information about all relational database snapshots**

The following `get-relational-database-snapshots` example displays details about all of the relational database snapshots in the configured AWS Region.

```
aws lightsail get-relational-database-snapshots
```

Output:

```
{
    "relationalDatabaseSnapshots": [
        {
            "name": "Database-1-1571350042",

        }
    ]
}
```

- For API details, see GetRelationalDatabases in *AWS CLI Command Reference*.

### `get-static-ip`

The following code example shows how to use `get-static-ip`.

#### AWS CLI

**To get information about a static IP**

The following `get-static-ip` example displays details about the specified static IP.

```
aws lightsail get-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
```

```
    "staticIp": {
        "name": "StaticIp-1",
        "arn": "arn:aws:lightsail:us-
west-2:111122223333:StaticIp/2257cd76-1f0e-4ac0-82e2-2EXAMPLE23ad",
        "supportCode": "6EXAMPLE3362/192.0.2.0",
        "createdAt": 1571071325.076,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "resourceType": "StaticIp",
        "ipAddress": "192.0.2.0",
        "isAttached": false
    }
}
```

- For API details, see GetStaticIp in *AWS CLI Command Reference*.

### `get-static-ips`

The following code example shows how to use `get-static-ips`.

#### AWS CLI

**To get information about all static IPs**

The following `get-static-ips` example displays details about all of the static IPs in the configured AWS Region.

```
aws lightsail get-static-ips
```

Output:

```
{
    "staticIps": [
        {
            "name": "StaticIp-1",
            "arn": "arn:aws:lightsail:us-
west-2:111122223333:StaticIp/2257cd76-1f0e-4ac0-8EXAMPLE16f9423ad",
            "supportCode": "6EXAMPLE3362/192.0.2.0",
            "createdAt": 1571071325.076,
            "location": {
```

```
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "resourceType": "StaticIp",
            "ipAddress": "192.0.2.0",
            "isAttached": false
        },
        {
            "name": "StaticIP-2",
            "arn": "arn:aws:lightsail:us-west-2:111122223333:StaticIp/c61edb40-
e5f0-4fd6-ae7c-8EXAMPLE19f8",
            "supportCode": "6EXAMPLE3362/192.0.2.2",
            "createdAt": 1568305385.681,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "resourceType": "StaticIp",
            "ipAddress": "192.0.2.2",
            "attachedTo": "WordPress-1",
            "isAttached": true
        }
    ]
}
```

- For API details, see GetStaticIps in *AWS CLI Command Reference*.

### `is-vpc-peered`

The following code example shows how to use `is-vpc-peered`.

#### AWS CLI

**To identify if your Amazon Lightsail virtual private cloud is peered**

The following `is-vpc-peered` example returns the peering status of the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```
aws lightsail is-vpc-peered \
    --region us-west-2
```

Output:

```
{
    "isPeered": true
}
```

- For API details, see IsVpcPeered in *AWS CLI Command Reference*.

### `open-instance-public-ports`

The following code example shows how to use `open-instance-public-ports`.

#### AWS CLI

**To open firewall ports for an instance**

The following `open-instance-public-ports` example opens TCP port 22 on the specified instance.

```
aws lightsail open-instance-public-ports \
    --instance-name MEAN-2 \
    --port-info fromPort=22,protocol=TCP,toPort=22
```

Output:

```
{
    "operation": {
        "id": "719744f0-a022-46f2-9f11-6EXAMPLE4642",
        "resourceName": "MEAN-2",
        "resourceType": "Instance",
        "createdAt": 1571072906.849,
        "location": {
            "availabilityZone": "us-west-2a",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationDetails": "22/tcp",
        "operationType": "OpenInstancePublicPorts",
        "status": "Succeeded",
        "statusChangedAt": 1571072906.849
    }
}
```

- For API details, see OpenInstancePublicPorts in *AWS CLI Command Reference*.

### `peer-vpc`

The following code example shows how to use `peer-vpc`.

#### AWS CLI

**To peer the Amazon Lightsail virtual private cloud**

The following `peer-vpc` example peers the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```
aws lightsail peer-vpc \
    --region us-west-2
```

Output:

```
{
    "operation": {
        "id": "787e846a-54ac-497f-bce2-9EXAMPLE5d91",
        "resourceName": "vpc-0EXAMPLEa5261efb3",

    }
}
```

- For API details, see PeerVpc in *AWS CLI Command Reference*.

