**To revoke an entitlement**

The following `revoke-flow-entitlement` example revokes an entitlement on the specified flow.

```
aws mediaconnect revoke-flow-entitlement \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --entitlement-arn arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement"
}
```

For more information, see Revoking an Entitlement in the *AWS Elemental MediaConnect User Guide*.

- For API details, see RevokeFlowEntitlement in *AWS CLI Command Reference*.

## `start-flow`

The following code example shows how to use `start-flow`.

**AWS CLI**

**To start a flow**

The following `start-flow` example starts the specified flow.

```
aws mediaconnect start-flow \
    --flow-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

This command produces no output. Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
    "Status": "STARTING"
}
```

For more information, see Starting a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see StartFlow in *AWS CLI Command Reference*.

### `stop-flow`

The following code example shows how to use `stop-flow`.

#### AWS CLI

**To stop a flow**

The following `stop-flow` example stops the specified flow.

```
aws mediaconnect stop-flow \
    --flow-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{
    "Status": "STOPPING",
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow"
}
```

For more information, see Stopping a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see StopFlow in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add tags to a MediaConnect resource**

The following `tag-resource` example adds a tag with a key name and value to the specified MediaConnect resource.

```
aws mediaconnect tag-resource \
    --resource-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame
    --tags region=west
```

This command produces no output.

For more information, see ListTagsForResource, TagResource, UntagResource in the *AWS Elemental MediaConnect API Reference*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a MediaConnect resource**

The following `untag-resource` example remove the tag with the specified key name and its associated value from a MediaConnect resource.

```
aws mediaconnect untag-resource \
    --resource-arn arn:aws:mediaconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame \
    --tag-keys region
```

This command produces no output.

For more information, see ListTagsForResource, TagResource, UntagResource in the *AWS Elemental MediaConnect API Reference*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-flow-entitlement`

The following code example shows how to use `update-flow-entitlement`.

#### AWS CLI

##### To update an entitlement

The following `update-flow-entitlement` example updates the specified entitlement with a new description and subscriber.

```
aws mediaconnect update-flow-entitlement \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --entitlement-arn arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement
 \
    --description 'For AnyCompany Affiliate' \
    --subscribers 777788889999
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "Entitlement": {
        "Name": "AnyCompany_Entitlement",
        "Description": "For AnyCompany Affiliate",
        "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement",
        "Encryption": {
            "KeyType": "static-key",
            "Algorithm": "aes128",
            "RoleArn": "arn:aws:iam::111122223333:role/MediaConnect-ASM",
            "SecretArn": "arn:aws:secretsmanager:us-
west-2:111122223333:secret:mySecret1"
        },
        "Subscribers": [
            "777788889999"
        ]
    }
}
```

For more information, see Updating an Entitlement in the *AWS Elemental MediaConnect User Guide*.

- For API details, see UpdateFlowEntitlement in *AWS CLI Command Reference*.

### `update-flow-output`

The following code example shows how to use `update-flow-output`.

#### AWS CLI

**To update an output on a flow**

The following `update-flow-output` example update an output on the specified flow.

```
aws mediaconnect update-flow-output \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
    --output-arn arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC \
    --port 3331
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
    "Output": {
        "Name": "NYC",
        "Port": 3331,
        "Description": "NYC stream",
        "Transport": {
            "Protocol": "rtp-fec",
            "SmoothingLatency": 100
        },
        "OutputArn": "arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC",
        "Destination": "192.0.2.12"
    }
}
```

For more information, see Updating Outputs on a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see UpdateFlowOutput in *AWS CLI Command Reference*.

### `update-flow-source`

The following code example shows how to use `update-flow-source`.

**AWS CLI**

**To update the source of an existing flow**

The following `update-flow-source` example updates the source of an existing flow.

```
aws mediaconnect update-flow-source \
    --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow \
    --source-arn arn:aws:mediaconnect:us-
east-1:111122223333:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource \
    --description 'Friday night show' \
    --ingest-port 3344 \
    --protocol rtp-fec \
    --whitelist-cidr 10.24.34.0/23
```

Output:

```
{
    "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
    "Source": {
        "IngestIp": "34.210.136.56",
        "WhitelistCidr": "10.24.34.0/23",
        "Transport": {
            "Protocol": "rtp-fec"
        },
        "IngestPort": 3344,
        "Name": "ShowSource",
        "Description": "Friday night show",
        "SourceArn": "arn:aws:mediaconnect:us-
east-1:111122223333:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource"
    }
}
```

For more information, see Updating the Source of a Flow in the *AWS Elemental MediaConnect User Guide*.

- For API details, see UpdateFlowSource in *AWS CLI Command Reference*.

## MediaConvert examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaConvert.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `cancel-job`

The following code example shows how to use `cancel-job`.

**AWS CLI**

**To cancel a job that is in a queue**

The following `cancel-job` example cancels the job with ID `1234567891234-abc123`. You can't cancel a job that the service has started processing.

```
aws mediaconvert cancel-job \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --id 1234567891234-abc123
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see Working with AWS Elemental MediaConvert Jobs in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CancelJob in *AWS CLI Command Reference*.

### `create-job-template`

The following code example shows how to use `create-job-template`.

**AWS CLI**

**To create a job template**

The following `create-job-template` example creates a job template with the transcoding settings that are specified in the file `job-template.json` that resides on your system.

```
aws mediaconvert create-job-template \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --name JobTemplate1 \
    --cli-input-json file://~/job-template.json
```

If you create your job template JSON file by using `get-job-template` and then modifying the file, remove the `JobTemplate` object, but keep the Settings child object inside it. Also, make sure to remove the following key-value pairs: `LastUpdated`, `Arn`, `Type`, and `CreatedAt`. You can specific the category, description, name, and queue either in the JSON file or at the command line.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON specification for the job template that you created.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreateJobTemplate in *AWS CLI Command Reference*.

### `create-job`

The following code example shows how to use `create-job`.

**AWS CLI**

**To create a job**

The following `create-job` example creates a transcoding job with the settings that are specified in a file `job.json` that resides on the system that you send the command from. This JSON job specification might specify each setting individually, reference a job template, or reference output presets.

```
aws mediaconvert create-job \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --cli-input-json file://~/job.json
```

You can use the AWS Elemental MediaConvert console to generate the JSON job specification by choosing your job settings, and then choosing **Show job JSON** at the bottom of the **Job** section.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON job specification that you sent with your request.

For more information, see Working with AWS Elemental MediaConvert Jobs in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreateJob in *AWS CLI Command Reference*.

### `create-preset`

The following code example shows how to use `create-preset`.

**AWS CLI**

**To create a custom output preset**

The following `create-preset` example creates a custom output preset based on the output settings that are specified in the file `preset.json`. You can specify the category, description, and name either in the JSON file or at the command line.

```
aws mediaconvert create-preset \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com
    --region region-name-1 \
    --cli-input-json file://~/preset.json
```

If you create your preset JSON file by using `get-preset` and then modifying the output file, ensure that you remove the following key-value pairs: `LastUpdated`, `Arn`, `Type`, and `CreatedAt`.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreatePreset in *AWS CLI Command Reference*.

### `create-queue`

The following code example shows how to use `create-queue`.

**AWS CLI**

**To create a custom queue**

The following `create-queue` example creates a custom transcoding queue.

```
aws mediaconvert create-queue \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --name Queue1 \
    --description "Keep this queue empty unless job is urgent."
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

Output:

```
{
    "Queue": {
        "Status": "ACTIVE",
        "Name": "Queue1",
        "LastUpdated": 1518034928,
        "Arn": "arn:aws:mediaconvert:region-name-1:012345678998:queues/Queue1",
        "Type": "CUSTOM",
        "CreatedAt": 1518034928,
        "Description": "Keep this queue empty unless job is urgent."
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see CreateQueue in *AWS CLI Command Reference*.

### `delete-job-template`

The following code example shows how to use `delete-job-template`.

#### AWS CLI

**To delete a job template**

The following `delete-job-template` example deletes the specified custom job template.

```
aws mediaconvert delete-job-template \
    --name "DASH Streaming" \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-job-templates` to confirm that your template was deleted.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see DeleteJobTemplate in *AWS CLI Command Reference*.

### `delete-preset`

The following code example shows how to use `delete-preset`.

**AWS CLI**

**To delete a custom on-demand queue**

The following `delete-preset` example deletes the specified custom preset.

```
aws mediaconvert delete-preset \
    --name SimpleMP4 \
    --endpoint-url  https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-presets` to confirm that your preset was deleted.

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see DeletePreset in *AWS CLI Command Reference*.

### `delete-queue`

The following code example shows how to use `delete-queue`.

**AWS CLI**

**To delete a custom on-demand queue**

The following `delete-queue` example deletes the specified custom on-demand queue.

You can't delete your default queue. You can't delete a reserved queue that has an active pricing plan or that contains unprocessed jobs.

```
aws mediaconvert delete-queue \
    --name Customer1 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-queues` to confirm that your queue was deleted.

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see DeleteQueue in *AWS CLI Command Reference*.

### `describe-endpoints`

The following code example shows how to use `describe-endpoints`.

**AWS CLI**

**To get your account-specific endpoint**

The following `describe-endpoints` example retrieves the endpoint that you need to send any other request to the service.

```
aws mediaconvert describe-endpoints
```

Output:

```
{
    "Endpoints": [
        {
            "Url": "https://abcd1234.mediaconvert.region-name-1.amazonaws.com"
        }
    ]
}
```

For more information, see Getting Started with MediaConvert Using the API in the *AWS Elemental MediaConvert API Reference*.

- For API details, see DescribeEndpoints in *AWS CLI Command Reference*.

### `get-job-template`

The following code example shows how to use `get-job-template`.

**AWS CLI**

**To get details for a job template**

The following `get-job-template` example displays the JSON definition of the specified custom job template.

```
aws mediaconvert get-job-template \
    --name "DASH Streaming" \
    --endpoint-url https://abcd1234.mediaconvert.us-east-1.amazonaws.com
```

Output:

```
{
    "JobTemplate": {
        "StatusUpdateInterval": "SECONDS_60",
        "LastUpdated": 1568652998,
        "Description": "Create a DASH streaming ABR stack",
        "CreatedAt": 1568652998,
        "Priority": 0,
        "Name": "DASH Streaming",
        "Settings": {
            ...<truncatedforbrevity>...
        },
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:jobTemplates/DASH
 Streaming",
        "Type": "CUSTOM"
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see GetJobTemplate in *AWS CLI Command Reference*.

### `get-job`

The following code example shows how to use `get-job`.

#### AWS CLI

**To get details for a particular job**

The following example requests the information for the job with ID `1234567890987-1ab2c3`, which in this example ended in an error.

```
aws mediaconvert get-job \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1 \
    --id 1234567890987-1ab2c3
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns a JSON file with job information, including job settings, any returned errors, and other job data, as follows:

```
{
    "Job": {
        "Status": "ERROR",
        "Queue": "arn:aws:mediaconvert:region-name-1:012345678998:queues/Queue1",
        "Settings": {
            ...<truncated for brevity>...
        },
        "ErrorMessage": "Unable to open input file [s3://my-input-bucket/file-
name.mp4]: [Failed probe/open: [Failed to read data: AssumeRole failed]]",
        "ErrorCode": 1434,
        "Role": "arn:aws:iam::012345678998:role/MediaConvertServiceRole",
        "Arn": "arn:aws:mediaconvert:us-
west-1:012345678998:jobs/1234567890987-1ab2c3",
        "UserMetadata": {},
        "Timing": {
            "FinishTime": 1517442131,
            "SubmitTime": 1517442103,
            "StartTime": 1517442104
        },
        "Id": "1234567890987-1ab2c3",
        "CreatedAt": 1517442103
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Jobs in the *AWS Elemental MediaConvert User Guide*.

- For API details, see GetJob in *AWS CLI Command Reference*.

## `get-preset`

The following code example shows how to use `get-preset`.

### AWS CLI

#### To get details for a particular preset

The following `get-preset` example requests the JSON definition of the specified custom preset.

```
aws mediaconvert get-preset \
    --name SimpleMP4 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Preset": {
        "Description": "Creates basic MP4 file. No filtering or preproccessing.",
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4",
        "LastUpdated": 1568843141,
        "Name": "SimpleMP4",
        "Settings": {
            "ContainerSettings": {
                "Mp4Settings": {
                    "FreeSpaceBox": "EXCLUDE",
                    "CslgAtom": "INCLUDE",
                    "MoovPlacement": "PROGRESSIVE_DOWNLOAD"
                },
                "Container": "MP4"
            },
            "AudioDescriptions": [
                {
                    "LanguageCodeControl": "FOLLOW_INPUT",
                    "AudioTypeControl": "FOLLOW_INPUT",
                    "CodecSettings": {
                        "AacSettings": {
                            "RawFormat": "NONE",
                            "CodecProfile": "LC",
                            "AudioDescriptionBroadcasterMix": "NORMAL",
                            "SampleRate": 48000,
                            "Bitrate": 96000,
                            "RateControlMode": "CBR",
                            "Specification": "MPEG4",
                            "CodingMode": "CODING_MODE_2_0"
                        },
                        "Codec": "AAC"
                    }
                }
            ],

- For API details, see GetPreset in *AWS CLI Command Reference*.

### `get-queue`

The following code example shows how to use `get-queue`.

#### AWS CLI

**To get details for a queue**

The following `get-queue` example retrieves the details of the specified custom queue.

```
aws mediaconvert get-queue \
    --name Customer1 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Queue": {
        "LastUpdated": 1526428502,
        "Type": "CUSTOM",
        "SubmittedJobsCount": 0,
        "Status": "ACTIVE",
        "PricingPlan": "ON_DEMAND",
        "CreatedAt": 1526428502,
        "ProgressingJobsCount": 0,
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/Customer1",
        "Name": "Customer1"
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see GetQueue in *AWS CLI Command Reference*.

### `list-job-templates`

The following code example shows how to use `list-job-templates`.

**AWS CLI**

**Example 1: To list your custom job templates**

The following `list-job-templates` example lists all custom job templates in the current Region. To list the system job templates, see the next example.

```
aws mediaconvert list-job-templates \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "JobTemplates": [
        {
            "Description": "Create a DASH streaming ABR stack",
            "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:jobTemplates/DASH
 Streaming",
            "Name": "DASH Streaming",
            "LastUpdated": 1568653007,
            "Priority": 0,
            "Settings": {
                ...<truncatedforbrevity>...
            },
            "Type": "CUSTOM",
            "StatusUpdateInterval": "SECONDS_60",
            "CreatedAt": 1568653007
        },
        {
            "Description": "Create a high-res file",
            "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:jobTemplates/File",
            "Name": "File",
            "LastUpdated": 1568653007,
            "Priority": 0,
            "Settings": {
                ...<truncatedforbrevity>...
            },
```

```
            "Type": "CUSTOM",
            "StatusUpdateInterval": "SECONDS_60",
            "CreatedAt": 1568653023
        }
    ]
}
```

**Example 2: To list the MediaConvert system job templates**

The following `list-job-templates` example lists all system job templates.

```
aws mediaconvert list-job-templates \
    --endpoint-url https://abcd1234.mediaconvert.us-east-1.amazonaws.com \
    --list-by SYSTEM
```

Output:

```
{
    "JobTemplates": [
        {
            "CreatedAt": 1568321779,
            "Arn": "arn:aws:mediaconvert:us-east-1:123456789012:jobTemplates/System-

                            "Type": "FILE_GROUP_SETTINGS"
                        },
                        "Name": "File Group"
                    }
                ]
            },
            "Type": "SYSTEM",
            "LastUpdated": 1568321779
```

```
        },
        ...<truncatedforbrevity>...
    ]
}
```

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListJobTemplates in *AWS CLI Command Reference*.

### `list-jobs`

The following code example shows how to use `list-jobs`.

**AWS CLI**

**To get details for all jobs in a region**

The following example requests the information for all of your jobs in the specified region.

```
aws mediaconvert list-jobs \
    --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
    --region region-name-1
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see Working with AWS Elemental MediaConvert Jobs in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListJobs in *AWS CLI Command Reference*.

### `list-presets`

The following code example shows how to use `list-presets`.

**AWS CLI**

**Example 1: To list your custom output presets**

The following `list-presets` example lists your custom output presets. To list the system presets, see the next example.

```
aws mediaconvert list-presets \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Presets": [
        {
            "Name": "SimpleMP4",
            "CreatedAt": 1568841521,
            "Settings": {
                ......
            },
            "Arn": "arn:aws:mediaconvert:us-east-1:003235472598:presets/SimpleMP4",
            "Type": "CUSTOM",
            "LastUpdated": 1568843141,
            "Description": "Creates basic MP4 file. No filtering or preproccessing."
        },
        {
            "Name": "SimpleTS",
            "CreatedAt": 1568843113,
            "Settings": {
                ... truncated for brevity ...
            },
            "Arn": "arn:aws:mediaconvert:us-east-1:003235472598:presets/SimpleTS",
            "Type": "CUSTOM",
            "LastUpdated": 1568843113,
            "Description": "Create a basic transport stream."
        }
    ]
}
```

**Example 2: To list the system output presets**

The following `list-presets` example lists the available MediaConvert system presets. To list your custom presets, see the previous example.

```
aws mediaconvert list-presets \
    --list-by SYSTEM \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Presets": [
        {
            "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/System-

            "CreatedAt": 1568321790,
            "Description": "XDCAM MPEG HD, 1920x1080i, 29.97fps, 35mbps",
            "LastUpdated": 1568321790,
            "Type": "SYSTEM",
            "Category": "MXF",
            "Settings": {
            ...<output settings removed for brevity>...
            }
        }
    ]
}
```

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListPresets in *AWS CLI Command Reference*.

### `list-queues`

The following code example shows how to use `list-queues`.

## AWS CLI

### To list your queues

The following `list-queues` example lists all of your MediaConvert queues.

```
aws mediaconvert list-queues \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Queues": [
        {
            "PricingPlan": "ON_DEMAND",
            "Type": "SYSTEM",
            "Status": "ACTIVE",
            "CreatedAt": 1503451595,
            "Name": "Default",
            "SubmittedJobsCount": 0,
            "ProgressingJobsCount": 0,
            "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/Default",
            "LastUpdated": 1534549158
        },
        {
            "PricingPlan": "ON_DEMAND",
            "Type": "CUSTOM",
            "Status": "ACTIVE",

        }
    ]
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListQueues in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list the tags on a MediaConvert queue, job template, or output preset**

The following `list-tags-for-resource` example lists the tags on the specified output preset.

```
aws mediaconvert list-tags-for-resource \
    --arn arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4 \
    --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "ResourceTags": {
        "Tags": {
            "customer": "zippyVideo"
        },
```

```
        "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4"
    }
}
```

For more information, see Tagging AWS Elemental MediaConvert Queues, Job Templates, and Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `update-job-template`

The following code example shows how to use `update-job-template`.

#### AWS CLI

**To change a job template**

The following `update-job-template` example replaces the JSON definition of the specified custom job template with the JSON definition in the provided file.

aws mediaconvert update-job-template --name File1 --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com --cli-input-json file://~/job-template-update.json

Contents of `job-template-update.json`:

```
{
    "Description": "A simple job template that generates a single file output.",
    "Queue": "arn:aws:mediaconvert:us-east-1:012345678998:queues/Default",
    "Name": "SimpleFile",
    "Settings": {
      "OutputGroups": [
        {
          "Name": "File Group",
          "Outputs": [
            {
              "ContainerSettings": {
                "Container": "MP4",

                      "Specification": "MPEG4"
                    }
                  },
                  "LanguageCodeControl": "FOLLOW_INPUT"
                }
              ]
            }
          ],
          "OutputGroupSettings": {
            "Type": "FILE_GROUP_SETTINGS",
            "FileGroupSettings": {}
          }
        }
      ],
      "AdAvailOffset": 0
    },
    "StatusUpdateInterval": "SECONDS_60",
    "Priority": 0
}
```

The system returns the JSON payload that you send with your request, even when the request results in an error. Therefore, the JSON returned is not necessarily the new definition of the job template.

Because the JSON payload can be long, you might need to scroll up to see any error messages.

For more information, see Working with AWS Elemental MediaConvert Job Templates in the *AWS Elemental MediaConvert User Guide*.

- For API details, see UpdateJobTemplate in *AWS CLI Command Reference*.

### `update-preset`

The following code example shows how to use `update-preset`.

#### AWS CLI

**To change a preset**

The following `update-preset` example replaces the description for the specified preset.

```
aws mediaconvert update-preset \
--name Customer1 \
--description "New description text."
--endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Output:

```
{
    "Preset": {
        "Arn": "arn:aws:mediaconvert:us-east-1:003235472598:presets/SimpleMP4",
        "Settings": {
        ...<output settings removed for brevity>...
        },
        "Type": "CUSTOM",
        "LastUpdated": 1568938411,
        "Description": "New description text.",
        "Name": "SimpleMP4",
        "CreatedAt": 1568938240
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Output Presets in the *AWS Elemental MediaConvert User Guide*.

- For API details, see UpdatePreset in *AWS CLI Command Reference*.

### `update-queue`

The following code example shows how to use `update-queue`.

#### AWS CLI

##### To change a queue

The following `update-queue` example pauses the specified queue, by changing its status to PAUSED.

```
aws mediaconvert update-queue \
--name Customer1 \
--status PAUSED
--endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
    "Queue": {
        "LastUpdated": 1568839845,
        "Status": "PAUSED",
        "ProgressingJobsCount": 0,
        "CreatedAt": 1526428516,
        "Arn": "arn:aws:mediaconvert:us-west-1:123456789012:queues/Customer1",
        "Name": "Customer1",
        "SubmittedJobsCount": 0,
        "PricingPlan": "ON_DEMAND",
        "Type": "CUSTOM"
    }
}
```

For more information, see Working with AWS Elemental MediaConvert Queues in the *AWS Elemental MediaConvert User Guide*.

- For API details, see UpdateQueue in *AWS CLI Command Reference*.

## MediaLive examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaLive.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `create-channel`

The following code example shows how to use `create-channel`.

**AWS CLI**

**To create a channel**

The following `create-channel` example creates a channel by passing in a JSON file that contains the parameters that you want to specify.

The channel in this example ingests an HLS PULL input that connects to a source that contains video, audio, and embedded captions. The channel creates one HLS output group with an Akamai server as the destination. The output group contains two outputs: one for the H.265 video and AAC audio, and one for the Web-VTT captions, in English only.

The JSON for this example channel includes the minimum required parameters for a channel that uses an HLS PULL input and that produces an HLS output group with Akamai as the destination. The JSON contains these main sections:

`InputAttachments`, which specifies one source for the audio, and one source for the captions. It does not specify a video selector, which means that MediaLive extracts the first video it finds in the source.`Destinations`, which contains the two IP addresses (URLs) for the single output group in this channel. These addresses require passwords.`EncoderSettings`, which contains subsections.`AudioDescriptions`, which specifies that the channel contains one audio output asset, which uses the source from InputAttachments, and produces audio in

AAC format.CaptionDescriptions, which specifies that the channel contains one captions output asset, which uses the source from InputAttachments, and produces captions in Web-VTT format.VideoDescriptions, which specifies that the channel contains one video output asset, with the specified resolution.OutputGroups, which specifies the output groups. In this example there is one group named Akamai. The connection is made using HLS PUT. The output group contains two outputs. One output is for the video asset (named Video_high) and the audio asset (named Audio_EN). One output is for the captions asset (named WebVTT_EN).

In this example, some of the parameters contain no value or contain nested empty parameters. For example, OutputSettings for the Video_and_audio output contains several nested parameters that end at an empty parameter M3u8Settings. This parameter must be included, but you can omit one, several, or all its children, which means that the child will take its default value or be null.

All the parameters that apply to this example channel but that aren't specified in this file will either take the default value, be set to null, or take a unique value generated by MediaLive.

```
aws medialive create-channel \
    --cli-input-json file://channel-in-hls-out-hls-akamai.json
```

Contents of channel-in-hls-out-hls-akamai.json:

```

                            "HlsOutputSettings": {
                                "HlsSettings": {
                                    "StandardHlsSettings": {
                                        "M3u8Settings": {}
                                    }
                                },
                                "NameModifier": "_1"
                            }
                        },
                        "VideoDescriptionName": "Video_high"
                    },
                    {
                        "CaptionDescriptionNames": [
                            "WebVTT_EN"
                        ],
                        "OutputName": "Captions-WebVTT",
                        "OutputSettings": {
```

```
                            "HlsOutputSettings": {
                                "HlsSettings": {
                                    "StandardHlsSettings": {
                                        "M3u8Settings": {}
                                    }
                                },
                                "NameModifier": "_2"
                            }
                        }
                    }
                ]
            }
        ],
        "TimecodeConfig": {
            "Source": "EMBEDDED"
        }
    }
}
```

**Output:**

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

ARN for the channel. The last part of the ARN is the unique channel ID.`EgressEndpoints` is blank in this example channel because it used only for PUSH inputs. When it applies it shows the addresses on MediaLive that content is pushed to.`OutputGroups`, `Outputs`. These show all the parameters for the output group and outputs, including those that you didn't include but that are relevant to this channel. The parameters might be empty (perhaps indicating the parameter or feature is disabled in this channel configuration) or might show the default value that will apply.`LogLevel` is set to the default (DISABLED).`Tags` is set to the default (null).`PipelinesRunningCount` and `State` show the current status of the channel.

For more information, see Creating a Channel from Scratch in the *AWS Elemental MediaLive User Guide*.

- For API details, see CreateChannel in *AWS CLI Command Reference*.

### `create-input`

The following code example shows how to use `create-input`.

**AWS CLI**

**To create an input**

The following `create-input` example creates an `HLS PULL` input by passing in a JSON file that contains the parameters that apply to this type of input. The JSON for this example input specifies two sources (addresses) to the input, in order to support redundancy in the ingest. These addresses require passwords.

```
aws medialive create-input \
    --cli-input-json file://input-hls-pull-news.json
```

Contents of `input-hls-pull-news.json`:

```
{
    "Name": "local_news",
    "RequestId": "cli000059",
    "Sources": [
            {
                    "Url": "https://203.0.113.13/newschannel/anytownusa.m3u8",
                    "Username": "examplecorp",
                    "PasswordParam": "/medialive/examplecorp1"
            },
       {
                    "Url": "https://198.51.100.54/fillervideos/oceanwaves.mp4",
                    "Username": "examplecorp",
                    "PasswordParam": "examplecorp2"
            }
    ],
    "Type": "URL_PULL"
}
```

**Output:**

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

`Arn` for the input. The last part of the ARN is the unique input ID.`Attached Channels`, which is always empty for a newly created input.`Destinations`, which is empty in this example because it is used only with a PUSH input.`Id` for the input, the same as the ID in the ARN.`MediaConnectFlows`, which is empty in this example because it is used only with an input

of type MediaConnect.`SecurityGroups`, which is empty in this example because it is used only with a PUSH input.`State` of this input.`Tags`, which is empty (the default for this parameter).

For more information, see Creating an Input in the *AWS Elemental MediaLive User Guide*.

- For API details, see CreateInput in *AWS CLI Command Reference*.

## MediaPackage examples using AWS CLI

#### `create-channel`

The following code example shows how to use `create-channel`.

#### AWS CLI

**To create a channel**

The following `create-channel` command creates a channel named `sportschannel` in the current account.

```
aws mediapackage create-channel --id sportschannel
```

Output:

```
{
   "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",
   "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "6d345804ec3f46c9b454a91d4a80d0e0",
                "Password": "generatedwebdavpassword1",
                "Url": "https://f31c86aed53b815a.mediapackage.us-

            }
        ]
    },
    "Id": "sportschannel",
    "Tags": {
        "region": "west"
    }
}
```

For more information, see Creating a Channel in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreateChannel in *AWS CLI Command Reference*.

## `create-origin-endpoint`

The following code example shows how to use `create-origin-endpoint`.

### AWS CLI

#### To create an origin endpoint

The following `create-origin-endpoint` command creates an origin endpoint named `cmafsports` with the package settings provided in a JSON file and specified endpoint settings.

```
aws mediapackage create-origin-endpoint \
    --channel-id sportschannel \
    --id cmafsports \
    --cmaf-package file://file/path/cmafpkg.json --description "cmaf output of
 sports" \
    --id cmaf_sports \
    --manifest-name sports_channel \
    --startover-window-seconds 300 \
    --tags region=west,media=sports \
    --time-delay-seconds 10
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
    "ChannelId": "sportschannel",
    "CmafPackage": {
        "HlsManifests": [
            {
                "AdMarkers": "PASSTHROUGH",
                "Id": "cmaf_sports_endpoint",
                "IncludeIframeOnlyStream": true,
                "ManifestName": "index",
                "PlaylistType": "EVENT",
                "PlaylistWindowSeconds": 300,
                "ProgramDateTimeIntervalSeconds": 300,
                "Url": "https://c4af3793bf76b33c.mediapackage.us-
west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/
index.m3u8"
            }
        ],
        "SegmentDurationSeconds": 2,
        "SegmentPrefix": "sportschannel"
    },
    "Description": "cmaf output of sports",
    "Id": "cmaf_sports",
    "ManifestName": "sports_channel",
    "StartoverWindowSeconds": 300,
    "Tags": {
        "region": "west",
        "media": "sports"
    },
```

```
    "TimeDelaySeconds": 10,
    "Url": "",
    "Whitelist": []
}
```

For more information, see Creating an Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreateOriginEndpoint in *AWS CLI Command Reference*.

### `delete-channel`

The following code example shows how to use `delete-channel`.

**AWS CLI**

**To delete a channel**

The following `delete-channel` command deletes the channel named `test`.

```
aws mediapackage delete-channel \
    --id test
```

This command produces no output.

For more information, see Deleting a Channel in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeleteChannel in *AWS CLI Command Reference*.

### `delete-origin-endpoint`

The following code example shows how to use `delete-origin-endpoint`.

**AWS CLI**

**To delete an origin endpoint**

The following `delete-origin-endpoint` command deletes the origin endpoint named `tester2`.

```
aws mediapackage delete-origin-endpoint \
    --id tester2
```

For more information, see Deleting an Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeleteOriginEndpoint in *AWS CLI Command Reference*.

### `describe-channel`

The following code example shows how to use `describe-channel`.

#### AWS CLI

**To describe a channel**

The following `describe-channel` command displays all of the details of the channel named `test`.

```
aws mediapackage describe-channel \
    --id test
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/584797f1740548c389a273585dd22a63",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "584797f1740548c389a273585dd22a63",
                "Password": "webdavgeneratedpassword1",
                "Url": "https://9be9c4405c474882.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
                "Username": "webdavgeneratedusername1"
            },
            {
                "Id": "7d187c8616fd455f88aaa5a9fcf74442",
                "Password": "webdavgeneratedpassword2",
                "Url": "https://7bf454c57220328d.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/7d187c8616fd455f88aaa5a9fcf74442/channel",
                "Username": "webdavgeneratedusername2"
            }
        ]
    },
```

```
    "Id": "test",
    "Tags": {}
}
```

For more information, see Viewing Channel Details<https://docs.aws.amazon.com/mediapackage/latest/ug/channels-view.html> in the *AWS Elemental MediaPackage User Guide*

- For API details, see DescribeChannel in *AWS CLI Command Reference*.

### `describe-origin-endpoint`

The following code example shows how to use `describe-origin-endpoint`.

#### AWS CLI

**To describe an origin endpoint**

The following `describe-origin-endpoint` command displays all of the details of the origin endpoint named `cmaf_sports`.

```
aws mediapackage describe-origin-endpoint \
    --id cmaf_sports
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
    "ChannelId": "sportschannel",
    "CmafPackage": {
        "HlsManifests": [
            {
                "AdMarkers": "NONE",
                "Id": "cmaf_sports_endpoint",
                "IncludeIframeOnlyStream": false,
                "PlaylistType": "EVENT",
                "PlaylistWindowSeconds": 60,
                "ProgramDateTimeIntervalSeconds": 0,
                "Url": "https://c4af3793bf76b33c.mediapackage.us-
west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/
index.m3u8"
            }
```

```
        ],
        "SegmentDurationSeconds": 2,
        "SegmentPrefix": "sportschannel"
    },
    "Id": "cmaf_sports",
    "ManifestName": "index",
    "StartoverWindowSeconds": 0,
    "Tags": {
        "region": "west",
        "media": "sports"
    },
    "TimeDelaySeconds": 0,
    "Url": "",
    "Whitelist": []
}
```

For more information, see Viewing a Single Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribeOriginEndpoint in *AWS CLI Command Reference*.

### `list-channels`

The following code example shows how to use `list-channels`.

#### AWS CLI

**To list all channels**

The following `list-channels` command lists all of the channels that are configured on the current AWS account.

```
aws mediapackage list-channels
```

Output:

```
{
    "Channels": [
        {
            "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/584797f1740548c389a273585dd22a63",
            "HlsIngest": {
                "IngestEndpoints": [
```

```
                    {
                        "Id": "584797f1740548c389a273585dd22a63",
                        "Password": "webdavgeneratedpassword1",
                        "Url": "https://9be9c4405c474882.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
                        "Username": "webdavgeneratedusername1"
                    },
                    {
                        "Id": "7d187c8616fd455f88aaa5a9fcf74442",
                        "Password": "webdavgeneratedpassword2",
                        "Url": "https://7bf454c57220328d.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/7d187c8616fd455f88aaa5a9fcf74442/channel",
                        "Username": "webdavgeneratedusername2"
                    }
                ]
            },
            "Id": "test",
            "Tags": {}
        }
    ]
}
```

For more information, see Viewing Channel Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListChannels in *AWS CLI Command Reference*.

## `list-origin-endpoints`

The following code example shows how to use `list-origin-endpoints`.

### AWS CLI

#### To list all origin-endpoints on a channel

The following `list-origin-endpoints` command lists all of the origin endpoints that are configured on the channel named `test`.

```
aws mediapackage list-origin-endpoints \
    --channel-id test
```

Output:

```
{
    "OriginEndpoints": [
        {
            "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/247cff871f2845d3805129be22f2c0a2",
            "ChannelId": "test",
            "DashPackage": {
                "ManifestLayout": "FULL",
                "ManifestWindowSeconds": 60,
                "MinBufferTimeSeconds": 30,
                "MinUpdatePeriodSeconds": 15,
                "PeriodTriggers": [],
                "Profile": "NONE",
                "SegmentDurationSeconds": 2,
                "SegmentTemplateFormat": "NUMBER_WITH_TIMELINE",
                "StreamSelection": {
                    "MaxVideoBitsPerSecond": 2147483647,

            "Whitelist": []
        }
    ]
}
```

For more information, see Viewing all Endpoints Associated with a Channel in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListOriginEndpoints in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list the tags assigned to a resource**

The following `list-tags-for-resource` command lists the tags that are assigned to the specified resource.

```
aws mediapackage list-tags-for-resource \
    --resource-arn arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0
```

Output:

```
{
```

```
    "Tags": {
        "region": "west"
    }
}
```

For more information, see Tagging Resources in AWS Elemental MediaPackage in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `rotate-ingest-endpoint-credentials`

The following code example shows how to use `rotate-ingest-endpoint-credentials`.

#### AWS CLI

**To rotate ingest credentials**

The following `rotate-ingest-endpoint-credentials` command rotates the WebDAV username and password for the specified ingest endpoint.

```
aws mediapackage rotate-ingest-endpoint-credentials \
    --id test \
    --ingest-endpoint-id 584797f1740548c389a273585dd22a63
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/584797f1740548c389a273585dd22a63",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "584797f1740548c389a273585dd22a63",
                "Password": "webdavregeneratedpassword1",
                "Url": "https://9be9c4405c474882.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
                "Username": "webdavregeneratedusername1"
            },
            {
                "Id": "7d187c8616fd455f88aaa5a9fcf74442",
                "Password": "webdavgeneratedpassword2",
```

```
                "Url": "https://7bf454c57220328d.mediapackage.us-
west-2.amazonaws.com/in/
v2/584797f1740548c389a273585dd22a63/7d187c8616fd455f88aaa5a9fcf74442/channel",
                "Username": "webdavgeneratedusername2"
            }
        ]
    },
    "Id": "test",
    "Tags": {}
}
```

For more information, see Rotating Credentials on an Input URL in the *AWS Elemental MediaPackage User Guide*.

- For API details, see RotateIngestEndpointCredentials in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To add a tag to a resource**

The following `tag-resource` commands adds a `region=west` key and value pair to the specified resource.

```
aws mediapackage tag-resource \
    --resource-arn arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \
    --tags region=west
```

This command produces no output.

For more information, see Tagging Resources in AWS Elemental MediaPackage in the *AWS Elemental MediaPackage User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag from a resource**

The following `untag-resource` command removes the tag with the key `region` from the specified channel.

```
aws mediapackage untag-resource \
    --resource-arn arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \
    --tag-keys region
```

For more information, see Tagging Resources in AWS Elemental MediaPackage in the *AWS Elemental MediaPackage User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

## `update-channel`

The following code example shows how to use `update-channel`.

**AWS CLI**

**To update a channel**

The following `update-channel` command updates the channel named `sportschannel` to include the description `24x7 sports`.

```
aws mediapackage update-channel \
    --id sportschannel \
    --description "24x7 sports"
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",
    "Description": "24x7 sports",
    "HlsIngest": {
        "IngestEndpoints": [
            {
                "Id": "6d345804ec3f46c9b454a91d4a80d0e0",
                "Password": "generatedwebdavpassword1",
```

```
                "Url": "https://f31c86aed53b815a.mediapackage.us-
west-2.amazonaws.com/in/
v2/6d345804ec3f46c9b454a91d4a80d0e0/6d345804ec3f46c9b454a91d4a80d0e0/channel",
                "Username": "generatedwebdavusername1"
            },
            {
                "Id": "2daa32878af24803b24183727211b8ff",
                "Password": "generatedwebdavpassword2",

- For API details, see UpdateChannel in *AWS CLI Command Reference*.

### `update-origin-endpoint`

The following code example shows how to use `update-origin-endpoint`.

#### AWS CLI

**To update an origin endpoint**

The following `update-origin-endpoint` command updates the origin endpoint named `cmaf_sports`. It changes the time delay to `0` seconds.

```
aws mediapackage update-origin-endpoint \
    --id cmaf_sports \
    --time-delay-seconds 0
```

Output:

```
{
    "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
```

```
    "ChannelId": "sportschannel",
    "CmafPackage": {
        "HlsManifests": [
            {
                "AdMarkers": "NONE",
                "Id": "cmaf_sports_endpoint",
                "IncludeIframeOnlyStream": false,
                "PlaylistType": "EVENT",
                "PlaylistWindowSeconds": 60,
                "ProgramDateTimeIntervalSeconds": 0,
                "Url": "https://c4af3793bf76b33c.mediapackage.us-
west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/
index.m3u8"
            }
        ],
        "SegmentDurationSeconds": 2,
        "SegmentPrefix": "sportschannel"
    },
    "Id": "cmaf_sports",
    "ManifestName": "index",
    "StartoverWindowSeconds": 0,
    "Tags": {
        "region": "west",
        "media": "sports"
    },
    "TimeDelaySeconds": 0,
    "Url": "",
    "Whitelist": []
}
```

For more information, see Editing an Endpoint in the *AWS Elemental MediaPackage User Guide*.

- For API details, see UpdateOriginEndpoint in *AWS CLI Command Reference*.

## MediaPackage VOD examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaPackage VOD.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `create-asset`

The following code example shows how to use `create-asset`.

**AWS CLI**

**To create an asset**

The following `create-asset` example creates an asset named `Chicken_Asset` in the current AWS account. The asset ingests the file `30sec_chicken.smil` to MediaPackage.

```
aws mediapackage-vod create-asset \
    --id chicken_asset \
    --packaging-group-id hls_chicken_gp \
    --source-role-arn arn:aws:iam::111122223333:role/EMP_Vod \
    --source-arn arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:assets/chicken_asset",
    "Id":"chicken_asset",
    "PackagingGroupId":"hls_chicken_gp",
    "SourceArn":"arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
    "SourceRoleArn":"arn:aws:iam::111122223333:role/EMP_Vod",
    "EgressEndpoints":[
        {
            "PackagingConfigurationId":"New_config_1",
            "Url":"https://c75ea2668ab49d02bca7ae10ef31c59e.egress.mediapackage-
vod.us-west-2.amazonaws.com/out/
```

```
v1/6644b55df1744261ab3732a8e5cdaf07/904b06a58c7645e08d57d40d064216ac/
f5b2e633ff4942228095d164c10074f3/index.m3u8"
        },
        {
            "PackagingConfigurationId":"new_hls",
            "Url":" https://c75ea2668ab49d02bca7ae10ef31c59e.egress.mediapackage-
vod.us-west-2.amazonaws.com/out/v1/6644b55df1744261ab3732a8e5cdaf07/
fe8f1f00a80e424cb4f8da4095835e9e/7370ec57432343af816332356d2bd5c6/string.m3u8"
        }
    ]
}
```

For more information, see Ingest an Asset in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreateAsset in *AWS CLI Command Reference*.

### `create-packaging-configuration`

The following code example shows how to use `create-packaging-configuration`.

#### AWS CLI

**To create a packaging configuration**

The following `create-packaging-configuration` example creates a packaging configuration named `new_hls` in the packaging group named `hls_chicken`. This example uses a file on disk named `hls_pc.json` to provide the details.

```
aws mediapackage-vod create-packaging-configuration \
    --id new_hls \
    --packaging-group-id hls_chicken \
    --hls-package file://hls_pc.json
```

Contents of `hls_pc.json`:

```
{
    "HlsManifests":[
        {
            "AdMarkers":"NONE",
            "IncludeIframeOnlyStream":false,
            "ManifestName":"string",
            "ProgramDateTimeIntervalSeconds":60,
```

```
            "RepeatExtXKey":true,
            "StreamSelection":{
                "MaxVideoBitsPerSecond":1000,
                "MinVideoBitsPerSecond":0,
                "StreamOrder":"ORIGINAL"
            }
        }
    ],
    "SegmentDurationSeconds":6,
    "UseAudioRenditionGroup":false
}
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-configurations/
new_hls",
    "Id":"new_hls",
    "PackagingGroupId":"hls_chicken",
    "HlsManifests":{
        "SegmentDurationSeconds":6,
        "UseAudioRenditionGroup":false,
        "HlsMarkers":[
            {
                "AdMarkers":"NONE",
                "IncludeIframeOnlyStream":false,
                "ManifestName":"string",
                "ProgramDateTimeIntervalSeconds":60,
                "RepeatExtXKey":true,
                "StreamSelection":{
                    "MaxVideoBitsPerSecond":1000,
                    "MinVideoBitsPerSecond":0,
                    "StreamOrder":"ORIGINAL"
                }
            }
        ]
    }
}
```

For more information, see Creating a Packaging Configuration in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreatePackagingConfiguration in *AWS CLI Command Reference*.

### `create-packaging-group`

The following code example shows how to use `create-packaging-group`.

#### AWS CLI

**To create a packaging group**

The following `create-packaging-group` example lists all of the packaging groups that are configured in the current AWS account.

```
aws mediapackage-vod create-packaging-group \
    --id hls_chicken
```

Output:

```
{
    "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-groups/
hls_chicken",
    "Id": "hls_chicken"
}
```

For more information, see Creating a Packaging Group in the *AWS Elemental MediaPackage User Guide*.

- For API details, see CreatePackagingGroup in *AWS CLI Command Reference*.

### `delete-asset`

The following code example shows how to use `delete-asset`.

#### AWS CLI

**To delete an asset**

The following `delete-asset` example deletes the asset named `30sec_chicken`.

```
aws mediapackage-vod delete-asset \
    --id 30sec_chicken
```

This command produces no output.

For more information, see Deleting an Asset in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeleteAsset in *AWS CLI Command Reference*.

### `delete-packaging-configuration`

The following code example shows how to use `delete-packaging-configuration`.

**AWS CLI**

**To delete a packaging configuration**

The following `delete-packaging-configuration` example deletes the packaging configuration named `CMAF`.

```
aws mediapackage-vod delete-packaging-configuration \
    --id CMAF
```

This command produces no output.

For more information, see Deleting a Packaging Configuration in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeletePackagingConfiguration in *AWS CLI Command Reference*.

### `delete-packaging-group`

The following code example shows how to use `delete-packaging-group`.

**AWS CLI**

**To delete a packaging group**

The following `delete-packaging-group` example deletes the packaging group named `Dash_widevine`.

```
aws mediapackage-vod delete-packaging-group \
    --id Dash_widevine
```

This command produces no output.

For more information, see Deleting a Packaging Group in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DeletePackagingGroup in *AWS CLI Command Reference*.

### `describe-asset`

The following code example shows how to use `describe-asset`.

#### AWS CLI

##### To describe an asset

The following `describe-asset` example displays all of the details of the asset named `30sec_chicken`.

```
aws mediapackage-vod describe-asset \
    --id 30sec_chicken
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:assets/30sec_chicken",
    "Id":"30sec_chicken",
    "PackagingGroupId":"Packaging_group_1",
    "SourceArn":"arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
    "SourceRoleArn":"arn:aws:iam::111122223333:role/EMP_Vod",
    "EgressEndpoints":[
        {
            "PackagingConfigurationId":"DASH",
            "Url":"https://a5f46a44118ba3e3724ef39ef532e701.egress.mediapackage-

index.m3u8"
```

```
        }
    ]
}
```

For more information, see Viewing Asset Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribeAsset in *AWS CLI Command Reference*.

### `describe-packaging-configuration`

The following code example shows how to use `describe-packaging-configuration`.

#### AWS CLI

**To describe a packaging configuration**

The following `describe-packaging-configuration` example displays all of the details of the packaging configuration named DASH.

```
aws mediapackage-vod describe-packaging-configuration \
    --id DASH
```

Output:

```
{
    "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-configurations/
DASH",
    "Id":"DASH",
    "PackagingGroupId":"Packaging_group_1",
    "DashPackage":[
        {
            "SegmentDurationSeconds":"2"
        },
        {
            "DashManifests":{
                "ManifestName":"index",
                "MinBufferTimeSeconds":"30",
                "Profile":"NONE"
            }
        }
    ]
}
```

For more information, see Viewing Packaging Configuration Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribePackagingConfiguration in *AWS CLI Command Reference*.

### `describe-packaging-group`

The following code example shows how to use `describe-packaging-group`.

#### AWS CLI

**To describe a packaging group**

The following `describe-packaging-group` example displays all of the details of the packaging group named `Packaging_group_1`.

```
aws mediapackage-vod describe-packaging-group \
    --id Packaging_group_1
```

Output:

```
{
    "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-groups/
Packaging_group_1",
    "Id": "Packaging_group_1"
}
```

For more information, see Viewing Packaging Group Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see DescribePackagingGroup in *AWS CLI Command Reference*.

### `list-assets`

The following code example shows how to use `list-assets`.

#### AWS CLI

**To list all assets**

The following `list-assets` example lists all of the assets that are configured in the current AWS account.

```
aws mediapackage-vod list-assets
```

Output:

```
{
    "Assets": [
        "Arn": "arn:aws:mediapackage-vod:us-
west-2:111122223333:assets/30sec_chicken",
        "Id": "30sec_chicken",
        "PackagingGroupId": "Packaging_group_1",
        "SourceArn": "arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
        "SourceRoleArn": "arn:aws:iam::111122223333:role/EMP_Vod"
    ]
}
```

For more information, see Viewing Asset Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListAssets in *AWS CLI Command Reference*.

### `list-packaging-configurations`

The following code example shows how to use `list-packaging-configurations`.

#### AWS CLI

##### To list all packaging configurations

The following `list-packaging-configurations` example lists all of the packaging configurations that are configured on the packaging group named `Packaging_group_1`.

```
aws mediapackage-vod list-packaging-configurations \
    --packaging-group-id Packaging_group_1
```

Output:

```
{
    "PackagingConfigurations":[
        {
            "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
configurations/CMAF",
            "Id":"CMAF",
            "PackagingGroupId":"Packaging_group_1",
```

```
            "CmafPackage":[
                {
                    "SegmentDurationSeconds":"2"
                },
                {
                    "HlsManifests":{
                        "AdMarkers":"NONE",
                        "RepeatExtXKey":"False",
                        "ManifestName":"index",
                        "ProgramDateTimeIntervalSeconds":"0",
                        "IncludeIframeOnlyStream":"False"
                    }
                }
            ]
        },
        {
            "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
configurations/DASH",
            "Id":"DASH",
            "PackagingGroupId":"Packaging_group_1",
            "DashPackage":[
                {
                    "SegmentDurationSeconds":"2"
                },
                {
                    "DashManifests":{
                        "ManifestName":"index",
                        "MinBufferTimeSeconds":"30",
                        "Profile":"NONE"
                    }
                }
            ]
        },
        {

                                "81376844-f976-481e-a84e-cc25d39b0b33"
                            ]
                        }
                    }
                },
                {
                    "HlsManifests":{
                        "AdMarkers":"NONE",
                        "RepeatExtXKey":"False",
                        "ManifestName":"index",
                        "ProgramDateTimeIntervalSeconds":"0",
                        "IncludeIframeOnlyStream":"False"
                    }
                }
            ]
        }
```

```
    ]
}
```

For more information, see Viewing Packaging Configuration Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListPackagingConfigurations in *AWS CLI Command Reference*.

### `list-packaging-groups`

The following code example shows how to use `list-packaging-groups`.

**AWS CLI**

**To list all packaging groups**

The following `list-packaging-groups` example lists all of the packaging groups that are configured in the current AWS account.

```
aws mediapackage-vod list-packaging-groups
```

Output:

```
{
    "PackagingGroups": [
        {
            "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
groups/Dash_widevine",
            "Id": "Dash_widevine"
        },
        {
            "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
groups/Encrypted_HLS",
            "Id": "Encrypted_HLS"
        },
        {
            "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
groups/Packaging_group_1",
            "Id": "Packaging_group_1"
        }
    ]
}
```

For more information, see Viewing Packaging Group Details in the *AWS Elemental MediaPackage User Guide*.

- For API details, see ListPackagingGroups in *AWS CLI Command Reference*.

## MediaStore Data Plane examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore Data Plane.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `delete-object`

The following code example shows how to use `delete-object`.

**AWS CLI**

**To delete an object**

The following `delete-object` example deletes the specified object.

```
aws mediastore-data delete-object \
    --endpoint=https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path=/folder_name/README.md
```

This command produces no output.

For more information, see Deleting an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see DeleteObject in *AWS CLI Command Reference*.

### `describe-object`

The following code example shows how to use `describe-object`.

**AWS CLI**

**To view the headers for an object**

The following `describe-object` example displays the headers for an object at the specified path.

```
aws mediastore-data describe-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball/setup.jpg
```

Output:

```
{
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",
    "ContentType": "image/jpeg",
    "ContentLength": "3860266",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3"
}
```

For more information, see Viewing the Details of an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see DescribeObject in *AWS CLI Command Reference*.

### `get-object`

The following code example shows how to use `get-object`.

**AWS CLI**

**Example 1: To download an entire object**

The following `get-object` example downloads the specified object.

```
aws mediastore-data get-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball/setup.jpg setup.jpg
```

Output:

```
{
    "ContentType": "image/jpeg",
    "StatusCode": 200,
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
    "ContentLength": "3860266",
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT"
}
```

**Example 2: To download part of an object**

The following `get-object` example downloads the specified part of an object.

```
aws mediastore-data get-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball/setup.jpg setup.jpg \
    --range "bytes=0-100"
```

Output:

```
{
    "StatusCode": 206,
    "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",
    "ContentType": "image/jpeg",
    "ContentRange": "bytes 0-100/3860266",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
    "ContentLength": "101"
}
```

For more information, see Downloading an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see GetObject in *AWS CLI Command Reference*.

## `list-items`

The following code example shows how to use `list-items`.

## AWS CLI

### Example 1: To view a list of items (objects and folders) stored in a container

The following `list-items` example displays a list of items (objects and folders) stored in the specified container.

```
aws mediastore-data list-items \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```
{
    "Items": [
        {
            "Type": "OBJECT",
            "ContentLength": 3784,
            "Name": "setup.jpg",
            "ETag":
 "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
            "ContentType": "image/jpeg",
            "LastModified": 1563571859.379
        },
        {
            "Type": "FOLDER",
            "Name": "events"
        }
    ]
}
```

### Example 2: To view a list of items (objects and folders) stored in a folder

The following `list-items` example displays a list of items (objects and folders) stored in the specified folder.

```
aws mediastore-data list-items \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --path events/baseball
```

Output:

```
{
```

```
    "Items": [
        {
            "ETag":
 "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
            "ContentType": "image/jpeg",
            "Type": "OBJECT",
            "ContentLength": 3860266,
            "LastModified": 1563573031.872,
            "Name": "setup.jpg"
        }
    ]
}
```

For more information, see Viewing a List of Objects in the *AWS Elemental MediaStore User Guide*.

- For API details, see ListItems in *AWS CLI Command Reference*.

### `put-object`

The following code example shows how to use `put-object`.

#### AWS CLI

**Example 1: To upload an object to a container**

The following `put-object` example upload an object to the specified container.

```
aws mediastore-data put-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --body ReadMe.md \
    --path ReadMe.md \
    --cache-control "max-age=6, public" \
    --content-type binary/octet-stream
```

Output:

```
{
    "ContentSHA256":
 "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
    "StorageClass": "TEMPORAL",
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3"
```

```
}
```

**Example 2: To upload an object to a folder within a container**

The following `put-object` example upload an object to the specified folder within a container.

```
aws mediastore-data put-object \
    --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
    --body ReadMe.md \
    --path /september-events/ReadMe.md \
    --cache-control "max-age=6, public" \
    --content-type binary/octet-stream
```

Output:

```
{
    "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",
    "ContentSHA256":
 "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
    "StorageClass": "TEMPORAL"
}
```

For more information, see Uploading an Object in the *AWS Elemental MediaStore User Guide*.

- For API details, see PutObject in *AWS CLI Command Reference*.

## MediaTailor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaTailor.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Actions

#### `delete-playback-configuration`

The following code example shows how to use `delete-playback-configuration`.

**AWS CLI**

**To delete a configuration**

The following `delete-playback-configuration` deletes a configuration named `campaign_short`.

```
aws mediatailor delete-playback-configuration \
    --name campaign_short
```

This command produces no output.

For more information, see Deleting a Configuration in the *AWS Elemental MediaTailor User Guide*.

- For API details, see DeletePlaybackConfiguration in *AWS CLI Command Reference*.

#### `get-playback-configuration`

The following code example shows how to use `get-playback-configuration`.

**AWS CLI**

**To describe a configuration**

The following `get-playback-configuration` displays all of the details of the configuration named `west_campaign`.

```
aws mediatailor get-playback-configuration \
    --name west_campaign
```

Output:

```
{
     "AdDecisionServerUrl": "http://your.ads.url",
     "CdnConfiguration": {},
     "DashConfiguration": {
         "ManifestEndpointPrefix":

index.m3u8"
        }
    ]
}
```

For more information, see Viewing a Configuration<https://docs.aws.amazon.com/mediatailor/latest/ug/configurations-view.html> in the *AWS Elemental MediaTailor User Guide*.

- For API details, see ListPlaybackConfigurations in *AWS CLI Command Reference*.

### `put-playback-configuration`

The following code example shows how to use `put-playback-configuration`.

#### AWS CLI

**To create a configuration**

The following `put-playback-configuration` creates a configuration named `campaign_short`.

```
aws mediatailor put-playback-configuration \
    --name campaign_short \
    --ad-decision-server-url http://your.ads.url \
    --video-content-source-url http://video.bucket/index.m3u8
```

Output:

```
{
    "AdDecisionServerUrl": "http://your.ads.url",
    "CdnConfiguration": {},
    "DashConfiguration": {
         "ManifestEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/
dash/1cbfeaaecb69778e0c167d0505a2bc57da2b1754/campaign_short/",
         "MpdLocation": "EMT_DEFAULT",
         "OriginManifestType": "MULTI_PERIOD"
    },
    "HlsConfiguration": {
        "ManifestEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/
master/1cbfeaaecb69778e0c167d0505a2bc57da2b1754/campaign_short/"
    },
    "Name": "campaign_short",
    "PlaybackConfigurationArn": "arn:aws:mediatailor:us-
west-2:123456789012:playbackConfiguration/campaign_short",
    "PlaybackEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com",
    "SessionInitializationEndpointPrefix":
 "https://13484114d38f4383bc0d6a7cb879bd00.mediatailor.us-west-2.amazonaws.com/v1/
session/1cbfeaaecb69778e0c167d0505a2bc57da2b1754/campaign_short/",
    "Tags": {},
    "VideoContentSourceUrl": "http://video.bucket/index.m3u8"
}
```

For more information, see Creating a Configuration in the *AWS Elemental MediaTailor User Guide*.

- For API details, see PutPlaybackConfiguration in *AWS CLI Command Reference*.

## MemoryDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MemoryDB.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `copy-snapshot`

The following code example shows how to use `copy-snapshot`.

**AWS CLI**

**To copy a snapshot**

The following `copy-snapshot` example creates a copy of a snapshot.

```
aws memorydb copy-snapshot \
    --source-snapshot-name my-cluster-snapshot \
    --target-snapshot-name my-cluster-snapshot-copy
```

Output

```
{
    "Snapshot": {
        "Name": "my-cluster-snapshot-copy",
        "Status": "creating",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:snapshot/my-cluster-
snapshot-copy",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": " ",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
```

```
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-xx2574fc",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
        }
    }
}
```

For more information, see Copying a snapshot in the *MemoryDB User Guide*.

- For API details, see CopySnapshot in *AWS CLI Command Reference*.

## `create-acl`

The following code example shows how to use `create-acl`.

### AWS CLI

#### To create an ACL

The following `create-acl` example creates a new Access control list.

```
aws memorydb create-acl \
    --acl-name "new-acl-1" \
    --user-names "my-user"
```

Output:

```
{
    "ACL": {
        "Name": "new-acl-1",
        "Status": "creating",
        "UserNames": [
            "my-user"
        ],
        "MinimumEngineVersion": "6.2",
        "Clusters": [],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/new-acl-1"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see CreateAcl in *AWS CLI Command Reference*.

## `create-cluster`

The following code example shows how to use `create-cluster`.

### AWS CLI

#### To create a cluster

The following `create-cluster` example creates a new cluster.

```
aws memorydb create-cluster \
    --cluster-name my-new-cluster \
    --node-type db.r6g.large \
    --acl-name my-acl \
    --subnet-group my-sg
```

Output:

```
{
    "Cluster": {
        "Name": "my-new-cluster",
        "Status": "creating",
        "NumberOfShards": 1,
        "AvailabilityMode": "MultiAZ",
        "ClusterEndpoint": {
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SubnetGroupName": "my-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:cluster/my-new-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "sat:10:00-sat:11:00",
        "SnapshotWindow": "07:30-08:30",
```

```
        "ACLName": "my-acl",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Managing Clusters in the *MemoryDB User Guide*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

### `create-parameter-group`

The following code example shows how to use `create-parameter-group`.

#### AWS CLI

**To create a parameter group**

The following `create-parameter-group` example creates a parameter group.

```
aws memorydb create-parameter-group \
    --parameter-group-name myRedis6x \
    --family memorydb_redis6 \
    --description "my-parameter-group"
```

Output:

```
{
    "ParameterGroup": {
        "Name": "myredis6x",
        "Family": "memorydb_redis6",
        "Description": "my-parameter-group",
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:parametergroup/myredis6x"
    }
}
```

For more information, see Creating a parameter group in the *MemoryDB User Guide*.

- For API details, see CreateParameterGroup in *AWS CLI Command Reference*.

### `create-snapshot`

The following code example shows how to use `create-snapshot`.

**AWS CLI**

**To create a snapshot**

The following `create-snapshot` example creates a snapshot.

```
aws memorydb create-snapshot \
    --cluster-name my-cluster \
    --snapshot-name my-cluster-snapshot
```

Output:

```
{
    "Snapshot": {
        "Name": "my-cluster-snapshot1",
        "Status": "creating",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:snapshot/my-cluster-
snapshot",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": "",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-862xxxxc",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
        }
    }
}
```

For more information, see Making manual snapshots in the *MemoryDB User Guide*.

- For API details, see CreateSnapshot in *AWS CLI Command Reference*.

## `create-subnet-group`

The following code example shows how to use `create-subnet-group`.

### AWS CLI

#### To create a subnet group

The following `create-subnet-group` example creates a subnet group.

```
aws memorydb create-subnet-group \
    --subnet-group-name mysubnetgroup \
    --description "my subnet group" \
    --subnet-ids subnet-5623xxxx
```

Output:

```
{
    "SubnetGroup": {
        "Name": "mysubnetgroup",
        "Description": "my subnet group",
        "VpcId": "vpc-86257xxx",
        "Subnets": [
            {
                "Identifier": "subnet-5623xxxx",
                "AvailabilityZone": {
                    "Name": "us-east-1a"
                }
            }
        ],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/mysubnetgroup"
    }
}
```

For more information, see Creating a subnet group in the *MemoryDB User Guide*.

- For API details, see CreateSubnetGroup in *AWS CLI Command Reference*.

## `create-user`

The following code example shows how to use `create-user`.

### AWS CLI

#### To creat a user

The following `create-user` example creates a new user.

```
aws memorydb create-user \
    --user-name user-name-1 \
    --access-string "~objects:* ~items:* ~public:*" \
     --authentication-mode \
         Passwords="enterapasswordhere",Type=password
```

Output:

```
{
    "User": {
        "Name": "user-name-1",
        "Status": "active",
        "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
        "ACLNames": [],
        "MinimumEngineVersion": "6.2",
        "Authentication": {
            "Type": "password",
            "PasswordCount": 1
        },
        "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:user/user-name-1"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see CreateUser in *AWS CLI Command Reference*.

## `delete-acl`

The following code example shows how to use `delete-acl`.

### AWS CLI

#### To delete an ACL

The following `delete-acl` example deletes an Access control list.

```
aws memorydb delete-acl \
    --acl-name "new-acl-1"
```

Output:

```
{
    "ACL": {
        "Name": "new-acl-1",
        "Status": "deleting",
        "UserNames": [
            "pat"
        ],
        "MinimumEngineVersion": "6.2",
        "Clusters": [],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/new-acl-1"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DeleteAcl in *AWS CLI Command Reference*.

### `delete-cluster`

The following code example shows how to use `delete-cluster`.

#### AWS CLI

**To delete a cluster**

The following `delete-cluster` example deletes a cluster.

```
aws memorydb delete-cluster \
    --cluster-name my-new-cluster
```

Output:

```
{
    "Cluster": {
        "Name": "my-new-cluster",
        "Status": "deleting",
        "NumberOfShards": 1,
        "ClusterEndpoint": {
            "Address": "clustercfg.my-new-cluster.xxxxx.memorydb.us-
east-1.amazonaws.com",
```

```
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SubnetGroupName": "my-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-new-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "sat:10:00-sat:11:00",
        "SnapshotWindow": "07:30-08:30",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Deleting a cluster in the *MemoryDB User Guide*.

- For API details, see DeleteCluster in *AWS CLI Command Reference*.

### `delete-parameter-group`

The following code example shows how to use `delete-parameter-group`.

#### AWS CLI

**To delete a parameter group**

The following `delete-parameter-group` example deletes a parameter group.

```
aws memorydb delete-parameter-group \
    --parameter-group-name myRedis6x
```

Output:

```
{
    "ParameterGroup": {
        "Name": "myredis6x",
        "Family": "memorydb_redis6",
        "Description": "my-parameter-group",
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/myredis6x"
```

```
    }
}
```

For more information, see Deleting a parameter group in the *MemoryDB User Guide*.

- For API details, see DeleteParameterGroup in *AWS CLI Command Reference*.

### `delete-snapshot`

The following code example shows how to use `delete-snapshot`.

#### AWS CLI

**To delete a snapshot**

The following `delete-snapshot` example deletes a snapshot.

```
aws memorydb delete-snapshot \
    --snapshot-name my-cluster-snapshot
```

Output:

```
{
    "Snapshot": {
        "Name": "my-cluster-snapshot",
        "Status": "deleting",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:snapshot/my-cluster-
snapshot",
        "ClusterConfiguration": {
            "Name": "my-cluster",
            "Description": "",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-862xxxxc",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
```

```
        }
    }
}
```

For more information, see Deleting a snapshot in the *MemoryDB User Guide*.

- For API details, see DeleteSnapshot in *AWS CLI Command Reference*.

### `delete-subnet-group`

The following code example shows how to use `delete-subnet-group`.

**AWS CLI**

**To delete a subnet group**

The following `delete-subnet-group` example deletes a subnet.

```
aws memorydb delete-subnet-group \
    --subnet-group-name mysubnetgroup
```

Output:

```
{
    "SubnetGroup": {
        "Name": "mysubnetgroup",
        "Description": "my subnet group",
        "VpcId": "vpc-86xxxx4fc",
        "Subnets": [
            {
                "Identifier": "subnet-56xxx61b",
                "AvailabilityZone": {
                    "Name": "us-east-1a"
                }
            }
        ],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/mysubnetgroup"
    }
}
```

For more information, see Deleting a subnet group in the *MemoryDB User Guide*.

- For API details, see DeleteSubnetGroup in *AWS CLI Command Reference*.

### `delete-user`

The following code example shows how to use `delete-user`.

#### AWS CLI

**To delete a user**

The following `delete-user` example deletes a user.

```
aws memorydb delete-user \
    --user-name my-user
```

Output:

```
{
    "User": {
        "Name": "my-user",
        "Status": "deleting",
        "AccessString": "on ~app::* resetchannels -@all +@read",
        "ACLNames": [
            "my-acl"
        ],
        "MinimumEngineVersion": "6.2",
        "Authentication": {
            "Type": "password",
            "PasswordCount": 1
        },
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

### `describe-acls`

The following code example shows how to use `describe-acls`.

**AWS CLI**

**To return a list of ACLs**

The following describe-acls` returns a list of ACLs.

```
aws memorydb describe-acls
```

Output:

```
{
    "ACLs": [
        {
            "Name": "open-access",
            "Status": "active",
            "UserNames": [
                "default"
            ],
            "MinimumEngineVersion": "6.2",
            "Clusters": [],
            "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/open-access"
        },
        {
            "Name": my-acl",
            "Status": "active",
            "UserNames": [],
            "MinimumEngineVersion": "6.2",
            "Clusters": [
                "my-cluster"
            ],
            "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxxx:acl/my-acl"
        }
    ]
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DescribeAcls in *AWS CLI Command Reference*.

## `describe-clusters`

The following code example shows how to use `describe-clusters`.

## AWS CLI

### To return a list of clusters

The following describe-clusters` returns a list of clusters.

```
aws memorydb describe-clusters
```

Output:

```
{
    "Clusters": [
        {
                "Name": "my-cluster",
                "Status": "available",
                "NumberOfShards": 2,
                "ClusterEndpoint": {
                    "Address": "clustercfg.my-cluster.llru6f.memorydb.us-
east-1.amazonaws.com",
                    "Port": 6379
                },
                "NodeType": "db.r6g.large",
                "EngineVersion": "6.2",
                "EnginePatchVersion": "6.2.6",
                "ParameterGroupName": "default.memorydb-redis6",
                "ParameterGroupStatus": "in-sync",
                "SecurityGroups": [
                    {
                        "SecurityGroupId": "sg-0a1434xxxxxc9fae",
                        "Status": "active"
                    }
                ],
                "SubnetGroupName": "pat-sg",
                "TLSEnabled": true,
                "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:cluster/my-cluster",
                "SnapshotRetentionLimit": 0,
                "MaintenanceWindow": "wed:03:00-wed:04:00",
                "SnapshotWindow": "04:30-05:30",
                "ACLName": "my-acl",
                "AutoMinorVersionUpgrade": true
        }
    ]
}
```

For more information, see Managing clusters in the *MemoryDB User Guide*.

- For API details, see DescribeClusters in *AWS CLI Command Reference*.

### `describe-engine-versions`

The following code example shows how to use `describe-engine-versions`.

#### AWS CLI

**To return a list of engine versions**

The following describe-engine-versions` returns a list of engine versions.

```
aws memorydb describe-engine-versions
```

Output:

```
{
    "EngineVersions": [
        {
            "EngineVersion": "6.2",
            "EnginePatchVersion": "6.2.6",
            "ParameterGroupFamily": "memorydb_redis6"
        }
    ]
}
```

For more information, see Engine versions and upgrading in the *MemoryDB User Guide*.

- For API details, see DescribeEngineVersions in *AWS CLI Command Reference*.

### `describe-events`

The following code example shows how to use `describe-events`.

#### AWS CLI

**To return a list of events**

The following describe-events` returns a list of events.

```
aws memorydb describe-events
```

Output:

```
{
    "Events": [
        {
            "SourceName": "my-cluster",
            "SourceType": "cluster",
            "Message": "Increase replica count started for replication group my-
cluster on 2022-07-22T14:09:01.440Z",
            "Date": "2022-07-22T07:09:01.443000-07:00"
        },
        {
            "SourceName": "my-user",
            "SourceType": "user",
            "Message": "Create user my-user operation completed.",
            "Date": "2022-07-22T07:00:02.975000-07:00"
        }
    ]
}
```

For more information, see Monitoring events in the *MemoryDB User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

### `describe-parameter-groups`

The following code example shows how to use `describe-parameter-groups`.

#### AWS CLI

**To return a list of parameter groups**

The following describe-parameter-groups` returns a list of parameter groups.

```
aws memorydb describe-parameter-groups
```

Output:

```
{
    "ParameterGroups": [
        {
            "Name": "default.memorydb-redis6",
            "Family": "memorydb_redis6",
```

```
            "Description": "Default parameter group for memorydb_redis6",
            "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/
default.memorydb-redis6"
        }
    ]
}
```

For more information, see Configuring engine parameters using parameter groups in the *MemoryDB User Guide*.

- For API details, see DescribeParameterGroups in *AWS CLI Command Reference*.

### `describe-parameters`

The following code example shows how to use `describe-parameters`.

#### AWS CLI

**To return a list of parameters**

The following describe-parameters` returns a list of parameters.

```
aws memorydb describe-parameters
```

Output:

```
{
    "Parameters": [
        {
            "Name": "acllog-max-len",
            "Value": "128",
            "Description": "The maximum length of the ACL Log",
            "DataType": "integer",
            "AllowedValues": "1-10000",
            "MinimumEngineVersion": "6.2.4"
        },
        {
            "Name": "activedefrag",
            "Value": "no",
            "Description": "Enabled active memory defragmentation",
            "DataType": "string",
            "AllowedValues": "yes,no",
            "MinimumEngineVersion": "6.2.4"
```

```
        },
        {
            "Name": "active-defrag-cycle-max",
            "Value": "75",
            "Description": "Maximal effort for defrag in CPU percentage",
            "DataType": "integer",
            "AllowedValues": "1-75",
            "MinimumEngineVersion": "6.2.4"
        },
        {
            "Name": "active-defrag-cycle-min",
            "Value": "5",
            "Description": "Minimal effort for defrag in CPU percentage",
            "DataType": "integer",
            "AllowedValues": "1-75",
            "MinimumEngineVersion": "6.2.4"
        },
        {
            "Name": "active-defrag-ignore-bytes",
            "Value": "104857600",
            "Description": "Minimum amount of fragmentation waste to start active
defrag",
            "DataType": "integer",
            "AllowedValues": "1048576-",
            "MinimumEngineVersion": "6.2.4"
        },
        {
            "Name": "active-defrag-max-scan-fields",
            "Value": "1000",
            "Description": "Maximum number of set/hash/zset/list fields that will be
processed from the main dictionary scan",
            "DataType": "integer",
            "AllowedValues": "1-1000000",
            "MinimumEngineVersion": "6.2.4"
        },
        {
            "Name": "active-defrag-threshold-lower",
            "Value": "10",
            "Description": "Minimum percentage of fragmentation to start active
defrag",
            "DataType": "integer",
            "AllowedValues": "1-100",
            "MinimumEngineVersion": "6.2.4"
        },
```

```
        {
            "Name": "active-defrag-threshold-upper",
            "Value": "100",
            "Description": "Maximum percentage of fragmentation at which we use
maximum effort",
            "DataType": "integer",
            "AllowedValues": "1-100",
            "MinimumEngineVersion": "6.2.4"
        },

```

For more information, see Configuring engine parameters using parameter groups in the *MemoryDB User Guide*.

- For API details, see DescribeParameters in *AWS CLI Command Reference*.

### `describe-snapshots`

The following code example shows how to use `describe-snapshots`.

#### AWS CLI

**To return a list of snapshots**

The following describe-snapshots` returns a list of snapshots.

```
aws memorydb describe-snapshots
```

Output:

```
{
"Snapshots": [
    {
        "Name": "my-cluster-snapshot",
        "Status": "available",
        "Source": "manual",
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx2:snapshot/my-cluster-
snapshot",
        "ClusterConfiguration": {
```

```
            "Name": "my-cluster",
            "Description": " ",
            "NodeType": "db.r6g.large",
            "EngineVersion": "6.2",
            "MaintenanceWindow": "wed:03:00-wed:04:00",
            "Port": 6379,
            "ParameterGroupName": "default.memorydb-redis6",
            "SubnetGroupName": "my-sg",
            "VpcId": "vpc-862574fc",
            "SnapshotRetentionLimit": 0,
            "SnapshotWindow": "04:30-05:30",
            "NumShards": 2
        }
    }
}
```

For more information, see Snapshot and restore in the *MemoryDB User Guide*.

- For API details, see DescribeSnapshots in *AWS CLI Command Reference*.

### `describe-subnet-groups`

The following code example shows how to use `describe-subnet-groups`.

#### AWS CLI

**To return a list of subnet groups**

The following describe-subnet-groups` returns a list of subnet groups.

```
aws memorydb describe-subnet-groups
```

Output

```
{
    "SubnetGroups": [
        {
            "Name": "my-sg",
            "Description": "pat-sg",
            "VpcId": "vpc-86xxx4fc",
            "Subnets": [
                {
                    "Identifier": "subnet-faxx84a6",
```

```
                    "AvailabilityZone": {
                        "Name": "us-east-1b"
                    }
                },
                {
                    "Identifier": "subnet-56xxf61b",
                    "AvailabilityZone": {
                        "Name": "us-east-1a"
                    }
                }
            ],
            "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:subnetgroup/my-sg"
        }
    ]
}
```

For more information, see Subnets and subnet groups in the *MemoryDB User Guide*.

- For API details, see DescribeSubnetGroups in *AWS CLI Command Reference*.

### `describe-users`

The following code example shows how to use `describe-users`.

#### AWS CLI

**To return a list of users**

The following describe-users` returns a list of users.

```
aws memorydb describe-users
```

Output

```
{
    "Users": [
        {
            "Name": "default",
            "Status": "active",
            "AccessString": "on ~* &* +@all",
            "ACLNames": [
                "open-access"
            ],
```

```
            "MinimumEngineVersion": "6.0",
            "Authentication": {
                "Type": "no-password"
            },
            "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/default"
        },
        {
            "Name": "my-user",
            "Status": "active",
            "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
            "ACLNames": [],
            "MinimumEngineVersion": "6.2",
            "Authentication": {
                "Type": "password",
                "PasswordCount": 2
            },
            "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
        }
    ]
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see DescribeUsers in *AWS CLI Command Reference*.

### `failover-shard`

The following code example shows how to use `failover-shard`.

#### AWS CLI

**To fail over a shard**

The following failover-shard` fails over a shard.

```
aws memorydb failover-shard \
    --cluster-name my-cluster --shard-name 0001
```

Output:

```
{
```

```
    "Cluster": {
        "Name": "my-cluster",
        "Status": "available",
        "NumberOfShards": 2,
        "ClusterEndpoint": {
            "Address": "clustercfg.my-cluster.xxxxxx.memorydb.us-
east-1.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-0a143xxxx45c9fae",
                "Status": "active"
            }
        ],
        "SubnetGroupName": "my-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "wed:03:00-wed:04:00",
        "SnapshotWindow": "04:30-05:30",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Minimizing downtime with MultiAZ in the *MemoryDB User Guide*.

- For API details, see FailoverShard in *AWS CLI Command Reference*.

## `list-allowed-node-type-updates`

The following code example shows how to use `list-allowed-node-type-updates`.

### AWS CLI

#### To return a list of allowed node type updates

The following list-allowed-node-type-updates returns a list of available node type updates.

```
aws memorydb list-allowed-node-type-updates
```

Output:

```
{
    "Cluster": {
        "Name": "my-cluster",
        "Status": "available",
        "NumberOfShards": 2,
        "ClusterEndpoint": {
            "Address": "clustercfg.my-cluster.xxxxxx.memorydb.us-
east-1.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "default.memorydb-redis6",
        "ParameterGroupStatus": "in-sync",
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-0a143xxxx45c9fae",
                "Status": "active"
            }
        ],
        "SubnetGroupName": "my-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "wed:03:00-wed:04:00",
        "SnapshotWindow": "04:30-05:30",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Scaling in the *MemoryDB User Guide*.

- For API details, see ListAllowedNodeTypeUpdates in *AWS CLI Command Reference*.

### `list-tags`

The following code example shows how to use `list-tags`.

**AWS CLI**

**To return a list of tags**

The following list-tags returns a list of tags.

```
aws memorydb list-tags \
    --resource-arn arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the *MemoryDB User Guide*.

- For API details, see ListTags in *AWS CLI Command Reference*.

## `reset-parameter-group`

The following code example shows how to use `reset-parameter-group`.

**AWS CLI**

**To reset a parameter group**

The following reset-parameter-group ` resets a parameter group.

```
aws memorydb reset-parameter-group \
    --parameter-group-name my-parameter-group \
    --all-parameters
```

Output:

```
{
```

```
    "ParameterGroup": {
        "Name": "my-parameter-group",
        "Family": "memorydb_redis6",
        "Description": "my parameter group",
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/my-parameter-
group"
    }
}
```

For more information, see Configuring engine parameters using parameter groups in the *MemoryDB User Guide*.

- For API details, see ResetParameterGroup in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To tag a resource**

The following tag-resource` adds a tag to a resource.

```
aws memorydb tag-resource \
    --resource-arn arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster \
    --tags Key="mykey",Value="myvalue"
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        },
        {
            "Key": "mykey",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the *MemoryDB User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To update an ACL**

The following update-acl` updates an ACL by adding a user.

```
aws memorydb untag-resource \
    --resource-arn arn:aws:memorydb:us-east-1:491658xxxxx:cluster/my-cluster \
    --tag-keys mykey
```

Output:

```
{
    "TagList": [
        {
            "Key": "mytag",
            "Value": "myvalue"
        }
    ]
}
```

For more information, see Tagging resources in the *MemoryDB User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-cluster`

The following code example shows how to use `update-cluster`.

#### AWS CLI

**To update a cluster**

The following update-cluster`` updates the parameter group of a cluster to my-parameter-group.

```
aws memorydb update-cluster \
    --cluster-name my-cluster \
    --parameter-group-name my-parameter-group
```

Output:

```
{
    "Cluster": {
        "Name": "my-cluster",
        "Status": "available",
        "NumberOfShards": 2,
        "AvailabilityMode": "MultiAZ",
        "ClusterEndpoint": {
            "Address": "clustercfg.my-cluster.llru6f.memorydb.us-
east-1.amazonaws.com",
            "Port": 6379
        },
        "NodeType": "db.r6g.large",
        "EngineVersion": "6.2",
        "EnginePatchVersion": "6.2.6",
        "ParameterGroupName": "my-parameter-group",
        "ParameterGroupStatus": "in-sync",
        "SecurityGroups": [
            {
                "SecurityGroupId": "sg-0a143xxxxxc9fae",
                "Status": "active"
            }
        ],
        "SubnetGroupName": "pat-sg",
        "TLSEnabled": true,
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster",
        "SnapshotRetentionLimit": 0,
        "MaintenanceWindow": "wed:03:00-wed:04:00",
        "SnapshotWindow": "04:30-05:30",
        "ACLName": "my-acl",
        "AutoMinorVersionUpgrade": true
    }
}
```

For more information, see Modifying a cluster in the *MemoryDB User Guide*.

- For API details, see UpdateCluster in *AWS CLI Command Reference*.

### `update-parameter-group`

The following code example shows how to use `update-parameter-group`.

#### AWS CLI

**To update a parameter group**

The following update-parameter-group`` updates a parameter group.

```
aws memorydb update-parameter-group \
    --parameter-group-name my-parameter-group \
    --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```
{
    "ParameterGroup": {
        "Name": "my-parameter-group",
        "Family": "memorydb_redis6",
        "Description": "my parameter group",
        "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:parametergroup/my-parameter-
group"
    }
}
```

For more information, see Modifying a parameter group in the *MemoryDB User Guide*.

- For API details, see UpdateParameterGroup in *AWS CLI Command Reference*.

### `update-subnet-group`

The following code example shows how to use `update-subnet-group`.

#### AWS CLI

**To update a subnet group**

The following update-subnet-group` updates a subnet group's subnet ID.

```
aws memorydb update-subnet-group \
    --subnet-group-name my-sg \
    --subnet-ids subnet-01f29d458f3xxxxx
```

Output:

```
{
    "SubnetGroup": {
        "Name": "my-sg-1",
        "Description": "my-sg",
        "VpcId": "vpc-09d2cfc01xxxxxxx",
        "Subnets": [
            {
                "Identifier": "subnet-01f29d458fxxxxxx",
                "AvailabilityZone": {
                    "Name": "us-east-1a"
                }
            }
        ],
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/my-sg"
    }
}
```

For more information, see Subnets and subnet groups in the *MemoryDB User Guide*.

- For API details, see UpdateSubnetGroup in *AWS CLI Command Reference*.

### `update-user`

The following code example shows how to use `update-user`.

#### AWS CLI

**To update a user**

The following `update-user` modifies a user's access string.

```
aws memorydb update-user \
    --user-name my-user \
    --access-string "off ~objects:* ~items:* ~public:* resetchannels -@all"
```

Output:

```
{
    "User": {
        "Name": "my-user",
        "Status": "modifying",
```

```
        "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
        "ACLNames": [
            "myt-acl"
        ],
        "MinimumEngineVersion": "6.2",
        "Authentication": {
            "Type": "password",
            "PasswordCount": 2
        },
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
    }
}
```

For more information, see Authenticating users with Access Control Lists in the *MemoryDB User Guide*.

- For API details, see UpdateUser in *AWS CLI Command Reference*.

## Amazon MSK examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon MSK.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `create-cluster`

The following code example shows how to use `create-cluster`.

### AWS CLI

#### To create an Amazon MSK cluster

The following `create-cluster` example creates an MSK cluster named `MessagingCluster` with three broker nodes. A JSON file named `brokernodegroupinfo.json` specifies the three subnets over which you want Amazon MSK to distribute the broker nodes. This example doesn't specify the monitoring level, so the cluster gets the `DEFAULT` level.

```
aws kafka create-cluster \
    --cluster-name "MessagingCluster" \
    --broker-node-group-info file://brokernodegroupinfo.json \
    --kafka-version "2.2.1" \
    --number-of-broker-nodes 3
```

Contents of `brokernodegroupinfo.json`:

```
{
    "InstanceType": "kafka.m5.xlarge",
    "BrokerAZDistribution": "DEFAULT",
    "ClientSubnets": [
        "subnet-0123456789111abcd",
        "subnet-0123456789222abcd",
        "subnet-0123456789333abcd"
    ]
}
```

Output:

```
{
    "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "ClusterName": "MessagingCluster",
    "State": "CREATING"
}
```

For more information, see Create an Amazon MSK Cluster in the *Amazon Managed Streaming for Apache Kafka*.

- For API details, see CreateCluster in *AWS CLI Command Reference*.

### `create-configuration`

The following code example shows how to use `create-configuration`.

**AWS CLI**

**To create a custom Amazon MSK configuration**

The following `create-configuration` example creates a custom MSK configuration with the server properties that are specified in the input file.

```
aws kafka create-configuration \
    --name "CustomConfiguration" \
    --description "Topic autocreation enabled; Apache ZooKeeper timeout 2000 ms; Log
 rolling 604800000 ms." \
    --kafka-versions "2.2.1" \
    --server-properties file://configuration.txt
```

Contents of `configuration.txt`:

```
auto.create.topics.enable = true
zookeeper.connection.timeout.ms = 2000
log.roll.ms = 604800000
```

This command produces no output. Output:

```
{
    "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "CreationTime": "2019-10-09T15:26:05.548Z",
    "LatestRevision":
        {
            "CreationTime": "2019-10-09T15:26:05.548Z",
            "Description": "Topic autocreation enabled; Apache ZooKeeper timeout
 2000 ms; Log rolling 604800000 ms.",
            "Revision": 1
        },
    "Name": "CustomConfiguration"
}
```

For more information, see Amazon MSK Configuration Operations in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see CreateConfiguration in *AWS CLI Command Reference*.

### `describe-cluster`

The following code example shows how to use `describe-cluster`.

**AWS CLI**

**To describe a cluster**

The following `describe-cluster` example describes an Amazon MSK cluster.

```
aws kafka describe-cluster \
    --cluster-arn arn:aws:kafka:us-east-1:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```
{
    "ClusterInfo": {
        "BrokerNodeGroupInfo": {
            "BrokerAZDistribution": "DEFAULT",
            "ClientSubnets": [
                "subnet-cbfff283",
                "subnet-6746046b"
            ],
            "InstanceType": "kafka.m5.large",
            "SecurityGroups": [
                "sg-f839b688"
            ],
            "StorageInfo": {
                "EbsStorageInfo": {
                    "VolumeSize": 100
                }
            }
        },
        "ClusterArn": "arn:aws:kafka:us-east-1:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",
        "ClusterName": "demo-cluster-1",
        "CreationTime": "2020-07-09T02:31:36.223000+00:00",
        "CurrentBrokerSoftwareInfo": {
            "KafkaVersion": "2.2.1"
```

```
        },
        "CurrentVersion": "K3AEGXETSR30VB",
        "EncryptionInfo": {
            "EncryptionAtRest": {
                "DataVolumeKMSKeyId": "arn:aws:kms:us-east-1:123456789012:key/
a7ca56d5-0768-4b64-a670-339a9fbef81c"
            },
            "EncryptionInTransit": {
                "ClientBroker": "TLS_PLAINTEXT",
                "InCluster": true
            }
        },
        "EnhancedMonitoring": "DEFAULT",
        "OpenMonitoring": {
            "Prometheus": {
                "JmxExporter": {
                    "EnabledInBroker": false
                },
                "NodeExporter": {
                    "EnabledInBroker": false
                }
            }
        },
        "NumberOfBrokerNodes": 2,
        "State": "ACTIVE",
        "Tags": {},
        "ZookeeperConnectString": "z-2.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-1.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-3.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181"
    }
}
```

For more information, see Listing Amazon MSK Clusters in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see DescribeCluster in *AWS CLI Command Reference*.

### `get-bootstrap-brokers`

The following code example shows how to use `get-bootstrap-brokers`.

**AWS CLI**

**To get bootstrap brokers**

The following `get-bootstrap-brokers` example retrieves the bootstrap broker information for an Amazon MSK cluster.

```
aws kafka get-bootstrap-brokers \
    --cluster-arn arn:aws:kafka:us-east-1:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```
{
    "BootstrapBrokerString": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:9092,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:9092",
    "BootstrapBrokerStringTls": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:9094,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:9094"
}
```

For more information, see Getting the Bootstrap Brokers in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see GetBootstrapBrokers in *AWS CLI Command Reference*.

## `list-clusters`

The following code example shows how to use `list-clusters`.

**AWS CLI**

**To list the available clusters**

The following `list-clusters` example lists the Amazon MSK clusters in your AWS account.

```
aws kafka list-clusters
```

Output:

```
{
```

```
    "ClusterInfoList": [
        {
            "BrokerNodeGroupInfo": {
                "BrokerAZDistribution": "DEFAULT",
                "ClientSubnets": [
                    "subnet-cbfff283",
                    "subnet-6746046b"
                ],
                "InstanceType": "kafka.m5.large",
                "SecurityGroups": [
                    "sg-f839b688"
                ],
                "StorageInfo": {
                    "EbsStorageInfo": {
                        "VolumeSize": 100
                    }
                }
            },
            "ClusterArn": "arn:aws:kafka:us-east-1:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",
            "ClusterName": "demo-cluster-1",
            "CreationTime": "2020-07-09T02:31:36.223000+00:00",
            "CurrentBrokerSoftwareInfo": {
                "KafkaVersion": "2.2.1"
            },
            "CurrentVersion": "K3AEGXETSR30VB",
            "EncryptionInfo": {
                "EncryptionAtRest": {
                    "DataVolumeKMSKeyId": "arn:aws:kms:us-east-1:123456789012:key/
a7ca56d5-0768-4b64-a670-339a9fbef81c"
                },
                "EncryptionInTransit": {
                    "ClientBroker": "TLS_PLAINTEXT",
                    "InCluster": true
                }
            },
            "EnhancedMonitoring": "DEFAULT",
            "OpenMonitoring": {
                "Prometheus": {
                    "JmxExporter": {
                        "EnabledInBroker": false
                    },
                    "NodeExporter": {
                        "EnabledInBroker": false
```

```
                    }
                }
            },
            "NumberOfBrokerNodes": 2,
            "State": "ACTIVE",
            "Tags": {},
            "ZookeeperConnectString": "z-2.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-1.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-3.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181"
        }
    ]
}
```

For more information, see Listing Amazon MSK Clusters in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see ListClusters in *AWS CLI Command Reference*.

### `update-broker-storage`

The following code example shows how to use `update-broker-storage`.

#### AWS CLI

**To update the EBS storage for brokers**

The following `update-broker-storage` example updates the amount of EBS storage for all the brokers in the cluster. Amazon MSK sets the target storage amount for each broker to the amount specified in the example. You can get the current version of the cluster by describing the cluster or by listing all of the clusters.

```
aws kafka update-broker-storage \
    --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2" \
    --current-version "K21V3IB1VIZYYH" \
    --target-broker-ebs-volume-info "KafkaBrokerNodeId=ALL,VolumeSizeGB=1100"
```

The output returns an ARN for this `update-broker-storage` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.

```
{
    "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "ClusterOperationArn": "arn:aws:kafka:us-west-2:123456789012:cluster-
operation/V123450123/a1b2c3d4-1234-abcd-cdef-22222EXAMPLE-2/a1b2c3d4-abcd-1234-
bcde-33333EXAMPLE"
}
```

For more information, see Update the EBS Storage for Brokers in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see UpdateBrokerStorage in *AWS CLI Command Reference*.

### `update-cluster-configuration`

The following code example shows how to use `update-cluster-configuration`.

#### AWS CLI

**To update the configuration of an Amazon MSK cluster**

The following `update-cluster-configuration` example updates the configuration of the specified existing MSK cluster. It uses a custom MSK configuration.

```
aws kafka update-cluster-configuration \
    --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2" \
    --configuration-info file://configuration-info.json \
    --current-version "K21V3IB1VIZYYH"
```

Contents of `configuration-info.json`:

```
{
    "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "Revision": 1
}
```

The output returns an ARN for this `update-cluster-configuration` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.

```
{
    "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
    "ClusterOperationArn": "arn:aws:kafka:us-west-2:123456789012:cluster-
operation/V123450123/a1b2c3d4-1234-abcd-cdef-22222EXAMPLE-2/a1b2c3d4-abcd-1234-
bcde-33333EXAMPLE"
}
```

For more information, see Update the Configuration of an Amazon MSK Cluster in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see UpdateClusterConfiguration in *AWS CLI Command Reference*.

## Network Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Network Manager.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `associate-customer-gateway`

The following code example shows how to use `associate-customer-gateway`.

#### AWS CLI

**To associate a customer gateway**

The following `associate-customer-gateway` example associates customer gateway `cgw-11223344556677889` in the specified global network with device `device-07f6fd08867abc123`.

```
aws networkmanager associate-customer-gateway \
    --customer-gateway-arn arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889  \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --region us-west-2
```

Output:

```
{
    "CustomerGatewayAssociation": {
        "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889",
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "State": "PENDING"
    }
}
```

For more information, see Customer Gateway Associations in the *Transit Gateway Network Manager Guide*.

- For API details, see AssociateCustomerGateway in *AWS CLI Command Reference*.

## `associate-link`

The following code example shows how to use `associate-link`.

### AWS CLI

#### To associate a link

The following `associate-link` example associates link `link-11112222aaaabbbb1` with device `device-07f6fd08867abc123`. The link and device are in the specified global network.

```
aws networkmanager associate-link \
```

```
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --link-id link-11112222aaaabbbb1 \
    --region us-west-2
```

Output:

```
{
    "LinkAssociation": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "LinkId": "link-11112222aaaabbbb1",
        "LinkAssociationState": "PENDING"
    }
}
```

For more information, see Device and Link Associations in the *Transit Gateway Network Manager Guide*.

- For API details, see AssociateLink in *AWS CLI Command Reference*.

### `create-core-network`

The following code example shows how to use `create-core-network`.

**AWS CLI**

**To create a core network**

The following `create-core-network` example creates a core network using an optional description and tags within an AWS Cloud WAN global network.

```
aws networkmanager create-core-network \
    --global-network-id global-network-0d59060f16a73bc41\
    --description "Main headquarters location"\
    --tags Key=Name,Value="New York City office"
```

Output:

```
{
```

```
    "CoreNetwork": {
        "GlobalNetworkId": "global-network-0d59060f16a73bc41",
        "CoreNetworkId": "core-network-0fab62fe438d94db6",
        "CoreNetworkArn": "arn:aws:networkmanager::987654321012:core-network/core-
network-0fab62fe438d94db6",
        "Description": "Main headquarters location",
        "CreatedAt": "2022-01-10T19:53:59+00:00",
        "State": "AVAILABLE",
        "Tags": [
            {
                "Key": "Name",
                "Value": "New York City office"
            }
        ]
    }
}
```

For more information, see Core networks in the *AWS Cloud WAN User Guide*.

- For API details, see CreateCoreNetwork in *AWS CLI Command Reference*.

### `create-device`

The following code example shows how to use `create-device`.

#### AWS CLI

**To create a device**

The following `create-device` example creates a device in the specified global network. The device details include a description, the type, vendor, model, and serial number.

```
aws networkmanager create-device
    --global-network-id global-network-01231231231231231 \
    --description "New York office device" \
    --type "office device" \
    --vendor "anycompany" \
    --model "abcabc" \
    --serial-number "1234" \
    --region us-west-2
```

Output:

```
{
    "Device": {
        "DeviceId": "device-07f6fd08867abc123",
        "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York office device",
        "Type": "office device",
        "Vendor": "anycompany",
        "Model": "abcabc",
        "SerialNumber": "1234",
        "CreatedAt": 1575554005.0,
        "State": "PENDING"
    }
}
```

For more information, see Working with Devices in the *Transit Gateway Network Manager Guide*.

- For API details, see CreateDevice in *AWS CLI Command Reference*.

### `create-global-network`

The following code example shows how to use `create-global-network`.

#### AWS CLI

**To create a global network**

The following `create-global-network` examples creates a new global network. The initial state upon creation is `PENDING`.

```
aws networkmanager create-global-network
```

Output:

```
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-00a77fc0f722dae74",
        "GlobalNetworkArn": "arn:aws:networkmanager::987654321012:global-network/
global-network-00a77fc0f722dae74",
        "CreatedAt": "2022-03-14T20:31:56+00:00",
```

```
        "State": "PENDING"
    }
}
```

- For API details, see CreateGlobalNetwork in *AWS CLI Command Reference*.

### `create-link`

The following code example shows how to use `create-link`.

#### AWS CLI

**To create a link**

The following `create-link` example creates a link in the specified global network. The link includes a description and details about the link type, bandwidth, and provider. The site ID indicates the site to which the link is associated.

```
aws networkmanager create-link \
    --global-network-id global-network-01231231231231231 \
    --description "VPN Link" \
    --type "broadband" \
    --bandwidth UploadSpeed=10,DownloadSpeed=20 \
    --provider "AnyCompany" \
    --site-id site-444555aaabbb11223 \
    --region us-west-2
```

Output:

```
{
    "Link": {
        "LinkId": "link-11112222aaaabbbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 10,
            "DownloadSpeed": 20
```

```
        },
        "Provider": "AnyCompany",
        "CreatedAt": 1575555811.0,
        "State": "PENDING"
    }
}
```

For more information, see Working with Links in the *Transit Gateway Network Manager Guide*.

- For API details, see CreateLink in *AWS CLI Command Reference*.

### `create-site`

The following code example shows how to use `create-site`.

#### AWS CLI

**To create a site**

The following `create-site` example creates a site in the specified global network. The site details include a description and the location information.

```
aws networkmanager create-site \
    --global-network-id global-network-01231231231231231 \
    --description  "New York head office" \
    --location Latitude=40.7128,Longitude=-74.0060 \
    --region us-west-2
```

Output:

```
{
    "Site": {
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York head office",
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554300.0,
```

```
        "State": "PENDING"
    }
}
```

For more information, see Working with Sites in the *Transit Gateway Network Manager Guide*.

- For API details, see CreateSite in *AWS CLI Command Reference*.

### `create-vpc-attachment`

The following code example shows how to use `create-vpc-attachment`.

**AWS CLI**

**To create a VPC attachment**

The following `create-vpc-attachment` example creates a VPC attachment with IPv6 support in a core network.

```
aws networkmanager create-vpc-attachment \
    --core-network-id core-network-0fab62fe438d94db6 \
    --vpc-arn arn:aws:ec2:us-east-1:987654321012:vpc/vpc-09f37f69e2786eeb8  \
    --subnet-arns arn:aws:ec2:us-east-1:987654321012:subnet/subnet-04ca4e010857e7bb7
 \
    --Ipv6Support=true
```

Output:

```
{
    "VpcAttachment": {
        "Attachment": {
            "CoreNetworkId": "core-network-0fab62fe438d94db6",
            "AttachmentId": "attachment-05e1da6eba87a06e6",
            "OwnerAccountId": "987654321012",
            "AttachmentType": "VPC",
            "State": "CREATING",
            "EdgeLocation": "us-east-1",
            "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/
vpc-09f37f69e2786eeb8",
            "Tags": [],
            "CreatedAt": "2022-03-10T20:59:14+00:00",
            "UpdatedAt": "2022-03-10T20:59:14+00:00"
```

```
        },
        "SubnetArns": [
            "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-04ca4e010857e7bb7"
        ],
        "Options": {
            "Ipv6Support": true
        }
    }
}
```

For more information, see Create an attachment in the *Cloud WAN User Guide*.

- For API details, see CreateVpcAttachment in *AWS CLI Command Reference*.

## `delete-attachment`

The following code example shows how to use `delete-attachment`.

### AWS CLI

#### To delete an attachment

The following `delete-attachment` example deletes a Connect attachment.

```
aws networkmanager delete-attachment \
    --attachment-id attachment-01feddaeae26ab68c
```

Output:

```
{
    "Attachment": {
        "CoreNetworkId": "core-network-0f4b0a9d5ee7761d1",
        "AttachmentId": "attachment-01feddaeae26ab68c",
        "OwnerAccountId": "987654321012",
        "AttachmentType": "CONNECT",
        "State": "DELETING",
        "EdgeLocation": "us-east-1",
        "ResourceArn": "arn:aws:networkmanager::987654321012:attachment/
attachment-02c3964448fedf5aa",
        "CreatedAt": "2022-03-15T19:18:41+00:00",
        "UpdatedAt": "2022-03-15T19:28:59+00:00"
    }
```

```
}
```

For more information, see Delete attachments in the *Cloud WAN User Guide*.

- For API details, see DeleteAttachment in *AWS CLI Command Reference*.

### `delete-bucket-analytics-configuration`

The following code example shows how to use `delete-bucket-analytics-configuration`.

**AWS CLI**

**To delete an analytics configuration for a bucket**

The following `delete-bucket-analytics-configuration` example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \
    --bucket my-bucket \
    --id 1
```

This command produces no output.

- For API details, see DeleteBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

### `delete-bucket-metrics-configuration`

The following code example shows how to use `delete-bucket-metrics-configuration`.

**AWS CLI**

**To delete a metrics configuration for a bucket**

The following `delete-bucket-metrics-configuration` example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123
```

This command produces no output.

- For API details, see DeleteBucketMetricsConfiguration in *AWS CLI Command Reference*.

### `delete-core-network`

The following code example shows how to use `delete-core-network`.

#### AWS CLI

##### To delete a core network

The following `delete-core-network` example deletes a core network from a Cloud WAN global network.

```
aws networkmanager delete-core-network \
    --core-network-id core-network-0fab62fe438d94db6
```

Output:

```
{
    "CoreNetwork": {
        "GlobalNetworkId": "global-network-0d59060f16a73bc41",
        "CoreNetworkId": "core-network-0fab62fe438d94db6",
        "Description": "Main headquarters location",
        "CreatedAt": "2021-12-09T18:31:11+00:00",
        "State": "DELETING",
        "Segments": [
            {
                "Name": "dev",
                "EdgeLocations": [
                    "us-east-1"
                ],
                "SharedSegments": []
            }
        ],
        "Edges": [
            {
                "EdgeLocation": "us-east-1",
                "Asn": 64512,
                "InsideCidrBlocks": []
            }
        ]
    }
```

```
}
```

For more information, see Core networks in the *Cloud WAN User Guide*.

- For API details, see DeleteCoreNetwork in *AWS CLI Command Reference*.

### `delete-device`

The following code example shows how to use `delete-device`.

#### AWS CLI

**To delete a device**

The following `delete-device` example deletes the specified device from the specified global network.

```
aws networkmanager delete-device \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --region us-west-2
```

Output:

```
{
    "Device": {
        "DeviceId": "device-07f6fd08867abc123",
        "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York office device",
        "Type": "office device",
        "Vendor": "anycompany",
        "Model": "abcabc",
        "SerialNumber": "1234",
        "SiteId": "site-444555aaabbb11223",
        "CreatedAt": 1575554005.0,
        "State": "DELETING"
    }
}
```

For more information, see Working with Devices in the *Transit Gateway Network Manager Guide*.

- For API details, see DeleteDevice in *AWS CLI Command Reference*.

### `delete-global-network`

The following code example shows how to use `delete-global-network`.

**AWS CLI**

**To delete a global network**

The following `delete-global-network` example deletes a global network.

```
aws networkmanager delete-global-network \
    --global-network-id global-network-052bedddccb193b6b
```

Output:

```
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-052bedddccb193b6b",
        "GlobalNetworkArn": "arn:aws:networkmanager::987654321012:global-network/
global-network-052bedddccb193b6b",
        "CreatedAt": "2021-12-09T18:19:12+00:00",
        "State": "DELETING"
    }
}
```

- For API details, see DeleteGlobalNetwork in *AWS CLI Command Reference*.

### `delete-link`

The following code example shows how to use `delete-link`.

**AWS CLI**

**To delete a link**

The following `delete-link` example deletes the specified link from the specified global network.

```
aws networkmanager delete-link \
```

```
    --global-network-id global-network-01231231231231231  \
    --link-id link-11112222aaaabbbb1 \
    --region us-west-2
```

Output:

```
{
    "Link": {
        "LinkId": "link-11112222aaaabbbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 20,
            "DownloadSpeed": 20
        },
        "Provider": "AnyCompany",
        "CreatedAt": 1575555811.0,
        "State": "DELETING"
    }
}
```

For more information, see Working with Links in the *Transit Gateway Network Manager Guide*.

- For API details, see DeleteLink in *AWS CLI Command Reference*.

## `delete-public-access-block`

The following code example shows how to use `delete-public-access-block`.

### AWS CLI

#### To delete the block public access configuration for a bucket

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
    --bucket my-bucket
```

This command produces no output.

- For API details, see DeletePublicAccessBlock in *AWS CLI Command Reference*.

### `delete-site`

The following code example shows how to use `delete-site`.

**AWS CLI**

**To delete a site**

The following `delete-site` example deletes the specified site (`site-444555aaabbb11223`) in the specified global network.

```
aws networkmanager delete-site \
    --global-network-id global-network-01231231231231231  \
    --site-id site-444555aaabbb11223 \
    --region us-west-2
```

Output:

```
{
    "Site": {
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York head office",
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554300.0,
        "State": "DELETING"
    }
}
```

For more information, see Working with Sites in the *Transit Gateway Network Manager Guide*.

- For API details, see DeleteSite in *AWS CLI Command Reference*.

### `deregister-transit-gateway`

The following code example shows how to use `deregister-transit-gateway`.

**AWS CLI**

**To deregister a transit gateway from a global network**

The following `deregister-transit-gateway` example deregisters the specified transit gateway from the specified global network.

```
aws networkmanager deregister-transit-gateway \
    --global-network-id global-network-01231231231231231 \
    --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc \
    --region us-west-2
```

Output:

```
{
    "TransitGatewayRegistration": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc",
        "State": {
            "Code": "DELETING"
        }
    }
}
```

For more information, see Transit Gateway Registrations in the *Transit Gateway Network Manager Guide*.

- For API details, see DeregisterTransitGateway in *AWS CLI Command Reference*.

### `describe-global-networks`

The following code example shows how to use `describe-global-networks`.

**AWS CLI**

**To describe your global networks**

The following `describe-global-networks` example describes all of your global networks in your account.

```
aws networkmanager describe-global-networks \
    --region us-west-2
```

Output:

```
{
    "GlobalNetworks": [
        {
            "GlobalNetworkId": "global-network-01231231231231231",
            "GlobalNetworkArn": "arn:aws:networkmanager::123456789012:global-
network/global-network-01231231231231231",
            "Description": "Company 1 global network",
            "CreatedAt": 1575553525.0,
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see DescribeGlobalNetworks in *AWS CLI Command Reference*.

### `disassociate-customer-gateway`

The following code example shows how to use `disassociate-customer-gateway`.

#### AWS CLI

**To disassociate a customer gateway**

The following `disassociate-customer-gateway` example disassociates the specified customer gateway (`cgw-11223344556677889`) from the specified global network.

```
aws networkmanager disassociate-customer-gateway \
    --global-network-id global-network-01231231231231231 \
    --customer-gateway-arn arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889 \
    --region us-west-2
```

Output:

```
{
    "CustomerGatewayAssociation": {
        "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-gateway/
cgw-11223344556677889",
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "State": "DELETING"
    }
}
```

For more information, see Customer Gateway Associations in the *Transit Gateway Network Manager Guide*.

- For API details, see DisassociateCustomerGateway in *AWS CLI Command Reference*.

### `disassociate-link`

The following code example shows how to use `disassociate-link`.

#### AWS CLI

**To disassociate a link**

The following `disassociate-link` example disassociates the specified link from device `device-07f6fd08867abc123` in the specified global network.

```
aws networkmanager disassociate-link \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --link-id link-11112222aaaabbbb1 \
    --region us-west-2
```

Output:

```
{
    "LinkAssociation": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "DeviceId": "device-07f6fd08867abc123",
        "LinkId": "link-11112222aaaabbbb1",
        "LinkAssociationState": "DELETING"
    }
}
```

For more information, see Device and Link Associations in the *Transit Gateway Network Manager Guide*.

- For API details, see DisassociateLink in *AWS CLI Command Reference*.

### `get-bucket-analytics-configuration`

The following code example shows how to use `get-bucket-analytics-configuration`.

**AWS CLI**

**To retrieve the analytics configuration for a bucket with a specific ID**

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration \
    --bucket my-bucket \
    --id 1
```

Output:

```
{
    "AnalyticsConfiguration": {
        "StorageClassAnalysis": {},
        "Id": "1"
    }
}
```

- For API details, see GetBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

### `get-bucket-metrics-configuration`

The following code example shows how to use `get-bucket-metrics-configuration`.

**AWS CLI**

**To retrieve the metrics configuration for a bucket with a specific ID**

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123
```

Output:

```
{
    "MetricsConfiguration": {
        "Filter": {
            "Prefix": "logs"
        },
        "Id": "123"
    }
}
```

- For API details, see GetBucketMetricsConfiguration in *AWS CLI Command Reference*.

### `get-customer-gateway-associations`

The following code example shows how to use `get-customer-gateway-associations`.

#### AWS CLI

**To get your customer gateway associations**

The following `get-customer-gateway-associations` example gets the customer gateway associations for the specified global network.

```
aws networkmanager get-customer-gateway-associations \
    --global-network-id global-network-01231231231231231 \
    --region us-west-2
```

Output:

```
{
    "CustomerGatewayAssociations": [
        {
            "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-
gateway/cgw-11223344556677889",
            "GlobalNetworkId": "global-network-01231231231231231",
            "DeviceId": "device-07f6fd08867abc123",
```

```
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see GetCustomerGatewayAssociations in *AWS CLI Command Reference*.

### `get-devices`

The following code example shows how to use `get-devices`.

#### AWS CLI

**To get your devices**

The following `get-devices` example gets the devices in the specified global network.

```
aws networkmanager get-devices \
    --global-network-id global-network-01231231231231231 \
    --region us-west-2
```

Output:

```
{
    "Devices": [
        {
            "DeviceId": "device-07f6fd08867abc123",
            "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
            "GlobalNetworkId": "global-network-01231231231231231",
            "Description": "NY office device",
            "Type": "office device",
            "Vendor": "anycompany",
            "Model": "abcabc",
            "SerialNumber": "1234",
            "CreatedAt": 1575554005.0,
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see GetDevices in *AWS CLI Command Reference*.

### `get-link-associations`

The following code example shows how to use `get-link-associations`.

#### AWS CLI

**To get your link associations**

The following `get-link-associations` example gets the link associations in the specified global network.

```
aws networkmanager get-link-associations \
    --global-network-id global-network-01231231231231231 \
    --region us-west-2
```

Output:

```
{
    "LinkAssociations": [
        {
            "GlobalNetworkId": "global-network-01231231231231231",
            "DeviceId": "device-07f6fd08867abc123",
            "LinkId": "link-11112222aaaabbbb1",
            "LinkAssociationState": "AVAILABLE"
        }
    ]
}
```

- For API details, see GetLinkAssociations in *AWS CLI Command Reference*.

### `get-links`

The following code example shows how to use `get-links`.

#### AWS CLI

**To get your links**

The following `get-links` example gets the links in the specified global network.

```
aws networkmanager get-links \
    --global-network-id global-network-01231231231231231 \
```

```
    --region us-west-2
```

Output:

```
{
    "Links": [
        {
            "LinkId": "link-11112222aaaabbbb1",
            "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
            "GlobalNetworkId": "global-network-01231231231231231",
            "SiteId": "site-444555aaabbb11223",
            "Description": "VPN Link",
            "Type": "broadband",
            "Bandwidth": {
                "UploadSpeed": 10,
                "DownloadSpeed": 20
            },
            "Provider": "AnyCompany",
            "CreatedAt": 1575555811.0,
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see GetLinks in *AWS CLI Command Reference*.

### `get-object-retention`

The following code example shows how to use `get-object-retention`.

#### AWS CLI

**To retrieve the object retention configuration for an object**

The following `get-object-retention` example retrieves the object retention configuration for the specified object.

```
aws s3api get-object-retention \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf
```

Output:

```
{
    "Retention": {
        "Mode": "GOVERNANCE",
        "RetainUntilDate": "2025-01-01T00:00:00.000Z"
    }
}
```

- For API details, see GetObjectRetention in *AWS CLI Command Reference*.

### `get-public-access-block`

The following code example shows how to use `get-public-access-block`.

**AWS CLI**

**To set or modify the block public access configuration for a bucket**

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block --bucket my-bucket
```

Output:

```
{
    "PublicAccessBlockConfiguration": {
        "IgnorePublicAcls": true,
        "BlockPublicPolicy": true,
        "BlockPublicAcls": true,
        "RestrictPublicBuckets": true
    }
}
```

- For API details, see GetPublicAccessBlock in *AWS CLI Command Reference*.

### `get-sites`

The following code example shows how to use `get-sites`.

### AWS CLI

#### To get your sites

The following `get-sites` example gets the sites in the specified global network.

```
aws networkmanager get-sites \
    --global-network-id global-network-01231231231231231 \
    --region us-west-2
```

Output:

```
{
    "Sites": [
        {
            "SiteId": "site-444555aaabbb11223",
            "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
            "GlobalNetworkId": "global-network-01231231231231231",
            "Description": "NY head office",
            "Location": {
                "Latitude": "40.7128",
                "Longitude": "-74.0060"
            },
            "CreatedAt": 1575554528.0,
            "State": "AVAILABLE"
        }
    ]
}
```

- For API details, see GetSites in *AWS CLI Command Reference*.

## `get-transit-gateway-registrations`

The following code example shows how to use `get-transit-gateway-registrations`.

### AWS CLI

#### To get your transit gateway registrations

The following `get-transit-gateway-registrations` example gets the transit gateways that are registered to the specified global network.

```
aws networkmanager get-transit-gateway-registrations \
    --global-network-id global-network-01231231231231231 \
    --region us-west-2
```

Output:

```
{
    "TransitGatewayRegistrations": [
        {
            "GlobalNetworkId": "global-network-01231231231231231",
            "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-
gateway/tgw-123abc05e04123abc",
            "State": {
                "Code": "AVAILABLE"
            }
        }
    ]
}
```

- For API details, see GetTransitGatewayRegistrations in *AWS CLI Command Reference*.

### `get-vpc-attachment`

The following code example shows how to use `get-vpc-attachment`.

#### AWS CLI

**To get an a VPC attachment**

The following `get-vpc-attachment` example returns information about a VPC attachment.

```
aws networkmanager get-vpc-attachment \
    --attachment-id  attachment-03b7ea450134787da
```

Output:

```
{
    "VpcAttachment": {
        "Attachment": {
            "CoreNetworkId": "core-network-0522de1b226a5d7b3",
            "AttachmentId": "attachment-03b7ea450134787da",
```

```
            "OwnerAccountId": "987654321012",
            "AttachmentType": "VPC",
            "State": "CREATING",
            "EdgeLocation": "us-east-1",
            "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-a7c4bbda",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "DevVPC"
                }
            ],
            "CreatedAt": "2022-03-11T17:48:58+00:00",
            "UpdatedAt": "2022-03-11T17:48:58+00:00"
        },
        "SubnetArns": [
            "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-202cde6c",
            "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-e5022dba",
            "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-2387ae02",
            "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-cda9dffc"
        ],
        "Options": {
            "Ipv6Support": false
        }
    }
}
```

For more information, see Attachments in the *Cloud WAN User Guide*.

- For API details, see GetVpcAttachment in *AWS CLI Command Reference*.

## `list-bucket-analytics-configurations`

The following code example shows how to use `list-bucket-analytics-configurations`.

### AWS CLI

#### To retrieve a list of analytics configurations for a bucket

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
    --bucket my-bucket
```

Output:

```
{
    "AnalyticsConfigurationList": [
        {
            "StorageClassAnalysis": {},
            "Id": "1"
        }
    ],
    "IsTruncated": false
}
```

- For API details, see ListBucketAnalyticsConfigurations in *AWS CLI Command Reference*.

### `list-bucket-metrics-configurations`

The following code example shows how to use `list-bucket-metrics-configurations`.

**AWS CLI**

**To retrieve a list of metrics configurations for a bucket**

The following `list-bucket-metrics-configurations` example retrieves a list of metrics configurations for the specified bucket.

```
aws s3api list-bucket-metrics-configurations \
    --bucket my-bucket
```

Output:

```
{
    "IsTruncated": false,
    "MetricsConfigurationList": [
        {
            "Filter": {
                "Prefix": "logs"
            },
            "Id": "123"
        },
        {
            "Filter": {
```

```
                "Prefix": "tmp"
            },
            "Id": "234"
        }
    ]
}
```

- For API details, see ListBucketMetricsConfigurations in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list the tags for a resource**

The following `list-tags-for-resource` example lists the tags for the specified device resource (`device-07f6fd08867abc123`).

```
aws networkmanager list-tags-for-resource \
    --resource-arn arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123 \
    --region us-west-2
```

Output:

```
{
    "TagList": [
        {
            "Key": "Network",
            "Value": "Northeast"
        }
    ]
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `put-bucket-metrics-configuration`

The following code example shows how to use `put-bucket-metrics-configuration`.

**AWS CLI**

**To set a metrics configuration for a bucket**

The following `put-bucket-metrics-configuration` example sets a metric configuration with ID 123 for the specified bucket.

```
aws s3api put-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123 \
    --metrics-configuration '{"Id": "123", "Filter": {"Prefix": "logs"}}'
```

This command produces no output.

- For API details, see PutBucketMetricsConfiguration in *AWS CLI Command Reference*.

### `put-object-retention`

The following code example shows how to use `put-object-retention`.

**AWS CLI**

**To set an object retention configuration for an object**

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```
aws s3api put-object-retention \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf \
    --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate": "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see PutObjectRetention in *AWS CLI Command Reference*.

### `put-public-access-block`

The following code example shows how to use `put-public-access-block`.

**AWS CLI**

**To set the block public access configuration for a bucket**

The following `put-public-access-block` example sets a restrictive block public access configuration for the specified bucket.

```
aws s3api put-public-access-block \
    --bucket my-bucket \
    --public-access-block-configuration
 "BlockPublicAcls=true,IgnorePublicAcls=true,BlockPublicPolicy=true,RestrictPublicBuckets=tr
```

This command produces no output.

- For API details, see PutPublicAccessBlock in *AWS CLI Command Reference*.

### `register-transit-gateway`

The following code example shows how to use `register-transit-gateway`.

#### AWS CLI

**To register a transit gateway in a global network**

The following `register-transit-gateway` example registers transit gateway `tgw-123abc05e04123abc` in the specified global network.

```
aws networkmanager register-transit-gateway \
    --global-network-id global-network-01231231231231231 \
    --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc \
    --region us-west-2
```

Output:

```
{
    "TransitGatewayRegistration": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-gateway/
tgw-123abc05e04123abc",
        "State": {
            "Code": "PENDING"
        }
    }
}
```

For more information, see Transit Gateway Registrations in the *Transit Gateway Network Manager Guide*.

- For API details, see RegisterTransitGateway in *AWS CLI Command Reference*.

### `reject-attachment`

The following code example shows how to use `reject-attachment`.

**AWS CLI**

**To reject an attachment**

The following `reject-attachment` example rejects a VPC attachment request.

```
aws networkmanager reject-attachment \
    --attachment-id  attachment-03b7ea450134787da
```

Output:

```
{
    "Attachment": {
        "CoreNetworkId": "core-network-0522de1b226a5d7b3",
        "AttachmentId": "attachment-03b7ea450134787da",
        "OwnerAccountId": "987654321012",
        "AttachmentType": "VPC",
        "State": "AVAILABLE",

    }
}
```

For more information, see Attachment acceptance in the *Cloud WAN User Guide*.

- For API details, see RejectAttachment in *AWS CLI Command Reference*.

### `start-route-analysis`

The following code example shows how to use `start-route-analysis`.

## AWS CLI

### To start route analysis

The following `start-route-analysis` example starts the analysis between a source and destination, including the optional `include-return-path`.

```
aws networkmanager start-route-analysis \
    --global-network-id global-network-00aa0aaa0b0aaa000 \
    --source TransitGatewayAttachmentArn=arn:aws:ec2:us-east-1:503089527312:transit-
gateway-attachment/tgw-attach-0d4a2d491bf68c093,IpAddress=10.0.0.0 \
    --destination TransitGatewayAttachmentArn=arn:aws:ec2:us-
west-1:503089527312:transit-gateway-attachment/tgw-
attach-002577f30bb181742,IpAddress=11.0.0.0 \
    --include-return-path
```

Output:

```
{
    "RouteAnalysis": {
        "GlobalNetworkId": "global-network-00aa0aaa0b0aaa000
        "OwnerAccountId": "1111222233333",
        "RouteAnalysisId": "a1873de1-273c-470c-1a2bc2345678",
        "StartTimestamp": 1695760154.0,
        "Status": "RUNNING",
        "Source": {
            "TransitGatewayAttachmentArn": "arn:aws:ec2:us-
east-1:111122223333:transit-gateway-attachment/tgw-attach-1234567890abcdef0,
            "TransitGatewayArn": "arn:aws:ec2:us-east-1:111122223333:transit-
gateway/tgw-abcdef01234567890",
            "IpAddress": "10.0.0.0"
        },
        "Destination": {
            "TransitGatewayAttachmentArn": "arn:aws:ec2:us-
west-1:555555555555:transit-gateway-attachment/tgw-attach-021345abcdef6789",
            "TransitGatewayArn": "arn:aws:ec2:us-west-1:111122223333:transit-
gateway/tgw-09876543210fedcba0",
            "IpAddress": "11.0.0.0"
        },
        "IncludeReturnPath": true,
        "UseMiddleboxes": false
    }
}
```

For more information, see Route Analyzer in the *AWS Global Networks for Transit Gateways User Guide*.

- For API details, see StartRouteAnalysis in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To apply tags to a resource**

The following `tag-resource` example applies the tag `Network=Northeast` to the device `device-07f6fd08867abc123`.

```
aws networkmanager tag-resource \
    --resource-arn arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123 \
    --tags Key=Network,Value=Northeast \
    --region us-west-2
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a resource**

The following `untag-resource` example removes the tag with the key `Network` from the device `device-07f6fd08867abc123`.

```
aws networkmanager untag-resource \
    --resource-arn arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123 ]
    --tag-keys Network \
    --region us-west-2
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-device`

The following code example shows how to use `update-device`.

#### AWS CLI

**To update a device**

The following `update-device` example updates device `device-07f6fd08867abc123` by specifying a site ID for the device.

```
aws networkmanager update-device \
    --global-network-id global-network-01231231231231231 \
    --device-id device-07f6fd08867abc123 \
    --site-id site-444555aaabbb11223 \
    --region us-west-2
```

Output:

```
{
    "Device": {
        "DeviceId": "device-07f6fd08867abc123",
        "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "NY office device",
        "Type": "Office device",
        "Vendor": "anycompany",
        "Model": "abcabc",
        "SerialNumber": "1234",
        "SiteId": "site-444555aaabbb11223",
        "CreatedAt": 1575554005.0,
        "State": "UPDATING"
    }
}
```

For more information, see Working with Devices in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateDevice in *AWS CLI Command Reference*.

### `update-global-network`

The following code example shows how to use `update-global-network`.

#### AWS CLI

**To update a global network**

The following `update-global-network` example updates the description for global network `global-network-01231231231231231`.

```
aws networkmanager update-global-network \
    --global-network-id global-network-01231231231231231 \
    --description "Head offices" \
    --region us-west-2
```

Output:

```
{
    "GlobalNetwork": {
        "GlobalNetworkId": "global-network-01231231231231231",
        "GlobalNetworkArn": "arn:aws:networkmanager::123456789012:global-network/
global-network-01231231231231231",
        "Description": "Head offices",
        "CreatedAt": 1575553525.0,
        "State": "UPDATING"
    }
}
```

For more information, see Global Networks in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateGlobalNetwork in *AWS CLI Command Reference*.

### `update-link`

The following code example shows how to use `update-link`.

#### AWS CLI

**To update a link**

The following `update-link` example updates the bandwidth information for link `link-11112222aaaabbbb1`.

```
aws networkmanager update-link \
    --global-network-id global-network-01231231231231231 \
    --link-id link-11112222aaaabbbb1 \
    --bandwidth  UploadSpeed=20,DownloadSpeed=20 \
    --region us-west-2
```

Output:

```
{
    "Link": {
        "LinkId": "link-11112222aaaabbbb1",
        "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
        "GlobalNetworkId": "global-network-01231231231231231",
        "SiteId": "site-444555aaabbb11223",
        "Description": "VPN Link",
        "Type": "broadband",
        "Bandwidth": {
            "UploadSpeed": 20,
            "DownloadSpeed": 20
        },
        "Provider": "AnyCompany",
        "CreatedAt": 1575555811.0,
        "State": "UPDATING"
    }
}
```

For more information, see Working with Links in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateLink in *AWS CLI Command Reference*.

### `update-site`

The following code example shows how to use `update-site`.

#### AWS CLI

##### To update a site

The following `update-site` example updates the description for site `site-444555aaabbb11223` in the specified global network.

```
aws networkmanager update-site \
    --global-network-id global-network-01231231231231231 \
    --site-id site-444555aaabbb11223 \
    --description "New York Office site" \
    --region us-west-2
```

Output:

```
{
    "Site": {
        "SiteId": "site-444555aaabbb11223",
        "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
        "GlobalNetworkId": "global-network-01231231231231231",
        "Description": "New York Office site",
        "Location": {
            "Latitude": "40.7128",
            "Longitude": "-74.0060"
        },
        "CreatedAt": 1575554528.0,
        "State": "UPDATING"
    }
}
```

For more information, see Working with Sites in the *Transit Gateway Network Manager Guide*.

- For API details, see UpdateSite in *AWS CLI Command Reference*.

## Nimble Studio examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Nimble Studio.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

## Actions

### `get-eula`

The following code example shows how to use `get-eula`.

**AWS CLI**

**To get information about your studio**

The following `get-eula` example lists the information about an EULA.

```
aws nimble get-eula \
    --eula-id "EULAid"
```

Output:

```
{
    "eula": {
        "content": "https://www.mozilla.org/en-US/MPL/2.0/",
        "createdAt": "2021-04-20T16:45:23+00:00",
        "eulaId": "gJZLygd-Srq_5NNbSfiaLg",
        "name": "Mozilla-FireFox",
        "updatedAt": "2021-04-20T16:45:23+00:00"
    }
}
```

For more information, see Accept the EULA in the *Amazon Nimble Studio User Guide*.

- For API details, see GetEula in *AWS CLI Command Reference*.

### `get-launch-profile-details`

The following code example shows how to use `get-launch-profile-details`.

**AWS CLI**

**To list the available widgets**

The following `get-launch-profile-details` example lists the details about a launch profile.

```
aws nimble get-launch-profile-details \
    --studio-id "StudioID" \
    --launch-profile-id "LaunchProfileID"
```

Output:

```
{
    "launchProfile": {
        "arn": "arn:aws:nimble:us-west-2:123456789012:launch-profile/

- For API details, see GetLaunchProfileDetails in *AWS CLI Command Reference*.

## `get-launch-profile`

The following code example shows how to use `get-launch-profile`.

### AWS CLI

#### To list the available widgets

The following `get-launch-profile` example lists information about a launch profile.

```
aws nimble get-launch-profile \
```

```
    --studio-id "StudioID" \
    --launch-profile-id "LaunchProfileID"
```

Output:

```
{
    "launchProfile": {
        "arn": "arn:aws:nimble:us-west-2:123456789012:launch-profile/
yeG7lDwNQEiwNTRT7DrV7Q",
        "createdAt": "2022-01-27T21:18:59+00:00",
        "createdBy": "AROA3OO2NEHCCYRNDDIFT:i-EXAMPLE11111",
        "description": "The Launch Profile for the Render workers created by
 StudioBuilder.",
        "ec2SubnetIds": [
            "subnet-EXAMPLE11111"
        ],
        "launchProfileId": "yeG7lDwNQEiwNTRT7DrV7Q",
        "launchProfileProtocolVersions": [
            "2021-03-31"
        ],
        "name": "RenderWorker-Default",
        "state": "READY",
        "statusCode": "LAUNCH_PROFILE_CREATED",
        "statusMessage": "Launch Profile has been created",
        "streamConfiguration": {
            "clipboardMode": "ENABLED",
            "ec2InstanceTypes": [
                "g4dn.4xlarge",
                "g4dn.8xlarge"
            ],

- For API details, see GetLaunchProfile in *AWS CLI Command Reference*.

## `get-studio`

The following code example shows how to use `get-studio`.

### AWS CLI

#### To get information about your studio

The following `get-studio` example lists the studios in your AWS account.

```
aws nimble get-studio \
    --studio-id "StudioID"
```

Output:

```
{
    "studio": {
        "adminRoleArn": "arn:aws:iam::123456789012:role/studio-admin-role",
        "arn": "arn:aws:nimble:us-west-2:123456789012:studio/stid-EXAMPLE11111",
        "createdAt": "2022-01-27T20:29:35+00:00",
        "displayName": "studio-name",
        "homeRegion": "us-west-2",
        "ssoClientId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "state": "READY",
        "statusCode": "STUDIO_CREATED",
        "statusMessage": "The studio has been created successfully ",
        "studioEncryptionConfiguration": {
            "keyType": "AWS_OWNED_KEY"
        },
        "studioId": "us-west-2:stid-EXAMPLE11111",
        "studioName": "studio-name",
        "studioUrl": "https://studio-name.nimblestudio.us-west-2.amazonaws.com",
        "tags": {},

        "userRoleArn": "arn:aws:iam::123456789012:role/studio-user-role"
    }
}
```

For more information, see What is Amazon Nimble Studio? in the *Amazon Nimble Studio User Guide*.

- For API details, see GetStudio in *AWS CLI Command Reference*.

## `list-eula-acceptances`

The following code example shows how to use `list-eula-acceptances`.

### AWS CLI

#### To list the available widgets

The following `list-eula-acceptances` example lists the accepted EULAs in your AWS account.

```
aws nimble list-eula-acceptances \
    --studio-id "StudioID"
```

Output:

```
{
    "eulaAcceptances": [
        {
            "acceptedAt": "2022-01-28T17:44:35+00:00",

### `list-studio-components`

The following code example shows how to use `list-studio-components`.

**AWS CLI**

**To list the available widgets**

The following `list-studio-components` example lists the studio components in your AWS account.

```
aws nimble list-studio-components \
    --studio-id "StudioID"
```

Output:

```
{
    "studioComponents": [
        {
            "arn": "arn:aws:nimble:us-west-2:123456789012:studio-component/
ZQuMxN99Qfa_Js6ma9TwdA",
            "configuration": {
                "sharedFileSystemConfiguration": {
                    "fileSystemId": "fs-EXAMPLE11111",
                    "linuxMountPoint": "/mnt/fsxshare",
                    "shareName": "share",
                    "windowsMountDrive": "Z"
                }
            },
            "createdAt": "2022-01-27T21:15:34+00:00",
            "createdBy": "AROA3OO2NEHCCYRNDDIFT:i-EXAMPLE11111",
            "description": "FSx for Windows",
            "ec2SecurityGroupIds": [
                "sg-EXAMPLE11111"
            ],
            "name": "FSxWindows",
            "state": "READY",
            "statusCode": "STUDIO_COMPONENT_CREATED",
            "statusMessage": "Studio Component has been created",
            "studioComponentId": "ZQuMxN99Qfa_Js6ma9TwdA",
            "subtype": "AMAZON_FSX_FOR_WINDOWS",
            "tags": {},
            "type": "SHARED_FILE_SYSTEM",
```

```
            "updatedAt": "2022-01-27T21:15:35+00:00",
            "updatedBy": "AROA3OO2NEHCCYRNDDIFT:i-EXAMPLE11111"
        },
    ...
}
```

For more information, see How StudioBuilder works with Amazon Nimble Studio in the *Amazon Nimble Studio User Guide*.

- For API details, see ListStudioComponents in *AWS CLI Command Reference*.

### `list-studio-members`

The following code example shows how to use `list-studio-members`.

**AWS CLI**

**To list the available widgets**

The following `list-studio-members` example lists the available studio members in your AWS account.

```
aws nimble list-studio-members \
    --studio-id "StudioID"
```

Output:

```
{
    "members": [
        {
            "identityStoreId": "d-EXAMPLE11111",
            "persona": "ADMINISTRATOR",
            "principalId": "EXAMPLE11111-e9fd012a-94ad-4f16-9866-c69a63ab6486"
        }
    ]
}
```

For more information, see Adding studio users in the *Amazon Nimble Studio User Guide*.

- For API details, see ListStudioMembers in *AWS CLI Command Reference*.

### `list-studios`

The following code example shows how to use `list-studios`.

#### AWS CLI

##### To list your studios

The following `list-studios` example lists the studios in your AWS account.

```
aws nimble list-studios
```

Output:

```
{
    "studios": [
        {
            "adminRoleArn": "arn:aws:iam::123456789012:role/studio-admin-role",
            "arn": "arn:aws:nimble:us-west-2:123456789012:studio/studio-id",
            "createdAt": "2022-01-27T20:29:35+00:00",
            "displayName": "studio-name",
            "homeRegion": "us-west-2",
            "ssoClientId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "state": "READY",
            "statusCode": "STUDIO_CREATED",
            "statusMessage": "The studio has been created successfully ",
            "studioEncryptionConfiguration": {
                "keyType": "AWS_OWNED_KEY"
            },
            "studioId": "us-west-2:studio-id",
            "studioName": "studio-name",
            "studioUrl": "https://studio-name.nimblestudio.us-west-2.amazonaws.com",
            "tags": {},
            "updatedAt": "2022-01-27T20:29:37+00:00",
            "userRoleArn": "arn:aws:iam::123456789012:role/studio-user-role"
        }
    ]
}
```

For more information, see What is Amazon Nimble Studio? in the *Amazon Nimble Studio User Guide*.

- For API details, see ListStudios in *AWS CLI Command Reference*.

## OpenSearch Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with OpenSearch Service.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

### Actions

#### `create-elasticsearch-domain`

The following code example shows how to use `create-elasticsearch-domain`.

#### AWS CLI

##### To create an Amazon Elasticsearch Service domain

The following `create-elasticsearch-domain` command creates a new Amazon Elasticsearch Service domain within a VPC and restricts access to a single user. Amazon ES infers the VPC ID from the specified subnet and security group IDs.

```
aws es create-elasticsearch-domain \
    --domain-name vpc-cli-example \
    --elasticsearch-version 6.2 \
    --elasticsearch-cluster-config
 InstanceType=m4.large.elasticsearch,InstanceCount=1 \
    --ebs-options EBSEnabled=true,VolumeType=standard,VolumeSize=10 \
    --access-policies '{"Version": "2012-10-17", "Statement": [ { "Effect":
 "Allow", "Principal": {"AWS": "arn:aws:iam::123456789012:root" }, "Action":"es:*",
 "Resource": "arn:aws:es:us-west-1:123456789012:domain/vpc-cli-example/*" } ] }' \
```

```
    --vpc-options SubnetIds=subnet-1a2a3a4a,SecurityGroupIds=sg-2a3a4a5a
```

Output:

```
{
    "DomainStatus": {
        "ElasticsearchClusterConfig": {
            "DedicatedMasterEnabled": false,
            "InstanceCount": 1,
            "ZoneAwarenessEnabled": false,
            "InstanceType": "m4.large.elasticsearch"
        },
        "DomainId": "123456789012/vpc-cli-example",
        "CognitoOptions": {
            "Enabled": false
        },
        "VPCOptions": {
            "SubnetIds": [
                "subnet-1a2a3a4a"
            ],
            "VPCId": "vpc-3a4a5a6a",
            "SecurityGroupIds": [
                "sg-2a3a4a5a"
            ],
            "AvailabilityZones": [
                "us-west-1c"
            ]
        },
        "Created": true,
        "Deleted": false,
        "EBSOptions": {
            "VolumeSize": 10,
            "VolumeType": "standard",
            "EBSEnabled": true
        },
        "Processing": true,
        "DomainName": "vpc-cli-example",
        "SnapshotOptions": {
            "AutomatedSnapshotStartHour": 0
        },
        "ElasticsearchVersion": "6.2",
        "AccessPolicies": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":
\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:root\"},\"Action\":
```

```

\"}]}",
        "AdvancedOptions": {
            "rest.action.multi.allow_explicit_index": "true"
        },
        "EncryptionAtRestOptions": {
            "Enabled": false
        },
        "ARN": "arn:aws:es:us-west-1:123456789012:domain/vpc-cli-example"
    }
}
```

For more information, see Creating and Managing Amazon Elasticsearch Service Domains in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see CreateElasticsearchDomain in *AWS CLI Command Reference*.

### `describe-elasticsearch-domain-config`

The following code example shows how to use `describe-elasticsearch-domain-config`.

#### AWS CLI

**To get domain configuration details**

The following `describe-elasticsearch-domain-config` example provides configuration details for a given domain, along with status information for each individual domain component.

```
aws es describe-elasticsearch-domain-config \
    --domain-name cli-example
```

Output:

```
{
    "DomainConfig": {
        "ElasticsearchVersion": {
            "Options": "7.4",
            "Status": {
                "CreationDate": 1589395034.946,
                "UpdateDate": 1589395827.325,
                "UpdateVersion": 8,
                "State": "Active",
```

```
                "PendingDeletion": false
            }
        },
        "ElasticsearchClusterConfig": {
            "Options": {
                "InstanceType": "c5.large.elasticsearch",
                "InstanceCount": 1,
                "DedicatedMasterEnabled": true,
                "ZoneAwarenessEnabled": false,
                "DedicatedMasterType": "c5.large.elasticsearch",
                "DedicatedMasterCount": 3,
                "WarmEnabled": true,
                "WarmType": "ultrawarm1.medium.elasticsearch",
                "WarmCount": 2
            },

- For API details, see DescribeElasticsearchDomainConfig in *AWS CLI Command Reference*.

### `describe-elasticsearch-domain`

The following code example shows how to use `describe-elasticsearch-domain`.

#### AWS CLI

**To get details for a single domain**

The following `describe-elasticsearch-domain` example provides configuration details for a given domain.

```
aws es describe-elasticsearch-domain \
    --domain-name cli-example
```

Output:

```
{
    "DomainStatus": {
        "DomainId": "123456789012/cli-example",
        "DomainName": "cli-example",
        "ARN": "arn:aws:es:us-east-1:123456789012:domain/cli-example",
        "Created": true,
        "Deleted": false,

## `describe-elasticsearch-domains`

The following code example shows how to use `describe-elasticsearch-domains`.

### AWS CLI

#### To get details for one or more domains

The following `describe-elasticsearch-domains` example provides configuration details for one or more domains.

```
aws es describe-elasticsearch-domains \
    --domain-names cli-example-1 cli-example-2
```

Output:

```
{
    "DomainStatusList": [{
            "DomainId": "123456789012/cli-example-1",
            "DomainName": "cli-example-1",
            "ARN": "arn:aws:es:us-east-1:123456789012:domain/cli-example-1",
            "Created": true,
            "Deleted": false,
            "Endpoint": "search-cli-example-1-1a2a3a4a5a6a7a8a9a0a.us-
east-1.es.amazonaws.com",
            "Processing": false,
            "UpgradeProcessing": false,
            "ElasticsearchVersion": "7.4",
            "ElasticsearchClusterConfig": {
                "InstanceType": "c5.large.elasticsearch",
                "InstanceCount": 1,
                 "DedicatedMasterEnabled": true,
                "ZoneAwarenessEnabled": false,
                "DedicatedMasterType": "c5.large.elasticsearch",
                "DedicatedMasterCount": 3,
                "WarmEnabled": true,
                "WarmType": "ultrawarm1.medium.elasticsearch",
                "WarmCount": 2
            },
            "EBSOptions": {
                "EBSEnabled": true,
                "VolumeType": "gp2",
                "VolumeSize": 10
            },

                "Enabled": false
            },
            "NodeToNodeEncryptionOptions": {
                "Enabled": false
            },
            "AdvancedOptions": {
                "rest.action.multi.allow_explicit_index": "true"
            },
            "ServiceSoftwareOptions": {
                "CurrentVersion": "",
                "NewVersion": "",
                "UpdateAvailable": false,
                "Cancellable": false,
                "UpdateStatus": "COMPLETED",
                "Description": "There is no software update available for this
 domain.",
                "AutomatedUpdateDate": 0.0
            },
            "DomainEndpointOptions": {
                "EnforceHTTPS": false,
                "TLSSecurityPolicy": "Policy-Min-TLS-1-0-2019-07"
            },
            "AdvancedSecurityOptions": {
                "Enabled": false,
                "InternalUserDatabaseEnabled": false
```

```
            }
        }
    ]
}
```

For more information, see Creating and Managing Amazon Elasticsearch Service Domains in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see DescribeElasticsearchDomains in *AWS CLI Command Reference*.

### `describe-reserved-elasticsearch-instances`

The following code example shows how to use `describe-reserved-elasticsearch-instances`.

**AWS CLI**

**To view all reserved instances**

The following `describe-elasticsearch-domains` example provides a summary of all instances you have reserved in a region.

```
aws es describe-reserved-elasticsearch-instances
```

Output:

```
{
    "ReservedElasticsearchInstances": [{
        "FixedPrice": 100.0,
        "ReservedElasticsearchInstanceOfferingId":
 "1a2a3a4a5-1a2a-3a4a-5a6a-1a2a3a4a5a6a",
        "ReservationName": "my-reservation",
        "PaymentOption": "PARTIAL_UPFRONT",
        "UsagePrice": 0.0,
        "ReservedElasticsearchInstanceId": "9a8a7a6a-5a4a-3a2a-1a0a-9a8a7a6a5a4a",
        "RecurringCharges": [{
            "RecurringChargeAmount": 0.603,
            "RecurringChargeFrequency": "Hourly"
        }],
        "State": "payment-pending",
        "StartTime": 1522872571.229,
```

```
        "ElasticsearchInstanceCount": 3,
        "Duration": 31536000,
        "ElasticsearchInstanceType": "m4.2xlarge.elasticsearch",
        "CurrencyCode": "USD"
    }]
}
```

For more information, see Reserved Instances in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see DescribeReservedElasticsearchInstances in *AWS CLI Command Reference*.

### `list-domain-names`

The following code example shows how to use `list-domain-names`.

**AWS CLI**

**To list all domains**

The following `list-domain-names` example provides a quick summary of all domains in the region.

```
aws es list-domain-names
```

Output:

```
{
    "DomainNames": [{
            "DomainName": "cli-example-1"
        },
        {
            "DomainName": "cli-example-2"
        }
    ]
}
```

For more information, see Creating and Managing Amazon Elasticsearch Service Domains in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see ListDomainNames in *AWS CLI Command Reference*.

# AWS OpsWorks examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS OpsWorks.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `assign-instance`

The following code example shows how to use `assign-instance`.

**AWS CLI**

**To assign a registered instance to a layer**

The following example assigns a registered instance to a custom layer.

```
aws opsworks --region us-east-1 assign-instance --instance-id 4d6d1710-ded9-42a1-
b08e-b043ad7af1e2 --layer-ids 26cf1d32-6876-42fa-bbf1-9cadc0bff938
```

*Output*: None.

**More Information**

For more information, see Assigning a Registered Instance to a Layer in the *AWS OpsWorks User Guide*.

- For API details, see AssignInstance in *AWS CLI Command Reference*.

### `assign-volume`

The following code example shows how to use `assign-volume`.

**AWS CLI**

**To assign a registered volume to an instance**

The following example assigns a registered Amazon Elastic Block Store (Amazon EBS) volume to an instance. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns when you register the volume with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID. Before you run `assign-volume`, you must first run `update-volume` to assign a mount point to the volume.

```
aws opsworks --region us-east-1 assign-volume --instance-id 4d6d1710-ded9-42a1-b08e-
b043ad7af1e2 --volume-id 26cf1d32-6876-42fa-bbf1-9cadc0bff938
```

*Output*: None.

**More Information**

For more information, see Assigning Amazon EBS Volumes to an Instance in the *AWS OpsWorks User Guide*.

- For API details, see AssignVolume in *AWS CLI Command Reference*.

### `associate-elastic-ip`

The following code example shows how to use `associate-elastic-ip`.

**AWS CLI**

**To associate an Elastic IP address with an instance**

The following example associates an Elastic IP address with a specified instance.

```
aws opsworks --region us-east-1 associate-elastic-ip --instance-id
 dfe18b02-5327-493d-91a4-c5c0c448927f --elastic-ip 54.148.130.96
```

*Output*: None.

**More Information**

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see AssociateElasticIp in *AWS CLI Command Reference*.

### `attach-elastic-load-balancer`

The following code example shows how to use `attach-elastic-load-balancer`.

**AWS CLI**

**To attach a load balancer to a layer**

The following example attaches a load balancer, identified by its name, to a specified layer.

```
aws opsworks --region us-east-1 attach-elastic-load-balancer --elastic-load-
balancer-name Java-LB --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4
```

*Output*: None.

**More Information**

For more information, see Elastic Load Balancing in the *AWS OpsWorks User Guide*.

- For API details, see AttachElasticLoadBalancer in *AWS CLI Command Reference*.

### `create-app`

The following code example shows how to use `create-app`.

**AWS CLI**

**Example 1: To create an app**

The following example creates a PHP app named SimplePHPApp from code stored in a GitHub repository. The command uses the shorthand form of the application source definition.

```
aws opsworks create-app \
    --region us-east-1 \
```

```
    --stack-id f6673d70-32e6-4425-8999-265dd002fec7 \
    --name SimplePHPApp \
    --type php \
    --app-source Type=git,Url=git://github.com/amazonwebservices/opsworks-demo-php-
simple-app.git,Revision=version1
```

Output:

```
{
    "AppId": "6cf5163c-a951-444f-a8f7-3716be75f2a2"
}
```

**Example 2: To create an app with an attached database**

The following example creates a JSP app from code stored in .zip archive in a public S3 bucket. It attaches an RDS DB instance to serve as the app's data store. The application and database sources are defined in separate JSON files that are in the directory from which you run the command.

```
aws opsworks create-app \
    --region us-east-1 \
    --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8 \
    --name SimpleJSP \
    --type java \
    --app-source file://appsource.json \
    --data-sources file://datasource.json
```

The application source information is in `appsource.json` and contains the following.

```
{
    "Type": "archive",
    "Url": "https://s3.amazonaws.com/opsworks-demo-assets/simplejsp.zip"
}
```

The database source information is in `datasource.json` and contains the following.

```
[
    {
        "Type": "RdsDbInstance",
        "Arn": "arn:aws:rds:us-west-2:123456789012:db:clitestdb",
```

```
        "DatabaseName": "mydb"
    }
]
```

**Note**: For an RDS DB instance, you must first use `register-rds-db-instance` to register the instance with the stack. For MySQL App Server instances, set `Type` to `OpsworksMysqlInstance`. These instances are created by AWS OpsWorks, so they do not have to be registered.

Output:

```
{
    "AppId": "26a61ead-d201-47e3-b55c-2a7c666942f8"
}
```

For more information, see Adding Apps in the *AWS OpsWorks User Guide*.

- For API details, see CreateApp in *AWS CLI Command Reference*.

## `create-deployment`

The following code example shows how to use `create-deployment`.

### AWS CLI

#### Example 1: To deploy apps and run stack commands

The following examples show how to use the `create-deployment` command to deploy apps and run stack commands. Notice that the quote (") characters in the JSON object that specifies the command are all preceded by escape characters (\). Without the escape characters, the command might return an invalid JSON error.

The following `create-deployment` example deploys an app to a specified stack.

```
aws opsworks create-deployment \
    --stack-id cfb7e082-ad1d-4599-8e81-de1c39ab45bf \
    --app-id 307be5c8-d55d-47b5-bd6e-7bd417c6c7eb
    --command "{\"Name\":\"deploy\"}"
```

Output:

```
{
    "DeploymentId": "5746c781-df7f-4c87-84a7-65a119880560"
}
```

**Example 2: To deploy a Rails App and Migrate the Database**

The following `create-deployment` command deploys a Ruby on Rails app to a specified stack and migrates the database.

```
aws opsworks create-deployment \
    --stack-id cfb7e082-ad1d-4599-8e81-de1c39ab45bf \
    --app-id 307be5c8-d55d-47b5-bd6e-7bd417c6c7eb \
    --command "{\"Name\":\"deploy\", \"Args\":{\"migrate\":[\"true\"]}}"
```

Output:

```
{
    "DeploymentId": "5746c781-df7f-4c87-84a7-65a119880560"
}
```

For more information on deployment, see Deploying Apps in the *AWS OpsWorks User Guide*.

**Example 3: Run a Recipe**

The following `create-deployment` command runs a custom recipe, `phpapp::appsetup`, on the instances in a specified stack.

```
aws opsworks create-deployment \
    --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb \
    --command "{\"Name\":\"execute_recipes\", \"Args\":{\"recipes\":
[\"phpapp::appsetup\"]}}"
```

Output:

```
{
    "DeploymentId": "5cbaa7b9-4e09-4e53-aa1b-314fbd106038"
}
```

For more information, see Run Stack Commands in the *AWS OpsWorks User Guide*.

**Example 4: Install Dependencies**

The following `create-deployment` command installs dependencies, such as packages or Ruby gems, on the instances in a specified stack.

```
aws opsworks create-deployment \
    --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb \
    --command "{\"Name\":\"install_dependencies\"}"
```

Output:

```
{
    "DeploymentId": "aef5b255-8604-4928-81b3-9b0187f962ff"
}
```

For more information, see Run Stack Commands in the *AWS OpsWorks User Guide*.

- For API details, see CreateDeployment in *AWS CLI Command Reference*.

## `create-instance`

The following code example shows how to use `create-instance`.

### AWS CLI

**To create an instance**

The following `create-instance` command creates an m1.large Amazon Linux instance named myinstance1 in a specified stack. The instance is assigned to one layer.

```
aws opsworks --region us-east-1 create-instance --stack-id 935450cc-61e0-4b03-
a3e0-160ac817d2bb --layer-ids 5c8c272a-f2d5-42e3-8245-5bf3927cb65b --hostname
 myinstance1 --instance-type m1.large --os "Amazon Linux"
```

To use an autogenerated name, call get-hostname-suggestion, which generates a hostname based on the theme that you specified when you created the stack. Then pass that name to the hostname argument.

*Output*:

```
{
  "InstanceId": "5f9adeaa-c94c-42c6-aeef-28a5376002cd"
}
```

**More Information**

For more information, see Adding an Instance to a Layer in the *AWS OpsWorks User Guide*.

- For API details, see CreateInstance in *AWS CLI Command Reference*.

### `create-layer`

The following code example shows how to use `create-layer`.

**AWS CLI**

**To create a layer**

The following `create-layer` command creates a PHP App Server layer named MyPHPLayer in a specified stack.

```
aws opsworks create-layer --region us-east-1 --stack-id
 f6673d70-32e6-4425-8999-265dd002fec7 --type php-app --name MyPHPLayer --shortname
 myphplayer
```

*Output*:

```
{
  "LayerId": "0b212672-6b4b-40e4-8a34-5a943cf2e07a"
}
```

**More Information**

For more information, see How to Create a Layer in the *AWS OpsWorks User Guide*.

- For API details, see CreateLayer in *AWS CLI Command Reference*.

### `create-server`

The following code example shows how to use `create-server`.

## AWS CLI

### To create a server

The following `create-server` example creates a new Chef Automate server named `automate-06` in your default region. Note that defaults are used for most other settings, such as number of backups to retain, and maintenance and backup start times. Before you run a `create-server` command, complete prerequisites in Getting Started with AWS OpsWorks for Chef Automate in the *AWS Opsworks for Chef Automate User Guide*.

```
aws opsworks-cm create-server \
    --engine "ChefAutomate" \
    --instance-profile-arn "arn:aws:iam::012345678901:instance-profile/aws-opsworks-
cm-ec2-role" \
    --instance-type "t2.medium" \
    --server-name "automate-06" \
    --service-role-arn "arn:aws:iam::012345678901:role/aws-opsworks-cm-service-role"
```

Output:

```
{
    "Server": {
        "AssociatePublicIpAddress": true,
        "BackupRetentionCount": 10,
        "CreatedAt": 2019-12-29T13:38:47.520Z,
        "DisableAutomatedBackup": FALSE,
        "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
        "Engine": "ChefAutomate",
        "EngineAttributes": [
            {
                "Name": "CHEF_AUTOMATE_ADMIN_PASSWORD",
                "Value": "1Example1"
            }
        ],
        "EngineModel": "Single",
        "EngineVersion": "2019-08",
        "InstanceProfileArn": "arn:aws:iam::012345678901:instance-profile/aws-
opsworks-cm-ec2-role",
        "InstanceType": "t2.medium",
        "PreferredBackupWindow": "Sun:02:00",
        "PreferredMaintenanceWindow": "00:00",
        "SecurityGroupIds": [ "sg-12345678" ],
```

```
        "ServerArn": "arn:aws:iam::012345678901:instance/automate-06-1010V4UU2WRM2",
        "ServerName": "automate-06",
        "ServiceRoleArn": "arn:aws:iam::012345678901:role/aws-opsworks-cm-service-
role",
        "Status": "CREATING",
        "SubnetIds": [ "subnet-12345678" ]
    }
}
```

For more information, see CreateServer in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see CreateServer in *AWS CLI Command Reference*.

### `create-stack`

The following code example shows how to use `create-stack`.

#### AWS CLI

**To create a stack**

The following `create-stack` command creates a stack named CLI Stack.

```
aws opsworks create-stack --name "CLI Stack" --stack-region "us-east-1" --service-
role-arn arn:aws:iam::123456789012:role/aws-opsworks-service-role --default-
instance-profile-arn arn:aws:iam::123456789012:instance-profile/aws-opsworks-ec2-
role --region us-east-1
```

The `service-role-arn` and `default-instance-profile-arn` parameters are required. You typically use the ones that AWS OpsWorks creates for you when you create your first stack. To get the Amazon Resource Names (ARNs) for your account, go to the IAM console, choose `Roles` in the navigation panel, choose the role or profile, and choose the `Summary` tab.

*Output*:

```
{
  "StackId": "f6673d70-32e6-4425-8999-265dd002fec7"
}
```

**More Information**

For more information, see Create a New Stack in the *AWS OpsWorks User Guide*.

- For API details, see CreateStack in *AWS CLI Command Reference*.

### `create-user-profile`

The following code example shows how to use `create-user-profile`.

**AWS CLI**

**To create a user profile**

You import an AWS Identity and Access Manager (IAM) user into AWS OpsWorks by calling create-user-profile to create a user profile. The following example creates a user profile for the cli-user-test IAM user, who is identified by Amazon Resource Name (ARN). The example assigns the user an SSH username of `myusername` and enables self management, which allows the user to specify an SSH public key.

```
aws opsworks --region us-east-1 create-user-profile --iam-user-arn
 arn:aws:iam::123456789102:user/cli-user-test --ssh-username myusername --allow-
self-management
```

*Output*:

```
{
  "IamUserArn": "arn:aws:iam::123456789102:user/cli-user-test"
}
```

**Tip**: This command imports an IAM user into AWS OpsWorks, but only with the permissions that are granted by the attached policies. You can grant per-stack AWS OpsWorks permissions by using the `set-permissions` command.

**More Information**

For more information, see Importing Users into AWS OpsWorks in the *AWS OpsWorks User Guide*.

- For API details, see CreateUserProfile in *AWS CLI Command Reference*.

### `delete-app`

The following code example shows how to use `delete-app`.

**AWS CLI**

**To delete an app**

The following example deletes a specified app, which is identified by its app ID. You can obtain an app ID by going to the app's details page on the AWS OpsWorks console or by running the `describe-apps` command.

```
aws opsworks delete-app --region us-east-1 --app-id 577943b9-2ec1-4baf-
a7bf-1d347601edc5
```

*Output*: None.

**More Information**

For more information, see Apps in the *AWS OpsWorks User Guide*.

- For API details, see DeleteApp in *AWS CLI Command Reference*.

## `delete-instance`

The following code example shows how to use `delete-instance`.

**AWS CLI**

**To delete an instance**

The following `delete-instance` example deletes a specified instance, which is identified by its instance ID. You can find an instance ID by opening the instance's details page in the AWS OpsWorks console, or by running the `describe-instances` command.

If the instance is online, you must first stop the instance by calling `stop-instance`, and then you must wait until the instance has stopped. Run `describe-instances` to check the instance status.

To remove the instance's Amazon EBS volumes or Elastic IP addresses, add the `--delete-volumes` or `--delete-elastic-ip` arguments, respectively.

```
aws opsworks delete-instance \
    --region us-east-1 \
```

```
    --instance-id 3a21cfac-4a1f-4ce2-a921-b2cfba6f7771
```

This command produces no output.

For more information, see Deleting AWS OpsWorks Instances in the *AWS OpsWorks User Guide*.

- For API details, see DeleteInstance in *AWS CLI Command Reference*.

### `delete-layer`

The following code example shows how to use `delete-layer`.

**AWS CLI**

**To delete a layer**

The following example deletes a specified layer, which is identified by its layer ID. You can obtain a layer ID by going to the layer's details page on the AWS OpsWorks console or by running the `describe-layers` command.

**Note:** Before deleting a layer, you must use `delete-instance` to delete all of the layer's instances.

```
aws opsworks delete-layer --region us-east-1 --layer-id a919454e-b816-4598-
b29a-5796afb498ed
```

*Output*: None.

**More Information**

For more information, see Deleting AWS OpsWorks Instances in the *AWS OpsWorks User Guide*.

- For API details, see DeleteLayer in *AWS CLI Command Reference*.

### `delete-stack`

The following code example shows how to use `delete-stack`.

**AWS CLI**

**To delete a stack**

The following example deletes a specified stack, which is identified by its stack ID. You can obtain a stack ID by clicking **Stack Settings** on the AWS OpsWorks console or by running the `describe-stacks` command.

**Note:** Before deleting a layer, you must use `delete-app`, `delete-instance`, and `delete-layer` to delete all of the stack's apps, instances, and layers.

```
aws opsworks delete-stack --region us-east-1 --stack-id
 154a9d89-7e9e-433b-8de8-617e53756c84
```

*Output*: None.

**More Information**

For more information, see Shut Down a Stack in the *AWS OpsWorks User Guide*.

- For API details, see DeleteStack in *AWS CLI Command Reference*.

### `delete-user-profile`

The following code example shows how to use `delete-user-profile`.

**AWS CLI**

**To delete a user profile and remove an IAM user from AWS OpsWorks**

The following example deletes the user profile for a specified AWS Identity and Access Management (IAM) user, who is identified by Amazon Resource Name (ARN). The operation removes the user from AWS OpsWorks, but does not delete the IAM user. You must use the IAM console, CLI, or API for that task.

```
aws opsworks --region us-east-1 delete-user-profile --iam-user-arn
 arn:aws:iam::123456789102:user/cli-user-test
```

*Output*: None.

**More Information**

For more information, see Importing Users into AWS OpsWorks in the *AWS OpsWorks User Guide*.

- For API details, see DeleteUserProfile in *AWS CLI Command Reference*.

### `deregister-elastic-ip`

The following code example shows how to use `deregister-elastic-ip`.

**AWS CLI**

**To deregister an Elastic IP address from a stack**

The following example deregisters an Elastic IP address, identified by its IP address, from its stack.

```
aws opsworks deregister-elastic-ip --region us-east-1 --elastic-ip 54.148.130.96
```

*Output*: None.

**More Information**

For more information, see Deregistering Elastic IP Addresses in the *AWS OpsWorks User Guide*.

- For API details, see DeregisterElasticIp in *AWS CLI Command Reference*.

### `deregister-instance`

The following code example shows how to use `deregister-instance`.

**AWS CLI**

**To deregister a registered instance from a stack**

The following `deregister-instance` command deregisters a registered instance from its stack.

```
aws opsworks --region us-east-1 deregister-instance --instance-id 4d6d1710-
ded9-42a1-b08e-b043ad7af1e2
```

*Output*: None.

**More Information**

For more information, see Deregistering a Registered Instance in the *AWS OpsWorks User Guide*.

- For API details, see DeregisterInstance in *AWS CLI Command Reference*.

### `deregister-rds-db-instance`

The following code example shows how to use `deregister-rds-db-instance`.

**AWS CLI**

**To deregister an Amazon RDS DB instance from a stack**

The following example deregisters an RDS DB instance, identified by its ARN, from its stack.

```
aws opsworks deregister-rds-db-instance --region us-east-1 --rds-db-instance-arn
 arn:aws:rds:us-west-2:123456789012:db:clitestdb
```

*Output*: None.

**More Information**

For more information, see Deregistering Amazon RDS Instances in the *ASW OpsWorks User Guide*.

instance ID: clitestdb Master usernams: cliuser Master PWD: some23!pwd DB Name: mydb aws opsworks deregister-rds-db-instance --region us-east-1 --rds-db-instance-arn arn:aws:rds:us-west-2:645732743964:db:clitestdb

- For API details, see DeregisterRdsDbInstance in *AWS CLI Command Reference*.

### `deregister-volume`

The following code example shows how to use `deregister-volume`.

**AWS CLI**

**To deregister an Amazon EBS volume**

The following example deregisters an EBS volume from its stack. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigned when you registered the volume with the stack, not the EC2 volume ID.

```
aws opsworks deregister-volume --region us-east-1 --volume-id 5c48ef52-3144-4bf5-
beaa-fda4deb23d4d
```

*Output*: None.

**More Information**

For more information, see Deregistering Amazon EBS Volumes in the *AWS OpsWorks User Guide*.

- For API details, see DeregisterVolume in *AWS CLI Command Reference*.

### `describe-apps`

The following code example shows how to use `describe-apps`.

**AWS CLI**

**To describe apps**

The following `describe-apps` command describes the apps in a specified stack.

```
aws opsworks describe-apps \
    --stack-id 38ee91e2-abdc-4208-a107-0b7168b3cc7a \
    --region us-east-1
```

Output:

```
{
    "Apps": [
        {
            "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",
            "AppSource": {
            "Url": "https://s3-us-west-2.amazonaws.com/opsworks-demo-assets/
simplejsp.zip",
            "Type": "archive"
        },
            "Name": "SimpleJSP",
            "EnableSsl": false,
            "SslConfiguration": {},
            "AppId": "da1decc1-0dff-43ea-ad7c-bb667cd87c8b",
            "Attributes": {
            "RailsEnv": null,
            "AutoBundleOnDeploy": "true",
            "DocumentRoot": "ROOT"
        },
            "Shortname": "simplejsp",
```

```
            "Type": "other",
            "CreatedAt": "2013-08-01T21:46:54+00:00"
        }
    ]
}
```

For more information, see Apps in the *AWS OpsWorks User Guide*.

- For API details, see DescribeApps in *AWS CLI Command Reference*.

### `describe-commands`

The following code example shows how to use `describe-commands`.

#### AWS CLI

**To describe commands**

The following `describe-commands` command describes the commands in a specified instance.

```
aws opsworks describe-commands \
    --instance-id 8c2673b9-3fe5-420d-9cfa-78d875ee7687 \
    --region us-east-1
```

Output:

```
{
    "Commands": [
        {
            "Status": "successful",
            "CompletedAt": "2013-07-25T18:57:47+00:00",
            "InstanceId": "8c2673b9-3fe5-420d-9cfa-78d875ee7687",
            "DeploymentId": "6ed0df4c-9ef7-4812-8dac-d54a05be1029",
            "AcknowledgedAt": "2013-07-25T18:57:41+00:00",
            "LogUrl": "https://s3.amazonaws.com/<bucket-name>/logs/008c1a91-

            "ExitCode": 0
        }
    ]
}
```

For more information, see AWS OpsWorks Lifecycle Events in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeCommands](#) in *AWS CLI Command Reference*.

### `describe-deployments`

The following code example shows how to use `describe-deployments`.

**AWS CLI**

**To describe deployments**

The following `describe-deployments` command describes the deployments in a specified stack.

```
aws opsworks --region us-east-1 describe-deployments --stack-id 38ee91e2-abdc-4208-
a107-0b7168b3cc7a
```

*Output*:

```
{
  "Deployments": [
      {
          "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",
```

```
            "Status": "successful",
            "CompletedAt": "2013-07-25T18:57:49+00:00",
            "DeploymentId": "6ed0df4c-9ef7-4812-8dac-d54a05be1029",
            "Command": {
                "Args": {},
                "Name": "undeploy"
            },
            "CreatedAt": "2013-07-25T18:57:34+00:00",
            "Duration": 15,
            "InstanceIds": [
                "8c2673b9-3fe5-420d-9cfa-78d875ee7687",
                "9e588a25-35b2-4804-bd43-488f85ebe5b7"
            ]
        },
        {
            "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",
            "Status": "successful",
            "CompletedAt": "2013-07-25T18:56:41+00:00",
            "IamUserArn": "arn:aws:iam::123456789012:user/someuser",
            "DeploymentId": "19d3121e-d949-4ff2-9f9d-94eac087862a",
            "Command": {
                "Args": {},
                "Name": "deploy"
            },
            "InstanceIds": [
                "8c2673b9-3fe5-420d-9cfa-78d875ee7687",
                "9e588a25-35b2-4804-bd43-488f85ebe5b7"
            ],
            "Duration": 72,
            "CreatedAt": "2013-07-25T18:55:29+00:00"
        }
    ]
}
```

**More Information**

For more information, see Deploying Apps in the *AWS OpsWorks User Guide*.

- For API details, see DescribeDeployments in *AWS CLI Command Reference*.

## `describe-elastic-ips`

The following code example shows how to use `describe-elastic-ips`.

**AWS CLI**

**To describe Elastic IP instances**

The following `describe-elastic-ips` command describes the Elastic IP addresses in a specified instance.

```
aws opsworks --region us-east-1 describe-elastic-ips --instance-id b62f3e04-
e9eb-436c-a91f-d9e9a396b7b0
```

*Output*:

```
{
  "ElasticIps": [
      {
          "Ip": "192.0.2.0",
          "Domain": "standard",
          "Region": "us-west-2"
      }
  ]
}
```

**More Information**

For more information, see Instances in the *AWS OpsWorks User Guide*.

- For API details, see DescribeElasticIps in *AWS CLI Command Reference*.

## `describe-elastic-load-balancers`

The following code example shows how to use `describe-elastic-load-balancers`.

**AWS CLI**

**To describe a stack's elastic load balancers**

The following `describe-elastic-load-balancers` command describes a specified stack's load balancers.

```
aws opsworks --region us-west-2 describe-elastic-load-balancers --stack-id
 6f4660e5-37a6-4e42-bfa0-1358ebd9c182
```

*Output*: This particular stack has one load balancer.

```
{
  "ElasticLoadBalancers": [
      {
          "SubnetIds": [
              "subnet-60e4ea04",
              "subnet-66e1c110"
          ],
          "Ec2InstanceIds": [],
          "ElasticLoadBalancerName": "my-balancer",
          "Region": "us-west-2",
          "LayerId": "344973cb-bf2b-4cd0-8d93-51cd819bab04",
          "AvailabilityZones": [
              "us-west-2a",
              "us-west-2b"
          ],
          "VpcId": "vpc-b319f9d4",
          "StackId": "6f4660e5-37a6-4e42-bfa0-1358ebd9c182",
          "DnsName": "my-balancer-2094040179.us-west-2.elb.amazonaws.com"
      }
  ]
}
```

**More Information**

For more information, see Apps in the *AWS OpsWorks User Guide*.

- For API details, see DescribeElasticLoadBalancers in *AWS CLI Command Reference*.

## `describe-instances`

The following code example shows how to use `describe-instances`.

### AWS CLI

**To describe instances**

The following `describe-instances` command describes the instances in a specified stack:

```
aws opsworks --region us-east-1 describe-instances --stack-id 8c428b08-a1a1-46ce-
a5f8-feddc43771b8
```

*Output*: The following output example is for a stack with two instances. The first is a registered EC2 instance, and the second was created by AWS OpsWorks.

```
{
  "Instances": [
    {
      "StackId": "71c7ca72-55ae-4b6a-8ee1-a8dcded3fa0f",
      "PrivateDns": "ip-10-31-39-66.us-west-2.compute.internal",
      "LayerIds": [
        "26cf1d32-6876-42fa-bbf1-9cadc0bff938"
      ],
      "EbsOptimized": false,
      "ReportedOs": {
        "Version": "14.04",

### More Information

For more information, see Instances in the *AWS OpsWorks User Guide*.

- For API details, see DescribeInstances in *AWS CLI Command Reference*.

### `describe-layers`

The following code example shows how to use `describe-layers`.

#### AWS CLI

**To describe a stack's layers**

The following `describe-layers` command describes the layers in a specified stack:

```
aws opsworks --region us-east-1 describe-layers --stack-id 38ee91e2-abdc-4208-
a107-0b7168b3cc7a
```

*Output*:

```
{
  "Layers": [
      {
          "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",
          "Type": "db-master",
          "DefaultSecurityGroupNames": [
              "AWS-OpsWorks-DB-Master-Server"
          ],
          "Name": "MySQL",
          "Packages": [],
          "DefaultRecipes": {
              "Undeploy": [],
              "Setup": [
                  "opsworks_initial_setup",
                  "ssh_host_keys",
                  "ssh_users",
                  "mysql::client",
                  "dependencies",
                  "ebs",
                  "opsworks_ganglia::client",
                  "mysql::server",
                  "dependencies",
                  "deploy::mysql"
              ],
              "Configure": [
                  "opsworks_ganglia::configure-client",
```

```
                "ssh_users",

    }
  ]
}
```

#### More Information

For more information, see Layers in the *AWS OpsWorks User Guide*.

- For API details, see DescribeLayers in *AWS CLI Command Reference*.

### `describe-load-based-auto-scaling`

The following code example shows how to use `describe-load-based-auto-scaling`.

#### AWS CLI

##### To describe a layer's load-based scaling configuration

The following example describes a specified layer's load-based scaling configuration. The layer is identified by its layer ID, which you can find on the layer's details page or by running `describe-layers`.

```
aws opsworks describe-load-based-auto-scaling --region us-east-1 --layer-ids
 6bec29c9-c866-41a0-aba5-fa3e374ce2a1
```

*Output*: The example layer has a single load-based instance.

```
{
  "LoadBasedAutoScalingConfigurations": [
    {
      "DownScaling": {
        "IgnoreMetricsTime": 10,
        "ThresholdsWaitTime": 10,
        "InstanceCount": 1,
        "CpuThreshold": 30.0
      },
      "Enable": true,
      "UpScaling": {
        "IgnoreMetricsTime": 5,
        "ThresholdsWaitTime": 5,
        "InstanceCount": 1,
        "CpuThreshold": 80.0
      },
      "LayerId": "6bec29c9-c866-41a0-aba5-fa3e374ce2a1"
    }
  ]
}
```

#### More Information

For more information, see How Automatic Load-based Scaling Works in the *AWS OpsWorks User Guide*.

- For API details, see DescribeLoadBasedAutoScaling in *AWS CLI Command Reference*.

### `describe-my-user-profile`

The following code example shows how to use `describe-my-user-profile`.

#### AWS CLI

##### To obtain a user's profile

The following example shows how to obtain the profile of the AWS Identity and Access Management (IAM) user that is running the command.

```
aws opsworks --region us-east-1 describe-my-user-profile
```

*Output*: For brevity, most of the user's SSH public key is replaced by an ellipsis (...).

```
{
  "UserProfile": {
    "IamUserArn": "arn:aws:iam::123456789012:user/myusername",
    "SshPublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAABJQ...3LQ4aX9jpxQw== rsa-
key-20141104",
    "Name": "myusername",
    "SshUsername": "myusername"
  }
}
```

#### More Information

For more information, see Importing Users into AWS OpsWorks in the *AWS OpsWorks User Guide*.

- For API details, see DescribeMyUserProfile in *AWS CLI Command Reference*.

### `describe-permissions`

The following code example shows how to use `describe-permissions`.

**AWS CLI**

**To obtain a user's per-stack AWS OpsWorks permission level**

The following example shows how to to obtain an AWS Identity and Access Management (IAM) user's permission level on a specified stack.

```
aws opsworks --region us-east-1 describe-permissions --iam-user-arn
 arn:aws:iam::123456789012:user/cli-user-test --stack-id d72553d4-8727-448c-9b00-
f024f0ba1b06
```

*Output*:

```
{
  "Permissions": [
    {
      "StackId": "d72553d4-8727-448c-9b00-f024f0ba1b06",
      "IamUserArn": "arn:aws:iam::123456789012:user/cli-user-test",
      "Level": "manage",
      "AllowSudo": true,
      "AllowSsh": true
    }
  ]
}
```

**More Information**

For more information, see Granting Per-Stack Permissions Levels in the *AWS OpsWorks User Guide*.

- For API details, see DescribePermissions in *AWS CLI Command Reference*.

## `describe-raid-arrays`

The following code example shows how to use `describe-raid-arrays`.

**AWS CLI**

**To describe RAID arrays**

The following example describes the RAID arrays attached to the instances in a specified stack.

```
aws opsworks --region us-east-1 describe-raid-arrays --stack-id
 d72553d4-8727-448c-9b00-f024f0ba1b06
```

*Output*: The following is the output for a stack with one RAID array.

```
{
  "RaidArrays": [
    {
      "StackId": "d72553d4-8727-448c-9b00-f024f0ba1b06",
      "AvailabilityZone": "us-west-2a",
      "Name": "Created for php-app1",
      "NumberOfDisks": 2,
      "InstanceId": "9f14adbc-ced5-43b6-bf01-e7d0db6cf2f7",
      "RaidLevel": 0,
      "VolumeType": "standard",
      "RaidArrayId": "f2d4e470-5972-4676-b1b8-bae41ec3e51c",
      "Device": "/dev/md0",
      "MountPoint": "/mnt/workspace",
      "CreatedAt": "2015-02-26T23:53:09+00:00",
      "Size": 100
    }
  ]
}
```

For more information, see EBS Volumes in the *AWS OpsWorks User Guide*.

- For API details, see DescribeRaidArrays in *AWS CLI Command Reference*.

## `describe-rds-db-instances`

The following code example shows how to use `describe-rds-db-instances`.

### AWS CLI

#### To describe a stack's registered Amazon RDS instances

The following example describes the Amazon RDS instances registered with a specified stack.

```
aws opsworks --region us-east-1 describe-rds-db-instances --stack-id
 d72553d4-8727-448c-9b00-f024f0ba1b06
```

*Output*: The following is the output for a stack with one registered RDS instance.

```
{
  "RdsDbInstances": [
    {
      "Engine": "mysql",
      "StackId": "d72553d4-8727-448c-9b00-f024f0ba1b06",
      "MissingOnRds": false,
      "Region": "us-west-2",
      "RdsDbInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:clitestdb",
      "DbPassword": "*****FILTERED*****",
      "Address": "clitestdb.cdlqlk5uwd0k.us-west-2.rds.amazonaws.com",
      "DbUser": "cliuser",
      "DbInstanceIdentifier": "clitestdb"
    }
  ]
}
```

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see DescribeRdsDbInstances in *AWS CLI Command Reference*.

### `describe-stack-provisioning-parameters`

The following code example shows how to use `describe-stack-provisioning-parameters`.

**AWS CLI**

**To return the provisioning parameters for a stack**

The following `describe-stack-provisioning-parameters` example returns the provisioning parameters for a specified stack. Provisioning parameters include settings such as the agent installation location and public key that OpsWorks uses to manage the agent on instances in a stack.

```
aws opsworks describe-stack-provisioning-parameters \
    --stack-id 62744d97-6faf-4ecb-969b-a086fEXAMPLE
```

Output:

```
{
    "AgentInstallerUrl": "https://opsworks-instance-agent-us-
west-2.s3.amazonaws.com/ID_number/opsworks-agent-installer.tgz",
```

```
    "Parameters": {
        "agent_installer_base_url": "https://opsworks-instance-agent-us-
west-2.s3.amazonaws.com",
        "agent_installer_tgz": "opsworks-agent-installer.tgz",
        "assets_download_bucket": "opsworks-instance-assets-us-
west-2.s3.amazonaws.com",
        "charlie_public_key": "-----BEGIN PUBLIC KEY-----PUBLIC_KEY_EXAMPLE\n-----
END PUBLIC KEY-----",
        "instance_service_endpoint": "opsworks-instance-service.us-
west-2.amazonaws.com",
        "instance_service_port": "443",
        "instance_service_region": "us-west-2",
        "instance_service_ssl_verify_peer": "true",
        "instance_service_use_ssl": "true",
        "ops_works_endpoint": "opsworks.us-west-2.amazonaws.com",
        "ops_works_port": "443",
        "ops_works_region": "us-west-2",
        "ops_works_ssl_verify_peer": "true",
        "ops_works_use_ssl": "true",
        "verbose": "false",
        "wait_between_runs": "30"
    }
}
```

For more information, see Run Stack Commands in the *AWS OpsWorks User Guide*.

- For API details, see DescribeStackProvisioningParameters in *AWS CLI Command Reference*.

### `describe-stack-summary`

The following code example shows how to use `describe-stack-summary`.

#### AWS CLI

**To describe a stack's configuration**

The following `describe-stack-summary` command returns a summary of the specified stack's configuration.

```
aws opsworks --region us-east-1 describe-stack-summary --stack-id 8c428b08-
a1a1-46ce-a5f8-feddc43771b8
```

*Output*:

```
{
  "StackSummary": {
    "StackId": "8c428b08-a1a1-46ce-a5f8-feddc43771b8",
    "InstancesCount": {
      "Booting": 1
    },
    "Name": "CLITest",
    "AppsCount": 1,
    "LayersCount": 1,
    "Arn": "arn:aws:opsworks:us-west-2:123456789012:stack/8c428b08-a1a1-46ce-a5f8-
feddc43771b8/"
  }
}
```

**More Information**

For more information, see Stacks in the *AWS OpsWorks User Guide*.

- For API details, see DescribeStackSummary in *AWS CLI Command Reference*.

## `describe-stacks`

The following code example shows how to use `describe-stacks`.

### AWS CLI

**To describe stacks**

The following `describe-stacks` command describes an account's stacks.

```
aws opsworks --region us-east-1 describe-stacks
```

*Output*:

```
{
  "Stacks": [
    {
      "ServiceRoleArn": "arn:aws:iam::444455556666:role/aws-opsworks-service-role",
      "StackId": "aeb7523e-7c8b-49d4-b866-03aae9d4fbcb",
      "DefaultRootDeviceType": "instance-store",
      "Name": "TomStack-sd",
      "ConfigurationManager": {
        "Version": "11.4",
```

```
        "Name": "Chef"
      },
      "UseCustomCookbooks": true,
      "CustomJson": "{\n  \"tomcat\": {\n    \"base_version\": 7,\n    \"java_opts
\": \"-Djava.awt.headless=true -Xmx256m\"\n  },\n  \"datasources\": {\n    \"ROOT\":
 \"jdbc/mydb\"\n  }\n}",
      "Region": "us-east-1",
      "DefaultInstanceProfileArn": "arn:aws:iam::444455556666:instance-profile/aws-
opsworks-ec2-role",
      "CustomCookbooksSource": {
        "Url": "git://github.com/example-repo/tomcustom.git",
        "Type": "git"
      },
      "DefaultAvailabilityZone": "us-east-1a",
      "HostnameTheme": "Layer_Dependent",
      "Attributes": {
        "Color": "rgb(45, 114, 184)"
      },
      "DefaultOs": "Amazon Linux",
      "CreatedAt": "2013-08-01T22:53:42+00:00"
    },
    {
      "ServiceRoleArn": "arn:aws:iam::444455556666:role/aws-opsworks-service-role",
      "StackId": "40738975-da59-4c5b-9789-3e422f2cf099",
      "DefaultRootDeviceType": "instance-store",
      "Name": "MyStack",
      "ConfigurationManager": {
        "Version": "11.4",
        "Name": "Chef"
      },
      "UseCustomCookbooks": false,
      "Region": "us-east-1",
      "DefaultInstanceProfileArn": "arn:aws:iam::444455556666:instance-profile/aws-
opsworks-ec2-role",
      "CustomCookbooksSource": {},
      "DefaultAvailabilityZone": "us-east-1a",
      "HostnameTheme": "Layer_Dependent",
      "Attributes": {
        "Color": "rgb(45, 114, 184)"
      },
      "DefaultOs": "Amazon Linux",
      "CreatedAt": "2013-10-25T19:24:30+00:00"
    }
  ]
```

```
}
```

#### More Information

For more information, see Stacks in the *AWS OpsWorks User Guide*.

- For API details, see DescribeStacks in *AWS CLI Command Reference*.

### `describe-timebased-auto-scaling`

The following code example shows how to use `describe-timebased-auto-scaling`.

#### AWS CLI

##### To describe the time-based scaling configuration of an instance

The following example describes a specified instance's time-based scaling configuration. The instance is identified by its instance ID, which you can find on the instances's details page or by running `describe-instances`.

```
aws opsworks describe-time-based-auto-scaling --region us-east-1 --instance-ids
 701f2ffe-5d8e-4187-b140-77b75f55de8d
```

*Output*: The example has a single time-based instance.

```
{
  "TimeBasedAutoScalingConfigurations": [
   {
      "InstanceId": "701f2ffe-5d8e-4187-b140-77b75f55de8d",
      "AutoScalingSchedule": {
        "Monday": {
          "11": "on",
          "10": "on",
          "13": "on",
          "12": "on"
        },
        "Tuesday": {
          "11": "on",
          "10": "on",
          "13": "on",
          "12": "on"
```

```
        }
      }
    }
  ]
}
```

**More Information**

For more information, see How Automatic Time-based Scaling Works in the *AWS OpsWorks User Guide*.

- For API details, see DescribeTimebasedAutoScaling in *AWS CLI Command Reference*.

## `describe-user-profiles`

The following code example shows how to use `describe-user-profiles`.

**AWS CLI**

**To describe user profiles**

The following `describe-user-profiles` command describes the account's user profiles.

```
aws opsworks --region us-east-1 describe-user-profiles
```

*Output*:

```
{
  "UserProfiles": [
    {
      "IamUserArn": "arn:aws:iam::123456789012:user/someuser",
      "SshPublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAABJQAAAQEAkOuP7i80q3Cko...",
      "AllowSelfManagement": true,
      "Name": "someuser",
      "SshUsername": "someuser"
    },
    {
      "IamUserArn": "arn:aws:iam::123456789012:user/cli-user-test",
      "AllowSelfManagement": true,
      "Name": "cli-user-test",
      "SshUsername": "myusername"
```

```
    }
  ]
}
```

#### More Information

For more information, see Managing AWS OpsWorks Users in the *AWS OpsWorks User Guide*.

- For API details, see DescribeUserProfiles in *AWS CLI Command Reference*.

### `describe-volumes`

The following code example shows how to use `describe-volumes`.

#### AWS CLI

##### To describe a stack's volumes

The following example describes a stack's EBS volumes.

```
aws opsworks --region us-east-1 describe-volumes --stack-id 8c428b08-a1a1-46ce-a5f8-
feddc43771b8
```

*Output*:

```
{
  "Volumes": [
    {
      "Status": "in-use",
      "AvailabilityZone": "us-west-2a",
      "Name": "CLITest",
      "InstanceId": "dfe18b02-5327-493d-91a4-c5c0c448927f",
      "VolumeType": "standard",
      "VolumeId": "56b66fbd-e1a1-4aff-9227-70f77118d4c5",
      "Device": "/dev/sdi",
      "Ec2VolumeId": "vol-295c1638",
      "MountPoint": "/mnt/myvolume",
      "Size": 1
    }
  ]
}
```

#### More Information

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see DescribeVolumes in *AWS CLI Command Reference*.

### `detach-elastic-load-balancer`

The following code example shows how to use `detach-elastic-load-balancer`.

#### AWS CLI

##### To detach a load balancer from its layer

The following example detaches a load balancer, identified by its name, from its layer.

```
aws opsworks --region us-east-1 detach-elastic-load-balancer --elastic-load-
balancer-name Java-LB --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4
```

*Output*: None.

##### More Information

For more information, see Elastic Load Balancing in the *AWS OpsWorks User Guide*.

- For API details, see DetachElasticLoadBalancer in *AWS CLI Command Reference*.

### `disassociate-elastic-ip`

The following code example shows how to use `disassociate-elastic-ip`.

#### AWS CLI

##### To disassociate an Elastic IP address from an instance

The following example disassociates an Elastic IP address from a specified instance.

```
aws opsworks --region us-east-1 disassociate-elastic-ip --elastic-ip 54.148.130.96
```

*Output*: None.

#### More Information

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see DisassociateElasticIp in *AWS CLI Command Reference*.

### `get-hostname-suggestion`

The following code example shows how to use `get-hostname-suggestion`.

#### AWS CLI

#### To get the next hostname for a layer

The following example gets the next generated hostname for a specified layer. The layer used for this example is a Java Application Server layer with one instance. The stack's hostname theme is the default, Layer_Dependent.

```
aws opsworks --region us-east-1 get-hostname-suggestion --layer-id
 888c5645-09a5-4d0e-95a8-812ef1db76a4
```

*Output*:

```
{
  "Hostname": "java-app2",
  "LayerId": "888c5645-09a5-4d0e-95a8-812ef1db76a4"
}
```

#### More Information

For more information, see Create a New Stack in the *AWS OpsWorks User Guide*.

- For API details, see GetHostnameSuggestion in *AWS CLI Command Reference*.

### `reboot-instance`

The following code example shows how to use `reboot-instance`.

#### AWS CLI

#### To reboot an instance

The following example reboots an instance.

```
aws opsworks --region us-east-1 reboot-instance --instance-id
 dfe18b02-5327-493d-91a4-c5c0c448927f
```

*Output*: None.

**More Information**

For more information, see Rebooting an Instance in the *AWS OpsWorks User Guide*.

- For API details, see RebootInstance in *AWS CLI Command Reference*.

### `register-elastic-ip`

The following code example shows how to use `register-elastic-ip`.

**AWS CLI**

**To register an Elastic IP address with a stack**

The following example registers an Elastic IP address, identified by its IP address, with a specified stack.

**Note:** The Elastic IP address must be in the same region as the stack.

```
aws opsworks register-elastic-ip --region us-east-1 --stack-id
 d72553d4-8727-448c-9b00-f024f0ba1b06 --elastic-ip 54.148.130.96
```

*Output*

```
{
  "ElasticIp": "54.148.130.96"
}
```

**More Information**

For more information, see Registering Elastic IP Addresses with a Stack in the *OpsWorks User Guide*.

- For API details, see RegisterElasticIp in *AWS CLI Command Reference*.

### `register-rds-db-instance`

The following code example shows how to use `register-rds-db-instance`.

**AWS CLI**

**To register an Amazon RDS instance with a stack**

The following example registers an Amazon RDS DB instance, identified by its Amazon Resource Name (ARN), with a specified stack. It also specifies the instance's master username and password. Note that AWS OpsWorks does not validate either of these values. If either one is incorrect, your application will not be able to connect to the database.

```
aws opsworks register-rds-db-instance --region us-east-1 --stack-id
 d72553d4-8727-448c-9b00-f024f0ba1b06 --rds-db-instance-arn arn:aws:rds:us-
west-2:123456789012:db:clitestdb  --db-user cliuser --db-password some23!pwd
```

*Output*: None.

**More Information**

For more information, see Registering Amazon RDS Instances with a Stack in the *AWS OpsWorks User Guide*.

- For API details, see RegisterRdsDbInstance in *AWS CLI Command Reference*.

### `register-volume`

The following code example shows how to use `register-volume`.

**AWS CLI**

**To register an Amazon EBS volume with a stack**

The following example registers an Amazon EBS volume, identified by its volume ID, with a specified stack.

```
aws opsworks register-volume --region us-east-1 --stack-id d72553d4-8727-448c-9b00-
f024f0ba1b06 --ec-2-volume-id vol-295c1638
```

*Output*:

```
{
  "VolumeId": "ee08039c-7cb7-469f-be10-40fb7f0c05e8"
}
```

**More Information**

For more information, see Registering Amazon EBS Volumes with a Stack in the *AWS OpsWorks User Guide*.

- For API details, see RegisterVolume in *AWS CLI Command Reference*.

## `register`

The following code example shows how to use `register`.

**AWS CLI**

**To register instances with a stack**

The following examples show a variety of ways to register instances with a stack that were created outside of AWS Opsworks. You can run `register` from the instance to be registered, or from a separate workstation. For more information, see Registering Amazon EC2 and On-premises Instances in the *AWS OpsWorks User Guide*.

**Note**: For brevity, the examples omit the `region` argument.

*To register an Amazon EC2 instance*

To indicate that you are registering an EC2 instance, set the `--infrastructure-class` argument to `ec2`.

The following example registers an EC2 instance with the specified stack from a separate workstation. The instance is identified by its EC2 ID, `i-12345678`. The example uses the workstation's default SSH username and attempts to log in to the instance using authentication techniques that do not require a password, such as a default private SSH key. If that fails, `register` queries for the password.

```
aws opsworks register --infrastructure-class=ec2 --stack-id 935450cc-61e0-4b03-
a3e0-160ac817d2bb i-12345678
```

The following example registers an EC2 instance with the specifed stack from a separate workstation. It uses the `--ssh-username` and `--ssh-private-key` arguments to explicitly specify the SSH username and private key file that the command uses to log into the instance. `ec2-user` is the standard username for Amazon Linux instances. Use `ubuntu` for Ubuntu instances.

```
aws opsworks register --infrastructure-class=ec2 --stack-id 935450cc-61e0-4b03-
a3e0-160ac817d2bb --ssh-username ec2-user --ssh-private-key ssh_private_key
 i-12345678
```

The following example registers the EC2 instance that is running the `register` command. Log in to the instance with SSH and run `register` with the `--local` argument instead of an instance ID or hostname.

```
aws opsworks register --infrastructure-class ec2 --stack-id 935450cc-61e0-4b03-
a3e0-160ac817d2bb --local
```

*To register an on-premises instance*

To indicate that you are registering an on-premises instance, set the `--infrastructure-class` argument to `on-premises`.

The following example registers an existing on-premises instance with a specified stack from a separate workstation. The instance is identified by its IP address, `192.0.2.3`. The example uses the workstation's default SSH username and attempts to log in to the instance using authentication techniques that do not require a password, such as a default private SSH key. If that fails, `register` queries for the password.

```
aws opsworks register --infrastructure-class on-premises --stack-id
 935450cc-61e0-4b03-a3e0-160ac817d2bb 192.0.2.3
```

The following example registers an on-premises instance with a specified stack from a separate workstation. The instance is identified by its hostname, `host1`. The `--override-...` arguments direct AWS OpsWorks to display `webserver1` as the host name and `192.0.2.3` and `10.0.0.2` as the instance's public and private IP addresses, respectively.

```
aws opsworks register --infrastructure-class on-premises --stack-id
 935450cc-61e0-4b03-a3e0-160ac817d2bb --override-hostname webserver1 --override-
public-ip 192.0.2.3 --override-private-ip 10.0.0.2 host1
```

The following example registers an on-premises instance with a specified stack from a separate workstation. The instance is identified by its IP address. `register` logs into the instance using the specified SSH username and private key file.

```
aws opsworks register --infrastructure-class on-premises --stack-id
 935450cc-61e0-4b03-a3e0-160ac817d2bb --ssh-username admin --ssh-private-key
 ssh_private_key 192.0.2.3
```

The following example registers an existing on-premises instance with a specified stack from a separate workstation. The command logs into the instance using a custom SSH command string that specifies the SSH password and the instance's IP address.

```
aws opsworks register --infrastructure-class on-premises --stack-id
 935450cc-61e0-4b03-a3e0-160ac817d2bb --override-ssh "sshpass -p 'mypassword' ssh
 your-user@192.0.2.3"
```

The following example registers the on-premises instance that is running the `register` command. Log in to the instance with SSH and run `register` with the `--local` argument instead of an instance ID or hostname.

```
aws opsworks register --infrastructure-class on-premises --stack-id
 935450cc-61e0-4b03-a3e0-160ac817d2bb --local
```

*Output*: The following is typical output for registering an EC2 instance.

```
Warning: Permanently added '52.11.41.206' (ECDSA) to the list of known hosts.

```

**More Information**

For more information, see Registering an Instance with an AWS OpsWorks Stack in the *AWS OpsWorks User Guide*.

- For API details, see Register in *AWS CLI Command Reference*.

### `set-load-based-auto-scaling`

The following code example shows how to use `set-load-based-auto-scaling`.

**AWS CLI**

**To set the load-based scaling configuration for a layer**

The following example enables load-based scaling for a specified layer and sets the configuration for that layer. You must use `create-instance` to add load-based instances to the layer.

```
aws opsworks --region us-east-1 set-load-based-auto-scaling --layer-id
 523569ae-2faf-47ac-b39e-f4c4b381f36d --enable --up-scaling file://upscale.json --
down-scaling file://downscale.json
```

The example puts the upscaling threshold settings in a separate file in the working directory named `upscale.json`, which contains the following.

```
{
```

```
  "InstanceCount": 2,
  "ThresholdsWaitTime": 3,
  "IgnoreMetricsTime": 3,
  "CpuThreshold": 85,
  "MemoryThreshold": 85,
  "LoadThreshold": 85
}
```

The example puts the downscaling threshold settings in a separate file in the working directory named `downscale.json`, which contains the following.

```
{
"InstanceCount": 2,
"ThresholdsWaitTime": 3,
"IgnoreMetricsTime": 3,
"CpuThreshold": 35,
"MemoryThreshold": 30,
"LoadThreshold": 30
}
```

*Output*: None.

**More Information**

For more information, see Using Automatic Load-based Scaling in the *AWS OpsWorks User Guide*.

- For API details, see SetLoadBasedAutoScaling in *AWS CLI Command Reference*.

## `set-permission`

The following code example shows how to use `set-permission`.

### AWS CLI

**To grant per-stack AWS OpsWorks permission levels**

When you import an AWS Identity and Access Management (IAM) user into AWS OpsWorks by calling `create-user-profile`, the user has only those permissions that are granted by the attached IAM policies. You can grant AWS OpsWorks permissions by modifying a user's policies. However, it is often easier to import a user and then use the `set-permission` command to

grant the user one of the standard permission levels for each stack to which the user will need access.

The following example grants permission for the specified stack for a user, who is identified by Amazon Resource Name (ARN). The example grants the user a Manage permissions level, with sudo and SSH privileges on the stack's instances.

```
aws opsworks set-permission --region us-east-1 --stack-id 71c7ca72-55ae-4b6a-8ee1-
a8dcded3fa0f --level manage  --iam-user-arn arn:aws:iam::123456789102:user/cli-user-
test --allow-ssh --allow-sudo
```

*Output*: None.

**More Information**

For more information, see Granting AWS OpsWorks Users Per-Stack Permissions in the *AWS OpsWorks User Guide*.

- For API details, see SetPermission in *AWS CLI Command Reference*.

### `set-time-based-auto-scaling`

The following code example shows how to use `set-time-based-auto-scaling`.

**AWS CLI**

**To set the time-based scaling configuration for a layer**

The following example sets the time-based configuration for a specified instance. You must first use `create-instance` to add the instance to the layer.

```
aws opsworks --region us-east-1 set-time-based-auto-scaling --instance-id
 69b6237c-08c0-4edb-a6af-78f3d01cedf2 --auto-scaling-schedule file://schedule.json
```

The example puts the schedule in a separate file in the working directory named `schedule.json`. For this example, the instance is on for a few hours around midday UTC (Coordinated Universal Time) on Monday and Tuesday.

```
{
  "Monday": {
    "10": "on",
```

```
    "11": "on",
    "12": "on",
    "13": "on"
  },
  "Tuesday": {
    "10": "on",
    "11": "on",
    "12": "on",
    "13": "on"
  }
}
```

*Output*: None.

**More Information**

For more information, see Using Automatic Time-based Scaling in the *AWS OpsWorks User Guide*.

- For API details, see SetTimeBasedAutoScaling in *AWS CLI Command Reference*.

### `start-instance`

The following code example shows how to use `start-instance`.

**AWS CLI**

**To start an instance**

The following `start-instance` command starts a specified 24/7 instance.

```
aws opsworks start-instance --instance-id f705ee48-9000-4890-8bd3-20eb05825aaf
```

*Output*: None. Use describe-instances to check the instance's status.

**Tip** You can start every offline instance in a stack with one command by calling start-stack.

**More Information**

For more information, see Manually Starting, Stopping, and Rebooting 24/7 Instances in the *AWS OpsWorks User Guide*.

- For API details, see StartInstance in *AWS CLI Command Reference*.

### `start-stack`

The following code example shows how to use `start-stack`.

**AWS CLI**

**To start a stack's instances**

The following example starts all of a stack's 24/7 instances. To start a particular instance, use `start-instance`.

```
aws opsworks --region us-east-1 start-stack --stack-id 8c428b08-a1a1-46ce-a5f8-
feddc43771b8
```

*Output*: None.

**More Information**

For more information, see Starting an Instance in the *AWS OpsWorks User Guide*.

- For API details, see StartStack in *AWS CLI Command Reference*.

### `stop-instance`

The following code example shows how to use `stop-instance`.

**AWS CLI**

**To stop an instance**

The following example stops a specified instance, which is identified by its instance ID. You can obtain an instance ID by going to the instance's details page on the AWS OpsWorks console or by running the `describe-instances` command.

```
aws opsworks stop-instance --region us-east-1 --instance-id 3a21cfac-4a1f-4ce2-a921-
b2cfba6f7771
```

You can restart a stopped instance by calling `start-instance` or by deleting the instance by calling `delete-instance`.

*Output*: None.

**More Information**

For more information, see Stopping an Instance in the *AWS OpsWorks User Guide*.

- For API details, see StopInstance in *AWS CLI Command Reference*.

### `stop-stack`

The following code example shows how to use `stop-stack`.

**AWS CLI**

**To stop a stack's instances**

The following example stops all of a stack's 24/7 instances. To stop a particular instance, use `stop-instance`.

```
aws opsworks --region us-east-1 stop-stack --stack-id 8c428b08-a1a1-46ce-a5f8-
feddc43771b8
```

*Output*: No output.

**More Information**

For more information, see Stopping an Instance in the *AWS OpsWorks User Guide*.

- For API details, see StopStack in *AWS CLI Command Reference*.

### `unassign-instance`

The following code example shows how to use `unassign-instance`.

**AWS CLI**

**To unassign a registered instance from its layers**

The following `unassign-instance` command unassigns an instance from its attached layers.

```
aws opsworks --region us-east-1 unassign-instance --instance-id 4d6d1710-ded9-42a1-
b08e-b043ad7af1e2
```

**Output**: None.

**More Information**

For more information, see Unassigning a Registered Instance in the *AWS OpsWorks User Guide*.

- For API details, see UnassignInstance in *AWS CLI Command Reference*.

### `unassign-volume`

The following code example shows how to use `unassign-volume`.

**AWS CLI**

**To unassign a volume from its instance**

The following example unassigns a registered Amazon Elastic Block Store (Amazon EBS) volume from its instance. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns when you register the volume with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID.

```
aws opsworks --region us-east-1 unassign-volume --volume-id 8430177d-52b7-4948-9c62-
e195af4703df
```

*Output*: None.

**More Information**

For more information, see Unassigning Amazon EBS Volumes in the *AWS OpsWorks User Guide*.

- For API details, see UnassignVolume in *AWS CLI Command Reference*.

### `update-app`

The following code example shows how to use `update-app`.

**AWS CLI**

**To update an app**

The following example updates a specified app to change its name.

```
aws opsworks --region us-east-1 update-app --app-id 26a61ead-d201-47e3-
b55c-2a7c666942f8 --name NewAppName
```

*Output*: None.

#### More Information

For more information, see Editing Apps in the *AWS OpsWorks User Guide*.

- For API details, see UpdateApp in *AWS CLI Command Reference*.

### `update-elastic-ip`

The following code example shows how to use `update-elastic-ip`.

#### AWS CLI

##### To update an Elastic IP address name

The following example updates the name of a specified Elastic IP address.

```
aws opsworks --region us-east-1 update-elastic-ip --elastic-ip 54.148.130.96 --name
 NewIPName
```

*Output*: None.

#### More Information

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see UpdateElasticIp in *AWS CLI Command Reference*.

### `update-instance`

The following code example shows how to use `update-instance`.

#### AWS CLI

##### To update an instance

The following example updates a specified instance's type.

```
aws opsworks --region us-east-1 update-instance --instance-id
 dfe18b02-5327-493d-91a4-c5c0c448927f --instance-type c3.xlarge
```

*Output*: None.

#### More Information

For more information, see Editing the Instance Configuration in the *AWS OpsWorks User Guide*.

- For API details, see UpdateInstance in *AWS CLI Command Reference*.

### `update-layer`

The following code example shows how to use `update-layer`.

**AWS CLI**

**To update a layer**

The following example updates a specified layer to use Amazon EBS-optimized instances.

```
aws opsworks --region us-east-1 update-layer --layer-id
 888c5645-09a5-4d0e-95a8-812ef1db76a4 --use-ebs-optimized-instances
```

*Output*: None.

**More Information**

For more information, see Editing an OpsWorks Layer's Configuration in the *AWS OpsWorks User Guide*.

- For API details, see UpdateLayer in *AWS CLI Command Reference*.

### `update-my-user-profile`

The following code example shows how to use `update-my-user-profile`.

**AWS CLI**

**To update a user's profile**

The following example updates the `development` user's profile to use a specified SSH public key. The user's AWS credentials are represented by the `development` profile in the `credentials` file (`~\.aws\credentials`), and the key is in a `.pem` file in the working directory.

```
aws opsworks --region us-east-1 --profile development update-my-user-profile --ssh-
public-key file://development_key.pem
```

*Output*: None.

**More Information**

For more information, see Editing AWS OpsWorks User Settings in the *AWS OpsWorks User Guide*.

- For API details, see UpdateMyUserProfile in *AWS CLI Command Reference*.

### `update-rds-db-instance`

The following code example shows how to use `update-rds-db-instance`.

**AWS CLI**

**To update a registered Amazon RDS DB instance**

The following example updates an Amazon RDS instance's master password value. Note that this command does not change the RDS instance's master password, just the password that you provide to AWS OpsWorks. If this password does not match the RDS instance's password, your application will not be able to connect to the database.

```
aws opsworks --region us-east-1 update-rds-db-instance --db-password 123456789
```

*Output*: None.

**More Information**

For more information, see Registering Amazon RDS Instances with a Stack in the *AWS OpsWorks User Guide*.

- For API details, see UpdateRdsDbInstance in *AWS CLI Command Reference*.

### `update-volume`

The following code example shows how to use `update-volume`.

**AWS CLI**

**To update a registered volume**

The following example updates a registered Amazon Elastic Block Store (Amazon EBS) volume's mount point. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns to the volume when you register it with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID.:

```
aws opsworks --region us-east-1 update-volume --volume-id 8430177d-52b7-4948-9c62-
e195af4703df --mount-point /mnt/myvol
```

*Output*: None.

**More Information**

For more information, see Assigning Amazon EBS Volumes to an Instance in the *AWS OpsWorks User Guide*.

- For API details, see UpdateVolume in *AWS CLI Command Reference*.

## AWS OpsWorks CM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS OpsWorks CM.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `associate-node`

The following code example shows how to use `associate-node`.

**AWS CLI**

**To associate nodes**

The following `associate-node` command associates a node named `i-44de882p` with a Chef Automate server named `automate-06`, meaning that the `automate-06` server manages the node, and communicates recipe commands to the node through `chef-client` agent software that is installed on the node by the associate-node command. Valid node names are EC2 instance IDs.:

```
aws opsworks-cm associate-node --server-name "automate-06" --node-name
 "i-43de882p" --engine-attributes "Name=CHEF_ORGANIZATION,Value='MyOrganization'
 Name=CHEF_NODE_PUBLIC_KEY,Value='Public_key_contents'"
```

The output returned by the command resembles the following. *Output*:

```
{
 "NodeAssociationStatusToken": "AHUY8wFe4pdXtZC5DiJa5SOLp5o14DH//
rHRqHDWXxwVoNBxcEy4V7R0NOFymh7E/1HumOBPsemPQFE6dcGaiFk"
}
```

**More Information**

For more information, see Adding Nodes Automatically in AWS OpsWorks for Chef Automate in the *AWS OpsWorks User Guide*.

- For API details, see AssociateNode in *AWS CLI Command Reference*.

### `create-backup`

The following code example shows how to use `create-backup`.

**AWS CLI**

**To create backups**

The following `create-backup` command starts a manual backup of a Chef Automate server named `automate-06` in the `us-east-1` region. The command adds a descriptive message to the backup in the `--description` parameter.

```
aws opsworks-cm create-backup \
```

```
    --server-name 'automate-06' \
    --description "state of my infrastructure at launch"
```

The output shows you information similar to the following about the new backup.

Output:

```
{
    "Backups": [
        {
            "BackupArn": "string",
            "BackupId": "automate-06-20160729133847520",
            "BackupType": "MANUAL",
            "CreatedAt": 2016-07-29T13:38:47.520Z,
            "Description": "state of my infrastructure at launch",
            "Engine": "Chef",
            "EngineModel": "Single",
            "EngineVersion": "12",
            "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/
automate-06-1010V4UU2WRM2",
            "InstanceType": "m4.large",
            "KeyPair": "",
            "PreferredBackupWindow": "",
            "PreferredMaintenanceWindow": "",
            "S3LogUrl": "https://s3.amazonaws.com/<bucket-name>/
automate-06-20160729133847520",
            "SecurityGroupIds": [ "sg-1a24c270" ],
            "ServerName": "automate-06",
            "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-
service-role.1114810729735",
            "Status": "OK",
            "StatusDescription": "",
            "SubnetIds": [ "subnet-49436a18" ],
            "ToolsVersion": "string",
            "UserArn": "arn:aws:iam::1019881987024:user/opsworks-user"
        }
    ],
}
```

For more information, see Back Up and Restore an AWS OpsWorks for Chef Automate Server in the *AWS OpsWorks User Guide*.

