- For API details, see [GetGcmChannel](#) in *AWS CLI Command Reference*.

get-sms-channel

The following code example shows how to use `get-sms-channel`.

AWS CLI

To retrieve information about the status and settings of the SMS channel for an application

The following `get-sms-channel` example retrieves status and settings of the sms channel for an application.

```
aws pinpoint get-sms-channel \  
  --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \  
  --region us-east-1
```

Output:

```
{  
  "SMSChannelResponse": {  
    "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",  
    "CreationDate": "2019-10-08T18:39:18.511Z",  
    "Enabled": true,  
    "Id": "sms",  
    "IsArchived": false,  
    "LastModifiedDate": "2019-10-08T18:39:18.511Z",  
    "Platform": "SMS",  
    "PromotionalMessagesPerSecond": 20,  
    "TransactionalMessagesPerSecond": 20,  
    "Version": 1  
  }  
}
```

- For API details, see [GetSmsChannel](#) in *AWS CLI Command Reference*.

get-sms-template

The following code example shows how to use `get-sms-template`.

AWS CLI

Retrieves the content and settings of a message template for messages that are sent through the SMS channel

The following `get-sms-template` example retrieves the content and settings of a SMS message template.

```
aws pinpoint get-sms-template \  
  --template-name TestTemplate \  
  --region us-east-1
```

Output:

```
{  
  "SMSTemplateResponse": {  
    "Arn": "arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:templates/  
TestTemplate/SMS",  
    "Body": "hello\n how are you?\n food is good",  
    "CreationDate": "2023-06-20T21:37:30.124Z",  
    "LastModifiedDate": "2023-06-20T21:37:30.124Z",  
    "tags": {},  
    "TemplateDescription": "Test SMS Template",  
    "TemplateName": "TestTemplate",  
    "TemplateType": "SMS",  
    "Version": "1"  
  }  
}
```

For more information, see [Amazon Pinpoint message templates](#) in the *Amazon Pinpoint User Guide*.

- For API details, see [GetSmsTemplate](#) in *AWS CLI Command Reference*.

get-voice-channel

The following code example shows how to use `get-voice-channel`.

AWS CLI**To retrieve information about the status and settings of the voice channel for an application**

The following `get-voice-channel` example retrieves status and settings of the voice channel for an application.

```
aws pinpoint get-voice-channel \  
  --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \  
  --region us-east-1
```

Output:

```
{
  "VoiceChannelResponse": {
    "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",
    "CreationDate": "2022-04-28T00:17:03.836Z",
    "Enabled": true,
    "Id": "voice",
    "IsArchived": false,
    "LastModifiedDate": "2022-04-28T00:17:03.836Z",
    "Platform": "VOICE",
    "Version": 1
  }
}
```

- For API details, see [GetVoiceChannel](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve a list of tags for a resource

The following `list-tags-for-resource` example retrieves all the tags (key names and values) that are associated with the specified resource.

```
aws pinpoint list-tags-for-resource \
  --resource-arn arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example
```

Output:

```
{
  "TagsModel": {
    "tags": {
      "Year": "2019",
      "Stack": "Production"
    }
  }
}
```

For more information, see 'Tagging Amazon Pinpoint Resources <<https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>>'__ in the *Amazon Pinpoint Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

phone-number-validate

The following code example shows how to use `phone-number-validate`.

AWS CLI

Retrieves information about a phone number

The following `phone-number-validate` retrieves information about a phone number.

```
aws pinpoint phone-number-validate \  
  --number-validate-request PhoneNumber="+12065550142" \  
  --region us-east-1
```

Output:

```
{  
  "NumberValidateResponse": {  
    "Carrier": "ExampleCorp Mobile",  
    "City": "Seattle",  
    "CleansedPhoneNumberE164": "+12065550142",  
    "CleansedPhoneNumberNational": "2065550142",  
    "Country": "United States",  
    "CountryCodeIso2": "US",  
    "CountryCodeNumeric": "1",  
    "OriginalPhoneNumber": "+12065550142",  
    "PhoneType": "MOBILE",  
    "PhoneTypeCode": 0,  
    "Timezone": "America/Los_Angeles",  
    "ZipCode": "98101"  
  }  
}
```

For more information, see [Amazon Pinpoint SMS channel](#) in the *Amazon Pinpoint User Guide*.

- For API details, see [PhoneNumberValidate](#) in *AWS CLI Command Reference*.

send-messages

The following code example shows how to use send-messages.

AWS CLI

To send SMS message using the endpoint of an application

The following send-messages example sends a direct message for an application with an endpoint.

```
aws pinpoint send-messages \  
  --application-id 611e3e3cdd47474c9c1399a505665b91 \  
  --message-request file://myfile.json \  
  --region us-west-2
```

Contents of myfile.json:

```
{  
  "MessageConfiguration": {  
    "SMSMessage": {  
      "Body": "hello, how are you?"  
    }  
  },  
  "Endpoints": {  
    "testendpoint": {}  
  }  
}
```

Output:

```
{  
  "MessageResponse": {  
    "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",  
    "EndpointResult": {  
      "testendpoint": {  
        "Address": "+12345678900",  
        "DeliveryStatus": "SUCCESSFUL",  
        "MessageId": "itnuqhai5alf1n6ahv3udc05n7hhddr6gb31q6g0",  
        "StatusCode": 200,  
        "StatusMessage": "MessageId:  
itnuqhai5alf1n6ahv3udc05n7hhddr6gb31q6g0"      }  
    }  
  }  
}
```

```
    }
  },
  "RequestId": "c7e23264-04b2-4a46-b800-d24923f74753"
}
}
```

For more information, see [Amazon Pinpoint SMS channel](#) in the *Amazon Pinpoint User Guide*.

- For API details, see [SendMessages](#) in *AWS CLI Command Reference*.

send-users-messages

The following code example shows how to use `send-users-messages`.

AWS CLI

To send SMS message for an user of an application

The following `send-users-messages` example sends a direct message for an user of an application.

```
aws pinpoint send-users-messages \
  --application-id 611e3e3cdd47474c9c1399a505665b91 \
  --send-users-message-request file://myfile.json \
  --region us-west-2
```

Contents of `myfile.json`:

```
{
  "MessageConfiguration": {
    "SMSMessage": {
      "Body": "hello, how are you?"
    }
  },
  "Users": {
    "testuser": {}
  }
}
```

Output:

```
{
```

```

"SendUsersMessageResponse": {
  "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",
  "RequestId": "e0b12cf5-2359-11e9-bb0b-d5fb91876b25",
  "Result": {
    "testuser": {
      "testuserendpoint": {
        "DeliveryStatus": "SUCCESSFUL",
        "MessageId": "7qu4hk5bqhda3i7i2n4pjf98qcu8b7p45ifsmo0",
        "StatusCode": 200,
        "StatusMessage": "MessageId:
7qu4hk5bqhda3i7i2n4pjf98qcu8b7p45ifsmo0",
        "Address": "+12345678900"
      }
    }
  }
}

```

For more information, see [Amazon Pinpoint SMS channel](#) in the *Amazon Pinpoint User Guide*.

- For API details, see [SendUsersMessages](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a resource

The following example adds two tags (key names and values) to a resource.

```

aws pinpoint list-tags-for-resource \
  --resource-arn arn:aws:mobiletargeting:us-
east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \
  --tags-model tags={Stack=Production,Year=2019}

```

This command produces no output.

For more information, see 'Tagging Amazon Pinpoint Resources <<https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>>'__ in the *Amazon Pinpoint Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To remove a tag from a resource

The following `untag-resource` example removes the specified tag (key name and value) from a resource.

```
aws pinpoint untag-resource \  
  --resource-arn arn:aws:mobiletargeting:us-  
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \  
  --tag-keys Year
```

This command produces no output.

Example 2: To remove multiple tags from a resource

The following `untag-resource` example removes the specified tags (key names and values) from a resource.

```
aws pinpoint untag-resource \  
  --resource-arn arn:aws:mobiletargeting:us-  
east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example \  
  --tag-keys Year Stack
```

This command produces no output.

For more information, see 'Tagging Amazon Pinpoint Resources <<https://docs.aws.amazon.com/pinpoint/latest/developerguide/tagging-resources.html>>'__ in the *Amazon Pinpoint Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-sms-channel

The following code example shows how to use `update-sms-channel`.

AWS CLI

To enable SMS channel or to update the status and settings of the SMS channel for an application.

The following `update-sms-channel` example enables SMS channel for an SMS channel for an application.

```
aws pinpoint update-sms-channel \  
  --application-id 611e3e3cdd47474c9c1399a505665b91 \  
  --sms-channel-request Enabled=true \  
  --region us-west-2
```

Output:

```
{  
  "SMSChannelResponse": {  
    "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",  
    "CreationDate": "2019-01-28T23:25:25.224Z",  
    "Enabled": true,  
    "Id": "sms",  
    "IsArchived": false,  
    "LastModifiedDate": "2023-05-18T23:22:50.977Z",  
    "Platform": "SMS",  
    "PromotionalMessagesPerSecond": 20,  
    "TransactionalMessagesPerSecond": 20,  
    "Version": 3  
  }  
}
```

For more information, see [Amazon Pinpoint SMS channel](#) in the *Amazon Pinpoint User Guide*.

- For API details, see [UpdateSmsChannel](#) in *AWS CLI Command Reference*.

Amazon Polly examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Polly.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

delete-lexicon

The following code example shows how to use `delete-lexicon`.

AWS CLI

To delete a lexicon

The following `delete-lexicon` example deletes the specified lexicon.

```
aws polly delete-lexicon \  
  --name w3c
```

This command produces no output.

For more information, see [Using the DeleteLexicon operation](#) in the *Amazon Polly Developer Guide*.

- For API details, see [DeleteLexicon](#) in *AWS CLI Command Reference*.

get-lexicon

The following code example shows how to use `get-lexicon`.

AWS CLI

To retrieve the content of a lexicon

The following `get-lexicon` example retrieves the content of the specified pronunciation lexicon.

```
aws polly get-lexicon \
  --name w3c
```

Output:

```
{
  "Lexicon": {
    "Content": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>\n<lexicon version=
\n\"1.0\" \n      xmlns=      \"http://www.w3.org/2005/01/pronunciation-lexicon
\n\" \n      xmlns:xsi=\"http://www.w3.org/2001/XMLSchema-instance\" \n
xsi:schemaLocation=\"http://www.w3.org/2005/01/pronunciation-lexicon \n
http://www.w3.org/TR/2007/CR-pronunciation-lexicon-20071212/pls.xsd\" \n
  alphabet=\"ipa\" \n      xml:lang=\"en-US\">\n  <lexeme>\n    <grapheme>W3C</
grapheme>\n      <alias>World Wide Web Consortium</alias>\n  </lexeme>\n</lexicon>
\n",
    "Name": "w3c"
  },
  "LexiconAttributes": {
    "Alphabet": "ipa",
    "LanguageCode": "en-US",
    "LastModified": 1603908910.99,
    "LexiconArn": "arn:aws:polly:us-west-2:880185128111:lexicon/w3c",
    "LexemesCount": 1,
    "Size": 492
  }
}
```

For more information, see [Using the GetLexicon operation](#) in the *Amazon Polly Developer Guide*.

- For API details, see [GetLexicon](#) in *AWS CLI Command Reference*.

get-speech-synthesis-task

The following code example shows how to use `get-speech-synthesis-task`.

AWS CLI

To get information about a speech synthesis task

The following `get-speech-synthesis-task` example retrieves information about the specified speech synthesis task.

```
aws polly get-speech-synthesis-task \  
  --task-id 70b61c0f-57ce-4715-a247-cae8729dcce9
```

Output:

```
{  
  "SynthesisTask": {  
    "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",  
    "TaskStatus": "completed",  
    "OutputUri": "https://s3.us-west-2.amazonaws.com/my-s3-  
bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",  
    "CreationTime": 1603911042.689,  
    "RequestCharacters": 1311,  
    "OutputFormat": "mp3",  
    "TextType": "text",  
    "VoiceId": "Joanna"  
  }  
}
```

For more information, see [Creating long audio files](#) in the *Amazon Polly Developer Guide*.

- For API details, see [GetSpeechSynthesisTask](#) in *AWS CLI Command Reference*.

list-lexicons

The following code example shows how to use `list-lexicons`.

AWS CLI

To list your lexicons

The following `list-lexicons` example lists your pronunciation lexicons.

```
aws polly list-lexicons
```

Output:

```
{  
  "Lexicons": [  
    {  
      "Name": "w3c",
```

```

        "Attributes": {
            "Alphabet": "ipa",
            "LanguageCode": "en-US",
            "LastModified": 1603908910.99,
            "LexiconArn": "arn:aws:polly:us-east-2:123456789012:lexicon/w3c",
            "LexemesCount": 1,
            "Size": 492
        }
    ]
}

```

For more information, see [Using the ListLexicons operation](#) in the *Amazon Polly Developer Guide*.

- For API details, see [ListLexicons](#) in *AWS CLI Command Reference*.

list-speech-synthesis-tasks

The following code example shows how to use `list-speech-synthesis-tasks`.

AWS CLI

To list your speech synthesis tasks

The following `list-speech-synthesis-tasks` example lists your speech synthesis tasks.

```
aws polly list-speech-synthesis-tasks
```

Output:

```

{
  "SynthesisTasks": [
    {
      "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",
      "TaskStatus": "completed",
      "OutputUri": "https://s3.us-west-2.amazonaws.com/my-s3-bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",
      "CreationTime": 1603911042.689,
      "RequestCharacters": 1311,
      "OutputFormat": "mp3",
      "TextType": "text",
    }
  ]
}

```

```

        "VoiceId": "Joanna"
      }
    ]
  }

```

For more information, see [Creating long audio files](#) in the *Amazon Polly Developer Guide*.

- For API details, see [ListSpeechSynthesisTasks](#) in *AWS CLI Command Reference*.

put-lexicon

The following code example shows how to use `put-lexicon`.

AWS CLI

To store a lexicon

The following `put-lexicon` example stores the specified pronunciation lexicon. The example `.pls` file specifies a W3C PLS-compliant lexicon.

```

aws polly put-lexicon \
  --name w3c \
  --content file://example.pls

```

Contents of `example.pls`

```

{
  <?xml version="1.0" encoding="UTF-8"?>
  <lexicon version="1.0"
    xmlns="http://www.w3.org/2005/01/pronunciation-lexicon"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:schemaLocation="http://www.w3.org/2005/01/pronunciation-lexicon
      http://www.w3.org/TR/2007/CR-pronunciation-lexicon-20071212/pls.xsd"
    alphabet="ipa"
    xml:lang="en-US">
    <lexeme>
      <grapheme>W3C</grapheme>
      <alias>World Wide Web Consortium</alias>
    </lexeme>
  </lexicon>
}

```

This command produces no output.

For more information, see [Using the PutLexicon operation](#) in the *Amazon Polly Developer Guide*.

- For API details, see [PutLexicon](#) in *AWS CLI Command Reference*.

start-speech-synthesis-task

The following code example shows how to use `start-speech-synthesis-task`.

AWS CLI

To synthesize text

The following `start-speech-synthesis-task` example synthesizes the text in `text_file.txt` and stores the resulting MP3 file in the specified bucket.

```
aws polly start-speech-synthesis-task \  
  --output-format mp3 \  
  --output-s3-bucket-name my-s3-bucket \  
  --text file://text_file.txt \  
  --voice-id Joanna
```

Output:

```
{  
  "SynthesisTask": {  
    "TaskId": "70b61c0f-57ce-4715-a247-cae8729dcce9",  
    "TaskStatus": "scheduled",  
    "OutputUri": "https://s3.us-east-2.amazonaws.com/my-s3-  
bucket/70b61c0f-57ce-4715-a247-cae8729dcce9.mp3",  
    "CreationTime": 1603911042.689,  
    "RequestCharacters": 1311,  
    "OutputFormat": "mp3",  
    "TextType": "text",  
    "VoiceId": "Joanna"  
  }  
}
```

For more information, see [Creating long audio files](#) in the *Amazon Polly Developer Guide*.

- For API details, see [StartSpeechSynthesisTask](#) in *AWS CLI Command Reference*.

AWS Price List examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Price List.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

}
],
"FormatVersion": "aws_v1"
}

```

- For API details, see [DescribeServices](#) in *AWS CLI Command Reference*.

get-attribute-values

The following code example shows how to use `get-attribute-values`.

AWS CLI

To retrieve a list of attribute values

The following `get-attribute-values` example retrieves a list of values available for the given attribute.

```

aws pricing get-attribute-values \
  --service-code AmazonEC2 \
  --attribute-name volumeType \
  --max-items 2

```

Output:

```
{
  "NextToken": "eyJ0ZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ==",
  "AttributeValues": [
    {
      "Value": "Cold HDD"
    },
    {
      "Value": "General Purpose"
    }
  ]
}
```

- For API details, see [GetAttributeValues](#) in *AWS CLI Command Reference*.

get-products

The following code example shows how to use get-products.

AWS CLI

To retrieve a list of products

This example retrieves a list of products that match the given criteria.

Command:

```
aws pricing get-products --filters file:///filters.json --format-version aws_v1 --
max-results 1 --service-code AmazonEC2
```

filters.json:

```
[
  {
    "Type": "TERM_MATCH",
    "Field": "ServiceCode",
    "Value": "AmazonEC2"
  },
  {
    "Type": "TERM_MATCH",
    "Field": "volumeType",
    "Value": "Provisioned IOPS"
  }
]
```

]

Output:

```
{
  "FormatVersion": "aws_v1",
  "NextToken": "WGDY7ko8fQXdlaUZVdasFQ==:RVSagyIFn770XQ0zdUIc09BY6ucBG9itXAZGZF/

- For API details, see [GetProducts](#) in *AWS CLI Command Reference*.

AWS Private CA examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Private CA.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-certificate-authority-audit-report

The following code example shows how to use `create-certificate-authority-audit-report`.

AWS CLI

To create a certificate authority audit report

The following `create-certificate-authority-audit-report` command creates an audit report for the private CA identified by the ARN.

```
aws acm-pca create-certificate-authority-audit-report --certificate-  
authority-arn arn:aws:acm-pca:us-east-1:accountid:certificate-  
authority/12345678-1234-1234-1234-123456789012 --s3-bucket-name your-bucket-name --  
audit-report-response-format JSON
```

- For API details, see [CreateCertificateAuthorityAuditReport](#) in *AWS CLI Command Reference*.

create-certificate-authority

The following code example shows how to use `create-certificate-authority`.

AWS CLI

To create a private certificate authority

The following `create-certificate-authority` command creates a private certificate authority in your AWS account.

```
aws acm-pca create-certificate-authority --certificate-authority-configuration  
file://C:\ca_config.txt --revocation-configuration file://C:\revoke_config.txt --  
certificate-authority-type "SUBORDINATE" --idempotency-token 98256344
```

- For API details, see [CreateCertificateAuthority](#) in *AWS CLI Command Reference*.

delete-certificate-authority

The following code example shows how to use `delete-certificate-authority`.

AWS CLI

To delete a private certificate authority

The following `delete-certificate-authority` command deletes the certificate authority identified by the ARN.

```
aws acm-pca delete-certificate-authority --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012
```

- For API details, see [DeleteCertificateAuthority](#) in *AWS CLI Command Reference*.

describe-certificate-authority-audit-report

The following code example shows how to use `describe-certificate-authority-audit-report`.

AWS CLI

To describe an audit report for a certificate authority

The following `describe-certificate-authority-audit-report` command lists information about the specified audit report for the CA identified by the ARN.

```
aws acm-pca describe-certificate-authority-audit-report --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/99999999-8888-7777-6666-555555555555 --audit-report-id
11111111-2222-3333-4444-555555555555
```

- For API details, see [DescribeCertificateAuthorityAuditReport](#) in *AWS CLI Command Reference*.

describe-certificate-authority

The following code example shows how to use `describe-certificate-authority`.

AWS CLI

To describe a private certificate authority

The following `describe-certificate-authority` command lists information about the private CA identified by the ARN.

```
aws acm-pca describe-certificate-authority --certificate-  
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-  
authority/12345678-1234-1234-1234-123456789012
```

- For API details, see [DescribeCertificateAuthority](#) in *AWS CLI Command Reference*.

get-certificate-authority-certificate

The following code example shows how to use `get-certificate-authority-certificate`.

AWS CLI

To retrieve a certificate authority (CA) certificate

The following `get-certificate-authority-certificate` command retrieves the certificate and certificate chain for the private CA specified by the ARN.

```
aws acm-pca get-certificate-authority-certificate --certificate-  
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-  
authority/12345678-1234-1234-1234-123456789012 --output text
```

- For API details, see [GetCertificateAuthorityCertificate](#) in *AWS CLI Command Reference*.

get-certificate-authority-csr

The following code example shows how to use `get-certificate-authority-csr`.

AWS CLI

To retrieve the certificate signing request for a certificate authority

The following `get-certificate-authority-csr` command retrieves the CSR for the private CA specified by the ARN.

```
aws acm-pca get-certificate-authority-csr --certificate-
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 --output text
```

- For API details, see [GetCertificateAuthorityCsr](#) in *AWS CLI Command Reference*.

get-certificate

The following code example shows how to use `get-certificate`.

AWS CLI

To retrieve an issued certificate

The following `get-certificate` example retrieves a certificate from the specified private CA.

```
aws acm-pca get-certificate \
  --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012 \
  --certificate-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-
authority/12345678-1234-1234-1234-123456789012/
certificate/6707447683a9b7f4055627ffd55cebcc \
  --output text
```

Output:

```
-----BEGIN CERTIFICATE-----
MIIEDzCCAvegAwIBAgIRAJuJ8f6ZVYL7gG/rS3qvrZMwDQYJKoZIhvcNAQELBQAw
cTElMAkGA1UEBhMCVVMxEzARBgNVBAgMC1dhc2hpbmd0b24xEDA0BgNVBACMB1Nl
...certificate body truncated for brevity...
tKCSglgZZrd4FdLw1EkGm+UVXnodwMtJEQyy3oTfZjURPIyyaqskTu/KSS7YDjK0
KQNY73D6Ltmd0EbAyyq10XiDxqY41lvKHJ1eZrPaBmYNABxU=
-----END CERTIFICATE----- -----BEGIN CERTIFICATE-----
MIIDrzCCApegAwIBAgIRA0skdzLvcj1eShkoyEE693AwDQYJKoZIhvcNAQELBQAw
cTElMAkGA1UEBhMCVVMxEzARBgNVBAgMC1dhc2hpbmd0b24xEDA0BgNVBACMB1Nl
...certificate body truncated for brevity...
kdRGB6P2hpxstD0UIwAoCbhoawWfA4ybJznf+j0QhAziNlRdKQRR8n0DWpKt7H9w
dJ5nxsTk/fniJz86Ddtp6n8s82wYdkN3cVffeK72A9aTCOU=
-----END CERTIFICATE-----
```

The first part of the output is the certificate itself. The second part is the certificate chain that chains to the root CA certificate. Note that when you use the `--output text` option, a TAB

character is inserted between the two certificate pieces (that is the cause of the indented text). If you intend to take this output and parse the certificates with other tools, you might need to remove the TAB character so it is processed correctly.

- For API details, see [GetCertificate](#) in *AWS CLI Command Reference*.

import-certificate-authority-certificate

The following code example shows how to use `import-certificate-authority-certificate`.

AWS CLI

To import your certificate authority certificate into ACM PCA

The following `import-certificate-authority-certificate` command imports the signed private CA certificate for the CA specified by the ARN into ACM PCA.

```
aws acm-pca import-certificate-authority-certificate --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/12345678-1234-1234-1234-123456789012 --certificate file://C:\ca_cert.pem --certificate-chain file://C:\ca_cert_chain.pem
```

- For API details, see [ImportCertificateAuthorityCertificate](#) in *AWS CLI Command Reference*.

issue-certificate

The following code example shows how to use `issue-certificate`.

AWS CLI

To issue a private certificate

The following `issue-certificate` command uses the private CA specified by the ARN to issue a private certificate.

```
aws acm-pca issue-certificate --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/12345678-1234-1234-1234-123456789012 --csr file://C:\cert_1.csr --signing-algorithm "SHA256WITHRSA" --validity Value=365,Type="DAYS" --idempotency-token 1234
```

- For API details, see [IssueCertificate](#) in *AWS CLI Command Reference*.

list-certificate-authorities

The following code example shows how to use `list-certificate-authorities`.

AWS CLI

To list your private certificate authorities

The following `list-certificate-authorities` command lists information about all of the private CAs in your account.

```
aws acm-pca list-certificate-authorities --max-results 10
```

- For API details, see [ListCertificateAuthorities](#) in *AWS CLI Command Reference*.

list-tags

The following code example shows how to use `list-tags`.

AWS CLI

To list the tags for your certificate authority

The following `list-tags` command lists the tags associated with the private CA specified by the ARN.

```
aws acm-pca list-tags --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/123455678-1234-1234-1234-123456789012 --max-results 10
```

- For API details, see [ListTags](#) in *AWS CLI Command Reference*.

revoke-certificate

The following code example shows how to use `revoke-certificate`.

AWS CLI

To revoke a private certificate

The following `revoke-certificate` command revokes a private certificate from the CA identified by the ARN.

```
aws acm-pca revoke-certificate --certificate-authority-arn arn:aws:acm-pca:us-west-2:1234567890:certificate-authority/12345678-1234-1234-1234-123456789012 --certificate-serial 67:07:44:76:83:a9:b7:f4:05:56:27:ff:d5:5c:eb:cc --revocation-reason "KEY_COMPROMISE"
```

- For API details, see [RevokeCertificate](#) in *AWS CLI Command Reference*.

tag-certificate-authority

The following code example shows how to use tag-certificate-authority.

AWS CLI

To attach tags to a private certificate authority

The following tag-certificate-authority command attaches one or more tags to your private CA.

```
aws acm-pca tag-certificate-authority --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/12345678-1234-1234-1234-123456789012 --tags Key=Admin,Value=Alice
```

- For API details, see [TagCertificateAuthority](#) in *AWS CLI Command Reference*.

untag-certificate-authority

The following code example shows how to use untag-certificate-authority.

AWS CLI

To remove one or more tags from your private certificate authority

The following untag-certificate-authority command removes tags from the private CA identified by the ARN.

```
aws acm-pca untag-certificate-authority --certificate-authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-authority/12345678-1234-1234-1234-123456789012 --tags Key=Purpose,Value=Website
```

- For API details, see [UntagCertificateAuthority](#) in *AWS CLI Command Reference*.

update-certificate-authority

The following code example shows how to use `update-certificate-authority`.

AWS CLI

To update the configuration of your private certificate authority

The following `update-certificate-authority` command updates the status and configuration of the private CA identified by the ARN.

```
aws acm-pca update-certificate-authority --certificate-  
authority-arn arn:aws:acm-pca:us-west-2:123456789012:certificate-  
authority/12345678-1234-1234-1234-1232456789012 --revocation-configuration file://C:  
\revoke_config.txt --status "DISABLED"
```

- For API details, see [UpdateCertificateAuthority](#) in *AWS CLI Command Reference*.

AWS Proton examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Proton.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

cancel-service-instance-deployment

The following code example shows how to use `cancel-service-instance-deployment`.

AWS CLI

To cancel a service instance deployment

The following `cancel-service-instance-deployment` example cancels a service instance deployment.

```
aws proton cancel-service-instance-deployment \  
  --service-instance-name "instance-one" \  
  --service-name "simple-svc"
```

Output:

```
{  
  "serviceInstance": {  
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-  
instance/instance-one",

- For API details, see [CancelServiceInstanceDeployment](#) in *AWS CLI Command Reference*.

cancel-service-pipeline-deployment

The following code example shows how to use `cancel-service-pipeline-deployment`.

AWS CLI

To cancel a service pipeline deployment

The following `cancel-service-pipeline-deployment` example cancels a service pipeline deployment.

```
aws proton cancel-service-pipeline-deployment \  
  --service-name "simple-svc"
```

Output:

```
{  
  "pipeline": {  
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline",  
    "createdAt": "2021-04-02T21:29:59.962000+00:00",  
    "deploymentStatus": "CANCELLING",  
    "lastDeploymentAttemptedAt": "2021-04-02T22:02:45.095000+00:00",

    "templateMajorVersion": "1",  
    "templateMinorVersion": "1",  
    "templateName": "svc-simple"  
  }  
}
```

For more information, see [Update a service pipeline](#) in the *The AWS Proton Administrator Guide* or [Update a service pipeline](#) in the *The AWS Proton User Guide*.

- For API details, see [CancelServicePipelineDeployment](#) in *AWS CLI Command Reference*.

create-service

The following code example shows how to use `create-service`.

AWS CLI

To create a service

The following `create-service` example creates a service with a service pipeline.

```
aws proton create-service \  
  --name "MySimpleService" \  
  --template-name "fargate-service" \  
  --template-major-version "1" \  
  --branch-name "mainline" \  
  --repository-connection-arn "arn:aws:codestar-connections:region-id:account-  
id:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \  
  --repository-id "myorg/myapp" \  
  --spec file://spec.yaml
```

Contents of `spec.yaml`:

```
proton: ServiceSpec  
  
pipeline:  
  my_sample_pipeline_required_input: "hello"  
  my_sample_pipeline_optional_input: "bye"  
  
instances:  
  - name: "acme-network-dev"  
    environment: "ENV_NAME"  
    spec:  
      my_sample_service_instance_required_input: "hi"  
      my_sample_service_instance_optional_input: "ho"
```

Output:

```
{  
  "service": {  
    "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",  
    "createdAt": "2020-11-18T19:50:27.460000+00:00",  
    "lastModifiedAt": "2020-11-18T19:50:27.460000+00:00",  
    "name": "MySimpleService",  
    "repositoryConnectionArn": "arn:aws:codestar-connections:region-  
id:123456789012connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
    "repositoryId": "myorg/myapp",  
    "status": "CREATE_IN_PROGRESS",  
    "templateName": "fargate-service"  
  }  
}
```

For more information, see [Create a service](#) in the *The AWS Proton Administrator Guide* and [Create a service](#) in the *The AWS Proton User Guide*.

- For API details, see [CreateService](#) in *AWS CLI Command Reference*.

delete-service

The following code example shows how to use `delete-service`.

AWS CLI

To delete a service

The following `delete-service` example deletes a service.

```
aws proton delete-service \  
  --name "simple-svc"
```

Output:

```
{  
  "service": {  
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",  
    "branchName": "mainline",  
    "createdAt": "2020-11-28T22:40:50.512000+00:00",  
    "description": "Edit by updating description",  
    "lastModifiedAt": "2020-11-29T00:30:39.248000+00:00",  
    "name": "simple-svc",  
    "repositoryConnectionArn": "arn:aws:codestar-connections:region-  
id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
    "repositoryId": "myorg/myapp",  
    "status": "DELETE_IN_PROGRESS",  
    "templateName": "fargate-service"  
  }  
}
```

For more information, see [Delete a service](#) in the *The AWS Proton Administrator Guide*.

- For API details, see [DeleteService](#) in *AWS CLI Command Reference*.

get-service-instance

The following code example shows how to use `get-service-instance`.

AWS CLI

To get service instance details

The following `get-service-instance` example gets detail data for a service instance.

```
aws proton get-service-instance \  
  --name "instance-one" \  
  --service-name "simple-svc"
```

Output:

```
{  
  "serviceInstance": {  
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-  
instance/instance-one",  
    "createdAt": "2020-11-28T22:40:50.512000+00:00",  
    "deploymentStatus": "SUCCEEDED",  
    "environmentName": "simple-env",  
    "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",  
    "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",  
    "name": "instance-one",  
    "serviceName": "simple-svc",  
    "spec": "proton: ServiceSpec\npipeline:\nmy_sample_pipeline_optional_input: hello world\nmy_sample_pipeline_required_input: pipeline up\ninstances:\n- name: instance-one\nenvironment: my-simple-env\n spec:\n  my_sample_service_instance_optional_input:  
Ola\n  my_sample_service_instance_required_input: Ciao",  
    "templateMajorVersion": "1",  
    "templateMinorVersion": "0",  
    "templateName": "svc-simple"  
  }  
}
```

For more information, see [View service data](#) in the *The AWS Proton Administrator Guide* or [View service data](#) in the *The AWS Proton User Guide*.

- For API details, see [GetServiceInstance](#) in *AWS CLI Command Reference*.

get-service

The following code example shows how to use `get-service`.

AWS CLI

To get service details

The following `get-service` example gets detail data for a service.

```
aws proton get-service \
  --name "simple-svc"
```

Output:

```
{
  "service": {
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc",
    "branchName": "mainline",
    "createdAt": "2020-11-28T22:40:50.512000+00:00",
    "lastModifiedAt": "2020-11-28T22:44:51.207000+00:00",
    "name": "simple-svc",
    "pipeline": {
      "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/
pipeline/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "createdAt": "2020-11-28T22:40:50.512000+00:00",

list-service-instances

The following code example shows how to use `list-service-instances`.

AWS CLI

Example 1: To list all service instances

The following `list-service-instances` example lists service instances.

```
aws proton list-service-instances
```

Output:

```
{
  "serviceInstances": [
    {
      "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/
service-instance/instance-one",
      "createdAt": "2020-11-28T22:40:50.512000+00:00",
      "deploymentStatus": "SUCCEEDED",
      "environmentArn": "arn:aws:proton:region-id:123456789012:environment/
simple-env",

      "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",
      "name": "instance-one",
      "serviceName": "simple-svc",
      "templateMajorVersion": "1",
      "templateMinorVersion": "0",
      "templateName": "fargate-service"
    }
  ]
}
```

For more information, see [View service instance data](#) in the *The AWS Proton Administrator Guide* or [View service instance data](#) in the *The AWS Proton User Guide*.

Example 2: To list the specified service instance

The following `get-service-instance` example gets a service instance.

```
aws proton get-service-instance \  
  --name "instance-one" \  
  --service-name "simple-svc"
```

Output:

```
{  
  "serviceInstance": {  
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-  
instance/instance-one",  
    "createdAt": "2020-11-28T22:40:50.512000+00:00",  
    "deploymentStatus": "SUCCEEDED",  
    "environmentName": "simple-env",  
    "lastDeploymentAttemptedAt": "2020-11-28T22:40:50.512000+00:00",  
    "lastDeploymentSucceededAt": "2020-11-28T22:40:50.512000+00:00",  
    "name": "instance-one",  
    "serviceName": "simple-svc",  
    "spec": "proton: ServiceSpec\npipeline:\nmy_sample_pipeline_optional_input: hello world\nmy_sample_pipeline_required_input: pipeline up\ninstances:\n- name: instance-one\nenvironment: my-simple-env\nspec:\n  my_sample_service_instance_optional_input:

    "templateName": "svc-simple"  
  }  
}
```

For more information, see [View service instance data](#) in the *The AWS Proton Administrator Guide* or [View service instance data](#) in the *The AWS Proton User Guide*.

- For API details, see [ListServiceInstances](#) in *AWS CLI Command Reference*.

update-service-instance

The following code example shows how to use `update-service-instance`.

AWS CLI

To update a service instance to a new minor version

The following `update-service-instance` example updates a service instance to a new minor version of its service template that adds a new instance named "my-other-instance" with a new required input.

```
aws proton update-service-instance \
  --service-name "simple-svc" \
  --spec "file://service-spec.yaml " \
  --template-major-version "1" \
  --template-minor-version "1" \
  --deployment-type "MINOR_VERSION" \
  --name "instance-one"
```

Contents of `service-spec.yaml`:

```
proton: ServiceSpec
pipeline:
  my_sample_pipeline_optional_input: "abc"
  my_sample_pipeline_required_input: "123"
instances:
  - name: "instance-one"
    environment: "simple-env"
    spec:
      my_sample_service_instance_optional_input: "def"
      my_sample_service_instance_required_input: "456"
  - name: "my-other-instance"
    environment: "simple-env"
    spec:
      my_sample_service_instance_required_input: "789"
```

Output:

```
{
  "serviceInstance": {
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/service-instance/instance-one",
    "createdAt": "2021-04-02T21:29:59.962000+00:00",
    "deploymentStatus": "IN_PROGRESS",
    "environmentName": "arn:aws:proton:region-id:123456789012:environment/simple-env",
```

```
    "lastDeploymentAttemptedAt": "2021-04-02T21:38:00.823000+00:00",
    "lastDeploymentSucceededAt": "2021-04-02T21:29:59.962000+00:00",
    "name": "instance-one",
    "serviceName": "simple-svc",
    "templateMajorVersion": "1",
    "templateMinorVersion": "0",
    "templateName": "svc-simple"
  }
}
```

For more information, see [Update a service instance](#) in the *The AWS Proton Administrator Guide* or [Update a service instance](#) in the *The AWS Proton User Guide*.

- For API details, see [UpdateServiceInstance](#) in *AWS CLI Command Reference*.

update-service-pipeline

The following code example shows how to use `update-service-pipeline`.

AWS CLI

To update a service pipeline

The following `update-service-pipeline` example updates a service pipeline to a new minor version of its service template.

```
aws proton update-service-pipeline \
  --service-name "simple-svc" \
  --spec "file://service-spec.yaml" \
  --template-major-version "1" \
  --template-minor-version "1" \
  --deployment-type "MINOR_VERSION"
```

Output:

```
{
  "pipeline": {
    "arn": "arn:aws:proton:region-id:123456789012:service/simple-svc/pipeline/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "createdAt": "2021-04-02T21:29:59.962000+00:00",
    "deploymentStatus": "IN_PROGRESS",
    "lastDeploymentAttemptedAt": "2021-04-02T21:39:28.991000+00:00",
```

```

        "lastDeploymentSucceededAt": "2021-04-02T21:29:59.962000+00:00",
        "spec": "proton: ServiceSpec\n\npipeline:\n
my_sample_pipeline_optional_input: \"abc\"\n my_sample_pipeline_required_input:
\"123\"\n\ninstances:\n - name: \"my-instance\"\n environment: \"MySimpleEnv
\n\n spec:\n my_sample_service_instance_optional_input: \"def
\n\n my_sample_service_instance_required_input: \"456\"\n - name:
\"my-other-instance\"\n environment: \"MySimpleEnv\"\n spec:\n
my_sample_service_instance_required_input: \"789\"\n",
        "templateMajorVersion": "1",
        "templateMinorVersion": "0",
        "templateName": "svc-simple"
    }
}

```

For more information, see [Update a service pipeline](#) in the *The AWS Proton Administrator Guide* or [Update a service pipeline](#) in the *The AWS Proton User Guide*.

- For API details, see [UpdateServicePipeline](#) in *AWS CLI Command Reference*.

update-service

The following code example shows how to use `update-service`.

AWS CLI

To update a service

The following `update-service` example edits a service description.

```

aws proton update-service \
  --name "MySimpleService" \
  --description "Edit by updating description"

```

Output:

```

{
  "service": {
    "arn": "arn:aws:proton:region-id:123456789012:service/MySimpleService",
    "branchName": "mainline",
    "createdAt": "2021-03-12T22:39:42.318000+00:00",
    "description": "Edit by updating description",
    "lastModifiedAt": "2021-03-12T22:44:21.975000+00:00",
  }
}

```

```
    "name": "MySimpleService",
    "repositoryConnectionArn": "arn:aws:codestar-connections:region-
id:123456789012:connection/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "repositoryId": "myorg/myapp",
    "status": "ACTIVE",
    "templateName": "fargate-service"
  }
}
```

For more information, see [Edit a service](#) in the *The AWS Proton Administrator Guide* or [Edit a service](#) in the *The AWS Proton User Guide*.

- For API details, see [UpdateService](#) in *AWS CLI Command Reference*.

QLDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with QLDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

cancel-journal-kinesis-stream

The following code example shows how to use `cancel-journal-kinesis-stream`.

AWS CLI

To cancel a journal stream

The following `cancel-journal-kinesis-stream` example cancels the specified journal stream from a ledger.

```
aws qlldb cancel-journal-kinesis-stream \  
  --ledger-name myExampleLedger \  
  --stream-id 7ISCKqwe4y25YyHLzYUFAf
```

Output:

```
{  
  "StreamId": "7ISCKqwe4y25YyHLzYUFAf"  
}
```

For more information, see [Streaming journal data from Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [CancelJournalKinesisStream](#) in *AWS CLI Command Reference*.

create-ledger

The following code example shows how to use `create-ledger`.

AWS CLI

Example 1: To create a ledger with default properties

The following `create-ledger` example creates a ledger with the name `myExampleLedger` and the permissions mode `STANDARD`. The optional parameters for deletion protection and AWS KMS key are not specified, so they default to `true` and an AWS owned KMS key respectively.

```
aws qlldb create-ledger \  
  --name myExampleLedger \  
  --permissions-mode STANDARD
```

Output:

```
{  
  "State": "CREATING",  
  "Arn": "arn:aws:qlldb:us-west-2:123456789012:ledger/myExampleLedger",  
  "DeletionProtection": true,
```

```
"CreationDateTime": 1568839243.951,  
"Name": "myExampleLedger",  
"PermissionsMode": "STANDARD"  
}
```

Example 2: To create a ledger with deletion protection disabled, a customer managed KMS key, and specified tags

The following `create-ledger` example creates a ledger with the name `myExampleLedger2` and the permissions mode `STANDARD`. The deletion protection feature is disabled, the specified customer managed KMS key is used for encryption at rest, and the specified tags are attached to the resource.

```
aws qlldb create-ledger \  
  --name myExampleLedger2 \  
  --permissions-mode STANDARD \  
  --no-deletion-protection \  
  --kms-key arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-  
EXAMPLE11111 \  
  --tags IsTest=true,Domain=Test
```

Output:

```
{  
  "Arn": "arn:aws:qlldb:us-west-2:123456789012:ledger/myExampleLedger2",  
  "DeletionProtection": false,  
  "CreationDateTime": 1568839543.557,  
  "State": "CREATING",  
  "Name": "myExampleLedger2",  
  "PermissionsMode": "STANDARD",  
  "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-  
EXAMPLE11111"  
}
```

For more information, see [Basic Operations for Amazon QLDB Ledgers](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [CreateLedger](#) in *AWS CLI Command Reference*.

delete-ledger

The following code example shows how to use `delete-ledger`.

AWS CLI

To delete a ledger

The following `delete-ledger` example deletes the specified ledger.

```
aws qlldb delete-ledger \  
  --name myExampleLedger
```

This command produces no output.

For more information, see [Basic Operations for Amazon QLDB Ledgers](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [DeleteLedger](#) in *AWS CLI Command Reference*.

describe-journal-kinesis-stream

The following code example shows how to use `describe-journal-kinesis-stream`.

AWS CLI

To describe a journal stream

The following `describe-journal-kinesis-stream` example displays the details for the specified journal stream from a ledger.

```
aws qlldb describe-journal-kinesis-stream \  
  --ledger-name myExampleLedger \  
  --stream-id 7ISckqwe4y25YyHLzYUFAf
```

Output:

```
{  
  "Stream": {  
    "LedgerName": "myExampleLedger",  
    "CreationTime": 1591221984.677,  
    "InclusiveStartTime": 1590710400.0,  
    "ExclusiveEndTime": 1590796799.0,  
    "RoleArn": "arn:aws:iam::123456789012:role/my-kinesis-stream-role",  
    "StreamId": "7ISckqwe4y25YyHLzYUFAf",
```

```

    "Arn": "arn:aws:qldb:us-east-1:123456789012:stream/
myExampleLedger/7ISCKqe4y25YyHLzYUFAf",
    "Status": "ACTIVE",
    "KinesisConfiguration": {
        "StreamArn": "arn:aws:kinesis:us-east-1:123456789012:stream/stream-for-
qldb",
        "AggregationEnabled": true
    },
    "StreamName": "myExampleLedger-stream"
}
}

```

For more information, see [Streaming journal data from Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [DescribeJournalKinesisStream](#) in *AWS CLI Command Reference*.

describe-journal-s3-export

The following code example shows how to use `describe-journal-s3-export`.

AWS CLI

To describe a journal export job

The following `describe-journal-s3-export` example displays the details for the specified export job from a ledger.

```

aws qldb describe-journal-s3-export \
  --name myExampleLedger \
  --export-id ADR20NPKN5LINYGb4dp7yZ

```

Output:

```

{
  "ExportDescription": {
    "S3ExportConfiguration": {
      "Bucket": "awsExampleBucket",
      "Prefix": "ledgerexport1/",
      "EncryptionConfiguration": {
        "ObjectEncryptionType": "SSE_S3"
      }
    }
  }
}

```

```
    },
    "RoleArn": "arn:aws:iam::123456789012:role/my-s3-export-role",
    "Status": "COMPLETED",
    "ExportCreationTime": 1568847801.418,
    "InclusiveStartTime": 1568764800.0,
    "ExclusiveEndTime": 1568847599.0,
    "LedgerName": "myExampleLedger",
    "ExportId": "ADR20NPKN5LINYGb4dp7yZ"
  }
}
```

For more information, see [Exporting Your Journal in Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [DescribeJournalS3Export](#) in *AWS CLI Command Reference*.

describe-ledger

The following code example shows how to use `describe-ledger`.

AWS CLI

To describe a ledger

The following `describe-ledger` example displays the details for the specified ledger.

```
aws qldb describe-ledger \
  --name myExampleLedger
```

Output:

```
{
  "CreationDateTime": 1568839243.951,
  "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",
  "State": "ACTIVE",
  "Name": "myExampleLedger",
  "DeletionProtection": true,
  "PermissionsMode": "STANDARD",
  "EncryptionDescription": {
    "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111",
    "EncryptionStatus": "ENABLED"
  }
}
```

```
}
```

For more information, see [Basic Operations for Amazon QLDB Ledgers](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [DescribeLedger](#) in *AWS CLI Command Reference*.

export-journal-to-s3

The following code example shows how to use `export-journal-to-s3`.

AWS CLI

To export journal blocks to S3

The following `export-journal-to-s3` example creates an export job for journal blocks within a specified date and time range from a ledger with the name `myExampleLedger`. The export job writes the blocks into a specified Amazon S3 bucket.

```
aws qldb export-journal-to-s3 \  
  --name myExampleLedger \  
  --inclusive-start-time 2019-09-18T00:00:00Z \  
  --exclusive-end-time 2019-09-18T22:59:59Z \  
  --role-arn arn:aws:iam::123456789012:role/my-s3-export-role \  
  --s3-export-configuration file://my-s3-export-config.json
```

Contents of `my-s3-export-config.json`:

```
{  
  "Bucket": "awsExampleBucket",  
  "Prefix": "ledgerexport1/",  
  "EncryptionConfiguration": {  
    "ObjectEncryptionType": "SSE_S3"  
  }  
}
```

Output:

```
{  
  "ExportId": "ADR2ONPKN5LINYGb4dp7yZ"  
}
```

For more information, see [Exporting Your Journal in Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [ExportJournalToS3](#) in *AWS CLI Command Reference*.

get-block

The following code example shows how to use `get-block`.

AWS CLI

Example 1: To get a journal block and proof for verification using input files

The following `get-block` example requests a block data object and a proof from the specified ledger. The request is for a specified digest tip address and block address.

```
aws qlldb get-block \  
  --name vehicle-registration \  
  --block-address file://myblockaddress.json \  
  --digest-tip-address file://mydigesttipaddress.json
```

Contents of `myblockaddress.json`:

```
{  
  "IonText": "{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1\\",sequenceNo:100}"  
}
```

Contents of `mydigesttipaddress.json`:

```
{  
  "IonText": "{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1\\",sequenceNo:123}"  
}
```

Output:

```
{  
  "Block": {  
    "IonText": "{blockAddress:{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1\  
\\",sequenceNo:100},transactionId:\\"FnQeJBAicTX0Ah32ZnVtSX\  
\\",blockTimestamp:2019-09-16T19:37:05.360Z,blockHash:
```

```

    }
}

```

For more information, see [Data Verification in Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

Example 2: To get a journal block and proof for verification using shorthand syntax

The following `get-block` example requests a block data object and a proof from the specified ledger using shorthand syntax. The request is for a specified digest tip address and block address.

```

aws qlldb get-block \
  --name vehicle-registration \

```

```
--block-address 'IonText="{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1\\",sequenceNo:100}"'
\
--digest-tip-address 'IonText="{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1
\\",sequenceNo:123}"'
```

Output:

```

get-digest

The following code example shows how to use `get-digest`.

AWS CLI

To get a digest for a ledger

The following `get-digest` example requests a digest from the specified ledger at the latest committed block in the journal.

```
aws qlldb get-digest \  
  --name vehicle-registration
```

Output:

```
{  
  "Digest": "6m6BMXobbJKpMhahwVthAEsN6awgnHK62Qq5McGP1Gk=",  
  "DigestTipAddress": {  
    "IonText": "{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1\\",sequenceNo:123}"  
  }  
}
```

For more information, see [Data Verification in Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [GetDigest](#) in *AWS CLI Command Reference*.

get-revision

The following code example shows how to use `get-revision`.

AWS CLI

Example 1: To get a document revision and proof for verification using input files

The following `get-revision` example requests a revision data object and a proof from the specified ledger. The request is for a specified digest tip address, document ID, and block address of the revision.

```
aws qlldb get-revision \
  --name vehicle-registration \
  --block-address file://myblockaddress.json \
  --document-id JUJgkIcNbhS2goq8RqLuZ4 \
  --digest-tip-address file://mydigesttipaddress.json
```

Contents of `myblockaddress.json`:

```
{
  "IonText": "{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1\\",sequenceNo:100}"
}
```

Contents of `mydigesttipaddress.json`:

```
{
  "IonText": "{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1\\",sequenceNo:123}"
}
```

Output:

```
{
  "Revision": {
    "IonText": "{blockAddress:{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1\\",sequenceNo:100},hash:{{mHVex/yjHAWjFPpwhBuH2GKXmKJjK2FBa9faqoUVNtg=}},data:

Example 2: To get a document revision and proof for verification using shorthand syntax

The following `get-revision` example requests a revision data object and a proof from the specified ledger using shorthand syntax. The request is for a specified digest tip address, document ID, and block address of the revision.

```
aws qldb get-revision \
  --name vehicle-registration \
  --block-address 'IonText="{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1\\",sequenceNo:100}"'
  \
  --document-id JUJgkIcNbhS2goq8RqLuZ4 \
  --digest-tip-address 'IonText="{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1
  \\",sequenceNo:123}"'
```

Output:

```
{
  "Revision": {
    "IonText": "{blockAddress:{strandId:\\"KmA3ZZca7vAIiJAK9S5Iw1
  \\",sequenceNo:100},hash:{{mHVex/yjHAWjFPpwhBuH2GKXmKJjK2FBa9faqoUVNtg=}},data:
  {VIN:\\"1N4AL11D75C109151\\",LicensePlateNumber:\\"LEWISR261LL\\",State:\\"WA

For more information, see [Data Verification in Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [GetRevision](#) in *AWS CLI Command Reference*.

list-journal-kinesis-streams-for-ledger

The following code example shows how to use `list-journal-kinesis-streams-for-ledger`.

AWS CLI

To list journal streams for a ledger

The following `list-journal-kinesis-streams-for-ledger` example lists journal streams for the specified ledger.

```
aws qlldb list-journal-kinesis-streams-for-ledger \
  --ledger-name myExampleLedger
```

Output:

```
{
  "Streams": [
    {
      "LedgerName": "myExampleLedger",
      "CreationTime": 1591221984.677,
      "InclusiveStartTime": 1590710400.0,
      "ExclusiveEndTime": 1590796799.0,
      "RoleArn": "arn:aws:iam::123456789012:role/my-kinesis-stream-role",
      "StreamId": "7ISCKqwe4y25YyHLzYUFaf",
      "Arn": "arn:aws:qlldb:us-east-1:123456789012:stream/
myExampleLedger/7ISCKqwe4y25YyHLzYUFaf",
      "Status": "ACTIVE",
      "KinesisConfiguration": {
        "StreamArn": "arn:aws:kinesis:us-east-1:123456789012:stream/stream-
for-qlldb",
        "AggregationEnabled": true
      },
    },
  ],
}
```

```

        "StreamName": "myExampleLedger-stream"
      }
    ]
  }

```

For more information, see [Streaming journal data from Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [ListJournalKinesisStreamsForLedger](#) in *AWS CLI Command Reference*.

list-journal-s3-exports-for-ledger

The following code example shows how to use `list-journal-s3-exports-for-ledger`.

AWS CLI

To list journal export jobs for a ledger

The following `list-journal-s3-exports-for-ledger` example lists journal export jobs for the specified ledger.

```

aws qlldb list-journal-s3-exports-for-ledger \
  --name myExampleLedger

```

Output:

```

{
  "JournalS3Exports": [
    {
      "LedgerName": "myExampleLedger",
      "ExclusiveEndTime": 1568847599.0,
      "ExportCreationTime": 1568847801.418,
      "S3ExportConfiguration": {
        "Bucket": "awsExampleBucket",
        "Prefix": "ledgerexport1/",
        "EncryptionConfiguration": {
          "ObjectEncryptionType": "SSE_S3"
        }
      },
      "ExportId": "ADR20NPKN5LINYGb4dp7yZ",
      "RoleArn": "arn:aws:iam::123456789012:role/qlldb-s3-export",
      "InclusiveStartTime": 1568764800.0,
      "Status": "IN_PROGRESS"
    }
  ]
}

```

```
    }  
  ]  
}
```

For more information, see [Exporting Your Journal in Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [ListJournalS3ExportsForLedger](#) in *AWS CLI Command Reference*.

list-journal-s3-exports

The following code example shows how to use `list-journal-s3-exports`.

AWS CLI

To list journal export jobs

The following `list-journal-s3-exports` example lists journal export jobs for all ledgers that are associated with the current AWS account and Region.

```
aws qlldb list-journal-s3-exports
```

Output:

```
{  
  "JournalS3Exports": [  
    {  
      "Status": "IN_PROGRESS",  
      "LedgerName": "myExampleLedger",  
      "S3ExportConfiguration": {  
        "EncryptionConfiguration": {  
          "ObjectEncryptionType": "SSE_S3"  
        },  
        "Bucket": "awsExampleBucket",  
        "Prefix": "ledgerexport1/"  
      },  
      "RoleArn": "arn:aws:iam::123456789012:role/my-s3-export-role",  
      "ExportCreationTime": 1568847801.418,  
      "ExportId": "ADR20NPKN5LINYGb4dp7yZ",  
      "InclusiveStartTime": 1568764800.0,  
      "ExclusiveEndTime": 1568847599.0  
    },  
    {
```

```
"Status": "COMPLETED",
"LedgerName": "myExampleLedger2",
"S3ExportConfiguration": {
  "EncryptionConfiguration": {
    "ObjectEncryptionType": "SSE_S3"
  },
  "Bucket": "awsExampleBucket",
  "Prefix": "ledgerexport1/"
},
"RoleArn": "arn:aws:iam::123456789012:role/my-s3-export-role",
"ExportCreationTime": 1568846847.638,
"ExportId": "2pdvW8UQrjBAiYTMehEJDI",
"InclusiveStartTime": 1568592000.0,
"ExclusiveEndTime": 1568764800.0
}
]
}
```

For more information, see [Exporting Your Journal in Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [ListJournalS3Exports](#) in *AWS CLI Command Reference*.

list-ledgers

The following code example shows how to use `list-ledgers`.

AWS CLI

To list your available ledgers

The following `list-ledgers` example lists all ledgers that are associated with the current AWS account and Region.

```
aws qldb list-ledgers
```

Output:

```
{
  "Ledgers": [
    {
      "State": "ACTIVE",
      "CreationDateTime": 1568839243.951,
```

```
        "Name": "myExampleLedger"
      },
      {
        "State": "ACTIVE",
        "CreationDateTime": 1568839543.557,
        "Name": "myExampleLedger2"
      }
    ]
  }
}
```

For more information, see [Basic Operations for Amazon QLDB Ledgers](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [ListLedgers](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags attached to a ledger

The following `list-tags-for-resource` example lists all tags attached to the specified ledger.

```
aws qldb list-tags-for-resource \
  --resource-arn arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger
```

Output:

```
{
  "Tags": {
    "IsTest": "true",
    "Domain": "Test"
  }
}
```

For more information, see [Tagging Amazon QLDB Resources](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

stream-journal-to-kinesis

The following code example shows how to use `stream-journal-to-kinesis`.

AWS CLI

Example 1: To stream journal data to Kinesis Data Streams using input files

The following `stream-journal-to-kinesis` example creates a stream of journal data within a specified date and time range from a ledger with the name `myExampleLedger`. The stream sends the data to a specified Amazon Kinesis data stream.

```
aws qlldb stream-journal-to-kinesis \  
  --ledger-name myExampleLedger \  
  --inclusive-start-time 2020-05-29T00:00:00Z \  
  --exclusive-end-time 2020-05-29T23:59:59Z \  
  --role-arn arn:aws:iam::123456789012:role/my-kinesis-stream-role \  
  --kinesis-configuration file://my-kinesis-config.json \  
  --stream-name myExampleLedger-stream
```

Contents of `my-kinesis-config.json`:

```
{  
  "StreamArn": "arn:aws:kinesis:us-east-1:123456789012:stream/stream-for-qlldb",  
  "AggregationEnabled": true  
}
```

Output:

```
{  
  "StreamId": "7ISckqwe4y25YyHLzYUFAf"  
}
```

For more information, see [Streaming journal data from Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

Example 2: To stream journal data to Kinesis Data Streams using shorthand syntax

The following `stream-journal-to-kinesis` example creates a stream of journal data within a specified date and time range from a ledger with the name `myExampleLedger`. The stream sends the data to a specified Amazon Kinesis data stream.

```
aws qlldb stream-journal-to-kinesis \  
  --ledger-name myExampleLedger \  
  --inclusive-start-time 2020-05-29T00:00:00Z \  
  --exclusive-end-time 2020-05-29T23:59:59Z \  
  --role-arn arn:aws:iam::123456789012:role/my-kinesis-stream-role \  
  --stream-name myExampleLedger-stream \  
  --kinesis-configuration StreamArn=arn:aws:kinesis:us-east-1:123456789012:stream/  
stream-for-qlldb,AggregationEnabled=true
```

Output:

```
{  
  "StreamId": "7ISCKqwe4y25YyHLzYUFAf"  
}
```

For more information, see [Streaming journal data from Amazon QLDB](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [StreamJournalToKinesis](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a ledger

The following `tag-resource` example adds a set of tags to a specified ledger.

```
aws qlldb tag-resource \  
  --resource-arn arn:aws:qlldb:us-west-2:123456789012:ledger/myExampleLedger \  
  --tags IsTest=true,Domain=Test
```

This command produces no output.

For more information, see [Tagging Amazon QLDB Resources](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource

The following `untag-resource` example removes tags with the specified tag keys from a specified ledger.

```
aws qlldb untag-resource \  
  --resource-arn arn:aws:qlldb:us-west-2:123456789012:ledger/myExampleLedger \  
  --tag-keys IsTest Domain
```

This command produces no output.

For more information, see [Tagging Amazon QLDB Resources](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-ledger-permissions-mode

The following code example shows how to use `update-ledger-permissions-mode`.

AWS CLI

Example 1: To update the permissions mode of a ledger to STANDARD

The following `update-ledger-permissions-mode` example assigns the STANDARD permissions mode to the specified ledger.

```
aws qlldb update-ledger-permissions-mode \  
  --name myExampleLedger \  
  --permissions-mode STANDARD
```

Output:

```
{  
  "Name": "myExampleLedger",  
  "Arn": "arn:aws:qlldb:us-west-2:123456789012:ledger/myExampleLedger",  
  "PermissionsMode": "STANDARD"
```

```
}
```

Example 2: To update the permissions mode of a ledger to ALLOW_ALL

The following `update-ledger-permissions-mode` example assigns the `ALLOW_ALL` permissions mode to the specified ledger.

```
aws qlldb update-ledger-permissions-mode \  
  --name myExampleLedger \  
  --permissions-mode ALLOW_ALL
```

Output:

```
{  
  "Name": "myExampleLedger",  
  "Arn": "arn:aws:qlldb:us-west-2:123456789012:ledger/myExampleLedger",  
  "PermissionsMode": "ALLOW_ALL"  
}
```

For more information, see [Basic Operations for Amazon QLDB Ledgers](#) in the *Amazon QLDB Developer Guide*.

- For API details, see [UpdateLedgerPermissionsMode](#) in *AWS CLI Command Reference*.

update-ledger

The following code example shows how to use `update-ledger`.

AWS CLI

Example 1: To update the deletion protection property of a ledger

The following `update-ledger` example updates the specified ledger to disable the deletion protection feature.

```
aws qlldb update-ledger \  
  --name myExampleLedger \  
  --no-deletion-protection
```

Output:

```
{
```

```
"CreationDateTime": 1568839243.951,  
"Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",  
"DeletionProtection": false,  
"Name": "myExampleLedger",  
"State": "ACTIVE"  
}
```

Example 2: To update the AWS KMS key of a ledger to a customer managed key

The following `update-ledger` example updates the specified ledger to use a customer managed KMS key for encryption at rest.

```
aws qldb update-ledger \  
  --name myExampleLedger \  
  --kms-key arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-cdef-  
EXAMPLE11111
```

Output:

```
{  
  "CreationDateTime": 1568839243.951,  
  "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",  
  "DeletionProtection": false,  
  "Name": "myExampleLedger",  
  "State": "ACTIVE",  
  "EncryptionDescription": {  
    "KmsKeyArn": "arn:aws:kms:us-west-2:123456789012:key/a1b2c3d4-5678-90ab-  
cdef-EXAMPLE11111",  
    "EncryptionStatus": "UPDATING"  
  }  
}
```

Example 3: To update the AWS KMS key of a ledger to an AWS owned key

The following `update-ledger` example updates the specified ledger to use an AWS owned KMS key for encryption at rest.

```
aws qldb update-ledger \  
  --name myExampleLedger \  
  --kms-key AWS_OWNED_KMS_KEY
```

Output:

```
{
  "CreationDateTime": 1568839243.951,
  "Arn": "arn:aws:qldb:us-west-2:123456789012:ledger/myExampleLedger",
  "DeletionProtection": false,
  "Name": "myExampleLedger",
  "State": "ACTIVE",
  "EncryptionDescription": {
    "KmsKeyArn": "AWS_OWNED_KMS_KEY",
    "EncryptionStatus": "UPDATING"
  }
}
```

- For API details, see [UpdateLedger](#) in *AWS CLI Command Reference*.

Amazon RDS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

add-option-to-option-group

The following code example shows how to use `add-option-to-option-group`.

AWS CLI

To add an option to an option group

The following add-option-to-option-group example adds an option to the specified option group.

```
aws rds add-option-to-option-group \  
  --option-group-name myoptiongroup \  
  --options OptionName=OEM,Port=5500,DBSecurityGroupMemberships=default \  
  --apply-immediately
```

Output:

```
{  
  "OptionGroup": {  
    "OptionGroupName": "myoptiongroup",  
    "OptionGroupDescription": "Test Option Group",  
    "EngineName": "oracle-ee",  
    "MajorEngineVersion": "12.1",  
    "Options": [  
      {  
        "OptionName": "Timezone",  
        "OptionDescription": "Change time zone",  
        "Persistent": true,  
        "Permanent": false,  
        "OptionSettings": [  
          {  
            "Name": "TIME_ZONE",  
            "Value": "Australia/Sydney",  
            "DefaultValue": "UTC",  
            "Description": "Specifies the timezone the user wants to  
change the system time to",  
            "ApplyType": "DYNAMIC",  
            "DataType": "STRING",  
            "AllowedValues": "Africa/Cairo,Africa/Casablanca,Africa/

For more information, see [Adding an Option to an Option Group](#) in the *Amazon RDS User Guide*.

- For API details, see [AddOptionToOptionGroup](#) in *AWS CLI Command Reference*.

add-role-to-db-cluster

The following code example shows how to use `add-role-to-db-cluster`.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB cluster

The following `add-role-to-db-cluster` example associates a role with a DB cluster.

```
aws rds add-role-to-db-cluster \  
  --db-cluster-identifier mydbcluster \  
  --role-arn arn:aws:iam::123456789012:role/RDSLoadFromS3
```

This command produces no output.

For more information, see [Associating an IAM role with an Amazon Aurora MySQL DB cluster](#) in the *Amazon Aurora User Guide*.

- For API details, see [AddRoleToDbCluster](#) in *AWS CLI Command Reference*.

add-role-to-db-instance

The following code example shows how to use `add-role-to-db-instance`.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB instance

The following `add-role-to-db-instance` example adds the role to an Oracle DB instance named `test-instance`.

```
aws rds add-role-to-db-instance \  
  --db-instance-identifier test-instance \  
  --feature-name S3_INTEGRATION \  
  --role-arn arn:aws:iam::111122223333:role/rds-s3-integration-role
```

This command produces no output.

For more information, see [Prerequisites for Amazon RDS Oracle Integration with Amazon S3](#) in the *Amazon RDS User Guide*.

- For API details, see [AddRoleToDbInstance](#) in *AWS CLI Command Reference*.

add-source-identifier-to-subscription

The following code example shows how to use `add-source-identifier-to-subscription`.

AWS CLI

To add a source identifier to a subscription

The following `add-source-identifier` example adds another source identifier to an existing subscription.

```
aws rds add-source-identifier-to-subscription \  
  --subscription-name my-instance-events \  
  --source-identifier test-instance-repl
```

Output:

```
{  
  "EventSubscription": {  
    "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",  
    "CustSubscriptionId": "my-instance-events",  
    "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-  
events",  
    "Enabled": false,  
    "Status": "modifying",  
    "EventCategoriesList": [  
      "backup",  
      "recovery"  
    ],  
    "CustomerAwsId": "123456789012",  
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",  
    "SourceType": "db-instance",  
    "SourceIdsList": [  
      "test-instance",  
      "test-instance-repl"  
    ]  
  }  
}
```

```
}
```

- For API details, see [AddSourceIdentifierToSubscription](#) in *AWS CLI Command Reference*.

add-tags-to-resource

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add tags to a resource

The following `add-tags-to-resource` example add tags to an RDS database.

```
aws rds add-tags-to-resource \  
  --resource-name arn:aws:rds:us-east-1:123456789012:db:database-mysql \  
  --tags "[{\"Key\": \"Name\", \"Value\": \"MyDatabase\"}, {\"Key\": \"Environment\", \"Value\": \"test\"}]\"
```

This command produces no output.

For more information, see [Tagging Amazon RDS Resources](#) in the *Amazon RDS User Guide*.

- For API details, see [AddTagsToResource](#) in *AWS CLI Command Reference*.

apply-pending-maintenance-action

The following code example shows how to use `apply-pending-maintenance-action`.

AWS CLI

To apply pending maintenance actions

The following `apply-pending-maintenance-action` example applies the pending maintenance actions for a DB cluster.

```
aws rds apply-pending-maintenance-action \  
  --resource-identifier arn:aws:rds:us-east-1:123456789012:cluster:my-db-cluster \  
  --apply-action system-update \  
  --opt-in-type immediate
```

Output:

```
{
  "ResourcePendingMaintenanceActions": {
    "ResourceIdentifier": "arn:aws:rds:us-east-1:123456789012:cluster:my-db-cluster",
    "PendingMaintenanceActionDetails": [
      {
        "Action": "system-update",
        "OptInStatus": "immediate",
        "CurrentApplyDate": "2021-01-23T01:07:36.100Z",
        "Description": "Upgrade to Aurora PostgreSQL 3.3.2"
      }
    ]
  }
}
```

For more information, see [Maintaining a DB instance](#) in the *Amazon RDS User Guide* and [Maintaining an Amazon Aurora DB cluster](#) in the *Amazon Aurora User Guide*.

- For API details, see [ApplyPendingMaintenanceAction](#) in *AWS CLI Command Reference*.

authorize-db-security-group-ingress

The following code example shows how to use `authorize-db-security-group-ingress`.

AWS CLI

To associate an AWS Identity and Access Management (IAM) role with a DB instance

The following `authorize-db-security-group-ingress` example configures the default security group with an ingress rule for the CIDR IP range 192.0.2.0/24.

```
aws rds authorize-db-security-group-ingress \
  --db-security-group-name default \
  --cidrip 192.0.2.0/24
```

Output:

```
{
  "DBSecurityGroup": {
    "OwnerId": "123456789012",
    "DBSecurityGroupName": "default",
```

```

    "DBSecurityGroupDescription": "default",
    "EC2SecurityGroups": [],
    "IPRanges": [
      {
        "Status": "authorizing",
        "CIDRIP": "192.0.2.0/24"
      }
    ],
    "DBSecurityGroupArn": "arn:aws:rds:us-east-1:111122223333:secgrp:default"
  }
}

```

For more information, see [Authorizing Network Access to a DB Security Group from an IP Range](#) in the *Amazon RDS User Guide*.

- For API details, see [AuthorizeDbSecurityGroupIngress](#) in *AWS CLI Command Reference*.

backtrack-db-cluster

The following code example shows how to use `backtrack-db-cluster`.

AWS CLI

To backtrack an Aurora DB cluster

The following `backtrack-db-cluster` example backtracks the specified DB cluster `sample-cluster` to March 19, 2018, at 10 a.m.

```
aws rds backtrack-db-cluster --db-cluster-identifier sample-cluster --backtrack-to
2018-03-19T10:00:00+00:00
```

This command outputs a JSON block that acknowledges the change to the RDS resource.

- For API details, see [BacktrackDbCluster](#) in *AWS CLI Command Reference*.

cancel-export-task

The following code example shows how to use `cancel-export-task`.

AWS CLI

To cancel a snapshot export to Amazon S3

The following `cancel-export-task` example cancels an export task in progress that is exporting a snapshot to Amazon S3.

```
aws rds cancel-export-task \  
  --export-task-identifier my-s3-export-1
```

Output:

```
{  
  "ExportTaskIdentifier": "my-s3-export-1",  
  "SourceArn": "arn:aws:rds:us-east-1:123456789012:snapshot:publisher-final-  
snapshot",  
  "SnapshotTime": "2019-03-24T20:01:09.815Z",  
  "S3Bucket": "mybucket",  
  "S3Prefix": "",  
  "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/export-snap-S3-role",  
  "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/abcd0000-7bfd-4594-af38-  
aabbccddeeff",  
  "Status": "CANCELING",  
  "PercentProgress": 0,  
  "TotalExtractedDataInGB": 0  
}
```

For more information, see [Canceling a snapshot export task](#) in the *Amazon RDS User Guide* or [Canceling a snapshot export task](#) in the *Amazon Aurora User Guide*.

- For API details, see [CancelExportTask](#) in *AWS CLI Command Reference*.

copy-db-cluster-parameter-group

The following code example shows how to use `copy-db-cluster-parameter-group`.

AWS CLI

To copy a DB cluster parameter group

The following `copy-db-cluster-parameter-group` example makes a copy of a DB cluster parameter group.

```
aws rds copy-db-cluster-parameter-group \  
  --source-db-cluster-parameter-group-identifier mydbclusterpg \  
  --target-db-cluster-parameter-group-identifier mydbclusterpg
```

```
--target-db-cluster-parameter-group-identifier mydbclusterpgcopy \  
--target-db-cluster-parameter-group-description "Copy of mydbclusterpg parameter  
group"
```

Output:

```
{  
  "DBClusterParameterGroup": {  
    "DBClusterParameterGroupName": "mydbclusterpgcopy",  
    "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:cluster-  
pg:mydbclusterpgcopy",  
    "DBParameterGroupFamily": "aurora-mysql5.7",  
    "Description": "Copy of mydbclusterpg parameter group"  
  }  
}
```

For more information, see [Copying a DB Cluster Parameter Group](#) in the *Amazon Aurora Users Guide*.

- For API details, see [CopyDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

copy-db-cluster-snapshot

The following code example shows how to use `copy-db-cluster-snapshot`.

AWS CLI

To copy a DB cluster snapshot

The following `copy-db-cluster-snapshot` example creates a copy of a DB cluster snapshot, including its tags.

```
aws rds copy-db-cluster-snapshot \  
  --source-db-cluster-snapshot-identifier arn:aws:rds:us-  
east-1:123456789012:cluster-snapshot:rds:myaurora-2019-06-04-09-16  
  --target-db-cluster-snapshot-identifier myclustersnapshotcopy \  
  --copy-tags
```

Output:

```
{
```

```

"DBClusterSnapshot": {
  "AvailabilityZones": [
    "us-east-1a",
    "us-east-1b",
    "us-east-1e"
  ],
  "DBClusterSnapshotIdentifier": "myclustersnapshotcopy",
  "DBClusterIdentifier": "myaurora",
  "SnapshotCreateTime": "2019-06-04T09:16:42.649Z",
  "Engine": "aurora-mysql",
  "AllocatedStorage": 0,
  "Status": "available",
  "Port": 0,
  "VpcId": "vpc-6594f31c",
  "ClusterCreateTime": "2019-04-15T14:18:42.785Z",
  "MasterUsername": "myadmin",
  "EngineVersion": "5.7.mysql_aurora.2.04.2",
  "LicenseModel": "aurora-mysql",
  "SnapshotType": "manual",
  "PercentProgress": 100,
  "StorageEncrypted": true,
  "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
  "DBClusterSnapshotArn": "arn:aws:rds:us-east-1:123456789012:cluster-
snapshot:myclustersnapshotcopy",
  "IAMDatabaseAuthenticationEnabled": false
}
}

```

For more information, see [Copying a Snapshot](#) in the *Amazon Aurora User Guide*.

- For API details, see [CopyDbClusterSnapshot](#) in *AWS CLI Command Reference*.

copy-db-parameter-group

The following code example shows how to use copy-db-parameter-group.

AWS CLI

To copy a DB cluster parameter group

The following copy-db-parameter-group example makes a copy of a DB parameter group.

```
aws rds copy-db-parameter-group \
```

```
--source-db-parameter-group-identifier mydbpg \  
--target-db-parameter-group-identifier mydbpgcopy \  
--target-db-parameter-group-description "Copy of mydbpg parameter group"
```

Output:

```
{  
  "DBParameterGroup": {  
    "DBParameterGroupName": "mydbpgcopy",  
    "DBParameterGroupArn": "arn:aws:rds:us-east-1:814387698303:pg:mydbpgcopy",  
    "DBParameterGroupFamily": "mysql5.7",  
    "Description": "Copy of mydbpg parameter group"  
  }  
}
```

For more information, see [Copying a DB Parameter Group](#) in the *Amazon RDS Users Guide*.

- For API details, see [CopyDbParameterGroup](#) in *AWS CLI Command Reference*.

copy-db-snapshot

The following code example shows how to use copy-db-snapshot.

AWS CLI

To copy a DB snapshot

The following copy-db-snapshot example creates a copy of a DB snapshot.

```
aws rds copy-db-snapshot \  
  --source-db-snapshot-identifier rds:database-mysql-2019-06-06-08-38  
  --target-db-snapshot-identifier mydbsnapshotcopy
```

Output:

```
{  
  "DBSnapshot": {  
    "VpcId": "vpc-6594f31c",  
    "Status": "creating",  
    "Encrypted": true,  
    "SourceDBSnapshotIdentifier": "arn:aws:rds:us-east-1:123456789012:snapshot:rds:database-mysql-2019-06-06-08-38",  
  }  
}
```

```

    "MasterUsername": "admin",
    "Iops": 1000,
    "Port": 3306,
    "LicenseModel": "general-public-license",
    "DBSnapshotArn": "arn:aws:rds:us-
east-1:123456789012:snapshot:mysnapshotcopy",
    "EngineVersion": "5.6.40",
    "OptionGroupName": "default:mysql-5-6",
    "ProcessorFeatures": [],
    "Engine": "mysql",
    "StorageType": "io1",
    "DbiResourceId": "db-ZI7UJ5BLKMBYFGX7FDENCKADC4",
    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
    "SnapshotType": "manual",
    "IAMDatabaseAuthenticationEnabled": false,
    "SourceRegion": "us-east-1",
    "DBInstanceIdentifier": "database-mysql",
    "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
    "AvailabilityZone": "us-east-1f",
    "PercentProgress": 0,
    "AllocatedStorage": 100,
    "DBSnapshotIdentifier": "mysnapshotcopy"
  }
}

```

For more information, see [Copying a Snapshot](#) in the *Amazon RDS User Guide*.

- For API details, see [CopyDbSnapshot](#) in *AWS CLI Command Reference*.

copy-option-group

The following code example shows how to use `copy-option-group`.

AWS CLI

To copy an option group

The following `copy-option-group` example makes a copy of an option group.

```

aws rds copy-option-group \
  --source-option-group-identifier myoptiongroup \
  --target-option-group-identifier new-option-group \
  --target-option-group-description "My option group copy"

```

Output:

```
{
  "OptionGroup": {
    "Options": [],
    "OptionGroupName": "new-option-group",
    "MajorEngineVersion": "11.2",
    "OptionGroupDescription": "My option group copy",
    "AllowsVpcAndNonVpcInstanceMemberships": true,
    "EngineName": "oracle-ee",
    "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:new-option-group"
  }
}
```

For more information, see [Making a Copy of an Option Group](#) in the *Amazon RDS User Guide*.

- For API details, see [CopyOptionGroup](#) in *AWS CLI Command Reference*.

create-blue-green-deployment

The following code example shows how to use `create-blue-green-deployment`.

AWS CLI**Example 1: To create a blue/green deployment for an RDS for MySQL DB instance**

The following `create-blue-green-deployment` example creates a blue/green deployment for a MySQL DB instance.

```
aws rds create-blue-green-deployment \
  --blue-green-deployment-name bgd-cli-test-instance \
  --source arn:aws:rds:us-east-1:123456789012:db:my-db-instance \
  --target-engine-version 8.0 \
  --target-db-parameter-group-name mysql-80-group
```

Output:

```
{
  "BlueGreenDeployment": {
    "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",
    "BlueGreenDeploymentName": "bgd-cli-test-instance",
    "Source": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
  }
}
```

```

    "SwitchoverDetails": [
      {
        "SourceMember": "arn:aws:rds:us-east-1:123456789012:db:my-db-

    "CreateTime": "2022-02-25T21:18:51.183000+00:00"
  }
}

```

For more information, see [Creating a blue/green deployment](#) in the *Amazon RDS User Guide*.

Example 2: To create a blue/green deployment for an Aurora MySQL DB cluster

The following `create-blue-green-deployment` example creates a blue/green deployment for an Aurora MySQL DB cluster.

```
aws rds create-blue-green-deployment \  
  --blue-green-deployment-name my-blue-green-deployment \  
  --source arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-cluster \  
  --target-engine-version 8.0 \  
  --target-db-cluster-parameter-group-name ams-80-binlog-enabled \  
  --target-db-parameter-group-name mysql-80-cluster-group
```

Output:

```
{  
  "BlueGreenDeployment": {  
    "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",  
    "BlueGreenDeploymentName": "my-blue-green-deployment",  
    "Source": "arn:aws:rds:us-east-1:123456789012:cluster:my-aurora-mysql-  
cluster",  
    "SwitchoverDetails": [

create-db-cluster-endpoint

The following code example shows how to use `create-db-cluster-endpoint`.

AWS CLI

To create a custom DB cluster endpoint

The following `create-db-cluster-endpoint` example creates a custom DB cluster endpoint and associate it with the specified Aurora DB cluster.

```
aws rds create-db-cluster-endpoint \  
  --db-cluster-endpoint-identifier mycustomendpoint \  
  --endpoint-type reader \  
  --db-cluster-identifier mydbcluster \  
  --static-members dbinstance1 dbinstance2
```

Output:

```
{  
  "DBClusterEndpointIdentifier": "mycustomendpoint",  
  "DBClusterIdentifier": "mydbcluster",  
  "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",  
  "Endpoint": "mycustomendpoint.cluster-custom-cnpxample.us-  
east-1.rds.amazonaws.com",  
  "Status": "creating",  
  "EndpointType": "CUSTOM",  
  "CustomEndpointType": "READER",  
  "StaticMembers": [  
    "dbinstance1",  
    "dbinstance2"  
  ],  
  "ExcludedMembers": [],  
  "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-  
endpoint:mycustomendpoint"  
}
```

For more information, see [Amazon Aurora Connection Management](#) in the *Amazon Aurora User Guide*.

- For API details, see [CreateDbClusterEndpoint](#) in *AWS CLI Command Reference*.

create-db-cluster-parameter-group

The following code example shows how to use `create-db-cluster-parameter-group`.

AWS CLI

To create a DB cluster parameter group

The following `create-db-cluster-parameter-group` example creates a DB cluster parameter group.

```
aws rds create-db-cluster-parameter-group \  
  --db-cluster-parameter-group-name mydbclusterparametergroup \  
  --db-parameter-group-family aurora5.6 \  
  --description "My new cluster parameter group"
```

Output:

```
{  
  "DBClusterParameterGroup": {  
    "DBClusterParameterGroupName": "mydbclusterparametergroup",  
    "DBParameterGroupFamily": "aurora5.6",  
    "Description": "My new cluster parameter group",  
    "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:cluster-  
pg:mydbclusterparametergroup"  
  }  
}
```

For more information, see [Creating a DB Cluster Parameter Group](#) in the *Amazon Aurora User Guide*.

- For API details, see [CreateDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

create-db-cluster-snapshot

The following code example shows how to use `create-db-cluster-snapshot`.

AWS CLI

To create a DB cluster snapshot

The following `create-db-cluster-snapshot` example creates a DB cluster snapshot.

```
aws rds create-db-cluster-snapshot \  
  --db-cluster-identifier mydbcluster \  
  --db-cluster-snapshot-identifier mydbclustersnapshot
```

Output:

```
{
```

```

"DBClusterSnapshot": {
  "AvailabilityZones": [
    "us-east-1a",
    "us-east-1b",
    "us-east-1e"
  ],

- For API details, see [CreateDbClusterSnapshot](#) in *AWS CLI Command Reference*.

create-db-cluster

The following code example shows how to use `create-db-cluster`.

AWS CLI

Example 1: To create a MySQL 5.7--compatible DB cluster

The following `create-db-cluster` example creates a MySQL 5.7-compatible DB cluster using the default engine version. Replace the sample password `secret99` with a secure password. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer

DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```
aws rds create-db-cluster \  
  --db-cluster-identifier sample-cluster \  
  --engine aurora-mysql \  
  --engine-version 5.7 \  
  --master-username admin \  
  --master-user-password secret99 \  
  --db-subnet-group-name default \  
  --vpc-security-group-ids sg-0b9130572daf3dc16
```

Output:

```
{  
  "DBCluster": {  
    "DBSubnetGroup": "default",  
    "VpcSecurityGroups": [  
      {  
        "VpcSecurityGroupId": "sg-0b9130572daf3dc16",  
        "Status": "active"  
      }  
    ],  
    "AllocatedStorage": 1,  
    "AssociatedRoles": [],  
    "PreferredBackupWindow": "09:12-09:42",  
    "ClusterCreateTime": "2023-02-27T23:21:33.048Z",  
    "DeletionProtection": false,  
    "IAMDatabaseAuthenticationEnabled": false,  
    "ReadReplicaIdentifiers": [],  
    "EngineMode": "provisioned",  
    "Engine": "aurora-mysql",  
    "StorageEncrypted": false,  
    "MultiAZ": false,  
    "PreferredMaintenanceWindow": "mon:04:31-mon:05:01",  
    "HttpEndpointEnabled": false,  
    "BackupRetentionPeriod": 1,  
    "DbClusterResourceId": "cluster-ANPAJ4AE5446DAEXAMPLE",  
    "DBClusterIdentifier": "sample-cluster",  
    "AvailabilityZones": [  
      "us-east-1a",  
      "us-east-1b",
```

```

        "us-east-1e"
    ],
    "MasterUsername": "master",
    "EngineVersion": "5.7.mysql_aurora.2.11.1",
    "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:sample-cluster",
    "DBClusterMembers": [],
    "Port": 3306,
    "Status": "creating",
    "Endpoint": "sample-cluster.cluster-cnpxexample.us-east-1.rds.amazonaws.com",

    "ReaderEndpoint": "sample-cluster.cluster-ro-cnpxexample.us-
east-1.rds.amazonaws.com",
    "CopyTagsToSnapshot": false
}
}

```

Example 2: To create a PostgreSQL--compatible DB cluster

The following `create-db-cluster` example creates a PostgreSQL-compatible DB cluster using the default engine version. Replace the example password `secret99` with a secure password. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```

aws rds create-db-cluster \
  --db-cluster-identifier sample-pg-cluster \
  --engine aurora-postgresql \
  --master-username master \
  --master-user-password secret99 \
  --db-subnet-group-name default \
  --vpc-security-group-ids sg-0b9130572daf3dc16

```

Output:

```

{
  "DBCluster": {
    "Endpoint": "sample-pg-cluster.cluster-cnpxexample.us-
east-1.rds.amazonaws.com",
    "HttpEndpointEnabled": false,
    "DBClusterMembers": [],

```

create-db-instance-read-replica

The following code example shows how to use `create-db-instance-read-replica`.

AWS CLI

To create a DB instance read replica

This example creates a read replica of an existing DB instance named `test-instance`. The read replica is named `test-instance-repl`.

```
aws rds create-db-instance-read-replica \  
  --db-instance-identifier test-instance-repl \  
  --source-db-instance-identifier test-instance
```

Output:

```
{  
  "DBInstance": {  
    "IAMDatabaseAuthenticationEnabled": false,  
    "MonitoringInterval": 0,  
    "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance-repl",  
    "ReadReplicaSourceDBInstanceIdentifier": "test-instance",  
    "DBInstanceIdentifier": "test-instance-repl",  
    ...some output truncated...  
  }  
}
```

- For API details, see [CreateDbInstanceReadReplica](#) in *AWS CLI Command Reference*.

create-db-instance

The following code example shows how to use `create-db-instance`.

AWS CLI

To create a DB instance

The following `create-db-instance` example uses the required options to launch a new DB instance.

```
aws rds create-db-instance \  
  --db-instance-identifier test-mysql-instance \  
  --db-instance-class db.t3.micro \  
  --engine mysql \  
  --master-username admin \  
  --master-user-password secret99 \  
  --allocated-storage 20
```

Output:

```
{  
  "DBInstance": {  
    "DBInstanceIdentifier": "test-mysql-instance",  
    "DBInstanceClass": "db.t3.micro",  
    "Engine": "mysql",  
    "DBInstanceStatus": "creating",  
    "MasterUsername": "admin",  
    "AllocatedStorage": 20,  
    "PreferredBackupWindow": "12:55-13:25",

create-db-parameter-group

The following code example shows how to use `create-db-parameter-group`.

AWS CLI

To create a DB parameter group

The following `create-db-parameter-group` example creates a DB parameter group.

```
aws rds create-db-parameter-group \
  --db-parameter-group-name mydbparametergroup \
  --db-parameter-group-family MySQL5.6 \
  --description "My new parameter group"
```

Output:

```
{
  "DBParameterGroup": {
    "DBParameterGroupName": "mydbparametergroup",
    "DBParameterGroupFamily": "mysql5.6",
    "Description": "My new parameter group",
    "DBParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:pg:mydbparametergroup"
  }
}
```

```
}  
}
```

For more information, see [Creating a DB Parameter Group](#) in the *Amazon RDS User Guide*.

- For API details, see [CreateDBParameterGroup](#) in *AWS CLI Command Reference*.

create-db-proxy-endpoint

The following code example shows how to use `create-db-proxy-endpoint`.

AWS CLI

To create a DB proxy endpoint for an RDS database

The following `create-db-proxy-endpoint` example creates a DB proxy endpoint.

```
aws rds create-db-proxy-endpoint \  
  --db-proxy-name proxyExample \  
  --db-proxy-endpoint-name "proxyep1" \  
  --vpc-subnet-ids subnetgroup1 subnetgroup2
```

Output:

```
{  
  "DBProxyEndpoint": {  
    "DBProxyEndpointName": "proxyep1",  
    "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-  
endpoint:prx-endpoint-0123a01b12345c0ab",

```

```

        "TargetRole": "READ_WRITE",
        "IsDefault": false
    }
}

```

For more information, see [Creating a proxy endpoint](#) in the *Amazon RDS User Guide* and [Creating a proxy endpoint](#) in the *Amazon Aurora User Guide*.

- For API details, see [CreateDbProxyEndpoint](#) in *AWS CLI Command Reference*.

create-db-proxy

The following code example shows how to use create-db-proxy.

AWS CLI

To create a DB proxy for an RDS database

The following create-db-proxy example creates a DB proxy.

```

aws rds create-db-proxy \
  --db-proxy-name proxyExample \
  --engine-family MYSQL \
  --auth
  Description="proxydescription1",AuthScheme="SECRETS",SecretArn="arn:aws:secretsmanager:us-
west-2:123456789123:secret:secretName-1234f",IAMAuth="DISABLED",ClientPasswordAuthType="MYSQ
  \
  --role-arn arn:aws:iam::123456789123:role/ProxyRole \
  --vpc-subnet-ids subnetgroup1 subnetgroup2

```

Output:

```

{
  "DBProxy": {
    "DBProxyName": "proxyExample",
    "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-
proxy:prx-0123a01b12345c0ab",
    "EngineFamily": "MYSQL",
    "VpcId": "vpc-1234567",
    "VpcSecuritytGroupIds": [
      "sg-1234",
      "sg-5678",
      "sg-9101"
    ]
  }
}

```

```

    ],
    "VpcSubnetIds": [
        "subnetgroup1",
        "subnetgroup2"
    ],
    "Auth": "[
        {
            "Description": "proxydescription1",

}
}

```

For more information, see [Creating an RDS Proxy](#) in the *Amazon RDS User Guide* and [Creating an RDS Proxy](#) in the *Amazon Aurora User Guide*.

- For API details, see [CreateDbProxy](#) in *AWS CLI Command Reference*.

create-db-security-group

The following code example shows how to use create-db-security-group.

AWS CLI

To create an Amazon RDS DB security group

The following create-db-security-group command creates a new Amazon RDS DB security group:

```
aws rds create-db-security-group --db-security-group-name mysecgroup --db-security-
group-description "My Test Security Group"
```

In the example, the new DB security group is named `mysecgroup` and has a description.

Output:

```
{
  "DBSecurityGroup": {
    "OwnerId": "123456789012",
    "DBSecurityGroupName": "mysecgroup",
    "DBSecurityGroupDescription": "My Test Security Group",
    "VpcId": "vpc-a1b2c3d4",
    "EC2SecurityGroups": [],
    "IPRanges": [],
    "DBSecurityGroupArn": "arn:aws:rds:us-west-2:123456789012:secgrp:mysecgroup"
  }
}
```

- For API details, see [CreateDbSecurityGroup](#) in *AWS CLI Command Reference*.

create-db-shard-group

The following code example shows how to use `create-db-shard-group`.

AWS CLI

Example 1: To create an Aurora PostgreSQL primary DB cluster

The following `create-db-cluster` example creates an Aurora PostgreSQL SQL primary DB cluster that's compatible with Aurora Serverless v2 and Aurora Limitless Database.

```
aws rds create-db-cluster \  
  --db-cluster-identifier my-sv2-cluster \  
  --engine aurora-postgresql \  
  --engine-version 15.2-limitless \  
  --storage-type aurora-iopt1 \  
  --serverless-v2-scaling-configuration MinCapacity=2,MaxCapacity=16 \  
  --enable-limitless-database \  
  --master-username myuser \  
  --master-user-password mypassword \  
  --enable-cloudwatch-logs-exports postgresql
```

Output:

```
{
  "DBCluster": {
    "AllocatedStorage": 1,
    "AvailabilityZones": [
      "us-east-2b",
      "us-east-2c",
      "us-east-2a"
    ],
    "BackupRetentionPeriod": 1,
    "DBClusterIdentifier": "my-sv2-cluster",
    "DBClusterParameterGroup": "default.aurora-postgresql15",

Example 2: To create the primary (writer) DB instance

The following `create-db-instance` example creates an Aurora Serverless v2 primary (writer) DB instance. When you use the console to create a DB cluster, Amazon RDS automatically creates the writer DB instance for your DB cluster. However, when you use the AWS CLI to create a DB cluster, you must explicitly create the writer DB instance for your DB cluster using the `create-db-instance` AWS CLI command.

```

aws rds create-db-instance \
  --db-instance-identifier my-sv2-instance \
  --db-cluster-identifier my-sv2-cluster \
  --engine aurora-postgresql \
  --db-instance-class db.serverless

```

Output:

```

{
  "DBInstance": {
    "DBInstanceIdentifier": "my-sv2-instance",
    "DBInstanceClass": "db.serverless",

```

```
"Engine": "aurora-postgresql",

```

Example 3: To create the DB shard group

The following `create-db-shard-group` example creates a DB shard group in your Aurora PostgreSQL primary DB cluster.

```

aws rds create-db-shard-group \
  --db-shard-group-identifier my-db-shard-group \
  --db-cluster-identifier my-sv2-cluster \
  --max-acu 768

```

Output:

```

{
  "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
  "DBShardGroupIdentifier": "my-db-shard-group",
  "DBClusterIdentifier": "my-sv2-cluster",
  "MaxACU": 768.0,
  "ComputeRedundancy": 0,
  "Status": "creating",
  "PubliclyAccessible": false,
  "Endpoint": "my-sv2-cluster.limitless-cekyceexample.us-east-2.rds.amazonaws.com"
}

```

For more information, see [Using Aurora Serverless v2](#) in the *Amazon Aurora User Guide*.

- For API details, see [CreateDbShardGroup](#) in *AWS CLI Command Reference*.

create-db-snapshot

The following code example shows how to use `create-db-snapshot`.

AWS CLI

To create a DB snapshot

The following `create-db-snapshot` example creates a DB snapshot.

```
aws rds create-db-snapshot \  
  --db-instance-identifier database-mysql \  
  --db-snapshot-identifier mydbsnapshot
```

Output:

```
{  
  "DBSnapshot": {  
    "DBSnapshotIdentifier": "mydbsnapshot",  
    "DBInstanceIdentifier": "database-mysql",  
    "Engine": "mysql",  
    "AllocatedStorage": 100,  
    "Status": "creating",  
    "Port": 3306,  
    "AvailabilityZone": "us-east-1b",  
    "VpcId": "vpc-6594f31c",  
    "InstanceCreateTime": "2019-04-30T15:45:53.663Z",  
    "MasterUsername": "admin",  
    "EngineVersion": "5.6.40",  
    "LicenseModel": "general-public-license",  
    "SnapshotType": "manual",  
    "Iops": 1000,  
    "OptionGroupName": "default:mysql-5-6",  
    "PercentProgress": 0,  
    "StorageType": "io1",  
    "Encrypted": true,  
    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",

    "IAMDatabaseAuthenticationEnabled": false,  
    "ProcessorFeatures": [],  
    "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"  
  }  
}
```

For more information, see [Creating a DB Snapshot](#) in the *Amazon RDS User Guide*.

- For API details, see [CreateDBSnapshot](#) in *AWS CLI Command Reference*.

create-db-subnet-group

The following code example shows how to use `create-db-subnet-group`.

AWS CLI

To create a DB subnet group

The following `create-db-subnet-group` example creates a DB subnet group called `mysubnetgroup` using existing subnets.

```
aws rds create-db-subnet-group \  
  --db-subnet-group-name mysubnetgroup \  
  --db-subnet-group-description "test DB subnet group" \  
  --subnet-ids  
  '["subnet-0a1dc4e1a6f123456","subnet-070dd7ecb3aaaaaaaa","subnet-00f5b198bc0abcdef"]'
```

Output:

```
{  
  "DBSubnetGroup": {  
    "DBSubnetGroupName": "mysubnetgroup",  
    "DBSubnetGroupDescription": "test DB subnet group",  
    "VpcId": "vpc-0f08e7610a1b2c3d4",  
    "SubnetGroupStatus": "Complete",  
    "Subnets": [  
      {  
        "SubnetIdentifier": "subnet-070dd7ecb3aaaaaaaa",  
        "SubnetAvailabilityZone": {  
          "Name": "us-west-2b"  
        },  
        "SubnetStatus": "Active"  
      },  
      {  
        "SubnetIdentifier": "subnet-00f5b198bc0abcdef",  
        "SubnetAvailabilityZone": {  
          "Name": "us-west-2d"  
        },  
        "SubnetStatus": "Active"  
      },  
      {  
        "SubnetIdentifier": "subnet-0a1dc4e1a6f123456",  
        "SubnetAvailabilityZone": {
```

```

        "Name": "us-west-2b"
      },
      "SubnetStatus": "Active"
    }
  ],
  "DBSubnetGroupArn": "arn:aws:rds:us-
west-2:0123456789012:subgrp:mysubnetgroup"
}
}

```

For more information, see [Creating a DB Instance in a VPC](#) in the *Amazon RDS User Guide*.

- For API details, see [CreateDbSubnetGroup](#) in *AWS CLI Command Reference*.

create-event-subscription

The following code example shows how to use `create-event-subscription`.

AWS CLI

To create an event subscription

The following `create-event-subscription` example creates a subscription for backup and recovery events for DB instances in the current AWS account. Notifications are sent to an Amazon Simple Notification Service topic, specified by `--sns-topic-arn`.

```

aws rds create-event-subscription \
  --subscription-name my-instance-events \
  --source-type db-instance \
  --event-categories ["backup","recovery"] \
  --sns-topic-arn arn:aws:sns:us-east-1:123456789012:interesting-events

```

Output:

```

{
  "EventSubscription": {
    "Status": "creating",
    "CustSubscriptionId": "my-instance-events",
    "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",
    "EventCategoriesList": [
      "backup",
      "recovery"
    ]
  },

```

```
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
    "CustomerAwsId": "123456789012",
    "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
    "SourceType": "db-instance",
    "Enabled": true
  }
}
```

- For API details, see [CreateEventSubscription](#) in *AWS CLI Command Reference*.

create-global-cluster

The following code example shows how to use `create-global-cluster`.

AWS CLI

To create a global DB cluster

The following `create-global-cluster` example creates a new Aurora MySQL-compatible global DB cluster.

```
aws rds create-global-cluster \  
  --global-cluster-identifier myglobalcluster \  
  --engine aurora-mysql
```

Output:

```
{
  "GlobalCluster": {
    "GlobalClusterIdentifier": "myglobalcluster",
    "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",
    "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
    "Status": "available",
    "Engine": "aurora-mysql",
    "EngineVersion": "5.7.mysql_aurora.2.07.2",
    "StorageEncrypted": false,
    "DeletionProtection": false,
    "GlobalClusterMembers": []
  }
}
```

For more information, see [Creating an Aurora global database](#) in the *Amazon Aurora User Guide*.

- For API details, see [CreateGlobalCluster](#) in *AWS CLI Command Reference*.

create-option-group

The following code example shows how to use create-option-group.

AWS CLI

To Create an Amazon RDS option group

The following create-option-group command creates a new Amazon RDS option group for Oracle Enterprise Edition version 11.2, is named `MyOptionGroup` and includes a description.

```
aws rds create-option-group \  
  --option-group-name MyOptionGroup \  
  --engine-name oracle-ee \  
  --major-engine-version 11.2 \  
  --option-group-description "Oracle Database Manager Database Control"
```

Output:

```
{  
  "OptionGroup": {  
    "OptionGroupName": "myoptiongroup",  
    "OptionGroupDescription": "Oracle Database Manager Database Control",  
    "EngineName": "oracle-ee",  
    "MajorEngineVersion": "11.2",  
    "Options": [],  
    "AllowsVpcAndNonVpcInstanceMemberships": true,  
    "OptionGroupArn": "arn:aws:rds:us-west-2:123456789012:og:myoptiongroup"  
  }  
}
```

- For API details, see [CreateOptionGroup](#) in *AWS CLI Command Reference*.

delete-blue-green-deployment

The following code example shows how to use delete-blue-green-deployment.

AWS CLI

Example 1: To delete resources in green environment for an RDS for MySQL DB instance

The following `delete-blue-green-deployment` example deletes the resources in a green environment for an RDS for MySQL DB instance.

```
aws rds delete-blue-green-deployment \  
  --blue-green-deployment-identifier bgd-v53303651eexfake \  
  --delete-target
```

Output:

```
{  
  "BlueGreenDeployment": {  
    "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",  
    "BlueGreenDeploymentName": "bgd-cli-test-instance",

- For API details, see [DeleteBlueGreenDeployment](#) in *AWS CLI Command Reference*.

delete-db-cluster-endpoint

The following code example shows how to use `delete-db-cluster-endpoint`.

AWS CLI

To delete a custom DB cluster endpoint

The following `delete-db-cluster-endpoint` example deletes the specified custom DB cluster endpoint.

```
aws rds delete-db-cluster-endpoint \  
  --db-cluster-endpoint-identifier mycustomendpoint
```

Output:

```
{  
  "DBClusterEndpointIdentifier": "mycustomendpoint",  
  "DBClusterIdentifier": "mydbcluster",  
  "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",  
  "Endpoint": "mycustomendpoint.cluster-custom-cnpeexample.us-  
east-1.rds.amazonaws.com",

  "CustomEndpointType": "READER",  
  "StaticMembers": [  
    "dbinstance1",  
    "dbinstance2",  
    "dbinstance3"  
  ],  
  "ExcludedMembers": [],  
  "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-  
endpoint:mycustomendpoint"  
}
```

For more information, see [Amazon Aurora Connection Management](#) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteDbClusterEndpoint](#) in *AWS CLI Command Reference*.

delete-db-cluster-parameter-group

The following code example shows how to use `delete-db-cluster-parameter-group`.

AWS CLI

To delete a DB cluster parameter group

The following `delete-db-cluster-parameter-group` example deletes the specified DB cluster parameter group.

```
aws rds delete-db-cluster-parameter-group \  
  --db-cluster-parameter-group-name mydbclusterparametergroup
```

This command produces no output.

For more information, see [Working with DB Parameter Groups and DB Cluster Parameter Groups](#) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

delete-db-cluster-snapshot

The following code example shows how to use `delete-db-cluster-snapshot`.

AWS CLI

To delete a DB cluster snapshot

The following `delete-db-cluster-snapshot` example deletes the specified DB cluster snapshot.

```
aws rds delete-db-cluster-snapshot \  
  --db-cluster-snapshot-identifier mydbclustersnapshot
```

Output:

```
{  
  "DBClusterSnapshot": {  
    "AvailabilityZones": [  
      "us-east-1a",  
      "us-east-1b",  
      "us-east-1e"  
    ],  
    "DBClusterSnapshotIdentifier": "mydbclustersnapshot",  
    "DBClusterIdentifier": "mydbcluster",  
    "SnapshotCreateTime": "2019-06-18T21:21:00.469Z",  
    "Engine": "aurora-mysql",  
    "AllocatedStorage": 0,  
    "Status": "available",  
    "Port": 0,  
    "VpcId": "vpc-6594f31c",
```

```
"ClusterCreateTime": "2019-04-15T14:18:42.785Z",
"MasterUsername": "myadmin",
"EngineVersion": "5.7.mysql_aurora.2.04.2",
"LicenseModel": "aurora-mysql",
"SnapshotType": "manual",
"PercentProgress": 100,
"StorageEncrypted": true,
"KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
"DBClusterSnapshotArn": "arn:aws:rds:us-east-1:123456789012:cluster-
snapshot:mydbclustersnapshot",
"IAMDatabaseAuthenticationEnabled": false
}
}
```

For more information, see [Deleting a Snapshot](#) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteDbClusterSnapshot](#) in *AWS CLI Command Reference*.

delete-db-cluster

The following code example shows how to use `delete-db-cluster`.

AWS CLI

Example 1: To delete a DB instance in a DB cluster

The following `delete-db-instance` example deletes the final DB instance in a DB cluster. You can't delete a DB cluster if it contains DB instances that aren't in the **deleting** state. You can't take a final snapshot when deleting a DB instance in a DB cluster.

```
aws rds delete-db-instance \
  --db-instance-identifier database-3
```

Output:

```
{
  "DBInstance": {
    "DBInstanceIdentifier": "database-3",
    "DBInstanceClass": "db.r4.large",
    "Engine": "aurora-postgresql",
    "DBInstanceStatus": "deleting",
```

```
...output omitted...  
}  
}
```

For more information, see [Deleting a DB Instance in an Aurora DB Cluster](#) in the *Amazon Aurora User Guide*.

Example 2: To delete a DB cluster

The following `delete-db-cluster` example deletes the DB cluster named `mycluster` and takes a final snapshot named `mycluster-final-snapshot`. The status of the DB cluster is **available** while the snapshot is being taken. To follow the progress of the deletion, use the `describe-db-clusters` CLI command.

```
aws rds delete-db-cluster \  
  --db-cluster-identifier mycluster \  
  --no-skip-final-snapshot \  
  --final-db-snapshot-identifier mycluster-final-snapshot
```

Output:

```
{  
  "DBCluster": {  
    "AllocatedStorage": 20,  
    "AvailabilityZones": [  
      "eu-central-1b",  
      "eu-central-1c",  
      "eu-central-1a"  
    ],  
    "BackupRetentionPeriod": 7,  
    "DBClusterIdentifier": "mycluster",  
    "DBClusterParameterGroup": "default.aurora-postgresql10",  
    "DBSubnetGroup": "default-vpc-aa11bb22",  
    "Status": "available",  
  
    ...output omitted...  
  }  
}
```

For more information, see [Aurora Clusters with a Single DB Instance](#) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteDbCluster](#) in *AWS CLI Command Reference*.

delete-db-instance-automated-backup

The following code example shows how to use `delete-db-instance-automated-backup`.

AWS CLI

To delete a replicated automated backup from a Region

The following `delete-db-instance-automated-backup` example deletes the automated backup with the specified Amazon Resource Name (ARN).

```
aws rds delete-db-instance-automated-backup \
  --db-instance-automated-backups-arn "arn:aws:rds:us-west-2:123456789012:auto-
  backup:ab-jkib2gfgq5rv7replzadausbrktni2bn4example"
```

Output:

```
{
  "DBInstanceAutomatedBackup": {
    "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
    "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
    "Region": "us-east-1",
    "DBInstanceIdentifier": "new-orcl-db",
    "RestoreWindow": {},
    "AllocatedStorage": 20,
    "Status": "deleting",
    "Port": 1521,
    "AvailabilityZone": "us-east-1b",
    "VpcId": "vpc-#####",
    "InstanceCreateTime": "2020-12-04T15:28:31Z",
    "MasterUsername": "admin",
    "Engine": "oracle-se2",
    "EngineVersion": "12.1.0.2.v21",
    "LicenseModel": "bring-your-own-license",
    "OptionGroupName": "default:oracle-se2-12-1",
    "Encrypted": false,
    "StorageType": "gp2",
```

```
    "IAMDatabaseAuthenticationEnabled": false,  
    "BackupRetentionPeriod": 7,  
    "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-  
backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example"  
  }  
}
```

For more information, see [Deleting replicated backups](#) in the *Amazon RDS User Guide*.

- For API details, see [DeleteDbInstanceAutomatedBackup](#) in *AWS CLI Command Reference*.

delete-db-instance

The following code example shows how to use `delete-db-instance`.

AWS CLI

To delete a DB instance

The following `delete-db-instance` example deletes the specified DB instance after creating a final DB snapshot named `test-instance-final-snap`.

```
aws rds delete-db-instance \  
  --db-instance-identifier test-instance \  
  --final-db-snapshot-identifier test-instance-final-snap
```

Output:

```
{  
  "DBInstance": {  
    "DBInstanceIdentifier": "test-instance",  
    "DBInstanceStatus": "deleting",  
    ...some output truncated...  
  }  
}
```

- For API details, see [DeleteDBInstance](#) in *AWS CLI Command Reference*.

delete-db-parameter-group

The following code example shows how to use `delete-db-parameter-group`.

AWS CLI

To delete a DB parameter group

The following command example deletes a DB parameter group.

```
aws rds delete-db-parameter-group \  
  --db-parameter-group-name mydbparametergroup
```

This command produces no output.

For more information, see [Working with DB Parameter Groups](#) in the *Amazon RDS User Guide*.

- For API details, see [DeleteDBParameterGroup](#) in *AWS CLI Command Reference*.

delete-db-proxy-endpoint

The following code example shows how to use delete-db-proxy-endpoint.

AWS CLI

To delete a DB proxy endpoint for an RDS database

The following delete-db-proxy-endpoint example deletes a DB proxy endpoint for the target database.

```
aws rds delete-db-proxy-endpoint \  
  --db-proxy-endpoint-name proxyEP1
```

Output:

```
{  
  "DBProxyEndpoint":  
    {  
      "DBProxyEndpointName": "proxyEP1",  
      "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-  
endpoint:prx-endpoint-0123a01b12345c0ab",  
      "DBProxyName": "proxyExample",  
      "Status": "deleting",  
      "VpcId": "vpc-1234567",  
      "VpcSecurityGroupIds": [  
        "sg-1234",
```

```
        "sg-5678"
      ],
      "VpcSubnetIds": [
        "subnetgroup1",
        "subnetgroup2"
      ],
      "Endpoint": "proxyEP1.endpoint.proxy-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
      "CreateDate": "2023-04-13T01:49:38.568000+00:00",
      "TargetRole": "READ_ONLY",
      "IsDefault": false
    }
  }
}
```

For more information, see [Deleting a proxy endpoint](#) in the *Amazon RDS User Guide* and [Deleting a proxy endpoint](#) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteDbProxyEndpoint](#) in *AWS CLI Command Reference*.

delete-db-proxy

The following code example shows how to use `delete-db-proxy`.

AWS CLI

To delete a DB proxy for an RDS database

The following `delete-db-proxy` example deletes a DB proxy.

```
aws rds delete-db-proxy \
  --db-proxy-name proxyExample
```

Output:

```
{
  "DBProxy": {
    "DBProxyName": "proxyExample",
    "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-
proxy:prx-0123a01b12345c0ab",
    "Status": "deleting",
    "EngineFamily": "PostgreSQL",
```

```

    "VpcId": "vpc-1234567",
    "VpcSecurityGroupIds": [
        "sg-1234",
        "sg-5678"
    ],
    "VpcSubnetIds": [
        "subnetgroup1",
        "subnetgroup2"
    ],
    "Auth": "[
        {
            "Description": "proxydescription`"
            "AuthScheme": "SECRETS",
            "SecretArn": "arn:aws:secretsmanager:us-
west-2:123456789123:secret:proxysecret1-Abcd1e",
            "IAMAuth": "DISABLED"
        } ],
    "RoleArn": "arn:aws:iam::12345678912:role/ProxyPostgreSQLRole",
    "Endpoint": "proxyExample.proxy-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
    "RequireTLS": false,
    "IdleClientTimeout": 1800,
    "DebuggingLogging": false,
    "CreateDate": "2023-04-05T16:09:33.452000+00:00",
    "UpdateDate": "2023-04-13T01:49:38.568000+00:00"
}
}

```

For more information, see [Deleting an RDS Proxy](#) in the *Amazon RDS User Guide* and [Deleting an RDS Proxy](#) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteDbProxy](#) in *AWS CLI Command Reference*.

delete-db-security-group

The following code example shows how to use delete-db-security-group.

AWS CLI

To delete a DB security group

The following delete-db-security-group example deletes a DB security group named mysecuritygroup.

```
aws rds delete-db-security-group \  
  --db-security-group-name mysecuritygroup
```

This command produces no output.

For more information, see [Working with DB security groups \(EC2-Classic platform\)](#) in the *Amazon RDS User Guide*.

- For API details, see [DeleteDbSecurityGroup](#) in *AWS CLI Command Reference*.

delete-db-shard-group

The following code example shows how to use `delete-db-shard-group`.

AWS CLI

Example 1: To delete a DB shard group unsuccessfully

The following `delete-db-shard-group` example shows the error that occurs when you try to delete a DB shard group before deleting all of your databases and schemas.

```
aws rds delete-db-shard-group \  
  --db-shard-group-identifier limitless-test-shard-grp
```

Output:

```
An error occurred (InvalidDBShardGroupState) when calling the DeleteDBShardGroup  
operation: Unable to delete the DB shard group limitless-test-db-shard-group.  
Delete all of your Limitless Database databases and schemas, then try again.
```

Example 2: To delete a DB shard group successfully

The following `delete-db-shard-group` example deletes a DB shard group after you've deleted all of your databases and schemas, including the `public` schema.

```
aws rds delete-db-shard-group \  
  --db-shard-group-identifier limitless-test-shard-grp
```

Output:

```
{
```

```
"DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
"DBShardGroupIdentifier": "limitless-test-shard-grp",
"DBClusterIdentifier": "limitless-test-cluster",
"MaxACU": 768.0,
"ComputeRedundancy": 0,
"Status": "deleting",
"PubliclyAccessible": true,
"Endpoint": "limitless-test-cluster.limitless-cekyceexample.us-east-2.rds.amazonaws.com"
}
```

For more information, see [Deleting Aurora DB clusters and DB instances](#) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteDbShardGroup](#) in *AWS CLI Command Reference*.

delete-db-snapshot

The following code example shows how to use `delete-db-snapshot`.

AWS CLI

To delete a DB snapshot

The following `delete-db-snapshot` example deletes the specified DB snapshot.

```
aws rds delete-db-snapshot \
  --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
  "DBSnapshot": {
    "DBSnapshotIdentifier": "mydbsnapshot",
    "DBInstanceIdentifier": "database-mysql",
    "SnapshotCreateTime": "2019-06-18T22:08:40.702Z",
    "Engine": "mysql",
    "AllocatedStorage": 100,
    "Status": "deleted",
    "Port": 3306,
    "AvailabilityZone": "us-east-1b",
    "VpcId": "vpc-6594f31c",
    "InstanceCreateTime": "2019-04-30T15:45:53.663Z",
```

```
"MasterUsername": "admin",
"EngineVersion": "5.6.40",
"LicenseModel": "general-public-license",
"SnapshotType": "manual",
"Iops": 1000,
"OptionGroupName": "default:mysql-5-6",
"PercentProgress": 100,
"StorageType": "io1",
"Encrypted": true,
"KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/AKIAIOSFODNN7EXAMPLE",
"DBSnapshotArn": "arn:aws:rds:us-east-1:123456789012:snapshot:mydbsnapshot",
"IAMDatabaseAuthenticationEnabled": false,
"ProcessorFeatures": [],
"DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
}
}
```

For more information, see [Deleting a Snapshot](#) in the *Amazon RDS User Guide*.

- For API details, see [DeleteDbSnapshot](#) in *AWS CLI Command Reference*.

delete-db-subnet-group

The following code example shows how to use `delete-db-subnet-group`.

AWS CLI

To delete a DB subnet group

The following `delete-db-subnet-group` example deletes the DB subnet group called `mysubnetgroup`.

```
aws rds delete-db-subnet-group --db-subnet-group-name mysubnetgroup
```

This command produces no output.

For more information, see [Working with a DB Instance in a VPC](#) in the *Amazon RDS User Guide*.

- For API details, see [DeleteDbSubnetGroup](#) in *AWS CLI Command Reference*.

delete-event-subscription

The following code example shows how to use `delete-event-subscription`.

AWS CLI

To delete an event subscription

The following `delete-event-subscription` example deletes the specified event subscription.

```
aws rds delete-event-subscription --subscription-name my-instance-events
```

Output:

```
{
  "EventSubscription": {
    "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-
events",
    "CustomerAwsId": "123456789012",
    "Enabled": false,
    "SourceIdsList": [
      "test-instance"
    ],
    "SourceType": "db-instance",
    "EventCategoriesList": [
      "backup",
      "recovery"
    ],
    "SubscriptionCreationTime": "2018-07-31 23:22:01.893",
    "CustSubscriptionId": "my-instance-events",
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",
    "Status": "deleting"
  }
}
```

- For API details, see [DeleteEventSubscription](#) in *AWS CLI Command Reference*.

`delete-global-cluster`

The following code example shows how to use `delete-global-cluster`.

AWS CLI

To delete a global DB cluster

The following `delete-global-cluster` example deletes an Aurora MySQL-compatible global DB cluster. The output shows the cluster that you're deleting, but subsequent `describe-global-clusters` commands don't list that DB cluster.

```
aws rds delete-global-cluster \  
  --global-cluster-identifier myglobalcluster
```

Output:

```
{  
  "GlobalCluster": {  
    "GlobalClusterIdentifier": "myglobalcluster",  
    "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",  
    "GlobalClusterArn": "arn:aws:rds::123456789012:global-  
cluster:myglobalcluster",  
    "Status": "available",  
    "Engine": "aurora-mysql",  
    "EngineVersion": "5.7.mysql_aurora.2.07.2",  
    "StorageEncrypted": false,  
    "DeletionProtection": false,  
    "GlobalClusterMembers": []  
  }  
}
```

For more information, see [Deleting an Aurora global database](#) in the *Amazon Aurora User Guide*.

- For API details, see [DeleteGlobalCluster](#) in *AWS CLI Command Reference*.

delete-option-group

The following code example shows how to use `delete-option-group`.

AWS CLI

To delete an option group

The following `delete-option-group` example deletes the specified option group.

```
aws rds delete-option-group \  
  --option-group-name myoptiongroup
```

This command produces no output.

For more information, see [Deleting an Option Group](#) in the *Amazon RDS User Guide*.

- For API details, see [DeleteOptionGroup](#) in *AWS CLI Command Reference*.

deregister-db-proxy-targets

The following code example shows how to use `deregister-db-proxy-targets`.

AWS CLI

To deregister a DB proxy target from database target group

The following `deregister-db-proxy-targets` example removes the association between the proxy `proxyExample` and its target.

```
aws rds deregister-db-proxy-targets \  
  --db-proxy-name proxyExample \  
  --db-instance-identifiers database-1
```

This command produces no output.

For more information, see [Deleting an RDS Proxy](#) in the *Amazon RDS User Guide* and [Deleting an RDS Proxy](#) in the *Amazon Aurora User Guide*.

- For API details, see [DeregisterDbProxyTargets](#) in *AWS CLI Command Reference*.

describe-account-attributes

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe account attributes

The following `describe-account-attributes` example retrieves the attributes for the current AWS account.

```
aws rds describe-account-attributes
```

Output:

```
{
  "AccountQuotas": [
    {
      "Max": 40,
      "Used": 4,
      "AccountQuotaName": "DBInstances"
    },
    {
      "Max": 40,
      "Used": 0,
      "AccountQuotaName": "ReservedDBInstances"
    },
    {
      "Max": 100000,
      "Used": 40,
      "AccountQuotaName": "AllocatedStorage"
    },
    {
      "Max": 25,
      "Used": 0,
      "AccountQuotaName": "DBSecurityGroups"
    },
    {
      "Max": 20,
      "Used": 0,
      "AccountQuotaName": "AuthorizationsPerDBSecurityGroup"
    },
    {
      "Max": 50,
      "Used": 1,
      "AccountQuotaName": "DBParameterGroups"
    },
    {
      "Max": 100,
      "Used": 3,
      "AccountQuotaName": "ManualSnapshots"
    },
    {
      "Max": 20,
      "Used": 0,
      "AccountQuotaName": "EventSubscriptions"
    },
  ],
}
```

```
{
  "Max": 50,
  "Used": 1,
  "AccountQuotaName": "DBSubnetGroups"
},
{
  "Max": 20,
  "Used": 1,
  "AccountQuotaName": "OptionGroups"
},
{
  "Max": 20,
  "Used": 6,
  "AccountQuotaName": "SubnetsPerDBSubnetGroup"
},
{
  "Max": 5,
  "Used": 0,
  "AccountQuotaName": "ReadReplicasPerMaster"
},
{
  "Max": 40,
  "Used": 1,
  "AccountQuotaName": "DBClusters"
},
{
  "Max": 50,
  "Used": 0,
  "AccountQuotaName": "DBClusterParameterGroups"
},
{
  "Max": 5,
  "Used": 0,
  "AccountQuotaName": "DBClusterRoles"
}
]
```

- For API details, see [DescribeAccountAttributes](#) in *AWS CLI Command Reference*.

describe-blue-green-deployments

The following code example shows how to use `describe-blue-green-deployments`.

AWS CLI

Example 1: To describe a blue/green deployment of an RDS DB instance after creation completes

The following `describe-blue-green-deployment` example retrieves the details of a blue/green deployment after creation completes.

```
aws rds describe-blue-green-deployments \  
  --blue-green-deployment-identifier bgd-v53303651eexfake
```

Output:

```
{  
  "BlueGreenDeployments": [  
    {  
      "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",  
      "BlueGreenDeploymentName": "bgd-cli-test-instance",  
      "Source": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",

]
}

```

For more information, see [Viewing a blue/green deployment](#) in the *Amazon RDS User Guide*.

Example 2: To describe a blue/green deployment for an Aurora MySQL DB cluster

The following describe-blue-green-deployment example retrieves the details of a blue/green deployment.

```
aws rds describe-blue-green-deployments \
  --blue-green-deployment-identifier bgd-wi89nwzglccsfake
```

Output:

```
{
  "BlueGreenDeployments": [
    {
      "BlueGreenDeploymentIdentifier": "bgd-wi89nwzglccsfake",
      "BlueGreenDeploymentName": "my-blue-green-deployment",

describe-db-cluster-backtracks

The following code example shows how to use `describe-db-cluster-backtracks`.

AWS CLI

To describe backtracks for a DB cluster

The following `describe-db-cluster-backtracks` example retrieves details about the specified DB cluster.

```
aws rds describe-db-cluster-backtracks \
  --db-cluster-identifier mydbcluster
```

Output:

```
{
  "DBClusterBacktracks": [
    {
      "DBClusterIdentifier": "mydbcluster",
      "BacktrackIdentifier": "2f5f5294-0dd2-44c9-9f50-EXAMPLE",
      "BacktrackTo": "2021-02-12T04:59:22Z",
      "BacktrackedFrom": "2021-02-12T14:37:31.640Z",
      "BacktrackRequestCreationTime": "2021-02-12T14:36:18.819Z",
      "Status": "COMPLETED"
    },
    {
      "DBClusterIdentifier": "mydbcluster",
      "BacktrackIdentifier": "3c7a6421-af2a-4ea3-ae95-EXAMPLE",
      "BacktrackTo": "2021-02-11T22:53:46Z",
      "BacktrackedFrom": "2021-02-12T00:09:27.006Z",
      "BacktrackRequestCreationTime": "2021-02-12T00:07:53.487Z",
      "Status": "COMPLETED"
    }
  ]
}
```

For more information, see [Backtracking an Aurora DB cluster](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbClusterBacktracks](#) in *AWS CLI Command Reference*.

describe-db-cluster-endpoints

The following code example shows how to use `describe-db-cluster-endpoints`.

AWS CLI

Example 1: To describe DB cluster endpoints

The following `describe-db-cluster-endpoints` example retrieves details for your DB cluster endpoints. The most common kinds of Aurora clusters have two endpoints. One endpoint has type `WRITER`. You can use this endpoint for all SQL statements. The other endpoint has type `READER`. You can use this endpoint only for `SELECT` and other read-only SQL statements.

```
aws rds describe-db-cluster-endpoints
```

Output:

```
{
  "DBClusterEndpoints": [
    {
      "DBClusterIdentifier": "my-database-1",
      "Endpoint": "my-database-1.cluster-cnpxample.us-east-1.rds.amazonaws.com",
      "Status": "creating",
      "EndpointType": "WRITER"
    },
    {
      "DBClusterIdentifier": "my-database-1",
      "Endpoint": "my-database-1.cluster-ro-cnpxample.us-east-1.rds.amazonaws.com",
      "Status": "creating",
      "EndpointType": "READER"
    },
    {
      "DBClusterIdentifier": "mydbcluster",
      "Endpoint": "mydbcluster.cluster-cnpxample.us-east-1.rds.amazonaws.com",
      "Status": "available",
      "EndpointType": "WRITER"
    },
    {
      "DBClusterIdentifier": "mydbcluster",
      "Endpoint": "mydbcluster.cluster-ro-cnpxample.us-east-1.rds.amazonaws.com",
      "Status": "available",
      "EndpointType": "READER"
    }
  ]
}
```

Example 2: To describe DB cluster endpoints of a single DB cluster

The following `describe-db-cluster-endpoints` example retrieves details for the DB cluster endpoints of a single specified DB cluster. Aurora Serverless clusters have only a single endpoint with a type of `WRITER`.

```
aws rds describe-db-cluster-endpoints \  
  --db-cluster-identifier serverless-cluster
```

Output:

```
{  
  "DBClusterEndpoints": [  
    {  
      "Status": "available",  
      "Endpoint": "serverless-cluster.cluster-cnpxample.us-  
east-1.rds.amazonaws.com",  
      "DBClusterIdentifier": "serverless-cluster",  
      "EndpointType": "WRITER"  
    }  
  ]  
}
```

For more information, see [Amazon Aurora Connection Management](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbClusterEndpoints](#) in *AWS CLI Command Reference*.

`describe-db-cluster-parameter-groups`

The following code example shows how to use `describe-db-cluster-parameter-groups`.

AWS CLI

To describe DB cluster parameter groups

The following `describe-db-cluster-parameter-groups` example retrieves details for your DB cluster parameter groups.

```
aws rds describe-db-cluster-parameter-groups
```

Output:

```
{
  "DBClusterParameterGroups": [
    {
      "DBClusterParameterGroupName": "default.aurora-mysql5.7",
      "DBParameterGroupFamily": "aurora-mysql5.7",
      "Description": "Default cluster parameter group for aurora-mysql5.7",
      "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:default.aurora-mysql5.7"
    },
    {
      "DBClusterParameterGroupName": "default.aurora-postgresql9.6",
      "DBParameterGroupFamily": "aurora-postgresql9.6",
      "Description": "Default cluster parameter group for aurora-
postgresql9.6",
      "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:default.aurora-postgresql9.6"
    },
    {
      "DBClusterParameterGroupName": "default.aurora5.6",
      "DBParameterGroupFamily": "aurora5.6",
      "Description": "Default cluster parameter group for aurora5.6",
      "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:default.aurora5.6"
    },
    {
      "DBClusterParameterGroupName": "mydbclusterpg",
      "DBParameterGroupFamily": "aurora-mysql5.7",
      "Description": "My DB cluster parameter group",
      "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:mydbclusterpg"
    },
    {
      "DBClusterParameterGroupName": "mydbclusterpgcopy",
      "DBParameterGroupFamily": "aurora-mysql5.7",
      "Description": "Copy of mydbclusterpg parameter group",
      "DBClusterParameterGroupArn": "arn:aws:rds:us-
east-1:123456789012:cluster-pg:mydbclusterpgcopy"
    }
  ]
}
```

For more information, see [Working with DB Parameter Groups and DB Cluster Parameter Groups](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbClusterParameterGroups](#) in *AWS CLI Command Reference*.

describe-db-cluster-parameters

The following code example shows how to use `describe-db-cluster-parameters`.

AWS CLI

Example 1: To describe the parameters in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves details about the parameters in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \  
  --db-cluster-parameter-group-name mydbclusterpg
```

Output:

```
{  
  "Parameters": [  
    {  
      "ParameterName": "allow-suspicious-udfs",  
      "Description": "Controls whether user-defined functions that have only  
an xxx symbol for the main function can be loaded",  
      "Source": "engine-default",  
      "ApplyType": "static",  
      "DataType": "boolean",  
      "AllowedValues": "0,1",  
      "IsModifiable": false,  
      "ApplyMethod": "pending-reboot",  
      "SupportedEngineModes": [  
        "provisioned"  
      ]  
    },  
    {  
      "ParameterName": "aurora_lab_mode",  
      "ParameterValue": "0",  
      "Description": "Enables new features in the Aurora engine.",  
      "Source": "engine-default",  
      "ApplyType": "static",  
      "DataType": "boolean",  
      "AllowedValues": "0,1",  
      "IsModifiable": true,  
    }  
  ]  
}
```

```

        "ApplyMethod": "pending-reboot",
        "SupportedEngineModes": [
            "provisioned"
        ]
    },
    ...some output truncated...
]
}

```

Example 2: To list only the parameter names in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves only the names of the parameters in a DB cluster parameter group.

```

aws rds describe-db-cluster-parameters \
  --db-cluster-parameter-group-name default.aurora-mysql5.7 \
  --query 'Parameters[].{ParameterName:ParameterName}'

```

Output:

```

[
  {
    "ParameterName": "allow-suspicious-udfs"
  },
  {
    "ParameterName": "aurora_binlog_read_buffer_size"
  },
  {
    "ParameterName": "aurora_binlog_replication_max_yield_seconds"
  },
  {
    "ParameterName": "aurora_binlog_use_large_read_buffer"
  },
  {
    "ParameterName": "aurora_lab_mode"
  },
  ...some output truncated...
]

```

Example 3: To describe only the modifiable parameters in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group.

```
aws rds describe-db-cluster-parameters \  
  --db-cluster-parameter-group-name default.aurora-mysql5.7 \  
  --query 'Parameters[].{ParameterName:ParameterName,IsModifiable:IsModifiable} |  
  [?IsModifiable == `true`]'
```

Output:

```
[  
  {  
    "ParameterName": "aurora_binlog_read_buffer_size",  
    "IsModifiable": true  
  },  
  {  
    "ParameterName": "aurora_binlog_replication_max_yield_seconds",  
    "IsModifiable": true  
  },  
  {  
    "ParameterName": "aurora_binlog_use_large_read_buffer",  
    "IsModifiable": true  
  },  
  {  
    "ParameterName": "aurora_lab_mode",  
    "IsModifiable": true  
  },  
  ...some output truncated...  
]
```

Example 4: To describe only the modifiable Boolean parameters in a DB cluster parameter group

The following `describe-db-cluster-parameters` example retrieves the names of only the parameters that you can modify in a DB cluster parameter group and that have a Boolean data type.

```
aws rds describe-db-cluster-parameters \  
  --db-cluster-parameter-group-name default.aurora-mysql5.7 \  
  --query 'Parameters[].{ParameterName:ParameterName,IsModifiable:IsModifiable} |  
  [?IsModifiable == `true` && ParameterType == `boolean`]'
```

```
--query 'Parameters[]'.
{ParameterName:ParameterName,DataType:DataType,IsModifiable:IsModifiable} | [?
DataType == `boolean`] | [?IsModifiable == `true`]'
```

Output:

```
[
  {
    "DataType": "boolean",
    "ParameterName": "aurora_binlog_use_large_read_buffer",
    "IsModifiable": true
  },
  {
    "DataType": "boolean",
    "ParameterName": "aurora_lab_mode",
    "IsModifiable": true
  },
  {
    "DataType": "boolean",
    "ParameterName": "autocommit",
    "IsModifiable": true
  },
  {
    "DataType": "boolean",
    "ParameterName": "automatic_sp_privileges",
    "IsModifiable": true
  },
  ...some output truncated...
]
```

For more information, see [Working with DB Parameter Groups and DB Cluster Parameter Groups](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbClusterParameters](#) in *AWS CLI Command Reference*.

describe-db-cluster-snapshot-attributes

The following code example shows how to use `describe-db-cluster-snapshot-attributes`.

AWS CLI

To describe the attribute names and values for a DB cluster snapshot

The following `describe-db-cluster-snapshot-attributes` example retrieves details of the attribute names and values for the specified DB cluster snapshot.

```
aws rds describe-db-cluster-snapshot-attributes \  
  --db-cluster-snapshot-identifier myclustersnapshot
```

Output:

```
{  
  "DBClusterSnapshotAttributesResult": {  
    "DBClusterSnapshotIdentifier": "myclustersnapshot",  
    "DBClusterSnapshotAttributes": [  
      {  
        "AttributeName": "restore",  
        "AttributeValues": [  
          "123456789012"  
        ]  
      }  
    ]  
  }  
}
```

For more information, see [Sharing a DB Cluster Snapshot](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbClusterSnapshotAttributes](#) in *AWS CLI Command Reference*.

describe-db-cluster-snapshots

The following code example shows how to use `describe-db-cluster-snapshots`.

AWS CLI

To describe a DB cluster snapshot for a DB cluster

The following `describe-db-cluster-snapshots` example retrieves the details for the DB cluster snapshots for the specified DB cluster.

```
aws rds describe-db-cluster-snapshots \  
  --db-cluster-identifier mydbcluster
```

Output:

```

{
  "DBClusterSnapshots": [
    {
      "AvailabilityZones": [
        "us-east-1a",
        "us-east-1b",

}
]
}

```

Example 2: To list certain attributes of all DB clusters

The following `describe-db-clusters` example retrieves only the `DBClusterIdentifier`, `Endpoint`, and `ReaderEndpoint` attributes of all your DB clusters in the current AWS Region.

```
aws rds describe-db-clusters \
  --query 'DBClusters[.]
{DBClusterIdentifier:DBClusterIdentifier,Endpoint:Endpoint,ReaderEndpoint:ReaderEndpoint}'
```

Output:

```
[
  {
    "Endpoint": "cluster-57-2020-05-01-2270.cluster-cnpxample.us-
east-1.rds.amazonaws.com",
    "ReaderEndpoint": "cluster-57-2020-05-01-2270.cluster-ro-cnpxample.us-
east-1.rds.amazonaws.com",
    "DBClusterIdentifier": "cluster-57-2020-05-01-2270"
  },
  {
    "Endpoint": "cluster-57-2020-05-01-4615.cluster-cnpxample.us-
east-1.rds.amazonaws.com",
    "ReaderEndpoint": "cluster-57-2020-05-01-4615.cluster-ro-cnpxample.us-
east-1.rds.amazonaws.com",

  },
  {
    "Endpoint": "pg2-cluster.cluster-cnpxample.us-east-1.rds.amazonaws.com",
    "ReaderEndpoint": "pg2-cluster.cluster-ro-cnpxample.us-
east-1.rds.amazonaws.com",
    "DBClusterIdentifier": "pg2-cluster"
  },
  ...output omitted...
]
```

Example 3: To list DB clusters with a specific attribute

The following `describe-db-clusters` example retrieves only the `DBClusterIdentifier` and `Engine` attributes of your DB clusters that use the `aurora-postgresql` DB engine.

```
aws rds describe-db-clusters \
  --query 'DBClusters[.]{DBClusterIdentifier:DBClusterIdentifier,Engine:Engine} |
[?Engine == `aurora-postgresql`]'
```

Output:

```
[
  {
    "Engine": "aurora-postgresql",
    "DBClusterIdentifier": "pg2-cluster"
  }
]
```

For more information, see [Amazon Aurora DB Clusters](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbClusters](#) in *AWS CLI Command Reference*.

describe-db-engine-versions

The following code example shows how to use `describe-db-engine-versions`.

AWS CLI

To describe the DB engine versions for the MySQL DB engine

The following `describe-db-engine-versions` example displays details about each of the DB engine versions for the specified DB engine.

```
aws rds describe-db-engine-versions \
  --engine mysql
```

Output:

```
{
  "DBEngineVersions": [
    {
      "Engine": "mysql",
      "EngineVersion": "5.5.46",
      "DBParameterGroupFamily": "mysql5.5",
      "DBEngineDescription": "MySQL Community Edition",
      "DBEngineVersionDescription": "MySQL 5.5.46",
      "ValidUpgradeTarget": [
        {
          "Engine": "mysql",
          "EngineVersion": "5.5.53",
          "Description": "MySQL 5.5.53",
          "AutoUpgrade": false,
          "IsMajorVersionUpgrade": false
        }
      ]
    }
  ]
}
```

```

    },
    {
      "Engine": "mysql",
      "EngineVersion": "5.5.54",
      "Description": "MySQL 5.5.54",
      "AutoUpgrade": false,
      "IsMajorVersionUpgrade": false
    },
    {
      "Engine": "mysql",
      "EngineVersion": "5.5.57",
      "Description": "MySQL 5.5.57",
      "AutoUpgrade": false,
      "IsMajorVersionUpgrade": false
    },
    ...some output truncated...
  ]
}

```

For more information, see [What Is Amazon Relational Database Service \(Amazon RDS\)?](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDBEngineVersions](#) in *AWS CLI Command Reference*.

describe-db-instance-automated-backups

The following code example shows how to use `describe-db-instance-automated-backups`.

AWS CLI

To describe the automated backups for a DB instance

The following `describe-db-instance-automated-backups` example displays details about the automated backups for the specified DB instance. The details include replicated automated backups in other AWS Regions.

```
aws rds describe-db-instance-automated-backups \
  --db-instance-identifier new-orcl-db
```

Output:

```
{
  "DBInstanceAutomatedBackups": [
```

```
{
  "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",

}
]
```

For more information, see [Finding information about replicated backups](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDbInstanceAutomatedBackups](#) in *AWS CLI Command Reference*.

describe-db-instances

The following code example shows how to use describe-db-instances.

AWS CLI

To describe a DB instance

The following describe-db-instances example retrieves details about the specified DB instance.

```
aws rds describe-db-instances \  
  --db-instance-identifier mydbinstancecf
```

Output:

```
{  
  "DBInstances": [  
    {  
      "DBInstanceIdentifier": "mydbinstancecf",  
      "DBInstanceClass": "db.t3.small",  
      "Engine": "mysql",  
      "DBInstanceStatus": "available",  
      "MasterUsername": "masterawsuser",  
      "Endpoint": {  
        "Address": "mydbinstancecf.abcxample.us-east-1.rds.amazonaws.com",  
        "Port": 3306,  
        "HostedZoneId": "Z2R2ITUGPM61AM"  
      },  
      "...some output truncated..."  
    }  
  ]  
}
```

- For API details, see [DescribeDBInstances](#) in *AWS CLI Command Reference*.

describe-db-log-files

The following code example shows how to use `describe-db-log-files`.

AWS CLI

To describe the log files for a DB instance

The following `describe-db-log-files` example retrieves details about the log files for the specified DB instance.

```
aws rds describe-db-log-files -\  
  --db-instance-identifier test-instance
```

Output:

```
{
  "DescribeDBLogFiles": [
    {
      "Size": 0,
      "LastWritten": 1533060000000,
      "LogFileName": "error/mysql-error-running.log"
    },
    {
      "Size": 2683,

describe-db-parameter-groups

The following code example shows how to use `describe-db-parameter-groups`.

AWS CLI

To describe your DB parameter group

The following `describe-db-parameter-groups` example retrieves details about your DB parameter groups.

```
aws rds describe-db-parameter-groups
```

Output:

```
{
  "DBParameterGroups": [
    {
      "DBParameterGroupName": "default.aurora-mysql5.7",
      "DBParameterGroupFamily": "aurora-mysql5.7",
      "Description": "Default parameter group for aurora-mysql5.7",
      "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.aurora-mysql5.7"
    },
    {
      "DBParameterGroupName": "default.aurora-postgresql9.6",
      "DBParameterGroupFamily": "aurora-postgresql9.6",
      "Description": "Default parameter group for aurora-postgresql9.6",
      "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.aurora-postgresql9.6"
    },
    {
      "DBParameterGroupName": "default.aurora5.6",
      "DBParameterGroupFamily": "aurora5.6",
      "Description": "Default parameter group for aurora5.6",
      "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.aurora5.6"
    },
    {
      "DBParameterGroupName": "default.mariadb10.1",
      "DBParameterGroupFamily": "mariadb10.1",
      "Description": "Default parameter group for mariadb10.1",
      "DBParameterGroupArn": "arn:aws:rds:us-east-1:123456789012:pg:default.mariadb10.1"
    },
    ...some output truncated...
  ]
}
```

```
}
```

For more information, see [Working with DB Parameter Groups](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDBParameterGroups](#) in *AWS CLI Command Reference*.

describe-db-parameters

The following code example shows how to use `describe-db-parameters`.

AWS CLI

To describe the parameters in a DB parameter group

The following `describe-db-parameters` example retrieves the details of the specified DB parameter group.

```
aws rds describe-db-parameters \  
  --db-parameter-group-name mydbpg
```

Output:

```
{  
  "Parameters": [  
    {  
      "ParameterName": "allow-suspicious-udfs",  
      "Description": "Controls whether user-defined functions that have only  
an xxx symbol for the main function can be loaded",  
      "Source": "engine-default",  
      "ApplyType": "static",  
      "DataType": "boolean",  
      "AllowedValues": "0,1",  
      "IsModifiable": false,  
      "ApplyMethod": "pending-reboot"  
    },  
    {  
      "ParameterName": "auto_generate_certs",  
      "Description": "Controls whether the server autogenerates SSL key and  
certificate files in the data directory, if they do not already exist.",  
      "Source": "engine-default",  
      "ApplyType": "static",  
      "DataType": "boolean",  
      "AllowedValues": "0,1",
```

```

        "IsModifiable": false,
        "ApplyMethod": "pending-reboot"
    },
    ...some output truncated...
]
}

```

For more information, see [Working with DB Parameter Groups](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDBParameters](#) in *AWS CLI Command Reference*.

describe-db-proxies

The following code example shows how to use describe-db-proxies.

AWS CLI

To describe a DB proxy for an RDS database

The following describe-db-proxies example returns information about DB proxies.

```
aws rds describe-db-proxies
```

Output:

```

{
  "DBProxies": [
    {
      "DBProxyName": "proxyExample1",
      "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-proxy:prx-0123a01b12345c0ab",

    "TargetRole": "READ_WRITE",
    "IsDefault": false
  }
]
}

```

For more information, see [Viewing a proxy endpoint](#) in the *Amazon RDS User Guide* and [Creating a proxy endpoint](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbProxyEndpoints](#) in *AWS CLI Command Reference*.

describe-db-proxy-target-groups

The following code example shows how to use `describe-db-proxy-target-groups`.

AWS CLI

To describe a DB proxy endpoints

The following `describe-db-proxy-target-groups` example returns information about DB proxy target groups.

```
aws rds describe-db-proxy-target-groups \
  --db-proxy-name proxyExample
```

Output:

```
{
  "TargetGroups":
  {
    "DBProxyName": "proxyExample",
    "TargetGroupName": "default",
    "TargetGroupArn": "arn:aws:rds:us-east-1:123456789012:target-group:prx-
tg-0123a01b12345c0ab",

    },
    "CreateDate": "2023-05-02T18:41:19.495000+00:00",
    "UpdateDate": "2023-05-02T18:41:21.762000+00:00"
  }
}
```

For more information, see [Viewing an RDS Proxy](#) in the *Amazon RDS User Guide* and [Viewing an RDS Proxy](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbProxyTargetGroups](#) in *AWS CLI Command Reference*.

describe-db-proxy-targets

The following code example shows how to use `describe-db-proxy-targets`.

AWS CLI

To describe DB proxy targets

The following `describe-db-proxy-targets` example returns information about DB proxy targets.

```
aws rds describe-db-proxy-targets \
  --db-proxy-name proxyExample
```

Output:

```
{
  "Targets": [
    {
      "Endpoint": "database1.ab0cd1efghij.us-east-1.rds.amazonaws.com",
      "TrackedClusterId": "database1",
      "RdsResourceId": "database1-instance-1",
      "Port": 3306,
      "Type": "RDS_INSTANCE",
      "Role": "READ_WRITE",
      "TargetHealth": {
        "State": "UNAVAILABLE",
        "Reason": "PENDING_PROXY_CAPACITY",
        "Description": "DBProxy Target is waiting for proxy to scale to
desired capacity"
      }
    }
  ]
}
```

For more information, see [Viewing an RDS proxy](#) in the *Amazon RDS User Guide* and [Viewing an RDS proxy](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbProxyTargets](#) in *AWS CLI Command Reference*.

describe-db-recommendations

The following code example shows how to use `describe-db-recommendations`.

AWS CLI

Example 1: To list all DB recommendations

The following `describe-db-recommendations` example lists all DB recommendations in your AWS account.

```
aws rds describe-db-recommendations
```

Output:

```
{
  "DBRecommendations": [
    {
      "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",

Example 4: To list all active DB recommendations

The following `describe-db-recommendations` example lists all active DB recommendations in your AWS account.

```
aws rds describe-db-recommendations \
  --filters Name=status,Values=active
```

Output:

```

{
  "DBRecommendations": [
    {
      "RecommendationId": "12ab3cde-f456-7g8h-9012-i3j45678k9lm",

describe-db-security-groups

The following code example shows how to use `describe-db-security-groups`.

AWS CLI

To list DB security groups

The following `describe-db-security-groups` example lists DB security groups.

```
aws rds describe-db-security-groups
```

Output:

```
{
  "DBSecurityGroups": [
    {
      "OwnerId": "123456789012",
```

```

        "DBSecurityGroupName": "default",
        "DBSecurityGroupDescription": "default",
        "EC2SecurityGroups": [],
        "IPRanges": [],
        "DBSecurityGroupArn": "arn:aws:rds:us-
west-1:111122223333:secgrp:default"
    },
    {
        "OwnerId": "123456789012",
        "DBSecurityGroupName": "mysecgroup",
        "DBSecurityGroupDescription": "My Test Security Group",
        "VpcId": "vpc-1234567f",
        "EC2SecurityGroups": [],
        "IPRanges": [],
        "DBSecurityGroupArn": "arn:aws:rds:us-
west-1:111122223333:secgrp:mysecgroup"
    }
]
}

```

For more information, see [Listing Available DB Security Groups](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDbSecurityGroups](#) in *AWS CLI Command Reference*.

describe-db-shard-groups

The following code example shows how to use `describe-db-shard-groups`.

AWS CLI

Example 1: To describe DB shard groups

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups.

```
aws rds describe-db-shard-groups
```

Output:

```

{
  "DBShardGroups": [
    {

```

```

    "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
    "DBShardGroupIdentifier": "limitless-test-shard-grp",
    "DBClusterIdentifier": "limitless-test-cluster",
    "MaxACU": 768.0,
    "ComputeRedundancy": 0,
    "Status": "available",
    "PubliclyAccessible": true,
    "Endpoint": "limitless-test-cluster.limitless-cekyceexample.us-
east-2.rds.amazonaws.com"
  },
  {
    "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
    "DBShardGroupIdentifier": "my-db-shard-group",
    "DBClusterIdentifier": "my-sv2-cluster",
    "MaxACU": 768.0,
    "ComputeRedundancy": 0,
    "Status": "available",
    "PubliclyAccessible": false,
    "Endpoint": "my-sv2-cluster.limitless-cekyceexample.us-
east-2.rds.amazonaws.com"
  }
]
}

```

For more information, see [Amazon Aurora DB Clusters](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeDbShardGroups](#) in *AWS CLI Command Reference*.

describe-db-snapshot-attributes

The following code example shows how to use `describe-db-snapshot-attributes`.

AWS CLI

To describe the attribute names and values for a DB snapshot

The following `describe-db-snapshot-attributes` example describes the attribute names and values for a DB snapshot.

```
aws rds describe-db-snapshot-attributes \
  --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
  "DBSnapshotAttributesResult": {
    "DBSnapshotIdentifier": "mydbsnapshot",
    "DBSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AttributeValues": [
          "123456789012",
          "210987654321"
        ]
      }
    ]
  }
}
```

For more information, see [Sharing a DB Snapshot](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDbSnapshotAttributes](#) in *AWS CLI Command Reference*.

describe-db-snapshots

The following code example shows how to use `describe-db-snapshots`.