### `reboot-instance`

The following code example shows how to use `reboot-instance`.

#### AWS CLI

**To reboot an instance**

The following `reboot-instance` example reboots the specified instance.

```
aws lightsail reboot-instance \
    --instance-name MEAN-1
```

Output:

```
{
    "operations": [
        {
            "id": "2b679f1c-8b71-4bb4-8e97-8EXAMPLEed93",
            "resourceName": "MEAN-1",
            "resourceType": "Instance",
            "createdAt": 1571694445.49,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationDetails": "",
            "operationType": "RebootInstance",
            "status": "Succeeded",
            "statusChangedAt": 1571694445.49
        }
    ]
}
```

- For API details, see RebootInstance in *AWS CLI Command Reference*.

### `reboot-relational-database`

The following code example shows how to use `reboot-relational-database`.

#### AWS CLI

**To reboot a relational database**

The following `reboot-relational-database` example reboots the specified relational database.

```
aws lightsail reboot-relational-database \
```

```
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "e4c980c0-3137-496c-9c91-1EXAMPLEdec2",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1571694532.91,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationDetails": "",
            "operationType": "RebootRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1571694532.91
        }
    ]
}
```

- For API details, see RebootRelationalDatabase in *AWS CLI Command Reference*.

## `release-static-ip`

The following code example shows how to use `release-static-ip`.

### AWS CLI

#### To delete a static IP

The following `release-static-ip` example deletes the specified static IP.

```
aws lightsail release-static-ip \
    --static-ip-name StaticIp-1
```

Output:

```
{
```

```
    "operations": [
        {
            "id": "e374c002-dc6d-4c7f-919f-2EXAMPLE13ce",
            "resourceName": "StaticIp-1",
            "resourceType": "StaticIp",
            "createdAt": 1571694962.003,
            "location": {
                "availabilityZone": "all",
                "regionName": "us-west-2"
            },
            "isTerminal": true,
            "operationType": "ReleaseStaticIp",
            "status": "Succeeded",
            "statusChangedAt": 1571694962.003
        }
    ]
}
```

- For API details, see ReleaseStaticIp in *AWS CLI Command Reference*.

### `start-instance`

The following code example shows how to use `start-instance`.

#### AWS CLI

##### To start an instance

The following `start-instance` example starts the specified instance.

```
aws lightsail start-instance \
    --instance-name WordPress-1
```

Output:

```
{
    "operations": [
        {
            "id": "f88d2a93-7cea-4165-afce-2d688cb18f23",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1571695583.463,
```

```
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StartInstance",
            "status": "Started",
            "statusChangedAt": 1571695583.463
        }
    ]
}
```

- For API details, see StartInstance in *AWS CLI Command Reference*.

### `start-relational-database`

The following code example shows how to use `start-relational-database`.

#### AWS CLI

**To start a relational database**

The following `start-relational-database` example starts the specified relational database.

```
aws lightsail start-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "4d5294ec-a38a-4fda-9e37-aEXAMPLE0d24",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1571695998.822,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
```

```
            "operationType": "StartRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1571695998.822
        }
    ]
}
```

- For API details, see StartRelationalDatabase in *AWS CLI Command Reference*.

### `stop-instance`

The following code example shows how to use `stop-instance`.

#### AWS CLI

**To stop an instance**

The following `stop-instance` example stops the specified instance.

```
aws lightsail stop-instance \
--instance-name WordPress-1
```

Output:

```
{
    "operations": [
        {
            "id": "265357e2-2943-4d51-888a-1EXAMPLE7585",
            "resourceName": "WordPress-1",
            "resourceType": "Instance",
            "createdAt": 1571695471.134,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StopInstance",
            "status": "Started",
            "statusChangedAt": 1571695471.134
        }
    ]
}
```

- For API details, see StopInstance in *AWS CLI Command Reference*.

### `stop-relational-database`

The following code example shows how to use `stop-relational-database`.