- For API details, see CreateBackup in *AWS CLI Command Reference*.

### `create-server`

The following code example shows how to use `create-server`.

**AWS CLI**

**To create a server**

The following `create-server` example creates a new Chef Automate server named `automate-06` in your default region. Note that defaults are used for most other settings, such as number of backups to retain, and maintenance and backup start times. Before you run a `create-server` command, complete prerequisites in Getting Started with AWS OpsWorks for Chef Automate in the *AWS Opsworks for Chef Automate User Guide*.

```
aws opsworks-cm create-server \
    --engine "Chef" \
    --engine-model "Single" \
    --engine-version "12" \
    --server-name "automate-06" \
    --instance-profile-arn "arn:aws:iam::1019881987024:instance-profile/aws-
opsworks-cm-ec2-role" \
    --instance-type "t2.medium" \
    --key-pair "amazon-test" \
    --service-role-arn "arn:aws:iam::044726508045:role/aws-opsworks-cm-service-role"
```

The output shows you information similar to the following about the new server:

```
{
    "Server": {
        "BackupRetentionCount": 10,
        "CreatedAt": 2016-07-29T13:38:47.520Z,
        "DisableAutomatedBackup": FALSE,
        "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
        "Engine": "Chef",
        "EngineAttributes": [
            {
                "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",
                "Value": "1Password1"
            }
        ],
        "EngineModel": "Single",
        "EngineVersion": "12",
```

```
        "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/aws-
opsworks-cm-ec2-role",
        "InstanceType": "t2.medium",
        "KeyPair": "amazon-test",
        "MaintenanceStatus": "",
        "PreferredBackupWindow": "Sun:02:00",
        "PreferredMaintenanceWindow": "00:00",
        "SecurityGroupIds": [ "sg-1a24c270" ],
        "ServerArn": "arn:aws:iam::1019881987024:instance/
automate-06-1010V4UU2WRM2",
        "ServerName": "automate-06",
        "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-
role",
        "Status": "CREATING",
        "StatusReason": "",
        "SubnetIds": [ "subnet-49436a18" ]
    }
}
```

For more information, see UpdateServer in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see CreateServer in *AWS CLI Command Reference*.

### `delete-backup`

The following code example shows how to use `delete-backup`.

#### AWS CLI

##### To delete backups

The following `delete-backup` command deletes a manual or automated backup of a Chef Automate server, identified by the backup ID. This command is useful when you are approaching the maximum number of backups that you can save, or you want to minimize your Amazon S3 storage costs.:

```
aws opsworks-cm delete-backup --backup-id "automate-06-2016-11-19T23:42:40.240Z"
```

The output shows whether the backup deletion succeeded.

##### More Information

For more information, see Back Up and Restore an AWS OpsWorks for Chef Automate Server in the *AWS OpsWorks User Guide*.

- For API details, see DeleteBackup in *AWS CLI Command Reference*.

### `delete-server`

The following code example shows how to use `delete-server`.

**AWS CLI**

**To delete servers**

The following `delete-server` command deletes a Chef Automate server, identified by the server's name. After the server is deleted, it is no longer returned by `DescribeServer` requests.:

```
aws opsworks-cm delete-server --server-name "automate-06"
```

The output shows whether the server deletion succeeded.

**More Information**

For more information, see Delete an AWS OpsWorks for Chef Automate Server in the *AWS OpsWorks User Guide*.

- For API details, see DeleteServer in *AWS CLI Command Reference*.

### `describe-account-attributes`

The following code example shows how to use `describe-account-attributes`.

**AWS CLI**

**To describe account attributes**

The following `describe-account-attributes` command returns information about your account's usage of AWS OpsWorks for Chef Automate resources.:

```
aws opsworks-cm describe-account-attributes
```

The output for each account attribute entry returned by the command resembles the following. *Output*:

```
{
 "Attributes": [
    {
       "Maximum": 5,
       "Name": "ServerLimit",
       "Used": 2
    }
 ]
}
```

**More Information**

For more information, see DescribeAccountAttributes in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see DescribeAccountAttributes in *AWS CLI Command Reference*.

### `describe-backups`

The following code example shows how to use `describe-backups`.

**AWS CLI**

**To describe backups**

The following `describe-backups` command returns information about all backups associated with your account in your default region.

```
aws opsworks-cm describe-backups
```

The output for each backup entry returned by the command resembles the following.

Output:

```
{
    "Backups": [
        {
            "BackupArn": "string",
```

```
            "BackupId": "automate-06-20160729133847520",
            "BackupType": "MANUAL",
            "CreatedAt": 2016-07-29T13:38:47.520Z,
            "Description": "state of my infrastructure at launch",
            "Engine": "Chef",
            "EngineModel": "Single",
            "EngineVersion": "12",
            "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/
automate-06-1010V4UU2WRM2",
            "InstanceType": "m4.large",
            "KeyPair": "",
            "PreferredBackupWindow": "",
            "PreferredMaintenanceWindow": "",
            "S3LogUrl": "https://s3.amazonaws.com/<bucket-name>/
automate-06-20160729133847520",
            "SecurityGroupIds": [ "sg-1a24c270" ],
            "ServerName": "automate-06",
            "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-
service-role.1114810729735",
            "Status": "Successful",
            "StatusDescription": "",
            "SubnetIds": [ "subnet-49436a18" ],
            "ToolsVersion": "string",
            "UserArn": "arn:aws:iam::1019881987024:user/opsworks-user"
        }
    ],
}
```

For more information, see Back Up and Restore an AWS OpsWorks for Chef Automate Server in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeBackups](#) in *AWS CLI Command Reference*.

### `describe-events`

The following code example shows how to use `describe-events`.

#### AWS CLI

**To describe events**

The following `describe-events` example returns information about all events that are associated with the specified Chef Automate server.

```
aws opsworks-cm describe-events \
    --server-name 'automate-06'
```

The output for each event entry returned by the command resembles the following example:

```
{
    "ServerEvents": [
        {
            "CreatedAt": 2016-07-29T13:38:47.520Z,
            "LogUrl": "https://s3.amazonaws.com/<bucket-name>/
automate-06-20160729133847520",
            "Message": "Updates successfully installed.",
            "ServerName": "automate-06"
        }
    ]
}
```

For more information, see General Troubleshooting Tips in the *AWS OpsWorks User Guide*.

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

### `describe-node-association-status`

The following code example shows how to use `describe-node-association-status`.

#### AWS CLI

**To describe node association status**

The following `describe-node-association-status` command returns the status of a request to associate a node with a Chef Automate server named `automate-06`.:

```
aws opsworks-cm describe-node-association-status --server-
name "automate-06" --node-association-status-token "AflJKl+/
GoKLZJBdDQEx0O65CDi57blQe9nKM8joSok0pQ9xr8DqApBN9/1O6sLdSvlfDEKkEx+eoCHvjoWHaOs="
```

The output for each account attribute entry returned by the command resembles the following. *Output*:

```
{
 "NodeAssociationStatus": "IN_PROGRESS"
```

```
}
```

#### More Information

For more information, see DescribeNodeAssociationStatus in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see DescribeNodeAssociationStatus in *AWS CLI Command Reference*.

### `describe-servers`

The following code example shows how to use `describe-servers`.

#### AWS CLI

##### To describe servers

The following `describe-servers` command returns information about all servers that are associated with your account, and in your default region.:

```
aws opsworks-cm describe-servers
```

The output for each server entry returned by the command resembles the following. *Output*:

```
{
 "Servers": [
    {
       "BackupRetentionCount": 8,
       "CreatedAt": 2016-07-29T13:38:47.520Z,
       "DisableAutomatedBackup": FALSE,
       "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
       "Engine": "Chef",
       "EngineAttributes": [
          {
             "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",
             "Value": "1Password1"
          }
       ],
       "EngineModel": "Single",
       "EngineVersion": "12",
       "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/
automate-06-1010V4UU2WRM2",
```

```
        "InstanceType": "m4.large",
        "KeyPair": "",
        "MaintenanceStatus": "SUCCESS",
        "PreferredBackupWindow": "03:00",
        "PreferredMaintenanceWindow": "Mon:09:00",
        "SecurityGroupIds": [ "sg-1a24c270" ],
        "ServerArn": "arn:aws:iam::1019881987024:instance/automate-06-1010V4UU2WRM2",
        "ServerName": "automate-06",
        "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-
role.1114810729735",
        "Status": "HEALTHY",
        "StatusReason": "",
        "SubnetIds": [ "subnet-49436a18" ]
    }
 ]
}
```

#### More Information

For more information, see DescribeServers in the *AWS OpsWorks for Chef Automate API Guide*.

- For API details, see DescribeServers in *AWS CLI Command Reference*.

### `disassociate-node`

The following code example shows how to use `disassociate-node`.

#### AWS CLI

##### To disassociate nodes

The following `disassociate-node` command disassociates a node named `i-44de882p`, removing the node from management by a Chef Automate server named `automate-06`. Valid node names are EC2 instance IDs.:

```
aws opsworks-cm disassociate-node --server-name "automate-06" --node-name
 "i-43de882p" --engine-attributes "Name=CHEF_ORGANIZATION,Value='MyOrganization'
 Name=CHEF_NODE_PUBLIC_KEY,Value='Public_key_contents'"
```

The output returned by the command resembles the following. *Output*:

```
{
```

```
 "NodeAssociationStatusToken": "AHUY8wFe4pdXtZC5DiJa5SOLp5o14DH//
rHRqHDWXxwVoNBxcEy4V7R0NOFymh7E/1HumOBPsemPQFE6dcGaiFk"
}
```

**More Information**

For more information, see Delete an AWS OpsWorks for Chef Automate Server in the *AWS OpsWorks User Guide*.

- For API details, see DisassociateNode in *AWS CLI Command Reference*.

### `restore-server`

The following code example shows how to use `restore-server`.

**AWS CLI**

**To restore a server**

The following `restore-server` command performs an in-place restoration of a Chef Automate server named `automate-06` in your default region from a backup with an ID of `automate-06-2016-11-22T16:13:27.998Z`. Restoring a server restores connections to the nodes that the Chef Automate server was managing at the time that the specified backup was performed.

aws opsworks-cm restore-server --backup-id "automate-06-2016-11-22T16:13:27.998Z" --server-name "automate-06"

The output is the command ID only. *Output*:

```
(None)
```

**More Information**

For more information, see Restore a Failed AWS OpsWorks for Chef Automate Server in the *AWS OpsWorks User Guide*.

- For API details, see RestoreServer in *AWS CLI Command Reference*.

### `start-maintenance`

The following code example shows how to use `start-maintenance`.

## AWS CLI

### To start maintenance

The following `start-maintenance` example manually starts maintenance on the specified Chef Automate or Puppet Enterprise server in your default region. This command is useful if an earlier, automated maintenance attempt failed, and the underlying cause of maintenance failure has been resolved.

```
aws opsworks-cm start-maintenance \
    --server-name 'automate-06'
```

Output:

```
{
    "Server": {
        "AssociatePublicIpAddress": true,
        "BackupRetentionCount": 10,

- For API details, see StartMaintenance in *AWS CLI Command Reference*.

### `update-server-engine-attributes`

The following code example shows how to use `update-server-engine-attributes`.

**AWS CLI**

**To update server engine attributes**

The following `update-server-engine-attributes` command updates the value of the `CHEF_PIVOTAL_KEY` engine attribute for a Chef Automate server named `automate-06`. It is currently not possible to change the value of other engine attributes.

```
aws opsworks-cm update-server-engine-attributes \
    --attribute-name CHEF_PIVOTAL_KEY \
    --attribute-value "new key value" \
    --server-name "automate-06"
```

The output shows you information similar to the following about the updated server.

```
{
    "Server": {
        "BackupRetentionCount": 2,
        "CreatedAt": 2016-07-29T13:38:47.520Z,
        "DisableAutomatedBackup": FALSE,
        "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
        "Engine": "Chef",
        "EngineAttributes": [
            {
                "Name": "CHEF_PIVOTAL_KEY",
                "Value": "new key value"
```

```
            }
        ],
        "EngineModel": "Single",
        "EngineVersion": "12",
        "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/
automate-06-1010V4UU2WRM2",
        "InstanceType": "m4.large",
        "KeyPair": "",
        "MaintenanceStatus": "SUCCESS",
        "PreferredBackupWindow": "Mon:09:15",
        "PreferredMaintenanceWindow": "03:00",
        "SecurityGroupIds": [ "sg-1a24c270" ],
        "ServerArn": "arn:aws:iam::1019881987024:instance/
automate-06-1010V4UU2WRM2",
        "ServerName": "automate-06",
        "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-
role.1114810729735",
        "Status": "HEALTHY",
        "StatusReason": "",
        "SubnetIds": [ "subnet-49436a18" ]
    }
}
```

For more information, see UpdateServerEngineAttributes in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see UpdateServerEngineAttributes in *AWS CLI Command Reference*.

### `update-server`

The following code example shows how to use `update-server`.

#### AWS CLI

**To update a server**

The following `update-server` command updates the maintenance start time of the specified Chef Automate server in your default region. The `--preferred-maintenance-window` parameter is added to change the start day and time of server maintenance to Mondays at 9:15 a.m. UTC.:

```
aws opsworks-cm update-server \
```

```
    --server-name "automate-06" \
    --preferred-maintenance-window "Mon:09:15"
```

The output shows you information similar to the following about the updated server.

```
{
    "Server": {
        "BackupRetentionCount": 8,
        "CreatedAt": 2016-07-29T13:38:47.520Z,
        "DisableAutomatedBackup": TRUE,
        "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
        "Engine": "Chef",
        "EngineAttributes": [
            {
                "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",
                "Value": "1Password1"
            }
        ],
        "EngineModel": "Single",
        "EngineVersion": "12",
        "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/
automate-06-1010V4UU2WRM2",
        "InstanceType": "m4.large",
        "KeyPair": "",
        "MaintenanceStatus": "OK",
        "PreferredBackupWindow": "Mon:09:15",
        "PreferredMaintenanceWindow": "03:00",
        "SecurityGroupIds": [ "sg-1a24c270" ],
        "ServerArn": "arn:aws:iam::1019881987024:instance/
automate-06-1010V4UU2WRM2",
        "ServerName": "automate-06",
        "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-
role.1114810729735",
        "Status": "HEALTHY",
        "StatusReason": "",
        "SubnetIds": [ "subnet-49436a18" ]
    }
}
```

For more information, see UpdateServer in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see UpdateServer in *AWS CLI Command Reference*.

# Organizations examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Organizations.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `accept-handshake`

The following code example shows how to use `accept-handshake`.

**AWS CLI**

**To accept a handshake from another account**

Bill, the owner of an organization, has previously invited Juan's account to join his organization. The following example shows Juan's account accepting the handshake and thus agreeing to the invitation.

```
aws organizations accept-handshake --handshake-id h-examplehandshakeid111
```

The output shows the following:

```
{
        "Handshake": {
                "Action": "INVITE",
```

```
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
                "RequestedTimestamp": 1481656459.257,
                "ExpirationTimestamp": 1482952459.257,
                "Id": "h-examplehandshakeid111",
                "Parties": [
                        {
                                "Id": "o-exampleorgid",
                                "Type": "ORGANIZATION"
                        },
                        {
                                "Id": "juan@example.com",
                                "Type": "EMAIL"
                        }
                ],
                "Resources": [
                        {
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@amazon.com"
                                        },
                                        {
                                                "Type": "MASTER_NAME",
                                                "Value": "Org Master Account"
                                        },
                                        {
                                                "Type": "ORGANIZATION_FEATURE_SET",
                                                "Value": "ALL"
                                        }
                                ],
                                "Type": "ORGANIZATION",
                                "Value": "o-exampleorgid"
                        },
                        {
                                "Type": "EMAIL",
                                "Value": "juan@example.com"
                        }
                ],
                "State": "ACCEPTED"
        }
}
```

- For API details, see AcceptHandshake in *AWS CLI Command Reference*.

### `attach-policy`

The following code example shows how to use `attach-policy`.

**AWS CLI**

**To attach a policy to a root, OU, or account**

**Example 1**

The following example shows how to attach a service control policy (SCP) to an OU:

```
aws organizations attach-policy
                --policy-id p-examplepolicyid111
                --target-id ou-examplerootid111-exampleouid111
```

**Example 2**

The following example shows how to attach a service control policy directly to an account:

```
aws organizations attach-policy
                --policy-id p-examplepolicyid111
                --target-id 333333333333
```

- For API details, see AttachPolicy in *AWS CLI Command Reference*.

### `cancel-handshake`

The following code example shows how to use `cancel-handshake`.

**AWS CLI**

**To cancel a handshake sent from another account**

Bill previously sent an invitation to Susan's account to join his organization. He changes his mind and decides to cancel the invitation before Susan accepts it. The following example shows Bill's cancellation:

```
aws organizations cancel-handshake --handshake-id h-examplehandshakeid111
```

The output includes a handshake object that shows that the state is now CANCELED:

```
{
        "Handshake": {
                "Id": "h-examplehandshakeid111",
                "State":"CANCELED",
                "Action": "INVITE",
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
                "Parties": [
                        {
                                "Id": "o-exampleorgid",
                                "Type": "ORGANIZATION"
                        },
                        {
                                "Id": "susan@example.com",
                                "Type": "EMAIL"
                        }
                ],
                "Resources": [
                        {
                                "Type": "ORGANIZATION",
                                "Value": "o-exampleorgid",
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@example.com"
                                        },
                                        {
                                                "Type": "MASTER_NAME",
                                                "Value": "Master Account"
                                        },
                                        {
                                                "Type": "ORGANIZATION_FEATURE_SET",
                                                "Value": "CONSOLIDATED_BILLING"
                                        }
                                ]
                        },
                        {
                                "Type": "EMAIL",
                                "Value": "anika@example.com"
                        },
                        {
                                "Type": "NOTES",
```

```
                                "Value": "This is a request for Susan's account to
 join Bob's organization."
                        }
                ],
                "RequestedTimestamp": 1.47008383521E9,
                "ExpirationTimestamp": 1.47137983521E9
        }
}
```

- For API details, see CancelHandshake in *AWS CLI Command Reference*.

### `create-account`

The following code example shows how to use `create-account`.

**AWS CLI**

**To create a member account that is automatically part of the organization**

The following example shows how to create a member account in an organization. The member account is configured with the name Production Account and the email address of susan@example.com. Organizations automatically creates an IAM role using the default name of OrganizationAccountAccessRole because the roleName parameter is not specified. Also, the setting that allows IAM users or roles with sufficient permissions to access account billing data is set to the default value of ALLOW because the IamUserAccessToBilling parameter is not specified. Organizations automatically sends Susan a "Welcome to AWS" email:

```
aws organizations create-account --email susan@example.com --account-name
 "Production Account"
```

The output includes a request object that shows that the status is now `IN_PROGRESS`:

```
{
        "CreateAccountStatus": {
                "State": "IN_PROGRESS",
                "Id": "car-examplecreateaccountrequestid111"
        }
}
```

You can later query the current status of the request by providing the Id response value to the describe-create-account-status command as the value for the create-account-request-id parameter.

For more information, see Creating an AWS Account in Your Organization in the *AWS Organizations Users Guide*.

- For API details, see CreateAccount in *AWS CLI Command Reference*.

### `create-organization`

The following code example shows how to use `create-organization`.

**AWS CLI**

**Example 1: To create a new organization**

Bill wants to create an organization using credentials from account 111111111111. The following example shows that the account becomes the master account in the new organization. Because he does not specify a features set, the new organization defaults to all features enabled and service control policies are enabled on the root.

```
aws organizations create-organization
```

The output includes an organization object with details about the new organization:

```
{
        "Organization": {
                "AvailablePolicyTypes": [
                        {
                                "Status": "ENABLED",
                                "Type": "SERVICE_CONTROL_POLICY"
                        }
                ],
                "MasterAccountId": "111111111111",
                "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/111111111111",
                "MasterAccountEmail": "bill@example.com",
                "FeatureSet": "ALL",
                "Id": "o-exampleorgid",
                "Arn": "arn:aws:organizations::111111111111:organization/o-
exampleorgid"
```

```
        }
}
```

**Example 2: To create a new organization with only consolidated billing features enabled**

The following example creates an organization that supports only the consolidated billing features:

```
aws organizations create-organization --feature-set CONSOLIDATED_BILLING
```

The output includes an organization object with details about the new organization:

```
{
        "Organization": {
                "Arn": "arn:aws:organizations::111111111111:organization/o-
exampleorgid",
                "AvailablePolicyTypes": [],
                "Id": "o-exampleorgid",
                "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/111111111111",
                "MasterAccountEmail": "bill@example.com",
                "MasterAccountId": "111111111111",
                "FeatureSet": "CONSOLIDATED_BILLING"
        }
}
```

For more information, see Creating an Organization in the *AWS Organizations Users Guide*.

- For API details, see CreateOrganization in *AWS CLI Command Reference*.

## `create-organizational-unit`

The following code example shows how to use `create-organizational-unit`.

### AWS CLI

**To create an OU in a root or parent OU**

The following example shows how to create an OU that is named AccountingOU:

```
aws organizations create-organizational-unit --parent-id r-examplerootid111 --name
 AccountingOU
```

The output includes an organizationalUnit object with details about the new OU:

```
{
        "OrganizationalUnit": {
                "Id": "ou-examplerootid111-exampleouid111",
                "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111",
                "Name": "AccountingOU"
        }
}
```

- For API details, see CreateOrganizationalUnit in *AWS CLI Command Reference*.

### `create-policy`

The following code example shows how to use `create-policy`.

#### AWS CLI

**Example 1: To create a policy with a text source file for the JSON policy**

The following example shows you how to create an service control policy (SCP) named `AllowAllS3Actions`. The policy contents are taken from a file on the local computer called `policy.json`.

```
aws organizations create-policy --content file://policy.json --name
 AllowAllS3Actions, --type SERVICE_CONTROL_POLICY --description "Allows delegation
 of all S3 actions"
```

The output includes a policy object with details about the new policy:

```
{
        "Policy": {
                "Content": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":
\"Allow\",\"Action\":[\"s3:*\"],\"Resource\":[\"*\"]}]}",
                "PolicySummary": {
                        "Arn": "arn:aws:organizations::o-exampleorgid:policy/
service_control_policy/p-examplepolicyid111",
                        "Description": "Allows delegation of all S3 actions",
                        "Name": "AllowAllS3Actions",
                        "Type":"SERVICE_CONTROL_POLICY"
```

```
                }
        }
}
```

**Example 2: To create a policy with a JSON policy as a parameter**

The following example shows you how to create the same SCP, this time by embedding the policy contents as a JSON string in the parameter. The string must be escaped with backslashes before the double quotes to ensure that they are treated as literals in the parameter, which itself is surrounded by double quotes:

```
aws organizations create-policy --content "{\"Version\":\"2012-10-17\",\"Statement
\":[{\"Effect\":\"Allow\",\"Action\":[\"s3:*\"],\"Resource\":[\"*\"]}]}" --name
 AllowAllS3Actions --type SERVICE_CONTROL_POLICY --description "Allows delegation of
 all S3 actions"
```

For more information about creating and using policies in your organization, see Managing Organization Policies in the *AWS Organizations User Guide*.

- For API details, see [CreatePolicy](#) in *AWS CLI Command Reference*.

### `decline-handshake`

The following code example shows how to use `decline-handshake`.

**AWS CLI**

**To decline a handshake sent from another account**

The following example shows that Susan, an admin who is the owner of account 222222222222, declines an invitation to join Bill's organization. The DeclineHandshake operation returns a handshake object, showing that the state is now DECLINED:

```
aws organizations decline-handshake --handshake-id h-examplehandshakeid111
```

The output includes a handshake object that shows the new state of `DECLINED`:

```
{
        "Handshake": {
                "Id": "h-examplehandshakeid111",
                "State": "DECLINED",
```

```
                "Resources": [
                        {
                                "Type": "ORGANIZATION",
                                "Value": "o-exampleorgid",
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@example.com"
                                        },
                                        {
                                                "Type": "MASTER_NAME",
                                                "Value": "Master Account"
                                        }
                                ]
                        },
                        {
                                "Type": "EMAIL",
                                "Value": "susan@example.com"
                        },
                        {
                                "Type": "NOTES",
                                "Value": "This is an invitation to Susan's account
 to join the Bill's organization."
                        }
                ],
                "Parties": [
                        {
                                "Type": "EMAIL",
                                "Id": "susan@example.com"
                        },
                        {
                                "Type": "ORGANIZATION",
                                "Id": "o-exampleorgid"
                        }
                ],
                "Action": "INVITE",
                "RequestedTimestamp": 1470684478.687,
                "ExpirationTimestamp": 1471980478.687,
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111"
        }
}
```

- For API details, see DeclineHandshake in *AWS CLI Command Reference*.

### `delete-organization`

The following code example shows how to use `delete-organization`.

**AWS CLI**

**To delete an organization**

The following example shows how to delete an organization. To perform this operation, you must be an admin of the master account in the organization. The example assumes that you previously removed all the member accounts, OUs, and policies from the organization:

```
aws organizations delete-organization
```

- For API details, see DeleteOrganization in *AWS CLI Command Reference*.

### `delete-organizational-unit`

The following code example shows how to use `delete-organizational-unit`.

**AWS CLI**

**To delete an OU**

The following example shows how to delete an OU. The example assumes that you previously removed all accounts and other OUs from the OU:

```
aws organizations delete-organizational-unit --organizational-unit-id ou-
examplerootid111-exampleouid111
```

- For API details, see DeleteOrganizationalUnit in *AWS CLI Command Reference*.

### `delete-policy`

The following code example shows how to use `delete-policy`.

**AWS CLI**

**To delete a policy**

The following example shows how to delete a policy from an organization. The example assumes that you previously detached the policy from all entities:

```
aws organizations delete-policy --policy-id p-examplepolicyid111
```

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

### `describe-account`

The following code example shows how to use `describe-account`.

**AWS CLI**

**To get the details about an account**

The following example shows you how to request details about an account:

```
aws organizations describe-account --account-id 555555555555
```

The output shows an account object with the details about the account:

```
{
        "Account": {
                "Id": "555555555555",
                "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/555555555555",
                "Name": "Beta account",
                "Email": "anika@example.com",
                "JoinedMethod": "INVITED",
                "JoinedTimeStamp": 1481756563.134,
                "Status": "ACTIVE"
        }
}
```

- For API details, see DescribeAccount in *AWS CLI Command Reference*.

### `describe-create-account-status`

The following code example shows how to use `describe-create-account-status`.

**AWS CLI**

**To get the latest status about a request to create an account**

The following example shows how to request the latest status for a previous request to create an account in an organization. The specified --request-id comes from the response of the original call to create-account. The account creation request shows by the status field that Organizations successfully completed the creation of the account.

Command:

```
aws organizations describe-create-account-status --create-account-request-id car-
examplecreateaccountrequestid111
```

Output:

```
{
  "CreateAccountStatus": {
    "State": "SUCCEEDED",
    "AccountId": "555555555555",
    "AccountName": "Beta account",
    "RequestedTimestamp": 1470684478.687,
    "CompletedTimestamp": 1470684532.472,
    "Id": "car-examplecreateaccountrequestid111"
  }
}
```

- For API details, see DescribeCreateAccountStatus in *AWS CLI Command Reference*.

### `describe-handshake`

The following code example shows how to use `describe-handshake`.

**AWS CLI**

**To get information about a handshake**

The following example shows you how to request details about a handshake. The handshake ID comes either from the original call to `InviteAccountToOrganization`, or from a call to `ListHandshakesForAccount` or `ListHandshakesForOrganization`:

```
aws organizations describe-handshake --handshake-id h-examplehandshakeid111
```

The output includes a handshake object that has all the details about the requested handshake:

```
{
        "Handshake": {
                "Id": "h-examplehandshakeid111",
                "State": "OPEN",
                "Resources": [
                        {
                                "Type": "ORGANIZATION",
                                "Value": "o-exampleorgid",
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@example.com"
                                        },
                                        {
                                                "Type": "MASTER_NAME",
                                                "Value": "Master Account"
                                        }
                                ]
                        },
                        {
                                "Type": "EMAIL",
                                "Value": "anika@example.com"
                        }
                ],
                "Parties": [
                        {
                                "Type": "ORGANIZATION",
                                "Id": "o-exampleorgid"
                        },
                        {
                                "Type": "EMAIL",
                                "Id": "anika@example.com"
                        }
                ],
                "Action": "INVITE",
                "RequestedTimestamp": 1470158698.046,
                "ExpirationTimestamp": 1471454698.046,
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111"
```

```
        }
}
```

- For API details, see DescribeHandshake in *AWS CLI Command Reference*.

### `describe-organization`

The following code example shows how to use `describe-organization`.

**AWS CLI**

**To get information about the current organization**

The following example shows you how to request details about an organization:

```
aws organizations describe-organization
```

The output includes an organization object that has the details about the organization:

```
{
        "Organization": {
                "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/111111111111",
                "MasterAccountEmail": "bill@example.com",
                "MasterAccountId": "111111111111",
                "Id": "o-exampleorgid",
                "FeatureSet": "ALL",
                "Arn": "arn:aws:organizations::111111111111:organization/o-
exampleorgid",
                "AvailablePolicyTypes": [
                        {
                                "Status": "ENABLED",
                                "Type": "SERVICE_CONTROL_POLICY"
                        }
                ]
        }
}
```

- For API details, see DescribeOrganization in *AWS CLI Command Reference*.

### `describe-organizational-unit`

The following code example shows how to use `describe-organizational-unit`.

#### AWS CLI

**To get information about an OU**

The following `describe-organizational-unit` example requests details about an OU.

```
aws organizations describe-organizational-unit \
    --organizational-unit-id ou-examplerootid111-exampleouid111
```

Output:

```
{
    "OrganizationalUnit": {
        "Name": "Accounting Group",
        "Arn": "arn:aws:organizations::123456789012:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111",
        "Id": "ou-examplerootid111-exampleouid111"
    }
}
```

- For API details, see DescribeOrganizationalUnit in *AWS CLI Command Reference*.

### `describe-policy`

The following code example shows how to use `describe-policy`.

#### AWS CLI

**To get information about a policy**

The following example shows how to request information about a policy:

```
aws organizations describe-policy --policy-id p-examplepolicyid111
```

The output includes a policy object that contains details about the policy:

```
{
        "Policy": {
```

```
                "Content": "{\n  \"Version\": \"2012-10-17\",\n  \"Statement\": [\n
    {\n      \"Effect\": \"Allow\",\n      \"Action\": \"*\",\n      \"Resource\":
 \"*\"\n    }\n  ]\n}",
                "PolicySummary": {
                        "Arn": "arn:aws:organizations::111111111111:policy/o-
exampleorgid/service_control_policy/p-examplepolicyid111",
                        "Type": "SERVICE_CONTROL_POLICY",
                        "Id": "p-examplepolicyid111",
                        "AwsManaged": false,
                        "Name": "AllowAllS3Actions",
                        "Description": "Enables admins to delegate S3 permissions"
                }
        }
}
```

- For API details, see DescribePolicy in *AWS CLI Command Reference*.

### `detach-policy`

The following code example shows how to use `detach-policy`.

#### AWS CLI

**To detach a policy from a root, OU, or account**

The following example shows how to detach a policy from an OU:

```
aws organizations  detach-policy  --target-id ou-examplerootid111-exampleouid111 --
policy-id p-examplepolicyid111
```

- For API details, see DetachPolicy in *AWS CLI Command Reference*.

### `disable-policy-type`

The following code example shows how to use `disable-policy-type`.

#### AWS CLI

**To disable a policy type in a root**

The following example shows how to disable the service control policy (SCP) policy type in a root:

```
aws organizations disable-policy-type --root-id r-examplerootid111 --policy-type
 SERVICE_CONTROL_POLICY
```

The output shows that the PolicyTypes response element no longer includes SERVICE_CONTROL_POLICY:

```
{
        "Root": {
                "PolicyTypes": [],
                "Name": "Root",
                "Id": "r-examplerootid111",
                "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-
examplerootid111"
        }
}
```

- For API details, see DisablePolicyType in *AWS CLI Command Reference*.

### `enable-all-features`

The following code example shows how to use `enable-all-features`.

#### AWS CLI

**To enable all features in an organization**

This example shows the administrator asking all the invited accounts in the organization to approve enabled all features in the organization. AWS Organizations sends an email to the address that is registered with every invited member account asking the owner to approve the change to all features by accepting the handshake that is sent. After all invited member accounts accept the handshake, the organization administrator can finalize the change to all features, and those with appropriate permissions can create policies and apply them to roots, OUs, and accounts:

```
aws organizations enable-all-features
```

The output is a handshake object that is sent to all invited member accounts for approval:

```
{
        "Handshake": {
```

```
                "Action": "ENABLE_ALL_FEATURES",
                "Arn":"arn:aws:organizations::111111111111:handshake/o-exampleorgid/
enable_all_features/h-examplehandshakeid111",
                "ExpirationTimestamp":1.483127868609E9,
                "Id":"h-examplehandshakeid111",
                "Parties": [
                        {
                                "id":"o-exampleorgid",
                                "type":"ORGANIZATION"
                        }
                ],
                "requestedTimestamp":1.481831868609E9,
                "resources": [
                        {
                                "type":"ORGANIZATION",
                                "value":"o-exampleorgid"
                        }
                ],
                "state":"REQUESTED"
        }
}
```

- For API details, see EnableAllFeatures in *AWS CLI Command Reference*.

### `enable-policy-type`

The following code example shows how to use `enable-policy-type`.

#### AWS CLI

**To enable the use of a policy type in a root**

The following example shows how to enable the service control policy (SCP) policy type in a root:

```
aws organizations enable-policy-type --root-id r-examplerootid111 --policy-type
 SERVICE_CONTROL_POLICY
```

The output shows a root object with a policyTypes response element showing that SCPs are now enabled:

```
{
```

```
        "Root": {
                "PolicyTypes": [
                        {
                                "Status":"ENABLED",
                                "Type":"SERVICE_CONTROL_POLICY"
                        }
                ],
                "Id": "r-examplerootid111",
                "Name": "Root",
                "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-
examplerootid111"
        }
}
```

- For API details, see EnablePolicyType in *AWS CLI Command Reference*.

### `invite-account-to-organization`

The following code example shows how to use `invite-account-to-organization`.

**AWS CLI**

**To invite an account to join an organization**

The following example shows the master account owned by bill@example.com inviting the account owned by juan@example.com to join an organization:

```
aws organizations invite-account-to-organization --target '{"Type": "EMAIL", "Id":
 "juan@example.com"}' --notes "This is a request for Juan's account to join Bill's
 organization."
```

The output includes a handshake structure that shows what is sent to the invited account:

```
{
        "Handshake": {
                "Action": "INVITE",
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
                "ExpirationTimestamp": 1482952459.257,

                                "Value": "juan@example.com"
                        }
                ],
                "State": "OPEN"
        }
}
```

- For API details, see InviteAccountToOrganization in *AWS CLI Command Reference*.

### `leave-organization`

The following code example shows how to use `leave-organization`.

**AWS CLI**

**To leave an organization as a member account**

The following example shows the administrator of a member account requesting to leave the organization it is currently a member of:

```
aws organizations leave-organization
```

- For API details, see LeaveOrganization in *AWS CLI Command Reference*.

### `list-accounts-for-parent`

The following code example shows how to use `list-accounts-for-parent`.

**AWS CLI**

**To retrieve a list of all of the accounts in a specified parent root or OU**

The following example shows how to request a list of the accounts in an OU:

```
aws organizations list-accounts-for-parent --parent-id ou-examplerootid111-
exampleouid111
```

The output includes a list of account summary objects.

```
{
        "Accounts": [
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/333333333333",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481835795.536,
                        "Id": "333333333333",
                        "Name": "Development Account",
                        "Email": "juan@example.com",
                        "Status": "ACTIVE"
                },
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/444444444444",
                        "JoinedMethod": "INVITED",
```

```
                        "JoinedTimestamp": 1481835812.143,
                        "Id": "444444444444",
                        "Name": "Test Account",
                        "Email": "anika@example.com",
                        "Status": "ACTIVE"
                }
        ]
}
```

- For API details, see ListAccountsForParent in *AWS CLI Command Reference*.

### `list-accounts`

The following code example shows how to use `list-accounts`.

#### AWS CLI

**To retrieve a list of all of the accounts in an organization**

The following example shows you how to request a list of the accounts in an organization:

```
aws organizations list-accounts
```

The output includes a list of account summary objects.

```
{
        "Accounts": [
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/111111111111",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481830215.45,
                        "Id": "111111111111",
                        "Name": "Master Account",
                        "Email": "bill@example.com",
                        "Status": "ACTIVE"
                },
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/222222222222",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481835741.044,
                        "Id": "222222222222",
```

```
                        "Name": "Production Account",
                        "Email": "alice@example.com",
                        "Status": "ACTIVE"
                },
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/333333333333",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481835795.536,
                        "Id": "333333333333",
                        "Name": "Development Account",
                        "Email": "juan@example.com",
                        "Status": "ACTIVE"
                },
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/444444444444",
                        "JoinedMethod": "INVITED",
                        "JoinedTimestamp": 1481835812.143,
                        "Id": "444444444444",
                        "Name": "Test Account",
                        "Email": "anika@example.com",
                        "Status": "ACTIVE"
                }
        ]
}
```

- For API details, see ListAccounts in *AWS CLI Command Reference*.

### `list-children`

The following code example shows how to use `list-children`.

#### AWS CLI

**To retrieve the child accounts and OUs of a parent OU or root**

The following example you how to list the root or OU that contains that account 444444444444:

```
aws organizations list-children --child-type ORGANIZATIONAL_UNIT --parent-id ou-
examplerootid111-exampleouid111
```

The output shows the two child OUs that are contained by the parent:

```
{
        "Children": [
                {
                        "Id": "ou-examplerootid111-exampleouid111",
                        "Type":"ORGANIZATIONAL_UNIT"
                },
                {
                        "Id":"ou-examplerootid111-exampleouid222",
                        "Type":"ORGANIZATIONAL_UNIT"
                }
        ]
}
```

- For API details, see ListChildren in *AWS CLI Command Reference*.

### `list-create-account-status`

The following code example shows how to use `list-create-account-status`.

**AWS CLI**

**Example 1: To retrieve a list of the account creation requests made in the current organization**

The following example shows how to request a list of account creation requests for an organization that have completed successfully:

```
aws organizations list-create-account-status --states SUCCEEDED
```

The output includes an array of objects with information about each request.

```
{
        "CreateAccountStatuses": [
                {
                        "AccountId": "444444444444",
                        "AccountName": "Developer Test Account",
                        "CompletedTimeStamp": 1481835812.143,
                        "Id": "car-examplecreateaccountrequestid111",
                        "RequestedTimeStamp": 1481829432.531,
```

```
                        "State": "SUCCEEDED"
                }
        ]
}
```

**Example 2: To retrieve a list of the in progress account creation requests made in the current organization**

The following example gets a list of in-progress account creation requests for an organization:

```
aws organizations list-create-account-status --states IN_PROGRESS
```

The output includes an array of objects with information about each request.

```
{
        "CreateAccountStatuses": [
                {
                  "State": "IN_PROGRESS",
                  "Id": "car-examplecreateaccountrequestid111",
                  "RequestedTimeStamp": 1481829432.531,
                  "AccountName": "Production Account"
                }
        ]
}
```

- For API details, see ListCreateAccountStatus in *AWS CLI Command Reference*.

### `list-handshakes-for-account`

The following code example shows how to use `list-handshakes-for-account`.

**AWS CLI**

**To retrieve a list of the handshakes sent to an account**

The following example shows how to get a list of all handshakes that are associated with the account of the credentials that were used to call the operation:

```
aws organizations list-handshakes-for-account
```

The output includes a list of handshake structures with information about each handshake including its current state:

```
{
        "Handshake": {
                "Action": "INVITE",
                "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
                "ExpirationTimestamp": 1482952459.257,
                "Id": "h-examplehandshakeid111",
                "Parties": [
                        {
                                "Id": "o-exampleorgid",
                                "Type": "ORGANIZATION"
                        },
                        {
                                "Id": "juan@example.com",
                                "Type": "EMAIL"
                        }
                ],
                "RequestedTimestamp": 1481656459.257,
                "Resources": [
                        {
                                "Resources": [
                                        {
                                                "Type": "MASTER_EMAIL",
                                                "Value": "bill@amazon.com"
                                        },
                                        {
                                                "Type": "MASTER_NAME",
                                                "Value": "Org Master Account"
                                        },
                                        {
                                                "Type": "ORGANIZATION_FEATURE_SET",
                                                "Value": "FULL"
                                        }
                                ],
                                "Type": "ORGANIZATION",
                                "Value": "o-exampleorgid"
                        },
                        {
                                "Type": "EMAIL",
                                "Value": "juan@example.com"
```

```
                        }
                ],
                "State": "OPEN"
        }
}
```

- For API details, see ListHandshakesForAccount in *AWS CLI Command Reference*.

### `list-handshakes-for-organization`

The following code example shows how to use `list-handshakes-for-organization`.

**AWS CLI**

**To retrieve a list of the handshakes associated with an organization**

The following example shows how to get a list of handshakes that are associated with the current organization:

```
aws organizations list-handshakes-for-organization
```

The output shows two handshakes. The first one is an invitation to Juan's account and shows a state of OPEN. The second is an invitation to Anika's account and shows a state of ACCEPTED:

```
{
        "Handshakes": [
                {
                        "Action": "INVITE",
                        "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
                        "ExpirationTimestamp": 1482952459.257,
                        "Id": "h-examplehandshakeid111",
                        "Parties": [
                                {
                                        "Id": "o-exampleorgid",
                                        "Type": "ORGANIZATION"
                                },
                                {
                                        "Id": "juan@example.com",
                                        "Type": "EMAIL"
                                }
                        ],
```

```
                        "RequestedTimestamp": 1481656459.257,
                        "Resources": [
                                {
                                        "Resources": [
                                                {
                                                        "Type": "MASTER_EMAIL",
                                                        "Value": "bill@amazon.com"
                                                },
                                                {
                                                        "Type": "MASTER_NAME",
                                                        "Value": "Org Master
 Account"
                                                },
                                                {
                                                        "Type":
 "ORGANIZATION_FEATURE_SET",
                                                        "Value": "FULL"
                                                }
                                        ],
                                        "Type": "ORGANIZATION",
                                        "Value": "o-exampleorgid"
                                },
                                {
                                        "Type": "EMAIL",
                                        "Value": "juan@example.com"
                                },
                                {
                                        "Type":"NOTES",
                                        "Value":"This is an invitation to Juan's
 account to join Bill's organization."
                                }
                        ],

                                                        "Value":"Master Account"
                                                }
                                        ],
                                        "Type":"ORGANIZATION",
                                        "Value":"o-exampleorgid"
                                },
                                {
                                        "Type":"EMAIL",
                                        "Value":"anika@example.com"
                                },
                                {
                                        "Type":"NOTES",
                                        "Value":"This is an invitation to Anika's
 account to join Bill's organization."
                                }
                        ]
                }
        ]
}
```

- For API details, see ListHandshakesForOrganization in *AWS CLI Command Reference*.

### `list-organizational-units-for-parent`

The following code example shows how to use `list-organizational-units-for-parent`.

**AWS CLI**

**To retrieve a list of the OUs in a parent OU or root**

The following example shows you how to get a list of OUs in a specified root:

```
aws organizations list-organizational-units-for-parent --parent-id r-
examplerootid111
```

The output shows that the specified root contains two OUs and shows details of each:

```
{
        "OrganizationalUnits": [
                {
                        "Name": "AccountingDepartment",
                        "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-
examplerootid111/ou-examplerootid111-exampleouid111"
                },
                {
                        "Name": "ProductionDepartment",
                        "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-
examplerootid111/ou-examplerootid111-exampleouid222"
                }
        ]
}
```

- For API details, see ListOrganizationalUnitsForParent in *AWS CLI Command Reference*.

## `list-parents`

The following code example shows how to use `list-parents`.

**AWS CLI**

**To list the parent OUs or roots for an account or child OU**

The following example you how to list the root or parent OU that contains that account 444444444444:

```
aws organizations list-parents --child-id 444444444444
```

The output shows that the specified account is in the OU with specified ID:

```
{
  "Parents": [
        {
          "Id": "ou-examplerootid111-exampleouid111",
          "Type": "ORGANIZATIONAL_UNIT"
        }
  ]
}
```

- For API details, see ListParents in *AWS CLI Command Reference*.

### `list-policies-for-target`

The following code example shows how to use `list-policies-for-target`.

#### AWS CLI

**To retrieve a list of the SCPs attached directly to an account**

The following example shows how to get a list of all service control policies (SCPs), as specified by the Filter parameter, that are directly attached to an account:

```
aws organizations list-policies-for-target --filter SERVICE_CONTROL_POLICY --target-
id 444444444444
```

The output includes a list of policy structures with summary information about the policies. The list does not include policies that apply to the account because of inheritance from its location in an OU hierarchy:

```
{
        "Policies": [
                {
                        "Type": "SERVICE_CONTROL_POLICY",
                        "Name": "AllowAllEC2Actions",
                        "AwsManaged", false,
                        "Id": "p-examplepolicyid222",
                        "Arn": "arn:aws:organizations::o-exampleorgid:policy/
service_control_policy/p-examplepolicyid222",
                        "Description": "Enables account admins to delegate
 permissions for any EC2 actions to users and roles in their accounts."
                }
```

```
        ]
}
```

- For API details, see ListPoliciesForTarget in *AWS CLI Command Reference*.

### `list-policies`

The following code example shows how to use `list-policies`.

#### AWS CLI

**To retrieve a list of all policies in an organization of a certain type**

The following example shows you how to get a list of SCPs, as specified by the filter parameter:

```
aws organizations list-policies --filter SERVICE_CONTROL_POLICY
```

The output includes a list of policies with summary information:

```
{
        "Policies": [
                {
                        "Type": "SERVICE_CONTROL_POLICY",
                        "Name": "AllowAllS3Actions",
                        "AwsManaged": false,
                        "Id": "p-examplepolicyid111",
                        "Arn": "arn:aws:organizations::111111111111:policy/
service_control_policy/p-examplepolicyid111",
                        "Description": "Enables account admins to delegate
 permissions for any S3 actions to users and roles in their accounts."
                },
                {
                        "Type": "SERVICE_CONTROL_POLICY",
                        "Name": "AllowAllEC2Actions",
                        "AwsManaged": false,
                        "Id": "p-examplepolicyid222",
                        "Arn": "arn:aws:organizations::111111111111:policy/
service_control_policy/p-examplepolicyid222",
                        "Description": "Enables account admins to delegate
 permissions for any EC2 actions to users and roles in their accounts."
                },
                {
```

```
                        "AwsManaged": true,
                        "Description": "Allows access to every operation",
                        "Type": "SERVICE_CONTROL_POLICY",
                        "Id": "p-FullAWSAccess",
                        "Arn": "arn:aws:organizations::aws:policy/
service_control_policy/p-FullAWSAccess",
                        "Name": "FullAWSAccess"
                }
        ]
}
```

- For API details, see ListPolicies in *AWS CLI Command Reference*.

### `list-roots`

The following code example shows how to use `list-roots`.

#### AWS CLI

**To retrieve a list of the roots in an organization**

This example shows you how to get the list of roots for an organization:

```
aws organizations list-roots
```

The output includes a list of root structures with summary information:

```
{
        "Roots": [
                {
                        "Name": "Root",
                        "Arn": "arn:aws:organizations::111111111111:root/o-
exampleorgid/r-examplerootid111",
                        "Id": "r-examplerootid111",
                        "PolicyTypes": [
                                {
                                        "Status":"ENABLED",
                                        "Type":"SERVICE_CONTROL_POLICY"
                                }
                        ]
                }
        ]
```

```
}
```

- For API details, see ListRoots in *AWS CLI Command Reference*.

### `list-targets-for-policy`

The following code example shows how to use `list-targets-for-policy`.

**AWS CLI**

**To retrieve a list of the roots, OUs, and accounts that a policy is attached to**

The following example shows how to get a list of the roots, OUs, and accounts that the specified policy is attached to:

```
aws organizations list-targets-for-policy --policy-id p-FullAWSAccess
```

The output includes a list of attachment objects with summary information about the roots, OUs, and accounts the policy is attached to:

```
{
        "Targets": [
                {
                        "Arn": "arn:aws:organizations::111111111111:root/o-
exampleorgid/r-examplerootid111",
                        "Name": "Root",
                        "TargetId":"r-examplerootid111",
                        "Type":"ROOT"
                },
                {
                        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/333333333333;",
                        "Name": "Developer Test Account",
                        "TargetId": "333333333333",
                        "Type": "ACCOUNT"
                },
                {
                        "Arn":"arn:aws:organizations::111111111111:ou/o-
exampleorgid/ou-examplerootid111-exampleouid111",
                        "Name":"Accounting",
                        "TargetId":"ou-examplerootid111-exampleouid111",
                        "Type":"ORGANIZATIONAL_UNIT"
```

```
                }
        ]
}
```

- For API details, see ListTargetsForPolicy in *AWS CLI Command Reference*.

### `move-account`

The following code example shows how to use `move-account`.

**AWS CLI**

**To move an account between roots or OUs**

The following example shows you how to move the master account in the organization from the root to an OU:

```
aws organizations move-account --account-id 333333333333 --source-parent-id r-
examplerootid111 --destination-parent-id ou-examplerootid111-exampleouid111
```

- For API details, see MoveAccount in *AWS CLI Command Reference*.

### `remove-account-from-organization`

The following code example shows how to use `remove-account-from-organization`.

**AWS CLI**

**To remove an account from an organization as the master account**

The following example shows you how to remove an account from an organization:

```
aws organizations remove-account-from-organization --account-id 333333333333
```

- For API details, see RemoveAccountFromOrganization in *AWS CLI Command Reference*.

### `update-organizational-unit`

The following code example shows how to use `update-organizational-unit`.

### AWS CLI

#### To rename an OU

This example shows you how to rename an OU: In this example, the OU is renamed "AccountingOU":

```
aws organizations update-organizational-unit --organizational-unit-id ou-
examplerootid111-exampleouid111 --name AccountingOU
```

The output shows the new name:

```
{
        "OrganizationalUnit": {
                "Id": "ou-examplerootid111-exampleouid111"
                "Name": "AccountingOU",
                "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-
examplerootid111-exampleouid111""
        }
}
```

- For API details, see UpdateOrganizationalUnit in *AWS CLI Command Reference*.

## `update-policy`

The following code example shows how to use `update-policy`.

### AWS CLI

#### Example 1: To rename a policy

The following `update-policy` example renames a policy and gives it a new description.

```
aws organizations update-policy \
    --policy-id p-examplepolicyid111 \
    --name Renamed-Policy \
    --description "This description replaces the original."
```

The output shows the new name and description.

```
{
    "Policy": {
```

```
        "Content": "{\n  \"Version\":\"2012-10-17\",\n  \"Statement\":{\n
  \"Effect\":\"Allow\",\n    \"Action\":\"ec2:*\",\n    \"Resource\":\"*\"\n
  }\n}\n",
        "PolicySummary": {
            "Id": "p-examplepolicyid111",
            "AwsManaged": false,
            "Arn":"arn:aws:organizations::111111111111:policy/o-exampleorgid/
service_control_policy/p-examplepolicyid111",
            "Description": "This description replaces the original.",
            "Name": "Renamed-Policy",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```

**Example 2: To replace a policy's JSON text content**

The following example shows you how to replace the JSON text of the SCP in the previous example with a new JSON policy text string that allows S3 instead of EC2:

```
aws organizations update-policy \
    --policy-id p-examplepolicyid111 \
    --content "{\"Version\":\"2012-10-17\",\"Statement\":{\"Effect\":\"Allow\",
\"Action\":\"s3:*\",\"Resource\":\"*\"}}"
```

The output shows the new content:

```
{
    "Policy": {
        "Content": "{ \"Version\": \"2012-10-17\", \"Statement\": { \"Effect\":
 \"Allow\", \"Action\": \"s3:*\", \"Resource\": \"*\" } }",
        "PolicySummary": {
            "Arn": "arn:aws:organizations::111111111111:policy/o-exampleorgid/
service_control_policy/p-examplepolicyid111",
            "AwsManaged": false;
            "Description": "This description replaces the original.",
            "Id": "p-examplepolicyid111",
            "Name": "Renamed-Policy",
            "Type": "SERVICE_CONTROL_POLICY"
        }
    }
}
```

- For API details, see UpdatePolicy in *AWS CLI Command Reference*.

## AWS Outposts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Outposts.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `get-outpost-instance-types`

The following code example shows how to use `get-outpost-instance-types`.

#### AWS CLI

**To get the instance types on your Outpost**

The following `get-outpost-instance-types` example gets the instance types for the specified Outpost.

```
aws outposts get-outpost-instance-types \
    --outpost-id op-0ab23c4567EXAMPLE
```

Output:

```
{
    "InstanceTypes": [
```

```
        {
            "InstanceType": "c5d.large"
        },
        {
            "InstanceType": "i3en.24xlarge"
        },
        {
            "InstanceType": "m5d.large"
        },
        {
            "InstanceType": "r5d.large"
        }
    ],
    "OutpostId": "op-0ab23c4567EXAMPLE",
    "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE"
}
```

For more information, see Launch an instance on your Outpost in the *AWS Outposts User Guide*.

- For API details, see GetOutpostInstanceTypes in *AWS CLI Command Reference*.

### `get-outpost`

The following code example shows how to use `get-outpost`.

#### AWS CLI

**To get Outpost details**

The following `get-outpost` example displays the details for the specified Outpost.

```
aws outposts get-outpost \
    --outpost-id op-0ab23c4567EXAMPLE
```

Output:

```
{
    "Outpost": {
        "OutpostId": "op-0ab23c4567EXAMPLE",
        "OwnerId": "123456789012",
        "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE",
```

```
        "SiteId": "os-0ab12c3456EXAMPLE",
        "Name": "EXAMPLE",
        "LifeCycleStatus": "ACTIVE",
        "AvailabilityZone": "us-west-2a",
        "AvailabilityZoneId": "usw2-az1",
        "Tags": {}
    }
}
```

For more information, see Working with Outposts in the *AWS Outposts User Guide*.

- For API details, see GetOutpost in *AWS CLI Command Reference*.

## `list-outposts`

The following code example shows how to use `list-outposts`.

### AWS CLI

#### To list Outposts

The following `list-outposts` example lists the Outposts in your AWS account.

```
aws outposts list-outposts
```

Output:

```
{
    "Outposts": [
        {
            "OutpostId": "op-0ab23c4567EXAMPLE",
            "OwnerId": "123456789012",
            "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE",
            "SiteId": "os-0ab12c3456EXAMPLE",
            "Name": "EXAMPLE",
            "Description": "example",
            "LifeCycleStatus": "ACTIVE",
            "AvailabilityZone": "us-west-2a",
            "AvailabilityZoneId": "usw2-az1",
            "Tags": {
                "Name": "EXAMPLE"
            }
```

```
        },
        {
            "OutpostId": "op-4fe3dc21baEXAMPLE",
            "OwnerId": "123456789012",
            "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-4fe3dc21baEXAMPLE",
            "SiteId": "os-0ab12c3456EXAMPLE",
            "Name": "EXAMPLE2",
            "LifeCycleStatus": "ACTIVE",
            "AvailabilityZone": "us-west-2a",
            "AvailabilityZoneId": "usw2-az1",
            "Tags": {}
        }
    ]
}
```

For more information, see Working with Outposts in the *AWS Outposts User Guide*.

- For API details, see ListOutposts in *AWS CLI Command Reference*.

### `list-sites`

The following code example shows how to use `list-sites`.

#### AWS CLI

**To list sites**

The following `list-sites` example lists the available Outpost sites in your AWS account.

```
aws outposts list-sites
```

Output:

```
{
    "Sites": [
        {
            "SiteId": "os-0ab12c3456EXAMPLE",
            "AccountId": "123456789012",
            "Name": "EXAMPLE",
            "Description": "example",
            "Tags": {}
        }
```

```
    ]
}
```

For more information, see Working with Outposts in the *AWS Outposts User Guide*.

- For API details, see ListSites in *AWS CLI Command Reference*.

## AWS Payment Cryptography examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `create-alias`

The following code example shows how to use `create-alias`.

#### AWS CLI

##### To create an alias for a key

The following `create-alias` example creates an alias for a key.

```
aws payment-cryptography create-alias \
    --alias-name alias/sampleAlias1 \
    --key-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h"
    }
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

### `create-key`

The following code example shows how to use `create-key`.

#### AWS CLI

**To create a key**

The following `create-key` example generates a 2KEY TDES key you can use to generate and verify CVV/CVV2 values.

```
aws payment-cryptography create-key \
    --exportable \
    --key-attributes KeyAlgorithm=TDES_2KEY,
 KeyUsage=TR31_C0_CARD_VERIFICATION_KEY,KeyClass=SYMMETRIC_KEY,
 KeyModesOfUse={Generate=true,Verify=true}
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
```

```
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": false,
                "Verify": true,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "CREATE_COMPLETE",
        "UsageStartTimestamp": "1686800690"
    }
}
```

For more information, see Generating keys in the *AWS Payment Cryptography User Guide*.

- For API details, see CreateKey in *AWS CLI Command Reference*.

### `delete-alias`

The following code example shows how to use `delete-alias`.

#### AWS CLI

**To delete an alias**

The following `delete-alias` example deletes an alias. It does not affect the key.

```
aws payment-cryptography delete-alias \
    --alias-name alias/sampleAlias1
```

This command produces no output.

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

### `delete-key`

The following code example shows how to use `delete-key`.

**AWS CLI**

**To delete a key**

The following `delete-key` example schedules a key for deletion after 7 days, which is the default waiting period.

```
aws payment-cryptography delete-key \
    --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686801198",
        "DeletePendingTimestamp": "1687405998",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": false,
                "Verify": true,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
```

```
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "DELETE_PENDING",
        "UsageStartTimestamp": "1686801190"
    }
}
```

For more information, see Deleting keys in the *AWS Payment Cryptography User Guide*.

- For API details, see DeleteKey in *AWS CLI Command Reference*.

### `export-key`

The following code example shows how to use `export-key`.

**AWS CLI**

**To export a key**

The following `export-key` example exports a key.

```
aws payment-cryptography export-key \
    --export-key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
lco3w6agsk7zgu2l \
    --key-material '{"Tr34KeyBlock": { \
        "CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-cryptography:us-
west-2:123456789012:key/ftobshq7pvioc5fx", \
        "ExportToken": "export-token-cu4lg26ofcziixny", \
        "KeyBlockFormat": "X9_TR34_2012", \
        "WrappingKeyCertificate": file://wrapping-key-certificate.pem }}'
```

Contents of `wrapping-key-certificate.pem`:

```
LS0tLS1CRUdJTiBDRVJUSUZJQ0FURS0tLS0tCk1JSUV2VENDQXFXZ0F3SUJBZ0lSQU1ZZS8xMXFUK2svVzlRUDJQOElv
```

Output:

```
{
    "WrappedKey": {
        "KeyMaterial":
 "308205A106092A864886F70D010702A08205923082058E020101310D300B0609608648016503040201308203F
        "WrappedKeyMaterialFormat": "TR34_KEY_BLOCK"
```

```
    }
}
```

For more information, see Export keys in the *AWS Payment Cryptography User Guide*.

- For API details, see ExportKey in *AWS CLI Command Reference*.

### `get-alias`

The following code example shows how to use `get-alias`.

#### AWS CLI

**To get an alias**

The following `get-alias` example returns the ARN of the key associated with the alias.

```
aws payment-cryptography get-alias \
    --alias-name alias/sampleAlias1
```

Output:

```
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h"
    }
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see GetAlias in *AWS CLI Command Reference*.

### `get-key`

The following code example shows how to use `get-key`.

#### AWS CLI

**To get the metadata of a key**

The following `get-key` example returns the metadata of the key associated with the alias. This operation does not return cryptographic material.

```
aws payment-cryptography get-key \
    --key-identifier alias/sampleAlias1
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "DeletePendingTimestamp": "1687405998",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_2KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": false,
                "DeriveKey": false,
                "Encrypt": false,
                "Generate": true,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": false,
                "Verify": true,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "F2E50F",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "DELETE_PENDING",
        "UsageStartTimestamp": "1686801190"
    }
}
```

For more information, see Get keys in the *AWS Payment Cryptography User Guide*.

- For API details, see GetKey in *AWS CLI Command Reference*.

### `get-parameters-for-export`

The following code example shows how to use `get-parameters-for-export`.

**AWS CLI**

**To initialize the export process**

The following `get-parameters-for-export` example generates a key pair, signs the key, and then returns the certificate and certificate root.

```
aws payment-cryptography get-parameters-for-export \
    --signing-key-algorithm RSA_2048 \
    --key-material-type TR34_KEY_BLOCK
```

Output:

```
{
    "ExportToken": "export-token-ep5cwyzune7oya53",
    "ParametersValidUntilTimestamp": "1687415640",
    "SigningKeyAlgorithm": "RSA_2048",
    "SigningKeyCertificate":

### `get-parameters-for-import`

The following code example shows how to use `get-parameters-for-import`.

#### AWS CLI

**To initialize the import process**

The following `get-parameters-for-import` example generates a key pair, signs the key, and then returns the certificate and certificate root.

```
aws payment-cryptography get-parameters-for-import \
    --key-material-type TR34_KEY_BLOCK \
    --wrapping-key-algorithm RSA_2048
```

Output:

```
{
    "ImportToken": "import-token-qgmafpaa7nt2kfbb",
    "ParametersValidUntilTimestamp": "1687415640",
    "WrappingKeyAlgorithm": "RSA_2048",

```

For more information, see Import keys in the *AWS Payment Cryptography User Guide*.

- For API details, see GetParametersForImport in *AWS CLI Command Reference*.

### `get-public-key-certificate`

The following code example shows how to use `get-public-key-certificate`.

#### AWS CLI

**To return the public key**

The following `get-public-key-certificate` example returns the public key portion of a key pair.

```
aws payment-cryptography get-public-key-certificate \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "KeyCertificate":
    "MIICiTCCAfICCQD6m7oRw0uXOjANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMC

```

For more information, see Get the public key/certificate associated with a key pair in the *AWS Payment Cryptography User Guide*.

- For API details, see GetPublicKeyCertificate in *AWS CLI Command Reference*.

### `import-key`

The following code example shows how to use `import-key`.

## AWS CLI

### To import a TR-34 key

The following `import-key` example imports a TR-34 key.

```
aws payment-cryptography import-key \
        --key-material='{ "Tr34KeyBlock": {" \
            CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-
cryptography:us-west-2:123456789012:key/rmm5wn2q564njnjm", \
            "ImportToken": "import-token-5ott6ho5nts7bbcg", \
            "KeyBlockFormat": "X9_TR34_2012", \
            "SigningKeyCertificate": file://signing-key-certificate.pem, \
            "WrappedKeyBlock": file://wrapped-key-block.pem }}'
```

Contents of `signing-key-certificate.pem`:

```
LS0tLS1CRUdJTiBDRVJUSUZJQ0FURS0tLS0tCk1JSUV2RENDQXFTZ0F3SUJBZ0lRYWVCK25IbE1WZU1PR1ZiNjU1Q2Jz
```

Contents of `wrapped-key-block.pem`:

```
3082059806092A864886F70D010702A0820589308205850201013110D300B06096086480165030402013082031606
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "2023-06-09T16:56:27.621000-07:00",
        "Enabled": true,

                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": false,
```

```
                "Verify": true,
                "Wrap": false
            },
            "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
        },
        "KeyCheckValue": "D9B20E",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "EXTERNAL",
        "KeyState": "CREATE_COMPLETE",
        "UsageStartTimestamp": "2023-06-09T16:56:27.621000-07:00"
    }
}
```

For more information, see Import keys in the *AWS Payment Cryptography User Guide*.

- For API details, see ImportKey in *AWS CLI Command Reference*.

## `list-aliases`

The following code example shows how to use `list-aliases`.

### AWS CLI

#### To get a list of aliases

The following `list-aliases` example shows all of the aliases in your account in this Region.

```
aws payment-cryptography list-aliases
```

Output:

```
{
    "Aliases": [
        {
            "AliasName": "alias/sampleAlias1",
            "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h"
        },
        {
            "AliasName": "alias/sampleAlias2",
            "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h"
```

```
        }
    ]
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see ListAliases in *AWS CLI Command Reference*.

### `list-keys`

The following code example shows how to use `list-keys`.

#### AWS CLI

**To get a list of keys**

The following `list-keys` example shows all of the keys in your account in this Region.

```
aws payment-cryptography list-keys
```

Output:

```
{
    "Keys": [
    {
        "CreateTimestamp": "1666506840",
        "Enabled": false,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_3KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": true,
                "DeriveKey": false,
                "Encrypt": true,
                "Generate": false,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": true,
                "Verify": false,
                "Wrap": true
```

```
            },
            "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
        },
        "KeyCheckValue": "369D",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "CREATE_COMPLETE",
        "UsageStopTimestamp": "1666938840"
    }
    ]
}
```

For more information, see List keys in the *AWS Payment Cryptography User Guide*.

- For API details, see ListKeys in *AWS CLI Command Reference*.

## `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

### AWS CLI

#### To get the list of tags for a key

The following `list-tags-for-resource` example gets the tags for a key.

```
aws payment-cryptography list-tags-for-resource \
    --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Tags": [
        {
            "Key": "BIN",
            "Value": "20151120"
        },
        {
            "Key": "Project",
            "Value": "Production"
        }
    ]
```

```
}
```

For more information, see Managing key tags with API operations in the *AWS Payment Cryptography User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `restore-key`

The following code example shows how to use `restore-key`.

**AWS CLI**

**To restore a key that is scheduled for deletion**

The following `restore-key` example cancels the deletion of a key.

```
aws payment-cryptography restore-key \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h",
        "KeyAttributes": {
            "KeyUsage": "TR31_V2_VISA_PIN_VERIFICATION_KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyAlgorithm": "TDES_3KEY",
            "KeyModesOfUse": {
                "Encrypt": false,
                "Decrypt": false,
                "Wrap": false,
                "Unwrap": false,
                "Generate": true,
                "Sign": false,
                "Verify": true,
                "DeriveKey": false,
                "NoRestrictions": false
            }
```

```
        },
        "KeyCheckValue": "",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "Enabled": false,
        "Exportable": true,
        "KeyState": "CREATE_COMPLETE",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "CreateTimestamp": "1686800690",
        "UsageStopTimestamp": "1687405998"
    }
}
```

For more information, see Deleting keys in the *AWS Payment Cryptography User Guide*.

- For API details, see RestoreKey in *AWS CLI Command Reference*.

### `start-key-usage`

The following code example shows how to use `start-key-usage`.

#### AWS CLI

**To enable a key**

The following `start-key-usage` example enables a key to be used.

```
aws payment-cryptography start-key-usage \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
        "CreateTimestamp": "1686800690",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
alsuwfxug3pgy6xh",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_3KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
```

```
                "Decrypt": true,
                "DeriveKey": false,
                "Encrypt": true,
                "Generate": false,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": true,
                "Verify": false,
                "Wrap": true
            },
            "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
        },
        "KeyCheckValue": "369D",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "CREATE_COMPLETE",
        "UsageStartTimestamp": "1686800690"
    }
}
```

For more information, see Enabling and disabling keys in the *AWS Payment Cryptography User Guide*.

- For API details, see StartKeyUsage in *AWS CLI Command Reference*.

### `stop-key-usage`

The following code example shows how to use `stop-key-usage`.

#### AWS CLI

**To disable a key**

The following `stop-key-usage` example disables a key.

```
aws payment-cryptography stop-key-usage \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h
```

Output:

```
{
    "Key": {
```

```
        "CreateTimestamp": "1686800690",
        "Enabled": true,
        "Exportable": true,
        "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
alsuwfxug3pgy6xh",
        "KeyAttributes": {
            "KeyAlgorithm": "TDES_3KEY",
            "KeyClass": "SYMMETRIC_KEY",
            "KeyModesOfUse": {
                "Decrypt": true,
                "DeriveKey": false,
                "Encrypt": true,
                "Generate": false,
                "NoRestrictions": false,
                "Sign": false,
                "Unwrap": true,
                "Verify": false,
                "Wrap": true
            },
            "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
        },
        "KeyCheckValue": "369D",
        "KeyCheckValueAlgorithm": "ANSI_X9_24",
        "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
        "KeyState": "CREATE_COMPLETE",
        "UsageStartTimestamp": "1686800690"
    }
}
```

For more information, see Enabling and disabling keys in the *AWS Payment Cryptography User Guide*.

- For API details, see StopKeyUsage in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

##### To tag a key

The following `tag-resource` example tags a key.

```
aws payment-cryptography tag-resource \
    --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
    --tags Key=sampleTag,Value=sampleValue
```

This command produces no output.

For more information, see Managing key tags in the *AWS Payment Cryptography User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To remove a tag from a key**

The following `untag-resource` example removes a tag from a key.

```
aws payment-cryptography untag-resource \
    --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
    --tag-keys sampleTag
```

This command produces no output.

For more information, see Managing key tags in the *AWS Payment Cryptography User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-alias`

The following code example shows how to use `update-alias`.

#### AWS CLI

**To update an alias**

The following `update-alias` example associates the alias with a different key.

```
aws payment-cryptography update-alias \
```

```
    --alias-name alias/sampleAlias1 \
    --key-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
tqv5yij6wtxx64pi
```

Output:

```
{
    "Alias": {
        "AliasName": "alias/sampleAlias1",
        "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
tqv5yij6wtxx64pi "
    }
}
```

For more information, see About aliases in the *AWS Payment Cryptography User Guide*.

- For API details, see UpdateAlias in *AWS CLI Command Reference*.

## AWS Payment Cryptography Data Plane examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography Data Plane.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `decrypt-data`

The following code example shows how to use `decrypt-data`.

**AWS CLI**

**To decrypt ciphertext**

The following `decrypt-data` example decrypts ciphertext data using a symmetric key. For this operation, the key must have `KeyModesOfUse` set to `Decrypt` and `KeyUsage` set to `TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY`.

```
aws payment-cryptography-data decrypt-data \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
    --cipher-text 33612AB9D6929C3A828EB6030082B2BD \
    --decryption-attributes 'Symmetric={Mode=CBC}'
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h",
    "KeyCheckValue": "71D7AE",
    "PlainText": "31323334313233343132333431323334"
}
```

For more information, see Decrypt data in the *AWS Payment Cryptography User Guide*.

- For API details, see DecryptData in *AWS CLI Command Reference*.

### `encrypt-data`

The following code example shows how to use `encrypt-data`.

**AWS CLI**

**To encrypt data**

The following `encrypt-data` example encrypts plaintext data using a symmetric key. For this operation, the key must have `KeyModesOfUse` set to `Encrypt` and `KeyUsage` set to `TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY`.

```
aws payment-cryptography-data encrypt-data \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
```

```
    --plain-text 31323334313233343132333431323334 \
    --encryption-attributes 'Symmetric={Mode=CBC}'
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h",
    "KeyCheckValue": "71D7AE",
    "CipherText": "33612AB9D6929C3A828EB6030082B2BD"
}
```

For more information, see Encrypt data in the *AWS Payment Cryptography User Guide*.

- For API details, see EncryptData in *AWS CLI Command Reference*.

### `generate-card-validation-data`

The following code example shows how to use `generate-card-validation-data`.

#### AWS CLI

**To generate a CVV**

The following `generate-card-validation-data` example generates a CVV/CVV2.

```
aws payment-cryptography-data generate-card-validation-data \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
    --primary-account-number=171234567890123 \
    --generation-attributes CardVerificationValue2={CardExpiryDate=0123}
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h",
    "KeyCheckValue": "CADDA1",
    "ValidationData": "801"
}
```

For more information, see Generate card data in the *AWS Payment Cryptography User Guide*.

- For API details, see GenerateCardValidationData in *AWS CLI Command Reference*.

### `generate-mac`

The following code example shows how to use `generate-mac`.

**AWS CLI**

**To generate a MAC**

The following `generate-card-validation-data` example generates a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key. The key must have `KeyUsage` set to `TR31_M7_HMAC_KEY` and `KeyModesOfUse` to `Generate`.

```
aws payment-cryptography-data generate-mac \
    --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h \
    --message-data
 "3b31303838343930303130373339343135 3d323430383232363030303730303033 33" \
    --generation-attributes Algorithm=HMAC_SHA256
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/
kwapwa6qaifllw2h,
    "KeyCheckValue": "2976E7",
    "Mac": "ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C"
}
```

For more information, see Generate MAC in the *AWS Payment Cryptography User Guide*.

- For API details, see GenerateMac in *AWS CLI Command Reference*.

### `generate-pin-data`

The following code example shows how to use `generate-pin-data`.

**AWS CLI**

**To generate a PIN**

The following `generate-card-validation-data` example generate a new random PIN using the Visa PIN scheme.

```
aws payment-cryptography-data generate-pin-data \
    --generation-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/37y2tsl45p5zjbh2 \
    --encryption-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/ivi5ksfsuplneuyt \
    --primary-account-number 171234567890123 \
    --pin-block-format ISO_FORMAT_0 \
    --generation-attributes VisaPin={PinVerificationKeyIndex=1}
```

Output:

```
{
    "GenerationKeyArn": "arn:aws:payment-cryptography:us-
east-2:111122223333:key/37y2tsl45p5zjbh2",
    "GenerationKeyCheckValue": "7F2363",
    "EncryptionKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
ivi5ksfsuplneuyt",
    "EncryptionKeyCheckValue": "7CC9E2",
    "EncryptedPinBlock": "AC17DC148BDA645E",
    "PinData": {
        "VerificationValue": "5507"
    }
}
```

For more information, see Generate PIN data in the *AWS Payment Cryptography User Guide*.

- For API details, see GeneratePinData in *AWS CLI Command Reference*.

## `re-encrypt-data`

The following code example shows how to use `re-encrypt-data`.

### AWS CLI

#### To re-encrypt data with a different key

The following `re-encrypt-data` example decrypts cipher text that was encrypted using an AES symmetric key and re-encrypts it using a Derived Unique Key Per Transaction (DUKPT) key.

```
aws payment-cryptography-data re-encrypt-data \
    --incoming-key-identifier arn:aws:payment-cryptography:us-
west-2:111122223333:key/hyvv7ymboitd4vfy \
    --outgoing-key-identifier arn:aws:payment-cryptography:us-
west-2:111122223333:key/jl6ythkcvzesbxen \
    --cipher-text
 4D2B0BDBA192D5AEFEAA5B3EC28E4A65383C313FFA25140101560F75FE1B99F27192A90980AB9334 \
    --incoming-encryption-attributes
 "Dukpt={Mode=ECB,KeySerialNumber=0123456789111111}" \
    --outgoing-encryption-attributes '{"Symmetric": {"Mode": "ECB"}}'
```

Output:

```
{
    "CipherText":
 "F94959DA30EEFF0C035483C6067667CF6796E3C1AD28C2B61F9CFEB772A8DD41C0D6822931E0D3B1",
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:111122223333:key/
jl6ythkcvzesbxen",
    "KeyCheckValue": "2E8CD9"
}
```

For more information, see Encrypt and decrypt data in the *AWS Payment Cryptography User Guide*.

- For API details, see ReEncryptData in *AWS CLI Command Reference*.

### `translate-pin-data`

The following code example shows how to use `translate-pin-data`.

#### AWS CLI

**To translate PIN data**

The following `translate-pin-data` example translates a PIN from PEK TDES encryption using ISO 0 PIN block to an AES ISO 4 PIN Block using the DUKPT algorithm.

```
aws payment-cryptography-data translate-pin-data \
    --encrypted-pin-block "AC17DC148BDA645E" \
    --incoming-translation-
attributes=IsoFormat0='{PrimaryAccountNumber=171234567890123}' \
```

```
    --incoming-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/ivi5ksfsuplneuyt \
    --outgoing-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/4pmyquwjs3yj4vwe \
    --outgoing-translation-attributes
 IsoFormat4="{PrimaryAccountNumber=171234567890123}" \
    --outgoing-dukpt-attributes KeySerialNumber="FFFF9876543210E00008"
```

Output:

```
{
    "PinBlock": "1F4209C670E49F83E75CC72E81B787D9",
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
ivi5ksfsuplneuyt
    "KeyCheckValue": "7CC9E2"
}
```

For more information, see Translate PIN data in the *AWS Payment Cryptography User Guide*.

- For API details, see TranslatePinData in *AWS CLI Command Reference*.

### `verify-auth-request-cryptogram`

The following code example shows how to use `verify-auth-request-cryptogram`.

#### AWS CLI

**To verify an auth request**

The following `verify-auth-request-cryptogram` example verifies an Authorization Request Cryptogram (ARQC).

```
aws payment-cryptography-data verify-auth-request-cryptogram \
    --auth-request-cryptogram F6E1BD1E6037FB3E \
    --auth-response-attributes '{"ArpcMethod1": {"AuthResponseCode": "1111"}}' \
    --key-identifier arn:aws:payment-cryptography:us-west-2:111122223333:key/
pboipdfzd4mdklya \
    --major-key-derivation-mode "EMV_OPTION_A" \
    --session-key-derivation-attributes '{"EmvCommon":
 {"ApplicationTransactionCounter": "1234","PanSequenceNumber":
 "01","PrimaryAccountNumber": "471234567890123"}}' \
    --transaction-data "123456789ABCDEF"
```

Output:

```
{
    "AuthResponseValue": "D899B8C6FBF971AA",
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:111122223333:key/
pboipdfzd4mdklya",
    "KeyCheckValue": "985792"
}
```

For more information, see Verify auth request (ARQC) cryptogram in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyAuthRequestCryptogram in *AWS CLI Command Reference*.

### `verify-card-validation-data`

The following code example shows how to use `verify-card-validation-data`.

#### AWS CLI

**To validate a CVV**

The following `verify-card-validation-data` example validates a CVV/CVV2 for a PAN.

```
aws payment-cryptography-data verify-card-validation-data \
    --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/
tqv5yij6wtxx64pi \
    --primary-account-number=171234567890123 \
    --verification-attributes CardVerificationValue2={CardExpiryDate=0123} \
    --validation-data 801
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
tqv5yij6wtxx64pi",
    "KeyCheckValue": "CADDA1"
}
```

For more information, see Verify card data in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyCardValidationData in *AWS CLI Command Reference*.

### `verify-mac`

The following code example shows how to use `verify-mac`.

#### AWS CLI

##### To verify a MAC

The following `verify-mac` example verifies a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key.

```
aws payment-cryptography-data verify-mac \
    --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/
qnobl5lghrzunce6 \
    --message-data
 "3b343038383439303031303733393431353d323430383232363030303730303033f33" \
    --verification-attributes='Algorithm=HMAC_SHA256' \
    --mac ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C
```

Output:

```
{
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
qnobl5lghrzunce6,
    "KeyCheckValue": "2976E7",
}
```

For more information, see Verify MAC in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyMac in *AWS CLI Command Reference*.

### `verify-pin-data`

The following code example shows how to use `verify-pin-data`.

#### AWS CLI

##### To verify a PIN

The following `verify-pin-data` example validates a PIN for a PAN.

```
aws payment-cryptography-data verify-pin-data \
```

```
    --verification-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/37y2tsl45p5zjbh2 \
    --encryption-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/ivi5ksfsuplneuyt \
    --primary-account-number 171234567890123 \
    --pin-block-format ISO_FORMAT_0 \
    --verification-attributes
 VisaPin="{PinVerificationKeyIndex=1,VerificationValue=5507}" \
    --encrypted-pin-block AC17DC148BDA645E
```

Output:

```
{
    "VerificationKeyArn": "arn:aws:payment-cryptography:us-
east-2:111122223333:key/37y2tsl45p5zjbh2",
    "VerificationKeyCheckValue": "7F2363",
    "EncryptionKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
ivi5ksfsuplneuyt",
    "EncryptionKeyCheckValue": "7CC9E2",
}
```

For more information, see Verify PIN data in the *AWS Payment Cryptography User Guide*.

- For API details, see VerifyPinData in *AWS CLI Command Reference*.

## Amazon Pinpoint examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Pinpoint.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

## Actions

### `create-app`

The following code example shows how to use `create-app`.

### AWS CLI

#### Example 1: To create an application

The following `create-app` example creates a new application (project).

```
aws pinpoint create-app \
    --create-application-request Name=ExampleCorp
```

Output:

```
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {}
    }
}
```

#### Example 2: To create an application that is tagged

The following `create-app` example creates a new application (project) and associates a tag (key and value) with the application.

```
aws pinpoint create-app \
    --create-application-request Name=ExampleCorp,tags={"Stack"="Test"}
```

Output:

```
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
```

```
        "Name": "ExampleCorp",
        "tags": {
            "Stack": "Test"
        }
    }
}
```

- For API details, see CreateApp in *AWS CLI Command Reference*.

### `create-sms-template`

The following code example shows how to use `create-sms-template`.

#### AWS CLI

**Creates a message template for messages that are sent through the SMS channel**

The following `create-sms-template` example creates a SMS message template.

```
aws pinpoint create-sms-template \
    --template-name TestTemplate \
    --sms-template-request file://myfile.json \
    --region us-east-1
```

Contents of `myfile.json`:

```
{
    "Body": "hello\n how are you?\n food is good",
    "TemplateDescription": "Test SMS Template"
}
```

Output:

```
{
    "CreateTemplateMessageBody": {
        "Arn": "arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:templates/
TestTemplate/SMS",
        "Message": "Created",
        "RequestID": "8c36b17f-a0b0-400f-ac21-29e9b62a975d"
    }
}
```

For more information, see Amazon Pinpoint message templates in the *Amazon Pinpoint User Guide*.

- For API details, see CreateSmsTemplate in *AWS CLI Command Reference*.

### `delete-app`

The following code example shows how to use `delete-app`.

#### AWS CLI

**To delete an application**

The following `delete-app` example deletes an application (project).

```
aws pinpoint delete-app \
    --application-id 810c7aab86d42fb2b56c8c966example
```

Output:

```
{
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {}
    }
}
```

- For API details, see DeleteApp in *AWS CLI Command Reference*.

### `get-apns-channel`

The following code example shows how to use `get-apns-channel`.

#### AWS CLI

**To retrieve information about the status and settings of the APNs channel for an application**

The following `get-apns-channel` example retrieves information about the status and settings of the APNs channel for an application.

```
aws pinpoint get-apns-channel \
    --application-id 9ab1068eb0a6461c86cce7f27ce0efd7 \
    --region us-east-1
```

Output:

```
{
    "APNSChannelResponse": {
        "ApplicationId": "9ab1068eb0a6461c86cce7f27ce0efd7",
        "CreationDate": "2019-05-09T21:54:45.082Z",
        "DefaultAuthenticationMethod": "CERTIFICATE",
        "Enabled": true,
        "HasCredential": true,
        "HasTokenKey": false,
        "Id": "apns",
        "IsArchived": false,
        "LastModifiedDate": "2019-05-09T22:04:01.067Z",
        "Platform": "APNS",
        "Version": 2
    }
}
```

- For API details, see GetApnsChannel in *AWS CLI Command Reference*.

### `get-app`

The following code example shows how to use `get-app`.

#### AWS CLI

**To retrieve information about an application (project)**

The following `get-app` example retrieves information about an application (project).

```
aws pinpoint get-app \
    --application-id 810c7aab86d42fb2b56c8c966example \
    --region us-east-1
```

Output:

```
{
```

```
    "ApplicationResponse": {
        "Arn": "arn:aws:mobiletargeting:us-
east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {
                "Year": "2019",
                "Stack": "Production"
            }
    }
}
```

- For API details, see GetApp in *AWS CLI Command Reference*.

### `get-apps`

The following code example shows how to use `get-apps`.

#### AWS CLI

**To retrieve information about all of your applications**

The following `get-apps` example retrieves information about all of your applications (projects).

```
aws pinpoint get-apps
```

Output:

```
{
    "ApplicationsResponse": {
        "Item": [
            {
                "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
                "Id": "810c7aab86d42fb2b56c8c966example",
                "Name": "ExampleCorp",
                "tags": {
                    "Year": "2019",
                    "Stack": "Production"
                }
            },
            {
```

```
                "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/42d8c7eb0990a57ba1d5476a3example",
                "Id": "42d8c7eb0990a57ba1d5476a3example",
                "Name": "AnyCompany",
                "tags": {}
            },
            {
                "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/80f5c382b638ffe5ad12376bbexample",
                "Id": "80f5c382b638ffe5ad12376bbexample",
                "Name": "ExampleCorp_Test",
                "tags": {
                    "Year": "2019",
                    "Stack": "Test"
                }
            }
        ],
        "NextToken":
 "eyJDcmVhdGlvbkRhdGUiOiIyMDE5LTA3LTE2VDE0OjM4OjUzLjkwM1oiLCJBY2NvdW50SWQiOiI1MTIzOTcxODM4Nz
    }
}
```

The presence of the `NextToken` response value indicates that there is more output available. Call the command again and supply that value as the `NextToken` input parameter.

- For API details, see GetApps in *AWS CLI Command Reference*.

### `get-campaign`

The following code example shows how to use `get-campaign`.

#### AWS CLI

**To retrieve information about the status, configuration, and other settings for a campaign**

The following `get-campaign` example retrieves information about the status, configuration, and other settings for a campaign.

```
aws pinpoint get-campaign \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --campaign-id a1e63c6cc0eb43ed826ffcc3cc90b30d \
    --region us-east-1
```

Output:

```
{
    "CampaignResponse": {
        "AdditionalTreatments": [],
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "Arn": "arn:aws:mobiletargeting:us-
east-1:AIDACKCEVSQ6C2EXAMPLE:apps/6e0b7591a90841d2b5d93fa11143e5a7/campaigns/

```

- For API details, see GetCampaign in *AWS CLI Command Reference*.

### `get-campaigns`

The following code example shows how to use `get-campaigns`.

#### AWS CLI

**To retrieves information about the status, configuration, and other settings for all the campaigns that are associated with an application**

The following `get-campaigns` example retrieves information about the status, configuration, and other settings for all the campaigns that are associated with an application.

```
aws pinpoint get-campaigns \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```
{
    "CampaignsResponse": {
        "Item": [
            {
                "AdditionalTreatments": [],
                "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
                "Arn": "arn:aws:mobiletargeting:us-

                "Version": 1
            }
        ]
    }
}
```

- For API details, see GetCampaigns in *AWS CLI Command Reference*.

### `get-channels`

The following code example shows how to use `get-channels`.

#### AWS CLI

**To retrieves information about the history and status of each channel for an application**

The following `get-channels` example retrieves information about the history and status of each channel for an application.

```
aws pinpoint get-channels \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```
{
    "ChannelsResponse": {
        "Channels": {
            "GCM": {
                "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
                "CreationDate": "2019-10-08T18:28:23.182Z",
                "Enabled": true,
                "HasCredential": true,
                "Id": "gcm",
                "IsArchived": false,
                "LastModifiedDate": "2019-10-08T18:28:23.182Z",
                "Version": 1
            },
            "SMS": {
                "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",

                "IsArchived": false,
                "LastModifiedDate": "2019-10-08T18:27:23.990Z",
                "Version": 1
            },
            "IN_APP": {
                "Enabled": true,
                "IsArchived": false,
                "Version": 0
            }
        }
    }
}
```

- For API details, see GetChannels in *AWS CLI Command Reference*.

### `get-email-channel`

The following code example shows how to use `get-email-channel`.

**AWS CLI**

**To retrieve information about the status and settings of the Email channel for an application**

The following `get-email-channel` example retrieves status and settings of the Email channel for an application.

```
aws pinpoint get-email-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```
{
    "EmailChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:27:23.990Z",
        "Enabled": true,
        "FromAddress": "sender@example.com",
        "Id": "email",
        "Identity": "arn:aws:ses:us-east-1:AIDACKCEVSQ6C2EXAMPLE:identity/
sender@example.com",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:27:23.990Z",
        "MessagesPerSecond": 1,
        "Platform": "EMAIL",
        "RoleArn": "arn:aws:iam::AIDACKCEVSQ6C2EXAMPLE:role/pinpoint-events",
        "Version": 1
    }
}
```

- For API details, see GetEmailChannel in *AWS CLI Command Reference*.

### `get-endpoint`

The following code example shows how to use `get-endpoint`.

**AWS CLI**

**To retrieve information about the settings and attributes of a specific endpoint for an application**

The following `get-endpoint` example retrieves information about the settings and attributes of a specific endpoint for an application.

```
aws pinpoint get-endpoint \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --endpoint-id testendpoint \
    --region us-east-1
```

Output:

```
{
    "EndpointResponse": {
        "Address": "+11234567890",
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "Attributes": {},
        "ChannelType": "SMS",
        "CohortId": "63",
        "CreationDate": "2019-01-28T23:55:11.534Z",
        "EffectiveDate": "2021-08-06T00:04:51.763Z",
        "EndpointStatus": "ACTIVE",
        "Id": "testendpoint",
        "Location": {
            "Country": "USA"
        },
        "Metrics": {
            "SmsDelivered": 1.0
        },
        "OptOut": "ALL",
        "RequestId": "a204b1f2-7e26-48a7-9c80-b49a2143489d",
        "User": {
            "UserAttributes": {
                "Age": [
                    "24"
                ]
            },
        "UserId": "testuser"
        }
    }
```

```
}
```

- For API details, see GetEndpoint in *AWS CLI Command Reference*.

### `get-gcm-channel`

The following code example shows how to use `get-gcm-channel`.

**AWS CLI**

**To retrieve information about the status and settings of the GCM channel for an application**

The following `get-gcm-channel` example retrieves information about the status and settings of the GCM channel for an application.

```
aws pinpoint get-gcm-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```
{
    "GCMChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:28:23.182Z",
        "Enabled": true,
        "HasCredential": true,
        "Id": "gcm",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:28:23.182Z",
        "Platform": "GCM",
        "Version": 1
    }
}
```

- For API details, see GetGcmChannel in *AWS CLI Command Reference*.

### `get-sms-channel`

The following code example shows how to use `get-sms-channel`.

**AWS CLI**

**To retrieve information about the status and settings of the SMS channel for an application**

The following `get-sms-channel` example retrieves status and settings of the sms channel for an application.

```
aws pinpoint get-sms-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```
{
    "SMSChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2019-10-08T18:39:18.511Z",
        "Enabled": true,
        "Id": "sms",
        "IsArchived": false,
        "LastModifiedDate": "2019-10-08T18:39:18.511Z",
        "Platform": "SMS",
        "PromotionalMessagesPerSecond": 20,
        "TransactionalMessagesPerSecond": 20,
        "Version": 1
    }
}
```

- For API details, see GetSmsChannel in *AWS CLI Command Reference*.

### `get-sms-template`

The following code example shows how to use `get-sms-template`.

**AWS CLI**

**Retrieves the content and settings of a message template for messages that are sent through the SMS channel**

The following `get-sms-template` example retrieves the content and settings of a SMS message template.

```
aws pinpoint get-sms-template \
    --template-name TestTemplate \
    --region us-east-1
```

Output:

```
{
    "SMSTemplateResponse": {
        "Arn": "arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:templates/
TestTemplate/SMS",
        "Body": "hello\n how are you?\n food is good",
        "CreationDate": "2023-06-20T21:37:30.124Z",
        "LastModifiedDate": "2023-06-20T21:37:30.124Z",
        "tags": {},
        "TemplateDescription": "Test SMS Template",
        "TemplateName": "TestTemplate",
        "TemplateType": "SMS",
        "Version": "1"
    }
}
```

For more information, see Amazon Pinpoint message templates in the *Amazon Pinpoint User Guide*.

- For API details, see GetSmsTemplate in *AWS CLI Command Reference*.

### `get-voice-channel`

The following code example shows how to use `get-voice-channel`.

#### AWS CLI

**To retrieve information about the status and settings of the voice channel for an application**

The following `get-voice-channel` example retrieves status and settings of the voice channel for an application.

```
aws pinpoint get-voice-channel \
    --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
    --region us-east-1
```

Output:

```
{
    "VoiceChannelResponse": {
        "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
        "CreationDate": "2022-04-28T00:17:03.836Z",
        "Enabled": true,
        "Id": "voice",
        "IsArchived": false,
        "LastModifiedDate": "2022-04-28T00:17:03.836Z",
        "Platform": "VOICE",
        "Version": 1
    }
}
```

- For API details, see GetVoiceChannel in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To retrieve a list of tags for a resource**

The following `list-tags-for-resource` example retrieves all the tags (key names and values) that are associated with the specified resource.

```
aws pinpoint list-tags-for-resource \
    --resource-arn arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example
```

Output:

```
{
    "TagsModel": {
        "tags": {
            "Year": "2019",
            "Stack": "Production"
        }
    }
}
```

For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>'__ in the *Amazon Pinpoint Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `phone-number-validate`

The following code example shows how to use `phone-number-validate`.

#### AWS CLI

**Retrieves information about a phone number**

The following `phone-number-validate` retrieves information about a phone number.

```
aws pinpoint phone-number-validate \
    --number-validate-request PhoneNumber="+12065550142" \
    --region us-east-1
```

Output:

```
{
    "NumberValidateResponse": {
        "Carrier": "ExampleCorp Mobile",
        "City": "Seattle",
        "CleansedPhoneNumberE164": "+12065550142",
        "CleansedPhoneNumberNational": "2065550142",
        "Country": "United States",
        "CountryCodeIso2": "US",
        "CountryCodeNumeric": "1",
        "OriginalPhoneNumber": "+12065550142",
        "PhoneType": "MOBILE",
        "PhoneTypeCode": 0,
        "Timezone": "America/Los_Angeles",
        "ZipCode": "98101"
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see PhoneNumberValidate in *AWS CLI Command Reference*.

### `send-messages`

The following code example shows how to use `send-messages`.

**AWS CLI**

**To send SMS message using the endpoint of an application**

The following `send-messages` example sends a direct message for an application with an endpoint.

```
aws pinpoint send-messages \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --message-request file://myfile.json \
    --region us-west-2
```

Contents of `myfile.json`:

```
{
    "MessageConfiguration": {
        "SMSMessage": {
            "Body": "hello, how are you?"
        }
    },
    "Endpoints": {
        "testendpoint": {}
    }
}
```

Output:

```
{
    "MessageResponse": {
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "EndpointResult": {
            "testendpoint": {
                "Address": "+12345678900",
                "DeliveryStatus": "SUCCESSFUL",
                "MessageId": "itnuqhai5alf1n6ahv3udc05n7hhddr6gb3lq6g0",
                "StatusCode": 200,
                "StatusMessage": "MessageId:
 itnuqhai5alf1n6ahv3udc05n7hhddr6gb3lq6g0"
```

```
            }
        },
        "RequestId": "c7e23264-04b2-4a46-b800-d24923f74753"
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see SendMessages in *AWS CLI Command Reference*.

### `send-users-messages`

The following code example shows how to use `send-users-messages`.

#### AWS CLI

**To send SMS message for an user of an application**

The following `send-users-messages` example sends a direct message for an user of an application.

```
aws pinpoint send-users-messages \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --send-users-message-request file://myfile.json \
    --region us-west-2
```

Contents of `myfile.json`:

```
{
    "MessageConfiguration": {
        "SMSMessage": {
            "Body": "hello, how are you?"
        }
    },
    "Users": {
        "testuser": {}
    }
}
```

Output:

```
{
```

```
    "SendUsersMessageResponse": {
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "RequestId": "e0b12cf5-2359-11e9-bb0b-d5fb91876b25",
        "Result": {
            "testuser": {
                "testuserendpoint": {
                    "DeliveryStatus": "SUCCESSFUL",
                    "MessageId": "7qu4hk5bqhda3i7i2n4pjf98qcuh8b7p45ifsmo0",
                    "StatusCode": 200,
                    "StatusMessage": "MessageId:
 7qu4hk5bqhda3i7i2n4pjf98qcuh8b7p45ifsmo0",
                    "Address": "+12345678900"
                }
            }
        }
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see SendUsersMessages in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To add tags to a resource**

The following example adds two tags (key names and values) to a resource.

```
aws pinpoint list-tags-for-resource \
    --resource-arn arn:aws:mobiletargeting:us-
east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
    --tags-model tags={Stack=Production,Year=2019}
```

This command produces no output.

For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>'__ in the *Amazon Pinpoint Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**Example 1: To remove a tag from a resource**

The following `untag-resource` example removes the specified tag (key name and value) from a resource.

```
aws pinpoint untag-resource \
    --resource-arn arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
    --tag-keys Year
```

This command produces no output.

**Example 2: To remove multiple tags from a resource**

The following `untag-resource` example removes the specified tags (key names and values) from a resource.

```
aws pinpoint untag-resource \
    --resource-arn arn:aws:mobiletargeting:us-
east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
    --tag-keys Year Stack
```

This command produces no output.

For more information, see 'Tagging Amazon Pinpoint Resources <https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>'__ in the *Amazon Pinpoint Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-sms-channel`

The following code example shows how to use `update-sms-channel`.

**AWS CLI**

**To enable SMS channel or to update the status and settings of the SMS channel for an application.**

The following `update-sms-channel` example enables SMS channel for an SMS channel for an application.

```
aws pinpoint update-sms-channel \
    --application-id 611e3e3cdd47474c9c1399a505665b91 \
    --sms-channel-request Enabled=true \
    --region us-west-2
```

Output:

```
{
    "SMSChannelResponse": {
        "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
        "CreationDate": "2019-01-28T23:25:25.224Z",
        "Enabled": true,
        "Id": "sms",
        "IsArchived": false,
        "LastModifiedDate": "2023-05-18T23:22:50.977Z",
        "Platform": "SMS",
        "PromotionalMessagesPerSecond": 20,
        "TransactionalMessagesPerSecond": 20,
        "Version": 3
    }
}
```

For more information, see Amazon Pinpoint SMS channel in the *Amazon Pinpoint User Guide*.

- For API details, see UpdateSmsChannel in *AWS CLI Command Reference*.

## Amazon Polly examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Polly.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `delete-lexicon`

The following code example shows how to use `delete-lexicon`.

**AWS CLI**

**To delete a lexicon**

The following `delete-lexicon` example deletes the specified lexicon.

```
aws polly delete-lexicon \
    --name w3c
```

This command produces no output.

For more information, see Using the DeleteLexicon operation in the *Amazon Polly Developer Guide*.

- For API details, see DeleteLexicon in *AWS CLI Command Reference*.

#### `get-lexicon`

The following code example shows how to use `get-lexicon`.

**AWS CLI**

**To retrieve the content of a lexicon**

The following `get-lexicon` example retrieves the content of the specified pronunciation lexicon.

```
aws polly get-lexicon \
    --name w3c
```

Output:

```
{
    "Lexicon": {
        "Content": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>\n<lexicon version=
\"1.0\" \n      xmlns=    \"http://www.w3.org/2005/01/pronunciation-lexicon
\"\n      xmlns:xsi=\"http://www.w3.org/2001/XMLSchema-instance\" \n
 xsi:schemaLocation=\"http://www.w3.org/2005/01/pronunciation-lexicon \n
 http://www.w3.org/TR/2007/CR-pronunciation-    lexicon-20071212/pls.xsd\"\n
   alphabet=\"ipa\" \n      xml:lang=\"en-US\">\n  <lexeme>\n    <grapheme>W3C</
grapheme>\n        <alias>World Wide Web Consortium</alias>\n  </lexeme>\n</lexicon>
\n",
        "Name": "w3c"
    },
    "LexiconAttributes": {
        "Alphabet": "ipa",
        "LanguageCode": "en-US",
        "LastModified": 1603908910.99,
        "LexiconArn": "arn:aws:polly:us-west-2:880185128111:lexicon/w3c",
        "LexemesCount": 1,
        "Size": 492
    }
}
```

For more information, see Using the GetLexicon operation in the *Amazon Polly Developer Guide*.

- For API details, see GetLexicon in *AWS CLI Command Reference*.

## `get-speech-synthesis-task`

The following code example shows how to use `get-speech-synthesis-task`.

### AWS CLI

#### To get information about a speech synthesis task

The following `get-speech-synthesis-task` example retrieves information about the specified speech synthesis task.

```
aws polly get-speech-synthesis-task \
    --task-id 70b61c0f-57ce-4715-a247-cae8729dcce9
```

Output:

```
{
    "SynthesisTask": {
        "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
        "TaskStatus": "completed",
        "OutputUri": "https://s3.us-west-2.amazonaws.com/my-s3-
bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
        "CreationTime": 1603911042.689,
        "RequestCharacters": 1311,
        "OutputFormat": "mp3",
        "TextType": "text",
        "VoiceId": "Joanna"
    }
}
```

For more information, see Creating long audio files in the *Amazon Polly Developer Guide*.

- For API details, see GetSpeechSynthesisTask in *AWS CLI Command Reference*.

### `list-lexicons`

The following code example shows how to use `list-lexicons`.

#### AWS CLI

**To list your lexicons**

The following `list-lexicons` example lists your pronunciation lexicons.

```
aws polly list-lexicons
```

Output:

```
{
    "Lexicons": [
        {
            "Name": "w3c",
```

```
            "Attributes": {
                "Alphabet": "ipa",
                "LanguageCode": "en-US",
                "LastModified": 1603908910.99,
                "LexiconArn": "arn:aws:polly:us-east-2:123456789012:lexicon/w3c",
                "LexemesCount": 1,
                "Size": 492
            }
        }
    ]
}
```

For more information, see Using the ListLexicons operation in the *Amazon Polly Developer Guide*.

- For API details, see ListLexicons in *AWS CLI Command Reference*.

### `list-speech-synthesis-tasks`

The following code example shows how to use `list-speech-synthesis-tasks`.

#### AWS CLI

**To list your speech synthesis tasks**

The following `list-speech-synthesis-tasks` example lists your speech synthesis tasks.

```
aws polly list-speech-synthesis-tasks
```

Output:

```
{
    "SynthesisTasks": [
        {
            "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
            "TaskStatus": "completed",
            "OutputUri": "https://s3.us-west-2.amazonaws.com/my-s3-
bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
            "CreationTime": 1603911042.689,
            "RequestCharacters": 1311,
            "OutputFormat": "mp3",
            "TextType": "text",
```

```
            "VoiceId": "Joanna"
        }
    ]
}
```

For more information, see Creating long audio files in the *Amazon Polly Developer Guide*.

- For API details, see ListSpeechSynthesisTasks in *AWS CLI Command Reference*.

### `put-lexicon`

The following code example shows how to use `put-lexicon`.

#### AWS CLI

**To store a lexicon**

The following `put-lexicon` example stores the specified pronunciation lexicon. The `example.pls` file specifies a W3C PLS-compliant lexicon.

```
aws polly put-lexicon \
    --name w3c \
    --content file://example.pls
```

Contents of `example.pls`

```
{
    <?xml version="1.0" encoding="UTF-8"?>
    <lexicon version="1.0"
        xmlns="http://www.w3.org/2005/01/pronunciation-lexicon"
        xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
        xsi:schemaLocation="http://www.w3.org/2005/01/pronunciation-lexicon
            http://www.w3.org/TR/2007/CR-pronunciation-lexicon-20071212/pls.xsd"
        alphabet="ipa"
        xml:lang="en-US">
        <lexeme>
            <grapheme>W3C</grapheme>
            <alias>World Wide Web Consortium</alias>
        </lexeme>
    </lexicon>
}
```

This command produces no output.

For more information, see Using the PutLexicon operation in the *Amazon Polly Developer Guide*.

- For API details, see PutLexicon in *AWS CLI Command Reference*.

### `start-speech-synthesis-task`

The following code example shows how to use `start-speech-synthesis-task`.

**AWS CLI**

**To synthesize text**

The following `start-speech-synthesis-task` example synthesizes the text in `text_file.txt` and stores the resulting MP3 file in the specified bucket.

```
aws polly start-speech-synthesis-task \
    --output-format mp3 \
    --output-s3-bucket-name my-s3-bucket \
    --text  file://text_file.txt \
    --voice-id Joanna
```

Output:

```
{
    "SynthesisTask": {
        "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
        "TaskStatus": "scheduled",
        "OutputUri": "https://s3.us-east-2.amazonaws.com/my-s3-
bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
        "CreationTime": 1603911042.689,
        "RequestCharacters": 1311,
        "OutputFormat": "mp3",
        "TextType": "text",
        "VoiceId": "Joanna"
    }
}
```

For more information, see Creating long audio files in the *Amazon Polly Developer Guide*.

- For API details, see StartSpeechSynthesisTask in *AWS CLI Command Reference*.

# AWS Price List examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Price List.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

## Topics

## Actions

### `describe-services`

The following code example shows how to use `describe-services`.

#### AWS CLI

**To retrieve service metadata**

This example retrieves the metadata for the Amazon EC2 service code.

Command:

```
aws pricing describe-services --service-code AmazonEC2 --format-version aws_v1 --
max-items 1
```

Output:

```
{
  "Services": [
      {
          "ServiceCode": "AmazonEC2",
          "AttributeNames": [
```

```
                "volumeType",
                "maxIopsvolume",
                "instance",
                "instanceCapacity10xlarge",
                "locationType",
                "instanceFamily",
                "operatingSystem",
                "clockSpeed",
                "LeaseContractLength",
                "ecu",
                "networkPerformance",
                "instanceCapacity8xlarge",
                "group",
                "maxThroughputvolume",
                "gpuMemory",
                "ebsOptimized",
                "elasticGpuType",
                "maxVolumeSize",
                "gpu",
                "processorFeatures",
                "intelAvxAvailable",
                "instanceCapacity4xlarge",
                "servicecode",
                "groupDescription",
                "processorArchitecture",
                "physicalCores",
                "productFamily",
                "enhancedNetworkingSupported",
                "intelTurboAvailable",
                "memory",
                "dedicatedEbsThroughput",
                "vcpu",
                "OfferingClass",
                "instanceCapacityLarge",
                "capacitystatus",
                "termType",
                "storage",
                "intelAvx2Available",
                "storageMedia",
                "physicalProcessor",
                "provisioned",
                "servicename",
                "PurchaseOption",
                "instanceCapacity18xlarge",
```

```
                "instanceType",
                "tenancy",
                "usagetype",
                "normalizationSizeFactor",
                "instanceCapacity2xlarge",
                "instanceCapacity16xlarge",
                "maxIopsBurstPerformance",
                "instanceCapacity12xlarge",
                "instanceCapacity32xlarge",
                "instanceCapacityXlarge",
                "licenseModel",
                "currentGeneration",
                "preInstalledSw",
                "location",
                "instanceCapacity24xlarge",
                "instanceCapacity9xlarge",
                "instanceCapacityMedium",
                "operation"
            ]
        }
    ],
    "FormatVersion": "aws_v1"
}
```

- For API details, see DescribeServices in *AWS CLI Command Reference*.

### `get-attribute-values`

The following code example shows how to use `get-attribute-values`.

#### AWS CLI

**To retrieve a list of attribute values**

The following `get-attribute-values` example retrieves a list of values available for the given attribute.

```
aws pricing get-attribute-values \
    --service-code AmazonEC2 \
    --attribute-name volumeType \
    --max-items 2
```

Output:

```
{
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ==",
    "AttributeValues": [
        {
            "Value": "Cold HDD"
        },
        {
            "Value": "General Purpose"
        }
    ]
}
```

- For API details, see GetAttributeValues in *AWS CLI Command Reference*.

### `get-products`

The following code example shows how to use `get-products`.

#### AWS CLI

**To retrieve a list of products**

This example retrieves a list of products that match the given criteria.

Command:

```
aws pricing get-products --filters file://filters.json --format-version aws_v1 --
max-results 1 --service-code AmazonEC2
```

filters.json:

```
        [
  {
    "Type": "TERM_MATCH",
    "Field": "ServiceCode",
    "Value": "AmazonEC2"
  },
  {
    "Type": "TERM_MATCH",
    "Field": "volumeType",
    "Value": "Provisioned IOPS"
  }
```

```
]
```

Output:

```
{
  "FormatVersion": "aws_v1",
  "NextToken": "WGDY7ko8fQXdlaUZVdasFQ==:RVSagyIFn770XQOzdUIcO9BY6ucBG9itXAZGZF/

  ]
}
```

- For API details, see GetProducts in *AWS CLI Command Reference*.

## AWS Private CA examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Private CA.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `create-certificate-authority-audit-report`

The following code example shows how to use `create-certificate-authority-audit-report`.

**AWS CLI**

**To create a certificate authority audit report**

The following `create-certificate-authority-audit-report` command creates an audit report for the private CA identified by the ARN.

```
aws acm-pca create-certificate-authority-audit-report --certificate-
authority-arn arn:aws:acm-pca:us-east-1:accountid:certificate-
authority/12345678-1234-1234-1234-123456789012 --s3-bucket-name your-bucket-name --
audit-report-response-format JSON
```

- For API details, see CreateCertificateAuthorityAuditReport in *AWS CLI Command Reference*.

#### `create-certificate-authority`

The following code example shows how to use `create-certificate-authority`.

**AWS CLI**

**To create a private certificate authority**

The following `create-certificate-authority` command creates a private certificate authority in your AWS account.

```
aws acm-pca create-certificate-authority --certificate-authority-configuration
 file://C:\ca_config.txt --revocation-configuration file://C:\revoke_config.txt --
certificate-authority-type "SUBORDINATE" --idempotency-token 98256344
```

- For API details, see CreateCertificateAuthority in *AWS CLI Command Reference*.

### `delete-certificate-authority`

The following code example shows how to use `delete-certificate-authority`.

**AWS CLI**

**To delete a private certificate authority**

The following `delete-certificate-authority` command deletes the certificate authority identified by the ARN.

```
aws acm-pca delete-certificate-authority --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012
```

- For API details, see DeleteCertificateAuthority in *AWS CLI Command Reference*.

### `describe-certificate-authority-audit-report`

The following code example shows how to use `describe-certificate-authority-audit-report`.

**AWS CLI**

**To describe an audit report for a certificate authority**

The following `describe-certificate-authority-audit-report` command lists information about the specified audit report for the CA identified by the ARN.

```
aws acm-pca describe-certificate-authority-audit-report --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/99999999-8888-7777-6666-555555555555 --audit-report-id
 11111111-2222-3333-4444-555555555555
```

- For API details, see DescribeCertificateAuthorityAuditReport in *AWS CLI Command Reference*.

### `describe-certificate-authority`

The following code example shows how to use `describe-certificate-authority`.

**AWS CLI**

**To describe a private certificate authority**

The following `describe-certificate-authority` command lists information about the private CA identified by the ARN.

```
aws acm-pca describe-certificate-authority --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012
```

- For API details, see DescribeCertificateAuthority in *AWS CLI Command Reference*.

### `get-certificate-authority-certificate`

The following code example shows how to use `get-certificate-authority-certificate`.

**AWS CLI**

**To retrieve a certificate authority (CA) certificate**

The following `get-certificate-authority-certificate` command retrieves the certificate and certificate chain for the private CA specified by the ARN.

```
aws acm-pca get-certificate-authority-certificate --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --output text
```

- For API details, see GetCertificateAuthorityCertificate in *AWS CLI Command Reference*.

### `get-certificate-authority-csr`

The following code example shows how to use `get-certificate-authority-csr`.

**AWS CLI**

**To retrieve the certificate signing request for a certificate authority**

The following `get-certificate-authority-csr` command retrieves the CSR for the private CA specified by the ARN.

```
aws acm-pca get-certificate-authority-csr --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --output text
```

- For API details, see GetCertificateAuthorityCsr in *AWS CLI Command Reference*.

### `get-certificate`

The following code example shows how to use `get-certificate`.

#### AWS CLI

**To retrieve an issued certificate**

The following `get-certificate` example retrieves a certificate from the specified private CA.

```
aws acm-pca get-certificate \
    --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 \
    --certificate-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012/
certificate/6707447683a9b7f4055627ffd55cebcc \
    --output text
```

Output:

```
-----BEGIN CERTIFICATE-----
MIIEDzCCAvegAwIBAgIRAJuJ8f6ZVYL7gG/rS3qvrZMwDQYJKoZIhvcNAQELBQAw
cTELMAkGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAOBgNVBAcMB1Nl
    ....certificate body truncated for brevity....
tKCSglgZZrd4FdLw1EkGm+UVXnodwMtJEQyy3oTfZjURPIyyaqskTu/KSS7YDjK0
KQNy73D6LtmdOEbAyq10XiDxqY41lvKHJ1eZrPaBmYNABxU=
-----END CERTIFICATE---- -----BEGIN CERTIFICATE-----
MIIDrzCCApegAwIBAgIRAOskdzLvcj1eShkoyEE693AwDQYJKoZIhvcNAQELBQAw
cTELMAkGA1UEBhMCVVMxEzARBgNVBAgMCldhc2hpbmd0b24xEDAOBgNVBAcMB1Nl
    ...certificate body truncated for brevity....
kdRGB6P2hpxstDOUIwAoCbhoaWwfA4ybJznf+jOQhAziNlRdKQRR8nODWpKt7H9w
dJ5nxsTk/fniJz86Ddtp6n8s82wYdkN3cVffeK72A9aTCOU=
-----END CERTIFICATE-----
```

The first part of the output is the certificate itself. The second part is the certificate chain that chains to the root CA certificate. Note that when you use the `--output text` option, a TAB

character is inserted between the two certificate pieces (that is the cause of the indented text). If you intend to take this output and parse the certificates with other tools, you might need to remove the TAB character so it is processed correctly.

- For API details, see GetCertificate in *AWS CLI Command Reference*.

### `import-certificate-authority-certificate`

The following code example shows how to use `import-certificate-authority-certificate`.

**AWS CLI**

**To import your certificate authority certificate into ACM PCA**

The following `import-certificate-authority-certificate` command imports the signed private CA certificate for the CA specified by the ARN into ACM PCA.

```
aws acm-pca import-certificate-authority-certificate --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --certificate file://C:\ca_cert.pem
 --certificate-chain file://C:\ca_cert_chain.pem
```

- For API details, see ImportCertificateAuthorityCertificate in *AWS CLI Command Reference*.

### `issue-certificate`

The following code example shows how to use `issue-certificate`.

**AWS CLI**

**To issue a private certificate**

The following `issue-certificate` command uses the private CA specified by the ARN to issue a private certificate.

```
aws acm-pca issue-certificate --certificate-authority-arn arn:aws:acm-pca:us-
west-2:123456789012:certificate-authority/12345678-1234-1234-1234-123456789012
 --csr file://C:\cert_1.csr --signing-algorithm "SHA256WITHRSA" --validity
 Value=365,Type="DAYS" --idempotency-token 1234
```

- For API details, see IssueCertificate in *AWS CLI Command Reference*.

### `list-certificate-authorities`

The following code example shows how to use `list-certificate-authorities`.

**AWS CLI**

**To list your private certificate authorities**

The following `list-certificate-authorities` command lists information about all of the private CAs in your account.

```
aws acm-pca list-certificate-authorities --max-results 10
```

- For API details, see ListCertificateAuthorities in *AWS CLI Command Reference*.

### `list-tags`

The following code example shows how to use `list-tags`.

**AWS CLI**

**To list the tags for your certificate authority**

The following `list-tags` command lists the tags associated with the private CA specified by the ARN.

```
aws acm-pca list-tags --certificate-authority-arn arn:aws:acm-pca:us-
west-2:123456789012:certificate-authority/123455678-1234-1234-1234-123456789012 --
max-results 10
```

- For API details, see ListTags in *AWS CLI Command Reference*.

### `revoke-certificate`

The following code example shows how to use `revoke-certificate`.

**AWS CLI**

**To revoke a private certificate**

The following `revoke-certificate` command revokes a private certificate from the CA identified by the ARN.

```
aws acm-pca revoke-certificate --certificate-authority-arn arn:aws:acm-pca:us-
west-2:1234567890:certificate-authority/12345678-1234-1234-1234-123456789012 --
certificate-serial 67:07:44:76:83:a9:b7:f4:05:56:27:ff:d5:5c:eb:cc --revocation-
reason "KEY_COMPROMISE"
```

- For API details, see RevokeCertificate in *AWS CLI Command Reference*.

### `tag-certificate-authority`

The following code example shows how to use `tag-certificate-authority`.

**AWS CLI**

**To attach tags to a private certificate authority**

The following `tag-certificate-authority` command attaches one or more tags to your private CA.

```
aws acm-pca tag-certificate-authority --certificate-authority-
arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --tags Key=Admin,Value=Alice
```

- For API details, see TagCertificateAuthority in *AWS CLI Command Reference*.

### `untag-certificate-authority`

The following code example shows how to use `untag-certificate-authority`.

**AWS CLI**

**To remove one or more tags from your private certificate authority**

The following `untag-certificate-authority` command removes tags from the private CA identified by the ARN.

```
aws acm-pca untag-certificate-authority --certificate-authority-
arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --tags Key=Purpose,Value=Website
```

- For API details, see UntagCertificateAuthority in *AWS CLI Command Reference*.

### `update-certificate-authority`

The following code example shows how to use `update-certificate-authority`.

**AWS CLI**

**To update the configuration of your private certificate authority**

The following `update-certificate-authority` command updates the status and configuration of the private CA identified by the ARN.

```
aws acm-pca update-certificate-authority --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-1232456789012 --revocation-configuration file://C:
\revoke_config.txt --status "DISABLED"
```

- For API details, see UpdateCertificateAuthority in *AWS CLI Command Reference*.

## AWS Proton examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Proton.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Actions**

### `cancel-service-instance-deployment`

The following code example shows how to use `cancel-service-instance-deployment`.

## AWS CLI

### To cancel a service instance deployment

The following `cancel-service-instance-deployment` example cancels a service instance deployment.

```
aws proton cancel-service-instance-deployment \
    --service-instance-name "instance-one" \
    --service-name "simple-svc"
```

Output:

```
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-
instance/instance-one",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "CANCELLING",
        "environmentName": "simple-env",
        "lastDeploymentAttemptedAt": "2021-04-02T21:45:15.406000+00:00",
        "lastDeploymentSucceededAt": "2021-04-02T21:38:00.823000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_optional_input: abc\n  my_sample_pipeline_required_input:
 '123'\ninstances:\n- name: my-instance\n  environment: MySimpleEnv
\n  spec:\n    my_sample_service_instance_optional_input: def\n
 my_sample_service_instance_required_input: '456'\n- name: my-other-instance\n
 environment: MySimpleEnv\n  spec:\n    my_sample_service_instance_required_input:
 '789'\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "1",
        "templateName": "svc-simple"
    }
}
```

For more information, see Update a service instance in the *The AWS Proton Administrator Guide* or Update a service instance in the *The AWS Proton User Guide*.

- For API details, see CancelServiceInstanceDeployment in *AWS CLI Command Reference*.

### `cancel-service-pipeline-deployment`

The following code example shows how to use `cancel-service-pipeline-deployment`.

**AWS CLI**

**To cancel a service pipeline deployment**

The following `cancel-service-pipeline-deployment` example cancels a service pipeline deployment.

```
aws proton cancel-service-pipeline-deployment \
    --service-name "simple-svc"
```

Output:

```
{
    "pipeline": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "CANCELLING",
        "lastDeploymentAttemptedAt": "2021-04-02T22:02:45.095000+00:00",
        "lastDeploymentSucceededAt": "2021-04-02T21:39:28.991000+00:00",
        "templateMajorVersion": "1",
        "templateMinorVersion": "1",
        "templateName": "svc-simple"
    }
}
```

For more information, see Update a service pipeline in the *The AWS Proton Administrator Guide* or Update a service pipeline in the *The AWS Proton User Guide*.

- For API details, see CancelServicePipelineDeployment in *AWS CLI Command Reference*.

### `create-service`

The following code example shows how to use `create-service`.

**AWS CLI**

**To create a service**

The following `create-service` example creates a service with a service pipeline.

```
aws proton create-service \
    --name "MySimpleService" \
    --template-name "fargate-service" \
    --template-major-version "1" \
    --branch-name "mainline" \
    --repository-connection-arn "arn:aws:codestar-connections:region-id:account-
id:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --repository-id "myorg/myapp" \
    --spec file://spec.yaml
```

Contents of `spec.yaml`:

```
proton: ServiceSpec

pipeline:
    my_sample_pipeline_required_input: "hello"
    my_sample_pipeline_optional_input: "bye"

instances:
    - name: "acme-network-dev"
        environment: "ENV_NAME"
        spec:
            my_sample_service_instance_required_input: "hi"
            my_sample_service_instance_optional_input: "ho"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
        "createdAt": "2020-11-18T19:50:27.460000+00:00",
        "lastModifiedAt": "2020-11-18T19:50:27.460000+00:00",
        "name": "MySimpleService",
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "repositoryId": "myorg/myapp",
        "status": "CREATE_IN_PROGRESS",
        "templateName": "fargate-service"
    }
}
```

For more information, see Create a service in the *The AWS Proton Administrator Guide* and Create a service in the *The AWS Proton User Guide*.

- For API details, see CreateService in *AWS CLI Command Reference*.

### `delete-service`

The following code example shows how to use `delete-service`.

#### AWS CLI

**To delete a service**

The following `delete-service` example deletes a service.

```
aws proton delete-service \
    --name "simple-svc"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
        "branchName": "mainline",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "description": "Edit by updating description",
        "lastModifiedAt": "2020-11-29T00:30:39.248000+00:00",
        "name": "simple-svc",
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "repositoryId": "myorg/myapp",
        "status": "DELETE_IN_PROGRESS",
        "templateName": "fargate-service"
    }
}
```

For more information, see Delete a service in the *The AWS Proton Administrator Guide*.

- For API details, see DeleteService in *AWS CLI Command Reference*.

### `get-service-instance`

The following code example shows how to use `get-service-instance`.

### AWS CLI

#### To get service instance details

The following `get-service-instance` example gets detail data for a service instance.

```
aws proton get-service-instance \
    --name "instance-one" \
    --service-name "simple-svc"
```

Output:

```
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-
instance/instance-one",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "deploymentStatus": "SUCCEEDED",
        "environmentName": "simple-env",
        "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
        "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_optional_input: hello world\n
 my_sample_pipeline_required_input: pipeline up\ninstances:\n- name: instance-one\n
 environment: my-simple-env\n  spec:\n    my_sample_service_instance_optional_input:
 Ola\n    my_sample_service_instance_required_input: Ciao\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```

For more information, see View service data in the *The AWS Proton Administrator Guide* or View service data in the *The AWS Proton User Guide*.

- For API details, see GetServiceInstance in *AWS CLI Command Reference*.

## `get-service`

The following code example shows how to use `get-service`.

## AWS CLI

### To get service details

The following `get-service` example gets detail data for a service.

```
aws proton get-service \
    --name "simple-svc"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
        "branchName": "mainline",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "lastModifiedAt": "2020-11-28T22:44:51.207000+00:00",
        "name": "simple-svc",
        "pipeline": {
            "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/
pipeline/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "createdAt": "2020-11-28T22:40:50.512000+00:00",
            "deploymentStatus": "SUCCEEDED",
            "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
            "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
            "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_required_input: hello\n  my_sample_pipeline_optional_input:
 bye\ninstances:\n- name: instance-svc-simple\n  environment: my-simple-
env\n  spec:\n    my_sample_service_instance_required_input: hi\n
 my_sample_service_instance_optional_input: ho\n",
            "templateMajorVersion": "1",
            "templateMinorVersion": "1",
            "templateName": "svc-simple"
        },
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "repositoryId": "myorg/myapp",
        "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_required_input: hello\n  my_sample_pipeline_optional_input:
 bye\ninstances:\n- name: instance-svc-simple\n  environment: my-simple-
env\n  spec:\n    my_sample_service_instance_required_input: hi\n
 my_sample_service_instance_optional_input: ho\n",
        "status": "ACTIVE",
```

```
        "templateName": "svc-simple"
    }
}
```

For more information, see View service data in the *The AWS Proton Administrator Guide* or View service data in the *The AWS Proton User Guide*.

- For API details, see GetService in *AWS CLI Command Reference*.

## `list-service-instances`

The following code example shows how to use `list-service-instances`.

### AWS CLI

#### Example 1: To list all service instances

The following `list-service-instances` example lists service instances.

```
aws proton list-service-instances
```

Output:

```
{
    "serviceInstances": [
        {
            "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/
service-instance/instance-one",
            "createdAt": "2020-11-28T22:40:50.512000+00:00",
            "deploymentStatus": "SUCCEEDED",
            "environmentArn": "arn:aws:proton:region-id:123456789012:environment/
simple-env",

            "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
            "name": "instance-one",
            "serviceName": "simple-svc",
            "templateMajorVersion": "1",
            "templateMinorVersion": "0",
            "templateName": "fargate-service"
        }
    ]
}
```

For more information, see View service instance data in the *The AWS Proton Administrator Guide* or View service instance data in the *The AWS Proton User Guide*.

**Example 2: To list the specified service instance**

The following `get-service-instance` example gets a service instance.

```
aws proton get-service-instance \
    --name "instance-one" \
    --service-name "simple-svc"
```

Output:

```
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-
instance/instance-one",
        "createdAt": "2020-11-28T22:40:50.512000+00:00",
        "deploymentStatus": "SUCCEEDED",
        "environmentName": "simple-env",
        "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",
        "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "spec": "proton: ServiceSpec\npipeline:\n
 my_sample_pipeline_optional_input: hello world\n
 my_sample_pipeline_required_input: pipeline up\ninstances:\n- name: instance-one\n

 Ola\n    my_sample_service_instance_required_input: Ciao\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```

For more information, see View service instance data in the *The AWS Proton Administrator Guide* or View service instance data in the *The AWS Proton User Guide*.

- For API details, see ListServiceInstances in *AWS CLI Command Reference*.

## `update-service-instance`

The following code example shows how to use `update-service-instance`.

**AWS CLI**

**To update a service instance to a new minor version**

The following `update-service-instance` example updates a service instance to a new minor version of its service template that adds a new instance named "my-other-instance" with a new required input.

```
aws proton update-service-instance \
    --service-name "simple-svc" \
    --spec "file://service-spec.yaml " \
    --template-major-version "1" \
    --template-minor-version "1" \
    --deployment-type "MINOR_VERSION" \
    --name "instance-one"
```

Contents of `service-spec.yaml`:

```
proton: ServiceSpec
pipeline:
    my_sample_pipeline_optional_input: "abc"
    my_sample_pipeline_required_input: "123"
instances:
    - name: "instance-one"
        environment: "simple-env"
        spec:
            my_sample_service_instance_optional_input: "def"
            my_sample_service_instance_required_input: "456"
    - name: "my-other-instance"
        environment: "simple-env"
        spec:
            my_sample_service_instance_required_input: "789"
```

Output:

```
{
    "serviceInstance": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-
instance/instance-one",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "IN_PROGRESS",
        "environmentName": "arn:aws:proton:region-id:123456789012:environment/
simple-env",
```

```
        "lastDeploymentAttemptedAt": "2021-04-02T21:38:00.823000+00:00",
        "lastDeploymentSucceededAt": "2021-04-02T21:29:59.962000+00:00",
        "name": "instance-one",
        "serviceName": "simple-svc",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```

For more information, see Update a service instance in the *The AWS Proton Administrator Guide* or Update a service instance in the *The AWS Proton User Guide*.

- For API details, see UpdateServiceInstance in *AWS CLI Command Reference*.

### `update-service-pipeline`

The following code example shows how to use `update-service-pipeline`.

#### AWS CLI

**To update a service pipeline**

The following `update-service-pipeline` example updates a service pipeline to a new minor version of its service template.

```
aws proton update-service-pipeline \
    --service-name "simple-svc" \
    --spec "file://service-spec.yaml" \
    --template-major-version "1" \
    --template-minor-version "1" \
    --deployment-type "MINOR_VERSION"
```

Output:

```
{
    "pipeline": {
        "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "createdAt": "2021-04-02T21:29:59.962000+00:00",
        "deploymentStatus": "IN_PROGRESS",
        "lastDeploymentAttemptedAt": "2021-04-02T21:39:28.991000+00:00",
```

```
        "lastDeploymentSucceededAt": "2021-04-02T21:29:59.962000+00:00",
        "spec": "proton: ServiceSpec\n\npipeline:\n
 my_sample_pipeline_optional_input: \"abc\"\n  my_sample_pipeline_required_input:
 \"123\"\n\ninstances:\n  - name: \"my-instance\"\n    environment: \"MySimpleEnv
\"\n    spec:\n      my_sample_service_instance_optional_input: \"def
\"\n      my_sample_service_instance_required_input: \"456\"\n  - name:
 \"my-other-instance\"\n    environment: \"MySimpleEnv\"\n    spec:\n
 my_sample_service_instance_required_input: \"789\"\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}
```

For more information, see Update a service pipeline in the *The AWS Proton Administrator Guide* or Update a service pipeline in the *The AWS Proton User Guide*.

- For API details, see UpdateServicePipeline in *AWS CLI Command Reference*.

### `update-service`

The following code example shows how to use `update-service`.

#### AWS CLI

**To update a service**

The following `update-service` example edits a service description.

```
aws proton update-service \
    --name "MySimpleService" \
    --description "Edit by updating description"
```

Output:

```
{
    "service": {
        "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
        "branchName": "mainline",
        "createdAt": "2021-03-12T22:39:42.318000+00:00",
        "description": "Edit by updating description",
        "lastModifiedAt": "2021-03-12T22:44:21.975000+00:00",
```

```
        "name": "MySimpleService",
        "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "repositoryId": "myorg/myapp",
        "status": "ACTIVE",
        "templateName": "fargate-service"
    }
}
```

For more information, see Edit a service in the *The AWS Proton Administrator Guide* or Edit a service in the *The AWS Proton User Guide*.

- For API details, see UpdateService in *AWS CLI Command Reference*.

## QLDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with QLDB.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `cancel-journal-kinesis-stream`

The following code example shows how to use `cancel-journal-kinesis-stream`.

#### AWS CLI

**To cancel a journal stream**

The following `cancel-journal-kinesis-stream` example cancels the specified journal stream from a ledger.

```
aws qldb cancel-journal-kinesis-stream \
    --ledger-name myExampleLedger \
    --stream-id 7ISCkqwe4y25YyHLzYUFAf
```

Output:

```
{
    "StreamId": "7ISCkqwe4y25YyHLzYUFAf"
}
```

For more information, see Streaming journal data from Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see CancelJournalKinesisStream in *AWS CLI Command Reference*.

## `create-ledger`

The following code example shows how to use `create-ledger`.

### AWS CLI

#### Example 1: To create a ledger with default properties

The following `create-ledger` example creates a ledger with the name `myExampleLedger` and the permissions mode `STANDARD`. The optional parameters for deletion protection and AWS KMS key are not specified, so they default to `true` and an AWS owned KMS key respectively.

```
aws qldb create-ledger \
    --name myExampleLedger \
    --permissions-mode STANDARD
```

Output:

```
{
    "State": "CREATING",
    "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",
    "DeletionProtection": true,
```

```
    "CreationDateTime": 1568839243.951,
    "Name": "myExampleLedger",
    "PermissionsMode": "STANDARD"
}
```

**Example 2: To create a ledger with deletion protection disabled, a customer managed KMS key, and specified tags**

The following `create-ledger` example creates a ledger with the name `myExampleLedger2` and the permissions mode `STANDARD`. The deletion protection feature is disabled, the specified customer managed KMS key is used for encryption at rest, and the specified tags are attached to the resource.

```
aws qldb create-ledger \
    --name myExampleLedger2 \
    --permissions-mode STANDARD \
    --no-deletion-protection \
    --kms-key arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111 \
    --tags IsTest=true,Domain=Test
```

Output:

```
{
    "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger2",
    "DeletionProtection": false,
    "CreationDateTime": 1568839543.557,
    "State": "CREATING",
    "Name": "myExampleLedger2",
    "PermissionsMode": "STANDARD",
    "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

For more information, see Basic Operations for Amazon QLDB Ledgers in the *Amazon QLDB Developer Guide*.

- For API details, see CreateLedger in *AWS CLI Command Reference*.

### `delete-ledger`

The following code example shows how to use `delete-ledger`.

**AWS CLI**

**To delete a ledger**

The following `delete-ledger` example deletes the specified ledger.

```
aws qldb delete-ledger \
    --name myExampleLedger
```

This command produces no output.

For more information, see Basic Operations for Amazon QLDB Ledgers in the *Amazon QLDB Developer Guide*.

- For API details, see DeleteLedger in *AWS CLI Command Reference*.

## `describe-journal-kinesis-stream`

The following code example shows how to use `describe-journal-kinesis-stream`.

**AWS CLI**

**To describe a journal stream**

The following `describe-journal-kinesis-stream` example displays the details for the specified journal stream from a ledger.

```
aws qldb describe-journal-kinesis-stream \
    --ledger-name myExampleLedger \
    --stream-id 7ISCkqwe4y25YyHLzYUFAf
```

Output:

```
{
    "Stream": {
        "LedgerName": "myExampleLedger",
        "CreationTime": 1591221984.677,
        "InclusiveStartTime": 1590710400.0,
        "ExclusiveEndTime": 1590796799.0,
        "RoleArn": "arn:aws:iam::123456789012:role/my-kinesis-stream-role",
        "StreamId": "7ISCkqwe4y25YyHLzYUFAf",
```

```
        "Arn": "arn:aws:qldb:us-east-1:123456789012:stream/
myExampleLedger/7ISCkqwe4y25YyHLzYUFAf",
        "Status": "ACTIVE",
        "KinesisConfiguration": {
            "StreamArn": "arn:aws:kinesis:us-east-1:123456789012:stream/stream-for-
qldb",
            "AggregationEnabled": true
        },
        "StreamName": "myExampleLedger-stream"
    }
}
```

For more information, see Streaming journal data from Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see DescribeJournalKinesisStream in *AWS CLI Command Reference*.

### `describe-journal-s3-export`

The following code example shows how to use `describe-journal-s3-export`.

#### AWS CLI

**To describe a journal export job**

The following `describe-journal-s3-export` example displays the details for the specified export job from a ledger.

```
aws qldb describe-journal-s3-export \
    --name myExampleLedger \
    --export-id ADR2ONPKN5LINYGb4dp7yZ
```

Output:

```
{
    "ExportDescription": {
        "S3ExportConfiguration": {
            "Bucket": "awsExampleBucket",
            "Prefix": "ledgerexport1/",
            "EncryptionConfiguration": {
                "ObjectEncryptionType": "SSE_S3"
            }
```

```
        },
        "RoleArn": "arn:aws:iam::123456789012:role/my-s3-export-role",
        "Status": "COMPLETED",
        "ExportCreationTime": 1568847801.418,
        "InclusiveStartTime": 1568764800.0,
        "ExclusiveEndTime": 1568847599.0,
        "LedgerName": "myExampleLedger",
        "ExportId": "ADR2ONPKN5LINYGb4dp7yZ"
    }
}
```

For more information, see Exporting Your Journal in Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see DescribeJournalS3Export in *AWS CLI Command Reference*.

### `describe-ledger`

The following code example shows how to use `describe-ledger`.

#### AWS CLI

**To describe a ledger**

The following `describe-ledger` example displays the details for the specified ledger.

```
aws qldb describe-ledger \
    --name myExampleLedger
```

Output:

```
{
    "CreationDateTime": 1568839243.951,
    "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",
    "State": "ACTIVE",
    "Name": "myExampleLedger",
    "DeletionProtection": true,
    "PermissionsMode": "STANDARD",
    "EncryptionDescription": {
        "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "EncryptionStatus": "ENABLED"
    }
```

```
}
```

For more information, see Basic Operations for Amazon QLDB Ledgers in the *Amazon QLDB Developer Guide*.

- For API details, see DescribeLedger in *AWS CLI Command Reference*.

### `export-journal-to-s3`

The following code example shows how to use `export-journal-to-s3`.

#### AWS CLI

**To export journal blocks to S3**

The following `export-journal-to-s3` example creates an export job for journal blocks within a specified date and time range from a ledger with the name `myExampleLedger`. The export job writes the blocks into a specified Amazon S3 bucket.

```
aws qldb export-journal-to-s3 \
    --name myExampleLedger \
    --inclusive-start-time 2019-09-18T00:00:00Z \
    --exclusive-end-time 2019-09-18T22:59:59Z \
    --role-arn arn:aws:iam::123456789012:role/my-s3-export-role \
    --s3-export-configuration file://my-s3-export-config.json
```

Contents of `my-s3-export-config.json`:

```
{
    "Bucket": "awsExampleBucket",
    "Prefix": "ledgerexport1/",
    "EncryptionConfiguration": {
        "ObjectEncryptionType": "SSE_S3"
    }
}
```

Output:

```
{
    "ExportId": "ADR2ONPKN5LINYGb4dp7yZ"
}
```

For more information, see Exporting Your Journal in Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see ExportJournalToS3 in *AWS CLI Command Reference*.

### `get-block`

The following code example shows how to use `get-block`.

**AWS CLI**

**Example 1: To get a journal block and proof for verification using input files**

The following `get-block` example requests a block data object and a proof from the specified ledger. The request is for a specified digest tip address and block address.

```
aws qldb get-block \
    --name vehicle-registration \
    --block-address file://myblockaddress.json \
    --digest-tip-address file://mydigesttipaddress.json
```

Contents of `myblockaddress.json`:

```
{
    "IonText": "{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl\",sequenceNo:100}"
}
```

Contents of `mydigesttipaddress.json`:

```
{
    "IonText": "{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl\",sequenceNo:123}"
}
```

Output:

```
{
    "Block": {
        "IonText": "{blockAddress:{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl
\",sequenceNo:100},transactionId:\"FnQeJBAicTX0Ah32ZnVtSX
\",blockTimestamp:2019-09-16T19:37:05.360Z,blockHash:
```

}
```

For more information, see Data Verification in Amazon QLDB in the *Amazon QLDB Developer Guide*.

**Example 2: To get a journal block and proof for verification using shorthand syntax**

The following `get-block` example requests a block data object and a proof from the specified ledger using shorthand syntax. The request is for a specified digest tip address and block address.

```
aws qldb get-block \
    --name vehicle-registration \
```

```
    --block-address 'IonText="{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl\",sequenceNo:100}"'
 \
    --digest-tip-address 'IonText="{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl
\",sequenceNo:123}"'
```

Output:

```
{
    "Block": {
        "IonText": "{blockAddress:{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl
\",sequenceNo:100},transactionId:\"FnQeJBAicTX0Ah32ZnVtSX

For more information, see Data Verification in Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see GetBlock in *AWS CLI Command Reference*.

### `get-digest`

The following code example shows how to use `get-digest`.

**AWS CLI**

**To get a digest for a ledger**

The following `get-digest` example requests a digest from the specified ledger at the latest committed block in the journal.

```
aws qldb get-digest \
    --name vehicle-registration
```

Output:

```
{
    "Digest": "6m6BMXobbJKpMhahwVthAEsN6awgnHK62Qq5McGP1Gk=",
    "DigestTipAddress": {
        "IonText": "{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl\",sequenceNo:123}"
    }
}
```

For more information, see Data Verification in Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see GetDigest in *AWS CLI Command Reference*.

### `get-revision`

The following code example shows how to use `get-revision`.

**AWS CLI**

**Example 1: To get a document revision and proof for verification using input files**

The following `get-revision` example requests a revision data object and a proof from the specified ledger. The request is for a specified digest tip address, document ID, and block address of the revision.

```
aws qldb get-revision \
    --name vehicle-registration \
    --block-address file://myblockaddress.json \
    --document-id JUJgkIcNbhS2goq8RqLuZ4 \
    --digest-tip-address file://mydigesttipaddress.json
```

Contents of `myblockaddress.json`:

```
{
    "IonText": "{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl\",sequenceNo:100}"
}
```

Contents of `mydigesttipaddress.json`:

```
{
    "IonText": "{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl\",sequenceNo:123}"
}
```

Output:

```
{
    "Revision": {
        "IonText": "{blockAddress:{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl
\",sequenceNo:100},hash:{{mHVex/yjHAWjFPpwhBuH2GKXmKJjK2FBa9faqoUVNtg=}},data:

    }
}
```

For more information, see Data Verification in Amazon QLDB in the *Amazon QLDB Developer Guide*.

**Example 2: To get a document revision and proof for verification using shorthand syntax**

The following `get-revision` example requests a revision data object and a proof from the specified ledger using shorthand syntax. The request is for a specified digest tip address, document ID, and block address of the revision.

```
aws qldb get-revision \
    --name vehicle-registration \
    --block-address 'IonText="{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl\",sequenceNo:100}"'
 \
    --document-id JUJgkIcNbhS2goq8RqLuZ4 \
    --digest-tip-address 'IonText="{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl
\",sequenceNo:123}"'
```

Output:

```
{
    "Revision": {
        "IonText": "{blockAddress:{strandId:\"KmA3ZZca7vAIiJAK9S5Iwl
\",sequenceNo:100},hash:{{mHVex/yjHAWjFPpwhBuH2GKXmKJjK2FBa9faqoUVNtg=}},data:

For more information, see Data Verification in Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see GetRevision in *AWS CLI Command Reference*.

### `list-journal-kinesis-streams-for-ledger`

The following code example shows how to use `list-journal-kinesis-streams-for-ledger`.

#### AWS CLI

**To list journal streams for a ledger**

The following `list-journal-kinesis-streams-for-ledger` example lists journal streams for the specified ledger.

```
aws qldb list-journal-kinesis-streams-for-ledger \
    --ledger-name myExampleLedger
```

Output:

```
{
    "Streams": [
        {
            "LedgerName": "myExampleLedger",
            "CreationTime": 1591221984.677,
            "InclusiveStartTime": 1590710400.0,
            "ExclusiveEndTime": 1590796799.0,
            "RoleArn": "arn:aws:iam::123456789012:role/my-kinesis-stream-role",
            "StreamId": "7ISCkqwe4y25YyHLzYUFAf",
            "Arn": "arn:aws:qldb:us-east-1:123456789012:stream/
myExampleLedger/7ISCkqwe4y25YyHLzYUFAf",
            "Status": "ACTIVE",
            "KinesisConfiguration": {
                "StreamArn": "arn:aws:kinesis:us-east-1:123456789012:stream/stream-
for-qldb",
                "AggregationEnabled": true
            },
```

```
            "StreamName": "myExampleLedger-stream"
        }
    ]
}
```

For more information, see Streaming journal data from Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see ListJournalKinesisStreamsForLedger in *AWS CLI Command Reference*.

### `list-journal-s3-exports-for-ledger`

The following code example shows how to use `list-journal-s3-exports-for-ledger`.

#### AWS CLI

**To list journal export jobs for a ledger**

The following `list-journal-s3-exports-for-ledger` example lists journal export jobs for the specified ledger.

```
aws qldb list-journal-s3-exports-for-ledger \
    --name myExampleLedger
```

Output:

```
{
    "JournalS3Exports": [
        {
            "LedgerName": "myExampleLedger",
            "ExclusiveEndTime": 1568847599.0,
            "ExportCreationTime": 1568847801.418,
            "S3ExportConfiguration": {
                "Bucket": "awsExampleBucket",
                "Prefix": "ledgerexport1/",
                "EncryptionConfiguration": {
                    "ObjectEncryptionType": "SSE_S3"
                }
            },
            "ExportId": "ADR2ONPKN5LINYGb4dp7yZ",
            "RoleArn": "arn:aws:iam::123456789012:role/qldb-s3-export",
            "InclusiveStartTime": 1568764800.0,
            "Status": "IN_PROGRESS"
```

```
        }
    ]
}
```

For more information, see Exporting Your Journal in Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see ListJournalS3ExportsForLedger in *AWS CLI Command Reference*.

### `list-journal-s3-exports`

The following code example shows how to use `list-journal-s3-exports`.

#### AWS CLI

**To list journal export jobs**

The following `list-journal-s3-exports` example lists journal export jobs for all ledgers that are associated with the current AWS account and Region.

```
aws qldb list-journal-s3-exports
```

Output:

```
{
    "JournalS3Exports": [
        {
            "Status": "IN_PROGRESS",
            "LedgerName": "myExampleLedger",
            "S3ExportConfiguration": {
                "EncryptionConfiguration": {
                    "ObjectEncryptionType": "SSE_S3"
                },
                "Bucket": "awsExampleBucket",
                "Prefix": "ledgerexport1/"
            },
            "RoleArn": "arn:aws:iam::123456789012:role/my-s3-export-role",
            "ExportCreationTime": 1568847801.418,
            "ExportId": "ADR2ONPKN5LINYGb4dp7yZ",
            "InclusiveStartTime": 1568764800.0,
            "ExclusiveEndTime": 1568847599.0
        },
        {
```

```
            "Status": "COMPLETED",
            "LedgerName": "myExampleLedger2",
            "S3ExportConfiguration": {
                "EncryptionConfiguration": {
                    "ObjectEncryptionType": "SSE_S3"
                },
                "Bucket": "awsExampleBucket",
                "Prefix": "ledgerexport1/"
            },
            "RoleArn": "arn:aws:iam::123456789012:role/my-s3-export-role",
            "ExportCreationTime": 1568846847.638,
            "ExportId": "2pdvW8UQrjBAiYTMehEJDI",
            "InclusiveStartTime": 1568592000.0,
            "ExclusiveEndTime": 1568764800.0
        }
    ]
}
```

For more information, see Exporting Your Journal in Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see ListJournalS3Exports in *AWS CLI Command Reference*.

### `list-ledgers`

The following code example shows how to use `list-ledgers`.

#### AWS CLI

**To list your available ledgers**

The following `list-ledgers` example lists all ledgers that are associated with the current AWS account and Region.

```
aws qldb list-ledgers
```

Output:

```
{
    "Ledgers": [
        {
            "State": "ACTIVE",
            "CreationDateTime": 1568839243.951,
```

```
            "Name": "myExampleLedger"
        },
        {
            "State": "ACTIVE",
            "CreationDateTime": 1568839543.557,
            "Name": "myExampleLedger2"
        }
    ]
}
```

For more information, see Basic Operations for Amazon QLDB Ledgers in the *Amazon QLDB Developer Guide*.

- For API details, see ListLedgers in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags attached to a ledger**

The following `list-tags-for-resource` example lists all tags attached to the specified ledger.

```
aws qldb list-tags-for-resource \
    --resource-arn arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger
```

Output:

```
{
    "Tags": {
        "IsTest": "true",
        "Domain": "Test"
    }
}
```

For more information, see Tagging Amazon QLDB Resources in the *Amazon QLDB Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `stream-journal-to-kinesis`

The following code example shows how to use `stream-journal-to-kinesis`.

**AWS CLI**

**Example 1: To stream journal data to Kinesis Data Streams using input files**

The following `stream-journal-to-kinesis` example creates a stream of journal data within a specified date and time range from a ledger with the name `myExampleLedger`. The stream sends the data to a specified Amazon Kinesis data stream.

```
aws qldb stream-journal-to-kinesis \
    --ledger-name myExampleLedger \
    --inclusive-start-time 2020-05-29T00:00:00Z \
    --exclusive-end-time 2020-05-29T23:59:59Z \
    --role-arn arn:aws:iam::123456789012:role/my-kinesis-stream-role \
    --kinesis-configuration file://my-kinesis-config.json \
    --stream-name myExampleLedger-stream
```

Contents of `my-kinesis-config.json`:

```
{
    "StreamArn": "arn:aws:kinesis:us-east-1:123456789012:stream/stream-for-qldb",
    "AggregationEnabled": true
}
```

Output:

```
{
    "StreamId": "7ISCkqwe4y25YyHLzYUFAf"
}
```

For more information, see Streaming journal data from Amazon QLDB in the *Amazon QLDB Developer Guide*.

**Example 2: To stream journal data to Kinesis Data Streams using shorthand syntax**

The following `stream-journal-to-kinesis` example creates a stream of journal data within a specified date and time range from a ledger with the name `myExampleLedger`. The stream sends the data to a specified Amazon Kinesis data stream.

```
aws qldb stream-journal-to-kinesis \
    --ledger-name myExampleLedger \
    --inclusive-start-time 2020-05-29T00:00:00Z \
    --exclusive-end-time 2020-05-29T23:59:59Z \
    --role-arn arn:aws:iam::123456789012:role/my-kinesis-stream-role \
    --stream-name myExampleLedger-stream \
    --kinesis-configuration StreamArn=arn:aws:kinesis:us-east-1:123456789012:stream/
stream-for-qldb,AggregationEnabled=true
```

Output:

```
{
    "StreamId": "7ISCkqwe4y25YyHLzYUFAf"
}
```

For more information, see Streaming journal data from Amazon QLDB in the *Amazon QLDB Developer Guide*.

- For API details, see StreamJournalToKinesis in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To tag a ledger**

The following `tag-resource` example adds a set of tags to a specified ledger.

```
aws qldb tag-resource \
    --resource-arn arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger \
    --tags IsTest=true,Domain=Test
```

This command produces no output.

For more information, see Tagging Amazon QLDB Resources in the *Amazon QLDB Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To remove tags from a resource**

The following `untag-resource` example removes tags with the specified tag keys from a specified ledger.

```
aws qldb untag-resource \
    --resource-arn arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger \
    --tag-keys IsTest Domain
```

This command produces no output.

For more information, see Tagging Amazon QLDB Resources in the *Amazon QLDB Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-ledger-permissions-mode`

The following code example shows how to use `update-ledger-permissions-mode`.

#### AWS CLI

**Example 1: To update the permissions mode of a ledger to STANDARD**

The following `update-ledger-permissions-mode` example assigns the `STANDARD` permissions mode to the specified ledger.

```
aws qldb update-ledger-permissions-mode \
    --name myExampleLedger \
    --permissions-mode STANDARD
```

Output:

```
{
    "Name": "myExampleLedger",
    "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",
    "PermissionsMode": "STANDARD"
```

```
}
```

**Example 2: To update the permissions mode of a ledger to ALLOW_ALL**

The following `update-ledger-permissions-mode` example assigns the `ALLOW_ALL` permissions mode to the specified ledger.

```
aws qldb update-ledger-permissions-mode \
    --name myExampleLedger \
    --permissions-mode ALLOW_ALL
```

Output:

```
{
    "Name": "myExampleLedger",
    "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",
    "PermissionsMode": "ALLOW_ALL"
}
```

For more information, see Basic Operations for Amazon QLDB Ledgers in the *Amazon QLDB Developer Guide*.

- For API details, see UpdateLedgerPermissionsMode in *AWS CLI Command Reference*.

### `update-ledger`

The following code example shows how to use `update-ledger`.

**AWS CLI**

**Example 1: To update the deletion protection property of a ledger**

The following `update-ledger` example updates the specified ledger to disable the deletion protection feature.

```
aws qldb update-ledger \
    --name myExampleLedger \
    --no-deletion-protection
```

Output:

```
{
```

```
    "CreationDateTime": 1568839243.951,
    "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",
    "DeletionProtection": false,
    "Name": "myExampleLedger",
    "State": "ACTIVE"
}
```

**Example 2: To update the AWS KMS key of a ledger to a customer managed key**

The following `update-ledger` example updates the specified ledger to use a customer managed KMS key for encryption at rest.

```
aws qldb update-ledger \
    --name myExampleLedger \
    --kms-key arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111
```

Output:

```
{
    "CreationDateTime": 1568839243.951,
    "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",
    "DeletionProtection": false,
    "Name": "myExampleLedger",
    "State": "ACTIVE",
    "EncryptionDescription": {
        "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
        "EncryptionStatus": "UPDATING"
    }
}
```

**Example 3: To update the AWS KMS key of a ledger to an AWS owned key**

The following `update-ledger` example updates the specified ledger to use an AWS owned KMS key for encryption at rest.

```
aws qldb update-ledger \
    --name myExampleLedger \
    --kms-key AWS_OWNED_KMS_KEY
```

Output:

```
{
    "CreationDateTime": 1568839243.951,
    "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",
    "DeletionProtection": false,
    "Name": "myExampleLedger",
    "State": "ACTIVE",
    "EncryptionDescription": {
        "KmsKeyArn": "AWS_OWNED_KMS_KEY",
        "EncryptionStatus": "UPDATING"
    }
}
```

For more information, see Basic Operations for Amazon QLDB Ledgers in the *Amazon QLDB Developer Guide*.

- For API details, see UpdateLedger in *AWS CLI Command Reference*.

## Amazon RDS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `add-option-to-option-group`

The following code example shows how to use `add-option-to-option-group`.

## AWS CLI

### To add an option to an option group

The following `add-option-to-option-group` example adds an option to the specified option group.

```
aws rds add-option-to-option-group \
    --option-group-name myoptiongroup \
    --options OptionName=OEM,Port=5500,DBSecurityGroupMemberships=default \
    --apply-immediately
```

Output:

```
{
    "OptionGroup": {
        "OptionGroupName": "myoptiongroup",
        "OptionGroupDescription": "Test Option Group",
        "EngineName": "oracle-ee",
        "MajorEngineVersion": "12.1",
        "Options": [
            {
                "OptionName": "Timezone",
                "OptionDescription": "Change time zone",
                "Persistent": true,
                "Permanent": false,
                "OptionSettings": [
                    {
                        "Name": "TIME_ZONE",
                        "Value": "Australia/Sydney",
                        "DefaultValue": "UTC",
                        "Description": "Specifies the timezone the user wants to
 change the system time to",
                        "ApplyType": "DYNAMIC",
                        "DataType": "STRING",
                        "AllowedValues": "Africa/Cairo,Africa/Casablanca,Africa/

                    {
                        "DBSecurityGroupName": "default",
                        "Status": "authorized"
                    }
                ],
                "VpcSecurityGroupMemberships": []
            }
        ],
        "AllowsVpcAndNonVpcInstanceMemberships": false,
        "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:myoptiongroup"
    }
}
```

For more information, see Adding an Option to an Option Group in the *Amazon RDS User Guide*.

- For API details, see AddOptionToOptionGroup in *AWS CLI Command Reference*.

### `add-role-to-db-cluster`

The following code example shows how to use `add-role-to-db-cluster`.

**AWS CLI**

**To associate an AWS Identity and Access Management (IAM) role with a DB cluster**

The following `add-role-to-db-cluster` example associates a role with a DB cluster.

```
aws rds add-role-to-db-cluster \
    --db-cluster-identifier mydbcluster \
    --role-arn arn:aws:iam::123456789012:role/RDSLoadFromS3
```

This command produces no output.

For more information, see Associating an IAM role with an Amazon Aurora MySQL DB cluster in the *Amazon Aurora User Guide*.

- For API details, see AddRoleToDbCluster in *AWS CLI Command Reference*.

### `add-role-to-db-instance`

The following code example shows how to use `add-role-to-db-instance`.

**AWS CLI**

**To associate an AWS Identity and Access Management (IAM) role with a DB instance**

The following `add-role-to-db-instance` example adds the role to an Oracle DB instance named `test-instance`.

```
aws rds add-role-to-db-instance \
    --db-instance-identifier test-instance \
    --feature-name S3_INTEGRATION \
    --role-arn arn:aws:iam::111122223333:role/rds-s3-integration-role
```

This command produces no output.

For more information, see Prerequisites for Amazon RDS Oracle Integration with Amazon S3 in the *Amazon RDS User Guide*.

- For API details, see AddRoleToDbInstance in *AWS CLI Command Reference*.

### `add-source-identifier-to-subscription`

The following code example shows how to use `add-source-identifier-to-subscription`.

**AWS CLI**

**To add a source identifier to a subscription**

The following `add-source-identifier` example adds another source identifier to an existing subscription.

```
aws rds add-source-identifier-to-subscription \
    --subscription-name my-instance-events \
    --source-identifier test-instance-repl
```

Output:

```
{
    "EventSubscription": {
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "CustSubscriptionId": "my-instance-events",
        "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
        "Enabled": false,
        "Status": "modifying",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "CustomerAwsId": "123456789012",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "SourceType": "db-instance",
        "SourceIdsList": [
            "test-instance",
            "test-instance-repl"
        ]
    }
```

```
}
```

- For API details, see AddSourceIdentifierToSubscription in *AWS CLI Command Reference*.

### `add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

**AWS CLI**

**To add tags to a resource**

The following `add-tags-to-resource` example add tags to an RDS database.

```
aws rds add-tags-to-resource \
    --resource-name arn:aws:rds:us-east-1:123456789012:db:database-mysql \
    --tags "[{\"Key\": \"Name\",\"Value\": \"MyDatabase\"},{\"Key\": \"Environment
\",\"Value\": \"test\"}]"
```

This command produces no output.

For more information, see Tagging Amazon RDS Resources in the *Amazon RDS User Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

### `apply-pending-maintenance-action`

The following code example shows how to use `apply-pending-maintenance-action`.

**AWS CLI**

**To apply pending maintenance actions**

The following `apply-pending-maintenance-action` example applies the pending maintenance actions for a DB cluster.

```
aws rds apply-pending-maintenance-action \
    --resource-identifier arn:aws:rds:us-east-1:123456789012:cluster:my-db-cluster \
    --apply-action system-update \
    --opt-in-type immediate
```

Output:

```
{
    "ResourcePendingMaintenanceActions": {
        "ResourceIdentifier": "arn:aws:rds:us-east-1:123456789012:cluster:my-db-
cluster",
        "PendingMaintenanceActionDetails": [
            {
                "Action": "system-update",
                "OptInStatus": "immediate",
                "CurrentApplyDate": "2021-01-23T01:07:36.100Z",
                "Description": "Upgrade to Aurora PostgreSQL 3.3.2"
            }
        ]
    }
}
```

For more information, see Maintaining a DB instance in the *Amazon RDS User Guide* and Maintaining an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see ApplyPendingMaintenanceAction in *AWS CLI Command Reference*.

### `authorize-db-security-group-ingress`

The following code example shows how to use `authorize-db-security-group-ingress`.

**AWS CLI**

**To associate an AWS Identity and Access Management (IAM) role with a DB instance**

The following `authorize-db-security-group-ingress` example configures the default security group with an ingress rule for the CIDR IP range 192.0.2.0/24.

```
aws rds authorize-db-security-group-ingress \
    --db-security-group-name default \
    --cidrip 192.0.2.0/24
```

Output:

```
{
    "DBSecurityGroup": {
        "OwnerId": "123456789012",
        "DBSecurityGroupName": "default",
```

```
        "DBSecurityGroupDescription": "default",
        "EC2SecurityGroups": [],
        "IPRanges": [
            {
                "Status": "authorizing",
                "CIDRIP": "192.0.2.0/24"
            }
        ],
        "DBSecurityGroupArn": "arn:aws:rds:us-east-1:111122223333:secgrp:default"
    }
}
```

For more information, see Authorizing Network Access to a DB Security Group from an IP Range in the *Amazon RDS User Guide*.

- For API details, see AuthorizeDbSecurityGroupIngress in *AWS CLI Command Reference*.

### `backtrack-db-cluster`

The following code example shows how to use `backtrack-db-cluster`.

#### AWS CLI

**To backtrack an Aurora DB cluster**

The following `backtrack-db-cluster` example backtracks the specified DB cluster sample-cluster to March 19, 2018, at 10 a.m.

```
aws rds backtrack-db-cluster --db-cluster-identifier sample-cluster --backtrack-to
 2018-03-19T10:00:00+00:00
```

This command outputs a JSON block that acknowledges the change to the RDS resource.

- For API details, see BacktrackDbCluster in *AWS CLI Command Reference*.

### `cancel-export-task`

The following code example shows how to use `cancel-export-task`.

#### AWS CLI

**To cancel a snapshot export to Amazon S3**

The following `cancel-export-task` example cancels an export task in progress that is exporting a snapshot to Amazon S3.

```
aws rds cancel-export-task \
    --export-task-identifier my-s3-export-1
```

Output:

```
{
    "ExportTaskIdentifier": "my-s3-export-1",
    "SourceArn": "arn:aws:rds:us-east-1:123456789012:snapshot:publisher-final-
snapshot",
    "SnapshotTime": "2019-03-24T20:01:09.815Z",
    "S3Bucket": "mybucket",
    "S3Prefix": "",
    "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/export-snap-S3-role",
    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/abcd0000-7bfd-4594-af38-
aabbccddeeff",
    "Status": "CANCELING",
    "PercentProgress": 0,
    "TotalExtractedDataInGB": 0
}
```

For more information, see Canceling a snapshot export task in the *Amazon RDS User Guide* or Canceling a snapshot export task in the *Amazon Aurora User Guide*.

- For API details, see CancelExportTask in *AWS CLI Command Reference*.

## `copy-db-cluster-parameter-group`

The following code example shows how to use `copy-db-cluster-parameter-group`.

### AWS CLI

#### To copy a DB cluster parameter group

The following `copy-db-cluster-parameter-group` example makes a copy of a DB cluster parameter group.

```
aws rds copy-db-cluster-parameter-group \
    --source-db-cluster-parameter-group-identifier mydbclusterpg \
```

```
    --target-db-cluster-parameter-group-identifier mydbclusterpgcopy \
    --target-db-cluster-parameter-group-description "Copy of mydbclusterpg parameter
 group"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "DBClusterParameterGroupName": "mydbclusterpgcopy",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:cluster-
pg:mydbclusterpgcopy",
        "DBParameterGroupFamily": "aurora-mysql5.7",
        "Description": "Copy of mydbclusterpg parameter group"
    }
}
```

For more information, see Copying a DB Cluster Parameter Group in the *Amazon Aurora Users Guide*.

- For API details, see CopyDbClusterParameterGroup in *AWS CLI Command Reference*.

### `copy-db-cluster-snapshot`

The following code example shows how to use `copy-db-cluster-snapshot`.

**AWS CLI**

**To copy a DB cluster snapshot**

The following `copy-db-cluster-snapshot` example creates a copy of a DB cluster snapshot, including its tags.

```
aws rds copy-db-cluster-snapshot \
    --source-db-cluster-snapshot-identifier arn:aws:rds:us-
east-1:123456789012:cluster-snapshot:rds:myaurora-2019-06-04-09-16
    --target-db-cluster-snapshot-identifier myclustersnapshotcopy \
    --copy-tags
```

Output:

```
{
```

```
    "DBClusterSnapshot": {
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1e"
        ],
        "DBClusterSnapshotIdentifier": "myclustersnapshotcopy",
        "DBClusterIdentifier": "myaurora",
        "SnapshotCreateTime": "2019-06-04T09:16:42.649Z",
        "Engine": "aurora-mysql",
        "AllocatedStorage": 0,
        "Status": "available",
        "Port": 0,
        "VpcId": "vpc-6594f31c",
        "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
        "MasterUsername": "myadmin",
        "EngineVersion": "5.7.mysql_aurora.2.04.2",
        "LicenseModel": "aurora-mysql",
        "SnapshotType": "manual",
        "PercentProgress": 100,
        "StorageEncrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBClusterSnapshotArn": "arn:aws:rds:us-east-1:123456789012:cluster-
snapshot:myclustersnapshotcopy",
        "IAMDatabaseAuthenticationEnabled": false
    }
}
```

For more information, see Copying a Snapshot in the *Amazon Aurora User Guide*.

- For API details, see CopyDbClusterSnapshot in *AWS CLI Command Reference*.

### `copy-db-parameter-group`

The following code example shows how to use `copy-db-parameter-group`.

#### AWS CLI

**To copy a DB cluster parameter group**

The following `copy-db-parameter-group` example makes a copy of a DB parameter group.

```
aws rds copy-db-parameter-group \
```

```
    --source-db-parameter-group-identifier mydbpg \
    --target-db-parameter-group-identifier mydbpgcopy \
    --target-db-parameter-group-description "Copy of mydbpg parameter group"
```

Output:

```
{
    "DBParameterGroup": {
        "DBParameterGroupName": "mydbpgcopy",
        "DBParameterGroupArn": "arn:aws:rds:us-east-1:814387698303:pg:mydbpgcopy",
        "DBParameterGroupFamily": "mysql5.7",
        "Description": "Copy of mydbpg parameter group"
    }
}
```

For more information, see Copying a DB Parameter Group in the *Amazon RDS Users Guide*.

- For API details, see CopyDbParameterGroup in *AWS CLI Command Reference*.

### `copy-db-snapshot`

The following code example shows how to use `copy-db-snapshot`.

#### AWS CLI

**To copy a DB snapshot**

The following `copy-db-snapshot` example creates a copy of a DB snapshot.

```
aws rds copy-db-snapshot \
    --source-db-snapshot-identifier rds:database-mysql-2019-06-06-08-38
    --target-db-snapshot-identifier mydbsnapshotcopy
```

Output:

```
{
    "DBSnapshot": {
        "VpcId": "vpc-6594f31c",
        "Status": "creating",
        "Encrypted": true,
        "SourceDBSnapshotIdentifier": "arn:aws:rds:us-
east-1:123456789012:snapshot:rds:database-mysql-2019-06-06-08-38",
```

```
        "MasterUsername": "admin",
        "Iops": 1000,
        "Port": 3306,
        "LicenseModel": "general-public-license",
        "DBSnapshotArn": "arn:aws:rds:us-
east-1:123456789012:snapshot:mydbsnapshotcopy",
        "EngineVersion": "5.6.40",
        "OptionGroupName": "default:mysql-5-6",
        "ProcessorFeatures": [],
        "Engine": "mysql",
        "StorageType": "io1",
        "DbiResourceId": "db-ZI7UJ5BLKMBYFGX7FDENCKADC4",
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "SnapshotType": "manual",
        "IAMDatabaseAuthenticationEnabled": false,
        "SourceRegion": "us-east-1",
        "DBInstanceIdentifier": "database-mysql",
        "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
        "AvailabilityZone": "us-east-1f",
        "PercentProgress": 0,
        "AllocatedStorage": 100,
        "DBSnapshotIdentifier": "mydbsnapshotcopy"
    }
}
```

For more information, see Copying a Snapshot in the *Amazon RDS User Guide*.

- For API details, see CopyDbSnapshot in *AWS CLI Command Reference*.

## `copy-option-group`

The following code example shows how to use `copy-option-group`.

### AWS CLI

#### To copy an option group

The following `copy-option-group` example makes a copy of an option group.

```
aws rds copy-option-group \
    --source-option-group-identifier myoptiongroup \
    --target-option-group-identifier new-option-group \
    --target-option-group-description "My option group copy"
```

Output:

```
{
    "OptionGroup": {
        "Options": [],
        "OptionGroupName": "new-option-group",
        "MajorEngineVersion": "11.2",
        "OptionGroupDescription": "My option group copy",
        "AllowsVpcAndNonVpcInstanceMemberships": true,
        "EngineName": "oracle-ee",
        "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:new-option-group"
    }
}
```

For more information, see Making a Copy of an Option Group in the *Amazon RDS User Guide*.

- For API details, see CopyOptionGroup in *AWS CLI Command Reference*.

### `create-blue-green-deployment`

The following code example shows how to use `create-blue-green-deployment`.

#### AWS CLI

**Example 1: To create a blue/green deployment for an RDS for MySQL DB instance**

The following `create-blue-green-deployment` example creates a blue/green deployment for a MySQL DB instance.

```
aws rds create-blue-green-deployment \
    --blue-green-deployment-name bgd-cli-test-instance \
    --source arn:aws:rds:us-east-1:123456789012:db:my-db-instance \
    --target-engine-version 8.0 \
    --target-db-parameter-group-name mysql-80-group
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",
        "Source": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
```

```
        "SwitchoverDetails": [
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance"
            },

```

For more information, see Creating a blue/green deployment in the *Amazon RDS User Guide*.

**Example 2: To create a blue/green deployment for an Aurora MySQL DB cluster**

The following `create-blue-green-deployment` example creates a blue/green deployment for an Aurora MySQL DB cluster.

```
aws rds create-blue-green-deployment \
    --blue-green-deployment-name my-blue-green-deployment \
    --source arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster \
    --target-engine-version 8.0 \
    --target-db-cluster-parameter-group-name ams-80-binlog-enabled \
    --target-db-parameter-group-name mysql-80-cluster-group
```

Output:

```
{
      "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
        "BlueGreenDeploymentName": "my-blue-green-deployment",
        "Source": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-
cluster",
        "SwitchoverDetails": [
          {
            "SourceMember": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-
mysql-cluster",

```

For more information, see Creating a blue/green deployment in the *Amazon Aurora User Guide*.

- For API details, see CreateBlueGreenDeployment in *AWS CLI Command Reference*.

### `create-db-cluster-endpoint`

The following code example shows how to use `create-db-cluster-endpoint`.

#### AWS CLI

**To create a custom DB cluster endpoint**

The following `create-db-cluster-endpoint` example creates a custom DB cluster endpoint and associate it with the specified Aurora DB cluster.

```
aws rds create-db-cluster-endpoint \
    --db-cluster-endpoint-identifier mycustomendpoint \
    --endpoint-type reader \
    --db-cluster-identifier mydbcluster \
    --static-members dbinstance1 dbinstance2
```

Output:

```
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
    "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-
east-1.rds.amazonaws.com",
    "Status": "creating",
    "EndpointType": "CUSTOM",
    "CustomEndpointType": "READER",
    "StaticMembers": [
        "dbinstance1",
        "dbinstance2"
    ],
    "ExcludedMembers": [],
    "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-
endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see CreateDbClusterEndpoint in *AWS CLI Command Reference*.

## `create-db-cluster-parameter-group`

The following code example shows how to use `create-db-cluster-parameter-group`.

### AWS CLI

#### To create a DB cluster parameter group

The following `create-db-cluster-parameter-group` example creates a DB cluster parameter group.

```
aws rds create-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclusterparametergroup \
    --db-parameter-group-family aurora5.6 \
    --description "My new cluster parameter group"
```

Output:

```
{
    "DBClusterParameterGroup": {
        "DBClusterParameterGroupName": "mydbclusterparametergroup",
        "DBParameterGroupFamily": "aurora5.6",
        "Description": "My new cluster parameter group",
        "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:cluster-
pg:mydbclusterparametergroup"
    }
}
```

For more information, see Creating a DB Cluster Parameter Group in the *Amazon Aurora User Guide*.

- For API details, see CreateDbClusterParameterGroup in *AWS CLI Command Reference*.

## `create-db-cluster-snapshot`

The following code example shows how to use `create-db-cluster-snapshot`.

### AWS CLI

#### To create a DB cluster snapshot

The following `create-db-cluster-snapshot` example creates a DB cluster snapshot.

```
aws rds create-db-cluster-snapshot \
    --db-cluster-identifier mydbcluster \
    --db-cluster-snapshot-identifier mydbclustersnapshot
```

Output:

```
{
```

```
    "DBClusterSnapshot": {
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1e"
        ],
        "DBClusterSnapshotIdentifier": "mydbclustersnapshot",
        "DBClusterIdentifier": "mydbcluster",
        "SnapshotCreateTime": "2019-06-18T21:21:00.469Z",
        "Engine": "aurora-mysql",
        "AllocatedStorage": 1,
        "Status": "creating",
        "Port": 0,
        "VpcId": "vpc-6594f31c",
        "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
        "MasterUsername": "myadmin",
        "EngineVersion": "5.7.mysql_aurora.2.04.2",
        "LicenseModel": "aurora-mysql",
        "SnapshotType": "manual",
        "PercentProgress": 0,
        "StorageEncrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBClusterSnapshotArn": "arn:aws:rds:us-east-1:123456789012:cluster-
snapshot:mydbclustersnapshot",
        "IAMDatabaseAuthenticationEnabled": false
    }
}
```

For more information, see Creating a DB Cluster Snapshot in the *Amazon Aurora User Guide*.

- For API details, see CreateDbClusterSnapshot in *AWS CLI Command Reference*.

## `create-db-cluster`

The following code example shows how to use `create-db-cluster`.

### AWS CLI

#### Example 1: To create a MySQL 5.7--compatible DB cluster

The following `create-db-cluster` example creates a MySQL 5.7-compatible DB cluster using the default engine version. Replace the sample password `secret99` with a secure password. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer

DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-cluster \
    --db-cluster-identifier sample-cluster \
    --engine aurora-mysql \
    --engine-version 5.7 \
    --master-username admin \
    --master-user-password secret99 \
    --db-subnet-group-name default \
    --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```
{
    "DBCluster": {
        "DBSubnetGroup": "default",
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-0b9130572daf3dc16",
                "Status": "active"
            }
        ],
        "AllocatedStorage": 1,
        "AssociatedRoles": [],
        "PreferredBackupWindow": "09:12-09:42",
        "ClusterCreateTime": "2023-02-27T23:21:33.048Z",
        "DeletionProtection": false,
        "IAMDatabaseAuthenticationEnabled": false,
        "ReadReplicaIdentifiers": [],
        "EngineMode": "provisioned",
        "Engine": "aurora-mysql",
        "StorageEncrypted": false,
        "MultiAZ": false,
        "PreferredMaintenanceWindow": "mon:04:31-mon:05:01",
        "HttpEndpointEnabled": false,
        "BackupRetentionPeriod": 1,
        "DbClusterResourceId": "cluster-ANPAJ4AE5446DAEXAMPLE",
        "DBClusterIdentifier": "sample-cluster",
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
```

```
            "us-east-1e"
        ],
        "MasterUsername": "master",
        "EngineVersion": "5.7.mysql_aurora.2.11.1",
        "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:sample-cluster",
        "DBClusterMembers": [],
        "Port": 3306,
        "Status": "creating",
        "Endpoint": "sample-cluster.cluster-cnpexample.us-east-1.rds.amazonaws.com",
        "DBClusterParameterGroup": "default.aurora-mysql5.7",
        "HostedZoneId": "Z2R2ITUGPM61AM",
        "ReaderEndpoint": "sample-cluster.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
        "CopyTagsToSnapshot": false
    }
}
```

**Example 2: To create a PostgreSQL--compatible DB cluster**

The following `create-db-cluster` example creates a PostgreSQL-compatible DB cluster using the default engine version. Replace the example password `secret99` with a secure password. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-cluster \
    --db-cluster-identifier sample-pg-cluster \
    --engine aurora-postgresql \
    --master-username master \
    --master-user-password secret99 \
    --db-subnet-group-name default \
    --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```
{
    "DBCluster": {
        "Endpoint": "sample-pg-cluster.cluster-cnpexample.us-
east-1.rds.amazonaws.com",
        "HttpEndpointEnabled": false,
        "DBClusterMembers": [],
```

```
        "EngineMode": "provisioned",
        "CopyTagsToSnapshot": false,
        "HostedZoneId": "Z2R2ITUGPM61AM",
        "IAMDatabaseAuthenticationEnabled": false,
        "AllocatedStorage": 1,
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-0b9130572daf3dc16",
                "Status": "active"
            }
        ],
        "DeletionProtection": false,
        "StorageEncrypted": false,
        "BackupRetentionPeriod": 1,
        "PreferredBackupWindow": "09:56-10:26",
        "ClusterCreateTime": "2023-02-27T23:26:08.371Z",
        "DBClusterParameterGroup": "default.aurora-postgresql13",
        "EngineVersion": "13.7",
        "Engine": "aurora-postgresql",
        "Status": "creating",
        "DBClusterIdentifier": "sample-pg-cluster",
        "MultiAZ": false,
        "Port": 5432,
        "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:sample-pg-
cluster",
        "AssociatedRoles": [],
        "DbClusterResourceId": "cluster-ANPAJ4AE5446DAEXAMPLE",
        "PreferredMaintenanceWindow": "wed:03:33-wed:04:03",
        "ReaderEndpoint": "sample-pg-cluster.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
        "MasterUsername": "master",
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1c"
        ],
        "ReadReplicaIdentifiers": [],
        "DBSubnetGroup": "default"
    }
}
```

For more information, see Creating an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see CreateDbCluster in *AWS CLI Command Reference*.

### `create-db-instance-read-replica`

The following code example shows how to use `create-db-instance-read-replica`.

**AWS CLI**

**To create a DB instance read replica**

This example creates a read replica of an existing DB instance named `test-instance`. The read replica is named `test-instance-repl`.

```
aws rds create-db-instance-read-replica \
    --db-instance-identifier test-instance-repl \
    --source-db-instance-identifier test-instance
```

Output:

```
{
    "DBInstance": {
        "IAMDatabaseAuthenticationEnabled": false,
        "MonitoringInterval": 0,
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance-repl",
        "ReadReplicaSourceDBInstanceIdentifier": "test-instance",
        "DBInstanceIdentifier": "test-instance-repl",
        ...some output truncated...
    }
}
```

- For API details, see CreateDbInstanceReadReplica in *AWS CLI Command Reference*.

### `create-db-instance`

The following code example shows how to use `create-db-instance`.

**AWS CLI**

**To create a DB instance**

The following `create-db-instance` example uses the required options to launch a new DB instance.

```
aws rds create-db-instance \
    --db-instance-identifier test-mysql-instance \
    --db-instance-class db.t3.micro \
    --engine mysql \
    --master-username admin \
    --master-user-password secret99 \
    --allocated-storage 20
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-mysql-instance",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "mysql",
        "DBInstanceStatus": "creating",
        "MasterUsername": "admin",
        "AllocatedStorage": 20,
        "PreferredBackupWindow": "12:55-13:25",
        "BackupRetentionPeriod": 1,
        "DBSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-12345abc",
                "Status": "active"
            }
        ],
        "DBParameterGroups": [
            {
                "DBParameterGroupName": "default.mysql5.7",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "DBSubnetGroup": {
            "DBSubnetGroupName": "default",
            "DBSubnetGroupDescription": "default",
            "VpcId": "vpc-2ff2ff2f",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {

    }
}
```

For more information, see Creating an Amazon RDS DB Instance in the *Amazon RDS User Guide*.

- For API details, see CreateDBInstance in *AWS CLI Command Reference*.

### `create-db-parameter-group`

The following code example shows how to use `create-db-parameter-group`.

#### AWS CLI

**To create a DB parameter group**

The following `create-db-parameter-group` example creates a DB parameter group.

```
aws rds create-db-parameter-group \
    --db-parameter-group-name mydbparametergroup \
    --db-parameter-group-family MySQL5.6 \
    --description "My new parameter group"
```

Output:

```
{
    "DBParameterGroup": {
        "DBParameterGroupName": "mydbparametergroup",
        "DBParameterGroupFamily": "mysql5.6",
        "Description": "My new parameter group",
        "DBParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:pg:mydbparametergroup"
```

```
    }
}
```

For more information, see Creating a DB Parameter Group in the *Amazon RDS User Guide*.

- For API details, see CreateDBParameterGroup in *AWS CLI Command Reference*.

### `create-db-proxy-endpoint`

The following code example shows how to use `create-db-proxy-endpoint`.

#### AWS CLI

**To create a DB proxy endpoint for an RDS database**

The following `create-db-proxy-endpoint` example creates a DB proxy endpoint.

```
aws rds create-db-proxy-endpoint \
    --db-proxy-name proxyExample \
    --db-proxy-endpoint-name "proxyep1" \
    --vpc-subnet-ids subnetgroup1 subnetgroup2
```

Output:

```
{
"DBProxyEndpoint": {
        "DBProxyEndpointName": "proxyep1",
        "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
        "DBProxyName": "proxyExample",
        "Status": "creating",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234",
            "sg-5678"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Endpoint": "proxyep1.endpoint.proxy-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
```

```
        "TargetRole": "READ_WRITE",
        "IsDefault": false
    }
}
```

For more information, see Creating a proxy endpoint in the *Amazon RDS User Guide* and Creating a proxy endpoint in the *Amazon Aurora User Guide*.

- For API details, see CreateDbProxyEndpoint in *AWS CLI Command Reference*.

### `create-db-proxy`

The following code example shows how to use `create-db-proxy`.

#### AWS CLI

**To create a DB proxy for an RDS database**

The following `create-db-proxy` example creates a DB proxy.

```
aws rds create-db-proxy \
    --db-proxy-name proxyExample \
    --engine-family MYSQL \
    --auth
 Description="proxydescription1",AuthScheme="SECRETS",SecretArn="arn:aws:secretsmanager:us-
west-2:123456789123:secret:secretName-1234f",IAMAuth="DISABLED",ClientPasswordAuthType="MYSQ
 \
    --role-arn arn:aws:iam::123456789123:role/ProxyRole \
    --vpc-subnet-ids subnetgroup1 subnetgroup2
```

Output:

```
{
"DBProxy": {
        "DBProxyName": "proxyExample",
        "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-
proxy:prx-0123a01b12345c0ab",
        "EngineFamily": "MYSQL",
        "VpcId": "vpc-1234567",
        "VpcSecuritytGroupIds": [
            "sg-1234",
            "sg-5678",
            "sg-9101"
```

```
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Auth": "[
            {
                "Description": "proxydescription1",
                "AuthScheme": "SECRETS",
                "SecretArn": "arn:aws:secretsmanager:us-
west-2:123456789123:secret:proxysecret1-Abcd1e",
                "IAMAuth": "DISABLED"
            }
        ]",
        "RoleArn": "arn:aws:iam::12345678912:role/ProxyRole",
        "Endpoint": "proxyExample.proxy-ab0cd1efghij.us-east-1.rds.amazonaws.com",
        "RequireTLS": false,
        "IdleClientTimeout": 1800,
        "DebuggingLogging": false,
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
        "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
    }
}
```

For more information, see Creating an RDS Proxy in the *Amazon RDS User Guide* and Creating an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see CreateDbProxy in *AWS CLI Command Reference*.

### `create-db-security-group`

The following code example shows how to use `create-db-security-group`.

#### AWS CLI

**To create an Amazon RDS DB security group**

The following `create-db-security-group` command creates a new Amazon RDS DB security group:

```
aws rds create-db-security-group --db-security-group-name mysecgroup --db-security-
group-description "My Test Security Group"
```

In the example, the new DB security group is named `mysecgroup` and has a description.

Output:

```
{
    "DBSecurityGroup": {
        "OwnerId": "123456789012",
        "DBSecurityGroupName": "mysecgroup",
        "DBSecurityGroupDescription": "My Test Security Group",
        "VpcId": "vpc-a1b2c3d4",
        "EC2SecurityGroups": [],
        "IPRanges": [],
        "DBSecurityGroupArn": "arn:aws:rds:us-west-2:123456789012:secgrp:mysecgroup"
    }
}
```

- For API details, see CreateDbSecurityGroup in *AWS CLI Command Reference*.

### `create-db-shard-group`

The following code example shows how to use `create-db-shard-group`.

#### AWS CLI

**Example 1: To create an Aurora PostgreSQL primary DB cluster**

The following `create-db-cluster` example creates an Aurora PostgreSQL SQL primary DB cluster that's compatible with Aurora Serverless v2 and Aurora Limitless Database.

```
aws rds create-db-cluster \
    --db-cluster-identifier my-sv2-cluster \
    --engine aurora-postgresql \
    --engine-version 15.2-limitless \
    --storage-type aurora-iopt1 \
    --serverless-v2-scaling-configuration MinCapacity=2,MaxCapacity=16 \
    --enable-limitless-database \
    --master-username myuser \
    --master-user-password mypassword \
    --enable-cloudwatch-logs-exports postgresql
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-east-2b",
            "us-east-2c",
            "us-east-2a"
        ],
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "my-sv2-cluster",
        "DBClusterParameterGroup": "default.aurora-postgresql15",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "my-sv2-cluster.cluster-cekycexample.us-
east-2.rds.amazonaws.com",
        "ReaderEndpoint": "my-sv2-cluster.cluster-ro-cekycexample.us-
east-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-postgresql",
        "EngineVersion": "15.2-limitless",
        "Port": 5432,
        "MasterUsername": "myuser",
        "PreferredBackupWindow": "06:05-06:35",
        "PreferredMaintenanceWindow": "mon:08:25-mon:08:55",
        "ReadReplicaIdentifiers": [],
        "DBClusterMembers": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-########",
                "Status": "active"
            }
        ],
        "HostedZoneId": "Z2XHWR1EXAMPLE",
        "StorageEncrypted": false,
        "DbClusterResourceId": "cluster-XYEDT6ML6FHIXH4Q2J1EXAMPLE",
        "DBClusterArn": "arn:aws:rds:us-east-2:123456789012:cluster:my-sv2-cluster",
        "AssociatedRoles": [],
        "IAMDatabaseAuthenticationEnabled": false,
        "ClusterCreateTime": "2024-02-19T16:24:07.771000+00:00",
        "EnabledCloudwatchLogsExports": [
            "postgresql"
        ],
        "EngineMode": "provisioned",
```

```
        "DeletionProtection": false,
        "HttpEndpointEnabled": false,
        "CopyTagsToSnapshot": false,
        "CrossAccountClone": false,
        "DomainMemberships": [],
        "TagList": [],
        "StorageType": "aurora-iopt1",
        "AutoMinorVersionUpgrade": true,
        "ServerlessV2ScalingConfiguration": {
            "MinCapacity": 2.0,
            "MaxCapacity": 16.0
        },
        "NetworkType": "IPV4",
        "IOOptimizedNextAllowedModificationTime":
 "2024-03-21T16:24:07.781000+00:00",
        "LimitlessDatabase": {
            "Status": "not-in-use",
            "MinRequiredACU": 96.0
        }
    }
}
```

**Example 2: To create the primary (writer) DB instance**

The following `create-db-instance` example creates an Aurora Serverless v2 primary (writer) DB instance. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-instance \
    --db-instance-identifier my-sv2-instance \
    --db-cluster-identifier my-sv2-cluster \
    --engine aurora-postgresql \
    --db-instance-class db.serverless
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "my-sv2-instance",
        "DBInstanceClass": "db.serverless",
```

```
        "Engine": "aurora-postgresql",
        "DBInstanceStatus": "creating",
        "MasterUsername": "myuser",
        "AllocatedStorage": 1,
        "PreferredBackupWindow": "06:05-06:35",
        "BackupRetentionPeriod": 1,
        "DBSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-########",
                "Status": "active"
            }
        ],
        "DBParameterGroups": [
            {
                "DBParameterGroupName": "default.aurora-postgresql15",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "DBSubnetGroup": {
            "DBSubnetGroupName": "default",
            "DBSubnetGroupDescription": "default",
            "VpcId": "vpc-########",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-########",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-2c"
                    },
                    "SubnetOutpost": {},
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-########",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-2a"
                    },
                    "SubnetOutpost": {},
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-########",
                    "SubnetAvailabilityZone": {
```

```
                    "Name": "us-east-2b"

        },
        "DedicatedLogVolume": false
    }
}
```

**Example 3: To create the DB shard group**

The following `create-db-shard-group` example creates a DB shard group in your Aurora PostgreSQL primary DB cluster.

```
aws rds create-db-shard-group \
    --db-shard-group-identifier my-db-shard-group \
    --db-cluster-identifier my-sv2-cluster \
    --max-acu 768
```

Output:

```
{
    "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
    "DBShardGroupIdentifier": "my-db-shard-group",
    "DBClusterIdentifier": "my-sv2-cluster",
    "MaxACU": 768.0,
    "ComputeRedundancy": 0,
    "Status": "creating",
    "PubliclyAccessible": false,
    "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-east-2.rds.amazonaws.com"
}
```

For more information, see Using Aurora Serverless v2 in the *Amazon Aurora User Guide*.

- For API details, see CreateDbShardGroup in *AWS CLI Command Reference*.

## `create-db-snapshot`

The following code example shows how to use `create-db-snapshot`.

## AWS CLI

### To create a DB snapshot

The following `create-db-snapshot` example creates a DB snapshot.

```
aws rds create-db-snapshot \
    --db-instance-identifier database-mysql \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBInstanceIdentifier": "database-mysql",
        "Engine": "mysql",
        "AllocatedStorage": 100,
        "Status": "creating",
        "Port": 3306,
        "AvailabilityZone": "us-east-1b",
        "VpcId": "vpc-6594f31c",
        "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
        "MasterUsername": "admin",
        "EngineVersion": "5.6.40",
        "LicenseModel": "general-public-license",
        "SnapshotType": "manual",
        "Iops": 1000,
        "OptionGroupName": "default:mysql-5-6",
        "PercentProgress": 0,
        "StorageType": "io1",
        "Encrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBSnapshotArn": "arn:aws:rds:us-east-1:123456789012:snapshot:mydbsnapshot",
        "IAMDatabaseAuthenticationEnabled": false,
        "ProcessorFeatures": [],
        "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
    }
}
```

For more information, see Creating a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see CreateDBSnapshot in *AWS CLI Command Reference*.

### `create-db-subnet-group`

The following code example shows how to use `create-db-subnet-group`.

**AWS CLI**

**To create a DB subnet group**

The following `create-db-subnet-group` example creates a DB subnet group called `mysubnetgroup` using existing subnets.

```
aws rds create-db-subnet-group \
    --db-subnet-group-name mysubnetgroup \
    --db-subnet-group-description "test DB subnet group" \
    --subnet-ids
 '["subnet-0a1dc4e1a6f123456","subnet-070dd7ecb3aaaaaaa","subnet-00f5b198bc0abcdef"]'
```

Output:

```
{
    "DBSubnetGroup": {
        "DBSubnetGroupName": "mysubnetgroup",
        "DBSubnetGroupDescription": "test DB subnet group",
        "VpcId": "vpc-0f08e7610a1b2c3d4",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-070dd7ecb3aaaaaaa",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-00f5b198bc0abcdef",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-0a1dc4e1a6f123456",
                "SubnetAvailabilityZone": {
```

```
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            }
        ],
        "DBSubnetGroupArn": "arn:aws:rds:us-
west-2:0123456789012:subgrp:mysubnetgroup"
    }
}
```

For more information, see Creating a DB Instance in a VPC in the *Amazon RDS User Guide*.

- For API details, see CreateDbSubnetGroup in *AWS CLI Command Reference*.

### `create-event-subscription`

The following code example shows how to use `create-event-subscription`.

#### AWS CLI

**To create an event subscription**

The following `create-event-subscription` example creates a subscription for backup and recovery events for DB instances in the current AWS account. Notifications are sent to an Amazon Simple Notification Service topic, specified by `--sns-topic-arn`.

```
aws rds create-event-subscription \
    --subscription-name my-instance-events \
    --source-type db-instance \
    --event-categories '["backup","recovery"]' \
    --sns-topic-arn arn:aws:sns:us-east-1:123456789012:interesting-events
```

Output:

```
{
    "EventSubscription": {
        "Status": "creating",
        "CustSubscriptionId": "my-instance-events",
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
```

```
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "CustomerAwsId": "123456789012",
        "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
        "SourceType": "db-instance",
        "Enabled": true
    }
}
```

- For API details, see CreateEventSubscription in *AWS CLI Command Reference*.

### `create-global-cluster`

The following code example shows how to use `create-global-cluster`.

#### AWS CLI

**To create a global DB cluster**

The following `create-global-cluster` example creates a new Aurora MySQL-compatible global DB cluster.

```
aws rds create-global-cluster \
    --global-cluster-identifier myglobalcluster \
    --engine aurora-mysql
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": false,
        "GlobalClusterMembers": []
    }
}
```

For more information, see Creating an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see CreateGlobalCluster in *AWS CLI Command Reference*.

### `create-option-group`

The following code example shows how to use `create-option-group`.

**AWS CLI**

**To Create an Amazon RDS option group**

The following `create-option-group` command creates a new Amazon RDS option group for `Oracle Enterprise Edition` version `11.2`, is named ``MyOptionGroup`` and includes a description.

```
aws rds create-option-group \
    --option-group-name MyOptionGroup \
    --engine-name oracle-ee \
    --major-engine-version 11.2 \
    --option-group-description "Oracle Database Manager Database Control"
```

Output:

```
{
    "OptionGroup": {
        "OptionGroupName": "myoptiongroup",
        "OptionGroupDescription": "Oracle Database Manager Database Control",
        "EngineName": "oracle-ee",
        "MajorEngineVersion": "11.2",
        "Options": [],
        "AllowsVpcAndNonVpcInstanceMemberships": true,
        "OptionGroupArn": "arn:aws:rds:us-west-2:123456789012:og:myoptiongroup"
    }
}
```

- For API details, see CreateOptionGroup in *AWS CLI Command Reference*.

### `delete-blue-green-deployment`

The following code example shows how to use `delete-blue-green-deployment`.

## AWS CLI

### Example 1: To delete resources in green environment for an RDS for MySQL DB instance

The following `delete-blue-green-deployment` example deletes the resources in a green environment for an RDS for MySQL DB instance.

```
aws rds delete-blue-green-deployment \
    --blue-green-deployment-identifier bgd-v53303651eexfake \
    --delete-target
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",
        "Source": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
        "Target": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-green-
rkfbpe",
        "SwitchoverDetails": [
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance",
                "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance-green-rkfbpe",
                "Status": "AVAILABLE"
            },
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance-replica-1",
                "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance-replica-1-green-j382ha",
                "Status": "AVAILABLE"
            },
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-

            },
            {
                "Name": "CONFIGURE_BACKUPS",
                "Status": "COMPLETED"
            },
            {
                "Name": "CREATING_TOPOLOGY_OF_SOURCE",
                "Status": "COMPLETED"
            }
        ],
        "Status": "DELETING",
        "CreateTime": "2022-02-25T21:18:51.183000+00:00",
        "DeleteTime": "2022-02-25T22:25:31.331000+00:00"
    }
}
```

For more information, see Deleting a blue/green deployment in the *Amazon RDS User Guide*.

**Example 2: To delete resources in green environment for an Aurora MySQL DB cluster**

The following `delete-blue-green-deployment` example deletes the resources in a green environment for an Aurora MySQL DB cluster.

```
aws rds delete-blue-green-deployment \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
    --delete-target
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
        "BlueGreenDeploymentName": "my-blue-green-deployment",
        "Source": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-
cluster",

    }
}
```

For more information, see Deleting a blue/green deployment in the *Amazon Aurora User Guide*.

- For API details, see DeleteBlueGreenDeployment in *AWS CLI Command Reference*.

## `delete-db-cluster-endpoint`

The following code example shows how to use `delete-db-cluster-endpoint`.

### AWS CLI

#### To delete a custom DB cluster endpoint

The following `delete-db-cluster-endpoint` example deletes the specified custom DB cluster endpoint.

```
aws rds delete-db-cluster-endpoint \
    --db-cluster-endpoint-identifier mycustomendpoint
```

Output:

```
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
    "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-
east-1.rds.amazonaws.com",
    "Status": "deleting",
    "EndpointType": "CUSTOM",
    "CustomEndpointType": "READER",
    "StaticMembers": [
        "dbinstance1",
        "dbinstance2",
        "dbinstance3"
    ],
    "ExcludedMembers": [],
    "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-
endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbClusterEndpoint in *AWS CLI Command Reference*.

## `delete-db-cluster-parameter-group`

The following code example shows how to use `delete-db-cluster-parameter-group`.

### AWS CLI

#### To delete a DB cluster parameter group

The following `delete-db-cluster-parameter-group` example deletes the specified DB cluster parameter group.

```
aws rds delete-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclusterparametergroup
```

This command produces no output.

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbClusterParameterGroup in *AWS CLI Command Reference*.

### `delete-db-cluster-snapshot`

The following code example shows how to use `delete-db-cluster-snapshot`.

#### AWS CLI

**To delete a DB cluster snapshot**

The following `delete-db-cluster-snapshot` example deletes the specified DB cluster snapshot.

```
aws rds delete-db-cluster-snapshot \
    --db-cluster-snapshot-identifier mydbclustersnapshot
```

Output:

```
{
    "DBClusterSnapshot": {
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1e"
        ],
        "DBClusterSnapshotIdentifier": "mydbclustersnapshot",
        "DBClusterIdentifier": "mydbcluster",
        "SnapshotCreateTime": "2019-06-18T21:21:00.469Z",
        "Engine": "aurora-mysql",
        "AllocatedStorage": 0,
        "Status": "available",
        "Port": 0,
        "VpcId": "vpc-6594f31c",
```

```
        "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
        "MasterUsername": "myadmin",
        "EngineVersion": "5.7.mysql_aurora.2.04.2",
        "LicenseModel": "aurora-mysql",
        "SnapshotType": "manual",
        "PercentProgress": 100,
        "StorageEncrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBClusterSnapshotArn": "arn:aws:rds:us-east-1:123456789012:cluster-
snapshot:mydbclustersnapshot",
        "IAMDatabaseAuthenticationEnabled": false
    }
}
```

For more information, see Deleting a Snapshot in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbClusterSnapshot in *AWS CLI Command Reference*.

### `delete-db-cluster`

The following code example shows how to use `delete-db-cluster`.

#### AWS CLI

**Example 1: To delete a DB instance in a DB cluster**

The following `delete-db-instance` example deletes the final DB instance in a DB cluster. You can't delete a DB cluster if it contains DB instances that aren't in the **deleting** state. You can't take a final snapshot when deleting a DB instance in a DB cluster.

```
aws rds delete-db-instance \
    --db-instance-identifier database-3
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "database-3",
        "DBInstanceClass": "db.r4.large",
        "Engine": "aurora-postgresql",
        "DBInstanceStatus": "deleting",
```

```
    ...output omitted...

    }
}
```

For more information, see Deleting a DB Instance in an Aurora DB Cluster in the *Amazon Aurora User Guide*.

**Example 2: To delete a DB cluster**

The following `delete-db-cluster` example deletes the DB cluster named `mycluster` and takes a final snapshot named `mycluster-final-snapshot`. The status of the DB cluster is **available** while the snapshot is being taken. To follow the progress of the deletion, use the `describe-db-clusters` CLI command.

```
aws rds delete-db-cluster \
    --db-cluster-identifier mycluster \
    --no-skip-final-snapshot \
    --final-db-snapshot-identifier mycluster-final-snapshot
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 20,
        "AvailabilityZones": [
            "eu-central-1b",
            "eu-central-1c",
            "eu-central-1a"
        ],
        "BackupRetentionPeriod": 7,
        "DBClusterIdentifier": "mycluster",
        "DBClusterParameterGroup": "default.aurora-postgresql10",
        "DBSubnetGroup": "default-vpc-aa11bb22",
        "Status": "available",

    ...output omitted...

    }
}
```

For more information, see Aurora Clusters with a Single DB Instance in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbCluster in *AWS CLI Command Reference*.

### `delete-db-instance-automated-backup`

The following code example shows how to use `delete-db-instance-automated-backup`.

**AWS CLI**

**To delete a replicated automated backup from a Region**

The following `delete-db-instance-automated-backup` example deletes the automated backup with the specified Amazon Resource Name (ARN).

```
aws rds delete-db-instance-automated-backup \
    --db-instance-automated-backups-arn "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
```

Output:

```
{
    "DBInstanceAutomatedBackup": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
        "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
        "Region": "us-east-1",
        "DBInstanceIdentifier": "new-orcl-db",
        "RestoreWindow": {},
        "AllocatedStorage": 20,
        "Status": "deleting",
        "Port": 1521,
        "AvailabilityZone": "us-east-1b",
        "VpcId": "vpc-########",
        "InstanceCreateTime": "2020-12-04T15:28:31Z",
        "MasterUsername": "admin",
        "Engine": "oracle-se2",
        "EngineVersion": "12.1.0.2.v21",
        "LicenseModel": "bring-your-own-license",
        "OptionGroupName": "default:oracle-se2-12-1",
        "Encrypted": false,
        "StorageType": "gp2",
```

```
        "IAMDatabaseAuthenticationEnabled": false,
        "BackupRetentionPeriod": 7,
        "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
    }
}
```

For more information, see Deleting replicated backups in the *Amazon RDS User Guide*.

- For API details, see DeleteDbInstanceAutomatedBackup in *AWS CLI Command Reference*.

### `delete-db-instance`

The following code example shows how to use `delete-db-instance`.

#### AWS CLI

**To delete a DB instance**

The following `delete-db-instance` example deletes the specified DB instance after creating a final DB snapshot named `test-instance-final-snap`.

```
aws rds delete-db-instance \
    --db-instance-identifier test-instance \
    --final-db-snapshot-identifier test-instance-final-snap
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-instance",
        "DBInstanceStatus": "deleting",
        ...some output truncated...
    }
}
```

- For API details, see DeleteDBInstance in *AWS CLI Command Reference*.

### `delete-db-parameter-group`

The following code example shows how to use `delete-db-parameter-group`.

**AWS CLI**

**To delete a DB parameter group**

The following command example deletes a DB parameter group.

```
aws rds delete-db-parameter-group \
    --db-parameter-group-name mydbparametergroup
```

This command produces no output.

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DeleteDBParameterGroup in *AWS CLI Command Reference*.

## `delete-db-proxy-endpoint`

The following code example shows how to use `delete-db-proxy-endpoint`.

**AWS CLI**

**To delete a DB proxy endpoint for an RDS database**

The following `delete-db-proxy-endpoint` example deletes a DB proxy endpoint for the target database.

```
aws rds delete-db-proxy-endpoint \
    --db-proxy-endpoint-name proxyEP1
```

Output:

```
{
"DBProxyEndpoint":
    {
        "DBProxyEndpointName": "proxyEP1",
        "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
        "DBProxyName": "proxyExample",
        "Status": "deleting",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234",
```

```
            "sg-5678"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Endpoint": "proxyEP1.endpoint.proxy-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
        "CreatedDate": "2023-04-13T01:49:38.568000+00:00",
        "TargetRole": "READ_ONLY",
        "IsDefault": false
    }
}
```

For more information, see Deleting a proxy endpoint in the *Amazon RDS User Guide* and Deleting a proxy endpoint in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbProxyEndpoint in *AWS CLI Command Reference*.

### `delete-db-proxy`

The following code example shows how to use `delete-db-proxy`.

#### AWS CLI

**To delete a DB proxy for an RDS database**

The following `delete-db-proxy` example deletes a DB proxy.

```
aws rds delete-db-proxy \
    --db-proxy-name proxyExample
```

Output:

```
{
        "DBProxy":
        {
            "DBProxyName": "proxyExample",
            "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-
proxy:prx-0123a01b12345c0ab",
            "Status": "deleting",

For more information, see Deleting an RDS Proxy in the *Amazon RDS User Guide* and Deleting an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbProxy in *AWS CLI Command Reference*.

## `delete-db-security-group`

The following code example shows how to use `delete-db-security-group`.

### AWS CLI

#### To delete a DB security group

The following `delete-db-security-group` example deletes a DB security group named `mysecuritygroup`.

```
aws rds delete-db-security-group \
    --db-security-group-name mysecuritygroup
```

This command produces no output.

For more information, see Working with DB security groups (EC2-Classic platform) in the *Amazon RDS User Guide*.

- For API details, see DeleteDbSecurityGroup in *AWS CLI Command Reference*.

### `delete-db-shard-group`

The following code example shows how to use `delete-db-shard-group`.

#### AWS CLI

**Example 1: To delete a DB shard group unsuccessfully**

The following `delete-db-shard-group` example shows the error that occurs when you try to delete a DB shard group before deleting all of your databases and schemas.

```
aws rds delete-db-shard-group \
    --db-shard-group-identifier limitless-test-shard-grp
```

Output:

```
An error occurred (InvalidDBShardGroupState) when calling the DeleteDBShardGroup
 operation: Unable to delete the DB shard group limitless-test-db-shard-group.
Delete all of your Limitless Database databases and schemas, then try again.
```

**Example 2: To delete a DB shard group successfully**

The following `delete-db-shard-group` example deletes a DB shard group after you've deleted all of your databases and schemas, including the `public` schema.

```
aws rds delete-db-shard-group \
    --db-shard-group-identifier limitless-test-shard-grp
```

Output:

```
{
```

```
    "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
    "DBShardGroupIdentifier": "limitless-test-shard-grp",
    "DBClusterIdentifier": "limitless-test-cluster",
    "MaxACU": 768.0,
    "ComputeRedundancy": 0,
    "Status": "deleting",
    "PubliclyAccessible": true,
    "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
}
```

For more information, see Deleting Aurora DB clusters and DB instances in the *Amazon Aurora User Guide*.

- For API details, see DeleteDbShardGroup in *AWS CLI Command Reference*.

### `delete-db-snapshot`

The following code example shows how to use `delete-db-snapshot`.