AWS CLI

Example 1: To describe a DB snapshot for a DB instance

The following `describe-db-snapshots` example retrieves the details of a DB snapshot for a DB instance.

```
aws rds describe-db-snapshots \
  --db-snapshot-identifier mydbsnapshot
```

Output:

```
{
  "DBSnapshots": [
    {
      "DBSnapshotIdentifier": "mydbsnapshot",
      "DBInstanceIdentifier": "mysqldb",
      "SnapshotCreateTime": "2018-02-08T22:28:08.598Z",
      "Engine": "mysql",
    }
  ]
}
```

```

    "AllocatedStorage": 20,
    "Status": "available",
    "Port": 3306,
    "AvailabilityZone": "us-east-1f",
    "VpcId": "vpc-6594f31c",
    "InstanceCreateTime": "2018-02-08T22:24:55.973Z",
    "MasterUsername": "mysqladmin",
    "EngineVersion": "5.6.37",
    "LicenseModel": "general-public-license",
    "SnapshotType": "manual",
    "OptionGroupName": "default:mysql-5-6",
    "PercentProgress": 100,
    "StorageType": "gp2",
    "Encrypted": false,
    "DBSnapshotArn": "arn:aws:rds:us-
east-1:123456789012:snapshot:mydbsnapshot",
    "IAMDatabaseAuthenticationEnabled": false,
    "ProcessorFeatures": [],
    "DbiResourceId": "db-AKIAIOSFODNN7EXAMPLE"
  }
]
}

```

For more information, see [Creating a DB Snapshot](#) in the *Amazon RDS User Guide*.

Example 2: To find the number of manual snapshots taken

The following `describe-db-snapshots` example uses the `length` operator in the `--query` option to return the number of manual snapshots that have been taken in a particular AWS Region.

```

aws rds describe-db-snapshots \
  --snapshot-type manual \
  --query "length(*[].[DBSnapshots:SnapshotType])" \
  --region eu-central-1

```

Output:

```
35
```

For more information, see [Creating a DB Snapshot](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDBSnapshots](#) in *AWS CLI Command Reference*.

describe-db-subnet-groups

The following code example shows how to use `describe-db-subnet-groups`.

AWS CLI

To describe a DB subnet group

The following `describe-db-subnet-groups` example retrieves the details of the specified DB subnet group.

```
aws rds describe-db-subnet-groups
```

Output:

```
{
  "DBSubnetGroups": [
    {
      "DBSubnetGroupName": "mydbsubnetgroup",
      "DBSubnetGroupDescription": "My DB Subnet Group",
      "VpcId": "vpc-971c12ee",
      "SubnetGroupStatus": "Complete",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-d8c8e7f4",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1a"
          },
          "SubnetStatus": "Active"
        },
        {
          "SubnetIdentifier": "subnet-718fdc7d",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1f"
          },
          "SubnetStatus": "Active"
        },
        {
          "SubnetIdentifier": "subnet-cbc8e7e7",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1a"
          },
          "SubnetStatus": "Active"
        }
      ]
    }
  ]
}
```

```
    },
    {
      "SubnetIdentifier": "subnet-0ccde220",
      "SubnetAvailabilityZone": {
        "Name": "us-east-1a"
      },
      "SubnetStatus": "Active"
    }
  ],
  "DBSubnetGroupArn": "arn:aws:rds:us-
east-1:123456789012:subgrp:mydbsubnetgroup"
}
]
```

For more information, see [Amazon Virtual Private Cloud VPCs and Amazon RDS](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeDbSubnetGroups](#) in *AWS CLI Command Reference*.

describe-engine-default-cluster-parameters

The following code example shows how to use `describe-engine-default-cluster-parameters`.

AWS CLI

To describe the default engine and system parameter information for the Aurora database engine

The following `describe-engine-default-cluster-parameters` example retrieves the details of the default engine and system parameter information for Aurora DB clusters with MySQL 5.7 compatibility.

```
aws rds describe-engine-default-cluster-parameters \
  --db-parameter-group-family aurora-mysql5.7
```

Output:

```
{
  "EngineDefaults": {
    "Parameters": [
```

```

    {
      "ParameterName": "aurora_load_from_s3_role",
      "Description": "IAM role ARN used to load data from AWS S3",
      "Source": "engine-default",
      "ApplyType": "dynamic",
      "DataType": "string",
      "IsModifiable": true,
      "SupportedEngineModes": [
        "provisioned"
      ]
    },
    ...some output truncated...
  ]
}

```

For more information, see [Working with DB Parameter Groups and DB Cluster Parameter Groups](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeEngineDefaultClusterParameters](#) in *AWS CLI Command Reference*.

describe-engine-default-parameters

The following code example shows how to use `describe-engine-default-parameters`.

AWS CLI

To describe the default engine and system parameter information for the database engine

The following `describe-engine-default-parameters` example retrieves details for the default engine and system parameter information for MySQL 5.7 DB instances.

```
aws rds describe-engine-default-parameters \
  --db-parameter-group-family mysql5.7
```

Output:

```

{
  "EngineDefaults": {
    "Parameters": [
      {
        "ParameterName": "allow-suspicious-udfs",

```

```

        "Description": "Controls whether user-defined functions that have
only an xxx symbol for the main function can be loaded",
        "Source": "engine-default",
        "ApplyType": "static",
        "DataType": "boolean",
        "AllowedValues": "0,1",
        "IsModifiable": false
    },
    ...some output truncated...
]
}
}

```

For more information, see [Working with DB Parameter Groups](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeEngineDefaultParameters](#) in *AWS CLI Command Reference*.

describe-event-categories

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe event categories

The following `describe-event-categories` example retrieves details about the event categories for all available event sources.

```
aws rds describe-event-categories
```

Output:

```

{
  "EventCategoriesMapList": [
    {
      "SourceType": "db-instance",
      "EventCategories": [
        "deletion",
        "read replica",
        "failover",
        "restoration",
        "maintenance",
        "low storage",

```

```
        "configuration change",
        "backup",
        "creation",
        "availability",
        "recovery",
        "failure",
        "backtrack",
        "notification"
    ]
},
{
    "SourceType": "db-security-group",
    "EventCategories": [
        "configuration change",
        "failure"
    ]
},
{
    "SourceType": "db-parameter-group",
    "EventCategories": [
        "configuration change"
    ]
},
{
    "SourceType": "db-snapshot",
    "EventCategories": [
        "deletion",
        "creation",
        "restoration",
        "notification"
    ]
},
{
    "SourceType": "db-cluster",
    "EventCategories": [
        "failover",
        "failure",
        "notification"
    ]
},
{
    "SourceType": "db-cluster-snapshot",
    "EventCategories": [
        "backup"
```

```
    ]
  }
]
}
```

- For API details, see [DescribeEventCategories](#) in *AWS CLI Command Reference*.

describe-event-subscriptions

The following code example shows how to use `describe-event-subscriptions`.

AWS CLI

To describe event subscriptions

This example describes all of the Amazon RDS event subscriptions for the current AWS account.

```
aws rds describe-event-subscriptions
```

Output:

```
{
  "EventSubscriptionsList": [
    {
      "EventCategoriesList": [
        "backup",
        "recovery"
      ],
      "Enabled": true,
      "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-
instance-events",
      "Status": "creating",
      "SourceType": "db-instance",
      "CustomerAwsId": "123456789012",
      "SubscriptionCreationTime": "2018-07-31 23:22:01.893",
      "CustSubscriptionId": "my-instance-events",
      "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events"
    },
    ...some output truncated...
  ]
}
```

- For API details, see [DescribeEventSubscriptions](#) in *AWS CLI Command Reference*.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To describe events

The following describe-events example retrieves details for the events that have occurred for the specified DB instance.

```
aws rds describe-events \  
  --source-identifier test-instance \  
  --source-type db-instance
```

Output:

```
{  
  "Events": [  
    {  
      "SourceType": "db-instance",  
      "SourceIdentifier": "test-instance",  
      "EventCategories": [  
        "backup"  
      ],  
      "Message": "Backing up DB instance",  
      "Date": "2018-07-31T23:09:23.983Z",  
      "SourceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance"  
    },  
    {  
      "SourceType": "db-instance",  
      "SourceIdentifier": "test-instance",  
      "EventCategories": [  
        "backup"  
      ],  
      "Message": "Finished DB Instance backup",  
      "Date": "2018-07-31T23:15:13.049Z",  
      "SourceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance"  
    }  
  ]  
}
```

```
}
```

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

describe-export-tasks

The following code example shows how to use describe-export-tasks.

AWS CLI

To describe snapshot export tasks

The following describe-export-tasks example returns information about snapshot exports to Amazon S3.

```
aws rds describe-export-tasks
```

Output:

```
{
  "ExportTasks": [
    {
      "ExportTaskIdentifier": "test-snapshot-export",
      "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:test-
snapshot",
      "SnapshotTime": "2020-03-02T18:26:28.163Z",
      "TaskStartTime": "2020-03-02T18:57:56.896Z",
      "TaskEndTime": "2020-03-02T19:10:31.985Z",
      "S3Bucket": "mybucket",
      "S3Prefix": "",
      "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
      "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
abcd0000-7fca-4128-82f2-aabbccddeeff",
      "Status": "COMPLETE",
      "PercentProgress": 100,
      "TotalExtractedDataInGB": 0
    },
    {
      "ExportTaskIdentifier": "my-s3-export",
      "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-
test",
      "SnapshotTime": "2020-03-27T20:48:42.023Z",
```

```

        "S3Bucket": "mybucket",
        "S3Prefix": "",
        "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",
        "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
abcd0000-7fca-4128-82f2-aabbccddeeff",
        "Status": "STARTING",
        "PercentProgress": 0,
        "TotalExtractedDataInGB": 0
    }
]
}

```

For more information, see [Monitoring Snapshot Exports](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeExportTasks](#) in *AWS CLI Command Reference*.

describe-global-clusters

The following code example shows how to use `describe-global-clusters`.

AWS CLI

To describe global DB clusters

The following `describe-global-clusters` example lists Aurora global DB clusters in the current AWS Region.

```
aws rds describe-global-clusters
```

Output:

```

{
  "GlobalClusters": [
    {
      "GlobalClusterIdentifier": "myglobalcluster",
      "GlobalClusterResourceId": "cluster-f5982077e3b5aabb",
      "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
      "Status": "available",
      "Engine": "aurora-mysql",
      "EngineVersion": "5.7.mysql_aurora.2.07.2",
      "StorageEncrypted": false,
      "DeletionProtection": false,

```

```

        "GlobalClusterMembers": []
      }
    ]
  }

```

For more information, see [Managing an Aurora global database](#) in the *Amazon Aurora User Guide*.

- For API details, see [DescribeGlobalClusters](#) in *AWS CLI Command Reference*.

describe-option-group-options

The following code example shows how to use describe-option-group-options.

AWS CLI

To describe all available options

The following describe-option-group-options example lists two options for an Oracle Database 19c instance.

```

aws rds describe-option-group-options \
  --engine-name oracle-ee \

describe-option-groups

The following code example shows how to use describe-option-groups.

AWS CLI

To describe the available option groups

The following `describe-option-groups` example lists the options groups for an Oracle Database 19c instance.

```
aws rds describe-option-groups \  
  --engine-name oracle-ee \  
  --major-engine-version 19
```

Output:

```
{  
  "OptionGroupsList": [  
    {  
      "OptionGroupName": "default:oracle-ee-19",  
      "OptionGroupDescription": "Default option group for oracle-ee 19",  
      "EngineName": "oracle-ee",  
      "MajorEngineVersion": "19",  
      "Options": [],  
      "AllowsVpcAndNonVpcInstanceMemberships": true,  
      "OptionGroupArn": "arn:aws:rds:us-west-1:111122223333:og:default:oracle-  
ee-19"  
    }  
  ]  
}
```

For more information, see [Listing the Options and Option Settings for an Option Group](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeOptionGroups](#) in *AWS CLI Command Reference*.

describe-orderable-db-instance-options

The following code example shows how to use `describe-orderable-db-instance-options`.

AWS CLI

To describe orderable DB instance options

The following `describe-orderable-db-instance-options` example retrieves details about the orderable options for a DB instances running the MySQL DB engine.

```
aws rds describe-orderable-db-instance-options \  
--engine mysql
```

Output:

```
{  
  "OrderableDBInstanceOptions": [  
    {  
      "MinStorageSize": 5,  
      "ReadReplicaCapable": true,  
      "MaxStorageSize": 6144,  
      "AvailabilityZones": [  
        {  
          "Name": "us-east-1a"  
        },  
        {  
          "Name": "us-east-1b"  
        },  
        {  
          "Name": "us-east-1c"  
        },  
        {  
          "Name": "us-east-1d"  
        }  
      ],  
      "SupportsIops": false,

      "SupportsEnhancedMonitoring": true,  
      "Engine": "mysql",  
      "SupportsIAMDatabaseAuthentication": false,  
      "SupportsPerformanceInsights": false  
    }  
  ]  
  ...some output truncated...  
}
```

- For API details, see [DescribeOrderableDBInstanceOptions](#) in *AWS CLI Command Reference*.

describe-pending-maintenance-actions

The following code example shows how to use `describe-pending-maintenance-actions`.

AWS CLI

To list resources with at least one pending maintenance action

The following `describe-pending-maintenance-actions` example lists the pending maintenance action for a DB instance.

```
aws rds describe-pending-maintenance-actions
```

Output:

```
{
  "PendingMaintenanceActions": [
    {
      "ResourceIdentifier": "arn:aws:rds:us-
west-2:123456789012:cluster:global-db1-cl1",
      "PendingMaintenanceActionDetails": [
        {
          "Action": "system-update",
          "Description": "Upgrade to Aurora PostgreSQL 2.4.2"
        }
      ]
    }
  ]
}
```

For more information, see [Maintaining a DB Instance](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribePendingMaintenanceActions](#) in *AWS CLI Command Reference*.

describe-reserved-db-instances-offerings

The following code example shows how to use `describe-reserved-db-instances-offerings`.

AWS CLI

To describe reserved DB instance offerings

The following `describe-reserved-db-instances-offerings` example retrieves details about reserved DB instance options for oracle.

```
aws rds describe-reserved-db-instances-offerings \  
  --product-description oracle
```

Output:

```
{  
  "ReservedDBInstancesOfferings": [  
    {  
      "CurrencyCode": "USD",  
      "UsagePrice": 0.0,  
      "ProductDescription": "oracle-se2(li)",  
      "ReservedDBInstancesOfferingId": "005bdee3-9ef4-4182-aa0c-58ef7cb6c2f8",  
      "MultiAZ": true,  
      "DBInstanceClass": "db.m4.xlarge",  
      "OfferingType": "Partial Upfront",  
      "RecurringCharges": [  
        {  
          "RecurringChargeAmount": 0.594,  
          "RecurringChargeFrequency": "Hourly"  
        }  
      ],  
      "FixedPrice": 4089.0,  
      "Duration": 31536000  
    },  
    ...some output truncated...  
  ]  
}
```

- For API details, see [DescribeReservedDbInstancesOfferings](#) in *AWS CLI Command Reference*.

`describe-reserved-db-instances`

The following code example shows how to use `describe-reserved-db-instances`.

AWS CLI

To describe reserved DB instances

The following `describe-reserved-db-instances` example retrieves details about any reserved DB instances in the current AWS account.

```
aws rds describe-reserved-db-instances
```

Output:

```
{
  "ReservedDBInstances": [
    {
      "ReservedDBInstanceId": "myreservedinstance",
      "ReservedDBInstancesOfferingId": "12ab34cd-59af-4b2c-a660-1abcdef23456",
      "DBInstanceClass": "db.t3.micro",
      "StartTime": "2020-06-01T13:44:21.436Z",
      "Duration": 31536000,
      "FixedPrice": 0.0,
      "UsagePrice": 0.0,
      "CurrencyCode": "USD",
      "DBInstanceCount": 1,
      "ProductDescription": "sqlserver-ex(li)",
      "OfferingType": "No Upfront",
      "MultiAZ": false,
      "State": "payment-pending",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": 0.014,
          "RecurringChargeFrequency": "Hourly"
        }
      ],
      "ReservedDBInstanceArn": "arn:aws:rds:us-west-2:123456789012:ri:myreservedinstance",
      "LeaseId": "a1b2c3d4-6b69-4a59-be89-5e11aa446666"
    }
  ]
}
```

For more information, see [Reserved DB Instances for Amazon RDS](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeReservedDbInstances](#) in *AWS CLI Command Reference*.

describe-source-regions

The following code example shows how to use `describe-source-regions`.

AWS CLI

To describe source Regions

The following `describe-source-regions` example retrieves details about all source AWS Regions. It also shows that automated backups can be replicated only from US West (Oregon) to the destination AWS Region, US East (N. Virginia).

```
aws rds describe-source-regions \  
  --region us-east-1
```

Output:

```
{  
  "SourceRegions": [  
    {  
      "RegionName": "af-south-1",  
      "Endpoint": "https://rds.af-south-1.amazonaws.com",  
      "Status": "available",  
      "SupportsDBInstanceAutomatedBackupsReplication": false  
    },  
    {  
      "RegionName": "ap-east-1",  
      "Endpoint": "https://rds.ap-east-1.amazonaws.com",  
      "Status": "available",  
      "SupportsDBInstanceAutomatedBackupsReplication": false  
    },  
    {  
      "RegionName": "ap-northeast-1",  
      "Endpoint": "https://rds.ap-northeast-1.amazonaws.com",  
      "Status": "available",  
      "SupportsDBInstanceAutomatedBackupsReplication": true  
    },  
    {  
      "RegionName": "ap-northeast-2",  
      "Endpoint": "https://rds.ap-northeast-2.amazonaws.com",
```

```
    "Status": "available",
    "SupportsDBInstanceAutomatedBackupsReplication": true
  },

  }
]
```

For more information, see [Finding information about replicated backups](#) in the *Amazon RDS User Guide*.

- For API details, see [DescribeSourceRegions](#) in *AWS CLI Command Reference*.

describe-valid-db-instance-modifications

The following code example shows how to use `describe-valid-db-instance-modifications`.

AWS CLI

To describe valid modifications for a DB instance

The following `describe-valid-db-instance-modifications` example retrieves details about the valid modifications for the specified DB instance.

```
aws rds describe-valid-db-instance-modifications \
  --db-instance-identifier test-instance
```

Output:

```
{
  "ValidDBInstanceModificationsMessage": {
    "ValidProcessorFeatures": [],
    "Storage": [
      {
        "StorageSize": [
          {
            "Step": 1,
            "To": 20,
            "From": 20
          },
          {
            "Step": 1,
            "To": 6144,
            "From": 22
          }
        ],
        "ProvisionedIops": [
          {
            "Step": 1,
            "To": 0,
            "From": 0
          }
        ],
        "IopsToStorageRatio": [
          {
            "To": 0.0,

        "From": 0.0
      }
    ],
    "StorageType": "magnetic"
  }
]
}
```

- For API details, see [DescribeValidDbInstanceModifications](#) in *AWS CLI Command Reference*.

download-db-log-file-portion

The following code example shows how to use `download-db-log-file-portion`.

AWS CLI

To download a DB log file

The following `download-db-log-file-portion` example downloads only the latest part of your log file, saving it to a local file named `tail.txt`.

```
aws rds download-db-log-file-portion \  
  --db-instance-identifier test-instance \  
  --log-file-name log.txt \  
  --output text > tail.txt
```

To download the entire file, you need to include the `--starting-token 0` parameter. The following example saves the output to a local file named `full.txt`.

```
aws rds download-db-log-file-portion \  
  --db-instance-identifier test-instance \  
  --log-file-name log.txt \  
  --starting-token 0 \  
  --output text > full.txt
```

The saved file might contain blank lines. They appear at the end of each part of the log file while being downloaded. This generally doesn't cause any trouble in your log file analysis.

- For API details, see [DownloadDbLogFilePortion](#) in *AWS CLI Command Reference*.

generate-auth-token

The following code example shows how to use `generate-auth-token`.

AWS CLI

To generate an authentication token

The following `generate-db-auth-token` example generates an authentication token for use with IAM database authentication.

```
aws rds generate-db-auth-token \  
  --hostname aumysql-test.cdgmuiadpid.us-west-2.rds.amazonaws.com \  
  --port 3306 \  
  --region us-east-1 \  
  --username jane_doe
```

Output:

```
aumysql-test.cdgmuiadpid.us-west-2.rds.amazonaws.com:3306/?  
Action=connect&DBUser=jane_doe&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-  
Credential=AKIAIESZCNJ30EXAMPLE%2F20180731%2Fus-east-1%2Frds-db%2Faws4_request&X-  
Amz-Date=20180731T235209Z&X-Amz-Expires=900&X-Amz-SignedHeaders=host&X-Amz-  
Signature=5a8753ebEXAMPLEEa2c724e5667797EXAMPLE9d6ec6e3f427191fa41aeEXAMPLE
```

- For API details, see [GenerateAuthToken](#) in *AWS CLI Command Reference*.

generate-db-auth-token

The following code example shows how to use `generate-db-auth-token`.

AWS CLI

To generate an IAM authentication token

The following `generate-db-auth-token` example generates IAM authentication token to connect to a database.

```
aws rds generate-db-auth-token \  
  --hostname mydb.123456789012.us-east-1.rds.amazonaws.com \  
  --port 3306 \  
  --region us-east-1 \  
  --username db_user
```

Output:

```
mydb.123456789012.us-east-1.rds.amazonaws.com:3306/?  
Action=connect&DBUser=db_user&X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-  
Credential=AKIAIEXAMPLE%2Fus-east-1%2Frds-db%2Faws4_request&X-Amz-  
Date=20210123T011543Z&X-Amz-Expires=900&X-Amz-SignedHeaders=host&X-Amz-  
Signature=88987EXAMPLE1EXAMPLE2EXAMPLE3EXAMPLE4EXAMPLE5EXAMPLE6
```

For more information, see [Connecting to your DB instance using IAM authentication](#) in the *Amazon RDS User Guide* and [Connecting to your DB cluster using IAM authentication](#) in the *Amazon Aurora User Guide*.

- For API details, see [GenerateDbAuthToken](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags on an Amazon RDS resource

The following `list-tags-for-resource` example lists all tags on a DB instance.

```
aws rds list-tags-for-resource \  
  --resource-name arn:aws:rds:us-east-1:123456789012:db:orc11
```

Output:

```
{  
  "TagList": [  
    {  
      "Key": "Environment",  
      "Value": "test"  
    },  
    {  
      "Key": "Name",  
      "Value": "MyDatabase"  
    }  
  ]  
}
```

For more information, see [Tagging Amazon RDS Resources](#) in the *Amazon RDS User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

modify-certificates

The following code example shows how to use `modify-certificates`.

AWS CLI

To temporarily override the system-default SSL/TLS certificate for new DB instances

The following `modify-certificates` example temporarily overrides the system-default SSL/TLS certificate for new DB instances.

```
aws rds modify-certificates \  
  --certificate-identifier rds-ca-2019
```

Output:

```
{  
  "Certificate": {  
    "CertificateIdentifier": "rds-ca-2019",  
    "CertificateType": "CA",  
    "Thumbprint": "EXAMPLE123456789012",  
    "ValidFrom": "2019-09-19T18:16:53Z",  
    "ValidTill": "2024-08-22T17:08:50Z",  
    "CertificateArn": "arn:aws:rds:us-east-1::cert:rds-ca-2019",  
    "CustomerOverride": true,  
    "CustomerOverrideValidTill": "2024-08-22T17:08:50Z"  
  }  
}
```

For more information, see [Rotating your SSL/TLS certificate](#) in the *Amazon RDS User Guide* and [Rotating your SSL/TLS certificate](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyCertificates](#) in *AWS CLI Command Reference*.

`modify-current-db-cluster-capacity`

The following code example shows how to use `modify-current-db-cluster-capacity`.

AWS CLI

To scale the capacity of an Aurora Serverless DB cluster

The following `modify-current-db-cluster-capacity` example scales the capacity of an Aurora Serverless DB cluster to 8.

```
aws rds modify-current-db-cluster-capacity \  
  --db-cluster-identifier mydbcluster \  
  --target-capacity 8
```

```
--capacity 8
```

Output:

```
{
  "DBClusterIdentifier": "mydbcluster",
  "PendingCapacity": 8,
  "CurrentCapacity": 1,
  "SecondsBeforeTimeout": 300,
  "TimeoutAction": "ForceApplyCapacityChange"
}
```

For more information, see [Scaling Aurora Serverless v1 DB cluster capacity manually](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyCurrentDbClusterCapacity](#) in *AWS CLI Command Reference*.

modify-db-cluster-endpoint

The following code example shows how to use `modify-db-cluster-endpoint`.

AWS CLI

To modify a custom DB cluster endpoint

The following `modify-db-cluster-endpoint` example modifies the specified custom DB cluster endpoint.

```
aws rds modify-db-cluster-endpoint \
  --db-cluster-endpoint-identifier mycustomendpoint \
  --static-members dbinstance1 dbinstance2 dbinstance3
```

Output:

```
{
  "DBClusterEndpointIdentifier": "mycustomendpoint",
  "DBClusterIdentifier": "mydbcluster",
  "DBClusterEndpointResourceIdentifier": "cluster-endpoint-ANPAJ4AE5446DAEXAMPLE",
  "Endpoint": "mycustomendpoint.cluster-custom-cnpxexample.us-east-1.rds.amazonaws.com",
  "Status": "modifying",
  "EndpointType": "CUSTOM",
}
```

```

    "CustomEndpointType": "READER",
    "StaticMembers": [
        "dbinstance1",
        "dbinstance2",
        "dbinstance3"
    ],
    "ExcludedMembers": [],
    "DBClusterEndpointArn": "arn:aws:rds:us-east-1:123456789012:cluster-
endpoint:mycustomendpoint"
}

```

For more information, see [Amazon Aurora Connection Management](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbClusterEndpoint](#) in *AWS CLI Command Reference*.

modify-db-cluster-parameter-group

The following code example shows how to use `modify-db-cluster-parameter-group`.

AWS CLI

To modify parameters in a DB cluster parameter group

The following `modify-db-cluster-parameter-group` example modifies the values of parameters in a DB cluster parameter group.

```

aws rds modify-db-cluster-parameter-group \
  --db-cluster-parameter-group-name mydbclusterpg \
  --parameters
  "ParameterName=server_audit_logging,ParameterValue=1,ApplyMethod=immediate" \
  "ParameterName=server_audit_logs_upload,ParameterValue=1,ApplyMethod=immediate"

```

Output:

```

{
  "DBClusterParameterGroupName": "mydbclusterpg"
}

```

For more information, see [Working with DB parameter groups and DB cluster parameter groups](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

modify-db-cluster-snapshot-attribute

The following code example shows how to use `modify-db-cluster-snapshot-attribute`.

AWS CLI

To modify a DB cluster snapshot attribute

The following `modify-db-cluster-snapshot-attribute` example makes changes to the specified DB cluster snapshot attribute.

```
aws rds modify-db-cluster-snapshot-attribute \  
  --db-cluster-snapshot-identifier myclustersnapshot \  
  --attribute-name restore \  
  --values-to-add 123456789012
```

Output:

```
{  
  "DBClusterSnapshotAttributesResult": {  
    "DBClusterSnapshotIdentifier": "myclustersnapshot",  
    "DBClusterSnapshotAttributes": [  
      {  
        "AttributeName": "restore",  
        "AttributeValues": [  
          "123456789012"  
        ]  
      }  
    ]  
  }  
}
```

For more information, see [Restoring from a DB Cluster Snapshot](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbClusterSnapshotAttribute](#) in *AWS CLI Command Reference*.

modify-db-cluster

The following code example shows how to use `modify-db-cluster`.

AWS CLI

Example 1: To modify a DB cluster

The following `modify-db-cluster` example changes the master user password for the DB cluster named `cluster-2` and sets the backup retention period to 14 days. The `--apply-immediately` parameter causes the changes to be made immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-cluster \  
  --db-cluster-identifier cluster-2 \  
  --backup-retention-period 14 \  
  --master-user-password newpassword99 \  
  --apply-immediately
```

Output:

```
{  
  "DBCluster": {  
    "AllocatedStorage": 1,  
    "AvailabilityZones": [  
      "eu-central-1b",  
      "eu-central-1c",  
      "eu-central-1a"  
    ],  
    "BackupRetentionPeriod": 14,  
    "DatabaseName": "",  
    "DBClusterIdentifier": "cluster-2",

        "PromotionTier": 1
      }
    ],
    "VpcSecurityGroups": [
      {
        "VpcSecurityGroupId": "sg-ID",
        "Status": "active"
      }
    ]
  }
}
```

```
    ],  
    ...output omitted...  
  }  
}
```

For more information, see [Controlling access with security groups](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbCluster](#) in *AWS CLI Command Reference*.

modify-db-instance

The following code example shows how to use `modify-db-instance`.

AWS CLI

Example 1: To modify a DB instance

The following `modify-db-instance` example associates an option group and a parameter group with a compatible Microsoft SQL Server DB instance. The `--apply-immediately` parameter causes the option and parameter groups to be associated immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-instance \  
  --db-instance-identifier database-2 \  
  --option-group-name test-se-2017 \  
  --db-parameter-group-name test-sqlserver-se-2017 \  
  --apply-immediately
```

Output:

```
{  
  "DBInstance": {  
    "DBInstanceIdentifier": "database-2",  
    "DBInstanceClass": "db.r4.large",  
    "Engine": "sqlserver-se",  
    "DBInstanceStatus": "available",  
  
    ...output omitted...  
  
    "DBParameterGroups": [  

```

```

        {
            "DBParameterGroupName": "test-sqlserver-se-2017",
            "ParameterApplyStatus": "applying"
        }
    ],
    "AvailabilityZone": "us-west-2d",

    ...output omitted...

    "MultiAZ": true,
    "EngineVersion": "14.00.3281.6.v1",
    "AutoMinorVersionUpgrade": false,
    "ReadReplicaDBInstanceIdentifiers": [],
    "LicenseModel": "license-included",
    "OptionGroupMemberships": [
        {
            "OptionGroupName": "test-se-2017",
            "Status": "pending-apply"
        }
    ],
    "CharacterSetName": "SQL_Latin1_General_CP1_CI_AS",
    "SecondaryAvailabilityZone": "us-west-2c",
    "PubliclyAccessible": true,
    "StorageType": "gp2",

    ...output omitted...

    "DeletionProtection": false,
    "AssociatedRoles": [],
    "MaxAllocatedStorage": 1000
}
}

```

For more information, see [Modifying an Amazon RDS DB Instance](#) in the *Amazon RDS User Guide*.

Example 2: To associate VPC security group with a DB instance

The following `modify-db-instance` example associates a specific VPC security group and removes DB security groups from a DB instance:

```

aws rds modify-db-instance \
    --db-instance-identifier dbName \

```

```
--vpc-security-group-ids sg-ID
```

Output:

```
{
  "DBInstance": {
    "DBInstanceIdentifier": "dbName",
    "DBInstanceClass": "db.t3.micro",
    "Engine": "mysql",
    "DBInstanceStatus": "available",
    "MasterUsername": "admin",
    "Endpoint": {
      "Address": "dbName.abcdefghijkl.us-west-2.rds.amazonaws.com",
      "Port": 3306,
      "HostedZoneId": "ABCDEFGHIJK1234"
    },
    "AllocatedStorage": 20,
    "InstanceCreateTime": "2024-02-15T00:37:58.793000+00:00",
    "PreferredBackupWindow": "11:57-12:27",
    "BackupRetentionPeriod": 7,
    "DBSecurityGroups": [],
    "VpcSecurityGroups": [
      {
        "VpcSecurityGroupId": "sg-ID",
        "Status": "active"
      }
    ],
    ... output omitted ...
    "MultiAZ": false,
    "EngineVersion": "8.0.35",
    "AutoMinorVersionUpgrade": true,
    "ReadReplicaDBInstanceIdentifiers": [],
    "LicenseModel": "general-public-license",
    ... output omitted ...
  }
}
```

For more information, see [Controlling access with security groups](#) in the *Amazon RDS User Guide*.

- For API details, see [ModifyDBInstance](#) in *AWS CLI Command Reference*.

modify-db-parameter-group

The following code example shows how to use `modify-db-parameter-group`.

AWS CLI

To modify a DB parameter group

The following `modify-db-parameter-group` example changes the value of the `clr` enabled parameter in a DB parameter group. The `--apply-immediately` parameter causes the DB parameter group to be modified immediately, instead of waiting until the next maintenance window.

```
aws rds modify-db-parameter-group \  
  --db-parameter-group-name test-sqlserver-se-2017 \  
  --parameters "ParameterName='clr  
enabled',ParameterValue=1,ApplyMethod=immediate"
```

Output:

```
{  
  "DBParameterGroupName": "test-sqlserver-se-2017"  
}
```

For more information, see [Modifying Parameters in a DB Parameter Group](#) in the *Amazon RDS User Guide*.

- For API details, see [ModifyDBParameterGroup](#) in *AWS CLI Command Reference*.

modify-db-proxy-endpoint

The following code example shows how to use `modify-db-proxy-endpoint`.

AWS CLI

To modify a DB proxy endpoint for an RDS database

The following `modify-db-proxy-endpoint` example modifies a DB proxy endpoint `proxyEndpoint` to set the read-timeout to 65 seconds.

```
aws rds modify-db-proxy-endpoint \  
  --db-proxy-endpoint-name proxyEndpoint \  
  --read-timeout-seconds 65
```

```
--cli-read-timeout 65
```

Output:

```
{
  "DBProxyEndpoint":
    {
      "DBProxyEndpointName": "proxyEndpoint",
      "DBProxyEndpointArn": "arn:aws:rds:us-east-1:123456789012:db-proxy-
endpoint:prx-endpoint-0123a01b12345c0ab",
      "DBProxyName": "proxyExample",
      "Status": "available",
      "VpcId": "vpc-1234567",
      "VpcSecurityGroupIds": [
        "sg-1234"
      ],
      "VpcSubnetIds": [
        "subnetgroup1",
        "subnetgroup2"
      ],
      "Endpoint": "proxyEndpoint.endpoint.proxyExample-ab0cd1efghij.us-
east-1.rds.amazonaws.com",
      "CreateDate": "2023-04-05T16:09:33.452000+00:00",
      "TargetRole": "READ_WRITE",
      "IsDefault": "false"
    }
}
```

For more information, see [Modifying a proxy endpoint](#) in the *Amazon RDS User Guide* and [Modifying a proxy endpoint](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbProxyEndpoint](#) in *AWS CLI Command Reference*.

modify-db-proxy-target-group

The following code example shows how to use `modify-db-proxy-target-group`.

AWS CLI

To modify a DB proxy endpoints

The following `modify-db-proxy-target-group` example modifies a DB proxy target group to set the maximum connections to 80 percent and maximum idle connections to 10 percent.

```
aws rds modify-db-proxy-target-group \  
  --target-group-name default \  
  --db-proxy-name proxyExample \  
  --connection-pool-config MaxConnectionsPercent=80,MaxIdleConnectionsPercent=10
```

Output:

```
{  
  "DBProxyTargetGroup":  
    {  
      "DBProxyName": "proxyExample",  
      "TargetGroupName": "default",  
      "TargetGroupArn": "arn:aws:rds:us-east-1:123456789012:target-group:prx-  
tg-0123a01b12345c0ab",  
      "IsDefault": true,  
      "Status": "available",  
      "ConnectionPoolConfig": {  
        "MaxConnectionsPercent": 80,  
        "MaxIdleConnectionsPercent": 10,  
        "ConnectionBorrowTimeout": 120,  
        "SessionPinningFilters": []  
      },  
      "CreateDate": "2023-05-02T18:41:19.495000+00:00",  
      "UpdateDate": "2023-05-02T18:41:21.762000+00:00"  
    }  
}
```

For more information, see [Modifying an RDS Proxy](#) in the *Amazon RDS User Guide* and [Modifying an RDS Proxy](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbProxyTargetGroup](#) in *AWS CLI Command Reference*.

modify-db-proxy

The following code example shows how to use `modify-db-proxy`.

AWS CLI

To modify a DB proxy for an RDS database

The following `modify-db-proxy` example modifies a DB proxy named `proxyExample` to require SSL for its connections.

```
aws rds modify-db-proxy \  
  --db-proxy-name proxyExample \  
  --require-tls
```

Output:

```
{  
  "DBProxy":  
    {  
      "DBProxyName": "proxyExample",  
      "DBProxyArn": "arn:aws:rds:us-east-1:123456789012:db-  
proxy:prx-0123a01b12345c0ab",  
      "Status": "modifying"  
      "EngineFamily": "PostgreSQL",  
      "VpcId": "sg-1234567",  
      "VpcSecurityGroupIds": [  
        "sg-1234"  
      ],  
      "VpcSubnetIds": [  
        "subnetgroup1",  
        "subnetgroup2"  
      ],  
      "Auth": "[  
        {  
          "Description": "proxydescription1",  
          "AuthScheme": "SECRETS",  
          "SecretArn": "arn:aws:secretsmanager:us-  
west-2:123456789123:secret:proxysecret1-Abcd1e",  
          "IAMAuth": "DISABLED"  
        }  
      ]",  
      "RoleArn": "arn:aws:iam::12345678912:role/ProxyPostgreSQLRole",  
      "Endpoint": "proxyExample.proxy-ab0cd1efghij.us-east-1.rds.amazonaws.com",  
      "RequireTLS": true,  
      "IdleClientTimeout": 1800,  
      "DebuggingLogging": false,  
      "CreateDate": "2023-04-05T16:09:33.452000+00:00",  
      "UpdatedDate": "2023-04-13T01:49:38.568000+00:00"  
    }  
}
```

For more information, see [Modify an RDS Proxy](#) in the *Amazon RDS User Guide* and [Creating an RDS Proxy](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbProxy](#) in *AWS CLI Command Reference*.

modify-db-shard-group

The following code example shows how to use `modify-db-shard-group`.

AWS CLI

Example 1: To modify a DB shard group

The following `modify-db-shard-group` example changes the maximum capacity of a DB shard group.

```
aws rds modify-db-shard-group \  
  --db-shard-group-identifier my-db-shard-group \  
  --max-acu 1000
```

Output:

```
{  
  "DBShardGroups": [  
    {  
      "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",  
      "DBShardGroupIdentifier": "my-db-shard-group",  
      "DBClusterIdentifier": "my-sv2-cluster",  
      "MaxACU": 768.0,  
      "ComputeRedundancy": 0,  
      "Status": "available",  
      "PubliclyAccessible": false,  
      "Endpoint": "my-sv2-cluster.limitless-cekyceexample.us-  
east-2.rds.amazonaws.com"  
    }  
  ]  
}
```

For more information, see [Amazon Aurora DB Clusters](#) in the *Amazon Aurora User Guide*.

Example 2: To describe your DB shard groups

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups after you run the `modify-db-shard-group` command. The maximum capacity of the DB shard group `my-db-shard-group` is now 1000 Aurora capacity units (ACUs).

```
aws rds describe-db-shard-groups
```

Output:

```
{
  "DBShardGroups": [
    {
      "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
      "DBShardGroupIdentifier": "limitless-test-shard-grp",
      "DBClusterIdentifier": "limitless-test-cluster",
      "MaxACU": 768.0,
      "ComputeRedundancy": 0,
      "Status": "available",
      "PubliclyAccessible": true,
      "Endpoint": "limitless-test-cluster.limitless-cekycexample.us-east-2.rds.amazonaws.com"
    },
    {
      "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
      "DBShardGroupIdentifier": "my-db-shard-group",
      "DBClusterIdentifier": "my-sv2-cluster",
      "MaxACU": 1000.0,
      "ComputeRedundancy": 0,
      "Status": "available",
      "PubliclyAccessible": false,
      "Endpoint": "my-sv2-cluster.limitless-cekycexample.us-east-2.rds.amazonaws.com"
    }
  ]
}
```

For more information, see [Amazon Aurora DB Clusters](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyDbShardGroup](#) in *AWS CLI Command Reference*.

modify-db-snapshot-attribute

The following code example shows how to use `modify-db-snapshot-attribute`.

AWS CLI

Example 1: To enable two AWS accounts to restore a DB snapshot

The following `modify-db-snapshot-attribute` example grants permission to two AWS accounts, with the identifiers 111122223333 and 444455556666, to restore the DB snapshot named `mydbsnapshot`.

```
aws rds modify-db-snapshot-attribute \  
  --db-snapshot-identifier mydbsnapshot \  
  --attribute-name restore \  
  --values-to-add {"111122223333","444455556666"}
```

Output:

```
{  
  "DBSnapshotAttributesResult": {  
    "DBSnapshotIdentifier": "mydbsnapshot",  
    "DBSnapshotAttributes": [  
      {  
        "AttributeName": "restore",  
        "AttributeValues": [  
          "111122223333",  
          "444455556666"  
        ]  
      }  
    ]  
  }  
}
```

For more information, see [Sharing a Snapshot](#) in the *Amazon RDS User Guide*.

Example 2: To prevent an AWS account from restoring a DB snapshot

The following `modify-db-snapshot-attribute` example removes permission from a particular AWS account to restore the DB snapshot named `mydbsnapshot`. When specifying a single account, the account identifier can't be surrounded by quotations marks or braces.

```
aws rds modify-db-snapshot-attribute \  
  --db-snapshot-identifier mydbsnapshot \  
  --attribute-name restore \  
  --values-to-remove 444455556666
```

Output:

```
{
  "DBSnapshotAttributesResult": {
    "DBSnapshotIdentifier": "mydbsnapshot",
    "DBSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AttributeValues": [
          "111122223333"
        ]
      }
    ]
  }
}
```

For more information, see [Sharing a Snapshot](#) in the *Amazon RDS User Guide*.

- For API details, see [ModifyDbSnapshotAttribute](#) in *AWS CLI Command Reference*.

modify-db-snapshot-attributes

The following code example shows how to use `modify-db-snapshot-attributes`.

AWS CLI**To modify a DB snapshot attribute**

The following `modify-db-snapshot-attribute` example permits two AWS account identifiers, 111122223333 and 444455556666, to restore the DB snapshot named `mydbsnapshot`.

```
aws rds modify-db-snapshot-attribute \
  --db-snapshot-identifier mydbsnapshot \
  --attribute-name restore \
  --values-to-add ["111122223333","444455556666"]'
```

Output:

```
{
  "DBSnapshotAttributesResult": {
    "DBSnapshotIdentifier": "mydbsnapshot",
```

```
    "DBSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AttributeValues": [
          "111122223333",
          "444455556666"
        ]
      }
    ]
  }
}
```

For more information, see [Sharing a Snapshot](#) in the *Amazon RDS User Guide*.

- For API details, see [ModifyDbSnapshotAttributes](#) in *AWS CLI Command Reference*.

modify-db-snapshot

The following code example shows how to use `modify-db-snapshot`.

AWS CLI

To modify a DB snapshot

The following `modify-db-snapshot` example upgrades a PostgreSQL 10.6 snapshot named `db5-snapshot-upg-test` to PostgreSQL 11.7. The new DB engine version is shown after the snapshot has finished upgrading and its status is **available**.

```
aws rds modify-db-snapshot \  
  --db-snapshot-identifier db5-snapshot-upg-test \  
  --engine-version 11.7
```

Output:

```
{  
  "DBSnapshot": {  
    "DBSnapshotIdentifier": "db5-snapshot-upg-test",  
    "DBInstanceIdentifier": "database-5",  
    "SnapshotCreateTime": "2020-03-27T20:49:17.092Z",  
    "Engine": "postgres",  
    "AllocatedStorage": 20,  
    "Status": "upgrading",  
    "Port": 5432,
```

```

    "AvailabilityZone": "us-west-2a",
    "VpcId": "vpc-2ff27557",
    "InstanceCreateTime": "2020-03-27T19:59:04.735Z",
    "MasterUsername": "postgres",
    "EngineVersion": "10.6",
    "LicenseModel": "postgresql-license",
    "SnapshotType": "manual",
    "OptionGroupName": "default:postgres-11",
    "PercentProgress": 100,
    "StorageType": "gp2",
    "Encrypted": false,
    "DBSnapshotArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-
upg-test",
    "IAMDatabaseAuthenticationEnabled": false,
    "ProcessorFeatures": [],
    "DbiResourceId": "db-GJMF75LM42IL6BTFRE4UZJ5YM4"
  }
}

```

For more information, see [Upgrading a PostgreSQL DB Snapshot](#) in the *Amazon RDS User Guide*.

- For API details, see [ModifyDbSnapshot](#) in *AWS CLI Command Reference*.

modify-db-subnet-group

The following code example shows how to use `modify-db-subnet-group`.

AWS CLI

To modify a DB subnet group

The following `modify-db-subnet-group` example adds a subnet with the ID `subnet-08e41f9e230222222` to the DB subnet group named `mysubnetgroup`. To keep the existing subnets in the subnet group, include their IDs as values in the `--subnet-ids` option. Make sure to have subnets with at least two different Availability Zones in the DB subnet group.

```

aws rds modify-db-subnet-group \
  --db-subnet-group-name mysubnetgroup \
  --subnet-ids
  ["subnet-0a1dc4e1a6f123456", "subnet-070dd7ecb3aaaaaaaa", "subnet-00f5b198bc0abcdef", "subnet-

```

Output:

```
{
  "DBSubnetGroup": {
    "DBSubnetGroupName": "mysubnetgroup",
    "DBSubnetGroupDescription": "test DB subnet group",
    "VpcId": "vpc-0f08e7610a1b2c3d4",
    "SubnetGroupStatus": "Complete",
    "Subnets": [
      {
        "SubnetIdentifier": "subnet-08e41f9e230222222",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2a"
        },
        "SubnetStatus": "Active"
      },
      {
        "SubnetIdentifier": "subnet-070dd7ecb3aaaaaaaa",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2b"
        },
        "SubnetStatus": "Active"
      },
      {
        "SubnetIdentifier": "subnet-00f5b198bc0abcdef",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2d"
        },
        "SubnetStatus": "Active"
      },
      {
        "SubnetIdentifier": "subnet-0a1dc4e1a6f123456",
        "SubnetAvailabilityZone": {
          "Name": "us-west-2b"
        },
        "SubnetStatus": "Active"
      }
    ],
    "DBSubnetGroupArn": "arn:aws:rds:us-west-2:534026745191:subgrp:mysubnetgroup"
  }
}
```

For more information, see [Step 3: Create a DB Subnet Group](#) in the *Amazon RDS User Guide*.

- For API details, see [ModifyDbSubnetGroup](#) in *AWS CLI Command Reference*.

modify-event-subscription

The following code example shows how to use `modify-event-subscription`.

AWS CLI

To modify an event subscription

The following `modify-event-subscription` example disables the specified event subscription, so that it no longer publishes notifications to the specified Amazon Simple Notification Service topic.

```
aws rds modify-event-subscription \  
  --subscription-name my-instance-events \  
  --no-enabled
```

Output:

```
{  
  "EventSubscription": {  
    "EventCategoriesList": [  
      "backup",  
      "recovery"  
    ],  
    "CustomerAwsId": "123456789012",  
    "SourceType": "db-instance",  
    "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",  
    "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-  
events",  
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",  
    "CustSubscriptionId": "my-instance-events",  
    "Status": "modifying",  
    "Enabled": false  
  }  
}
```

- For API details, see [ModifyEventSubscription](#) in *AWS CLI Command Reference*.

modify-global-cluster

The following code example shows how to use `modify-global-cluster`.

AWS CLI

To modify a global DB cluster

The following `modify-global-cluster` example enables deletion protection for an Aurora MySQL-compatible global DB cluster.

```
aws rds modify-global-cluster \  
  --global-cluster-identifier myglobalcluster \  
  --deletion-protection
```

Output:

```
{  
  "GlobalCluster": {  
    "GlobalClusterIdentifier": "myglobalcluster",  
    "GlobalClusterResourceId": "cluster-f0e523bfe07aabb",  
    "GlobalClusterArn": "arn:aws:rds::123456789012:global-  
cluster:myglobalcluster",  
    "Status": "available",  
    "Engine": "aurora-mysql",  
    "EngineVersion": "5.7.mysql_aurora.2.07.2",  
    "StorageEncrypted": false,  
    "DeletionProtection": true,  
    "GlobalClusterMembers": []  
  }  
}
```

For more information, see [Managing an Aurora global database](#) in the *Amazon Aurora User Guide*.

- For API details, see [ModifyGlobalCluster](#) in *AWS CLI Command Reference*.

promote-read-replica-db-cluster

The following code example shows how to use `promote-read-replica-db-cluster`.

AWS CLI

To promote a DB cluster read replica

The following `promote-read-replica-db-cluster` example promotes the specified read replica to become a standalone DB cluster.

```
aws rds promote-read-replica-db-cluster \  
  --db-cluster-identifier mydbcluster-1
```

Output:

```
{  
  "DBCluster": {  
    "AllocatedStorage": 1,  
    "AvailabilityZones": [  
      "us-east-1a",  
      "us-east-1b",  
      "us-east-1c"  
    ],  
    "BackupRetentionPeriod": 1,  
    "DatabaseName": "",  
    "DBClusterIdentifier": "mydbcluster-1",  
    "...some output truncated..."  
  }  
}
```

For more information, see [Promoting a read replica to be a DB cluster](#) in the *Amazon Aurora User Guide*.

- For API details, see [PromoteReadReplicaDbCluster](#) in *AWS CLI Command Reference*.

promote-read-replica

The following code example shows how to use `promote-read-replica`.

AWS CLI

To promote a read replica

The following `promote-read-replica` example promotes the specified read replica to become a standalone DB instance.

```
aws rds promote-read-replica \  
  --db-instance-identifier test-instance-repl
```

Output:

```
{  
  "DBInstance": {  
    "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:test-instance-repl",  
    "StorageType": "standard",  
    "ReadReplicaSourceDBInstanceIdentifier": "test-instance",  
    "DBInstanceStatus": "modifying",  
    ...some output truncated...  
  }  
}
```

- For API details, see [PromoteReadReplica](#) in *AWS CLI Command Reference*.

purchase-reserved-db-instance

The following code example shows how to use `purchase-reserved-db-instance`.

AWS CLI

To purchase a reserved DB instance offering

The following `purchase-reserved-db-instances-offering` example purchases a reserved DB instance offering. The `reserved-db-instances-offering-id` must be a valid offering ID, as returned by the `describe-reserved-db-instances-offering` command.

```
aws rds purchase-reserved-db-instances-offering --reserved-db-instances-offering-id  
438012d3-4a52-4cc7-b2e3-8dff72e0e706
```

- For API details, see [PurchaseReservedDbInstance](#) in *AWS CLI Command Reference*.

purchase-reserved-db-instances-offerings

The following code example shows how to use `purchase-reserved-db-instances-offerings`.

AWS CLI

Example 1: To find a reserved DB instance to purchase

The following `describe-reserved-db-instances-offerings` example lists the available reserved MySQL DB instances with the `db.t2.micro` instance class and a duration of one year. The offering ID is required for purchasing a reserved DB instance.

```
aws rds describe-reserved-db-instances-offerings \  
  --product-description mysql \  
  --db-instance-class db.t2.micro \  
  --duration 1
```

Output:

```
{  
  "ReservedDBInstancesOfferings": [  
    {  
      "ReservedDBInstancesOfferingId": "8ba30be1-b9ec-447f-8f23-6114e3f4c7b4",  
      "DBInstanceClass": "db.t2.micro",  
      "Duration": 31536000,  
      "FixedPrice": 51.0,  
      "UsagePrice": 0.0,  
      "CurrencyCode": "USD",  
      "ProductDescription": "mysql",  
      "OfferingType": "Partial Upfront",  
      "MultiAZ": false,  
      "RecurringCharges": [  
        {  
          "RecurringChargeAmount": 0.006,  
          "RecurringChargeFrequency": "Hourly"  
        }  
      ]  
    },  
    ... some output truncated ...  
  ]  
}
```

For more information, see [Reserved DB Instances for Amazon RDS](#) in the *Amazon RDS User Guide*.

Example 2: To purchase a reserved DB instance

The following `purchase-reserved-db-instances-offering` example shows how to buy the reserved DB instance offering from the previous example.

```
aws rds purchase-reserved-db-instances-offering --reserved-db-instances-offering-id
8ba30be1-b9ec-447f-8f23-6114e3f4c7b4
```

Output:

```
{
  "ReservedDBInstance": {
    "ReservedDBInstanceId": "ri-2020-06-29-16-54-57-670",
    "ReservedDBInstancesOfferingId": "8ba30be1-b9ec-447f-8f23-6114e3f4c7b4",
    "DBInstanceClass": "db.t2.micro",
    "StartTime": "2020-06-29T16:54:57.670Z",
    "Duration": 31536000,
    "FixedPrice": 51.0,
    "UsagePrice": 0.0,
    "CurrencyCode": "USD",
    "DBInstanceCount": 1,
    "ProductDescription": "mysql",
    "OfferingType": "Partial Upfront",
    "MultiAZ": false,
    "State": "payment-pending",
    "RecurringCharges": [
      {
        "RecurringChargeAmount": 0.006,
        "RecurringChargeFrequency": "Hourly"
      }
    ],
    "ReservedDBInstanceArn": "arn:aws:rds:us-
west-2:123456789012:ri:ri-2020-06-29-16-54-57-670"
  }
}
```

For more information, see [Reserved DB Instances for Amazon RDS](#) in the *Amazon RDS User Guide*.

- For API details, see [PurchaseReservedDbInstancesOfferings](#) in *AWS CLI Command Reference*.

reboot-db-instance

The following code example shows how to use `reboot-db-instance`.

AWS CLI

To reboot a DB instance

The following `reboot-db-instance` example starts a reboot of the specified DB instance.

```
aws rds reboot-db-instance \  
  --db-instance-identifier test-mysql-instance
```

Output:

```
{  
  "DBInstance": {  
    "DBInstanceIdentifier": "test-mysql-instance",  
    "DBInstanceClass": "db.t3.micro",  
    "Engine": "mysql",  
    "DBInstanceStatus": "rebooting",  
    "MasterUsername": "admin",  
    "Endpoint": {  
      "Address": "test-mysql-instance.#####.us-  
west-2.rds.amazonaws.com",  
      "Port": 3306,  
      "HostedZoneId": "Z1PVIF0EXAMPLE"  
    },  
    ... output omitted...  
  }  
}
```

For more information, see [Rebooting a DB Instance](#) in the *Amazon RDS User Guide*.

- For API details, see [RebootDBInstance](#) in *AWS CLI Command Reference*.

reboot-db-shard-group

The following code example shows how to use `reboot-db-shard-group`.

AWS CLI

Example 1: To reboot a DB shard group

The following `reboot-db-shard-group` example reboots a DB shard group.

```
aws rds reboot-db-shard-group \  
  --db-shard-group-identifier test-mysql-instance
```

```
--db-shard-group-identifier my-db-shard-group
```

Output:

```
{
  "DBShardGroups": [
    {
      "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
      "DBShardGroupIdentifier": "my-db-shard-group",
      "DBClusterIdentifier": "my-sv2-cluster",
      "MaxACU": 1000.0,
      "ComputeRedundancy": 0,
      "Status": "available",
      "PubliclyAccessible": false,
      "Endpoint": "my-sv2-cluster.limitless-cekyceexample.us-east-2.rds.amazonaws.com"
    }
  ]
}
```

For more information, see [Rebooting an Amazon Aurora DB cluster or Amazon Aurora DB instance](#) in the *Amazon Aurora User Guide*.

Example 2: To describe your DB shard groups

The following `describe-db-shard-groups` example retrieves the details of your DB shard groups after you run the `reboot-db-shard-group` command. The DB shard group `my-db-shard-group` is now rebooting.

```
aws rds describe-db-shard-groups
```

Output:

```
{
  "DBShardGroups": [
    {
      "DBShardGroupResourceId": "shardgroup-7bb446329da94788b3f957746example",
      "DBShardGroupIdentifier": "limitless-test-shard-grp",
      "DBClusterIdentifier": "limitless-test-cluster",
      "MaxACU": 768.0,
      "ComputeRedundancy": 0,

```

```

        "Status": "available",
        "PubliclyAccessible": true,
        "Endpoint": "limitless-test-cluster.limitless-cekyceexample.us-
east-2.rds.amazonaws.com"
    },
    {
        "DBShardGroupResourceId": "shardgroup-a6e3a0226aa243e2ac6c7a1234567890",
        "DBShardGroupIdentifier": "my-db-shard-group",
        "DBClusterIdentifier": "my-sv2-cluster",
        "MaxACU": 1000.0,
        "ComputeRedundancy": 0,
        "Status": "rebooting",
        "PubliclyAccessible": false,
        "Endpoint": "my-sv2-cluster.limitless-cekyceexample.us-
east-2.rds.amazonaws.com"
    }
]
}

```

For more information, see [Rebooting an Amazon Aurora DB cluster or Amazon Aurora DB instance](#) in the *Amazon Aurora User Guide*.

- For API details, see [RebootDbShardGroup](#) in *AWS CLI Command Reference*.

register-db-proxy-targets

The following code example shows how to use `register-db-proxy-targets`.

AWS CLI

To register a DB proxy with a database

The following `register-db-proxy-targets` example creates the association between a database and a proxy.

```

aws rds register-db-proxy-targets \
  --db-proxy-name proxyExample \
  --db-cluster-identifiers database-5

```

Output:

```
{
```

```
"DBProxyTargets": [  
  {  
    "RdsResourceId": "database-5",  
    "Port": 3306,  
    "Type": "TRACKED_CLUSTER",  
    "TargetHealth": {  
      "State": "REGISTERING"  
    }  
  },  
  {  
    "Endpoint": "database-5instance-1.ab0cd1efghij.us-  
east-1.rds.amazonaws.com",  
    "RdsResourceId": "database-5",  
    "Port": 3306,  
    "Type": "RDS_INSTANCE",  
    "TargetHealth": {  
      "State": "REGISTERING"  
    }  
  }  
]  
}
```

For more information, see [Creating an RDS proxy](#) in the *Amazon RDS User Guide* and [Creating an RDS proxy](#) in the *Amazon Aurora User Guide*.

- For API details, see [RegisterDbProxyTargets](#) in *AWS CLI Command Reference*.

remove-from-global-cluster

The following code example shows how to use `remove-from-global-cluster`.

AWS CLI

To detach an Aurora secondary cluster from an Aurora global database cluster

The following `remove-from-global-cluster` example detaches an Aurora secondary cluster from an Aurora global database cluster. The cluster changes from being read-only to a standalone cluster with read-write capability.

```
aws rds remove-from-global-cluster \  
  --region us-west-2 \  
  --global-cluster-identifier myglobalcluster \  
  --secondary-cluster-identifier mysecondarycluster
```

```
--db-cluster-identifier arn:aws:rds:us-west-2:123456789012:cluster:DB-1
```

Output:

```
{
  "GlobalCluster": {
    "GlobalClusterIdentifier": "myglobalcluster",
    "GlobalClusterResourceId": "cluster-abc123def456gh",
    "GlobalClusterArn": "arn:aws:rds::123456789012:global-
cluster:myglobalcluster",
    "Status": "available",
    "Engine": "aurora-postgresql",
    "EngineVersion": "10.11",
    "StorageEncrypted": true,
    "DeletionProtection": false,
    "GlobalClusterMembers": [
      {
        "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:js-
global-cluster",
        "Readers": [
          "arn:aws:rds:us-west-2:123456789012:cluster:DB-1"
        ],
        "IsWriter": true
      },
      {
        "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:DB-1",
        "Readers": [],
        "IsWriter": false,
        "GlobalWriteForwardingStatus": "disabled"
      }
    ]
  }
}
```

For more information, see [Removing a cluster from an Amazon Aurora global database](#) in the *Amazon Aurora User Guide*.

- For API details, see [RemoveFromGlobalCluster](#) in *AWS CLI Command Reference*.

remove-option-from-option-group

The following code example shows how to use `remove-option-from-option-group`.

AWS CLI

To delete an option from an option group

The following `remove-option-from-option-group` example removes the OEM option from `myoptiongroup`.

```
aws rds remove-option-from-option-group \  
  --option-group-name myoptiongroup \  
  --options OEM \  
  --apply-immediately
```

Output:

```
{  
  "OptionGroup": {  
    "OptionGroupName": "myoptiongroup",  
    "OptionGroupDescription": "Test",  
    "EngineName": "oracle-ee",  
    "MajorEngineVersion": "19",  
    "Options": [],  
    "AllowsVpcAndNonVpcInstanceMemberships": true,  
    "OptionGroupArn": "arn:aws:rds:us-east-1:123456789012:og:myoptiongroup"  
  }  
}
```

For more information, see [Removing an Option from an Option Group](#) in the *Amazon Aurora User Guide*.

- For API details, see [RemoveOptionFromOptionGroup](#) in *AWS CLI Command Reference*.

remove-role-from-db-cluster

The following code example shows how to use `remove-role-from-db-cluster`.

AWS CLI

To disassociate an AWS Identity and Access Management (IAM) role from a DB cluster

The following `remove-role-from-db-cluster` example removes a role from a DB cluster.

```
aws rds remove-role-from-db-cluster \  
  \
```

```
--db-cluster-identifier mydbcluster \  
--role-arn arn:aws:iam::123456789012:role/RDSLoadFromS3
```

This command produces no output.

For more information, see [Associating an IAM role with an Amazon Aurora MySQL DB cluster](#) in the *Amazon Aurora User Guide*.

- For API details, see [RemoveRoleFromDbCluster](#) in *AWS CLI Command Reference*.

remove-role-from-db-instance

The following code example shows how to use `remove-role-from-db-instance`.

AWS CLI

To disassociate an AWS Identity and Access Management (IAM) role from a DB instance

The following `remove-role-from-db-instance` example removes the role named `rds-s3-integration-role` from an Oracle DB instance named `test-instance`.

```
aws rds remove-role-from-db-instance \  
  --db-instance-identifier test-instance \  
  --feature-name S3_INTEGRATION \  
  --role-arn arn:aws:iam::111122223333:role/rds-s3-integration-role
```

This command produces no output.

For more information, see [Disabling RDS SQL Server Integration with S3](#) in the *Amazon RDS User Guide*.

- For API details, see [RemoveRoleFromDbInstance](#) in *AWS CLI Command Reference*.

remove-source-identifier-from-subscription

The following code example shows how to use `remove-source-identifier-from-subscription`.

AWS CLI

To remove a source identifier from a subscription

The following `remove-source-identifier` example removes the specified source identifier from an existing subscription.

```
aws rds remove-source-identifier-from-subscription \  
  --subscription-name my-instance-events \  
  --source-identifier test-instance-repl
```

Output:

```
{  
  "EventSubscription": {  
    "EventSubscriptionArn": "arn:aws:rds:us-east-1:123456789012:es:my-instance-  
events",  
    "SubscriptionCreationTime": "Tue Jul 31 23:22:01 UTC 2018",  
    "EventCategoriesList": [  
      "backup",  
      "recovery"  
    ],  
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:interesting-events",  
    "Status": "modifying",  
    "CustSubscriptionId": "my-instance-events",  
    "CustomerAwsId": "123456789012",  
    "SourceIdsList": [  
      "test-instance"  
    ],  
    "SourceType": "db-instance",  
    "Enabled": false  
  }  
}
```

- For API details, see [RemoveSourceIdentifierFromSubscription](#) in *AWS CLI Command Reference*.

remove-tags-from-resource

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI

To remove tags from a resource

The following `remove-tags-from-resource` example removes tags from a resource.

```
aws rds remove-tags-from-resource \  
  --resource-name arn:aws:rds:us-east-1:123456789012:db:mydbinstance \  
  --tag-keys Name Environment
```

This command produces no output.

For more information, see [Tagging Amazon RDS resources](#) in the *Amazon RDS User Guide* and [Tagging Amazon RDS resources](#) in the *Amazon Aurora User Guide*.

- For API details, see [RemoveTagsFromResource](#) in *AWS CLI Command Reference*.

reset-db-cluster-parameter-group

The following code example shows how to use `reset-db-cluster-parameter-group`.

AWS CLI

Example 1: To reset all parameters to their default values

The following `reset-db-cluster-parameter-group` example resets all parameter values in a customer-created DB cluster parameter group to their default values.

```
aws rds reset-db-cluster-parameter-group \  
  --db-cluster-parameter-group-name mydbclpg \  
  --reset-all-parameters
```

Output:

```
{  
  "DBClusterParameterGroupName": "mydbclpg"  
}
```

For more information, see [Working with DB parameter groups and DB cluster parameter groups](#) in the *Amazon Aurora User Guide*.

Example 2: To reset specific parameters to their default values

The following `reset-db-cluster-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB cluster parameter group.

```
aws rds reset-db-cluster-parameter-group \  
  --db-cluster-parameter-group-name mydbclpg \  
  --parameter-name myparam
```

```
--db-cluster-parameter-group-name mydbclpgy \  
--parameters "ParameterName=max_connections,ApplyMethod=immediate" \  
             "ParameterName=max_allowed_packet,ApplyMethod=immediate"
```

Output:

```
{  
  "DBClusterParameterGroupName": "mydbclpg"  
}
```

For more information, see [Working with DB parameter groups and DB cluster parameter groups](#) in the *Amazon Aurora User Guide*.

- For API details, see [ResetDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

reset-db-parameter-group

The following code example shows how to use `reset-db-parameter-group`.

AWS CLI

Example 1: To reset all parameters to their default values

The following `reset-db-parameter-group` example resets all parameter values in a customer-created DB parameter group to their default values.

```
aws rds reset-db-parameter-group \  
  --db-parameter-group-name mypg \  
  --reset-all-parameters
```

Output:

```
{  
  "DBParameterGroupName": "mypg"  
}
```

For more information, see [Working with DB parameter groups](#) in the *Amazon RDS User Guide* and [Working with DB parameter groups and DB cluster parameter groups](#) in the *Amazon Aurora User Guide*.

Example 2: To reset specific parameters to their default values

The following `reset-db-parameter-group` example resets the parameter values for specific parameters to their default values in a customer-created DB parameter group.

```
aws rds reset-db-parameter-group \  
  --db-parameter-group-name mypg \  
  --parameters "ParameterName=max_connections,ApplyMethod=immediate" \  
               "ParameterName=max_allowed_packet,ApplyMethod=immediate"
```

Output:

```
{  
  "DBParameterGroupName": "mypg"  
}
```

For more information, see [Working with DB parameter groups](#) in the *Amazon RDS User Guide* and [Working with DB parameter groups and DB cluster parameter groups](#) in the *Amazon Aurora User Guide*.

- For API details, see [ResetDbParameterGroup](#) in *AWS CLI Command Reference*.

restore-db-cluster-from-s3

The following code example shows how to use `restore-db-cluster-from-s3`.

AWS CLI

To restore an Amazon Aurora DB cluster from Amazon S3

The following `restore-db-cluster-from-s3` example restores an Amazon Aurora MySQL version 5.7-compatible DB cluster from a MySQL 5.7 DB backup file in Amazon S3.

```
aws rds restore-db-cluster-from-s3 \  
  --db-cluster-identifier cluster-s3-restore \  
  --engine aurora-mysql \  
  --master-username admin \  
  --master-user-password mypassword \  
  --s3-bucket-name mybucket \  
  --s3-prefix test-backup \  
  --s3-ingestion-role-arn arn:aws:iam::123456789012:role/service-role/TestBackup \  
  --source-engine mysql \  
  --source-engine-version 5.7.28
```

Output:

```
{
  "DBCluster": {
    "AllocatedStorage": 1,
    "AvailabilityZones": [
      "us-west-2c",
      "us-west-2a",
      "us-west-2b"
    ],

```

For more information, see [Migrating Data from MySQL by Using an Amazon S3 Bucket](#) in the *Amazon Aurora User Guide*.

- For API details, see [RestoreDbClusterFromS3](#) in *AWS CLI Command Reference*.

restore-db-cluster-from-snapshot

The following code example shows how to use `restore-db-cluster-from-snapshot`.

AWS CLI

To restore a DB cluster from a snapshot

The following `restore-db-cluster-from-snapshot` restores an Aurora PostgreSQL DB cluster compatible with PostgreSQL version 10.7 from a DB cluster snapshot named `test-instance-snapshot`.

```
aws rds restore-db-cluster-from-snapshot \  
  --db-cluster-identifier newdbcluster \  
  --snapshot-identifier test-instance-snapshot \  
  --engine aurora-postgresql \  
  --engine-version 10.7
```

Output:

```
{  
  "DBCluster": {  
    "AllocatedStorage": 1,  
    "AvailabilityZones": [  
      "us-west-2c",  
      "us-west-2a",  
      "us-west-2b"  
    ],  
    "BackupRetentionPeriod": 7,  
    "DatabaseName": "",
```

```

    "DBClusterIdentifier": "newdbcluster",
    "DBClusterParameterGroup": "default.aurora-postgresql10",
    "DBSubnetGroup": "default",
    "Status": "creating",
    "Endpoint": "newdbcluster.cluster-#####.us-west-2.rds.amazonaws.com",
    "ReaderEndpoint": "newdbcluster.cluster-ro-#####.us-
west-2.rds.amazonaws.com",

    "HttpEndpointEnabled": false,
    "CopyTagsToSnapshot": false,
    "CrossAccountClone": false,
    "DomainMemberships": []
  }
}

```

For more information, see [Restoring from a DB Cluster Snapshot](#) in the *Amazon Aurora User Guide*.

- For API details, see [RestoreDbClusterFromSnapshot](#) in *AWS CLI Command Reference*.

restore-db-cluster-to-point-in-time

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

AWS CLI

To restore a DB cluster to a specified time

The following `restore-db-cluster-to-point-in-time` example restores the DB cluster named `database-4` to the latest possible time. Using `copy-on-write` as the restore type restores the new DB cluster as a clone of the source DB cluster.

```
aws rds restore-db-cluster-to-point-in-time \  
  --source-db-cluster-identifier database-4 \  
  --db-cluster-identifier sample-cluster-clone \  
  --restore-type copy-on-write \  
  --use-latest-restorable-time
```

Output:

```
{  
  "DBCluster": {  
    "AllocatedStorage": 1,  
    "AvailabilityZones": [  
      "us-west-2c",  
      "us-west-2a",  
      "us-west-2b"  
    ],  
    "BackupRetentionPeriod": 7,  
    "DatabaseName": "",  
    "DBClusterIdentifier": "sample-cluster-clone",  
    "DBClusterParameterGroup": "default.aurora-postgresql10",  
    "DBSubnetGroup": "default",  
    "Status": "creating",  
    "Endpoint": "sample-cluster-clone.cluster-#####.us-  
west-2.rds.amazonaws.com",  
    "ReaderEndpoint": "sample-cluster-clone.cluster-ro-#####.us-  
west-2.rds.amazonaws.com",  
    "MultiAZ": false,  
    "Engine": "aurora-postgresql",  
    "EngineVersion": "10.7",  
    "Port": 5432,
```

```

    "MasterUsername": "postgres",
    "PreferredBackupWindow": "09:33-10:03",
    "PreferredMaintenanceWindow": "sun:12:22-sun:12:52",
    "ReadReplicaIdentifiers": [],
    "DBClusterMembers": [],
    "VpcSecurityGroups": [
      {
        "VpcSecurityGroupId": "sg-#####",
        "Status": "active"
      }
    ],
    "HostedZoneId": "Z1PVIIF0EXAMPLE",
    "StorageEncrypted": true,
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/287364e4-33e3-4755-a3b0-
a1b2c3d4e5f6",
    "DbClusterResourceId": "cluster-BIZ77GDSA2XBSTNPFW1EXAMPLE",
    "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster-
clone",

    "DeletionProtection": false,
    "HttpEndpointEnabled": false,
    "CopyTagsToSnapshot": false,
    "CrossAccountClone": false
  }
}

```

For more information, see [Restoring a DB Cluster to a Specified Time](#) in the *Amazon Aurora User Guide*.

- For API details, see [RestoreDbClusterToPointInTime](#) in *AWS CLI Command Reference*.

restore-db-instance-from-db-snapshot

The following code example shows how to use `restore-db-instance-from-db-snapshot`.

AWS CLI

To restore a DB instance from a DB snapshot

The following `restore-db-instance-from-db-snapshot` example creates a new DB instance named `db7-new-instance` with the `db.t3.small` DB instance class from the specified DB snapshot. The source DB instance from which the snapshot was taken uses a deprecated DB instance class, so you can't upgrade it.

```
aws rds restore-db-instance-from-db-snapshot \  
  --db-instance-identifier db7-new-instance \  
  --db-snapshot-identifier db7-test-snapshot \  
  --db-instance-class db.t3.small
```

Output:

```
{  
  "DBInstance": {  
    "DBInstanceIdentifier": "db7-new-instance",  
    "DBInstanceClass": "db.t3.small",  
    "Engine": "mysql",  
    "DBInstanceStatus": "creating",  
  
    ...output omitted...  
  
    "PreferredMaintenanceWindow": "mon:07:37-mon:08:07",  
    "PendingModifiedValues": {},  
    "MultiAZ": false,  
    "EngineVersion": "5.7.22",  
    "AutoMinorVersionUpgrade": true,  
    "ReadReplicaDBInstanceIdentifiers": [],  
    "LicenseModel": "general-public-license",  
  
    ...output omitted...  
  
    "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:db7-new-instance",  
    "IAMDatabaseAuthenticationEnabled": false,  
    "PerformanceInsightsEnabled": false,  
    "DeletionProtection": false,  
    "AssociatedRoles": []  
  }  
}
```

For more information, see [Restoring from a DB Snapshot](#) in the *Amazon RDS User Guide*.

- For API details, see [RestoreDbInstanceFromDbSnapshot](#) in *AWS CLI Command Reference*.

restore-db-instance-from-s3

The following code example shows how to use `restore-db-instance-from-s3`.

AWS CLI

To restore a DB instance from a backup in Amazon S3

The following `restore-db-instance-from-s3` example creates a new DB instance named `restored-test-instance` from an existing backup in the `my-backups` S3 bucket.

```
aws rds restore-db-instance-from-s3 \  
  --db-instance-identifier restored-test-instance \  
  --allocated-storage 250 --db-instance-class db.m4.large --engine mysql \  
  --master-username master --master-user-password secret99 \  
  --s3-bucket-name my-backups --s3-ingestion-role-arn \  
  arn:aws:iam::123456789012:role/my-role \  
  --source-engine mysql --source-engine-version 5.6.27
```

- For API details, see [RestoreDbInstanceFromS3](#) in *AWS CLI Command Reference*.

restore-db-instance-to-point-in-time

The following code example shows how to use `restore-db-instance-to-point-in-time`.

AWS CLI

Example 1: To restore a DB instance to a point in time

The following `restore-db-instance-to-point-in-time` example restores `test-instance` to a new DB instance named `restored-test-instance`, as of the specified time.

```
aws rds restore-db-instance-to-point-in-time \  
  --source-db-instance-identifier test-instance \  
  --target-db-instance restored-test-instance \  
  --restore-time 2018-07-30T23:45:00.000Z
```

Output:

```
{
```

```

    "DBInstance": {
      "AllocatedStorage": 20,
      "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:restored-test-
instance",
      "DBInstanceStatus": "creating",
      "DBInstanceIdentifier": "restored-test-instance",
      ...some output omitted...
    }
  }
}

```

For more information, see [Restoring a DB instance to a specified time](#) in the *Amazon RDS User Guide*.

Example 2: To restore a DB instance to a specified time from a replicated backup

The following `restore-db-instance-to-point-in-time` example restores an Oracle DB instance to the specified time from a replicated automated backup.

```

aws rds restore-db-instance-to-point-in-time \
  --source-db-instance-automated-backups-arn "arn:aws:rds:us-
west-2:123456789012:auto-backup:ab-jkib2gfq5rv7replzadausbrktni2bn4example" \
  --target-db-instance-identifier myorclinstance-from-replicated-backup \
  --restore-time 2020-12-08T18:45:00.000Z

```

Output:

```

{
  "DBInstance": {
    "DBInstanceIdentifier": "myorclinstance-from-replicated-backup",
    "DBInstanceClass": "db.t3.micro",
    "Engine": "oracle-se2",
    "DBInstanceStatus": "creating",
    "MasterUsername": "admin",
    "DBName": "ORCL",
    "AllocatedStorage": 20,
    "PreferredBackupWindow": "07:45-08:15",
    "BackupRetentionPeriod": 14,
    ... some output omitted ...
    "DbiResourceId": "db-KGLXG75BGVIWKQT7NQ4EXAMPLE",
    "CACertificateIdentifier": "rds-ca-2019",
    "DomainMemberships": [],
    "CopyTagsToSnapshot": false,
  }
}

```

```
    "MonitoringInterval": 0,
    "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:myorclinstance-from-
replicated-backup",
    "IAMDatabaseAuthenticationEnabled": false,
    "PerformanceInsightsEnabled": false,
    "DeletionProtection": false,
    "AssociatedRoles": [],
    "TagList": []
  }
}
```

For more information, see [Restoring to a specified time from a replicated backup](#) in the *Amazon RDS User Guide*.

- For API details, see [RestoreDbInstanceToPointInTime](#) in *AWS CLI Command Reference*.

start-activity-stream

The following code example shows how to use `start-activity-stream`.

AWS CLI

To start a database activity stream

The following `start-activity-stream` example starts an asynchronous activity stream to monitor an Aurora cluster named `my-pg-cluster`.

```
aws rds start-activity-stream \
  --region us-east-1 \
  --mode async \
  --kms-key-id arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-
h123-456i789jk011 \
  --resource-arn arn:aws:rds:us-east-1:1234567890123:cluster:my-pg-cluster \
  --apply-immediately
```

Output:

```
{
  "KmsKeyId": "arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-
h123-456i789jk011",
  "KinesisStreamName": "aws-rds-das-cluster-0ABCDEFGH11JKLM2NOPQ3R4S",
  "Status": "starting",
```

```
"Mode": "async",
"ApplyImmediately": true
}
```

For more information, see [Starting a database activity stream](#) in the *Amazon Aurora User Guide*.

- For API details, see [StartActivityStream](#) in *AWS CLI Command Reference*.

start-db-cluster

The following code example shows how to use `start-db-cluster`.

AWS CLI

To start a DB cluster

The following `start-db-cluster` example starts a DB cluster and its DB instances.

```
aws rds start-db-cluster \
  --db-cluster-identifier mydbcluster
```

Output:

```
{
  "DBCluster": {
    "AllocatedStorage": 1,
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1e",
      "us-east-1b"
    ],
    "BackupRetentionPeriod": 1,
    "DatabaseName": "mydb",
    "DBClusterIdentifier": "mydbcluster",
    ...some output truncated...
  }
}
```

For more information, see [Stopping and starting an Amazon Aurora DB cluster](#) in the *Amazon Aurora User Guide*.

- For API details, see [StartDbCluster](#) in *AWS CLI Command Reference*.

start-db-instance-automated-backups-replication

The following code example shows how to use `start-db-instance-automated-backups-replication`.

AWS CLI

To enable cross-Region automated backups

The following `start-db-instance-automated-backups-replication` example replicates automated backups from a DB instance in the US East (N. Virginia) Region to US West (Oregon). The backup retention period is 14 days.

```
aws rds start-db-instance-automated-backups-replication \  
  --region us-west-2 \  
  --source-db-instance-arn "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db" \  
  --backup-retention-period 14
```

Output:

```
{  
  "DBInstanceAutomatedBackup": {  
    "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",  
    "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",  
    "Region": "us-east-1",  
    "DBInstanceIdentifier": "new-orcl-db",  
    "RestoreWindow": {},  
    "AllocatedStorage": 20,  
    "Status": "pending",  
    "Port": 1521,  
    "InstanceCreateTime": "2020-12-04T15:28:31Z",  
    "MasterUsername": "admin",  
    "Engine": "oracle-se2",  
    "EngineVersion": "12.1.0.2.v21",  
    "LicenseModel": "bring-your-own-license",  
    "OptionGroupName": "default:oracle-se2-12-1",  
    "Encrypted": false,  
    "StorageType": "gp2",  
    "IAMDatabaseAuthenticationEnabled": false,  
    "BackupRetentionPeriod": 14,  
    "DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-backup:ab-jkib2gfgq5rv7replzadtausbrktni2bn4example"  
  }  
}
```

```
}
```

For more information, see [Enabling cross-Region automated backups](#) in the *Amazon RDS User Guide*.

- For API details, see [StartDbInstanceAutomatedBackupsReplication](#) in *AWS CLI Command Reference*.

start-db-instance

The following code example shows how to use `start-db-instance`.

AWS CLI

To start a DB instance

The following `start-db-instance` example starts the specified DB instance.

```
aws rds start-db-instance \  
  --db-instance-identifier test-instance
```

Output:

```
{  
  "DBInstance": {  
    "DBInstanceStatus": "starting",  
    ...some output truncated...  
  }  
}
```

- For API details, see [StartDbInstance](#) in *AWS CLI Command Reference*.

start-export-task

The following code example shows how to use `start-export-task`.

AWS CLI

To export a snapshot to Amazon S3

The following `start-export-task` example exports a DB snapshot named `db5-snapshot-test` to the Amazon S3 bucket named `mybucket`.

```
aws rds start-export-task \  
  --export-task-identifier my-s3-export \  
  --source-arn arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-test \  
  --s3-bucket-name mybucket \  
  --iam-role-arn arn:aws:iam::123456789012:role/service-role/ExportRole \  
  --kms-key-id arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-  
  aabbccddeeff
```

Output:

```
{  
  "ExportTaskIdentifier": "my-s3-export",  
  "SourceArn": "arn:aws:rds:us-west-2:123456789012:snapshot:db5-snapshot-test",  
  "SnapshotTime": "2020-03-27T20:48:42.023Z",  
  "S3Bucket": "mybucket",  
  "IamRoleArn": "arn:aws:iam::123456789012:role/service-role/ExportRole",  
  "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/abcd0000-7fca-4128-82f2-  
  aabbccddeeff",  
  "Status": "STARTING",  
  "PercentProgress": 0,  
  "TotalExtractedDataInGB": 0  
}
```

For more information, see [Exporting a Snapshot to an Amazon S3 Bucket](#) in the *Amazon RDS User Guide*.

- For API details, see [StartExportTask](#) in *AWS CLI Command Reference*.

stop-activity-stream

The following code example shows how to use stop-activity-stream.

AWS CLI

To stop a database activity stream

The following stop-activity-stream example stops an activity stream in an Aurora cluster named my-pg-cluster.

```
aws rds stop-activity-stream \  
  --region us-east-1 \  
  --cluster-id my-pg-cluster
```

```
--resource-arn arn:aws:rds:us-east-1:1234567890123:cluster:my-pg-cluster \  
--apply-immediately
```

Output:

```
{  
  "KmsKeyId": "arn:aws:kms:us-east-1:1234567890123:key/a12c345d-6ef7-890g-  
h123-456i789jk011",  
  "KinesisStreamName": "aws-rds-das-cluster-0ABCDEFGH11JKLM2NOPQ3R4S",  
  "Status": "stopping"  
}
```

For more information, see [Stopping an activity stream](#) in the *Amazon Aurora User Guide*.

- For API details, see [StopActivityStream](#) in *AWS CLI Command Reference*.

stop-db-cluster

The following code example shows how to use `stop-db-cluster`.

AWS CLI

To stop a DB cluster

The following `stop-db-cluster` example stops a DB cluster and its DB instances.

```
aws rds stop-db-cluster \  
--db-cluster-identifier mydbcluster
```

Output:

```
{  
  "DBCluster": {  
    "AllocatedStorage": 1,  
    "AvailabilityZones": [  
      "us-east-1a",  
      "us-east-1e",  
      "us-east-1b"  
    ],  
    "BackupRetentionPeriod": 1,  
    "DatabaseName": "mydb",  
    "DBClusterIdentifier": "mydbcluster",
```

```
    ...some output truncated...
  }
}
```

For more information, see [Stopping and starting an Amazon Aurora DB cluster](#) in the *Amazon Aurora User Guide*.

- For API details, see [StopDbCluster](#) in *AWS CLI Command Reference*.

stop-db-instance-automated-backups-replication

The following code example shows how to use `stop-db-instance-automated-backups-replication`.

AWS CLI

To stop replicating automated backups

The following `stop-db-instance-automated-backups-replication` ends replication of automated backups to the US West (Oregon) Region. Replicated backups are retained according to the set backup retention period.

```
aws rds stop-db-instance-automated-backups-replication \
  --region us-west-2 \
  --source-db-instance-arn "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db"
```

Output:

```
{
  "DBInstanceAutomatedBackup": {
    "DBInstanceArn": "arn:aws:rds:us-east-1:123456789012:db:new-orcl-db",
    "DbiResourceId": "db-JKIB2GFQ5RV7REPLZA4EXAMPLE",
    "Region": "us-east-1",
    "DBInstanceIdentifier": "new-orcl-db",
    "RestoreWindow": {
      "EarliestTime": "2020-12-04T23:13:21.030Z",
      "LatestTime": "2020-12-07T19:59:57Z"
    },
    "AllocatedStorage": 20,
    "Status": "replicating",
    "Port": 1521,
    "InstanceCreateTime": "2020-12-04T15:28:31Z",
```

```
"MasterUsername": "admin",
"Engine": "oracle-se2",
"EngineVersion": "12.1.0.2.v21",
"LicenseModel": "bring-your-own-license",
"OptionGroupName": "default:oracle-se2-12-1",
"Encrypted": false,
"StorageType": "gp2",
"IAMDatabaseAuthenticationEnabled": false,
"BackupRetentionPeriod": 7,
"DBInstanceAutomatedBackupsArn": "arn:aws:rds:us-west-2:123456789012:auto-
backup:ab-jkib2gfg5rv7replzadabrktni2bn4example"
}
}
```

For more information, see [Stopping automated backup replication](#) in the *Amazon RDS User Guide*.

- For API details, see [StopDbInstanceAutomatedBackupsReplication](#) in *AWS CLI Command Reference*.

stop-db-instance

The following code example shows how to use `stop-db-instance`.

AWS CLI

To stop a DB instance

The following `stop-db-instance` example stops the specified DB instance.

```
aws rds stop-db-instance \
  --db-instance-identifier test-instance
```

Output:

```
{
  "DBInstance": {
    "DBInstanceStatus": "stopping",
    ...some output truncated...
  }
}
```

- For API details, see [StopDbInstance](#) in *AWS CLI Command Reference*.

switchover-blue-green-deployment

The following code example shows how to use `switchover-blue-green-deployment`.

AWS CLI

Example 1: To switch a blue/green deployment for an RDS DB instance

The following `switchover-blue-green-deployment` example promotes the specified green environment as the new production environment.

```
aws rds switchover-blue-green-deployment \  
  --blue-green-deployment-identifier bgd-wi89nwzglccsfake \  
  --switchover-timeout 300
```

Output:

```
{  
  "BlueGreenDeployment": {  
    "BlueGreenDeploymentIdentifier": "bgd-v53303651eexfake",  
    "BlueGreenDeploymentName": "bgd-cli-test-instance",

- For API details, see [SwitchoverBlueGreenDeployment](#) in *AWS CLI Command Reference*.

Amazon RDS Data Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Data Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

batch-execute-statement

The following code example shows how to use batch-execute-statement.

AWS CLI

To execute a batch SQL statement

The following batch-execute-statement example executes a batch SQL statement over an array of data with a parameter set.

```
aws rds-data batch-execute-statement \
  --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \
  --database "mydb" \
  --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \
  --sql "insert into mytable values (:id, :val)" \
  --parameter-sets "[[{"name\": \"id\", \"value\": {\"longValue\": 1}}, {\"name\": \"val\", \"value\": {\"stringValue\": \"ValueOne\"}}], [\"name\": \"id\", \"value\": {\"longValue\": 2}}, {\"name\": \"val\", \"value\": {\"stringValue\": \"ValueTwo\"}}], [\"name\": \"id\", \"value\": {\"longValue\": 3}}, {\"name\": \"val\", \"value\": {\"stringValue\": \"ValueThree\"}}]]]"
```

This command produces no output.

For more information, see [Using the Data API for Aurora Serverless](#) in the *Amazon RDS User Guide*.

- For API details, see [BatchExecuteStatement](#) in *AWS CLI Command Reference*.

begin-transaction

The following code example shows how to use `begin-transaction`.

AWS CLI

To start a SQL transaction

The following `begin-transaction` example starts a SQL transaction.

```
aws rds-data begin-transaction \  
  --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \  
  --database "mydb" \  
  --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret"
```

Output:

```
{  
  "transactionId": "ABC1234567890xyz"  
}
```

For more information, see [Using the Data API for Aurora Serverless](#) in the *Amazon RDS User Guide*.

- For API details, see [BeginTransaction](#) in *AWS CLI Command Reference*.

commit-transaction

The following code example shows how to use `commit-transaction`.

AWS CLI

To commit a SQL transaction

The following `commit-transaction` example ends the specified SQL transaction and commits the changes that you made as part of it.

```
aws rds-data commit-transaction \  
  --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \  
  --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \  
  --transaction-id "ABC1234567890xyz"
```

Output:

```
{  
  "transactionStatus": "Transaction Committed"  
}
```

For more information, see [Using the Data API for Aurora Serverless](#) in the *Amazon RDS User Guide*.

- For API details, see [CommitTransaction](#) in *AWS CLI Command Reference*.

execute-statement

The following code example shows how to use `execute-statement`.

AWS CLI

Example 1: To execute a SQL statement that is part of a transaction

The following `execute-statement` example runs a SQL statement that is part of a transaction.

```
aws rds-data execute-statement \  
  --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \  
  --database "mydb" \  
  --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \  
  --sql "update mytable set quantity=5 where id=201" \  
  --transaction-id "ABC1234567890xyz"
```

Output:

```
{  
  "numberOfRecordsUpdated": 1  
}
```

Example 2: To execute a SQL statement with parameters

The following `execute-statement` example runs a SQL statement with parameters.

```
aws rds-data execute-statement \  
  --resource-arn "arn:aws:rds:us-east-1:123456789012:cluster:mydbcluster" \  
  --database "mydb" \  
  --secret-arn "arn:aws:secretsmanager:us-east-1:123456789012:secret:mysecret" \  
  --sql "insert into mytable values (:id, :val)" \  
  --parameters "[{\"name\": \"id\", \"value\": {\"longValue\": 1}}, {\"name\":  
  \"val\", \"value\": {\"stringValue\": \"value1\"}}]"
```

Output:

```
{  
  "numberOfRecordsUpdated": 1  
}
```

For more information, see [Using the Data API for Aurora Serverless](#) in the *Amazon RDS User Guide*.

- For API details, see [ExecuteStatement](#) in *AWS CLI Command Reference*.

rollback-transaction

The following code example shows how to use `rollback-transaction`.

AWS CLI

To roll back a SQL transaction

The following `rollback-transaction` example rolls back the specified SQL transaction.

```
aws rds-data rollback-transaction \  
  --resource-arn "arn:aws:rds:us-west-2:123456789012:cluster:mydbcluster" \  
  --secret-arn "arn:aws:secretsmanager:us-west-2:123456789012:secret:mysecret" \  
  --transaction-id "ABC1234567890xyz"
```

Output:

```
{  
  "transactionStatus": "Rollback Complete"  
}
```

For more information, see [Using the Data API for Aurora Serverless](#) in the *Amazon RDS User Guide*.

- For API details, see [RollbackTransaction](#) in *AWS CLI Command Reference*.

Amazon RDS Performance Insights examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon RDS Performance Insights.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

describe-dimension-keys

The following code example shows how to use describe-dimension-keys.

AWS CLI

To describe dimension keys

This example requests the names of all wait events. The data is summarized by event name, and the aggregate values of those events over the specified time period.

Command:

```
aws pi describe-dimension-keys --service-type RDS --identifier db-
LKCG0BK26374TPTDFX0IWVCPMM --start-time 1527026400 --end-time 1527080400 --metric
db.load.avg --group-by '{"Group":"db.wait_event"}
```

Output:

```
{
  "AlignedEndTime": 1.5270804E9,
  "AlignedStartTime": 1.5270264E9,
  "Keys": [
    {
      "Dimensions": {"db.wait_event.name": "wait/synch/mutex/innodb/aurora_lock_thread_slot_futex"},
      "Total": 0.05906906851195666
    },
    {
      "Dimensions": {"db.wait_event.name": "wait/io/aurora_redo_log_flush"},
      "Total": 0.015824722186149193
    },
    {
      "Dimensions": {"db.wait_event.name": "CPU"},
      "Total": 0.008014396230265477
    },
    {
      "Dimensions": {"db.wait_event.name": "wait/io/aurora_respond_to_client"},
      "Total": 0.0036361612526204477
    },
    {
      "Dimensions": {"db.wait_event.name": "wait/io/table/sql/handler"},
      "Total": 0.0019108398419382965
    },
    {
      "Dimensions": {"db.wait_event.name": "wait/synch/cond/mysys/my_thread_var::suspend"},
      "Total": 8.533847837782684E-4
    },
    {
      "Dimensions": {"db.wait_event.name": "wait/io/file/csv/data"},
      "Total": 6.864181956477376E-4
    },
    {
      "Dimensions": {"db.wait_event.name": "Unknown"},
      "Total": 3.895887056379051E-4
    },
    {
      "Dimensions": {"db.wait_event.name": "wait/synch/mutex/sql/FILE_AS_TABLE::LOCK_shim_lists"},

```

```

        "Total": 3.710368625122906E-5
      },
      {
        "Dimensions": {"db.wait_event.name": "wait/lock/table/sql/handler"},
        "Total": 0
      }
    ]
  }

```

- For API details, see [DescribeDimensionKeys](#) in *AWS CLI Command Reference*.

get-resource-metrics

The following code example shows how to use `get-resource-metrics`.

AWS CLI

To get resource metrics

This example requests data points for the `db.wait_event` dimension group, and for the `db.wait_event.name` dimension within that group. In the response, the relevant data points are grouped by the requested dimension (`db.wait_event.name`).

Command:

```

aws pi get-resource-metrics --service-type RDS --identifier db-
LKCG0BK26374TPTDFX0IWVCPM --start-time 1527026400 --end-time 1527080400 --period-
in-seconds 300 --metric db.load.avg --metric-queries file://metric-queries.json

```

The arguments for `--metric-queries` are stored in a JSON file, `metric-queries.json`. Here are the contents of that file:

```

[
  {
    "Metric": "db.load.avg",

Amazon Redshift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Redshift.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

accept-reserved-node-exchange

The following code example shows how to use `accept-reserved-node-exchange`.

AWS CLI

To accept reserved node exchange

The following `accept-reserved-node-exchange` example accepts exchange of a DC1 reserved node for a DC2 reserved node.

```
aws redshift accept-reserved-node-exchange /
  --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE /
  --target-reserved-node-offering-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:

```
{
  "ExchangedReservedNode": {
    "ReservedNodeId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
    "ReservedNodeOfferingId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",
    "NodeType": "dc2.large",
    "StartTime": "2019-12-06T21:17:26Z",
    "Duration": 31536000,
    "FixedPrice": 0.0,
    "UsagePrice": 0.0,
    "CurrencyCode": "USD",
    "NodeCount": 1,
    "State": "exchanging",
    "OfferingType": "All Upfront",
    "RecurringCharges": [
      {
        "RecurringChargeAmount": 0.0,
        "RecurringChargeFrequency": "Hourly"
      }
    ],
    "ReservedNodeOfferingType": "Regular"
  }
}
```

For more information, see [Upgrading Reserved Nodes With the AWS CLI](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [AcceptReservedNodeExchange](#) in *AWS CLI Command Reference*.

authorize-cluster-security-group-ingress

The following code example shows how to use `authorize-cluster-security-group-ingress`.

AWS CLI

Authorizing Access to an EC2 Security Group This example authorizes access to a named Amazon EC2 security group.
Command:

```
aws redshift authorize-cluster-security-group-ingress --cluster-security-group-name
mysecuritygroup --ec2-security-group-name myec2securitygroup --ec2-security-group-
owner-id 123445677890
```

Authorizing Access to a CIDR rangeThis example authorizes access to a CIDR range.**Command:**

```
aws redshift authorize-cluster-security-group-ingress --cluster-security-group-name
mysecuritygroup --cidrip 192.168.100.100/32
```

- For API details, see [AuthorizeClusterSecurityGroupIngress](#) in *AWS CLI Command Reference*.

authorize-snapshot-access

The following code example shows how to use `authorize-snapshot-access`.

AWS CLI

Authorize an AWS Account to Restore a SnapshotThis example authorizes the AWS account 444455556666 to restore the snapshot `my-snapshot-id`. By default, the output is in JSON format.**Command:**

```
aws redshift authorize-snapshot-access --snapshot-id my-snapshot-id --account-with-
restore-access 444455556666
```

Result:

```
{
  "Snapshot": {
    "Status": "available",
    "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
    "EstimatedSecondsToCompletion": 0,
    "AvailabilityZone": "us-east-1a",
    "ClusterVersion": "1.0",

    "OwnerAccount": "111122223333",
    "BackupProgressInMegabytes": 11.0,
    "ElapsedTimeInSeconds": 0,
    "DBName": "dev",
    "CurrentBackupRateInMegabytesPerSecond": 0.1534,
    "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
    "ActualIncrementalBackupSizeInMegabytes": 11.0,
    "SnapshotType": "manual",
    "NodeType": "dw.hs1.xlarge",
    "ClusterIdentifier": "mycluster",
```

```
    "TotalBackupSizeInMegabytes": 20.0,  
    "Port": 5439,  
    "NumberOfNodes": 2,  
    "SnapshotIdentifier": "my-snapshot-id"  
  }  
}
```

- For API details, see [AuthorizeSnapshotAccess](#) in *AWS CLI Command Reference*.

batch-delete-cluster-snapshots

The following code example shows how to use `batch-delete-cluster-snapshots`.

AWS CLI

To delete a set of cluster snapshots

The following `batch-delete-cluster-snapshots` example deletes a set of manual cluster snapshots.

```
aws redshift batch-delete-cluster-snapshots \  
    --identifiers SnapshotIdentifier=mycluster-2019-11-06-14-12  
    SnapshotIdentifier=mycluster-2019-11-06-14-20
```

Output:

```
{  
  "Resources": [  
    "mycluster-2019-11-06-14-12",  
    "mycluster-2019-11-06-14-20"  
  ]  
}
```

For more information, see [Amazon Redshift Snapshots](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [BatchDeleteClusterSnapshots](#) in *AWS CLI Command Reference*.

batch-modify-cluster-snapshots

The following code example shows how to use `batch-modify-cluster-snapshots`.

AWS CLI

To modify a set of cluster snapshots

The following `batch-modify-cluster-snapshots` example modifies the settings for a set of cluster snapshots.

```
aws redshift batch-modify-cluster-snapshots \  
  --snapshot-identifier-list mycluster-2019-11-06-16-31 mycluster-2019-11-06-16-32 \  
  \  
  --manual-snapshot-retention-period 30
```

Output:

```
{  
  "Resources": [  
    "mycluster-2019-11-06-16-31",  
    "mycluster-2019-11-06-16-32"  
  ],  
  "Errors": [],  
  "ResponseMetadata": {  
    "RequestId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",  
    "HTTPStatusCode": 200,  
    "HTTPHeaders": {  
      "x-amzn-requestid": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",  
      "content-type": "text/xml",  
      "content-length": "480",  
      "date": "Sat, 07 Dec 2019 00:36:09 GMT",  
      "connection": "keep-alive"  
    },  
    "RetryAttempts": 0  
  }  
}
```

For more information, see [Amazon Redshift Snapshots](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [BatchModifyClusterSnapshots](#) in *AWS CLI Command Reference*.

cancel-resize

The following code example shows how to use `cancel-resize`.

AWS CLI

To cancel resize of a cluster

The following `cancel-resize` example cancels a classic resize operation for a cluster.

```
aws redshift cancel-resize \  
  --cluster-identifier mycluster
```

Output:

```
{  
  "TargetNodeType": "dc2.large",  
  "TargetNumberOfNodes": 2,  
  "TargetClusterType": "multi-node",  
  "Status": "CANCELLING",  
  "ResizeType": "ClassicResize",  
  "TargetEncryptionType": "NONE"  
}
```

For more information, see [Resizing Clusters in Amazon Redshift](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CancelResize](#) in *AWS CLI Command Reference*.

copy-cluster-snapshot

The following code example shows how to use `copy-cluster-snapshot`.

AWS CLI

Get a Description of All Cluster Versions This example returns a description of all cluster versions. By default, the output is in JSON format. Command:

```
aws redshift copy-cluster-snapshot --source-snapshot-identifier  
  cm:examplecluster-2013-01-22-19-27-58 --target-snapshot-identifier my-saved-  
  snapshot-copy
```

Result:

```
{  
  "Snapshot": {
```

```

    "Status": "available",
    "SnapshotCreateTime": "2013-01-22T19:27:58.931Z",
    "AvailabilityZone": "us-east-1c",
    "ClusterVersion": "1.0",
    "MasterUsername": "adminuser",
    "DBName": "dev",
    "ClusterCreateTime": "2013-01-22T19:23:59.368Z",
    "SnapshotType": "manual",
    "NodeType": "dw.hs1.xlarge",
    "ClusterIdentifier": "examplecluster",
    "Port": 5439,
    "NumberOfNodes": "2",
    "SnapshotIdentifier": "my-saved-snapshot-copy"
  },
  "ResponseMetadata": {
    "RequestId": "3b279691-64e3-11e2-bec0-17624ad140dd"
  }
}

```

- For API details, see [CopyClusterSnapshot](#) in *AWS CLI Command Reference*.

create-cluster-parameter-group

The following code example shows how to use `create-cluster-parameter-group`.

AWS CLI

Create a Cluster Parameter Group This example creates a new cluster parameter group.
Command:

```

aws redshift create-cluster-parameter-group --parameter-group-name
myclusterparametergroup --parameter-group-family redshift-1.0 --description "My
first cluster parameter group"

```

Result:

```

{
  "ClusterParameterGroup": {
    "ParameterGroupFamily": "redshift-1.0",
    "Description": "My first cluster parameter group",
    "ParameterGroupName": "myclusterparametergroup"
  },
}

```

```

    "ResponseMetadata": {
      "RequestId": "739448f0-64cc-11e2-8f7d-3b939af52818"
    }
  }
}

```

- For API details, see [CreateClusterParameterGroup](#) in *AWS CLI Command Reference*.

create-cluster-security-group

The following code example shows how to use `create-cluster-security-group`.

AWS CLI

Creating a Cluster Security Group This example creates a new cluster security group. By default, the output is in JSON format. Command:

```
aws redshift create-cluster-security-group --cluster-security-group-name
mysecuritygroup --description "This is my cluster security group"
```

Result:

```

{
  "create_cluster_security_group_response": {
    "create_cluster_security_group_result": {
      "cluster_security_group": {
        "description": "This is my cluster security group",
        "owner_id": "300454760768",
        "cluster_security_group_name": "mysecuritygroup",
        "ec2_security_groups": \[],
        "ip_ranges": \[]
      }
    },
    "response_metadata": {
      "request_id": "5df486a0-343a-11e2-b0d8-d15d0ef48549"
    }
  }
}

```

You can also obtain the same information in text format using the `--output text` option. Command:

`--output text` option. Command:

option.Command:

```
aws redshift create-cluster-security-group --cluster-security-group-name
mysecuritygroup --description "This is my cluster security group" --output text
```

Result:

```
This is my cluster security group 300454760768 mysecuritygroup
a0c0bfab-343a-11e2-95d2-c3dc9fe8ab57
```

- For API details, see [CreateClusterSecurityGroup](#) in *AWS CLI Command Reference*.

create-cluster-snapshot

The following code example shows how to use `create-cluster-snapshot`.

AWS CLI

Create a Cluster Snapshot This example creates a new cluster snapshot. By default, the output is in JSON format.

Command:

```
aws redshift create-cluster-snapshot --cluster-identifier mycluster --snapshot-
identifier my-snapshot-id
```

Result:

```
{
  "Snapshot": {
    "Status": "creating",
    "SnapshotCreateTime": "2013-01-22T22:20:33.548Z",
    "AvailabilityZone": "us-east-1a",
    "ClusterVersion": "1.0",
    "MasterUsername": "adminuser",
    "DBName": "dev",
    "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
    "SnapshotType": "manual",
    "NodeType": "dw.hs1.xlarge",
    "ClusterIdentifier": "mycluster",
    "Port": 5439,
    "NumberOfNodes": "2",
    "SnapshotIdentifier": "my-snapshot-id"
  }
}
```

```

    },
    "ResponseMetadata": {
      "RequestId": "f024d1a5-64e1-11e2-88c5-53eb05787dfb"
    }
  }
}

```

- For API details, see [CreateClusterSnapshot](#) in *AWS CLI Command Reference*.

create-cluster-subnet-group

The following code example shows how to use `create-cluster-subnet-group`.

AWS CLI

Create a Cluster Subnet Group This example creates a new cluster subnet group. Command:

```
aws redshift create-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup
--description "My subnet group" --subnet-ids subnet-763fdd1c
```

Result:

```

{
  "ClusterSubnetGroup": {
    "Subnets": [
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-763fdd1c",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1a"
        }
      }
    ],
    "VpcId": "vpc-7e3fdd14",
    "SubnetGroupStatus": "Complete",
    "Description": "My subnet group",
    "ClusterSubnetGroupName": "mysubnetgroup"
  },
  "ResponseMetadata": {
    "RequestId": "500b8ce2-698f-11e2-9790-fd67517fb6fd"
  }
}

```

- For API details, see [CreateClusterSubnetGroup](#) in *AWS CLI Command Reference*.

create-cluster

The following code example shows how to use `create-cluster`.

AWS CLI

Create a Cluster with Minimal Parameters This example creates a cluster with the minimal set of parameters. By default, the output is in JSON format. Command:

```
aws redshift create-cluster --node-type dw.hs1.xlarge --number-of-nodes 2 --master-username adminuser --master-user-password TopSecret1 --cluster-identifier mycluster
```

Result:

```
{
  "Cluster": {
    "NodeType": "dw.hs1.xlarge",
    "ClusterVersion": "1.0",
    "PubliclyAccessible": "true",
    "MasterUsername": "adminuser",
    "ClusterParameterGroups": [
      {
        "ParameterApplyStatus": "in-sync",
        "ParameterGroupName": "default.redshift-1.0"
      }
    ],
    "ClusterSecurityGroups": [
      {
        "Status": "active",
        "ClusterSecurityGroupName": "default"
      }
    ],
    "AllowVersionUpgrade": true,
    "VpcSecurityGroups": [],
    "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",
    "AutomatedSnapshotRetentionPeriod": 1,
    "ClusterStatus": "creating",
    "ClusterIdentifier": "mycluster",
    "DBName": "dev",
    "NumberOfNodes": 2,
    "PendingModifiedValues": {
      "MasterUserPassword": "\*****"
    }
  },
  "ResponseMetadata": {
```

```

    "RequestId": "7cf4bcfc-64dd-11e2-bea9-49e0ce183f07"
  }
}

```

- For API details, see [CreateCluster](#) in *AWS CLI Command Reference*.

create-event-subscription

The following code example shows how to use `create-event-subscription`.

AWS CLI

To create a notification subscription for an event

The following `create-event-subscription` example creates an event notification subscription.

```

aws redshift create-event-subscription \
  --subscription-name mysubscription \
  --sns-topic-arn arn:aws:sns:us-west-2:123456789012:MySNSStopic \
  --source-type cluster \
  --source-ids mycluster

```

Output:

```

{
  "EventSubscription": {
    "CustomerAwsId": "123456789012",
    "CustSubscriptionId": "mysubscription",
    "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNSStopic",
    "Status": "active",
    "SubscriptionCreationTime": "2019-12-09T20:05:19.365Z",
    "SourceType": "cluster",
    "SourceIdsList": [
      "mycluster"
    ],
    "EventCategoriesList": [],
    "Severity": "INFO",
    "Enabled": true,
    "Tags": []
  }
}

```

For more information, see [Subscribing to Amazon Redshift Event Notifications](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateEventSubscription](#) in *AWS CLI Command Reference*.

create-hsm-client-certificate

The following code example shows how to use `create-hsm-client-certificate`.

AWS CLI

To create an HSM client certificate

The following `create-hsm-client-certificate` example generates an HSM client certificate that a cluster can use to connect to an HSM.

```
aws redshift create-hsm-client-certificate \
  --hsm-client-certificate-identifier myhsmclientcert
```

Output:

```
{
  "HsmClientCertificate": {
    "HsmClientCertificateIdentifier": "myhsmclientcert",
    "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----
MIICiEXAMPLECQD6m7oRw0uX0jANBgkqhkiG9w0BAQUFADCBiDELMakGA1UEBhMC

    "Tags": []
  }
}
```

For more information, see [Amazon Redshift API Permissions Reference](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateHsmClientCertificate](#) in *AWS CLI Command Reference*.

create-hsm-configuration

The following code example shows how to use `create-hsm-configuration`.

AWS CLI

To create an HSM configuration

The following `create-hsm-configuration` example creates the specified HSM configuration that contains information required by a cluster to store and use database encryption keys in a hardware security module (HSM).

```
aws redshift create-hsm-configuration /
  --hsm-configuration-identifier myhsmconnection
  --description "My HSM connection"
  --hsm-ip-address 192.0.2.09
  --hsm-partition-name myhsmpartition /
  --hsm-partition-password A1b2c3d4 /
  --hsm-server-public-certificate myhsmclientcert
```

Output:

```
{
  "HsmConfiguration": {
    "HsmConfigurationIdentifier": "myhsmconnection",
    "Description": "My HSM connection",
    "HsmIpAddress": "192.0.2.09",
    "HsmPartitionName": "myhsmpartition",
    "Tags": []
  }
}
```

- For API details, see [CreateHsmConfiguration](#) in *AWS CLI Command Reference*.

create-snapshot-copy-grant

The following code example shows how to use `create-snapshot-copy-grant`.

AWS CLI

To create a snapshot copy grant

The following `create-snapshot-copy-grant` example creates a snapshot copy grant and encrypts copied snapshots in a destination AWS Region.

```
aws redshift create-snapshot-copy-grant \  
  --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```
{  
  "SnapshotCopyGrant": {  
    "SnapshotCopyGrantName": "mysnapshotcopygrantname",  
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/  
bPxRfih3yCo8nvbEXAMPLEKEY",  
    "Tags": []  
  }  
}
```

For more information, see [Amazon Redshift Database Encryption](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateSnapshotCopyGrant](#) in *AWS CLI Command Reference*.

create-snapshot-schedule

The following code example shows how to use `create-snapshot-schedule`.

AWS CLI

To create snapshot schedule

The following `create-snapshot-schedule` example creates a snapshot schedule with the specified description and a rate of every 12 hours.

```
aws redshift create-snapshot-schedule \  
  --schedule-definitions "rate(12 hours)" \  
  --schedule-identifier mysnapshotschedule \  
  --schedule-description "My schedule description"
```

Output:

```
{
  "ScheduleDefinitions": [
    "rate(12 hours)"
  ],
  "ScheduleIdentifier": "mysnapshotschedule",
  "ScheduleDescription": "My schedule description",
  "Tags": []
}
```

For more information, see [Automated Snapshot Schedules](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateSnapshotSchedule](#) in *AWS CLI Command Reference*.

create-tags

The following code example shows how to use `create-tags`.

AWS CLI**To create tags for a cluster**

The following `create-tags` example adds the specified tag key/value pair to the specified cluster.

```
aws redshift create-tags \
  --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
  --tags "Key"="mytags", "Value"="tag1"
```

This command does not produce any output.

For more information, see [Tagging Resources in Amazon Redshift](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [CreateTags](#) in *AWS CLI Command Reference*.

delete-cluster-parameter-group

The following code example shows how to use `delete-cluster-parameter-group`.

AWS CLI

Delete a Cluster Parameter Group This example deletes a cluster parameter group. Command:

```
aws redshift delete-cluster-parameter-group --parameter-group-name
myclusterparametergroup
```

- For API details, see [DeleteClusterParameterGroup](#) in *AWS CLI Command Reference*.

delete-cluster-security-group

The following code example shows how to use `delete-cluster-security-group`.

AWS CLI

Delete a Cluster Security Group This example deletes a cluster security group. Command:

```
aws redshift delete-cluster-security-group --cluster-security-group-name
mysecuritygroup
```

- For API details, see [DeleteClusterSecurityGroup](#) in *AWS CLI Command Reference*.

delete-cluster-snapshot

The following code example shows how to use `delete-cluster-snapshot`.

AWS CLI

Delete a Cluster Snapshot This example deletes a cluster snapshot. Command:

```
aws redshift delete-cluster-snapshot --snapshot-identifier my-snapshot-id
```

- For API details, see [DeleteClusterSnapshot](#) in *AWS CLI Command Reference*.

delete-cluster-subnet-group

The following code example shows how to use `delete-cluster-subnet-group`.

AWS CLI

Delete a Cluster subnet Group This example deletes a cluster subnet group. Command:

```
aws redshift delete-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup
```

Result:

```
{
  "ResponseMetadata": {
    "RequestId": "253fbffd-6993-11e2-bc3a-47431073908a"
  }
}
```

- For API details, see [DeleteClusterSubnetGroup](#) in *AWS CLI Command Reference*.

delete-cluster

The following code example shows how to use `delete-cluster`.

AWS CLI

Delete a Cluster with No Final Cluster SnapshotThis example deletes a cluster, forcing data deletion so no final cluster snapshot is created.**Command:**

```
aws redshift delete-cluster --cluster-identifier mycluster --skip-final-cluster-snapshot
```

Delete a Cluster, Allowing a Final Cluster SnapshotThis example deletes a cluster, but specifies a final cluster snapshot.**Command:**

```
aws redshift delete-cluster --cluster-identifier mycluster --final-cluster-snapshot-identifier myfinalsnapshot
```

- For API details, see [DeleteCluster](#) in *AWS CLI Command Reference*.

delete-event-subscription

The following code example shows how to use `delete-event-subscription`.

AWS CLI

To delete event subscription

The following `delete-event-subscription` example deletes the specified event notification subscription.

```
aws redshift delete-event-subscription \  
  --subscription-name mysubscription
```

This command does not produce any output.

For more information, see [Subscribing to Amazon Redshift Event Notifications](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteEventSubscription](#) in *AWS CLI Command Reference*.

delete-hsm-client-certificate

The following code example shows how to use `delete-hsm-client-certificate`.

AWS CLI

To delete HSM client certificate

The following `delete-hsm-client-certificate` example deletes an HSM client certificate.

```
aws redshift delete-hsm-client-certificate \  
  --hsm-client-certificate-identifier myhsmclientcert
```

This command does not produce any output.

For more information, see [Amazon Redshift API Permissions Reference](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteHsmClientCertificate](#) in *AWS CLI Command Reference*.

delete-hsm-configuration

The following code example shows how to use `delete-hsm-configuration`.

AWS CLI

To delete an HSM configuration

The following `delete-hsm-configuration` example deletes the specified HSM configuration from the current AWS account.

```
aws redshift delete-hsm-configuration /  
  --hsm-configuration-identifier myhsmconnection
```

This command does not produce any output.

- For API details, see [DeleteHsmConfiguration](#) in *AWS CLI Command Reference*.

delete-scheduled-action

The following code example shows how to use `delete-scheduled-action`.

AWS CLI

To delete scheduled action

The following `delete-scheduled-action` example deletes the specified scheduled action.

```
aws redshift delete-scheduled-action \  
  --scheduled-action-name myscheduledaction
```

This command does not produce any output.

- For API details, see [DeleteScheduledAction](#) in *AWS CLI Command Reference*.

delete-snapshot-copy-grant

The following code example shows how to use `delete-snapshot-copy-grant`.

AWS CLI

To delete snapshot copy grant

The following `delete-snapshot-copy-grant` example deletes the specified snapshot copy grant.

```
aws redshift delete-snapshot-copy-grant \  
  --snapshot-copy-grant-name mysnapshotcopygrantname
```

This command does not produce any output.

For more information, see [Amazon Redshift Database Encryption](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteSnapshotCopyGrant](#) in *AWS CLI Command Reference*.

delete-snapshot-schedule

The following code example shows how to use `delete-snapshot-schedule`.

AWS CLI

To delete snapshot schedule

The following `delete-snapshot-schedule` example deletes the specified snapshot schedule. You must disassociate clusters before deleting the schedule.

```
aws redshift delete-snapshot-schedule \  
  --schedule-identifier mysnapshotschedule
```

This command does not produce any output.

For more information, see [Automated Snapshot Schedules](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteSnapshotSchedule](#) in *AWS CLI Command Reference*.

delete-tags

The following code example shows how to use `delete-tags`.

AWS CLI

To delete tags from a cluster

The following `delete-tags` example deletes the tags with the specified key names from the specified cluster.

```
aws redshift delete-tags \  
  --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \  
  --tag-keys "clustertagkey" "clustertagvalue"
```

This command does not produce any output.

For more information, see [Tagging Resources in Amazon Redshift](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DeleteTags](#) in *AWS CLI Command Reference*.

describe-account-attributes

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe attributes of an AWS account

The following `describe-account-attributes` example displays the attributes attached to the calling AWS account.

```
aws redshift describe-account-attributes
```

Output:

```
{
  "AccountAttributes": [
    {
      "AttributeName": "max-defer-maintenance-duration",
      "AttributeValues": [
        {
          "AttributeValue": "45"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeAccountAttributes](#) in *AWS CLI Command Reference*.

describe-cluster-db-revisions

The following code example shows how to use `describe-cluster-db-revisions`.

AWS CLI

To describe DB revisions for a cluster

The following `describe-cluster-db-revisions` example displays the details of an array of `ClusterDbRevision` objects for the specified cluster.

```
aws redshift describe-cluster-db-revisions \  
  --cluster-identifier mycluster
```

Output:

```
{  
  "ClusterDbRevisions": [  
    {  
      "ClusterIdentifier": "mycluster",  
      "CurrentDatabaseRevision": "11420",  
      "DatabaseRevisionReleaseDate": "2019-11-22T16:43:49.597Z",  
      "RevisionTargets": []  
    }  
  ]  
}
```

- For API details, see [DescribeClusterDbRevisions](#) in *AWS CLI Command Reference*.

`describe-cluster-parameter-groups`

The following code example shows how to use `describe-cluster-parameter-groups`.

AWS CLI

Get a Description of All Cluster Parameter Groups This example returns a description of all cluster parameter groups for the account, with column headers. By default, the output is in JSON format.
Command:

```
aws redshift describe-cluster-parameter-groups
```

Result:

```
{  
  "ParameterGroups": [  
    {  
      "ParameterGroupFamily": "redshift-1.0",  
      "Description": "My first cluster parameter group",  
      "ParameterGroupIdentifier": "pg1",  
      "ParameterGroupStatus": "available",  
      "ParameterGroupType": "default",  
      "CreationTime": "2019-11-22T16:43:49.597Z",  
      "DeletionProtection": false,  
      "AllowMajorVersionUpgrade": true,  
      "AllowMinorVersionUpgrade": true,  
      "AssociatedRoles": [],  
      "ClusterDbRevisions": []  
    }  
  ]  
}
```

```
    "ParameterGroupName": "myclusterparametergroup"
  } ],
  "ResponseMetadata": {
    "RequestId": "8ceb8f6f-64cc-11e2-bea9-49e0ce183f07"
  }
}
```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-cluster-parameter-groups --output text
```

Result:

```
redshift-1.0      My first cluster parameter group      myclusterparametergroup
RESPONSEMETADATA 9e665a36-64cc-11e2-8f7d-3b939af52818
```

- For API details, see [DescribeClusterParameterGroups](#) in *AWS CLI Command Reference*.

describe-cluster-parameters

The following code example shows how to use `describe-cluster-parameters`.

AWS CLI

Retrieve the Parameters for a Specified Cluster Parameter GroupThis example retrieves the parameters for the named parameter group. By default, the output is in JSON format.Command:

```
aws redshift describe-cluster-parameters --parameter-group-name
myclusterparametergroup
```

Result:

```
{
  "Parameters": [
```

```

    {
      "Description": "Sets the display format for date and time values.",
      "DataType": "string",
      "IsModifiable": true,
      "Source": "engine-default",
      "ParameterValue": "ISO, MDY",
      "ParameterName": "datestyle"
    },
    {
      "Description": "Sets the number of digits displayed for floating-point
values",
      "DataType": "integer",
      "IsModifiable": true,
      "AllowedValues": "-15-2",
      "Source": "engine-default",
      "ParameterValue": "0",
      "ParameterName": "extra_float_digits"
    },
    (...remaining output omitted...)
  ]
}

```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-cluster-parameters --parameter-group-name
myclusterparametergroup --output text
```

Result:

```

RESPONSEMETADATA    cdac40aa-64cc-11e2-9e70-918437dd236d
Sets the display format for date and time values.  string True  engine-default
ISO, MDY      datestyle
Sets the number of digits displayed for floating-point values  integer True
-15-2  engine-default  0      extra_float_digits
This parameter applies a user-defined label to a group of queries that are run
during the same session..  string True  engine-default  default query_group
require ssl for all databaseconnections  boolean True  true,false  engine-
default  false  require_ssl

```

```

Sets the schema search order for names that are not schema-qualified.      string
True    engine-default $user, public  search_path
Aborts any statement that takes over the specified number of milliseconds. integer
True    engine-default 0              statement_timeout

\["query_concurrency":5}]          wlm_json_configuration

```

- For API details, see [DescribeClusterParameters](#) in *AWS CLI Command Reference*.

describe-cluster-security-groups

The following code example shows how to use `describe-cluster-security-groups`.

AWS CLI

Get a Description of All Cluster Security Groups This example returns a description of all cluster security groups for the account. By default, the output is in JSON format. Command:

```
aws redshift describe-cluster-security-groups
```

Result:

```

{
  "ClusterSecurityGroups": [
    {
      "OwnerId": "100447751468",
      "Description": "default",

      "Description": "This is my cluster security group",
      "ClusterSecurityGroupName": "mysecuritygroup",
      "EC2SecurityGroups": [],
      "IPRanges": []
    }
  ]
}

```

```

    },
    (...remaining output omitted...)
  ]
}

```

- For API details, see [DescribeClusterSecurityGroups](#) in *AWS CLI Command Reference*.

describe-cluster-snapshots

The following code example shows how to use `describe-cluster-snapshots`.

AWS CLI

Get a Description of All Cluster Snapshots This example returns a description of all cluster snapshots for the account. By default, the output is in JSON format. Command:

```
aws redshift describe-cluster-snapshots
```

Result:

```

{
  "Snapshots": [
    {
      "Status": "available",
      "SnapshotCreateTime": "2013-07-17T22:02:22.852Z",

  }
]
}
(...remaining output omitted...)

```

- For API details, see [DescribeClusterSnapshots](#) in *AWS CLI Command Reference*.

describe-cluster-subnet-groups

The following code example shows how to use `describe-cluster-subnet-groups`.

AWS CLI

Get a Description of All Cluster Subnet Groups This example returns a description of all cluster subnet groups. By default, the output is in JSON format. Command:

```
aws redshift describe-cluster-subnet-groups
```

Result:

```
{
  "ClusterSubnetGroups": [
    {
      "Subnets": [
        {
          "SubnetStatus": "Active",
          "SubnetIdentifier": "subnet-763fdd1c",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1a"
          }
        }
      ],
      "VpcId": "vpc-7e3fdd14",
      "SubnetGroupStatus": "Complete",
      "Description": "My subnet group",
      "ClusterSubnetGroupName": "mysubnetgroup"
    }
  ],
  "ResponseMetadata": {
    "RequestId": "37fa8c89-6990-11e2-8f75-ab4018764c77"
  }
}
```

- For API details, see [DescribeClusterSubnetGroups](#) in *AWS CLI Command Reference*.

describe-cluster-tracks

The following code example shows how to use `describe-cluster-tracks`.

AWS CLI**To describe cluster tracks**

The following `describe-cluster-tracks` example displays details of the available maintenance tracks.

```
aws redshift describe-cluster-tracks \
```

```
--maintenance-track-name current
```

Output:

```
{
  "MaintenanceTracks": [
    {
      "MaintenanceTrackName": "current",
      "DatabaseVersion": "1.0.11420",
      "UpdateTargets": [
        {
          "MaintenanceTrackName": "preview_features",
          "DatabaseVersion": "1.0.11746",
          "SupportedOperations": [
            {
              "OperationName": "restore-from-cluster-snapshot"
            }
          ]
        },
        {
          "MaintenanceTrackName": "trailing",
          "DatabaseVersion": "1.0.11116",
          "SupportedOperations": [
            {
              "OperationName": "restore-from-cluster-snapshot"
            },
            {
              "OperationName": "modify-cluster"
            }
          ]
        }
      ]
    }
  ]
}
```

For more information, see [Choosing Cluster Maintenance Tracks](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeClusterTracks](#) in *AWS CLI Command Reference*.

describe-cluster-versions

The following code example shows how to use `describe-cluster-versions`.

AWS CLI

Get a Description of All Cluster VersionsThis example returns a description of all cluster versions. By default, the output is in JSON format.**Command:**

```
aws redshift describe-cluster-versions
```

Result:

```
{
  "ClusterVersions": [
    {
      "ClusterVersion": "1.0",
      "Description": "Initial release",
      "ClusterParameterGroupFamily": "redshift-1.0"
    } ],
  "ResponseMetadata": {
    "RequestId": "16a53de3-64cc-11e2-bec0-17624ad140dd"
  }
}
```

- For API details, see [DescribeClusterVersions](#) in *AWS CLI Command Reference*.

describe-clusters

The following code example shows how to use `describe-clusters`.

AWS CLI

Get a Description of All ClustersThis example returns a description of all clusters for the account. By default, the output is in JSON format.**Command:**

```
aws redshift describe-clusters
```

Result:

```
{
```

```
"Clusters": [
  {
    "NodeType": "dw.hs1.xlarge",
    "Endpoint": {
      "Port": 5439,
      "Address": "mycluster.coqoarplqhsn.us-east-1.redshift.amazonaws.com"
    },
    "ClusterVersion": "1.0",
    "PubliclyAccessible": "true",
    "MasterUsername": "adminuser",
    "ClusterParameterGroups": [
      {
        "ParameterApplyStatus": "in-sync",
        "ParameterGroupName": "default.redshift-1.0"
      }
    ],
    "ClusterSecurityGroups": [
      {
        "Status": "active",
        "ClusterSecurityGroupName": "default"
      }
    ],
    "AllowVersionUpgrade": true,
    "VpcSecurityGroups": [],
    "AvailabilityZone": "us-east-1a",
    "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
    "PreferredMaintenanceWindow": "sat:03:30-sat:04:00",

- For API details, see [DescribeClusters](#) in *AWS CLI Command Reference*.

describe-default-cluster-parameters

The following code example shows how to use describe-default-cluster-parameters.

AWS CLI

Get a Description of Default Cluster Parameters This example returns a description of the default cluster parameters for the redshift-1.0 family. By default, the output is in JSON format. Command:

```
aws redshift describe-default-cluster-parameters --parameter-group-family
redshift-1.0
```

Result:

```
{
  "DefaultClusterParameters": {
    "ParameterGroupFamily": "redshift-1.0",
    "Parameters": [
      {
        "Description": "Sets the display format for date and time values.",
        "DataType": "string",
        "IsModifiable": true,
        "Source": "engine-default",
        "ParameterValue": "ISO, MDY",
        "ParameterName": "datestyle"
      }
    ]
  }
}
```

```
    },
    {
      "Description": "Sets the number of digits displayed for floating-point
values",
      "DataType": "integer",
      "IsModifiable": true,
      "AllowedValues": "-15-2",
      "Source": "engine-default",
      "ParameterValue": "0",
      "ParameterName": "extra_float_digits"
    },
    (...remaining output omitted...)
  ]
}
```

To see a list of valid parameter group families, use the `describe-cluster-parameter-groups` command.

`describe-cluster-parameter-groups` command.

command.

- For API details, see [DescribeDefaultClusterParameters](#) in *AWS CLI Command Reference*.

describe-event-categories

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe event categories for a cluster

The following `describe-event-categories` example displays details for the event categories for a cluster.

```
aws redshift describe-event-categories \
  --source-type cluster
```

Output:

```
{
```

```

    "EventCategoriesMapList": [
      {
        "SourceType": "cluster",
        "Events": [
          {
            "EventId": "REDSHIFT-EVENT-2000",
            "EventCategories": [
              "management"
            ],
            "EventDescription": "Cluster <cluster name> created at <time in
UTC>.",
            "Severity": "INFO"
          },
          {
            "EventId": "REDSHIFT-EVENT-2001",
            "EventCategories": [
              "management"
            ],
            "EventDescription": "Cluster <cluster name> deleted at <time in
UTC>.",
            "Severity": "INFO"
          },
          {
            "EventId": "REDSHIFT-EVENT-3625",
            "EventCategories": [
              "monitoring"
            ],
            "EventDescription": "The cluster <cluster name> can't be resumed
with its previous elastic network interface <ENI id>. We will allocate a new
elastic network interface and associate it with the cluster node.",
            "Severity": "INFO"
          }
        ]
      }
    ]
  }
}

```

- For API details, see [DescribeEventCategories](#) in *AWS CLI Command Reference*.

describe-event-subscriptions

The following code example shows how to use describe-event-subscriptions.

AWS CLI

To describe event subscriptions

The following `describe-event-subscriptions` example displays event notification subscriptions for the specified subscription.

```
aws redshift describe-event-subscriptions \  
  --subscription-name mysubscription
```

Output:

```
{  
  "EventSubscriptionsList": [  
    {  
      "CustomerAwsId": "123456789012",  
      "CustSubscriptionId": "mysubscription",  
      "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNSStopic",  
      "Status": "active",  
      "SubscriptionCreationTime": "2019-12-09T21:50:21.332Z",  
      "SourceIdsList": [],  
      "EventCategoriesList": [  
        "management"  
      ],  
      "Severity": "ERROR",  
      "Enabled": true,  
      "Tags": []  
    }  
  ]  
}
```

For more information, see [Subscribing to Amazon Redshift Event Notifications](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeEventSubscriptions](#) in *AWS CLI Command Reference*.

`describe-events`

The following code example shows how to use `describe-events`.

AWS CLI

Describe All Events this example returns all events. By default, the output is in JSON format. Command:

```
aws redshift describe-events
```

Result:

```
{
  "Events": [
    {
      "Date": "2013-01-22T19:17:03.640Z",
      "SourceIdentifier": "myclusterparametergroup",
      "Message": "Cluster parameter group myclusterparametergroup has been
created.",
      "SourceType": "cluster-parameter-group"
    } ],
  "ResponseMetadata": {
    "RequestId": "9f056111-64c9-11e2-9390-ff04f2c1e638"
  }
}
```

You can also obtain the same information in text format using the `--output text` option. Command:

`--output text` option. Command:

option. Command:

```
aws redshift describe-events --output text
```

Result:

```
2013-01-22T19:17:03.640Z    myclusterparametergroup Cluster parameter group
myclusterparametergroup has been created.    cluster-parameter-group
RESPONSEMETADATA    8e5fe765-64c9-11e2-bce3-e56f52c50e17
```

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

describe-hsm-client-certificates

The following code example shows how to use `describe-hsm-client-certificates`.

AWS CLI

To describe HSM client certificates

The following `describe-hsm-client-certificates` example displays details for the specified HSM client certificate.

```
aws redshift describe-hsm-client-certificates \
  --hsm-client-certificate-identifier myhsmclientcert
```

Output:

```
{
  "HsmClientCertificates": [
    {
      "HsmClientCertificateIdentifier": "myhsmclientcert",
      "HsmClientCertificatePublicKey": "-----BEGIN CERTIFICATE-----\

For more information, see [Amazon Redshift API Permissions Reference](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeHsmClientCertificates](#) in *AWS CLI Command Reference*.

describe-hsm-configurations

The following code example shows how to use describe-hsm-configurations.

AWS CLI

To describe HSM configurations

The following describe-hsm-configurations example displays details for the available HSM configurations for the calling AWS account.

```
aws redshift describe-hsm-configurations /  
  --hsm-configuration-identifier myhsmconnection
```

Output:

```
{  
  "HsmConfigurations": [  
    {  
      "HsmConfigurationIdentifier": "myhsmconnection",  
      "Description": "My HSM connection",  
      "HsmIpAddress": "192.0.2.09",  
      "HsmPartitionName": "myhsmpartition",  
      "Tags": []  
    }  
  ]  
}
```

- For API details, see [DescribeHsmConfigurations](#) in *AWS CLI Command Reference*.

describe-logging-status

The following code example shows how to use describe-logging-status.

AWS CLI

To describe logging status for a cluster

The following describe-logging-status example displays whether information, such as queries and connection attempts, is being logged for a cluster.

```
aws redshift describe-logging-status \  
  --cluster-identifier mycluster
```

Output:

```
{  
  "LoggingEnabled": false  
}
```

For more information, see [Database Audit Logging](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeLoggingStatus](#) in *AWS CLI Command Reference*.

describe-node-configuration-options

The following code example shows how to use `describe-node-configuration-options`.

AWS CLI

To describe node configuration options

The following `describe-node-configuration-options` example displays the properties of possible node configurations such as node type, number of nodes, and disk usage for the specified cluster snapshot.

```
aws redshift describe-node-configuration-options \  
  --action-type restore-cluster \  
  --snapshot-identifier rs:mycluster-2019-12-09-16-42-43
```

Output:

```
{  
  "NodeConfigurationOptionList": [  
    {  
      "NodeType": "dc2.large",  
      "NumberOfNodes": 2,  
      "EstimatedDiskUtilizationPercent": 19.61  
    },  
    {  
      "NodeType": "dc2.large",
```

```

        "NumberOfNodes": 4,
        "EstimatedDiskUtilizationPercent": 9.96
    },
    {
        "NodeType": "ds2.xlarge",
        "NumberOfNodes": 2,
        "EstimatedDiskUtilizationPercent": 1.53
    },
    {
        "NodeType": "ds2.xlarge",
        "NumberOfNodes": 4,
        "EstimatedDiskUtilizationPercent": 0.78
    }
]
}

```

For more information, see [Purchasing Amazon Redshift Reserved Nodes](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeNodeConfigurationOptions](#) in *AWS CLI Command Reference*.

describe-orderable-cluster-options

The following code example shows how to use `describe-orderable-cluster-options`.

AWS CLI

Describing All Orderable Cluster Options This example returns descriptions of all orderable cluster options. By default, the output is in JSON format. **Command:**

```
aws redshift describe-orderable-cluster-options
```

Result:

```

{
  "OrderableClusterOptions": [
    {
      "NodeType": "dw.hs1.8xlarge",
      "AvailabilityZones": [
        { "Name": "us-east-1a" },
        { "Name": "us-east-1b" },
        { "Name": "us-east-1c" } ],
    }
  ]
}

```

```

    "ClusterVersion": "1.0",
    "ClusterType": "multi-node"
  },
  {
    "NodeType": "dw.hs1.xlarge",
    "AvailabilityZones": [
      { "Name": "us-east-1a" },
      { "Name": "us-east-1b" },
      { "Name": "us-east-1c" } ],
    "ClusterVersion": "1.0",
    "ClusterType": "multi-node"
  },
  {
    "NodeType": "dw.hs1.xlarge",
    "AvailabilityZones": [
      { "Name": "us-east-1a" },
      { "Name": "us-east-1b" },
      { "Name": "us-east-1c" } ],
    "ClusterVersion": "1.0",
    "ClusterType": "single-node"
  } ],
  "ResponseMetadata": {
    "RequestId": "f6000035-64cb-11e2-9135-ff82df53a51a"
  }
}

```

You can also obtain the same information in text format using the `--output text` option.Command:

`--output text` option.Command:

option.Command:

```
aws redshift describe-orderable-cluster-options --output text
```

Result:

```

RESPONSEMETADATA  e648696b-64cb-11e2-bec0-17624ad140dd

```

- For API details, see [DescribeOrderableClusterOptions](#) in *AWS CLI Command Reference*.

describe-reserved-node-offerings

The following code example shows how to use `describe-reserved-node-offerings`.

AWS CLI

Describe Reserved Node Offerings This example shows all of the reserved node offerings that are available for purchase.
Command:

```
aws redshift describe-reserved-node-offerings
```

Result:

```

{
  "ReservedNodeOfferings": [
    {
      "OfferingType": "Heavy Utilization",
      "FixedPrice": "",
      "NodeType": "dw.hs1.xlarge",
      "UsagePrice": "",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": "",
          "RecurringChargeFrequency": "Hourly"
        }
      ],
      "Duration": 31536000,
      "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
    },
    {
      "OfferingType": "Heavy Utilization",
      "FixedPrice": "",
      "NodeType": "dw.hs1.8xlarge",

```

```

    "UsagePrice": "",
    "RecurringCharges": [
      {
        "RecurringChargeAmount": "",
        "RecurringChargeFrequency": "Hourly"
      } ],
    "Duration": 31536000,
    "ReservedNodeOfferingId": "e5a2ff3b-352d-4a9c-ad7d-373c4cab5dd2"
  },
  ...remaining output omitted...
],
"ResponseMetadata": {
  "RequestId": "8b1a1a43-75ff-11e2-9666-e142fe91ddd1"
}
}

```

If you want to purchase a reserved node offering, you can call `purchase-reserved-node-offering` using a valid *ReservedNodeOfferingId*.

`purchase-reserved-node-offering` using a valid *ReservedNodeOfferingId*.

using a valid *ReservedNodeOfferingId*.

ReservedNodeOfferingId.

.

- For API details, see [DescribeReservedNodeOfferings](#) in *AWS CLI Command Reference*.

describe-reserved-nodes

The following code example shows how to use `describe-reserved-nodes`.

AWS CLI

Describe Reserved Nodes This example shows a reserved node offering that has been purchased. Command:

```
aws redshift describe-reserved-nodes
```

Result:

```
{
```

```

"ResponseMetadata": {
  "RequestId": "bc29ce2e-7600-11e2-9949-4b361e7420b7"
},
"ReservedNodes": [
  {
    "OfferingType": "Heavy Utilization",
    "FixedPrice": "",
    "NodeType": "dw.hs1.xlarge",
    "ReservedNodeId": "1ba8e2e3-bc01-4d65-b35d-a4a3e931547e",
    "UsagePrice": "",
    "RecurringCharges": [
      {
        "RecurringChargeAmount": "",
        "RecurringChargeFrequency": "Hourly"
      } ],
    "NodeCount": 1,
    "State": "payment-pending",
    "StartTime": "2013-02-13T17:08:39.051Z",
    "Duration": 31536000,
    "ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
  }
]
}

```

- For API details, see [DescribeReservedNodes](#) in *AWS CLI Command Reference*.

describe-resize

The following code example shows how to use `describe-resize`.

AWS CLI

Describe ResizeThis example describes the latest resize of a cluster. The request was for 3 nodes of type `dw.hs1.8xlarge`. Command:

```
aws redshift describe-resize --cluster-identifier mycluster
```

Result:

```

{
  "Status": "NONE",
  "TargetClusterType": "multi-node",

```

```
"TargetNodeType": "dw.hs1.8xlarge",
"ResponseMetadata": {
  "RequestId": "9f52b0b4-7733-11e2-aa9b-318b2909bd27"
},
"TargetNumberOfNodes": "3"
}
```

- For API details, see [DescribeResize](#) in *AWS CLI Command Reference*.

describe-scheduled-actions

The following code example shows how to use describe-scheduled-actions.

AWS CLI

To describe scheduled actions

The following describe-scheduled-actions example displays details for any currently scheduled actions.

```
aws redshift describe-scheduled-actions
```

Output:

```
{
  "ScheduledActions": [
    {
      "ScheduledActionName": "resizecluster",
      "TargetAction": {
        "ResizeCluster": {
          "ClusterIdentifier": "mycluster",
          "NumberOfNodes": 4,
          "Classic": false
        }
      },
      "Schedule": "at(2019-12-10T00:07:00)",
      "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
      "State": "ACTIVE",
      "NextInvocations": [
        "2019-12-10T00:07:00Z"
      ]
    }
  ]
}
```

```
]
}
```

- For API details, see [DescribeScheduledActions](#) in *AWS CLI Command Reference*.

describe-snapshot-copy-grants

The following code example shows how to use `describe-snapshot-copy-grants`.

AWS CLI

To describe snapshot copy grants

The following `describe-snapshot-copy-grants` example displays details for the specified cluster snapshot copy grant.

```
aws redshift describe-snapshot-copy-grants \
  --snapshot-copy-grant-name mysnapshotcopygrantname
```

Output:

```
{
  "SnapshotCopyGrants": [
    {
      "SnapshotCopyGrantName": "mysnapshotcopygrantname",
      "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
bPxRfih3yCo8nvbEXAMPLEKEY",
      "Tags": []
    }
  ]
}
```

For more information, see [Amazon Redshift Database Encryption](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeSnapshotCopyGrants](#) in *AWS CLI Command Reference*.

describe-snapshot-schedules

The following code example shows how to use `describe-snapshot-schedules`.

AWS CLI

To describe snapshot schedules

The following `describe-snapshot-schedules` example displays details for the specified cluster snapshot schedule.

```
aws redshift describe-snapshot-schedules \  
  --cluster-identifier mycluster \  
  --schedule-identifier mysnapshotschedule
```

Output:

```
{  
  "SnapshotSchedules": [  
    {  
      "ScheduleDefinitions": [  
        "rate(12 hours)"  
      ],  
      "ScheduleIdentifier": "mysnapshotschedule",  
      "ScheduleDescription": "My schedule description",  
      "Tags": [],  
      "AssociatedClusterCount": 1,  
      "AssociatedClusters": [  
        {  
          "ClusterIdentifier": "mycluster",  
          "ScheduleAssociationState": "ACTIVE"  
        }  
      ]  
    }  
  ]  
}
```

For more information, see [Automated Snapshot Schedules](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeSnapshotSchedules](#) in *AWS CLI Command Reference*.

describe-storage

The following code example shows how to use `describe-storage`.

AWS CLI

To describe storage

The following `describe-storage` example displays details about the backup storage and provisional storage sizes for the account.

```
aws redshift describe-storage
```

Output:

```
{
  "TotalBackupSizeInMegaBytes": 193149.0,
  "TotalProvisionedStorageInMegaBytes": 655360.0
}
```

For more information, see [Managing Snapshot Storage](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeStorage](#) in *AWS CLI Command Reference*.

`describe-table-restore-status`

The following code example shows how to use `describe-table-restore-status`.

AWS CLI

To describe status of table restore requests from a cluster snapshot

The following `describe-table-restore-status` example displays details for table restore requests made for the specified cluster.

```
aws redshift describe-table-restore-status /
  --cluster-identifier mycluster
```

Output:

```
{
  "TableRestoreStatusDetails": [
    {
      "TableRestoreRequestId": "z1116630-0e80-46f4-ba86-bd9670411ebd",
      "Status": "IN_PROGRESS",

```

```

    "RequestTime": "2019-12-27T18:22:12.257Z",
    "ClusterIdentifier": "mycluster",
    "SnapshotIdentifier": "mysnapshotid",
    "SourceDatabaseName": "dev",
    "SourceSchemaName": "public",
    "SourceTableName": "mytable",
    "TargetDatabaseName": "dev",
    "TargetSchemaName": "public",
    "NewTableName": "mytable-clone"
  }
]
}

```

For more information, see [Restoring a Table from a Snapshot](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeTableRestoreStatus](#) in *AWS CLI Command Reference*.

describe-tags

The following code example shows how to use `describe-tags`.

AWS CLI

To describe tags

The following `describe-tags` example displays the resources the specified cluster associated with the specified tag names and values.

```

aws redshift describe-tags \
  --resource-name arn:aws:redshift:us-west-2:123456789012:cluster:mycluster \
  --tag-keys clustertagkey \
  --tag-values clustertagvalue

```

Output:

```

{
  "TaggedResources": [
    {
      "Tag": {
        "Key": "clustertagkey",
        "Value": "clustertagvalue"
      },

```

```
        "ResourceName": "arn:aws:redshift:us-  
west-2:123456789012:cluster:mycluster",  
        "ResourceType": "cluster"  
    }  
]  
}
```

For more information, see [Tagging Resources in Amazon Redshift](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

disable-snapshot-copy

The following code example shows how to use `disable-snapshot-copy`.

AWS CLI

To disable snapshot copy for a cluster

The following `disable-snapshot-copy` example disables the automatic copy of a snapshot for the specified cluster.

```
aws redshift disable-snapshot-copy \  
--cluster-identifier mycluster
```

Output:

```
{  
  "Cluster": {  
    "ClusterIdentifier": "mycluster",  
    "NodeType": "dc2.large",  
    "ClusterStatus": "available",

For more information, see [Copying Snapshots to Another AWS Region](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [DisableSnapshotCopy](#) in *AWS CLI Command Reference*.

enable-snapshot-copy

The following code example shows how to use `enable-snapshot-copy`.

AWS CLI

To enable snapshot copy for a cluster

The following `enable-snapshot-copy` example enables the automatic copy of a snapshot for the specified cluster.

```
aws redshift enable-snapshot-copy \
  --cluster-identifier mycluster \
  --destination-region us-west-1
```

Output:

```
{
  "Cluster": {

get-cluster-credentials

The following code example shows how to use `get-cluster-credentials`.

AWS CLI

To get cluster credentials for an AWS account

The following `get-cluster-credentials` example retrieves temporary credentials that enable access to an Amazon Redshift database.

```
aws redshift get-cluster-credentials \
  --db-user adminuser --db-name dev \
  --cluster-identifier mycluster
```

Output:

```
{
  "DbUser": "IAM:adminuser",
  "DbPassword": "AMAFUyyuros/QjxPTtgzcsuQsqzIasdzJEN04aCtWDzXx109d6UmpkBtvEqFly/
EXAMPLE==",
  "Expiration": "2019-12-10T17:25:05.770Z"
}
```

For more information, see [Generating IAM Database Credentials Using the Amazon Redshift CLI or API](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [GetClusterCredentials](#) in *AWS CLI Command Reference*.

get-reserved-node-exchange-offerings

The following code example shows how to use `get-reserved-node-exchange-offerings`.

AWS CLI

To get reserved node exchange offerings

The following `get-reserved-node-exchange-offerings` example retrieves an array of DC2 `ReservedNodeOfferings` that match the specified DC1 reserved node.

```
aws redshift get-reserved-node-exchange-offerings \  
  --reserved-node-id 12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE
```

Output:

```
{  
  "ReservedNodeOfferings": [  
    {  
      "ReservedNodeOfferingId": "12345678-12ab-12a1-1a2a-12ab-12a12EXAMPLE",  
      "NodeType": "dc2.large",  
      "Duration": 31536000,  
      "FixedPrice": 0.0,  
      "UsagePrice": 0.0,  
      "CurrencyCode": "USD",  
      "OfferingType": "All Upfront",  
      "RecurringCharges": [  
        {  
          "RecurringChargeAmount": 0.0,  
          "RecurringChargeFrequency": "Hourly"  
        }  
      ],  
      "ReservedNodeOfferingType": "Regular"  
    }  
  ]  
}
```

For more information, see [Upgrading Reserved Nodes With the AWS CLI](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [GetReservedNodeExchangeOfferings](#) in *AWS CLI Command Reference*.

modify-cluster-iam-roles

The following code example shows how to use `modify-cluster-iam-roles`.

AWS CLI

To modify the IAM role for a cluster

The following `modify-cluster-iam-roles` example removes the specified AWS IAM role from the specified cluster.

```
aws redshift modify-cluster-iam-roles \  
  --cluster-identifier mycluster \  
  --remove-iam-roles arn:aws:iam::123456789012:role/myRedshiftRole
```

Output:

```
{  
  "Cluster": {  
    "ClusterIdentifier": "mycluster",  
    "NodeType": "dc2.large",

modify-cluster-maintenance

The following code example shows how to use `modify-cluster-maintenance`.