**AWS CLI**

**To stop a relational database**

The following `stop-relational-database` example stops the specified relational database.

```
aws lightsail stop-relational-database \
    --relational-database-name Database-1
```

Output:

```
{
    "operations": [
        {
            "id": "cc559c19-4adb-41e4-b75b-5EXAMPLE4e61",
            "resourceName": "Database-1",
            "resourceType": "RelationalDatabase",
            "createdAt": 1571695526.29,
            "location": {
                "availabilityZone": "us-west-2a",
                "regionName": "us-west-2"
            },
            "isTerminal": false,
            "operationType": "StopRelationalDatabase",
            "status": "Started",
            "statusChangedAt": 1571695526.29
        }
    ]
}
```

- For API details, see StopRelationalDatabase in *AWS CLI Command Reference*.

### `unpeer-vpc`

The following code example shows how to use `unpeer-vpc`.

**AWS CLI**

**To unpeer the Amazon Lightsail virtual private cloud**

The following `unpeer-vpc` example unpeers the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```
aws lightsail unpeer-vpc \
    --region us-west-2
```

Output:

```
{
    "operation": {
        "id": "531aca64-7157-47ab-84c6-eEXAMPLEd898",
        "resourceName": "vpc-0EXAMPLEa5261efb3",
        "resourceType": "PeeredVpc",
        "createdAt": 1571694109.945,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "isTerminal": true,
        "operationDetails": "vpc-e2b3eb9b",
        "operationType": "UnpeeredVpc",
        "status": "Succeeded",
        "statusChangedAt": 1571694109.945
    }
}
```

- For API details, see UnpeerVpc in *AWS CLI Command Reference*.

## Macie examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Macie.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `describe-buckets`

The following code example shows how to use `describe-buckets`.

**AWS CLI**

**To query data about one or more S3 buckets that Amazon Macie monitors and analyzes for your account**

The following `describe-buckets` example queries metadata for all S3 buckets whose names begin with MY-S3 and are in the current AWS Region.

```
aws macie2 describe-buckets \
    --criteria '{"bucketName":{"prefix":"my-S3"}}'
```

Output:

```
{
    "buckets": [
        {
            "accountId": "123456789012",
            "allowsUnencryptedObjectUploads": "FALSE",

# Amazon Managed Grafana examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Managed Grafana.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

## Actions

### `list-workspaces`

The following code example shows how to use `list-workspaces`.

**AWS CLI**

**To list workspaces for the account in the Region specified by the user credential**

The following `list-workspaces` example lists Grafana workspaces for the account's Region.

```
aws grafana list-workspaces
```

Output:

```
{
    "workspaces": [
        {
            "authentication": {
                "providers": [
```

```
                    "AWS_SSO"
                ]
            },
            "created": "2022-04-04T16:20:21.796000-07:00",
            "description": "to test tags",
            "endpoint": "g-949e7b44df.grafana-workspace.us-east-1.amazonaws.com",
            "grafanaVersion": "8.2",
            "id": "g-949e7b44df",
            "modified": "2022-04-04T16:20:21.796000-07:00",
            "name": "testtag2",
            "notificationDestinations": [
                "SNS"
            ],
            "status": "ACTIVE"
        },
        {
            "authentication": {
                "providers": [
                    "AWS_SSO"
                ]
            },
            "created": "2022-04-20T10:22:15.115000-07:00",
            "description": "ww",

## Actions

### `add-flow-outputs`

The following code example shows how to use `add-flow-outputs`.

**AWS CLI**

**To add outputs to a flow**

The following `add-flow-outputs` example adds outputs to the specified flow.

```
aws mediaconnect add-flow-outputs \
--flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
--outputs Description='NYC
 stream',Destination=192.0.2.12,Name=NYC,Port=3333,Protocol=rtp-
fec,SmoothingLatency=100 Description='LA
 stream',Destination=203.0.113.9,Name=LA,Port=4444,Protocol=rtp-
fec,SmoothingLatency=100
```

Output:

```
{
    "Outputs": [
        {
            "Port": 3333,
            "OutputArn": "arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC",
```

```
            "Name": "NYC",
            "Description": "NYC stream",
            "Destination": "192.0.2.12",
            "Transport": {
                "Protocol": "rtp-fec",
                "SmoothingLatency": 100
            }
        },
        {
            "Port": 4444,
            "OutputArn": "arn:aws:mediaconnect:us-
east-1:111122223333:output:2-987655dEF67hiJ89-c34de5fG678h:LA",
            "Name": "LA",
            "Description": "LA stream",
            "Destination": "203.0.113.9",
            "Transport": {
                "Protocol": "rtp-fec",
                "SmoothingLatency": 100
            }
        }
    ],
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame"
}
```

For more information, see Adding Outputs to a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see AddFlowOutputs in *AWS CLI Command Reference*.

### `create-flow`

The following code example shows how to use `create-flow`.

#### AWS CLI

**To create a flow**

The following `create-flow` example creates a flow with the specified configuration.