#### AWS CLI

**To delete a DB snapshot**

The following `delete-db-snapshot` example deletes the specified DB snapshot.

```
aws rds delete-db-snapshot \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBInstanceIdentifier": "database-mysql",
        "SnapshotCreateTime": "2019-06-18T22:08:40.702Z",

        "VpcId": "vpc-6594f31c",
        "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
```

```
        "MasterUsername": "admin",
        "EngineVersion": "5.6.40",
        "LicenseModel": "general-public-license",
        "SnapshotType": "manual",
        "Iops": 1000,
        "OptionGroupName": "default:mysql-5-6",
        "PercentProgress": 100,
        "StorageType": "io1",
        "Encrypted": true,
        "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
        "DBSnapshotArn": "arn:aws:rds:us-east-1:123456789012:snapshot:mydbsnapshot",
        "IAMDatabaseAuthenticationEnabled": false,
        "ProcessorFeatures": [],
        "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
    }
}
```

For more information, see Deleting a Snapshot in the *Amazon RDS User Guide*.

- For API details, see DeleteDbSnapshot in *AWS CLI Command Reference*.

### `delete-db-subnet-group`

The following code example shows how to use `delete-db-subnet-group`.

#### AWS CLI

**To delete a DB subnet group**

The following `delete-db-subnet-group` example deletes the DB subnet group called `mysubnetgroup`.

```
aws rds delete-db-subnet-group --db-subnet-group-name mysubnetgroup
```

This command produces no output.

For more information, see Working with a DB Instance in a VPC in the *Amazon RDS User Guide*.

- For API details, see DeleteDbSubnetGroup in *AWS CLI Command Reference*.

### `delete-event-subscription`

The following code example shows how to use `delete-event-subscription`.

**AWS CLI**

**To delete an event subscription**

The following `delete-event-subscription` example deletes the specified event subscription.

```
aws rds delete-event-subscription --subscription-name my-instance-events
```

Output:

```
{
    "EventSubscription": {
        "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
        "CustomerAwsId": "123456789012",
        "Enabled": false,
        "SourceIdsList": [
            "test-instance"
        ],
        "SourceType": "db-instance",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "SubscriptionCreationTime": "2018-07-31 23:22:01.893",
        "CustSubscriptionId": "my-instance-events",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "Status": "deleting"
    }
}
```

- For API details, see DeleteEventSubscription in *AWS CLI Command Reference*.

## `delete-global-cluster`

The following code example shows how to use `delete-global-cluster`.

**AWS CLI**

**To delete a global DB cluster**

The following `delete-global-cluster` example deletes an Aurora MySQL-compatible global DB cluster. The output shows the cluster that you're deleting, but subsequent `describe-global-clusters` commands don't list that DB cluster.

```
aws rds delete-global-cluster \
    --global-cluster-identifier myglobalcluster
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": false,
        "GlobalClusterMembers": []
    }
}
```

For more information, see Deleting an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see DeleteGlobalCluster in *AWS CLI Command Reference*.

### `delete-option-group`

The following code example shows how to use `delete-option-group`.

#### AWS CLI

**To delete an option group**

The following `delete-option-group` example deletes the specified option group.

```
aws rds delete-option-group \
    --option-group-name myoptiongroup
```

This command produces no output.

For more information, see Deleting an Option Group in the *Amazon RDS User Guide*.

- For API details, see DeleteOptionGroup in *AWS CLI Command Reference*.

### `deregister-db-proxy-targets`

The following code example shows how to use `deregister-db-proxy-targets`.

**AWS CLI**

**To deregister a DB proxy target from database target group**

The following `deregister-db-proxy-targets` example removes the association between the proxy `proxyExample` and its target.

```
aws rds deregister-db-proxy-targets \
    --db-proxy-name proxyExample \
    --db-instance-identifiers database-1
```

This command produces no output.

For more information, see Deleting an RDS Proxy in the *Amazon RDS User Guide* and Deleting an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see DeregisterDbProxyTargets in *AWS CLI Command Reference*.

### `describe-account-attributes`

The following code example shows how to use `describe-account-attributes`.

**AWS CLI**

**To describe account attributes**

The following `describe-account-attributes` example retrieves the attributes for the current AWS account.

```
aws rds describe-account-attributes
```

Output:

```
{
    "AccountQuotas": [
        {
            "Max": 40,
            "Used": 4,
            "AccountQuotaName": "DBInstances"
        },
        {
            "Max": 40,
            "Used": 0,
            "AccountQuotaName": "ReservedDBInstances"
        },
        {
            "Max": 100000,
            "Used": 40,
            "AccountQuotaName": "AllocatedStorage"
        },
        {
            "Max": 25,
            "Used": 0,
            "AccountQuotaName": "DBSecurityGroups"
        },
        {
            "Max": 20,
            "Used": 0,
            "AccountQuotaName": "AuthorizationsPerDBSecurityGroup"
        },
        {
            "Max": 50,
            "Used": 1,
            "AccountQuotaName": "DBParameterGroups"
        },
        {
            "Max": 100,
            "Used": 3,
            "AccountQuotaName": "ManualSnapshots"
        },
        {
            "Max": 20,
            "Used": 0,
            "AccountQuotaName": "EventSubscriptions"
        },
```

```
        {
            "Max": 50,
            "Used": 1,
            "AccountQuotaName": "DBSubnetGroups"
        },
        {
            "Max": 20,
            "Used": 1,
            "AccountQuotaName": "OptionGroups"
        },
        {
            "Max": 20,
            "Used": 6,
            "AccountQuotaName": "SubnetsPerDBSubnetGroup"
        },
        {
            "Max": 5,
            "Used": 0,
            "AccountQuotaName": "ReadReplicasPerMaster"
        },
        {
            "Max": 40,
            "Used": 1,
            "AccountQuotaName": "DBClusters"
        },
        {
            "Max": 50,
            "Used": 0,
            "AccountQuotaName": "DBClusterParameterGroups"
        },
        {
            "Max": 5,
            "Used": 0,
            "AccountQuotaName": "DBClusterRoles"
        }
    ]
}
```

- For API details, see DescribeAccountAttributes in *AWS CLI Command Reference*.

### `describe-blue-green-deployments`

The following code example shows how to use `describe-blue-green-deployments`.

## AWS CLI

### Example 1: To describe a blue/green deployment of an RDS DB instance after creation completes

The following `describe-blue-green-deployment` example retrieves the details of a blue/green deployment after creation completes.

```
aws rds describe-blue-green-deployments \
    --blue-green-deployment-identifier bgd-v53303651eexfake
```

Output:

```
{
    "BlueGreenDeployments": [
        {
            "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
            "BlueGreenDeploymentName": "bgd-cli-test-instance",

        }
    ]
}
```

For more information, see Viewing a blue/green deployment in the *Amazon RDS User Guide*.

**Example 2: To describe a blue/green deployment for an Aurora MySQL DB cluster**

The following `describe-blue-green-deployment` example retrieves the details of a blue/green deployment.

```
aws rds describe-blue-green-deployments \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake
```

Output:

```
{
    "BlueGreenDeployments": [
        {
            "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
            "BlueGreenDeploymentName": "my-blue-green-deployment",

        }
    ]
}
```

For more information, see Viewing a blue/green deployment in the *Amazon Aurora User Guide*.

**Example 3: To describe a blue/green deployment for an Aurora MySQL cluster after switchover**

The following `describe-blue-green-deployment` example retrieves the details about a blue/green deployment after the green environment is promoted to be the production environment.

```
aws rds describe-blue-green-deployments \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake
```

Output:

```
{
    "BlueGreenDeployments": [
        {
            "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
            "BlueGreenDeploymentName": "my-blue-green-deployment",

- For API details, see DescribeBlueGreenDeployments in *AWS CLI Command Reference*.

### `describe-certificates`

The following code example shows how to use `describe-certificates`.

#### AWS CLI

**To describe certificates**

The following `describe-certificates` example retrieves the details of the certificate associated with the user's default region.

```
aws rds describe-certificates
```

Output:

```
{
    "Certificates": [
        {
            "CertificateIdentifier": "rds-ca-ecc384-g1",
            "CertificateType": "CA",
            "Thumbprint": "2ee3dcc06e50192559b13929e73484354f23387d",
            "ValidFrom": "2021-05-24T22:06:59+00:00",
            "ValidTill": "2121-05-24T23:06:59+00:00",
            "CertificateArn": "arn:aws:rds:us-west-2::cert:rds-ca-ecc384-g1",
            "CustomerOverride": false
        },
        {
            "CertificateIdentifier": "rds-ca-rsa4096-g1",
```

```
            "CertificateType": "CA",

            "CertificateArn": "arn:aws:rds:us-west-2::cert:rds-ca-2019",
            "CustomerOverride": false
        }
    ],
    "DefaultCertificateForNewLaunches": "rds-ca-rsa2048-g1"
}
```

For more information, see Using SSL/TLS to encrypt a connection to a DB instance in the *Amazon RDS User Guide* and Using SSL/TLS to encrypt a connection to a DB cluster in the *Amazon Aurora User Guide*.

- For API details, see DescribeCertificates in *AWS CLI Command Reference*.

### `describe-db-cluster-backtracks`

The following code example shows how to use `describe-db-cluster-backtracks`.

#### AWS CLI

**To describe backtracks for a DB cluster**

The following `describe-db-cluster-backtracks` example retrieves details about the specified DB cluster.

```
aws rds describe-db-cluster-backtracks \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBClusterBacktracks": [
        {
            "DBClusterIdentifier": "mydbcluster",
            "BacktrackIdentifier": "2f5f5294-0dd2-44c9-9f50-EXAMPLE",
            "BacktrackTo": "2021-02-12T04:59:22Z",
            "BacktrackedFrom": "2021-02-12T14:37:31.640Z",
            "BacktrackRequestCreationTime": "2021-02-12T14:36:18.819Z",
            "Status": "COMPLETED"
        },
        {
            "DBClusterIdentifier": "mydbcluster",
            "BacktrackIdentifier": "3c7a6421-af2a-4ea3-ae95-EXAMPLE",
            "BacktrackTo": "2021-02-11T22:53:46Z",
            "BacktrackedFrom": "2021-02-12T00:09:27.006Z",
            "BacktrackRequestCreationTime": "2021-02-12T00:07:53.487Z",
            "Status": "COMPLETED"
        }
    ]
}
```

For more information, see Backtracking an Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterBacktracks in *AWS CLI Command Reference*.

## `describe-db-cluster-endpoints`

The following code example shows how to use `describe-db-cluster-endpoints`.

### AWS CLI

#### Example 1: To describe DB cluster endpoints

The following `describe-db-cluster-endpoints` example retrieves details for your DB cluster endpoints. The most common kinds of Aurora clusters have two endpoints. One endpoint has type `WRITER`. You can use this endpoint for all SQL statements. The other endpoint has type `READER`. You can use this endpoint only for SELECT and other read-only SQL statements.

```
aws rds describe-db-cluster-endpoints
```

Output:

```
{
    "DBClusterEndpoints": [
        {
            "DBClusterIdentifier": "my-database-1",
            "Endpoint": "my-database-1.cluster-cnpexample.us-
east-1.rds.amazonaws.com",
            "Status": "creating",
            "EndpointType": "WRITER"
        },
        {
            "DBClusterIdentifier": "my-database-1",
            "Endpoint": "my-database-1.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
            "Status": "creating",
            "EndpointType": "READER"
        },
        {
            "DBClusterIdentifier": "mydbcluster",
            "Endpoint": "mydbcluster.cluster-cnpexamle.us-east-1.rds.amazonaws.com",
            "Status": "available",
            "EndpointType": "WRITER"
        },
        {
            "DBClusterIdentifier": "mydbcluster",
            "Endpoint": "mydbcluster.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
            "Status": "available",
            "EndpointType": "READER"
        }
    ]
}
```

**Example 2: To describe DB cluster endpoints of a single DB cluster**

The following `describe-db-cluster-endpoints` example retrieves details for the DB cluster endpoints of a single specified DB cluster. Aurora Serverless clusters have only a single endpoint with a type of `WRITER`.

```
aws rds describe-db-cluster-endpoints \
    --db-cluster-identifier serverless-cluster
```

Output:

```
{
    "DBClusterEndpoints": [
        {
            "Status": "available",
            "Endpoint": "serverless-cluster.cluster-cnpexample.us-
east-1.rds.amazonaws.com",
            "DBClusterIdentifier": "serverless-cluster",
            "EndpointType": "WRITER"
        }
    ]
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterEndpoints in *AWS CLI Command Reference*.

## `describe-db-cluster-parameter-groups`

The following code example shows how to use `describe-db-cluster-parameter-groups`.

### AWS CLI

**To describe DB cluster parameter groups**

The following `describe-db-cluster-parameter-groups` example retrieves details for your DB cluster parameter groups.

```
aws rds describe-db-cluster-parameter-groups
```

Output:

```
{
    "DBClusterParameterGroups": [
        {
            "DBClusterParameterGroupName": "default.aurora-mysql5.7",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "Default cluster parameter group for aurora-mysql5.7",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:default.aurora-mysql5.7"
        },
        {
            "DBClusterParameterGroupName": "default.aurora-postgresql9.6",
            "DBParameterGroupFamily": "aurora-postgresql9.6",
            "Description": "Default cluster parameter group for aurora-
postgresql9.6",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:default.aurora-postgresql9.6"
        },
        {
            "DBClusterParameterGroupName": "default.aurora5.6",
            "DBParameterGroupFamily": "aurora5.6",
            "Description": "Default cluster parameter group for aurora5.6",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:default.aurora5.6"
        },
        {
            "DBClusterParameterGroupName": "mydbclusterpg",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "My DB cluster parameter group",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:mydbclusterpg"
        },
        {
            "DBClusterParameterGroupName": "mydbclusterpgcopy",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "Copy of mydbclusterpg parameter group",
            "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:mydbclusterpgcopy"
        }
    ]
}
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterParameterGroups in *AWS CLI Command Reference*.

### `describe-db-cluster-parameters`

The following code example shows how to use `describe-db-cluster-parameters`.

**AWS CLI**

**Example 1: To describe the parameters in a DB cluster parameter group**

The following `describe-db-cluster-parameters` example retrieves details about the parameters in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name mydbclusterpg
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "allow-suspicious-udfs",
            "Description": "Controls whether user-defined functions that have only
 an xxx symbol for the main function can be loaded",
            "Source": "engine-default",
            "ApplyType": "static",
            "DataType": "boolean",
            "AllowedValues": "0,1",
            "IsModifiable": false,
            "ApplyMethod": "pending-reboot",
            "SupportedEngineModes": [
                "provisioned"
            ]
        },
        {
            "ParameterName": "aurora_lab_mode",
            "ParameterValue": "0",
            "Description": "Enables new features in the Aurora engine.",
            "Source": "engine-default",
            "ApplyType": "static",
            "DataType": "boolean",
            "AllowedValues": "0,1",
            "IsModifiable": true,
```

```
            "ApplyMethod": "pending-reboot",
            "SupportedEngineModes": [
                "provisioned"
            ]
        },
        ...some output truncated...
    ]
}
```

**Example 2: To list only the parameter names in a DB cluster parameter group**

The following `describe-db-cluster-parameters` example retrieves only the names of the parameters in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].{ParameterName:ParameterName}'
```

Output:

```
[
    {
        "ParameterName": "allow-suspicious-udfs"
    },
    {
        "ParameterName": "aurora_binlog_read_buffer_size"
    },
    {
        "ParameterName": "aurora_binlog_replication_max_yield_seconds"
    },
    {
        "ParameterName": "aurora_binlog_use_large_read_buffer"
    },
    {
        "ParameterName": "aurora_lab_mode"
    },

    ...some output truncated...
    }
]
```

**Example 3: To describe only the modifiable parameters in a DB cluster parameter group**

The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
    --query 'Parameters[].{ParameterName:ParameterName,IsModifiable:IsModifiable} |
 [?IsModifiable == `true`]'
```

Output:

```
[
    {
        "ParameterName": "aurora_binlog_read_buffer_size",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_binlog_replication_max_yield_seconds",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_binlog_use_large_read_buffer",
        "IsModifiable": true
    },
    {
        "ParameterName": "aurora_lab_mode",
        "IsModifiable": true
    },

    ...some output truncated...
    }
]
```

**Example 4: To describe only the modifable Boolean parameters in a DB cluster parameter group**

The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group and that have a Boolean data type.

```
aws rds describe-db-cluster-parameters \
    --db-cluster-parameter-group-name default.aurora-mysql5.7 \
```

```
    --query 'Parameters[].
{ParameterName:ParameterName,DataType:DataType,IsModifiable:IsModifiable} | [?
DataType == `boolean`] | [?IsModifiable == `true`]'
```

Output:

```
[
    {
        "DataType": "boolean",
        "ParameterName": "aurora_binlog_use_large_read_buffer",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "aurora_lab_mode",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "autocommit",
        "IsModifiable": true
    },
    {
        "DataType": "boolean",
        "ParameterName": "automatic_sp_privileges",
        "IsModifiable": true
    },
    ...some output truncated...
    }
]
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterParameters in *AWS CLI Command Reference*.

### `describe-db-cluster-snapshot-attributes`

The following code example shows how to use `describe-db-cluster-snapshot-attributes`.

#### AWS CLI

**To describe the attribute names and values for a DB cluster snapshot**

The following `describe-db-cluster-snapshot-attributes` example retrieves details of the attribute names and values for the specified DB cluster snapshot.

```
aws rds describe-db-cluster-snapshot-attributes \
    --db-cluster-snapshot-identifier myclustersnapshot
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotIdentifier": "myclustersnapshot",
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789012"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a DB Cluster Snapshot in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusterSnapshotAttributes in *AWS CLI Command Reference*.

### `describe-db-cluster-snapshots`

The following code example shows how to use `describe-db-cluster-snapshots`.

#### AWS CLI

**To describe a DB cluster snapshot for a DB cluster**

The following `describe-db-cluster-snapshots` example retrieves the details for the DB cluster snapshots for the specified DB cluster.

```
aws rds describe-db-cluster-snapshots \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBClusterSnapshots": [
        {
            "AvailabilityZones": [
                "us-east-1a",
                "us-east-1b",
                "us-east-1e"
            ],
            "DBClusterSnapshotIdentifier": "myclustersnapshotcopy",
            "DBClusterIdentifier": "mydbcluster",
            "SnapshotCreateTime": "2019-06-04T09:16:42.649Z",
            "Engine": "aurora-mysql",
            "AllocatedStorage": 0,

                    "PromotionTier": 1
                }
            ],
            "VpcSecurityGroups": [
                {
                    "VpcSecurityGroupId": "sg-0b9130572daf3dc16",
                    "Status": "active"
                }
            ],
            "HostedZoneId": "Z2R2ITUGPM61AM",
            "StorageEncrypted": true,
            "KmsKeyId": "arn:aws:kms:us-east-1:814387698303:key/
AKIAIOSFODNN7EXAMPLE",
            "DbClusterResourceId": "cluster-AKIAIOSFODNN7EXAMPLE",
            "DBClusterArn": "arn:aws:rds:us-
east-1:123456789012:cluster:mydbcluster",
            "AssociatedRoles": [],
            "IAMDatabaseAuthenticationEnabled": false,
            "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
            "EngineMode": "provisioned",
            "DeletionProtection": false,
            "HttpEndpointEnabled": false
        }
    ]
}
```

**Example 2: To list certain attributes of all DB clusters**

The following `describe-db-clusters` example retrieves only the `DBClusterIdentifier`, `Endpoint`, and `ReaderEndpoint` attributes of all your DB clusters in the current AWS Region.

```
aws rds describe-db-clusters \
    --query 'DBClusters[].
{DBClusterIdentifier:DBClusterIdentifier,Endpoint:Endpoint,ReaderEndpoint:ReaderEndpoint}'
```

Output:

```
[
    {
        "Endpoint": "cluster-57-2020-05-01-2270.cluster-cnpexample.us-
east-1.rds.amazonaws.com",
        "ReaderEndpoint": "cluster-57-2020-05-01-2270.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
        "DBClusterIdentifier": "cluster-57-2020-05-01-2270"
    },
    {
        "Endpoint": "cluster-57-2020-05-01-4615.cluster-cnpexample.us-
east-1.rds.amazonaws.com",
        "ReaderEndpoint": "cluster-57-2020-05-01-4615.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
        "DBClusterIdentifier": "cluster-57-2020-05-01-4615"
    },
    {
        "Endpoint": "pg2-cluster.cluster-cnpexample.us-east-1.rds.amazonaws.com",
        "ReaderEndpoint": "pg2-cluster.cluster-ro-cnpexample.us-
east-1.rds.amazonaws.com",
        "DBClusterIdentifier": "pg2-cluster"
    },
    ...output omitted...
    }
]
```

**Example 3: To list DB clusters with a specific attribute**

The following `describe-db-clusters` example retrieves only the `DBClusterIdentifier` and `Engine` attributes of your DB clusters that use the `aurora-postgresql` DB engine.

```
aws rds describe-db-clusters \
    --query 'DBClusters[].{DBClusterIdentifier:DBClusterIdentifier,Engine:Engine} |
 [?Engine == `aurora-postgresql`]'
```

Output:

```
[
    {
        "Engine": "aurora-postgresql",
        "DBClusterIdentifier": "pg2-cluster"
    }
]
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbClusters in *AWS CLI Command Reference*.

### `describe-db-engine-versions`

The following code example shows how to use `describe-db-engine-versions`.

#### AWS CLI

**To describe the DB engine versions for the MySQL DB engine**

The following `describe-db-engine-versions` example displays details about each of the DB engine versions for the specified DB engine.

```
aws rds describe-db-engine-versions \
    --engine mysql
```

Output:

```
{
    "DBEngineVersions": [
        {
            "Engine": "mysql",
            "EngineVersion": "5.5.46",
            "DBParameterGroupFamily": "mysql5.5",
            "DBEngineDescription": "MySQL Community Edition",
            "DBEngineVersionDescription": "MySQL 5.5.46",
            "ValidUpgradeTarget": [
                {
                    "Engine": "mysql",
                    "EngineVersion": "5.5.53",
                    "Description": "MySQL 5.5.53",
                    "AutoUpgrade": false,
                    "IsMajorVersionUpgrade": false
```

```
            },
            {
                "Engine": "mysql",
                "EngineVersion": "5.5.54",
                "Description": "MySQL 5.5.54",
                "AutoUpgrade": false,
                "IsMajorVersionUpgrade": false
            },
            {
                "Engine": "mysql",
                "EngineVersion": "5.5.57",
                "Description": "MySQL 5.5.57",
                "AutoUpgrade": false,
                "IsMajorVersionUpgrade": false
            },
            ...some output truncated...
        ]
    }
```

For more information, see What Is Amazon Relational Database Service (Amazon RDS)? in the *Amazon RDS User Guide*.

- For API details, see DescribeDBEngineVersions in *AWS CLI Command Reference*.

### `describe-db-instance-automated-backups`

The following code example shows how to use `describe-db-instance-automated-backups`.

#### AWS CLI

**To describe the automated backups for a DB instance**

The following `describe-db-instance-automated-backups` example displays details about the automated backups for the specified DB instance. The details include replicated automated backups in other AWS Regions.

```
aws rds describe-db-instance-automated-backups \
    --db-instance-identifier new-orcl-db
```

Output:

```
{
    "DBInstanceAutomatedBackups": [
```

```
        {
            "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
            "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
            "Region": "us-east-1",
            "DBInstanceIdentifier": "new-orcl-db",
            "RestoreWindow": {
                "EarliestTime": "2020-12-07T21:05:20.939Z",
                "LatestTime": "2020-12-07T21:05:20.939Z"
            },
            "AllocatedStorage": 20,
            "Status": "replicating",
            "Port": 1521,
            "InstanceCreateTime": "2020-12-04T15:28:31Z",
            "MasterUsername": "admin",
            "Engine": "oracle-se2",
            "EngineVersion": "12.1.0.2.v21",
            "LicenseModel": "bring-your-own-license",
            "OptionGroupName": "default:oracle-se2-12-1",
            "Encrypted": false,
            "StorageType": "gp2",
            "IAMDatabaseAuthenticationEnabled": false,
            "BackupRetentionPeriod": 14,
            "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-
west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
        }
    ]
}
```

For more information, see Finding information about replicated backups in the *Amazon RDS User Guide*.

- For API details, see DescribeDbInstanceAutomatedBackups in *AWS CLI Command Reference*.

### `describe-db-instances`

The following code example shows how to use `describe-db-instances`.

#### AWS CLI

**To describe a DB instance**

The following `describe-db-instances` example retrieves details about the specified DB instance.

```
aws rds describe-db-instances \
    --db-instance-identifier mydbinstancecf
```

Output:

```
{
    "DBInstances": [
        {
            "DBInstanceIdentifier": "mydbinstancecf",
            "DBInstanceClass": "db.t3.small",
            "Engine": "mysql",
            "DBInstanceStatus": "available",
            "MasterUsername": "masterawsuser",
            "Endpoint": {
                "Address": "mydbinstancecf.abcexample.us-east-1.rds.amazonaws.com",
                "Port": 3306,
                "HostedZoneId": "Z2R2ITUGPM61AM"
            },
            ...some output truncated...
        }
    ]
}
```

- For API details, see DescribeDBInstances in *AWS CLI Command Reference*.

### `describe-db-log-files`

The following code example shows how to use `describe-db-log-files`.

#### AWS CLI

**To describe the log files for a DB instance**

The following `describe-db-log-files` example retrieves details about the log files for the specified DB instance.

```
aws rds describe-db-log-files -\
    -db-instance-identifier test-instance
```

Output:

```
{
    "DescribeDBLogFiles": [
        {
            "Size": 0,
            "LastWritten": 1533060000000,
            "LogFileName": "error/mysql-error-running.log"
        },
        {
            "Size": 2683,
            "LastWritten": 1532994300000,
            "LogFileName": "error/mysql-error-running.log.0"
        },
        {
            "Size": 107,
            "LastWritten": 1533057300000,
            "LogFileName": "error/mysql-error-running.log.18"
        },
        {
            "Size": 13105,
            "LastWritten": 1532991000000,
            "LogFileName": "error/mysql-error-running.log.23"
        },
        {
            "Size": 0,
            "LastWritten": 1533061200000,
            "LogFileName": "error/mysql-error.log"
        },
        {
            "Size": 3519,
            "LastWritten": 1532989252000,
            "LogFileName": "mysqlUpgrade"
        }
    ]
}
```

- For API details, see DescribeDbLogFiles in *AWS CLI Command Reference*.

### `describe-db-parameter-groups`

The following code example shows how to use `describe-db-parameter-groups`.

**AWS CLI**

**To describe your DB parameter group**

The following `describe-db-parameter-groups` example retrieves details about your DB parameter groups.

```
aws rds describe-db-parameter-groups
```

Output:

```
{
    "DBParameterGroups": [
        {
            "DBParameterGroupName": "default.aurora-mysql5.7",
            "DBParameterGroupFamily": "aurora-mysql5.7",
            "Description": "Default parameter group for aurora-mysql5.7",
            "DBParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:pg:default.aurora-mysql5.7"
        },
        {
            "DBParameterGroupName": "default.aurora-postgresql9.6",
            "DBParameterGroupFamily": "aurora-postgresql9.6",
            "Description": "Default parameter group for aurora-postgresql9.6",
            "DBParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:pg:default.aurora-postgresql9.6"
        },
        {
            "DBParameterGroupName": "default.aurora5.6",
            "DBParameterGroupFamily": "aurora5.6",
            "Description": "Default parameter group for aurora5.6",
            "DBParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:pg:default.aurora5.6"
        },
        {
            "DBParameterGroupName": "default.mariadb10.1",
            "DBParameterGroupFamily": "mariadb10.1",
            "Description": "Default parameter group for mariadb10.1",
            "DBParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:pg:default.mariadb10.1"
        },
        ...some output truncated...
    ]
```

```
}
```

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeDBParameterGroups in *AWS CLI Command Reference*.

### `describe-db-parameters`

The following code example shows how to use `describe-db-parameters`.

#### AWS CLI

**To describe the parameters in a DB parameter group**

The following `describe-db-parameters` example retrieves the details of the specified DB parameter group.

```
aws rds describe-db-parameters \
    --db-parameter-group-name mydbpg
```

Output:

```
{
    "Parameters": [
        {
            "ParameterName": "allow-suspicious-udfs",
            "Description": "Controls whether user-defined functions that have only
 an xxx symbol for the main function can be loaded",
            "Source": "engine-default",
            "ApplyType": "static",
            "DataType": "boolean",
            "AllowedValues": "0,1",
            "IsModifiable": false,
            "ApplyMethod": "pending-reboot"
        },
        {
            "ParameterName": "auto_generate_certs",
            "Description": "Controls whether the server autogenerates SSL key and
 certificate files in the data directory, if they do not already exist.",
            "Source": "engine-default",
            "ApplyType": "static",
            "DataType": "boolean",
            "AllowedValues": "0,1",
```

```
            "IsModifiable": false,
            "ApplyMethod": "pending-reboot"
        },
        ...some output truncated...
    ]
}
```

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeDBParameters in *AWS CLI Command Reference*.

### `describe-db-proxies`

The following code example shows how to use `describe-db-proxies`.

#### AWS CLI

**To describe a DB proxy for an RDS database**

The following `describe-db-proxies` example returns information about DB proxies.

```
aws rds describe-db-proxies
```

Output:

```
{
    "DBProxies": [
        {
            "DBProxyName": "proxyExample1",
            "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-
proxy:prx-0123a01b12345c0ab",
            "Status": "available",
            "EngineFamily": "PostgreSQL",
            "VpcId": "vpc-1234567",
            "VpcSecurityGroupIds": [
                "sg-1234"
            ],
            "VpcSubnetIds": [
                "subnetgroup1",
                "subnetgroup2"
            ],
            "Auth": "[
                {
```

```
                    "Description": "proxydescription1"
                    "AuthScheme": "SECRETS",
                    "SecretArn": "arn:aws:secretsmanager:us-
west-2:123456789123:secret:secretName-1234f",
                    "IAMAuth": "DISABLED"
                }
            ]",
            "RoleArn": "arn:aws:iam::12345678912??:role/ProxyPostgreSQLRole",

        }
    ]
}
```

For more information, see Viewing an RDS Proxy in the *Amazon RDS User Guide* and Viewing an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbProxies in *AWS CLI Command Reference*.

### `describe-db-proxy-endpoints`

The following code example shows how to use `describe-db-proxy-endpoints`.

#### AWS CLI

**To describe a DB proxy endpoints**

The following `describe-db-proxy-endpoints` example returns information about DB proxy endpoints.

```
aws rds describe-db-proxy-endpoints
```

Output:

```
{
    "DBProxyEndpoints": [
        {
            "DBProxyEndpointName": "proxyEndpoint1",
            "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
            "DBProxyName": "proxyExample",
            "Status": "available",
            "VpcId": "vpc-1234567",
            "VpcSecurityGroupIds": [
                "sg-1234"
            ],
            "VpcSubnetIds": [
                "subnetgroup1",
```

```
                "subnetgroup2"
            ],
            "Endpoint": "proxyEndpoint1.endpoint.proxy-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
            "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
            "TargetRole": "READ_WRITE",
            "IsDefault": false
        },
        {
            "DBProxyEndpointName": "proxyEndpoint2",
            "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-
endpoint:prx-endpoint-4567a01b12345c0ab",
            "DBProxyName": "proxyExample2",
            "Status": "available",
            "VpcId": "vpc1234567",
            "VpcSecurityGroupIds": [
                "sg-5678"
            ],
            "VpcSubnetIds": [
                "subnetgroup1",
                "subnetgroup2"
            ],
            "Endpoint": "proxyEndpoint2.endpoint.proxy-cd1ef2klmnop.us-
east-1.rds.amazonaws.com",
            "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
            "TargetRole": "READ_WRITE",
            "IsDefault": false
        }
    ]
}
```

For more information, see Viewing a proxy endpoint in the *Amazon RDS User Guide* and Creating a proxy endpoint in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbProxyEndpoints in *AWS CLI Command Reference*.

### `describe-db-proxy-target-groups`

The following code example shows how to use `describe-db-proxy-target-groups`.

#### AWS CLI

**To describe a DB proxy endpoints**

The following `describe-db-proxy-target-groups` example returns information about DB proxy target groups.

```
aws rds describe-db-proxy-target-groups \
    --db-proxy-name proxyExample
```

Output:

```
{
"TargetGroups":
    {
        "DBProxyName": "proxyExample",
        "TargetGroupName": "default",
        "TargetGroupArn": "arn:aws:rds:us-east-1:123456789012:target-group:prx-
tg-0123a01b12345c0ab",
        "IsDefault": true,
        "Status": "available",
        "ConnectionPoolConfig": {
            "MaxConnectionsPercent": 100,
            "MaxIdleConnectionsPercent": 50,
            "ConnectionBorrowTimeout": 120,
            "SessionPinningFilters": []
        },
        "CreatedDate": "2023-05-02T18:41:19.495000+00:00",
        "UpdatedDate": "2023-05-02T18:41:21.762000+00:00"
    }

### `describe-db-proxy-targets`

The following code example shows how to use `describe-db-proxy-targets`.

#### AWS CLI

**To describe DB proxy targets**

The following `describe-db-proxy-targets` example returns information about DB proxy targets.

```
aws rds describe-db-proxy-targets \
    --db-proxy-name proxyExample
```

Output:

```
{
    "Targets": [
        {
            "Endpoint": "database1.ab0cd1efghij.us-east-1.rds.amazonaws.com",
            "TrackedClusterId": "database1",
            "RdsResourceId": "database1-instance-1",
            "Port": 3306,
            "Type": "RDS_INSTANCE",
            "Role": "READ_WRITE",
            "TargetHealth": {
                "State": "UNAVAILABLE",
                "Reason": "PENDING_PROXY_CAPACITY",
                "Description": "DBProxy Target is waiting for proxy to scale to
 desired capacity"
            }
        }
    ]
}
```

For more information, see Viewing an RDS proxy in the *Amazon RDS User Guide* and Viewing an RDS proxy in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbProxyTargets in *AWS CLI Command Reference*.

## `describe-db-recommendations`

The following code example shows how to use `describe-db-recommendations`.

### AWS CLI

#### Example 1: To list all DB recommendations

The following `describe-db-recommendations` example lists all DB recommendations in your AWS account.

```
aws rds describe-db-recommendations
```

Output:

```
{
    "DBRecommendations": [
        {
            "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",
            "TypeId": "config_recommendation::old_minor_version",
            "Severity": "informational",
            "ResourceArn": "arn:aws:rds:us-west-2:111122223333:db:database-1",

                },
                {
                    "Text": "Using Amazon RDS Blue/Green Deployments for database
 updates for Amazon RDS",
                    "Url": "https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/
blue-green-deployments.html"
                }
            ]
        }
    ]
}
```

For more information, see Viewing and responding to Amazon RDS recommendations in the *Amazon RDS User Guide* and Viewing and responding to Amazon RDS recommendations in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbRecommendations in *AWS CLI Command Reference*.

### `describe-db-security-groups`

The following code example shows how to use `describe-db-security-groups`.

#### AWS CLI

**To list DB security groups**

The following `describe-db-security-groups` example lists DB security groups.

```
aws rds describe-db-security-groups
```

Output:

```
{
    "DBSecurityGroups": [
        {
            "OwnerId": "123456789012",
```

```
            "DBSecurityGroupName": "default",
            "DBSecurityGroupDescription": "default",
            "EC2SecurityGroups": [],
            "IPRanges": [],
            "DBSecurityGroupArn": "arn:aws:rds:us-
west-1:111122223333:secgrp:default"
        },
        {
            "OwnerId": "123456789012",
            "DBSecurityGroupName": "mysecgroup",
            "DBSecurityGroupDescription": "My Test Security Group",
            "VpcId": "vpc-1234567f",
            "EC2SecurityGroups": [],
            "IPRanges": [],
            "DBSecurityGroupArn": "arn:aws:rds:us-
west-1:111122223333:secgrp:mysecgroup"
        }
    ]
}
```

For more information, see Listing Available DB Security Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeDbSecurityGroups in *AWS CLI Command Reference*.

### `describe-db-shard-groups`

The following code example shows how to use `describe-db-shard-groups`.

#### AWS CLI

**Example 1: To describe DB shard groups**

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups.

```
aws rds describe-db-shard-groups
```

Output:

```
{
    "DBShardGroups": [
        {
```

```
            "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
            "DBShardGroupIdentifier": "limitless-test-shard-grp",
            "DBClusterIdentifier": "limitless-test-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": true,
            "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        },
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

- For API details, see DescribeDbShardGroups in *AWS CLI Command Reference*.

## `describe-db-snapshot-attributes`

The following code example shows how to use `describe-db-snapshot-attributes`.

### AWS CLI

#### To describe the attribute names and values for a DB snapshot

The following `describe-db-snapshot-attributes` example describes the attribute names and values for a DB snapshot.

```
aws rds describe-db-snapshot-attributes \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789012",
                    "210987654321"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see DescribeDbSnapshotAttributes in *AWS CLI Command Reference*.

### `describe-db-snapshots`

The following code example shows how to use `describe-db-snapshots`.

#### AWS CLI

**Example 1: To describe a DB snapshot for a DB instance**

The following `describe-db-snapshots` example retrieves the details of a DB snapshot for a DB instance.

```
aws rds describe-db-snapshots \
    --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
    "DBSnapshots": [
        {
            "DBSnapshotIdentifier": "mydbsnapshot",
            "DBInstanceIdentifier": "mysqldb",
            "SnapshotCreateTime": "2018-02-08T22:28:08.598Z",
            "Engine": "mysql",
```

```
            "AllocatedStorage": 20,
            "Status": "available",
            "Port": 3306,
            "AvailabilityZone": "us-east-1f",
            "VpcId": "vpc-6594f31c",
            "InstanceCreateTime": "2018-02-08T22:24:55.973Z",
            "MasterUsername": "mysqladmin",
            "EngineVersion": "5.6.37",
            "LicenseModel": "general-public-license",
            "SnapshotType": "manual",
            "OptionGroupName": "default:mysql-5-6",
            "PercentProgress": 100,
            "StorageType": "gp2",
            "Encrypted": false,
            "DBSnapshotArn": "arn:aws:rds:us-
east-1:123456789012:snapshot:mydbsnapshot",
            "IAMDatabaseAuthenticationEnabled": false,
            "ProcessorFeatures": [],
            "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
        }
    ]
}
```

For more information, see Creating a DB Snapshot in the *Amazon RDS User Guide*.

**Example 2: To find the number of manual snapshots taken**

The following `describe-db-snapshots` example uses the `length` operator in the `--query` option to return the number of manual snapshots that have been taken in a particular AWS Region.

```
aws rds describe-db-snapshots \
    --snapshot-type manual \
    --query "length(*[].{DBSnapshots:SnapshotType})" \
    --region eu-central-1
```

Output:

```
35
```

For more information, see Creating a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see DescribeDBSnapshots in *AWS CLI Command Reference*.

### `describe-db-subnet-groups`

The following code example shows how to use `describe-db-subnet-groups`.

**AWS CLI**

**To describe a DB subnet group**

The following `describe-db-subnet-groups` example retrieves the details of the specified DB subnet group.

```
aws rds describe-db-subnet-groups
```

Output:

```
{
    "DBSubnetGroups": [
        {
            "DBSubnetGroupName": "mydbsubnetgroup",
            "DBSubnetGroupDescription": "My DB Subnet Group",
            "VpcId": "vpc-971c12ee",
            "SubnetGroupStatus": "Complete",
            "Subnets": [
                {
                    "SubnetIdentifier": "subnet-d8c8e7f4",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1a"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-718fdc7d",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1f"
                    },
                    "SubnetStatus": "Active"
                },
                {
                    "SubnetIdentifier": "subnet-cbc8e7e7",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1a"
                    },
                    "SubnetStatus": "Active"
```

```
                },
                {
                    "SubnetIdentifier": "subnet-0ccde220",
                    "SubnetAvailabilityZone": {
                        "Name": "us-east-1a"
                    },
                    "SubnetStatus": "Active"
                }
            ],
            "DBSubnetGroupArn": "arn:aws:rds:us-
east-1:123456789012:subgrp:mydbsubnetgroup"
        }
    ]
}
```

For more information, see Amazon Virtual Private Cloud VPCs and Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see DescribeDbSubnetGroups in *AWS CLI Command Reference*.

### `describe-engine-default-cluster-parameters`

The following code example shows how to use `describe-engine-default-cluster-parameters`.

**AWS CLI**

**To describe the default engine and system parameter information for the Aurora database engine**

The following `describe-engine-default-cluster-parameters` example retrieves the details of the default engine and system parameter information for Aurora DB clusters with MySQL 5.7 compatibility.

```
aws rds describe-engine-default-cluster-parameters \
    --db-parameter-group-family aurora-mysql5.7
```

Output:

```
{
    "EngineDefaults": {
        "Parameters": [
```

```
            {
                "ParameterName": "aurora_load_from_s3_role",
                "Description": "IAM role ARN used to load data from AWS S3",
                "Source": "engine-default",
                "ApplyType": "dynamic",
                "DataType": "string",
                "IsModifiable": true,
                "SupportedEngineModes": [
                    "provisioned"
                ]
            },
            ...some output truncated...
        ]
    }
}
```

For more information, see Working with DB Parameter Groups and DB Cluster Parameter Groups in the *Amazon Aurora User Guide*.

- For API details, see DescribeEngineDefaultClusterParameters in *AWS CLI Command Reference*.

### `describe-engine-default-parameters`

The following code example shows how to use `describe-engine-default-parameters`.

#### AWS CLI

**To describe the default engine and system parameter information for the database engine**

The following `describe-engine-default-parameters` example retrieves details for the default engine and system parameter information for MySQL 5.7 DB instances.

```
aws rds describe-engine-default-parameters \
    --db-parameter-group-family mysql5.7
```

Output:

```
{
    "EngineDefaults": {
        "Parameters": [
            {
                "ParameterName": "allow-suspicious-udfs",
```

```
                "Description": "Controls whether user-defined functions that have
 only an xxx symbol for the main function can be loaded",
                "Source": "engine-default",
                "ApplyType": "static",
                "DataType": "boolean",
                "AllowedValues": "0,1",
                "IsModifiable": false
            },
            ...some output truncated...
        ]
    }
}
```

For more information, see Working with DB Parameter Groups in the *Amazon RDS User Guide*.

- For API details, see DescribeEngineDefaultParameters in *AWS CLI Command Reference*.

### `describe-event-categories`

The following code example shows how to use `describe-event-categories`.

#### AWS CLI

**To describe event categories**

The following `describe-event-categories` example retrieves details about the event categories for all available event sources.

```
aws rds describe-event-categories
```

Output:

```
{
    "EventCategoriesMapList": [
        {
            "SourceType": "db-instance",
            "EventCategories": [
                "deletion",
                "read replica",
                "failover",
                "restoration",
                "maintenance",
                "low storage",
```

```
                "configuration change",
                "backup",
                "creation",
                "availability",
                "recovery",
                "failure",
                "backtrack",
                "notification"
            ]
        },
        {
            "SourceType": "db-security-group",
            "EventCategories": [
                "configuration change",
                "failure"
            ]
        },
        {
            "SourceType": "db-parameter-group",
            "EventCategories": [
                "configuration change"
            ]
        },
        {
            "SourceType": "db-snapshot",
            "EventCategories": [
                "deletion",
                "creation",
                "restoration",
                "notification"
            ]
        },
        {
            "SourceType": "db-cluster",
            "EventCategories": [
                "failover",
                "failure",
                "notification"
            ]
        },
        {
            "SourceType": "db-cluster-snapshot",
            "EventCategories": [
                "backup"
```

```
            ]
        }
    ]
}
```

- For API details, see DescribeEventCategories in *AWS CLI Command Reference*.

### `describe-event-subscriptions`

The following code example shows how to use `describe-event-subscriptions`.

#### AWS CLI

**To describe event subscriptions**

This example describes all of the Amazon RDS event subscriptions for the current AWS account.

```
aws rds describe-event-subscriptions
```

Output:

```
{
    "EventSubscriptionsList": [
        {
            "EventCategoriesList": [
                "backup",
                "recovery"
            ],
            "Enabled": true,
            "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-
instance-events",
            "Status": "creating",
            "SourceType": "db-instance",
            "CustomerAwsId": "123456789012",
            "SubscriptionCreationTime": "2018-07-31 23:22:01.893",
            "CustSubscriptionId": "my-instance-events",
            "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events"
        },
        ...some output truncated...
    ]
}
```

- For API details, see DescribeEventSubscriptions in *AWS CLI Command Reference*.

### `describe-events`

The following code example shows how to use `describe-events`.

**AWS CLI**

**To describe events**

The following `describe-events` example retrieves details for the events that have occurred for the specified DB instance.

```
aws rds describe-events \
    --source-identifier test-instance \
    --source-type db-instance
```

Output:

```
{
    "Events": [
        {
            "SourceType": "db-instance",
            "SourceIdentifier": "test-instance",
            "EventCategories": [
                "backup"
            ],
            "Message": "Backing up DB instance",
            "Date": "2018-07-31T23:09:23.983Z",
            "SourceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance"
        },
        {
            "SourceType": "db-instance",
            "SourceIdentifier": "test-instance",
            "EventCategories": [
                "backup"
            ],
            "Message": "Finished DB Instance backup",
            "Date": "2018-07-31T23:15:13.049Z",
            "SourceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance"
        }
    ]
```

```
}
```

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

### `describe-export-tasks`

The following code example shows how to use `describe-export-tasks`.

#### AWS CLI

**To describe snapshot export tasks**

The following `describe-export-tasks` example returns information about snapshot exports to Amazon S3.

```
aws rds describe-export-tasks
```

Output:

```
{
    "ExportTasks": [
        {
            "ExportTaskIdentifier": "test-snapshot-export",
            "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:test-
snapshot",
            "SnapshotTime": "2020-03-02T18:26:28.163Z",
            "TaskStartTime": "2020-03-02T18:57:56.896Z",
            "TaskEndTime": "2020-03-02T19:10:31.985Z",
            "S3Bucket": "mybucket",
            "S3Prefix": "",
            "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
abcd0000-7fca-4128-82f2-aabbccddeeff",
            "Status": "COMPLETE",
            "PercentProgress": 100,
            "TotalExtractedDataInGB": 0
        },
        {
            "ExportTaskIdentifier": "my-s3-export",
            "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-
test",
            "SnapshotTime": "2020-03-27T20:48:42.023Z",
```

```
            "S3Bucket": "mybucket",
            "S3Prefix": "",
            "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
abcd0000-7fca-4128-82f2-aabbccddeeff",
            "Status": "STARTING",
            "PercentProgress": 0,
            "TotalExtractedDataInGB": 0
        }
    ]
}
```

For more information, see Monitoring Snapshot Exports in the *Amazon RDS User Guide*.

- For API details, see DescribeExportTasks in *AWS CLI Command Reference*.

### `describe-global-clusters`

The following code example shows how to use `describe-global-clusters`.

#### AWS CLI

**To describe global DB clusters**

The following `describe-global-clusters` example lists Aurora global DB clusters in the current AWS Region.

```
aws rds describe-global-clusters
```

Output:

```
{
    "GlobalClusters": [
        {
            "GlobalClusterIdentifier": "myglobalcluster",
            "GlobalClusterResourceId": "cluster-f5982077e3b5aabb",

```

```
            "GlobalClusterMembers": []
        }
    ]
}
```

For more information, see Managing an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see DescribeGlobalClusters in *AWS CLI Command Reference*.

### `describe-option-group-options`

The following code example shows how to use `describe-option-group-options`.

**AWS CLI**

**To describe all available options**

The following `describe-option-group-options` example lists two options for an Oracle Database 19c instance.

```
aws rds describe-option-group-options \
    --engine-name oracle-ee \
    --major-engine-version 19 \
    --max-items 2
```

Output:

```
{
    "OptionGroupOptions": [
        {
            "Name": "APEX",
            "Description": "Oracle Application Express Runtime Environment",
            "EngineName": "oracle-ee",
            "MajorEngineVersion": "19",
            "MinimumRequiredMinorEngineVersion": "0.0.0.ru-2019-07.rur-2019-07.r1",
            "PortRequired": false,
            "OptionsDependedOn": [],
            "OptionsConflictsWith": [],
            "Persistent": false,
            "Permanent": false,
            "RequiresAutoMinorEngineVersionUpgrade": false,
```

```
            "VpcOnly": false,
            "SupportsOptionVersionDowngrade": false,
            "OptionGroupOptionSettings": [],
            "OptionGroupOptionVersions": [
                {
                    "Version": "19.1.v1",
                    "IsDefault": true
                },
                {
                    "Version": "19.2.v1",
                    "IsDefault": false
                }
            ]
        },
        {
            "Name": "APEX-DEV",
            "Description": "Oracle Application Express Development Environment",
            "EngineName": "oracle-ee",
            "MajorEngineVersion": "19",
            "MinimumRequiredMinorEngineVersion": "0.0.0.ru-2019-07.rur-2019-07.r1",
            "PortRequired": false,
            "OptionsDependedOn": [
                "APEX"
            ],
            "OptionsConflictsWith": [],
            "Persistent": false,
            "Permanent": false,
            "RequiresAutoMinorEngineVersionUpgrade": false,
            "VpcOnly": false,
            "OptionGroupOptionSettings": []
        }
    ],
    "NextToken": "eyJNYXJrZXIiOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

For more information, see Listing the Options and Option Settings for an Option Group in the *Amazon RDS User Guide*.

- For API details, see DescribeOptionGroupOptions in *AWS CLI Command Reference*.

### `describe-option-groups`

The following code example shows how to use `describe-option-groups`.

**AWS CLI**

**To describe the available option groups**

The following `describe-option-groups` example lists the options groups for an Oracle Database 19c instance.

```
aws rds describe-option-groups \
    --engine-name oracle-ee \
    --major-engine-version 19
```

Output:

```
{
    "OptionGroupsList": [
        {
            "OptionGroupName": "default:oracle-ee-19",
            "OptionGroupDescription": "Default option group for oracle-ee 19",
            "EngineName": "oracle-ee",
            "MajorEngineVersion": "19",
            "Options": [],
            "AllowsVpcAndNonVpcInstanceMemberships": true,
            "OptionGroupArn": "arn:aws:rds:us-west-1:111122223333:og:default:oracle-
ee-19"
        }
    ]
}
```

For more information, see Listing the Options and Option Settings for an Option Group in the *Amazon RDS User Guide*.

- For API details, see DescribeOptionGroups in *AWS CLI Command Reference*.

### `describe-orderable-db-instance-options`

The following code example shows how to use `describe-orderable-db-instance-options`.

**AWS CLI**

**To describe orderable DB instance options**

The following `describe-orderable-db-instance-options` example retrieves details about the orderable options for a DB instances running the MySQL DB engine.

```
aws rds describe-orderable-db-instance-options \
    --engine mysql
```

Output:

```
{
    "OrderableDBInstanceOptions": [
        {
            "MinStorageSize": 5,
            "ReadReplicaCapable": true,
            "MaxStorageSize": 6144,
            "AvailabilityZones": [
                {
                    "Name": "us-east-1a"
                },
                {
                    "Name": "us-east-1b"
                },
                {
                    "Name": "us-east-1c"
                },
                {
                    "Name": "us-east-1d"
                }
            ],
            "SupportsIops": false,
            "AvailableProcessorFeatures": [],
            "MultiAZCapable": true,
            "DBInstanceClass": "db.m1.large",
            "Vpc": true,
            "StorageType": "gp2",
            "LicenseModel": "general-public-license",
            "EngineVersion": "5.5.46",
            "SupportsStorageEncryption": false,
            "SupportsEnhancedMonitoring": true,
            "Engine": "mysql",
            "SupportsIAMDatabaseAuthentication": false,
            "SupportsPerformanceInsights": false
        }
    ]
    ...some output truncated...
}
```

- For API details, see DescribeOrderableDBInstanceOptions in *AWS CLI Command Reference*.

### `describe-pending-maintenance-actions`

The following code example shows how to use `describe-pending-maintenance-actions`.

**AWS CLI**

**To list resources with at least one pending maintenance action**

The following `describe-pending-maintenance-actions` example lists the pending maintenace action for a DB instance.

```
aws rds describe-pending-maintenance-actions
```

Output:

```
{
    "PendingMaintenanceActions": [
        {
            "ResourceIdentifier": "arn:aws:rds:us-
west-2:123456789012:cluster:global-db1-cl1",
            "PendingMaintenanceActionDetails": [
                {
                    "Action": "system-update",
                    "Description": "Upgrade to Aurora PostgreSQL 2.4.2"
                }
            ]
        }
    ]
}
```

For more information, see Maintaining a DB Instance in the *Amazon RDS User Guide*.

- For API details, see DescribePendingMaintenanceActions in *AWS CLI Command Reference*.

### `describe-reserved-db-instances-offerings`

The following code example shows how to use `describe-reserved-db-instances-offerings`.

**AWS CLI**

**To describe reserved DB instance offerings**

The following `describe-reserved-db-instances-offerings` example retrieves details about reserved DB instance options for `oracle`.

```
aws rds describe-reserved-db-instances-offerings \
    --product-description oracle
```

Output:

```
{
    "ReservedDBInstancesOfferings": [
        {
            "CurrencyCode": "USD",
            "UsagePrice": 0.0,
            "ProductDescription": "oracle-se2(li)",
            "ReservedDBInstancesOfferingId": "005bdee3-9ef4-4182-aa0c-58ef7cb6c2f8",
            "MultiAZ": true,
            "DBInstanceClass": "db.m4.xlarge",
            "OfferingType": "Partial Upfront",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.594,
                    "RecurringChargeFrequency": "Hourly"
                }
            ],
            "FixedPrice": 4089.0,
            "Duration": 31536000
        },
    ...some output truncated...
}
```

- For API details, see DescribeReservedDbInstancesOfferings in *AWS CLI Command Reference*.

## `describe-reserved-db-instances`

The following code example shows how to use `describe-reserved-db-instances`.

**AWS CLI**

**To describe reserved DB instances**

The following `describe-reserved-db-instances` example retrieves details about any reserved DB instances in the current AWS account.

```
aws rds describe-reserved-db-instances
```

Output:

```
{
    "ReservedDBInstances": [
        {
            "ReservedDBInstanceId": "myreservedinstance",
            "ReservedDBInstancesOfferingId": "12ab34cd-59af-4b2c-a660-1abcdef23456",
            "DBInstanceClass": "db.t3.micro",
            "StartTime": "2020-06-01T13:44:21.436Z",
            "Duration": 31536000,
            "FixedPrice": 0.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
            "DBInstanceCount": 1,
            "ProductDescription": "sqlserver-ex(li)",
            "OfferingType": "No Upfront",
            "MultiAZ": false,
            "State": "payment-pending",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.014,
                    "RecurringChargeFrequency": "Hourly"
                }
            ],
            "ReservedDBInstanceArn": "arn:aws:rds:us-
west-2:123456789012:ri:myreservedinstance",
            "LeaseId": "a1b2c3d4-6b69-4a59-be89-5e11aa446666"
        }
    ]
}
```

For more information, see Reserved DB Instances for Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see DescribeReservedDbInstances in *AWS CLI Command Reference*.

### `describe-source-regions`

The following code example shows how to use `describe-source-regions`.

**AWS CLI**

**To describe source Regions**

The following `describe-source-regions` example retrieves details about all source AWS Regions. It also shows that automated backups can be replicated only from US West (Oregon) to the destination AWS Region, US East (N. Virginia).

```
aws rds describe-source-regions \
    --region us-east-1
```

Output:

```
{
    "SourceRegions": [
        {
            "RegionName": "af-south-1",
            "Endpoint": "https://rds.af-south-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": false
        },
        {
            "RegionName": "ap-east-1",
            "Endpoint": "https://rds.ap-east-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": false
        },
        {
            "RegionName": "ap-northeast-1",
            "Endpoint": "https://rds.ap-northeast-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": true
        },
        {
            "RegionName": "ap-northeast-2",
            "Endpoint": "https://rds.ap-northeast-2.amazonaws.com",
```

```
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": true
        },
        {
            "RegionName": "ap-northeast-3",
            "Endpoint": "https://rds.ap-northeast-3.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": false
        },
        {
            "RegionName": "ap-south-1",
            "Endpoint": "https://rds.ap-south-1.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": true
        },
        {
            "RegionName": "ap-southeast-1",

        },
        {
            "RegionName": "us-west-2",
           "Endpoint": "https://rds.us-west-2.amazonaws.com",
            "Status": "available",
            "SupportsDBInstanceAutomatedBackupsReplication": true
        }
    ]
}
```

For more information, see Finding information about replicated backups in the *Amazon RDS User Guide*.

- For API details, see DescribeSourceRegions in *AWS CLI Command Reference*.

### `describe-valid-db-instance-modifications`

The following code example shows how to use `describe-valid-db-instance-modifications`.

**AWS CLI**

**To describe valid modifications for a DB instance**

The following `describe-valid-db-instance-modifications` example retrieves details about the valid modifications for the specified DB instance.

```
aws rds describe-valid-db-instance-modifications \
    --db-instance-identifier test-instance
```

Output:

```
{
    "ValidDBInstanceModificationsMessage": {
        "ValidProcessorFeatures": [],
        "Storage": [
            {
                "StorageSize": [
                    {
                        "Step": 1,
                        "To": 20,
                        "From": 20
                    },
                    {
                        "Step": 1,
                        "To": 6144,
                        "From": 22
                    }
                ],
                "ProvisionedIops": [
                    {
                        "Step": 1,
                        "To": 0,
                        "From": 0
                    }
                ],
                "IopsToStorageRatio": [
                    {
                        "To": 0.0,
                        "From": 0.0
                    }
                ],
                "StorageType": "gp2"
            },
            {
                "StorageSize": [
                    {
                        "Step": 1,
                        "To": 6144,
                        "From": 100
                    }
                ],
                "ProvisionedIops": [
                    {
                        "Step": 1,
```

```
                        "To": 40000,
                        "From": 1000
                    }
                ],
                "IopsToStorageRatio": [
                    {
                        "To": 50.0,
                        "From": 1.0
                    }
                ],
                "StorageType": "io1"
            },
            {
                "StorageSize": [
                    {
                        "Step": 1,

                        "From": 0
                    }
                ],
                "IopsToStorageRatio": [
                    {
                        "To": 0.0,
                        "From": 0.0
                    }
                ],
                "StorageType": "magnetic"
            }
        ]
    }
}
```

- For API details, see DescribeValidDbInstanceModifications in *AWS CLI Command Reference*.

### `download-db-log-file-portion`

The following code example shows how to use `download-db-log-file-portion`.

**AWS CLI**

**To download a DB log file**

The following `download-db-log-file-portion` example downloads only the latest part of your log file, saving it to a local file named `tail.txt`.

```
aws rds download-db-log-file-portion \
    --db-instance-identifier test-instance \
    --log-file-name log.txt \
    --output text > tail.txt
```

To download the entire file, you need to include the `--starting-token 0` parameter. The following example saves the output to a local file named `full.txt`.

```
aws rds download-db-log-file-portion \
    --db-instance-identifier test-instance \
    --log-file-name log.txt \
    --starting-token 0 \
    --output text > full.txt
```

The saved file might contain blank lines. They appear at the end of each part of the log file while being downloaded. This generally doesn't cause any trouble in your log file analysis.

- For API details, see DownloadDbLogFilePortion in *AWS CLI Command Reference*.

### `generate-auth-token`

The following code example shows how to use `generate-auth-token`.

**AWS CLI**

**To generate an authentication token**

The following `generate-db-auth-token` example generates an authentication token for use with IAM database authentication.

```
aws rds generate-db-auth-token \
    --hostname aurmysql-test.cdgmuqiadpid.us-west-2.rds.amazonaws.com \
    --port 3306 \
    --region us-east-1 \
    --username jane_doe
```

Output:

```
aurmysql-test.cdgmuqiadpid.us-west-2.rds.amazonaws.com:3306/?
Action=connect&DBUser=jane_doe&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-
Credential=AKIAIESZCNJ3OEXAMPLE%2F20180731%2Fus-east-1%2Frds-db%2Faws4_request&X-
Amz-Date=20180731T235209Z&X-Amz-Expires=900&X-Amz-SignedHeaders=host&X-Amz-
Signature=5a8753ebEXAMPLEa2c724e5667797EXAMPLE9d6ec6e3f427191fa41aeEXAMPLE
```

- For API details, see GenerateAuthToken in *AWS CLI Command Reference*.

### `generate-db-auth-token`

The following code example shows how to use `generate-db-auth-token`.

#### AWS CLI

**To generate an IAM authentication token**

The following `generate-db-auth-token` example generates IAM authentication token to connect to a database.

```
aws rds generate-db-auth-token \
    --hostname mydb.123456789012.us-east-1.rds.amazonaws.com \
    --port 3306 \
    --region us-east-1 \
    --username db_user
```

Output:

```
mydb.123456789012.us-east-1.rds.amazonaws.com:3306/?
Action=connect&DBUser=db_user&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-
Credential=AKIAIEXAMPLE%2Fus-east-1%2Frds-db%2Faws4_request&X-Amz-
Date=20210123T011543Z&X-Amz-Expires=900&X-Amz-SignedHeaders=host&X-Amz-
Signature=88987EXAMPLE1EXAMPLE2EXAMPLE3EXAMPLE4EXAMPLE5EXAMPLE6
```

For more information, see Connecting to your DB instance using IAM authentication in the *Amazon RDS User Guide* and Connecting to your DB cluster using IAM authentication in the *Amazon Aurora User Guide*.

- For API details, see GenerateDbAuthToken in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags on an Amazon RDS resource**

The following `list-tags-for-resource` example lists all tags on a DB instance.

```
aws rds list-tags-for-resource \
    --resource-name arn:aws:rds:us-east-1:123456789012:db:orcl1
```

Output:

```
{
    "TagList": [
        {
            "Key": "Environment",
            "Value": "test"
        },
        {
            "Key": "Name",
            "Value": "MyDatabase"
        }
    ]
}
```

For more information, see Tagging Amazon RDS Resources in the *Amazon RDS User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `modify-certificates`

The following code example shows how to use `modify-certificates`.

**AWS CLI**

**To temporarily override the system-default SSL/TLS certificate for new DB instances**

The following `modify-certificates` example temporarily overrides the system-default SSL/TLS certificate for new DB instances.

```
aws rds modify-certificates \
    --certificate-identifier rds-ca-2019
```

Output:

```
{
    "Certificate": {
        "CertificateIdentifier": "rds-ca-2019",
        "CertificateType": "CA",
        "Thumbprint": "EXAMPLE123456789012",
        "ValidFrom": "2019-09-19T18:16:53Z",
        "ValidTill": "2024-08-22T17:08:50Z",
        "CertificateArn": "arn:aws:rds:us-east-1::cert:rds-ca-2019",
        "CustomerOverride": true,
        "CustomerOverrideValidTill": "2024-08-22T17:08:50Z"
    }
}
```

For more information, see Rotating your SSL/TLS certificate in the *Amazon RDS User Guide* and Rotating your SSL/TLS certificate in the *Amazon Aurora User Guide*.

- For API details, see ModifyCertificates in *AWS CLI Command Reference*.

### `modify-current-db-cluster-capacity`

The following code example shows how to use `modify-current-db-cluster-capacity`.

**AWS CLI**

**To scale the capacity of an Aurora Serverless DB cluster**

The following `modify-current-db-cluster-capacity` example scales the capacity of an Aurora Serverless DB cluster to 8.

```
aws rds modify-current-db-cluster-capacity \
    --db-cluster-identifier mydbcluster \
```

```
    --capacity 8
```

Output:

```
{
    "DBClusterIdentifier": "mydbcluster",
    "PendingCapacity": 8,
    "CurrentCapacity": 1,
    "SecondsBeforeTimeout": 300,
    "TimeoutAction": "ForceApplyCapacityChange"
}
```

For more information, see Scaling Aurora Serverless v1 DB cluster capacity manually in the *Amazon Aurora User Guide*.

- For API details, see ModifyCurrentDbClusterCapacity in *AWS CLI Command Reference*.

### `modify-db-cluster-endpoint`

The following code example shows how to use `modify-db-cluster-endpoint`.

#### AWS CLI

**To modify a custom DB cluster endpoint**

The following `modify-db-cluster-endpoint` example modifies the specified custom DB cluster endpoint.

```
aws rds modify-db-cluster-endpoint \
    --db-cluster-endpoint-identifier mycustomendpoint \
    --static-members dbinstance1 dbinstance2 dbinstance3
```

Output:

```
{
    "DBClusterEndpointIdentifier": "mycustomendpoint",
    "DBClusterIdentifier": "mydbcluster",
    "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
    "Endpoint": "mycustomendpoint.cluster-custom-cnpexample.us-
east-1.rds.amazonaws.com",
    "Status": "modifying",
    "EndpointType": "CUSTOM",
```

```
    "CustomEndpointType": "READER",
    "StaticMembers": [
        "dbinstance1",
        "dbinstance2",
        "dbinstance3"
    ],
    "ExcludedMembers": [],
    "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-
endpoint:mycustomendpoint"
}
```

For more information, see Amazon Aurora Connection Management in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbClusterEndpoint in *AWS CLI Command Reference*.

### `modify-db-cluster-parameter-group`

The following code example shows how to use `modify-db-cluster-parameter-group`.

#### AWS CLI

**To modify parameters in a DB cluster parameter group**

The following `modify-db-cluster-parameter-group` example modifies the values of parameters in a DB cluster parameter group.

```
aws rds modify-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclusterpg \
    --parameters
 "ParameterName=server_audit_logging,ParameterValue=1,ApplyMethod=immediate" \

 "ParameterName=server_audit_logs_upload,ParameterValue=1,ApplyMethod=immediate"
```

Output:

```
{
    "DBClusterParameterGroupName": "mydbclusterpg"
}
```

For more information, see Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbClusterParameterGroup in *AWS CLI Command Reference*.

### `modify-db-cluster-snapshot-attribute`

The following code example shows how to use `modify-db-cluster-snapshot-attribute`.

**AWS CLI**

**To modify a DB cluster snapshot attribute**

The following `modify-db-cluster-snapshot-attribute` example makes changes to the specified DB cluster snapshot attribute.

```
aws rds modify-db-cluster-snapshot-attribute \
    --db-cluster-snapshot-identifier myclustersnapshot \
    --attribute-name restore \
    --values-to-add 123456789012
```

Output:

```
{
    "DBClusterSnapshotAttributesResult": {
        "DBClusterSnapshotIdentifier": "myclustersnapshot",
        "DBClusterSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "123456789012"
                ]
            }
        ]
    }
}
```

For more information, see Restoring from a DB Cluster Snapshot in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbClusterSnapshotAttribute in *AWS CLI Command Reference*.

### `modify-db-cluster`

The following code example shows how to use `modify-db-cluster`.

## AWS CLI

### Example 1: To modify a DB cluster

The following `modify-db-cluster` example changes the master user password for the DB cluster named `cluster-2` and sets the backup retention period to 14 days. The `--apply-immediately` parameter causes the changes to be made immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-cluster \
    --db-cluster-identifier cluster-2 \
    --backup-retention-period 14 \
    --master-user-password newpassword99 \
    --apply-immediately
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "eu-central-1b",
            "eu-central-1c",
            "eu-central-1a"
        ],
        "BackupRetentionPeriod": 14,
        "DatabaseName": "",
        "DBClusterIdentifier": "cluster-2",
        "DBClusterParameterGroup": "default.aurora5.6",
        "DBSubnetGroup": "default-vpc-2305ca49",
        "Status": "available",
        "EarliestRestorableTime": "2020-06-03T02:07:29.637Z",
        "Endpoint": "cluster-2.cluster-############.eu-central-1.rds.amazonaws.com",
        "ReaderEndpoint": "cluster-2.cluster-ro-############.eu-
central-1.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora",
        "EngineVersion": "5.6.10a",

        "CrossAccountClone": false,
        "DomainMemberships": []
    }
}
```

For more information, see Modifying an Amazon Aurora DB Cluster in the *Amazon Aurora User Guide*.

**Example 2: To associate VPC security group with a DB cluster**

The following `modify-db-instance` example associates a specific VPC security group and removes DB security groups from a DB cluster.

```
aws rds modify-db-cluster \
    --db-cluster-identifier dbName \
```

```
    --vpc-security-group-ids sg-ID
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2b",
            "us-west-2a"
        ],
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "dbName",
        "DBClusterParameterGroup": "default.aurora-mysql8.0",
        "DBSubnetGroup": "default",
        "Status": "available",
        "EarliestRestorableTime": "2024-02-15T01:12:13.966000+00:00",

        "ReaderEndpoint": "dbName.cluster-ro-abcdefghji.us-
west-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-mysql",
        "EngineVersion": "8.0.mysql_aurora.3.04.1",
        "LatestRestorableTime": "2024-02-15T02:25:33.696000+00:00",
        "Port": 3306,
        "MasterUsername": "admin",
        "PreferredBackupWindow": "10:59-11:29",
        "PreferredMaintenanceWindow": "thu:08:54-thu:09:24",
        "ReadReplicaIdentifiers": [],
        "DBClusterMembers": [
            {
                "DBInstanceIdentifier": "dbName-instance-1",
                "IsClusterWriter": true,
                "DBClusterParameterGroupStatus": "in-sync",
                "PromotionTier": 1
            }
        ],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-ID",
                "Status": "active"
            }
```

```
        ],
        ...output omitted...
    }
}
```

For more information, see Controlling access with security groups in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbCluster in *AWS CLI Command Reference*.

### `modify-db-instance`

The following code example shows how to use `modify-db-instance`.

**AWS CLI**

**Example 1: To modify a DB instance**

The following `modify-db-instance` example associates an option group and a parameter group with a compatible Microsoft SQL Server DB instance. The `--apply-immediately` parameter causes the option and parameter groups to be associated immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-instance \
    --db-instance-identifier database-2 \
    --option-group-name test-se-2017 \
    --db-parameter-group-name test-sqlserver-se-2017 \
    --apply-immediately
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "database-2",
        "DBInstanceClass": "db.r4.large",
        "Engine": "sqlserver-se",
        "DBInstanceStatus": "available",

        ...output omitted...

        "DBParameterGroups": [
```

```
            {
                "DBParameterGroupName": "test-sqlserver-se-2017",
                "ParameterApplyStatus": "applying"
            }
        ],
        "AvailabilityZone": "us-west-2d",

        ...output omitted...

        "MultiAZ": true,
        "EngineVersion": "14.00.3281.6.v1",
        "AutoMinorVersionUpgrade": false,
        "ReadReplicaDBInstanceIdentifiers": [],
        "LicenseModel": "license-included",
        "OptionGroupMemberships": [
            {
                "OptionGroupName": "test-se-2017",
                "Status": "pending-apply"
            }
        ],
        "CharacterSetName": "SQL_Latin1_General_CP1_CI_AS",
        "SecondaryAvailabilityZone": "us-west-2c",
        "PubliclyAccessible": true,
        "StorageType": "gp2",

        ...output omitted...

        "DeletionProtection": false,
        "AssociatedRoles": [],
        "MaxAllocatedStorage": 1000
    }
}
```

For more information, see Modifying an Amazon RDS DB Instance in the *Amazon RDS User Guide*.

**Example 2: To associate VPC security group with a DB instance**

The following `modify-db-instance` example associates a specific VPC security group and removes DB security groups from a DB instance:

```
aws rds modify-db-instance \
    --db-instance-identifier dbName \
```

```
    --vpc-security-group-ids sg-ID
```

Output:

```
{
"DBInstance": {
    "DBInstanceIdentifier": "dbName",
    "DBInstanceClass": "db.t3.micro",
    "Engine": "mysql",
    "DBInstanceStatus": "available",
    "MasterUsername": "admin",
    "Endpoint": {
        "Address": "dbName.abcdefghijk.us-west-2.rds.amazonaws.com",
        "Port": 3306,
        "HostedZoneId": "ABCDEFGHIJK1234"
    },
    "AllocatedStorage": 20,
    "InstanceCreateTime": "2024-02-15T00:37:58.793000+00:00",
    "PreferredBackupWindow": "11:57-12:27",
    "BackupRetentionPeriod": 7,
    "DBSecurityGroups": [],
    "VpcSecurityGroups": [
        {
            "VpcSecurityGroupId": "sg-ID",
            "Status": "active"
        }
    ],
    ... output omitted ...
    "MultiAZ": false,
    "EngineVersion": "8.0.35",
    "AutoMinorVersionUpgrade": true,
    "ReadReplicaDBInstanceIdentifiers": [],
    "LicenseModel": "general-public-license",

    ... output ommited ...
    }
}
```

For more information, see Controlling access with security groups in the *Amazon RDS User Guide*.

- For API details, see ModifyDBInstance in *AWS CLI Command Reference*.

### `modify-db-parameter-group`

The following code example shows how to use `modify-db-parameter-group`.

**AWS CLI**

**To modify a DB parameter group**

The following `modify-db-parameter-group` example changes the value of the `clr enabled` parameter in a DB parameter group. The `--apply-immediately` parameter causes the DB parameter group to be modified immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-parameter-group \
    --db-parameter-group-name test-sqlserver-se-2017 \
    --parameters "ParameterName='clr
 enabled',ParameterValue=1,ApplyMethod=immediate"
```

Output:

```
{
    "DBParameterGroupName": "test-sqlserver-se-2017"
}
```

For more information, see Modifying Parameters in a DB Parameter Group in the *Amazon RDS User Guide*.

- For API details, see ModifyDBParameterGroup in *AWS CLI Command Reference*.

### `modify-db-proxy-endpoint`

The following code example shows how to use `modify-db-proxy-endpoint`.

**AWS CLI**

**To modify a DB proxy endpoint for an RDS database**

The following `modify-db-proxy-endpoint` example modifies a DB proxy endpoint `proxyEndpoint` to set the read-timeout to 65 seconds.

```
aws rds modify-db-proxy-endpoint \
    --db-proxy-endpoint-name proxyEndpoint \
```

```
    --cli-read-timeout 65
```

Output:

```
{
"DBProxyEndpoint":
    {
        "DBProxyEndpointName": "proxyEndpoint",
        "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
        "DBProxyName": "proxyExample",
        "Status": "available",
        "VpcId": "vpc-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Endpoint": "proxyEndpoint.endpoint.proxyExample-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
        "TargetRole": "READ_WRITE",
        "IsDefault": "false"
    }
}
```

For more information, see Modifying a proxy endpoint in the *Amazon RDS User Guide* and Modifying a proxy endpoint in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbProxyEndpoint in *AWS CLI Command Reference*.

### `modify-db-proxy-target-group`

The following code example shows how to use `modify-db-proxy-target-group`.

#### AWS CLI

**To modify a DB proxy endpoints**

The following `modify-db-proxy-target-group` example modifies a DB proxy target group to set the maximum connections to 80 percent and maximum idle connections to 10 percent.

```
aws rds modify-db-proxy-target-group \
    --target-group-name default \
    --db-proxy-name proxyExample \
    --connection-pool-config MaxConnectionsPercent=80,MaxIdleConnectionsPercent=10
```

Output:

```
{
"DBProxyTargetGroup":
    {
        "DBProxyName": "proxyExample",
        "TargetGroupName": "default",
        "TargetGroupArn": "arn:aws:rds:us-east-1:123456789012:target-group:prx-
tg-0123a01b12345c0ab",
        "IsDefault": true,
        "Status": "available",
        "ConnectionPoolConfig": {
            "MaxConnectionsPercent": 80,
            "MaxIdleConnectionsPercent": 10,
            "ConnectionBorrowTimeout": 120,
            "SessionPinningFilters": []
        },
        "CreatedDate": "2023-05-02T18:41:19.495000+00:00",
        "UpdatedDate": "2023-05-02T18:41:21.762000+00:00"
    }
}
```

For more information, see Modifying an RDS Proxy in the *Amazon RDS User Guide* and Modifying an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbProxyTargetGroup in *AWS CLI Command Reference*.

### `modify-db-proxy`

The following code example shows how to use `modify-db-proxy`.

#### AWS CLI

##### To modify a DB proxy for an RDS database

The following `modify-db-proxy` example modifies a DB proxy named `proxyExample` to require SSL for its connections.

```
aws rds modify-db-proxy \
    --db-proxy-name proxyExample \
    --require-tls
```

Output:

```
{
"DBProxy":
    {
        "DBProxyName": "proxyExample",
        "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-
proxy:prx-0123a01b12345c0ab",
        "Status": "modifying"
        "EngineFamily": "PostgreSQL",
        "VpcId": "sg-1234567",
        "VpcSecurityGroupIds": [
            "sg-1234"
        ],
        "VpcSubnetIds": [
            "subnetgroup1",
            "subnetgroup2"
        ],
        "Auth": "[
            {
                "Description": "proxydescription1",
                "AuthScheme": "SECRETS",
                "SecretArn": "arn:aws:secretsmanager:us-
west-2:123456789123:secret:proxysecret1-Abcd1e",
                "IAMAuth": "DISABLED"
            }
        ]",
        "RoleArn": "arn:aws:iam::12345678912:role/ProxyPostgreSQLRole",
        "Endpoint": "proxyExample.proxy-ab0cd1efghij.us-east-1.rds.amazonaws.com",
        "RequireTLS": true,
        "IdleClientTimeout": 1800,
        "DebuggingLogging": false,
        "CreatedDate": "2023-04-05T16:09:33.452000+00:00",
        "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"
    }
}
```

For more information, see Modify an RDS Proxy in the *Amazon RDS User Guide* and Creating an RDS Proxy in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbProxy in *AWS CLI Command Reference*.

### `modify-db-shard-group`

The following code example shows how to use `modify-db-shard-group`.

**AWS CLI**

**Example 1: To modify a DB shard group**

The following `modify-db-shard-group` example changes the maximum capacity of a DB shard group.

```
aws rds modify-db-shard-group \
    --db-shard-group-identifier my-db-shard-group \
    --max-acu 1000
```

Output:

```
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

**Example 2: To describe your DB shard groups**

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups after you run the `modify-db-shard-group` command. The maximum capacity of the DB shard group `my-db-shard-group` is now 1000 Aurora capacity units (ACUs).

```
aws rds describe-db-shard-groups
```

Output:

```
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
            "DBShardGroupIdentifier": "limitless-test-shard-grp",
            "DBClusterIdentifier": "limitless-test-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": true,
            "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        },
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 1000.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Amazon Aurora DB Clusters in the *Amazon Aurora User Guide*.

- For API details, see ModifyDbShardGroup in *AWS CLI Command Reference*.

### `modify-db-snapshot-attribute`

The following code example shows how to use `modify-db-snapshot-attribute`.

## AWS CLI

### Example 1: To enable two AWS accounts to restore a DB snapshot

The following `modify-db-snapshot-attribute` example grants permission to two AWS accounts, with the identifiers `111122223333` and `444455556666`, to restore the DB snapshot named `mydbsnapshot`.

```
aws rds modify-db-snapshot-attribute \
    --db-snapshot-identifier mydbsnapshot \
    --attribute-name restore \
    --values-to-add {"111122223333","444455556666"}
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "111122223333",
                    "444455556666"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a Snapshot in the *Amazon RDS User Guide*.

### Example 2: To prevent an AWS account from restoring a DB snapshot

The following `modify-db-snapshot-attribute` example removes permission from a particular AWS account to restore the DB snapshot named `mydbsnapshot`. When specifying a single account, the account identifier can't be surrounded by quotations marks or braces.

```
aws rds modify-db-snapshot-attribute \
    --db-snapshot-identifier mydbsnapshot \
    --attribute-name restore \
    --values-to-remove 444455556666
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "111122223333"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a Snapshot in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSnapshotAttribute in *AWS CLI Command Reference*.

### `modify-db-snapshot-attributes`

The following code example shows how to use `modify-db-snapshot-attributes`.

#### AWS CLI

**To modify a DB snapshot attribute**

The following `modify-db-snapshot-attribute` example permits two AWS account identifiers, `111122223333` and `444455556666`, to restore the DB snapshot named `mydbsnapshot`.

```
aws rds modify-db-snapshot-attribute \
    --db-snapshot-identifier mydbsnapshot \
    --attribute-name restore \
    --values-to-add '["111122223333","444455556666"]'
```

Output:

```
{
    "DBSnapshotAttributesResult": {
        "DBSnapshotIdentifier": "mydbsnapshot",
```

```
        "DBSnapshotAttributes": [
            {
                "AttributeName": "restore",
                "AttributeValues": [
                    "111122223333",
                    "444455556666"
                ]
            }
        ]
    }
}
```

For more information, see Sharing a Snapshot in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSnapshotAttributes in *AWS CLI Command Reference*.

### `modify-db-snapshot`

The following code example shows how to use `modify-db-snapshot`.

#### AWS CLI

**To modify a DB snapshot**

The following `modify-db-snapshot` example upgrades a PostgeSQL 10.6 snapshot named `db5-snapshot-upg-test` to PostgreSQL 11.7. The new DB engine version is shown after the snapshot has finished upgrading and its status is **available**.

```
aws rds modify-db-snapshot \
    --db-snapshot-identifier db5-snapshot-upg-test \
    --engine-version 11.7
```

Output:

```
{
    "DBSnapshot": {
        "DBSnapshotIdentifier": "db5-snapshot-upg-test",
        "DBInstanceIdentifier": "database-5",
        "SnapshotCreateTime": "2020-03-27T20:49:17.092Z",
        "Engine": "postgres",
        "AllocatedStorage": 20,
        "Status": "upgrading",
        "Port": 5432,
```

```
        "AvailabilityZone": "us-west-2a",
        "VpcId": "vpc-2ff27557",
        "InstanceCreateTime": "2020-03-27T19:59:04.735Z",
        "MasterUsername": "postgres",
        "EngineVersion": "10.6",
        "LicenseModel": "postgresql-license",
        "SnapshotType": "manual",
        "OptionGroupName": "default:postgres-11",
        "PercentProgress": 100,
        "StorageType": "gp2",
        "Encrypted": false,
        "DBSnapshotArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-
upg-test",
        "IAMDatabaseAuthenticationEnabled": false,
        "ProcessorFeatures": [],
        "DbiResourceId": "db-GJMF75LM42IL6BTFRE4UZJ5YM4"
    }
}
```

For more information, see Upgrading a PostgreSQL DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSnapshot in *AWS CLI Command Reference*.

### `modify-db-subnet-group`

The following code example shows how to use `modify-db-subnet-group`.

#### AWS CLI

**To modify a DB subnet group**

The following `modify-db-subnet-group` example adds a subnet with the ID `subnet-08e41f9e230222222` to the DB subnet group named `mysubnetgroup`. To keep the existing subnets in the subnet group, include their IDs as values in the `--subnet-ids` option. Make sure to have subnets with at least two different Availability Zones in the DB subnet group.

```
aws rds modify-db-subnet-group \
    --db-subnet-group-name mysubnetgroup \
    --subnet-ids
 '["subnet-0a1dc4e1a6f123456","subnet-070dd7ecb3aaaaaaa","subnet-00f5b198bc0abcdef","subnet-
```

Output:

```
{
    "DBSubnetGroup": {
        "DBSubnetGroupName": "mysubnetgroup",
        "DBSubnetGroupDescription": "test DB subnet group",
        "VpcId": "vpc-0f08e7610a1b2c3d4",
        "SubnetGroupStatus": "Complete",
        "Subnets": [
            {
                "SubnetIdentifier": "subnet-08e41f9e230222222",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2a"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-070dd7ecb3aaaaaaa",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-00f5b198bc0abcdef",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2d"
                },
                "SubnetStatus": "Active"
            },
            {
                "SubnetIdentifier": "subnet-0a1dc4e1a6f123456",
                "SubnetAvailabilityZone": {
                    "Name": "us-west-2b"
                },
                "SubnetStatus": "Active"
            }
        ],
        "DBSubnetGroupArn": "arn:aws:rds:us-
west-2:534026745191:subgrp:mysubnetgroup"
    }
}
```

For more information, see Step 3: Create a DB Subnet Group in the *Amazon RDS User Guide*.

- For API details, see ModifyDbSubnetGroup in *AWS CLI Command Reference*.

### `modify-event-subscription`

The following code example shows how to use `modify-event-subscription`.

**AWS CLI**

**To modify an event subscription**

The following `modify-event-subscription` example disables the specified event subscription, so that it no longer publishes notifications to the specified Amazon Simple Notification Service topic.

```
aws rds modify-event-subscription \
    --subscription-name my-instance-events \
    --no-enabled
```

Output:

```
{
    "EventSubscription": {
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "CustomerAwsId": "123456789012",
        "SourceType": "db-instance",
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "CustSubscriptionId": "my-instance-events",
        "Status": "modifying",
        "Enabled": false
    }
}
```

- For API details, see ModifyEventSubscription in *AWS CLI Command Reference*.

### `modify-global-cluster`

The following code example shows how to use `modify-global-cluster`.

**AWS CLI**

**To modify a global DB cluster**

The following `modify-global-cluster` example enables deletion protection for an Aurora MySQL-compatible global DB cluster.

```
aws rds modify-global-cluster \
    --global-cluster-identifier myglobalcluster \
    --deletion-protection
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.mysql_aurora.2.07.2",
        "StorageEncrypted": false,
        "DeletionProtection": true,
        "GlobalClusterMembers": []
    }
}
```

For more information, see Managing an Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see ModifyGlobalCluster in *AWS CLI Command Reference*.

### `promote-read-replica-db-cluster`

The following code example shows how to use `promote-read-replica-db-cluster`.

**AWS CLI**

**To promote a DB cluster read replica**

The following `promote-read-replica-db-cluster` example promotes the specified read replica to become a standalone DB cluster.

```
aws rds promote-read-replica-db-cluster \
    --db-cluster-identifier mydbcluster-1
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1b",
            "us-east-1c"
        ],
        "BackupRetentionPeriod": 1,
        "DatabaseName": "",
        "DBClusterIdentifier": "mydbcluster-1",
        ...some output truncated...
    }
}
```

For more information, see Promoting a read replica to be a DB cluster in the *Amazon Aurora User Guide*.

- For API details, see PromoteReadReplicaDbCluster in *AWS CLI Command Reference*.

### `promote-read-replica`

The following code example shows how to use `promote-read-replica`.

**AWS CLI**

**To promote a read replica**

The following `promote-read-replica` example promotes the specified read replica to become a standalone DB instance.

```
aws rds promote-read-replica \
    --db-instance-identifier test-instance-repl
```

Output:

```
{
    "DBInstance": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance-repl",
        "StorageType": "standard",
        "ReadReplicaSourceDBInstanceIdentifier": "test-instance",
        "DBInstanceStatus": "modifying",
        ...some output truncated...
    }
}
```

- For API details, see PromoteReadReplica in *AWS CLI Command Reference*.

### `purchase-reserved-db-instance`

The following code example shows how to use `purchase-reserved-db-instance`.

**AWS CLI**

**To purchase a reserved DB instance offering**

The following `purchase-reserved-db-instances-offering` example purchases a reserved DB instance offering. The `reserved-db-instances-offering-id` must be a valid offering ID, as returned by the `describe-reserved-db-instances-offering` command.

aws rds purchase-reserved-db-instances-offering --reserved-db-instances-offering-id 438012d3-4a52-4cc7-b2e3-8dff72e0e706

- For API details, see PurchaseReservedDbInstance in *AWS CLI Command Reference*.

### `purchase-reserved-db-instances-offerings`

The following code example shows how to use `purchase-reserved-db-instances-offerings`.

**AWS CLI**

**Example 1: To find a reserved DB instance to purchase**

The following `describe-reserved-db-instances-offerings` example lists the available reserved MySQL DB instances with the db.t2.micro instance class and a duration of one year. The offering ID is required for purchasing a reserved DB instance.

```
aws rds describe-reserved-db-instances-offerings \
    --product-description mysql \
    --db-instance-class db.t2.micro \
    --duration 1
```

Output:

```
{
    "ReservedDBInstancesOfferings": [
        {
            "ReservedDBInstancesOfferingId": "8ba30be1-b9ec-447f-8f23-6114e3f4c7b4",
            "DBInstanceClass": "db.t2.micro",
            "Duration": 31536000,
            "FixedPrice": 51.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
            "ProductDescription": "mysql",
            "OfferingType": "Partial Upfront",
            "MultiAZ": false,
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.006,
                    "RecurringChargeFrequency": "Hourly"
                }
            ]
        },
    ... some output truncated ...
    ]
}
```

For more information, see Reserved DB Instances for Amazon RDS in the *Amazon RDS User Guide*.

**Example 2: To purchase a reserved DB instance**

The following `purchase-reserved-db-instances-offering` example shows how to buy the reserved DB instance offering from the previous example.

aws rds purchase-reserved-db-instances-offering --reserved-db-instances-offering-id 8ba30be1-b9ec-447f-8f23-6114e3f4c7b4

Output:

```
{
    "ReservedDBInstance": {
        "ReservedDBInstanceId": "ri-2020-06-29-16-54-57-670",
        "ReservedDBInstancesOfferingId": "8ba30be1-b9ec-447f-8f23-6114e3f4c7b4",
        "DBInstanceClass": "db.t2.micro",
        "StartTime": "2020-06-29T16:54:57.670Z",
        "Duration": 31536000,
        "FixedPrice": 51.0,
        "UsagePrice": 0.0,
        "CurrencyCode": "USD",
        "DBInstanceCount": 1,
        "ProductDescription": "mysql",
        "OfferingType": "Partial Upfront",
        "MultiAZ": false,
        "State": "payment-pending",
        "RecurringCharges": [
            {
                "RecurringChargeAmount": 0.006,
                "RecurringChargeFrequency": "Hourly"
            }
        ],
        "ReservedDBInstanceArn": "arn:aws:rds:us-
west-2:123456789012:ri:ri-2020-06-29-16-54-57-670"
    }
}
```

For more information, see Reserved DB Instances for Amazon RDS in the *Amazon RDS User Guide*.

- For API details, see PurchaseReservedDbInstancesOfferings in *AWS CLI Command Reference*.

### `reboot-db-instance`

The following code example shows how to use `reboot-db-instance`.

#### AWS CLI

**To reboot a DB instance**

The following `reboot-db-instance` example starts a reboot of the specified DB instance.

```
aws rds reboot-db-instance \
    --db-instance-identifier test-mysql-instance
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "test-mysql-instance",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "mysql",
        "DBInstanceStatus": "rebooting",
        "MasterUsername": "admin",
        "Endpoint": {
            "Address": "test-mysql-instance.############.us-
west-2.rds.amazonaws.com",
            "Port": 3306,
            "HostedZoneId": "Z1PVIF0EXAMPLE"
        },

    ... output omitted...

    }
}
```

For more information, see Rebooting a DB Instance in the *Amazon RDS User Guide*.

- For API details, see RebootDBInstance in *AWS CLI Command Reference*.

### `reboot-db-shard-group`

The following code example shows how to use `reboot-db-shard-group`.

#### AWS CLI

##### Example 1: To reboot a DB shard group

The following `reboot-db-shard-group` example reboots a DB shard group.

```
aws rds reboot-db-shard-group \
```

```
    --db-shard-group-identifier my-db-shard-group
```

Output:

```
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 1000.0,
            "ComputeRedundancy": 0,
            "Status": "available",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Rebooting an Amazon Aurora DB cluster or Amazon Aurora DB instance in the *Amazon Aurora User Guide*.

**Example 2: To describe your DB shard groups**

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups after you run the `reboot-db-shard-group` command. The DB shard group `my-db-shard-group` is now rebooting.

```
aws rds describe-db-shard-groups
```

Output:

```
{
    "DBShardGroups": [
        {
            "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
            "DBShardGroupIdentifier": "limitless-test-shard-grp",
            "DBClusterIdentifier": "limitless-test-cluster",
            "MaxACU": 768.0,
            "ComputeRedundancy": 0,
```

```
            "Status": "available",
            "PubliclyAccessible": true,
            "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        },
        {
            "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
            "DBShardGroupIdentifier": "my-db-shard-group",
            "DBClusterIdentifier": "my-sv2-cluster",
            "MaxACU": 1000.0,
            "ComputeRedundancy": 0,
            "Status": "rebooting",
            "PubliclyAccessible": false,
            "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-
east-2.rds.amazonaws.com"
        }
    ]
}
```

For more information, see Rebooting an Amazon Aurora DB cluster or Amazon Aurora DB instance in the *Amazon Aurora User Guide*.

- For API details, see RebootDbShardGroup in *AWS CLI Command Reference*.

### `register-db-proxy-targets`

The following code example shows how to use `register-db-proxy-targets`.

#### AWS CLI

**To register a DB proxy with a database**

The following `register-db-proxy-targets` example creates the association between a database and a proxy.

```
aws rds register-db-proxy-targets \
    --db-proxy-name proxyExample \
    --db-cluster-identifiers database-5
```

Output:

```
{
```

```
    "DBProxyTargets": [
        {
            "RdsResourceId": "database-5",
            "Port": 3306,
            "Type": "TRACKED_CLUSTER",
            "TargetHealth": {
                "State": "REGISTERING"
            }
        },
        {
            "Endpoint": "database-5instance-1.ab0cd1efghij.us-
east-1.rds.amazonaws.com",
            "RdsResourceId": "database-5",
            "Port": 3306,
            "Type": "RDS_INSTANCE",
            "TargetHealth": {
                "State": "REGISTERING"
            }
        }
    ]
}
```

For more information, see Creating an RDS proxy in the *Amazon RDS User Guide* and Creating an RDS proxy in the *Amazon Aurora User Guide*.

- For API details, see RegisterDbProxyTargets in *AWS CLI Command Reference*.

### `remove-from-global-cluster`

The following code example shows how to use `remove-from-global-cluster`.

**AWS CLI**

**To detach an Aurora secondary cluster from an Aurora global database cluster**

The following `remove-from-global-cluster` example detaches an Aurora secondary cluster from an Aurora global database cluster. The cluster changes from being read-only to a standalone cluster with read-write capability.

```
aws rds remove-from-global-cluster \
    --region us-west-2 \
    --global-cluster-identifier myglobalcluster \
```

```
    --db-cluster-identifier arn:aws:rds:us-west-2:123456789012:cluster:DB-1
```

Output:

```
{
    "GlobalCluster": {
        "GlobalClusterIdentifier": "myglobalcluster",
        "GlobalClusterResourceId": "cluster-abc123def456gh",
        "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
        "Status": "available",
        "Engine": "aurora-postgresql",
        "EngineVersion": "10.11",
        "StorageEncrypted": true,
        "DeletionProtection": false,
        "GlobalClusterMembers": [
            {
                "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:js-
global-cluster",
                "Readers": [
                    "arn:aws:rds:us-west-2:123456789012:cluster:DB-1"
                ],
                "IsWriter": true
            },
            {
                "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:DB-1",
                "Readers": [],
                "IsWriter": false,
                "GlobalWriteForwardingStatus": "disabled"
            }
        ]
    }
}
```

For more information, see Removing a cluster from an Amazon Aurora global database in the *Amazon Aurora User Guide*.

- For API details, see RemoveFromGlobalCluster in *AWS CLI Command Reference*.

### `remove-option-from-option-group`

The following code example shows how to use `remove-option-from-option-group`.

**AWS CLI**

**To delete an option from an option group**

The following `remove-option-from-option-group` example removes the `OEM` option from `myoptiongroup`.

```
aws rds remove-option-from-option-group \
    --option-group-name myoptiongroup \
    --options OEM \
    --apply-immediately
```

Output:

```
{
    "OptionGroup": {
        "OptionGroupName": "myoptiongroup",
        "OptionGroupDescription": "Test",
        "EngineName": "oracle-ee",
        "MajorEngineVersion": "19",
        "Options": [],
        "AllowsVpcAndNonVpcInstanceMemberships": true,
        "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:myoptiongroup"
    }
}
```

For more information, see Removing an Option from an Option Group in the *Amazon Aurora User Guide*.

- For API details, see RemoveOptionFromOptionGroup in *AWS CLI Command Reference*.

### `remove-role-from-db-cluster`

The following code example shows how to use `remove-role-from-db-cluster`.

**AWS CLI**

**To disassociate an AWS Identity and Access Management (IAM) role from a DB cluster**

The following `remove-role-from-db-cluster` example removes a role from a DB cluster.

```
aws rds remove-role-from-db-cluster \
```

```
    --db-cluster-identifier mydbcluster \
    --role-arn arn:aws:iam::123456789012:role/RDSLoadFromS3
```

This command produces no output.

For more information, see Associating an IAM role with an Amazon Aurora MySQL DB cluster in the *Amazon Aurora User Guide*.

- For API details, see RemoveRoleFromDbCluster in *AWS CLI Command Reference*.

### `remove-role-from-db-instance`

The following code example shows how to use `remove-role-from-db-instance`.

**AWS CLI**

**To disassociate an AWS Identity and Access Management (IAM) role from a DB instance**

The following `remove-role-from-db-instance` example removes the role named `rds-s3-integration-role` from an Oracle DB instance named `test-instance`.

```
aws rds remove-role-from-db-instance \
    --db-instance-identifier test-instance \
    --feature-name S3_INTEGRATION \
    --role-arn arn:aws:iam::111122223333:role/rds-s3-integration-role
```

This command produces no output.

For more information, see Disabling RDS SQL Server Integration with S3 in the *Amazon RDS User Guide*.

- For API details, see RemoveRoleFromDbInstance in *AWS CLI Command Reference*.

### `remove-source-identifier-from-subscription`

The following code example shows how to use `remove-source-identifier-from-subscription`.

**AWS CLI**

**To remove a source identifier from a subscription**

The following `remove-source-identifier` example removes the specified source identifier from an existing subscription.

```
aws rds remove-source-identifier-from-subscription \
    --subscription-name my-instance-events \
    --source-identifier test-instance-repl
```

Output:

```
{
    "EventSubscription": {
        "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
        "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
        "EventCategoriesList": [
            "backup",
            "recovery"
        ],
        "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
        "Status": "modifying",
        "CustSubscriptionId": "my-instance-events",
        "CustomerAwsId": "123456789012",
        "SourceIdsList": [
            "test-instance"
        ],
        "SourceType": "db-instance",
        "Enabled": false
    }
}
```

- For API details, see RemoveSourceIdentifierFromSubscription in *AWS CLI Command Reference*.

### `remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

#### AWS CLI

**To remove tags from a resource**

The following `remove-tags-from-resource` example removes tags from a resource.

```
aws rds remove-tags-from-resource \
    --resource-name arn:aws:rds:us-east-1:123456789012:db:mydbinstance \
    --tag-keys Name Environment
```

This command produces no output.

For more information, see Tagging Amazon RDS resources in the *Amazon RDS User Guide* and Tagging Amazon RDS resources in the *Amazon Aurora User Guide*.

- For API details, see RemoveTagsFromResource in *AWS CLI Command Reference*.

### `reset-db-cluster-parameter-group`

The following code example shows how to use `reset-db-cluster-parameter-group`.

#### AWS CLI

**Example 1: To reset all parameters to their default values**

The following `reset-db-cluster-parameter-group` example resets all parameter values in a customer-created DB cluster parameter group to their default values.

```
aws rds reset-db-cluster-parameter-group \
    --db-cluster-parameter-group-name mydbclpg \
    --reset-all-parameters
```

Output:

```
{
    "DBClusterParameterGroupName": "mydbclpg"
}
```

For more information, see Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

**Example 2: To reset specific parameters to their default values**

The following `reset-db-cluster-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB cluster parameter group.

```
aws rds reset-db-cluster-parameter-group \
```

```
    --db-cluster-parameter-group-name mydbclpgy \
    --parameters "ParameterName=max_connections,ApplyMethod=immediate" \
                 "ParameterName=max_allowed_packet,ApplyMethod=immediate"
```

Output:

```
{
    "DBClusterParameterGroupName": "mydbclpg"
}
```

For more information, see Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

- For API details, see ResetDbClusterParameterGroup in *AWS CLI Command Reference*.

### `reset-db-parameter-group`

The following code example shows how to use `reset-db-parameter-group`.

#### AWS CLI

**Example 1: To reset all parameters to their default values**

The following `reset-db-parameter-group` example resets all parameter values in a customer-created DB parameter group to their default values.

```
aws rds reset-db-parameter-group \
    --db-parameter-group-name mypg \
    --reset-all-parameters
```

Output:

```
{
    "DBParameterGroupName": "mypg"
}
```

For more information, see Working with DB parameter groups in the *Amazon RDS User Guide* and Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

**Example 2: To reset specific parameters to their default values**

The following `reset-db-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB parameter group.

```
aws rds reset-db-parameter-group \
    --db-parameter-group-name mypg \
    --parameters "ParameterName=max_connections,ApplyMethod=immediate" \
                 "ParameterName=max_allowed_packet,ApplyMethod=immediate"
```

Output:

```
{
    "DBParameterGroupName": "mypg"
}
```

For more information, see Working with DB parameter groups in the *Amazon RDS User Guide* and Working with DB parameter groups and DB cluster parameter groups in the *Amazon Aurora User Guide*.

- For API details, see ResetDbParameterGroup in *AWS CLI Command Reference*.

### `restore-db-cluster-from-s3`

The following code example shows how to use `restore-db-cluster-from-s3`.

#### AWS CLI

**To restore an Amazon Aurora DB cluster from Amazon S3**

The following `restore-db-cluster-from-s3` example restores an Amazon Aurora MySQL version 5.7-compatible DB cluster from a MySQL 5.7 DB backup file in Amazon S3.

```
aws rds restore-db-cluster-from-s3 \
    --db-cluster-identifier cluster-s3-restore \
    --engine aurora-mysql \
    --master-username admin \
    --master-user-password mypassword \
    --s3-bucket-name mybucket \
    --s3-prefix test-backup \
    --s3-ingestion-role-arn arn:aws:iam::123456789012:role/service-role/TestBackup \
    --source-engine mysql \
    --source-engine-version 5.7.28
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
            "us-west-2b"
        ],
        "BackupRetentionPeriod": 1,
        "DBClusterIdentifier": "cluster-s3-restore",
        "DBClusterParameterGroup": "default.aurora-mysql5.7",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "cluster-s3-restore.cluster-co3xyzabc123.us-
west-2.rds.amazonaws.com",
        "ReaderEndpoint": "cluster-s3-restore.cluster-ro-co3xyzabc123.us-
west-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-mysql",
        "EngineVersion": "5.7.12",
        "Port": 3306,
        "MasterUsername": "admin",
        "PreferredBackupWindow": "11:15-11:45",
        "PreferredMaintenanceWindow": "thu:12:19-thu:12:49",
        "ReadReplicaIdentifiers": [],
        "DBClusterMembers": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-########",
                "Status": "active"
            }
        ],
        "HostedZoneId": "Z1PVIF0EXAMPLE",
        "StorageEncrypted": false,
        "DbClusterResourceId": "cluster-SU5THYQQHOWCXZZDGXREXAMPLE",
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:cluster-s3-
restore",
        "AssociatedRoles": [],
        "IAMDatabaseAuthenticationEnabled": false,
        "ClusterCreateTime": "2020-07-27T14:22:08.095Z",
        "EngineMode": "provisioned",
        "DeletionProtection": false,
```

```
        "HttpEndpointEnabled": false,
        "CopyTagsToSnapshot": false,
        "CrossAccountClone": false,
        "DomainMemberships": []
    }
}
```

For more information, see Migrating Data from MySQL by Using an Amazon S3 Bucket in the *Amazon Aurora User Guide*.

- For API details, see RestoreDbClusterFromS3 in *AWS CLI Command Reference*.

### `restore-db-cluster-from-snapshot`

The following code example shows how to use `restore-db-cluster-from-snapshot`.

**AWS CLI**

**To restore a DB cluster from a snapshot**

The following `restore-db-cluster-from-snapshot` restores an Aurora PostgreSQL DB cluster compatible with PostgreSQL version 10.7 from a DB cluster snapshot named `test-instance-snapshot`.

```
aws rds restore-db-cluster-from-snapshot \
    --db-cluster-identifier newdbcluster \
    --snapshot-identifier test-instance-snapshot \
    --engine aurora-postgresql \
    --engine-version 10.7
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
            "us-west-2b"
        ],

### `restore-db-cluster-to-point-in-time`

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

**AWS CLI**

**To restore a DB cluster to a specified time**

The following `restore-db-cluster-to-point-in-time` example restores the DB cluster named `database-4` to the latest possible time. Using `copy-on-write` as the restore type restores the new DB cluster as a clone of the source DB cluster.

```
aws rds restore-db-cluster-to-point-in-time \
    --source-db-cluster-identifier database-4 \
    --db-cluster-identifier sample-cluster-clone \
    --restore-type copy-on-write \
    --use-latest-restorable-time
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-west-2c",
            "us-west-2a",
            "us-west-2b"
        ],
        "BackupRetentionPeriod": 7,
        "DatabaseName": "",
        "DBClusterIdentifier": "sample-cluster-clone",
        "DBClusterParameterGroup": "default.aurora-postgresql10",
        "DBSubnetGroup": "default",
        "Status": "creating",
        "Endpoint": "sample-cluster-clone.cluster-############.us-
west-2.rds.amazonaws.com",
        "ReaderEndpoint": "sample-cluster-clone.cluster-ro-############.us-
west-2.rds.amazonaws.com",
        "MultiAZ": false,
        "Engine": "aurora-postgresql",
        "EngineVersion": "10.7",
        "Port": 5432,
```

```
        "MasterUsername": "postgres",
        "PreferredBackupWindow": "09:33-10:03",
        "PreferredMaintenanceWindow": "sun:12:22-sun:12:52",
        "ReadReplicaIdentifiers": [],
        "DBClusterMembers": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sg-########",
                "Status": "active"
            }
        ],
        "HostedZoneId": "Z1PVIF0EXAMPLE",
        "StorageEncrypted": true,
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/287364e4-33e3-4755-a3b0-

        "CopyTagsToSnapshot": false,
        "CrossAccountClone": false
    }
}
```

For more information, see Restoring a DB Cluster to a Specified Time in the *Amazon Aurora User Guide*.

- For API details, see RestoreDbClusterToPointInTime in *AWS CLI Command Reference*.

### `restore-db-instance-from-db-snapshot`

The following code example shows how to use `restore-db-instance-from-db-snapshot`.

#### AWS CLI

**To restore a DB instance from a DB snapshot**

The following `restore-db-instance-from-db-snapshot` example creates a new DB instance named `db7-new-instance` with the `db.t3.small` DB instance class from the specified DB snapshot. The source DB instance from which the snapshot was taken uses a deprecated DB instance class, so you can't upgrade it.

```
aws rds restore-db-instance-from-db-snapshot \
    --db-instance-identifier db7-new-instance \
    --db-snapshot-identifier db7-test-snapshot \
    --db-instance-class db.t3.small
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "db7-new-instance",
        "DBInstanceClass": "db.t3.small",
        "Engine": "mysql",
        "DBInstanceStatus": "creating",

        ...output omitted...

        "PreferredMaintenanceWindow": "mon:07:37-mon:08:07",
        "PendingModifiedValues": {},
        "MultiAZ": false,
        "EngineVersion": "5.7.22",
        "AutoMinorVersionUpgrade": true,
        "ReadReplicaDBInstanceIdentifiers": [],
        "LicenseModel": "general-public-license",

        ...output omitted...

        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:db7-new-instance",
        "IAMDatabaseAuthenticationEnabled": false,
        "PerformanceInsightsEnabled": false,
        "DeletionProtection": false,
        "AssociatedRoles": []
    }
}
```

For more information, see Restoring from a DB Snapshot in the *Amazon RDS User Guide*.

- For API details, see RestoreDbInstanceFromDbSnapshot in *AWS CLI Command Reference*.

### `restore-db-instance-from-s3`

The following code example shows how to use `restore-db-instance-from-s3`.

**AWS CLI**

**To restore a DB instance from a backup in Amazon S3**

The following `restore-db-instance-from-s3` example creates a new DB instance named `restored-test-instance` from an existing backup in the `my-backups` S3 bucket.

```
aws rds restore-db-instance-from-s3 \
    --db-instance-identifier restored-test-instance \
    --allocated-storage 250 --db-instance-class db.m4.large --engine mysql \
    --master-username master --master-user-password secret99 \
    --s3-bucket-name my-backups --s3-ingestion-role-arn
 arn:aws:iam::123456789012:role/my-role \
    --source-engine mysql --source-engine-version 5.6.27
```

- For API details, see RestoreDbInstanceFromS3 in *AWS CLI Command Reference*.

### `restore-db-instance-to-point-in-time`

The following code example shows how to use `restore-db-instance-to-point-in-time`.

**AWS CLI**

**Example 1: To restore a DB instance to a point in time**

The following `restore-db-instance-to-point-in-time` example restores `test-instance` to a new DB instance named `restored-test-instance`, as of the specified time.

```
aws rds restore-db-instance-to-point-in-time \
    --source-db-instance-identifier test-instance \
    --target-db-instance restored-test-instance \
    --restore-time 2018-07-30T23:45:00.000Z
```

Output:

```
{
```

```
    "DBInstance": {
        "AllocatedStorage": 20,
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:restored-test-
instance",
        "DBInstanceStatus": "creating",
        "DBInstanceIdentifier": "restored-test-instance",
        ...some output omitted...
    }
}
```

For more information, see Restoring a DB instance to a specified time in the *Amazon RDS User Guide*.

**Example 2: To restore a DB instance to a specified time from a replicated backup**

The following `restore-db-instance-to-point-in-time` example restores an Oracle DB instance to the specified time from a replicated automated backup.

```
aws rds restore-db-instance-to-point-in-time \
    --source-db-instance-automated-backups-arn "arn:aws:rds:us-
west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example" \
    --target-db-instance-identifier myorclinstance-from-replicated-backup \
    --restore-time 2020-12-08T18:45:00.000Z
```

Output:

```
{
    "DBInstance": {
        "DBInstanceIdentifier": "myorclinstance-from-replicated-backup",
        "DBInstanceClass": "db.t3.micro",
        "Engine": "oracle-se2",
        "DBInstanceStatus": "creating",
        "MasterUsername": "admin",
        "DBName": "ORCL",
        "AllocatedStorage": 20,
        "PreferredBackupWindow": "07:45-08:15",
        "BackupRetentionPeriod": 14,
        ... some output omitted ...
        "DbiResourceId": "db-KGLXG75BGVIWKQT7NQ4EXAMPLE",
        "CACertificateIdentifier": "rds-ca-2019",
        "DomainMemberships": [],
        "CopyTagsToSnapshot": false,
```

```
        "MonitoringInterval": 0,
        "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:myorclinstance-from-
replicated-backup",
        "IAMDatabaseAuthenticationEnabled": false,
        "PerformanceInsightsEnabled": false,
        "DeletionProtection": false,
        "AssociatedRoles": [],
        "TagList": []
    }
}
```

For more information, see Restoring to a specified time from a replicated backup in the *Amazon RDS User Guide*.

- For API details, see RestoreDbInstanceToPointInTime in *AWS CLI Command Reference*.

### `start-activity-stream`

The following code example shows how to use `start-activity-stream`.

#### AWS CLI

**To start a database activity stream**

The following `start-activity-stream` example starts an asynchronous activity stream to monitor an Aurora cluster named my-pg-cluster.

```
aws rds start-activity-stream \
    --region us-east-1 \
    --mode async \
    --kms-key-id arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-
h123-456i789jk0l1 \
    --resource-arn arn:aws:rds:us-east-1:1234567890123:cluster:my-pg-cluster \
    --apply-immediately
```

Output:

```
{
    "KmsKeyId": "arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-
h123-456i789jk0l1",
    "KinesisStreamName": "aws-rds-das-cluster-0ABCDEFGHI1JKLM2NOPQ3R4S",
    "Status": "starting",
```

```
    "Mode": "async",
    "ApplyImmediately": true
}
```

For more information, see Starting a database activity stream in the *Amazon Aurora User Guide*.

- For API details, see StartActivityStream in *AWS CLI Command Reference*.

### `start-db-cluster`

The following code example shows how to use `start-db-cluster`.

#### AWS CLI

**To start a DB cluster**

The following `start-db-cluster` example starts a DB cluster and its DB instances.

```
aws rds start-db-cluster \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1e",
            "us-east-1b"
        ],
        "BackupRetentionPeriod": 1,
        "DatabaseName": "mydb",
        "DBClusterIdentifier": "mydbcluster",
        ...some output truncated...
    }
}
```

For more information, see Stopping and starting an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see StartDbCluster in *AWS CLI Command Reference*.

### `start-db-instance-automated-backups-replication`

The following code example shows how to use `start-db-instance-automated-backups-replication`.

#### AWS CLI

**To enable cross-Region automated backups**

The following `start-db-instance-automated-backups-replication` example replicates automated backups from a DB instance in the US East (N. Virginia) Region to US West (Oregon). The backup retention period is 14 days.

```
aws rds start-db-instance-automated-backups-replication \
    --region us-west-2 \
    --source-db-instance-arn "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db" \
    --backup-retention-period 14
```

Output:

```
{
    "DBInstanceAutomatedBackup": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
        "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
        "Region": "us-east-1",
        "DBInstanceIdentifier": "new-orcl-db",
        "RestoreWindow": {},
        "AllocatedStorage": 20,
        "Status": "pending",
        "Port": 1521,
        "InstanceCreateTime": "2020-12-04T15:28:31Z",
        "MasterUsername": "admin",
        "Engine": "oracle-se2",
        "EngineVersion": "12.1.0.2.v21",
        "LicenseModel": "bring-your-own-license",
        "OptionGroupName": "default:oracle-se2-12-1",
        "Encrypted": false,
        "StorageType": "gp2",
        "IAMDatabaseAuthenticationEnabled": false,
        "BackupRetentionPeriod": 14,
        "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
    }
```

```
}
```

For more information, see Enabling cross-Region automated backups in the *Amazon RDS User Guide*.

- For API details, see StartDbInstanceAutomatedBackupsReplication in *AWS CLI Command Reference*.

### `start-db-instance`

The following code example shows how to use `start-db-instance`.

**AWS CLI**

**To start a DB instance**

The following `start-db-instance` example starts the specified DB instance.

```
aws rds start-db-instance \
    --db-instance-identifier test-instance
```

Output:

```
{
    "DBInstance": {
        "DBInstanceStatus": "starting",
        ...some output truncated...
    }
}
```

- For API details, see StartDbInstance in *AWS CLI Command Reference*.

### `start-export-task`

The following code example shows how to use `start-export-task`.

**AWS CLI**

**To export a snapshot to Amazon S3**

The following `start-export-task` example exports a DB snapshot named `db5-snapshot-test` to the Amazon S3 bucket named `mybucket`.

```
aws rds start-export-task \
    --export-task-identifier my-s3-export \
    --source-arn arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-test \
    --s3-bucket-name mybucket \
    --iam-role-arn arn:aws:iam::123456789012:role/service-role/ExportRole \
    --kms-key-id arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-
aabbccddeeff
```

Output:

```
{
    "ExportTaskIdentifier": "my-s3-export",
    "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-test",
    "SnapshotTime": "2020-03-27T20:48:42.023Z",
    "S3Bucket": "mybucket",
    "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-
aabbccddeeff",
    "Status": "STARTING",
    "PercentProgress": 0,
    "TotalExtractedDataInGB": 0
}
```

For more information, see Exporting a Snapshot to an Amazon S3 Bucket in the *Amazon RDS User Guide*.

- For API details, see StartExportTask in *AWS CLI Command Reference*.

### `stop-activity-stream`

The following code example shows how to use `stop-activity-stream`.

#### AWS CLI

**To stop a database activity stream**

The following `stop-activity-stream` example stops an activity stream in an Aurora cluster named my-pg-cluster.

```
aws rds stop-activity-stream \
    --region us-east-1 \
```

```
    --resource-arn arn:aws:rds:us-east-1:1234567890123:cluster:my-pg-cluster \
    --apply-immediately
```

Output:

```
{
    "KmsKeyId": "arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-
h123-456i789jk0l1",
    "KinesisStreamName": "aws-rds-das-cluster-0ABCDEFGHI1JKLM2NOPQ3R4S",
    "Status": "stopping"
}
```

For more information, see Stopping an activity stream in the *Amazon Aurora User Guide*.

- For API details, see StopActivityStream in *AWS CLI Command Reference*.

### `stop-db-cluster`

The following code example shows how to use `stop-db-cluster`.

#### AWS CLI

**To stop a DB cluster**

The following `stop-db-cluster` example stops a DB cluster and its DB instances.

```
aws rds stop-db-cluster \
    --db-cluster-identifier mydbcluster
```

Output:

```
{
    "DBCluster": {
        "AllocatedStorage": 1,
        "AvailabilityZones": [
            "us-east-1a",
            "us-east-1e",
            "us-east-1b"
        ],
        "BackupRetentionPeriod": 1,
        "DatabaseName": "mydb",
        "DBClusterIdentifier": "mydbcluster",
```

```
        ...some output truncated...
    }
}
```

For more information, see Stopping and starting an Amazon Aurora DB cluster in the *Amazon Aurora User Guide*.

- For API details, see StopDbCluster in *AWS CLI Command Reference*.

### `stop-db-instance-automated-backups-replication`

The following code example shows how to use `stop-db-instance-automated-backups-replication`.

#### AWS CLI

**To stop replicating automated backups**

The following `stop-db-instance-automated-backups-replication` ends replication of automated backups to the US West (Oregon) Region. Replicated backups are retained according to the set backup retention period.

```
aws rds stop-db-instance-automated-backups-replication \
    --region us-west-2 \
    --source-db-instance-arn "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db"
```

Output:

```
{
    "DBInstanceAutomatedBackup": {
        "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
        "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
        "Region": "us-east-1",
        "DBInstanceIdentifier": "new-orcl-db",
        "RestoreWindow": {
            "EarliestTime": "2020-12-04T23:13:21.030Z",
            "LatestTime": "2020-12-07T19:59:57Z"
        },
        "AllocatedStorage": 20,
        "Status": "replicating",
        "Port": 1521,
        "InstanceCreateTime": "2020-12-04T15:28:31Z",
```

```
        "MasterUsername": "admin",
        "Engine": "oracle-se2",
        "EngineVersion": "12.1.0.2.v21",
        "LicenseModel": "bring-your-own-license",
        "OptionGroupName": "default:oracle-se2-12-1",
        "Encrypted": false,
        "StorageType": "gp2",
        "IAMDatabaseAuthenticationEnabled": false,
        "BackupRetentionPeriod": 7,
        "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"
    }
}
```

For more information, see Stopping automated backup replication in the *Amazon RDS User Guide*.

- For API details, see StopDbInstanceAutomatedBackupsReplication in *AWS CLI Command Reference*.

### `stop-db-instance`

The following code example shows how to use `stop-db-instance`.

#### AWS CLI

**To stop a DB instance**

The following `stop-db-instance` example stops the specified DB instance.

```
aws rds stop-db-instance \
    --db-instance-identifier test-instance
```

Output:

```
{
    "DBInstance": {
        "DBInstanceStatus": "stopping",
        ...some output truncated...
    }
}
```

- For API details, see StopDbInstance in *AWS CLI Command Reference*.

### `switchover-blue-green-deployment`

The following code example shows how to use `switchover-blue-green-deployment`.

**AWS CLI**

**Example 1: To switch a blue/green deployment for an RDS DB instance**

The following `switchover-blue-green-deployment` example promotes the specified green environment as the new production environment.

```
aws rds switchover-blue-green-deployment \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
    --switchover-timeout 300
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
        "BlueGreenDeploymentName": "bgd-cli-test-instance",
        "Source": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
        "Target": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance-green-
blhi1e",
        "SwitchoverDetails": [
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance",
                "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance-green-blhi1e",
                "Status": "AVAILABLE"
            },
            {
                "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-
instance-replica-1",
                "TargetMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-

        "CreateTime": "2022-02-25T22:33:22.225000+00:00"
    }
}
```

For more information, see Switching a blue/green deployment in the *Amazon RDS User Guide*.

**Example 2: To promote a blue/green deployment for an Aurora MySQL DB cluster**

The following `switchover-blue-green-deployment` example promotes the specified green environment as the new production environment.

```
aws rds switchover-blue-green-deployment \
    --blue-green-deployment-identifier bgd-wi89nwzglccsfake \
    --switchover-timeout 300
```

Output:

```
{
    "BlueGreenDeployment": {
        "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
        "BlueGreenDeploymentName": "my-blue-green-deployment",

```

For more information, see Switching a blue/green deployment in the *Amazon Aurora User Guide*.

- For API details, see SwitchoverBlueGreenDeployment in *AWS CLI Command Reference*.

# Amazon RDS Data Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Data Service.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

## Topics

## Actions

### `batch-execute-statement`

The following code example shows how to use `batch-execute-statement`.

#### AWS CLI

**To execute a batch SQL statement**

The following `batch-execute-statement` example executes a batch SQL statement over an array of data with a parameter set.

```
aws rds-data batch-execute-statement \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --sql "insert into mytable values (:id, :val)" \
    --parameter-sets "[[{\"name\": \"id\", \"value\": {\"longValue\": 1}},{\"name\":
 \"val\", \"value\": {\"stringValue\": \"ValueOne\"}}],
        [{\"name\": \"id\", \"value\": {\"longValue\": 2}},{\"name\": \"val\",
 \"value\": {\"stringValue\": \"ValueTwo\"}}],
        [{\"name\": \"id\", \"value\": {\"longValue\": 3}},{\"name\": \"val\",
 \"value\": {\"stringValue\": \"ValueThree\"}}]]"
```

This command produces no output.

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see BatchExecuteStatement in *AWS CLI Command Reference*.

### `begin-transaction`

The following code example shows how to use `begin-transaction`.

#### AWS CLI

**To start a SQL transaction**

The following `begin-transaction` example starts a SQL transaction.

```
aws rds-data begin-transaction \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret"
```

Output:

```
{
    "transactionId": "ABC1234567890xyz"
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see BeginTransaction in *AWS CLI Command Reference*.

### `commit-transaction`

The following code example shows how to use `commit-transaction`.

#### AWS CLI

**To commit a SQL transaction**

The following `commit-transaction` example ends the specified SQL transaction and commits the changes that you made as part of it.

```
aws rds-data commit-transaction \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "transactionStatus": "Transaction Committed"
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see CommitTransaction in *AWS CLI Command Reference*.

### `execute-statement`

The following code example shows how to use `execute-statement`.

#### AWS CLI

**Example 1: To execute a SQL statement that is part of a transaction**

The following `execute-statement` example runs a SQL statement that is part of a transaction.

```
aws rds-data execute-statement \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --sql "update mytable set quantity=5 where id=201" \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "numberOfRecordsUpdated": 1
}
```

**Example 2: To execute a SQL statement with parameters**

The following `execute-statement` example runs a SQL statement with parameters.

```
aws rds-data execute-statement \
    --resource-arn "arn:aws:rds:us-east-1:123456789012:cluster:mydbcluster" \
    --database "mydb" \
    --secret-arn "arn:aws:secretsmanager:us-east-1:123456789012:secret:mysecret" \
    --sql "insert into mytable values (:id, :val)" \
    --parameters "[{\"name\": \"id\", \"value\": {\"longValue\": 1}},{\"name\":
 \"val\", \"value\": {\"stringValue\": \"value1\"}}]"
```

Output:

```
{
    "numberOfRecordsUpdated": 1
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see ExecuteStatement in *AWS CLI Command Reference*.

### `rollback-transaction`

The following code example shows how to use `rollback-transaction`.

#### AWS CLI

**To roll back a SQL transaction**

The following `rollback-transaction` example rolls back the specified SQL transaction.

```
aws rds-data rollback-transaction \
    --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
    --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
    --transaction-id "ABC1234567890xyz"
```

Output:

```
{
    "transactionStatus": "Rollback Complete"
}
```

For more information, see Using the Data API for Aurora Serverless in the *Amazon RDS User Guide*.

- For API details, see RollbackTransaction in *AWS CLI Command Reference*.

## Amazon RDS Performance Insights examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Performance Insights.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Actions

#### `describe-dimension-keys`

The following code example shows how to use `describe-dimension-keys`.

#### AWS CLI

**To describe dimension keys**

This example requests the names of all wait events. The data is summarized by event name, and the aggregate values of those events over the specified time period.

Command:

```
aws pi describe-dimension-keys --service-type RDS --identifier db-
LKCGOBK26374TPTDFXOIWVCPPM --start-time 1527026400 --end-time 1527080400 --metric
 db.load.avg --group-by '{"Group":"db.wait_event"}'
```

Output:

```
{
    "AlignedEndTime": 1.5270804E9,
    "AlignedStartTime": 1.5270264E9,
    "Keys": [
        {
            "Dimensions": {"db.wait_event.name": "wait/synch/mutex/innodb/
aurora_lock_thread_slot_futex"},
            "Total": 0.05906906851195666
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/aurora_redo_log_flush"},
            "Total": 0.015824722186149193
        },
        {
            "Dimensions": {"db.wait_event.name": "CPU"},
            "Total": 0.008014396230265477
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/
aurora_respond_to_client"},
            "Total": 0.0036361612526204477
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/table/sql/handler"},
            "Total": 0.0019108398419382965
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/synch/cond/mysys/
my_thread_var::suspend"},
            "Total": 8.533847837782684E-4
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/io/file/csv/data"},
            "Total": 6.864181956477376E-4
        },
        {
            "Dimensions": {"db.wait_event.name": "Unknown"},
            "Total": 3.895887056379051E-4
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/synch/mutex/sql/
FILE_AS_TABLE::LOCK_shim_lists"},
```

```
            "Total": 3.710368625122906E-5
        },
        {
            "Dimensions": {"db.wait_event.name": "wait/lock/table/sql/handler"},
            "Total": 0
        }
    ]
}
```

- For API details, see DescribeDimensionKeys in *AWS CLI Command Reference*.

### `get-resource-metrics`

The following code example shows how to use `get-resource-metrics`.

**AWS CLI**

**To get resource metrics**

This example requests data points for the *db.wait_event* dimension group, and for the *db.wait_event.name* dimension within that group. In the response, the relevant data points are grouped by the requested dimension (*db.wait_event.name*).

Command:

```
aws pi get-resource-metrics --service-type RDS --identifier db-
LKCGOBK26374TPTDFXOIWVCPPM --start-time 1527026400 --end-time 1527080400 --period-
in-seconds 300 --metric db.load.avg --metric-queries file://metric-queries.json
```

The arguments for `--metric-queries` are stored in a JSON file, `metric-queries.json`. Here are the contents of that file:

```
[
    {
        "Metric": "db.load.avg",
        "GroupBy": {
            "Group":"db.wait_event"
        }
    }
]
```

Output:

```
{
    "AlignedEndTime": 1.5270804E9,
    "AlignedStartTime": 1.5270264E9,
    "Identifier": "db-LKCGOBK26374TPTDFXOIWVCPPM",
    "MetricList": [
        {
            "Key": {
                "Metric": "db.load.avg"
            },
            "DataPoints": [
                {
                    "Timestamp": 1527026700.0,
                    "Value": 1.3533333333333333
                },
                {
                    "Timestamp": 1527027000.0,
                    "Value": 0.88
                },
                <...remaining output omitted...>
            ]
        },
        {
            "Key": {
                "Metric": "db.load.avg",
                "Dimensions": {
                    "db.wait_event.name": "wait/synch/mutex/innodb/
aurora_lock_thread_slot_futex"
                }
            },
            "DataPoints": [
                {
                    "Timestamp": 1527026700.0,
                    "Value": 0.8566666666666667
                },
                {
                    "Timestamp": 1527027000.0,
                    "Value": 0.8633333333333333
                },
                <...remaining output omitted...>
            ],
        },
            <...remaining output omitted...>
```

```
    ]
}
```

- For API details, see GetResourceMetrics in *AWS CLI Command Reference*.

## Amazon Redshift examples using AWS CLI

#### `accept-reserved-node-exchange`

The following code example shows how to use `accept-reserved-node-exchange`.

#### AWS CLI

##### To accept reserved node exchange

The following `accept-reserved-node-exchange` example accepts exchange of a DC1 reserved node for a DC2 reserved node.

```
aws redshift accept-reserved-node-exchange /
    --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE /
    --target-reserved-node-offering-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:

```
{
    "ExchangedReservedNode": {
        "ReservedNodeId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
        "ReservedNodeOfferingId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
        "NodeType": "dc2.large",
        "StartTime": "2019-12-06T21:17:26Z",
        "Duration": 31536000,
        "FixedPrice": 0.0,
        "UsagePrice": 0.0,
        "CurrencyCode": "USD",
        "NodeCount": 1,
        "State": "exchanging",
        "OfferingType": "All Upfront",
        "RecurringCharges": [
            {
                "RecurringChargeAmount": 0.0,
                "RecurringChargeFrequency": "Hourly"
            }
        ],
        "ReservedNodeOfferingType": "Regular"
    }
}
```

For more information, see Upgrading Reserved Nodes With the AWS CLI in the *Amazon Redshift Cluster Management Guide*.

- For API details, see AcceptReservedNodeExchange in *AWS CLI Command Reference*.

### `authorize-cluster-security-group-ingress`

The following code example shows how to use `authorize-cluster-security-group-ingress`.

#### AWS CLI

Authorizing Access to an EC2 Security GroupThis example authorizes access to a named Amazon EC2 security group.Command:

```
aws redshift authorize-cluster-security-group-ingress --cluster-security-group-name
 mysecuritygroup --ec2-security-group-name myec2securitygroup --ec2-security-group-
owner-id 123445677890
```

Authorizing Access to a CIDR rangeThis example authorizes access to a CIDR range.Command:

```
aws redshift authorize-cluster-security-group-ingress --cluster-security-group-name
 mysecuritygroup --cidrip 192.168.100.100/32
```

- For API details, see AuthorizeClusterSecurityGroupIngress in *AWS CLI Command Reference*.

### `authorize-snapshot-access`

The following code example shows how to use `authorize-snapshot-access`.

#### AWS CLI

Authorize an AWS Account to Restore a SnapshotThis example authorizes the AWS account `444455556666` to restore the snapshot `my-snapshot-id`. By default, the output is in JSON format.Command:

```
aws redshift authorize-snapshot-access --snapshot-id my-snapshot-id --account-with-
restore-access 444455556666
```

Result:

```
{
   "Snapshot": {
      "Status": "available",
      "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
      "EstimatedSecondsToCompletion": 0,
      "AvailabilityZone": "us-east-1a",
      "ClusterVersion": "1.0",
      "MasterUsername": "adminuser",
      "Encrypted": false,
      "OwnerAccount": "111122223333",
      "BackupProgressInMegabytes": 11.0,
      "ElapsedTimeInSeconds": 0,
      "DBName": "dev",
      "CurrentBackupRateInMegabytesPerSecond: 0.1534,
      "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
      "ActualIncrementalBackupSizeInMegabytes"; 11.0,
      "SnapshotType": "manual",
      "NodeType": "dw.hs1.xlarge",
      "ClusterIdentifier": "mycluster",
```

```
      "TotalBackupSizeInMegabytes": 20.0,
      "Port": 5439,
      "NumberOfNodes": 2,
      "SnapshotIdentifier": "my-snapshot-id"
   }
}
```

- For API details, see AuthorizeSnapshotAccess in *AWS CLI Command Reference*.

### `batch-delete-cluster-snapshots`

The following code example shows how to use `batch-delete-cluster-snapshots`.

**AWS CLI**

**To delete a set of cluster snapshots**

The following `batch-delete-cluster-snapshots` example deletes a set of manual cluster snapshots.

```
aws redshift batch-delete-cluster-snapshots \
        --identifiers SnapshotIdentifier=mycluster-2019-11-06-14-12
 SnapshotIdentifier=mycluster-2019-11-06-14-20
```

Output:

```
{
    "Resources": [
        "mycluster-2019-11-06-14-12",
        "mycluster-2019-11-06-14-20"
    ]
}
```

For more information, see Amazon Redshift Snapshots in the *Amazon Redshift Cluster Management Guide*.

- For API details, see BatchDeleteClusterSnapshots in *AWS CLI Command Reference*.

### `batch-modify-cluster-snapshots`

The following code example shows how to use `batch-modify-cluster-snapshots`.

**AWS CLI**

**To modify a set of cluster snapshots**

The following `batch-modify-cluster-snapshots` example modifies the settings for a set of cluster snapshots.

```
aws redshift batch-modify-cluster-snapshots \
    --snapshot-identifier-list mycluster-2019-11-06-16-31 mycluster-2019-11-06-16-32
 \
    --manual-snapshot-retention-period 30
```

Output:

```
{
    "Resources": [
        "mycluster-2019-11-06-16-31",
        "mycluster-2019-11-06-16-32"
    ],
    "Errors": [],
    "ResponseMetadata": {
        "RequestId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
        "HTTPStatusCode": 200,
        "HTTPHeaders": {
                "x-amzn-requestid": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE,
                "content-type": "text/xml",
                "content-length": "480",
                "date": "Sat, 07 Dec 2019 00:36:09 GMT",
                "connection": "keep-alive"
        },
        "RetryAttempts": 0
    }
}
```

For more information, see Amazon Redshift Snapshots in the *Amazon Redshift Cluster Management Guide*.

- For API details, see BatchModifyClusterSnapshots in *AWS CLI Command Reference*.

## `cancel-resize`

The following code example shows how to use `cancel-resize`.

**AWS CLI**

**To cancel resize of a cluster**

The following `cancel-resize` example cancels a classic resize operation for a cluster.

```
aws redshift cancel-resize \
    --cluster-identifier mycluster
```

Output:

```
{
    "TargetNodeType": "dc2.large",
    "TargetNumberOfNodes": 2,
    "TargetClusterType": "multi-node",
    "Status": "CANCELLING",
    "ResizeType": "ClassicResize",
    "TargetEncryptionType": "NONE"
}
```

For more information, see Resizing Clusters in Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CancelResize in *AWS CLI Command Reference*.

## `copy-cluster-snapshot`

The following code example shows how to use `copy-cluster-snapshot`.

**AWS CLI**

Get a Description of All Cluster VersionsThis example returns a description of all cluster versions. By default, the output is in JSON format.Command:

```
aws redshift copy-cluster-snapshot --source-snapshot-identifier
 cm:examplecluster-2013-01-22-19-27-58 --target-snapshot-identifier my-saved-
snapshot-copy
```

Result:

```
{
   "Snapshot": {
```

```
      "Status": "available",
      "SnapshotCreateTime": "2013-01-22T19:27:58.931Z",
      "AvailabilityZone": "us-east-1c",
      "ClusterVersion": "1.0",
      "MasterUsername": "adminuser",
      "DBName": "dev",
      "ClusterCreateTime": "2013-01-22T19:23:59.368Z",
      "SnapshotType": "manual",
      "NodeType": "dw.hs1.xlarge",
      "ClusterIdentifier": "examplecluster",
      "Port": 5439,
      "NumberOfNodes": "2",
      "SnapshotIdentifier": "my-saved-snapshot-copy"
   },
   "ResponseMetadata": {
      "RequestId": "3b279691-64e3-11e2-bec0-17624ad140dd"
   }
}
```

- For API details, see CopyClusterSnapshot in *AWS CLI Command Reference*.

### `create-cluster-parameter-group`

The following code example shows how to use `create-cluster-parameter-group`.

#### AWS CLI

Create a Cluster Parameter GroupThis example creates a new cluster parameter group.Command:

```
aws redshift create-cluster-parameter-group --parameter-group-name
 myclusterparametergroup --parameter-group-family redshift-1.0 --description "My
 first cluster parameter group"
```

Result:

```
{
   "ClusterParameterGroup": {
      "ParameterGroupFamily": "redshift-1.0",
      "Description": "My first cluster parameter group",
      "ParameterGroupName": "myclusterparametergroup"
   },
```

```
   "ResponseMetadata": {
      "RequestId": "739448f0-64cc-11e2-8f7d-3b939af52818"
   }
}
```

- For API details, see CreateClusterParameterGroup in *AWS CLI Command Reference*.

### `create-cluster-security-group`

The following code example shows how to use `create-cluster-security-group`.

#### AWS CLI

Creating a Cluster Security GroupThis example creates a new cluster security group. By default, the output is in JSON format.Command:

```
aws redshift create-cluster-security-group --cluster-security-group-name
 mysecuritygroup --description "This is my cluster security group"
```

Result:

```
{
   "create_cluster_security_group_response": {
      "create_cluster_security_group_result": {
         "cluster_security_group": {
            "description": "This is my cluster security group",
            "owner_id": "300454760768",
            "cluster_security_group_name": "mysecuritygroup",
            "ec2_security_groups": \[],
            "ip_ranges": \[]
         }
      },
      "response_metadata": {
         "request_id": "5df486a0-343a-11e2-b0d8-d15d0ef48549"
      }
   }
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift create-cluster-security-group --cluster-security-group-name
 mysecuritygroup --description "This is my cluster security group" --output text
```

Result:

```
This is my cluster security group   300454760768    mysecuritygroup
a0c0bfab-343a-11e2-95d2-c3dc9fe8ab57
```

- For API details, see CreateClusterSecurityGroup in *AWS CLI Command Reference*.

### `create-cluster-snapshot`

The following code example shows how to use `create-cluster-snapshot`.

#### AWS CLI

Create a Cluster SnapshotThis example creates a new cluster snapshot. By default, the output is in JSON format.Command:

```
aws redshift create-cluster-snapshot --cluster-identifier mycluster --snapshot-
identifier my-snapshot-id
```

Result:

```
{
   "Snapshot": {
      "Status": "creating",
      "SnapshotCreateTime": "2013-01-22T22:20:33.548Z",
      "AvailabilityZone": "us-east-1a",
      "ClusterVersion": "1.0",
      "MasterUsername": "adminuser",
      "DBName": "dev",
      "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
      "SnapshotType": "manual",
      "NodeType": "dw.hs1.xlarge",
      "ClusterIdentifier": "mycluster",
      "Port": 5439,
      "NumberOfNodes": "2",
      "SnapshotIdentifier": "my-snapshot-id"
```

```
   },
   "ResponseMetadata": {
      "RequestId": "f024d1a5-64e1-11e2-88c5-53eb05787dfb"
   }
}
```

- For API details, see CreateClusterSnapshot in *AWS CLI Command Reference*.

### `create-cluster-subnet-group`

The following code example shows how to use `create-cluster-subnet-group`.

#### AWS CLI

Create a Cluster Subnet GroupThis example creates a new cluster subnet group.Command:

```
aws redshift create-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup
 --description "My subnet group" --subnet-ids subnet-763fdd1c
```

Result:

```
{
   "ClusterSubnetGroup": {
      "Subnets": [
         {
            "SubnetStatus": "Active",
            "SubnetIdentifier": "subnet-763fdd1c",
            "SubnetAvailabilityZone": {
               "Name": "us-east-1a"
            }
         } ],
      "VpcId": "vpc-7e3fdd14",
      "SubnetGroupStatus": "Complete",
      "Description": "My subnet group",
      "ClusterSubnetGroupName": "mysubnetgroup"
   },
   "ResponseMetadata": {
      "RequestId": "500b8ce2-698f-11e2-9790-fd67517fb6fd"
   }
}
```

- For API details, see CreateClusterSubnetGroup in *AWS CLI Command Reference*.

### `create-cluster`

The following code example shows how to use `create-cluster`.

**AWS CLI**

Create a Cluster with Minimal ParametersThis example creates a cluster with the minimal set of parameters. By default, the output is in JSON format.Command:

```
aws redshift create-cluster --node-type dw.hs1.xlarge --number-of-nodes 2 --master-
username adminuser --master-user-password TopSecret1 --cluster-identifier mycluster
```

Result:

```
{
   "Cluster": {
      "NodeType": "dw.hs1.xlarge",
      "ClusterVersion": "1.0",
      "PubliclyAccessible": "true",
      "MasterUsername": "adminuser",
      "ClusterParameterGroups": [
         {
            "ParameterApplyStatus": "in-sync",
            "ParameterGroupName": "default.redshift-1.0"
         } ],
      "ClusterSecurityGroups": [
         {
            "Status": "active",
            "ClusterSecurityGroupName": "default"
         } ],
      "AllowVersionUpgrade": true,
      "VpcSecurityGroups": \[],
      "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
      "AutomatedSnapshotRetentionPeriod": 1,
      "ClusterStatus": "creating",
      "ClusterIdentifier": "mycluster",
      "DBName": "dev",
      "NumberOfNodes": 2,
      "PendingModifiedValues": {
         "MasterUserPassword": "\****"
      }
   },
   "ResponseMetadata": {
```

```
      "RequestId": "7cf4bcfc-64dd-11e2-bea9-49e0ce183f07"
   }
}
```

- For API details, see CreateCluster in *AWS CLI Command Reference*.

### `create-event-subscription`

The following code example shows how to use `create-event-subscription`.

#### AWS CLI

**To create a notification subscription for an event**

The following `create-event-subscription` example creates an event notification subscription.

```
aws redshift create-event-subscription \
    --subscription-name mysubscription \
    --sns-topic-arn arn:aws:sns:us-west-2:123456789012:MySNStopic \
    --source-type cluster \
    --source-ids mycluster
```

Output:

```
{
        "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "mysubscription",
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNStopic",
        "Status": "active",
        "SubscriptionCreationTime": "2019-12-09T20:05:19.365Z",
        "SourceType": "cluster",
        "SourceIdsList": [
            "mycluster"
        ],
        "EventCategoriesList": [],
        "Severity": "INFO",
        "Enabled": true,
        "Tags": []
    }
}
```

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateEventSubscription in *AWS CLI Command Reference*.

### `create-hsm-client-certificate`

The following code example shows how to use `create-hsm-client-certificate`.

**AWS CLI**

**To create an HSM client certificate**

The following `create-hsm-client-certificate` example generates an HSM client certificate that a cluster can use to connect to an HSM.

```
aws redshift create-hsm-client-certificate \
    --hsm-client-certificate-identifier myhsmclientcert
```

Output:

```
{
    "HsmClientCertificate": {
        "HsmClientCertificateIdentifier": "myhsmclientcert",
        "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----
        MIICiEXAMPLECQD6m7oRw0uXOjANBgkqhkiG9w0BAQUFADCBiDELMAkGA1UEBhMC

        NYiytVbZPQUQ5Yaxu2jXnimvw3rEXAMPLE=-----END CERTIFICATE-----\n",
    "Tags": []
    }
}
```

For more information, see Amazon Redshift API Permissions Reference in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateHsmClientCertificate in *AWS CLI Command Reference*.

### `create-hsm-configuration`

The following code example shows how to use `create-hsm-configuration`.

**AWS CLI**

**To create an HSM configuration**

The following `create-hsm-configuration` example creates the specified HSM configuration that contains information required by a cluster to store and use database encryption keys in a hardware security module (HSM).

```
aws redshift create-hsm-configuration /
    --hsm-configuration-identifier myhsmconnection
    --description "My HSM connection"
    --hsm-ip-address 192.0.2.09
    --hsm-partition-name myhsmpartition /
    --hsm-partition-password A1b2c3d4 /
    --hsm-server-public-certificate myhsmclientcert
```

Output:

```
{
    "HsmConfiguration": {
        "HsmConfigurationIdentifier": "myhsmconnection",
        "Description": "My HSM connection",
        "HsmIpAddress": "192.0.2.09",
        "HsmPartitionName": "myhsmpartition",
        "Tags": []
    }
}
```

- For API details, see CreateHsmConfiguration in *AWS CLI Command Reference*.

### `create-snapshot-copy-grant`

The following code example shows how to use `create-snapshot-copy-grant`.

**AWS CLI**

**To create a snapshot copy grant**

The following `create-snapshot-copy-grant` example creates a snapshot copy grant and encrypts copied snapshots in a destination AWS Region.

```
aws redshift create-snapshot-copy-grant \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```
{
    "SnapshotCopyGrant": {
        "SnapshotCopyGrantName": "mysnapshotcopygrantname",
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
bPxRfih3yCo8nvbEXAMPLEKEY",
        "Tags": []
    }
}
```

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateSnapshotCopyGrant in *AWS CLI Command Reference*.

## `create-snapshot-schedule`

The following code example shows how to use `create-snapshot-schedule`.

**AWS CLI**

**To create snapshot schedule**

The following `create-snapshot-schedule` example creates a snapshot schedule with the specified description and a rate of every 12 hours.

```
aws redshift create-snapshot-schedule \
    --schedule-definitions "rate(12 hours)" \
    --schedule-identifier mysnapshotschedule \
    --schedule-description "My schedule description"
```

Output:

```
{
    "ScheduleDefinitions": [
        "rate(12 hours)"
    ],
    "ScheduleIdentifier": "mysnapshotschedule",
    "ScheduleDescription": "My schedule description",
    "Tags": []
}
```

For more information, see Automated Snapshot Schedules in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateSnapshotSchedule in *AWS CLI Command Reference*.

### `create-tags`

The following code example shows how to use `create-tags`.

**AWS CLI**

**To create tags for a cluster**

The following `create-tags` example adds the specified tag key/value pair to the specified cluster.

```
aws redshift create-tags \
    --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
    --tags "Key"="mytags","Value"="tag1"
```

This command does not produce any output.

For more information, see Tagging Resources in Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see CreateTags in *AWS CLI Command Reference*.

### `delete-cluster-parameter-group`

The following code example shows how to use `delete-cluster-parameter-group`.

**AWS CLI**

Delete a Cluster Parameter GroupThis example deletes a cluster parameter group.Command:

```
aws redshift delete-cluster-parameter-group --parameter-group-name
 myclusterparametergroup
```

- For API details, see DeleteClusterParameterGroup in *AWS CLI Command Reference*.

### `delete-cluster-security-group`

The following code example shows how to use `delete-cluster-security-group`.

**AWS CLI**

Delete a Cluster Security GroupThis example deletes a cluster security group.Command:

```
aws redshift delete-cluster-security-group --cluster-security-group-name
 mysecuritygroup
```

- For API details, see DeleteClusterSecurityGroup in *AWS CLI Command Reference*.

### `delete-cluster-snapshot`

The following code example shows how to use `delete-cluster-snapshot`.

**AWS CLI**

Delete a Cluster SnapshotThis example deletes a cluster snapshot.Command:

```
aws redshift delete-cluster-snapshot --snapshot-identifier my-snapshot-id
```

- For API details, see DeleteClusterSnapshot in *AWS CLI Command Reference*.

### `delete-cluster-subnet-group`

The following code example shows how to use `delete-cluster-subnet-group`.

**AWS CLI**

Delete a Cluster subnet GroupThis example deletes a cluster subnet group.Command:

```
aws redshift delete-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup
```

Result:

```
{
   "ResponseMetadata": {
      "RequestId": "253fbffd-6993-11e2-bc3a-47431073908a"
   }
}
```

- For API details, see DeleteClusterSubnetGroup in *AWS CLI Command Reference*.

### `delete-cluster`

The following code example shows how to use `delete-cluster`.

#### AWS CLI

Delete a Cluster with No Final Cluster SnapshotThis example deletes a cluster, forcing data deletion so no final cluster snapshot is created.Command:

```
aws redshift delete-cluster --cluster-identifier mycluster --skip-final-cluster-
snapshot
```

Delete a Cluster, Allowing a Final Cluster SnapshotThis example deletes a cluster, but specifies a final cluster snapshot.Command:

```
aws redshift delete-cluster --cluster-identifier mycluster --final-cluster-snapshot-
identifier myfinalsnapshot
```

- For API details, see DeleteCluster in *AWS CLI Command Reference*.

### `delete-event-subscription`

The following code example shows how to use `delete-event-subscription`.

#### AWS CLI

**To delete event subscription**

The following `delete-event-subscription` example deletes the specified event notification subscription.

```
aws redshift delete-event-subscription \
    --subscription-name mysubscription
```

This command does not produce any output.

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteEventSubscription in *AWS CLI Command Reference*.

### `delete-hsm-client-certificate`

The following code example shows how to use `delete-hsm-client-certificate`.

**AWS CLI**

**To delete HSM client certificate**

The following `delete-hsm-client-certificate` example deletes an HSM client certificate.

```
aws redshift delete-hsm-client-certificate \
    --hsm-client-certificate-identifier myhsmclientcert
```

This command does not produce any output.

For more information, see Amazon Redshift API Permissions Reference in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteHsmClientCertificate in *AWS CLI Command Reference*.

### `delete-hsm-configuration`

The following code example shows how to use `delete-hsm-configuration`.

**AWS CLI**

**To delete an HSM configuration**

The following `delete-hsm-configuration` example deletes the specified HSM configuration from the current AWS account.

```
aws redshift delete-hsm-configuration /
    --hsm-configuration-identifier myhsmconnection
```

This command does not produce any output.

- For API details, see DeleteHsmConfiguration in *AWS CLI Command Reference*.

### `delete-scheduled-action`

The following code example shows how to use `delete-scheduled-action`.

#### AWS CLI

**To delete scheduled action**

The following `delete-scheduled-action` example deletes the specified scheduled action.

```
aws redshift delete-scheduled-action \
    --scheduled-action-name myscheduledaction
```

This command does not produce any output.

- For API details, see DeleteScheduledAction in *AWS CLI Command Reference*.

### `delete-snapshot-copy-grant`

The following code example shows how to use `delete-snapshot-copy-grant`.

#### AWS CLI

**To delete snapshot copy grant**

The following `delete-snapshot-copy-grant` example deletes the specified snapshot copy grant.

```
aws redshift delete-snapshot-copy-grant \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

This command does not produce any output.

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteSnapshotCopyGrant in *AWS CLI Command Reference*.

### `delete-snapshot-schedule`

The following code example shows how to use `delete-snapshot-schedule`.

**AWS CLI**

**To delete snapshot schedule**

The following `delete-snapshot-schedule` example deletes the specified snapshot schedule. You must disassociate clusters before deleting the schedule.

```
aws redshift delete-snapshot-schedule \
    --schedule-identifier mysnapshotschedule
```

This command does not produce any output.

For more information, see Automated Snapshot Schedules in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteSnapshotSchedule in *AWS CLI Command Reference*.

### `delete-tags`

The following code example shows how to use `delete-tags`.

**AWS CLI**

**To delete tags from a cluster**

The following `delete-tags` example deletes the tags with the specified key names from the specified cluster.

```
aws redshift delete-tags \
    --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
    --tag-keys "clustertagkey" "clustertagvalue"
```

This command does not produce any output.

For more information, see Tagging Resources in Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DeleteTags in *AWS CLI Command Reference*.

### `describe-account-attributes`

The following code example shows how to use `describe-account-attributes`.

**AWS CLI**

**To describe attributes of an AWS account**

The following `describe-account-attributes` example displays the attributes attached to the calling AWS account.

```
aws redshift describe-account-attributes
```

Output:

```
{
    "AccountAttributes": [
        {
            "AttributeName": "max-defer-maintenance-duration",
            "AttributeValues": [
                {
                    "AttributeValue": "45"
                }
            ]
        }
    ]
}
```

- For API details, see DescribeAccountAttributes in *AWS CLI Command Reference*.

### `describe-cluster-db-revisions`

The following code example shows how to use `describe-cluster-db-revisions`.

**AWS CLI**

**To describe DB revisions for a cluster**

The following `describe-cluster-db-revisions` example displays the details of an array of `ClusterDbRevision` objects for the specified cluster.

```
aws redshift describe-cluster-db-revisions \
    --cluster-identifier mycluster
```

Output:

```
{
    "ClusterDbRevisions": [
        {
            "ClusterIdentifier": "mycluster",
            "CurrentDatabaseRevision": "11420",
            "DatabaseRevisionReleaseDate": "2019-11-22T16:43:49.597Z",
            "RevisionTargets": []
        }
    ]
}
```

- For API details, see DescribeClusterDbRevisions in *AWS CLI Command Reference*.

### `describe-cluster-parameter-groups`

The following code example shows how to use `describe-cluster-parameter-groups`.

#### AWS CLI

Get a Description of All Cluster Parameter GroupsThis example returns a description of all cluster parameter groups for the account, with column headers. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-parameter-groups
```

Result:

```
{
   "ParameterGroups": [
      {
         "ParameterGroupFamily": "redshift-1.0",
         "Description": "My first cluster parameter group",
```

```
         "ParameterGroupName": "myclusterparametergroup"
      } ],
   "ResponseMetadata": {
      "RequestId": "8ceb8f6f-64cc-11e2-bea9-49e0ce183f07"
   }
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-cluster-parameter-groups --output text
```

Result:

```
redshift-1.0        My first cluster parameter group        myclusterparametergroup
RESPONSEMETADATA    9e665a36-64cc-11e2-8f7d-3b939af52818
```

- For API details, see DescribeClusterParameterGroups in *AWS CLI Command Reference*.

### `describe-cluster-parameters`

The following code example shows how to use `describe-cluster-parameters`.

#### AWS CLI

Retrieve the Parameters for a Specified Cluster Parameter GroupThis example retrieves the parameters for the named parameter group. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-parameters --parameter-group-name
 myclusterparametergroup
```

Result:

```
{
   "Parameters": [
```

```
      {
         "Description": "Sets the display format for date and time values.",
         "DataType": "string",
         "IsModifiable": true,
         "Source": "engine-default",
         "ParameterValue": "ISO, MDY",
         "ParameterName": "datestyle"
      },
      {
         "Description": "Sets the number of digits displayed for floating-point
 values",
         "DataType": "integer",
         "IsModifiable": true,
         "AllowedValues": "-15-2",
         "Source": "engine-default",
         "ParameterValue": "0",
         "ParameterName": "extra_float_digits"
      },
      (...remaining output omitted...)
   ]
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-cluster-parameters --parameter-group-name
 myclusterparametergroup --output text
```

Result:

```
RESPONSEMETADATA    cdac40aa-64cc-11e2-9e70-918437dd236d
Sets the display format for date and time values.   string  True    engine-default
 ISO, MDY        datestyle
Sets the number of digits displayed for floating-point values       integer True
 -15-2   engine-default  0       extra_float_digits
This parameter applies a user-defined label to a group of queries that are run
 during the same session..    string  True    engine-default  default query_group
require ssl for all databaseconnections     boolean True    true,false      engine-
default  false   require_ssl
```

```
Sets the schema search order for names that are not schema-qualified.       string
 True    engine-default  $user, public   search_path
Aborts any statement that takes over the specified number of milliseconds.  integer
 True    engine-default  0       statement_timeout
wlm json configuration      string  True    engine-default
 \[{"query_concurrency":5}]      wlm_json_configuration
```

- For API details, see DescribeClusterParameters in *AWS CLI Command Reference*.

### `describe-cluster-security-groups`

The following code example shows how to use `describe-cluster-security-groups`.

#### AWS CLI

Get a Description of All Cluster Security GroupsThis example returns a description of all cluster security groups for the account. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-security-groups
```

Result:

```
{
   "ClusterSecurityGroups": [
      {
         "OwnerId": "100447751468",
         "Description": "default",
         "ClusterSecurityGroupName": "default",
         "EC2SecurityGroups": \[],
         "IPRanges": [
            {
               "Status": "authorized",
               "CIDRIP": "0.0.0.0/0"
            }
         ]
      },
      {
         "OwnerId": "100447751468",
         "Description": "This is my cluster security group",
         "ClusterSecurityGroupName": "mysecuritygroup",
         "EC2SecurityGroups": \[],
         "IPRanges": \[]
```

```
      },
      (...remaining output omitted...)
   ]
}
```

- For API details, see DescribeClusterSecurityGroups in *AWS CLI Command Reference*.

### `describe-cluster-snapshots`

The following code example shows how to use `describe-cluster-snapshots`.

#### AWS CLI

Get a Description of All Cluster SnapshotsThis example returns a description of all cluster snapshots for the account. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-snapshots
```

Result:

```
{
   "Snapshots": [
      {
         "Status": "available",
         "SnapshotCreateTime": "2013-07-17T22:02:22.852Z",
         "EstimatedSecondsToCompletion": -1,
         "AvailabilityZone": "us-east-1a",
         "ClusterVersion": "1.0",
         "MasterUsername": "adminuser",
         "Encrypted": false,
         "OwnerAccount": "111122223333",
         "BackupProgressInMegabytes": 20.0,
         "ElapsedTimeInSeconds": 0,
         "DBName": "dev",
         "CurrentBackupRateInMegabytesPerSecond: 0.0,
         "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
         "ActualIncrementalBackupSizeInMegabytes"; 20.0
         "SnapshotType": "automated",
         "NodeType": "dw.hs1.xlarge",
         "ClusterIdentifier": "mycluster",
         "Port": 5439,
         "TotalBackupSizeInMegabytes": 20.0,
```

```
            "NumberOfNodes": "2",

            "Encrypted": false,
            "SnapshotType": "manual",
            "Port": 5439,
            "SnapshotIdentifier": "my-snapshot-id"
        } ]
    }
    (...remaining output omitted...)
```

- For API details, see DescribeClusterSnapshots in *AWS CLI Command Reference*.

### `describe-cluster-subnet-groups`

The following code example shows how to use `describe-cluster-subnet-groups`.

#### AWS CLI

Get a Description of All Cluster Subnet GroupsThis example returns a description of all cluster subnet groups. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-subnet-groups
```

Result:

```
{
   "ClusterSubnetGroups": [
      {
         "Subnets": [
            {
               "SubnetStatus": "Active",
               "SubnetIdentifier": "subnet-763fdd1c",
               "SubnetAvailabilityZone": {
                  "Name": "us-east-1a"
               }
            }
         ],
         "VpcId": "vpc-7e3fdd14",
         "SubnetGroupStatus": "Complete",
         "Description": "My subnet group",
         "ClusterSubnetGroupName": "mysubnetgroup"
      }
   ],
   "ResponseMetadata": {
      "RequestId": "37fa8c89-6990-11e2-8f75-ab4018764c77"
   }
}
```

- For API details, see DescribeClusterSubnetGroups in *AWS CLI Command Reference*.

### `describe-cluster-tracks`

The following code example shows how to use `describe-cluster-tracks`.

#### AWS CLI

**To describe cluster tracks**

The following `describe-cluster-tracks` example displays details of the available maintenance tracks.

```
aws redshift describe-cluster-tracks \
```

```
    --maintenance-track-name current
```

Output:

```
{
    "MaintenanceTracks": [
        {
            "MaintenanceTrackName": "current",
            "DatabaseVersion": "1.0.11420",
            "UpdateTargets": [
                {
                    "MaintenanceTrackName": "preview_features",
                    "DatabaseVersion": "1.0.11746",
                    "SupportedOperations": [
                        {
                            "OperationName": "restore-from-cluster-snapshot"
                        }
                    ]
                },
                {
                    "MaintenanceTrackName": "trailing",
                    "DatabaseVersion": "1.0.11116",
                    "SupportedOperations": [
                        {
                            "OperationName": "restore-from-cluster-snapshot"
                        },
                        {
                            "OperationName": "modify-cluster"
                        }
                    ]
                }
            ]
        }
    ]
}
```

For more information, see Choosing Cluster Maintenance Tracks in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeClusterTracks in *AWS CLI Command Reference*.

### `describe-cluster-versions`

The following code example shows how to use `describe-cluster-versions`.

**AWS CLI**

Get a Description of All Cluster VersionsThis example returns a description of all cluster versions. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-versions
```

Result:

```
{
   "ClusterVersions": [
      {
      "ClusterVersion": "1.0",
      "Description": "Initial release",
      "ClusterParameterGroupFamily": "redshift-1.0"
      } ],
   "ResponseMetadata": {
      "RequestId": "16a53de3-64cc-11e2-bec0-17624ad140dd"
   }
}
```

- For API details, see DescribeClusterVersions in *AWS CLI Command Reference*.

### `describe-clusters`

The following code example shows how to use `describe-clusters`.

**AWS CLI**

Get a Description of All ClustersThis example returns a description of all clusters for the account. By default, the output is in JSON format.Command:

```
aws redshift describe-clusters
```

Result:

```
{
```

```
    "Clusters": [
    {
       "NodeType": "dw.hs1.xlarge",
       "Endpoint": {
          "Port": 5439,
          "Address": "mycluster.coqoarplqhsn.us-east-1.redshift.amazonaws.com"
       },
       "ClusterVersion": "1.0",
       "PubliclyAccessible": "true",
       "MasterUsername": "adminuser",
       "ClusterParameterGroups": [
          {
             "ParameterApplyStatus": "in-sync",
             "ParameterGroupName": "default.redshift-1.0"
          } ],
       "ClusterSecurityGroups": [
          {
             "Status": "active",
             "ClusterSecurityGroupName": "default"
          } ],
       "AllowVersionUpgrade": true,
       "VpcSecurityGroups": \[],
       "AvailabilityZone": "us-east-1a",
       "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
       "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
       "AutomatedSnapshotRetentionPeriod": 1,
       "ClusterStatus": "available",
       "ClusterIdentifier": "mycluster",
       "DBName": "dev",
       "NumberOfNodes": 2,
       "PendingModifiedValues": {}
    } ],
    "ResponseMetadata": {
       "RequestId": "65b71cac-64df-11e2-8f5b-e90bd6c77476"
    }
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-clusters --output text
```

Result:

```
dw.hs1.xlarge       1.0     true    adminuser       True    us-east-1a

```

- For API details, see DescribeClusters in *AWS CLI Command Reference*.

### `describe-default-cluster-parameters`

The following code example shows how to use `describe-default-cluster-parameters`.

#### AWS CLI

Get a Description of Default Cluster ParametersThis example returns a description of the default cluster parameters for the `redshift-1.0` family. By default, the output is in JSON format.Command:

```
aws redshift describe-default-cluster-parameters --parameter-group-family
 redshift-1.0
```

Result:

```
{
   "DefaultClusterParameters": {
   "ParameterGroupFamily": "redshift-1.0",
   "Parameters": [
      {
         "Description": "Sets the display format for date and time values.",
         "DataType": "string",
         "IsModifiable": true,
         "Source": "engine-default",
         "ParameterValue": "ISO, MDY",
         "ParameterName": "datestyle"
```

```
      },
      {
         "Description": "Sets the number of digits displayed for floating-point
 values",
         "DataType": "integer",
         "IsModifiable": true,
         "AllowedValues": "-15-2",
         "Source": "engine-default",
         "ParameterValue": "0",
         "ParameterName": "extra_float_digits"
      },
      (...remaining output omitted...)
      ]
   }
}
```

To see a list of valid parameter group families, use the `describe-cluster-parameter-groups` command.

`describe-cluster-parameter-groups` command.

command.

- For API details, see DescribeDefaultClusterParameters in *AWS CLI Command Reference*.

### `describe-event-categories`

The following code example shows how to use `describe-event-categories`.

#### AWS CLI

**To describe event categories for a cluster**

The following `describe-event-categories` example displays details for the event categories for a cluster.

```
aws redshift describe-event-categories \
    --source-type cluster
```

Output:

```
{
```

```
    "EventCategoriesMapList": [
        {
            "SourceType": "cluster",
            "Events": [
                {
                    "EventId": "REDSHIFT-EVENT-2000",
                    "EventCategories": [
                        "management"
                    ],
                    "EventDescription": "Cluster <cluster name> created at <time in
 UTC>.",
                    "Severity": "INFO"
                },
                {
                    "EventId": "REDSHIFT-EVENT-2001",
                    "EventCategories": [
                        "management"
                    ],
                    "EventDescription": "Cluster <cluster name> deleted at <time in
 UTC>.",
                    "Severity": "INFO"

                {
                    "EventId": "REDSHIFT-EVENT-3625",
                    "EventCategories": [
                        "monitoring"
                    ],
                    "EventDescription": "The cluster <cluster name> can't be resumed
 with its previous elastic network interface <ENI id>. We will allocate a new
 elastic network interface and associate it with the cluster node.",
                    "Severity": "INFO"
                }
            ]
        }
    ]
}
```

- For API details, see DescribeEventCategories in *AWS CLI Command Reference*.

### `describe-event-subscriptions`

The following code example shows how to use `describe-event-subscriptions`.

**AWS CLI**

**To describe event subscriptions**

The following `describe-event-subscriptions` example displays event notification subscriptions for the specified subscription.

```
aws redshift describe-event-subscriptions \
    --subscription-name mysubscription
```

Output:

```
{
    "EventSubscriptionsList": [
        {
            "CustomerAwsId": "123456789012",
            "CustSubscriptionId": "mysubscription",
            "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNStopic",
            "Status": "active",
            "SubscriptionCreationTime": "2019-12-09T21:50:21.332Z",
            "SourceIdsList": [],
            "EventCategoriesList": [
                "management"
            ],
            "Severity": "ERROR",
            "Enabled": true,
            "Tags": []
        }
    ]
}
```

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeEventSubscriptions in *AWS CLI Command Reference*.

## `describe-events`

The following code example shows how to use `describe-events`.

**AWS CLI**

Describe All Eventsthis example returns all events. By default, the output is in JSON format.Command:

```
aws redshift describe-events
```

Result:

```
{
   "Events": [
      {
      "Date": "2013-01-22T19:17:03.640Z",
      "SourceIdentifier": "myclusterparametergroup",
      "Message": "Cluster parameter group myclusterparametergroup has been
 created.",
      "SourceType": "cluster-parameter-group"
      } ],
   "ResponseMetadata": {
      "RequestId": "9f056111-64c9-11e2-9390-ff04f2c1e638"
   }
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-events --output text
```

Result:

```
2013-01-22T19:17:03.640Z    myclusterparametergroup Cluster parameter group
 myclusterparametergroup has been created.       cluster-parameter-group
RESPONSEMETADATA    8e5fe765-64c9-11e2-bce3-e56f52c50e17
```

- For API details, see DescribeEvents in *AWS CLI Command Reference*.

### `describe-hsm-client-certificates`

The following code example shows how to use `describe-hsm-client-certificates`.

#### AWS CLI

##### To describe HSM client certificates

The following `describe-hsm-client-certificates` example displays details for the specified HSM client certificate.

```
aws redshift describe-hsm-client-certificates \
    --hsm-client-certificate-identifier myhsmclientcert
```

Output:

```
{
    "HsmClientCertificates": [
        {
        "HsmClientCertificateIdentifier": "myhsmclientcert",
        "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----\

        "Tags": []
        }
    ]
}
```

For more information, see Amazon Redshift API Permissions Reference in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeHsmClientCertificates in *AWS CLI Command Reference*.

### `describe-hsm-configurations`

The following code example shows how to use `describe-hsm-configurations`.

**AWS CLI**

**To describe HSM configurations**

The following `describe-hsm-configurations` example displays details for the available HSM configurations for the calling AWS account.

```
aws redshift describe-hsm-configurations /
    --hsm-configuration-identifier myhsmconnection
```

Output:

```
{
    "HsmConfigurations": [
        {
            "HsmConfigurationIdentifier": "myhsmconnection",
            "Description": "My HSM connection",
            "HsmIpAddress": "192.0.2.09",
            "HsmPartitionName": "myhsmpartition",
            "Tags": []
        }
    ]
}
```

- For API details, see DescribeHsmConfigurations in *AWS CLI Command Reference*.

### `describe-logging-status`

The following code example shows how to use `describe-logging-status`.

**AWS CLI**

**To describe logging status for a cluster**

The following `describe-logging-status` example displays whether information, such as queries and connection attempts, is being logged for a cluster.

```
aws redshift describe-logging-status \
    --cluster-identifier mycluster
```

Output:

```
{
    "LoggingEnabled": false
}
```

For more information, see Database Audit Logging in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeLoggingStatus in *AWS CLI Command Reference*.

### `describe-node-configuration-options`

The following code example shows how to use `describe-node-configuration-options`.

**AWS CLI**

**To describe node configuration options**

The following `describe-node-configuration-options` example displays the properties of possible node configurations such as node type, number of nodes, and disk usage for the specified cluster snapshot.

```
aws redshift describe-node-configuration-options \
    --action-type restore-cluster \
    --snapshot-identifier rs:mycluster-2019-12-09-16-42-43
```

Output:

```
{
    "NodeConfigurationOptionList": [
        {
            "NodeType": "dc2.large",
            "NumberOfNodes": 2,
            "EstimatedDiskUtilizationPercent": 19.61
        },
        {
            "NodeType": "dc2.large",
```

```
            "NumberOfNodes": 4,
            "EstimatedDiskUtilizationPercent": 9.96
        },
        {
            "NodeType": "ds2.xlarge",
            "NumberOfNodes": 2,
            "EstimatedDiskUtilizationPercent": 1.53
        },
        {
            "NodeType": "ds2.xlarge",
            "NumberOfNodes": 4,
            "EstimatedDiskUtilizationPercent": 0.78
        }
    ]
}
```

For more information, see Purchasing Amazon Redshift Reserved Nodes in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeNodeConfigurationOptions in *AWS CLI Command Reference*.

### `describe-orderable-cluster-options`

The following code example shows how to use `describe-orderable-cluster-options`.

#### AWS CLI

Describing All Orderable Cluster OptionsThis example returns descriptions of all orderable cluster options. By default, the output is in JSON format.Command:

```
aws redshift describe-orderable-cluster-options
```

Result:

```
{
   "OrderableClusterOptions": [
      {
         "NodeType": "dw.hs1.8xlarge",
         "AvailabilityZones": [
            { "Name": "us-east-1a" },
            { "Name": "us-east-1b" },
            { "Name": "us-east-1c" } ],
```

```
         "ClusterVersion": "1.0",
         "ClusterType": "multi-node"
      },
      {
         "NodeType": "dw.hs1.xlarge",
         "AvailabilityZones": [
            { "Name": "us-east-1a" },
            { "Name": "us-east-1b" },
            { "Name": "us-east-1c" } ],
         "ClusterVersion": "1.0",
         "ClusterType": "multi-node"
      },
      {
      "NodeType": "dw.hs1.xlarge",
      "AvailabilityZones": [
         { "Name": "us-east-1a" },
         { "Name": "us-east-1b" },
         { "Name": "us-east-1c" } ],
      "ClusterVersion": "1.0",
      "ClusterType": "single-node"
      } ],
   "ResponseMetadata": {
      "RequestId": "f6000035-64cb-11e2-9135-ff82df53a51a"
   }
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-orderable-cluster-options --output text
```

Result:

```
dw.hs1.8xlarge      1.0     multi-node
us-east-1a
us-east-1b
us-east-1c
dw.hs1.xlarge       1.0     multi-node
us-east-1a
```

```
us-east-1b
us-east-1c
dw.hs1.xlarge       1.0     single-node
us-east-1a
us-east-1b
us-east-1c
RESPONSEMETADATA    e648696b-64cb-11e2-bec0-17624ad140dd
```

- For API details, see DescribeOrderableClusterOptions in *AWS CLI Command Reference*.

### `describe-reserved-node-offerings`

The following code example shows how to use `describe-reserved-node-offerings`.

#### AWS CLI

Describe Reserved Node OfferingsThis example shows all of the reserved node offerings that are available for purchase.Command:

```
aws redshift describe-reserved-node-offerings
```

Result:

```
{
   "ReservedNodeOfferings": [
      {
         "OfferingType": "Heavy Utilization",
         "FixedPrice": "",
         "NodeType": "dw.hs1.xlarge",
         "UsagePrice": "",
         "RecurringCharges": [
            {
               "RecurringChargeAmount": "",
               "RecurringChargeFrequency": "Hourly"
            } ],
         "Duration": 31536000,
         "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
      },
      {
         "OfferingType": "Heavy Utilization",
         "FixedPrice": "",
         "NodeType": "dw.hs1.8xlarge",
```

```
            "UsagePrice": "",
            "RecurringCharges": [
               {
               "RecurringChargeAmount": "",
               "RecurringChargeFrequency": "Hourly"
               } ],
            "Duration": 31536000,
            "ReservedNodeOfferingId": "e5a2ff3b-352d-4a9c-ad7d-373c4cab5dd2"
         },
         ...remaining output omitted...
      ],
      "ResponseMetadata": {
         "RequestId": "8b1a1a43-75ff-11e2-9666-e142fe91ddd1"
      }
}
```

If you want to purchase a reserved node offering, you can call `purchase-reserved-node-offering` using a valid *ReservedNodeOfferingId*.

`purchase-reserved-node-offering` using a valid *ReservedNodeOfferingId*.

using a valid *ReservedNodeOfferingId*.

*ReservedNodeOfferingId*.

.

- For API details, see DescribeReservedNodeOfferings in *AWS CLI Command Reference*.

### `describe-reserved-nodes`

The following code example shows how to use `describe-reserved-nodes`.

#### AWS CLI

Describe Reserved NodesThis example shows a reserved node offering that has been purchased.Command:

```
aws redshift describe-reserved-nodes
```

Result:

```
{
```

```
   "ResponseMetadata": {
      "RequestId": "bc29ce2e-7600-11e2-9949-4b361e7420b7"
   },
   "ReservedNodes": [
      {
         "OfferingType": "Heavy Utilization",
         "FixedPrice": "",
         "NodeType": "dw.hs1.xlarge",
         "ReservedNodeId": "1ba8e2e3-bc01-4d65-b35d-a4a3e931547e",
         "UsagePrice": "",
         "RecurringCharges": [
            {
               "RecurringChargeAmount": "",
               "RecurringChargeFrequency": "Hourly"
            } ],
         "NodeCount": 1,
         "State": "payment-pending",
         "StartTime": "2013-02-13T17:08:39.051Z",
         "Duration": 31536000,
         "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
      }
   ]
}
```

- For API details, see DescribeReservedNodes in *AWS CLI Command Reference*.

### `describe-resize`

The following code example shows how to use `describe-resize`.

#### AWS CLI

Describe ResizeThis example describes the latest resize of a cluster. The request was for 3 nodes of type `dw.hs1.8xlarge`.Command:

```
aws redshift describe-resize --cluster-identifier mycluster
```

Result:

```
{
   "Status": "NONE",
   "TargetClusterType": "multi-node",
```

```
   "TargetNodeType": "dw.hs1.8xlarge",
   "ResponseMetadata": {
      "RequestId": "9f52b0b4-7733-11e2-aa9b-318b2909bd27"
   },
   "TargetNumberOfNodes": "3"
}
```

- For API details, see DescribeResize in *AWS CLI Command Reference*.

### `describe-scheduled-actions`

The following code example shows how to use `describe-scheduled-actions`.

#### AWS CLI

**To describe scheduled actions**

The following `describe-scheduled-actions` example displays details for any currently scheduled actions.

```
aws redshift describe-scheduled-actions
```

Output:

```
{
    "ScheduledActions": [
        {
            "ScheduledActionName": "resizecluster",
            "TargetAction": {
                "ResizeCluster": {
                    "ClusterIdentifier": "mycluster",
                    "NumberOfNodes": 4,
                    "Classic": false
                }
            },
            "Schedule": "at(2019-12-10T00:07:00)",
            "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
            "State": "ACTIVE",
            "NextInvocations": [
                "2019-12-10T00:07:00Z"
            ]
        }
```

```
    ]
}
```

- For API details, see DescribeScheduledActions in *AWS CLI Command Reference*.

### `describe-snapshot-copy-grants`

The following code example shows how to use `describe-snapshot-copy-grants`.

**AWS CLI**

**To describe snapshot copy grants**

The following `describe-snapshot-copy-grants` example displays details for the specified cluster snapshot copy grant.

```
aws redshift describe-snapshot-copy-grants \
    --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```
{
    "SnapshotCopyGrants": [
        {
            "SnapshotCopyGrantName": "mysnapshotcopygrantname",
            "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
bPxRfih3yCo8nvbEXAMPLEKEY",
            "Tags": []
        }
    ]
}
```

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeSnapshotCopyGrants in *AWS CLI Command Reference*.

### `describe-snapshot-schedules`

The following code example shows how to use `describe-snapshot-schedules`.

**AWS CLI**

**To describe snapshot schedules**

The following `describe-snapshot-schedules` example displays details for the specified cluster snapshot schedule.

```
aws redshift describe-snapshot-schedules \
    --cluster-identifier mycluster \
    --schedule-identifier mysnapshotschedule
```

Output:

```
{
    "SnapshotSchedules": [
        {
            "ScheduleDefinitions": [
                "rate(12 hours)"
            ],
            "ScheduleIdentifier": "mysnapshotschedule",
            "ScheduleDescription": "My schedule description",
            "Tags": [],
            "AssociatedClusterCount": 1,
            "AssociatedClusters": [
                {
                    "ClusterIdentifier": "mycluster",
                    "ScheduleAssociationState": "ACTIVE"
                }
            ]
        }
    ]
}
```

For more information, see Automated Snapshot Schedules in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeSnapshotSchedules in *AWS CLI Command Reference*.

### `describe-storage`

The following code example shows how to use `describe-storage`.

**AWS CLI**

**To describe storage**

The following `describe-storage` example displays details about the backup storage and provisional storage sizes for the account.

```
aws redshift describe-storage
```

Output:

```
{
    "TotalBackupSizeInMegaBytes": 193149.0,
    "TotalProvisionedStorageInMegaBytes": 655360.0
}
```

For more information, see Managing Snapshot Storage in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeStorage in *AWS CLI Command Reference*.

## `describe-table-restore-status`

The following code example shows how to use `describe-table-restore-status`.

**AWS CLI**

**To describe status of table restore requests from a cluster snapshot**

The following `describe-table-restore-status` example displays details for table restore requests made for the specified cluster.

```
aws redshift describe-table-restore-status /
    --cluster-identifier mycluster
```

Output:

```
{
    "TableRestoreStatusDetails": [
        {
            "TableRestoreRequestId": "z1116630-0e80-46f4-ba86-bd9670411ebd",
            "Status": "IN_PROGRESS",
```

```
            "RequestTime": "2019-12-27T18:22:12.257Z",
            "ClusterIdentifier": "mycluster",
            "SnapshotIdentifier": "mysnapshotid",
            "SourceDatabaseName": "dev",
            "SourceSchemaName": "public",
            "SourceTableName": "mytable",
            "TargetDatabaseName": "dev",
            "TargetSchemaName": "public",
            "NewTableName": "mytable-clone"
        }
    ]
}
```

For more information, see Restoring a Table from a Snapshot in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeTableRestoreStatus in *AWS CLI Command Reference*.

### `describe-tags`

The following code example shows how to use `describe-tags`.

#### AWS CLI

**To describe tags**

The following `describe-tags` example displays the resources the specified cluster associated with the specified tag names and values.

```
aws redshift describe-tags \
    --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
    --tag-keys clustertagkey \
    --tag-values clustertagvalue
```

Output:

```
{
    "TaggedResources": [
                    {
            "Tag": {
                "Key": "clustertagkey",
                "Value": "clustertagvalue"
            },
```

```
            "ResourceName": "arn:aws:redshift:us-
west-2:123456789012:cluster:mycluster",
            "ResourceType": "cluster"
        }
    ]
}
```

For more information, see Tagging Resources in Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

### `disable-snapshot-copy`

The following code example shows how to use `disable-snapshot-copy`.

#### AWS CLI

**To disable snapshot copy for a cluster**

The following `disable-snapshot-copy` example disables the automatic copy of a snapshot for the specified cluster.

```
aws redshift disable-snapshot-copy \
    --cluster-identifier mycluster
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",

    }
}
```

For more information, see Copying Snapshots to Another AWS Region in the *Amazon Redshift Cluster Management Guide*.

- For API details, see DisableSnapshotCopy in *AWS CLI Command Reference*.

### `enable-snapshot-copy`

The following code example shows how to use `enable-snapshot-copy`.

#### AWS CLI

**To enable snapshot copy for a cluster**

The following `enable-snapshot-copy` example enables the automatic copy of a snapshot for the specified cluster.

```
aws redshift enable-snapshot-copy \
    --cluster-identifier mycluster \
    --destination-region us-west-1
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
        "AutomatedSnapshotRetentionPeriod": 3,
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [],
        "VpcSecurityGroups": [
```

```
            {
                "VpcSecurityGroupId": "sh-f4c731cd",
                "Status": "active"
            }
        ],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "ClusterSubnetGroupName": "default",
        "VpcId": "vpc-b1ael7t9",
        "AvailabilityZone": "us-west-2f",
        "PreferredMaintenanceWindow": "sat:16:00-sat:16:30",
        "PendingModifiedValues": {
            "NodeType": "dc2.large",
            "NumberOfNodes": 2,
            "ClusterType": "multi-node"
        },
        "ClusterVersion": "1.0",
        "AllowVersionUpgrade": true,
        "NumberOfNodes": 4,
        "PubliclyAccessible": false,
        "Encrypted": false,
        "ClusterSnapshotCopyStatus": {
            "DestinationRegion": "us-west-1",
            "RetentionPeriod": 7,
            "ManualSnapshotRetentionPeriod": -1
        },
        "Tags": [
            {
                "Key": "mytags",
                "Value": "tag1"
            }
        ],
        "EnhancedVpcRouting": false,
        "IamRoles": [
            {
                "IamRoleArn": "arn:aws:iam::123456789012:role/myRedshiftRole",
                "ApplyStatus": "in-sync"
            }
        ],
        "MaintenanceTrackName": "current",
```

```
        "DeferredMaintenanceWindows": [],
        "ExpectedNextSnapshotScheduleTime": "2019-12-10T04:42:43.390Z",
        "ExpectedNextSnapshotScheduleTimeStatus": "OnTrack",
        "NextMaintenanceWindowStartTime": "2019-12-14T16:00:00Z"
    }
}
```

For more information, see Copying Snapshots to Another AWS Region in the *Amazon Redshift Cluster Management Guide*.

- For API details, see EnableSnapshotCopy in *AWS CLI Command Reference*.

### `get-cluster-credentials`

The following code example shows how to use `get-cluster-credentials`.

#### AWS CLI

**To get cluster credentials for an AWS account**

The following `get-cluster-credentials` example retrieves temporary credentials that enable access to an Amazon Redshift database.

```
aws redshift get-cluster-credentials \
    --db-user adminuser --db-name dev \
    --cluster-identifier mycluster
```

Output:

```
{
    "DbUser": "IAM:adminuser",
    "DbPassword": "AMAFUyyuros/QjxPTtgzcsuQsqzIasdzJEN04aCtWDzXx1O9d6UmpkBtvEeqFly/
EXAMPLE==",
    "Expiration": "2019-12-10T17:25:05.770Z"
}
```

For more information, see Generating IAM Database Credentials Using the Amazon Redshift CLI or API in the *Amazon Redshift Cluster Management Guide*.

- For API details, see GetClusterCredentials in *AWS CLI Command Reference*.

### `get-reserved-node-exchange-offerings`

The following code example shows how to use `get-reserved-node-exchange-offerings`.

**AWS CLI**

**To get reserved node exchange offerings**

The following `get-reserved-node-exchange-offerings` example retrieves an array of DC2 `ReservedNodeOfferings` that match the specified DC1 reserved node.

```
aws redshift get-reserved-node-exchange-offerings \
    --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:

```
{
    "ReservedNodeOfferings": [
        {
            "ReservedNodeOfferingId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
            "NodeType": "dc2.large",
            "Duration": 31536000,
            "FixedPrice": 0.0,
            "UsagePrice": 0.0,
            "CurrencyCode": "USD",
            "OfferingType": "All Upfront",
            "RecurringCharges": [
                {
                    "RecurringChargeAmount": 0.0,
                    "RecurringChargeFrequency": "Hourly"
                }
            ],
            "ReservedNodeOfferingType": "Regular"
        }
    ]
}
```

For more information, see Upgrading Reserved Nodes With the AWS CLI in the *Amazon Redshift Cluster Management Guide*.

- For API details, see GetReservedNodeExchangeOfferings in *AWS CLI Command Reference*.

### `modify-cluster-iam-roles`

The following code example shows how to use `modify-cluster-iam-roles`.

**AWS CLI**

**To modify the IAM role for a cluster**

The following `modify-cluster-iam-roles` example removes the specified AWS IAM role from the specified cluster.

```
aws redshift modify-cluster-iam-roles \
    --cluster-identifier mycluster \
    --remove-iam-roles arn:aws:iam::123456789012:role/myRedshiftRole
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
        "AutomatedSnapshotRetentionPeriod": 3,
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sh-f9b731sd",
                "Status": "active"
            }
        ],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
                "ParameterApplyStatus": "in-sync"
```

```
            }
        ],
        "ClusterSubnetGroupName": "default",
        "VpcId": "vpc-b2fal7t9",
        "AvailabilityZone": "us-west-2f",
        "PreferredMaintenanceWindow": "sat:16:00-sat:16:30",
        "PendingModifiedValues": {
            "NodeType": "dc2.large",
            "NumberOfNodes": 2,
            "ClusterType": "multi-node"
        },
        "ClusterVersion": "1.0",
        "AllowVersionUpgrade": true,
        "NumberOfNodes": 4,
        "PubliclyAccessible": false,
        "Encrypted": false,
        "ClusterSnapshotCopyStatus": {
            "DestinationRegion": "us-west-1",
            "RetentionPeriod": 7,
            "ManualSnapshotRetentionPeriod": -1
        },
        "Tags": [
            {
                "Key": "mytags",
                "Value": "tag1"
            }
        ],
        "EnhancedVpcRouting": false,
        "IamRoles": [],
        "MaintenanceTrackName": "current",
        "DeferredMaintenanceWindows": [],
        "ExpectedNextSnapshotScheduleTime": "2019-12-11T04:42:55.631Z",
        "ExpectedNextSnapshotScheduleTimeStatus": "OnTrack",
        "NextMaintenanceWindowStartTime": "2019-12-14T16:00:00Z"
    }
}
```

For more information, see Using Identity-Based Policies (IAM Policies) for Amazon Redshift in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyClusterIamRoles in *AWS CLI Command Reference*.

### `modify-cluster-maintenance`

The following code example shows how to use `modify-cluster-maintenance`.

**AWS CLI**

**To modify cluster maintenance**

The following `modify-cluster-maintenance` example defers the maintenance of the specified cluster by 30 days.

```
aws redshift modify-cluster-maintenance \
    --cluster-identifier mycluster \
    --defer-maintenance \
    --defer-maintenance-duration 30
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
        "AutomatedSnapshotRetentionPeriod": 3,
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sh-a1a123ab",
                "Status": "active"
            }
        ],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
```

```
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "ClusterSubnetGroupName": "default",
        "VpcId": "vpc-b1ael7t9",
        "AvailabilityZone": "us-west-2f",
        "PreferredMaintenanceWindow": "sat:16:00-sat:16:30",
        "PendingModifiedValues": {
            "NodeType": "dc2.large",
            "NumberOfNodes": 2,
            "ClusterType": "multi-node"
        },
        "ClusterVersion": "1.0",
        "AllowVersionUpgrade": true,
        "NumberOfNodes": 4,
        "PubliclyAccessible": false,
        "Encrypted": false,
        "ClusterSnapshotCopyStatus": {
            "DestinationRegion": "us-west-1",
            "RetentionPeriod": 7,
            "ManualSnapshotRetentionPeriod": -1
        },
        "Tags": [
            {
                "Key": "mytags",
                "Value": "tag1"
            }
        ],
        "EnhancedVpcRouting": false,

        "MaintenanceTrackName": "current",
        "DeferredMaintenanceWindows": [
            {
                "DeferMaintenanceIdentifier": "dfm-mUdVIfFcT1B4SGhw6fyF",
                "DeferMaintenanceStartTime": "2019-12-10T18:18:39.354Z",
                "DeferMaintenanceEndTime": "2020-01-09T18:18:39.354Z"
            }
        ],
        "ExpectedNextSnapshotScheduleTime": "2019-12-11T04:42:55.631Z",
        "ExpectedNextSnapshotScheduleTimeStatus": "OnTrack",
        "NextMaintenanceWindowStartTime": "2020-01-11T16:00:00Z"
    }
}
```

For more information, see Cluster Maintenance in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyClusterMaintenance in *AWS CLI Command Reference*.

### `modify-cluster-parameter-group`

The following code example shows how to use `modify-cluster-parameter-group`.

**AWS CLI**

**Modify a parameter in a parameter group**

The following `modify-cluster-parameter-group` example modifies the *wlm_json_configuration* parameter for workload management. It accepts the parameters from a file that contains the JSON contents shown below.

```
aws redshift modify-cluster-parameter-group \
    --parameter-group-name myclusterparametergroup \
    --parameters file://modify_pg.json
```

Contents of `modify_pg.json`:

```
[
    {
        "ParameterName": "wlm_json_configuration",
        "ParameterValue": "[{\"user_group\":\"example_user_group1\",\"query_group\":
 \"example_query_group1\", \"query_concurrency\":7},{\"query_concurrency\":5}]"
    }
]
```

Output:

```
{
   "ParameterGroupStatus": "Your parameter group has been updated but changes won't
 get applied until you reboot the associated Clusters.",
   "ParameterGroupName": "myclusterparametergroup",
   "ResponseMetadata": {
      "RequestId": "09974cc0-64cd-11e2-bea9-49e0ce183f07"
   }
}
```

- For API details, see ModifyClusterParameterGroup in *AWS CLI Command Reference*.

### `modify-cluster-snapshot-schedule`

The following code example shows how to use `modify-cluster-snapshot-schedule`.

**AWS CLI**

**To modify cluster snapshot schedule**

The following `modify-cluster-snapshot-schedule` example removes the specified snapshot schedule from the specified cluster.

```
aws redshift modify-cluster-snapshot-schedule \
    --cluster-identifier mycluster \
    --schedule-identifier mysnapshotschedule \
    --disassociate-schedule
```

This command does not produce any output.

For more information, see Automated Snapshot Schedules in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyClusterSnapshotSchedule in *AWS CLI Command Reference*.

### `modify-cluster-snapshot`

The following code example shows how to use `modify-cluster-snapshot`.

**AWS CLI**

**To modify cluster snapshot**

The following `modify-cluster-snapshot` example sets the manual retention period setting for the specified cluster snapshot to value of 10 days.

```
aws redshift modify-cluster-snapshot \
    --snapshot-identifier mycluster-2019-11-06-16-32 \
    --manual-snapshot-retention-period 10
```

Output:

```
{
    "Snapshot": {
        "SnapshotIdentifier": "mycluster-2019-11-06-16-32",
        "ClusterIdentifier": "mycluster",
        "SnapshotCreateTime": "2019-12-07T00:34:05.633Z",
        "Status": "available",
        "Port": 5439,
        "AvailabilityZone": "us-west-2f",
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",

        "ManualSnapshotRetentionPeriod": 10,
        "ManualSnapshotRemainingDays": 6,
        "SnapshotRetentionStartTime": "2019-12-07T00:34:07.479Z"
    }
}
```

For more information, see Amazon Redshift Snapshots in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyClusterSnapshot in *AWS CLI Command Reference*.

### `modify-cluster-subnet-group`

The following code example shows how to use `modify-cluster-subnet-group`.

#### AWS CLI

Modify the Subnets in a Cluster Subnet GroupThis example shows how to modify the list of subnets in a cache subnet group. By default, the output is in JSON format.Command:

```
aws redshift modify-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup
 --subnet-ids subnet-763fdd1 subnet-ac830e9
```

Result:

```
{
   "ClusterSubnetGroup":
   {
      "Subnets": [
         {
            "SubnetStatus": "Active",
            "SubnetIdentifier": "subnet-763fdd1c",
            "SubnetAvailabilityZone":
               { "Name": "us-east-1a" }
         },
         {
            "SubnetStatus": "Active",
            "SubnetIdentifier": "subnet-ac830e9",
            "SubnetAvailabilityZone":
               { "Name": "us-east-1b" }
         } ],
      "VpcId": "vpc-7e3fdd14",
      "SubnetGroupStatus": "Complete",
      "Description": "My subnet group",
      "ClusterSubnetGroupName": "mysubnetgroup"
   },
   "ResponseMetadata": {
      "RequestId": "8da93e89-8372-f936-93a8-873918938197a"
   }
}
```

- For API details, see ModifyClusterSubnetGroup in *AWS CLI Command Reference*.

### `modify-cluster`

The following code example shows how to use `modify-cluster`.

**AWS CLI**

Associate a Security Group with a ClusterThis example shows how to associate a cluster security group with the specified cluster.Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --cluster-security-groups
 mysecuritygroup
```

Modify the Maintenance Window for a ClusterThis shows how to change the weekly preferred maintenance window for a cluster to be the minimum four hour window starting Sundays at 11:15 PM, and ending Mondays at 3:15 AM.Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --preferred-maintenance-
window Sun:23:15-Mon:03:15
```

Change the Master Password for the ClusterThis example shows how to change the master password for a cluster.Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --master-user-password
 A1b2c3d4
```

- For API details, see ModifyCluster in *AWS CLI Command Reference*.

### `modify-event-subscription`

The following code example shows how to use `modify-event-subscription`.

**AWS CLI**

**To modify event subscription**

The following `modify-event-subscription` example disables the specified event notification subscription.

```
aws redshift modify-event-subscription \
    --subscription-name mysubscription \
    --no-enabled
```

Output:

```
{
    "EventSubscription": {
        "CustomerAwsId": "123456789012",
        "CustSubscriptionId": "mysubscription",
        "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNStopic",
        "Status": "active",
        "SubscriptionCreationTime": "2019-12-09T21:50:21.332Z",
        "SourceIdsList": [],
        "EventCategoriesList": [
            "management"
        ],
        "Severity": "ERROR",
        "Enabled": false,
        "Tags": []
    }
}
```

For more information, see Subscribing to Amazon Redshift Event Notifications in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifyEventSubscription in *AWS CLI Command Reference*.

### `modify-scheduled-action`

The following code example shows how to use `modify-scheduled-action`.

#### AWS CLI

**To modify scheduled action**

The following `modify-scheduled-action` example adds a description to the specified existing scheduled action.

```
aws redshift modify-scheduled-action \
    --scheduled-action-name myscheduledaction \
    --scheduled-action-description "My scheduled action"
```

Output:

```
{
```

```
    "ScheduledActionName": "myscheduledaction",
    "TargetAction": {
        "ResizeCluster": {
            "ClusterIdentifier": "mycluster",
            "NumberOfNodes": 2,
            "Classic": false
        }
    },
    "Schedule": "at(2019-12-25T00:00:00)",
    "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
    "ScheduledActionDescription": "My scheduled action",
    "State": "ACTIVE",
    "NextInvocations": [
        "2019-12-25T00:00:00Z"
    ]
}
```

- For API details, see ModifyScheduledAction in *AWS CLI Command Reference*.

### `modify-snapshot-copy-retention-period`

The following code example shows how to use `modify-snapshot-copy-retention-period`.

**AWS CLI**

**To modify snapshot copy retention period**

The following `modify-snapshot-copy-retention-period` example modifies the number of days to retain snapshots for the specified cluster in the destination AWS Region after they are copied from the source AWS Region.

```
aws redshift modify-snapshot-copy-retention-period \
    --cluster-identifier mycluster \
    --retention-period 15
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "available",
```

```
        "ClusterAvailabilityStatus": "Available",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
        "AutomatedSnapshotRetentionPeriod": 3,
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sh-a1a123ab",
                "Status": "active"
            }
        ],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
                "ParameterApplyStatus": "in-sync"
            }
        ],
        "ClusterSubnetGroupName": "default",
        "VpcId": "vpc-b1fet7t9",
        "AvailabilityZone": "us-west-2f",
        "PreferredMaintenanceWindow": "sat:16:00-sat:16:30",
        "PendingModifiedValues": {
            "NodeType": "dc2.large",
            "NumberOfNodes": 2,

        },
        "ClusterVersion": "1.0",
        "AllowVersionUpgrade": true,
        "NumberOfNodes": 4,
        "PubliclyAccessible": false,
        "Encrypted": false,
        "ClusterSnapshotCopyStatus": {
            "DestinationRegion": "us-west-1",
            "RetentionPeriod": 15,
            "ManualSnapshotRetentionPeriod": -1
        },
        "Tags": [
            {
```

```
                "Key": "mytags",
                "Value": "tag1"
            }
        ],
        "EnhancedVpcRouting": false,
        "IamRoles": [],
        "MaintenanceTrackName": "current",
        "DeferredMaintenanceWindows": [
            {
                "DeferMaintenanceIdentifier": "dfm-mUdVSfDcT1F4SGhw6fyF",
                "DeferMaintenanceStartTime": "2019-12-10T18:18:39.354Z",
                "DeferMaintenanceEndTime": "2020-01-09T18:18:39.354Z"
            }
        ],
        "NextMaintenanceWindowStartTime": "2020-01-11T16:00:00Z"
    }
}
```

For more information, see Snapshot Schedule Format in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifySnapshotCopyRetentionPeriod in *AWS CLI Command Reference*.

### `modify-snapshot-schedule`

The following code example shows how to use `modify-snapshot-schedule`.

#### AWS CLI

##### To modify snapshot schedule

The following `modify-snapshot-schedule` example modifies the rate of the specified snapshot schedule to every 10 hours.

```
aws redshift modify-snapshot-schedule \
    --schedule-identifier mysnapshotschedule \
    --schedule-definitions "rate(10 hours)"
```

Output:

```
{
    "ScheduleDefinitions": [
```

```
        "rate(10 hours)"
    ],
    "ScheduleIdentifier": "mysnapshotschedule",
    "ScheduleDescription": "My schedule description",
    "Tags": []
}
```

For more information, see Snapshot Schedule Format in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ModifySnapshotSchedule in *AWS CLI Command Reference*.

### `purchase-reserved-node-offering`

The following code example shows how to use `purchase-reserved-node-offering`.

**AWS CLI**

Purchase a Reserved NodeThis example shows how to purchase a reserved node offering. The `reserved-node-offering-id` is obtained by calling `describe-reserved-node-offerings`.Command:

```
aws redshift purchase-reserved-node-offering --reserved-node-offering-id ceb6a579-cf4c-4343-be8b-d832c45ab51c
```

Result:

```
{
   "ReservedNode": {
      "OfferingType": "Heavy Utilization",
      "FixedPrice": "",
      "NodeType": "dw.hs1.xlarge",
      "ReservedNodeId": "1ba8e2e3-bc01-4d65-b35d-a4a3e931547e",
      "UsagePrice": "",
      "RecurringCharges": [
         {
            "RecurringChargeAmount": "",
            "RecurringChargeFrequency": "Hourly"
         }
      ],
      "NodeCount": 1,
```

```
      "State": "payment-pending",
      "StartTime": "2013-02-13T17:08:39.051Z",
      "Duration": 31536000,
      "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
   },
   "ResponseMetadata": {
      "RequestId": "01bda7bf-7600-11e2-b605-2568d7396e7f"
   }
}
```

- For API details, see PurchaseReservedNodeOffering in *AWS CLI Command Reference*.

### `reboot-cluster`

The following code example shows how to use `reboot-cluster`.

#### AWS CLI

Reboot a ClusterThis example reboots a cluster. By default, the output is in JSON format.Command:

```
aws redshift reboot-cluster --cluster-identifier mycluster
```

Result:

```
{
   "Cluster": {
      "NodeType": "dw.hs1.xlarge",
      "Endpoint": {
         "Port": 5439,
         "Address": "mycluster.coqoarplqhsn.us-east-1.redshift.amazonaws.com"
      },
      "ClusterVersion": "1.0",
      "PubliclyAccessible": "true",
      "MasterUsername": "adminuser",
      "ClusterParameterGroups": [
         {
         "ParameterApplyStatus": "in-sync",
         "ParameterGroupName": "default.redshift-1.0"
         }
      ],
      "ClusterSecurityGroups": [
```

```
            {
            "Status": "active",
            "ClusterSecurityGroupName": "default"
            }
         ],
         "AllowVersionUpgrade": true,
         "VpcSecurityGroups": \[],
         "AvailabilityZone": "us-east-1a",
         "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
         "PreferredMaintenanceWindow": "sun:23:15-mon:03:15",
         "AutomatedSnapshotRetentionPeriod": 1,
         "ClusterStatus": "rebooting",
         "ClusterIdentifier": "mycluster",
         "DBName": "dev",
         "NumberOfNodes": 2,
         "PendingModifiedValues": {}
      },
      "ResponseMetadata": {
         "RequestId": "61c8b564-64e8-11e2-8f7d-3b939af52818"
      }
}
```

- For API details, see RebootCluster in *AWS CLI Command Reference*.

### `reset-cluster-parameter-group`

The following code example shows how to use `reset-cluster-parameter-group`.

#### AWS CLI

Reset Parameters in a Parameter GroupThis example shows how to reset all of the parameters in a parameter group.Command:

```
aws redshift reset-cluster-parameter-group --parameter-group-name
 myclusterparametergroup --reset-all-parameters
```

- For API details, see ResetClusterParameterGroup in *AWS CLI Command Reference*.

### `resize-cluster`

The following code example shows how to use `resize-cluster`.

## AWS CLI

### To resize cluster

The following `resize-cluster` example resizes the specified cluster.

```
aws redshift resize-cluster \
    --cluster-identifier mycluster \
    --cluster-type multi-node \
    --node-type dc2.large \
    --number-of-nodes 6 \
    --classic
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "resizing",
        "ClusterAvailabilityStatus": "Modifying",
        "MasterUsername": "adminuser",
        "DBName": "dev",
        "Endpoint": {
            "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",
            "Port": 5439
        },
        "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
        "AutomatedSnapshotRetentionPeriod": 3,
        "ManualSnapshotRetentionPeriod": -1,
        "ClusterSecurityGroups": [],
        "VpcSecurityGroups": [
            {
                "VpcSecurityGroupId": "sh-a1a123ab",
                "Status": "active"
            }
        ],
        "ClusterParameterGroups": [
            {
                "ParameterGroupName": "default.redshift-1.0",
                "ParameterApplyStatus": "in-sync"
            }
        ],
```

```
        "ClusterSubnetGroupName": "default",
        "VpcId": "vpc-a1abc1a1",
        "AvailabilityZone": "us-west-2f",
        "PreferredMaintenanceWindow": "sat:16:00-sat:16:30",
        "PendingModifiedValues": {
            "NodeType": "dc2.large",
            "NumberOfNodes": 6,
            "ClusterType": "multi-node"
        },
        "ClusterVersion": "1.0",
        "AllowVersionUpgrade": true,
        "NumberOfNodes": 4,
        "PubliclyAccessible": false,
        "Encrypted": false,
        "ClusterSnapshotCopyStatus": {
            "DestinationRegion": "us-west-1",
            "RetentionPeriod": 15,
            "ManualSnapshotRetentionPeriod": -1
        },
        "Tags": [
            {
                "Key": "mytags",
                "Value": "tag1"
            }
        ],
        "EnhancedVpcRouting": false,
        "IamRoles": [],
        "MaintenanceTrackName": "current",
        "DeferredMaintenanceWindows": [
            {

                "DeferMaintenanceStartTime": "2019-12-10T18:18:39.354Z",
                "DeferMaintenanceEndTime": "2020-01-09T18:18:39.354Z"
            }
        ],
        "NextMaintenanceWindowStartTime": "2020-01-11T16:00:00Z",
        "ResizeInfo": {
            "ResizeType": "ClassicResize",
            "AllowCancelResize": true
        }
    }
}
```

For more information, see Resizing a Cluster in the *Amazon Redshift Cluster Management Guide*.

- For API details, see ResizeCluster in *AWS CLI Command Reference*.

### `restore-from-cluster-snapshot`

The following code example shows how to use `restore-from-cluster-snapshot`.

#### AWS CLI

Restore a Cluster From a SnapshotThis example restores a cluster from a snapshot.Command:

```
aws redshift restore-from-cluster-snapshot --cluster-identifier mycluster-clone --
snapshot-identifier my-snapshot-id
```

Result:

```
{
   "Cluster": {
      "NodeType": "dw.hs1.xlarge",
      "ClusterVersion": "1.0",
      "PubliclyAccessible": "true",
      "MasterUsername": "adminuser",
      "ClusterParameterGroups": [
         {
         "ParameterApplyStatus": "in-sync",
         "ParameterGroupName": "default.redshift-1.0"
         }
      ],
      "ClusterSecurityGroups": [
         {
         "Status": "active",
         "ClusterSecurityGroupName": "default"
         }
      ],
      "AllowVersionUpgrade": true,
      "VpcSecurityGroups": \[],
      "PreferredMaintenanceWindow": "sun:23:15-mon:03:15",
      "AutomatedSnapshotRetentionPeriod": 1,
      "ClusterStatus": "creating",
      "ClusterIdentifier": "mycluster-clone",
      "DBName": "dev",
      "NumberOfNodes": 2,
```

```
      "PendingModifiedValues": {}
   },
   "ResponseMetadata": {
      "RequestId": "77fd512b-64e3-11e2-8f5b-e90bd6c77476"
   }
}
```

- For API details, see RestoreFromClusterSnapshot in *AWS CLI Command Reference*.

### `restore-table-from-cluster-snapshot`

The following code example shows how to use `restore-table-from-cluster-snapshot`.

**AWS CLI**

**To restore table from a cluster snapshot**

The following `restore-table-from-cluster-snapshot` example creates a new table from the specified table in the specified cluster snapshot.