AWS CLI

To modify cluster maintenance

The following `modify-cluster-maintenance` example defers the maintenance of the specified cluster by 30 days.

```
aws redshift modify-cluster-maintenance \  
  --cluster-identifier mycluster \  
  --defer-maintenance \  
  --defer-maintenance-duration 30
```

Output:

```
{  
  "Cluster": {  
    "ClusterIdentifier": "mycluster",  
    "NodeType": "dc2.large",  
    "ClusterStatus": "available",  
    "ClusterAvailabilityStatus": "Available",  
    "MasterUsername": "adminuser",  
    "DBName": "dev",  
    "Endpoint": {  
      "Address": "mycluster.cmeaswquae.us-west-2.redshift.amazonaws.com",  
      "Port": 5439  
    },  
    "ClusterCreateTime": "2019-12-05T18:44:36.991Z",  
    "AutomatedSnapshotRetentionPeriod": 3,  
    "ManualSnapshotRetentionPeriod": -1,  
    "ClusterSecurityGroups": [],  
    "VpcSecurityGroups": [  
      {  
        "VpcSecurityGroupId": "sh-a1a123ab",  
        "Status": "active"  
      }  
    ],  
    "ClusterParameterGroups": [  
      {  
        "ParameterGroupName": "default.redshift-1.0",
```

```
        "ParameterApplyStatus": "in-sync"
    }
],

"ExpectedNextSnapshotScheduleTimeStatus": "OnTrack",
"NextMaintenanceWindowStartTime": "2020-01-11T16:00:00Z"
}
}
```

For more information, see [Cluster Maintenance](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [ModifyClusterMaintenance](#) in *AWS CLI Command Reference*.

modify-cluster-parameter-group

The following code example shows how to use `modify-cluster-parameter-group`.

AWS CLI

Modify a parameter in a parameter group

The following `modify-cluster-parameter-group` example modifies the `wlm_json_configuration` parameter for workload management. It accepts the parameters from a file that contains the JSON contents shown below.

```
aws redshift modify-cluster-parameter-group \  
  --parameter-group-name myclusterparametergroup \  
  --parameters file://modify_pg.json
```

Contents of `modify_pg.json`:

```
[  
  {  
    "ParameterName": "wlm_json_configuration",  
    "ParameterValue": "[{\\"user_group\\":\\"example_user_group1\\",\\"query_group\\":  
  \\"example_query_group1\\", \\"query_concurrency\\":7},{\\"query_concurrency\\":5}]"  
  }  
]
```

Output:

```
{  
  "ParameterGroupStatus": "Your parameter group has been updated but changes won't  
  get applied until you reboot the associated Clusters.",  
  "ParameterGroupName": "myclusterparametergroup",  
  "ResponseMetadata": {  
    "RequestId": "09974cc0-64cd-11e2-bea9-49e0ce183f07"  
  }  
}
```

- For API details, see [ModifyClusterParameterGroup](#) in *AWS CLI Command Reference*.

modify-cluster-snapshot-schedule

The following code example shows how to use `modify-cluster-snapshot-schedule`.

AWS CLI

To modify cluster snapshot schedule

The following `modify-cluster-snapshot-schedule` example removes the specified snapshot schedule from the specified cluster.

```
aws redshift modify-cluster-snapshot-schedule \  
  --cluster-identifier mycluster \  
  --schedule-identifier mysnapshotschedule \  
  --disassociate-schedule
```

This command does not produce any output.

For more information, see [Automated Snapshot Schedules](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [ModifyClusterSnapshotSchedule](#) in *AWS CLI Command Reference*.

modify-cluster-snapshot

The following code example shows how to use `modify-cluster-snapshot`.

AWS CLI

To modify cluster snapshot

The following `modify-cluster-snapshot` example sets the manual retention period setting for the specified cluster snapshot to value of 10 days.

```
aws redshift modify-cluster-snapshot \  
  --snapshot-identifier mycluster-2019-11-06-16-32 \  
  --manual-snapshot-retention-period 10
```

Output:

```
{
  "Snapshot": {
    "SnapshotIdentifier": "mycluster-2019-11-06-16-32",
    "ClusterIdentifier": "mycluster",
    "SnapshotCreateTime": "2019-12-07T00:34:05.633Z",
    "Status": "available",
    "Port": 5439,
    "AvailabilityZone": "us-west-2f",
    "ClusterCreateTime": "2019-12-05T18:44:36.991Z",
    "MasterUsername": "adminuser",
    "ClusterVersion": "1.0",
    "SnapshotType": "manual",
    "NodeType": "dc2.large",
    "NumberOfNodes": 2,

        "Value": "mytagvalue"
      }
    ],
    "EnhancedVpcRouting": false,
    "MaintenanceTrackName": "current",
    "ManualSnapshotRetentionPeriod": 10,
    "ManualSnapshotRemainingDays": 6,
    "SnapshotRetentionStartTime": "2019-12-07T00:34:07.479Z"
  }
}
```

For more information, see [Amazon Redshift Snapshots](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [ModifyClusterSnapshot](#) in *AWS CLI Command Reference*.

modify-cluster-subnet-group

The following code example shows how to use `modify-cluster-subnet-group`.

AWS CLI

Modify the Subnets in a Cluster Subnet Group This example shows how to modify the list of subnets in a cache subnet group. By default, the output is in JSON format.**Command:**

```
aws redshift modify-cluster-subnet-group --cluster-subnet-group-name mysubnetgroup
--subnet-ids subnet-763fdd1 subnet-ac830e9
```

Result:

```
{
  "ClusterSubnetGroup": {
    "Subnets": [
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-763fdd1c",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1a"
        }
      },
      {
        "SubnetStatus": "Active",
        "SubnetIdentifier": "subnet-ac830e9",
        "SubnetAvailabilityZone": {
          "Name": "us-east-1b"
        }
      }
    ],
    "VpcId": "vpc-7e3fdd14",
    "SubnetGroupStatus": "Complete",
    "Description": "My subnet group",
    "ClusterSubnetGroupName": "mysubnetgroup"
  },
  "ResponseMetadata": {
    "RequestId": "8da93e89-8372-f936-93a8-873918938197a"
  }
}
```

- For API details, see [ModifyClusterSubnetGroup](#) in *AWS CLI Command Reference*.

modify-cluster

The following code example shows how to use `modify-cluster`.

AWS CLI

Associate a Security Group with a Cluster This example shows how to associate a cluster security group with the specified cluster. Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --cluster-security-groups mysecuritygroup
```

Modify the Maintenance Window for a Cluster This shows how to change the weekly preferred maintenance window for a cluster to be the minimum four hour window starting Sundays at 11:15 PM, and ending Mondays at 3:15 AM. Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --preferred-maintenance-window Sun:23:15-Mon:03:15
```

Change the Master Password for the Cluster This example shows how to change the master password for a cluster. Command:

```
aws redshift modify-cluster --cluster-identifier mycluster --master-user-password A1b2c3d4
```

- For API details, see [ModifyCluster](#) in *AWS CLI Command Reference*.

modify-event-subscription

The following code example shows how to use `modify-event-subscription`.

AWS CLI

To modify event subscription

The following `modify-event-subscription` example disables the specified event notification subscription.

```
aws redshift modify-event-subscription \  
  --subscription-name mysubscription \  
  --no-enabled
```

Output:

```
{
  "EventSubscription": {
    "CustomerAwsId": "123456789012",
    "CustSubscriptionId": "mysubscription",
    "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:MySNStopic",
    "Status": "active",
    "SubscriptionCreationTime": "2019-12-09T21:50:21.332Z",
    "SourceIdsList": [],
    "EventCategoriesList": [
      "management"
    ],
    "Severity": "ERROR",
    "Enabled": false,
    "Tags": []
  }
}
```

For more information, see [Subscribing to Amazon Redshift Event Notifications](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [ModifyEventSubscription](#) in *AWS CLI Command Reference*.

modify-scheduled-action

The following code example shows how to use `modify-scheduled-action`.

AWS CLI**To modify scheduled action**

The following `modify-scheduled-action` example adds a description to the specified existing scheduled action.

```
aws redshift modify-scheduled-action \
  --scheduled-action-name myscheduledaction \
  --scheduled-action-description "My scheduled action"
```

Output:

```
{
```

```

    "ScheduledActionName": "myscheduledaction",
    "TargetAction": {
      "ResizeCluster": {
        "ClusterIdentifier": "mycluster",
        "NumberOfNodes": 2,
        "Classic": false
      }
    },
    "Schedule": "at(2019-12-25T00:00:00)",
    "IamRole": "arn:aws:iam::123456789012:role/myRedshiftRole",
    "ScheduledActionDescription": "My scheduled action",
    "State": "ACTIVE",
    "NextInvocations": [
      "2019-12-25T00:00:00Z"
    ]
  }
}

```

- For API details, see [ModifyScheduledAction](#) in *AWS CLI Command Reference*.

modify-snapshot-copy-retention-period

The following code example shows how to use `modify-snapshot-copy-retention-period`.

AWS CLI

To modify snapshot copy retention period

The following `modify-snapshot-copy-retention-period` example modifies the number of days to retain snapshots for the specified cluster in the destination AWS Region after they are copied from the source AWS Region.

```

aws redshift modify-snapshot-copy-retention-period \
  --cluster-identifier mycluster \
  --retention-period 15

```

Output:

```

{
  "Cluster": {
    "ClusterIdentifier": "mycluster",
    "NodeType": "dc2.large",
    "ClusterStatus": "available",

```

```
"ClusterAvailabilityStatus": "Available",

}
}

```

For more information, see [Snapshot Schedule Format](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [ModifySnapshotCopyRetentionPeriod](#) in *AWS CLI Command Reference*.

modify-snapshot-schedule

The following code example shows how to use `modify-snapshot-schedule`.

AWS CLI

To modify snapshot schedule

The following `modify-snapshot-schedule` example modifies the rate of the specified snapshot schedule to every 10 hours.

```

aws redshift modify-snapshot-schedule \
  --schedule-identifier mysnapshotschedule \
  --schedule-definitions "rate(10 hours)"

```

Output:

```

{
  "ScheduleDefinitions": [

```

```

    "rate(10 hours)"
  ],
  "ScheduleIdentifier": "mysnapshotschedule",
  "ScheduleDescription": "My schedule description",
  "Tags": []
}

```

For more information, see [Snapshot Schedule Format](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [ModifySnapshotSchedule](#) in *AWS CLI Command Reference*.

purchase-reserved-node-offering

The following code example shows how to use `purchase-reserved-node-offering`.

AWS CLI

Purchase a Reserved Node This example shows how to purchase a reserved node offering. The `reserved-node-offering-id` is obtained by calling `describe-reserved-node-offerings`. Command:

```
aws redshift purchase-reserved-node-offering --reserved-node-offering-id ceb6a579-cf4c-4343-be8b-d832c45ab51c
```

Result:

```

{
  "ReservedNode": {
    "OfferingType": "Heavy Utilization",
    "FixedPrice": "",
    "NodeType": "dw.hs1.xlarge",
    "ReservedNodeId": "1ba8e2e3-bc01-4d65-b35d-a4a3e931547e",
    "UsagePrice": "",
    "RecurringCharges": [
      {
        "RecurringChargeAmount": "",
        "RecurringChargeFrequency": "Hourly"
      }
    ],
    "NodeCount": 1,
  }
}

```

```
"State": "payment-pending",
"StartTime": "2013-02-13T17:08:39.051Z",
"Duration": 31536000,
"ReservedNodeOfferingId": "ceb6a579-cf4c-4343-be8b-d832c45ab51c"
},
"ResponseMetadata": {
  "RequestId": "01bda7bf-7600-11e2-b605-2568d7396e7f"
}
}
```

- For API details, see [PurchaseReservedNodeOffering](#) in *AWS CLI Command Reference*.

reboot-cluster

The following code example shows how to use `reboot-cluster`.

AWS CLI

Reboot a Cluster This example reboots a cluster. By default, the output is in JSON format.
Command:

```
aws redshift reboot-cluster --cluster-identifier mycluster
```

Result:

```
{
  "Cluster": {
    "NodeType": "dw.hs1.xlarge",
    "Endpoint": {
      "Port": 5439,

```

- For API details, see [RebootCluster](#) in *AWS CLI Command Reference*.

reset-cluster-parameter-group

The following code example shows how to use `reset-cluster-parameter-group`.

AWS CLI

Reset Parameters in a Parameter Group This example shows how to reset all of the parameters in a parameter group. Command:

```
aws redshift reset-cluster-parameter-group --parameter-group-name
myclusterparametergroup --reset-all-parameters
```

- For API details, see [ResetClusterParameterGroup](#) in *AWS CLI Command Reference*.

resize-cluster

The following code example shows how to use `resize-cluster`.

AWS CLI

To resize cluster

The following `resize-cluster` example resizes the specified cluster.

```
aws redshift resize-cluster \  
  --cluster-identifier mycluster \  
  --cluster-type multi-node \  
  --node-type dc2.large \  
  --number-of-nodes 6 \  
  --classic
```

Output:

```
{  
  "Cluster": {  
    "ClusterIdentifier": "mycluster",  
    "NodeType": "dc2.large",  
    "ClusterStatus": "resizing",

restore-from-cluster-snapshot

The following code example shows how to use `restore-from-cluster-snapshot`.

AWS CLI

Restore a Cluster From a Snapshot This example restores a cluster from a snapshot. Command:

```
aws redshift restore-from-cluster-snapshot --cluster-identifier mycluster-clone --
snapshot-identifier my-snapshot-id
```

Result:

```
{
  "Cluster": {
    "NodeType": "dw.hs1.xlarge",
    "ClusterVersion": "1.0",
    "PubliclyAccessible": "true",
    "MasterUsername": "adminuser",
    "ClusterParameterGroups": [
      {
        "ParameterApplyStatus": "in-sync",
        "ParameterGroupName": "default.redshift-1.0"
      }
    ],
    "ClusterSecurityGroups": [
      {
        "Status": "active",
        "ClusterSecurityGroupName": "default"
      }
    ],
    "AllowVersionUpgrade": true,
    "VpcSecurityGroups": [],
    "PreferredMaintenanceWindow": "sun:23:15-mon:03:15",
    "AutomatedSnapshotRetentionPeriod": 1,
    "ClusterStatus": "creating",
    "ClusterIdentifier": "mycluster-clone",
    "DBName": "dev",
    "NumberOfNodes": 2,
```

```
    "PendingModifiedValues": {}
  },
  "ResponseMetadata": {
    "RequestId": "77fd512b-64e3-11e2-8f5b-e90bd6c77476"
  }
}
```

- For API details, see [RestoreFromClusterSnapshot](#) in *AWS CLI Command Reference*.

restore-table-from-cluster-snapshot

The following code example shows how to use `restore-table-from-cluster-snapshot`.

AWS CLI

To restore table from a cluster snapshot

The following `restore-table-from-cluster-snapshot` example creates a new table from the specified table in the specified cluster snapshot.

```
aws redshift restore-table-from-cluster-snapshot /
  --cluster-identifier mycluster /
  --snapshot-identifier mycluster-2019-11-19-16-17 /
  --source-database-name dev /
  --source-schema-name public /
  --source-table-name mytable /
  --target-database-name dev /
  --target-schema-name public /
  --new-table-name mytable-clone
```

Output:

```
{
  "TableRestoreStatus": {
    "TableRestoreRequestId": "a123a12b-abc1-1a1a-a123-a1234ab12345",
    "Status": "PENDING",
    "RequestTime": "2019-12-20T00:20:16.402Z",
    "ClusterIdentifier": "mycluster",
    "SnapshotIdentifier": "mycluster-2019-11-19-16-17",
    "SourceDatabaseName": "dev",
    "SourceSchemaName": "public",
    "SourceTableName": "mytable",
```

```
    "TargetDatabaseName": "dev",
    "TargetSchemaName": "public",
    "NewTableName": "mytable-clone"
  }
}
```

For more information, see [Restoring a Table from a Snapshot](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [RestoreTableFromClusterSnapshot](#) in *AWS CLI Command Reference*.

revoke-cluster-security-group-ingress

The following code example shows how to use `revoke-cluster-security-group-ingress`.

AWS CLI

Revoke Access from an EC2 Security Group This example revokes access to a named Amazon EC2 security group. Command:

```
aws redshift revoke-cluster-security-group-ingress --cluster-security-group-name
mysecuritygroup --ec2-security-group-name myec2securitygroup --ec2-security-group-
owner-id 123445677890
```

Revoking Access to a CIDR range This example revokes access to a CIDR range. Command:

```
aws redshift revoke-cluster-security-group-ingress --cluster-security-group-name
mysecuritygroup --cidrip 192.168.100.100/32
```

- For API details, see [RevokeClusterSecurityGroupIngress](#) in *AWS CLI Command Reference*.

revoke-snapshot-access

The following code example shows how to use `revoke-snapshot-access`.

AWS CLI

Revoke the Authorization of an AWS Account to Restore a Snapshot This example revokes the authorization of the AWS account 444455556666 to restore the snapshot `my-snapshot-id`. By default, the output is in JSON format. Command:

```
aws redshift revoke-snapshot-access --snapshot-id my-snapshot-id --account-with-restore-access 444455556666
```

Result:

```
{
  "Snapshot": {
    "Status": "available",
    "SnapshotCreateTime": "2013-07-17T22:04:18.947Z",
    "EstimatedSecondsToCompletion": 0,
    "AvailabilityZone": "us-east-1a",
    "ClusterVersion": "1.0",
    "MasterUsername": "adminuser",
    "Encrypted": false,
    "OwnerAccount": "111122223333",
    "BackupProgressInMegabytes": 11.0,
    "ElapsedTimeInSeconds": 0,
    "DBName": "dev",
    "CurrentBackupRateInMegabytesPerSecond": 0.1534,
    "ClusterCreateTime": "2013-01-22T21:59:29.559Z",
    "ActualIncrementalBackupSizeInMegabytes": 11.0,
    "SnapshotType": "manual",
    "NodeType": "dw.hs1.xlarge",
    "ClusterIdentifier": "mycluster",
    "TotalBackupSizeInMegabytes": 20.0,
    "Port": 5439,
    "NumberOfNodes": 2,
    "SnapshotIdentifier": "my-snapshot-id"
  }
}
```

- For API details, see [RevokeSnapshotAccess](#) in *AWS CLI Command Reference*.

rotate-encryption-key

The following code example shows how to use rotate-encryption-key.

AWS CLI

To rotate encryption key for a cluster

The following rotate-encryption-key example rotates the encryption key for the specified cluster.

```
aws redshift rotate-encryption-key \  
  --cluster-identifier mycluster
```

Output:

```
{  
  "Cluster": {  
    "ClusterIdentifier": "mycluster",  
    "NodeType": "dc2.large",  
    "ClusterStatus": "rotating-keys",  
    "ClusterAvailabilityStatus": "Modifying",  
    "MasterUsername": "adminuser",  
    "DBName": "dev",  
    "Endpoint": {  
      "Address": "mycluster.cmeaswqeuae.us-west-2.redshift.amazonaws.com",  
      "Port": 5439  
    },  
    "ClusterCreateTime": "2019-12-10T19:25:45.886Z",  
    "AutomatedSnapshotRetentionPeriod": 30,  
    "ManualSnapshotRetentionPeriod": -1,  
    "ClusterSecurityGroups": [],  
    "VpcSecurityGroups": [  
      {  
        "VpcSecurityGroupId": "sh-a1a123ab",  
        "Status": "active"  
      }  
    ],  
    "ClusterParameterGroups": [  
      {  
        "ParameterGroupName": "default.redshift-1.0",  
        "ParameterApplyStatus": "in-sync"  
      }  
    ],  
    "ClusterSubnetGroupName": "default",  
    "VpcId": "vpc-a1abc1a1",  
    "AvailabilityZone": "us-west-2a",  
    "PreferredMaintenanceWindow": "sat:16:00-sat:16:30",  
    "PendingModifiedValues": {},  
    "ClusterVersion": "1.0",  
    "AllowVersionUpgrade": true,  
  }  
}
```

```
    "NumberOfNodes": 2,
    "PubliclyAccessible": false,
    "Encrypted": true,
    "Tags": [],
    "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/
bPxRfih3yCo8nvbEXAMPLEKEY",
    "EnhancedVpcRouting": false,
    "IamRoles": [
      {
        "IamRoleArn": "arn:aws:iam::123456789012:role/myRedshiftRole",
        "ApplyStatus": "in-sync"
      }
    ],
    "MaintenanceTrackName": "current",
    "DeferredMaintenanceWindows": [],
    "NextMaintenanceWindowStartTime": "2019-12-14T16:00:00Z"
  }
}
```

For more information, see [Amazon Redshift Database Encryption](#) in the *Amazon Redshift Cluster Management Guide*.

- For API details, see [RotateEncryptionKey](#) in *AWS CLI Command Reference*.

Amazon Rekognition examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Rekognition.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

compare-faces

The following code example shows how to use compare-faces.

For more information, see [Comparing faces in images](#).

AWS CLI

To compare faces in two images

The following compare-faces command compares faces in two images stored in an Amazon S3 bucket.

```
aws rekognition compare-faces \  
  --source-image '{"S3object":{"Bucket":"MyImageS3Bucket","Name":"source.jpg"}}' \  
  --target-image '{"S3object":{"Bucket":"MyImageS3Bucket","Name":"target.jpg"}}'
```

Output:

```
{  
  "UnmatchedFaces": [],  
  "FaceMatches": [  
    {  
      "Face": {  
        "BoundingBox": {

    },
    "Confidence": 100.0
}
}

```

For more information, see [Comparing Faces in Images](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [CompareFaces](#) in *AWS CLI Command Reference*.

create-collection

The following code example shows how to use `create-collection`.

For more information, see [Creating a collection](#).

AWS CLI

To create a collection

The following `create-collection` command creates a collection with the specified name.

```
aws rekognition create-collection \  
  --collection-id "MyCollection"
```

Output:

```
{  
  "CollectionArn": "aws:rekognition:us-west-2:123456789012:collection/  
MyCollection",  
  "FaceModelVersion": "4.0",  
  "StatusCode": 200  
}
```

For more information, see [Creating a Collection](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [CreateCollection](#) in *AWS CLI Command Reference*.

create-stream-processor

The following code example shows how to use `create-stream-processor`.

AWS CLI

To create a new stream processor

The following `create-stream-processor` example creates a new stream processor with the specified configuration.

```
aws rekognition create-stream-processor --name my-stream-processor\  
  --input '{"KinesisVideoStream":{"Arn":"arn:aws:kinesisvideo:us-  
west-2:123456789012:stream/macwebcam/1530559711205"}}'\
```

```
--stream-processor-output '{"KinesisDataStream":{"Arn":"arn:aws:kinesis:us-  
west-2:123456789012:stream/AmazonRekognitionRekStream"}}'\  
--role-arn arn:aws:iam::123456789012:role/AmazonRekognitionDetect\  
--settings '{"FaceSearch":  
{"CollectionId":"MyCollection","FaceMatchThreshold":85.5}}'
```

Output:

```
{  
  "StreamProcessorArn": "arn:aws:rekognition:us-  
west-2:123456789012:streamprocessor/my-stream-processor"  
}
```

For more information, see [Working with Streaming Videos](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [CreateStreamProcessor](#) in *AWS CLI Command Reference*.

delete-collection

The following code example shows how to use delete-collection.

For more information, see [Deleting a collection](#).

AWS CLI

To delete a collection

The following delete-collection command deletes the specified collection.

```
aws rekognition delete-collection \  
  --collection-id MyCollection
```

Output:

```
{  
  "StatusCode": 200  
}
```

For more information, see [Deleting a Collection](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [DeleteCollection](#) in *AWS CLI Command Reference*.

delete-faces

The following code example shows how to use delete-faces.

For more information, see [Deleting faces from a collection](#).

AWS CLI

To delete faces from a collection

The following delete-faces command deletes the specified face from a collection.

```
aws rekognition delete-faces \  
  --collection-id MyCollection \  
  --face-ids '["0040279c-0178-436e-b70a-e61b074e96b0"]'
```

Output:

```
{  
  "DeletedFaces": [  
    "0040279c-0178-436e-b70a-e61b074e96b0"  
  ]  
}
```

For more information, see [Deleting Faces from a Collection](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [DeleteFaces](#) in *AWS CLI Command Reference*.

delete-stream-processor

The following code example shows how to use delete-stream-processor.

AWS CLI

To delete a stream processor

The following delete-stream-processor command deletes the specified stream processor.

```
aws rekognition delete-stream-processor \  
  --stream-processor-name MyStreamProcessor
```

```
--name my-stream-processor
```

This command produces no output.

For more information, see [Working with Streaming Videos](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [DeleteStreamProcessor](#) in *AWS CLI Command Reference*.

describe-collection

The following code example shows how to use describe-collection.

For more information, see [Describing a collection](#).

AWS CLI

To describe a collection

The following describe-collection example displays the details about the specified collection.

```
aws rekognition describe-collection \  
  --collection-id MyCollection
```

Output:

```
{  
  "FaceCount": 200,  
  "CreationTimestamp": 1569444828.274,  
  "CollectionARN": "arn:aws:rekognition:us-west-2:123456789012:collection/  
MyCollection",  
  "FaceModelVersion": "4.0"  
}
```

For more information, see [Describing a Collection](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [DescribeCollection](#) in *AWS CLI Command Reference*.

describe-stream-processor

The following code example shows how to use describe-stream-processor.

AWS CLI

To get information about a stream processor

The following `describe-stream-processor` command displays details about the specified stream processor.

```
aws rekognition describe-stream-processor \  
  --name my-stream-processor
```

Output:

```
{  
  "Status": "STOPPED",  
  "Name": "my-stream-processor",  
  "LastUpdateTimestamp": 1532449292.712,  
  "Settings": {  
    "FaceSearch": {  
      "FaceMatchThreshold": 80.0,  
      "CollectionId": "my-collection"  
    }  
  },  
  "RoleArn": "arn:aws:iam::123456789012:role/AmazonRekognitionDetectStream",  
  "StreamProcessorArn": "arn:aws:rekognition:us-west-2:123456789012:streamprocessor/my-stream-processor",  
  "Output": {  
    "KinesisDataStream": {  
      "Arn": "arn:aws:kinesis:us-west-2:123456789012:stream/AmazonRekognitionRekStream"  
    }  
  },  
  "Input": {  
    "KinesisVideoStream": {  
      "Arn": "arn:aws:kinesisvideo:us-west-2:123456789012:stream/macwebcam/123456789012"  
    }  
  },  
  "CreationTimestamp": 1532449292.712  
}
```

For more information, see [Working with Streaming Videos](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [DescribeStreamProcessor](#) in *AWS CLI Command Reference*.

detect-faces

The following code example shows how to use detect-faces.

For more information, see [Detecting faces in an image](#).

AWS CLI

To detect faces in an image

The following detect-faces command detects faces in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-faces \  
  --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"MyFriend.jpg"}}' \  
  --attributes "ALL"
```

Output:

```
{  
  "FaceDetails": [  
    {  
      "Confidence": 100.0,  
      "Eyeglasses": {

For more information, see [Detecting Faces in an Image](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [DetectFaces](#) in *AWS CLI Command Reference*.

detect-labels

The following code example shows how to use `detect-labels`.

For more information, see [Detecting labels in an image](#).

AWS CLI

To detect a label in an image

The following `detect-labels` example detects scenes and objects in an image stored in an Amazon S3 bucket.

```
aws rekognition detect-labels \  
  --image '{"S3Object":{"Bucket":"bucket","Name":"image"}}'
```

Output:

```
{  
  "Labels": [

For more information, see [Detecting Labels in an Image](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [DetectLabels](#) in *AWS CLI Command Reference*.

detect-moderation-labels

The following code example shows how to use `detect-moderation-labels`.

For more information, see [Detecting inappropriate images](#).

AWS CLI

To detect unsafe content in an image

The following `detect-moderation-labels` command detects unsafe content in the specified image stored in an Amazon S3 bucket.

```
aws rekognition detect-moderation-labels \
  --image "S3Object={Bucket=MyImageS3Bucket,Name=gun.jpg}"
```

Output:

```
{
  "ModerationModelVersion": "3.0",
  "ModerationLabels": [
    {
      "Confidence": 97.29618072509766,
      "ParentName": "Violence",
      "Name": "Weapon Violence"
    },
    {
      "Confidence": 97.29618072509766,
      "ParentName": "",

```

```

        "Name": "Violence"
      }
    ]
  }

```

For more information, see [Detecting Unsafe Images](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [DetectModerationLabels](#) in *AWS CLI Command Reference*.

detect-text

The following code example shows how to use `detect-text`.

For more information, see [Detecting text in an image](#).

AWS CLI

To detect text in an image

The following `detect-text` command detects text in the specified image.

```

aws rekognition detect-text \
  --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePicture.jpg"}}'

```

Output:

```

- For API details, see [DetectText](#) in *AWS CLI Command Reference*.

disassociate-faces

The following code example shows how to use `disassociate-faces`.

AWS CLI

```
aws rekognition disassociate-faces --face-ids list-of-face-ids
  --user-id user-id --collection-id collection-name --region region-name
```

- For API details, see [DisassociateFaces](#) in *AWS CLI Command Reference*.

get-celebrity-info

The following code example shows how to use `get-celebrity-info`.

AWS CLI

To get information about a celebrity

The following `get-celebrity-info` command displays information about the specified celebrity. The `id` parameter comes from a previous call to `recognize-celebrities`.

```
aws rekognition get-celebrity-info --id nnnnnnn
```

Output:

```
{
  "Name": "Celeb A",
  "Urls": [
    "www.imdb.com/name/aaaaaaaaa"
  ]
}
```

For more information, see [Getting Information About a Celebrity](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [GetCelebrityInfo](#) in *AWS CLI Command Reference*.

get-celebrity-recognition

The following code example shows how to use `get-celebrity-recognition`.

AWS CLI

To get the results of a celebrity recognition operation

The following `get-celebrity-recognition` command displays the results of a celebrity recognition operation that you started previously by calling `start-celebrity-recognition`.

```
aws rekognition get-celebrity-recognition \
  --job-id 1234567890abcdef1234567890abcdef1234567890abcdef
```

Output:

```
{

get-person-tracking

The following code example shows how to use `get-person-tracking`.

AWS CLI

To get the results of a people pathing operation

The following `get-person-tracking` command displays the results of a people pathing operation that you started previously by calling `start-person-tracking`.

```

aws rekognition get-person-tracking \
  --job-id 1234567890abcdef1234567890abcdef1234567890abcdef

```

Output:

```

{
  "Persons": [
    {
      "Timestamp": 500,
      "Person": {
        "BoundingBox": {

```

```

  "FrameWidth": 1920
}
}

```

For more information, see [People Pathing](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [GetPersonTracking](#) in *AWS CLI Command Reference*.

index-faces

The following code example shows how to use `index-faces`.

For more information, see [Adding faces to a collection](#).

AWS CLI

To add faces to a collection

The following `index-faces` command adds the faces found in an image to the specified collection.

```
aws rekognition index-faces \  
  --image '{"S3Object":{"Bucket":"MyVideoS3Bucket","Name":"MyPicture.jpg"}}' \  
  --collection-id MyCollection \  
  --max-faces 1 \  
  --quality-filter "AUTO" \  
  --detection-attributes "ALL" \  
  --external-image-id "MyPicture.jpg"
```

Output:

```
{  
  "FaceRecords": [  
    {  
      "FaceDetail": {  
        "Confidence": 99.993408203125,

list-collections

The following code example shows how to use `list-collections`.

For more information, see [Listing collections](#).

AWS CLI

To list the available collections

The following `list-collections` command lists the available collections in the AWS account.

```
aws rekognition list-collections
```

Output:

```
{  
  "FaceModelVersions": [  
    "2.0",  
    "3.0",  
    "3.0",  
    "3.0",  
    "4.0",
```

```
        "1.0",
        "3.0",
        "4.0",
        "4.0",
        "4.0"
    ],
    "CollectionIds": [
        "MyCollection1",
        "MyCollection2",
        "MyCollection3",

- For API details, see [ListFaces](#) in *AWS CLI Command Reference*.

list-stream-processors

The following code example shows how to use `list-stream-processors`.

AWS CLI

To list the stream processors in your account

The following `list-stream-processors` command lists the stream processors in your account and the state of each.

```
aws rekognition list-stream-processors
```

Output:

```
{
  "StreamProcessors": [
    {
      "Status": "STOPPED",
      "Name": "my-stream-processor"
    }
  ]
}
```

For more information, see [Working with Streaming Videos](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [ListStreamProcessors](#) in *AWS CLI Command Reference*.

recognize-celebrities

The following code example shows how to use `recognize-celebrities`.

For more information, see [Recognizing celebrities in an image](#).

AWS CLI

To recognize celebrities in an image

The following `recognize-celebrities` command recognizes celebrities in the specified image stored in an Amazon S3 bucket.:

```
aws rekognition recognize-celebrities \  
  --image "S3Object={Bucket=MyImageS3Bucket,Name=moviestars.jpg}"
```

Output:

```

search-faces-by-image

The following code example shows how to use `search-faces-by-image`.

For more information, see [Searching for a face \(image\)](#).

AWS CLI

To search for faces in a collection that match the largest face in an image.

The following `search-faces-by-image` command searches for faces in a collection that match the largest face in the specified image.:

```
aws rekognition search-faces-by-image \
  --image '{"S3Object":{"Bucket":"MyImageS3Bucket","Name":"ExamplePerson.jpg"}}' \
  --collection-id MyFaceImageCollection

search-faces

The following code example shows how to use search-faces.

For more information, see [Searching for a face \(face ID\)](#).

AWS CLI

To search for faces in a collection that match a face ID.

The following search-faces command searches for faces in a collection that match the specified face ID.

```
aws rekognition search-faces \  
  --face-id 8d3cfc70-4ba8-4b36-9644-90fba29c2dac \  
  --collection-id MyCollection
```

Output:

```
{  
  "SearchedFaceId": "8d3cfc70-4ba8-4b36-9644-90fba29c2dac",  
  "FaceModelVersion": "3.0",

start-celebrity-recognition

The following code example shows how to use `start-celebrity-recognition`.

AWS CLI

To start the recognition of celebrities in a stored video

The following `start-celebrity-recognition` command starts a job to look for celebrities in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-celebrity-recognition \
  --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
  "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [Recognizing Celebrities in a Stored Video](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartCelebrityRecognition](#) in *AWS CLI Command Reference*.

start-content-moderation

The following code example shows how to use `start-content-moderation`.

AWS CLI

To start the recognition of unsafe content in a stored video

The following `start-content-moderation` command starts a job to detect unsafe content in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-content-moderation \
  --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
  "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [Detecting Unsafe Stored Videos](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartContentModeration](#) in *AWS CLI Command Reference*.

start-face-detection

The following code example shows how to use `start-face-detection`.

AWS CLI

To detect faces in a video

The following `start-face-detection` command starts a job to detect faces in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-face-detection
  --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
  "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [Detecting Faces in a Stored Video](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartFaceDetection](#) in *AWS CLI Command Reference*.

start-face-search

The following code example shows how to use `start-face-search`.

AWS CLI

To search for faces in a collection that match faces detected in a video

The following `start-face-search` command starts a job to search for faces in a collection that match faces detected in the specified video file in an Amazon S3 bucket.

```
aws rekognition start-face-search \
  --video "S3Object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}" \
  --collection-id collection
```

Output:

```
{
  "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [Searching Stored Videos for Faces](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartFaceSearch](#) in *AWS CLI Command Reference*.

start-label-detection

The following code example shows how to use `start-label-detection`.

AWS CLI

To detect objects and scenes in a video

The following `start-label-detection` command starts a job to detect objects and scenes in the specified video file stored in an Amazon S3 bucket.

```
aws rekognition start-label-detection \  
  --video "S3object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{  
  "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"  
}
```

For more information, see [Detecting Labels in a Video](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartLabelDetection](#) in *AWS CLI Command Reference*.

start-person-tracking

The following code example shows how to use `start-person-tracking`.

AWS CLI

To start the pathing of people in a stored video

The following `start-person-tracking` command starts a job to track the paths that people take in the specified video file stored in an Amazon S3 bucket.:

```
aws rekognition start-person-tracking \  
  --video "S3object={Bucket=MyVideoS3Bucket,Name=MyVideoFile.mpg}"
```

Output:

```
{
  "JobId": "1234567890abcdef1234567890abcdef1234567890abcdef1234567890abcdef"
}
```

For more information, see [People Pathing](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartPersonTracking](#) in *AWS CLI Command Reference*.

start-stream-processor

The following code example shows how to use `start-stream-processor`.

AWS CLI**To start a stream processor**

The following `start-stream-processor` command starts the specified video stream processor.

```
aws rekognition start-stream-processor \
  --name my-stream-processor
```

This command produces no output.

For more information, see [Working with Streaming Videos](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StartStreamProcessor](#) in *AWS CLI Command Reference*.

stop-stream-processor

The following code example shows how to use `stop-stream-processor`.

AWS CLI**To stop a running stream processor**

The following `stop-stream-processor` command stops the specified running stream processor.

```
aws rekognition stop-stream-processor \  
  --name my-stream-processor
```

This command produces no output.

For more information, see [Working with Streaming Videos](#) in the *Amazon Rekognition Developer Guide*.

- For API details, see [StopStreamProcessor](#) in *AWS CLI Command Reference*.

AWS RAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS RAM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

accept-resource-share-invitation

The following code example shows how to use `accept-resource-share-invitation`.

AWS CLI

To accept a resource share invitation

The following `accept-resource-share-invitation` example accepts the specified resource share invitation. Principals in the invited account can immediately start using the resources in the share.

```
aws ram accept-resource-share-invitation \  
  --resource-share-invitation-arn arn:aws:ram:us-west-2:111111111111:resource-  
share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE
```

Output:

```
{  
  "resourceShareInvitation": {  
    "resourceShareInvitationArn": "arn:aws:ram:us-west-2:111111111111:resource-  
share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE",  
    "resourceShareName": "MyLicenseShare",  
    "resourceShareArn": "arn:aws:ram:us-west-2:111111111111:resource-  
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE",  
    "senderAccountId": "111111111111",  
    "receiverAccountId": "222222222222",  
    "invitationTimestamp": "2021-09-22T15:07:35.620000-07:00",  
    "status": "ACCEPTED"  
  }  
}
```

- For API details, see [AcceptResourceShareInvitation](#) in *AWS CLI Command Reference*.

associate-resource-share-permission

The following code example shows how to use `associate-resource-share-permission`.

AWS CLI

To associate a RAM managed permission with a resource share

The following `associate-resource-share-permission` example replaces the existing managed permission for the relevant resource type with the specified managed permission. Access to all resources of the relevant resource type is governed by the new permission.

```
aws ram associate-resource-share-permission \  
  --permission-arn arn:aws:ram::aws:permission/  
AWSRAMPermissionGlueDatabaseReadWrite \  
  --replace \  
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-  
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE
```

Output:

```
{
  "returnValue": true
}
```

- For API details, see [AssociateResourceSharePermission](#) in *AWS CLI Command Reference*.

associate-resource-share

The following code example shows how to use `associate-resource-share`.

AWS CLI**Example 1: To associate a resource with a resource share**

The following `associate-resource-share` example adds a license configuration to the specified resource share.

```
aws ram associate-resource-share \
  --resource-share arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \
  --resource-arns arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE
```

Output:

```
{
  "resourceShareAssociations": [
    {
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE",
      "associatedEntity": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
      "associationType": "RESOURCE",
      "status": "ASSOCIATING",
      "external": false
    }
  ]
}
```

Example 2: To associate a principal with a resource share

The following `associate-resource-share` example grants access for the specified resource share to all accounts in the specified organizational unit.

```
aws ram associate-resource-share \  
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-  
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \  
  --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-  
rEXAMPLE
```

Output:

```
{  
  "resourceShareAssociations": [  
    {  
      "status": "ASSOCIATING",  
      "associationType": "PRINCIPAL",  
      "associatedEntity": "arn:aws:organizations::123456789012:ou/  
o-63bEXAMPLE/ou-46xi-rEXAMPLE",  
      "external": false,  
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-  
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE"  
    }  
  ]  
}
```

- For API details, see [AssociateResourceShare](#) in *AWS CLI Command Reference*.

create-resource-share

The following code example shows how to use `create-resource-share`.

AWS CLI

Example 1: To create a resource share

The following `create-resource-share` example creates an empty resource share with the specified name. You must separately add resources, principals, and permissions to the share.

```
aws ram create-resource-share \  
  --name my-share
```

```
--name MyNewResourceShare
```

Output:

```
{
  "resourceShare": {
    "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/4476c27d-8feb-4b21-afe9-7de23EXAMPLE",
    "name": "MyNewResourceShare",
    "owningAccountId": "123456789012",
    "allowExternalPrincipals": true,
    "status": "ACTIVE",
    "creationTime": 1634586271.302,
    "lastUpdatedTime": 1634586271.302
  }
}
```

Example 2: To create a resource share with AWS accounts as principals

The following `create-resource-share` example creates a resource share and grants access to the specified AWS account (222222222222). If the specified principals are not part of the same AWS Organization, then invitations are sent and must be accepted before access is granted.

```
aws ram create-resource-share \
  --name MyNewResourceShare \
  --principals 222222222222
```

Example 3: To create a resource share restricted to your AWS Organization

The following `create-resource-share` example creates a resource share that is restricted to accounts in the AWS Organization that your account is a member of, and adds the specified OU as a principal. All accounts in that OU can use the resources in the resource share.

```
aws ram create-resource-share \
  --name MyNewResourceShare \
  --no-allow-external-principals \
  --principals arn:aws:organizations::123456789012:ou/o-63bEXAMPLE/ou-46xi-
rEXAMPLE
```

Output:

```
{
  "resourceShare": {
    "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
    "name": "MyNewResourceShare",
    "owningAccountId": "123456789012",
    "allowExternalPrincipals": false,
    "status": "ACTIVE",
    "creationTime": 1634587042.49,
    "lastUpdatedTime": 1634587042.49
  }
}
```

- For API details, see [CreateResourceShare](#) in *AWS CLI Command Reference*.

delete-resource-share

The following code example shows how to use `delete-resource-share`.

AWS CLI

To delete a resource share

The following `delete-resource-share` example deletes the specified resource share.

```
aws ram delete-resource-share \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

The following output indicates success:

```
{
  "returnValue": true
}
```

- For API details, see [DeleteResourceShare](#) in *AWS CLI Command Reference*.

disassociate-resource-share-permission

The following code example shows how to use `disassociate-resource-share-permission`.

AWS CLI

To remove a RAM managed permission for a resource type from a resource share

The following `disassociate-resource-share-permission` example removes the RAM managed permission for Glue databases from the specified resource share.

```
aws ram disassociate-resource-share-permission \  
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-  
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE \  
  --permission-arn arn:aws:ram::aws:permission/  
AWSRAMPermissionGlueDatabaseReadWrite
```

Output:

```
{  
  "returnValue": true  
}
```

- For API details, see [DisassociateResourceSharePermission](#) in *AWS CLI Command Reference*.

disassociate-resource-share

The following code example shows how to use `disassociate-resource-share`.

AWS CLI

To remove a resource from a resource share

The following `disassociate-resource-share` example removes the specified resource, in this case a VPC subnet, from the specified resource share. Any principals with access to the resource share can no longer perform operations on that resource.

```
aws ram disassociate-resource-share \  
  --resource-arns arn:aws:ec2:us-west-2:123456789012:subnet/  
subnet-0250c25a1fEXAMPLE \  
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-  
b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{
```

```
"resourceShareAssociations": [  
  "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-  
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",  
  "associatedEntity": "arn:aws:ec2:us-west-2:123456789012:subnet/  
subnet-0250c25a1fEXAMPLE",  
  "associationType": "RESOURCE",  
  "status": "DISASSOCIATING",  
  "external": false  
]  
}
```

- For API details, see [DisassociateResourceShare](#) in *AWS CLI Command Reference*.

enable-sharing-with-aws-organization

The following code example shows how to use `enable-sharing-with-aws-organization`.

AWS CLI

To enable resource sharing across AWS Organizations

The following `enable-sharing-with-aws-organization` example enables resource sharing across your organization and organizational units.

```
aws ram enable-sharing-with-aws-organization
```

The following output indicates success.

```
{  
  "returnValue": true  
}
```

- For API details, see [EnableSharingWithAwsOrganization](#) in *AWS CLI Command Reference*.

get-permission

The following code example shows how to use `get-permission`.

AWS CLI

To retrieve the details for a RAM managed permission

The following `get-permission` example displays the details for the default version of the specified RAM managed permission.

```
aws ram get-permission \
  --permission-arn arn:aws:ram::aws:permission/
  AWSRAMPermissionGlueTableReadWriteForDatabase
```

Output:

```
{
  "permission": {
    "arn": "arn:aws:ram::aws:permission/
  AWSRAMPermissionGlueTableReadWriteForDatabase",
    "version": "2",
    "defaultVersion": true,
    "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
    "resourceType": "glue:Database",
    "permission": "{\"Effect\":\"Allow\",\"Action\":[\"glue:GetTable
  \", \"glue:UpdateTable\", \"glue>DeleteTable\", \"glue:BatchDeleteTable\",
  \"glue:BatchDeleteTableVersion\", \"glue:GetTableVersion\", \"glue:GetTableVersions
  \", \"glue:GetPartition\", \"glue:GetPartitions\", \"glue:BatchGetPartition\",
  \"glue:BatchCreatePartition\", \"glue>CreatePartition\", \"glue:UpdatePartition
  \", \"glue:BatchDeletePartition\", \"glue>DeletePartition\", \"glue:GetTables\",
  \"glue:SearchTables\"]}",
    "creationTime": 1624912434.431,
    "lastUpdatedTime": 1624912434.431,
    "isResourceTypeDefault": false
  }
}
```

- For API details, see [GetPermission](#) in *AWS CLI Command Reference*.

get-resource-policies

The following code example shows how to use `get-resource-policies`.

AWS CLI

To get the policies for a resource

The following `get-resource-policies` example displays the resource-based permission policies for the specified resource associated with a resource share.

```
aws ram get-resource-policies \  
  --resource-arns arn:aws:ec2:us-west-2:123456789012:subnet/  
subnet-0250c25a1fEXAMPLE
```

Output:

```
{  
  "policies": [  
    "{ \"Version\": \"2008-10-17\", \"Statement\": [{ \"Sid\": \"RamStatement1\",  
\"Effect\": \"Allow\", \"Principal\": { \"AWS\": [] }, \"Action\": [ \"ec2:RunInstances  
\", \"ec2:CreateNetworkInterface\", \"ec2:DescribeSubnets\" ], \"Resource\":  
\"arn:aws:ec2:us-west-2:123456789012:subnet/subnet-0250c25a1fEXAMPLE\" ] } }"  
  ]  
}
```

- For API details, see [GetResourcePolicies](#) in *AWS CLI Command Reference*.

get-resource-share-associations

The following code example shows how to use `get-resource-share-associations`.

AWS CLI

Example 1: To list all resource associations for all resource types

The following `get-resource-share-associations` example lists the resource associations for all resource types across all of your resource shares.

```
aws ram get-resource-share-associations \  
  --association-type RESOURCE
```

Output:

```
{  
  "resourceShareAssociations": [  
    {  
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-  
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",  
      "associatedEntity": "arn:aws:ec2:us-west-2:123456789012:subnet/  
subnet-0250c25a1fEXAMPLE",  
    }  
  ]  
}
```

```

        "resourceShareName": "MySubnetShare",
        "associationType": "RESOURCE",
        "status": "ASSOCIATED",
        "creationTime": 1565303590.973,
        "lastUpdatedTime": 1565303591.695,
        "external": false
    },
    {
        "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/8167bdfc-4480-4a01-8632-315e0EXAMPLE",
        "associatedEntity": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
        "resourceShareName": "MyLicenseShare",
        "associationType": "RESOURCE",
        "status": "ASSOCIATED",
        "creationTime": 1632342958.457,
        "lastUpdatedTime": 1632342958.907,
        "external": false
    }
]
}

```

Example 2: To list principal associations for a resource share

The following `get-resource-share-associations` example lists only the principal associations for only the specified resource share.

```

aws ram get-resource-share-associations \
  --resource-share-arns arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE \
  --association-type PRINCIPAL

```

Output:

```

{
  "resourceShareAssociations": [
    {
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
      "resourceShareName": "MyNewResourceShare",
      "associatedEntity": "arn:aws:organizations::123456789012:ou/
o-63bEXAMPLE/ou-46xi-rEXAMPLE",

```

```

        "associationType": "PRINCIPAL",
        "status": "ASSOCIATED",
        "creationTime": 1634587042.49,
        "lastUpdatedTime": 1634587044.291,
        "external": false
    }
]
}

```

- For API details, see [GetResourceShareAssociations](#) in *AWS CLI Command Reference*.

get-resource-share-invitations

The following code example shows how to use `get-resource-share-invitations`.

AWS CLI

To list your resource share invitations

The following `get-resource-share-invitations` example lists your current resource share invitations.

```
aws ram get-resource-share-invitations
```

Output:

```

{
  "resourceShareInvitations": [
    {
      "resourceShareInvitationArn": "arn:aws:ram:us-west-2:1:111111111111:resource-share-invitation/32b639f0-14b8-7e8f-55ea-e6117EXAMPLE",
      "resourceShareName": "project-resource-share",
      "resourceShareArn": "arn:aws:ram:us-west-2:1:111111111111:resource-share/fcb639f0-1449-4744-35bc-a983fEXAMPLE",
      "senderAccountId": "111111111111",
      "receiverAccountId": "222222222222",
      "invitationTimestamp": 1565312166.258,
      "status": "PENDING"
    }
  ]
}

```

```
}
```

- For API details, see [GetResourceShareInvitations](#) in *AWS CLI Command Reference*.

get-resource-shares

The following code example shows how to use `get-resource-shares`.

AWS CLI

Example 1: To list resource shares you own and share with others

The following `get-resource-shares` example lists the resource shares that created and are sharing with others.

```
aws ram get-resource-shares \
  --resource-owner SELF
```

Output:

```
{
  "resourceShares": [
    {
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/3ab63985-99d9-1cd2-7d24-75e93EXAMPLE",
      "name": "my-resource-share",
      "owningAccountId": "123456789012",
      "allowExternalPrincipals": false,
      "status": "ACTIVE",
      "tags": [
        {
          "key": "project",
          "value": "lima"
        }
      ]
      "creationTime": 1565295733.282,
      "lastUpdatedTime": 1565295733.282
    },
    {
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
```

```
        "name": "my-resource-share",
        "owningAccountId": "123456789012",
        "allowExternalPrincipals": true,
        "status": "ACTIVE",
        "creationTime": 1565295733.282,
        "lastUpdatedTime": 1565295733.282
    }
]
```

Example 2: To list resource shares owned by others and shared with you

The following `get-resource-shares` example lists the resource shares that others created and shared with you. In this example, there are none.

```
aws ram get-resource-shares \
  --resource-owner OTHER-ACCOUNTS
```

Output:

```
{
  "resourceShares": []
}
```

- For API details, see [GetResourceShares](#) in *AWS CLI Command Reference*.

list-pending-invitation-resources

The following code example shows how to use `list-pending-invitation-resources`.

AWS CLI

To list the resources that are available in a pending resource share

The following `list-pending-invitation-resources` example lists all of the resources that are in the resource share associated with the specified invitation.

```
aws ram list-pending-invitation-resources \
  --resource-share-invitation-arn arn:aws:ram:us-west-2:123456789012:resource-
share-invitation/1e3477be-4a95-46b4-bbe0-c4001EXAMPLE
```

Output:

```
{
  "resources": [
    {
      "arn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-04a555b0e6EXAMPLE",
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7be8694e-095c-41ca-9ce8-7be4aEXAMPLE",
      "creationTime": 1634676051.269,
      "lastUpdatedTime": 1634676052.07,
      "status": "AVAILABLE",
      "type": "ec2:Subnet"
    },
    {
      "arn": "arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-36be0485f5ae379cc74cf8e92EXAMPLE",
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
      "creationTime": 1624912434.431,
      "lastUpdatedTime": 1624912434.431,
      "status": "AVAILABLE",
      "type": "license-manager:LicenseConfiguration"
    }
  ]
}
```

- For API details, see [ListPendingInvitationResources](#) in *AWS CLI Command Reference*.

list-permissions

The following code example shows how to use `list-permissions`.

AWS CLI**To list the available RAM managed permissions**

The following `list-permissions` example lists all of the RAM managed permissions available for only the AWS Glue database resource type.

```
aws ram list-permissions \
  --resource-type glue:Database
```

Output:

```
{
  "permissions": [
    {
      "arn": "arn:aws:ram::aws:permission/
AWSRAMDefaultPermissionGlueDatabase",
      "version": "1",
      "defaultVersion": true,
      "name": "AWSRAMDefaultPermissionGlueDatabase",
      "resourceType": "glue:Database",
      "creationTime": 1592007820.935,
      "lastUpdatedTime": 1592007820.935,
      "isResourceTypeDefault": true
    },
    {
      "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
      "version": "2",
      "defaultVersion": true,
      "name": "AWSRAMPermissionGlueAllTablesReadWriteForDatabase",
      "resourceType": "glue:Database",
      "creationTime": 1624912413.323,
      "lastUpdatedTime": 1624912413.323,
      "isResourceTypeDefault": false
    },
    {
      "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite",
      "version": "2",
      "defaultVersion": true,
      "name": "AWSRAMPermissionGlueDatabaseReadWrite",
      "resourceType": "glue:Database",
      "creationTime": 1624912417.4,
      "lastUpdatedTime": 1624912417.4,
      "isResourceTypeDefault": false
    },
    {
      "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueTableReadWriteForDatabase",
      "version": "2",
      "defaultVersion": true,
      "name": "AWSRAMPermissionGlueTableReadWriteForDatabase",
      "resourceType": "glue:Database",
```

```

        "creationTime": 1624912434.431,
        "lastUpdatedTime": 1624912434.431,
        "isResourceTypeDefault": false
    }
]
}

```

The following `list-permissions` example displays the available RAM managed permissions for all resource types.

```
aws ram list-permissions
```

Output:

```

{
  "permissions": [
    {
      "arn": "arn:aws:ram::aws:permission/
AWSRAMBlankEndEntityCertificateAPICSRPassthroughIssuanceCertificateAuthority",
      "version": "1",
      "defaultVersion": true,
      "name":
"AWSRAMBlankEndEntityCertificateAPICSRPassthroughIssuanceCertificateAuthority",
      "resourceType": "acm-pca:CertificateAuthority",
      "creationTime": 1623264861.085,
      "lastUpdatedTime": 1623264861.085,
      "isResourceTypeDefault": false
    },
    {
      "arn": "arn:aws:ram::aws:permission/AWSRAMDefaultPermissionAppMesh",
      "version": "1",
      "defaultVersion": true,
      "name": "AWSRAMDefaultPermissionAppMesh",
      "resourceType": "appmesh:Mesh",
      "creationTime": 1589307188.584,
      "lastUpdatedTime": 1589307188.584,
      "isResourceTypeDefault": true
    },
    ...TRUNCATED FOR BREVITY...
    {
      "arn": "arn:aws:ram::aws:permission/
AWSRAMSubordinateCACertificatePathLen0IssuanceCertificateAuthority",
      "version": "1",

```

```

        "defaultVersion": true,
        "name":
"AWSRAMSubordinateCACertificatePathLen0IssuanceCertificateAuthority",
        "resourceType": "acm-pca:CertificateAuthority",
        "creationTime": 1623264876.75,
        "lastUpdatedTime": 1623264876.75,
        "isResourceTypeDefault": false
    }
]
}

```

- For API details, see [ListPermissions](#) in *AWS CLI Command Reference*.

list-principals

The following code example shows how to use `list-principals`.

AWS CLI

To list principals with access to a resource

The following `list-principals` example displays a list of the principals that can access resources of the specified type through any resource shares.

```

aws ram list-principals \
  --resource-type ec2:Subnet

```

Output:

```

{
  "principals": [
    {
      "id": "arn:aws:organizations::123456789012:ou/o-gx7EXAMPLE/ou-29c5-
zEXAMPLE",
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
      "creationTime": 1565298209.737,
      "lastUpdatedTime": 1565298211.019,
      "external": false
    }
  ]
}

```

- For API details, see [ListPrincipals](#) in *AWS CLI Command Reference*.

list-resource-share-permissions

The following code example shows how to use `list-resource-share-permissions`.

AWS CLI

To list all of the RAM managed permissions currently attached to a resource share

The following `list-resource-share-permissions` example lists all of the RAM managed permissions that are attached to the specified resource share.

```
aws ram list-resource-share-permissions \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-
share/27d09b4b-5e12-41d1-a4f2-19dedEXAMPLE
```

Output:

```
{
  "permissions": [
    {
      "arn": "arn:aws:ram::aws:permission/
AWSRAMDefaultPermissionLicenseConfiguration",
      "version": "1",
      "resourceType": "license-manager:LicenseConfiguration",
      "status": "ASSOCIATED",
      "lastUpdatedTime": 1632342984.234
    },
    {
      "arn": "arn:aws:ram::aws:permission/
AWSRAMPermissionGlueDatabaseReadWrite",
      "version": "2",
      "resourceType": "glue:Database",
      "status": "ASSOCIATED",
      "lastUpdatedTime": 1632512462.297
    }
  ]
}
```

- For API details, see [ListResourceSharePermissions](#) in *AWS CLI Command Reference*.

list-resource-types

The following code example shows how to use `list-resource-types`.

AWS CLI

To list the resource types that are supported by AWS RAM

The following `list-resource-types` example lists all of the resource types currently supported by AWS RAM.

```
aws ram list-resource-types
```

Output:

```
{
  "resourceTypes": [
    {
      "resourceType": "route53resolver:FirewallRuleGroup",
      "serviceName": "route53resolver"
    },
    {
      "resourceType": "ec2:LocalGatewayRouteTable",
      "serviceName": "ec2"
    },
    ...OUTPUT TRUNCATED FOR BREVITY...
    {
      "resourceType": "ec2:Subnet",
      "serviceName": "ec2"
    },
    {
      "resourceType": "ec2:TransitGatewayMulticastDomain",
      "serviceName": "ec2"
    }
  ]
}
```

- For API details, see [ListResourceTypes](#) in *AWS CLI Command Reference*.

list-resources

The following code example shows how to use `list-resources`.

AWS CLI

To list the resources associated with a resource share

The following `list-resources` example lists all resources in the specified resource share that are of the specified resource type.

```
aws ram list-resources \
  --resource-type ec2:Subnet \
  --resource-owner SELF \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{
  "resources": [
    {
      "arn": "aarn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0250c25a1f4e15235",
      "type": "ec2:Subnet",
      "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",
      "creationTime": 1565301545.023,
      "lastUpdatedTime": 1565301545.947
    }
  ]
}
```

- For API details, see [ListResources](#) in *AWS CLI Command Reference*.

promote-resource-share-created-from-policy

The following code example shows how to use `promote-resource-share-created-from-policy`.

AWS CLI

To promote a resource-policy based resource share to full functionality in AWS RAM

The following `promote-resource-share-created-from-policy` example takes a resource share that you created implicitly by attaching a resource-based policy, and converts it to be fully functional with the AWS RAM console and its CLI and API operations.

```
aws ram promote-resource-share-created-from-policy \  
  --resource-share-arn arn:aws:ram:us-east-1:123456789012:resource-  
share/91fa8429-2d06-4032-909a-90909EXAMPLE
```

Output:

```
{  
  "returnValue": true  
}
```

- For API details, see [PromoteResourceShareCreatedFromPolicy](#) in *AWS CLI Command Reference*.

reject-resource-share-invitation

The following code example shows how to use `reject-resource-share-invitation`.

AWS CLI

To reject a resource share invitation

The following `reject-resource-share-invitation` example rejects the specified resource share invitation.

```
aws ram reject-resource-share-invitation \  
  --resource-share-invitation-arn arn:aws:ram:us-west-2:111111111111:resource-  
share-invitation/32b639f0-14b8-7e8f-55ea-e6117EXAMPLE
```

Output:

```
"resourceShareInvitations": [  
  {  
    "resourceShareInvitationArn": "arn:aws:ram:us-west2-1:111111111111:resource-  
share-invitation/32b639f0-14b8-7e8f-55ea-e6117EXAMPLE",  
    "resourceShareName": "project-resource-share",
```

```
    "resourceShareArn": "arn:aws:ram:us-west-2:111111111111:resource-share/
    fcb639f0-1449-4744-35bc-a983fEXAMPLE",
    "senderAccountId": "111111111111",
    "receiverAccountId": "222222222222",
    "invitationTimestamp": 1565319592.463,
    "status": "REJECTED"
  }
]
```

- For API details, see [RejectResourceShareInvitation](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a resource share

The following `tag-resource` example adds a tag key `project` and associated value `lima` to the specified resource share.

```
aws ram tag-resource \
  --tags key=project,value=lima \
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-
  b505-7e2a-420d-6f5d3EXAMPLE
```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource share

The following `untag-resource` example removes the `project` tag key and associated value from the specified resource share.

```
aws ram untag-resource \  
  --tag-keys project \  
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-  
b505-7e2a-420d-6f5d3EXAMPLE
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-resource-share

The following code example shows how to use `update-resource-share`.

AWS CLI

To update a resource share

The following `update-resource-share` example changes the specified resource share to allow external principals that are not in an AWS Organization.

```
aws ram update-resource-share \  
  --allow-external-principals \  
  --resource-share-arn arn:aws:ram:us-west-2:123456789012:resource-share/7ab63972-  
b505-7e2a-420d-6f5d3EXAMPLE
```

Output:

```
{  
  "resourceShare": {  
    "resourceShareArn": "arn:aws:ram:us-west-2:123456789012:resource-  
share/7ab63972-b505-7e2a-420d-6f5d3EXAMPLE",  
    "name": "my-resource-share",  
    "owningAccountId": "123456789012",  
    "allowExternalPrincipals": true,  
    "status": "ACTIVE",  
    "creationTime": 1565295733.282,  
    "lastUpdatedTime": 1565303080.023  
  }  
}
```

- For API details, see [UpdateResourceShare](#) in *AWS CLI Command Reference*.

Resource Explorer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Explorer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

associate-default-view

The following code example shows how to use `associate-default-view`.

AWS CLI

To set a Resource Explorer view as the default for its AWS Region

The following `associate-default-view` example sets a view, as specified by its ARN, to be the default view for the AWS Region in which you call the operation.

```
aws resource-explorer-2 associate-default-view \  
  --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-View/  
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{  
  "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-  
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"  
}
```

For more information, see [Setting a default view in an AWS Region](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [AssociateDefaultView](#) in *AWS CLI Command Reference*.

batch-get-view

The following code example shows how to use `batch-get-view`.

AWS CLI

To retrieve details about multiple Resource Explorer views

The following `batch-get-view` example displays the details about two views specified by their ARNs. Use spaces to separate the multiple ARNs in the `--view-arn` parameter.

```
aws resource-explorer-2 batch-get-view \
  --view-arns arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222, \
              arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
  "Views": [
    {
      "Filters": {
        "FilterString": "service:ec2"
      },
      "IncludedProperties": [
        {
          "Name": "tags"
        }
      ],
      "LastUpdatedAt": "2022-07-13T21:33:45.249000+00:00",
      "Owner": "123456789012",
      "Scope": "arn:aws:iam::123456789012:root",
      "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-
EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
    },
    {
```

```
    "Filters": {
      "FilterString": ""
    },
    "IncludedProperties": [
      {
        "Name": "tags"
      }
    ],
    "LastUpdatedAt": "2022-07-13T20:34:11.314000+00:00",
    "Owner": "123456789012",
    "Scope": "arn:aws:iam::123456789012:root",
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-
Main-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
  }
]
"Errors": []
}
```

For more information about views, see [About Resource Explorer views](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [BatchGetView](#) in *AWS CLI Command Reference*.

create-index

The following code example shows how to use `create-index`.

AWS CLI

To turn on Resource Explorer in an AWS Region by creating an index

The following `create-index` example creates a local index in the AWS Region in which the operation is called. The AWS CLI automatically generates a random `client-token` parameter value and includes it in the call to AWS if you don't specify a value.

```
aws resource-explorer-2 create-index \
  --region us-east-1
```

Output:

```
{
```

```
"Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE22222c",
"CreatedAt": "2022-11-01T20:00:59.149Z",
"State": "CREATING"
}
```

After you create a local index, you can convert it into the aggregator index for the account by running the [update-index-type](#) command.

For more information, see [Turning on Resource Explorer in an AWS Region to index your resources](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [CreateIndex](#) in *AWS CLI Command Reference*.

create-view

The following code example shows how to use `create-view`.

AWS CLI

Example 1: To create an unfiltered view for the index in an AWS Region

The following `create-view` example creates a view in the specified AWS Region that returns all results in the Region without any filtering. The view includes the optional `Tags` field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```
aws resource-explorer-2 create-view \
  --view-name My-Main-View \
  --included-properties Name=tags \
  --region us-east-1
```

Output:

```
{
  "View": {
    "Filters": {
      "FilterString": ""
    },
    "IncludedProperties": [
      {
        "Name": "tags"
      }
    ]
  }
}
```

```

    }
  ],
  "LastUpdatedAt": "2022-07-13T20:34:11.314000+00:00",
  "Owner": "123456789012",
  "Scope": "arn:aws:iam::123456789012:root",
  "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-Main-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
}

```

Example 2: To create a view that returns only resources associated with Amazon EC2

The following `create-view` creates a view in AWS Region `us-east-1` that returns only those resources in the Region that are associated with the Amazon EC2 service. The view includes the optional `Tags` field on returned results. Because this view is created in the Region that contains the aggregator index, it can include results from all Regions in the account that contain a Resource Explorer index.

```

aws resource-explorer-2 create-view \
  --view-name My-EC2-Only-View \
  --included-properties Name=tags \
  --filters FilterString="service:ec2" \
  --region us-east-1

```

Output:

```

{
  "View": {
    "Filters": {
      "FilterString": "service:ec2"
    },
    "IncludedProperties": [
      {
        "Name": "tags"
      }
    ],
    "LastUpdatedAt": "2022-07-13T21:35:09.059Z",
    "Owner": "123456789012",
    "Scope": "arn:aws:iam::123456789012:root",
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
  }
}

```

```
}
```

For more information, see [Creating views for search](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [CreateView](#) in *AWS CLI Command Reference*.

delete-index

The following code example shows how to use `delete-index`.

AWS CLI

To turn off Resource Explorer in an AWS Region by deleting its index

The following `delete-index` example deletes the specified Resource Explorer index in the AWS Region in which you make the request.

```
aws resource-explorer-2 delete-index \  
  --arn arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-  
cdef-fedc-EXAMPLE22222 \  
  --region us-west-2
```

Output:

```
{  
  "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-  
cdef-fedc-EXAMPLE22222",  
  "State": "DELETING"  
}
```

For more information about deleting an index, see [Turning off AWS Resource Explorer in an AWS Region](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [DeleteIndex](#) in *AWS CLI Command Reference*.

delete-view

The following code example shows how to use `delete-view`.

AWS CLI

To delete a Resource Explorer view

The following `delete-view` example deletes a view specified by its ARN.

```
aws resource-explorer-2 delete-view \  
  --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-  
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{  
  "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-  
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"  
}
```

For more information, see [Deleting views](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [DeleteView](#) in *AWS CLI Command Reference*.

disassociate-default-view

The following code example shows how to use `disassociate-default-view`.

AWS CLI

To remove the default Resource Explorer view for an AWS Region

The following `disassociate-default-view` removes the default Resource Explorer view for the AWS Region in which you call the operation. After performing this operation, all search operations in the Region must explicitly specify a view or the operation fails.

```
aws resource-explorer-2 disassociate-default-view
```

This command produces no output.

For more information, see [Setting a default view in an AWS Region](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [DisassociateDefaultView](#) in *AWS CLI Command Reference*.

get-default-view

The following code example shows how to use `get-default-view`.

AWS CLI

To retrieve the Resource Explorer view that is the default view for its AWS Region

The following `get-default-view` example retrieves the ARN of the view that is the default for the AWS Region in which you call the operation.

```
aws resource-explorer-2 get-default-view
```

Output:

```
{
  "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/default-
view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
```

For more information, see [Setting a default view in an AWS Region](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [GetDefaultView](#) in *AWS CLI Command Reference*.

get-index

The following code example shows how to use `get-index`.

AWS CLI

Example 1: To retrieve the details for a Resource Explorer aggregator index

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains the aggregator index for the account, the output lists the Regions that replicate data into this Region's index.

```
aws resource-explorer-2 get-index \
  --region us-east-1
```

Output:

```
{
  "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE11111",
  "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
```

```

    "LastUpdatedAt": "2022-07-13T18:41:58.799000+00:00",
    "ReplicatingFrom": [
      "ap-south-1",
      "us-west-2"
    ],
    "State": "ACTIVE",
    "Tags": {},
    "Type": "AGGREGATOR"
  }

```

Example 2: To retrieve the details for a Resource Explorer local index

The following `get-index` example displays the details for the Resource Explorer index in the specified AWS Region. Because the specified Region contains a local index, the output lists the Region to which it replicates data from this Region's index.

```

aws resource-explorer-2 get-index \
  --region us-west-2

```

Output:

```

{
  "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-
  cdef-fedc-EXAMPLE22222",
  "CreatedAt": "2022-07-12T18:59:10.503000+00:00",
  "LastUpdatedAt": "2022-07-13T18:41:58.799000+00:00",
  "ReplicatingTo": [
    "us-west-2"
  ],
  "State": "ACTIVE",
  "Tags": {},
  "Type": "LOCAL"
}

```

For more information about indexes, see [Checking which AWS Regions have Resource Explorer turned on](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [GetIndex](#) in *AWS CLI Command Reference*.

get-view

The following code example shows how to use `get-view`.

AWS CLI

To retrieve details about a Resource Explorer view

The following `get-view` example displays the details about a view specified by its ARN.

```
aws resource-explorer-2 get-view \  
  --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-Only-  
View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{  
  "Tags" : {},  
  "View" : {  
    "Filters" : {  
      "FilterString" : "service:ec2"  
    },  
    "IncludedProperties" : [  
      {  
        "Name" : "tags"  
      }  
    ],  
    "LastUpdatedAt" : "2022-07-13T21:33:45.249Z",  
    "Owner" : "123456789012",  
    "Scope" : "arn:aws:iam::123456789012:root",  
    "ViewArn" : "arn:aws:resource-explorer-2:us-east-1:123456789012:view/EC2-  
Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"  
  }  
}
```

For more information about views, see [About Resource Explorer views](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [GetView](#) in *AWS CLI Command Reference*.

list-indexes

The following code example shows how to use `list-indexes`.

AWS CLI

To list the AWS Regions where Resource Explorer has indexes

The following `list-indexes` example lists the indexes for all Regions where Resource Explorer has an index. The response specifies the type of each index, its AWS Region, and its ARN.

```
aws resource-explorer-2 list-indexes
```

Output:

```
{
  "Indexes": [
    {
      "Arn": "arn:aws:resource-explorer-2:us-west-2:123456789012:index/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111",
      "Region": "us-west-2",
      "Type": "AGGREGATOR"
    },
    {
      "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222",
      "Region": "us-east-1",
      "Type": "LOCAL"
    },
    {
      "Arn": "arn:aws:resource-explorer-2:us-east-2:123456789012:index/EXAMPLE8-90ab-cdef-fedc-EXAMPLE33333",
      "Region": "us-east-2",
      "Type": "LOCAL"
    },
    {
      "Arn": "arn:aws:resource-explorer-2:us-west-1:123456789012:index/EXAMPLE8-90ab-cdef-fedc-EXAMPLE44444",
      "Region": "us-west-1",
      "Type": "LOCAL"
    }
  ]
}
```

For more information about indexes, see [Checking which AWS Regions have Resource Explorer turned on](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [ListIndexes](#) in *AWS CLI Command Reference*.

list-supported-resource-types

The following code example shows how to use `list-supported-resource-types`.

AWS CLI

To list the AWS Regions where Resource Explorer has indexes

The following `list-supported-resource-types` example lists all of the resource types currently supported by &AREXlong;. The example response includes a `NextToken` value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 list-supported-resource-types \  
  --max-items 10
```

Output:

```
{  
  "ResourceTypes": [  
    {  
      "ResourceType": "cloudfront:cache-policy",  
      "Service": "cloudfront"  
    },  
    {  
      "ResourceType": "cloudfront:distribution",  
      "Service": "cloudfront"  
    },  
    {  
      "ResourceType": "cloudfront:function",  
      "Service": "cloudfront"  
    },  
    {  
      "ResourceType": "cloudfront:origin-access-identity",  
      "Service": "cloudfront"  
    },  
    {  
      "ResourceType": "cloudfront:origin-request-policy",  
      "Service": "cloudfront"  
    },  
    {  
      "ResourceType": "cloudfront:realtime-log-config",  
      "Service": "cloudfront"  
    },  
  ],  
}
```

```

    {
      "ResourceType": "cloudfront:response-headers-policy",
      "Service": "cloudfront"
    },
    {
      "ResourceType": "cloudwatch:alarm",
      "Service": "cloudwatch"
    },
    {
      "ResourceType": "cloudwatch:dashboard",
      "Service": "cloudwatch"
    },
    {
      "ResourceType": "cloudwatch:insight-rule",
      "Service": "cloudwatch"
    }
  ],
  "NextToken": "eyJ0ZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxMH0="
}

```

To get the next part of the output, call the operation again, and pass the previous call's `NextToken` response value as the value for `--starting-token`. Repeat until `NextToken` is absent from the response.

```

aws resource-explorer-2 list-supported-resource-types \
  --max-items 10 \
  --starting-token
eyJ0ZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAxMH0=

```

Output:

```

{
  "ResourceTypes": [
    {
      "ResourceType": "cloudwatch:metric-stream",
      "Service": "cloudwatch"
    },
    {
      "ResourceType": "dynamodb:table",
      "Service": "dynamodb"
    },
    {

```

```

    "ResourceType": "ec2:capacity-reservation",
    "Service": "ec2"
  },
  {
    "ResourceType": "ec2:capacity-reservation-fleet",
    "Service": "ec2"
  },
  {
    "ResourceType": "ec2:client-vpn-endpoint",
    "Service": "ec2"
  },
  {
    "ResourceType": "ec2:customer-gateway",
    "Service": "ec2"
  },
  {
    "ResourceType": "ec2:dedicated-host",
    "Service": "ec2"
  },
  {
    "ResourceType": "ec2:dhcp-options",
    "Service": "ec2"
  },
  {
    "ResourceType": "ec2:egress-only-internet-gateway",
    "Service": "ec2"
  },
  {
    "ResourceType": "ec2:elastic-gpu",
    "Service": "ec2"
  }
],
"NextToken": "eyJ0ZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyMH0="
}

```

For more information about indexes, see [Checking which AWS Regions have Resource Explorer turned on](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [ListSupportedResourceTypes](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags attached to a Resource Explorer view or index

The following `list-tags-for-resource` example lists the tag key and value pairs attached to view with the specified ARN. You must call the operation from the AWS Region that contains the resource.

```
aws resource-explorer-2 list-tags-for-resource \
  --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111
```

Output:

```
{
  "Tags": {
    "application": "MainCorpApp",
    "department": "1234"
  }
}
```

For more information about tagging views, see [Tagging views for access control](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-views

The following code example shows how to use `list-views`.

AWS CLI

To list the Resource Explorer views available in an AWS Region

The following `list-views` example lists all of the views available in the Region in which you invoke the operation.

```
aws resource-explorer-2 list-views
```

Output:

```
{
  "Views": [

search

The following code example shows how to use search.

AWS CLI

Example 1: To search using the default view

The following search example displays all resources in the specified that are associated with the service. The search uses the default view for the Region. The example response includes a `NextToken` value, which indicates that there is more output available to retrieve with additional calls.

```
aws resource-explorer-2 search \
  --query-string "service:iam"
```

Output:

```
{
  "Count": {
    "Complete": true,
    "TotalResources": 55
  },
  "NextToken":
  "AG9V0EF1KLEXAMPLE0hJHVwo5chEXAMPLER5XiEpNrgsEXAMPLE...b0Cm0F0ryHEXAMPLE",
  "Resources": [{
```

```

    "Arn": "arn:aws:iam::123456789012:policy/service-role/Some-Policy-For-A-
Service-Role",
    "LastReportedAt": "2022-07-21T12:34:42Z",
    "OwningAccountId": "123456789012",
    "Properties": [],
    "Region": "global",
    "ResourceType": "iam:policy",
    "Service": "iam"
  }, {
    "Arn": "arn:aws:iam::123456789012:policy/service-role/Another-Policy-For-A-
Service-Role",
    "LastReportedAt": "2022-07-21T12:34:42Z",
    "OwningAccountId": "123456789012",
    "Properties": [],
    "Region": "global",
    "ResourceType": "iam:policy",
    "Service": "iam"
  }, {
    ... TRUNCATED FOR BREVITY ...
  }],
  "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/my-default-
view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}

```

Example 2: To search using a specified view

The following search example search displays all resources ("*") in the specified AWS Region that are visible through the specified view. The results include only resources associated with Amazon EC2 because of the filters attached to the view.

```

aws resource-explorer-2 search \
  -- query-string "*" \
  -- view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-view/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222

```

Output:

```

HTTP/1.1 200 OK
Date: Tue, 01 Nov 2022 20:00:59 GMT
Content-Type: application/json
Content-Length: <PayloadSizeBytes>

{

```

```
"Count": {
  "Complete": true,
  "TotalResources": 67
},
"Resources": [{

        "Value": "Production"
      }],
      "LastReportedAt": "2021-11-15T15:11:05Z",
      "Name": "tags"
    }],
    "Region": "us-east-1",
    "ResourceType": "ec2:dhcptions",
    "Service": "ec2"
  }, {
    ... TRUNCATED FOR BREVITY ...
  }],
  "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-
view/EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
}

```

For more information, see [Using AWS Resource Explorer to search for resources](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [Search](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a Resource Explorer view

The following tag-resource example adds the tag key "environment" with the value "production" to the view with the specified ARN.

```

aws resource-explorer-2 tag-resource \
  --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View//
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111 \
  --tags environment=production

```

This command produces no output.

For more information, see [Tagging views for access control](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a Resource Explorer view

The following `untag-resource` example removes any tag with the key name "environment" from the view with the specified ARN.

```
aws resource-explorer-2 untag-resource \  
  --resource-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View//  
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111 \  
  --tag-keys environment
```

This command produces no output.

For more information, see [Tagging views for access control](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-index-type

The following code example shows how to use `update-index-type`.

AWS CLI

To change the type of a Resource Explorer index

The following `update-index-type` example converts the specified index from type `local` to type `aggregator` to turn on the ability to search for resources across all AWS Regions in the account. You must send the request to the AWS Region that contains the index you want to update.

```
aws resource-explorer-2 update-index-type \  
  --index-arn arn:aws:resource-explorer-2:us-east-1:123456789012:index/My-Index//  
EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111 \  
  --index-type aggregator
```

```
--arn arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE11111 \
--type aggregator \
--region us-east-1
```

Output:

```
{
  "Arn": "arn:aws:resource-explorer-2:us-east-1:123456789012:index/EXAMPLE8-90ab-
cdef-fedc-EXAMPLE11111",
  "LastUpdatedAt": "2022-07-13T18:41:58.799Z",
  "State": "updating",
  "Type": "aggregator"
}
```

For more information about changing an index's type, see [Turning on cross-Region search by creating an aggregator index](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [UpdateIndexType](#) in *AWS CLI Command Reference*.

update-view

The following code example shows how to use `update-view`.

AWS CLI

Example 1: To update the `IncludedProperties` field for a Resource Explorer view

The following `update-view` example updates the specified view by adding `tags` to the optional `IncludedProperties`. After running this operation, search operations that use this view include information about the tags attached to the resources that appear in the results.

```
aws resource-explorer-2 update-view \
  --included-properties Name=tags \
  --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222
```

Output:

```
{
```

```

"View": {
  "Filters": {
    "FilterString": ""
  },
  "IncludedProperties": [
    {
      "Name": "tags"
    }
  ],
  "LastUpdatedAt": "2022-07-19T17:41:21.710000+00:00",
  "Owner": "123456789012",
  "Scope": "arn:aws:iam::123456789012:root",
  "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-EC2-
Only-View/EXAMPLE8-90ab-cdef-fedc-EXAMPLE11111"
}
}

```

Example 2: To update the filters attached to a view

The following `update-view` example updates the specified view to use a filter that limits results to only resource types that are associated with the Amazon EC2 service.

```

aws resource-explorer-2 update-view \
  --filters FilterString="service:ec2" \
  --view-arn arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222

```

Output:

```

{
  "View": {
    "Filters": {
      "FilterString": "service:ec2"
    },
    "IncludedProperties": [],
    "LastUpdatedAt": "2022-07-19T17:41:21.710000+00:00",
    "Owner": "123456789012",
    "Scope": "arn:aws:iam::123456789012:root",
    "ViewArn": "arn:aws:resource-explorer-2:us-east-1:123456789012:view/My-View/
EXAMPLE8-90ab-cdef-fedc-EXAMPLE22222"
  }
}

```

For more information about views, see [About Resource Explorer views](#) in the *AWS Resource Explorer Users Guide*.

- For API details, see [UpdateView](#) in *AWS CLI Command Reference*.

Resource Groups examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-group

The following code example shows how to use `create-group`.

AWS CLI

Example 1: To create a tag-based resource group

The following `create-group` example creates a tag-based resource group of Amazon EC2 instances in the current region. It's based on a query for resources that are tagged with the key `Name`, and the value `WebServers`. The group name is `tbq-WebServer`. The query is in a separate JSON file that is passed to the command.

```
aws resource-groups create-group \  
  --name tbq-WebServer \  
  --resource-query file://query.json
```

Contents of query.json:

```
{
  "Type": "TAG_FILTERS_1_0",
  "Query": "{\"ResourceTypeFilters\": [\"AWS::EC2::Instance\"], \"TagFilters\": [ { \"Key\": \"Name\", \"Values\": [ \"WebServers\" ] } ] }"
```

Output:

```
{
  "Group": {
    "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",
    "Name": "tbq-WebServer"
  },
  "ResourceQuery": {
    "Type": "TAG_FILTERS_1_0",
    "Query": "{\"ResourceTypeFilters\": [\"AWS::EC2::Instance\"], \"TagFilters\": [ { \"Key\": \"Name\", \"Values\": [ \"WebServers\" ] } ] }"
```

Example 2: To create a CloudFormation stack-based resource group

The following `create-group` example creates an AWS CloudFormation stack-based resource group named `sampleCFNstackgroup`. The query includes all resources in the specified CloudFormation stack that are supported by AWS Resource Groups.

```
aws resource-groups create-group \
  --name cbq-CFNstackgroup \
  --resource-query file://query.json
```

Contents of query.json:

```
{
  "Type": "CLOUDFORMATION_STACK_1_0",
  "Query": "{\"ResourceTypeFilters\": [\"AWS::AllSupported\"], \"StackIdentifier\": \"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-z39z-11z8-97z5-500z212zz6fz\"}"
```

Output:

```
{
  "Group": {
    "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-
CFNstackgroup",
    "Name": "cbq-CFNstackgroup"
  },
  "ResourceQuery": {
    "Type": "CLOUDFORMATION_STACK_1_0",
    "Query": "{\"ResourceTypeFilters\": [\"AWS::AllSupported\"], \"StackIdentifier
\": \"arn:aws:cloudformation:us-east-2:123456789012:stack/MyCFNStack/1415z9z0-
z39z-11z8-97z5-500z212zz6fz\"}"
  }
}
```

For more information, see [Create Groups](#) in the *AWS Resource Groups User Guide*.

- For API details, see [CreateGroup](#) in *AWS CLI Command Reference*.

delete-group

The following code example shows how to use `delete-group`.

AWS CLI**To update the description for a resource group**

The following `delete-group` example updates the specified resource group.

```
aws resource-groups delete-group \
  --group-name tbq-WebServer
```

Output:

```
{
  "Group": {
    "GroupArn": "arn:aws:resource-groups:us-west-2:1234567890:group/tbq-
WebServer",
    "Name": "tbq-WebServer"
  }
}
```

```
}
```

For more information, see [Delete Groups](#) in the *AWS Resource Groups User Guide*.

- For API details, see [DeleteGroup](#) in *AWS CLI Command Reference*.

get-group-query

The following code example shows how to use `get-group-query`.

AWS CLI

To get the query attached to a resource group

The following `get-group-query` example displays query attached to the specified resource group.

```
aws resource-groups get-group-query \  
  --group-name tbq-WebServer
```

Output:

```
{  
  "GroupQuery": {  
    "GroupName": "tbq-WebServer",  
    "ResourceQuery": {  
      "Type": "TAG_FILTERS_1_0",  
      "Query": "{\"ResourceTypeFilters\": [\"AWS::EC2::Instance\"], \"TagFilters  
\": [{\"Key\": \"Name\", \"Values\": [\"WebServers\"]}]}"  
    }  
  }  
}
```

- For API details, see [GetGroupQuery](#) in *AWS CLI Command Reference*.

get-group

The following code example shows how to use `get-group`.

AWS CLI

To get information about a resource group

The following `get-group` example displays details about the specified resource group. To get the query attached to the group, use `get-group-query`.

```
aws resource-groups get-group \  
  --group-name tbq-WebServer
```

Output:

```
{  
  "Group": {  
    "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-  
WebServer",  
    "Name": "tbq-WebServer",  
    "Description": "A tag-based query resource group of WebServers."  
  }  
}
```

- For API details, see [GetGroup](#) in *AWS CLI Command Reference*.

get-tags

The following code example shows how to use `get-tags`.

AWS CLI

To retrieve the tags attached to a resource group

The following `get-tags` example displays the tag key and value pairs attached to the specified resource group (the group itself, not its members).

```
aws resource-groups get-tags \  
  --arn arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer
```

Output:

```
{  
  "Arn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",  
  "Tags": {  
    "QueryType": "tags",  
    "QueryResources": "ec2-instances"  
  }  
}
```

```
}
```

- For API details, see [GetTags](#) in *AWS CLI Command Reference*.

list-group-resources

The following code example shows how to use `list-group-resources`.

AWS CLI

To list all of the resources in a resource group

Example 1: The following `list-resource-groups` example lists all of the resources that are part of the specified resource group.

```
aws resource-groups list-group-resources \  
  --group-name tbq-WebServer
```

Output:

```
{  
  "ResourceIdentifiers": [  
    {  
      "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/  
i-09f77fa38c12345ab",  
      "ResourceType": "AWS::EC2::Instance"  
    }  
  ]  
}
```

Example 2: The following example lists all of the resources in the group that also have a 'resource-type' of the 'AWS::EC2::Instance':

```
aws resource-groups list-group-resources --group-name tbq-WebServer --filters  
Name=resource-type,Values=AWS::EC2::Instance
```

- For API details, see [ListGroupResources](#) in *AWS CLI Command Reference*.

list-groups

The following code example shows how to use `list-groups`.

AWS CLI

To list the available resource groups

The following `list-groups` example displays a list of all of the resource groups.

```
aws resource-groups list-groups
```

Output:

```
{
  "GroupIdentifiers": [
    {
      "GroupName": "tbq-WebServer",
      "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer3"
    },
    {
      "GroupName": "cbq-CFNStackQuery",
      "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-CFNStackQuery"
    }
  ],
  "Groups": [
    {
      "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",
      "Name": "tbq-WebServer"
    },
    {
      "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-CFNStackQuery",
      "Name": "cbq-CFNStackQuery"
    }
  ]
}
```

- For API details, see [ListGroups](#) in *AWS CLI Command Reference*.

`list-resource-groups`

The following code example shows how to use `list-resource-groups`.

AWS CLI

To list all of the resources in a resource group

The following `list-resource-groups` example lists all of the resources that are part of the specified resource group.

```
aws resource-groups list-group-resources \  
  --group-name tbq-WebServer
```

Output:

```
{  
  "ResourceIdentifiers": [  
    {  
      "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/  
i-09f77fa38c12345ab",  
      "ResourceType": "AWS::EC2::Instance"  
    }  
  ]  
}
```

- For API details, see [ListResourceGroups](#) in *AWS CLI Command Reference*.

put-group-configuration

The following code example shows how to use `put-group-configuration`.

AWS CLI

To attach a service configuration to a resource group

Example 1: The following `put-group-configuration` example specifies that the resource group is to contain only Amazon EC2 capacity reservations for instances in the C5 or M5 families.

```
aws resource-groups put-group-configuration \  
  --group MyTestGroup \  
  --configuration file://config.json
```

Contents of `config.json`:

```
[
  {
    "Type": "AWS::EC2::HostManagement",
    "Parameters": [
      {
        "Name": "allowed-host-families",
        "Values": [ "c5", "m5" ]
      },
      {
        "Name": "any-host-based-license-configuration",
        "Values": [ "true" ]
      }
    ]
  },
  {
    "Type": "AWS::ResourceGroups::Generic",
    "Parameters": [
      {
        "Name": "allowed-resource-types",
        "Values": [ "AWS::EC2::Host" ]
      },
      {
        "Name": "deletion-protection",
        "Values": [ "UNLESS_EMPTY" ]
      }
    ]
  }
]
```

This command produces no output if successful.

For more information, see [Service configurations for resource groups](#) in the *Resource Groups API Reference Guide*.

- For API details, see [PutGroupConfiguration](#) in *AWS CLI Command Reference*.

search-resources

The following code example shows how to use search-resources.

AWS CLI

To find resources that match a query

The following `search-resources` example retrieves a list of all AWS resources that match the specified query.

```
aws resource-groups search-resources \  
  --resource-query file://query.json
```

Contents of `query.json`:

```
{  
  "Type": "TAG_FILTERS_1_0",  
  "Query": "{\"ResourceTypeFilters\": [\"AWS::EC2::Instance\"], \"TagFilters\":  
  [{\"Key\": \"Patch Group\", \"Values\": [\"Dev\"]}]}"  
}
```

Output:

```
{  
  "ResourceIdentifiers": [  
    {  
      "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/  
i-01a23bc45d67890ef",  
      "ResourceType": "AWS::EC2::Instance"  
    }  
  ]  
}
```

- For API details, see [SearchResources](#) in *AWS CLI Command Reference*.

tag

The following code example shows how to use `tag`.

AWS CLI

To attach a tag to a resource group

The following `tag` example attaches the specified tag key and value pairs to the specified resource group (the group itself, not its members).

```
aws resource-groups tag \  
  --tags QueryType=tags,QueryResources=ec2-instances \  
  --resource-group-id <resource-group-id>
```

```
--arn arn:aws:resource-groups:us-west-2:128716708097:group/tbq-WebServer
```

Output:

```
{
  "Arn": "arn:aws:resource-groups:us-west-2:128716708097:group/tbq-WebServer",
  "Tags": {
    "QueryType": "tags",
    "QueryResources": "ec2-instances"
  }
}
```

For more information, see [Manage tags](#) in the *AWS Resource Groups User Guide*.

- For API details, see [Tag](#) in *AWS CLI Command Reference*.

untag

The following code example shows how to use untag.

AWS CLI

To remove tags from a resource group

The following untags example removes any tag with the specified key from the resource group itself, not its members.

```
aws resource-groups untag \
  --arn arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer \
  --keys QueryType
```

Output:

```
{
  "Arn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-WebServer",
  "Keys": [
    "QueryType"
  ]
}
```

For more information, see [Manage tags](#) in the *AWS Resource Groups User Guide*.

- For API details, see [Untag](#) in *AWS CLI Command Reference*.

update-group-query

The following code example shows how to use update-group-query.

AWS CLI

Example 1: To update the query for a tag-based resource group

The following update-group-query example updates the query attached to the specified tag-based resource group.

```
aws resource-groups update-group-query \  
  --group-name tbq-WebServer \  
  --resource-query '{"Type":"TAG_FILTERS_1_0", "Query":{"ResourceTypeFilters\  
["AWS::EC2::Instance"],\TagFilters":{"Key":"Name", "Values":["WebServers\  
"]}}}'
```

Output:

```
{  
  "Group": {  
    "GroupArn": "arn:aws:resource-groups:us-east-2:123456789012:group/tbq-  
WebServer",  
    "Name": "tbq-WebServer"  
  },  
  "ResourceQuery": {  
    "Type": "TAG_FILTERS_1_0",  
    "Query": "{\ResourceTypeFilters\":[\AWS::EC2::Instance],\TagFilters\  
[{\Key\:\Name\", \Values\:[\WebServers\]}]}"  
  }  
}
```

For more information, see [Update Groups](#) in the *AWS Resource Groups User Guide*.

Example 2: To update the query for a CloudFormation stack-based resource group

The following update-group-query example updates the query attached to the specified AWS CloudFormation stack-based resource group.

```
aws resource-groups update-group-query \  
  --group-name cbq-CFNstackgroup \  
  --resource-query '{"Type": "CLOUDFORMATION_STACK_1_0", "Query":  
"{\ResourceTypeFilters\":[\AWS::AllSupported],\StackIdentifier\  
":
```

```
\\"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-z39z-11z8-97z5-500z212zz6fz\\"}"}'
```

Output:

```
{
  "Group": {
    "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/cbq-CFNstackgroup",
    "Name": "cbq-CFNstackgroup"
  },
  "ResourceQuery": {
    "Type": "CLOUDFORMATION_STACK_1_0",
    "Query": "{\"ResourceTypeFilters\": [\"AWS::AllSupported\"], \"StackIdentifier\": \"arn:aws:cloudformation:us-west-2:123456789012:stack/MyCFNStack/1415z9z0-z39z-11z8-97z5-500z212zz6fz\"}"
  }
}
```

For more information, see [Update Groups](#) in the *AWS Resource Groups User Guide*.

- For API details, see [UpdateGroupQuery](#) in *AWS CLI Command Reference*.

update-group

The following code example shows how to use `update-group`.

AWS CLI**To update the description for a resource group**

The following `update-group` example updates the description for the specified resource group.

```
aws resource-groups update-group \
  --group-name tbq-WebServer \
  --description "Resource group for all web server resources."
```

Output:

```
{
  "Group": {
```

```
    "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/tbq-
WebServer",
    "Name": "tbq-WebServer"
    "Description": "Resource group for all web server resources."
  }
}
```

For more information, see [Update Groups](#) in the *AWS Resource Groups User Guide*.

- For API details, see [UpdateGroup](#) in *AWS CLI Command Reference*.

Resource Groups Tagging API examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Resource Groups Tagging API.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

get-resources

The following code example shows how to use `get-resources`.

AWS CLI

To get a list of tagged resources

The following `get-resources` example displays a list of resources in the account that are tagged with the specified key name and value.

```
aws resourcegroupstaggingapi get-resources \  
  --tag-filters Key=Environment,Values=Production \  
  --tags-per-page 100
```

Output:

```
{  
  "ResourceTagMappingList": [  
    {  
      "ResourceARN": " arn:aws:inspector:us-west-2:123456789012:target/0-  
nvgVhaxX/template/0-7sbz2Kz0",  
      "Tags": [  
        {  
          "Key": "Environment",  
          "Value": "Production"  
        }  
      ]  
    }  
  ]  
}
```

For more information, see [GetResources](#) in the *Resource Groups Tagging API Reference*.

- For API details, see [GetResources](#) in *AWS CLI Command Reference*.

get-tag-keys

The following code example shows how to use `get-tag-keys`.

AWS CLI

To get a list of all tag keys

The following `get-tag-keys` example retrieves the list of all tag key names used by resources in the account.

```
aws resourcegroupstaggingapi get-tag-keys
```

Output:

```
{
```

```
"TagKeys": [  
  "Environment",  
  "CostCenter",  
  "Department"  
]  
}
```

For more information, see [GetTagKeys](#) in the *Resource Groups Tagging API Reference*.

- For API details, see [GetTagKeys](#) in *AWS CLI Command Reference*.

get-tag-values

The following code example shows how to use `get-tag-values`.

AWS CLI

To get a list of all tag values

The following `get-tag-values` example displays all of the values used for the specified key for all resources in the

```
aws resourcegroupstaggingapi get-tag-values \  
  --key=Environment
```

Output:

```
{  
  "TagValues": [  
    "Alpha",  
    "Gamma",  
    "Production"  
  ]  
}
```

For more information, see [GetTagValues](#) in the *Resource Groups Tagging API Reference*.

- For API details, see [GetTagValues](#) in *AWS CLI Command Reference*.

tag-resources

The following code example shows how to use `tag-resources`.

AWS CLI

To attach a tag to a resource

The following `tag-resources` example tags the specified resource with a key name and value.

```
aws resourcegroupstaggingapi tag-resources \  
  --resource-arn-list arn:aws:s3:::MyProductionBucket \  
  --tags Environment=Production,CostCenter=1234
```

Output:

```
{  
  "FailedResourcesMap": {}  
}
```

For more information, see [TagResources](#) in the *Resource Groups Tagging API Reference*.

- For API details, see [TagResources](#) in *AWS CLI Command Reference*.

untag-resources

The following code example shows how to use `untag-resources`.

AWS CLI

To remove a tag from a resource

The following `untag-resources` example removes the specified tag keys and any associated values from the specified resource.

```
aws resourcegroupstaggingapi untag-resources \  
  --resource-arn-list arn:aws:s3:::awsexamplebucket \  
  --tag-keys Environment CostCenter
```

Output:

```
{  
  "FailedResourcesMap": {}  
}
```

For more information, see [UntagResources](#) in the *Resource Groups Tagging API Reference*.

- For API details, see [UntagResources](#) in *AWS CLI Command Reference*.

AWS RoboMaker examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS RoboMaker.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

batch-describe-simulation-job

The following code example shows how to use `batch-describe-simulation-job`.

AWS CLI

To batch describe simulation jobs

The following `batch-describe-simulation-job` example retrieves details for the three specified simulation jobs.

Command:

```
aws robomaker batch-describe-simulation-job \  
--job arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-66bbb3gpxm8x  
arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-p0cpdrrwng2n  
arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-g8h6tg1mblgw
```

Output:

```

{
  "jobs": [
    {

- For API details, see [BatchDescribeSimulationJob](#) in *AWS CLI Command Reference*.

cancel-simulation-job

The following code example shows how to use `cancel-simulation-job`.

AWS CLI

To cancel a simulation job

The following `cancel-simulation-job` example cancels the specified simulation job.

```

aws robomaker cancel-simulation-job \
  --job arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-66bbb3gpxm8x

```

- For API details, see [CancelSimulationJob](#) in *AWS CLI Command Reference*.

create-deployment-job

The following code example shows how to use `create-deployment-job`.

AWS CLI

To create a deployment job

This example creates a deployment job for fleet `MyFleet`. It includes an environment variable named `"ENVIRONMENT"`. It also attaches a tag named `"Region"`.

Command:

```
aws robomaker create-deployment-job --deployment-config
concurrentDeploymentPercentage=20, failureThresholdPercentage=25
--fleet arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
Trek/1539894765711 --tags Region=West --deployment-application-configs
application=arn:aws:robomaker:us-west-2:111111111111:robot-application/
RoboMakerVoiceInteractionRobot/1546537110575, applicationVersion=1, launchConfig={environmentV
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/sim-0974h36s4v0t",
  "fleet": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
MyFleet/1539894765711",
  "status": "Pending",
  "deploymentApplicationConfigs": [
    {
      "application": "arn:aws:robomaker:us-west-2:111111111111:robot-
application/RoboMakerVoiceInteractionRobot/1546537110575",
      "applicationVersion": "1",
      "launchConfig": {
        "packageName": "voice_interaction_robot",
        "launchFile": "await_commands.launch",
        "environmentVariables": {
          "ENVIRONMENT": "Beta"
        }
      }
    }
  ]
}
```

```
],
"createdAt": 1550770236.0,
"deploymentConfig": {
  "concurrentDeploymentPercentage": 20,
  "failureThresholdPercentage": 25
},
"tags": {
  "Region": "West"
}
}
```

- For API details, see [CreateDeploymentJob](#) in *AWS CLI Command Reference*.

create-fleet

The following code example shows how to use `create-fleet`.

AWS CLI

To create a fleet

This example creates a fleet. It attaches a tag named `Region`.

Command:

```
aws robomaker create-fleet --name MyFleet --tags Region=East
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/MyOtherFleet/1550771394395",
  "name": "MyFleet",
  "createdAt": 1550771394.0,
  "tags": {
    "Region": "East"
  }
}
```

- For API details, see [CreateFleet](#) in *AWS CLI Command Reference*.

create-robot-application-version

The following code example shows how to use `create-robot-application-version`.

AWS CLI

To create a robot application version

This example creates a robot application version.

Command:

```
aws robomaker create-robot-application-version --application arn:aws:robomaker:us-west-2:111111111111:robot-application/MyRobotApplication/1551201873931
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/MyRobotApplication/1551201873931",
  "name": "MyRobotApplication",
  "version": "1",
  "sources": [
    {
      "s3Bucket": "my-bucket",
      "s3Key": "my-robot-application.tar.gz",
      "etag": "f8cf5526f1c6e7b3a72c3ed3f79c5493-70",
      "architecture": "ARMHF"
    }
  ],
  "robotSoftwareSuite": {
    "name": "ROS",
    "version": "Kinetic"
  },
  "lastUpdatedAt": 1551201873.0,
  "revisionId": "9986bb8d-a695-4ab4-8810-9f4a74d1aa00"
  "tags": {}
}
```

- For API details, see [CreateRobotApplicationVersion](#) in *AWS CLI Command Reference*.

create-robot-application

The following code example shows how to use create-robot-application.

AWS CLI

To create a robot application

This example creates a robot application.

Command:

```
aws robomaker create-robot-application --name MyRobotApplication --sources
s3Bucket=my-bucket,s3Key=my-robot-application.tar.gz,architecture=X86_64 --robot-
software-suite name=ROS,version=Kinetic
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/
MyRobotApplication/1551201873931",
  "name": "MyRobotApplication",
  "version": "$LATEST",
  "sources": [
    {
      "s3Bucket": "my-bucket",
      "s3Key": "my-robot-application.tar.gz",
      "architecture": "ARMHF"
    }
  ],
  "robotSoftwareSuite": {
    "name": "ROS",
    "version": "Kinetic"
  },
  "lastUpdatedAt": 1551201873.0,
  "revisionId": "1f3cb539-9239-4841-a656-d3efcffa07e1",
  "tags": {}
}
```

- For API details, see [CreateRobotApplication](#) in *AWS CLI Command Reference*.

create-robot

The following code example shows how to use create-robot.

AWS CLI

To create a robot

This example creates a robot. It uses the ARMHF architecture. It also attaches a tag named Region.

Command:

```
aws robomaker create-robot --name MyRobot --architecture ARMHF --greengrass-group-id
0f728a3c-7dbf-4a3e-976d-d16a8360caba --tags Region=East
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398",
  "name": "MyRobot",
  "createdAt": 1550772325.0,
  "greengrassGroupId": "0f728a3c-7dbf-4a3e-976d-d16a8360caba",
  "architecture": "ARMHF",
  "tags": {
    "Region": "East"
  }
}
```

- For API details, see [CreateRobot](#) in *AWS CLI Command Reference*.

create-simulation-application-version

The following code example shows how to use create-simulation-application-version.

AWS CLI

To create a simulation application version

This example creates a robot application version.

Command:

```
aws robomaker create-simulation-application-version --application
arn:aws:robomaker:us-west-2:111111111111:robot-application/
MySimulationApplication/1551203427605
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-application/
MyRobotApplication/1551203427605",
  "name": "MyRobotApplication",
  "version": "1",
  "sources": [
    {
      "s3Bucket": "my-bucket",

create-simulation-application

The following code example shows how to use create-simulation-application.

AWS CLI

To create a simulation application

This example creates a simulation application.

Command:

```
aws robomaker create-simulation-application --name MyRobotApplication --sources
s3Bucket=my-bucket,s3Key=my-simulation-application.tar.gz,architecture=ARMHF
--robot-software-suite name=ROS,version=Kinetic --simulation-software-suite
name=Gazebo,version=7 --rendering-engine name=OGRE,version=1.x
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-application/
MyRobotApplication/1551203301792",
  "name": "MyRobotApplication",
  "version": "$LATEST",
  "sources": [
    {
      "s3Bucket": "my-bucket",
      "s3Key": "my-simulation-application.tar.gz",
      "architecture": "X86_64"
    }
  ],
  "simulationSoftwareSuite": {
    "name": "Gazebo",
    "version": "7"
  },
  "robotSoftwareSuite": {
    "name": "ROS",
    "version": "Kinetic"
  },
  "renderingEngine": {
    "name": "OGRE",
    "version": "1.x"
  },
  "lastUpdatedAt": 1551203301.0,
  "revisionId": "ee753e53-519c-4d37-895d-65e79bcd1914",
  "tags": {}
}
```

- For API details, see [CreateSimulationApplication](#) in *AWS CLI Command Reference*.

create-simulation-job

The following code example shows how to use `create-simulation-job`.

AWS CLI

To create a simulation job

This example creates a simulation job. It uses a robot application and a simulation application.

Command:

```
aws robomaker create-simulation-job --max-job-duration-
in-seconds 3600 --iam-role arn:aws:iam::111111111111:role/
AWSRoboMakerCloudWatch-154766341-SimulationJobRole-G00BWTQ8YBG6 --robot-
applications application=arn:aws:robomaker:us-west-2:111111111111:robot-application/
MyRobotApplication/1551203485821,launchConfig={packageName=hello_world_robot,launchFile=rota
--simulation-applications application=arn:aws:robomaker:us-
west-2:111111111111:simulation-application/
MySimulationApplication/1551203427605,launchConfig={packageName=hello_world_simulation,launch
--tags Region=North
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-w7m68wpr05h8",
  "status": "Pending",
  "lastUpdatedAt": 1551213837.0,

            "launchFile": "empty_world.launch"
        }
    }
],
"tags": {
    "Region": "North"
}
}
}

```

- For API details, see [CreateSimulationJob](#) in *AWS CLI Command Reference*.

delete-fleet

The following code example shows how to use `delete-fleet`.

AWS CLI

To delete a fleet

This example deletes a fleet.

Command:

```
aws robomaker delete-fleet --fleet arn:aws:robomaker:us-
west-2:111111111111:deployment-fleet/MyFleet/1550771394395
```

- For API details, see [DeleteFleet](#) in *AWS CLI Command Reference*.

delete-robot-application

The following code example shows how to use `delete-robot-application`.

AWS CLI

To delete a robot application

This example deletes a robot application.

Command:

```
aws robomaker delete-robot-application --application arn:aws:robomaker:us-west-2:111111111111:robot-application/MyRobotApplication/1551203485821
```

- For API details, see [DeleteRobotApplication](#) in *AWS CLI Command Reference*.

delete-robot

The following code example shows how to use delete-robot.

AWS CLI

To delete a robot

This example deletes a robot.

Command:

```
aws robomaker delete-robot --robot arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1540829698778
```

- For API details, see [DeleteRobot](#) in *AWS CLI Command Reference*.

delete-simulation-application

The following code example shows how to use delete-simulation-application.

AWS CLI

To delete a simulation application

This example deletes a simulation application.

Command:

```
aws robomaker delete-simulation-application --application arn:aws:robomaker:us-west-2:111111111111:simulation-application/MySimulationApplication/1551203427605
```

- For API details, see [DeleteSimulationApplication](#) in *AWS CLI Command Reference*.

deregister-robot

The following code example shows how to use `deregister-robot`.

AWS CLI

To deregister a robot from a fleet

This example deregisters a robot from a fleet.

Command:

```
aws robomaker deregister-robot --fleet arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/MyFleet/1550771358907 --robot arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398
```

Output:

```
{
  "fleet": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/MyFleet/1550771358907",
  "robot": "arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398"
}
```

- For API details, see [DeregisterRobot](#) in *AWS CLI Command Reference*.

describe-deployment-job

The following code example shows how to use `describe-deployment-job`.

AWS CLI

To describe a deployment job

The following `describe-deployment-job` example retrieves the details about the specified deployment job.

```
aws robomaker describe-deployment-job \  
  --job arn:aws:robomaker:us-west-2:111111111111:deployment-job/deployment-  
xl8qssl6pbcn
```

Output:

```
{  
  "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/deployment-  
xl8qssl6pbcn",  
  "fleet": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/

  ],  
  "tags": {}  
}
```

- For API details, see [DescribeDeploymentJob](#) in *AWS CLI Command Reference*.

describe-fleet

The following code example shows how to use describe-fleet.

AWS CLI

To describe a fleet

The following describe-fleet example retrieves the details for the specified fleet.

```
aws robomaker describe-fleet \  
  --fleet arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/  
  MyFleet/1550771358907
```

Output:

```
{  
  "name": "MyFleet",  
  "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/  
  MyFleet/1539894765711",

list-fleets

The following code example shows how to use `list-fleets`.

AWS CLI

To list fleets

This example lists fleets. A maximum of 20 fleets will be returned.

Command:

```
aws robomaker list-fleets --max-items 20
```

Output:

```
{
  "fleetDetails": [
    {
      "name": "Trek",
      "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/MyFleet/1539894765711",
      "createdAt": 1539894765.0,
      "lastDeploymentStatus": "Failed",

      "lastDeploymentTime": 1544719763.0
    }
  ]
}
```

- For API details, see [ListFleets](#) in *AWS CLI Command Reference*.

list-robot-applications

The following code example shows how to use `list-robot-applications`.

AWS CLI**To list robot applications**

This example lists robot applications. Results are limited to 20 robot applications.

Command:

```
aws robomaker list-robot-applications --max-results 20
```

Output:

```
{
```

```
"robotApplicationSummaries": [  
  {  
    "name": "MyRobot",  
    "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/

list-simulation-applications

The following code example shows how to use `list-simulation-applications`.

AWS CLI

To list simulation applications

This example lists simulation applications. A maximum of 20 simulation applications will be returned.

Command:

```
aws robomaker list-simulation-applications --max-results 20
```

Output:

```
{
  "simulationApplicationSummaries": [
    {
      "name": "AWSRoboMakerObjectTracker-1548959046124_NPvyfcatq",
      "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-application/AWSRoboMakerObjectTracker-1548959046124_NPvyfcatq/1548959170096",
      "version": "$LATEST",
      "lastUpdatedAt": 1548959170.0
    },
    {

list-simulation-jobs

The following code example shows how to use `list-simulation-jobs`.

AWS CLI

To list simulation jobs

This example lists simulation jobs.

Command:

```
aws robomaker list-simulation-jobs
```

Output:

```

{
  "simulationJobSummaries": [
    {
      "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-job/

    }
  ]
}

```

- For API details, see [ListSimulationJobs](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

This example lists tags for an AWS RoboMaker resource.

Command:

```
aws robomaker list-tags-for-resource --resource-arn "arn:aws:robomaker:us-west-2:111111111111:robot/Robby_the_Robot/1544035373264"
```

Output:

```
{
  "tags": {
    "Region": "North",
    "Stage": "Initial"
  }
}
```

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

register-robot

The following code example shows how to use `register-robot`.

AWS CLI

To register a robot

This example registers a robot to a fleet.

Command:

```
aws robomaker register-robot --fleet arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/MyFleet/1550771358907 --robot arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398
```

Output:

```
{
  "fleet": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/MyFleet/1550771358907",
  "robot": "arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1550772324398"
}
```

- For API details, see [RegisterRobot](#) in *AWS CLI Command Reference*.

restart-simulation-job

The following code example shows how to use `restart-simulation-job`.

AWS CLI

To restart a simulation

This example restarts a simulation.

Command:

```
aws robomaker restart-simulation-job --job arn:aws:robomaker:us-west-2:111111111111:simulation-job/sim-t6rdgt70mftr
```

- For API details, see [RestartSimulationJob](#) in *AWS CLI Command Reference*.

sync-deployment-job

The following code example shows how to use `sync-deployment-job`.

AWS CLI

To sync a deployment job

This example synchronizes a deployment job.

Command:

```
aws robomaker sync-deployment-job --fleet arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/Trek/1539894765711
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:deployment-job/
deployment-09ccxs3tlfms",
  "fleet": "arn:aws:robomaker:us-west-2:111111111111:deployment-fleet/
MyFleet/1539894765711",
  "status": "Pending",
  "deploymentConfig": {
    "concurrentDeploymentPercentage": 20,
```

```
    "failureThresholdPercentage": 25
  },
  "deploymentApplicationConfigs": [
    {
      "application": "arn:aws:robomaker:us-west-2:111111111111:robot-
application/MyRobotApplication/1546541208251",
      "applicationVersion": "1",
      "launchConfig": {
        "packageName": "hello_world_simulation",
        "launchFile": "empty_world.launch"
      }
    }
  ],
  "createdAt": 1551286954.0
}
```

- For API details, see [SyncDeploymentJob](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

This example tags a resource. It attaches two tags: Region and Stage.

Command:

```
aws robomaker tag-resource --resource-arn "arn:aws:robomaker:us-
west-2:111111111111:robot/MyRobot/1544035373264" --tags Region=North,Stage=Initial
```

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a resource

This example removes a tag from a resource. It removes the Region tag.

Command:

```
aws robomaker untag-resource --resource-arn "arn:aws:robomaker:us-west-2:111111111111:robot/MyRobot/1544035373264" --tag-keys Region
```

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-robot-application

The following code example shows how to use update-robot-application.

AWS CLI

To update a robot application

This example updates a robot application.

Command:

```
aws robomaker update-robot-application --application arn:aws:robomaker:us-west-2:111111111111:robot-application/MyRobotApplication/1551203485821 --sources s3Bucket=my-bucket,s3Key=my-robot-application.tar.gz,architecture=X86_64 --robot-software-suite name=ROS,version=Kinetic
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:robot-application/MyRobotApplication/1551203485821",
  "name": "MyRobotApplication",
  "version": "$LATEST",
  "sources": [
    {
      "s3Bucket": "my-bucket",
      "s3Key": "my-robot-application.tar.gz",
      "architecture": "X86_64"
    }
  ],
  "robotSoftwareSuite": {
```

```
    "name": "ROS",
    "version": "Kinetic"
  },
  "lastUpdatedAt": 1551287993.0,
  "revisionId": "20b5e331-24fd-4504-8b8c-531afe5f4c94"
}
```

- For API details, see [UpdateRobotApplication](#) in *AWS CLI Command Reference*.

update-simulation-application

The following code example shows how to use `update-simulation-application`.

AWS CLI

To update a simulation application

This example updates a simulation application.

Command:

```
aws robomaker update-simulation-application --application
arn:aws:robomaker:us-west-2:111111111111:simulation-application/
MySimulationApplication/1551203427605 --sources s3Bucket=my-bucket,s3Key=my-
simulation-application.tar.gz,architecture=X86_64 --robot-software-suite
name=ROS,version=Kinetic --simulation-software-suite name=Gazebo,version=7 --
rendering-engine name=OGRE,version=1.x
```

Output:

```
{
  "arn": "arn:aws:robomaker:us-west-2:111111111111:simulation-application/
MySimulationApplication/1551203427605",
  "name": "MySimulationApplication",
  "version": "$LATEST",
  "sources": [
    {
      "s3Bucket": "my-bucket",
      "s3Key": "my-simulation-application.tar.gz",
      "architecture": "X86_64"
    }
  ],
}
```

```
"simulationSoftwareSuite": {
  "name": "Gazebo",
  "version": "7"
},
"robotSoftwareSuite": {
  "name": "ROS",
  "version": "Kinetic"
},
"renderingEngine": {
  "name": "OGRE",
  "version": "1.x"
},
"lastUpdatedAt": 1551289361.0,
"revisionId": "4a22cb5d-93c5-4cef-9311-52bdd119b79e"
}
```

- For API details, see [UpdateSimulationApplication](#) in *AWS CLI Command Reference*.

Route 53 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

change-resource-record-sets

The following code example shows how to use `change-resource-sets`.

AWS CLI

To create, update, or delete a resource record set

The following `change-resource-record-sets` command creates a resource record set using the `hosted-zone-id` `Z1R8UBAEXAMPLE` and the JSON-formatted configuration in the file `C:\awscli\route53\change-resource-record-sets.json`:

```
aws route53 change-resource-record-sets --hosted-zone-id Z1R8UBAEXAMPLE --change-batch file://C:\awscli\route53\change-resource-record-sets.json
```

For more information, see `POST ChangeResourceRecordSets` in the *Amazon Route 53 API Reference*.

The configuration in the JSON file depends on the kind of resource record set you want to create:

        "DNSName": "DNS domain name for your CloudFront distribution, Amazon S3
        bucket, Elastic Load Balancing load balancer, or another resource record set in
        this hosted zone",
        "EvaluateTargetHealth": true|false
    },
    "HealthCheckId": "optional ID of an Amazon Route 53 health check"
}
},
{...}
]
}

```

- For API details, see [ChangeResourceRecordSets](#) in *AWS CLI Command Reference*.

change-tags-for-resource

The following code example shows how to use `change-tags-for-resource`.

AWS CLI

The following command adds a tag named `owner` to a healthcheck resource specified by ID:

```
aws route53 change-tags-for-resource --resource-type healthcheck --resource-id
6233434j-18c1-34433-ba8e-3443434 --add-tags Key=owner,Value=myboss
```

The following command removes a tag named `owner` from a hosted zone resource specified by ID:

```
aws route53 change-tags-for-resource --resource-type hostedzone --resource-id
Z1523434445 --remove-tag-keys owner
```

- For API details, see [ChangeTagsForResource](#) in *AWS CLI Command Reference*.

create-health-check

The following code example shows how to use `create-health-check`.

AWS CLI

To create a health check

The following `create-health-check` command creates a health check using the caller reference `2014-04-01-18:47` and the JSON-formatted configuration in the file `C:\awscli\route53\create-health-check.json`:

```
aws route53 create-health-check --caller-reference 2014-04-01-18:47 --health-check-config file://C:\awscli\route53\create-health-check.json
```

JSON syntax:

```
{
  "IPAddress": "IP address of the endpoint to check",
  "Port": port on the endpoint to check--required when Type is "TCP",
  "Type": "HTTP"|"HTTPS"|"HTTP_STR_MATCH"|"HTTPS_STR_MATCH"|"TCP",
  "ResourcePath": "path of the file that you want Amazon Route 53 to request--all Types except TCP",
  "FullyQualifiedDomainName": "domain name of the endpoint to check--all Types except TCP",
  "SearchString": "if Type is HTTP_STR_MATCH or HTTPS_STR_MATCH, the string to search for in the response body from the specified resource",
  "RequestInterval": 10 | 30,
  "FailureThreshold": integer between 1 and 10
}
```

To add the health check to a Route 53 resource record set, use the `change-resource-record-sets` command.

For more information, see Amazon Route 53 Health Checks and DNS Failover in the *Amazon Route 53 Developer Guide*.

- For API details, see [CreateHealthCheck](#) in *AWS CLI Command Reference*.

create-hosted-zone

The following code example shows how to use `create-hosted-zone`.

AWS CLI

To create a hosted zone

The following `create-hosted-zone` command adds a hosted zone named `example.com` using the caller reference `2014-04-01-18:47`. The optional comment includes a space, so it must be enclosed in quotation marks:

```
aws route53 create-hosted-zone --name example.com --caller-reference
2014-04-01-18:47 --hosted-zone-config Comment="command-line version"
```

For more information, see *Working with Hosted Zones* in the *Amazon Route 53 Developer Guide*.

- For API details, see [CreateHostedZone](#) in *AWS CLI Command Reference*.

delete-health-check

The following code example shows how to use `delete-health-check`.

AWS CLI

To delete a health check

The following `delete-health-check` command deletes the health check with a `health-check-id` of `e75b48d9-547a-4c3d-88a5-ae4002397608`:

```
aws route53 delete-health-check --health-check-id e75b48d9-547a-4c3d-88a5-
ae4002397608
```

- For API details, see [DeleteHealthCheck](#) in *AWS CLI Command Reference*.

delete-hosted-zone

The following code example shows how to use `delete-hosted-zone`.

AWS CLI

To delete a hosted zone

The following `delete-hosted-zone` command deletes the hosted zone with an `id` of `Z36KTIQEXAMPLE`:

```
aws route53 delete-hosted-zone --id Z36KTIQEXAMPLE
```

- For API details, see [DeleteHostedZone](#) in *AWS CLI Command Reference*.

get-change

The following code example shows how to use `get-change`.

AWS CLI

To get the status of a change to resource record sets

The following `get-change` command gets the status and other information about the `change-resource-record-sets` request that has an `Id` of `/change/CWPIK4URU2I5S`:

```
aws route53 get-change --id /change/CWPIK4URU2I5S
```

- For API details, see [GetChange](#) in *AWS CLI Command Reference*.

get-health-check

The following code example shows how to use `get-health-check`.

AWS CLI

To get information about a health check

The following `get-health-check` command gets information about the health check that has a `health-check-id` of `02ec8401-9879-4259-91fa-04e66d094674`:

```
aws route53 get-health-check --health-check-id 02ec8401-9879-4259-91fa-04e66d094674
```

- For API details, see [GetHealthCheck](#) in *AWS CLI Command Reference*.

get-hosted-zone

The following code example shows how to use `get-hosted-zone`.

AWS CLI

To get information about a hosted zone

The following `get-hosted-zone` command gets information about the hosted zone with an `id` of `Z1R8UBAEXAMPLE`:

```
aws route53 get-hosted-zone --id Z1R8UBAEXAMPLE
```

- For API details, see [GetHostedZone](#) in *AWS CLI Command Reference*.

list-health-checks

The following code example shows how to use `list-health-checks`.

AWS CLI

To list the health checks associated with the current AWS account

The following `list-health-checks` command lists detailed information about the first 100 health checks that are associated with the current AWS account.:

```
aws route53 list-health-checks
```

If you have more than 100 health checks, or if you want to list them in groups smaller than 100, include the `--max-items` parameter. For example, to list health checks one at a time, use the following command:

```
aws route53 list-health-checks --max-items 1
```

To view the next health check, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, for example:

```
aws route53 list-health-checks --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

- For API details, see [ListHealthChecks](#) in *AWS CLI Command Reference*.

list-hosted-zones-by-name

The following code example shows how to use `list-hosted-zones-by-name`.

AWS CLI

The following command lists up to 100 hosted zones ordered by domain name:

```
aws route53 list-hosted-zones-by-name
```

Output:

```
{
  "HostedZones": [
    {
      "ResourceRecordSetCount": 2,
      "CallerReference": "test20150527-2",
      "Config": {
        "Comment": "test2",
        "PrivateZone": false
      },
      "Id": "/hostedzone/Z119WBBTVP5WFX",
      "Name": "2.example.com."
    },
    {
      "ResourceRecordSetCount": 2,
      "CallerReference": "test20150527-1",
      "Config": {
        "Comment": "test",
        "PrivateZone": false
      },
      "Id": "/hostedzone/Z3P5QSUBK4POTI",
      "Name": "www.example.com."
    }
  ],
  "IsTruncated": false,
  "MaxItems": "100"
}
```

The following command lists hosted zones ordered by name, beginning with `www.example.com`:

```
aws route53 list-hosted-zones-by-name --dns-name www.example.com
```

Output:

```
{
  "HostedZones": [
    {
      "ResourceRecordSetCount": 2,
      "CallerReference": "mwunderl20150527-1",
      "Config": {
```

```
        "Comment": "test",
        "PrivateZone": false
    },
    "Id": "/hostedzone/Z3P5QSUBK4P0TI",
    "Name": "www.example.com."
}
],
"DNSName": "www.example.com",
"IsTruncated": false,
"MaxItems": "100"
}
```

- For API details, see [ListHostedZonesByName](#) in *AWS CLI Command Reference*.

list-hosted-zones

The following code example shows how to use `list-hosted-zones`.

AWS CLI

To list the hosted zones associated with the current AWS account

The following `list-hosted-zones` command lists summary information about the first 100 hosted zones that are associated with the current AWS account.:

```
aws route53 list-hosted-zones
```

If you have more than 100 hosted zones, or if you want to list them in groups smaller than 100, include the `--max-items` parameter. For example, to list hosted zones one at a time, use the following command:

```
aws route53 list-hosted-zones --max-items 1
```

To view information about the next hosted zone, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, for example:

```
aws route53 list-hosted-zones --max-items 1 --starting-token Z3M3LMPEXAMPLE
```

- For API details, see [ListHostedZones](#) in *AWS CLI Command Reference*.

list-query-logging-configs

The following code example shows how to use `list-query-logging-configs`.

AWS CLI

To list query logging configurations

The following `list-query-logging-configs` example lists information about the first 100 query logging configurations in your AWS account, for the hosted zone Z10X3WQEXAMPLE.

```
aws route53 list-query-logging-configs \
  --hosted-zone-id Z10X3WQEXAMPLE
```

Output:

```
{
  "QueryLoggingConfigs": [
    {
      "Id": "964ff34e-ae03-4f06-80a2-9683cexample",
      "HostedZoneId": "Z10X3WQEXAMPLE",
      "CloudWatchLogsLogGroupArn": "arn:aws:logs:us-east-1:111122223333:log-
group:/aws/route53/example.com:*"
    }
  ]
}
```

For more information, see [Logging DNS queries](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListQueryLoggingConfigs](#) in *AWS CLI Command Reference*.

list-resource-record-sets

The following code example shows how to use `list-resource-record-sets`.

AWS CLI

To list the resource record sets in a hosted zone

The following `list-resource-record-sets` command lists summary information about the first 100 resource record sets in a specified hosted zone.:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE
```

If the hosted zone contains more than 100 resource record sets, or if you want to list them in groups smaller than 100, include the `--max-items` parameter. For example, to list resource record sets one at a time, use the following command:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --max-items 1
```

To view information about the next resource record set in the hosted zone, take the value of `NextToken` from the response to the previous command, and include it in the `--starting-token` parameter, for example:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --max-items 1  
--starting-token Z3M3LMPEXAMPLE
```

To view all the resource record sets of a particular name, use the `--query` parameter to filter them out. For example:

```
aws route53 list-resource-record-sets --hosted-zone-id Z2LD58HEXAMPLE --query  
"ResourceRecordSets[?Name == 'example.domain.']"
```

- For API details, see [ListResourceRecordSets](#) in *AWS CLI Command Reference*.

Route 53 domain registration examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 domain registration.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

check-domain-availability

The following code example shows how to use check-domain-availability.

AWS CLI

To determine whether you can register a domain name with Route 53

The following check-domain-availability command returns information about whether the domain name example.com is available to be registered using Route 53.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains check-domain-availability \  
  --region us-east-1 \  
  --domain-name example.com
```

Output:

```
{  
  "Availability": "UNAVAILABLE"  
}
```

Route 53 supports a large number of top-level domains (TLDs), such as .com and .jp, but we don't support all available TLDs. If you check the availability of a domain and Route 53 doesn't support the TLD, check-domain-availability returns the following message.

```
An error occurred (UnsupportedTLD) when calling the CheckDomainAvailability  
operation: <top-level domain> tld is not supported.
```

For a list of the TLDs that you can use when registering a domain with Route 53, see [Domains That You Can Register with Amazon Route 53](#) in the *Amazon Route 53 Developer Guide*. For more information about registering domains with Amazon Route 53, see [Registering a New Domain](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [CheckDomainAvailability](#) in *AWS CLI Command Reference*.

check-domain-transferability

The following code example shows how to use `check-domain-transferability`.

AWS CLI

To determine whether a domain can be transferred to Route 53

The following `check-domain-transferability` command returns information about whether you can transfer the domain name `example.com` to Route 53.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains check-domain-transferability \  
  --region us-east-1 \  
  --domain-name example.com
```

Output:

```
{  
  "Transferability": {  
    "Transferable": "UNTRANSFERABLE"  
  }  
}
```

For more information, see [Transferring Registration for a Domain to Amazon Route 53](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [CheckDomainTransferability](#) in *AWS CLI Command Reference*.

delete-tags-for-domain

The following code example shows how to use `delete-tags-for-domain`.

AWS CLI

To delete tags for a domain

The following `delete-tags-for-domain` command deletes three tags from the specified domain. Note that you specify only the tag key, not the tag value.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains delete-tags-for-domain \  
  --region us-east-1 \  
  --domain-name example.com \  
  --tags-to-delete accounting-key hr-key engineering-key
```

This command produces no output.

To confirm that the tags were deleted, you can run [list-tags-for-domain](#) . For more information, see [Tagging Amazon Route 53 Resources](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DeleteTagsForDomain](#) in *AWS CLI Command Reference*.

disable-domain-auto-renew

The following code example shows how to use `disable-domain-auto-renew`.

AWS CLI

To disable automatic renewal of a domain

The following `disable-domain-auto-renew` command configures Route 53 to *not* automatically renew the domain `example.com` before registration for the domain expires.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains disable-domain-auto-renew \  
  --region us-east-1 \  
  --domain-name example.com
```

This command produces no output.

To confirm that the setting was changed, you can run [get-domain-detail](#) . If automatic renewal is disabled, the value of `AutoRenew` is `False`. For more information about automatic renewal, see [Renewing Registration for a Domain <https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html>](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DisableDomainAutoRenew](#) in *AWS CLI Command Reference*.

disable-domain-transfer-lock

The following code example shows how to use `disable-domain-transfer-lock`.

AWS CLI

To disable the transfer lock on a domain

The following `disable-domain-transfer-lock` command removes the transfer lock on the domain `example.com` so that the domain can be transferred to another registrar. This command changes the `clientTransferProhibited` status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains disable-domain-transfer-lock \  
  --region us-east-1 \  
  --domain-name example.com
```

Output:

```
{  
  "OperationId": "3f28e0ac-126a-4113-9048-cc930example"  
}
```

To confirm that the transfer lock has been changed, you can run [get-domain-detail](#). When the transfer lock is disabled, the value of `StatusList` does *not* include `clientTransferProhibited`.

For more information about the transfer process, see [Transferring a Domain from Amazon Route 53 to Another Registrar](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DisableDomainTransferLock](#) in *AWS CLI Command Reference*.

enable-domain-auto-renew

The following code example shows how to use `enable-domain-auto-renew`.

AWS CLI

To enable automatic renewal of a domain

The following `enable-domain-auto-renew` command configures Route 53 to automatically renew the domain `example.com` before registration for the domain expires.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains enable-domain-auto-renew \  
  --region us-east-1 \  
  --domain-name example.com
```

This command produces no output. To confirm that the setting was changed, you can run [get-domain-detail](#). If automatic renewal is enabled, the value of `AutoRenew` is `True`.

For more information about automatic renewal, see [Renewing Registration for a Domain](https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html) <<https://docs.aws.amazon.com/Route53/latest/DeveloperGuide/domain-renew.html>> in the *Amazon Route 53 Developer Guide*.

- For API details, see [EnableDomainAutoRenew](#) in *AWS CLI Command Reference*.

enable-domain-transfer-lock

The following code example shows how to use `enable-domain-transfer-lock`.

AWS CLI

To enable the transfer lock on a domain

The following `enable-domain-transfer-lock` command locks the specified domain so that it can't be transferred to another registrar. This command changes the `clientTransferProhibited` status.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains enable-domain-transfer-lock \  
  --region us-east-1 \  
  --domain-name example.com
```

Output:

```
{
```

```
"OperationId": "3f28e0ac-126a-4113-9048-cc930example"  
}
```

To confirm that the transfer lock has been changed, you can run [get-domain-detail](#). When the transfer lock is enabled, the value of `StatusList` includes `clientTransferProhibited`.

For more information about the transfer process, see [Transferring a Domain from Amazon Route 53 to Another Registrar](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [EnableDomainTransferLock](#) in *AWS CLI Command Reference*.

get-contact-reachability-status

The following code example shows how to use `get-contact-reachability-status`.

AWS CLI

To determine whether the registrant contact has responded to a confirmation email

The following `get-contact-reachability-status` command returns information about whether the registrant contact for the specified domain has responded to a confirmation email.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-contact-reachability-status \  
  --region us-east-1 \  
  --domain-name example.com
```

Output:

```
{  
  "domainName": "example.com",  
  "status": "DONE"  
}
```

For more information, see [Resending Authorization and Confirmation Emails](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetContactReachabilityStatus](#) in *AWS CLI Command Reference*.

get-domain-detail

The following code example shows how to use `get-domain-detail`.

AWS CLI

To get detailed information about a specified domain

The following `get-domain-detail` command displays detailed information about the specified domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-domain-detail \  
  --region us-east-1 \  
  --domain-name example.com
```

Output:

```
{  
  "DomainName": "example.com",  
  "Nameservers": [  
    {  
      "Name": "ns-2048.awsdns-64.com",  
      "GlueIps": []  
    },  
    {  
      "Name": "ns-2049.awsdns-65.net",  
      "GlueIps": []  
    },  
    {  
      "Name": "ns-2050.awsdns-66.org",  
      "GlueIps": []  
    },  
    {  
      "Name": "ns-2051.awsdns-67.co.uk",  
      "GlueIps": []  
    }  
  ],  
  "AutoRenew": true,  
  "AdminContact": {  
    "FirstName": "Saanvi",
```

```
    "LastName": "Sarkar",
    "ContactType": "COMPANY",
    "OrganizationName": "Example",
    "AddressLine1": "123 Main Street",
    "City": "Anytown",

  "clientTransferProhibited"
]
}
```

- For API details, see [GetDomainDetail](#) in *AWS CLI Command Reference*.

get-domain-suggestions

The following code example shows how to use `get-domain-suggestions`.

AWS CLI

To get a list of suggested domain names

The following `get-domain-suggestions` command displays a list of suggested domain names based on the domain name `example.com`. The response includes only domain names that are available. This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-domain-suggestions \
  --region us-east-1 \
  --domain-name example.com \
  --suggestion-count 10 \
  --only-available
```

Output:

```
{
  "SuggestionsList": [
    {
      "DomainName": "egzaampal.com",
      "Availability": "AVAILABLE"
    },
    {
```

```
    "DomainName": "examplelaw.com",
    "Availability": "AVAILABLE"
  },
  {
    "DomainName": "examplehouse.net",
    "Availability": "AVAILABLE"
  },
  {
    "DomainName": "homeexample.net",
    "Availability": "AVAILABLE"
  },
  {
    "DomainName": "examplelist.com",
    "Availability": "AVAILABLE"
  },
  {
    "DomainName": "examplenews.net",
    "Availability": "AVAILABLE"
  },
  {
    "DomainName": "officeexample.com",
    "Availability": "AVAILABLE"
  },
  {
    "DomainName": "exampleworld.com",
    "Availability": "AVAILABLE"
  },
  {
    "DomainName": "exampleart.com",
    "Availability": "AVAILABLE"
  }
]
}
```

- For API details, see [GetDomainSuggestions](#) in *AWS CLI Command Reference*.

get-operation-detail

The following code example shows how to use get-operation-detail.

AWS CLI

To get the current status of an operation

Some domain registration operations operate asynchronously and return a response before they finish. These operations return an operation ID that you can use to get the current status. The following `get-operation-detail` command returns the status of the specified operation.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains get-operation-detail \  
  --region us-east-1 \  
  --operation-id edbd8d63-7fe7-4343-9bc5-54033example
```

Output:

```
{  
  "OperationId": "edbd8d63-7fe7-4343-9bc5-54033example",  
  "Status": "SUCCESSFUL",  
  "DomainName": "example.com",  
  "Type": "DOMAIN_LOCK",  
  "SubmittedDate": 1573749367.864  
}
```

- For API details, see [GetOperationDetail](#) in *AWS CLI Command Reference*.

list-domains

The following code example shows how to use `list-domains`.

AWS CLI

To list the domains that are registered with the current AWS account

The following `list-domains` command lists summary information about the domains that are registered with the current AWS account.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-domains
```

```
--region us-east-1
```

Output:

```
{
  "Domains": [
    {
      "DomainName": "example.com",
      "AutoRenew": true,
      "TransferLock": true,
      "Expiry": 1602712345.0
    },
    {
      "DomainName": "example.net",
      "AutoRenew": true,
      "TransferLock": true,
      "Expiry": 1602723456.0
    },
    {
      "DomainName": "example.org",
      "AutoRenew": true,
      "TransferLock": true,
      "Expiry": 1602734567.0
    }
  ]
}
```

- For API details, see [ListDomains](#) in *AWS CLI Command Reference*.

list-operations

The following code example shows how to use `list-operations`.

AWS CLI**To list the status of operations that return an operation ID**

Some domain registration operations run asynchronously and return a response before they finish. These operations return an operation ID that you can use to get the current status. The following `list-operations` command lists summary information, including the status, about the current domain-registration operations.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-operations
  --region us-east-1
```

Output:

```
{
  "Operations": [
    {
      "OperationId": "aab9822f-1da0-4bf3-8a15-fd4e0example",
      "Status": "SUCCESSFUL",
      "Type": "DOMAIN_LOCK",
      "SubmittedDate": 1455321739.986
    },
    {
      "OperationId": "c24379ed-76be-42f8-bdad-9379bexample",
      "Status": "SUCCESSFUL",
      "Type": "UPDATE_NAMESERVER",
      "SubmittedDate": 1468960475.109
    },
    {
      "OperationId": "f47e1297-ef9e-4c2b-ae1e-a5fcbexample",
      "Status": "SUCCESSFUL",
      "Type": "RENEW_DOMAIN",
      "SubmittedDate": 1473561835.943
    },
    {
      "OperationId": "75584f23-b15f-459e-aed7-dc6f5example",
      "Status": "SUCCESSFUL",
      "Type": "UPDATE_DOMAIN_CONTACT",
      "SubmittedDate": 1547501003.41
    }
  ]
}
```

The output includes all the operations that return an operation ID and that you have performed on all the domains that you have ever registered using the current AWS account. If you want to get only the operations that you submitted after a specified date, you can include the `submitted-since` parameter and specify a date in Unix format and Coordinated Universal

Time (UTC). The following command gets the status of all operations that were submitted after 12:00 am UTC on January 1, 2020.

```
aws route53domains list-operations \  
  --submitted-since 1577836800
```

- For API details, see [ListOperations](#) in *AWS CLI Command Reference*.

list-tags-for-domain

The following code example shows how to use `list-tags-for-domain`.

AWS CLI

To list tags for a domain

The following `list-tags-for-domain` command lists the tags that are currently associated with the specified domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains list-tags-for-domain \  
  --region us-east-1 \  
  --domain-name example.com
```

Output:

```
{  
  "TagList": [  
    {  
      "Key": "key1",  
      "Value": "value1"  
    },  
    {  
      "Key": "key2",  
      "Value": "value2"  
    }  
  ]  
}
```

For more information, see [Tagging Amazon Route 53 Resources](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListTagsForDomain](#) in *AWS CLI Command Reference*.

register-domain

The following code example shows how to use `register-domain`.

AWS CLI

To register a domain

The following `register-domain` command registers a domain, retrieving all parameter values from a JSON-formatted file.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains register-domain \  
  --region us-east-1 \  
  --cli-input-json file://register-domain.json
```

Contents of `register-domain.json`:

```
{  
  "DomainName": "example.com",  
  "DurationInYears": 1,  
  "AutoRenew": true,  
  "AdminContact": {  
    "FirstName": "Martha",  
    "LastName": "Rivera",  
    "ContactType": "PERSON",  
    "OrganizationName": "Example",  
    "AddressLine1": "1 Main Street",  
    "City": "Anytown",  
    "State": "WA",  
    "CountryCode": "US",  
    "ZipCode": "98101",  
    "PhoneNumber": "+1.8005551212",  
    "Email": "mrivera@example.com"  
  },  
  "RegistrantContact": {
```

```
"FirstName": "Li",
"LastName": "Juan",
"ContactType": "PERSON",
"OrganizationName": "Example",
"AddressLine1": "1 Main Street",
"City": "Anytown",
"State": "WA",
"CountryCode": "US",
"ZipCode": "98101",
"PhoneNumber": "+1.8005551212",
"Email": "ljuan@example.com"
},
"TechContact": {
  "FirstName": "Mateo",
  "LastName": "Jackson",
  "ContactType": "PERSON",
  "OrganizationName": "Example",
  "AddressLine1": "1 Main Street",
  "City": "Anytown",
  "State": "WA",
  "CountryCode": "US",
  "ZipCode": "98101",
  "PhoneNumber": "+1.8005551212",
  "Email": "mjackson@example.com"
},
"PrivacyProtectAdminContact": true,
"PrivacyProtectRegistrantContact": true,
"PrivacyProtectTechContact": true
}
```

Output:

```
{
  "OperationId": "b114c44a-9330-47d1-a6e8-a0b11example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see [get-operation-detail](#).

For more information, see [Registering a New Domain](#) in the *Amazon Route 53 Developer Guide*.

For information about which top-level domains (TLDs) require values for `ExtraParams` and what the valid values are, see [ExtraParam](#) in the *Amazon Route 53 API Reference*.

- For API details, see [RegisterDomain](#) in *AWS CLI Command Reference*.

renew-domain

The following code example shows how to use `renew-domain`.

AWS CLI

To renew a domain

The following `renew-domain` command renews the specified domain for five years. To get the value for `current-expiry-year`, use the `get-domain-detail` command, and convert the value of `ExpirationDate` from Unix format.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains renew-domain \  
  --region us-east-1 \  
  --domain-name example.com \  
  --duration-in-years 5 \  
  --current-expiry-year 2020
```

Output:

```
{  
  "OperationId": "3f28e0ac-126a-4113-9048-cc930example"  
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see [get-operation-detail](#).

The registry for each top-level domain (TLD), such as `.com` or `.org`, controls the maximum number of years that you can renew a domain for. To get the maximum renewal period for your domain, see the "Registration and Renewal Period" section for your TLD in [Domains That You Can Register with Amazon Route 53](#) in the *Amazon Route 53 Developer Guide*.

For more information, see [Renewing Registration for a Domain](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [RenewDomain](#) in *AWS CLI Command Reference*.

resent-contact-reachability-email

The following code example shows how to use `resent-contact-reachability-email`.

AWS CLI

To resend the confirmation email to the current email address for the registrant contact

The following `resent-contact-reachability-email` command resends the confirmation email to the current email address for the registrant contact for the `example.com` domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains resent-contact-reachability-email \  
  --region us-east-1 \  
  --domain-name example.com
```

Output:

```
{  
  "domainName": "example.com",  
  "emailAddress": "moliveira@example.com",  
  "isAlreadyVerified": true  
}
```

If the value of `isAlreadyVerified` is `true`, as in this example, the registrant contact has already confirmed that the specified email address is reachable.

For more information, see [Resending Authorization and Confirmation Emails](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ResendContactReachabilityEmail](#) in *AWS CLI Command Reference*.

retrieve-domain-auth-code

The following code example shows how to use `retrieve-domain-auth-code`.

AWS CLI

To get the authorization code for a domain so you can transfer the domain to another registrar

The following `retrieve-domain-auth-code` command gets the current authorization code for the `example.com` domain. You give this value to another domain registrar when you want to transfer the domain to that registrar.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains retrieve-domain-auth-code \  
  --region us-east-1 \  
  --domain-name example.com
```

Output:

```
{  
  "AuthCode": ")o!v3dJeXampLe"  
}
```

For more information, see [Transferring a Domain from Amazon Route 53 to Another Registrar](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [RetrieveDomainAuthCode](#) in *AWS CLI Command Reference*.

transfer-domain

The following code example shows how to use `transfer-domain`.

AWS CLI

To transfer a domain to Amazon Route 53

The following `transfer-domain` command transfers a domain to Route 53, with the parameters provided by the JSON-formatted file `C:\temp\transfer-domain.json`.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains transfer-domain \  
--region us-east-1 \  
--cli-input-json file://C:\temp\transfer-domain.json
```

Contents of `transfer-domain.json`:

```
{  
  "DomainName": "example.com",  
  "DurationInYears": 1,  
  "Nameservers": [  
    {  
      "Name": "ns-2048.awsdns-64.com"  
    },  
    {  
      "Name": "ns-2049.awsdns-65.net"  
    },  
    {  
      "Name": "ns-2050.awsdns-66.org"  
    },  
    {  
      "Name": "ns-2051.awsdns-67.co.uk"  
    }  
  ],  
  "AuthCode": ")o!v3dJeXampLe",  
  "AutoRenew": true,  
  "AdminContact": {  
    "FirstName": "Martha",  
    "LastName": "Rivera",  
    "ContactType": "PERSON",  
    "OrganizationName": "Example",  
    "AddressLine1": "1 Main Street",  
    "City": "Anytown",  
    "State": "WA",  
    "CountryCode": "US",  
    "ZipCode": "98101",  
    "PhoneNumber": "+1.8005551212",  
    "Email": "mrivera@example.com"  
  },  
  "RegistrantContact": {  
    "FirstName": "Li",  
    "LastName": "Juan",  
    "ContactType": "PERSON",  
    "OrganizationName": "Example",
```

```
    "AddressLine1": "1 Main Street",
    "City": "Anytown",
    "State": "WA",
    "CountryCode": "US",
    "ZipCode": "98101",
    "PhoneNumber": "+1.8005551212",
    "Email": "ljuan@example.com"
  },
  "TechContact": {
    "FirstName": "Mateo",
    "LastName": "Jackson",
    "ContactType": "PERSON",
    "OrganizationName": "Example",
    "AddressLine1": "1 Main Street",
    "City": "Anytown",
    "State": "WA",
    "CountryCode": "US",
    "ZipCode": "98101",
    "PhoneNumber": "+1.8005551212",
    "Email": "mjackson@example.com"
  },
  "PrivacyProtectAdminContact": true,
  "PrivacyProtectRegistrantContact": true,
  "PrivacyProtectTechContact": true
}
```

Output:

```
{
  "OperationId": "b114c44a-9330-47d1-a6e8-a0b11example"
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see [get-operation-detail](#).

For more information, see [Transferring Registration for a Domain to Amazon Route 53](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [TransferDomain](#) in *AWS CLI Command Reference*.

update-domain-contact-privacy

The following code example shows how to use `update-domain-contact-privacy`.

AWS CLI

To update the privacy settings for the contacts for a domain

The following `update-domain-contact-privacy` command turns off privacy protection for the administrative contact for the `example.com` domain. This command runs only in the `us-east-1` Region.

If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-contact-privacy \  
  --region us-east-1 \  
  --domain-name example.com \  
  --no-admin-privacy
```

Output:

```
{  
  "OperationId": "b3a219e9-d801-4244-b533-b7256example"  
}
```

To confirm that the operation succeeded, you can run `get-operation-detail`. For more information, see [get-operation-detail](#).

For more information, see [Enabling or Disabling Privacy Protection for Contact Information for a Domain](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [UpdateDomainContactPrivacy](#) in *AWS CLI Command Reference*.

update-domain-contact

The following code example shows how to use `update-domain-contact`.

AWS CLI

To update the contact information for a domain

The following `update-domain-contact` command updates the contact information for a domain, getting the parameters from the JSON-formatted file `C:\temp\update-domain-contact.json`.