```
aws mediaconnect create-flow \
    --availability-zone us-west-2c \
    --name ExampleFlow \
```

```
    --source Description='Example source,
 backup',IngestPort=1055,Name=BackupSource,Protocol=rtp,WhitelistCidr=10.24.34.0/23
```

Output:

```
{
    "Flow": {
        "FlowArn": "arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:ExampleFlow",
        "AvailabilityZone": "us-west-2c",
        "EgressIp": "54.245.71.21",
        "Source": {
            "IngestPort": 1055,
            "SourceArn": "arn:aws:mediaconnect:us-
east-1:123456789012:source:2-3aBC45dEF67hiJ89-c34de5fG678h:BackupSource",
            "Transport": {
                "Protocol": "rtp",
                "MaxBitrate": 80000000
            },
            "Description": "Example source, backup",
            "IngestIp": "54.245.71.21",
            "WhitelistCidr": "10.24.34.0/23",
            "Name": "mySource"
        },
        "Entitlements": [],
        "Name": "ExampleFlow",
        "Outputs": [],
        "Status": "STANDBY",
        "Description": "Example source, backup"
    }
}
```

For more information, see Creating a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see CreateFlow in *AWS CLI Command Reference*.

### `delete-flow`

The following code example shows how to use `delete-flow`.

#### AWS CLI

**To delete a flow**

The following `delete-flow` example deletes the specified flow.

```
aws mediaconnect delete-flow \
    --flow-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
    "Status": "DELETING"
}
```

For more information, see Deleting a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see DeleteFlow in *AWS CLI Command Reference*.

### `describe-flow`

The following code example shows how to use `describe-flow`.

#### AWS CLI

**To view the details of a flow**

The following `describe-flow` example displays the specified flow's details, such as ARN, Availability Zone, status, source, entitlements, and outputs.

```
aws mediaconnect describe-flow \
    --flow-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{
    "Flow": {
        "EgressIp": "54.201.4.39",
        "AvailabilityZone": "us-west-2c",
        "Status": "ACTIVE",
        "FlowArn": "arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
```

```
        "Entitlements": [
            {
                "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:123456789012:entitlement:1-AaBb11CcDd22EeFf-34DE5fG12AbC:MyEntitlement",
                "Description": "Assign to this account",
                "Name": "MyEntitlement",
                "Subscribers": [
                    "444455556666"
                ]
            }
        ],
        "Description": "NYC awards show",
        "Name": "AwardsShow",
        "Outputs": [
            {
                "Port": 2355,
                "Name": "NYC",
                "Transport": {
                    "SmoothingLatency": 0,
                    "Protocol": "rtp-fec"
                },
                "OutputArn": "arn:aws:mediaconnect:us-
east-1:123456789012:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC",
                "Destination": "192.0.2.0"
            },
            {
                "Port": 3025,
                "Name": "LA",
                "Transport": {
                    "SmoothingLatency": 0,
                    "Protocol": "rtp-fec"
                },
                "OutputArn": "arn:aws:mediaconnect:us-
east-1:123456789012:output:2-987655dEF67hiJ89-c34de5fG678h:LA",
                "Destination": "192.0.2.0"
            }
        ],
        "Source": {
            "IngestIp": "54.201.4.39",
            "SourceArn": "arn:aws:mediaconnect:us-
east-1:123456789012:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource",
            "Transport": {
                "MaxBitrate": 80000000,
                "Protocol": "rtp"
```

```
            },
            "IngestPort": 1069,
            "Description": "Saturday night show",
            "Name": "ShowSource",
            "WhitelistCidr": "10.24.34.0/23"
        }
    }
}
```

For more information, see Viewing the Details of a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see DescribeFlow in *AWS CLI Command Reference*.

### `grant-flow-entitlements`

The following code example shows how to use `grant-flow-entitlements`.

**AWS CLI**

**To grant an entitlement on a flow**

The following `grant-flow-entitlements` example grants an entitlement to the specified existing flow to share your content with another AWS account.