```
aws redshift restore-table-from-cluster-snapshot /
    --cluster-identifier mycluster /
    --snapshot-identifier mycluster-2019-11-19-16-17 /
    --source-database-name dev /
    --source-schema-name public /
    --source-table-name mytable /
    --target-database-name dev /
    --target-schema-name public /
    --new-table-name mytable-clone
```

Output:

```
{
    "TableRestoreStatus": {
        "TableRestoreRequestId": "a123a12b-abc1-1a1a-a123-a1234ab12345",
        "Status": "PENDING",
        "RequestTime": "2019-12-20T00:20:16.402Z",
        "ClusterIdentifier": "mycluster",
        "SnapshotIdentifier": "mycluster-2019-11-19-16-17",
        "SourceDatabaseName": "dev",
        "SourceSchemaName": "public",
        "SourceTableName": "mytable",
```

```
        "TargetDatabaseName": "dev",
        "TargetSchemaName": "public",
        "NewTableName": "mytable-clone"
    }
}
```

For more information, see Restoring a Table from a Snapshot in the *Amazon Redshift Cluster Management Guide*.

- For API details, see RestoreTableFromClusterSnapshot in *AWS CLI Command Reference*.

### `revoke-cluster-security-group-ingress`

The following code example shows how to use `revoke-cluster-security-group-ingress`.

**AWS CLI**

Revoke Access from an EC2 Security GroupThis example revokes access to a named Amazon EC2 security group.Command:

```
aws redshift revoke-cluster-security-group-ingress --cluster-security-group-name
 mysecuritygroup --ec2-security-group-name myec2securitygroup --ec2-security-group-
owner-id 123445677890
```

Revoking Access to a CIDR rangeThis example revokes access to a CIDR range.Command:

```
aws redshift revoke-cluster-security-group-ingress --cluster-security-group-name
 mysecuritygroup --cidrip 192.168.100.100/32
```

- For API details, see RevokeClusterSecurityGroupIngress in *AWS CLI Command Reference*.

### `revoke-snapshot-access`

The following code example shows how to use `revoke-snapshot-access`.

**AWS CLI**

Revoke the Authorization of an AWS Account to Restore a SnapshotThis example revokes the authorization of the AWS account `444455556666` to restore the snapshot `my-snapshot-id`. By default, the output is in JSON format.Command:

```
aws redshift revoke-snapshot-access --snapshot-id my-snapshot-id --account-with-
restore-access 444455556666
```

Result:

```
{
   "Snapshot": {
      "Status": "available",
      "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
      "EstimatedSecondsToCompletion": 0,
      "AvailabilityZone": "us-east-1a",
      "ClusterVersion": "1.0",
      "MasterUsername": "adminuser",
      "Encrypted": false,
      "OwnerAccount": "111122223333",
      "BackupProgressInMegabytes": 11.0,
      "ElapsedTimeInSeconds": 0,
      "DBName": "dev",
      "CurrentBackupRateInMegabytesPerSecond: 0.1534,
      "ClusterCreateTime": "2013-01-22T21:59:29.559Z",

## `rotate-encryption-key`

The following code example shows how to use `rotate-encryption-key`.

### AWS CLI

#### To rotate encryption key for a cluster

The following `rotate-encryption-key` example rotates the encryption key for the specified cluster.

```
aws redshift rotate-encryption-key \
    --cluster-identifier mycluster
```

Output:

```
{
    "Cluster": {
        "ClusterIdentifier": "mycluster",
        "NodeType": "dc2.large",
        "ClusterStatus": "rotating-keys",

For more information, see Amazon Redshift Database Encryption in the *Amazon Redshift Cluster Management Guide*.

- For API details, see RotateEncryptionKey in *AWS CLI Command Reference*.

## Amazon Rekognition examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Rekognition.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `compare-faces`

The following code example shows how to use `compare-faces`.

For more information, see Comparing faces in images.

### AWS CLI

#### To compare faces in two images

The following `compare-faces` command compares faces in two images stored in an Amazon S3 bucket.

```
aws rekognition compare-faces \
    --source-image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"source.jpg"}}' \
    --target-image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"target.jpg"}}'
```

Output:

```
{
    "UnmatchedFaces": [],
    "FaceMatches": [
        {
            "Face": {
                "BoundingBox": {
                    "Width": 0.12368916720151901,

        },
        "Confidence": 100.0
    }
}
```

For more information, see Comparing Faces in Images in the *Amazon Rekognition Developer Guide*.

- For API details, see CompareFaces in *AWS CLI Command Reference*.

### `create-collection`

The following code example shows how to use `create-collection`.

For more information, see Creating a collection.

**AWS CLI**

**To create a collection**

The following `create-collection` command creates a collection with the specified name.

```
aws rekognition create-collection \
    --collection-id "MyCollection"
```

Output:

```
{
    "CollectionArn": "aws:rekognition:us-west-2:123456789012:collection/
MyCollection",
    "FaceModelVersion": "4.0",
    "StatusCode": 200
}
```

For more information, see Creating a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see CreateCollection in *AWS CLI Command Reference*.

### `create-stream-processor`

The following code example shows how to use `create-stream-processor`.

**AWS CLI**

**To create a new stream processor**

The following `create-stream-processor` example creates a new stream processor with the specified configuration.

```
aws rekognition create-stream-processor --name my-stream-processor\
    --input '{"KinesisVideoStream":{"Arn":"arn:aws:kinesisvideo:us-
west-2:123456789012:stream/macwebcam/1530559711205"}}'\
```

```
    --stream-processor-output '{"KinesisDataStream":{"Arn":"arn:aws:kinesis:us-
west-2:123456789012:stream/AmazonRekognitionRekStream"}}'\
    --role-arn arn:aws:iam::123456789012:role/AmazonRekognitionDetect\
    --settings '{"FaceSearch":
{"CollectionId":"MyCollection","FaceMatchThreshold":85.5}}'
```

Output:

```
{
    "StreamProcessorArn": "arn:aws:rekognition:us-
west-2:123456789012:streamprocessor/my-stream-processor"
}
```

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see CreateStreamProcessor in *AWS CLI Command Reference*.

### `delete-collection`

The following code example shows how to use `delete-collection`.

For more information, see Deleting a collection.

**AWS CLI**

**To delete a collection**

The following `delete-collection` command deletes the specified collection.

```
aws rekognition delete-collection \
    --collection-id MyCollection
```

Output:

```
{
    "StatusCode": 200
}
```

For more information, see Deleting a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see DeleteCollection in *AWS CLI Command Reference*.

### `delete-faces`

The following code example shows how to use `delete-faces`.

For more information, see Deleting faces from a collection.

**AWS CLI**

**To delete faces from a collection**

The following `delete-faces` command deletes the specified face from a collection.

```
aws rekognition delete-faces \
    --collection-id MyCollection
    --face-ids '["0040279c-0178-436e-b70a-e61b074e96b0"]'
```

Output:

```
{
    "DeletedFaces": [
        "0040279c-0178-436e-b70a-e61b074e96b0"
    ]
}
```

For more information, see Deleting Faces from a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see DeleteFaces in *AWS CLI Command Reference*.

### `delete-stream-processor`

The following code example shows how to use `delete-stream-processor`.

**AWS CLI**

**To delete a stream processor**

The following `delete-stream-processor` command deletes the specified stream processor.

```
aws rekognition delete-stream-processor \
```

```
    --name my-stream-processor
```

This command produces no output.

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see DeleteStreamProcessor in *AWS CLI Command Reference*.

### `describe-collection`

The following code example shows how to use `describe-collection`.

For more information, see Describing a collection.

**AWS CLI**

**To describe a collection**

The following `describe-collection` example displays the details about the specified collection.

```
aws rekognition describe-collection \
    --collection-id MyCollection
```

Output:

```
{
    "FaceCount": 200,
    "CreationTimestamp": 1569444828.274,
    "CollectionARN": "arn:aws:rekognition:us-west-2:123456789012:collection/
MyCollection",
    "FaceModelVersion": "4.0"
}
```

For more information, see Describing a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see DescribeCollection in *AWS CLI Command Reference*.

### `describe-stream-processor`

The following code example shows how to use `describe-stream-processor`.

## AWS CLI

### To get information about a stream processor

The following `describe-stream-processor` command displays details about the specified stream processor.

```
aws rekognition describe-stream-processor \
    --name my-stream-processor
```

Output:

```
{
    "Status": "STOPPED",
    "Name": "my-stream-processor",
    "LastUpdateTimestamp": 1532449292.712,
    "Settings": {
        "FaceSearch": {
            "FaceMatchThreshold": 80.0,
            "CollectionId": "my-collection"
        }
    },
    "RoleArn": "arn:aws:iam::123456789012:role/AmazonRekognitionDetectStream",
    "StreamProcessorArn": "arn:aws:rekognition:us-
west-2:123456789012:streamprocessor/my-stream-processpr",
    "Output": {
        "KinesisDataStream": {
            "Arn": "arn:aws:kinesis:us-west-2:123456789012:stream/
AmazonRekognitionRekStream"
        }
    },
    "Input": {
        "KinesisVideoStream": {
            "Arn": "arn:aws:kinesisvideo:us-west-2:123456789012:stream/
macwebcam/123456789012"
        }
    },
    "CreationTimestamp": 1532449292.712
}
```

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see DescribeStreamProcessor in *AWS CLI Command Reference*.

### `detect-faces`

The following code example shows how to use `detect-faces`.

For more information, see Detecting faces in an image.

#### AWS CLI

##### To detect faces in an image

The following `detect-faces` command detects faces in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-faces \
    --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"MyFriend.jpg"}}' \
    --attributes "ALL"
```

Output:

```
{
    "FaceDetails": [
        {
            "Confidence": 100.0,
            "Eyeglasses": {

For more information, see Detecting Faces in an Image in the *Amazon Rekognition Developer Guide*.

- For API details, see DetectFaces in *AWS CLI Command Reference*.

### `detect-labels`

The following code example shows how to use `detect-labels`.

For more information, see Detecting labels in an image.

#### AWS CLI

**To detect a label in an image**

The following `detect-labels` example detects scenes and objects in an image stored in an Amazon S3 bucket.

```
aws rekognition detect-labels \
    --image '{"S3Object":{"Bucket":"bucket","Name":"image"}}'
```

Output:

```
{
    "Labels": [
        {
            "Instances": [],
            "Confidence": 99.15271759033203,

For more information, see Detecting Labels in an Image in the *Amazon Rekognition Developer Guide*.

- For API details, see DetectLabels in *AWS CLI Command Reference*.

### `detect-moderation-labels`

The following code example shows how to use `detect-moderation-labels`.

For more information, see Detecting inappropriate images.

#### AWS CLI

**To detect unsafe content in an image**

The following `detect-moderation-labels` command detects unsafe content in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-moderation-labels \
    --image "S3Object={Bucket=MyImageS3Bucket,Name=gun.jpg}"
```

Output:

```
{
    "ModerationModelVersion": "3.0",
    "ModerationLabels": [
        {
            "Confidence": 97.29618072509766,
            "ParentName": "Violence",
            "Name": "Weapon Violence"
        },
        {
            "Confidence": 97.29618072509766,
            "ParentName": "",
```

```
            "Name": "Violence"
        }
    ]
}
```

For more information, see Detecting Unsafe Images in the *Amazon Rekognition Developer Guide*.

- For API details, see DetectModerationLabels in *AWS CLI Command Reference*.

### `detect-text`

The following code example shows how to use `detect-text`.

For more information, see Detecting text in an image.

#### AWS CLI

**To detect text in an image**

The following `detect-text` command detects text in the specified image.

```
aws rekognition detect-text \
    --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePicture.jpg"}}'
```

Output:

```
{
    "TextDetections": [
        {

            "Type": "WORD",
            "Id": 4
        }
    ]
}
```

- For API details, see DetectText in *AWS CLI Command Reference*.

### `disassociate-faces`

The following code example shows how to use `disassociate-faces`.

**AWS CLI**

```
aws rekognition disassociate-faces --face-ids list-of-face-ids
  --user-id user-id --collection-id collection-name --region region-name
```

- For API details, see DisassociateFaces in *AWS CLI Command Reference*.

### `get-celebrity-info`

The following code example shows how to use `get-celebrity-info`.

**AWS CLI**

**To get information about a celebrity**

The following `get-celebrity-info` command displays information about the specified celebrity. The `id` parameter comes from a previous call to `recognize-celebrities`.

```
aws rekognition get-celebrity-info --id nnnnnnn
```

Output:

```
{
    "Name": "Celeb A",
    "Urls": [
        "www.imdb.com/name/aaaaaaaaa"
    ]
}
```

For more information, see Getting Information About a Celebrity in the *Amazon Rekognition Developer Guide*.

- For API details, see GetCelebrityInfo in *AWS CLI Command Reference*.

### `get-celebrity-recognition`

The following code example shows how to use `get-celebrity-recognition`.

#### AWS CLI

**To get the results of a celebrity recognition operation**

The following `get-celebrity-recognition` command diplays the results of a celebrity recognition operation that you started previously by calling `start-celebrity-recognition`.

```
aws rekognition get-celebrity-recognition  \
    --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```
{
    "NextToken": "3D01ClxlCiT31VsRDkAO3IybLb/h5AtDWSGuhYi
+N1FIJwwPtAkuKzDhL2rV3GcwmNt77+12",

### `get-content-moderation`

The following code example shows how to use `get-content-moderation`.

## AWS CLI

### To get the results of an unsafe content operation

The following `get-content-moderation` command displays the results of an unsafe content operation that you started previously by calling `start-content-moderation`.

```
aws rekognition get-content-moderation \
    --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```
{
    "NextToken": "dlhcKMHMzpCBGFukz6IO3JMcWiJAamCVhXHt3r6b4b5Tfbyw3q7o+Jeezt
+ZpgfOnW9FCCgQ",
    "ModerationLabels": [
        {
            "Timestamp": 0,
            "ModerationLabel": {
                "Confidence": 97.39583587646484,
                "ParentName": "",
                "Name": "Violence"
            }
        },
        {
            "Timestamp": 0,
            "ModerationLabel": {
                "Confidence": 97.39583587646484,
                "ParentName": "Violence",
                "Name": "Weapon Violence"
            }
        }
    ],
    "JobStatus": "SUCCEEDED",
    "VideoMetadata": {
        "Format": "QuickTime / MOV",
        "FrameRate": 29.97515869140625,
        "Codec": "h264",
        "DurationMillis": 6039,
        "FrameHeight": 1920,
        "FrameWidth": 1080
    }
}
```

## `get-label-detection`

The following code example shows how to use `get-label-detection`.

### AWS CLI

#### To get the results of an objects and scenes detection operation

The following `get-label-detection` command displays the results of an objects and scenes detection operation that you started previously by calling `start-label-detection`.

```
aws rekognition get-label-detection  \
    --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```
{
    "Labels": [
        {
            "Timestamp": 0,
            "Label": {
                "Instances": [],
                "Confidence": 50.19071578979492,
                "Parents": [
                    {
                        "Name": "Person"
                    },
                    {
                        "Name": "Crowd"
                    }
                ],
                "Name": "Audience"
            }
        },
        {
            "Timestamp": 0,
            "Label": {
                "Instances": [],
                "Confidence": 55.74115753173828,
                "Parents": [
                    {
                        "Name": "Room"
                    },
                    {
                        "Name": "Indoors"
                    },
                    {
                        "Name": "School"
                    }
                ],
                "Name": "Classroom"
            }
        }
    ],
```

### `get-person-tracking`

The following code example shows how to use `get-person-tracking`.

**AWS CLI**

**To get the results of a people pathing operation**

The following `get-person-tracking` command displays the results of a people pathing operation that you started previously by calling `start-person-tracking`.

```
aws rekognition get-person-tracking  \
    --job-id 1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```
{
    "Persons": [
        {
            "Timestamp": 500,
            "Person": {
                "BoundingBox": {
```

```
                    "Width": 0.4151041805744171,

        "Codec": "h264",
        "DurationMillis": 6806,
        "FrameHeight": 1080,
        "FrameWidth": 1920
    }
}
```

For more information, see People Pathing in the *Amazon Rekognition Developer Guide*.

- For API details, see GetPersonTracking in *AWS CLI Command Reference*.

### `index-faces`

The following code example shows how to use `index-faces`.

For more information, see Adding faces to a collection.

**AWS CLI**

**To add faces to a collection**

The following `index-faces` command adds the faces found in an image to the specified collection.

```
aws rekognition index-faces \
    --image '{"S3Object":{"Bucket":"MyVideoS3Bucket","Name":"MyPicture.jpg"}}' \
    --collection-id MyCollection \
    --max-faces 1 \
    --quality-filter "AUTO" \
    --detection-attributes "ALL" \
    --external-image-id "MyPicture.jpg"
```

Output:

```
{
    "FaceRecords": [
        {
            "FaceDetail": {
                "Confidence": 99.993408203125,

For more information, see Adding Faces to a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see IndexFaces in *AWS CLI Command Reference*.

### `list-collections`

The following code example shows how to use `list-collections`.

For more information, see Listing collections.

#### AWS CLI

**To list the available collections**

The following `list-collections` command lists the available collections in the AWS account.

```
aws rekognition list-collections
```

Output:

```
{
    "FaceModelVersions": [
        "2.0",
        "3.0",
        "3.0",
        "3.0",
        "4.0",
```

```
        "1.0",
        "3.0",
        "4.0",
        "4.0",
        "4.0"
    ],
    "CollectionIds": [
        "MyCollection1",
        "MyCollection2",
        "MyCollection3",
        "MyCollection4",
        "MyCollection5",
        "MyCollection6",
        "MyCollection7",
        "MyCollection8",
        "MyCollection9",
        "MyCollection10"
    ]
}
```

For more information, see Listing Collections in the *Amazon Rekognition Developer Guide*.

- For API details, see ListCollections in *AWS CLI Command Reference*.

### `list-faces`

The following code example shows how to use `list-faces`.

For more information, see Listing faces in a collection.

#### AWS CLI

**To list the faces in a collection**

The following `list-faces` command lists the faces in the specified collection.

```
aws rekognition list-faces \
    --collection-id MyCollection
```

Output:

```
{
    "FaceModelVersion": "3.0",
```

```

}
```

For more information, see Listing Faces in a Collection in the *Amazon Rekognition Developer Guide*.

- For API details, see ListFaces in *AWS CLI Command Reference*.

### `list-stream-processors`

The following code example shows how to use `list-stream-processors`.

**AWS CLI**

**To list the stream processors in your account**

The following `list-stream-processors` command lists the stream processors in your account and the state of each.

```
aws rekognition list-stream-processors
```

Output:

```
{
    "StreamProcessors": [
        {
            "Status": "STOPPED",
            "Name": "my-stream-processor"
        }
    ]
}
```

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see ListStreamProcessors in *AWS CLI Command Reference*.

### `recognize-celebrities`

The following code example shows how to use `recognize-celebrities`.

For more information, see Recognizing celebrities in an image.

**AWS CLI**

**To recognize celebrities in an image**

The following `recognize-celebrities` command recognizes celebrities in the specified image stored in an Amazon S3 bucket.:

```
aws rekognition recognize-celebrities \
    --image "S3Object={Bucket=MyImageS3Bucket,Name=moviestars.jpg}"
```

Output:

```

- For API details, see RecognizeCelebrities in *AWS CLI Command Reference*.

### `search-faces-by-image`

The following code example shows how to use `search-faces-by-image`.

For more information, see Searching for a face (image).

#### AWS CLI

**To search for faces in a collection that match the largest face in an image.**

The following `search-faces-by-image` command searches for faces in a collection that match the largest face in the specified image.:

```
aws rekognition search-faces-by-image \
    --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePerson.jpg"}}' \
    --collection-id MyFaceImageCollection

### `search-faces`

The following code example shows how to use `search-faces`.

For more information, see Searching for a face (face ID).

**AWS CLI**

**To search for faces in a collection that match a face ID.**

The following `search-faces` command searches for faces in a collection that match the specified face ID.

```
aws rekognition search-faces \
    --face-id 8d3cfc70-4ba8-4b36-9644-90fba29c2dac \
    --collection-id MyCollection
```

Output:

```
{
    "SearchedFaceId": "8d3cfc70-4ba8-4b36-9644-90fba29c2dac",
    "FaceModelVersion": "3.0",

        }
    ]
}
```

For more information, see Searching for a Face Using Its Face ID in the *Amazon Rekognition Developer Guide*.

- For API details, see SearchFaces in *AWS CLI Command Reference*.

### `start-celebrity-recognition`

The following code example shows how to use `start-celebrity-recognition`.

**AWS CLI**

**To start the recognition of celebrities in a stored video**

The following `start-celebrity-recognition` command starts a job to look for celebrities in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-celebrity-recognition \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Recognizing Celebrities in a Stored Video in the *Amazon Rekognition Developer Guide*.

- For API details, see StartCelebrityRecognition in *AWS CLI Command Reference*.

### `start-content-moderation`

The following code example shows how to use `start-content-moderation`.

#### AWS CLI

**To start the recognition of unsafe content in a stored video**

The following `start-content-moderation` command starts a job to detect unsafe content in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-content-moderation \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Unsafe Stored Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see StartContentModeration in *AWS CLI Command Reference*.

### `start-face-detection`

The following code example shows how to use `start-face-detection`.

#### AWS CLI

**To detect faces in a video**

The following `start-face-detection` command starts a job to detect faces in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-face-detection
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Faces in a Stored Video in the *Amazon Rekognition Developer Guide*.

- For API details, see StartFaceDetection in *AWS CLI Command Reference*.

### `start-face-search`

The following code example shows how to use `start-face-search`.

#### AWS CLI

**To search for faces in a collection that match faces detected in a video**

The following `start-face-search` command starts a job to search for faces in a collection that match faces detected in the specified video file in an Amazon S3 bucket.

```
aws rekognition start-face-search \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}" \
    --collection-id collection
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Searching Stored Videos for Faces in the *Amazon Rekognition Developer Guide*.

- For API details, see StartFaceSearch in *AWS CLI Command Reference*.

### `start-label-detection`

The following code example shows how to use `start-label-detection`.

**AWS CLI**

**To detect objects and scenes in a video**

The following `start-label-detection` command starts a job to detect objects and scenes in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-label-detection \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see Detecting Labels in a Video in the *Amazon Rekognition Developer Guide*.

- For API details, see StartLabelDetection in *AWS CLI Command Reference*.

### `start-person-tracking`

The following code example shows how to use `start-person-tracking`.

**AWS CLI**

**To start the pathing of people in a stored video**

The following `start-person-tracking` command starts a job to track the paths that people take in the specified video fiel stored in an Amazon S3 bucket.:

```
aws rekognition start-person-tracking \
    --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
    "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see People Pathing in the *Amazon Rekognition Developer Guide*.

- For API details, see StartPersonTracking in *AWS CLI Command Reference*.

### `start-stream-processor`

The following code example shows how to use `start-stream-processor`.

**AWS CLI**

**To start a stream processor**

The following `start-stream-processor` command starts the specified video stream processor.

```
aws rekognition start-stream-processor \
    --name my-stream-processor
```

This command produces no output.

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see StartStreamProcessor in *AWS CLI Command Reference*.

### `stop-stream-processor`

The following code example shows how to use `stop-stream-processor`.

**AWS CLI**

**To stop a running stream processor**

The following `stop-stream-processor` command stops the specified running stream processor.

```
aws rekognition stop-stream-processor \
    --name my-stream-processor
```

This command produces no output.

For more information, see Working with Streaming Videos in the *Amazon Rekognition Developer Guide*.

- For API details, see StopStreamProcessor in *AWS CLI Command Reference*.

## AWS RAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS RAM.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `accept-resource-share-invitation`

The following code example shows how to use `accept-resource-share-invitation`.

#### AWS CLI

##### To accept a resource share invitation

The following `accept-resource-share-invitation` example accepts the specified resource share invitation. Principals in the invited account can immediately start using the resources in the share.

```
aws ram accept-resource-share-invitation \
    --resource-share-invitation-arn arn:aws:ram:us-west-2:111111111111:resource-
share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE
```

Output:

```
{
    "resourceShareInvitation": {
        "resourceShareInvitationArn": "arn:aws:ram:us-west-2:111111111111:resource-
share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE",
        "resourceShareName": "MyLicenseShare",
        "resourceShareArn": "arn:aws:ram:us-west-2:111111111111:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE",
        "senderAccountId": "111111111111",
        "receiverAccountId": "222222222222",
        "invitationTimestamp": "2021-09-22T15:07:35.620000-07:00",
        "status": "ACCEPTED"
    }
}
```

- For API details, see AcceptResourceShareInvitation in *AWS CLI Command Reference*.

### `associate-resource-share-permission`

The following code example shows how to use `associate-resource-share-permission`.

**AWS CLI**

**To associate a RAM managed permission with a resource share**

The following `associate-resource-share-permission` example replaces the existing managed permission for the relevant resource type with the specified managed permission. Access to all resources of the relevant resource type is governed by the new permission.

```
aws ram associate-resource-share-permission \
    --permission-arn arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite \
    --replace \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE
```

Output:

```
{
    "returnValue": true
}
```

- For API details, see AssociateResourceSharePermission in *AWS CLI Command Reference*.

### `associate-resource-share`

The following code example shows how to use `associate-resource-share`.

**AWS CLI**

**Example 1: To associate a resource with a resource share**

The following `associate-resource-share` example adds a license configuration to the specified resource share.

```
aws ram associate-resource-share \
    --resource-share arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \
    --resource-arns arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE
```

Output:

```
{
    "resourceShareAssociations": [
        {
           "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE",
           "associatedEntity": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
           "associationType": "RESOURCE",
           "status": "ASSOCIATING",
           "external": false
        }
    ]
}
```

**Example 2: To associate a principal with a resource share**

The following `associate-resource-share` example grants access for the specified resource share to all accounts in the specified organizational unit.

```
aws ram associate-resource-share \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \
    --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-
rEXAMPLE
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "status": "ASSOCIATING",
            "associationType": "PRINCIPAL",
            "associatedEntity": "arn:aws:organizations::123456789012:ou/
o-63bEXAMPLE/ou-46xi-rEXAMPLE",
            "external": false,
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE"
        }
    ]
}
```

- For API details, see AssociateResourceShare in *AWS CLI Command Reference*.

## `create-resource-share`

The following code example shows how to use `create-resource-share`.

### AWS CLI

**Example 1: To create a resource share**

The following `create-resource-share` example creates an empty resource share with the specified name. You must separately add resources, principals, and permissions to the share.

```
aws ram create-resource-share \
```

```
    --name MyNewResourceShare
```

Output:

```
{
    "resourceShare": {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/4476c27d-8feb-4b21-afe9-7de23EXAMPLE",
        "name": "MyNewResourceShare",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": true,
        "status": "ACTIVE",
        "creationTime": 1634586271.302,
        "lastUpdatedTime": 1634586271.302
    }
}
```

**Example 2: To create a resource share with AWS accounts as principals**

The following `create-resource-share` example creates a resource share and grants access to the specified AWS account (222222222222). If the specified principals are not part of the same AWS Organization, then invitations are sent and must be accepted before access is granted.

```
aws ram create-resource-share \
    --name MyNewResourceShare \
    --principals 222222222222
```

**Example 3: To create a resource share restricted to your AWS Organization**

The following `create-resource-share` example creates a resource share that is restricted to accounts in the AWS Organization that your account is a member of, and adds the specified OU as a principal. All accounts in that OU can use the resources in the resource share.

```
aws ram create-resource-share \
    --name MyNewResourceShare \
    --no-allow-external-principals \
    --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-
rEXAMPLE
```

Output:

```
{
    "resourceShare": {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
        "name": "MyNewResourceShare",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": false,
        "status": "ACTIVE",
        "creationTime": 1634587042.49,
        "lastUpdatedTime": 1634587042.49
    }
}
```

- For API details, see CreateResourceShare in *AWS CLI Command Reference*.

### `delete-resource-share`

The following code example shows how to use `delete-resource-share`.

#### AWS CLI

**To delete a resource share**

The following `delete-resource-share` example deletes the specified resource share.

```
aws ram delete-resource-share \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

The following output indicates success:

```
{
    "returnValue": true
}
```

- For API details, see DeleteResourceShare in *AWS CLI Command Reference*.

### `disassociate-resource-share-permission`

The following code example shows how to use `disassociate-resource-share-permission`.

**AWS CLI**

**To remove a RAM managed permission for a resource type from a resource share**

The following `disassociate-resource-share-permission` example removes the RAM managed permission for Glue databases from the specified resource share.

```
aws ram disassociate-resource-share-permission \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \
    --permission-arn arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite
```

Output:

```
{
    "returnValue": true
}
```

- For API details, see DisassociateResourceSharePermission in *AWS CLI Command Reference*.

### `disassociate-resource-share`

The following code example shows how to use `disassociate-resource-share`.

**AWS CLI**

**To remove a resource from a resource share**

The following `disassociate-resource-share` example removes the specified resource, in this case a VPC subnet, from the specified resource share. Any principals with access to the resource share can no longer perform operations on that resource.

```
aws ram disassociate-resource-share \
    --resource-arns arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{
```

```
    "resourceShareAssociations": [
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
        "associatedEntity": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE",
        "associationType": "RESOURCE",
        "status": "DISASSOCIATING",
        "external": false
    ]
}
```

- For API details, see DisassociateResourceShare in *AWS CLI Command Reference*.

### `enable-sharing-with-aws-organization`

The following code example shows how to use `enable-sharing-with-aws-organization`.

**AWS CLI**

**To enable resource sharing across AWS Organizations**

The following `enable-sharing-with-aws-organization` example enables resource sharing across your organization and organizational units.

```
aws ram enable-sharing-with-aws-organization
```

The following output indicates success.

```
{
    "returnValue": true
}
```

- For API details, see EnableSharingWithAwsOrganization in *AWS CLI Command Reference*.

### `get-permission`

The following code example shows how to use `get-permission`.

**AWS CLI**

**To retrieve the details for a RAM managed permission**

The following `get-permission` example displays the details for the default version of the specified RAM managed permission.

```
aws ram get-permission \
    --permission-arn arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase
```

Output:

```
{
    "permission": {
        "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase",
        "version": "2",
        "defaultVersion": true,
        "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
        "resourceType": "glue:Database",
        "permission": "{\"Effect\":\"Allow\",\"Action\":[\"glue:GetTable
\", \"glue:UpdateTable\", \"glue:DeleteTable\", \"glue:BatchDeleteTable\",
 \"glue:BatchDeleteTableVersion\", \"glue:GetTableVersion\", \"glue:GetTableVersions
\", \"glue:GetPartition\", \"glue:GetPartitions\", \"glue:BatchGetPartition\",
 \"glue:BatchCreatePartition\", \"glue:CreatePartition\", \"glue:UpdatePartition
\", \"glue:BatchDeletePartition\", \"glue:DeletePartition\", \"glue:GetTables\",
 \"glue:SearchTables\"]}",
        "creationTime": 1624912434.431,
        "lastUpdatedTime": 1624912434.431,
        "isResourceTypeDefault": false
    }
}
```

- For API details, see GetPermission in *AWS CLI Command Reference*.

## `get-resource-policies`

The following code example shows how to use `get-resource-policies`.

### AWS CLI

#### To get the policies for a resource

The following `get-resource-policies` example displays the resource-based permission policies for the specified resource associated with a resource share.

```
aws ram get-resource-policies \
    --resource-arns arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE
```

Output:

```
{
    "policies": [
         "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"RamStatement1\",
\"Effect\":\"Allow\",\"Principal\":{\"AWS\":[]},\"Action\":[\"ec2:RunInstances
\",\"ec2:CreateNetworkInterface\",\"ec2:DescribeSubnets\"],\"Resource\":
\"arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0250c25a1fEXAMPLE\"}]}"
    ]
}
```

- For API details, see GetResourcePolicies in *AWS CLI Command Reference*.

### `get-resource-share-associations`

The following code example shows how to use `get-resource-share-associations`.

#### AWS CLI

**Example 1: To list all resource associations for all resource types**

The following `get-resource-share-associations` example lists the resource associations for all resource types across all of your resource shares.

```
aws ram get-resource-share-associations \
    --association-type RESOURCE
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
            "associatedEntity": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1fEXAMPLE",
```

```
            "resourceShareName": "MySubnetShare",
            "associationType": "RESOURCE",
            "status": "ASSOCIATED",
            "creationTime": 1565303590.973,
            "lastUpdatedTime": 1565303591.695,
            "external": false
        },
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/8167bdfe-4480-4a01-8632-315e0EXAMPLE",
            "associatedEntity": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
            "resourceShareName": "MyLicenseShare",
            "associationType": "RESOURCE",
            "status": "ASSOCIATED",
            "creationTime": 1632342958.457,
            "lastUpdatedTime": 1632342958.907,
            "external": false
        }
    ]
}
```

**Example 2: To list principal associations for a resource share**

The following `get-resource-share-associations` example lists only the principal associations for only the specified resource share.

```
aws ram get-resource-share-associations \
   --resource-share-arns arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE \
   --association-type PRINCIPAL
```

Output:

```
{
    "resourceShareAssociations": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
            "resourceShareName": "MyNewResourceShare",
            "associatedEntity": "arn:aws:organizations::123456789012:ou/
o-63bEXAMPLE/ou-46xi-rEXAMPLE",
```

```
            "associationType": "PRINCIPAL",
            "status": "ASSOCIATED",
            "creationTime": 1634587042.49,
            "lastUpdatedTime": 1634587044.291,
            "external": false
        }
    ]
}
```

- For API details, see GetResourceShareAssociations in *AWS CLI Command Reference*.

### `get-resource-share-invitations`

The following code example shows how to use `get-resource-share-invitations`.

**AWS CLI**

**To list your resource share invitations**

The following `get-resource-share-invitations` example lists your current resource share invitations.

```
aws ram get-resource-share-invitations
```

Output:

```
{
    "resourceShareInvitations": [
        {
            "resourceShareInvitationArn": "arn:aws:ram:us-
west2-1:111111111111:resource-share-invitation/32b639f0-14b8-7e8f-55ea-
e6117EXAMPLE",
            "resourceShareName": "project-resource-share",
            "resourceShareArn": "arn:aws:ram:us-west-2:111111111111:resource-share/
fcb639f0-1449-4744-35bc-a983fEXAMPLE",
            "senderAccountId": "111111111111",
            "receiverAccountId": "222222222222",
            "invitationTimestamp": 1565312166.258,
            "status": "PENDING"
        }
    ]
```

```
}
```

- For API details, see GetResourceShareInvitations in *AWS CLI Command Reference*.

### `get-resource-shares`

The following code example shows how to use `get-resource-shares`.

**AWS CLI**

**Example 1: To list resource shares you own and share with others**

The following `get-resource-shares` example lists the resource shares that created and are sharing with others.

```
aws ram get-resource-shares \
    --resource-owner SELF
```

Output:

```
{
    "resourceShares": [
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/3ab63985-99d9-1cd2-7d24-75e93EXAMPLE",
            "name": "my-resource-share",
            "owningAccountId": "123456789012",
            "allowExternalPrincipals": false,
            "status": "ACTIVE",
            "tags": [
                {
                    "key": "project",
                    "value": "lima"
                }
            ]
            "creationTime": 1565295733.282,
            "lastUpdatedTime": 1565295733.282
        },
        {
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
```

```
            "name": "my-resource-share",
            "owningAccountId": "123456789012",
            "allowExternalPrincipals": true,
            "status": "ACTIVE",
            "creationTime": 1565295733.282,
            "lastUpdatedTime": 1565295733.282
        }
    ]
}
```

**Example 2: To list resource shares owned by others and shared with you**

The following `get-resource-shares` example lists the resource shares that others created and shared with you. In this example, there are none.

```
aws ram get-resource-shares \
    --resource-owner OTHER-ACCOUNTS
```

Output:

```
{
    "resourceShares": []
}
```

- For API details, see GetResourceShares in *AWS CLI Command Reference*.

## `list-pending-invitation-resources`

The following code example shows how to use `list-pending-invitation-resources`.

**AWS CLI**

**To list the resources that are available in a pending resource share**

The following `list-pending-invitation-resources` example lists all of the resources that are in the resource share associated with the specified invitation.

```
aws ram list-pending-invitation-resources \
    --resource-share-invitation-arn arn:aws:ram:us-west-2:123456789012:resource-
share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE
```

Output:

```
{
   "resources": [
        {
            "arn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-04a555b0e6EXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
            "creationTime": 1634676051.269,
            "lastUpdatedTime": 1634676052.07,
            "status": "AVAILABLE",
            "type": "ec2:Subnet"
        },
        {
            "arn": "arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
            "creationTime": 1624912434.431,
            "lastUpdatedTime": 1624912434.431,
            "status": "AVAILABLE",
            "type": "license-manager:LicenseConfiguration"
      }
   ]
}
```

- For API details, see ListPendingInvitationResources in *AWS CLI Command Reference*.

## `list-permissions`

The following code example shows how to use `list-permissions`.

### AWS CLI

#### To list the available RAM managed permissions

The following `list-permissions` example lists all of the RAM managed permissions available for only the AWS Glue database resource type.

```
aws ram list-permissions \
    --resource-type glue:Database
```

Output:

```
{
    "permissions": [
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMDefaultPermissionGlueDatabase",
            "version": "1",
            "defaultVersion": true,
            "name": "AWSRAMDefaultPermissionGlueDatabase",
            "resourceType": "glue:Database",
            "creationTime": 1592007820.935,
            "lastUpdatedTime": 1592007820.935,
            "isResourceTypeDefault": true
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
            "resourceType": "glue:Database",
            "creationTime": 1624912413.323,
            "lastUpdatedTime": 1624912413.323,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueDatabaseReadWrite",
            "resourceType": "glue:Database",
            "creationTime": 1624912417.4,
            "lastUpdatedTime": 1624912417.4,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase",
            "version": "2",
            "defaultVersion": true,
            "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
            "resourceType": "glue:Database",
```

```
            "creationTime": 1624912434.431,
            "lastUpdatedTime": 1624912434.431,
            "isResourceTypeDefault": false
        }
    ]
}
```

The following `list-permissions` example displays the available RAM managed permissions for all resource types.

```
aws ram list-permissions
```

Output:

```
{
    "permissions": [
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMBlankEndEntityCertificateAPICSRPassthroughIssuanceCertificateAuthority",
            "version": "1",
            "defaultVersion": true,
            "name":
 "AWSRAMBlankEndEntityCertificateAPICSRPassthroughIssuanceCertificateAuthority",
            "resourceType": "acm-pca:CertificateAuthority",
            "creationTime": 1623264861.085,
            "lastUpdatedTime": 1623264861.085,
            "isResourceTypeDefault": false
        },
        {
            "arn": "arn:aws:ram::aws:permission/AWSRAMDefaultPermissionAppMesh",
            "version": "1",
            "defaultVersion": true,
            "name": "AWSRAMDefaultPermissionAppMesh",
            "resourceType": "appmesh:Mesh",
            "creationTime": 1589307188.584,
            "lastUpdatedTime": 1589307188.584,
            "isResourceTypeDefault": true
        },
        ...TRUNCATED FOR BREVITY...
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMSubordinateCACertificatePathLen0IssuanceCertificateAuthority",
            "version": "1",
```

```
            "defaultVersion": true,
            "name":
 "AWSRAMSubordinateCACertificatePathLen0IssuanceCertificateAuthority",
            "resourceType": "acm-pca:CertificateAuthority",
            "creationTime": 1623264876.75,
            "lastUpdatedTime": 1623264876.75,
            "isResourceTypeDefault": false
        }
    ]
}
```

- For API details, see ListPermissions in *AWS CLI Command Reference*.

### `list-principals`

The following code example shows how to use `list-principals`.

#### AWS CLI

**To list principals with access to a resource**

The following `list-principals` example displays a list of the principals that can access resources of the specified type through any resource shares.

```
aws ram list-principals \
    --resource-type ec2:Subnet
```

Output:

```
{
    "principals": [
        {
            "id": "arn:aws:organizations::123456789012:ou/o-gx7EXAMPLE/ou-29c5-
zEXAMPLE",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
            "creationTime": 1565298209.737,
            "lastUpdatedTime": 1565298211.019,
            "external": false
        }
    ]
}
```

- For API details, see ListPrincipals in *AWS CLI Command Reference*.

### `list-resource-share-permissions`

The following code example shows how to use `list-resource-share-permissions`.

**AWS CLI**

**To list all of the RAM managed permissions currently attached to a resource share**

The following `list-resource-share-permissions` example lists all of the RAM managed permissions that are attached to the specified resource share.

```
aws ram list-resource-share-permissions \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE
```

Output:

```
{
    "permissions": [
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMDefaultPermissionLicenseConfiguration",
            "version": "1",
            "resourceType": "license-manager:LicenseConfiguration",
            "status": "ASSOCIATED",
            "lastUpdatedTime": 1632342984.234
        },
        {
            "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite",
            "version": "2",
            "resourceType": "glue:Database",
            "status": "ASSOCIATED",
            "lastUpdatedTime": 1632512462.297
        }
    ]
}
```

- For API details, see ListResourceSharePermissions in *AWS CLI Command Reference*.

### `list-resource-types`

The following code example shows how to use `list-resource-types`.

#### AWS CLI

**To list the resource types that are supported by AWS RAM**

The following `list-resource-types` example lists all of the resource types currently supported by AWS RAM.

```
aws ram list-resource-types
```

Output:

```
{
    "resourceTypes": [
        {
            "resourceType": "route53resolver:FirewallRuleGroup",
            "serviceName": "route53resolver"
        },
        {
            "resourceType": "ec2:LocalGatewayRouteTable",
            "serviceName": "ec2"
        },
        ...OUTPUT TRUNCATED FOR BREVITY...
        {
            "resourceType": "ec2:Subnet",
            "serviceName": "ec2"
        },
        {
            "resourceType": "ec2:TransitGatewayMulticastDomain",
            "serviceName": "ec2"
        }
    ]
}
```

- For API details, see ListResourceTypes in *AWS CLI Command Reference*.

### `list-resources`

The following code example shows how to use `list-resources`.

**AWS CLI**

**To list the resources associated with a resource share**

The following `list-resources` example lists all resources in the specified resource share that are of the specified resource type.

```
aws ram list-resources \
    --resource-type ec2:Subnet \
    --resource-owner SELF \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{
    "resources": [
        {
            "arn": "aarn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1f4e15235",
            "type": "ec2:Subnet",
            "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
            "creationTime": 1565301545.023,
            "lastUpdatedTime": 1565301545.947
        }
    ]
}
```

- For API details, see ListResources in *AWS CLI Command Reference*.

### `promote-resource-share-created-from-policy`

The following code example shows how to use `promote-resource-share-created-from-policy`.

**AWS CLI**

**To promote a resource-policy based resource share to full functionality in AWS RAM**

The following `promote-resource-share-created-from-policy` example takes a resource share that you created implicitly by attaching a resource-based policy, and converts it to be fully functional with the AWS RAM console and its CLI and API operations.

```
aws ram promote-resource-share-created-from-policy \
    --resource-share-arn arn:aws:ram:us-east-1:123456789012:resource-
share/91fa8429-2d06-4032-909a-90909EXAMPLE
```

Output:

```
{
    "returnValue": true
}
```

- For API details, see PromoteResourceShareCreatedFromPolicy in *AWS CLI Command Reference*.

### `reject-resource-share-invitation`

The following code example shows how to use `reject-resource-share-invitation`.

**AWS CLI**

**To reject a resource share invitation**

The following `reject-resource-share-invitation` example rejects the specified resource share invitation.

```
aws ram reject-resource-share-invitation \
    --resource-share-invitation-arn arn:aws:ram:us-west-2:111111111111:resource-
share-invitation/32b639f0-14b8-7e8f-55ea-e6117EXAMPLE
```

Output:

```
"resourceShareInvitations": [
    {
        "resourceShareInvitationArn": "arn:aws:ram:us-west2-1:111111111111:resource-
share-invitation/32b639f0-14b8-7e8f-55ea-e6117EXAMPLE",
        "resourceShareName": "project-resource-share",
```

```
        "resourceShareArn": "arn:aws:ram:us-west-2:111111111111:resource-share/
fcb639f0-1449-4744-35bc-a983fEXAMPLE",
        "senderAccountId": "111111111111",
        "receiverAccountId": "222222222222",
        "invitationTimestamp": 1565319592.463,
        "status": "REJECTED"
    }
]
```

- For API details, see RejectResourceShareInvitation in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add tags to a resource share**

The following `tag-resource` example adds a tag key `project` and associated value `lima` to the specified resource share.

```
aws ram tag-resource \
    --tags key=project,value=lima \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a resource share**

The following `untag-resource` example removes the `project` tag key and associated value from the specified resource share.

```
aws ram untag-resource \
    --tag-keys project \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-resource-share`

The following code example shows how to use `update-resource-share`.

#### AWS CLI

**To update a resource share**

The following `update-resource-share` example changes the specified resource share to allow external principals that are not in an AWS Organization.

```
aws ram update-resource-share \
    --allow-external-principals \
    --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{
    "resourceShare": {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
        "name": "my-resource-share",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": true,
        "status": "ACTIVE",
        "creationTime": 1565295733.282,
        "lastUpdatedTime": 1565303080.023
    }
}
```

- For API details, see UpdateResourceShare in *AWS CLI Command Reference*.

## Resource Explorer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Explorer.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

### Actions

#### `associate-default-view`

The following code example shows how to use `associate-default-view`.

#### AWS CLI

**To set a Resource Explorer view as the default for its AWS Region**

The following `associate-default-view` example sets a view, as specified by its ARN, to be the default view for the AWS Region in which you call the operation.

```
aws resource-explorer-2 associate-default-view \
    --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see Setting a default view in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see AssociateDefaultView in *AWS CLI Command Reference*.

### `batch-get-view`

The following code example shows how to use `batch-get-view`.

**AWS CLI**

**To retrieve details about multiple Resource Explorer views**

The following `batch-get-view` example displays the details about two views specified by their ARNs. Use spaces to separate the multiple ARNs in the --view-arn parameter.

```
aws resource-explorer-2 batch-get-view \
    --view-arns arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222, \
                arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
    "Views": [
        {
            "Filters": {
                "FilterString": "service:ec2"
            },
            "IncludedProperties": [
                {
                    "Name": "tags"
                }
            ],
            "LastUpdatedAt": "2022-07-13T21:33:45.249000+00:00",
            "Owner": "123456789012",
            "Scope": "arn:aws:iam::123456789012:root",
            "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-
EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
        },
        {
```

```
            "Filters": {
                "FilterString": ""
            },
            "IncludedProperties": [
                {
                    "Name": "tags"
                }
            ],
            "LastUpdatedAt": "2022-07-13T20:34:11.314000+00:00",
            "Owner": "123456789012",
            "Scope": "arn:aws:iam::123456789012:root",
            "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-
Main-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
        }
    ]
    "Errors": []
}
```

For more information about views, see About Resource Explorer views in the *AWS Resource Explorer Users Guide*.

- For API details, see BatchGetView in *AWS CLI Command Reference*.

### `create-index`

The following code example shows how to use `create-index`.

#### AWS CLI

**To turn on Resource Explorer in an AWS Region by creating an index**

The following `create-index` example creates a local index in the AWS Region in which the operation is called. The AWS CLI automatically generates a random `client-token` parameter value and includes it in the call to AWS if you don't specify a value.

```
aws resource-explorer-2 create-index \
    --region us-east-1
```

Output:

```
{
```

```
    "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE22222c",
    "CreatedAt": "2022-11-01T20:00:59.149Z",
    "State": "CREATING"
}
```

After you create a local index, you can convert it into the aggregator index for the account by running the update-index-type command.

For more information, see Turning on Resource Explorer in an AWS Region to index your resources in the *AWS Resource Explorer Users Guide*.

- For API details, see CreateIndex in *AWS CLI Command Reference*.

### `create-view`

The following code example shows how to use `create-view`.

#### AWS CLI

**Example 1: To create an unfiltered view for the index in an AWS Region**

The following `create-view` example creates a view in the specified AWS Region that returns all results in the Region without any filtering. The view includes the optional Tags field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```
aws resource-explorer-2 create-view \
    --view-name My-Main-View \
    --included-properties Name=tags \
    --region us-east-1
```

Output:

```
{
    "View": {
        "Filters": {
            "FilterString": ""
        },
        "IncludedProperties": [
            {
                "Name": "tags"
```

```
            }
        ],
        "LastUpdatedAt": "2022-07-13T20:34:11.314000+00:00",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
    }
}
```

**Example 2: To create a view that returns only resources associated with Amazon EC2**

The following `create-view` creates a view in AWS Region `us-east-1` that returns only those resources in the Region that are associated with the Amazon EC2 service. The view includes the optional `Tags` field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```
aws resource-explorer-2 create-view \
    --view-name My-EC2-Only-View \
    --included-properties Name=tags \
    --filters FilterString="service:ec2" \
    --region us-east-1
```

Output:

```
{
    "View": {
        "Filters": {
            "FilterString": "service:ec2"
        },
        "IncludedProperties": [
            {
                "Name":"tags"
            }
        ],
        "LastUpdatedAt": "2022-07-13T21:35:09.059Z",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-
Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
    }
```

```
}
```

For more information, see Creating views for search in the *AWS Resource Explorer Users Guide*.

- For API details, see CreateView in *AWS CLI Command Reference*.

### `delete-index`

The following code example shows how to use `delete-index`.

#### AWS CLI

**To turn off Resource Explorer in an AWS Region by deleting its index**

The following `delete-index` example deletes the specified Resource Explorer index in the AWS Region in which you make the request.

```
aws resource-explorer-2 delete-index \
    --arn arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE22222 \
    --region us-west-2
```

Output:

```
{
    "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE22222",
    "State": "DELETING"
}
```

For more information about deleting an index, see Turning off AWS Resource Explorer in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see DeleteIndex in *AWS CLI Command Reference*.

### `delete-view`

The following code example shows how to use `delete-view`.

#### AWS CLI

**To delete a Resource Explorer view**

The following `delete-view` example deletes a view specified by its ARN.

```
aws resource-explorer-2 delete-view \
    --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see Deleting views in the *AWS Resource Explorer Users Guide*.

- For API details, see DeleteView in *AWS CLI Command Reference*.

### `disassociate-default-view`

The following code example shows how to use `disassociate-default-view`.

**AWS CLI**

**To remove the default Resource Explorer view for an AWS Region**

The following `disassociate-default-view` removes the default Resource Explorer view for the AWS Region in which you call the operation. After performing this operation, all search operations in the Region must explicitly specify a view or the operation fails.

```
aws resource-explorer-2 disassociate-default-view
```

This command produces no output.

For more information, see Setting a default view in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see DisassociateDefaultView in *AWS CLI Command Reference*.

### `get-default-view`

The following code example shows how to use `get-default-view`.

### AWS CLI

#### To retrieve the Resource Explorer view that is the default view for its AWS Region

The following `get-default-view` example retrieves the ARN of the view that is the default for the AWS Region in which you call the operation.

```
aws resource-explorer-2 get-default-view
```

Output:

```
{
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/default-
view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see Setting a default view in an AWS Region in the *AWS Resource Explorer Users Guide*.

- For API details, see GetDefaultView in *AWS CLI Command Reference*.

## `get-index`

The following code example shows how to use `get-index`.

### AWS CLI

#### Example 1: To retrieve the details for a Resource Explorer aggregator index

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains the aggregator index for the account, the output lists the Regions that replicate data into this Region's index.

```
aws resource-explorer-2 get-index \
    --region us-east-1
```

Output:

```
{
    "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE11111",
    "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
```

```
    "LastUpdatedAt": "2022-07-13T18:41:58.799000+00:00",
    "ReplicatingFrom": [
        "ap-south-1",
        "us-west-2"
    ],
    "State": "ACTIVE",
    "Tags": {},
    "Type": "AGGREGATOR"
}
```

**Example 2: To retrieve the details for a Resource Explorer local index**

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains a local index, the output lists the Region to which it replicates data from this Region's index.

```
aws resource-explorer-2 get-index \
    --region us-west-2
```

Output:

```
{
    "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE22222",
    "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
    "LastUpdatedAt": "2022-07-13T18:41:58.799000+00:00",
    "ReplicatingTo": [
        "us-west-2"
    ],
    "State": "ACTIVE",
    "Tags": {},
    "Type": "LOCAL"
}
```

For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the *AWS Resource Explorer Users Guide*.

- For API details, see GetIndex in *AWS CLI Command Reference*.

### `get-view`

The following code example shows how to use `get-view`.

**AWS CLI**

**To retrieve details about a Resource Explorer view**

The following `get-view` example displays the details about a view specified by its ARN.

```
aws resource-explorer-2 get-view \
    --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
  "Tags" : {},
  "View" : {
        "Filters" : {
            "FilterString" : "service:ec2"
        },
        "IncludedProperties" : [
            {
                "Name" : "tags"
            }
        ],
        "LastUpdatedAt" : "2022-07-13T21:33:45.249Z",
        "Owner" : "123456789012",
        "Scope" : "arn:aws:iam::123456789012:root",
        "ViewArn" : "arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-
Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
  }
}
```

For more information about views, see About Resource Explorer views in the *AWS Resource Explorer Users Guide*.

- For API details, see GetView in *AWS CLI Command Reference*.

## `list-indexes`

The following code example shows how to use `list-indexes`.

**AWS CLI**

**To list the AWS Regions where Resource Explorer has indexes**

The following `list-indexes` example lists the indexes for all Regions where Resource Explorer has an index. The response specifies the type of each index, its AWS Region, and its ARN.

```
aws resource-explorer-2 list-indexes
```

Output:

```
{
    "Indexes": [
        {
            "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111",
            "Region": "us-west-2",
            "Type": "AGGREGATOR"
        },
        {
            "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222",
            "Region": "us-east-1",
            "Type": "LOCAL"
        },
        {
            "Arn": "arn:aws:resource-explorer-2:us-east-2:123456789012:index/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE33333",
            "Region": "us-east-2",
            "Type": "LOCAL"
        },
        {
            "Arn": "arn:aws:resource-explorer-2:us-west-1:123456789012:index/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE44444",
            "Region": "us-west-1",
            "Type": "LOCAL"
        }
    ]
}
```

For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the *AWS Resource Explorer Users Guide*.

- For API details, see ListIndexes in *AWS CLI Command Reference*.

### `list-supported-resource-types`

The following code example shows how to use `list-supported-resource-types`.

**AWS CLI**

**To list the AWS Regions where Resource Explorer has indexes**

The following `list-supported-resource-types` example lists all of the resource types currently supported by &AREXlong;. The example response includes a `NextToken` value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 list-supported-resource-types \
    --max-items 10
```

Output:

```
{
    "ResourceTypes": [
        {
            "ResourceType": "cloudfront:cache-policy",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:distribution",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:function",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:origin-access-identity",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:origin-request-policy",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudfront:realtime-log-config",
            "Service": "cloudfront"
        },
```

```
        {
            "ResourceType": "cloudfront:response-headers-policy",
            "Service": "cloudfront"
        },
        {
            "ResourceType": "cloudwatch:alarm",
            "Service": "cloudwatch"
        },
        {
            "ResourceType": "cloudwatch:dashboard",
            "Service": "cloudwatch"
        },
        {
            "ResourceType": "cloudwatch:insight-rule",
            "Service": "cloudwatch"
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxMH0="
}
```

To get the next part of the output, call the operation again, and pass the previous call's `NextToken` response value as the value for `--starting-token`. Repeat until `NextToken` is absent from the response.

```
aws resource-explorer-2 list-supported-resource-types \
    --max-items 10  \
    --starting-token
 eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxMH0=
```

Output:

```
{
    "ResourceTypes": [
        {
            "ResourceType": "cloudwatch:metric-stream",
            "Service": "cloudwatch"
        },
        {
            "ResourceType": "dynamodb:table",
            "Service": "dynamodb"
        },
        {
```

```
            "ResourceType": "ec2:capacity-reservation",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:capacity-reservation-fleet",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:client-vpn-endpoint",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:customer-gateway",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:dedicated-host",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:dhcp-options",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:egress-only-internet-gateway",
            "Service": "ec2"
        },
        {
            "ResourceType": "ec2:elastic-gpu",
            "Service": "ec2"
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyMH0="
}
```

For more information about indexes, see Checking which AWS Regions have Resource Explorer turned on in the *AWS Resource Explorer Users Guide*.

- For API details, see ListSupportedResourceTypes in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags attached to a Resource Explorer view or index**

The following `list-tags-for-resource` example lists the tag key and value pairs attached to view with the specified ARN. You must call the operation from the AWS Region that contains the resource.

```
aws resource-explorer-2 list-tags-for-resource \
    --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
    "Tags": {
        "application": "MainCorpApp",
        "department": "1234"
    }
}
```

For more information about tagging views, see Tagging views for access control in the *AWS Resource Explorer Users Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `list-views`

The following code example shows how to use `list-views`.

**AWS CLI**

**To list the Resource Explorer views available in an AWS Region**

The following `list-views` example lists all of the views available in the Region in which you invoke the operation.

```
aws resource-explorer-2 list-views
```

Output:

```
{
    "Views": [
        "arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111",
        "arn:aws:resource-explorer-2:us-east-1:123456789012:view/Default-All-
Resources-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222",
        "arn:aws:resource-explorer-2:us-east-1:123456789012:view/Production-Only-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE33333"
    ]
}
```

For more information about views, see About Resource Explorer views in the *AWS Resource Explorer Users Guide*.

- For API details, see ListViews in *AWS CLI Command Reference*.

### `search`

The following code example shows how to use `search`.

#### AWS CLI

**Example 1: To search using the default view**

The following `search` example displays all resources in the specified that are associated with the service. The search uses the default view for the Region. The example response includes a `NextToken` value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 search \
    --query-string "service:iam"
```

Output:

```
{
    "Count": {
        "Complete": true,
        "TotalResources": 55
    },
    "NextToken":
 "AG9VOEF1KLEXAMPLEOhJHVwo5chEXAMPLER5XiEpNrgsEXAMPLE...b0CmOFOryHEXAMPLE",
    "Resources": [{
```

```
        "Arn": "arn:aws:iam::123456789012:policy/service-role/Some-Policy-For-A-
Service-Role",
        "LastReportedAt": "2022-07-21T12:34:42Z",
        "OwningAccountId": "123456789012",
        "Properties": [],
        "Region": "global",
        "ResourceType": "iam:policy",
        "Service": "iam"
    }, {
        "Arn": "arn:aws:iam::123456789012:policy/service-role/Another-Policy-For-A-
Service-Role",
        "LastReportedAt": "2022-07-21T12:34:42Z",
        "OwningAccountId": "123456789012",
        "Properties": [],
        "Region": "global",
        "ResourceType": "iam:policy",
        "Service": "iam"
    }, {
       ... TRUNCATED FOR BREVITY ...
    }],
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/my-default-
view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

**Example 2: To search using a specified view**

The following `search` example search displays all resources ("*") in the specified AWS Region that are visible through the specified view. The results include only resources associated with Amazon EC2 because of the filters attached to the view.

```
aws resource-explorer-2 search \
    -- query-string "*" \
    -- view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-view/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222
```

Output:

```
HTTP/1.1 200 OK
Date: Tue, 01 Nov 2022 20:00:59 GMT
Content-Type: application/json
Content-Length: <PayloadSizeBytes>

    {
```

```
        "Count": {
            "Complete": true,
            "TotalResources": 67
        },
        "Resources": [{
            "Arn": "arn:aws:ec2:us-east-1:123456789012:network-acl/acl-1a2b3c4d",
            "LastReportedAt": "2022-07-21T18:52:02Z",
            "OwningAccountId": "123456789012",
            "Properties": [{
                "Data": [{
                    "Key": "Department",
                    "Value": "AppDevelopment"
                }, {
                    "Key": "Environment",
                    "Value": "Production"
                }],
                "LastReportedAt": "2021-11-15T14:48:29Z",
                "Name": "tags"
            }],
            "Region": "us-east-1",
            "ResourceType": "ec2:network-acl",
            "Service": "ec2"
        }, {
            "Arn": "arn:aws:ec2:us-east-1:123456789012:subnet/subnet-1a2b3c4d",
            "LastReportedAt": "2022-07-21T21:22:23Z",
            "OwningAccountId": "123456789012",
            "Properties": [{
                "Data": [{
                    "Key": "Department",
                    "Value": "AppDevelopment"
                }, {
                    "Key": "Environment",
                    "Value": "Production"
                }],
                "LastReportedAt": "2021-07-29T19:02:39Z",
                "Name": "tags"
            }],
            "Region": "us-east-1",
            "ResourceType": "ec2:subnet",
            "Service": "ec2"
        }, {
            "Arn": "arn:aws:ec2:us-east-1:123456789012:dhcp-options/dopt-1a2b3c4d",
            "LastReportedAt": "2022-07-21T06:08:53Z",
            "OwningAccountId": "123456789012",
```

```
            "Properties": [{
                "Data": [{
                    "Key": "Department",
                    "Value": "AppDevelopment"
                }, {
                    "Key": "Environment",
                    "Value": "Production"
                }],
                "LastReportedAt": "2021-11-15T15:11:05Z",
                "Name": "tags"
            }],
            "Region": "us-east-1",
            "ResourceType": "ec2:dhcpoptions",
            "Service": "ec2"
        }, {
            ... TRUNCATED FOR BREVITY ...
        }],
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-
view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
    }
```

For more information, see Using AWS Resource Explorer to search for resources in the *AWS Resource Explorer Users Guide*.

- For API details, see Search in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To tag a Resource Explorer view**

The following `tag-resource` example adds the tag key "environment" with the value "production" to the view with the specified ARN.

```
aws resource-explorer-2 tag-resource \
    --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View//
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111 \
    --tags environment=production
```

This command produces no output.

For more information, see Tagging views for access control in the *AWS Resource Explorer Users Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag from a Resource Explorer view**

The following `untag-resource` example removes any tag with the key name "environment" from the view with the specified ARN.

```
aws resource-explorer-2 untag-resource \
    --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View//
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111 \
    --tag-keys environment
```

This command produces no output.

For more information, see Tagging views for access control in the *AWS Resource Explorer Users Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-index-type`

The following code example shows how to use `update-index-type`.

**AWS CLI**

**To change the type of a Resource Explorer index**

The following `update-index-type` example converts the specified index from type `local` to type `aggregator` to turn on the ability to search for resources across all AWS Regions in the account. You must send the request to the AWS Region that contains the index you want to update.

```
aws resource-explorer-2 update-index-type \
```

```
    --arn arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE11111 \
    --type aggregator \
    --region us-east-1
```

Output:

```
{
    "Arn":"arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE11111",
    "LastUpdatedAt":"2022-07-13T18:41:58.799Z",
    "State":"updating",
    "Type":"aggregator"
}
```

For more information about changing an index's type, see Turning on cross-Region search by creating an aggregator index in the *AWS Resource Explorer Users Guide*.

- For API details, see UpdateIndexType in *AWS CLI Command Reference*.

### `update-view`

The following code example shows how to use `update-view`.

#### AWS CLI

**Example 1: To update the IncludedProperties field for a Resource Explorer view**

The following `update-view` example updates the specified view by adding `` `tags` `` to the optional `` `IncludedProperties` ``. After running this operation, search operations that use this view include information about the tags attached to the resources that appear in the results.

```
aws resource-explorer-2 update-view \
    --included-properties Name=tags \
    --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222
```

Output:

```
{
```

```
    "View": {
        "Filters": {
            "FilterString": ""
        },
        "IncludedProperties": [
            {
                "Name": "tags"
            }
        ],
        "LastUpdatedAt": "2022-07-19T17:41:21.710000+00:00",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-
Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
    }
}
```

**Example 2: To update the filters attached to a view**

The following `update-view` example updates the specified view to use a filter that limits results to only resource types that are associated with the Amazon EC2 service.

```
aws resource-explorer-2 update-view \
    --filters FilterString="service:ec2" \
    --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222
```

Output:

```
{
    "View": {
    "Filters": {
        "FilterString": "service:ec2"
    },
    "IncludedProperties": [],
    "LastUpdatedAt": "2022-07-19T17:41:21.710000+00:00",
        "Owner": "123456789012",
        "Scope": "arn:aws:iam::123456789012:root",
        "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
    }
}
```

For more information about views, see About Resource Explorer views in the *AWS Resource Explorer Users Guide*.

- For API details, see UpdateView in *AWS CLI Command Reference*.

## Resource Groups examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `create-group`

The following code example shows how to use `create-group`.

#### AWS CLI

**Example 1: To create a tag-based resource group**

The following `create-group` example creates a tag-based resource group of Amazon EC2 instances in the current region. It's based on a query for resources that are tagged with the key `Name`, and the value `WebServers`. The group name is `tbq-WebServer`. The query is in a separate JSON file that is passed to the command.

```
aws resource-groups create-group \
    --name tbq-WebServer \
    --resource-query file://query.json
```

Contents of `query.json`:

```
{
    "Type": "TAG_FILTERS_1_0",
    "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
}
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer"
    },
    "ResourceQuery": {
        "Type": "TAG_FILTERS_1_0",
        "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
    }
}
```

**Example 2: To create a CloudFormation stack-based resource group**

The following `create-group` example creates an AWS CloudFormation stack-based resource group named `sampleCFNstackgroup`. The query includes all resources in the specified CloudFormation stack that are supported by AWS Resource Groups.

```
aws resource-groups create-group \
    --name cbq-CFNstackgroup \
    --resource-query file://query.json
```

Contents of `query.json`:

```
{
    "Type": "CLOUDFORMATION_STACK_1_0",
    "Query": "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier
\":\"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-
z39z-11z8-97z5-500z212zz6fz\"}"
}
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNstackgroup",
        "Name": "cbq-CFNstackgroup"
    },
    "ResourceQuery": {
        "Type": "CLOUDFORMATION_STACK_1_0",
        "Query": "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier
\":\"arn:aws:cloudformation:us-east-2:123456789012:stack/MyCFNStack/1415z9z0-
z39z-11z8-97z5-500z212zz6fz\"}"}'
    }
}
```

For more information, see Create Groups in the *AWS Resource Groups User Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

### `delete-group`

The following code example shows how to use `delete-group`.

#### AWS CLI

**To update the description for a resource group**

The following `delete-group` example updates the specified resource group.

```
aws resource-groups delete-group \
    --group-name tbq-WebServer
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:1234567890:group/tbq-
WebServer",
        "Name": "tbq-WebServer"
    }
```

```
}
```

For more information, see Delete Groups in the *AWS Resource Groups User Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

### `get-group-query`

The following code example shows how to use `get-group-query`.

#### AWS CLI

**To get the query attached to a resource group**

The following `get-group-query` example displays query attached to the specified resource group.

```
aws resource-groups get-group-query \
    --group-name tbq-WebServer
```

Output:

```
{
    "GroupQuery": {
        "GroupName": "tbq-WebServer",
        "ResourceQuery": {
            "Type": "TAG_FILTERS_1_0",
            "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters
\":[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
        }
    }
}
```

- For API details, see GetGroupQuery in *AWS CLI Command Reference*.

### `get-group`

The following code example shows how to use `get-group`.

#### AWS CLI

**To get information about a resource group**

The following `get-group` example displays details about the specified resource group. To get the query attached to the group, use `get-group-query`.

```
aws resource-groups get-group \
    --group-name tbq-WebServer
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer",
        "Description": "A tag-based query resource group of WebServers."
    }
}
```

- For API details, see GetGroup in *AWS CLI Command Reference*.

### `get-tags`

The following code example shows how to use `get-tags`.

#### AWS CLI

**To retrieve the tags attached to a resource group**

The following `get-tags` example displays the tag key and value pairs attached to the specified resource group (the group itself, not its members).

```
aws resource-groups get-tags \
    --arn arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer
```

Output:

```
{
    "Arn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",
    "Tags": {
        "QueryType": "tags",
        "QueryResources": "ec2-instances"
    }
```

```
}
```

- For API details, see GetTags in *AWS CLI Command Reference*.

### `list-group-resources`

The following code example shows how to use `list-group-resources`.

**AWS CLI**

**To list all of the resources in a resource group**

Example 1: The following `list-resource-groups` example lists all of the resources that are part of the specified resource group.

```
aws resource-groups list-group-resources \
    --group-name tbq-WebServer
```

Output:

```
{
    "ResourceIdentifiers": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-09f77fa38c12345ab",
            "ResourceType": "AWS::EC2::Instance"
        }
    ]
}
```

Example 2: The following example lists all of the resources in the group that also have a 'resource-type' of the 'AWS::EC2::Instance'. :

aws resource-groups list-group-resources --group-name tbq-WebServer --filters Name=resource-type,Values=AWS::EC2::Instance

- For API details, see ListGroupResources in *AWS CLI Command Reference*.

### `list-groups`

The following code example shows how to use `list-groups`.

**AWS CLI**

**To list the available resource groups**

The following `list-groups` example displays a list of all of the resource groups.

```
aws resource-groups list-groups
```

Output:

```
{
    "GroupIdentifiers": [
        {
            "GroupName": "tbq-WebServer",
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer3"
        },
        {
            "GroupName": "cbq-CFNStackQuery",
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNStackQuery"
        }
    ],
    "Groups": [
        {
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
            "Name": "tbq-WebServer"
        },
        {
            "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNStackQuery",
            "Name": "cbq-CFNStackQuery"
        }
    ]
}
```

- For API details, see ListGroups in *AWS CLI Command Reference*.

## `list-resource-groups`

The following code example shows how to use `list-resource-groups`.

**AWS CLI**

**To list all of the resources in a resource group**

The following `list-resource-groups` example lists all of the resources that are part of the specified resource group.

```
aws resource-groups list-group-resources \
    --group-name tbq-WebServer
```

Output:

```
{
    "ResourceIdentifiers": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-09f77fa38c12345ab",
            "ResourceType": "AWS::EC2::Instance"
        }
    ]
}
```

- For API details, see ListResourceGroups in *AWS CLI Command Reference*.

### `put-group-configuration`

The following code example shows how to use `put-group-configuration`.

**AWS CLI**

**To attach a service configuration to a resource group**

Example 1: The following `put-group-configuration` example specifies that the resource group is to contain only Amazon EC2 capacity reservations for instances in the `C5` or `M5` families.

```
aws resource-groups put-group-configuration \
    --group MyTestGroup \
    --configuration file://config.json
```

Contents of `config.json`:

```
[
    {
        "Type": "AWS::EC2::HostManagement",
        "Parameters": [
            {
                "Name": "allowed-host-families",
                "Values": [ "c5", "m5" ]
            },
                {
                    "Name": "any-host-based-license-configuration",
                    "Values": [ "true" ]
                }
        ]
    },
    {
        "Type": "AWS::ResourceGroups::Generic",
        "Parameters": [
            {
                "Name": "allowed-resource-types",
                "Values": [ "AWS::EC2::Host" ]
            },
            {
                "Name": "deletion-protection",
                "Values": [ "UNLESS_EMPTY" ]
            }
        ]
    }
]
```

This command produces no output if successful.

For more information, see Service configurations for resource groups in the *Resource Groups API Reference Guide*.

- For API details, see PutGroupConfiguration in *AWS CLI Command Reference*.

### `search-resources`

The following code example shows how to use `search-resources`.

#### AWS CLI

**To find resources that match a query**

The following `search-resources` example retrieves a list of all AWS resources that match the specified query.

```
aws resource-groups search-resources \
    --resource-query file://query.json
```

Contents of `query.json`:

```
{
    "Type": "TAG_FILTERS_1_0",
    "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Patch Group\", \"Values\":[\"Dev\"]}]}"
}
```

Output:

```
{
    "ResourceIdentifiers": [
        {
            "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-01a23bc45d67890ef",
            "ResourceType": "AWS::EC2::Instance"
        }
    ]
}
```

- For API details, see SearchResources in *AWS CLI Command Reference*.

### `tag`

The following code example shows how to use `tag`.

#### AWS CLI

**To attach a tag to a resource group**

The following `tag` example attaches the specified tag key and value pairs to the specified resource group (the group itself, not its members).

```
aws resource-groups tag \
    --tags QueryType=tags,QueryResources=ec2-instances \
```

```
    --arn arn:aws:resource-groups:us-west-2:128716708097:group/tbq-WebServer
```

Output:

```
{
    "Arn": "arn:aws:resource-groups:us-west-2:128716708097:group/tbq-WebServer",
    "Tags": {
        "QueryType": "tags",
        "QueryResources": "ec2-instances"
    }
}
```

For more information, see Manage tags in the *AWS Resource Groups User Guide*.

- For API details, see Tag in *AWS CLI Command Reference*.

### `untag`

The following code example shows how to use `untag`.

#### AWS CLI

**To remove tags from a resource group**

The following `untags` example removes any tag with the specified key from the resource group itself, not its members.

```
aws resource-groups untag \
    --arn arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer \
    --keys QueryType
```

Output:

```
{
    "Arn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",
    "Keys": [
        "QueryType"
    ]
}
```

For more information, see Manage tags in the *AWS Resource Groups User Guide*.

- For API details, see Untag in *AWS CLI Command Reference*.

### update-group-query

The following code example shows how to use update-group-query.

#### AWS CLI

##### Example 1: To update the query for a tag-based resource group

The following update-group-query example updates the query attached to the specified tag-based resource group.

```
aws resource-groups update-group-query \
    --group-name tbq-WebServer \
    --resource-query '{"Type":"TAG_FILTERS_1_0", "Query":"{\"ResourceTypeFilters\":
[\"AWS::EC2::Instance\"],\"TagFilters\":[{\"Key\":\"Name\", \"Values\":[\"WebServers
\"]}]}"}'
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-east-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer"
    },
    "ResourceQuery": {
        "Type": "TAG_FILTERS_1_0",
        "Query": "{\"ResourceTypeFilters\":[\"AWS::EC2::Instance\"],\"TagFilters\":
[{\"Key\":\"Name\", \"Values\":[\"WebServers\"]}]}"
    }
}
```

For more information, see Update Groups in the *AWS Resource Groups User Guide*.

##### Example 2: To update the query for a CloudFormation stack-based resource group

The following update-group-query example updates the query attached to the specified AWS CloudFormation stack-based resource group.

```
aws resource-groups update-group-query \
    --group-name cbq-CFNstackgroup \
    --resource-query '{"Type": "CLOUDFORMATION_STACK_1_0", "Query":
 "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier\":
```

```
\"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-
z39z-11z8-97z5-500z212zz6fz\"}"}'
```

Output:

```
{
    "Group": {
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNstackgroup",
        "Name": "cbq-CFNstackgroup"
    },
    "ResourceQuery": {
        "Type": "CLOUDFORMATION_STACK_1_0",
        "Query": "{\"ResourceTypeFilters\":[\"AWS::AllSupported\"],\"StackIdentifier
\":\"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-
z39z-11z8-97z5-500z212zz6fz\"}"
    }
}
```

For more information, see Update Groups in the *AWS Resource Groups User Guide*.

- For API details, see UpdateGroupQuery in *AWS CLI Command Reference*.

### `update-group`

The following code example shows how to use `update-group`.

#### AWS CLI

**To update the description for a resource group**

The following `update-group` example updates the description for the specified resource group.

```
aws resource-groups update-group \
    --group-name tbq-WebServer \
    --description "Resource group for all web server resources."
```

Output:

```
{
    "Group": {
```

```
        "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
        "Name": "tbq-WebServer"
        "Description": "Resource group for all web server resources."
    }
}
```

For more information, see Update Groups in the *AWS Resource Groups User Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

## Resource Groups Tagging API examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups Tagging API.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `get-resources`

The following code example shows how to use `get-resources`.

#### AWS CLI

##### To get a list of tagged resources

The following `get-resources` example displays a list of resources in the account that are tagged with the specified key name and value.

```
aws resourcegroupstaggingapi get-resources \
    --tag-filters Key=Environment,Values=Production \
    --tags-per-page 100
```

Output:

```
{
    "ResourceTagMappingList": [
        {
            "ResourceARN": " arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-7sbz2Kz0",
            "Tags": [
                {
                    "Key": "Environment",
                    "Value": "Production"
                }
            ]
        }
    ]
}
```

For more information, see GetResources in the *Resource Groups Tagging API Reference*.

- For API details, see GetResources in *AWS CLI Command Reference*.

### `get-tag-keys`

The following code example shows how to use `get-tag-keys`.

#### AWS CLI

**To get a list of all tag keys**

The following `get-tag-keys` example retrieves the list of all tag key names used by resources in the account.

```
aws resourcegroupstaggingapi get-tag-keys
```

Output:

```
{
```

```
    "TagKeys": [
        "Environment",
        "CostCenter",
        "Department"
    ]
}
```

For more information, see GetTagKeys in the *Resource Groups Tagging API Reference*.

- For API details, see GetTagKeys in *AWS CLI Command Reference*.

### `get-tag-values`

The following code example shows how to use `get-tag-values`.

#### AWS CLI

**To get a list of all tag values**

The following `get-tag-values` example displays all of the values used for the specified key for all resources in the

```
aws resourcegroupstaggingapi get-tag-values \
    --key=Environment
```

Output:

```
{
    "TagValues": [
        "Alpha",
        "Gamma",
        "Production"
    ]
}
```

For more information, see GetTagValues in the *Resource Groups Tagging API Reference*.

- For API details, see GetTagValues in *AWS CLI Command Reference*.

### `tag-resources`

The following code example shows how to use `tag-resources`.

**AWS CLI**

**To attach a tag to a resource**

The following `tag-resources` example tags the specified resource with a key name and value.

```
aws resourcegroupstaggingapi tag-resources \
    --resource-arn-list arn:aws:s3:::MyProductionBucket \
    --tags Environment=Production,CostCenter=1234
```

Output:

```
{
    "FailedResourcesMap": {}
}
```

For more information, see TagResources in the *Resource Groups Tagging API Reference*.

- For API details, see TagResources in *AWS CLI Command Reference*.

### `untag-resources`

The following code example shows how to use `untag-resources`.

**AWS CLI**

**To remove a tag from a resource**

The following `untag-resources` example removes the specified tag keys and any associated values from the specified resource.

```
aws resourcegroupstaggingapi untag-resources \
    --resource-arn-list arn:aws:s3:::awsexamplebucket \
    --tag-keys Environment CostCenter
```

Output:

```
{
    "FailedResourcesMap": {}
}
```

For more information, see UntagResources in the *Resource Groups Tagging API Reference*.

- For API details, see UntagResources in *AWS CLI Command Reference*.

## AWS RoboMaker examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS RoboMaker.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Actions

#### `batch-describe-simulation-job`

The following code example shows how to use `batch-describe-simulation-job`.

#### AWS CLI

##### To batch describe simulation jobs

The following `batch-describe-simulation-job` example retrieves details for the three specified simulation jobs.

Command:

```
aws robomaker batch-describe-simulation-job \
--job arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-66bbb3gpxm8x
 arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-p0cpdrrwng2n
 arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-g8h6tglmblgw
```

Output:

```
{
    "jobs": [
        {
            "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-job/

```

- For API details, see BatchDescribeSimulationJob in *AWS CLI Command Reference*.

## `cancel-simulation-job`

The following code example shows how to use `cancel-simulation-job`.

### AWS CLI

#### To cancel a simulation job

The following `cancel-simulation-job` example cancels the specified simulation job.

```
aws robomaker cancel-simulation-job \
    --job arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-66bbb3gpxm8x
```

- For API details, see CancelSimulationJob in *AWS CLI Command Reference*.

### `create-deployment-job`

The following code example shows how to use `create-deployment-job`.

**AWS CLI**

**To create a deployment job**

This example creates a deployment job for fleet MyFleet. It includes an environment variable named "ENVIRONMENT". It also attaches a tag named "Region".

Command:

```
aws robomaker create-deployment-job --deployment-config
 concurrentDeploymentPercentage=20,failureThresholdPercentage=25
 --fleet arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
Trek/1539894765711 --tags Region=West --deployment-application-configs
 application=arn:aws:robomaker:us-west-2:111111111111:robot-application/
RoboMakerVoiceInteractionRobot/1546537110575,applicationVersion=1,launchConfig={environmentV
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/sim-0974h36s4v0t",
  "fleet": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
MyFleet/1539894765711",
  "status": "Pending",
  "deploymentApplicationConfigs": [
      {
          "application": "arn:aws:robomaker:us-west-2:111111111111:robot-
application/RoboMakerVoiceInteractionRobot/1546537110575",
          "applicationVersion": "1",
          "launchConfig": {
              "packageName": "voice_interaction_robot",
              "launchFile": "await_commands.launch",
              "environmentVariables": {
                  "ENVIRONMENT": "Beta"
              }
          }
      }
```

```
  ],
  "createdAt": 1550770236.0,
  "deploymentConfig": {
      "concurrentDeploymentPercentage": 20,
      "failureThresholdPercentage": 25
  },
  "tags": {
      "Region": "West"
  }
}
```

- For API details, see CreateDeploymentJob in *AWS CLI Command Reference*.

### `create-fleet`

The following code example shows how to use `create-fleet`.

#### AWS CLI

**To create a fleet**

This example creates a fleet. It attaches a tag named Region.

Command:

```
aws robomaker create-fleet --name MyFleet --tags Region=East
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
MyOtherFleet/1550771394395",
  "name": "MyFleet",
  "createdAt": 1550771394.0,
  "tags": {
      "Region": "East"
  }
}
```

- For API details, see CreateFleet in *AWS CLI Command Reference*.

### `create-robot-application-version`

The following code example shows how to use `create-robot-application-version`.

**AWS CLI**

**To create a robot application version**

This example creates a robot application version.

Command:

```
aws robomaker create-robot-application-version --application arn:aws:robomaker:us-
west-2:111111111111:robot-application/MyRobotApplication/1551201873931
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/
MyRobotApplication/1551201873931",
  "name": "MyRobotApplication",
  "version": "1",
  "sources": [
      {
          "s3Bucket": "my-bucket",
          "s3Key": "my-robot-application.tar.gz",
          "etag": "f8cf5526f1c6e7b3a72c3ed3f79c5493-70",
          "architecture": "ARMHF"
      }
  ],
  "robotSoftwareSuite": {
      "name": "ROS",
      "version": "Kinetic"
  },
  "lastUpdatedAt": 1551201873.0,
  "revisionId": "9986bb8d-a695-4ab4-8810-9f4a74d1aa00"
  "tags": {}
}
```

- For API details, see CreateRobotApplicationVersion in *AWS CLI Command Reference*.

### `create-robot-application`

The following code example shows how to use `create-robot-application`.

**AWS CLI**

**To create a robot application**

This example creates a robot application.

Command:

```
aws robomaker create-robot-application --name MyRobotApplication --sources
 s3Bucket=my-bucket,s3Key=my-robot-application.tar.gz,architecture=X86_64 --robot-
software-suite name=ROS,version=Kinetic
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/
MyRobotApplication/1551201873931",
  "name": "MyRobotApplication",
  "version": "$LATEST",
  "sources": [
      {
          "s3Bucket": "my-bucket",
          "s3Key": "my-robot-application.tar.gz",
          "architecture": "ARMHF"
      }
  ],
  "robotSoftwareSuite": {
      "name": "ROS",
      "version": "Kinetic"
  },
  "lastUpdatedAt": 1551201873.0,
  "revisionId": "1f3cb539-9239-4841-a656-d3efcffa07e1",
  "tags": {}
}
```

- For API details, see CreateRobotApplication in *AWS CLI Command Reference*.

### `create-robot`

The following code example shows how to use `create-robot`.

**AWS CLI**

**To create a robot**

This example creates a robot. It uses the ARMHF architecture. It also attaches a tag named Region.

Command:

```
aws robomaker create-robot --name MyRobot --architecture ARMHF --greengrass-group-id
 0f728a3c-7dbf-4a3e-976d-d16a8360caba --tags Region=East
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398",
  "name": "MyRobot",
  "createdAt": 1550772325.0,
  "greengrassGroupId": "0f728a3c-7dbf-4a3e-976d-d16a8360caba",
  "architecture": "ARMHF",
  "tags": {
      "Region": "East"
  }
}
```

- For API details, see CreateRobot in *AWS CLI Command Reference*.

### `create-simulation-application-version`

The following code example shows how to use `create-simulation-application-version`.

**AWS CLI**

**To create a simulation application version**

This example creates a robot application version.

Command:

```
aws robomaker create-simulation-application-version --application
 arn:aws:robomaker:us-west-2:111111111111:robot-application/
MySimulationApplication/1551203427605
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-application/
MyRobotApplication/1551203427605",
  "name": "MyRobotApplication",
  "version": "1",
  "sources": [
      {
          "s3Bucket": "my-bucket",
          "s3Key": "my-simulation-application.tar.gz",
          "etag": "00d8a94ff113856688c4fce618ae0f45-94",
          "architecture": "X86_64"
      }
  ],
  "simulationSoftwareSuite": {
      "name": "Gazebo",
      "version": "7"
  },
  "robotSoftwareSuite": {
      "name": "ROS",
      "version": "Kinetic"
  },
  "renderingEngine": {
      "name": "OGRE",
      "version": "1.x"
  },
 "lastUpdatedAt": 1551203853.0,
  "revisionId": "ee753e53-519c-4d37-895d-65e79bcd1914",
  "tags": {}
}
```

- For API details, see CreateSimulationApplicationVersion in *AWS CLI Command Reference*.

### `create-simulation-application`

The following code example shows how to use `create-simulation-application`.

## AWS CLI

### To create a simulation application

This example creates a simulation application.

Command:

```
aws robomaker create-simulation-application  --name MyRobotApplication --sources
 s3Bucket=my-bucket,s3Key=my-simulation-application.tar.gz,architecture=ARMHF
 --robot-software-suite name=ROS,version=Kinetic --simulation-software-suite
 name=Gazebo,version=7 --rendering-engine name=OGRE,version=1.x
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-application/
MyRobotApplication/1551203301792",
  "name": "MyRobotApplication",
  "version": "$LATEST",
  "sources": [
      {
          "s3Bucket": "my-bucket",
          "s3Key": "my-simulation-application.tar.gz",
          "architecture": "X86_64"
      }
  ],
  "simulationSoftwareSuite": {
      "name": "Gazebo",
      "version": "7"
  },
  "robotSoftwareSuite": {
      "name": "ROS",
      "version": "Kinetic"
  },
  "renderingEngine": {
      "name": "OGRE",
      "version": "1.x"
  },
  "lastUpdatedAt": 1551203301.0,
  "revisionId": "ee753e53-519c-4d37-895d-65e79bcd1914",
  "tags": {}
}
```

- For API details, see CreateSimulationApplication in *AWS CLI Command Reference*.

### `create-simulation-job`

The following code example shows how to use `create-simulation-job`.

**AWS CLI**

**To create a simulation job**

This example creates a simulation job. It uses a robot application and a simulation application.

Command:

```
aws robomaker create-simulation-job --max-job-duration-
in-seconds 3600 --iam-role arn:aws:iam::111111111111:role/
AWSRoboMakerCloudWatch-154766341-SimulationJobRole-G0OBWTQ8YBG6 --robot-
applications application=arn:aws:robomaker:us-west-2:111111111111:robot-application/
MyRobotApplication/1551203485821,launchConfig={packageName=hello_world_robot,launchFile=rota
 --simulation-applications application=arn:aws:robomaker:us-
west-2:111111111111:simulation-application/
MySimulationApplication/1551203427605,launchConfig={packageName=hello_world_simulation,launc
 --tags Region=North
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-w7m68wpr05h8",
  "status": "Pending",
  "lastUpdatedAt": 1551213837.0,
  "failureBehavior": "Fail",
  "clientRequestToken": "b283ccce-e468-43ee-8642-be76a9d69f15",
  "maxJobDurationInSeconds": 3600,
  "simulationTimeMillis": 0,
  "iamRole": "arn:aws:iam::111111111111:role/MySimulationRole",
  "robotApplications": [
      {
          "application": "arn:aws:robomaker:us-west-2:111111111111:robot-
application/MyRobotApplication/1551203485821",
          "applicationVersion": "$LATEST",
          "launchConfig": {
              "packageName": "hello_world_robot",
```

```
                "launchFile": "rotate.launch"
            }
        }
    ],
    "simulationApplications": [
        {
            "application": "arn:aws:robomaker:us-west-2:111111111111:simulation-
application/MySimulationApplication/1551203427605",
            "applicationVersion": "$LATEST",
            "launchConfig": {
                "packageName": "hello_world_simulation",
                "launchFile": "empty_world.launch"
            }
        }
    ],
    "tags": {
        "Region": "North"
    }
}
```

- For API details, see CreateSimulationJob in *AWS CLI Command Reference*.

### `delete-fleet`

The following code example shows how to use `delete-fleet`.

#### AWS CLI

**To delete a fleet**

This example deletes a fleet.

Command:

```
aws robomaker delete-fleet --fleet arn:aws:robomaker:us-
west-2:111111111111:deployment-fleet/MyFleet/1550771394395
```

- For API details, see DeleteFleet in *AWS CLI Command Reference*.

### `delete-robot-application`

The following code example shows how to use `delete-robot-application`.

**AWS CLI**

**To delete a robot application**

This example deletes a robot application.

Command:

```
aws robomaker delete-robot-application --application arn:aws:robomaker:us-
west-2:111111111111:robot-application/MyRobotApplication/1551203485821
```

- For API details, see DeleteRobotApplication in *AWS CLI Command Reference*.

### `delete-robot`

The following code example shows how to use `delete-robot`.

**AWS CLI**

**To delete a robot**

This example deletes a robot.

Command:

```
aws robomaker delete-robot --robot arn:aws:robomaker:us-west-2:111111111111:robot/
MyRobot/1540829698778
```

- For API details, see DeleteRobot in *AWS CLI Command Reference*.

### `delete-simulation-application`

The following code example shows how to use `delete-simulation-application`.

**AWS CLI**

**To delete a simulation application**

This example deletes a simulation application.

Command:

```
aws robomaker delete-simulation-application --application arn:aws:robomaker:us-
west-2:111111111111:simulation-application/MySimulationApplication/1551203427605
```

- For API details, see DeleteSimulationApplication in *AWS CLI Command Reference*.

### `deregister-robot`

The following code example shows how to use `deregister-robot`.

**AWS CLI**

**To deregister a robot from a fleet**

This example deregisters a robot from a fleet.

Command:

```
aws robomaker deregister-robot --fleet arn:aws:robomaker:us-
west-2:111111111111:deployment-fleet/MyFleet/1550771358907 --robot
 arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398
```

Output:

```
{
  "fleet": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
MyFleet/1550771358907",
  "robot": "arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398"
}
```

- For API details, see DeregisterRobot in *AWS CLI Command Reference*.

### `describe-deployment-job`

The following code example shows how to use `describe-deployment-job`.

**AWS CLI**

**To describe a deployment job**

The following `describe-deployment-job` example retrieves the details about the specified deployment job.

```
aws robomaker describe-deployment-job \
    --job arn:aws:robomaker:us-west-2:111111111111:deployment-job/deployment-
xl8qssl6pbcn
```

Output:

```
{
    "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/deployment-
xl8qssl6pbcn",
    "fleet": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
Trek/1539894765711",
    "status": "InProgress",
    "deploymentConfig": {
        "concurrentDeploymentPercentage": 20,
        "failureThresholdPercentage": 25
    },
    "deploymentApplicationConfigs": [
        {
            "application": "arn:aws:robomaker:us-west-2:111111111111:robot-
application/RoboMakerHelloWorldRobot/1546541208251",
            "applicationVersion": "1",
            "launchConfig": {
                "packageName": "hello_world_robot",
                "launchFile": "rotate.launch"
            }
        }
    ],
    "createdAt": 1551218369.0,
    "robotDeploymentSummary": [
        {

            "deploymentStartTime": 1551218376.0,
            "status": "Deploying",
            "progressDetail": {}
        }
    ],
    "tags": {}
}
```

- For API details, see DescribeDeploymentJob in *AWS CLI Command Reference*.

### `describe-fleet`

The following code example shows how to use `describe-fleet`.

#### AWS CLI

##### To describe a fleet

The following `describe-fleet` example retrieves the details for the specified fleet.

```
aws robomaker describe-fleet \
    --fleet arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
MyFleet/1550771358907
```

Output:

```
{
    "name": "MyFleet",
    "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
MyFleet/1539894765711",
    "robots": [
        {

            "createdAt": 1540834232.0
        },
        {
            "arn": "arn:aws:robomaker:us-west-2:111111111111:robot/
MyOtherRobot/1540829698778",
            "createdAt": 1540829698.0
        }
    ],
    "createdAt": 1539894765.0,
    "lastDeploymentStatus": "Succeeded",
    "lastDeploymentJob": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/
deployment-xl8qssl6pbcn",
    "lastDeploymentTime": 1551218369.0,
    "tags": {}
}
```

- For API details, see DescribeFleet in *AWS CLI Command Reference*.

### `describe-robot-application`

The following code example shows how to use `describe-robot-application`.

#### AWS CLI

**To describe a robot application**

This example describes a robot application.

Command:

```
aws robomaker describe-robot-application --application arn:aws:robomaker:us-
west-2:111111111111:robot-application/MyRobotApplication/1551203485821
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/
MyRobotApplication/1551203485821",
  "name": "MyRobotApplication",
  "version": "$LATEST",
  "sources": [
      {
          "s3Bucket": "my-bucket",
          "s3Key": "my-robot-application.tar.gz",
          "architecture": "X86_64"
      }
  ],
  "robotSoftwareSuite": {
      "name": "ROS",
      "version": "Kinetic"
  },
  "revisionId": "e72efe0d-f44f-4333-b604-f6fa5c6bb50b",
  "lastUpdatedAt": 1551203485.0,
  "tags": {}
}
```

- For API details, see DescribeRobotApplication in *AWS CLI Command Reference*.

### `describe-robot`

The following code example shows how to use `describe-robot`.

**AWS CLI**

**To describe a robot**

This example describes a robot.

Command:

```
aws robomaker describe-robot --robot arn:aws:robomaker:us-west-2:111111111111:robot/
MyRobot/1550772324398
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398",
  "name": "MyRobot",
  "status": "Available",
  "greengrassGroupId": "0f728a3c-7dbf-4a3e-976d-d16a8360caba",
  "createdAt": 1550772325.0,
  "architecture": "ARMHF",
  "tags": {
      "Region": "East"
  }
}
```

- For API details, see DescribeRobot in *AWS CLI Command Reference*.

### `describe-simulation-application`

The following code example shows how to use `describe-simulation-application`.

**AWS CLI**

**To describe a simulation application**

This example describes a simulation application.

Command:

```
aws robomaker describe-simulation-application --application arn:aws:robomaker:us-
west-2:111111111111:simulation-application/MySimulationApplication/1551203427605
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-application/
MySimulationApplication/1551203427605",
  "name": "MySimulationApplication",
  "version": "$LATEST",
  "sources": [
      {
          "s3Bucket": "my-bucket",
          "s3Key": "my-simulation-application.tar.gz",
          "architecture": "X86_64"
      }
  ],
  "simulationSoftwareSuite": {
      "name": "Gazebo",
      "version": "7"
  },
  "robotSoftwareSuite": {
      "name": "ROS",
      "version": "Kinetic"
  },
  "renderingEngine": {
      "name": "OGRE",
      "version": "1.x"
  },
  "revisionId": "783674ab-b7b8-42d9-b01f-9373907987e5",
  "lastUpdatedAt": 1551203427.0,
  "tags": {}
}
```

- For API details, see DescribeSimulationApplication in *AWS CLI Command Reference*.

## `describe-simulation-job`

The following code example shows how to use `describe-simulation-job`.

### AWS CLI

#### To describe a simulation job

This example describes a simulation job.

Command:

```
aws robomaker describe-simulation-job --job arn:aws:robomaker:us-
west-2:111111111111:simulation-job/sim-pql32v7pfjy6
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-pql32v7pfjy6",
  "status": "Running",
  "lastUpdatedAt": 1551219349.0,
  "failureBehavior": "Continue",

### `list-deployment-jobs`

The following code example shows how to use `list-deployment-jobs`.

**AWS CLI**

**To list deployment jobs**

The following `list-deployment-jobs` example retrieves a list of deployment jobs.

```
aws robomaker list-deployment-jobs
```

Output:

```
{
    "deploymentJobs": [
        {
            "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/

}
```

- For API details, see [ListDeploymentJobs](#) in *AWS CLI Command Reference*.

## `list-fleets`

The following code example shows how to use `list-fleets`.

### AWS CLI

#### To list fleets

This example lists fleets. A maximum of 20 fleets will be returned.

Command:

```
aws robomaker list-fleets --max-items 20
```

Output:

```
{
  "fleetDetails": [
      {
          "name": "Trek",
          "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
MyFleet/1539894765711",
          "createdAt": 1539894765.0,
          "lastDeploymentStatus": "Failed",
          "lastDeploymentJob": "arn:aws:robomaker:us-west-2:111111111111:deployment-
job/deployment-4w4g69p25zdb",
          "lastDeploymentTime": 1544719763.0
      }
  ]
}
```

- For API details, see ListFleets in *AWS CLI Command Reference*.

### `list-robot-applications`

The following code example shows how to use `list-robot-applications`.

#### AWS CLI

**To list robot applications**

This example lists robot applications. Results are limited to 20 robot applications.

Command:

```
aws robomaker list-robot-applications --max-results 20
```

Output:

```
{
```

```
  "robotApplicationSummaries": [
      {
          "name": "MyRobot",
          "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/
MyRobot/1546537110575",
          "version": "$LATEST",
          "lastUpdatedAt": 1546540372.0
      },
      {
          "name": "AnotherRobot",
          "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/
AnotherRobot/1546541208251",
          "version": "$LATEST",
          "lastUpdatedAt": 1546541208.0
      },
      {
          "name": "MySuperRobot",
          "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/
MySuperRobot/1547663517377",
          "version": "$LATEST",
          "lastUpdatedAt": 1547663517.0
      }
  ]
}
```

- For API details, see ListRobotApplications in *AWS CLI Command Reference*.

### `list-robots`

The following code example shows how to use `list-robots`.

#### AWS CLI

##### To list robots

This example lists robots. A maximum of 20 robots will be returned.

Command:

```
aws robomaker list-robots --max-results 20
```

Output:

```
{
  "robots": [
      {
          "arn": "arn:aws:robomaker:us-west-2:111111111111:robot/
Robot100/1544035373264",
          "name": "Robot100",
          "status": "Available",
          "createdAt": 1544035373.0,
          "architecture": "X86_64"
      },
      {
          "arn": "arn:aws:robomaker:us-west-2:111111111111:robot/
Robot101/1542146976587",
          "name": "Robot101",
          "status": "Available",
          "createdAt": 1542146976.0,
          "architecture": "X86_64"
      },
      {
          "arn": "arn:aws:robomaker:us-west-2:111111111111:robot/
Robot102/1540834232469",
          "name": "Robot102",
          "fleetArn": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
Trek/1539894765711",
          "status": "Available",
          "createdAt": 1540834232.0,
          "architecture": "X86_64",
          "lastDeploymentJob": "arn:aws:robomaker:us-west-2:111111111111:deployment-
job/deployment-jb007b75gl5f",
          "lastDeploymentTime": 1550689533.0
      },
      {
          "arn": "arn:aws:robomaker:us-west-2:111111111111:robot/
MyRobot/1540829698778",
          "name": "MyRobot",
          "status": "Registered",
          "createdAt": 1540829698.0,
          "architecture": "X86_64"
      }
  ]
}
```

- For API details, see ListRobots in *AWS CLI Command Reference*.

### `list-simulation-applications`

The following code example shows how to use `list-simulation-applications`.

**AWS CLI**

**To list simulation applications**

This example lists simulation applications. A maximum of 20 simulation applications will be returned.

Command:

```
aws robomaker list-simulation-applications --max-results 20
```

Output:

```
{
  "simulationApplicationSummaries": [
      {
          "name": "AWSRoboMakerObjectTracker-1548959046124_NPvyfcatq",

}
```

- For API details, see ListSimulationApplications in *AWS CLI Command Reference*.

### `list-simulation-jobs`

The following code example shows how to use `list-simulation-jobs`.

#### AWS CLI

##### To list simulation jobs

This example lists simulation jobs.

Command:

```
aws robomaker list-simulation-jobs
```

Output:

```
{
    "simulationJobSummaries": [
        {
            "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-job/

          ]
      }
  ]
}
```

- For API details, see ListSimulationJobs in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for a resource**

This example lists tags for an AWS RoboMaker resource.

Command:

```
aws robomaker list-tags-for-resource --resource-arn "arn:aws:robomaker:us-
west-2:111111111111:robot/Robby_the_Robot/1544035373264"
```

Output:

```
{
  "tags": {
      "Region": "North",
      "Stage": "Initial"
  }
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `register-robot`

The following code example shows how to use `register-robot`.

**AWS CLI**

**To register a robot**

This example registers a robot to a fleet.

Command:

```
aws robomaker register-robot --fleet arn:aws:robomaker:us-
west-2:111111111111:deployment-fleet/MyFleet/1550771358907 --robot
 arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398
```

Output:

```
{
  "fleet": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
MyFleet/1550771358907",
  "robot": "arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398"
}
```

- For API details, see RegisterRobot in *AWS CLI Command Reference*.

### `restart-simulation-job`

The following code example shows how to use `restart-simulation-job`.

**AWS CLI**

**To restart a simulation**

This example restarts a simulation.

Command:

```
aws robomaker restart-simulation-job --job arn:aws:robomaker:us-
west-2:111111111111:simulation-job/sim-t6rdgt70mftr
```

- For API details, see RestartSimulationJob in *AWS CLI Command Reference*.

### `sync-deployment-job`

The following code example shows how to use `sync-deployment-job`.

**AWS CLI**

**To sync a deployment job**

This example synchronizes a deployment job.

Command:

```
aws robomaker sync-deployment-job --fleet arn:aws:robomaker:us-
west-2:111111111111:deployment-fleet/Trek/1539894765711
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/
deployment-09ccxs3tlfms",
  "fleet": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
MyFleet/1539894765711",
  "status": "Pending",
  "deploymentConfig": {
      "concurrentDeploymentPercentage": 20,
```

```
        "failureThresholdPercentage": 25
    },
    "deploymentApplicationConfigs": [
        {
            "application": "arn:aws:robomaker:us-west-2:111111111111:robot-
application/MyRobotApplication/1546541208251",
            "applicationVersion": "1",
            "launchConfig": {
                "packageName": "hello_world_simulation",
                "launchFile": "empty_world.launch"
            }
        }
    ],
    "createdAt": 1551286954.0
}
```

- For API details, see SyncDeploymentJob in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**To tag a resource**

This example tags a resource. It attaches two tags: Region and Stage.

Command:

```
aws robomaker tag-resource --resource-arn "arn:aws:robomaker:us-
west-2:111111111111:robot/MyRobot/1544035373264" --tags Region=North,Stage=Initial
```

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

#### AWS CLI

**To untag a resource**

This example removes a tag from a resource. It removes the Region tag.

Command:

```
aws robomaker untag-resource --resource-arn "arn:aws:robomaker:us-
west-2:111111111111:robot/MyRobot/1544035373264" --tag-keys Region
```

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-robot-application`

The following code example shows how to use `update-robot-application`.

**AWS CLI**

**To update a robot application**

This example updates a robot application.

Command:

```
aws robomaker update-robot-application --application arn:aws:robomaker:us-
west-2:111111111111:robot-application/MyRobotApplication/1551203485821 --sources
 s3Bucket=my-bucket,s3Key=my-robot-application.tar.gz,architecture=X86_64 --robot-
software-suite name=ROS,version=Kinetic
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/
MyRobotApplication/1551203485821",
  "name": "MyRobotApplication",
  "version": "$LATEST",
  "sources": [
      {
          "s3Bucket": "my-bucket",
          "s3Key": "my-robot-application.tar.gz",
          "architecture": "X86_64"
      }
  ],
  "robotSoftwareSuite": {
```

```
        "name": "ROS",
        "version": "Kinetic"
    },
    "lastUpdatedAt": 1551287993.0,
    "revisionId": "20b5e331-24fd-4504-8b8c-531afe5f4c94"
}
```

- For API details, see UpdateRobotApplication in *AWS CLI Command Reference*.

### `update-simulation-application`

The following code example shows how to use `update-simulation-application`.

**AWS CLI**

**To update a simulation application**

This example updates a simulation application.

Command:

```
aws robomaker update-simulation-application --application
 arn:aws:robomaker:us-west-2:111111111111:simulation-application/
MySimulationApplication/1551203427605 --sources s3Bucket=my-bucket,s3Key=my-
simulation-application.tar.gz,architecture=X86_64 --robot-software-suite
 name=ROS,version=Kinetic --simulation-software-suite name=Gazebo,version=7 --
rendering-engine name=OGRE,version=1.x
```

Output:

```
{
    "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-application/
MySimulationApplication/1551203427605",
    "name": "MySimulationApplication",
    "version": "$LATEST",
    "sources": [
        {
            "s3Bucket": "my-bucket",
            "s3Key": "my-simulation-application.tar.gz",
            "architecture": "X86_64"
        }
    ],
```

```
  "simulationSoftwareSuite": {
      "name": "Gazebo",
      "version": "7"
  },
  "robotSoftwareSuite": {
      "name": "ROS",
      "version": "Kinetic"
  },
  "renderingEngine": {
      "name": "OGRE",
      "version": "1.x"
  },
  "lastUpdatedAt": 1551289361.0,
  "revisionId": "4a22cb5d-93c5-4cef-9311-52bdd119b79e"
}
```

- For API details, see UpdateSimulationApplication in *AWS CLI Command Reference*.

## Route 53 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `change-resource-record-sets`

The following code example shows how to use `change-resource-record-sets`.

**AWS CLI**

**To create, update, or delete a resource record set**

The following `change-resource-record-sets` command creates a resource record set using the `hosted-zone-id` `Z1R8UBAEXAMPLE` and the JSON-formatted configuration in the file `C:\awscli\route53\change-resource-record-sets.json`:

```
aws route53 change-resource-record-sets --hosted-zone-id Z1R8UBAEXAMPLE --change-
batch file://C:\awscli\route53\change-resource-record-sets.json
```

For more information, see POST ChangeResourceRecordSets in the *Amazon Route 53 API Reference*.

The configuration in the JSON file depends on the kind of resource record set you want to create:

BasicWeightedAliasWeighted AliasLatencyLatency AliasFailoverFailover Alias

**Basic Syntax**:

```
{
  "Comment": "optional comment about the changes in this change batch request",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "DNS domain name",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
        "TTL": time to live in seconds,

}
```

**Failover Syntax**:

```
{
  "Comment": "optional comment about the changes in this change batch request",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "DNS domain name",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
        "SetIdentifier": "unique description for this resource record set",
        "Failover": "PRIMARY" | "SECONDARY",
        "TTL": time to live in seconds,
        "ResourceRecords": [
          {
            "Value": "applicable value for the record type"
          },
          {...}
        ],
        "HealthCheckId": "ID of an Amazon Route 53 health check"
      }
    },
    {...}
  ]
}
```

**Failover Alias Syntax**:

```
{
  "Comment": "optional comment about the changes in this change batch request",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "DNS domain name",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"PTR"|"SRV"|"SPF"|"AAAA",
        "SetIdentifier": "unique description for this resource record set",
        "Failover": "PRIMARY" | "SECONDARY",
        "AliasTarget": {
          "HostedZoneId": "hosted zone ID for your CloudFront distribution, Amazon
 S3 bucket, Elastic Load Balancing load balancer, or Amazon Route 53 hosted zone",
```

```
          "DNSName": "DNS domain name for your CloudFront distribution, Amazon S3
 bucket, Elastic Load Balancing load balancer, or another resource record set in
 this hosted zone",
          "EvaluateTargetHealth": true|false
        },
        "HealthCheckId": "optional ID of an Amazon Route 53 health check"
      }
    },
    {...}
  ]
}
```

- For API details, see ChangeResourceRecordSets in *AWS CLI Command Reference*.

### `change-tags-for-resource`

The following code example shows how to use `change-tags-for-resource`.

**AWS CLI**

The following command adds a tag named `owner` to a healthcheck resource specified by ID:

```
aws route53 change-tags-for-resource --resource-type healthcheck --resource-id
 6233434j-18c1-34433-ba8e-3443434 --add-tags Key=owner,Value=myboss
```

The following command removes a tag named `owner` from a hosted zone resource specified by ID:

```
aws route53 change-tags-for-resource --resource-type hostedzone --resource-id
 Z1523434445 --remove-tag-keys owner
```

- For API details, see ChangeTagsForResource in *AWS CLI Command Reference*.

### `create-health-check`

The following code example shows how to use `create-health-check`.

**AWS CLI**

**To create a health check**

The following `create-health-check` command creates a health check using the caller reference `2014-04-01-18:47` and the JSON-formatted configuration in the file `C:\awscli\route53\create-health-check.json`:

```
aws route53 create-health-check --caller-reference 2014-04-01-18:47 --health-check-config file://C:\awscli\route53\create-health-check.json
```

JSON syntax:

```
{
  "IPAddress": "IP address of the endpoint to check",
  "Port": port on the endpoint to check--required when Type is "TCP",
  "Type": "HTTP"|"HTTPS"|"HTTP_STR_MATCH"|"HTTPS_STR_MATCH"|"TCP",
  "ResourcePath": "path of the file that you want Amazon Route 53 to request--all
 Types except TCP",
  "FullyQualifiedDomainName": "domain name of the endpoint to check--all Types
 except TCP",
  "SearchString": "if Type is HTTP_STR_MATCH or HTTPS_STR_MATCH, the string to
 search for in the response body from the specified resource",
  "RequestInterval": 10 | 30,
  "FailureThreshold": integer between 1 and 10
}
```

To add the health check to a Route 53 resource record set, use the `change-resource-record-sets` command.

For more information, see Amazon Route 53 Health Checks and DNS Failover in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateHealthCheck in *AWS CLI Command Reference*.

## `create-hosted-zone`

The following code example shows how to use `create-hosted-zone`.

### AWS CLI

#### To create a hosted zone

The following `create-hosted-zone` command adds a hosted zone named `example.com` using the caller reference `2014-04-01-18:47`. The optional comment includes a space, so it must be enclosed in quotation marks:

```
aws route53 create-hosted-zone --name example.com --caller-reference
 2014-04-01-18:47 --hosted-zone-config Comment="command-line version"
```

For more information, see Working with Hosted Zones in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateHostedZone in *AWS CLI Command Reference*.

### `delete-health-check`

The following code example shows how to use `delete-health-check`.

#### AWS CLI

**To delete a health check**

The following `delete-health-check` command deletes the health check with a `health-check-id` of `e75b48d9-547a-4c3d-88a5-ae4002397608`:

```
aws route53 delete-health-check --health-check-id e75b48d9-547a-4c3d-88a5-
ae4002397608
```

- For API details, see DeleteHealthCheck in *AWS CLI Command Reference*.

### `delete-hosted-zone`

The following code example shows how to use `delete-hosted-zone`.

#### AWS CLI

**To delete a hosted zone**

The following `delete-hosted-zone` command deletes the hosted zone with an `id` of `Z36KTIQEXAMPLE`:

```
aws route53 delete-hosted-zone --id Z36KTIQEXAMPLE
```

- For API details, see DeleteHostedZone in *AWS CLI Command Reference*.

### `get-change`

The following code example shows how to use `get-change`.

**AWS CLI**

**To get the status of a change to resource record sets**

The following `get-change` command gets the status and other information about the `change-resource-record-sets` request that has an `Id` of `/change/CWPIK4URU2I5S`:

```
aws route53 get-change --id /change/CWPIK4URU2I5S
```

- For API details, see GetChange in *AWS CLI Command Reference*.

### `get-health-check`

The following code example shows how to use `get-health-check`.

**AWS CLI**

**To get information about a health check**

The following `get-health-check` command gets information about the health check that has a `health-check-id` of `02ec8401-9879-4259-91fa-04e66d094674`:

```
aws route53 get-health-check --health-check-id 02ec8401-9879-4259-91fa-04e66d094674
```

- For API details, see GetHealthCheck in *AWS CLI Command Reference*.

### `get-hosted-zone`

The following code example shows how to use `get-hosted-zone`.

**AWS CLI**

**To get information about a hosted zone**

The following `get-hosted-zone` command gets information about the hosted zone with an `id` of `Z1R8UBAEXAMPLE`:

```
aws route53 get-hosted-zone --id Z1R8UBAEXAMPLE
```

- For API details, see GetHostedZone in *AWS CLI Command Reference*.

### `list-health-checks`

The following code example shows how to use `list-health-checks`.

**AWS CLI**

**To list the health checks associated with the current AWS account**

The following `list-health-checks` command lists detailed information about the first 100 health checks that are associated with the current AWS account.:

```
aws route53 list-health-checks
```

If you have more than 100 health checks, or if you want to list them in groups smaller than 100, include the `--maxitems` parameter. For example, to list health checks one at a time, use the following command:

```
aws route53 list-health-checks --max-items 1
```

To view the next health check, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, for example:

```
aws route53 list-health-checks --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

- For API details, see ListHealthChecks in *AWS CLI Command Reference*.

### `list-hosted-zones-by-name`

The following code example shows how to use `list-hosted-zones-by-name`.

**AWS CLI**

The following command lists up to 100 hosted zones ordered by domain name:

```
aws route53 list-hosted-zones-by-name
```

Output:

```
{
  "HostedZones": [
      {
          "ResourceRecordSetCount": 2,
          "CallerReference": "test20150527-2",
          "Config": {
              "Comment": "test2",
              "PrivateZone": false
          },
          "Id": "/hostedzone/Z119WBBTVP5WFX",
          "Name": "2.example.com."
      },
      {
          "ResourceRecordSetCount": 2,
          "CallerReference": "test20150527-1",
          "Config": {
              "Comment": "test",
              "PrivateZone": false
          },
          "Id": "/hostedzone/Z3P5QSUBK4POTI",
          "Name": "www.example.com."
      }
  ],
  "IsTruncated": false,
  "MaxItems": "100"
}
```

The following command lists hosted zones ordered by name, beginning with `www.example.com`:

```
aws route53 list-hosted-zones-by-name --dns-name www.example.com
```

Output:

```
{
  "HostedZones": [
      {
          "ResourceRecordSetCount": 2,
          "CallerReference": "mwunderl20150527-1",
          "Config": {
```

```
                "Comment": "test",
                "PrivateZone": false
            },
            "Id": "/hostedzone/Z3P5QSUBK4POTI",
            "Name": "www.example.com."
        }
    ],
    "DNSName": "www.example.com",
    "IsTruncated": false,
    "MaxItems": "100"
}
```

- For API details, see ListHostedZonesByName in *AWS CLI Command Reference*.

### `list-hosted-zones`

The following code example shows how to use `list-hosted-zones`.

#### AWS CLI

**To list the hosted zones associated with the current AWS account**

The following `list-hosted-zones` command lists summary information about the first 100 hosted zones that are associated with the current AWS account.:

```
aws route53 list-hosted-zones
```

If you have more than 100 hosted zones, or if you want to list them in groups smaller than 100, include the `--max-items` parameter. For example, to list hosted zones one at a time, use the following command:

```
aws route53 list-hosted-zones --max-items 1
```

To view information about the next hosted zone, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, for example:

```
aws route53 list-hosted-zones --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

- For API details, see ListHostedZones in *AWS CLI Command Reference*.

### `list-query-logging-configs`

The following code example shows how to use `list-query-logging-configs`.

**AWS CLI**

**To list query logging configurations**

The following `list-query-logging-configs` example lists information about the first 100 query logging configurations in your AWS account, for the hosted zone `Z1OX3WQEXAMPLE`.

```
aws route53 list-query-logging-configs \
    --hosted-zone-id Z1OX3WQEXAMPLE
```

Output:

```
{
    "QueryLoggingConfigs": [
        {
            "Id": "964ff34e-ae03-4f06-80a2-9683cexample",
            "HostedZoneId": "Z1OX3WQEXAMPLE",
            "CloudWatchLogsLogGroupArn": "arn:aws:logs:us-east-1:111122223333:log-
group:/aws/route53/example.com:*"
        }
    ]
}
```

For more information, see Logging DNS queries in the *Amazon Route 53 Developer Guide*.

- For API details, see ListQueryLoggingConfigs in *AWS CLI Command Reference*.

### `list-resource-record-sets`

The following code example shows how to use `list-resource-record-sets`.

**AWS CLI**

**To list the resource record sets in a hosted zone**

The following `list-resource-record-sets` command lists summary information about the first 100 resource record sets in a specified hosted zone.:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE
```

If the hosted zone contains more than 100 resource record sets, or if you want to list them in groups smaller than 100, include the `--maxitems` parameter. For example, to list resource record sets one at a time, use the following command:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --max-items 1
```

To view information about the next resource record set in the hosted zone, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, for example:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --max-items 1
 --starting-token Z3M3LMPEXAMPLE
```

To view all the resource record sets of a particular name, use the `--query` parameter to filter them out. For example:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --query
 "ResourceRecordSets[?Name == 'example.domain.']"
```

- For API details, see ListResourceRecordSets in *AWS CLI Command Reference*.

## Route 53 domain registration examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 domain registration.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `check-domain-availability`

The following code example shows how to use `check-domain-availability`.

#### AWS CLI

**To determine whether you can register a domain name with Route 53**

The following `check-domain-availability` command returns information about whether the domain name `example.com` is available to be registered using Route 53.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains check-domain-availability \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "Availability": "UNAVAILABLE"
}
```

Route 53 supports a large number of top-level domains (TLDs), such as `.com` and `.jp`, but we don't support all available TLDs. If you check the availability of a domain and Route 53 doesn't support the TLD, `check-domain-availability` returns the following message.

```
An error occurred (UnsupportedTLD) when calling the CheckDomainAvailability
 operation: <top-level domain> tld is not supported.
```

For a list of the TLDs that you can use when registering a domain with Route 53, see Domains That You Can Register with Amazon Route 53 in the *Amazon Route 53 Developer Guide*. For more information about registering domains with Amazon Route 53, see Registering a New Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see CheckDomainAvailability in *AWS CLI Command Reference*.

### `check-domain-transferability`

The following code example shows how to use `check-domain-transferability`.

**AWS CLI**

**To determine whether a domain can be transferred to Route 53**

The following `check-domain-transferability` command returns information about whether you can transfer the domain name `example.com` to Route 53.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains check-domain-transferability \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "Transferability": {
        "Transferable": "UNTRANSFERABLE"
    }
}
```

For more information, see Transferring Registration for a Domain to Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

- For API details, see CheckDomainTransferability in *AWS CLI Command Reference*.

### `delete-tags-for-domain`

The following code example shows how to use `delete-tags-for-domain`.

**AWS CLI**

**To delete tags for a domain**

The following `delete-tags-for-domain` command deletes three tags from the specified domain. Note that you specify only the tag key, not the tag value.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains delete-tags-for-domain \
    --region us-east-1 \
    --domain-name example.com \
    --tags-to-delete accounting-key hr-key engineering-key
```

This command produces no output.

To confirm that the tags were deleted, you can run list-tags-for-domain . For more information, see Tagging Amazon Route 53 Resources in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteTagsForDomain in *AWS CLI Command Reference*.

### `disable-domain-auto-renew`

The following code example shows how to use `disable-domain-auto-renew`.

**AWS CLI**

**To disable automatic renewal of a domain**

The following `disable-domain-auto-renew` command configures Route 53 to *not* automatically renew the domain `example.com` before registration for the domain expires.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains disable-domain-auto-renew \
    --region us-east-1 \
    --domain-name example.com
```

This command produces no output.

To confirm that the setting was changed, you can run get-domain-detail . If automatic renewal is disabled, the value of `AutoRenew` is `False`. For more information about automatic renewal, see Renewing Registration for a Domain <https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html in the *Amazon Route 53 Developer Guide*.

- For API details, see DisableDomainAutoRenew in *AWS CLI Command Reference*.

### `disable-domain-transfer-lock`

The following code example shows how to use `disable-domain-transfer-lock`.

**AWS CLI**

**To disable the transfer lock on a domain**

The following `disable-domain-transfer-lock` command removes the transfer lock on the domain `example.com` so that the domain can be transferred to another registrar. This command changes the `clientTransferProhibited` status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains disable-domain-transfer-lock \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "OperationId": "3f28e0ac-126a-4113-9048-cc930example"
}
```

To confirm that the transfer lock has been changed, you can run get-domain-detail . When the transfer lock is disabled, the value of `StatusList` does *not* include `clientTransferProhibited`.

For more information about the transfer process, see Transferring a Domain from Amazon Route 53 to Another Registrar in the *Amazon Route 53 Developer Guide*.

- For API details, see DisableDomainTransferLock in *AWS CLI Command Reference*.

### `enable-domain-auto-renew`

The following code example shows how to use `enable-domain-auto-renew`.

**AWS CLI**

**To enable automatic renewal of a domain**

The following `enable-domain-auto-renew` command configures Route 53 to automatically renew the domain `example.com` before registration for the domain expires.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains enable-domain-auto-renew \
    --region us-east-1 \
    --domain-name example.com
```

This command produces no output. To confirm that the setting was changed, you can run get-domain-detail . If automatic renewal is enabled, the value of `AutoRenew` is `True`.

For more information about automatic renewal, see Renewing Registration for a Domain <https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html in the *Amazon Route 53 Developer Guide*.

- For API details, see EnableDomainAutoRenew in *AWS CLI Command Reference*.

### `enable-domain-transfer-lock`

The following code example shows how to use `enable-domain-transfer-lock`.

**AWS CLI**

**To enable the transfer lock on a domain**

The following `enable-domain-transfer-lock` command locks the specified domain so that it can't be transferred to another registrar. This command changes the `clientTransferProhibited` status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains enable-domain-transfer-lock \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
```

```
    "OperationId": "3f28e0ac-126a-4113-9048-cc930example"
}
```

To confirm that the transfer lock has been changed, you can run get-domain-detail . When the transfer lock is enabled, the value of `StatusList` includes `clientTransferProhibited`.

For more information about the transfer process, see Transferring a Domain from Amazon Route 53 to Another Registrar in the *Amazon Route 53 Developer Guide*.

- For API details, see EnableDomainTransferLock in *AWS CLI Command Reference*.

### `get-contact-reachability-status`

The following code example shows how to use `get-contact-reachability-status`.

**AWS CLI**

**To determine whether the registrant contact has responded to a confirmation email**

The following `get-contact-reachability-status` command returns information about whether the registrant contact for the specified domain has responded to a confirmation email.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-contact-reachability-status \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "domainName": "example.com",
    "status": "DONE"
}
```

For more information, see Resending Authorization and Confirmation Emails in the *Amazon Route 53 Developer Guide*.

- For API details, see GetContactReachabilityStatus in *AWS CLI Command Reference*.

### `get-domain-detail`

The following code example shows how to use `get-domain-detail`.

**AWS CLI**

**To get detailed information about a specified domain**

The following `get-domain-detail` command displays detailed information about the specified domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-domain-detail \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "DomainName": "example.com",
    "Nameservers": [
        {
            "Name": "ns-2048.awsdns-64.com",
            "GlueIps": []
        },
        {
            "Name": "ns-2049.awsdns-65.net",
            "GlueIps": []
        },
        {
            "Name": "ns-2050.awsdns-66.org",
            "GlueIps": []
        },
        {
            "Name": "ns-2051.awsdns-67.co.uk",
            "GlueIps": []
        }
    ],
    "AutoRenew": true,
    "AdminContact": {
        "FirstName": "Saanvi",
```

```
        "LastName": "Sarkar",
        "ContactType": "COMPANY",
        "OrganizationName": "Example",
        "AddressLine1": "123 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "ssarkar@example.com",
        "ExtraParams": []
    },
    "RegistrantContact": {
        "FirstName": "Alejandro",
        "LastName": "Rosalez",
        "ContactType": "COMPANY",
        "OrganizationName": "Example",
        "AddressLine1": "123 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "arosalez@example.com",
        "ExtraParams": []
    },
    "TechContact": {
        "FirstName": "Wang",
        "LastName": "Xiulan",
        "ContactType": "COMPANY",
        "OrganizationName": "Example",
        "AddressLine1": "123 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "wxiulan@example.com",
        "ExtraParams": []
    },
    "AdminPrivacy": true,
    "RegistrantPrivacy": true,
    "TechPrivacy": true,
    "RegistrarName": "Amazon Registrar, Inc.",
```

```
    "WhoIsServer": "whois.registrar.amazon.com",
    "RegistrarUrl": "http://registrar.amazon.com",
    "AbuseContactEmail": "abuse@registrar.amazon.com",
    "AbuseContactPhone": "+1.2062661000",
    "CreationDate": 1444934889.601,
    "ExpirationDate": 1602787689.0,
    "StatusList": [
        "clientTransferProhibited"
    ]
}
```

- For API details, see GetDomainDetail in *AWS CLI Command Reference*.

### `get-domain-suggestions`

The following code example shows how to use `get-domain-suggestions`.

#### AWS CLI

**To get a list of suggested domain names**

The following `get-domain-suggestions` command displays a list of suggested domain names based on the domain name `example.com`. The response includes only domain names that are available. This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-domain-suggestions \
    --region us-east-1 \
    --domain-name example.com \
    --suggestion-count 10 \
    --only-available
```

Output:

```
{
    "SuggestionsList": [
        {
            "DomainName": "egzaampal.com",
            "Availability": "AVAILABLE"
        },
        {
```

```
            "DomainName": "examplelaw.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "examplehouse.net",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "homeexample.net",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "examplelist.com",
            "Availability": "AVAILABLE"
       },
        {
            "DomainName": "examplenews.net",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "officeexample.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "exampleworld.com",
            "Availability": "AVAILABLE"
        },
        {
            "DomainName": "exampleart.com",
            "Availability": "AVAILABLE"
        }
    ]
}
```

- For API details, see GetDomainSuggestions in *AWS CLI Command Reference*.

### `get-operation-detail`

The following code example shows how to use `get-operation-detail`.

#### AWS CLI

**To get the current status of an operation**

Some domain registration operations operate asynchronously and return a response before they finish. These operations return an operation ID that you can use to get the current status. The following `get-operation-detail` command returns the status of the specified operation.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-operation-detail \
    --region us-east-1 \
    --operation-id edbd8d63-7fe7-4343-9bc5-54033example
```

Output:

```
{
    "OperationId": "edbd8d63-7fe7-4343-9bc5-54033example",
    "Status": "SUCCESSFUL",
    "DomainName": "example.com",
    "Type": "DOMAIN_LOCK",
    "SubmittedDate": 1573749367.864
}
```

- For API details, see GetOperationDetail in *AWS CLI Command Reference*.

### `list-domains`

The following code example shows how to use `list-domains`.

**AWS CLI**

**To list the domains that are registered with the current AWS account**

The following `list-domains` command lists summary information about the domains that are registered with the current AWS account.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-domains
```

```
    --region us-east-1
```

Output:

```
{
    "Domains": [
        {
            "DomainName": "example.com",
            "AutoRenew": true,
            "TransferLock": true,
            "Expiry": 1602712345.0
        },
        {
            "DomainName": "example.net",
            "AutoRenew": true,
            "TransferLock": true,
            "Expiry": 1602723456.0
        },
        {
            "DomainName": "example.org",
            "AutoRenew": true,
            "TransferLock": true,
            "Expiry": 1602734567.0
        }
    ]
}
```

- For API details, see ListDomains in *AWS CLI Command Reference*.

### `list-operations`

The following code example shows how to use `list-operations`.

#### AWS CLI

**To list the status of operations that return an operation ID**

Some domain registration operations run asynchronously and return a response before they finish. These operations return an operation ID that you can use to get the current status. The following `list-operations` command lists summary information, including the status, about the current domain-registration operations.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-operations
    --region us-east-1
```

Output:

```
{
    "Operations": [
        {
            "OperationId": "aab9822f-1da0-4bf3-8a15-fd4e0example",
            "Status": "SUCCESSFUL",
            "Type": "DOMAIN_LOCK",
            "SubmittedDate": 1455321739.986
        },
        {
            "OperationId": "c24379ed-76be-42f8-bdad-9379bexample",
            "Status": "SUCCESSFUL",
            "Type": "UPDATE_NAMESERVER",
            "SubmittedDate": 1468960475.109
        },
        {
            "OperationId": "f47e1297-ef9e-4c2b-ae1e-a5fcbexample",
            "Status": "SUCCESSFUL",
            "Type": "RENEW_DOMAIN",
            "SubmittedDate": 1473561835.943
        },
        {
            "OperationId": "75584f23-b15f-459e-aed7-dc6f5example",
            "Status": "SUCCESSFUL",
            "Type": "UPDATE_DOMAIN_CONTACT",
            "SubmittedDate": 1547501003.41
        }
    ]
}
```

The output includes all the operations that return an operation ID and that you have performed on all the domains that you have ever registered using the current AWS account. If you want to get only the operations that you submitted after a specified date, you can include the `submitted-since` parameter and specify a date in Unix format and Coordinated Universal

Time (UTC). The following command gets the status of all operations that were submitted after 12:00 am UTC on January 1, 2020.

```
aws route53domains list-operations \
    --submitted-since 1577836800
```

- For API details, see ListOperations in *AWS CLI Command Reference*.

### `list-tags-for-domain`

The following code example shows how to use `list-tags-for-domain`.

**AWS CLI**

**To list tags for a domain**

The following `list-tags-for-domain` command lists the tags that are currently associated with the specified domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-tags-for-domain \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "TagList": [
        {
            "Key": "key1",
            "Value": "value1"
        },
        {
            "Key": "key2",
            "Value": "value2"
        }
    ]
}
```

For more information, see Tagging Amazon Route 53 Resources in the *Amazon Route 53 Developer Guide*.

- For API details, see ListTagsForDomain in *AWS CLI Command Reference*.

### `register-domain`

The following code example shows how to use `register-domain`.

#### AWS CLI

**To register a domain**

The following `register-domain` command registers a domain, retrieving all parameter values from a JSON-formatted file.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains register-domain \
    --region us-east-1 \
    --cli-input-json file://register-domain.json
```

Contents of `register-domain.json`:

```
{
    "DomainName": "example.com",
    "DurationInYears": 1,
    "AutoRenew": true,
    "AdminContact": {
        "FirstName": "Martha",
        "LastName": "Rivera",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "mrivera@example.com"
    },
    "RegistrantContact": {
```

```
        "FirstName": "Li",
        "LastName": "Juan",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "ljuan@example.com"
    },
    "TechContact": {
        "FirstName": "Mateo",
        "LastName": "Jackson",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "mjackson@example.com"
    },
    "PrivacyProtectAdminContact": true,
    "PrivacyProtectRegistrantContact": true,
    "PrivacyProtectTechContact": true
}
```

Output:

```
{
    "OperationId": "b114c44a-9330-47d1-a6e8-a0b11example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail .

For more information, see Registering a New Domain in the *Amazon Route 53 Developer Guide*.

For information about which top-level domains (TLDs) require values for `ExtraParams` and what the valid values are, see ExtraParam in the *Amazon Route 53 API Reference*.

- For API details, see RegisterDomain in *AWS CLI Command Reference*.

### `renew-domain`

The following code example shows how to use `renew-domain`.

**AWS CLI**

**To renew a domain**

The following `renew-domain` command renews the specified domain for five years. To get the value for `current-expiry-year`, use the `get-domain-detail` command, and convert the value of `ExpirationDate` from Unix format.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains renew-domain \
    --region us-east-1 \
    --domain-name example.com \
    --duration-in-years 5 \
    --current-expiry-year 2020
```

Output:

```
{
    "OperationId": "3f28e0ac-126a-4113-9048-cc930example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail.

The registry for each top-level domain (TLD), such as .com or .org, controls the maximum number of years that you can renew a domain for. To get the maximum renewal period for your domain, see the "Registration and Renewal Period" section for your TLD in Domains That You Can Register with Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

For more information, see Renewing Registration for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see RenewDomain in *AWS CLI Command Reference*.

### `resend-contact-reachability-email`

The following code example shows how to use `resend-contact-reachability-email`.

**AWS CLI**

**To resend the confirmation email to the current email address for the registrant contact**

The following `resend-contact-reachability-email` command resends the confirmation email to the current email address for the registrant contact for the example.com domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains resend-contact-reachability-email \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "domainName": "example.com",
    "emailAddress": "moliveira@example.com",
    "isAlreadyVerified": true
}
```

If the value of `isAlreadyVerified` is `true`, as in this example, the registrant contact has already confirmed that the specified email address is reachable.

For more information, see Resending Authorization and Confirmation Emails in the *Amazon Route 53 Developer Guide*.

- For API details, see ResendContactReachabilityEmail in *AWS CLI Command Reference*.

### `retrieve-domain-auth-code`

The following code example shows how to use `retrieve-domain-auth-code`.

**AWS CLI**

**To get the authorization code for a domain so you can transfer the domain to another registrar**

The following `retrieve-domain-auth-code` command gets the current authorization code for the example.com domain. You give this value to another domain registrar when you want to transfer the domain to that registrar.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains retrieve-domain-auth-code \
    --region us-east-1 \
    --domain-name example.com
```

Output:

```
{
    "AuthCode": ")o!v3dJeXampLe"
}
```

For more information, see Transferring a Domain from Amazon Route 53 to Another Registrar in the *Amazon Route 53 Developer Guide*.

- For API details, see RetrieveDomainAuthCode in *AWS CLI Command Reference*.

### `transfer-domain`

The following code example shows how to use `transfer-domain`.

**AWS CLI**

**To transfer a domain to Amazon Route 53**

The following `transfer-domain` command transfers a domain to Route 53, with the parameters provided by the JSON-formatted file `C:\temp\transfer-domain.json`.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains transfer-domain \
    --region us-east-1 \
    --cli-input-json file://C:\temp\transfer-domain.json
```

Contents of `transfer-domain.json`:

```
{
    "DomainName": "example.com",
    "DurationInYears": 1,
    "Nameservers": [
        {
            "Name": "ns-2048.awsdns-64.com"
        },
        {
            "Name": "ns-2049.awsdns-65.net"
        },
        {
            "Name": "ns-2050.awsdns-66.org"
        },
        {
            "Name": "ns-2051.awsdns-67.co.uk"
        }
    ],
    "AuthCode": ")o!v3dJeXampLe",
    "AutoRenew": true,
    "AdminContact": {
        "FirstName": "Martha",
        "LastName": "Rivera",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "mrivera@example.com"
    },
    "RegistrantContact": {
        "FirstName": "Li",
        "LastName": "Juan",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
```

```
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "ljuan@example.com"
    },
    "TechContact": {
        "FirstName": "Mateo",
        "LastName": "Jackson",
        "ContactType": "PERSON",
        "OrganizationName": "Example",
        "AddressLine1": "1 Main Street",
        "City": "Anytown",
        "State": "WA",
        "CountryCode": "US",
        "ZipCode": "98101",
        "PhoneNumber": "+1.8005551212",
        "Email": "mjackson@example.com"
    },
    "PrivacyProtectAdminContact": true,
    "PrivacyProtectRegistrantContact": true,
    "PrivacyProtectTechContact": true
}
```

Output:

```
{
    "OperationId": "b114c44a-9330-47d1-a6e8-a0b11example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail .

For more information, see Transferring Registration for a Domain to Amazon Route 53 in the *Amazon Route 53 Developer Guide*.

- For API details, see TransferDomain in *AWS CLI Command Reference*.

### `update-domain-contact-privacy`

The following code example shows how to use `update-domain-contact-privacy`.

**AWS CLI**

**To update the privacy settings for the contacts for a domain**

The following `update-domain-contact-privacy` command turns off privacy protection for the administrative contact for the example.com domain. This command runs only in the `us-east-1` Region.

If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-contact-privacy \
    --region us-east-1 \
    --domain-name example.com \
    --no-admin-privacy
```

Output:

```
{
    "OperationId": "b3a219e9-d801-4244-b533-b7256example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see get-operation-detail .

For more information, see Enabling or Disabling Privacy Protection for Contact Information for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateDomainContactPrivacy in *AWS CLI Command Reference*.

### `update-domain-contact`

The following code example shows how to use `update-domain-contact`.

**AWS CLI**

**To update the contact information for a domain**

The following `update-domain-contact` command updates the contact information for a domain, getting the parameters from the JSON-formatted file `C:\temp\update-domain-contact.json`.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-contact \
    --region us-east-1 \
    --cli-input-json file://C:\temp\update-domain-contact.json
```

Contents of `update-domain-contact.json`:

```
{
    "AdminContact": {
        "AddressLine1": "101 Main Street",
        "AddressLine2": "Suite 1a",
        "City": "Seattle",
        "ContactType": "COMPANY",
        "CountryCode": "US",
        "Email": "w.xiulan@example.com",
        "FirstName": "Wang",
        "LastName": "Xiulan",
        "OrganizationName": "Example",
        "PhoneNumber": "+1.8005551212",
        "State": "WA",
        "ZipCode": "98101"
    },
    "DomainName": "example.com",
    "RegistrantContact": {
        "AddressLine1": "101 Main Street",
        "AddressLine2": "Suite 1a",
        "City": "Seattle",
        "ContactType": "COMPANY",
        "CountryCode": "US",
        "Email": "w.xiulan@example.com",
        "FirstName": "Wang",
        "LastName": "Xiulan",
        "OrganizationName": "Example",
        "PhoneNumber": "+1.8005551212",
        "State": "WA",
        "ZipCode": "98101"
    },
    "TechContact": {
        "AddressLine1": "101 Main Street",
        "AddressLine2": "Suite 1a",
        "City": "Seattle",
```

```
        "ContactType": "COMPANY",
        "CountryCode": "US",
        "Email": "w.xiulan@example.com",
        "FirstName": "Wang",
        "LastName": "Xiulan",
        "OrganizationName": "Example",
        "PhoneNumber": "+1.8005551212",
        "State": "WA",
        "ZipCode": "98101"
    }
}
```

Output:

```
{
    "OperationId": "b3a219e9-d801-4244-b533-b7256example"
}
```

To confirm that the operation succeeded, you can run get-domain-detail . For more information, see Updating Contact Information for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateDomainContact in *AWS CLI Command Reference*.

### `update-domain-nameservers`

The following code example shows how to use `update-domain-nameservers`.

#### AWS CLI

**To update the name servers for a domain**

The following `update-domain-nameservers` command updates the name servers for a domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-nameservers \
    --region us-east-1 \
    --domain-name example.com \
    --nameservers Name=ns-1.awsdns-01.org Name=ns-2.awsdns-02.co.uk
 Name=ns-3.awsdns-03.net Name=ns-4.awsdns-04.com
```

Output:

```
{
    "OperationId": "f1691ec4-0e7a-489e-82e0-b19d3example"
}
```

To confirm that the operation succeeded, you can run get-domain-detail .

For more information, see Adding or Changing Name Servers and Glue Records for a Domain in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateDomainNameservers in *AWS CLI Command Reference*.

### `update-tags-for-domain`

The following code example shows how to use `update-tags-for-domain`.

**AWS CLI**

**To add or update tags for a domain**

The following `update-tags-for-domain` command adds or updates two keys and the corresponding values for the example.com domain. To update the value for a key, just include the key and the new value. You can add or update tags in only one domain at a time.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-tags-for-domain \
    --region us-east-1 \
    --domain-name example.com \
    --tags-to-update "Key=key1,Value=value1" "Key=key2,Value=value2"
```

This command produces no output. To confirm that the tags were added or updated, you can run list-tags-for-domain .

For more information, see Tagging Amazon Route 53 Resources in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateTagsForDomain in *AWS CLI Command Reference*.

### `view-billing`

The following code example shows how to use `view-billing`.

**AWS CLI**

**To get billing information for domain registration charges for the current AWS account**

The following `view-billing` command returns all the domain-related billing records for the current account for the period from January 1, 2018 (1514764800 in Unix time) and midnight on December 31, 2019 (1577836800 in Unix time).

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains view-billing \
    --region us-east-1 \
    --start-time 1514764800 \
    --end-time 1577836800
```

Output:

```
{
    "BillingRecords": [
        {
            "DomainName": "example.com",
            "Operation": "RENEW_DOMAIN",
            "InvoiceId": "149962827",
            "BillDate": 1536618063.181,
            "Price": 12.0
        },
        {
            "DomainName": "example.com",
            "Operation": "RENEW_DOMAIN",
            "InvoiceId": "290913289",
            "BillDate": 1568162630.884,
            "Price": 12.0
        }
    ]
}
```

For more information, see ViewBilling in the *Amazon Route 53 API Reference*.

- For API details, see ViewBilling in *AWS CLI Command Reference*.

## Route 53 Resolver examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 Resolver.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `associate-firewall-rule-group`

The following code example shows how to use `associate-firewall-rule-group`.

**AWS CLI**

**To associate a firewall rule group with a VPC**

The following `associate-firewall-rule-group` example associates a DNS Firewall rule group with an Amazon VPC.

```
aws route53resolver associate-firewall-rule-group \
    --name test-association \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --vpc-id vpc-31e92222 \
    --priority 101
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 101,
        "MutationProtection": "DISABLED",
        "Status": "UPDATING",
        "StatusMessage": "Creating Firewall Rule Group Association",
        "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:47:48.755768Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateFirewallRuleGroup in *AWS CLI Command Reference*.

### `associate-resolver-endpoint-ip-address`

The following code example shows how to use `associate-resolver-endpoint-ip-address`.

#### AWS CLI

**To associate another IP address with a Resolver endpoint**

The following `associate-resolver-endpoint-ip-address` example associates another IP address with an inbound Resolver endpoint. If you specify only a subnet ID and omit the IP address from the `--ip-address` parameter, Resolver chooses an IP address for you from among the available IP addresses in the specified subnet.

```
aws route53resolver associate-resolver-endpoint-ip-address \
    --resolver-endpoint-id rslvr-in-497098ad5example \
    --ip-address="SubnetId=subnet-12d8exam,Ip=192.0.2.118"
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-497098ad5example",
        "CreatorRequestId": "AWSConsole.25.0123456789",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-497098ad5example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 3,
        "HostVPCId": "vpc-304bexam",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Resolver Endpoint",
        "CreationTime": "2020-01-02T23:25:45.538Z",
        "ModificationTime": "2020-01-02T23:25:45.538Z"
    }
}
```

For more information, see Values That You Specify When You Create or Edit Inbound Endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateResolverEndpointIpAddress in *AWS CLI Command Reference*.

### `associate-resolver-rule`

The following code example shows how to use `associate-resolver-rule`.

#### AWS CLI

**To associate a Resolver rule with a VPC**

The following `associate-resolver-rule` example associates a Resolver rule with an Amazon VPC. After you run the command, Resolver starts to forward DNS queries to your network based on the settings in the rule, such as the domain name of the queries that are forwarded.

```
aws route53resolver associate-resolver-rule \
    --name my-resolver-rule-association \
    --resolver-rule-id rslvr-rr-42b60677c0example \
    --vpc-id vpc-304bexam
```

Output:

```
{
    "ResolverRuleAssociation": {
        "Id": "rslvr-rrassoc-d61cbb2c8bexample",
        "ResolverRuleId": "rslvr-rr-42b60677c0example",
        "Name": "my-resolver-rule-association",
        "VPCId": "vpc-304bexam",
        "Status": "CREATING",
        "StatusMessage": "[Trace id: 1-5dc5a8fa-ec2cc480d2ef07617example] Creating
 the association."
    }
}
```

For more information, see Forwarding Outbound DNS Queries to Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see AssociateResolverRule in *AWS CLI Command Reference*.

### `create-firewall-domain-list`

The following code example shows how to use `create-firewall-domain-list`.

#### AWS CLI

**To create a Route 53 Resolver DNS Firewall domain list**

The following `create-firewall-domain-list` example creates a Route 53 Resolver DNS Firewall domain list, named test, in your AWS account.

```
aws route53resolver create-firewall-domain-list \
    --creator-request-id my-request-id \
    --name test
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-d61cbb2cbexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/
rslvr-fdl-d61cbb2cbexample",
```

```
        "Name": "test",
        "DomainCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Domain List",
        "CreatorRequestId": "my-request-id",
        "CreationTime": "2021-05-25T15:55:51.115365Z",
        "ModificationTime": "2021-05-25T15:55:51.115365Z"
    }
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateFirewallDomainList in *AWS CLI Command Reference*.

### `create-firewall-rule-group`

The following code example shows how to use `create-firewall-rule-group`.

#### AWS CLI

**To create a Firewall rule group**

The following `create-firewall-rule-group` example creates a DNS Firewall rule group.

```
aws route53resolver create-firewall-rule-group \
    --creator-request-id my-request-id \
    --name test
```

Output:

```
{
    "FirewallRuleGroup": {
        "Id": "rslvr-frg-47f93271fexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/
rslvr-frg-47f93271fexample",
        "Name": "test",
        "RuleCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Rule Group",
        "OwnerId": "123456789012",
        "CreatorRequestId": "my-request-id",
```

```
        "ShareStatus": "NOT_SHARED",
        "CreationTime": "2021-05-25T18:59:26.490017Z",
        "ModificationTime": "2021-05-25T18:59:26.490017Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateFirewallRuleGroup in *AWS CLI Command Reference*.

### `create-firewall-rule`

The following code example shows how to use `create-firewall-rule`.

**AWS CLI**

**To create a firewall rule**

The following `create-firewall-rule` example creates a firewall rule in a DNS Firewall rule for domains listed in a DNS Firewall domain list.

```
aws route53resolver create-firewall-rule \
    --name allow-rule \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample \
    --priority 101 \
    --action ALLOW
```

Output:

```
{
    "FirewallRule": {
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
        "Name": "allow-rule",
        "Priority": 101,
        "Action": "ALLOW",
        "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:44:00.346093Z",
        "ModificationTime": "2021-05-25T21:44:00.346093Z"
```

```
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateFirewallRule in *AWS CLI Command Reference*.

### `create-resolver-endpoint`

The following code example shows how to use `create-resolver-endpoint`.

**AWS CLI**

**To create an inbound Resolver endpoint**

The following `create-resolver-endpoint` example creates an inbound Resolver endpoint. You can use the same command to create both inbound and outbound endpoints.

aws route53resolver create-resolver-endpoint --name my-inbound-endpoint --creator-request-id 2020-01-01-18:47 --security-group-ids "sg-f62bexam" --direction INBOUND --ip-addresses SubnetId=subnet-ba47exam,Ip=192.0.2.255 SubnetId=subnet-12d8exam,Ip=192.0.2.254

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-f9ab8a03f1example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-f9ab8a03f1example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304examp",
        "Status": "CREATING",
        "StatusMessage": "[Trace id: 1-5dc1ff84-f3477826e4a190025example] Creating
 the Resolver Endpoint",
        "CreationTime": "2020-01-01T23:02:29.583Z",
```

```
        "ModificationTime": "2020-01-01T23:02:29.583Z"
    }
}
```

**To create an outbound Resolver endpoint**

The following `create-resolver-endpoint` example creates an outbound resolver endpoint using the values in the JSON-formatted document `create-outbound-resolver-endpoint.json`.

```
aws route53resolver create-resolver-endpoint \
    --cli-input-json file://c:\temp\create-outbound-resolver-endpoint.json
```

Contents of `create-outbound-resolver-endpoint.json`:

```
{
   "CreatorRequestId": "2020-01-01-18:47",
   "Direction": "OUTBOUND",
   "IpAddresses": [
      {
         "Ip": "192.0.2.255",
         "SubnetId": "subnet-ba47exam"
      },
      {
         "Ip": "192.0.2.254",
         "SubnetId": "subnet-12d8exam"
      }
   ],
   "Name": "my-outbound-endpoint",
   "SecurityGroupIds": [ "sg-05cd7b25d6example" ],
   "Tags": [
      {
         "Key": "my-key-name",
         "Value": "my-key-value"
      }
   ]
}
```

For more information, see Resolving DNS Queries Between VPCs and Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see CreateResolverEndpoint in *AWS CLI Command Reference*.

## `create-resolver-rule`

The following code example shows how to use `create-resolver-rule`.

### AWS CLI

#### To create a Resolver rule

The following `create-resolver-rule` example creates a Resolver forwarding rule. The rule uses the outbound endpoint rslvr-out-d5e5920e37example to forward DNS queries for `example.com` to the IP addresses 10.24.8.75 and 10.24.8.156.

```
aws route53resolver create-resolver-rule \
    --creator-request-id 2020-01-02-18:47 \
    --domain-name example.com \
    --name my-rule \
    --resolver-endpoint-id rslvr-out-d5e5920e37example \
    --rule-type FORWARD \
    --target-ips "Ip=10.24.8.75" "Ip=10.24.8.156"
```

Output:

```
{
    "ResolverRule": {
        "Status": "COMPLETE",
        "RuleType": "FORWARD",
        "ResolverEndpointId": "rslvr-out-d5e5920e37example",
        "Name": "my-rule",
        "DomainName": "example.com.",
        "CreationTime": "2022-05-10T21:35:30.923187Z",
        "TargetIps": [
            {
                "Ip": "10.24.8.75",
                "Port": 53
            },
            {
                "Ip": "10.24.8.156",
                "Port": 53
            }
        ],
        "CreatorRequestId": "2022-05-10-16:33",
        "ModificationTime": "2022-05-10T21:35:30.923187Z",
```

```
        "ShareStatus": "NOT_SHARED",
        "Arn": "arn:aws:route53resolver:us-east-1:111117012054:resolver-rule/rslvr-
rr-b1e0b905e93611111",
        "OwnerId": "111111111111",
        "Id": "rslvr-rr-rslvr-rr-b1e0b905e93611111",
        "StatusMessage": "[Trace id: 1-22222222-3e56afcc71a3724664f22e24]
 Successfully created Resolver Rule."
    }
}
```

- For API details, see CreateResolverRule in *AWS CLI Command Reference*.

### `delete-firewall-domain-list`

The following code example shows how to use `delete-firewall-domain-list`.

#### AWS CLI

**To delete a Route 53 Resolver DNS Firewall domain list**

The following `delete-firewall-domain-list` example deletes a Route 53 Resolver DNS Firewall domain list, named test, in your AWS account.

```
aws route53resolver delete-firewall-domain-list \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-9e956e9ffexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/
rslvr-fdl-9e956e9ffexample",
        "Name": "test",
        "DomainCount": 6,
        "Status": "DELETING",
        "StatusMessage": "Deleting the Firewall Domain List",
        "CreatorRequestId": "my-request-id",
        "CreationTime": "2021-05-25T15:55:51.115365Z",
        "ModificationTime": "2021-05-25T18:58:05.588024Z"
    }
```

```
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteFirewallDomainList in *AWS CLI Command Reference*.

### `delete-firewall-rule-group`

The following code example shows how to use `delete-firewall-rule-group`.

#### AWS CLI

**To delete a firewall rule group**

The following `delete-firewall-rule-group` example deletes a firewall rule group.

```
aws route53resolver delete-firewall-rule-group \
    --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
    "FirewallRuleGroup": {
        "Id": "rslvr-frg-47f93271fexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/
rslvr-frg-47f93271fexample",
        "Name": "test",
        "RuleCount": 0,
        "Status": "UPDATING",
        "StatusMessage": "Updating Firewall Rule Group",
        "OwnerId": "123456789012",
        "CreatorRequestId": "my-request-id",
        "ShareStatus": "NOT_SHARED",
        "CreationTime": "2021-05-25T18:59:26.490017Z",
        "ModificationTime": "2021-05-25T21:51:53.028688Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteFirewallRuleGroup in *AWS CLI Command Reference*.

### `delete-firewall-rule`

The following code example shows how to use `delete-firewall-rule`.

#### AWS CLI

**To delete a firewall rule**

The following `delete-firewall-rule` example deletes a specified firewall rule.

```
aws route53resolver delete-firewall-rule \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample
```

Output:

```
{
    "FirewallRule": {
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
        "Name": "allow-rule",
        "Priority": 102,
        "Action": "ALLOW",
        "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:44:00.346093Z",
        "ModificationTime": "2021-05-25T21:45:59.611600Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see DeleteFirewallRule in *AWS CLI Command Reference*.

### `delete-resolver-endpoint`

The following code example shows how to use `delete-resolver-endpoint`.

#### AWS CLI

**To delete a Resolver endpoint**

The following `delete-resolver-endpoint` example deletes the specified endpoint.

**Important** If you delete an inbound endpoint, DNS queries from your network are no longer forwarded to Resolver in the VPC that you specified in the endpoint. If you delete an outbound endpoint, Resolver stops forwarding DNS queries from your VPC to your network for rules that specify the deleted outbound endpoint.

```
aws route53resolver delete-resolver-endpoint \
    --resolver-endpoint-id rslvr-in-497098ad59example
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-497098ad59example",
        "CreatorRequestId": "AWSConsole.25.157290example",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-497098ad59example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 5,
        "HostVPCId": "vpc-304bexam",
        "Status": "DELETING",
        "StatusMessage": "[Trace id: 1-5dc5b658-811b5be0922bbc382example] Deleting
 ResolverEndpoint.",
        "CreationTime": "2020-01-01T23:25:45.538Z",
        "ModificationTime": "2020-01-02T23:25:45.538Z"
    }
}
```

- For API details, see DeleteResolverEndpoint in *AWS CLI Command Reference*.

## `delete-resolver-rule`

The following code example shows how to use `delete-resolver-rule`.

### AWS CLI

#### To delete a Resolver rule

The following `delete-resolver-rule` example deletes the specified rule.

**Note** If a rule is associated with any VPCs, you must first disassociate the rule from the VPCs before you can delete it.

```
aws route53resolver delete-resolver-rule \
    --resolver-rule-id rslvr-rr-5b3809426bexample
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-5b3809426bexample",
        "CreatorRequestId": "2020-01-03-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/rslvr-
rr-5b3809426bexample",
        "DomainName": "zenith.example.com.",
        "Status": "DELETING",
        "StatusMessage": "[Trace id: 1-5dc5e05b-602e67b052cb74f05example] Deleting
 Resolver Rule.",
        "RuleType": "FORWARD",
        "Name": "my-resolver-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.50",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-d5e5920e3example",
        "OwnerId": "111122223333",
        "ShareStatus": "NOT_SHARED"
    }
}
```

- For API details, see DeleteResolverRule in *AWS CLI Command Reference*.

## `disassociate-firewall-rule-group`

The following code example shows how to use `disassociate-firewall-rule-group`.

### AWS CLI

#### To disassociate a firewall rule group from a VPC

The following `disassociate-firewall-rule-group` example disassociates a DNS Firewall rule group from an Amazon VPC.

```
aws route53resolver disassociate-firewall-rule-group \
    --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 103,
        "MutationProtection": "DISABLED",
        "Status": "DELETING",
        "StatusMessage": "Deleting the Firewall Rule Group Association",
        "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:51:02.377887Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the *Amazon Route 53 Developer Guide*.

- For API details, see DisassociateFirewallRuleGroup in *AWS CLI Command Reference*.

## `disassociate-resolver-endpoint-ip-address`

The following code example shows how to use `disassociate-resolver-endpoint-ip-address`.

### AWS CLI

#### To disassociate an IP address from a Resolver endpoint

The following `disassociate-resolver-endpoint-ip-address` example removes an IP address from a specified Resolver inbound or outbound endpoint.

**Note** An endpoint must have at least two IP addresses. If an endpoint currently has only two IP addresses and you want to replace one address with another address, you must first use associate-resolver-endpoint-ip-address to associate the new IP address. Then you can disassociate one of the original IP addresses from the endpoint.

```
aws route53resolver disassociate-resolver-endpoint-ip-address \
    --resolver-endpoint-id rslvr-in-f9ab8a03f1example \
    --ip-address="SubnetId=subnet-12d8a459,Ip=172.31.40.121"
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-f9ab8a03f1example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-f9ab8a03f1example",
        "Name": "my-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 3,
        "HostVPCId": "vpc-304bexam",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Resolver Endpoint",
        "CreationTime": "2020-01-01T23:02:29.583Z",
        "ModificationTime": "2020-01-05T23:02:29.583Z"
    }
}
```

- For API details, see DisassociateResolverEndpointIpAddress in *AWS CLI Command Reference*.

### `disassociate-resolver-rule`

The following code example shows how to use `disassociate-resolver-rule`.

#### AWS CLI

**To disassociate a Resolver rule from an Amazon VPC**

The following `disassociate-resolver-rule` example removes the association between the specified Resolver rule and the specified VPC. You can disassociate a rule from a VPC in the following circumstances:

For DNS queries that originate in this VPC, you want Resolver to stop forwarding queries to your network for the domain name that is specified in the rule.You want to delete the forwarding rule. If a rule is currently associated with one or more VPCs, you must disassociate the rule from all VPCs before you can delete it.

```
aws route53resolver disassociate-resolver-rule \
    --resolver-rule-id rslvr-rr-4955cb98ceexample \
    --vpc-id vpc-304bexam
```

Output:

```
{
    "ResolverRuleAssociation": {
        "Id": "rslvr-rrassoc-322f4e8b9cexample",
        "ResolverRuleId": "rslvr-rr-4955cb98ceexample",
        "Name": "my-resolver-rule-association",
        "VPCId": "vpc-304bexam",
        "Status": "DELETING",
        "StatusMessage": "[Trace id: 1-5dc5ffa2-a26c38004c1f94006example] Deleting
 Association"
    }
}
```

- For API details, see DisassociateResolverRule in *AWS CLI Command Reference*.

### `get-firewall-config`

The following code example shows how to use `get-firewall-config`.

#### AWS CLI

**To get a firewall config for a VPC**

The following `get-firewall-config` example retrieves the DNS Firewall behavior for the specified VPC.

```
aws route53resolver get-firewall-config \
```

```
    --resource-id vpc-31e92222
```

Output:

```
{
    "FirewallConfig": {
        "Id": "rslvr-fc-86016850cexample",
        "ResourceId": "vpc-31e9222",
        "OwnerId": "123456789012",
        "FirewallFailOpen": "DISABLED"
    }
}
```

For more information, see DNS Firewall VPC configuration in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallConfig in *AWS CLI Command Reference*.

### `get-firewall-domain-list`

The following code example shows how to use `get-firewall-domain-list`.

**AWS CLI**

**To get a Route 53 Resolver DNS Firewall domain list**

The following `get-firewall-domain-list` example retrieves the domain list with the ID you specify.

```
aws route53resolver get-firewall-domain-list \
    --firewall-domain-list-id rslvr-fdl-42b60677cexample
```

Output:

```
{
    "FirewallDomainList": {
        "Id": "rslvr-fdl-9e956e9ffexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123457689012:firewall-domain-list/
rslvr-fdl-42b60677cexample",
        "Name": "test",
```

```
        "DomainCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Domain List",
        "CreatorRequestId": "my-request-id",
        "CreationTime": "2021-05-25T15:55:51.115365Z",
        "ModificationTime": "2021-05-25T15:55:51.115365Z"
    }
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallDomainList in *AWS CLI Command Reference*.

### `get-firewall-rule-group-association`

The following code example shows how to use `get-firewall-rule-group-association`.

#### AWS CLI

**To get a firewall rule group association**

The following `get-firewall-rule-group-association` example retrieves a firewall rule group association.

```
aws route53resolver get-firewall-rule-group-association \
    --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 101,
        "MutationProtection": "DISABLED",
        "Status": "COMPLETE",
        "StatusMessage": "Finished rule group association update",
```

```
        "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:47:48.755768Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallRuleGroupAssociation in *AWS CLI Command Reference*.

### `get-firewall-rule-group-policy`

The following code example shows how to use `get-firewall-rule-group-policy`.

#### AWS CLI

**To get an AWS IAM policy**

The following `get-firewall-rule-group-policy` example gets the AWS Identity and Access Management (AWS IAM) policy for sharing the specified rule group.

```
aws route53resolver get-firewall-rule-group-policy \
    --arn arn:aws:route53resolver:us-west-2:AWS_ACCOUNT_ID:firewall-rule-group/
rslvr-frg-47f93271fexample
```

Output:

```
{
    "FirewallRuleGroupPolicy": "{\"Version\":\"2012-10-17\",
\"Statement\":[{\"Sid\":\"test\",\"Effect\":\"Allow\",\"Principal
\":{\"AWS\":\"arn:aws:iam::AWS_ACCOUNT_ID:root\"},\"Action\":
[\"route53resolver:GetFirewallRuleGroup\",\"route53resolver:ListFirewallRuleGroups
\"],\"Resource\":\"arn:aws:route53resolver:us-east-1:AWS_ACCOUNT_ID:firewall-rule-
group/rslvr-frg-47f93271fexample\"}]}"
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallRuleGroupPolicy in *AWS CLI Command Reference*.

### `get-firewall-rule-group`

The following code example shows how to use `get-firewall-rule-group`.

#### AWS CLI

**To get a Firewall rule group**

The following `get-firewall-rule-group` example retrieves information about a DNS Firewall rule group with the ID you provide.

```
aws route53resolver get-firewall-rule-group \
    --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
    "FirewallRuleGroup": {
        "Id": "rslvr-frg-47f93271fexample",
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/
rslvr-frg-47f93271fexample",
        "Name": "test",
        "RuleCount": 0,
        "Status": "COMPLETE",
        "StatusMessage": "Created Firewall Rule Group",
        "OwnerId": "123456789012",
        "CreatorRequestId": "my-request-id",
        "ShareStatus": "NOT_SHARED",
        "CreationTime": "2021-05-25T18:59:26.490017Z",
        "ModificationTime": "2021-05-25T18:59:26.490017Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see GetFirewallRuleGroup in *AWS CLI Command Reference*.

### `get-resolver-endpoint`

The following code example shows how to use `get-resolver-endpoint`.

**AWS CLI**

**To get information about a Resolver endpoint**

The following `get-resolver-endpoint` example displays details for the outbound specified endpoint. You can use `get-resolver-endpoint` for both inbound and outbound endpoints by specifying the applicable endpoint ID.

```
aws route53resolver get-resolver-endpoint \
    --resolver-endpoint-id rslvr-out-d5e5920e37example
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-out-d5e5920e37example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-out-d5e5920e37example",
        "Name": "my-outbound-endpoint",
        "SecurityGroupIds": [
            "sg-05cd7b25d6example"
        ],
        "Direction": "OUTBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304bexam",
        "Status": "OPERATIONAL",
        "StatusMessage": "This Resolver Endpoint is operational.",
        "CreationTime": "2020-01-01T23:50:50.979Z",
        "ModificationTime": "2020-01-02T23:50:50.979Z"
    }
}
```

For more information, see Values That You Specify When You Create or Edit Inbound Endpoints in the *Amazon Route 53 Developer Guide*.

- For API details, see GetResolverEndpoint in *AWS CLI Command Reference*.

## `get-resolver-rule-association`

The following code example shows how to use `get-resolver-rule-association`.

**AWS CLI**

**To get information about the association between a Resolver rule and a VPC**

The following `get-resolver-rule-association` example displays details about the association between a specified Resolver rule and a VPC. You associate a resolver rule and a VPC using associate-resolver-rule.

```
aws route53resolver get-resolver-rule-association \
    --resolver-rule-association-id rslvr-rrassoc-d61cbb2c8bexample
```

Output:

```
{
    "ResolverRuleAssociation": {
        "Id": "rslvr-rrassoc-d61cbb2c8bexample",
        "ResolverRuleId": "rslvr-rr-42b60677c0example",
        "Name": "my-resolver-rule-association",
        "VPCId": "vpc-304bexam",
        "Status": "COMPLETE",
        "StatusMessage": ""
    }
}
```

- For API details, see GetResolverRuleAssociation in *AWS CLI Command Reference*.

## `get-resolver-rule`

The following code example shows how to use `get-resolver-rule`.

**AWS CLI**

**To get information about a Resolver rule**

The following `get-resolver-rule` example displays details about the specified Resolver rule, such as the domain name that the rule forwards DNS queries for and the ID of the outbound resolver endpoint that the rule is associated with.

```
aws route53resolver get-resolver-rule \
    --resolver-rule-id rslvr-rr-42b60677c0example
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-42b60677c0example",
        "CreatorRequestId": "2020-01-01-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/rslvr-
rr-42b60677c0example",
        "DomainName": "example.com.",
        "Status": "COMPLETE",
        "StatusMessage": "[Trace id: 1-5dc4b177-ff1d9d001a0f80005example]
 Successfully created Resolver Rule.",
        "RuleType": "FORWARD",
        "Name": "my-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.45",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-d5e5920e37example",
        "OwnerId": "111122223333",
        "ShareStatus": "NOT_SHARED"
    }
}
```

For more information, see Values That You Specify When You Create or Edit Rules in the *Amazon Route 53 Developer Guide*.

- For API details, see GetResolverRule in *AWS CLI Command Reference*.

## `import-firewall-domains`

The following code example shows how to use `import-firewall-domains`.

### AWS CLI

#### To import domains into a domain list

The following `import-firewall-domains` example imports a set of domains from a file into a DNS Firewall domain list that you specify.

```
aws route53resolver import-firewall-domains \
```

```
    --firewall-domain-list-id rslvr-fdl-d61cbb2cbexample \
    --operation REPLACE \
    --domain-file-url s3://PATH/TO/YOUR/FILE
```

Output:

```
{
    "Id": "rslvr-fdl-d61cbb2cbexample",
    "Name": "test",
    "Status": "IMPORTING",
    "StatusMessage": "Importing domains from provided file."
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see ImportFirewallDomains in *AWS CLI Command Reference*.

### `list-firewall-configs`

The following code example shows how to use `list-firewall-configs`.

#### AWS CLI

**To list firewall configs**

The following `list-firewall-configs` example lists your DNS Firewall configurations.

```
aws route53resolver list-firewall-configs
```

Output:

```
{
    "FirewallConfigs": [
        {
            "Id": "rslvr-fc-86016850cexample",
            "ResourceId": "vpc-31e92222",
            "OwnerId": "123456789012",
            "FirewallFailOpen": "DISABLED"
        }
    ]
}
```

For more information, see DNS Firewall VPC configuration in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallConfigs in *AWS CLI Command Reference*.

### `list-firewall-domain-lists`

The following code example shows how to use `list-firewall-domain-lists`.

#### AWS CLI

**To list all of Route 53 Resolver DNS Firewall domain lists**

The following `list-firewall-domain-lists` example lists all the domain lists.

```
aws route53resolver list-firewall-domain-lists
```

Output:

```
{
    "FirewallDomainLists": [
        {
            "Id": "rslvr-fdl-2c46f2ecfexample",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-
list/rslvr-fdl-2c46f2ecfexample",
            "Name": "AWSManagedDomainsMalwareDomainList",
            "CreatorRequestId": "AWSManagedDomainsMalwareDomainList",
            "ManagedOwnerName": "Route 53 Resolver DNS Firewall"
        },
        {
            "Id": "rslvr-fdl-aa970e9e1example",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-
list/rslvr-fdl-aa970e9e1example",
            "Name": "AWSManagedDomainsBotnetCommandandControl",
            "CreatorRequestId": "AWSManagedDomainsBotnetCommandandControl",
            "ManagedOwnerName": "Route 53 Resolver DNS Firewall"
        },
        {
            "Id": "rslvr-fdl-42b60677cexample",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789111:firewall-domain-
list/rslvr-fdl-42b60677cexample",
            "Name": "test",
            "CreatorRequestId": "my-request-id"
```

```
        }
    ]
}
```

For more information, see Route 53 Resolver DNS Firewall domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallDomainLists in *AWS CLI Command Reference*.

### `list-firewall-domains`

The following code example shows how to use `list-firewall-domains`.

**AWS CLI**

**To list domains in a domain list**

The following `list-firewall-domains` example lists the domains in a DNS Firewall domain list that you specify.

```
aws route53resolver list-firewall-domains \
    --firewall-domain-list-id rslvr-fdl-d61cbb2cbexample
```

Output:

```
{
    "Domains": [
        "test1.com.",
        "test2.com.",
        "test3.com."
    ]
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallDomains in *AWS CLI Command Reference*.

### `list-firewall-rule-group-associations`

The following code example shows how to use `list-firewall-rule-group-associations`.

**AWS CLI**

**To list DNS Firewall rule group associations**

The following `list-firewall-rule-group-associations` example lists your DNS Firewall rule group associations with Amazon VPCs.

```
aws route53resolver list-firewall-rule-group-associations
```

Output:

```
{
    "FirewallRuleGroupAssociations": [
        {
            "Id": "rslvr-frgassoc-57e8873d7example",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-
group-association/rslvr-frgassoc-57e8873d7example",
            "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
            "VpcId": "vpc-31e92222",
            "Name": "test-association",
            "Priority": 101,
            "MutationProtection": "DISABLED",
            "Status": "UPDATING",
            "StatusMessage": "Creating Firewall Rule Group Association",
            "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
            "CreationTime": "2021-05-25T21:47:48.755768Z",
            "ModificationTime": "2021-05-25T21:47:48.755768Z"
        }
    ]
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule group in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallRuleGroupAssociations in *AWS CLI Command Reference*.

## `list-firewall-rule-groups`

The following code example shows how to use `list-firewall-rule-groups`.

**AWS CLI**

**To get a list of your Firewall rule groups**

The following `list-firewall-rule-groups` example lists your DNS Firewall rule groups.

```
aws route53resolver list-firewall-rule-groups
```

Output:

```
{
    "FirewallRuleGroups": [
        {
            "Id": "rslvr-frg-47f93271fexample",
            "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-
group/rslvr-frg-47f93271fexample",
            "Name": "test",
            "OwnerId": "123456789012",
            "CreatorRequestId": "my-request-id",
            "ShareStatus": "NOT_SHARED"
        }
    ]
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallRuleGroups in *AWS CLI Command Reference*.

### `list-firewall-rules`

The following code example shows how to use `list-firewall-rules`.

#### AWS CLI

**To list firewall rules**

The following `list-firewall-rules` example list all of your DNS Firewall rules within a firewall rule group.

```
aws route53resolver list-firewall-rules \
    --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
```

```
    "FirewallRules": [
        {
            "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
            "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
            "Name": "allow-rule",
            "Priority": 101,
            "Action": "ALLOW",
            "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
            "CreationTime": "2021-05-25T21:44:00.346093Z",
            "ModificationTime": "2021-05-25T21:44:00.346093Z"
        }
    ]
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see ListFirewallRules in *AWS CLI Command Reference*.

### `list-resolver-endpoint-ip-addresses`

The following code example shows how to use `list-resolver-endpoint-ip-addresses`.

#### AWS CLI

**To list IP addresses for a specified inbound or outbound endpoint**

The following `list-resolver-endpoint-ip-addresses` example lists information about the IP addresses that are associated with the inbound endpoint `rslvr-in-f9ab8a03f1example`. You can also use `list-resolver-endpoint-ip-addresses` for outbound endpoints by specifying the applicable endpoint ID.

```
aws route53resolver list-resolver-endpoint-ip-addresses \
    --resolver-endpoint-id rslvr-in-f9ab8a03f1example
```

Output:

```
{
    "MaxResults": 10,
    "IpAddresses": [
        {
            "IpId": "rni-1de60cdbfeexample",
```

```
            "SubnetId": "subnet-ba47exam",
            "Ip": "192.0.2.44",
            "Status": "ATTACHED",
            "StatusMessage": "This IP address is operational.",
            "CreationTime": "2020-01-03T23:02:29.587Z",
            "ModificationTime": "2020-01-03T23:03:05.555Z"
        },
        {
            "IpId": "rni-aac7085e38example",
            "SubnetId": "subnet-12d8exam",
            "Ip": "192.0.2.45",
            "Status": "ATTACHED",
            "StatusMessage": "This IP address is operational.",
            "CreationTime": "2020-01-03T23:02:29.593Z",
            "ModificationTime": "2020-01-03T23:02:55.060Z"
        }
    ]
}
```

For more information about the values in the output, see Values That You Specify When You Create or Edit Inbound Endpoints, and Values That You Specify When You Create or Edit Outbound Endpoints, both in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResolverEndpointIpAddresses in *AWS CLI Command Reference*.

## `list-resolver-endpoints`

The following code example shows how to use `list-resolver-endpoints`.

### AWS CLI

#### To list Resolver endpoints in an AWS Region

The following `list-resolver-endpoints` example lists the inbound and outbound Resolver endpoints that exist in the current account.

```
aws route53resolver list-resolver-endpoints
```

Output:

```
{
    "MaxResults": 10,
```

```
    "ResolverEndpoints": [
        {
            "Id": "rslvr-in-497098ad59example",
            "CreatorRequestId": "2020-01-01-18:47",
            "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-
endpoint/rslvr-in-497098ad59example",
            "Name": "my-inbound-endpoint",
            "SecurityGroupIds": [
                "sg-05cd7b25d6example"
            ],
            "Direction": "INBOUND",
            "IpAddressCount": 2,
            "HostVPCId": "vpc-304bexam",
            "Status": "OPERATIONAL",
            "StatusMessage": "This Resolver Endpoint is operational.",
            "CreationTime": "2020-01-01T23:25:45.538Z",
            "ModificationTime": "2020-01-01T23:25:45.538Z"
        },
        {
            "Id": "rslvr-out-d5e5920e37example",
            "CreatorRequestId": "2020-01-01-18:48",
            "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-
endpoint/rslvr-out-d5e5920e37example",
            "Name": "my-outbound-endpoint",
            "SecurityGroupIds": [
                "sg-05cd7b25d6example"
            ],
            "Direction": "OUTBOUND",
            "IpAddressCount": 2,
            "HostVPCId": "vpc-304bexam",
            "Status": "OPERATIONAL",
            "StatusMessage": "This Resolver Endpoint is operational.",
            "CreationTime": "2020-01-01T23:50:50.979Z",
            "ModificationTime": "2020-01-01T23:50:50.979Z"
        }
    ]
}
```

- For API details, see ListResolverEndpoints in *AWS CLI Command Reference*.

### `list-resolver-rule-associations`

The following code example shows how to use `list-resolver-rule-associations`.

**AWS CLI**

**To list associations between Resolver rules and VPCs**

The following `list-resolver-rule-associations` example lists the associations between resolver rules and VPCs in the current AWS account.

```
aws route53resolver list-resolver-rule-associations
```

Output:

```
{
    "MaxResults": 30,
    "ResolverRuleAssociations": [
        {
            "Id": "rslvr-autodefined-assoc-vpc-304bexam-internet-resolver",
            "ResolverRuleId": "rslvr-autodefined-rr-internet-resolver",
            "Name": "System Rule Association",
            "VPCId": "vpc-304bexam",
            "Status": "COMPLETE",
            "StatusMessage": ""
        },
        {
            "Id": "rslvr-rrassoc-d61cbb2c8bexample",
            "ResolverRuleId": "rslvr-rr-42b60677c0example",
            "Name": "my-resolver-rule-association",
            "VPCId": "vpc-304bexam",
            "Status": "COMPLETE",
            "StatusMessage": ""
        }
    ]
}
```

For more information, see How Route 53 Resolver Forwards DNS Queries from Your VPCs to Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResolverRuleAssociations in *AWS CLI Command Reference*.

## `list-resolver-rules`

The following code example shows how to use `list-resolver-rules`.

## AWS CLI

### To list Resolver rules

The following `list-resolver-rules` example lists all the Resolver rules in the current AWS account.

```
aws route53resolver list-resolver-rules
```

Output:

```
{
    "MaxResults": 30,
    "ResolverRules": [
        {
            "Id": "rslvr-autodefined-rr-internet-resolver",
            "CreatorRequestId": "",
            "Arn": "arn:aws:route53resolver:us-west-2::autodefined-rule/rslvr-
autodefined-rr-internet-resolver",
            "DomainName": ".",
            "Status": "COMPLETE",
            "RuleType": "RECURSIVE",
            "Name": "Internet Resolver",
            "OwnerId": "Route 53 Resolver",
            "ShareStatus": "NOT_SHARED"
        },
        {
            "Id": "rslvr-rr-42b60677c0example",
            "CreatorRequestId": "2020-01-01-18:47",
            "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/
rslvr-rr-42b60677c0bc4e299",
            "DomainName": "example.com.",
            "Status": "COMPLETE",
            "StatusMessage": "[Trace id: 1-5dc4b177-ff1d9d001a0f80005example]
 Successfully created Resolver Rule.",
            "RuleType": "FORWARD",
            "Name": "my-rule",
            "TargetIps": [
                {
                    "Ip": "192.0.2.45",
                    "Port": 53
                }
            ],
```

```
            "ResolverEndpointId": "rslvr-out-d5e5920e37example",
            "OwnerId": "111122223333",
            "ShareStatus": "NOT_SHARED"
        }
    ]
}
```

For more information, see How Route 53 Resolver Forwards DNS Queries from Your VPCs to Your Network in the *Amazon Route 53 Developer Guide*.

- For API details, see ListResolverRules in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list the tags for a Resolver resource**

The following `list-tags-for-resource` example lists the tags that are assigned to the specified Resolver rule.

```
aws route53resolver list-tags-for-resource \
    --resource-arn "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/
rslvr-rr-42b60677c0example"
```

Output:

```
{
    "Tags": [
        {
            "Key": "my-key-1",
            "Value": "my-value-1"
        },
        {
            "Key": "my-key-2",
            "Value": "my-value-2"
        }
    ]
}
```

For information about using tags for cost allocation, see Using Cost Allocation Tags in the *AWS Billing and Cost Management User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `put-firewall-rule-group-policy`

The following code example shows how to use `put-firewall-rule-group-policy`.

**AWS CLI**

**To attach an AWS IAM policy to share a Firewall rule group policy**

The following `put-firewall-rule-group-policy` example attaches an AWS Identity and Access Management (AWS IAM) policy for sharing the rule group.

```
aws route53resolver put-firewall-rule-group-policy \
    --firewall-rule-group-policy "{\"Version\":\"2012-10-17\",
\"Statement\":[{\"Sid\":\"test\",\"Effect\":\"Allow\",\"Principal
\":{\"AWS\":\"arn:aws:iam::AWS_ACCOUNT_ID:root\"},\"Action\":
[\"route53resolver:GetFirewallRuleGroup\",\"route53resolver:ListFirewallRuleGroups
\"],\"Resource\":\"arn:aws:route53resolver:us-east-1:AWS_ACCOUNT_ID:firewall-rule-
group/rslvr-frg-47f93271fexample\"}]}"
```

Output:

```
{
    "ReturnValue": true
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see PutFirewallRuleGroupPolicy in *AWS CLI Command Reference*.

### `put-resolver-rule-policy`

The following code example shows how to use `put-resolver-rule-policy`.

**AWS CLI**

**To share a Resolver rule with another AWS account**

The following `put-resolver-rule-policy` example specifies a Resolver rule that you want to share with another AWS account, the account that you want to share the rule with, and the rule-related operations that you want the account to be able to perform on the rules.

**Note** You must run this command using credentials from the same account that created the rule.

```
aws route53resolver put-resolver-rule-policy \
    --region us-east-1 \
    --arn "arn:aws:route53resolver:us-east-1:111122223333:resolver-rule/rslvr-
rr-42b60677c0example" \
    --resolver-rule-policy "{\"Version\": \"2012-10-17\", \
        \"Statement\": [ { \
        \"Effect\" : \"Allow\", \
        \"Principal\" : {\"AWS\" : \"444455556666\" }, \
        \"Action\" : [ \
            \"route53resolver:GetResolverRule\", \
            \"route53resolver:AssociateResolverRule\", \
            \"route53resolver:DisassociateResolverRule\", \
            \"route53resolver:ListResolverRules\", \
            \"route53resolver:ListResolverRuleAssociations\" ], \
        \"Resource\" : [ \"arn:aws:route53resolver:us-east-1:111122223333:resolver-
rule/rslvr-rr-42b60677c0example\" ] } ] }"
```

Output:

```
{
    "ReturnValue": true
}
```

After you run `put-resolver-rule-policy`, you can run the following two Resource Access Manager (RAM) commands. You must use the account that you want to share the rule with:

`get-resource-share-invitations` returns the value `resourceShareInvitationArn`. You need this value to accept the invitation to use the shared rule.`accept-resource-share-invitation` accepts the invitation to use the shared rule.

For more information, see the following documentation:

get-resource-share-invitationsaccept-resource-share-invitationsSharing Forwarding Rules with Other AWS Accounts and Using Shared Rules in the *Amazon Route 53 Developer Guide*

- For API details, see PutResolverRulePolicy in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To associate tags with a Resolver resource**

The following `tag-resource` example associates two tag key/value pairs with the specified Resolver rule.

```
aws route53resolver tag-resource \
    --resource-arn "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/
rslvr-rr-42b60677c0example" \
    --tags "Key=my-key-1,Value=my-value-1" "Key=my-key-2,Value=my-value-2"
```

This command produces no output.

For information about using tags for cost allocation, see Using Cost Allocation Tags in the *AWS Billing and Cost Management User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a Resolver resource**

The following `untag-resource` example removes two tags from the specified Resolver rule.

```
aws route53resolver untag-resource \
    --resource-arn "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/
rslvr-rr-42b60677c0example" \
    --tag-keys my-key-1 my-key-2
```

This command produces no output. To confirm that the tags were removed, you can use list-tags-for-resource.

For information about using tags for cost allocation, see Using Cost Allocation Tags in the *AWS Billing and Cost Management User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-firewall-config`

The following code example shows how to use `update-firewall-config`.

**AWS CLI**

**To update a firewall config**

The following `update-firewall-config` example updates DNS Firewall configuration.

```
aws route53resolver update-firewall-config \
    --resource-id vpc-31e92222 \
    --firewall-fail-open DISABLED
```

Output:

```
{
    "FirewallConfig": {
        "Id": "rslvr-fc-86016850cexample",
        "ResourceId": "vpc-31e92222",
        "OwnerId": "123456789012",
        "FirewallFailOpen": "DISABLED"
    }
}
```

For more information, see DNS Firewall VPC configuration in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallConfig in *AWS CLI Command Reference*.

### `update-firewall-domains`

The following code example shows how to use `update-firewall-domains`.

**AWS CLI**

**To update a domain list**

The following `update-firewall-domains` example adds the domains to a domain list with the ID you provide.

```
aws route53resolver update-firewall-domains \
    --firewall-domain-list-id rslvr-fdl-42b60677cexampleb \
    --operation ADD \
    --domains test1.com test2.com test3.com
```

Output:

```
{
    "Id": "rslvr-fdl-42b60677cexample",
    "Name": "test",
    "Status": "UPDATING",
    "StatusMessage": "Updating the Firewall Domain List"
}
```

For more information, see Managing your own domain lists in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallDomains in *AWS CLI Command Reference*.

### `update-firewall-rule-group-association`

The following code example shows how to use `update-firewall-rule-group-association`.

#### AWS CLI

**To update a firewall rule group association**

The following `update-firewall-rule-group-association` example updates a firewall rule group association.

```
aws route53resolver update-firewall-rule-group-association \
    --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example \
    --priority 103
```

Output:

```
{
    "FirewallRuleGroupAssociation": {
        "Id": "rslvr-frgassoc-57e8873d7example",
```

```
        "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "VpcId": "vpc-31e92222",
        "Name": "test-association",
        "Priority": 103,
        "MutationProtection": "DISABLED",
        "Status": "UPDATING",
        "StatusMessage": "Updating the Firewall Rule Group Association Attributes",
        "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:47:48.755768Z",
        "ModificationTime": "2021-05-25T21:50:09.272569Z"
    }
}
```

For more information, see Managing associations between your VPC and Route 53 Resolver DNS Firewall rule group in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallRuleGroupAssociation in *AWS CLI Command Reference*.

### `update-firewall-rule`

The following code example shows how to use `update-firewall-rule`.

#### AWS CLI

**To update a firewall rule**

The following `update-firewall-rule` example updates a firewall rule with the parameters you specify.

```
aws route53resolver update-firewall-rule \
    --firewall-rule-group-id rslvr-frg-47f93271fexample \
    --firewall-domain-list-id rslvr-fdl-9e956e9ffexample \
    --priority 102
```

Output:

```
{
    "FirewallRule": {
        "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
        "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
        "Name": "allow-rule",
```

```
        "Priority": 102,
        "Action": "ALLOW",
        "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
        "CreationTime": "2021-05-25T21:44:00.346093Z",
        "ModificationTime": "2021-05-25T21:45:59.611600Z"
    }
}
```

For more information, see Managing rule groups and rules in DNS Firewall in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateFirewallRule in *AWS CLI Command Reference*.

### `update-resolver-endpoint`

The following code example shows how to use `update-resolver-endpoint`.

#### AWS CLI

**To update the name of a Resolver endpoint**

The following `update-resolver-endpoint` example updates the name of a Resolver endpoint. Updating other values isn't supported.

```
aws route53resolver update-resolver-endpoint \
    --resolver-endpoint-id rslvr-in-b5d45e32bdc445f09 \
    --name my-renamed-inbound-endpoint
```

Output:

```
{
    "ResolverEndpoint": {
        "Id": "rslvr-in-b5d45e32bdexample",
        "CreatorRequestId": "2020-01-02-18:48",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-b5d45e32bdexample",
        "Name": "my-renamed-inbound-endpoint",
        "SecurityGroupIds": [
            "sg-f62bexam"
        ],
        "Direction": "INBOUND",
        "IpAddressCount": 2,
        "HostVPCId": "vpc-304bexam",
```

```
        "Status": "OPERATIONAL",
        "StatusMessage": "This Resolver Endpoint is operational.",
        "CreationTime": "2020-01-01T18:33:59.265Z",
        "ModificationTime": "2020-01-08T18:33:59.265Z"
    }
}
```

- For API details, see UpdateResolverEndpoint in *AWS CLI Command Reference*.

### `update-resolver-rule`

The following code example shows how to use `update-resolver-rule`.

#### AWS CLI

**Example 1: To update settings Resolver endpoint**

The following `update-resolver-rule` example updates the name of the rule, the IP addresses on your on-premises network that DNS queries are forwarded to, and the ID of the outbound Resolver endpoint that you're using to forward queries to your network.

**Note** Existing values for `TargetIps` are overwritten, so you must specify all the IP addresses that you want the rule to have after the update.

```
aws route53resolver update-resolver-rule \
    --resolver-rule-id rslvr-rr-1247fa64f3example \
    --config Name="my-2nd-rule",TargetIps=[{Ip=192.0.2.45,Port=53},
{Ip=192.0.2.46,Port=53}],ResolverEndpointId=rslvr-out-7b89ed0d25example
```

Output:

```
{
    "ResolverRule": {
        "Id": "rslvr-rr-1247fa64f3example",
        "CreatorRequestId": "2020-01-02-18:47",
        "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/rslvr-
rr-1247fa64f3example",
        "DomainName": "www.example.com.",
        "Status": "COMPLETE",
        "StatusMessage": "[Trace id: 1-5dcc90b9-8a8ee860aba1ebd89example]
 Successfully updated Resolver Rule.",
        "RuleType": "FORWARD",
```

```
        "Name": "my-2nd-rule",
        "TargetIps": [
            {
                "Ip": "192.0.2.45",
                "Port": 53
            },
            {
                "Ip": "192.0.2.46",
                "Port": 53
            }
        ],
        "ResolverEndpointId": "rslvr-out-7b89ed0d25example",
        "OwnerId": "111122223333",
        "ShareStatus": "NOT_SHARED"
    }
}
```

**Example 2: To update settings Resolver endpoint using a file for ``config`` settings**

You can alternatively include the `config` settings in a JSON file and then specify that file when you call `update-resolver-rule`.

```
aws route53resolver update-resolver-rule \
    --resolver-rule-id rslvr-rr-1247fa64f3example \
    --config file://c:\temp\update-resolver-rule.json
```

Contents of `update-resolver-rule.json`.

```
{
    "Name": "my-2nd-rule",
    "TargetIps": [
        {
            "Ip": "192.0.2.45",
            "Port": 53
        },
        {
            "Ip": "192.0.2.46",
            "Port": 53
        }
    ],
    "ResolverEndpointId": "rslvr-out-7b89ed0d25example"
}
```

For more information, see Values That You Specify When You Create or Edit Rules in the *Amazon Route 53 Developer Guide*.

- For API details, see UpdateResolverRule in *AWS CLI Command Reference*.

## Amazon S3 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon S3.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `abort-multipart-upload`

The following code example shows how to use `abort-multipart-upload`.

#### AWS CLI

**To abort the specified multipart upload**

The following `abort-multipart-upload` command aborts a multipart upload for the key `multipart/01` in the bucket `my-bucket`.

```
aws s3api abort-multipart-upload \
    --bucket my-bucket \
    --key multipart/01 \
    --upload-id
 dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URCS
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

- For API details, see AbortMultipartUpload in *AWS CLI Command Reference*.

### `complete-multipart-upload`

The following code example shows how to use `complete-multipart-upload`.

**AWS CLI**

The following command completes a multipart upload for the key `multipart/01` in the bucket `my-bucket`:

```
aws s3api complete-multipart-upload --multipart-upload file://
mpustruct --bucket my-bucket --key 'multipart/01' --upload-id
 dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URCS
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

The multipart upload option in the above command takes a JSON structure that describes the parts of the multipart upload that should be reassembled into the complete file. In this example, the `file://` prefix is used to load the JSON structure from a file in the local folder named `mpustruct`.

mpustruct:

```
{
  "Parts": [
    {
      "ETag": "e868e0f4719e394144ef36531ee6824c",
      "PartNumber": 1
    },
    {
      "ETag": "6bb2b12753d66fe86da4998aa33fffb0",
      "PartNumber": 2
    },
    {
      "ETag": "d0a0112e841abec9c9ec83406f0159c8",
      "PartNumber": 3
    }
```

```
  ]
}
```

The ETag value for each part is upload is output each time you upload a part using the `upload-part` command and can also be retrieved by calling `list-parts` or calculated by taking the MD5 checksum of each part.

Output:

```
{
    "ETag": "\"3944a9f7a4faab7f78788ff6210f63f0-3\"",
    "Bucket": "my-bucket",
    "Location": "https://my-bucket.s3.amazonaws.com/multipart%2F01",
    "Key": "multipart/01"
}
```

- For API details, see CompleteMultipartUpload in *AWS CLI Command Reference*.

### `copy-object`

The following code example shows how to use `copy-object`.

**AWS CLI**

The following command copies an object from `bucket-1` to `bucket-2`:

```
aws s3api copy-object --copy-source bucket-1/test.txt --key test.txt --bucket
 bucket-2
```

Output:

```
{
    "CopyObjectResult": {
        "LastModified": "2015-11-10T01:07:25.000Z",
        "ETag": "\"589c8b79c230a6ecd5a7e1d040a9a030\""
    },
    "VersionId": "YdnYvTCVDqRRFA.NFJjy36p0hxifMlkA"
}
```

- For API details, see CopyObject in *AWS CLI Command Reference*.

### cp

The following code example shows how to use cp.

**AWS CLI**

**Example 1: Copying a local file to S3**

The following cp command copies a single file to a specified bucket and key:

```
aws s3 cp test.txt s3://mybucket/test2.txt
```

Output:

```
upload: test.txt to s3://mybucket/test2.txt
```

**Example 2: Copying a local file to S3 with an expiration date**

The following cp command copies a single file to a specified bucket and key that expires at the specified ISO 8601 timestamp:

```
aws s3 cp test.txt s3://mybucket/test2.txt \
    --expires 2014-10-01T20:30:00Z
```

Output:

```
upload: test.txt to s3://mybucket/test2.txt
```

**Example 3: Copying a file from S3 to S3**

The following cp command copies a single s3 object to a specified bucket and key:

```
aws s3 cp s3://mybucket/test.txt s3://mybucket/test2.txt
```

Output:

```
copy: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

**Example 4: Copying an S3 object to a local file**

The following cp command copies a single object to a specified file locally:

```
aws s3 cp s3://mybucket/test.txt test2.txt
```

Output:

```
download: s3://mybucket/test.txt to test2.txt
```

**Example 5: Copying an S3 object from one bucket to another**

The following `cp` command copies a single object to a specified bucket while retaining its original name:

```
aws s3 cp s3://mybucket/test.txt s3://mybucket2/
```

Output:

```
copy: s3://mybucket/test.txt to s3://mybucket2/test.txt
```

**Example 6: Recursively copying S3 objects to a local directory**

When passed with the parameter `--recursive`, the following `cp` command recursively copies all objects under a specified prefix and bucket to a specified directory. In this example, the bucket `mybucket` has the objects `test1.txt` and `test2.txt`:

```
aws s3 cp s3://mybucket . \
    --recursive
```

Output:

```
download: s3://mybucket/test1.txt to test1.txt
download: s3://mybucket/test2.txt to test2.txt
```

**Example 7: Recursively copying local files to S3**

When passed with the parameter `--recursive`, the following `cp` command recursively copies all files under a specified directory to a specified bucket and prefix while excluding some files by using an `--exclude` parameter. In this example, the directory `myDir` has the files `test1.txt` and `test2.jpg`:

```
aws s3 cp myDir s3://mybucket/ \
```

```
    --recursive \
    --exclude "*.jpg"
```

Output:

```
upload: myDir/test1.txt to s3://mybucket/test1.txt
```

**Example 8: Recursively copying S3 objects to another bucket**

When passed with the parameter `--recursive`, the following `cp` command recursively copies all objects under a specified bucket to another bucket while excluding some objects by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `another/test1.txt`:

```
aws s3 cp s3://mybucket/ s3://mybucket2/ \
    --recursive \
    --exclude "another/*"
```

Output:

```
copy: s3://mybucket/test1.txt to s3://mybucket2/test1.txt
```

You can combine `--exclude` and `--include` options to copy only objects that match a pattern, excluding all others:

```
aws s3 cp s3://mybucket/logs/ s3://mybucket2/logs/ \
    --recursive \
    --exclude "*" \
    --include "*.log"
```

Output:

```
copy: s3://mybucket/logs/test/test.log to s3://mybucket2/logs/test/test.log
copy: s3://mybucket/logs/test3.log to s3://mybucket2/logs/test3.log
```

**Example 9: Setting the Access Control List (ACL) while copying an S3 object**

The following `cp` command copies a single object to a specified bucket and key while setting the ACL to `public-read-write`:

```
aws s3 cp s3://mybucket/test.txt s3://mybucket/test2.txt \
    --acl public-read-write
```

Output:

```
copy: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

Note that if you're using the `--acl` option, ensure that any associated IAM policies include the `"s3:PutObjectAcl"` action:

```
aws iam get-user-policy \
    --user-name myuser \
    --policy-name mypolicy
```

Output:

```
{
    "UserName": "myuser",
    "PolicyName": "mypolicy",
    "PolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
            {
                "Action": [
                    "s3:PutObject",
                    "s3:PutObjectAcl"
                ],
                "Resource": [
                    "arn:aws:s3:::mybucket/*"
                ],
                "Effect": "Allow",
                "Sid": "Stmt1234567891234"
            }
        ]
    }
}
```

**Example 10: Granting permissions for an S3 object**

The following `cp` command illustrates the use of the `--grants` option to grant read access to all users identified by URI and full control to a specific user identified by their Canonical ID:

```
aws s3 cp file.txt s3://mybucket/ --grants read=uri=http://acs.amazonaws.com/groups/
global/AllUsers
 full=id=79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be
```

Output:

```
upload: file.txt to s3://mybucket/file.txt
```

**Example 11: Uploading a local file stream to S3**

PowerShell may alter the encoding of or add a CRLF to piped input.

The following cp command uploads a local file stream from standard input to a specified bucket and key:

```
aws s3 cp - s3://mybucket/stream.txt
```

**Example 12: Uploading a local file stream that is larger than 50GB to S3**

The following cp command uploads a 51GB local file stream from standard input to a specified bucket and key. The `--expected-size` option must be provided, or the upload may fail when it reaches the default part limit of 10,000:

```
aws s3 cp - s3://mybucket/stream.txt --expected-size 54760833024
```

**Example 13: Downloading an S3 object as a local file stream**

PowerShell may alter the encoding of or add a CRLF to piped or redirected output.

The following cp command downloads an S3 object locally as a stream to standard output. Downloading as a stream is not currently compatible with the `--recursive` parameter:

```
aws s3 cp s3://mybucket/stream.txt -
```

**Example 14: Uploading to an S3 access point**

The following cp command uploads a single file (`mydoc.txt`) to the access point (`myaccesspoint`) at the key (`mykey`):

```
aws s3 cp mydoc.txt s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

Output:

```
upload: mydoc.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

**Example 15: Downloading from an S3 access point**

The following cp command downloads a single object (mykey) from the access point (myaccesspoint) to the local file (mydoc.txt):

```
aws s3 cp s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey
 mydoc.txt
```

Output:

```
download: s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey to
 mydoc.txt
```

- For API details, see Cp in *AWS CLI Command Reference*.

### `create-bucket`

The following code example shows how to use `create-bucket`.

**AWS CLI**

**Example 1: To create a bucket**

The following `create-bucket` example creates a bucket named `my-bucket`:

```
aws s3api create-bucket \
    --bucket my-bucket \
    --region us-east-1
```

Output:

```
{
```

```
    "Location": "/my-bucket"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

**Example 2: To create a bucket with owner enforced**

The following `create-bucket` example creates a bucket named `my-bucket` that uses the bucket owner enforced setting for S3 Object Ownership.

```
aws s3api create-bucket \
    --bucket my-bucket \
    --region us-east-1 \
    --object-ownership BucketOwnerEnforced
```

Output:

```
{
    "Location": "/my-bucket"
}
```

For more information, see Controlling ownership of objects and disabling ACLs in the *Amazon S3 User Guide*.

**Example 3: To create a bucket outside of the ``us-east-1`` region**

The following `create-bucket` example creates a bucket named `my-bucket` in the `eu-west-1` region. Regions outside of `us-east-1` require the appropriate `LocationConstraint` to be specified in order to create the bucket in the desired region.

```
aws s3api create-bucket \
    --bucket my-bucket \
    --region eu-west-1 \
    --create-bucket-configuration LocationConstraint=eu-west-1
```

Output:

```
{
    "Location": "http://my-bucket.s3.amazonaws.com/"
}
```

For more information, see Creating a bucket in the *Amazon S3 User Guide*.

- For API details, see CreateBucket in *AWS CLI Command Reference*.

### `create-multipart-upload`

The following code example shows how to use `create-multipart-upload`.

#### AWS CLI

The following command creates a multipart upload in the bucket `my-bucket` with the key `multipart/01`:

```
aws s3api create-multipart-upload --bucket my-bucket --key 'multipart/01'
```

Output:

```
{
    "Bucket": "my-bucket",
    "UploadId":
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URC
    "Key": "multipart/01"
}
```

The completed file will be named `01` in a folder called `multipart` in the bucket `my-bucket`. Save the upload ID, key and bucket name for use with the `upload-part` command.

- For API details, see CreateMultipartUpload in *AWS CLI Command Reference*.

### `delete-bucket-analytics-configuration`

The following code example shows how to use `delete-bucket-analytics-configuration`.

#### AWS CLI

**To delete an analytics configuration for a bucket**

The following `delete-bucket-analytics-configuration` example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \
    --bucket my-bucket \
```

```
    --id 1
```

This command produces no output.

- For API details, see DeleteBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

### `delete-bucket-cors`

The following code example shows how to use `delete-bucket-cors`.

**AWS CLI**

The following command deletes a Cross-Origin Resource Sharing configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-cors --bucket my-bucket
```

- For API details, see DeleteBucketCors in *AWS CLI Command Reference*.

### `delete-bucket-encryption`

The following code example shows how to use `delete-bucket-encryption`.

**AWS CLI**

**To delete the server-side encryption configuration of a bucket**

The following `delete-bucket-encryption` example deletes the server-side encryption configuration of the specified bucket.

```
aws s3api delete-bucket-encryption \
    --bucket my-bucket
```

This command produces no output.

- For API details, see DeleteBucketEncryption in *AWS CLI Command Reference*.

### `delete-bucket-intelligent-tiering-configuration`

The following code example shows how to use `delete-bucket-intelligent-tiering-configuration`.

**AWS CLI**

**To remove an S3 Intelligent-Tiering configuration on a bucket**

The following `delete-bucket-intelligent-tiering-configuration` example removes an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket.

```
aws s3api delete-bucket-intelligent-tiering-configuration \
    --bucket DOC-EXAMPLE-BUCKET \
    --id ExampleConfig
```

This command produces no output.

For more information, see Using S3 Intelligent-Tiering in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketIntelligentTieringConfiguration in *AWS CLI Command Reference*.

### `delete-bucket-inventory-configuration`

The following code example shows how to use `delete-bucket-inventory-configuration`.

**AWS CLI**

**To delete the inventory configuration of a bucket**

The following `delete-bucket-inventory-configuration` example deletes the inventory configuration with ID 1 for the specified bucket.

```
aws s3api delete-bucket-inventory-configuration \
    --bucket my-bucket \
    --id 1
```

This command produces no output.

- For API details, see DeleteBucketInventoryConfiguration in *AWS CLI Command Reference*.

### `delete-bucket-lifecycle`

The following code example shows how to use `delete-bucket-lifecycle`.

**AWS CLI**

The following command deletes a lifecycle configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-lifecycle --bucket my-bucket
```

- For API details, see DeleteBucketLifecycle in *AWS CLI Command Reference*.

### `delete-bucket-metrics-configuration`

The following code example shows how to use `delete-bucket-metrics-configuration`.

**AWS CLI**

**To delete a metrics configuration for a bucket**

The following `delete-bucket-metrics-configuration` example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123
```

This command produces no output.

- For API details, see DeleteBucketMetricsConfiguration in *AWS CLI Command Reference*.

### `delete-bucket-ownership-controls`

The following code example shows how to use `delete-bucket-ownership-controls`.

**AWS CLI**

**To remove the bucket ownership settings of a bucket**

The following `delete-bucket-ownership-controls` example removes the bucket ownership settings of a bucket.

```
aws s3api delete-bucket-ownership-controls \
    --bucket DOC-EXAMPLE-BUCKET
```

This command produces no output.

For more information, see Setting Object Ownership on an existing bucket in the *Amazon S3 User Guide*.

- For API details, see DeleteBucketOwnershipControls in *AWS CLI Command Reference*.

### `delete-bucket-policy`

The following code example shows how to use `delete-bucket-policy`.

**AWS CLI**

The following command deletes a bucket policy from a bucket named `my-bucket`:

```
aws s3api delete-bucket-policy --bucket my-bucket
```

- For API details, see DeleteBucketPolicy in *AWS CLI Command Reference*.

### `delete-bucket-replication`

The following code example shows how to use `delete-bucket-replication`.

**AWS CLI**

The following command deletes a replication configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-replication --bucket my-bucket
```

- For API details, see DeleteBucketReplication in *AWS CLI Command Reference*.

### `delete-bucket-tagging`

The following code example shows how to use `delete-bucket-tagging`.

**AWS CLI**

The following command deletes a tagging configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-tagging --bucket my-bucket
```

- For API details, see DeleteBucketTagging in *AWS CLI Command Reference*.

### `delete-bucket-website`

The following code example shows how to use `delete-bucket-website`.

#### AWS CLI

The following command deletes a website configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-website --bucket my-bucket
```

- For API details, see DeleteBucketWebsite in *AWS CLI Command Reference*.

### `delete-bucket`

The following code example shows how to use `delete-bucket`.

#### AWS CLI

The following command deletes a bucket named `my-bucket`:

```
aws s3api delete-bucket --bucket my-bucket --region us-east-1
```

- For API details, see DeleteBucket in *AWS CLI Command Reference*.

### `delete-object-tagging`

The following code example shows how to use `delete-object-tagging`.

#### AWS CLI

**To delete the tag sets of an object**

The following `delete-object-tagging` example deletes the tag with the specified key from the object `doc1.rtf`.

```
aws s3api delete-object-tagging \
    --bucket my-bucket \
    --key doc1.rtf
```

This command produces no output.

- For API details, see DeleteObjectTagging in *AWS CLI Command Reference*.

### `delete-object`

The following code example shows how to use `delete-object`.

#### AWS CLI

The following command deletes an object named `test.txt` from a bucket named `my-bucket`:

```
aws s3api delete-object --bucket my-bucket --key test.txt
```

If bucket versioning is enabled, the output will contain the version ID of the delete marker:

```
{
  "VersionId": "9_gKg5vG56F.TTEUdwkxGpJ3tNDlWlGq",
  "DeleteMarker": true
}
```

For more information about deleting objects, see Deleting Objects in the *Amazon S3 Developer Guide*.

- For API details, see DeleteObject in *AWS CLI Command Reference*.

### `delete-objects`

The following code example shows how to use `delete-objects`.

#### AWS CLI

The following command deletes an object from a bucket named `my-bucket`:

```
aws s3api delete-objects --bucket my-bucket --delete file://delete.json
```

`delete.json` is a JSON document in the current directory that specifies the object to delete:

```
{
  "Objects": [
    {
      "Key": "test1.txt"
    }
  ],
  "Quiet": false
}
```

Output:

```
{
    "Deleted": [
        {
            "DeleteMarkerVersionId": "mYAT5Mc6F7aeUL8SS7FAAqUPO1koHwzU",
            "Key": "test1.txt",
            "DeleteMarker": true
        }
    ]
}
```

- For API details, see DeleteObjects in *AWS CLI Command Reference*.

### `delete-public-access-block`

The following code example shows how to use `delete-public-access-block`.

**AWS CLI**

**To delete the block public access configuration for a bucket**

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
    --bucket my-bucket
```

This command produces no output.