This command runs only in the us-east-1 Region. If your default region is set to us-east-1, you can omit the region parameter.

```
aws route53domains update-domain-contact \  
  --region us-east-1 \  
  --cli-input-json file://C:\temp\update-domain-contact.json
```

Contents of update-domain-contact.json:

```
{  
  "AdminContact": {  
    "AddressLine1": "101 Main Street",  
    "AddressLine2": "Suite 1a",  
    "City": "Seattle",  
    "ContactType": "COMPANY",  
    "CountryCode": "US",  
    "Email": "w.xiulan@example.com",  
    "FirstName": "Wang",  
    "LastName": "Xiulan",  
    "OrganizationName": "Example",  
    "PhoneNumber": "+1.8005551212",  
    "State": "WA",  
    "ZipCode": "98101"  
  },  
  "DomainName": "example.com",  
  "RegistrantContact": {  
    "AddressLine1": "101 Main Street",  
    "AddressLine2": "Suite 1a",  
    "City": "Seattle",  
    "ContactType": "COMPANY",  
    "CountryCode": "US",  
    "Email": "w.xiulan@example.com",  
    "FirstName": "Wang",  
    "LastName": "Xiulan",  
    "OrganizationName": "Example",  
    "PhoneNumber": "+1.8005551212",  
    "State": "WA",  
    "ZipCode": "98101"  
  },  
  "TechContact": {  
    "AddressLine1": "101 Main Street",  
    "AddressLine2": "Suite 1a",  
    "City": "Seattle",
```

```
"ContactType": "COMPANY",
"CountryCode": "US",
"Email": "w.xiulan@example.com",
"FirstName": "Wang",
"LastName": "Xiulan",
"OrganizationName": "Example",
"PhoneNumber": "+1.8005551212",
"State": "WA",
"ZipCode": "98101"
}
}
```

Output:

```
{
  "OperationId": "b3a219e9-d801-4244-b533-b7256example"
}
```

To confirm that the operation succeeded, you can run [get-domain-detail](#) . For more information, see [Updating Contact Information for a Domain](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [UpdateDomainContact](#) in *AWS CLI Command Reference*.

update-domain-nameservers

The following code example shows how to use `update-domain-nameservers`.

AWS CLI

To update the name servers for a domain

The following `update-domain-nameservers` command updates the name servers for a domain.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-domain-nameservers \
  --region us-east-1 \
  --domain-name example.com \
  --nameservers Name=ns-1.awsdns-01.org Name=ns-2.awsdns-02.co.uk
Name=ns-3.awsdns-03.net Name=ns-4.awsdns-04.com
```

Output:

```
{
  "OperationId": "f1691ec4-0e7a-489e-82e0-b19d3example"
}
```

To confirm that the operation succeeded, you can run [get-domain-detail](#) .

For more information, see [Adding or Changing Name Servers and Glue Records for a Domain](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [UpdateDomainNameservers](#) in *AWS CLI Command Reference*.

update-tags-for-domain

The following code example shows how to use `update-tags-for-domain`.

AWS CLI**To add or update tags for a domain**

The following `update-tags-for-domain` command adds or updates two keys and the corresponding values for the `example.com` domain. To update the value for a key, just include the key and the new value. You can add or update tags in only one domain at a time.

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains update-tags-for-domain \
  --region us-east-1 \
  --domain-name example.com \
  --tags-to-update "Key=key1,Value=value1" "Key=key2,Value=value2"
```

This command produces no output. To confirm that the tags were added or updated, you can run [list-tags-for-domain](#) .

For more information, see [Tagging Amazon Route 53 Resources](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [UpdateTagsForDomain](#) in *AWS CLI Command Reference*.

view-billing

The following code example shows how to use `view-billing`.

AWS CLI

To get billing information for domain registration charges for the current AWS account

The following `view-billing` command returns all the domain-related billing records for the current account for the period from January 1, 2018 (1514764800 in Unix time) and midnight on December 31, 2019 (1577836800 in Unix time).

This command runs only in the `us-east-1` Region. If your default region is set to `us-east-1`, you can omit the `region` parameter.

```
aws route53domains view-billing \  
  --region us-east-1 \  
  --start-time 1514764800 \  
  --end-time 1577836800
```

Output:

```
{  
  "BillingRecords": [  
    {  
      "DomainName": "example.com",  
      "Operation": "RENEW_DOMAIN",  
      "InvoiceId": "149962827",  
      "BillDate": 1536618063.181,  
      "Price": 12.0  
    },  
    {  
      "DomainName": "example.com",  
      "Operation": "RENEW_DOMAIN",  
      "InvoiceId": "290913289",  
      "BillDate": 1568162630.884,  
      "Price": 12.0  
    }  
  ]  
}
```

For more information, see [ViewBilling](#) in the *Amazon Route 53 API Reference*.

- For API details, see [ViewBilling](#) in *AWS CLI Command Reference*.

Route 53 Resolver examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Route 53 Resolver.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

associate-firewall-rule-group

The following code example shows how to use `associate-firewall-rule-group`.

AWS CLI

To associate a firewall rule group with a VPC

The following `associate-firewall-rule-group` example associates a DNS Firewall rule group with an Amazon VPC.

```
aws route53resolver associate-firewall-rule-group \  
  --name test-association \  
  --firewall-rule-group-id rslvr-frg-47f93271fexample \  
  --vpc-id vpc-31e92222 \  
  --priority 101
```

Output:

```
{
  "FirewallRuleGroupAssociation": {
    "Id": "rslvr-frgassoc-57e8873d7example",
    "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-association/rslvr-frgassoc-57e8873d7example",
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
    "VpcId": "vpc-31e92222",
    "Name": "test-association",
    "Priority": 101,
    "MutationProtection": "DISABLED",
    "Status": "UPDATING",
    "StatusMessage": "Creating Firewall Rule Group Association",
    "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
    "CreationTime": "2021-05-25T21:47:48.755768Z",
    "ModificationTime": "2021-05-25T21:47:48.755768Z"
  }
}
```

For more information, see [Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [AssociateFirewallRuleGroup](#) in *AWS CLI Command Reference*.

associate-resolver-endpoint-ip-address

The following code example shows how to use `associate-resolver-endpoint-ip-address`.

AWS CLI

To associate another IP address with a Resolver endpoint

The following `associate-resolver-endpoint-ip-address` example associates another IP address with an inbound Resolver endpoint. If you specify only a subnet ID and omit the IP address from the `--ip-address` parameter, Resolver chooses an IP address for you from among the available IP addresses in the specified subnet.

```
aws route53resolver associate-resolver-endpoint-ip-address \
  --resolver-endpoint-id rslvr-in-497098ad5example \
  --ip-address="SubnetId=subnet-12d8exam,Ip=192.0.2.118"
```

Output:

```
{
  "ResolverEndpoint": {

- For API details, see [AssociateResolverEndpointIpAddress](#) in *AWS CLI Command Reference*.

associate-resolver-rule

The following code example shows how to use `associate-resolver-rule`.

AWS CLI

To associate a Resolver rule with a VPC

The following `associate-resolver-rule` example associates a Resolver rule with an Amazon VPC. After you run the command, Resolver starts to forward DNS queries to your network based on the settings in the rule, such as the domain name of the queries that are forwarded.

```
aws route53resolver associate-resolver-rule \
  --name my-resolver-rule-association \
  --resolver-rule-id rslvr-rr-42b60677c0example \
  --vpc-id vpc-304bexam
```

Output:

```
{
  "ResolverRuleAssociation": {
    "Id": "rslvr-rrassoc-d61cbb2c8bexample",
    "ResolverRuleId": "rslvr-rr-42b60677c0example",
    "Name": "my-resolver-rule-association",
    "VPCId": "vpc-304bexam",
    "Status": "CREATING",
    "StatusMessage": "[Trace id: 1-5dc5a8fa-ec2cc480d2ef07617example] Creating
the association."
  }
}
```

For more information, see [Forwarding Outbound DNS Queries to Your Network](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [AssociateResolverRule](#) in *AWS CLI Command Reference*.

create-firewall-domain-list

The following code example shows how to use `create-firewall-domain-list`.

AWS CLI**To create a Route 53 Resolver DNS Firewall domain list**

The following `create-firewall-domain-list` example creates a Route 53 Resolver DNS Firewall domain list, named `test`, in your AWS account.

```
aws route53resolver create-firewall-domain-list \
  --creator-request-id my-request-id \
  --name test
```

Output:

```
{
  "FirewallDomainList": {
    "Id": "rslvr-fdl-d61cbb2cbexample",
    "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/
rslvr-fdl-d61cbb2cbexample",
```

```
    "Name": "test",
    "DomainCount": 0,
    "Status": "COMPLETE",
    "StatusMessage": "Created Firewall Domain List",
    "CreatorRequestId": "my-request-id",
    "CreationTime": "2021-05-25T15:55:51.115365Z",
    "ModificationTime": "2021-05-25T15:55:51.115365Z"
  }
}
```

For more information, see [Managing your own domain lists](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [CreateFirewallDomainList](#) in *AWS CLI Command Reference*.

create-firewall-rule-group

The following code example shows how to use `create-firewall-rule-group`.

AWS CLI

To create a Firewall rule group

The following `create-firewall-rule-group` example creates a DNS Firewall rule group.

```
aws route53resolver create-firewall-rule-group \
  --creator-request-id my-request-id \
  --name test
```

Output:

```
{
  "FirewallRuleGroup": {
    "Id": "rslvr-frg-47f93271fexample",
    "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/rslvr-frg-47f93271fexample",
    "Name": "test",
    "RuleCount": 0,
    "Status": "COMPLETE",
    "StatusMessage": "Created Firewall Rule Group",
    "OwnerId": "123456789012",
    "CreatorRequestId": "my-request-id",
```

```

    "ShareStatus": "NOT_SHARED",
    "CreationTime": "2021-05-25T18:59:26.490017Z",
    "ModificationTime": "2021-05-25T18:59:26.490017Z"
  }
}

```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [CreateFirewallRuleGroup](#) in *AWS CLI Command Reference*.

create-firewall-rule

The following code example shows how to use `create-firewall-rule`.

AWS CLI

To create a firewall rule

The following `create-firewall-rule` example creates a firewall rule in a DNS Firewall rule for domains listed in a DNS Firewall domain list.

```

aws route53resolver create-firewall-rule \
  --name allow-rule \
  --firewall-rule-group-id rslvr-frg-47f93271fexample \
  --firewall-domain-list-id rslvr-fdl-9e956e9ffexample \
  --priority 101 \
  --action ALLOW

```

Output:

```

{
  "FirewallRule": {
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
    "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
    "Name": "allow-rule",
    "Priority": 101,
    "Action": "ALLOW",
    "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
    "CreationTime": "2021-05-25T21:44:00.346093Z",
    "ModificationTime": "2021-05-25T21:44:00.346093Z"
  }
}

```

```
}
}
```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [CreateFirewallRule](#) in *AWS CLI Command Reference*.

create-resolver-endpoint

The following code example shows how to use `create-resolver-endpoint`.

AWS CLI

To create an inbound Resolver endpoint

The following `create-resolver-endpoint` example creates an inbound Resolver endpoint. You can use the same command to create both inbound and outbound endpoints.

```
aws route53resolver create-resolver-endpoint --name my-inbound-endpoint --creator-request-id 2020-01-01-18:47 --security-group-ids "sg-f62bexam" --direction INBOUND --ip-addresses SubnetId=subnet-ba47exam,Ip=192.0.2.255 SubnetId=subnet-12d8exam,Ip=192.0.2.254
```

Output:

```
{
  "ResolverEndpoint": {
    "Id": "rslvr-in-f9ab8a03f1example",
    "CreatorRequestId": "2020-01-01-18:47",
    "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/rslvr-in-f9ab8a03f1example",
    "Name": "my-inbound-endpoint",
    "SecurityGroupIds": [
      "sg-f62bexam"
    ],
    "Direction": "INBOUND",
    "IpAddressCount": 2,
    "HostVPCId": "vpc-304examp",
    "Status": "CREATING",
    "StatusMessage": "[Trace id: 1-5dc1ff84-f3477826e4a190025example] Creating the Resolver Endpoint",
    "CreationTime": "2020-01-01T23:02:29.583Z",
```

```
    "ModificationTime": "2020-01-01T23:02:29.583Z"
  }
}
```

To create an outbound Resolver endpoint

The following `create-resolver-endpoint` example creates an outbound resolver endpoint using the values in the JSON-formatted document `create-outbound-resolver-endpoint.json`.

```
aws route53resolver create-resolver-endpoint \
  --cli-input-json file://c:\temp\create-outbound-resolver-endpoint.json
```

Contents of `create-outbound-resolver-endpoint.json`:

```
{
  "CreatorRequestId": "2020-01-01-18:47",
  "Direction": "OUTBOUND",
  "IpAddresses": [
    {
      "Ip": "192.0.2.255",
      "SubnetId": "subnet-ba47exam"
    },
    {
      "Ip": "192.0.2.254",
      "SubnetId": "subnet-12d8exam"
    }
  ],
  "Name": "my-outbound-endpoint",
  "SecurityGroupIds": [ "sg-05cd7b25d6example" ],
  "Tags": [
    {
      "Key": "my-key-name",
      "Value": "my-key-value"
    }
  ]
}
```

For more information, see [Resolving DNS Queries Between VPCs and Your Network](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [CreateResolverEndpoint](#) in *AWS CLI Command Reference*.

create-resolver-rule

The following code example shows how to use `create-resolver-rule`.

AWS CLI

To create a Resolver rule

The following `create-resolver-rule` example creates a Resolver forwarding rule. The rule uses the outbound endpoint `rslvr-out-d5e5920e37example` to forward DNS queries for `example.com` to the IP addresses `10.24.8.75` and `10.24.8.156`.

```
aws route53resolver create-resolver-rule \
  --creator-request-id 2020-01-02-18:47 \
  --domain-name example.com \
  --name my-rule \
  --resolver-endpoint-id rslvr-out-d5e5920e37example \
  --rule-type FORWARD \
  --target-ips "Ip=10.24.8.75" "Ip=10.24.8.156"
```

Output:

```
{
  "ResolverRule": {
    "Status": "COMPLETE",
    "RuleType": "FORWARD",
    "ResolverEndpointId": "rslvr-out-d5e5920e37example",
    "Name": "my-rule",
    "DomainName": "example.com.",
    "CreationTime": "2022-05-10T21:35:30.923187Z",
    "TargetIps": [
      {
        "Ip": "10.24.8.75",
        "Port": 53
      },
      {
        "Ip": "10.24.8.156",
        "Port": 53
      }
    ],
    "CreatorRequestId": "2022-05-10-16:33",
    "ModificationTime": "2022-05-10T21:35:30.923187Z",
```

```

    "ShareStatus": "NOT_SHARED",
    "Arn": "arn:aws:route53resolver:us-east-1:111117012054:resolver-rule/rslvr-rr-b1e0b905e93611111",
    "OwnerId": "111111111111",
    "Id": "rslvr-rr-rslvr-rr-b1e0b905e93611111",
    "StatusMessage": "[Trace id: 1-22222222-3e56afcc71a3724664f22e24]
Successfully created Resolver Rule."
  }
}

```

- For API details, see [CreateResolverRule](#) in *AWS CLI Command Reference*.

delete-firewall-domain-list

The following code example shows how to use `delete-firewall-domain-list`.

AWS CLI

To delete a Route 53 Resolver DNS Firewall domain list

The following `delete-firewall-domain-list` example deletes a Route 53 Resolver DNS Firewall domain list, named `test`, in your AWS account.

```
aws route53resolver delete-firewall-domain-list \
  --firewall-domain-list-id rslvr-fdl-9e956e9ffexample
```

Output:

```

{
  "FirewallDomainList": {
    "Id": "rslvr-fdl-9e956e9ffexample",
    "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/rslvr-fdl-9e956e9ffexample",
    "Name": "test",
    "DomainCount": 6,
    "Status": "DELETING",
    "StatusMessage": "Deleting the Firewall Domain List",
    "CreatorRequestId": "my-request-id",
    "CreationTime": "2021-05-25T15:55:51.115365Z",
    "ModificationTime": "2021-05-25T18:58:05.588024Z"
  }
}

```

```
}
```

For more information, see [Managing your own domain lists](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DeleteFirewallDomainList](#) in *AWS CLI Command Reference*.

delete-firewall-rule-group

The following code example shows how to use `delete-firewall-rule-group`.

AWS CLI

To delete a firewall rule group

The following `delete-firewall-rule-group` example deletes a firewall rule group.

```
aws route53resolver delete-firewall-rule-group \  
  --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{  
  "FirewallRuleGroup": {  
    "Id": "rslvr-frg-47f93271fexample",  
    "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/  
rslvr-frg-47f93271fexample",  
    "Name": "test",  
    "RuleCount": 0,  
    "Status": "UPDATING",  
    "StatusMessage": "Updating Firewall Rule Group",  
    "OwnerId": "123456789012",  
    "CreatorRequestId": "my-request-id",  
    "ShareStatus": "NOT_SHARED",  
    "CreationTime": "2021-05-25T18:59:26.490017Z",  
    "ModificationTime": "2021-05-25T21:51:53.028688Z"  
  }  
}
```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DeleteFirewallRuleGroup](#) in *AWS CLI Command Reference*.

delete-firewall-rule

The following code example shows how to use `delete-firewall-rule`.

AWS CLI

To delete a firewall rule

The following `delete-firewall-rule` example deletes a specified firewall rule.

```
aws route53resolver delete-firewall-rule \  
  --firewall-rule-group-id rslvr-frg-47f93271fexample \  
  --firewall-domain-list-id rslvr-fdl-9e956e9ffexample
```

Output:

```
{  
  "FirewallRule": {  
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",  
    "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",  
    "Name": "allow-rule",  
    "Priority": 102,  
    "Action": "ALLOW",  
    "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",  
    "CreationTime": "2021-05-25T21:44:00.346093Z",  
    "ModificationTime": "2021-05-25T21:45:59.611600Z"  
  }  
}
```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DeleteFirewallRule](#) in *AWS CLI Command Reference*.

delete-resolver-endpoint

The following code example shows how to use `delete-resolver-endpoint`.

AWS CLI

To delete a Resolver endpoint

The following `delete-resolver-endpoint` example deletes the specified endpoint.

Important If you delete an inbound endpoint, DNS queries from your network are no longer forwarded to Resolver in the VPC that you specified in the endpoint. If you delete an outbound endpoint, Resolver stops forwarding DNS queries from your VPC to your network for rules that specify the deleted outbound endpoint.

```
aws route53resolver delete-resolver-endpoint \  
  --resolver-endpoint-id rslvr-in-497098ad59example
```

Output:

```
{  
  "ResolverEndpoint": {  
    "Id": "rslvr-in-497098ad59example",  
    "CreatorRequestId": "AWSConsole.25.157290example",  
    "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/  
rslvr-in-497098ad59example",  
    "Name": "my-inbound-endpoint",  
    "SecurityGroupIds": [  
      "sg-05cd7b25d6example"  
    ],  
    "Direction": "INBOUND",  
    "IpAddressCount": 5,  
    "HostVPCId": "vpc-304bexam",  
    "Status": "DELETING",  
    "StatusMessage": "[Trace id: 1-5dc5b658-811b5be0922bbc382example] Deleting  
ResolverEndpoint.",  
    "CreationTime": "2020-01-01T23:25:45.538Z",  
    "ModificationTime": "2020-01-02T23:25:45.538Z"  
  }  
}
```

- For API details, see [DeleteResolverEndpoint](#) in *AWS CLI Command Reference*.

delete-resolver-rule

The following code example shows how to use `delete-resolver-rule`.

AWS CLI

To delete a Resolver rule

The following `delete-resolver-rule` example deletes the specified rule.

Note If a rule is associated with any VPCs, you must first disassociate the rule from the VPCs before you can delete it.

```
aws route53resolver delete-resolver-rule \  
  --resolver-rule-id rslvr-rr-5b3809426bexample
```

Output:

```
{  
  "ResolverRule": {  
    "Id": "rslvr-rr-5b3809426bexample",  
    "CreatorRequestId": "2020-01-03-18:47",  
    "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/rslvr-  
rr-5b3809426bexample",  
    "DomainName": "zenith.example.com.",  
    "Status": "DELETING",  
    "StatusMessage": "[Trace id: 1-5dc5e05b-602e67b052cb74f05example] Deleting  
Resolver Rule.",  
    "RuleType": "FORWARD",  
    "Name": "my-resolver-rule",  
    "TargetIps": [  
      {  
        "Ip": "192.0.2.50",  
        "Port": 53  
      }  
    ],  
    "ResolverEndpointId": "rslvr-out-d5e5920e3example",  
    "OwnerId": "111122223333",  
    "ShareStatus": "NOT_SHARED"  
  }  
}
```

- For API details, see [DeleteResolverRule](#) in *AWS CLI Command Reference*.

disassociate-firewall-rule-group

The following code example shows how to use `disassociate-firewall-rule-group`.

AWS CLI

To disassociate a firewall rule group from a VPC

The following `disassociate-firewall-rule-group` example disassociates a DNS Firewall rule group from an Amazon VPC.

```
aws route53resolver disassociate-firewall-rule-group \  
  --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example
```

Output:

```
{  
  "FirewallRuleGroupAssociation": {  
    "Id": "rslvr-frgassoc-57e8873d7example",  
    "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-  
association/rslvr-frgassoc-57e8873d7example",  
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",  
    "VpcId": "vpc-31e92222",  
    "Name": "test-association",  
    "Priority": 103,  
    "MutationProtection": "DISABLED",  
    "Status": "DELETING",  
    "StatusMessage": "Deleting the Firewall Rule Group Association",  
    "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",  
    "CreationTime": "2021-05-25T21:47:48.755768Z",  
    "ModificationTime": "2021-05-25T21:51:02.377887Z"  
  }  
}
```

For more information, see [Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [DisassociateFirewallRuleGroup](#) in *AWS CLI Command Reference*.

disassociate-resolver-endpoint-ip-address

The following code example shows how to use `disassociate-resolver-endpoint-ip-address`.

AWS CLI

To disassociate an IP address from a Resolver endpoint

The following `disassociate-resolver-endpoint-ip-address` example removes an IP address from a specified Resolver inbound or outbound endpoint.

Note An endpoint must have at least two IP addresses. If an endpoint currently has only two IP addresses and you want to replace one address with another address, you must first use [associate-resolver-endpoint-ip-address](#) to associate the new IP address. Then you can disassociate one of the original IP addresses from the endpoint.

```
aws route53resolver disassociate-resolver-endpoint-ip-address \
  --resolver-endpoint-id rslvr-in-f9ab8a03f1example \
  --ip-address="SubnetId=subnet-12d8a459,Ip=172.31.40.121"
```

Output:

```
{
  "ResolverEndpoint": {
    "Id": "rslvr-in-f9ab8a03f1example",
    "CreatorRequestId": "2020-01-01-18:47",
    "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/
rslvr-in-f9ab8a03f1example",
    "Name": "my-inbound-endpoint",
    "SecurityGroupIds": [
      "sg-f62bexam"
    ],
    "Direction": "INBOUND",
    "IpAddressCount": 3,
    "HostVPCId": "vpc-304bexam",
    "Status": "UPDATING",
    "StatusMessage": "Updating the Resolver Endpoint",
    "CreationTime": "2020-01-01T23:02:29.583Z",
    "ModificationTime": "2020-01-05T23:02:29.583Z"
  }
}
```

- For API details, see [DisassociateResolverEndpointIpAddress](#) in *AWS CLI Command Reference*.

disassociate-resolver-rule

The following code example shows how to use `disassociate-resolver-rule`.

AWS CLI

To disassociate a Resolver rule from an Amazon VPC

The following `disassociate-resolver-rule` example removes the association between the specified Resolver rule and the specified VPC. You can disassociate a rule from a VPC in the following circumstances:

For DNS queries that originate in this VPC, you want Resolver to stop forwarding queries to your network for the domain name that is specified in the rule. You want to delete the forwarding rule. If a rule is currently associated with one or more VPCs, you must disassociate the rule from all VPCs before you can delete it.

```
aws route53resolver disassociate-resolver-rule \  
  --resolver-rule-id rslvr-rr-4955cb98ceexample \  
  --vpc-id vpc-304bexam
```

Output:

```
{  
  "ResolverRuleAssociation": {  
    "Id": "rslvr-rrassoc-322f4e8b9cexample",  
    "ResolverRuleId": "rslvr-rr-4955cb98ceexample",  
    "Name": "my-resolver-rule-association",  
    "VPCId": "vpc-304bexam",  
    "Status": "DELETING",  
    "StatusMessage": "[Trace id: 1-5dc5ffa2-a26c38004c1f94006example] Deleting  
Association"  
  }  
}
```

- For API details, see [DisassociateResolverRule](#) in *AWS CLI Command Reference*.

get-firewall-config

The following code example shows how to use `get-firewall-config`.

AWS CLI

To get a firewall config for a VPC

The following `get-firewall-config` example retrieves the DNS Firewall behavior for the specified VPC.

```
aws route53resolver get-firewall-config \  
  --vpc-id vpc-304bexam
```

```
--resource-id vpc-31e92222
```

Output:

```
{
  "FirewallConfig": {
    "Id": "rslvr-fc-86016850cexample",
    "ResourceId": "vpc-31e92222",
    "OwnerId": "123456789012",
    "FirewallFailOpen": "DISABLED"
  }
}
```

For more information, see [DNS Firewall VPC configuration](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetFirewallConfig](#) in *AWS CLI Command Reference*.

get-firewall-domain-list

The following code example shows how to use `get-firewall-domain-list`.

AWS CLI

To get a Route 53 Resolver DNS Firewall domain list

The following `get-firewall-domain-list` example retrieves the domain list with the ID you specify.

```
aws route53resolver get-firewall-domain-list \
  --firewall-domain-list-id rslvr-fdl-42b60677cexample
```

Output:

```
{
  "FirewallDomainList": {
    "Id": "rslvr-fdl-9e956e9ffexample",
    "Arn": "arn:aws:route53resolver:us-west-2:123457689012:firewall-domain-list/rslvr-fdl-42b60677cexample",
    "Name": "test",
  }
}
```

```
    "DomainCount": 0,  
    "Status": "COMPLETE",  
    "StatusMessage": "Created Firewall Domain List",  
    "CreatorRequestId": "my-request-id",  
    "CreationTime": "2021-05-25T15:55:51.115365Z",  
    "ModificationTime": "2021-05-25T15:55:51.115365Z"  
  }  
}
```

For more information, see [Managing your own domain lists](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetFirewallDomainList](#) in *AWS CLI Command Reference*.

get-firewall-rule-group-association

The following code example shows how to use `get-firewall-rule-group-association`.

AWS CLI

To get a firewall rule group association

The following `get-firewall-rule-group-association` example retrieves a firewall rule group association.

```
aws route53resolver get-firewall-rule-group-association \  
  --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example
```

Output:

```
{  
  "FirewallRuleGroupAssociation": {  
    "Id": "rslvr-frgassoc-57e8873d7example",  
    "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-  
association/rslvr-frgassoc-57e8873d7example",  
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",  
    "VpcId": "vpc-31e92222",  
    "Name": "test-association",  
    "Priority": 101,  
    "MutationProtection": "DISABLED",  
    "Status": "COMPLETE",  
    "StatusMessage": "Finished rule group association update",  
  }  
}
```

```

    "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
    "CreationTime": "2021-05-25T21:47:48.755768Z",
    "ModificationTime": "2021-05-25T21:47:48.755768Z"
  }
}

```

For more information, see [Managing associations between your VPC and Route 53 Resolver DNS Firewall rule groups](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetFirewallRuleGroupAssociation](#) in *AWS CLI Command Reference*.

get-firewall-rule-group-policy

The following code example shows how to use `get-firewall-rule-group-policy`.

AWS CLI

To get an AWS IAM policy

The following `get-firewall-rule-group-policy` example gets the AWS Identity and Access Management (AWS IAM) policy for sharing the specified rule group.

```

aws route53resolver get-firewall-rule-group-policy \
  --arn arn:aws:route53resolver:us-west-2:AWS_ACCOUNT_ID:firewall-rule-group/
  rslvr-frg-47f93271fexample

```

Output:

```

{
  "FirewallRuleGroupPolicy": "{\"Version\":\"2012-10-17\",
  \"Statement\": [{\"Sid\":\"test\", \"Effect\":\"Allow\", \"Principal\": {\"AWS\": \"arn:aws:iam::AWS_ACCOUNT_ID:root\"}, \"Action\": [\"route53resolver:GetFirewallRuleGroup\", \"route53resolver:ListFirewallRuleGroups\"], \"Resource\": \"arn:aws:route53resolver:us-east-1:AWS_ACCOUNT_ID:firewall-rule-group/rslvr-frg-47f93271fexample\"}]}\"
}

```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetFirewallRuleGroupPolicy](#) in *AWS CLI Command Reference*.

get-firewall-rule-group

The following code example shows how to use `get-firewall-rule-group`.

AWS CLI

To get a Firewall rule group

The following `get-firewall-rule-group` example retrieves information about a DNS Firewall rule group with the ID you provide.

```
aws route53resolver get-firewall-rule-group \  
  --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{  
  "FirewallRuleGroup": {  
    "Id": "rslvr-frg-47f93271fexample",  
    "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group/  
rslvr-frg-47f93271fexample",  
    "Name": "test",  
    "RuleCount": 0,  
    "Status": "COMPLETE",  
    "StatusMessage": "Created Firewall Rule Group",  
    "OwnerId": "123456789012",  
    "CreatorRequestId": "my-request-id",  
    "ShareStatus": "NOT_SHARED",  
    "CreationTime": "2021-05-25T18:59:26.490017Z",  
    "ModificationTime": "2021-05-25T18:59:26.490017Z"  
  }  
}
```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetFirewallRuleGroup](#) in *AWS CLI Command Reference*.

get-resolver-endpoint

The following code example shows how to use `get-resolver-endpoint`.

AWS CLI

To get information about a Resolver endpoint

The following `get-resolver-endpoint` example displays details for the outbound specified endpoint. You can use `get-resolver-endpoint` for both inbound and outbound endpoints by specifying the applicable endpoint ID.

```
aws route53resolver get-resolver-endpoint \  
  --resolver-endpoint-id rslvr-out-d5e5920e37example
```

Output:

```
{  
  "ResolverEndpoint": {  
    "Id": "rslvr-out-d5e5920e37example",  
    "CreatorRequestId": "2020-01-01-18:47",  
    "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/  
rslvr-out-d5e5920e37example",  
    "Name": "my-outbound-endpoint",  
    "SecurityGroupIds": [  
      "sg-05cd7b25d6example"  
    ],  
    "Direction": "OUTBOUND",  
    "IpAddressCount": 2,  
    "HostVPCId": "vpc-304bexam",  
    "Status": "OPERATIONAL",  
    "StatusMessage": "This Resolver Endpoint is operational.",  
    "CreationTime": "2020-01-01T23:50:50.979Z",  
    "ModificationTime": "2020-01-02T23:50:50.979Z"  
  }  
}
```

For more information, see [Values That You Specify When You Create or Edit Inbound Endpoints](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetResolverEndpoint](#) in *AWS CLI Command Reference*.

`get-resolver-rule-association`

The following code example shows how to use `get-resolver-rule-association`.

AWS CLI

To get information about the association between a Resolver rule and a VPC

The following `get-resolver-rule-association` example displays details about the association between a specified Resolver rule and a VPC. You associate a resolver rule and a VPC using [associate-resolver-rule](#).

```
aws route53resolver get-resolver-rule-association \  
  --resolver-rule-association-id rslvr-rrassoc-d61cbb2c8bexample
```

Output:

```
{  
  "ResolverRuleAssociation": {  
    "Id": "rslvr-rrassoc-d61cbb2c8bexample",  
    "ResolverRuleId": "rslvr-rr-42b60677c0example",  
    "Name": "my-resolver-rule-association",  
    "VPCId": "vpc-304bexam",  
    "Status": "COMPLETE",  
    "StatusMessage": ""  
  }  
}
```

- For API details, see [GetResolverRuleAssociation](#) in *AWS CLI Command Reference*.

get-resolver-rule

The following code example shows how to use `get-resolver-rule`.

AWS CLI

To get information about a Resolver rule

The following `get-resolver-rule` example displays details about the specified Resolver rule, such as the domain name that the rule forwards DNS queries for and the ID of the outbound resolver endpoint that the rule is associated with.

```
aws route53resolver get-resolver-rule \  
  --resolver-rule-id rslvr-rr-42b60677c0example
```

Output:

```
{
  "ResolverRule": {
    "Id": "rslvr-rr-42b60677c0example",
    "CreatorRequestId": "2020-01-01-18:47",
    "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/rslvr-rr-42b60677c0example",
    "DomainName": "example.com.",
    "Status": "COMPLETE",
    "StatusMessage": "[Trace id: 1-5dc4b177-ff1d9d001a0f80005example]
Successfully created Resolver Rule.",
    "RuleType": "FORWARD",
    "Name": "my-rule",
    "TargetIps": [
      {
        "Ip": "192.0.2.45",
        "Port": 53
      }
    ],
    "ResolverEndpointId": "rslvr-out-d5e5920e37example",
    "OwnerId": "111122223333",
    "ShareStatus": "NOT_SHARED"
  }
}
```

For more information, see [Values That You Specify When You Create or Edit Rules](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [GetResolverRule](#) in *AWS CLI Command Reference*.

import-firewall-domains

The following code example shows how to use `import-firewall-domains`.

AWS CLI**To import domains into a domain list**

The following `import-firewall-domains` example imports a set of domains from a file into a DNS Firewall domain list that you specify.

```
aws route53resolver import-firewall-domains \
```

```
--firewall-domain-list-id rslvr-fdl-d61cbb2cbexample \  
--operation REPLACE \  
--domain-file-url s3://PATH/TO/YOUR/FILE
```

Output:

```
{  
  "Id": "rslvr-fdl-d61cbb2cbexample",  
  "Name": "test",  
  "Status": "IMPORTING",  
  "StatusMessage": "Importing domains from provided file."  
}
```

For more information, see [Managing your own domain lists](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ImportFirewallDomains](#) in *AWS CLI Command Reference*.

list-firewall-configs

The following code example shows how to use `list-firewall-configs`.

AWS CLI

To list firewall configs

The following `list-firewall-configs` example lists your DNS Firewall configurations.

```
aws route53resolver list-firewall-configs
```

Output:

```
{  
  "FirewallConfigs": [  
    {  
      "Id": "rslvr-fc-86016850cexample",  
      "ResourceId": "vpc-31e92222",  
      "OwnerId": "123456789012",  
      "FirewallFailOpen": "DISABLED"  
    }  
  ]  
}
```

For more information, see [DNS Firewall VPC configuration](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListFirewallConfigs](#) in *AWS CLI Command Reference*.

list-firewall-domain-lists

The following code example shows how to use `list-firewall-domain-lists`.

AWS CLI

To list all of Route 53 Resolver DNS Firewall domain lists

The following `list-firewall-domain-lists` example lists all the domain lists.

```
aws route53resolver list-firewall-domain-lists
```

Output:

```
{
  "FirewallDomainLists": [
    {
      "Id": "rslvr-fdl-2c46f2ecfexample",
      "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/rslvr-fdl-2c46f2ecfexample",
      "Name": "AWSManagedDomainsMalwareDomainList",
      "CreatorRequestId": "AWSManagedDomainsMalwareDomainList",
      "ManagedOwnerName": "Route 53 Resolver DNS Firewall"
    },
    {
      "Id": "rslvr-fdl-aa970e9e1example",
      "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-domain-list/rslvr-fdl-aa970e9e1example",
      "Name": "AWSManagedDomainsBotnetCommandandControl",
      "CreatorRequestId": "AWSManagedDomainsBotnetCommandandControl",
      "ManagedOwnerName": "Route 53 Resolver DNS Firewall"
    },
    {
      "Id": "rslvr-fdl-42b60677cexample",
      "Arn": "arn:aws:route53resolver:us-west-2:123456789111:firewall-domain-list/rslvr-fdl-42b60677cexample",
      "Name": "test",
      "CreatorRequestId": "my-request-id"
    }
  ]
}
```

```
    }  
  ]  
}
```

For more information, see [Route 53 Resolver DNS Firewall domain lists](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListFirewallDomainLists](#) in *AWS CLI Command Reference*.

list-firewall-domains

The following code example shows how to use `list-firewall-domains`.

AWS CLI

To list domains in a domain list

The following `list-firewall-domains` example lists the domains in a DNS Firewall domain list that you specify.

```
aws route53resolver list-firewall-domains \  
  --firewall-domain-list-id rslvr-fd1-d61cbb2cbexample
```

Output:

```
{  
  "Domains": [  
    "test1.com.",  
    "test2.com.",  
    "test3.com."  
  ]  
}
```

For more information, see [Managing your own domain lists](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListFirewallDomains](#) in *AWS CLI Command Reference*.

list-firewall-rule-group-associations

The following code example shows how to use `list-firewall-rule-group-associations`.

AWS CLI

To list DNS Firewall rule group associations

The following `list-firewall-rule-group-associations` example lists your DNS Firewall rule group associations with Amazon VPCs.

```
aws route53resolver list-firewall-rule-group-associations
```

Output:

```
{
  "FirewallRuleGroupAssociations": [
    {
      "Id": "rslvr-frgassoc-57e8873d7example",
      "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-
group-association/rslvr-frgassoc-57e8873d7example",
      "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
      "VpcId": "vpc-31e92222",
      "Name": "test-association",
      "Priority": 101,
      "MutationProtection": "DISABLED",
      "Status": "UPDATING",
      "StatusMessage": "Creating Firewall Rule Group Association",
      "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
      "CreationTime": "2021-05-25T21:47:48.755768Z",
      "ModificationTime": "2021-05-25T21:47:48.755768Z"
    }
  ]
}
```

For more information, see [Managing associations between your VPC and Route 53 Resolver DNS Firewall rule group](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListFirewallRuleGroupAssociations](#) in *AWS CLI Command Reference*.

list-firewall-rule-groups

The following code example shows how to use `list-firewall-rule-groups`.

AWS CLI

To get a list of your Firewall rule groups

The following `list-firewall-rule-groups` example lists your DNS Firewall rule groups.

```
aws route53resolver list-firewall-rule-groups
```

Output:

```
{
  "FirewallRuleGroups": [
    {
      "Id": "rslvr-frg-47f93271fexample",
      "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-
group/rslvr-frg-47f93271fexample",
      "Name": "test",
      "OwnerId": "123456789012",
      "CreatorRequestId": "my-request-id",
      "ShareStatus": "NOT_SHARED"
    }
  ]
}
```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListFirewallRuleGroups](#) in *AWS CLI Command Reference*.

list-firewall-rules

The following code example shows how to use `list-firewall-rules`.

AWS CLI

To list firewall rules

The following `list-firewall-rules` example list all of your DNS Firewall rules within a firewall rule group.

```
aws route53resolver list-firewall-rules \
  --firewall-rule-group-id rslvr-frg-47f93271fexample
```

Output:

```
{
```

```
"FirewallRules": [  
  {  
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",  
    "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",  
    "Name": "allow-rule",  
    "Priority": 101,  
    "Action": "ALLOW",  
    "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",  
    "CreationTime": "2021-05-25T21:44:00.346093Z",  
    "ModificationTime": "2021-05-25T21:44:00.346093Z"  
  }  
]  
}
```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListFirewallRules](#) in *AWS CLI Command Reference*.

list-resolver-endpoint-ip-addresses

The following code example shows how to use `list-resolver-endpoint-ip-addresses`.

AWS CLI

To list IP addresses for a specified inbound or outbound endpoint

The following `list-resolver-endpoint-ip-addresses` example lists information about the IP addresses that are associated with the inbound endpoint `rslvr-in-f9ab8a03f1example`. You can also use `list-resolver-endpoint-ip-addresses` for outbound endpoints by specifying the applicable endpoint ID.

```
aws route53resolver list-resolver-endpoint-ip-addresses \  
  --resolver-endpoint-id rslvr-in-f9ab8a03f1example
```

Output:

```
{  
  "MaxResults": 10,  
  "IpAddresses": [  
    {  
      "IpId": "rni-1de60cdbfeexample",
```

```

        "SubnetId": "subnet-ba47exam",
        "Ip": "192.0.2.44",
        "Status": "ATTACHED",
        "StatusMessage": "This IP address is operational.",
        "CreationTime": "2020-01-03T23:02:29.587Z",
        "ModificationTime": "2020-01-03T23:03:05.555Z"
    },
    {
        "IpId": "rni-aac7085e38example",
        "SubnetId": "subnet-12d8exam",
        "Ip": "192.0.2.45",
        "Status": "ATTACHED",
        "StatusMessage": "This IP address is operational.",
        "CreationTime": "2020-01-03T23:02:29.593Z",
        "ModificationTime": "2020-01-03T23:02:55.060Z"
    }
]
}

```

For more information about the values in the output, see [Values That You Specify When You Create or Edit Inbound Endpoints](#), and [Values That You Specify When You Create or Edit Outbound Endpoints](#), both in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListResolverEndpointIpAddresses](#) in *AWS CLI Command Reference*.

list-resolver-endpoints

The following code example shows how to use `list-resolver-endpoints`.

AWS CLI

To list Resolver endpoints in an AWS Region

The following `list-resolver-endpoints` example lists the inbound and outbound Resolver endpoints that exist in the current account.

```
aws route53resolver list-resolver-endpoints
```

Output:

```
{
  "MaxResults": 10,
```

```

"ResolverEndpoints": [
  {
    "Id": "rslvr-in-497098ad59example",
    "CreatorRequestId": "2020-01-01-18:47",
    "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-
endpoint/rslvr-in-497098ad59example",
    "Name": "my-inbound-endpoint",
    "SecurityGroupIds": [
      "sg-05cd7b25d6example"
    ],
    "Direction": "INBOUND",
    "IpAddressCount": 2,
    "HostVPCId": "vpc-304bexam",
    "Status": "OPERATIONAL",
    "StatusMessage": "This Resolver Endpoint is operational.",
    "CreationTime": "2020-01-01T23:25:45.538Z",
    "ModificationTime": "2020-01-01T23:25:45.538Z"
  },
  {
    "Id": "rslvr-out-d5e5920e37example",
    "CreatorRequestId": "2020-01-01-18:48",
    "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-
endpoint/rslvr-out-d5e5920e37example",
    "Name": "my-outbound-endpoint",
    "SecurityGroupIds": [
      "sg-05cd7b25d6example"
    ],
    "Direction": "OUTBOUND",
    "IpAddressCount": 2,
    "HostVPCId": "vpc-304bexam",
    "Status": "OPERATIONAL",
    "StatusMessage": "This Resolver Endpoint is operational.",
    "CreationTime": "2020-01-01T23:50:50.979Z",
    "ModificationTime": "2020-01-01T23:50:50.979Z"
  }
]
}

```

- For API details, see [ListResolverEndpoints](#) in *AWS CLI Command Reference*.

list-resolver-rule-associations

The following code example shows how to use `list-resolver-rule-associations`.

AWS CLI

To list associations between Resolver rules and VPCs

The following `list-resolver-rule-associations` example lists the associations between resolver rules and VPCs in the current AWS account.

```
aws route53resolver list-resolver-rule-associations
```

Output:

```
{
  "MaxResults": 30,
  "ResolverRuleAssociations": [
    {
      "Id": "rslvr-autodefined-assoc-vpc-304bexam-internet-resolver",
      "ResolverRuleId": "rslvr-autodefined-rr-internet-resolver",
      "Name": "System Rule Association",
      "VPCId": "vpc-304bexam",
      "Status": "COMPLETE",
      "StatusMessage": ""
    },
    {
      "Id": "rslvr-rrassoc-d61cbb2c8bexample",
      "ResolverRuleId": "rslvr-rr-42b60677c0example",
      "Name": "my-resolver-rule-association",
      "VPCId": "vpc-304bexam",
      "Status": "COMPLETE",
      "StatusMessage": ""
    }
  ]
}
```

For more information, see [How Route 53 Resolver Forwards DNS Queries from Your VPCs to Your Network](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListResolverRuleAssociations](#) in *AWS CLI Command Reference*.

list-resolver-rules

The following code example shows how to use `list-resolver-rules`.

AWS CLI

To list Resolver rules

The following `list-resolver-rules` example lists all the Resolver rules in the current AWS account.

```
aws route53resolver list-resolver-rules
```

Output:

```
{
  "MaxResults": 30,
  "ResolverRules": [
    {
      "Id": "rslvr-autodefined-rr-internet-resolver",
      "CreatorRequestId": "",
      "Arn": "arn:aws:route53resolver:us-west-2::autodefined-rule/rslvr-
autodefined-rr-internet-resolver",
      "DomainName": ".",
      "Status": "COMPLETE",
      "RuleType": "RECURSIVE",
      "Name": "Internet Resolver",
      "OwnerId": "Route 53 Resolver",
      "ShareStatus": "NOT_SHARED"
    },
    {
      "Id": "rslvr-rr-42b60677c0example",
      "CreatorRequestId": "2020-01-01-18:47",
      "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/
rslvr-rr-42b60677c0bc4e299",
      "DomainName": "example.com.",
      "Status": "COMPLETE",
      "StatusMessage": "[Trace id: 1-5dc4b177-ff1d9d001a0f80005example]
Successfully created Resolver Rule.",
      "RuleType": "FORWARD",
      "Name": "my-rule",
      "TargetIps": [
        {
          "Ip": "192.0.2.45",
          "Port": 53
        }
      ]
    }
  ],
}
```

```
        "ResolverEndpointId": "rslvr-out-d5e5920e37example",
        "OwnerId": "111122223333",
        "ShareStatus": "NOT_SHARED"
    }
]
}
```

For more information, see [How Route 53 Resolver Forwards DNS Queries from Your VPCs to Your Network](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [ListResolverRules](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a Resolver resource

The following `list-tags-for-resource` example lists the tags that are assigned to the specified Resolver rule.

```
aws route53resolver list-tags-for-resource \
    --resource-arn "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/
rslvr-rr-42b60677c0example"
```

Output:

```
{
  "Tags": [
    {
      "Key": "my-key-1",
      "Value": "my-value-1"
    },
    {
      "Key": "my-key-2",
      "Value": "my-value-2"
    }
  ]
}
```

For information about using tags for cost allocation, see [Using Cost Allocation Tags](#) in the *AWS Billing and Cost Management User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-firewall-rule-group-policy

The following code example shows how to use `put-firewall-rule-group-policy`.

AWS CLI

To attach an AWS IAM policy to share a Firewall rule group policy

The following `put-firewall-rule-group-policy` example attaches an AWS Identity and Access Management (AWS IAM) policy for sharing the rule group.

```
aws route53resolver put-firewall-rule-group-policy \
  --firewall-rule-group-policy "{\"Version\":\"2012-10-17\",
  \"Statement\": [{\"Sid\":\"test\", \"Effect\":\"Allow\", \"Principal
  \": {\"AWS\": \"arn:aws:iam::AWS_ACCOUNT_ID:root\"}, \"Action\":
  [\"route53resolver:GetFirewallRuleGroup\", \"route53resolver:ListFirewallRuleGroups
  \"], \"Resource\": \"arn:aws:route53resolver:us-east-1:AWS_ACCOUNT_ID:firewall-rule-
  group/rslvr-frg-47f93271fexample\"}]}"
```

Output:

```
{
  "ReturnValue": true
}
```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [PutFirewallRuleGroupPolicy](#) in *AWS CLI Command Reference*.

put-resolver-rule-policy

The following code example shows how to use `put-resolver-rule-policy`.

AWS CLI

To share a Resolver rule with another AWS account

The following `put-resolver-rule-policy` example specifies a Resolver rule that you want to share with another AWS account, the account that you want to share the rule with, and the rule-related operations that you want the account to be able to perform on the rules.

Note You must run this command using credentials from the same account that created the rule.

```
aws route53resolver put-resolver-rule-policy \
  --region us-east-1 \
  --arn "arn:aws:route53resolver:us-east-1:111122223333:resolver-rule/rslvr-
rr-42b60677c0example" \
  --resolver-rule-policy "{\"Version\": \"2012-10-17\", \
    \"Statement\": [ { \
      \"Effect\": \"Allow\", \
      \"Principal\": {\"AWS\": \"444455556666\" }, \
      \"Action\": [ \
        \"route53resolver:GetResolverRule\", \
        \"route53resolver:AssociateResolverRule\", \
        \"route53resolver:DisassociateResolverRule\", \
        \"route53resolver:ListResolverRules\", \
        \"route53resolver:ListResolverRuleAssociations\" ], \
      \"Resource\": [ \"arn:aws:route53resolver:us-east-1:111122223333:resolver-
rule/rslvr-rr-42b60677c0example\" ] } ] }"
```

Output:

```
{
  "ReturnValue": true
}
```

After you run `put-resolver-rule-policy`, you can run the following two Resource Access Manager (RAM) commands. You must use the account that you want to share the rule with:

`get-resource-share-invitations` returns the value `resourceShareInvitationArn`. You need this value to accept the invitation to use the shared rule. `accept-resource-share-invitation` accepts the invitation to use the shared rule.

For more information, see the following documentation:

[get-resource-share-invitationsaccept-resource-share-invitationsSharing Forwarding Rules with Other AWS Accounts and Using Shared Rules](#) in the *Amazon Route 53 Developer Guide*

- For API details, see [PutResolverRulePolicy](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To associate tags with a Resolver resource

The following `tag-resource` example associates two tag key/value pairs with the specified Resolver rule.

```
aws route53resolver tag-resource \  
  --resource-arn "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/  
rslvr-rr-42b60677c0example" \  
  --tags "Key=my-key-1,Value=my-value-1" "Key=my-key-2,Value=my-value-2"
```

This command produces no output.

For information about using tags for cost allocation, see [Using Cost Allocation Tags](#) in the *AWS Billing and Cost Management User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a Resolver resource

The following `untag-resource` example removes two tags from the specified Resolver rule.

```
aws route53resolver untag-resource \  
  --resource-arn "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/  
rslvr-rr-42b60677c0example" \  
  --tag-keys my-key-1 my-key-2
```

This command produces no output. To confirm that the tags were removed, you can use [list-tags-for-resource](#).

For information about using tags for cost allocation, see [Using Cost Allocation Tags](#) in the *AWS Billing and Cost Management User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-firewall-config

The following code example shows how to use `update-firewall-config`.

AWS CLI

To update a firewall config

The following `update-firewall-config` example updates DNS Firewall configuration.

```
aws route53resolver update-firewall-config \  
  --resource-id vpc-31e92222 \  
  --firewall-fail-open DISABLED
```

Output:

```
{  
  "FirewallConfig": {  
    "Id": "rslvr-fc-86016850cexample",  
    "ResourceId": "vpc-31e92222",  
    "OwnerId": "123456789012",  
    "FirewallFailOpen": "DISABLED"  
  }  
}
```

For more information, see [DNS Firewall VPC configuration](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [UpdateFirewallConfig](#) in *AWS CLI Command Reference*.

update-firewall-domains

The following code example shows how to use `update-firewall-domains`.

AWS CLI

To update a domain list

The following `update-firewall-domains` example adds the domains to a domain list with the ID you provide.

```
aws route53resolver update-firewall-domains \  
  --firewall-domain-list-id rslvr-fdl-42b60677cexampleb \  
  --operation ADD \  
  --domains test1.com test2.com test3.com
```

Output:

```
{  
  "Id": "rslvr-fdl-42b60677cexample",  
  "Name": "test",  
  "Status": "UPDATING",  
  "StatusMessage": "Updating the Firewall Domain List"  
}
```

For more information, see [Managing your own domain lists](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [UpdateFirewallDomains](#) in *AWS CLI Command Reference*.

update-firewall-rule-group-association

The following code example shows how to use `update-firewall-rule-group-association`.

AWS CLI

To update a firewall rule group association

The following `update-firewall-rule-group-association` example updates a firewall rule group association.

```
aws route53resolver update-firewall-rule-group-association \  
  --firewall-rule-group-association-id rslvr-frgassoc-57e8873d7example \  
  --priority 103
```

Output:

```
{  
  "FirewallRuleGroupAssociation": {  
    "Id": "rslvr-frgassoc-57e8873d7example",
```

```

    "Arn": "arn:aws:route53resolver:us-west-2:123456789012:firewall-rule-group-
association/rslvr-frgassoc-57e8873d7example",
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
    "VpcId": "vpc-31e92222",
    "Name": "test-association",
    "Priority": 103,
    "MutationProtection": "DISABLED",
    "Status": "UPDATING",
    "StatusMessage": "Updating the Firewall Rule Group Association Attributes",
    "CreatorRequestId": "2ca1a304-32b3-4f5f-bc4c-EXAMPLE11111",
    "CreationTime": "2021-05-25T21:47:48.755768Z",
    "ModificationTime": "2021-05-25T21:50:09.272569Z"
  }
}

```

For more information, see [Managing associations between your VPC and Route 53 Resolver DNS Firewall rule group](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [UpdateFirewallRuleGroupAssociation](#) in *AWS CLI Command Reference*.

update-firewall-rule

The following code example shows how to use `update-firewall-rule`.

AWS CLI

To update a firewall rule

The following `update-firewall-rule` example updates a firewall rule with the parameters you specify.

```

aws route53resolver update-firewall-rule \
  --firewall-rule-group-id rslvr-frg-47f93271fexample \
  --firewall-domain-list-id rslvr-fdl-9e956e9ffexample \
  --priority 102

```

Output:

```

{
  "FirewallRule": {
    "FirewallRuleGroupId": "rslvr-frg-47f93271fexample",
    "FirewallDomainListId": "rslvr-fdl-9e956e9ffexample",
    "Name": "allow-rule",

```

```

    "Priority": 102,
    "Action": "ALLOW",
    "CreatorRequestId": "d81e3fb7-020b-415e-939f-EXAMPLE11111",
    "CreationTime": "2021-05-25T21:44:00.346093Z",
    "ModificationTime": "2021-05-25T21:45:59.611600Z"
  }
}

```

For more information, see [Managing rule groups and rules in DNS Firewall](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [UpdateFirewallRule](#) in *AWS CLI Command Reference*.

update-resolver-endpoint

The following code example shows how to use `update-resolver-endpoint`.

AWS CLI

To update the name of a Resolver endpoint

The following `update-resolver-endpoint` example updates the name of a Resolver endpoint. Updating other values isn't supported.

```

aws route53resolver update-resolver-endpoint \
  --resolver-endpoint-id rslvr-in-b5d45e32bdc445f09 \
  --name my-renamed-inbound-endpoint

```

Output:

```

{
  "ResolverEndpoint": {
    "Id": "rslvr-in-b5d45e32bdexample",
    "CreatorRequestId": "2020-01-02-18:48",
    "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-endpoint/rslvr-in-b5d45e32bdexample",
    "Name": "my-renamed-inbound-endpoint",
    "SecurityGroupIds": [
      "sg-f62bexam"
    ],
    "Direction": "INBOUND",
    "IpAddressCount": 2,
    "HostVPCId": "vpc-304bexam",
  }
}

```

```

    "Status": "OPERATIONAL",
    "StatusMessage": "This Resolver Endpoint is operational.",
    "CreationTime": "2020-01-01T18:33:59.265Z",
    "ModificationTime": "2020-01-08T18:33:59.265Z"
  }
}

```

- For API details, see [UpdateResolverEndpoint](#) in *AWS CLI Command Reference*.

update-resolver-rule

The following code example shows how to use `update-resolver-rule`.

AWS CLI

Example 1: To update settings Resolver endpoint

The following `update-resolver-rule` example updates the name of the rule, the IP addresses on your on-premises network that DNS queries are forwarded to, and the ID of the outbound Resolver endpoint that you're using to forward queries to your network.

Note Existing values for `TargetIps` are overwritten, so you must specify all the IP addresses that you want the rule to have after the update.

```

aws route53resolver update-resolver-rule \
  --resolver-rule-id rslvr-rr-1247fa64f3example \
  --config Name="my-2nd-rule",TargetIps=[{Ip=192.0.2.45,Port=53},
{Ip=192.0.2.46,Port=53}],ResolverEndpointId=rslvr-out-7b89ed0d25example

```

Output:

```

{
  "ResolverRule": {
    "Id": "rslvr-rr-1247fa64f3example",
    "CreatorRequestId": "2020-01-02-18:47",
    "Arn": "arn:aws:route53resolver:us-west-2:111122223333:resolver-rule/rslvr-rr-1247fa64f3example",
    "DomainName": "www.example.com.",
    "Status": "COMPLETE",
    "StatusMessage": "[Trace id: 1-5dcc90b9-8a8ee860aba1ebd89example]
Successfully updated Resolver Rule.",
    "RuleType": "FORWARD",

```

```
    "Name": "my-2nd-rule",
    "TargetIps": [
      {
        "Ip": "192.0.2.45",
        "Port": 53
      },
      {
        "Ip": "192.0.2.46",
        "Port": 53
      }
    ],
    "ResolverEndpointId": "rslvr-out-7b89ed0d25example",
    "OwnerId": "111122223333",
    "ShareStatus": "NOT_SHARED"
  }
}
```

Example 2: To update settings Resolver endpoint using a file for ``config`` settings

You can alternatively include the config settings in a JSON file and then specify that file when you call `update-resolver-rule`.

```
aws route53resolver update-resolver-rule \
  --resolver-rule-id rslvr-rr-1247fa64f3example \
  --config file://c:\temp\update-resolver-rule.json
```

Contents of `update-resolver-rule.json`.

```
{
  "Name": "my-2nd-rule",
  "TargetIps": [
    {
      "Ip": "192.0.2.45",
      "Port": 53
    },
    {
      "Ip": "192.0.2.46",
      "Port": 53
    }
  ],
  "ResolverEndpointId": "rslvr-out-7b89ed0d25example"
}
```

For more information, see [Values That You Specify When You Create or Edit Rules](#) in the *Amazon Route 53 Developer Guide*.

- For API details, see [UpdateResolverRule](#) in *AWS CLI Command Reference*.

Amazon S3 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon S3.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

abort-multipart-upload

The following code example shows how to use `abort-multipart-upload`.

AWS CLI

To abort the specified multipart upload

The following `abort-multipart-upload` command aborts a multipart upload for the key `multipart/01` in the bucket `my-bucket`.

```
aws s3api abort-multipart-upload \  
  --bucket my-bucket \  
  --key multipart/01 \  
  --upload-id  
dfRtDYU0WWCCcH43C3WfbkR0NycyCpTJJvxu2i5GYkZ1jF.Yxwh6XG7WfS2vC4to6HiV6Yj1x.cph0gtNBtJ8P3URCS
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

- For API details, see [AbortMultipartUpload](#) in *AWS CLI Command Reference*.

complete-multipart-upload

The following code example shows how to use `complete-multipart-upload`.

AWS CLI

The following command completes a multipart upload for the key `multipart/01` in the bucket `my-bucket`:

```
aws s3api complete-multipart-upload --multipart-upload file://
mpustruct --bucket my-bucket --key 'multipart/01' --upload-id
dfRtDYU0WWCCcH43C3WfbkR0NycyCpTJJvxu2i5GYkZlJF.Yxwh6XG7WfS2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URCS
```

The upload ID required by this command is output by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`.

The multipart upload option in the above command takes a JSON structure that describes the parts of the multipart upload that should be reassembled into the complete file. In this example, the `file://` prefix is used to load the JSON structure from a file in the local folder named `mpustruct`.

`mpustruct`:

```
{
  "Parts": [
    {
      "ETag": "e868e0f4719e394144ef36531ee6824c",
      "PartNumber": 1
    },
    {
      "ETag": "6bb2b12753d66fe86da4998aa33fffb0",
      "PartNumber": 2
    },
    {
      "ETag": "d0a0112e841abec9c9ec83406f0159c8",
      "PartNumber": 3
    }
  ]
}
```

```
]
}
```

The ETag value for each part is output each time you upload a part using the `upload-part` command and can also be retrieved by calling `list-parts` or calculated by taking the MD5 checksum of each part.

Output:

```
{
  "ETag": "\"3944a9f7a4faab7f78788ff6210f63f0-3\"",
  "Bucket": "my-bucket",
  "Location": "https://my-bucket.s3.amazonaws.com/multipart%2F01",
  "Key": "multipart/01"
}
```

- For API details, see [CompleteMultipartUpload](#) in *AWS CLI Command Reference*.

copy-object

The following code example shows how to use `copy-object`.

AWS CLI

The following command copies an object from `bucket-1` to `bucket-2`:

```
aws s3api copy-object --copy-source bucket-1/test.txt --key test.txt --bucket
bucket-2
```

Output:

```
{
  "CopyObjectResult": {
    "LastModified": "2015-11-10T01:07:25.000Z",
    "ETag": "\"589c8b79c230a6ecd5a7e1d040a9a030\""
  },
  "VersionId": "YdnYvTCVDqRRFA.NFJjy36p0hxifM1kA"
}
```

- For API details, see [CopyObject](#) in *AWS CLI Command Reference*.

cp

The following code example shows how to use cp.

AWS CLI

Example 1: Copying a local file to S3

The following cp command copies a single file to a specified bucket and key:

```
aws s3 cp test.txt s3://mybucket/test2.txt
```

Output:

```
upload: test.txt to s3://mybucket/test2.txt
```

Example 2: Copying a local file to S3 with an expiration date

The following cp command copies a single file to a specified bucket and key that expires at the specified ISO 8601 timestamp:

```
aws s3 cp test.txt s3://mybucket/test2.txt \  
--expires 2014-10-01T20:30:00Z
```

Output:

```
upload: test.txt to s3://mybucket/test2.txt
```

Example 3: Copying a file from S3 to S3

The following cp command copies a single s3 object to a specified bucket and key:

```
aws s3 cp s3://mybucket/test.txt s3://mybucket/test2.txt
```

Output:

```
copy: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

Example 4: Copying an S3 object to a local file

The following cp command copies a single object to a specified file locally:

```
aws s3 cp s3://mybucket/test.txt test2.txt
```

Output:

```
download: s3://mybucket/test.txt to test2.txt
```

Example 5: Copying an S3 object from one bucket to another

The following `cp` command copies a single object to a specified bucket while retaining its original name:

```
aws s3 cp s3://mybucket/test.txt s3://mybucket2/
```

Output:

```
copy: s3://mybucket/test.txt to s3://mybucket2/test.txt
```

Example 6: Recursively copying S3 objects to a local directory

When passed with the parameter `--recursive`, the following `cp` command recursively copies all objects under a specified prefix and bucket to a specified directory. In this example, the bucket `mybucket` has the objects `test1.txt` and `test2.txt`:

```
aws s3 cp s3://mybucket . \  
--recursive
```

Output:

```
download: s3://mybucket/test1.txt to test1.txt  
download: s3://mybucket/test2.txt to test2.txt
```

Example 7: Recursively copying local files to S3

When passed with the parameter `--recursive`, the following `cp` command recursively copies all files under a specified directory to a specified bucket and prefix while excluding some files by using an `--exclude` parameter. In this example, the directory `myDir` has the files `test1.txt` and `test2.jpg`:

```
aws s3 cp myDir s3://mybucket/ \  
--recursive --exclude test2.jpg
```

```
--recursive \  
--exclude "*.jpg"
```

Output:

```
upload: myDir/test1.txt to s3://mybucket/test1.txt
```

Example 8: Recursively copying S3 objects to another bucket

When passed with the parameter `--recursive`, the following `cp` command recursively copies all objects under a specified bucket to another bucket while excluding some objects by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `another/test1.txt`:

```
aws s3 cp s3://mybucket/ s3://mybucket2/ \  
--recursive \  
--exclude "another/*"
```

Output:

```
copy: s3://mybucket/test1.txt to s3://mybucket2/test1.txt
```

You can combine `--exclude` and `--include` options to copy only objects that match a pattern, excluding all others:

```
aws s3 cp s3://mybucket/logs/ s3://mybucket2/logs/ \  
--recursive \  
--exclude "*" \  
--include "*.log"
```

Output:

```
copy: s3://mybucket/logs/test/test.log to s3://mybucket2/logs/test/test.log  
copy: s3://mybucket/logs/test3.log to s3://mybucket2/logs/test3.log
```

Example 9: Setting the Access Control List (ACL) while copying an S3 object

The following `cp` command copies a single object to a specified bucket and key while setting the ACL to `public-read-write`:

```
aws s3 cp s3://mybucket/test.txt s3://mybucket/test2.txt \  
--acl public-read-write
```

Output:

```
copy: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

Note that if you're using the `--acl` option, ensure that any associated IAM policies include the `"s3:PutObjectAcl"` action:

```
aws iam get-user-policy \  
--user-name myuser \  
--policy-name mypolicy
```

Output:

```
{  
  "UserName": "myuser",  
  "PolicyName": "mypolicy",  
  "PolicyDocument": {  
    "Version": "2012-10-17",  
    "Statement": [  
      {  
        "Action": [  
          "s3:PutObject",  
          "s3:PutObjectAcl"  
        ],  
        "Resource": [  
          "arn:aws:s3:::mybucket/*"  
        ],  
        "Effect": "Allow",  
        "Sid": "Stmt1234567891234"  
      }  
    ]  
  }  
}
```

Example 10: Granting permissions for an S3 object

The following `cp` command illustrates the use of the `--grants` option to grant read access to all users identified by URI and full control to a specific user identified by their Canonical ID:

```
aws s3 cp file.txt s3://mybucket/ --grants read=uri=http://acs.amazonaws.com/groups/global/AllUsers
full=id=79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be
```

Output:

```
upload: file.txt to s3://mybucket/file.txt
```

Example 11: Uploading a local file stream to S3

PowerShell may alter the encoding of or add a CRLF to piped input.

The following `cp` command uploads a local file stream from standard input to a specified bucket and key:

```
aws s3 cp - s3://mybucket/stream.txt
```

Example 12: Uploading a local file stream that is larger than 50GB to S3

The following `cp` command uploads a 51GB local file stream from standard input to a specified bucket and key. The `--expected-size` option must be provided, or the upload may fail when it reaches the default part limit of 10,000:

```
aws s3 cp - s3://mybucket/stream.txt --expected-size 54760833024
```

Example 13: Downloading an S3 object as a local file stream

PowerShell may alter the encoding of or add a CRLF to piped or redirected output.

The following `cp` command downloads an S3 object locally as a stream to standard output. Downloading as a stream is not currently compatible with the `--recursive` parameter:

```
aws s3 cp s3://mybucket/stream.txt -
```

Example 14: Uploading to an S3 access point

The following `cp` command uploads a single file (`mydoc.txt`) to the access point (`myaccesspoint`) at the key (`mykey`):

```
aws s3 cp mydoc.txt s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

Output:

```
upload: mydoc.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/
myaccesspoint/mykey
```

Example 15: Downloading from an S3 access point

The following `cp` command downloads a single object (`mykey`) from the access point (`myaccesspoint`) to the local file (`mydoc.txt`):

```
aws s3 cp s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey
mydoc.txt
```

Output:

```
download: s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey to
mydoc.txt
```

- For API details, see [Cp](#) in *AWS CLI Command Reference*.

create-bucket

The following code example shows how to use `create-bucket`.

AWS CLI**Example 1: To create a bucket**

The following `create-bucket` example creates a bucket named `my-bucket`:

```
aws s3api create-bucket \
  --bucket my-bucket \
  --region us-east-1
```

Output:

```
{
```

```
"Location": "/my-bucket"  
}
```

For more information, see [Creating a bucket](#) in the *Amazon S3 User Guide*.

Example 2: To create a bucket with owner enforced

The following `create-bucket` example creates a bucket named `my-bucket` that uses the bucket owner enforced setting for S3 Object Ownership.

```
aws s3api create-bucket \  
  --bucket my-bucket \  
  --region us-east-1 \  
  --object-ownership BucketOwnerEnforced
```

Output:

```
{  
  "Location": "/my-bucket"  
}
```

For more information, see [Controlling ownership of objects and disabling ACLs](#) in the *Amazon S3 User Guide*.

Example 3: To create a bucket outside of the ``us-east-1`` region

The following `create-bucket` example creates a bucket named `my-bucket` in the `eu-west-1` region. Regions outside of `us-east-1` require the appropriate `LocationConstraint` to be specified in order to create the bucket in the desired region.

```
aws s3api create-bucket \  
  --bucket my-bucket \  
  --region eu-west-1 \  
  --create-bucket-configuration LocationConstraint=eu-west-1
```

Output:

```
{  
  "Location": "http://my-bucket.s3.amazonaws.com/"  
}
```

For more information, see [Creating a bucket](#) in the *Amazon S3 User Guide*.

- For API details, see [CreateBucket](#) in *AWS CLI Command Reference*.

create-multipart-upload

The following code example shows how to use `create-multipart-upload`.

AWS CLI

The following command creates a multipart upload in the bucket `my-bucket` with the key `multipart/01`:

```
aws s3api create-multipart-upload --bucket my-bucket --key 'multipart/01'
```

Output:

```
{
  "Bucket": "my-bucket",
  "UploadId":
  "dfRtDYU0WWCCcH43C3WFbkR0NycyCpTJJvxu2i5GYkZ1jF.Yxwh6XG7WfS2vC4to6HiV6Yj1x.cph0gtNBtJ8P3URC
  "Key": "multipart/01"
}
```

The completed file will be named `01` in a folder called `multipart` in the bucket `my-bucket`. Save the upload ID, key and bucket name for use with the `upload-part` command.

- For API details, see [CreateMultipartUpload](#) in *AWS CLI Command Reference*.

delete-bucket-analytics-configuration

The following code example shows how to use `delete-bucket-analytics-configuration`.

AWS CLI

To delete an analytics configuration for a bucket

The following `delete-bucket-analytics-configuration` example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \
  --bucket my-bucket \
```

```
--id 1
```

This command produces no output.

- For API details, see [DeleteBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

delete-bucket-cors

The following code example shows how to use `delete-bucket-cors`.

AWS CLI

The following command deletes a Cross-Origin Resource Sharing configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-cors --bucket my-bucket
```

- For API details, see [DeleteBucketCors](#) in *AWS CLI Command Reference*.

delete-bucket-encryption

The following code example shows how to use `delete-bucket-encryption`.

AWS CLI

To delete the server-side encryption configuration of a bucket

The following `delete-bucket-encryption` example deletes the server-side encryption configuration of the specified bucket.

```
aws s3api delete-bucket-encryption \  
  --bucket my-bucket
```

This command produces no output.

- For API details, see [DeleteBucketEncryption](#) in *AWS CLI Command Reference*.

delete-bucket-intelligent-tiering-configuration

The following code example shows how to use `delete-bucket-intelligent-tiering-configuration`.

AWS CLI

To remove an S3 Intelligent-Tiering configuration on a bucket

The following `delete-bucket-intelligent-tiering-configuration` example removes an S3 Intelligent-Tiering configuration, named `ExampleConfig`, on a bucket.

```
aws s3api delete-bucket-intelligent-tiering-configuration \  
  --bucket DOC-EXAMPLE-BUCKET \  
  --id ExampleConfig
```

This command produces no output.

For more information, see [Using S3 Intelligent-Tiering](#) in the *Amazon S3 User Guide*.

- For API details, see [DeleteBucketIntelligentTieringConfiguration](#) in *AWS CLI Command Reference*.

`delete-bucket-inventory-configuration`

The following code example shows how to use `delete-bucket-inventory-configuration`.

AWS CLI

To delete the inventory configuration of a bucket

The following `delete-bucket-inventory-configuration` example deletes the inventory configuration with ID 1 for the specified bucket.

```
aws s3api delete-bucket-inventory-configuration \  
  --bucket my-bucket \  
  --id 1
```

This command produces no output.

- For API details, see [DeleteBucketInventoryConfiguration](#) in *AWS CLI Command Reference*.

`delete-bucket-lifecycle`

The following code example shows how to use `delete-bucket-lifecycle`.

AWS CLI

The following command deletes a lifecycle configuration from a bucket named my-bucket:

```
aws s3api delete-bucket-lifecycle --bucket my-bucket
```

- For API details, see [DeleteBucketLifecycle](#) in *AWS CLI Command Reference*.

delete-bucket-metrics-configuration

The following code example shows how to use delete-bucket-metrics-configuration.

AWS CLI

To delete a metrics configuration for a bucket

The following delete-bucket-metrics-configuration example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \  
  --bucket my-bucket \  
  --id 123
```

This command produces no output.

- For API details, see [DeleteBucketMetricsConfiguration](#) in *AWS CLI Command Reference*.

delete-bucket-ownership-controls

The following code example shows how to use delete-bucket-ownership-controls.

AWS CLI

To remove the bucket ownership settings of a bucket

The following delete-bucket-ownership-controls example removes the bucket ownership settings of a bucket.

```
aws s3api delete-bucket-ownership-controls \  
  --bucket DOC-EXAMPLE-BUCKET
```

This command produces no output.

For more information, see [Setting Object Ownership on an existing bucket](#) in the *Amazon S3 User Guide*.

- For API details, see [DeleteBucketOwnershipControls](#) in *AWS CLI Command Reference*.

delete-bucket-policy

The following code example shows how to use `delete-bucket-policy`.

AWS CLI

The following command deletes a bucket policy from a bucket named `my-bucket`:

```
aws s3api delete-bucket-policy --bucket my-bucket
```

- For API details, see [DeleteBucketPolicy](#) in *AWS CLI Command Reference*.

delete-bucket-replication

The following code example shows how to use `delete-bucket-replication`.

AWS CLI

The following command deletes a replication configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-replication --bucket my-bucket
```

- For API details, see [DeleteBucketReplication](#) in *AWS CLI Command Reference*.

delete-bucket-tagging

The following code example shows how to use `delete-bucket-tagging`.

AWS CLI

The following command deletes a tagging configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-tagging --bucket my-bucket
```

- For API details, see [DeleteBucketTagging](#) in *AWS CLI Command Reference*.

delete-bucket-website

The following code example shows how to use `delete-bucket-website`.

AWS CLI

The following command deletes a website configuration from a bucket named `my-bucket`:

```
aws s3api delete-bucket-website --bucket my-bucket
```

- For API details, see [DeleteBucketWebsite](#) in *AWS CLI Command Reference*.

delete-bucket

The following code example shows how to use `delete-bucket`.

AWS CLI

The following command deletes a bucket named `my-bucket`:

```
aws s3api delete-bucket --bucket my-bucket --region us-east-1
```

- For API details, see [DeleteBucket](#) in *AWS CLI Command Reference*.

delete-object-tagging

The following code example shows how to use `delete-object-tagging`.

AWS CLI

To delete the tag sets of an object

The following `delete-object-tagging` example deletes the tag with the specified key from the object `doc1.rtf`.

```
aws s3api delete-object-tagging \  
  --bucket my-bucket \  
  --key doc1.rtf
```

This command produces no output.

- For API details, see [DeleteObjectTagging](#) in *AWS CLI Command Reference*.

delete-object

The following code example shows how to use `delete-object`.

AWS CLI

The following command deletes an object named `test.txt` from a bucket named `my-bucket`:

```
aws s3api delete-object --bucket my-bucket --key test.txt
```

If bucket versioning is enabled, the output will contain the version ID of the delete marker:

```
{
  "VersionId": "9_gKg5vG56F.TTEUdwkxGpJ3tND1W1Gq",
  "DeleteMarker": true
}
```

For more information about deleting objects, see *Deleting Objects in the Amazon S3 Developer Guide*.

- For API details, see [DeleteObject](#) in *AWS CLI Command Reference*.

delete-objects

The following code example shows how to use `delete-objects`.

AWS CLI

The following command deletes an object from a bucket named `my-bucket`:

```
aws s3api delete-objects --bucket my-bucket --delete file://delete.json
```

`delete.json` is a JSON document in the current directory that specifies the object to delete:

```
{
  "Objects": [
    {
      "Key": "test1.txt"
    }
  ],
  "Quiet": false
}
```

Output:

```
{
  "Deleted": [
    {
      "DeleteMarkerVersionId": "mYAT5Mc6F7aeUL8SS7FAAqUP01koHwzU",
      "Key": "test1.txt",
      "DeleteMarker": true
    }
  ]
}
```

- For API details, see [DeleteObjects](#) in *AWS CLI Command Reference*.

delete-public-access-block

The following code example shows how to use `delete-public-access-block`.

AWS CLI**To delete the block public access configuration for a bucket**

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
  --bucket my-bucket
```

This command produces no output.

- For API details, see [DeletePublicAccessBlock](#) in *AWS CLI Command Reference*.

get-bucket-accelerate-configuration

The following code example shows how to use `get-bucket-accelerate-configuration`.

AWS CLI**To retrieve the accelerate configuration of a bucket**

The following `get-bucket-accelerate-configuration` example retrieves the accelerate configuration for the specified bucket.

```
aws s3api get-bucket-accelerate-configuration \  
  --bucket my-bucket
```

Output:

```
{  
  "Status": "Enabled"  
}
```

- For API details, see [GetBucketAccelerateConfiguration](#) in *AWS CLI Command Reference*.

get-bucket-acl

The following code example shows how to use `get-bucket-acl`.

AWS CLI

The following command retrieves the access control list for a bucket named `my-bucket`:

```
aws s3api get-bucket-acl --bucket my-bucket
```

Output:

```
{  
  "Owner": {  
    "DisplayName": "my-username",  
    "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"  
  },  
  "Grants": [  
    {  
      "Grantee": {  
        "DisplayName": "my-username",  
        "ID":  
"7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"  
      },  
      "Permission": "FULL_CONTROL"  
    }  
  ]  
}
```

- For API details, see [GetBucketAcl](#) in *AWS CLI Command Reference*.

get-bucket-analytics-configuration

The following code example shows how to use `get-bucket-analytics-configuration`.

AWS CLI

To retrieve the analytics configuration for a bucket with a specific ID

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration \  
  --bucket my-bucket \  
  --id 1
```

Output:

```
{  
  "AnalyticsConfiguration": {  
    "StorageClassAnalysis": {},  
    "Id": "1"  
  }  
}
```

- For API details, see [GetBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

get-bucket-cors

The following code example shows how to use `get-bucket-cors`.

AWS CLI

The following command retrieves the Cross-Origin Resource Sharing configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-cors --bucket my-bucket
```

Output:

```
{  
  "CORSRules": [  
    {
```

```
    "AllowedHeaders": [
      "*"
    ],
    "ExposeHeaders": [
      "x-amz-server-side-encryption"
    ],
    "AllowedMethods": [
      "PUT",
      "POST",
      "DELETE"
    ],
    "MaxAgeSeconds": 3000,
    "AllowedOrigins": [
      "http://www.example.com"
    ]
  },
  {
    "AllowedHeaders": [
      "Authorization"
    ],
    "MaxAgeSeconds": 3000,
    "AllowedMethods": [
      "GET"
    ],
    "AllowedOrigins": [
      "*"
    ]
  }
]
```

- For API details, see [GetBucketCors](#) in *AWS CLI Command Reference*.

get-bucket-encryption

The following code example shows how to use `get-bucket-encryption`.

AWS CLI

To retrieve the server-side encryption configuration for a bucket

The following `get-bucket-encryption` example retrieves the server-side encryption configuration for the bucket `my-bucket`.

```
aws s3api get-bucket-encryption \  
  --bucket my-bucket
```

Output:

```
{  
  "ServerSideEncryptionConfiguration": {  
    "Rules": [  
      {  
        "ApplyServerSideEncryptionByDefault": {  
          "SSEAlgorithm": "AES256"  
        }  
      }  
    ]  
  }  
}
```

- For API details, see [GetBucketEncryption](#) in *AWS CLI Command Reference*.

get-bucket-intelligent-tiering-configuration

The following code example shows how to use `get-bucket-intelligent-tiering-configuration`.

AWS CLI**To retrieve an S3 Intelligent-Tiering configuration on a bucket**

The following `get-bucket-intelligent-tiering-configuration` example retrieves an S3 Intelligent-Tiering configuration, named `ExampleConfig`, on a bucket.

```
aws s3api get-bucket-intelligent-tiering-configuration \  
  --bucket DOC-EXAMPLE-BUCKET \  
  --id ExampleConfig
```

Output:

```
{  
  "IntelligentTieringConfiguration": {  
    "Id": "ExampleConfig2",
```

```
    "Filter": {
      "Prefix": "images"
    },
    "Status": "Enabled",
    "Tierings": [
      {
        "Days": 90,
        "AccessTier": "ARCHIVE_ACCESS"
      },
      {
        "Days": 180,
        "AccessTier": "DEEP_ARCHIVE_ACCESS"
      }
    ]
  }
}
```

For more information, see [Using S3 Intelligent-Tiering](#) in the *Amazon S3 User Guide*.

- For API details, see [GetBucketIntelligentTieringConfiguration](#) in *AWS CLI Command Reference*.

get-bucket-inventory-configuration

The following code example shows how to use `get-bucket-inventory-configuration`.

AWS CLI

To retrieve the inventory configuration for a bucket

The following `get-bucket-inventory-configuration` example retrieves the inventory configuration for the specified bucket with ID 1.

```
aws s3api get-bucket-inventory-configuration \
  --bucket my-bucket \
  --id 1
```

Output:

```
{
  "InventoryConfiguration": {
    "IsEnabled": true,
    "Destination": {
```

```
    "S3BucketDestination": {
      "Format": "ORC",
      "Bucket": "arn:aws:s3::my-bucket",
      "AccountId": "123456789012"
    },
    "IncludedObjectVersions": "Current",
    "Id": "1",
    "Schedule": {
      "Frequency": "Weekly"
    }
  }
}
```

- For API details, see [GetBucketInventoryConfiguration](#) in *AWS CLI Command Reference*.

get-bucket-lifecycle-configuration

The following code example shows how to use `get-bucket-lifecycle-configuration`.

AWS CLI

The following command retrieves the lifecycle configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-lifecycle-configuration --bucket my-bucket
```

Output:

```
{
  "Rules": [
    {
      "ID": "Move rotated logs to Glacier",
      "Prefix": "rotated/",
      "Status": "Enabled",
      "Transitions": [
        {
          "Date": "2015-11-10T00:00:00.000Z",
          "StorageClass": "GLACIER"
        }
      ]
    },
    {
```

```

        "Status": "Enabled",
        "Prefix": "",
        "NoncurrentVersionTransitions": [
            {
                "NoncurrentDays": 0,
                "StorageClass": "GLACIER"
            }
        ],
        "ID": "Move old versions to Glacier"
    }
]
}

```

- For API details, see [GetBucketLifecycleConfiguration](#) in *AWS CLI Command Reference*.

get-bucket-lifecycle

The following code example shows how to use `get-bucket-lifecycle`.

AWS CLI

The following command retrieves the lifecycle configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-lifecycle --bucket my-bucket
```

Output:

```

{
  "Rules": [
    {
      "ID": "Move to Glacier after sixty days (objects in logs/2015/)",
      "Prefix": "logs/2015/",
      "Status": "Enabled",
      "Transition": {
        "Days": 60,
        "StorageClass": "GLACIER"
      }
    },
    {
      "Expiration": {
        "Date": "2016-01-01T00:00:00.000Z"
      }
    }
  ],
}

```

```
    "ID": "Delete 2014 logs in 2016.",
    "Prefix": "logs/2014/",
    "Status": "Enabled"
  }
]
```

- For API details, see [GetBucketLifecycle](#) in *AWS CLI Command Reference*.

get-bucket-location

The following code example shows how to use `get-bucket-location`.

AWS CLI

The following command retrieves the location constraint for a bucket named `my-bucket`, if a constraint exists:

```
aws s3api get-bucket-location --bucket my-bucket
```

Output:

```
{
  "LocationConstraint": "us-west-2"
}
```

- For API details, see [GetBucketLocation](#) in *AWS CLI Command Reference*.

get-bucket-logging

The following code example shows how to use `get-bucket-logging`.

AWS CLI

To retrieve the logging status for a bucket

The following `get-bucket-logging` example retrieves the logging status for the specified bucket.

```
aws s3api get-bucket-logging \
```

```
--bucket my-bucket
```

Output:

```
{
  "LoggingEnabled": {
    "TargetPrefix": "",
    "TargetBucket": "my-bucket-logs"
  }
}
```

- For API details, see [GetBucketLogging](#) in *AWS CLI Command Reference*.

get-bucket-metrics-configuration

The following code example shows how to use `get-bucket-metrics-configuration`.

AWS CLI**To retrieve the metrics configuration for a bucket with a specific ID**

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \
  --bucket my-bucket \
  --id 123
```

Output:

```
{
  "MetricsConfiguration": {
    "Filter": {
      "Prefix": "logs"
    },
    "Id": "123"
  }
}
```

- For API details, see [GetBucketMetricsConfiguration](#) in *AWS CLI Command Reference*.

get-bucket-notification-configuration

The following code example shows how to use `get-bucket-notification-configuration`.

AWS CLI

The following command retrieves the notification configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-notification-configuration --bucket my-bucket
```

Output:

```
{
  "TopicConfigurations": [
    {
      "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWw1",
      "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
      "Events": [
        "s3:ObjectCreated:*"
      ]
    }
  ]
}
```

- For API details, see [GetBucketNotificationConfiguration](#) in *AWS CLI Command Reference*.

get-bucket-notification

The following code example shows how to use `get-bucket-notification`.

AWS CLI

The following command retrieves the notification configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-notification --bucket my-bucket
```

Output:

```
{
```

```
"TopicConfiguration": {
  "Topic": "arn:aws:sns:us-west-2:123456789012:my-notification-topic",
  "Id": "YmQzMmEwM2EjZWVlI0NGItNzVtZjI1MC00ZjgyLWZDBiZWw1",
  "Event": "s3:ObjectCreated:*",
  "Events": [
    "s3:ObjectCreated:*"
  ]
}
```

- For API details, see [GetBucketNotification](#) in *AWS CLI Command Reference*.

get-bucket-ownership-controls

The following code example shows how to use `get-bucket-ownership-controls`.

AWS CLI

To retrieve the bucket ownership settings of a bucket

The following `get-bucket-ownership-controls` example retrieves the bucket ownership settings of a bucket.

```
aws s3api get-bucket-ownership-controls \
  --bucket DOC-EXAMPLE-BUCKET
```

Output:

```
{
  "OwnershipControls": {
    "Rules": [
      {
        "ObjectOwnership": "BucketOwnerEnforced"
      }
    ]
  }
}
```

For more information, see [Viewing the Object Ownership setting for an S3 bucket](#) in the *Amazon S3 User Guide*.

- For API details, see [GetBucketOwnershipControls](#) in *AWS CLI Command Reference*.

get-bucket-policy-status

The following code example shows how to use `get-bucket-policy-status`.

AWS CLI

To retrieve the policy status for a bucket indicating whether the bucket is public

The following `get-bucket-policy-status` example retrieves the policy status for the bucket `my-bucket`.

```
aws s3api get-bucket-policy-status \
  --bucket my-bucket
```

Output:

```
{
  "PolicyStatus": {
    "IsPublic": false
  }
}
```

- For API details, see [GetBucketPolicyStatus](#) in *AWS CLI Command Reference*.

get-bucket-policy

The following code example shows how to use `get-bucket-policy`.

AWS CLI

The following command retrieves the bucket policy for a bucket named `my-bucket`:

```
aws s3api get-bucket-policy --bucket my-bucket
```

Output:

```
{
  "Policy": "{\n\"Version\": \"2008-10-17\", \"Statement\": [\n{\n\"Sid\": \"\", \"Effect\n\": \"Allow\", \"Principal\": \"*\", \"Action\": \"s3:GetObject\", \"Resource\":
```

```
\\"arn:aws:s3:::my-bucket/*\\"},{\\"Sid\\":\\"\\",\\"Effect\\":\\"Deny\\",\\"Principal\\":\\"*\\",
\\"Action\\":\\"s3:GetObject\\",\\"Resource\\":\\"arn:aws:s3:::my-bucket/secret/*\\"}]}"
}
```

Get and put a bucket policyThe following example shows how you can download an Amazon S3 bucket policy, make modifications to the file, and then use `put-bucket-policy` to apply the modified bucket policy. To download the bucket policy to a file, you can run:

```
aws s3api get-bucket-policy --bucket mybucket --query Policy --output text >
policy.json
```

You can then modify the `policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

`policy.json` file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

file as needed. Finally you can apply this modified policy back to the S3 bucket by running:

```
aws s3api put-bucket-policy --bucket mybucket --policy file://policy.json
```

- For API details, see [GetBucketPolicy](#) in *AWS CLI Command Reference*.

get-bucket-replication

The following code example shows how to use `get-bucket-replication`.

AWS CLI

The following command retrieves the replication configuration for a bucket named `my-bucket`:

```
aws s3api get-bucket-replication --bucket my-bucket
```

Output:

```
{
  "ReplicationConfiguration": {
    "Rules": [
      {
```

```

        "Status": "Enabled",
        "Prefix": "",
        "Destination": {
            "Bucket": "arn:aws:s3:::my-bucket-backup",
            "StorageClass": "STANDARD"
        },
        "ID": "ZmUwNzE4ZmQ4tMjVhOS00MTlkLOGI4NDkzZTIWJjNTUtYTA1"
    },
    ],
    "Role": "arn:aws:iam::123456789012:role/s3-replication-role"
}

```

- For API details, see [GetBucketReplication](#) in *AWS CLI Command Reference*.

get-bucket-request-payment

The following code example shows how to use `get-bucket-request-payment`.

AWS CLI

To retrieve the request payment configuration for a bucket

The following `get-bucket-request-payment` example retrieves the requester pays configuration for the specified bucket.

```
aws s3api get-bucket-request-payment \
  --bucket my-bucket
```

Output:

```
{
  "Payer": "BucketOwner"
}
```

- For API details, see [GetBucketRequestPayment](#) in *AWS CLI Command Reference*.

get-bucket-tagging

The following code example shows how to use `get-bucket-tagging`.

AWS CLI

The following command retrieves the tagging configuration for a bucket named my-bucket:

```
aws s3api get-bucket-tagging --bucket my-bucket
```

Output:

```
{
  "TagSet": [
    {
      "Value": "marketing",
      "Key": "organization"
    }
  ]
}
```

- For API details, see [GetBucketTagging](#) in *AWS CLI Command Reference*.

get-bucket-versioning

The following code example shows how to use get-bucket-versioning.

AWS CLI

The following command retrieves the versioning configuration for a bucket named my-bucket:

```
aws s3api get-bucket-versioning --bucket my-bucket
```

Output:

```
{
  "Status": "Enabled"
}
```

- For API details, see [GetBucketVersioning](#) in *AWS CLI Command Reference*.

get-bucket-website

The following code example shows how to use get-bucket-website.

AWS CLI

The following command retrieves the static website configuration for a bucket named my-bucket:

```
aws s3api get-bucket-website --bucket my-bucket
```

Output:

```
{
  "IndexDocument": {
    "Suffix": "index.html"
  },
  "ErrorDocument": {
    "Key": "error.html"
  }
}
```

- For API details, see [GetBucketWebsite](#) in *AWS CLI Command Reference*.

get-object-acl

The following code example shows how to use `get-object-acl`.

AWS CLI

The following command retrieves the access control list for an object in a bucket named my-bucket:

```
aws s3api get-object-acl --bucket my-bucket --key index.html
```

Output:

```
{
  "Owner": {
    "DisplayName": "my-username",
    "ID": "7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
  },
  "Grants": [
    {
      "Grantee": {
```

```

        "DisplayName": "my-username",
        "ID":
"7009a8971cd538e11f6b6606438875e7c86c5b672f46db45460ddcd087d36c32"
    },
    "Permission": "FULL_CONTROL"
  },
  {
    "Grantee": {
      "URI": "http://acs.amazonaws.com/groups/global/AllUsers"
    },
    "Permission": "READ"
  }
]
}

```

- For API details, see [GetObjectAcl](#) in *AWS CLI Command Reference*.

get-object-attributes

The following code example shows how to use get-object-attributes.

AWS CLI

To retrieves metadata from an object without returning the object itself

The following get-object-attributes example retrieves metadata from the object doc1.rtf.

```

aws s3api get-object-attributes \
  --bucket my-bucket \
  --key doc1.rtf \
  --object-attributes "StorageClass" "ETag" "ObjectSize"

```

Output:

```

{
  "LastModified": "2022-03-15T19:37:31+00:00",
  "VersionId": "IuCPjXTDzHNf1dAuitVBIKJpF2p1fg4P",
  "ETag": "b662d79adeb7c8d787ea7eafb9ef6207",
  "StorageClass": "STANDARD",
  "ObjectSize": 405
}

```

For more information, see [GetObjectAttributes](#) in the Amazon S3 API Reference.

- For API details, see [GetObjectAttributes](#) in *AWS CLI Command Reference*.

get-object-legal-hold

The following code example shows how to use `get-object-legal-hold`.

AWS CLI

Retrieves the Legal Hold status of an object

The following `get-object-legal-hold` example retrieves the Legal Hold status for the specified object.

```
aws s3api get-object-legal-hold \  
  --bucket my-bucket-with-object-lock \  
  --key doc1.rtf
```

Output:

```
{  
  "LegalHold": {  
    "Status": "ON"  
  }  
}
```

- For API details, see [GetObjectLegalHold](#) in *AWS CLI Command Reference*.

get-object-lock-configuration

The following code example shows how to use `get-object-lock-configuration`.

AWS CLI

To retrieve an object lock configuration for a bucket

The following `get-object-lock-configuration` example retrieves the object lock configuration for the specified bucket.

```
aws s3api get-object-lock-configuration \  
  --bucket my-bucket-with-object-lock
```

Output:

```
{
  "ObjectLockConfiguration": {
    "ObjectLockEnabled": "Enabled",
    "Rule": {
      "DefaultRetention": {
        "Mode": "COMPLIANCE",
        "Days": 50
      }
    }
  }
}
```

- For API details, see [GetObjectLockConfiguration](#) in *AWS CLI Command Reference*.

get-object-retention

The following code example shows how to use `get-object-retention`.

AWS CLI**To retrieve the object retention configuration for an object**

The following `get-object-retention` example retrieves the object retention configuration for the specified object.

```
aws s3api get-object-retention \
  --bucket my-bucket-with-object-lock \
  --key doc1.rtf
```

Output:

```
{
  "Retention": {
    "Mode": "GOVERNANCE",
    "RetainUntilDate": "2025-01-01T00:00:00.000Z"
  }
}
```

- For API details, see [GetObjectRetention](#) in *AWS CLI Command Reference*.

get-object-tagging

The following code example shows how to use `get-object-tagging`.

AWS CLI

To retrieve the tags attached to an object

The following `get-object-tagging` example retrieves the values for the specified key from the specified object.

```
aws s3api get-object-tagging \  
  --bucket my-bucket \  
  --key doc1.rtf
```

Output:

```
{  
  "TagSet": [  
    {  
      "Value": "confidential",  
      "Key": "designation"  
    }  
  ]  
}
```

The following `get-object-tagging` example tries to retrieve the tag sets of the object `doc2.rtf`, which has no tags.

```
aws s3api get-object-tagging \  
  --bucket my-bucket \  
  --key doc2.rtf
```

Output:

```
{  
  "TagSet": []  
}
```

The following `get-object-tagging` example retrieves the tag sets of the object `doc3.rtf`, which has multiple tags.

```
aws s3api get-object-tagging \  
  --bucket my-bucket \  
  --key doc3.rtf
```

Output:

```
{  
  "TagSet": [  
    {  
      "Value": "confidential",  
      "Key": "designation"  
    },  
    {  
      "Value": "finance",  
      "Key": "department"  
    },  
    {  
      "Value": "payroll",  
      "Key": "team"  
    }  
  ]  
}
```

- For API details, see [GetObjectTagging](#) in *AWS CLI Command Reference*.

get-object-torrent

The following code example shows how to use `get-object-torrent`.

AWS CLI

The following command creates a torrent for an object in a bucket named `my-bucket`:

```
aws s3api get-object-torrent --bucket my-bucket --key large-video-file.mp4 large-  
video-file.torrent
```

The torrent file is saved locally in the current folder. Note that the output filename (`large-video-file.torrent`) is specified without an option name and must be the last argument in the command.

- For API details, see [GetObjectTorrent](#) in *AWS CLI Command Reference*.

get-object

The following code example shows how to use `get-object`.

AWS CLI

The following example uses the `get-object` command to download an object from Amazon S3:

```
aws s3api get-object --bucket text-content --key dir/my_images.tar.bz2
my_images.tar.bz2
```

Note that the outfile parameter is specified without an option name such as "`--outfile`". The name of the output file must be the last parameter in the command.

The example below demonstrates the use of `--range` to download a specific byte range from an object. Note the byte ranges needs to be prefixed with "`bytes=`":

```
aws s3api get-object --bucket text-content --key dir/my_data --range bytes=8888-9999
my_data_range
```

For more information about retrieving objects, see *Getting Objects in the Amazon S3 Developer Guide*.

- For API details, see [GetObject](#) in *AWS CLI Command Reference*.

get-public-access-block

The following code example shows how to use `get-public-access-block`.

AWS CLI

To set or modify the block public access configuration for a bucket

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block \
--bucket my-bucket
```

Output:

```
{
  "PublicAccessBlockConfiguration": {
    "IgnorePublicAcls": true,
    "BlockPublicPolicy": true,
    "BlockPublicAcls": true,
    "RestrictPublicBuckets": true
  }
}
```

- For API details, see [GetPublicAccessBlock](#) in *AWS CLI Command Reference*.

head-bucket

The following code example shows how to use head-bucket.

AWS CLI

The following command verifies access to a bucket named my-bucket:

```
aws s3api head-bucket --bucket my-bucket
```

If the bucket exists and you have access to it, no output is returned. Otherwise, an error message will be shown. For example:

```
A client error (404) occurred when calling the HeadBucket operation: Not Found
```

- For API details, see [HeadBucket](#) in *AWS CLI Command Reference*.

head-object

The following code example shows how to use head-object.

AWS CLI

The following command retrieves metadata for an object in a bucket named my-bucket:

```
aws s3api head-object --bucket my-bucket --key index.html
```

Output:

```
{
  "AcceptRanges": "bytes",
  "ContentType": "text/html",
  "LastModified": "Thu, 16 Apr 2015 18:19:14 GMT",
  "ContentLength": 77,
  "VersionId": "null",
  "ETag": "\"30a6ec7e1a9ad79c203d05a589c8b400\"",
  "Metadata": {}
}
```

- For API details, see [HeadObject](#) in *AWS CLI Command Reference*.

list-bucket-analytics-configurations

The following code example shows how to use `list-bucket-analytics-configurations`.

AWS CLI**To retrieve a list of analytics configurations for a bucket**

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
  --bucket my-bucket
```

Output:

```
{
  "AnalyticsConfigurationList": [
    {
      "StorageClassAnalysis": {},
      "Id": "1"
    }
  ],
  "IsTruncated": false
}
```

- For API details, see [ListBucketAnalyticsConfigurations](#) in *AWS CLI Command Reference*.

list-bucket-intelligent-tiering-configurations

The following code example shows how to use `list-bucket-intelligent-tiering-configurations`.

AWS CLI

To retrieve all S3 Intelligent-Tiering configurations on a bucket

The following `list-bucket-intelligent-tiering-configurations` example retrieves all S3 Intelligent-Tiering configuration on a bucket.

```
aws s3api list-bucket-intelligent-tiering-configurations \
  --bucket DOC-EXAMPLE-BUCKET
```

Output:

```
{
  "IsTruncated": false,
  "IntelligentTieringConfigurationList": [
    {
      "Id": "ExampleConfig",
      "Filter": {
        "Prefix": "images"
      },
      "Status": "Enabled",
      "Tierings": [
        {
          "Days": 90,
          "AccessTier": "ARCHIVE_ACCESS"
        },
        {
          "Days": 180,
          "AccessTier": "DEEP_ARCHIVE_ACCESS"
        }
      ]
    },
    {
      "Id": "ExampleConfig2",
      "Status": "Disabled",
      "Tierings": [
        {
```

```
        "Days": 730,
        "AccessTier": "ARCHIVE_ACCESS"
      }
    ]
  },
  {
    "Id": "ExampleConfig3",
    "Filter": {
      "Tag": {
        "Key": "documents",
        "Value": "taxes"
      }
    },
    "Status": "Enabled",
    "Tierings": [
      {
        "Days": 90,
        "AccessTier": "ARCHIVE_ACCESS"
      },
      {
        "Days": 365,
        "AccessTier": "DEEP_ARCHIVE_ACCESS"
      }
    ]
  }
]
```

For more information, see [Using S3 Intelligent-Tiering](#) in the *Amazon S3 User Guide*.

- For API details, see [ListBucketIntelligentTieringConfigurations](#) in *AWS CLI Command Reference*.

list-bucket-inventory-configurations

The following code example shows how to use `list-bucket-inventory-configurations`.

AWS CLI

To retrieve a list of inventory configurations for a bucket

The following `list-bucket-inventory-configurations` example lists the inventory configurations for the specified bucket.

```
aws s3api list-bucket-inventory-configurations \  
  --bucket my-bucket
```

Output:

```
{  
  "InventoryConfigurationList": [  
    {  
      "IsEnabled": true,  
      "Destination": {  
        "S3BucketDestination": {  
          "Format": "ORC",  
          "Bucket": "arn:aws:s3:::my-bucket",  
          "AccountId": "123456789012"  
        }  
      },  
      "IncludedObjectVersions": "Current",  
      "Id": "1",  
      "Schedule": {  
        "Frequency": "Weekly"  
      }  
    },  
    {  
      "IsEnabled": true,  
      "Destination": {  
        "S3BucketDestination": {  
          "Format": "CSV",  
          "Bucket": "arn:aws:s3:::my-bucket",  
          "AccountId": "123456789012"  
        }  
      },  
      "IncludedObjectVersions": "Current",  
      "Id": "2",  
      "Schedule": {  
        "Frequency": "Daily"  
      }  
    }  
  ],  
  "IsTruncated": false  
}
```

- For API details, see [ListBucketInventoryConfigurations](#) in *AWS CLI Command Reference*.

list-bucket-metrics-configurations

The following code example shows how to use `list-bucket-metrics-configurations`.

AWS CLI

To retrieve a list of metrics configurations for a bucket

The following `list-bucket-metrics-configurations` example retrieves a list of metrics configurations for the specified bucket.

```
aws s3api list-bucket-metrics-configurations \  
  --bucket my-bucket
```

Output:

```
{  
  "IsTruncated": false,  
  "MetricsConfigurationList": [  
    {  
      "Filter": {  
        "Prefix": "logs"  
      },  
      "Id": "123"  
    },  
    {  
      "Filter": {  
        "Prefix": "tmp"  
      },  
      "Id": "234"  
    }  
  ]  
}
```

- For API details, see [ListBucketMetricsConfigurations](#) in *AWS CLI Command Reference*.

list-buckets

The following code example shows how to use `list-buckets`.

AWS CLI

The following command uses the `list-buckets` command to display the names of all your Amazon S3 buckets (across all regions):

```
aws s3api list-buckets --query "Buckets[].Name"
```

The query option filters the output of `list-buckets` down to only the bucket names.

For more information about buckets, see *Working with Amazon S3 Buckets in the Amazon S3 Developer Guide*.

- For API details, see [ListBuckets](#) in *AWS CLI Command Reference*.

list-multipart-uploads

The following code example shows how to use `list-multipart-uploads`.

AWS CLI

The following command lists all of the active multipart uploads for a bucket named `my-bucket`:

```
aws s3api list-multipart-uploads --bucket my-bucket
```

Output:

```
{
  "Uploads": [
    {
      "Initiator": {
        "DisplayName": "username",
        "ID": "arn:aws:iam::0123456789012:user/username"
      },
      "Initiated": "2015-06-02T18:01:30.000Z",
      "UploadId":
"dfRtDYU0WWCCcH43C3WFbkR0NycyCpTJJvxu2i5GYkZ1jF.Yxwh6XG7WfS2vC4to6HiV6Yj1x.cph0gtNBtJ8P3URC",
      "StorageClass": "STANDARD",
      "Key": "multipart/01",
      "Owner": {
        "DisplayName": "aws-account-name",
```

```

        "ID":
        "100719349fc3b6dcd7c820a124bf7aec408092c3d7b51b38494939801fc248b"
    }
    ],
    "CommonPrefixes": []
}

```

In progress multipart uploads incur storage costs in Amazon S3. Complete or abort an active multipart upload to remove its parts from your account.

- For API details, see [ListMultipartUploads](#) in *AWS CLI Command Reference*.

list-object-versions

The following code example shows how to use `list-object-versions`.

AWS CLI

The following command retrieves version information for an object in a bucket named `my-bucket`:

```
aws s3api list-object-versions --bucket my-bucket --prefix index.html
```

Output:

```

{
  "DeleteMarkers": [
    {
      "Owner": {
        "DisplayName": "my-username",
        "ID":
        "7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
      },
      "IsLatest": true,
      "VersionId": "B2VsEK5saUNNHKc0AJj7hIE86RozToyq",
      "Key": "index.html",
      "LastModified": "2015-11-10T00:57:03.000Z"
    },
    {
      "Owner": {
        "DisplayName": "my-username",

```

```

        "ID":
"7009a8971cd660687538875e7c86c5b672fe116bd438f46db45460ddcd036c32"
    },
    "IsLatest": false,
    "VersionId": ".FLQEZscLIcfxSq.jsFJ.szUkmng2Yw6",
    "Key": "index.html",
    "LastModified": "2015-11-09T23:32:20.000Z"
  }
],
"Versions": [
  {
    "LastModified": "2015-11-10T00:20:11.000Z",
    "VersionId": "Rb_l2T8UHDkFEwCgJjhlGPOZC0qJ.vpD",
    "ETag": "\"0622528de826c0df5db1258a23b80be5\"",
    "StorageClass": "STANDARD",
    "Key": "index.html",
    "Owner": {
      "DisplayName": "my-username",
      "ID":

    "IsLatest": false,
    "Size": 533823
  }
]
}
```

- For API details, see [ListObjectVersions](#) in *AWS CLI Command Reference*.

list-objects-v2

The following code example shows how to use `list-objects-v2`.

AWS CLI

To get a list of objects in a bucket

The following `list-objects-v2` example lists the objects in the specified bucket.

```
aws s3api list-objects-v2 \
  --bucket my-bucket
```

Output:

```
{
  "Contents": [
    {
      "LastModified": "2019-11-05T23:11:50.000Z",
      "ETag": "\"621503c373607d548b37cff8778d992c\"",
      "StorageClass": "STANDARD",
      "Key": "doc1.rtf",
      "Size": 391
    },
    {

    "StorageClass": "STANDARD",
    "Key": "doc4.rtf",
    "Size": 6225
  }
]
}
```

- For API details, see [ListObjectsV2](#) in *AWS CLI Command Reference*.

list-objects

The following code example shows how to use `list-objects`.

AWS CLI

The following example uses the `list-objects` command to display the names of all the objects in the specified bucket:

```
aws s3api list-objects --bucket text-content --query 'Contents[].{Key: Key, Size: Size}'
```

The example uses the `--query` argument to filter the output of `list-objects` down to the key value and size for each object

For more information about objects, see *Working with Amazon S3 Objects in the Amazon S3 Developer Guide*.

- For API details, see [ListObjects](#) in *AWS CLI Command Reference*.

list-parts

The following code example shows how to use `list-parts`.

AWS CLI

The following command lists all of the parts that have been uploaded for a multipart upload with key `multipart/01` in the bucket `my-bucket`:

```
aws s3api list-parts --bucket my-bucket --key 'multipart/01' --upload-id
dfRtDYU0WWCCcH43C3WFbkR0NycyCpTJJvxu2i5GYkZljF.Yxwh6XG7Wfs2vC4to6HiV6Yjlx.cph0gtNBtJ8P3URCS
```

Output:

```
{
  "Owner": {
    "DisplayName": "aws-account-name",
    "ID": "100719349fc3b6dcd7c820a124bf7aec408092c3d7b51b38494939801fc248b"
  },
  "Initiator": {
    "DisplayName": "username",
    "ID": "arn:aws:iam::0123456789012:user/username"
  },
  "Parts": [
    {
      "LastModified": "2015-06-02T18:07:35.000Z",
      "PartNumber": 1,
      "ETag": "\"e868e0f4719e394144ef36531ee6824c\"",
      "Size": 5242880
    },
    {
      "LastModified": "2015-06-02T18:07:42.000Z",
      "PartNumber": 2,
      "ETag": "\"6bb2b12753d66fe86da4998aa33fffb0\"",
      "Size": 5242880
    },
    {
      "LastModified": "2015-06-02T18:07:47.000Z",
      "PartNumber": 3,
      "ETag": "\"d0a0112e841abec9c9ec83406f0159c8\"",
      "Size": 5242880
    }
  ]
}
```

```
"StorageClass": "STANDARD"  
}
```

- For API details, see [ListParts](#) in *AWS CLI Command Reference*.

ls

The following code example shows how to use `ls`.

AWS CLI

Example 1: Listing all user owned buckets

The following `ls` command lists all of the bucket owned by the user. In this example, the user owns the buckets `mybucket` and `mybucket2`. The timestamp is the date the bucket was created, shown in your machine's time zone. This date can change when making changes to your bucket, such as editing its bucket policy. Note if `s3://` is used for the path argument `<S3Uri>`, it will list all of the buckets as well.

```
aws s3 ls
```

Output:

```
2013-07-11 17:08:50 mybucket  
2013-07-24 14:55:44 mybucket2
```

Example 2: Listing all prefixes and objects in a bucket

The following `ls` command lists objects and common prefixes under a specified bucket and prefix. In this example, the user owns the bucket `mybucket` with the objects `test.txt` and `somePrefix/test.txt`. The `LastWriteTime` and `Length` are arbitrary. Note that since the `ls` command has no interaction with the local filesystem, the `s3://` URI scheme is not required to resolve ambiguity and may be omitted.

```
aws s3 ls s3://mybucket
```

Output:

```
PRE somePrefix/
```

```
2013-07-25 17:06:27      88 test.txt
```

Example 3: Listing all prefixes and objects in a specific bucket and prefix

The following `ls` command lists objects and common prefixes under a specified bucket and prefix. However, there are no objects nor common prefixes under the specified bucket and prefix.

```
aws s3 ls s3://mybucket/noExistPrefix
```

Output:

```
None
```

Example 4: Recursively listing all prefixes and objects in a bucket

The following `ls` command will recursively list objects in a bucket. Rather than showing `PRE dirname/` in the output, all the content in a bucket will be listed in order.

```
aws s3 ls s3://mybucket \  
--recursive
```

Output:

```
2013-09-02 21:37:53      10 a.txt  
2013-09-02 21:37:53  2863288 foo.zip  
2013-09-02 21:32:57      23 foo/bar/.baz/a  
2013-09-02 21:32:58      41 foo/bar/.baz/b  
2013-09-02 21:32:57     281 foo/bar/.baz/c  
2013-09-02 21:32:57      73 foo/bar/.baz/d  
2013-09-02 21:32:57     452 foo/bar/.baz/e  
2013-09-02 21:32:57     896 foo/bar/.baz/hooks/bar  
2013-09-02 21:32:57     189 foo/bar/.baz/hooks/foo  
2013-09-02 21:32:57     398 z.txt
```

Example 5: Summarizing all prefixes and objects in a bucket

The following `ls` command demonstrates the same command using the `--human-readable` and `--summarize` options. `--human-readable` displays file size in Bytes/MiB/KiB/GiB/TiB/PiB/EiB. `--summarize` displays the total number of objects and total size at the end of the result listing:

```
aws s3 ls s3://mybucket \  
  --recursive \  
  --human-readable \  
  --summarize
```

Output:

```
2013-09-02 21:37:53  10 Bytes a.txt  
2013-09-02 21:37:53 2.9 MiB foo.zip  
2013-09-02 21:32:57  23 Bytes foo/bar/.baz/a  
2013-09-02 21:32:58  41 Bytes foo/bar/.baz/b  
2013-09-02 21:32:57 281 Bytes foo/bar/.baz/c  
2013-09-02 21:32:57  73 Bytes foo/bar/.baz/d  
2013-09-02 21:32:57 452 Bytes foo/bar/.baz/e  
2013-09-02 21:32:57 896 Bytes foo/bar/.baz/hooks/bar  
2013-09-02 21:32:57 189 Bytes foo/bar/.baz/hooks/foo  
2013-09-02 21:32:57 398 Bytes z.txt  
  
Total Objects: 10  
Total Size: 2.9 MiB
```

Example 6: Listing from an S3 access point

The following `ls` command list objects from access point (myaccesspoint):

```
aws s3 ls s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
```

Output:

```
2013-07-25 17:06:27          PRE somePrefix/  
                   88 test.txt
```

- For API details, see [Ls](#) in *AWS CLI Command Reference*.

mb

The following code example shows how to use `mb`.

AWS CLI

Example 1: Create a bucket

The following `mb` command creates a bucket. In this example, the user makes the bucket `mybucket`. The bucket is created in the region specified in the user's configuration file:

```
aws s3 mb s3://mybucket
```

Output:

```
make_bucket: s3://mybucket
```

Example 2: Create a bucket in the specified region

The following `mb` command creates a bucket in a region specified by the `--region` parameter. In this example, the user makes the bucket `mybucket` in the region `us-west-1`:

```
aws s3 mb s3://mybucket \  
  --region us-west-1
```

Output:

```
make_bucket: s3://mybucket
```

- For API details, see [Mb](#) in *AWS CLI Command Reference*.

mv

The following code example shows how to use `mv`.

AWS CLI

Example 1: Move a local file to the specified bucket

The following `mv` command moves a single file to a specified bucket and key.

```
aws s3 mv test.txt s3://mybucket/test2.txt
```

Output:

```
move: test.txt to s3://mybucket/test2.txt
```

Example 2: Move an object to the specified bucket and key

The following `mv` command moves a single `s3` object to a specified bucket and key.

```
aws s3 mv s3://mybucket/test.txt s3://mybucket/test2.txt
```

Output:

```
move: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

Example 3: Move an S3 object to the local directory

The following `mv` command moves a single object to a specified file locally.

```
aws s3 mv s3://mybucket/test.txt test2.txt
```

Output:

```
move: s3://mybucket/test.txt to test2.txt
```

Example 4: Move an object with its original name to the specified bucket

The following `mv` command moves a single object to a specified bucket while retaining its original name:

```
aws s3 mv s3://mybucket/test.txt s3://mybucket2/
```

Output:

```
move: s3://mybucket/test.txt to s3://mybucket2/test.txt
```

Example 5: Move all objects and prefixes in a bucket to the local directory

When passed with the parameter `--recursive`, the following `mv` command recursively moves all objects under a specified prefix and bucket to a specified directory. In this example, the bucket `mybucket` has the objects `test1.txt` and `test2.txt`.

```
aws s3 mv s3://mybucket . \
```

```
--recursive
```

Output:

```
move: s3://mybucket/test1.txt to test1.txt
move: s3://mybucket/test2.txt to test2.txt
```

Example 6: Move all objects and prefixes in a bucket to the local directory, except ``.jpg`` files

When passed with the parameter `--recursive`, the following `mv` command recursively moves all files under a specified directory to a specified bucket and prefix while excluding some files by using an `--exclude` parameter. In this example, the directory `myDir` has the files `test1.txt` and `test2.jpg`.

```
aws s3 mv myDir s3://mybucket/ \
  --recursive \
  --exclude "*.jpg"
```

Output:

```
move: myDir/test1.txt to s3://mybucket2/test1.txt
```

Example 7: Move all objects and prefixes in a bucket to the local directory, except specified prefix

When passed with the parameter `--recursive`, the following `mv` command recursively moves all objects under a specified bucket to another bucket while excluding some objects by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `another/test1.txt`.

```
aws s3 mv s3://mybucket/ s3://mybucket2/ \
  --recursive \
  --exclude "mybucket/another/*"
```

Output:

```
move: s3://mybucket/test1.txt to s3://mybucket2/test1.txt
```

Example 8: Move an object to the specified bucket and set the ACL

The following `mv` command moves a single object to a specified bucket and key while setting the ACL to `public-read-write`.

```
aws s3 mv s3://mybucket/test.txt s3://mybucket/test2.txt \  
--acl public-read-write
```

Output:

```
move: s3://mybucket/test.txt to s3://mybucket/test2.txt
```

Example 9: Move a local file to the specified bucket and grant permissions

The following `mv` command illustrates the use of the `--grants` option to grant read access to all users and full control to a specific user identified by their email address.

```
aws s3 mv file.txt s3://mybucket/ \  
--grants read=uri=http://acs.amazonaws.com/groups/global/AllUsers  
full=emailaddress=user@example.com
```

Output:

```
move: file.txt to s3://mybucket/file.txt
```

Example 10: Move a file to an S3 access point

The following `mv` command moves a single file named `mydoc.txt` to the access point named `myaccesspoint` at the key named `mykey`.

```
aws s3 mv mydoc.txt s3://arn:aws:s3:us-west-2:123456789012:accesspoint/  
myaccesspoint/mykey
```

Output:

```
move: mydoc.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/  
mykey
```

- For API details, see [Mv](#) in *AWS CLI Command Reference*.

presign

The following code example shows how to use presign.

AWS CLI

Example 1: To create a pre-signed URL with the default one hour lifetime that links to an object in an S3 bucket

The following presign command generates a pre-signed URL for a specified bucket and key that is valid for one hour.

```
aws s3 presign s3://DOC-EXAMPLE-BUCKET/test2.txt
```

Output:

```
https://DOC-EXAMPLE-BUCKET.s3.us-west-2.amazonaws.com/key?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAEXAMPLE123456789%2F20210621%2Fus-west-2%2Fs3%2Faws4_request&X-Amz-Date=20210621T041609Z&X-Amz-Expires=3600&X-Amz-SignedHeaders=host&X-Amz-Signature=EXAMBLE1234494d5fba3fed607f98018e1dfc62e2529ae96d844123456
```

Example 2: To create a pre-signed URL with a custom lifetime that links to an object in an S3 bucket

The following presign command generates a pre-signed URL for a specified bucket and key that is valid for one week.

```
aws s3 presign s3://DOC-EXAMPLE-BUCKET/test2.txt \
  --expires-in 604800
```

Output:

```
https://DOC-EXAMPLE-BUCKET.s3.us-west-2.amazonaws.com/key?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-Credential=AKIAEXAMPLE123456789%2F20210621%2Fus-west-2%2Fs3%2Faws4_request&X-Amz-Date=20210621T041609Z&X-Amz-Expires=604800&X-Amz-SignedHeaders=host&X-Amz-Signature=EXAMBLE1234494d5fba3fed607f98018e1dfc62e2529ae96d844123456
```

For more information, see [Share an Object with Others](#) in the *S3 Developer Guide* guide.

- For API details, see [Presign](#) in *AWS CLI Command Reference*.

put-bucket-accelerate-configuration

The following code example shows how to use `put-bucket-accelerate-configuration`.

AWS CLI

To set the accelerate configuration of a bucket

The following `put-bucket-accelerate-configuration` example enables the accelerate configuration for the specified bucket.

```
aws s3api put-bucket-accelerate-configuration \  
  --bucket my-bucket \  
  --accelerate-configuration Status=Enabled
```

This command produces no output.

- For API details, see [PutBucketAccelerateConfiguration](#) in *AWS CLI Command Reference*.

put-bucket-acl

The following code example shows how to use `put-bucket-acl`.

AWS CLI

This example grants `full` control to two AWS users (`user1@example.com` and `user2@example.com`) and read permission to everyone:

```
aws s3api put-bucket-acl --bucket MyBucket --grant-full-control  
  emailaddress=user1@example.com,emailaddress=user2@example.com --grant-read  
  uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See <http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html> for details on custom ACLs (the `s3api` ACL commands, such as `put-bucket-acl`, use the same shorthand argument notation).

- For API details, see [PutBucketAcl](#) in *AWS CLI Command Reference*.

put-bucket-analytics-configuration

The following code example shows how to use `put-bucket-analytics-configuration`.

AWS CLI

To sets an analytics configuration for the bucket

The following `put-bucket-analytics-configuration` example configures analytics for the specified bucket.

```
aws s3api put-bucket-analytics-configuration \  
  --bucket my-bucket --id 1 \  
  --analytics-configuration '{"Id": "1","StorageClassAnalysis": {}}'
```

This command produces no output.

- For API details, see [PutBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

put-bucket-cors

The following code example shows how to use `put-bucket-cors`.

AWS CLI

The following example enables PUT, POST, and DELETE requests from *www.example.com*, and enables GET requests from any domain:

```
aws s3api put-bucket-cors --bucket MyBucket --cors-configuration file://cors.json  
  
cors.json:  
{  
  "CORSRules": [  
    {  
      "AllowedOrigins": ["http://www.example.com"],  
      "AllowedHeaders": ["*"],  
      "AllowedMethods": ["PUT", "POST", "DELETE"],  
      "MaxAgeSeconds": 3000,  
      "ExposeHeaders": ["x-amz-server-side-encryption"]  
    },  
    {  
      "AllowedOrigins": ["*"],  
      "AllowedHeaders": ["Authorization"],  
      "AllowedMethods": ["GET"],  
      "MaxAgeSeconds": 3000  
    }  
  ]  
}
```

```
]
}
```

- For API details, see [PutBucketCors](#) in *AWS CLI Command Reference*.

put-bucket-encryption

The following code example shows how to use `put-bucket-encryption`.

AWS CLI

To configure server-side encryption for a bucket

The following `put-bucket-encryption` example sets AES256 encryption as the default for the specified bucket.

```
aws s3api put-bucket-encryption \
  --bucket my-bucket \
  --server-side-encryption-configuration '{"Rules":
  [{"ApplyServerSideEncryptionByDefault": {"SSEAlgorithm": "AES256"}}]}'
```

This command produces no output.

- For API details, see [PutBucketEncryption](#) in *AWS CLI Command Reference*.

put-bucket-intelligent-tiering-configuration

The following code example shows how to use `put-bucket-intelligent-tiering-configuration`.

AWS CLI

To update an S3 Intelligent-Tiering configuration on a bucket

The following `put-bucket-intelligent-tiering-configuration` example updates an S3 Intelligent-Tiering configuration, named `ExampleConfig`, on a bucket. The configuration will transition objects that have not been accessed under the prefix `images` to Archive Access after 90 days and Deep Archive Access after 180 days.

```
aws s3api put-bucket-intelligent-tiering-configuration \
```

```
--bucket DOC-EXAMPLE-BUCKET \  
--id "ExampleConfig" \  
--intelligent-tiering-configuration file://intelligent-tiering-  
configuration.json
```

Contents of `intelligent-tiering-configuration.json`:

```
{  
  "Id": "ExampleConfig",  
  "Status": "Enabled",  
  "Filter": {  
    "Prefix": "images"  
  },  
  "Tierings": [  
    {  
      "Days": 90,  
      "AccessTier": "ARCHIVE_ACCESS"  
    },  
    {  
      "Days": 180,  
      "AccessTier": "DEEP_ARCHIVE_ACCESS"  
    }  
  ]  
}
```

This command produces no output.

For more information, see [Setting Object Ownership on an existing bucket](#) in the *Amazon S3 User Guide*.

- For API details, see [PutBucketIntelligentTieringConfiguration](#) in *AWS CLI Command Reference*.

put-bucket-inventory-configuration

The following code example shows how to use `put-bucket-inventory-configuration`.

AWS CLI

Example 1: To set an inventory configuration for a bucket

The following `put-bucket-inventory-configuration` example sets a weekly ORC-formatted inventory report for the bucket `my-bucket`.

```
aws s3api put-bucket-inventory-configuration \  
  --bucket my-bucket \  
  --id 1 \  
  --inventory-configuration '{"Destination": { "S3BucketDestination":  
  { "AccountId": "123456789012", "Bucket": "arn:aws:s3:::my-bucket", "Format":  
  "ORC" }}, "IsEnabled": true, "Id": "1", "IncludedObjectVersions": "Current",  
  "Schedule": { "Frequency": "Weekly" } }'
```

This command produces no output.

Example 2: To set an inventory configuration for a bucket

The following `put-bucket-inventory-configuration` example sets a daily CSV-formatted inventory report for the bucket `my-bucket`.

```
aws s3api put-bucket-inventory-configuration \  
  --bucket my-bucket \  
  --id 2 \  
  --inventory-configuration '{"Destination": { "S3BucketDestination":  
  { "AccountId": "123456789012", "Bucket": "arn:aws:s3:::my-bucket", "Format":  
  "CSV" }}, "IsEnabled": true, "Id": "2", "IncludedObjectVersions": "Current",  
  "Schedule": { "Frequency": "Daily" } }'
```

This command produces no output.

- For API details, see [PutBucketInventoryConfiguration](#) in *AWS CLI Command Reference*.

put-bucket-lifecycle-configuration

The following code example shows how to use `put-bucket-lifecycle-configuration`.

AWS CLI

The following command applies a lifecycle configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-lifecycle-configuration --bucket my-bucket --lifecycle-  
configuration file://lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```
{
```

```
"Rules": [
  {
    "ID": "Move rotated logs to Glacier",
    "Prefix": "rotated/",
    "Status": "Enabled",
    "Transitions": [
      {
        "Date": "2015-11-10T00:00:00.000Z",
        "StorageClass": "GLACIER"
      }
    ]
  },
  {
    "Status": "Enabled",
    "Prefix": "",
    "NoncurrentVersionTransitions": [
      {
        "NoncurrentDays": 2,
        "StorageClass": "GLACIER"
      }
    ],
    "ID": "Move old versions to Glacier"
  }
]
```

The first rule moves files with the prefix `rotated` to Glacier on the specified date. The second rule moves old object versions to Glacier when they are no longer current. For information on acceptable timestamp formats, see [Specifying Parameter Values in the AWS CLI User Guide](#).

- For API details, see [PutBucketLifecycleConfiguration](#) in *AWS CLI Command Reference*.

put-bucket-lifecycle

The following code example shows how to use `put-bucket-lifecycle`.

AWS CLI

The following command applies a lifecycle configuration to the bucket `my-bucket`:

```
aws s3api put-bucket-lifecycle --bucket my-bucket --lifecycle-configuration file://lifecycle.json
```

The file `lifecycle.json` is a JSON document in the current folder that specifies two rules:

```
{
  "Rules": [
    {
      "ID": "Move to Glacier after sixty days (objects in logs/2015/)",
      "Prefix": "logs/2015/",
      "Status": "Enabled",
      "Transition": {
        "Days": 60,
        "StorageClass": "GLACIER"
      }
    },
    {
      "Expiration": {
        "Date": "2016-01-01T00:00:00.000Z"
      },
      "ID": "Delete 2014 logs in 2016.",
      "Prefix": "logs/2014/",
      "Status": "Enabled"
    }
  ]
}
```

The first rule moves files to Amazon Glacier after sixty days. The second rule deletes files from Amazon S3 on the specified date. For information on acceptable timestamp formats, see *Specifying Parameter Values in the AWS CLI User Guide*.

Each rule in the above example specifies a policy (Transition or Expiration) and file prefix (folder name) to which it applies. You can also create a rule that applies to an entire bucket by specifying a blank prefix:

```
{
  "Rules": [
    {
      "ID": "Move to Glacier after sixty days (all objects in bucket)",
      "Prefix": "",
      "Status": "Enabled",
      "Transition": {
        "Days": 60,
        "StorageClass": "GLACIER"
      }
    }
  ]
}
```

```
    }  
  ]  
}
```

- For API details, see [PutBucketLifecycle](#) in *AWS CLI Command Reference*.

put-bucket-logging

The following code example shows how to use `put-bucket-logging`.

AWS CLI

Example 1: To set bucket policy logging

The following `put-bucket-logging` example sets the logging policy for *MyBucket*. First, grant the logging service principal permission in your bucket policy using the `put-bucket-policy` command.

```
aws s3api put-bucket-policy \  
  --bucket MyBucket \  
  --policy file://policy.json
```

Contents of `policy.json`:

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Sid": "S3ServerAccessLogsPolicy",  
      "Effect": "Allow",  
      "Principal": {"Service": "logging.s3.amazonaws.com"},  
      "Action": "s3:PutObject",  
      "Resource": "arn:aws:s3:::MyBucket/Logs/*",  
      "Condition": {  
        "ArnLike": {"aws:SourceARN": "arn:aws:s3:::SOURCE-BUCKET-NAME"},  
        "StringEquals": {"aws:SourceAccount": "SOURCE-AWS-ACCOUNT-ID"}  
      }  
    }  
  ]  
}
```

To apply the logging policy, use `put-bucket-logging`.

```
aws s3api put-bucket-logging \  
  --bucket MyBucket \  
  --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{  
  "LoggingEnabled": {  
    "TargetBucket": "MyBucket",  
    "TargetPrefix": "Logs/"  
  }  
}
```

The `put-bucket-policy` command is required to grant `s3:PutObject` permissions to the logging service principal.

For more information, see [Amazon S3 Server Access Logging](#) in the *Amazon S3 User Guide*.

Example 2: To set a bucket policy for logging access to only a single user

The following `put-bucket-logging` example sets the logging policy for *MyBucket*. The AWS user *bob@example.com* will have full control over the log files, and no one else has any access. First, grant S3 permission with `put-bucket-acl`.

```
aws s3api put-bucket-acl \  
  --bucket MyBucket \  
  --grant-write URI=http://acs.amazonaws.com/groups/s3/LogDelivery \  
  --grant-read-acp URI=http://acs.amazonaws.com/groups/s3/LogDelivery
```

Then apply the logging policy using `put-bucket-logging`.

```
aws s3api put-bucket-logging \  
  --bucket MyBucket \  
  --bucket-logging-status file://logging.json
```

Contents of `logging.json`:

```
{  
  "LoggingEnabled": {  
    "TargetBucket": "MyBucket",  
    "TargetPrefix": "MyBucketLogs/",  
  }  
}
```

```
    "TargetGrants": [
      {
        "Grantee": {
          "Type": "AmazonCustomerByEmail",
          "EmailAddress": "bob@example.com"
        },
        "Permission": "FULL_CONTROL"
      }
    ]
  }
}
```

the `put-bucket-acl` command is required to grant S3's log delivery system the necessary permissions (write and read-acp permissions).

For more information, see [Amazon S3 Server Access Logging](#) in the *Amazon S3 Developer Guide*.

- For API details, see [PutBucketLogging](#) in *AWS CLI Command Reference*.

put-bucket-metrics-configuration

The following code example shows how to use `put-bucket-metrics-configuration`.

AWS CLI

To set a metrics configuration for a bucket

The following `put-bucket-metrics-configuration` example sets a metric configuration with ID 123 for the specified bucket.

```
aws s3api put-bucket-metrics-configuration \
  --bucket my-bucket \
  --id 123 \
  --metrics-configuration '{"Id": "123", "Filter": {"Prefix": "logs"}}'
```

This command produces no output.

- For API details, see [PutBucketMetricsConfiguration](#) in *AWS CLI Command Reference*.

put-bucket-notification-configuration

The following code example shows how to use `put-bucket-notification-configuration`.

AWS CLI

To enable the specified notifications to a bucket

The following `put-bucket-notification-configuration` example applies a notification configuration to a bucket named `my-bucket`. The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor.

```
aws s3api put-bucket-notification-configuration \  
  --bucket my-bucket \  
  --notification-configuration file://notification.json
```

Contents of `notification.json`:

```
{  
  "TopicConfigurations": [  
    {  
      "TopicArn": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic",  
      "Events": [  
        "s3:ObjectCreated:*"  
      ]  
    }  
  ]  
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it.

```
{  
  "Version": "2008-10-17",  
  "Id": "example-ID",  
  "Statement": [  
    {  
      "Sid": "example-statement-ID",  
      "Effect": "Allow",  
      "Principal": {  
        "Service": "s3.amazonaws.com"  
      },  
      "Action": [  
        "SNS:Publish"  
      ],  
      "Resource": "arn:aws:sns:us-west-2:123456789012::s3-notification-topic",  
      "Condition": {
```

```

        "ArnLike": {
            "aws:SourceArn": "arn:aws:s3:*:*:my-bucket"
        }
    }
}
]
}

```

- For API details, see [PutBucketNotificationConfiguration](#) in *AWS CLI Command Reference*.

put-bucket-notification

The following code example shows how to use `put-bucket-notification`.

AWS CLI

The applies a notification configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-notification --bucket my-bucket --notification-configuration
file://notification.json
```

The file `notification.json` is a JSON document in the current folder that specifies an SNS topic and an event type to monitor:

```
{
  "TopicConfiguration": {
    "Event": "s3:ObjectCreated:*",
    "Topic": "arn:aws:sns:us-west-2:123456789012:s3-notification-topic"
  }
}
```

The SNS topic must have an IAM policy attached to it that allows Amazon S3 to publish to it:

```
{
  "Version": "2008-10-17",
  "Id": "example-ID",
  "Statement": [
    {
      "Sid": "example-statement-ID",
      "Effect": "Allow",
      "Principal": {
```

```
    "Service": "s3.amazonaws.com"
  },
  "Action": [
    "SNS:Publish"
  ],
  "Resource": "arn:aws:sns:us-west-2:123456789012:my-bucket",
  "Condition": {
    "ArnLike": {
      "aws:SourceArn": "arn:aws:s3:*:*:my-bucket"
    }
  }
}
```

- For API details, see [PutBucketNotification](#) in *AWS CLI Command Reference*.

put-bucket-ownership-controls

The following code example shows how to use `put-bucket-ownership-controls`.

AWS CLI

To update the bucket ownership settings of a bucket

The following `put-bucket-ownership-controls` example updates the bucket ownership settings of a bucket.

```
aws s3api put-bucket-ownership-controls \
  --bucket DOC-EXAMPLE-BUCKET \
  --ownership-controls="Rules=[{ObjectOwnership=BucketOwnerEnforced}]"
```

This command produces no output.

For more information, see [Setting Object Ownership on an existing bucket](#) in the *Amazon S3 User Guide*.

- For API details, see [PutBucketOwnershipControls](#) in *AWS CLI Command Reference*.

put-bucket-policy

The following code example shows how to use `put-bucket-policy`.

AWS CLI

This example allows all users to retrieve any object in *MyBucket* except those in the *MySecretFolder*. It also grants put and delete permission to the root user of the AWS account 1234-5678-9012:

```
aws s3api put-bucket-policy --bucket MyBucket --policy file://policy.json
```

```
policy.json:
```

```
{
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": "*",
      "Action": "s3:GetObject",
      "Resource": "arn:aws:s3:::MyBucket/*"
    },
    {
      "Effect": "Deny",
      "Principal": "*",
      "Action": "s3:GetObject",
      "Resource": "arn:aws:s3:::MyBucket/MySecretFolder/*"
    },
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:root"
      },
      "Action": [
        "s3:DeleteObject",
        "s3:PutObject"
      ],
      "Resource": "arn:aws:s3:::MyBucket/*"
    }
  ]
}
```

- For API details, see [PutBucketPolicy](#) in *AWS CLI Command Reference*.

put-bucket-replication

The following code example shows how to use put-bucket-replication.

AWS CLI

To configure replication for an S3 bucket

The following `put-bucket-replication` example applies a replication configuration to the specified S3 bucket.

```
aws s3api put-bucket-replication \  
  --bucket AWSDOC-EXAMPLE-BUCKET1 \  
  --replication-configuration file://replication.json
```

Contents of `replication.json`:

```
{  
  "Role": "arn:aws:iam::123456789012:role/s3-replication-role",  
  "Rules": [  
    {  
      "Status": "Enabled",  
      "Priority": 1,  
      "DeleteMarkerReplication": { "Status": "Disabled" },  
      "Filter" : { "Prefix": ""},  
      "Destination": {  
        "Bucket": "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET2"  
      }  
    }  
  ]  
}
```

The destination bucket must have versioning enabled. The specified role must have permission to write to the destination bucket and have a trust relationship that allows Amazon S3 to assume the role.

Example role permission policy:

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": [  
        "s3:GetReplicationConfiguration",
```

```

        "s3:ListBucket"
    ],
    "Resource": [
        "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET1"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "s3:GetObjectVersion",
        "s3:GetObjectVersionAcl",
        "s3:GetObjectVersionTagging"
    ],
    "Resource": [
        "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET1/*"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "s3:ReplicateObject",
        "s3:ReplicateDelete",
        "s3:ReplicateTags"
    ],
    "Resource": "arn:aws:s3:::AWSDOC-EXAMPLE-BUCKET2/*"
}
]
}

```

Example trust relationship policy:

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "s3.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}

```

This command produces no output.

For more information, see [This is the topic title](#) in the *Amazon Simple Storage Service Console User Guide*.

- For API details, see [PutBucketReplication](#) in *AWS CLI Command Reference*.

put-bucket-request-payment

The following code example shows how to use `put-bucket-request-payment`.

AWS CLI

Example 1: To enable `requester pays` configuration for a bucket

The following `put-bucket-request-payment` example enables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \  
  --bucket my-bucket \  
  --request-payment-configuration '{"Payer":"Requester}"'
```

This command produces no output.

Example 2: To disable `requester pays` configuration for a bucket

The following `put-bucket-request-payment` example disables `requester pays` for the specified bucket.

```
aws s3api put-bucket-request-payment \  
  --bucket my-bucket \  
  --request-payment-configuration '{"Payer":"BucketOwner}"'
```

This command produces no output.

- For API details, see [PutBucketRequestPayment](#) in *AWS CLI Command Reference*.

put-bucket-tagging

The following code example shows how to use `put-bucket-tagging`.

AWS CLI

The following command applies a tagging configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-tagging --bucket my-bucket --tagging file://tagging.json
```

The file `tagging.json` is a JSON document in the current folder that specifies tags:

```
{
  "TagSet": [
    {
      "Key": "organization",
      "Value": "marketing"
    }
  ]
}
```

Or apply a tagging configuration to `my-bucket` directly from the command line:

```
aws s3api put-bucket-tagging --bucket my-bucket --tagging
'TagSet=[{Key=organization,Value=marketing}]'
```

- For API details, see [PutBucketTagging](#) in *AWS CLI Command Reference*.

put-bucket-versioning

The following code example shows how to use `put-bucket-versioning`.

AWS CLI

The following command enables versioning on a bucket named `my-bucket`:

```
aws s3api put-bucket-versioning --bucket my-bucket --versioning-configuration
Status=Enabled
```

The following command enables versioning, and uses an mfa code

```
aws s3api put-bucket-versioning --bucket my-bucket --versioning-configuration
Status=Enabled --mfa "SERIAL 123456"
```

- For API details, see [PutBucketVersioning](#) in *AWS CLI Command Reference*.

put-bucket-website

The following code example shows how to use `put-bucket-website`.

AWS CLI

The applies a static website configuration to a bucket named `my-bucket`:

```
aws s3api put-bucket-website --bucket my-bucket --website-configuration file://
website.json
```

The file `website.json` is a JSON document in the current folder that specifies index and error pages for the website:

```
{
  "IndexDocument": {
    "Suffix": "index.html"
  },
  "ErrorDocument": {
    "Key": "error.html"
  }
}
```

- For API details, see [PutBucketWebsite](#) in *AWS CLI Command Reference*.

put-object-acl

The following code example shows how to use `put-object-acl`.

AWS CLI

The following command grants `full control` to two AWS users (`user1@example.com` and `user2@example.com`) and `read` permission to everyone:

```
aws s3api put-object-acl --bucket MyBucket --key file.txt --grant-full-control
emailaddress=user1@example.com,emailaddress=user2@example.com --grant-read
uri=http://acs.amazonaws.com/groups/global/AllUsers
```

See <http://docs.aws.amazon.com/AmazonS3/latest/API/RESTBucketPUTacl.html> for details on custom ACLs (the s3api ACL commands, such as `put-object-acl`, use the same shorthand argument notation).

- For API details, see [PutObjectAcl](#) in *AWS CLI Command Reference*.

put-object-legal-hold

The following code example shows how to use `put-object-legal-hold`.

AWS CLI

To apply a Legal Hold to an object

The following `put-object-legal-hold` example sets a Legal Hold on the object `doc1.rtf`.

```
aws s3api put-object-legal-hold \  
  --bucket my-bucket-with-object-lock \  
  --key doc1.rtf \  
  --legal-hold Status=ON
```

This command produces no output.

- For API details, see [PutObjectLegalHold](#) in *AWS CLI Command Reference*.

put-object-lock-configuration

The following code example shows how to use `put-object-lock-configuration`.

AWS CLI

To set an object lock configuration on a bucket

The following `put-object-lock-configuration` example sets a 50-day object lock on the specified bucket.

```
aws s3api put-object-lock-configuration \  
  --bucket my-bucket-with-object-lock \  
  --object-lock-configuration '{ "ObjectLockEnabled": "Enabled", "Rule":  
  { "DefaultRetention": { "Mode": "COMPLIANCE", "Days": 50 } } }'
```

This command produces no output.

- For API details, see [PutObjectLockConfiguration](#) in *AWS CLI Command Reference*.

put-object-retention

The following code example shows how to use `put-object-retention`.

AWS CLI

To set an object retention configuration for an object

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```
aws s3api put-object-retention \  
  --bucket my-bucket-with-object-lock \  
  --key doc1.rtf \  
  --retention '{"Mode": "GOVERNANCE", "RetainUntilDate": "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see [PutObjectRetention](#) in *AWS CLI Command Reference*.

put-object-tagging

The following code example shows how to use `put-object-tagging`.

AWS CLI

To set a tag on an object

The following `put-object-tagging` example sets a tag with the key `designation` and the value `confidential` on the specified object.

```
aws s3api put-object-tagging \  
  --bucket my-bucket \  
  --key doc1.rtf \  
  --tagging '{"TagSet": [{ "Key": "designation", "Value": "confidential" }]}'
```

This command produces no output.

The following `put-object-tagging` example sets multiple tags sets on the specified object.

```
aws s3api put-object-tagging \  
  --bucket my-bucket-example \  
  --key doc3.rtf \  
  --tagging '{"TagSet": [{ "Key": "designation", "Value": "confidential" },  
  { "Key": "department", "Value": "finance" }, { "Key": "team", "Value":  
  "payroll" } ]}'
```

This command produces no output.

- For API details, see [PutObjectTagging](#) in *AWS CLI Command Reference*.

put-object

The following code example shows how to use `put-object`.

AWS CLI

The following example uses the `put-object` command to upload an object to Amazon S3:

```
aws s3api put-object --bucket text-content --key dir-1/my_images.tar.bz2 --body  
my_images.tar.bz2
```

The following example shows an upload of a video file (The video file is specified using Windows file system syntax.):

```
aws s3api put-object --bucket text-content --key dir-1/big-video-file.mp4 --body e:  
\media\videos\f-sharp-3-data-services.mp4
```

For more information about uploading objects, see *Uploading Objects in the Amazon S3 Developer Guide*.

- For API details, see [PutObject](#) in *AWS CLI Command Reference*.

put-public-access-block

The following code example shows how to use `put-public-access-block`.

AWS CLI

To set the block public access configuration for a bucket

The following `put-public-access-block` example sets a restrictive block public access configuration for the specified bucket.

```
aws s3api put-public-access-block \  
  --bucket my-bucket \  
  --public-access-block-configuration  
  "BlockPublicAcls=true,IgnorePublicAcls=true,BlockPublicPolicy=true,RestrictPublicBuckets=true"
```

This command produces no output.

- For API details, see [PutPublicAccessBlock](#) in *AWS CLI Command Reference*.

rb

The following code example shows how to use `rb`.

AWS CLI

Example 1: Delete a bucket

The following `rb` command removes a bucket. In this example, the user's bucket is `mybucket`. Note that the bucket must be empty in order to remove:

```
aws s3 rb s3://mybucket
```

Output:

```
remove_bucket: mybucket
```

Example 2: Force delete a bucket

The following `rb` command uses the `--force` parameter to first remove all of the objects in the bucket and then remove the bucket itself. In this example, the user's bucket is `mybucket` and the objects in `mybucket` are `test1.txt` and `test2.txt`:

```
aws s3 rb s3://mybucket \  
  --force
```

Output:

```
delete: s3://mybucket/test1.txt
```

```
delete: s3://mybucket/test2.txt
remove_bucket: mybucket
```

- For API details, see [Rb](#) in *AWS CLI Command Reference*.

restore-object

The following code example shows how to use `restore-object`.

AWS CLI

To create a restore request for an object

The following `restore-object` example restores the specified Amazon S3 Glacier object for the bucket `my-glacier-bucket` for 10 days.

```
aws s3api restore-object \
  --bucket my-glacier-bucket \
  --key doc1.rtf \
  --restore-request Days=10
```

This command produces no output.

- For API details, see [RestoreObject](#) in *AWS CLI Command Reference*.

rm

The following code example shows how to use `rm`.

AWS CLI

Example 1: Delete an S3 object

The following `rm` command deletes a single S3 object:

```
aws s3 rm s3://mybucket/test2.txt
```

Output:

```
delete: s3://mybucket/test2.txt
```

Example 2: Delete all contents in a bucket

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive`. In this example, the bucket `mybucket` contains the objects `test1.txt` and `test2.txt`:

```
aws s3 rm s3://mybucket \  
  --recursive
```

Output:

```
delete: s3://mybucket/test1.txt  
delete: s3://mybucket/test2.txt
```

Example 3: Delete all contents in a bucket, except ``.jpg`` files

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive` while excluding some objects by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `test2.jpg`:

```
aws s3 rm s3://mybucket/ \  
  --recursive \  
  --exclude "*.jpg"
```

Output:

```
delete: s3://mybucket/test1.txt
```

Example 4: Delete all contents in a bucket, except objects under the specified prefix

The following `rm` command recursively deletes all objects under a specified bucket and prefix when passed with the parameter `--recursive` while excluding all objects under a particular prefix by using an `--exclude` parameter. In this example, the bucket `mybucket` has the objects `test1.txt` and `another/test.txt`:

```
aws s3 rm s3://mybucket/ \  
  --recursive \  
  --exclude another/
```

```
--exclude "another/*"
```

Output:

```
delete: s3://mybucket/test1.txt
```

Example 5: Delete an object from an S3 access point

The following `rm` command deletes a single object (`mykey`) from the access point (`myaccesspoint`). :: The following `rm` command deletes a single object (`mykey`) from the access point (`myaccesspoint`).

```
aws s3 rm s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey
```

Output:

```
delete: s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/mykey
```

- For API details, see [Rm](#) in *AWS CLI Command Reference*.

select-object-content

The following code example shows how to use `select-object-content`.

AWS CLI

To filter the contents of an Amazon S3 object based on an SQL statement

The following `select-object-content` example filters the object `my-data-file.csv` with the specified SQL statement and sends output to a file.

```
aws s3api select-object-content \  
  --bucket my-bucket \  
  --key my-data-file.csv \  
  --expression "select * from s3object limit 100" \  
  --expression-type 'SQL' \  
  --input-serialization '{"CSV": {}, "CompressionType": "NONE"}' \  
  --output-serialization '{"CSV": {}}' "output.csv"
```

This command produces no output.

- For API details, see [SelectObjectContent](#) in *AWS CLI Command Reference*.

sync

The following code example shows how to use sync.

AWS CLI

Example 1: Sync all local objects to the specified bucket

The following sync command syncs objects from a local directory to the specified prefix and bucket by uploading the local files to S3. A local file will require uploading if the size of the local file is different than the size of the S3 object, the last modified time of the local file is newer than the last modified time of the S3 object, or the local file does not exist under the specified bucket and prefix. In this example, the user syncs the bucket mybucket to the local current directory. The local current directory contains the files test.txt and test2.txt. The bucket mybucket contains no objects.

```
aws s3 sync . s3://mybucket
```

Output:

```
upload: test.txt to s3://mybucket/test.txt
upload: test2.txt to s3://mybucket/test2.txt
```

Example 2: Sync all S3 objects from the specified S3 bucket to another bucket

The following sync command syncs objects under a specified prefix and bucket to objects under another specified prefix and bucket by copying S3 objects. An S3 object will require copying if the sizes of the two S3 objects differ, the last modified time of the source is newer than the last modified time of the destination, or the S3 object does not exist under the specified bucket and prefix destination.