```
aws mediaconnect grant-flow-entitlements \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --entitlements Description='For
 AnyCompany',Encryption={"Algorithm=aes128,KeyType=static-
key,RoleArn=arn:aws:iam::111122223333:role/MediaConnect-
ASM,SecretArn=arn:aws:secretsmanager:us-
west-2:111122223333:secret:mySecret1"},Name=AnyCompany_Entitlement,Subscribers=444455556666
 Description='For Example Corp',Name=ExampleCorp,Subscribers=777788889999
```

Output:

```
{
    "Entitlements": [
        {
            "Name": "AnyCompany_Entitlement",
```

```
            "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement",
            "Subscribers": [
                "444455556666"
            ],
            "Description": "For AnyCompany",
            "Encryption": {
                "SecretArn": "arn:aws:secretsmanager:us-
west-2:111122223333:secret:mySecret1",
                "Algorithm": "aes128",
                "RoleArn": "arn:aws:iam::111122223333:role/MediaConnect-ASM",
                "KeyType": "static-key"
            }
        },
        {
            "Name": "ExampleCorp",
            "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-3333cccc4444dddd-1111aaaa2222:ExampleCorp",
            "Subscribers": [
                "777788889999"
            ],
            "Description": "For Example Corp"
        }
    ],
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame"
}
```

For more information, see Granting an Entitlement on a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see GrantFlowEntitlements in *AWS CLI Command Reference*.

## `list-entitlements`

The following code example shows how to use `list-entitlements`.

### AWS CLI

#### To view a list of entitlements

The following `list-entitlements` example displays a list of all entitlements that have been granted to the account.

```
aws mediaconnect list-entitlements
```

Output:

```
{
    "Entitlements": [
        {
            "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:MyEntitlement",
            "EntitlementName": "MyEntitlement"
        }
    ]
}
```

For more information, see ListEntitlements in the *AWS Elemental MediaConnect API Reference*.

- For API details, see ListEntitlements in *AWS CLI Command Reference*.

### `list-flows`

The following code example shows how to use `list-flows`.

#### AWS CLI

**To view a list of flows**

The following `list-flows` example displays a list of flows.

```
aws mediaconnect list-flows
```

Output:

```
{
    "Flows": [
        {
            "Status": "STANDBY",
            "SourceType": "OWNED",
            "AvailabilityZone": "us-west-2a",
            "Description": "NYC awards show",
            "Name": "AwardsShow",
```

```
            "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow"
        },
        {
            "Status": "STANDBY",
            "SourceType": "OWNED",
            "AvailabilityZone": "us-west-2c",
            "Description": "LA basketball game",
            "Name": "BasketballGame",
            "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame"
        }
    ]
}
```

For more information, see Viewing a List of Flows in the *AWS Elemental MediaConnect User Guide*.

- For API details, see ListFlows in *AWS CLI Command Reference*.

## `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

### AWS CLI

#### To list tags for a MediaConnect resource

The following `list-tags-for-resource` example displays the tag keys and values associated with the specified MediaConnect resource.

```
aws mediaconnect list-tags-for-resource \
    --resource-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame
```

Output:

```
{
    "Tags": {
        "region": "west",
        "stage": "prod"
    }
```

```
}
```

For more information, see ListTagsForResource, TagResource, UntagResource in the *AWS Elemental MediaConnect API Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `remove-flow-output`

The following code example shows how to use `remove-flow-output`.

**AWS CLI**

**To remove an output from a flow**

The following `remove-flow-output` example removes an output from the specified flow.

```
aws mediaconnect remove-flow-output \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --output-arn arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "OutputArn": "arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC"
}
```

For more information, see Removing Outputs from a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see RemoveFlowOutput in *AWS CLI Command Reference*.

### `revoke-flow-entitlement`

The following code example shows how to use `revoke-flow-entitlement`.

**AWS CLI**