- For API details, see DeletePublicAccessBlock in *AWS CLI Command Reference*.

### `get-bucket-accelerate-configuration`

The following code example shows how to use `get-bucket-accelerate-configuration`.

**AWS CLI**

**To retrieve the accelerate configuration of a bucket**

The following `get-bucket-accelerate-configuration` example retrieves the accelerate configuration for the specified bucket.

```
aws s3api get-bucket-accelerate-configuration \
    --bucket my-bucket
```

Output:

```
{
    "Status": "Enabled"
}
```

- For API details, see GetBucketAccelerateConfiguration in *AWS CLI Command Reference*.

### `get-bucket-acl`

The following code example shows how to use `get-bucket-acl`.

#### AWS CLI

The following command retrieves the access control list for a bucket named `my-bucket`:

```
aws s3api get-bucket-acl --bucket my-bucket
```

Output:

```
{
    "Owner": {
        "DisplayName": "my-username",
        "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
    },
    "Grants": [
        {
            "Grantee": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
            },
            "Permission": "FULL_CONTROL"
        }
    ]
}
```

- For API details, see GetBucketAcl in *AWS CLI Command Reference*.

### `get-bucket-analytics-configuration`

The following code example shows how to use `get-bucket-analytics-configuration`.

#### AWS CLI

**To retrieve the analytics configuration for a bucket with a specific ID**

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration \
    --bucket my-bucket \
    --id 1
```

Output:

```
{
    "AnalyticsConfiguration": {
        "StorageClassAnalysis": {},
        "Id": "1"
    }
}
```

- For API details, see GetBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

### `get-bucket-cors`

The following code example shows how to use `get-bucket-cors`.

#### AWS CLI

The following command retrieves the Cross-Origin Resource Sharing configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-cors --bucket my-bucket
```

Output:

```
{
    "CORSRules": [
        {
```

```
            "AllowedHeaders": [
                "*"
            ],
            "ExposeHeaders": [
                "x-amz-server-side-encryption"
            ],
            "AllowedMethods": [
                "PUT",
                "POST",
                "DELETE"
            ],
            "MaxAgeSeconds": 3000,
            "AllowedOrigins": [
                "http://www.example.com"
            ]
        },
        {
            "AllowedHeaders": [
                "Authorization"
            ],
            "MaxAgeSeconds": 3000,
            "AllowedMethods": [
                "GET"
            ],
            "AllowedOrigins": [
                "*"
            ]
        }
    ]
}
```

- For API details, see GetBucketCors in *AWS CLI Command Reference*.

### `get-bucket-encryption`

The following code example shows how to use `get-bucket-encryption`.

#### AWS CLI

**To retrieve the server-side encryption configuration for a bucket**

The following `get-bucket-encryption` example retrieves the server-side encryption configuration for the bucket `my-bucket`.

```
aws s3api get-bucket-encryption \
    --bucket my-bucket
```

Output:

```
{
    "ServerSideEncryptionConfiguration": {
        "Rules": [
            {
                "ApplyServerSideEncryptionByDefault": {
                    "SSEAlgorithm": "AES256"
                }
            }
        ]
    }
}
```

- For API details, see GetBucketEncryption in *AWS CLI Command Reference*.

### `get-bucket-intelligent-tiering-configuration`

The following code example shows how to use `get-bucket-intelligent-tiering-configuration`.

**AWS CLI**

**To retrieve an S3 Intelligent-Tiering configuration on a bucket**

The following `get-bucket-intelligent-tiering-configuration` example retrieves an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket.

```
aws s3api get-bucket-intelligent-tiering-configuration \
    --bucket DOC-EXAMPLE-BUCKET \
    --id ExampleConfig
```

Output:

```
{
    "IntelligentTieringConfiguration": {
        "Id": "ExampleConfig2",
```

```
        "Filter": {
            "Prefix": "images"
        },
        "Status": "Enabled",
        "Tierings": [
            {
                "Days": 90,
                "AccessTier": "ARCHIVE_ACCESS"
            },
            {
                "Days": 180,
                "AccessTier": "DEEP_ARCHIVE_ACCESS"
            }
        ]
    }
}
```

For more information, see Using S3 Intelligent-Tiering in the *Amazon S3 User Guide*.

- For API details, see GetBucketIntelligentTieringConfiguration in *AWS CLI Command Reference*.

### `get-bucket-inventory-configuration`

The following code example shows how to use `get-bucket-inventory-configuration`.

**AWS CLI**

**To retrieve the inventory configuration for a bucket**

The following `get-bucket-inventory-configuration` example retrieves the inventory configuration for the specified bucket with ID 1.

```
aws s3api get-bucket-inventory-configuration \
    --bucket my-bucket \
    --id 1
```

Output:

```
{
    "InventoryConfiguration": {
        "IsEnabled": true,
        "Destination": {
```

```
            "S3BucketDestination": {
                "Format": "ORC",
                "Bucket": "arn:aws:s3:::my-bucket",
                "AccountId": "123456789012"
            }
        },
        "IncludedObjectVersions": "Current",
        "Id": "1",
        "Schedule": {
            "Frequency": "Weekly"
        }
    }
}
```

- For API details, see GetBucketInventoryConfiguration in *AWS CLI Command Reference*.

### `get-bucket-lifecycle-configuration`

The following code example shows how to use `get-bucket-lifecycle-configuration`.

#### AWS CLI

The following command retrieves the lifecycle configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-lifecycle-configuration --bucket my-bucket
```

Output:

```
{
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        },
        {
```

```
            "Status": "Enabled",
            "Prefix": "",
            "NoncurrentVersionTransitions": [
                {
                    "NoncurrentDays": 0,
                    "StorageClass": "GLACIER"
                }
            ],
            "ID": "Move old versions to Glacier"
        }
    ]
}
```

- For API details, see GetBucketLifecycleConfiguration in *AWS CLI Command Reference*.

### `get-bucket-lifecycle`

The following code example shows how to use `get-bucket-lifecycle`.

#### AWS CLI

The following command retrieves the lifecycle configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-lifecycle --bucket my-bucket
```

Output:

```
{
  "Rules": [
    {
      "ID": "Move to Glacier after sixty days (objects in logs/2015/)",
      "Prefix": "logs/2015/",
      "Status": "Enabled",
      "Transition": {
        "Days": 60,
        "StorageClass": "GLACIER"
      }
    },
    {
      "Expiration": {
        "Date": "2016-01-01T00:00:00.000Z"
      },
```

```
      "ID": "Delete 2014 logs in 2016.",
      "Prefix": "logs/2014/",
      "Status": "Enabled"
    }
  ]
}
```

- For API details, see GetBucketLifecycle in *AWS CLI Command Reference*.

### `get-bucket-location`

The following code example shows how to use `get-bucket-location`.

**AWS CLI**

The following command retrieves the location constraint for a bucket named `my-bucket`, if a constraint exists:

```
aws s3api get-bucket-location --bucket my-bucket
```

Output:

```
{
    "LocationConstraint": "us-west-2"
}
```

- For API details, see GetBucketLocation in *AWS CLI Command Reference*.

### `get-bucket-logging`

The following code example shows how to use `get-bucket-logging`.

**AWS CLI**

**To retrieve the logging status for a bucket**

The following `get-bucket-logging` example retrieves the logging status for the specified bucket.

```
aws s3api get-bucket-logging \
```

```
    --bucket my-bucket
```

Output:

```
{
    "LoggingEnabled": {
        "TargetPrefix": "",
        "TargetBucket": "my-bucket-logs"
          }
}
```

- For API details, see GetBucketLogging in *AWS CLI Command Reference*.

### `get-bucket-metrics-configuration`

The following code example shows how to use `get-bucket-metrics-configuration`.

**AWS CLI**

**To retrieve the metrics configuration for a bucket with a specific ID**

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123
```

Output:

```
{
    "MetricsConfiguration": {
        "Filter": {
            "Prefix": "logs"
        },
        "Id": "123"
    }
}
```

- For API details, see GetBucketMetricsConfiguration in *AWS CLI Command Reference*.

### `get-bucket-notification-configuration`

The following code example shows how to use `get-bucket-notification-configuration`.

#### AWS CLI

The following command retrieves the notification configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-notification-configuration --bucket my-bucket
```

Output:

```
{
    "TopicConfigurations": [
        {
            "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWNl",
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
            "Events": [
                "s3:ObjectCreated:*"
            ]
        }
    ]
}
```

- For API details, see GetBucketNotificationConfiguration in *AWS CLI Command Reference*.

### `get-bucket-notification`

The following code example shows how to use `get-bucket-notification`.

#### AWS CLI

The following command retrieves the notification configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-notification --bucket my-bucket
```

Output:

```
{
```

```
    "TopicConfiguration": {
        "Topic": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
        "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWNl",
        "Event": "s3:ObjectCreated:*",
        "Events": [
            "s3:ObjectCreated:*"
        ]
    }
}
```

- For API details, see GetBucketNotification in *AWS CLI Command Reference*.

### `get-bucket-ownership-controls`

The following code example shows how to use `get-bucket-ownership-controls`.

#### AWS CLI

**To retrieve the bucket ownership settings of a bucket**

The following `get-bucket-ownership-controls` example retrieves the bucket ownership settings of a bucket.

```
aws s3api get-bucket-ownership-controls \
    --bucket DOC-EXAMPLE-BUCKET
```

Output:

```
{
    "OwnershipControls": {
        "Rules": [
            {
                "ObjectOwnership": "BucketOwnerEnforced"
            }
        ]
    }
}
```

For more information, see Viewing the Object Ownership setting for an S3 bucket in the *Amazon S3 User Guide*.

- For API details, see GetBucketOwnershipControls in *AWS CLI Command Reference*.

### `get-bucket-policy-status`

The following code example shows how to use `get-bucket-policy-status`.

**AWS CLI**

**To retrieve the policy status for a bucket indicating whether the bucket is public**

The following `get-bucket-policy-status` example retrieves the policy status for the bucket `my-bucket`.

```
aws s3api get-bucket-policy-status \
    --bucket my-bucket
```

Output:

```
{
    "PolicyStatus": {
        "IsPublic": false
    }
}
```

- For API details, see GetBucketPolicyStatus in *AWS CLI Command Reference*.

### `get-bucket-policy`

The following code example shows how to use `get-bucket-policy`.

**AWS CLI**

The following command retrieves the bucket policy for a bucket named `my-bucket`:

```
aws s3api get-bucket-policy --bucket my-bucket
```

Output:

```
{
    "Policy": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"\",\"Effect
\":\"Allow\",\"Principal\":\"*\",\"Action\":\"s3:GetObject\",\"Resource\":
```

```
\"arn:aws:s3:::my-bucket/*\"},{\"Sid\":\"\",\"Effect\":\"Deny\",\"Principal\":\"*\",
\"Action\":\"s3:GetObject\",\"Resource\":\"arn:aws:s3:::my-bucket/secret/*\"}]}"
}
```

Get and put a bucket policyThe following example shows how you can download an Amazon S3 bucket policy, make modifications to the file, and then use `put-bucket-policy` to apply the modified bucket policy. To download the bucket policy to a file, you can run:

```
aws s3api get-bucket-policy --bucket mybucket --query Policy --output text >
 policy.json
```

You can then modify the `policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

`policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

```
aws s3api put-bucket-policy --bucket mybucket --policy file://policy.json
```

- For API details, see GetBucketPolicy in *AWS CLI Command Reference*.

### `get-bucket-replication`

The following code example shows how to use `get-bucket-replication`.

#### AWS CLI

The following command retrieves the replication configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-replication --bucket my-bucket
```

Output:

```
{
    "ReplicationConfiguration": {
        "Rules": [
            {
```

```
                "Status": "Enabled",
                "Prefix": "",
                "Destination": {
                    "Bucket": "arn:aws:s3:::my-bucket-backup",
                    "StorageClass": "STANDARD"
                },
                "ID": "ZmUwNzE4ZmQ4tMjVhOS00MTlkLOGI4NDkzZTIWJjNTUtYTA1"
            }
        ],
        "Role": "arn:aws:iam::123456789012:role/s3-replication-role"
    }
}
```

- For API details, see GetBucketReplication in *AWS CLI Command Reference*.

### `get-bucket-request-payment`

The following code example shows how to use `get-bucket-request-payment`.

#### AWS CLI

**To retrieve the request payment configuration for a bucket**

The following `get-bucket-request-payment` example retrieves the requester pays configuration for the specified bucket.

```
aws s3api get-bucket-request-payment \
    --bucket my-bucket
```

Output:

```
{
    "Payer": "BucketOwner"
}
```

- For API details, see GetBucketRequestPayment in *AWS CLI Command Reference*.

### `get-bucket-tagging`

The following code example shows how to use `get-bucket-tagging`.

**AWS CLI**

The following command retrieves the tagging configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-tagging --bucket my-bucket
```

Output:

```
{
    "TagSet": [
        {
            "Value": "marketing",
            "Key": "organization"
        }
    ]
}
```

- For API details, see GetBucketTagging in *AWS CLI Command Reference*.

### `get-bucket-versioning`

The following code example shows how to use `get-bucket-versioning`.

**AWS CLI**

The following command retrieves the versioning configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-versioning --bucket my-bucket
```

Output:

```
{
    "Status": "Enabled"
}
```

- For API details, see GetBucketVersioning in *AWS CLI Command Reference*.

### `get-bucket-website`

The following code example shows how to use `get-bucket-website`.

### AWS CLI

The following command retrieves the static website configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-website --bucket my-bucket
```

Output:

```
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

- For API details, see GetBucketWebsite in *AWS CLI Command Reference*.

## `get-object-acl`

The following code example shows how to use `get-object-acl`.

### AWS CLI

The following command retrieves the access control list for an object in a bucket named `my-bucket`:

```
aws s3api get-object-acl --bucket my-bucket --key index.html
```

Output:

```
{
    "Owner": {
        "DisplayName": "my-username",
        "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
    },
    "Grants": [
        {
            "Grantee": {
```

```
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
            },
            "Permission": "FULL_CONTROL"
        },
        {
            "Grantee": {
                "URI": "http://acs.amazonaws.com/groups/global/AllUsers"
            },
            "Permission": "READ"
        }
    ]
}
```

- For API details, see GetObjectAcl in *AWS CLI Command Reference*.

### `get-object-attributes`

The following code example shows how to use `get-object-attributes`.

#### AWS CLI

**To retrieves metadata from an object without returning the object itself**

The following `get-object-attributes` example retrieves metadata from the object `doc1.rtf`.

```
aws s3api get-object-attributes \
    --bucket my-bucket \
    --key doc1.rtf \
    --object-attributes "StorageClass" "ETag" "ObjectSize"
```

Output:

```
{
    "LastModified": "2022-03-15T19:37:31+00:00",
    "VersionId": "IuCPjXTDzHNfldAuitVBIKJpF2p1fg4P",
    "ETag": "b662d79adeb7c8d787ea7eafb9ef6207",
    "StorageClass": "STANDARD",
    "ObjectSize": 405
}
```

For more information, see GetObjectAttributes in the Amazon S3 API Reference.

- For API details, see GetObjectAttributes in *AWS CLI Command Reference*.

### `get-object-legal-hold`

The following code example shows how to use `get-object-legal-hold`.

**AWS CLI**

**Retrieves the Legal Hold status of an object**

The following `get-object-legal-hold` example retrieves the Legal Hold status for the specified object.

```
aws s3api get-object-legal-hold \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf
```

Output:

```
{
    "LegalHold": {
        "Status": "ON"
    }
}
```

- For API details, see GetObjectLegalHold in *AWS CLI Command Reference*.

### `get-object-lock-configuration`

The following code example shows how to use `get-object-lock-configuration`.

**AWS CLI**

**To retrieve an object lock configuration for a bucket**

The following `get-object-lock-configuration` example retrieves the object lock configuration for the specified bucket.

```
aws s3api get-object-lock-configuration \
    --bucket my-bucket-with-object-lock
```

Output:

```
{
    "ObjectLockConfiguration": {
        "ObjectLockEnabled": "Enabled",
        "Rule": {
            "DefaultRetention": {
                "Mode": "COMPLIANCE",
                "Days": 50
            }
        }
    }
}
```

- For API details, see GetObjectLockConfiguration in *AWS CLI Command Reference*.

### `get-object-retention`

The following code example shows how to use `get-object-retention`.

#### AWS CLI

**To retrieve the object retention configuration for an object**

The following `get-object-retention` example retrieves the object retention configuration for the specified object.

```
aws s3api get-object-retention \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf
```

Output:

```
{
    "Retention": {
        "Mode": "GOVERNANCE",
        "RetainUntilDate": "2025-01-01T00:00:00.000Z"
    }
}
```

- For API details, see GetObjectRetention in *AWS CLI Command Reference*.

### `get-object-tagging`

The following code example shows how to use `get-object-tagging`.

**AWS CLI**

**To retrieve the tags attached to an object**

The following `get-object-tagging` example retrieves the values for the specified key from the specified object.

```
aws s3api get-object-tagging \
    --bucket my-bucket \
    --key doc1.rtf
```

Output:

```
{
    "TagSet": [
        {
            "Value": "confidential",
            "Key": "designation"
        }
    ]
}
```

The following `get-object-tagging` example tries to retrieve the tag sets of the object `doc2.rtf`, which has no tags.

```
aws s3api get-object-tagging \
    --bucket my-bucket \
    --key doc2.rtf
```

Output:

```
{
    "TagSet": []
}
```

The following `get-object-tagging` example retrieves the tag sets of the object `doc3.rtf`, which has multiple tags.

```
aws s3api get-object-tagging \
    --bucket my-bucket \
    --key doc3.rtf
```

Output:

```
{
    "TagSet": [
        {
            "Value": "confidential",
            "Key": "designation"
        },
        {
            "Value": "finance",
            "Key": "department"
        },
        {
            "Value": "payroll",
            "Key": "team"
        }
    ]
}
```

- For API details, see GetObjectTagging in *AWS CLI Command Reference*.

### `get-object-torrent`

The following code example shows how to use `get-object-torrent`.

#### AWS CLI

The following command creates a torrent for an object in a bucket named `my-bucket`:

```
aws s3api get-object-torrent --bucket my-bucket --key large-video-file.mp4 large-
video-file.torrent
```

The torrent file is saved locally in the current folder. Note that the output filename (`large-video-file.torrent`) is specified without an option name and must be the last argument in the command.

- For API details, see GetObjectTorrent in *AWS CLI Command Reference*.

### `get-object`

The following code example shows how to use `get-object`.

**AWS CLI**

The following example uses the `get-object` command to download an object from Amazon S3:

```
aws s3api get-object --bucket text-content --key dir/my_images.tar.bz2
 my_images.tar.bz2
```

Note that the outfile parameter is specified without an option name such as "--outfile". The name of the output file must be the last parameter in the command.

The example below demonstrates the use of `--range` to download a specific byte range from an object. Note the byte ranges needs to be prefixed with "bytes=":

```
aws s3api get-object --bucket text-content --key dir/my_data --range bytes=8888-9999
 my_data_range
```

For more information about retrieving objects, see Getting Objects in the *Amazon S3 Developer Guide*.

- For API details, see GetObject in *AWS CLI Command Reference*.

### `get-public-access-block`

The following code example shows how to use `get-public-access-block`.

**AWS CLI**

**To set or modify the block public access configuration for a bucket**

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block \
    --bucket my-bucket
```

Output:

```
{
    "PublicAccessBlockConfiguration": {
        "IgnorePublicAcls": true,
        "BlockPublicPolicy": true,
        "BlockPublicAcls": true,
        "RestrictPublicBuckets": true
    }
}
```

- For API details, see GetPublicAccessBlock in *AWS CLI Command Reference*.

### `head-bucket`

The following code example shows how to use `head-bucket`.

#### AWS CLI

The following command verifies access to a bucket named `my-bucket`:

```
aws s3api head-bucket --bucket my-bucket
```

If the bucket exists and you have access to it, no output is returned. Otherwise, an error message will be shown. For example:

```
A client error (404) occurred when calling the HeadBucket operation: Not Found
```

- For API details, see HeadBucket in *AWS CLI Command Reference*.

### `head-object`

The following code example shows how to use `head-object`.

#### AWS CLI

The following command retrieves metadata for an object in a bucket named `my-bucket`:

```
aws s3api head-object --bucket my-bucket --key index.html
```

Output:

```
{
    "AcceptRanges": "bytes",
    "ContentType": "text/html",
    "LastModified": "Thu, 16 Apr 2015 18:19:14 GMT",
    "ContentLength": 77,
    "VersionId": "null",
    "ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",
    "Metadata": {}
}
```

- For API details, see HeadObject in *AWS CLI Command Reference*.

### `list-bucket-analytics-configurations`

The following code example shows how to use `list-bucket-analytics-configurations`.

#### AWS CLI

**To retrieve a list of analytics configurations for a bucket**

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
    --bucket my-bucket
```

Output:

```
{
    "AnalyticsConfigurationList": [
        {
            "StorageClassAnalysis": {},
            "Id": "1"
        }
    ],
    "IsTruncated": false
}
```

- For API details, see ListBucketAnalyticsConfigurations in *AWS CLI Command Reference*.

### `list-bucket-intelligent-tiering-configurations`

The following code example shows how to use `list-bucket-intelligent-tiering-configurations`.

**AWS CLI**

**To retrieve all S3 Intelligent-Tiering configurations on a bucket**

The following `list-bucket-intelligent-tiering-configurations` example retrieves all S3 Intelligent-Tiering configuration on a bucket.

```
aws s3api list-bucket-intelligent-tiering-configurations \
    --bucket DOC-EXAMPLE-BUCKET
```

Output:

```
{
    "IsTruncated": false,
    "IntelligentTieringConfigurationList": [
        {
            "Id": "ExampleConfig",
            "Filter": {
                "Prefix": "images"
            },
            "Status": "Enabled",
            "Tierings": [
                {
                    "Days": 90,
                    "AccessTier": "ARCHIVE_ACCESS"
                },
                {
                    "Days": 180,
                    "AccessTier": "DEEP_ARCHIVE_ACCESS"
                }
            ]
        },
        {
            "Id": "ExampleConfig2",
            "Status": "Disabled",
            "Tierings": [
                {
```

```
                    "Days": 730,
                    "AccessTier": "ARCHIVE_ACCESS"
                }
            ]
        },
        {
            "Id": "ExampleConfig3",
            "Filter": {
                "Tag": {
                    "Key": "documents",
                    "Value": "taxes"
                }
            },
            "Status": "Enabled",
            "Tierings": [
                {
                    "Days": 90,
                    "AccessTier": "ARCHIVE_ACCESS"
                },
                {
                    "Days": 365,
                    "AccessTier": "DEEP_ARCHIVE_ACCESS"
                }
            ]
        }
    ]
}
```

For more information, see Using S3 Intelligent-Tiering in the *Amazon S3 User Guide*.

- For API details, see ListBucketIntelligentTieringConfigurations in *AWS CLI Command Reference*.

## `list-bucket-inventory-configurations`

The following code example shows how to use `list-bucket-inventory-configurations`.

### AWS CLI

#### To retrieve a list of inventory configurations for a bucket

The following `list-bucket-inventory-configurations` example lists the inventory configurations for the specified bucket.

```
aws s3api list-bucket-inventory-configurations \
    --bucket my-bucket
```

Output:

```
{
    "InventoryConfigurationList": [
        {
            "IsEnabled": true,
            "Destination": {
                "S3BucketDestination": {
                    "Format": "ORC",
                    "Bucket": "arn:aws:s3:::my-bucket",
                    "AccountId": "123456789012"
                }
            },
            "IncludedObjectVersions": "Current",
            "Id": "1",
            "Schedule": {
                "Frequency": "Weekly"
            }
        },
        {
            "IsEnabled": true,
            "Destination": {
                "S3BucketDestination": {
                    "Format": "CSV",
                    "Bucket": "arn:aws:s3:::my-bucket",
                    "AccountId": "123456789012"
                }
            },
            "IncludedObjectVersions": "Current",
            "Id": "2",
            "Schedule": {
                "Frequency": "Daily"
            }
        }
    ],
    "IsTruncated": false
}
```

- For API details, see ListBucketInventoryConfigurations in *AWS CLI Command Reference*.

### `list-bucket-metrics-configurations`

The following code example shows how to use `list-bucket-metrics-configurations`.

#### AWS CLI

**To retrieve a list of metrics configurations for a bucket**

The following `list-bucket-metrics-configurations` example retrieves a list of metrics configurations for the specified bucket.

```
aws s3api list-bucket-metrics-configurations \
    --bucket my-bucket
```

Output:

```
{
    "IsTruncated": false,
    "MetricsConfigurationList": [
        {
            "Filter": {
                "Prefix": "logs"
            },
            "Id": "123"
        },
        {
            "Filter": {
                "Prefix": "tmp"
            },
            "Id": "234"
        }
    ]
}
```

- For API details, see ListBucketMetricsConfigurations in *AWS CLI Command Reference*.

### `list-buckets`

The following code example shows how to use `list-buckets`.

**AWS CLI**

The following command uses the `list-buckets` command to display the names of all your Amazon S3 buckets (across all regions):

```
aws s3api list-buckets --query "Buckets[].Name"
```

The query option filters the output of `list-buckets` down to only the bucket names.

For more information about buckets, see Working with Amazon S3 Buckets in the *Amazon S3 Developer Guide*.

- For API details, see ListBuckets in *AWS CLI Command Reference*.

### `list-multipart-uploads`

The following code example shows how to use `list-multipart-uploads`.

**AWS CLI**

The following command lists all of the active multipart uploads for a bucket named `my-bucket`:

```
aws s3api list-multipart-uploads --bucket my-bucket
```

Output:

```
{
    "Uploads": [
        {
            "Initiator": {
                "DisplayName": "username",
                "ID": "arn:aws:iam::0123456789012:user/username"
            },
            "Initiated": "2015-06-02T18:01:30.000Z",
            "UploadId":
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URC
            "StorageClass": "STANDARD",
            "Key": "multipart/01",
            "Owner": {
                "DisplayName": "aws-account-name",
```

```
                "ID":
 "100719349fc3b6dcd7c820a124bf7aecd408092c3d7b51b38494939801fc248b"
            }
        }
    ],
    "CommonPrefixes": []
}
```

In progress multipart uploads incur storage costs in Amazon S3. Complete or abort an active multipart upload to remove its parts from your account.

- For API details, see ListMultipartUploads in *AWS CLI Command Reference*.

### `list-object-versions`

The following code example shows how to use `list-object-versions`.

#### AWS CLI

The following command retrieves version information for an object in a bucket named `my-bucket`:

```
aws s3api list-object-versions --bucket my-bucket --prefix index.html
```

Output:

```
{
    "DeleteMarkers": [
        {
            "Owner": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": true,
            "VersionId": "B2VsEK5saUNNHKcOAJj7hIE86RozToyq",
            "Key": "index.html",
            "LastModified": "2015-11-10T00:57:03.000Z"
        },
        {
            "Owner": {
                "DisplayName": "my-username",
```

```
                "ID":
"7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": false,
            "VersionId": ".FLQEZscLIcfxSq.jsFJ.szUkmng2Yw6",
            "Key": "index.html",
            "LastModified": "2015-11-09T23:32:20.000Z"
        }
    ],
    "Versions": [
        {
            "LastModified": "2015-11-10T00:20:11.000Z",
            "VersionId": "Rb_l2T8UHDkFEwCgJjhlgPOZC0qJ.vpD",
            "ETag": "\"0622528de826c0df5db1258a23b80be5\"",
            "StorageClass": "STANDARD",
            "Key": "index.html",
            "Owner": {
                "DisplayName": "my-username",
                "ID":
"7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": false,
            "Size": 38
        },
        {
            "LastModified": "2015-11-09T23:26:41.000Z",
            "VersionId": "rasWWGpgk9E4s0LyTJgusGeRQKLVIAFf",
            "ETag": "\"06225825b8028de826c0df5db1a23be5\"",
            "StorageClass": "STANDARD",
            "Key": "index.html",
            "Owner": {
                "DisplayName": "my-username",
                "ID":
"7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": false,
            "Size": 38
        },
        {
            "LastModified": "2015-11-09T22:50:50.000Z",
            "VersionId": "null",
            "ETag": "\"d1f45267a863c8392e07d24dd592f1b9\"",
            "StorageClass": "STANDARD",
            "Key": "index.html",
```

```
            "Owner": {
                "DisplayName": "my-username",
                "ID":
 "7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
            },
            "IsLatest": false,
            "Size": 533823
        }
    ]
}
```

- For API details, see ListObjectVersions in *AWS CLI Command Reference*.

### `list-objects-v2`

The following code example shows how to use `list-objects-v2`.

#### AWS CLI

**To get a list of objects in a bucket**

The following `list-objects-v2` example lists the objects in the specified bucket.

```
aws s3api list-objects-v2 \
    --bucket my-bucket
```

Output:

```
{
    "Contents": [
        {
            "LastModified": "2019-11-05T23:11:50.000Z",
            "ETag": "\"621503c373607d548b37cff8778d992c\"",
            "StorageClass": "STANDARD",
            "Key": "doc1.rtf",
            "Size": 391
        },
        {
            "LastModified": "2019-11-05T23:11:50.000Z",
            "ETag": "\"a2cecc36ab7c7fe3a71a273b9d45b1b5\"",
            "StorageClass": "STANDARD",
            "Key": "doc2.rtf",
```

```
            "Size": 373
        },
        {
            "LastModified": "2019-11-05T23:11:50.000Z",
            "ETag": "\"08210852f65a2e9cb999972539a64d68\"",
            "StorageClass": "STANDARD",
            "Key": "doc3.rtf",
            "Size": 399
        },
        {
            "LastModified": "2019-11-05T23:11:50.000Z",
            "ETag": "\"d1852dd683f404306569471af106988e\"",
            "StorageClass": "STANDARD",
            "Key": "doc4.rtf",
            "Size": 6225
        }
    ]
}
```

- For API details, see ListObjectsV2 in *AWS CLI Command Reference*.

### `list-objects`

The following code example shows how to use `list-objects`.

#### AWS CLI

The following example uses the `list-objects` command to display the names of all the objects in the specified bucket:

```
aws s3api list-objects --bucket text-content --query 'Contents[].{Key: Key, Size:
 Size}'
```

The example uses the `--query` argument to filter the output of `list-objects` down to the key value and size for each object

For more information about objects, see Working with Amazon S3 Objects in the *Amazon S3 Developer Guide*.

- For API details, see ListObjects in *AWS CLI Command Reference*.

### `list-parts`

The following code example shows how to use `list-parts`.

#### AWS CLI

The following command lists all of the parts that have been uploaded for a multipart upload with key `multipart/01` in the bucket `my-bucket`:

```
aws s3api list-parts --bucket my-bucket --key 'multipart/01' --upload-id
 dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URCS
```

Output:

```
{
    "Owner": {
        "DisplayName": "aws-account-name",
        "ID": "100719349fc3b6dcd7c820a124bf7aecd408092c3d7b51b38494939801fc248b"
    },
    "Initiator": {
        "DisplayName": "username",
        "ID": "arn:aws:iam::0123456789012:user/username"
    },
    "Parts": [
        {
            "LastModified": "2015-06-02T18:07:35.000Z",
            "PartNumber": 1,
            "ETag": "\"e868e0f4719e394144ef36531ee6824c\"",
            "Size": 5242880
        },
        {
            "LastModified": "2015-06-02T18:07:42.000Z",
            "PartNumber": 2,
            "ETag": "\"6bb2b12753d66fe86da4998aa33fffb0\"",
            "Size": 5242880
        },
        {
            "LastModified": "2015-06-02T18:07:47.000Z",
            "PartNumber": 3,
            "ETag": "\"d0a0112e841abec9c9ec83406f0159c8\"",
            "Size": 5242880
        }
    ],
```

```
    "StorageClass": "STANDARD"
}
```

- For API details, see ListParts in *AWS CLI Command Reference*.

### `ls`

The following code example shows how to use `ls`.

**AWS CLI**

**Example 1: Listing all user owned buckets**

The following `ls` command lists all of the bucket owned by the user. In this example, the user owns the buckets `mybucket` and `mybucket2`. The timestamp is the date the bucket was created, shown in your machine's time zone. This date can change when making changes to your bucket, such as editing its bucket policy. Note if `s3://` is used for the path argument `<S3Uri>`, it will list all of the buckets as well.

```
aws s3 ls
```

Output:

```
2013-07-11 17:08:50 mybucket
2013-07-24 14:55:44 mybucket2
```

**Example 2: Listing all prefixes and objects in a bucket**

The following `ls` command lists objects and common prefixes under a specified bucket and prefix. In this example, the user owns the bucket `mybucket` with the objects `test.txt` and `somePrefix/test.txt`. The `LastWriteTime` and `Length` are arbitrary. Note that since the `ls` command has no interaction with the local filesystem, the `s3://` URI scheme is not required to resolve ambiguity and may be omitted.

```
aws s3 ls s3://mybucket
```

Output:

```
                           PRE somePrefix/
```

```
2013-07-25 17:06:27         88 test.txt
```

**Example 3: Listing all prefixes and objects in a specific bucket and prefix**

The following `ls` command lists objects and common prefixes under a specified bucket and prefix. However, there are no objects nor common prefixes under the specified bucket and prefix.

```
aws s3 ls s3://mybucket/noExistPrefix
```

Output:

```
None
```

**Example 4: Recursively listing all prefixes and objects in a bucket**

The following `ls` command will recursively list objects in a bucket. Rather than showing PRE `dirname/` in the output, all the content in a bucket will be listed in order.

```
aws s3 ls s3://mybucket \
    --recursive
```

Output:

```
2013-09-02 21:37:53         10 a.txt
2013-09-02 21:37:53    2863288 foo.zip
2013-09-02 21:32:57         23 foo/bar/.baz/a
2013-09-02 21:32:58         41 foo/bar/.baz/b
2013-09-02 21:32:57        281 foo/bar/.baz/c
2013-09-02 21:32:57         73 foo/bar/.baz/d
2013-09-02 21:32:57        452 foo/bar/.baz/e
2013-09-02 21:32:57        896 foo/bar/.baz/hooks/bar
2013-09-02 21:32:57        189 foo/bar/.baz/hooks/foo
2013-09-02 21:32:57        398 z.txt
```

**Example 5: Summarizing all prefixes and objects in a bucket**

The following `ls` command demonstrates the same command using the --human-readable and --summarize options. --human-readable displays file size in Bytes/MiB/KiB/GiB/TiB/PiB/EiB. --summarize displays the total number of objects and total size at the end of the result listing:

```
aws s3 ls s3://mybucket \
    --recursive \
    --human-readable \
    --summarize
```

Output:

```
2013-09-02 21:37:53   10 Bytes a.txt
2013-09-02 21:37:53  2.9 MiB foo.zip
2013-09-02 21:32:57   23 Bytes foo/bar/.baz/a
2013-09-02 21:32:58   41 Bytes foo/bar/.baz/b
2013-09-02 21:32:57  281 Bytes foo/bar/.baz/c
2013-09-02 21:32:57   73 Bytes foo/bar/.baz/d
2013-09-02 21:32:57  452 Bytes foo/bar/.baz/e
2013-09-02 21:32:57  896 Bytes foo/bar/.baz/hooks/bar
2013-09-02 21:32:57  189 Bytes foo/bar/.baz/hooks/foo
2013-09-02 21:32:57  398 Bytes z.txt

Total Objects: 10
   Total Size: 2.9 MiB
```

**Example 6: Listing from an S3 access point**

The following `ls` command list objects from access point (`myaccesspoint`):

```
aws s3 ls s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
```

Output:

```
                           PRE somePrefix/
2013-07-25 17:06:27         88 test.txt
```

- For API details, see Ls in *AWS CLI Command Reference*.

### `mb`

The following code example shows how to use `mb`.

### AWS CLI

**Example 1: Create a bucket**

The following `mb` command creates a bucket. In this example, the user makes the bucket `mybucket`. The bucket is created in the region specified in the user's configuration file:

```
aws s3 mb s3://mybucket
```

Output:

```
make_bucket: s3://mybucket
```

**Example 2: Create a bucket in the specified region**

The following `mb` command creates a bucket in a region specified by the `--region` parameter. In this example, the user makes the bucket `mybucket` in the region `us-west-1`:

```
aws s3 mb s3://mybucket \
    --region us-west-1
```

Output:

```
make_bucket: s3://mybucket
```

- For API details, see Mb in *AWS CLI Command Reference*.

### `mv`

The following code example shows how to use `mv`.

**AWS CLI**

**Example 1: Move a local file to the specified bucket**

The following `mv` command moves a single file to a specified bucket and key.

```
aws s3 mv test.txt s3://mybucket/test2.txt
```

Output:

```
move: test.txt to s3://mybucket/test2.txt
```

**Example 2: Move an object to the specified bucket and key**

The following `mv` command moves a single s3 object to a specified bucket and key.

```
aws s3 mv s3://mybucket/test.txt s3://mybucket/test2.txt
```

Output:

```
move: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

**Example 3: Move an S3 object to the local directory**

The following `mv` command moves a single object to a specified file locally.

```
aws s3 mv s3://mybucket/test.txt test2.txt
```

Output:

```
move: s3://mybucket/test.txt to test2.txt
```

**Example 4: Move an object with it's original name to the specified bucket**

The following `mv` command moves a single object to a specified bucket while retaining its original name:

```
aws s3 mv s3://mybucket/test.txt s3://mybucket2/
```

Output:

```
move: s3://mybucket/test.txt to s3://mybucket2/test.txt
```

**Example 5: Move all objects and prefixes in a bucket to the local directory**

When passed with the parameter `--recursive`, the following `mv` command recursively moves all objects under a specified prefix and bucket to a specified directory. In this example, the bucket `mybucket` has the objects `test1.txt` and `test2.txt`.

```
aws s3 mv s3://mybucket . \
```

```
    --recursive
```

Output:

```
move: s3://mybucket/test1.txt to test1.txt
move: s3://mybucket/test2.txt to test2.txt
```

**Example 6: Move all objects and prefixes in a bucket to the local directory, except ``.jpg`` files**

When passed with the parameter `--recursive`, the following `mv` command recursively moves all files under a specified directory to a specified bucket and prefix while excluding some files by using an `--exclude` parameter. In this example, the directory `myDir` has the files `test1.txt` and `test2.jpg`.

```
aws s3 mv myDir s3://mybucket/ \
    --recursive \
    --exclude "*.jpg"
```

Output:

```
move: myDir/test1.txt to s3://mybucket2/test1.txt
```

**Example 7: Move all objects and prefixes in a bucket to the local directory, except specified prefix**

When passed with the parameter `--recursive`, the following `mv` command recursively moves all objects under a specified bucket to another bucket while excluding some objects by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `another/test1.txt`.

```
aws s3 mv s3://mybucket/ s3://mybucket2/ \
    --recursive \
    --exclude "mybucket/another/*"
```

Output:

```
move: s3://mybucket/test1.txt to s3://mybucket2/test1.txt
```

**Example 8: Move an object to the specified bucket and set the ACL**

The following mv command moves a single object to a specified bucket and key while setting the ACL to public-read-write.

```
aws s3 mv s3://mybucket/test.txt s3://mybucket/test2.txt \
    --acl public-read-write
```

Output:

```
move: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

**Example 9: Move a local file to the specified bucket and grant permissions**

The following mv command illustrates the use of the --grants option to grant read access to all users and full control to a specific user identified by their email address.

```
aws s3 mv file.txt s3://mybucket/ \
    --grants read=uri=http://acs.amazonaws.com/groups/global/AllUsers
 full=emailaddress=user@example.com
```

Output:

```
move: file.txt to s3://mybucket/file.txt
```

**Example 10: Move a file to an S3 access point**

The following mv command moves a single file named mydoc.txt to the access point named myaccesspoint at the key named mykey.

```
aws s3 mv mydoc.txt s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

Output:

```
move: mydoc.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
mykey
```

- For API details, see Mv in *AWS CLI Command Reference*.

### `presign`

The following code example shows how to use `presign`.

#### AWS CLI

**Example 1: To create a pre-signed URL with the default one hour lifetime that links to an object in an S3 bucket**

The following `presign` command generates a pre-signed URL for a specified bucket and key that is valid for one hour.

```
aws s3 presign s3://DOC-EXAMPLE-BUCKET/test2.txt
```

Output:

```
https://DOC-EXAMPLE-BUCKET.s3.us-west-2.amazonaws.com/key?X-Amz-Algorithm=AWS4-
HMAC-SHA256&X-Amz-Credential=AKIAEXAMPLE123456789%2F20210621%2Fus-
west-2%2Fs3%2Faws4_request&X-Amz-Date=20210621T041609Z&X-Amz-Expires=3600&X-Amz-
SignedHeaders=host&X-Amz-
Signature=EXAMBLE1234494d5fba3fed607f98018e1dfc62e2529ae96d844123456
```

**Example 2: To create a pre-signed URL with a custom lifetime that links to an object in an S3 bucket**

The following `presign` command generates a pre-signed URL for a specified bucket and key that is valid for one week.

```
aws s3 presign s3://DOC-EXAMPLE-BUCKET/test2.txt \
    --expires-in 604800
```

Output:

```
https://DOC-EXAMPLE-BUCKET.s3.us-west-2.amazonaws.com/key?X-Amz-Algorithm=AWS4-
HMAC-SHA256&X-Amz-Credential=AKIAEXAMPLE123456789%2F20210621%2Fus-
west-2%2Fs3%2Faws4_request&X-Amz-Date=20210621T041609Z&X-Amz-Expires=604800&X-Amz-
SignedHeaders=host&X-Amz-
Signature=EXAMBLE1234494d5fba3fed607f98018e1dfc62e2529ae96d844123456
```

For more information, see Share an Object with Others in the *S3 Developer Guide* guide.

- For API details, see Presign in *AWS CLI Command Reference*.

### `put-bucket-accelerate-configuration`

The following code example shows how to use `put-bucket-accelerate-configuration`.

#### AWS CLI

**To set the accelerate configuration of a bucket**

The following `put-bucket-accelerate-configuration` example enables the accelerate configuration for the specified bucket.

```
aws s3api put-bucket-accelerate-configuration \
    --bucket my-bucket \
    --accelerate-configuration Status=Enabled
```

This command produces no output.

- For API details, see PutBucketAccelerateConfiguration in *AWS CLI Command Reference*.

### `put-bucket-acl`

The following code example shows how to use `put-bucket-acl`.

#### AWS CLI

This example grants `full control` to two AWS users (*user1@example.com* and *user2@example.com*) and `read` permission to everyone:

```
aws s3api put-bucket-acl --bucket MyBucket --grant-full-control
 emailaddress=user1@example.com,emailaddress=user2@example.com --grant-read
 uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html for details on custom ACLs (the s3api ACL commands, such as `put-bucket-acl`, use the same shorthand argument notation).

- For API details, see PutBucketAcl in *AWS CLI Command Reference*.

### `put-bucket-analytics-configuration`

The following code example shows how to use `put-bucket-analytics-configuration`.

**AWS CLI**

**To sets an analytics configuration for the bucket**

The following `put-bucket-analytics-configuration` example configures analytics for the specified bucket.

```
aws s3api put-bucket-analytics-configuration \
    --bucket my-bucket --id 1 \
    --analytics-configuration '{"Id": "1","StorageClassAnalysis": {}}'
```

This command produces no output.

- For API details, see PutBucketAnalyticsConfiguration in *AWS CLI Command Reference*.

## `put-bucket-cors`

The following code example shows how to use `put-bucket-cors`.

**AWS CLI**

The following example enables PUT, POST, and DELETE requests from *www.example.com*, and enables GET requests from any domain:

```
aws s3api put-bucket-cors --bucket MyBucket --cors-configuration file://cors.json

cors.json:
{
  "CORSRules": [
    {
      "AllowedOrigins": ["http://www.example.com"],
      "AllowedHeaders": ["*"],
      "AllowedMethods": ["PUT", "POST", "DELETE"],
      "MaxAgeSeconds": 3000,
      "ExposeHeaders": ["x-amz-server-side-encryption"]
    },
    {
      "AllowedOrigins": ["*"],
      "AllowedHeaders": ["Authorization"],
      "AllowedMethods": ["GET"],
      "MaxAgeSeconds": 3000
    }
```

```
  ]
}
```

- For API details, see PutBucketCors in *AWS CLI Command Reference*.

### `put-bucket-encryption`

The following code example shows how to use `put-bucket-encryption`.

**AWS CLI**

**To configure server-side encryption for a bucket**

The following `put-bucket-encryption` example sets AES256 encryption as the default for the specified bucket.

```
aws s3api put-bucket-encryption \
    --bucket my-bucket \
    --server-side-encryption-configuration '{"Rules":
 [{"ApplyServerSideEncryptionByDefault": {"SSEAlgorithm": "AES256"}}]}'
```

This command produces no output.

- For API details, see PutBucketEncryption in *AWS CLI Command Reference*.

### `put-bucket-intelligent-tiering-configuration`

The following code example shows how to use `put-bucket-intelligent-tiering-configuration`.

**AWS CLI**

**To update an S3 Intelligent-Tiering configuration on a bucket**

The following `put-bucket-intelligent-tiering-configuration` example updates an S3 Intelligent-Tiering configuration, named ExampleConfig, on a bucket. The configuration will transition objects that have not been accessed under the prefix images to Archive Access after 90 days and Deep Archive Access after 180 days.

```
aws s3api put-bucket-intelligent-tiering-configuration \
```

```
    --bucket DOC-EXAMPLE-BUCKET \
    --id "ExampleConfig" \
    --intelligent-tiering-configuration file://intelligent-tiering-
configuration.json
```

Contents of `intelligent-tiering-configuration.json`:

```
{
    "Id": "ExampleConfig",
    "Status": "Enabled",
    "Filter": {
        "Prefix": "images"
        },
    "Tierings": [
        {
            "Days": 90,
            "AccessTier": "ARCHIVE_ACCESS"
        },
        {
            "Days": 180,
            "AccessTier": "DEEP_ARCHIVE_ACCESS"
        }
    ]
}
```

This command produces no output.

For more information, see Setting Object Ownership on an existing bucket in the *Amazon S3 User Guide*.

- For API details, see PutBucketIntelligentTieringConfiguration in *AWS CLI Command Reference*.

### `put-bucket-inventory-configuration`

The following code example shows how to use `put-bucket-inventory-configuration`.

#### AWS CLI

**Example 1: To set an inventory configuration for a bucket**

The following `put-bucket-inventory-configuration` example sets a weekly ORC-formatted inventory report for the bucket `my-bucket`.

```
aws s3api put-bucket-inventory-configuration \
    --bucket my-bucket \
    --id 1 \
    --inventory-configuration '{"Destination": { "S3BucketDestination":
 { "AccountId": "123456789012", "Bucket": "arn:aws:s3:::my-bucket", "Format":
 "ORC" }}, "IsEnabled": true, "Id": "1", "IncludedObjectVersions": "Current",
 "Schedule": { "Frequency": "Weekly" }}'
```

This command produces no output.

**Example 2: To set an inventory configuration for a bucket**

The following `put-bucket-inventory-configuration` example sets a daily CSV-formatted inventory report for the bucket `my-bucket`.

```
aws s3api put-bucket-inventory-configuration \
    --bucket my-bucket \
    --id 2 \
    --inventory-configuration '{"Destination": { "S3BucketDestination":
 { "AccountId": "123456789012", "Bucket": "arn:aws:s3:::my-bucket", "Format":
 "CSV" }}, "IsEnabled": true, "Id": "2", "IncludedObjectVersions": "Current",
 "Schedule": { "Frequency": "Daily" }}'
```

This command produces no output.

- For API details, see PutBucketInventoryConfiguration in *AWS CLI Command Reference*.

## `put-bucket-lifecycle-configuration`

The following code example shows how to use `put-bucket-lifecycle-configuration`.

### AWS CLI

The following command applies a lifecycle configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-lifecycle-configuration --bucket my-bucket --lifecycle-
configuration  file://lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```
{
```

```
    "Rules": [
        {
            "ID": "Move rotated logs to Glacier",
            "Prefix": "rotated/",
            "Status": "Enabled",
            "Transitions": [
                {
                    "Date": "2015-11-10T00:00:00.000Z",
                    "StorageClass": "GLACIER"
                }
            ]
        },
        {
            "Status": "Enabled",
            "Prefix": "",
            "NoncurrentVersionTransitions": [
                {
                    "NoncurrentDays": 2,
                    "StorageClass": "GLACIER"
                }
            ],
            "ID": "Move old versions to Glacier"
        }
    ]
}
```

The first rule moves files with the prefix `rotated` to Glacier on the specified date. The second rule moves old object versions to Glacier when they are no longer current. For information on acceptable timestamp formats, see Specifying Parameter Values in the *AWS CLI User Guide*.

- For API details, see PutBucketLifecycleConfiguration in *AWS CLI Command Reference*.

### `put-bucket-lifecycle`

The following code example shows how to use `put-bucket-lifecycle`.

#### AWS CLI

The following command applies a lifecycle configuration to the bucket `my-bucket`:

```
aws s3api put-bucket-lifecycle --bucket my-bucket --lifecycle-configuration file://
lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```
{
  "Rules": [
    {
      "ID": "Move to Glacier after sixty days (objects in logs/2015/)",
      "Prefix": "logs/2015/",
      "Status": "Enabled",
      "Transition": {
        "Days": 60,
        "StorageClass": "GLACIER"
      }
    },
    {
      "Expiration": {
        "Date": "2016-01-01T00:00:00.000Z"
      },
      "ID": "Delete 2014 logs in 2016.",
      "Prefix": "logs/2014/",
      "Status": "Enabled"
    }
  ]
}
```

The first rule moves files to Amazon Glacier after sixty days. The second rule deletes files from Amazon S3 on the specified date. For information on acceptable timestamp formats, see Specifying Parameter Values in the *AWS CLI User Guide*.

Each rule in the above example specifies a policy (`Transition` or `Expiration`) and file prefix (folder name) to which it applies. You can also create a rule that applies to an entire bucket by specifying a blank prefix:

```
{
  "Rules": [
    {
      "ID": "Move to Glacier after sixty days (all objects in bucket)",
      "Prefix": "",
      "Status": "Enabled",
      "Transition": {
        "Days": 60,
        "StorageClass": "GLACIER"
      }
```

```
    }
  ]
}
```

- For API details, see PutBucketLifecycle in *AWS CLI Command Reference*.

### `put-bucket-logging`

The following code example shows how to use `put-bucket-logging`.

#### AWS CLI

**Example 1: To set bucket policy logging**

The following `put-bucket-logging` example sets the logging policy for *MyBucket*. First, grant the logging service principal permission in your bucket policy using the `put-bucket-policy` command.

```
aws s3api put-bucket-policy \
    --bucket MyBucket \
    --policy file://policy.json
```

Contents of `policy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "S3ServerAccessLogsPolicy",
            "Effect": "Allow",
            "Principal": {"Service": "logging.s3.amazonaws.com"},
            "Action": "s3:PutObject",
            "Resource": "arn:aws:s3:::MyBucket/Logs/*",
            "Condition": {
                "ArnLike": {"aws:SourceARN": "arn:aws:s3:::SOURCE-BUCKET-NAME"},
                "StringEquals": {"aws:SourceAccount": "SOURCE-AWS-ACCOUNT-ID"}
            }
        }
    ]
}
```

To apply the logging policy, use `put-bucket-logging`.

```
aws s3api put-bucket-logging \
    --bucket MyBucket \
    --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{
     "LoggingEnabled": {
         "TargetBucket": "MyBucket",
         "TargetPrefix": "Logs/"
     }
 }
```

The `put-bucket-policy` command is required to grant `s3:PutObject` permissions to the logging service principal.

For more information, see Amazon S3 Server Access Logging in the *Amazon S3 User Guide*.

**Example 2: To set a bucket policy for logging access to only a single user**

The following `put-bucket-logging` example sets the logging policy for *MyBucket*. The AWS user *bob@example.com* will have full control over the log files, and no one else has any access. First, grant S3 permission with `put-bucket-acl`.

```
aws s3api put-bucket-acl \
    --bucket MyBucket \
    --grant-write URI=http://acs.amazonaws.com/groups/s3/LogDelivery \
    --grant-read-acp URI=http://acs.amazonaws.com/groups/s3/LogDelivery
```

Then apply the logging policy using `put-bucket-logging`.

```
aws s3api put-bucket-logging \
    --bucket MyBucket \
    --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{
    "LoggingEnabled": {
        "TargetBucket": "MyBucket",
        "TargetPrefix": "MyBucketLogs/",
```

```
        "TargetGrants": [
            {
                "Grantee": {
                    "Type": "AmazonCustomerByEmail",
                    "EmailAddress": "bob@example.com"
                },
                "Permission": "FULL_CONTROL"
            }
        ]
    }
}
```

the `put-bucket-acl` command is required to grant S3's log delivery system the necessary permissions (write and read-acp permissions).

For more information, see Amazon S3 Server Access Logging in the *Amazon S3 Developer Guide*.

- For API details, see PutBucketLogging in *AWS CLI Command Reference*.

### `put-bucket-metrics-configuration`

The following code example shows how to use `put-bucket-metrics-configuration`.

**AWS CLI**

**To set a metrics configuration for a bucket**

The following `put-bucket-metrics-configuration` example sets a metric configuration with ID 123 for the specified bucket.

```
aws s3api put-bucket-metrics-configuration \
    --bucket my-bucket \
    --id 123 \
    --metrics-configuration '{"Id": "123", "Filter": {"Prefix": "logs"}}'
```

This command produces no output.

- For API details, see PutBucketMetricsConfiguration in *AWS CLI Command Reference*.

### `put-bucket-notification-configuration`

The following code example shows how to use `put-bucket-notification-configuration`.

**AWS CLI**

**To enable the specified notifications to a bucket**

The following `put-bucket-notification-configuration` example applies a notification configuration to a bucket named `my-bucket`. The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor.

```
aws s3api put-bucket-notification-configuration \
    --bucket my-bucket \
    --notification-configuration file://notification.json
```

Contents of `notification.json`:

```
{
    "TopicConfigurations": [
        {
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic",
            "Events": [
                "s3:ObjectCreated:*"
            ]
        }
    ]
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it.

```
{
    "Version": "2008-10-17",
    "Id": "example-ID",
    "Statement": [
        {
            "Sid": "example-statement-ID",
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": [
                "SNS:Publish"
            ],
            "Resource": "arn:aws:sns:us-west-2:123456789012::s3-notification-topic",
            "Condition": {
```

```
                "ArnLike": {
                    "aws:SourceArn": "arn:aws:s3:*:*:my-bucket"
                }
            }
        }
    ]
}
```

- For API details, see PutBucketNotificationConfiguration in *AWS CLI Command Reference*.

### `put-bucket-notification`

The following code example shows how to use `put-bucket-notification`.

#### AWS CLI

The applies a notification configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-notification --bucket my-bucket --notification-configuration
 file://notification.json
```

The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor:

```
{
  "TopicConfiguration": {
    "Event": "s3:ObjectCreated:*",
    "Topic": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic"
  }
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it:

```
{
 "Version": "2008-10-17",
 "Id": "example-ID",
 "Statement": [
  {
   "Sid": "example-statement-ID",
   "Effect": "Allow",
   "Principal": {
```

```
      "Service": "s3.amazonaws.com"
    },
    "Action": [
     "SNS:Publish"
    ],
    "Resource": "arn:aws:sns:us-west-2:123456789012:my-bucket",
    "Condition": {
       "ArnLike": {
       "aws:SourceArn": "arn:aws:s3:*:*:my-bucket"
     }
    }
   }
 ]
}
```

- For API details, see PutBucketNotification in *AWS CLI Command Reference*.

### `put-bucket-ownership-controls`

The following code example shows how to use `put-bucket-ownership-controls`.

**AWS CLI**

**To update the bucket ownership settings of a bucket**

The following `put-bucket-ownership-controls` example updates the bucket ownership settings of a bucket.

```
aws s3api put-bucket-ownership-controls \
    --bucket DOC-EXAMPLE-BUCKET \
    --ownership-controls="Rules=[{ObjectOwnership=BucketOwnerEnforced}]"
```

This command produces no output.

For more information, see Setting Object Ownership on an existing bucket in the *Amazon S3 User Guide*.

- For API details, see PutBucketOwnershipControls in *AWS CLI Command Reference*.

### `put-bucket-policy`

The following code example shows how to use `put-bucket-policy`.

**AWS CLI**

This example allows all users to retrieve any object in *MyBucket* except those in the *MySecretFolder*. It also grants `put` and `delete` permission to the root user of the AWS account `1234-5678-9012`:

```
aws s3api put-bucket-policy --bucket MyBucket --policy file://policy.json

policy.json:
{
   "Statement": [
      {
         "Effect": "Allow",
         "Principal": "*",
         "Action": "s3:GetObject",
         "Resource": "arn:aws:s3:::MyBucket/*"
      },
      {
         "Effect": "Deny",
         "Principal": "*",
         "Action": "s3:GetObject",
         "Resource": "arn:aws:s3:::MyBucket/MySecretFolder/*"
      },
      {
         "Effect": "Allow",
         "Principal": {
            "AWS": "arn:aws:iam::123456789012:root"
         },
         "Action": [
            "s3:DeleteObject",
            "s3:PutObject"
         ],
         "Resource": "arn:aws:s3:::MyBucket/*"
      }
   ]
}
```

- For API details, see PutBucketPolicy in *AWS CLI Command Reference*.

### `put-bucket-replication`

The following code example shows how to use `put-bucket-replication`.

**AWS CLI**

**To configure replication for an S3 bucket**

The following `put-bucket-replication` example applies a replication configuration to the specified S3 bucket.

```
aws s3api put-bucket-replication \
    --bucket AWSDOC-EXAMPLE-BUCKET1 \
    --replication-configuration file://replication.json
```

Contents of `replication.json`:

```
{
    "Role": "arn:aws:iam::123456789012:role/s3-replication-role",
    "Rules": [
        {
            "Status": "Enabled",
            "Priority": 1,
            "DeleteMarkerReplication": { "Status": "Disabled" },
            "Filter" : { "Prefix": ""},
            "Destination": {
                "Bucket": "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET2"
            }
        }
    ]
}
```

The destination bucket must have versioning enabled. The specified role must have permission to write to the destination bucket and have a trust relationship that allows Amazon S3 to assume the role.

Example role permission policy:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetReplicationConfiguration",
```

```
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET1"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObjectVersion",
                "s3:GetObjectVersionAcl",
                "s3:GetObjectVersionTagging"
            ],
            "Resource": [
                "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET1/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:ReplicateObject",
                "s3:ReplicateDelete",
                "s3:ReplicateTags"
            ],
            "Resource": "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET2/*"
        }
    ]
}
```

Example trust relationship policy:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

This command produces no output.

For more information, see This is the topic title in the *Amazon Simple Storage Service Console User Guide*.

- For API details, see PutBucketReplication in *AWS CLI Command Reference*.

### `put-bucket-request-payment`

The following code example shows how to use `put-bucket-request-payment`.

**AWS CLI**

**Example 1: To enable ``requester pays`` configuration for a bucket**

The following `put-bucket-request-payment` example enables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket my-bucket \
    --request-payment-configuration '{"Payer":"Requester"}'
```

This command produces no output.

**Example 2: To disable ``requester pays`` configuration for a bucket**

The following `put-bucket-request-payment` example disables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \
    --bucket my-bucket \
    --request-payment-configuration '{"Payer":"BucketOwner"}'
```

This command produces no output.

- For API details, see PutBucketRequestPayment in *AWS CLI Command Reference*.

### `put-bucket-tagging`

The following code example shows how to use `put-bucket-tagging`.

**AWS CLI**

The following command applies a tagging configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-tagging --bucket my-bucket --tagging file://tagging.json
```

The file `tagging.json` is a JSON document in the current folder that specifies tags:

```
{
   "TagSet": [
     {
       "Key": "organization",
       "Value": "marketing"
     }
   ]
}
```

Or apply a tagging configuration to `my-bucket` directly from the command line:

```
aws s3api put-bucket-tagging --bucket my-bucket --tagging
 'TagSet=[{Key=organization,Value=marketing}]'
```

- For API details, see PutBucketTagging in *AWS CLI Command Reference*.

### `put-bucket-versioning`

The following code example shows how to use `put-bucket-versioning`.

**AWS CLI**

The following command enables versioning on a bucket named `my-bucket`:

```
aws s3api put-bucket-versioning --bucket my-bucket --versioning-configuration
 Status=Enabled
```

The following command enables versioning, and uses an mfa code

```
aws s3api put-bucket-versioning --bucket my-bucket --versioning-configuration
 Status=Enabled --mfa "SERIAL 123456"
```

- For API details, see PutBucketVersioning in *AWS CLI Command Reference*.

### `put-bucket-website`

The following code example shows how to use `put-bucket-website`.

#### AWS CLI

The applies a static website configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-website --bucket my-bucket --website-configuration file://
website.json
```

The file `website.json` is a JSON document in the current folder that specifies index and error pages for the website:

```
{
    "IndexDocument": {
        "Suffix": "index.html"
    },
    "ErrorDocument": {
        "Key": "error.html"
    }
}
```

- For API details, see PutBucketWebsite in *AWS CLI Command Reference*.

### `put-object-acl`

The following code example shows how to use `put-object-acl`.

#### AWS CLI

The following command grants `full control` to two AWS users (*user1@example.com* and *user2@example.com*) and `read` permission to everyone:

```
aws s3api put-object-acl --bucket MyBucket --key file.txt --grant-full-control
 emailaddress=user1@example.com,emailaddress=user2@example.com --grant-read
 uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html for details on custom ACLs (the s3api ACL commands, such as `put-object-acl`, use the same shorthand argument notation).

- For API details, see PutObjectAcl in *AWS CLI Command Reference*.

### `put-object-legal-hold`

The following code example shows how to use `put-object-legal-hold`.

**AWS CLI**

**To apply a Legal Hold to an object**

The following `put-object-legal-hold` example sets a Legal Hold on the object `doc1.rtf`.

```
aws s3api put-object-legal-hold \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf \
    --legal-hold Status=ON
```

This command produces no output.

- For API details, see PutObjectLegalHold in *AWS CLI Command Reference*.

### `put-object-lock-configuration`

The following code example shows how to use `put-object-lock-configuration`.

**AWS CLI**

**To set an object lock configuration on a bucket**

The following `put-object-lock-configuration` example sets a 50-day object lock on the specified bucket.

```
aws s3api put-object-lock-configuration \
    --bucket my-bucket-with-object-lock \
    --object-lock-configuration '{ "ObjectLockEnabled": "Enabled", "Rule":
 { "DefaultRetention": { "Mode": "COMPLIANCE", "Days": 50 }}}'
```

This command produces no output.

- For API details, see PutObjectLockConfiguration in *AWS CLI Command Reference*.

### `put-object-retention`

The following code example shows how to use `put-object-retention`.

**AWS CLI**

**To set an object retention configuration for an object**

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```
aws s3api put-object-retention \
    --bucket my-bucket-with-object-lock \
    --key doc1.rtf \
    --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate": "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see PutObjectRetention in *AWS CLI Command Reference*.

### `put-object-tagging`

The following code example shows how to use `put-object-tagging`.

**AWS CLI**

**To set a tag on an object**

The following `put-object-tagging` example sets a tag with the key `designation` and the value `confidential` on the specified object.

```
aws s3api put-object-tagging \
    --bucket my-bucket \
    --key doc1.rtf \
    --tagging '{"TagSet": [{ "Key": "designation", "Value": "confidential" }]}'
```

This command produces no output.

The following `put-object-tagging` example sets multiple tags sets on the specified object.

```
aws s3api put-object-tagging \
    --bucket my-bucket-example \
    --key doc3.rtf \
    --tagging '{"TagSet": [{ "Key": "designation", "Value": "confidential" },
 { "Key": "department", "Value": "finance" }, { "Key": "team", "Value":
 "payroll" } ]}'
```

This command produces no output.

- For API details, see PutObjectTagging in *AWS CLI Command Reference*.

### `put-object`

The following code example shows how to use `put-object`.

#### AWS CLI

The following example uses the `put-object` command to upload an object to Amazon S3:

```
aws s3api put-object --bucket text-content --key dir-1/my_images.tar.bz2 --body
 my_images.tar.bz2
```

The following example shows an upload of a video file (The video file is specified using Windows file system syntax.):

```
aws s3api put-object --bucket text-content --key dir-1/big-video-file.mp4 --body e:
\media\videos\f-sharp-3-data-services.mp4
```

For more information about uploading objects, see Uploading Objects in the *Amazon S3 Developer Guide*.

- For API details, see PutObject in *AWS CLI Command Reference*.

### `put-public-access-block`

The following code example shows how to use `put-public-access-block`.

#### AWS CLI

**To set the block public access configuration for a bucket**

The following `put-public-access-block` example sets a restrictive block public access configuration for the specified bucket.

```
aws s3api put-public-access-block \
    --bucket my-bucket \
    --public-access-block-configuration
 "BlockPublicAcls=true,IgnorePublicAcls=true,BlockPublicPolicy=true,RestrictPublicBuckets=tr
```

This command produces no output.

- For API details, see PutPublicAccessBlock in *AWS CLI Command Reference*.

### `rb`

The following code example shows how to use `rb`.

#### AWS CLI

**Example 1: Delete a bucket**

The following `rb` command removes a bucket. In this example, the user's bucket is `mybucket`. Note that the bucket must be empty in order to remove:

```
aws s3 rb s3://mybucket
```

Output:

```
remove_bucket: mybucket
```

**Example 2: Force delete a bucket**

The following `rb` command uses the `--force` parameter to first remove all of the objects in the bucket and then remove the bucket itself. In this example, the user's bucket is `mybucket` and the objects in `mybucket` are `test1.txt` and `test2.txt`:

```
aws s3 rb s3://mybucket \
    --force
```

Output:

```
delete: s3://mybucket/test1.txt
```

```
delete: s3://mybucket/test2.txt
remove_bucket: mybucket
```

- For API details, see Rb in *AWS CLI Command Reference*.

### `restore-object`

The following code example shows how to use `restore-object`.

**AWS CLI**

**To create a restore request for an object**

The following `restore-object` example restores the specified Amazon S3 Glacier object for the bucket `my-glacier-bucket` for 10 days.

```
aws s3api restore-object \
    --bucket my-glacier-bucket \
    --key doc1.rtf \
    --restore-request Days=10
```

This command produces no output.

- For API details, see RestoreObject in *AWS CLI Command Reference*.

### `rm`

The following code example shows how to use `rm`.

**AWS CLI**

**Example 1: Delete an S3 object**

The following `rm` command deletes a single s3 object:

```
aws s3 rm s3://mybucket/test2.txt
```

Output:

```
delete: s3://mybucket/test2.txt
```

**Example 2: Delete all contents in a bucket**

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive`. In this example, the bucket `mybucket` contains the objects `test1.txt` and `test2.txt`:

```
aws s3 rm s3://mybucket \
    --recursive
```

Output:

```
delete: s3://mybucket/test1.txt
delete: s3://mybucket/test2.txt
```

**Example 3: Delete all contents in a bucket, except ``.jpg`` files**

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive` while excluding some objects by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `test2.jpg`:

```
aws s3 rm s3://mybucket/ \
    --recursive \
    --exclude "*.jpg"
```

Output:

```
delete: s3://mybucket/test1.txt
```

**Example 4: Delete all contents in a bucket, except objects under the specified prefix**

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive` while excluding all objects under a particular prefix by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `another/test.txt`:

```
aws s3 rm s3://mybucket/ \
    --recursive \
```

```
    --exclude "another/*"
```

Output:

```
delete: s3://mybucket/test1.txt
```

**Example 5: Delete an object from an S3 access point**

The following `rm` command deletes a single object (`mykey`) from the access point (`myaccesspoint`). :: The following `rm` command deletes a single object (`mykey`) from the access point (`myaccesspoint`).

```
aws s3 rm s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey
```

Output:

```
delete: s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey
```

- For API details, see Rm in *AWS CLI Command Reference*.

### `select-object-content`

The following code example shows how to use `select-object-content`.

**AWS CLI**

**To filter the contents of an Amazon S3 object based on an SQL statement**

The following `select-object-content` example filters the object `my-data-file.csv` with the specified SQL statement and sends output to a file.

```
aws s3api select-object-content \
    --bucket my-bucket \
    --key my-data-file.csv \
    --expression "select * from s3object limit 100" \
    --expression-type 'SQL' \
    --input-serialization '{"CSV": {}, "CompressionType": "NONE"}' \
    --output-serialization '{"CSV": {}}' "output.csv"
```

This command produces no output.

- For API details, see SelectObjectContent in *AWS CLI Command Reference*.

### sync

The following code example shows how to use `sync`.

**AWS CLI**

**Example 1: Sync all local objects to the specified bucket**

The following `sync` command syncs objects from a local directory to the specified prefix and bucket by uploading the local files to S3. A local file will require uploading if the size of the local file is different than the size of the S3 object, the last modified time of the local file is newer than the last modified time of the S3 object, or the local file does not exist under the specified bucket and prefix. In this example, the user syncs the bucket `mybucket` to the local current directory. The local current directory contains the files `test.txt` and `test2.txt`. The bucket `mybucket` contains no objects.

```
aws s3 sync . s3://mybucket
```

Output:

```
upload: test.txt to s3://mybucket/test.txt
upload: test2.txt to s3://mybucket/test2.txt
```

**Example 2: Sync all S3 objects from the specified S3 bucket to another bucket**

The following `sync` command syncs objects under a specified prefix and bucket to objects under another specified prefix and bucket by copying S3 objects. An S3 object will require copying if the sizes of the two S3 objects differ, the last modified time of the source is newer than the last modified time of the destination, or the S3 object does not exist under the specified bucket and prefix destination.

In this example, the user syncs the bucket `mybucket` to the bucket `mybucket2`. The bucket `mybucket` contains the objects `test.txt` and `test2.txt`. The bucket `mybucket2` contains no objects:

```
aws s3 sync s3://mybucket s3://mybucket2
```

Output:

```
copy: s3://mybucket/test.txt to s3://mybucket2/test.txt
copy: s3://mybucket/test2.txt to s3://mybucket2/test2.txt
```

**Example 3: Sync all S3 objects from the specified S3 bucket to the local directory**

The following `sync` command syncs files from the specified S3 bucket to the local directory by downloading S3 objects. An S3 object will require downloading if the size of the S3 object differs from the size of the local file, the last modified time of the S3 object is newer than the last modified time of the local file, or the S3 object does not exist in the local directory. Take note that when objects are downloaded from S3, the last modified time of the local file is changed to the last modified time of the S3 object. In this example, the user syncs the bucket `mybucket` to the current local directory. The bucket `mybucket` contains the objects `test.txt` and `test2.txt`. The current local directory has no files:

```
aws s3 sync s3://mybucket .
```

Output:

```
download: s3://mybucket/test.txt to test.txt
download: s3://mybucket/test2.txt to test2.txt
```

**Example 4: Sync all local objects to the specified bucket and delete all files that do not match**

The following `sync` command syncs objects under a specified prefix and bucket to files in a local directory by uploading the local files to S3. Because of the `--delete` parameter, any files existing under the specified prefix and bucket but not existing in the local directory will be deleted. In this example, the user syncs the bucket `mybucket` to the local current directory. The local current directory contains the files `test.txt` and `test2.txt`. The bucket `mybucket` contains the object `test3.txt`:

```
aws s3 sync . s3://mybucket \
    --delete
```

Output:

```
upload: test.txt to s3://mybucket/test.txt
```

```
upload: test2.txt to s3://mybucket/test2.txt
delete: s3://mybucket/test3.txt
```

**Example 5: Sync all local objects to the specified bucket except ``.jpg`` files**

The following `sync` command syncs objects under a specified prefix and bucket to files in a local directory by uploading the local files to S3. Because of the `--exclude` parameter, all files matching the pattern existing both in S3 and locally will be excluded from the sync. In this example, the user syncs the bucket `mybucket` to the local current directory. The local current directory contains the files `test.jpg` and `test2.txt`. The bucket `mybucket` contains the object `test.jpg` of a different size than the local `test.jpg`:

```
aws s3 sync . s3://mybucket \
    --exclude "*.jpg"
```

Output:

```
upload: test2.txt to s3://mybucket/test2.txt
```

**Example 6: Sync all local objects to the specified bucket except ``.jpg`` files**

The following `sync` command syncs files under a local directory to objects under a specified prefix and bucket by downloading S3 objects. This example uses the `--exclude` parameter flag to exclude a specified directory and S3 prefix from the `sync` command. In this example, the user syncs the local current directory to the bucket `mybucket`. The local current directory contains the files `test.txt` and `another/test2.txt`. The bucket `mybucket` contains the objects `another/test5.txt` and `test1.txt`:

```
aws s3 sync s3://mybucket/ . \
    --exclude "*another/*"
```

Output:

```
download: s3://mybucket/test1.txt to test1.txt
```

**Example 7: Sync all objects between buckets in different regions**

The following `sync` command syncs files between two buckets in different regions:

```
aws s3 sync s3://my-us-west-2-bucket s3://my-us-east-1-bucket \
    --source-region us-west-2 \
    --region us-east-1
```

Output:

```
download: s3://my-us-west-2-bucket/test1.txt to s3://my-us-east-1-bucket/test1.txt
```

**Example 8: Sync to an S3 access point**

The following `sync` command syncs the current directory to the access point (`myaccesspoint`):

```
aws s3 sync . s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
```

Output:

```
upload: test.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/test.txt
upload: test2.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/test2.txt
```

- For API details, see Sync in *AWS CLI Command Reference*.

### `upload-part-copy`

The following code example shows how to use `upload-part-copy`.

**AWS CLI**

**To upload part of an object by copying data from an existing object as the data source**

The following `upload-part-copy` example uploads a part by copying data from an existing object as a data source.

```
aws s3api upload-part-copy \
    --bucket my-bucket \
    --key "Map_Data_June.mp4" \
    --copy-source "my-bucket/copy_of_Map_Data_June.mp4" \
    --part-number 1 \
```

```
    --upload-id
 "bq0tdE1CDpWQYRPLHuNG50xAT6pA5D.m_RiBy0ggOH6b13pVRY7QjvLlf75iFdJqp_2wztk5hvpUM2SesXgrzbehG5
```

Output:

```
{
    "CopyPartResult": {
        "LastModified": "2019-12-13T23:16:03.000Z",
        "ETag": "\"711470fc377698c393d94aed6305e245\""
    }
}
```

- For API details, see UploadPartCopy in *AWS CLI Command Reference*.

### `upload-part`

The following code example shows how to use `upload-part`.

#### AWS CLI

The following command uploads the first part in a multipart upload initiated with the `create-multipart-upload` command:

```
aws s3api upload-part --bucket my-bucket --key 'multipart/01' --part-number 1 --body
 part01 --upload-id
 "dfRtDYU0WWCCcH43C3WFbkRONycyCpTJJvxu2i5GYkZljF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URC
```

The body option takes the name or path of a local file for upload (do not use the file:// prefix). The minimum part size is 5 MB. Upload ID is returned by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`. Bucket and key are specified when you create the multipart upload.

Output:

```
{
    "ETag": "\"e868e0f4719e394144ef36531ee6824c\""
}
```

Save the ETag value of each part for later. They are required to complete the multipart upload.

- For API details, see UploadPart in *AWS CLI Command Reference*.

### `website`

The following code example shows how to use `website`.

**AWS CLI**

**Configure an S3 bucket as a static website**

The following command configures a bucket named `my-bucket` as a static website. The index document option specifies the file in `my-bucket` that visitors will be directed to when they navigate to the website URL. In this case, the bucket is in the us-west-2 region, so the site would appear at `http://my-bucket.s3-website-us-west-2.amazonaws.com`.

All files in the bucket that appear on the static site must be configured to allow visitors to open them. File permissions are configured separately from the bucket website configuration.

```
aws s3 website s3://my-bucket/ \
    --index-document index.html \
    --error-document error.html
```

For information on hosting a static website in Amazon S3, see Hosting a Static Website in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see Website in *AWS CLI Command Reference*.

## Amazon S3 Control examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon S3 Control.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `create-access-point`

The following code example shows how to use `create-access-point`.

**AWS CLI**

**To create an access point**

The following `create-access-point` example creates an access point named `finance-ap` for the bucket `business-records` in account 123456789012. Before running this example, replace the access point name, bucket name, and account number with appropriate values for your use case.

```
aws s3control create-access-point \
    --account-id 123456789012 \
    --bucket business-records \
    --name finance-ap
```

This command produces no output.

For more information, see Creating Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see CreateAccessPoint in *AWS CLI Command Reference*.

#### `create-job`

The following code example shows how to use `create-job`.

**AWS CLI**

**To create an Amazon S3 batch operations job**

The following `create-job` example creates an Amazon S3 batch operations job to tag objects as `confidential` in the bucket ``employee-records`.

```
aws s3control create-job \
```

```
    --account-id 123456789012 \
    --operation '{"S3PutObjectTagging": { "TagSet": [{"Key":"confidential",
 "Value":"true"}] }}' \
    --report '{"Bucket":"arn:aws:s3:::employee-records-logs","Prefix":"batch-op-
create-job",
 "Format":"Report_CSV_20180820","Enabled":true,"ReportScope":"AllTasks"}' \
    --manifest '{"Spec":{"Format":"S3BatchOperations_CSV_20180820","Fields":
["Bucket","Key"]},"Location":{"ObjectArn":"arn:aws:s3:::employee-records-logs/inv-
report/7a6a9be4-072c-407e-85a2-
ec3e982f773e.csv","ETag":"69f52a4e9f797e987155d9c8f5880897"}}' \
    --priority 42 \
    --role-arn arn:aws:iam::123456789012:role/S3BatchJobRole
```

Output:

```
{
    "JobId": "93735294-df46-44d5-8638-6356f335324e"
}
```

- For API details, see CreateJob in *AWS CLI Command Reference*.

### `delete-access-point-policy`

The following code example shows how to use `delete-access-point-policy`.

#### AWS CLI

**To delete an access point policy**

The following `delete-access-point-policy` example deletes the access point policy from the access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control delete-access-point-policy \
    --account-id 123456789012 \
    --name finance-ap
```

This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see DeleteAccessPointPolicy in *AWS CLI Command Reference*.

### `delete-access-point`

The following code example shows how to use `delete-access-point`.

**AWS CLI**

**To delete an access point**

The following `delete-access-point` example deletes an access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control delete-access-point \
    --account-id 123456789012 \
    --name finance-ap
```

This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see DeleteAccessPoint in *AWS CLI Command Reference*.

### `delete-public-access-block`

The following code example shows how to use `delete-public-access-block`.

**AWS CLI**

**To delete block public access settings for an account**

The following `delete-public-access-block` example deletes block public access settings for the specified account.

```
aws s3control delete-public-access-block \
    --account-id 123456789012
```

This command produces no output.

- For API details, see DeletePublicAccessBlock in *AWS CLI Command Reference*.

### `describe-job`

The following code example shows how to use `describe-job`.

**AWS CLI**

**To describe an Amazon S3 batch operations job**

The following `describe-job` provides configuration parameters and status for the specified batch operations job.

```
aws s3control describe-job \
    --account-id 123456789012 \
    --job-id 93735294-df46-44d5-8638-6356f335324e
```

Output:

```
{
    "Job": {
        "TerminationDate": "2019-10-03T21:49:53.944Z",
        "JobId": "93735294-df46-44d5-8638-6356f335324e",
        "FailureReasons": [],
        "Manifest": {
            "Spec": {
                "Fields": [
                    "Bucket",
                    "Key"
                ],
                "Format": "S3BatchOperations_CSV_20180820"
            },

        "Status": "Complete"
    }
}
```

- For API details, see DescribeJob in *AWS CLI Command Reference*.

### `get-access-point-policy-status`

The following code example shows how to use `get-access-point-policy-status`.

#### AWS CLI

**To retrieve the access point policy status**

The following `get-access-point-policy-status` example retrieves the access point policy status for the access point named `finance-ap` in account 123456789012. The access point policy status indicates whether the access point's policy allows public access. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point-policy-status \
    --account-id 123456789012 \
    --name finance-ap
```

Output:

```
{
    "PolicyStatus": {
        "IsPublic": false
    }
}
```

For more information about when an access point policy is considered public, see The Meaning of "Public" in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see GetAccessPointPolicyStatus in *AWS CLI Command Reference*.

### `get-access-point-policy`

The following code example shows how to use `get-access-point-policy`.

#### AWS CLI

**To retrieve an access point policy**

The following `get-access-point-policy` example retrieves the access point policy from the access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point-policy \
    --account-id 123456789012 \
    --name finance-ap
```

Output:

```
{
    "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:role/Admin\"},\"Action\":
\"s3:GetObject\",\"Resource\":\"arn:aws:s3:us-west-2:123456789012:accesspoint/
finance-ap/object/records/*\"}]}"
```

```
}
```

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see GetAccessPointPolicy in *AWS CLI Command Reference*.

### `get-access-point`

The following code example shows how to use `get-access-point`.

#### AWS CLI

**To retrieve access point configuration details**

The following `get-access-point` example retrieves the configuration details for the access point named `finance-ap` in account 123456789012. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point \
    --account-id 123456789012 \
    --name finance-ap
```

Output:

```
{
    "Name": "finance-ap",
    "Bucket": "business-records",
    "NetworkOrigin": "Internet",
    "PublicAccessBlockConfiguration": {
        "BlockPublicAcls": false,
        "IgnorePublicAcls": false,
        "BlockPublicPolicy": false,
        "RestrictPublicBuckets": false
    },
    "CreationDate": "2020-01-01T00:00:00Z"
}
```

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see GetAccessPoint in *AWS CLI Command Reference*.

### `get-multi-region-access-point-routes`

The following code example shows how to use `get-multi-region-access-point-routes`.

#### AWS CLI

**To query the current Multi-Region Access Point route configuration**

The following `get-multi-region-access-point-routes` example returns the current routing configuration for the specified Multi-Region Access Point.

```
aws s3control get-multi-region-access-point-routes \
    --region Region \
    --account-id 111122223333 \
    --mrap MultiRegionAccessPoint_ARN
```

Output:

```
{
    "Mrap": "arn:aws:s3::111122223333:accesspoint/0000000000000.mrap",
    "Routes": [
        {
            "Bucket": "DOC-EXAMPLE-BUCKET-1",
            "Region": "ap-southeast-2",
            "TrafficDialPercentage": 100
        },
        {
            "Bucket": "DOC-EXAMPLE-BUCKET-2",
            "Region": "us-west-1",
            "TrafficDialPercentage": 0
        }
    ]
}
```

- For API details, see GetMultiRegionAccessPointRoutes in *AWS CLI Command Reference*.

### `get-public-access-block`

The following code example shows how to use `get-public-access-block`.

#### AWS CLI

**To list public block access settings for an account**

The following `get-public-access-block` example displays the block public access settings for the specified account.

```
aws s3control get-public-access-block \
    --account-id 123456789012
```

Output:

```
{
   "PublicAccessBlockConfiguration": {
      "BlockPublicPolicy": true,
      "RestrictPublicBuckets": true,
      "IgnorePublicAcls": true,
      "BlockPublicAcls": true
   }
}
```

- For API details, see GetPublicAccessBlock in *AWS CLI Command Reference*.

## `list-access-points`

The following code example shows how to use `list-access-points`.

### AWS CLI

#### Example 1: To retrieve a list of all access points for an account

The following `list-access-points` example displays a list of all access points attached to buckets owned by account 123456789012.

```
aws s3control list-access-points \
    --account-id 123456789012
```

Output:

```
{
    "AccessPointList": [
        {
            "Name": "finance-ap",
            "NetworkOrigin": "Internet",
```

```
            "Bucket": "business-records"
        },
        {
            "Name": "managers-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "business-records"
        },
        {
            "Name": "private-network-ap",
            "NetworkOrigin": "VPC",
            "VpcConfiguration": {
                "VpcId": "1a2b3c"
            },
            "Bucket": "business-records"
        },
        {
            "Name": "customer-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "external-docs"
        },
        {
            "Name": "public-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "external-docs"
        }
    ]
}
```

**Example 2: To retrieve a list of all access points for a bucket**

The following `list-access-points` example retrieves a list of all access points attached to the bucket `external-docs` owned by account 123456789012.

```
aws s3control list-access-points \
    --account-id 123456789012 \
    --bucket external-docs
```

Output:

```
{
    "AccessPointList": [
        {
            "Name": "customer-ap",
```

```
            "NetworkOrigin": "Internet",
            "Bucket": "external-docs"
        },
        {
            "Name": "public-ap",
            "NetworkOrigin": "Internet",
            "Bucket": "external-docs"
        }
    ]
}
```

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see ListAccessPoints in *AWS CLI Command Reference*.

## `list-jobs`

The following code example shows how to use `list-jobs`.

### AWS CLI

#### To list an accounts Amazon S3 batch operations jobs

The following `list-jobs` example lists all recent batch operations jobs for the specified account.

```
aws s3control list-jobs \
    --account-id 123456789012
```

Output:

```
{
    "Jobs": [
        {
            "Operation": "S3PutObjectTagging",
            "ProgressSummary": {
                "NumberOfTasksFailed": 0,
                "NumberOfTasksSucceeded": 8,
                "TotalNumberOfTasks": 8
            },
            "CreationTime": "2019-10-03T21:48:48.048Z",
```

```
            "Status": "Complete",
            "JobId": "93735294-df46-44d5-8638-6356f335324e",
            "Priority": 42
        },
        {
            "Operation": "S3PutObjectTagging",
            "ProgressSummary": {
                "NumberOfTasksFailed": 0,
                "NumberOfTasksSucceeded": 0,
                "TotalNumberOfTasks": 0
            },
            "CreationTime": "2019-10-03T21:46:07.084Z",
            "Status": "Failed",
            "JobId": "3f3c7619-02d3-4779-97f6-1d98dd313108",
            "Priority": 42
        },
    ]
}
```

- For API details, see ListJobs in *AWS CLI Command Reference*.

### `put-access-point-policy`

The following code example shows how to use `put-access-point-policy`.

#### AWS CLI

**To set an access point policy**

The following `put-access-point-policy` example places the specified access point policy for the access point `finance-ap` in account 123456789012. If the access point `finance-ap` already has a policy, this command replaces the existing policy with the one specified in this command. Before running this example, replace the account number, access point name, and policy statements with appropriate values for your use case.

```
aws s3control put-access-point-policy \
    --account-id 123456789012 \
    --name finance-ap \
    --policy file://ap-policy.json
```

Contents of `ap-policy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:user/Alice"
            },
            "Action": "s3:GetObject",
            "Resource": "arn:aws:s3:us-west-2:123456789012:accesspoint/finance-ap/
object/Alice/*"
        }
    ]
}
```

This command produces no output.

For more information, see Managing Data Access with Amazon S3 Access Points in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see PutAccessPointPolicy in *AWS CLI Command Reference*.

### `put-public-access-block`

The following code example shows how to use `put-public-access-block`.

#### AWS CLI

**To edit block public access settings for an account**

The following `put-public-access-block` example toggles all block public access settings to `true` for the specified account.

```
aws s3control put-public-access-block \
    --account-id 123456789012 \
    --public-access-block-configuration '{"BlockPublicAcls": true,
 "IgnorePublicAcls": true, "BlockPublicPolicy": true, "RestrictPublicBuckets":
 true}'
```

This command produces no output.

- For API details, see PutPublicAccessBlock in *AWS CLI Command Reference*.

### `submit-multi-region-access-point-routes`

The following code example shows how to use `submit-multi-region-access-point-routes`.

**AWS CLI**

**To update your Multi-Region Access Point routing configuration**

The following `submit-multi-region-access-point-routes` example updates the routing statuses of `DOC-EXAMPLE-BUCKET-1` and `DOC-EXAMPLE-BUCKET-2` in the `ap-southeast-2` Region for your Multi-Region Access Point.

```
aws s3control submit-multi-region-access-point-routes \
    --region ap-southeast-2 \
    --account-id 111122223333 \
    --mrap MultiRegionAccessPoint_ARN \
    --route-updates Bucket=DOC-EXAMPLE-BUCKET-1,TrafficDialPercentage=100
 Bucket=DOC-EXAMPLE-BUCKET-2,TrafficDialPercentage=0
```

This command produces no output.

- For API details, see SubmitMultiRegionAccessPointRoutes in *AWS CLI Command Reference*.

### `update-job-priority`

The following code example shows how to use `update-job-priority`.

**AWS CLI**

**To update the job priority of an Amazon S3 batch operations job**

The following `update-job-priority` example updates the specified job to a new priority.

```
aws s3control update-job-priority \
    --account-id 123456789012 \
    --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
    --priority 52
```

Output:

```
{
    "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386",
```

```
    "Priority": 52
}
```

- For API details, see UpdateJobPriority in *AWS CLI Command Reference*.

### `update-job-status`

The following code example shows how to use `update-job-status`.

**AWS CLI**

**To update the status of an Amazon S3 batch operations job**

The following `update-job-status` example cancels the specified job which is awaiting approval.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
    --requested-job-status Cancelled
```

Output:

```
{
    "Status": "Cancelled",
    "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386"
}
```

The following `update-job-status` example confirms and runs the specified which is awaiting approval.

```
aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
    --requested-job-status Ready

Output::

{
    "Status": "Ready",
    "JobId": "5782949f-3301-4fb3-be34-8d5bab54dbca"
```

```
}
```

The following `update-job-status` example cancels the specified job which is running.

```
 aws s3control update-job-status \
    --account-id 123456789012 \
    --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
    --requested-job-status Cancelled

Output::
{
         "Status": "Cancelling",
         "JobId": "5782949f-3301-4fb3-be34-8d5bab54dbca"
}
```

- For API details, see UpdateJobStatus in *AWS CLI Command Reference*.

## S3 Glacier examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with S3 Glacier.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `abort-multipart-upload`

The following code example shows how to use `abort-multipart-upload`.

**AWS CLI**

The following command deletes an in-progress multipart upload to a vault named `my-vault`:

```
aws glacier abort-multipart-upload --account-id - --vault-name my-vault
 --upload-id 19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ
```

This command does not produce any output. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account. The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see AbortMultipartUpload in *AWS CLI Command Reference*.

### `abort-vault-lock`

The following code example shows how to use `abort-vault-lock`.

**AWS CLI**

**To abort an in-progress vault lock process**

The following `abort-vault-lock` example deletes a vault lock policy from the specified vault and resets the lock state of the vault lock to unlocked.

```
aws glacier abort-vault-lock \
    --account-id - \
    --vault-name MyVaultName
```

This command produces no output.

For more information, see Abort Vault Lock (DELETE lock-policy) in the *Amazon Glacier API Developer Guide*.

- For API details, see AbortVaultLock in *AWS CLI Command Reference*.

### `add-tags-to-vault`

The following code example shows how to use `add-tags-to-vault`.

**AWS CLI**

The following command adds two tags to a vault named `my-vault`:

```
aws glacier add-tags-to-vault --account-id - --vault-name my-vault --tags
 id=1234,date=july2015
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see AddTagsToVault in *AWS CLI Command Reference*.

### `complete-multipart-upload`

The following code example shows how to use `complete-multipart-upload`.

**AWS CLI**

The following command completes multipart upload for a 3 MiB archive:

```
aws glacier complete-multipart-upload --archive-size 3145728 --checksum
 9628195fcdbcbbe76cdde456d4646fa7de5f219fb39823836d81f0cc0e18aa67
 --upload-id 19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ --account-id - --vault-name my-vault
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`. The checksum parameter takes a SHA-256 tree hash of the archive in hexadecimal.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, including instructions on calculating a tree hash, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see CompleteMultipartUpload in *AWS CLI Command Reference*.

### `complete-vault-lock`

The following code example shows how to use `complete-vault-lock`.

**AWS CLI**

**To complete an in-progress vault lock process**

The following `complete-vault-lock` example completes the in-progress locking progress for the specified vault and sets the lock state of the vault lock to `Locked`. You get the value for the `lock-id` parameter when you run `initiate-lock-process`.

```
aws glacier complete-vault-lock \
    --account-id - \
    --vault-name MyVaultName \
    --lock-id 9QZgEXAMPLEPhvL6xEXAMPLE
```

This command produces no output.

For more information, see Complete Vault Lock (POST lockId) in the *Amazon Glacier API Developer Guide*.

- For API details, see CompleteVaultLock in *AWS CLI Command Reference*.

### `create-vault`

The following code example shows how to use `create-vault`.

**AWS CLI**

The following command creates a new vault named `my-vault`:

```
aws glacier create-vault --vault-name my-vault --account-id -
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see CreateVault in *AWS CLI Command Reference*.

### `delete-archive`

The following code example shows how to use `delete-archive`.

**AWS CLI**

**To delete an archive from a vault**

The following `delete-archive` example removes the specified archive from `example_vault`.

```
aws glacier delete-archive \
    --account-id 111122223333  \
    --vault-name example_vault \
    --archive-id Sc0u9ZP8yaWkmh-XGlIvAVprtLhaLCGnNwNl5I5x9HqPIkX5mjc0DrId3Ln-
Gi_k2HzmlIDZUz117KSdVMdMXLuFWi9PJUitxWO73edQ43eTlMWkH0pd9zVSAuV_XXZBVhKhyGhJ7w
```

This command produces no output.

- For API details, see DeleteArchive in *AWS CLI Command Reference*.

## `delete-vault-access-policy`

The following code example shows how to use `delete-vault-access-policy`.

**AWS CLI**

**To remove the access policy of a vault**

The following `delete-vault-access-policy` example removes the access policy for the specified vault.

```
aws glacier delete-vault-access-policy \
    --account-id 111122223333 \
    --vault-name example_vault
```

This command produces no output.

- For API details, see DeleteVaultAccessPolicy in *AWS CLI Command Reference*.

## `delete-vault-notifications`

The following code example shows how to use `delete-vault-notifications`.

**AWS CLI**

**To remove the SNS notifications for a vault**

The following `delete-vault-notifications` example removes notifications sent by Amazon Simple Notification Service (Amazon SNS) for the specified vault.

```
aws glacier delete-vault-notifications \
    --account-id 111122223333 \
    --vault-name example_vault
```

This command produces no output.

- For API details, see DeleteVaultNotifications in *AWS CLI Command Reference*.

### `delete-vault`

The following code example shows how to use `delete-vault`.

#### AWS CLI

The following command deletes a vault named `my-vault`:

```
aws glacier delete-vault --vault-name my-vault --account-id -
```

This command does not produce any output. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see DeleteVault in *AWS CLI Command Reference*.

### `describe-job`

The following code example shows how to use `describe-job`.

#### AWS CLI

The following command retrieves information about an inventory retrieval job on a vault named `my-vault`:

```
aws glacier describe-job --account-id - --vault-name my-
vault --job-id zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW
```

Output:

```
{
```

```
    "InventoryRetrievalParameters": {
        "Format": "JSON"
    },
    "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
    "Completed": false,
    "JobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW",
    "Action": "InventoryRetrieval",
    "CreationDate": "2015-07-17T20:23:41.616Z",
    "StatusCode": "InProgress"
}
```

The job ID can be found in the output of `aws glacier initiate-job` and `aws glacier list-jobs`. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see DescribeJob in *AWS CLI Command Reference*.

### `describe-vault`

The following code example shows how to use `describe-vault`.

#### AWS CLI

The following command retrieves data about a vault named `my-vault`:

```
aws glacier describe-vault --vault-name my-vault --account-id -
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see DescribeVault in *AWS CLI Command Reference*.

### `get-data-retrieval-policy`

The following code example shows how to use `get-data-retrieval-policy`.

#### AWS CLI

The following command gets the data retrieval policy for the in-use account:

```
aws glacier get-data-retrieval-policy --account-id -
```

Output:

```
{
    "Policy": {
        "Rules": [
            {
                "BytesPerHour": 10737418240,
                "Strategy": "BytesPerHour"
            }
        ]
    }
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see GetDataRetrievalPolicy in *AWS CLI Command Reference*.

### `get-job-output`

The following code example shows how to use `get-job-output`.

#### AWS CLI

The following command saves the output from a vault inventory job to a file in the current directory named `output.json`:

```
aws glacier get-job-output --account-id - --vault-name my-
vault --job-id zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW output.json
```

The `job-id` is available in the output of `aws glacier list-jobs`. Note that the output file name is a positional argument that is not prefixed by an option name. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

Output:

```
{
    "status": 200,
    "acceptRanges": "bytes",
    "contentType": "application/json"
```

```
}
```

output.json:

```
{"VaultARN":"arn:aws:glacier:us-west-2:0123456789012:vaults/
my-vault","InventoryDate":"2015-04-07T00:26:18Z","ArchiveList":
[{"ArchiveId":"kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw","ArchiveDescription":"multipart
 upload
 test","CreationDate":"2015-04-06T22:24:34Z","Size":3145728,"SHA256TreeHash":"9628195fcdbcbb
```

- For API details, see GetJobOutput in *AWS CLI Command Reference*.

### `get-vault-access-policy`

The following code example shows how to use `get-vault-access-policy`.

#### AWS CLI

**To retrieve the access policy of a vault**

The following `get-vault-access-policy` example retrieves the access policy for the specified vault.

```
aws glacier get-vault-access-policy \
    --account-id 111122223333 \
    --vault-name example_vault
```

Output:

```
{
    "policy": {
        "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect
\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::444455556666:root
\"},\"Action\":\"glacier:ListJobs\",\"Resource\":\"arn:aws:glacier:us-
east-1:111122223333:vaults/example_vault\"},{\"Effect\":\"Allow\",\"Principal\":
{\"AWS\":\"arn:aws:iam::444455556666:root\"},\"Action\":\"glacier:UploadArchive\",
\"Resource\":\"arn:aws:glacier:us-east-1:111122223333:vaults/example_vault\"}]}"
    }
}
```

- For API details, see GetVaultAccessPolicy in *AWS CLI Command Reference*.

### `get-vault-lock`

The following code example shows how to use `get-vault-lock`.

**AWS CLI**

**To get the details of a vault lock**

The following `get-vault-lock` example retrieved the details about the lock for the specified vault.

```
aws glacier get-vault-lock \
    --account-id - \
    --vault-name MyVaultName
```

Output:

```
{
    "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"Define-vault-
lock\",\"Effect\":\"Deny\",\"Principal\":{\"AWS\":\"arn:aws:iam::999999999999:root
\"},\"Action\":\"glacier:DeleteArchive\",\"Resource\":\"arn:aws:glacier:us-
west-2:99999999999:vaults/MyVaultName\",\"Condition\":{\"NumericLessThanEquals\":
{\"glacier:ArchiveAgeinDays\":\"365\"}}}]}",
    "State": "Locked",
    "CreationDate": "2019-07-29T22:25:28.640Z"
}
```

For more information, see Get Vault Lock (GET lock-policy) in the *Amazon Glacier API Developer Guide*.

- For API details, see GetVaultLock in *AWS CLI Command Reference*.

### `get-vault-notifications`

The following code example shows how to use `get-vault-notifications`.

**AWS CLI**

The following command gets a description of the notification configuration for a vault named `my-vault`:

```
aws glacier get-vault-notifications --account-id - --vault-name my-vault
```

Output:

```
{
    "vaultNotificationConfig": {
        "Events": [
            "InventoryRetrievalCompleted",
            "ArchiveRetrievalCompleted"
        ],
        "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault"
    }
}
```

If no notifications have been configured for the vault, an error is returned. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see GetVaultNotifications in *AWS CLI Command Reference*.

### `initiate-job`

The following code example shows how to use `initiate-job`.

#### AWS CLI

The following command initiates a job to get an inventory of the vault `my-vault`:

```
aws glacier initiate-job --account-id - --vault-name my-vault --job-parameters
 '{"Type": "inventory-retrieval"}'
```

Output:

```
{
    "location": "/0123456789012/vaults/my-vault/jobs/
zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW",
    "jobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The following command initiates a job to retrieve an archive from the vault `my-vault`:

```
aws glacier initiate-job --account-id - --vault-name my-vault --job-parameters
 file://job-archive-retrieval.json
```

`job-archive-retrieval.json` is a JSON file in the local folder that specifies the type of job, archive ID, and some optional parameters:

```
{
  "Type": "archive-retrieval",
  "ArchiveId": "kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw",
  "Description": "Retrieve archive on 2015-07-17",
  "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-topic"
}
```

Archive IDs are available in the output of `aws glacier upload-archive` and `aws glacier get-job-output`.

Output:

```
{
    "location": "/011685312445/vaults/mwunderl/jobs/l7IL5-
EkXyEY9Ws95fClzIbk2O5uLYaFdAYOi-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJO59-8N9aHWav",
    "jobId": "l7IL5-EkXy2O5uLYaFdAYOiEY9Ws95fClzIbk-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJO59-8N9aHWav"
}
```

See Initiate Job in the *Amazon Glacier API Reference* for details on the job parameters format.

- For API details, see InitiateJob in *AWS CLI Command Reference*.

### `initiate-multipart-upload`

The following code example shows how to use `initiate-multipart-upload`.

**AWS CLI**

The following command initiates a multipart upload to a vault named `my-vault` with a part size of 1 MiB (1024 x 1024 bytes) per file:

```
aws glacier initiate-multipart-upload --account-id - --part-size 1048576 --vault-
name my-vault --archive-description "multipart upload test"
```

The archive description parameter is optional. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

This command outputs an upload ID when successful. Use the upload ID when uploading each part of your archive with `aws glacier upload-multipart-part`. For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see InitiateMultipartUpload in *AWS CLI Command Reference*.

### `initiate-vault-lock`

The following code example shows how to use `initiate-vault-lock`.

**AWS CLI**

**To initiate the vault locking process**

The following `initiate-vault-lock` example installs a vault lock policy on the specified vault and sets the lock state of the vault lock to `InProgress`. You must complete the process by calling `complete-vault-lock` within 24 hours to set the state of the vault lock to `Locked`.

```
aws glacier initiate-vault-lock \
    --account-id - \
    --vault-name MyVaultName \
    --policy file://vault_lock_policy.json
```

Contents of `vault_lock_policy.json`:

```
{"Policy":"{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"Define-vault-
lock\",\"Effect\":\"Deny\",\"Principal\":{\"AWS\":\"arn:aws:iam::999999999999:root
\"},\"Action\":\"glacier:DeleteArchive\",\"Resource\":\"arn:aws:glacier:us-
```

```
west-2:999999999999:vaults/examplevault\",\"Condition\":{\"NumericLessThanEquals\":
{\"glacier:ArchiveAgeinDays\":\"365\"}}}]}"}
```

The output is the vault lock ID that you can use to complete the vault lock process.

```
{
    "lockId": "9QZgEXAMPLEPhvL6xEXAMPLE"
}
```

For more information, see Initiate Vault Lock (POST lock-policy) in the *Amazon Glacier API Developer Guide*.

- For API details, see InitiateVaultLock in *AWS CLI Command Reference*.

### `list-jobs`

The following code example shows how to use `list-jobs`.

#### AWS CLI

The following command lists in-progress and recently completed jobs for a vault named `my-vault`:

```
aws glacier list-jobs --account-id - --vault-name my-vault
```

Output:

```
{
    "JobList": [
        {
            "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
            "RetrievalByteRange": "0-3145727",
            "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault",
            "Completed": false,
            "SHA256TreeHash":
 "9628195fcdbcbbe76cdde932d4646fa7de5f219fb39823836d81f0cc0e18aa67",
            "JobId": "l7IL5-EkXyEY9Ws95fClzIbk2O5uLYaFdAYOi-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJO59-8N9aHWav",
            "ArchiveId": "kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw",
```

```
            "JobDescription": "Retrieve archive on 2015-07-17",
            "ArchiveSizeInBytes": 3145728,
            "Action": "ArchiveRetrieval",
            "ArchiveSHA256TreeHash":
 "9628195fcdbcbbe76cdde932d4646fa7de5f219fb39823836d81f0cc0e18aa67",
            "CreationDate": "2015-07-17T21:16:13.840Z",
            "StatusCode": "InProgress"
        },
        {
            "InventoryRetrievalParameters": {
                "Format": "JSON"
            },
            "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
            "Completed": false,
            "JobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
RO47Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_XqlNHS61dsO4CnMW",
            "Action": "InventoryRetrieval",
            "CreationDate": "2015-07-17T20:23:41.616Z",
            "StatusCode": ""InProgress""
        }
    ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see ListJobs in *AWS CLI Command Reference*.

### `list-multipart-uploads`

The following code example shows how to use `list-multipart-uploads`.

**AWS CLI**

The following command shows all of the in-progress multipart uploads for a vault named `my-vault`:

```
aws glacier list-multipart-uploads --account-id - --vault-name my-vault
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see ListMultipartUploads in *AWS CLI Command Reference*.

### `list-parts`

The following code example shows how to use `list-parts`.

**AWS CLI**

The following command lists the uploaded parts for a multipart upload to a vault named `my-vault`:

```
aws glacier list-parts --account-id - --vault-name my-vault --upload-id "SYZi7qnL-
YGqGwAm8Kn3BLP2ElNCvnB-5961R09CSaPmPwkYGHOqeN_nX3-Vhnd2yF0KfB5FkmbnBU9GubbdrCs8ut-D"
```

Output:

```
{
    "MultipartUploadId": "SYZi7qnL-
YGqGwAm8Kn3BLP2ElNCvnB-5961R09CSaPmPwkYGHOqeN_nX3-Vhnd2yF0KfB5FkmbnBU9GubbdrCs8ut-
D",
    "Parts": [
        {
            "RangeInBytes": "0-1048575",
            "SHA256TreeHash":
 "e1f2a7cd6e047350f69b9f8cfa60fa606fe2f02802097a9a026360a7edc1f553"
        },
        {
            "RangeInBytes": "1048576-2097151",
            "SHA256TreeHash":
 "43cf3061fb95796aed99a11a6aa3cd8f839eed15e655ab0a597126210636aee6"
        }
    ],
    "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
    "CreationDate": "2015-07-18T00:05:23.830Z",
    "PartSizeInBytes": 1048576
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see ListParts in *AWS CLI Command Reference*.

### `list-provisioned-capacity`

The following code example shows how to use `list-provisioned-capacity`.

**AWS CLI**

**To retrieve the provisioned capacity units**

The following `list-provisioned-capacity` example retrieves details for any provisioned capacity units for the specified account.

```
aws glacier list-provisioned-capacity \
    --account-id 111122223333
```

Output:

```
{
    "ProvisionedCapacityList": [
        {
            "CapacityId": "HpASAuvfRFiVDbOjMfEIcr8K",
            "ExpirationDate": "2020-03-18T19:59:24.000Z",
            "StartDate": "2020-02-18T19:59:24.912Z"
        }
    ]
}
```

- For API details, see ListProvisionedCapacity in *AWS CLI Command Reference*.

### `list-tags-for-vault`

The following code example shows how to use `list-tags-for-vault`.

**AWS CLI**

The following command lists the tags applied to a vault named `my-vault`:

```
aws glacier list-tags-for-vault --account-id - --vault-name my-vault
```

Output:

```
{
    "Tags": {
        "date": "july2015",
        "id": "1234"
    }
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see ListTagsForVault in *AWS CLI Command Reference*.

### `list-vaults`

The following code example shows how to use `list-vaults`.

#### AWS CLI

The following command lists the vaults in the default account and region:

```
aws glacier list-vaults --account-id -
```

Output:

```
{
    "VaultList": [
        {
            "SizeInBytes": 3178496,
            "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
            "LastInventoryDate": "2015-04-07T00:26:19.028Z",
            "VaultName": "my-vault",
            "NumberOfArchives": 1,
            "CreationDate": "2015-04-06T21:23:45.708Z"
        }
    ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see ListVaults in *AWS CLI Command Reference*.

### `purchase-provisioned-capacity`

The following code example shows how to use `purchase-provisioned-capacity`.

**AWS CLI**

**To purchase a provisioned capacity unit**

The following `purchase-provisioned-capacity` example purchases a provisioned capacity unit.

```
aws glacier purchase-provisioned-capacity \
    --account-id 111122223333
```

Output:

```
{
    "capacityId": "HpASAuvfRFiVDbOjMfEIcr8K"
}
```

- For API details, see PurchaseProvisionedCapacity in *AWS CLI Command Reference*.

### `remove-tags-from-vault`

The following code example shows how to use `remove-tags-from-vault`.

**AWS CLI**

The following command removes a tag with the key `date` from a vault named `my-vault`:

```
aws glacier remove-tags-from-vault --account-id - --vault-name my-vault --tag-keys
 date
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see RemoveTagsFromVault in *AWS CLI Command Reference*.

### `set-data-retrieval-policy`

The following code example shows how to use `set-data-retrieval-policy`.

**AWS CLI**

The following command configures a data retrieval policy for the in-use account:

```
aws glacier set-data-retrieval-policy --account-id - --policy file://data-retrieval-policy.json
```

`data-retrieval-policy.json` is a JSON file in the current folder that specifies a data retrieval policy:

```
{
  "Rules":[
     {
         "Strategy":"BytesPerHour",
         "BytesPerHour":10737418240
      }
   ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The following command sets the data retrieval policy to `FreeTier` using inline JSON:

```
aws glacier set-data-retrieval-policy --account-id - --policy '{"Rules":[{"Strategy":"FreeTier"}]}'
```

See Set Data Retrieval Policy in the *Amazon Glacier API Reference* for details on the policy format.

- For API details, see SetDataRetrievalPolicy in *AWS CLI Command Reference*.

### `set-vault-access-policy`

The following code example shows how to use `set-vault-access-policy`.

**AWS CLI**

**To set the access policy of a vault**

The following `set-vault-access-policy` example attaches a permission policy to the specified vault.

```
aws glacier set-vault-access-policy \
    --account-id 111122223333 \
    --vault-name example_vault
    --policy '{"Policy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::444455556666:root
\"},\"Action\":\"glacier:ListJobs\",\"Resource\":\"arn:aws:glacier:us-
east-1:111122223333:vaults/example_vault\"},{\"Effect\":\"Allow\",\"Principal\":
{\"AWS\":\"arn:aws:iam::444455556666:root\"},\"Action\":\"glacier:UploadArchive\",
\"Resource\":\"arn:aws:glacier:us-east-1:111122223333:vaults/example_vault\"}]}"}'
```

This command produces no output.

- For API details, see SetVaultAccessPolicy in *AWS CLI Command Reference*.

## `set-vault-notifications`

The following code example shows how to use `set-vault-notifications`.

**AWS CLI**

The following command configures SNS notifications for a vault named `my-vault`:

```
aws glacier set-vault-notifications --account-id - --vault-name my-vault --vault-
notification-config file://notificationconfig.json
```

`notificationconfig.json` is a JSON file in the current folder that specifies an SNS topic and the events to publish:

```
{
  "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault",
  "Events": ["ArchiveRetrievalCompleted", "InventoryRetrievalCompleted"]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see SetVaultNotifications in *AWS CLI Command Reference*.

### `upload-archive`

The following code example shows how to use `upload-archive`.

**AWS CLI**

The following command uploads an archive in the current folder named `archive.zip` to a vault named `my-vault`:

```
aws glacier upload-archive --account-id - --vault-name my-vault --body archive.zip
```

Output:

```
{
    "archiveId": "kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw",
    "checksum": "969fb39823836d81f0cc028195fcdbcbbe76cdde932d4646fa7de5f21e18aa67",
    "location": "/0123456789012/vaults/my-vault/archives/
kKB7ymWJVpPSwhGP6ycSOAekp9ZYe_--zM_mw6k76ZFGEIWQX-ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hHO0bjbGehXTcApVud_wyDw"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

To retrieve an uploaded archive, initiate a retrieval job with the aws glacier initiate-job command.

- For API details, see UploadArchive in *AWS CLI Command Reference*.

### `upload-multipart-part`

The following code example shows how to use `upload-multipart-part`.

**AWS CLI**

The following command uploads the first 1 MiB (1024 x 1024 bytes) part of an archive:

```
aws glacier upload-multipart-part --body part1 --range 'bytes
 0-1048575/*' --account-id - --vault-name my-vault --upload-
id 19gaRezEXAMPLES6Ry5YYdqthHOC_kGRCT03L9yetr220UmPtBYKk-
OssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The body parameter takes a path to a part file on the local filesystem. The range parameter takes an HTTP content range indicating the bytes that the part occupies in the completed archive. The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see Using Amazon Glacier in the *AWS CLI User Guide*.

- For API details, see UploadMultipartPart in *AWS CLI Command Reference*.

## Secrets Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Secrets Manager.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `batch-get-secret-value`

The following code example shows how to use `batch-get-secret-value`.

#### AWS CLI

##### Example 1: To retrieve the secret value for a group of secrets listed by name

The following `batch-get-secret-value` example gets the secret value secrets for three secrets.

```
aws secretsmanager batch-get-secret-value \
    --secret-id-list MySecret1 MySecret2 MySecret3
```

Output:

```
{
    "SecretValues": [
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret1-
a1b2c3",
            "Name": "MySecret1",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEaaaaa",
            "SecretString": "{\"username\":\"diego_ramirez\",\"password\":\"EXAMPLE-
PASSWORD\",\"engine\":\"mysql\",\"host\":\"secretsmanagertutorial.cluster.us-
west-2.rds.amazonaws.com\",\"port\":3306,\"dbClusterIdentifier\":
\"secretsmanagertutorial\"}",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1523477145.729"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret2-
a1b2c3",
            "Name": "MySecret2",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEbbbbb",
            "SecretString": "{\"username\":\"akua_mansa\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
```

```
                "AWSCURRENT"
            ],
            "CreatedDate": "1673477781.275"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret3-
a1b2c3",
            "Name": "MySecret3",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEccccc",
            "SecretString": "{\"username\":\"jie_liu\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1373477721.124"
        }
    ],
    "Errors": []
}
```

For more information, see Retrieve a group of secrets in a batch in the *AWS Secrets Manager User Guide*.

**Example 2: To retrieve the secret value for a group of secrets selected by filter**

The following `batch-get-secret-value` example gets the secret value secrets in your account that have `MySecret` in the name. Filtering by name is case sensitive.

```
aws secretsmanager batch-get-secret-value \
    --filters Key="name",Values="MySecret"
```

Output:

```
{
    "SecretValues": [
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret1-
a1b2c3",
            "Name": "MySecret1",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEaaaaa",
            "SecretString": "{\"username\":\"diego_ramirez\",\"password\":\"EXAMPLE-
PASSWORD\",\"engine\":\"mysql\",\"host\":\"secretsmanagertutorial.cluster.us-
```

```
west-2.rds.amazonaws.com\",\"port\":3306,\"dbClusterIdentifier\":
\"secretsmanagertutorial\"}",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1523477145.729"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret2-
a1b2c3",
            "Name": "MySecret2",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEbbbbb",
            "SecretString": "{\"username\":\"akua_mansa\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1673477781.275"
        },
        {
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret3-
a1b2c3",
            "Name": "MySecret3",
            "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEccccc",
            "SecretString": "{\"username\":\"jie_liu\",\"password\":\"EXAMPLE-
PASSWORD\"",
            "VersionStages": [
                "AWSCURRENT"
            ],
            "CreatedDate": "1373477721.124"
        }
    ],
    "Errors": []
}
```

For more information, see Retrieve a group of secrets in a batch in the *AWS Secrets Manager User Guide*.

- For API details, see BatchGetSecretValue in *AWS CLI Command Reference*.

### `cancel-rotate-secret`

The following code example shows how to use `cancel-rotate-secret`.

**AWS CLI**

**To turn off automatic rotation for a secret**

The following `cancel-rotate-secret` example turns off automatic rotation for a secret. To resume rotation, call `rotate-secret`.

```
aws secretsmanager cancel-rotate-secret \
    --secret-id MyTestSecret
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret"
}
```

For more information, see Rotate a secret in the *Secrets Manager User Guide*.

- For API details, see CancelRotateSecret in *AWS CLI Command Reference*.

## `create-secret`

The following code example shows how to use `create-secret`.

**AWS CLI**

**Example 1: To create a secret**

The following `create-secret` example creates a secret with two key-value pairs.

```
aws secretsmanager create-secret \
    --name MyTestSecret \
    --description "My test secret created with the CLI." \
    --secret-string "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}"
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
```

```
  "Name": "MyTestSecret",
  "VersionId": "EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE"
}
```

For more information, see Create a secret in the *Secrets Manager User Guide*.

**Example 2: To create a secret from credentials in a JSON file**

The following `create-secret` example creates a secret from credentials in a file. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager create-secret \
    --name MyTestSecret \
    --secret-string file://mycreds.json
```

Contents of `mycreds.json`:

```
{
  "engine": "mysql",
  "username": "saanvis",
  "password": "EXAMPLE-PASSWORD",
  "host": "my-database-endpoint.us-west-2.rds.amazonaws.com",
  "dbname": "myDatabase",
  "port": "3306"
}
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret",
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Create a secret in the *Secrets Manager User Guide*.

- For API details, see CreateSecret in *AWS CLI Command Reference*.

## `delete-resource-policy`

The following code example shows how to use `delete-resource-policy`.

**AWS CLI**

**To delete the resource-based policy attached to a secret**

The following `delete-resource-policy` example deletes the resource-based policy attached to a secret.

```
aws secretsmanager delete-resource-policy \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Authentication and access control in the *Secrets Manager User Guide*.

- For API details, see DeleteResourcePolicy in *AWS CLI Command Reference*.

## `delete-secret`

The following code example shows how to use `delete-secret`.

**AWS CLI**

**Example 1: To delete a secret**

The following `delete-secret` example deletes a secret. You can recover the secret with `restore-secret` until the date and time in the `DeletionDate` response field. To delete a secret that is replicated to other regions, first remove its replicas with `remove-regions-from-replication`, and then call `delete-secret`.

```
aws secretsmanager delete-secret \
    --secret-id MyTestSecret \
    --recovery-window-in-days 7
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "DeletionDate": 1524085349.095
}
```

For more information, see Delete a secret in the *Secrets Manager User Guide*.

**Example 2: To delete a secret immediately**

The following `delete-secret` example deletes a secret immediately without a recovery window. You can't recover this secret.

```
aws secretsmanager delete-secret \
    --secret-id MyTestSecret \
    --force-delete-without-recovery
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "DeletionDate": 1508750180.309
}
```

For more information, see Delete a secret in the *Secrets Manager User Guide*.

- For API details, see DeleteSecret in *AWS CLI Command Reference*.

## `describe-secret`

The following code example shows how to use `describe-secret`.

### AWS CLI

**To retrieve the details of a secret**

The following `describe-secret` example shows the details of a secret.

```
aws secretsmanager describe-secret \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
Ca8JGt",
    "Name": "MyTestSecret",
    "Description": "My test secret",
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/EXAMPLE1-90ab-cdef-fedc-
ba987EXAMPLE",
    "RotationEnabled": true,
    "RotationLambdaARN": "arn:aws:lambda:us-
west-2:123456789012:function:MyTestRotationLambda",
    "RotationRules": {
        "AutomaticallyAfterDays": 2,
        "Duration": "2h",
        "ScheduleExpression": "cron(0 16 1,15 * ? *)"
    },
    "LastRotatedDate": 1525747253.72,
    "LastChangedDate": 1523477145.729,
    "LastAccessedDate": 1524572133.25,
    "Tags": [
        {
            "Key": "SecondTag",
            "Value": "AnotherValue"
        },
        {
            "Key": "FirstTag",
            "Value": "SomeValue"
        }
    ],
    "VersionIdsToStages": {
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [
            "AWSPREVIOUS"
        ],
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222": [
            "AWSCURRENT"
        ],
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333": [
            "AWSPENDING"
        ]
```

```
    },
    "CreatedDate": 1521534252.66,
    "PrimaryRegion": "us-west-2",
    "ReplicationStatus": [
        {
            "Region": "eu-west-3",
            "KmsKeyId": "alias/aws/secretsmanager",
            "Status": "InSync",
            "StatusMessage": "Replication succeeded"
        }
    ]
}
```

For more information, see Secret in the *Secrets Manager User Guide*.

- For API details, see DescribeSecret in *AWS CLI Command Reference*.

### `get-random-password`

The following code example shows how to use `get-random-password`.

**AWS CLI**

**To generate a random password**

The following `get-random-password` example generates a random password 20 characters long that includes at least one uppercase letter, lowercase letter, number, and punctuation.

```
aws secretsmanager get-random-password \
    --require-each-included-type \
    --password-length 20
```

Output:

```
{
    "RandomPassword": "EXAMPLE-PASSWORD"
}
```

For more information, see Create and manage secrets in the *Secrets Manager User Guide*.

- For API details, see GetRandomPassword in *AWS CLI Command Reference*.

### `get-resource-policy`

The following code example shows how to use `get-resource-policy`.

#### AWS CLI

**To retrieve the resource-based policy attached to a secret**

The following `get-resource-policy` example retrieves the resource-based policy attached to a secret.

```
aws secretsmanager get-resource-policy \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "ResourcePolicy": "{\n\"Version\":\"2012-10-17\",\n\"Statement\":[{\n\"Effect\":
\"Allow\",\n
    \"Principal\":{\n\"AWS\":\"arn:aws:iam::123456789012:root\"\n},\n\"Action\":
    \"secretsmanager:GetSecretValue\",\n\"Resource\":\"*\"\n}]\n}"
}
```

For more information, see Authentication and access control in the *Secrets Manager User Guide*.

- For API details, see GetResourcePolicy in *AWS CLI Command Reference*.

### `get-secret-value`

The following code example shows how to use `get-secret-value`.

#### AWS CLI

**Example 1: To retrieve the encrypted secret value of a secret**

The following `get-secret-value` example gets the current secret value.

```
aws secretsmanager get-secret-value \
```

```
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "SecretString": "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}",
    "VersionStages": [
        "AWSCURRENT"
    ],
    "CreatedDate": 1523477145.713
}
```

For more information, see Retrieve a secret in the *Secrets Manager User Guide*.

**Example 2: To retrieve the previous secret value**

The following `get-secret-value` example gets the previous secret value.:

```
aws secretsmanager get-secret-value \
    --secret-id MyTestSecret
    --version-stage AWSPREVIOUS
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "SecretString": "{\"user\":\"diegor\",\"password\":\"PREVIOUS-EXAMPLE-PASSWORD
\"}",
    "VersionStages": [
        "AWSPREVIOUS"
    ],
    "CreatedDate": 1523477145.713
}
```

For more information, see Retrieve a secret in the *Secrets Manager User Guide*.

- For API details, see GetSecretValue in *AWS CLI Command Reference*.

### `list-secret-version-ids`

The following code example shows how to use `list-secret-version-ids`.

#### AWS CLI

**To list all of the secret versions associated with a secret**

The following `list-secret-version-ids` example gets a list of all of the versions of a secret.

```
aws secretsmanager list-secret-version-ids \
    --secret-id MyTestSecret
```

Output:

```
{
  "Versions": [
    {
        "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "VersionStages": [
            "AWSPREVIOUS"
        ],
        "LastAccessedDate": 1523477145.713,
        "CreatedDate": 1523477145.713
    },
    {
        "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "VersionStages": [
            "AWSCURRENT"
        ],
        "LastAccessedDate": 1523477145.713,
        "CreatedDate": 1523486221.391
    },
    {
        "CreatedDate": 1.51197446236E9,
        "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333;"
    }
    ],
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
```

```
    "Name": "MyTestSecret"
}
```

For more information, see Version in the *Secrets Manager User Guide*.

- For API details, see ListSecretVersionIds in *AWS CLI Command Reference*.

## `list-secrets`

The following code example shows how to use `list-secrets`.

### AWS CLI

#### Example 1: To list the secrets in your account

The following `list-secrets` example gets a list of the secrets in your account.

```
aws secretsmanager list-secrets
```

Output:

```
{
    "SecretList": [
        {
            "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-a1b2c3",
            "Name": "MyTestSecret",
            "LastChangedDate": 1523477145.729,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [
                    "AWSCURRENT"
                ]
            }
        },
        {
            "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:AnotherSecret-d4e5f6",
            "Name": "AnotherSecret",
            "LastChangedDate": 1523482025.685,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222": [
                    "AWSCURRENT"
```

```
                ]
            }
        }
    ]
}
```

For more information, see Find a secret in the *Secrets Manager User Guide*.

**Example 2: To filter the list of secrets in your account**

The following `list-secrets` example gets a list of the secrets in your account that have `Test` in the name. Filtering by name is case sensitive.

```
aws secretsmanager list-secrets \
    --filter Key="name",Values="Test"
```

Output:

```
{
    "SecretList": [
        {
            "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-a1b2c3",
            "Name": "MyTestSecret",
            "LastChangedDate": 1523477145.729,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [
                    "AWSCURRENT"
                ]
            }
        }
    ]
}
```

For more information, see Find a secret in the *Secrets Manager User Guide*.

**Example 3: To list the secrets in your account managed by another service**

The following `list-secrets` example returns the secrets in your account that are managed by Amazon RDS.

```
aws secretsmanager list-secrets \
```

```
    --filter Key="owning-service",Values="rds"
```

Output:

```
{
    "SecretList": [
        {
            "Name": "rds!cluster-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Tags": [
                {
                    "Value": "arn:aws:rds:us-
west-2:123456789012:cluster:database-1",
                    "Key": "aws:rds:primaryDBClusterArn"
                },
                {
                    "Value": "rds",
                    "Key": "aws:secretsmanager:owningService"
                }
            ],
            "RotationRules": {
                "AutomaticallyAfterDays": 1
            },
            "LastChangedDate": 1673477781.275,
            "LastRotatedDate": 1673477781.26,
            "SecretVersionsToStages": {
                "a1b2c3d4-5678-90ab-cdef-EXAMPLEaaaaa": [
                    "AWSPREVIOUS"
                ],
                "a1b2c3d4-5678-90ab-cdef-EXAMPLEbbbbb": [
                    "AWSCURRENT",
                    "AWSPENDING"
                ]
            },
            "OwningService": "rds",
            "RotationEnabled": true,
            "CreatedDate": 1673467300.7,
            "LastAccessedDate": 1673395200.0,
            "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:rds!
cluster-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111-a1b2c3",
            "Description": "Secret associated with primary RDS DB cluster:
 arn:aws:rds:us-west-2:123456789012:cluster:database-1"
        }
    ]
```

```
}
```

For more information, see Secrets managed by other services in the *Secrets Manager User Guide*.

- For API details, see ListSecrets in *AWS CLI Command Reference*.

### `put-resource-policy`

The following code example shows how to use `put-resource-policy`.

#### AWS CLI

**To add a resource-based policy to a secret**

The following `put-resource-policy` example adds a permissions policy to a secret, checking first that the policy does not provide broad access to the secret. The policy is read from a file. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager put-resource-policy \
    --secret-id MyTestSecret \
    --resource-policy file://mypolicy.json \
    --block-public-policy
```

Contents of `mypolicy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:role/MyRole"
            },
            "Action": "secretsmanager:GetSecretValue",
            "Resource": "*"
        }
    ]
}
```

Output:

```
{
```

```
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Attach a permissions policy to a secret in the *Secrets Manager User Guide*.

- For API details, see PutResourcePolicy in *AWS CLI Command Reference*.

### `put-secret-value`

The following code example shows how to use `put-secret-value`.

**AWS CLI**

**Example 1: To store a new secret value in a secret**

The following `put-secret-value` example creates a new version of a secret with two key-value pairs.

```
aws secretsmanager put-secret-value \
    --secret-id MyTestSecret \
    --secret-string "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}"
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-1a2b3c",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "VersionStages": [
        "AWSCURRENT"
    ]
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

**Example 2: To store a new secret value from credentials in a JSON file**

The following `put-secret-value` example creates a new version of a secret from credentials in a file. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager put-secret-value \
    --secret-id MyTestSecret \
    --secret-string file://mycreds.json
```

Contents of `mycreds.json`:

```
{
  "engine": "mysql",
  "username": "saanvis",
  "password": "EXAMPLE-PASSWORD",
  "host": "my-database-endpoint.us-west-2.rds.amazonaws.com",
  "dbname": "myDatabase",
  "port": "3306"
}
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "VersionStages": [
        "AWSCURRENT"
    ]
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

- For API details, see PutSecretValue in *AWS CLI Command Reference*.

### `remove-regions-from-replication`

The following code example shows how to use `remove-regions-from-replication`.

#### AWS CLI

**To delete a replica secret**

The following `remove-regions-from-replication` example deletes a replica secret in eu-west-3. To delete a primary secret that is replicated to other regions, first delete the replicas and then call `delete-secret`.

```
aws secretsmanager remove-regions-from-replication \
    --secret-id MyTestSecret \
    --remove-replica-regions eu-west-3
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-1a2b3c",
    "ReplicationStatus": []
}
```

For more information, see Delete a replica secret in the *Secrets Manager User Guide*.

- For API details, see RemoveRegionsFromReplication in *AWS CLI Command Reference*.

### `replicate-secret-to-regions`

The following code example shows how to use `replicate-secret-to-regions`.

#### AWS CLI

**To replicate a secret to another region**

The following `replicate-secret-to-regions` example replicates a secret to eu-west-3. The replica is encrypted with the AWS managed key `aws/secretsmanager`.

```
aws secretsmanager replicate-secret-to-regions \
    --secret-id MyTestSecret \
    --add-replica-regions Region=eu-west-3
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-1a2b3c",
    "ReplicationStatus": [
```

```
        {
            "Region": "eu-west-3",
            "KmsKeyId": "alias/aws/secretsmanager",
            "Status": "InProgress"
        }
    ]
}
```

For more information, see Replicate a secret to another Region in the *Secrets Manager User Guide*.

- For API details, see ReplicateSecretToRegions in *AWS CLI Command Reference*.

### `restore-secret`

The following code example shows how to use `restore-secret`.

#### AWS CLI

**To restore a previously deleted secret**

The following `restore-secret` example restores a secret that was previously scheduled for deletion.

```
aws secretsmanager restore-secret \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Delete a secret in the *Secrets Manager User Guide*.

- For API details, see RestoreSecret in *AWS CLI Command Reference*.

### `rotate-secret`

The following code example shows how to use `rotate-secret`.

**AWS CLI**

**Example 1: To configure and start automatic rotation for a secret**

The following `rotate-secret` example configures and starts automatic rotation for a secret. Secrets Manager rotates the secret once immediately, and then every eight hours in a two hour window. The output shows the `VersionId` of the new secret version created by rotation.

```
aws secretsmanager rotate-secret \
    --secret-id MyTestDatabaseSecret \
    --rotation-lambda-arn arn:aws:lambda:us-
west-2:1234566789012:function:SecretsManagerTestRotationLambda \
    --rotation-rules "{\"ScheduleExpression\": \"cron(0 8/8 * * ? *)\", \"Duration
\": \"2h\"}"
```

Output:

```
{
    "ARN": "aws:arn:secretsmanager:us-
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
    "Name": "MyTestDatabaseSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Rotate secrets in the *Secrets Manager User Guide*.

**Example 2: To configure and start automatic rotation on a rotation interval**

The following `rotate-secret` example configures and starts automatic rotation for a secret. Secrets Manager rotates the secret once immediately, and then every 10 days. The output shows the `VersionId` of the new secret version created by rotation.

```
aws secretsmanager rotate-secret \
    --secret-id MyTestDatabaseSecret \
    --rotation-lambda-arn arn:aws:lambda:us-
west-2:1234566789012:function:SecretsManagerTestRotationLambda \
    --rotation-rules "{\"ScheduleExpression\": \"rate(10 days)\"}"
```

Output:

```
{
```

```
    "ARN": "aws:arn:secretsmanager:us-
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
    "Name": "MyTestDatabaseSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Rotate secrets in the *Secrets Manager User Guide*.

**Example 3: To rotate a secret immediately**

The following `rotate-secret` example starts an immediate rotation. The output shows the `VersionId` of the new secret version created by rotation. The secret must already have rotation configured.

```
aws secretsmanager rotate-secret \
    --secret-id MyTestDatabaseSecret
```

Output:

```
{
    "ARN": "aws:arn:secretsmanager:us-
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",
    "Name": "MyTestDatabaseSecret",
    "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Rotate secrets in the *Secrets Manager User Guide*.

- For API details, see RotateSecret in *AWS CLI Command Reference*.

## `stop-replication-to-replica`

The following code example shows how to use `stop-replication-to-replica`.

### AWS CLI

**To promote a replica secret to a primary**

The following `stop-replication-to-replica` example removes the link between a replica secret to the primary. The replica secret is promoted to a primary secret in the replica region. You must call `stop-replication-to-replica` from within the replica region.

```
aws secretsmanager stop-replication-to-replica \
    --secret-id MyTestSecret
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3"
}
```

For more information, see Promote a replica secret in the *Secrets Manager User Guide*.

- For API details, see StopReplicationToReplica in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

#### AWS CLI

**Example 1: To add a tag to a secret**

The following example shows how to attach a tag with shorthand syntax.

```
aws secretsmanager tag-resource \
    --secret-id MyTestSecret \
    --tags Key=FirstTag,Value=FirstValue
```

This command produces no output.

For more information, see Tag your secrets in the *Secrets Manager User Guide*.

**Example 2: To add multiple tags to a secret**

The following `tag-resource` example attaches two key-value tags to a secret.

```
aws secretsmanager tag-resource \
    --secret-id MyTestSecret \
    --tags '[{"Key": "FirstTag", "Value": "FirstValue"}, {"Key": "SecondTag",
 "Value": "SecondValue"}]'
```

This command produces no output.

For more information, see Tag secrets in the *Secrets Manager User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from a secret**

The following `untag-resource` example removes two tags from a secret. For each tag, both key and value are removed.

```
aws secretsmanager untag-resource \
    --secret-id MyTestSecret \
    --tag-keys '[ "FirstTag", "SecondTag"]'
```

This command produces no output.

For more information, see Tag secrets in the *Secrets Manager User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-secret-version-stage`

The following code example shows how to use `update-secret-version-stage`.

**AWS CLI**

**Example 1: To revert a secret to the previous version**

The following `update-secret-version-stage` example moves the AWSCURRENT staging label to the previous version of a secret, which reverts the secret to the previous version. To find the ID for the previous version, use `list-secret-version-ids`. For this example, the version with the AWSCURRENT label is a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 and the version with the AWSPREVIOUS label is a1b2c3d4-5678-90ab-cdef-EXAMPLE22222. In this example, you move the AWSCURRENT label from version 11111 to 22222. Because the AWSCURRENT

label is removed from a version, `update-secret-version-stage` automatically moves the AWSPREVIOUS label to that version (11111). The effect is that the AWSCURRENT and AWSPREVIOUS versions are swapped.

```
aws secretsmanager update-secret-version-stage \
    --secret-id MyTestSecret \
    --version-stage AWSCURRENT \
    --move-to-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --remove-from-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Version in the *Secrets Manager User Guide*.

**Example 2: To add a staging label attached to a version of a secret**

The following `update-secret-version-stage` example adds a staging label to a version of a secret. You can review the results by running `list-secret-version-ids` and viewing the `VersionStages` response field for the affected version.

```
aws secretsmanager update-secret-version-stage \
    --secret-id MyTestSecret \
    --version-stage STAGINGLABEL1 \
    --move-to-version-id EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Version in the *Secrets Manager User Guide*.

**Example 3: To delete a staging label attached to a version of a secret**

The following `update-secret-version-stage` example deletes a staging label that is attached to a version of a secret. You can review the results by running `list-secret-version-ids` and viewing the `VersionStages` response field for the affected version.

```
aws secretsmanager update-secret-version-stage \
    --secret-id MyTestSecret \
    --version-stage STAGINGLABEL1 \
    --remove-from-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Version in the *Secrets Manager User Guide*.

- For API details, see UpdateSecretVersionStage in *AWS CLI Command Reference*.

## `update-secret`

The following code example shows how to use `update-secret`.

### AWS CLI

**Example 1: To update the description of a secret**

The following `update-secret` example updates the description of a secret.

```
aws secretsmanager update-secret \
    --secret-id MyTestSecret \
    --description "This is a new description for the secret."
```

Output:

```
{
```

```
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

**Example 2: To update the encryption key associated with a secret**

The following `update-secret` example updates the KMS key used to encrypt the secret value. The KMS key must be in the same region as the secret.

```
aws secretsmanager update-secret \
    --secret-id MyTestSecret \
    --kms-key-id arn:aws:kms:us-west-2:123456789012:key/EXAMPLE1-90ab-cdef-fedc-
ba987EXAMPLE
```

Output:

```
{
    "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
    "Name": "MyTestSecret"
}
```

For more information, see Modify a secret in the *Secrets Manager User Guide*.

- For API details, see UpdateSecret in *AWS CLI Command Reference*.

## `validate-resource-policy`

The following code example shows how to use `validate-resource-policy`.

### AWS CLI

**To validate a resource policy**

The following `validate-resource-policy` example checks that a resource policy doesn't grant broad access to a secret. The policy is read from a file on disk. For more information, see Loading AWS CLI parameters from a file in the *AWS CLI User Guide*.

```
aws secretsmanager validate-resource-policy \
```

```
    --resource-policy file://mypolicy.json
```

Contents of `mypolicy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:role/MyRole"
            },
            "Action": "secretsmanager:GetSecretValue",
            "Resource": "*"
        }
    ]
}
```

Output:

```
{
    "PolicyValidationPassed": true,
    "ValidationErrors": []
}
```

For more information, see Permissions reference for Secrets Manager in the *Secrets Manager User Guide*.

- For API details, see ValidateResourcePolicy in *AWS CLI Command Reference*.

## Security Hub examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Security Hub.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `accept-administrator-invitation`

The following code example shows how to use `accept-administrator-invitation`.

**AWS CLI**

**To accept an invitation from an administrator account**

The following `accept-administrator-invitation` example accepts the specified invitation from the specified administrator account.

```
aws securityhub accept-invitation \
    --administrator-id 123456789012 \
    --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see AcceptAdministratorInvitation in *AWS CLI Command Reference*.

#### `accept-invitation`

The following code example shows how to use `accept-invitation`.

**AWS CLI**

**To accept an invitation from an administrator account**

The following `accept-invitation` example accepts the specified invitation from the specified administrator account.

```
aws securityhub accept-invitation \
    --master-id 123456789012 \
    --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see AcceptInvitation in *AWS CLI Command Reference*.

### `batch-delete-automation-rules`

The following code example shows how to use `batch-delete-automation-rules`.

**AWS CLI**

**To delete automation rules**

The following `batch-delete-automation-rules` example deletes the specified automation rule. You can delete one or more rules with a single command. Only the Security Hub administrator account can run this command.

```
aws securityhub batch-delete-automation-rules \
    --automation-rules-arns '["arn:aws:securityhub:us-
east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]'
```

Output:

```
{
    "ProcessedAutomationRules": [
        "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    ],
    "UnprocessedAutomationRules": []
}
```

For more information, see Deleting automation rules in the *AWS Security Hub User Guide*.

- For API details, see BatchDeleteAutomationRules in *AWS CLI Command Reference*.

### `batch-disable-standards`

The following code example shows how to use `batch-disable-standards`.

#### AWS CLI

##### To disable a standard

The following `batch-disable-standards` example disables the standard associated with the specified subscription ARN.

```
aws securityhub batch-disable-standards \
    --standards-subscription-arns "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
```

Output:

```
{
    "StandardsSubscriptions": [
        {
            "StandardsArn": "arn:aws:securityhub:eu-central-1::standards/pci-dss/
v/3.2.1",
            "StandardsInput": { },
            "StandardsStatus": "DELETING",
            "StandardsSubscriptionArn": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
        }
    ]
}
```

For more information, see Disabling or enabling a security standard in the *AWS Security Hub User Guide*.

- For API details, see BatchDisableStandards in *AWS CLI Command Reference*.

### `batch-enable-standards`

The following code example shows how to use `batch-enable-standards`.

#### AWS CLI

##### To enable a standard

The following `batch-enable-standards` example enables the PCI DSS standard for the requesting account.

```
aws securityhub batch-enable-standards \
    --standards-subscription-requests '{"StandardsArn":"arn:aws:securityhub:us-
west-1::standards/pci-dss/v/3.2.1"}'
```

Output:

```
{
    "StandardsSubscriptions": [
        {
            "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/
v/3.2.1",
            "StandardsInput": { },
            "StandardsStatus": "PENDING",
            "StandardsSubscriptionArn": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
        }
    ]
}
```

For more information, see Disabling or enabling a security standard in the *AWS Security Hub User Guide*.

- For API details, see BatchEnableStandards in *AWS CLI Command Reference*.

### `batch-get-automation-rules`

The following code example shows how to use `batch-get-automation-rules`.

#### AWS CLI

**To get details for automation rules**

The following `batch-get-automation-rules` example gets details for the specified automation rule. You can get details for one or more automation rules with a single command.

```
aws securityhub batch-get-automation-rules \
    --automation-rules-arns '["arn:aws:securityhub:us-
east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]'
```

Output:

```
{
    "Rules": [
        {
            "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RuleStatus": "ENABLED",
            "RuleOrder": 1,
            "RuleName": "Suppress informational findings",
            "Description": "Suppress GuardDuty findings with Informational
 severity",
            "IsTerminal": false,
            "Criteria": {
                "ProductName": [
                    {
                        "Value": "GuardDuty",
                        "Comparison": "EQUALS"
                    }
                ],
                "SeverityLabel": [
                    {
                        "Value": "INFORMATIONAL",
                        "Comparison": "EQUALS"
                    }
                ],
                "WorkflowStatus": [
                    {
                        "Value": "NEW",
                        "Comparison": "EQUALS"
                    }
                ],
                "RecordState": [
                    {
                        "Value": "ACTIVE",
                        "Comparison": "EQUALS"
                    }
                ]
            },
            "Actions": [
                {
                    "Type": "FINDING_FIELDS_UPDATE",
                    "FindingFieldsUpdate": {
                        "Note": {
```

```
                            "Text": "Automatically suppress GuardDuty findings with
 Informational severity",
                            "UpdatedBy": "sechub-automation"
                        },
                        "Workflow": {
                            "Status": "SUPPRESSED"
                        }
                    }
                }
            ],
            "CreatedAt": "2023-05-31T17:56:14.837000+00:00",
            "UpdatedAt": "2023-05-31T17:59:38.466000+00:00",
            "CreatedBy": "arn:aws:iam::123456789012:role/Admin"
        }
    ],
    "UnprocessedAutomationRules": []
}
```

For more information, see Viewing automation rules in the *AWS Security Hub User Guide*.

- For API details, see BatchGetAutomationRules in *AWS CLI Command Reference*.

### `batch-get-configuration-policy-associations`

The following code example shows how to use `batch-get-configuration-policy-associations`.

**AWS CLI**

**To get configuration association details for a batch of targets**

The following `batch-get-configuration-policy-associations` example retrieves association details for the specified targets. You can provide account IDs, organizational unit IDs, or the root ID for the target.

```
aws securityhub batch-get-configuration-policy-associations \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```
{
```

```
    "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "TargetId": "ou-6hi7-8j91kl2m",
    "TargetType": "ORGANIZATIONAL_UNIT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
    "AssociationStatus": "SUCCESS",
    "AssociationStatusMessage": "Association applied successfully on this target."
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see BatchGetConfigurationPolicyAssociations in *AWS CLI Command Reference*.

### `batch-get-security-controls`

The following code example shows how to use `batch-get-security-controls`.

**AWS CLI**

**To get security control details**

The following `batch-get-security-controls` example gets details for the security controls ACM.1 and IAM.1 in the current AWS account and AWS Region.

```
aws securityhub batch-get-security-controls \
    --security-control-ids '["ACM.1", "IAM.1"]'
```

Output:

```
{
    "SecurityControls": [
        {
            "SecurityControlId": "ACM.1",
            "SecurityControlArn": "arn:aws:securityhub:us-
east-2:123456789012:security-control/ACM.1",
            "Title": "Imported and ACM-issued certificates should be renewed after a
 specified time period",
            "Description": "This control checks whether an AWS Certificate Manager
 (ACM) certificate is renewed within the specified time period. It checks both
 imported certificates and certificates provided by ACM. The control fails if the
```

```
 certificate isn't renewed within the specified time period. Unless you provide a
 custom parameter value for the renewal period, Security Hub uses a default value of
 30 days.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
ACM.1/remediation",
            "SeverityRating": "MEDIUM",
            "SecurityControlStatus": "ENABLED"
            "UpdateStatus": "READY",
            "Parameters": {
                "daysToExpiration": {
                    "ValueType": CUSTOM,
                    "Value": {
                        "Integer": 15
                    }
                }
            },
            "LastUpdateReason": "Updated control parameter"
        },
        {
            "SecurityControlId": "IAM.1",
            "SecurityControlArn": "arn:aws:securityhub:us-
east-2:123456789012:security-control/IAM.1",
            "Title": "IAM policies should not allow full \"*\" administrative
 privileges",
            "Description": "This AWS control checks whether the default version of
 AWS Identity and Access Management (IAM) policies (also known as customer managed
 policies) do not have administrator access with a statement that has \"Effect\":
 \"Allow\" with \"Action\": \"*\" over \"Resource\": \"*\". It only checks for
 the Customer Managed Policies that you created, but not inline and AWS Managed
 Policies.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
IAM.1/remediation",
            "SeverityRating": "HIGH",
            "SecurityControlStatus": "ENABLED"
            "UpdateStatus": "READY",
            "Parameters": {}
        }
    ]
}
```

For more information, see Viewing details for a control in the *AWS Security Hub User Guide*.

- For API details, see BatchGetSecurityControls in *AWS CLI Command Reference*.

### batch-get-standards-control-associations

The following code example shows how to use `batch-get-standards-control-associations`.

**AWS CLI**

**To get the enablement status of a control**

The following `batch-get-standards-control-associations` example identifies whether the specified controls are enabled in the specified standards.

```
aws securityhub batch-get-standards-control-associations \
    --standards-control-association-ids '[{"SecurityControlId":
 "Config.1","StandardsArn": "arn:aws:securityhub:us-east-1:123456789012:ruleset/cis-
aws-foundations-benchmark/v/1.2.0"}, {"SecurityControlId": "IAM.6","StandardsArn":
 "arn:aws:securityhub:us-east-1:123456789012:standards/aws-foundational-security-
best-practices/v/1.0.0"}]'
```

Output:

```
{
    "StandardsControlAssociationDetails": [
        {
            "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-
benchmark/v/1.2.0",
            "SecurityControlId": "Config.1",
            "SecurityControlArn": "arn:aws:securityhub:us-
east-1:068873283051:security-control/Config.1",
            "AssociationStatus": "ENABLED",
            "RelatedRequirements": [
                "CIS AWS Foundations 2.5"
            ],
            "UpdatedAt": "2022-10-27T16:07:12.960000+00:00",
            "StandardsControlTitle": "Ensure AWS Config is enabled",
            "StandardsControlDescription": "AWS Config is a web service that
 performs configuration management of supported AWS resources within your account
 and delivers log files to you. The recorded information includes the configuration
 item (AWS resource), relationships between configuration items (AWS resources), and
 any configuration changes between resources. It is recommended to enable AWS Config
 in all regions.",
            "StandardsControlArns": [
```

```
                "arn:aws:securityhub:us-east-1:068873283051:control/cis-aws-
foundations-benchmark/v/1.2.0/2.5"
            ]
        },
        {
            "StandardsArn": "arn:aws:securityhub:us-east-1::standards/aws-
foundational-security-best-practices/v/1.0.0",
            "SecurityControlId": "IAM.6",
            "SecurityControlArn": "arn:aws:securityhub:us-
east-1:068873283051:security-control/IAM.6",
            "AssociationStatus": "DISABLED",
            "RelatedRequirements": [],
            "UpdatedAt": "2022-11-22T21:30:35.080000+00:00",
            "UpdatedReason": "test",
            "StandardsControlTitle": "Hardware MFA should be enabled for the root
 user",
            "StandardsControlDescription": "This AWS control checks whether your AWS
 account is enabled to use a hardware multi-factor authentication (MFA) device to
 sign in with root user credentials.",
            "StandardsControlArns": [
                "arn:aws:securityhub:us-east-1:068873283051:control/aws-
foundational-security-best-practices/v/1.0.0/IAM.6"
            ]
        }
    ]
}
```

For more information, see Enabling and disabling controls in specific standards in the *AWS Security Hub User Guide*.

- For API details, see BatchGetStandardsControlAssociations in *AWS CLI Command Reference*.

### `batch-import-findings`

The following code example shows how to use `batch-import-findings`.

#### AWS CLI

##### To update a finding

The following `batch-import-findings` example updates a finding.

```
aws securityhub batch-import-findings \
```

```
    --findings '
       [{
           "AwsAccountId": "123456789012",
           "CreatedAt": "2020-05-27T17:05:54.832Z",
           "Description": "Vulnerability in a CloudTrail trail",
           "FindingProviderFields": {
               "Severity": {
                   "Label": "LOW",
                   "Original": "10"
               },
               "Types": [
                   "Software and Configuration Checks/Vulnerabilities/CVE"
               ]
           },
           "GeneratorId": "TestGeneratorId",
           "Id": "Id1",
           "ProductArn": "arn:aws:securityhub:us-
west-1:123456789012:product/123456789012/default",
           "Resources": [
               {
                   "Id": "arn:aws:cloudtrail:us-west-1:123456789012:trail/
TrailName",
                   "Partition": "aws",
                   "Region": "us-west-1",
                   "Type": "AwsCloudTrailTrail"
               }
           ],
           "SchemaVersion": "2018-10-08",
           "Title": "CloudTrail trail vulnerability",
           "UpdatedAt": "2020-06-02T16:05:54.832Z"
       }]'
```

Output:

```
{
    "FailedCount": 0,
    "SuccessCount": 1,
    "FailedFindings": []
}
```

For more information, see Using BatchImportFindings to create and update findings in the *AWS Security Hub User Guide*.

- For API details, see BatchImportFindings in *AWS CLI Command Reference*.

### `batch-update-automation-rules`

The following code example shows how to use `batch-update-automation-rules`.

**AWS CLI**

**To update automation rules**

The following `batch-update-automation-rules` example updates the specified automation rule. You can update one or more rules with a single command. Only the Security Hub administrator account can run this command.

```
aws securityhub batch-update-automation-rules \
    --update-automation-rules-request-items '[ \
        { \
            "Actions": [{ \
                "Type": "FINDING_FIELDS_UPDATE", \
                "FindingFieldsUpdate": { \
                    "Note": { \
                        "Text": "Known issue that is a risk", \
                        "UpdatedBy": "sechub-automation" \
                    }, \
                    "Workflow": { \
                        "Status": "NEW" \
                    } \
                } \
            }], \
            "Criteria": { \
                "SeverityLabel": [{ \
                    "Value": "LOW", \
                    "Comparison": "EQUALS" \
                }] \
            }, \
            "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111", \
            "RuleOrder": 1, \
            "RuleStatus": "DISABLED" \
        } \
    ]'
```

Output:

```
{
    "ProcessedAutomationRules": [
        "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    ],
    "UnprocessedAutomationRules": []
}
```

For more information, see Editing automation rules in the *AWS Security Hub User Guide*.

- For API details, see BatchUpdateAutomationRules in *AWS CLI Command Reference*.

## `batch-update-findings`

The following code example shows how to use `batch-update-findings`.

### AWS CLI

#### Example 1: To update a finding

The following `batch-update-findings` example updates two findings to add a note, change the severity label, and resolve it.

```
aws securityhub batch-update-findings \
    --finding-identifiers '[{"Id": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111", "ProductArn": "arn:aws:securityhub:us-
west-1::product/aws/securityhub"}, {"Id": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222", "ProductArn": "arn:aws:securityhub:us-
west-1::product/aws/securityhub"}]' \
    --note '{"Text": "Known issue that is not a risk.", "UpdatedBy": "user1"}' \
    --severity '{"Label": "LOW"}' \
    --workflow '{"Status": "RESOLVED"}'
```

Output:

```
{
    "ProcessedFindings": [
        {
```

```
            "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
        },
        {
            "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
        }
    ],
    "UnprocessedFindings": []
}
```

For more information, see Using BatchUpdateFindings to update a finding in the *AWS Security Hub User Guide*.

**Example 2: To update a finding using shorthand syntax**

The following `batch-update-findings` example updates two findings to add a note, change the severity label, and resolve it using shorthand syntax.

```
aws securityhub batch-update-findings \
    --finding-identifiers Id="arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",ProductArn="arn:aws:securityhub:us-
west-1::product/aws/securityhub" Id="arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",ProductArn="arn:aws:securityhub:us-
west-1::product/aws/securityhub" \
    --note Text="Known issue that is not a risk.",UpdatedBy="user1" \
    --severity Label="LOW" \
    --workflow Status="RESOLVED"
```

Output:

```
{
    "ProcessedFindings": [
        {
            "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
        },
```

```
        {
            "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/
v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
        }
    ],
    "UnprocessedFindings": []
}
```

For more information, see Using BatchUpdateFindings to update a finding in the *AWS Security Hub User Guide*.

- For API details, see BatchUpdateFindings in *AWS CLI Command Reference*.

### `batch-update-standards-control-associations`

The following code example shows how to use `batch-update-standards-control-associations`.

#### AWS CLI

**To update the enablement status of a control in enabled standards**

The following `batch-update-standards-control-associations` example disables CloudTrail.1 in the specified standards.

```
aws securityhub batch-update-standards-control-associations \
    --standards-control-association-updates '[{"SecurityControlId": "CloudTrail.1",
 "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0", "AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable
 to environment"}, {"SecurityControlId": "CloudTrail.1", "StandardsArn":
 "arn:aws:securityhub:::standards/cis-aws-foundations-benchmark/v/1.4.0",
 "AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable to
 environment"}]'
```

This command produces no output when successful.

For more information, see Enabling and disabling controls in specific standards and Enabling and disabling controls in all standards in the *AWS Security Hub User Guide*.

- For API details, see BatchUpdateStandardsControlAssociations in *AWS CLI Command Reference*.

### `create-action-target`

The following code example shows how to use `create-action-target`.

**AWS CLI**

**To create a custom action**

The following `create-action-target` example creates a custom action. It provides the name, description, and identifier for the action.

```
aws securityhub create-action-target \
    --name "Send to remediation" \
    --description "Action to send the finding for remediation tracking" \
    --id "Remediation"
```

Output:

```
{
    "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/custom/
Remediation"
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see CreateActionTarget in *AWS CLI Command Reference*.

### `create-automation-rule`

The following code example shows how to use `create-automation-rule`.

**AWS CLI**

**To create an automation rule**

The following `create-automation-rule` example creates an automation rule in the current AWS account and AWS Region. Security Hub filters your findings based on the specified criteria and applies the actions to matching findings. Only the Security Hub administrator account can run this command.

```
aws securityhub create-automation-rule \
```

```
    --actions '[{ \
        "Type": "FINDING_FIELDS_UPDATE", \
        "FindingFieldsUpdate": { \
            "Severity": { \
                "Label": "HIGH" \
            }, \
            "Note": { \
                "Text": "Known issue that is a risk. Updated by automation rules", \
                "UpdatedBy": "sechub-automation" \
            } \
        } \
    }]' \
    --criteria '{ \
        "SeverityLabel": [{ \
            "Value": "INFORMATIONAL", \
            "Comparison": "EQUALS" \
        }] \
    }' \
    --description "A sample rule" \
    --no-is-terminal \
    --rule-name "sample rule" \
    --rule-order 1 \
    --rule-status "ENABLED"
```

Output:

```
{
    "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Creating automation rules in the *AWS Security Hub User Guide*.

- For API details, see CreateAutomationRule in *AWS CLI Command Reference*.

## `create-configuration-policy`

The following code example shows how to use `create-configuration-policy`.

### AWS CLI

#### To create a configuration policy

The following `create-configuration-policy` example creates a configuration policy with the specified settings.

```
aws securityhub create-configuration-policy \
    --name "SampleConfigurationPolicy" \
    --description "SampleDescription" \
    --configuration-policy '{"SecurityHub": {"ServiceEnabled":
 true, "EnabledStandardIdentifiers": ["arn:aws:securityhub:eu-
central-1::standards/aws-foundational-security-best-practices/
v/1.0.0","arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"],"SecurityControlsConfiguration":{"DisabledSecurityControlIdentifiers":
 ["CloudTrail.2"], "SecurityControlCustomParameters": [{"SecurityControlId":
 "ACM.1", "Parameters": {"daysToExpiration": {"ValueType": "CUSTOM", "Value":
 {"Integer": 15}}}}]}}}' \
    --tags '{"Environment": "Prod"}'
```

Output:

```
{
    "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Name": "SampleConfigurationPolicy",
    "Description": "SampleDescription",
    "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
    "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
    "ConfigurationPolicy": {
        "SecurityHub": {
            "ServiceEnabled": true,
            "EnabledStandardIdentifiers": [
                "arn:aws:securityhub:eu-central-1::standards/aws-foundational-
security-best-practices/v/1.0.0",
                "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
            ],
            "SecurityControlsConfiguration": {
                "DisabledSecurityControlIdentifiers": [
                    "CloudTrail.2"
                ],
                "SecurityControlCustomParameters": [
                    {
                        "SecurityControlId": "ACM.1",
                        "Parameters": {
```

```
                            "daysToExpiration": {
                                "ValueType": "CUSTOM",
                                "Value": {
                                    "Integer": 15
                                }
                            }
                        }
                    }
                ]
            }
        }
    }
}
```

For more information, see Creating and associating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see CreateConfigurationPolicy in *AWS CLI Command Reference*.

### `create-finding-aggregator`

The following code example shows how to use `create-finding-aggregator`.

#### AWS CLI

**To enable finding aggregation**

The following `create-finding-aggregator` example configures finding aggregation. It is run from US East (Virginia), which designates US East (Virginia) as the aggregation Region. It indicates to only link specified Regions, and to not automatically link new Regions. It selects US West (N. California) and US West (Oregon) as the linked Regions.

```
aws securityhub create-finding-aggregator \
    --region us-east-1 \
    --region-linking-mode SPECIFIED_REGIONS \
    --regions us-west-1,us-west-2
```

Output:

```
{
    "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:222222222222:finding-
aggregator/123e4567-e89b-12d3-a456-426652340000",
```

```
    "FindingAggregationRegion": "us-east-1",
    "RegionLinkingMode": "SPECIFIED_REGIONS",
    "Regions": "us-west-1,us-west-2"
}
```

For more information, see Enabling finding aggregation in the *AWS Security Hub User Guide*.

- For API details, see CreateFindingAggregator in *AWS CLI Command Reference*.

### `create-insight`

The following code example shows how to use `create-insight`.

**AWS CLI**

**To create a custom insight**

The following `create-insight` example creates a custom insight named Critical role findings that returns critical findings that are related to AWS roles.

```
aws securityhub create-insight \
    --filters '{"ResourceType": [{ "Comparison": "EQUALS", "Value": "AwsIamRole"}],
 "SeverityLabel": [{"Comparison": "EQUALS", "Value": "CRITICAL"}]}' \
    --group-by-attribute "ResourceId" \
    --name "Critical role findings"
```

Output:

```
{
    "InsightArn": "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Managing custom insights in the *AWS Security Hub User Guide*.

- For API details, see CreateInsight in *AWS CLI Command Reference*.

### `create-members`

The following code example shows how to use `create-members`.

**AWS CLI**

**To add accounts as member accounts**

The following `create-members` example adds two accounts as member accounts to the requesting administrator account.

```
aws securityhub create-members \
    --account-details '[{"AccountId": "123456789111"}, {"AccountId":
 "123456789222"}]'
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see CreateMembers in *AWS CLI Command Reference*.

### `decline-invitations`

The following code example shows how to use `decline-invitations`.

**AWS CLI**

**To decline an invitation to be a member account**

The following `decline-invitations` example declines an invitation to be a member account of the specified administrator account. The member account is the requesting account.

```
aws securityhub decline-invitations \
    --account-ids "123456789012"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DeclineInvitations in *AWS CLI Command Reference*.

### `delete-action-target`

The following code example shows how to use `delete-action-target`.

**AWS CLI**

**To delete a custom action**

The following `delete-action-target` example deletes the custom action identified by the specified ARN.

```
aws securityhub delete-action-target \
    --action-target-arn "arn:aws:securityhub:us-west-1:123456789012:action/custom/
Remediation"
```

Output:

```
{
    "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/custom/
Remediation"
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see DeleteActionTarget in *AWS CLI Command Reference*.

### `delete-configuration-policy`

The following code example shows how to use `delete-configuration-policy`.

**AWS CLI**

**To delete a configuration policy**

The following `delete-configuration-policy` example deletes the specified configuration policy.

```
aws securityhub delete-configuration-policy \
    --identifier "arn:aws:securityhub:eu-central-1:123456789012:configuration-
policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see Deleting and disassociating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see DeleteConfigurationPolicy in *AWS CLI Command Reference*.

### `delete-finding-aggregator`

The following code example shows how to use `delete-finding-aggregator`.

#### AWS CLI

**To stop finding aggregation**

The following `delete-finding-aggregator` example stops finding aggregation. It is run from US East (Virginia), which is the aggregation Region.

```
aws securityhub delete-finding-aggregator \
    --region us-east-1 \
    --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-
aggregator/123e4567-e89b-12d3-a456-426652340000
```

This command produces no output.

For more information, see Stopping finding aggregation in the *AWS Security Hub User Guide*.

- For API details, see DeleteFindingAggregator in *AWS CLI Command Reference*.

### `delete-insight`

The following code example shows how to use `delete-insight`.

#### AWS CLI

**To delete a custom insight**

The following `delete-insight` example deletes the custom insight with the specified ARN.

```
aws securityhub delete-insight \
    --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
   "InsightArn": "arn:aws:securityhub:eu-
central-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

For more information, see Managing custom insights in the *AWS Security Hub User Guide*.

- For API details, see DeleteInsight in *AWS CLI Command Reference*.

### `delete-invitations`

The following code example shows how to use `delete-invitations`.

#### AWS CLI

**To delete an invitation to be a member account**

The following `delete-invitations` example deletes an invitation to be a member account for the specified administrator account. The member account is the requesting account.

```
aws securityhub delete-invitations \
    --account-ids "123456789012"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DeleteInvitations in *AWS CLI Command Reference*.

### `delete-members`

The following code example shows how to use `delete-members`.

**AWS CLI**

**To delete member accounts**

The following `delete-members` example deletes the specified member accounts from the requesting administrator account.

```
aws securityhub delete-members \
    --account-ids "123456789111" "123456789222"
```

Output:

```
{
    "UnprocessedAccounts": []
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DeleteMembers in *AWS CLI Command Reference*.

### `describe-action-targets`

The following code example shows how to use `describe-action-targets`.

**AWS CLI**

**To retrieve details about custom actions**

The following `describe-action-targets` example retrieves information about the custom action identified by the specified ARN.

```
aws securityhub describe-action-targets \
    --action-target-arns "arn:aws:securityhub:us-west-1:123456789012:action/custom/
Remediation"
```

Output:

```
{
    "ActionTargets": [
        {
            "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/
custom/Remediation",
            "Description": "Action to send the finding for remediation tracking",
            "Name": "Send to remediation"
        }
    ]
}
```

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see DescribeActionTargets in *AWS CLI Command Reference*.

### `describe-hub`

The following code example shows how to use `describe-hub`.

#### AWS CLI

**To get information about a hub resource**

The following `describe-hub` example returns the subscription date for the specified hub resource. The hub resource is identified by its ARN.

```
aws securityhub describe-hub \
    --hub-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default"
```

Output:

```
{
    "HubArn": "arn:aws:securityhub:us-west-1:123456789012:hub/default",
    "SubscribedAt": "2019-11-19T23:15:10.046Z"
}
```

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see DescribeHub in *AWS CLI Command Reference*.

### `describe-organization-configuration`

The following code example shows how to use `describe-organization-configuration`.

**AWS CLI**

**To view how Security Hub is configured for an organization**

The following `describe-organization-configuration` example returns information about the way an organization is configured in Security Hub. In this example, the organization uses central configuration. Only the Security Hub administrator account can run this command.

```
aws securityhub describe-organization-configuration
```

Output:

```
{
    "AutoEnable": false,
    "MemberAccountLimitReached": false,
    "AutoEnableStandards": "NONE",
    "OrganizationConfiguration": {
        "ConfigurationType": "LOCAL",
        "Status": "ENABLED",
        "StatusMessage": "Central configuration has been enabled successfully"
    }
}
```

For more information, see Managing accounts with AWS Organizations in the *AWS Security Hub User Guide*.

- For API details, see DescribeOrganizationConfiguration in *AWS CLI Command Reference*.

### `describe-products`

The following code example shows how to use `describe-products`.

**AWS CLI**

**To return information about available product integrations**

The following `describe-products` example returns the available product integrations one at a time.

```
aws securityhub describe-products \
    --max-results 1
```

Output:

```
{
    "NextToken": "U2FsdGVkX18vvPlOqb7RDrWRWVFBJI46MOIAb+nZmRJmR15NoRi2gm13sdQEn3O/
pq/78dGs+bKpgA+7HMPHO0qX33/zoRI+uIG/F9yLNhcOrOWzFUdy36JcXLQji3Rpnn/
cD1SVkGA98qI3zPOSDg==",
    "Products": [
        {
            "ProductArn": "arn:aws:securityhub:us-west-1:123456789333:product/
crowdstrike/crowdstrike-falcon",
            "ProductName": "CrowdStrike Falcon",
            "CompanyName": "CrowdStrike",
            "Description": "CrowdStrike Falcon's single lightweight sensor unifies
 next-gen antivirus, endpoint detection and response, and 24/7 managed hunting, via
 the cloud.",
            "Categories": [
                "Endpoint Detection and Response (EDR)",
                "AV Scanning and Sandboxing",
                "Threat Intelligence Feeds and Reports",
                "Endpoint Forensics",
                "Network Forensics"
            ],
            "IntegrationTypes": [
                "SEND_FINDINGS_TO_SECURITY_HUB"
            ],
            "MarketplaceUrl": "https://aws.amazon.com/marketplace/seller-profile?
id=a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ActivationUrl": "https://falcon.crowdstrike.com/support/documentation",
            "ProductSubscriptionResourcePolicy": "{\"Version\":
\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":
\"123456789333\"},\"Action\":[\"securityhub:BatchImportFindings\"],\"Resource\":
\"arn:aws:securityhub:us-west-1:123456789012:product-subscription/crowdstrike/
crowdstrike-falcon\",\"Condition\":{\"StringEquals\":{\"securityhub:TargetAccount
\":\"123456789012\"}}},{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":
\"123456789012\"},\"Action\":[\"securityhub:BatchImportFindings\"],\"Resource
\":\"arn:aws:securityhub:us-west-1:123456789333:product/crowdstrike/crowdstrike-
falcon\",\"Condition\":{\"StringEquals\":{\"securityhub:TargetAccount\":
\"123456789012\"}}}]}"
        }
   ]
```

```
}
```

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see DescribeProducts in *AWS CLI Command Reference*.

### `describe-standards-controls`

The following code example shows how to use `describe-standards-controls`.

#### AWS CLI

**To request the list of controls in an enabled standard**

The following `describe-standards-controls` example requests the list of controls in the requestor account's subscription to the PCI DSS standard. The request returns two controls at a time.

```
aws securityhub describe-standards-controls \
    --standards-subscription-arn "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1" \
    --max-results 2
```

Output:

```
{
    "Controls": [
        {
            "StandardsControlArn": "arn:aws:securityhub:us-
west-1:123456789012:control/pci-dss/v/3.2.1/PCI.AutoScaling.1",
            "ControlStatus": "ENABLED",
            "ControlStatusUpdatedAt": "2020-05-15T18:49:04.473000+00:00",
            "ControlId": "PCI.AutoScaling.1",
            "Title": "Auto scaling groups associated with a load balancer should use
 health checks",
            "Description": "This AWS control checks whether your Auto Scaling groups
 that are associated with a load balancer are using Elastic Load Balancing health
 checks.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
PCI.AutoScaling.1/remediation",
            "SeverityRating": "LOW",
            "RelatedRequirements": [
                "PCI DSS 2.2"
```

```
            ]
        },
        {
            "StandardsControlArn": "arn:aws:securityhub:us-
west-1:123456789012:control/pci-dss/v/3.2.1/PCI.CW.1",
            "ControlStatus": "ENABLED",
            "ControlStatusUpdatedAt": "2020-05-15T18:49:04.498000+00:00",
            "ControlId": "PCI.CW.1",
            "Title": "A log metric filter and alarm should exist for usage of the
 \"root\" user",
            "Description": "This control checks for the CloudWatch metric
 filters using the following pattern { $.userIdentity.type = \"Root\" &&
 $.userIdentity.invokedBy NOT EXISTS && $.eventType != \"AwsServiceEvent\" }
 It checks that the log group name is configured for use with active multi-
region CloudTrail, that there is at least one Event Selector for a Trail with
 IncludeManagementEvents set to true and ReadWriteType set to All, and that there is
 at least one active subscriber to an SNS topic associated with the alarm.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
PCI.CW.1/remediation",
            "SeverityRating": "MEDIUM",
            "RelatedRequirements": [
                "PCI DSS 7.2.1"
            ]
        }

}
```

For more information, see Viewing details for controls in the *AWS Security Hub User Guide*.

- For API details, see DescribeStandardsControls in *AWS CLI Command Reference*.

## `describe-standards`

The following code example shows how to use `describe-standards`.

### AWS CLI

#### To return a list of available standards

The following `describe-standards` example returns the list of available standards.

```
aws securityhub describe-standards
```

Output:

```
{
    "Standards": [
        {
            "StandardsArn": "arn:aws:securityhub:us-west-1::standards/aws-
foundational-security-best-practices/v/1.0.0",
            "Name": "AWS Foundational Security Best Practices v1.0.0",
            "Description": "The AWS Foundational Security Best Practices standard
 is a set of automated security checks that detect when AWS accounts and deployed
 resources do not align to security best practices. The standard is defined by AWS
 security experts. This curated set of controls helps improve your security posture
 in AWS, and cover AWS's most popular and foundational services.",
            "EnabledByDefault": true
        },
        {
            "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-
benchmark/v/1.2.0",
            "Name": "CIS AWS Foundations Benchmark v1.2.0",
            "Description": "The Center for Internet Security (CIS) AWS Foundations
 Benchmark v1.2.0 is a set of security configuration best practices for AWS. This
 Security Hub standard automatically checks for your compliance readiness against a
 subset of CIS requirements.",
            "EnabledByDefault": true
        },
        {
            "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/
v/3.2.1",
            "Name": "PCI DSS v3.2.1",
            "Description": "The Payment Card Industry Data Security Standard (PCI
 DSS) v3.2.1 is an information security standard for entities that store, process,
 and/or transmit cardholder data. This Security Hub standard automatically checks
 for your compliance readiness against a subset of PCI DSS requirements.",
            "EnabledByDefault": false
        }
    ]
}
```

For more information, see Security standards in AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see DescribeStandards in *AWS CLI Command Reference*.

### `disable-import-findings-for-product`

The following code example shows how to use `disable-import-findings-for-product`.

**AWS CLI**

**To stop receiving findings from a product integration**

The following `disable-import-findings-for-product` example disables the flow of findings for the specified subscription to a product integration.

```
aws securityhub disable-import-findings-for-product \
    --product-subscription-arn "arn:aws:securityhub:us-west-1:123456789012:product-subscription/crowdstrike/crowdstrike-falcon"
```

This command produces no output.

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see DisableImportFindingsForProduct in *AWS CLI Command Reference*.

### `disable-organization-admin-account`

The following code example shows how to use `disable-organization-admin-account`.

**AWS CLI**

**To remove a Security Hub administrator account**

The following `disable-organization-admin-account` example revokes the specified account's assignment as a Security Hub administrator account for AWS Organizations.

```
aws securityhub disable-organization-admin-account \
    --admin-account-id 777788889999
```

This command produces no output.

For more information, see Designating a Security Hub administrator account in the *AWS Security Hub User Guide*.

- For API details, see DisableOrganizationAdminAccount in *AWS CLI Command Reference*.

### `disable-security-hub`

The following code example shows how to use `disable-security-hub`.

**AWS CLI**

**To disable AWS Security Hub**

The following `disable-security-hub` example disables AWS Security Hub for the requesting account.

```
aws securityhub disable-security-hub
```

This command produces no output.

For more information, see Disabling AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see DisableSecurityHub in *AWS CLI Command Reference*.

### `disassociate-from-administrator-account`

The following code example shows how to use `disassociate-from-administrator-account`.

**AWS CLI**

**To disassociate from an administrator account**

The following `disassociate-from-administrator-account` example disassociates the requesting account from its current administrator account.

```
aws securityhub disassociate-from-administrator-account
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DisassociateFromAdministratorAccount in *AWS CLI Command Reference*.

### `disassociate-from-master-account`

The following code example shows how to use `disassociate-from-master-account`.

**AWS CLI**

**To disassociate from an administrator account**

The following `disassociate-from-master-account` example disassociates the requesting account from its current administrator account.

```
aws securityhub disassociate-from-master-account
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DisassociateFromMasterAccount in *AWS CLI Command Reference*.

### `disassociate-members`

The following code example shows how to use `disassociate-members`.

**AWS CLI**

**To disassociate member accounts**

The following `disassociate-members` example disassociates the specified member accounts from the requesting administrator account.

```
aws securityhub disassociate-members  \
    --account-ids "123456789111" "123456789222"
```

This command produces no output.

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see DisassociateMembers in *AWS CLI Command Reference*.

### `enable-import-findings-for-product`

The following code example shows how to use `enable-import-findings-for-product`.

#### AWS CLI

**To start receiving findings from a product integration**

The following `enable-import-findings-for-product` example enables the flow of findings from the specified product integration.

```
aws securityhub enable-import-findings-for-product \
    --product-arn "arn:aws:securityhub:us-east-1:123456789333:product/crowdstrike/
crowdstrike-falcon"
```

Output:

```
{
    "ProductSubscriptionArn": "arn:aws:securityhub:us-east-1:123456789012:product-
subscription/crowdstrike/crowdstrike-falcon"
}
```

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see EnableImportFindingsForProduct in *AWS CLI Command Reference*.

### `enable-organization-admin-account`

The following code example shows how to use `enable-organization-admin-account`.

#### AWS CLI

**To designate an organization account as a Security Hub administrator account**

The following `enable-organization-admin-account` example designates the specified account as a Security Hub administrator account.

```
aws securityhub enable-organization-admin-account \
    --admin-account-id 777788889999
```

This command produces no output.

For more information, see Designating a Security Hub administrator account in the *AWS Security Hub User Guide*.

- For API details, see EnableOrganizationAdminAccount in *AWS CLI Command Reference*.

### `enable-security-hub`

The following code example shows how to use `enable-security-hub`.

**AWS CLI**

**To enable AWS Security Hub**

The following `enable-security-hub` example enables AWS Security Hub for the requesting account. It configures Security Hub to enable the default standards. For the hub resource, it assigns the value `Security` to the tag `Department`.

```
aws securityhub enable-security-hub \
    --enable-default-standards \
    --tags '{"Department": "Security"}'
```

This command produces no output.

For more information, see Enabling Security Hub in the *AWS Security Hub User Guide*.

- For API details, see EnableSecurityHub in *AWS CLI Command Reference*.

### `get-administrator-account`

The following code example shows how to use `get-administrator-account`.

**AWS CLI**

**To retrieve information about an administrator account**

The following `get-administrator-account` example retrieves information about the administrator account for the requesting account.

```
aws securityhub get-administrator-account
```

Output:

```
{
   "Master": {
      "AccountId": "123456789012",
      "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
      "InvitedAt": 2020-06-01T20:21:18.042000+00:00,
      "MemberStatus": "ASSOCIATED"
   }
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetAdministratorAccount in *AWS CLI Command Reference*.

### `get-configuration-policy-association`

The following code example shows how to use `get-configuration-policy-association`.

**AWS CLI**

**To get configuration association details for a target**

The following `get-configuration-policy-association` example retrieves association details for the specified target. You can provide an account ID, organizational unit ID, or the root ID for the target.

```
aws securityhub get-configuration-policy-association \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```
{
    "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "TargetId": "ou-6hi7-8j91kl2m",
    "TargetType": "ORGANIZATIONAL_UNIT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
    "AssociationStatus": "SUCCESS",
    "AssociationStatusMessage": "Association applied successfully on this target."
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see GetConfigurationPolicyAssociation in *AWS CLI Command Reference*.

### `get-configuration-policy`

The following code example shows how to use `get-configuration-policy`.

#### AWS CLI

**To view configuration policy details**

The following `get-configuration-policy` example retrieves details about the specified configuration policy.

```
aws securityhub get-configuration-policy \
   --identifier "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "ce5ed1e7-9639-4e2f-9313-fa87fcef944b",
    "Name": "SampleConfigurationPolicy",
    "Description": "SampleDescription",
    "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
    "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
    "ConfigurationPolicy": {
        "SecurityHub": {
            "ServiceEnabled": true,
            "EnabledStandardIdentifiers": [
                "arn:aws:securityhub:eu-central-1::standards/aws-foundational-
security-best-practices/v/1.0.0",
                "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
            ],
            "SecurityControlsConfiguration": {
                "DisabledSecurityControlIdentifiers": [
                    "CloudTrail.2"
                ],
```

```
                "SecurityControlCustomParameters": [
                    {
                        "SecurityControlId": "ACM.1",
                        "Parameters": {
                            "daysToExpiration": {
                                "ValueType": "CUSTOM",
                                "Value": {
                                    "Integer": 15
                                }
                            }
                        }
                    }
                ]
            }
        }
    }
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see GetConfigurationPolicy in *AWS CLI Command Reference*.

### `get-enabled-standards`

The following code example shows how to use `get-enabled-standards`.

#### AWS CLI

**To retrieve information about an enabled standard**

The following `get-enabled-standards` example retrieves information about the PCI DSS standard.

```
aws securityhub get-enabled-standards \
    --standards-subscription-arn "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
```

Output:

```
{
    "StandardsSubscriptions": [
        {
```

```
            "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/
v/3.2.1",
            "StandardsInput": { },
            "StandardsStatus": "READY",
            "StandardsSubscriptionArn": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
        }
    ]
}
```

For more information, see Security standards in AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see GetEnabledStandards in *AWS CLI Command Reference*.

### `get-finding-aggregator`

The following code example shows how to use `get-finding-aggregator`.

#### AWS CLI

**To retrieve the current finding aggregation configuration**

The following `get-finding-aggregator` example retrieves the current finding aggregation configuration.

```
aws securityhub get-finding-aggregator \
    --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-
aggregator/123e4567-e89b-12d3-a456-426652340000
```

Output:

```
{
    "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:222222222222:finding-
aggregator/123e4567-e89b-12d3-a456-426652340000",
    "FindingAggregationRegion": "us-east-1",
    "RegionLinkingMode": "SPECIFIED_REGIONS",
    "Regions": "us-west-1,us-west-2"
}
```

For more information, see Viewing the current finding aggregation configuration in the *AWS Security Hub User Guide*.

- For API details, see GetFindingAggregator in *AWS CLI Command Reference*.

### `get-finding-history`

The following code example shows how to use `get-finding-history`.

**AWS CLI**

**To get finding history**

The following `get-finding-history` example gets up to the last 90 days of history for the specified finding. In this example, the results are limited to two records of finding history.

```
aws securityhub get-finding-history \
    --finding-identifier Id="arn:aws:securityhub:us-
east-1:123456789012:security-control/S3.17/finding/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",ProductArn="arn:aws:securityhub:us-east-1::product/aws/securityhub"
```

Output:

```
{
    "Records": [
        {
            "FindingIdentifier": {
                "Id": "arn:aws:securityhub:us-east-1:123456789012:security-control/
S3.17/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
                "ProductArn": "arn:aws:securityhub:us-east-1::product/aws/
securityhub"
            },
            "UpdateTime": "2023-06-02T03:15:25.685000+00:00",
            "FindingCreated": false,
            "UpdateSource": {
                "Type": "BATCH_IMPORT_FINDINGS",
                "Identity": "arn:aws:securityhub:us-east-1::product/aws/securityhub"
            },
            "Updates": [
                {
                    "UpdatedField": "Compliance.RelatedRequirements",
                    "OldValue": "[\"NIST.800-53.r5 SC-12(2)\",\"NIST.800-53.r5

                "ProductArn": "arn:aws:securityhub:us-east-1::product/aws/
securityhub"
            },
            "UpdateTime": "2023-05-23T02:06:51.518000+00:00",
            "FindingCreated": "true",
            "UpdateSource": {
                "Type": "BATCH_IMPORT_FINDINGS",
                "Identity": "arn:aws:securityhub:us-east-1::product/aws/securityhub"
            },
            "Updates": []
        }
    ]
}
```

For more information, see Finding history in the *AWS Security Hub User Guide*.

- For API details, see GetFindingHistory in *AWS CLI Command Reference*.

### `get-findings`

The following code example shows how to use `get-findings`.

#### AWS CLI

##### Example 1: To return findings generated for a specific standard

The following `get-findings` example returns findings for the PCI DSS standard.

```
aws securityhub get-findings \
    --filters '{"GeneratorId":[{"Value": "pci-dss","Comparison":"PREFIX"}]}' \
    --max-items 1
```

Output:

```
{
    "Findings": [
        {
            "SchemaVersion": "2018-10-08",
            "Id": "arn:aws:securityhub:eu-central-1:123456789012:subscription/pci-
dss/v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub",
            "GeneratorId": "pci-dss/v/3.2.1/PCI.Lambda.2",

                }
            ],
            "Compliance": {
```

```
                "Status": "PASSED",
                "RelatedRequirements": [
                    "PCI DSS 1.2.1",
                    "PCI DSS 1.3.1",
                    "PCI DSS 1.3.2",
                    "PCI DSS 1.3.4"
                ]
            },
            "WorkflowState": "NEW",
            "Workflow": {
                "Status": "NEW"
            },
            "RecordState": "ARCHIVED"
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxfQ=="
}
```

**Example 2: To return critical-severity findings that have a workflow status of NOTIFIED**

The following `get-findings` example returns findings that have a severity label value of CRITICAL and a workflow status of NOTIFIED. The results are sorted in descending order by the value of Confidence.

```
aws securityhub get-findings \
    --filters '{"SeverityLabel":[{"Value":
 "CRITICAL","Comparison":"EQUALS"}],"WorkflowStatus":
 [{"Value":"NOTIFIED","Comparison":"EQUALS"}]}' \
    --sort-criteria '{ "Field": "Confidence", "SortOrder": "desc"}' \
    --max-items 1
```

Output:

```
{
    "Findings": [
        {
            "SchemaVersion": "2018-10-08",
            "Id": "arn:aws:securityhub:us-west-1: 123456789012:subscription/cis-aws-

```

For more information, see Filtering and grouping findings in the *AWS Security Hub User Guide*.

- For API details, see GetFindings in *AWS CLI Command Reference*.

### `get-insight-results`

The following code example shows how to use `get-insight-results`.

**AWS CLI**

**To retrieve the results for an insight**

The following `get-insight-results` example returns the list of insight results for the insight with the specified ARN.

```
aws securityhub get-insight-results \
    --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "InsightResults": {
        "GroupByAttribute": "ResourceId",
        "InsightArn": "arn:aws:securityhub:us-
west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
        "ResultValues": [
            {
                "Count": 10,
                "GroupByAttributeValue": "AWS::::Account:123456789111"
            },
            {
                "Count": 3,
                "GroupByAttributeValue": "AWS::::Account:123456789222"
            }
        ]
    }
}
```

For more information, see Viewing and taking action on insight results and findings in the *AWS Security Hub User Guide*.

- For API details, see GetInsightResults in *AWS CLI Command Reference*.

## `get-insights`

The following code example shows how to use `get-insights`.

## AWS CLI

### To retrieve details about an insight

The following `get-insights` example retrieves the configuration details for the insight with the specified ARN.

```
aws securityhub get-insights \
    --insight-arns "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{
    "Insights": [
        {
            "Filters": {
               "ResourceType": [
                    {
                        "Comparison": "EQUALS",
                        "Value": "AwsIamRole"
                    }
                ],
                "SeverityLabel": [
                    {
                        "Comparison": "EQUALS",
                        "Value": "CRITICAL"
                    }
                ],
            },
            "GroupByAttribute": "ResourceId",
            "InsightArn": "arn:aws:securityhub:us-
west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
            "Name": "Critical role findings"
        }
    ]
}
```

For more information, see Insights in AWS Security Hub in the *AWS Security Hub User Guide*.

- For API details, see GetInsights in *AWS CLI Command Reference*.

### `get-invitations-count`

The following code example shows how to use `get-invitations-count`.

**AWS CLI**

**To retrieve the number of invitations that were not accepted**

The following `get-invitations-count` example retrieves the number of invitations that the requesting account declined or did not respond to.

```
aws securityhub get-invitations-count
```

Output:

```
{
  "InvitationsCount": 3
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetInvitationsCount in *AWS CLI Command Reference*.

### `get-master-account`

The following code example shows how to use `get-master-account`.

**AWS CLI**

**To retrieve information about an administrator account**

The following `get-master-account` example retrieves information about the administrator account for the requesting account.

```
aws securityhub get-master-account
```

Output:

```
{
```

```
   "Master": {
      "AccountId": "123456789012",
      "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
      "InvitedAt": 2020-06-01T20:21:18.042000+00:00,
      "MemberStatus": "ASSOCIATED"
   }
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetMasterAccount in *AWS CLI Command Reference*.

### `get-members`

The following code example shows how to use `get-members`.

#### AWS CLI

**To retrieve information about selected member accounts**

The following `get-members` example retrieves information about the specified member accounts.

```
aws securityhub get-members \
    --account-ids "444455556666" "777788889999"
```

Output:

```
{
    "Members": [
        {
            "AccountId": "123456789111",
            "AdministratorId": "123456789012",
            "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
            "MasterId": "123456789012",
            "MemberStatus": "ASSOCIATED",
            "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
        },
        {
            "AccountId": "123456789222",
```

```
            "AdministratorId": "123456789012",
            "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
            "MasterId": "123456789012",
            "MemberStatus": "ASSOCIATED",
            "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
        }
    ],
    "UnprocessedAccounts": [ ]
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see GetMembers in *AWS CLI Command Reference*.

### `get-security-control-definition`

The following code example shows how to use `get-security-control-definition`.

**AWS CLI**

**To get security control definition details**

The following `get-security-control-definition` example retrieves definition details for a Security Hub security control. Details include the control title, description, Region availability, parameters, and other information.

```
aws securityhub get-security-control-definition \
    --security-control-id ACM.1
```

Output:

```
{
    "SecurityControlDefinition": {
        "SecurityControlId": "ACM.1",
        "Title": "Imported and ACM-issued certificates should be renewed after a
 specified time period",
        "Description": "This control checks whether an AWS Certificate Manager
 (ACM) certificate is renewed within the specified time period. It checks both
 imported certificates and certificates provided by ACM. The control fails if the
 certificate isn't renewed within the specified time period. Unless you provide a
```

```
 custom parameter value for the renewal period, Security Hub uses a default value of
 30 days.",
        "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/ACM.1/
remediation",
        "SeverityRating": "MEDIUM",
        "CurrentRegionAvailability": "AVAILABLE",
        "ParameterDefinitions": {
            "daysToExpiration": {
                "Description": "Number of days within which the ACM certificate must
 be renewed",
                "ConfigurationOptions": {
                    "Integer": {
                        "DefaultValue": 30,
                        "Min": 14,
                        "Max": 365
                    }
                }
            }
        }
    }
}
```

For more information, see Custom control parameters in the *AWS Security Hub User Guide*.

- For API details, see GetSecurityControlDefinition in *AWS CLI Command Reference*.

### `invite-members`

The following code example shows how to use `invite-members`.

#### AWS CLI

**To send invitations to member accounts**

The following `invite-members` example sends invitations to the specified member accounts.

```
aws securityhub invite-members \
    --account-ids "123456789111" "123456789222"
```

Output:

```
{
    "UnprocessedAccounts": []
```

```
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see InviteMembers in *AWS CLI Command Reference*.

### `list-automation-rules`

The following code example shows how to use `list-automation-rules`.

**AWS CLI**

**To view a list of automation rules**

The following `list-automation-rules` example lists the automation rules for an AWS account. Only the Security Hub administrator account can run this command.

```
aws securityhub list-automation-rules \
    --max-results 3 \
    --next-token NULL
```

Output:

```
{
    "AutomationRulesMetadata": [
        {
            "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RuleStatus": "ENABLED",
            "RuleOrder": 1,
            "RuleName": "Suppress informational findings",
            "Description": "Suppress GuardDuty findings with Informational
 severity",
            "IsTerminal": false,
            "CreatedAt": "2023-05-31T17:56:14.837000+00:00",
            "UpdatedAt": "2023-05-31T17:59:38.466000+00:00",
            "CreatedBy": "arn:aws:iam::123456789012:role/Admin"
        },
        {
            "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
```

```
            "RuleStatus": "ENABLED",
            "RuleOrder": 1,
            "RuleName": "sample rule",
            "Description": "A sample rule",
            "IsTerminal": false,
            "CreatedAt": "2023-07-15T23:37:20.223000+00:00",
            "UpdatedAt": "2023-07-15T23:37:20.223000+00:00",
            "CreatedBy": "arn:aws:iam::123456789012:role/Admin"
        },
        {
            "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "RuleStatus": "ENABLED",
            "RuleOrder": 1,
            "RuleName": "sample rule",
            "Description": "A sample rule",
            "IsTerminal": false,
            "CreatedAt": "2023-07-15T23:45:25.126000+00:00",
            "UpdatedAt": "2023-07-15T23:45:25.126000+00:00",
            "CreatedBy": "arn:aws:iam::123456789012:role/Admin"
        }
    ]
}
```

For more information, see Viewing automation rules in the *AWS Security Hub User Guide*.

- For API details, see ListAutomationRules in *AWS CLI Command Reference*.

### `list-configuration-policies`

The following code example shows how to use `list-configuration-policies`.

#### AWS CLI

**To list configuration policy summaries**

The following `list-configuration-policies` example lists a summary of configuration policies for the organization.

```
aws securityhub list-configuration-policies \
    --max-items 3
```

Output:

```
{
    "ConfigurationPolicySummaries": [
        {
            "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-
policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "SampleConfigurationPolicy1",
            "Description": "SampleDescription1",
            "UpdatedAt": "2023-09-26T21:08:36.214000+00:00",
            "ServiceEnabled": true
        },
        {
            "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-
policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Name": "SampleConfigurationPolicy2",
            "Description": "SampleDescription2"
            "UpdatedAt": "2023-11-28T19:26:25.207000+00:00",
            "ServiceEnabled": true
        },
        {
            "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-
policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
            "Name": "SampleConfigurationPolicy3",
            "Description": "SampleDescription3",
            "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
            "ServiceEnabled": true
        }
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see ListConfigurationPolicies in *AWS CLI Command Reference*.

## `list-configuration-policy-associations`

The following code example shows how to use `list-configuration-policy-associations`.

### AWS CLI

#### To list configuration associations

The following `list-configuration-policy-associations` example lists a summary of configuration associations for the organization. The response include associations with configuration policies and self-managed behavior.

```
aws securityhub list-configuration-policy-associations \
    --association-type "APPLIED" \
    --max-items 4
```

Output:

```
{
    "ConfigurationPolicyAssociationSummaries": [
        {
            "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "TargetId": "r-1ab2",
            "TargetType": "ROOT",
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-11-28T19:26:49.417000+00:00",
            "AssociationStatus": "FAILED",
            "AssociationStatusMessage": "Policy association failed because 2
 organizational units or accounts under this root failed."
        },
        {
            "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "TargetId": "ou-1ab2-c3de4f5g",

            "AssociationStatus": "SUCCESS",
            "AssociationStatusMessage": "Association applied successfully on this
 target."
        },
        {
```

```
            "ConfigurationPolicyId": "SELF_MANAGED_SECURITY_HUB",
            "TargetId": "111122223333",
            "TargetType": "ACCOUNT",
            "AssociationType": "APPLIED",
            "UpdatedAt": "2023-11-28T22:01:26.409000+00:00",
            "AssociationStatus": "SUCCESS"
    }
}
```

For more information, see Viewing Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see ListConfigurationPolicyAssociations in *AWS CLI Command Reference*.

### `list-enabled-products-for-import`

The following code example shows how to use `list-enabled-products-for-import`.

**AWS CLI**

**To return the list of enabled product integrations**

The following `list-enabled-products-for-import` example returns the list of subscription ARNS for the currently enabled product integrations.

```
aws securityhub list-enabled-products-for-import
```

Output:

```
{
    "ProductSubscriptions": [ "arn:aws:securityhub:us-west-1:123456789012:product-subscription/crowdstrike/crowdstrike-falcon", "arn:aws:securityhub:us-west-1:123456789012:product-subscription/aws/securityhub" ]
}
```

For more information, see Managing product integrations in the *AWS Security Hub User Guide*.

- For API details, see ListEnabledProductsForImport in *AWS CLI Command Reference*.

### `list-finding-aggregators`

The following code example shows how to use `list-finding-aggregators`.

**AWS CLI**

**To list the available widgets**

The following `list-finding-aggregators` example returns the ARN of the finding aggregation configuration.

```
aws securityhub list-finding-aggregators
```

Output:

```
{
    "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:222222222222:finding-
aggregator/123e4567-e89b-12d3-a456-426652340000"
}
```

For more information, see Viewing the current finding aggregation configuration in the *AWS Security Hub User Guide*.

- For API details, see ListFindingAggregators in *AWS CLI Command Reference*.

## `list-invitations`

The following code example shows how to use `list-invitations`.

**AWS CLI**

**To display a list of invitations**

The following `list-invitations` example retrieves the list of invitations sent to the requesting account.

```
aws securityhub list-invitations
```

Output:

```
{
    "Invitations": [
        {
            "AccountId": "123456789012",
```

```
            "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
            "InvitedAt": 2020-06-01T20:21:18.042000+00:00,
            "MemberStatus": "ASSOCIATED"
        }
    ],
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see ListInvitations in *AWS CLI Command Reference*.

### `list-members`

The following code example shows how to use `list-members`.

#### AWS CLI

**To retrieve a list of member accounts**

The following `list-members` example returns the list of member accounts for the requesting administrator account.

```
aws securityhub list-members
```

Output:

```
{
    "Members": [
        {
            "AccountId": "123456789111",
            "AdministratorId": "123456789012",
            "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
            "MasterId": "123456789012",
            "MemberStatus": "ASSOCIATED",
            "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
        },
        {
            "AccountId": "123456789222",
            "AdministratorId": "123456789012",
            "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
            "MasterId": "123456789012",
```

```
            "MemberStatus": "ASSOCIATED",
            "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
        }
    ],
}
```

For more information, see Managing administrator and member accounts in the *AWS Security Hub User Guide*.

- For API details, see ListMembers in *AWS CLI Command Reference*.

### `list-organization-admin-accounts`

The following code example shows how to use `list-organization-admin-accounts`.

**AWS CLI**

**To list the designated Security Hub administrator accounts**

The following `list-organization-admin-accounts` example lists the Security Hub administrator accounts for an organization.

```
aws securityhub list-organization-admin-accounts
```

Output:

```
{
    AdminAccounts": [
        { "AccountId": "777788889999" },
        { "Status": "ENABLED" }
    ]
}
```

For more information, see Designating a Security Hub administrator account in the *AWS Security Hub User Guide*.

- For API details, see ListOrganizationAdminAccounts in *AWS CLI Command Reference*.

### `list-security-control-definitions`

The following code example shows how to use `list-security-control-definitions`.

## AWS CLI

### Example 1: To list all available security controls

The following `list-security-control-definitions` example lists the available security controls across all Security Hub standards. This example limits the results to three controls.

```
aws securityhub list-security-control-definitions \
    --max-items 3
```

Output:

```
{
    "SecurityControlDefinitions": [
        {
            "SecurityControlId": "ACM.1",
            "Title": "Imported and ACM-issued certificates should be renewed after a
 specified time period",
            "Description": "This control checks whether an AWS Certificate Manager
 (ACM) certificate is renewed within the specified time period. It checks both
 imported certificates and certificates provided by ACM. The control fails if the
 certificate isn't renewed within the specified time period. Unless you provide a
 custom parameter value for the renewal period, Security Hub uses a default value of
 30 days.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
ACM.1/remediation",
            "SeverityRating": "MEDIUM",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": [
                "Parameters"
            ]
        },
        {
            "SecurityControlId": "ACM.2",
            "Title": "RSA certificates managed by ACM should use a key length of at
 least 2,048 bits",
            "Description": "This control checks whether RSA certificates managed by
 AWS Certificate Manager use a key length of at least 2,048 bits. The control fails
 if the key length is smaller than 2,048 bits.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
ACM.2/remediation",
            "SeverityRating": "HIGH",
            "CurrentRegionAvailability": "AVAILABLE",
```

```
            "CustomizableProperties": []
        },
        {
            "SecurityControlId": "APIGateway.1",
            "Title": "API Gateway REST and WebSocket API execution logging should be
 enabled",
            "Description": "This control checks whether all stages of an Amazon
 API Gateway REST or WebSocket API have logging enabled. The control fails if
 the 'loggingLevel' isn't 'ERROR' or 'INFO' for all stages of the API. Unless you
 provide custom parameter values to indicate that a specific log type should be
 enabled, Security Hub produces a passed finding if the logging level is either
 'ERROR' or 'INFO'.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
APIGateway.1/remediation",
            "SeverityRating": "MEDIUM",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": [
                "Parameters"
            ]
        }
    ],
    "NextToken": "U2FsdGVkX1/UprCPzxVbkDeHikDXbDxfgJZ1w2RG1XWsFPTMTIQPVE0m/

+NYawjocVBeos6xzn/8qnbF9IuwGg=="
}
```

For more information, see Viewing details for a standard in the *AWS Security Hub User Guide*.

**Example 2: To list available security controls for a specific standard**

The following `list-security-control-definitions` example lists the available security controls for the CIS AWS Foundations Benchmark v1.4.0. This example limits the results to three controls.

```
aws securityhub list-security-control-definitions \
    --standards-arn "arn:aws:securityhub:us-east-1::standards/cis-aws-foundations-
benchmark/v/1.4.0" \
    --max-items 3
```

Output:

```
{
```

```
    "SecurityControlDefinitions": [
        {
            "SecurityControlId": "CloudTrail.1",
            "Title": "CloudTrail should be enabled and configured with at least one
 multi-Region trail that includes read and write management events",
            "Description": "This AWS control checks that there is at least one
 multi-region AWS CloudTrail trail includes read and write management events.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
CloudTrail.1/remediation",
            "SeverityRating": "HIGH",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": []
        },
        {
            "SecurityControlId": "CloudTrail.2",
            "Title": "CloudTrail should have encryption at-rest enabled",
            "Description": "This AWS control checks whether AWS CloudTrail is
 configured to use the server side encryption (SSE) AWS Key Management Service (AWS
 KMS) customer master key (CMK) encryption. The check will pass if the KmsKeyId is
 defined.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
CloudTrail.2/remediation",
            "SeverityRating": "MEDIUM",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": []
        },
        {
            "SecurityControlId": "CloudTrail.4",
            "Title": "CloudTrail log file validation should be enabled",
            "Description": "This AWS control checks whether CloudTrail log file
 validation is enabled.",
            "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
CloudTrail.4/remediation",
            "SeverityRating": "MEDIUM",
            "CurrentRegionAvailability": "AVAILABLE",
            "CustomizableProperties": []
        }
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAzfQ=="
}
```

For more information, see Viewing details for a standard in the *AWS Security Hub User Guide*.

- For API details, see ListSecurityControlDefinitions in *AWS CLI Command Reference*.

## `list-standards-control-associations`

The following code example shows how to use `list-standards-control-associations`.

### AWS CLI

#### To get the enablement status of a control in each enabled standard

The following `list-standards-control-associations` example lists the enablement status of CloudTrail.1 in each enabled standard.

```
aws securityhub list-standards-control-associations \
    --security-control-id CloudTrail.1
```

Output:

```
{
    "StandardsControlAssociationSummaries": [
        {
            "StandardsArn": "arn:aws:securityhub:us-east-2::standards/nist-800-53/

 information includes the identity of the API caller, the time of the API call,
 the source IP address of the API caller, the request parameters, and the response
 elements returned by the AWS service. CloudTrail provides a history of AWS API
 calls for an account, including API calls made via the Management Console, SDKs,
 command line tools, and higher-level AWS services (such as CloudFormation)."
        }
    ]
}
```

For more information, see Enabling and disabling controls in specific standards in the *AWS Security Hub User Guide*.

- For API details, see ListStandardsControlAssociations in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To retrieve the tags assigned to a resource**

The following `list-tags-for-resource` example returns the tags assigned to the specified hub resource.

```
aws securityhub list-tags-for-resource \
    --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default"
```

Output:

```
{
    "Tags": {
        "Department" : "Operations",
        "Area" : "USMidwest"
    }
}
```

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `start-configuration-policy-association`

The following code example shows how to use `start-configuration-policy-association`.

**AWS CLI**

**Example 1: To associate a configuration policy**

The following `start-configuration-policy-association` example associates the specified configuration policy with the specified organizational unit. A configuration may be associated with a target account, organizational unit, or the root.

```
aws securityhub start-configuration-policy-association \
    --configuration-policy-identifier "arn:aws:securityhub:eu-
central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333" \
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```
{
    "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "TargetId": "ou-6hi7-8j91kl2m",
    "TargetType": "ORGANIZATIONAL_UNIT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-11-29T17:40:52.468000+00:00",
    "AssociationStatus": "PENDING"
}
```

For more information, see Creating and associating Security Hub configuration policies in the *AWS Security Hub User Guide*.

**Example 2: To associate a self-managed configuration**

The following `start-configuration-policy-association` example associates a self-managed configuration with the specified account.

```
aws securityhub start-configuration-policy-association \
    --configuration-policy-identifier "SELF_MANAGED_SECURITY_HUB" \
    --target '{"OrganizationalUnitId": "123456789012"}'
```

Output:

```
{
    "ConfigurationPolicyId": "SELF_MANAGED_SECURITY_HUB",
    "TargetId": "123456789012",
    "TargetType": "ACCOUNT",
    "AssociationType": "APPLIED",
    "UpdatedAt": "2023-11-29T17:40:52.468000+00:00",
    "AssociationStatus": "PENDING"
}
```

For more information, see Creating and associating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see StartConfigurationPolicyAssociation in *AWS CLI Command Reference*.

## `start-configuration-policy-disassociation`

The following code example shows how to use `start-configuration-policy-disassociation`.

**AWS CLI**

**Example 1: To disassociate a configuration policy**

The following `start-configuration-policy-disassociation` example disassociates a configuration policy from the specified organizational unit. A configuration may be disassociated from a target account, organizational unit, or the root.

```
aws securityhub start-configuration-policy-disassociation \
    --configuration-policy-identifier "arn:aws:securityhub:eu-
central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333" \
```

```
    --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

This command produces no output.

For more information, see Disassociating a configuration from accounts and OUs in the *AWS Security Hub User Guide*.

**Example 2: To disassociate a self-managed configuration**

The following `start-configuration-policy-disassociation` example disassociates a self-managed configuration from the specified account.

```
aws securityhub start-configuration-policy-disassociation \
    --configuration-policy-identifier "SELF_MANAGED_SECURITY_HUB" \
    --target '{"AccountId": "123456789012"}'
```

This command produces no output.

For more information, see Disassociating a configuration from accounts and OUs in the *AWS Security Hub User Guide*.

- For API details, see StartConfigurationPolicyDisassociation in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To assign a tag to a resource**

The following `tag-resource` example assigns values for the Department and Area tags to the specified hub resource.

```
aws securityhub tag-resource \
    --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default" \
    --tags '{"Department":"Operations", "Area":"USMidwest"}'
```

This command produces no output.

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag value from a resource**

The following `untag-resource` example removes the Department tag from the specified hub resource.