In this example, the user syncs the bucket mybucket to the bucket mybucket2. The bucket mybucket contains the objects test.txt and test2.txt. The bucket mybucket2 contains no objects:

```
aws s3 sync s3://mybucket s3://mybucket2
```

Output:

```
copy: s3://mybucket/test.txt to s3://mybucket2/test.txt
copy: s3://mybucket/test2.txt to s3://mybucket2/test2.txt
```

Example 3: Sync all S3 objects from the specified S3 bucket to the local directory

The following sync command syncs files from the specified S3 bucket to the local directory by downloading S3 objects. An S3 object will require downloading if the size of the S3 object differs from the size of the local file, the last modified time of the S3 object is newer than the last modified time of the local file, or the S3 object does not exist in the local directory. Take note that when objects are downloaded from S3, the last modified time of the local file is changed to the last modified time of the S3 object. In this example, the user syncs the bucket mybucket to the current local directory. The bucket mybucket contains the objects test.txt and test2.txt. The current local directory has no files:

```
aws s3 sync s3://mybucket .
```

Output:

```
download: s3://mybucket/test.txt to test.txt
download: s3://mybucket/test2.txt to test2.txt
```

Example 4: Sync all local objects to the specified bucket and delete all files that do not match

The following sync command syncs objects under a specified prefix and bucket to files in a local directory by uploading the local files to S3. Because of the --delete parameter, any files existing under the specified prefix and bucket but not existing in the local directory will be deleted. In this example, the user syncs the bucket mybucket to the local current directory. The local current directory contains the files test.txt and test2.txt. The bucket mybucket contains the object test3.txt:

```
aws s3 sync . s3://mybucket \
  --delete
```

Output:

```
upload: test.txt to s3://mybucket/test.txt
```

```
upload: test2.txt to s3://mybucket/test2.txt
delete: s3://mybucket/test3.txt
```

Example 5: Sync all local objects to the specified bucket except ``.jpg`` files

The following sync command syncs objects under a specified prefix and bucket to files in a local directory by uploading the local files to S3. Because of the `--exclude` parameter, all files matching the pattern existing both in S3 and locally will be excluded from the sync. In this example, the user syncs the bucket `mybucket` to the local current directory. The local current directory contains the files `test.jpg` and `test2.txt`. The bucket `mybucket` contains the object `test.jpg` of a different size than the local `test.jpg`:

```
aws s3 sync . s3://mybucket \
  --exclude "*.jpg"
```

Output:

```
upload: test2.txt to s3://mybucket/test2.txt
```

Example 6: Sync all local objects to the specified bucket except ``.jpg`` files

The following sync command syncs files under a local directory to objects under a specified prefix and bucket by downloading S3 objects. This example uses the `--exclude` parameter flag to exclude a specified directory and S3 prefix from the sync command. In this example, the user syncs the local current directory to the bucket `mybucket`. The local current directory contains the files `test.txt` and `another/test2.txt`. The bucket `mybucket` contains the objects `another/test5.txt` and `test1.txt`:

```
aws s3 sync s3://mybucket/ . \
  --exclude "*another/*"
```

Output:

```
download: s3://mybucket/test1.txt to test1.txt
```

Example 7: Sync all objects between buckets in different regions

The following sync command syncs files between two buckets in different regions:

```
aws s3 sync s3://my-us-west-2-bucket s3://my-us-east-1-bucket \  
  --source-region us-west-2 \  
  --region us-east-1
```

Output:

```
download: s3://my-us-west-2-bucket/test1.txt to s3://my-us-east-1-bucket/test1.txt
```

Example 8: Sync to an S3 access point

The following sync command syncs the current directory to the access point (myaccesspoint):

```
aws s3 sync . s3://arn:aws:s3:us-west-2:123456789012:accesspoint/myaccesspoint/
```

Output:

```
upload: test.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/  
myaccesspoint/test.txt  
upload: test2.txt to s3://arn:aws:s3:us-west-2:123456789012:accesspoint/  
myaccesspoint/test2.txt
```

- For API details, see [Sync](#) in *AWS CLI Command Reference*.

upload-part-copy

The following code example shows how to use upload-part-copy.

AWS CLI

To upload part of an object by copying data from an existing object as the data source

The following upload-part-copy example uploads a part by copying data from an existing object as a data source.

```
aws s3api upload-part-copy \  
  --bucket my-bucket \  
  --key "Map_Data_June.mp4" \  
  --copy-source "my-bucket/copy_of_Map_Data_June.mp4" \  
  --part-number 1 \  
  --
```

```
--upload-id
"bq0tdE1CDpWQYRPLHuNG50xAT6pA5D.m_RiBy0gg0H6b13pVRY7QjvL1f75iFdJqp_2wztk5hvpUM2SesXgrzbehG5"
```

Output:

```
{
  "CopyPartResult": {
    "LastModified": "2019-12-13T23:16:03.000Z",
    "ETag": "\"711470fc377698c393d94aed6305e245\""
  }
}
```

- For API details, see [UploadPartCopy](#) in *AWS CLI Command Reference*.

upload-part

The following code example shows how to use `upload-part`.

AWS CLI

The following command uploads the first part in a multipart upload initiated with the `create-multipart-upload` command:

```
aws s3api upload-part --bucket my-bucket --key 'multipart/01' --part-number 1 --body
part01 --upload-id
"dfRtDYU0WWCCcH43C3WFbkR0NycyCpTJJvxu2i5GYkZ1jF.Yxwh6XG7WfS2vC4to6HiV6Yj1x.cph0gtNBtJ8P3URC"
```

The `body` option takes the name or path of a local file for upload (do not use the `file://` prefix). The minimum part size is 5 MB. Upload ID is returned by `create-multipart-upload` and can also be retrieved with `list-multipart-uploads`. Bucket and key are specified when you create the multipart upload.

Output:

```
{
  "ETag": "\"e868e0f4719e394144ef36531ee6824c\""
}
```

Save the ETag value of each part for later. They are required to complete the multipart upload.

- For API details, see [UploadPart](#) in *AWS CLI Command Reference*.

website

The following code example shows how to use `website`.

AWS CLI

Configure an S3 bucket as a static website

The following command configures a bucket named `my-bucket` as a static website. The `index document` option specifies the file in `my-bucket` that visitors will be directed to when they navigate to the website URL. In this case, the bucket is in the `us-west-2` region, so the site would appear at `http://my-bucket.s3-website-us-west-2.amazonaws.com`.

All files in the bucket that appear on the static site must be configured to allow visitors to open them. File permissions are configured separately from the bucket website configuration.

```
aws s3 website s3://my-bucket/ \  
  --index-document index.html \  
  --error-document error.html
```

For information on hosting a static website in Amazon S3, see [Hosting a Static Website](#) in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see [Website](#) in *AWS CLI Command Reference*.

Amazon S3 Control examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon S3 Control.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-access-point

The following code example shows how to use create-access-point.

AWS CLI

To create an access point

The following create-access-point example creates an access point named finance-ap for the bucket business-records in account 123456789012. Before running this example, replace the access point name, bucket name, and account number with appropriate values for your use case.

```
aws s3control create-access-point \  
  --account-id 123456789012 \  
  --bucket business-records \  
  --name finance-ap
```

This command produces no output.

For more information, see [Creating Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see [CreateAccessPoint](#) in *AWS CLI Command Reference*.

create-job

The following code example shows how to use create-job.

AWS CLI

To create an Amazon S3 batch operations job

The following create-job example creates an Amazon S3 batch operations job to tag objects as confidential in the bucket employee-records.

```
aws s3control create-job \  
  --account-id 123456789012 \  
  --bucket employee-records \  
  --name my-job
```

```
--account-id 123456789012 \  
--operation '{"S3PutObjectTagging": { "TagSet": [{"Key":"confidential",  
"Value":"true"}] }}' \  
--report '{"Bucket":"arn:aws:s3:::employee-records-logs","Prefix":"batch-op-  
create-job",  
"Format":"Report_CSV_20180820","Enabled":true,"ReportScope":"AllTasks"}' \  
--manifest '{"Spec":{"Format":"S3BatchOperations_CSV_20180820","Fields":  
["Bucket","Key"]},"Location":{"ObjectArn":"arn:aws:s3:::employee-records-logs/inv-  
report/7a6a9be4-072c-407e-85a2-  
ec3e982f773e.csv","ETag":"69f52a4e9f797e987155d9c8f5880897"}}' \  
--priority 42 \  
--role-arn arn:aws:iam::123456789012:role/S3BatchJobRole
```

Output:

```
{  
  "JobId": "93735294-df46-44d5-8638-6356f335324e"  
}
```

- For API details, see [CreateJob](#) in *AWS CLI Command Reference*.

delete-access-point-policy

The following code example shows how to use `delete-access-point-policy`.

AWS CLI

To delete an access point policy

The following `delete-access-point-policy` example deletes the access point policy from the access point named `finance-ap` in account `123456789012`. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control delete-access-point-policy \  
--account-id 123456789012 \  
--name finance-ap
```

This command produces no output.

For more information, see [Managing Data Access with Amazon S3 Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see [DeleteAccessPointPolicy](#) in *AWS CLI Command Reference*.

delete-access-point

The following code example shows how to use `delete-access-point`.

AWS CLI

To delete an access point

The following `delete-access-point` example deletes an access point named `finance-ap` in account `123456789012`. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control delete-access-point \  
  --account-id 123456789012 \  
  --name finance-ap
```

This command produces no output.

For more information, see [Managing Data Access with Amazon S3 Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see [DeleteAccessPoint](#) in *AWS CLI Command Reference*.

delete-public-access-block

The following code example shows how to use `delete-public-access-block`.

AWS CLI

To delete block public access settings for an account

The following `delete-public-access-block` example deletes block public access settings for the specified account.

```
aws s3control delete-public-access-block \  
  --account-id 123456789012
```

This command produces no output.

- For API details, see [DeletePublicAccessBlock](#) in *AWS CLI Command Reference*.

describe-job

The following code example shows how to use `describe-job`.

AWS CLI

To describe an Amazon S3 batch operations job

The following `describe-job` provides configuration parameters and status for the specified batch operations job.

```
aws s3control describe-job \
  --account-id 123456789012 \
  --job-id 93735294-df46-44d5-8638-6356f335324e
```

Output:

```
{
  "Job": {
    "TerminationDate": "2019-10-03T21:49:53.944Z",
    "JobId": "93735294-df46-44d5-8638-6356f335324e",
    "FailureReasons": [],
    "Manifest": {
      "Spec": {
        "Fields": [
          "Bucket",
          "Key"
        ],
        "Format": "S3BatchOperations_CSV_20180820"
      },
      "Location": {
        "ETag": "69f52a4e9f797e987155d9c8f5880897",
        "ObjectArn": "arn:aws:s3:::employee-records-logs/inv-report/7a6a9be4-072c-407e-85a2-ec3e982f773e.csv"
      }
    },
    "Operation": {
      "S3PutObjectTagging": {
        "TagSet": [
          {
```

```

        "Value": "true",
        "Key": "confidential"
      }
    ]
  }
},
"RoleArn": "arn:aws:iam::123456789012:role/S3BatchJobRole",
"ProgressSummary": {
  "TotalNumberOfTasks": 8,
  "NumberOfTasksFailed": 0,
  "NumberOfTasksSucceeded": 8
},
"Priority": 42,
"Report": {
  "ReportScope": "AllTasks",
  "Format": "Report_CSV_20180820",
  "Enabled": true,
  "Prefix": "batch-op-create-job",
  "Bucket": "arn:aws:s3:::employee-records-logs"
},
"JobArn": "arn:aws:s3:us-west-2:123456789012:job/93735294-
df46-44d5-8638-6356f335324e",
"CreationTime": "2019-10-03T21:48:48.048Z",
"Status": "Complete"
}
}

```

- For API details, see [DescribeJob](#) in *AWS CLI Command Reference*.

get-access-point-policy-status

The following code example shows how to use `get-access-point-policy-status`.

AWS CLI

To retrieve the access point policy status

The following `get-access-point-policy-status` example retrieves the access point policy status for the access point named `finance-ap` in account `123456789012`. The access point policy status indicates whether the access point's policy allows public access. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point-policy-status \  
  --account-id 123456789012 \  
  --name finance-ap
```

Output:

```
{  
  "PolicyStatus": {  
    "IsPublic": false  
  }  
}
```

For more information about when an access point policy is considered public, see [The Meaning of "Public"](#) in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see [GetAccessPointPolicyStatus](#) in *AWS CLI Command Reference*.

get-access-point-policy

The following code example shows how to use `get-access-point-policy`.

AWS CLI

To retrieve an access point policy

The following `get-access-point-policy` example retrieves the access point policy from the access point named `finance-ap` in account `123456789012`. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point-policy \  
  --account-id 123456789012 \  
  --name finance-ap
```

Output:

```
{  
  "Policy": "{\"Version\":\"2012-10-17\", \"Statement\": [{\"Effect\":\"Allow\", \"Principal\": {\"AWS\": \"arn:aws:iam:123456789012:role/Admin\"}, \"Action\": \"s3:GetObject\", \"Resource\": \"arn:aws:s3:us-west-2:123456789012:accesspoint/finance-ap/object/records/*\"}]}"
```

```
}
```

For more information, see [Managing Data Access with Amazon S3 Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see [GetAccessPointPolicy](#) in *AWS CLI Command Reference*.

get-access-point

The following code example shows how to use `get-access-point`.

AWS CLI

To retrieve access point configuration details

The following `get-access-point` example retrieves the configuration details for the access point named `finance-ap` in account `123456789012`. Before running this example, replace the access point name and account number with appropriate values for your use case.

```
aws s3control get-access-point \  
  --account-id 123456789012 \  
  --name finance-ap
```

Output:

```
{  
  "Name": "finance-ap",  
  "Bucket": "business-records",  
  "NetworkOrigin": "Internet",  
  "PublicAccessBlockConfiguration": {  
    "BlockPublicAcls": false,  
    "IgnorePublicAcls": false,  
    "BlockPublicPolicy": false,  
    "RestrictPublicBuckets": false  
  },  
  "CreationDate": "2020-01-01T00:00:00Z"  
}
```

For more information, see [Managing Data Access with Amazon S3 Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see [GetAccessPoint](#) in *AWS CLI Command Reference*.

get-multi-region-access-point-routes

The following code example shows how to use `get-multi-region-access-point-routes`.

AWS CLI

To query the current Multi-Region Access Point route configuration

The following `get-multi-region-access-point-routes` example returns the current routing configuration for the specified Multi-Region Access Point.

```
aws s3control get-multi-region-access-point-routes \
  --region Region \
  --account-id 111122223333 \
  --mrap MultiRegionAccessPoint_ARN
```

Output:

```
{
  "Mrap": "arn:aws:s3::111122223333:accesspoint/0000000000000000.mrap",
  "Routes": [
    {
      "Bucket": "DOC-EXAMPLE-BUCKET-1",
      "Region": "ap-southeast-2",
      "TrafficDialPercentage": 100
    },
    {
      "Bucket": "DOC-EXAMPLE-BUCKET-2",
      "Region": "us-west-1",
      "TrafficDialPercentage": 0
    }
  ]
}
```

- For API details, see [GetMultiRegionAccessPointRoutes](#) in *AWS CLI Command Reference*.

get-public-access-block

The following code example shows how to use `get-public-access-block`.

AWS CLI

To list public block access settings for an account

The following `get-public-access-block` example displays the block public access settings for the specified account.

```
aws s3control get-public-access-block \  
  --account-id 123456789012
```

Output:

```
{  
  "PublicAccessBlockConfiguration": {  
    "BlockPublicPolicy": true,  
    "RestrictPublicBuckets": true,  
    "IgnorePublicAcls": true,  
    "BlockPublicAcls": true  
  }  
}
```

- For API details, see [GetPublicAccessBlock](#) in *AWS CLI Command Reference*.

list-access-points

The following code example shows how to use `list-access-points`.

AWS CLI

Example 1: To retrieve a list of all access points for an account

The following `list-access-points` example displays a list of all access points attached to buckets owned by account 123456789012.

```
aws s3control list-access-points \  
  --account-id 123456789012
```

Output:

```
{  
  "AccessPointList": [  
    {  
      "Name": "finance-ap",  
      "NetworkOrigin": "Internet",
```

```

    "Bucket": "business-records"
  },
  {
    "Name": "managers-ap",
    "NetworkOrigin": "Internet",
    "Bucket": "business-records"
  },
  {
    "Name": "private-network-ap",
    "NetworkOrigin": "VPC",
    "VpcConfiguration": {
      "VpcId": "1a2b3c"
    },
    "Bucket": "business-records"
  },
  {
    "Name": "customer-ap",
    "NetworkOrigin": "Internet",
    "Bucket": "external-docs"
  },
  {
    "Name": "public-ap",
    "NetworkOrigin": "Internet",
    "Bucket": "external-docs"
  }
]
}

```

Example 2: To retrieve a list of all access points for a bucket

The following `list-access-points` example retrieves a list of all access points attached to the bucket `external-docs` owned by account `123456789012`.

```

aws s3control list-access-points \
  --account-id 123456789012 \
  --bucket external-docs

```

Output:

```

{
  "AccessPointList": [
    {
      "Name": "customer-ap",

```

```

        "NetworkOrigin": "Internet",
        "Bucket": "external-docs"
    },
    {
        "Name": "public-ap",
        "NetworkOrigin": "Internet",
        "Bucket": "external-docs"
    }
]
}

```

For more information, see [Managing Data Access with Amazon S3 Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see [ListAccessPoints](#) in *AWS CLI Command Reference*.

list-jobs

The following code example shows how to use `list-jobs`.

AWS CLI

To list an accounts Amazon S3 batch operations jobs

The following `list-jobs` example lists all recent batch operations jobs for the specified account.

```

aws s3control list-jobs \
  --account-id 123456789012

```

Output:

```

{
  "Jobs": [
    {
      "Operation": "S3PutObjectTagging",
      "ProgressSummary": {
        "NumberOfTasksFailed": 0,
        "NumberOfTasksSucceeded": 8,
        "TotalNumberOfTasks": 8
      },
      "CreationTime": "2019-10-03T21:48:48.048Z",
    }
  ]
}

```

```

        "Status": "Complete",
        "JobId": "93735294-df46-44d5-8638-6356f335324e",
        "Priority": 42
    },
    {
        "Operation": "S3PutObjectTagging",
        "ProgressSummary": {
            "NumberOfTasksFailed": 0,
            "NumberOfTasksSucceeded": 0,
            "TotalNumberOfTasks": 0
        },
        "CreationTime": "2019-10-03T21:46:07.084Z",
        "Status": "Failed",
        "JobId": "3f3c7619-02d3-4779-97f6-1d98dd313108",
        "Priority": 42
    },
]
}

```

- For API details, see [ListJobs](#) in *AWS CLI Command Reference*.

put-access-point-policy

The following code example shows how to use `put-access-point-policy`.

AWS CLI

To set an access point policy

The following `put-access-point-policy` example places the specified access point policy for the access point `finance-ap` in account `123456789012`. If the access point `finance-ap` already has a policy, this command replaces the existing policy with the one specified in this command. Before running this example, replace the account number, access point name, and policy statements with appropriate values for your use case.

```

aws s3control put-access-point-policy \
  --account-id 123456789012 \
  --name finance-ap \
  --policy file://ap-policy.json

```

Contents of `ap-policy.json`:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:user/Alice"
      },
      "Action": "s3:GetObject",
      "Resource": "arn:aws:s3:us-west-2:123456789012:accesspoint/finance-ap/
object/Alice/*"
    }
  ]
}
```

This command produces no output.

For more information, see [Managing Data Access with Amazon S3 Access Points](#) in the *Amazon Simple Storage Service Developer Guide*.

- For API details, see [PutAccessPointPolicy](#) in *AWS CLI Command Reference*.

put-public-access-block

The following code example shows how to use `put-public-access-block`.

AWS CLI

To edit block public access settings for an account

The following `put-public-access-block` example toggles all block public access settings to `true` for the specified account.

```
aws s3control put-public-access-block \
  --account-id 123456789012 \
  --public-access-block-configuration '{"BlockPublicAcls": true,
  "IgnorePublicAcls": true, "BlockPublicPolicy": true, "RestrictPublicBuckets":
  true}'
```

This command produces no output.

- For API details, see [PutPublicAccessBlock](#) in *AWS CLI Command Reference*.

submit-multi-region-access-point-routes

The following code example shows how to use `submit-multi-region-access-point-routes`.

AWS CLI

To update your Multi-Region Access Point routing configuration

The following `submit-multi-region-access-point-routes` example updates the routing statuses of `DOC-EXAMPLE-BUCKET-1` and `DOC-EXAMPLE-BUCKET-2` in the `ap-southeast-2` Region for your Multi-Region Access Point.

```
aws s3control submit-multi-region-access-point-routes \  
  --region ap-southeast-2 \  
  --account-id 111122223333 \  
  --mrap MultiRegionAccessPoint_ARN \  
  --route-updates Bucket=DOC-EXAMPLE-BUCKET-1,TrafficDialPercentage=100  
  Bucket=DOC-EXAMPLE-BUCKET-2,TrafficDialPercentage=0
```

This command produces no output.

- For API details, see [SubmitMultiRegionAccessPointRoutes](#) in *AWS CLI Command Reference*.

update-job-priority

The following code example shows how to use `update-job-priority`.

AWS CLI

To update the job priority of an Amazon S3 batch operations job

The following `update-job-priority` example updates the specified job to a new priority.

```
aws s3control update-job-priority \  
  --account-id 123456789012 \  
  --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \  
  --priority 52
```

Output:

```
{  
  "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386",
```

```
"Priority": 52
}
```

- For API details, see [UpdateJobPriority](#) in *AWS CLI Command Reference*.

update-job-status

The following code example shows how to use `update-job-status`.

AWS CLI

To update the status of an Amazon S3 batch operations job

The following `update-job-status` example cancels the specified job which is awaiting approval.

```
aws s3control update-job-status \
  --account-id 123456789012 \
  --job-id 8d9a18fe-c303-4d39-8ccc-860d372da386 \
  --requested-job-status Cancelled
```

Output:

```
{
  "Status": "Cancelled",
  "JobId": "8d9a18fe-c303-4d39-8ccc-860d372da386"
}
```

The following `update-job-status` example confirms and runs the specified which is awaiting approval.

```
aws s3control update-job-status \
  --account-id 123456789012 \
  --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \
  --requested-job-status Ready
```

Output::

```
{
  "Status": "Ready",
  "JobId": "5782949f-3301-4fb3-be34-8d5bab54dbca"
}
```

```
}
```

The following `update-job-status` example cancels the specified job which is running.

```
aws s3control update-job-status \  
  --account-id 123456789012 \  
  --job-id 5782949f-3301-4fb3-be34-8d5bab54dbca \  
  --requested-job-status Cancelled  
  
Output::  
{  
    "Status": "Cancelling",  
    "JobId": "5782949f-3301-4fb3-be34-8d5bab54dbca"  
}
```

- For API details, see [UpdateJobStatus](#) in *AWS CLI Command Reference*.

S3 Glacier examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with S3 Glacier.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

abort-multipart-upload

The following code example shows how to use `abort-multipart-upload`.

AWS CLI

The following command deletes an in-progress multipart upload to a vault named `my-vault`:

```
aws glacier abort-multipart-upload --account-id - --vault-name my-vault
--upload-id 19gaRezEXAMPLES6Ry5YYdqthH0C_kGRCT03L9yetr220UmPtBYKk-
0ssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ
```

This command does not produce any output. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account. The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see *Using Amazon Glacier* in the *AWS CLI User Guide*.

- For API details, see [AbortMultipartUpload](#) in *AWS CLI Command Reference*.

`abort-vault-lock`

The following code example shows how to use `abort-vault-lock`.

AWS CLI

To abort an in-progress vault lock process

The following `abort-vault-lock` example deletes a vault lock policy from the specified vault and resets the lock state of the vault lock to unlocked.

```
aws glacier abort-vault-lock \
--account-id - \
--vault-name MyVaultName
```

This command produces no output.

For more information, see [Abort Vault Lock \(DELETE lock-policy\)](#) in the *Amazon Glacier API Developer Guide*.

- For API details, see [AbortVaultLock](#) in *AWS CLI Command Reference*.

add-tags-to-vault

The following code example shows how to use `add-tags-to-vault`.

AWS CLI

The following command adds two tags to a vault named `my-vault`:

```
aws glacier add-tags-to-vault --account-id - --vault-name my-vault --tags
id=1234,date=july2015
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [AddTagsToVault](#) in *AWS CLI Command Reference*.

complete-multipart-upload

The following code example shows how to use `complete-multipart-upload`.

AWS CLI

The following command completes multipart upload for a 3 MiB archive:

```
aws glacier complete-multipart-upload --archive-size 3145728 --checksum
9628195fcdcbcbbe76cdde456d4646fa7de5f219fb39823836d81f0cc0e18aa67
--upload-id 19gaRezEXAMPLES6Ry5YYdqthH0C_kGRCT03L9yetr220UmPtBYKk-
0ssZtLqyFu7sY1_lR7vgFuJV6NtcV5zpsJ --account-id - --vault-name my-vault
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`. The checksum parameter takes a SHA-256 tree hash of the archive in hexadecimal.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, including instructions on calculating a tree hash, see *Using Amazon Glacier* in the *AWS CLI User Guide*.

- For API details, see [CompleteMultipartUpload](#) in *AWS CLI Command Reference*.

complete-vault-lock

The following code example shows how to use `complete-vault-lock`.

AWS CLI

To complete an in-progress vault lock process

The following `complete-vault-lock` example completes the in-progress locking progress for the specified vault and sets the lock state of the vault lock to `Locked`. You get the value for the `lock-id` parameter when you run `initiate-lock-process`.

```
aws glacier complete-vault-lock \  
  --account-id - \  
  --vault-name MyVaultName \  
  --lock-id 9QZgEXAMPLEPhvL6xEXAMPLE
```

This command produces no output.

For more information, see [Complete Vault Lock \(POST lockId\)](#) in the *Amazon Glacier API Developer Guide*.

- For API details, see [CompleteVaultLock](#) in *AWS CLI Command Reference*.

create-vault

The following code example shows how to use `create-vault`.

AWS CLI

The following command creates a new vault named `my-vault`:

```
aws glacier create-vault --vault-name my-vault --account-id -
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [CreateVault](#) in *AWS CLI Command Reference*.

delete-archive

The following code example shows how to use `delete-archive`.

AWS CLI

To delete an archive from a vault

The following `delete-archive` example removes the specified archive from `example_vault`.

```
aws glacier delete-archive \  
  --account-id 111122223333 \  
  --vault-name example_vault \  
  --archive-id Sc0u9ZP8yaWkmh-XG1IvAVprtLhaLCGnNwN15I5x9HqPIkX5mjc0DrId3Ln-  
  Gi_k2HzmlIDZUz117KSdVMdMXLuFwi9PJUitxw073edQ43eT1MwkH0pd9zVSAuV_XXZBVhKhyGhJ7w
```

This command produces no output.

- For API details, see [DeleteArchive](#) in *AWS CLI Command Reference*.

`delete-vault-access-policy`

The following code example shows how to use `delete-vault-access-policy`.

AWS CLI

To remove the access policy of a vault

The following `delete-vault-access-policy` example removes the access policy for the specified vault.

```
aws glacier delete-vault-access-policy \  
  --account-id 111122223333 \  
  --vault-name example_vault
```

This command produces no output.

- For API details, see [DeleteVaultAccessPolicy](#) in *AWS CLI Command Reference*.

`delete-vault-notifications`

The following code example shows how to use `delete-vault-notifications`.

AWS CLI

To remove the SNS notifications for a vault

The following `delete-vault-notifications` example removes notifications sent by Amazon Simple Notification Service (Amazon SNS) for the specified vault.

```
aws glacier delete-vault-notifications \  
  --account-id 111122223333 \  
  --vault-name example_vault
```

This command produces no output.

- For API details, see [DeleteVaultNotifications](#) in *AWS CLI Command Reference*.

delete-vault

The following code example shows how to use `delete-vault`.

AWS CLI

The following command deletes a vault named `my-vault`:

```
aws glacier delete-vault --vault-name my-vault --account-id -
```

This command does not produce any output. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [DeleteVault](#) in *AWS CLI Command Reference*.

describe-job

The following code example shows how to use `describe-job`.

AWS CLI

The following command retrieves information about an inventory retrieval job on a vault named `my-vault`:

```
aws glacier describe-job --account-id - --vault-name my-  
vault --job-id zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-  
R047Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_Xq1NHS61ds04CnMW
```

Output:

```
{
```

```
"InventoryRetrievalParameters": {
  "Format": "JSON"
},
"VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
"Completed": false,
"JobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
R047Yc6FxsdGBgf_Q2DK5Ejh18CnTS5XW4_Xq1NHS61ds04CnMW",
"Action": "InventoryRetrieval",
"CreationDate": "2015-07-17T20:23:41.616Z",
"StatusCode": "InProgress"
}
```

The job ID can be found in the output of `aws glacier initiate-job` and `aws glacier list-jobs`. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [DescribeJob](#) in *AWS CLI Command Reference*.

describe-vault

The following code example shows how to use `describe-vault`.

AWS CLI

The following command retrieves data about a vault named `my-vault`:

```
aws glacier describe-vault --vault-name my-vault --account-id -
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [DescribeVault](#) in *AWS CLI Command Reference*.

get-data-retrieval-policy

The following code example shows how to use `get-data-retrieval-policy`.

AWS CLI

The following command gets the data retrieval policy for the in-use account:

```
aws glacier get-data-retrieval-policy --account-id -
```

Output:

```
{
  "Policy": {
    "Rules": [
      {
        "BytesPerHour": 10737418240,
        "Strategy": "BytesPerHour"
      }
    ]
  }
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [GetDataRetrievalPolicy](#) in *AWS CLI Command Reference*.

get-job-output

The following code example shows how to use `get-job-output`.

AWS CLI

The following command saves the output from a vault inventory job to a file in the current directory named `output.json`:

```
aws glacier get-job-output --account-id - --vault-name my-
vault --job-id zbxcm3Z_3z5UkooroF7SuZKrxgGoDc3RloGduS7Eg-
R047Yc6FxsdsGBgf_Q2DK5Ejh18CnTS5XW4_Xq1NHS61ds04CnMW output.json
```

The `job-id` is available in the output of `aws glacier list-jobs`. Note that the output file name is a positional argument that is not prefixed by an option name. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

Output:

```
{
  "status": 200,
  "acceptRanges": "bytes",
  "contentType": "application/json"
```

```
}

```

output.json:

```
{
  "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
  "InventoryDate": "2015-04-07T00:26:18Z",
  "ArchiveList": [
    {
      "ArchiveId": "kKB7ymWJVpPSwhGP6ycS0Aekp9ZYe_--zM_mw6k76ZFGEIWQX-ybtRDvc2VkpSDtfKmqRj0IRQLSGsNuDp-AJVlu2ccmDSyDUMzWkbwbpAdGATGDiB3hH00bjbGehXTcApVud_wyDw",
      "ArchiveDescription": "multipart upload test",
      "CreationDate": "2015-04-06T22:24:34Z",
      "Size": 3145728,
      "SHA256TreeHash": "9628195fcdbcb"
    }
  ]
}
```

- For API details, see [GetJobOutput](#) in *AWS CLI Command Reference*.

get-vault-access-policy

The following code example shows how to use `get-vault-access-policy`.

AWS CLI

To retrieve the access policy of a vault

The following `get-vault-access-policy` example retrieves the access policy for the specified vault.

```
aws glacier get-vault-access-policy \
  --account-id 111122223333 \
  --vault-name example_vault
```

Output:

```
{
  "policy": {
    "Policy": "{\n\"Version\": \"2012-10-17\", \"Statement\": [\n\"Effect\": \"Allow\", \"Principal\": {\n\"AWS\": \"arn:aws:iam::444455556666:root\"}, \"Action\": \"glacier:ListJobs\", \"Resource\": \"arn:aws:glacier:us-east-1:111122223333:vaults/example_vault\"}, {\n\"Effect\": \"Allow\", \"Principal\": {\n\"AWS\": \"arn:aws:iam::444455556666:root\"}, \"Action\": \"glacier:UploadArchive\", \"Resource\": \"arn:aws:glacier:us-east-1:111122223333:vaults/example_vault\"}]\n}"
  }
}
```

- For API details, see [GetVaultAccessPolicy](#) in *AWS CLI Command Reference*.

get-vault-lock

The following code example shows how to use `get-vault-lock`.

AWS CLI

To get the details of a vault lock

The following `get-vault-lock` example retrieved the details about the lock for the specified vault.

```
aws glacier get-vault-lock \
  --account-id - \
  --vault-name MyVaultName
```

Output:

```
{
  "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"Define-vault-lock\",\"Effect\":\"Deny\",\"Principal\":{\"AWS\":\"arn:aws:iam:999999999999:root\"},\"Action\":\"glacier:DeleteArchive\",\"Resource\":\"arn:aws:glacier:us-west-2:999999999999:vaults/MyVaultName\",\"Condition\":{\"NumericLessThanEquals\":{\"glacier:ArchiveAgeinDays\":\"365\"}}}]}\",
  "State": "Locked",
  "CreationDate": "2019-07-29T22:25:28.640Z"
}
```

For more information, see [Get Vault Lock \(GET lock-policy\)](#) in the *Amazon Glacier API Developer Guide*.

- For API details, see [GetVaultLock](#) in *AWS CLI Command Reference*.

get-vault-notifications

The following code example shows how to use `get-vault-notifications`.

AWS CLI

The following command gets a description of the notification configuration for a vault named `my-vault`:

```
aws glacier get-vault-notifications --account-id - --vault-name my-vault
```

Output:

```
{
  "vaultNotificationConfig": {
    "Events": [
      "InventoryRetrievalCompleted",
      "ArchiveRetrievalCompleted"
    ],
    "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault"
  }
}
```

If no notifications have been configured for the vault, an error is returned. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [GetVaultNotifications](#) in *AWS CLI Command Reference*.

initiate-job

The following code example shows how to use `initiate-job`.

AWS CLI

The following command initiates a job to get an inventory of the vault `my-vault`:

```
aws glacier initiate-job --account-id - --vault-name my-vault --job-parameters
'{"Type": "inventory-retrieval"}'
```

Output:

```
{
  "location": "/0123456789012/vaults/my-vault/jobs/
zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
R047Yc6FxsdBgf_Q2DK5Ejh18CnTS5XW4_Xq1NHS61ds04CnMW",
  "jobId": "zbxcm3Z_3z5UkoroF7SuZKrxgGoDc3RloGduS7Eg-
R047Yc6FxsdBgf_Q2DK5Ejh18CnTS5XW4_Xq1NHS61ds04CnMW"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The following command initiates a job to retrieve an archive from the vault `my-vault`:

```
aws glacier initiate-job --account-id - --vault-name my-vault --job-parameters
file://job-archive-retrieval.json
```

`job-archive-retrieval.json` is a JSON file in the local folder that specifies the type of job, archive ID, and some optional parameters:

```
{
  "Type": "archive-retrieval",
  "ArchiveId": "kKB7ymWJVpPSwhGP6ycS0Aekp9ZYe_--zM_mw6k76ZFGIEWQX-
ybtRDvc2VkpSDtFkmQrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKbwbpAdGATGDiB3hH00bjbGehXTcApVud_wyDw",
  "Description": "Retrieve archive on 2015-07-17",
  "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-topic"
}
```

Archive IDs are available in the output of `aws glacier upload-archive` and `aws glacier get-job-output`.

Output:

```
{
  "location": "/011685312445/vaults/mwunderl/jobs/l7IL5-
EkXyEY9Ws95fClzIbk205uLYaFdAY0i-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJ059-8N9aHWav",
  "jobId": "l7IL5-EkXy205uLYaFdAY0iEY9Ws95fClzIbk-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJ059-8N9aHWav"
}
```

See *Initiate Job* in the *Amazon Glacier API Reference* for details on the job parameters format.

- For API details, see [InitiateJob](#) in *AWS CLI Command Reference*.

initiate-multipart-upload

The following code example shows how to use `initiate-multipart-upload`.

AWS CLI

The following command initiates a multipart upload to a vault named `my-vault` with a part size of 1 MiB (1024 x 1024 bytes) per file:

```
aws glacier initiate-multipart-upload --account-id - --part-size 1048576 --vault-name my-vault --archive-description "multipart upload test"
```

The archive description parameter is optional. Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

This command outputs an upload ID when successful. Use the upload ID when uploading each part of your archive with `aws glacier upload-multipart-part`. For more information on multipart uploads to Amazon Glacier using the AWS CLI, see *Using Amazon Glacier in the AWS CLI User Guide*.

- For API details, see [InitiateMultipartUpload](#) in *AWS CLI Command Reference*.

initiate-vault-lock

The following code example shows how to use `initiate-vault-lock`.

AWS CLI

To initiate the vault locking process

The following `initiate-vault-lock` example installs a vault lock policy on the specified vault and sets the lock state of the vault lock to `InProgress`. You must complete the process by calling `complete-vault-lock` within 24 hours to set the state of the vault lock to `Locked`.

```
aws glacier initiate-vault-lock \  
  --account-id - \  
  --vault-name MyVaultName \  
  --policy file://vault_lock_policy.json
```

Contents of `vault_lock_policy.json`:

```
{"Policy":{"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"Define-vault-lock\",\"Effect\":\"Deny\",\"Principal\":{\"AWS\":\"arn:aws:iam:999999999999:root\"},\"Action\":\"glacier:DeleteArchive\",\"Resource\":\"arn:aws:glacier:us-
```

```
west-2:999999999999:vaults/examplevault\", \"Condition\": { \"NumericLessThanEquals\": { \"glacier:ArchiveAgeInDays\": \"365\" } } } ] ] ] }
```

The output is the vault lock ID that you can use to complete the vault lock process.

```
{
  "lockId": "9QZgEXAMPLEPhvL6xEXAMPLE"
}
```

For more information, see [Initiate Vault Lock \(POST lock-policy\)](#) in the *Amazon Glacier API Developer Guide*.

- For API details, see [InitiateVaultLock](#) in *AWS CLI Command Reference*.

list-jobs

The following code example shows how to use `list-jobs`.

AWS CLI

The following command lists in-progress and recently completed jobs for a vault named `my-vault`:

```
aws glacier list-jobs --account-id - --vault-name my-vault
```

Output:

```
{
  "JobList": [
    {
      "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
      "RetrievalByteRange": "0-3145727",
      "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault",
      "Completed": false,
      "SHA256TreeHash":
"9628195fcdbcbbe76cdde932d4646fa7de5f219fb39823836d81f0cc0e18aa67",
      "JobId": "17IL5-EkXyEY9Ws95fClzIbk205uLYaFdAY0i-
azsX_Z8V6NH4yERHzars8wTKYQMX6nBDI9cMNHzyZJ059-8N9aHWav",
      "ArchiveId": "kKB7ymWJVpPSwhGP6ycS0Aekp9ZYe_--zM_mw6k76ZFGIEWQX-
ybtRDvc2VkPSDtFkMqrj0IRQLSGsNuDp-
AJVlu2ccmDSyDUmZwKwbpbAdGATGDiB3hH00bjbGehXTcApVud_wyDw",
```

```

        "JobDescription": "Retrieve archive on 2015-07-17",
        "ArchiveSizeInBytes": 3145728,

```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [ListJobs](#) in *AWS CLI Command Reference*.

list-multipart-uploads

The following code example shows how to use `list-multipart-uploads`.

AWS CLI

The following command shows all of the in-progress multipart uploads for a vault named `my-vault`:

```
aws glacier list-multipart-uploads --account-id - --vault-name my-vault
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see *Using Amazon Glacier in the AWS CLI User Guide*.

- For API details, see [ListMultipartUploads](#) in *AWS CLI Command Reference*.

list-parts

The following code example shows how to use `list-parts`.

AWS CLI

The following command lists the uploaded parts for a multipart upload to a vault named `my-vault`:

```
aws glacier list-parts --account-id - --vault-name my-vault --upload-id "SYZi7qnL-
YGqGwAm8Kn3BLP2E1NCvnB-5961R09CSaPmPwkYGH0qeN_nX3-Vhnd2yF0KfB5FkmbnBU9Gubbd1Cs8ut-D"
```

Output:

```
{
  "MultipartUploadId": "SYZi7qnL-
YGqGwAm8Kn3BLP2E1NCvnB-5961R09CSaPmPwkYGH0qeN_nX3-Vhnd2yF0KfB5FkmbnBU9Gubbd1Cs8ut-
D",
  "Parts": [
    {
      "RangeInBytes": "0-1048575",

    },
    {
      "RangeInBytes": "1048576-2097151",
      "SHA256TreeHash":
"43cf3061fb95796aed99a11a6aa3cd8f839eed15e655ab0a597126210636aee6"
    }
  ],
  "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
  "CreationDate": "2015-07-18T00:05:23.830Z",
  "PartSizeInBytes": 1048576
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see [Using Amazon Glacier in the AWS CLI User Guide](#).

- For API details, see [ListParts](#) in *AWS CLI Command Reference*.

list-provisioned-capacity

The following code example shows how to use `list-provisioned-capacity`.

AWS CLI

To retrieve the provisioned capacity units

The following `list-provisioned-capacity` example retrieves details for any provisioned capacity units for the specified account.

```
aws glacier list-provisioned-capacity \  
  --account-id 111122223333
```

Output:

```
{  
  "ProvisionedCapacityList": [  
    {  
      "CapacityId": "HpASAUvfRFiVDb0jMfEIcr8K",  
      "ExpirationDate": "2020-03-18T19:59:24.000Z",  
      "StartDate": "2020-02-18T19:59:24.912Z"  
    }  
  ]  
}
```

- For API details, see [ListProvisionedCapacity](#) in *AWS CLI Command Reference*.

list-tags-for-vault

The following code example shows how to use `list-tags-for-vault`.

AWS CLI

The following command lists the tags applied to a vault named `my-vault`:

```
aws glacier list-tags-for-vault --account-id - --vault-name my-vault
```

Output:

```
{
  "Tags": {
    "date": "july2015",
    "id": "1234"
  }
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [ListTagsForVault](#) in *AWS CLI Command Reference*.

list-vaults

The following code example shows how to use `list-vaults`.

AWS CLI

The following command lists the vaults in the default account and region:

```
aws glacier list-vaults --account-id -
```

Output:

```
{
  "VaultList": [
    {
      "SizeInBytes": 3178496,
      "VaultARN": "arn:aws:glacier:us-west-2:0123456789012:vaults/my-vault",
      "LastInventoryDate": "2015-04-07T00:26:19.028Z",
      "VaultName": "my-vault",
      "NumberOfArchives": 1,
      "CreationDate": "2015-04-06T21:23:45.708Z"
    }
  ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [ListVaults](#) in *AWS CLI Command Reference*.

purchase-provisioned-capacity

The following code example shows how to use `purchase-provisioned-capacity`.

AWS CLI

To purchase a provisioned capacity unit

The following `purchase-provisioned-capacity` example purchases a provisioned capacity unit.

```
aws glacier purchase-provisioned-capacity \  
  --account-id 111122223333
```

Output:

```
{  
  "capacityId": "HpASAUvfRFiVDb0jMfEIcr8K"  
}
```

- For API details, see [PurchaseProvisionedCapacity](#) in *AWS CLI Command Reference*.

remove-tags-from-vault

The following code example shows how to use `remove-tags-from-vault`.

AWS CLI

The following command removes a tag with the key `date` from a vault named `my-vault`:

```
aws glacier remove-tags-from-vault --account-id - --vault-name my-vault --tag-keys  
  date
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [RemoveTagsFromVault](#) in *AWS CLI Command Reference*.

set-data-retrieval-policy

The following code example shows how to use `set-data-retrieval-policy`.

AWS CLI

The following command configures a data retrieval policy for the in-use account:

```
aws glacier set-data-retrieval-policy --account-id - --policy file://data-retrieval-policy.json
```

`data-retrieval-policy.json` is a JSON file in the current folder that specifies a data retrieval policy:

```
{
  "Rules":[
    {
      "Strategy":"BytesPerHour",
      "BytesPerHour":10737418240
    }
  ]
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The following command sets the data retrieval policy to `FreeTier` using inline JSON:

```
aws glacier set-data-retrieval-policy --account-id - --policy '{"Rules": [{"Strategy":"FreeTier"}]}'
```

See `Set Data Retrieval Policy` in the *Amazon Glacier API Reference* for details on the policy format.

- For API details, see [SetDataRetrievalPolicy](#) in *AWS CLI Command Reference*.

set-vault-access-policy

The following code example shows how to use `set-vault-access-policy`.

AWS CLI

To set the access policy of a vault

The following `set-vault-access-policy` example attaches a permission policy to the specified vault.

```
aws glacier set-vault-access-policy \  
  --account-id 111122223333 \  
  --vault-name example_vault \  
  --policy '{"Policy": "{\"Version\":\"2012-10-17\",\"Statement\":  
[{\n\"Effect\":\n\"Allow\", \n\"Principal\":{\n\"AWS\":\n\"arn:aws:iam:444455556666:root  
\n\"}, \n\"Action\":\n\"glacier:ListJobs\", \n\"Resource\":\n\"arn:aws:glacier:us-  
east-1:111122223333:vaults/example_vault\"}, {\n\"Effect\":\n\"Allow\", \n\"Principal\":  
{\n\"AWS\":\n\"arn:aws:iam:444455556666:root\", \n\"Action\":\n\"glacier:UploadArchive\",  
\n\"Resource\":\n\"arn:aws:glacier:us-east-1:111122223333:vaults/example_vault\"}}]}'
```

This command produces no output.

- For API details, see [SetVaultAccessPolicy](#) in *AWS CLI Command Reference*.

set-vault-notifications

The following code example shows how to use `set-vault-notifications`.

AWS CLI

The following command configures SNS notifications for a vault named `my-vault`:

```
aws glacier set-vault-notifications --account-id - --vault-name my-vault --vault-  
notification-config file://notificationconfig.json
```

`notificationconfig.json` is a JSON file in the current folder that specifies an SNS topic and the events to publish:

```
{  
  "SNSTopic": "arn:aws:sns:us-west-2:0123456789012:my-vault",  
  "Events": ["ArchiveRetrievalCompleted", "InventoryRetrievalCompleted"]  
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

- For API details, see [SetVaultNotifications](#) in *AWS CLI Command Reference*.

upload-archive

The following code example shows how to use `upload-archive`.

AWS CLI

The following command uploads an archive in the current folder named `archive.zip` to a vault named `my-vault`:

```
aws glacier upload-archive --account-id - --vault-name my-vault --body archive.zip
```

Output:

```
{
  "archiveId": "kKB7ymWJVpPSwhGP6ycS0Aekp9ZYe_--zM_mw6k76ZFGIEWQX-
ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJV1u2ccmDSyDUmZwKbwbpAdGATGDiB3hH00bjbGehXTcApVud_wyDw",
  "checksum": "969fb39823836d81f0cc028195fcdcbbbe76cdde932d4646fa7de5f21e18aa67",
  "location": "/0123456789012/vaults/my-vault/archives/
kKB7ymWJVpPSwhGP6ycS0Aekp9ZYe_--zM_mw6k76ZFGIEWQX-ybtRDvc2VkPSDtfKmQrj0IRQLSGsNuDp-
AJV1u2ccmDSyDUmZwKbwbpAdGATGDiB3hH00bjbGehXTcApVud_wyDw"
}
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

To retrieve an uploaded archive, initiate a retrieval job with the `aws glacier initiate-job` command.

- For API details, see [UploadArchive](#) in *AWS CLI Command Reference*.

upload-multipart-part

The following code example shows how to use `upload-multipart-part`.

AWS CLI

The following command uploads the first 1 MiB (1024 x 1024 bytes) part of an archive:

```
aws glacier upload-multipart-part --body part1 --range 'bytes
0-1048575/*' --account-id - --vault-name my-vault --upload-
id 19gaRezEXAMPLES6Ry5YYdqthH0C_kGRCT03L9yetr220UmPtBYKk-
0ssZtLqyFu7sY1_1R7vgFuJV6NtcV5zpsJ
```

Amazon Glacier requires an account ID argument when performing operations, but you can use a hyphen to specify the in-use account.

The body parameter takes a path to a part file on the local filesystem. The range parameter takes an HTTP content range indicating the bytes that the part occupies in the completed archive. The upload ID is returned by the `aws glacier initiate-multipart-upload` command and can also be obtained by using `aws glacier list-multipart-uploads`.

For more information on multipart uploads to Amazon Glacier using the AWS CLI, see *Using Amazon Glacier* in the *AWS CLI User Guide*.

- For API details, see [UploadMultipartPart](#) in *AWS CLI Command Reference*.

Secrets Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Secrets Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

Actions

batch-get-secret-value

The following code example shows how to use `batch-get-secret-value`.

AWS CLI

Example 1: To retrieve the secret value for a group of secrets listed by name

The following `batch-get-secret-value` example gets the secret value secrets for three secrets.

```
aws secretsmanager batch-get-secret-value \  
  --secret-id-list MySecret1 MySecret2 MySecret3
```

Output:

```
{  
  "SecretValues": [  
    {  
      "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret1-  
a1b2c3",  
      "Name": "MySecret1",  
      "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEaaaaa",  
      "SecretString": "{\"username\":\"diego_ramirez\",\"password\":\"EXAMPLE-  
PASSWORD\",\"engine\":\"mysql\",\"host\":\"secretsmanagertutorial.cluster.us-  
west-2.rds.amazonaws.com\",\"port\":3306,\"dbClusterIdentifier\":  
\"secretsmanagertutorial\"}",  
      "VersionStages": [  
        "AWSCURRENT"  
      ],  
      "CreateDate": "1523477145.729"  
    },  
    {  
      "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret2-  
a1b2c3",  
      "Name": "MySecret2",  
      "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEebbbb",  
      "SecretString": "{\"username\":\"akua_mansa\",\"password\":\"EXAMPLE-

  }
],
"Errors": []
}

```

For more information, see [Retrieve a group of secrets in a batch](#) in the *AWS Secrets Manager User Guide*.

Example 2: To retrieve the secret value for a group of secrets selected by filter

The following `batch-get-secret-value` example gets the secret value secrets in your account that have `MySecret` in the name. Filtering by name is case sensitive.

```
aws secretsmanager batch-get-secret-value \
  --filters Key="name",Values="MySecret"
```

Output:

```

{
  "SecretValues": [
    {
      "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MySecret1-
a1b2c3",
      "Name": "MySecret1",
      "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLEeaaaa",
      "SecretString": "{\"username\": \"diego_ramirez\", \"password\": \"EXAMPLE-
PASSWORD\", \"engine\": \"mysql\", \"host\": \"secretsmanagertutorial.cluster.us-

```

```

  \"VersionStages\": [
    \"AWSCURRENT\"
  ],
  \"CreateDate\": \"1373477721.124\"
}
],
\"Errors\": []
}

```

For more information, see [Retrieve a group of secrets in a batch](#) in the *AWS Secrets Manager User Guide*.

- For API details, see [BatchGetSecretValue](#) in *AWS CLI Command Reference*.

cancel-rotate-secret

The following code example shows how to use `cancel-rotate-secret`.

AWS CLI

To turn off automatic rotation for a secret

The following `cancel-rotate-secret` example turns off automatic rotation for a secret. To resume rotation, call `rotate-secret`.

```
aws secretsmanager cancel-rotate-secret \  
  --secret-id MyTestSecret
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",  
  "Name": "MyTestSecret"  
}
```

For more information, see [Rotate a secret](#) in the *Secrets Manager User Guide*.

- For API details, see [CancelRotateSecret](#) in *AWS CLI Command Reference*.

create-secret

The following code example shows how to use `create-secret`.

AWS CLI

Example 1: To create a secret

The following `create-secret` example creates a secret with two key-value pairs.

```
aws secretsmanager create-secret \  
  --name MyTestSecret \  
  --description "My test secret created with the CLI." \  
  --secret-string "{\"user\": \"diegor\", \"password\": \"EXAMPLE-PASSWORD\"}"
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
```

```
"Name": "MyTestSecret",
"VersionId": "EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE"
}
```

For more information, see [Create a secret](#) in the *Secrets Manager User Guide*.

Example 2: To create a secret from credentials in a JSON file

The following `create-secret` example creates a secret from credentials in a file. For more information, see [Loading AWS CLI parameters from a file](#) in the *AWS CLI User Guide*.

```
aws secretsmanager create-secret \
  --name MyTestSecret \
  --secret-string file://mycreds.json
```

Contents of `mycreds.json`:

```
{
  "engine": "mysql",
  "username": "saanvis",
  "password": "EXAMPLE-PASSWORD",
  "host": "my-database-endpoint.us-west-2.rds.amazonaws.com",
  "dbname": "myDatabase",
  "port": "3306"
}
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
  "Name": "MyTestSecret",
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see [Create a secret](#) in the *Secrets Manager User Guide*.

- For API details, see [CreateSecret](#) in *AWS CLI Command Reference*.

delete-resource-policy

The following code example shows how to use `delete-resource-policy`.

AWS CLI

To delete the resource-based policy attached to a secret

The following `delete-resource-policy` example deletes the resource-based policy attached to a secret.

```
aws secretsmanager delete-resource-policy \  
  --secret-id MyTestSecret
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-  
a1b2c3",  
  "Name": "MyTestSecret"  
}
```

For more information, see [Authentication and access control](#) in the *Secrets Manager User Guide*.

- For API details, see [DeleteResourcePolicy](#) in *AWS CLI Command Reference*.

delete-secret

The following code example shows how to use `delete-secret`.

AWS CLI

Example 1: To delete a secret

The following `delete-secret` example deletes a secret. You can recover the secret with `restore-secret` until the date and time in the `DeletionDate` response field. To delete a secret that is replicated to other regions, first remove its replicas with `remove-regions-from-replication`, and then call `delete-secret`.

```
aws secretsmanager delete-secret \  
  --secret-id MyTestSecret \  
  --recovery-window-in-days 7
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
  "Name": "MyTestSecret",
  "DeletionDate": 1524085349.095
}
```

For more information, see [Delete a secret](#) in the *Secrets Manager User Guide*.

Example 2: To delete a secret immediately

The following `delete-secret` example deletes a secret immediately without a recovery window. You can't recover this secret.

```
aws secretsmanager delete-secret \
  --secret-id MyTestSecret \
  --force-delete-without-recovery
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
  "Name": "MyTestSecret",
  "DeletionDate": 1508750180.309
}
```

For more information, see [Delete a secret](#) in the *Secrets Manager User Guide*.

- For API details, see [DeleteSecret](#) in *AWS CLI Command Reference*.

describe-secret

The following code example shows how to use `describe-secret`.

AWS CLI

To retrieve the details of a secret

The following `describe-secret` example shows the details of a secret.

```
aws secretsmanager describe-secret \  
--secret-id MyTestSecret
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-  
Ca8JGt",  
  "Name": "MyTestSecret",  
  "Description": "My test secret",

    ]  
  }  
}
```

```
},
"CreateDate": 1521534252.66,
"PrimaryRegion": "us-west-2",
"ReplicationStatus": [
  {
    "Region": "eu-west-3",
    "KmsKeyId": "alias/aws/secretsmanager",
    "Status": "InSync",
    "StatusMessage": "Replication succeeded"
  }
]
}
```

For more information, see [Secret](#) in the *Secrets Manager User Guide*.

- For API details, see [DescribeSecret](#) in *AWS CLI Command Reference*.

get-random-password

The following code example shows how to use `get-random-password`.

AWS CLI

To generate a random password

The following `get-random-password` example generates a random password 20 characters long that includes at least one uppercase letter, lowercase letter, number, and punctuation.

```
aws secretsmanager get-random-password \
  --require-each-included-type \
  --password-length 20
```

Output:

```
{
  "RandomPassword": "EXAMPLE-PASSWORD"
}
```

For more information, see [Create and manage secrets](#) in the *Secrets Manager User Guide*.

- For API details, see [GetRandomPassword](#) in *AWS CLI Command Reference*.

get-resource-policy

The following code example shows how to use `get-resource-policy`.

AWS CLI

To retrieve the resource-based policy attached to a secret

The following `get-resource-policy` example retrieves the resource-based policy attached to a secret.

```
aws secretsmanager get-resource-policy \  
  --secret-id MyTestSecret
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-  
a1b2c3",  
  "Name": "MyTestSecret",  
  "ResourcePolicy": "{\n  \"Version\": \"2012-10-17\",  
  \"Statement\": [\n    {\n      \"Effect\":  
\\\"Allow\\\",  
      \"Principal\": {\n        \"AWS\": \"arn:aws:iam::123456789012:root\"\n      },  
      \"Action\":  
      \"secretsmanager:GetSecretValue\",  
      \"Resource\": \"*\"\n    }\n  ]\n}"
```

For more information, see [Authentication and access control](#) in the *Secrets Manager User Guide*.

- For API details, see [GetResourcePolicy](#) in *AWS CLI Command Reference*.

get-secret-value

The following code example shows how to use `get-secret-value`.

AWS CLI

Example 1: To retrieve the encrypted secret value of a secret

The following `get-secret-value` example gets the current secret value.

```
aws secretsmanager get-secret-value \  
  --secret-id MyTestSecret
```

```
--secret-id MyTestSecret
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
  "Name": "MyTestSecret",
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "SecretString": "{\"user\":\"diegor\",\"password\":\"EXAMPLE-PASSWORD\"}",
  "VersionStages": [
    "AWSCURRENT"
  ],
  "CreateDate": 1523477145.713
}
```

For more information, see [Retrieve a secret](#) in the *Secrets Manager User Guide*.

Example 2: To retrieve the previous secret value

The following `get-secret-value` example gets the previous secret value.:

```
aws secretsmanager get-secret-value \
  --secret-id MyTestSecret
  --version-stage AWSPREVIOUS
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
  "Name": "MyTestSecret",
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
  "SecretString": "{\"user\":\"diegor\",\"password\":\"PREVIOUS-EXAMPLE-PASSWORD
\"}",
  "VersionStages": [
    "AWSPREVIOUS"
  ],
  "CreateDate": 1523477145.713
}
```

For more information, see [Retrieve a secret](#) in the *Secrets Manager User Guide*.

- For API details, see [GetSecretValue](#) in *AWS CLI Command Reference*.

list-secret-version-ids

The following code example shows how to use `list-secret-version-ids`.

AWS CLI

To list all of the secret versions associated with a secret

The following `list-secret-version-ids` example gets a list of all of the versions of a secret.

```
aws secretsmanager list-secret-version-ids \  
  --secret-id MyTestSecret
```

Output:

```
{  
  "Versions": [  
    {  
      "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
      "VersionStages": [  
        "AWSPREVIOUS"  
      ],  
      "LastAccessedDate": 1523477145.713,  
      "CreateDate": 1523477145.713  
    },  
    {  
      "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
      "VersionStages": [  
        "AWSCURRENT"  
      ],  
      "LastAccessedDate": 1523477145.713,  
      "CreateDate": 1523486221.391  
    },  
    {  
      "CreateDate": 1.51197446236E9,  
      "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333;"  
    }  
  ],  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",
```

```
"Name": "MyTestSecret"  
}
```

For more information, see [Version](#) in the *Secrets Manager User Guide*.

- For API details, see [ListSecretVersionIds](#) in *AWS CLI Command Reference*.

list-secrets

The following code example shows how to use `list-secrets`.

AWS CLI

Example 1: To list the secrets in your account

The following `list-secrets` example gets a list of the secrets in your account.

```
aws secretsmanager list-secrets
```

Output:

```
{  
  "SecretList": [  
    {  
      "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",  
      "Name": "MyTestSecret",  
      "LastChangedDate": 1523477145.729,  
      "SecretVersionsToStages": {  
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [  
          "AWSCURRENT"  
        ]  
      }  
    },  
    {  
      "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:AnotherSecret-d4e5f6",  
      "Name": "AnotherSecret",  
      "LastChangedDate": 1523482025.685,  
      "SecretVersionsToStages": {  
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222": [  
          "AWSCURRENT"  
        ]  
      }  
    }  
  ]  
}
```

```
    ]
  }
}
]
```

For more information, see [Find a secret](#) in the *Secrets Manager User Guide*.

Example 2: To filter the list of secrets in your account

The following `list-secrets` example gets a list of the secrets in your account that have `Test` in the name. Filtering by name is case sensitive.

```
aws secretsmanager list-secrets \
  --filter Key="name",Values="Test"
```

Output:

```
{
  "SecretList": [
    {
      "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-a1b2c3",
      "Name": "MyTestSecret",
      "LastChangedDate": 1523477145.729,
      "SecretVersionsToStages": {
        "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111": [
          "AWSCURRENT"
        ]
      }
    }
  ]
}
```

For more information, see [Find a secret](#) in the *Secrets Manager User Guide*.

Example 3: To list the secrets in your account managed by another service

The following `list-secrets` example returns the secrets in your account that are managed by Amazon RDS.

```
aws secretsmanager list-secrets \
```

```
--filter Key="owning-service",Values="rds"
```

Output:

```
{
  "SecretList": [
    {
      "Name": "rds!cluster-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "Tags": [
        {
          "Value": "arn:aws:rds:us-
west-2:123456789012:cluster:database-1",
          "Key": "aws:rds:primaryDBClusterArn"
        },
        {
          "Value": "rds",
          "Key": "aws:secretsmanager:owningService"
        }
      ],
      "RotationRules": {
        "AutomaticallyAfterDays": 1
      },
      "LastChangedDate": 1673477781.275,
      "LastRotatedDate": 1673477781.26,
      "SecretVersionsToStages": {
        "a1b2c3d4-5678-90ab-cdef-EXAMPLEEaaaaa": [
          "AWSPREVIOUS"
        ],
        "a1b2c3d4-5678-90ab-cdef-EXAMPLEebbbbb": [
          "AWSCURRENT",
          "AWSPENDING"
        ]
      },
      "OwningService": "rds",
      "RotationEnabled": true,
      "CreatedDate": 1673467300.7,
      "LastAccessedDate": 1673395200.0,
      "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:rds!
cluster-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111-a1b2c3",
      "Description": "Secret associated with primary RDS DB cluster:
arn:aws:rds:us-west-2:123456789012:cluster:database-1"
    }
  ]
}
```

```
}
```

For more information, see [Secrets managed by other services](#) in the *Secrets Manager User Guide*.

- For API details, see [ListSecrets](#) in *AWS CLI Command Reference*.

put-resource-policy

The following code example shows how to use `put-resource-policy`.

AWS CLI

To add a resource-based policy to a secret

The following `put-resource-policy` example adds a permissions policy to a secret, checking first that the policy does not provide broad access to the secret. The policy is read from a file. For more information, see [Loading AWS CLI parameters from a file](#) in the *AWS CLI User Guide*.

```
aws secretsmanager put-resource-policy \  
  --secret-id MyTestSecret \  
  --resource-policy file://mypolicy.json \  
  --block-public-policy
```

Contents of `mypolicy.json`:

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Principal": {  
        "AWS": "arn:aws:iam::123456789012:role/MyRole"  
      },  
      "Action": "secretsmanager:GetSecretValue",  
      "Resource": "*"   
    }  
  ]  
}
```

Output:

```
{
```

```
"ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
  "Name": "MyTestSecret"
}
```

For more information, see [Attach a permissions policy to a secret](#) in the *Secrets Manager User Guide*.

- For API details, see [PutResourcePolicy](#) in *AWS CLI Command Reference*.

put-secret-value

The following code example shows how to use `put-secret-value`.

AWS CLI

Example 1: To store a new secret value in a secret

The following `put-secret-value` example creates a new version of a secret with two key-value pairs.

```
aws secretsmanager put-secret-value \
  --secret-id MyTestSecret \
  --secret-string "{\"user\": \"diegor\", \"password\": \"EXAMPLE-PASSWORD\"}"
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:MyTestSecret-1a2b3c",
  "Name": "MyTestSecret",
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "VersionStages": [
    "AWSCURRENT"
  ]
}
```

For more information, see [Modify a secret](#) in the *Secrets Manager User Guide*.

Example 2: To store a new secret value from credentials in a JSON file

The following `put-secret-value` example creates a new version of a secret from credentials in a file. For more information, see [Loading AWS CLI parameters from a file](#) in the *AWS CLI User Guide*.

```
aws secretsmanager put-secret-value \  
  --secret-id MyTestSecret \  
  --secret-string file://mycreds.json
```

Contents of `mycreds.json`:

```
{  
  "engine": "mysql",  
  "username": "saanvis",  
  "password": "EXAMPLE-PASSWORD",  
  "host": "my-database-endpoint.us-west-2.rds.amazonaws.com",  
  "dbname": "myDatabase",  
  "port": "3306"  
}
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-a1b2c3",  
  "Name": "MyTestSecret",  
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "VersionStages": [  
    "AWSCURRENT"  
  ]  
}
```

For more information, see [Modify a secret](#) in the *Secrets Manager User Guide*.

- For API details, see [PutSecretValue](#) in *AWS CLI Command Reference*.

remove-regions-from-replication

The following code example shows how to use `remove-regions-from-replication`.

AWS CLI

To delete a replica secret

The following `remove-regions-from-replication` example deletes a replica secret in `eu-west-3`. To delete a primary secret that is replicated to other regions, first delete the replicas and then call `delete-secret`.

```
aws secretsmanager remove-regions-from-replication \  
  --secret-id MyTestSecret \  
  --remove-replica-regions eu-west-3
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-  
west-2:123456789012:secret:MyTestSecret-1a2b3c",  
  "ReplicationStatus": []  
}
```

For more information, see [Delete a replica secret](#) in the *Secrets Manager User Guide*.

- For API details, see [RemoveRegionsFromReplication](#) in *AWS CLI Command Reference*.

replicate-secret-to-regions

The following code example shows how to use `replicate-secret-to-regions`.

AWS CLI

To replicate a secret to another region

The following `replicate-secret-to-regions` example replicates a secret to `eu-west-3`. The replica is encrypted with the AWS managed key `aws/secretsmanager`.

```
aws secretsmanager replicate-secret-to-regions \  
  --secret-id MyTestSecret \  
  --add-replica-regions Region=eu-west-3
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-  
west-2:123456789012:secret:MyTestSecret-1a2b3c",  
  "ReplicationStatus": [  
    {  
      "Region": "eu-west-3",  
      "Status": "REPLICATED"  
    }  
  ]  
}
```

```
{
  "Region": "eu-west-3",
  "KmsKeyId": "alias/aws/secretsmanager",
  "Status": "InProgress"
}
]
```

For more information, see [Replicate a secret to another Region](#) in the *Secrets Manager User Guide*.

- For API details, see [ReplicateSecretToRegions](#) in *AWS CLI Command Reference*.

restore-secret

The following code example shows how to use `restore-secret`.

AWS CLI

To restore a previously deleted secret

The following `restore-secret` example restores a secret that was previously scheduled for deletion.

```
aws secretsmanager restore-secret \
  --secret-id MyTestSecret
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
  "Name": "MyTestSecret"
}
```

For more information, see [Delete a secret](#) in the *Secrets Manager User Guide*.

- For API details, see [RestoreSecret](#) in *AWS CLI Command Reference*.

rotate-secret

The following code example shows how to use `rotate-secret`.

AWS CLI

Example 1: To configure and start automatic rotation for a secret

The following `rotate-secret` example configures and starts automatic rotation for a secret. Secrets Manager rotates the secret once immediately, and then every eight hours in a two hour window. The output shows the `VersionId` of the new secret version created by rotation.

```
aws secretsmanager rotate-secret \  
  --secret-id MyTestDatabaseSecret \  
  --rotation-lambda-arn arn:aws:lambda:us-  
west-2:1234566789012:function:SecretsManagerTestRotationLambda \  
  --rotation-rules "{\"ScheduleExpression\": \"cron(0 8/8 * * ? *)\", \"Duration  
\": \"2h\"}"
```

Output:

```
{  
  "ARN": "aws:arn:secretsmanager:us-  
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",  
  "Name": "MyTestDatabaseSecret",  
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
}
```

For more information, see [Rotate secrets](#) in the *Secrets Manager User Guide*.

Example 2: To configure and start automatic rotation on a rotation interval

The following `rotate-secret` example configures and starts automatic rotation for a secret. Secrets Manager rotates the secret once immediately, and then every 10 days. The output shows the `VersionId` of the new secret version created by rotation.

```
aws secretsmanager rotate-secret \  
  --secret-id MyTestDatabaseSecret \  
  --rotation-lambda-arn arn:aws:lambda:us-  
west-2:1234566789012:function:SecretsManagerTestRotationLambda \  
  --rotation-rules "{\"ScheduleExpression\": \"rate(10 days)\"}"
```

Output:

```
{
```

```
"ARN": "aws:arn:secretsmanager:us-  
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",  
  "Name": "MyTestDatabaseSecret",  
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
}
```

For more information, see [Rotate secrets](#) in the *Secrets Manager User Guide*.

Example 3: To rotate a secret immediately

The following `rotate-secret` example starts an immediate rotation. The output shows the `VersionId` of the new secret version created by rotation. The secret must already have rotation configured.

```
aws secretsmanager rotate-secret \  
  --secret-id MyTestDatabaseSecret
```

Output:

```
{  
  "ARN": "aws:arn:secretsmanager:us-  
west-2:123456789012:secret:MyTestDatabaseSecret-a1b2c3",  
  "Name": "MyTestDatabaseSecret",  
  "VersionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
}
```

For more information, see [Rotate secrets](#) in the *Secrets Manager User Guide*.

- For API details, see [RotateSecret](#) in *AWS CLI Command Reference*.

stop-replication-to-replica

The following code example shows how to use `stop-replication-to-replica`.

AWS CLI

To promote a replica secret to a primary

The following `stop-replication-to-replica` example removes the link between a replica secret to the primary. The replica secret is promoted to a primary secret in the replica region. You must call `stop-replication-to-replica` from within the replica region.

```
aws secretsmanager stop-replication-to-replica \  
  --secret-id MyTestSecret
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-  
a1b2c3"  
}
```

For more information, see [Promote a replica secret](#) in the *Secrets Manager User Guide*.

- For API details, see [StopReplicationToReplica](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

Example 1: To add a tag to a secret

The following example shows how to attach a tag with shorthand syntax.

```
aws secretsmanager tag-resource \  
  --secret-id MyTestSecret \  
  --tags Key=FirstTag,Value=FirstValue
```

This command produces no output.

For more information, see [Tag your secrets](#) in the *Secrets Manager User Guide*.

Example 2: To add multiple tags to a secret

The following tag-resource example attaches two key-value tags to a secret.

```
aws secretsmanager tag-resource \  
  --secret-id MyTestSecret \  
  --tags '[{"Key": "FirstTag", "Value": "FirstValue"}, {"Key": "SecondTag",  
"Value": "SecondValue"}]'
```

This command produces no output.

For more information, see [Tag secrets](#) in the *Secrets Manager User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a secret

The following `untag-resource` example removes two tags from a secret. For each tag, both key and value are removed.

```
aws secretsmanager untag-resource \  
  --secret-id MyTestSecret \  
  --tag-keys '[ "FirstTag", "SecondTag"]'
```

This command produces no output.

For more information, see [Tag secrets](#) in the *Secrets Manager User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-secret-version-stage

The following code example shows how to use `update-secret-version-stage`.

AWS CLI

Example 1: To revert a secret to the previous version

The following `update-secret-version-stage` example moves the `AWSCURRENT` staging label to the previous version of a secret, which reverts the secret to the previous version. To find the ID for the previous version, use `list-secret-version-ids`. For this example, the version with the `AWSCURRENT` label is `a1b2c3d4-5678-90ab-cdef-EXAMPLE11111` and the version with the `AWSPREVIOUS` label is `a1b2c3d4-5678-90ab-cdef-EXAMPLE22222`. In this example, you move the `AWSCURRENT` label from version 11111 to 22222. Because the `AWSCURRENT`

label is removed from a version, `update-secret-version-stage` automatically moves the `AWSPREVIOUS` label to that version (11111). The effect is that the `AWSCURRENT` and `AWSPREVIOUS` versions are swapped.

```
aws secretsmanager update-secret-version-stage \  
  --secret-id MyTestSecret \  
  --version-stage AWSCURRENT \  
  --move-to-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \  
  --remove-from-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-  
a1b2c3",  
  "Name": "MyTestSecret"  
}
```

For more information, see [Version](#) in the *Secrets Manager User Guide*.

Example 2: To add a staging label attached to a version of a secret

The following `update-secret-version-stage` example adds a staging label to a version of a secret. You can review the results by running `list-secret-version-ids` and viewing the `VersionStages` response field for the affected version.

```
aws secretsmanager update-secret-version-stage \  
  --secret-id MyTestSecret \  
  --version-stage STAGINGLABEL1 \  
  --move-to-version-id EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-  
a1b2c3",  
  "Name": "MyTestSecret"  
}
```

For more information, see [Version](#) in the *Secrets Manager User Guide*.

Example 3: To delete a staging label attached to a version of a secret

The following `update-secret-version-stage` example deletes a staging label that is attached to a version of a secret. You can review the results by running `list-secret-version-ids` and viewing the `VersionStages` response field for the affected version.

```
aws secretsmanager update-secret-version-stage \  
  --secret-id MyTestSecret \  
  --version-stage STAGINGLABEL1 \  
  --remove-from-version-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{  
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-  
a1b2c3",  
  "Name": "MyTestSecret"  
}
```

For more information, see [Version](#) in the *Secrets Manager User Guide*.

- For API details, see [UpdateSecretVersionStage](#) in *AWS CLI Command Reference*.

update-secret

The following code example shows how to use `update-secret`.

AWS CLI

Example 1: To update the description of a secret

The following `update-secret` example updates the description of a secret.

```
aws secretsmanager update-secret \  
  --secret-id MyTestSecret \  
  --description "This is a new description for the secret."
```

Output:

```
{
```

```
"ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
  "Name": "MyTestSecret"
}
```

For more information, see [Modify a secret](#) in the *Secrets Manager User Guide*.

Example 2: To update the encryption key associated with a secret

The following `update-secret` example updates the KMS key used to encrypt the secret value. The KMS key must be in the same region as the secret.

```
aws secretsmanager update-secret \
  --secret-id MyTestSecret \
  --kms-key-id arn:aws:kms:us-west-2:123456789012:key/EXAMPLE1-90ab-cdef-fedc-
ba987EXAMPLE
```

Output:

```
{
  "ARN": "arn:aws:secretsmanager:us-west-2:123456789012:secret:MyTestSecret-
a1b2c3",
  "Name": "MyTestSecret"
}
```

For more information, see [Modify a secret](#) in the *Secrets Manager User Guide*.

- For API details, see [UpdateSecret](#) in *AWS CLI Command Reference*.

validate-resource-policy

The following code example shows how to use `validate-resource-policy`.

AWS CLI

To validate a resource policy

The following `validate-resource-policy` example checks that a resource policy doesn't grant broad access to a secret. The policy is read from a file on disk. For more information, see [Loading AWS CLI parameters from a file](#) in the *AWS CLI User Guide*.

```
aws secretsmanager validate-resource-policy \
```

```
--resource-policy file://mypolicy.json
```

Contents of `mypolicy.json`:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:role/MyRole"
      },
      "Action": "secretsmanager:GetSecretValue",
      "Resource": "*"
    }
  ]
}
```

Output:

```
{
  "PolicyValidationPassed": true,
  "ValidationErrors": []
}
```

For more information, see [Permissions reference for Secrets Manager](#) in the *Secrets Manager User Guide*.

- For API details, see [ValidateResourcePolicy](#) in *AWS CLI Command Reference*.

Security Hub examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Security Hub.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

accept-administrator-invitation

The following code example shows how to use `accept-administrator-invitation`.

AWS CLI

To accept an invitation from an administrator account

The following `accept-administrator-invitation` example accepts the specified invitation from the specified administrator account.

```
aws securityhub accept-invitation \  
  --administrator-id 123456789012 \  
  --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb
```

This command produces no output.

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [AcceptAdministratorInvitation](#) in *AWS CLI Command Reference*.

accept-invitation

The following code example shows how to use `accept-invitation`.

AWS CLI

To accept an invitation from an administrator account

The following `accept-invitation` example accepts the specified invitation from the specified administrator account.

```
aws securityhub accept-invitation \  
  --master-id 123456789012 \  
  --invitation-id 7ab938c5d52d7904ad09f9e7c20cc4eb
```

This command produces no output.

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [AcceptInvitation](#) in *AWS CLI Command Reference*.

batch-delete-automation-rules

The following code example shows how to use `batch-delete-automation-rules`.

AWS CLI

To delete automation rules

The following `batch-delete-automation-rules` example deletes the specified automation rule. You can delete one or more rules with a single command. Only the Security Hub administrator account can run this command.

```
aws securityhub batch-delete-automation-rules \  
  --automation-rules-arns '["arn:aws:securityhub:us-  
east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]'
```

Output:

```
{  
  "ProcessedAutomationRules": [  
    "arn:aws:securityhub:us-east-1:123456789012:automation-rule/  
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
  ],  
  "UnprocessedAutomationRules": []  
}
```

For more information, see [Deleting automation rules](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchDeleteAutomationRules](#) in *AWS CLI Command Reference*.

batch-disable-standards

The following code example shows how to use batch-disable-standards.

AWS CLI

To disable a standard

The following batch-disable-standards example disables the standard associated with the specified subscription ARN.

```
aws securityhub batch-disable-standards \  
  --standards-subscription-arns "arn:aws:securityhub:us-  
west-1:123456789012:subscription/pci-dss/v/3.2.1"
```

Output:

```
{  
  "StandardsSubscriptions": [  
    {  
      "StandardsArn": "arn:aws:securityhub:eu-central-1::standards/pci-dss/  
v/3.2.1",  
      "StandardsInput": { },  
      "StandardsStatus": "DELETING",  
      "StandardsSubscriptionArn": "arn:aws:securityhub:us-  
west-1:123456789012:subscription/pci-dss/v/3.2.1"  
    }  
  ]  
}
```

For more information, see [Disabling or enabling a security standard](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchDisableStandards](#) in *AWS CLI Command Reference*.

batch-enable-standards

The following code example shows how to use batch-enable-standards.

AWS CLI

To enable a standard

The following `batch-enable-standards` example enables the PCI DSS standard for the requesting account.

```
aws securityhub batch-enable-standards \  
  --standards-subscription-requests '{"StandardsArn":"arn:aws:securityhub:us-  
west-1::standards/pci-dss/v/3.2.1"}'
```

Output:

```
{  
  "StandardsSubscriptions": [  
    {  
      "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/  
v/3.2.1",  
      "StandardsInput": { },  
      "StandardsStatus": "PENDING",  
      "StandardsSubscriptionArn": "arn:aws:securityhub:us-  
west-1:123456789012:subscription/pci-dss/v/3.2.1"  
    }  
  ]  
}
```

For more information, see [Disabling or enabling a security standard](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchEnableStandards](#) in *AWS CLI Command Reference*.

batch-get-automation-rules

The following code example shows how to use `batch-get-automation-rules`.

AWS CLI

To get details for automation rules

The following `batch-get-automation-rules` example gets details for the specified automation rule. You can get details for one or more automation rules with a single command.

```
aws securityhub batch-get-automation-rules \  
  --automation-rules-arns '['arn:aws:securityhub:us-  
east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"]'
```

Output:

```
{
  "Rules": [
    {
      "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "RuleStatus": "ENABLED",
      "RuleOrder": 1,
      "RuleName": "Suppress informational findings",
      "Description": "Suppress GuardDuty findings with Informational
severity",
      "IsTerminal": false,
      "Criteria": {
        "ProductName": [
          {
            "Value": "GuardDuty",
            "Comparison": "EQUALS"
          }
        ],
        "SeverityLabel": [
          {
            "Value": "INFORMATIONAL",
            "Comparison": "EQUALS"
          }
        ],
        "WorkflowStatus": [
          {
            "Value": "NEW",
            "Comparison": "EQUALS"
          }
        ],
        "RecordState": [
          {
            "Value": "ACTIVE",
            "Comparison": "EQUALS"
          }
        ]
      },
      "Actions": [
        {
          "Type": "FINDING_FIELDS_UPDATE",
          "FindingFieldsUpdate": {
            "Note": {
```

```

        "Text": "Automatically suppress GuardDuty findings with
Informational severity",
        "UpdatedBy": "sechub-automation"
    },
    "Workflow": {
        "Status": "SUPPRESSED"
    }
}
],
"CreatedAt": "2023-05-31T17:56:14.837000+00:00",
"UpdatedAt": "2023-05-31T17:59:38.466000+00:00",
"CreatedBy": "arn:aws:iam::123456789012:role/Admin"
}
],
"UnprocessedAutomationRules": []
}

```

For more information, see [Viewing automation rules](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchGetAutomationRules](#) in *AWS CLI Command Reference*.

batch-get-configuration-policy-associations

The following code example shows how to use `batch-get-configuration-policy-associations`.

AWS CLI

To get configuration association details for a batch of targets

The following `batch-get-configuration-policy-associations` example retrieves association details for the specified targets. You can provide account IDs, organizational unit IDs, or the root ID for the target.

```
aws securityhub batch-get-configuration-policy-associations \
  --target '{"OrganizationalUnitId": "ou-6hi7-8j91k12m"}
```

Output:

```
{
```

```

"ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
"TargetId": "ou-6hi7-8j91kl2m",
"TargetType": "ORGANIZATIONAL_UNIT",
"AssociationType": "APPLIED",
"UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
"AssociationStatus": "SUCCESS",
"AssociationStatusMessage": "Association applied successfully on this target."
}

```

For more information, see [Viewing Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchGetConfigurationPolicyAssociations](#) in *AWS CLI Command Reference*.

batch-get-security-controls

The following code example shows how to use `batch-get-security-controls`.

AWS CLI

To get security control details

The following `batch-get-security-controls` example gets details for the security controls ACM.1 and IAM.1 in the current AWS account and AWS Region.

```

aws securityhub batch-get-security-controls \
  --security-control-ids '["ACM.1", "IAM.1"]'

```

Output:

```

{
  "SecurityControls": [
    {
      "SecurityControlId": "ACM.1",
      "SecurityControlArn": "arn:aws:securityhub:us-east-2:123456789012:security-control/ACM.1",
      "Title": "Imported and ACM-issued certificates should be renewed after a specified time period",
      "Description": "This control checks whether an AWS Certificate Manager (ACM) certificate is renewed within the specified time period. It checks both imported certificates and certificates provided by ACM. The control fails if the

```

```

certificate isn't renewed within the specified time period. Unless you provide a
custom parameter value for the renewal period, Security Hub uses a default value of
30 days.",
    "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
ACM.1/remediation",
    "SeverityRating": "MEDIUM",
    "SecurityControlStatus": "ENABLED"
    "UpdateStatus": "READY",
    "Parameters": {
        "daysToExpiration": {
            "ValueType": CUSTOM,
            "Value": {
                "Integer": 15
            }
        }
    },
    "LastUpdateReason": "Updated control parameter"
},
{
    "SecurityControlId": "IAM.1",
    "SecurityControlArn": "arn:aws:securityhub:us-
east-2:123456789012:security-control/IAM.1",
    "Title": "IAM policies should not allow full \"*\" administrative
privileges",
    "Description": "This AWS control checks whether the default version of
AWS Identity and Access Management (IAM) policies (also known as customer managed
policies) do not have administrator access with a statement that has \"Effect\":
\"Allow\" with \"Action\": \"*\" over \"Resource\": \"*\". It only checks for
the Customer Managed Policies that you created, but not inline and AWS Managed
Policies.",
    "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/
IAM.1/remediation",
    "SeverityRating": "HIGH",
    "SecurityControlStatus": "ENABLED"
    "UpdateStatus": "READY",
    "Parameters": {}
}
]
}

```

For more information, see [Viewing details for a control](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchGetSecurityControls](#) in *AWS CLI Command Reference*.

batch-get-standards-control-associations

The following code example shows how to use `batch-get-standards-control-associations`.

AWS CLI

To get the enablement status of a control

The following `batch-get-standards-control-associations` example identifies whether the specified controls are enabled in the specified standards.

```
aws securityhub batch-get-standards-control-associations \
  --standards-control-association-ids '[{"SecurityControlId":
  "Config.1","StandardsArn": "arn:aws:securityhub:us-east-1:123456789012:ruleset/cis-
  aws-foundations-benchmark/v/1.2.0"}, {"SecurityControlId": "IAM.6","StandardsArn":
  "arn:aws:securityhub:us-east-1:123456789012:standards/aws-foundational-security-
  best-practices/v/1.0.0"}]'
```

Output:

```
{
  "StandardsControlAssociationDetails": [
    {
      "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-
      benchmark/v/1.2.0",
      "SecurityControlId": "Config.1",
      "SecurityControlArn": "arn:aws:securityhub:us-
      east-1:068873283051:security-control/Config.1",

foundational-security-best-practices/v/1.0.0/IAM.6"
    ]
  }
]
}

```

For more information, see [Enabling and disabling controls in specific standards](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchGetStandardsControlAssociations](#) in *AWS CLI Command Reference*.

batch-import-findings

The following code example shows how to use `batch-import-findings`.

AWS CLI

To update a finding

The following `batch-import-findings` example updates a finding.

```
aws securityhub batch-import-findings \
```

```

--findings '
  [{
    "AwsAccountId": "123456789012",
    "CreatedAt": "2020-05-27T17:05:54.832Z",
    "Description": "Vulnerability in a CloudTrail trail",
    "FindingProviderFields": {
      "Severity": {
        "Label": "LOW",
        "Original": "10"
      },
      "Types": [
        "Software and Configuration Checks/Vulnerabilities/CVE"
      ]
    },
    "GeneratorId": "TestGeneratorId",
    "Id": "Id1",
    "ProductArn": "arn:aws:securityhub:us-
west-1:123456789012:product/123456789012/default",
    "Resources": [
      {
        "Id": "arn:aws:cloudtrail:us-west-1:123456789012:trail/
TrailName",
        "Partition": "aws",
        "Region": "us-west-1",
        "Type": "AwsCloudTrailTrail"
      }
    ],
    "SchemaVersion": "2018-10-08",
    "Title": "CloudTrail trail vulnerability",
    "UpdatedAt": "2020-06-02T16:05:54.832Z"
  ]]'

```

Output:

```

{
  "FailedCount": 0,
  "SuccessCount": 1,
  "FailedFindings": []
}

```

For more information, see [Using BatchImportFindings to create and update findings](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchImportFindings](#) in *AWS CLI Command Reference*.

batch-update-automation-rules

The following code example shows how to use `batch-update-automation-rules`.

AWS CLI

To update automation rules

The following `batch-update-automation-rules` example updates the specified automation rule. You can update one or more rules with a single command. Only the Security Hub administrator account can run this command.

```
aws securityhub batch-update-automation-rules \
  --update-automation-rules-request-items '[ \
    { \
      "Actions": [{ \
        "Type": "FINDING_FIELDS_UPDATE", \
        "FindingFieldsUpdate": { \
          "Note": { \
            "Text": "Known issue that is a risk", \
            "UpdatedBy": "sechub-automation" \
          }, \
          "Workflow": { \
            "Status": "NEW" \
          } \
        } \
      }], \
      "Criteria": { \
        "SeverityLabel": [{ \
          "Value": "LOW", \
          "Comparison": "EQUALS" \
        }] \
      }, \
      "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111", \
      "RuleOrder": 1, \
      "RuleStatus": "DISABLED" \
    } \
  ]'
```

Output:

```
{
  "ProcessedAutomationRules": [
    "arn:aws:securityhub:us-east-1:123456789012:automation-rule/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
  ],
  "UnprocessedAutomationRules": []
}
```

For more information, see [Editing automation rules](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchUpdateAutomationRules](#) in *AWS CLI Command Reference*.

batch-update-findings

The following code example shows how to use `batch-update-findings`.

AWS CLI**Example 1: To update a finding**

The following `batch-update-findings` example updates two findings to add a note, change the severity label, and resolve it.

```
aws securityhub batch-update-findings \
  --finding-identifiers '[{"Id": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111", "ProductArn": "arn:aws:securityhub:us-
west-1::product/aws/securityhub"}, {"Id": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222", "ProductArn": "arn:aws:securityhub:us-
west-1::product/aws/securityhub"}]' \
  --note '{"Text": "Known issue that is not a risk.", "UpdatedBy": "user1"}' \
  --severity '{"Label": "LOW"}' \
  --workflow '{"Status": "RESOLVED"}'
```

Output:

```
{
  "ProcessedFindings": [
    {
```

```

        "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
    },
    {
        "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "ProductArn": "arn:aws:securityhub:us-west-1::product/aws/securityhub"
    }
],
"UnprocessedFindings": []
}

```

For more information, see [Using BatchUpdateFindings to update a finding](#) in the *AWS Security Hub User Guide*.

Example 2: To update a finding using shorthand syntax

The following `batch-update-findings` example updates two findings to add a note, change the severity label, and resolve it using shorthand syntax.

```

aws securityhub batch-update-findings \
  --finding-identifiers Id="arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",ProductArn="arn:aws:securityhub:us-west-1::product/aws/securityhub" Id="arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",ProductArn="arn:aws:securityhub:us-west-1::product/aws/securityhub" \
  --note Text="Known issue that is not a risk.",UpdatedBy="user1" \
  --severity Label="LOW" \
  --workflow Status="RESOLVED"

```

Output:

```

{
  "ProcessedFindings": [
    {
      "Id": "arn:aws:securityhub:us-west-1:123456789012:subscription/pci-dss/v/3.2.1/PCI.Lambda.2/finding/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

    }
  ],
  "UnprocessedFindings": []
}

```

For more information, see [Using BatchUpdateFindings to update a finding](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchUpdateFindings](#) in *AWS CLI Command Reference*.

batch-update-standards-control-associations

The following code example shows how to use `batch-update-standards-control-associations`.

AWS CLI

To update the enablement status of a control in enabled standards

The following `batch-update-standards-control-associations` example disables `CloudTrail.1` in the specified standards.

```

aws securityhub batch-update-standards-control-associations \
  --standards-control-association-updates '[{"SecurityControlId": "CloudTrail.1",
"StandardsArn": "arn:aws:securityhub::ruleset/cis-aws-foundations-benchmark/
v/1.2.0", "AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable
to environment"}, {"SecurityControlId": "CloudTrail.1", "StandardsArn":
"arn:aws:securityhub::standards/cis-aws-foundations-benchmark/v/1.4.0",
"AssociationStatus": "DISABLED", "UpdatedReason": "Not applicable to
environment"}]'

```

This command produces no output when successful.

For more information, see [Enabling and disabling controls in specific standards](#) and [Enabling and disabling controls in all standards](#) in the *AWS Security Hub User Guide*.

- For API details, see [BatchUpdateStandardsControlAssociations](#) in *AWS CLI Command Reference*.

create-action-target

The following code example shows how to use `create-action-target`.

AWS CLI

To create a custom action

The following `create-action-target` example creates a custom action. It provides the name, description, and identifier for the action.

```
aws securityhub create-action-target \  
  --name "Send to remediation" \  
  --description "Action to send the finding for remediation tracking" \  
  --id "Remediation"
```

Output:

```
{  
  "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/custom/  
Remediation"  
}
```

For more information, see [Creating a custom action and associating it with a CloudWatch Events rule](#) in the *AWS Security Hub User Guide*.

- For API details, see [CreateActionTarget](#) in *AWS CLI Command Reference*.

create-automation-rule

The following code example shows how to use `create-automation-rule`.

AWS CLI

To create an automation rule

The following `create-automation-rule` example creates an automation rule in the current AWS account and AWS Region. Security Hub filters your findings based on the specified criteria and applies the actions to matching findings. Only the Security Hub administrator account can run this command.

```
aws securityhub create-automation-rule \  

```

```

--actions '[{ \
  "Type": "FINDING_FIELDS_UPDATE", \
  "FindingFieldsUpdate": { \
    "Severity": { \
      "Label": "HIGH" \
    }, \
    "Note": { \
      "Text": "Known issue that is a risk. Updated by automation rules", \
      "UpdatedBy": "sechub-automation" \
    } \
  } \
}]' \
--criteria '{ \
  "SeverityLabel": [{ \
    "Value": "INFORMATIONAL", \
    "Comparison": "EQUALS" \
  }] \
}' \
--description "A sample rule" \
--no-is-terminal \
--rule-name "sample rule" \
--rule-order 1 \
--rule-status "ENABLED"

```

Output:

```

{
  "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}

```

For more information, see [Creating automation rules](#) in the *AWS Security Hub User Guide*.

- For API details, see [CreateAutomationRule](#) in *AWS CLI Command Reference*.

create-configuration-policy

The following code example shows how to use create-configuration-policy.

AWS CLI

To create a configuration policy

The following `create-configuration-policy` example creates a configuration policy with the specified settings.

```
aws securityhub create-configuration-policy \
  --name "SampleConfigurationPolicy" \
  --description "SampleDescription" \
  --configuration-policy '{"SecurityHub": {"ServiceEnabled":
true, "EnabledStandardIdentifiers": ["arn:aws:securityhub:eu-
central-1::standards/aws-foundational-security-best-practices/
v/1.0.0", "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"], "SecurityControlsConfiguration": {"DisabledSecurityControlIdentifiers":
["CloudTrail.2"], "SecurityControlCustomParameters": [{"SecurityControlId":
"ACM.1", "Parameters": {"daysToExpiration": {"ValueType": "CUSTOM", "Value":
{"Integer": 15}}}]}}}' \
  --tags '{"Environment": "Prod"}'
```

Output:

```
{
  "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "Name": "SampleConfigurationPolicy",
  "Description": "SampleDescription",
  "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
  "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
  "ConfigurationPolicy": {
    "SecurityHub": {
      "ServiceEnabled": true,
      "EnabledStandardIdentifiers": [
        "arn:aws:securityhub:eu-central-1::standards/aws-foundational-
security-best-practices/v/1.0.0",
        "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
      ],
      "SecurityControlsConfiguration": {
        "DisabledSecurityControlIdentifiers": [
          "CloudTrail.2"
        ],
        "SecurityControlCustomParameters": [
          {
            "SecurityControlId": "ACM.1",
            "Parameters": {
```

```
    "daysToExpiration": {
      "ValueType": "CUSTOM",
      "Value": {
        "Integer": 15
      }
    }
  }
}
]
```

For more information, see [Creating and associating Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

- For API details, see [CreateConfigurationPolicy](#) in *AWS CLI Command Reference*.

create-finding-aggregator

The following code example shows how to use `create-finding-aggregator`.

AWS CLI

To enable finding aggregation

The following `create-finding-aggregator` example configures finding aggregation. It is run from US East (Virginia), which designates US East (Virginia) as the aggregation Region. It indicates to only link specified Regions, and to not automatically link new Regions. It selects US West (N. California) and US West (Oregon) as the linked Regions.

```
aws securityhub create-finding-aggregator \
  --region us-east-1 \
  --region-linking-mode SPECIFIED_REGIONS \
  --regions us-west-1,us-west-2
```

Output:

```
{
  "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:222222222222:finding-
  aggregator/123e4567-e89b-12d3-a456-426652340000",
```

```
"FindingAggregationRegion": "us-east-1",
"RegionLinkingMode": "SPECIFIED_REGIONS",
"Regions": "us-west-1,us-west-2"
}
```

For more information, see [Enabling finding aggregation](#) in the *AWS Security Hub User Guide*.

- For API details, see [CreateFindingAggregator](#) in *AWS CLI Command Reference*.

create-insight

The following code example shows how to use `create-insight`.

AWS CLI

To create a custom insight

The following `create-insight` example creates a custom insight named `Critical role findings` that returns critical findings that are related to AWS roles.

```
aws securityhub create-insight \
  --filters '{"ResourceType": [{ "Comparison": "EQUALS", "Value": "AwsIamRole"}],
  "SeverityLabel": [{"Comparison": "EQUALS", "Value": "CRITICAL"}]}' \
  --group-by-attribute "ResourceId" \
  --name "Critical role findings"
```

Output:

```
{
  "InsightArn": "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/
  custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see [Managing custom insights](#) in the *AWS Security Hub User Guide*.

- For API details, see [CreateInsight](#) in *AWS CLI Command Reference*.

create-members

The following code example shows how to use `create-members`.

AWS CLI

To add accounts as member accounts

The following `create-members` example adds two accounts as member accounts to the requesting administrator account.

```
aws securityhub create-members \  
  --account-details '[{"AccountId": "123456789111"}, {"AccountId":  
  "123456789222"}]'
```

Output:

```
{  
  "UnprocessedAccounts": []  
}
```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [CreateMembers](#) in *AWS CLI Command Reference*.

decline-invitations

The following code example shows how to use `decline-invitations`.

AWS CLI

To decline an invitation to be a member account

The following `decline-invitations` example declines an invitation to be a member account of the specified administrator account. The member account is the requesting account.

```
aws securityhub decline-invitations \  
  --account-ids "123456789012"
```

Output:

```
{  
  "UnprocessedAccounts": []  
}
```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [DeclineInvitations](#) in *AWS CLI Command Reference*.

delete-action-target

The following code example shows how to use `delete-action-target`.

AWS CLI

To delete a custom action

The following `delete-action-target` example deletes the custom action identified by the specified ARN.

```
aws securityhub delete-action-target \  
    --action-target-arn "arn:aws:securityhub:us-west-1:123456789012:action/custom/  
Remediation"
```

Output:

```
{  
  "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/custom/  
Remediation"  
}
```

For more information, see [Creating a custom action and associating it with a CloudWatch Events rule](#) in the *AWS Security Hub User Guide*.

- For API details, see [DeleteActionTarget](#) in *AWS CLI Command Reference*.

delete-configuration-policy

The following code example shows how to use `delete-configuration-policy`.

AWS CLI

To delete a configuration policy

The following `delete-configuration-policy` example deletes the specified configuration policy.

```
aws securityhub delete-configuration-policy \  
  --identifier "arn:aws:securityhub:eu-central-1:123456789012:configuration-  
policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

This command produces no output.

For more information, see [Deleting and disassociating Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

- For API details, see [DeleteConfigurationPolicy](#) in *AWS CLI Command Reference*.

delete-finding-aggregator

The following code example shows how to use delete-finding-aggregator.

AWS CLI

To stop finding aggregation

The following delete-finding-aggregator example stops finding aggregation. It is run from US East (Virginia), which is the aggregation Region.

```
aws securityhub delete-finding-aggregator \  
  --region us-east-1 \  
  --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-  
aggregator/123e4567-e89b-12d3-a456-426652340000
```

This command produces no output.

For more information, see [Stopping finding aggregation](#) in the *AWS Security Hub User Guide*.

- For API details, see [DeleteFindingAggregator](#) in *AWS CLI Command Reference*.

delete-insight

The following code example shows how to use delete-insight.

AWS CLI

To delete a custom insight

The following `delete-insight` example deletes the custom insight with the specified ARN.

```
aws securityhub delete-insight \  
  --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/  
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE111111"
```

Output:

```
{  
  "InsightArn": "arn:aws:securityhub:eu-  
central-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-  
EXAMPLE111111"  
}
```

For more information, see [Managing custom insights](#) in the *AWS Security Hub User Guide*.

- For API details, see [DeleteInsight](#) in *AWS CLI Command Reference*.

delete-invitations

The following code example shows how to use `delete-invitations`.

AWS CLI

To delete an invitation to be a member account

The following `delete-invitations` example deletes an invitation to be a member account for the specified administrator account. The member account is the requesting account.

```
aws securityhub delete-invitations \  
  --account-ids "123456789012"
```

Output:

```
{  
  "UnprocessedAccounts": []  
}
```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [DeleteInvitations](#) in *AWS CLI Command Reference*.

delete-members

The following code example shows how to use delete-members.

AWS CLI

To delete member accounts

The following delete-members example deletes the specified member accounts from the requesting administrator account.

```
aws securityhub delete-members \  
  --account-ids "123456789111" "123456789222"
```

Output:

```
{  
  "UnprocessedAccounts": []  
}
```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [DeleteMembers](#) in *AWS CLI Command Reference*.

describe-action-targets

The following code example shows how to use describe-action-targets.

AWS CLI

To retrieve details about custom actions

The following describe-action-targets example retrieves information about the custom action identified by the specified ARN.

```
aws securityhub describe-action-targets \  
  --action-target-arns "arn:aws:securityhub:us-west-1:123456789012:action/custom/  
  Remediation"
```

Output:

```
{
  "ActionTargets": [
    {
      "ActionTargetArn": "arn:aws:securityhub:us-west-1:123456789012:action/
custom/Remediation",
      "Description": "Action to send the finding for remediation tracking",
      "Name": "Send to remediation"
    }
  ]
}
```

For more information, see [Creating a custom action and associating it with a CloudWatch Events rule](#) in the *AWS Security Hub User Guide*.

- For API details, see [DescribeActionTargets](#) in *AWS CLI Command Reference*.

describe-hub

The following code example shows how to use `describe-hub`.

AWS CLI**To get information about a hub resource**

The following `describe-hub` example returns the subscription date for the specified hub resource. The hub resource is identified by its ARN.

```
aws securityhub describe-hub \
  --hub-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default"
```

Output:

```
{
  "HubArn": "arn:aws:securityhub:us-west-1:123456789012:hub/default",
  "SubscribedAt": "2019-11-19T23:15:10.046Z"
}
```

For more information, see [AWS::SecurityHub::Hub](#) in the *AWS CloudFormation User Guide*.

- For API details, see [DescribeHub](#) in *AWS CLI Command Reference*.

describe-organization-configuration

The following code example shows how to use `describe-organization-configuration`.

AWS CLI

To view how Security Hub is configured for an organization

The following `describe-organization-configuration` example returns information about the way an organization is configured in Security Hub. In this example, the organization uses central configuration. Only the Security Hub administrator account can run this command.

```
aws securityhub describe-organization-configuration
```

Output:

```
{
  "AutoEnable": false,
  "MemberAccountLimitReached": false,
  "AutoEnableStandards": "NONE",
  "OrganizationConfiguration": {
    "ConfigurationType": "LOCAL",
    "Status": "ENABLED",
    "StatusMessage": "Central configuration has been enabled successfully"
  }
}
```

For more information, see [Managing accounts with AWS Organizations](#) in the *AWS Security Hub User Guide*.

- For API details, see [DescribeOrganizationConfiguration](#) in *AWS CLI Command Reference*.

describe-products

The following code example shows how to use `describe-products`.

AWS CLI

To return information about available product integrations

The following `describe-products` example returns the available product integrations one at a time.

```
aws securityhub describe-products \
  --max-results 1
```

Output:

```
{
  "NextToken": "U2FsdGVkX18vvP10qb7RD1rWRWVFBJI46M0IAb+nZmRJmR15NoRi2gm13sdQEn30/pq/78dGs+bKpgA+7HMPH00qX33/zoRI+uIG/F9yLNhc0r0WzFUdy36JcXLQji3Rpnn/cD1SVkGA98qI3zPOSDg==",
  "Products": [
    {
      "ProductArn": "arn:aws:securityhub:us-west-1:123456789333:product/crowdstrike/crowdstrike-falcon",
      "ProductName": "CrowdStrike Falcon",
      "CompanyName": "CrowdStrike",
      "Description": "CrowdStrike Falcon's single lightweight sensor unifies next-gen antivirus, endpoint detection and response, and 24/7 managed hunting, via the cloud.",
      "Categories": [
        "Endpoint Detection and Response (EDR)",
        "AV Scanning and Sandboxing",
        "Threat Intelligence Feeds and Reports",
        "Endpoint Forensics",
        "Network Forensics"
      ],
      "IntegrationTypes": [

      "ProductSubscriptionResourcePolicy": "{\"Version\": \"2012-10-17\", \"Statement\": [{\"Effect\": \"Allow\", \"Principal\": {\"AWS\": \"123456789333\"}, \"Action\": [\"securityhub:BatchImportFindings\"], \"Resource\": \"arn:aws:securityhub:us-west-1:123456789012:product-subscription/crowdstrike/crowdstrike-falcon\", \"Condition\": {\"StringEquals\": {\"securityhub:TargetAccount\": \"123456789012\"}}}], {\"Effect\": \"Allow\", \"Principal\": {\"AWS\": \"123456789012\"}, \"Action\": [\"securityhub:BatchImportFindings\"], \"Resource\": \"arn:aws:securityhub:us-west-1:123456789333:product/crowdstrike/crowdstrike-falcon\", \"Condition\": {\"StringEquals\": {\"securityhub:TargetAccount\": \"123456789012\"}}}]}"
    }
  ]
}
```

```
}
```

For more information, see [Managing product integrations](#) in the *AWS Security Hub User Guide*.

- For API details, see [DescribeProducts](#) in *AWS CLI Command Reference*.

describe-standards-controls

The following code example shows how to use `describe-standards-controls`.

AWS CLI

To request the list of controls in an enabled standard

The following `describe-standards-controls` example requests the list of controls in the requestor account's subscription to the PCI DSS standard. The request returns two controls at a time.

```
aws securityhub describe-standards-controls \
  --standards-subscription-arn "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1" \
  --max-results 2
```

Output:

```
{
  "Controls": [
    {
      "StandardsControlArn": "arn:aws:securityhub:us-
west-1:123456789012:control/pci-dss/v/3.2.1/PCI.AutoScaling.1",

```

For more information, see [Viewing details for controls](#) in the *AWS Security Hub User Guide*.

- For API details, see [DescribeStandardsControls](#) in *AWS CLI Command Reference*.

describe-standards

The following code example shows how to use describe-standards.

AWS CLI

To return a list of available standards

The following describe-standards example returns the list of available standards.

```
aws securityhub describe-standards
```

Output:

```
{
  "Standards": [
    {
      "StandardsArn": "arn:aws:securityhub:us-west-1::standards/aws-
foundational-security-best-practices/v/1.0.0",
      "Name": "AWS Foundational Security Best Practices v1.0.0",
      "Description": "The AWS Foundational Security Best Practices standard
is a set of automated security checks that detect when AWS accounts and deployed
resources do not align to security best practices. The standard is defined by AWS
security experts. This curated set of controls helps improve your security posture
in AWS, and cover AWS's most popular and foundational services.",
      "EnabledByDefault": true
    },
    {
      "StandardsArn": "arn:aws:securityhub:::ruleset/cis-aws-foundations-
benchmark/v/1.2.0",
      "Name": "CIS AWS Foundations Benchmark v1.2.0",
      "Description": "The Center for Internet Security (CIS) AWS Foundations
Benchmark v1.2.0 is a set of security configuration best practices for AWS. This
Security Hub standard automatically checks for your compliance readiness against a
subset of CIS requirements.",
      "EnabledByDefault": true
    },
    {
      "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/
v/3.2.1",
      "Name": "PCI DSS v3.2.1",
      "Description": "The Payment Card Industry Data Security Standard (PCI
DSS) v3.2.1 is an information security standard for entities that store, process,
and/or transmit cardholder data. This Security Hub standard automatically checks
for your compliance readiness against a subset of PCI DSS requirements.",
      "EnabledByDefault": false
    }
  ]
}
```

For more information, see [Security standards in AWS Security Hub](#) in the *AWS Security Hub User Guide*.

- For API details, see [DescribeStandards](#) in *AWS CLI Command Reference*.

disable-import-findings-for-product

The following code example shows how to use `disable-import-findings-for-product`.

AWS CLI

To stop receiving findings from a product integration

The following `disable-import-findings-for-product` example disables the flow of findings for the specified subscription to a product integration.

```
aws securityhub disable-import-findings-for-product \  
  --product-subscription-arn "arn:aws:securityhub:us-west-1:123456789012:product-  
subscription/crowdstrike/crowdstrike-falcon"
```

This command produces no output.

For more information, see [Managing product integrations](#) in the *AWS Security Hub User Guide*.

- For API details, see [DisableImportFindingsForProduct](#) in *AWS CLI Command Reference*.

disable-organization-admin-account

The following code example shows how to use `disable-organization-admin-account`.

AWS CLI

To remove a Security Hub administrator account

The following `disable-organization-admin-account` example revokes the specified account's assignment as a Security Hub administrator account for AWS Organizations.

```
aws securityhub disable-organization-admin-account \  
  --admin-account-id 777788889999
```

This command produces no output.

For more information, see [Designating a Security Hub administrator account](#) in the *AWS Security Hub User Guide*.

- For API details, see [DisableOrganizationAdminAccount](#) in *AWS CLI Command Reference*.

disable-security-hub

The following code example shows how to use `disable-security-hub`.

AWS CLI

To disable AWS Security Hub

The following `disable-security-hub` example disables AWS Security Hub for the requesting account.

```
aws securityhub disable-security-hub
```

This command produces no output.

For more information, see [Disabling AWS Security Hub](#) in the *AWS Security Hub User Guide*.

- For API details, see [DisableSecurityHub](#) in *AWS CLI Command Reference*.

disassociate-from-administrator-account

The following code example shows how to use `disassociate-from-administrator-account`.

AWS CLI

To disassociate from an administrator account

The following `disassociate-from-administrator-account` example disassociates the requesting account from its current administrator account.

```
aws securityhub disassociate-from-administrator-account
```

This command produces no output.

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [DisassociateFromAdministratorAccount](#) in *AWS CLI Command Reference*.

disassociate-from-master-account

The following code example shows how to use `disassociate-from-master-account`.

AWS CLI

To disassociate from an administrator account

The following `disassociate-from-master-account` example disassociates the requesting account from its current administrator account.

```
aws securityhub disassociate-from-master-account
```

This command produces no output.

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [DisassociateFromMasterAccount](#) in *AWS CLI Command Reference*.

disassociate-members

The following code example shows how to use `disassociate-members`.

AWS CLI

To disassociate member accounts

The following `disassociate-members` example disassociates the specified member accounts from the requesting administrator account.

```
aws securityhub disassociate-members \  
  --account-ids "123456789111" "123456789222"
```

This command produces no output.

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [DisassociateMembers](#) in *AWS CLI Command Reference*.

enable-import-findings-for-product

The following code example shows how to use `enable-import-findings-for-product`.

AWS CLI

To start receiving findings from a product integration

The following `enable-import-findings-for-product` example enables the flow of findings from the specified product integration.

```
aws securityhub enable-import-findings-for-product \  
  --product-arn "arn:aws:securityhub:us-east-1:123456789333:product/crowdstrike/  
crowdstrike-falcon"
```

Output:

```
{  
  "ProductSubscriptionArn": "arn:aws:securityhub:us-east-1:123456789012:product-  
subscription/crowdstrike/crowdstrike-falcon"  
}
```

For more information, see [Managing product integrations](#) in the *AWS Security Hub User Guide*.

- For API details, see [EnableImportFindingsForProduct](#) in *AWS CLI Command Reference*.

enable-organization-admin-account

The following code example shows how to use `enable-organization-admin-account`.

AWS CLI

To designate an organization account as a Security Hub administrator account

The following `enable-organization-admin-account` example designates the specified account as a Security Hub administrator account.

```
aws securityhub enable-organization-admin-account \  
  --admin-account-id 777788889999
```

This command produces no output.

For more information, see [Designating a Security Hub administrator account](#) in the *AWS Security Hub User Guide*.

- For API details, see [EnableOrganizationAdminAccount](#) in *AWS CLI Command Reference*.

enable-security-hub

The following code example shows how to use `enable-security-hub`.

AWS CLI

To enable AWS Security Hub

The following `enable-security-hub` example enables AWS Security Hub for the requesting account. It configures Security Hub to enable the default standards. For the hub resource, it assigns the value `Security` to the tag `Department`.

```
aws securityhub enable-security-hub \  
  --enable-default-standards \  
  --tags '{"Department": "Security"}'
```

This command produces no output.

For more information, see [Enabling Security Hub](#) in the *AWS Security Hub User Guide*.

- For API details, see [EnableSecurityHub](#) in *AWS CLI Command Reference*.

get-administrator-account

The following code example shows how to use `get-administrator-account`.

AWS CLI

To retrieve information about an administrator account

The following `get-administrator-account` example retrieves information about the administrator account for the requesting account.

```
aws securityhub get-administrator-account
```

Output:

```
{
  "Master": {
    "AccountId": "123456789012",
    "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
    "InvitedAt": 2020-06-01T20:21:18.042000+00:00,
    "MemberStatus": "ASSOCIATED"
  }
}
```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetAdministratorAccount](#) in *AWS CLI Command Reference*.

get-configuration-policy-association

The following code example shows how to use `get-configuration-policy-association`.

AWS CLI

To get configuration association details for a target

The following `get-configuration-policy-association` example retrieves association details for the specified target. You can provide an account ID, organizational unit ID, or the root ID for the target.

```
aws securityhub get-configuration-policy-association \
  --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```
{
  "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
  "TargetId": "ou-6hi7-8j91kl2m",
  "TargetType": "ORGANIZATIONAL_UNIT",
  "AssociationType": "APPLIED",
  "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",
  "AssociationStatus": "SUCCESS",
  "AssociationStatusMessage": "Association applied successfully on this target."
}
```

For more information, see [Viewing Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetConfigurationPolicyAssociation](#) in *AWS CLI Command Reference*.

get-configuration-policy

The following code example shows how to use `get-configuration-policy`.

AWS CLI

To view configuration policy details

The following `get-configuration-policy` example retrieves details about the specified configuration policy.

```
aws securityhub get-configuration-policy \  
  --identifier "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/  
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{  
  "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/  
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

v/1.2.0"  
      ],  
      "SecurityControlsConfiguration": {  
        "DisabledSecurityControlIdentifiers": [  
          "CloudTrail.2"  
        ],  
      }  
    }  
  }  
}
```

```

    "SecurityControlCustomParameters": [
      {
        "SecurityControlId": "ACM.1",
        "Parameters": {
          "daysToExpiration": {
            "ValueType": "CUSTOM",
            "Value": {
              "Integer": 15
            }
          }
        }
      }
    ]
  }
}

```

For more information, see [Viewing Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetConfigurationPolicy](#) in *AWS CLI Command Reference*.

get-enabled-standards

The following code example shows how to use `get-enabled-standards`.

AWS CLI

To retrieve information about an enabled standard

The following `get-enabled-standards` example retrieves information about the PCI DSS standard.

```

aws securityhub get-enabled-standards \
  --standards-subscription-arn "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"

```

Output:

```

{
  "StandardsSubscriptions": [
    {

```

```

        "StandardsArn": "arn:aws:securityhub:us-west-1::standards/pci-dss/
v/3.2.1",
        "StandardsInput": { },
        "StandardsStatus": "READY",
        "StandardsSubscriptionArn": "arn:aws:securityhub:us-
west-1:123456789012:subscription/pci-dss/v/3.2.1"
    }
]
}

```

For more information, see [Security standards in AWS Security Hub](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetEnabledStandards](#) in *AWS CLI Command Reference*.

get-finding-aggregator

The following code example shows how to use `get-finding-aggregator`.

AWS CLI

To retrieve the current finding aggregation configuration

The following `get-finding-aggregator` example retrieves the current finding aggregation configuration.

```

aws securityhub get-finding-aggregator \
  --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-
aggregator/123e4567-e89b-12d3-a456-426652340000

```

Output:

```

{
  "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:222222222222:finding-
aggregator/123e4567-e89b-12d3-a456-426652340000",
  "FindingAggregationRegion": "us-east-1",
  "RegionLinkingMode": "SPECIFIED_REGIONS",
  "Regions": "us-west-1,us-west-2"
}

```

For more information, see [Viewing the current finding aggregation configuration](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetFindingAggregator](#) in *AWS CLI Command Reference*.

get-finding-history

The following code example shows how to use `get-finding-history`.

AWS CLI

To get finding history

The following `get-finding-history` example gets up to the last 90 days of history for the specified finding. In this example, the results are limited to two records of finding history.

```
aws securityhub get-finding-history \
  --finding-identifier Id="arn:aws:securityhub:us-
east-1:123456789012:security-control/S3.17/finding/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111",ProductArn="arn:aws:securityhub:us-east-1::product/aws/securityhub"
```

Output:

```
{
  "Records": [
    {
      "FindingIdentifier": {
        "Id": "arn:aws:securityhub:us-east-1:123456789012:security-control/

    "Updates": []
}
]
}

```

For more information, see [Finding history](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetFindingHistory](#) in *AWS CLI Command Reference*.

get-findings

The following code example shows how to use get-findings.

AWS CLI

Example 1: To return findings generated for a specific standard

The following get-findings example returns findings for the PCI DSS standard.

```
aws securityhub get-findings \  
  --filters '{"GeneratorId":[{"Value": "pci-dss","Comparison":"PREFIX"}]}' \  
  --max-items 1
```

Output:

```
{  
  "Findings": [  
    {  
      "SchemaVersion": "2018-10-08",  
      "Id": "arn:aws:securityhub:eu-central-1:123456789012:subscription/pci-

Example 2: To return critical-severity findings that have a workflow status of NOTIFIED

The following `get-findings` example returns findings that have a severity label value of `CRITICAL` and a workflow status of `NOTIFIED`. The results are sorted in descending order by the value of `Confidence`.

```

aws securityhub get-findings \
  --filters '{"SeverityLabel":[{"Value":
"CRITICAL","Comparison":"EQUALS"}],"WorkflowStatus":
[{"Value":"NOTIFIED","Comparison":"EQUALS"}]}' \
  --sort-criteria '{ "Field": "Confidence", "SortOrder": "desc"}' \
  --max-items 1

```

Output:

```

{
  "Findings": [
    {

get-insight-results

The following code example shows how to use `get-insight-results`.

AWS CLI

To retrieve the results for an insight

The following `get-insight-results` example returns the list of insight results for the insight with the specified ARN.

```
aws securityhub get-insight-results \  
  --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/  
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{  
  "InsightResults": {  
    "GroupByAttribute": "ResourceId",  
    "InsightArn": "arn:aws:securityhub:us-  
west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-  
EXAMPLE11111",  
    "ResultValues": [  
      {  
        "Count": 10,  
        "GroupByAttributeValue": "AWS:::Account:123456789111"  
      },  
      {  
        "Count": 3,  
        "GroupByAttributeValue": "AWS:::Account:123456789222"  
      }  
    ]  
  }  
}
```

For more information, see [Viewing and taking action on insight results and findings](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetInsightResults](#) in *AWS CLI Command Reference*.

get-insights

The following code example shows how to use `get-insights`.

AWS CLI

To retrieve details about an insight

The following `get-insights` example retrieves the configuration details for the insight with the specified ARN.

```
aws securityhub get-insights \  
  --insight-arns "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/  
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
```

Output:

```
{  
  "Insights": [  
    {  
      "Filters": {  
        "ResourceType": [  
          {  
            "Comparison": "EQUALS",  
            "Value": "AwsIamRole"  
          }  
        ],  
        "SeverityLabel": [  
          {  
            "Comparison": "EQUALS",  
            "Value": "CRITICAL"  
          }  
        ],  
      },  
      "GroupByAttribute": "ResourceId",  
      "InsightArn": "arn:aws:securityhub:us-

EXAMPLE11111",  
      "Name": "Critical role findings"  
    }  
  ]  
}
```

For more information, see [Insights in AWS Security Hub](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetInsights](#) in *AWS CLI Command Reference*.

get-invitations-count

The following code example shows how to use `get-invitations-count`.

AWS CLI

To retrieve the number of invitations that were not accepted

The following `get-invitations-count` example retrieves the number of invitations that the requesting account declined or did not respond to.

```
aws securityhub get-invitations-count
```

Output:

```
{
  "InvitationsCount": 3
}
```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetInvitationsCount](#) in *AWS CLI Command Reference*.

get-master-account

The following code example shows how to use `get-master-account`.

AWS CLI

To retrieve information about an administrator account

The following `get-master-account` example retrieves information about the administrator account for the requesting account.

```
aws securityhub get-master-account
```

Output:

```
{
```

```
"Master": {
  "AccountId": "123456789012",
  "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
  "InvitedAt": 2020-06-01T20:21:18.042000+00:00,
  "MemberStatus": "ASSOCIATED"
}
```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetMasterAccount](#) in *AWS CLI Command Reference*.

get-members

The following code example shows how to use `get-members`.

AWS CLI

To retrieve information about selected member accounts

The following `get-members` example retrieves information about the specified member accounts.

```
aws securityhub get-members \
  --account-ids "444455556666" "777788889999"
```

Output:

```
{
  "Members": [
    {
      "AccountId": "123456789111",
      "AdministratorId": "123456789012",
      "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
      "MasterId": "123456789012",
      "MemberStatus": "ASSOCIATED",
      "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
    },
    {
      "AccountId": "123456789222",
```

```

    "AdministratorId": "123456789012",
    "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
    "MasterId": "123456789012",
    "MemberStatus": "ASSOCIATED",
    "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
  }
],
"UnprocessedAccounts": [ ]
}

```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetMembers](#) in *AWS CLI Command Reference*.

get-security-control-definition

The following code example shows how to use `get-security-control-definition`.

AWS CLI

To get security control definition details

The following `get-security-control-definition` example retrieves definition details for a Security Hub security control. Details include the control title, description, Region availability, parameters, and other information.

```
aws securityhub get-security-control-definition \
  --security-control-id ACM.1
```

Output:

```

{
  "SecurityControlDefinition": {
    "SecurityControlId": "ACM.1",
    "Title": "Imported and ACM-issued certificates should be renewed after a
specified time period",
    "Description": "This control checks whether an AWS Certificate Manager
(ACM) certificate is renewed within the specified time period. It checks both
imported certificates and certificates provided by ACM. The control fails if the
certificate isn't renewed within the specified time period. Unless you provide a

```

```
custom parameter value for the renewal period, Security Hub uses a default value of
30 days.",
  "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/ACM.1/
remediation",
  "SeverityRating": "MEDIUM",
  "CurrentRegionAvailability": "AVAILABLE",
  "ParameterDefinitions": {
    "daysToExpiration": {
      "Description": "Number of days within which the ACM certificate must
be renewed",
      "ConfigurationOptions": {
        "Integer": {
          "DefaultValue": 30,
          "Min": 14,
          "Max": 365
        }
      }
    }
  }
}
```

For more information, see [Custom control parameters](#) in the *AWS Security Hub User Guide*.

- For API details, see [GetSecurityControlDefinition](#) in *AWS CLI Command Reference*.

invite-members

The following code example shows how to use `invite-members`.

AWS CLI

To send invitations to member accounts

The following `invite-members` example sends invitations to the specified member accounts.

```
aws securityhub invite-members \
  --account-ids "123456789111" "123456789222"
```

Output:

```
{
  "UnprocessedAccounts": []
}
```

```
}
```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [InviteMembers](#) in *AWS CLI Command Reference*.

list-automation-rules

The following code example shows how to use `list-automation-rules`.

AWS CLI

To view a list of automation rules

The following `list-automation-rules` example lists the automation rules for an AWS account. Only the Security Hub administrator account can run this command.

```
aws securityhub list-automation-rules \  
  --max-results 3 \  
  --next-token NULL
```

Output:

```
{  
  "AutomationRulesMetadata": [  
    {  
      "RuleArn": "arn:aws:securityhub:us-east-1:123456789012:automation-rule/

  }
]
}

```

For more information, see [Viewing automation rules](#) in the *AWS Security Hub User Guide*.

- For API details, see [ListAutomationRules](#) in *AWS CLI Command Reference*.

list-configuration-policies

The following code example shows how to use `list-configuration-policies`.

AWS CLI

To list configuration policy summaries

The following `list-configuration-policies` example lists a summary of configuration policies for the organization.

```
aws securityhub list-configuration-policies \
  --max-items 3
```

Output:

```
{
  "ConfigurationPolicySummaries": [
    {
      "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "Name": "SampleConfigurationPolicy1",
      "Description": "SampleDescription1",
      "UpdatedAt": "2023-09-26T21:08:36.214000+00:00",
      "ServiceEnabled": true
    },
    {
      "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "Name": "SampleConfigurationPolicy2",
      "Description": "SampleDescription2",
      "UpdatedAt": "2023-11-28T19:26:25.207000+00:00",
      "ServiceEnabled": true
    },
    {
      "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",

      "Name": "SampleConfigurationPolicy3",
      "Description": "SampleDescription3",
      "UpdatedAt": "2023-11-28T20:28:04.494000+00:00",
      "ServiceEnabled": true
    }
  ]
}
```

For more information, see [Viewing Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

- For API details, see [ListConfigurationPolicies](#) in *AWS CLI Command Reference*.

list-configuration-policy-associations

The following code example shows how to use `list-configuration-policy-associations`.

AWS CLI

To list configuration associations

The following `list-configuration-policy-associations` example lists a summary of configuration associations for the organization. The response include associations with configuration policies and self-managed behavior.

```
aws securityhub list-configuration-policy-associations \  
  --association-type "APPLIED" \  
  --max-items 4
```

Output:

```
{  
  "ConfigurationPolicyAssociationSummaries": [  
    {  
      "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
      "TargetId": "r-1ab2",  
      "TargetType": "ROOT",  
      "AssociationType": "APPLIED",  
      "UpdatedAt": "2023-11-28T19:26:49.417000+00:00",  
      "AssociationStatus": "FAILED",  
      "AssociationStatusMessage": "Policy association failed because 2  
organizational units or accounts under this root failed."  
    },  
    {  
      "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
      "TargetId": "ou-1ab2-c3de4f5g",  
      "TargetType": "ORGANIZATIONAL_UNIT",  
      "AssociationType": "APPLIED",  
      "UpdatedAt": "2023-09-26T21:14:05.283000+00:00",  
      "AssociationStatus": "FAILED",  
      "AssociationStatusMessage": "One or more children under this target  
failed association."  
    },  
    {  
      "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",  
      "TargetId": "ou-6hi7-8j91kl2m",  
      "TargetType": "ORGANIZATIONAL_UNIT",  
      "AssociationType": "APPLIED",  
      "UpdatedAt": "2023-09-26T21:13:01.816000+00:00",  
      "AssociationStatus": "SUCCESS",  
      "AssociationStatusMessage": "Association applied successfully on this  
target."  
    },  
    {
```

```
"ConfigurationPolicyId": "SELF_MANAGED_SECURITY_HUB",
"TargetId": "111122223333",
"TargetType": "ACCOUNT",
"AssociationType": "APPLIED",
"UpdatedAt": "2023-11-28T22:01:26.409000+00:00",
"AssociationStatus": "SUCCESS"
}
}
```

For more information, see [Viewing Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

- For API details, see [ListConfigurationPolicyAssociations](#) in *AWS CLI Command Reference*.

list-enabled-products-for-import

The following code example shows how to use `list-enabled-products-for-import`.

AWS CLI

To return the list of enabled product integrations

The following `list-enabled-products-for-import` example returns the list of subscription ARNS for the currently enabled product integrations.

```
aws securityhub list-enabled-products-for-import
```

Output:

```
{
  "ProductSubscriptions": [ "arn:aws:securityhub:us-west-1:123456789012:product-
subscription/crowdstrike/crowdstrike-falcon", "arn:aws:securityhub:us-
west-1:123456789012:product-subscription/aws/securityhub" ]
}
```

For more information, see [Managing product integrations](#) in the *AWS Security Hub User Guide*.

- For API details, see [ListEnabledProductsForImport](#) in *AWS CLI Command Reference*.

list-finding-aggregators

The following code example shows how to use `list-finding-aggregators`.

AWS CLI

To list the available widgets

The following `list-finding-aggregators` example returns the ARN of the finding aggregation configuration.

```
aws securityhub list-finding-aggregators
```

Output:

```
{
  "FindingAggregatorArn": "arn:aws:securityhub:us-east-1:222222222222:finding-
aggregator/123e4567-e89b-12d3-a456-426652340000"
}
```

For more information, see [Viewing the current finding aggregation configuration](#) in the *AWS Security Hub User Guide*.

- For API details, see [ListFindingAggregators](#) in *AWS CLI Command Reference*.

list-invitations

The following code example shows how to use `list-invitations`.

AWS CLI

To display a list of invitations

The following `list-invitations` example retrieves the list of invitations sent to the requesting account.

```
aws securityhub list-invitations
```

Output:

```
{
  "Invitations": [
    {
      "AccountId": "123456789012",
```

```
        "InvitationId": "7ab938c5d52d7904ad09f9e7c20cc4eb",
        "InvitedAt": 2020-06-01T20:21:18.042000+00:00,
        "MemberStatus": "ASSOCIATED"
    },
],
}
```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [ListInvitations](#) in *AWS CLI Command Reference*.

list-members

The following code example shows how to use `list-members`.

AWS CLI

To retrieve a list of member accounts

The following `list-members` example returns the list of member accounts for the requesting administrator account.

```
aws securityhub list-members
```

Output:

```
{
  "Members": [
    {
      "AccountId": "123456789111",
      "AdministratorId": "123456789012",
      "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
      "MasterId": "123456789012",
      "MemberStatus": "ASSOCIATED",
      "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
    },
    {
      "AccountId": "123456789222",
      "AdministratorId": "123456789012",
      "InvitedAt": 2020-06-01T20:15:15.289000+00:00,
      "MasterId": "123456789012",

```

```
        "MemberStatus": "ASSOCIATED",
        "UpdatedAt": 2020-06-01T20:15:15.289000+00:00
      },
    ],
  }
}
```

For more information, see [Managing administrator and member accounts](#) in the *AWS Security Hub User Guide*.

- For API details, see [ListMembers](#) in *AWS CLI Command Reference*.

list-organization-admin-accounts

The following code example shows how to use `list-organization-admin-accounts`.

AWS CLI

To list the designated Security Hub administrator accounts

The following `list-organization-admin-accounts` example lists the Security Hub administrator accounts for an organization.

```
aws securityhub list-organization-admin-accounts
```

Output:

```
{
  AdminAccounts": [
    { "AccountId": "777788889999" },
    { "Status": "ENABLED" }
  ]
}
```

For more information, see [Designating a Security Hub administrator account](#) in the *AWS Security Hub User Guide*.

- For API details, see [ListOrganizationAdminAccounts](#) in *AWS CLI Command Reference*.

list-security-control-definitions

The following code example shows how to use `list-security-control-definitions`.

AWS CLI

Example 1: To list all available security controls

The following `list-security-control-definitions` example lists the available security controls across all Security Hub standards. This example limits the results to three controls.

```
aws securityhub list-security-control-definitions \  
  --max-items 3
```

Output:

```
{  
  "SecurityControlDefinitions": [  
    {  
      "SecurityControlId": "ACM.1",  
      "Title": "Imported and ACM-issued certificates should be renewed after a  
specified time period",  
      "Description": "This control checks whether an AWS Certificate Manager  
(ACM) certificate is renewed within the specified time period. It checks both  
imported certificates and certificates provided by ACM. The control fails if the  
certificate isn't renewed within the specified time period. Unless you provide a  
custom parameter value for the renewal period, Security Hub uses a default value of  
30 days.",  
      "RemediationUrl": "https://docs.aws.amazon.com/console/securityhub/  
ACM.1/remediation",  
      "SeverityRating": "MEDIUM",  
      "CurrentRegionAvailability": "AVAILABLE",  
      "CustomizableProperties": [  
        "Parameters"  
      ]  
    },

Example 2: To list available security controls for a specific standard

The following `list-security-control-definitions` example lists the available security controls for the CIS AWS Foundations Benchmark v1.4.0. This example limits the results to three controls.

```

aws securityhub list-security-control-definitions \
  --standards-arn "arn:aws:securityhub:us-east-1::standards/cis-aws-foundations-
benchmark/v/1.4.0" \
  --max-items 3

```

Output:

```
{
```

```

"SecurityControlDefinitions": [
  {
    "SecurityControlId": "CloudTrail.1",
    "Title": "CloudTrail should be enabled and configured with at least one
multi-Region trail that includes read and write management events",
    "Description": "This AWS control checks that there is at least one

list-standards-control-associations

The following code example shows how to use `list-standards-control-associations`.

AWS CLI

To get the enablement status of a control in each enabled standard

The following `list-standards-control-associations` example lists the enablement status of `CloudTrail.1` in each enabled standard.

```
aws securityhub list-standards-control-associations \  
  --security-control-id CloudTrail.1
```

Output:

```
{

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve the tags assigned to a resource

The following `list-tags-for-resource` example returns the tags assigned to the specified hub resource.

```

aws securityhub list-tags-for-resource \
  --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default"

```

Output:

```
{
  "Tags": {
    "Department" : "Operations",
    "Area" : "USMidwest"
  }
}
```

For more information, see [AWS::SecurityHub::Hub](#) in the *AWS CloudFormation User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

start-configuration-policy-association

The following code example shows how to use start-configuration-policy-association.

AWS CLI

Example 1: To associate a configuration policy

The following start-configuration-policy-association example associates the specified configuration policy with the specified organizational unit. A configuration may be associated with a target account, organizational unit, or the root.

```
aws securityhub start-configuration-policy-association \
  --configuration-policy-identifier "arn:aws:securityhub:eu-
central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333" \
  --target '{"OrganizationalUnitId": "ou-6hi7-8j91kl2m"}'
```

Output:

```
{
  "ConfigurationPolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
  "TargetId": "ou-6hi7-8j91kl2m",
  "TargetType": "ORGANIZATIONAL_UNIT",
  "AssociationType": "APPLIED",
  "UpdatedAt": "2023-11-29T17:40:52.468000+00:00",
  "AssociationStatus": "PENDING"
}
```

For more information, see [Creating and associating Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

Example 2: To associate a self-managed configuration

The following `start-configuration-policy-association` example associates a self-managed configuration with the specified account.

```
aws securityhub start-configuration-policy-association \  
  --configuration-policy-identifier "SELF_MANAGED_SECURITY_HUB" \  
  --target '{"OrganizationalUnitId": "123456789012"}'
```

Output:

```
{  
  "ConfigurationPolicyId": "SELF_MANAGED_SECURITY_HUB",  
  "TargetId": "123456789012",  
  "TargetType": "ACCOUNT",  
  "AssociationType": "APPLIED",  
  "UpdatedAt": "2023-11-29T17:40:52.468000+00:00",  
  "AssociationStatus": "PENDING"  
}
```

For more information, see [Creating and associating Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

- For API details, see [StartConfigurationPolicyAssociation](#) in *AWS CLI Command Reference*.

start-configuration-policy-disassociation

The following code example shows how to use `start-configuration-policy-disassociation`.

AWS CLI

Example 1: To disassociate a configuration policy

The following `start-configuration-policy-disassociation` example disassociates a configuration policy from the specified organizational unit. A configuration may be disassociated from a target account, organizational unit, or the root.

```
aws securityhub start-configuration-policy-disassociation \  
  --configuration-policy-identifier "arn:aws:securityhub:eu-  
central-1:123456789012:configuration-policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE33333" \  
  --target '{"OrganizationalUnitId": "123456789012"}'
```

```
--target '{"OrganizationalUnitId": "ou-6hi7-8j91k12m"}'
```

This command produces no output.

For more information, see [Disassociating a configuration from accounts and OUs](#) in the *AWS Security Hub User Guide*.

Example 2: To disassociate a self-managed configuration

The following `start-configuration-policy-disassociation` example disassociates a self-managed configuration from the specified account.

```
aws securityhub start-configuration-policy-disassociation \  
  --configuration-policy-identifier "SELF_MANAGED_SECURITY_HUB" \  
  --target '{"AccountId": "123456789012"}'
```

This command produces no output.

For more information, see [Disassociating a configuration from accounts and OUs](#) in the *AWS Security Hub User Guide*.

- For API details, see [StartConfigurationPolicyDisassociation](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To assign a tag to a resource

The following `tag-resource` example assigns values for the Department and Area tags to the specified hub resource.

```
aws securityhub tag-resource \  
  --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default" \  
  --tags '{"Department":"Operations", "Area":"USMidwest"}'
```

This command produces no output.

For more information, see [AWS::SecurityHub::Hub](#) in the *AWS CloudFormation User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag value from a resource

The following `untag-resource` example removes the Department tag from the specified hub resource.

```
aws securityhub untag-resource \  
  --resource-arn "arn:aws:securityhub:us-west-1:123456789012:hub/default" \  
  --tag-keys "Department"
```

This command produces no output.

For more information, see [AWS::SecurityHub::Hub](#) in the *AWS CloudFormation User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-action-target

The following code example shows how to use `update-action-target`.

AWS CLI

To update a custom action

The following `update-action-target` example updates the name of the custom action identified by the specified ARN.

```
aws securityhub update-action-target \  
  --action-target-arn "arn:aws:securityhub:us-west-1:123456789012:action/custom/  
Remediation" \  
  --name "Send to remediation"
```

This command produces no output.

For more information, see [Creating a custom action and associating it with a CloudWatch Events rule](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateActionTarget](#) in *AWS CLI Command Reference*.

update-configuration-policy

The following code example shows how to use update-configuration-policy.

AWS CLI

To update a configuration policy

The following update-configuration-policy example updates an existing configuration policy to use the specified settings.

```
aws securityhub update-configuration-policy \
  --identifier "arn:aws:securityhub:eu-central-1:508236694226:configuration-
policy/09f37766-57d8-4ede-9d33-5d8b0fecf70e" \
  --name "SampleConfigurationPolicyUpdated" \
  --description "SampleDescriptionUpdated" \
  --configuration-policy '{"SecurityHub": {"ServiceEnabled":
true, "EnabledStandardIdentifiers": ["arn:aws:securityhub:eu-
central-1::standards/aws-foundational-security-best-practices/
v/1.0.0","arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"],"SecurityControlsConfiguration":{"DisabledSecurityControlIdentifiers":
["CloudWatch.1"], "SecurityControlCustomParameters": [{"SecurityControlId":
"ACM.1", "Parameters": {"daysToExpiration": {"ValueType": "CUSTOM", "Value":
{"Integer": 21}}}]}}}' \
  --updated-reason "Disabling CloudWatch.1 and changing parameter value"
```

Output:

```
{
  "Arn": "arn:aws:securityhub:eu-central-1:123456789012:configuration-policy/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

  "CreatedAt": "2023-11-28T20:28:04.494000+00:00",
  "ConfigurationPolicy": {
    "SecurityHub": {
      "ServiceEnabled": true,
      "EnabledStandardIdentifiers": [
```

```

        "arn:aws:securityhub:eu-central-1::standards/aws-foundational-
security-best-practices/v/1.0.0",
        "arn:aws:securityhub:::ruleset/cis-aws-foundations-benchmark/
v/1.2.0"
    ],
    "SecurityControlsConfiguration": {
        "DisabledSecurityControlIdentifiers": [
            "CloudWatch.1"
        ],
        "SecurityControlCustomParameters": [
            {
                "SecurityControlId": "ACM.1",
                "Parameters": {
                    "daysToExpiration": {
                        "ValueType": "CUSTOM",
                        "Value": {
                            "Integer": 21
                        }
                    }
                }
            }
        ]
    }
}

```

For more information, see [Updating Security Hub configuration policies](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateConfigurationPolicy](#) in *AWS CLI Command Reference*.

update-finding-aggregator

The following code example shows how to use update-finding-aggregator.

AWS CLI

To update the current finding aggregation configuration

The following update-finding-aggregator example changes the finding aggregation configuration to link from selected Regions. It is run from US East (Virginia), which is the

aggregation Region. It selects US West (N. California) and US West (Oregon) as the linked Regions.

```
aws securityhub update-finding-aggregator \  
  --region us-east-1 \  
  --finding-aggregator-arn arn:aws:securityhub:us-east-1:222222222222:finding-  
aggregator/123e4567-e89b-12d3-a456-426652340000 \  
  --region-linking-mode SPECIFIED_REGIONS \  
  --regions us-west-1,us-west-2
```

This command produces no output.

For more information, see [Updating the finding aggregation configuration](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateFindingAggregator](#) in *AWS CLI Command Reference*.

update-insight

The following code example shows how to use update-insight.

AWS CLI

Example 1: To change the filter for a custom insight

The following update-insight example changes the filters for a custom insight. The updated insight looks for findings with a high severity that are related to AWS roles.

```
aws securityhub update-insight \  
  --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/  
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \  
  --filters '{"ResourceType": [{"Comparison": "EQUALS", "Value": "AwsIamRole"}],  
"SeverityLabel": [{"Comparison": "EQUALS", "Value": "HIGH"}]}' \  
  --name "High severity role findings"
```

Example 2: To change the grouping attribute for a custom insight

The following update-insight example changes the grouping attribute for the custom insight with the specified ARN. The new grouping attribute is the resource ID.

```
aws securityhub update-insight \  
  --insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/  
custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \  
  --grouping-attribute "ResourceID" \  
  --name "High severity role findings"
```

```
--insight-arn "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \  
--group-by-attribute "ResourceId" \  
--name "Critical role findings"
```

Output:

```
{  
  "Insights": [  
    {  
      "InsightArn": "arn:aws:securityhub:us-west-1:123456789012:insight/123456789012/custom/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
      "Name": "Critical role findings",  
      "Filters": {  
        "SeverityLabel": [  
          {  
            "Value": "CRITICAL",  
            "Comparison": "EQUALS"  
          }  
        ],  
        "ResourceType": [  
          {  
            "Value": "AwsIamRole",  
            "Comparison": "EQUALS"  
          }  
        ]  
      },  
      "GroupByAttribute": "ResourceId"  
    }  
  ]  
}
```

For more information, see [Managing custom insights](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateInsight](#) in *AWS CLI Command Reference*.

update-organization-configuration

The following code example shows how to use `update-organization-configuration`.

AWS CLI

To update how Security Hub is configured for an organization

The following `update-organization-configuration` example specifies that Security Hub should use central configuration to configure an organization. After running this command, the delegated Security Hub administrator can create and manage configuration policies to configure the organization. The delegated administrator can also use this command to switch from central to local configuration. If local configuration is the configuration type, the delegated administrator can choose whether to automatically enable Security Hub and default security standards in new organization accounts.

```
aws securityhub update-organization-configuration \  
  --no-auto-enable \  
  --organization-configuration '{"ConfigurationType": "CENTRAL"}'
```

This command produces no output.

For more information, see [Managing accounts with AWS Organizations](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateOrganizationConfiguration](#) in *AWS CLI Command Reference*.

update-security-control

The following code example shows how to use `update-security-control`.

AWS CLI

To update security control properties

The following `update-security-control` example specifies custom values for a Security Hub security control parameter.

```
aws securityhub update-security-control \  
  --security-control-id ACM.1 \  
  --parameters '{"daysToExpiration": {"ValueType": "CUSTOM", "Value": {"Integer":  
15}}}' \  
  --last-update-reason "Internal compliance requirement"
```

This command produces no output.

For more information, see [Custom control parameters](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateSecurityControl](#) in *AWS CLI Command Reference*.

update-security-hub-configuration

The following code example shows how to use `update-security-hub-configuration`.

AWS CLI

To update Security Hub configuration

The following `update-security-hub-configuration` example configures Security Hub to automatically enable new controls for enabled standards.

```
aws securityhub update-security-hub-configuration \  
  --auto-enable-controls
```

This command produces no output.

For more information, see [Enabling new controls automatically](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateSecurityHubConfiguration](#) in *AWS CLI Command Reference*.

update-standards-control

The following code example shows how to use `update-standards-control`.

AWS CLI

Example 1: To disable a control

The following `update-standards-control` example disables the `PCI.AutoScaling.1` control.

```
aws securityhub update-standards-control \  
  --standards-control-arn "arn:aws:securityhub:us-west-1:123456789012:control/pci-  
dss/v/3.2.1/PCI.AutoScaling.1" \  
  --control-status "DISABLED" \  
  --disabled-reason "Not applicable for my service"
```

This command produces no output.

Example 2: To enable a control

The following `update-standards-control` example enables the `PCI.AutoScaling.1` control.

```
aws securityhub update-standards-control \  
  --standards-control-arn "arn:aws:securityhub:us-west-1:123456789012:control/pci-  
dss/v/3.2.1/PCI.AutoScaling.1" \  
  --control-status "ENABLED"
```

This command produces no output.

For more information, see [Disabling and enabling individual controls](#) in the *AWS Security Hub User Guide*.

- For API details, see [UpdateStandardsControl](#) in *AWS CLI Command Reference*.

AWS Serverless Application Repository examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Serverless Application Repository.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

Actions

put-application-policy

The following code example shows how to use `put-application-policy`.

AWS CLI

Example 1: To share an application publicly

The following `put-application-policy` shares an application publicly, so anyone can find and deploy your application in the AWS Serverless Application Repository.

```
aws serverlessrepo put-application-policy \  
  --application-id arn:aws:serverlessrepo:us-east-1:123456789012:applications/my-  
test-application \  
  --statements Principals='*',Actions=Deploy
```

Output:

```
{  
  "Statements": [  
    {  
      "Actions": [  
        "Deploy"  
      ],  
      "Principals": [  
        ""  
      ],  
      "StatementId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"  
    }  
  ]  
}
```

Example 2: To share an application privately

The following `put-application-policy` shares an application privately, so only specific AWS accounts can find and deploy your application in the AWS Serverless Application Repository.

```
aws serverlessrepo put-application-policy \  
  --application-id arn:aws:serverlessrepo:us-east-1:123456789012:applications/my-  
test-application \  
  --statements Principals=111111111111,222222222222,Actions=Deploy
```

Output:

```
{  
  "Statements": [  

```

```
    {
      "Actions": [
        "Deploy"
      ],
      "Principals": [
        "111111111111",
        "222222222222"
      ],
      "StatementId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
    }
  ]
}
```

For more information, see [Sharing an Application Through the Console](#) in the *AWS Serverless Application Repository Developer Guide*

- For API details, see [PutApplicationPolicy](#) in *AWS CLI Command Reference*.

Service Catalog examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Service Catalog.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

accept-portfolio-share

The following code example shows how to use `accept-portfolio-share`.

AWS CLI

To accept a portfolio share

The following `accept-portfolio-share` example accepts an offer, made by another user, to share the specified portfolio.

```
aws servicecatalog accept-portfolio-share \  
  --portfolio-id port-2s6wuabcdefghijk
```

This command produces no output.

- For API details, see [AcceptPortfolioShare](#) in *AWS CLI Command Reference*.

associate-principal-with-portfolio

The following code example shows how to use `associate-principal-with-portfolio`.

AWS CLI

To associate a principal with a portfolio

The following `associate-principal-with-portfolio` example associates a user with the specified portfolio.

```
aws servicecatalog associate-principal-with-portfolio \  
  --portfolio-id port-2s6abcdefwdh4 \  
  --principal-arn arn:aws:iam::123456789012:user/usertest \  
  --principal-type IAM
```

This command produces no output.

- For API details, see [AssociatePrincipalWithPortfolio](#) in *AWS CLI Command Reference*.

associate-product-with-portfolio

The following code example shows how to use `associate-product-with-portfolio`.

AWS CLI

To associate a product with a portfolio

The following `associate-product-with-portfolio` example associates the given product with the specified portfolio.

```
aws servicecatalog associate-product-with-portfolio
  --product-id prod-3p5abcdef3oyk
  --portfolio-id port-2s6abcdef5wdh4
```

This command produces no output.

- For API details, see [AssociateProductWithPortfolio](#) in *AWS CLI Command Reference*.

associate-tag-option-with-resource

The following code example shows how to use `associate-tag-option-with-resource`.

AWS CLI

To associate a TagOption with a resource

The following `associate-tag-option-with-resource` example associates the specified TagOption with the specified resource.

```
aws servicecatalog associate-tag-option-with-resource \
  --resource-id port-2s6abcdq5wdh4 \
  --tag-option-id tag-p3abc2pkpz5qc
```

This command produces no output.

- For API details, see [AssociateTagOptionWithResource](#) in *AWS CLI Command Reference*.

copy-product

The following code example shows how to use `copy-product`.

AWS CLI

To copy a product

The following `copy-product` example makes a copy of the specified product, using a JSON file to pass parameters.

```
aws servicecatalog copy-product --cli-input-json file:///copy-product-input.json
```

Contents of `copy-product-input.json`:

```
{
  "SourceProductArn": "arn:aws:catalog:us-west-2:123456789012:product/prod-
tcabcd3syn2xy",
  "TargetProductName": "copy-of-myproduct",
  "CopyOptions": [
    "CopyTags"
  ]
}
```

Output:

```
{
  "CopyProductToken": "copyproduct-abc5defgjkdji"
}
```

- For API details, see [CopyProduct](#) in *AWS CLI Command Reference*.

create-portfolio-share

The following code example shows how to use `create-portfolio-share`.

AWS CLI

To share a portfolio with an account

The following `create-portfolio-share` example shares the specified portfolio with the specified account.

```
aws servicecatalog create-portfolio-share \
  --portfolio-id port-2s6abcdef5wdh4 \
  --account-id 794123456789
```

This command produces no output.

- For API details, see [CreatePortfolioShare](#) in *AWS CLI Command Reference*.

create-portfolio

The following code example shows how to use `create-portfolio`.

AWS CLI

To create a portfolio

The following `create-portfolio` example creates a portfolio.

```
aws servicecatalog create-portfolio \
  --provider-name my-provider \
  --display-name my-portfolio
```

Output:

```
{
  "PortfolioDetail": {
    "ProviderName": "my-provider",
    "DisplayName": "my-portfolio",
    "CreatedTime": 1571337221.555,
    "ARN": "arn:aws:catalog:us-east-2:123456789012:portfolio/
port-2s6xmplq5wdh4",
    "Id": "port-2s6xmplq5wdh4"
  }
}
```

- For API details, see [CreatePortfolio](#) in *AWS CLI Command Reference*.

create-product

The following code example shows how to use `create-product`.

AWS CLI

To create a product

The following `create-product` example creates a product, using a JSON file to pass parameters.

```
aws servicecatalog create-product \
  --cli-input-json file://create-product-input.json
```

Contents of `create-product-input.json`:

```
{
  "AcceptLanguage": "en",
  "Name": "test-product",
  "Owner": "test-owner",
  "Description": "test-description",
  "Distributor": "test-distributor",
  "SupportDescription": "test-support",
  "SupportEmail": "test@amazon.com",
  "SupportUrl": "https://aws.amazon.com",
  "ProductType": "CLOUD_FORMATION_TEMPLATE",
  "Tags": [
    {
      "Key": "region",
      "Value": "us-east-1"
    }
  ],
  "ProvisioningArtifactParameters": {
    "Name": "test-version-name",
    "Description": "test-version-description",
    "Info": {
      "LoadTemplateFromURL": "https://s3-us-west-1.amazonaws.com/
cloudformation-templates-us-west-1/my-cfn-template.template"
    },
    "Type": "CLOUD_FORMATION_TEMPLATE"
  }
}
```

Output:

```
{
  "Tags": [
    {
      "Key": "region",
      "Value": "us-east-1"
    }
  ],
  "ProductViewDetail": {

}
}
```

- For API details, see [CreateProduct](#) in *AWS CLI Command Reference*.

create-provisioning-artifact

The following code example shows how to use create-provisioning-artifact.

AWS CLI

To create a provisioning artifact

The following create-provisioning-artifact example creates a provisioning artifact, using a JSON file to pass parameters.

```
aws servicecatalog create-provisioning-artifact \
  --cli-input-json file://create-provisioning-artifact-input.json
```

Contents of create-provisioning-artifact-input.json:

```
{
  "ProductId": "prod-nfi2abcdefghi",
```

```
"Parameters": {
  "Name": "test-provisioning-artifact",
  "Description": "test description",
  "Info": {
    "LoadTemplateFromURL": "https://s3-us-west-1.amazonaws.com/
cloudformation-templates-us-west-1/my-cfn-template.template"
  },
  "Type": "CLOUD_FORMATION_TEMPLATE"
}
}
```

Output:

```
{
  "Info": {
    "TemplateUrl": "https://s3-us-west-1.amazonaws.com/cloudformation-templates-
us-west-1/my-cfn-template.template"
  },
  "Status": "CREATING",
  "ProvisioningArtifactDetail": {
    "Id": "pa-bb4abcdefwnaio",
    "Name": "test-provisioning-artifact",
    "Description": "test description",
    "Active": true,
    "Type": "CLOUD_FORMATION_TEMPLATE",
    "CreatedTime": 1576022545.0
  }
}
```

- For API details, see [CreateProvisioningArtifact](#) in *AWS CLI Command Reference*.

create-tag-option

The following code example shows how to use create-tag-option.

AWS CLI

To create a TagOption

The following create-tag-option example creates a TagOption.

```
aws servicecatalog create-tag-option
```

```
--key 1234
--value name
```

Output:

```
{
  "TagOptionDetail": {
    "Id": "tag-iabcdn4fzjjms",
    "Value": "name",
    "Active": true,
    "Key": "1234"
  }
}
```

- For API details, see [CreateTagOption](#) in *AWS CLI Command Reference*.

delete-portfolio-share

The following code example shows how to use `delete-portfolio-share`.

AWS CLI

To stop sharing a portfolio with an account

The following `delete-portfolio-share` example stops sharing the portfolio with the specified account.

```
aws servicecatalog delete-portfolio-share \
  --portfolio-id port-2s6abcdq5wdh4 \
  --account-id 123456789012
```

This command produces no output.

- For API details, see [DeletePortfolioShare](#) in *AWS CLI Command Reference*.

delete-portfolio

The following code example shows how to use `delete-portfolio`.

AWS CLI

To delete a portfolio

The following `delete-portfolio` example deletes the specified portfolio.

```
aws servicecatalog delete-portfolio \  
  --id port-abcdlx4gox4do
```

This command produces no output.

- For API details, see [DeletePortfolio](#) in *AWS CLI Command Reference*.

delete-product

The following code example shows how to use `delete-product`.

AWS CLI

To delete a product

The following `delete-product` example deletes the specified product.

```
aws servicecatalog delete-product \  
  --id prod-abcdcek6yhbxi
```

This command produces no output.

- For API details, see [DeleteProduct](#) in *AWS CLI Command Reference*.

delete-provisioning-artifact

The following code example shows how to use `delete-provisioning-artifact`.

AWS CLI

To delete a provisioning artifact

The following `delete-provisioning-artifact` example deletes the specified provisioning artifact.

```
aws servicecatalog delete-provisioning-artifact \  
  --product-id prod-abc2uebuplcpw \  
  --provisioning-artifact-id pa-pqabccddii7ouc
```

This command produces no output.

- For API details, see [DeleteProvisioningArtifact](#) in *AWS CLI Command Reference*.

delete-tag-option

The following code example shows how to use `delete-tag-option`.

AWS CLI

To delete a TagOption

The following `delete-tag-option` example deletes the specified TagOption.

```
aws servicecatalog delete-tag-option \  
  --id tag-iabcdn4fzjjms
```

This command produces no output.

- For API details, see [DeleteTagOption](#) in *AWS CLI Command Reference*.

describe-copy-product-status

The following code example shows how to use `describe-copy-product-status`.

AWS CLI

To describe the status of the copy product operation

The following `describe-copy-product-status` example displays the current status of the specified asynchronous copy product operation.

```
aws servicecatalog describe-copy-product-status \  
  --copy-product-token copyproduct-znn5tf5abcd3w
```

Output:

```
{  
  "CopyProductStatus": "SUCCEEDED",  
  "TargetProductId": "prod-os6hog7abcdt2"  
}
```

- For API details, see [DescribeCopyProductStatus](#) in *AWS CLI Command Reference*.

describe-portfolio

The following code example shows how to use describe-portfolio.

AWS CLI

To describe a portfolio

The following describe-portfolio example displays details for the specified portfolio.

```
aws servicecatalog describe-portfolio \  
  --id port-2s6abcdq5wdh4
```

Output:

```
{  
  "TagOptions": [],  
  "PortfolioDetail": {  
    "ARN": "arn:aws:catalog:us-west-2:687558541234:portfolio/  
port-2s6abcdq5wdh4",  
    "Id": "port-2s6wuzyzq5wdh4",  
    "CreatedTime": 1571337221.555,  
    "DisplayName": "my-portfolio",  
    "ProviderName": "my-provider"  
  },  
  "Tags": []  
}
```

- For API details, see [DescribePortfolio](#) in *AWS CLI Command Reference*.

describe-product-as-admin

The following code example shows how to use describe-product-as-admin.

AWS CLI

To describe a product as an administrator

The following describe-product-as-admin example displays details for the specified product using administrator privileges.

```
aws servicecatalog describe-product-as-admin \  
  --id port-2s6abcdq5wdh4
```

```
--id prod-abcdcek6yhbxix
```

Output:

```
{
  "TagOptions": [],
  "ProductViewDetail": {
    "ProductARN": "arn:aws:catalog:us-west-2:687558542028:product/prod-
abcdcek6yhbxix",
    "ProductViewSummary": {
      "SupportEmail": "test@amazon.com",
      "Type": "CLOUD_FORMATION_TEMPLATE",
      "Distributor": "test-distributor",
      "ShortDescription": "test-description",
      "Owner": "test-owner",
      "Id": "prodview-wi3l2j4abc6vc",
      "SupportDescription": "test-support",
      "ProductId": "prod-abcdcek6yhbxix",
      "HasDefaultPath": false,
      "Name": "test-product3",
      "SupportUrl": "https://aws.amazon.com"
    },
    "CreatedTime": 1577136715.0,
    "Status": "CREATED"
  },
  "ProvisioningArtifactSummaries": [
    {
      "CreatedTime": 1577136715.0,
      "Description": "test-version-description",
      "ProvisioningArtifactMetadata": {
        "SourceProvisioningArtifactId": "pa-abcdxkkiv5fcm"
      },
      "Name": "test-version-name-3",
      "Id": "pa-abcdxkkiv5fcm"
    }
  ],
  "Tags": [
    {
      "Value": "iad",
      "Key": "region"
    }
  ]
}
```

- For API details, see [DescribeProductAsAdmin](#) in *AWS CLI Command Reference*.

describe-provisioned-product

The following code example shows how to use `describe-provisioned-product`.

AWS CLI

To describe a provisioned product

The following `describe-provisioned-product` example displays details for the specified provisioned product.

```
aws servicecatalog describe-provisioned-product \  
  --id pp-dpom27bm4abcd
```

Output:

```
{  
  "ProvisionedProductDetail": {  
    "Status": "ERROR",  
    "CreatedTime": 1577222793.358,  
    "Arn": "arn:aws:servicecatalog:us-west-2:123456789012:stack/mytestppname3/  
pp-dpom27bm4abcd",  
    "Id": "pp-dpom27bm4abcd",  
    "StatusMessage": "AmazonCloudFormationException Parameters: [KeyName]  
must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code:  
ValidationError; Request ID: 5528602a-a9ef-427c-825c-f82c31b814f5)",  
    "IdempotencyToken": "527c5358-2a1a-4b9e-b1b9-7293b0ddff42",  
    "LastRecordId": "rec-tfuawdjovzxge",

    "Name": "mytestppname3"  
  },  
  "CloudWatchDashboards": []  
}
```

- For API details, see [DescribeProvisionedProduct](#) in *AWS CLI Command Reference*.

describe-provisioning-artifact

The following code example shows how to use `describe-provisioning-artifact`.

AWS CLI

To describe a provisioning artifact

The following `describe-provisioning-artifact` example displays details for the specified provisioning artifact.

```
aws servicecatalog describe-provisioning-artifact \  
  --provisioning-artifact-id pa-pcz347abcdcfm \  
  --product-id prod-abcdfz3syn2rg
```

Output:

```
{  
  "Info": {  
    "TemplateUrl": "https://awsdocs.s3.amazonaws.com/servicecatalog/  
myexampledevelopment-environment.template"  
  },  
  "ProvisioningArtifactDetail": {  
    "Id": "pa-pcz347abcdcfm",  
    "Active": true,  
    "Type": "CLOUD_FORMATION_TEMPLATE",  
    "Description": "updated description",  
    "CreatedTime": 1562097906.0,  
    "Name": "updated name"  
  },  
  "Status": "AVAILABLE"  
}
```

- For API details, see [DescribeProvisioningArtifact](#) in *AWS CLI Command Reference*.

describe-tag-option

The following code example shows how to use `describe-tag-option`.

AWS CLI

To describe a TagOption

The following `describe-tag-option` example displays details for the specified TagOption.

```
aws servicecatalog describe-tag-option \  
  --tag-option-id tag-option-id
```

```
--id tag-p3tej2abcd5qc
```

Output:

```
{
  "TagOptionDetail": {
    "Active": true,
    "Id": "tag-p3tej2abcd5qc",
    "Value": "value-3",
    "Key": "1234"
  }
}
```

- For API details, see [DescribeTagOption](#) in *AWS CLI Command Reference*.

disassociate-principal-from-portfolio

The following code example shows how to use `disassociate-principal-from-portfolio`.

AWS CLI**To disassociate a principal from a portfolio**

The following `disassociate-principal-from-portfolio` example disassociates the specified principal from the portfolio.

```
aws servicecatalog disassociate-principal-from-portfolio \
  --portfolio-id port-2s6abcdq5wdh4 \
  --principal-arn arn:aws:iam::123456789012:group/myendusers
```

This command produces no output.

- For API details, see [DisassociatePrincipalFromPortfolio](#) in *AWS CLI Command Reference*.

disassociate-product-from-portfolio

The following code example shows how to use `disassociate-product-from-portfolio`.

AWS CLI**To disassociate a product from a portfolio**

The following `disassociate-product-from-portfolio` example disassociates the specified product from the portfolio.

```
aws servicecatalog disassociate-product-from-portfolio \  
  --product-id prod-3p5abcdmu3oyk \  
  --portfolio-id port-2s6abcdq5wdh4
```

This command produces no output.

- For API details, see [DisassociateProductFromPortfolio](#) in *AWS CLI Command Reference*.

disassociate-tag-option-from-resource

The following code example shows how to use `disassociate-tag-option-from-resource`.

AWS CLI

To disassociate a TagOption from a resource

The following `disassociate-tag-option-from-resource` example disassociates the specified `TagOption` from the resource.

```
aws servicecatalog disassociate-tag-option-from-resource \  
  --resource-id port-2s6abcdq5wdh4 \  
  --tag-option-id tag-p3abc2pkpz5qc
```

This command produces no output.

- For API details, see [DisassociateTagOptionFromResource](#) in *AWS CLI Command Reference*.

list-accepted-portfolio-shares

The following code example shows how to use `list-accepted-portfolio-shares`.

AWS CLI

To list accepted portfolio shares

The following `list-accepted-portfolio-shares` example lists all portfolios for which sharing was accepted by this account, including only the default Service Catalog portfolios.

```
aws servicecatalog list-accepted-portfolio-shares \
  --portfolio-share-type "AWS_SERVICECATALOG"
```

Output:

```
{
  "PortfolioDetails": [
    {
      "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/port-
d2abcd5dpkuma",
      "Description": "AWS Service Catalog Reference blueprints for often-used
AWS services such as EC2, S3, RDS, VPC and EMR.",
      "CreatedTime": 1574456190.687,
      "ProviderName": "AWS Service Catalog",
      "DisplayName": "Reference Architectures",
      "Id": "port-d2abcd5dpkuma"
    },
    {
      "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/port-
abcdefaua7zpu",
      "Description": "AWS well-architected blueprints for high reliability
applications.",
      "CreatedTime": 1574461496.092,
      "ProviderName": "AWS Service Catalog",
      "DisplayName": "High Reliability Architectures",
      "Id": "port-abcdefaua7zpu"
    }
  ]
}
```

- For API details, see [ListAcceptedPortfolioShares](#) in *AWS CLI Command Reference*.

list-portfolio-access

The following code example shows how to use `list-portfolio-access`.

AWS CLI

To list accounts with access to a portfolio

The following `list-portfolio-access` example lists the AWS accounts that have access to the specified portfolio.

```
aws servicecatalog list-portfolio-access \  
  --portfolio-id port-2s6abcdq5wdh4
```

Output:

```
{  
  "AccountIds": [  
    "123456789012"  
  ]  
}
```

- For API details, see [ListPortfolioAccess](#) in *AWS CLI Command Reference*.

list-portfolios-for-product

The following code example shows how to use `list-portfolios-for-product`.

AWS CLI

To list portfolios associated with a product

The following `list-portfolios-for-product` example lists the portfolios associated with the specified product.

```
aws servicecatalog list-portfolios-for-product \  
  --product-id prod-abcdefz3syn2rg
```

Output:

```
{  
  "PortfolioDetails": [  
    {  
      "CreatedTime": 1571337221.555,  
      "Id": "port-2s6abcdq5wdh4",  
      "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/  
port-2s6abcdq5wdh4",  
      "DisplayName": "my-portfolio",  
      "ProviderName": "my-provider"  
    },  
    {
```

```
        "CreatedTime": 1559665256.348,  
        "Id": "port-5abcd3e5st4ei",  
        "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/  
port-5abcd3e5st4ei",  
        "DisplayName": "test",  
        "ProviderName": "provider-name"  
    }  
]  
}
```

- For API details, see [ListPortfoliosForProduct](#) in *AWS CLI Command Reference*.

list-portfolios

The following code example shows how to use `list-portfolios`.

AWS CLI

To list portfolios

The following `list-portfolios` example lists the Service Catalog portfolios in the current Region.

```
aws servicecatalog list-portfolios
```

Output:

```
{  
  "PortfolioDetails": [  
    {  
      "CreatedTime": 1559665256.348,  
      "ARN": "arn:aws:catalog:us-east-2:123456789012:portfolio/  
port-5pzcxmlst4ei",  
      "DisplayName": "my-portfolio",  
      "Id": "port-5pzcxmlst4ei",  
      "ProviderName": "my-user"  
    }  
  ]  
}
```

- For API details, see [ListPortfolios](#) in *AWS CLI Command Reference*.

list-principals-for-portfolio

The following code example shows how to use `list-principals-for-portfolio`.

AWS CLI

To list all principals for a portfolio

The following `list-principals-for-portfolio` example lists all principals for the specified portfolio.

```
aws servicecatalog list-principals-for-portfolio \  
  --portfolio-id port-2s6abcdq5wdh4
```

Output:

```
{  
  "Principals": [  
    {  
      "PrincipalARN": "arn:aws:iam::123456789012:user/usertest",  
      "PrincipalType": "IAM"  
    }  
  ]  
}
```

- For API details, see [ListPrincipalsForPortfolio](#) in *AWS CLI Command Reference*.

list-provisioning-artifacts

The following code example shows how to use `list-provisioning-artifacts`.

AWS CLI

To list all provisioning artifacts for a product

The following `list-provisioning-artifacts` example lists all provisioning artifacts for the specified product.

```
aws servicecatalog list-provisioning-artifacts \  
  --product-id prod-nfi2abcdefgcpw
```

Output:

```
{
  "ProvisioningArtifactDetails": [
    {
      "Id": "pa-abcdef54ipm6z",
      "Description": "test-version-description",
      "Type": "CLOUD_FORMATION_TEMPLATE",
      "CreatedTime": 1576021147.0,
      "Active": true,
      "Name": "test-version-name"
    },
    {
      "Id": "pa-bb4zyxwwnaio",
      "Description": "test description",
      "Type": "CLOUD_FORMATION_TEMPLATE",
      "CreatedTime": 1576022545.0,
      "Active": true,
      "Name": "test-provisioning-artifact-2"
    }
  ]
}
```

- For API details, see [ListProvisioningArtifacts](#) in *AWS CLI Command Reference*.

list-resources-for-tag-option

The following code example shows how to use `list-resources-for-tag-option`.

AWS CLI

To list resources associated to a TagOption

The following `list-resources-for-tag-option` example lists the resources associated with the specified `TagOption`.

```
aws servicecatalog list-resources-for-tag-option \
  --tag-option-id tag-p3tej2abcd5qc
```

Output:

```
{
  "ResourceDetails": [
    {
```

```
    "ARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-
abcdfz3syn2rg",
    "Name": "my product",
    "Description": "description",
    "CreatedTime": 1562097906.0,
    "Id": "prod-abcdfz3syn2rg"
  }
]
```

- For API details, see [ListResourcesForTagOption](#) in *AWS CLI Command Reference*.

list-tag-options

The following code example shows how to use `list-tag-options`.

AWS CLI

The following `list-tag-options` example lists all values for `TagOptions`.

```
aws servicecatalog list-tag-options
```

Output:

```
{
  "TagOptionDetails": [
    {
      "Value": "newvalue",
      "Active": true,
      "Id": "tag-iabcdn4fzjjms",
      "Key": "1234"
    },
    {
      "Value": "value1",
      "Active": true,
      "Id": "tag-e3abcdvmwvrzy",
      "Key": "key"
    }
  ]
}
```

- For API details, see [ListTagOptions](#) in *AWS CLI Command Reference*.

provision-product

The following code example shows how to use `provision-product`.

AWS CLI

To provision a product

The following `provision-product` example provisions the specified product using the specified provisioning artifact.

```
aws servicecatalog provision-product \  
  --product-id prod-abcdefz3syn2rg \  
  --provisioning-artifact-id pa-abc347pcscfm \  
  --provisioned-product-name "mytestppname3"
```

Output:

```
{  
  "RecordDetail": {  
    "RecordId": "rec-tfuawdabcdege",  
    "CreatedTime": 1577222793.362,  
    "ProvisionedProductId": "pp-abcd27bm4mldq",  
    "PathId": "lpv2-abcdg3jp6t5k6",  
    "RecordErrors": [],  
    "ProductId": "prod-abcdefz3syn2rg",  
    "UpdatedTime": 1577222793.362,  
    "RecordType": "PROVISION_PRODUCT",  
    "ProvisionedProductName": "mytestppname3",  
    "ProvisioningArtifactId": "pa-pcz347abcdcfm",  
    "RecordTags": [],  
    "Status": "CREATED",  
    "ProvisionedProductType": "CFN_STACK"  
  }  
}
```

- For API details, see [ProvisionProduct](#) in *AWS CLI Command Reference*.

reject-portfolio-share

The following code example shows how to use `reject-portfolio-share`.

AWS CLI

To reject a portfolio share

The following `reject-portfolio-share` example rejects the portfolio share for the given portfolio.

```
aws servicecatalog reject-portfolio-share \  
  --portfolio-id port-2s6wuabcdefghijk
```

This command produces no output.

- For API details, see [RejectPortfolioShare](#) in *AWS CLI Command Reference*.

scan-provisioned-products

The following code example shows how to use `scan-provisioned-products`.

AWS CLI

To list all available provisioned products

The following `scan-provisioned-products` example lists available provisioned products.

```
aws servicecatalog scan-provisioned-products
```

Output:

```
{  
  "ProvisionedProducts": [  
    {  
      "Status": "ERROR",  
      "Arn": "arn:aws:servicecatalog:us-west-2:123456789012:stack/  
mytestppname3/pp-abcd27bm4mldq",  
      "StatusMessage": "AmazonCloudFormationException Parameters: [KeyName]  
must have values (Service: AmazonCloudFormation; Status Code: 400; Error Code:  
ValidationError; Request ID: 5528602a-a9ef-427c-825c-f82c31b814f5)",  
      "Id": "pp-abcd27bm4mldq",  
      "Type": "CFN_STACK",  
      "IdempotencyToken": "527c5358-2a1a-4b9e-b1b9-7293b0ddff42",  
      "CreatedTime": 1577222793.358,  
    }  
  ]  
}
```

```
        "Name": "mytestppname3",
        "LastRecordId": "rec-tfuawdabcdxge"
    }
]
}
```

- For API details, see [ScanProvisionedProducts](#) in *AWS CLI Command Reference*.

search-products-as-admin

The following code example shows how to use `search-products-as-admin`.

AWS CLI

To search products with administrator privileges

The following `search-products-as-admin` example searches for products with admin privileges, using a portfolio ID as a filter.

```
aws servicecatalog search-products-as-admin \
  --portfolio-id port-5abcd3e5st4ei
```

Output:

```
{
  "ProductViewDetails": [
    {
      "ProductViewSummary": {
        "Name": "my product",
        "Owner": "owner name",
        "Type": "CLOUD_FORMATION_TEMPLATE",
        "ProductId": "prod-abcdefz3syn2rg",
        "HasDefaultPath": false,
        "Id": "prodview-abcdmyuzv2dlu",
        "ShortDescription": "description"
      },
      "ProductARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-abcdefz3syn2rg",
      "CreatedTime": 1562097906.0,
      "Status": "CREATED"
    }
  ]
}
```

```
}
```

- For API details, see [SearchProductsAsAdmin](#) in *AWS CLI Command Reference*.

search-provisioned-products

The following code example shows how to use `search-provisioned-products`.

AWS CLI

To search provisioned products

The following `search-provisioned-products` example searches for provisioned products matching the specified product ID, using a JSON file to pass parameters.

```
aws servicecatalog search-provisioned-products \  
  --cli-input-json file://search-provisioned-products-input.json
```

Contents of `search-provisioned-products-input.json`:

```
{  
  "Filters": {  
    "SearchQuery": [  
      "prod-tcjevz3syn2rg"  
    ]  
  }  
}
```

Output:

```
{  
  "ProvisionedProducts": [  
    {  
      "ProvisioningArtifactId": "pa-pcz347abcdcfm",  
      "Name": "mytestppname3",

}

```

- For API details, see [SearchProvisionedProducts](#) in *AWS CLI Command Reference*.

update-portfolio

The following code example shows how to use `update-portfolio`.

AWS CLI

To update a portfolio

The following `update-portfolio` example updates the name of the specified portfolio.

```
aws servicecatalog update-portfolio \  
  --id port-5abcd3e5st4ei \  
  --display-name "New portfolio name"
```

Output:

```
{  
  "PortfolioDetail": {  
    "DisplayName": "New portfolio name",  
    "ProviderName": "provider",  
    "ARN": "arn:aws:catalog:us-west-2:123456789012:portfolio/  
port-5abcd3e5st4ei",  
    "Id": "port-5abcd3e5st4ei",  
    "CreatedTime": 1559665256.348  
  },  
  "Tags": []  
}
```

- For API details, see [UpdatePortfolio](#) in *AWS CLI Command Reference*.

update-product

The following code example shows how to use `update-product`.

AWS CLI

To update a product

The following `update-product` example updates the name and owner of the specified product.

```
aws servicecatalog update-product \  
  --id port-5abcd3e5st4ei \  
  --display-name "New portfolio name"
```

```
--id prod-os6abc7drqlt2 \  
--name "New product name" \  
--owner "Updated product owner"
```

Output:

```
{  
  "Tags": [  
    {  
      "Value": "iad",  
      "Key": "region"  
    }  
  ],  
  "ProductViewDetail": {  
    "ProductViewSummary": {  
      "Owner": "Updated product owner",  
      "ProductId": "prod-os6abc7drqlt2",  
      "Distributor": "test-distributor",  
      "SupportUrl": "https://aws.amazon.com",  
      "Name": "New product name",  
      "ShortDescription": "test-description",  
      "HasDefaultPath": false,  
      "Id": "prodview-6abcdgrfhvidy",  
      "SupportDescription": "test-support",  
      "SupportEmail": "test@amazon.com",  
      "Type": "CLOUD_FORMATION_TEMPLATE"  
    },  
    "Status": "CREATED",  
    "ProductARN": "arn:aws:catalog:us-west-2:123456789012:product/prod-  
os6abc7drqlt2",  
    "CreatedTime": 1577136255.0  
  }  
}
```

- For API details, see [UpdateProduct](#) in *AWS CLI Command Reference*.

update-provisioning-artifact

The following code example shows how to use `update-provisioning-artifact`.

AWS CLI

To update a provisioning artifact

The following `update-provisioning-artifact` example updates the name and description of the specified provisioning artifact, using a JSON file to pass parameters.

```
aws servicecatalog update-provisioning-artifact \  
  --cli-input-json file://update-provisioning-artifact-input.json
```

Contents of `update-provisioning-artifact-input.json`:

```
{  
  "ProductId": "prod-abcdefz3syn2rg",  
  "ProvisioningArtifactId": "pa-pcz347abcdcfm",  
  "Name": "updated name",  
  "Description": "updated description"  
}
```

Output:

```
{  
  "Info": {  
    "TemplateUrl": "https://awsdocs.s3.amazonaws.com/servicecatalog/  
myexampledevelopment-environment.template"  
  },  
  "Status": "AVAILABLE",  
  "ProvisioningArtifactDetail": {  
    "Active": true,  
    "Description": "updated description",  
    "Id": "pa-pcz347abcdcfm",  
    "Name": "updated name",  
    "Type": "CLOUD_FORMATION_TEMPLATE",  
    "CreatedTime": 1562097906.0  
  }  
}
```

- For API details, see [UpdateProvisioningArtifact](#) in *AWS CLI Command Reference*.

update-tag-option

The following code example shows how to use `update-tag-option`.

AWS CLI

To update a TagOption

The following `update-tag-option` example updates the value of a `TagOption`, using the specified JSON file.

```
aws servicecatalog update-tag-option --cli-input-json file://update-tag-option-input.json
```

Contents of `update-tag-option-input.json`:

```
{
  "Id": "tag-iabcdn4fzjjms",
  "Value": "newvalue",
  "Active": true
}
```

Output:

```
{
  "TagOptionDetail": {
    "Value": "newvalue",
    "Key": "1234",
    "Active": true,
    "Id": "tag-iabcdn4fzjjms"
  }
}
```

- For API details, see [UpdateTagOption](#) in *AWS CLI Command Reference*.

Service Quotas examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Service Quotas.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

get-aws-default-service-quota

The following code example shows how to use `get-aws-default-service-quota`.

AWS CLI

To describe a default service quota

The following `get-aws-default-service-quota` example displays details for the specified quota.

```
aws service-quotas get-aws-default-service-quota \  
  --service-code ec2 \  
  --quota-code L-1216C47A
```

Output:

```
{  
  "Quota": {  
    "ServiceCode": "ec2",  
    "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",  
    "QuotaArn": "arn:aws:servicequotas:us-east-2::ec2/L-1216C47A",  
    "QuotaCode": "L-1216C47A",  
    "QuotaName": "Running On-Demand Standard (A, C, D, H, I, M, R, T, Z)  
instances",  
    "Value": 5.0,  
    "Unit": "None",  
    "Adjustable": true,  
    "GlobalQuota": false,  
    "UsageMetric": {  
      "MetricNamespace": "AWS/Usage",  
      "MetricName": "ResourceCount",  
      "MetricDimensions": {  
        "Class": "Standard/OnDemand",  
        "Resource": "vCPU",  
        "Service": "EC2",  
        "Type": "Resource"  
      }  
    }  
  }  
}
```

```

        },
        "MetricStatisticRecommendation": "Maximum"
    }
}
}

```

- For API details, see [GetAwsDefaultServiceQuota](#) in *AWS CLI Command Reference*.

get-requested-service-quota-change

The following code example shows how to use `get-requested-service-quota-change`.

AWS CLI

To describe a service quota increase request

The following `get-requested-service-quota-change` example describes the specified quota increase request.

```
aws service-quotas get-requested-service-quota-change \
  --request-id d187537d15254312a9609aa51bbf7624u7W49tP0
```

Output:

```
{
  "RequestedQuota": {
    "Id": "d187537d15254312a9609aa51bbf7624u7W49tP0",
    "CaseId": "6780195351",
    "ServiceCode": "ec2",
    "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
    "QuotaCode": "L-20F13EBD",
    "QuotaName": "Running Dedicated c5n Hosts",
    "DesiredValue": 2.0,
    "Status": "CASE_OPENED",
    "Created": 1580446904.067,
    "LastUpdated": 1580446953.265,

    "GlobalQuota": false,
    "Unit": "None"
  }
}
```

```
}
```

- For API details, see [GetRequestedServiceQuotaChange](#) in *AWS CLI Command Reference*.

get-service-quota

The following code example shows how to use `get-service-quota`.

AWS CLI

To describe a service quota

The following `get-service-quota` example displays details about the specified quota.

```
aws service-quotas get-service-quota \  
  --service-code ec2 \  
  --quota-code L-1216C47A
```

Output:

```
{  
  "Quota": {  
    "ServiceCode": "ec2",  
    "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",  
    "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/L-1216C47A",  
    "QuotaCode": "L-1216C47A",  
    "QuotaName": "Running On-Demand Standard (A, C, D, H, I, M, R, T, Z)  
instances",  
    "Value": 1920.0,  
    "Unit": "None",  
    "Adjustable": true,  
    "GlobalQuota": false,  
    "UsageMetric": {  
      "MetricNamespace": "AWS/Usage",  
      "MetricName": "ResourceCount",  
      "MetricDimensions": {  
        "Class": "Standard/OnDemand",  
        "Resource": "vCPU",  
        "Service": "EC2",  
        "Type": "Resource"  
      },  
      "MetricStatisticRecommendation": "Maximum"  
    }  
  }  
}
```

```
    }  
  }  
}
```

- For API details, see [GetServiceQuota](#) in *AWS CLI Command Reference*.

list-aws-default-service-quotas

The following code example shows how to use `list-aws-default-service-quotas`.

AWS CLI

To list the default quotas for a service

The following `list-aws-default-service-quotas` example lists the default values for the quotas for the specified service.

```
aws service-quotas list-aws-default-service-quotas \  
  --service-code xray
```

Output:

```
{  
  "Quotas": [  
    {  
      "ServiceCode": "xray",  
      "ServiceName": "AWS X-Ray",  
      "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-C6B6F05D",  
      "QuotaCode": "L-C6B6F05D",  
      "QuotaName": "Indexed annotations per trace",  
      "Value": 50.0,  
      "Unit": "None",  
      "Adjustable": false,  
      "GlobalQuota": false  
    },  
    {  
      "ServiceCode": "xray",  
      "ServiceName": "AWS X-Ray",  
      "QuotaArn": "arn:aws:servicequotas:us-west-2::xray/L-D781C0FD",  
      "QuotaCode": "L-D781C0FD",  
      "QuotaName": "Segment document size",  
      "Value": 64.0,  
    }  
  ]  
}
```

        "Adjustable": false,
        "GlobalQuota": false
    }
]
}

```

- For API details, see [ListAwsDefaultServiceQuotas](#) in *AWS CLI Command Reference*.

list-requested-service-quota-change-history-by-quota

The following code example shows how to use `list-requested-service-quota-change-history-by-quota`.

AWS CLI

To list your quota increase requests

The following `list-requested-service-quota-change-history-by-quota` example lists the quota increase requests for the specified quota.

```

aws service-quotas list-requested-service-quota-change-history-by-quota \
  --service-code ec2 \
  --quota-code L-20F13EBD

```

Output:

```

{
  "RequestedQuotas": [
    {
      "Id": "d187537d15254312a9609aa51bbf7624u7W49tP0",

```

```

    "CaseId": "6780195351",
    "ServiceCode": "ec2",
    "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
    "QuotaCode": "L-20F13EBD",
    "QuotaName": "Running Dedicated c5n Hosts",
    "DesiredValue": 2.0,
    "Status": "CASE_OPENED",
    "Created": 1580446904.067,
    "LastUpdated": 1580446953.265,
    "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\\\"arn:aws:iam::123456789012:root\\\"}\",
    "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/
L-20F13EBD",
    "GlobalQuota": false,
    "Unit": "None"
  }
]
}

```

- For API details, see [ListRequestedServiceQuotaChangeHistoryByQuota](#) in *AWS CLI Command Reference*.

list-requested-service-quota-change-history

The following code example shows how to use `list-requested-service-quota-change-history`.

AWS CLI

To list your quota increase requests

The following `list-requested-service-quota-change-history` example lists the quota increase requests for the specified service.

```
aws service-quotas list-requested-service-quota-change-history \
  --service-code ec2
```

Output:

```
{
  "RequestedQuotas": [
```

```

    {
      "Id": "d187537d15254312a9609aa51bbf7624u7W49tP0",
      "CaseId": "6780195351",
      "ServiceCode": "ec2",
      "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",
      "QuotaCode": "L-20F13EBD",
      "QuotaName": "Running Dedicated c5n Hosts",
      "DesiredValue": 2.0,
      "Status": "CASE_OPENED",
      "Created": 1580446904.067,
      "LastUpdated": 1580446953.265,
      "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":
\\\"arn:aws:iam::123456789012:root\\\"}\",
      "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/
L-20F13EBD",
      "GlobalQuota": false,
      "Unit": "None"
    }
  ]
}

```

- For API details, see [ListRequestedServiceQuotaChangeHistory](#) in *AWS CLI Command Reference*.

list-service-quotas

The following code example shows how to use `list-service-quotas`.

AWS CLI

To list the quotas for a service

The following `list-service-quotas` example displays details about the quotas for AWS CloudFormation.

```
aws service-quotas list-service-quotas \
  --service-code cloudformation
```

Output:

```
{
  "Quotas": [
```

```
{
  "ServiceCode": "cloudformation",
  "ServiceName": "AWS CloudFormation",
  "QuotaArn": "arn:aws:servicequotas:us-
east-2:123456789012:cloudformation/L-87D14FB7",
  "QuotaCode": "L-87D14FB7",
  "QuotaName": "Output count in CloudFormation template",
  "Value": 60.0,
  "Unit": "None",
  "Adjustable": false,
  "GlobalQuota": false
},
{
  "ServiceCode": "cloudformation",
  "ServiceName": "AWS CloudFormation",
  "QuotaArn": "arn:aws:servicequotas:us-
east-2:123456789012:cloudformation/L-0485CB21",
  "QuotaCode": "L-0485CB21",
  "QuotaName": "Stack count",
  "Value": 200.0,
  "Unit": "None",
  "Adjustable": true,
  "GlobalQuota": false
}
]
```

- For API details, see [ListServiceQuotas](#) in *AWS CLI Command Reference*.

list-services

The following code example shows how to use `list-services`.

AWS CLI

To list the available services

The following command lists the services that are available in Service Quotas.

```
aws service-quotas list-services
```

Output:

```
{
  "Services": [
    {
      "ServiceCode": "AWSCloudMap",
      "ServiceName": "AWS Cloud Map"
    },
    {
      "ServiceCode": "access-analyzer",
      "ServiceName": "Access Analyzer"
    },
    {
      "ServiceCode": "acm",
      "ServiceName": "AWS Certificate Manager (ACM)"
    },
    ...truncated...
    {
      "ServiceCode": "xray",
      "ServiceName": "AWS X-Ray"
    }
  ]
}
```

You can add the `--query` parameter to filter the display to the information that you are interested in. The following example displays only the service codes.

```
aws service-quotas list-services \
  --query Services[*].ServiceCode
```

Output:

```
[
  "AWSCloudMap",
  "access-analyzer",
  "acm",
  "acm-pca",
  "amplify",
  "apigateway",
  "application-autoscaling",
  ...truncated...
  "xray"
```

```
]
```

- For API details, see [ListServices](#) in *AWS CLI Command Reference*.

request-service-quota-increase

The following code example shows how to use `request-service-quota-increase`.

AWS CLI

To request a service quota increase

The following `request-service-quota-increase` example requests an increase in the specified service quota.

```
aws service-quotas request-service-quota-increase \  
  --service-code ec2 \  
  --quota-code L-20F13EBD \  
  --desired-value 2
```

Output:

```
{  
  "RequestedQuota": {  
    "Id": "d187537d15254312a9609aa51bbf7624u7W49tP0",  
    "ServiceCode": "ec2",  
    "ServiceName": "Amazon Elastic Compute Cloud (Amazon EC2)",  
    "QuotaCode": "L-20F13EBD",  
    "QuotaName": "Running Dedicated c5n Hosts",  
    "DesiredValue": 2.0,  
    "Status": "PENDING",  
    "Created": 1580446904.067,  
    "Requester": "{\"accountId\":\"123456789012\",\"callerArn\":  
  \\\narn:aws:iam::123456789012:root\"}",  
    "QuotaArn": "arn:aws:servicequotas:us-east-2:123456789012:ec2/L-20F13EBD",  
    "GlobalQuota": false,  
    "Unit": "None"  
  }  
}
```

- For API details, see [RequestServiceQuotaIncrease](#) in *AWS CLI Command Reference*.

Amazon SES examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SES.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

delete-identity

The following code example shows how to use `delete-identity`.

AWS CLI

To delete an identity

The following example uses the `delete-identity` command to delete an identity from the list of identities verified with Amazon SES:

```
aws ses delete-identity --identity user@example.com
```

For more information about verified identities, see *Verifying Email Addresses and Domains in Amazon SES* in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [DeleteIdentity](#) in *AWS CLI Command Reference*.

get-identity-dkim-attributes

The following code example shows how to use `get-identity-dkim-attributes`.

AWS CLI

To get the Amazon SES Easy DKIM attributes for a list of identities

The following example uses the `get-identity-dkim-attributes` command to retrieve the Amazon SES Easy DKIM attributes for a list of identities:

```
aws ses get-identity-dkim-attributes --identities "example.com" "user@example.com"
```

Output:

```
{
  "DkimAttributes": {
    "example.com": {
      "DkimTokens": [
        "EXAMPLEjcs5xoyqytjsotsijas7236gr",
        "EXAMPLEjr76cvoc6mysspnioorxsn6ep",
        "EXAMPLEkbnkqkhlm2lyz77ppkulerm4k"
      ],
      "DkimEnabled": true,
      "DkimVerificationStatus": "Success"
    },
    "user@example.com": {
      "DkimEnabled": false,
      "DkimVerificationStatus": "NotStarted"
    }
  }
}
```

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about Easy DKIM, see Easy DKIM in Amazon SES in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [GetIdentityDkimAttributes](#) in *AWS CLI Command Reference*.

get-identity-notification-attributes

The following code example shows how to use `get-identity-notification-attributes`.

AWS CLI

To get the Amazon SES notification attributes for a list of identities

The following example uses the `get-identity-notification-attributes` command to retrieve the Amazon SES notification attributes for a list of identities:

```
aws ses get-identity-notification-attributes --identities "user1@example.com"
"user2@example.com"
```

Output:

```
{
  "NotificationAttributes": {
    "user1@example.com": {
      "ForwardingEnabled": false,
      "ComplaintTopic": "arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic",
      "BounceTopic": "arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic",
      "DeliveryTopic": "arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic"
    },
    "user2@example.com": {
      "ForwardingEnabled": true
    }
  }
}
```

This command returns the status of email feedback forwarding and, if applicable, the Amazon Resource Names (ARNs) of the Amazon SNS topics that bounce, complaint, and delivery notifications are sent to.

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about notifications, see *Using Notifications With Amazon SES* in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [GetIdentityNotificationAttributes](#) in *AWS CLI Command Reference*.

`get-identity-verification-attributes`

The following code example shows how to use `get-identity-verification-attributes`.

AWS CLI

To get the Amazon SES verification status for a list of identities

The following example uses the `get-identity-verification-attributes` command to retrieve the Amazon SES verification status for a list of identities:

```
aws ses get-identity-verification-attributes --identities "user1@example.com"
"user2@example.com"
```

Output:

```
{
  "VerificationAttributes": {
    "user1@example.com": {
      "VerificationStatus": "Success"
    },
    "user2@example.com": {
      "VerificationStatus": "Pending"
    }
  }
}
```

If you call this command with an identity that you have never submitted for verification, that identity won't appear in the output.

For more information about verified identities, see *Verifying Email Addresses and Domains in Amazon SES* in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [GetIdentityVerificationAttributes](#) in *AWS CLI Command Reference*.

get-send-quota

The following code example shows how to use `get-send-quota`.

AWS CLI

To get your Amazon SES sending limits

The following example uses the `get-send-quota` command to return your Amazon SES sending limits:

```
aws ses get-send-quota
```

Output:

```
{
  "Max24HourSend": 200.0,
  "SentLast24Hours": 1.0,
  "MaxSendRate": 1.0
}
```

Max24HourSend is your sending quota, which is the maximum number of emails that you can send in a 24-hour period. The sending quota reflects a rolling time period. Every time you try to send an email, Amazon SES checks how many emails you sent in the previous 24 hours. As long as the total number of emails that you have sent is less than your quota, your send request will be accepted and your email will be sent.

SentLast24Hours is the number of emails that you have sent in the previous 24 hours.

MaxSendRate is the maximum number of emails that you can send per second.

Note that sending limits are based on recipients rather than on messages. For example, an email that has 10 recipients counts as 10 against your sending quota.

For more information, see *Managing Your Amazon SES Sending Limits* in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [GetSendQuota](#) in *AWS CLI Command Reference*.

get-send-statistics

The following code example shows how to use `get-send-statistics`.

AWS CLI**To get your Amazon SES sending statistics**

The following example uses the `get-send-statistics` command to return your Amazon SES sending statistics

```
aws ses get-send-statistics
```

Output:

```
{
  "SendDataPoints": [
    {
      "Complaints": 0,
      "Timestamp": "2013-06-12T19:32:00Z",
      "DeliveryAttempts": 2,
      "Bounces": 0,
      "Rejects": 0
    },
    {
      "Complaints": 0,
      "Timestamp": "2013-06-12T00:47:00Z",
      "DeliveryAttempts": 1,
      "Bounces": 0,
      "Rejects": 0
    }
  ]
}
```

The result is a list of data points, representing the last two weeks of sending activity. Each data point in the list contains statistics for a 15-minute interval.

In this example, there are only two data points because the only emails that the user sent in the last two weeks fell within two 15-minute intervals.

For more information, see *Monitoring Your Amazon SES Usage Statistics* in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [GetSendStatistics](#) in *AWS CLI Command Reference*.

list-identities

The following code example shows how to use `list-identities`.

AWS CLI**To list all identities (email addresses and domains) for a specific AWS account**

The following example uses the `list-identities` command to list all identities that have been submitted for verification with Amazon SES:

```
aws ses list-identities
```

Output:

```
{
  "Identities": [
    "user@example.com",
    "example.com"
  ]
}
```

The list that is returned contains all identities regardless of verification status (verified, pending verification, failure, etc.).

In this example, email addresses *and* domains are returned because we did not specify the `identity-type` parameter.

For more information about verification, see [Verifying Email Addresses and Domains in Amazon SES](#) in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [ListIdentities](#) in *AWS CLI Command Reference*.

send-email

The following code example shows how to use `send-email`.

AWS CLI**To send a formatted email using Amazon SES**

The following example uses the `send-email` command to send a formatted email:

```
aws ses send-email --from sender@example.com --destination file://destination.json
--message file://message.json
```

Output:

```
{
  "MessageId": "EXAMPLEf3a5efcd1-51adec81-d2a4-4e3f-9fe2-5d85c1b23783-000000"
}
```

The destination and the message are JSON data structures saved in .json files in the current directory. These files are as follows:

destination.json:

```
{
  "ToAddresses": ["recipient1@example.com", "recipient2@example.com"],
  "CcAddresses": ["recipient3@example.com"],
  "BccAddresses": []
}
```

message.json:

```
{
  "Subject": {
    "Data": "Test email sent using the AWS CLI",
    "Charset": "UTF-8"
  },
  "Body": {
    "Text": {
      "Data": "This is the message body in text format.",
      "Charset": "UTF-8"
    },
    "Html": {
      "Data": "This message body contains HTML formatting. It can, for example,
contain links like this one: <a class=\"uLink\" href=\"http://docs.aws.amazon.com/
ses/latest/DeveloperGuide\" target=\"_blank\">Amazon SES Developer Guide</a>.",
      "Charset": "UTF-8"
    }
  }
}
```

Replace the sender and recipient email addresses with the ones you want to use. Note that the sender's email address must be verified with Amazon SES. Until you are granted production access to Amazon SES, you must also verify the email address of each recipient unless the recipient is the Amazon SES mailbox simulator. For more information on verification, see *Verifying Email Addresses and Domains in Amazon SES* in the *Amazon Simple Email Service Developer Guide*.

The Message ID in the output indicates that the call to send-email was successful.

If you don't receive the email, check your Junk box.

For more information on sending formatted email, see [Sending Formatted Email Using the Amazon SES API](#) in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [SendEmail](#) in *AWS CLI Command Reference*.

send-raw-email

The following code example shows how to use `send-raw-email`.

AWS CLI

To send a raw email using Amazon SES

The following example uses the `send-raw-email` command to send an email with a TXT attachment:

```
aws ses send-raw-email --raw-message file://message.json
```

Output:

```
{
  "MessageId": "EXAMPLEf3f73d99b-c63fb06f-d263-41f8-a0fb-d0dc67d56c07-000000"
}
```

The raw message is a JSON data structure saved in a file named `message.json` in the current directory. It contains the following:

```
{
  "Data": "From: sender@example.com\nTo: recipient@example.com\nSubject: Test email
sent using the AWS CLI (contains an attachment)\nMIME-Version: 1.0\nContent-type:
Multipart/Mixed; boundary=\"NextPart\"\n\n--NextPart\nContent-Type: text/plain
\n\nThis is the message body.\n\n--NextPart\nContent-Type: text/plain;\nContent-
Disposition: attachment; filename=\"attachment.txt\"\n\nThis is the text in the
attachment.\n\n--NextPart--"
}
```

As you can see, "Data" is one long string that contains the entire raw email content in MIME format, including an attachment called `attachment.txt`.

Replace `sender@example.com` and `recipient@example.com` with the addresses you want to use. Note that the sender's email address must be verified with Amazon SES. Until you are granted

production access to Amazon SES, you must also verify the email address of the recipient unless the recipient is the Amazon SES mailbox simulator. For more information on verification, see *Verifying Email Addresses and Domains in Amazon SES* in the *Amazon Simple Email Service Developer Guide*.

The Message ID in the output indicates that the call to `send-raw-email` was successful.

If you don't receive the email, check your Junk box.

For more information on sending raw email, see *Sending Raw Email Using the Amazon SES API* in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [SendRawEmail](#) in *AWS CLI Command Reference*.

set-identity-dkim-enabled

The following code example shows how to use `set-identity-dkim-enabled`.

AWS CLI

To enable or disable Easy DKIM for an Amazon SES verified identity

The following example uses the `set-identity-dkim-enabled` command to disable DKIM for a verified email address:

```
aws ses set-identity-dkim-enabled --identity user@example.com --no-dkim-enabled
```

For more information about Easy DKIM, see *Easy DKIM in Amazon SES* in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [SetIdentityDkimEnabled](#) in *AWS CLI Command Reference*.

set-identity-feedback-forwarding-enabled

The following code example shows how to use `set-identity-feedback-forwarding-enabled`.

AWS CLI

To enable or disable bounce and complaint email feedback forwarding for an Amazon SES verified identity

The following example uses the `set-identity-feedback-forwarding-enabled` command to enable a verified email address to receive bounce and complaint notifications by email:

```
aws ses set-identity-feedback-forwarding-enabled --identity user@example.com --forwarding-enabled
```

You are required to receive bounce and complaint notifications via either Amazon SNS or email feedback forwarding, so you can only disable email feedback forwarding if you select an Amazon SNS topic for both bounce and complaint notifications.

For more information about notifications, see *Using Notifications With Amazon SES* in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [SetIdentityFeedbackForwardingEnabled](#) in *AWS CLI Command Reference*.

set-identity-notification-topic

The following code example shows how to use `set-identity-notification-topic`.

AWS CLI

To set the Amazon SNS topic to which Amazon SES will publish bounce, complaint, and/or delivery notifications for a verified identity

The following example uses the `set-identity-notification-topic` command to specify the Amazon SNS topic to which a verified email address will receive bounce notifications:

```
aws ses set-identity-notification-topic --identity user@example.com --notification-type Bounce --sns-topic arn:aws:sns:us-east-1:EXAMPLE65304:MyTopic
```

For more information about notifications, see *Using Notifications With Amazon SES* in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [SetIdentityNotificationTopic](#) in *AWS CLI Command Reference*.

verify-domain-dkim

The following code example shows how to use `verify-domain-dkim`.

AWS CLI

To generate a verified domain's DKIM tokens for DKIM signing with Amazon SES

The following example uses the `verify-domain-dkim` command to generate DKIM tokens for a domain that has been verified with Amazon SES:

```
aws ses verify-domain-dkim --domain example.com
```

Output:

```
{
  "DkimTokens": [
    "EXAMPLEq76owjnks3lnluwg65scbemvw",
    "EXAMPLEi3dnsj67hstzaj673klariwx2",
    "EXAMPLEwfbtcukvimehexktdtaz6naj"
  ]
}
```

To set up DKIM, you must use the returned DKIM tokens to update your domain's DNS settings with CNAME records that point to DKIM public keys hosted by Amazon SES. For more information, see [Easy DKIM in Amazon SES](#) in the *Amazon Simple Email Service Developer Guide*.

- For API details, see [VerifyDomainDkim](#) in *AWS CLI Command Reference*.

verify-domain-identity

The following code example shows how to use `verify-domain-identity`.

AWS CLI

To verify a domain with Amazon SES

The following example uses the `verify-domain-identity` command to verify a domain:

```
aws ses verify-domain-identity --domain example.com
```

Output:

```
{
  "VerificationToken": "eoEmxw+YaYhb3h3iVJHuXMJXqeu1q1/wmvjuEXAMPLE"
}
```

To complete domain verification, you must add a TXT record with the returned verification token to your domain's DNS settings. For more information, see *Verifying Domains in Amazon SES in the Amazon Simple Email Service Developer Guide*.

- For API details, see [VerifyDomainIdentity](#) in *AWS CLI Command Reference*.

verify-email-identity

The following code example shows how to use `verify-email-identity`.

AWS CLI

To verify an email address with Amazon SES

The following example uses the `verify-email-identity` command to verify an email address:

```
aws ses verify-email-identity --email-address user@example.com
```

Before you can send an email using Amazon SES, you must verify the address or domain that you are sending the email from to prove that you own it. If you do not have production access yet, you also need to verify any email addresses that you send emails to except for email addresses provided by the Amazon SES mailbox simulator.

After `verify-email-identity` is called, the email address will receive a verification email. The user must click on the link in the email to complete the verification process.

For more information, see *Verifying Email Addresses in Amazon SES in the Amazon Simple Email Service Developer Guide*.

- For API details, see [VerifyEmailIdentity](#) in *AWS CLI Command Reference*.

Shield examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Shield.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- [Actions](#)

Actions

associate-drt-log-bucket

The following code example shows how to use `associate-drt-log-bucket`.

AWS CLI

To authorize the DRT to access an Amazon S3 bucket

The following `associate-drt-log-bucket` example creates an association between the DRT and the specified S3 bucket. This permits the DRT to access the bucket on behalf of the account.:

```
aws shield associate-drt-log-bucket \  
  --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see [Authorize the DDoS Response Team](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [AssociateDrtLogBucket](#) in *AWS CLI Command Reference*.

associate-drt-role

The following code example shows how to use `associate-drt-role`.

AWS CLI

To authorize the DRT to mitigate potential attacks on your behalf

The following `associate-drt-role` example creates an association between the DRT and the specified role. The DRT can use the role to access and manage the account.

```
aws shield associate-drt-role \  
  --role-arn arn:aws:iam::123456789012:role/service-role/DrtRole
```

This command produces no output.

For more information, see [Authorize the DDoS Response Team](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [AssociateDrtRole](#) in *AWS CLI Command Reference*.

create-protection

The following code example shows how to use `create-protection`.

AWS CLI

To enable AWS Shield Advanced protection for a single AWS resource

The following `create-protection` example enables Shield Advanced protection for the specified AWS CloudFront distribution.

```
aws shield create-protection \  
  --name "Protection for CloudFront distribution" \  
  --resource-arn arn:aws:cloudfront::123456789012:distribution/E198WC25FX0WY8
```

Output:

```
{  
  "ProtectionId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
}
```

For more information, see [Specify Your Resources to Protect](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [CreateProtection](#) in *AWS CLI Command Reference*.

create-subscription

The following code example shows how to use `create-subscription`.

AWS CLI

To enable AWS Shield Advanced protection for an account

The following `create-subscription` example enables Shield Advanced protection for the account.

```
aws shield create-subscription
```

This command produces no output.

For more information, see [Getting Started with AWS Shield Advanced](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [CreateSubscription](#) in *AWS CLI Command Reference*.

delete-protection

The following code example shows how to use `delete-protection`.

AWS CLI

To remove AWS Shield Advanced protection from an AWS resource

The following `delete-protection` example removes the specified AWS Shield Advanced protection.

```
aws shield delete-protection \  
  --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see [Removing AWS Shield Advanced from an AWS Resource](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [DeleteProtection](#) in *AWS CLI Command Reference*.

describe-attack

The following code example shows how to use `describe-attack`.

AWS CLI

To retrieve a detailed description of an attack

The following describe-attack example displays details about the DDoS attack with the specified attack ID. You can obtain attack IDs by running the list-attacks command.

```
aws shield describe-attack --attack-id a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{
  "Attack": {
    "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "ResourceArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/testElb",

For more information, see [Reviewing DDoS Incidents](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [DescribeAttack](#) in *AWS CLI Command Reference*.

describe-drt-access

The following code example shows how to use `describe-drt-access`.

AWS CLI

To retrieve a description of the authorizations the DRT has to mitigate attacks on your behalf

The following `describe-drt-access` example retrieves the role and S3 bucket authorizations that the DRT has, which allow it to respond to potential attacks on your behalf.

```
aws shield describe-drt-access
```

Output:

```

{
  "RoleArn": "arn:aws:iam::123456789012:role/service-role/DrtRole",
  "LogBucketList": [
    "flow-logs-for-website-lb"
  ]
}

```

For more information, see [Authorize the DDoS Response Team](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [DescribeDrtAccess](#) in *AWS CLI Command Reference*.

describe-emergency-contact-settings

The following code example shows how to use `describe-emergency-contact-settings`.

AWS CLI

To retrieve emergency e-mail addresses that you have on file with the DRT

The following `describe-emergency-contact-settings` example retrieves the e-mail addresses that are on file with the DRT for the account. These are the addresses the DRT should contact when it's responding to a suspected attack.

```
aws shield describe-emergency-contact-settings
```

Output:

```
{
  "EmergencyContactList": [
    {
      "EmailAddress": "ops@example.com"
    },
    {
      "EmailAddress": "ddos-notifications@example.com"
    }
  ]
}
```

For more information, see [How AWS Shield Works](https://docs.aws.amazon.com/waf/latest/developerguide/ddos-overview.html) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [DescribeEmergencyContactSettings](#) in *AWS CLI Command Reference*.

describe-protection

The following code example shows how to use `describe-protection`.

AWS CLI

To retrieve the details for an AWS Shield Advanced protection

The following `describe-protection` example displays details about the Shield Advanced protection with the specified ID. You can obtain protection IDs by running the `list-protections` command.

```
aws shield describe-protection \  
  --protection-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{  
  "Protection": {  
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
    "Name": "1.2.3.4",  
    "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:eip-allocation/  
eipalloc-0ac1537af40742a6d"  
  }  
}
```

For more information, see [Specify Your Resources to Protect](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [DescribeProtection](#) in *AWS CLI Command Reference*.

describe-subscription

The following code example shows how to use `describe-subscription`.

AWS CLI

To retrieve the details of the AWS Shield Advanced protection for the account

The following `describe-subscription` example displays details about the Shield Advanced protection provided for the account.:

```
aws shield describe-subscription
```

Output:

```
{  
  "Subscription": {  
    "StartTime": 1534368978.0,
```

```

    "EndTime": 1597613778.0,
    "TimeCommitmentInSeconds": 63244800,
    "AutoRenew": "ENABLED",
    "Limits": [
      {
        "Type": "GLOBAL_ACCELERATOR",
        "Max": 1000
      },
      {
        "Type": "ROUTE53_HOSTED_ZONE",
        "Max": 1000
      },
      {
        "Type": "CF_DISTRIBUTION",
        "Max": 1000
      },
      {
        "Type": "ELB_LOAD_BALANCER",
        "Max": 1000
      },
      {
        "Type": "EC2_ELASTIC_IP_ALLOCATION",
        "Max": 1000
      }
    ]
  }
}

```

For more information, see [How AWS Shield Works](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [DescribeSubscription](#) in *AWS CLI Command Reference*.

disassociate-drt-log-bucket

The following code example shows how to use `disassociate-drt-log-bucket`.

AWS CLI

To remove the authorization for DRT to access an Amazon S3 bucket on your behalf

The following `disassociate-drt-log-bucket` example removes the association between the DRT and the specified S3 bucket. After this command completes, the DRT can no longer access the bucket on behalf of the account.

```
aws shield disassociate-drt-log-bucket \  
  --log-bucket flow-logs-for-website-lb
```

This command produces no output.

For more information, see [Authorize the DDoS Response Team](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [DisassociateDrtLogBucket](#) in *AWS CLI Command Reference*.

disassociate-drt-role

The following code example shows how to use `disassociate-drt-role`.

AWS CLI

To remove the authorization for DRT to mitigate potential attacks on your behalf

The following `disassociate-drt-role` example removes the association between the DRT and the account. After this call, the DRT can no longer access or manage your account.

```
aws shield disassociate-drt-role
```

This command produces no output.

For more information, see [Authorize the DDoS Response Team](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [DisassociateDrtRole](#) in *AWS CLI Command Reference*.

get-subscription-state

The following code example shows how to use `get-subscription-state`.

AWS CLI

To retrieve the current state of the account's AWS Shield Advanced subscription

The following `get-subscription-state` example retrieves the state of the Shield Advanced protection for the account.

```
aws shield get-subscription-state
```

Output:

```
{
  "SubscriptionState": "ACTIVE"
}
```

For more information, see [How AWS Shield Works](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [GetSubscriptionState](#) in *AWS CLI Command Reference*.

list-attacks

The following code example shows how to use `list-attacks`.

AWS CLI**To retrieve attack summaries from AWS Shield Advanced**

The following `list-attacks` example retrieves summaries of attacks for the specified AWS CloudFront distribution during the specified time period. The response includes attack IDs that you can provide to the `describe-attack` command for detailed information on an attack.

```
aws shield list-attacks \
  --resource-arns arn:aws:cloudfront::12345678910:distribution/E1PXMP22ZVFAOR \
  --start-time FromInclusive=1529280000,ToExclusive=1529300000
```

Output:

```
{
  "AttackSummaries": [
    {
      "AttackId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/
E1PXMP22ZVFAOR",
      "StartTime": 1529280000.0,
      "EndTime": 1529449200.0,
      "AttackVectors": [
        {
          "VectorType": "SYN_FLOOD"
        }
      ]
    }
  ]
}
```

```
]
}
```

For more information, see [Reviewing DDoS Incidents](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [ListAttacks](#) in *AWS CLI Command Reference*.

list-protections

The following code example shows how to use `list-protections`.

AWS CLI

To retrieve protection summaries from AWS Shield Advanced

The following `list-protections` example retrieves summaries of the protections that are enabled for the account.

```
aws shield list-protections
```

Output:

```
{
  "Protections": [
    {
      "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "Name": "Protection for CloudFront distribution",
      "ResourceArn": "arn:aws:cloudfront::123456789012:distribution/
E198WC25FX0WY8"
    }
  ]
}
```

For more information, see [Specify Your Resources to Protect](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [ListProtections](#) in *AWS CLI Command Reference*.

update-emergency-contact-settings

The following code example shows how to use `update-emergency-contact-settings`.

AWS CLI

To define the emergency e-mail addresses that are on file with the DRT

The following `update-emergency-contact-settings` example defines two e-mail addresses that the DRT should contact when it's responding to a suspected attack.

```
aws shield update-emergency-contact-settings \  
    --emergency-contact-list EmailAddress=ops@example.com EmailAddress=ddos-  
notifications@example.com
```

This command produces no output.

For more information, see [How AWS Shield Works](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [UpdateEmergencyContactSettings](#) in *AWS CLI Command Reference*.

update-subscription

The following code example shows how to use `update-subscription`.

AWS CLI

To modify the account's AWS Shield Advanced subscription

The following `update-subscription` example enables auto-renewal of the AWS Shield Advanced subscription for the account.

```
aws shield update-subscription \  
    --auto-renew ENABLED
```

This command produces no output.

For more information, see [How AWS Shield Works](#) in the *AWS Shield Advanced Developer Guide*.

- For API details, see [UpdateSubscription](#) in *AWS CLI Command Reference*.

Signer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Signer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

cancel-signing-profile

The following code example shows how to use `cancel-signing-profile`.

AWS CLI

To delete a signing profile

The following `cancel-signing-profile` example removes an existing signing profile from AWS Signer.

```
aws signer cancel-signing-profile \  
  --profile-name MyProfile1
```

This command produces no output.

- For API details, see [CancelSigningProfile](#) in *AWS CLI Command Reference*.

describe-signing-job

The following code example shows how to use `describe-signing-job`.

AWS CLI

To display details about a signing job

The following `describe-signing-job` example displays details about the specified signing job.

```
aws signer describe-signing-job \  
  --job-id 2065c468-73e2-4385-a6c9-0123456789abc
```

Output:

```
{  
  "status": "Succeeded",  
  "completedAt": 1568412037,  
  "platformId": "AmazonFreeRTOS-Default",  
  "signingMaterial": {  
    "certificateArn": "arn:aws:acm:us-  
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"  
  },  
  "statusReason": "Signing Succeeded",  
  "jobId": "2065c468-73e2-4385-a6c9-0123456789abc",

    }  
  },  
  "requestedBy": "arn:aws:iam::123456789012:user/maria",  
  "createdAt": 1568412036  
}
```

- For API details, see [DescribeSigningJob](#) in *AWS CLI Command Reference*.

get-signing-platform

The following code example shows how to use `get-signing-platform`.

AWS CLI

To display details about a signing platform

The following `get-signing-platform` example displays details about the specified signing platform.

```
aws signer get-signing-platform \  
  --platform-id AmazonFreeRTOS-TI-CC3220SF
```

Output:

```
{  
  "category": "AWS",

- For API details, see [GetSigningPlatform](#) in *AWS CLI Command Reference*.

get-signing-profile

The following code example shows how to use `get-signing-profile`.

AWS CLI

To display details about a signing profile

The following `get-signing-profile` example displays details about the specified signing profile.

```
aws signer get-signing-profile \  
  --profile-name MyProfile3
```

Output:

```
{  
  "platformId": "AmazonFreeRTOS-TI-CC3220SF",  
  "profileName": "MyProfile3",  
  "status": "Active",  
  "signingMaterial": {  
    "certificateArn": "arn:aws:acm:us-  
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"  
  }  
}
```

- For API details, see [GetSigningProfile](#) in *AWS CLI Command Reference*.

list-signing-jobs

The following code example shows how to use `list-signing-jobs`.

AWS CLI

To list all signing jobs

The following `list-signing-jobs` example displays details about all signing jobs for the account.

```
aws signer list-signing-jobs
```

In this example, two jobs are returned, one successful, and one failed.

```
{
  "jobs": [
    {
      "status": "Succeeded",
      "signingMaterial": {
        "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
      },

  ]
}
```

```
}
```

- For API details, see [ListSigningJobs](#) in *AWS CLI Command Reference*.

list-signing-platforms

The following code example shows how to use `list-signing-platforms`.

AWS CLI

To list all signing platforms

The following `list-signing-platforms` example displays details about all available signing platforms.

```
aws signer list-signing-platforms
```

Output:

```
{
  "platforms": [
    {
      "category": "AWS",
      "displayName": "AWS IoT Device Management SHA256-ECDSA ",
      "target": "SHA256-ECDSA",
      "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",

    "target": "SHA256-ECDSA",
    "platformId": "AmazonFreeRTOS-Default",
    "signingConfiguration": {
      "encryptionAlgorithmOptions": {
        "defaultValue": "ECDSA",
        "allowedValues": [
```

```

        "ECDSA"
      ],
    },
    "hashAlgorithmOptions": {
      "defaultValue": "SHA256",
      "allowedValues": [
        "SHA256"
      ]
    },
  },
  "maxSizeInMB": 16,
  "partner": "AmazonFreeRTOS",
  "signingImageFormat": {
    "defaultFormat": "JSONEmbedded",
    "supportedFormats": [
      "JSONEmbedded"
    ]
  }
}
]
}

```

- For API details, see [ListSigningPlatforms](#) in *AWS CLI Command Reference*.

list-signing-profiles

The following code example shows how to use `list-signing-profiles`.

AWS CLI

To list all signing profiles

The following `list-signing-profiles` example displays details about all signing profiles for the account.

```
aws signer list-signing-profiles
```

Output:

```
{
  "profiles": [
    {
```

```

    "platformId": "AmazonFreeRTOS-TI-CC3220SF",
    "profileName": "MyProfile4",
    "status": "Active",
    "signingMaterial": {
      "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
    }
  },
  {
    "platformId": "AWSIoTDeviceManagement-SHA256-ECDSA",
    "profileName": "MyProfile5",
    "status": "Active",
    "signingMaterial": {
      "certificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc"
    }
  }
]
}

```

- For API details, see [ListSigningProfiles](#) in *AWS CLI Command Reference*.

put-signing-profile

The following code example shows how to use `put-signing-profile`.

AWS CLI

To create a signing profile

The following `put-signing-profile` example creates a signing profile using the specified certificate and platform.

```

aws signer put-signing-profile \
  --profile-name MyProfile6 \
  --signing-material certificateArn=arn:aws:acm:us-
west-2:123456789012:certificate/6a55389b-306b-4e8c-a95c-0123456789abc \
  --platform AmazonFreeRTOS-TI-CC3220SF

```

Output:

```
{
```

```
"arn": "arn:aws:signer:us-west-2:123456789012:/signing-profiles/MyProfile6"
}
```

- For API details, see [PutSigningProfile](#) in *AWS CLI Command Reference*.

start-signing-job

The following code example shows how to use `start-signing-job`.

AWS CLI

To start a signing job

The following `start-signing-job` example starts a signing job on the code found at the specified source. It uses the specified profile to do the signing and places the signed code in the specified destination.

```
aws signer start-signing-job \
  --source 's3={bucketName=signer-
source,key=MyCode.rb,version=PNyFaUTgsQh5ZdMCcoCe6pT1g0pgB_M4}' \
  --destination 's3={bucketName=signer-destination,prefix=signed-}' \
  --profile-name MyProfile7
```

The output is the ID of the signing job.

```
{
  "jobId": "2065c468-73e2-4385-a6c9-0123456789abc"
}
```

- For API details, see [StartSigningJob](#) in *AWS CLI Command Reference*.

Snowball examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Snowball.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

get-snowball-usage

The following code example shows how to use `get-snowball-usage`.

AWS CLI

To get information about the Snowball service limit for your account

The following `get-snowball-usage` example displays information about the Snowball service limit for your account, and also the number of Snowballs your account has in use.

```
aws snowball get-snowball-usage
```

Output:

```
{
  "SnowballLimit": 1,
  "SnowballsInUse": 0
}
```

FOR more information, see [AWS Snowball Edge Limits](#) in the *AWS Snowball Developer Guide*.

- For API details, see [GetSnowballUsage](#) in *AWS CLI Command Reference*.

list-jobs

The following code example shows how to use `list-jobs`.

AWS CLI

To list the current Snowball jobs in your account

The following `list-jobs` example displays an array of `JobListEntry` objects. In this example, a single job is listed.

```
aws snowball list-jobs
```

Output:

```
{
  "JobListEntries": [
    {
      "CreationDate": 2016-09-27T14:50Z,
      "Description": "Important Photos 2016-08-11",
      "IsMaster": TRUE,
      "JobId": "ABCd1e324fe-022f-488e-a98b-3b0566063db1",
      "JobState": "Complete",
      "JobType": "IMPORT",
      "SnowballType": "EDGE"
    }
  ]
}
```

For more information, see [Jobs for AWS Snowball Edge devices](#) in the *AWS Snowball Developer Guide*.

- For API details, see [ListJobs](#) in *AWS CLI Command Reference*.

Amazon SNS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SNS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- [Scenarios](#)

Actions

add-permission

The following code example shows how to use add-permission.

AWS CLI

To add a permission to a topic

The following add-permission example adds the permission for AWS account 987654321098 to use the Publish action with the specified topic under AWS account 123456789012.

```
aws sns add-permission \  
  --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \  
  --label Publish-Permission \  
  --aws-account-id 987654321098 \  
  --action-name Publish
```

This command produces no output.

- For API details, see [AddPermission](#) in *AWS CLI Command Reference*.

check-if-phone-number-is-opted-out

The following code example shows how to use check-if-phone-number-is-opted-out.

AWS CLI

To check SMS message opt-out for a phone number

The following check-if-phone-number-is-opted-out example checks whether the specified phone number is opted out of receiving SMS messages from the current AWS account.

```
aws sns check-if-phone-number-is-opted-out \  

```

```
--phone-number +1555550100
```

Output:

```
{
  "isOptedOut": false
}
```

- For API details, see [CheckIfPhoneNumbersOptedOut](#) in *AWS CLI Command Reference*.

confirm-subscription

The following code example shows how to use `confirm-subscription`.

AWS CLI**To confirm a subscription**

The following `confirm-subscription` command completes the confirmation process started when you subscribed to an SNS topic named `my-topic`. The `--token` parameter comes from the confirmation message sent to the notification endpoint specified in the `subscribe` call.

```
aws sns confirm-subscription \
  --topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \
  --token
2336412f37fb687f5d51e6e241d7700ae02f7124d8268910b858cb4db727ceeb2474bb937929d3bdd7ce5d0cce1
```

Output:

```
{
  "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
}
```

- For API details, see [ConfirmSubscription](#) in *AWS CLI Command Reference*.

create-platform-application

The following code example shows how to use `create-platform-application`.

AWS CLI

To create a platform application

The following `create-platform-application` example creates a Google Firebase platform application using the specified platform credential.

```
aws sns create-platform-application \  
  --name MyApplication \  
  --platform GCM \  
  --attributes PlatformCredential=EXAMPLEabcd12345jklm67890stuv12345bcdef
```

Output:

```
{  
  "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/GCM/  
MyApplication"  
}
```

- For API details, see [CreatePlatformApplication](#) in *AWS CLI Command Reference*.

create-topic

The following code example shows how to use `create-topic`.

AWS CLI

To create an SNS topic

The following `create-topic` example creates an SNS topic named `my-topic`.

```
aws sns create-topic \  
  --name my-topic
```

Output:

```
{  
  "ResponseMetadata": {  
    "RequestId": "1469e8d7-1642-564e-b85d-a19b4b341f83"  
  },
```

```
"TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
}
```

For more information, see [Using the AWS Command Line Interface with Amazon SQS and Amazon SNS](#) in the *AWS Command Line Interface User Guide*.

- For API details, see [CreateTopic](#) in *AWS CLI Command Reference*.

delete-endpoint

The following code example shows how to use delete-endpoint.

AWS CLI

To delete a platform application endpoint

The following delete-endpoint example deletes the specified platform application endpoint.

```
aws sns delete-endpoint \  
  --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/  
  MyApplication/12345678-abcd-9012-efgh-345678901234
```

This command produces no output.

- For API details, see [DeleteEndpoint](#) in *AWS CLI Command Reference*.

delete-platform-application

The following code example shows how to use delete-platform-application.

AWS CLI

To delete a platform application

The following delete-platform-application example deletes the specified platform application.

```
aws sns delete-platform-application \  
  --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/ADM/  
  MyApplication
```

This command produces no output.

- For API details, see [DeletePlatformApplication](#) in *AWS CLI Command Reference*.

delete-topic

The following code example shows how to use `delete-topic`.

AWS CLI

To delete an SNS topic

The following `delete-topic` example deletes the specified SNS topic.

```
aws sns delete-topic \  
  --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

This command produces no output.

- For API details, see [DeleteTopic](#) in *AWS CLI Command Reference*.

get-endpoint-attributes

The following code example shows how to use `get-endpoint-attributes`.

AWS CLI

To list platform application endpoint attributes

The following `get-endpoint-attributes` example lists the attributes for the specified platform application endpoint.

```
aws sns get-endpoint-attributes \  
  --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/  
MyApplication/12345678-abcd-9012-efgh-345678901234
```

Output:

```
{  
  "Attributes": {
```

```
    "Enabled": "true",  
    "Token": "EXAMPLE12345..."  
  }  
}
```

- For API details, see [GetEndpointAttributes](#) in *AWS CLI Command Reference*.

get-platform-application-attributes

The following code example shows how to use `get-platform-application-attributes`.

AWS CLI

To list the platform application attributes

The following `get-platform-application-attributes` example lists the attributes for the specified platform application.

```
aws sns get-platform-application-attributes \  
  --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/MPNS/  
  MyApplication
```

Output:

```
{  
  "Attributes": {  
    "Enabled": "true",  
    "SuccessFeedbackSampleRate": "100"  
  }  
}
```

- For API details, see [GetPlatformApplicationAttributes](#) in *AWS CLI Command Reference*.

get-sms-attributes

The following code example shows how to use `get-sms-attributes`.

AWS CLI

To list the default SMS message attributes

The following `get-sms-attributes` example lists the default attributes for sending SMS messages.

```
aws sns get-sms-attributes
```

Output:

```
{
  "attributes": {
    "DefaultSenderId": "MyName"
  }
}
```

- For API details, see [GetSMSAttributes](#) in *AWS CLI Command Reference*.

get-subscription-attributes

The following code example shows how to use `get-subscription-attributes`.

AWS CLI

To retrieve subscription attributes for a topic

The following `get-subscription-attributes` displays the attributes of the specified subscription. You can get the `subscription-arn` from the output of the `list-subscriptions` command.

```
aws sns get-subscription-attributes \
  --subscription-arn "arn:aws:sns:us-west-2:123456789012:my-
  topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
```

Output:

```
{
  "Attributes": {
    "Endpoint": "my-email@example.com",
    "Protocol": "email",
    "RawMessageDelivery": "false",
    "ConfirmationWasAuthenticated": "false",
    "Owner": "123456789012",
```

```

    "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f",
    "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
  }
}

```

- For API details, see [GetSubscriptionAttributes](#) in *AWS CLI Command Reference*.

get-topic-attributes

The following code example shows how to use get-topic-attributes.

AWS CLI

To retrieve the attributes of a topic

The following get-topic-attributes example displays the attributes for the specified topic.

```

aws sns get-topic-attributes \
  --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"

```

Output:

```

{
  "Attributes": {
    "SubscriptionsConfirmed": "1",
    "DisplayName": "my-topic",
    "SubscriptionsDeleted": "0",
    "EffectiveDeliveryPolicy": "{\"http\":{\"defaultHealthyRetryPolicy\":{\"minDelayTarget\":20,\"maxDelayTarget\":20,\"numRetries\":3,\"numMaxDelayRetries\":0,\"numNoDelayRetries\":0,\"numMinDelayRetries\":0,\"backoffFunction\":\"linear\"},\"disableSubscriptionOverrides\":false}}",
    "Owner": "123456789012",
    "Policy": "{\"Version\":\"2008-10-17\",\"Id\":\"__default_policy_ID\",\"Statement\": [{\"Sid\":\"__default_statement_ID\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"*\"},\"Action\": [\"SNS:Subscribe\",\"SNS:ListSubscriptionsByTopic\",\"SNS:DeleteTopic\",\"SNS:GetTopicAttributes\",\"SNS:Publish\",\"SNS:RemovePermission\",\"SNS:AddPermission\",\"SNS:SetTopicAttributes\"],\"Resource\":\"arn:aws:sns:us-west-2:123456789012:my-topic\",\"Condition\": {\"StringEquals\":{\"AWS:SourceOwner\":\"0123456789012\"}}}]}",
    "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
    "SubscriptionsPending": "0"
  }
}

```

```
}  
}
```

- For API details, see [GetTopicAttributes](#) in *AWS CLI Command Reference*.

list-endpoints-by-platform-application

The following code example shows how to use `list-endpoints-by-platform-application`.

AWS CLI

To list the endpoints for a platform application

The following `list-endpoints-by-platform-application` example lists the endpoints and endpoint attributes for the specified platform application.

```
aws sns list-endpoints-by-platform-application \  
  --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/  
  MyApplication
```

Output:

```
{  
  "Endpoints": [  
    {  
      "Attributes": {  
        "Token": "EXAMPLE12345...",  
        "Enabled": "true"  
      },  
      "EndpointArn": "arn:aws:sns:us-west-2:123456789012:endpoint/GCM/  
MyApplication/12345678-abcd-9012-efgh-345678901234"  
    }  
  ]  
}
```

- For API details, see [ListEndpointsByPlatformApplication](#) in *AWS CLI Command Reference*.

list-phone-numbers-opted-out

The following code example shows how to use `list-phone-numbers-opted-out`.

AWS CLI

To list SMS message opt-outs

The following `list-phone-numbers-opted-out` example lists the phone numbers opted out of receiving SMS messages.

```
aws sns list-phone-numbers-opted-out
```

Output:

```
{
  "phoneNumbers": [
    "+15555550100"
  ]
}
```

- For API details, see [ListPhoneNumbersOptedOut](#) in *AWS CLI Command Reference*.

list-platform-applications

The following code example shows how to use `list-platform-applications`.

AWS CLI

To list platform applications

The following `list-platform-applications` example lists the platform applications for ADM and MPNS.

```
aws sns list-platform-applications
```

Output:

```
{
  "PlatformApplications": [
    {
      "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/ADM/MyApplication",
      "Attributes": {
        "SuccessFeedbackSampleRate": "100",
        "Enabled": "true"
      }
    }
  ]
}
```

```

    }
  },
  {
    "PlatformApplicationArn": "arn:aws:sns:us-west-2:123456789012:app/MPNS/
MyOtherApplication",
    "Attributes": {
      "SuccessFeedbackSampleRate": "100",
      "Enabled": "true"
    }
  }
]
}

```

- For API details, see [ListPlatformApplications](#) in *AWS CLI Command Reference*.

list-subscriptions-by-topic

The following code example shows how to use `list-subscriptions-by-topic`.

AWS CLI

To list the subscriptions associated with a topic

The following `list-subscriptions-by-topic` retrieves a list of SNS subscriptions associated with the specified topic.

```
aws sns list-subscriptions-by-topic \
  --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic"
```

Output:

```
{
  "Subscriptions": [
    {
      "Owner": "123456789012",
      "Endpoint": "my-email@example.com",
      "Protocol": "email",
      "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
      "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
    }
  ]
}
```

```
}
```

- For API details, see [ListSubscriptionsByTopic](#) in *AWS CLI Command Reference*.

list-subscriptions

The following code example shows how to use `list-subscriptions`.

AWS CLI

To list your SNS subscriptions

The following `list-subscriptions` example displays a list of the SNS subscriptions in your AWS account.

```
aws sns list-subscriptions
```

Output:

```
{
  "Subscriptions": [
    {
      "Owner": "123456789012",
      "Endpoint": "my-email@example.com",
      "Protocol": "email",
      "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic",
      "SubscriptionArn": "arn:aws:sns:us-west-2:123456789012:my-
topic:8a21d249-4329-4871-acc6-7be709c6ea7f"
    }
  ]
}
```

- For API details, see [ListSubscriptions](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a topic

The following `list-tags-for-resource` example lists the tags for the specified Amazon SNS topic.

```
aws sns list-tags-for-resource \
  --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic
```

Output:

```
{
  "Tags": [
    {
      "Key": "Team",
      "Value": "Alpha"
    }
  ]
}
```

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-topics

The following code example shows how to use `list-topics`.

AWS CLI

To list your SNS topics

The following `list-topics` example lists all of SNS topics in your AWS account.

```
aws sns list-topics
```

Output:

```
{
  "Topics": [
    {
      "TopicArn": "arn:aws:sns:us-west-2:123456789012:my-topic"
    }
  ]
}
```

- For API details, see [ListTopics](#) in *AWS CLI Command Reference*.

opt-in-phone-number

The following code example shows how to use `opt-in-phone-number`.

AWS CLI

To opt-in for SMS messages

The following `opt-in-phone-number` example opts the specified phone number into receiving SMS messages.

```
aws sns opt-in-phone-number \  
  --phone-number +15555550100
```

This command produces no output.

- For API details, see [OptInPhoneNumber](#) in *AWS CLI Command Reference*.

publish

The following code example shows how to use `publish`.

AWS CLI

Example 1: To publish a message to a topic

The following `publish` example publishes the specified message to the specified SNS topic. The message comes from a text file, which enables you to include line breaks.

```
aws sns publish \  
  --topic-arn "arn:aws:sns:us-west-2:123456789012:my-topic" \  
  --message file://message.txt
```

Contents of `message.txt`:

```
Hello World  
Second Line
```

Output:

```
{
  "MessageId": "123a45b6-7890-12c3-45d6-111122223333"
}
```

Example 2: To publish an SMS message to a phone number

The following `publish` example publishes the message `Hello world!` to the phone number `+1-555-555-0100`.

```
aws sns publish \
  --message "Hello world!" \
  --phone-number +1-555-555-0100
```

Output:

```
{
  "MessageId": "123a45b6-7890-12c3-45d6-333322221111"
}
```

- For API details, see [Publish](#) in *AWS CLI Command Reference*.

put-data-protection-policy

The following code example shows how to use `put-data-protection-policy`.

AWS CLI

To set data protection policy

Example 1: To deny publishers from publishing messages with `CreditCardNumber`

The following `put-data-protection-policy` example denies publishers from publishing messages with `CreditCardNumber`.

```
aws sns put-data-protection-policy \
  --resource-arn arn:aws:sns:us-east-1:123456789012:mytopic \
  --data-protection-policy "{\"Name\":\"data_protection_policy\",\"Description\":"
  "\"Example data protection policy\",\"Version\":\"2021-06-01\",\"Statement\":"
  "\":[{\"DataDirection\":\"Inbound\",\"Principal\":[\"*\"],\"DataIdentifier\":"
  "\":[\"arn:aws:dataprotection::aws:data-identifier/CreditCardNumber\"],\"Operation\":"
  "\":{\"Deny\":{}}}]}"
```

This command produces no output.

Example 2: To load parameters from a file

The following `put-data-protection-policy` loads parameters from a file.

```
aws sns put-data-protection-policy \  
  --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \  
  --data-protection-policy file://policy.json
```

This command produces no output.

- For API details, see [PutDataProtectionPolicy](#) in *AWS CLI Command Reference*.

remove-permission

The following code example shows how to use `remove-permission`.

AWS CLI

To remove a permission from a topic

The following `remove-permission` example removes the permission `Publish-Permission` from the specified topic.

```
aws sns remove-permission \  
  --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \  
  --label Publish-Permission
```

This command produces no output.

- For API details, see [RemovePermission](#) in *AWS CLI Command Reference*.

set-endpoint-attributes

The following code example shows how to use `set-endpoint-attributes`.

AWS CLI

To set endpoint attributes

The following `set-endpoint-attributes` example disables the specified platform application endpoint.

```
aws sns set-endpoint-attributes \  
  --endpoint-arn arn:aws:sns:us-west-2:123456789012:endpoint/GCM/  
MyApplication/12345678-abcd-9012-efgh-345678901234 \  
  --attributes Enabled=false
```

Output:

```
{  
  "Attributes": {  
    "Enabled": "false",  
    "Token": "EXAMPLE12345..."  
  }  
}
```

- For API details, see [SetEndpointAttributes](#) in *AWS CLI Command Reference*.

set-platform-application-attributes

The following code example shows how to use `set-platform-application-attributes`.

AWS CLI

To set platform application attributes

The following `set-platform-application-attributes` example sets the `EventDeliveryFailure` attribute for the specified platform application to the ARN of the specified Amazon SNS topic.

```
aws sns set-platform-application-attributes \  
  --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/  
MyApplication \  
  --attributes EventDeliveryFailure=arn:aws:sns:us-  
west-2:123456789012:AnotherTopic
```

This command produces no output.

- For API details, see [SetPlatformApplicationAttributes](#) in *AWS CLI Command Reference*.

set-sms-attributes

The following code example shows how to use `set-sms-attributes`.

AWS CLI

To set SMS message attributes

The following `set-sms-attributes` example sets the default sender ID for SMS messages to `MyName`.

```
aws sns set-sms-attributes \  
  --attributes DefaultSenderId=MyName
```

This command produces no output.

- For API details, see [SetSMSAttributes](#) in *AWS CLI Command Reference*.

set-subscription-attributes

The following code example shows how to use `set-subscription-attributes`.

AWS CLI

To set subscription attributes

The following `set-subscription-attributes` example sets the `RawMessageDelivery` attribute to an SQS subscription.

```
aws sns set-subscription-attributes \  
  --subscription-arn arn:aws:sns:us-  
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \  
  --attribute-name RawMessageDelivery \  
  --attribute-value true
```

This command produces no output.

The following `set-subscription-attributes` example sets a `FilterPolicy` attribute to an SQS subscription.

```
aws sns set-subscription-attributes \  
  --subscription-arn arn:aws:sns:us-  
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \  
  --attribute-name FilterPolicy \  
  --attribute-value true
```

```
--attribute-value "{ \"anyMandatoryKey\": [\"any\", \"of\", \"these\"] }"
```

This command produces no output.

The following `set-subscription-attributes` example removes the `FilterPolicy` attribute from an SQS subscription.

```
aws sns set-subscription-attributes \  
  --subscription-arn arn:aws:sns:us-  
east-1:123456789012:mytopic:f248de18-2cf6-578c-8592-b6f1eaa877dc \  
  --attribute-name FilterPolicy \  
  --attribute-value "{}"
```

This command produces no output.

- For API details, see [SetSubscriptionAttributes](#) in *AWS CLI Command Reference*.

set-topic-attributes

The following code example shows how to use `set-topic-attributes`.

AWS CLI

To set an attribute for a topic

The following `set-topic-attributes` example sets the `DisplayName` attribute for the specified topic.

```
aws sns set-topic-attributes \  
  --topic-arn arn:aws:sns:us-west-2:123456789012:MyTopic \  
  --attribute-name DisplayName \  
  --attribute-value MyTopicDisplayName
```

This command produces no output.

- For API details, see [SetTopicAttributes](#) in *AWS CLI Command Reference*.

subscribe

The following code example shows how to use `subscribe`.

AWS CLI

To subscribe to a topic

The following `subscribe` command subscribes an email address to the specified topic.

```
aws sns subscribe \  
  --topic-arn arn:aws:sns:us-west-2:123456789012:my-topic \  
  --protocol email \  
  --notification-endpoint my-email@example.com
```

Output:

```
{  
  "SubscriptionArn": "pending confirmation"  
}
```

- For API details, see [Subscribe](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a topic

The following `tag-resource` example adds a metadata tag to the specified Amazon SNS topic.

```
aws sns tag-resource \  
  --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \  
  --tags Key=Team,Value=Alpha
```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

unsubscribe

The following code example shows how to use `unsubscribe`.

AWS CLI

To unsubscribe from a topic

The following `unsubscribe` example deletes the specified subscription from a topic.

```
aws sns unsubscribe \  
  --subscription-arn arn:aws:sns:us-west-2:0123456789012:my-  
  topic:8a21d249-4329-4871-acc6-7be709c6ea7f
```

This command produces no output.

- For API details, see [Unsubscribe](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a topic

The following `untag-resource` example removes any tags with the specified keys from the specified Amazon SNS topic.

```
aws sns untag-resource \  
  --resource-arn arn:aws:sns:us-west-2:123456789012:MyTopic \  
  --tag-keys Team
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

Scenarios

Create a platform endpoint for push notifications

The following code example shows how to create a platform endpoint for Amazon SNS push notifications.

AWS CLI

To create a platform application endpoint

The following `create-platform-endpoint` example creates an endpoint for the specified platform application using the specified token.

```
aws sns create-platform-endpoint \  
  --platform-application-arn arn:aws:sns:us-west-2:123456789012:app/GCM/  
MyApplication \  
  --token EXAMPLE12345...
```

Output:

```
{  
  "EndpointArn": "arn:aws:sns:us-west-2:1234567890:endpoint/GCM/  
MyApplication/12345678-abcd-9012-efgh-345678901234"  
}
```

Amazon SQS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SQS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-permission

The following code example shows how to use `add-permission`.

AWS CLI

To add a permission to a queue

This example enables the specified AWS account to send messages to the specified queue.

Command:

```
aws sqs add-permission --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --label SendMessagesFromMyQueue --aws-account-ids 12345EXAMPLE --actions SendMessage
```

Output:

```
None.
```

- For API details, see [AddPermission](#) in *AWS CLI Command Reference*.

cancel-message-move-task

The following code example shows how to use `cancel-message-move-task`.

AWS CLI

To cancel a message move task

The following `cancel-message-move-task` example cancels the specified message move task.

```
aws sqs cancel-message-move-task \  
  --task-handle AQEB6nR4...Hz1vZQ==
```

Output:

```
{  
  "ApproximateNumberOfMessagesMoved": 102  
}
```

For more information, see [Amazon SQS API permissions: Actions and resource reference](#) in the *Developer Guide*.

- For API details, see [CancelMessageMoveTask](#) in *AWS CLI Command Reference*.

change-message-visibility-batch

The following code example shows how to use `change-message-visibility-batch`.

AWS CLI

To change multiple messages' timeout visibilities as a batch

This example changes the 2 specified messages' timeout visibilities to 10 hours (10 hours * 60 minutes * 60 seconds).

Command:

```
aws sqs change-message-visibility-batch --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://change-message-visibility-batch.json
```

Input file (`change-message-visibility-batch.json`):

```
[
  {
    "Id": "FirstMessage",
    "ReceiptHandle": "AQEBhz2q...Jf3kaw==",
    "VisibilityTimeout": 36000
  },
  {
    "Id": "SecondMessage",
    "ReceiptHandle": "AQEBkTUH...HifSnw==",
    "VisibilityTimeout": 36000
  }
]
```

Output:

```
{
  "Successful": [
    {
      "Id": "SecondMessage"
    },
    {
```

```
    "Id": "FirstMessage"
  }
]
}
```

- For API details, see [ChangeMessageVisibilityBatch](#) in *AWS CLI Command Reference*.

change-message-visibility

The following code example shows how to use `change-message-visibility`.

AWS CLI

To change a message's timeout visibility

This example changes the specified message's timeout visibility to 10 hours (10 hours * 60 minutes * 60 seconds).

Command:

```
aws sqs change-message-visibility --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --receipt-handle AQEBTpyI...t6HyQg== --
visibility-timeout 36000
```

Output:

```
None.
```

- For API details, see [ChangeMessageVisibility](#) in *AWS CLI Command Reference*.

create-queue

The following code example shows how to use `create-queue`.

AWS CLI

To create a queue

This example creates a queue with the specified name, sets the message retention period to 3 days (3 days * 24 hours * 60 minutes * 60 seconds), and sets the queue's dead letter queue to the specified queue with a maximum receive count of 1,000 messages.

Command:

```
aws sqs create-queue --queue-name MyQueue --attributes file://create-queue.json
```

Input file (create-queue.json):

```
{
  "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-east-1:80398EXAMPLE:MyDeadLetterQueue\", \"maxReceiveCount\":\"1000\"}\",
  "MessageRetentionPeriod": "259200"
}
```

Output:

```
{
  "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

- For API details, see [CreateQueue](#) in *AWS CLI Command Reference*.

delete-message-batch

The following code example shows how to use `delete-message-batch`.

AWS CLI**To delete multiple messages as a batch**

This example deletes the specified messages.

Command:

```
aws sqs delete-message-batch --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://delete-message-batch.json
```

Input file (delete-message-batch.json):

```
[
  {
    "Id": "FirstMessage",
    "ReceiptHandle": "AQEB1mg1...Z4GuLw=="
  }
]
```

```
  },
  {
    "Id": "SecondMessage",
    "ReceiptHandle": "AQEBLsYM...VQubAA=="
  }
]
```

Output:

```
{
  "Successful": [
    {
      "Id": "FirstMessage"
    },
    {
      "Id": "SecondMessage"
    }
  ]
}
```

- For API details, see [DeleteMessageBatch](#) in *AWS CLI Command Reference*.

delete-message

The following code example shows how to use delete-message.

AWS CLI

To delete a message

This example deletes the specified message.

Command:

```
aws sqs delete-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --receipt-handle AQEBRXTo...q2doVA==
```

Output:

```
None.
```

- For API details, see [DeleteMessage](#) in *AWS CLI Command Reference*.

delete-queue

The following code example shows how to use `delete-queue`.

AWS CLI

To delete a queue

This example deletes the specified queue.

Command:

```
aws sqs delete-queue --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyNewerQueue
```

Output:

```
None.
```

- For API details, see [DeleteQueue](#) in *AWS CLI Command Reference*.

get-queue-attributes

The following code example shows how to use `get-queue-attributes`.

AWS CLI

To get a queue's attributes

This example gets all of the specified queue's attributes.

Command:

```
aws sqs get-queue-attributes --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names All
```

Output:

```
{
  "Attributes": {
    "ApproximateNumberOfMessagesNotVisible": "0",
```

```

    "RedrivePolicy": "{\\"deadLetterTargetArn\\":\\"arn:aws:sqs:us-
east-1:80398EXAMPLE:MyDeadLetterQueue\\",\\"maxReceiveCount\\":1000}",
    "MessageRetentionPeriod": "345600",
    "ApproximateNumberOfMessagesDelayed": "0",
    "MaximumMessageSize": "262144",
    "CreatedTimestamp": "1442426968",
    "ApproximateNumberOfMessages": "0",
    "ReceiveMessageWaitTimeSeconds": "0",
    "DelaySeconds": "0",
    "VisibilityTimeout": "30",
    "LastModifiedTimestamp": "1442426968",
    "QueueArn": "arn:aws:sqs:us-east-1:80398EXAMPLE:MyNewQueue"
  }
}

```

This example gets only the specified queue's maximum message size and visibility timeout attributes.

Command:

```

aws sqs get-queue-attributes --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyNewQueue --attribute-names MaximumMessageSize
VisibilityTimeout

```

Output:

```

{
  "Attributes": {
    "VisibilityTimeout": "30",
    "MaximumMessageSize": "262144"
  }
}

```

- For API details, see [GetQueueAttributes](#) in *AWS CLI Command Reference*.

get-queue-url

The following code example shows how to use `get-queue-url`.

AWS CLI

To get a queue URL

This example gets the specified queue's URL.

Command:

```
aws sqs get-queue-url --queue-name MyQueue
```

Output:

```
{
  "QueueUrl": "https://queue.amazonaws.com/80398EXAMPLE/MyQueue"
}
```

- For API details, see [GetQueueUrl](#) in *AWS CLI Command Reference*.

list-dead-letter-source-queues

The following code example shows how to use `list-dead-letter-source-queues`.

AWS CLI

To list dead letter source queues

This example lists the queues that are associated with the specified dead letter source queue.

Command:

```
aws sqs list-dead-letter-source-queues --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue
```

Output:

```
{
  "queueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
  ]
}
```

- For API details, see [ListDeadLetterSourceQueues](#) in *AWS CLI Command Reference*.

list-message-move-tasks

The following code example shows how to use `list-message-move-tasks`.

AWS CLI

To list the message move tasks

The following `list-message-move-tasks` example lists the 2 most recent message move tasks in the specified queue.

```
aws sqs list-message-move-tasks \  
  --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue \  
  --max-results 2
```

Output:

```
{  
  "Results": [  
    {  
      "TaskHandle": "AQEB6nR4...HzlvZQ==",  
      "Status": "RUNNING",  
      "SourceArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1",  
      "DestinationArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2",  
      "MaxNumberOfMessagesPerSecond": 50,  
      "ApproximateNumberOfMessagesMoved": 203,  
      "ApproximateNumberOfMessagesToMove": 30,  
      "StartedTimestamp": 1442428276921  
    },  
    {  
      "Status": "COMPLETED",  
      "SourceArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1",  
      "DestinationArn": "arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2",  
      "ApproximateNumberOfMessagesMoved": 29,  
      "ApproximateNumberOfMessagesToMove": 0,  
      "StartedTimestamp": 1342428272093  
    }  
  ]  
}
```

For more information, see [Amazon SQS API permissions: Actions and resource reference](#) in the *Developer Guide*.

- For API details, see [ListMessageMoveTasks](#) in *AWS CLI Command Reference*.

list-queue-tags

The following code example shows how to use `list-queue-tags`.

AWS CLI

To list all cost allocation tags for a queue

The following `list-queue-tags` example displays all of the cost allocation tags associated with the specified queue.

```
aws sqs list-queue-tags \  
  --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue
```

Output:

```
{  
  "Tags": {  
    "Team": "Alpha"  
  }  
}
```

For more information, see [Listing Cost Allocation Tags](#) in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see [ListQueueTags](#) in *AWS CLI Command Reference*.

list-queues

The following code example shows how to use `list-queues`.

AWS CLI

To list queues

This example lists all queues.

Command:

```
aws sqs list-queues
```

Output:

```
{
  "QueueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/TestQueue1",
    "https://queue.amazonaws.com/80398EXAMPLE/TestQueue2"
  ]
}
```

This example lists only queues that start with "My".

Command:

```
aws sqs list-queues --queue-name-prefix My
```

Output:

```
{
  "QueueUrls": [
    "https://queue.amazonaws.com/80398EXAMPLE/MyDeadLetterQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyQueue",
    "https://queue.amazonaws.com/80398EXAMPLE/MyOtherQueue"
  ]
}
```

- For API details, see [ListQueues](#) in *AWS CLI Command Reference*.

purge-queue

The following code example shows how to use `purge-queue`.

AWS CLI**To purge a queue**

This example deletes all messages in the specified queue.

Command:

```
aws sqs purge-queue --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyNewQueue
```

Output:

```
None.
```

- For API details, see [PurgeQueue](#) in *AWS CLI Command Reference*.

receive-message

The following code example shows how to use `receive-message`.

AWS CLI

To receive a message

This example receives up to 10 available messages, returning all available attributes.

Command:

```
aws sqs receive-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names All --message-attribute-names All --max-number-of-messages 10
```

Output:

```
{
  "Messages": [
    {
      "Body": "My first message.",
      "ReceiptHandle": "AQEBzbVv...fqNzFw==",
      "MD5ofBody": "1000f835...a35411fa",
      "MD5ofMessageAttributes": "9424c491...26bc3ae7",
      "MessageId": "d6790f8d-d575-4f01-bc51-40122EXAMPLE",
      "Attributes": {
        "ApproximateFirstReceiveTimestamp": "1442428276921",
        "SenderId": "AIDAIAZKMSNQ7TEXAMPLE",
        "ApproximateReceiveCount": "5",
        "SentTimestamp": "1442428276921"
      },
      "MessageAttributes": {
```

```

    "PostalCode": {
      "DataType": "String",
      "StringValue": "ABC123"
    },
    "City": {
      "DataType": "String",
      "StringValue": "Any City"
    }
  }
}
]
}

```

This example receives the next available message, returning only the `SenderId` and `SentTimestamp` attributes as well as the `PostalCode` message attribute.

Command:

```

aws sqs receive-message --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --attribute-names SenderId SentTimestamp
--message-attribute-names PostalCode

```

Output:

```

{
  "Messages": [
    {
      "Body": "My first message.",
      "ReceiptHandle": "AQEB6nR4...HzlvZQ==",
      "MD5OfBody": "1000f835...a35411fa",
      "MD5OfMessageAttributes": "b8e89563...e088e74f",
      "MessageId": "d6790f8d-d575-4f01-bc51-40122EXAMPLE",
      "Attributes": {
        "SenderId": "AIDAIKMSNQ7TEXAMPLE",
        "SentTimestamp": "1442428276921"
      },
      "MessageAttributes": {
        "PostalCode": {
          "DataType": "String",
          "StringValue": "ABC123"
        }
      }
    }
  ]
}

```

```
]
}
```

- For API details, see [ReceiveMessage](#) in *AWS CLI Command Reference*.

remove-permission

The following code example shows how to use `remove-permission`.

AWS CLI

To remove a permission

This example removes the permission with the specified label from the specified queue.

Command:

```
aws sqs remove-permission --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --label SendMessagesFromMyQueue
```

Output:

```
None.
```

- For API details, see [RemovePermission](#) in *AWS CLI Command Reference*.

send-message-batch

The following code example shows how to use `send-message-batch`.

AWS CLI

To send multiple messages as a batch

This example sends 2 messages with the specified message bodies, delay periods, and message attributes, to the specified queue.

Command:

```
aws sqs send-message-batch --queue-url https://sqs.us-
east-1.amazonaws.com/80398EXAMPLE/MyQueue --entries file://send-message-batch.json
```

Input file (send-message-batch.json):

```
[
  {
    "Id": "FuelReport-0001-2015-09-16T140731Z",
    "MessageBody": "Fuel report for account 0001 on 2015-09-16 at 02:07:31 PM.",
    "DelaySeconds": 10,
    "MessageAttributes": {
      "SellerName": {
        "DataType": "String",
        "StringValue": "Example Store"
      },
      "City": {
        "DataType": "String",
        "StringValue": "Any City"
      },
      "Region": {
        "DataType": "String",
        "StringValue": "WA"
      },
      "PostalCode": {
        "DataType": "String",
        "StringValue": "99065"
      },
      "PricePerGallon": {
        "DataType": "Number",
        "StringValue": "1.99"
      }
    }
  },
  {
    "Id": "FuelReport-0002-2015-09-16T140930Z",
    "MessageBody": "Fuel report for account 0002 on 2015-09-16 at 02:09:30 PM.",
    "DelaySeconds": 10,
    "MessageAttributes": {
      "SellerName": {
        "DataType": "String",
        "StringValue": "Example Fuels"
      },
      "City": {
        "DataType": "String",
        "StringValue": "North Town"
      },
      "Region": {
```

```

        "DataType": "String",
        "StringValue": "WA"
    },
    "PostalCode": {
        "DataType": "String",
        "StringValue": "99123"
    },
    "PricePerGallon": {
        "DataType": "Number",
        "StringValue": "1.87"
    }
}
]

```

Output:

```

{
  "Successful": [
    {
      "MD50fMessageBody": "203c4a38...7943237e",
      "MD50fMessageAttributes": "10809b55...baf283ef",
      "Id": "FuelReport-0001-2015-09-16T140731Z",
      "MessageId": "d175070c-d6b8-4101-861d-adeb3EXAMPLE"
    },
    {
      "MD50fMessageBody": "2cf0159a...c1980595",
      "MD50fMessageAttributes": "55623928...ae354a25",
      "Id": "FuelReport-0002-2015-09-16T140930Z",
      "MessageId": "f9b7d55d-0570-413e-b9c5-a9264EXAMPLE"
    }
  ]
}

```

- For API details, see [SendMessageBatch](#) in *AWS CLI Command Reference*.

send-message

The following code example shows how to use send-message.

AWS CLI

To send a message

This example sends a message with the specified message body, delay period, and message attributes, to the specified queue.

Command:

```
aws sqs send-message --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyQueue --message-body "Information about the largest city in Any Region." --delay-seconds 10 --message-attributes file://send-message.json
```

Input file (send-message.json):

```
{
  "City": {
    "DataType": "String",
    "StringValue": "Any City"
  },
  "Greeting": {
    "DataType": "Binary",
    "BinaryValue": "Hello, World!"
  },
  "Population": {
    "DataType": "Number",
    "StringValue": "1250800"
  }
}
```

Output:

```
{
  "MD5ofMessageBody": "51b0a325...39163aa0",
  "MD5ofMessageAttributes": "00484c68...59e48f06",
  "MessageId": "da68f62c-0c07-4bee-bf5f-7e856EXAMPLE"
}
```

- For API details, see [SendMessage](#) in *AWS CLI Command Reference*.

set-queue-attributes

The following code example shows how to use `set-queue-attributes`.

AWS CLI

To set queue attributes

This example sets the specified queue to a delivery delay of 10 seconds, a maximum message size of 128 KB (128 KB * 1,024 bytes), a message retention period of 3 days (3 days * 24 hours * 60 minutes * 60 seconds), a receive message wait time of 20 seconds, and a default visibility timeout of 60 seconds. This example also associates the specified dead letter queue with a maximum receive count of 1,000 messages.

Command:

```
aws sqs set-queue-attributes --queue-url https://sqs.us-east-1.amazonaws.com/80398EXAMPLE/MyNewQueue --attributes file://set-queue-attributes.json
```

Input file (set-queue-attributes.json):

```
{
  "DelaySeconds": "10",
  "MaximumMessageSize": "131072",
  "MessageRetentionPeriod": "259200",
  "ReceiveMessageWaitTimeSeconds": "20",
  "RedrivePolicy": "{\"deadLetterTargetArn\":\"arn:aws:sqs:us-east-1:80398EXAMPLE:MyDeadLetterQueue\",\"maxReceiveCount\":\"1000\"}",
  "VisibilityTimeout": "60"
}
```

Output:

```
None.
```

- For API details, see [SetQueueAttributes](#) in *AWS CLI Command Reference*.

start-message-move-task

The following code example shows how to use `start-message-move-task`.

AWS CLI

*Example 1: *To start a message move task**

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the source queue.

```
aws sqs start-message-move-task \  
  --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue
```

Output:

```
{  
  "TaskHandle": "AQEB6nR4...Hz1vZQ=="  
}
```

For more information, see [This is the topic title](#) in the *Name of your guide*.

*Example 2: *To start a message move task with a maximum rate**

The following `start-message-move-task` example starts a message move task to redrive messages from the specified dead-letter queue to the specified destination queue at a maximum rate of 50 messages per second.

```
aws sqs start-message-move-task \  
  --source-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue1 \  
  --destination-arn arn:aws:sqs:us-west-2:80398EXAMPLE:MyQueue2 \  
  --max-number-of-messages-per-second 50
```

Output:

```
{  
  "TaskHandle": "AQEB6nR4...Hz1vZQ=="  
}
```

For more information, see [Amazon SQS API permissions: Actions and resource reference](#) in the *Developer Guide*.

- For API details, see [StartMessageMoveTask](#) in *AWS CLI Command Reference*.

tag-queue

The following code example shows how to use `tag-queue`.

AWS CLI

To add cost allocation tags to a queue

The following `tag-queue` example adds a cost allocation tag to the specified Amazon SQS queue.

```
aws sqs tag-queue \  
  --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \  
  --tags Priority=Highest
```

This command produces no output.

For more information, see [Adding Cost Allocation Tags](#) in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see [TagQueue](#) in *AWS CLI Command Reference*.

untag-queue

The following code example shows how to use `untag-queue`.

AWS CLI

To remove cost allocation tags from a queue

The following `untag-queue` example removes a cost allocation tag from the specified Amazon SQS queue.

```
aws sqs untag-queue \  
  --queue-url https://sqs.us-west-2.amazonaws.com/123456789012/MyQueue \  
  --tag-keys "Priority"
```

This command produces no output.

For more information, see [Adding Cost Allocation Tags](#) in the *Amazon Simple Queue Service Developer Guide*.

- For API details, see [UntagQueue](#) in *AWS CLI Command Reference*.

Storage Gateway examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Storage Gateway.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

describe-gateway-information

The following code example shows how to use `describe-gateway-information`.

AWS CLI

To describe a gateway

The following `describe-gateway-information` command returns metadata about the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This examples specifies a gateway with the id `sgw-12A3456B` in account `123456789012`:

```
aws storagegateway describe-gateway-information --gateway-arn
"arn:aws:storagegateway:us-west-2:123456789012:gateway/sgw-12A3456B"
```

This command outputs a JSON block that contains metadata about about the gateway such as its name, network interfaces, configured time zone, and the state (whether the gateway is running or not).

- For API details, see [DescribeGatewayInformation](#) in *AWS CLI Command Reference*.

list-file-shares

The following code example shows how to use `list-file-shares`.

AWS CLI

To list file shares

The following command-name example lists the available widgets in your AWS account.

```
aws storagegateway list-file-shares \  
  --gateway-arn arn:aws:storagegateway:us-east-1:209870788375:gateway/sgw-FB02E292
```

Output:

```
{  
  "FileShareInfoList": [  
    {  
      "FileShareType": "NFS",  
      "FileShareARN": "arn:aws:storagegateway:us-east-1:111122223333:share/  
share-2FA12345",  
      "FileShareId": "share-2FA12345",  
      "FileShareStatus": "AVAILABLE",  
      "GatewayARN": "arn:aws:storagegateway:us-east-1:111122223333:gateway/  
sgw-FB0AAAAA"  
    }  
  ],  
  "Marker": null  
}
```

For more information, see [ListFileShares](#) in the *AWS Storage Gateway Service API Reference*.

- For API details, see [ListFileShares](#) in *AWS CLI Command Reference*.

list-gateways

The following code example shows how to use `list-gateways`.

AWS CLI

To list gateways for an account

The following `list-gateways` command lists all the gateways defined for an account:

```
aws storagegateway list-gateways
```

This command outputs a JSON block that contains a list of gateway Amazon Resource Names (ARNs).

- For API details, see [ListGateways](#) in *AWS CLI Command Reference*.

list-volumes

The following code example shows how to use `list-volumes`.

AWS CLI

To list the volumes configured for a gateway

The following `list-volumes` command returns a list of volumes configured for the specified gateway. To specify which gateway to describe, use the Amazon Resource Name (ARN) of the gateway in the command.

This examples specifies a gateway with the id `sgw-12A3456B` in account `123456789012`:

```
aws storagegateway list-volumes --gateway-arn "arn:aws:storagegateway:us-west-2:123456789012:gateway/sgw-12A3456B"
```

This command outputs a JSON block that a list of volumes that includes the type and ARN for each volume.

- For API details, see [ListVolumes](#) in *AWS CLI Command Reference*.

refresh-cache

The following code example shows how to use `refresh-cache`.

AWS CLI

To refresh the file share cache

The following `refresh-cache` example refreshes the cache for the specified file share.

```
aws storagegateway refresh-cache \  
  --file-share-arn arn:aws:storagegateway:us-east-1:111122223333:share/  
share-2FA12345
```

Output:

```
{
  "FileShareARN": "arn:aws:storagegateway:us-east-1:111122223333:share/
share-2FA12345",
  "NotificationId": "4954d4b1-abcd-ef01-1234-97950a7d3483"
}
```

For more information, see [ListFileShares](#) in the *AWS Storage Gateway Service API Reference*.

- For API details, see [RefreshCache](#) in *AWS CLI Command Reference*.

AWS STS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS STS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

assume-role-with-saml

The following code example shows how to use `assume-role-with-saml`.

AWS CLI

To get short-term credentials for a role authenticated with SAML

The following `assume-role-with-saml` command retrieves a set of short-term credentials for the IAM role `TestSaml`. The request in this example is authenticated by using the SAML assertion supplied by your identity provider when you authenticate to it.

```
aws sts assume-role-with-saml \
  --role-arn arn:aws:iam::123456789012:role/TestSaml \
  --principal-arn arn:aws:iam::123456789012:saml-provider/SAML-test \
  --saml-assertion
"VERYLONGENCODEDASSERTIONEXAMPLExzYw1s0kF1ZG11bmN1PmJsYW5rPC9zYW1s0kF1ZG11bmN1Pjwvc2FtbDpBd

assume-role-with-web-identity

The following code example shows how to use `assume-role-with-web-identity`.

AWS CLI

To get short-term credentials for a role authenticated with Web Identity (OAuth 2.0)

The following `assume-role-with-web-identity` command retrieves a set of short-term credentials for the IAM role `app1`. The request is authenticated by using the web identity token supplied by the specified web identity provider. Two additional policies are applied to the session to further restrict what the user can do. The returned credentials expire one hour after they are generated.

```
aws sts assume-role-with-web-identity \
  --duration-seconds 3600 \
  --role-session-name "app1" \
  --provider-id "www.amazon.com" \
  --policy-arns "arn:aws:iam::123456789012:policy/
q=webidentitydemopolicy1","arn:aws:iam::123456789012:policy/webidentitydemopolicy2"
  \

    "Expiration": "2016-03-15T00:05:07Z",
    "AccessKeyId": "ASIAJEXAMPLEXEG2JICEA"
  }
}
```

The output of the command contains an access key, secret key, and session token that you can use to authenticate to AWS.

For AWS CLI use, you can set up a named profile associated with a role. When you use the profile, the AWS CLI will call `assume-role` and manage credentials for you. For more information, see [Use an IAM role in the AWS CLI](#) in the *AWS CLI User Guide*.

- For API details, see [AssumeRole](#) in *AWS CLI Command Reference*.

decode-authorization-message

The following code example shows how to use `decode-authorization-message`.

AWS CLI

To decode an encoded authorization message returned in response to a request

The following `decode-authorization-message` example decodes additional information about the authorization status of a request from an encoded message returned in response to an Amazon Web Services request.

```
aws sts decode-authorization-message \
  --encoded-message EXAMPLEwodyRNrtlQARDip-
eTA6i6Dr1UhhPQrLWB_lAb15pAKx19mPDlexYcGBreyIKQC1BGBIPBKr3dFDkwqe07e2NMk5j_hmzAiChJN-8oy3Ewi

}

```

For more information, see [Policy evaluation logic](#) in the *AWS IAM User Guide*.

- For API details, see [DecodeAuthorizationMessage](#) in *AWS CLI Command Reference*.

get-caller-identity

The following code example shows how to use `get-caller-identity`.

AWS CLI

To get details about the current IAM identity

The following `get-caller-identity` command displays information about the IAM identity used to authenticate the request. The caller is an IAM user.

```
aws sts get-caller-identity
```

Output:

```
{
  "UserId": "AIDASAMPLEUSERID",
  "Account": "123456789012",
  "Arn": "arn:aws:iam::123456789012:user/DevAdmin"
}
```

- For API details, see [GetCallerIdentity](#) in *AWS CLI Command Reference*.

get-federation-token

The following code example shows how to use `get-federation-token`.

AWS CLI

To return a set of temporary security credentials using IAM user access key credentials

The following `get-federation-token` example returns a set of temporary security credentials (consisting of an access key ID, a secret access key, and a security token) for a user. You must call the `GetFederationToken` operation using the long-term security credentials of an IAM user.

```
aws sts get-federation-token \
  --name Bob \
  --policy file://myfile.json \
  --policy-arns arn=arn:aws:iam::aws:policy/AmazonS3ReadOnlyAccess \
  --duration-seconds 900
```

Contents of `myfile.json`:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:Describe*",

```

```

    "Resource": "*"
  },
  {
    "Effect": "Allow",
    "Action": "elasticloadbalancing:Describe*",
    "Resource": "*"
  },
  {
    "Effect": "Allow",
    "Action": [
      "cloudwatch:ListMetrics",
      "cloudwatch:GetMetricStatistics",
      "cloudwatch:Describe*"
    ],
    "Resource": "*"
  },
  {
    "Effect": "Allow",
    "Action": "autoscaling:Describe*",
    "Resource": "*"
  }
]
}

```

Output:

```

{
  "Credentials": {
    "AccessKeyId": "ASIAIOSFODNN7EXAMPLE",
    "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY",
    "SessionToken": "EXAMPLEpZ21uX2VjEGoaCXVzLXdlc3QtMiJIMEYCIQC/

    "FederatedUserId": "111122223333:Bob",
    "Arn": "arn:aws:sts::111122223333:federated-user/Bob"
  },
  "PackedPolicySize": 36
}

```

For more information, see [Requesting Temporary Security Credentials](#) in the *AWS IAM User Guide*.

- For API details, see [GetFederationToken](#) in *AWS CLI Command Reference*.

get-session-token

The following code example shows how to use `get-session-token`.

AWS CLI

To get a set of short term credentials for an IAM identity

The following `get-session-token` command retrieves a set of short-term credentials for the IAM identity making the call. The resulting credentials can be used for requests where multi-factor authentication (MFA) is required by policy. The credentials expire 15 minutes after they are generated.

```
aws sts get-session-token \  
  --duration-seconds 900 \  
  --serial-number "YourMFADeviceSerialNumber" \  
  --token-code 123456
```

Output:

```
{  
  "Credentials": {  
    "AccessKeyId": "ASIAIOSFODNN7EXAMPLE",  
    "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxRfiCYzEXAMPLEKEY",  
    "SessionToken": "AQoEXAMPLEH4aoAH0gNCAPyJxz4B1CFFxWNE1OPTgk5TthT  
+FvwqnKwRc0IfrrRh3c/LTo6UDdyJw00vEVPvLXCrrrUtdnniCEXAMPLE/

    "Expiration": "2020-05-19T18:06:10+00:00"  
  }  
}
```

For more information, see [Requesting Temporary Security Credentials](#) in the *AWS IAM User Guide*.

- For API details, see [GetSessionToken](#) in *AWS CLI Command Reference*.

AWS Support examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Support.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-attachments-to-set

The following code example shows how to use `add-attachments-to-set`.

AWS CLI

To add an attachment to a set

The following `add-attachments-to-set` example adds an image to a set that you can then specify for a support case in your AWS account.

```
aws support add-attachments-to-set \  
  --attachment-set-id "as-2f5a6faa2a4a1e600-mu-nk5xQ1Br70-  
G1cUos5LZkd38K0AHZa9BMDVzNEXAMPLE" \  
  --attachments fileName=troubleshoot-screenshot.png,data=base64-encoded-string
```

Output:

```
{  
  "attachmentSetId": "as-2f5a6faa2a4a1e600-mu-nk5xQ1Br70-  
G1cUos5LZkd38K0AHZa9BMDVzNEXAMPLE",
```

```
"expiryTime": "2020-05-14T17:04:40.790+0000"  
}
```

For more information, see [Case management](#) in the *AWS Support User Guide*.

- For API details, see [AddAttachmentsToSet](#) in *AWS CLI Command Reference*.

add-communication-to-case

The following code example shows how to use `add-communication-to-case`.

AWS CLI

To add communication to a case

The following `add-communication-to-case` example adds communications to a support case in your AWS account.

```
aws support add-communication-to-case \  
  --case-id "case-12345678910-2013-c4c1d2bf33c5cf47" \  
  --communication-body "I'm attaching a set of images to this case." \  
  --cc-email-addresses "myemail@example.com" \  
  --attachment-set-id "as-2f5a6faa2a4a1e600-mu-nk5xQ1Br70-  
G1cUos5LZkd38K0AHZa9BMDVzNEXAMPLE"
```

Output:

```
{  
  "result": true  
}
```

For more information, see [Case management](#) in the *AWS Support User Guide*.

- For API details, see [AddCommunicationToCase](#) in *AWS CLI Command Reference*.

create-case

The following code example shows how to use `create-case`.

AWS CLI

To create a case

The following `create-case` example creates a support case for your AWS account.

```
aws support create-case \  
  --category-code "using-aws" \  
  --cc-email-addresses "myemail@example.com" \  
  --communication-body "I want to learn more about an AWS service." \  
  --issue-type "technical" \  
  --language "en" \  
  --service-code "general-info" \  
  --severity-code "low" \  
  --subject "Question about my account"
```

Output:

```
{  
  "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47"  
}
```

For more information, see [Case management](#) in the *AWS Support User Guide*.

- For API details, see [CreateCase](#) in *AWS CLI Command Reference*.

describe-attachment

The following code example shows how to use `describe-attachment`.

AWS CLI

To describe an attachment

The following `describe-attachment` example returns information about the attachment with the specified ID.

```
aws support describe-attachment \  
  --attachment-id "attachment-KBnjRNrePd9D6Jx0-Mm00xZuDEaL2JAj_0-  
gJv9qqDooTipsz3V1Nb19rCfkZneeQeDPgp8X1iVJyHH7UuhZDdNeqGoduZsPrAhyMakqlc60-  
iJjL5HqyYGiT1FG8EXAMPLE"
```

Output:

```
{  
  "attachment": {
```

```
    "fileName": "troubleshoot-screenshot.png",
    "data": "base64-blob"
  }
}
```

For more information, see [Case management](#) in the *AWS Support User Guide*.

- For API details, see [DescribeAttachment](#) in *AWS CLI Command Reference*.

describe-cases

The following code example shows how to use `describe-cases`.

AWS CLI

To describe a case

The following `describe-cases` example returns information about the specified support case in your AWS account.

```
aws support describe-cases \
  --display-id "1234567890" \
  --after-time "2020-03-23T21:31:47.774Z" \
  --include-resolved-cases \
  --language "en" \
  --no-include-communications \
  --max-item 1
```

Output:

```
{
  "cases": [
    {
      "status": "resolved",
      "ccEmailAddresses": [],
      "timeCreated": "2020-03-23T21:31:47.774Z",
      "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47",
      "severityCode": "low",
      "language": "en",
      "categoryCode": "using-aws",
      "serviceCode": "general-info",
      "submittedBy": "myemail@example.com",
      "displayId": "1234567890",
    }
  ]
}
```

```

      "subject": "Question about my account"
    }
  ]
}

```

For more information, see [Case management](#) in the *AWS Support User Guide*.

- For API details, see [DescribeCases](#) in *AWS CLI Command Reference*.

describe-communications

The following code example shows how to use describe-communications.

AWS CLI

To describe the latest communication for a case

The following describe-communications example returns the latest communication for the specified support case in your AWS account.

```

aws support describe-communications \
  --case-id "case-12345678910-2013-c4c1d2bf33c5cf47" \
  --after-time "2020-03-23T21:31:47.774Z" \
  --max-item 1

```

Output:

```

{
  "communications": [
    {
      "body": "I want to learn more about an AWS service.",
      "attachmentSet": [],
      "caseId": "case-12345678910-2013-c4c1d2bf33c5cf47",
      "timeCreated": "2020-05-12T23:12:35.000Z",
      "submittedBy": "Amazon Web Services"
    }
  ],
  "NextToken": "eyJmZXRhZG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQEXAMPLE=="
}

```

For more information, see [Case management](#) in the *AWS Support User Guide*.

- For API details, see [DescribeCommunications](#) in *AWS CLI Command Reference*.

describe-services

The following code example shows how to use describe-services.

AWS CLI

To list AWS services and service categories

The following describe-services example lists the available service categories for requesting general information.

```
aws support describe-services \  
  --service-code-list "general-info"
```

Output:

```
{  
  "services": [  
    {  
      "code": "general-info",  
      "name": "General Info and Getting Started",  
      "categories": [  
        {  
          "code": "charges",  
          "name": "How Will I Be Charged?"  
        },  
        {  
          "code": "gdpr-queries",  
          "name": "Data Privacy Query"  
        },  
        {  
          "code": "reserved-instances",  
          "name": "Reserved Instances"  
        },  
        {  
          "code": "resource",  
          "name": "Where is my Resource?"  
        },  
        {  
          "code": "using-aws",  
          "name": "Using AWS & Services"  
        },  
        {
```

```
        "code": "free-tier",
        "name": "Free Tier"
    },
    {
        "code": "security-and-compliance",
        "name": "Security & Compliance"
    },
    {
        "code": "account-structure",
        "name": "Account Structure"
    }
]
}
```

For more information, see [Case management](#) in the *AWS Support User Guide*.

- For API details, see [DescribeServices](#) in *AWS CLI Command Reference*.

describe-severity-levels

The following code example shows how to use `describe-severity-levels`.

AWS CLI

To list the available severity levels

The following `describe-severity-levels` example lists the available severity levels for a support case.

```
aws support describe-severity-levels
```

Output:

```
{
  "severityLevels": [
    {
      "code": "low",
      "name": "Low"
    },
    {
      "code": "normal",
```

```
        "name": "Normal"
    },
    {
        "code": "high",
        "name": "High"
    },
    {
        "code": "urgent",
        "name": "Urgent"
    },
    {
        "code": "critical",
        "name": "Critical"
    }
]
}
```

For more information, see [Choosing a severity](#) in the *AWS Support User Guide*.

- For API details, see [DescribeSeverityLevels](#) in *AWS CLI Command Reference*.

describe-trusted-advisor-check-refresh-statuses

The following code example shows how to use `describe-trusted-advisor-check-refresh-statuses`.

AWS CLI

To list the refresh statuses of AWS Trusted Advisor checks

The following `describe-trusted-advisor-check-refresh-statuses` example lists the refresh statuses for two Trusted Advisor checks: Amazon S3 Bucket Permissions and IAM Use.

```
aws support describe-trusted-advisor-check-refresh-statuses \
  --check-id "Pfx0RwqBli" "zXCkfM1nI3"
```

Output:

```
{
  "statuses": [
    {
      "checkId": "Pfx0RwqBli",
```

```
    "status": "none",
    "millisUntilNextRefreshable": 0
  },
  {
    "checkId": "zXCkfM1nI3",
    "status": "none",
    "millisUntilNextRefreshable": 0
  }
]
```

For more information, see [AWS Trusted Advisor](#) in the *AWS Support User Guide*.

- For API details, see [DescribeTrustedAdvisorCheckRefreshStatuses](#) in *AWS CLI Command Reference*.

describe-trusted-advisor-check-result

The following code example shows how to use `describe-trusted-advisor-check-result`.

AWS CLI

To list the results of an AWS Trusted Advisor check

The following `describe-trusted-advisor-check-result` example lists the results of the IAM Use check.

```
aws support describe-trusted-advisor-check-result \
  --check-id "zXCkfM1nI3"
```

Output:

```
{
  "result": {
    "checkId": "zXCkfM1nI3",
    "timestamp": "2020-05-13T21:38:05Z",
    "status": "ok",
    "resourcesSummary": {
      "resourcesProcessed": 1,
      "resourcesFlagged": 0,
      "resourcesIgnored": 0,
      "resourcesSuppressed": 0
    }
  },
```

```
    "categorySpecificSummary": {
      "costOptimizing": {
        "estimatedMonthlySavings": 0.0,
        "estimatedPercentMonthlySavings": 0.0
      }
    },
    "flaggedResources": [
      {
        "status": "ok",
        "resourceId": "47DEQpj8HBSa-_TImW-5JCeuQeRkm5NMpJWZEXAMPLE",
        "isSuppressed": false
      }
    ]
  }
}
```

For more information, see [AWS Trusted Advisor](#) in the *AWS Support User Guide*.

- For API details, see [DescribeTrustedAdvisorCheckResult](#) in *AWS CLI Command Reference*.

describe-trusted-advisor-check-summaries

The following code example shows how to use `describe-trusted-advisor-check-summaries`.

AWS CLI

To list the summaries of AWS Trusted Advisor checks

The following `describe-trusted-advisor-check-summaries` example lists the results for two Trusted Advisor checks: Amazon S3 Bucket Permissions and IAM Use.

```
aws support describe-trusted-advisor-check-summaries \
  --check-ids "Pfx0RwqBli" "zXCkfM1nI3"
```

Output:

```
{
  "summaries": [
    {
      "checkId": "Pfx0RwqBli",
      "timestamp": "2020-05-13T21:38:12Z",
```

```

    "status": "ok",
    "hasFlaggedResources": true,
    "resourcesSummary": {
      "resourcesProcessed": 44,
      "resourcesFlagged": 0,
      "resourcesIgnored": 0,
      "resourcesSuppressed": 0
    },
    "categorySpecificSummary": {
      "costOptimizing": {
        "estimatedMonthlySavings": 0.0,
        "estimatedPercentMonthlySavings": 0.0
      }
    }
  },
  {
    "checkId": "zXCkfM1nI3",
    "timestamp": "2020-05-13T21:38:05Z",
    "status": "ok",
    "hasFlaggedResources": true,
    "resourcesSummary": {
      "resourcesProcessed": 1,
      "resourcesFlagged": 0,

```

For more information, see [AWS Trusted Advisor](#) in the *AWS Support User Guide*.

- For API details, see [DescribeTrustedAdvisorCheckSummaries](#) in *AWS CLI Command Reference*.

describe-trusted-advisor-checks

The following code example shows how to use `describe-trusted-advisor-checks`.

AWS CLI

To list the available AWS Trusted Advisor checks

The following `describe-trusted-advisor-checks` example lists the available Trusted Advisor checks in your AWS account. This information includes the check name, ID, description, category, and metadata. Note that the output is shortened for readability.

```
aws support describe-trusted-advisor-checks \  
  --language "en"
```

Output:

```
{  
  "checks": [  
    {  
      "id": "zXCkFM1nI3",  
      "name": "IAM Use",  
      "description": "Checks for your use of AWS Identity and Access  
Management (IAM). You can use IAM to create users, groups, and roles in AWS, and  
you can use permissions to control access to AWS resources. \n<br>\n<br>\n<b>Alert  
Criteria</b><br>\nYellow: No IAM users have been created for this account.\n<br>  
<br>\n<b>Recommended Action</b><br>\nCreate one or more IAM users and groups in  
your account. You can then create additional users whose permissions are limited  
to perform specific tasks in your AWS environment. For more information, see <a  
href=\"https://docs.aws.amazon.com/IAM/latest/UserGuide/IAMGettingStarted.html\"  
target=\"_blank\">Getting Started</a>. \n<br><br>\n<b>Additional Resources</b><br>  
<a href=\"https://docs.aws.amazon.com/IAM/latest/UserGuide/IAM_Introduction.html\"  
target=\"_blank\">What Is IAM?</a>",  
      "category": "security",  
      "metadata": []  
    }  
  ]  
}
```

For more information, see [AWS Trusted Advisor](#) in the *AWS Support User Guide*.

- For API details, see [DescribeTrustedAdvisorChecks](#) in *AWS CLI Command Reference*.

refresh-trusted-advisor-check

The following code example shows how to use `refresh-trusted-advisor-check`.

AWS CLI

To refresh an AWS Trusted Advisor check

The following `refresh-trusted-advisor-check` example refreshes the Amazon S3 Bucket Permissions Trusted Advisor check in your AWS account.

```
aws support refresh-trusted-advisor-check \  
  --check-id "Pfx0RwqBli"
```

Output:

```
{  
  "status": {  
    "checkId": "Pfx0RwqBli",  
    "status": "enqueued",  
    "millisUntilNextRefreshable": 3599992  
  }  
}
```

For more information, see [AWS Trusted Advisor](#) in the *AWS Support User Guide*.

- For API details, see [RefreshTrustedAdvisorCheck](#) in *AWS CLI Command Reference*.

resolve-case

The following code example shows how to use `resolve-case`.

AWS CLI

To resolve a support case

The following `resolve-case` example resolves a support case in your AWS account.

```
aws support resolve-case \  
  --case-id "case-12345678910-2013-c4c1d2bf33c5cf47"
```

Output:

```
{  
  "finalCaseStatus": "resolved",
```

```
"initialCaseStatus": "work-in-progress"  
}
```

For more information, see [Case management](#) in the *AWS Support User Guide*.

- For API details, see [ResolveCase](#) in *AWS CLI Command Reference*.

Amazon SWF examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon SWF.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

count-closed-workflow-executions

The following code example shows how to use `count-closed-workflow-executions`.

AWS CLI

Counting Closed Workflow Executions

You can use `swf count-closed-workflow-executions` to retrieve the number of closed workflow executions for a given domain. You can specify filters to count specific classes of executions.

The `--domain` and *either* `--close-time-filter` or `--start-time-filter` arguments are required. All other arguments are optional.

```
aws swf count-closed-workflow-executions \  
  --domain DataFrobtzz \  
  --close-time-filter "{ \"latestDate\" : 1377129600, \"oldestDate\" :  
1370044800 }"
```

Output:

```
{  
  "count": 2,  
  "truncated": false  
}
```

If "truncated" is true, then "count" represents the maximum number that can be returned by Amazon SWF. Any further results are truncated.

To reduce the number of results returned, you can:

modify the `--close-time-filter` or `--start-time-filter` values to narrow the time range that is searched. Each of these is mutually exclusive: You can specify *only one of these* in a request. Use the `--close-status-filter`, `--execution-filter`, `--tag-filter` or `--type-filter` arguments to further filter the results. However, these arguments are also mutually exclusive.

See Also [CountClosedWorkflowExecutions](#) in the *Amazon Simple Workflow Service API Reference*

- For API details, see [CountClosedWorkflowExecutions](#) in *AWS CLI Command Reference*.

count-open-workflow-executions

The following code example shows how to use `count-open-workflow-executions`.

AWS CLI

Counting Open Workflow Executions

You can use `swf count-open-workflow-executions` to retrieve the number of open workflow executions for a given domain. You can specify filters to count specific classes of executions.

The `--domain` and `--start-time-filter` arguments are required. All other arguments are optional.

```
aws swf count-open-workflow-executions \  
  --domain DataFrobtzz \  
  --start-time-filter "{ \"latestDate\" : 1377129600, \"oldestDate\" :  
1370044800 }"
```

Output:

```
{  
  "count": 4,  
  "truncated": false  
}
```

If "truncated" is true, then "count" represents the maximum number that can be returned by Amazon SWF. Any further results are truncated.

To reduce the number of results returned, you can:

modify the `--start-time-filter` values to narrow the time range that is searched. Use the `--close-status-filter`, `--execution-filter`, `--tag-filter` or `--type-filter` arguments to further filter the results. Each of these is mutually exclusive: You can specify *only one of these* in a request.

For more information, see `CountOpenWorkflowExecutions` in the *Amazon Simple Workflow Service API Reference*

- For API details, see [CountOpenWorkflowExecutions](#) in *AWS CLI Command Reference*.

deprecate-domain

The following code example shows how to use `deprecate-domain`.

AWS CLI

Deprecating a Domain

To deprecate a domain (you can still see it, but cannot create new workflow executions or register types on it), use `swf deprecate-domain`. It has a sole required parameter, `--name`, which takes the name of the domain to deprecate.

```
aws swf deprecate-domain \  
  --name DataFrobtzz
```

```
--name MyNeatNewDomain ""
```

As with `register-domain`, no output is returned. If you use `list-domains` to view the registered domains, however, you will see that the domain has been deprecated and no longer appears in the returned data.

```
aws swf list-domains \  
  --registration-status REGISTERED  
  {  
    "domainInfos": [  
      {  
        "status": "REGISTERED",  
        "name": "DataFrobotz"  
      },  
      {  
        "status": "REGISTERED",  
        "name": "erontest"  
      }  
    ]  
  }
```

If you use `--registration-status DEPRECATED` with `list-domains`, you will see your deprecated domain.

```
aws swf list-domains \  
  --registration-status DEPRECATED  
  {  
    "domainInfos": [  
      {  
        "status": "DEPRECATED",  
        "name": "MyNeatNewDomain"  
      }  
    ]  
  }
```

You can still use `describe-domain` to get information about a deprecated domain.

```
aws swf describe-domain \  
  --name MyNeatNewDomain  
  {  
    "domainInfo": {
```

```
        "status": "DEPRECATED",
        "name": "MyNeatNewDomain"
    },
    "configuration": {
        "workflowExecutionRetentionPeriodInDays": "0"
    }
}
```

See Also [DeprecateDomain](#) in the *Amazon Simple Workflow Service API Reference*

- For API details, see [DeprecateDomain](#) in *AWS CLI Command Reference*.

describe-domain

The following code example shows how to use `describe-domain`.

AWS CLI

Getting Information About a Domain

To get detailed information about a particular domain, use the `swf describe-domain` command. There is one required parameter: `--name`, which takes the name of the domain you want information about.

```
aws swf describe-domain \
  --name DataFrobotz
  {
    "domainInfo": {
      "status": "REGISTERED",
      "name": "DataFrobotz"
    },
    "configuration": {
      "workflowExecutionRetentionPeriodInDays": "1"
    }
  }
```

You can also use `describe-domain` to get information about deprecated domains.

```
aws swf describe-domain \
  --name MyNeatNewDomain
  {
    "domainInfo": {
```

```
        "status": "DEPRECATED",
        "name": "MyNeatNewDomain"
    },
    "configuration": {
        "workflowExecutionRetentionPeriodInDays": "0"
    }
}
```

See Also [DescribeDomain](#) in the *Amazon Simple Workflow Service API Reference*

- For API details, see [DescribeDomain](#) in *AWS CLI Command Reference*.

list-activity-types

The following code example shows how to use `list-activity-types`.

AWS CLI

Listing Activity Types

To get a list of the activity types for a domain, use `swf list-activity-types`. The `--domain` and `--registration-status` arguments are required.

```
aws swf list-activity-types \
  --domain DataFrobtzz \
  --registration-status REGISTERED
```

Output:

```
{
  "typeInfos": [
    {
      "status": "REGISTERED",
      "creationDate": 1371454150.451,
      "activityType": {
        "version": "1",
        "name": "confirm-user-email"
      },
      "description": "subscribe confirm-user-email activity"
    },
    {
      "status": "REGISTERED",
```

```

    "creationDate": 1371454150.709,
    "activityType": {
      "version": "1",
      "name": "confirm-user-phone"
    },
    "description": "subscribe confirm-user-phone activity"
  },
  {
    "status": "REGISTERED",
    "creationDate": 1371454149.871,
    "activityType": {
      "version": "1",
      "name": "get-subscription-info"
    },
    "description": "subscribe get-subscription-info activity"
  },
  {
    "status": "REGISTERED",
    "creationDate": 1371454150.909,
    "activityType": {
      "version": "1",
      "name": "send-subscription-success"
    },
    "description": "subscribe send-subscription-success activity"
  },
  {
    "status": "REGISTERED",
    "creationDate": 1371454150.085,
    "activityType": {
      "version": "1",
      "name": "subscribe-user-sns"
    },
    "description": "subscribe subscribe-user-sns activity"
  }
]
}

```

You can use the `--name` argument to select only activity types with a particular name:

```

aws swf list-activity-types \
  --domain DataFrobtzz \
  --registration-status REGISTERED \
  --name "send-subscription-success"

```

Output:

```
{
  "typeInfos": [
    {
      "status": "REGISTERED",
      "creationDate": 1371454150.909,
      "activityType": {
        "version": "1",
        "name": "send-subscription-success"
      },
      "description": "subscribe send-subscription-success activity"
    }
  ]
}
```

To retrieve results in pages, you can set the `--maximum-page-size` argument. If more results are returned than will fit in a page of results, a `"nextPageToken"` will be returned in the result set:

```
aws swf list-activity-types \
  --domain DataFrobtzz \
  --registration-status REGISTERED \
  --maximum-page-size 2
```

Output:

```
{
  "nextPageToken": "AAAAKgAAAAEAAAAAAAAAAAAA1Gp1BelJq
+PmHvAnDxJYbup8+0R4LVtbXLDL17QNY7C30pHo9Ssz06D/GuFz10yC73umBQ1t0PJ/gC/
aYpzDMqUIWIA1T9W0s2DryyZX40C/6Lhk9/
o5kdsuWMSBkHhgaZjgwp3WJINIFJFdaSMxY2vYAX7AtRtpcqJuBDDRE9RaRqDGyqIYUMltarki qpSY1ZVveBasBvlyvU
WGAaqehiDz7/JzLT/wWNNUM0d+Nhe",
  "typeInfos": [
    {
      "status": "REGISTERED",
      "creationDate": 1371454150.451,
      "activityType": {
        "version": "1",
        "name": "confirm-user-email"
      },
      "description": "subscribe confirm-user-email activity"
    }
  ]
}
```

```

    },
    {
      "status": "REGISTERED",
      "creationDate": 1371454150.709,
      "activityType": {
        "version": "1",
        "name": "confirm-user-phone"
      },
      "description": "subscribe confirm-user-phone activity"
    }
  ]
}

```

You can pass the `nextPageToken` value to the next call to `list-activity-types` in the `--next-page-token` argument, retrieving the next page of results:

```

aws swf list-activity-types \
  --domain DataFrobtzz \
  --registration-status REGISTERED \
  --maximum-page-size 2 \
  --next-page-token "AAAAKgAAAAEAAAAAAAAAAAAA1Gp1Be1Jq
+PmHvAnDxJYbup8+0R4LVtbXLD17QNY7C30pHo9Ssz06D/GuFz10yC73umBQ1t0PJ/gC/
aYpzDMqUIWIA1T9W0s2DryyZX40C/6Lhk9/
o5kdsuWMSBkHhgaZjgwp3WJINIFJFdaSMxY2vYAX7AtRtpcqJuBDDRE9RaRqDGyqIYUMltarki qpSY1ZVveBasBv1vyU
WGAaqehiDz7/JzLT/wWNNUM0d+Nhe"

```

Output:

```

{
  "nextPageToken": "AAAAKgAAAAEAAAAAAAAAAAAAw+7LZ4GRZPzTqBHsp2wBxWB8m1sgLCclgCuq3J+h/
m3+v0fFqtkcjLwV5cc40jNAzTCuq/
XcylPumGwkjbajtqpZpbq0cVNfjFxFgoi0LB201bvV0krbUISBvlpFPmSwpDSZJsxg5UxCcweteS1Fn1PNSZ/
MoinBZo80TkjMuzcsTuK0zH9wCaR8ITcALJ3SaqHU3pyIRS5hPmFA30LIc8zaAepjlaujo6hntNSCruB4"
  "typeInfos": [
    {
      "status": "REGISTERED",
      "creationDate": 1371454149.871,
      "activityType": {
        "version": "1",
        "name": "get-subscription-info"
      },
      "description": "subscribe get-subscription-info activity"
    },
  ],
}

```

```

    {
      "status": "REGISTERED",
      "creationDate": 1371454150.909,
      "activityType": {
        "version": "1",
        "name": "send-subscription-success"
      },
      "description": "subscribe send-subscription-success activity"
    }
  ]
}

```

If there are still more results to return, "nextPageToken" will be returned with the results. When there are no more pages of results to return, "nextPageToken" will *not* be returned in the result set.

You can use the `--reverse-order` argument to reverse the order of the returned results. This also affects paged results.

```

aws swf list-activity-types \
  --domain DataFrobtzz \
  --registration-status REGISTERED \
  --maximum-page-size 2 \
  --reverse-order

```

Output:

```

{
  "nextPageToken": "AAAAKgAAAAEAAAAAAAAAAwXcpu5ePSyQkrC
+8WMbmSrenuZC2ZkIXQYBPB/b9xIOVkj+bMEFhGj0KmmJ4rF7iddhjf7UMYCsfGkEn7mk
+yMCgVc1JxDWmB0EH46bhcmclmYNQihMDmUwocpr7To6/R7CLu0St1gkFayx0idJXErQW0zdNfQaIWAnF/
cwioBbXlkz1fQzmDeU3M5oYGMPQIrUqkPq7pMEW0q0lK5eDN97NzFYdZZ/r1cLDWPZhUjY",
  "typeInfos": [
    {
      "status": "REGISTERED",
      "creationDate": 1371454150.085,
      "activityType": {
        "version": "1",
        "name": "subscribe-user-sns"
      },
      "description": "subscribe subscribe-user-sns activity"
    },
  ],
}

```

```
{
  "status": "REGISTERED",
  "creationDate": 1371454150.909,
  "activityType": {
    "version": "1",
    "name": "send-subscription-success"
  },
  "description": "subscribe send-subscription-success activity"
}
]
```

See Also [ListActivityTypes](#) in the *Amazon Simple Workflow Service API Reference*

- For API details, see [ListActivityTypes](#) in *AWS CLI Command Reference*.

list-domains

The following code example shows how to use `list-domains`.

AWS CLI

Example 1: To list your registered domains

The following `list-domains` command example lists the REGISTERED SWF domains that you have registered for your account.

```
aws swf list-domains \
  --registration-status REGISTERED
```

Output:

```
{
  "domainInfos": [
    {
      "status": "REGISTERED",
      "name": "DataFrobotz"
    },
    {
      "status": "REGISTERED",
      "name": "erontest"
    }
  ]
}
```

```
]
}
```

For more information, see [ListDomains](#) in the *Amazon Simple Workflow Service API Reference*

Example 2: To list your deprecated domains

The following `list-domains` command example lists the DEPRECATED SWF domains that you have registered for your account. Deprecated domains are domains that can not register new workflows or activities, but that can still be queried.