```
aws securityhub untag-resource \
    --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default" \
    --tag-keys "Department"
```

This command produces no output.

For more information, see AWS::SecurityHub::Hub in the *AWS CloudFormation User Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-action-target`

The following code example shows how to use `update-action-target`.

**AWS CLI**

**To update a custom action**

The following `update-action-target` example updates the name of the custom action identified by the specified ARN.

```
aws securityhub update-action-target \
    --action-target-arn "arn:aws:securityhub:us-west-1:123456789012:action/custom/
Remediation" \
    --name "Send to remediation"
```

This command produces no output.

For more information, see Creating a custom action and associating it with a CloudWatch Events rule in the *AWS Security Hub User Guide*.

- For API details, see UpdateActionTarget in *AWS CLI Command Reference*.

### `update-configuration-policy`

The following code example shows how to use `update-configuration-policy`.

**AWS CLI**

**To update a configuration policy**

The following `update-configuration-policy` example updates an existing configuration policy to use the specified settings.

```
aws securityhub update-configuration-policy \
    --identifier "arn:aws:securityhub:eu-central-1:508236694226:configuration-
policy/09f37766-57d8-4ede-9d33-5d8b0fecf70e" \
    --name "SampleConfigurationPolicyUpdated" \
    --description "SampleDescriptionUpdated" \
    --configuration-policy '{"SecurityHub": {"ServiceEnabled":
 true, "EnabledStandardIdentifiers": ["arn:aws:securityhub:eu-
central-1::standards/aws-foundational-security-best-practices/
v/1.0.0","arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"],"SecurityControlsConfiguration":{"DisabledSecurityControlIdentifiers":
 ["CloudWatch.1"], "SecurityControlCustomParameters": [{"SecurityControlId":
 "ACM.1", "Parameters": {"daysToExpiration": {"ValueType": "CUSTOM", "Value":
 {"Integer": 21}}}}]}}}' \
    --updated-reason "Disabling CloudWatch.1 and changing parameter value"
```

Output:

```
{
    "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Name": "SampleConfigurationPolicyUpdated",
    "Description": "SampleDescriptionUpdated",
    "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
    "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
    "ConfigurationPolicy": {
        "SecurityHub": {
            "ServiceEnabled": true,
            "EnabledStandardIdentifiers": [
```

```
                "arn:aws:securityhub:eu-central-1::standards/aws-foundational-
security-best-practices/v/1.0.0",
                "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
            ],
            "SecurityControlsConfiguration": {
                "DisabledSecurityControlIdentifiers": [
                    "CloudWatch.1"
                ],
                "SecurityControlCustomParameters": [
                    {
                        "SecurityControlId": "ACM.1",
                        "Parameters": {
                            "daysToExpiration": {
                                "ValueType": "CUSTOM",
                                "Value": {
                                    "Integer": 21
                                }
                            }
                        }
                    }
                ]
            }
        }
    }
}
```

For more information, see Updating Security Hub configuration policies in the *AWS Security Hub User Guide*.

- For API details, see UpdateConfigurationPolicy in *AWS CLI Command Reference*.

### `update-finding-aggregator`

The following code example shows how to use `update-finding-aggregator`.

**AWS CLI**

**To update the current finding aggregation configuration**

The following `update-finding-aggregator` example changes the finding aggregation configuration to link from selected Regions. It is run from US East (Virginia), which is the

aggregation Region. It selects US West (N. California) and US West (Oregon) as the linked Regions.

```
aws securityhub update-finding-aggregator \
    --region us-east-1 \
    --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-
aggregator/123e4567-e89b-12d3-a456-426652340000 \
    --region-linking-mode SPECIFIED_REGIONS \
    --regions us-west-1,us-west-2
```

This command produces no output.

For more information, see Updating the finding aggregation configuration in the *AWS Security Hub User Guide*.

- For API details, see UpdateFindingAggregator in *AWS CLI Command Reference*.

## `update-insight`

The following code example shows how to use `update-insight`.

### AWS CLI

#### Example 1: To change the filter for a custom insight

The following `update-insight` example changes the filters for a custom insight. The updated insight looks for findings with a high severity that are related to AWS roles.

```
aws securityhub update-insight \
    --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --filters '{"ResourceType": [{ "Comparison": "EQUALS", "Value": "AwsIamRole"}],
 "SeverityLabel": [{"Comparison": "EQUALS", "Value": "HIGH"}]}' \
    --name "High severity role findings"
```

#### Example 2: To change the grouping attribute for a custom insight

The following `update-insight` example changes the grouping attribute for the custom insight with the specified ARN. The new grouping attribute is the resource ID.

```
aws securityhub update-insight \
```

```
    --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
    --group-by-attribute "ResourceId" \
    --name "Critical role findings"
```

Output:

```
{
    "Insights": [
        {
            "InsightArn": "arn:aws:securityhub:us-
west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",
            "Name": "Critical role findings",
            "Filters": {
                "SeverityLabel": [
                    {
                        "Value": "CRITICAL",
                        "Comparison": "EQUALS"
                    }
                ],
                "ResourceType": [
                    {
                        "Value": "AwsIamRole",
                        "Comparison": "EQUALS"
                    }
                ]
            },
            "GroupByAttribute": "ResourceId"
        }
    ]
}
```

For more information, see Managing custom insights in the *AWS Security Hub User Guide*.

- For API details, see UpdateInsight in *AWS CLI Command Reference*.

### `update-organization-configuration`

The following code example shows how to use `update-organization-configuration`.

**AWS CLI**

**To update how Security Hub is configured for an organization**

The following `update-organization-configuration` example specifies that Security Hub should use central configuration to configure an organization. After running this command, the delegated Security Hub administrator can create and manage configuration policies to configure the organization. The delegated administrator can also use this command to switch from central to local configuration. If local configuration is the configuration type, the delegated administrator can choose whether to automatically enable Security Hub and default security standards in new organization accounts.

```
aws securityhub update-organization-configuration \
    --no-auto-enable \
    --organization-configuration '{"ConfigurationType": "CENTRAL"}'
```

This command produces no output.

For more information, see Managing accounts with AWS Organizations in the *AWS Security Hub User Guide*.

- For API details, see UpdateOrganizationConfiguration in *AWS CLI Command Reference*.

## `update-security-control`

The following code example shows how to use `update-security-control`.

**AWS CLI**

**To update security control properties**

The following `update-security-control` example specifies custom values for a Security Hub security control parameter.

```
aws securityhub update-security-control \
    --security-control-id ACM.1 \
    --parameters '{"daysToExpiration": {"ValueType": "CUSTOM", "Value": {"Integer":
 15}}}' \
    --last-update-reason "Internal compliance requirement"
```

This command produces no output.

For more information, see Custom control parameters in the *AWS Security Hub User Guide*.

- For API details, see UpdateSecurityControl in *AWS CLI Command Reference*.

### `update-security-hub-configuration`

The following code example shows how to use `update-security-hub-configuration`.

**AWS CLI**

**To update Security Hub configuration**

The following `update-security-hub-configuration` example configures Security Hub to automatically enable new controls for enabled standards.

```
aws securityhub update-security-hub-configuration \
    --auto-enable-controls
```

This command produces no output.

For more information, see Enabling new controls automatically in the *AWS Security Hub User Guide*.

- For API details, see UpdateSecurityHubConfiguration in *AWS CLI Command Reference*.

### `update-standards-control`

The following code example shows how to use `update-standards-control`.

**AWS CLI**

**Example 1: To disable a control**

The following `update-standards-control` example disables the PCI.AutoScaling.1 control.

```
aws securityhub update-standards-control \
    --standards-control-arn "arn:aws:securityhub:us-west-1:123456789012:control/pci-
dss/v/3.2.1/PCI.AutoScaling.1" \
    --control-status "DISABLED" \
    --disabled-reason "Not applicable for my service"
```

This command produces no output.

**Example 2: To enable a control**

The following `update-standards-control` example enables the PCI.AutoScaling.1 control.

```
aws securityhub update-standards-control \
    --standards-control-arn "arn:aws:securityhub:us-west-1:123456789012:control/pci-dss/v/3.2.1/PCI.AutoScaling.1" \
    --control-status "ENABLED"
```

This command produces no output.

For more information, see Disabling and enabling individual controls in the *AWS Security Hub User Guide*.

- For API details, see UpdateStandardsControl in *AWS CLI Command Reference*.

## AWS Serverless Application Repository examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Serverless Application Repository.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

- Actions

### Actions

#### `put-application-policy`

The following code example shows how to use `put-application-policy`.

**AWS CLI**

**Example 1: To share an application publicly**

The following `put-application-policy` shares an application publicly, so anyone can find and deploy your application in the AWS Serverless Application Repository.

```
aws serverlessrepo put-application-policy \
    --application-id arn:aws:serverlessrepo:us-east-1:123456789012:applications/my-
test-application \
    --statements Principals='*',Actions=Deploy
```

Output:

```
{
    "Statements": [
        {
            "Actions": [
                "Deploy"
            ],
            "Principals": [
                ""
            ],
            "StatementId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
        }
    ]
}
```

**Example 2:** To share an application privately

The following `put-application-policy` shares an application privately, so only specific AWS accounts can find and deploy your application in the AWS Serverless Application Repository.

```
aws serverlessrepo put-application-policy \
    --application-id arn:aws:serverlessrepo:us-east-1:123456789012:applications/my-
test-application \
    --statements Principals=111111111111,222222222222,Actions=Deploy
```

Output:

```
{
    "Statements": [
```

```
        {
            "Actions": [
                "Deploy"
            ],
            "Principals": [
                "111111111111",
                "222222222222"
            ],
            "StatementId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
        }
    ]
}
```

For more information, see Sharing an Application Through the Console in the *AWS Serverless Application Repository Developer Guide*

- For API details, see PutApplicationPolicy in *AWS CLI Command Reference*.

## Service Catalog examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Service Catalog.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `accept-portfolio-share`

The following code example shows how to use `accept-portfolio-share`.

**AWS CLI**

**To accept a portfolio share**

The following `accept-portfolio-share` example accepts an offer, made by another user, to share the specified portfolio.

```
aws servicecatalog accept-portfolio-share \
    --portfolio-id port-2s6wuabcdefghijk
```

This command produces no output.

- For API details, see AcceptPortfolioShare in *AWS CLI Command Reference*.

### `associate-principal-with-portfolio`

The following code example shows how to use `associate-principal-with-portfolio`.

**AWS CLI**

**To associate a principal with a portfolio**

The following `associate-principal-with-portfolio` example associates a user with the specified portfolio.

```
aws servicecatalog associate-principal-with-portfolio \
    --portfolio-id port-2s6abcdefwdh4 \
    --principal-arn arn:aws:iam::123456789012:user/usertest \
    --principal-type IAM
```

This command produces no output.

- For API details, see AssociatePrincipalWithPortfolio in *AWS CLI Command Reference*.

### `associate-product-with-portfolio`

The following code example shows how to use `associate-product-with-portfolio`.

**AWS CLI**

**To associate a product with a portfolio**

The following `associate-product-with-portfolio` example associates the given product with the specified portfolio.

```
aws servicecatalog associate-product-with-portfolio
     --product-id prod-3p5abcdef3oyk
     --portfolio-id port-2s6abcdef5wdh4
```

This command produces no output.

- For API details, see AssociateProductWithPortfolio in *AWS CLI Command Reference*.

### `associate-tag-option-with-resource`

The following code example shows how to use `associate-tag-option-with-resource`.

**AWS CLI**

**To associate a TagOption with a resource**

The following `associate-tag-option-with-resource` example associates the specified TagOption with the specified resource.

```
aws servicecatalog associate-tag-option-with-resource \
    --resource-id port-2s6abcdq5wdh4 \
    --tag-option-id tag-p3abc2pkpz5qc
```

This command produces no output.

- For API details, see AssociateTagOptionWithResource in *AWS CLI Command Reference*.

### `copy-product`

The following code example shows how to use `copy-product`.

**AWS CLI**

**To copy a product**

The following `copy-product` example makes a copy of the specified product, using a JSON file to pass parameters.

```
aws servicecatalog copy-product --cli-input-json file://copy-product-input.json
```

Contents of `copy-product-input.json`:

```
{
    "SourceProductArn": "arn:aws:catalog:us-west-2:123456789012:product/prod-
tcabcd3syn2xy",
    "TargetProductName": "copy-of-myproduct",
    "CopyOptions": [
        "CopyTags"
    ]
}
```

Output:

```
{
    "CopyProductToken": "copyproduct-abc5defgjkdji"
}
```

- For API details, see CopyProduct in *AWS CLI Command Reference*.

### `create-portfolio-share`

The following code example shows how to use `create-portfolio-share`.

#### AWS CLI

**To share a portfolio with an account**

The following `create-portfolio-share` example shares the specified portfolio with the specified account.

```
aws servicecatalog create-portfolio-share \
    --portfolio-id port-2s6abcdef5wdh4 \
    --account-id 794123456789
```

This command produceds no output.

- For API details, see CreatePortfolioShare in *AWS CLI Command Reference*.

### `create-portfolio`

The following code example shows how to use `create-portfolio`.

**AWS CLI**

**To create a portfolio**

The following `create-portfolio` example creates a portfolio.

```
aws servicecatalog create-portfolio  \
    --provider-name my-provider \
    --display-name my-portfolio
```

Output:

```
{
    "PortfolioDetail": {
        "ProviderName": "my-provider",
        "DisplayName": "my-portfolio",
        "CreatedTime": 1571337221.555,
        "ARN": "arn:aws:catalog:us-east-2:123456789012:portfolio/
port-2s6xmplq5wdh4",
        "Id": "port-2s6xmplq5wdh4"
    }
}
```

- For API details, see CreatePortfolio in *AWS CLI Command Reference*.

### `create-product`

The following code example shows how to use `create-product`.

**AWS CLI**

**To create a product**

The following `create-product` example creates a product, using a JSON file to pass parameters.

```
aws servicecatalog create-product \
    --cli-input-json file://create-product-input.json
```

Contents of `create-product-input.json`:

```
{
    "AcceptLanguage": "en",
    "Name": "test-product",
    "Owner": "test-owner",
    "Description": "test-description",
    "Distributor": "test-distributor",
    "SupportDescription": "test-support",
    "SupportEmail": "test@amazon.com",
    "SupportUrl": "https://aws.amazon.com",
    "ProductType": "CLOUD_FORMATION_TEMPLATE",
    "Tags": [
        {
            "Key": "region",
            "Value": "us-east-1"
        }
    ],
    "ProvisioningArtifactParameters": {
        "Name": "test-version-name",
        "Description": "test-version-description",
        "Info": {
            "LoadTemplateFromURL": "https://s3-us-west-1.amazonaws.com/
cloudformation-templates-us-west-1/my-cfn-template.template"
        },
        "Type": "CLOUD_FORMATION_TEMPLATE"
    }
}
```

Output:

```
{
    "Tags": [
        {
            "Key": "region",
            "Value": "us-east-1"
        }
    ],
    "ProductViewDetail": {
        "CreatedTime": 1576025036.0,
        "ProductARN": "arn:aws:catalog:us-west-2:1234568542028:product/
prod-3p5abcdef3oyk",
        "Status": "CREATED",
        "ProductViewSummary": {
            "Type": "CLOUD_FORMATION_TEMPLATE",
```

```
            "Distributor": "test-distributor",
            "SupportUrl": "https://aws.amazon.com",
            "SupportEmail": "test@amazon.com",
            "Id": "prodview-abcd42wvx45um",
            "SupportDescription": "test-support",
            "ShortDescription": "test-description",
            "Owner": "test-owner",
            "Name": "test-product2",
            "HasDefaultPath": false,
            "ProductId": "prod-3p5abcdef3oyk"
        }
    },
    "ProvisioningArtifactDetail": {
        "CreatedTime": 1576025036.0,
        "Active": true,
        "Id": "pa-pq3p5lil12a34",
        "Description": "test-version-description",
        "Name": "test-version-name",
        "Type": "CLOUD_FORMATION_TEMPLATE"
    }
}
```

- For API details, see CreateProduct in *AWS CLI Command Reference*.

### `create-provisioning-artifact`

The following code example shows how to use `create-provisioning-artifact`.

#### AWS CLI

**To create a provisioning artifact**

The following `create-provisioning-artifact` example creates a provisioning artifact, using a JSON file to pass parameters.

```
aws servicecatalog create-provisioning-artifact \
   --cli-input-json file://create-provisioning-artifact-input.json
```

Contents of `create-provisioning-artifact-input.json`:

```
{
    "ProductId": "prod-nfi2abcdefghi",
```

```
    "Parameters": {
        "Name": "test-provisioning-artifact",
        "Description": "test description",
        "Info": {
            "LoadTemplateFromURL": "https://s3-us-west-1.amazonaws.com/
cloudformation-templates-us-west-1/my-cfn-template.template"
        },
        "Type": "CLOUD_FORMATION_TEMPLATE"
    }
}
```

Output:

```
{
    "Info": {
        "TemplateUrl": "https://s3-us-west-1.amazonaws.com/cloudformation-templates-
us-west-1/my-cfn-template.template"
    },
    "Status": "CREATING",
    "ProvisioningArtifactDetail": {
        "Id": "pa-bb4abcdefwnaio",
        "Name": "test-provisioning-artifact",
        "Description": "test description",
        "Active": true,
        "Type": "CLOUD_FORMATION_TEMPLATE",
        "CreatedTime": 1576022545.0
    }
}
```

- For API details, see CreateProvisioningArtifact in *AWS CLI Command Reference*.

### `create-tag-option`

The following code example shows how to use `create-tag-option`.

#### AWS CLI

##### To create a TagOption

The following `create-tag-option` example creates a TagOption.

```
aws servicecatalog create-tag-option
```

```
    --key 1234
    --value name
```

Output:

```
{
    "TagOptionDetail": {
    "Id": "tag-iabcdn4fzjjms",
    "Value": "name",
    "Active": true,
    "Key": "1234"
    }
}
```

- For API details, see CreateTagOption in *AWS CLI Command Reference*.

### `delete-portfolio-share`

The following code example shows how to use `delete-portfolio-share`.

#### AWS CLI

**To stop sharing a portfolio with an account**

The following `delete-portfolio-share` example stops sharing the portfolio with the specified account.

```
aws servicecatalog delete-portfolio-share \
    --portfolio-id port-2s6abcdq5wdh4 \
    --account-id 123456789012
```

This command produces no output.

- For API details, see DeletePortfolioShare in *AWS CLI Command Reference*.

### `delete-portfolio`

The following code example shows how to use `delete-portfolio`.

#### AWS CLI

**To delete a portfolio**

The following `delete-portfolio` example deletes the specified portfolio.

```
aws servicecatalog delete-portfolio \
    --id port-abcdlx4gox4do
```

This command produces no output.

- For API details, see DeletePortfolio in *AWS CLI Command Reference*.

### `delete-product`

The following code example shows how to use `delete-product`.

#### AWS CLI

**To delete a product**

The following `delete-product` example deletes the specified product.

```
aws servicecatalog delete-product \
    --id prod-abcdcek6yhbxi
```

This command produces no output.

- For API details, see DeleteProduct in *AWS CLI Command Reference*.

### `delete-provisioning-artifact`

The following code example shows how to use `delete-provisioning-artifact`.

#### AWS CLI

**To delete a provisioning artifact**

The following `delete-provisioning-artifact` example deletes the specified provisioning artifact.

```
aws servicecatalog delete-provisioning-artifact \
    --product-id prod-abc2uebuplcpw \
    --provisioning-artifact-id pa-pqabcddii7ouc
```

This command produces no output.

- For API details, see DeleteProvisioningArtifact in *AWS CLI Command Reference*.

### `delete-tag-option`

The following code example shows how to use `delete-tag-option`.

**AWS CLI**

**To delete a TagOption**

The following `delete-tag-option` example deletes the specified TagOption.

```
aws servicecatalog delete-tag-option \
    --id tag-iabcdn4fzjjms
```

This command produces no output.

- For API details, see DeleteTagOption in *AWS CLI Command Reference*.

### `describe-copy-product-status`

The following code example shows how to use `describe-copy-product-status`.

**AWS CLI**

**To describe the status of the copy product operation**

The following `describe-copy-product-status` example displays the current status of the specified asynchronous copy product operation.

```
aws servicecatalog describe-copy-product-status \
    --copy-product-token copyproduct-znn5tf5abcd3w
```

Output:

```
{
    "CopyProductStatus": "SUCCEEDED",
    "TargetProductId": "prod-os6hog7abcdt2"
}
```

- For API details, see DescribeCopyProductStatus in *AWS CLI Command Reference*.

### `describe-portfolio`

The following code example shows how to use `describe-portfolio`.

**AWS CLI**

**To describe a portfolio**

The following `describe-portfolio` example displays details for the specified portfolio.

```
aws servicecatalog describe-portfolio \
    --id port-2s6abcdq5wdh4
```

Output:

```
{
    "TagOptions": [],
    "PortfolioDetail": {
        "ARN": "arn:aws:catalog:us-west-2:687558541234:portfolio/
port-2s6abcdq5wdh4",
        "Id": "port-2s6wuzyq5wdh4",
        "CreatedTime": 1571337221.555,
        "DisplayName": "my-portfolio",
        "ProviderName": "my-provider"
    },
    "Tags": []
}
```

- For API details, see DescribePortfolio in *AWS CLI Command Reference*.

### `describe-product-as-admin`

The following code example shows how to use `describe-product-as-admin`.

**AWS CLI**

**To describe a product as an administrator**

The following `describe-product-as-admin` example displays details for the specified product using administrator privileges.

```
aws servicecatalog describe-product-as-admin \
```

```
    --id prod-abcdcek6yhbxi
```

Output:

```
{
    "TagOptions": [],
    "ProductViewDetail": {
        "ProductARN": "arn:aws:catalog:us-west-2:687558542028:product/prod-
abcdcek6yhbxi",
        "ProductViewSummary": {
            "SupportEmail": "test@amazon.com",
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "Distributor": "test-distributor",
            "ShortDescription": "test-description",
            "Owner": "test-owner",
            "Id": "prodview-wi3l2j4abc6vc",
            "SupportDescription": "test-support",
            "ProductId": "prod-abcdcek6yhbxi",
            "HasDefaultPath": false,
            "Name": "test-product3",
            "SupportUrl": "https://aws.amazon.com"
        },
        "CreatedTime": 1577136715.0,
        "Status": "CREATED"
    },
    "ProvisioningArtifactSummaries": [
        {
            "CreatedTime": 1577136715.0,
            "Description": "test-version-description",
            "ProvisioningArtifactMetadata": {
                "SourceProvisioningArtifactId": "pa-abcdxkkiv5fcm"
            },
            "Name": "test-version-name-3",
            "Id": "pa-abcdxkkiv5fcm"
        }
    ],
    "Tags": [
        {
            "Value": "iad",
            "Key": "region"
        }
    ]
}
```

- For API details, see DescribeProductAsAdmin in *AWS CLI Command Reference*.

### `describe-provisioned-product`

The following code example shows how to use `describe-provisioned-product`.

**AWS CLI**

**To describe a provisioned product**

The following `describe-provisioned-product` example displays details for the specified provisioned product.

```
aws servicecatalog describe-provisioned-product \
    --id pp-dpom27bm4abcd
```

Output:

```
{
    "ProvisionedProductDetail": {
        "Status": "ERROR",
        "CreatedTime": 1577222793.358,
        "Arn": "arn:aws:servicecatalog:us-west-2:123456789012:stack/mytestppname3/
pp-dpom27bm4abcd",
        "Id": "pp-dpom27bm4abcd",
        "StatusMessage": "AmazonCloudFormationException  Parameters: [KeyName]
 must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code:
 ValidationError; Request ID: 5528602a-a9ef-427c-825c-f82c31b814f5)",
        "IdempotencyToken": "527c5358-2a1a-4b9e-b1b9-7293b0ddff42",
        "LastRecordId": "rec-tfuawdjovzxge",
        "Type": "CFN_STACK",
        "Name": "mytestppname3"
    },
    "CloudWatchDashboards": []
}
```

- For API details, see DescribeProvisionedProduct in *AWS CLI Command Reference*.

### `describe-provisioning-artifact`

The following code example shows how to use `describe-provisioning-artifact`.

**AWS CLI**

**To describe a provisioning artifact**

The following `describe-provisioning-artifact` example displays details for the specified provisioning artifact.

```
aws servicecatalog describe-provisioning-artifact \
    --provisioning-artifact-id pa-pcz347abcdcfm \
    --product-id prod-abcdfz3syn2rg
```

Output:

```
{
    "Info": {
        "TemplateUrl": "https://awsdocs.s3.amazonaws.com/servicecatalog/
myexampledevelopment-environment.template"
    },
    "ProvisioningArtifactDetail": {
        "Id": "pa-pcz347abcdcfm",
        "Active": true,
        "Type": "CLOUD_FORMATION_TEMPLATE",
        "Description": "updated description",
        "CreatedTime": 1562097906.0,
        "Name": "updated name"
    },
    "Status": "AVAILABLE"
}
```

- For API details, see DescribeProvisioningArtifact in *AWS CLI Command Reference*.

## `describe-tag-option`

The following code example shows how to use `describe-tag-option`.

**AWS CLI**

**To describe a TagOption**

The following `describe-tag-option` example displays details for the specified TagOption.

```
aws servicecatalog describe-tag-option \
```

```
    --id tag-p3tej2abcd5qc
```

Output:

```
{
    "TagOptionDetail": {
        "Active": true,
        "Id": "tag-p3tej2abcd5qc",
        "Value": "value-3",
        "Key": "1234"
    }
}
```

- For API details, see DescribeTagOption in *AWS CLI Command Reference*.

### `disassociate-principal-from-portfolio`

The following code example shows how to use `disassociate-principal-from-portfolio`.

**AWS CLI**

**To disassociate a principal from a portfolio**

The following `disassociate-principal-from-portfolio` example disassociates the specified principal from the portfolio.

```
aws servicecatalog disassociate-principal-from-portfolio \
    --portfolio-id port-2s6abcdq5wdh4 \
    --principal-arn arn:aws:iam::123456789012:group/myendusers
```

This command produces no output.

- For API details, see DisassociatePrincipalFromPortfolio in *AWS CLI Command Reference*.

### `disassociate-product-from-portfolio`

The following code example shows how to use `disassociate-product-from-portfolio`.

**AWS CLI**

**To disassociate a product from a portfolio**

The following `disassociate-product-from-portfolio` example disassociates the specified product from the portfolio.

```
aws servicecatalog disassociate-product-from-portfolio \
    --product-id prod-3p5abcdmu3oyk \
    --portfolio-id port-2s6abcdq5wdh4
```

This command produces no output.

- For API details, see DisassociateProductFromPortfolio in *AWS CLI Command Reference*.

### `disassociate-tag-option-from-resource`

The following code example shows how to use `disassociate-tag-option-from-resource`.

**AWS CLI**

**To disassociate a TagOption from a resource**

The following `disassociate-tag-option-from-resource` example disassociates the specified `TagOption` from the resource.

```
aws servicecatalog disassociate-tag-option-from-resource \
     --resource-id port-2s6abcdq5wdh4 \
     --tag-option-id tag-p3abc2pkpz5qc
```

This command produces no output.

- For API details, see DisassociateTagOptionFromResource in *AWS CLI Command Reference*.

### `list-accepted-portfolio-shares`

The following code example shows how to use `list-accepted-portfolio-shares`.

**AWS CLI**

**To list accepted portfolio shares**

The following `list-accepted-portfolio-shares` example lists all portfolios for which sharing was accepted by this account, including only the default Service Catalog portfolios.

```
aws servicecatalog list-accepted-portfolio-shares \
    --portfolio-share-type "AWS_SERVICECATALOG"
```

Output:

```
{
    "PortfolioDetails": [
        {
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/port-
d2abcd5dpkuma",
            "Description": "AWS Service Catalog Reference blueprints for often-used
 AWS services such as EC2, S3, RDS, VPC and EMR.",
            "CreatedTime": 1574456190.687,
            "ProviderName": "AWS Service Catalog",
            "DisplayName": "Reference Architectures",
            "Id": "port-d2abcd5dpkuma"
        },
        {
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/port-
abcdefaua7zpu",
            "Description": "AWS well-architected blueprints for high reliability
 applications.",
            "CreatedTime": 1574461496.092,
            "ProviderName": "AWS Service Catalog",
            "DisplayName": "High Reliability Architectures",
            "Id": "port-abcdefaua7zpu"
        }
    ]
}
```

- For API details, see ListAcceptedPortfolioShares in *AWS CLI Command Reference*.

### `list-portfolio-access`

The following code example shows how to use `list-portfolio-access`.

#### AWS CLI

**To list accounts with access to a portfolio**

The following `list-portfolio-access` example lists the AWS accounts that have access to the specified portfolio.

```
aws servicecatalog list-portfolio-access \
    --portfolio-id port-2s6abcdq5wdh4
```

Output:

```
{
    "AccountIds": [
        "123456789012"
    ]
}
```

- For API details, see ListPortfolioAccess in *AWS CLI Command Reference*.

### `list-portfolios-for-product`

The following code example shows how to use `list-portfolios-for-product`.

**AWS CLI**

**To list portfolios associated with a product**

The following `list-portfolios-for-product` example lists the portfolios associated with the specified product.

```
aws servicecatalog list-portfolios-for-product \
    --product-id prod-abcdfz3syn2rg
```

Output:

```
{
    "PortfolioDetails": [
        {
            "CreatedTime": 1571337221.555,
            "Id": "port-2s6abcdq5wdh4",
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-2s6abcdq5wdh4",
            "DisplayName": "my-portfolio",
            "ProviderName": "my-provider"
        },
        {
```

```
            "CreatedTime": 1559665256.348,
            "Id": "port-5abcd3e5st4ei",
            "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-5abcd3e5st4ei",
            "DisplayName": "test",
            "ProviderName": "provider-name"
        }
    ]
}
```

- For API details, see ListPortfoliosForProduct in *AWS CLI Command Reference*.

### `list-portfolios`

The following code example shows how to use `list-portfolios`.

#### AWS CLI

**To list portfolios**

The following `list-portfolios` example lists the Service Catalog portfolios in the current Region.

```
aws servicecatalog list-portfolios
```

Output:

```
{
    "PortfolioDetails": [
        {
           "CreatedTime": 1559665256.348,
           "ARN": "arn:aws:catalog:us-east-2:123456789012:portfolio/
port-5pzcxmplst4ei",
           "DisplayName": "my-portfolio",
           "Id": "port-5pzcxmplst4ei",
           "ProviderName": "my-user"
        }
    ]
}
```

- For API details, see ListPortfolios in *AWS CLI Command Reference*.

### `list-principals-for-portfolio`

The following code example shows how to use `list-principals-for-portfolio`.

**AWS CLI**

**To list all principals for a portfolio**

The following `list-principals-for-portfolio` example lists all principals for the specified portfolio.

```
aws servicecatalog list-principals-for-portfolio \
    --portfolio-id port-2s6abcdq5wdh4
```

Output:

```
{
    "Principals": [
        {
            "PrincipalARN": "arn:aws:iam::123456789012:user/usertest",
            "PrincipalType": "IAM"
        }
    ]
}
```

- For API details, see ListPrincipalsForPortfolio in *AWS CLI Command Reference*.

### `list-provisioning-artifacts`

The following code example shows how to use `list-provisioning-artifacts`.

**AWS CLI**

**To list all provisioning artifacts for a product**

The following `list-provisioning-artifacts` example lists all provisioning artifacts for the specified product.

```
aws servicecatalog list-provisioning-artifacts \
    --product-id prod-nfi2abcdefgcpw
```

Output:

```
{
    "ProvisioningArtifactDetails": [
        {
            "Id": "pa-abcdef54ipm6z",
            "Description": "test-version-description",
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "CreatedTime": 1576021147.0,
            "Active": true,
            "Name": "test-version-name"
        },
        {
            "Id": "pa-bb4zyxwwnaio",
            "Description": "test description",
            "Type": "CLOUD_FORMATION_TEMPLATE",
            "CreatedTime": 1576022545.0,
            "Active": true,
            "Name": "test-provisioning-artifact-2"
        }
    ]
}
```

- For API details, see ListProvisioningArtifacts in *AWS CLI Command Reference*.

### `list-resources-for-tag-option`

The following code example shows how to use `list-resources-for-tag-option`.

#### AWS CLI

**To list resources associated to a TagOption**

The following `list-resources-for-tag-option` example lists the resources associated with the specified `TagOption`.

```
aws servicecatalog list-resources-for-tag-option \
    --tag-option-id tag-p3tej2abcd5qc
```

Output:

```
{
    "ResourceDetails": [
        {
```

```
            "ARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
abcdfz3syn2rg",
            "Name": "my product",
            "Description": "description",
            "CreatedTime": 1562097906.0,
            "Id": "prod-abcdfz3syn2rg"
        }
    ]
}
```

- For API details, see ListResourcesForTagOption in *AWS CLI Command Reference*.

### `list-tag-options`

The following code example shows how to use `list-tag-options`.

#### AWS CLI

The following `list-tag-options` example lists all values for `TagOptions`.

```
aws servicecatalog list-tag-options
```

Output:

```
{
    "TagOptionDetails": [
        {
            "Value": "newvalue",
            "Active": true,
            "Id": "tag-iabcdn4fzjjms",
            "Key": "1234"
        },
        {
            "Value": "value1",
            "Active": true,
            "Id": "tag-e3abcdvmwvrzy",
            "Key": "key"
        }
    ]
}
```

- For API details, see ListTagOptions in *AWS CLI Command Reference*.

### `provision-product`

The following code example shows how to use `provision-product`.

#### AWS CLI

**To provision a product**

The following `provision-product` example provisions the specified product using the specified provisioning artifact.

```
aws servicecatalog provision-product \
    --product-id prod-abcdfz3syn2rg \
    --provisioning-artifact-id pa-abc347pcsccfm \
    --provisioned-product-name "mytestppname3"
```

Output:

```
{
    "RecordDetail": {
        "RecordId": "rec-tfuawdabcdege",
        "CreatedTime": 1577222793.362,
        "ProvisionedProductId": "pp-abcd27bm4mldq",
        "PathId": "lpv2-abcdg3jp6t5k6",
        "RecordErrors": [],
        "ProductId": "prod-abcdfz3syn2rg",
        "UpdatedTime": 1577222793.362,
        "RecordType": "PROVISION_PRODUCT",
        "ProvisionedProductName": "mytestppname3",
        "ProvisioningArtifactId": "pa-pcz347abcdcfm",
        "RecordTags": [],
        "Status": "CREATED",
        "ProvisionedProductType": "CFN_STACK"
    }
}
```

- For API details, see ProvisionProduct in *AWS CLI Command Reference*.

### `reject-portfolio-share`

The following code example shows how to use `reject-portfolio-share`.

**AWS CLI**

**To reject a portfolio share**

The following `reject-portfolio-share` example rejects the portfolio share for the given portfolio.

```
aws servicecatalog reject-portfolio-share \
    --portfolio-id port-2s6wuabcdefghijk
```

This command produces no output.

- For API details, see RejectPortfolioShare in *AWS CLI Command Reference*.

## `scan-provisioned-products`

The following code example shows how to use `scan-provisioned-products`.

**AWS CLI**

**To list all available provisioned products**

The following `scan-provisioned-products` example lists available provisioned products.

```
aws servicecatalog scan-provisioned-products
```

Output:

```
{
    "ProvisionedProducts": [
        {
            "Status": "ERROR",
            "Arn": "arn:aws:servicecatalog:us-west-2:123456789012:stack/
mytestppname3/pp-abcd27bm4mldq",
            "StatusMessage": "AmazonCloudFormationException  Parameters: [KeyName]
 must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code:
 ValidationError; Request ID: 5528602a-a9ef-427c-825c-f82c31b814f5)",
            "Id": "pp-abcd27bm4mldq",
            "Type": "CFN_STACK",
            "IdempotencyToken": "527c5358-2a1a-4b9e-b1b9-7293b0ddff42",
            "CreatedTime": 1577222793.358,
```

```
            "Name": "mytestppname3",
            "LastRecordId": "rec-tfuawdabcdxge"
        }
    ]
}
```

- For API details, see ScanProvisionedProducts in *AWS CLI Command Reference*.

### `search-products-as-admin`

The following code example shows how to use `search-products-as-admin`.

**AWS CLI**

**To search products with administrator privileges**

The following `search-products-as-admin` example searches for products with admin privileges, using a portfolio ID as a filter.

```
aws servicecatalog search-products-as-admin \
    --portfolio-id port-5abcd3e5st4ei
```

Output:

```
{
    "ProductViewDetails": [
        {
            "ProductViewSummary": {
                "Name": "my product",
                "Owner": "owner name",
                "Type": "CLOUD_FORMATION_TEMPLATE",
                "ProductId": "prod-abcdfz3syn2rg",
                "HasDefaultPath": false,
                "Id": "prodview-abcdmyuzv2dlu",
                "ShortDescription": "description"
            },
            "ProductARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
abcdfz3syn2rg",
            "CreatedTime": 1562097906.0,
            "Status": "CREATED"
        }
    ]
```

```
}
```

- For API details, see SearchProductsAsAdmin in *AWS CLI Command Reference*.

### `search-provisioned-products`

The following code example shows how to use `search-provisioned-products`.

**AWS CLI**

**To search provisioned products**

The following `search-provisioned-products` example searches for provisioned products matching the specified product ID, using a JSON file to pass parameters.

```
aws servicecatalog search-provisioned-products \
    --cli-input-json file://search-provisioned-products-input.json
```

Contents of `search-provisioned-products-input.json`:

```
{
    "Filters": {
        "SearchQuery": [
            "prod-tcjvfz3syn2rg"
        ]
    }
}
```

Output:

```
{
    "ProvisionedProducts": [
        {
            "ProvisioningArtifactId": "pa-pcz347abcdcfm",
            "Name": "mytestppname3",
            "CreatedTime": 1577222793.358,

            "ProductId": "prod-abcdfz3syn2rg"
        }
    ],
    "TotalResultsCount": 1
}
```

- For API details, see SearchProvisionedProducts in *AWS CLI Command Reference*.

### update-portfolio

The following code example shows how to use update-portfolio.

#### AWS CLI

##### To update a portfolio

The following update-portfolio example updates the name of the specified portfolio.

```
aws servicecatalog update-portfolio \
    --id port-5abcd3e5st4ei \
    --display-name "New portfolio name"
```

Output:

```
{
    "PortfolioDetail": {
        "DisplayName": "New portfolio name",
        "ProviderName": "provider",
        "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/
port-5abcd3e5st4ei",
        "Id": "port-5abcd3e5st4ei",
        "CreatedTime": 1559665256.348
    },
    "Tags": []
}
```

- For API details, see UpdatePortfolio in *AWS CLI Command Reference*.

### update-product

The following code example shows how to use update-product.

#### AWS CLI

##### To update a product

The following update-product example updates the name and owner of the specified product.

```
aws servicecatalog update-product \
```

```
    --id prod-os6abc7drqlt2 \
    --name "New product name" \
    --owner "Updated product owner"
```

Output:

```
{
    "Tags": [
        {
            "Value": "iad",
            "Key": "region"
        }
    ],
    "ProductViewDetail": {
        "ProductViewSummary": {
            "Owner": "Updated product owner",
            "ProductId": "prod-os6abc7drqlt2",
            "Distributor": "test-distributor",
            "SupportUrl": "https://aws.amazon.com",
            "Name": "New product name",
            "ShortDescription": "test-description",
            "HasDefaultPath": false,
            "Id": "prodview-6abcdgrfhvidy",
            "SupportDescription": "test-support",
            "SupportEmail": "test@amazon.com",
            "Type": "CLOUD_FORMATION_TEMPLATE"
        },
        "Status": "CREATED",
        "ProductARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
os6abc7drqlt2",
        "CreatedTime": 1577136255.0
    }
}
```

- For API details, see UpdateProduct in *AWS CLI Command Reference*.

### `update-provisioning-artifact`

The following code example shows how to use `update-provisioning-artifact`.

#### AWS CLI

**To update a provisioning artifact**

The following `update-provisioning-artifact` example updates the name and description of the specified provisioning artifact, using a JSON file to pass parameters.

```
aws servicecatalog update-provisioning-artifact \
    --cli-input-json file://update-provisioning-artifact-input.json
```

Contents of `update-provisioning-artifact-input.json`:

```
{
    "ProductId": "prod-abcdfz3syn2rg",
    "ProvisioningArtifactId": "pa-pcz347abcdcfm",
    "Name": "updated name",
    "Description": "updated description"
}
```

Output:

```
{
    "Info": {
        "TemplateUrl": "https://awsdocs.s3.amazonaws.com/servicecatalog/
myexampledevelopment-environment.template"
    },
    "Status": "AVAILABLE",
    "ProvisioningArtifactDetail": {
        "Active": true,
        "Description": "updated description",
        "Id": "pa-pcz347abcdcfm",
        "Name": "updated name",
        "Type": "CLOUD_FORMATION_TEMPLATE",
        "CreatedTime": 1562097906.0
    }
}
```

- For API details, see UpdateProvisioningArtifact in *AWS CLI Command Reference*.

### `update-tag-option`

The following code example shows how to use `update-tag-option`.

#### AWS CLI

**To update a TagOption**

The following `update-tag-option` example updates the value of a `TagOption`, using the specified JSON file.

```
aws servicecatalog update-tag-option --cli-input-json file://update-tag-option-
input.json
```

Contents of `update-tag-option-input.json`:

```
{
    "Id": "tag-iabcdn4fzjjms",
    "Value": "newvalue",
    "Active": true
}
```

Output:

```
{
    "TagOptionDetail": {
        "Value": "newvalue",
        "Key": "1234",
        "Active": true,
        "Id": "tag-iabcdn4fzjjms"
    }
}
```

- For API details, see UpdateTagOption in *AWS CLI Command Reference*.

## Service Quotas examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Service Quotas.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `get-aws-default-service-quota`

The following code example shows how to use `get-aws-default-service-quota`.

### AWS CLI

#### To describe a default service quota

The following `get-aws-default-service-quota` example displays details for the specified quota.

```
aws service-quotas get-aws-default-service-quota \
    --service-code ec2 \
    --quota-code L-1216C47A
```

Output:

```
{
    "Quota": {
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaArn": "arn:aws:servicequotas:us-east-2::ec2/L-1216C47A",
        "QuotaCode": "L-1216C47A",
        "QuotaName": "Running On-Demand Standard (A, C, D, H, I, M, R, T, Z)
 instances",
        "Value": 5.0,
        "Unit": "None",
        "Adjustable": true,
        "GlobalQuota": false,
        "UsageMetric": {
            "MetricNamespace": "AWS/Usage",
            "MetricName": "ResourceCount",
            "MetricDimensions": {
                "Class": "Standard/OnDemand",
                "Resource": "vCPU",
                "Service": "EC2",
                "Type": "Resource"
```

```
            },
            "MetricStatisticRecommendation": "Maximum"
        }
    }
}
```

- For API details, see GetAwsDefaultServiceQuota in *AWS CLI Command Reference*.

### `get-requested-service-quota-change`

The following code example shows how to use `get-requested-service-quota-change`.

**AWS CLI**

**To describe a service quota increase request**

The following `get-requested-service-quota-change` example describes the specified quota increase request.

```
aws service-quotas get-requested-service-quota-change \
    --request-id d187537d15254312a9609aa51bbf7624u7W49tPO
```

Output:

```
{
    "RequestedQuota": {
        "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
        "CaseId": "6780195351",
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaCode": "L-20F13EBD",
        "QuotaName": "Running Dedicated c5n Hosts",
        "DesiredValue": 2.0,
        "Status": "CASE_OPENED",
        "Created": 1580446904.067,
        "LastUpdated": 1580446953.265,
        "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
        "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/L-20F13EBD",
        "GlobalQuota": false,
        "Unit": "None"
    }
```

```
}
```

- For API details, see GetRequestedServiceQuotaChange in *AWS CLI Command Reference*.

### `get-service-quota`

The following code example shows how to use `get-service-quota`.

**AWS CLI**

**To describe a service quota**

The following `get-service-quota` example displays details about the specified quota.

```
aws service-quotas get-service-quota \
    --service-code ec2 \
    --quota-code L-1216C47A
```

Output:

```
{
    "Quota": {
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/L-1216C47A",
        "QuotaCode": "L-1216C47A",
        "QuotaName": "Running On-Demand Standard (A, C, D, H, I, M, R, T, Z)
 instances",
        "Value": 1920.0,
        "Unit": "None",
        "Adjustable": true,
        "GlobalQuota": false,
        "UsageMetric": {
            "MetricNamespace": "AWS/Usage",
            "MetricName": "ResourceCount",
            "MetricDimensions": {
                "Class": "Standard/OnDemand",
                "Resource": "vCPU",
                "Service": "EC2",
                "Type": "Resource"
            },
            "MetricStatisticRecommendation": "Maximum"
```

```
        }
    }
}
```

- For API details, see GetServiceQuota in *AWS CLI Command Reference*.

### `list-aws-default-service-quotas`

The following code example shows how to use `list-aws-default-service-quotas`.

#### AWS CLI

**To list the default quotas for a service**

The following `list-aws-default-service-quotas` example lists the default values for the quotas for the specified service.

```
aws service-quotas list-aws-default-service-quotas \
    --service-code xray
```

Output:

```
{
    "Quotas": [
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-C6B6F05D",
            "QuotaCode": "L-C6B6F05D",
            "QuotaName": "Indexed annotations per trace",
            "Value": 50.0,
            "Unit": "None",
            "Adjustable": false,
            "GlobalQuota": false
        },
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-D781C0FD",
            "QuotaCode": "L-D781C0FD",
            "QuotaName": "Segment document size",
            "Value": 64.0,
```

```
            "Unit": "Kilobytes",
            "Adjustable": false,
            "GlobalQuota": false
        },
        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray",
            "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-998BFF16",
            "QuotaCode": "L-998BFF16",
            "QuotaName": "Trace and service graph retention in days",
            "Value": 30.0,
            "Unit": "None",
            "Adjustable": false,
            "GlobalQuota": false
        }
    ]
}
```

- For API details, see ListAwsDefaultServiceQuotas in *AWS CLI Command Reference*.

### `list-requested-service-quota-change-history-by-quota`

The following code example shows how to use `list-requested-service-quota-change-history-by-quota`.

#### AWS CLI

**To list your quota increase requests**

The following `list-requested-service-quota-change-history-by-quota` example lists the quota increase requests for the specified quota.

```
aws service-quotas list-requested-service-quota-change-history-by-quota \
    --service-code ec2 \
    --quota-code L-20F13EBD
```

Output:

```
{
    "RequestedQuotas": [
        {
            "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
```

```
            "CaseId": "6780195351",
            "ServiceCode": "ec2",
            "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
            "QuotaCode": "L-20F13EBD",
            "QuotaName": "Running Dedicated c5n Hosts",
            "DesiredValue": 2.0,
            "Status": "CASE_OPENED",
            "Created": 1580446904.067,
            "LastUpdated": 1580446953.265,
            "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
            "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/
L-20F13EBD",
            "GlobalQuota": false,
            "Unit": "None"
        }
    ]
}
```

- For API details, see ListRequestedServiceQuotaChangeHistoryByQuota in *AWS CLI Command Reference*.

### `list-requested-service-quota-change-history`

The following code example shows how to use `list-requested-service-quota-change-history`.

#### AWS CLI

##### To list your quota increase requests

The following `list-requested-service-quota-change-history` example lists the quota increase requests for the specified service.

```
aws service-quotas list-requested-service-quota-change-history \
    --service-code ec2
```

Output:

```
{
    "RequestedQuotas": [
```

```
        {
            "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
            "CaseId": "6780195351",
            "ServiceCode": "ec2",
            "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
            "QuotaCode": "L-20F13EBD",
            "QuotaName": "Running Dedicated c5n Hosts",
            "DesiredValue": 2.0,
            "Status": "CASE_OPENED",
            "Created": 1580446904.067,
            "LastUpdated": 1580446953.265,
            "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
            "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/
L-20F13EBD",
            "GlobalQuota": false,
            "Unit": "None"
        }
    ]
}
```

- For API details, see ListRequestedServiceQuotaChangeHistory in *AWS CLI Command Reference*.

### `list-service-quotas`

The following code example shows how to use `list-service-quotas`.

#### AWS CLI

**To list the quotas for a service**

The following `list-service-quotas` example displays details about the quotas for AWS CloudFormation.

```
aws service-quotas list-service-quotas \
    --service-code cloudformation
```

Output:

```
{
    "Quotas": [
```

```
        {
            "ServiceCode": "cloudformation",
            "ServiceName": "AWS CloudFormation",
            "QuotaArn": "arn:aws:servicequotas:us-
east-2:123456789012:cloudformation/L-87D14FB7",
            "QuotaCode": "L-87D14FB7",
            "QuotaName": "Output count in CloudFormation template",
            "Value": 60.0,
            "Unit": "None",
            "Adjustable": false,
            "GlobalQuota": false
        },
        {
            "ServiceCode": "cloudformation",
            "ServiceName": "AWS CloudFormation",
            "QuotaArn": "arn:aws:servicequotas:us-
east-2:123456789012:cloudformation/L-0485CB21",
            "QuotaCode": "L-0485CB21",
            "QuotaName": "Stack count",
            "Value": 200.0,
            "Unit": "None",
            "Adjustable": true,
            "GlobalQuota": false
        }
    ]
}
```

- For API details, see ListServiceQuotas in *AWS CLI Command Reference*.

## `list-services`

The following code example shows how to use `list-services`.

### AWS CLI

#### To list the available services

The following command lists the services that are available in Service Quotas.

```
aws service-quotas list-services
```

Output:

```
{
    "Services": [
        {
            "ServiceCode": "AWSCloudMap",
            "ServiceName": "AWS Cloud Map"
        },
        {
            "ServiceCode": "access-analyzer",
            "ServiceName": "Access Analyzer"
        },
        {
            "ServiceCode": "acm",
            "ServiceName": "AWS Certificate Manager (ACM)"
        },

        ...truncated...

        {
            "ServiceCode": "xray",
            "ServiceName": "AWS X-Ray"
        }
    ]
}
```

You can add the `--query` parameter to filter the display to the information that you are interested in. The following example displays only the service codes.

```
aws service-quotas list-services \
    --query Services[*].ServiceCode
```

Output:

```
[
    "AWSCloudMap",
    "access-analyzer",
    "acm",
    "acm-pca",
    "amplify",
    "apigateway",
    "application-autoscaling",
        ...truncated...
    "xray"
```

```
]
```

- For API details, see ListServices in *AWS CLI Command Reference*.

### `request-service-quota-increase`

The following code example shows how to use `request-service-quota-increase`.

**AWS CLI**

**To request a service quota increase**

The following `request-service-quota-increase` example requests an increase in the specified service quota.

```
aws service-quotas request-service-quota-increase \
    --service-code ec2 \
    --quota-code L-20F13EBD \
    --desired-value 2
```

Output:

```
{
    "RequestedQuota": {
        "Id": "d187537d15254312a9609aa51bbf7624u7W49tPO",
        "ServiceCode": "ec2",
        "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
        "QuotaCode": "L-20F13EBD",
        "QuotaName": "Running Dedicated c5n Hosts",
        "DesiredValue": 2.0,
        "Status": "PENDING",
        "Created": 1580446904.067,
        "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\"arn:aws:iam::123456789012:root\"}",
        "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/L-20F13EBD",
        "GlobalQuota": false,
        "Unit": "None"
    }
}
```

- For API details, see RequestServiceQuotaIncrease in *AWS CLI Command Reference*.

## Amazon SES examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SES.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

### Actions

#### `delete-identity`

The following code example shows how to use `delete-identity`.

**AWS CLI**

**To delete an identity**

The following example uses the `delete-identity` command to delete an identity from the list of identities verified with Amazon SES:

```
aws ses delete-identity --identity user@example.com
```

For more information about verified identities, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see DeleteIdentity in *AWS CLI Command Reference*.

#### `get-identity-dkim-attributes`

The following code example shows how to use `get-identity-dkim-attributes`.

**AWS CLI**

**To get the Amazon SES Easy DKIM attributes for a list of identities**

The following example uses the `get-identity-dkim-attributes` command to retrieve the Amazon SES Easy DKIM attributes for a list of identities:

```
aws ses get-identity-dkim-attributes --identities "example.com" "user@example.com"
```

Output:

```
{
   "DkimAttributes": {
       "example.com": {
           "DkimTokens": [
               "EXAMPLEjcs5xoyqytjsotsijas7236gr",
               "EXAMPLEjr76cvoc6mysspnioorxsn6ep",
               "EXAMPLEkbmkqkhlm2lyz77ppkulerm4k"
           ],
           "DkimEnabled": true,
           "DkimVerificationStatus": "Success"
       },
       "user@example.com": {
           "DkimEnabled": false,
           "DkimVerificationStatus": "NotStarted"
       }
   }
}
```

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about Easy DKIM, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetIdentityDkimAttributes in *AWS CLI Command Reference*.

## `get-identity-notification-attributes`

The following code example shows how to use `get-identity-notification-attributes`.

**AWS CLI**

**To get the Amazon SES notification attributes for a list of identities**

The following example uses the `get-identity-notification-attributes` command to retrieve the Amazon SES notification attributes for a list of identities:

```
aws ses get-identity-notification-attributes --identities "user1@example.com"
 "user2@example.com"
```

Output:

```
{
   "NotificationAttributes": {
       "user1@example.com": {
           "ForwardingEnabled": false,
           "ComplaintTopic": "arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic",
           "BounceTopic": "arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic",
           "DeliveryTopic": "arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic"
       },
       "user2@example.com": {
           "ForwardingEnabled": true
       }
   }
}
```

This command returns the status of email feedback forwarding and, if applicable, the Amazon Resource Names (ARNs) of the Amazon SNS topics that bounce, complaint, and delivery notifications are sent to.

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about notifications, see Using Notifications With Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetIdentityNotificationAttributes in *AWS CLI Command Reference*.

## `get-identity-verification-attributes`

The following code example shows how to use `get-identity-verification-attributes`.

**AWS CLI**

**To get the Amazon SES verification status for a list of identities**

The following example uses the `get-identity-verification-attributes` command to retrieve the Amazon SES verification status for a list of identities:

```
aws ses get-identity-verification-attributes --identities "user1@example.com"
 "user2@example.com"
```

Output:

```
{
   "VerificationAttributes": {
       "user1@example.com": {
           "VerificationStatus": "Success"
       },
       "user2@example.com": {
           "VerificationStatus": "Pending"
       }
   }
}
```

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about verified identities, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetIdentityVerificationAttributes in *AWS CLI Command Reference*.

### `get-send-quota`

The following code example shows how to use `get-send-quota`.

**AWS CLI**

**To get your Amazon SES sending limits**

The following example uses the `get-send-quota` command to return your Amazon SES sending limits:

```
aws ses get-send-quota
```

Output:

```
{
   "Max24HourSend": 200.0,
   "SentLast24Hours": 1.0,
   "MaxSendRate": 1.0
}
```

Max24HourSend is your sending quota, which is the maximum number of emails that you can send in a 24-hour period. The sending quota reflects a rolling time period. Every time you try to send an email, Amazon SES checks how many emails you sent in the previous 24 hours. As long as the total number of emails that you have sent is less than your quota, your send request will be accepted and your email will be sent.

SentLast24Hours is the number of emails that you have sent in the previous 24 hours.

MaxSendRate is the maximum number of emails that you can send per second.

Note that sending limits are based on recipients rather than on messages. For example, an email that has 10 recipients counts as 10 against your sending quota.

For more information, see Managing Your Amazon SES Sending Limits in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetSendQuota in *AWS CLI Command Reference*.

### `get-send-statistics`

The following code example shows how to use `get-send-statistics`.

#### AWS CLI

**To get your Amazon SES sending statistics**

The following example uses the `get-send-statistics` command to return your Amazon SES sending statistics

```
aws ses get-send-statistics
```

Output:

```
{
   "SendDataPoints": [
       {
           "Complaints": 0,
           "Timestamp": "2013-06-12T19:32:00Z",
           "DeliveryAttempts": 2,
           "Bounces": 0,
           "Rejects": 0
       },
       {
           "Complaints": 0,
           "Timestamp": "2013-06-12T00:47:00Z",
           "DeliveryAttempts": 1,
           "Bounces": 0,
           "Rejects": 0
       }
   ]
}
```

The result is a list of data points, representing the last two weeks of sending activity. Each data point in the list contains statistics for a 15-minute interval.

In this example, there are only two data points because the only emails that the user sent in the last two weeks fell within two 15-minute intervals.

For more information, see Monitoring Your Amazon SES Usage Statistics in the *Amazon Simple Email Service Developer Guide*.

- For API details, see GetSendStatistics in *AWS CLI Command Reference*.

## `list-identities`

The following code example shows how to use `list-identities`.

### AWS CLI

#### To list all identities (email addresses and domains) for a specific AWS account

The following example uses the `list-identities` command to list all identities that have been submitted for verification with Amazon SES:

```
aws ses list-identities
```

Output:

```
{
    "Identities": [
      "user@example.com",
      "example.com"
    ]
}
```

The list that is returned contains all identities regardless of verification status (verified, pending verification, failure, etc.).

In this example, email addresses *and* domains are returned because we did not specify the identity-type parameter.

For more information about verification, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see ListIdentities in *AWS CLI Command Reference*.

### `send-email`

The following code example shows how to use `send-email`.

#### AWS CLI

**To send a formatted email using Amazon SES**

The following example uses the `send-email` command to send a formatted email:

```
aws ses send-email --from sender@example.com --destination file://destination.json
 --message file://message.json
```

Output:

```
{
   "MessageId": "EXAMPLEf3a5efcd1-51adec81-d2a4-4e3f-9fe2-5d85c1b23783-000000"
}
```

The destination and the message are JSON data structures saved in .json files in the current directory. These files are as follows:

`destination.json`:

```
{
  "ToAddresses":  ["recipient1@example.com", "recipient2@example.com"],
  "CcAddresses":  ["recipient3@example.com"],
  "BccAddresses": []
}
```

`message.json`:

```
{
   "Subject": {
       "Data": "Test email sent using the AWS CLI",
       "Charset": "UTF-8"
   },
   "Body": {
       "Text": {
           "Data": "This is the message body in text format.",
           "Charset": "UTF-8"
       },
       "Html": {
           "Data": "This message body contains HTML formatting. It can, for example,
 contain links like this one: <a class=\"ulink\" href=\"http://docs.aws.amazon.com/
ses/latest/DeveloperGuide\" target=\"_blank\">Amazon SES Developer Guide</a>.",
           "Charset": "UTF-8"
       }
   }
}
```

Replace the sender and recipient email addresses with the ones you want to use. Note that the sender's email address must be verified with Amazon SES. Until you are granted production access to Amazon SES, you must also verify the email address of each recipient unless the recipient is the Amazon SES mailbox simulator. For more information on verification, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

The Message ID in the output indicates that the call to send-email was successful.

If you don't receive the email, check your Junk box.

For more information on sending formatted email, see Sending Formatted Email Using the Amazon SES API in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SendEmail in *AWS CLI Command Reference*.

### `send-raw-email`

The following code example shows how to use `send-raw-email`.

**AWS CLI**

**To send a raw email using Amazon SES**

The following example uses the `send-raw-email` command to send an email with a TXT attachment:

```
aws ses send-raw-email --raw-message file://message.json
```

Output:

```
{
   "MessageId": "EXAMPLEf3f73d99b-c63fb06f-d263-41f8-a0fb-d0dc67d56c07-000000"
}
```

The raw message is a JSON data structure saved in a file named `message.json` in the current directory. It contains the following:

```
{
   "Data": "From: sender@example.com\nTo: recipient@example.com\nSubject: Test email
 sent using the AWS CLI (contains an attachment)\nMIME-Version: 1.0\nContent-type:
 Multipart/Mixed; boundary=\"NextPart\"\n\n--NextPart\nContent-Type: text/plain
\n\nThis is the message body.\n\n--NextPart\nContent-Type: text/plain;\nContent-
Disposition: attachment; filename=\"attachment.txt\"\n\nThis is the text in the
 attachment.\n\n--NextPart--"
}
```

As you can see, "Data" is one long string that contains the entire raw email content in MIME format, including an attachment called attachment.txt.

Replace sender@example.com and recipient@example.com with the addresses you want to use. Note that the sender's email address must be verified with Amazon SES. Until you are granted

production access to Amazon SES, you must also verify the email address of the recipient unless the recipient is the Amazon SES mailbox simulator. For more information on verification, see Verifying Email Addresses and Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

The Message ID in the output indicates that the call to send-raw-email was successful.

If you don't receive the email, check your Junk box.

For more information on sending raw email, see Sending Raw Email Using the Amazon SES API in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SendRawEmail in *AWS CLI Command Reference*.

### `set-identity-dkim-enabled`

The following code example shows how to use `set-identity-dkim-enabled`.

**AWS CLI**

**To enable or disable Easy DKIM for an Amazon SES verified identity**

The following example uses the `set-identity-dkim-enabled` command to disable DKIM for a verified email address:

```
aws ses set-identity-dkim-enabled --identity user@example.com --no-dkim-enabled
```

For more information about Easy DKIM, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SetIdentityDkimEnabled in *AWS CLI Command Reference*.

### `set-identity-feedback-forwarding-enabled`

The following code example shows how to use `set-identity-feedback-forwarding-enabled`.

**AWS CLI**

**To enable or disable bounce and complaint email feedback forwarding for an Amazon SES verified identity**

The following example uses the `set-identity-feedback-forwarding-enabled` command to enable a verified email address to receive bounce and complaint notifications by email:

```
aws ses set-identity-feedback-forwarding-enabled --identity user@example.com --
forwarding-enabled
```

You are required to receive bounce and complaint notifications via either Amazon SNS or email feedback forwarding, so you can only disable email feedback forwarding if you select an Amazon SNS topic for both bounce and complaint notifications.

For more information about notifications, see Using Notifications With Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SetIdentityFeedbackForwardingEnabled in *AWS CLI Command Reference*.

### `set-identity-notification-topic`

The following code example shows how to use `set-identity-notification-topic`.

**AWS CLI**

**To set the Amazon SNS topic to which Amazon SES will publish bounce, complaint, and/or delivery notifications for a verified identity**

The following example uses the `set-identity-notification-topic` command to specify the Amazon SNS topic to which a verified email address will receive bounce notifications:

```
aws ses set-identity-notification-topic --identity user@example.com --notification-
type Bounce --sns-topic arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic
```

For more information about notifications, see Using Notifications With Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see SetIdentityNotificationTopic in *AWS CLI Command Reference*.

### `verify-domain-dkim`

The following code example shows how to use `verify-domain-dkim`.

**AWS CLI**

**To generate a verified domain's DKIM tokens for DKIM signing with Amazon SES**

The following example uses the `verify-domain-dkim` command to generate DKIM tokens for a domain that has been verified with Amazon SES:

```
aws ses verify-domain-dkim --domain example.com
```

Output:

```
{
   "DkimTokens": [
       "EXAMPLEq76owjnks3lnluwg65scbemvw",
       "EXAMPLEi3dnsj67hstzaj673klariwx2",
       "EXAMPLEwfbtcukvimehexktmdtaz6naj"
   ]
}
```

To set up DKIM, you must use the returned DKIM tokens to update your domain's DNS settings with CNAME records that point to DKIM public keys hosted by Amazon SES. For more information, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyDomainDkim in *AWS CLI Command Reference*.

### `verify-domain-identity`

The following code example shows how to use `verify-domain-identity`.

#### AWS CLI

**To verify a domain with Amazon SES**

The following example uses the `verify-domain-identity` command to verify a domain:

```
aws ses verify-domain-identity --domain example.com
```

Output:

```
{
   "VerificationToken": "eoEmxw+YaYhb3h3iVJHuXMJXqeu1q1/wwmvjuEXAMPLE"
}
```

To complete domain verification, you must add a TXT record with the returned verification token to your domain's DNS settings. For more information, see Verifying Domains in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyDomainIdentity in *AWS CLI Command Reference*.

### `verify-email-identity`

The following code example shows how to use `verify-email-identity`.

**AWS CLI**

**To verify an email address with Amazon SES**

The following example uses the `verify-email-identity` command to verify an email address:

```
aws ses verify-email-identity --email-address user@example.com
```

Before you can send an email using Amazon SES, you must verify the address or domain that you are sending the email from to prove that you own it. If you do not have production access yet, you also need to verify any email addresses that you send emails to except for email addresses provided by the Amazon SES mailbox simulator.

After verify-email-identity is called, the email address will receive a verification email. The user must click on the link in the email to complete the verification process.

For more information, see Verifying Email Addresses in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see VerifyEmailIdentity in *AWS CLI Command Reference*.

## Shield examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Shield.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `associate-drt-log-bucket`

The following code example shows how to use `associate-drt-log-bucket`.

**AWS CLI**

**To authorize the DRT to access an Amazon S3 bucket**

The following `associate-drt-log-bucket` example creates an association between the DRT and the specified S3 bucket. This permits the DRT to access the bucket on behalf of the account.:

```
aws shield associate-drt-log-bucket \
    --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see AssociateDrtLogBucket in *AWS CLI Command Reference*.

#### `associate-drt-role`

The following code example shows how to use `associate-drt-role`.

**AWS CLI**

**To authorize the DRT to mitigate potential attacks on your behalf**

The following `associate-drt-role` example creates an association between the DRT and the specified role. The DRT can use the role to access and manage the account.

```
aws shield associate-drt-role \
    --role-arn arn:aws:iam::123456789012:role/service-role/DrtRole
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see AssociateDrtRole in *AWS CLI Command Reference*.

### `create-protection`

The following code example shows how to use `create-protection`.

#### AWS CLI

**To enable AWS Shield Advanced protection for a single AWS resource**

The following `create-protection` example enables Shield Advanced protection for the specified AWS CloudFront distribution.

```
aws shield create-protection \
    --name "Protection for CloudFront distribution" \
    --resource-arn arn:aws:cloudfront::123456789012:distribution/E198WC25FXOWY8
```

Output:

```
{
    "ProtectionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see Specify Your Resources to Protect in the *AWS Shield Advanced Developer Guide*.

- For API details, see CreateProtection in *AWS CLI Command Reference*.

### `create-subscription`

The following code example shows how to use `create-subscription`.

**AWS CLI**

**To enable AWS Shield Advanced protection for an account**

The following `create-subscription` example enables Shield Advanced protection for the account.

```
aws shield create-subscription
```

This command produces no output.

For more information, see Getting Started with AWS Shield Advanced in the *AWS Shield Advanced Developer Guide*.

- For API details, see CreateSubscription in *AWS CLI Command Reference*.

### `delete-protection`

The following code example shows how to use `delete-protection`.

**AWS CLI**

**To remove AWS Shield Advanced protection from an AWS resource**

The following `delete-protection` example removes the specified AWS Shield Advanced protection.

```
aws shield delete-protection \
    --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see Removing AWS Shield Advanced from an AWS Resource in the *AWS Shield Advanced Developer Guide*.

- For API details, see DeleteProtection in *AWS CLI Command Reference*.

### `describe-attack`

The following code example shows how to use `describe-attack`.

**AWS CLI**

**To retrieve a detailed description of an attack**

The following `describe-attack` example displays details about the DDoS attack with the specified attack ID. You can obtain attack IDs by running the `list-attacks` command.

```
aws shield describe-attack --attack-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
    "Attack": {
        "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "ResourceArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/testElb",

For more information, see Reviewing DDoS Incidents in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeAttack in *AWS CLI Command Reference*.

### `describe-drt-access`

The following code example shows how to use `describe-drt-access`.

#### AWS CLI

**To retrieve a description of the authorizations the DRT has to mitigate attacks on your behalf**

The following `describe-drt-access` example retrieves the role and S3 bucket authorizations that the DRT has, which allow it to respond to potential attacks on your behalf.

```
aws shield describe-drt-access
```

Output:

```
{
    "RoleArn": "arn:aws:iam::123456789012:role/service-role/DrtRole",
    "LogBucketList": [
        "flow-logs-for-website-lb"
    ]
}
```

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeDrtAccess in *AWS CLI Command Reference*.

### `describe-emergency-contact-settings`

The following code example shows how to use `describe-emergency-contact-settings`.

**AWS CLI**

**To retrieve emergency e-mail addresses that you have on file with the DRT**

The following `describe-emergency-contact-settings` example retrieves the e-mail addresses that are on file with the DRT for the account. These are the addresses the DRT should contact when it's responding to a suspected attack.

```
aws shield describe-emergency-contact-settings
```

Output:

```
{
    "EmergencyContactList": [
        {
            "EmailAddress": "ops@example.com"
        },
        {
            "EmailAddress": "ddos-notifications@example.com"
       }
    ]
}
```

For more information, see How AWS Shield Works<https://docs.aws.amazon.com/waf/latest/developerguide/ddos-overview.html> in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeEmergencyContactSettings in *AWS CLI Command Reference*.

### `describe-protection`

The following code example shows how to use `describe-protection`.

**AWS CLI**

**To retrieve the details for an AWS Shield Advanced protection**

The following `describe-protection` example displays details about the Shield Advanced protection with the specified ID. You can obtain protection IDs by running the `list-protections` command.

```
aws shield describe-protection \
    --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "Protection": {
        "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Name": "1.2.3.4",
        "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:eip-allocation/
eipalloc-0ac1537af40742a6d"
    }
}
```

For more information, see Specify Your Resources to Protect in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeProtection in *AWS CLI Command Reference*.

### `describe-subscription`

The following code example shows how to use `describe-subscription`.

#### AWS CLI

**To retrieve the details of the AWS Shield Advanced protection for the account**

The following `describe-subscription` example displays details about the Shield Advanced protection provided for the account.:

```
aws shield describe-subscription
```

Output:

```
{
    "Subscription": {
        "StartTime": 1534368978.0,
```

```
        "EndTime": 1597613778.0,
        "TimeCommitmentInSeconds": 63244800,
        "AutoRenew": "ENABLED",
        "Limits": [
            {
                "Type": "GLOBAL_ACCELERATOR",
                "Max": 1000
            },
            {
                "Type": "ROUTE53_HOSTED_ZONE",
                "Max": 1000
            },
            {
                "Type": "CF_DISTRIBUTION",
                "Max": 1000
            },
            {
                "Type": "ELB_LOAD_BALANCER",
                "Max": 1000
            },
            {
                "Type": "EC2_ELASTIC_IP_ALLOCATION",
                "Max": 1000
            }
        ]
    }
}
```

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see DescribeSubscription in *AWS CLI Command Reference*.

## `disassociate-drt-log-bucket`

The following code example shows how to use `disassociate-drt-log-bucket`.

### AWS CLI

#### To remove the authorization for DRT to access an Amazon S3 bucket on your behalf

The following `disassociate-drt-log-bucket` example removes the association between the DRT and the specified S3 bucket. After this command completes, the DRT can no longer access the bucket on behalf of the account.

```
aws shield disassociate-drt-log-bucket \
    --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateDrtLogBucket in *AWS CLI Command Reference*.

### `disassociate-drt-role`

The following code example shows how to use `disassociate-drt-role`.

#### AWS CLI

**To remove the authorization for DRT to mitigate potential attacks on your behalf**

The following `disassociate-drt-role` example removes the association between the DRT and the account. After this call, the DRT can no longer access or manage your account.

```
aws shield disassociate-drt-role
```

This command produces no output.

For more information, see Authorize the DDoS Response Team in the *AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateDrtRole in *AWS CLI Command Reference*.

### `get-subscription-state`

The following code example shows how to use `get-subscription-state`.

#### AWS CLI

**To retrieve the current state of the account's AWS Shield Advanced subscription**

The following `get-subscription-state` example retrieves the state of the Shield Advanced protection for the account.

```
aws shield get-subscription-state
```

Output:

```
{
    "SubscriptionState": "ACTIVE"
}
```

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see GetSubscriptionState in *AWS CLI Command Reference*.

### `list-attacks`

The following code example shows how to use `list-attacks`.

#### AWS CLI

**To retrieve attack summaries from AWS Shield Advanced**

The following `list-attacks` example retrieves summaries of attacks for the specified AWS CloudFront distribution during the specified time period. The response includes attack IDs that you can provide to the `describe-attack` command for detailed information on an attack.

```
aws shield list-attacks \
    --resource-arns arn:aws:cloudfront::12345678910:distribution/E1PXMP22ZVFAOR \
    --start-time FromInclusive=1529280000,ToExclusive=1529300000
```

Output:

```
{
    "AttackSummaries": [
        {
            "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/
E1PXMP22ZVFAOR",
            "StartTime": 1529280000.0,
            "EndTime": 1529449200.0,
            "AttackVectors": [
                {
                    "VectorType": "SYN_FLOOD"
                }
            ]
        }
```

```
    ]
}
```

For more information, see Reviewing DDoS Incidents in the *AWS Shield Advanced Developer Guide*.

- For API details, see ListAttacks in *AWS CLI Command Reference*.

### `list-protections`

The following code example shows how to use `list-protections`.

#### AWS CLI

**To retrieve protection summaries from AWS Shield Advanced**

The following `list-protections` example retrieves summaries of the protections that are enabled for the account.

```
aws shield list-protections
```

Output:

```
{
    "Protections": [
        {
            "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Name": "Protection for CloudFront distribution",
            "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/
E198WC25FXOWY8"
        }
    ]
}
```

For more information, see Specify Your Resources to Protect in the *AWS Shield Advanced Developer Guide*.

- For API details, see ListProtections in *AWS CLI Command Reference*.

### `update-emergency-contact-settings`

The following code example shows how to use `update-emergency-contact-settings`.

**AWS CLI**

**To define the emergency e-mail addresses that are on file with the DRT**

The following `update-emergency-contact-settings` example defines two e-mail addresses that the DRT should contact when it's responding to a suspected attack.

```
aws shield update-emergency-contact-settings \
        --emergency-contact-list EmailAddress=ops@example.com EmailAddress=ddos-
notifications@example.com
```

This command produces no output.

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see UpdateEmergencyContactSettings in *AWS CLI Command Reference*.

### `update-subscription`

The following code example shows how to use `update-subscription`.

**AWS CLI**

**To modify the account's AWS Shield Advanced subscription**

The following `update-subscription` example enables auto-renewal of the AWS Shield Advanced subscription for the account.

```
aws shield update-subscription \
    --auto-renew ENABLED
```

This command produces no output.

For more information, see How AWS Shield Works in the *AWS Shield Advanced Developer Guide*.

- For API details, see UpdateSubscription in *AWS CLI Command Reference*.

## Signer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Signer.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Actions

#### `cancel-signing-profile`

The following code example shows how to use `cancel-signing-profile`.

**AWS CLI**

**To delete a signing profile**

The following `cancel-signing-profile` example removes an existing signing profile from AWS Signer.

```
aws signer cancel-signing-profile \
    --profile-name MyProfile1
```

This command produces no output.

- For API details, see CancelSigningProfile in *AWS CLI Command Reference*.

#### `describe-signing-job`

The following code example shows how to use `describe-signing-job`.

**AWS CLI**

**To display details about a signing job**

The following `describe-signing-job` example displays details about the specified signing job.

```
aws signer describe-signing-job \
    --job-id 2065c468-73e2-4385-a6c9-0123456789abc
```

Output:

```
{
    "status": "Succeeded",
    "completedAt": 1568412037,
    "platformId": "AmazonFreeRTOS-Default",
    "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
    },
    "statusReason": "Signing Succeeded",

### `get-signing-platform`

The following code example shows how to use `get-signing-platform`.

### AWS CLI

#### To display details about a signing platform

The following `get-signing-platform` example displays details about the specified signing platform.

```
aws signer get-signing-platform \
    --platform-id AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
{
    "category": "AWS",
    "displayName": "Amazon FreeRTOS SHA1-RSA CC3220SF-Format",
    "target": "SHA1-RSA-TISHA1",
    "platformId": "AmazonFreeRTOS-TI-CC3220SF",
    "signingConfiguration": {
        "encryptionAlgorithmOptions": {
            "defaultValue": "RSA",
            "allowedValues": [
                "RSA"
            ]
        },
        "hashAlgorithmOptions": {
            "defaultValue": "SHA1",
            "allowedValues": [
                "SHA1"
            ]
        }
    },
    "maxSizeInMB": 16,
    "partner": "AmazonFreeRTOS",
    "signingImageFormat": {
        "defaultFormat": "JSONEmbedded",
        "supportedFormats": [
            "JSONEmbedded"
        ]
    }
}
```

- For API details, see GetSigningPlatform in *AWS CLI Command Reference*.

### `get-signing-profile`

The following code example shows how to use `get-signing-profile`.

**AWS CLI**

**To display details about a signing profile**

The following `get-signing-profile` example displays details about the specified signing profile.

```
aws signer get-signing-profile \
    --profile-name MyProfile3
```

Output:

```
{
    "platformId": "AmazonFreeRTOS-TI-CC3220SF",
    "profileName": "MyProfile3",
    "status": "Active",
    "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
    }
}
```

- For API details, see GetSigningProfile in *AWS CLI Command Reference*.

### `list-signing-jobs`

The following code example shows how to use `list-signing-jobs`.

**AWS CLI**

**To list all signing jobs**

The following `list-signing-jobs` example displays details about all signing jobs for the account.

```
aws signer list-signing-jobs
```

In this example, two jobs are returned, one successful, and one failed.

```
{
    "jobs": [
        {
            "status": "Succeeded",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            },
            "jobId": "2065c468-73e2-4385-a6c9-0123456789abc",
            "source": {
                "s3": {
                    "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4",
                    "bucketName": "signer-source",
                    "key": "MyCode.rb"
                }
            },
            "signedObject": {
                "s3": {
                    "bucketName": "signer-destination",
                    "key": "signed-2065c468-73e2-4385-a6c9-0123456789abc"
                }
            },
            "createdAt": 1568412036
        },
        {
            "status": "Failed",
            "source": {
                "s3": {
                    "version": "PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4",
                    "bucketName": "signer-source",
                    "key": "MyOtherCode.rb"
                }
            },
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            },
            "createdAt": 1568402690,
            "jobId": "74d9825e-22fc-4a0d-b962-0123456789abc"
        }
    ]
```

```
}
```

- For API details, see ListSigningJobs in *AWS CLI Command Reference*.

### `list-signing-platforms`

The following code example shows how to use `list-signing-platforms`.

#### AWS CLI

**To list all signing platforms**

The following `list-signing-platforms` example displays details about all available signing platforms.

```
aws signer list-signing-platforms
```

Output:

```
{
    "platforms": [
        {
            "category": "AWS",
            "displayName": "AWS IoT Device Management SHA256-ECDSA ",
            "target": "SHA256-ECDSA",
            "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "ECDSA",
                    "allowedValues": [
                        "ECDSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA256",
                    "allowedValues": [
                        "SHA256"
                    ]
                }
            },
            "maxSizeInMB": 2048,
            "partner": "AWSIoTDeviceManagement",
```

```
            "signingImageFormat": {
                "defaultFormat": "JSONDetached",
                "supportedFormats": [
                    "JSONDetached"
                ]
            }
        },
        {
            "category": "AWS",
            "displayName": "Amazon FreeRTOS SHA1-RSA CC3220SF-Format",
            "target": "SHA1-RSA-TISHA1",
            "platformId": "AmazonFreeRTOS-TI-CC3220SF",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "RSA",
                    "allowedValues": [
                        "RSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA1",
                    "allowedValues": [
                        "SHA1"
                    ]
                }
            },
            "maxSizeInMB": 16,
            "partner": "AmazonFreeRTOS",
            "signingImageFormat": {
                "defaultFormat": "JSONEmbedded",
                "supportedFormats": [
                    "JSONEmbedded"
                ]
            }
        },
        {
            "category": "AWS",
            "displayName": "Amazon FreeRTOS SHA256-ECDSA",
            "target": "SHA256-ECDSA",
            "platformId": "AmazonFreeRTOS-Default",
            "signingConfiguration": {
                "encryptionAlgorithmOptions": {
                    "defaultValue": "ECDSA",
                    "allowedValues": [
```

```
                        "ECDSA"
                    ]
                },
                "hashAlgorithmOptions": {
                    "defaultValue": "SHA256",
                    "allowedValues": [
                        "SHA256"
                    ]
                }
            },
            "maxSizeInMB": 16,
            "partner": "AmazonFreeRTOS",
            "signingImageFormat": {
                "defaultFormat": "JSONEmbedded",
                "supportedFormats": [
                    "JSONEmbedded"
                ]
            }
        }
    ]
}
```

- For API details, see ListSigningPlatforms in *AWS CLI Command Reference*.

### `list-signing-profiles`

The following code example shows how to use `list-signing-profiles`.

#### AWS CLI

**To list all signing profiles**

The following `list-signing-profiles` example displays details about all signing profiles for the account.

```
aws signer list-signing-profiles
```

Output:

```
{
    "profiles": [
        {
```

```
            "platformId": "AmazonFreeRTOS-TI-CC3220SF",
            "profileName": "MyProfile4",
            "status": "Active",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            }
        },
        {
            "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",
            "profileName": "MyProfile5",
            "status": "Active",
            "signingMaterial": {
                "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
            }
        }
    ]
}
```

- For API details, see ListSigningProfiles in *AWS CLI Command Reference*.

### `put-signing-profile`

The following code example shows how to use `put-signing-profile`.

#### AWS CLI

**To create a signing profile**

The following `put-signing-profile` example creates a signing profile using the specified certificate and platform.

```
aws signer put-signing-profile \
    --profile-name MyProfile6 \
    --signing-material certificateArn=arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc \
    --platform AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
{
```

```
    "arn": "arn:aws:signer:us-west-2:123456789012:/signing-profiles/MyProfile6"
}
```

- For API details, see PutSigningProfile in *AWS CLI Command Reference*.

### `start-signing-job`

The following code example shows how to use `start-signing-job`.

**AWS CLI**

**To start a signing job**

The following `start-signing-job` example starts a signing job on the code found at the specified source. It uses the specified profile to do the signing and places the signed code in the specified destination.

```
aws signer start-signing-job \
    --source 's3={bucketName=signer-
source,key=MyCode.rb,version=PNyFaUTgsQh5ZdMCcoCe6pT1gOpgB_M4}' \
    --destination 's3={bucketName=signer-destination,prefix=signed-}' \
    --profile-name MyProfile7
```

The output is the ID of the signing job.

```
{
    "jobId": "2065c468-73e2-4385-a6c9-0123456789abc"
}
```

- For API details, see StartSigningJob in *AWS CLI Command Reference*.

## Snowball examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Snowball.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `get-snowball-usage`

The following code example shows how to use `get-snowball-usage`.

**AWS CLI**

**To get information about the Snowball service limit for your account**

The following `get-snowball-usage` example displays information about the Snowball service limit for your account, and also the number of Snowballs your account has in use.

```
aws snowball get-snowball-usage
```

Output:

```
{
    "SnowballLimit": 1,
    "SnowballsInUse": 0
}
```

FOR more information, see AWS Snowball Edge Limits in the *AWS Snowball Developer Guide*.

- For API details, see GetSnowballUsage in *AWS CLI Command Reference*.

#### `list-jobs`

The following code example shows how to use `list-jobs`.

**AWS CLI**

**To list the current Snowball jobs in your account**

The following `list-jobs` example displays an array of `JobListEntry` objects. In this example, a single job is listed.

```
aws snowball list-jobs
```

Output:

```
{
    "JobListEntries": [
        {
            "CreationDate": 2016-09-27T14:50Z,
             "Description": "Important Photos 2016-08-11",
             "IsMaster": TRUE,
             "JobId": "ABCd1e324fe-022f-488e-a98b-3b0566063db1",
             "JobState": "Complete",
             "JobType": "IMPORT",
             "SnowballType": "EDGE"
        }
   ]
}
```

For more information, see Jobs for AWS Snowball Edge devices in the *AWS Snowball Developer Guide*.

- For API details, see ListJobs in *AWS CLI Command Reference*.

## Amazon SNS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SNS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Actions

#### `add-permission`

The following code example shows how to use `add-permission`.

**AWS CLI**

**To add a permission to a topic**

The following `add-permission` example adds the permission for AWS account 987654321098 to use the `Publish` action with the specified topic under AWS account 123456789012.

```
aws sns add-permission \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --label Publish-Permission \
    --aws-account-id 987654321098 \
    --action-name Publish
```

This command produces no output.

- For API details, see AddPermission in *AWS CLI Command Reference*.

#### `check-if-phone-number-is-opted-out`

The following code example shows how to use `check-if-phone-number-is-opted-out`.

**AWS CLI**

**To check SMS message opt-out for a phone number**

The following `check-if-phone-number-is-opted-out` example checks whether the specified phone number is opted out of receiving SMS messages from the current AWS account.

```
aws sns check-if-phone-number-is-opted-out \
```

```
    --phone-number +1555550100
```

Output:

```
{
    "isOptedOut": false
}
```

- For API details, see CheckIfPhoneNumberIsOptedOut in *AWS CLI Command Reference*.

### `confirm-subscription`

The following code example shows how to use `confirm-subscription`.

**AWS CLI**

**To confirm a subscription**

The following `confirm-subscription` command completes the confirmation process started when you subscribed to an SNS topic named `my-topic`. The --token parameter comes from the confirmation message sent to the notification endpoint specified in the subscribe call.

```
aws sns confirm-subscription \
    --topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \
    --token
 2336412f37fb687f5d51e6e241d7700ae02f7124d8268910b858cb4db727ceeb2474bb937929d3bdd7ce5d0cce1
```

Output:

```
{
    "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
}
```

- For API details, see ConfirmSubscription in *AWS CLI Command Reference*.

### `create-platform-application`

The following code example shows how to use `create-platform-application`.

**AWS CLI**

**To create a platform application**

The following `create-platform-application` example creates a Google Firebase platform application using the specified platform credential.

```
aws sns create-platform-application \
    --name MyApplication \
    --platform GCM \
    --attributes PlatformCredential=EXAMPLEabcd12345jklm67890stuv12345bcdef
```

Output:

```
{
    "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication"
}
```

- For API details, see CreatePlatformApplication in *AWS CLI Command Reference*.

### `create-topic`

The following code example shows how to use `create-topic`.

**AWS CLI**

**To create an SNS topic**

The following `create-topic` example creates an SNS topic named `my-topic`.

```
aws sns create-topic \
    --name my-topic
```

Output:

```
{
    "ResponseMetadata": {
        "RequestId": "1469e8d7-1642-564e-b85d-a19b4b341f83"
    },
```

```
    "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
}
```

For more information, see Using the AWS Command Line Interface with Amazon SQS and Amazon SNS in the *AWS Command Line Interface User Guide*.

- For API details, see CreateTopic in *AWS CLI Command Reference*.

### `delete-endpoint`

The following code example shows how to use `delete-endpoint`.

**AWS CLI**

**To delete a platform application endpoint**

The following `delete-endpoint` example deletes the specified platform application endpoint.

```
aws sns delete-endpoint \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234
```

This command produces no output.

- For API details, see DeleteEndpoint in *AWS CLI Command Reference*.

### `delete-platform-application`

The following code example shows how to use `delete-platform-application`.

**AWS CLI**

**To delete a platform application**

The following `delete-platform-application` example deletes the specified platform application.

```
aws sns delete-platform-application \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/ADM/
MyApplication
```

This command produces no output.

- For API details, see DeletePlatformApplication in *AWS CLI Command Reference*.

### `delete-topic`

The following code example shows how to use `delete-topic`.

**AWS CLI**

**To delete an SNS topic**

The following `delete-topic` example deletes the specified SNS topic.

```
aws sns delete-topic \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

This command produces no output.

- For API details, see DeleteTopic in *AWS CLI Command Reference*.

### `get-endpoint-attributes`

The following code example shows how to use `get-endpoint-attributes`.

**AWS CLI**

**To list platform application endpoint attributes**

The following `get-endpoint-attributes` example lists the attributes for the specified platform application endpoint.

```
aws sns get-endpoint-attributes \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234
```

Output:

```
{
    "Attributes": {
```

```
        "Enabled": "true",
        "Token": "EXAMPLE12345..."
    }
}
```

- For API details, see GetEndpointAttributes in *AWS CLI Command Reference*.

### `get-platform-application-attributes`

The following code example shows how to use `get-platform-application-attributes`.

**AWS CLI**

**To list the platform application attributes**

The following `get-platform-application-attributes` example lists the attributes for the specified platform application.

```
aws sns get-platform-application-attributes \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/MPNS/
MyApplication
```

Output:

```
{
    "Attributes": {
        "Enabled": "true",
        "SuccessFeedbackSampleRate": "100"
    }
}
```

- For API details, see GetPlatformApplicationAttributes in *AWS CLI Command Reference*.

### `get-sms-attributes`

The following code example shows how to use `get-sms-attributes`.

**AWS CLI**

**To list the default SMS message attributes**

The following `get-sms-attributes` example lists the default attributes for sending SMS messages.

```
aws sns get-sms-attributes
```

Output:

```
{
    "attributes": {
        "DefaultSenderID": "MyName"
    }
}
```

- For API details, see GetSMSAttributes in *AWS CLI Command Reference*.

### `get-subscription-attributes`

The following code example shows how to use `get-subscription-attributes`.

**AWS CLI**

**To retrieve subscription attributes for a topic**

The following `get-subscription-attributes` displays the attributes of the specified subscription. You can get the `subscription-arn` from the output of the `list-subscriptions` command.

```
aws sns get-subscription-attributes \
    --subscription-arn "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
```

Output:

```
{
    "Attributes": {
        "Endpoint": "my-email@example.com",
        "Protocol": "email",
        "RawMessageDelivery": "false",
        "ConfirmationWasAuthenticated": "false",
        "Owner": "123456789012",
```

```
        "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f",
        "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
    }
}
```

- For API details, see GetSubscriptionAttributes in *AWS CLI Command Reference*.

### `get-topic-attributes`

The following code example shows how to use `get-topic-attributes`.

#### AWS CLI

**To retrieve the attributes of a topic**

The following `get-topic-attributes` example displays the attributes for the specified topic.

```
aws sns get-topic-attributes \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

Output:

```
{
    "Attributes": {
        "SubscriptionsConfirmed": "1",
        "DisplayName": "my-topic",
        "SubscriptionsDeleted": "0",
        "EffectiveDeliveryPolicy": "{\"http\":{\"defaultHealthyRetryPolicy\":
{\"minDelayTarget\":20,\"maxDelayTarget\":20,\"numRetries\":3,\"numMaxDelayRetries
\":0,\"numNoDelayRetries\":0,\"numMinDelayRetries\":0,\"backoffFunction\":\"linear
\"},\"disableSubscriptionOverrides\":false}}",
        "Owner": "123456789012",
        "Policy": "{\"Version\":\"2008-10-17\",\"Id\":\"__default_policy_ID\",
\"Statement\":[{\"Sid\":\"__default_statement_ID\",\"Effect\":\"Allow\",\"Principal
\":{\"AWS\":\"*\"},\"Action\":[\"SNS:Subscribe\",\"SNS:ListSubscriptionsByTopic
\",\"SNS:DeleteTopic\",\"SNS:GetTopicAttributes\",\"SNS:Publish\",
\"SNS:RemovePermission\",\"SNS:AddPermission\",\"SNS:SetTopicAttributes\"],
\"Resource\":\"arn:aws:sns:us-west-2:123456789012:my-topic\",\"Condition\":
{\"StringEquals\":{\"AWS:SourceOwner\":\"0123456789012\"}}}]}",
        "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
        "SubscriptionsPending": "0"
```

```
    }
}
```

- For API details, see GetTopicAttributes in *AWS CLI Command Reference*.

### `list-endpoints-by-platform-application`

The following code example shows how to use `list-endpoints-by-platform-application`.

**AWS CLI**

**To list the endpoints for a platform application**

The following `list-endpoints-by-platform-application` example lists the endpoints and endpoint attributes for the specified platform application.

```
aws sns list-endpoints-by-platform-application \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication
```

Output:

```
{
    "Endpoints": [
        {
            "Attributes": {
                "Token": "EXAMPLE12345...,
                "Enabled": "true"
            },
            "EndpointArn": "arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234"
        }
    ]
}
```

- For API details, see ListEndpointsByPlatformApplication in *AWS CLI Command Reference*.

### `list-phone-numbers-opted-out`

The following code example shows how to use `list-phone-numbers-opted-out`.

**AWS CLI**

**To list SMS message opt-outs**

The following `list-phone-numbers-opted-out` example lists the phone numbers opted out of receiving SMS messages.

```
aws sns list-phone-numbers-opted-out
```

Output:

```
{
    "phoneNumbers": [
        "+15555550100"
    ]
}
```

- For API details, see ListPhoneNumbersOptedOut in *AWS CLI Command Reference*.

## `list-platform-applications`

The following code example shows how to use `list-platform-applications`.

**AWS CLI**

**To list platform applications**

The following `list-platform-applications` example lists the platform applications for ADM and MPNS.

```
aws sns list-platform-applications
```

Output:

```
{
    "PlatformApplications": [
        {
            "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/ADM/
MyApplication",
            "Attributes": {
                "SuccessFeedbackSampleRate": "100",
                "Enabled": "true"
```

```
            }
        },
        {
            "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/MPNS/
MyOtherApplication",
            "Attributes": {
                "SuccessFeedbackSampleRate": "100",
                "Enabled": "true"
            }
        }
    ]
}
```

- For API details, see ListPlatformApplications in *AWS CLI Command Reference*.

### `list-subscriptions-by-topic`

The following code example shows how to use `list-subscriptions-by-topic`.

**AWS CLI**

**To list the subscriptions associated with a topic**

The following `list-subscriptions-by-topic` retrieves a list of SNS subscriptions associated with the specified topic.

```
aws sns list-subscriptions-by-topic \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

Output:

```
{
    "Subscriptions": [
        {
            "Owner": "123456789012",
            "Endpoint": "my-email@example.com",
            "Protocol": "email",
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
            "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
        }
    ]
```

```
}
```

- For API details, see ListSubscriptionsByTopic in *AWS CLI Command Reference*.

### `list-subscriptions`

The following code example shows how to use `list-subscriptions`.

**AWS CLI**

**To list your SNS subscriptions**

The following `list-subscriptions` example displays a list of the SNS subscriptions in your AWS account.

```
aws sns list-subscriptions
```

Output:

```
{
    "Subscriptions": [
        {
            "Owner": "123456789012",
            "Endpoint": "my-email@example.com",
            "Protocol": "email",
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
            "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
        }
    ]
}
```

- For API details, see ListSubscriptions in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list tags for a topic**

The following `list-tags-for-resource` example lists the tags for the specified Amazon SNS topic.

```
aws sns list-tags-for-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic
```

Output:

```
{
    "Tags": [
        {
            "Key": "Team",
            "Value": "Alpha"
        }
    ]
}
```

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `list-topics`

The following code example shows how to use `list-topics`.

#### AWS CLI

**To list your SNS topics**

The following `list-topics` example lists all of SNS topics in your AWS account.

```
aws sns list-topics
```

Output:

```
{
    "Topics": [
        {
            "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
        }
    ]
}
```

- For API details, see ListTopics in *AWS CLI Command Reference*.

### `opt-in-phone-number`

The following code example shows how to use `opt-in-phone-number`.

**AWS CLI**

**To opt-in for SMS messages**

The following `opt-in-phone-number` example opts the specified phone number into receiving SMS messages.

```
aws sns opt-in-phone-number \
    --phone-number +15555550100
```

This command produces no output.

- For API details, see OptInPhoneNumber in *AWS CLI Command Reference*.

### `publish`

The following code example shows how to use `publish`.

**AWS CLI**

**Example 1: To publish a message to a topic**

The following `publish` example publishes the specified message to the specified SNS topic. The message comes from a text file, which enables you to include line breaks.

```
aws sns publish \
    --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic" \
    --message file://message.txt
```

Contents of `message.txt`:

```
Hello World
Second Line
```

Output:

```
{
    "MessageId": "123a45b6-7890-12c3-45d6-111122223333"
}
```

**Example 2: To publish an SMS message to a phone number**

The following `publish` example publishes the message `Hello world!` to the phone number `+1-555-555-0100`.

```
aws sns publish \
    --message "Hello world!" \
    --phone-number +1-555-555-0100
```

Output:

```
{
    "MessageId": "123a45b6-7890-12c3-45d6-333322221111"
}
```

- For API details, see Publish in *AWS CLI Command Reference*.

## `put-data-protection-policy`

The following code example shows how to use `put-data-protection-policy`.

### AWS CLI

**To set data protection policy**

**Example 1: To deny publishers from publishing messages with CreditCardNumber**

The following `put-data-protection-policy` example denies publishers from publishing messages with CreditCardNumber.

```
aws sns put-data-protection-policy \
    --resource-arn arn:aws:sns:us-east-1:123456789012:mytopic \
    --data-protection-policy "{\"Name\":\"data_protection_policy\",\"Description
\":\"Example data protection policy\",\"Version\":\"2021-06-01\",\"Statement
\":[{\"DataDirection\":\"Inbound\",\"Principal\":[\"*\"],\"DataIdentifier\":
[\"arn:aws:dataprotection::aws:data-identifier/CreditCardNumber\"],\"Operation\":
{\"Deny\":{}}}]}"
```

This command produces no output.

**Example 2: To load parameters from a file**

The following `put-data-protection-policy` loads parameters from a file.

```
aws sns put-data-protection-policy \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --data-protection-policy file://policy.json
```

This command produces no output.

- For API details, see PutDataProtectionPolicy in *AWS CLI Command Reference*.

### `remove-permission`

The following code example shows how to use `remove-permission`.

**AWS CLI**

**To remove a permission from a topic**

The following `remove-permission` example removes the permission `Publish-Permission` from the specified topic.

```
aws sns remove-permission \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --label Publish-Permission
```

This command produces no output.

- For API details, see RemovePermission in *AWS CLI Command Reference*.

### `set-endpoint-attributes`

The following code example shows how to use `set-endpoint-attributes`.

**AWS CLI**

**To set endpoint attributes**

The following `set-endpoint-attributes` example disables the specified platform application endpoint.

```
aws sns set-endpoint-attributes \
    --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234 \
    --attributes Enabled=false
```

Output:

```
{
    "Attributes": {
        "Enabled": "false",
        "Token": "EXAMPLE12345..."
    }
}
```

- For API details, see SetEndpointAttributes in *AWS CLI Command Reference*.

### `set-platform-application-attributes`

The following code example shows how to use `set-platform-application-attributes`.

**AWS CLI**

**To set platform application attributes**

The following `set-platform-application-attributes` example sets the `EventDeliveryFailure` attribute for the specified platform application to the ARN of the specified Amazon SNS topic.

```
aws sns set-platform-application-attributes \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication \
    --attributes EventDeliveryFailure=arn:aws:sns:us-
west-2:123456789012:AnotherTopic
```

This command produces no output.

- For API details, see SetPlatformApplicationAttributes in *AWS CLI Command Reference*.

### `set-sms-attributes`

The following code example shows how to use `set-sms-attributes`.

**AWS CLI**

**To set SMS message attributes**

The following `set-sms-attributes` example sets the default sender ID for SMS messages to `MyName`.

```
aws sns set-sms-attributes \
    --attributes DefaultSenderID=MyName
```

This command produces no output.

- For API details, see SetSMSAttributes in *AWS CLI Command Reference*.

## `set-subscription-attributes`

The following code example shows how to use `set-subscription-attributes`.

**AWS CLI**

**To set subscription attributes**

The following `set-subscription-attributes` example sets the `RawMessageDelivery` attribute to an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \
    --attribute-name RawMessageDelivery \
    --attribute-value true
```

This command produces no output.

The following `set-subscription-attributes` example sets a `FilterPolicy` attribute to an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \
    --attribute-name FilterPolicy \
```

```
    --attribute-value "{ \"anyMandatoryKey\": [\"any\", \"of\", \"these\"] }"
```

This command produces no output.

The following `set-subscription-attributes` example removes the `FilterPolicy` attribute from an SQS subscription.

```
aws sns set-subscription-attributes \
    --subscription-arn arn:aws:sns:us-
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \
    --attribute-name FilterPolicy \
    --attribute-value "{}"
```

This command produces no output.

- For API details, see SetSubscriptionAttributes in *AWS CLI Command Reference*.

### `set-topic-attributes`

The following code example shows how to use `set-topic-attributes`.

**AWS CLI**

**To set an attribute for a topic**

The following `set-topic-attributes` example sets the `DisplayName` attribute for the specified topic.

```
aws sns set-topic-attributes \
    --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --attribute-name DisplayName \
    --attribute-value MyTopicDisplayName
```

This command produces no output.

- For API details, see SetTopicAttributes in *AWS CLI Command Reference*.

### `subscribe`

The following code example shows how to use `subscribe`.

**AWS CLI**

**To subscribe to a topic**

The following `subscribe` command subscribes an email address to the specified topic.

```
aws sns subscribe \
    --topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \
    --protocol email \
    --notification-endpoint my-email@example.com
```

Output:

```
{
    "SubscriptionArn": "pending confirmation"
}
```

- For API details, see Subscribe in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add a tag to a topic**

The following `tag-resource` example adds a metadata tag to the specified Amazon SNS topic.

```
aws sns tag-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --tags Key=Team,Value=Alpha
```

This command produces no output.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `unsubscribe`

The following code example shows how to use `unsubscribe`.

**AWS CLI**

**To unsubscribe from a topic**

The following `unsubscribe` example deletes the specified subscription from a topic.

```
aws sns unsubscribe \
    --subscription-arn arn:aws:sns:us-west-2:0123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f
```

This command produces no output.

- For API details, see Unsubscribe in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove a tag from a topic**

The following `untag-resource` example removes any tags with the specified keys from the specified Amazon SNS topic.

```
aws sns untag-resource \
    --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \
    --tag-keys Team
```

This command produces no output.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### Scenarios

### Create a platform endpoint for push notifications

The following code example shows how to create a platform endpoint for Amazon SNS push notifications.

**AWS CLI**

**To create a platform application endpoint**

The following `create-platform-endpoint` example creates an endpoint for the specified platform application using the specified token.

```
aws sns create-platform-endpoint \
    --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/
MyApplication \
    --token EXAMPLE12345...
```

Output:

```
{
      "EndpointArn": "arn:aws:sns:us-west-2:1234567890:endpoint/GCM/
MyApplication/12345678-abcd-9012-efgh-345678901234"
}
```

## Amazon SQS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SQS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `add-permission`

The following code example shows how to use `add-permission`.

**AWS CLI**

**To add a permission to a queue**

This example enables the specified AWS account to send messages to the specified queue.

Command:

```
aws sqs add-permission --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyQueue --label SendMessagesFromMyQueue --aws-account-ids 12345EXAMPLE --actions
 SendMessage
```

Output:

```
None.
```

- For API details, see AddPermission in *AWS CLI Command Reference*.

### `cancel-message-move-task`

The following code example shows how to use `cancel-message-move-task`.

**AWS CLI**

**To cancel a message move task**

The following `cancel-message-move-task` example cancels the specified message move task.

```
aws sqs cancel-message-move-task \
    --task-handle AQEB6nR4...HzlvZQ==
```

Output:

```
{
    "ApproximateNumberOfMessagesMoved": 102
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see CancelMessageMoveTask in *AWS CLI Command Reference*.

### `change-message-visibility-batch`

The following code example shows how to use `change-message-visibility-batch`.

**AWS CLI**

**To change multiple messages' timeout visibilities as a batch**

This example changes the 2 specified messages' timeout visibilities to 10 hours (10 hours * 60 minutes * 60 seconds).

Command:

```
aws sqs change-message-visibility-batch --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://change-message-
visibility-batch.json
```

Input file (change-message-visibility-batch.json):

```
[
  {
    "Id": "FirstMessage",
        "ReceiptHandle": "AQEBhz2q...Jf3kaw==",
        "VisibilityTimeout": 36000
  },
  {
    "Id": "SecondMessage",
        "ReceiptHandle": "AQEBkTUH...HifSnw==",
        "VisibilityTimeout": 36000
  }
]
```

Output:

```
{
  "Successful": [
    {
      "Id": "SecondMessage"
    },
    {
```

```
      "Id": "FirstMessage"
    }
  ]
}
```

- For API details, see ChangeMessageVisibilityBatch in *AWS CLI Command Reference*.

### `change-message-visibility`

The following code example shows how to use `change-message-visibility`.

**AWS CLI**

**To change a message's timeout visibility**

This example changes the specified message's timeout visibility to 10 hours (10 hours * 60 minutes * 60 seconds).

Command:

```
aws sqs change-message-visibility --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --receipt-handle AQEBTpyI...t6HyQg== --
visibility-timeout 36000
```

Output:

```
None.
```

- For API details, see ChangeMessageVisibility in *AWS CLI Command Reference*.

### `create-queue`

The following code example shows how to use `create-queue`.

**AWS CLI**

**To create a queue**

This example creates a queue with the specified name, sets the message retention period to 3 days (3 days * 24 hours * 60 minutes * 60 seconds), and sets the queue's dead letter queue to the specified queue with a maximum receive count of 1,000 messages.

Command:

```
aws sqs create-queue --queue-name MyQueue --attributes file://create-queue.json
```

Input file (create-queue.json):

```
{
  "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":\"1000\"}",
  "MessageRetentionPeriod": "259200"
}
```

Output:

```
{
  "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

- For API details, see CreateQueue in *AWS CLI Command Reference*.

### `delete-message-batch`

The following code example shows how to use `delete-message-batch`.

#### AWS CLI

**To delete multiple messages as a batch**

This example deletes the specified messages.

Command:

```
aws sqs delete-message-batch --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://delete-message-batch.json
```

Input file (delete-message-batch.json):

```
[
  {
        "Id": "FirstMessage",
        "ReceiptHandle": "AQEB1mgl...Z4GuLw=="
```

```
  },
  {
    "Id": "SecondMessage",
        "ReceiptHandle": "AQEBLsYM...VQubAA=="
  }
]
```

Output:

```
{
  "Successful": [
    {
      "Id": "FirstMessage"
    },
    {
      "Id": "SecondMessage"
    }
  ]
}
```

- For API details, see DeleteMessageBatch in *AWS CLI Command Reference*.

### `delete-message`

The following code example shows how to use `delete-message`.

#### AWS CLI

**To delete a message**

This example deletes the specified message.

Command:

```
aws sqs delete-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyQueue --receipt-handle AQEBRXTo...q2doVA==
```

Output:

```
None.
```

- For API details, see DeleteMessage in *AWS CLI Command Reference*.

### `delete-queue`

The following code example shows how to use `delete-queue`.

**AWS CLI**

**To delete a queue**

This example deletes the specified queue.

Command:

```
aws sqs delete-queue --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyNewerQueue
```

Output:

```
None.
```

- For API details, see DeleteQueue in *AWS CLI Command Reference*.

### `get-queue-attributes`

The following code example shows how to use `get-queue-attributes`.

**AWS CLI**

**To get a queue's attributes**

This example gets all of the specified queue's attributes.

Command:

```
aws sqs get-queue-attributes --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names All
```

Output:

```
{
  "Attributes": {
    "ApproximateNumberOfMessagesNotVisible": "0",
```

```
    "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":1000}",
    "MessageRetentionPeriod": "345600",
    "ApproximateNumberOfMessagesDelayed": "0",
    "MaximumMessageSize": "262144",
    "CreatedTimestamp": "1442426968",
    "ApproximateNumberOfMessages": "0",
    "ReceiveMessageWaitTimeSeconds": "0",
    "DelaySeconds": "0",
    "VisibilityTimeout": "30",
    "LastModifiedTimestamp": "1442426968",
    "QueueArn": "arn:aws:sqs:us-east-1:80398EXAMPLE:MyNewQueue"
  }
}
```

This example gets only the specified queue's maximum message size and visibility timeout attributes.

Command:

```
aws sqs get-queue-attributes --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyNewQueue --attribute-names MaximumMessageSize
 VisibilityTimeout
```

Output:

```
{
  "Attributes": {
    "VisibilityTimeout": "30",
    "MaximumMessageSize": "262144"
  }
}
```

- For API details, see GetQueueAttributes in *AWS CLI Command Reference*.

### `get-queue-url`

The following code example shows how to use `get-queue-url`.

#### AWS CLI

**To get a queue URL**

This example gets the specified queue's URL.

Command:

```
aws sqs get-queue-url --queue-name MyQueue
```

Output:

```
{
  "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

- For API details, see GetQueueUrl in *AWS CLI Command Reference*.

### `list-dead-letter-source-queues`

The following code example shows how to use `list-dead-letter-source-queues`.

**AWS CLI**

**To list dead letter source queues**

This example lists the queues that are associated with the specified dead letter source queue.

Command:

```
aws sqs list-dead-letter-source-queues --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue
```

Output:

```
{
  "queueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
  ]
}
```

- For API details, see ListDeadLetterSourceQueues in *AWS CLI Command Reference*.

### `list-message-move-tasks`

The following code example shows how to use `list-message-move-tasks`.

#### AWS CLI

##### To list the message move tasks

The following `list-message-move-tasks` example lists the 2 most recent message move tasks in the specified queue.

```
aws sqs list-message-move-tasks \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue \
    --max-results 2
```

Output:

```
{
    "Results": [
        {
            "TaskHandle": "AQEB6nR4...HzlvZQ==",
            "Status": "RUNNING",
            "SourceArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1",
            "DestinationArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2",
            "MaxNumberOfMessagesPerSecond": 50,
            "ApproximateNumberOfMessagesMoved": 203,
            "ApproximateNumberOfMessagesToMove": 30,
            "StartedTimestamp": 1442428276921
        },

        {
            "Status": "COMPLETED",
            "SourceArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1",
            "DestinationArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2",
            "ApproximateNumberOfMessagesMoved": 29,
            "ApproximateNumberOfMessagesToMove": 0,
            "StartedTimestamp": 1342428272093
        }
    ]
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see ListMessageMoveTasks in *AWS CLI Command Reference*.

### `list-queue-tags`

The following code example shows how to use `list-queue-tags`.

**AWS CLI**

**To list all cost allocation tags for a queue**

The following `list-queue-tags` example displays all of the cost allocation tags associated with the specified queue.

```
aws sqs list-queue-tags \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue
```

Output:

```
{
    "Tags": {
        "Team": "Alpha"
    }
}
```

For more information, see Listing Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see ListQueueTags in *AWS CLI Command Reference*.

### `list-queues`

The following code example shows how to use `list-queues`.

**AWS CLI**

**To list queues**

This example lists all queues.

Command:

```
aws sqs list-queues
```

Output:

```
{
  "QueueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/TestQueue1",
        "https://queue.amazonaws.com/80398EXAMPLE/TestQueue2"
  ]
}
```

This example lists only queues that start with "My".

Command:

```
aws sqs list-queues --queue-name-prefix My
```

Output:

```
{
  "QueueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
  ]
}
```

- For API details, see ListQueues in *AWS CLI Command Reference*.

### `purge-queue`

The following code example shows how to use `purge-queue`.

#### AWS CLI

##### To purge a queue

This example deletes all messages in the specified queue.

Command:

```
aws sqs purge-queue --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyNewQueue
```

Output:

```
None.
```

- For API details, see PurgeQueue in *AWS CLI Command Reference*.

### `receive-message`

The following code example shows how to use `receive-message`.

#### AWS CLI

**To receive a message**

This example receives up to 10 available messages, returning all available attributes.

Command:

```
aws sqs receive-message --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names All --message-attribute-
names All --max-number-of-messages 10
```

Output:

```
{
  "Messages": [
    {
      "Body": "My first message.",
      "ReceiptHandle": "AQEBzbVv...fqNzFw==",
      "MD5OfBody": "1000f835...a35411fa",
      "MD5OfMessageAttributes": "9424c491...26bc3ae7",
      "MessageId": "d6790f8d-d575-4f01-bc51-40122EXAMPLE",
      "Attributes": {
        "ApproximateFirstReceiveTimestamp": "1442428276921",
        "SenderId": "AIDAIAZKMSNQ7TEXAMPLE",
        "ApproximateReceiveCount": "5",
        "SentTimestamp": "1442428276921"
      },
      "MessageAttributes": {
```

```
        "PostalCode": {
          "DataType": "String",
          "StringValue": "ABC123"
        },
        "City": {
          "DataType": "String",
          "StringValue": "Any City"
        }
      }
    }
  ]
}
```

This example receives the next available message, returning only the SenderId and SentTimestamp attributes as well as the PostalCode message attribute.

Command:

```
aws sqs receive-message --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names SenderId SentTimestamp
 --message-attribute-names PostalCode
```

Output:

```
{
  "Messages": [
    {
      "Body": "My first message.",
      "ReceiptHandle": "AQEB6nR4...HzlvZQ==",
      "MD5OfBody": "1000f835...a35411fa",
      "MD5OfMessageAttributes": "b8e89563...e088e74f",
      "MessageId": "d6790f8d-d575-4f01-bc51-40122EXAMPLE",
      "Attributes": {
        "SenderId": "AIDAIAZKMSNQ7TEXAMPLE",
        "SentTimestamp": "1442428276921"
      },
      "MessageAttributes": {
        "PostalCode": {
          "DataType": "String",
          "StringValue": "ABC123"
        }
      }
    }
```

```
  ]
}
```

- For API details, see ReceiveMessage in *AWS CLI Command Reference*.

### `remove-permission`

The following code example shows how to use `remove-permission`.

**AWS CLI**

**To remove a permission**

This example removes the permission with the specified label from the specified queue.

Command:

```
aws sqs remove-permission --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --label SendMessagesFromMyQueue
```

Output:

```
None.
```

- For API details, see RemovePermission in *AWS CLI Command Reference*.

### `send-message-batch`

The following code example shows how to use `send-message-batch`.

**AWS CLI**

**To send multiple messages as a batch**

This example sends 2 messages with the specified message bodies, delay periods, and message attributes, to the specified queue.

Command:

```
aws sqs send-message-batch --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://send-message-batch.json
```

Input file (send-message-batch.json):

```
[
  {
    "Id": "FuelReport-0001-2015-09-16T140731Z",
        "MessageBody": "Fuel report for account 0001 on 2015-09-16 at 02:07:31 PM.",
        "DelaySeconds": 10,
        "MessageAttributes": {
          "SellerName": {
            "DataType": "String",
                "StringValue": "Example Store"
      },
          "City": {
        "DataType": "String",
        "StringValue": "Any City"
      },
          "Region": {
            "DataType": "String",
                "StringValue": "WA"
      },
          "PostalCode": {
            "DataType": "String",
                "StringValue": "99065"
          },
          "PricePerGallon": {
            "DataType": "Number",
                "StringValue": "1.99"
      }
        }
  },
  {
    "Id": "FuelReport-0002-2015-09-16T140930Z",
        "MessageBody": "Fuel report for account 0002 on 2015-09-16 at 02:09:30 PM.",
        "DelaySeconds": 10,
        "MessageAttributes": {
          "SellerName": {
            "DataType": "String",
                "StringValue": "Example Fuels"
      },
          "City": {
        "DataType": "String",
        "StringValue": "North Town"
      },
          "Region": {
```

```
            "DataType": "String",
                "StringValue": "WA"
      },
          "PostalCode": {
            "DataType": "String",
                "StringValue": "99123"
          },
          "PricePerGallon": {
            "DataType": "Number",
                "StringValue": "1.87"
      }
        }
  }
]
```

Output:

```
{
  "Successful": [
    {
      "MD5OfMessageBody": "203c4a38...7943237e",
      "MD5OfMessageAttributes": "10809b55...baf283ef",
      "Id": "FuelReport-0001-2015-09-16T140731Z",
      "MessageId": "d175070c-d6b8-4101-861d-adeb3EXAMPLE"
    },
    {
      "MD5OfMessageBody": "2cf0159a...c1980595",
      "MD5OfMessageAttributes": "55623928...ae354a25",
      "Id": "FuelReport-0002-2015-09-16T140930Z",
      "MessageId": "f9b7d55d-0570-413e-b9c5-a9264EXAMPLE"
    }
  ]
}
```

- For API details, see SendMessageBatch in *AWS CLI Command Reference*.

### `send-message`

The following code example shows how to use `send-message`.

#### AWS CLI

**To send a message**

This example sends a message with the specified message body, delay period, and message attributes, to the specified queue.

Command:

```
aws sqs send-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/
MyQueue --message-body "Information about the largest city in Any Region." --delay-
seconds 10 --message-attributes file://send-message.json
```

Input file (send-message.json):

```
{
  "City": {
    "DataType": "String",
    "StringValue": "Any City"
  },
  "Greeting": {
    "DataType": "Binary",
    "BinaryValue": "Hello, World!"
  },
  "Population": {
    "DataType": "Number",
    "StringValue": "1250800"
  }
}
```

Output:

```
{
  "MD5OfMessageBody": "51b0a325...39163aa0",
  "MD5OfMessageAttributes": "00484c68...59e48f06",
  "MessageId": "da68f62c-0c07-4bee-bf5f-7e856EXAMPLE"
}
```

- For API details, see SendMessage in *AWS CLI Command Reference*.

### `set-queue-attributes`

The following code example shows how to use `set-queue-attributes`.

**AWS CLI**

**To set queue attributes**

This example sets the specified queue to a delivery delay of 10 seconds, a maximum message size of 128 KB (128 KB * 1,024 bytes), a message retention period of 3 days (3 days * 24 hours * 60 minutes * 60 seconds), a receive message wait time of 20 seconds, and a default visibility timeout of 60 seconds. This example also associates the specified dead letter queue with a maximum receive count of 1,000 messages.

Command:

```
aws sqs set-queue-attributes --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyNewQueue --attributes file://set-queue-
attributes.json
```

Input file (set-queue-attributes.json):

```
{
  "DelaySeconds": "10",
  "MaximumMessageSize": "131072",
  "MessageRetentionPeriod": "259200",
  "ReceiveMessageWaitTimeSeconds": "20",
  "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-
east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":\"1000\"}",
  "VisibilityTimeout": "60"
}
```

Output:

```
None.
```

- For API details, see SetQueueAttributes in *AWS CLI Command Reference*.

## `start-message-move-task`

The following code example shows how to use `start-message-move-task`.

**AWS CLI**

*Example 1: *To start a message move task**

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the source queue.

```
aws sqs start-message-move-task \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue
```

Output:

```
{
    "TaskHandle": "AQEB6nR4...HzlvZQ=="
}
```

For more information, see This is the topic title in the *Name of your guide*.

*Example 2: *To start a message move task with a maximum rate**

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the specified destination queue at a maximum rate of 50 messages per second.

```
aws sqs start-message-move-task \
    --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1 \
    --destination-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2 \
    --max-number-of-messages-per-second 50
```

Output:

```
{
    "TaskHandle": "AQEB6nR4...HzlvZQ=="
}
```

For more information, see Amazon SQS API permissions: Actions and resource reference in the *Developer Guide*.

- For API details, see StartMessageMoveTask in *AWS CLI Command Reference*.

### `tag-queue`

The following code example shows how to use `tag-queue`.

**AWS CLI**

**To add cost allocation tags to a queue**

The following `tag-queue` example adds a cost allocation tag to the specified Amazon SQS queue.

```
aws sqs tag-queue \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \
    --tags Priority=Highest
```

This command produces no output.

For more information, see Adding Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see TagQueue in *AWS CLI Command Reference*.

### `untag-queue`

The following code example shows how to use `untag-queue`.

**AWS CLI**

**To remove cost allocation tags from a queue**

The following `untag-queue` example removes a cost allocation tag from the specified Amazon SQS queue.

```
aws sqs untag-queue \
    --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \
    --tag-keys "Priority"
```

This command produces no output.

For more information, see Adding Cost Allocation Tags in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see UntagQueue in *AWS CLI Command Reference*.

## Storage Gateway examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Storage Gateway.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

### Actions

#### `describe-gateway-information`

The following code example shows how to use `describe-gateway-information`.

#### AWS CLI

**To describe a gateway**

The following `describe-gateway-information` command returns metadata about the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This examples specifies a gateway with the id `sgw-12A3456B` in account `123456789012`:

```
aws storagegateway describe-gateway-information --gateway-arn
 "arn:aws:storagegateway:us-west-2:123456789012:gateway/sgw-12A3456B"
```

This command outputs a JSON block that contains metadata about about the gateway such as its name, network interfaces, configured time zone, and the state (whether the gateway is running or not).

- For API details, see DescribeGatewayInformation in *AWS CLI Command Reference*.

### `list-file-shares`

The following code example shows how to use `list-file-shares`.

#### AWS CLI

##### To list file shares

The following `command-name` example lists the available widgets in your AWS account.

```
aws storagegateway list-file-shares \
    --gateway-arn arn:aws:storagegateway:us-east-1:209870788375:gateway/sgw-FB02E292
```

Output:

```
{
    "FileShareInfoList": [
        {
            "FileShareType": "NFS",
            "FileShareARN": "arn:aws:storagegateway:us-east-1:111122223333:share/
share-2FA12345",
            "FileShareId": "share-2FA12345",
            "FileShareStatus": "AVAILABLE",
            "GatewayARN": "arn:aws:storagegateway:us-east-1:111122223333:gateway/
sgw-FB0AAAAA"
        }
    ],
    "Marker": null
}
```

For more information, see ListFileShares in the *AWS Storage Gateway Service API Reference*.

- For API details, see ListFileShares in *AWS CLI Command Reference*.

### `list-gateways`

The following code example shows how to use `list-gateways`.

#### AWS CLI

##### To list gateways for an account

The following `list-gateways` command lists all the gateways defined for an account:

```
aws storagegateway list-gateways
```

This command outputs a JSON block that contains a list of gateway Amazon Resource Names (ARNs).

- For API details, see ListGateways in *AWS CLI Command Reference*.

### `list-volumes`

The following code example shows how to use `list-volumes`.

**AWS CLI**

**To list the volumes configured for a gateway**

The following `list-volumes` command returns a list of volumes configured for the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This examples specifies a gateway with the id `sgw-12A3456B` in account `123456789012`:

```
aws storagegateway list-volumes --gateway-arn "arn:aws:storagegateway:us-
west-2:123456789012:gateway/sgw-12A3456B"
```

This command outputs a JSON block that a list of volumes that includes the type and ARN for each volume.

- For API details, see ListVolumes in *AWS CLI Command Reference*.

### `refresh-cache`

The following code example shows how to use `refresh-cache`.

**AWS CLI**

**To refresh the file share cache**

The following `refresh-cache` example refreshes the cache for the specified file share.

```
aws storagegateway refresh-cache \
    --file-share-arn arn:aws:storagegateway:us-east-1:111122223333:share/
share-2FA12345
```

Output:

```
{
    "FileShareARN": "arn:aws:storagegateway:us-east-1:111122223333:share/
share-2FA12345",
    "NotificationId": "4954d4b1-abcd-ef01-1234-97950a7d3483"
}
```

For more information, see ListFileShares in the *AWS Storage Gateway Service API Reference*.

- For API details, see RefreshCache in *AWS CLI Command Reference*.

## AWS STS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS STS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Actions

#### `assume-role-with-saml`

The following code example shows how to use `assume-role-with-saml`.

#### AWS CLI

**To get short-term credentials for a role authenticated with SAML**

The following `assume-role-with-saml` command retrieves a set of short-term credentials for the IAM role `TestSaml`. The request in this example is authenticated by using the SAML assertion supplied by your identity provider when you authenticate to it.

```
aws sts assume-role-with-saml \
    --role-arn arn:aws:iam::123456789012:role/TestSaml \
    --principal-arn arn:aws:iam::123456789012:saml-provider/SAML-test \
    --saml-assertion
 "VERYLONGENCODEDASSERTIONEXAMPLExzYW1sOkF1ZGllbmNlPmJsYW5rPC9zYW1sOkF1ZGllbmNlPjwvc2FtbDpBd

For more information, see Requesting Temporary Security Credentials in the *AWS IAM User Guide*.

- For API details, see AssumeRoleWithSaml in *AWS CLI Command Reference*.

### `assume-role-with-web-identity`

The following code example shows how to use `assume-role-with-web-identity`.

**AWS CLI**

**To get short-term credentials for a role authenticated with Web Identity (OAuth 2."0)**

The following `assume-role-with-web-identity` command retrieves a set of short-term credentials for the IAM role app1. The request is authenticated by using the web identity token supplied by the specified web identity provider. Two additional policies are applied to the session to further restrict what the user can do. The returned credentials expire one hour after they are generated.

```
aws sts assume-role-with-web-identity \
    --duration-seconds 3600 \
    --role-session-name "app1" \
    --provider-id "www.amazon.com" \
    --policy-arns "arn:aws:iam::123456789012:policy/
q=webidentitydemopolicy1","arn:aws:iam::123456789012:policy/webidentitydemopolicy2"
 \
    --role-arn arn:aws:iam::123456789012:role/FederatedWebIdentityRole \
    --web-identity-token "Atza

    },
    "Provider": "www.amazon.com"
}
```

For more information, see Requesting Temporary Security Credentials in the *AWS IAM User Guide*.

- For API details, see AssumeRoleWithWebIdentity in *AWS CLI Command Reference*.

### `assume-role`

The following code example shows how to use `assume-role`.

**AWS CLI**

**To assume a role**

The following `assume-role` command retrieves a set of short-term credentials for the IAM role `s3-access-example`.

```
aws sts assume-role \
    --role-arn arn:aws:iam::123456789012:role/xaccounts3access \
    --role-session-name s3-access-example
```

Output:

```
{
    "AssumedRoleUser": {
        "AssumedRoleId": "AROA3XFRBF535PLBIFPI4:s3-access-example",
        "Arn": "arn:aws:sts::123456789012:assumed-role/xaccounts3access/s3-access-
example"
    },
    "Credentials": {
        "SecretAccessKey": "9drTJvcXLB89EXAMPLELB8923FB892xMFI",
        "SessionToken": "AQoXdzELDDY//////////
wEaoAK1wvxJY12r2IrDFT2IvAzTCn3zHoZ7YNtpiQLF0MqZye/qwjzP2iEXAMPLEbw/
m3hsj8VBTkPORGvr9jM5sgP+w9IZWZnU+LWhmg
+a5fDi2oTGUYcdg9uexQ4mtCHIHfi4citgqZTgco40Yqr4lIlo4V2b2Dyauk0eYFNebHtYlFVgAUj
+7Indz3LU0aTWk1WKIjHmmMCIoTkyYp/k7kUG7moeEYKSitwQIi6Gjn+nyzM
```

```
+PtoA3685ixzv0R7i5rjQi0YE0lf1oeie3bDiNHncmzosRM6SFiPzSvp6h/32xQuZsjcypmwsPSDtTPYcs0+YN/8BRi2
IcrxSpnWEXAMPLEXSDFTAQAM6Dl9zR0tXoybnlrZIwMLlMi1Kcgo5OytwU=",
        "Expiration": "2016-03-15T00:05:07Z",
        "AccessKeyId": "ASIAJEXAMPLEXEG2JICEA"
    }
}
```

The output of the command contains an access key, secret key, and session token that you can use to authenticate to AWS.

For AWS CLI use, you can set up a named profile associated with a role. When you use the profile, the AWS CLI will call assume-role and manage credentials for you. For more information, see Use an IAM role in the AWS CLI in the *AWS CLI User Guide*.

- For API details, see AssumeRole in *AWS CLI Command Reference*.

### `decode-authorization-message`

The following code example shows how to use `decode-authorization-message`.

#### AWS CLI

**To decode an encoded authorization message returned in response to a request**

The following `decode-authorization-message` example decodes additional information about the authorization status of a request from an encoded message returned in response to an Amazon Web Services request.

```
aws sts decode-authorization-message \
    --encoded-message EXAMPLEWodyRNrtlQARDip-
eTA6i6DrlUhHhPQrLWB_lAbl5pAKxl9mPDLexYcGBreyIKQC1BGBIpBKr3dFDkwqeO7e2NMk5j_hmzAiChJN-8oy3Ewi

}
```

For more information, see Policy evaluation logic in the *AWS IAM User Guide*.

- For API details, see DecodeAuthorizationMessage in *AWS CLI Command Reference*.

## `get-caller-identity`

The following code example shows how to use `get-caller-identity`.

### AWS CLI

#### To get details about the current IAM identity

The following `get-caller-identity` command displays information about the IAM identity used to authenticate the request. The caller is an IAM user.

```
aws sts get-caller-identity
```

Output:

```
{
    "UserId": "AIDASAMPLEUSERID",
    "Account": "123456789012",
    "Arn": "arn:aws:iam::123456789012:user/DevAdmin"
}
```

- For API details, see GetCallerIdentity in *AWS CLI Command Reference*.

### `get-federation-token`

The following code example shows how to use `get-federation-token`.

**AWS CLI**

**To return a set of temporary security credentials using IAM user access key credentials**

The following `get-federation-token` example returns a set of temporary security credentials (consisting of an access key ID, a secret access key, and a security token) for a user. You must call the `GetFederationToken` operation using the long-term security credentials of an IAM user.

```
aws sts get-federation-token \
    --name Bob \
    --policy file://myfile.json \
    --policy-arns arn=arn:aws:iam::aws:policy/AmazonS3ReadOnlyAccess \
    --duration-seconds 900
```

Contents of `myfile.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:Describe*",
```

```
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "elasticloadbalancing:Describe*",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:ListMetrics",
                "cloudwatch:GetMetricStatistics",
                "cloudwatch:Describe*"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "autoscaling:Describe*",
            "Resource": "*"
        }
    ]
}
```

Output:

```
{
    "Credentials": {
        "AccessKeyId": "ASIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
        "SessionToken": "EXAMPLEpZ2luX2VjEGoaCXVzLXdlc3QtMiJIMEYCIQC/

    },
    "FederatedUser": {
        "FederatedUserId": "111122223333:Bob",
        "Arn": "arn:aws:sts::111122223333:federated-user/Bob"
    },
    "PackedPolicySize": 36
}
```

For more information, see Requesting Temporary Security Credentials in the *AWS IAM User Guide*.

- For API details, see GetFederationToken in *AWS CLI Command Reference*.

### `get-session-token`

The following code example shows how to use `get-session-token`.

**AWS CLI**

**To get a set of short term credentials for an IAM identity**

The following `get-session-token` command retrieves a set of short-term credentials for the IAM identity making the call. The resulting credentials can be used for requests where multi-factor authentication (MFA) is required by policy. The credentials expire 15 minutes after they are generated.

```
aws sts get-session-token \
    --duration-seconds 900 \
    --serial-number "YourMFADeviceSerialNumber" \
    --token-code 123456
```

Output:

```
{
    "Credentials": {
        "AccessKeyId": "ASIAIOSFODNN7EXAMPLE",
        "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",
        "SessionToken": "AQoEXAMPLEH4aoAH0gNCAPyJxz4BlCFFxWNE1OPTgk5TthT
+FvwqnKwRcOIfrRh3c/LTo6UDdyJwOOvEVPvLXCrrrUtdnniCEXAMPLE/

        "Expiration": "2020-05-19T18:06:10+00:00"
    }
}
```

For more information, see Requesting Temporary Security Credentials in the *AWS IAM User Guide*.

- For API details, see GetSessionToken in *AWS CLI Command Reference*.

# AWS Support examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Support.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `add-attachments-to-set`

The following code example shows how to use `add-attachments-to-set`.

**AWS CLI**

**To add an attachment to a set**

The following `add-attachments-to-set` example adds an image to a set that you can then specify for a support case in your AWS account.

```
aws support add-attachments-to-set \
    --attachment-set-id "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-
G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE" \
    --attachments fileName=troubleshoot-screenshot.png,data=base64-encoded-string
```

Output:

```
{
    "attachmentSetId": "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-
G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE",
```

```
    "expiryTime": "2020-05-14T17:04:40.790+0000"
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see AddAttachmentsToSet in *AWS CLI Command Reference*.

### `add-communication-to-case`

The following code example shows how to use `add-communication-to-case`.

**AWS CLI**

**To add communication to a case**

The following `add-communication-to-case` example adds communications to a support case in your AWS account.

```
aws support add-communication-to-case \
    --case-id "case-12345678910-2013-c4c1d2bf33c5cf47" \
    --communication-body "I'm attaching a set of images to this case." \
    --cc-email-addresses "myemail@example.com" \
    --attachment-set-id "as-2f5a6faa2a4a1e600-mu-nk5xQlBr70-
G1cUos5LZkd38KOAHZa9BMDVzNEXAMPLE"
```

Output:

```
{
    "result": true
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see AddCommunicationToCase in *AWS CLI Command Reference*.

### `create-case`

The following code example shows how to use `create-case`.

**AWS CLI**

**To create a case**

The following `create-case` example creates a support case for your AWS account.

```
aws support create-case \
    --category-code "using-aws" \
    --cc-email-addresses "myemail@example.com" \
    --communication-body "I want to learn more about an AWS service." \
    --issue-type "technical" \
    --language "en" \
    --service-code "general-info" \
    --severity-code "low" \
    --subject "Question about my account"
```

Output:

```
{
    "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47"
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see CreateCase in *AWS CLI Command Reference*.

### `describe-attachment`

The following code example shows how to use `describe-attachment`.

#### AWS CLI

**To describe an attachment**

The following `describe-attachment` example returns information about the attachment with the specified ID.

```
aws support describe-attachment \
    --attachment-id "attachment-KBnjRNrePd9D6Jx0-Mm00xZuDEaL2JAj_0-
gJv9qqDooTipsz3V1Nb19rCfkZneeQeDPgp8X1iVJyHH7UuhZDdNeqGoduZsPrAhyMakqlc60-
iJjL5HqyYGiT1FG8EXAMPLE"
```

Output:

```
{
    "attachment": {
```

```
        "fileName": "troubleshoot-screenshot.png",
        "data": "base64-blob"
    }
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see DescribeAttachment in *AWS CLI Command Reference*.

### `describe-cases`

The following code example shows how to use `describe-cases`.

#### AWS CLI

**To describe a case**

The following `describe-cases` example returns information about the specified support case in your AWS account.

```
aws support describe-cases \
    --display-id "1234567890" \
    --after-time "2020-03-23T21:31:47.774Z" \
    --include-resolved-cases \
    --language "en" \
    --no-include-communications \
    --max-item 1
```

Output:

```
{
    "cases": [
        {
            "status": "resolved",
            "ccEmailAddresses": [],
            "timeCreated": "2020-03-23T21:31:47.774Z",
            "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47",
            "severityCode": "low",
            "language": "en",
            "categoryCode": "using-aws",
            "serviceCode": "general-info",
            "submittedBy": "myemail@example.com",
            "displayId": "1234567890",
```

```
            "subject": "Question about my account"
        }
    ]
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see DescribeCases in *AWS CLI Command Reference*.

### `describe-communications`

The following code example shows how to use `describe-communications`.

#### AWS CLI

**To describe the latest communication for a case**

The following `describe-communications` example returns the latest communication for the specified support case in your AWS account.

```
aws support describe-communications \
    --case-id "case-12345678910-2013-c4c1d2bf33c5cf47" \
    --after-time "2020-03-23T21:31:47.774Z" \
    --max-item 1
```

Output:

```
{
    "communications": [
        {
            "body": "I want to learn more about an AWS service.",
            "attachmentSet": [],
            "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47",
            "timeCreated": "2020-05-12T23:12:35.000Z",
            "submittedBy": "Amazon Web Services"
        }
    ],
    "NextToken": "eyJuZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQEXAMPLE=="
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see DescribeCommunications in *AWS CLI Command Reference*.

## describe-services

The following code example shows how to use `describe-services`.

### AWS CLI

#### To list AWS services and service categories

The following `describe-services` example lists the available service categories for requesting general information.

```
aws support describe-services \
    --service-code-list "general-info"
```

Output:

```
{
    "services": [
        {
            "code": "general-info",
            "name": "General Info and Getting Started",
            "categories": [
                {
                    "code": "charges",
                    "name": "How Will I Be Charged?"
                },
                {
                    "code": "gdpr-queries",
                    "name": "Data Privacy Query"
                },
                {
                    "code": "reserved-instances",
                    "name": "Reserved Instances"
                },
                {
                    "code": "resource",
                    "name": "Where is my Resource?"
                },
                {
                    "code": "using-aws",
                    "name": "Using AWS & Services"
                },
                {
```

```
                    "code": "free-tier",
                    "name": "Free Tier"
                },
                {
                    "code": "security-and-compliance",
                    "name": "Security & Compliance"
                },
                {
                    "code": "account-structure",
                    "name": "Account Structure"
                }
            ]
        }
    ]
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see DescribeServices in *AWS CLI Command Reference*.

### `describe-severity-levels`

The following code example shows how to use `describe-severity-levels`.

#### AWS CLI

**To list the available severity levels**

The following `describe-severity-levels` example lists the available severity levels for a support case.

```
aws support describe-severity-levels
```

Output:

```
{
    "severityLevels": [
        {
            "code": "low",
            "name": "Low"
        },
        {
            "code": "normal",
```

```
            "name": "Normal"
        },
        {
            "code": "high",
            "name": "High"
        },
        {
            "code": "urgent",
            "name": "Urgent"
        },
        {
            "code": "critical",
            "name": "Critical"
        }
    ]
}
```

For more information, see Choosing a severity in the *AWS Support User Guide*.

- For API details, see DescribeSeverityLevels in *AWS CLI Command Reference*.

### `describe-trusted-advisor-check-refresh-statuses`

The following code example shows how to use `describe-trusted-advisor-check-refresh-statuses`.

#### AWS CLI

**To list the refresh statuses of AWS Trusted Advisor checks**

The following `describe-trusted-advisor-check-refresh-statuses` example lists the refresh statuses for two Trusted Advisor checks: Amazon S3 Bucket Permissions and IAM Use.

```
aws support describe-trusted-advisor-check-refresh-statuses \
    --check-id "Pfx0RwqBli" "zXCkfM1nI3"
```

Output:

```
{
    "statuses": [
        {
            "checkId": "Pfx0RwqBli",
```

```
            "status": "none",
            "millisUntilNextRefreshable": 0
        },
        {
            "checkId": "zXCkfM1nI3",
            "status": "none",
            "millisUntilNextRefreshable": 0
        }
    ]
}
```

For more information, see AWS Trusted Advisor in the *AWS Support User Guide*.

- For API details, see DescribeTrustedAdvisorCheckRefreshStatuses in *AWS CLI Command Reference*.

### `describe-trusted-advisor-check-result`

The following code example shows how to use `describe-trusted-advisor-check-result`.

#### AWS CLI

**To list the results of an AWS Trusted Advisor check**

The following `describe-trusted-advisor-check-result` example lists the results of the IAM Use check.

```
aws support describe-trusted-advisor-check-result \
    --check-id "zXCkfM1nI3"
```

Output:

```
{
    "result": {
        "checkId": "zXCkfM1nI3",
        "timestamp": "2020-05-13T21:38:05Z",
        "status": "ok",
        "resourcesSummary": {
            "resourcesProcessed": 1,
            "resourcesFlagged": 0,
            "resourcesIgnored": 0,
            "resourcesSuppressed": 0
        },
```

```
        "categorySpecificSummary": {
            "costOptimizing": {
                "estimatedMonthlySavings": 0.0,
                "estimatedPercentMonthlySavings": 0.0
            }
        },
        "flaggedResources": [
            {
                "status": "ok",
                "resourceId": "47DEQpj8HBSa-_TImW-5JCeuQeRkm5NMpJWZEXAMPLE",
                "isSuppressed": false
            }
        ]
    }
}
```

For more information, see AWS Trusted Advisor in the *AWS Support User Guide*.

- For API details, see DescribeTrustedAdvisorCheckResult in *AWS CLI Command Reference*.

### `describe-trusted-advisor-check-summaries`

The following code example shows how to use `describe-trusted-advisor-check-summaries`.

**AWS CLI**

**To list the summaries of AWS Trusted Advisor checks**

The following `describe-trusted-advisor-check-summaries` example lists the results for two Trusted Advisor checks: Amazon S3 Bucket Permissions and IAM Use.

```
aws support describe-trusted-advisor-check-summaries \
    --check-ids "Pfx0RwqBli" "zXCkfM1nI3"
```

Output:

```
{
    "summaries": [
        {
            "checkId": "Pfx0RwqBli",
            "timestamp": "2020-05-13T21:38:12Z",
```

```
            "status": "ok",
            "hasFlaggedResources": true,
            "resourcesSummary": {
                "resourcesProcessed": 44,
                "resourcesFlagged": 0,
                "resourcesIgnored": 0,
                "resourcesSuppressed": 0
            },
            "categorySpecificSummary": {
                "costOptimizing": {
                    "estimatedMonthlySavings": 0.0,
                    "estimatedPercentMonthlySavings": 0.0
                }
            }
        },
        {
            "checkId": "zXCkfM1nI3",
            "timestamp": "2020-05-13T21:38:05Z",
            "status": "ok",
            "hasFlaggedResources": true,
            "resourcesSummary": {
                "resourcesProcessed": 1,
                "resourcesFlagged": 0,
                "resourcesIgnored": 0,
                "resourcesSuppressed": 0
            },
            "categorySpecificSummary": {
                "costOptimizing": {
                    "estimatedMonthlySavings": 0.0,
                    "estimatedPercentMonthlySavings": 0.0
                }
            }
        }
    ]
}
```

For more information, see AWS Trusted Advisor in the *AWS Support User Guide*.

- For API details, see DescribeTrustedAdvisorCheckSummaries in *AWS CLI Command Reference*.

### `describe-trusted-advisor-checks`

The following code example shows how to use `describe-trusted-advisor-checks`.

**AWS CLI**

**To list the available AWS Trusted Advisor checks**

The following `describe-trusted-advisor-checks` example lists the available Trusted Advisor checks in your AWS account. This information includes the check name, ID, description, category, and metadata. Note that the output is shortened for readability.

```
aws support describe-trusted-advisor-checks \
    --language "en"
```

Output:

```
{
    "checks": [
        {
            "id": "zXCkfM1nI3",
            "name": "IAM Use",
            "description": "Checks for your use of AWS Identity and Access
 Management (IAM). You can use IAM to create users, groups, and roles in AWS, and
 you can use permissions to control access to AWS resources. \n<br>\n<br>\n<b>Alert
 Criteria</b><br>\nYellow: No IAM users have been created for this account.\n<br>
\n<br>\n<b>Recommended Action</b><br>\nCreate one or more IAM users and groups in
 your account. You can then create additional users whose permissions are limited
 to perform specific tasks in your AWS environment. For more information, see <a
 href=\"https://docs.aws.amazon.com/IAM/latest/UserGuide/IAMGettingStarted.html\"
 target=\"_blank\">Getting Started</a>. \n<br><br>\n<b>Additional Resources</b><br>
\n<a href=\"https://docs.aws.amazon.com/IAM/latest/UserGuide/IAM_Introduction.html\"
 target=\"_blank\">What Is IAM?</a>",
            "category": "security",
            "metadata": []
        }
    ]
}
```

For more information, see AWS Trusted Advisor in the *AWS Support User Guide*.

- For API details, see DescribeTrustedAdvisorChecks in *AWS CLI Command Reference*.

## `refresh-trusted-advisor-check`

The following code example shows how to use `refresh-trusted-advisor-check`.

**AWS CLI**

**To refresh an AWS Trusted Advisor check**

The following `refresh-trusted-advisor-check` example refreshes the Amazon S3 Bucket Permissions Trusted Advisor check in your AWS account.

```
aws support refresh-trusted-advisor-check \
    --check-id "Pfx0RwqBli"
```

Output:

```
{
    "status": {
        "checkId": "Pfx0RwqBli",
        "status": "enqueued",
        "millisUntilNextRefreshable": 3599992
    }
}
```

For more information, see AWS Trusted Advisor in the *AWS Support User Guide*.

- For API details, see RefreshTrustedAdvisorCheck in *AWS CLI Command Reference*.

## `resolve-case`

The following code example shows how to use `resolve-case`.

**AWS CLI**

**To resolve a support case**

The following `resolve-case` example resolves a support case in your AWS account.

```
aws support resolve-case \
    --case-id "case-12345678910-2013-c4c1d2bf33c5cf47"
```

Output:

```
{
    "finalCaseStatus": "resolved",
```

```
    "initialCaseStatus": "work-in-progress"
}
```

For more information, see Case management in the *AWS Support User Guide*.

- For API details, see ResolveCase in *AWS CLI Command Reference*.

## Amazon SWF examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SWF.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `count-closed-workflow-executions`

The following code example shows how to use `count-closed-workflow-executions`.

#### AWS CLI

**Counting Closed Workflow Executions**

You can use `swf count-closed-workflow-executions` to retrieve the number of closed workflow executions for a given domain. You can specify filters to count specific classes of executions.

The `--domain` and *either* `--close-time-filter` or `--start-time-filter` arguments are required. All other arguments are optional.

```
aws swf count-closed-workflow-executions \
    --domain DataFrobtzz \
    --close-time-filter "{ \"latestDate\" : 1377129600, \"oldestDate\" :
 1370044800 }"
```

Output:

```
{
    "count": 2,
    "truncated": false
}
```

If "truncated" is `true`, then "count" represents the maximum number that can be returned by Amazon SWF. Any further results are truncated.

To reduce the number of results returned, you can:

modify the `--close-time-filter` or `--start-time-filter` values to narrow the time range that is searched. Eachof these is mutually exclusive: You can specify *only one of these* in a request.use the `--close-status-filter`, `--execution-filter`, `--tag-filter` or `--type-filter` arguments to furtherfilter the results. However, these arguments are also mutually exclusive.

See AlsoCountClosedWorkflowExecutions in the *Amazon Simple Workflow Service API Reference*

- For API details, see CountClosedWorkflowExecutions in *AWS CLI Command Reference*.

### `count-open-workflow-executions`

The following code example shows how to use `count-open-workflow-executions`.

**AWS CLI**

**Counting Open Workflow Executions**

You can use `swf count-open-workflow-executions` to retrieve the number of open workflow executions for a given domain. You can specify filters to count specific classes of executions.

The `--domain` and `--start-time-filter` arguments are required. All other arguments are optional.

```
aws swf count-open-workflow-executions \
    --domain DataFrobtzz \
    --start-time-filter "{ \"latestDate\" : 1377129600, \"oldestDate\" :
 1370044800 }"
```

Output:

```
{
    "count": 4,
    "truncated": false
}
```

If "truncated" is `true`, then "count" represents the maximum number that can be returned by Amazon SWF. Any further results are truncated.

To reduce the number of results returned, you can:

modify the `--start-time-filter` values to narrow the time range that is searched.use the `--close-status-filter`, `--execution-filter`, `--tag-filter` or `--type-filter` arguments to furtherfilter the results. Each of these is mutually exclusive: You can specify *only one of these* in a request.

For more information, see CountOpenWorkflowExecutions in the *Amazon Simple Workflow Service API Reference*

- For API details, see CountOpenWorkflowExecutions in *AWS CLI Command Reference*.

### `deprecate-domain`

The following code example shows how to use `deprecate-domain`.

**AWS CLI**

**Deprecating a Domain**

To deprecate a domain (you can still see it, but cannot create new workflow executions or register types on it), use `swf deprecate-domain`. It has a sole required parameter, `--name`, which takes the name of the domain to deprecate.

```
aws swf deprecate-domain \
```

```
    --name MyNeatNewDomain ""
```

As with `register-domain`, no output is returned. If you use `list-domains` to view the registered domains, however, you will see that the domain has been deprecated and no longer appears in the returned data.

```
aws swf list-domains \
    --registration-status REGISTERED
        {
            "domainInfos": [
                {
                    "status": "REGISTERED",
                    "name": "DataFrobotz"
                },
                {
                    "status": "REGISTERED",
                    "name": "erontest"
                }
            ]
        }
```

If you use `--registration-status DEPRECATED` with `list-domains`, you will see your deprecated domain.

```
aws swf list-domains \
    --registration-status DEPRECATED
        {
            "domainInfos": [
                {
                    "status": "DEPRECATED",
                    "name": "MyNeatNewDomain"
                }
            ]
        }
```

You can still use `describe-domain` to get information about a deprecated domain.

```
aws swf describe-domain \
    --name MyNeatNewDomain
        {
            "domainInfo": {
```

```
                "status": "DEPRECATED",
                "name": "MyNeatNewDomain"
            },
            "configuration": {
                "workflowExecutionRetentionPeriodInDays": "0"
            }
        }
```

See AlsoDeprecateDomain in the *Amazon Simple Workflow Service API Reference*

- For API details, see DeprecateDomain in *AWS CLI Command Reference*.

### `describe-domain`

The following code example shows how to use `describe-domain`.

**AWS CLI**

**Getting Information About a Domain**

To get detailed information about a particular domain, use the `swf describe-domain` command. There is one required parameter: `--name`, which takes the name of the domain you want information about.

```
aws swf describe-domain \
    --name DataFrobotz
        {
            "domainInfo": {
                "status": "REGISTERED",
                "name": "DataFrobotz"
            },
            "configuration": {
                "workflowExecutionRetentionPeriodInDays": "1"
            }
        }
```

You can also use `describe-domain` to get information about deprecated domains.

```
aws swf describe-domain \
    --name MyNeatNewDomain
        {
            "domainInfo": {
```

```
                "status": "DEPRECATED",
                "name": "MyNeatNewDomain"
            },
            "configuration": {
                "workflowExecutionRetentionPeriodInDays": "0"
            }
        }
```

See AlsoDescribeDomain in the *Amazon Simple Workflow Service API Reference*

- For API details, see DescribeDomain in *AWS CLI Command Reference*.

### `list-activity-types`

The following code example shows how to use `list-activity-types`.

#### AWS CLI

##### Listing Activity Types

To get a list of the activity types for a domain, use `swf list-activity-types`. The `--domain` and `--registration-status` arguments are required.

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED
```

Output:

```
{
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.451,
            "activityType": {
                "version": "1",
                "name": "confirm-user-email"
            },
            "description": "subscribe confirm-user-email activity"
        },
        {
            "status": "REGISTERED",
```

```
            "creationDate": 1371454150.709,
            "activityType": {
                "version": "1",
                "name": "confirm-user-phone"
            },
            "description": "subscribe confirm-user-phone activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454149.871,
            "activityType": {
                "version": "1",
                "name": "get-subscription-info"
            },
            "description": "subscribe get-subscription-info activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.085,
            "activityType": {
                "version": "1",
                "name": "subscribe-user-sns"
            },
            "description": "subscribe subscribe-user-sns activity"
        }
    ]
}
```

You can use the `--name` argument to select only activity types with a particular name:

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --name "send-subscription-success"
```

Output:

```
{
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        }
    ]
}
```

To retrieve results in pages, you can set the `--maximum-page-size` argument. If more results are returned than will fit in a page of results, a "nextPageToken" will be returned in the result set:

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --maximum-page-size 2
```

Output:

```
{
    "nextPageToken": "AAAAKgAAAAEAAAAAAAAAA1Gp1BelJq
+PmHvAnDxJYbup8+0R4LVtbXLDl7QNY7C3OpHo9Sz06D/GuFz1OyC73umBQ1tOPJ/gC/
aYpzDMqUIWIA1T9W0s2DryyZX4OC/6Lhk9/
o5kdsuWMSBkHhgaZjgwp3WJINIFJFdaSMxY2vYAX7AtRtpcqJuBDDRE9RaRqDGYqIYUMltarkiqpSY1ZVveBasBvlvyU
WGAaqehiDz7/JzLT/wWNNUMOd+Nhe",
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.451,
            "activityType": {
                "version": "1",
                "name": "confirm-user-email"
            },
            "description": "subscribe confirm-user-email activity"
```

```
        },
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.709,
            "activityType": {
                "version": "1",
                "name": "confirm-user-phone"
            },
            "description": "subscribe confirm-user-phone activity"
        }
    ]
}
```

You can pass the nextPageToken value to the next call to `list-activity-types` in the `--next-page-token` argument, retrieving the next page of results:

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --maximum-page-size 2 \
    --next-page-token "AAAAKgAAAAEAAAAAAAAAA1Gp1BelJq
+PmHvAnDxJYbup8+0R4LVtbXLDl7QNY7C3OpHo9Sz06D/GuFz1OyC73umBQ1tOPJ/gC/
aYpzDMqUIWIA1T9W0s2DryyZX4OC/6Lhk9/
o5kdsuWMSBkHhgaZjgwp3WJINIFJFdaSMxY2vYAX7AtRtpcqJuBDDRE9RaRqDGYqIYUMltarkiqpSY1ZVveBasBvlvyU
WGAaqehiDz7/JzLT/wWNNUMOd+Nhe"
```

Output:

```
{
    "nextPageToken": "AAAAKgAAAAEAAAAAAAAAAw+7LZ4GRZPzTqBHsp2wBxWB8m1sgLCclgCuq3J+h/
m3+vOfFqtkcjLwV5cc4OjNAzTCuq/
XcylPumGwkjbajtqpZpbqOcVNfjFxGoi0LB2Olbvv0krbUISBvlpFPmSWpDSZJsxg5UxCcweteSlFn1PNSZ/
MoinBZo8OTkjMuzcsTuKOzH9wCaR8ITcALJ3SaqHU3pyIRS5hPmFA3OLIc8zaAepjlaujo6hntNSCruB4"
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454149.871,
            "activityType": {
                "version": "1",
                "name": "get-subscription-info"
            },
            "description": "subscribe get-subscription-info activity"
        },
```

```
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        }
    ]
}
```

If there are still more results to return, "nextPageToken" will be returned with the results. When there are no more pages of results to return, "nextPageToken" will *not* be returned in the result set.

You can use the `--reverse-order` argument to reverse the order of the returned results. This also affects paged results.

```
aws swf list-activity-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED \
    --maximum-page-size 2 \
    --reverse-order
```

Output:

```
{
    "nextPageToken": "AAAAKgAAAAEAAAAAAAAAAwXcpu5ePSyQkrC
+8WMbmSrenuZC2ZkIXQYBPB/b9xIOVkj+bMEFhGj0KmmJ4rF7iddhjf7UMYCsfGkEn7mk
+yMCgVc1JxDWmB0EH46bhcmcLmYNQihMDmUWocpr7To6/R7CLu0St1gkFayxOidJXErQW0zdNfQaIWAnF/
cwioBbXlkz1fQzmDeU3M5oYGMPQIrUqkPq7pMEW0q0lK5eDN97NzFYdZZ/rlcLDWPZhUjY",
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.085,
            "activityType": {
                "version": "1",
                "name": "subscribe-user-sns"
            },
            "description": "subscribe subscribe-user-sns activity"
        },
```

```
        {
            "status": "REGISTERED",
            "creationDate": 1371454150.909,
            "activityType": {
                "version": "1",
                "name": "send-subscription-success"
            },
            "description": "subscribe send-subscription-success activity"
        }
    ]
}
```

See AlsoListActivityTypes in the *Amazon Simple Workflow Service API Reference*

- For API details, see ListActivityTypes in *AWS CLI Command Reference*.

### `list-domains`

The following code example shows how to use `list-domains`.

**AWS CLI**

**Example 1: To list your registered domains**

The following `list-domains` command example lists the `REGISTERED` SWF domains that you have registered for your account.

```
aws swf list-domains \
    --registration-status REGISTERED
```

Output:

```
{
  "domainInfos": [
    {
      "status": "REGISTERED",
      "name": "DataFrobotz"
    },
    {
      "status": "REGISTERED",
      "name": "erontest"
    }
```

```
  ]
}
```

For more information, see ListDomains in the *Amazon Simple Workflow Service API Reference*

**Example 2: To list your deprecated domains**

The following `list-domains` command example lists the `DEPRECATED` SWF domains that you have registered for your account. Deprecated domains are domains that can not register new workflows or activities, but that can still be queried.

```
aws swf list-domains \
    --registration-status DEPRECATED
```

Output:

```
{
  "domainInfos": [
    {
      "status": "DEPRECATED",
      "name": "MyNeatNewDomain"
    }
  ]
}
```

For more information, see ListDomains in the *Amazon Simple Workflow Service API Reference*

**Example 3: To list the first page of registered domains**

The following `list-domains` command example lists the first page `REGISTERED` SWF domains that you have registered for your account using the `--maximum-page-size` option.

```
aws swf list-domains \
    --registration-status REGISTERED \
    --maximum-page-size 1
```

Output:

```
{
    "domainInfos": [
```

```
        {
            "status": "REGISTERED",
            "name": "DataFrobotz"
        }
    ],
"nextPageToken": "AAAAKgAAAAEAAAAAAAAAA2QJKNtidVgd49TTeNwYcpD
+QKT2ynuEbibcQWe2QKrslMGe63gpS0MgZGpcpoKttL4OCXRFn98Xif557it
+wSZUsvUDtImjDLvguyuyyFdIZtvIxIKEOPm3k2r4OjAGaFsGOuVbrKljvla7wdU7FYH3OlkNCP8b7PBj9SBkUyGoiAg
}
```

For more information, see ListDomains in the *Amazon Simple Workflow Service API Reference*

**Example 4: To list the specified single page of registered domains**

The following `list-domains` command example lists the first page `REGISTERED` SWF domains that you have registered for your account using the `--maximum-page-size` option.

When you make the call again, this time supplying the value of `nextPageToken` in the `--next-page-token` argument, you'll get another page of results.

```
aws swf list-domains \
    --registration-status REGISTERED \
    --maximum-page-size 1 \
    --next-page-token "AAAAKgAAAAEAAAAAAAAAA2QJKNtidVgd49TTeNwYcpD
+QKT2ynuEbibcQWe2QKrslMGe63gpS0MgZGpcpoKttL4OCXRFn98Xif557it
+wSZUsvUDtImjDLvguyuyyFdIZtvIxIKEOPm3k2r4OjAGaFsGOuVbrKljvla7wdU7FYH3OlkNCP8b7PBj9SBkUyGoiAg
```

Output:

```
{
    "domainInfos": [
        {
            "status": "REGISTERED",
            "name": "erontest"
        }
    ]
}
```

When there are no further pages of results to retrieve, `nextPageToken` will not be returned in the results.

For more information, see ListDomains in the *Amazon Simple Workflow Service API Reference*

- For API details, see ListDomains in *AWS CLI Command Reference*.

### `list-workflow-types`

The following code example shows how to use `list-workflow-types`.

**AWS CLI**

**Listing Workflow Types**

To get a list of the workflow types for a domain, use `swf list-workflow-types`. The `--domain` and `--registration-status` arguments are required. Here's a simple example.

```
aws swf list-workflow-types \
    --domain DataFrobtzz \
    --registration-status REGISTERED
```

Output:

```
{
    "typeInfos": [
        {
            "status": "REGISTERED",
            "creationDate": 1371454149.598,
            "description": "DataFrobtzz subscribe workflow",
            "workflowType": {
                "version": "v3",
                "name": "subscribe"
            }
        }
    ]
}
```

As with `list-activity-types`, you can use the `--name` argument to select only workflow types with a particular name, and use the `--maximum-page-size` argument in coordination with `--next-page-token` to page results. To reverse the order in which results are returned, use `--reverse-order`.

See AlsoListWorkflowTypes in the *Amazon Simple Workflow Service API Reference*

- For API details, see ListWorkflowTypes in *AWS CLI Command Reference*.

## `register-domain`

The following code example shows how to use `register-domain`.

### AWS CLI

#### Registering a Domain

You can use the AWS CLI to register new domains. Use the `swf register-domain` command. There are two required parameters, `--name`, which takes the domain name, and `--workflow-execution-retention-period-in-days`, which takes an integer to specify the number of days to retain workflow execution data on this domain, up to a maxium period of 90 days (for more information, see the SWF FAQ <https://aws.amazon.com/swf/faqs/#retain_limit>). Workflow execution data will not be retained after the specified number of days have passed.

```
aws swf register-domain \
    --name MyNeatNewDomain \
    --workflow-execution-retention-period-in-days 0
    ""
```

When you register a domain, nothing is returned (""), but you can use `swf list-domains` or `swf describe-domain` to see the new domain.

```
aws swf list-domains \
    --registration-status REGISTERED
        {
            "domainInfos": [
                {
                    "status": "REGISTERED",
                    "name": "DataFrobotz"
                },
                {
                    "status": "REGISTERED",
                    "name": "MyNeatNewDomain"
                },
                {
                    "status": "REGISTERED",
                    "name": "erontest"
                }
            ]
        }
```

Using `swf describe-domain`:

```
aws swf describe-domain --name MyNeatNewDomain
{
    "domainInfo": {
        "status": "REGISTERED",
        "name": "MyNeatNewDomain"
    },
    "configuration": {
        "workflowExecutionRetentionPeriodInDays": "0"
    }
}
```

See AlsoRegisterDomain in the *Amazon Simple Workflow Service API Reference*

- For API details, see RegisterDomain in *AWS CLI Command Reference*.

### `register-workflow-type`

The following code example shows how to use `register-workflow-type`.

#### AWS CLI

##### Registering a Workflow Type

To register a Workflow type with the AWS CLI, use the `swf register-workflow-type` command.

```
aws swf register-workflow-type \
    --domain DataFrobtzz \
    --name "MySimpleWorkflow" \
    --workflow-version "v1"
```

If successful, the command produces no output.

On an error (for example, if you try to register the same workflow typetwice, or specify a domain that doesn't exist) you will get a response in JSON.

```
{
    "message": "WorkflowType=[name=MySimpleWorkflow, version=v1]",
    "__type": "com.amazonaws.swf.base.model#TypeAlreadyExistsFault"
}
```

The `--domain`, `--name` and `--workflow-version` are required. You can also set the workflow description, timeouts, and child workflow policy.

For more information, see RegisterWorkflowType in the *Amazon Simple Workflow Service API Reference*

- For API details, see RegisterWorkflowType in *AWS CLI Command Reference*.

## Systems Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Systems Manager.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `add-tags-to-resource`

The following code example shows how to use `add-tags-to-resource`.

#### AWS CLI

**Example 1: To add tags to a maintenance window**

The following `add-tags-to-resource` example adds a tag to the specified maintenance window.

```
aws ssm add-tags-to-resource \
    --resource-type "MaintenanceWindow" \
```

```
    --resource-id "mw-03eb9db428EXAMPLE" \
    --tags "Key=Stack,Value=Production"
```

This command produces no output.

**Example 2: To add tags to a parameter**

The following `add-tags-to-resource` example adds two tags to to the specified parameter.

```
aws ssm add-tags-to-resource \
    --resource-type "Parameter" \
    --resource-id "My-Parameter" \
    --tags '[{"Key":"Region","Value":"East"},{"Key":"Environment",
 "Value":"Production"}]'
```

This command produces no output.

**Example 3: To add tags to an SSM document**

The following `add-tags-to-resource` example adds a tag to to the specified document.

```
aws ssm add-tags-to-resource \
    --resource-type "Document" \
    --resource-id "My-Document" \
    --tags "Key=Quarter,Value=Q322"
```

This command produces no output.

For more information, see Tagging Systems Manager resources in the *AWS Systems Manager User Guide*.

- For API details, see AddTagsToResource in *AWS CLI Command Reference*.

## `associate-ops-item-related-item`

The following code example shows how to use `associate-ops-item-related-item`.

### AWS CLI

**To associate a related item**

The following `associate-ops-item-related-item` example associates a related item to the OpsItem.

```
aws ssm associate-ops-item-related-item \
    --ops-item-id "oi-649fExample" \
    --association-type "RelatesTo" \
    --resource-type "AWS::SSMIncidents::IncidentRecord" \
    --resource-uri "arn:aws:ssm-incidents::111122223333:incident-record/Example-
Response-Plan/c2bde883-f7d5-343a-b13a-bf5fe9ea689f"
```

Output:

```
{
    "AssociationId": "61d7178d-a30d-4bc5-9b4e-a9e74EXAMPLE"
}
```

For more information, see Working with Incident Manager incidents in OpsCenter in the *AWS Systems Manager User Guide*.

- For API details, see AssociateOpsItemRelatedItem in *AWS CLI Command Reference*.

### `cancel-command`

The following code example shows how to use `cancel-command`.

**AWS CLI**

**Example 1: To cancel a command for all instances**

The following `cancel-command` example attempts to cancel the specified command that is already running for all instances.

```
aws ssm cancel-command \
    --command-id "662add3d-5831-4a10-b64a-f2ff3EXAMPLE"
```

This command produces no output.

**Example 2: To cancel a command for specific instances**

The following `cancel-command` example attempts to cancel a command for the specified instance only.

```
aws ssm cancel-command \
    --command-id "662add3d-5831-4a10-b64a-f2ff3EXAMPLE"
```

```
    --instance-ids "i-02573cafcfEXAMPLE"
```

This command produces no output.

For more information, see Tagging Systems Manager Parameters in the *AWS Systems Manager User Guide*.

- For API details, see CancelCommand in *AWS CLI Command Reference*.

### `cancel-maintenance-window-execution`

The following code example shows how to use `cancel-maintenance-window-execution`.

**AWS CLI**

**To cancel a maintenance window execution**

This `cancel-maintenance-window-execution` example stops the specified maintenance window execution that is already in progress.

```
aws ssm cancel-maintenance-window-execution \
    --window-execution-id j2l8d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE
```

Output:

```
{
    "WindowExecutionId": "j2l8d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE"
}
```

For more information, see Systems Manager Maintenance Windows Tutorials (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see CancelMaintenanceWindowExecution in *AWS CLI Command Reference*.

### `create-activation`

The following code example shows how to use `create-activation`.

**AWS CLI**

**To create a managed instance activation**

The following `create-activation` example creates a managed instance activation.

```
aws ssm create-activation \
    --default-instance-name "HybridWebServers" \
    --iam-role "HybridWebServersRole" \
    --registration-limit 5
```

Output:

```
{
    "ActivationId": "5743558d-563b-4457-8682-d16c3EXAMPLE",
    "ActivationCode": "dRmgnYaFv567vEXAMPLE"
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the *AWS Systems Manager User Guide*.

- For API details, see CreateActivation in *AWS CLI Command Reference*.

### `create-association-batch`

The following code example shows how to use `create-association-batch`.

#### AWS CLI

**To create multiple associations**

This example associates a configuration document with multiple instances. The output returns a list of successful and failed operations, if applicable.

Command:

```
aws ssm create-association-batch --entries "Name=AWS-
UpdateSSMAgent,InstanceId=i-1234567890abcdef0" "Name=AWS-
UpdateSSMAgent,InstanceId=i-9876543210abcdef0"
```

Output:

```
{
  "Successful": [
      {
          "Name": "AWS-UpdateSSMAgent",
```

```
            "InstanceId": "i-1234567890abcdef0",
            "AssociationVersion": "1",
            "Date": 1550504725.007,
            "LastUpdateAssociationDate": 1550504725.007,
            "Status": {
                "Date": 1550504725.007,
                "Name": "Associated",
                "Message": "Associated with AWS-UpdateSSMAgent"
            },
            "Overview": {
                "Status": "Pending",
                "DetailedStatus": "Creating"
            },
            "DocumentVersion": "$DEFAULT",
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ]
        },
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-9876543210abcdef0",
            "AssociationVersion": "1",
            "Date": 1550504725.057,
            "LastUpdateAssociationDate": 1550504725.057,
            "Status": {
                "Date": 1550504725.057,
                "Name": "Associated",
                "Message": "Associated with AWS-UpdateSSMAgent"
            },
            "Overview": {
                "Status": "Pending",
                "DetailedStatus": "Creating"
            },
            "DocumentVersion": "$DEFAULT",
            "AssociationId": "9c9f7f20-5154-4fed-a83e-0123456789ab",
            "Targets": [
                {
                    "Key": "InstanceIds",
```

```
                "Values": [
                    "i-9876543210abcdef0"
                ]
            }
        ]
    }
  ],
  "Failed": []
}
```

- For API details, see CreateAssociationBatch in *AWS CLI Command Reference*.

### `create-association`

The following code example shows how to use `create-association`.

#### AWS CLI

**Example 1: To associate a document using instance IDs**

This example associates a configuration document with an instance, using instance IDs.

```
aws ssm create-association \
    --instance-id "i-0cb2b964d3e14fd9f" \
    --name "AWS-UpdateSSMAgent"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
```

```
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see CreateAssociation in the *AWS Systems Manager API Reference*.

**Example 2: To associate a document using targets**

This example associates a configuration document with an instance, using targets.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
```

```
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see CreateAssociation in the *AWS Systems Manager API Reference*.

**Example 3: To create an association that runs only once**

This example creates a new association that only runs once on the specified date and time. Associations created with a date in the past or present (by the time it is processed the date is in the past) run immediately.

```
aws ssm create-association \
    --name "AWS-UpdateSSMAgent" \
    --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f" \
    --schedule-expression "at(2020-05-14T15:55:00)"  \
    --apply-only-at-cron-interval
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487875500.33,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-0cb2b964d3e14fd9f",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
```

```
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487875500.33,
        "Date": 1487875500.33,
        "Targets": [
            {
                "Values": [
                    "i-0cb2b964d3e14fd9f"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see CreateAssociation in the *AWS Systems Manager API Reference* or Reference: Cron and rate expressions for Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see CreateAssociation in *AWS CLI Command Reference*.

### `create-document`

The following code example shows how to use `create-document`.

#### AWS CLI

**To create a document**

The following `create-document` example creates a Systems Manager document.

```
aws ssm create-document \
    --content file://exampleDocument.yml \
    --name "Example" \
    --document-type "Automation" \
    --document-format YAML
```

Output:

```
{
    "DocumentDescription": {
        "Hash": "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
        "HashType": "Sha256",
```

```
        "Name": "Example",
        "Owner": "29884EXAMPLE",
        "CreatedDate": 1583256349.452,
        "Status": "Creating",
        "DocumentVersion": "1",
        "Description": "Document Example",
        "Parameters": [
            {
                "Name": "AutomationAssumeRole",
                "Type": "String",
                "Description": "(Required) The ARN of the role that allows
 Automation to perform the actions on your behalf. If no role is specified, Systems
 Manager Automation uses your IAM permissions to execute this document.",
                "DefaultValue": ""
            },
            {
                "Name": "InstanceId",
                "Type": "String",
                "Description": "(Required) The ID of the Amazon EC2 instance.",
                "DefaultValue": ""
            }
        ],
        "PlatformTypes": [
            "Windows",
            "Linux"
        ],
        "DocumentType": "Automation",
        "SchemaVersion": "0.3",
        "LatestVersion": "1",
        "DefaultVersion": "1",
        "DocumentFormat": "YAML",
        "Tags": []
    }
}
```

For more information, see Creating Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see CreateDocument in *AWS CLI Command Reference*.

### `create-maintenance-window`

The following code example shows how to use `create-maintenance-window`.

## AWS CLI

### Example 1: To create a maintenance window

The following `create-maintenance-window` example creates a new maintenance window that every five minutes for up to two hours (as needed), prevents new tasks from starting within one hour of the end of the maintenance window execution, allows unassociated targets (instances that you haven't registered with the maintenance window), and indicates through the use of custom tags that its creator intends to use it in a tutorial.

```
aws ssm create-maintenance-window \
    --name "My-Tutorial-Maintenance-Window" \
    --schedule "rate(5 minutes)" \
    --duration 2 --cutoff 1 \
    --allow-unassociated-targets \
    --tags "Key=Purpose,Value=Tutorial"
```

Output:

```
{
    "WindowId": "mw-0c50858d01EXAMPLE"
}
```

### Example 2: To create a maintenance window that runs only once

The following `create-maintenance-window` example creates a new maintenance window that only runs one time on the specified date and time.

```
aws ssm create-maintenance-window \
    --name My-One-Time-Maintenance-Window \
    --schedule "at(2020-05-14T15:55:00)" \
    --duration 5 \
    --cutoff 2 \
    --allow-unassociated-targets \
    --tags "Key=Environment,Value=Production"
```

Output:

```
{
    "WindowId": "mw-01234567890abcdef"
```

```
}
```

For more information, see Maintenance Windows in the *AWS Systems Manager User Guide*.

- For API details, see CreateMaintenanceWindow in *AWS CLI Command Reference*.

### `create-ops-item`

The following code example shows how to use `create-ops-item`.

**AWS CLI**

**To create an OpsItems**

The following `create-ops-item` example uses the /aws/resources key in OperationalData to create an OpsItem with an Amazon DynamoDB related resource.

```
aws ssm create-ops-item \
    --title "EC2 instance disk full" \
    --description "Log clean up may have failed which caused the disk to be full" \
    --priority 2 \
    --source ec2 \
    --operational-data '{"/aws/resources":{"Value":"[{\"arn
\": \"arn:aws:dynamodb:us-west-2:12345678:table/OpsItems
\"}]","Type":"SearchableString"}}' \
    --notifications Arn="arn:aws:sns:us-west-2:12345678:TestUser"
```

Output:

```
{
    "OpsItemId": "oi-1a2b3c4d5e6f"
}
```

For more information, see Creating OpsItems in the *AWS Systems Manager User Guide*.

- For API details, see CreateOpsItem in *AWS CLI Command Reference*.

### `create-patch-baseline`

The following code example shows how to use `create-patch-baseline`.

**AWS CLI**

**Example 1: To create a patch baseline with auto-approval**

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves patches for a production environment seven days after they are released by Microsoft.

```
aws ssm create-patch-baseline \
    --name "Windows-Production-Baseline-AutoApproval" \
    --operating-system "WINDOWS" \
    --approval-rules
 "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,Important
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},Approv
 \
    --description "Baseline containing all updates approved for Windows Server
 production systems"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

**Example 2: To create a patch baseline with an approval cutoff date**

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves all patches for a production environment that are released on or before July 7, 2020.

```
aws ssm create-patch-baseline \
    --name "Windows-Production-Baseline-AutoApproval" \
    --operating-system "WINDOWS" \
    --approval-rules
 "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,Important
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},Approv
 \
    --description "Baseline containing all updates approved for Windows Server
 production systems"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

**Example 3: To create a patch baseline with approval rules stored in a JSON file**

The following `create-patch-baseline` example creates a patch baseline for Amazon Linux 2017.09 that approves patches for a production environment seven days after they are released, specifies approval rules for the patch baseline, and specifies a custom repository for patches.

```
aws ssm create-patch-baseline \
    --cli-input-json file://my-amazon-linux-approval-rules-and-repo.json
```

Contents of `my-amazon-linux-approval-rules-and-repo.json`:

```
{
    "Name": "Amazon-Linux-2017.09-Production-Baseline",
    "Description": "My approval rules patch baseline for Amazon Linux 2017.09
 instances",
    "OperatingSystem": "AMAZON_LINUX",
    "Tags": [
        {
            "Key": "Environment",
            "Value": "Production"
        }
    ],
    "ApprovalRules": {
        "PatchRules": [
            {
                "ApproveAfterDays": 7,
                "EnableNonSecurity": true,
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "SEVERITY",
                            "Values": [
                                "Important",
                                "Critical"
                            ]
                        },
```

```
                        {
                            "Key": "CLASSIFICATION",
                            "Values": [
                                "Security",
                                "Bugfix"
                            ]
                        },
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "AmazonLinux2017.09"
                            ]
                        }
                    ]
                }
            }
        ]
    },
    "Sources": [
        {
            "Name": "My-AL2017.09",
            "Products": [
                "AmazonLinux2017.09"
            ],
            "Configuration": "[amzn-main] \nname=amzn-main-Base
\nmirrorlist=http://repo./$awsregion./$awsdomain//$releasever/main/mirror.list //
nmirrorlist_expire=300//nmetadata_expire=300 \npriority=10 \nfailovermethod=priority
 \nfastestmirror_enabled=0 \ngpgcheck=1 \ngpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-
KEY-amazon-ga \nenabled=1 \nretries=3 \ntimeout=5\nreport_instanceid=yes"
        }
    ]
}
```

**Example 4: To create a patch baseline that specifies approved and rejected patches**

The following `create-patch-baseline` example explicitly specifies patches to approve and reject as exception to the default approval rules.

```
aws ssm create-patch-baseline \
    --name "Amazon-Linux-2017.09-Alpha-Baseline" \
    --description "My custom approve/reject patch baseline for Amazon Linux 2017.09
 instances" \
    --operating-system "AMAZON_LINUX" \
```

```
    --approved-patches "CVE-2018-1234567,example-pkg-EE-2018*.amzn1.noarch" \
    --approved-patches-compliance-level "HIGH" \
    --approved-patches-enable-non-security \
    --tags "Key=Environment,Value=Alpha"
```

For more information, see Create a Custom Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see CreatePatchBaseline in *AWS CLI Command Reference*.

### `create-resource-data-sync`

The following code example shows how to use `create-resource-data-sync`.

**AWS CLI**

**To create a resource data sync**

This example creates a resource data sync. There is no output if the command succeeds.

Command:

```
aws ssm create-resource-data-sync --sync-name "ssm-resource-data-sync" --s3-
destination "BucketName=ssm-bucket,Prefix=inventory,SyncFormat=JsonSerDe,Region=us-
east-1"
```

- For API details, see CreateResourceDataSync in *AWS CLI Command Reference*.

### `delete-activation`

The following code example shows how to use `delete-activation`.

**AWS CLI**

**To delete a managed instance activation**

The following `delete-activation` example deletes a managed instance activation.

```
aws ssm delete-activation \
    --activation-id "aa673477-d926-42c1-8757-1358cEXAMPLE"
```

This command produces no output.

For more information, see Setting Up AWS Systems Manager for Hybrid Environments in the *AWS Systems Manager User Guide*.

- For API details, see DeleteActivation in *AWS CLI Command Reference*.

### `delete-association`

The following code example shows how to use `delete-association`.

**AWS CLI**

**Example 1: To delete an association using the association ID**

The following `delete-association` example deletes the association for the specified association ID. There is no output if the command succeeds.

```
aws ssm delete-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

This command produces no output.

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

**Example 2: To delete an association**

The following `delete-association` example deletes the association between an instance and a document. There is no output if the command succeeds.

```
aws ssm delete-association \
    --instance-id "i-1234567890abcdef0" \
    --name "AWS-UpdateSSMAgent"
```

This command produces no output.

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see DeleteAssociation in *AWS CLI Command Reference*.

### `delete-document`

The following code example shows how to use `delete-document`.

**AWS CLI**

**To delete a document**

The following `delete-document` example deletes a Systems Manager document.

```
aws ssm delete-document \
    --name "Example"
```

This command produces no output.

For more information, see Creating Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see DeleteDocument in *AWS CLI Command Reference*.

### `delete-inventory`

The following code example shows how to use `delete-inventory`.

**AWS CLI**

**To delete a custom inventory type**

This example deletes a custom inventory schema.

Command:

```
aws ssm delete-inventory --type-name "Custom:RackInfo" --schema-delete-option
 "DeleteSchema"
```

Output:

```
{
  "DeletionId": "d72ac9e8-1f60-4d40-b1c6-bf8c78c68c4d",
  "TypeName": "Custom:RackInfo",
  "DeletionSummary": {
      "TotalCount": 1,
```

```
      "RemainingCount": 1,
      "SummaryItems": [
          {
              "Version": "1.0",
              "Count": 1,
              "RemainingCount": 1
          }
      ]
  }
}
```

**To disable a custom inventory type**

This example disables a custom inventory schema.

Command:

```
aws ssm delete-inventory --type-name "Custom:RackInfo" --schema-delete-option
 "DisableSchema"
```

Output:

```
{
  "DeletionId": "6961492a-8163-44ec-aa1e-923364dd0850",
  "TypeName": "Custom:RackInformation",
  "DeletionSummary": {
      "TotalCount": 0,
      "RemainingCount": 0,
      "SummaryItems": []
  }
}
```

- For API details, see DeleteInventory in *AWS CLI Command Reference*.

### `delete-maintenance-window`

The following code example shows how to use `delete-maintenance-window`.

**AWS CLI**

**To delete a maintenance window**

This `delete-maintenance-window` example removes the specified maintenance window.

```
aws ssm delete-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9"
```

Output:

```
{
    "WindowId":"mw-1a2b3c4d5e6f7g8h9"
}
```

For more information, see Delete a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DeleteMaintenanceWindow in *AWS CLI Command Reference*.

### `delete-parameter`

The following code example shows how to use `delete-parameter`.

**AWS CLI**

**To delete a parameter**

The following `delete-parameter` example deletes the specified single parameter.

```
aws ssm delete-parameter \
    --name "MyParameter"
```

This command produces no output.

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

- For API details, see DeleteParameter in *AWS CLI Command Reference*.

### `delete-parameters`

The following code example shows how to use `delete-parameters`.

**AWS CLI**

**To delete a list of parameters**

The following `delete-parameters` example deletes the specified parameters.

```
aws ssm delete-parameters \
    --names "MyFirstParameter" "MySecondParameter" "MyInvalidParameterName"
```

Output:

```
{
    "DeletedParameters": [
        "MyFirstParameter",
        "MySecondParameter"
    ],
    "InvalidParameters": [
        "MyInvalidParameterName"
    ]
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

- For API details, see DeleteParameters in *AWS CLI Command Reference*.

## `delete-patch-baseline`

The following code example shows how to use `delete-patch-baseline`.

**AWS CLI**

**To delete a patch baseline**

The following `delete-patch-baseline` example deletes the specified patch baseline.

```
aws ssm delete-patch-baseline \
    --baseline-id "pb-045f10b4f382baeda"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f382baeda"
}
```

For more information, see Update or Delete a Patch Baseline (Console) in the *AWS Systems Manager User Guide*.

- For API details, see DeletePatchBaseline in *AWS CLI Command Reference*.

### `delete-resource-data-sync`

The following code example shows how to use `delete-resource-data-sync`.

**AWS CLI**

**To delete a resource data sync**

This example deletes a resource data sync. There is no output if the command succeeds.

Command:

```
aws ssm delete-resource-data-sync --sync-name "ssm-resource-data-sync"
```

- For API details, see DeleteResourceDataSync in *AWS CLI Command Reference*.

### `deregister-managed-instance`

The following code example shows how to use `deregister-managed-instance`.

**AWS CLI**

**To deregister a managed instance**

The following `deregister-managed-instance` example deregisters the specified managed instance.

```
aws ssm deregister-managed-instance
    --instance-id "mi-08ab247cdfEXAMPLE"
```

This command produces no output.

For more information, see Deregistering Managed Instances in a Hybrid Environment in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterManagedInstance in *AWS CLI Command Reference*.

### `deregister-patch-baseline-for-patch-group`

The following code example shows how to use `deregister-patch-baseline-for-patch-group`.

**AWS CLI**

**To deregister a patch group from a patch baseline**

The following `deregister-patch-baseline-for-patch-group` example deregisters the specified patch group from the specified patch baseline.

```
aws ssm deregister-patch-baseline-for-patch-group \
    --patch-group "Production" \
    --baseline-id "pb-0ca44a362fEXAMPLE"
```

Output:

```
{
  "PatchGroup":"Production",
  "BaselineId":"pb-0ca44a362fEXAMPLE"
}
```

For more information, see Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterPatchBaselineForPatchGroup in *AWS CLI Command Reference*.

### `deregister-target-from-maintenance-window`

The following code example shows how to use `deregister-target-from-maintenance-window`.

**AWS CLI**

**To remove a target from a maintenance window**

The following `deregister-target-from-maintenance-window` example removes the specified target from the specified maintenance window.

```
aws ssm deregister-target-from-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --window-target-id "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
```

Output:

```
{
    "WindowId":"mw-ab12cd34ef56gh78",
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Update a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterTargetFromMaintenanceWindow in *AWS CLI Command Reference*.

### `deregister-task-from-maintenance-window`

The following code example shows how to use `deregister-task-from-maintenance-window`.

#### AWS CLI

**To remove a task from a maintenance window**

The following `deregister-task-from-maintenance-window` example removes the specified task from the specified maintenance window.

```
aws ssm deregister-task-from-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --window-task-id "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d5e6c"
```

Output:

```
{
    "WindowTaskId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d5e6c",
    "WindowId":"mw-ab12cd34ef56gh78"
}
```

For more information, see Systems Manager Maintenance Windows Tutorials (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DeregisterTaskFromMaintenanceWindow in *AWS CLI Command Reference*.

### `describe-activations`

The following code example shows how to use `describe-activations`.

**AWS CLI**

**To describe activations**

The following `describe-activations` example lists details about the activations in your AWS account.

```
aws ssm describe-activations
```

Output:

```
{
    "ActivationList": [
        {
            "ActivationId": "5743558d-563b-4457-8682-d16c3EXAMPLE",
            "Description": "Example1",
            "IamRole": "HybridWebServersRole,
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1584316800.0,
            "Expired": false,
            "CreatedDate": 1581954699.792
        },
        {
            "ActivationId": "3ee0322b-f62d-40eb-b672-13ebfEXAMPLE",
            "Description": "Example2",
            "IamRole": "HybridDatabaseServersRole",
            "RegistrationLimit": 5,
            "RegistrationsCount": 5,
            "ExpirationDate": 1580515200.0,
            "Expired": true,
            "CreatedDate": 1578064132.002
        },
```

```
    ]
}
```

For more information, see Step 4: Create a Managed-Instance Activation for a Hybrid Environment in the *AWS Systems Manager User Guide*.

- For API details, see DescribeActivations in *AWS CLI Command Reference*.

### `describe-association-execution-targets`

The following code example shows how to use `describe-association-execution-targets`.

**AWS CLI**

**To get details of an association execution**

The following `describe-association-execution-targets` example describes the specified association execution.

```
aws ssm describe-association-execution-targets \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --execution-id "7abb6378-a4a5-4f10-8312-0123456789ab"
```

Output:

```
{
    "AssociationExecutionTargets": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
            "ResourceId": "i-1234567890abcdef0",
            "ResourceType": "ManagedInstance",
            "Status": "Success",
            "DetailedStatus": "Success",
            "LastExecutionDate": 1550505538.497,
            "OutputSource": {
                "OutputSourceId": "97fff367-fc5a-4299-aed8-0123456789ab",
                "OutputSourceType": "RunCommand"
            }
        }
    ]
```

```
}
```

For more information, see Viewing association histories in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAssociationExecutionTargets in *AWS CLI Command Reference*.

### `describe-association-executions`

The following code example shows how to use `describe-association-executions`.

#### AWS CLI

**Example 1: To get details of all executions for an association**

The following `describe-association-executions` example describes all executions of the specified association.

```
aws ssm describe-association-executions \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "474925ef-1249-45a2-b93d-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505536.843,
            "ResourceCountByStatus": "{Success=1}"
        },
        ...
```

```
    ]
}
```

For more information, see Viewing association histories in the *AWS Systems Manager User Guide*.

**Example 2: To get details of all executions for an association after a specific date and time**

The following `describe-association-executions` example describes all executions of an association after the specified date and time.

```
aws ssm describe-association-executions \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --filters "Key=CreatedTime,Value=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

Output:

```
{
    "AssociationExecutions": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "474925ef-1249-45a2-b93d-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505827.119,
            "ResourceCountByStatus": "{Success=1}"
        },
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
            "Status": "Success",
            "DetailedStatus": "Success",
            "CreatedTime": 1550505536.843,
            "ResourceCountByStatus": "{Success=1}"
        },
        ...
    ]
}
```

For more information, see Viewing association histories in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAssociationExecutions in *AWS CLI Command Reference*.

## describe-association

The following code example shows how to use `describe-association`.

### AWS CLI

#### Example 1: To get details of an association

The following `describe-association` example describes the association for the specified association ID.

```
aws ssm describe-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-GatherSoftwareInventory",
        "AssociationVersion": "1",
        "Date": 1534864780.995,
        "LastUpdateAssociationDate": 1543235759.81,
        "Overview": {
            "Status": "Success",
            "AssociationStatusAggregatedCount": {
                "Success": 2
            }
        },
        "DocumentVersion": "$DEFAULT",
        "Parameters": {
            "applications": [
                "Enabled"
            ],
            "awsComponents": [
                "Enabled"
            ],
            "customInventory": [
                "Enabled"
            ],
            "files": [
                ""
            ],
            "instanceDetailedInformation": [
```

```
                "Enabled"
            ],
            "networkConfig": [
                "Enabled"
            ],
            "services": [
                "Enabled"
            ],
            "windowsRegistry": [
                ""
            ],
            "windowsRoles": [
                "Enabled"
            ],
            "windowsUpdates": [
                "Enabled"
            ]
        },
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "*"
                ]
            }
        ],
        "ScheduleExpression": "rate(24 hours)",
        "LastExecutionDate": 1550501886.0,
        "LastSuccessfulExecutionDate": 1550501886.0,
        "AssociationName": "Inventory-Association"
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

**Example 2: To get details of an association for a specific instance and document**

The following `describe-association` example describes the association between an instance and a document.

```
aws ssm describe-association \
```

```
    --instance-id "i-1234567890abcdef0" \
    --name "AWS-UpdateSSMAgent"
```

Output:

```
{
    "AssociationDescription": {
        "Status": {
            "Date": 1487876122.564,
            "Message": "Associated with AWS-UpdateSSMAgent",
            "Name": "Associated"
        },
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-1234567890abcdef0",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Associated",
            "AssociationStatusAggregatedCount": {
                "Pending": 1
            }
        },
        "AssociationId": "d8617c07-2079-4c18-9847-1234567890ab",
        "DocumentVersion": "$DEFAULT",
        "LastUpdateAssociationDate": 1487876122.564,
        "Date": 1487876122.564,
        "Targets": [
            {
                "Values": [
                    "i-1234567890abcdef0"
                ],
                "Key": "InstanceIds"
            }
        ]
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAssociation in *AWS CLI Command Reference*.

### `describe-automation-executions`

The following code example shows how to use `describe-automation-executions`.

#### AWS CLI

##### To describe an automation execution

The following `describe-automation-executions` example displays details about an Automation execution.

```
aws ssm describe-automation-executions \
    --filters Key=ExecutionId,Values=73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "AutomationExecutionMetadataList": [
        {
            "AutomationExecutionId": "73c8eef8-f4ee-4a05-820c-e354fEXAMPLE",
            "DocumentName": "AWS-StartEC2Instance",
            "DocumentVersion": "1",
            "AutomationExecutionStatus": "Success",
            "ExecutionStartTime": 1583737233.748,
            "ExecutionEndTime": 1583737234.719,
            "ExecutedBy": "arn:aws:sts::29884EXAMPLE:assumed-role/mw_service_role/
OrchestrationService",
            "LogFile": "",
            "Outputs": {},
            "Mode": "Auto",
            "Targets": [],
            "ResolvedTargets": {
                "ParameterValues": [],
                "Truncated": false
            },
            "AutomationType": "Local"
        }
    ]
}
```

For more information, see Running a Simple Automation Workflow in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAutomationExecutions in *AWS CLI Command Reference*.

### `describe-automation-step-executions`

The following code example shows how to use `describe-automation-step-executions`.

**AWS CLI**

**Example 1: To describe all steps for an automation execution**

The following `describe-automation-step-executions` example displays details about the steps of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "StepExecutions": [
        {
            "StepName": "startInstances",
            "Action": "aws:changeInstanceState",
            "ExecutionStartTime": 1583737234.134,
            "ExecutionEndTime": 1583737234.672,
            "StepStatus": "Success",
            "Inputs": {
                "DesiredState": "\"running\"",
                "InstanceIds": "[\"i-0cb99161f6EXAMPLE\"]"
            },
            "Outputs": {
                "InstanceStates": [
                    "running"
                ]
            },
            "StepExecutionId": "95e70479-cf20-4d80-8018-7e4e2EXAMPLE",
            "OverriddenParameters": {}
        }
    ]
}
```

**Example 2: To describe a specific step for an automation execution**

The following `describe-automation-step-executions` example displays details about a specific step of an Automation execution.

```
aws ssm describe-automation-step-executions \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE \
    --filters Key=StepExecutionId,Values=95e70479-cf20-4d80-8018-7e4e2EXAMPLE
```

For more information, see Running an Automation Workflow Step by Step (Command Line) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAutomationStepExecutions in *AWS CLI Command Reference*.

### `describe-available-patches`

The following code example shows how to use `describe-available-patches`.

#### AWS CLI

**To get available patches**

The following `describe-available-patches` example retrieves details about all available patches for Windows Server 2019 that have a MSRC severity of Critical.

```
aws ssm describe-available-patches \
    --filters "Key=PRODUCT,Values=WindowsServer2019"
 "Key=MSRC_SEVERITY,Values=Critical"
```

Output:

```
{
    "Patches": [
        {
            "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
            "ReleaseDate": 1544047205.0,
            "Title": "2018-11 Update for Windows Server 2019 for x64-based Systems
 (KB4470788)",
            "Description": "Install this update to resolve issues in Windows. For a
 complete listing of the issues that are included in this update, see the associated
 Microsoft Knowledge Base article for more information. After you install this item,
 you may have to restart your computer.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
            "Vendor": "Microsoft",
```

```
            "ProductFamily": "Windows",
            "Product": "WindowsServer2019",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4470788",
            "MsrcNumber": "",
            "Language": "All"
        },
        {
            "Id": "c96115e1-5587-4115-b851-22baa46a3f11",
            "ReleaseDate": 1549994410.0,
            "Title": "2019-02 Security Update for Adobe Flash Player for Windows
 Server 2019 for x64-based Systems (KB4487038)",
            "Description": "A security issue has been identified in a Microsoft
 software product that could affect your system. You can help protect your system
 by installing this update from Microsoft. For a complete listing of the issues that
 are included in this update, see the associated Microsoft Knowledge Base article.
 After you install this update, you may have to restart your system.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4487038",
            "Vendor": "Microsoft",

            "Product": "WindowsServer2019",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4487038",
            "MsrcNumber": "",
            "Language": "All"
        },
        ...
    ]
}
```

**To get details of a specific patch**

The following `describe-available-patches` example retrieves details about the specified patch.

```
aws ssm describe-available-patches \
    --filters "Key=PATCH_ID,Values=KB4480979"
```

Output:

```
{
```

```
    "Patches": [
        {
            "Id": "680861e3-fb75-432e-818e-d72e5f2be719",
            "ReleaseDate": 1546970408.0,
            "Title": "2019-01 Security Update for Adobe Flash Player for Windows
 Server 2016 for x64-based Systems (KB4480979)",
            "Description": "A security issue has been identified in a Microsoft
 software product that could affect your system. You can help protect your system
 by installing this update from Microsoft. For a complete listing of the issues that
 are included in this update, see the associated Microsoft Knowledge Base article.
 After you install this update, you may have to restart your system.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4480979",
            "Vendor": "Microsoft",
            "ProductFamily": "Windows",
            "Product": "WindowsServer2016",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Critical",
            "KbNumber": "KB4480979",
            "MsrcNumber": "",
            "Language": "All"
        }
    ]
}
```

For more information, see How Patch Manager Operations Work in the *AWS Systems Manager User Guide*.

- For API details, see DescribeAvailablePatches in *AWS CLI Command Reference*.

### `describe-document-permission`

The following code example shows how to use `describe-document-permission`.

#### AWS CLI

**To describe document permissions**

The following `describe-document-permission` example displays permission details about a Systems Manager document that is shared publicly.

```
aws ssm describe-document-permission \
    --name "Example" \
```

```
    --permission-type "Share"
```

Output:

```
{
    "AccountIds": [
        "all"
    ],
    "AccountSharingInfoList": [
        {
            "AccountId": "all",
            "SharedDocumentVersion": "$DEFAULT"
        }
    ]
}
```

For more information, see Share a Systems Manager Document in the *AWS Systems Manager User Guide*.

- For API details, see DescribeDocumentPermission in *AWS CLI Command Reference*.

### `describe-document`

The following code example shows how to use `describe-document`.

#### AWS CLI

**To display details of a document**

The following `describe-document` example displays details about a Systems Manager document in your AWS account.

```
aws ssm describe-document \
    --name "Example"
```

Output:

```
{
    "Document": {
        "Hash": "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
        "HashType": "Sha256",
        "Name": "Example",
```

```
        "Owner": "29884EXAMPLE",
        "CreatedDate": 1583257938.266,
        "Status": "Active",
        "DocumentVersion": "1",
        "Description": "Document Example",
        "Parameters": [
            {
                "Name": "AutomationAssumeRole",
                "Type": "String",
                "Description": "(Required) The ARN of the role that allows
 Automation to perform the actions on your behalf. If no role is specified, Systems
 Manager Automation uses your IAM permissions to execute this document.",
                "DefaultValue": ""
            },
            {
                "Name": "InstanceId",
                "Type": "String",
                "Description": "(Required) The ID of the Amazon EC2 instance.",
                "DefaultValue": ""
            }
        ],
        "PlatformTypes": [
            "Windows",
            "Linux"
        ],
        "DocumentType": "Automation",
        "SchemaVersion": "0.3",
        "LatestVersion": "1",
        "DefaultVersion": "1",
        "DocumentFormat": "YAML",
        "Tags": []
    }
}
```

For more information, see Creating Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see DescribeDocument in *AWS CLI Command Reference*.

### `describe-effective-instance-associations`

The following code example shows how to use `describe-effective-instance-associations`.

**AWS CLI**

**To get details of the effective associations for an instance**

The following `describe-effective-instance-associations` example retrieves details about the effective associations for an instance.

Command:

```
aws ssm describe-effective-instance-associations --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "Associations": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "InstanceId": "i-1234567890abcdef0",
            "Content": "{\n    \"schemaVersion\": \"1.2\",\n    \"description\":
 \"Update the Amazon SSM Agent to the latest version or specified version.\",\n
   \"parameters\": {\n        \"version\": {\n            \"default\": \"\",\n
         \"description\": \"(Optional) A specific version of the Amazon SSM Agent
 to install. If not specified, the agent will be updated to the latest version.\",
\n            \"type\": \"String\"\n        },\n        \"allowDowngrade\": {\n
           \"default\": \"false\",\n            \"description\": \"(Optional)
 Allow the Amazon SSM Agent service to be downgraded to an earlier version. If
 set to false, the service can be upgraded to newer versions only (default). If
 set to true, specify the earlier version.\",\n            \"type\": \"String\",
\n            \"allowedValues\": [\n                \"true\",\n
 \"false\"\n            ]\n        }\n    },\n    \"runtimeConfig\": {\n
 \"aws:updateSsmAgent\": {\n            \"properties\": [\n                {\n
              \"agentName\": \"amazon-ssm-agent\",\n                \"source\":
 \"https://s3.{Region}.amazonaws.com/amazon-ssm-{Region}/ssm-agent-manifest.json\",
\n                \"allowDowngrade\": \"{{ allowDowngrade }}\",\n
 \"targetVersion\": \"{{ version }}\"\n                }\n            ]\n        }\n
    }\n}\n",
            "AssociationVersion": "1"
        }
    ]
}
```

- For API details, see DescribeEffectiveInstanceAssociations in *AWS CLI Command Reference*.

## describe-effective-patches-for-patch-baseline

The following code example shows how to use `describe-effective-patches-for-patch-baseline`.

### AWS CLI

#### Example 1: To get all patches defined by a custom patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by a custom patch baseline in the current AWS account. Note that for a custom baseline, only the ID is required for `--baseline-id`.

```
aws ssm describe-effective-patches-for-patch-baseline \
    --baseline-id "pb-08b654cf9b9681f04"
```

Output:

```
{
    "EffectivePatches": [
        {
            "Patch": {
                "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
                "ReleaseDate": 1544047205.0,
                "Title": "2018-11 Update for Windows Server 2019 for x64-based
 Systems (KB4470788)",
                "Description": "Install this update to resolve issues in Windows.
 For a complete listing of the issues that are included in this update, see the
 associated Microsoft Knowledge Base article for more information. After you install
 this item, you may have to restart your computer.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Critical",
                "KbNumber": "KB4470788",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
```

```
                "ComplianceLevel": "CRITICAL",
                "ApprovalDate": 1544047205.0
            }
        },
        {
            "Patch": {
                "Id": "915a6b1a-f556-4d83-8f50-b2e75a9a7e58",
                "ReleaseDate": 1549994400.0,
                "Title": "2019-02 Cumulative Update for .NET Framework 3.5 and 4.7.2
 for Windows Server 2019 for x64 (KB4483452)",
                "Description": "A security issue has been identified in a Microsoft
 software product that could affect your system. You can help protect your system by
 installing this update from Microsoft. For a complete listing of the issues that
 are included in this update, see the associated Microsoft Knowledge Base article.
 After you install this update, you may have to restart your system.",
                "ContentUrl": "https://support.microsoft.com/en-us/kb/4483452",
                "Vendor": "Microsoft",
                "ProductFamily": "Windows",
                "Product": "WindowsServer2019",
                "Classification": "SecurityUpdates",
                "MsrcSeverity": "Important",
                "KbNumber": "KB4483452",
                "MsrcNumber": "",
                "Language": "All"
            },
            "PatchStatus": {
                "DeploymentStatus": "APPROVED",
                "ComplianceLevel": "CRITICAL",
                "ApprovalDate": 1549994400.0
            }
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

**Example 2: To get all patches defined by an AWS managed patch baseline**

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by an AWS managed patch baseline. Note that for an AWS managed baseline, the complete baseline ARN is required for `--baseline-id`

```
aws ssm describe-effective-patches-for-patch-baseline \
```

```
    --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed"
```

See example 1 for sample output.

For more information, see How Security Patches Are Selected in the *AWS Systems Manager User Guide*.

- For API details, see DescribeEffectivePatchesForPatchBaseline in *AWS CLI Command Reference*.

### `describe-instance-associations-status`

The following code example shows how to use `describe-instance-associations-status`.

#### AWS CLI

**To describe the status of an instance's associations**

This example shows details of the associations for an instance.

Command:

```
aws ssm describe-instance-associations-status --instance-id "i-1234567890abcdef0"
```

Output:

```
{
  "InstanceAssociationStatusInfos": [
      {
          "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
          "Name": "AWS-GatherSoftwareInventory",
          "DocumentVersion": "1",
          "AssociationVersion": "1",
          "InstanceId": "i-1234567890abcdef0",
          "ExecutionDate": 1550501886.0,
          "Status": "Success",
          "ExecutionSummary": "1 out of 1 plugin processed, 1 success, 0 failed, 0
 timedout, 0 skipped. ",
          "AssociationName": "Inventory-Association"
      },
      {
          "AssociationId": "5c5a31f6-6dae-46f9-944c-0123456789ab",
```

```
            "Name": "AWS-UpdateSSMAgent",
            "DocumentVersion": "1",
            "AssociationVersion": "1",
            "InstanceId": "i-1234567890abcdef0",
            "ExecutionDate": 1550505828.548,
            "Status": "Success",
            "DetailedStatus": "Success",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

- For API details, see DescribeInstanceAssociationsStatus in *AWS CLI Command Reference*.

### `describe-instance-information`

The following code example shows how to use `describe-instance-information`.

#### AWS CLI

**Example 1: To describe managed instance information**

The following `describe-instance-information` example retrieves details of each of your managed instances.

```
aws ssm describe-instance-information
```

**Example 2: To describe information about a specific managed instance**

The following `describe-instance-information` example shows details of the managed instance `i-028ea792daEXAMPLE`.

```
aws ssm describe-instance-information \
    --filters "Key=InstanceIds,Values=i-028ea792daEXAMPLE"
```

**Example 3: To describe information about managed instances with a specific tag key**

The following `describe-instance-information` example shows details for managed instances that have the tag key `DEV`.

```
aws ssm describe-instance-information \
```

```
    --filters "Key=tag-key,Values=DEV"
```

Output:

```
{
    "InstanceInformationList": [
        {
            "InstanceId": "i-028ea792daEXAMPLE",
            "PingStatus": "Online",
            "LastPingDateTime": 1582221233.421,
            "AgentVersion": "2.3.842.0",
            "IsLatestVersion": true,
            "PlatformType": "Linux",
            "PlatformName": "SLES",
            "PlatformVersion": "15.1",
            "ResourceType": "EC2Instance",
            "IPAddress": "192.0.2.0",
            "ComputerName": "ip-198.51.100.0.us-east-2.compute.internal",
            "AssociationStatus": "Success",
            "LastAssociationExecutionDate": 1582220806.0,
            "LastSuccessfulAssociationExecutionDate": 1582220806.0,
            "AssociationOverview": {
                "DetailedStatus": "Success",
                "InstanceAssociationStatusAggregatedCount": {
                    "Success": 2
                }
            }
        }
    ]
}
```

For more information, see Managed Instances in the *AWS Systems Manager User Guide*.

- For API details, see DescribeInstanceInformation in *AWS CLI Command Reference*.

### `describe-instance-patch-states-for-patch-group`

The following code example shows how to use `describe-instance-patch-states-for-patch-group`.