```
aws swf list-domains \
  --registration-status DEPRECATED
```

Output:

```
{
  "domainInfos": [
    {
      "status": "DEPRECATED",
      "name": "MyNeatNewDomain"
    }
  ]
}
```

For more information, see [ListDomains](#) in the *Amazon Simple Workflow Service API Reference*

Example 3: To list the first page of registered domains

The following `list-domains` command example lists the first page REGISTERED SWF domains that you have registered for your account using the `--maximum-page-size` option.

```
aws swf list-domains \
  --registration-status REGISTERED \
  --maximum-page-size 1
```

Output:

```
{
  "domainInfos": [
```

```

    {
      "status": "REGISTERED",
      "name": "DataFrobotz"
    }
  ],
  "nextPageToken": "AAAAKgAAAAEAAAAAAAAAAAAA2QJKNtidVgd49TTeNwYcpD
+QKT2ynuEbibcQWe2QKrs1MGe63gpS0MgZGpcpoKttL40CXRFn98Xif557it
+wSZUsvUDtImjDLvguyuyyFdIZtvIxIKE0Pm3k2r40jAGaFsG0uVbrK1jv1a7wdU7FYH301kNCP8b7PBj9SBkUyGoiAg
}

```

For more information, see [ListDomains](#) in the *Amazon Simple Workflow Service API Reference*

Example 4: To list the specified single page of registered domains

The following `list-domains` command example lists the first page REGISTERED SWF domains that you have registered for your account using the `--maximum-page-size` option.

When you make the call again, this time supplying the value of `nextPageToken` in the `--next-page-token` argument, you'll get another page of results.

```

aws swf list-domains \
  --registration-status REGISTERED \
  --maximum-page-size 1 \
  --next-page-token "AAAAKgAAAAEAAAAAAAAAAAAA2QJKNtidVgd49TTeNwYcpD
+QKT2ynuEbibcQWe2QKrs1MGe63gpS0MgZGpcpoKttL40CXRFn98Xif557it
+wSZUsvUDtImjDLvguyuyyFdIZtvIxIKE0Pm3k2r40jAGaFsG0uVbrK1jv1a7wdU7FYH301kNCP8b7PBj9SBkUyGoiAg

```

Output:

```

{
  "domainInfos": [
    {
      "status": "REGISTERED",
      "name": "erontest"
    }
  ]
}

```

When there are no further pages of results to retrieve, `nextPageToken` will not be returned in the results.

For more information, see [ListDomains](#) in the *Amazon Simple Workflow Service API Reference*

- For API details, see [ListDomains](#) in *AWS CLI Command Reference*.

list-workflow-types

The following code example shows how to use `list-workflow-types`.

AWS CLI

Listing Workflow Types

To get a list of the workflow types for a domain, use `swf list-workflow-types`. The `--domain` and `--registration-status` arguments are required. Here's a simple example.

```
aws swf list-workflow-types \  
  --domain DataFrobtzz \  
  --registration-status REGISTERED
```

Output:

```
{  
  "typeInfos": [  
    {  
      "status": "REGISTERED",  
      "creationDate": 1371454149.598,  
      "description": "DataFrobtzz subscribe workflow",  
      "workflowType": {  
        "version": "v3",  
        "name": "subscribe"  
      }  
    }  
  ]  
}
```

As with `list-activity-types`, you can use the `--name` argument to select only workflow types with a particular name, and use the `--maximum-page-size` argument in coordination with `--next-page-token` to page results. To reverse the order in which results are returned, use `--reverse-order`.

See Also [ListWorkflowTypes](#) in the *Amazon Simple Workflow Service API Reference*

- For API details, see [ListWorkflowTypes](#) in *AWS CLI Command Reference*.

register-domain

The following code example shows how to use `register-domain`.

AWS CLI

Registering a Domain

You can use the AWS CLI to register new domains. Use the `swf register-domain` command. There are two required parameters, `--name`, which takes the domain name, and `--workflow-execution-retention-period-in-days`, which takes an integer to specify the number of days to retain workflow execution data on this domain, up to a maximum period of 90 days (for more information, see the SWF FAQ <https://aws.amazon.com/swf/faqs/#retain_limit>). Workflow execution data will not be retained after the specified number of days have passed.

```
aws swf register-domain \  
  --name MyNeatNewDomain \  
  --workflow-execution-retention-period-in-days 0  
  ""
```

When you register a domain, nothing is returned (""), but you can use `swf list-domains` or `swf describe-domain` to see the new domain.

```
aws swf list-domains \  
  --registration-status REGISTERED  
  {  
    "domainInfos": [  
      {  
        "status": "REGISTERED",  
        "name": "DataFrobotz"  
      },  
      {  
        "status": "REGISTERED",  
        "name": "MyNeatNewDomain"  
      },  
      {  
        "status": "REGISTERED",  
        "name": "erontest"  
      }  
    ]  
  }
```

Using `swf describe-domain`:

```
aws swf describe-domain --name MyNeatNewDomain
{
  "domainInfo": {
    "status": "REGISTERED",
    "name": "MyNeatNewDomain"
  },
  "configuration": {
    "workflowExecutionRetentionPeriodInDays": "0"
  }
}
```

See Also [RegisterDomain](#) in the *Amazon Simple Workflow Service API Reference*

- For API details, see [RegisterDomain](#) in *AWS CLI Command Reference*.

register-workflow-type

The following code example shows how to use `register-workflow-type`.

AWS CLI

Registering a Workflow Type

To register a Workflow type with the AWS CLI, use the `swf register-workflow-type` command.

```
aws swf register-workflow-type \
  --domain DataFrobtzz \
  --name "MySimpleWorkflow" \
  --workflow-version "v1"
```

If successful, the command produces no output.

On an error (for example, if you try to register the same workflow type twice, or specify a domain that doesn't exist) you will get a response in JSON.

```
{
  "message": "WorkflowType=[name=MySimpleWorkflow, version=v1]",
  "__type": "com.amazonaws.swf.base.model#TypeAlreadyExistsFault"
}
```

The `--domain`, `--name` and `--workflow-version` are required. You can also set the workflow description, timeouts, and child workflow policy.

For more information, see [RegisterWorkflowType](#) in the *Amazon Simple Workflow Service API Reference*

- For API details, see [RegisterWorkflowType](#) in *AWS CLI Command Reference*.

Systems Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Systems Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-tags-to-resource

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

Example 1: To add tags to a maintenance window

The following `add-tags-to-resource` example adds a tag to the specified maintenance window.

```
aws ssm add-tags-to-resource \  
    --resource-type "MaintenanceWindow" \  
    --tags "tag-key=tag-value"
```

```
--resource-id "mw-03eb9db428EXAMPLE" \  
--tags "Key=Stack,Value=Production"
```

This command produces no output.

Example 2: To add tags to a parameter

The following `add-tags-to-resource` example adds two tags to to the specified parameter.

```
aws ssm add-tags-to-resource \  
  --resource-type "Parameter" \  
  --resource-id "My-Parameter" \  
  --tags '[{"Key":"Region","Value":"East"}, {"Key":"Environment",  
  "Value":"Production"}]'
```

This command produces no output.

Example 3: To add tags to an SSM document

The following `add-tags-to-resource` example adds a tag to to the specified document.

```
aws ssm add-tags-to-resource \  
  --resource-type "Document" \  
  --resource-id "My-Document" \  
  --tags "Key=Quarter,Value=Q322"
```

This command produces no output.

For more information, see [Tagging Systems Manager resources](#) in the *AWS Systems Manager User Guide*.

- For API details, see [AddTagsToResource](#) in *AWS CLI Command Reference*.

associate-ops-item-related-item

The following code example shows how to use `associate-ops-item-related-item`.

AWS CLI

To associate a related item

The following `associate-ops-item-related-item` example associates a related item to the OpsItem.

```
aws ssm associate-ops-item-related-item \  
  --ops-item-id "oi-649fExample" \  
  --association-type "RelatesTo" \  
  --resource-type "AWS::SSMIncidents::IncidentRecord" \  
  --resource-uri "arn:aws:ssm-incidents::111122223333:incident-record/Example-  
Response-Plan/c2bde883-f7d5-343a-b13a-bf5fe9ea689f"
```

Output:

```
{  
  "AssociationId": "61d7178d-a30d-4bc5-9b4e-a9e74EXAMPLE"  
}
```

For more information, see [Working with Incident Manager incidents in OpsCenter](#) in the *AWS Systems Manager User Guide*.

- For API details, see [AssociateOpsItemRelatedItem](#) in *AWS CLI Command Reference*.

cancel-command

The following code example shows how to use `cancel-command`.

AWS CLI

Example 1: To cancel a command for all instances

The following `cancel-command` example attempts to cancel the specified command that is already running for all instances.

```
aws ssm cancel-command \  
  --command-id "662add3d-5831-4a10-b64a-f2ff3EXAMPLE"
```

This command produces no output.

Example 2: To cancel a command for specific instances

The following `cancel-command` example attempts to cancel a command for the specified instance only.

```
aws ssm cancel-command \  
  --command-id "662add3d-5831-4a10-b64a-f2ff3EXAMPLE"
```

```
--instance-ids "i-02573cafcfEXAMPLE"
```

This command produces no output.

For more information, see [Tagging Systems Manager Parameters](#) in the *AWS Systems Manager User Guide*.

- For API details, see [CancelCommand](#) in *AWS CLI Command Reference*.

cancel-maintenance-window-execution

The following code example shows how to use `cancel-maintenance-window-execution`.

AWS CLI

To cancel a maintenance window execution

This `cancel-maintenance-window-execution` example stops the specified maintenance window execution that is already in progress.

```
aws ssm cancel-maintenance-window-execution \  
  --window-execution-id j218d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE
```

Output:

```
{  
  "WindowExecutionId": "j218d5b5c-mw66-tk4d-r3g9-1d4d1EXAMPLE"  
}
```

For more information, see [Systems Manager Maintenance Windows Tutorials \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [CancelMaintenanceWindowExecution](#) in *AWS CLI Command Reference*.

create-activation

The following code example shows how to use `create-activation`.

AWS CLI

To create a managed instance activation

The following `create-activation` example creates a managed instance activation.

```
aws ssm create-activation \  
  --default-instance-name "HybridWebServers" \  
  --iam-role "HybridWebServersRole" \  
  --registration-limit 5
```

Output:

```
{  
  "ActivationId": "5743558d-563b-4457-8682-d16c3EXAMPLE",  
  "ActivationCode": "dRmgnYaFv567vEXAMPLE"  
}
```

For more information, see [Step 4: Create a Managed-Instance Activation for a Hybrid Environment](#) in the *AWS Systems Manager User Guide*.

- For API details, see [CreateActivation](#) in *AWS CLI Command Reference*.

create-association-batch

The following code example shows how to use `create-association-batch`.

AWS CLI

To create multiple associations

This example associates a configuration document with multiple instances. The output returns a list of successful and failed operations, if applicable.

Command:

```
aws ssm create-association-batch --entries "Name=AWS-  
UpdateSSMAgent,InstanceId=i-1234567890abcdef0" "Name=AWS-  
UpdateSSMAgent,InstanceId=i-9876543210abcdef0"
```

Output:

```
{  
  "Successful": [  
    {  
      "Name": "AWS-UpdateSSMAgent",
```

```
"InstanceId": "i-1234567890abcdef0",
"AssociationVersion": "1",
"Date": 1550504725.007,
"LastUpdateAssociationDate": 1550504725.007,
"Status": {
  "Date": 1550504725.007,
  "Name": "Associated",
  "Message": "Associated with AWS-UpdateSSMAgent"
},
"Overview": {
  "Status": "Pending",
  "DetailedStatus": "Creating"
},
"DocumentVersion": "$DEFAULT",
"AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
"Targets": [
  {
    "Key": "InstanceIds",
    "Values": [
      "i-1234567890abcdef0"
    ]
  }
]
},
{
  "Name": "AWS-UpdateSSMAgent",
  "InstanceId": "i-9876543210abcdef0",
  "AssociationVersion": "1",
  "Date": 1550504725.057,
  "LastUpdateAssociationDate": 1550504725.057,
  "Status": {

```

```

        "Values": [
            "i-9876543210abcdef0"
        ]
    }
]
},
"Failed": []
}

```

- For API details, see [CreateAssociationBatch](#) in *AWS CLI Command Reference*.

create-association

The following code example shows how to use create-association.

AWS CLI

Example 1: To associate a document using instance IDs

This example associates a configuration document with an instance, using instance IDs.

```

aws ssm create-association \
  --instance-id "i-0cb2b964d3e14fd9f" \
  --name "AWS-UpdateSSMAgent"

```

Output:

```

{
  "AssociationDescription": {
    "Status": {
      "Date": 1487875500.33,
      "Message": "Associated with AWS-UpdateSSMAgent",
      "Name": "Associated"
    },
    "Name": "AWS-UpdateSSMAgent",
    "InstanceId": "i-0cb2b964d3e14fd9f",
    "Overview": {
      "Status": "Pending",
      "DetailedStatus": "Creating"
    },
    "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
  }
}

```

```

    "DocumentVersion": "$DEFAULT",
    "LastUpdateAssociationDate": 1487875500.33,
    "Date": 1487875500.33,
    "Targets": [
      {
        "Values": [
          "i-0cb2b964d3e14fd9f"
        ],
        "Key": "InstanceIds"
      }
    ]
  }
}

```

For more information, see [CreateAssociation](#) in the *AWS Systems Manager API Reference*.

Example 2: To associate a document using targets

This example associates a configuration document with an instance, using targets.

```

aws ssm create-association \
  --name "AWS-UpdateSSMAgent" \
  --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f"

```

Output:

```

{
  "AssociationDescription": {
    "Status": {
      "Date": 1487875500.33,
      "Message": "Associated with AWS-UpdateSSMAgent",
      "Name": "Associated"
    },
    "Name": "AWS-UpdateSSMAgent",
    "InstanceId": "i-0cb2b964d3e14fd9f",
    "Overview": {
      "Status": "Pending",
      "DetailedStatus": "Creating"
    },
    "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
    "DocumentVersion": "$DEFAULT",
    "LastUpdateAssociationDate": 1487875500.33,

```

```

    "Date": 1487875500.33,
    "Targets": [
      {
        "Values": [
          "i-0cb2b964d3e14fd9f"
        ],
        "Key": "InstanceIds"
      }
    ]
  }
}

```

For more information, see [CreateAssociation](#) in the *AWS Systems Manager API Reference*.

Example 3: To create an association that runs only once

This example creates a new association that only runs once on the specified date and time. Associations created with a date in the past or present (by the time it is processed the date is in the past) run immediately.

```

aws ssm create-association \
  --name "AWS-UpdateSSMAgent" \
  --targets "Key=instanceids,Values=i-0cb2b964d3e14fd9f" \
  --schedule-expression "at(2020-05-14T15:55:00)" \
  --apply-only-at-cron-interval

```

Output:

```

{
  "AssociationDescription": {
    "Status": {
      "Date": 1487875500.33,
      "Message": "Associated with AWS-UpdateSSMAgent",
      "Name": "Associated"
    },
    "Name": "AWS-UpdateSSMAgent",
    "InstanceId": "i-0cb2b964d3e14fd9f",
    "Overview": {
      "Status": "Pending",
      "DetailedStatus": "Creating"
    },
    "AssociationId": "b7c3266e-a544-44db-877e-b20d3a108189",
  }
}

```

```
"DocumentVersion": "$DEFAULT",
"LastUpdateAssociationDate": 1487875500.33,
"Date": 1487875500.33,
"Targets": [
  {
    "Values": [
      "i-0cb2b964d3e14fd9f"
    ],
    "Key": "InstanceIds"
  }
]
```

For more information, see [CreateAssociation](#) in the *AWS Systems Manager API Reference* or [Reference: Cron and rate expressions for Systems Manager](#) in the *AWS Systems Manager User Guide*.

- For API details, see [CreateAssociation](#) in *AWS CLI Command Reference*.

create-document

The following code example shows how to use create-document.

AWS CLI

To create a document

The following create-document example creates a Systems Manager document.

```
aws ssm create-document \
  --content file://exampleDocument.yml \
  --name "Example" \
  --document-type "Automation" \
  --document-format YAML
```

Output:

```
{
  "DocumentDescription": {
    "Hash": "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
    "HashType": "Sha256",
```

```

    "Name": "Example",
    "Owner": "29884EXAMPLE",
    "CreateDate": 1583256349.452,
    "Status": "Creating",
    "DocumentVersion": "1",
    "Description": "Document Example",
    "Parameters": [
      {
        "Name": "AutomationAssumeRole",
        "Type": "String",
        "Description": "(Required) The ARN of the role that allows
Automation to perform the actions on your behalf. If no role is specified, Systems
Manager Automation uses your IAM permissions to execute this document.",
        "DefaultValue": ""
      },
      {
        "Name": "InstanceId",
        "Type": "String",
        "Description": "(Required) The ID of the Amazon EC2 instance.",
        "DefaultValue": ""
      }
    ],
    "PlatformTypes": [
      "Windows",
      "Linux"
    ],
    "DocumentType": "Automation",
    "SchemaVersion": "0.3",
    "LatestVersion": "1",
    "DefaultVersion": "1",
    "DocumentFormat": "YAML",
    "Tags": []
  }
}

```

For more information, see [Creating Systems Manager Documents](#) in the *AWS Systems Manager User Guide*.

- For API details, see [CreateDocument](#) in *AWS CLI Command Reference*.

create-maintenance-window

The following code example shows how to use create-maintenance-window.

AWS CLI

Example 1: To create a maintenance window

The following `create-maintenance-window` example creates a new maintenance window that every five minutes for up to two hours (as needed), prevents new tasks from starting within one hour of the end of the maintenance window execution, allows unassociated targets (instances that you haven't registered with the maintenance window), and indicates through the use of custom tags that its creator intends to use it in a tutorial.

```
aws ssm create-maintenance-window \  
  --name "My-Tutorial-Maintenance-Window" \  
  --schedule "rate(5 minutes)" \  
  --duration 2 --cutoff 1 \  
  --allow-unassociated-targets \  
  --tags "Key=Purpose,Value=Tutorial"
```

Output:

```
{  
  "WindowId": "mw-0c50858d01EXAMPLE"  
}
```

Example 2: To create a maintenance window that runs only once

The following `create-maintenance-window` example creates a new maintenance window that only runs one time on the specified date and time.

```
aws ssm create-maintenance-window \  
  --name My-One-Time-Maintenance-Window \  
  --schedule "at(2020-05-14T15:55:00)" \  
  --duration 5 \  
  --cutoff 2 \  
  --allow-unassociated-targets \  
  --tags "Key=Environment,Value=Production"
```

Output:

```
{  
  "WindowId": "mw-01234567890abcdef"
```

```
}
```

For more information, see [Maintenance Windows](#) in the *AWS Systems Manager User Guide*.

- For API details, see [CreateMaintenanceWindow](#) in *AWS CLI Command Reference*.

create-ops-item

The following code example shows how to use `create-ops-item`.

AWS CLI

To create an OpsItems

The following `create-ops-item` example uses the `/aws/resources` key in `OperationalData` to create an OpsItem with an Amazon DynamoDB related resource.

```
aws ssm create-ops-item \  
  --title "EC2 instance disk full" \  
  --description "Log clean up may have failed which caused the disk to be full" \  
  --priority 2 \  
  --source ec2 \  
  --operational-data '{"aws/resources":{"Value":["arn\  
\": \"arn:aws:dynamodb:us-west-2:12345678:table/OpsItems\  
\"]},"Type":"SearchableString"}' \  
  --notifications Arn="arn:aws:sns:us-west-2:12345678:TestUser"
```

Output:

```
{  
  "OpsItemId": "oi-1a2b3c4d5e6f"  
}
```

For more information, see [Creating OpsItems](#) in the *AWS Systems Manager User Guide*.

- For API details, see [CreateOpsItem](#) in *AWS CLI Command Reference*.

create-patch-baseline

The following code example shows how to use `create-patch-baseline`.

AWS CLI

Example 1: To create a patch baseline with auto-approval

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves patches for a production environment seven days after they are released by Microsoft.

```
aws ssm create-patch-baseline \  
  --name "Windows-Production-Baseline-AutoApproval" \  
  --operating-system "WINDOWS" \  
  --approval-rules  
  "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,Important  
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},Approv  
  \  
  --description "Baseline containing all updates approved for Windows Server  
  production systems"
```

Output:

```
{  
  "BaselineId": "pb-045f10b4f3EXAMPLE"  
}
```

Example 2: To create a patch baseline with an approval cutoff date

The following `create-patch-baseline` example creates a patch baseline for Windows Server that approves all patches for a production environment that are released on or before July 7, 2020.

```
aws ssm create-patch-baseline \  
  --name "Windows-Production-Baseline-AutoApproval" \  
  --operating-system "WINDOWS" \  
  --approval-rules  
  "PatchRules=[{PatchFilterGroup={PatchFilters=[{Key=MSRC_SEVERITY,Values=[Critical,Important  
{Key=CLASSIFICATION,Values=[SecurityUpdates,Updates,UpdateRollups,CriticalUpdates]}]},Approv  
  \  
  --description "Baseline containing all updates approved for Windows Server  
  production systems"
```

Output:

```
{
  "BaselineId": "pb-045f10b4f3EXAMPLE"
}
```

Example 3: To create a patch baseline with approval rules stored in a JSON file

The following `create-patch-baseline` example creates a patch baseline for Amazon Linux 2017.09 that approves patches for a production environment seven days after they are released, specifies approval rules for the patch baseline, and specifies a custom repository for patches.

```
aws ssm create-patch-baseline \
  --cli-input-json file://my-amazon-linux-approval-rules-and-repo.json
```

Contents of `my-amazon-linux-approval-rules-and-repo.json`:

```
{
  "Name": "Amazon-Linux-2017.09-Production-Baseline",
  "Description": "My approval rules patch baseline for Amazon Linux 2017.09
instances",
  "OperatingSystem": "AMAZON_LINUX",
  "Tags": [
    {
      "Key": "Environment",
      "Value": "Production"
    }
  ],
  "ApprovalRules": {
    "PatchRules": [
      {
        "ApproveAfterDays": 7,
        "EnableNonSecurity": true,
        "PatchFilterGroup": {
          "PatchFilters": [
            {
              "Key": "SEVERITY",
              "Values": [
                "Important",
                "Critical"
              ]
            }
          ]
        }
      }
    ]
  },
}
```

```

        {
            "Key": "CLASSIFICATION",
            "Values": [
                "Security",
                "Bugfix"
            ]
        },
        {
            "Key": "PRODUCT",
            "Values": [
                "AmazonLinux2017.09"
            ]
        }
    ]
}
}
}
],
"Sources": [
    {
        "Name": "My-AL2017.09",
        "Products": [
            "AmazonLinux2017.09"
        ],
        "Configuration": "[amzn-main] \nname=amzn-main-Base
\nmirrorlist=http://repo./$awsregion./$awsdomain//$releasever/main/mirror.list //
\nmirrorlist_expire=300//\nmetadata_expire=300 \npriority=10 \nfailovermethod=priority
\nfastestmirror_enabled=0 \ngpgcheck=1 \ngpgkey=file:///etc/pki/rpm-gpg/RPM-GPG-
KEY-amazon-ga \nenabled=1 \nretries=3 \ntimeout=5\nreport_instanceid=yes"
    }
]
}

```

Example 4: To create a patch baseline that specifies approved and rejected patches

The following `create-patch-baseline` example explicitly specifies patches to approve and reject as exception to the default approval rules.

```

aws ssm create-patch-baseline \
  --name "Amazon-Linux-2017.09-Alpha-Baseline" \
  --description "My custom approve/reject patch baseline for Amazon Linux 2017.09
instances" \
  --operating-system "AMAZON_LINUX" \

```

```
--approved-patches "CVE-2018-1234567,example-pkg-EE-2018*.amzn1.noarch" \  
--approved-patches-compliance-level "HIGH" \  
--approved-patches-enable-non-security \  
--tags "Key=Environment,Value=Alpha"
```

For more information, see [Create a Custom Patch Baseline](#) in the *AWS Systems Manager User Guide*.

- For API details, see [CreatePatchBaseline](#) in *AWS CLI Command Reference*.

create-resource-data-sync

The following code example shows how to use `create-resource-data-sync`.

AWS CLI

To create a resource data sync

This example creates a resource data sync. There is no output if the command succeeds.

Command:

```
aws ssm create-resource-data-sync --sync-name "ssm-resource-data-sync" --s3-  
destination "BucketName=ssm-bucket,Prefix=inventory,SyncFormat=JsonSerDe,Region=us-  
east-1"
```

- For API details, see [CreateResourceDataSync](#) in *AWS CLI Command Reference*.

delete-activation

The following code example shows how to use `delete-activation`.

AWS CLI

To delete a managed instance activation

The following `delete-activation` example deletes a managed instance activation.

```
aws ssm delete-activation \  
--activation-id "aa673477-d926-42c1-8757-1358cEXAMPLE"
```

This command produces no output.

For more information, see [Setting Up AWS Systems Manager for Hybrid Environments](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeleteActivation](#) in *AWS CLI Command Reference*.

delete-association

The following code example shows how to use delete-association.

AWS CLI

Example 1: To delete an association using the association ID

The following delete-association example deletes the association for the specified association ID. There is no output if the command succeeds.

```
aws ssm delete-association \  
  --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

This command produces no output.

For more information, see [Editing and creating a new version of an association](#) in the *AWS Systems Manager User Guide*.

Example 2: To delete an association

The following delete-association example deletes the association between an instance and a document. There is no output if the command succeeds.

```
aws ssm delete-association \  
  --instance-id "i-1234567890abcdef0" \  
  --name "AWS-UpdateSSMAgent"
```

This command produces no output.

For more information, see [Working with associations in Systems Manager](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeleteAssociation](#) in *AWS CLI Command Reference*.

delete-document

The following code example shows how to use delete-document.

AWS CLI

To delete a document

The following delete-document example deletes a Systems Manager document.

```
aws ssm delete-document \  
  --name "Example"
```

This command produces no output.

For more information, see [Creating Systems Manager Documents](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeleteDocument](#) in *AWS CLI Command Reference*.

delete-inventory

The following code example shows how to use delete-inventory.

AWS CLI

To delete a custom inventory type

This example deletes a custom inventory schema.

Command:

```
aws ssm delete-inventory --type-name "Custom:RackInfo" --schema-delete-option  
  "DeleteSchema"
```

Output:

```
{  
  "DeletionId": "d72ac9e8-1f60-4d40-b1c6-bf8c78c68c4d",  
  "TypeName": "Custom:RackInfo",  
  "DeletionSummary": {  
    "TotalCount": 1,  
  }  
}
```

```
    "RemainingCount": 1,
    "SummaryItems": [
      {
        "Version": "1.0",
        "Count": 1,
        "RemainingCount": 1
      }
    ]
  }
}
```

To disable a custom inventory type

This example disables a custom inventory schema.

Command:

```
aws ssm delete-inventory --type-name "Custom:RackInfo" --schema-delete-option
"DisableSchema"
```

Output:

```
{
  "DeletionId": "6961492a-8163-44ec-aa1e-923364dd0850",
  "TypeName": "Custom:RackInformation",
  "DeletionSummary": {
    "TotalCount": 0,
    "RemainingCount": 0,
    "SummaryItems": []
  }
}
```

- For API details, see [DeleteInventory](#) in *AWS CLI Command Reference*.

delete-maintenance-window

The following code example shows how to use `delete-maintenance-window`.

AWS CLI

To delete a maintenance window

This `delete-maintenance-window` example removes the specified maintenance window.

```
aws ssm delete-maintenance-window \  
  --window-id "mw-1a2b3c4d5e6f7g8h9"
```

Output:

```
{  
  "WindowId": "mw-1a2b3c4d5e6f7g8h9"  
}
```

For more information, see [Delete a Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeleteMaintenanceWindow](#) in *AWS CLI Command Reference*.

delete-parameter

The following code example shows how to use `delete-parameter`.

AWS CLI

To delete a parameter

The following `delete-parameter` example deletes the specified single parameter.

```
aws ssm delete-parameter \  
  --name "MyParameter"
```

This command produces no output.

For more information, see [Working with Parameter Store](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeleteParameter](#) in *AWS CLI Command Reference*.

delete-parameters

The following code example shows how to use `delete-parameters`.

AWS CLI

To delete a list of parameters

The following `delete-parameters` example deletes the specified parameters.

```
aws ssm delete-parameters \  
  --names "MyFirstParameter" "MySecondParameter" "MyInvalidParameterName"
```

Output:

```
{  
  "DeletedParameters": [  
    "MyFirstParameter",  
    "MySecondParameter"  
  ],  
  "InvalidParameters": [  
    "MyInvalidParameterName"  
  ]  
}
```

For more information, see [Working with Parameter Store](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeleteParameters](#) in *AWS CLI Command Reference*.

delete-patch-baseline

The following code example shows how to use `delete-patch-baseline`.

AWS CLI

To delete a patch baseline

The following `delete-patch-baseline` example deletes the specified patch baseline.

```
aws ssm delete-patch-baseline \  
  --baseline-id "pb-045f10b4f382baeda"
```

Output:

```
{
  "BaselineId": "pb-045f10b4f382baeda"
}
```

For more information, see [Update or Delete a Patch Baseline \(Console\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeletePatchBaseline](#) in *AWS CLI Command Reference*.

delete-resource-data-sync

The following code example shows how to use `delete-resource-data-sync`.

AWS CLI

To delete a resource data sync

This example deletes a resource data sync. There is no output if the command succeeds.

Command:

```
aws ssm delete-resource-data-sync --sync-name "ssm-resource-data-sync"
```

- For API details, see [DeleteResourceDataSync](#) in *AWS CLI Command Reference*.

deregister-managed-instance

The following code example shows how to use `deregister-managed-instance`.

AWS CLI

To deregister a managed instance

The following `deregister-managed-instance` example deregisters the specified managed instance.

```
aws ssm deregister-managed-instance
  --instance-id "mi-08ab247cdfEXAMPLE"
```

This command produces no output.

For more information, see [Deregistering Managed Instances in a Hybrid Environment](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeregisterManagedInstance](#) in *AWS CLI Command Reference*.

deregister-patch-baseline-for-patch-group

The following code example shows how to use `deregister-patch-baseline-for-patch-group`.

AWS CLI

To deregister a patch group from a patch baseline

The following `deregister-patch-baseline-for-patch-group` example deregisters the specified patch group from the specified patch baseline.

```
aws ssm deregister-patch-baseline-for-patch-group \  
  --patch-group "Production" \  
  --baseline-id "pb-0ca44a362fEXAMPLE"
```

Output:

```
{  
  "PatchGroup": "Production",  
  "BaselineId": "pb-0ca44a362fEXAMPLE"  
}
```

For more information, see [Add a Patch Group to a Patch Baseline](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeregisterPatchBaselineForPatchGroup](#) in *AWS CLI Command Reference*.

deregister-target-from-maintenance-window

The following code example shows how to use `deregister-target-from-maintenance-window`.

AWS CLI

To remove a target from a maintenance window

The following `deregister-target-from-maintenance-window` example removes the specified target from the specified maintenance window.

```
aws ssm deregister-target-from-maintenance-window \  
  --window-id "mw-ab12cd34ef56gh78" \  
  --window-target-id "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
```

Output:

```
{  
  "WindowId": "mw-ab12cd34ef56gh78",  
  "WindowTargetId": "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"  
}
```

For more information, see [Update a Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeregisterTargetFromMaintenanceWindow](#) in *AWS CLI Command Reference*.

deregister-task-from-maintenance-window

The following code example shows how to use `deregister-task-from-maintenance-window`.

AWS CLI

To remove a task from a maintenance window

The following `deregister-task-from-maintenance-window` example removes the specified task from the specified maintenance window.

```
aws ssm deregister-task-from-maintenance-window \  
  --window-id "mw-ab12cd34ef56gh78" \  
  --window-task-id "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d5e6c"
```

Output:

```
{  
  "WindowTaskId": "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d5e6c",  
  "WindowId": "mw-ab12cd34ef56gh78"  
}
```

For more information, see [Systems Manager Maintenance Windows Tutorials \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DeregisterTaskFromMaintenanceWindow](#) in *AWS CLI Command Reference*.

describe-activations

The following code example shows how to use describe-activations.

AWS CLI

To describe activations

The following describe-activations example lists details about the activations in your AWS account.

```
aws ssm describe-activations
```

Output:

```
{
  "ActivationList": [
    {
      "ActivationId": "5743558d-563b-4457-8682-d16c3EXAMPLE",
      "Description": "Example1",
      "IamRole": "HybridWebServersRole",
      "RegistrationLimit": 5,
      "RegistrationsCount": 5,
      "ExpirationDate": 1584316800.0,
      "Expired": false,
      "CreatedDate": 1581954699.792
    },
    {
      "ActivationId": "3ee0322b-f62d-40eb-b672-13ebfEXAMPLE",
      "Description": "Example2",
      "IamRole": "HybridDatabaseServersRole",
      "RegistrationLimit": 5,
      "RegistrationsCount": 5,
      "ExpirationDate": 1580515200.0,
      "Expired": true,
      "CreatedDate": 1578064132.002
    },
  ],
}
```

```
]
}
```

For more information, see [Step 4: Create a Managed-Instance Activation for a Hybrid Environment](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeActivations](#) in *AWS CLI Command Reference*.

describe-association-execution-targets

The following code example shows how to use `describe-association-execution-targets`.

AWS CLI

To get details of an association execution

The following `describe-association-execution-targets` example describes the specified association execution.

```
aws ssm describe-association-execution-targets \
  --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
  --execution-id "7abb6378-a4a5-4f10-8312-0123456789ab"
```

Output:

```
{
  "AssociationExecutionTargets": [
    {
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
      "AssociationVersion": "1",
      "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
      "ResourceId": "i-1234567890abcdef0",
      "ResourceType": "ManagedInstance",
      "Status": "Success",
      "DetailedStatus": "Success",
      "LastExecutionDate": 1550505538.497,
      "OutputSource": {
        "OutputSourceId": "97fff367-fc5a-4299-aed8-0123456789ab",
        "OutputSourceType": "RunCommand"
      }
    }
  ]
}
```

```
}
```

For more information, see [Viewing association histories](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeAssociationExecutionTargets](#) in *AWS CLI Command Reference*.

describe-association-executions

The following code example shows how to use `describe-association-executions`.

AWS CLI

Example 1: To get details of all executions for an association

The following `describe-association-executions` example describes all executions of the specified association.

```
aws ssm describe-association-executions \  
  --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{  
  "AssociationExecutions": [  
    {  
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",  
      "AssociationVersion": "1",  
      "ExecutionId": "474925ef-1249-45a2-b93d-0123456789ab",  
      "Status": "Success",  
      "DetailedStatus": "Success",  
      "CreatedTime": 1550505827.119,  
      "ResourceCountByStatus": "{Success=1}"  
    },  
    {  
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",  
      "AssociationVersion": "1",  
      "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",  
      "Status": "Success",  
      "DetailedStatus": "Success",  
      "CreatedTime": 1550505536.843,  
      "ResourceCountByStatus": "{Success=1}"  
    },  
    ...  
  ]  
}
```

```
]
}
```

For more information, see [Viewing association histories](#) in the *AWS Systems Manager User Guide*.

Example 2: To get details of all executions for an association after a specific date and time

The following `describe-association-executions` example describes all executions of an association after the specified date and time.

```
aws ssm describe-association-executions \
  --association-id "8dfe3659-4309-493a-8755-0123456789ab" \
  --filters "Key=CreatedTime,Value=2019-02-18T16:00:00Z,Type=GREATER_THAN"
```

Output:

```
{
  "AssociationExecutions": [
    {
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
      "AssociationVersion": "1",
      "ExecutionId": "474925ef-1249-45a2-b93d-0123456789ab",
      "Status": "Success",
      "DetailedStatus": "Success",
      "CreatedTime": 1550505827.119,
      "ResourceCountByStatus": "{Success=1}"
    },
    {
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
      "AssociationVersion": "1",
      "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
      "Status": "Success",
      "DetailedStatus": "Success",
      "CreatedTime": 1550505536.843,
      "ResourceCountByStatus": "{Success=1}"
    },
    ...
  ]
}
```

For more information, see [Viewing association histories](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeAssociationExecutions](#) in *AWS CLI Command Reference*.

describe-association

The following code example shows how to use describe-association.

AWS CLI

Example 1: To get details of an association

The following describe-association example describes the association for the specified association ID.

```
aws ssm describe-association \  
  --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{  
  "AssociationDescription": {  
    "Name": "AWS-GatherSoftwareInventory",  
    "AssociationVersion": "1",  
    "Date": 1534864780.995,  
    "LastUpdateAssociationDate": 1543235759.81,  
    "Overview": {  
      "Status": "Success",  
      "AssociationStatusAggregatedCount": {  
        "Success": 2  
      }  
    },  
    "DocumentVersion": "$DEFAULT",  
    "Parameters": {  
      "applications": [  
        "Enabled"  
      ],  
      "awsComponents": [  
        "Enabled"  
      ],  
      "customInventory": [  
        "Enabled"  
      ],  
      "files": [  
        ""  
      ],  
      "instanceDetailedInformation": [  
        ""  
      ]  
    }  
  }  
}
```

```

        "Enabled"
    ],
    "networkConfig": [
        "Enabled"
    ],
    "services": [
        "Enabled"
    ],

  "ScheduleExpression": "rate(24 hours)",
  "LastExecutionDate": 1550501886.0,
  "LastSuccessfulExecutionDate": 1550501886.0,
  "AssociationName": "Inventory-Association"
}
}

```

For more information, see [Editing and creating a new version of an association](#) in the *AWS Systems Manager User Guide*.

Example 2: To get details of an association for a specific instance and document

The following describe-association example describes the association between an instance and a document.

```
aws ssm describe-association \
```

```
--instance-id "i-1234567890abcdef0" \  
--name "AWS-UpdateSSMAgent"
```

Output:

```
{  
  "AssociationDescription": {  
    "Status": {  
      "Date": 1487876122.564,  
      "Message": "Associated with AWS-UpdateSSMAgent",  
      "Name": "Associated"  
    },  
    "Name": "AWS-UpdateSSMAgent",  
    "InstanceId": "i-1234567890abcdef0",

        "Pending": 1  
      }  
    },  
    "AssociationId": "d8617c07-2079-4c18-9847-1234567890ab",  
    "DocumentVersion": "$DEFAULT",  
    "LastUpdateAssociationDate": 1487876122.564,  
    "Date": 1487876122.564,  
    "Targets": [  
      {  
        "Values": [  
          "i-1234567890abcdef0"  
        ],  
        "Key": "InstanceIds"  
      }  
    ]  
  }  
}
```

For more information, see [Editing and creating a new version of an association](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeAssociation](#) in *AWS CLI Command Reference*.

describe-automation-executions

The following code example shows how to use describe-automation-executions.

AWS CLI

To describe an automation execution

The following describe-automation-executions example displays details about an Automation execution.

```
aws ssm describe-automation-executions \
  --filters Key=ExecutionId,Values=73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
  "AutomationExecutionMetadataList": [
    {
      "AutomationExecutionId": "73c8eef8-f4ee-4a05-820c-e354fEXAMPLE",
      "DocumentName": "AWS-StartEC2Instance",
      "DocumentVersion": "1",
      "AutomationExecutionStatus": "Success",
      "ExecutionStartTime": 1583737233.748,
      "ExecutionEndTime": 1583737234.719,
      "ExecutedBy": "arn:aws:sts::29884EXAMPLE:assumed-role/mw_service_role/
OrchestrationService",
      "LogFile": "",
      "Outputs": {},
      "Mode": "Auto",
      "Targets": [],
      "ResolvedTargets": {
        "ParameterValues": [],
        "Truncated": false
      },
      "AutomationType": "Local"
    }
  ]
}
```

For more information, see [Running a Simple Automation Workflow](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeAutomationExecutions](#) in *AWS CLI Command Reference*.

describe-automation-step-executions

The following code example shows how to use describe-automation-step-executions.

AWS CLI

Example 1: To describe all steps for an automation execution

The following describe-automation-step-executions example displays details about the steps of an Automation execution.

```
aws ssm describe-automation-step-executions \
  --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{
  "StepExecutions": [
    {
      "StepName": "startInstances",
      "Action": "aws:changeInstanceState",
      "ExecutionStartTime": 1583737234.134,
      "ExecutionEndTime": 1583737234.672,
      "StepStatus": "Success",
      "Inputs": {
        "DesiredState": "\"running\"",
        "InstanceIds": "[\"i-0cb99161f6EXAMPLE\"]"
      },
      "Outputs": {
        "InstanceStates": [
          "running"
        ]
      },
      "StepExecutionId": "95e70479-cf20-4d80-8018-7e4e2EXAMPLE",
      "OverriddenParameters": {}
    }
  ]
}
```

Example 2: To describe a specific step for an automation execution

The following `describe-automation-step-executions` example displays details about a specific step of an Automation execution.

```
aws ssm describe-automation-step-executions \  
  --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE \  
  --filters Key=StepExecutionId,Values=95e70479-cf20-4d80-8018-7e4e2EXAMPLE
```

For more information, see [Running an Automation Workflow Step by Step \(Command Line\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeAutomationStepExecutions](#) in *AWS CLI Command Reference*.

describe-available-patches

The following code example shows how to use `describe-available-patches`.

AWS CLI

To get available patches

The following `describe-available-patches` example retrieves details about all available patches for Windows Server 2019 that have a MSRC severity of Critical.

```
aws ssm describe-available-patches \  
  --filters "Key=PRODUCT,Values=WindowsServer2019"  
  "Key=MSRC_SEVERITY,Values=Critical"
```

Output:

```
{  
  "Patches": [  
    {  
      "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",  
      "ReleaseDate": 1544047205.0,  
      "Title": "2018-11 Update for Windows Server 2019 for x64-based Systems  
(KB4470788)",  
      "Description": "Install this update to resolve issues in Windows. For a  
complete listing of the issues that are included in this update, see the associated  
Microsoft Knowledge Base article for more information. After you install this item,  
you may have to restart your computer.",  
      "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",  
      "Vendor": "Microsoft",
```

```

        "ProductFamily": "Windows",
        "Product": "WindowsServer2019",
        "Classification": "SecurityUpdates",

}

```

To get details of a specific patch

The following `describe-available-patches` example retrieves details about the specified patch.

```
aws ssm describe-available-patches \
  --filters "Key=PATCH_ID,Values=KB4480979"
```

Output:

```
{
```

```
"Patches": [
  {
    "Id": "680861e3-fb75-432e-818e-d72e5f2be719",

- For API details, see [DescribeAvailablePatches](#) in *AWS CLI Command Reference*.

describe-document-permission

The following code example shows how to use `describe-document-permission`.

AWS CLI

To describe document permissions

The following `describe-document-permission` example displays permission details about a Systems Manager document that is shared publicly.

```
aws ssm describe-document-permission \
  --name "Example" \
```

```
--permission-type "Share"
```

Output:

```
{
  "AccountIds": [
    "all"
  ],
  "AccountSharingInfoList": [
    {
      "AccountId": "all",
      "SharedDocumentVersion": "$DEFAULT"
    }
  ]
}
```

For more information, see [Share a Systems Manager Document](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeDocumentPermission](#) in *AWS CLI Command Reference*.

describe-document

The following code example shows how to use `describe-document`.

AWS CLI**To display details of a document**

The following `describe-document` example displays details about a Systems Manager document in your AWS account.

```
aws ssm describe-document \
  --name "Example"
```

Output:

```
{
  "Document": {
    "Hash": "fc2410281f40779e694a8b95975d0f9f316da8a153daa94e3d9921102EXAMPLE",
    "HashType": "Sha256",
    "Name": "Example",
  }
}
```

```
"Owner": "29884EXAMPLE",
"CreateDate": 1583257938.266,
"Status": "Active",
"DocumentVersion": "1",
"Description": "Document Example",
"Parameters": [
  {
    "Name": "AutomationAssumeRole",
    "Type": "String",
    "Description": "(Required) The ARN of the role that allows
Automation to perform the actions on your behalf. If no role is specified, Systems
Manager Automation uses your IAM permissions to execute this document.",
    "DefaultValue": ""
  },
  {
    "Name": "InstanceId",
    "Type": "String",
    "Description": "(Required) The ID of the Amazon EC2 instance.",
    "DefaultValue": ""
  }
],
"PlatformTypes": [
  "Windows",
  "Linux"
],
"DocumentType": "Automation",
"SchemaVersion": "0.3",

"DefaultVersion": "1",
"DocumentFormat": "YAML",
"Tags": []
}
```

For more information, see [Creating Systems Manager Documents](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeDocument](#) in *AWS CLI Command Reference*.

describe-effective-instance-associations

The following code example shows how to use `describe-effective-instance-associations`.

AWS CLI

To get details of the effective associations for an instance

The following `describe-effective-instance-associations` example retrieves details about the effective associations for an instance.

Command:

```
aws ssm describe-effective-instance-associations --instance-id "i-1234567890abcdef0"
```

Output:

```
{
  "Associations": [
    {
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
      "InstanceId": "i-1234567890abcdef0",
      "Content": "{\n  \"schemaVersion\": \"1.2\",\n  \"description\":\n  \"Update the Amazon SSM Agent to the latest version or specified version.\",\n  \"parameters\": {\n    \"version\": {\n      \"default\": \"\",\n      \"description\": \"(Optional) A specific version of the Amazon SSM Agent\n  to install. If not specified, the agent will be updated to the latest version.\",\n      \"type\": \"String\"\n    },\n    \"allowDowngrade\": {\n      \"default\": \"false\",\n      \"description\": \"(Optional)\n  Allow the Amazon SSM Agent service to be downgraded to an earlier version. If\n  set to false, the service can be upgraded to newer versions only (default). If\n  set to true, specify the earlier version.\",\n      \"type\": \"String\",\n      \"allowedValues\": [\n        \"true\",\n        \"false\"\n      ]\n    },\n    \"runtimeConfig\": {\n      \"aws:updateSsmAgent\": {\n        \"properties\": [\n          {\n            \"agentName\": \"amazon-ssm-agent\",\n            \"source\":\n            \"https://s3.{Region}.amazonaws.com/amazon-ssm-{Region}/ssm-agent-manifest.json\",\n            \"allowDowngrade\": \"{{ allowDowngrade }}\",\n            \"targetVersion\": \"{{ version }}\"\n          }\n        ]\n      }\n    }\n  }\n  \"AssociationVersion\": \"1\"\n    }
  ]
}
```

- For API details, see [DescribeEffectiveInstanceAssociations](#) in *AWS CLI Command Reference*.

describe-effective-patches-for-patch-baseline

The following code example shows how to use `describe-effective-patches-for-patch-baseline`.

AWS CLI

Example 1: To get all patches defined by a custom patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by a custom patch baseline in the current AWS account. Note that for a custom baseline, only the ID is required for `--baseline-id`.

```
aws ssm describe-effective-patches-for-patch-baseline \
  --baseline-id "pb-08b654cf9b9681f04"
```

Output:

```
{
  "EffectivePatches": [
    {
      "Patch": {
        "Id": "fe6bd8c2-3752-4c8b-ab3e-1a7ed08767ba",
        "ReleaseDate": 1544047205.0,
        "Title": "2018-11 Update for Windows Server 2019 for x64-based
Systems (KB4470788)",
        "Description": "Install this update to resolve issues in Windows.
For a complete listing of the issues that are included in this update, see the
associated Microsoft Knowledge Base article for more information. After you install
this item, you may have to restart your computer.",
        "ContentUrl": "https://support.microsoft.com/en-us/kb/4470788",
        "Vendor": "Microsoft",
        "ProductFamily": "Windows",
        "Product": "WindowsServer2019",
        "Classification": "SecurityUpdates",
        "MsrcSeverity": "Critical",
        "KbNumber": "KB4470788",
        "MsrcNumber": "",
        "Language": "All"
      },
      "PatchStatus": {
        "DeploymentStatus": "APPROVED",
```

```

        "ComplianceLevel": "CRITICAL",
        "ApprovalDate": 1544047205.0
    },
    {
        "Patch": {
            "Id": "915a6b1a-f556-4d83-8f50-b2e75a9a7e58",
            "ReleaseDate": 1549994400.0,
            "Title": "2019-02 Cumulative Update for .NET Framework 3.5 and 4.7.2
for Windows Server 2019 for x64 (KB4483452)",
            "Description": "A security issue has been identified in a Microsoft
software product that could affect your system. You can help protect your system by
installing this update from Microsoft. For a complete listing of the issues that
are included in this update, see the associated Microsoft Knowledge Base article.
After you install this update, you may have to restart your system.",
            "ContentUrl": "https://support.microsoft.com/en-us/kb/4483452",
            "Vendor": "Microsoft",
            "ProductFamily": "Windows",
            "Product": "WindowsServer2019",
            "Classification": "SecurityUpdates",
            "MsrcSeverity": "Important",
            "KbNumber": "KB4483452",
            "MsrcNumber": "",
            "Language": "All"
        },
        "PatchStatus": {
            "DeploymentStatus": "APPROVED",
            "ComplianceLevel": "CRITICAL",
            "ApprovalDate": 1549994400.0
        }
    },
    ...
],
"NextToken": "--token string truncated--"
}

```

Example 2: To get all patches defined by an AWS managed patch baseline

The following `describe-effective-patches-for-patch-baseline` example returns the patches defined by an AWS managed patch baseline. Note that for an AWS managed baseline, the complete baseline ARN is required for `--baseline-id`

```
aws ssm describe-effective-patches-for-patch-baseline \
```

```
--baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/  
pb-020d361a05defe4ed"
```

See example 1 for sample output.

For more information, see [How Security Patches Are Selected](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeEffectivePatchesForPatchBaseline](#) in *AWS CLI Command Reference*.

describe-instance-associations-status

The following code example shows how to use `describe-instance-associations-status`.

AWS CLI

To describe the status of an instance's associations

This example shows details of the associations for an instance.

Command:

```
aws ssm describe-instance-associations-status --instance-id "i-1234567890abcdef0"
```

Output:

```
{  
  "InstanceAssociationStatusInfos": [  
    {  
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",  
      "Name": "AWS-GatherSoftwareInventory",  
      "DocumentVersion": "1",  
      "AssociationVersion": "1",  
      "InstanceId": "i-1234567890abcdef0",  
      "ExecutionDate": 1550501886.0,  
      "Status": "Success",  
      "ExecutionSummary": "1 out of 1 plugin processed, 1 success, 0 failed, 0  
      timedout, 0 skipped. ",  
      "AssociationName": "Inventory-Association"  
    },  
    {  
      "AssociationId": "5c5a31f6-6dae-46f9-944c-0123456789ab",
```

```
    "Name": "AWS-UpdateSSMAgent",
    "DocumentVersion": "1",
    "AssociationVersion": "1",
    "InstanceId": "i-1234567890abcdef0",
    "ExecutionDate": 1550505828.548,
    "Status": "Success",
    "DetailedStatus": "Success",
    "AssociationName": "UpdateSSMAgent"
  }
]
```

- For API details, see [DescribeInstanceAssociationsStatus](#) in *AWS CLI Command Reference*.

describe-instance-information

The following code example shows how to use `describe-instance-information`.

AWS CLI

Example 1: To describe managed instance information

The following `describe-instance-information` example retrieves details of each of your managed instances.

```
aws ssm describe-instance-information
```

Example 2: To describe information about a specific managed instance

The following `describe-instance-information` example shows details of the managed instance `i-028ea792daEXAMPLE`.

```
aws ssm describe-instance-information \
  --filters "Key=InstanceIds,Values=i-028ea792daEXAMPLE"
```

Example 3: To describe information about managed instances with a specific tag key

The following `describe-instance-information` example shows details for managed instances that have the tag key `DEV`.

```
aws ssm describe-instance-information \
```

```
--filters "Key=tag-key,Values=DEV"
```

Output:

```
{
  "InstanceInformationList": [
    {
      "InstanceId": "i-028ea792daEXAMPLE",
      "PingStatus": "Online",
      "LastPingDateTime": 1582221233.421,
      "AgentVersion": "2.3.842.0",
      "IsLatestVersion": true,
      "PlatformType": "Linux",
      "PlatformName": "SLES",
      "PlatformVersion": "15.1",
      "ResourceType": "EC2Instance",
      "IPAddress": "192.0.2.0",
      "ComputerName": "ip-198.51.100.0.us-east-2.compute.internal",
      "AssociationStatus": "Success",
      "LastAssociationExecutionDate": 1582220806.0,
      "LastSuccessfulAssociationExecutionDate": 1582220806.0,
      "AssociationOverview": {
        "DetailedStatus": "Success",
        "InstanceAssociationStatusAggregatedCount": {
          "Success": 2
        }
      }
    }
  ]
}
```

For more information, see [Managed Instances](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeInstanceInformation](#) in *AWS CLI Command Reference*.

describe-instance-patch-states-for-patch-group

The following code example shows how to use `describe-instance-patch-states-for-patch-group`.

AWS CLI

Example 1: To get the instance states for a patch group

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states per-instance for the specified patch group.

```
aws ssm describe-instance-patch-states-for-patch-group \  
  --patch-group "Production"
```

Output:

```
{  
  "InstancePatchStates": [  
    {  
      "InstanceId": "i-02573cafcfEXAMPLE",  
      "PatchGroup": "Production",  
      "BaselineId": "pb-0c10e65780EXAMPLE",

    "SecurityNonCompliantCount": 1,
    "OtherNonCompliantCount": 0
  }
]
}

```

Example 2: To get the instance states for a patch group with more than five missing patches

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with more than five missing patches.

```

aws ssm describe-instance-patch-states-for-patch-group \
  --filters Key=MissingCount,Type=GreaterThan,Values=5 \
  --patch-group "Production"

```

Output:

```

{
  "InstancePatchStates": [
    {
      "InstanceId": "i-02573cafcfEXAMPLE",
      "PatchGroup": "Production",
      "BaselineId": "pb-0c10e65780EXAMPLE",

    "CriticalNonCompliantCount": 0,
    "SecurityNonCompliantCount": 1,
    "OtherNonCompliantCount": 1
  }
]
}

```

Example 3: To get the instance states for a patch group with fewer than ten instances that require a reboot

The following `describe-instance-patch-states-for-patch-group` example retrieves details about the patch summary states for the specified patch group for instances with fewer than ten instances requiring a reboot.

```

aws ssm describe-instance-patch-states-for-patch-group \
  --filters Key=InstalledPendingRebootCount,Type=LessThan,Values=10 \
  --patch-group "Production"

```

Output:

```

{
  "InstancePatchStates": [
    {
      "InstanceId": "i-02573cafcfEXAMPLE",
      "BaselineId": "pb-0c10e65780EXAMPLE",

        "SecurityNonCompliantCount": 1,
        "OtherNonCompliantCount": 0
    }
]
}
```

For more information, see [Understanding patch compliance state values](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeInstancePatchStatesForPatchGroup](#) in *AWS CLI Command Reference*.

describe-instance-patch-states

The following code example shows how to use `describe-instance-patch-states`.

AWS CLI

To get the patch summary states for instances

This `describe-instance-patch-states` example gets the patch summary states for an instance.

```
aws ssm describe-instance-patch-states \
  --instance-ids "i-1234567890abcdef0"
```

Output:

```
{
  "InstancePatchStates": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "PatchGroup": "my-patch-group",
      "BaselineId": "pb-0713accee01234567",
      "SnapshotId": "521c3536-930c-4aa9-950e-01234567abcd",
      "CriticalNonCompliantCount": 2,
      "SecurityNonCompliantCount": 2,
      "OtherNonCompliantCount": 1,
    }
  ]
}
```

```

    "InstalledCount": 123,
    "InstalledOtherCount": 334,
    "InstalledPendingRebootCount": 0,
    "InstalledRejectedCount": 0,
    "MissingCount": 1,

describe-instance-patches

The following code example shows how to use `describe-instance-patches`.

AWS CLI

Example 1: To get the patch state details for an instance

The following `describe-instance-patches` example retrieves details about the patches for the specified instance.

```
aws ssm describe-instance-patches \
  --instance-id "i-1234567890abcdef0"
```

Output:

```
{
  "Patches": [
    {
      "Title": "2019-01 Security Update for Adobe Flash Player for Windows
Server 2016 for x64-based Systems (KB4480979)",
```

```

        "KBId": "KB4480979",
        "Classification": "SecurityUpdates",
        "Severity": "Critical",
        "State": "Installed",
        "InstalledTime": "2019-01-09T00:00:00+00:00"
    },
    {
        "Title": "",
        "KBId": "KB4481031",
        "Classification": "",
        "Severity": "",
        "State": "InstalledOther",
        "InstalledTime": "2019-02-08T00:00:00+00:00"
    },
    ...
],
"NextToken": "--token string truncated--"
}

```

Example 2: To get a list of patches in the Missing state for an instance

The following `describe-instance-patches` example retrieves information about patches that are in the Missing state for the specified instance.

```

aws ssm describe-instance-patches \
  --instance-id "i-1234567890abcdef0" \
  --filters Key=State,Values=Missing

```

Output:

```

{
  "Patches": [
    {
      "Title": "Windows Malicious Software Removal Tool x64 - February 2019 (KB890830)",
      "KBId": "KB890830",
      "Classification": "UpdateRollups",
      "Severity": "Unspecified",
      "State": "Missing",
      "InstalledTime": "1970-01-01T00:00:00+00:00"
    },
    ...
  ],
}

```

```
"NextToken": "--token string truncated--"
}
```

For more information, see [About Patch Compliance States](#) in the *AWS Systems Manager User Guide*.

Example 3: To get a list of patches installed since a specified `InstalledTime` for an instance

The following `describe-instance-patches` example retrieves information about patches installed since a specified time for the specified instance by combining the use of `--filters` and `--query`.

```
aws ssm describe-instance-patches \
  --instance-id "i-1234567890abcdef0" \
  --filters Key=State,Values=Installed \
  --query "Patches[?InstalledTime >= `2023-01-01T16:00:00`]"
```

Output:

```
{
  "Patches": [
    {
      "Title": "2023-03 Cumulative Update for Windows Server 2019 (1809) for
x64-based Systems (KB5023702)",
      "KBId": "KB5023702",
      "Classification": "SecurityUpdates",
      "Severity": "Critical",
      "State": "Installed",
      "InstalledTime": "2023-03-16T11:00:00+00:00"
    },
    ...
  ],
  "NextToken": "--token string truncated--"
}
```

- For API details, see [DescribeInstancePatches](#) in *AWS CLI Command Reference*.

describe-inventory-deletions

The following code example shows how to use `describe-inventory-deletions`.

AWS CLI

To get inventory deletions

This example retrieves details for inventory deletion operations.

Command:

```
aws ssm describe-inventory-deletions
```

Output:

```
{
  "InventoryDeletions": [
    {
      "DeletionId": "6961492a-8163-44ec-aa1e-01234567850",
      "TypeName": "Custom:RackInformation",
      "DeletionStartTime": 1550254911.0,
      "LastStatus": "InProgress",
      "LastStatusMessage": "The Delete is in progress",
      "DeletionSummary": {
        "TotalCount": 0,
        "RemainingCount": 0,
        "SummaryItems": []
      },
      "LastStatusUpdateTime": 1550254911.0
    },
    {
      "DeletionId": "d72ac9e8-1f60-4d40-b1c6-987654321c4d",
      "TypeName": "Custom:RackInfo",
      "DeletionStartTime": 1550254859.0,
      "LastStatus": "InProgress",
      "LastStatusMessage": "The Delete is in progress",
      "DeletionSummary": {
        "TotalCount": 1,
        "RemainingCount": 1,
        "SummaryItems": [
          {
            "Version": "1.0",
            "Count": 1,
            "RemainingCount": 1
          }
        ]
      }
    }
  ]
}
```

```
    },
    "LastStatusUpdateTime": 1550254859.0
  }
]
}
```

To get details of a specific inventory deletion

This example retrieves details for a specific inventory deletion operation.

Command:

```
aws ssm describe-inventory-deletions --deletion-id "d72ac9e8-1f60-4d40-
b1c6-987654321c4d"
```

Output:

```
{
  "InventoryDeletions": [
    {
      "DeletionId": "d72ac9e8-1f60-4d40-b1c6-987654321c4d",
      "TypeName": "Custom:RackInfo",
      "DeletionStartTime": 1550254859.0,
      "LastStatus": "InProgress",
      "LastStatusMessage": "The Delete is in progress",
      "DeletionSummary": {
        "TotalCount": 1,
        "RemainingCount": 1,
        "SummaryItems": [
          {
            "Version": "1.0",
            "Count": 1,
            "RemainingCount": 1
          }
        ]
      },
      "LastStatusUpdateTime": 1550254859.0
    }
  ]
}
```

- For API details, see [DescribeInventoryDeletions](#) in *AWS CLI Command Reference*.

describe-maintenance-window-execution-task-invocations

The following code example shows how to use `describe-maintenance-window-execution-task-invocations`.

AWS CLI

To get the specific task invocations performed for a maintenance window task execution

The following `describe-maintenance-window-execution-task-invocations` example lists the invocations for the specified task executed as part of the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-task-invocations \
  --window-execution-id "518d5565-5969-4cca-8f0e-da3b2a638355" \
  --task-id "ac0c6ae1-daa3-4a89-832e-d384503b6586"
```

Output:

```
{
  "WindowExecutionTaskInvocationIdentities": [
    {
      "Status": "SUCCESS",
      "Parameters": "{\"documentName\":\"AWS-RunShellScript\",\"instanceIds\":[\"i-0000293ffd8c57862\"],\"parameters\":{\"commands\":[\"df\"]},\"maxConcurrency\":\"1\",\"maxErrors\":\"1\"}",
      "InvocationId": "e274b6e1-fe56-4e32-bd2a-8073c6381d8b",
      "StartTime": 1487692834.723,
      "EndTime": 1487692834.871,
      "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2a638355",
      "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d384503b6586"
    }
  ]
}
```

For more information, see [View Information About Tasks and Task Executions \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeMaintenanceWindowExecutionTaskInvocations](#) in *AWS CLI Command Reference*.

describe-maintenance-window-execution-tasks

The following code example shows how to use `describe-maintenance-window-execution-tasks`.

AWS CLI

To list all tasks associated with a maintenance window execution

The following `ssm describe-maintenance-window-execution-tasks` example lists the tasks associated with the specified maintenance window execution.

```
aws ssm describe-maintenance-window-execution-tasks \  
  --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE"
```

Output:

```
{  
  "WindowExecutionTaskIdentities": [  
    {  
      "Status": "SUCCESS",  
      "TaskArn": "AWS-RunShellScript",  
      "StartTime": 1487692834.684,  
      "TaskType": "RUN_COMMAND",  
      "EndTime": 1487692835.005,  
      "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",  
      "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"  
    }  
  ]  
}
```

For more information, see [View Information About Tasks and Task Executions \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeMaintenanceWindowExecutionTasks](#) in *AWS CLI Command Reference*.

describe-maintenance-window-executions

The following code example shows how to use `describe-maintenance-window-executions`.

AWS CLI

Example 1: To list all executions for a maintenance window

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-executions \  
  --window-id "mw-ab12cd34eEXAMPLE"
```

Output:

```
{  
  "WindowExecutions": [  
    {  
      "WindowId": "mw-ab12cd34eEXAMPLE",  
      "WindowExecutionId": "6027b513-64fe-4cf0-be7d-1191aEXAMPLE",  
      "Status": "IN_PROGRESS",  
      "StartTime": "2021-08-04T11:00:00.000000-07:00"  
    },  
    {  
      "WindowId": "mw-ab12cd34eEXAMPLE",  
      "WindowExecutionId": "ff75b750-4834-4377-8f61-b3cadEXAMPLE",  
      "Status": "SUCCESS",  
      "StartTime": "2021-08-03T11:00:00.000000-07:00",  
      "EndTime": "2021-08-03T11:37:21.450000-07:00"  
    },  
    {  
      "WindowId": "mw-ab12cd34eEXAMPLE",  
      "WindowExecutionId": "9fac7dd9-ff21-42a5-96ad-bbc4bEXAMPLE",  
      "Status": "FAILED",  
      "StatusDetails": "One or more tasks in the orchestration failed.",  
      "StartTime": "2021-08-02T11:00:00.000000-07:00",  
      "EndTime": "2021-08-02T11:22:36.190000-07:00"  
    }  
  ]  
}
```

Example 2: To list all executions for a maintenance window before a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window before the specified date.

```
aws ssm describe-maintenance-window-executions \  
  --window-id "mw-ab12cd34eEXAMPLE" \  
  --filters "Key=ExecutedBefore,Values=2021-08-03T00:00:00Z"
```

Output:

```
{  
  "WindowExecutions": [  
    {  
      "WindowId": "mw-ab12cd34eEXAMPLE",  
      "WindowExecutionId": "9fac7dd9-ff21-42a5-96ad-bbc4bEXAMPLE",  
      "Status": "FAILED",  
      "StatusDetails": "One or more tasks in the orchestration failed.",  
      "StartTime": "2021-08-02T11:00:00.000000-07:00",  
      "EndTime": "2021-08-02T11:22:36.190000-07:00"  
    }  
  ]  
}
```

Example 3: To list all executions for a maintenance window after a specified date

The following `describe-maintenance-window-executions` example lists all of the executions for the specified maintenance window after the specified date.

```
aws ssm describe-maintenance-window-executions \  
  --window-id "mw-ab12cd34eEXAMPLE" \  
  --filters "Key=ExecutedAfter,Values=2021-08-04T00:00:00Z"
```

Output:

```
{  
  "WindowExecutions": [  
    {  
      "WindowId": "mw-ab12cd34eEXAMPLE",  
      "WindowExecutionId": "6027b513-64fe-4cf0-be7d-1191aEXAMPLE",  
      "Status": "IN_PROGRESS",  
      "StartTime": "2021-08-04T11:00:00.000000-07:00"  
    }  
  ]  
}
```

For more information, see [View information about tasks and task executions \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeMaintenanceWindowExecutions](#) in *AWS CLI Command Reference*.

describe-maintenance-window-schedule

The following code example shows how to use `describe-maintenance-window-schedule`.

AWS CLI

Example 1: To list upcoming executions for a maintenance window

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window.

```
aws ssm describe-maintenance-window-schedule \
  --window-id mw-ab12cd34eEXAMPLE
```

Output:

```
{
  "ScheduledWindowExecutions": [
    {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "Name": "My-First-Maintenance-Window",
      "ExecutionTime": "2020-02-19T16:00Z"
    },
    {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "Name": "My-First-Maintenance-Window",
      "ExecutionTime": "2020-02-26T16:00Z"
    },
    ...
  ]
}
```

Example 2: To list all upcoming executions for a maintenance window before a specified date

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window that occur before the specified date.

```
aws ssm describe-maintenance-window-schedule \  
  --window-id mw-0ecb1226dd7b2e9a6 \  
  --filters "Key=ScheduledBefore,Values=2020-02-15T06:00:00Z"
```

Example 3: To list all upcoming executions for a maintenance window after a specified date

The following `describe-maintenance-window-schedule` example lists all upcoming executions for the specified maintenance window that occur after the specified date.

```
aws ssm describe-maintenance-window-schedule \  
  --window-id mw-0ecb1226dd7b2e9a6 \  
  --filters "Key=ScheduledAfter,Values=2020-02-15T06:00:00Z"
```

For more information, see [View Information About Maintenance Windows \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeMaintenanceWindowSchedule](#) in *AWS CLI Command Reference*.

describe-maintenance-window-targets

The following code example shows how to use `describe-maintenance-window-targets`.

AWS CLI

Example 1: To list all targets for a Maintenance Window

The following `describe-maintenance-window-targets` example lists all of the targets for a maintenance window.

```
aws ssm describe-maintenance-window-targets \  
  --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```
{  
  "Targets": [  
    {  
      "ResourceType": "INSTANCE",  
      "OwnerInformation": "Single instance",  
      "WindowId": "mw-06cf17cbefEXAMPLE",  
      "Targets": [  
        {
```

```

        "Values": [
            "i-0000293ffdEXAMPLE"
        ],
        "Key": "InstanceIds"
    }
],
"WindowTargetId": "350d44e6-28cc-44e2-951f-4b2c9EXAMPLE"
},
{
    "ResourceType": "INSTANCE",
    "OwnerInformation": "Two instances in a list",
    "WindowId": "mw-06cf17cbefEXAMPLE",
    "Targets": [
        {
            "Values": [
                "i-0000293ffdEXAMPLE",
                "i-0cb2b964d3EXAMPLE"
            ],
            "Key": "InstanceIds"
        }
    ],
    "WindowTargetId": "e078a987-2866-47be-bedd-d9cf4EXAMPLE"
}
]
}

```

Example 2: To list all targets for a maintenance window matching a specific owner information value

This `describe-maintenance-window-targets` example lists all of the targets for a maintenance window with a specific value.

```

aws ssm describe-maintenance-window-targets \
  --window-id "mw-0ecb1226ddEXAMPLE" \
  --filters "Key=OwnerInformation,Values=CostCenter1"

```

Output:

```

{
  "Targets": [
    {
      "WindowId": "mw-0ecb1226ddEXAMPLE",
      "WindowTargetId": "da89dcc3-7f9c-481d-ba2b-edcb7d0057f9",

```

```

    "ResourceType": "INSTANCE",
    "Targets": [
      {
        "Key": "tag:Environment",
        "Values": [
          "Prod"
        ]
      }
    ],
    "OwnerInformation": "CostCenter1",
    "Name": "ProdTarget1"
  }
]
}

```

For more information, see [View Information About Maintenance Windows \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeMaintenanceWindowTargets](#) in *AWS CLI Command Reference*.

describe-maintenance-window-tasks

The following code example shows how to use `describe-maintenance-window-tasks`.

AWS CLI

Example 1: To list all tasks for a maintenance window

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window.

```
aws ssm describe-maintenance-window-tasks \
  --window-id "mw-06cf17cbefEXAMPLE"
```

Output:

```

{
  "Tasks": [
    {
      "WindowId": "mw-06cf17cbefEXAMPLE",
      "WindowTaskId": "018b31c3-2d77-4b9e-bd48-c91edEXAMPLE",
      "TaskArn": "AWS-RestartEC2Instance",
      "TaskParameters": {},
    }
  ]
}

```

```

    "Type": "AUTOMATION",
    "Description": "Restarting EC2 Instance for maintenance",
    "MaxConcurrency": "1",
    "MaxErrors": "1",
    "Name": "My-Automation-Example-Task",
    "Priority": 0,
    "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/

      "MaxErrors": "1",  
      "Name": "MyTask"  
    }  
  ]  
}
```

Example 3: To list all tasks for a maintenance window that have a Priority of 3

The following `describe-maintenance-window-tasks` example lists all of the tasks for the specified maintenance window that have a `Priority` of 3.

```
aws ssm describe-maintenance-window-tasks \  
  --window-id "mw-ab12cd34eEXAMPLE" \  
  --filters "Key=Priority,Values=3"
```

Output:

```
{  
  "Tasks": [  
    {  
      "WindowId": "mw-ab12cd34eEXAMPLE",

```

Example 4: To list all tasks for a maintenance window that have a Priority of 1 and use Run Command

This describe-maintenance-window-tasks example lists all of the tasks for the specified maintenance window that have a Priority of 1 and use Run Command.

```

aws ssm describe-maintenance-window-tasks \
  --window-id "mw-ab12cd34eEXAMPLE" \
  --filters "Key=Priority,Values=1" "Key=TaskType,Values=RUN_COMMAND"

```

Output:

```

{
  "Tasks": [
    {
      "WindowId": "mw-ab12cd34eEXAMPLE",
      "WindowTaskId": "0d36e6b4-3a4f-411e-adcb-3558eEXAMPLE",
      "TaskArn": "AWS-RunPowerShellScript",
      "Type": "RUN_COMMAND",

        "MaxErrors": "1",
        "Name": "MyRunCommandTask"
    }
]
}
```

For more information, see [View information about maintenance windows \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeMaintenanceWindowTasks](#) in *AWS CLI Command Reference*.

describe-maintenance-windows-for-target

The following code example shows how to use `describe-maintenance-windows-for-target`.

AWS CLI

To list all maintenance windows associated with a specific instance

The following `describe-maintenance-windows-for-target` example lists the maintenance windows that have targets or tasks associated with the specified instance.

```
aws ssm describe-maintenance-windows-for-target \
  --targets Key=InstanceIds,Values=i-1234567890EXAMPLE \
  --resource-type INSTANCE
```

Output:

```
{
  "WindowIdentities": [
    {
      "WindowId": "mw-0c5ed765acEXAMPLE",
      "Name": "My-First-Maintenance-Window"
    }
  ]
}
```

For more information, see [View Information About Maintenance Windows \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeMaintenanceWindowsForTarget](#) in *AWS CLI Command Reference*.

describe-maintenance-windows

The following code example shows how to use `describe-maintenance-windows`.

AWS CLI

Example 1: To list all maintenance windows

The following `describe-maintenance-windows` example lists all maintenance windows in your AWS account in the current Region.

```
aws ssm describe-maintenance-windows
```

Output:

```
{
  "WindowIdentities": [
    {
      "WindowId": "mw-0ecb1226ddEXAMPLE",
      "Name": "MyMaintenanceWindow-1",
      "Enabled": true,
      "Duration": 2,
      "Cutoff": 1,
      "Schedule": "rate(180 minutes)",
      "NextExecutionTime": "2020-02-12T23:19:20.596Z"
    },
    {
      "WindowId": "mw-03eb9db428EXAMPLE",
      "Name": "MyMaintenanceWindow-2",
      "Enabled": true,
      "Duration": 3,
      "Cutoff": 1,
      "Schedule": "rate(7 days)",
      "NextExecutionTime": "2020-02-17T23:22:00.956Z"
    }
  ]
}
```

Example 2: To list all enabled maintenance windows

The following `describe-maintenance-windows` example lists all enabled maintenance windows.

```
aws ssm describe-maintenance-windows \  
  --filters "Key=Enabled,Values=true"
```

Example 3: To list maintenance windows matching a specific name

This `describe-maintenance-windows` example lists all maintenance windows with the specified name.

```
aws ssm describe-maintenance-windows \  
  --filters "Key=Name,Values=MyMaintenanceWindow"
```

For more information, see [View Information About Maintenance Windows \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeMaintenanceWindows](#) in *AWS CLI Command Reference*.

describe-ops-items

The following code example shows how to use `describe-ops-items`.

AWS CLI

To list a set of OpsItems

The following `describe-ops-items` example displays a list of all open OpsItems in your AWS account.

```
aws ssm describe-ops-items \  
  --ops-item-filters "Key=Status,Values=Open,Operator=Equal"
```

Output:

```
{  
  "OpsItemSummaries": [  
    {  
      "CreatedBy": "arn:aws:sts::111222333444:assumed-role/OpsItem-CWE-Role/

describe-parameters

The following code example shows how to use describe-parameters.

AWS CLI

Example 1: To list all parameters

The following describe-parameters example lists all parameters in the current AWS account and Region.

```
aws ssm describe-parameters
```

Output:

```

{
  "Parameters": [
    {
      "Name": "MySecureStringParameter",
      "Type": "SecureString",
      "KeyId": "alias/aws/ssm",
      "LastModifiedDate": 1582155479.205,
      "LastModifiedUser": "arn:aws:sts::111222333444:assumed-role/Admin/
Richard-Roe-Managed",
      "Description": "This is a SecureString parameter",
      "Version": 2,
      "Tier": "Advanced",
    }
  ]
}

```

```

    "Policies": [
      {
        "PolicyText": "{\"Type\":\"Expiration\",\"Version\":\"1.0\",
\\Attributes\":{\"Timestamp\":\"2020-07-07T22:30:00Z\"}}",
        "PolicyType": "Expiration",
        "PolicyStatus": "Pending"
      },
      {
        "PolicyText": "{\"Type\":\"ExpirationNotification\",\"Version\":
\\\"1.0\\\",\\\"Attributes\":{\"Before\":\"12\\\",\\\"Unit\":\"Hours\"}}",
        "PolicyType": "ExpirationNotification",
        "PolicyStatus": "Pending"
      }
    ]
  },
  {
    "Name": "MyStringListParameter",
    "Type": "StringList",
    "LastModifiedDate": 1582154764.222,
    "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",
    "Description": "This is a StringList parameter",
    "Version": 1,
    "Tier": "Standard",
    "Policies": []
  },
  {
    "Name": "MyStringParameter",
    "Type": "String",
    "LastModifiedDate": 1582154711.976,
    "LastModifiedUser": "arn:aws:iam::111222333444:user/Alejandro-Rosalez",
    "Description": "This is a String parameter",
    "Version": 1,

    "Type": "String",
    "LastModifiedDate": 1580862415.521,
    "LastModifiedUser": "arn:aws:sts::111222333444:assumed-role/lambda-ssm-
role/Automation-UpdateSSM-Param",
    "Version": 3,
    "Tier": "Standard",
    "Policies": []
  }
}

```

```
    }  
  ]  
}
```

Example 2: To list all parameters matching specific metadata

This `describe-parameters` example lists all parameters matching a filter.

```
aws ssm describe-parameters --filters "Key=Type,Values=StringList"
```

Output:

```
{  
  "Parameters": [  
    {  
      "Name": "MyStringListParameter",  
      "Type": "StringList",  
      "LastModifiedDate": 1582154764.222,  
      "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",  
      "Description": "This is a StringList parameter",  
      "Version": 1,  
      "Tier": "Standard",  
      "Policies": []  
    }  
  ]  
}
```

For more information, see [Searching for Systems Manager Parameters](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribeParameters](#) in *AWS CLI Command Reference*.

describe-patch-baselines

The following code example shows how to use `describe-patch-baselines`.

AWS CLI

Example 1: To list all patch baselines

The following `describe-patch-baselines` example retrieves details for all patch baselines in your account in the current Region.

```
aws ssm describe-patch-baselines
```

Output:

```
{
  "BaselineIdentities": [
    {
      "BaselineName": "AWS-SuseDefaultPatchBaseline",
      "DefaultBaseline": true,
      "BaselineDescription": "Default Patch Baseline for Suse Provided by
AWS.",
      "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-0123fdb36e334a3b2",
      "OperatingSystem": "SUSE"
    },
    {
      "BaselineName": "AWS-DefaultPatchBaseline",
      "DefaultBaseline": false,
      "BaselineDescription": "Default Patch Baseline Provided by AWS.",
      "BaselineId": "arn:aws:ssm:us-east-2:733109147000:patchbaseline/
pb-020d361a05defe4ed",
      "OperatingSystem": "WINDOWS"
    },
    ...
    {
      "BaselineName": "MyWindowsPatchBaseline",
      "DefaultBaseline": true,
      "BaselineDescription": "My patch baseline for EC2 instances for Windows
Server",
      "BaselineId": "pb-0ad00e0dd7EXAMPLE",
      "OperatingSystem": "WINDOWS"
    }
  ]
}
```

Example 2: To list all patch baselines provided by AWS

The following describe-patch-baselines example lists all patch baselines provided by AWS.

```
aws ssm describe-patch-baselines \
  --filters "Key=OWNER,Values=[AWS]"
```

Example 3: To list all patch baselines that you own

The following `describe-patch-baselines` example lists all custom patch baselines created in your account in the current Region.

```
aws ssm describe-patch-baselines \  
  --filters "Key=OWNER,Values=[Self]"
```

For more information, see [About Predefined and Custom Patch Baselines](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribePatchBaselines](#) in *AWS CLI Command Reference*.

`describe-patch-group-state`

The following code example shows how to use `describe-patch-group-state`.

AWS CLI

To get the state of a patch group

The following `describe-patch-group-state` example retrieves the high-level patch compliance summary for a patch group.

```
aws ssm describe-patch-group-state \  
  --patch-group "Production"
```

Output:

```
{  
  "Instances": 21,  
  "InstancesWithCriticalNonCompliantPatches": 1,  
  "InstancesWithFailedPatches": 2,  
  "InstancesWithInstalledOtherPatches": 3,  
  "InstancesWithInstalledPatches": 21,  
  "InstancesWithInstalledPendingRebootPatches": 2,  
  "InstancesWithInstalledRejectedPatches": 1,  
  "InstancesWithMissingPatches": 3,  
  "InstancesWithNotApplicablePatches": 4,  
  "InstancesWithOtherNonCompliantPatches": 1,  
  "InstancesWithSecurityNonCompliantPatches": 1,  
}
```

```
"InstancesWithUnreportedNotApplicablePatches": 2
}
```

For more information, see About patch groups <<https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-patchgroups.html>>__ and [Understanding patch compliance state values](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribePatchGroupState](#) in *AWS CLI Command Reference*.

describe-patch-groups

The following code example shows how to use describe-patch-groups.

AWS CLI

To display patch group registrations

The following describe-patch-groups example lists the patch group registrations.

```
aws ssm describe-patch-groups
```

Output:

```
{
  "Mappings": [
    {
      "PatchGroup": "Production",
      "BaselineIdentity": {
        "BaselineId": "pb-0123456789abcdef0",
        "BaselineName": "ProdPatching",
        "OperatingSystem": "WINDOWS",
        "BaselineDescription": "Patches for Production",
        "DefaultBaseline": false
      }
    },
    {
      "PatchGroup": "Development",
      "BaselineIdentity": {
        "BaselineId": "pb-0713accee01234567",
        "BaselineName": "DevPatching",
        "OperatingSystem": "WINDOWS",
        "BaselineDescription": "Patches for Development",

```

```
        "DefaultBaseline": true
      }
    },
    ...
  ]
}
```

For more information, see [Create a Patch Group](https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html) <<https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>>__ and [Add a Patch Group to a Patch Baseline](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribePatchGroups](#) in *AWS CLI Command Reference*.

describe-patch-properties

The following code example shows how to use `describe-patch-properties`.

AWS CLI

To list the Amazon Linux patch availability

The following `describe-patch-properties` example displays a list of the Amazon Linux products for which patches are available in your AWS account.

```
aws ssm describe-patch-properties \
  --operating-system AMAZON_LINUX \
  --property PRODUCT
```

Output:

```
{
  "Properties": [
    {
      "Name": "AmazonLinux2012.03"
    },
    {
      "Name": "AmazonLinux2012.09"
    },
    {
      "Name": "AmazonLinux2013.03"
    },
    {
```

```
    "Name": "AmazonLinux2013.09"  
  },  
  {  
    "Name": "AmazonLinux2014.03"  
  },  
  {  
    "Name": "AmazonLinux2014.09"  
  },  
  {  
    "Name": "AmazonLinux2015.03"  
  },  
  {  
    "Name": "AmazonLinux2015.09"  
  },  
  {  
    "Name": "AmazonLinux2016.03"  
  },  
  {  
    "Name": "AmazonLinux2016.09"  
  },  
  {  
    "Name": "AmazonLinux2017.03"  
  },  
  {  
    "Name": "AmazonLinux2017.09"  
  },  
  {  
    "Name": "AmazonLinux2018.03"  
  }  
]  
}
```

For more information, see [About Patch Baselines](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DescribePatchProperties](#) in *AWS CLI Command Reference*.

describe-sessions

The following code example shows how to use describe-sessions.

AWS CLI

Example 1: To list all active Session Manager sessions

This `describe-sessions` example retrieves a list of the active sessions created most recently (both connected and disconnected sessions) over the past 30 days that were started by the specified user. This command returns only results for connections to targets initiated using Session Manager. It does not list connections made through other means, such as Remote Desktop Connections or SSH.

```
aws ssm describe-sessions \  
  --state "Active" \  
  --filters "key=Owner,value=arn:aws:sts::123456789012:assumed-role/Administrator/  
Shirley-Rodriguez"
```

Output:

```
{  
  "Sessions": [  
    {  
      "SessionId": "John-07a16060613c408b5",  
      "Target": "i-1234567890abcdef0",  
      "Status": "Connected",  
      "StartDate": 1550676938.352,  
      "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-  
Rodriguez",  
      "OutputUrl": {}  
    },  
    {  
      "SessionId": "John-01edf534b8b56e8eb",  
      "Target": "i-9876543210abcdef0",  
      "Status": "Connected",  
      "StartDate": 1550676842.194,  
      "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Shirley-  
Rodriguez",  
      "OutputUrl": {}  
    }  
  ]  
}
```

Example 2: To list all terminated Session Manager sessions

This `describe-sessions` example retrieves a list of the most recently terminated sessions from the past 30 days for all users.

```
aws ssm describe-sessions \  
  --state "Terminated"
```

```
--state "History"
```

Output:

```
{
  "Sessions": [
    {
      "SessionId": "Mary-Major-0022b1eb2b0d9e3bd",
      "Target": "i-1234567890abcdef0",
      "Status": "Terminated",
      "StartDate": 1550520701.256,
      "EndDate": 1550521931.563,
      "Owner": "arn:aws:sts::123456789012:assumed-role/Administrator/Mary-
Major"
    },
    {
      "SessionId": "Jane-Roe-0db53f487931ed9d4",
      "Target": "i-9876543210abcdef0",
      "Status": "Terminated",
      "StartDate": 1550161369.149,

- For API details, see [DescribeSessions](#) in *AWS CLI Command Reference*.

disassociate-ops-item-related-item

The following code example shows how to use `disassociate-ops-item-related-item`.

AWS CLI

To delete a related item association

The following `disassociate-ops-item-related-item` example deletes the association between the `OpsItem` and a related item.

```
aws ssm disassociate-ops-item-related-item \  
  --ops-item-id "oi-f99f2EXAMPLE" \  
  --association-id "e2036148-cccb-490e-ac2a-390e5EXAMPLE"
```

This command produces no output.

For more information, see [Working with Incident Manager incidents in OpsCenter](#) in the *AWS Systems Manager User Guide*.

- For API details, see [DisassociateOpsItemRelatedItem](#) in *AWS CLI Command Reference*.

get-automation-execution

The following code example shows how to use `get-automation-execution`.

AWS CLI

To display details about an automation execution

The following `get-automation-execution` example displays detailed information about an Automation execution.

```
aws ssm get-automation-execution \  
  --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE
```

Output:

```
{  
  "AutomationExecution": {  
    "AutomationExecutionId": "73c8eef8-f4ee-4a05-820c-e354fEXAMPLE",  
    "DocumentName": "AWS-StartEC2Instance",  
    "DocumentVersion": "1",

```

For more information, see [Walkthrough: Patch a Linux AMI \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetAutomationExecution](#) in *AWS CLI Command Reference*.

get-calendar-state

The following code example shows how to use `get-calendar-state`.

AWS CLI

Example 1: To get the current state of a change calendar

This `get-calendar-state` example returns the state of a calendar at the current time. Because the example doesn't specify a time, the current state of the calendar is reported.

```
aws ssm get-calendar-state \  
  --calendar-names "MyCalendar"
```

Output:

```
{  
  "State": "OPEN",  
  "AtTime": "2020-02-19T22:28:51Z",  
  "NextTransitionTime": "2020-02-24T21:15:19Z"  
}
```

Example 2: To get the state of a change calendar at a specified time

This `get-calendar-state` example returns the state of a calendar at the specified time.

```
aws ssm get-calendar-state \  
  --calendar-names "MyCalendar" \  
  --at-time "2020-07-19T21:15:19Z"
```

Output:

```
{  
  "State": "CLOSED",  
  "AtTime": "2020-07-19T21:15:19Z"  
}
```

For more information, see [Get the State of the Change Calendar](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetCalendarState](#) in *AWS CLI Command Reference*.

get-command-invocation

The following code example shows how to use `get-command-invocation`.

AWS CLI

To display the details of a command invocation

The following `get-command-invocation` example lists all the invocations of the specified command on the specified instance.

```
aws ssm get-command-invocation \  
  --command-id "ef7fd8-9b57-4151-a15c-db9a12345678" \  
  --instance-id "i-1234567890abcdef0"
```

Output:

```
{  
  "CommandId": "ef7fd8-9b57-4151-a15c-db9a12345678",  
  "InstanceId": "i-1234567890abcdef0",  
  "Comment": "b48291dd-ba76-43e0-b9df-13e11ddaac26:6960febb-2907-4b59-8e1a-d6ce8EXAMPLE",  
  "DocumentName": "AWS-UpdateSSMAgent",  
  "DocumentVersion": "",  
  "PluginName": "aws:updateSsmAgent",  
  "ResponseCode": 0,  
  "ExecutionStartDateTime": "2020-02-19T18:18:03.419Z",  
  "ExecutionElapsedTime": "PT0.091S",  
  "ExecutionEndDateTime": "2020-02-19T18:18:03.419Z",  
  "Status": "Success",  
  "StatusDetails": "Success",  
  "StandardOutputContent": "Updating amazon-ssm-agent from 2.3.842.0 to latest  
\nSuccessfully downloaded https://s3.us-east-2.amazonaws.com/amazon-ssm-us-east-2/  
ssm-agent-manifest.json\namazon-ssm-agent 2.3.842.0 has already been installed,  
update skipped\n",  
  "StandardOutputUrl": "",  
  "StandardErrorContent": "",  
  "StandardErrorUrl": "",  
  "CloudWatchOutputConfig": {  
    "CloudWatchLogGroupName": "",  
    "CloudWatchOutputEnabled": false  
  }  
}
```

For more information, see [Understanding Command Statuses](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetCommandInvocation](#) in *AWS CLI Command Reference*.

get-connection-status

The following code example shows how to use `get-connection-status`.

AWS CLI

To display the connection status of a managed instance

This `get-connection-status` example returns the connection status of the specified managed instance.

```
aws ssm get-connection-status \  
  --target i-1234567890abcdef0
```

Output:

```
{  
  "Target": "i-1234567890abcdef0",  
  "Status": "connected"  
}
```

- For API details, see [GetConnectionStatus](#) in *AWS CLI Command Reference*.

get-default-patch-baseline

The following code example shows how to use `get-default-patch-baseline`.

AWS CLI

Example 1: To display the default Windows patch baseline

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Windows Server.

```
aws ssm get-default-patch-baseline
```

Output:

```
{
  "BaselineId": "pb-0713accee01612345",
  "OperatingSystem": "WINDOWS"
}
```

Example 2: To display the default patch baseline for Amazon Linux

The following `get-default-patch-baseline` example retrieves details for the default patch baseline for Amazon Linux.

```
aws ssm get-default-patch-baseline \
  --operating-system AMAZON_LINUX
```

Output:

```
{
  "BaselineId": "pb-047c6eb9c8fc12345",
  "OperatingSystem": "AMAZON_LINUX"
}
```

For more information, see [About Predefined and Custom Patch Baselines](https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-baselines.html) <<https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-baselines.html>> and [Set an Existing Patch Baseline as the Default](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetDefaultPatchBaseline](#) in *AWS CLI Command Reference*.

get-deployable-patch-snapshot-for-instance

The following code example shows how to use `get-deployable-patch-snapshot-for-instance`.

AWS CLI

To retrieve the current snapshot for the patch baseline an instance uses

The following `get-deployable-patch-snapshot-for-instance` example retrieves details for the current snapshot for the specified patch baseline used by an instance. This command must be run from the instance using the instance credentials. To ensure it uses the instance credentials, run `aws configure` and specify only the Region of your instance. Leave the `Access Key` and `Secret Key` fields empty.

Tip: Use `uuidgen` to generate a `snapshot-id`.

```
aws ssm get-deployable-patch-snapshot-for-instance \  
  --instance-id "i-1234567890abcdef0" \  
  --snapshot-id "521c3536-930c-4aa9-950e-01234567abcd"
```

Output:

```
{  
  "InstanceId": "i-1234567890abcdef0",  
  "SnapshotId": "521c3536-930c-4aa9-950e-01234567abcd",  
  "Product": "AmazonLinux2018.03",  
  "SnapshotDownloadUrl": "https://patch-baseline-snapshot-us-  
east-1.s3.amazonaws.com/  
ed85194ef27214f5984f28b4d664d14f7313568fea7d4b6ac6c10ad1f729d7e7-773304212436/  
AMAZON_LINUX-521c3536-930c-4aa9-950e-01234567abcd?X-Amz-Algorithm=AWS4-HMAC-  
SHA256&X-Amz-Date=20190215T164031Z&X-Amz-SignedHeaders=host&X-Amz-Expires=86400&X-

}
```

For more information, see [Parameter name: Snapshot ID](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetDeployablePatchSnapshotForInstance](#) in *AWS CLI Command Reference*.

get-document

The following code example shows how to use `get-document`.

AWS CLI

To get document content

The following `get-document` example displays the content of a Systems Manager document.

```
aws ssm get-document \  
  --name "AWS-RunShellScript"
```

Output:

```
{
  "Name": "AWS-RunShellScript",
  "DocumentVersion": "1",
  "Status": "Active",
  "Content": "{\n  \"schemaVersion\": \"1.2\",\n  \"description\": \"Run a shell script or specify the commands to run.\",\n  \"parameters\": {\n    \"commands\": {\n      \"type\": \"StringList\",\n      \"description\": \"(Required) Specify a shell script or a command to run.\",\n      \"minItems\": 1,\n      \"displayType\": \"textarea\",\n      \"workingDirectory\": {\n        \"type\": \"String\",\n        \"default\": \"\",\n        \"description\": \"(Optional) The path to the working directory on your instance.\",\n        \"maxChars\": 4096,\n        \"executionTimeout\": {\n          \"type\": \"String\",\n          \"default\": \"3600\",\n          \"description\": \"(Optional) The time in seconds for a command to complete before it is considered to have failed. Default is 3600 (1 hour). Maximum is 172800 (48 hours).\",\n          \"allowedPattern\": \"([1-9][0-9]{0,4})|(1[0-6][0-9]{4})|(17[0-1][0-9]{3})|(172[0-7][0-9]{2})|(172800)\"\n        }\n      },\n      \"runtimeConfig\": {\n        \"aws:runShellScript\": {\n          \"properties\": [\n            {\n              \"id\": \"0.aws:runShellScript\",\n              \"runCommand\": \"{{ commands }}\",\n              \"workingDirectory\": \"{{ workingDirectory }}\",\n              \"timeoutSeconds\": \"{{ executionTimeout }}\"\n            }\n          ]\n        }\n      }\n    }\n  },\n  \"DocumentType\": \"Command\",\n  \"DocumentFormat\": \"JSON\"\n}"
```

For more information, see [AWS Systems Manager Documents](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetDocument](#) in *AWS CLI Command Reference*.

get-inventory-schema

The following code example shows how to use `get-inventory-schema`.

AWS CLI

To view your inventory schema

This example returns a list of inventory type names for the account.

Command:

```
aws ssm get-inventory-schema
```

Output:

```
{
  "Schemas": [
    {
      "TypeName": "AWS:AWSComponent",
      "Version": "1.0",
      "Attributes": [
        {
          "Name": "Name",
          "DataType": "STRING"
        },
        {
          "Name": "ApplicationType",
          "DataType": "STRING"
        },
        {
          "Name": "Publisher",
          "DataType": "STRING"
        },
        {
          "Name": "Version",
          "DataType": "STRING"
        },
        {
          "Name": "InstalledTime",
          "DataType": "STRING"
        },
        {
          "Name": "Architecture",
          "DataType": "STRING"
        },
        {
          "Name": "URL",
          "DataType": "STRING"
        }
      ]
    },
    ...
  ],
  "NextToken": "--token string truncated--"
}
```

```
}
```

To view the inventory schema for a specific inventory type

This example return the inventory schema for a the AWS:AWSComponent inventory type.

Command:

```
aws ssm get-inventory-schema --type-name "AWS:AWSComponent"
```

- For API details, see [GetInventorySchema](#) in *AWS CLI Command Reference*.

get-inventory

The following code example shows how to use `get-inventory`.

AWS CLI

To view your inventory

This example gets the custom metadata for your inventory.

Command:

```
aws ssm get-inventory
```

Output:

```
{
  "Entities": [
    {
      "Data": {
        "AWS:InstanceInformation": {
          "Content": [
            {
              "ComputerName": "ip-172-31-44-222.us-
west-2.compute.internal",
              "InstanceId": "i-0cb2b964d3e14fd9f",
              "IpAddress": "172.31.44.222",
              "AgentType": "amazon-ssm-agent",
              "ResourceType": "EC2Instance",
              "AgentVersion": "2.0.672.0",
              "PlatformVersion": "2016.09",
```

```

        "PlatformName": "Amazon Linux AMI",
        "PlatformType": "Linux"
      }
    ],
    "TypeName": "AWS:InstanceInformation",
    "SchemaVersion": "1.0",
    "CaptureTime": "2017-02-20T18:03:58Z"
  }
},
  "Id": "i-0cb2b964d3e14fd9f"
}
]
}

```

- For API details, see [GetInventory](#) in *AWS CLI Command Reference*.

get-maintenance-window-execution-task-invocation

The following code example shows how to use `get-maintenance-window-execution-task-invocation`.

AWS CLI

To get information about a maintenance window task invocation

The following `get-maintenance-window-execution-task-invocation` example lists information about the specified task invocation that is part of the specified maintenance window execution.

```

aws ssm get-maintenance-window-execution-task-invocation \
  --window-execution-id "bc494bfa-e63b-49f6-8ad1-aa9f2EXAMPLE" \
  --task-id "96f2ad59-97e3-461d-a63d-40c8aEXAMPLE" \
  --invocation-id "a5273e2c-d2c6-4880-b3e1-5e550EXAMPLE"

```

Output:

```

{
  "Status": "SUCCESS",
  "Parameters": "{\"comment\": \"\", \"documentName\": \"AWS-RunPowerShellScript\", \"instanceIds\": [\"i-1234567890EXAMPLE\"], \"maxConcurrency\": \"1\", \"maxErrors\": \"1\", \"parameters\": {\"executionTimeout\": [\"3600\"], \"workingDirectory\": [\"\"], \"commands\": [\"echo Hello\"]}, \"timeoutSeconds\": 600}"
}

```

```

"ExecutionId": "03b6baa0-5460-4e15-83f2-ea685EXAMPLE",

}

```

For more information, see [View Information About Tasks and Task Executions \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetMaintenanceWindowExecutionTaskInvocation](#) in *AWS CLI Command Reference*.

get-maintenance-window-execution-task

The following code example shows how to use `get-maintenance-window-execution-task`.

AWS CLI

To get information about a maintenance window task execution

The following `get-maintenance-window-execution-task` example lists information about a task that is part of the specified maintenance window execution.

```

aws ssm get-maintenance-window-execution-task \
  --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE" \
  --task-id "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"

```

Output:

```

{
  "WindowExecutionId": "518d5565-5969-4cca-8f0e-da3b2EXAMPLE",
  "TaskExecutionId": "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE",

```

For more information, see [View information about tasks and task executions \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetMaintenanceWindowExecutionTask](#) in *AWS CLI Command Reference*.

get-maintenance-window-execution

The following code example shows how to use `get-maintenance-window-execution`.

AWS CLI

To get information about a maintenance window task execution

The following `get-maintenance-window-execution` example lists information about a task executed as part of the specified maintenance window execution.

```
aws ssm get-maintenance-window-execution \  
  --window-execution-id "518d5565-5969-4cca-8f0e-da3b2EXAMPLE"
```

Output:

```
{  
  "Status": "SUCCESS",  
  "TaskIds": [  
    "ac0c6ae1-daa3-4a89-832e-d3845EXAMPLE"

get-maintenance-window

The following code example shows how to use `get-maintenance-window`.

AWS CLI

To get information about a maintenance window

The following `get-maintenance-window` example retrieves details about the specified maintenance window.

```
aws ssm get-maintenance-window \
  --window-id "mw-03eb9db428EXAMPLE"
```

Output:

```
{
  "AllowUnassociatedTargets": true,
  "CreateDate": 1515006912.957,
  "Cutoff": 1,
  "Duration": 6,
  "Enabled": true,
  "ModifiedDate": 2020-01-01T10:04:04.099Z,
  "Name": "My-Maintenance-Window",
  "Schedule": "rate(3 days)",
  "WindowId": "mw-03eb9db428EXAMPLE",
  "NextExecutionTime": "2020-02-25T00:08:15.099Z"
}
```

For more information, see [View information about maintenance windows \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetMaintenanceWindow](#) in *AWS CLI Command Reference*.

get-ops-item

The following code example shows how to use `get-ops-item`.

AWS CLI

To view information about an OpsItem

The following `get-ops-item` example displays details about the specified OpsItem.

```
aws ssm get-ops-item \
  --ops-item-id oi-0b725EXAMPLE
```

Output:

```
{
  "OpsItem": {
    "CreatedBy": "arn:aws:sts::111222333444:assumed-role/OpsItem-CWE-Role/

```

For more information, see [Working with OpsItems](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetOpsItem](#) in *AWS CLI Command Reference*.

get-ops-summary

The following code example shows how to use `get-ops-summary`.

AWS CLI

To view a summary of all OpsItems

The following `get-ops-summary` example displays a summary of all OpsItems in your AWS account.

```
aws ssm get-ops-summary
```

Output:

```

{
  "Entities": [
    {
      "Id": "oi-4309fEXAMPLE",
      "Data": {

get-parameter-history

The following code example shows how to use `get-parameter-history`.

AWS CLI

To get a value history for a parameter

The following `get-parameter-history` example lists the history of changes for the specified parameter, including its value.

```
aws ssm get-parameter-history \  
  --name "MyStringParameter"
```

Output:

```
{  
  "Parameters": [  
    {  
      "Name": "MyStringParameter",  
      "Type": "String",  
      "LastModifiedDate": 1582154711.976,  
      "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",  
      "Description": "This is the first version of my String parameter",  
      "Value": "Veni",  
      "Version": 1,  
      "Labels": [],  
      "Tier": "Standard",  
      "Policies": []  
    },  
    {  
      "Name": "MyStringParameter",  
      "Type": "String",  
      "LastModifiedDate": 1582156093.471,  
      "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",  
      "Description": "This is the second version of my String parameter",  
      "Value": "Vidi",  
      "Version": 2,  
      "Labels": [],  
      "Tier": "Standard",  
      "Policies": []  
    },  
    {  
      "Name": "MyStringParameter",  
      "Type": "String",  
      "LastModifiedDate": 1582156117.545,  
      "LastModifiedUser": "arn:aws:iam::111222333444:user/Mary-Major",  
      "Description": "This is the third version of my String parameter",  
      "Value": "Vici",  
      "Version": 3,  
      "Labels": [],  
      "Tier": "Standard",  
      "Policies": []  
    }  
  ]  
}
```

```
]
}
```

For more information, see [Working with parameter versions](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetParameterHistory](#) in *AWS CLI Command Reference*.

get-parameter

The following code example shows how to use `get-parameter`.

AWS CLI

Example 1: To display the value of a parameter

The following `get-parameter` example lists the value for the specified single parameter.

```
aws ssm get-parameter \
  --name "MyStringParameter"
```

Output:

```
{
  "Parameter": {
    "Name": "MyStringParameter",
    "Type": "String",
    "Value": "Veni",
    "Version": 1,
    "LastModifiedDate": 1530018761.888,
    "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MyStringParameter"
    "DataType": "text"
  }
}
```

For more information, see [Working with Parameter Store](#) in the *AWS Systems Manager User Guide*.

Example 2: To decrypt the value of a SecureString parameter

The following `get-parameter` example decrypts the value of the specified `SecureString` parameter.

```
aws ssm get-parameter \  
  --name "MySecureStringParameter" \  
  --with-decryption
```

Output:

```
{  
  "Parameter": {  
    "Name": "MySecureStringParameter",  
    "Type": "SecureString",  
    "Value": "16679b88-310b-4895-a943-e0764EXAMPLE",  
    "Version": 2,  
    "LastModifiedDate": 1582155479.205,  
    "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/  
MySecureStringParameter"  
    "DataType": "text"  
  }  
}
```

For more information, see [Working with Parameter Store](#) in the *AWS Systems Manager User Guide*.

Example 3: To display the value of a parameter using labels

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```
aws ssm get-parameter \  
  --name "MyParameter:label"
```

Output:

```
{  
  "Parameter": {  
    "Name": "MyParameter",  
    "Type": "String",  
    "Value": "parameter version 2",  
    "Version": 2,  
    "Selector": ":label",  
    "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",  
    "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
```

```
    "DataType": "text"
  }
}
```

For more information, see [Working with parameter labels](#) in the *AWS Systems Manager User Guide*.

Example 4: To display the value of a parameter using versions

The following `get-parameter` example lists the value for the specified single parameter version.

```
aws ssm get-parameter \
  --name "MyParameter:2"
```

Output:

```
{
  "Parameter": {
    "Name": "MyParameter",
    "Type": "String",
    "Value": "parameter version 2",
    "Version": 2,
    "Selector": ":2",
    "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
    "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
    "DataType": "text"
  }
}
```

For more information, see [Working with parameter labels](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetParameter](#) in *AWS CLI Command Reference*.

get-parameters-by-path

The following code example shows how to use `get-parameters-by-path`.

AWS CLI

To list parameters in a specific path

The following `get-parameters-by-path` example lists the parameters within the specified hierarchy.

```
aws ssm get-parameters-by-path \  
  --path "/site/newyork/department/"
```

Output:

```
{  
  "Parameters": [  
    {  
      "Name": "/site/newyork/department/marketing",  
      "Type": "String",  
      "Value": "Floor 2",  
      "Version": 1,  
      "LastModifiedDate": 1530018761.888,  
      "ARN": "arn:aws:ssm:us-east-1:111222333444:parameter/site/newyork/  
department/marketing"  
    },  
    {  
      "Name": "/site/newyork/department/infotech",  
      "Type": "String",  
      "Value": "Floor 3",  
      "Version": 1,  
      "LastModifiedDate": 1530018823.429,  
      "ARN": "arn:aws:ssm:us-east-1:111222333444:parameter/site/newyork/  
department/infotech"  
    },  
    ...  
  ]  
}
```

For more information, see [Working with parameter hierarchies](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetParametersByPath](#) in *AWS CLI Command Reference*.

get-parameters

The following code example shows how to use `get-parameters`.

AWS CLI

Example 1: To list the values for a parameter

The following `get-parameters` example lists the values for the three specified parameters.

```
aws ssm get-parameters \  
  --names "MyStringParameter" "MyStringListParameter" "MyInvalidParameterName"
```

Output:

```
{  
  "Parameters": [  
    {  
      "Name": "MyStringListParameter",  
      "Type": "StringList",  
      "Value": "alpha,beta,gamma",  
      "Version": 1,  
      "LastModifiedDate": 1582154764.222,  
      "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/  
MyStringListParameter"  
      "DataType": "text"  
    },  
    {  
      "Name": "MyStringParameter",  
      "Type": "String",  
      "Value": "Vici",  
      "Version": 3,  
      "LastModifiedDate": 1582156117.545,  
      "ARN": "arn:aws:ssm:us-east-2:111222333444:parameter/MyStringParameter"  
      "DataType": "text"  
    }  
  ],  
  "InvalidParameters": [  
    "MyInvalidParameterName"  
  ]  
}
```

For more information, see [Working with Parameter Store](#) in the *AWS Systems Manager User Guide*.

Example 2: To list names and values of multiple parameters using the `--query` option

The following `get-parameters` example lists the names and values for the specified parameters.

```
aws ssm get-parameters \  
  --names MyStringParameter MyStringListParameter \  
  --query "Parameters[*].{Name:Name,Value:Value}"
```

Output:

```
[  
  {  
    "Name": "MyStringListParameter",  
    "Value": "alpha,beta,gamma"  
  },  
  {  
    "Name": "MyStringParameter",  
    "Value": "Vidi"  
  }  
]
```

For more information, see [Working with Parameter Store](#) in the *AWS Systems Manager User Guide*.

Example 3: To display the value of a parameter using labels

The following `get-parameter` example lists the value for the specified single parameter with a specified label.

```
aws ssm get-parameter \  
  --name "MyParameter:label"
```

Output:

```
{  
  "Parameters": [  
    {  
      "Name": "MyLabelParameter",  
      "Type": "String",  
      "Value": "parameter by label",  
      "Version": 1,  
      "Selector": ":label",  
      "LastModifiedDate": "2021-07-12T09:49:15.865000-07:00",
```

```
    "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/MyParameter",
    "DataType": "text"
  },
  {
    "Name": "MyVersionParameter",
    "Type": "String",
    "Value": "parameter by version",
    "Version": 2,
    "Selector": ":2",
    "LastModifiedDate": "2021-03-24T16:20:28.236000-07:00",
    "ARN": "arn:aws:ssm:us-west-2:786973925828:parameter/unlabel-param",
    "DataType": "text"
  }
],
"InvalidParameters": []
}
```

For more information, see [Working with parameter labels](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetParameters](#) in *AWS CLI Command Reference*.

get-patch-baseline-for-patch-group

The following code example shows how to use `get-patch-baseline-for-patch-group`.

AWS CLI

To display the patch baseline for a patch group

The following `get-patch-baseline-for-patch-group` example retrieves details about the patch baseline for the specified patch group.

```
aws ssm get-patch-baseline-for-patch-group \
  --patch-group "DEV"
```

Output:

```
{
  "PatchGroup": "DEV",
  "BaselineId": "pb-0123456789abcdef0",
  "OperatingSystem": "WINDOWS"
```

```
}
```

For more information, see [Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>](https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html) and [Add a Patch Group to a Patch Baseline](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetPatchBaselineForPatchGroup](#) in *AWS CLI Command Reference*.

get-patch-baseline

The following code example shows how to use `get-patch-baseline`.

AWS CLI

To display a patch baseline

The following `get-patch-baseline` example retrieves the details for the specified patch baseline.

```
aws ssm get-patch-baseline \  
  --baseline-id "pb-0123456789abcdef0"
```

Output:

```
{  
  "BaselineId": "pb-0123456789abcdef0",  
  "Name": "WindowsPatching",  
  "OperatingSystem": "WINDOWS",  
  "GlobalFilters": {

For more information, see [About Patch Baselines](#) in the *AWS Systems Manager User Guide*.

- For API details, see [GetPatchBaseline](#) in *AWS CLI Command Reference*.

get-service-setting

The following code example shows how to use `get-service-setting`.

AWS CLI

To retrieve the service setting for Parameter Store throughput

The following `get-service-setting` example retrieves the current service setting for Parameter Store throughput in the specified region.

```

aws ssm get-service-setting \
  --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-
  store/high-throughput-enabled

```

Output:

```
{
  "ServiceSetting": {

  }
}
```

For more information, see [Increasing Parameter Store Throughput](#) in the *AWS Systems Manager Users Guide*.

- For API details, see [GetServiceSetting](#) in *AWS CLI Command Reference*.

label-parameter-version

The following code example shows how to use `label-parameter-version`.

AWS CLI

Example 1: To add a label to latest version of a parameter

The following `label-parameter-version` example adds a label to the latest version of the specified parameter.

```
aws ssm label-parameter-version \
  --name "MyStringParameter" \
  --labels "ProductionReady"
```

Output:

```
{
  "InvalidLabels": [],
  "ParameterVersion": 3
}
```

For more information, see [Working with parameter labels](#) in the *AWS Systems Manager User Guide*.

Example 2: To add a label to a specific version of a parameter

The following `label-parameter-version` example adds a label to the specified version of a parameter.

```
aws ssm label-parameter-version \  
  --name "MyStringParameter" \  
  --labels "ProductionReady" \  
  --parameter-version "2" --labels "DevelopmentReady"
```

For more information, see [Working with parameter labels](#) in the *AWS Systems Manager User Guide*.

- For API details, see [LabelParameterVersion](#) in *AWS CLI Command Reference*.

list-association-versions

The following code example shows how to use `list-association-versions`.

AWS CLI

To list all versions of an association for a specific association ID

The following `list-association-versions` example lists all versions of the specified associations.

```
aws ssm list-association-versions \  
  --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

Output:

```
{  
  "AssociationVersions": [  
    {  
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",  
      "AssociationVersion": "1",  
      "CreateDate": 1550505536.726,  
      "Name": "AWS-UpdateSSMAgent",  
      "Parameters": {  
        "allowDowngrade": [  
          "false"  
        ],  
      },  
    },  
  ],  
}
```

```
        "version": [
            ""
        ],
    },
    "Targets": [
        {
            "Key": "InstanceIds",
            "Values": [
                "i-1234567890abcdef0"
            ]
        }
    ],
    "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
    "AssociationName": "UpdateSSMAgent"
}
]
```

For more information, see [Working with associations in Systems Manager](#) in the *AWS Systems Manager User Guide*.

- For API details, see [ListAssociationVersions](#) in *AWS CLI Command Reference*.

list-associations

The following code example shows how to use `list-associations`.

AWS CLI

Example 1: To list your associations for a specific instance

The following `list-associations` example lists all associations with the `AssociationName`, `UpdateSSMAgent`.

```
aws ssm list-associations /
  --association-filter-list "key=AssociationName,value=UpdateSSMAgent"
```

Output:

```
{
  "Associations": [
    {
      "Name": "AWS-UpdateSSMAgent",
```

```

    "InstanceId": "i-1234567890abcdef0",
    "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
    "AssociationVersion": "1",
    "Targets": [
      {
        "Key": "InstanceIds",
        "Values": [
          "i-016648b75dd622dab"
        ]
      }
    ],
    "Overview": {
      "Status": "Pending",
      "DetailedStatus": "Associated",
      "AssociationStatusAggregatedCount": {
        "Pending": 1
      }
    },
    "ScheduleExpression": "cron(0 00 12 ? * SUN *)",
    "AssociationName": "UpdateSSMAgent"
  }
]
}

```

For more information, see [Working with associations in Systems Manager](#) in the *Systems Manager User Guide*.

Example 2: To list your associations for a specific document

The following list-associations example lists all associations for the specified document.

```

aws ssm list-associations /
  --association-filter-list "key=Name,value=AWS-UpdateSSMAgent"

```

Output:

```

{
  "Associations": [
    {
      "Name": "AWS-UpdateSSMAgent",
      "InstanceId": "i-1234567890abcdef0",
      "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
      "AssociationVersion": "1",

```

```
    "Targets": [
      {
        "Key": "InstanceIds",

        "Success": 1
      }
    }
  }
]
}
```

For more information, see [Working with associations in Systems Manager](#) in the *Systems Manager User Guide*.

- For API details, see [ListAssociations](#) in *AWS CLI Command Reference*.

list-command-invocations

The following code example shows how to use `list-command-invocations`.

AWS CLI

To list the invocations of a specific command

The following `list-command-invocations` example lists all the invocations of a command.

```
aws ssm list-command-invocations \
  --command-id "ef7fd8-9b57-4151-a15c-db9a12345678" \
  --details
```

Output:

```
{

- For API details, see [ListCommandInvocations](#) in *AWS CLI Command Reference*.

list-commands

The following code example shows how to use `list-commands`.

AWS CLI

Example 1: To get the status of a specific command

The following `list-commands` example retrieves and displays the status of the specified command.

```
aws ssm list-commands \  
  --command-id "0831e1a8-a1ac-4257-a1fd-c831bEXAMPLE"
```

Example 2: To get the status of commands requested after a specific date

The following `list-commands` example retrieves the details of commands requested after the specified date.

```
aws ssm list-commands \  
  --filter "key=InvokedAfter,value=2020-02-01T00:00:00Z"
```

Example 3: To list all commands requested in an AWS account

The following `list-commands` example lists all commands requested by users in the current AWS account and Region.

```
aws ssm list-commands
```

Output:

```
{  
  "Commands": [  
    {  
      "CommandId": "8bee3135-398c-4d31-99b6-e42d2EXAMPLE",

list-compliance-items

The following code example shows how to use `list-compliance-items`.

AWS CLI

To list compliance items for a specific instance

This example lists all compliance items for the specified instance.

Command:

```
aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-types "ManagedInstance"
```

Output:

```
{
  "ComplianceItems": [
    {
      "ComplianceType": "Association",
      "ResourceType": "ManagedInstance",
      "ResourceId": "i-1234567890abcdef0",
      "Id": "8dfe3659-4309-493a-8755-0123456789ab",
      "Title": "",
      "Status": "COMPLIANT",
      "Severity": "UNSPECIFIED",
      "ExecutionSummary": {
        "ExecutionTime": 1550408470.0
      },
      "Details": {
        "DocumentName": "AWS-GatherSoftwareInventory",
        "DocumentVersion": "1"
      }
    },
    {
      "ComplianceType": "Association",
      "ResourceType": "ManagedInstance",
```

```

    "ResourceId": "i-1234567890abcdef0",
    "Id": "e4c2ed6d-516f-41aa-aa2a-0123456789ab",
    "Title": "",
    "Status": "COMPLIANT",
    "Severity": "UNSPECIFIED",
    "ExecutionSummary": {
      "ExecutionTime": 1550508475.0
    },
    "Details": {
      "DocumentName": "AWS-UpdateSSMAgent",
      "DocumentVersion": "1"
    }
  },
  ...
],
"NextToken": "--token string truncated--"
}

```

To list compliance items for a specific instance and association ID

This example lists all compliance items for the specified instance and association ID.

Command:

```

aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-types
"ManagedInstance" --filters "Key=ComplianceType,Values=Association,Type=EQUAL"
"Key=Id,Values=e4c2ed6d-516f-41aa-aa2a-0123456789ab,Type=EQUAL"

```

To list compliance items for a instance after a specific date and time

This example lists all compliance items for an instance after the specified date and time.

Command:

```

aws ssm list-compliance-items --resource-ids "i-1234567890abcdef0" --resource-types
"ManagedInstance" --filters
"Key=ExecutionTime,Values=2019-02-18T16:00:00Z,Type=GREATER_THAN"

```

- For API details, see [ListComplianceItems](#) in *AWS CLI Command Reference*.

list-compliance-summaries

The following code example shows how to use `list-compliance-summaries`.

AWS CLI

To list compliance summaries for all compliance types

This example lists compliance summaries for all compliance types in your account.

Command:

```
aws ssm list-compliance-summaries
```

Output:

```
{
  "ComplianceSummaryItems": [
    {
      "ComplianceType": "Association",
      "CompliantSummary": {
        "CompliantCount": 2,
        "SeveritySummary": {
          "CriticalCount": 0,
          "HighCount": 0,
          "MediumCount": 0,
          "LowCount": 0,
          "InformationalCount": 0,
          "UnspecifiedCount": 2
        }
      },
      "NonCompliantSummary": {
        "NonCompliantCount": 0,
        "SeveritySummary": {
          "CriticalCount": 0,
          "HighCount": 0,
          "MediumCount": 0,
          "LowCount": 0,
          "InformationalCount": 0,
          "UnspecifiedCount": 0
        }
      }
    },
    {
      "ComplianceType": "Patch",

```

To list compliance summaries for a specific compliance type

This example lists the compliance summary for the Patch compliance type.

Command:

```
aws ssm list-compliance-summaries --filters
"Key=ComplianceType,Values=Patch,Type=EQUAL"
```

- For API details, see [ListComplianceSummaries](#) in *AWS CLI Command Reference*.

list-document-metadata-history

The following code example shows how to use `list-document-metadata-history`.

AWS CLI

Example: To view approval history and status for a change template

The following `list-document-metadata-history` example returns the approval history for the specified Change Manager change template.

```
aws ssm list-document-metadata-history \  
  --name MyChangeManageTemplate \  
  --metadata DocumentReviews
```

Output:

```
{  
  "Name": "MyChangeManagerTemplate",  
  "DocumentVersion": "1",  
  "Author": "arn:aws:iam::111222333444:user/JohnDoe",  
  "Metadata": {  
    "ReviewerResponse": [  
      {  
        "CreateTime": "2021-07-30T11:58:28.025000-07:00",  
        "UpdateTime": "2021-07-30T12:01:19.274000-07:00",  
        "ReviewStatus": "APPROVED",  
        "Comment": [  
          {  
            "Type": "COMMENT",  
            "Content": "I approve this template version"  
          }  
        ],  
        "Reviewer": "arn:aws:iam::111222333444:user/ShirleyRodriguez"  
      },  
      {  
        "CreateTime": "2021-07-30T11:58:28.025000-07:00",  
        "UpdateTime": "2021-07-30T11:58:28.025000-07:00",  
        "ReviewStatus": "PENDING"  
      }  
    ]  
  }  
}
```

For more information, see [Reviewing and approving or rejecting change templates](#) in the *AWS Systems Manager User Guide*.

- For API details, see [ListDocumentMetadataHistory](#) in *AWS CLI Command Reference*.

list-document-versions

The following code example shows how to use `list-document-versions`.

AWS CLI

To list document versions

The following `list-document-versions` example lists all versions for a Systems Manager document.

```
aws ssm list-document-versions \  
  --name "Example"
```

Output:

```
{  
  "DocumentVersions": [  
    {  
      "Name": "Example",  
      "DocumentVersion": "1",  
      "CreateDate": 1583257938.266,  
      "IsDefaultVersion": true,  
      "DocumentFormat": "YAML",  
      "Status": "Active"  
    }  
  ]  
}
```

For more information, see [Sending Commands that Use the Document Version Parameter](#) in the *AWS Systems Manager User Guide*.

- For API details, see [ListDocumentVersions](#) in *AWS CLI Command Reference*.

list-documents

The following code example shows how to use `list-documents`.

AWS CLI

Example 1: To list documents

The following `list-documents` example lists documents owned by the requesting account tagged with the custom tag.

```
aws ssm list-documents \  
  --filters Key=Owner,Values=Self Key=tag:DocUse,Values=Testing
```

Output:

```
{  
  "DocumentIdentifiers": [  
    {  
      "Name": "Example",  
      "Owner": "29884EXAMPLE",  
      "PlatformTypes": [  
        "Windows",  
        "Linux"  
      ],  
      "DocumentVersion": "1",  
      "DocumentType": "Automation",  
      "SchemaVersion": "0.3",  
      "DocumentFormat": "YAML",  
      "Tags": [  
        {  
          "Key": "DocUse",  
          "Value": "Testing"  
        }  
      ]  
    }  
  ]  
}
```

For more information, see [AWS Systems Manager Documents](#) in the *AWS Systems Manager User Guide*.

Example 2: To list shared documents

The following `list-documents` example lists shared documents, including private shared documents not owned by AWS.

```
aws ssm list-documents \  
  --filters Key=Name,Values=sharedDocNamePrefix Key=Owner,Values=Private
```

Output:

```
{
  "DocumentIdentifiers": [
    {
      "Name": "Example",
      "Owner": "12345EXAMPLE",
      "PlatformTypes": [
        "Windows",
        "Linux"
      ],
      "DocumentVersion": "1",
      "DocumentType": "Command",
      "SchemaVersion": "0.3",
      "DocumentFormat": "YAML",
      "Tags": []
    }
  ]
}
```

For more information, see [AWS Systems Manager Documents](#) in the *AWS Systems Manager User Guide*.

- For API details, see [ListDocuments](#) in *AWS CLI Command Reference*.

list-inventory-entries

The following code example shows how to use `list-inventory-entries`.

AWS CLI**Example 1: To view specific inventory type entries for an instance**

This following `list-inventory-entries` example lists the inventory entries for the `AWS:Application` inventory type on a specific instance.

```
aws ssm list-inventory-entries \
  --instance-id "i-1234567890abcdef0" \
  --type-name "AWS:Application"
```

Output:

```
{
  "TypeName": "AWS:Application",
  "InstanceId": "i-1234567890abcdef0",
  "SchemaVersion": "1.1",
  "CaptureTime": "2019-02-15T12:17:55Z",
  "Entries": [
    {
      "Architecture": "i386",
      "Name": "Amazon SSM Agent",
      "PackageId": "{88a60be2-89a1-4df8-812a-80863c2a2b68}",
      "Publisher": "Amazon Web Services",
      "Version": "2.3.274.0"
    },
    {
      "Architecture": "x86_64",
      "InstalledTime": "2018-05-03T13:42:34Z",
      "Name": "AmazonCloudWatchAgent",
      "Publisher": "",
      "Version": "1.200442.0"
    }
  ]
}
```

Example 2: To view custom inventory entries assigned to an instance

The following `list-inventory-entries` example lists a custom inventory entry assigned to an instance.

```
aws ssm list-inventory-entries \
  --instance-id "i-1234567890abcdef0" \
  --type-name "Custom:RackInfo"
```

Output:

```
{
  "TypeName": "Custom:RackInfo",
  "InstanceId": "i-1234567890abcdef0",
  "SchemaVersion": "1.0",
  "CaptureTime": "2021-05-22T10:01:01Z",
  "Entries": [
    {
      "RackLocation": "Bay B/Row C/Rack D/Shelf E"
    }
  ]
}
```

```

    }
  ]
}

```

- For API details, see [ListInventoryEntries](#) in *AWS CLI Command Reference*.

list-ops-item-related-items

The following code example shows how to use `list-ops-item-related-items`.

AWS CLI

To list the related-item resources of an OpsItem

The following `list-ops-item-related-items` example lists the related-item resources of an OpsItem.

```

aws ssm list-ops-item-related-items \
  --ops-item-id "oi-f99f2EXAMPLE"

```

Output:

```

{
  "Summaries": [
    {
      "OpsItemId": "oi-f99f2EXAMPLE",
      "AssociationId": "e2036148-cccb-490e-ac2a-390e5EXAMPLE",
      "ResourceType": "AWS::SSMIncidents::IncidentRecord",
      "AssociationType": "IsParentOf",
      "ResourceUri": "arn:aws:ssm-incidents::111122223333:incident-record/example-response/64bd9b45-1d0e-2622-840d-03a87a1451fa",
      "CreatedBy": {
        "Arn": "arn:aws:sts::111122223333:assumed-role/AWSServiceRoleForIncidentManager/IncidentResponse"
      },
      "CreatedTime": "2021-08-11T18:47:14.994000+00:00",
      "LastModifiedBy": {
        "Arn": "arn:aws:sts::111122223333:assumed-role/AWSServiceRoleForIncidentManager/IncidentResponse"
      },
      "LastModifiedTime": "2021-08-11T18:47:14.994000+00:00"
    }
  ]
}

```

```
]
}
```

For more information, see [Working with Incident Manager incidents in OpsCenter](#) in the *AWS Systems Manager User Guide*.

- For API details, see [ListOpsItemRelatedItems](#) in *AWS CLI Command Reference*.

list-resource-compliance-summaries

The following code example shows how to use `list-resource-compliance-summaries`.

AWS CLI

To list resource-level compliance summary counts

This example lists resource-level compliance summary counts.

Command:

```
aws ssm list-resource-compliance-summaries
```

Output:

```
{
  "ResourceComplianceSummaryItems": [
    {
      "ComplianceType": "Association",
      "ResourceType": "ManagedInstance",
      "ResourceId": "i-1234567890abcdef0",
      "Status": "COMPLIANT",
      "OverallSeverity": "UNSPECIFIED",
      "ExecutionSummary": {
        "ExecutionTime": 1550509273.0
      },
      "CompliantSummary": {
        "CompliantCount": 2,
        "SeveritySummary": {
          "CriticalCount": 0,
          "HighCount": 0,
          "MediumCount": 0,
          "LowCount": 0,
          "InformationalCount": 0,

```

```
        "UnspecifiedCount": 2
      }
    },
    "NonCompliantSummary": {
      "NonCompliantCount": 0,
      "SeveritySummary": {
        "CriticalCount": 0,
        "HighCount": 0,
        "MediumCount": 0,
        "LowCount": 0,
        "InformationalCount": 0,
        "UnspecifiedCount": 0
      }
    }
  },
  {
    "ComplianceType": "Patch",
    "ResourceType": "ManagedInstance",
    "ResourceId": "i-9876543210abcdef0",
    "Status": "COMPLIANT",
    "OverallSeverity": "UNSPECIFIED",
    "ExecutionSummary": {
      "ExecutionTime": 1550248550.0,
      "ExecutionId": "7abb6378-a4a5-4f10-8312-0123456789ab",
      "ExecutionType": "Command"
    },
    "CompliantSummary": {
      "CompliantCount": 397,
      "SeveritySummary": {

        "LowCount": 0,
```

```

        "InformationalCount": 0,
        "UnspecifiedCount": 0
      }
    }
  ],
  "NextToken": "--token string truncated--"
}

```

To list resource-level compliance summaries for a specific compliance type

This example lists resource-level compliance summaries for the Patch compliance type.

Command:

```
aws ssm list-resource-compliance-summaries --filters
"Key=ComplianceType,Values=Patch,Type=EQUAL"
```

- For API details, see [ListResourceComplianceSummaries](#) in *AWS CLI Command Reference*.

list-resource-data-sync

The following code example shows how to use `list-resource-data-sync`.

AWS CLI

To list your resource data sync configurations

This example retrieves information about your resource data sync configurations.

```
aws ssm list-resource-data-sync
```

Output:

```

{
  "ResourceDataSyncItems": [
    {
      "SyncName": "MyResourceDataSync",
      "S3Destination": {
        "BucketName": "ssm-resource-data-sync",
        "SyncFormat": "JsonSerDe",
        "Region": "us-east-1"
      }
    }
  ]
}

```

```
    },
    "LastSyncTime": 1550261472.003,
    "LastSuccessfulSyncTime": 1550261472.003,
    "LastStatus": "Successful",
    "SyncCreatedTime": 1543235736.72,
    "LastSyncStatusMessage": "The sync was successfully completed"
  }
]
}
```

- For API details, see [ListResourceDataSync](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags applied to a patch baseline

The following `list-tags-for-resource` example lists the tags for a patch baseline.

```
aws ssm list-tags-for-resource \
  --resource-type "PatchBaseline" \
  --resource-id "pb-0123456789abcdef0"
```

Output:

```
{
  "TagList": [
    {
      "Key": "Environment",
      "Value": "Production"
    },
    {
      "Key": "Region",
      "Value": "EMEA"
    }
  ]
}
```

For more information, see [Tagging AWS Resources](#) in the *AWS General Reference*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

modify-document-permission

The following code example shows how to use `modify-document-permission`.

AWS CLI

To modify document permissions

The following `modify-document-permission` example shares a Systems Manager document publicly.

```
aws ssm modify-document-permission \  
  --name "Example" \  
  --permission-type "Share" \  
  --account-ids-to-add "All"
```

This command produces no output.

For more information, see [Share a Systems Manager Document](#) in the *AWS Systems Manager User Guide*.

- For API details, see [ModifyDocumentPermission](#) in *AWS CLI Command Reference*.

put-compliance-items

The following code example shows how to use `put-compliance-items`.

AWS CLI

To register a compliance type and compliance details to a designated instance

This example registers the compliance type `Custom:AVCheck` to the specified managed instance. There is no output if the command succeeds.

Command:

```
aws ssm put-compliance-items --resource-id "i-1234567890abcdef0" --  
resource-type "ManagedInstance" --compliance-type "Custom:AVCheck"  
  --execution-summary "ExecutionTime=2019-02-18T16:00:00Z" --items  
  "Id=Version2.0,Title=ScanHost,Severity=CRITICAL,Status=COMPLIANT"
```

- For API details, see [PutComplianceItems](#) in *AWS CLI Command Reference*.

put-inventory

The following code example shows how to use `put-inventory`.

AWS CLI

To assign customer metadata to an instance

This example assigns rack location information to an instance. There is no output if the command succeeds.

Command (Linux):

```
aws ssm put-inventory --instance-id "i-016648b75dd622dab" --items
' [{"TypeName": "Custom:RackInfo", "SchemaVersion": "1.0", "CaptureTime":
"2019-01-22T10:01:01Z", "Content": [{"RackLocation": "Bay B/Row C/Rack D/Shelf
E"}]} ]'
```

Command (Windows):

```
aws ssm put-inventory --instance-id "i-016648b75dd622dab" --items
"TypeName=Custom:RackInfo,SchemaVersion=1.0,CaptureTime=2019-01-22T10:01:01Z,Content=[{Rack
B/Row C/Rack D/Shelf F'}]"
```

- For API details, see [PutInventory](#) in *AWS CLI Command Reference*.

put-parameter

The following code example shows how to use `put-parameter`.

AWS CLI

Example 1: To change a parameter value

The following `put-parameter` example changes the value of the specified parameter.

```
aws ssm put-parameter \
  --name "MyStringParameter" \
  --type "String" \
  --value "Vici" \
```

```
--overwrite
```

Output:

```
{
  "Version": 2,
  "Tier": "Standard"
}
```

For more information, see [Create a Systems Manager parameter \(AWS CLI\)](https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html), 'Managing parameter tiers <<https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>>` __, and [Working with parameter policies](#) in the *AWS Systems Manager User Guide*.

Example 2: To create an advanced parameter

The following `put-parameter` example creates an advanced parameter.

```
aws ssm put-parameter \
  --name "MyAdvancedParameter" \
  --description "This is an advanced parameter" \
  --value "Lorem ipsum dolor sit amet, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation ullamco laboris nisi ut aliquip ex ea commodo consequat [truncated]" \
  --type "String" \
  --tier Advanced
```

Output:

```
{
  "Version": 1,
  "Tier": "Advanced"
}
```

For more information, see [Create a Systems Manager parameter \(AWS CLI\)](https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html), 'Managing parameter tiers <<https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>>` __, and [Working with parameter policies](#) in the *AWS Systems Manager User Guide*.

Example 3: To convert a standard parameter to an advanced parameter

The following `put-parameter` example converts a existing standard parameter into an advanced parameter.

```
aws ssm put-parameter \  
  --name "MyConvertedParameter" \  
  --value "abc123" \  
  --type "String" \  
  --tier Advanced \  
  --overwrite
```

Output:

```
{  
  "Version": 2,  
  "Tier": "Advanced"  
}
```

For more information, see [Create a Systems Manager parameter \(AWS CLI\)](#), 'Managing parameter tiers <<https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>>` __, and [Working with parameter policies](#) in the *AWS Systems Manager User Guide*.

Example 4: To create a parameter with a policy attached

The following `put-parameter` example creates an advanced parameter with a parameter policy attached.

```
aws ssm put-parameter \  
  --name "/Finance/Payroll/q2accesskey" \  
  --value "P@sSwW)rd" \  
  --type "SecureString" \  
  --tier Advanced \  
  --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification\",\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},{\"Type\":\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":\"60\",\"Unit\":\"Days\"}}]"
```

Output:

```
{
```

```

    "Version": 1,
    "Tier": "Advanced"
  }

```

For more information, see [Create a Systems Manager parameter \(AWS CLI\)](https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html), 'Managing parameter tiers <<https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>> `___, and [Working with parameter policies](#) in the *AWS Systems Manager User Guide*.

Example 5: To add a policy to an existing parameter

The following `put-parameter` example attaches a policy to an existing advanced parameter.

```

aws ssm put-parameter \
  --name "/Finance/Payroll/q2accesskey" \
  --value "N3wP@sSw)rd" \
  --type "SecureString" \
  --tier Advanced \
  --policies "[{\"Type\":\"Expiration\",\"Version\":\"1.0\",\"Attributes\":{\"Timestamp\":\"2020-06-30T00:00:00.000Z\"}},{\"Type\":\"ExpirationNotification\",\"Version\":\"1.0\",\"Attributes\":{\"Before\":\"5\",\"Unit\":\"Days\"}},{\"Type\":\"NoChangeNotification\",\"Version\":\"1.0\",\"Attributes\":{\"After\":\"60\",\"Unit\":\"Days\"}}]"
  --overwrite

```

Output:

```

{
  "Version": 2,
  "Tier": "Advanced"
}

```

For more information, see [Create a Systems Manager parameter \(AWS CLI\)](https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html), 'Managing parameter tiers <<https://docs.aws.amazon.com/systems-manager/latest/userguide/parameter-store-advanced-parameters.html>> `___, and [Working with parameter policies](#) in the *AWS Systems Manager User Guide*.

- For API details, see [PutParameter](#) in *AWS CLI Command Reference*.

register-default-patch-baseline

The following code example shows how to use `register-default-patch-baseline`.

AWS CLI

To set the default patch baseline

The following `register-default-patch-baseline` example registers the specified custom patch baseline as the default patch baseline for the operating system type that it supports.

```
aws ssm register-default-patch-baseline \  
  --baseline-id "pb-abc123cf9bEXAMPLE"
```

Output:

```
{  
  "BaselineId": "pb-abc123cf9bEXAMPLE"  
}
```

The following `register-default-patch-baseline` example registers the default patch baseline provided by AWS for CentOS as the default patch baseline.

```
aws ssm register-default-patch-baseline \  
  --baseline-id "arn:aws:ssm:us-east-2:733109147000:patchbaseline/  
pb-0574b43a65ea646ed"
```

Output:

```
{  
  "BaselineId": "pb-abc123cf9bEXAMPLE"  
}
```

For more information, see [About Predefined and Custom Patch Baselines](#) in the *AWS Systems Manager User Guide*.

- For API details, see [RegisterDefaultPatchBaseline](#) in *AWS CLI Command Reference*.

register-patch-baseline-for-patch-group

The following code example shows how to use `register-patch-baseline-for-patch-group`.

AWS CLI

To register a patch baseline for a patch group

The following `register-patch-baseline-for-patch-group` example registers a patch baseline for a patch group.

```
aws ssm register-patch-baseline-for-patch-group \  
  --baseline-id "pb-045f10b4f382baeda" \  
  --patch-group "Production"
```

Output:

```
{  
  "BaselineId": "pb-045f10b4f382baeda",  
  "PatchGroup": "Production"  
}
```

For more information, see [Create a Patch Group <https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html>](https://docs.aws.amazon.com/systems-manager/latest/userguide/sysman-patch-group-tagging.html) and [Add a Patch Group to a Patch Baseline](#) in the *AWS Systems Manager User Guide*.

- For API details, see [RegisterPatchBaselineForPatchGroup](#) in *AWS CLI Command Reference*.

register-target-with-maintenance-window

The following code example shows how to use `register-target-with-maintenance-window`.

AWS CLI

Example 1: To register a single target with a maintenance window

The following `register-target-with-maintenance-window` example registers an instance with a maintenance window.

```
aws ssm register-target-with-maintenance-window \  
  --window-id "mw-ab12cd34ef56gh78" \  
  --target "Key=InstanceIds,Values=i-0000293ffd8c57862" \  
  --owner-information "Single instance" \  
  --resource-type "INSTANCE"
```

Output:

```
{  
  "WindowTargetId": "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"
```

```
}
```

Example 2: To register multiple targets with a maintenance window using instance IDs

The following `register-target-with-maintenance-window` example registers two instances with a maintenance window by specifying their instance IDs.

```
aws ssm register-target-with-maintenance-window \  
  --window-id "mw-ab12cd34ef56gh78" \  
  --target "Key=InstanceIds,Values=i-0000293ffd8c57862,i-0cb2b964d3e14fd9f" \  
  --owner-information "Two instances in a list" \  
  --resource-type "INSTANCE"
```

Output:

```
{  
  "WindowTargetId": "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"  
}
```

Example 3: To register targets with a maintenance window using resource tags

The following `register-target-with-maintenance-window` example registers instances with a maintenance window by specifying resource tags that have been applied to the instances.

```
aws ssm register-target-with-maintenance-window \  
  --window-id "mw-06cf17cbefcb4bf4f" \  
  --targets "Key=tag:Environment,Values=Prod" "Key=Role,Values=Web" \  
  --owner-information "Production Web Servers" \  
  --resource-type "INSTANCE"
```

Output:

```
{  
  "WindowTargetId": "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"  
}
```

Example 4: To register targets using a group of tag keys

The following `register-target-with-maintenance-window` example registers instances that all have one or more tag keys assigned to them, regardless of their key values.

```
aws ssm register-target-with-maintenance-window \  
  --window-id "mw-0c50858d01EXAMPLE" \  
  --resource-type "INSTANCE" \  
  --target "Key=tag-key,Values=Name,Instance-Type,CostCenter"
```

Output:

```
{  
  "WindowTargetId": "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"  
}
```

Example 5: To register targets using a resource group name

The following `register-target-with-maintenance-window` example registers a specified resource group, regardless of the type of resources it contains.

```
aws ssm register-target-with-maintenance-window \  
  --window-id "mw-0c50858d01EXAMPLE" \  
  --resource-type "RESOURCE_GROUP" \  
  --target "Key=resource-groups:Name,Values=MyResourceGroup"
```

Output:

```
{  
  "WindowTargetId": "1a2b3c4d-1a2b-1a2b-1a2b-1a2b3c4d-1a2"  
}
```

For more information, see [Register a Target Instance with the Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [RegisterTargetWithMaintenanceWindow](#) in *AWS CLI Command Reference*.

register-task-with-maintenance-window

The following code example shows how to use `register-task-with-maintenance-window`.

AWS CLI

Example 1: To register an Automation task with a maintenance window

The following `register-task-with-maintenance-window` example registers an Automation task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
  --window-id "mw-082dcd7649EXAMPLE" \
  --targets Key=InstanceIds,Values=i-1234520122EXAMPLE \
  --task-arn AWS-RestartEC2Instance \
  --service-role-arn arn:aws:iam::111222333444:role/SSM --task-type AUTOMATION \
  --task-invocation-parameters "{\"Automation\":{\"DocumentVersion\":{\"\"$LATEST\"},\
  \"Parameters\":{\"\"InstanceId\":[\"{{RESOURCE_ID}}\"]}}}" \
  --priority 0 \
  --max-concurrency 1 \
  --max-errors 1 \
  --name "AutomationExample" \
  --description "Restarting EC2 Instance for maintenance"
```

Output:

```
{
  "WindowTaskId": "11144444-5555-6666-7777-88888888"
}
```

For more information, see [Register a Task with the Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

Example 2: To register a Lambda task with a Maintenance Window

The following `register-task-with-maintenance-window` example registers a Lambda task with a Maintenance Window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
  --window-id "mw-082dcd7649dee04e4" \
  --targets Key=InstanceIds,Values=i-12344d305eEXAMPLE \
  --task-arn arn:aws:lambda:us-east-1:111222333444:function:SSMTestLAMBDA \
  --service-role-arn arn:aws:iam::111222333444:role/SSM \
  --task-type LAMBDA \
  --task-invocation-parameters '{"Lambda":{"Payload":{"\"InstanceId\":"\
  \"{{RESOURCE_ID}}\"\",\"targetType\":{\"\"{{TARGET_TYPE}}\""},\"Qualifier\":\"$LATEST\"}}' \
  --priority 0 \
  --max-concurrency 10 \
  --max-errors 5 \
  --name "Lambda_Example" \
```

```
--description "My Lambda Example"
```

Output:

```
{
  "WindowTaskId": "22244444-5555-6666-7777-88888888"
}
```

For more information, see [Register a Task with the Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

Example 3: To register a Run Command task with a maintenance window

The following `register-task-with-maintenance-window` example registers a Run Command task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
  --window-id "mw-082dcd7649dee04e4" \
  --targets "Key=InstanceIds,Values=i-12344d305eEXAMPLE" \
  --service-role-arn "arn:aws:iam::111222333444:role/SSM" \
  --task-type "RUN_COMMAND" \
  --name "SSMInstallPowerShellModule" \
  --task-arn "AWS-InstallPowerShellModule" \
  --task-invocation-parameters "{\"RunCommand\":{\"Comment\":"\"\",
  \"OutputS3BucketName\":"\"runcommandlogs\"\", \"Parameters\":"{\"commands\":[\"Get-
  Module -ListAvailable\"], \"executionTimeout\":[\"3600\"], \"source\":[\"https://
  gallery.technet.microsoft.com/EZOut-33ae0fb7/file/110351/1/EZOut.zip\"],
  \"workingDirectory\":[\"\\\\\\\\\\\\\\\\\"]}, \"TimeoutSeconds\":600}}" \
  --max-concurrency 1 \
  --max-errors 1 \
  --priority 10
```

Output:

```
{
  "WindowTaskId": "33344444-5555-6666-7777-88888888"
}
```

For more information, see [Register a Task with the Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

Example 4: To register a Step Functions task with a maintenance window

The following `register-task-with-maintenance-window` example registers a Step Functions task with a maintenance window that is targeted at an instance.

```
aws ssm register-task-with-maintenance-window \
  --window-id "mw-1234d787d6EXAMPLE" \
  --targets Key=WindowTargetIds,Values=12347414-69c3-49f8-95b8-ed2dcEXAMPLE \
  --task-arn arn:aws:states:us-
east-1:111222333444:stateMachine:SSMTestStateMachine \
  --service-role-arn arn:aws:iam::111222333444:role/MaintenanceWindows \
  --task-type STEP_FUNCTIONS \
  --task-invocation-parameters '{"StepFunctions":{"Input":{"\"InstanceId\":
\"{{RESOURCE_ID}}\"}}}' \
  --priority 0 \
  --max-concurrency 10 \
  --max-errors 5 \
  --name "Step_Functions_Example" \
  --description "My Step Functions Example"
```

Output:

```
{
  "WindowTaskId": "444444444-5555-6666-7777-88888888"
}
```

For more information, see [Register a Task with the Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

Example 5: To register a task using a maintenance windows target ID

The following `register-task-with-maintenance-window` example registers a task using a maintenance window target ID. The maintenance window target ID was in the output of the `aws ssm register-target-with-maintenance-window` command. You can also retrieve it from the output of the `aws ssm describe-maintenance-window-targets` command.

```
aws ssm register-task-with-maintenance-window \
  --targets "Key=WindowTargetIds,Values=350d44e6-28cc-44e2-951f-4b2c9EXAMPLE" \
  --task-arn "AWS-RunShellScript" \
  --service-role-arn "arn:aws:iam::111222333444:role/MaintenanceWindowsRole" \
  --window-id "mw-ab12cd34eEXAMPLE" \
  --task-type "RUN_COMMAND" \
  --task-parameters "{\"commands\":{\"Values\":[\"df\"]}}" \
  --max-concurrency 1 \
```

```
--max-errors 1 \  
--priority 10
```

Output:

```
{  
  "WindowTaskId": "33344444-5555-6666-7777-88888888"  
}
```

For more information, see [Register a Task with the Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [RegisterTaskWithMaintenanceWindow](#) in *AWS CLI Command Reference*.

remove-tags-from-resource

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI**To remove a tag from a patch baseline**

The following `remove-tags-from-resource` example removes tags from a patch baseline.

```
aws ssm remove-tags-from-resource \  
  --resource-type "PatchBaseline" \  
  --resource-id "pb-0123456789abcdef0" \  
  --tag-keys "Region"
```

This command produces no output.

For more information, see [Tagging AWS Resources](#) in the *AWS General Reference*.

- For API details, see [RemoveTagsFromResource](#) in *AWS CLI Command Reference*.

reset-service-setting

The following code example shows how to use `reset-service-setting`.

AWS CLI**To reset the service setting for Parameter Store throughput**

The following `reset-service-setting` example resets the service setting for Parameter Store throughput in the specified region to no longer use increased throughput.

```
aws ssm reset-service-setting \  
  --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-  
store/high-throughput-enabled
```

Output:

```
{  
  "ServiceSetting": {  
    "SettingId": "/ssm/parameter-store/high-throughput-enabled",  
    "SettingValue": "false",  
    "LastModifiedDate": 1555532818.578,  
    "LastModifiedUser": "System",  
    "ARN": "arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-  
store/high-throughput-enabled",  
    "Status": "Default"  
  }  
}
```

For more information, see [Increasing Parameter Store Throughput](#) in the *AWS Systems Manager User Guide*.

- For API details, see [ResetServiceSetting](#) in *AWS CLI Command Reference*.

resume-session

The following code example shows how to use `resume-session`.