#### AWS CLI

**Example 1: To get the instance states for a patch group**

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states per-instance for the specified patch group.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
            "MissingCount": 2,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 2671,
            "NotApplicableCount": 400,
            "OperationStartTime": "2021-08-04T11:03:50.590000-07:00",

            "InstalledRejectedCount": 0,
            "MissingCount": 2,
```

```
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 2671,
            "NotApplicableCount": 400,
            "OperationStartTime": "2021-08-04T22:06:20.340000-07:00",
            "OperationEndTime": "2021-08-04T22:07:11.220000-07:00",
            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 0
        }
    ]
}
```

**Example 2: To get the instance states for a patch group with more than five missing patches**

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with more than five missing patches.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --filters Key=MissingCount,Type=GreaterThan,Values=5 \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "PatchGroup": "Production",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
            "OwnerInformation": "",
            "InstalledCount": 46,
            "InstalledOtherCount": 4,
            "InstalledPendingRebootCount": 1,
            "InstalledRejectedCount": 1,
            "MissingCount": 7,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 232,
            "NotApplicableCount": 654,
```

```
            "OperationStartTime": "2021-08-04T11:03:50.590000-07:00",
            "OperationEndTime": "2021-08-04T11:04:21.555000-07:00",
            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 1
        }
    ]
}
```

**Example 3: To get the instance states for a patch group with fewer than ten instances that require a reboot**

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with fewer than ten instances requiring a reboot.

```
aws ssm describe-instance-patch-states-for-patch-group \
    --filters Key=InstalledPendingRebootCount,Type=LessThan,Values=10 \
    --patch-group "Production"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-02573cafcfEXAMPLE",
            "BaselineId": "pb-0c10e65780EXAMPLE",
            "SnapshotId": "a3f5ff34-9bc4-4d2c-a665-4d1c1EXAMPLE",
            "PatchGroup": "Production",
            "OwnerInformation": "",
            "InstalledCount": 32,
            "InstalledOtherCount": 1,
            "InstalledPendingRebootCount": 4,
            "InstalledRejectedCount": 0,
            "MissingCount": 2,
            "FailedCount": 0,
            "UnreportedNotApplicableCount": 846,
            "NotApplicableCount": 212,
            "OperationStartTime": "2021-08-046T11:03:50.590000-07:00",
            "OperationEndTime": "2021-08-06T11:04:21.555000-07:00",
```

```
            "Operation": "Scan",
            "RebootOption": "NoReboot",
            "CriticalNonCompliantCount": 0,
            "SecurityNonCompliantCount": 1,
            "OtherNonCompliantCount": 0
        }
    ]
}
```

For more information, see Understanding patch compliance state values in the *AWS Systems Manager User Guide*.

- For API details, see DescribeInstancePatchStatesForPatchGroup in *AWS CLI Command Reference*.

### `describe-instance-patch-states`

The following code example shows how to use `describe-instance-patch-states`.

**AWS CLI**

**To get the patch summary states for instances**

This `describe-instance-patch-states` example gets the patch summary states for an instance.

```
aws ssm describe-instance-patch-states \
    --instance-ids "i-1234567890abcdef0"
```

Output:

```
{
    "InstancePatchStates": [
        {
            "InstanceId": "i-1234567890abcdef0",
            "PatchGroup": "my-patch-group",
            "BaselineId": "pb-0713accee01234567",
            "SnapshotId": "521c3536-930c-4aa9-950e-01234567abcd",
            "CriticalNonCompliantCount": 2,
            "SecurityNonCompliantCount": 2,
            "OtherNonCompliantCount": 1,
```

```
            "InstalledCount": 123,
            "InstalledOtherCount": 334,
            "InstalledPendingRebootCount": 0,
            "InstalledRejectedCount": 0,
            "MissingCount": 1,
            "FailedCount": 2,
            "UnreportedNotApplicableCount": 11,
            "NotApplicableCount": 2063,
            "OperationStartTime": "2021-05-03T11:00:56-07:00",
            "OperationEndTime": "2021-05-03T11:01:09-07:00",
            "Operation": "Scan",
            "LastNoRebootInstallOperationTime": "2020-06-14T12:17:41-07:00",
            "RebootOption": "RebootIfNeeded"
        }
    ]
}
```

For more information, see About Patch Compliance in the *AWS Systems Manager User Guide*.

- For API details, see DescribeInstancePatchStates in *AWS CLI Command Reference*.

### `describe-instance-patches`

The following code example shows how to use `describe-instance-patches`.

#### AWS CLI

**Example 1: To get the patch state details for an instance**

The following `describe-instance-patches` example retrieves details about the patches for the specified instance.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "Patches": [
        {
            "Title": "2019-01 Security Update for Adobe Flash Player for Windows
 Server 2016 for x64-based Systems (KB4480979)",
```

```
            "KBId": "KB4480979",
            "Classification": "SecurityUpdates",
            "Severity": "Critical",
            "State": "Installed",
            "InstalledTime": "2019-01-09T00:00:00+00:00"
        },
        {
            "Title": "",
            "KBId": "KB4481031",
            "Classification": "",
            "Severity": "",
            "State": "InstalledOther",
            "InstalledTime": "2019-02-08T00:00:00+00:00"
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

**Example 2: To get a list of patches in the Missing state for an instance**

The following `describe-instance-patches` example retrieves information about patches that are in the Missing state for the specified instance.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
    --filters Key=State,Values=Missing
```

Output:

```
{
    "Patches": [
        {
            "Title": "Windows Malicious Software Removal Tool x64 - February 2019
 (KB890830)",
            "KBId": "KB890830",
            "Classification": "UpdateRollups",
            "Severity": "Unspecified",
            "State": "Missing",
            "InstalledTime": "1970-01-01T00:00:00+00:00"
        },
        ...
    ],
```

```
    "NextToken": "--token string truncated--"
}
```

For more information, see About Patch Compliance States in the *AWS Systems Manager User Guide*.

**Example 3: To get a list of patches installed since a specified InstalledTime for an instance**

The following `describe-instance-patches` example retrieves information about patches installed since a specified time for the specified instance by combining the use of `--filters` and `--query`.

```
aws ssm describe-instance-patches \
    --instance-id "i-1234567890abcdef0" \
    --filters Key=State,Values=Installed \
    --query "Patches[?InstalledTime >= `2023-01-01T16:00:00`]"
```

Output:

```
{
    "Patches": [
        {
            "Title": "2023-03 Cumulative Update for Windows Server 2019 (1809) for
 x64-based Systems (KB5023702)",
            "KBId": "KB5023702",
            "Classification": "SecurityUpdates",
            "Severity": "Critical",
            "State": "Installed",
            "InstalledTime": "2023-03-16T11:00:00+00:00"
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

- For API details, see DescribeInstancePatches in *AWS CLI Command Reference*.

### `describe-inventory-deletions`

The following code example shows how to use `describe-inventory-deletions`.

## AWS CLI

### To get inventory deletions

This example retrieves details for inventory deletion operations.

Command:

```
aws ssm describe-inventory-deletions
```

Output:

```
{
  "InventoryDeletions": [
      {
          "DeletionId": "6961492a-8163-44ec-aa1e-01234567850",
          "TypeName": "Custom:RackInformation",
          "DeletionStartTime": 1550254911.0,
          "LastStatus": "InProgress",
          "LastStatusMessage": "The Delete is in progress",
          "DeletionSummary": {
              "TotalCount": 0,
              "RemainingCount": 0,
              "SummaryItems": []
          },
          "LastStatusUpdateTime": 1550254911.0
      },
      {
          "DeletionId": "d72ac9e8-1f60-4d40-b1c6-987654321c4d",
          "TypeName": "Custom:RackInfo",
          "DeletionStartTime": 1550254859.0,
          "LastStatus": "InProgress",
          "LastStatusMessage": "The Delete is in progress",
          "DeletionSummary": {
              "TotalCount": 1,
              "RemainingCount": 1,
              "SummaryItems": [
                  {
                      "Version": "1.0",
                      "Count": 1,
                      "RemainingCount": 1
                  }
              ]
```

```
            },
            "LastStatusUpdateTime": 1550254859.0
        }
    ]
}
```

**To get details of a specific inventory deletion**

This example retrieves details for a specific inventory deletion operation.

Command:

```
aws ssm describe-inventory-deletions --deletion-id "d72ac9e8-1f60-4d40-
b1c6-987654321c4d"
```

Output:

```
{
    "InventoryDeletions": [
        {
            "DeletionId": "d72ac9e8-1f60-4d40-b1c6-987654321c4d",
            "TypeName": "Custom:RackInfo",
            "DeletionStartTime": 1550254859.0,
            "LastStatus": "InProgress",
            "LastStatusMessage": "The Delete is in progress",
            "DeletionSummary": {
                "TotalCount": 1,
                "RemainingCount": 1,
                "SummaryItems": [
                    {
                        "Version": "1.0",
                        "Count": 1,
                        "RemainingCount": 1
                    }
                ]
            },
            "LastStatusUpdateTime": 1550254859.0
        }
    ]
}
```

- For API details, see DescribeInventoryDeletions in *AWS CLI Command Reference*.

### `describe-maintenance-window-execution-task-invocations`

The following code example shows how to use `describe-maintenance-window-execution-task-invocations`.

#### AWS CLI

**To get the specific task invocations performed for a maintenance window task execution**

The following `describe-maintenance-window-execution-task-invocations` example lists the invocations for the specified task executed as part of the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-task-invocations \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2a638355" \
    --task-id "ac0c6ae1-daa3-4a89-832e-d384503b6586"
```

Output:

```
{
    "WindowExecutionTaskInvocationIdentities": [
        {
            "Status": "SUCCESS",
            "Parameters": "{\"documentName\":\"AWS-RunShellScript\",\"instanceIds\":
[\"i-0000293ffd8c57862\"],\"parameters\":{\"commands\":[\"df\"]},\"maxConcurrency\":
\"1\",\"maxErrors\":\"1\"}",
            "InvocationId": "e274b6e1-fe56-4e32-bd2a-8073c6381d8b",
            "StartTime": 1487692834.723,
            "EndTime": 1487692834.871,
            "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2a638355",
            "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d384503b6586"
        }
    ]
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutionTaskInvocations in *AWS CLI Command Reference*.

### `describe-maintenance-window-execution-tasks`

The following code example shows how to use `describe-maintenance-window-execution-tasks`.

**AWS CLI**

**To list all tasks associated with a maintenance window execution**

The following `ssm describe-maintenance-window-execution-tasks` example lists the tasks associated with the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-tasks \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE"
```

Output:

```
{
    "WindowExecutionTaskIdentities": [
        {
            "Status": "SUCCESS",
            "TaskArn": "AWS-RunShellScript",
            "StartTime": 1487692834.684,
            "TaskType": "RUN_COMMAND",
            "EndTime": 1487692835.005,
            "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
            "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
        }
    ]
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutionTasks in *AWS CLI Command Reference*.

### `describe-maintenance-window-executions`

The following code example shows how to use `describe-maintenance-window-executions`.

## AWS CLI

### Example 1: To list all executions for a maintenance window

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34eEXAMPLE"
```

Output:

```
{
    "WindowExecutions": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowExecutionId": "6027b513-64fe-4cf0-be7d-1191aEXAMPLE",
            "Status": "IN_PROGRESS",
            "StartTime": "2021-08-04T11:00:00.000000-07:00"

        },
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowExecutionId": "ff75b750-4834-4377-8f61-b3cadEXAMPLE",
            "Status": "SUCCESS",
            "StartTime": "2021-08-03T11:00:00.000000-07:00",
            "EndTime": "2021-08-03T11:37:21.450000-07:00"
        },
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowExecutionId": "9fac7dd9-ff21-42a5-96ad-bbc4bEXAMPLE",
            "Status": "FAILED",
            "StatusDetails": "One or more tasks in the orchestration failed.",
            "StartTime": "2021-08-02T11:00:00.000000-07:00",
            "EndTime": "2021-08-02T11:22:36.190000-07:00"
        }
    ]
}
```

### Example 2: To list all executions for a maintenance window before a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window before the specified date.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=ExecutedBefore,Values=2021-08-03T00:00:00Z"
```

Output:

```
{
    "WindowExecutions": [
        {
        "WindowId": "mw-ab12cd34eEXAMPLE",
        "WindowExecutionId": "9fac7dd9-ff21-42a5-96ad-bbc4bEXAMPLE",
        "Status": "FAILED",
        "StatusDetails": "One or more tasks in the orchestration failed.",
        "StartTime": "2021-08-02T11:00:00.000000-07:00",
        "EndTime": "2021-08-02T11:22:36.190000-07:00"
    }
    ]
}
```

**Example 3: To list all executions for a maintenance window after a specified date**

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window after the specified date.

```
aws ssm describe-maintenance-window-executions \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=ExecutedAfter,Values=2021-08-04T00:00:00Z"
```

Output:

```
{
    "WindowExecutions": [
        {
        "WindowId": "mw-ab12cd34eEXAMPLE",
        "WindowExecutionId": "6027b513-64fe-4cf0-be7d-1191aEXAMPLE",
        "Status": "IN_PROGRESS",
        "StartTime": "2021-08-04T11:00:00.000000-07:00"
        }
    ]
}
```

For more information, see View information about tasks and task executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowExecutions in *AWS CLI Command Reference*.

### `describe-maintenance-window-schedule`

The following code example shows how to use `describe-maintenance-window-schedule`.

**AWS CLI**

**Example 1: To list upcoming executions for a maintenance window**

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-schedule \
    --window-id mw-ab12cd34eEXAMPLE
```

Output:

```
{
    "ScheduledWindowExecutions": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "Name": "My-First-Maintenance-Window",
            "ExecutionTime": "2020-02-19T16:00Z"
        },
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "Name": "My-First-Maintenance-Window",
            "ExecutionTime": "2020-02-26T16:00Z"
        },
        ...
    ]
}
```

**Example 2: To list all upcoming executions for a maintenance window before a specified date**

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window that occur before the specified date.

```
aws ssm describe-maintenance-window-schedule \
    --window-id mw-0ecb1226dd7b2e9a6 \
    --filters "Key=ScheduledBefore,Values=2020-02-15T06:00:00Z"
```

**Example 3: To list all upcoming executions for a maintenance window after a specified date**

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window that occur after the specified date.

```
aws ssm describe-maintenance-window-schedule \
    --window-id mw-0ecb1226dd7b2e9a6 \
    --filters "Key=ScheduledAfter,Values=2020-02-15T06:00:00Z"
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowSchedule in *AWS CLI Command Reference*.

## `describe-maintenance-window-targets`

The following code example shows how to use `describe-maintenance-window-targets`.

### AWS CLI

**Example 1: To list all targets for a Maintenance Window**

The following `describe-maintenance-window-targets` example lists all of the targets for a maintenance window.

```
aws ssm describe-maintenance-window-targets \
    --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{
    "Targets": [
        {
            "ResourceType": "INSTANCE",
            "OwnerInformation": "Single instance",
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "Targets": [
                {
```

```
                    "Values": [
                        "i-0000293ffdEXAMPLE"
                    ],
                    "Key": "InstanceIds"
                }
            ],
            "WindowTargetId": "350d44e6-28cc-44e2-951f-4b2c9EXAMPLE"
        },
        {
            "ResourceType": "INSTANCE",
            "OwnerInformation": "Two instances in a list",
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "Targets": [
                {
                    "Values": [
                        "i-0000293ffdEXAMPLE",
                        "i-0cb2b964d3EXAMPLE"
                    ],
                    "Key": "InstanceIds"
                }
            ],
            "WindowTargetId": "e078a987-2866-47be-bedd-d9cf4EXAMPLE"
        }
    ]
}
```

**Example 2: To list all targets for a maintenance window matching a specific owner information value**

This `describe-maintenance-window-targets` example lists all of the targets for a maintenance window with a specific value.

```
aws ssm describe-maintenance-window-targets \
    --window-id "mw-0ecb1226ddEXAMPLE" \
    --filters "Key=OwnerInformation,Values=CostCenter1"
```

Output:

```
{
    "Targets": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "WindowTargetId": "da89dcc3-7f9c-481d-ba2b-edcb7d0057f9",
```

```
            "ResourceType": "INSTANCE",
            "Targets": [
                {
                    "Key": "tag:Environment",
                    "Values": [
                        "Prod"
                    ]
                }
            ],
            "OwnerInformation": "CostCenter1",
            "Name": "ProdTarget1"
        }
    ]
}
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowTargets in *AWS CLI Command Reference*.

### `describe-maintenance-window-tasks`

The following code example shows how to use `describe-maintenance-window-tasks`.

#### AWS CLI

**Example 1: To list all tasks for a maintenance window**

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "WindowTaskId": "018b31c3-2d77-4b9e-bd48-c91edEXAMPLE",
            "TaskArn": "AWS-RestartEC2Instance",
            "TaskParameters": {},
```

```
            "Type": "AUTOMATION",
            "Description": "Restarting EC2 Instance for maintenance",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "My-Automation-Example-Task",
            "Priority": 0,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ]
        },
        {
            "WindowId": "mw-06cf17cbefEXAMPLE",
            "WindowTaskId": "1943dee0-0a17-4978-9bf4-3cc2fEXAMPLE",
            "TaskArn": "AWS-DisableS3BucketPublicReadWrite",
            "TaskParameters": {},
            "Type": "AUTOMATION",
            "Description": "Automation task to disable read/write access on public
 S3 buckets",
            "MaxConcurrency": "10",
            "MaxErrors": "5",
            "Name": "My-Disable-S3-Public-Read-Write-Access-Automation-Task",
            "Priority": 0,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ]
        }
    ]
}
```

**Example 2: To list all tasks for a maintenance window that invokes the AWS-RunPowerShellScript command document**

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that invokes the `AWS-RunPowerShellScript` command document.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=TaskArn,Values=AWS-RunPowerShellScript"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
            "TaskArn": "AWS-RunPowerShellScript",
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 1,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyTask"
        }
    ]
}
```

**Example 3: To list all tasks for a maintenance window that have a Priority of 3**

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that have a `Priority` of `3`.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=Priority,Values=3"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
            "TaskArn": "AWS-RunPowerShellScript",
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 3,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyRunCommandTask"
        },
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowTaskId": "ee45feff-ad65-4a6c-b478-5cab8EXAMPLE",
            "TaskArn": "AWS-RestartEC2Instance",
            "Type": "AUTOMATION",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
```

```
                }
            ],
            "TaskParameters": {},
            "Priority": 3,
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "10",
            "MaxErrors": "5",
            "Name": "My-Automation-Task",
            "Description": "A description for my Automation task"
        }
    ]
}
```

**Example 4: To list all tasks for a maintenance window that have a Priority of 1 and use Run Command**

This `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that have a `Priority` of 1 and use Run Command.

```
aws ssm describe-maintenance-window-tasks \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --filters "Key=Priority,Values=1" "Key=TaskType,Values=RUN_COMMAND"
```

Output:

```
{
    "Tasks": [
        {
            "WindowId": "mw-ab12cd34eEXAMPLE",
            "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
            "TaskArn": "AWS-RunPowerShellScript",
            "Type": "RUN_COMMAND",
            "Targets": [
                {
                    "Key": "WindowTargetIds",
                    "Values": [
                        "da89dcc3-7f9c-481d-ba2b-edcb7EXAMPLE"
                    ]
                }
            ],
            "TaskParameters": {},
            "Priority": 1,
```

```
            "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Name": "MyRunCommandTask"
        }
    ]
}
```

For more information, see View information about maintenance windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowTasks in *AWS CLI Command Reference*.

### `describe-maintenance-windows-for-target`

The following code example shows how to use `describe-maintenance-windows-for-target`.

#### AWS CLI

**To list all maintenance windows associated with a specific instance**

The following `describe-maintenance-windows-for-target` example lists the maintenance windows that have targets or tasks associated with the specified instance.

```
aws ssm describe-maintenance-windows-for-target \
    --targets Key=InstanceIds,Values=i-1234567890EXAMPLE \
    --resource-type INSTANCE
```

Output:

```
{
    "WindowIdentities": [
        {
            "WindowId": "mw-0c5ed765acEXAMPLE",
            "Name": "My-First-Maintenance-Window"
        }
    ]
}
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindowsForTarget in *AWS CLI Command Reference*.

### `describe-maintenance-windows`

The following code example shows how to use `describe-maintenance-windows`.

**AWS CLI**

**Example 1: To list all maintenance windows**

The following `describe-maintenance-windows` example lists all maintenance windows in your AWS account in the current Region.

```
aws ssm describe-maintenance-windows
```

Output:

```
{
    "WindowIdentities": [
        {
            "WindowId": "mw-0ecb1226ddEXAMPLE",
            "Name": "MyMaintenanceWindow-1",
            "Enabled": true,
            "Duration": 2,
            "Cutoff": 1,
            "Schedule": "rate(180 minutes)",
            "NextExecutionTime": "2020-02-12T23:19:20.596Z"
        },
        {
            "WindowId": "mw-03eb9db428EXAMPLE",
            "Name": "MyMaintenanceWindow-2",
            "Enabled": true,
            "Duration": 3,
            "Cutoff": 1,
            "Schedule": "rate(7 days)",
            "NextExecutionTime": "2020-02-17T23:22:00.956Z"
        },
    ]
}
```

**Example 2: To list all enabled maintenance windows**

The following `describe-maintenance-windows` example lists all enabled maintenance windows.

```
aws ssm describe-maintenance-windows \
    --filters "Key=Enabled,Values=true"
```

**Example 3: To list maintenance windows matching a specific name**

This `describe-maintenance-windows` example lists all maintenance windows with the specified name.

```
aws ssm describe-maintenance-windows \
    --filters "Key=Name,Values=MyMaintenanceWindow"
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see DescribeMaintenanceWindows in *AWS CLI Command Reference*.

### `describe-ops-items`

The following code example shows how to use `describe-ops-items`.

**AWS CLI**

**To list a set of OpsItems**

The following `describe-ops-items` example displays a list of all open OpsItems in your AWS account.

```
aws ssm describe-ops-items \
    --ops-item-filters "Key=Status,Values=Open,Operator=Equal"
```

Output:

```
{
    "OpsItemSummaries": [
        {
            "CreatedBy": "arn:aws:sts::111222333444:assumed-role/OpsItem-CWE-Role/

```

```
                "/aws/resources": {
                    "Value": "[{\"arn\":\"arn:aws:ec2:us-
east-2:111222333444:instance/i-0beccfbc02EXAMPLE\"}]",
                    "Type": "SearchableString"
                }
            },
            "Category": "Availability",
            "Severity": "3"
        }
    ]
}
```

For more information, see Working with OpsItems in the *AWS Systems Manager User Guide*.

- For API details, see DescribeOpsItems in *AWS CLI Command Reference*.

### `describe-parameters`

The following code example shows how to use `describe-parameters`.

#### AWS CLI

**Example 1: To list all parameters**

The following `describe-parameters` example lists all parameters in the current AWS account and Region.

```
aws ssm describe-parameters
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MySecureStringParameter",
            "Type": "SecureString",
            "KeyId": "alias/aws/ssm",
            "LastModifiedDate": 1582155479.205,
            "LastModifiedUser": "arn:aws:sts::111222333444:assumed-role/Admin/
Richard-Roe-Managed",
            "Description": "This is a SecureString parameter",
            "Version": 2,
            "Tier": "Advanced",
```

```
            "Policies": [
                {
                    "PolicyText": "{\"Type\":\"Expiration\",\"Version\":\"1.0\",
\"Attributes\":{\"Timestamp\":\"2020-07-07T22:30:00Z\"}}",
                    "PolicyType": "Expiration",
                    "PolicyStatus": "Pending"
                },
                {
                    "PolicyText": "{\"Type\":\"ExpirationNotification\",\"Version\":
\"1.0\",\"Attributes\":{\"Before\":\"12\",\"Unit\":\"Hours\"}}",
                    "PolicyType": "ExpirationNotification",
                    "PolicyStatus": "Pending"
                }
            ]
        },
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "LastModifiedDate": 1582154764.222,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is a StringList parameter",
            "Version": 1,
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582154711.976,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Alejandro-Rosalez",
            "Description": "This is a String parameter",
            "Version": 1,
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "latestAmi",
            "Type": "String",
            "LastModifiedDate": 1580862415.521,
            "LastModifiedUser": "arn:aws:sts::111222333444:assumed-role/lambda-ssm-
role/Automation-UpdateSSM-Param",
            "Version": 3,
            "Tier": "Standard",
            "Policies": []
```

```
        }
    ]
}
```

**Example 2: To list all parameters matching specific metadata**

This `describe-parameters` example lists all parameters matching a filter.

aws ssm describe-parameters --filters "Key=Type,Values=StringList"

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "LastModifiedDate": 1582154764.222,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is a StringList parameter",
            "Version": 1,
            "Tier": "Standard",
            "Policies": []
        }
    ]
}
```

For more information, see Searching for Systems Manager Parameters in the *AWS Systems Manager User Guide*.

- For API details, see DescribeParameters in *AWS CLI Command Reference*.

## `describe-patch-baselines`

The following code example shows how to use `describe-patch-baselines`.

### AWS CLI

**Example 1: To list all patch baselines**

The following `describe-patch-baselines` example retreives details for all patch baselines in your account in the current Region.

```
aws ssm describe-patch-baselines
```

Output:

```
{
    "BaselineIdentities": [
        {
            "BaselineName": "AWS-SuseDefaultPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "Default Patch Baseline for Suse Provided by
 AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0123fdb36e334a3b2",
            "OperatingSystem": "SUSE"
        },
        {
            "BaselineName": "AWS-DefaultPatchBaseline",
            "DefaultBaseline": false,
            "BaselineDescription": "Default Patch Baseline Provided by AWS.",
            "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed",
            "OperatingSystem": "WINDOWS"
        },
        ...
        {
            "BaselineName": "MyWindowsPatchBaseline",
            "DefaultBaseline": true,
            "BaselineDescription": "My patch baseline for EC2 instances for Windows
 Server",
            "BaselineId": "pb-0ad00e0dd7EXAMPLE",
            "OperatingSystem": "WINDOWS"
        }
    ]
}
```

**Example 2: To list all patch baselines provided by AWS**

The following `describe-patch-baselines` example lists all patch baselines provided by AWS.

```
aws ssm describe-patch-baselines \
    --filters "Key=OWNER,Values=[AWS]"
```

**Example 3: To list all patch baselines that you own**

The following `describe-patch-baselines` example lists all custom patch baselines created in your account in the current Region.

```
aws ssm describe-patch-baselines \
    --filters "Key=OWNER,Values=[Self]"
```

For more information, see About Predefined and Custom Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchBaselines in *AWS CLI Command Reference*.

## `describe-patch-group-state`

The following code example shows how to use `describe-patch-group-state`.

### AWS CLI

**To get the state of a patch group**

The following `describe-patch-group-state` example retrieves the high-level patch compliance summary for a patch group.

```
aws ssm describe-patch-group-state \
    --patch-group "Production"
```

Output:

```
{
    "Instances": 21,
    "InstancesWithCriticalNonCompliantPatches": 1,
    "InstancesWithFailedPatches": 2,
    "InstancesWithInstalledOtherPatches": 3,
    "InstancesWithInstalledPatches": 21,
    "InstancesWithInstalledPendingRebootPatches": 2,
    "InstancesWithInstalledRejectedPatches": 1,
    "InstancesWithMissingPatches": 3,
    "InstancesWithNotApplicablePatches": 4,
    "InstancesWithOtherNonCompliantPatches": 1,
    "InstancesWithSecurityNonCompliantPatches": 1,
```

```
    "InstancesWithUnreportedNotApplicablePatches": 2
}
```

For more information, see About patch groups <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-patchgroups.html>__ and Understanding patch compliance state values in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchGroupState in *AWS CLI Command Reference*.

### `describe-patch-groups`

The following code example shows how to use `describe-patch-groups`.

#### AWS CLI

**To display patch group registrations**

The following `describe-patch-groups` example lists the patch group registrations.

```
aws ssm describe-patch-groups
```

Output:

```
{
    "Mappings": [
        {
            "PatchGroup": "Production",
            "BaselineIdentity": {
                "BaselineId": "pb-0123456789abcdef0",
                "BaselineName": "ProdPatching",
                "OperatingSystem": "WINDOWS",
                "BaselineDescription": "Patches for Production",
                "DefaultBaseline": false
            }
        },
        {
            "PatchGroup": "Development",
            "BaselineIdentity": {
                "BaselineId": "pb-0713accee01234567",
                "BaselineName": "DevPatching",
                "OperatingSystem": "WINDOWS",
                "BaselineDescription": "Patches for Development",
```

```
                "DefaultBaseline": true
            }
        },
        ...
    ]
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchGroups in *AWS CLI Command Reference*.

### `describe-patch-properties`

The following code example shows how to use `describe-patch-properties`.

#### AWS CLI

**To list the Amazon Linux patch availability**

The following `describe-patch-properties` example displays a list of the Amazon Linux products for which patches are available in your AWS account.

```
aws ssm describe-patch-properties \
    --operating-system AMAZON_LINUX \
    --property PRODUCT
```

Output:

```
{
    "Properties": [
        {
            "Name": "AmazonLinux2012.03"
        },
        {
            "Name": "AmazonLinux2012.09"
        },
        {
            "Name": "AmazonLinux2013.03"
        },
        {
```

```
            "Name": "AmazonLinux2013.09"
        },
        {
            "Name": "AmazonLinux2014.03"
        },
        {
            "Name": "AmazonLinux2014.09"
        },
        {
            "Name": "AmazonLinux2015.03"
        },
        {
            "Name": "AmazonLinux2015.09"
        },
        {
            "Name": "AmazonLinux2016.03"
        },
        {
            "Name": "AmazonLinux2016.09"
        },
        {
            "Name": "AmazonLinux2017.03"
        },
        {
            "Name": "AmazonLinux2017.09"
        },
        {
            "Name": "AmazonLinux2018.03"
        }
    ]
}
```

For more information, see About Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see DescribePatchProperties in *AWS CLI Command Reference*.

## `describe-sessions`

The following code example shows how to use `describe-sessions`.

### AWS CLI

#### Example 1: To list all active Session Manager sessions

This `describe-sessions` example retrieves a list of the active sessions created most recently (both connected and disconnected sessions) over the past 30 days that were started by the specified user. This command returns only results for connections to targets initiated using Session Manager. It does not list connections made through other means, such as Remote Desktop Connections or SSH.

```
aws ssm describe-sessions \
    --state "Active" \
    --filters "key=Owner,value=arn:aws:sts::123456789012:assumed-role/Administrator/
Shirley-Rodriguez"
```

Output:

```
{
    "Sessions": [
        {
            "SessionId": "John-07a16060613c408b5",
            "Target": "i-1234567890abcdef0",
            "Status": "Connected",
            "StartDate": 1550676938.352,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-
Rodriguez",
            "OutputUrl": {}
        },
        {
            "SessionId": "John-01edf534b8b56e8eb",
            "Target": "i-9876543210abcdef0",
            "Status": "Connected",
            "StartDate": 1550676842.194,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-
Rodriguez",
            "OutputUrl": {}
        }
    ]
}
```

**Example 2: To list all terminated Session Manager sessions**

This `describe-sessions` example retrieves a list of the most recently terminated sessions from the past 30 days for all users.

```
aws ssm describe-sessions \
```

```
    --state "History"
```

Output:

```
{
    "Sessions": [
        {
            "SessionId": "Mary-Major-0022b1eb2b0d9e3bd",
            "Target": "i-1234567890abcdef0",
            "Status": "Terminated",
            "StartDate": 1550520701.256,
            "EndDate": 1550521931.563,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Mary-
Major"
        },
        {
            "SessionId": "Jane-Roe-0db53f487931ed9d4",
            "Target": "i-9876543210abcdef0",
            "Status": "Terminated",
            "StartDate": 1550161369.149,
            "EndDate": 1550162580.329,
            "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Jane-Roe"
        },
        ...
    ],
    "NextToken": "--token string truncated--"
}
```

For more information, see View Session History in the *AWS Systems Manager User Guide*.

- For API details, see DescribeSessions in *AWS CLI Command Reference*.

## `disassociate-ops-item-related-item`

The following code example shows how to use `disassociate-ops-item-related-item`.

### AWS CLI

#### To delete a related item association

The following `disassociate-ops-item-related-item` example deletes the association between the OpsItem and a related item.

```
aws ssm disassociate-ops-item-related-item \
    --ops-item-id "oi-f99f2EXAMPLE" \
    --association-id "e2036148-cccb-490e-ac2a-390e5EXAMPLE"
```

This command produces no output.

For more information, see Working with Incident Manager incidents in OpsCenter in the *AWS Systems Manager User Guide*.

- For API details, see DisassociateOpsItemRelatedItem in *AWS CLI Command Reference*.

### `get-automation-execution`

The following code example shows how to use `get-automation-execution`.

#### AWS CLI

**To display details about an automation execution**

The following `get-automation-execution` example displays detailed information about an Automation execution.

```
aws ssm get-automation-execution \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
    "AutomationExecution": {
        "AutomationExecutionId": "73c8eef8-f4ee-4a05-820c-e354fEXAMPLE",
        "DocumentName": "AWS-StartEC2Instance",
        "DocumentVersion": "1",
        "ExecutionStartTime": 1583737233.748,
        "ExecutionEndTime": 1583737234.719,
        "AutomationExecutionStatus": "Success",
        "StepExecutions": [
            {
                "StepName": "startInstances",
                "Action": "aws:changeInstanceState",
                "ExecutionStartTime": 1583737234.134,
                "ExecutionEndTime": 1583737234.672,
```

```
                "StepStatus": "Success",
                "Inputs": {
                    "DesiredState": "\"running\"",
                    "InstanceIds": "[\"i-0cb99161f6EXAMPLE\"]"
                },
                "Outputs": {
                    "InstanceStates": [
                        "running"
                    ]
                },
                "StepExecutionId": "95e70479-cf20-4d80-8018-7e4e2EXAMPLE",
                "OverriddenParameters": {}
            }
        ],
        "StepExecutionsTruncated": false,
        "Parameters": {
            "AutomationAssumeRole": [
                ""
            ],
            "InstanceId": [
                "i-0cb99161f6EXAMPLE"
            ]
        },
        "Outputs": {},
        "Mode": "Auto",
        "ExecutedBy": "arn:aws:sts::29884EXAMPLE:assumed-role/mw_service_role/
OrchestrationService",
        "Targets": [],
        "ResolvedTargets": {
            "ParameterValues": [],
            "Truncated": false
        }
    }
}
```

For more information, see Walkthrough: Patch a Linux AMI (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetAutomationExecution in *AWS CLI Command Reference*.

### `get-calendar-state`

The following code example shows how to use `get-calendar-state`.

**AWS CLI**

**Example 1: To get the current state of a change calendar**

This `get-calendar-state` example returns the state of a calendar at the current time. Because the example doesn't specify a time, the current state of the calendar is reported.

```
aws ssm get-calendar-state \
    --calendar-names "MyCalendar"
```

Output:

```
{
    "State": "OPEN",
    "AtTime": "2020-02-19T22:28:51Z",
    "NextTransitionTime": "2020-02-24T21:15:19Z"
}
```

**Example 2: To get the state of a change calendar at a specified time**

This `get-calendar-state` example returns the state of a calendar at the specified time.

```
aws ssm get-calendar-state \
    --calendar-names "MyCalendar" \
    --at-time "2020-07-19T21:15:19Z"
```

Output:

```
{
    "State": "CLOSED",
    "AtTime": "2020-07-19T21:15:19Z"
}
```

For more information, see Get the State of the Change Calendar in the *AWS Systems Manager User Guide*.

- For API details, see GetCalendarState in *AWS CLI Command Reference*.

## `get-command-invocation`

The following code example shows how to use `get-command-invocation`.

**AWS CLI**

**To display the details of a command invocation**

The following `get-command-invocation` example lists all the invocations of the specified command on the specified instance.

```
aws ssm get-command-invocation \
    --command-id "ef7fdfd8-9b57-4151-a15c-db9a12345678" \
    --instance-id "i-1234567890abcdef0"
```

Output:

```
{
    "CommandId": "ef7fdfd8-9b57-4151-a15c-db9a12345678",
    "InstanceId": "i-1234567890abcdef0",
    "Comment": "b48291dd-ba76-43e0-b9df-13e11ddaac26:6960febb-2907-4b59-8e1a-
d6ce8EXAMPLE",
    "DocumentName": "AWS-UpdateSSMAgent",
    "DocumentVersion": "",
    "PluginName": "aws:updateSsmAgent",
    "ResponseCode": 0,
    "ExecutionStartDateTime": "2020-02-19T18:18:03.419Z",
    "ExecutionElapsedTime": "PT0.091S",
    "ExecutionEndDateTime": "2020-02-19T18:18:03.419Z",
    "Status": "Success",
    "StatusDetails": "Success",
    "StandardOutputContent": "Updating amazon-ssm-agent from 2.3.842.0 to latest
\nSuccessfully downloaded https://s3.us-east-2.amazonaws.com/amazon-ssm-us-east-2/
ssm-agent-manifest.json\namazon-ssm-agent 2.3.842.0 has already been installed,
 update skipped\n",
    "StandardOutputUrl": "",
    "StandardErrorContent": "",
    "StandardErrorUrl": "",
    "CloudWatchOutputConfig": {
        "CloudWatchLogGroupName": "",
        "CloudWatchOutputEnabled": false
    }
}
```

For more information, see Understanding Command Statuses in the *AWS Systems Manager User Guide*.

- For API details, see GetCommandInvocation in *AWS CLI Command Reference*.

### `get-connection-status`

The following code example shows how to use `get-connection-status`.

**AWS CLI**

**To display the connection status of a managed instance**

This `get-connection-status` example returns the connection status of the specified managed instance.

```
aws ssm get-connection-status \
    --target i-1234567890abcdef0
```

Output:

```
{
    "Target": "i-1234567890abcdef0",
    "Status": "connected"
}
```

- For API details, see GetConnectionStatus in *AWS CLI Command Reference*.

### `get-default-patch-baseline`

The following code example shows how to use `get-default-patch-baseline`.

**AWS CLI**

**Example 1: To display the default Windows patch baseline**

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Windows Server.

```
aws ssm get-default-patch-baseline
```

Output:

```
{
  "BaselineId": "pb-0713accee01612345",
  "OperatingSystem": "WINDOWS"
}
```

**Example 2: To display the default patch baseline for Amazon Linux**

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Amazon Linux.

```
aws ssm get-default-patch-baseline \
    --operating-system AMAZON_LINUX
```

Output:

```
{
    "BaselineId": "pb-047c6eb9c8fc12345",
    "OperatingSystem": "AMAZON_LINUX"
}
```

For more information, see About Predefined and Custom Patch Baselines <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-baselines.html>__ and Set an Existing Patch Baseline as the Default in the *AWS Systems Manager User Guide*.

- For API details, see GetDefaultPatchBaseline in *AWS CLI Command Reference*.

## `get-deployable-patch-snapshot-for-instance`

The following code example shows how to use `get-deployable-patch-snapshot-for-instance`.

### AWS CLI

**To retrieve the current snapshot for the patch baseline an instance uses**

The following `get-deployable-patch-snapshot-for-instance` example retrieves details for the current snapshot for the specified patch baseline used by an instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, run `aws configure` and specify only the Region of your instance. Leave the `Access Key` and `Secret Key` fields empty.

Tip: Use uuidgen to generate a snapshot-id.

```
aws ssm get-deployable-patch-snapshot-for-instance \
    --instance-id "i-1234567890abcdef0" \
    --snapshot-id "521c3536-930c-4aa9-950e-01234567abcd"
```

Output:

```
{
    "InstanceId": "i-1234567890abcdef0",
    "SnapshotId": "521c3536-930c-4aa9-950e-01234567abcd",
    "Product": "AmazonLinux2018.03",
    "SnapshotDownloadUrl": "https://patch-baseline-snapshot-us-
east-1.s3.amazonaws.com/
ed85194ef27214f5984f28b4d664d14f7313568fea7d4b6ac6c10ad1f729d7e7-773304212436/
AMAZON_LINUX-521c3536-930c-4aa9-950e-01234567abcd?X-Amz-Algorithm=AWS4-HMAC-
SHA256&X-Amz-Date=20190215T164031Z&X-Amz-SignedHeaders=host&X-Amz-Expires=86400&X-
Amz-Credential=AKIAJ5C56P35AEBRX2QQ%2F20190215%2Fus-east-1%2Fs3%2Faws4_request&X-
Amz-Signature=efaaaf6e3878e77f48a6697e015efdbda9c426b09c5822055075c062f6ad2149"
}
```

For more information, see Parameter name: Snapshot ID in the *AWS Systems Manager User Guide*.

- For API details, see GetDeployablePatchSnapshotForInstance in *AWS CLI Command Reference*.

### `get-document`

The following code example shows how to use `get-document`.

#### AWS CLI

##### To get document content

The following `get-document` example displays the content of a Systems Manager document.

```
aws ssm get-document \
    --name "AWS-RunShellScript"
```

Output:

```
{
    "Name": "AWS-RunShellScript",
    "DocumentVersion": "1",
    "Status": "Active",
    "Content": "{\n    \"schemaVersion\":\"1.2\",\n    \"description\":\"Run a
 shell script or specify the commands to run.\",\n    \"parameters\":{\n
 \"commands\":{\n            \"type\":\"StringList\",\n            \"description
\":\"(Required) Specify a shell script or a command to run.\",\n
 \"minItems\":1,\n            \"displayType\":\"textarea\"\n        },\n
 \"workingDirectory\":{\n            \"type\":\"String\",\n            \"default
\":\"\",\n            \"description\":\"(Optional) The path to the working
 directory on your instance.\",\n            \"maxChars\":4096\n        },\n
   \"executionTimeout\":{\n            \"type\":\"String\",\n            \"default
\":\"3600\",\n            \"description\":\"(Optional) The time in seconds for a
 command to complete before it is considered to have failed. Default is 3600 (1
 hour). Maximum is 172800 (48 hours).\",\n            \"allowedPattern\":\"([1-9]
[0-9]{0,4})|(1[0-6][0-9]{4})|(17[0-1][0-9]{3})|(172[0-7][0-9]{2})|(172800)\"\n
        }\n    },\n    \"runtimeConfig\":{\n        \"aws:runShellScript\":{\n
            \"properties\":[\n                {\n                    \"id\":
\"0.aws:runShellScript\",\n                    \"runCommand\":\"{{ commands }}\",\n
                    \"workingDirectory\":\"{{ workingDirectory }}\",\n
       \"timeoutSeconds\":\"{{ executionTimeout }}\"\n                }\n
  ]\n        }\n    }\n}\n",
    "DocumentType": "Command",
    "DocumentFormat": "JSON"
}
```

For more information, see AWS Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see GetDocument in *AWS CLI Command Reference*.

## `get-inventory-schema`

The following code example shows how to use `get-inventory-schema`.

### AWS CLI

#### To view your inventory schema

This example returns a list of inventory type names for the account.

Command:

```
aws ssm get-inventory-schema
```

Output:

```
{
  "Schemas": [
      {
          "TypeName": "AWS:AWSComponent",
          "Version": "1.0",
          "Attributes": [
              {
                  "Name": "Name",
                  "DataType": "STRING"
              },
              {
                  "Name": "ApplicationType",
                  "DataType": "STRING"
              },
              {
                  "Name": "Publisher",
                  "DataType": "STRING"
              },
              {
                  "Name": "Version",
                  "DataType": "STRING"
              },
              {
                  "Name": "InstalledTime",
                  "DataType": "STRING"
              },
              {
                  "Name": "Architecture",
                  "DataType": "STRING"
              },
              {
                  "Name": "URL",
                  "DataType": "STRING"
              }
          ]
      },
      ...
  ],
  "NextToken": "--token string truncated--"
```

```
}
```

**To view the inventory schema for a specific inventory type**

This example return the inventory schema for a the AWS:AWSComponent inventory type.

Command:

```
aws ssm get-inventory-schema --type-name "AWS:AWSComponent"
```

- For API details, see GetInventorySchema in *AWS CLI Command Reference*.

## `get-inventory`

The following code example shows how to use `get-inventory`.

### AWS CLI

**To view your inventory**

This example gets the custom metadata for your inventory.

Command:

```
aws ssm get-inventory
```

Output:

```
{
  "Entities": [
      {
          "Data": {
              "AWS:InstanceInformation": {
                  "Content": [
                      {
                          "ComputerName": "ip-172-31-44-222.us-
west-2.compute.internal",
                          "InstanceId": "i-0cb2b964d3e14fd9f",
                          "IpAddress": "172.31.44.222",
                          "AgentType": "amazon-ssm-agent",
                          "ResourceType": "EC2Instance",
                          "AgentVersion": "2.0.672.0",
                          "PlatformVersion": "2016.09",
```

```
                        "PlatformName": "Amazon Linux AMI",
                        "PlatformType": "Linux"
                    }
                ],
                "TypeName": "AWS:InstanceInformation",
                "SchemaVersion": "1.0",
                "CaptureTime": "2017-02-20T18:03:58Z"
            }
        },
        "Id": "i-0cb2b964d3e14fd9f"
    }
  ]
}
```

- For API details, see GetInventory in *AWS CLI Command Reference*.

### `get-maintenance-window-execution-task-invocation`

The following code example shows how to use `get-maintenance-window-execution-task-invocation`.

#### AWS CLI

**To get information about a maintenance window task invocation**

The following `get-maintenance-window-execution-task-invocation` example lists information about the specified task invocation that is part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution-task-invocation \
    --window-execution-id "bc494bfa-e63b-49f6-8ad1-aa9f2EXAMPLE" \
    --task-id "96f2ad59-97e3-461d-a63d-40c8aEXAMPLE" \
    --invocation-id "a5273e2c-d2c6-4880-b3e1-5e550EXAMPLE"
```

Output:

```
{
    "Status": "SUCCESS",
    "Parameters": "{\"comment\":\"\",\"documentName\":\"AWS-RunPowerShellScript\",
\"instanceIds\":[\"i-1234567890EXAMPLE\"],\"maxConcurrency\":\"1\",\"maxErrors\":
\"1\",\"parameters\":{\"executionTimeout\":[\"3600\"],\"workingDirectory\":[\"\"],
\"commands\":[\"echo Hello\"]},\"timeoutSeconds\":600}",
```

```
    "ExecutionId": "03b6baa0-5460-4e15-83f2-ea685EXAMPLE",
    "InvocationId": "a5273e2c-d2c6-4880-b3e1-5e550EXAMPLE",
    "StartTime": 1549998326.421,
    "TaskType": "RUN_COMMAND",
    "EndTime": 1550001931.784,
    "WindowExecutionId": "bc494bfa-e63b-49f6-8ad1-aa9f2EXAMPLE",
    "StatusDetails": "Failed",
    "TaskExecutionId": "96f2ad59-97e3-461d-a63d-40c8aEXAMPLE"
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecutionTaskInvocation in *AWS CLI Command Reference*.

### `get-maintenance-window-execution-task`

The following code example shows how to use `get-maintenance-window-execution-task`.

#### AWS CLI

**To get information about a maintenance window task execution**

The following `get-maintenance-window-execution-task` example lists information about a task that is part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution-task \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE" \
    --task-id "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
```

Output:

```
{
    "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
    "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE",
    "TaskArn": "AWS-RunPatchBaseline",
    "ServiceRole": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
    "Type": "RUN_COMMAND",
    "TaskParameters": [
        {
            "BaselineOverride": {
```

```
                "Values": [
                    ""
                ]
            },
            "InstallOverrideList": {
                "Values": [
                    ""
                ]
            },
            "Operation": {
                "Values": [
                    "Scan"
                ]
            },
            "RebootOption": {
                "Values": [
                    "RebootIfNeeded"
                ]
            },
            "SnapshotId": {
                "Values": [
                    "{{ aws:ORCHESTRATION_ID }}"
                ]
            },
            "aws:InstanceId": {
                "Values": [
                    "i-02573cafcfEXAMPLE",
                    "i-0471e04240EXAMPLE",
                    "i-07782c72faEXAMPLE"
                ]
            }
        }
    ],
    "Priority": 1,
    "MaxConcurrency": "1",
    "MaxErrors": "3",
    "Status": "SUCCESS",
    "StartTime": "2021-08-04T11:45:35.088000-07:00",
    "EndTime": "2021-08-04T11:53:09.079000-07:00"
}
```

For more information, see View information about tasks and task executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecutionTask in *AWS CLI Command Reference*.

### `get-maintenance-window-execution`

The following code example shows how to use `get-maintenance-window-execution`.

**AWS CLI**

**To get information about a maintenance window task execution**

The following `get-maintenance-window-execution` example lists information about a task executed as part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution \
    --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE"
```

Output:

```
{
    "Status": "SUCCESS",
    "TaskIds": [
        "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"
    ],
    "StartTime": 1487692834.595,
    "EndTime": 1487692835.051,
    "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
}
```

For more information, see View Information About Tasks and Task Executions (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowExecution in *AWS CLI Command Reference*.

### `get-maintenance-window-task`

The following code example shows how to use `get-maintenance-window-task`.

**AWS CLI**

**To get information about a maintenance window task**

The following `get-maintenance-window-task` example retreives details about the specified maintenance window task.

```
aws ssm get-maintenance-window-task \
    --window-id mw-0c5ed765acEXAMPLE \
    --window-task-id 0e842a8d-2d44-4886-bb62-af8dcEXAMPLE
```

Output:

```
{
    "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
    "MaxErrors": "1",
    "TaskArn": "AWS-RunPowerShellScript",
    "MaxConcurrency": "1",
    "WindowTaskId": "0e842a8d-2d44-4886-bb62-af8dcEXAMPLE",
    "TaskParameters": {},
    "Priority": 1,
    "TaskInvocationParameters": {
        "RunCommand": {
            "Comment": "",
            "TimeoutSeconds": 600,
            "Parameters": {
                "commands": [
                    "echo Hello"
                ],
                "executionTimeout": [
                    "3600"
                ],
                "workingDirectory": [
                    ""
                ]
            }
        }
    },
    "WindowId": "mw-0c5ed765acEXAMPLE",
    "TaskType": "RUN_COMMAND",
    "Targets": [
        {
            "Values": [
                "84c818da-b619-4d3d-9651-946f3EXAMPLE"
            ],
            "Key": "WindowTargetIds"
```

```
        }
    ],
    "Name": "ExampleTask"
}
```

For more information, see View Information About Maintenance Windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindowTask in *AWS CLI Command Reference*.

### `get-maintenance-window`

The following code example shows how to use `get-maintenance-window`.

#### AWS CLI

**To get information about a maintenance window**

The following `get-maintenance-window` example retrieves details about the specified maintenance window.

```
aws ssm get-maintenance-window \
    --window-id "mw-03eb9db428EXAMPLE"
```

Output:

```
{
    "AllowUnassociatedTargets": true,
    "CreatedDate": 1515006912.957,
    "Cutoff": 1,
    "Duration": 6,
    "Enabled": true,
    "ModifiedDate": 2020-01-01T10:04:04.099Z,
    "Name": "My-Maintenance-Window",
    "Schedule": "rate(3 days)",
    "WindowId": "mw-03eb9db428EXAMPLE",
    "NextExecutionTime": "2020-02-25T00:08:15.099Z"
}
```

For more information, see View information about maintenance windows (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see GetMaintenanceWindow in *AWS CLI Command Reference*.

### get-ops-item

The following code example shows how to use `get-ops-item`.

#### AWS CLI

**To view information about an OpsItem**

The following `get-ops-item` example displays details about the specified OpsItem.

```
aws ssm get-ops-item \
    --ops-item-id oi-0b725EXAMPLE
```

Output:

```
{
    "OpsItem": {
        "CreatedBy": "arn:aws:sts::111222333444:assumed-role/OpsItem-CWE-Role/
fbf77cbe264a33509569f23e4EXAMPLE",
        "CreatedTime": "2019-12-04T15:52:16.793000-08:00",
        "Description": "CloudWatch Event Rule SSMOpsItems-EC2-instance-terminated
 was triggered. Your EC2 instance has terminated. See below for more details.",
        "LastModifiedBy": "arn:aws:sts::111222333444:assumed-role/OpsItem-CWE-Role/
fbf77cbe264a33509569f23e4EXAMPLE",
        "LastModifiedTime": "2019-12-04T15:52:16.793000-08:00",
        "Notifications": [],
        "RelatedOpsItems": [],
        "Status": "Open",
        "OpsItemId": "oi-0b725EXAMPLE",
        "Title": "EC2 instance terminated",
        "Source": "EC2",
        "OperationalData": {
            "/aws/automations": {
                "Value": "[ { \"automationType\": \"AWS:SSM:Automation\",
 \"automationId\": \"AWS-CreateManagedWindowsInstance\" }, { \"automationType\":
 \"AWS:SSM:Automation\", \"automationId\": \"AWS-CreateManagedLinuxInstance\" } ]",
                "Type": "SearchableString"
            },
            "/aws/dedup": {
                "Value": "{\"dedupString\":\"SSMOpsItems-EC2-instance-terminated
\"}",
                "Type": "SearchableString"
            },
            "/aws/resources": {
```

```
                "Value": "[{\"arn\":\"arn:aws:ec2:us-east-2:111222333444:instance/
i-05adec7e97EXAMPLE\"}]",
                "Type": "SearchableString"
            },
            "event-time": {

    }
}
```

For more information, see Working with OpsItems in the *AWS Systems Manager User Guide*.

- For API details, see GetOpsItem in *AWS CLI Command Reference*.

### `get-ops-summary`

The following code example shows how to use `get-ops-summary`.

#### AWS CLI

**To view a summary of all OpsItems**

The following `get-ops-summary` example displays a summary of all OpsItems in your AWS account.

```
aws ssm get-ops-summary
```

Output:

```
{
    "Entities": [
        {
            "Id": "oi-4309fEXAMPLE",
            "Data": {
                "AWS:OpsItem": {
```

```
                    "CaptureTime": "2020-02-26T18:58:32.918Z",
                    "Content": [
                        {
                            "AccountId": "111222333444",
                            "Category": "Availability",
                            "CreatedBy": "arn:aws:sts::111222333444:assumed-role/

## `get-parameter-history`

The following code example shows how to use `get-parameter-history`.

### AWS CLI

#### To get a value history for a parameter

The following `get-parameter-history` example lists the history of changes for the specified parameter, including its value.

```
aws ssm get-parameter-history \
    --name "MyStringParameter"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582154711.976,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is the first version of my String parameter",
            "Value": "Veni",
            "Version": 1,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582156093.471,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is the second version of my String parameter",
            "Value": "Vidi",
            "Version": 2,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "LastModifiedDate": 1582156117.545,
            "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
            "Description": "This is the third version of my String parameter",
            "Value": "Vici",
            "Version": 3,
            "Labels": [],
            "Tier": "Standard",
            "Policies": []
        }
```

```
    ]
}
```

For more information, see Working with parameter versions in the *AWS Systems Manager User Guide*.

- For API details, see GetParameterHistory in *AWS CLI Command Reference*.

### `get-parameter`

The following code example shows how to use `get-parameter`.

**AWS CLI**

**Example 1: To display the value of a parameter**

The following `get-parameter` example lists the value for the specified single parameter.

```
aws ssm get-parameter \
    --name "MyStringParameter"
```

Output:

```
{
    "Parameter": {
        "Name": "MyStringParameter",
        "Type": "String",
        "Value": "Veni",
        "Version": 1,
        "LastModifiedDate": 1530018761.888,
        "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MyStringParameter"
        "DataType": "text"
    }
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

**Example 2: To decrypt the value of a SecureString parameter**

The following `get-parameter` example decrypts the value of the specified `SecureString` parameter.

```
aws ssm get-parameter \
    --name "MySecureStringParameter" \
    --with-decryption
```

Output:

```
{
    "Parameter": {
        "Name": "MySecureStringParameter",
        "Type": "SecureString",
        "Value": "16679b88-310b-4895-a943-e0764EXAMPLE",
        "Version": 2,
        "LastModifiedDate": 1582155479.205,
        "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/
MySecureStringParameter"
        "DataType": "text"
    }
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

**Example 3: To display the value of a parameter using labels**

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```
aws ssm get-parameter \
    --name "MyParameter:label"
```

Output:

```
{
    "Parameter": {
        "Name": "MyParameter",
        "Type": "String",
        "Value": "parameter version 2",
        "Version": 2,
        "Selector": ":label",
        "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
        "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
```

```
        "DataType": "text"
    }
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

**Example 4: To display the value of a parameter using versions**

The following `get-parameter` example lists the value for the specified single parameter version.

```
aws ssm get-parameter \
    --name "MyParameter:2"
```

Output:

```
{
    "Parameter": {
        "Name": "MyParameter",
        "Type": "String",
        "Value": "parameter version 2",
        "Version": 2,
        "Selector": ":2",
        "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
        "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
        "DataType": "text"
    }
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

- For API details, see GetParameter in *AWS CLI Command Reference*.

## `get-parameters-by-path`

The following code example shows how to use `get-parameters-by-path`.

### AWS CLI

**To list parameters in a specific path**

The following `get-parameters-by-path` example lists the parameters within the specified hierarchy.

```
aws ssm get-parameters-by-path \
    --path "/site/newyork/department/"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "/site/newyork/department/marketing",
            "Type": "String",
            "Value": "Floor 2",
            "Version": 1,
            "LastModifiedDate": 1530018761.888,
            "ARN": "arn:aws:ssm:us-east-1:111222333444:parameter/site/newyork/
department/marketing"
        },
        {
            "Name": "/site/newyork/department/infotech",
            "Type": "String",
            "Value": "Floor 3",
            "Version": 1,
            "LastModifiedDate": 1530018823.429,
            "ARN": "arn:aws:ssm:us-east-1:111222333444:parameter/site/newyork/
department/infotech"
        },
        ...
    ]
}
```

For more information, see Working with parameter hierarchies in the *AWS Systems Manager User Guide*.

- For API details, see GetParametersByPath in *AWS CLI Command Reference*.

### `get-parameters`

The following code example shows how to use `get-parameters`.

## AWS CLI

### Example 1: To list the values for a parameter

The following `get-parameters` example lists the values for the three specified parameters.

```
aws ssm get-parameters \
    --names "MyStringParameter" "MyStringListParameter" "MyInvalidParameterName"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyStringListParameter",
            "Type": "StringList",
            "Value": "alpha,beta,gamma",
            "Version": 1,
            "LastModifiedDate": 1582154764.222,
            "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/
MyStringListParameter"
            "DataType": "text"
        },
        {
            "Name": "MyStringParameter",
            "Type": "String",
            "Value": "Vici",
            "Version": 3,
            "LastModifiedDate": 1582156117.545,
            "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MyStringParameter"
            "DataType": "text"
        }
    ],
    "InvalidParameters": [
        "MyInvalidParameterName"
    ]
}
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

### Example 2: To list names and values of multiple parameters using the ``--query`` option

The following `get-parameters` example lists the names and values for the specified parameters.

```
aws ssm get-parameters \
    --names MyStringParameter MyStringListParameter \
    --query "Parameters[*].{Name:Name,Value:Value}"
```

Output:

```
[
    {
        "Name": "MyStringListParameter",
        "Value": "alpha,beta,gamma"
    },
    {
        "Name": "MyStringParameter",
        "Value": "Vidi"
    }
]
```

For more information, see Working with Parameter Store in the *AWS Systems Manager User Guide*.

**Example 3: To display the value of a parameter using labels**

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```
aws ssm get-parameter \
    --name "MyParameter:label"
```

Output:

```
{
    "Parameters": [
        {
            "Name": "MyLabelParameter",
            "Type": "String",
            "Value": "parameter by label",
            "Version": 1,
            "Selector": ":label",
            "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
```

```
            "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
            "DataType": "text"
        },
        {
            "Name": "MyVersionParameter",
            "Type": "String",
            "Value": "parameter by version",
            "Version": 2,
            "Selector": ":2",
            "LastModifiedDate": "2021-03-24T16:20:28.236000-07:00",
            "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/unlabel-param",
            "DataType": "text"
        }
    ],
    "InvalidParameters": []
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

- For API details, see GetParameters in *AWS CLI Command Reference*.

### `get-patch-baseline-for-patch-group`

The following code example shows how to use `get-patch-baseline-for-patch-group`.

**AWS CLI**

**To display the patch baseline for a patch group**

The following `get-patch-baseline-for-patch-group` example retrieves details about the patch baseline for the specified patch group.

```
aws ssm get-patch-baseline-for-patch-group \
    --patch-group "DEV"
```

Output:

```
{
    "PatchGroup": "DEV",
    "BaselineId": "pb-0123456789abcdef0",
    "OperatingSystem": "WINDOWS"
```

```
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see GetPatchBaselineForPatchGroup in *AWS CLI Command Reference*.

### `get-patch-baseline`

The following code example shows how to use `get-patch-baseline`.

**AWS CLI**

**To display a patch baseline**

The following `get-patch-baseline` example retrieves the details for the specified patch baseline.

```
aws ssm get-patch-baseline \
    --baseline-id "pb-0123456789abcdef0"
```

Output:

```
{
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
```

```
                    ]
                },
                "ComplianceLevel": "CRITICAL",
                "ApproveAfterDays": 0,
                "EnableNonSecurity": false
            }
        ]
    },
    "ApprovedPatches": [],
    "ApprovedPatchesComplianceLevel": "UNSPECIFIED",
    "ApprovedPatchesEnableNonSecurity": false,
    "RejectedPatches": [],
    "RejectedPatchesAction": "ALLOW_AS_DEPENDENCY",
    "PatchGroups": [
        "QA",
        "DEV"
    ],
    "CreatedDate": 1550244180.465,
    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
}
```

For more information, see About Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see GetPatchBaseline in *AWS CLI Command Reference*.

## `get-service-setting`

The following code example shows how to use `get-service-setting`.

### AWS CLI

#### To retrieve the service setting for Parameter Store throughput

The following `get-service-setting` This example retrieves the current service setting for Parameter Store throughput in the specified region.

```
aws ssm get-service-setting \
    --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-
store/high-throughput-enabled
```

Output:

```
{
    "ServiceSetting": {
        "SettingId": "/ssm/parameter-store/high-throughput-enabled",
        "SettingValue": "false",
        "LastModifiedDate": 1555532818.578,
        "LastModifiedUser": "System",
        "ARN": "arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-
store/high-throughput-enabled",
        "Status": "Default"
    }
}
```

For more information, see Increasing Parameter Store Throughput in the *AWS Systems Manager Users Guide*.

- For API details, see GetServiceSetting in *AWS CLI Command Reference*.

### `label-parameter-version`

The following code example shows how to use `label-parameter-version`.

#### AWS CLI

**Example 1: To add a label to latest version of a parameter**

The following `label-parameter-version` example adds a label to the latest version of the specified parameter.

```
aws ssm label-parameter-version \
    --name "MyStringParameter" \
    --labels "ProductionReady"
```

Output:

```
{
    "InvalidLabels": [],
    "ParameterVersion": 3
}
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

**Example 2: To add a label to a specific version of a parameter**

The following `label-parameter-version` example adds a label to the specified version of a parameter.

```
aws ssm label-parameter-version \
    --name "MyStringParameter" \
    --labels "ProductionReady" \
    --parameter-version "2" --labels "DevelopmentReady"
```

For more information, see Working with parameter labels in the *AWS Systems Manager User Guide*.

- For API details, see LabelParameterVersion in *AWS CLI Command Reference*.

## `list-association-versions`

The following code example shows how to use `list-association-versions`.

### AWS CLI

**To list all versions of an association for a specific association ID**

The following `list-association-versions` example lists all versions of the specified associations.

```
aws ssm list-association-versions \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{
"AssociationVersions": [
        {
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "CreatedDate": 1550505536.726,
            "Name": "AWS-UpdateSSMAgent",
            "Parameters": {
                "allowDowngrade": [
                    "false"
                ],
```

```
                "version": [
                    ""
                ]
            },
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ],
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see ListAssociationVersions in *AWS CLI Command Reference*.

### `list-associations`

The following code example shows how to use `list-associations`.

#### AWS CLI

**Example 1: To list your associations for a specific instance**

The following list-associations example lists all associations with the AssociationName, UpdateSSMAgent.

```
aws ssm list-associations /
    --association-filter-list "key=AssociationName,value=UpdateSSMAgent"
```

Output:

```
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
```

```
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-016648b75dd622dab"
                    ]
                }
            ],
            "Overview": {
                "Status": "Pending",
                "DetailedStatus": "Associated",
                "AssociationStatusAggregatedCount": {
                    "Pending": 1
                }
            },
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Systems Manager User Guide*.

**Example 2: To list your associations for a specific document**

The following list-associations example lists all associations for the specified document.

```
aws ssm list-associations /
    --association-filter-list "key=Name,value=AWS-UpdateSSMAgent"
```

Output:

```
{
    "Associations": [
        {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-1234567890abcdef0",
            "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
            "AssociationVersion": "1",
```

```
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-1234567890abcdef0"
                    ]
                }
            ],
            "LastExecutionDate": 1550505828.548,
            "Overview": {
                "Status": "Success",
                "DetailedStatus": "Success",
                "AssociationStatusAggregatedCount": {
                    "Success": 1
                }
            },
            "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
            "AssociationName": "UpdateSSMAgent"
        },
    {
            "Name": "AWS-UpdateSSMAgent",
            "InstanceId": "i-9876543210abcdef0",
            "AssociationId": "fbc07ef7-b985-4684-b82b-0123456789ab",
            "AssociationVersion": "1",
            "Targets": [
                {
                    "Key": "InstanceIds",
                    "Values": [
                        "i-9876543210abcdef0"
                    ]
                }
            ],
            "LastExecutionDate": 1550507531.0,
            "Overview": {
                "Status": "Success",
                "AssociationStatusAggregatedCount": {
                    "Success": 1
                }
            }
        }
    ]
}
```

For more information, see Working with associations in Systems Manager in the *Systems Manager User Guide*.

- For API details, see ListAssociations in *AWS CLI Command Reference*.

### `list-command-invocations`

The following code example shows how to use `list-command-invocations`.

#### AWS CLI

**To list the invocations of a specific command**

The following `list-command-invocations` example lists all the invocations of a command.

```
aws ssm list-command-invocations \
    --command-id "ef7fdfd8-9b57-4151-a15c-db9a12345678" \
    --details
```

Output:

```
{
    "CommandInvocations": [
        {
            "CommandId": "ef7fdfd8-9b57-4151-a15c-db9a12345678",

        }
    ]
}
```

For more information, see Understanding Command Statuses in the *AWS Systems Manager User Guide*.

- For API details, see ListCommandInvocations in *AWS CLI Command Reference*.

### `list-commands`

The following code example shows how to use `list-commands`.

#### AWS CLI

**Example 1: To get the status of a specific command**

The following `list-commands` example retrieves and displays the status of the specified command.

```
aws ssm list-commands \
    --command-id "0831e1a8-a1ac-4257-a1fd-c831bEXAMPLE"
```

**Example 2: To get the status of commands requested after a specific date**

The following `list-commands` example retrieves the details of commands requested after the specified date.

```
aws ssm list-commands \
    --filter "key=InvokedAfter,value=2020-02-01T00:00:00Z"
```

**Example 3: To list all commands requested in an AWS account**

The following `list-commands` example lists all commands requested by users in the current AWS account and Region.

```
aws ssm list-commands
```

Output:

```
{
    "Commands": [
        {
            "CommandId": "8bee3135-398c-4d31-99b6-e42d2EXAMPLE",
            "DocumentName": "AWS-UpdateSSMAgent",
            "DocumentVersion": "",

### `list-compliance-items`

The following code example shows how to use `list-compliance-items`.

**AWS CLI**

**To list compliance items for a specific instance**

This example lists all compliance items for the specified instance.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-types
 "ManagedInstance"
```

Output:

```
{
  "ComplianceItems": [
      {
          "ComplianceType": "Association",
          "ResourceType": "ManagedInstance",
          "ResourceId": "i-1234567890abcdef0",
          "Id": "8dfe3659-4309-493a-8755-0123456789ab",
          "Title": "",
          "Status": "COMPLIANT",
          "Severity": "UNSPECIFIED",
          "ExecutionSummary": {
              "ExecutionTime": 1550408470.0
          },
          "Details": {
              "DocumentName": "AWS-GatherSoftwareInventory",
              "DocumentVersion": "1"
          }
      },
      {
          "ComplianceType": "Association",
          "ResourceType": "ManagedInstance",
```

```
            "ResourceId": "i-1234567890abcdef0",
            "Id": "e4c2ed6d-516f-41aa-aa2a-0123456789ab",
            "Title": "",
            "Status": "COMPLIANT",
            "Severity": "UNSPECIFIED",
            "ExecutionSummary": {
                "ExecutionTime": 1550508475.0
            },
            "Details": {
                "DocumentName": "AWS-UpdateSSMAgent",
                "DocumentVersion": "1"
            }
        },
                ...
    ],
    "NextToken": "--token string truncated--"
}
```

**To list compliance items for a specific instance and association ID**

This example lists all compliance items for the specified instance and association ID.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-types
 "ManagedInstance" --filters "Key=ComplianceType,Values=Association,Type=EQUAL"
 "Key=Id,Values=e4c2ed6d-516f-41aa-aa2a-0123456789ab,Type=EQUAL"
```

**To list compliance items for a instance after a specific date and time**

This example lists all compliance items for an instance after the specified date and time.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-types
 "ManagedInstance" --filters
 "Key=ExecutionTime,Values=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

- For API details, see ListComplianceItems in *AWS CLI Command Reference*.

### `list-compliance-summaries`

The following code example shows how to use `list-compliance-summaries`.

**AWS CLI**

**To list compliance summaries for all compliance types**

This example lists compliance summaries for all compliance types in your account.

Command:

```
aws ssm list-compliance-summaries
```

Output:

```
{
  "ComplianceSummaryItems": [
      {
          "ComplianceType": "Association",
          "CompliantSummary": {
              "CompliantCount": 2,
              "SeveritySummary": {
                  "CriticalCount": 0,
                  "HighCount": 0,
                  "MediumCount": 0,
                  "LowCount": 0,
                  "InformationalCount": 0,
                  "UnspecifiedCount": 2
              }
          },
          "NonCompliantSummary": {
              "NonCompliantCount": 0,
              "SeveritySummary": {
                  "CriticalCount": 0,
                  "HighCount": 0,
                  "MediumCount": 0,
                  "LowCount": 0,
                  "InformationalCount": 0,
                  "UnspecifiedCount": 0
              }
          }
      },
      {
          "ComplianceType": "Patch",
          "CompliantSummary": {
              "CompliantCount": 1,
              "SeveritySummary": {
```

```
                    "CriticalCount": 0,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 1
                }
            },
            "NonCompliantSummary": {
                "NonCompliantCount": 1,
                "SeveritySummary": {
                    "CriticalCount": 1,
                    "HighCount": 0,
                    "MediumCount": 0,
                    "LowCount": 0,
                    "InformationalCount": 0,
                    "UnspecifiedCount": 0
                }
            }
        },
                ...
    ],
    "NextToken": "eyJOZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

**To list compliance summaries for a specific compliance type**

This example lists the compliance summary for the Patch compliance type.

Command:

```
aws ssm list-compliance-summaries --filters
 "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

- For API details, see ListComplianceSummaries in *AWS CLI Command Reference*.

## `list-document-metadata-history`

The following code example shows how to use `list-document-metadata-history`.

### AWS CLI

**Example: To view approval history and status for a change template**

The following `list-document-metadata-history` example returns the approval history for the specified Change Manager change template.

```
aws ssm list-document-metadata-history \
    --name MyChangeManageTemplate \
    --metadata DocumentReviews
```

Output:

```
{
    "Name": "MyChangeManagerTemplate",
    "DocumentVersion": "1",
    "Author": "arn:aws:iam::111222333444;:user/JohnDoe",
    "Metadata": {
        "ReviewerResponse": [
            {
                "CreateTime": "2021-07-30T11:58:28.025000-07:00",
                "UpdatedTime": "2021-07-30T12:01:19.274000-07:00",
                "ReviewStatus": "APPROVED",
                "Comment": [
                    {
                        "Type": "COMMENT",
                        "Content": "I approve this template version"
                    }
                ],
                "Reviewer": "arn:aws:iam::111222333444;:user/ShirleyRodriguez"
            },
            {
                "CreateTime": "2021-07-30T11:58:28.025000-07:00",
                "UpdatedTime": "2021-07-30T11:58:28.025000-07:00",
                "ReviewStatus": "PENDING"
            }
        ]
    }
}
```

For more information, see Reviewing and approving or rejecting change templates in the *AWS Systems Manager User Guide*.

- For API details, see ListDocumentMetadataHistory in *AWS CLI Command Reference*.

### `list-document-versions`

The following code example shows how to use `list-document-versions`.

**AWS CLI**

**To list document versions**

The following `list-document-versions` example lists all versions for a Systems Manager document.

```
aws ssm list-document-versions \
    --name "Example"
```

Output:

```
{
    "DocumentVersions": [
        {
            "Name": "Example",
            "DocumentVersion": "1",
            "CreatedDate": 1583257938.266,
            "IsDefaultVersion": true,
            "DocumentFormat": "YAML",
            "Status": "Active"
        }
    ]
}
```

For more information, see Sending Commands that Use the Document Version Parameter in the *AWS Systems Manager User Guide*.

- For API details, see ListDocumentVersions in *AWS CLI Command Reference*.

### `list-documents`

The following code example shows how to use `list-documents`.

**AWS CLI**

**Example 1: To list documents**

The following `list-documents` example lists documents owned by the requesting account tagged with the custom tag.

```
aws ssm list-documents \
    --filters Key=Owner,Values=Self Key=tag:DocUse,Values=Testing
```

Output:

```
{
    "DocumentIdentifiers": [
        {
            "Name": "Example",
            "Owner": "29884EXAMPLE",
            "PlatformTypes": [
                "Windows",
                "Linux"
            ],
            "DocumentVersion": "1",
            "DocumentType": "Automation",
            "SchemaVersion": "0.3",
            "DocumentFormat": "YAML",
            "Tags": [
                {
                    "Key": "DocUse",
                    "Value": "Testing"
                }
            ]
        }
    ]
}
```

For more information, see AWS Systems Manager Documents in the *AWS Systems Manager User Guide*.

**Example 2: To list shared documents**

The following `list-documents` example lists shared documents, including private shared documents not owned by AWS.

```
aws ssm list-documents \
    --filters Key=Name,Values=sharedDocNamePrefix  Key=Owner,Values=Private
```

Output:

```
{
    "DocumentIdentifiers": [
        {
            "Name": "Example",
            "Owner": "12345EXAMPLE",
            "PlatformTypes": [
                "Windows",
                "Linux"
            ],
            "DocumentVersion": "1",
            "DocumentType": "Command",
            "SchemaVersion": "0.3",
            "DocumentFormat": "YAML",
            "Tags": []
        }
    ]
}
```

For more information, see AWS Systems Manager Documents in the *AWS Systems Manager User Guide*.

- For API details, see ListDocuments in *AWS CLI Command Reference*.

## `list-inventory-entries`

The following code example shows how to use `list-inventory-entries`.

### AWS CLI

#### Example 1: To view specific inventory type entries for an instance

This following `list-inventory-entries` example lists the inventory entries for the AWS:Application inventory type on a specific instance.

```
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \
    --type-name "AWS:Application"
```

Output:

```
{
  "TypeName": "AWS:Application",
  "InstanceId": "i-1234567890abcdef0",
  "SchemaVersion": "1.1",
  "CaptureTime": "2019-02-15T12:17:55Z",
  "Entries": [
    {
      "Architecture": "i386",
      "Name": "Amazon SSM Agent",
      "PackageId": "{88a60be2-89a1-4df8-812a-80863c2a2b68}",
      "Publisher": "Amazon Web Services",
      "Version": "2.3.274.0"
    },
    {
      "Architecture": "x86_64",
      "InstalledTime": "2018-05-03T13:42:34Z",
      "Name": "AmazonCloudWatchAgent",
      "Publisher": "",
      "Version": "1.200442.0"
    }
  ]
}
```

**Example 2: To view custom inventory entries assigned to an instance**

The following `list-inventory-entries` example lists a custom inventory entry assigned to an instance.

```
aws ssm list-inventory-entries \
    --instance-id "i-1234567890abcdef0" \
    --type-name "Custom:RackInfo"
```

Output:

```
{
  "TypeName": "Custom:RackInfo",
  "InstanceId": "i-1234567890abcdef0",
  "SchemaVersion": "1.0",
  "CaptureTime": "2021-05-22T10:01:01Z",
  "Entries": [
    {
      "RackLocation": "Bay B/Row C/Rack D/Shelf E"
```

```
    }
  ]
}
```

- For API details, see ListInventoryEntries in *AWS CLI Command Reference*.

### `list-ops-item-related-items`

The following code example shows how to use `list-ops-item-related-items`.

**AWS CLI**

**To list the related-item resources of an OpsItem**

The following `list-ops-item-related-items` example lists the related-item resources of an OpsItem.

```
aws ssm list-ops-item-related-items \
    --ops-item-id "oi-f99f2EXAMPLE"
```

Output:

```
{
    "Summaries": [
        {
            "OpsItemId": "oi-f99f2EXAMPLE",
            "AssociationId": "e2036148-cccb-490e-ac2a-390e5EXAMPLE",
            "ResourceType": "AWS::SSMIncidents::IncidentRecord",
            "AssociationType": "IsParentOf",
            "ResourceUri": "arn:aws:ssm-incidents::111122223333:incident-record/
example-response/64bd9b45-1d0e-2622-840d-03a87a1451fa",
            "CreatedBy": {
                "Arn": "arn:aws:sts::111122223333:assumed-role/
AWSServiceRoleForIncidentManager/IncidentResponse"
            },
            "CreatedTime": "2021-08-11T18:47:14.994000+00:00",
            "LastModifiedBy": {
                "Arn": "arn:aws:sts::111122223333:assumed-role/
AWSServiceRoleForIncidentManager/IncidentResponse"
            },
            "LastModifiedTime": "2021-08-11T18:47:14.994000+00:00"
        }
```

```
    ]
}
```

For more information, see Working with Incident Manager incidents in OpsCenter in the *AWS Systems Manager User Guide*.

- For API details, see ListOpsItemRelatedItems in *AWS CLI Command Reference*.

### `list-resource-compliance-summaries`

The following code example shows how to use `list-resource-compliance-summaries`.

**AWS CLI**

**To list resource-level compliance summary counts**

This example lists resource-level compliance summary counts.

Command:

```
aws ssm list-resource-compliance-summaries
```

Output:

```
{
  "ResourceComplianceSummaryItems": [
      {
          "ComplianceType": "Association",
          "ResourceType": "ManagedInstance",
          "ResourceId": "i-1234567890abcdef0",
          "Status": "COMPLIANT",
          "OverallSeverity": "UNSPECIFIED",
          "ExecutionSummary": {
              "ExecutionTime": 1550509273.0
          },
          "CompliantSummary": {
              "CompliantCount": 2,
              "SeveritySummary": {
                  "CriticalCount": 0,
                  "HighCount": 0,
                  "MediumCount": 0,
                  "LowCount": 0,
                  "InformationalCount": 0,
```

```
                "UnspecifiedCount": 2
            }
        },
        "NonCompliantSummary": {
            "NonCompliantCount": 0,
            "SeveritySummary": {
                "CriticalCount": 0,
                "HighCount": 0,
                "MediumCount": 0,
                "LowCount": 0,
                "InformationalCount": 0,
                "UnspecifiedCount": 0
            }
        }
    },
    {
        "ComplianceType": "Patch",

        }
    }
  ],
  "NextToken": "--token string truncated--"
}
```

**To list resource-level compliance summaries for a specific compliance type**

This example lists resource-level compliance summaries for the Patch compliance type.

Command:

```
aws ssm list-resource-compliance-summaries --filters
 "Key=ComplianceType,Values=Patch,Type=EQUAL"
```

- For API details, see ListResourceComplianceSummaries in *AWS CLI Command Reference*.

## `list-resource-data-sync`

The following code example shows how to use `list-resource-data-sync`.

### AWS CLI

**To list your resource data sync configurations**

This example retrieves information about your resource data sync configurations.

```
aws ssm list-resource-data-sync
```

Output:

```
{
    "ResourceDataSyncItems": [
        {
            "SyncName": "MyResourceDataSync",
            "S3Destination": {
                "BucketName": "ssm-resource-data-sync",
                "SyncFormat": "JsonSerDe",
                "Region": "us-east-1"
```

```
            },
            "LastSyncTime": 1550261472.003,
            "LastSuccessfulSyncTime": 1550261472.003,
            "LastStatus": "Successful",
            "SyncCreatedTime": 1543235736.72,
            "LastSyncStatusMessage": "The sync was successfully completed"
        }
    ]
}
```

- For API details, see ListResourceDataSync in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To list the tags applied to a patch baseline**

The following `list-tags-for-resource` example lists the tags for a patch baseline.

```
aws ssm list-tags-for-resource \
    --resource-type "PatchBaseline" \
    --resource-id "pb-0123456789abcdef0"
```

Output:

```
{
    "TagList": [
        {
            "Key": "Environment",
            "Value": "Production"
        },
        {
            "Key": "Region",
            "Value": "EMEA"
        }
    ]
}
```

For more information, see Tagging AWS Resources in the *AWS General Reference*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `modify-document-permission`

The following code example shows how to use `modify-document-permission`.

**AWS CLI**

**To modify document permissions**

The following `modify-document-permission` example shares a Systems Manager document publicly.

```
aws ssm modify-document-permission \
    --name "Example" \
    --permission-type "Share" \
    --account-ids-to-add "All"
```

This command produces no output.

For more information, see Share a Systems Manager Document in the *AWS Systems Manager User Guide*.

- For API details, see ModifyDocumentPermission in *AWS CLI Command Reference*.

### `put-compliance-items`

The following code example shows how to use `put-compliance-items`.

**AWS CLI**

**To register a compliance type and compliance details to a designated instance**

This example registers the compliance type `Custom:AVCheck` to the specified managed instance. There is no output if the command succeeds.

Command:

```
aws ssm put-compliance-items --resource-id "i-1234567890abcdef0" --
resource-type "ManagedInstance" --compliance-type "Custom:AVCheck"
 --execution-summary "ExecutionTime=2019-02-18T16:00:00Z" --items
 "Id=Version2.0,Title=ScanHost,Severity=CRITICAL,Status=COMPLIANT"
```

- For API details, see PutComplianceItems in *AWS CLI Command Reference*.

### `put-inventory`

The following code example shows how to use `put-inventory`.

#### AWS CLI

**To assign customer metadata to an instance**

This example assigns rack location information to an instance. There is no output if the command succeeds.

Command (Linux):

```
aws ssm put-inventory --instance-id "i-016648b75dd622dab" --items
 '[{"TypeName": "Custom:RackInfo","SchemaVersion": "1.0","CaptureTime":
 "2019-01-22T10:01:01Z","Content":[{"RackLocation": "Bay B/Row C/Rack D/Shelf
 E"}]}]'
```

Command (Windows):

```
aws ssm put-inventory --instance-id "i-016648b75dd622dab" --items
 "TypeName=Custom:RackInfo,SchemaVersion=1.0,CaptureTime=2019-01-22T10:01:01Z,Content=[{Rack
 B/Row C/Rack D/Shelf F'}]"
```

- For API details, see PutInventory in *AWS CLI Command Reference*.

### `put-parameter`

The following code example shows how to use `put-parameter`.

#### AWS CLI

**Example 1: To change a parameter value**

The following `put-parameter` example changes the value of the specified parameter.

```
aws ssm put-parameter \
    --name "MyStringParameter" \
    --type "String" \
    --value "Vici" \
```

```
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Standard"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), 'Managing parameter tiers <https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>`__, and Working with parameter policies in the *AWS Systems Manager User Guide*.

**Example 2: To create an advanced parameter**

The following `put-parameter` example creates an advanced parameter.

```
aws ssm put-parameter \
    --name "MyAdvancedParameter" \
    --description "This is an advanced parameter" \
    --value "Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod
 tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam,
 quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat
 [truncated]" \
    --type "String" \
    --tier Advanced
```

Output:

```
{
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), 'Managing parameter tiers <https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>`__, and Working with parameter policies in the *AWS Systems Manager User Guide*.

**Example 3: To convert a standard parameter to an advanced parameter**

The following `put-parameter` example converts a existing standard parameter into an advanced parameter.

```
aws ssm put-parameter \
    --name "MyConvertedParameter" \
    --value "abc123" \
    --type "String" \
    --tier Advanced \
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), 'Managing parameter tiers <https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>`__, and Working with parameter policies in the *AWS Systems Manager User Guide*.

**Example 4: To create a parameter with a policy attached**

The following `put-parameter` example creates an advanced parameter with a parameter policy attached.

```
aws ssm put-parameter \
    --name "/Finance/Payroll/q2accesskey" \
    --value "P@sSwW)rd" \
    --type "SecureString" \
    --tier Advanced \
    --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":
{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification\",
\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},{\"Type\":
\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":\"60\",\"Unit
\":\"Days\"}}]"
```

Output:

```
{
```

```
    "Version": 1,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), 'Managing parameter tiers <https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>`__, and Working with parameter policies in the *AWS Systems Manager User Guide*.

**Example 5: To add a policy to an existing parameter**

The following `put-parameter` example attaches a policy to an existing advanced parameter.

```
aws ssm put-parameter \
    --name "/Finance/Payroll/q2accesskey" \
    --value "N3wP@sSwW)rd" \
    --type "SecureString" \
    --tier Advanced \
    --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":
{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification\",
\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},{\"Type\":
\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":\"60\",\"Unit
\":\"Days\"}}]"
    --overwrite
```

Output:

```
{
    "Version": 2,
    "Tier": "Advanced"
}
```

For more information, see Create a Systems Manager parameter (AWS CLI), 'Managing parameter tiers <https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>`__, and Working with parameter policies in the *AWS Systems Manager User Guide*.

- For API details, see PutParameter in *AWS CLI Command Reference*.

### `register-default-patch-baseline`

The following code example shows how to use `register-default-patch-baseline`.

**AWS CLI**

**To set the default patch baseline**

The following `register-default-patch-baseline` example registers the specified custom patch baseline as the default patch baseline for the operating system type that it supports.

```
aws ssm register-default-patch-baseline \
    --baseline-id "pb-abc123cf9bEXAMPLE"
```

Output:

```
{
    "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

The following `register-default-patch-baseline` example registers the default patch baseline provided by AWS for CentOS as the default patch baseline.

```
aws ssm register-default-patch-baseline \
    --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0574b43a65ea646ed"
```

Output:

```
{
    "BaselineId":"pb-abc123cf9bEXAMPLE"
}
```

For more information, see About Predefined and Custom Patch Baselines in the *AWS Systems Manager User Guide*.

- For API details, see RegisterDefaultPatchBaseline in *AWS CLI Command Reference*.

### `register-patch-baseline-for-patch-group`

The following code example shows how to use `register-patch-baseline-for-patch-group`.

**AWS CLI**

**To register a patch baseline for a patch group**

The following `register-patch-baseline-for-patch-group` example registers a patch baseline for a patch group.

```
aws ssm register-patch-baseline-for-patch-group \
    --baseline-id "pb-045f10b4f382baeda" \
    --patch-group "Production"
```

Output:

```
{
    "BaselineId": "pb-045f10b4f382baeda",
    "PatchGroup": "Production"
}
```

For more information, see Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>__ and Add a Patch Group to a Patch Baseline in the *AWS Systems Manager User Guide*.

- For API details, see RegisterPatchBaselineForPatchGroup in *AWS CLI Command Reference*.

### `register-target-with-maintenance-window`

The following code example shows how to use `register-target-with-maintenance-window`.

#### AWS CLI

**Example 1: To register a single target with a maintenance window**

The following `register-target-with-maintenance-window` example registers an instance with a maintenance window.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --target "Key=InstanceIds,Values=i-0000293ffd8c57862" \
    --owner-information "Single instance" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
```

```
}
```

**Example 2: To register multiple targets with a maintenance window using instance IDs**

The following `register-target-with-maintenance-window` example registers two instances with a maintenance window by specifying their instance IDs.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-ab12cd34ef56gh78" \
    --target "Key=InstanceIds,Values=i-0000293ffd8c57862,i-0cb2b964d3e14fd9f" \
    --owner-information "Two instances in a list" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

**Example 3: To register targets with a maintenance window using resource tags**

The following `register-target-with-maintenance-window` example registers instances with a maintenance window by specifying resource tags that have been applied to the instances.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-06cf17cbefcb4bf4f" \
    --targets "Key=tag:Environment,Values=Prod" "Key=Role,Values=Web" \
    --owner-information "Production Web Servers" \
    --resource-type "INSTANCE"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

**Example 4: To register targets using a group of tag keys**

The following `register-target-with-maintenance-window` example register instances that all have one or more tag keys assigned to them, regardless of their key values.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-0c50858d01EXAMPLE" \
    --resource-type "INSTANCE" \
    --target "Key=tag-key,Values=Name,Instance-Type,CostCenter"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

**Example 5: To register targets using a resource group name**

The following `register-target-with-maintenance-window` example register a specified resource group, regardless of the type of resources it contains.

```
aws ssm register-target-with-maintenance-window \
    --window-id "mw-0c50858d01EXAMPLE" \
    --resource-type "RESOURCE_GROUP" \
    --target "Key=resource-groups:Name,Values=MyResourceGroup"
```

Output:

```
{
    "WindowTargetId":"1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
}
```

For more information, see Register a Target Instance with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see RegisterTargetWithMaintenanceWindow in *AWS CLI Command Reference*.

## `register-task-with-maintenance-window`

The following code example shows how to use `register-task-with-maintenance-window`.

### AWS CLI

**Example 1: To register an Automation task with a maintenance window**

The following `register-task-with-maintenance-window` example registers an Automation task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649EXAMPLE" \
    --targets Key=InstanceIds,Values=i-1234520122EXAMPLE \
    --task-arn AWS-RestartEC2Instance \
    --service-role-arn arn:aws:iam::111222333444:role/SSM --task-type AUTOMATION \
    --task-invocation-parameters "{\"Automation\":{\"DocumentVersion\":\"\$LATEST\",
\"Parameters\":{\"InstanceId\":[\"{{RESOURCE_ID}}\"]}}}" \
    --priority 0 \
    --max-concurrency 1 \
    --max-errors 1 \
    --name "AutomationExample" \
    --description "Restarting EC2 Instance for maintenance"
```

Output:

```
{
    "WindowTaskId":"11144444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

**Example 2: To register a Lambda task with a Maintenance Window**

The following `register-task-with-maintenance-window` example registers a Lambda task with a Maintenance Window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649dee04e4" \
    --targets Key=InstanceIds,Values=i-12344d305eEXAMPLE \
    --task-arn arn:aws:lambda:us-east-1:111222333444:function:SSMTestLAMBDA \
    --service-role-arn arn:aws:iam::111222333444:role/SSM \
    --task-type LAMBDA \
    --task-invocation-parameters '{"Lambda":{"Payload":"{\"InstanceId\":
\"{{RESOURCE_ID}}\",\"targetType\":\"{{TARGET_TYPE}}\"}","Qualifier":"$LATEST"}}' \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Lambda_Example" \
```

```
    --description "My Lambda Example"
```

Output:

```
{
    "WindowTaskId":"22244444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

**Example 3: To register a Run Command task with a maintenance window**

The following `register-task-with-maintenance-window` example registers a Run Command task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-082dcd7649dee04e4" \
    --targets "Key=InstanceIds,Values=i-12344d305eEXAMPLE" \
    --service-role-arn "arn:aws:iam::111222333444:role/SSM" \
    --task-type "RUN_COMMAND" \
    --name "SSMInstallPowerShellModule" \
    --task-arn "AWS-InstallPowerShellModule" \
    --task-invocation-parameters "{\"RunCommand\":{\"Comment\":\"\",
\"OutputS3BucketName\":\"runcommandlogs\",\"Parameters\":{\"commands\":[\"Get-
Module -ListAvailable\"],\"executionTimeout\":[\"3600\"],\"source\":[\"https:\/
\/gallery.technet.microsoft.com\/EZOut-33ae0fb7\/file\/110351\/1\/EZOut.zip\"],
\"workingDirectory\":[\"\\\\\"]},\"TimeoutSeconds\":600}}" \
    --max-concurrency 1 \
    --max-errors 1 \
    --priority 10
```

Output:

```
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

**Example 4: To register a Step Functions task with a maintenance window**

The following `register-task-with-maintenance-window` example registers a Step Functions task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
    --window-id "mw-1234d787d6EXAMPLE" \
    --targets Key=WindowTargetIds,Values=12347414-69c3-49f8-95b8-ed2dcEXAMPLE \
    --task-arn arn:aws:states:us-
east-1:111222333444:stateMachine:SSMTestStateMachine \
    --service-role-arn arn:aws:iam::111222333444:role/MaintenanceWindows \
    --task-type STEP_FUNCTIONS \
    --task-invocation-parameters '{"StepFunctions":{"Input":"{\"InstanceId\":
\"{{RESOURCE_ID}}\"}"}}' \
    --priority 0 \
    --max-concurrency 10 \
    --max-errors 5 \
    --name "Step_Functions_Example" \
    --description "My Step Functions Example"
```

Output:

```
{
    "WindowTaskId":"44444444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

**Example 5: To register a task using a maintenance windows target ID**

The following `register-task-with-maintenance-window` example registers a task using a maintenance window target ID. The maintenance window target ID was in the output of the `aws ssm register-target-with-maintenance-window` command. You can also retrieve it from the output of the `aws ssm describe-maintenance-window-targets` command.

```
aws ssm register-task-with-maintenance-window \
    --targets "Key=WindowTargetIds,Values=350d44e6-28cc-44e2-951f-4b2c9EXAMPLE" \
    --task-arn "AWS-RunShellScript" \
    --service-role-arn "arn:aws:iam::111222333444:role/MaintenanceWindowsRole" \
    --window-id "mw-ab12cd34eEXAMPLE" \
    --task-type "RUN_COMMAND" \
    --task-parameters  "{\"commands\":{\"Values\":[\"df\"]}}" \
    --max-concurrency 1 \
```

```
    --max-errors 1 \
    --priority 10
```

Output:

```
{
    "WindowTaskId":"33344444-5555-6666-7777-88888888"
}
```

For more information, see Register a Task with the Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see RegisterTaskWithMaintenanceWindow in *AWS CLI Command Reference*.

### `remove-tags-from-resource`

The following code example shows how to use `remove-tags-from-resource`.

**AWS CLI**

**To remove a tag from a patch baseline**

The following `remove-tags-from-resource` example removes tags from a patch baseline.

```
aws ssm remove-tags-from-resource \
    --resource-type "PatchBaseline" \
    --resource-id "pb-0123456789abcdef0" \
    --tag-keys "Region"
```

This command produces no output.

For more information, see Tagging AWS Resources in the *AWS General Reference*.

- For API details, see RemoveTagsFromResource in *AWS CLI Command Reference*.

### `reset-service-setting`

The following code example shows how to use `reset-service-setting`.

**AWS CLI**

**To reset the service setting for Parameter Store throughput**

The following `reset-service-setting` example resets the service setting for Parameter Store throughput in the specified region to no longer use increased throughput.

```
aws ssm reset-service-setting \
    --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-
store/high-throughput-enabled
```

Output:

```
{
    "ServiceSetting": {
        "SettingId": "/ssm/parameter-store/high-throughput-enabled",
        "SettingValue": "false",
        "LastModifiedDate": 1555532818.578,
        "LastModifiedUser": "System",
        "ARN": "arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-
store/high-throughput-enabled",
        "Status": "Default"
    }
}
```

For more information, see Increasing Parameter Store Throughput in the *AWS Systems Manager User Guide*.

- For API details, see ResetServiceSetting in *AWS CLI Command Reference*.

### `resume-session`

The following code example shows how to use `resume-session`.

**AWS CLI**

**To resume a Session Manager session**

This `resume-session` example resumes a Session Manager session with an instance after it has been disconnected. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```
aws ssm resume-session \
    --session-id Mary-Major-07a16060613c408b5
```

Output:

```
{
    "SessionId": "Mary-Major-07a16060613c408b5",
    "TokenValue":
 "AAEAAVbTGsaOnyvcUoNGqifbv5r/8lgxuQljCuY8qVcvOnoBAAAAAFxtd3jIXAFUUXGTJ7zF/

```

For more information, see Install the Session Manager Plugin for the AWS CLI in the *AWS Systems Manager User Guide*.

- For API details, see ResumeSession in *AWS CLI Command Reference*.

## `send-automation-signal`

The following code example shows how to use `send-automation-signal`.

### AWS CLI

#### To send a signal to an automation execution

The following `send-automation-signal` example sends an Approve signal to an Automation execution.

```
aws ssm send-automation-signal \
    --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE \
    --signal-type "Approve"
```

This command produces no output.

For more information, see Running an Automation Workflow with Approvers in the *AWS Systems Manager User Guide*.

- For API details, see SendAutomationSignal in *AWS CLI Command Reference*.

### `send-command`

The following code example shows how to use `send-command`.

### AWS CLI

#### Example 1: To run a command on one or more remote instances

The following `send-command` example runs an `echo` command on a target instance.

```
aws ssm send-command \
    --document-name "AWS-RunShellScript" \
    --parameters 'commands=["echo HelloWorld"]' \
    --targets "Key=instanceids,Values=i-1234567890abcdef0" \
    --comment "echo HelloWorld"
```

Output:

```
{
    "Command": {
        "CommandId": "92853adf-ba41-4cd6-9a88-142d1EXAMPLE",
        "DocumentName": "AWS-RunShellScript",
        "DocumentVersion": "",
        "Comment": "echo HelloWorld",
        "ExpiresAfter": 1550181014.717,
        "Parameters": {
            "commands": [
                "echo HelloWorld"
            ]
        },
        "InstanceIds": [
            "i-0f00f008a2dcbefe2"
        ],
        "Targets": [],
        "RequestedDateTime": 1550173814.717,
        "Status": "Pending",
        "StatusDetails": "Pending",
        "OutputS3BucketName": "",
        "OutputS3KeyPrefix": "",
        "MaxConcurrency": "50",
        "MaxErrors": "0",
        "TargetCount": 1,
        "CompletedCount": 0,
        "ErrorCount": 0,
```

```
        "DeliveryTimedOutCount": 0,
        "ServiceRole": "",
        "NotificationConfig": {
            "NotificationArn": "",
            "NotificationEvents": [],
            "NotificationType": ""
        },
        "CloudWatchOutputConfig": {
            "CloudWatchLogGroupName": "",
            "CloudWatchOutputEnabled": false
        }
    }
}
```

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

**Examle 2: To get IP information about an instance**

The following `send-command` example retrieves the IP information about an instance.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

**Example 3: To run a command on instances with specific tags**

The following `send-command` example runs a command on instances that have the tag key "ENV" and the value "Dev".

```
aws ssm send-command \
    --targets "Key=tag:ENV,Values=Dev" \
    --document-name "AWS-RunShellScript" \
    --parameters "commands=ifconfig"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

**Example 4: To run a command that sends SNS notifications**

The following `send-command` example runs a command that sends SNS notifications for all notification events and the Command notification type.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --service-role-arn "arn:aws:iam::123456789012:role/SNS_Role" \
    --notification-config "NotificationArn=arn:aws:sns:us-
east-1:123456789012:SNSTopicName,NotificationEvents=All,NotificationType=Command"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

**Example 5: To run a command that outputs to S3 and CloudWatch**

The following `send-command` example runs a command that outputs command details to an S3 bucket and to a CloudWatch Logs log group.

```
aws ssm send-command \
    --instance-ids "i-1234567890abcdef0" \
    --document-name "AWS-RunShellScript" \
    --comment "IP config" \
    --parameters "commands=ifconfig" \
    --output-s3-bucket-name "s3-bucket-name" \
    --output-s3-key-prefix "runcommand" \
    --cloud-watch-output-config
 "CloudWatchOutputEnabled=true,CloudWatchLogGroupName=CWLGroupName"
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

**Example 6: To run commands on multiple instances with different tags**

The following `send-command` example runs a command on instances with two different tag keys and values.

```
aws ssm send-command \
    --document-name "AWS-RunPowerShellScript" \
    --parameters commands=["echo helloWorld"] \
    --targets Key=tag:Env,Values=Dev Key=tag:Role,Values=WebServers
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

**Example 7: To target multiple instances with the same tag key**

The following `send-command` example runs a command on instances that have the same tag key but with different values.

```
aws ssm send-command \
    --document-name "AWS-RunPowerShellScript" \
    --parameters commands=["echo helloWorld"] \
    --targets Key=tag:Env,Values=Dev,Test
```

See example 1 for sample output.

For more information, see Running Commands Using Systems Manager Run Command in the *AWS Systems Manager User Guide*.

**Example 8: To run a command that uses a shared document**

The following `send-command` example runs a shared document on a target instance.

```
aws ssm send-command \
    --document-name "arn:aws:ssm:us-east-1:123456789012:document/ExampleDocument" \
    --targets "Key=instanceids,Values=i-1234567890abcdef0"
```

See example 1 for sample output.

For more information, see Using shared SSM documents in the *AWS Systems Manager User Guide*.

- For API details, see SendCommand in *AWS CLI Command Reference*.

### `start-associations-once`

The following code example shows how to use `start-associations-once`.

#### AWS CLI

**To run an association immediately and only one time**

The following `start-associations-once` example run the specified association immediately and only once. There is no output if the command succeeds.

```
aws ssm start-associations-once \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

This command produces no output.

For more information, see Viewing association histories in the *AWS Systems Manager User Guide*.

- For API details, see StartAssociationsOnce in *AWS CLI Command Reference*.

### `start-automation-execution`

The following code example shows how to use `start-automation-execution`.

#### AWS CLI

**Example 1: To execute an automation document**

The following `start-automation-execution` example runs an Automation document.

```
aws ssm start-automation-execution \
    --document-name "AWS-UpdateLinuxAmi" \
    --parameters "AutomationAssumeRole=arn:aws:iam::123456789012:role/
SSMAutomationRole,SourceAmiId=ami-EXAMPLE,IamInstanceProfileName=EC2InstanceRole"
```

Output:

```
{
  "AutomationExecutionId": "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
}
```

For more information, see Running an Automation Workflow Manually in the *AWS Systems Manager User Guide*.

**Example 2: To run a shared automation document**

The following `start-automation-execution` example runs a shared Automation document.

```
aws ssm start-automation-execution \
    --document-name "arn:aws:ssm:us-east-1:123456789012:document/ExampleDocument"
```

Output:

```
{
  "AutomationExecutionId": "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
}
```

For more information, see Using shared SSM documents in the *AWS Systems Manager User Guide*.

- For API details, see StartAutomationExecution in *AWS CLI Command Reference*.

## `start-change-request-execution`

The following code example shows how to use `start-change-request-execution`.

### AWS CLI

**Example 1: To start a change request**

The following `start-change-request-execution` example starts a change request with minimal options specified.

```
aws ssm start-change-request-execution \
    --change-request-name MyChangeRequest \
    --document-name AWS-HelloWorldChangeTemplate \
    --runbooks '[{"DocumentName": "AWS-HelloWorld","Parameters":
 {"AutomationAssumeRole": ["arn:aws:iam:us-east-2:1112223233444:role/
MyChangeManagerAssumeRole"]}}]' \
    --parameters
 Approver="JohnDoe",ApproverType="IamUser",ApproverSnsTopicArn="arn:aws:sns:us-
east-2:1112223233444:MyNotificationTopic"
```

Output:

```
{
```

```
  "AutomationExecutionId": "9d32a4fc-f944-11e6-4105-0a1b2EXAMPLE"
}
```

**Example 2: To start a change request using an external JSON file**

The following `start-automation-execution` example starts a change request with multiple options specified in a JSON file.

```
aws ssm start-change-request-execution \
    --cli-input-json file://MyChangeRequest.json
```

Contents of `MyChangeRequest.json`:

```
{
    "ChangeRequestName": "MyChangeRequest",
    "DocumentName": "AWS-HelloWorldChangeTemplate",
    "DocumentVersion": "$DEFAULT",
    "ScheduledTime": "2021-12-30T03:00:00",
    "ScheduledEndTime": "2021-12-30T03:05:00",
    "Tags": [
        {
            "Key": "Purpose",
            "Value": "Testing"
        }
    ],
    "Parameters": {
        "Approver": [
            "JohnDoe"
        ],
        "ApproverType": [
            "IamUser"
        ],
        "ApproverSnsTopicArn": [
            "arn:aws:sns:us-east-2:111222333444;:MyNotificationTopic
        ]
    },
    "Runbooks": [
        {
            "DocumentName": "AWS-HelloWorld",
            "DocumentVersion": "1",
            "MaxConcurrency": "1",
            "MaxErrors": "1",
            "Parameters": {
```

```
                "AutomationAssumeRole": [
                    "arn:aws:iam::111222333444:role/MyChangeManagerAssumeRole"
                ]
            }
        }
    ],
    "ChangeDetails": "### Document Name: HelloWorldChangeTemplate\n\n## What does
 this document do?\nThis change template demonstrates the feature set available
 for creating change templates for Change Manager. This template starts a Runbook
 workflow for the Automation document called AWS-HelloWorld.\n\n## Input Parameters
\n* ApproverSnsTopicArn: (Required) Amazon Simple Notification Service ARN for
 approvers.\n* Approver: (Required) The name of the approver to send this request
 to.\n* ApproverType: (Required) The type of reviewer.\n  * Allowed Values: IamUser,
 IamGroup, IamRole, SSOGroup, SSOUser\n\n## Output Parameters\nThis document has no
 outputs \n"
}
```

Output:

```
{
  "AutomationExecutionId": "9d32a4fc-f944-11e6-4105-0a1b2EXAMPLE"
}
```

For more information, see Creating change requests in the *AWS Systems Manager User Guide*.

- For API details, see StartChangeRequestExecution in *AWS CLI Command Reference*.

### `start-session`

The following code example shows how to use `start-session`.

#### AWS CLI

##### Example 1: To start a Session Manager session

This `start-session` example establishes a connection with an instance for a Session Manager session. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```
aws ssm start-session \
    --target "i-1234567890abcdef0"
```

Output:

```
Starting session with SessionId: Jane-Roe-07a16060613c408b5
```

**Example 2: To start a Session Manager session using SSH**

This `start-session` example establishes a connection with an instance for a Session Manager session using SSH. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call, and that the command uses the default user on the instance, such as `ec2-user` for EC2 instances for Linux.

```
ssh -i /path/my-key-pair.pem ec2-user@i-02573cafcfEXAMPLE
```

Output:

```
Starting session with SessionId: ec2-user-07a16060613c408b5
```

For more information, see Start a Session and Install the Session Manager Plugin for the AWS CLI in the *AWS Systems Manager User Guide*.

- For API details, see StartSession in *AWS CLI Command Reference*.

### `stop-automation-execution`

The following code example shows how to use `stop-automation-execution`.

**AWS CLI**

**To stop an automation execution**

The following `stop-automation-execution` example stops an Automation document.

```
aws ssm stop-automation-execution
    --automation-execution-id "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
```

This command produces no output.

For more information, see Running an Automation Workflow Manually in the *AWS Systems Manager User Guide*.

- For API details, see StopAutomationExecution in *AWS CLI Command Reference*.

### `terminate-session`

The following code example shows how to use `terminate-session`.

**AWS CLI**

**To end a Session Manager session**

This `terminate-session` example permanently ends a session that was created by the user "Shirley-Rodriguez" and closes the data connection between the Session Manager client and SSM Agent on the instance.

```
aws ssm terminate-session \
    --session-id "Shirley-Rodriguez-07a16060613c408b5"
```

Output:

```
{
    "SessionId": "Shirley-Rodriguez-07a16060613c408b5"
}
```

For more information, see Terminate a Session in the *AWS Systems Manager User Guide*.

- For API details, see TerminateSession in *AWS CLI Command Reference*.

### `unlabel-parameter-version`

The following code example shows how to use `unlabel-parameter-version`.

**AWS CLI**

**To delete parameter labels**

The following `unlabel-parameter-version` example deletes the specified labels from the given parameter version.

```
aws ssm unlabel-parameter-version \
    --name "parameterName" \
    --parameter-version "version" \
    --labels "label_1" "label_2" "label_3"
```

Output:

```
{
    "RemovedLabels": [
        "label_1"
        "label_2"
        "label_3"
    ],
    "InvalidLabels": []
}
```

For more information, see Delete parameter labels (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see UnlabelParameterVersion in *AWS CLI Command Reference*.

### `update-association-status`

The following code example shows how to use `update-association-status`.

#### AWS CLI

**To update the association status**

The following `update-association-status` example updates the association status of the association between an instance and a document.

```
aws ssm update-association-status \
    --name "AWS-UpdateSSMAgent" \
    --instance-id "i-1234567890abcdef0" \
    --association-status
 "Date=1424421071.939,Name=Pending,Message=temp_status_change,AdditionalInfo=Additional-
Config-Needed"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-UpdateSSMAgent",
        "InstanceId": "i-1234567890abcdef0",
        "AssociationVersion": "1",
        "Date": 1550507529.604,
```

```
        "LastUpdateAssociationDate": 1550507806.974,
        "Status": {
            "Date": 1424421071.0,
            "Name": "Pending",
            "Message": "temp_status_change",
            "AdditionalInfo": "Additional-Config-Needed"
        },
        "Overview": {
            "Status": "Success",
            "AssociationStatusAggregatedCount": {
                "Success": 1
            }
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "InstanceIds",
                "Values": [
                    "i-1234567890abcdef0"
                ]
            }
        ],
        "LastExecutionDate": 1550507808.0,
        "LastSuccessfulExecutionDate": 1550507808.0
    }
}
```

For more information, see Working with associations in Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see UpdateAssociationStatus in *AWS CLI Command Reference*.

## `update-association`

The following code example shows how to use `update-association`.

### AWS CLI

#### Example 1: To update a document association

The following `update-association` example updates an association with a new document version.

```
aws ssm update-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
    --document-version "\$LATEST"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-UpdateSSMAgent",
        "AssociationVersion": "2",
        "Date": 1550508093.293,
        "LastUpdateAssociationDate": 1550508106.596,
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$LATEST",
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "tag:Name",
                "Values": [
                    "Linux"
                ]
            }
        ],
        "LastExecutionDate": 1550508094.879,
        "LastSuccessfulExecutionDate": 1550508094.879
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

**Example 2: To update the schedule expression of an association**

The following `update-association` example updates the schedule expression for the specified association.

```
aws ssm update-association \
    --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
```

```
    --schedule-expression "cron(0 0 0/4 1/1 * ? *)"
```

Output:

```
{
    "AssociationDescription": {
        "Name": "AWS-HelloWorld",
        "AssociationVersion": "2",
        "Date": "2021-02-08T13:54:19.203000-08:00",
        "LastUpdateAssociationDate": "2021-06-29T11:51:07.933000-07:00",
        "Overview": {
            "Status": "Pending",
            "DetailedStatus": "Creating"
        },
        "DocumentVersion": "$DEFAULT",
        "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
        "Targets": [
            {
                "Key": "aws:NoOpAutomationTag",
                "Values": [
                    "AWS-NoOpAutomationTarget-Value"
                ]
            }
        ],
        "ScheduleExpression": "cron(0 0 0/4 1/1 * ? *)",
        "LastExecutionDate": "2021-06-26T19:00:48.110000-07:00",
        "ApplyOnlyAtCronInterval": false
    }
}
```

For more information, see Editing and creating a new version of an association in the *AWS Systems Manager User Guide*.

- For API details, see UpdateAssociation in *AWS CLI Command Reference*.

### `update-document-default-version`

The following code example shows how to use `update-document-default-version`.

#### AWS CLI

**To update the default version of a document**

The following `update-document-default-version` example updates the default version of a Systems Manager document.

```
aws ssm update-document-default-version \
    --name "Example" \
    --document-version "2"
```

Output:

```
{
    "Description": {
        "Name": "Example",
        "DefaultVersion": "2"
    }
}
```

For more information, see Writing SSM Document Content in the *AWS Systems Manager User Guide*.

- For API details, see UpdateDocumentDefaultVersion in *AWS CLI Command Reference*.

### `update-document-metadata`

The following code example shows how to use `update-document-metadata`.

#### AWS CLI

**Example: To approve the latest version of a change template**

The following `update-document-metadata` provides an approval for the latest version of a change template that has been submitted for review.

```
aws ssm update-document-metadata \
    --name MyChangeManagerTemplate \
    --document-reviews 'Action=Approve,Comment=[{Type=Comment,Content=Approved!}]'
```

This command produces no output.

For more information, see Reviewing and approving or rejecting change templates in the *AWS Systems Manager User Guide*.

- For API details, see UpdateDocumentMetadata in *AWS CLI Command Reference*.

### `update-document`

The following code example shows how to use `update-document`.

**AWS CLI**

**To create a new version of a document**

The following `update-document` example creates a new version of a document when run on a Windows computer. The document specified by `--document` must be in JSON format. Note that `file://` must be referenced followed by the path of the content file. Because of the $ at the beginning of the `--document-version` parameter, On Windows you must surround the value with double quotes. On Linux, MacOS, or at a PowerShell prompt, you must surround the value with single quotes.

**Windows version**:

```
aws ssm update-document \
    --name "RunShellScript" \
    --content "file://RunShellScript.json" \
    --document-version "$LATEST"
```

**Linux/Mac version**:

```
aws ssm update-document \
    --name "RunShellScript" \
    --content "file://RunShellScript.json" \
    --document-version '$LATEST'
```

Output:

```
{
  "DocumentDescription": {
      "Status": "Updating",
      "Hash": "f775e5df4904c6fa46686c4722fae9de1950dace25cd9608ff8d622046b68d9b",
      "Name": "RunShellScript",
      "Parameters": [
          {
              "Type": "StringList",
              "Name": "commands",
              "Description": "(Required) Specify a shell script or a command to
 run."
```

```
            }
        ],
        "DocumentType": "Command",
        "PlatformTypes": [
            "Linux"
        ],
        "DocumentVersion": "2",
        "HashType": "Sha256",
        "CreatedDate": 1487899655.152,
        "Owner": "809632081692",
        "SchemaVersion": "2.0",
        "DefaultVersion": "1",
        "LatestVersion": "2",
        "Description": "Run an updated script"
    }
}
```

- For API details, see UpdateDocument in *AWS CLI Command Reference*.

### `update-maintenance-window-target`

The following code example shows how to use `update-maintenance-window-target`.

#### AWS CLI

**To update a maintenance window target**

The following `update-maintenance-window-target` example updates only the name of a maintenance window target.

```
aws ssm update-maintenance-window-target \
    --window-id "mw-0c5ed765acEXAMPLE" \
    --window-target-id "57e8344e-fe64-4023-8191-6bf05EXAMPLE" \
    --name "NewName" \
    --no-replace
```

Output:

```
{
    "Description": "",
    "OwnerInformation": "",
    "WindowTargetId": "57e8344e-fe64-4023-8191-6bf05EXAMPLE",
```

```
    "WindowId": "mw-0c5ed765acEXAMPLE",
    "Targets": [
        {
            "Values": [
                "i-1234567890EXAMPLE"
            ],
            "Key": "InstanceIds"
        }
    ],
    "Name": "NewName"
}
```

For more information, see Update a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindowTarget in *AWS CLI Command Reference*.

### `update-maintenance-window-task`

The following code example shows how to use `update-maintenance-window-task`.

#### AWS CLI

**To update a maintenance window task**

The following `update-maintenance-window-task` example updates the service role for a maintenance window task.

```
aws ssm update-maintenance-window-task \
    --window-id "mw-0c5ed765acEXAMPLE" \
    --window-task-id "23d3809e-9fbe-4ddf-b41a-b49d7EXAMPLE" \
    --service-role-arn "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM"
```

Output:

```
{
    "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
    "MaxErrors": "1",
    "TaskArn": "AWS-UpdateEC2Config",
    "MaxConcurrency": "1",
    "WindowTaskId": "23d3809e-9fbe-4ddf-b41a-b49d7EXAMPLE",
```

```
    "TaskParameters": {},
    "Priority": 1,
    "TaskInvocationParameters": {
        "RunCommand": {
            "TimeoutSeconds": 600,
            "Parameters": {
                "allowDowngrade": [
                    "false"
                ]
            }
        }
    },
    "WindowId": "mw-0c5ed765acEXAMPLE",
    "Description": "UpdateEC2Config",
    "Targets": [
        {
            "Values": [
                "57e8344e-fe64-4023-8191-6bf05EXAMPLE"
            ],
            "Key": "WindowTargetIds"
        }
    ],
    "Name": "UpdateEC2Config"
}
```

For more information, see Update a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindowTask in *AWS CLI Command Reference*.

### `update-maintenance-window`

The following code example shows how to use `update-maintenance-window`.

#### AWS CLI

**Example 1: To update a maintenance window**

The following `update-maintenance-window` example updates the name of a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
```

```
    --name "My-Renamed-MW"
```

Output:

```
{
    "Cutoff": 1,
    "Name": "My-Renamed-MW",
    "Schedule": "cron(0 16 ? * TUE *)",
    "Enabled": true,
    "AllowUnassociatedTargets": true,
    "WindowId": "mw-1a2b3c4d5e6f7g8h9",
    "Duration": 4
}
```

**Example 2: To disable a maintenance window**

The following `update-maintenance-window` example disables a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --no-enabled
```

**Example 3: To enable a maintenance window**

The following `update-maintenance-window` example enables a maintenance window.

```
aws ssm update-maintenance-window \
    --window-id "mw-1a2b3c4d5e6f7g8h9" \
    --enabled
```

For more information, see Update a Maintenance Window (AWS CLI) in the *AWS Systems Manager User Guide*.

- For API details, see UpdateMaintenanceWindow in *AWS CLI Command Reference*.

## `update-managed-instance-role`

The following code example shows how to use `update-managed-instance-role`.

### AWS CLI

**To update the IAM role of a managed instance**

The following `update-managed-instance-role` example updates the IAM instance profile of a managed instance.

```
aws ssm update-managed-instance-role \
    --instance-id "mi-08ab247cdfEXAMPLE" \
    --iam-role "ExampleRole"
```

This command produces no output.

For more information, see Step 4: Create an IAM Instance Profile for Systems Manager in the *AWS Systems Manager User Guide*.

- For API details, see UpdateManagedInstanceRole in *AWS CLI Command Reference*.

### `update-ops-item`

The following code example shows how to use `update-ops-item`.

**AWS CLI**

**To update an OpsItem**

The following `update-ops-item` example updates the description, priority, and category for an OpsItem. In addition, the command specifies an SNS topic where the notifications are sent when this OpsItem is edited or changed.

```
aws ssm update-ops-item \
    --ops-item-id "oi-287b5EXAMPLE" \
    --description "Primary OpsItem for failover event 2020-01-01-fh398yf" \
    --priority 2 \
    --category "Security" \
    --notifications "Arn=arn:aws:sns:us-east-2:111222333444:my-us-east-2-topic"
```

Output:

```
This command produces no output.
```

For more information, see Working with OpsItems in the *AWS Systems Manager User Guide*.

- For API details, see UpdateOpsItem in *AWS CLI Command Reference*.

### `update-patch-baseline`

The following code example shows how to use `update-patch-baseline`.

**AWS CLI**

**Example 1: To update a patch baseline**

The following `update-patch-baseline` example adds the specified two patches as rejected and one patch as approved to the specified patch baseline.

```
aws ssm update-patch-baseline \
        --baseline-id "pb-0123456789abcdef0" \
        --rejected-patches "KB2032276" "MS10-048" \
        --approved-patches "KB2124261"
```

Output:

```
{
    "BaselineId": "pb-0123456789abcdef0",
    "Name": "WindowsPatching",
    "OperatingSystem": "WINDOWS",
    "GlobalFilters": {
        "PatchFilters": []
    },
    "ApprovalRules": {
        "PatchRules": [
            {
                "PatchFilterGroup": {
                    "PatchFilters": [
                        {
                            "Key": "PRODUCT",
                            "Values": [
                                "WindowsServer2016"
                            ]
                        }
                    ]
                },
                "ComplianceLevel": "CRITICAL",
                "ApproveAfterDays": 0,
                "EnableNonSecurity": false
            }
        ]
```

```
    },
    "ApprovedPatches": [
        "KB2124261"
    ],
    "ApprovedPatchesComplianceLevel": "UNSPECIFIED",
    "ApprovedPatchesEnableNonSecurity": false,
    "RejectedPatches": [
        "KB2032276",
        "MS10-048"
    ],
    "RejectedPatchesAction": "ALLOW_AS_DEPENDENCY",
    "CreatedDate": 1550244180.465,
    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
}
```

**Example 2: To rename a patch baseline**

The following `update-patch-baseline` example renames the specified patch baseline.

```
aws ssm update-patch-baseline \
    --baseline-id "pb-0713accee01234567" \
    --name "Windows-Server-2012-R2-Important-and-Critical-Security-Updates"
```

For more information, see Update or Delete a Patch Baseline <https://docs.aws.amazon.com/systems-manager/latest/userguide/patch-baseline-update-or-delete.html>`__ in the *AWS Systems Manager User Guide*.

- For API details, see UpdatePatchBaseline in *AWS CLI Command Reference*.

## `update-resource-data-sync`

The following code example shows how to use `update-resource-data-sync`.

### AWS CLI

**To update a resource data sync**

The following `update-resource-data-sync` example updates a SyncFromSource resource data sync.

```
aws ssm update-resource-data-sync \
    --sync-name exampleSync \
    --sync-type SyncFromSource \
    --sync-source '{"SourceType":"SingleAccountMultiRegions", "SourceRegions":["us-
east-1", "us-west-2"]}'
```

This command produces no output.

For more information, see Setting Up Systems Manager Explorer to Display Data from Multiple Accounts and Regions in the *AWS Systems Manager User Guide*.

- For API details, see UpdateResourceDataSync in *AWS CLI Command Reference*.

### `update-service-setting`

The following code example shows how to use `update-service-setting`.

#### AWS CLI

**To update the service setting for Parameter Store throughput**

The following `update-service-setting` example updates the current service setting for Parameter Store throughput in the specified region to use increased throughput.

```
aws ssm update-service-setting \
    --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-
store/high-throughput-enabled \
    --setting-value true
```

This command produces no output.

For more information, see Increasing Parameter Store Throughput in the *AWS Systems Manager User Guide*.

- For API details, see UpdateServiceSetting in *AWS CLI Command Reference*.

## Amazon Textract examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Textract.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

## Actions

### `analyze-document`

The following code example shows how to use `analyze-document`.

**AWS CLI**

**To analyze text in a document**

The following `analyze-document` example shows how to analyze text in a document.

Linux/macOS:

```
aws textract analyze-document \
    --document '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
    --feature-types '["TABLES","FORMS"]'
```

Windows:

```
aws textract analyze-document \
    --document "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document\"}}" \
    --feature-types "[\"TABLES\",\"FORMS\"]" \
    --region region-name
```

Output:

```
{
    "Blocks": [
```

```
        {
            "Geometry": {
                "BoundingBox": {
                    "Width": 1.0,
                    "Top": 0.0,
                    "Left": 0.0,
                    "Height": 1.0
                },
                "Polygon": [
                    {
                        "Y": 0.0,
                        "X": 0.0
                    },
                    {
                        "Y": 0.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 0.0
                    }
                ]
            },
            "Relationships": [
                {
                    "Type": "CHILD",
                    "Ids": [
                        "87586964-d50d-43e2-ace5-8a890657b9a0",
                        "a1e72126-21d9-44f4-a8d6-5c385f9002ba",
                        "e889d012-8a6b-4d2e-b7cd-7a8b327d876a"
                    ]
                }
            ],
            "BlockType": "PAGE",
            "Id": "c2227f12-b25d-4e1f-baea-1ee180d926b2"
        }
    ],
    "DocumentMetadata": {
        "Pages": 1
    }
```

```
}
```

For more information, see Analyzing Document Text with Amazon Textract in the *Amazon Textract Developers Guide*

- For API details, see AnalyzeDocument in *AWS CLI Command Reference*.

### `detect-document-text`

The following code example shows how to use `detect-document-text`.

**AWS CLI**

**To detect text in a document**

The following `detect-document-text` The following example shows how to detect text in a document.

Linux/macOS:

```
aws textract detect-document-text \
    --document '{"S3Object":{"Bucket":"bucket","Name":"document"}}'
```

Windows:

```
aws textract detect-document-text \
    --document "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document\"}}" \
    --region region-name
```

Output:

```
{
    "Blocks": [
        {
            "Geometry": {
                "BoundingBox": {
                    "Width": 1.0,
                    "Top": 0.0,
                    "Left": 0.0,
                    "Height": 1.0
                },
                "Polygon": [
```

```
                    {
                        "Y": 0.0,
                        "X": 0.0
                    },
                    {
                        "Y": 0.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 0.0
                    }
                ]
            },
            "Relationships": [
                {

### `get-document-analysis`

The following code example shows how to use `get-document-analysis`.

#### AWS CLI

**To get the results of asynchronous text analysis of a multi-page document**

The following `get-document-analysis` example shows how to get the results of asynchronous text analysis of a multi-page document.

```
aws textract get-document-analysis \
    --job-id df7cf32ebbd2a5de113535fcf4d921926a701b09b4e7d089f3aebadb41e0712b \
    --max-results 1000
```

Output:

```
{
    "Blocks": [
        {
            "Geometry": {
                "BoundingBox": {
                    "Width": 1.0,
                    "Top": 0.0,
                    "Left": 0.0,
                    "Height": 1.0
                },
                "Polygon": [
                    {
                        "Y": 0.0,
                        "X": 0.0
                    },
                    {
                        "Y": 0.0,
                        "X": 1.0
                    },

### `get-document-text-detection`

The following code example shows how to use `get-document-text-detection`.

#### AWS CLI

**To get the results of asynchronous text detection in a multi-page document**

The following `get-document-text-detection` example shows how to get the results of asynchronous text detection in a multi-page document.

```
aws textract get-document-text-detection \
    --job-id 57849a3dc627d4df74123dca269d69f7b89329c870c65bb16c9fd63409d200b9 \
    --max-results 1000
```

Output

```
{
    "Blocks": [
        {
```

```
            "Geometry": {
                "BoundingBox": {
                    "Width": 1.0,
                    "Top": 0.0,
                    "Left": 0.0,
                    "Height": 1.0
                },
                "Polygon": [
                    {
                        "Y": 0.0,
                        "X": 0.0
                    },
                    {
                        "Y": 0.0,
                        "X": 1.0
                    },
                    {
                        "Y": 1.0,
                        "X": 1.0
                    },
                    {

- For API details, see GetDocumentTextDetection in *AWS CLI Command Reference*.

### `start-document-analysis`

The following code example shows how to use `start-document-analysis`.

**AWS CLI**

**To start analyzing text in a multi-page document**

The following `start-document-analysis` example shows how to start asynchronous analysis of text in a multi-page document.

Linux/macOS:

```
aws textract start-document-analysis \
    --document-location '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
    --feature-types '["TABLES","FORMS"]' \
    --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"
```

Windows:

```
aws textract start-document-analysis \
    --document-location "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document
\"}}" \
    --feature-types "[\"TABLES\", \"FORMS\"]" \
    --region region-name \
    --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"
```

Output:

```
{
    "JobId": "df7cf32ebbd2a5de113535fcf4d921926a701b09b4e7d089f3aebadb41e0712b"
```

```
}
```

For more information, see Detecting and Analyzing Text in Multi-Page Documents in the *Amazon Textract Developers Guide*

- For API details, see StartDocumentAnalysis in *AWS CLI Command Reference*.

### `start-document-text-detection`

The following code example shows how to use `start-document-text-detection`.

**AWS CLI**

**To start detecting text in a multi-page document**

The following `start-document-text-detection` example shows how to start asynchronous detection of text in a multi-page document.

Linux/macOS:

```
aws textract start-document-text-detection \
        --document-location '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
        --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleARN"
```

Windows:

```
aws textract start-document-text-detection \
    --document-location "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document
\"}}" \
    --region region-name \
    --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"
```

Output:

```
{
    "JobId": "57849a3dc627d4df74123dca269d69f7b89329c870c65bb16c9fd63409d200b9"
}
```

For more information, see Detecting and Analyzing Text in Multi-Page Documents in the *Amazon Textract Developers Guide*

- For API details, see StartDocumentTextDetection in *AWS CLI Command Reference*.

# Amazon Transcribe examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Transcribe.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

## Actions

### `create-language-model`

The following code example shows how to use `create-language-model`.

### AWS CLI

#### Example 1: To create a custom language model using both training and tuning data.

The following `create-language-model` example creates a custom language model. You can use a custom language model to improve transcription performance for domains such as legal, hospitality, finance, and insurance. For language-code, enter a valid language code. For base-model-name, specify a base model that is best suited for the sample rate of the audio that you want to transcribe with your custom language model. For model-name, specify the name that you want to call the custom language model.

```
aws transcribe create-language-model \
    --language-code language-code \
    --base-model-name base-model-name \
    --model-name cli-clm-example \
    --input-data-config S3Uri="s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-for-
training-data",TuningDataS3Uri="s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-for-
```

```
tuning-data",DataAccessRoleArn="arn:aws:iam::AWS-account-number:role/IAM-role-with-
permissions-to-create-a-custom-language-model"
```

Output:

```
{
    "LanguageCode": "language-code",
    "BaseModelName": "base-model-name",
    "ModelName": "cli-clm-example",
    "InputDataConfig": {
        "S3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/",
        "TuningDataS3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/",
        "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-with-
permissions-create-a-custom-language-model"
    },
    "ModelStatus": "IN_PROGRESS"
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

**Example 2: To create a custom language model using only training data.**

The following `create-language-model` example transcribes your audio file. You can use a custom language model to improve transcription performance for domains such as legal, hospitality, finance, and insurance. For language-code, enter a valid language code. For base-model-name, specify a base model that is best suited for the sample rate of the audio that you want to transcribe with your custom language model. For model-name, specify the name that you want to call the custom language model.

```
aws transcribe create-language-model \
    --language-code en-US \
    --base-model-name base-model-name \
    --model-name cli-clm-example \
    --input-data-config S3Uri="s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-For-
Training-Data",DataAccessRoleArn="arn:aws:iam::AWS-account-number:role/IAM-role-
with-permissions-to-create-a-custom-language-model"
```

Output:

```
{
```

```
    "LanguageCode": "en-US",
    "BaseModelName": "base-model-name",
    "ModelName": "cli-clm-example",
    "InputDataConfig": {
        "S3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-For-Training-Data/",
        "DataAccessRoleArn": "arn:aws:iam::your-AWS-account-number:role/IAM-role-
with-permissions-to-create-a-custom-language-model"
    },
    "ModelStatus": "IN_PROGRESS"
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateLanguageModel in *AWS CLI Command Reference*.

### `create-medical-vocabulary`

The following code example shows how to use `create-medical-vocabulary`.

#### AWS CLI

**To create a medical custom vocabulary**

The following `create-medical-vocabulary` example creates a custom vocabulary. To create a custom vocabulary, you must have created a text file with all the terms that you want to transcribe more accurately. For vocabulary-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of that text file. For language-code, specify a language code corresponding to the language of your custom vocabulary. For vocabulary-name, specify what you want to call your custom vocabulary.

```
aws transcribe create-medical-vocabulary \
    --vocabulary-name cli-medical-vocab-example \
    --language-code language-code \
    --vocabulary-file-uri https://DOC-EXAMPLE-BUCKET.AWS-Region.amazonaws.com/the-
text-file-for-the-medical-custom-vocabulary.txt
```

Output:

```
{
    "VocabularyName": "cli-medical-vocab-example",
    "LanguageCode": "language-code",
```

```
    "VocabularyState": "PENDING"
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateMedicalVocabulary in *AWS CLI Command Reference*.

### `create-vocabulary-filter`

The following code example shows how to use `create-vocabulary-filter`.

**AWS CLI**

**To create a vocabulary filter**

The following `create-vocabulary-filter` example creates a vocabulary filter that uses a text file that contains a list of words that you wouldn't want to appear in a transcription. For language-code, specify the language code corresponding to the language of your vocabulary filter. For vocabulary-filter-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of the text file. For vocabulary-filter-name, specify the name of your vocabulary filter.

```
aws transcribe create-vocabulary-filter \
    --language-code language-code \
    --vocabulary-filter-file-uri s3://DOC-EXAMPLE-BUCKET/vocabulary-filter.txt \
    --vocabulary-filter-name cli-vocabulary-filter-example
```

Output:

```
{
    "VocabularyFilterName": "cli-vocabulary-filter-example",
    "LanguageCode": "language-code"
}
```

For more information, see Filtering Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateVocabularyFilter in *AWS CLI Command Reference*.

### `create-vocabulary`

The following code example shows how to use `create-vocabulary`.

**AWS CLI**

**To create a custom vocabulary**

The following `create-vocabulary` example creates a custom vocabulary. To create a custom vocabulary, you must have created a text file with all the terms that you want to transcribe more accurately. For vocabulary-file-uri, specify the Amazon Simple Storage Service (Amazon S3) URI of that text file. For language-code, specify a language code corresponding to the language of your custom vocabulary. For vocabulary-name, specify what you want to call your custom vocabulary.

```
aws transcribe create-vocabulary \
    --language-code language-code \
    --vocabulary-name cli-vocab-example \
    --vocabulary-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/the-text-file-
for-the-custom-vocabulary.txt
```

Output:

```
{
    "VocabularyName": "cli-vocab-example",
    "LanguageCode": "language-code",
    "VocabularyState": "PENDING"
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see CreateVocabulary in *AWS CLI Command Reference*.

## `delete-language-model`

The following code example shows how to use `delete-language-model`.

**AWS CLI**

**To delete a custom language model**

The following `delete-language-model` example deletes a custom language model.

```
aws transcribe delete-language-model \
    --model-name model-name
```

This command produces no output.

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteLanguageModel in *AWS CLI Command Reference*.

### `delete-medical-transcription-job`

The following code example shows how to use `delete-medical-transcription-job`.

**AWS CLI**

**To delete a medical transcription job**

The following `delete-medical-transcription-job` example deletes a medical transcription job.

```
aws transcribe delete-medical-transcription-job \
    --medical-transcription-job-name medical-transcription-job-name
```

This command produces no output.

For more information, see DeleteMedicalTranscriptionJob in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteMedicalTranscriptionJob in *AWS CLI Command Reference*.

### `delete-medical-vocabulary`

The following code example shows how to use `delete-medical-vocabulary`.

**AWS CLI**

**To delete a medical custom vocabulary**

The following `delete-medical-vocabulary` example deletes a medical custom vocabulary. For vocabulary-name, specify the name of the medical custom vocabulary.

```
aws transcribe delete-vocabulary \
    --vocabulary-name medical-custom-vocabulary-name
```

This command produces no output.

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteMedicalVocabulary in *AWS CLI Command Reference*.

### `delete-transcription-job`

The following code example shows how to use `delete-transcription-job`.

**AWS CLI**

**To delete one of your transcription jobs**

The following `delete-transcription-job` example deletes one of your transcription jobs.

```
aws transcribe delete-transcription-job \
    --transcription-job-name your-transcription-job
```

This command produces no output.

For more information, see DeleteTranscriptionJob in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteTranscriptionJob in *AWS CLI Command Reference*.

### `delete-vocabulary-filter`

The following code example shows how to use `delete-vocabulary-filter`.

**AWS CLI**

**To delete a vocabulary filter**

The following `delete-vocabulary-filter` example deletes a vocabulary filter.

```
aws transcribe delete-vocabulary-filter \
    --vocabulary-filter-name vocabulary-filter-name
```

This command produces no output.

For more information, see Filtering Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteVocabularyFilter in *AWS CLI Command Reference*.

### `delete-vocabulary`

The following code example shows how to use `delete-vocabulary`.

**AWS CLI**

**To delete a custom vocabulary**

The following `delete-vocabulary` example deletes a custom vocabulary.

```
aws transcribe delete-vocabulary \
    --vocabulary-name vocabulary-name
```

This command produces no output.

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see DeleteVocabulary in *AWS CLI Command Reference*.

### `describe-language-model`

The following code example shows how to use `describe-language-model`.

**AWS CLI**

**To get information about a specific custom language model**

The following `describe-language-model` example gets information about a specific custom language model. For example, under BaseModelName you can see whether your model is trained using a NarrowBand or WideBand model. Custom language models with a NarrowBand base model can transcribe audio with a sample rate less than 16 kHz. Language models using a WideBand base model can transcribe audio with a sample rate greater than 16 kHz. The S3Uri parameter indicates the Amazon S3 prefix you've used to access the training data to create the custom language model.

```
aws transcribe describe-language-model \
    --model-name cli-clm-example
```

Output:

```
{
```

```
    "LanguageModel": {
        "ModelName": "cli-clm-example",
        "CreateTime": "2020-09-25T17:57:38.504000+00:00",
        "LastModifiedTime": "2020-09-25T17:57:48.585000+00:00",
        "LanguageCode": "language-code",
        "BaseModelName": "base-model-name",
        "ModelStatus": "IN_PROGRESS",
        "UpgradeAvailability": false,
        "InputDataConfig": {
            "S3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/",
            "TuningDataS3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/",
            "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-
with-permissions-to-create-a-custom-language-model"
        }
    }
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see DescribeLanguageModel in *AWS CLI Command Reference*.

### `get-medical-transcription-job`

The following code example shows how to use `get-medical-transcription-job`.

**AWS CLI**

**To get information about a specific medical transcription job**

The following `get-medical-transcription-job` example gets information about a specific medical transcription job. To access the transcription results, use the TranscriptFileUri parameter. If you've enabled additional features for the transcription job, you can see them in the Settings object. The Specialty parameter shows the medical specialty of the provider. The Type parameter indicates whether the speech in the transcription job is of a medical conversation, or a medical dictation.

```
aws transcribe get-medical-transcription-job \
    --medical-transcription-job-name vocabulary-dictation-medical-transcription-job
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-
job",
        "TranscriptionJobStatus": "COMPLETED",
        "LanguageCode": "en-US",
        "MediaSampleRateHertz": 48000,
        "MediaFormat": "mp4",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-audio-file.file-extension"
        },
        "Transcript": {
            "TranscriptFileUri": "https://s3.Region.amazonaws.com/Amazon-S3-Prefix/
vocabulary-dictation-medical-transcription-job.json"
        },
        "StartTime": "2020-09-21T21:17:27.045000+00:00",
        "CreationTime": "2020-09-21T21:17:27.016000+00:00",
        "CompletionTime": "2020-09-21T21:17:59.561000+00:00",
        "Settings": {
            "ChannelIdentification": false,
            "ShowAlternatives": false,
            "VocabularyName": "cli-medical-vocab-example"
        },
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Batch Transcription in the *Amazon Transcribe Developer Guide*.

- For API details, see GetMedicalTranscriptionJob in *AWS CLI Command Reference*.

## `get-medical-vocabulary`

The following code example shows how to use `get-medical-vocabulary`.

### AWS CLI

#### To get information about a medical custom vocabulary

The following `get-medical-vocabulary` example gets information on a medical custom vocabulary. You can use the VocabularyState parameter to see the processing state of the vocabulary. If it's READY, you can use it in the StartMedicalTranscriptionJob operation.:

```
aws transcribe get-medical-vocabulary \
    --vocabulary-name medical-vocab-example
```

Output:

```
{
    "VocabularyName": "medical-vocab-example",
    "LanguageCode": "en-US",
    "VocabularyState": "READY",
    "LastModifiedTime": "2020-09-19T23:59:04.349000+00:00",
    "DownloadUri": "https://link-to-download-the-text-file-used-to-create-your-
medical-custom-vocabulary"
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see GetMedicalVocabulary in *AWS CLI Command Reference*.

### `get-transcription-job`

The following code example shows how to use `get-transcription-job`.

#### AWS CLI

**To get information about a specific transcription job**

The following `get-transcription-job` example gets information about a specific transcription job. To access the transcription results, use the TranscriptFileUri parameter. Use the MediaFileUri parameter to see which audio file you transcribed with this job. You can use the Settings object to see the optional features you've enabled in the transcription job.

```
aws transcribe get-transcription-job \
    --transcription-job-name your-transcription-job
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "your-transcription-job",
```

```
        "TranscriptionJobStatus": "COMPLETED",
        "LanguageCode": "language-code",
        "MediaSampleRateHertz": 48000,
        "MediaFormat": "mp4",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.file-extension"
        },
        "Transcript": {
            "TranscriptFileUri": "https://Amazon-S3-file-location-of-transcription-
output"
        },
        "StartTime": "2020-09-18T22:27:23.970000+00:00",
        "CreationTime": "2020-09-18T22:27:23.948000+00:00",
        "CompletionTime": "2020-09-18T22:28:21.197000+00:00",
        "Settings": {
            "ChannelIdentification": false,
            "ShowAlternatives": false
        },
        "IdentifyLanguage": true,
        "IdentifiedLanguageScore": 0.8672199249267578
    }
}
```

For more information, see Getting Started (AWS Command Line Interface) in the *Amazon Transcribe Developer Guide*.

- For API details, see GetTranscriptionJob in *AWS CLI Command Reference*.

## `get-vocabulary-filter`

The following code example shows how to use `get-vocabulary-filter`.

### AWS CLI

#### To get information about a vocabulary filter

The following `get-vocabulary-filter` example gets information about a vocabulary filter. You can use the DownloadUri parameter to get the list of words you used to create the vocabulary filter.

```
aws transcribe get-vocabulary-filter \
    --vocabulary-filter-name testFilter
```

Output:

```
{
    "VocabularyFilterName": "testFilter",
    "LanguageCode": "language-code",
    "LastModifiedTime": "2020-05-07T22:39:32.147000+00:00",
    "DownloadUri": "https://Amazon-S3-location-to-download-your-vocabulary-filter"
}
```

For more information, see Filter Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see GetVocabularyFilter in *AWS CLI Command Reference*.

### `get-vocabulary`

The following code example shows how to use `get-vocabulary`.

#### AWS CLI

**To get information about a custom vocabulary**

The following `get-vocabulary` example gets information on a previously created custom vocabulary.

```
aws transcribe get-vocabulary \
    --vocabulary-name cli-vocab-1
```

Output:

```
{
    "VocabularyName": "cli-vocab-1",
    "LanguageCode": "language-code",
    "VocabularyState": "READY",
    "LastModifiedTime": "2020-09-19T23:22:32.836000+00:00",
    "DownloadUri": "https://link-to-download-the-text-file-used-to-create-your-
custom-vocabulary"
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see GetVocabulary in *AWS CLI Command Reference*.

### `list-language-models`

The following code example shows how to use `list-language-models`.

**AWS CLI**

**To list your custom language models**

The following `list-language-models` example lists the custom language models associated with your AWS account and Region. You can use the `S3Uri` and `TuningDataS3Uri` parameters to find the Amazon S3 prefixes you've used as your training data, or your tuning data. The BaseModelName tells you whether you've used a NarrowBand, or WideBand model to create a custom language model. You can transcribe audio with a sample rate of less than 16 kHz with a custom language model using a NarrowBand base model. You can transcribe audio 16 kHz or greater with a custom language model using a WideBand base model. The `ModelStatus` parameter shows whether you can use the custom language model in a transcription job. If the value is COMPLETED, you can use it in a transcription job.

```
aws transcribe list-language-models
```

Output:

```
{
    "Models": [
        {
            "ModelName": "cli-clm-2",
            "CreateTime": "2020-09-25T17:57:38.504000+00:00",
            "LastModifiedTime": "2020-09-25T17:57:48.585000+00:00",
            "LanguageCode": "language-code",
            "BaseModelName": "WideBand",
            "ModelStatus": "IN_PROGRESS",
            "UpgradeAvailability": false,
            "InputDataConfig": {
                "S3Uri": "s3://DOC-EXAMPLE-BUCKET/clm-training-data/",
                "TuningDataS3Uri": "s3://DOC-EXAMPLE-BUCKET/clm-tuning-data/",
                "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-
used-to-create-the-custom-language-model"
            }
        },
        {
            "ModelName": "cli-clm-1",
            "CreateTime": "2020-09-25T17:16:01.835000+00:00",
```

```
            "LastModifiedTime": "2020-09-25T17:16:15.555000+00:00",
            "LanguageCode": "language-code",
            "BaseModelName": "WideBand",
            "ModelStatus": "IN_PROGRESS",
            "UpgradeAvailability": false,
            "InputDataConfig": {
                "S3Uri": "s3://DOC-EXAMPLE-BUCKET/clm-training-data/",
                "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-
used-to-create-the-custom-language-model"
            }
        },
        {
            "ModelName": "clm-console-1",
            "CreateTime": "2020-09-24T19:26:28.076000+00:00",
            "LastModifiedTime": "2020-09-25T04:25:22.271000+00:00",
            "LanguageCode": "language-code",
            "BaseModelName": "NarrowBand",
            "ModelStatus": "COMPLETED",
            "UpgradeAvailability": false,
            "InputDataConfig": {
                "S3Uri": "s3://DOC-EXAMPLE-BUCKET/clm-training-data/",
                "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-
used-to-create-the-custom-language-model"
            }
        }
    ]
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see ListLanguageModels in *AWS CLI Command Reference*.

### `list-medical-transcription-jobs`

The following code example shows how to use `list-medical-transcription-jobs`.

**AWS CLI**

**To list your medical transcription jobs**

The following `list-medical-transcription-jobs` example lists the medical transcription jobs associated with your AWS account and Region. To get more information about a particular

transcription job, copy the value of a MedicalTranscriptionJobName parameter in the transcription output, and specify that value for the `MedicalTranscriptionJobName` option of the `get-medical-transcription-job` command. To see more of your transcription jobs, copy the value of the NextToken parameter, run the `list-medical-transcription-jobs` command again, and specify that value in the `--next-token` option.

```
aws transcribe list-medical-transcription-jobs
```

Output:

```
{
    "NextToken": "3/PblzkiGhzjER3KHuQt2fmbPLF7cDYafjFMEoGn44ON/
gsuUSTIkGyanvRE6WMXFd/ZTEc2EZj+P9eii/

}
```

For more information, see https://docs.aws.amazon.com/transcribe/latest/dg/batch-med-transcription.html> in the *Amazon Transcribe Developer Guide*.

- For API details, see ListMedicalTranscriptionJobs in *AWS CLI Command Reference*.

### `list-medical-vocabularies`

The following code example shows how to use `list-medical-vocabularies`.

**AWS CLI**

**To list your medical custom vocabularies**

The following `list-medical-vocabularies` example lists the medical custom vocabularies associated with your AWS account and Region. To get more information about a particular transcription job, copy the value of a `MedicalTranscriptionJobName` parameter in the transcription output, and specify that value for the `MedicalTranscriptionJobName` option of the `get-medical-transcription-job` command. To see more of your transcription jobs, copy the value of the `NextToken` parameter, run the `list-medical-transcription-jobs` command again, and specify that value in the `--next-token` option.

```
aws transcribe list-medical-vocabularies
```

Output:

```
{
    "Vocabularies": [
        {
            "VocabularyName": "cli-medical-vocab-2",
            "LanguageCode": "en-US",
            "LastModifiedTime": "2020-09-21T21:44:59.521000+00:00",
            "VocabularyState": "READY"
        },
        {
            "VocabularyName": "cli-medical-vocab-1",
```

```
            "LanguageCode": "en-US",
            "LastModifiedTime": "2020-09-19T23:59:04.349000+00:00",
            "VocabularyState": "READY"
        }
    ]
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see ListMedicalVocabularies in *AWS CLI Command Reference*.

### `list-transcription-jobs`

The following code example shows how to use `list-transcription-jobs`.

#### AWS CLI

**To list your transcription jobs**

The following `list-transcription-jobs` example lists the transcription jobs associated with your AWS account and Region.

```
aws transcribe list-transcription-jobs
```

Output:

```
{
    "NextToken": "NextToken",
    "TranscriptionJobSummaries": [
        {
            "TranscriptionJobName": "speak-id-job-1",
            "CreationTime": "2020-08-17T21:06:15.391000+00:00",
            "StartTime": "2020-08-17T21:06:15.416000+00:00",
            "CompletionTime": "2020-08-17T21:07:05.098000+00:00",
            "LanguageCode": "language-code",
            "TranscriptionJobStatus": "COMPLETED",
            "OutputLocationType": "SERVICE_BUCKET"
        },
        {
            "TranscriptionJobName": "job-1",

        }
    ]
}
```

For more information, see Getting Started (AWS Command Line Interface) in the *Amazon Transcribe Developer Guide*.

- For API details, see ListTranscriptionJobs in *AWS CLI Command Reference*.

### `list-vocabularies`

The following code example shows how to use `list-vocabularies`.

**AWS CLI**

**To list your custom vocabularies**

The following `list-vocabularies` example lists the custom vocabularies associated with your AWS account and Region.

```
aws transcribe list-vocabularies
```

Output:

```
{
    "NextToken": "NextToken",
    "Vocabularies": [
        {
            "VocabularyName": "ards-test-1",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-04-27T22:00:27.330000+00:00",
            "VocabularyState": "READY"
        },
        {
            "VocabularyName": "sample-test",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-04-24T23:04:11.044000+00:00",
            "VocabularyState": "READY"
        },
        {
            "VocabularyName": "CRLF-to-LF-test-3-1",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-04-24T22:12:22.277000+00:00",
            "VocabularyState": "READY"
        },
        {
            "VocabularyName": "CRLF-to-LF-test-2",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-04-24T21:53:50.455000+00:00",
            "VocabularyState": "READY"
        },
        {
            "VocabularyName": "CRLF-to-LF-1-1",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-04-24T21:39:33.356000+00:00",
            "VocabularyState": "READY"
```

```
        }
    ]
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see ListVocabularies in *AWS CLI Command Reference*.

### `list-vocabulary-filters`

The following code example shows how to use `list-vocabulary-filters`.

#### AWS CLI

**To list your vocabulary filters**

The following `list-vocabulary-filters` example lists the vocabulary filters associated with your AWS account and Region.

```
aws transcribe list-vocabulary-filters
```

Output:

```
{
    "NextToken": "NextToken": [
        {
            "VocabularyFilterName": "testFilter",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-07T22:39:32.147000+00:00"
        },
        {
            "VocabularyFilterName": "testFilter2",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-21T23:29:35.174000+00:00"
        },
        {
            "VocabularyFilterName": "filter2",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-08T20:18:26.426000+00:00"
        },
        {
            "VocabularyFilterName": "filter-review",
```

```
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-06-03T18:52:30.448000+00:00"
        },
        {
            "VocabularyFilterName": "crlf-filt",
            "LanguageCode": "language-code",
            "LastModifiedTime": "2020-05-22T19:42:42.737000+00:00"
        }
    ]
}
```

For more information, see Filtering Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see ListVocabularyFilters in *AWS CLI Command Reference*.

### `start-medical-transcription-job`

The following code example shows how to use `start-medical-transcription-job`.

**AWS CLI**

**Example 1: To transcribe a medical dictation stored as an audio file**

The following `start-medical-transcription-job` example transcribes an audio file. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName":"DOC-EXAMPLE-BUCKET",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
        "StartTime": "2020-09-20T00:35:22.256000+00:00",
        "CreationTime": "2020-09-20T00:35:22.218000+00:00",
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Batch Transcription Overview in the *Amazon Transcribe Developer Guide*.

**Example 2: To transcribe a clinician-patient dialogue stored as an audio file**

The following `start-medical-transcription-job` example transcribes an audio file containing a clinician-patient dialogue. You specify the location of the transcription output in the OutputBucketName parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://mysecondfile.json
```

Contents of `mysecondfile.json`:

```
{
    "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"DOC-EXAMPLE-BUCKET",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "simple-conversation-medical-transcription-
job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
        "StartTime": "2020-09-20T23:19:49.965000+00:00",
        "CreationTime": "2020-09-20T23:19:49.941000+00:00",
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see Batch Transcription Overview in the *Amazon Transcribe Developer Guide*.

**Example 3: To transcribe a multichannel audio file of a clinician-patient dialogue**

The following `start-medical-transcription-job` example transcribes the audio from each channel in the audio file and merges the separate transcriptions from each channel into a single transcription output. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://mythirdfile.json
```

Contents of `mythirdfile.json`:

```
{
    "MedicalTranscriptionJobName": "multichannel-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"DOC-EXAMPLE-BUCKET",
        "Media": {
```

```
          "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
        "Settings":{
          "ChannelIdentification": true
        }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "multichannel-conversation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
        "StartTime": "2020-09-20T23:46:44.081000+00:00",
        "CreationTime": "2020-09-20T23:46:44.053000+00:00",
        "Settings": {
            "ChannelIdentification": true
        },
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see Channel Identification in the *Amazon Transcribe Developer Guide*.

**Example 4: To transcribe an audio file of a clinician-patient dialogue and identify the speakers in the transcription output**

The following `start-medical-transcription-job` example transcribes an audio file and labels the speech of each speaker in the transcription output. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myfourthfile.json
```

Contents of `myfourthfile.json`:

```
{
    "MedicalTranscriptionJobName": "speaker-id-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"DOC-EXAMPLE-BUCKET",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
    "Settings":{
        "ShowSpeakerLabels": true,
        "MaxSpeakerLabels": 2
        }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "speaker-id-conversation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T18:43:37.265000+00:00",
        "CreationTime": "2020-09-21T18:43:37.157000+00:00",
        "Settings": {
            "ShowSpeakerLabels": true,
            "MaxSpeakerLabels": 2
        },
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see Identifying Speakers in the *Amazon Transcribe Developer Guide*.

**Example 5: To transcribe a medical conversation stored as an audio file with up to two transcription alternatives**

The following `start-medical-transcription-job` example creates up to two alternative transcriptions from a single audio file. Every transcriptions has a level of confidence associated with it. By default, Amazon Transcribe returns the transcription with the highest confidence level. You can specify that Amazon Transcribe return additional transcriptions with lower confidence levels. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://myfifthfile.json
```

Contents of `myfifthfile.json`:

```
{
    "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION",
    "OutputBucketName":"DOC-EXAMPLE-BUCKET",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    },
    "Settings":{
        "ShowAlternatives": true,
        "MaxAlternatives": 2
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "alternatives-conversation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T19:09:18.199000+00:00",
        "CreationTime": "2020-09-21T19:09:18.171000+00:00",
```

```
        "Settings": {
            "ShowAlternatives": true,
            "MaxAlternatives": 2
        },
        "Specialty": "PRIMARYCARE",
        "Type": "CONVERSATION"
    }
}
```

For more information, see Alternative Transcriptions in the *Amazon Transcribe Developer Guide*.

**Example 6: To transcribe an audio file of a medical dictation with up to two alternative transcriptions**

The following `start-medical-transcription-job` example transcribes an audio file and uses a vocabulary filter to mask any unwanted words. You specify the location of the transcription output in the OutputBucketName parameter.

```
aws transcribe start-medical-transcription-job \
    --cli-input-json file://mysixthfile.json
```

Contents of `mysixthfile.json`:

```
{
    "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-
job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName":"DOC-EXAMPLE-BUCKET",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    },
    "Settings":{
          "ShowAlternatives": true,
          "MaxAlternatives": 2
    }
}
```

Output:

```
{
```

```
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "alternatives-dictation-medical-
transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T21:01:14.592000+00:00",
        "CreationTime": "2020-09-21T21:01:14.569000+00:00",
        "Settings": {
            "ShowAlternatives": true,
            "MaxAlternatives": 2
        },
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Alternative Transcriptions in the *Amazon Transcribe Developer Guide*.

**Example 7: To transcribe an audio file of a medical dictation with increased accuracy by using a custom vocabulary**

The following `start-medical-transcription-job` example transcribes an audio file and uses a medical custom vocabulary you've previously created to increase the transcription accuracy. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myseventhfile.json
```

Contents of `mysixthfile.json`:

```
{
    "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-job",
    "LanguageCode": "language-code",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION",
    "OutputBucketName":"DOC-EXAMPLE-BUCKET",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
```

```
    },
    "Settings":{
        "VocabularyName": "cli-medical-vocab-1"
    }
}
```

Output:

```
{
    "MedicalTranscriptionJob": {
        "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-
job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
        },
        "StartTime": "2020-09-21T21:17:27.045000+00:00",
        "CreationTime": "2020-09-21T21:17:27.016000+00:00",
        "Settings": {
            "VocabularyName": "cli-medical-vocab-1"
        },
        "Specialty": "PRIMARYCARE",
        "Type": "DICTATION"
    }
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see StartMedicalTranscriptionJob in *AWS CLI Command Reference*.

## `start-transcription-job`

The following code example shows how to use `start-transcription-job`.

### AWS CLI

#### Example 1: To transcribe an audio file

The following `start-transcription-job` example transcribes your audio file.

```
aws transcribe start-transcription-job \
```

```
    --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
    "TranscriptionJobName": "cli-simple-transcription-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
    }
}
```

For more information, see Getting Started (AWS Command Line Interface) in the *Amazon Transcribe Developer Guide*.

**Example 2: To transcribe a multi-channel audio file**

The following `start-transcription-job` example transcribes your multi-channel audio file.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mysecondfile.json
```

Contents of `mysecondfile.json`:

```
{
    "TranscriptionJobName": "cli-channelid-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "ChannelIdentification":true
    }
}
```

Output:

```
{
```

```
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-channelid-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-17T16:07:56.817000+00:00",
        "CreationTime": "2020-09-17T16:07:56.784000+00:00",
        "Settings": {
            "ChannelIdentification": true
        }
    }
}
```

For more information, see Transcribing Multi-Channel Audio in the *Amazon Transcribe Developer Guide*.

**Example 3: To transcribe an audio file and identify the different speakers**

The following `start-transcription-job` example transcribes your audio file and identifies the speakers in the transcription output.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mythirdfile.json
```

Contents of `mythirdfile.json`:

```
{
    "TranscriptionJobName": "cli-speakerid-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
    "ShowSpeakerLabels": true,
    "MaxSpeakerLabels": 2
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-speakerid-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-17T16:22:59.696000+00:00",
        "CreationTime": "2020-09-17T16:22:59.676000+00:00",
        "Settings": {
            "ShowSpeakerLabels": true,
            "MaxSpeakerLabels": 2
        }
    }
}
```

For more information, see Identifying Speakers in the *Amazon Transcribe Developer Guide*.

**Example 4: To transcribe an audio file and mask any unwanted words in the transcription output**

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myfourthfile.json
```

Contents of `myfourthfile.json`:

```
{
    "TranscriptionJobName": "cli-filter-mask-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
          "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
```

```
        "VocabularyFilterName": "your-vocabulary-filter",
        "VocabularyFilterMethod": "mask"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-filter-mask-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
        "StartTime": "2020-09-18T16:36:18.568000+00:00",
        "CreationTime": "2020-09-18T16:36:18.547000+00:00",
        "Settings": {
            "VocabularyFilterName": "your-vocabulary-filter",
            "VocabularyFilterMethod": "mask"
        }
    }
}
```

For more information, see Filtering Transcriptions in the *Amazon Transcribe Developer Guide*.

**Example 5: To transcribe an audio file and remove any unwanted words in the transcription output**

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myfifthfile.json
```

Contents of `myfifthfile.json`:

```
{
    "TranscriptionJobName": "cli-filter-remove-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
```

```
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "VocabularyFilterName": "your-vocabulary-filter",
        "VocabularyFilterMethod": "remove"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-filter-remove-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-18T16:36:18.568000+00:00",
        "CreationTime": "2020-09-18T16:36:18.547000+00:00",
        "Settings": {
            "VocabularyFilterName": "your-vocabulary-filter",
            "VocabularyFilterMethod": "remove"
        }
    }
}
```

For more information, see Filtering Transcriptions in the *Amazon Transcribe Developer Guide*.

**Example 6: To transcribe an audio file with increased accuracy using a custom vocabulary**

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://mysixthfile.json
```

Contents of `mysixthfile.json`:

```
{
```

```
    "TranscriptionJobName": "cli-vocab-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
        "VocabularyName": "your-vocabulary"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-vocab-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "the-language-of-your-transcription-job",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-18T16:36:18.568000+00:00",
        "CreationTime": "2020-09-18T16:36:18.547000+00:00",
        "Settings": {
            "VocabularyName": "your-vocabulary"
        }
    }
}
```

For more information, see Filtering Transcriptions in the *Amazon Transcribe Developer Guide*.

**Example 7: To identify the language of an audio file and transcribe it**

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myseventhfile.json
```

Contents of `myseventhfile.json`:

```
{
    "TranscriptionJobName": "cli-identify-language-transcription-job",
    "IdentifyLanguage": true,
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-identify-language-transcription-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-
file-name.file-extension"
        },
        "StartTime": "2020-09-18T22:27:23.970000+00:00",
        "CreationTime": "2020-09-18T22:27:23.948000+00:00",
        "IdentifyLanguage": true
    }
}
```

For more information, see Identifying the Language in the *Amazon Transcribe Developer Guide*.

**Example 8: To transcribe an audio file with personally identifiable information redacted**

The following `start-transcription-job` example transcribes your audio file and redacts any personally identifiable information in the transcription output.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myeighthfile.json
```

Contents of `myeigthfile.json`:

```
{
    "TranscriptionJobName": "cli-redaction-job",
    "LanguageCode": "language-code",
    "Media": {
```

```
        "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
    },
    "ContentRedaction": {
        "RedactionOutput":"redacted",
        "RedactionType":"PII"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-redaction-job",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
        "StartTime": "2020-09-25T23:49:13.195000+00:00",
        "CreationTime": "2020-09-25T23:49:13.176000+00:00",
        "ContentRedaction": {
            "RedactionType": "PII",
            "RedactionOutput": "redacted"
        }
    }
}
```

For more information, see Automatic Content Redaction in the *Amazon Transcribe Developer Guide*.

**Example 9: To generate a transcript with personally identifiable information (PII) redacted and an unredacted transcript**

The following `start-transcription-job` example generates two transcrptions of your audio file, one with the personally identifiable information redacted, and the other without any redactions.

```
aws transcribe start-transcription-job \
    --cli-input-json file://myninthfile.json
```

Contents of `myninthfile.json`:

```
{
    "TranscriptionJobName": "cli-redaction-job-with-unredacted-transcript",
    "LanguageCode": "language-code",
    "Media": {
          "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
    "ContentRedaction": {
        "RedactionOutput":"redacted_and_unredacted",
        "RedactionType":"PII"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-redaction-job-with-unredacted-transcript",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
        },
        "StartTime": "2020-09-25T23:59:47.677000+00:00",
        "CreationTime": "2020-09-25T23:59:47.653000+00:00",
        "ContentRedaction": {
            "RedactionType": "PII",
            "RedactionOutput": "redacted_and_unredacted"
        }
    }
}
```

For more information, see Automatic Content Redaction in the *Amazon Transcribe Developer Guide*.

**Example 10: To use a custom language model you've previously created to transcribe an audio file.**

The following `start-transcription-job` example transcribes your audio file with a custom language model you've previously created.

```
aws transcribe start-transcription-job \
```

```
    --cli-input-json file://mytenthfile.json
```

Contents of `mytenthfile.json`:

```
{
    "TranscriptionJobName": "cli-clm-2-job-1",
    "LanguageCode": "language-code",
    "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.file-extension"
    },
    "ModelSettings": {
        "LanguageModelName":"cli-clm-2"
    }
}
```

Output:

```
{
    "TranscriptionJob": {
        "TranscriptionJobName": "cli-clm-2-job-1",
        "TranscriptionJobStatus": "IN_PROGRESS",
        "LanguageCode": "language-code",
        "Media": {
            "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.file-extension"
        },
        "StartTime": "2020-09-28T17:56:01.835000+00:00",
        "CreationTime": "2020-09-28T17:56:01.801000+00:00",
        "ModelSettings": {
            "LanguageModelName": "cli-clm-2"
        }
    }
}
```

For more information, see Improving Domain-Specific Transcription Accuracy with Custom Language Models in the *Amazon Transcribe Developer Guide*.

- For API details, see StartTranscriptionJob in *AWS CLI Command Reference*.

### `update-medical-vocabulary`

The following code example shows how to use `update-medical-vocabulary`.

**AWS CLI**

**To update a medical custom vocabulary with new terms.**

The following `update-medical-vocabulary` example replaces the terms used in a medical custom vocabulary with the new ones. Prerequisite: to replace the terms in a medical custom vocabulary, you need a file with new terms.

```
aws transcribe update-medical-vocabulary \
    --vocabulary-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/medical-custom-vocabulary.txt \
    --vocabulary-name medical-custom-vocabulary \
    --language-code language
```

Output:

```
{
    "VocabularyName": "medical-custom-vocabulary",
    "LanguageCode": "en-US",
    "VocabularyState": "PENDING"
}
```

For more information, see Medical Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see UpdateMedicalVocabulary in *AWS CLI Command Reference*.

### `update-vocabulary-filter`

The following code example shows how to use `update-vocabulary-filter`.

**AWS CLI**

**To replace the words in a vocabulary filter**

The following `update-vocabulary-filter` example replaces the words in a vocabulary filter with new ones. Prerequisite: To update a vocabulary filter with the new words, you must have those words saved as a text file.

```
aws transcribe update-vocabulary-filter \
```

```
    --vocabulary-filter-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/your-text-
file-to-update-your-vocabulary-filter.txt \
    --vocabulary-filter-name vocabulary-filter-name
```

Output:

```
{
    "VocabularyFilterName": "vocabulary-filter-name",
    "LanguageCode": "language-code",
    "LastModifiedTime": "2020-09-23T18:40:35.139000+00:00"
}
```

For more information, see Filtering Unwanted Words in the *Amazon Transcribe Developer Guide*.

- For API details, see UpdateVocabularyFilter in *AWS CLI Command Reference*.

### `update-vocabulary`

The following code example shows how to use `update-vocabulary`.

#### AWS CLI

**To update a custom vocabulary with new terms.**

The following `update-vocabulary` example overwrites the terms used to create a custom vocabulary with the new ones that you provide. Prerequisite: to replace the terms in a custom vocabulary, you need a file with new terms.

```
aws transcribe update-vocabulary \
    --vocabulary-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/custom-
vocabulary.txt \
    --vocabulary-name custom-vocabulary \
    --language-code language-code
```

Output:

```
{
    "VocabularyName": "custom-vocabulary",
    "LanguageCode": "language",
    "VocabularyState": "PENDING"
```

```
}
```

For more information, see Custom Vocabularies in the *Amazon Transcribe Developer Guide*.

- For API details, see UpdateVocabulary in *AWS CLI Command Reference*.

## Amazon Translate examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Translate.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Actions

#### `import-terminology`

The following code example shows how to use `import-terminology`.

#### AWS CLI

**To import a custom terminology from a file**

The following `import-terminology` example creates a terminology called `MyTestTerminology` from the `test-terminology.csv` file:

```
aws translate import-terminology \
    --name MyTestTerminology \
```

```
    --description "Creating a test terminology in AWS Translate" \
    --merge-strategy OVERWRITE \
    --data-file fileb://test-terminology.csv \
    --terminology-data Format=CSV
```

Contents of `test-terminology.csv`:

en,fr,es,zh Hello world!,Bonjour tout le monde!,Hola Mundo!,????
Amazon,Amazon,Amazon,Amazon

Output:

```
{
    "TerminologyProperties": {
        "SourceLanguageCode": "en",
        "Name": "MyTestTerminology",
        "TargetLanguageCodes": [
            "fr",
            "es",
            "zh"
        ],
        "SizeBytes": 97,
        "LastUpdatedAt": 1571089500.851,
        "CreatedAt": 1571089500.851,
        "TermCount": 6,
        "Arn": "arn:aws:translate:us-west-2:123456789012:terminology/
MyTestTerminology/LATEST",
        "Description": "Creating a test terminology in AWS Translate"
    }
}
```

- For API details, see ImportTerminology in *AWS CLI Command Reference*.

## Trusted Advisor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Trusted Advisor.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### `get-organization-recommendation`

The following code example shows how to use `get-organization-recommendation`.

**AWS CLI**

**To get an organization recommendation**

The following `get-organization-recommendation` example gets an organization recommendation by its identifier.

```
aws trustedadvisor get-organization-recommendation \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-bf3a-44e8-8213-2ed68b39d9d5
```

Output:

```
{
    "organizationRecommendation": {
        "arn": "arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
        "name": "Lambda Runtime Deprecation Warning",
        "description": "One or more lambdas are using a deprecated runtime",
        "awsServices": [
            "lambda"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
        "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
        "lifecycleStage": "resolved",
```

```
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
            "errorCount": 0,
            "okCount": 0,
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "warning",
        "type": "priority"
    }
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see GetOrganizationRecommendation in *AWS CLI Command Reference*.

### `get-recommendation`

The following code example shows how to use `get-recommendation`.

#### AWS CLI

**To get a recommendation**

The following `get-recommendation` example gets a recommendation by its identifier.

```
aws trustedadvisor get-recommendation \
    --recommendation-identifier
 arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-
bbb7-491a-833b-5773e9589578
```

Output:

```
{
    "recommendation": {
        "arn": "arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-
bbb7-491a-833b-5773e9589578",
        "name": "MFA Recommendation",
        "description": "Enable multi-factor authentication",
```

```
        "awsServices": [
            "iam"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/7DAFEmoDos",
        "id": "55fa4d2e-bbb7-491a-833b-5773e9589578",
        "lastUpdatedAt": "2023-11-01T15:57:58.673Z",
        "pillarSpecificAggregates": {
            "costOptimizing": {
                "estimatedMonthlySavings": 0.0,
                "estimatedPercentMonthlySavings": 0.0
            }
        },
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
            "errorCount": 1,
            "okCount": 0,
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "error",
        "type": "standard"
    }
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see GetRecommendation in *AWS CLI Command Reference*.

## `list-checks`

The following code example shows how to use `list-checks`.

### AWS CLI

#### To list Trusted Advisor checks

The following `list-checks` example lists all Trusted Advisor checks.

```
aws trustedadvisor list-checks
```

Output:

```
{
    "checkSummaries": [
        {
            "arn": "arn:aws:trustedadvisor:::check/1iG5NDGVre",
            "awsServices": [
                "EC2"
            ],
            "description": "Checks security groups for rules that allow unrestricted
 access to a resource. Unrestricted access increases opportunities for malicious
 activity (hacking, denial-of-service attacks, loss of data)",
            "id": "1iG5NDGVre",
            "metadata": {
                "0": "Region",
                "1": "Security Group Name",
                "2": "Security Group ID",
                "3": "Protocol",
                "4": "Port",
                "5": "Status",
                "6": "IP Range"
            },
            "name": "Security Groups - Unrestricted Access",
            "pillars": [
                "security"
            ],
            "source": "ta_check"

### `list-organization-recommendation-accounts`

The following code example shows how to use `list-organization-recommendation-accounts`.

#### AWS CLI

**To list organization recommendation accounts**

The following `list-organization-recommendation-accounts` example lists all account recommendation summaries for an organization recommendation by its identifier.

```
aws trustedadvisor list-organization-recommendation-accounts \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-
recommendation/9534ec9b-bf3a-44e8-8213-2ed68b39d9d5
```

Output:

```
{
    "accountRecommendationLifecycleSummaries": [{
        "accountId": "000000000000",
        "accountRecommendationArn":
 "arn:aws:trustedadvisor::000000000000:recommendation/9534ec9b-
bf3a-44e8-8213-2ed68b39d9d5",
        "lifecycleStage": "resolved",
        "updateReason": "Resolved issue",
        "updateReasonCode": "valid_business_case",
        "lastUpdatedAt": "2023-01-17T18:25:44.552Z"
    }],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see ListOrganizationRecommendationAccounts in *AWS CLI Command Reference*.

### `list-organization-recommendation-resources`

The following code example shows how to use `list-organization-recommendation-resources`.

#### AWS CLI

**To list organization recommendation resources**

The following `list-organization-recommendation-resources` example lists all resources for an organization recommendation by its identifier.

```
aws trustedadvisor list-organization-recommendation-resources \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-
recommendation/5a694939-2e54-45a2-ae72-730598fa89d0
```

Output:

```
{
    "organizationRecommendationResourceSummaries": [
        {
```

```
            "arn": "arn:aws:trustedadvisor::000000000000:recommendation-

## `list-organization-recommendations`

The following code example shows how to use `list-organization-recommendations`.

### AWS CLI

#### Example 1: To list organization recommendations

The following `list-organization-recommendations` example lists all organization recommendations and does not include a filter.

```
aws trustedadvisor list-organization-recommendations
```

Output:

```
{
    "organizationRecommendationSummaries": [
        {
            "arn": "arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-
bf3a-44e8-8213-2ed68b39d9d5",
            "name": "Lambda Runtime Deprecation Warning",
            "awsServices": [
                "lambda"
            ],
            "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
            "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
            "lifecycleStage": "resolved",
            "pillars": [
                "security"
            ],
            "resourcesAggregates": {
                "errorCount": 0,
                "okCount": 0,
                "warningCount": 0
            },
            "source": "ta_check",
            "status": "warning",
            "type": "priority"
        },
        {
            "arn": "arn:aws:trustedadvisor:::organization-
recommendation/4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
            "name": "Lambda Runtime Deprecation Warning",
            "awsServices": [
                "lambda"
            ],
            "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
            "id": "4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
            "lifecycleStage": "resolved",
            "pillars": [
                "security"
```

```
            ],
            "resourcesAggregates": {
                "errorCount": 0,
                "okCount": 0,
                "warningCount": 0
            },
            "source": "ta_check",
            "status": "warning",
            "type": "priority"
        },
    ],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

**Example 2: To list organization recommendations with a filter**

The following `list-organization-recommendations` example filters and returns a max of one organization recommendation that is a part of the "security" pillar.

```
aws trustedadvisor list-organization-recommendations \
    --pillar security \
    --max-items 100
```

Output:

```
{
    "organizationRecommendationSummaries": [{
        "arn": "arn:aws:trustedadvisor:::organization-recommendation/9534ec9b-
bf3a-44e8-8213-2ed68b39d9d5",
        "name": "Lambda Runtime Deprecation Warning",
        "awsServices": [
            "lambda"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
        "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
        "lifecycleStage": "resolved",
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
```

```
            "errorCount": 0,
            "okCount": 0,
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "warning",
        "type": "priority"
    }],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

**Example 3: To list organization recommendations with a pagination token**

The following `list-organization-recommendations` example uses the "nextToken" returned from a previous request to fetch the next page of organization recommendations.

```
aws trustedadvisor list-organization-recommendations \
    --pillar security \
    --max-items 100 \
    --starting-token <next-token>
```

Output:

```
{
    "organizationRecommendationSummaries": [{
        "arn": "arn:aws:trustedadvisor:::organization-
recommendation/4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
        "name": "Lambda Runtime Deprecation Warning",
        "awsServices": [
            "lambda"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/L4dfs2Q4C5",
        "id": "4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
        "lifecycleStage": "resolved",
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
            "errorCount": 0,
            "okCount": 0,
```

```
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "warning",
        "type": "priority"
    }]
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see ListOrganizationRecommendations in *AWS CLI Command Reference*.

### `list-recommendation-resources`

The following code example shows how to use `list-recommendation-resources`.

#### AWS CLI

**To list recommendation resources**

The following `list-recommendation-resources` example lists all resources for a recommendation by its identifier.

```
aws trustedadvisor list-recommendation-resources \
    --recommendation-identifier
 arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-
bbb7-491a-833b-5773e9589578
```

Output:

```
{
    "recommendationResourceSummaries": [
        {
            "arn": "arn:aws:trustedadvisor::000000000000:recommendation-
resource/55fa4d2e-

## `list-recommendations`

The following code example shows how to use `list-recommendations`.

### AWS CLI

#### Example 1: To list recommendations

The following `list-recommendations` example lists all recommendations and does not include a filter.

```
aws trustedadvisor list-recommendations
```

Output:

```
{
    "recommendationSummaries": [
        {
            "arn": "arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-
bbb7-491a-833b-5773e9589578",
            "name": "MFA Recommendation",
            "awsServices": [
                "iam"
            ],
            "checkArn": "arn:aws:trustedadvisor:::check/7DAFEmoDos",
            "id": "55fa4d2e-bbb7-491a-833b-5773e9589578",
            "lastUpdatedAt": "2023-11-01T15:57:58.673Z",
            "pillarSpecificAggregates": {
                "costOptimizing": {
                    "estimatedMonthlySavings": 0.0,
                    "estimatedPercentMonthlySavings": 0.0
                }
            },
            "pillars": [
                "security"
            ],
            "resourcesAggregates": {
                "errorCount": 1,
                "okCount": 0,
                "warningCount": 0
            },
            "source": "ta_check",
            "status": "error",
            "type": "standard"
        },
        {
            "arn":
 "arn:aws:trustedadvisor::000000000000:recommendation/8b602b6f-452d-4cb2-8a9e-
c7650955d9cd",
            "name": "RDS clusters quota warning",
            "awsServices": [
                "rds"
            ],
            "checkArn": "arn:aws:trustedadvisor:::check/gjqMBn6pjz",
            "id": "8b602b6f-452d-4cb2-8a9e-c7650955d9cd",
            "lastUpdatedAt": "2023-11-01T15:58:17.397Z",
            "pillarSpecificAggregates": {
```

```
                "costOptimizing": {
                    "estimatedMonthlySavings": 0.0,
                    "estimatedPercentMonthlySavings": 0.0
                }
            },
            "pillars": [
                "service_limits"
            ],
            "resourcesAggregates": {
                "errorCount": 0,
                "okCount": 3,
                "warningCount": 6
            },
            "source": "ta_check",
            "status": "warning",
            "type": "standard"
        }
    ],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

**Example 2: To list recommendations with a filter**

The following `list-recommendations` example lists recommendations and includes a filter.

```
aws trustedadvisor list-recommendations \
    --aws-service iam \
    --max-items 100
```

Output:

```
{
    "recommendationSummaries": [{
        "arn": "arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-
bbb7-491a-833b-5773e9589578",
        "name": "MFA Recommendation",
        "awsServices": [
            "iam"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/7DAFEmoDos",
```

```
        "id": "55fa4d2e-bbb7-491a-833b-5773e9589578",
        "lastUpdatedAt": "2023-11-01T15:57:58.673Z",
        "pillarSpecificAggregates": {
            "costOptimizing": {
                "estimatedMonthlySavings": 0.0,
                "estimatedPercentMonthlySavings": 0.0
            }
        },
        "pillars": [
            "security"
        ],
        "resourcesAggregates": {
            "errorCount": 1,
            "okCount": 0,
            "warningCount": 0
        },
        "source": "ta_check",
        "status": "error",
        "type": "standard"
    }],
    "nextToken": "REDACTED"
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

**Example 3: To list recommendations with a pagination token**

The following `list-recommendations` example uses the "nextToken" returned from a previous request to fetch the next page of filtered Recommendations.

```
aws trustedadvisor list-recommendations \
    --aws-service rds \
    --max-items 100 \
    --starting-token <next-token>
```

Output:

```
{
    "recommendationSummaries": [{
        "arn":
 "arn:aws:trustedadvisor::000000000000:recommendation/8b602b6f-452d-4cb2-8a9e-
c7650955d9cd",
```

```
        "name": "RDS clusters quota warning",
        "awsServices": [
            "rds"
        ],
        "checkArn": "arn:aws:trustedadvisor:::check/gjqMBn6pjz",
        "id": "8b602b6f-452d-4cb2-8a9e-c7650955d9cd",
        "lastUpdatedAt": "2023-11-01T15:58:17.397Z",
        "pillarSpecificAggregates": {
            "costOptimizing": {
                "estimatedMonthlySavings": 0.0,
                "estimatedPercentMonthlySavings": 0.0
            }
        },
        "pillars": [
            "service_limits"
        ],
        "resourcesAggregates": {
            "errorCount": 0,
            "okCount": 3,
            "warningCount": 6
        },
        "source": "ta_check",
        "status": "warning",
        "type": "standard"
    }]
}
```

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see ListRecommendations in *AWS CLI Command Reference*.

### `update-organization-recommendation-lifecycle`

The following code example shows how to use `update-organization-recommendation-lifecycle`.

#### AWS CLI

**To update an organization recommendation lifecycle**

The following `update-organization-recommendation-lifecycle` example updates the lifecycle of an organization recommendation by its identifier.

```
aws trustedadvisor update-organization-recommendation-lifecycle \
    --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-
recommendation/96b5e5ca-7930-444c-90c6-06d386128100 \
    --lifecycle-stage dismissed \
    --update-reason-code not_applicable
```

This command produces no output.

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see UpdateOrganizationRecommendationLifecycle in *AWS CLI Command Reference*.

### `update-recommendation-lifecycle`

The following code example shows how to use `update-recommendation-lifecycle`.

**AWS CLI**

**To update a recommendation lifecycle**

The following `update-recommendation-lifecycle` example updates the lifecycle of a recommendation by its identifier.

```
aws trustedadvisor update-recommendation-lifecycle \
    --recommendation-identifier
 arn:aws:trustedadvisor::000000000000:recommendation/861c9c6e-
f169-405a-8b59-537a8caccd7a \
    --lifecycle-stage resolved \
    --update-reason-code valid_business_case
```

This command produces no output.

For more information, see Get started with the Trusted Advisor API in the *AWS Trusted Advisor User Guide*.

- For API details, see UpdateRecommendationLifecycle in *AWS CLI Command Reference*.

# Verified Permissions examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Verified Permissions.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

## Actions

### `create-identity-source`

The following code example shows how to use `create-identity-source`.

**AWS CLI**

**To create an identity source**

The following `create-identity-source` example creates an identity source that lets you reference identities stored in the specified Amazon Cognito user pool. Those identities are available in Verified Permissions as entities of type `User`.

```
aws verifiedpermissions create-identity-source \
    --configuration file://config.txt \
    --principal-entity-type "User" \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `config.txt`:

```
{
```

```
    "cognitoUserPoolConfiguration": {
        "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-
west-2_1a2b3c4d5",
        "clientIds":["a1b2c3d4e5f6g7h8i9j0kalbmc"]
    }
}
```

Output:

```
{
    "createdDate": "2023-05-19T20:30:28.214829+00:00",
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see CreateIdentitySource in *AWS CLI Command Reference*.

### `create-policy-store`

The following code example shows how to use `create-policy-store`.

#### AWS CLI

**To create a policy store**

The following `create-policy-store` example creates a policy store in the current AWS Region.

```
aws verifiedpermissions create-policy-store \
    --validation-settings "mode=STRICT"
```

Output:

```
{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
    "createdDate": "2023-05-16T17:41:29.103459+00:00",
```

```
    "lastUpdatedDate": "2023-05-16T17:41:29.103459+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see CreatePolicyStore in *AWS CLI Command Reference*.

### `create-policy-template`

The following code example shows how to use `create-policy-template`.

**AWS CLI**

**Example 1: To create a policy template**

The following `create-policy-template` example creates a policy template with a statement that contains a placeholder for the principal.

```
aws verifiedpermissions create-policy-template \
    --definition file://template1.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file `template1.txt`:

```
permit(
    principal in ?principal,
    action == Action::"view",
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```
{
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111"
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see CreatePolicyTemplate in *AWS CLI Command Reference*.

### `create-policy`

The following code example shows how to use `create-policy`.

**AWS CLI**

**Example 1: To create a static policy**

The following `create-policy` example creates a static policy with a policy scope that specifies both a principal and a resource.

```
aws verifiedpermissions create-policy \
    --definition file://definition1.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file `definition1.txt`:

```
{
    "static": {
        "description":  "Grant everyone of janeFriends UserGroup access to the
 vacationFolder Album",
        "statement": "permit(principal in UserGroup::\"janeFriends\", action,
 resource in Album::\"vacationFolder\" );"
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:33:37.382907+00:00",
    "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
    "policyId": "SPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "STATIC",
    "principal": {
        "entityId": "janeFriends",
        "entityType": "UserGroup"
```

```
    },
    "resource": {
        "entityId": "vacationFolder",
        "entityType": "Album"
    }
}
```

**Example 2: To create a static policy that grants access to a resource to everyone**

The following `create-policy` example creates a static policy with a policy scope that specifies only a resource.

```
aws verifiedpermissions create-policy \
    --definition file://definition2.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file `definition2.txt`:

```
{
    "static": {
        "description":  "Grant everyone access to the publicFolder Album",
        "statement": "permit(principal, action, resource in Album::\"publicFolder
\");"
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:39:44.975897+00:00",
    "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
    "policyId": "PbfR73F8oh5MMfr9uRtFDB",
    "policyStoreId": "PSEXAMPLEabcdefg222222",
    "policyType": "STATIC",
    "resource": {
        "entityId": "publicFolder",
        "entityType": "Album"
    }
}
```

**Example 3: To create a template-linked policy that is associated with the specified template**

The following `create-policy` example creates a template-linked policy using the specified policy template and associates the specified principal to use with the new template-linked policy.

```
aws verifiedpermissions create-policy \
    --definition file://definition.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `definition.txt`:

```
{
    "templateLinked": {
        "policyTemplateId": "PTEXAMPLEabcdefg111111",
        "principal": {
            "entityType": "User",
            "entityId": "alice"
        }
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:49:51.490211+00:00",
    "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",
    "policyId": "TPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "TEMPLATE_LINKED",
    "principal": {
        "entityId": "alice",
        "entityType": "User"
    },
    "resource": {
        "entityId": "VacationPhoto94.jpg",
        "entityType": "Photo"
    }
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see CreatePolicy in *AWS CLI Command Reference*.

### `delete-identity-source`

The following code example shows how to use `delete-identity-source`.

**AWS CLI**

**To delete an identity source**

The following `delete-identity-source` example deletes the identity source that has the specified Id.

```
aws verifiedpermissions delete-identity-source \
    --identity-source-id ISEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see DeleteIdentitySource in *AWS CLI Command Reference*.

### `delete-policy-store`

The following code example shows how to use `delete-policy-store`.

**AWS CLI**

**To delete a policy store**

The following `delete-policy-store` example deletes the policy store that has the specified Id.

```
aws verifiedpermissions delete-policy-store \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see DeletePolicyStore in *AWS CLI Command Reference*.

### `delete-policy-template`

The following code example shows how to use `delete-policy-template`.

**AWS CLI**

**To delete a policy template**

The following `delete-policy-template` example deletes the policy template that has the specified Id.

```
aws verifiedpermissions delete-policy \
    --policy-template-id PTEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see DeletePolicyTemplate in *AWS CLI Command Reference*.

### `delete-policy`

The following code example shows how to use `delete-policy`.

**AWS CLI**

**To delete a static or template-linked policy**

The following `delete-policy` example deletes the policy that has the specified Id.

```
aws verifiedpermissions delete-policy \
    --policy-id SPEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see DeletePolicy in *AWS CLI Command Reference*.

### `get-identity-source`

The following code example shows how to use `get-identity-source`.

#### AWS CLI

**To retrieve details about an identity source**

The following `get-identity-source` example displays the details for the identity source with the specified Id.

```
aws verifiedpermissions get-identity-source \
    --identity-source  ISEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "createdDate": "2023-06-12T22:27:49.150035+00:00",
    "details": {
        "clientIds": [ "a1b2c3d4e5f6g7h8i9j0kalbmc" ],
        "discoveryUrl": "https://cognito-idp.us-west-2.amazonaws.com/us-
west-2_1a2b3c4d5",
        "openIdIssuer": "COGNITO",
        "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-
west-2_1a2b3c4d5"
    },
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-06-12T22:27:49.150035+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "principalEntityType": "User"
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see GetIdentitySource in *AWS CLI Command Reference*.

### `get-policy-store`

The following code example shows how to use `get-policy-store`.

**AWS CLI**

**To retrieve details about a policy store**

The following `get-policy-store` example displays the details for the policy store with the specified Id.

```
aws verifiedpermissions get-policy-store \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
    "createdDate": "2023-06-05T20:16:46.225598+00:00",
    "lastUpdatedDate": "2023-06-08T20:40:23.173691+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "validationSettings": { "mode": "OFF" }
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see GetPolicyStore in *AWS CLI Command Reference*.

### `get-policy-template`

The following code example shows how to use `get-policy-template`.

**AWS CLI**

**To retrieve details about a policy template**

The following `get-policy-template` example displays the details for the policy template with the specified ID.

```
aws verifiedpermissions get-policy-template \
    --policy-template-id  PTEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111",
    "statement": "permit(\n    principal in ?principal,\n    action == Action::
\"view\",\n    resource == Photo::\"VacationPhoto94.jpg\"\n);"
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see GetPolicyTemplate in *AWS CLI Command Reference*.

## `get-policy`

The following code example shows how to use `get-policy`.

### AWS CLI

#### To retrieve details about a policy

The following `get-policy` example displays the details for the policy with the specified ID.

```
aws verifiedpermissions get-policy \
    --policy-id PSEXAMPLEabcdefg111111 \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "createdDate": "2023-06-12T20:33:37.382907+00:00",
    "definition": {
        "static": {
            "description": "Grant everyone of janeFriends UserGroup access to the
 vacationFolder Album",
            "statement": "permit(principal in UserGroup::\"janeFriends\", action,
 resource in Album::\"vacationFolder\" );"
        }
    },
```

```
    "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
    "policyId": "SPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "STATIC",
    "principal": {
        "entityId": "janeFriends",
        "entityType": "UserGroup"
    },
    "resource": {
        "entityId": "vacationFolder",
        "entityType": "Album"
    }
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see GetPolicy in *AWS CLI Command Reference*.

### `get-schema`

The following code example shows how to use `get-schema`.

#### AWS CLI

**To retrieve the schema in a policy store**

The following `get-schema` example displays the details of the schema in the specified policy store.

```
aws verifiedpermissions get-schema \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "schema": "{\"MySampleNamespace\":{\"entityTypes\":{\"Employee\":{\"shape
\":{\"attributes\":{\"jobLevel\":{\"type\":\"Long\"},\"name\":{\"type\":\"String
\"}},\"type\":\"Record\"}}},\"actions\":{\"remoteAccess\":{\"appliesTo\":
{\"principalTypes\":[\"Employee\"]}}}}}",
    "createdDate": "2023-06-14T17:47:13.999885+00:00",
```

```
    "lastUpdatedDate": "2023-06-14T17:47:13.999885+00:00"
}
```

For more information about schema, see Policy store schema in the *Amazon Verified Permissions User Guide*.

- For API details, see GetSchema in *AWS CLI Command Reference*.

### `is-authorized-with-token`

The following code example shows how to use `is-authorized-with-token`.

**AWS CLI**

**Example 1: To request an authorization decision for a user request (allow)**

The following `is-authorized-with-token` example requests an authorization decision for a user who was authenticated by Amazon Cognito. The request uses the identity token provided by Cognito rather than the access token. In this example, the specified information store is configured to return principals as entities of type `CognitoUser`.

```
aws verifiedpermissions is-authorized-with-token \
    --action actionId="View",actionType="Action" \
    --resource entityId="vacationPhoto94.jpg",entityType="Photo" \
    --policy-store-id PSEXAMPLEabcdefg111111 \
    --identity-token "AbCdE12345...long.string...54321EdCbA"
```

The policy store contains a policy with the following statement that accepts identities from the specified Cognito user pool and application Id.

```
permit(
    principal == CognitoUser::"us-east-1_1a2b3c4d5|a1b2c3d4e5f6g7h8i9j0kalbmc",
    action,
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```
{
    "decision":"Allow",
```

```
    "determiningPolicies":[
        {
        "determiningPolicyId":"SPEXAMPLEabcdefg111111"
        }
    ],
    "errors":[]
}
```

For more information about using identities from a Cognito user pool, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see IsAuthorizedWithToken in *AWS CLI Command Reference*.

### `is-authorized`

The following code example shows how to use `is-authorized`.

#### AWS CLI

**Example 1: To request an authorization decision for a user request (allow)**

The following `is-authorized` example requests an authorization decision for a principal of type `User` named `Alice`, who wants to perform the `updatePhoto` operation, on a resource of type `Photo` named `VacationPhoto94.jpg`.

The response shows that the request is allowed by one policy.

```
aws verifiedpermissions is-authorized \
    --principal entityType=User,entityId=alice \
    --action actionType=Action,actionId=view \
    --resource entityType=Photo,entityId=VactionPhoto94.jpg \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "decision": "ALLOW",
    "determiningPolicies": [
        {
            "policyId": "SPEXAMPLEabcdefg111111"
        }
    ],
```

```
    "errors": []
}
```

**Example 2: To request an authorization decision for a user request (deny)**

The following example is the same as the previous example, except that the principal is `User::"Bob"`. The policy store doesn't contain any policy that allows that user access to `Album::"alice_folder"`.

The output indicates that the `Deny` was implicit because the list of `DeterminingPolicies` is empty.

```
aws verifiedpermissions create-policy \
    --definition file://definition2.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "decision": "DENY",
    "determiningPolicies": [],
    "errors": []
}
```

For more information, see the Amazon Verified Permissions User Guide.

- For API details, see IsAuthorized in *AWS CLI Command Reference*.

## `list-identity-sources`

The following code example shows how to use `list-identity-sources`.

### AWS CLI

**To list the available identity sources**

The following `list-identity-sources` example lists all identity sources in the specified policy store.

```
aws verifiedpermissions list-identity-sources \
```

```
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "identitySources": [
        {
            "createdDate": "2023-06-12T22:27:49.150035+00:00",
            "details": {
                "clientIds": [ "a1b2c3d4e5f6g7h8i9j0kalbmc" ],
                "discoveryUrl": "https://cognito-idp.us-west-2.amazonaws.com/us-
west-2_1a2b3c4d5",
                "openIdIssuer": "COGNITO",
                "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/
us-west-2_1a2b3c4d5"
            },
            "identitySourceId": "ISEXAMPLEabcdefg111111",
            "lastUpdatedDate": "2023-06-12T22:27:49.150035+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "principalEntityType": "User"
        }
    ]
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see ListIdentitySources in *AWS CLI Command Reference*.

## `list-policies`

The following code example shows how to use `list-policies`.

### AWS CLI

#### To list the available policies

The following `list-policies` example lists all policies in the specified policy store.

```
aws verifiedpermissions list-policies \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "policies": [
        {
            "createdDate": "2023-06-12T20:33:37.382907+00:00",
            "definition": {
                "static": {
                    "description": "Grant everyone of janeFriends UserGroup access
 to the vacationFolder Album"
                }
            },
            "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
            "policyId": "SPEXAMPLEabcdefg111111",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyType": "STATIC",
            "principal": {
                "entityId": "janeFriends",
                "entityType": "UserGroup"
            },
            "resource": {
                "entityId": "vacationFolder",
                "entityType": "Album"
            }
        },
        {
            "createdDate": "2023-06-12T20:39:44.975897+00:00",
            "definition": {
                "static": {
                    "description": "Grant everyone access to the publicFolder Album"
                }
            },
            "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
            "policyId": "SPEXAMPLEabcdefg222222",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyType": "STATIC",
            "resource": {
                "entityId": "publicFolder",
                "entityType": "Album"
            }
        },
        {
            "createdDate": "2023-06-12T20:49:51.490211+00:00",
            "definition": {
```

```
                "templateLinked": {
                    "policyTemplateId": "PTEXAMPLEabcdefg111111"
                }
            },
            "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",
            "policyId": "SPEXAMPLEabcdefg333333",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyType": "TEMPLATE_LINKED",
            "principal": {
                "entityId": "alice",
                "entityType": "User"
            },
            "resource": {
                "entityId": "VacationPhoto94.jpg",
                "entityType": "Photo"
            }
        }
    ]
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see ListPolicies in *AWS CLI Command Reference*.

## `list-policy-stores`

The following code example shows how to use `list-policy-stores`.

### AWS CLI

#### To list the available policy stores

The following `list-policy-stores` example lists all policy stores in the AWS Region. All commands for Verified Permissions except `create-policy-store` and `list-policy-stores` require that you specify the Id of the policy store you want to work with.

```
aws verifiedpermissions list-policy-stores
```

Output:

```
{
```

```
    "policyStores": [
        {
            "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
            "createdDate": "2023-06-05T20:16:46.225598+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg111111"
        },
        {
            "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg222222",
            "createdDate": "2023-06-08T18:09:37.364356+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg222222"
        },
        {
            "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg333333",
            "createdDate": "2023-06-08T18:09:46.920600+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg333333"
        }
    ]
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see ListPolicyStores in *AWS CLI Command Reference*.

### `list-policy-templates`

The following code example shows how to use `list-policy-templates`.

**AWS CLI**

**To list the available policy templates**

The following `list-policy-templates` example lists all policy templates in the specified policy store.

```
aws verifiedpermissions list-policy-templates \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "policyTemplates": [
        {
            "createdDate": "2023-06-12T20:47:42.804511+00:00",
            "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
            "policyStoreId": "PSEXAMPLEabcdefg111111",
            "policyTemplateId": "PTEXAMPLEabcdefg111111"
        }
    ]
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see ListPolicyTemplates in *AWS CLI Command Reference*.

### `put-schema`

The following code example shows how to use `put-schema`.

#### AWS CLI

**To save a schema to a policy store**

The following `put-schema` example creates or replaces the schema in the specified policy store.

The `cedarJson` parameter in the input file takes a string representation of a JSON object. It contains embedded quotation marks (") within the outermost quotation mark pair. This requires you to convert the JSON to a string by preceding all embedded quotation marks with a backslash character ( \" ) and combining all lines into a single text line with no line breaks.

Example strings can be displayed wrapped across multiple lines here for readability, but the operation requires the parameters be submitted as single line strings.

aws verifiedpermissions put-schema --definition file://schema.txt --policy-store-id PSEXAMPLEabcdefg111111

Contents of `schema.txt`:

```
{
    "cedarJson": "{\"MySampleNamespace\": {\"actions\": {\"remoteAccess\": {
```

```
            \"appliesTo\": {\"principalTypes\": [\"Employee\"]}}},\"entityTypes\": {
            \"Employee\": {\"shape\": {\"attributes\": {\"jobLevel\": {\"type\":
            \"Long\"},\"name\": {\"type\": \"String\"}},\"type\": \"Record\"}}}}}"
}
```

Output:

```
{
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "namespaces": [
        "MySampleNamespace"
    ],
    "createdDate": "2023-06-14T17:47:13.999885+00:00",
    "lastUpdatedDate": "2023-06-14T17:47:13.999885+00:00"
}
```

For more information about schema, see Policy store schema in the *Amazon Verified Permissions User Guide*.

- For API details, see PutSchema in *AWS CLI Command Reference*.

### `update-identity-source`

The following code example shows how to use `update-identity-source`.

#### AWS CLI

**To update an identity source**

The following `update-identity-source` example modifies the specified identity source by providing a new Cognito user pool configuration and changing the entity type returned by the identity source.

```
aws verifiedpermissions update-identity-source
    --identity-source-id ISEXAMPLEabcdefg111111 \
    --update-configuration file://config.txt \
    --principal-entity-type "Employee" \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `config.txt`:

```
{
```

```
        "cognitoUserPoolConfiguration": {
                "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/
us-west-2_1a2b3c4d5",
                "clientIds":["a1b2c3d4e5f6g7h8i9j0kalbmc"]
        }
}
```

Output:

```
{
    "createdDate": "2023-05-19T20:30:28.214829+00:00",
    "identitySourceId": "ISEXAMPLEabcdefg111111",
    "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about identity sources, see Using Amazon Verified Permissions with identity providers in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdateIdentitySource in *AWS CLI Command Reference*.

### `update-policy-store`

The following code example shows how to use `update-policy-store`.

#### AWS CLI

**To update a policy store**

The following `update-policy-store` example modifies a policy store by changing its validation setting.

```
aws verifiedpermissions update-policy-store \
    --validation-settings "mode=STRICT" \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
    "createdDate": "2023-05-16T17:41:29.103459+00:00",
```

```
    "lastUpdatedDate": "2023-05-16T17:41:29.103459+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about policy stores, see Amazon Verified Permissions policy stores in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdatePolicyStore in *AWS CLI Command Reference*.

### `update-policy-template`

The following code example shows how to use `update-policy-template`.

#### AWS CLI

**Example 1: To update a policy template**

The following `update-policy-template` example modifies the specified template-linked policy to replace its policy statement.

```
aws verifiedpermissions update-policy-template \
    --policy-template-id PTEXAMPLEabcdefg111111 \
    --statement file://template1.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file `template1.txt`:

```
permit(
    principal in ?principal,
    action == Action::"view",
    resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```
{
    "createdDate": "2023-06-12T20:47:42.804511+00:00",
    "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyTemplateId": "PTEXAMPLEabcdefg111111"
}
```

For more information about policy templates, see Amazon Verified Permissions policy templates in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdatePolicyTemplate in *AWS CLI Command Reference*.

### `update-policy`

The following code example shows how to use `update-policy`.

**AWS CLI**

**Example 1: To create a static policy**

The following `create-policy` example creates a static policy with a policy scope that specifies both a principal and a resource.

```
aws verifiedpermissions create-policy \
    --definition file://definition.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

The `statement` parameter takes a string representation of a JSON object. It contains embedded quotation marks (") within the outermost quotation mark pair. This requires you to convert the JSON to a string by preceding all embedded quotation marks with a backslash character ( \" ) and combining all lines into a single text line with no line breaks.

Example strings can be displayed wrapped across multiple lines here for readability, but the operation requires the parameters be submitted as single line strings.

Contents of file `definition.txt`:

```
{
    "static": {
        "description":  "Grant everyone of janeFriends UserGroup access to the
 vacationFolder Album",
        "statement": "permit(principal in UserGroup::\"janeFriends\", action,
 resource in Album::\"vacationFolder\" );"
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:33:37.382907+00:00",
    "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
    "policyId": "SPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "STATIC",
    "principal": {
        "entityId": "janeFriends",
        "entityType": "UserGroup"
    },
    "resource": {
        "entityId": "vacationFolder",
        "entityType": "Album"
    }
}
```

**Example 2: To create a static policy that grants access to a resource to everyone**

The following `create-policy` example creates a static policy with a policy scope that specifies only a resource.

```
aws verifiedpermissions create-policy \
    --definition file://definition2.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file `definition2.txt`:

```
{
    "static": {
        "description":  "Grant everyone access to the publicFolder Album",
        "statement": "permit(principal, action, resource in Album::\"publicFolder
\");"
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:39:44.975897+00:00",
    "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
    "policyId": "PbfR73F8oh5MMfr9uRtFDB",
```

```
    "policyStoreId": "PSEXAMPLEabcdefg222222",
    "policyType": "STATIC",
    "resource": {
        "entityId": "publicFolder",
        "entityType": "Album"
    }
}
```

**Example 3: To create a template-linked policy that is associated with the specified template**

The following `create-policy` example creates a template-linked policy using the specified policy template and associates the specified principal to use with the new template-linked policy.

```
aws verifiedpermissions create-policy \
    --definition file://definition2.txt \
    --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of definition3.txt:

```
{
    "templateLinked": {
        "policyTemplateId": "PTEXAMPLEabcdefg111111",
        "principal": {
            "entityType": "User",
            "entityId": "alice"
        }
    }
}
```

Output:

```
{
    "createdDate": "2023-06-12T20:49:51.490211+00:00",
    "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",
    "policyId": "TPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "TEMPLATE_LINKED",
    "principal": {
        "entityId": "alice",
        "entityType": "User"
    },
```

```
    "resource": {
        "entityId": "VacationPhoto94.jpg",
        "entityType": "Photo"
    }
}
```

For more information about policies, see Amazon Verified Permissions policies in the *Amazon Verified Permissions User Guide*.

- For API details, see UpdatePolicy in *AWS CLI Command Reference*.

## VPC Lattice examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with VPC Lattice.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `create-listener`

The following code example shows how to use `create-listener`.

#### AWS CLI

##### To create a listener

The following `create-listener` example creates an HTTPS listener with a default rule that forwards traffic to the specified VPC Lattice target group.

```
aws vpc-lattice create-listener \
    --name my-service-listener \
    --protocol HTTPS \
    --port 443 \
    --service-identifier svc-0285b53b2eEXAMPLE \
    --default-action file://listener-config.json
```

Contents of `listener-config.json`:

```
{
    "forward": {
        "targetGroups": [
            {
                "targetGroupIdentifier": "tg-0eaa4b9ab4EXAMPLE"
            }
        ]
    }
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE/listener/listener-07cc7fb0abEXAMPLE",
    "defaultAction": {
        "forward": {
            "targetGroups": [
                {
                    "targetGroupIdentifier": "tg-0eaa4b9ab4EXAMPLE",
                    "weight": 100
                }
            ]
        }
    },
    "id": "listener-07cc7fb0abEXAMPLE",
    "name": "my-service-listener",
    "port": 443,
    "protocol": "HTTPS",
    "serviceArn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "serviceId": "svc-0285b53b2eEXAMPLE"
}
```

For more information, see Listeners in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateListener in *AWS CLI Command Reference*.

### `create-service-network-service-association`

The following code example shows how to use `create-service-network-service-association`.

**AWS CLI**

**To create a service association**

The following `create-service-network-service-association` example associates the specified service with the specified service network.

```
aws vpc-lattice create-service-network-service-association \
    --service-identifier svc-0285b53b2eEXAMPLE \
    --service-network-identifier sn-080ec7dc93EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-
east-2:123456789012:servicenetworkserviceassociation/snsa-0e16955a8cEXAMPLE",
    "createdBy": "123456789012",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-
svcs.us-east-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CEXAMPLE"
    },
    "id": "snsa-0e16955a8cEXAMPLE",
    "status": "CREATE_IN_PROGRESS"
}
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateServiceNetworkServiceAssociation in *AWS CLI Command Reference*.

### `create-service-network-vpc-association`

The following code example shows how to use `create-service-network-vpc-association`.

### AWS CLI

#### To create a VPC association

The following `create-service-network-vpc-association` example associates the specified vpc with the specified service network. The specified security group controls which resources in the VPC can access the service network and its services.

```
aws vpc-lattice create-service-network-vpc-association \
    --vpc-identifier vpc-0a1b2c3d4eEXAMPLE \
    --service-network-identifier sn-080ec7dc93EXAMPLE \
    --security-group-ids sg-0aee16bc6cEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",
    "createdBy": "123456789012",
    "id": "snva-0821fc8631EXAMPLE",
    "securityGroupIds": [
        "sg-0aee16bc6cEXAMPLE"
    ],
    "status": "CREATE_IN_PROGRESS"
}
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateServiceNetworkVpcAssociation in *AWS CLI Command Reference*.

## `create-service-network`

The following code example shows how to use `create-service-network`.

### AWS CLI

#### To create a service network

The following `create-service-network` example creates a service network with the specified name.

```
aws vpc-lattice create-service-network \
```

```
    --name my-service-network
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "authType": "NONE",
    "id": "sn-080ec7dc93EXAMPLE",
    "name": "my-service-network"
}
```

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateServiceNetwork in *AWS CLI Command Reference*.

### `create-service`

The following code example shows how to use `create-service`.

#### AWS CLI

**To create a service**

The following `create-service` example creates a service with the specified name.

```
aws vpc-lattice create-service \
    --name my-lattice-service
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "authType": "NONE",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.1a2b3c4.vpc-lattice-
svcs.us-east-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CEXAMPLE"
    },
    "id": "svc-0285b53b2eEXAMPLE",
    "name": "my-lattice-service",
    "status": "CREATE_IN_PROGRESS"
```

```
}
```

For more information, see Services in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateService in *AWS CLI Command Reference*.

### `create-target-group`

The following code example shows how to use `create-target-group`.

#### AWS CLI

**Example 1: To create a target group of type INSTANCE**

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-instance \
    --type INSTANCE \
    --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "healthCheck": {
            "enabled": true,
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
```

```
            "matcher": {
                "httpCode": "200"
            },
            "path": "/",
            "protocol": "HTTPS",
            "protocolVersion": "HTTP1",
            "unhealthyThresholdCount": 2
        },
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-instance",
    "status": "CREATE_IN_PROGRESS",
    "type": "INSTANCE"
}
```

**Example 2: To create a target group of type IP**

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-ip \
    --type IP \
    --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{
    "ipAddressType": "IPV4",
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```
{
```

```
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "healthCheck": {
            "enabled": true,
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
            "matcher": {
                "httpCode": "200"
            },
            "path": "/",
            "protocol": "HTTPS",
            "protocolVersion": "HTTP1",
            "unhealthyThresholdCount": 2
        },
        "ipAddressType": "IPV4",
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-ip",
    "status": "CREATE_IN_PROGRESS",
    "type": "IP"
}
```

**Example 3: To create a target group of type LAMBDA**

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-lambda \
    --type LAMBDA
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
```

```
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-lambda",
    "status": "CREATE_IN_PROGRESS",
    "type": "LAMBDA"
}
```

**Example 4: To create a target group of type ALB**

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
    --name my-lattice-target-group-alb \
    --type ALB \
    --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-alb",
    "status": "CREATE_IN_PROGRESS",
    "type": "ALB"
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see CreateTargetGroup in *AWS CLI Command Reference*.

### `delete-auth-policy`

The following code example shows how to use `delete-auth-policy`.

**AWS CLI**

**To delete an auth policy**

The following `delete-auth-policy` example deletes the auth policy for the specified service.

```
aws vpc-lattice delete-auth-policy \
    --resource-identifier svc-0285b53b2eEXAMPLE
```

This command produces no output.

For more information, see Auth policies in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteAuthPolicy in *AWS CLI Command Reference*.

### `delete-listener`

The following code example shows how to use `delete-listener`.

**AWS CLI**

**To delete a listener**

The following `delete-listener` example deletes the specified listener.

```
aws vpc-lattice delete-listener \
    --listener-identifier listener-07cc7fb0abEXAMPLE \
    --service-identifier svc-0285b53b2eEXAMPLE
```

This command produces no output.

For more information, see Listeners in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteListener in *AWS CLI Command Reference*.

### `delete-service-network-service-association`

The following code example shows how to use `delete-service-network-service-association`.

**AWS CLI**

**To delete a service association**

The following `delete-service-network-service-association` example disassociates the specified service association.

```
aws vpc-lattice delete-service-network-service-association \
    --service-network-service-association-identifier snsa-031fabb4d8EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-
east-2:123456789012:servicenetworkserviceassociation/snsa-031fabb4d8EXAMPLE",
    "id": "snsa-031fabb4d8EXAMPLE",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteServiceNetworkServiceAssociation in *AWS CLI Command Reference*.

### `delete-service-network-vpc-association`

The following code example shows how to use `delete-service-network-vpc-association`.

**AWS CLI**

**To delete a VPC association**

The following `delete-service-network-vpc-association` example disassociates the specified VPC association.

```
aws vpc-lattice delete-service-network-vpc-association \
    --service-network-vpc-association-identifier snva-0821fc8631EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",
    "id": "snva-0821fc8631EXAMPLE",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteServiceNetworkVpcAssociation in *AWS CLI Command Reference*.

### `delete-service-network`

The following code example shows how to use `delete-service-network`.

#### AWS CLI

**To delete a service network**

The following `delete-service-network` example deletes the specified service network.

```
aws vpc-lattice delete-service-network \
    --service-network-identifier sn-080ec7dc93EXAMPLE
```

This command produces no output.

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteServiceNetwork in *AWS CLI Command Reference*.

### `delete-service`

The following code example shows how to use `delete-service`.

#### AWS CLI

**To delete a service**

The following `delete-service` example deletes the specified service.

```
aws vpc-lattice delete-service \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "id": "svc-0285b53b2eEXAMPLE",
    "name": "my-lattice-service",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Services in VPC Lattice in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteService in *AWS CLI Command Reference*.

### `delete-target-group`

The following code example shows how to use `delete-target-group`.

#### AWS CLI

**To delete a target group**

The following `delete-target-group` example deletes the specified target group.

```
aws vpc-lattice delete-target-group \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "status": "DELETE_IN_PROGRESS"
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see DeleteTargetGroup in *AWS CLI Command Reference*.

### `deregister-targets`

The following code example shows how to use `deregister-targets`.

**AWS CLI**

**To deregister a target**

The following `deregister-targets` example deregisters the specified target from the specified target group.

```
aws vpc-lattice deregister-targets \
    --targets i-07dd579bc5EXAMPLE \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "successful": [
        {
            "id": "i-07dd579bc5EXAMPLE",
            "port": 443
        }
    ],
    "unsuccessful": []
}
```

For more information, see Register targets in the *Amazon VPC Lattice User Guide*.

- For API details, see DeregisterTargets in *AWS CLI Command Reference*.

### `get-auth-policy`

The following code example shows how to use `get-auth-policy`.

**AWS CLI**

**To get information about an auth policy**

The following `get-auth-policy` example gets information about the auth policy for the specified service.

```
aws vpc-lattice get-auth-policy \
    --resource-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "createdAt": "2023-06-07T03:51:20.266Z",
    "lastUpdatedAt": "2023-06-07T04:39:27.082Z",
    "policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:role/my-clients\"},
\"Action\":\"vpc-lattice-svcs:Invoke\",\"Resource\":\"arn:aws:vpc-lattice:us-
east-2:123456789012:service/svc-0285b53b2eEXAMPLE\"}]}",
    "state": "Active"
}
```

For more information, see Auth policies in the *Amazon VPC Lattice User Guide*.

- For API details, see GetAuthPolicy in *AWS CLI Command Reference*.

### `get-listener`

The following code example shows how to use `get-listener`.

#### AWS CLI

**To get information about a service listener**

The following `get-listener` example gets information about the specified listener for the specified service.

```
aws vpc-lattice get-listener \
    --listener-identifier listener-0ccf55918cEXAMPLE \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE/listener/listener-0ccf55918cEXAMPLE",
    "createdAt": "2023-05-07T05:08:45.192Z",
    "defaultAction": {
```

```
        "forward": {
            "targetGroups": [
                {
                    "targetGroupIdentifier": "tg-0ff213abb6EXAMPLE",
                    "weight": 1
                }
            ]
        }
    },
    "id": "listener-0ccf55918cEXAMPLE",
    "lastUpdatedAt": "2023-05-07T05:08:45.192Z",
    "name": "http-80",
    "port": 80,
    "protocol": "HTTP",
    "serviceArn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "serviceId": "svc-0285b53b2eEXAMPLE"
}
```

For more information, see Define routing in the *Amazon VPC Lattice User Guide*.

- For API details, see GetListener in *AWS CLI Command Reference*.

### `get-service-network-service-association`

The following code example shows how to use `get-service-network-service-association`.

#### AWS CLI

**To get information about a service association**

The following `get-service-network-service-association` example gets information about the specified service association.

```
aws vpc-lattice get-service-network-service-association \
    --service-network-service-association-identifier snsa-031fabb4d8EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-
east-2:123456789012:servicenetworkserviceassociation/snsa-031fabb4d8EXAMPLE",
```

```
    "createdAt": "2023-05-05T21:48:16.076Z",
    "createdBy": "123456789012",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-
svcs.us-east-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CEXAMPLE"
    },
    "id": "snsa-031fabb4d8EXAMPLE",
    "serviceArn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "serviceId": "svc-0285b53b2eEXAMPLE",
    "serviceName": "my-lattice-service",
    "serviceNetworkArn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "serviceNetworkId": "sn-080ec7dc93EXAMPLE",
    "serviceNetworkName": "my-service-network",
    "status": "ACTIVE"
}
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see GetServiceNetworkServiceAssociation in *AWS CLI Command Reference*.

### `get-service-network-vpc-association`

The following code example shows how to use `get-service-network-vpc-association`.

#### AWS CLI

**To get information about a VPC association**

The following `get-service-network-vpc-association` example gets information about the specified VPC association.

```
aws vpc-lattice get-service-network-vpc-association \
    --service-network-vpc-association-identifier snva-0821fc8631EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",
```

```
    "createdAt": "2023-06-06T23:41:08.421Z",
    "createdBy": "123456789012",
    "id": "snva-0c5dcb60d6EXAMPLE",
    "lastUpdatedAt": "2023-06-06T23:41:08.421Z",
    "securityGroupIds": [
        "sg-0aee16bc6cEXAMPLE"
    ],
    "serviceNetworkArn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "serviceNetworkId": "sn-080ec7dc93EXAMPLE",
    "serviceNetworkName": "my-service-network",
    "status": "ACTIVE",
    "vpcId": "vpc-0a1b2c3d4eEXAMPLE"
}
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see GetServiceNetworkVpcAssociation in *AWS CLI Command Reference*.

### `get-service-network`

The following code example shows how to use `get-service-network`.

#### AWS CLI

**To get information about a service network**

The following `get-service-network` example gets information about the specified service network.

```
aws vpc-lattice get-service-network \
    --service-network-identifier sn-080ec7dc93EXAMPLE
```

Output:

```
{
   "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
   "authType": "AWS_IAM",
   "createdAt": "2023-05-05T15:26:08.417Z",
   "id": "sn-080ec7dc93EXAMPLE",
   "lastUpdatedAt": "2023-05-05T15:26:08.417Z",
```

```
    "name": "my-service-network",
    "numberOfAssociatedServices": 2,
    "numberOfAssociatedVPCs": 3
}
```

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see GetServiceNetwork in *AWS CLI Command Reference*.

### `get-service`

The following code example shows how to use `get-service`.

#### AWS CLI

**To get information about a service**

The following `get-service` example gets information about the specified service.

```
aws vpc-lattice get-service \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
    "authType": "AWS_IAM",
    "createdAt": "2023-05-05T21:35:29.339Z",
    "dnsEntry": {
        "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-
svcs.us-east-2.on.aws",
        "hostedZoneId": "Z09127221KTH2CFUOHIZH"
    },
    "id": "svc-0285b53b2eEXAMPLE",
    "lastUpdatedAt": "2023-05-05T21:35:29.339Z",
    "name": "my-lattice-service",
    "status": "ACTIVE"
}
```

For more information, see Services in the *Amazon VPC Lattice User Guide*.

- For API details, see GetService in *AWS CLI Command Reference*.

### `get-target-group`

The following code example shows how to use `get-target-group`.

**AWS CLI**

**To get information about a target group**

The following `get-target-group` example gets information about the specified target group, which has a target type of `INSTANCE`.

```
aws vpc-lattice get-target-group \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
        "healthCheck": {
            "enabled": true,
            "healthCheckIntervalSeconds": 30,
            "healthCheckTimeoutSeconds": 5,
            "healthyThresholdCount": 5,
            "matcher": {
                "httpCode": "200"
            },
            "path": "/",
            "protocol": "HTTPS",
            "protocolVersion": "HTTP1",
            "unhealthyThresholdCount": 2
        },
        "port": 443,
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "createdAt": "2023-05-06T04:41:04.122Z",
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "lastUpdatedAt": "2023-05-06T04:41:04.122Z",
    "name": "my-target-group",
    "serviceArns": [
```

```
        "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE"
    ],
    "status": "ACTIVE",
    "type": "INSTANCE"
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see GetTargetGroup in *AWS CLI Command Reference*.

## `list-listeners`

The following code example shows how to use `list-listeners`.

### AWS CLI

#### To list service listeners

The following `list-listeners` example lists the listeners for the specified service.

```
aws vpc-lattice list-listeners \
    --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE/listener/listener-0ccf55918cEXAMPLE",
            "createdAt": "2023-05-07T05:08:45.192Z",
            "id": "listener-0ccf55918cEXAMPLE",
            "lastUpdatedAt": "2023-05-07T05:08:45.192Z",
            "name": "http-80",
            "port": 80,
            "protocol": "HTTP"
        }
    ]
}
```

For more information, see Define routing in the *Amazon VPC Lattice User Guide*.

- For API details, see ListListeners in *AWS CLI Command Reference*.

### `list-service-network-service-associations`

The following code example shows how to use `list-service-network-service-associations`.

**AWS CLI**

**To list service associations**

The following `list-service-network-service-associations` example lists the service associations for the specified service network. The `--query` option scopes the output to the IDs of the service associations.

```
aws vpc-lattice list-service-network-service-associations \
    --service-network-identifier sn-080ec7dc93EXAMPLE \
    --query items[*].id
```

Output:

```
[
    "snsa-031fabb4d8EXAMPLE",
    "snsa-0e16955a8cEXAMPLE"
]
```

For more information, see Manage service associations in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworkServiceAssociations in *AWS CLI Command Reference*.

### `list-service-network-vpc-associations`

The following code example shows how to use `list-service-network-vpc-associations`.

**AWS CLI**

**To list VPC associations**

The following `list-service-network-vpc-associations` example lists the VPC associations for the specified service network. The `--query` option scopes the output to the IDs of the VPC associations.

```
aws vpc-lattice list-service-network-vpc-associations \
    --service-network-identifier sn-080ec7dc93EXAMPLE \
    --query items[*].id
```

Output:

```
[
    "snva-0821fc8631EXAMPLE",
    "snva-0c5dcb60d6EXAMPLE"
]
```

For more information, see Manage VPC associations in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworkVpcAssociations in *AWS CLI Command Reference*.

### `list-service-networks`

The following code example shows how to use `list-service-networks`.

#### AWS CLI

**To list your service networks**

The following `list-service-networks` example lists the service networks owned or shared with the calling account. The `--query` option scopes the results to the Amazon Resource Names (ARN) of the service networks.

```
aws vpc-lattice list-service-networks \
    --query items[*].arn
```

Output:

```
[
    "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
    "arn:aws:vpc-lattice:us-east-2:111122223333:servicenetwork/sn-0ec4d436cfEXAMPLE"
]
```

For more information, see Service networks in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServiceNetworks in *AWS CLI Command Reference*.

### `list-services`

The following code example shows how to use `list-services`.

**AWS CLI**

**To list your services**

The following `list-services` example lists the servies owned or shared with the calling account. The `--query` option scopes the results to the Amazon Resource Names (ARN) of the services.

```
aws vpc-lattice list-services \
    --query items[*].arn
```

Output:

```
[
    "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE",
    "arn:aws:vpc-lattice:us-east-2:111122223333:service/svc-0b8ac96550EXAMPLE"
]
```

For more information, see Services in the *Amazon VPC Lattice User Guide*.

- For API details, see ListServices in *AWS CLI Command Reference*.

### `list-target-groups`

The following code example shows how to use `list-target-groups`.

**AWS CLI**

**To list your target groups**

The following `list-target-groups` example lists the target groups with a target type of LAMBDA.

```
aws vpc-lattice list-target-groups \
    --target-group-type LAMBDA
```

Output:

```
{
    "items": [
        {
            "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-045c1b7d9dEXAMPLE",
            "createdAt": "2023-05-06T05:22:16.637Z",
            "id": "tg-045c1b7d9dEXAMPLE",
            "lastUpdatedAt": "2023-05-06T05:22:16.637Z",
            "name": "my-target-group-lam",
            "serviceArns": [
                "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE"
            ],
            "status": "ACTIVE",
            "type": "LAMBDA"
        }
    ]
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see ListTargetGroups in *AWS CLI Command Reference*.

### `list-targets`

The following code example shows how to use `list-targets`.

#### AWS CLI

**To list the targets for a target group**

The following `list-targets` example lists the targets for the specified target group.

```
aws vpc-lattice list-targets \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "items": [
        {
            "id": "i-07dd579bc5EXAMPLE",
```

```
            "port": 443,
            "status": "HEALTHY"
        },
        {
            "id": "i-047b3c9078EXAMPLE",
            "port": 443,
            "reasonCode": "HealthCheckFailed",
            "status": "UNHEALTHY"
        }
    ]
}
```

For more information, see Target groups in the *Amazon VPC Lattice User Guide*.

- For API details, see ListTargets in *AWS CLI Command Reference*.

### `put-auth-policy`

The following code example shows how to use `put-auth-policy`.

#### AWS CLI

**To create an auth policy for a service**

The following `put-auth-policy` example grants access to requests from any authenticated principal that uses the specified IAM role. The resource is the ARN of the service to which the policy is attached.

```
aws vpc-lattice put-auth-policy \
    --resource-identifier svc-0285b53b2eEXAMPLE \
    --policy file://auth-policy.json
```

Contents of `auth-policy.json`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "AWS": "arn:aws:iam::123456789012:role/my-clients"
            },
```

```
            "Action": "vpc-lattice-svcs:Invoke",
            "Resource": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE"
        }
    ]
}
```

Output:

```
{
    "policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow
\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:role/my-clients\"},
\"Action\":\"vpc-lattice-svcs:Invoke\",\"Resource\":\"arn:aws:vpc-lattice:us-
east-2:123456789012:service/svc-0285b53b2eEXAMPLE\"}]}",
    "state": "Active"
}
```

For more information, see Auth policies in the *Amazon VPC Lattice User Guide*.

- For API details, see PutAuthPolicy in *AWS CLI Command Reference*.

## `register-targets`

The following code example shows how to use `register-targets`.

### AWS CLI

#### To register a target

The following `register-targets` example registers the specified targets with the specified target group.

```
aws vpc-lattice register-targets \
    --targets id=i-047b3c9078EXAMPLE id=i-07dd579bc5EXAMPLE \
    --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
    "successful": [
        {
            "id": "i-07dd579bc5EXAMPLE",
```

```
            "port": 443
        }
    ],
    "unsuccessful": [
        {
            "failureCode": "UnsupportedTarget",
            "failureMessage": "Instance targets must be in the same VPC as their
 target group",
            "id": "i-047b3c9078EXAMPLE",
            "port": 443
        }
    ]
}
```

For more information, see Register targets in the *Amazon VPC Lattice User Guide*.

- For API details, see RegisterTargets in *AWS CLI Command Reference*.

## AWS WAF Classic examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAF Classic.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `put-logging-configuration`

The following code example shows how to use `put-logging-configuration`.

**AWS CLI**

**To create a logging configuration for the web ACL ARN with the specified Kinesis Firehose stream ARN**

The following `put-logging-configuration` example displays logging configuration for WAF with CloudFront.

```
aws waf put-logging-configuration \
    --logging-configuration ResourceArn=arn:aws:waf::123456789012:webacl/3bffd3ed-fa2e-445e-869f-a6a7cf153fd3,LogDestinationConfigs=arn:aws:firehose:us-east-1:123456789012:deliverystream/aws-waf-logs-firehose-stream,RedactedFields=[]
```

Output:

```
{
    "LoggingConfiguration": {
        "ResourceArn": "arn:aws:waf::123456789012:webacl/3bffd3ed-fa2e-445e-869f-a6a7cf153fd3",
        "LogDestinationConfigs": [
            "arn:aws:firehose:us-east-1:123456789012:deliverystream/aws-waf-logs-firehose-stream"
        ]
    }
}
```

- For API details, see PutLoggingConfiguration in *AWS CLI Command Reference*.

### `update-byte-match-set`

The following code example shows how to use `update-byte-match-set`.

**AWS CLI**

**To update a byte match set**

The following `update-byte-match-set` command deletes a ByteMatchTuple object (filter) in a ByteMatchSet:

```
aws waf update-byte-match-set --byte-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --
```

```
updates
 Action="DELETE",ByteMatchTuple={FieldToMatch={Type="HEADER",Data="referer"},TargetString="b
```

For more information, see Working with String Match Conditions in the *AWS WAF* developer guide.

- For API details, see UpdateByteMatchSet in *AWS CLI Command Reference*.

### `update-ip-set`

The following code example shows how to use `update-ip-set`.

**AWS CLI**

**To update an IP set**

The following `update-ip-set` command updates an IPSet with an IPv4 address and deletes an IPv6 address:

```
aws waf update-ip-set --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90
 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
 Action="INSERT",IPSetDescriptor={Type="IPV4",Value="12.34.56.78/16"},Action="DELETE",IPSetD
```

Alternatively you can use a JSON file to specify the input. For example:

```
aws waf update-ip-set --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-
token 12cs345-67cd-890b-1cd2-c3a4567d89f1  --updates file://change.json
```

Where content of the JSON file is:

```
[
{
"Action": "INSERT",
"IPSetDescriptor":
{
"Type": "IPV4",
"Value": "12.34.56.78/16"
}
},
{
"Action": "DELETE",
"IPSetDescriptor":
```

```
{
"Type": "IPV6",
"Value": "1111:0000:0000:0000:0000:0000:0000:0111/128"
}
}
]
```

For more information, see Working with IP Match Conditions in the *AWS WAF* developer guide.

- For API details, see UpdateIpSet in *AWS CLI Command Reference*.

### `update-rule`

The following code example shows how to use `update-rule`.

#### AWS CLI

**To update a rule**

The following `update-rule` command deletes a Predicate object in a rule:

```
aws waf update-rule --rule-id a123fae4-b567-8e90-1234-5ab67ac8ca90
 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
 Action="DELETE",Predicate={Negated=false,Type="ByteMatch",DataId="MyByteMatchSetID"}
```

For more information, see Working with Rules in the *AWS WAF* developer guide.

- For API details, see UpdateRule in *AWS CLI Command Reference*.

### `update-size-constraint-set`

The following code example shows how to use `update-size-constraint-set`.

#### AWS CLI

**To update a size constraint set**

The following `update-size-constraint-set` command deletes a SizeConstraint object (filters) in a size constraint set:

```
aws waf update-size-constraint-set --size-constraint-set-id a123fae4-
b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --
```

```
updates
 Action="DELETE",SizeConstraint={FieldToMatch={Type="QUERY_STRING"},TextTransformation="NONE
```

For more information, see Working with Size Constraint Conditions in the *AWS WAF* developer guide.

- For API details, see UpdateSizeConstraintSet in *AWS CLI Command Reference*.

### `update-sql-injection-match-set`

The following code example shows how to use `update-sql-injection-match-set`.

**AWS CLI**

**To update a SQL Injection Match Set**

The following `update-sql-injection-match-set` command deletes a SqlInjectionMatchTuple object (filters) in a SQL injection match set:

```
aws waf update-sql-injection-match-set --sql-injection-
match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --
change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
 Action="DELETE",SqlInjectionMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformati
```

For more information, see Working with SQL Injection Match Conditions in the *AWS WAF* developer guide.

- For API details, see UpdateSqlInjectionMatchSet in *AWS CLI Command Reference*.

### `update-web-acl`

The following code example shows how to use `update-web-acl`.

**AWS CLI**

**To update a web ACL**

The following `update-web-acl` command deletes an `ActivatedRule` object in a WebACL.

aws waf update-web-acl --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates

Action="DELETE",ActivatedRule='{Priority=1,RuleId="WAFRule-1-Example",Action={Type="ALLOW"},Type="REGULAR"}'

Output:

```
{
    "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see Working with Web ACLs in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateWebAcl in *AWS CLI Command Reference*.

### `update-xss-match-set`

The following code example shows how to use `update-xss-match-set`.

#### AWS CLI

**To update an XSSMatchSet**

The following `update-xss-match-set` command deletes an XssMatchTuple object (filters) in an XssMatchSet:

```
aws waf update-xss-match-set --xss-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90
 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
 Action="DELETE",XssMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_D
```

For more information, see Working with Cross-site Scripting Match Conditions in the *AWS WAF* developer guide.

- For API details, see UpdateXssMatchSet in *AWS CLI Command Reference*.

## AWS WAF Classic Regional examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAF Classic Regional.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `associate-web-acl`

The following code example shows how to use `associate-web-acl`.

**AWS CLI**

**To associate a web ACL with a resource**

The following `associate-web-acl` command associates a web ACL, specified by the web-acl-id, with a resource, specified by the resource-arn. The resource ARN can refer to either a application load balancer or an API Gateway:

```
aws waf-regional associate-web-acl \
    --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --resource-arn 12cs345-67cd-890b-1cd2-c3a4567d89f1
```

For more information, see Working with Web ACLs in the *AWS WAF Developer Guide*.

- For API details, see AssociateWebAcl in *AWS CLI Command Reference*.

#### `put-logging-configuration`

The following code example shows how to use `put-logging-configuration`.

**AWS CLI**

**To create a logging configuration for the web ACL ARN with the specified Kinesis Firehose stream ARN**

The following `put-logging-configuration` example displays logging configuration for WAF with ALB/APIGateway in Region `us-east-1`.

```
aws waf-regional put-logging-configuration \
    --logging-configuration ResourceArn=arn:aws:waf-
regional:us-east-1:123456789012:webacl/3bffd3ed-fa2e-445e-869f-
a6a7cf153fd3,LogDestinationConfigs=arn:aws:firehose:us-
east-1:123456789012:deliverystream/aws-waf-logs-firehose-stream,RedactedFields=[] \
    --region us-east-1
```

Output:

```
{
    "LoggingConfiguration": {
        "ResourceArn": "arn:aws:waf-regional:us-east-1:123456789012:webacl/3bffd3ed-
fa2e-445e-869f-a6a7cf153fd3",
        "LogDestinationConfigs": [
            "arn:aws:firehose:us-east-1:123456789012:deliverystream/aws-waf-logs-
firehose-stream"
        ]
    }
}
```

- For API details, see PutLoggingConfiguration in *AWS CLI Command Reference*.

### `update-byte-match-set`

The following code example shows how to use `update-byte-match-set`.

#### AWS CLI

**To update a byte match set**

The following `update-byte-match-set` command deletes a `ByteMatchTuple` object (filter) in a `ByteMatchSet`. Because the `updates` value has embedded double quotes, you must surround the value with single quotes.

```
aws waf-regional update-byte-match-set \
    --byte-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",ByteMatchTuple={FieldToMatch={Type="HEADER",Data="referer"},TargetString="
```

For more information, see Working with String Match Conditions in the *AWS WAF Developer Guide*.

- For API details, see UpdateByteMatchSet in *AWS CLI Command Reference*.

### `update-ip-set`

The following code example shows how to use `update-ip-set`.

#### AWS CLI

**To update an IP set**

The following `update-ip-set` command updates an IPSet with an IPv4 address and deletes an IPv6 address. Get the value for `change-token` by running the `get-change-token` command. Because the value for updates includes embedded double-quotes, you must surround the value with single quotes.

```
aws waf update-ip-set \
    --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="INSERT",IPSetDescriptor={Type="IPV4",Value="12.34.56.78/16"},Action="DELETE",IPSet
```

Alternatively you can use a JSON file to specify the input. For example:

```
aws waf-regional update-ip-set \
    --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1  \
    --updates file://change.json
```

Content of the `change.json`

```
[
    {
        "Action": "INSERT",
        "IPSetDescriptor":
        {
            "Type": "IPV4",
            "Value": "12.34.56.78/16"
        }
    },
```

```
    {
        "Action": "DELETE",
        "IPSetDescriptor":
        {
            "Type": "IPV6",
            "Value": "1111:0000:0000:0000:0000:0000:0000:0111/128"
        }
    }
]
```

For more information, see Working with IP Match Conditions in the *AWS WAF Developer Guide*.

- For API details, see UpdateIpSet in *AWS CLI Command Reference*.

### `update-rule`

The following code example shows how to use `update-rule`.

#### AWS CLI

**To update a rule**

The following `update-rule` command deletes a `Predicate` object in a rule. Because the `updates` value has embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-rule \
    --rule-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",Predicate={Negated=false,Type="ByteMatch",DataId="MyByteMatchSetID"}'
```

For more information, see Working with Rules in the *AWS WAF Developer Guide* .

- For API details, see UpdateRule in *AWS CLI Command Reference*.

### `update-size-constraint-set`

The following code example shows how to use `update-size-constraint-set`.

#### AWS CLI

**To update a size constraint set**

The following `update-size-constraint-set` command deletes a SizeConstraint` object (filters) in a size constraint set. Because the `updates` value contains embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-size-constraint-set \
    --size-constraint-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",SizeConstraint={FieldToMatch={Type="QUERY_STRING"},TextTransformation="NON
```

For more information, see Working with Size Constraint Conditions in the *AWS WAF Developer Guide*.

- For API details, see UpdateSizeConstraintSet in *AWS CLI Command Reference*.

### `update-sql-injection-match-set`

The following code example shows how to use `update-sql-injection-match-set`.

**AWS CLI**

**To update a SQL Injection Match Set**

The following `update-sql-injection-match-set` command deletes a `SqlInjectionMatchTuple` object (filters) in a SQL injection match set. Because the `updates` value contains embedded double quotes, you must surround the entire value in single quotes. :

aws waf-regional update-sql-injection-match-set --sql-injection-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates 'Action="DELETE",SqlInjectionMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformatio

For more information, see Working with SQL Injection Match Conditions in the *AWS WAF Developer Guide*.

- For API details, see UpdateSqlInjectionMatchSet in *AWS CLI Command Reference*.

### `update-web-acl`

The following code example shows how to use `update-web-acl`.

**AWS CLI**

**To update a web ACL**

The following `update-web-acl` command deletes an `ActivatedRule` object in a WebACL. Because the `updates` value contains embedded double quotes, you must surround the entire value in single quotes.

```
aws waf-regional update-web-acl \
    --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates Action="DELETE",ActivatedRule='{Priority=1,RuleId="WAFRule-1-
Example",Action={Type="ALLOW"},Type="ALLOW"}'
```

For more information, see Working with Web ACLs in the *AWS WAF Developer Guide*.

- For API details, see UpdateWebAcl in *AWS CLI Command Reference*.

## `update-xss-match-set`

The following code example shows how to use `update-xss-match-set`.

**AWS CLI**

**To update an XSSMatchSet**

The following `update-xss-match-set` command deletes an `XssMatchTuple` object (filters) in an `XssMatchSet`. Because the `updates` value contains embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-xss-match-set \
    --xss-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
    --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
    --updates
 'Action="DELETE",XssMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_
```

For more information, see Working with Cross-site Scripting Match Conditions in the *AWS WAF Developer Guide* .

- For API details, see UpdateXssMatchSet in *AWS CLI Command Reference*.

# AWS WAFV2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAFV2.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

## Topics

## Actions

### `associate-web-acl`

The following code example shows how to use `associate-web-acl`.

#### AWS CLI

**To associate a web ACL with a regional AWS resource**

The following `associate-web-acl` example associates the specified web ACL with an Application Load Balancer.

```
aws wafv2 associate-web-acl \
    --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/waf-cli-alb/1ea17125f8b25a2a \
    --region us-west-2
```

This command produces no output.

For more information, see Associating or Disassociating a Web ACL with an AWS Resource in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see AssociateWebAcl in *AWS CLI Command Reference*.

### `check-capacity`

The following code example shows how to use `check-capacity`.

**AWS CLI**

**To obtain the capacity used by a set of rules**

The following `check-capacity` retrieves the capacity requirements for a rule set that contains a rate-based rule statement, and an AND rule statement that contains nested rules.

```
aws wafv2 check-capacity \
    --scope REGIONAL \
    --rules file://waf-rule-list.json \
    --region us-west-2
```

Contents of file://waf-rule-list.json:

```
[
    {
        "Name":"basic-rule",
        "Priority":0,
        "Statement":{
            "AndStatement":{
                "Statements":[
                    {
                        "ByteMatchStatement":{
                            "SearchString":"example.com",
                            "FieldToMatch":{
                                "SingleHeader":{
                                    "Name":"host"
                                }
                            },
                            "TextTransformations":[
                                {
                                    "Priority":0,
                                    "Type":"LOWERCASE"
                                }
                            ],
                            "PositionalConstraint":"EXACTLY"
                        }
```

```
                    },
                    {
                        "GeoMatchStatement":{
                            "CountryCodes":[
                                "US",
                                "IN"
                            ]
                        }
                    }
                ]
            }
        },
        "Action":{
            "Allow":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"basic-rule"
        }
    },
    {
        "Name":"rate-rule",
        "Priority":1,
        "Statement":{
            "RateBasedStatement":{
                "Limit":1000,
                "AggregateKeyType":"IP"
            }
        },
        "Action":{
            "Block":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"rate-rule"
        }
    }
```

```
]
```

Output:

```
{
    "Capacity":15
}
```

For more information, see AWS WAF Web ACL Capacity Units (WCU) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see CheckCapacity in *AWS CLI Command Reference*.

### `create-ip-set`

The following code example shows how to use `create-ip-set`.

#### AWS CLI

**To create an IP set for use in your web ACLs and rule groups**

The following `create-ip-set` command creates an IP set with a single address range specification.

```
aws wafv2 create-ip-set \
    --name testip \
    --scope REGIONAL \
    --ip-address-version IPV4 \
    --addresses 198.51.100.0/16
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"",
        "Name":"testip",
        "LockToken":"447e55ac-0000-0000-0000-86b67c17f8b5",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
```

```
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see CreateIpSet in *AWS CLI Command Reference*.

### `create-regex-pattern-set`

The following code example shows how to use `create-regex-pattern-set`.

#### AWS CLI

**To create a regex pattern set for use in your web ACLs and rule groups**

The following `create-regex-pattern-set` command creates a regex pattern set with two regex patterns specified.

```
aws wafv2 create-regex-pattern-set \
    --name regexPatterSet01 \
    --scope REGIONAL \
    --description 'Test web-acl' \
    --regular-expression-list '[{"RegexString": "/[0-9]*/"},{"RegexString": "/[a-
z]*/"}]'
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/
regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"Test web-acl",
        "Name":"regexPatterSet01",
        "LockToken":"0bc01e21-03c9-4b98-9433-6229cbf1ef1c",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see CreateRegexPatternSet in *AWS CLI Command Reference*.

### `create-rule-group`

The following code example shows how to use `create-rule-group`.

**AWS CLI**

**To create a custom rule group for use in your web ACLs**

The following `create-rule-group` command creates a custom rule group for regional use. The rule statements for the group are provided in a JSON-formatted file.

```
aws wafv2 create-rule-group \
    --name "TestRuleGroup" \
    --scope REGIONAL \
    --capacity 250 \
    --rules file://waf-rule.json \
    --visibility-config
 SampledRequestsEnabled=true,CloudWatchMetricsEnabled=true,MetricName=TestRuleGroupMetrics
 \
    --region us-west-2
```

Contents of file://waf-rule.json:

```
[
    {
        "Name":"basic-rule",
        "Priority":0,
        "Statement":{
            "AndStatement":{
                "Statements":[
                    {
                        "ByteMatchStatement":{
                            "SearchString":"example.com",
                            "FieldToMatch":{
                                "SingleHeader":{
                                    "Name":"host"
                                }
                            },
                            "TextTransformations":[
                                {
                                    "Priority":0,
                                    "Type":"LOWERCASE"
                                }
```

```
                            ],
                            "PositionalConstraint":"EXACTLY"
                        }
                    },
                    {
                        "GeoMatchStatement":{
                            "CountryCodes":[
                                "US",
                                "IN"
                            ]
                        }
                    }
                ]
            }
        },
        "Action":{
            "Allow":{

            }
        },
        "VisibilityConfig":{
            "SampledRequestsEnabled":true,
            "CloudWatchMetricsEnabled":true,
            "MetricName":"basic-rule"
        }
    }
]
```

Output:

```
{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/
TestRuleGroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"",
        "Name":"TestRuleGroup",
        "LockToken":"7b3bcec2-374e-4c5a-b2b9-563bf47249f0",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}
```

For more information, see Managing Your Own Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see CreateRuleGroup in *AWS CLI Command Reference*.

### `create-web-acl`

The following code example shows how to use `create-web-acl`.

**AWS CLI**

**To create a web ACL**

The following `create-web-acl` command creates a web ACL for regional use. The rule statements for the web ACL are provided in a JSON-formatted file.

```
aws wafv2 create-web-acl \
    --name TestWebAcl \
    --scope REGIONAL \
    --default-action Allow={} \
    --visibility-config
 SampledRequestsEnabled=true,CloudWatchMetricsEnabled=true,MetricName=TestWebAclMetrics
 \
    --rules file://waf-rule.json \
    --region us-west-2
```

Contents of file://waf-rule.json:

```
[
    {
        "Name":"basic-rule",
        "Priority":0,
        "Statement":{
            "AndStatement":{
                "Statements":[
                    {

- For API details, see CreateWebAcl in *AWS CLI Command Reference*.

### `delete-ip-set`

The following code example shows how to use `delete-ip-set`.

**AWS CLI**

**To delete an IP set**

The following `delete-ip-set` deletes the specified IP set. This call requires an ID, which you can obtain from the call, `list-ip-sets`, and a lock token, which you can obtain from the calls, `list-ip-sets` and `get-ip-set`.

```
aws wafv2 delete-ip-set \
    --name test1 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token 46851772-db6f-459d-9385-49428812e357
```

This command produces no output.

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteIpSet in *AWS CLI Command Reference*.

### `delete-logging-configuration`

The following code example shows how to use `delete-logging-configuration`.

**AWS CLI**

**To disable logging for a web ACL**

The following `delete-logging-configuration` removes any logging configuration from the specified web ACL.

```
aws wafv2 delete-logging-configuration \
```

```
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see Logging Web ACL Traffic Information in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteLoggingConfiguration in *AWS CLI Command Reference*.

### `delete-regex-pattern-set`

The following code example shows how to use `delete-regex-pattern-set`.

#### AWS CLI

**To delete a regex pattern set**

The following `delete-regex-pattern-set` updates the settings for the specified regex pattern set. This call requires an ID, which you can obtain from the call, `list-regex-pattern-sets`, and a lock token, which you can obtain from the call `list-regex-pattern-sets` or the call `get-regex-pattern-set`.

```
aws wafv2 delete-regex-pattern-set \
    --name regexPatterSet01 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token 0bc01e21-03c9-4b98-9433-6229cbf1ef1c
```

This command produces no output.

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteRegexPatternSet in *AWS CLI Command Reference*.

### `delete-rule-group`

The following code example shows how to use `delete-rule-group`.

#### AWS CLI

**To delete a custom rule group**

The following `delete-rule-group` deletes the specified custom rule group. This call requires an ID, which you can obtain from the call, `list-rule-groups`, and a lock token, which you can obtain from the call `list-rule-groups` or the call `get-rule-group`.

```
aws wafv2 delete-rule-group \
    --name TestRuleGroup \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token 7b3bcec2-0000-0000-0000-563bf47249f0
```

This command produces no output.

For more information, see Managing Your Own Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteRuleGroup in *AWS CLI Command Reference*.

### `delete-web-acl`

The following code example shows how to use `delete-web-acl`.

#### AWS CLI

**To delete a web ACL**

The following `delete-web-acl` deletes the specified web ACL from your account. A web ACL can only be deleted when it's not associated with any resources. This call requires an ID, which you can obtain from the call, `list-web-acls`, and a lock token, which you can obtain from the call `list-web-acls` or the call `get-web-acl`.

```
aws wafv2 delete-web-acl \
    --name test \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token ebab4ed2-155e-4c9a-9efb-e4c45665b1f5
```

This command produces no output.

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DeleteWebAcl in *AWS CLI Command Reference*.

### `describe-managed-rule-group`

The following code example shows how to use `describe-managed-rule-group`.

**AWS CLI**

**To retrieve the description for a managed rule group**

The following `describe-managed-rule-group` retrieves the description for an AWS managed rule group.

```
aws wafv2 describe-managed-rule-group \
    --vendor-name AWS \
    --name AWSManagedRulesCommonRuleSet \
    --scope REGIONAL
```

Output:

```
{
    "Capacity": 700,
    "Rules": [
        {
            "Name": "NoUserAgent_HEADER",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "UserAgent_BadBots_HEADER",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "SizeRestrictions_QUERYSTRING",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "SizeRestrictions_Cookie_HEADER",
            "Action": {
                "Block": {}
```

```
            }
        },
        {
            "Name": "SizeRestrictions_BODY",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "SizeRestrictions_URIPATH",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "EC2MetaDataSSRF_BODY",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "EC2MetaDataSSRF_COOKIE",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "EC2MetaDataSSRF_URIPATH",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "EC2MetaDataSSRF_QUERYARGUMENTS",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "GenericLFI_QUERYARGUMENTS",
            "Action": {
                "Block": {}
            }
        },
```

```
        {
            }
            "Name": "GenericLFI_URIPATH",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "GenericLFI_BODY",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "RestrictedExtensions_URIPATH",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "RestrictedExtensions_QUERYARGUMENTS",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "GenericRFI_QUERYARGUMENTS",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "GenericRFI_BODY",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "GenericRFI_URIPATH",
            "Action": {
                "Block": {}
            }
        },
        {
```

```
            "Name": "CrossSiteScripting_COOKIE",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "CrossSiteScripting_QUERYARGUMENTS",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "CrossSiteScripting_BODY",
            "Action": {
                "Block": {}
            }
        },
        {
            "Name": "CrossSiteScripting_URIPATH",
            "Action": {
                "Block": {}
            }
        }
    ]
}
```

For more information, see Managed Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DescribeManagedRuleGroup in *AWS CLI Command Reference*.

## `disassociate-web-acl`

The following code example shows how to use `disassociate-web-acl`.

### AWS CLI

#### To disassociate a web ACL from a regional AWS resource

The following `disassociate-web-acl` example removes any existing web ACL association from the specified Application Load Balancer.

```
aws wafv2 disassociate-web-acl \
```

```
    --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/waf-cli-alb/1ea17125f8b25a2a \
    --region us-west-2
```

This command produces no output.

For more information, see Associating or Disassociating a Web ACL with an AWS Resource in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see DisassociateWebAcl in *AWS CLI Command Reference*.

### `get-ip-set`

The following code example shows how to use `get-ip-set`.

#### AWS CLI

**To retrieve a specific IP set**

The following `get-ip-set` retrieves the IP set with the specified name, scope, and ID. You can get the ID for an IP set from the commands `create-ip-set` and `list-ip-sets`.

```
aws wafv2 get-ip-set \
    --name testip \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "IPSet":{
        "Description":"",
        "Name":"testip",
        "IPAddressVersion":"IPV4",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
        "Addresses":[
            "192.0.2.0/16"
        ]
    },
    "LockToken":"447e55ac-2396-4c6d-b9f9-86b67c17f8b5"
```

```
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetIpSet in *AWS CLI Command Reference*.

### `get-logging-configuration`

The following code example shows how to use `get-logging-configuration`.

#### AWS CLI

**To retrieve the logging configurations for a web ACL**

The following `get-logging-configuration` retrieves the logging configuration for the specified web ACL.

```
aws wafv2 get-logging-configuration \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
    --region us-west-2
```

Output:

```
{
    "LoggingConfiguration":{
        "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "RedactedFields":[
            {
                "Method":{

                }
            }
        ],
        "LogDestinationConfigs":[
            "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-logs-
custom-transformation"
        ]
    }
}
```

For more information, see Logging Web ACL Traffic Information in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetLoggingConfiguration in *AWS CLI Command Reference*.

### `get-rate-based-statement-managed-keys`

The following code example shows how to use `get-rate-based-statement-managed-keys`.

**AWS CLI**

**To retrieve a list of IP addresses that are blocked by a rate-based rule**

The following `get-rate-based-statement-managed-keys` retrieves the IP addresses currently blocked by a rate-based rule that's being used for a regional application.

```
aws wafv2 get-rate-based-statement-managed-keys \
    --scope REGIONAL \
    --web-acl-name testwebacl2 \
    --web-acl-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --rule-name ratebasedtest
```

Output:

```
{
    "ManagedKeysIPV4":{
        "IPAddressVersion":"IPV4",
        "Addresses":[
            "198.51.100.0/32"
        ]
    },
    "ManagedKeysIPV6":{
        "IPAddressVersion":"IPV6",
        "Addresses":[

        ]
    }
}
```

For more information, see Rate-Based Rule Statement in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetRateBasedStatementManagedKeys in *AWS CLI Command Reference*.

### `get-regex-pattern-set`

The following code example shows how to use `get-regex-pattern-set`.

#### AWS CLI

**To retrieve a specific regex pattern set**

The following `get-regex-pattern-set` retrieves the regex pattern set with the specified name, scope, region, and ID. You can get the ID for a regex pattern set from the commands `create-regex-pattern-set` and `list-regex-pattern-sets`.

```
aws wafv2 get-regex-pattern-set \
    --name regexPatterSet01 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --region us-west-2
```

Output:

```
{
    "RegexPatternSet":{
        "Description":"Test web-acl",
        "RegularExpressionList":[
            {
                "RegexString":"/[0-9]*/"
            },
            {
                "RegexString":"/[a-z]*/"
            }
        ],
        "Name":"regexPatterSet01",
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/
regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    "LockToken":"c8abf33f-b6fc-46ae-846e-42f994d57b29"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetRegexPatternSet in *AWS CLI Command Reference*.

### `get-rule-group`

The following code example shows how to use `get-rule-group`.

**AWS CLI**

**To retrieve a specific custom rule group**

The following `get-rule-group` retrieves the custom rule group with the specified name, scope, and ID. You can get the ID for a rule group from the commands `create-rule-group` and `list-rule-groups`.

```
aws wafv2 get-rule-group \
    --name ff \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "RuleGroup":{
        "Capacity":1,
        "Description":"",
        "Rules":[
            {
                "Priority":0,
                "Action":{
                    "Block":{

                    }
                },
                "VisibilityConfig":{
                    "SampledRequestsEnabled":true,
                    "CloudWatchMetricsEnabled":true,
                    "MetricName":"jj"
                },
                "Name":"jj",
                "Statement":{
                    "SizeConstraintStatement":{
                        "ComparisonOperator":"LE",
                        "TextTransformations":[
                            {
                                "Priority":0,
```

```
                                "Type":"NONE"
                            }
                        ],
                        "FieldToMatch":{
                            "UriPath":{

### `get-sampled-requests`

The following code example shows how to use `get-sampled-requests`.

#### AWS CLI

**To retrieve a sample of web requests for a web ACL**

The following `get-sampled-requests` retrieves the sampled web requests for the specified web ACL, rule metric, and time frame.

```
aws wafv2 get-sampled-requests \
```

```
    --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --rule-metric-name AWS-AWSManagedRulesSQLiRuleSet \
    --scope=REGIONAL \
    --time-window StartTime=2020-02-12T20:00Z,EndTime=2020-02-12T21:10Z \
    --max-items 100
```

Output:

```
{
    "TimeWindow": {
    "EndTime": 1581541800.0,
    "StartTime": 1581537600.0
    },
    "SampledRequests": [
        {
            "Action": "BLOCK",
            "Timestamp": 1581541799.564,
            "RuleNameWithinRuleGroup": "AWS#AWSManagedRulesSQLiRuleSet#SQLi_BODY",

### `get-web-acl-for-resource`

The following code example shows how to use `get-web-acl-for-resource`.

#### AWS CLI

**To retrieve the web ACL that's associated with an AWS resource**

The following `get-web-acl-for-resource` retrieves the JSON for the web ACL that's associated with the specified resource.

```
aws wafv2 get-web-acl-for-resource \
    --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/waf-cli-alb/1ea17125f8b25a2a
```

Output:

```
{
    "WebACL":{
        "Capacity":3,
        "Description":"",
        "Rules":[
            {
                "Priority":1,
                "Action":{
                    "Block":{

                    }
                },
                "VisibilityConfig":{
                    "SampledRequestsEnabled":true,
                    "CloudWatchMetricsEnabled":true,
                    "MetricName":"testrule01"
                },
                "Name":"testrule01",
                "Statement":{
                    "AndStatement":{
                        "Statements":[
                            {
                                "ByteMatchStatement":{
                                    "PositionalConstraint":"EXACTLY",

- For API details, see GetWebAclForResource in *AWS CLI Command Reference*.

### `get-web-acl`

The following code example shows how to use `get-web-acl`.

**AWS CLI**

**To retrieve a web ACL**

The following `get-web-acl` retrieves the web ACL with the specified name, scope, and ID. You can get the ID for a web ACL from the commands `create-web-acl` and `list-web-acls`.

```
aws wafv2 get-web-acl \
    --name test01 \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "WebACL":{
        "Capacity":3,
        "Description":"",
        "Rules":[
            {
                "Priority":1,
                "Action":{
                    "Block":{

                    }
                },
                "VisibilityConfig":{
                   "SampledRequestsEnabled":true,
                    "CloudWatchMetricsEnabled":true,
                    "MetricName":"testrule01"
                },
                "Name":"testrule01",
                "Statement":{
                    "AndStatement":{
                        "Statements":[
                            {
                                "ByteMatchStatement":{
                                    "PositionalConstraint":"EXACTLY",
                                    "TextTransformations":[
```

```
                                    {
                                        "Priority":0,
                                        "Type":"NONE"
                                    }
                                ],
                                "SearchString":"dGVzdHN0cmluZw==",
                                "FieldToMatch":{
                                    "UriPath":{

                                    }
                                }
                            }
                        },
                        {
                            "SizeConstraintStatement":{
                                "ComparisonOperator":"EQ",
                                "TextTransformations":[
                                    {
                                        "Priority":0,
                                        "Type":"NONE"
                                    }
                                ],
                                "FieldToMatch":{
                                    "QueryString":{

                                    }
                                },
                                "Size":0
                            }
                        }
                    ]
                }
            }
        }
    ],
    "VisibilityConfig":{

        "Name":"test01"
    },
    "LockToken":"e3db7e2c-d58b-4ee6-8346-6aec5511c6fb"
}
```

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see GetWebAcl in *AWS CLI Command Reference*.

### `list-available-managed-rule-groups`

The following code example shows how to use `list-available-managed-rule-groups`.

#### AWS CLI

**To retrieve the managed rule groups**

The following `list-available-managed-rule-groups` returns the list of all managed rule groups that are currently available for use in your web ACLs.

```
aws wafv2 list-available-managed-rule-groups \
    --scope REGIONAL
```

Output:

```
{
   "ManagedRuleGroups": [
       {
           "VendorName": "AWS",
           "Name": "AWSManagedRulesCommonRuleSet",
           "Description": "Contains rules that are generally applicable to web
applications. This provides protection against exploitation of a wide range of
vulnerabilities, including those described in OWASP publications and common Common
Vulnerabilities and Exposures (CVE)."
       },
       {
           "VendorName": "AWS",
           "Name": "AWSManagedRulesAdminProtectionRuleSet",
```

```
            "Description": "Contains rules that allow you to block external access
to exposed admin pages. This may be useful if you are running third-party software
or would like to reduce the risk of a malicious actor gaining administrative access
to your application."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesKnownBadInputsRuleSet",
            "Description": "Contains rules that allow you to block request patterns
that are known to be invalid and are associated with exploitation or discovery of
vulnerabilities. This can help reduce the risk of a malicious actor discovering a
vulnerable application."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesSQLiRuleSet",
            "Description": "Contains rules that allow you to block request patterns
associated with exploitation of SQL databases, like SQL injection attacks. This can
help prevent remote injection of unauthorized queries."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesLinuxRuleSet",
            "Description": "Contains rules that block request patterns associated
with exploitation of vulnerabilities specific to Linux, including LFI attacks. This
can help prevent attacks that expose file contents or execute code for which the
attacker should not have had access."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesUnixRuleSet",
            "Description": "Contains rules that block request patterns associated
with exploiting vulnerabilities specific to POSIX/POSIX-like OS, including LFI
attacks. This can help prevent attacks that expose file contents or execute code
for which access should not been allowed."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesWindowsRuleSet",
            "Description": "Contains rules that block request patterns associated
with exploiting vulnerabilities specific to Windows, (e.g., PowerShell commands).
This can help prevent exploits that allow attacker to run unauthorized commands or
execute malicious code."
        },
```

```
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesPHPRuleSet",
            "Description": "Contains rules that block request patterns associated
 with exploiting vulnerabilities specific to the use of the PHP, including injection
 of unsafe PHP functions. This can help prevent exploits that allow an attacker to
 remotely execute code or commands."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesWordPressRuleSet",
            "Description": "The WordPress Applications group contains rules that
 block request patterns associated with the exploitation of vulnerabilities specific
 to WordPress sites."
        },
        {
            "VendorName": "AWS",
            "Name": "AWSManagedRulesAmazonIpReputationList",
            "Description": "This group contains rules that are based on Amazon
 threat intelligence. This is useful if you would like to block sources associated
 with bots or other threats."
        }
    ]
}
```

For more information, see Managed Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListAvailableManagedRuleGroups in *AWS CLI Command Reference*.

## `list-ip-sets`

The following code example shows how to use `list-ip-sets`.

### AWS CLI

#### To retrieve a list of IP sets

The following `list-ip-sets` retrieves all IP sets for the account that have regional scope.

```
aws wafv2 list-ip-sets \
    --scope REGIONAL
```

Output:

```
{
    "IPSets":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"",
            "Name":"testip",
            "LockToken":"0674c84b-0304-47fe-8728-c6bff46af8fc",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111  "
        }
    ],
    "NextMarker":"testip"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListIpSets in *AWS CLI Command Reference*.

## `list-logging-configurations`

The following code example shows how to use `list-logging-configurations`.

### AWS CLI

#### To retrieve a list of all logging configurations for a region

The following `list-logging-configurations` retrieves the all logging configurations for web ACLs that are scoped for regional use in the `us-west-2` region.

```
aws wafv2 list-logging-configurations \
    --scope REGIONAL \
    --region us-west-2
```

Output:

```
{
    "LoggingConfigurations":[
        {
```

```
            "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
test-2/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "RedactedFields":[
                {
                    "QueryString":{

                    }
                }
            ],
            "LogDestinationConfigs":[
                "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-
logs-test"
            ]
        },
        {
            "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
test/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "RedactedFields":[
                {
                    "Method":{

                    }
                }
            ],
            "LogDestinationConfigs":[
                "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-
logs-custom-transformation"
            ]
        }
    ]
}
```

For more information, see Logging Web ACL Traffic Information in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListLoggingConfigurations in *AWS CLI Command Reference*.

### `list-regex-pattern-sets`

The following code example shows how to use `list-regex-pattern-sets`.

**AWS CLI**

**To retrieve a list of regex pattern sets**

The following `list-regex-pattern-sets` retrieves all regex pattern sets for the account that are defined in the region `us-west-2`.

```
aws wafv2 list-regex-pattern-sets \
--scope REGIONAL \
--region us-west-2
```

Output:

```
{
    "NextMarker":"regexPatterSet01",
    "RegexPatternSets":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/
regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"Test web-acl",
            "Name":"regexPatterSet01",
            "LockToken":"f17743f7-0000-0000-0000-19a8b93bfb01",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListRegexPatternSets in *AWS CLI Command Reference*.

## `list-resources-for-web-acl`

The following code example shows how to use `list-resources-for-web-acl`.

**AWS CLI**

**To retrieve the resources associated with a web ACL**

The following `list-resources-for-web-acl` retrieves the API Gateway REST API resources that are currently associated with the specified web ACL in the region `us-west-2`.

```
aws wafv2 list-resources-for-web-acl \
    --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/TestWebAcl/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --resource-type API_GATEWAY \
    --region us-west-2
```

Output:

```
{
    "ResourceArns": [
        "arn:aws:apigateway:us-west-2::/restapis/EXAMPLE111/stages/testing"
    ]
}
```

For more information, see Associating or Disassociating a Web ACL with an AWS Resource in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListResourcesForWebAcl in *AWS CLI Command Reference*.

### `list-rule-groups`

The following code example shows how to use `list-rule-groups`.

#### AWS CLI

**To retrieve a list of custom rule groups**

The following `list-rule-groups` retrieves all custom rule groups that are defined for the account for the specified scope and region location.

```
aws wafv2 list-rule-groups \
    --scope REGIONAL \
    --region us-west-2
```

Output:

```
{
    "RuleGroups":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/
TestRuleGroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```
            "Description":"",
            "Name":"TestRuleGroup",
            "LockToken":"1eb5ec48-0000-0000-0000-ee9b906c541e",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        },
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
            "Description":"",
            "Name":"test",
            "LockToken":"b0f4583e-998b-4880-9069-3fbe45738b43",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
        }
    ],
    "NextMarker":"test"
}
```

For more information, see Managing Your Own Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListRuleGroups in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

#### AWS CLI

**To retrieve all tags for an AWS WAF resource**

The following `list-tags-for-resource` retrieves the list of all tag key, value pairs for the specified web ACL.

```
aws wafv2 list-tags-for-resource \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/testwebacl2/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
    "NextMarker":"",
    "TagInfoForResource":{
```

```
        "ResourceARN":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
testwebacl2/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TagList":[

        ]
    }
}
```

For more information, see Getting Started with AWS WAF in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `list-web-acls`

The following code example shows how to use `list-web-acls`.

#### AWS CLI

**To retrieve the web ACLs for a scope**

The following `list-web-acls` retrieves all web ACLs that are defined for the account for the specified scope.

```
aws wafv2 list-web-acls \
    --scope REGIONAL
```

Output:

```
{
    "NextMarker":"Testt",
    "WebACLs":[
        {
            "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/Testt/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
            "Description":"sssss",
            "Name":"Testt",
            "LockToken":"7f36cb30-74ef-4cff-8cd4-a77e1aba1746",
            "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
        }
    ]
}
```

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see ListWebAcls in *AWS CLI Command Reference*.

### `put-logging-configuration`

The following code example shows how to use `put-logging-configuration`.

**AWS CLI**

**To add a logging configuration to a web ACL**

The following `put-logging-configuration` adds the Amazon Kinesis Data Firehose logging configuration `aws-waf-logs-custom-transformation` to the specified web ACL, with no fields redacted from the logs.

```
aws wafv2 put-logging-configuration \
    --logging-configuration ResourceArn=arn:aws:wafv2:us-
west-2:123456789012:regional/webacl/test-cli/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111,LogDestinationConfigs=arn:aws:firehose:us-
west-2:123456789012:deliverystream/aws-waf-logs-custom-transformation \
            --region us-west-2
```

Output:

```
{
    "LoggingConfiguration":{
        "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-
cli/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "LogDestinationConfigs":[
            "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-logs-
custom-transformation"
        ]
    }
}
```

For more information, see Logging Web ACL Traffic Information in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see PutLoggingConfiguration in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To add tags to an AWS WAF resource**

The following `tag-resource` example adds a tag with a key of `Name` and value set to `AWSWAF` to the specified web ACL.

```
aws wafv2 tag-resource \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
apiGatewayWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tags Key=Name,Value=AWSWAF
```

This command produces no output.

For more information, see Getting Started with AWS WAF in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To remove tags from an AWS WAF resource**

The following `untag-resource` example removes the tag with the key `KeyName` from the specified web ACL.

```
aws wafv2 untag-resource \
    --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
apiGatewayWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --tag-keys "KeyName"
```

This command produces no output.

For more information, see Getting Started with AWS WAF in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-ip-set`

The following code example shows how to use `update-ip-set`.

**AWS CLI**

**To modify the settings for an existing IP set**

The following `update-ip-set` updates the settings for the specified IP set. This call requires an ID, which you can obtain from the call, `list-ip-sets`, and a lock token which you can obtain from the calls, `list-ip-sets` and `get-ip-set`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-ip-set \
    --name testip \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --addresses 198.51.100.0/16 \
    --lock-token 447e55ac-2396-4c6d-b9f9-86b67c17f8b5
```

Output:

```
{
    "NextLockToken": "0674c84b-0304-47fe-8728-c6bff46af8fc"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateIpSet in *AWS CLI Command Reference*.

### `update-regex-pattern-set`

The following code example shows how to use `update-regex-pattern-set`.

**AWS CLI**

**To modify the settings for an existing regex pattern set**

The following `update-regex-pattern-set` updates the settings for the specified regex pattern set. This call requires an ID, which you can obtain from the call, `list-regex-pattern-sets`, and a lock token which you can obtain from the calls, `list-regex-pattern-sets` and `get-regex-pattern-set`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-regex-pattern-set \
    --name ExampleRegex \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --regular-expression-list RegexString="^.+$"  \
    --lock-token ed207e9c-82e9-4a77-aadd-81e6173ab7eb
```

Output:

```
{
    "NextLockToken": "12ebc73e-fa68-417d-a9b8-2bdd761a4fa5"
}
```

For more information, see IP Sets and Regex Pattern Sets in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateRegexPatternSet in *AWS CLI Command Reference*.

### `update-rule-group`

The following code example shows how to use `update-rule-group`.

#### AWS CLI

**To update a custom rule group**

The following `update-rule-group` changes the visibility configuration for an existing custom rule group. This call requires an ID, which you can obtain from the call, `list-rule-groups`, and a lock token which you can obtain from the calls, `list-rule-groups` and `get-rule-group`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-rule-group \
    --name TestRuleGroup \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
```

```
    --lock-token 7b3bcec2-0000-0000-0000-563bf47249f0 \
    --visibility-config
 SampledRequestsEnabled=false,CloudWatchMetricsEnabled=false,MetricName=TestMetricsForRuleGr
 \
    --region us-west-2
```

Output:

```
{
    "NextLockToken": "1eb5ec48-0000-0000-0000-ee9b906c541e"
}
```

For more information, see Managing Your Own Rule Groups in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateRuleGroup in *AWS CLI Command Reference*.

### `update-web-acl`

The following code example shows how to use `update-web-acl`.

#### AWS CLI

**To update a web ACL**

The following `update-web-acl` changes settings for an existing web ACL. This call requires an ID, which you can obtain from the call, `list-web-acls`, and a lock token and other settings, which you can obtain from the call `get-web-acl`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-web-acl \
    --name TestWebAcl \
    --scope REGIONAL \
    --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
    --lock-token 2294b3a1-0000-0000-0000-a3ae04329de9 \
    --default-action Block={} \
    --visibility-config
 SampledRequestsEnabled=false,CloudWatchMetricsEnabled=false,MetricName=NewMetricTestWebAcl
 \
    --rules file://waf-rule.json \
    --region us-west-2
```

Output:

```
{
    "NextLockToken": "714a0cfb-0000-0000-0000-2959c8b9a684"
}
```

For more information, see Managing and Using a Web Access Control List (Web ACL) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see UpdateWebAcl in *AWS CLI Command Reference*.

## Amazon WorkDocs examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkDocs.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `abort-document-version-upload`

The following code example shows how to use `abort-document-version-upload`.

#### AWS CLI

##### To stop a document version upload

This example stops a previously initiated document version upload.

Command:

```
aws workdocs abort-document-version-upload --document-id
 feaba64d4efdf271c2521b60a2a44a8f057e84beaabbe22f01267313209835f2 --version-id
 1536773972914-ddb67663e782e7ce8455ebc962217cf9f9e47b5a9a702e5c84dcccd417da9313
```

Output:

```
None
```

- For API details, see AbortDocumentVersionUpload in *AWS CLI Command Reference*.

### `activate-user`

The following code example shows how to use `activate-user`.

#### AWS CLI

**To activate a user**

This example activates an inactive user.

Command:

```
aws workdocs activate-user --user-id
 "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
{
  "User": {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "Username": "exampleUser",
      "EmailAddress": "exampleUser@site.awsapps.com",
      "GivenName": "Example",
      "Surname": "User",
      "OrganizationId": "d-926726012c",
      "RootFolderId":
 "75f67c183aa1217409ac87576a45c03a5df5e6d8c51c35c01669970538e86cd0",
      "RecycleBinFolderId":
 "642b7dd3e60b14204534f3df7b1959e01b5d170f8c2707f410e40a8149120a57",
      "Status": "ACTIVE",
```

```
      "Type": "MINIMALUSER",
      "CreatedTimestamp": 1521226107.747,
      "ModifiedTimestamp": 1525297406.462,
      "Storage": {
          "StorageUtilizedInBytes": 0,
          "StorageRule": {
              "StorageAllocatedInBytes": 0,
              "StorageType": "QUOTA"
          }
      }
  }
}
```

- For API details, see ActivateUser in *AWS CLI Command Reference*.

### `add-resource-permissions`

The following code example shows how to use `add-resource-permissions`.

**AWS CLI**

**To add permissions for a resource**

This example adds permissions to the resource for the specified principals.

Command:

```
aws workdocs add-resource-permissions --resource-id
 d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --principals
 Id=anonymous,Type=ANONYMOUS,Role=VIEWER
```

Output:

```
{
  "ShareResults": [
      {
          "PrincipalId": "anonymous",
          "Role": "VIEWER",
          "Status": "SUCCESS",
          "ShareId":
 "d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65",
          "StatusMessage": ""
```

```
      }
  ]
}
```

- For API details, see AddResourcePermissions in *AWS CLI Command Reference*.

### `create-comment`

The following code example shows how to use `create-comment`.

**AWS CLI**

**To add a new comment**

This example adds a new comment to the specified document version.

Command:

```
aws workdocs create-comment --document-id
 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id
 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
text "This is a comment."
```

Output:

```
{
  "Comment": {
      "CommentId": "1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
      "ThreadId": "1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
      "Text": "This is a comment.",
      "Contributor": {
          "Id": "arn:aws:iam::123456789123:user/exampleUser",
          "Username": "exampleUser",
          "GivenName": "Example",
          "Surname": "User",
          "Status": "ACTIVE"
      },
      "CreatedTimestamp": 1534799058.197,
      "Status": "PUBLISHED",
      "Visibility": "PUBLIC"
```

```
  }
}
```

- For API details, see CreateComment in *AWS CLI Command Reference*.

### `create-custom-metadata`

The following code example shows how to use `create-custom-metadata`.

**AWS CLI**

**To create custom metadata**

This example creates custom metadata for the specified document.

Command:

```
aws workdocs create-custom-metadata --resource-id
 d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --custom-metadata
 KeyName1=example,KeyName2=example2
```

Output:

```
None
```

- For API details, see CreateCustomMetadata in *AWS CLI Command Reference*.

### `create-folder`

The following code example shows how to use `create-folder`.

**AWS CLI**

**To create a folder**

This example creates a folder.

Command:

```
aws workdocs create-folder --name documents --parent-folder-id
 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

```
{
  "Metadata": {
      "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
      "Name": "documents",
      "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "ParentFolderId":
 "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
      "CreatedTimestamp": 1534450467.622,
      "ModifiedTimestamp": 1534450467.622,
      "ResourceState": "ACTIVE",
      "Signature": "",
      "Size": 0,
      "LatestVersionSize": 0
  }
}
```

- For API details, see CreateFolder in *AWS CLI Command Reference*.

### `create-labels`

The following code example shows how to use `create-labels`.

#### AWS CLI

**To create labels**

This example creates a series of labels for a document.

Command:

```
aws workdocs create-labels --resource-id
 d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --labels
 "documents" "examples" "my_documents"
```

Output:

```
None
```

- For API details, see CreateLabels in *AWS CLI Command Reference*.

### `create-notification-subscription`

The following code example shows how to use `create-notification-subscription`.

**AWS CLI**

**To create a notification subscription**

The following `create-notification-subscription` example configures a notification subscription for the specified Amazon WorkDocs organization.

```
aws workdocs create-notification-subscription \
    --organization-id d-123456789c \
    --protocol HTTPS \
    --subscription-type ALL \
    --notification-endpoint "https://example.com/example"
```

Output:

```
{
    "Subscription": {
        "SubscriptionId": "123ab4c5-678d-901e-f23g-45h6789j0123",
        "EndPoint": "https://example.com/example",
        "Protocol": "HTTPS"
    }
}
```

For more information, see Subscribe to Notifications in the *Amazon WorkDocs Developer Guide*.

- For API details, see CreateNotificationSubscription in *AWS CLI Command Reference*.

### `create-user`

The following code example shows how to use `create-user`.

**AWS CLI**

**To create a new user**

This example creates a new user in a Simple AD or Microsoft AD directory.

Command:

```
aws workdocs create-user --organization-id d-926726012c --username exampleUser2
 --email-address exampleUser2@site.awsapps.com --given-name example2Name --surname
 example2Surname --password examplePa$$w0rd
```

Output:

```
{
  "User": {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "Username": "exampleUser2",
      "EmailAddress": "exampleUser2@site.awsapps.com",
      "GivenName": "example2Name",
      "Surname": "example2Surname",
      "OrganizationId": "d-926726012c",
      "RootFolderId":
 "35b886cb17198cbd547655e58b025dff0cf34aaed638be52009567e23dc67390",
      "RecycleBinFolderId":
 "9858c3e9ed4c2460dde9aadb4c69fde998070dd46e5e985bd08ec6169ea249ff",
      "Status": "ACTIVE",
      "Type": "MINIMALUSER",
      "CreatedTimestamp": 1535478836.584,
      "ModifiedTimestamp": 1535478836.584,
      "Storage": {
          "StorageUtilizedInBytes": 0,
          "StorageRule": {
              "StorageAllocatedInBytes": 0,
              "StorageType": "QUOTA"
          }
      }
  }
}
```

- For API details, see CreateUser in *AWS CLI Command Reference*.

## `deactivate-user`

The following code example shows how to use `deactivate-user`.

### AWS CLI

#### To deactivate a user

This example deactivates an active user.

Command:

```
aws workdocs deactivate-user --user-id
 "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
None
```

- For API details, see DeactivateUser in *AWS CLI Command Reference*.

### `delete-comment`

The following code example shows how to use `delete-comment`.

**AWS CLI**

**To delete a specified comment from a document version**

This example deletes the specified comment from the specified document version.

Command:

```
aws workdocs delete-comment --document-id
 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id
 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
comment-id 1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5
```

Output:

```
None
```

- For API details, see DeleteComment in *AWS CLI Command Reference*.

### `delete-custom-metadata`

The following code example shows how to use `delete-custom-metadata`.

**AWS CLI**

**To delete custom metadata from a resource**

This example deletes all custom metadata from the specified resource.

Command:

```
aws workdocs delete-custom-metadata --resource-id
 d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --delete-all
```

Output:

```
None
```

- For API details, see DeleteCustomMetadata in *AWS CLI Command Reference*.

### `delete-document`

The following code example shows how to use `delete-document`.

**AWS CLI**

**To delete a document**

This example deletes the specified document.

Command:

```
aws workdocs delete-document --document-id
 b83ed5e5b167b65ef69de9d597627ff1a0d4f07a45e67f1fab7d26b54427de0a
```

Output:

```
None
```

- For API details, see DeleteDocument in *AWS CLI Command Reference*.

### `delete-folder-contents`

The following code example shows how to use `delete-folder-contents`.

**AWS CLI**

**To delete the contents of a folder**

This example deletes the contents of the specified folder.

Command:

```
aws workdocs delete-folder-contents --folder-id
 26fa8aa4ba2071447c194f7b150b07149dbdb9e1c8a301872dcd93a4735ce65d
```

Output:

```
None
```

- For API details, see DeleteFolderContents in *AWS CLI Command Reference*.

### `delete-folder`

The following code example shows how to use `delete-folder`.

**AWS CLI**

**To delete a folder**

This example deletes the specified folder.

Command:

```
aws workdocs delete-folder --folder-id
 26fa8aa4ba2071447c194f7b150b07149dbdb9e1c8a301872dcd93a4735ce65d
```

Output:

```
None
```

- For API details, see DeleteFolder in *AWS CLI Command Reference*.

### `delete-labels`

The following code example shows how to use `delete-labels`.

**AWS CLI**

**To delete labels**

This example deletes the specified labels from a document.

Command:

```
aws workdocs delete-labels --resource-id
 d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --labels
 "documents" "examples"
```

Output:

```
None
```

- For API details, see DeleteLabels in *AWS CLI Command Reference*.

### `delete-notification-subscription`

The following code example shows how to use `delete-notification-subscription`.

**AWS CLI**

**To delete a notification subscription**

The following `delete-notification-subscription` example deletes the specified notification subscription.

```
aws workdocs delete-notification-subscription \
    --subscription-id 123ab4c5-678d-901e-f23g-45h6789j0123 \
    --organization-id d-123456789c
```

This command produces no output.

For more information, see Subscribe to Notifications in the *Amazon WorkDocs Developer Guide*.

- For API details, see DeleteNotificationSubscription in *AWS CLI Command Reference*.

### `delete-user`

The following code example shows how to use `delete-user`.

**AWS CLI**

**To delete a user**

This example deletes a user.

Command:

```
aws workdocs delete-user --user-id
 "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
None
```

- For API details, see DeleteUser in *AWS CLI Command Reference*.

## `describe-activities`

The following code example shows how to use `describe-activities`.

**AWS CLI**

**To get a list of user activities**

This example returns a list of the latest user activities for the specified organization, with a limit set for the latest two activities.

Command:

```
aws workdocs describe-activities --organization-id d-926726012c --limit 2
```

Output:

```
{
  "UserActivities": [
      {
          "Type": "DOCUMENT_VERSION_DOWNLOADED",
          "TimeStamp": 1534800122.17,
```

```
            "Initiator": {
                "Id": "arn:aws:iam::123456789123:user/exampleUser"
            },
            "ResourceMetadata": {
                "Type": "document",
                "Name": "updatedDoc",
                "Id":
 "15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3",
                "Owner": {
                    "Id":
 "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
                    "GivenName": "exampleName",
                    "Surname": "exampleSurname"
                }
            }
        },
        {
            "Type": "DOCUMENT_VERSION_VIEWED",
            "TimeStamp": 1534799079.207,
            "Initiator": {
                "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
                "GivenName": "exampleName",
                "Surname": "exampleSurname"
            },
            "ResourceMetadata": {
                "Type": "document",
                "Name": "updatedDoc",
                "Id":
 "15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3",

```

- For API details, see DescribeActivities in *AWS CLI Command Reference*.

### `describe-comments`

The following code example shows how to use `describe-comments`.

**AWS CLI**

**To list all comments for a specified document version**

This example lists all the comments for the specified document version.

Command:

```
aws workdocs describe-comments --document-id
 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id
 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920
```

Output:

```
{
  "Comments": [
      {
          "CommentId": "1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
          "ThreadId": "1534799058197-

          "Text": "This is a comment.",
          "Contributor": {
              "Username": "arn:aws:iam::123456789123:user/exampleUser",
              "Type": "USER"
          },
          "CreatedTimestamp": 1534799058.197,
          "Status": "PUBLISHED",
          "Visibility": "PUBLIC"
      }
  ]
}
```

- For API details, see DescribeComments in *AWS CLI Command Reference*.

### `describe-document-versions`

The following code example shows how to use `describe-document-versions`.

## AWS CLI

### To retrieve a document's versions

This example retrieves the document versions for the specified document, including initialized versions and a URL for the source document.

Command:

```
aws workdocs describe-document-versions --document-id
 d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --fields SOURCE
```

Output:

```
{
  "DocumentVersions": [
      {
          "Id":
 "1534452029587-15e129dfc187505c407588df255be83de2920d733859f1d2762411d22a83e3ef",
          "Name": "exampleDoc.docx",
          "ContentType": "application/vnd.openxmlformats-
officedocument.wordprocessingml.document",

### `describe-folder-contents`

The following code example shows how to use `describe-folder-contents`.

#### AWS CLI

**To describe the contents of a folder**

This example describes all the active contents of the specified folder, including its documents and subfolders, sorted by date in ascending order.

Command:

```
aws workdocs describe-folder-contents --folder-id
 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678 --sort DATE --
order ASCENDING --type ALL
```

Output:

```
{
  "Folders": [
      {
          "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
          "Name": "testing",
          "CreatorId":
 "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",

              "CreatorId":
 "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
          },
          "ResourceState": "ACTIVE"
      }
```

```
  ]
}
```

- For API details, see DescribeFolderContents in *AWS CLI Command Reference*.

### `describe-groups`

The following code example shows how to use `describe-groups`.

**AWS CLI**

**To retrieve a list of groups**

The following `describe-groups` example lists the groups associated with the specified Amazon WorkDocs organization.

```
aws workdocs describe-groups \
    --search-query "e" \
    --organization-id d-123456789c
```

Output:

```
{
    "Groups": [
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444&d-123456789c",
            "Name": "Example Group 1"
        },
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-5555&d-123456789c",
            "Name": "Example Group 2"
        }
    ]
}
```

For more information, see Getting Started with Amazon WorkDocs in the *Amazon WorkDocs Administration Guide*.

- For API details, see DescribeGroups in *AWS CLI Command Reference*.

### `describe-notification-subscriptions`

The following code example shows how to use `describe-notification-subscriptions`.

**AWS CLI**

**To retrieve a list of notification subscriptions**

The following `describe-notification-subscriptions` example retrieves the notification subscriptions for the specified Amazon WorkDocs organization.

```
aws workdocs describe-notification-subscriptions \
    --organization-id d-123456789c
```

Output:

```
{
    "Subscriptions": [
        {
            "SubscriptionId": "123ab4c5-678d-901e-f23g-45h6789j0123",
            "EndPoint": "https://example.com/example",
            "Protocol": "HTTPS"
        }
    ]
}
```

For more information, see Subscribe to Notifications in the *Amazon WorkDocs Developer Guide*.

- For API details, see DescribeNotificationSubscriptions in *AWS CLI Command Reference*.

### `describe-resource-permissions`

The following code example shows how to use `describe-resource-permissions`.

**AWS CLI**

**To get a list of permissions for a resource**

This example returns a list of the permissions for the specified resource (document or folder).

Command:

```
aws workdocs describe-resource-permissions --resource-id
 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3
```

Output:

```
{
  "Principals": [
      {
          "Id": "anonymous",
          "Type": "ANONYMOUS",
          "Roles": [
              {
                  "Role": "VIEWER",
                  "Type": "DIRECT"
              }
          ]
      },
      {
          "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
          "Type": "USER",
          "Roles": [
              {
                  "Role": "OWNER",
                  "Type": "DIRECT"
              }
          ]
      },
      {
          "Id": "d-926726012c",
          "Type": "ORGANIZATION",
          "Roles": [
              {
                  "Role": "VIEWER",
                  "Type": "INHERITED"
              }
          ]
      }
  ]
}
```

- For API details, see DescribeResourcePermissions in *AWS CLI Command Reference*.

## `describe-users`

The following code example shows how to use `describe-users`.

### AWS CLI

#### To retrieve details for specified users

This example retrieves details for all the users in the specified organization.

Command:

```
aws workdocs describe-users --organization-id d-926726012c
```

Output:

```
{
  "Users": [
      {
          "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
          "Username": "example1User",
          "OrganizationId": "d-926726012c",
          "RootFolderId":
 "3c0e3f849dd20a9771d937b9bbcc97e18796150ae56c26d64a4fa0320a2dedc9",
          "RecycleBinFolderId":
 "c277f4c4d647be1f5147b3184ffa96e1e2bf708278b696cacba68ba13b91f4fe",
          "Status": "INACTIVE",
          "Type": "USER",
          "CreatedTimestamp": 1535478999.452,
          "ModifiedTimestamp": 1535478999.452
      },
      {
          "Id": "S-1-1-11-1111111111-2222222222-3333333333-4444&d-926726012c",
          "Username": "example2User",
          "EmailAddress": "example2User@site.awsapps.com",
          "GivenName": "example2Name",
          "Surname": "example2Surname",
          "OrganizationId": "d-926726012c",
          "RootFolderId":
 "35b886cb17198cbd547655e58b025dff0cf34aaed638be52009567e23dc67390",
          "RecycleBinFolderId":
 "9858c3e9ed4c2460dde9aadb4c69fde998070dd46e5e985bd08ec6169ea249ff",
          "Status": "ACTIVE",
          "Type": "MINIMALUSER",
```

```
            "CreatedTimestamp": 1535478836.584,
            "ModifiedTimestamp": 1535478836.584
        }
    ]
}
```

- For API details, see DescribeUsers in *AWS CLI Command Reference*.

### `get-document-path`

The following code example shows how to use `get-document-path`.

**AWS CLI**

**To retrieve a document's path information**

This example retrieves the path information (hierarchy from the root folder) for the specified document, and includes the names of the parent folders.

Command:

```
aws workdocs get-document-path --document-id
 d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --fields NAME
```

Output:

```
{
  "Path": {
      "Components": [
          {
              "Id":
 "a43d29cbb8e7c4d25cfee8b803a504b0dc63e760b55ad0c611c6b87691eb6ff3",
              "Name": "/"
          },
          {
              "Id":
 "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
              "Name": "Top Level Folder"
          },
          {
              "Id":
 "d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65",
```

```
                "Name": "exampleDoc.docx"
            }
        ]
    }
}
```

- For API details, see GetDocumentPath in *AWS CLI Command Reference*.

### `get-document-version`

The following code example shows how to use `get-document-version`.

**AWS CLI**

**To retrieve version metadata for a specified document**

This example retrieves version metadata for the specified document, including a source URL and custom metadata.

Command:

```
aws workdocs get-document-version --document-id
 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id
 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
fields SOURCE --include-custom-metadata
```

Output:

```
{
  "Metadata": {
      "Id":
 "1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920",
      "Name": "exampleDoc",
      "ContentType": "application/vnd.openxmlformats-
officedocument.wordprocessingml.document",
      "Size": 11537,
      "Signature": "1a23456b78901c23d4ef56gh7EXAMPLE",
      "Status": "ACTIVE",
      "CreatedTimestamp": 1521672507.741,

  }
}
```

- For API details, see GetDocumentVersion in *AWS CLI Command Reference*.

### `get-document`

The following code example shows how to use `get-document`.

#### AWS CLI

**To retrieve document details**

This example retrieves the details of the specified document.

Command:

```
aws workdocs get-document --document-id
 d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65
```

Output:

```
{
  "Metadata": {
      "Id": "d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65",

                "Name": "Top Level Folder"
            },
            {
                "Id":
 "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
                "Name": "Sublevel Folder"
            }
        ]
    }
}
```

- For API details, see GetFolderPath in *AWS CLI Command Reference*.

### `get-folder`

The following code example shows how to use `get-folder`.

#### AWS CLI

**To retrieve the metadata for a folder**

This example retrieves the metadata for the specified folder.

Command:

```
aws workdocs get-folder --folder-id
 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08
```

Output:

```
{
    "Metadata": {
        "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
        "Name": "exampleFolder",
        "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
        "ParentFolderId":
 "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
        "CreatedTimestamp": 1534450467.622,
        "ModifiedTimestamp": 1534451113.504,
        "ResourceState": "ACTIVE",
```

```
      "Signature": "1a23456b78901c23d4ef56gh7EXAMPLE",
      "Size": 23019,
      "LatestVersionSize": 11537
  }
}
```

- For API details, see GetFolder in *AWS CLI Command Reference*.

### `get-resources`

The following code example shows how to use `get-resources`.

**AWS CLI**

**To retrieve shared resources**

The following `get-resources` example retrieves the resources shared with the specified Amazon WorkDocs user.

```
aws workdocs get-resources \
    --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333" \
    --collection-type SHARED_WITH_ME
```

Output:

```
{
"Folders": [],
"Documents": []
}
```

For more information, see Sharing Files and Folders in the *Amazon WorkDocs User Guide*.

- For API details, see GetResources in *AWS CLI Command Reference*.

### `initiate-document-version-upload`

The following code example shows how to use `initiate-document-version-upload`.

**AWS CLI**

**To initiate a document version upload**

The following `initiate-document-upload` example creates a new document object and version object.

```
aws workdocs initiate-document-version-upload \
    --name exampledocname \
    --parent-folder-id
 eacd546d952531c633452ed67cac23161aa0d5df2e8061223a59e8f67e7b6189
```

Output:

```
{
    "Metadata": {
        "Id": "feaba64d4efdf271c2521b60a2a44a8f057e84beaabbe22f01267313209835f2",
        "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
        "ParentFolderId":
 "eacd546d952531c633452ed67cac23161aa0d5df2e8061223a59e8f67e7b6189",
        "CreatedTimestamp": 1536773972.914,
        "ModifiedTimestamp": 1536773972.914,
        "LatestVersionMetadata": {
            "Id": "1536773972914-

            "x-amz-server-side-encryption": "ABC123"
```

```
        }
    }
}
```

- For API details, see InitiateDocumentVersionUpload in *AWS CLI Command Reference*.

### `remove-all-resource-permissions`

The following code example shows how to use `remove-all-resource-permissions`.

**AWS CLI**

**To remove all permissions from a specified resource**

This example removes all permissions from the specified resource.

Command:

```
aws workdocs remove-all-resource-permissions --resource-id
 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

```
None
```

- For API details, see RemoveAllResourcePermissions in *AWS CLI Command Reference*.

### `remove-resource-permission`

The following code example shows how to use `remove-resource-permission`.

**AWS CLI**

**To remove permissions from a resource**

This example removes permissions from the resource for the specified principal.

Command:

```
aws workdocs remove-resource-permission --resource-id
 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678 --principal-id
 anonymous
```

Output:

```
None
```

- For API details, see RemoveResourcePermission in *AWS CLI Command Reference*.

### `update-document-version`

The following code example shows how to use `update-document-version`.

**AWS CLI**

**To change a document version status to Active**

This example changes the status of the document version to Active.

Command:

```
aws workdocs update-document-version --document-id
 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id
 1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
version-status ACTIVE
```

Output:

```
None
```

- For API details, see UpdateDocumentVersion in *AWS CLI Command Reference*.

### `update-document`

The following code example shows how to use `update-document`.

**AWS CLI**

**To update a document**

This example updates a document's name and parent folder.

Command:

```
aws workdocs update-document --document-id
 15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --name updatedDoc
 --parent-folder-id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08
```

Output:

```
None
```

- For API details, see UpdateDocument in *AWS CLI Command Reference*.

### `update-folder`

The following code example shows how to use `update-folder`.

#### AWS CLI

**To update a folder**

This example updates a folder's name and parent folder.

Command:

```
aws workdocs update-folder --folder-id
 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08 --name
 exampleFolder1 --parent-folder-id
 1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

```
None
```

- For API details, see UpdateFolder in *AWS CLI Command Reference*.

### `update-user`

The following code example shows how to use `update-user`.

#### AWS CLI

**To update a user**

This example updates the time zone for the specified user.

Command:

```
aws workdocs update-user --user-id
 "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c" --time-zone-id
 "America/Los_Angeles"
```

Output:

```
{
  "User": {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "Username": "exampleUser",
      "EmailAddress": "exampleUser@site.awsapps.com",
      "GivenName": "Example",
      "Surname": "User",
      "OrganizationId": "d-926726012c",
      "RootFolderId":
 "c5eceb5e1a2d1d460c9d1af8330ae117fc8d39bb1d3ed6acd0992d5ff192d986",
      "RecycleBinFolderId":
 "6ca20102926ad15f04b1d248d6d6e44f2449944eda5c758f9a1e9df6a6b7fa66",
      "Status": "ACTIVE",
      "Type": "USER",
      "TimeZoneId": "America/Los_Angeles",
      "Storage": {
          "StorageUtilizedInBytes": 0,
          "StorageRule": {
              "StorageAllocatedInBytes": 53687091200,
              "StorageType": "QUOTA"
          }
      }
  }
}
```

- For API details, see UpdateUser in *AWS CLI Command Reference*.

## Amazon WorkMail examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkMail.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `associate-delegate-to-resource`

The following code example shows how to use `associate-delegate-to-resource`.

**AWS CLI**

**To add a delegate to a resource**

The following `associate-delegate-to-resource` command adds a delegate to a resource.

```
aws workmail associate-delegate-to-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-68bf2d3b1c0244aab7264c24b9217443 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see AssociateDelegateToResource in *AWS CLI Command Reference*.

#### `associate-member-to-group`

The following code example shows how to use `associate-member-to-group`.

**AWS CLI**

**To add a member to a group**

The following `associate-member-to-group` command adds the specified member to a group.

```
aws workmail associate-member-to-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --member-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see AssociateMemberToGroup in *AWS CLI Command Reference*.

### `create-alias`

The following code example shows how to use `create-alias`.

#### AWS CLI

**To create an alias**

The following `create-alias` command creates an alias for the specified entity (user or group).

```
aws workmail create-alias \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --alias exampleAlias@site.awsapps.com
```

This command produces no output.

- For API details, see CreateAlias in *AWS CLI Command Reference*.

### `create-group`

The following code example shows how to use `create-group`.

#### AWS CLI

**To create a new group**

The following `create-group` command creates a new group for the specified organization.

```
aws workmail create-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
```

```
    --name exampleGroup1
```

Output:

```
{
    "GroupId": "S-1-1-11-1122222222-2222233333-3333334444-4444"
}
```

- For API details, see CreateGroup in *AWS CLI Command Reference*.

### `create-resource`

The following code example shows how to use `create-resource`.

#### AWS CLI

**To create a new resource**

The following `create-resource` command creates a new resource (meeting room) for the specified organization.

```
aws workmail create-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --name exampleRoom1 \
    --type ROOM
```

Output:

```
{
    "ResourceId": "r-7afe0efbade843a58cdc10251fce992c"
}
```

- For API details, see CreateResource in *AWS CLI Command Reference*.

### `create-user`

The following code example shows how to use `create-user`.

#### AWS CLI

**To create a new user**

The following `create-user` command creates a new user.

```
aws workmail create-user \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --name exampleName \
    --display-name exampleDisplayName \
    --password examplePa$$w0rd
```

Output:

```
{
    "UserId": "S-1-1-11-1111111111-2222222222-3333333333-3333"
}
```

- For API details, see CreateUser in *AWS CLI Command Reference*.

### `delete-access-control-rule`

The following code example shows how to use `delete-access-control-rule`.

**AWS CLI**

**To delete an access control rule**

The following `delete-access-control-rule` example deletes the specified access control rule from the specified Amazon WorkMail organization.

```
aws workmail delete-access-control-rule \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --name "myRule"
```

This command produces no output.

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see DeleteAccessControlRule in *AWS CLI Command Reference*.

### `delete-alias`

The following code example shows how to use `delete-alias`.

**AWS CLI**

**To delete an alias**

The following `delete-alias` command deletes the alias for the specified entity (user or group).

```
aws workmail delete-alias \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --alias exampleAlias@site.awsapps.com
```

This command produces no output.

- For API details, see DeleteAlias in *AWS CLI Command Reference*.

### `delete-group`

The following code example shows how to use `delete-group`.

**AWS CLI**

**To delete an existing group**

The following `delete-group` command deletes an existing group from Amazon WorkMail.

```
aws workmail delete-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

This command produces no output.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

### `delete-mailbox-permissions`

The following code example shows how to use `delete-mailbox-permissions`.

**AWS CLI**

**To delete mailbox permissions**

The following `delete-mailbox-permissions` command deletes mailbox permissions that were previously granted to a user or group. The entity represents the user that owns the mailbox, and the grantee represents the user or group for whom to delete permissions.

```
aws workmail delete-mailbox-permissions \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --grantee-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DeleteMailboxPermissions in *AWS CLI Command Reference*.

### `delete-resource`

The following code example shows how to use `delete-resource`.

#### AWS CLI

**To delete an existing resource**

The following `delete-resource` command deletes an existing resource from Amazon WorkMail.

```
aws workmail delete-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-7afe0efbade843a58cdc10251fce992c
```

This command produces no output.

- For API details, see DeleteResource in *AWS CLI Command Reference*.

### `delete-user`

The following code example shows how to use `delete-user`.

#### AWS CLI

**To delete a user**

The following `delete-user` command deletes the specified user from Amazon WorkMail and all subsequent systems.

```
aws workmail delete-user \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DeleteUser in *AWS CLI Command Reference*.

### `deregister-from-work-mail`

The following code example shows how to use `deregister-from-work-mail`.

#### AWS CLI

**To disable an existing entity**

The following `deregister-from-work-mail` command disables an existing entity (user, group, or resource) from using Amazon WorkMail.

```
aws workmail deregister-from-work-mail \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DeregisterFromWorkMail in *AWS CLI Command Reference*.

### `describe-group`

The following code example shows how to use `describe-group`.

#### AWS CLI

**To retrieve information for a group**

The following `describe-group` command retrieves information about the specified group.

```
aws workmail describe-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

Output:

```
{
    "GroupId": "S-1-1-11-1122222222-2222233333-3333334444-4444",
    "Name": "exampleGroup1",
    "State": "ENABLED"
}
```

- For API details, see DescribeGroup in *AWS CLI Command Reference*.

### `describe-organization`

The following code example shows how to use `describe-organization`.

#### AWS CLI

**To retrieve information for an organization**

The following `describe-organization` command retrieves information for the specified Amazon WorkMail organization.

```
aws workmail describe-organization \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "OrganizationId": "m-d281d0a2fd824be5b6cd3d3ce909fd27",
    "Alias": "alias",
    "State": "Active",
    "DirectoryId": "d-926726012c",
    "DirectoryType": "VpcDirectory",
    "DefaultMailDomain": "site.awsapps.com",
    "CompletedDate": 1522693605.468,
    "ARN": "arn:aws:workmail:us-west-2:111122223333:organization/m-
n1pq2345678r901st2u3vx45x6789yza"
}
```

For more information, see Working with Organizations in the *Amazon WorkMail Administrator Guide*.

- For API details, see DescribeOrganization in *AWS CLI Command Reference*.

### `describe-resource`

The following code example shows how to use `describe-resource`.

#### AWS CLI

**To retrieve information for a resource**

The following `describe-resource` command retrieves information about the specified resource.

```
aws workmail describe-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-7afe0efbade843a58cdc10251fce992c
```

Output:

```
{
    "ResourceId": "r-7afe0efbade843a58cdc10251fce992c",
    "Name": "exampleRoom1",
    "Type": "ROOM",
    "BookingOptions": {
        "AutoAcceptRequests": true,
        "AutoDeclineRecurringRequests": false,
        "AutoDeclineConflictingRequests": true
    },
    "State": "ENABLED"
}
```

- For API details, see DescribeResource in *AWS CLI Command Reference*.

### `describe-user`

The following code example shows how to use `describe-user`.

#### AWS CLI

**To retrieve user information**

The following `describe-user` command retrieves information about the specified user.

```
aws workmail describe-user \
```

```
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "UserId": "S-1-1-11-1111111111-2222222222-3333333333-3333",
    "Name": "exampleUser1",
    "Email": "exampleUser1@site.awsapps.com",
    "DisplayName": "",
    "State": "ENABLED",
    "UserRole": "USER",
    "EnabledDate": 1532459261.827
}
```

- For API details, see DescribeUser in *AWS CLI Command Reference*.

### `disassociate-delegate-from-resource`

The following code example shows how to use `disassociate-delegate-from-resource`.

**AWS CLI**

**To remove a member from a resource**

The following `disassociate-delegate-from-resource` command removes the specified member from a resource.

```
ws workmail disassociate-delegate-from-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-68bf2d3b1c0244aab7264c24b9217443 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DisassociateDelegateFromResource in *AWS CLI Command Reference*.

### `disassociate-member-from-group`

The following code example shows how to use `disassociate-member-from-group`.

**AWS CLI**

**To remove a member from a group**

The following `disassociate-member-from-group` command removes the specified member from a group.

```
aws workmail disassociate-member-from-group \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --member-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see DisassociateMemberFromGroup in *AWS CLI Command Reference*.

## `get-access-control-effect`

The following code example shows how to use `get-access-control-effect`.

**AWS CLI**

**To get the effect of access control rules**

The following `get-access-control-effect` example retrieves the effect of the specified Amazon WorkMail organization's access control rules for the specified IP address, access protocol action, and user ID.

```
aws workmail get-access-control-effect \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --ip-address "192.0.2.0" \
    --action "WindowsOutlook" \
    --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333"
```

Output:

```
{
    "Effect": "DENY",
    "MatchedRules": [
        "myRule"
    ]
```

```
}
```

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see GetAccessControlEffect in *AWS CLI Command Reference*.

### `get-mailbox-details`

The following code example shows how to use `get-mailbox-details`.

**AWS CLI**

**To get a user's mailbox details**

The following `get-mailbox-details` command retrieves details about the specified user's mailbox.

```
aws workmail get-mailbox-details \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "MailboxQuota": 51200,
    "MailboxSize": 0.03890800476074219
}
```

For more information, see Managing User Accounts in the *Amazon WorkMail Administrator Guide*.

- For API details, see GetMailboxDetails in *AWS CLI Command Reference*.

### `list-access-control-rules`

The following code example shows how to use `list-access-control-rules`.

**AWS CLI**

**To list access control rules**

The following `list-access-control-rules` example lists the access control rules for the specified Amazon WorkMail organization.

```
aws workmail list-access-control-rules \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza
```

Output:

```
{
    "Rules": [
        {
            "Name": "default",
            "Effect": "ALLOW",
            "Description": "Default WorkMail Rule",
            "DateCreated": 0.0,
            "DateModified": 0.0
        },
        {
            "Name": "myRule",
            "Effect": "DENY",
            "Description": "my rule",
            "UserIds": [
            "S-1-1-11-1111111111-2222222222-3333333333-3333"
            ],
            "DateCreated": 1581635628.0,
            "DateModified": 1581635628.0
        }
    ]
}
```

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListAccessControlRules in *AWS CLI Command Reference*.

## `list-aliases`

The following code example shows how to use `list-aliases`.

### AWS CLI

#### To list aliases for a member

The following `list-aliases` command lists aliases for the specified member (user or group).

```
aws workmail list-aliases \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "Aliases": [
        "exampleAlias@site.awsapps.com",
        "exampleAlias1@site.awsapps.com"
    ]
}
```

- For API details, see ListAliases in *AWS CLI Command Reference*.

### `list-group-members`

The following code example shows how to use `list-group-members`.

#### AWS CLI

**To list group members**

The following `list-group-members` command lists the members of the specified group.

```
aws workmail list-group-members \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

Output:

```
{
    "Members": [
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
            "Name": "exampleUser1",
            "Type": "USER",
            "State": "ENABLED",
            "EnabledDate": 1532459261.827
        }
```

```
    ]
}
```

- For API details, see ListGroupMembers in *AWS CLI Command Reference*.

### `list-groups`

The following code example shows how to use `list-groups`.

**AWS CLI**

**To retrieve a list of groups**

The following `list-groups` command retrieves summaries of the groups in the specified organization.

```
aws workmail list-groups \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "Groups": [
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444",
            "Name": "exampleGroup1",
            "State": "DISABLED"
        },
        {
            "Id": "S-4-4-44-1122222222-2222233333-3333334444-4444",
            "Name": "exampleGroup2",
            "State": "ENABLED"
        }
    ]
}
```

- For API details, see ListGroups in *AWS CLI Command Reference*.

### `list-mailbox-permissions`

The following code example shows how to use `list-mailbox-permissions`.

**AWS CLI**

**To retrieve mailbox permissions**

The following `list-mailbox-permissions` command retrieves the mailbox permissions associated with the specified entity's mailbox.

```
aws workmail list-mailbox-permissions \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{
    "Permissions": [
        {
            "GranteeId": "S-1-1-11-1122222222-2222233333-3333334444-4444",
            "GranteeType": "USER",
            "PermissionValues": [
                "FULL_ACCESS"
            ]
        }
    ]
}
```

- For API details, see ListMailboxPermissions in *AWS CLI Command Reference*.

## `list-organizations`

The following code example shows how to use `list-organizations`.

**AWS CLI**

**To retrieve a list of organizations**

The following `list-organizations` command retrieves summaries of non-deleted organizations.

```
aws workmail list-organizations
```

Output:

```
{
    "OrganizationSummaries": [
        {
            "OrganizationId": "m-d281d0a2fd824be5b6cd3d3ce909fd27",
            "Alias": "exampleAlias",
            "State": "Active"
        }
    ]
}
```

- For API details, see ListOrganizations in *AWS CLI Command Reference*.

### `list-resource-delegates`

The following code example shows how to use `list-resource-delegates`.

**AWS CLI**

**To list the delegates for a resource**

The following `list-resource-delegates` command retrieves the delegates associated with the specified resource.

```
aws workmail list-resource-delegates \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-68bf2d3b1c0244aab7264c24b9217443
```

Output:

```
{
    "Delegates": [
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
            "Type": "USER"
        }
    ]
}
```

- For API details, see ListResourceDelegates in *AWS CLI Command Reference*.

### `list-resources`

The following code example shows how to use `list-resources`.

**AWS CLI**

**To retrieve a list of resources**

The following `list-resources` command retrieves summaries of the resources for the specified organization.

```
aws workmail list-resources \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "Resources": [
        {
            "Id": "r-7afe0efbade843a58cdc10251fce992c",
            "Name": "exampleRoom1",
            "Type": "ROOM",
            "State": "ENABLED"
        }
    ]
}
```

- For API details, see ListResources in *AWS CLI Command Reference*.

### `list-tags-for-resource`

The following code example shows how to use `list-tags-for-resource`.

**AWS CLI**

**To list the tags for a resource**

The following `list-tags-for-resource` example lists the tags for the specified Amazon WorkMail organization.

```
aws workmail list-tags-for-resource \
```

```
    --resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-
n1pq2345678r901st2u3vx45x6789yza
```

Output:

```
{
    "Tags": [
        {
            "Key": "priority",
            "Value": "1"
        }
    ]
}
```

For more information, see Tagging an Organization in the *Amazon WorkMail Administrator Guide*.

- For API details, see ListTagsForResource in *AWS CLI Command Reference*.

### `list-users`

The following code example shows how to use `list-users`.

#### AWS CLI

**To retrieve a list of users**

The following `list-users` command retrieves summaries of the users in the specified organization.

```
aws workmail list-users \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
    "Users": [
        {
            "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
            "Email": "exampleUser1@site.awsapps.com",
            "Name": "exampleUser1",
            "State": "ENABLED",
```

```
            "UserRole": "USER",
            "EnabledDate": 1532459261.827
        },
        {
            "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444",
            "Name": "exampleGuestUser",
            "State": "DISABLED",
            "UserRole": "SYSTEM_USER"
        }
    ]
}
```

- For API details, see ListUsers in *AWS CLI Command Reference*.

### `put-access-control-rule`

The following code example shows how to use `put-access-control-rule`.

#### AWS CLI

**To put a new access control rule**

The following `put-access-control-rule` example denies the specified user access to the specified Amazon WorkMail organization.

```
aws workmail put-access-control-rule \
    --name "myRule" \
    --effect "DENY" \
    --description "my rule" \
    --user-ids "S-1-1-11-1111111111-2222222222-3333333333-3333" \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza
```

This command produces no output.

For more information, see Working with Access Control Rules in the *Amazon WorkMail Administrator Guide*.

- For API details, see PutAccessControlRule in *AWS CLI Command Reference*.

### `put-mailbox-permissions`

The following code example shows how to use `put-mailbox-permissions`.

**AWS CLI**

**To set mailbox permissions**

The following `put-mailbox-permissions` command sets full access permissions for the specified grantee (user or group). The entity represents the owner of the mailbox.

```
aws workmail put-mailbox-permissions \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --grantee-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --permission-values FULL_ACCESS
```

This command produces no output.

- For API details, see PutMailboxPermissions in *AWS CLI Command Reference*.

### `register-to-work-mail`

The following code example shows how to use `register-to-work-mail`.

**AWS CLI**

**To register an existing or disabled entity**

The following `register-to-work-mail` command enables the specified existing entity (user, group, or resource) to use Amazon WorkMail.

```
aws workmail register-to-work-mail \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \
    --email exampleGroup1@site.awsapps.com
```

This command produces no output.

- For API details, see RegisterToWorkMail in *AWS CLI Command Reference*.

### `reset-password`

The following code example shows how to use `reset-password`.

**AWS CLI**

**To reset a user's password**

The following `reset-password` command resets the password for the specified user.

```
aws workmail reset-password \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --password examplePa$$w0rd
```

This command produces no output.

- For API details, see ResetPassword in *AWS CLI Command Reference*.

### `tag-resource`

The following code example shows how to use `tag-resource`.

**AWS CLI**

**To apply a tag to a resource**

The following `tag-resource` example applies a tag with key "priority" and value "1" to the specified Amazon WorkMail organization.

```
aws workmail tag-resource \
    --resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-
n1pq2345678r901st2u3vx45x6789yza \
    --tags "Key=priority,Value=1"
```

This command produces no output.

For more information, see Tagging an Organization in the *Amazon WorkMail Administrator Guide*.

- For API details, see TagResource in *AWS CLI Command Reference*.

### `untag-resource`

The following code example shows how to use `untag-resource`.

**AWS CLI**

**To untag a resource**

The following `untag-resource` example removes the specified tag from the specified Amazon WorkMail organization.

```
aws workmail untag-resource \
    --resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-
n1pq2345678r901st2u3vx45x6789yza \
    --tag-keys "priority"
```

This command produces no output.

For more information, see Tagging an Organization in the *Amazon WorkMail Administrator Guide*.

- For API details, see UntagResource in *AWS CLI Command Reference*.

### `update-mailbox-quota`

The following code example shows how to use `update-mailbox-quota`.

**AWS CLI**

**To update a user's mailbox quota**

The following `update-mailbox-quota` command changes the specified user's mailbox quota.

```
aws workmail update-mailbox-quota \
    --organization-id m-n1pq2345678r901st2u3vx45x6789yza \
    --user-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --mailbox-quota 40000
```

This command produces no output.

For more information, see Managing User Accounts in the *Amazon WorkMail Administrator Guide*.

- For API details, see UpdateMailboxQuota in *AWS CLI Command Reference*.

### `update-primary-email-address`

The following code example shows how to use `update-primary-email-address`.

#### AWS CLI

**To update a primary email address**

The following `update-primary-email-address` command updates the primary email address of the specified entity (user, group, or resource).

```
aws workmail update-primary-email-address \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333 \
    --email exampleUser2@site.awsapps.com
```

This command produces no output.

- For API details, see UpdatePrimaryEmailAddress in *AWS CLI Command Reference*.

### `update-resource`

The following code example shows how to use `update-resource`.

#### AWS CLI

**To update a resource**

The following `update-resource` command updates the name of the specified resource.

```
aws workmail update-resource \
    --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
    --resource-id r-7afe0efbade843a58cdc10251fce992c \
    --name exampleRoom2
```

This command produces no output.

- For API details, see UpdateResource in *AWS CLI Command Reference*.

## Amazon WorkMail Message Flow examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkMail Message Flow.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `get-raw-message-content`

The following code example shows how to use `get-raw-message-content`.

**AWS CLI**

**To get the raw content of an email message**

The following `get-raw-message-content` example gets the raw content of an in-transit email message and sends it to a text file named `test`.

```
aws workmailmessageflow get-raw-message-content \
    --message-id a1b2cd34-ef5g-6h7j-kl8m-npq9012345rs \
    test
```

Contents of file `test` after command runs:

```
Subject: Hello World
From: =?UTF-8?Q?marymajor_marymajor?= <marymajor@example.com>
To: =?UTF-8?Q?mateojackson=40example=2Enet?= <mateojackson@example.net>

```

For more information, see Retrieving Message Content with AWS Lambda in the *Amazon WorkMail Administrator Guide*.

- For API details, see GetRawMessageContent in *AWS CLI Command Reference*.

## WorkSpaces examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with WorkSpaces.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `create-tags`

The following code example shows how to use `create-tags`.

**AWS CLI**

**To add tags to a WorkSpace**

The following `create-tags` example adds the specified tags to the specified WorkSpace.

```
aws workspaces create-tags \
    --resource-id ws-dk1xzr417 \
    --tags Key=Department,Value=Finance
```

This command produces no output.

For more information, see Tag WorkSpaces resources in the *Amazon WorkSpaces Administration Guide*.

- For API details, see CreateTags in *AWS CLI Command Reference*.

#### `create-workspaces`

The following code example shows how to use `create-workspaces`.

## AWS CLI

### Example 1: To create an AlwaysOn WorkSpace

The following `create-workspaces` example creates an AlwaysOn WorkSpace for the specified user, using the specified directory and bundle.

```
aws workspaces create-workspaces \
    --workspaces DirectoryId=d-926722edaf,UserName=Mateo,BundleId=wsb-0zsvgp8fc
```

Output:

```
{
    "FailedRequests": [],
    "PendingRequests": [
        {
            "WorkspaceId": "ws-kcqms853t",
            "DirectoryId": "d-926722edaf",
            "UserName": "Mateo",
            "State": "PENDING",
            "BundleId": "wsb-0zsvgp8fc"
        }
    ]
}
```

### Example 2: To create an AutoStop WorkSpace

The following `create-workspaces` example creates an AutoStop WorkSpace for the specified user, using the specified directory and bundle.

```
aws workspaces create-workspaces \
    --workspaces
 DirectoryId=d-926722edaf,UserName=Mary,BundleId=wsb-0zsvgp8fc,WorkspaceProperties={RunningM
```

Output:

```
{
    "FailedRequests": [],
    "PendingRequests": [
        {
            "WorkspaceId": "ws-dk1xzr417",
```

```
            "DirectoryId": "d-926722edaf",
            "UserName": "Mary",
            "State": "PENDING",
            "BundleId": "wsb-0zsvgp8fc"
        }
    ]
}
```

**Example 3: To create a user-decoupled WorkSpace**

The following `create-workspaces` example creates a user-decoupled WorkSpace by setting the username to `[UNDEFINED]`, and specifying a WorkSpace name, directory ID, and bundle ID.

```
aws workspaces create-workspaces \
    --workspaces
 DirectoryId=d-926722edaf,UserName='"[UNDEFINED]"',WorkspaceName=MaryWorkspace1,BundleId=wsb
```

Output:

```
{
    "FailedRequests": [],
    "PendingRequests": [
        {
            "WorkspaceId": "ws-abcd1234",
            "DirectoryId": "d-926722edaf",
            "UserName": "[UNDEFINED]",
            "State": "PENDING",
            "BundleId": "wsb-0zsvgp8fc",
            "WorkspaceName": "MaryWorkspace1"
        }
    ]
}
```

For more information, see Launch a virtual desktop in the *Amazon WorkSpaces Administration Guide*.

- For API details, see CreateWorkspaces in *AWS CLI Command Reference*.

## `delete-tags`

The following code example shows how to use `delete-tags`.

**AWS CLI**

**To delete a tag from a WorkSpace**

The following `delete-tags` example deletes the specified tag from the specified WorkSpace.

```
aws workspaces delete-tags \
    --resource-id ws-dk1xzr417 \
    --tag-keys Department
```

This command produces no output.

For more information, see Tag WorkSpaces resources in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DeleteTags in *AWS CLI Command Reference*.

### `deregister-workspace-directory`

The following code example shows how to use `deregister-workspace-directory`.

**AWS CLI**

**To deregister a directory**

The following `deregister-workspace-directory` example deregisters the specified directory.

```
aws workspaces deregister-workspace-directory \
    --directory-id d-926722edaf
```

This command produces no output.

For more information, see Register a directory with WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DeregisterWorkspaceDirectory in *AWS CLI Command Reference*.

### `describe-tags`

The following code example shows how to use `describe-tags`.

**AWS CLI**

**To describe the tags for a WorkSpace**

The following `describe-tags` example describes the tags for the specified WorkSpace.

```
aws workspaces describe-tags \
    --resource-id ws-dk1xzr417
```

Output:

```
{
    "TagList": [
        {
            "Key": "Department",
            "Value": "Finance"
        }
    ]
}
```

For more information, see Tag WorkSpaces resources in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeTags in *AWS CLI Command Reference*.

### `describe-workspace-bundles`

The following code example shows how to use `describe-workspace-bundles`.

**AWS CLI**

**To list the bundles provided by Amazon**

The following `describe-workspace-bundles` example lists the names and IDs of the bundles provided by Amazon, in table format and sorted by name.

```
aws workspaces describe-workspace-bundles \
    --owner AMAZON \
    --query "Bundles[*].[Name, BundleId]"
```

Output:

```
[
    [
        "Standard with Amazon Linux 2",
        "wsb-clj85qzj1"
    ],
    [
        "Performance with Windows 10 (Server 2016 based)",
        "wsb-gm4d5tx2v"
    ],
    [
        "PowerPro with Windows 7",
        "wsb-1pzkp0bx4"
    ],
    [
        "Power with Amazon Linux 2",
        "wsb-2bs6k5lgn"
    ],
    [
        "Graphics with Windows 10 (Server 2019 based)",
        "wsb-03gyjnfyy"
    ],
    ...
]
```

For more information, see WorkSpaces bundles and images in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspaceBundles in *AWS CLI Command Reference*.

### `describe-workspace-directories`

The following code example shows how to use `describe-workspace-directories`.

#### AWS CLI

**To describe a registered directory**

The following `describe-workspace-directories` example describes the specified registered directory.

```
aws workspaces describe-workspace-directories \
    --directory-ids d-926722edaf
```

Output:

```
{
    "Directories": [
        {
            "DirectoryId": "d-926722edaf",
            "Alias": "d-926722edaf",
            "DirectoryName": "example.com",
            "RegistrationCode": "WSpdx+9RJ8JT",
            "SubnetIds": [
                "subnet-9d19c4c6",
                "subnet-500d5819"
            ],
            "DnsIpAddresses": [
                "172.16.1.140",
                "172.16.0.30"
            ],
            "CustomerUserName": "Administrator",
            "IamRoleId": "arn:aws:iam::123456789012:role/workspaces_DefaultRole",
            "DirectoryType": "SIMPLE_AD",
            "WorkspaceSecurityGroupId": "sg-0d89e927e5645d7c5",
            "State": "REGISTERED",
            "WorkspaceCreationProperties": {
                "EnableWorkDocs": false,
                "EnableInternetAccess": false,
                "UserEnabledAsLocalAdministrator": true,
                "EnableMaintenanceMode": true
            },
            "WorkspaceAccessProperties": {
                "DeviceTypeWindows": "ALLOW",
                "DeviceTypeOsx": "ALLOW",
                "DeviceTypeWeb": "DENY",
                "DeviceTypeIos": "ALLOW",
                "DeviceTypeAndroid": "ALLOW",
                "DeviceTypeChromeOs": "ALLOW",
                "DeviceTypeZeroClient": "ALLOW",
                "DeviceTypeLinux": "DENY"
            },
            "Tenancy": "SHARED",
            "SelfservicePermissions": {
                "RestartWorkspace": "ENABLED",
                "IncreaseVolumeSize": "DISABLED",
                "ChangeComputeType": "DISABLED",
                "SwitchRunningMode": "DISABLED",
```

```
                "RebuildWorkspace": "DISABLED"
            }
        }
    ]
}
```

For more information, see Manage directories for WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspaceDirectories in *AWS CLI Command Reference*.

### `describe-workspaces-connection-status`

The following code example shows how to use `describe-workspaces-connection-status`.

**AWS CLI**

**To describe the connection status of a WorkSpace**

The following `describe-workspaces-connection-status` example describes the connection status of the specified WorkSpace.

```
aws workspaces describe-workspaces-connection-status \
    --workspace-ids ws-dk1xzr417
```

Output:

```
{
    "WorkspacesConnectionStatus": [
        {
            "WorkspaceId": "ws-dk1xzr417",
            "ConnectionState": "CONNECTED",
            "ConnectionStateCheckTimestamp": 1662526214.744
        }
    ]
}
```

For more information, see Administer your WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspacesConnectionStatus in *AWS CLI Command Reference*.

### `describe-workspaces`

The following code example shows how to use `describe-workspaces`.

#### AWS CLI

##### To describe a WorkSpace

The following `describe-workspaces` example describes the specified WorkSpace.

```
aws workspaces describe-workspaces \
    --workspace-ids ws-dk1xzr417
```

Output:

```
{
    "Workspaces": [
        {
            "WorkspaceId": "ws-dk1xzr417",
            "DirectoryId": "d-926722edaf",
            "UserName": "Mary",
            "IpAddress": "172.16.0.175",
            "State": "STOPPED",
            "BundleId": "wsb-0zsvgp8fc",
            "SubnetId": "subnet-500d5819",
            "ComputerName": "WSAMZN-RBSLTTD9",
            "WorkspaceProperties": {
                "RunningMode": "AUTO_STOP",
                "RunningModeAutoStopTimeoutInMinutes": 60,
                "RootVolumeSizeGib": 80,
                "UserVolumeSizeGib": 10,
                "ComputeTypeName": "VALUE"
            },
            "ModificationStates": []
        }
    ]
}
```

For more information, see Administer your WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see DescribeWorkspaces in *AWS CLI Command Reference*.

### `migrate-workspace`

The following code example shows how to use `migrate-workspace`.

**AWS CLI**

**To migrate a WorkSpace**

The following `migrate-workspace` example migrates the specified WorkSpace to the specified bundle.

```
aws workspaces migrate-workspace \
    --source-workspace-id ws-dk1xzr417 \
    --bundle-id wsb-j4dky1gs4
```

Output:

```
{
    "SourceWorkspaceId": "ws-dk1xzr417",
    "TargetWorkspaceId": "ws-x5h1lbkp5"
}
```

For more information, see Migrate a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see MigrateWorkspace in *AWS CLI Command Reference*.

### `modify-workspace-creation-properties`

The following code example shows how to use `modify-workspace-creation-properties`.

**AWS CLI**

**To modify a WorkSpace creation property of a directory**

The following `modify-workspace-creation-properties` example enables the `EnableInternetAccess` property for the specified directory. This enables automatic assignment of public IP addresses for the WorkSpaces created for the directory.

```
aws workspaces modify-workspace-creation-properties \
    --resource-id d-926722edaf \
```

```
    --workspace-creation-properties EnableInternetAccess=true
```

This command produces no output.

For more information, see Update directory details for your WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see ModifyWorkspaceCreationProperties in *AWS CLI Command Reference*.

### `modify-workspace-properties`

The following code example shows how to use `modify-workspace-properties`.

**AWS CLI**

**To modify the running mode of a WorkSpace**

The following `modify-workspace-properties` example sets the running mode of the specified WorkSpace to `AUTO_STOP`.

```
aws workspaces modify-workspace-properties \
    --workspace-id ws-dk1xzr417 \
    --workspace-properties RunningMode=AUTO_STOP
```

This command produces no output.

For more information, see Modify a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see ModifyWorkspaceProperties in *AWS CLI Command Reference*.

### `modify-workspace-state`

The following code example shows how to use `modify-workspace-state`.

**AWS CLI**

**To modify the state of a WorkSpace**

The following `modify-workspace-state` example sets the state of the specified WorkSpace to `ADMIN_MAINTENANCE`.

```
aws workspaces modify-workspace-state \
```

```
    --workspace-id ws-dk1xzr417 \
    --workspace-state ADMIN_MAINTENANCE
```

This command produces no output.

For more information, see WorkSpace maintenance in the *Amazon WorkSpaces Administration Guide*.

- For API details, see ModifyWorkspaceState in *AWS CLI Command Reference*.

### `reboot-workspaces`

The following code example shows how to use `reboot-workspaces`.

**AWS CLI**

**To reboot a WorkSpace**

The following `reboot-workspaces` example reboots the specified WorkSpace.

```
aws workspaces reboot-workspaces \
    --reboot-workspace-requests ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Reboot a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RebootWorkspaces in *AWS CLI Command Reference*.

### `rebuild-workspaces`

The following code example shows how to use `rebuild-workspaces`.

**AWS CLI**

**To rebuild a WorkSpace**

The following `rebuild-workspaces` example rebuilds the specified WorkSpace.

```
aws workspaces rebuild-workspaces \
    --rebuild-workspace-requests ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Rebuild a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RebuildWorkspaces in *AWS CLI Command Reference*.

### `register-workspace-directory`

The following code example shows how to use `register-workspace-directory`.

**AWS CLI**

**To register a directory**

The following `register-workspace-directory` example registers the specified directory for use with Amazon WorkSpaces.

```
aws workspaces register-workspace-directory \
    --directory-id d-926722edaf \
    --no-enable-work-docs
```

This command produces no output.

For more information, see Register a directory with WorkSpaces in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RegisterWorkspaceDirectory in *AWS CLI Command Reference*.

### `restore-workspace`

The following code example shows how to use `restore-workspace`.

**AWS CLI**

**To restore a WorkSpace**

The following `restore-workspace` example restores the specified WorkSpace.

```
aws workspaces restore-workspace \
    --workspace-id ws-dk1xzr417
```

This command produces no output.

For more information, see Restore a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see RestoreWorkspace in *AWS CLI Command Reference*.

## `start-workspaces`

The following code example shows how to use `start-workspaces`.

**AWS CLI**

**To start an AutoStop WorkSpace**

The following `start-workspaces` example starts the specified WorkSpace. The WorkSpace must have a running mode of `AutoStop`.

```
aws workspaces start-workspaces \
    --start-workspace-requests WorkspaceId=ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Stop and start an AutoStop WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see StartWorkspaces in *AWS CLI Command Reference*.

### `stop-workspaces`

The following code example shows how to use `stop-workspaces`.

**AWS CLI**

**To stop an AutoStop WorkSpace**

The following `stop-workspaces` example stops the specified WorkSpace. The WorkSpace must have a running mode of `AutoStop`.

```
aws workspaces stop-workspaces \
    --stop-workspace-requests WorkspaceId=ws-dk1xzr417
```

Output:

```
{
    "FailedRequests": []
}
```

For more information, see Stop and start an AutoStop WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see StopWorkspaces in *AWS CLI Command Reference*.

### `terminate-workspaces`

The following code example shows how to use `terminate-workspaces`.

**AWS CLI**

**To terminate a WorkSpace**

The following `terminate-workspaces` example terminates the specified workspace.

```
aws workspaces terminate-workspaces \
    --terminate-workspace-requests ws-dk1xzr417
```

Output:

```
{
```

```
    "FailedRequests": []
}
```

For more information, see Delete a WorkSpace in the *Amazon WorkSpaces Administration Guide*.

- For API details, see TerminateWorkspaces in *AWS CLI Command Reference*.

## X-Ray examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with X-Ray.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

- Actions

### Actions

#### `batch-traces-get`

The following code example shows how to use `batch-traces-get`.

#### AWS CLI

##### To get a list of traces

The following `batch-get-traces` example retrieves a list of traces specified by an ID. The full trace includes a document for each segment, compiled from all of the segment documents received with the same trace ID.

```
aws xray batch-get-traces \
```

```
    --trace-ids 1-5d82881a-0a9126e92a73e971eed891b9
```

Output:

```
{
    "Traces": [
        {
            "Id": "1-5d82881a-0a9126e92a73e971eed891b9",
            "Duration": 0.232,
            "Segments": [
                {
                    "Id": "54aff5735b12dd28",
                    "Document": "{\"id\":\"54aff5735b12dd28\",\"name\":
\"Scorekeep\",\"start_time\":1.568835610432E9,\"end_time\":1.568835610664E9,

                }
            ]
        }
```

```
    ],
    "UnprocessedTraceIds": []
}
```

For more information, see Using the AWS X-Ray API with the AWS CLI in the *AWS X-Ray Developer Guide*.

- For API details, see BatchTracesGet in *AWS CLI Command Reference*.

### `create-group`

The following code example shows how to use `create-group`.

#### AWS CLI

**To create a group**

The following `create-group` example creates a group resource named `AdminGroup`. The group gets a filter expression that defines the criteria of the group as a segment related to a specific service causing a fault or an error.

```
aws xray create-group \
   --group-name "AdminGroup" \
   --filter-expression "service(\"mydomain.com\") {fault OR error}"
```

Output:

```
{
    "GroupName": "AdminGroup",
    "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/AdminGroup/123456789",
    "FilterExpression": "service(\"mydomain.com\") {fault OR error}"
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see CreateGroup in *AWS CLI Command Reference*.

### `create-sampling-rule`

The following code example shows how to use `create-sampling-rule`.

## AWS CLI

### To create a sampling rule

The following `create-sampling-rule` example creates a rule to control sampling behavior for instrumented applications. The rules are provided by a JSON file. The majority of the sampling rule fields are required to create the rule.

```
aws xray create-sampling-rule \
    --cli-input-json file://9000-base-scorekeep.json
```

Contents of `9000-base-scorekeep.json`:

```
{
    "SamplingRule": {
        "RuleName": "base-scorekeep",
        "ResourceARN": "*",
        "Priority": 9000,
        "FixedRate": 0.1,
        "ReservoirSize": 5,
        "ServiceName": "Scorekeep",
        "ServiceType": "*",
        "Host": "*",
        "HTTPMethod": "*",
        "URLPath": "*",
        "Version": 1
    }
}
```

Output:

```
{
    "SamplingRuleRecord": {
        "SamplingRule": {
            "RuleName": "base-scorekeep",
            "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/base-
scorekeep",
            "ResourceARN": "*",
            "Priority": 9000,
            "FixedRate": 0.1,
            "ReservoirSize": 5,
            "ServiceName": "Scorekeep",
```

```
            "ServiceType": "*",
            "Host": "*",
            "HTTPMethod": "*",
            "URLPath": "*",
            "Version": 1,
            "Attributes": {}
        },
        "CreatedAt": 1530574410.0,
        "ModifiedAt": 1530574410.0
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see CreateSamplingRule in *AWS CLI Command Reference*.

### `delete-group`

The following code example shows how to use `delete-group`.

#### AWS CLI

**To delete a group**

The following `delete-group` example deletes the specified group resource.

```
aws xray delete-group \
    --group-name "AdminGroup" \
    --group-arn "arn:aws:xray:us-east-2:123456789012:group/AdminGroup/123456789"
```

This command produces no output.

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see DeleteGroup in *AWS CLI Command Reference*.

### `delete-sampling-rule`

The following code example shows how to use `delete-sampling-rule`.

**AWS CLI**

**To delete a sampling rule**

The following `delete-sampling-rule` example deletes the specified sampling rule. You can specify the group by using either the group name or group ARN.

```
aws xray delete-sampling-rule \
    --rule-name polling-scorekeep
```

Output:

```
{
    "SamplingRuleRecord": {
        "SamplingRule": {
            "RuleName": "polling-scorekeep",
            "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/polling-
scorekeep",
            "ResourceARN": "*",
            "Priority": 5000,
            "FixedRate": 0.003,
            "ReservoirSize": 0,
            "ServiceName": "Scorekeep",
            "ServiceType": "*",
            "Host": "*",
            "HTTPMethod": "GET",
            "URLPath": "/api/state/*",
            "Version": 1,
            "Attributes": {}
        },
        "CreatedAt": 1530574399.0,
        "ModifiedAt": 1530574399.0
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see DeleteSamplingRule in *AWS CLI Command Reference*.

## `get-encryption-config`

The following code example shows how to use `get-encryption-config`.

**AWS CLI**

**To retrieve the encryption configuration**

The following `get-encryption-config` example retrieves the current encryption configuration for your AWS X-Ray data.

```
aws xray get-encryption-config
```

Output:

```
{
    "EncryptionConfig": {
        "KeyId": "ae4aa6d49-a4d8-9df9-a475-4ff6d7898456",
        "Status": "ACTIVE",
        "Type": "NONE"
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see GetEncryptionConfig in *AWS CLI Command Reference*.

### `get-group`

The following code example shows how to use `get-group`.

**AWS CLI**

**To retrieve a group**

The following `get-group` example displays details for the specified group resource. The details include the group name, the group ARN, and the filter expression that defines the criteria for that group. Groups can also be retrieved by ARN.

```
aws xray get-group \
    --group-name "AdminGroup"
```

Output:

```
{
```

```
    "Group": [
        {
            "GroupName": "AdminGroup",
            "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
AdminGroup/123456789",
            "FilterExpression": "service(\"mydomain.com\") {fault OR error}"
        }
    ]
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see GetGroup in *AWS CLI Command Reference*.

### `get-groups`

The following code example shows how to use `get-groups`.

#### AWS CLI

**To retrieve all groups**

The following example displays details for all active group.

```
aws xray get-groups
```

Output:

```
{
    "Groups": [
        {
            "GroupName": "AdminGroup",
            "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
AdminGroup/123456789",
            "FilterExpression": "service(\"example.com\") {fault OR error}"
        },
        {
            "GroupName": "SDETGroup",
            "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/
SDETGroup/987654321",
            "FilterExpression": "responsetime > 2"
        }
```

```
    ]
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see GetGroups in *AWS CLI Command Reference*.

### `get-sampling-rules`

The following code example shows how to use `get-sampling-rules`.

#### AWS CLI

**To retrieve all sampling rules**

The following `get-sampling-rules` example displays details for all available sampling rules.:

```
aws xray get-sampling-rules
```

Output:

```
{
    "SamplingRuleRecords": [
        {
            "SamplingRule": {
                "RuleName": "Default",
                "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/Default",
                "ResourceARN": "*",
                "Priority": 10000,
                "FixedRate": 0.01,
                "ReservoirSize": 0,
                "ServiceName": "*",
                "ServiceType": "*",
                "Host": "*",
                "HTTPMethod": "*",
                "URLPath": "*",
                "Version": 1,
                "Attributes": {}
            },
            "CreatedAt": 0.0,
            "ModifiedAt": 1530558121.0
        },
```

```
        {
            "SamplingRule": {
                "RuleName": "base-scorekeep",
                "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/base-scorekeep",
                "ResourceARN": "*",
                "Priority": 9000,
                "FixedRate": 0.1,
                "ReservoirSize": 2,
                "ServiceName": "Scorekeep",
                "ServiceType": "*",
                "Host": "*",
                "HTTPMethod": "*",
                "URLPath": "*",
                "Version": 1,
                "Attributes": {}
            },
            "CreatedAt": 1530573954.0,
            "ModifiedAt": 1530920505.0
        },
        {
            "SamplingRule": {
                "RuleName": "polling-scorekeep",
                "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/polling-
scorekeep",
                "ResourceARN": "*",
                "Priority": 5000,
                "FixedRate": 0.003,
                "ReservoirSize": 0,
                "ServiceName": "Scorekeep",
                "ServiceType": "*",
                "Host": "*",
                "HTTPMethod": "GET",
                "URLPath": "/api/state/*",
                "Version": 1,
                "Attributes": {}
            },
            "CreatedAt": 1530918163.0,
            "ModifiedAt": 1530918163.0
        }
    ]
}
```

For more information, see Using Sampling Rules with the X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see GetSamplingRules in *AWS CLI Command Reference*.

### `get-sampling-targets`

The following code example shows how to use `get-sampling-targets`.

#### AWS CLI

**To request a sampling quota**

The following `get-sampling-targets` example requests a sampling quota for rules that the service is using to sample requests. The response from AWS X-Ray includes a quota that can be used instead of borrowing from the reservoir.

```
aws xray get-sampling-targets \
    --sampling-statistics-documents '[ { "RuleName": "base-scorekeep", "ClientID":
 "ABCDEF1234567890ABCDEF10", "Timestamp": "2018-07-07T00:20:06, "RequestCount": 110,
 "SampledCount": 20, "BorrowCount": 10 }, { "RuleName": "polling-scorekeep", 31,
 "BorrowCount": 0 } ]'
```

Output:

```
{
    "SamplingTargetDocuments": [
        {
            "RuleName": "base-scorekeep",
            "FixedRate": 0.1,
            "ReservoirQuota": 2,
            "ReservoirQuotaTTL": 1530923107.0,
            "Interval": 10
        },
        {
            "RuleName": "polling-scorekeep",
            "FixedRate": 0.003,
            "ReservoirQuota": 0,
            "ReservoirQuotaTTL": 1530923107.0,
            "Interval": 10
        }
    ],
    "LastRuleModification": 1530920505.0,
```

```
    "UnprocessedStatistics": []
}
```

For more information, see Using Sampling Rules with the X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see GetSamplingTargets in *AWS CLI Command Reference*.

### `get-service-graph`

The following code example shows how to use `get-service-graph`.

#### AWS CLI

**To get a service graph**

The following example displays a document within a specified time period that describes services processing incoming requests, and the downstream services that they call as a result.:

```
aws xray get-service-graph \
    --start-time 1568835392.0
    --end-time 1568835446.0
```

Output:

```
{
    "Services": [
        {
            "ReferenceId": 0,
            "Name": "Scorekeep",
            "Names": [
                "Scorekeep"
            ],
            "Root": true,
            "Type": "AWS::ElasticBeanstalk::Environment",
            "State": "active",
            "StartTime": 1568835392.0,
            "EndTime": 1568835446.0,
            "Edges": [
                {
                    "ReferenceId": 1,
                    "StartTime": 1568835392.0,
                    "EndTime": 1568835446.0,
```

```
                    "SummaryStatistics": {
                        "OkCount": 14,
                        "ErrorStatistics": {
                            "ThrottleCount": 0,
                            "OtherCount": 0,
                            "TotalCount": 0
                        },
                        "FaultStatistics": {
                            "OtherCount": 0,
                            "TotalCount": 0
                        },
                        "TotalCount": 14,
                        "TotalResponseTime": 0.13
                    },
                    "ResponseTimeHistogram": [
                        {
                            "Value": 0.008,
                            "Count": 1
                        },
                        {
                            "Value": 0.005,
                            "Count": 7
                        },
                        {
                            "Value": 0.009,
                            "Count": 1
                        },
                        {
                            "Value": 0.021,
                            "Count": 1
                        },
                        {
                            "Value": 0.038,
                            "Count": 1
                        },
                        {
                            "Value": 0.007,
                            "Count": 1
                        },
                        {
                            "Value": 0.006,
                            "Count": 2
                        }
                    ],
```

```

                },

                ... TRUNCATED FOR BREVITY ...

            ]
        }
    ],
    "StartTime": 1568835392.0,
    "EndTime": 1568835446.0,
    "ContainsOldGroupVersions": false
}
```

For more information, see Using the AWS X-Ray API with the AWS CLI in the *AWS X-Ray Developer Guide*.

- For API details, see GetServiceGraph in *AWS CLI Command Reference*.

### `get-trace-summaries`

The following code example shows how to use `get-trace-summaries`.

#### AWS CLI

**To get a trace summary**

The following `get-trace-summaries` example retrieves IDs and metadata for traces available within a specified time frame.

```
aws xray get-trace-summaries \
    --start-time 1568835392.0 \
    --end-time 1568835446.0
```

Output:

```
[
    "http://scorekeep-env-1.123456789.us-east-2.elasticbeanstalk.com/api/move/
VSAE93HF/GSSD2NTB/DP0PCC09",
    "http://scorekeep-env-1.123456789.us-east-2.elasticbeanstalk.com/api/move/
GCQ2B35P/FREELDFT/4LRE643M",
    "http://scorekeep-env-1.123456789.us-east-2.elasticbeanstalk.com/api/game/
VSAE93HF/GSSD2NTB/starttime/1568835513",
```

```
    "http://scorekeep-env-1.123456789.us-east-2.elasticbeanstalk.com/api/
move/4MQNA5NN/L99KK2RF/null"
]
```

For more information, see Using the AWS X-Ray API with the AWS CLI in the *AWS X-Ray Developer Guide*.

- For API details, see GetTraceSummaries in *AWS CLI Command Reference*.

### `put-encryption-config`

The following code example shows how to use `put-encryption-config`.

**AWS CLI**

**To update the encryption configuration**

The following `put-encryption-config``example updates the encryption configuration for AWS X-Ray data to use the default AWS managed KMS key ``aws/xray`.

```
aws xray put-encryption-config \
    --type KMS \
    --key-id alias/aws/xray
```

Output:

```
{
    "EncryptionConfig": {
        "KeyId": "arn:aws:kms:us-west-2:123456789012:key/c234g4e8-39e9-4gb0-84e2-
b0ea215cbba5",
        "Status": "UPDATING",
        "Type": "KMS"
    }
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see PutEncryptionConfig in *AWS CLI Command Reference*.

### `put-trace-segments`

The following code example shows how to use `put-trace-segments`.

**AWS CLI**

**To upload a segment**

The following `put-trace-segments` example uploads segment documents to AWS X-Ray. The segment document is consumed as a list of JSON segment documents.

```
aws xray put-trace-segments \
    --trace-segment-documents "{\"id\":\"20312a0e2b8809f4\",\"name
\":\"DynamoDB\",\"trace_id\":\"1-5832862d-a43aafded3334a971fe312db\",
\"start_time\":1.479706157195E9,\"end_time\":1.479706157202E9,\"parent_id\":
\"79736b962fe3239e\",\"http\":{\"response\":{\"content_length\":60,\"status
\":200}},\"inferred\":true,\"aws\":{\"consistent_read\":false,\"table_name
\":\"scorekeep-session-xray\",\"operation\":\"GetItem\",\"request_id\":
\"SCAU23OM6M8FO38UASGC7785ARVV4KQNSO5AEMVJF66Q9ASUAAJG\",\"resource_names\":
[\"scorekeep-session-xray\"]},\"origin\":\"AWS::DynamoDB::Table\"}"
```

Output:

```
{
    "UnprocessedTraceSegments": []
}
```

For more information, see Sending Trace Data to AWS X-Ray in the *AWS X-Ray Developer Guide*.

- For API details, see PutTraceSegments in *AWS CLI Command Reference*.

### `update-group`

The following code example shows how to use `update-group`.

**AWS CLI**

**To update a group**

The following `update-group` example updates the criteria by which to accept traces into the group named `AdminGroup`. You can specify the desired group by using either the group name or group ARN.

```
aws xray update-group \
    --group-name "AdminGroup" \
    --group-arn "arn:aws:xray:us-west-2:123456789012:group/AdminGroup/123456789" \
    --filter-expression "service(\"mydomain.com\") {fault}"
```

Output:

```
{
    "GroupName": "AdminGroup",
    "GroupARN": "arn:aws:xray:us-east-2:123456789012:group/AdminGroup/123456789",
    "FilterExpression": "service(\"mydomain.com\") {fault}"
}
```

For more information, see Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API in the *AWS X-Ray Developer Guide*.

- For API details, see UpdateGroup in *AWS CLI Command Reference*.

### `update-sampling-rule`

The following code example shows how to use `update-sampling-rule`.

#### AWS CLI

**To update a sampling rule**

The following `update-sampling-rule` example modifies a sampling rule's configuration. The rules are consumed from a JSON file. Only the fields being updated are required.

```
aws xray update-sampling-rule \
   --cli-input-json file://1000-default.json
```

Contents of `1000-default.json`:

```
{
    "SamplingRuleUpdate": {
        "RuleName": "Default",
        "FixedRate": 0.01,
        "ReservoirSize": 0
    }
```

```
}
```

Output:

```
{
    "SamplingRuleRecords": [
        {
            "SamplingRule": {
                "RuleName": "Default",
                "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/
Default",
                "ResourceARN": "*",
                "Priority": 10000,
                "FixedRate": 0.01,

# AWS CLI with Bash script code examples

The code examples in this topic show you how to use the AWS Command Line Interface with Bash script with AWS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

*Cross-service examples* are sample applications that work across multiple AWS services.

**Examples**

- Actions and scenarios using AWS CLI with Bash script

## Actions and scenarios using AWS CLI with Bash script

The following code examples show how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with AWS services.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

**Services**

- DynamoDB examples using AWS CLI with Bash script
- Amazon EC2 examples using AWS CLI with Bash script
- HealthImaging examples using AWS CLI with Bash script
- IAM examples using AWS CLI with Bash script
- Amazon S3 examples using AWS CLI with Bash script
- AWS STS examples using AWS CLI with Bash script

### DynamoDB examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with DynamoDB.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

**Topics**

### Actions

#### `BatchGetItem`

The following code example shows how to use `BatchGetItem`.

**AWS CLI with Bash script**

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
###############################################################################
# function dynamodb_batch_get_item
#
# This function gets a batch of items from a DynamoDB table.
#
# Parameters:
#       -i item  -- Path to json file containing the keys of the items to get.
#
#  Returns:
#       The items as json output.
#  And:
#       0 - If successful.
#       1 - If it fails.
###############################################################################
function dynamodb_batch_get_item() {
  local item response
  local option OPTARG # Required to use getopts command in a function.
```

```
#######################################
# Function usage explanation
#######################################
function usage() {

### `UpdateItem`

The following code example shows how to use `UpdateItem`.

### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function dynamodb_update_item
#
# This function updates an item in a DynamoDB table.
#
#
# Parameters:
#       -n table_name  -- The name of the table.
#       -k keys  -- Path to json file containing the keys that identify the item to
 update.
#       -e update expression  -- An expression that defines one or more attributes
 to be updated.
#       -v values  -- Path to json file containing the update values.
#
#  Returns:
#       0 - If successful.
#       1 - If it fails.
##############################################################################
function dynamodb_update_item() {
  local table_name keys update_expression values response
  local option OPTARG # Required to use getopts command in a function.

### Scenarios

#### Get started with tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table, then delete the table.

#### AWS CLI with Bash script

## Amazon EC2 examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with Amazon EC2.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Actions

#### `AllocateAddress`

The following code example shows how to use `AllocateAddress`.

#### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function ec2_allocate_address
#
```

```
# This function allocates an Elastic IP address for use with Amazon Elastic Compute
 Cloud (Amazon EC2) instances in a specific AWS Region.
#
# Parameters:
#       -d domain - The domain for the Elastic IP address (either 'vpc' or
 'standard').
#
# Returns:
#       The allocated Elastic IP address, or an error message if the operation
 fails.
# And:
#       0 - If successful.
#       1 - If it fails.
#

}
```

- For API details, see TerminateInstances in *AWS CLI Command Reference*.

## Scenarios

### Get started with instances

The following code example shows how to:

- Create a key pair and security group.
- Select an Amazon Machine Image (AMI) and compatible instance type, then create an instance.
- Stop and restart the instance.
- Associate an Elastic IP address with your instance.
- Connect to your instance with SSH, then clean up resources.

### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

Run an interactive scenario at a command prompt.

```

## HealthImaging examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with HealthImaging.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

  return 0
}
```

- For API details, see ListUsers in *AWS CLI Command Reference*.

### Scenarios

#### Create a user and assume a role

The following code example shows how to create a user and assume a role.

> **Warning**
>
> To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as AWS IAM Identity Center.

- Create a user with no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list S3 buckets using temporary credentials, then clean up resources.

#### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function iam_create_user_assume_role
#
# Scenario to create an IAM user, create an IAM role, and apply the role to the
 user.

## Amazon S3 examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with Amazon S3.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

### Topics

### Actions

#### `CopyObject`

The following code example shows how to use `CopyObject`.

#### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
##############################################################################
function errecho() {
```

```
  printf "%s\n" "$*" 1>&2
}

#############################################################################
# function copy_item_in_bucket
#
# This function creates a copy of the specified file in the same bucket.
#
# Parameters:
#       $1 - The name of the bucket to copy the file from and to.
#       $2 - The key of the source file to copy.
#       $3 - The key of the destination file.
#
# Returns:
#       0 - If successful.
#       1 - If it fails.
#############################################################################
function copy_item_in_bucket() {
  local bucket_name=$1
  local source_key=$2
  local destination_key=$3
  local response

  response=$(aws s3api copy-object \
    --bucket "$bucket_name" \
    --copy-source "$bucket_name/$source_key" \
    --key "$destination_key")

  # shellcheck disable=SC2181
  if [[ $? -ne 0 ]]; then
    errecho "ERROR:  AWS reports s3api copy-object operation failed.\n$response"
    return 1
  fi
}
```

- For API details, see CopyObject in *AWS CLI Command Reference*.

### `CreateBucket`

The following code example shows how to use `CreateBucket`.

### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function iecho
#
# This function enables the script to display the specified text only if
# the global variable $VERBOSE is set to true.
##############################################################################
function iecho() {
  if [[ $VERBOSE == true ]]; then
    echo "$@"
  fi
}

##############################################################################
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
##############################################################################
function errecho() {
  printf "%s\n" "$*" 1>&2
}

##############################################################################
# function create-bucket
#
# This function creates the specified bucket in the specified AWS Region, unless
# it already exists.
#
# Parameters:
#       -b bucket_name  -- The name of the bucket to create.
#       -r region_code  -- The code for an AWS Region in which to
#                          create the bucket.
#
# Returns:
#       The URL of the bucket that was created.
```

```
#     And:
#       0 - If successful.
#       1 - If it fails.

  # shellcheck disable=SC2181
  if [[ ${?} -ne 0 ]]; then
    errecho "ERROR: AWS reports put-object operation failed.\n$response"
    return 1
  fi
}
```

- For API details, see GetObject in *AWS CLI Command Reference*.

### `HeadBucket`

The following code example shows how to use `HeadBucket`.

#### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function bucket_exists
#
# This function checks to see if the specified bucket already exists.
#
# Parameters:
#       $1 - The name of the bucket to check.
#
# Returns:
#       0 - If the bucket already exists.
#       1 - If the bucket doesn't exist.
##############################################################################
function bucket_exists() {
  local bucket_name
  bucket_name=$1

  # Check whether the bucket already exists.
  # We suppress all output - we're interested only in the return code.

  if aws s3api head-bucket \
    --bucket "$bucket_name" \
    >/dev/null 2>&1; then
    return 0 # 0 in Bash script means true.
  else
    return 1 # 1 in Bash script means false.
  fi
}
```

- For API details, see HeadBucket in *AWS CLI Command Reference*.

### `ListObjectsV2`

The following code example shows how to use `ListObjectsV2`.

#### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
##############################################################################
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
##############################################################################
function errecho() {
  printf "%s\n" "$*" 1>&2
}

##############################################################################
# function list_items_in_bucket
#
# This function displays a list of the files in the bucket with each file's
# size. The function uses the --query parameter to retrieve only the key and
# size fields from the Contents collection.
#
# Parameters:
#       $1 - The name of the bucket.
#
# Returns:
#       The list of files in text format.
#     And:
#       0 - If successful.
#       1 - If it fails.
##############################################################################
function list_items_in_bucket() {
  local bucket_name=$1
  local response

  response=$(aws s3api list-objects \
    --bucket "$bucket_name" \
```

```
    --output text \
    --query 'Contents[].{Key: Key, Size: Size}')

  # shellcheck disable=SC2181
  if [[ ${?} -eq 0 ]]; then
    echo "$response"
  else
    errecho "ERROR: AWS reports s3api list-objects operation failed.\n$response"
    return 1
  fi
}
```

- For API details, see ListObjectsV2 in *AWS CLI Command Reference*.

### `PutObject`

The following code example shows how to use `PutObject`.

#### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
###############################################################################
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
###############################################################################
function errecho() {
  printf "%s\n" "$*" 1>&2
}

###############################################################################
# function copy_file_to_bucket
#
# This function creates a file in the specified bucket.
#
```

```
# Parameters:
#       $1 - The name of the bucket to copy the file to.
#       $2 - The path and file name of the local file to copy to the bucket.
#       $3 - The key (name) to call the copy of the file in the bucket.
#
# Returns:
#       0 - If successful.
#       1 - If it fails.
###############################################################################
function copy_file_to_bucket() {
  local response bucket_name source_file destination_file_name
  bucket_name=$1
  source_file=$2
  destination_file_name=$3

  response=$(aws s3api put-object \
    --bucket "$bucket_name" \
    --body "$source_file" \
    --key "$destination_file_name")

  # shellcheck disable=SC2181
  if [[ ${?} -ne 0 ]]; then
    errecho "ERROR: AWS reports put-object operation failed.\n$response"
    return 1
  fi
}
```

- For API details, see PutObject in *AWS CLI Command Reference*.

### Scenarios

### Get started with buckets and objects

The following code example shows how to:

- Create a bucket and upload a file to it.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the bucket objects and the bucket.

### AWS CLI with Bash script

> **Note**
>
> There's more on GitHub. Find the complete example and learn how to set up and run in the AWS Code Examples Repository.

```
###############################################################################
# function s3_getting_started
#
# This function creates, copies, and deletes S3 buckets and objects.
#
# Returns:
#       0 - If successful.
#       1 - If an error occurred.
###############################################################################
function s3_getting_started() {
  {
    if [ "$BUCKET_OPERATIONS_SOURCED" != "True" ]; then

## AWS STS examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with AWS STS.

*Actions* are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

*Scenarios* are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

# Security in the AWS Command Line Interface

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS Compliance Programs. To learn about the compliance programs that apply to AWS Command Line Interface, see AWS Services in Scope by Compliance Program.
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using the AWS Command Line Interface (AWS CLI). The following topics show you how to configure the AWS CLI to meet your security and compliance objectives. You also learn how to use the AWS CLI to help you to monitor and secure your AWS resources.

**Topics**

# Data protection in the AWS CLI

The AWS shared responsibility model applies to data protection in AWS Command Line Interface. As described in this model, AWS is responsible for protecting the global infrastructure that runs all

of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the *AWS Security Blog*.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with AWS CLI or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

## Data encryption

A key feature of any secure service is that information is encrypted when it is not being actively used.

### Encryption at rest

The AWS CLI does not itself store any customer data other than the credentials it needs to interact with the AWS services on the user's behalf.

If you use the AWS CLI to invoke an AWS service that transmits customer data to your local computer for storage, then refer to the Security & Compliance chapter in that service's User Guide for information on how that data is stored, protected, and encrypted.

### Encryption in transit

By default, all data transmitted from the client computer running the AWS CLI and AWS service endpoints is encrypted by sending everything through a HTTPS/TLS connection.

You don't need to do anything to enable the use of HTTPS/TLS. It is always enabled unless you explicitly disable it for an individual command by using the `--no-verify-ssl` command line option.

# Identity and Access Management

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use AWS resources. IAM is an AWS service that you can use with no additional charge.

**Topics**

## Audience

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in AWS.

**Service user** – If you use AWS services to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more AWS features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in AWS, see Troubleshooting AWS identity and access or the user guide of the AWS service you are using.

**Service administrator** – If you're in charge of AWS resources at your company, you probably have full access to AWS. It's your job to determine which AWS features and resources your service users should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with AWS, see the user guide of the AWS service you are using.

**IAM administrator** – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to AWS. To view example AWS identity-based policies that you can use in IAM, see the user guide of the AWS service you are using.

## Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. You must be *authenticated* (signed in to AWS) as the AWS account root user, as an IAM user, or by assuming an IAM role.

You can sign in to AWS as a federated identity by using credentials provided through an identity source. AWS IAM Identity Center (IAM Identity Center) users, your company's single sign-on authentication, and your Google or Facebook credentials are examples of federated identities. When you sign in as a federated identity, your administrator previously set up identity federation using IAM roles. When you access AWS by using federation, you are indirectly assuming a role.

Depending on the type of user you are, you can sign in to the AWS Management Console or the AWS access portal. For more information about signing in to AWS, see How to sign in to your AWS account in the *AWS Sign-In User Guide*.

If you access AWS programmatically, AWS provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests by using your credentials. If you don't use AWS tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see Signing AWS API requests in the *IAM User Guide*.

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see Multi-factor authentication in the *AWS IAM Identity Center User Guide* and Using multi-factor authentication (MFA) in AWS in the *IAM User Guide*.

### AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account *root user* and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you don't use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see Tasks that require root user credentials in the *IAM User Guide*.

### Federated identity

As a best practice, require human users, including users that require administrator access, to use federation with an identity provider to access AWS services by using temporary credentials.

A *federated identity* is a user from your enterprise user directory, a web identity provider, the AWS Directory Service, the Identity Center directory, or any user that accesses AWS services by using credentials provided through an identity source. When federated identities access AWS accounts, they assume roles, and the roles provide temporary credentials.

For centralized access management, we recommend that you use AWS IAM Identity Center. You can create users and groups in IAM Identity Center, or you can connect and synchronize to a set of users and groups in your own identity source for use across all your AWS accounts and applications. For information about IAM Identity Center, see What is IAM Identity Center? in the *AWS IAM Identity Center User Guide*.

### IAM users and groups

An *IAM user* is an identity within your AWS account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see Rotate access keys regularly for use cases that require long-term credentials in the *IAM User Guide*.

An *IAM group* is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named *IAMAdmins* and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see When to create an IAM user (instead of a role) in the *IAM User Guide*.

## IAM roles

An *IAM role* is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by switching roles. You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see Using IAM roles in the *IAM User Guide*.

IAM roles with temporary credentials are useful in the following situations:

- **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see Creating a role for a third-party Identity Provider in the *IAM User Guide*. If you use IAM Identity Center, you configure a permission set. To control what your identities can access after they authenticate, IAM Identity Center correlates the permission set to a role in IAM. For information about permissions sets, see Permission sets in the *AWS IAM Identity Center User Guide*.
- **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.
- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the *IAM User Guide*.
- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.
  - **Forward access sessions (FAS)** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. When you use some services, you might perform an

action that then initiates another action in a different service. FAS uses the permissions of the principal calling an AWS service, combined with the requesting AWS service to make requests to downstream services. FAS requests are only made when a service receives a request that requires interactions with other AWS services or resources to complete. In this case, you must have permissions to perform both actions. For policy details when making FAS requests, see Forward access sessions.

- **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the *IAM User Guide*.
- **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the *IAM User Guide*.

To learn whether to use IAM roles or IAM users, see When to create an IAM role (instead of a user) in the *IAM User Guide*.

## Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the *IAM User Guide*.

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

By default, users and roles have no permissions. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies. The administrator can then add the IAM policies to roles, and users can assume the roles.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

## Identity-based policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Creating IAM policies in the *IAM User Guide*.

Identity-based policies can be further categorized as *inline policies* or *managed policies*. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see Choosing between managed policies and inline policies in the *IAM User Guide*.

## Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

## Access control lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see Access control list (ACL) overview in the *Amazon Simple Storage Service Developer Guide*.

## Other policy types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of an entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the `Principal` field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the *IAM User Guide*.
- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see How SCPs work in the *AWS Organizations User Guide*.
- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the *IAM User Guide*.

### Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the *IAM User Guide*.

## How AWS services work with IAM

To get a high-level view of how AWS services work with most IAM features, see AWS services that work with IAM in the *IAM User Guide*.

To learn how to use a specific AWS service with IAM, see the security section of the relevant service's User Guide.

## Troubleshooting AWS identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with AWS and IAM.

**Topics**

- I am not authorized to perform an action in AWS
- I am not authorized to perform iam:PassRole
- I want to allow people outside of my AWS account to access my AWS resources

### I am not authorized to perform an action in AWS

If you receive an error that you're not authorized to perform an action, your policies must be updated to allow you to perform the action.

The following example error occurs when the `mateojackson` IAM user tries to use the console to view details about a fictional *`my-example-widget`* resource but doesn't have the fictional `awes:`*`GetWidget`* permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform:
 awes:GetWidget on resource: my-example-widget
```

In this case, the policy for the `mateojackson` user must be updated to allow access to the *`my-example-widget`* resource by using the `awes:`*`GetWidget`* action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

## I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to AWS.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in AWS. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform:
 iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

## I want to allow people outside of my AWS account to access my AWS resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether AWS supports these features, see How AWS services work with IAM.
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the *IAM User Guide*.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the *IAM User Guide*.

- To learn the difference between using roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the *IAM User Guide*.

## Compliance Validation for this AWS Product or Service

To learn whether an AWS service is within the scope of specific compliance programs, see AWS services in Scope by Compliance Program and choose the compliance program that you are interested in. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- Security and Compliance Quick Start Guides – These deployment guides discuss architectural considerations and provide steps for deploying baseline environments on AWS that are security and compliance focused.
- Architecting for HIPAA Security and Compliance on Amazon Web Services – This whitepaper describes how companies can use AWS to create HIPAA-eligible applications.

  > **Note**
  >
  > Not all AWS services are HIPAA eligible. For more information, see the HIPAA Eligible Services Reference.

- AWS Compliance Resources – This collection of workbooks and guides might apply to your industry and location.
- AWS Customer Compliance Guides – Understand the shared responsibility model through the lens of compliance. The guides summarize the best practices for securing AWS services and map the guidance to security controls across multiple frameworks (including National Institute of Standards and Technology (NIST), Payment Card Industry Security Standards Council (PCI), and International Organization for Standardization (ISO)).
- Evaluating Resources with Rules in the *AWS Config Developer Guide* – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.

- AWS Security Hub – This AWS service provides a comprehensive view of your security state within AWS. Security Hub uses security controls to evaluate your AWS resources and to check your compliance against security industry standards and best practices. For a list of supported services and controls, see Security Hub controls reference.
- Amazon GuardDuty – This AWS service detects potential threats to your AWS accounts, workloads, containers, and data by monitoring your environment for suspicious and malicious activities. GuardDuty can help you address various compliance requirements, like PCI DSS, by meeting intrusion detection requirements mandated by certain compliance frameworks.
- AWS Audit Manager – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.

This AWS product or service follows the shared responsibility model through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the AWS service security documentation page and AWS services that are in scope of AWS compliance efforts by compliance program.

## Resilience for this AWS Product or Service

The AWS global infrastructure is built around AWS Regions and Availability Zones.

AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking.

With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

This AWS product or service follows the shared responsibility model through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the AWS service security documentation page and AWS services that are in scope of AWS compliance efforts by compliance program.

## Infrastructure Security for this AWS Product or Service

This AWS product or service uses managed services, and therefore is protected by the AWS global network security. For information about AWS security services and how AWS protects

infrastructure, see AWS Cloud Security. To design your AWS environment using the best practices for infrastructure security, see Infrastructure Protection in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access this AWS Product or Service through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.

This AWS product or service follows the shared responsibility model through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the AWS service security documentation page and AWS services that are in scope of AWS compliance efforts by compliance program.

## Enforce a minimum version of TLS

To add increased security when communicating with AWS services, you should use TLS 1.2 or later. When you use the AWS CLI, Python is used to set the TLS version.

AWS CLI version 2 uses an internal Python script that's compiled to use a minimum of TLS 1.2 when the service it's talking to supports it. As long as you use version 2 of the AWS CLI, no further steps are needed to enforce this minimum.

# Troubleshoot AWS CLI errors

This section covers common errors and troubleshooting steps to follow to resolve your issue. We suggest following the general troubleshooting first.

**Contents**

## General troubleshooting to try first

If you receive an error or encounter an issue with the AWS CLI, we suggest the following general tips to help you troubleshoot.

Back to top

## Check your AWS CLI command formatting

If you receive an error that indicates that a command doesn't exist, or that it doesn't recognize a parameter (`Parameter validation failed`) that the documentation says is available , then your command might be formatted incorrectly. We suggest that you check the following:

- Check your command for spelling and formatting errors.
- Confirm all quotes and escaping appropriate for your terminal is correct in your command.
- Generate an AWS CLI skeleton to confirm your command structure.
- For JSON, see the additional troubleshooting for JSON values. If you're having issues with your terminal processing JSON formatting, we suggest skipping past the terminal's quoting rules by using Blobs to pass JSON data directly to the AWS CLI.

For more information on how a specific command should be structured, see the AWS CLI version 2 reference guide.

Back to top

## Check the AWS Region your AWS CLI command is using

> **Note**
>
> You must specify an AWS Region when using the AWS CLI, either explicitly or by setting a default Region. For a list of all of the AWS Regions that you can specify, see AWS Regions and Endpoints in the *Amazon Web Services General Reference*. The AWS Region designators used by the AWS CLI are the same names that you see in AWS Management Console URLs and service endpoints.

Errors or unexpected results might occur if an AWS service isn't available for your specified AWS Region or your resources are located in a different AWS Region. In order of precedence, the AWS Region is set in the following ways:

- The `--region` command line option.
- The SDK compatible `AWS_REGION` environment variable.
- The `AWS_DEFAULT_REGION` environment variable.
- The `region` profile setting.

Confirm you're using the correct AWS Region for your resources.

Back to top

## Confirm that you're running a recent version of the AWS CLI

If you receive an error that indicates that a command doesn't exist, or that it doesn't recognize a parameter that the AWS CLI version 2 reference guide says is available, first confirm that your command is correctly formatted. If the formatting is correct, then we recommend that you upgrade to the most recent version of the AWS CLI. Updated versions of the AWS CLI are released almost every business day. New AWS services, features, and parameters are introduced in those new versions of the AWS CLI. The only way to get access to those new services, features, or parameters is to upgrade to a version that was released after that element was first introduced.

How you update your version of the AWS CLI depends on how you originally installed it as described in the section called “Install/Update”.

If you used one of the bundled installers, you might need to remove the existing installation before you download and install the latest version for your operating system.

Back to top

## Use the `--debug` option

When the AWS CLI reports an error that you don't immediately understand, or produces results that you don't expect, you can get more detail about the error by running the command again with the `--debug` option. With this option, the AWS CLI outputs details about every step it takes to process your command. The details in the output can help you to determine when the error occurs and provides clues about where it started.

You can send the output to a text file for later review, or to send to AWS Support when asked for it.

When you include the `--debug` option, some of the details include:

- Looking for credentials
- Parsing the provided parameters
- Constructing the request sent to AWS servers
- The contents of the request sent to AWS
- The contents of the raw response
- The formatted output

Here's an example of a command run with and without the `--debug` option.

```
$ aws iam list-groups --profile MyTestProfile
{
    "Groups": [
        {
            "Path": "/",
            "GroupName": "MyTestGroup",
            "GroupId": "AGPA0123456789EXAMPLE",
            "Arn": "arn:aws:iam::123456789012:group/MyTestGroup",
            "CreateDate": "2019-08-12T19:34:04Z"
        }
    ]
}
```

```

## Enable and review the AWS CLI command history logs

You can enable the AWS CLI command history logs using the `cli_history` file setting. After enabling this setting, the AWS CLI records the history of `aws` commands.

You can this list your history using the `aws history list` command, and use the resulting command_ids in the `aws history show` command for details. For more information see `aws history` in the *AWS CLI reference guide*.

When you include the `--debug` option, some of the details include:

- API calls made to botocore
- Status codes
- HTTP responses
- Headers
- Return codes

You can use this information to confirm paramater data and API calls are behaving in the way you expect, and can then deduce at what step in the process your command is failing.

Back to top

## Confirm that your AWS CLI is configured

Various errors can occur if your `config` and `credentials` files or your IAM user or role is not configured correctly. For more information on resolving errors with `config` and `credentials` files or your IAM user or roles, see the section called “Access denied errors” and the section called “Invalid credentials and key errors”.

Back to top

# Command not found errors

This error means that the operating system can't find the AWS CLI command. The installation might be incomplete or requires updating.

**Possible cause: You're trying to use an AWS CLI feature newer than your installed version, or have incorrect formatting**

*Example error text:*

```
$ aws s3 copy
usage: aws [options] <command> <subcommand> [<subcommand> ...] [parameters]
To see help text, you can run:

  aws help
  aws <command> help
  aws <command> <subcommand> help
aws: error: argument subcommand: Invalid choice, valid choices are:

ls                                       | website
cp                                       | mv
....
```

Various errors can occur if your command is formatted incorrectly or you are using an earlier version from before the feature was released. For more information on resolving errors around these two issues, see the section called “Check your AWS CLI command formatting” and the section called “Confirm that you're running a recent version of the AWS CLI”.

Back to top

**Possible cause: The terminal needs to be restarted after installation**

*Example error text:*

```
$ aws --version
command not found: aws
```

If the `aws` command cannot be found after first installing or updating the AWS CLI, you might need to restart your terminal for it to recognize any `PATH` updates.

Back to top

**Possible cause: The AWS CLI did not fully install**

*Example error text:*

```
$ aws --version
command not found: aws
```

If the `aws` command cannot be found after first installing or updating the AWS CLI, it might not have been fully installed. Try reinstalling by following the steps for your platform in the section called "Install/Update".

Back to top

**Possible cause: The AWS CLI does not have permissions (Linux)**

If the `aws` command cannot be found after first installing or updating the AWS CLI on Linux, it might not have `execute` permissions for the folder it installed in. Run the following command with the PATH to your AWS CLI installation,to provide chmod permissions to the AWS CLI:

```
$ sudo chmod -R 755 /usr/local/aws-cli/
```

Back to top

**Possible cause: The operating system PATH was not updated during installation**

*Example error text:*

```
$ aws --version
command not found: aws
```

You might need to add the `aws` executable to your operating system's PATH environment variable. To add the AWS CLI to your PATH, use the following instructions for your operating system.

Linux and macOS

1. Find your shell's profile script in your user directory. If you're not sure which shell you have, run `echo $SHELL`.

   ```
   $ ls -a ~
   ```

```
.  ..  .bash_logout  .bash_profile  .bashrc  Desktop  Documents  Downloads
```

- **Bash** – `.bash_profile`, `.profile`, or `.bash_login`
- **Zsh** – `.zshrc`
- **Tcsh** – `.tcshrc`, `.cshrc`, or `.login`

2. Add an export command to your profile script. The following command adds your local bin to the current PATH variable.

```
export PATH=/usr/local/bin:$PATH
```

3. Reload the updated profile into your current session.

```
$ source ~/.bash_profile
```

Windows

1. In a Windows Command Prompt, use the `where` command with the `/R` *path* parameter to find the `aws` file location. The results return all folders containing `aws`.

```
C:\> where /R c:\ aws
c:\Program Files\Amazon\AWSCLIV2\aws.exe
...
```

   By default, the AWS CLI version 2 is located in:

```
c:\Program Files\Amazon\AWSCLIV2\aws.exe
```

2. Press the Windows key and enter **`environment variables`**.
3. From the list of suggestions, choose **Edit environment variables for your account**.
4. Choose **PATH**, and then choose **Edit**.
5. Add the path you found in the first step into the **Variable value** field, for example, ***`C:\Program Files\Amazon\AWSCLIV2\aws.exe`***.
6. Choose **OK** twice to apply the new settings.
7. Close any running command prompts and reopen the command prompt window.

Back to top

# The "aws --version" command returns a different version than you installed

Your terminal might be returning a different PATH for the AWS CLI than you expect.

**Possible cause: The terminal needs to be restarted after installing**

If the aws command shows the wrong version, you might need to restart your terminal for it to recognize any PATH updates. All open terminals needs to be closed, not just your active terminal.

Back to top

**Possible cause: The system needs to be restarted after installing**

If the aws command shows the wrong version and restarting the terminal didn't work, you might need to restart your system for it to recognize your PATH updates.

Back to top

**Possible cause: You have multiple versions of the AWS CLI**

If you updated the AWS CLI and used a different install method than your pre-existing installation, it might cause multiple versions to be installed. For example, if on Linux or macOS you used pip for your current install, but tried to update using the .pkg install file, this could cause some conflicts especially with your PATH pointing to the old version.

To resolve this, uninstall all versions of the AWS CLI and perform a clean install.

After uninstalling all versions, follow instructions appropriate for your operating system to install your desired version of the AWS CLI version 1 or AWS CLI version 2.

> **Note**
>
> If this is happening after you installed the AWS CLI version 2 with a pre-existing install of AWS CLI version 1, follow the migration instructions in the section called “Migration instructions”.

Back to top

# The "aws --version" command returns a version after uninstalling the AWS CLI

This often occurs when there is still an AWS CLI installed somewhere on your system.

**Possible cause: The terminal needs to be restarted after uninstalling**

If the `aws --version` command still works, you might need to restart your terminal for it to recognize any terminal updates.

Back to top

**Possible cause: You have multiple versions of the AWS CLI on your system, or didn't use the same uninstall method that you used to originally install the AWS CLI**

The AWS CLI might not uninstall correctly if you uninstalled the AWS CLI using a different method than you used to install it, or if you installed multiple versions. For example, if you used `pip` for your current install, you must use `pip` to uninstall it. To resolve this, uninstall AWS CLI using the same method that you used to install it.

1. Follow the instructions appropriate for your operating system and your original installation method to uninstall the AWS CLI version 1 and AWS CLI version 2.
2. Close all terminals you have open.
3. Open your preferred terminal, enter in the following command and confirm that no version is returned.

```
$ aws --version
command not found: aws
```

If you still have a version listed in the output, the AWS CLI was most likely installed using a different method or there are multiple versions. If you don't know which method you installed the AWS CLI, follow the instructions for each uninstall method for the AWS CLI version 1 and AWS CLI version 2 appropriate to your operating system until no version output is received.

> **Note**
>
> If you used a package manager to install the AWS CLI (`pip`, `apt`, `brew`, etc.), you must use the same package manager to uninstall it. Be sure to follow the

instructions provided by the package manager on how to uninstall all versions of a package.

Back to top

# The AWS CLI processed a command with an incomplete parameter name

**Possible cause: You used a recognized abbreviation of the AWS CLI parameter**

Since the AWS CLI is built using Python, the AWS CLI uses the Python `argparse` library, including the `allow_abbrev` argument. Abbreviations of parameters are recognized by the AWS CLI and processed.

The following `create-change-set` command example changes the CloudFormation stack name. The parameter `--change-set-n` is recognized as an abbreviation of `--change-set-name`, and the AWS CLI processes the command.

```
$ aws cloudformation create-change-set --stack-name my-stack --change-set-n my-change-set
```

When your abbreviation could be multiple commands, the parameter will not be recognized as an abbreviation.

The following `create-change-set` command example changes the CloudFormation stack name. The parameter `--change-set-` is **not** recognized as an abbreviation, as there are there are multiple parameters it could be an abbreviation of, such as `--change-set-name` and `--change-set-type`. Therefore the AWS CLI does **not** process the command.

```
$ aws cloudformation create-change-set --stack-name my-stack --change-set- my-change-set
```

**Warning**

**Do not** purposefully use parameter abbreviations. They are unreliable and are not backwards compatible. If any new parameters are added to a command that confuse your abbreviations, it will break your commands.

Additionally, if the parameter is a single-value argument, it can cause unexpected behavior with your commands. If multiple instances of a single-value argument is passed, only the last instance will run. In the following example, the parameter `--filters` is a single-valued argument. The parameters `--filters` and `--filter` are specified. The `--filter` parameter is an abbreviation of `--filters`. This cause two instances of `--filters` being applied and only the last `--filter` argument applies.

```
$ aws ec2 describe-vpc-peering-connections \
    --filters Name=tag:TagName,Values=VpcPeeringConnection \
    --filter Name=status-code,Values=active
```

Confirm you are using valid parameters before running a command to prevent unexpected behavior.

Back to top

# Access denied errors

**Possible cause: The AWS CLI program file doesn't have "run" permission**

On Linux or macOS, make sure that the `aws` program has run permissions for the calling user. Typically, the permissions are set to 755.

To add run permission for your user, run the following command, substituting *`~/.local/bin/aws`* with the path to the program on your computer.

```
$ chmod +x ~/.local/bin/aws
```

Back to top

**Possible cause: Your IAM identity doesn't have permission to perform the operation**

*Example error text:*

```
$ aws s3 ls
An error occurred (AcessDenied) when calling the ListBuckets operation: Access
 denied.
```

When you run a AWS CLI command, AWS operations are performed on your behalf, using credentials that associate you with an IAM account or role. The policies attached must grant you permission to call the API actions that correspond to the commands that you run with the AWS CLI.

Most commands call a single action with a name that matches the command name. However, custom commands like `aws s3 sync` call multiple APIs. You can see which APIs a command calls by using the `--debug` option.

If you are sure that the user or role has the proper permissions assigned by policy, make sure that your AWS CLI command is using the credentials you expect. See the next section about credentials to verify that the credentials the AWS CLI is using are the ones that you expect.

For information about assigning IAM permissions, see Overview of Access Management: Permissions and Policies in the *IAM User Guide*.

Back to top

## Invalid credentials and key errors

*Example error text:*

```
$ aws s3 ls
An error occurred (InvalidAccessKeyId) when calling the ListBuckets operation: The AWS
 Access Key Id
you provided does not exist in our records.
```

```
$ aws s3 ls
An error occurred (InvalidClientTokenId) when calling the ListBuckets operation: The
 security token
included in the request is invalid.
```

**Possible cause: The AWS CLI is reading incorrect credentials or from an unexpected location**

The AWS CLI might be reading credentials from a different location than you expect, or your key pair information is incorrect. You can run `aws configure list` to confirm which credentials are used.

The following example shows how to check the credentials used for the default profile.

```
$ aws configure list
      Name                    Value             Type    Location
      ----                    -----             ----    --------
   profile                <not set>             None    None
access_key     ****************XYVA shared-credentials-file
secret_key     ****************ZAGY shared-credentials-file
    region                us-west-2      config-file    ~/.aws/config
```

The following example shows how to check the credentials of a named profile.

```
$ aws configure list --profile saanvi
      Name                    Value             Type    Location
      ----                    -----             ----    --------
   profile                    saanvi           manual    --profile
access_key         **************** shared-credentials-file
secret_key         **************** shared-credentials-file
    region                us-west-2      config-file    ~/.aws/config
```

To confirm your key pair details, check your `config` and `credentials` files. For more information on `config` and `credentials` files, see the section called "Configuration and credential file settings". For more information on credentials and authentication, including credentials precedence, see *Authentication and access credentials*.

Back to top

**Possible cause: Your computer's clock is out of sync**

If you are using valid credentials, your clock might be out of sync. On Linux or macOS, run `date` to check the time.

```
$ date
```

If your system clock is not correct within a few minutes, use `ntpd` to sync it.

```
$ sudo service ntpd stop
$ sudo ntpdate time.nist.gov
$ sudo service ntpd start
$ ntpstat
```

On Windows, use the date and time options in the Control Panel to configure your system clock.

Back to top

# Signature does not match errors

*Example error text:*

```
$ aws s3 ls
An error occurred (SignatureDoesNotMatch) when calling the ListBuckets operation: The
 request signature we
calculated does not match the signature you provided. Check your key and signing
 method.
```

When the AWS CLI runs a command, it sends an encrypted request to the AWS servers to perform the appropriate AWS service operations. Your credentials (the access key and secret key) are involved in the encryption and enable AWS to authenticate the person making the request. There are several things that can interfere with the correct operation of this process, as follows.

**Possible cause: Your clock is out of sync with the AWS servers**

To help protect against replay attacks, the current time can be used during the encryption/decryption process. If the time of the client and server disagree by more than the allowed amount, the process can fail and the request is rejected. This can also happen when you run a command in a virtual machine whose clock is out of sync with the host machine's clock. One possible cause is when the virtual machine hibernates and takes some time after waking up to sync the clock with the host machine.

On Linux or macOS, run `date` to check the time.

```
$ date
```

If your system clock is not correct within a few minutes, use `ntpd` to sync it.

```
$ sudo service ntpd stop
$ sudo ntpdate time.nist.gov
$ sudo service ntpd start
$ ntpstat
```

On Windows, use the date and time options in the Control Panel to configure your system clock.

Back to top

**Possible cause: Your operating system is mishandling AWS keys that contain certain special characters**

If your AWS keys include certain special characters, such as `-`, `+`, `/`, or `%`, some operating system variants process the string improperly and cause the key string to be interpreted incorrectly.

If you process your keys using other tools or scripts, such as tools that build the credentials file on a new instance as part of its creation, those tools and scripts might have their own handling of special characters that causes them to be transformed into something that AWS no longer recognizes.

We suggest regenerating the secret key to get one that does not include the special character causing issues.

Back to top

# SSL certificate errors

**Possible cause: The AWS CLI doesn't trust your proxy's certificate**

*Example error text:*

```
$ aws s3 ls
[SSL: CERTIFICATE_ VERIFY_FAILED] certificate verify failed
```

When you use a AWS CLI command, you receive an `[SSL: CERTIFICATE_ VERIFY_FAILED] certificate verify failed` error message. This is caused by the AWS CLI not trusting your proxy's certificate due to factors such as your proxy's certificate being self-signed, with your company set as the Certification Authority (CA). This prevents the AWS CLI from finding your companies CA root certificate in the local CA registry.

To fix this, instruct the AWS CLI where to find your companies `.pem` file using the `ca_bundle` configuration file setting, **`--ca-bundle`** command line option, or the `AWS_CA_BUNDLE` environment variable.

Back to top

**Possible cause: Your configuration isn't pointing to the correct CA root certificate location**

*Example error text:*

```
$ aws s3 ls
SSL validation failed for regionname [Errno 2] No such file or directory
```

This is caused by your Certification Authority (CA) bundle file location being configured incorrectly in the AWS CLI. To fix this, confirm where your companies `.pem` file is located and update the AWS CLI configuration by using the `ca_bundle` configuration file setting, **`--ca-bundle`** command line option, or the `AWS_CA_BUNDLE` environment variable.

Back to top

**Possible cause: Your configuration isn't using the correct AWS Region**

*Example error text:*

```
$ aws s3 ls
[SSL: CERTIFICATE_ VERIFY_FAILED] certificate verify failed
```

Errors or unexpected results might occur if an AWS service isn't available for your specified AWS Region or your resources are located in a different AWS Region. For troubleshooting steps, see the section called “Check the AWS Region your AWS CLI command is using”.

Back to top

**Possible cause: Your TLS version needs to be updated**

*Example error text:*

```
$ aws s3 ls
[SSL: UNSAFE_LEGACY_RENEGOTIATION_DISABLED] unsafe legacy renegotiation disabled
```

The AWS service is using a version of TLS that is incompatible with your device's TLS version. To resolve this issue, update to a supported TLS version. For more information, see the section called “Enforcing a minimum TLS version”.

Back to top

# Invalid JSON errors

*Example error text:*

```
$ aws dynamodb update-table \
    --provisioned-throughput '{"ReadCapacityUnits":15,WriteCapacityUnits":10}' \
    --table-name MyDDBTable
Error parsing parameter '--provisioned-throughput': Invalid JSON: Expecting property
 name enclosed in
double quotes: line 1 column 25 (char 24)
JSON received: {"ReadCapacityUnits":15,WriteCapacityUnits":10}
```

When you use an AWS CLI command, you receive a "`Invalid JSON`" error message. This is usually an error seen when you enter a command with an expected JSON format and the AWS CLI cannot read your JSON correctly.

**Possible cause: You did not enter valid JSON for the AWS CLI to use**

Confirm you have valid JSON entered for your command. We suggest using a JSON validator for JSON you're having issues formatting.

For more advanced JSON usage in the command line, consider using a command line JSON processor, like `jq`, to create JSON strings. For more information on `jq`, see the jq repository on *GitHub*.

Back to top

**Possible cause: Your terminal's quoting rules are preventing valid JSON being sent to the AWS CLI**

Before the AWS CLI receives anything from a command, your terminal processes the command using it's own quoting and escaping rules. Due to a terminal's formatting rules, some of your JSON content may be stripped before the command is passed to the AWS CLI. When formulating commands, be sure to use your terminal's quoting rules.

To troubleshoot, use the `echo` command to see how the shell is handling your parameters:

```
$ echo {"ReadCapacityUnits":15,"WriteCapacityUnits":10}
ReadCapacityUnits:15 WriteCapacityUnits:10
```

```
$ echo '{"ReadCapacityUnits":15,"WriteCapacityUnits":10}'
{"ReadCapacityUnits":15,"WriteCapacityUnits":10}
```

Modify your command until your until valid JSON is returned.

For more in-depth troubleshooting, use the `--debug` parameter to view the debug logs as they'll display exactly what got passed to the AWS CLI:

```
$ aws dynamodb update-table \
    --provisioned-throughput '{"ReadCapacityUnits":15,WriteCapacityUnits":10}' \
    --table-name MyDDBTable \
    --debug
2022-07-19 22:25:07,741 - MainThread - awscli.clidriver - DEBUG - CLI version: aws-
cli/1.18.147
Python/2.7.18 Linux/5.4.196-119.356.amzn2int.x86_64 botocore/1.18.6
2022-07-19 22:25:07,741 - MainThread - awscli.clidriver - DEBUG - Arguments entered
 to CLI:
['dynamodb', 'update-table', '--provisioned-throughput',
 '{"ReadCapacityUnits":15,WriteCapacityUnits":10}',
 '--table-name', 'MyDDBTable', '--debug']
```

Use your terminal's quoting rules to fix any issues your JSON input has when being sent to the AWS CLI. For more information on quoting rules, see the section called “Quotes with Strings”.

> **Note**
>
> If you're having issues with getting valid JSON to the AWS CLI, we recommend to bypass a terminal's quoting rules for JSON data input by using Blobs to pass your JSON data directly to the AWS CLI. For more information on Blobs, see Blob.

# Migrate from AWS CLI version 1 to version 2

This section contains instructions for updating the AWS CLI version 1 to AWS CLI version 2. The AWS CLI version 2 builds on AWS CLI version 1 and includes features and enhancements based on community feedback.

Before you migrate to version 2, learn about the differences between the versions. The AWS CLI version 2 includes new features and changes that might require you to update your scripts or commands for backwards compatibility.

AWS CLI versions 1 and 2 use the same `aws` command name. If you have both versions installed, your computer uses the first one found in your search path.

If you previously installed AWS CLI version 1, follow our migration instructions to start using version 2.

If you have not previous installed AWS CLI version 1, follow the instructions in *Get started*.

**Topics**

# New features and changes in AWS CLI version 2

This topic describes new features and changes in behavior between AWS CLI version 1 and AWS CLI version 2. These changes might require you to update your scripts or commands to get the same behavior in version 2 as you did in version 1.

**Topics**

## AWS CLI version 2 new features

The AWS CLI version 2 is the most recent major version of the AWS CLI and supports all of the latest features. Some features introduced in version 2 are not backported to version 1 and you must upgrade to access those features. These features include the following:

**Python interpreter not needed**

The AWS CLI version 2 doesn't need a separate install of Python. It includes an embedded version.

**Wizards**

You can use a wizard with the AWS CLI version 2. The wizard guides you through constructing certain commands.

**IAM Identity Center authentication**

If your organization uses AWS IAM Identity Center (IAM Identity Center), your users can sign in to Active Directory, a built-in IAM Identity Center directory, or another IdP connected to IAM Identity Center. Then, they are mapped to an AWS Identity and Access Management (IAM) role that allows you to run AWS CLI commands.

**Auto-prompt**

When enabled, the AWS CLI version 2 can prompt you for commands, parameters, and resources when you run an `aws` command.

**Run the AWS CLI from the official Amazon ECR Public or Docker images**

The official Docker image for the AWS CLI provides isolation, portability, and security that AWS directly supports and maintains. This way, you can use the AWS CLI version 2 in a container-based environment without having to manage the installation yourself.

**Client-side pager**

The AWS CLI version 2 provides the use of a client-side pager program for output. By default, this feature is turned on and returns all output through your operating system's default pager program.

**`aws configure import`**

Import `.csv` credentials generated from the AWS Management Console. A `.csv` file is imported with the profile name matching the IAM user name.

**`aws configure list-profiles`**

Lists the names of all profiles you have configured.

**the section called “YAML stream output format”**

The `yaml` and `yaml-stream` format takes advantage of the YAML format while providing more responsive viewing of large datasets by streaming the data to you. You can start viewing and using YAML data before the entire query downloads.

**New high-level ddb commands for DynamoDB**

The AWS CLI version 2 has the high-level Amazon DynamoDB commands `ddb put` and `ddb select`. These commands provide a simplified interface for putting items in DynamoDB tables and searching in a DynamoDB table or index.

**`aws logs tail`**

The AWS CLI version 2 has a custom `aws logs tail` command that tails the logs for an Amazon CloudWatch Logs group. By default, the command returns logs from all associated CloudWatch Logs streams during the past ten minutes.

**Added metadata support for high-level `s3` commands**

The AWS CLI version 2 adds the `--copy-props` parameter to the high-level `s3` commands. With this parameter, you can configure additional metadata and tags for Amazon Simple Storage Service (Amazon S3).

**`AWS_REGION`**

The AWS CLI version 2 has an AWS SDK-compatible environment variable called `AWS_REGION`. This variable specifies the AWS Region to send requests to. It overrides the `AWS_DEFAULT_REGION` environment variable, which is only applicable in the AWS CLI.

## Breaking changes between AWS CLI version 1 and AWS CLI version 2

This sections describes all of the changes in behavior between AWS CLI version 1 and AWS CLI version 2. These changes might require you to update your scripts or commands to get the same behavior in version 2 as you did in version 1.

### Topics

- Pager used for all output by default
- Timestamp output values are standardized to ISO 8601 format
- Improved handling of CloudFormation deployments that result in no changes
- Changed default behavior for Regional Amazon S3 endpoint for us-east-1 Region
- Changed default behavior for Regional AWS STS endpoints
- ecr get-login removed and replaced with ecr get-login-password
- AWS CLI version 2 support for plugins is changing
- Hidden alias support removed
- The api_versions configuration file setting is not supported
- AWS CLI version 2 uses only Signature v4 to authenticate Amazon S3 requests
- AWS CLI version 2 is more consistent with paging parameters
- AWS CLI version 2 provides more consistent return codes across all commands

### Environment variable added to set text file encoding

By default, text files for the section called "Blob" use the same encoding as the installed locale. Because the AWS CLI version 2 uses an embedded version of Python, the `PYTHONUTF8` and `PYTHONIOENCODING` environment variables are not supported. To set encoding for text files to be different from the locale, use the `AWS_CLI_FILE_ENCODING` environment variable. The following example sets the AWS CLI to open text files using `UTF-8` on Windows.

```
AWS_CLI_FILE_ENCODING=UTF-8
```

For more information, see Environment variables to configure the AWS CLI .

### Binary parameters are passed as base64-encoded strings by default

In the AWS CLI, some commands required base64-encoded strings, while others required UTF-8-encoded byte strings. In the AWS CLI version 1, passing data between two encoded string types often required some intermediate processing. The AWS CLI version 2 makes handling binary parameters more consistent, which helps pass values from one command to another more reliably.

By default, the AWS CLI version 2 passes all binary input and binary output parameters as the base64-encoded string `blobs` (binary large object). For more information, see the section called "Blob".

To revert to the AWS CLI version 1 behavior, use the `cli_binary_format` file configuration or the `--cli-binary-format` parameter.

### Improved Amazon S3 handling of file properties and tags for multipart copies

When you use the AWS CLI version 1 commands in the `aws s3` namespace to copy a file from one S3 bucket location to another, and that operation uses multipart copy, no file properties from the source object are copied to the destination object.

By default, the corresponding commands in the AWS CLI version 2 transfer all tags and some of the properties from the source to the destination copy. Compared to the AWS CLI version 1, this can result in more AWS API calls being made to the Amazon S3 endpoint. To change the default behavior for `s3` commands in AWS CLI version 2 , use the `--copy-props` parameter.

For more information, see the section called “File properties and tags in multipart copies”.

### No automatic retrieval of `http://` or `https://` URLs for parameters

The AWS CLI version 2 does not perform a `GET` operation when a parameter value begins with `http://` or `https://`, and does not use the returned content as the parameter value. As a result, the associated command line option `cli_follow_urlparam` is removed from the AWS CLI version 2.

If you need to retrieve a URL and pass the URL contents into a parameter value, we recommend that you use `curl` or a similar tool to download the contents of the URL to a local file. Then, use the `file://` syntax to read the contents of that file and use it as the parameter value.

For example, the following command no longer tries to retrieve the contents of the page found at `http://www.example.com` and pass those contents as the parameter. Instead, it passes the literal text string `https://example.com` as the parameter.

```
$ aws ssm put-parameter \
    --value http://www.example.com \
    --name prod.microservice1.db.secret \
    --type String 2
```

If you need to retrieve and use the contents of a web URL as a parameter, you can do the following in version 2.

```
$ curl https://my.example.com/mypolicyfile.json -o mypolicyfile.json
```

```
$ aws iam put-role-policy \
    --policy-document file://./mypolicyfile.json \
    --role-name MyRole \
    --policy-name MyReadOnlyPolicy
```

In the preceding example, the `-o` parameter tells `curl` to save the file in the current folder with the same name as the source file. The second command retrieves the content of that downloaded file and passes the content as the value of `--policy-document`.

### Pager used for all output by default

By default, the AWS CLI version 2 returns all output through your operating system's default pager program. This program is the `less` program on Linux or macOS, and the `more` program on Windows. This can help you navigate a large amount of output from a service by displaying that output one page at a time.

You can configure the AWS CLI version 2 to use a different paging program or none at all. For more information, see the section called "Client-side pager".

### Timestamp output values are standardized to ISO 8601 format

By default, the AWS CLI version 2 returns all timestamp response values in the ISO 8601 format. In AWS CLI version 1, commands returned timestamp values in whatever format was returned by the HTTP API response, which could vary from service to service.

To see timestamps in the format returned by the HTTP API response, use the `wire` value in your `config` file. For more information, see `cli_timestamp_format`.

### Improved handling of CloudFormation deployments that result in no changes

By default in the AWS CLI version 1, if you deploy a AWS CloudFormation template that results in no changes, the AWS CLI returns a failed error code. This causes problems if you don't consider that to be an error and you want your script to continue. You can work around this in the AWS CLI version 1 by adding the flag `--no-fail-on-empty-changeset`, which returns `0`.

Since this is a common use case, the AWS CLI version 2 defaults to returning a successful exit code of `0` when there is no change caused by a deployment and the operation returns an empty changeset.

To revert to the original behavior, add the flag `--fail-on-empty-changeset`.

## Changed default behavior for Regional Amazon S3 endpoint for `us-east-1` Region

When you configure theAWS CLI version 1 to use the `us-east-1` Region, the AWS CLI uses the global `s3.amazonaws.com` endpoint that is physically hosted in the `us-east-1` Region. The AWS CLI version 2 uses the true Regional endpoint `s3.us-east-1.amazonaws.com` when that Region is specified. To force the AWS CLI version 2 to use the global endpoint, you can set the Region for a command to `aws-global`.

## Changed default behavior for Regional AWS STS endpoints

By default, the AWS CLI version 2 sends all AWS Security Token Service (AWS STS) API requests to the Regional endpoint for the currently configured AWS Region.

By default, the AWS CLI version 1 sends AWS STS requests to the global AWS STS endpoint. You can control this default behavior in version 1 by using the `sts_regional_endpoints` setting.

## `ecr get-login` removed and replaced with `ecr get-login-password`

The AWS CLI version 2 replaces the command `aws ecr get-login` with the `aws ecr get-login-password` command that improves automated integration with container authentication.

The `aws ecr get-login-password` command reduces the risk of exposing your credentials in the process list, shell history, or other log files. It also improves compatibility with the `docker login` command for better automation.

The `aws ecr get-login-password` command is available in the AWS CLI version 1.17.10 and later, and the AWS CLI version 2. The earlier `aws ecr get-login` command is still available in the AWS CLI version 1 for backward compatibility.

With the `aws ecr get-login-password` command, you can replace the following code that retrieves a password.

```
$ (aws ecr get-login --no-include-email)
```

To reduce the risk of exposing the password to the shell history or logs, use the following example command instead. In this example, the password is piped directly to the `docker login` command, where it is assigned to the password parameter by the `--password-stdin` option.

```
$ aws ecr get-login-password | docker login --username AWS --password-stdin MY-
REGISTRY-URL
```

For more information, see aws ecr get-login-password in the *AWS CLI version 2 Reference Guide*.

## AWS CLI version 2 support for plugins is changing

Plugin support in the AWS CLI version 2 is completely provisional and is intended to help users migrate from AWS CLI version 1 until a stable, updated plugin interface is released. There are no guarantees that a particular plugin or even the AWS CLI plugin interface will be supported in future versions of the AWS CLI version 2. If you rely on plugins, be sure to lock into a particular version of the AWS CLI and test the functionality of your plugin when you do upgrade.

To enable plugin support, create a `[plugins]` section in your `~/.aws/config`.

```
[plugins]
cli_legacy_plugin_path = <path-to-plugins>/python3.7/site-packages
<plugin-name> = <plugin-module>
```

In the `[plugins]` section, define the `cli_legacy_plugin_path` variable and set its value to the Python site packages path where your plugin module is. Then, you can configure a plugin by providing a name for the plugin (`plugin-name`) and the file name of the Python module (`plugin-module`) that contains the source code for your plugin. The AWS CLI loads each plugin by importing its `plugin-module` and calling its `awscli_initialize` function.

## Hidden alias support removed

AWS CLI version 2 no longer supports the following hidden aliases that were supported in version 1.

In the following table, the first column displays the service, command, and parameter that work in all versions, including the AWS CLI version 2. The second column displays the alias that no longer works in the AWS CLI version 2.

| Working service, command, and parameter | Obsolete alias |
| --- | --- |
| cognito-identity create-identity-pool open-id-connect-provider-arns | open-id-connect-provider-arns |

| Working service, command, and parameter | Obsolete alias |
| --- | --- |
| storagegateway describe-tapes tape-arns | tape-ar-ns |
| storagegateway.describe-tape-archives.tape-arns | tape-ar-ns |
| storagegateway.describe-vtl-devices.vtl-device-arns | vtl-device-ar-ns |
| storagegateway.describe-cached-iscsi-volumes.volume-arns | volume-ar-ns |
| storagegateway.describe-stored-iscsi-volumes.volume-arns | volume-ar-ns |
| route53domains.view-billing.start-time | start |
| deploy.create-deployment-group.ec2-tag-set | ec-2-tag-set |
| deploy.list-application-revisions.s3-bucket | s-3-bucket |
| deploy.list-application-revisions.s3-key-prefix | s-3-key-prefix |
| deploy.update-deployment-group.ec2-tag-set | ec-2-tag-set |
| iam.enable-mfa-device.authentication-code1 | authentication-code-1 |
| iam.enable-mfa-device.authentication-code2 | authentication-code-2 |
| iam.resync-mfa-device.authentication-code1 | authentication-code-1 |
| iam.resync-mfa-device.authentication-code2 | authentication-code-2 |
| importexport.get-shipping-label.street1 | street-1 |
| importexport.get-shipping-label.street2 | street-2 |
| importexport.get-shipping-label.street3 | street-3 |
| lambda.publish-version.code-sha256 | code-sha-256 |
| lightsail.import-key-pair.public-key-base64 | public-key-base-64 |
| opsworks.register-volume.ec2-volume-id | ec-2-volume-id |

### The `api_versions` configuration file setting is not supported

The AWS CLI version 2 doesn't support calling earlier versions of AWS service APIs by using the `api_versions` configuration file setting. All AWS CLI commands now call the latest version of the service APIs that are currently supported by the endpoint.

### AWS CLI version 2 uses only Signature v4 to authenticate Amazon S3 requests

The AWS CLI version 2 doesn't support earlier signature algorithms to cryptographically authenticate service requests sent to Amazon S3 endpoints. This signing happens automatically with every Amazon S3 request and only the Signature Version 4 Signing Process is supported. You can't configure the signature version. All Amazon S3 bucket presigned URLs now use only SigV4 and have a maximum expiration duration of one week.

### AWS CLI version 2 is more consistent with paging parameters

In the AWS CLI version 1, if you specify pagination parameters on the command line, then automatic pagination is turned off as expected. However, when you specify pagination parameters by using a file with the `--cli-input-json` parameter, automatic pagination was not turned off, which could result in unexpected output. The AWS CLI version 2 turns off automatic pagination regardless of how you provide the parameters.

### AWS CLI version 2 provides more consistent return codes across all commands

The AWS CLI version 2 is more consistent across all commands and properly returns an appropriate exit code compared to the AWS CLI version 1. We also added exit codes 252, 253, and 254. For more information on exit codes, see the section called “Return Codes”.

If you have a dependency on how the AWS CLI version 1 uses return code values, we recommend checking the exit codes to make sure that you're getting the values you expect.

## AWS CLI version 2 migration instructions

This topic provides instructions for migrating from AWS CLI version 1 to AWS CLI version 2.

AWS CLI versions 1 and 2 use the same `aws` command name. If you have both versions installed, your computer uses the first one found in your search path. If you previously installed AWS CLI version 1, we recommend that you do one of the following to use AWS CLI version 2:

- **Recommended** – Uninstall AWS CLI version 1 and use only AWS CLI version 2.

- To have both version installed, use your operating system's ability to create a symbolic link (symlink) or alias with a different name for one of the two `aws` commands.

For information on breaking changes between version 1 and version 2, see the section called "New features and changes".

## Replacing version 1 with version 2

Perform the following steps to replace AWS CLI version 1 with AWS CLI version 2.

**To replace AWS CLI version 1 with AWS CLI version 2**

1. Prepare any existing scripts you have for the migration by confirming any breaking changes between version 1 and version 2 in the section called "New features and changes".
2. Uninstall the AWS CLI version 1 by following the uninstall instructions for your operating system in Installing, updating, and uninstalling the AWS CLI version 1.
3. Confirm that the AWS CLI is completely uninstalled by using the following command.

   ```
   $ aws --version
   ```

   Complete one of the following based on the output:

   - **No version returned:** You've successfully uninstalled the AWS CLI version 1 and can proceed to the next step.
   - **A version is returned:** You still have an install of the AWS CLI version 1. For troubleshooting steps, see the section called "The `aws --version` command returns a version after uninstalling the AWS CLI". Perform troubleshooting steps until no version output is received.
4. Install the AWS CLI version 2 by following the appropriate install instructions for your operating system in Install or update to the latest version of the AWS CLI.

## Side-by-side install

To have both versions installed, use your operating system's ability to create a symbolic link (symlink) or alias with a different name for one of the two `aws` commands.

1. Install the AWS CLI version 2 by following the appropriate install instructions for your operating system in Install or update to the latest version of the AWS CLI.

2. Use your operating system's ability to create a symlink or alias with a different name for one of the two `aws` commands, such as using *`aws2`* for AWS CLI version 2. The following are symlink examples for AWS CLI version 2. Replace the *PATH* with your install location.

   Linux and macOS

   You can use a symbolic link or alias on Linux and macOS.

   ```
   $ alias aws2='PATH'
   ```

   Windows command prompt

   DOSKEY on Windows.

   ```
   C:\> doskey aws2=PATH
   ```

# Uninstall the AWS CLI version 2

This topic describes how to uninstall the AWS Command Line Interface version 2 (AWS CLI version 2).

AWS CLI version 2 uninstallation instructions:

## Linux

To uninstall the AWS CLI version 2, run the following commands.

1. Locate the symlink and install paths.

   - Use the `which` command to find the symlink. This shows the path you used with the `--bin-dir` parameter.

     ```
     $ which aws
     /usr/local/bin/aws
     ```

   - Use the `ls` command to find the directory that the symlink points to. This gives you the path you used with the `--install-dir` parameter.

     ```
     $ ls -l /usr/local/bin/aws
     lrwxrwxrwx 1 ec2-user ec2-user 49 Oct 22 09:49 /usr/local/bin/aws -> /usr/local/aws-cli/v2/current/bin/aws
     ```

2. Delete the two symlinks in the `--bin-dir` directory. If your user has write permission to these directories, you don't need to use `sudo`.

   ```
   $ sudo rm /usr/local/bin/aws
   $ sudo rm /usr/local/bin/aws_completer
   ```

3. Delete the `--install-dir` directory. If your user has write permission to this directory, you don't need to use `sudo`.

   ```
   $ sudo rm -rf /usr/local/aws-cli
   ```

4. **(Optional)** Remove the shared AWS SDK and AWS CLI settings information in the `.aws` folder.

> **Warning**
>
> These configuration and credentials settings are shared across all AWS SDKs and the AWS CLI. If you remove this folder, they cannot be accessed by any AWS SDKs that are still on your system.

The default location of the `.aws` folder differs between platforms, by default the folder is located in *~/.aws/*. If your user has write permission to this directory, you don't need to use `sudo`.

```
$ sudo rm -rf ~/.aws/
```

## macOS

To uninstall the AWS CLI version 2, run the following commands, substituting the paths you used to install. The example commands use the default installation paths.

1. Find the folder that contains the symlinks to the main program and the completer.

   ```
   $ which aws
   /usr/local/bin/aws
   ```

2. Using that information, run the following command to find the installation folder that the symlinks point to.

   ```
   $ ls -l /usr/local/bin/aws
   lrwxrwxrwx 1 ec2-user ec2-user 49 Oct 22 09:49 /usr/local/bin/aws -> /usr/local/aws-cli/aws
   ```

3. Delete the two symlinks in the first folder. If your user already has write permission to these folders, you don't need to use `sudo`.

   ```
   $ sudo rm /usr/local/bin/aws
   $ sudo rm /usr/local/bin/aws_completer
   ```

4. Delete the main installation folder. Use `sudo` to gain write access to the `/usr/local` folder.

```
$ sudo rm -rf /usr/local/aws-cli
```

5. **(Optional)** Remove the shared AWS SDK and AWS CLI settings information in the `.aws` folder.

> **Warning**
>
> These configuration and credentials settings are shared across all AWS SDKs and the AWS CLI. If you remove this folder, they cannot be accessed by any AWS SDKs that are still on your system.

The default location of the `.aws` folder differs between platforms, by default the folder is located in *~/.aws/*. If your user has write permission to this directory, you don't need to use sudo.

```
$ sudo rm -rf ~/.aws/
```

## Windows

1. Open **Programs and Features** by doing one of the following:
   - Open the **Control Panel**, and then choose **Programs and Features**.
   - Open a command prompt, and then enter the following command.

     ```
     C:\> appwiz.cpl
     ```
2. Select the entry named **AWS Command Line Interface**, and then choose **Uninstall** to launch the uninstaller.
3. Confirm that you want to uninstall the AWS CLI.
4. **(Optional)** Remove the shared AWS SDK and AWS CLI settings information in the `.aws` folder.

> **Warning**
>
> These configuration and credentials settings are shared across all AWS SDKs and the AWS CLI. If you remove this folder, they cannot be accessed by any AWS SDKs that are still on your system.

The default location of the `.aws` folder differs between platforms, by default the folder is located in *`%UserProfile%\.aws`*.

```
$ rmdir %UserProfile%\.aws
```

## Troubleshooting AWS CLI install and uninstall errors

If you come across issues after installing or uninstalling the AWS CLI, see *Troubleshoot errors* for troubleshooting steps. For the most relevant troubleshooting steps, see the section called “Command not found errors”, the section called “The "`aws --version`" command returns a different version than you installed”, and the section called “The "`aws --version`" command returns a version after uninstalling the AWS CLI”.

# AWS CLI user guide document history

The following table describes important additions to the *AWS Command Line Interface User Guide*, beginning in January 2019. For notification about updates to this documentation, you can subscribe to the RSS feed.

| Change | Description | Date |
| --- | --- | --- |
| Updated credential and authentication information. | Updated credential and authentication method instructions and examples. This includes updating relevant Getting started pages and configuration pages. To accommodate this increase in documentation, relevant credential topics were moved to the new Authentication and access credentials section. | March 31, 2023 |
| Token provider configuration with automatic authentication refresh for AWS IAM Identity Center added | The new process to configure the AWS CLI to authentic ate users with AWS IAM Identity Center (IAM Identity Center) using the SSO token provider configuration, which can automatically retrieve refreshed authentication tokens. | December 7, 2022 |
| Official Amazon ECR Public image for the AWS CLI version 2 released | The official supported Amazon ECR Public image for the AWS CLI version 2 is released for Linux, macOS, and Windows. | November 18, 2022 |

| | | |
|---|---|---|
| Updated the guide for migrating from AWS CLI V1 to V2 | Expanded the breaking changes guide to include migration instructions to going from AWS CLI version 1 to the AWS CLI version 2. Includes updates to the Troubleshooting page to help with installation issues. | May 13, 2022 |