AWS CLI

To resume a Session Manager session

This `resume-session` example resumes a Session Manager session with an instance after it has been disconnected. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```
aws ssm resume-session \  
  --session-id Mary-Major-07a16060613c408b5
```

Output:

```
{
  "SessionId": "Mary-Major-07a16060613c408b5",
  "TokenValue":
    "AAEAAVbTGsa0nyvcUoNGqifbv5r/8l9xuQljCuY8qVcv0noBAAAAAFxtd3jIXAFUUXGTJ7zF/
    AWJpWdvi0lF5p3dlAgrqVIV06IEXhkHLz0/1gXKRKEME71E6TL0p1LDJAMZ
    +kREejkZu4c5AxMkrQjMF+gtHP1bYJKTwtHQd1wjulPLex08SH17g5R/
    wekrj6WsDUpnEegFBfGftpAIz2GXQVfTJXKfkc5qepQ11C11D0IT2doz0qXgHwfQHfAKLErM5dWDZqKwyT1Z3iw7unQd
    +ihfGa6MEJJ97Jmat/a2TspEn0jNn9Mvu5iwXIW2yCvWZrGUj+/
    QI5Xr7s1XJBEskR54o4fN0GV9RWl0RZsZm1m1ki0JJtiwwgZ",
  "StreamUrl": "wss://ssmmessages.us-east-2.amazonaws.com/v1/data-channel/Mary-
    Major-07a16060613c408b5?role=publish_subscribe"
}
```

For more information, see [Install the Session Manager Plugin for the AWS CLI](#) in the *AWS Systems Manager User Guide*.

- For API details, see [ResumeSession](#) in *AWS CLI Command Reference*.

send-automation-signal

The following code example shows how to use `send-automation-signal`.

AWS CLI

To send a signal to an automation execution

The following `send-automation-signal` example sends an Approve signal to an Automation execution.

```
aws ssm send-automation-signal \
  --automation-execution-id 73c8eef8-f4ee-4a05-820c-e354fEXAMPLE \
  --signal-type "Approve"
```

This command produces no output.

For more information, see [Running an Automation Workflow with Approvers](#) in the *AWS Systems Manager User Guide*.

- For API details, see [SendAutomationSignal](#) in *AWS CLI Command Reference*.

send-command

The following code example shows how to use send-command.

AWS CLI

Example 1: To run a command on one or more remote instances

The following send-command example runs an echo command on a target instance.

```
aws ssm send-command \  
  --document-name "AWS-RunShellScript" \  
  --parameters 'commands=["echo HelloWorld"]' \  
  --targets "Key=instanceids,Values=i-1234567890abcdef0" \  
  --comment "echo HelloWorld"
```

Output:

```
{  
  "Command": {  
    "CommandId": "92853adf-ba41-4cd6-9a88-142d1EXAMPLE",  
    "DocumentName": "AWS-RunShellScript",  
    "DocumentVersion": "",  
    "Comment": "echo HelloWorld",  
    "ExpiresAfter": 1550181014.717,  
    "Parameters": {  
      "commands": [  
        "echo HelloWorld"  
      ]  
    },  
    "InstanceIds": [  
      "i-0f00f008a2dcbefe2"  
    ],  
    "Targets": [],  
    "RequestedDateTime": 1550173814.717,  
    "Status": "Pending",  
    "StatusDetails": "Pending",  
    "OutputS3BucketName": "",  
    "OutputS3KeyPrefix": "",  
    "MaxConcurrency": "50",  
    "MaxErrors": "0",  
    "TargetCount": 1,  
    "CompletedCount": 0,  
    "ErrorCount": 0,  
  },  
}
```

```
"DeliveryTimedOutCount": 0,
"ServiceRole": "",
"NotificationConfig": {
  "NotificationArn": "",
  "NotificationEvents": [],
  "NotificationType": ""
},
"CloudWatchOutputConfig": {
  "CloudWatchLogGroupName": "",
  "CloudWatchOutputEnabled": false
}
}
```

For more information, see [Running Commands Using Systems Manager Run Command](#) in the *AWS Systems Manager User Guide*.

Example 2: To get IP information about an instance

The following send-command example retrieves the IP information about an instance.

```
aws ssm send-command \
  --instance-ids "i-1234567890abcdef0" \
  --document-name "AWS-RunShellScript" \
  --comment "IP config" \
  --parameters "commands=ifconfig"
```

See example 1 for sample output.

For more information, see [Running Commands Using Systems Manager Run Command](#) in the *AWS Systems Manager User Guide*.

Example 3: To run a command on instances with specific tags

The following send-command example runs a command on instances that have the tag key "ENV" and the value "Dev".

```
aws ssm send-command \
  --targets "Key=tag:ENV,Values=Dev" \
  --document-name "AWS-RunShellScript" \
  --parameters "commands=ifconfig"
```

See example 1 for sample output.

For more information, see [Running Commands Using Systems Manager Run Command](#) in the *AWS Systems Manager User Guide*.

Example 4: To run a command that sends SNS notifications

The following `send-command` example runs a command that sends SNS notifications for all notification events and the Command notification type.

```
aws ssm send-command \  
  --instance-ids "i-1234567890abcdef0" \  
  --document-name "AWS-RunShellScript" \  
  --comment "IP config" \  
  --parameters "commands=ifconfig" \  
  --service-role-arn "arn:aws:iam::123456789012:role/SNS_Role" \  
  --notification-config "NotificationArn=arn:aws:sns:us-  
east-1:123456789012:SNSTopicName,NotificationEvents=All,NotificationType=Command"
```

See example 1 for sample output.

For more information, see [Running Commands Using Systems Manager Run Command](#) in the *AWS Systems Manager User Guide*.

Example 5: To run a command that outputs to S3 and CloudWatch

The following `send-command` example runs a command that outputs command details to an S3 bucket and to a CloudWatch Logs log group.

```
aws ssm send-command \  
  --instance-ids "i-1234567890abcdef0" \  
  --document-name "AWS-RunShellScript" \  
  --comment "IP config" \  
  --parameters "commands=ifconfig" \  
  --output-s3-bucket-name "s3-bucket-name" \  
  --output-s3-key-prefix "runcommand" \  
  --cloud-watch-output-config  
  "CloudWatchOutputEnabled=true,CloudWatchLogGroupName=CWLGroupName"
```

See example 1 for sample output.

For more information, see [Running Commands Using Systems Manager Run Command](#) in the *AWS Systems Manager User Guide*.

Example 6: To run commands on multiple instances with different tags

The following `send-command` example runs a command on instances with two different tag keys and values.

```
aws ssm send-command \  
  --document-name "AWS-RunPowerShellScript" \  
  --parameters commands=["echo helloWorld"] \  
  --targets Key=tag:Env,Values=Dev Key=tag:Role,Values=WebServers
```

See example 1 for sample output.

For more information, see [Running Commands Using Systems Manager Run Command](#) in the *AWS Systems Manager User Guide*.

Example 7: To target multiple instances with the same tag key

The following `send-command` example runs a command on instances that have the same tag key but with different values.

```
aws ssm send-command \  
  --document-name "AWS-RunPowerShellScript" \  
  --parameters commands=["echo helloWorld"] \  
  --targets Key=tag:Env,Values=Dev,Test
```

See example 1 for sample output.

For more information, see [Running Commands Using Systems Manager Run Command](#) in the *AWS Systems Manager User Guide*.

Example 8: To run a command that uses a shared document

The following `send-command` example runs a shared document on a target instance.

```
aws ssm send-command \  
  --document-name "arn:aws:ssm:us-east-1:123456789012:document/ExampleDocument" \  
  --targets "Key=instanceids,Values=i-1234567890abcdef0"
```

See example 1 for sample output.

For more information, see [Using shared SSM documents](#) in the *AWS Systems Manager User Guide*.

- For API details, see [SendCommand](#) in *AWS CLI Command Reference*.

start-associations-once

The following code example shows how to use `start-associations-once`.

AWS CLI

To run an association immediately and only one time

The following `start-associations-once` example run the specified association immediately and only once. There is no output if the command succeeds.

```
aws ssm start-associations-once \  
  --association-id "8dfe3659-4309-493a-8755-0123456789ab"
```

This command produces no output.

For more information, see [Viewing association histories](#) in the *AWS Systems Manager User Guide*.

- For API details, see [StartAssociationsOnce](#) in *AWS CLI Command Reference*.

start-automation-execution

The following code example shows how to use `start-automation-execution`.

AWS CLI

Example 1: To execute an automation document

The following `start-automation-execution` example runs an Automation document.

```
aws ssm start-automation-execution \  
  --document-name "AWS-UpdateLinuxAmi" \  
  --parameters "AutomationAssumeRole=arn:aws:iam::123456789012:role/  
SSMAutomationRole,SourceAmiId=ami-EXAMPLE,IamInstanceProfileName=EC2InstanceRole"
```

Output:

```
{  
  "AutomationExecutionId": "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"  
}
```

For more information, see [Running an Automation Workflow Manually](#) in the *AWS Systems Manager User Guide*.

Example 2: To run a shared automation document

The following `start-automation-execution` example runs a shared Automation document.

```
aws ssm start-automation-execution \  
  --document-name "arn:aws:ssm:us-east-1:123456789012:document/ExampleDocument"
```

Output:

```
{  
  "AutomationExecutionId": "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"  
}
```

For more information, see [Using shared SSM documents](#) in the *AWS Systems Manager User Guide*.

- For API details, see [StartAutomationExecution](#) in *AWS CLI Command Reference*.

start-change-request-execution

The following code example shows how to use `start-change-request-execution`.

AWS CLI

Example 1: To start a change request

The following `start-change-request-execution` example starts a change request with minimal options specified.

```
aws ssm start-change-request-execution \  
  --change-request-name MyChangeRequest \  
  --document-name AWS-HelloWorldChangeTemplate \  
  --runbooks '[{"DocumentName": "AWS-HelloWorld", "Parameters":  
  {"AutomationAssumeRole": ["arn:aws:iam:us-east-2:1112223233444:role/  
MyChangeManagerAssumeRole"]}]}' \  
  --parameters  
  Approver="JohnDoe", ApproverType="IamUser", ApproverSnsTopicArn="arn:aws:sns:us-  
east-2:1112223233444:MyNotificationTopic"
```

Output:

```
{
```

```
"AutomationExecutionId": "9d32a4fc-f944-11e6-4105-0a1b2EXAMPLE"  
}
```

Example 2: To start a change request using an external JSON file

The following `start-automation-execution` example starts a change request with multiple options specified in a JSON file.

```
aws ssm start-change-request-execution \  
  --cli-input-json file://MyChangeRequest.json
```

Contents of `MyChangeRequest.json`:

```
{  
  "ChangeRequestName": "MyChangeRequest",  
  "DocumentName": "AWS-HelloWorldChangeTemplate",  
  "DocumentVersion": "$DEFAULT",  
  "ScheduledTime": "2021-12-30T03:00:00",  
  "ScheduledEndTime": "2021-12-30T03:05:00",  
  "Tags": [  
    {  
      "Key": "Purpose",  
      "Value": "Testing"  
    }  
  ],  
  "Parameters": {  
    "Approver": [  
      "JohnDoe"  
    ],  
    "ApproverType": [  
      "IamUser"  
    ],  
    "ApproverSnsTopicArn": [  
      "arn:aws:sns:us-east-2:111222333444:MyNotificationTopic"  
    ]  
  },  
  "Runbooks": [  
    {  
      "DocumentName": "AWS-HelloWorld",  
      "DocumentVersion": "1",  
      "MaxConcurrency": "1",  
      "MaxErrors": "1",  
      "Parameters": {
```

```

        "AutomationAssumeRole": [
            "arn:aws:iam::111222333444:role/MyChangeManagerAssumeRole"
        ]
    },
    ],
    "ChangeDetails": "### Document Name: HelloWorldChangeTemplate\n\n## What does
this document do?\nThis change template demonstrates the feature set available
for creating change templates for Change Manager. This template starts a Runbook
workflow for the Automation document called AWS-HelloWorld.\n\n## Input Parameters
\n* ApproverSnsTopicArn: (Required) Amazon Simple Notification Service ARN for
approvers.\n* Approver: (Required) The name of the approver to send this request
to.\n* ApproverType: (Required) The type of reviewer.\n * Allowed Values: IamUser,
IamGroup, IamRole, SSOGroup, SSOUser\n\n## Output Parameters\nThis document has no
outputs \n"
}

```

Output:

```

{
  "AutomationExecutionId": "9d32a4fc-f944-11e6-4105-0a1b2EXAMPLE"
}

```

For more information, see [Creating change requests](#) in the *AWS Systems Manager User Guide*.

- For API details, see [StartChangeRequestExecution](#) in *AWS CLI Command Reference*.

start-session

The following code example shows how to use `start-session`.

AWS CLI

Example 1: To start a Session Manager session

This `start-session` example establishes a connection with an instance for a Session Manager session. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call.

```

aws ssm start-session \
  --target "i-1234567890abcdef0"

```

Output:

```
Starting session with SessionId: Jane-Roe-07a16060613c408b5
```

Example 2: To start a Session Manager session using SSH

This `start-session` example establishes a connection with an instance for a Session Manager session using SSH. Note that this interactive command requires the Session Manager plugin to be installed on the client machine making the call, and that the command uses the default user on the instance, such as `ec2-user` for EC2 instances for Linux.

```
ssh -i /path/my-key-pair.pem ec2-user@i-02573cafcfEXAMPLE
```

Output:

```
Starting session with SessionId: ec2-user-07a16060613c408b5
```

For more information, see [Start a Session](#) and [Install the Session Manager Plugin for the AWS CLI](#) in the *AWS Systems Manager User Guide*.

- For API details, see [StartSession](#) in *AWS CLI Command Reference*.

stop-automation-execution

The following code example shows how to use `stop-automation-execution`.

AWS CLI**To stop an automation execution**

The following `stop-automation-execution` example stops an Automation document.

```
aws ssm stop-automation-execution  
  --automation-execution-id "4105a4fc-f944-11e6-9d32-0a1b2EXAMPLE"
```

This command produces no output.

For more information, see [Running an Automation Workflow Manually](#) in the *AWS Systems Manager User Guide*.

- For API details, see [StopAutomationExecution](#) in *AWS CLI Command Reference*.

terminate-session

The following code example shows how to use `terminate-session`.

AWS CLI

To end a Session Manager session

This `terminate-session` example permanently ends a session that was created by the user "Shirley-Rodriguez" and closes the data connection between the Session Manager client and SSM Agent on the instance.

```
aws ssm terminate-session \  
  --session-id "Shirley-Rodriguez-07a16060613c408b5"
```

Output:

```
{  
  "SessionId": "Shirley-Rodriguez-07a16060613c408b5"  
}
```

For more information, see [Terminate a Session](#) in the *AWS Systems Manager User Guide*.

- For API details, see [TerminateSession](#) in *AWS CLI Command Reference*.

unlabel-parameter-version

The following code example shows how to use `unlabel-parameter-version`.

AWS CLI

To delete parameter labels

The following `unlabel-parameter-version` example deletes the specified labels from the given parameter version.

```
aws ssm unlabel-parameter-version \  
  --name "parameterName" \  
  --parameter-version "version" \  
  --labels "label_1" "label_2" "label_3"
```

Output:

```
{
  "RemovedLabels": [
    "label_1"
    "label_2"
    "label_3"
  ],
  "InvalidLabels": []
}
```

For more information, see [Delete parameter labels \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UnlabelParameterVersion](#) in *AWS CLI Command Reference*.

update-association-status

The following code example shows how to use `update-association-status`.

AWS CLI**To update the association status**

The following `update-association-status` example updates the association status of the association between an instance and a document.

```
aws ssm update-association-status \
  --name "AWS-UpdateSSMAgent" \
  --instance-id "i-1234567890abcdef0" \
  --association-status
  "Date=1424421071.939,Name=Pending,Message=temp_status_change,AdditionalInfo=Additional-
  Config-Needed"
```

Output:

```
{
  "AssociationDescription": {
    "Name": "AWS-UpdateSSMAgent",
    "InstanceId": "i-1234567890abcdef0",
    "AssociationVersion": "1",
    "Date": 1550507529.604,
```

```

    "LastUpdateAssociationDate": 1550507806.974,
    "Status": {
      "Date": 1424421071.0,
      "Name": "Pending",
      "Message": "temp_status_change",
      "AdditionalInfo": "Additional-Config-Needed"
    },
    "Overview": {
      "Status": "Success",
      "AssociationStatusAggregatedCount": {
        "Success": 1
      }
    },
    "DocumentVersion": "$DEFAULT",
    "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
    "Targets": [
      {
        "Key": "InstanceIds",
        "Values": [
          "i-1234567890abcdef0"
        ]
      }
    ],
    "LastExecutionDate": 1550507808.0,
    "LastSuccessfulExecutionDate": 1550507808.0
  }
}

```

For more information, see [Working with associations in Systems Manager](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateAssociationStatus](#) in *AWS CLI Command Reference*.

update-association

The following code example shows how to use update-association.

AWS CLI

Example 1: To update a document association

The following update-association example updates an association with a new document version.

```
aws ssm update-association \  
  --association-id "8dfe3659-4309-493a-8755-0123456789ab" \  
  --document-version "$LATEST"
```

Output:

```
{  
  "AssociationDescription": {  
    "Name": "AWS-UpdateSSMAgent",  
    "AssociationVersion": "2",  
    "Date": 1550508093.293,  
    "LastUpdateAssociationDate": 1550508106.596,  
    "Overview": {  
      "Status": "Pending",  
      "DetailedStatus": "Creating"  
    },  
    "DocumentVersion": "$LATEST",  
    "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",  
    "Targets": [  
      {  
        "Key": "tag:Name",  
        "Values": [  
          "Linux"  
        ]  
      }  
    ],  
    "LastExecutionDate": 1550508094.879,  
    "LastSuccessfulExecutionDate": 1550508094.879  
  }  
}
```

For more information, see [Editing and creating a new version of an association](#) in the *AWS Systems Manager User Guide*.

Example 2: To update the schedule expression of an association

The following `update-association` example updates the schedule expression for the specified association.

```
aws ssm update-association \  
  --association-id "8dfe3659-4309-493a-8755-0123456789ab" \  
  --document-version "$LATEST"
```

```
--schedule-expression "cron(0 0 0/4 1/1 * ? *)"
```

Output:

```
{
  "AssociationDescription": {
    "Name": "AWS-HelloWorld",
    "AssociationVersion": "2",
    "Date": "2021-02-08T13:54:19.203000-08:00",
    "LastUpdateAssociationDate": "2021-06-29T11:51:07.933000-07:00",
    "Overview": {
      "Status": "Pending",
      "DetailedStatus": "Creating"
    },
    "DocumentVersion": "$DEFAULT",
    "AssociationId": "8dfe3659-4309-493a-8755-0123456789ab",
    "Targets": [
      {
        "Key": "aws:NoOpAutomationTag",
        "Values": [
          "AWS-NoOpAutomationTarget-Value"
        ]
      }
    ],
    "ScheduleExpression": "cron(0 0 0/4 1/1 * ? *)",
    "LastExecutionDate": "2021-06-26T19:00:48.110000-07:00",
    "ApplyOnlyAtCronInterval": false
  }
}
```

For more information, see [Editing and creating a new version of an association](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateAssociation](#) in *AWS CLI Command Reference*.

update-document-default-version

The following code example shows how to use `update-document-default-version`.

AWS CLI**To update the default version of a document**

The following `update-document-default-version` example updates the default version of a Systems Manager document.

```
aws ssm update-document-default-version \  
  --name "Example" \  
  --document-version "2"
```

Output:

```
{  
  "Description": {  
    "Name": "Example",  
    "DefaultVersion": "2"  
  }  
}
```

For more information, see [Writing SSM Document Content](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateDocumentDefaultVersion](#) in *AWS CLI Command Reference*.

update-document-metadata

The following code example shows how to use `update-document-metadata`.

AWS CLI

Example: To approve the latest version of a change template

The following `update-document-metadata` provides an approval for the latest version of a change template that has been submitted for review.

```
aws ssm update-document-metadata \  
  --name MyChangeManagerTemplate \  
  --document-reviews 'Action=Approve,Comment=[{Type=Comment,Content=Approved!}]'
```

This command produces no output.

For more information, see [Reviewing and approving or rejecting change templates](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateDocumentMetadata](#) in *AWS CLI Command Reference*.

update-document

The following code example shows how to use update-document.

AWS CLI

To create a new version of a document

The following update-document example creates a new version of a document when run on a Windows computer. The document specified by --document must be in JSON format. Note that file:// must be referenced followed by the path of the content file. Because of the \$ at the beginning of the --document-version parameter, On Windows you must surround the value with double quotes. On Linux, MacOS, or at a PowerShell prompt, you must surround the value with single quotes.

Windows version:

```
aws ssm update-document \  
  --name "RunShellScript" \  
  --content "file://RunShellScript.json" \  
  --document-version "$LATEST"
```

Linux/Mac version:

```
aws ssm update-document \  
  --name "RunShellScript" \  
  --content "file://RunShellScript.json" \  
  --document-version '$LATEST'
```

Output:

```
{  
  "DocumentDescription": {  
    "Status": "Updating",  
    "Hash": "f775e5df4904c6fa46686c4722fae9de1950dace25cd9608ff8d622046b68d9b",  
    "Name": "RunShellScript",  
    "Parameters": [  
      {  
        "Type": "StringList",  
        "Name": "commands",  
        "Description": "(Required) Specify a shell script or a command to  
run."      }  
    ]  
  }  
}
```

```

    }
  ],
  "DocumentType": "Command",
  "PlatformTypes": [
    "Linux"
  ],
  "DocumentVersion": "2",
  "HashType": "Sha256",
  "CreateDate": 1487899655.152,
  "Owner": "809632081692",
  "SchemaVersion": "2.0",
  "DefaultVersion": "1",
  "LatestVersion": "2",
  "Description": "Run an updated script"
}
}

```

- For API details, see [UpdateDocument](#) in *AWS CLI Command Reference*.

update-maintenance-window-target

The following code example shows how to use `update-maintenance-window-target`.

AWS CLI

To update a maintenance window target

The following `update-maintenance-window-target` example updates only the name of a maintenance window target.

```

aws ssm update-maintenance-window-target \
  --window-id "mw-0c5ed765acEXAMPLE" \
  --window-target-id "57e8344e-fe64-4023-8191-6bf05EXAMPLE" \
  --name "NewName" \
  --no-replace

```

Output:

```

{
  "Description": "",
  "OwnerInformation": "",
  "WindowTargetId": "57e8344e-fe64-4023-8191-6bf05EXAMPLE",

```

```

    "WindowId": "mw-0c5ed765acEXAMPLE",
    "Targets": [
      {
        "Values": [
          "i-1234567890EXAMPLE"
        ],
        "Key": "InstanceIds"
      }
    ],
    "Name": "NewName"
  }

```

For more information, see [Update a Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateMaintenanceWindowTarget](#) in *AWS CLI Command Reference*.

update-maintenance-window-task

The following code example shows how to use `update-maintenance-window-task`.

AWS CLI

To update a maintenance window task

The following `update-maintenance-window-task` example updates the service role for a maintenance window task.

```

aws ssm update-maintenance-window-task \
  --window-id "mw-0c5ed765acEXAMPLE" \
  --window-task-id "23d3809e-9fbe-4ddf-b41a-b49d7EXAMPLE" \
  --service-role-arn "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM"

```

Output:

```

{
  "ServiceRoleArn": "arn:aws:iam::111222333444:role/aws-service-role/
ssm.amazonaws.com/AWSServiceRoleForAmazonSSM",
  "MaxErrors": "1",
  "TaskArn": "AWS-UpdateEC2Config",
  "MaxConcurrency": "1",
  "WindowTaskId": "23d3809e-9fbe-4ddf-b41a-b49d7EXAMPLE",

```

```

    "TaskParameters": {},
    "Priority": 1,
    "TaskInvocationParameters": {
      "RunCommand": {
        "TimeoutSeconds": 600,
        "Parameters": {
          "allowDowngrade": [
            "false"
          ]
        }
      }
    },
    "WindowId": "mw-0c5ed765acEXAMPLE",
    "Description": "UpdateEC2Config",
    "Targets": [
      {
        "Values": [
          "57e8344e-fe64-4023-8191-6bf05EXAMPLE"
        ],
        "Key": "WindowTargetIds"
      }
    ],
    "Name": "UpdateEC2Config"
  }
}

```

For more information, see [Update a Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateMaintenanceWindowTask](#) in *AWS CLI Command Reference*.

update-maintenance-window

The following code example shows how to use `update-maintenance-window`.

AWS CLI

Example 1: To update a maintenance window

The following `update-maintenance-window` example updates the name of a maintenance window.

```

aws ssm update-maintenance-window \
  --window-id "mw-1a2b3c4d5e6f7g8h9" \

```

```
--name "My-Renamed-MW"
```

Output:

```
{
  "Cutoff": 1,
  "Name": "My-Renamed-MW",
  "Schedule": "cron(0 16 ? * TUE *)",
  "Enabled": true,
  "AllowUnassociatedTargets": true,
  "WindowId": "mw-1a2b3c4d5e6f7g8h9",
  "Duration": 4
}
```

Example 2: To disable a maintenance window

The following `update-maintenance-window` example disables a maintenance window.

```
aws ssm update-maintenance-window \
  --window-id "mw-1a2b3c4d5e6f7g8h9" \
  --no-enabled
```

Example 3: To enable a maintenance window

The following `update-maintenance-window` example enables a maintenance window.

```
aws ssm update-maintenance-window \
  --window-id "mw-1a2b3c4d5e6f7g8h9" \
  --enabled
```

For more information, see [Update a Maintenance Window \(AWS CLI\)](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateMaintenanceWindow](#) in *AWS CLI Command Reference*.

update-managed-instance-role

The following code example shows how to use `update-managed-instance-role`.

AWS CLI

To update the IAM role of a managed instance

The following `update-managed-instance-role` example updates the IAM instance profile of a managed instance.

```
aws ssm update-managed-instance-role \  
  --instance-id "mi-08ab247cdfEXAMPLE" \  
  --iam-role "ExampleRole"
```

This command produces no output.

For more information, see [Step 4: Create an IAM Instance Profile for Systems Manager](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateManagedInstanceRole](#) in *AWS CLI Command Reference*.

update-ops-item

The following code example shows how to use `update-ops-item`.

AWS CLI

To update an OpsItem

The following `update-ops-item` example updates the description, priority, and category for an OpsItem. In addition, the command specifies an SNS topic where the notifications are sent when this OpsItem is edited or changed.

```
aws ssm update-ops-item \  
  --ops-item-id "oi-287b5EXAMPLE" \  
  --description "Primary OpsItem for failover event 2020-01-01-fh398yf" \  
  --priority 2 \  
  --category "Security" \  
  --notifications "Arn=arn:aws:sns:us-east-2:111222333444:my-us-east-2-topic"
```

Output:

```
This command produces no output.
```

For more information, see [Working with OpsItems](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateOpsItem](#) in *AWS CLI Command Reference*.

update-patch-baseline

The following code example shows how to use update-patch-baseline.

AWS CLI

Example 1: To update a patch baseline

The following update-patch-baseline example adds the specified two patches as rejected and one patch as approved to the specified patch baseline.

```
aws ssm update-patch-baseline \  
  --baseline-id "pb-0123456789abcdef0" \  
  --rejected-patches "KB2032276" "MS10-048" \  
  --approved-patches "KB2124261"
```

Output:

```
{  
  "BaselineId": "pb-0123456789abcdef0",  
  "Name": "WindowsPatching",  
  "OperatingSystem": "WINDOWS",  
  "GlobalFilters": {  
    "PatchFilters": []  
  },  
  "ApprovalRules": {  
    "PatchRules": [  
      {  
        "PatchFilterGroup": {  
          "PatchFilters": [  
            {  
              "Key": "PRODUCT",  
              "Values": [  
                "WindowsServer2016"  
              ]  
            }  
          ]  
        }  
      }  
    ],  
    "ComplianceLevel": "CRITICAL",  
    "ApproveAfterDays": 0,  
    "EnableNonSecurity": false  
  }  
}
```

```

    },
    "ApprovedPatches": [
      "KB2124261"
    ],
    "ApprovedPatchesComplianceLevel": "UNSPECIFIED",
    "ApprovedPatchesEnableNonSecurity": false,
    "RejectedPatches": [
      "KB2032276",
      "MS10-048"
    ],
    "RejectedPatchesAction": "ALLOW_AS_DEPENDENCY",
    "CreateDate": 1550244180.465,
    "ModifiedDate": 1550244180.465,
    "Description": "Patches for Windows Servers",
    "Sources": []
  }
}

```

Example 2: To rename a patch baseline

The following `update-patch-baseline` example renames the specified patch baseline.

```

aws ssm update-patch-baseline \
  --baseline-id "pb-0713accee01234567" \
  --name "Windows-Server-2012-R2-Important-and-Critical-Security-Updates"

```

For more information, see [Update or Delete a Patch Baseline](https://docs.aws.amazon.com/systems-manager/latest/userguide/patch-baseline-update-or-delete.html) <<https://docs.aws.amazon.com/systems-manager/latest/userguide/patch-baseline-update-or-delete.html>>` __ in the *AWS Systems Manager User Guide*.

- For API details, see [UpdatePatchBaseline](#) in *AWS CLI Command Reference*.

update-resource-data-sync

The following code example shows how to use `update-resource-data-sync`.

AWS CLI

To update a resource data sync

The following `update-resource-data-sync` example updates a `SyncFromSource` resource data sync.

```
aws ssm update-resource-data-sync \  
  --sync-name exampleSync \  
  --sync-type SyncFromSource \  
  --sync-source '{"SourceType":"SingleAccountMultiRegions", "SourceRegions":["us-  
east-1", "us-west-2"]}'
```

This command produces no output.

For more information, see [Setting Up Systems Manager Explorer to Display Data from Multiple Accounts and Regions](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateResourceDataSync](#) in *AWS CLI Command Reference*.

update-service-setting

The following code example shows how to use `update-service-setting`.

AWS CLI

To update the service setting for Parameter Store throughput

The following `update-service-setting` example updates the current service setting for Parameter Store throughput in the specified region to use increased throughput.

```
aws ssm update-service-setting \  
  --setting-id arn:aws:ssm:us-east-1:123456789012:servicesetting/ssm/parameter-  
store/high-throughput-enabled \  
  --setting-value true
```

This command produces no output.

For more information, see [Increasing Parameter Store Throughput](#) in the *AWS Systems Manager User Guide*.

- For API details, see [UpdateServiceSetting](#) in *AWS CLI Command Reference*.

Amazon Textract examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Textract.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

analyze-document

The following code example shows how to use `analyze-document`.

AWS CLI

To analyze text in a document

The following `analyze-document` example shows how to analyze text in a document.

Linux/macOS:

```
aws textract analyze-document \
  --document '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
  --feature-types ['TABLES','FORMS']
```

Windows:

```
aws textract analyze-document \
  --document "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document\"}}\" \
  --feature-types [\"TABLES\",\"FORMS\"] \
  --region region-name
```

Output:

```
{

- For API details, see [AnalyzeDocument](#) in *AWS CLI Command Reference*.

detect-document-text

The following code example shows how to use detect-document-text.

AWS CLI

To detect text in a document

The following detect-document-text The following example shows how to detect text in a document.

Linux/macOS:

```
aws textract detect-document-text \  
  --document '{"S3Object":{"Bucket":"bucket","Name":"document"}}'
```

Windows:

```
aws textract detect-document-text \  
  --document "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document\"}}\" \  
  --region region-name
```

Output:

```
{  
  "Blocks": [  
    {  
      "Geometry": {

start-document-analysis

The following code example shows how to use `start-document-analysis`.

AWS CLI

To start analyzing text in a multi-page document

The following `start-document-analysis` example shows how to start asynchronous analysis of text in a multi-page document.

Linux/macOS:

```

aws textract start-document-analysis \
  --document-location '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
  --feature-types ["TABLES","FORMS"] \
  --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"

```

Windows:

```

aws textract start-document-analysis \
  --document-location '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \
  --feature-types ["TABLES","FORMS"] \
  --region region-name \
  --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"

```

Output:

```

{
  "JobId": "df7cf32ebbd2a5de113535fcf4d921926a701b09b4e7d089f3aebadb41e0712b"
}

```

```
}
```

For more information, see *Detecting and Analyzing Text in Multi-Page Documents* in the *Amazon Textract Developers Guide*

- For API details, see [StartDocumentAnalysis](#) in *AWS CLI Command Reference*.

start-document-text-detection

The following code example shows how to use `start-document-text-detection`.

AWS CLI

To start detecting text in a multi-page document

The following `start-document-text-detection` example shows how to start asynchronous detection of text in a multi-page document.

Linux/macOS:

```
aws textract start-document-text-detection \  
  --document-location '{"S3Object":{"Bucket":"bucket","Name":"document"}}' \  
  --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleARN"
```

Windows:

```
aws textract start-document-text-detection \  
  --document-location "{\"S3Object\":{\"Bucket\":\"bucket\",\"Name\":\"document\"]]\" \  
  --region region-name \  
  --notification-channel "SNSTopicArn=arn:snsTopic,RoleArn=roleArn"
```

Output:

```
{  
  "JobId": "57849a3dc627d4df74123dca269d69f7b89329c870c65bb16c9fd63409d200b9"  
}
```

Amazon Transcribe examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Transcribe.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-language-model

The following code example shows how to use `create-language-model`.

AWS CLI

Example 1: To create a custom language model using both training and tuning data.

The following `create-language-model` example creates a custom language model. You can use a custom language model to improve transcription performance for domains such as legal, hospitality, finance, and insurance. For `language-code`, enter a valid language code. For `base-model-name`, specify a base model that is best suited for the sample rate of the audio that you want to transcribe with your custom language model. For `model-name`, specify the name that you want to call the custom language model.

```
aws transcribe create-language-model \
  --language-code language-code \
  --base-model-name base-model-name \
  --model-name cli-clm-example \
  --input-data-config S3Uri="s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-for-
training-data",TuningDataS3Uri="s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-for-
```

```
tuning-data",DataAccessRoleArn="arn:aws:iam::AWS-account-number:role/IAM-role-with-
permissions-to-create-a-custom-language-model"
```

Output:

```
{
  "LanguageCode": "language-code",
  "BaseModelName": "base-model-name",
  "ModelName": "cli-clm-example",
  "InputDataConfig": {
    "S3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/",
    "TuningDataS3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/",
    "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-with-
permissions-create-a-custom-language-model"
  },
  "ModelStatus": "IN_PROGRESS"
}
```

For more information, see [Improving Domain-Specific Transcription Accuracy with Custom Language Models](#) in the *Amazon Transcribe Developer Guide*.

Example 2: To create a custom language model using only training data.

The following `create-language-model` example transcribes your audio file. You can use a custom language model to improve transcription performance for domains such as legal, hospitality, finance, and insurance. For `language-code`, enter a valid language code. For `base-model-name`, specify a base model that is best suited for the sample rate of the audio that you want to transcribe with your custom language model. For `model-name`, specify the name that you want to call the custom language model.

```
aws transcribe create-language-model \
  --language-code en-US \
  --base-model-name base-model-name \
  --model-name cli-clm-example \
  --input-data-config S3Uri="s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-For-
Training-Data",DataAccessRoleArn="arn:aws:iam::AWS-account-number:role/IAM-role-
with-permissions-to-create-a-custom-language-model"
```

Output:

```
{
```

```
"LanguageCode": "en-US",
"BaseModelName": "base-model-name",
"ModelName": "cli-clm-example",
"InputDataConfig": {
  "S3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix-For-Training-Data/",
  "DataAccessRoleArn": "arn:aws:iam::your-AWS-account-number:role/IAM-role-
with-permissions-to-create-a-custom-language-model"
},
"ModelStatus": "IN_PROGRESS"
}
```

For more information, see [Improving Domain-Specific Transcription Accuracy with Custom Language Models](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [CreateLanguageModel](#) in *AWS CLI Command Reference*.

create-medical-vocabulary

The following code example shows how to use `create-medical-vocabulary`.

AWS CLI

To create a medical custom vocabulary

The following `create-medical-vocabulary` example creates a custom vocabulary. To create a custom vocabulary, you must have created a text file with all the terms that you want to transcribe more accurately. For `vocabulary-file-uri`, specify the Amazon Simple Storage Service (Amazon S3) URI of that text file. For `language-code`, specify a language code corresponding to the language of your custom vocabulary. For `vocabulary-name`, specify what you want to call your custom vocabulary.

```
aws transcribe create-medical-vocabulary \
  --vocabulary-name cli-medical-vocab-example \
  --language-code language-code \
  --vocabulary-file-uri https://DOC-EXAMPLE-BUCKET.AWS-Region.amazonaws.com/the-
text-file-for-the-medical-custom-vocabulary.txt
```

Output:

```
{
  "VocabularyName": "cli-medical-vocab-example",
  "LanguageCode": "language-code",
```

```
"VocabularyState": "PENDING"
}
```

For more information, see [Medical Custom Vocabularies](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [CreateMedicalVocabulary](#) in *AWS CLI Command Reference*.

create-vocabulary-filter

The following code example shows how to use `create-vocabulary-filter`.

AWS CLI

To create a vocabulary filter

The following `create-vocabulary-filter` example creates a vocabulary filter that uses a text file that contains a list of words that you wouldn't want to appear in a transcription. For `language-code`, specify the language code corresponding to the language of your vocabulary filter. For `vocabulary-filter-file-uri`, specify the Amazon Simple Storage Service (Amazon S3) URI of the text file. For `vocabulary-filter-name`, specify the name of your vocabulary filter.

```
aws transcribe create-vocabulary-filter \
  --language-code language-code \
  --vocabulary-filter-file-uri s3://DOC-EXAMPLE-BUCKET/vocabulary-filter.txt \
  --vocabulary-filter-name cli-vocabulary-filter-example
```

Output:

```
{
  "VocabularyFilterName": "cli-vocabulary-filter-example",
  "LanguageCode": "language-code"
}
```

For more information, see [Filtering Unwanted Words](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [CreateVocabularyFilter](#) in *AWS CLI Command Reference*.

create-vocabulary

The following code example shows how to use `create-vocabulary`.

AWS CLI

To create a custom vocabulary

The following `create-vocabulary` example creates a custom vocabulary. To create a custom vocabulary, you must have created a text file with all the terms that you want to transcribe more accurately. For `vocabulary-file-uri`, specify the Amazon Simple Storage Service (Amazon S3) URI of that text file. For `language-code`, specify a language code corresponding to the language of your custom vocabulary. For `vocabulary-name`, specify what you want to call your custom vocabulary.

```
aws transcribe create-vocabulary \  
  --language-code language-code \  
  --vocabulary-name cli-vocab-example \  
  --vocabulary-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/the-text-file-  
for-the-custom-vocabulary.txt
```

Output:

```
{  
  "VocabularyName": "cli-vocab-example",  
  "LanguageCode": "language-code",  
  "VocabularyState": "PENDING"  
}
```

For more information, see [Custom Vocabularies](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [CreateVocabulary](#) in *AWS CLI Command Reference*.

delete-language-model

The following code example shows how to use `delete-language-model`.

AWS CLI

To delete a custom language model

The following `delete-language-model` example deletes a custom language model.

```
aws transcribe delete-language-model \  
  --model-name model-name
```

This command produces no output.

For more information, see [Improving Domain-Specific Transcription Accuracy with Custom Language Models](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [DeleteLanguageModel](#) in *AWS CLI Command Reference*.

delete-medical-transcription-job

The following code example shows how to use `delete-medical-transcription-job`.

AWS CLI

To delete a medical transcription job

The following `delete-medical-transcription-job` example deletes a medical transcription job.

```
aws transcribe delete-medical-transcription-job \  
  --medical-transcription-job-name medical-transcription-job-name
```

This command produces no output.

For more information, see [DeleteMedicalTranscriptionJob](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [DeleteMedicalTranscriptionJob](#) in *AWS CLI Command Reference*.

delete-medical-vocabulary

The following code example shows how to use `delete-medical-vocabulary`.

AWS CLI

To delete a medical custom vocabulary

The following `delete-medical-vocabulary` example deletes a medical custom vocabulary. For `vocabulary-name`, specify the name of the medical custom vocabulary.

```
aws transcribe delete-vocabulary \  
  --vocabulary-name medical-custom-vocabulary-name
```

This command produces no output.

For more information, see [Medical Custom Vocabularies](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [DeleteMedicalVocabulary](#) in *AWS CLI Command Reference*.

delete-transcription-job

The following code example shows how to use `delete-transcription-job`.

AWS CLI

To delete one of your transcription jobs

The following `delete-transcription-job` example deletes one of your transcription jobs.

```
aws transcribe delete-transcription-job \  
  --transcription-job-name your-transcription-job
```

This command produces no output.

For more information, see [DeleteTranscriptionJob](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [DeleteTranscriptionJob](#) in *AWS CLI Command Reference*.

delete-vocabulary-filter

The following code example shows how to use `delete-vocabulary-filter`.

AWS CLI

To delete a vocabulary filter

The following `delete-vocabulary-filter` example deletes a vocabulary filter.

```
aws transcribe delete-vocabulary-filter \  
  --vocabulary-filter-name vocabulary-filter-name
```

This command produces no output.

For more information, see [Filtering Unwanted Words](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [DeleteVocabularyFilter](#) in *AWS CLI Command Reference*.

delete-vocabulary

The following code example shows how to use delete-vocabulary.

AWS CLI

To delete a custom vocabulary

The following delete-vocabulary example deletes a custom vocabulary.

```
aws transcribe delete-vocabulary \  
  --vocabulary-name vocabulary-name
```

This command produces no output.

For more information, see [Custom Vocabularies](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [DeleteVocabulary](#) in *AWS CLI Command Reference*.

describe-language-model

The following code example shows how to use describe-language-model.

AWS CLI

To get information about a specific custom language model

The following describe-language-model example gets information about a specific custom language model. For example, under BaseModelName you can see whether your model is trained using a NarrowBand or WideBand model. Custom language models with a NarrowBand base model can transcribe audio with a sample rate less than 16 kHz. Language models using a WideBand base model can transcribe audio with a sample rate greater than 16 kHz. The S3Uri parameter indicates the Amazon S3 prefix you've used to access the training data to create the custom language model.

```
aws transcribe describe-language-model \  
  --model-name cli-clm-example
```

Output:

```
{
```

```
"LanguageModel": {
  "ModelName": "cli-clm-example",
  "CreateTime": "2020-09-25T17:57:38.504000+00:00",
  "LastModifiedTime": "2020-09-25T17:57:48.585000+00:00",
  "LanguageCode": "language-code",
  "BaseModelName": "base-model-name",
  "ModelStatus": "IN_PROGRESS",
  "UpgradeAvailability": false,
  "InputDataConfig": {
    "S3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/",
    "TuningDataS3Uri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/",
    "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-
with-permissions-to-create-a-custom-language-model"
  }
}
```

For more information, see [Improving Domain-Specific Transcription Accuracy with Custom Language Models](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [DescribeLanguageModel](#) in *AWS CLI Command Reference*.

get-medical-transcription-job

The following code example shows how to use `get-medical-transcription-job`.

AWS CLI

To get information about a specific medical transcription job

The following `get-medical-transcription-job` example gets information about a specific medical transcription job. To access the transcription results, use the `TranscriptFileUri` parameter. If you've enabled additional features for the transcription job, you can see them in the `Settings` object. The `Specialty` parameter shows the medical specialty of the provider. The `Type` parameter indicates whether the speech in the transcription job is of a medical conversation, or a medical dictation.

```
aws transcribe get-medical-transcription-job \
  --medical-transcription-job-name vocabulary-dictation-medical-transcription-job
```

Output:

```
{
  "MedicalTranscriptionJob": {
    "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-
job",
    "TranscriptionJobStatus": "COMPLETED",
    "LanguageCode": "en-US",
    "MediaSampleRateHertz": 48000,
    "MediaFormat": "mp4",
    "Media": {
      "MediaFileUri": "s3://Amazon-S3-Prefix/your-audio-file.file-extension"
    },
    "Transcript": {
      "TranscriptFileUri": "https://s3.Region.amazonaws.com/Amazon-S3-Prefix/
vocabulary-dictation-medical-transcription-job.json"
    },
    "StartTime": "2020-09-21T21:17:27.045000+00:00",
    "CreationTime": "2020-09-21T21:17:27.016000+00:00",
    "CompletionTime": "2020-09-21T21:17:59.561000+00:00",
    "Settings": {
      "ChannelIdentification": false,
      "ShowAlternatives": false,
      "VocabularyName": "cli-medical-vocab-example"
    },
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION"
  }
}
```

For more information, see [Batch Transcription](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [GetMedicalTranscriptionJob](#) in *AWS CLI Command Reference*.

get-medical-vocabulary

The following code example shows how to use `get-medical-vocabulary`.

AWS CLI

To get information about a medical custom vocabulary

The following `get-medical-vocabulary` example gets information on a medical custom vocabulary. You can use the `VocabularyState` parameter to see the processing state of the vocabulary. If it's `READY`, you can use it in the `StartMedicalTranscriptionJob` operation.:

```
aws transcribe get-medical-vocabulary \  
  --vocabulary-name medical-vocab-example
```

Output:

```
{  
  "VocabularyName": "medical-vocab-example",  
  "LanguageCode": "en-US",  
  "VocabularyState": "READY",  
  "LastModifiedTime": "2020-09-19T23:59:04.349000+00:00",  
  "DownloadUri": "https://link-to-download-the-text-file-used-to-create-your-  
  medical-custom-vocabulary"  
}
```

For more information, see [Medical Custom Vocabularies](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [GetMedicalVocabulary](#) in *AWS CLI Command Reference*.

get-transcription-job

The following code example shows how to use `get-transcription-job`.

AWS CLI

To get information about a specific transcription job

The following `get-transcription-job` example gets information about a specific transcription job. To access the transcription results, use the `TranscriptFileUri` parameter. Use the `MediaFileUri` parameter to see which audio file you transcribed with this job. You can use the `Settings` object to see the optional features you've enabled in the transcription job.

```
aws transcribe get-transcription-job \  
  --transcription-job-name your-transcription-job
```

Output:

```
{  
  "TranscriptionJob": {  
    "TranscriptionJobName": "your-transcription-job",
```

```
"TranscriptionJobStatus": "COMPLETED",
"LanguageCode": "language-code",
"MediaSampleRateHertz": 48000,
"MediaFormat": "mp4",
"Media": {
  "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.file-extension"
},
"Transcript": {
  "TranscriptFileUri": "https://Amazon-S3-file-location-of-transcription-
output"
},
"StartTime": "2020-09-18T22:27:23.970000+00:00",
"CreationTime": "2020-09-18T22:27:23.948000+00:00",
"CompletionTime": "2020-09-18T22:28:21.197000+00:00",
"Settings": {
  "ChannelIdentification": false,
  "ShowAlternatives": false
},
"IdentifyLanguage": true,
"IdentifiedLanguageScore": 0.8672199249267578
}
}
```

For more information, see [Getting Started \(AWS Command Line Interface\)](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [GetTranscriptionJob](#) in *AWS CLI Command Reference*.

get-vocabulary-filter

The following code example shows how to use `get-vocabulary-filter`.

AWS CLI

To get information about a vocabulary filter

The following `get-vocabulary-filter` example gets information about a vocabulary filter. You can use the `DownloadUri` parameter to get the list of words you used to create the vocabulary filter.

```
aws transcribe get-vocabulary-filter \
  --vocabulary-filter-name testFilter
```

Output:

```
{
  "VocabularyFilterName": "testFilter",
  "LanguageCode": "language-code",
  "LastModifiedTime": "2020-05-07T22:39:32.147000+00:00",
  "DownloadUri": "https://Amazon-S3-location-to-download-your-vocabulary-filter"
}
```

For more information, see [Filter Unwanted Words](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [GetVocabularyFilter](#) in *AWS CLI Command Reference*.

get-vocabulary

The following code example shows how to use `get-vocabulary`.

AWS CLI**To get information about a custom vocabulary**

The following `get-vocabulary` example gets information on a previously created custom vocabulary.

```
aws transcribe get-vocabulary \
  --vocabulary-name cli-vocab-1
```

Output:

```
{
  "VocabularyName": "cli-vocab-1",
  "LanguageCode": "language-code",
  "VocabularyState": "READY",
  "LastModifiedTime": "2020-09-19T23:22:32.836000+00:00",
  "DownloadUri": "https://link-to-download-the-text-file-used-to-create-your-
custom-vocabulary"
}
```

For more information, see [Custom Vocabularies](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [GetVocabulary](#) in *AWS CLI Command Reference*.

list-language-models

The following code example shows how to use `list-language-models`.

AWS CLI

To list your custom language models

The following `list-language-models` example lists the custom language models associated with your AWS account and Region. You can use the `S3Uri` and `TuningDataS3Uri` parameters to find the Amazon S3 prefixes you've used as your training data, or your tuning data. The `BaseModelName` tells you whether you've used a `NarrowBand`, or `WideBand` model to create a custom language model. You can transcribe audio with a sample rate of less than 16 kHz with a custom language model using a `NarrowBand` base model. You can transcribe audio 16 kHz or greater with a custom language model using a `WideBand` base model. The `ModelStatus` parameter shows whether you can use the custom language model in a transcription job. If the value is `COMPLETED`, you can use it in a transcription job.

```
aws transcribe list-language-models
```

Output:

```
{
  "Models": [
    {
      "ModelName": "cli-clm-2",
      "CreateTime": "2020-09-25T17:57:38.504000+00:00",
      "LastModifiedTime": "2020-09-25T17:57:48.585000+00:00",
      "LanguageCode": "language-code",
      "BaseModelName": "WideBand",
      "ModelStatus": "IN_PROGRESS",
      "UpgradeAvailability": false,
      "InputDataConfig": {
        "S3Uri": "s3://DOC-EXAMPLE-BUCKET/clm-training-data/",
        "TuningDataS3Uri": "s3://DOC-EXAMPLE-BUCKET/clm-tuning-data/",
        "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-used-to-create-the-custom-language-model"
      }
    },
    {
      "ModelName": "cli-clm-1",
      "CreateTime": "2020-09-25T17:16:01.835000+00:00",
```

```

    "LastModifiedTime": "2020-09-25T17:16:15.555000+00:00",
    "LanguageCode": "language-code",
    "BaseModelName": "WideBand",
    "ModelStatus": "IN_PROGRESS",
    "UpgradeAvailability": false,
    "InputDataConfig": {
      "S3Uri": "s3://DOC-EXAMPLE-BUCKET/clm-training-data/",
      "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-used-to-create-the-custom-language-model"
    }
  },
  {

      "S3Uri": "s3://DOC-EXAMPLE-BUCKET/clm-training-data/",
      "DataAccessRoleArn": "arn:aws:iam::AWS-account-number:role/IAM-role-used-to-create-the-custom-language-model"
    }
  }
]
}

```

For more information, see [Improving Domain-Specific Transcription Accuracy with Custom Language Models](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [ListLanguageModels](#) in *AWS CLI Command Reference*.

list-medical-transcription-jobs

The following code example shows how to use `list-medical-transcription-jobs`.

AWS CLI

To list your medical transcription jobs

The following `list-medical-transcription-jobs` example lists the medical transcription jobs associated with your AWS account and Region. To get more information about a particular

transcription job, copy the value of a `MedicalTranscriptionJobName` parameter in the transcription output, and specify that value for the `MedicalTranscriptionJobName` option of the `get-medical-transcription-job` command. To see more of your transcription jobs, copy the value of the `NextToken` parameter, run the `list-medical-transcription-jobs` command again, and specify that value in the `--next-token` option.

```
aws transcribe list-medical-transcription-jobs
```

Output:

```
{
  "NextToken": "3/PblzkiGhzjER3KHuQt2fmbPLF7cDYafjFMEoGn440N/

list-medical-vocabularies

The following code example shows how to use `list-medical-vocabularies`.

AWS CLI

To list your medical custom vocabularies

The following `list-medical-vocabularies` example lists the medical custom vocabularies associated with your AWS account and Region. To get more information about a particular transcription job, copy the value of a `MedicalTranscriptionJobName` parameter in the transcription output, and specify that value for the `MedicalTranscriptionJobName` option of the `get-medical-transcription-job` command. To see more of your transcription jobs, copy the value of the `NextToken` parameter, run the `list-medical-transcription-jobs` command again, and specify that value in the `--next-token` option.

```
aws transcribe list-medical-vocabularies
```

Output:

```
{
  "Vocabularies": [
    {
      "VocabularyName": "cli-medical-vocab-2",
      "LanguageCode": "en-US",
      "LastModifiedTime": "2020-09-21T21:44:59.521000+00:00",
      "VocabularyState": "READY"
    },
    {

  ]
}
```

```
    }  
  ]  
}
```

For more information, see [Custom Vocabularies](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [ListVocabularies](#) in *AWS CLI Command Reference*.

list-vocabulary-filters

The following code example shows how to use `list-vocabulary-filters`.

AWS CLI

To list your vocabulary filters

The following `list-vocabulary-filters` example lists the vocabulary filters associated with your AWS account and Region.

```
aws transcribe list-vocabulary-filters
```

Output:

```
{  
  "NextToken": "NextToken": [  
    {  
      "VocabularyFilterName": "testFilter",  
      "LanguageCode": "language-code",  
      "LastModifiedTime": "2020-05-07T22:39:32.147000+00:00"  
    },  
    {  
      "VocabularyFilterName": "testFilter2",  
      "LanguageCode": "language-code",  
      "LastModifiedTime": "2020-05-21T23:29:35.174000+00:00"  
    },  
    {  
      "VocabularyFilterName": "filter2",  
      "LanguageCode": "language-code",  
      "LastModifiedTime": "2020-05-08T20:18:26.426000+00:00"  
    },  
    {  
      "VocabularyFilterName": "filter-review",
```

```
    "LanguageCode": "language-code",
    "LastModifiedTime": "2020-06-03T18:52:30.448000+00:00"
  },
  {
    "VocabularyFilterName": "crlf-filt",
    "LanguageCode": "language-code",
    "LastModifiedTime": "2020-05-22T19:42:42.737000+00:00"
  }
]
}
```

For more information, see [Filtering Unwanted Words](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [ListVocabularyFilters](#) in *AWS CLI Command Reference*.

start-medical-transcription-job

The following code example shows how to use `start-medical-transcription-job`.

AWS CLI

Example 1: To transcribe a medical dictation stored as an audio file

The following `start-medical-transcription-job` example transcribes an audio file. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
  --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
  "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
  "LanguageCode": "language-code",
  "Specialty": "PRIMARYCARE",
  "Type": "DICTATION",
  "OutputBucketName": "DOC-EXAMPLE-BUCKET",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
  }
}
```

Output:

```
{
  "MedicalTranscriptionJob": {
    "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "language-code",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    },
    "StartTime": "2020-09-20T00:35:22.256000+00:00",
    "CreationTime": "2020-09-20T00:35:22.218000+00:00",
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION"
  }
}
```

For more information, see [Batch Transcription Overview](#) in the *Amazon Transcribe Developer Guide*.

Example 2: To transcribe a clinician-patient dialogue stored as an audio file

The following `start-medical-transcription-job` example transcribes an audio file containing a clinician-patient dialogue. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
  --cli-input-json file://mysecondfile.json
```

Contents of `mysecondfile.json`:

```
{
  "MedicalTranscriptionJobName": "simple-dictation-medical-transcription-job",
  "LanguageCode": "language-code",
  "Specialty": "PRIMARYCARE",
  "Type": "CONVERSATION",
  "OutputBucketName": "DOC-EXAMPLE-BUCKET",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
  }
}
```

Output:

```
{
  "MedicalTranscriptionJob": {
    "MedicalTranscriptionJobName": "simple-conversation-medical-transcription-
job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "language-code",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    },
    "StartTime": "2020-09-20T23:19:49.965000+00:00",
    "CreationTime": "2020-09-20T23:19:49.941000+00:00",
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION"
  }
}
```

For more information, see [Batch Transcription Overview](#) in the *Amazon Transcribe Developer Guide*.

Example 3: To transcribe a multichannel audio file of a clinician-patient dialogue

The following `start-medical-transcription-job` example transcribes the audio from each channel in the audio file and merges the separate transcriptions from each channel into a single transcription output. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
  --cli-input-json file://mythirdfile.json
```

Contents of `mythirdfile.json`:

```
{
  "MedicalTranscriptionJobName": "multichannel-conversation-medical-transcription-
job",
  "LanguageCode": "language-code",
  "Specialty": "PRIMARYCARE",
  "Type": "CONVERSATION",
  "OutputBucketName": "DOC-EXAMPLE-BUCKET",
  "Media": {
```

```

    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
  },
  "Settings":{
    "ChannelIdentification": true
  }
}

```

Output:

```

{
  "MedicalTranscriptionJob": {
    "MedicalTranscriptionJobName": "multichannel-conversation-medical-
transcription-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "language-code",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    },
    "StartTime": "2020-09-20T23:46:44.081000+00:00",
    "CreationTime": "2020-09-20T23:46:44.053000+00:00",
    "Settings": {
      "ChannelIdentification": true
    },
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION"
  }
}

```

For more information, see [Channel Identification](#) in the *Amazon Transcribe Developer Guide*.

Example 4: To transcribe an audio file of a clinician-patient dialogue and identify the speakers in the transcription output

The following `start-medical-transcription-job` example transcribes an audio file and labels the speech of each speaker in the transcription output. You specify the location of the transcription output in the `OutputBucketName` parameter.

```

aws transcribe start-medical-transcription-job \
  --cli-input-json file://myfourthfile.json

```

Contents of `myfourthfile.json`:

```
{
  "MedicalTranscriptionJobName": "speaker-id-conversation-medical-transcription-
job",
  "LanguageCode": "language-code",
  "Specialty": "PRIMARYCARE",
  "Type": "CONVERSATION",
  "OutputBucketName": "DOC-EXAMPLE-BUCKET",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
  },
  "Settings": {
    "ShowSpeakerLabels": true,
    "MaxSpeakerLabels": 2
  }
}
```

Output:

```
{
  "MedicalTranscriptionJob": {
    "MedicalTranscriptionJobName": "speaker-id-conversation-medical-
transcription-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "language-code",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    },
    "StartTime": "2020-09-21T18:43:37.265000+00:00",
    "CreationTime": "2020-09-21T18:43:37.157000+00:00",
    "Settings": {
      "ShowSpeakerLabels": true,
      "MaxSpeakerLabels": 2
    },
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION"
  }
}
```

For more information, see [Identifying Speakers](#) in the *Amazon Transcribe Developer Guide*.

Example 5: To transcribe a medical conversation stored as an audio file with up to two transcription alternatives

The following `start-medical-transcription-job` example creates up to two alternative transcriptions from a single audio file. Every transcription has a level of confidence associated with it. By default, Amazon Transcribe returns the transcription with the highest confidence level. You can specify that Amazon Transcribe return additional transcriptions with lower confidence levels. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \  
  --cli-input-json file://myfifthfile.json
```

Contents of `myfifthfile.json`:

```
{  
  "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-  
job",  
  "LanguageCode": "language-code",  
  "Specialty": "PRIMARYCARE",  
  "Type": "CONVERSATION",  
  "OutputBucketName": "DOC-EXAMPLE-BUCKET",  
  "Media": {  
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"  
  },  
  "Settings": {  
    "ShowAlternatives": true,  
    "MaxAlternatives": 2  
  }  
}
```

Output:

```
{  
  "MedicalTranscriptionJob": {  
    "MedicalTranscriptionJobName": "alternatives-conversation-medical-  
transcription-job",  
    "TranscriptionJobStatus": "IN_PROGRESS",  
    "LanguageCode": "language-code",  
    "Media": {  
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"  
    },  
    "StartTime": "2020-09-21T19:09:18.199000+00:00",  
    "CreationTime": "2020-09-21T19:09:18.171000+00:00",  
  }  
}
```

```
    "Settings": {
      "ShowAlternatives": true,
      "MaxAlternatives": 2
    },
    "Specialty": "PRIMARYCARE",
    "Type": "CONVERSATION"
  }
}
```

For more information, see [Alternative Transcriptions](#) in the *Amazon Transcribe Developer Guide*.

Example 6: To transcribe an audio file of a medical dictation with up to two alternative transcriptions

The following `start-medical-transcription-job` example transcribes an audio file and uses a vocabulary filter to mask any unwanted words. You specify the location of the transcription output in the `OutputBucketName` parameter.

```
aws transcribe start-medical-transcription-job \
  --cli-input-json file://mysixthfile.json
```

Contents of `mysixthfile.json`:

```
{
  "MedicalTranscriptionJobName": "alternatives-conversation-medical-transcription-
job",
  "LanguageCode": "language-code",
  "Specialty": "PRIMARYCARE",
  "Type": "DICTATION",
  "OutputBucketName": "DOC-EXAMPLE-BUCKET",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
  },
  "Settings": {
    "ShowAlternatives": true,
    "MaxAlternatives": 2
  }
}
```

Output:

```
{
```

```

    "MedicalTranscriptionJob": {
      "MedicalTranscriptionJobName": "alternatives-dictation-medical-
transcription-job",
      "TranscriptionJobStatus": "IN_PROGRESS",
      "LanguageCode": "language-code",
      "Media": {
        "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
      },
      "StartTime": "2020-09-21T21:01:14.592000+00:00",
      "CreationTime": "2020-09-21T21:01:14.569000+00:00",
      "Settings": {
        "ShowAlternatives": true,
        "MaxAlternatives": 2
      },
      "Specialty": "PRIMARYCARE",
      "Type": "DICTATION"
    }
  }
}

```

For more information, see [Alternative Transcriptions](#) in the *Amazon Transcribe Developer Guide*.

Example 7: To transcribe an audio file of a medical dictation with increased accuracy by using a custom vocabulary

The following `start-medical-transcription-job` example transcribes an audio file and uses a medical custom vocabulary you've previously created to increase the transcription accuracy. You specify the location of the transcription output in the `OutputBucketName` parameter.

```

aws transcribe start-transcription-job \
  --cli-input-json file://myseventhfile.json

```

Contents of `mysixthfile.json`:

```

{
  "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-job",
  "LanguageCode": "language-code",
  "Specialty": "PRIMARYCARE",
  "Type": "DICTATION",
  "OutputBucketName": "DOC-EXAMPLE-BUCKET",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
  }
}

```

```
  },
  "Settings":{
    "VocabularyName": "cli-medical-vocab-1"
  }
}
```

Output:

```
{
  "MedicalTranscriptionJob": {
    "MedicalTranscriptionJobName": "vocabulary-dictation-medical-transcription-
job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "language-code",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.extension"
    },
    "StartTime": "2020-09-21T21:17:27.045000+00:00",
    "CreationTime": "2020-09-21T21:17:27.016000+00:00",
    "Settings": {
      "VocabularyName": "cli-medical-vocab-1"
    },
    "Specialty": "PRIMARYCARE",
    "Type": "DICTATION"
  }
}
```

For more information, see [Medical Custom Vocabularies](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [StartMedicalTranscriptionJob](#) in *AWS CLI Command Reference*.

start-transcription-job

The following code example shows how to use `start-transcription-job`.

AWS CLI

Example 1: To transcribe an audio file

The following `start-transcription-job` example transcribes your audio file.

```
aws transcribe start-transcription-job \
```

```
--cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{
  "TranscriptionJobName": "cli-simple-transcription-job",
  "LanguageCode": "the-language-of-your-transcription-job",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
  }
}
```

For more information, see [Getting Started \(AWS Command Line Interface\)](#) in the *Amazon Transcribe Developer Guide*.

Example 2: To transcribe a multi-channel audio file

The following `start-transcription-job` example transcribes your multi-channel audio file.

```
aws transcribe start-transcription-job \
  --cli-input-json file://mysecondfile.json
```

Contents of `mysecondfile.json`:

```
{
  "TranscriptionJobName": "cli-channelid-job",
  "LanguageCode": "the-language-of-your-transcription-job",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
  },
  "Settings":{
    "ChannelIdentification":true
  }
}
```

Output:

```
{
```

```
"TranscriptionJob": {
  "TranscriptionJobName": "cli-channelid-job",
  "TranscriptionJobStatus": "IN_PROGRESS",
  "LanguageCode": "the-language-of-your-transcription-job",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-
file-name.file-extension"
  },
  "StartTime": "2020-09-17T16:07:56.817000+00:00",
  "CreationTime": "2020-09-17T16:07:56.784000+00:00",
  "Settings": {
    "ChannelIdentification": true
  }
}
```

For more information, see [Transcribing Multi-Channel Audio](#) in the *Amazon Transcribe Developer Guide*.

Example 3: To transcribe an audio file and identify the different speakers

The following `start-transcription-job` example transcribes your audio file and identifies the speakers in the transcription output.

```
aws transcribe start-transcription-job \
  --cli-input-json file://mythirdfile.json
```

Contents of `mythirdfile.json`:

```
{
  "TranscriptionJobName": "cli-speakerid-job",
  "LanguageCode": "the-language-of-your-transcription-job",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
  },
  "Settings":{
    "ShowSpeakerLabels": true,
    "MaxSpeakerLabels": 2
  }
}
```

Output:

```
{
  "TranscriptionJob": {
    "TranscriptionJobName": "cli-speakerid-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-
file-name.file-extension"
    },
    "StartTime": "2020-09-17T16:22:59.696000+00:00",
    "CreationTime": "2020-09-17T16:22:59.676000+00:00",
    "Settings": {
      "ShowSpeakerLabels": true,
      "MaxSpeakerLabels": 2
    }
  }
}
```

For more information, see [Identifying Speakers](#) in the *Amazon Transcribe Developer Guide*.

Example 4: To transcribe an audio file and mask any unwanted words in the transcription output

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```
aws transcribe start-transcription-job \
  --cli-input-json file://myfourthfile.json
```

Contents of `myfourthfile.json`:

```
{
  "TranscriptionJobName": "cli-filter-mask-job",
  "LanguageCode": "the-language-of-your-transcription-job",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
  },
  "Settings":{
```

```

    "VocabularyFilterName": "your-vocabulary-filter",
    "VocabularyFilterMethod": "mask"
  }
}

```

Output:

```

{
  "TranscriptionJob": {
    "TranscriptionJobName": "cli-filter-mask-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
      "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
    },
    "StartTime": "2020-09-18T16:36:18.568000+00:00",
    "CreationTime": "2020-09-18T16:36:18.547000+00:00",
    "Settings": {
      "VocabularyFilterName": "your-vocabulary-filter",
      "VocabularyFilterMethod": "mask"
    }
  }
}

```

For more information, see [Filtering Transcriptions](#) in the *Amazon Transcribe Developer Guide*.

Example 5: To transcribe an audio file and remove any unwanted words in the transcription output

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```

aws transcribe start-transcription-job \
  --cli-input-json file://myfifthfile.json

```

Contents of `myfifthfile.json`:

```

{
  "TranscriptionJobName": "cli-filter-remove-job",
  "LanguageCode": "the-language-of-your-transcription-job",
  "Media": {

```

```

    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
  },
  "Settings":{
    "VocabularyFilterName": "your-vocabulary-filter",
    "VocabularyFilterMethod": "remove"
  }
}

```

Output:

```

{
  "TranscriptionJob": {
    "TranscriptionJobName": "cli-filter-remove-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-
file-name.file-extension"
    },
    "StartTime": "2020-09-18T16:36:18.568000+00:00",
    "CreationTime": "2020-09-18T16:36:18.547000+00:00",
    "Settings": {
      "VocabularyFilterName": "your-vocabulary-filter",
      "VocabularyFilterMethod": "remove"
    }
  }
}

```

For more information, see [Filtering Transcriptions](#) in the *Amazon Transcribe Developer Guide*.

Example 6: To transcribe an audio file with increased accuracy using a custom vocabulary

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```

aws transcribe start-transcription-job \
  --cli-input-json file://mysixthfile.json

```

Contents of `mysixthfile.json`:

```

{

```

```

    "TranscriptionJobName": "cli-vocab-job",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
    },
    "Settings":{
      "VocabularyName": "your-vocabulary"
    }
  }
}

```

Output:

```

{
  "TranscriptionJob": {
    "TranscriptionJobName": "cli-vocab-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "the-language-of-your-transcription-job",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-
file-name.file-extension"
    },
    "StartTime": "2020-09-18T16:36:18.568000+00:00",
    "CreationTime": "2020-09-18T16:36:18.547000+00:00",
    "Settings": {
      "VocabularyName": "your-vocabulary"
    }
  }
}

```

For more information, see [Filtering Transcriptions](#) in the *Amazon Transcribe Developer Guide*.

Example 7: To identify the language of an audio file and transcribe it

The following `start-transcription-job` example transcribes your audio file and uses a vocabulary filter you've previously created to mask any unwanted words.

```

aws transcribe start-transcription-job \
  --cli-input-json file://myseventhfile.json

```

Contents of `myseventhfile.json`:

```
{
  "TranscriptionJobName": "cli-identify-language-transcription-job",
  "IdentifyLanguage": true,
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-file-
name.file-extension"
  }
}
```

Output:

```
{
  "TranscriptionJob": {
    "TranscriptionJobName": "cli-identify-language-transcription-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/Amazon-S3-prefix/your-media-
file-name.file-extension"
    },
    "StartTime": "2020-09-18T22:27:23.970000+00:00",
    "CreationTime": "2020-09-18T22:27:23.948000+00:00",
    "IdentifyLanguage": true
  }
}
```

For more information, see [Identifying the Language](#) in the *Amazon Transcribe Developer Guide*.

Example 8: To transcribe an audio file with personally identifiable information redacted

The following `start-transcription-job` example transcribes your audio file and redacts any personally identifiable information in the transcription output.

```
aws transcribe start-transcription-job \
  --cli-input-json file://myeighthfile.json
```

Contents of `myeighthfile.json`:

```
{
  "TranscriptionJobName": "cli-redaction-job",
  "LanguageCode": "language-code",
  "Media": {
```

```

    "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
  },
  "ContentRedaction": {
    "RedactionOutput": "redacted",
    "RedactionType": "PII"
  }
}

```

Output:

```

{
  "TranscriptionJob": {
    "TranscriptionJobName": "cli-redaction-job",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "language-code",
    "Media": {
      "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
    },
    "StartTime": "2020-09-25T23:49:13.195000+00:00",
    "CreationTime": "2020-09-25T23:49:13.176000+00:00",
    "ContentRedaction": {
      "RedactionType": "PII",
      "RedactionOutput": "redacted"
    }
  }
}

```

For more information, see [Automatic Content Redaction](#) in the *Amazon Transcribe Developer Guide*.

Example 9: To generate a transcript with personally identifiable information (PII) redacted and an unredacted transcript

The following `start-transcription-job` example generates two transcriptions of your audio file, one with the personally identifiable information redacted, and the other without any redactions.

```

aws transcribe start-transcription-job \
  --cli-input-json file://myninthfile.json

```

Contents of `myninthfile.json`:

```
{
  "TranscriptionJobName": "cli-redaction-job-with-unredacted-transcript",
  "LanguageCode": "language-code",
  "Media": {
    "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
  },
  "ContentRedaction": {
    "RedactionOutput": "redacted_and_unredacted",
    "RedactionType": "PII"
  }
}
```

Output:

```
{
  "TranscriptionJob": {
    "TranscriptionJobName": "cli-redaction-job-with-unredacted-transcript",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "language-code",
    "Media": {
      "MediaFileUri": "s3://Amazon-S3-Prefix/your-media-file.file-extension"
    },
    "StartTime": "2020-09-25T23:59:47.677000+00:00",
    "CreationTime": "2020-09-25T23:59:47.653000+00:00",
    "ContentRedaction": {
      "RedactionType": "PII",
      "RedactionOutput": "redacted_and_unredacted"
    }
  }
}
```

For more information, see [Automatic Content Redaction](#) in the *Amazon Transcribe Developer Guide*.

Example 10: To use a custom language model you've previously created to transcribe an audio file.

The following `start-transcription-job` example transcribes your audio file with a custom language model you've previously created.

```
aws transcribe start-transcription-job \
```

```
--cli-input-json file://mytenthfile.json
```

Contents of mytenthfile.json:

```
{
  "TranscriptionJobName": "cli-clm-2-job-1",
  "LanguageCode": "language-code",
  "Media": {
    "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.file-extension"
  },
  "ModelSettings": {
    "LanguageModelName": "cli-clm-2"
  }
}
```

Output:

```
{
  "TranscriptionJob": {
    "TranscriptionJobName": "cli-clm-2-job-1",
    "TranscriptionJobStatus": "IN_PROGRESS",
    "LanguageCode": "language-code",
    "Media": {
      "MediaFileUri": "s3://DOC-EXAMPLE-BUCKET/your-audio-file.file-extension"
    },
    "StartTime": "2020-09-28T17:56:01.835000+00:00",
    "CreationTime": "2020-09-28T17:56:01.801000+00:00",
    "ModelSettings": {
      "LanguageModelName": "cli-clm-2"
    }
  }
}
```

For more information, see [Improving Domain-Specific Transcription Accuracy with Custom Language Models](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [StartTranscriptionJob](#) in *AWS CLI Command Reference*.

update-medical-vocabulary

The following code example shows how to use update-medical-vocabulary.

AWS CLI

To update a medical custom vocabulary with new terms.

The following `update-medical-vocabulary` example replaces the terms used in a medical custom vocabulary with the new ones. Prerequisite: to replace the terms in a medical custom vocabulary, you need a file with new terms.

```
aws transcribe update-medical-vocabulary \  
  --vocabulary-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/medical-custom-  
vocabulary.txt \  
  --vocabulary-name medical-custom-vocabulary \  
  --language-code language
```

Output:

```
{  
  "VocabularyName": "medical-custom-vocabulary",  
  "LanguageCode": "en-US",  
  "VocabularyState": "PENDING"  
}
```

For more information, see [Medical Custom Vocabularies](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [UpdateMedicalVocabulary](#) in *AWS CLI Command Reference*.

update-vocabulary-filter

The following code example shows how to use `update-vocabulary-filter`.

AWS CLI

To replace the words in a vocabulary filter

The following `update-vocabulary-filter` example replaces the words in a vocabulary filter with new ones. Prerequisite: To update a vocabulary filter with the new words, you must have those words saved as a text file.

```
aws transcribe update-vocabulary-filter \  
  --vocabulary-filter-name medical-custom-vocabulary-filter \  
  --words-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/medical-custom-  
vocabulary-filter-words.txt
```

```
--vocabulary-filter-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/your-text-  
file-to-update-your-vocabulary-filter.txt \  
--vocabulary-filter-name vocabulary-filter-name
```

Output:

```
{  
  "VocabularyFilterName": "vocabulary-filter-name",  
  "LanguageCode": "language-code",  
  "LastModifiedTime": "2020-09-23T18:40:35.139000+00:00"  
}
```

For more information, see [Filtering Unwanted Words](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [UpdateVocabularyFilter](#) in *AWS CLI Command Reference*.

update-vocabulary

The following code example shows how to use update-vocabulary.

AWS CLI

To update a custom vocabulary with new terms.

The following update-vocabulary example overwrites the terms used to create a custom vocabulary with the new ones that you provide. Prerequisite: to replace the terms in a custom vocabulary, you need a file with new terms.

```
aws transcribe update-vocabulary \  
  --vocabulary-file-uri s3://DOC-EXAMPLE-BUCKET/Amazon-S3-Prefix/custom-  
vocabulary.txt \  
  --vocabulary-name custom-vocabulary \  
  --language-code language-code
```

Output:

```
{  
  "VocabularyName": "custom-vocabulary",  
  "LanguageCode": "language",  
  "VocabularyState": "PENDING"
```

```
}
```

For more information, see [Custom Vocabularies](#) in the *Amazon Transcribe Developer Guide*.

- For API details, see [UpdateVocabulary](#) in *AWS CLI Command Reference*.

Amazon Translate examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Translate.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

import-terminology

The following code example shows how to use `import-terminology`.

AWS CLI

To import a custom terminology from a file

The following `import-terminology` example creates a terminology called `MyTestTerminology` from the `test-terminology.csv` file:

```
aws translate import-terminology \  
  --name MyTestTerminology \  
  --file test-terminology.csv
```

```
--description "Creating a test terminology in AWS Translate" \  
--merge-strategy OVERWRITE \  
--data-file fileb://test-terminology.csv \  
--terminology-data Format=CSV
```

Contents of test-terminology.csv:

```
en,fr,es,zh Hello world!,Bonjour tout le monde!,Hola Mundo!,????  
Amazon,Amazon,Amazon,Amazon
```

Output:

```
{  
  "TerminologyProperties": {  
    "SourceLanguageCode": "en",  
    "Name": "MyTestTerminology",  
    "TargetLanguageCodes": [  
      "fr",  
      "es",  
      "zh"  
    ],  
    "SizeBytes": 97,  
    "LastUpdatedAt": 1571089500.851,  
    "CreatedAt": 1571089500.851,  
    "TermCount": 6,  
    "Arn": "arn:aws:translate:us-west-2:123456789012:terminology/  
MyTestTerminology/LATEST",  
    "Description": "Creating a test terminology in AWS Translate"  
  }  
}
```

- For API details, see [ImportTerminology](#) in *AWS CLI Command Reference*.

Trusted Advisor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Trusted Advisor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- For API details, see [ListOrganizationRecommendationResources](#) in *AWS CLI Command Reference*.

list-organization-recommendations

The following code example shows how to use `list-organization-recommendations`.

AWS CLI

Example 1: To list organization recommendations

The following `list-organization-recommendations` example lists all organization recommendations and does not include a filter.

```
aws trustedadvisor list-organization-recommendations
```

Output:

```
{
  "organizationRecommendationSummaries": [
    {
      "arn": "arn:aws:trustedadvisor::organization-recommendation/9534ec9b-
bf3a-44e8-8213-2ed68b39d9d5",
      "name": "Lambda Runtime Deprecation Warning",
      "awsServices": [
        "lambda"
      ],
      "checkArn": "arn:aws:trustedadvisor::check/L4dfs2Q4C5",
      "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
      "lifecycleStage": "resolved",
      "pillars": [
        "security"
      ],
      "resourcesAggregates": {
        "errorCount": 0,
        "okCount": 0,
        "warningCount": 0
      },
      "source": "ta_check",
      "status": "warning",
      "type": "priority"
    },
    {
      "arn": "arn:aws:trustedadvisor::organization-
recommendation/4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
      "name": "Lambda Runtime Deprecation Warning",
      "awsServices": [
        "lambda"
      ],
      "checkArn": "arn:aws:trustedadvisor::check/L4dfs2Q4C5",
      "id": "4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
      "lifecycleStage": "resolved",
      "pillars": [
        "security"
      ]
    }
  ]
}
```

```

    ],
    "resourcesAggregates": {
      "errorCount": 0,
      "okCount": 0,
      "warningCount": 0
    },
    "source": "ta_check",
    "status": "warning",
    "type": "priority"
  },
],
"nextToken": "REDACTED"
}

```

For more information, see [Get started with the Trusted Advisor API](#) in the *AWS Trusted Advisor User Guide*.

Example 2: To list organization recommendations with a filter

The following `list-organization-recommendations` example filters and returns a max of one organization recommendation that is a part of the "security" pillar.

```

aws trustedadvisor list-organization-recommendations \
  --pillar security \
  --max-items 100

```

Output:

```

{
  "organizationRecommendationSummaries": [{
    "arn": "arn:aws:trustedadvisor::organization-recommendation/9534ec9b-
bf3a-44e8-8213-2ed68b39d9d5",
    "name": "Lambda Runtime Deprecation Warning",
    "awsServices": [
      "lambda"
    ],
    "checkArn": "arn:aws:trustedadvisor::check/L4dfs2Q4C5",
    "id": "9534ec9b-bf3a-44e8-8213-2ed68b39d9d5",
    "lifecycleStage": "resolved",
    "pillars": [
      "security"
    ],
    "resourcesAggregates": {

```

```

        "errorCount": 0,
        "okCount": 0,
        "warningCount": 0
    },
    "source": "ta_check",
    "status": "warning",
    "type": "priority"
}],
"nextToken": "REDACTED"
}

```

For more information, see [Get started with the Trusted Advisor API](#) in the *AWS Trusted Advisor User Guide*.

Example 3: To list organization recommendations with a pagination token

The following `list-organization-recommendations` example uses the `"nextToken"` returned from a previous request to fetch the next page of organization recommendations.

```

aws trustedadvisor list-organization-recommendations \
  --pillar security \
  --max-items 100 \
  --starting-token <next-token>

```

Output:

```

{
  "organizationRecommendationSummaries": [{
    "arn": "arn:aws:trustedadvisor::organization-recommendation/4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
    "name": "Lambda Runtime Deprecation Warning",
    "awsServices": [
      "lambda"
    ],
    "checkArn": "arn:aws:trustedadvisor::check/L4dfs2Q4C5",
    "id": "4ecff4d4-1bc1-4c99-a5b8-0fff9ee500d6",
    "lifecycleStage": "resolved",
    "pillars": [
      "security"
    ],
    "resourcesAggregates": {
      "errorCount": 0,
      "okCount": 0,

```

```

        "warningCount": 0
      },
      "source": "ta_check",
      "status": "warning",
      "type": "priority"
    }]
  }

```

For more information, see [Get started with the Trusted Advisor API](#) in the *AWS Trusted Advisor User Guide*.

- For API details, see [ListOrganizationRecommendations](#) in *AWS CLI Command Reference*.

list-recommendation-resources

The following code example shows how to use `list-recommendation-resources`.

AWS CLI

To list recommendation resources

The following `list-recommendation-resources` example lists all resources for a recommendation by its identifier.

```

aws trustedadvisor list-recommendation-resources \
  --recommendation-identifier
  arn:aws:trustedadvisor::000000000000:recommendation/55fa4d2e-
  bbb7-491a-833b-5773e9589578

```

Output:

```

{
  "recommendationResourceSummaries": [
    {
      "arn": "arn:aws:trustedadvisor::000000000000:recommendation-
resource/55fa4d2e-

      "errorCount": 0,
      "okCount": 3,
      "warningCount": 6
    },
    "source": "ta_check",
    "status": "warning",
    "type": "standard"
  }
}

```

For more information, see [Get started with the Trusted Advisor API](#) in the *AWS Trusted Advisor User Guide*.

- For API details, see [ListRecommendations](#) in *AWS CLI Command Reference*.

update-organization-recommendation-lifecycle

The following code example shows how to use `update-organization-recommendation-lifecycle`.

AWS CLI

To update an organization recommendation lifecycle

The following `update-organization-recommendation-lifecycle` example updates the lifecycle of an organization recommendation by its identifier.

```
aws trustedadvisor update-organization-recommendation-lifecycle \  
  --organization-recommendation-identifier arn:aws:trustedadvisor:::organization-  
recommendation/96b5e5ca-7930-444c-90c6-06d386128100 \  
  --lifecycle-stage dismissed \  
  --update-reason-code not_applicable
```

This command produces no output.

For more information, see [Get started with the Trusted Advisor API](#) in the *AWS Trusted Advisor User Guide*.

- For API details, see [UpdateOrganizationRecommendationLifecycle](#) in *AWS CLI Command Reference*.

update-recommendation-lifecycle

The following code example shows how to use `update-recommendation-lifecycle`.

AWS CLI

To update a recommendation lifecycle

The following `update-recommendation-lifecycle` example updates the lifecycle of a recommendation by its identifier.

```
aws trustedadvisor update-recommendation-lifecycle \  
  --recommendation-identifier  
arn:aws:trustedadvisor:::000000000000:recommendation/861c9c6e-  
f169-405a-8b59-537a8cacc7a \  
  --lifecycle-stage resolved \  
  --update-reason-code valid_business_case
```

This command produces no output.

For more information, see [Get started with the Trusted Advisor API](#) in the *AWS Trusted Advisor User Guide*.

- For API details, see [UpdateRecommendationLifecycle](#) in *AWS CLI Command Reference*.

Verified Permissions examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Verified Permissions.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-identity-source

The following code example shows how to use `create-identity-source`.

AWS CLI

To create an identity source

The following `create-identity-source` example creates an identity source that lets you reference identities stored in the specified Amazon Cognito user pool. Those identities are available in Verified Permissions as entities of type `User`.

```
aws verifiedpermissions create-identity-source \  
  --configuration file://config.txt \  
  --principal-entity-type "User" \  
  --policy-store-id PSEXAMPLEEabcdefg111111
```

Contents of `config.txt`:

```
{
```

```
"cognitoUserPoolConfiguration": {
  "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-
west-2_1a2b3c4d5",
  "clientIds":["a1b2c3d4e5f6g7h8i9j0kalbmc"]
}
}
```

Output:

```
{
  "createdDate": "2023-05-19T20:30:28.214829+00:00",
  "identitySourceId": "ISEXAMPLEabcdefg111111",
  "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
  "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about identity sources, see [Using Amazon Verified Permissions with identity providers](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [CreateIdentitySource](#) in *AWS CLI Command Reference*.

create-policy-store

The following code example shows how to use create-policy-store.

AWS CLI

To create a policy store

The following create-policy-store example creates a policy store in the current AWS Region.

```
aws verifiedpermissions create-policy-store \
  --validation-settings "mode=STRICT"
```

Output:

```
{
  "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
  "createdDate": "2023-05-16T17:41:29.103459+00:00",
```

```
"lastUpdatedDate": "2023-05-16T17:41:29.103459+00:00",  
"policyStoreId": "PSEXAMPLEEabcdefg111111"  
}
```

For more information about policy stores, see [Amazon Verified Permissions policy stores](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [CreatePolicyStore](#) in *AWS CLI Command Reference*.

create-policy-template

The following code example shows how to use `create-policy-template`.

AWS CLI

Example 1: To create a policy template

The following `create-policy-template` example creates a policy template with a statement that contains a placeholder for the principal.

```
aws verifiedpermissions create-policy-template \  
  --definition file://template1.txt \  
  --policy-store-id PSEXAMPLEEabcdefg111111
```

Contents of file `template1.txt`:

```
permit(  
  principal in ?principal,  
  action == Action::"view",  
  resource == Photo::"VacationPhoto94.jpg"  
);
```

Output:

```
{  
  "createdDate": "2023-06-12T20:47:42.804511+00:00",  
  "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",  
  "policyStoreId": "PSEXAMPLEEabcdefg111111",  
  "policyTemplateId": "PTEXAMPLEEabcdefg111111"  
}
```

For more information about policy templates, see [Amazon Verified Permissions policy templates](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [CreatePolicyTemplate](#) in *AWS CLI Command Reference*.

create-policy

The following code example shows how to use create-policy.

AWS CLI

Example 1: To create a static policy

The following create-policy example creates a static policy with a policy scope that specifies both a principal and a resource.

```
aws verifiedpermissions create-policy \  
  --definition file://definition1.txt \  
  --policy-store-id PSEXAMPLEEabcdefg111111
```

Contents of file definition1.txt:

```
{  
  "static": {  
    "description": "Grant everyone of janeFriends UserGroup access to the  
vacationFolder Album",  
    "statement": "permit(principal in UserGroup::\\"janeFriends\\", action,  
resource in Album::\\"vacationFolder\\" );"  
  }  
}
```

Output:

```
{  
  "createdDate": "2023-06-12T20:33:37.382907+00:00",  
  "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",  
  "policyId": "SPEXAMPLEEabcdefg111111",  
  "policyStoreId": "PSEXAMPLEEabcdefg111111",  
  "policyType": "STATIC",  
  "principal": {  
    "entityId": "janeFriends",  
    "entityType": "UserGroup"  }  
}
```

```
    },
    "resource": {
      "entityId": "vacationFolder",
      "entityType": "Album"
    }
  }
}
```

Example 2: To create a static policy that grants access to a resource to everyone

The following `create-policy` example creates a static policy with a policy scope that specifies only a resource.

```
aws verifiedpermissions create-policy \
  --definition file://definition2.txt \
  --policy-store-id PSEXAMPLEEabcdefg111111
```

Contents of file `definition2.txt`:

```
{
  "static": {
    "description": "Grant everyone access to the publicFolder Album",
    "statement": "permit(principal, action, resource in Album:\""publicFolder
  \");"
  }
}
```

Output:

```
{
  "createdDate": "2023-06-12T20:39:44.975897+00:00",
  "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
  "policyId": "PbfR73F8oh5MMfr9uRtFDB",
  "policyStoreId": "PSEXAMPLEEabcdefg222222",
  "policyType": "STATIC",
  "resource": {
    "entityId": "publicFolder",
    "entityType": "Album"
  }
}
```

Example 3: To create a template-linked policy that is associated with the specified template

The following `create-policy` example creates a template-linked policy using the specified policy template and associates the specified principal to use with the new template-linked policy.

```
aws verifiedpermissions create-policy \  
  --definition file://definition.txt \  
  --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of `definition.txt`:

```
{  
  "templateLinked": {  
    "policyTemplateId": "PTEXAMPLEabcdefg111111",  
    "principal": {  
      "entityType": "User",  
      "entityId": "alice"  
    }  
  }  
}
```

Output:

```
{  
  "createdDate": "2023-06-12T20:49:51.490211+00:00",  
  "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",  
  "policyId": "TPEXAMPLEabcdefg111111",  
  "policyStoreId": "PSEXAMPLEabcdefg111111",  
  "policyType": "TEMPLATE_LINKED",  
  "principal": {  
    "entityId": "alice",  
    "entityType": "User"  
  },  
  "resource": {  
    "entityId": "VacationPhoto94.jpg",  
    "entityType": "Photo"  
  }  
}
```

For more information about policies, see [Amazon Verified Permissions policies](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [CreatePolicy](#) in *AWS CLI Command Reference*.

delete-identity-source

The following code example shows how to use delete-identity-source.

AWS CLI

To delete an identity source

The following delete-identity-source example deletes the identity source that has the specified Id.

```
aws verifiedpermissions delete-identity-source \  
  --identity-source-id ISEXAMPLEabcdefg111111 \  
  --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about identity sources, see [Using Amazon Verified Permissions with identity providers](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [DeleteIdentitySource](#) in *AWS CLI Command Reference*.

delete-policy-store

The following code example shows how to use delete-policy-store.

AWS CLI

To delete a policy store

The following delete-policy-store example deletes the policy store that has the specified Id.

```
aws verifiedpermissions delete-policy-store \  
  --policy-store-id PSEXAMPLEabcdefg111111
```

This command produces no output.

For more information about policy stores, see [Amazon Verified Permissions policy stores](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [DeletePolicyStore](#) in *AWS CLI Command Reference*.

delete-policy-template

The following code example shows how to use delete-policy-template.

AWS CLI

To delete a policy template

The following delete-policy-template example deletes the policy template that has the specified Id.

```
aws verifiedpermissions delete-policy \  
  --policy-template-id PTEXTAMPEabcdefg111111 \  
  --policy-store-id PSEXAMPEabcdefg111111
```

This command produces no output.

For more information about policy templates, see [Amazon Verified Permissions policy templates](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [DeletePolicyTemplate](#) in *AWS CLI Command Reference*.

delete-policy

The following code example shows how to use delete-policy.

AWS CLI

To delete a static or template-linked policy

The following delete-policy example deletes the policy that has the specified Id.

```
aws verifiedpermissions delete-policy \  
  --policy-id SPEXAMPEabcdefg111111 \  
  --policy-store-id PSEXAMPEabcdefg111111
```

This command produces no output.

For more information about policies, see [Amazon Verified Permissions policies](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [DeletePolicy](#) in *AWS CLI Command Reference*.

get-identity-source

The following code example shows how to use `get-identity-source`.

AWS CLI

To retrieve details about an identity source

The following `get-identity-source` example displays the details for the identity source with the specified `Id`.

```
aws verifiedpermissions get-identity-source \  
  --identity-source ISEXAMPLEabcdefg111111 \  
  --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{  
  "createdDate": "2023-06-12T22:27:49.150035+00:00",  
  "details": {  
    "clientIds": [ "a1b2c3d4e5f6g7h8i9j0kalbmc" ],  
    "discoveryUrl": "https://cognito-idp.us-west-2.amazonaws.com/us-  
west-2_1a2b3c4d5",  
    "openIdIssuer": "COGNITO",  
    "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-  
west-2_1a2b3c4d5"  
  },  
  "identitySourceId": "ISEXAMPLEabcdefg111111",  
  "lastUpdatedDate": "2023-06-12T22:27:49.150035+00:00",  
  "policyStoreId": "PSEXAMPLEabcdefg111111",  
  "principalEntityType": "User"  
}
```

For more information about identity sources, see [Using Amazon Verified Permissions with identity providers](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [GetIdentitySource](#) in *AWS CLI Command Reference*.

get-policy-store

The following code example shows how to use `get-policy-store`.

AWS CLI

To retrieve details about a policy store

The following `get-policy-store` example displays the details for the policy store with the specified Id.

```
aws verifiedpermissions get-policy-store \  
  --policy-store-id PSEXAMPLEEabcdefg111111
```

Output:

```
{  
  "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/  
PSEXAMPLEEabcdefg111111",  
  "createdDate": "2023-06-05T20:16:46.225598+00:00",  
  "lastUpdatedDate": "2023-06-08T20:40:23.173691+00:00",  
  "policyStoreId": "PSEXAMPLEEabcdefg111111",  
  "validationSettings": { "mode": "OFF" }  
}
```

For more information about policy stores, see [Amazon Verified Permissions policy stores](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [GetPolicyStore](#) in *AWS CLI Command Reference*.

get-policy-template

The following code example shows how to use `get-policy-template`.

AWS CLI

To retrieve details about a policy template

The following `get-policy-template` example displays the details for the policy template with the specified ID.

```
aws verifiedpermissions get-policy-template \  
  --policy-template-id PTEXAMPLEEabcdefg111111 \  
  --policy-store-id PSEXAMPLEEabcdefg111111
```

Output:

```
{
  "createdDate": "2023-06-12T20:47:42.804511+00:00",
  "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
  "policyStoreId": "PSEXAMPLEabcdefg111111",
  "policyTemplateId": "PTEXAMPLEabcdefg111111",
  "statement": "permit(\n  principal in ?principal,\n  action == Action::\n  \"view\", \n  resource == Photo::\"VacationPhoto94.jpg\"\\n);"
}
```

For more information about policy templates, see [Amazon Verified Permissions policy templates](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [GetPolicyTemplate](#) in *AWS CLI Command Reference*.

get-policy

The following code example shows how to use `get-policy`.

AWS CLI**To retrieve details about a policy**

The following `get-policy` example displays the details for the policy with the specified ID.

```
aws verifiedpermissions get-policy \
  --policy-id PSEXAMPLEabcdefg111111 \
  --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
  "createdDate": "2023-06-12T20:33:37.382907+00:00",
  "definition": {
    "static": {
      "description": "Grant everyone of janeFriends UserGroup access to the vacationFolder Album",
      "statement": "permit(principal in UserGroup::\"janeFriends\", action, resource in Album::\"vacationFolder\" );"
    }
  },
}
```

```

    "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
    "policyId": "SPEXAMPLEabcdefg111111",
    "policyStoreId": "PSEXAMPLEabcdefg111111",
    "policyType": "STATIC",
    "principal": {
      "entityId": "janeFriends",
      "entityType": "UserGroup"
    },
    "resource": {
      "entityId": "vacationFolder",
      "entityType": "Album"
    }
  }
}

```

For more information about policies, see [Amazon Verified Permissions policies](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [GetPolicy](#) in *AWS CLI Command Reference*.

get-schema

The following code example shows how to use `get-schema`.

AWS CLI

To retrieve the schema in a policy store

The following `get-schema` example displays the details of the schema in the specified policy store.

```

aws verifiedpermissions get-schema \
  --policy-store-id PSEXAMPLEabcdefg111111

```

Output:

```

{
  "policyStoreId": "PSEXAMPLEabcdefg111111",
  "schema": "{\"MySampleNamespace\":{\"entityTypes\":{\"Employee\":{\"shape\":"
  "\":{\"attributes\":{\"jobLevel\":{\"type\":\"Long\"},\"name\":{\"type\":\"String\":"
  "\":\"Record\"}}},\"actions\":{\"remoteAccess\":{\"appliesTo\":{\"principalTypes\":"
  "\":[\"Employee\"]}}}}}}",
  "createdDate": "2023-06-14T17:47:13.999885+00:00",

```

```
"lastUpdatedDate": "2023-06-14T17:47:13.999885+00:00"
}
```

For more information about schema, see [Policy store schema](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [GetSchema](#) in *AWS CLI Command Reference*.

is-authorized-with-token

The following code example shows how to use `is-authorized-with-token`.

AWS CLI

Example 1: To request an authorization decision for a user request (allow)

The following `is-authorized-with-token` example requests an authorization decision for a user who was authenticated by Amazon Cognito. The request uses the identity token provided by Cognito rather than the access token. In this example, the specified information store is configured to return principals as entities of type `CognitoUser`.

```
aws verifiedpermissions is-authorized-with-token \
  --action actionId="View",actionType="Action" \
  --resource entityId="vacationPhoto94.jpg",entityType="Photo" \
  --policy-store-id PSEXAMPLEEabcdefg111111 \
  --identity-token "AbCdE12345...long.string...54321EdCbA"
```

The policy store contains a policy with the following statement that accepts identities from the specified Cognito user pool and application Id.

```
permit(
  principal == CognitoUser::"us-east-1_1a2b3c4d5|a1b2c3d4e5f6g7h8i9j0ka1bmc",
  action,
  resource == Photo::"VacationPhoto94.jpg"
);
```

Output:

```
{
  "decision":"Allow",
```

```
"determiningPolicies":[
  {
    "determiningPolicyId":"SPEXAMPLEabcdefg111111"
  }
],
"errors":[]
}
```

For more information about using identities from a Cognito user pool, see [Using Amazon Verified Permissions with identity providers](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [IsAuthorizedWithToken](#) in *AWS CLI Command Reference*.

is-authorized

The following code example shows how to use `is-authorized`.

AWS CLI

Example 1: To request an authorization decision for a user request (allow)

The following `is-authorized` example requests an authorization decision for a principal of type `User` named `Alice`, who wants to perform the `updatePhoto` operation, on a resource of type `Photo` named `VacationPhoto94.jpg`.

The response shows that the request is allowed by one policy.

```
aws verifiedpermissions is-authorized \
  --principal entityType=User,entityId=alice \
  --action actionType=Action,actionId=view \
  --resource entityType=Photo,entityId=VacationPhoto94.jpg \
  --policy-store-id SPEXAMPLEabcdefg111111
```

Output:

```
{
  "decision": "ALLOW",
  "determiningPolicies": [
    {
      "policyId": "SPEXAMPLEabcdefg111111"
    }
  ],
}
```

```
"errors": []
}
```

Example 2: To request an authorization decision for a user request (deny)

The following example is the same as the previous example, except that the principal is `User::"Bob"`. The policy store doesn't contain any policy that allows that user access to `Album::"alice_folder"`.

The output indicates that the Deny was implicit because the list of `DeterminingPolicies` is empty.

```
aws verifiedpermissions create-policy \
  --definition file://definition2.txt \
  --policy-store-id PSEXAMPLEEabcdefg111111
```

Output:

```
{
  "decision": "DENY",
  "determiningPolicies": [],
  "errors": []
}
```

For more information, see the [Amazon Verified Permissions User Guide](#).

- For API details, see [IsAuthorized](#) in *AWS CLI Command Reference*.

list-identity-sources

The following code example shows how to use `list-identity-sources`.

AWS CLI

To list the available identity sources

The following `list-identity-sources` example lists all identity sources in the specified policy store.

```
aws verifiedpermissions list-identity-sources \
```

```
--policy-store-id PSEXAMPLEEabcdefg111111
```

Output:

```
{
  "identitySources": [
    {
      "createdDate": "2023-06-12T22:27:49.150035+00:00",
      "details": {
        "clientIds": [ "a1b2c3d4e5f6g7h8i9j0kalbmc" ],
        "discoveryUrl": "https://cognito-idp.us-west-2.amazonaws.com/us-west-2_1a2b3c4d5",
        "openIdIssuer": "COGNITO",
        "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/us-west-2_1a2b3c4d5"
      },
      "identitySourceId": "ISEXAMPLEEabcdefg111111",
      "lastUpdatedDate": "2023-06-12T22:27:49.150035+00:00",
      "policyStoreId": "PSEXAMPLEEabcdefg111111",
      "principalEntityType": "User"
    }
  ]
}
```

For more information about identity sources, see [Using Amazon Verified Permissions with identity providers](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [ListIdentitySources](#) in *AWS CLI Command Reference*.

list-policies

The following code example shows how to use `list-policies`.

AWS CLI

To list the available policies

The following `list-policies` example lists all policies in the specified policy store.

```
aws verifiedpermissions list-policies \  
  --policy-store-id PSEXAMPLEEabcdefg111111
```

Output:

```
{
  "policies": [
    {
      "createdDate": "2023-06-12T20:33:37.382907+00:00",
      "definition": {
        "static": {
          "description": "Grant everyone of janeFriends UserGroup access
to the vacationFolder Album"
        }
      },
      "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
      "policyId": "SPEXAMPLEabcdefg111111",
      "policyStoreId": "PSEXAMPLEabcdefg111111",
      "policyType": "STATIC",
      "principal": {
        "entityId": "janeFriends",
        "entityType": "UserGroup"
      },
      "resource": {
        "entityId": "vacationFolder",
        "entityType": "Album"
      }
    },
    {
      "createdDate": "2023-06-12T20:39:44.975897+00:00",
      "definition": {
        "static": {
          "description": "Grant everyone access to the publicFolder Album"
        }
      },
      "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
      "policyId": "SPEXAMPLEabcdefg222222",
      "policyStoreId": "PSEXAMPLEabcdefg111111",
      "policyType": "STATIC",
      "resource": {
        "entityId": "publicFolder",
        "entityType": "Album"
      }
    },
    {
      "createdDate": "2023-06-12T20:49:51.490211+00:00",
      "definition": {
```

```
        "templateLinked": {
            "policyTemplateId": "PTEXAMPLEEabcdefg111111"
        }
    },
    "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",
    "policyId": "SPEXAMPLEEabcdefg333333",
    "policyStoreId": "PSEXAMPLEEabcdefg111111",
    "policyType": "TEMPLATE_LINKED",
    "principal": {
        "entityId": "alice",
        "entityType": "User"
    },
    "resource": {
        "entityId": "VacationPhoto94.jpg",
        "entityType": "Photo"
    }
}
]
```

For more information about policies, see [Amazon Verified Permissions policies](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [ListPolicies](#) in *AWS CLI Command Reference*.

list-policy-stores

The following code example shows how to use `list-policy-stores`.

AWS CLI

To list the available policy stores

The following `list-policy-stores` example lists all policy stores in the AWS Region. All commands for Verified Permissions except `create-policy-store` and `list-policy-stores` require that you specify the Id of the policy store you want to work with.

```
aws verifiedpermissions list-policy-stores
```

Output:

```
{
```

```
"policyStores": [  
  {  
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/  
PSEXAMPLEabcdefg111111",  
    "createdDate": "2023-06-05T20:16:46.225598+00:00",  
    "policyStoreId": "PSEXAMPLEabcdefg111111"  
  },  
  {  
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/  
PSEXAMPLEabcdefg222222",  
    "createdDate": "2023-06-08T18:09:37.364356+00:00",  
    "policyStoreId": "PSEXAMPLEabcdefg222222"  
  },  
  {  
    "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/  
PSEXAMPLEabcdefg333333",  
    "createdDate": "2023-06-08T18:09:46.920600+00:00",  
    "policyStoreId": "PSEXAMPLEabcdefg333333"  
  }  
]
```

For more information about policy stores, see [Amazon Verified Permissions policy stores](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [ListPolicyStores](#) in *AWS CLI Command Reference*.

list-policy-templates

The following code example shows how to use `list-policy-templates`.

AWS CLI

To list the available policy templates

The following `list-policy-templates` example lists all policy templates in the specified policy store.

```
aws verifiedpermissions list-policy-templates \  
  --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
  "policyTemplates": [
    {
      "createdDate": "2023-06-12T20:47:42.804511+00:00",
      "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",
      "policyStoreId": "PSEXAMPLEabcdefg111111",
      "policyTemplateId": "PTEXAMPLEabcdefg111111"
    }
  ]
}
```

For more information about policy templates, see [Amazon Verified Permissions policy templates](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [ListPolicyTemplates](#) in *AWS CLI Command Reference*.

put -schema

The following code example shows how to use `put -schema`.

AWS CLI

To save a schema to a policy store

The following `put -schema` example creates or replaces the schema in the specified policy store.

The `cedarJson` parameter in the input file takes a string representation of a JSON object. It contains embedded quotation marks (") within the outermost quotation mark pair. This requires you to convert the JSON to a string by preceding all embedded quotation marks with a backslash character (\) and combining all lines into a single text line with no line breaks.

Example strings can be displayed wrapped across multiple lines here for readability, but the operation requires the parameters be submitted as single line strings.

```
aws verifiedpermissions put-schema --definition file://schema.txt --policy-store-id
PSEXAMPLEabcdefg111111
```

Contents of `schema.txt`:

```
{
  "cedarJson": "{\"MySampleNamespace\": {\"actions\": {\"remoteAccess\": {
```

```

    \"appliesTo\": {\"principalTypes\": [\"Employee\"]}},\"entityTypes\": {
    \"Employee\": {\"shape\": {\"attributes\": {\"jobLevel\": {\"type\":
    \"Long\"}},\"name\": {\"type\": \"String\"}},\"type\": \"Record\"}}}}}"
  }

```

Output:

```

{
  "policyStoreId": "PSEXAMPLEabcdefg111111",
  "namespaces": [
    "MySampleNamespace"
  ],
  "createdDate": "2023-06-14T17:47:13.999885+00:00",
  "lastUpdatedDate": "2023-06-14T17:47:13.999885+00:00"
}

```

For more information about schema, see [Policy store schema](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [PutSchema](#) in *AWS CLI Command Reference*.

update-identity-source

The following code example shows how to use `update-identity-source`.

AWS CLI

To update an identity source

The following `update-identity-source` example modifies the specified identity source by providing a new Cognito user pool configuration and changing the entity type returned by the identity source.

```

aws verifiedpermissions update-identity-source
  --identity-source-id ISEXAMPLEabcdefg111111 \
  --update-configuration file://config.txt \
  --principal-entity-type "Employee" \
  --policy-store-id PSEXAMPLEabcdefg111111

```

Contents of `config.txt`:

```

{

```

```
    "cognitoUserPoolConfiguration": {
      "userPoolArn": "arn:aws:cognito-idp:us-west-2:123456789012:userpool/
us-west-2_1a2b3c4d5",
      "clientIds":["a1b2c3d4e5f6g7h8i9j0kalbmc"]
    }
  }
```

Output:

```
{
  "createdDate": "2023-05-19T20:30:28.214829+00:00",
  "identitySourceId": "ISEXAMPLEabcdefg111111",
  "lastUpdatedDate": "2023-05-19T20:30:28.214829+00:00",
  "policyStoreId": "PSEXAMPLEabcdefg111111"
}
```

For more information about identity sources, see [Using Amazon Verified Permissions with identity providers](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [UpdateIdentitySource](#) in *AWS CLI Command Reference*.

update-policy-store

The following code example shows how to use `update-policy-store`.

AWS CLI

To update a policy store

The following `update-policy-store` example modifies a policy store by changing its validation setting.

```
aws verifiedpermissions update-policy-store \
  --validation-settings "mode=STRICT" \
  --policy-store-id PSEXAMPLEabcdefg111111
```

Output:

```
{
  "arn": "arn:aws:verifiedpermissions::123456789012:policy-store/
PSEXAMPLEabcdefg111111",
  "createdDate": "2023-05-16T17:41:29.103459+00:00",
```

```
"lastUpdatedDate": "2023-05-16T17:41:29.103459+00:00",  
"policyStoreId": "PSEXAMPLEEabcdefg111111"  
}
```

For more information about policy stores, see [Amazon Verified Permissions policy stores](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [UpdatePolicyStore](#) in *AWS CLI Command Reference*.

update-policy-template

The following code example shows how to use `update-policy-template`.

AWS CLI

Example 1: To update a policy template

The following `update-policy-template` example modifies the specified template-linked policy to replace its policy statement.

```
aws verifiedpermissions update-policy-template \  
  --policy-template-id PTEXAMPLEEabcdefg111111 \  
  --statement file://template1.txt \  
  --policy-store-id PSEXAMPLEEabcdefg111111
```

Contents of file `template1.txt`:

```
permit(  
  principal in ?principal,  
  action == Action::"view",  
  resource == Photo::"VacationPhoto94.jpg"  
);
```

Output:

```
{  
  "createdDate": "2023-06-12T20:47:42.804511+00:00",  
  "lastUpdatedDate": "2023-06-12T20:47:42.804511+00:00",  
  "policyStoreId": "PSEXAMPLEEabcdefg111111",  
  "policyTemplateId": "PTEXAMPLEEabcdefg111111"  
}
```

For more information about policy templates, see [Amazon Verified Permissions policy templates](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [UpdatePolicyTemplate](#) in *AWS CLI Command Reference*.

update-policy

The following code example shows how to use `update-policy`.

AWS CLI

Example 1: To create a static policy

The following `create-policy` example creates a static policy with a policy scope that specifies both a principal and a resource.

```
aws verifiedpermissions create-policy \  
  --definition file://definition.txt \  
  --policy-store-id PSEXAMPLEEabcdefg111111
```

The `statement` parameter takes a string representation of a JSON object. It contains embedded quotation marks (") within the outermost quotation mark pair. This requires you to convert the JSON to a string by preceding all embedded quotation marks with a backslash character (\) and combining all lines into a single text line with no line breaks.

Example strings can be displayed wrapped across multiple lines here for readability, but the operation requires the parameters be submitted as single line strings.

Contents of file `definition.txt`:

```
{  
  "static": {  
    "description": "Grant everyone of janeFriends UserGroup access to the  
vacationFolder Album",  
    "statement": "permit(principal in UserGroup::\"janeFriends\", action,  
resource in Album::\"vacationFolder\" );"  
  }  
}
```

Output:

```
{
  "createdDate": "2023-06-12T20:33:37.382907+00:00",
  "lastUpdatedDate": "2023-06-12T20:33:37.382907+00:00",
  "policyId": "SPEXAMPLEabcdefg111111",
  "policyStoreId": "PSEXAMPLEabcdefg111111",
  "policyType": "STATIC",
  "principal": {
    "entityId": "janeFriends",
    "entityType": "UserGroup"
  },
  "resource": {
    "entityId": "vacationFolder",
    "entityType": "Album"
  }
}
```

Example 2: To create a static policy that grants access to a resource to everyone

The following create-policy example creates a static policy with a policy scope that specifies only a resource.

```
aws verifiedpermissions create-policy \
  --definition file://definition2.txt \
  --policy-store-id PSEXAMPLEabcdefg111111
```

Contents of file definition2.txt:

```
{
  "static": {
    "description": "Grant everyone access to the publicFolder Album",
    "statement": "permit(principal, action, resource in Album:\""publicFolder
  \");"
  }
}
```

Output:

```
{
  "createdDate": "2023-06-12T20:39:44.975897+00:00",
  "lastUpdatedDate": "2023-06-12T20:39:44.975897+00:00",
  "policyId": "PbfR73F8oh5MMfr9uRtFDB",
```

```

    "policyStoreId": "PSEXAMPLEEabcdefg222222",
    "policyType": "STATIC",
    "resource": {
      "entityId": "publicFolder",
      "entityType": "Album"
    }
  }
}

```

Example 3: To create a template-linked policy that is associated with the specified template

The following `create-policy` example creates a template-linked policy using the specified policy template and associates the specified principal to use with the new template-linked policy.

```

aws verifiedpermissions create-policy \
  --definition file://definition2.txt \
  --policy-store-id PSEXAMPLEEabcdefg111111

```

Contents of `definition3.txt`:

```

{
  "templateLinked": {
    "policyTemplateId": "PTEXAMPLEEabcdefg111111",
    "principal": {
      "entityType": "User",
      "entityId": "alice"
    }
  }
}

```

Output:

```

{
  "createdDate": "2023-06-12T20:49:51.490211+00:00",
  "lastUpdatedDate": "2023-06-12T20:49:51.490211+00:00",
  "policyId": "TPEXAMPLEEabcdefg111111",
  "policyStoreId": "PSEXAMPLEEabcdefg111111",
  "policyType": "TEMPLATE_LINKED",
  "principal": {
    "entityId": "alice",
    "entityType": "User"
  },
}

```

```
"resource": {
  "entityId": "VacationPhoto94.jpg",
  "entityType": "Photo"
}
```

For more information about policies, see [Amazon Verified Permissions policies](#) in the *Amazon Verified Permissions User Guide*.

- For API details, see [UpdatePolicy](#) in *AWS CLI Command Reference*.

VPC Lattice examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with VPC Lattice.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-listener

The following code example shows how to use `create-listener`.

AWS CLI

To create a listener

The following `create-listener` example creates an HTTPS listener with a default rule that forwards traffic to the specified VPC Lattice target group.

```
aws vpc-lattice create-listener \  
  --name my-service-listener \  
  --protocol HTTPS \  
  --port 443 \  
  --service-identifier svc-0285b53b2eEXAMPLE \  
  --default-action file://listener-config.json
```

Contents of listener-config.json:

```
{  
  "forward": {  
    "targetGroups": [  
      {  
        "targetGroupIdentifier": "tg-0eaa4b9ab4EXAMPLE"  
      }  
    ]  
  }  
}
```

Output:

```
{  
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/  
svc-0285b53b2eEXAMPLE/listener/listener-07cc7fb0abEXAMPLE",  
  "defaultAction": {  
    "forward": {  
      "targetGroups": [  
        {  
          "targetGroupIdentifier": "tg-0eaa4b9ab4EXAMPLE",  
          "weight": 100  
        }  
      ]  
    }  
  },  
  "id": "listener-07cc7fb0abEXAMPLE",  
  "name": "my-service-listener",  
  "port": 443,  
  "protocol": "HTTPS",  
  "serviceArn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/  
svc-0285b53b2eEXAMPLE",  
  "serviceId": "svc-0285b53b2eEXAMPLE"  
}
```

For more information, see [Listeners](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [CreateListener](#) in *AWS CLI Command Reference*.

create-service-network-service-association

The following code example shows how to use `create-service-network-service-association`.

AWS CLI

To create a service association

The following `create-service-network-service-association` example associates the specified service with the specified service network.

```
aws vpc-lattice create-service-network-service-association \  
  --service-identifier svc-0285b53b2eEXAMPLE \  
  --service-network-identifier sn-080ec7dc93EXAMPLE
```

Output:

```
{  
  "arn": "arn:aws:vpc-lattice:us-  
east-2:123456789012:servicenetworkserviceassociation/snsa-0e16955a8cEXAMPLE",  
  "createdBy": "123456789012",  
  "dnsEntry": {  
    "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-  
svcs.us-east-2.on.aws",  
    "hostedZoneId": "Z09127221KTH2CEXAMPLE"  
  },  
  "id": "snsa-0e16955a8cEXAMPLE",  
  "status": "CREATE_IN_PROGRESS"  
}
```

For more information, see [Manage service associations](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [CreateServiceNetworkServiceAssociation](#) in *AWS CLI Command Reference*.

create-service-network-vpc-association

The following code example shows how to use `create-service-network-vpc-association`.

AWS CLI

To create a VPC association

The following `create-service-network-vpc-association` example associates the specified vpc with the specified service network. The specified security group controls which resources in the VPC can access the service network and its services.

```
aws vpc-lattice create-service-network-vpc-association \  
  --vpc-identifier vpc-0a1b2c3d4eEXAMPLE \  
  --service-network-identifier sn-080ec7dc93EXAMPLE \  
  --security-group-ids sg-0aee16bc6cEXAMPLE
```

Output:

```
{  
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetworkvpcassociation/  
snva-0821fc8631EXAMPLE",  
  "createdBy": "123456789012",  
  "id": "snva-0821fc8631EXAMPLE",  
  "securityGroupIds": [  
    "sg-0aee16bc6cEXAMPLE"  
  ],  
  "status": "CREATE_IN_PROGRESS"  
}
```

For more information, see [Manage VPC associations](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [CreateServiceNetworkVpcAssociation](#) in *AWS CLI Command Reference*.

create-service-network

The following code example shows how to use `create-service-network`.

AWS CLI

To create a service network

The following `create-service-network` example creates a service network with the specified name.

```
aws vpc-lattice create-service-network \  
  --name my-service-network
```

```
--name my-service-network
```

Output:

```
{
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
  "authType": "NONE",
  "id": "sn-080ec7dc93EXAMPLE",
  "name": "my-service-network"
}
```

For more information, see [Service networks](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [CreateServiceNetwork](#) in *AWS CLI Command Reference*.

create-service

The following code example shows how to use `create-service`.

AWS CLI

To create a service

The following `create-service` example creates a service with the specified name.

```
aws vpc-lattice create-service \
  --name my-lattice-service
```

Output:

```
{
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
  "authType": "NONE",
  "dnsEntry": {
    "domainName": "my-lattice-service-0285b53b2eEXAMPLE.1a2b3c4.vpc-lattice-
svcs.us-east-2.on.aws",
    "hostedZoneId": "Z09127221KTH2CEXAMPLE"
  },
  "id": "svc-0285b53b2eEXAMPLE",
  "name": "my-lattice-service",
  "status": "CREATE_IN_PROGRESS"
}
```

```
}
```

For more information, see [Services in VPC Lattice](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [CreateService](#) in *AWS CLI Command Reference*.

create-target-group

The following code example shows how to use `create-target-group`.

AWS CLI

Example 1: To create a target group of type INSTANCE

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \  
  --name my-lattice-target-group-instance \  
  --type INSTANCE \  
  --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{  
  "port": 443,  
  "protocol": "HTTPS",  
  "protocolVersion": "HTTP1",  
  "vpcIdentifier": "vpc-f1663d9868EXAMPLE"  
}
```

Output:

```
{  
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/  
tg-0eaa4b9ab4EXAMPLE",  
  "config": {  
    "healthCheck": {  
      "enabled": true,  
      "healthCheckIntervalSeconds": 30,  
      "healthCheckTimeoutSeconds": 5,  
      "healthyThresholdCount": 5,  
    }  
  }  
}
```

```

    "matcher": {
      "httpCode": "200"
    },
    "path": "/",
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "unhealthyThresholdCount": 2
  },
  "port": 443,
  "protocol": "HTTPS",
  "protocolVersion": "HTTP1",
  "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
},
"id": "tg-0eaa4b9ab4EXAMPLE",
"name": "my-lattice-target-group-instance",
"status": "CREATE_IN_PROGRESS",
"type": "INSTANCE"
}

```

Example 2: To create a target group of type IP

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```

aws vpc-lattice create-target-group \
  --name my-lattice-target-group-ip \
  --type IP \
  --config file://tg-config.json

```

Contents of `tg-config.json`:

```

{
  "ipAddressType": "IPV4",
  "port": 443,
  "protocol": "HTTPS",
  "protocolVersion": "HTTP1",
  "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}

```

Output:

```

{

```

```

    "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
    "config": {
      "healthCheck": {
        "enabled": true,
        "healthCheckIntervalSeconds": 30,
        "healthCheckTimeoutSeconds": 5,
        "healthyThresholdCount": 5,
        "matcher": {
          "httpCode": "200"
        },
        "path": "/",
        "protocol": "HTTPS",
        "protocolVersion": "HTTP1",
        "unhealthyThresholdCount": 2
      },
      "ipAddressType": "IPV4",
      "port": 443,
      "protocol": "HTTPS",
      "protocolVersion": "HTTP1",
      "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
    },
    "id": "tg-0eaa4b9ab4EXAMPLE",
    "name": "my-lattice-target-group-ip",
    "status": "CREATE_IN_PROGRESS",
    "type": "IP"
  }

```

Example 3: To create a target group of type LAMBDA

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```

aws vpc-lattice create-target-group \
  --name my-lattice-target-group-lambda \
  --type LAMBDA

```

Output:

```

{
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",

```

```
"id": "tg-0eaa4b9ab4EXAMPLE",
"name": "my-lattice-target-group-lambda",
"status": "CREATE_IN_PROGRESS",
"type": "LAMBDA"
}
```

Example 4: To create a target group of type ALB

The following `create-target-group` example creates a target group with the specified name, type, and configuration.

```
aws vpc-lattice create-target-group \
  --name my-lattice-target-group-alb \
  --type ALB \
  --config file://tg-config.json
```

Contents of `tg-config.json`:

```
{
  "port": 443,
  "protocol": "HTTPS",
  "protocolVersion": "HTTP1",
  "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
}
```

Output:

```
{
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-0eaa4b9ab4EXAMPLE",
  "config": {
    "port": 443,
    "protocol": "HTTPS",
    "protocolVersion": "HTTP1",
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"
  },
  "id": "tg-0eaa4b9ab4EXAMPLE",
  "name": "my-lattice-target-group-alb",
  "status": "CREATE_IN_PROGRESS",
  "type": "ALB"
}
```

For more information, see [Target groups](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [CreateTargetGroup](#) in *AWS CLI Command Reference*.

delete-auth-policy

The following code example shows how to use delete-auth-policy.

AWS CLI

To delete an auth policy

The following delete-auth-policy example deletes the auth policy for the specified service.

```
aws vpc-lattice delete-auth-policy \  
  --resource-identifier svc-0285b53b2eEXAMPLE
```

This command produces no output.

For more information, see [Auth policies](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [DeleteAuthPolicy](#) in *AWS CLI Command Reference*.

delete-listener

The following code example shows how to use delete-listener.

AWS CLI

To delete a listener

The following delete-listener example deletes the specified listener.

```
aws vpc-lattice delete-listener \  
  --listener-identifier listener-07cc7fb0abEXAMPLE \  
  --service-identifier svc-0285b53b2eEXAMPLE
```

This command produces no output.

For more information, see [Listeners](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [DeleteListener](#) in *AWS CLI Command Reference*.

delete-service-network-service-association

The following code example shows how to use `delete-service-network-service-association`.

AWS CLI

To delete a service association

The following `delete-service-network-service-association` example disassociates the specified service association.

```
aws vpc-lattice delete-service-network-service-association \  
  --service-network-service-association-identifier sns-a-031fabb4d8EXAMPLE
```

Output:

```
{  
  "arn": "arn:aws:vpc-lattice:us-  
east-2:123456789012:servicenetworkserviceassociation/sns-a-031fabb4d8EXAMPLE",  
  "id": "sns-a-031fabb4d8EXAMPLE",  
  "status": "DELETE_IN_PROGRESS"  
}
```

For more information, see [Manage service associations](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [DeleteServiceNetworkServiceAssociation](#) in *AWS CLI Command Reference*.

delete-service-network-vpc-association

The following code example shows how to use `delete-service-network-vpc-association`.

AWS CLI

To delete a VPC association

The following `delete-service-network-vpc-association` example disassociates the specified VPC association.

```
aws vpc-lattice delete-service-network-vpc-association \  
  --service-network-vpc-association-identifier snva-0821fc8631EXAMPLE
```

Output:

```
{
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",
  "id": "snva-0821fc8631EXAMPLE",
  "status": "DELETE_IN_PROGRESS"
}
```

For more information, see [Manage VPC associations](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [DeleteServiceNetworkVpcAssociation](#) in *AWS CLI Command Reference*.

delete-service-network

The following code example shows how to use `delete-service-network`.

AWS CLI**To delete a service network**

The following `delete-service-network` example deletes the specified service network.

```
aws vpc-lattice delete-service-network \
  --service-network-identifier sn-080ec7dc93EXAMPLE
```

This command produces no output.

For more information, see [Service networks](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [DeleteServiceNetwork](#) in *AWS CLI Command Reference*.

delete-service

The following code example shows how to use `delete-service`.

AWS CLI**To delete a service**

The following `delete-service` example deletes the specified service.

```
aws vpc-lattice delete-service \  
  --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{  
  "arn": "arn:aws:vpc-lattice:us-west-2:123456789012:service/  
svc-0285b53b2eEXAMPLE",  
  "id": "svc-0285b53b2eEXAMPLE",  
  "name": "my-lattice-service",  
  "status": "DELETE_IN_PROGRESS"  
}
```

For more information, see [Services in VPC Lattice](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [DeleteService](#) in *AWS CLI Command Reference*.

delete-target-group

The following code example shows how to use delete-target-group.

AWS CLI

To delete a target group

The following delete-target-group example deletes the specified target group.

```
aws vpc-lattice delete-target-group \  
  --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{  
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/  
tg-0eaa4b9ab4EXAMPLE",  
  "id": "tg-0eaa4b9ab4EXAMPLE",  
  "status": "DELETE_IN_PROGRESS"  
}
```

For more information, see [Target groups](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [DeleteTargetGroup](#) in *AWS CLI Command Reference*.

deregister-targets

The following code example shows how to use `deregister-targets`.

AWS CLI

To deregister a target

The following `deregister-targets` example deregisters the specified target from the specified target group.

```
aws vpc-lattice deregister-targets \  
  --targets i-07dd579bc5EXAMPLE \  
  --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{  
  "successful": [  
    {  
      "id": "i-07dd579bc5EXAMPLE",  
      "port": 443  
    }  
  ],  
  "unsuccessful": []  
}
```

For more information, see [Register targets](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [DeregisterTargets](#) in *AWS CLI Command Reference*.

get-auth-policy

The following code example shows how to use `get-auth-policy`.

AWS CLI

To get information about an auth policy

The following `get-auth-policy` example gets information about the auth policy for the specified service.

```
aws vpc-lattice get-auth-policy \  
  --resource-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{

For more information, see [Auth policies](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [GetAuthPolicy](#) in *AWS CLI Command Reference*.

get-listener

The following code example shows how to use `get-listener`.

AWS CLI

To get information about a service listener

The following `get-listener` example gets information about the specified listener for the specified service.

```
aws vpc-lattice get-listener \  
  --listener-identifier listener-0ccf55918cEXAMPLE \  
  --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{  
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/  
svc-0285b53b2eEXAMPLE/listener/listener-0ccf55918cEXAMPLE",  
  "createdAt": "2023-05-07T05:08:45.192Z",  
  "defaultAction": {
```

```

    "forward": {
      "targetGroups": [
        {
          "targetGroupIdentifier": "tg-0ff213abb6EXAMPLE",
          "weight": 1
        }
      ]
    },
    "id": "listener-0ccf55918cEXAMPLE",

svc-0285b53b2eEXAMPLE",
    "serviceId": "svc-0285b53b2eEXAMPLE"
  }
}

```

For more information, see [Define routing](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [GetListener](#) in *AWS CLI Command Reference*.

get-service-network-service-association

The following code example shows how to use `get-service-network-service-association`.

AWS CLI

To get information about a service association

The following `get-service-network-service-association` example gets information about the specified service association.

```

aws vpc-lattice get-service-network-service-association \
  --service-network-service-association-identifier sns-a-031fabb4d8EXAMPLE

```

Output:

```

{
  "arn": "arn:aws:vpc-lattice:us-
east-2:123456789012:servicenetworkserviceassociation/sns-a-031fabb4d8EXAMPLE",

    "serviceNetworkId": "sn-080ec7dc93EXAMPLE",
    "serviceNetworkName": "my-service-network",
    "status": "ACTIVE"
  }
}

```

For more information, see [Manage service associations](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [GetServiceNetworkServiceAssociation](#) in *AWS CLI Command Reference*.

get-service-network-vpc-association

The following code example shows how to use `get-service-network-vpc-association`.

AWS CLI

To get information about a VPC association

The following `get-service-network-vpc-association` example gets information about the specified VPC association.

```

aws vpc-lattice get-service-network-vpc-association \
  --service-network-vpc-association-identifier snva-0821fc8631EXAMPLE

```

Output:

```

{
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetworkvpcassociation/
snva-0821fc8631EXAMPLE",

```

```

    "serviceNetworkId": "sn-080ec7dc93EXAMPLE",
    "serviceNetworkName": "my-service-network",
    "status": "ACTIVE",
    "vpcId": "vpc-0a1b2c3d4eEXAMPLE"
  }

```

For more information, see [Manage VPC associations](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [GetServiceNetworkVpcAssociation](#) in *AWS CLI Command Reference*.

get-service-network

The following code example shows how to use `get-service-network`.

AWS CLI

To get information about a service network

The following `get-service-network` example gets information about the specified service network.

```

aws vpc-lattice get-service-network \
  --service-network-identifier sn-080ec7dc93EXAMPLE

```

Output:

```

{
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/
sn-080ec7dc93EXAMPLE",
  "authType": "AWS_IAM",
  "createdAt": "2023-05-05T15:26:08.417Z",
  "id": "sn-080ec7dc93EXAMPLE",

```

```
"name": "my-service-network",
"numberOfAssociatedServices": 2,
"numberOfAssociatedVPCs": 3
}
```

For more information, see [Service networks](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [GetServiceNetwork](#) in *AWS CLI Command Reference*.

get-service

The following code example shows how to use `get-service`.

AWS CLI

To get information about a service

The following `get-service` example gets information about the specified service.

```
aws vpc-lattice get-service \
  --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE",
  "authType": "AWS_IAM",
  "createdAt": "2023-05-05T21:35:29.339Z",
  "dnsEntry": {
    "domainName": "my-lattice-service-0285b53b2eEXAMPLE.7d67968.vpc-lattice-
svcs.us-east-2.on.aws",
    "hostedZoneId": "Z09127221KTH2CFU0HIZH"
  },
  "id": "svc-0285b53b2eEXAMPLE",
  "lastUpdatedAt": "2023-05-05T21:35:29.339Z",
  "name": "my-lattice-service",
  "status": "ACTIVE"
}
```

For more information, see [Services](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [GetService](#) in *AWS CLI Command Reference*.

get-target-group

The following code example shows how to use `get-target-group`.

AWS CLI

To get information about a target group

The following `get-target-group` example gets information about the specified target group, which has a target type of `INSTANCE`.

```
aws vpc-lattice get-target-group \  
  --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{  
  "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/  
tg-0eaa4b9ab4EXAMPLE",  
  "config": {  
    "healthCheck": {  
      "enabled": true,  
      "healthCheckIntervalSeconds": 30,  
      "healthCheckTimeoutSeconds": 5,  
      "healthyThresholdCount": 5,  
      "matcher": {  
        "httpCode": "200"  
      },  
      "path": "/",  
      "protocol": "HTTPS",  
      "protocolVersion": "HTTP1",  
      "unhealthyThresholdCount": 2  
    },  
    "port": 443,  
    "protocol": "HTTPS",  
    "protocolVersion": "HTTP1",  
    "vpcIdentifier": "vpc-f1663d9868EXAMPLE"  
  },  
  "createdAt": "2023-05-06T04:41:04.122Z",  
  "id": "tg-0eaa4b9ab4EXAMPLE",  
  "lastUpdatedAt": "2023-05-06T04:41:04.122Z",  
  "name": "my-target-group",  
  "serviceArns": [  

```

```
    "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE"  
  ],  
  "status": "ACTIVE",  
  "type": "INSTANCE"  
}
```

For more information, see [Target groups](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [GetTargetGroup](#) in *AWS CLI Command Reference*.

list-listeners

The following code example shows how to use `list-listeners`.

AWS CLI

To list service listeners

The following `list-listeners` example lists the listeners for the specified service.

```
aws vpc-lattice list-listeners \  
  --service-identifier svc-0285b53b2eEXAMPLE
```

Output:

```
{  
  "items": [  
    {  
      "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:service/  
svc-0285b53b2eEXAMPLE/listener/listener-0ccf55918cEXAMPLE",  
      "createdAt": "2023-05-07T05:08:45.192Z",  
      "id": "listener-0ccf55918cEXAMPLE",  
      "lastUpdatedAt": "2023-05-07T05:08:45.192Z",  
      "name": "http-80",  
      "port": 80,  
      "protocol": "HTTP"  
    }  
  ]  
}
```

For more information, see [Define routing](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [ListListeners](#) in *AWS CLI Command Reference*.

list-service-network-service-associations

The following code example shows how to use `list-service-network-service-associations`.

AWS CLI

To list service associations

The following `list-service-network-service-associations` example lists the service associations for the specified service network. The `--query` option scopes the output to the IDs of the service associations.

```
aws vpc-lattice list-service-network-service-associations \  
  --service-network-identifier sn-080ec7dc93EXAMPLE \  
  --query items[*].id
```

Output:

```
[  
  "snsa-031fabb4d8EXAMPLE",  
  "snsa-0e16955a8cEXAMPLE"  
]
```

For more information, see [Manage service associations](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [ListServiceNetworkServiceAssociations](#) in *AWS CLI Command Reference*.

list-service-network-vpc-associations

The following code example shows how to use `list-service-network-vpc-associations`.

AWS CLI

To list VPC associations

The following `list-service-network-vpc-associations` example lists the VPC associations for the specified service network. The `--query` option scopes the output to the IDs of the VPC associations.

```
aws vpc-lattice list-service-network-vpc-associations \  
  --service-network-identifier sn-080ec7dc93EXAMPLE \  
  --query items[*].id
```

Output:

```
[  
  "snva-0821fc8631EXAMPLE",  
  "snva-0c5dcb60d6EXAMPLE"  
]
```

For more information, see [Manage VPC associations](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [ListServiceNetworkVpcAssociations](#) in *AWS CLI Command Reference*.

list-service-networks

The following code example shows how to use `list-service-networks`.

AWS CLI

To list your service networks

The following `list-service-networks` example lists the service networks owned or shared with the calling account. The `--query` option scopes the results to the Amazon Resource Names (ARN) of the service networks.

```
aws vpc-lattice list-service-networks \  
  --query items[*].arn
```

Output:

```
[  
  "arn:aws:vpc-lattice:us-east-2:123456789012:servicenetwork/  
sn-080ec7dc93EXAMPLE",  
  "arn:aws:vpc-lattice:us-east-2:111122223333:servicenetwork/sn-0ec4d436cfEXAMPLE"  
]
```

For more information, see [Service networks](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [ListServiceNetworks](#) in *AWS CLI Command Reference*.

list-services

The following code example shows how to use `list-services`.

AWS CLI

To list your services

The following `list-services` example lists the services owned or shared with the calling account. The `--query` option scopes the results to the Amazon Resource Names (ARN) of the services.

```
aws vpc-lattice list-services \  
  --query items[*].arn
```

Output:

```
[  
  "arn:aws:vpc-lattice:us-east-2:123456789012:service/svc-0285b53b2eEXAMPLE",  
  "arn:aws:vpc-lattice:us-east-2:111122223333:service/svc-0b8ac96550EXAMPLE"  
]
```

For more information, see [Services](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [ListServices](#) in *AWS CLI Command Reference*.

list-target-groups

The following code example shows how to use `list-target-groups`.

AWS CLI

To list your target groups

The following `list-target-groups` example lists the target groups with a target type of LAMBDA.

```
aws vpc-lattice list-target-groups \  
  --target-group-type LAMBDA
```

Output:

```
{
  "items": [
    {
      "arn": "arn:aws:vpc-lattice:us-east-2:123456789012:targetgroup/
tg-045c1b7d9dEXAMPLE",
      "createdAt": "2023-05-06T05:22:16.637Z",
      "id": "tg-045c1b7d9dEXAMPLE",
      "lastUpdatedAt": "2023-05-06T05:22:16.637Z",
      "name": "my-target-group-lam",
      "serviceArns": [
        "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE"
      ],
      "status": "ACTIVE",
      "type": "LAMBDA"
    }
  ]
}
```

For more information, see [Target groups](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [ListTargetGroups](#) in *AWS CLI Command Reference*.

list-targets

The following code example shows how to use `list-targets`.

AWS CLI

To list the targets for a target group

The following `list-targets` example lists the targets for the specified target group.

```
aws vpc-lattice list-targets \
  --target-group-identifier tg-0eaa4b9ab4EXAMPLE
```

Output:

```
{
  "items": [
    {
      "id": "i-07dd579bc5EXAMPLE",
```

```

        "port": 443,
        "status": "HEALTHY"
    },
    {
        "id": "i-047b3c9078EXAMPLE",
        "port": 443,
        "reasonCode": "HealthCheckFailed",
        "status": "UNHEALTHY"
    }
]
}

```

For more information, see [Target groups](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [ListTargets](#) in *AWS CLI Command Reference*.

put-auth-policy

The following code example shows how to use `put-auth-policy`.

AWS CLI

To create an auth policy for a service

The following `put-auth-policy` example grants access to requests from any authenticated principal that uses the specified IAM role. The resource is the ARN of the service to which the policy is attached.

```

aws vpc-lattice put-auth-policy \
  --resource-identifier svc-0285b53b2eEXAMPLE \
  --policy file://auth-policy.json

```

Contents of `auth-policy.json`:

```

{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Principal": {
        "AWS": "arn:aws:iam::123456789012:role/my-clients"
      }
    },
  ],
}

```

```

        "Action": "vpc-lattice-svcs:Invoke",
        "Resource": "arn:aws:vpc-lattice:us-east-2:123456789012:service/
svc-0285b53b2eEXAMPLE"
    }
]
}

```

Output:

```

{
  "policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow\",
\"Principal\":{\"AWS\":\"arn:aws:iam:123456789012:role/my-clients\"},
\"Action\":\"vpc-lattice-svcs:Invoke\",\"Resource\":\"arn:aws:vpc-lattice:us-
east-2:123456789012:service/svc-0285b53b2eEXAMPLE\"}]}",
  "state": "Active"
}

```

For more information, see [Auth policies](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [PutAuthPolicy](#) in *AWS CLI Command Reference*.

register-targets

The following code example shows how to use `register-targets`.

AWS CLI**To register a target**

The following `register-targets` example registers the specified targets with the specified target group.

```

aws vpc-lattice register-targets \
  --targets id=i-047b3c9078EXAMPLE id=i-07dd579bc5EXAMPLE \
  --target-group-identifier tg-0eaa4b9ab4EXAMPLE

```

Output:

```

{
  "successful": [
    {
      "id": "i-07dd579bc5EXAMPLE",

```

```
        "port": 443
      }
    ],
    "unsuccessful": [
      {
        "failureCode": "UnsupportedTarget",
        "failureMessage": "Instance targets must be in the same VPC as their
target group",
        "id": "i-047b3c9078EXAMPLE",
        "port": 443
      }
    ]
  ]
}
```

For more information, see [Register targets](#) in the *Amazon VPC Lattice User Guide*.

- For API details, see [RegisterTargets](#) in *AWS CLI Command Reference*.

AWS WAF Classic examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAF Classic.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

put-logging-configuration

The following code example shows how to use `put-logging-configuration`.

AWS CLI

To create a logging configuration for the web ACL ARN with the specified Kinesis Firehose stream ARN

The following `put-logging-configuration` example displays logging configuration for WAF with CloudFront.

```
aws waf put-logging-configuration \  
  --logging-configuration ResourceArn=arn:aws:waf::123456789012:webacl/3bffd3ed-  
fa2e-445e-869f-a6a7cf153fd3,LogDestinationConfigs=arn:aws:firehose:us-  
east-1:123456789012:deliverystream/aws-waf-logs-firehose-stream,RedactedFields=[]
```

Output:

```
{  
  "LoggingConfiguration": {  
    "ResourceArn": "arn:aws:waf::123456789012:webacl/3bffd3ed-fa2e-445e-869f-  
a6a7cf153fd3",  
    "LogDestinationConfigs": [  
      "arn:aws:firehose:us-east-1:123456789012:deliverystream/aws-waf-logs-  
firehose-stream"  
    ]  
  }  
}
```

- For API details, see [PutLoggingConfiguration](#) in *AWS CLI Command Reference*.

update-byte-match-set

The following code example shows how to use `update-byte-match-set`.

AWS CLI

To update a byte match set

The following `update-byte-match-set` command deletes a `ByteMatchTuple` object (`filter`) in a `ByteMatchSet`:

```
aws waf update-byte-match-set --byte-match-set-id a123fae4-  
b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --
```

```
updates
```

```
Action="DELETE",ByteMatchTuple={FieldToMatch={Type="HEADER",Data="referer"},TargetString="b
```

For more information, see [Working with String Match Conditions](#) in the *AWS WAF developer guide*.

- For API details, see [UpdateByteMatchSet](#) in *AWS CLI Command Reference*.

update-ip-set

The following code example shows how to use `update-ip-set`.

AWS CLI

To update an IP set

The following `update-ip-set` command updates an IPSet with an IPv4 address and deletes an IPv6 address:

```
aws waf update-ip-set --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90
--change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
Action="INSERT",IPSetDescriptor={Type="IPV4",Value="12.34.56.78/16"},Action="DELETE",IPSetD
```

Alternatively you can use a JSON file to specify the input. For example:

```
aws waf update-ip-set --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --change-
token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates file://change.json
```

Where content of the JSON file is:

```
[
{
  "Action": "INSERT",
  "IPSetDescriptor":
  {
    "Type": "IPV4",
    "Value": "12.34.56.78/16"
  }
},
{
  "Action": "DELETE",
  "IPSetDescriptor":
```

```
{
  "Type": "IPV6",
  "Value": "1111:0000:0000:0000:0000:0000:0000:0111/128"
}
}
]
```

For more information, see *Working with IP Match Conditions* in the *AWS WAF developer guide*.

- For API details, see [UpdateIpSet](#) in *AWS CLI Command Reference*.

update-rule

The following code example shows how to use `update-rule`.

AWS CLI

To update a rule

The following `update-rule` command deletes a Predicate object in a rule:

```
aws waf update-rule --rule-id a123fae4-b567-8e90-1234-5ab67ac8ca90
--change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
Action="DELETE",Predicate={Negated=false,Type="ByteMatch",DataId="MyByteMatchSetID"}
```

For more information, see *Working with Rules* in the *AWS WAF developer guide*.

- For API details, see [UpdateRule](#) in *AWS CLI Command Reference*.

update-size-constraint-set

The following code example shows how to use `update-size-constraint-set`.

AWS CLI

To update a size constraint set

The following `update-size-constraint-set` command deletes a `SizeConstraint` object (filters) in a size constraint set:

```
aws waf update-size-constraint-set --size-constraint-set-id a123fae4-
b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --
```

```
updates
```

```
Action="DELETE",SizeConstraint={FieldToMatch={Type="QUERY_STRING"},TextTransformation="NONE"
```

For more information, see [Working with Size Constraint Conditions](#) in the *AWS WAF developer guide*.

- For API details, see [UpdateSizeConstraintSet](#) in *AWS CLI Command Reference*.

update-sql-injection-match-set

The following code example shows how to use `update-sql-injection-match-set`.

AWS CLI

To update a SQL Injection Match Set

The following `update-sql-injection-match-set` command deletes a `SqlInjectionMatchTuple` object (filters) in a SQL injection match set:

```
aws waf update-sql-injection-match-set --sql-injection-  
match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 --  
change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates  
Action="DELETE",SqlInjectionMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="NONE"
```

For more information, see [Working with SQL Injection Match Conditions](#) in the *AWS WAF developer guide*.

- For API details, see [UpdateSqlInjectionMatchSet](#) in *AWS CLI Command Reference*.

update-web-acl

The following code example shows how to use `update-web-acl`.

AWS CLI

To update a web ACL

The following `update-web-acl` command deletes an `ActivatedRule` object in a WebACL.

```
aws waf update-web-acl --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90  
--change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
```

```
Action="DELETE",ActivatedRule='{Priority=1,RuleId="WAFRule-1-Example",Action={Type="ALLOW"},Type="REGULAR"}'
```

Output:

```
{
  "ChangeToken": "12cs345-67cd-890b-1cd2-c3a4567d89f1"
}
```

For more information, see [Working with Web ACLs](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [UpdateWebAcl](#) in *AWS CLI Command Reference*.

update-xss-match-set

The following code example shows how to use `update-xss-match-set`.

AWS CLI

To update an XSSMatchSet

The following `update-xss-match-set` command deletes an `XssMatchTuple` object (filters) in an `XssMatchSet`:

```
aws waf update-xss-match-set --xss-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90
--change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --updates
Action="DELETE",XssMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_D
```

For more information, see [Working with Cross-site Scripting Match Conditions](#) in the *AWS WAF developer guide*.

- For API details, see [UpdateXssMatchSet](#) in *AWS CLI Command Reference*.

AWS WAF Classic Regional examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAF Classic Regional.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

associate-web-acl

The following code example shows how to use `associate-web-acl`.

AWS CLI

To associate a web ACL with a resource

The following `associate-web-acl` command associates a web ACL, specified by the `web-acl-id`, with a resource, specified by the `resource-arn`. The resource ARN can refer to either a application load balancer or an API Gateway:

```
aws waf-regional associate-web-acl \  
  --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \  
  --resource-arn 12cs345-67cd-890b-1cd2-c3a4567d89f1
```

For more information, see [Working with Web ACLs](#) in the *AWS WAF Developer Guide*.

- For API details, see [AssociateWebAcl](#) in *AWS CLI Command Reference*.

put-logging-configuration

The following code example shows how to use `put-logging-configuration`.

AWS CLI

To create a logging configuration for the web ACL ARN with the specified Kinesis Firehose stream ARN

The following `put-logging-configuration` example displays logging configuration for WAF with ALB/APIGateway in Region `us-east-1`.

```
aws waf-regional put-logging-configuration \  
  --logging-configuration ResourceArn=arn:aws:waf-  
regional:us-east-1:123456789012:webacl/3bffd3ed-fa2e-445e-869f-  
a6a7cf153fd3,LogDestinationConfigs=arn:aws:firehose:us-  
east-1:123456789012:deliverystream/aws-waf-logs-firehose-stream,RedactedFields=[] \  
  --region us-east-1
```

Output:

```
{  
  "LoggingConfiguration": {  
    "ResourceArn": "arn:aws:waf-regional:us-east-1:123456789012:webacl/3bffd3ed-  
fa2e-445e-869f-a6a7cf153fd3",  
    "LogDestinationConfigs": [  
      "arn:aws:firehose:us-east-1:123456789012:deliverystream/aws-waf-logs-  
firehose-stream"  
    ]  
  }  
}
```

- For API details, see [PutLoggingConfiguration](#) in *AWS CLI Command Reference*.

update-byte-match-set

The following code example shows how to use update-byte-match-set.

AWS CLI

To update a byte match set

The following update-byte-match-set command deletes a ByteMatchTuple object (filter) in a ByteMatchSet. Because the updates value has embedded double quotes, you must surround the value with single quotes.

```
aws waf-regional update-byte-match-set \  
  --byte-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \  
  --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \  
  --updates  
'Action="DELETE",ByteMatchTuple={FieldToMatch={Type="HEADER",Data="referer"},TargetString="'
```

For more information, see [Working with String Match Conditions](#) in the *AWS WAF Developer Guide*.

- For API details, see [UpdateByteMatchSet](#) in *AWS CLI Command Reference*.

update-ip-set

The following code example shows how to use `update-ip-set`.

AWS CLI

To update an IP set

The following `update-ip-set` command updates an IPSet with an IPv4 address and deletes an IPv6 address. Get the value for `change-token` by running the `get-change-token` command. Because the value for `updates` includes embedded double-quotes, you must surround the value with single quotes.

```
aws waf update-ip-set \  
  --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \  
  --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \  
  --updates  
  'Action="INSERT",IPSetDescriptor={Type="IPV4",Value="12.34.56.78/16"},Action="DELETE",IPSet'
```

Alternatively you can use a JSON file to specify the input. For example:

```
aws waf-regional update-ip-set \  
  --ip-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \  
  --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \  
  --updates file://change.json
```

Content of the `change.json`

```
[  
  {  
    "Action": "INSERT",  
    "IPSetDescriptor":  
    {  
      "Type": "IPV4",  
      "Value": "12.34.56.78/16"  
    }  
  },  
]
```

```

    {
      "Action": "DELETE",
      "IPSetDescriptor":
      {
        "Type": "IPV6",
        "Value": "1111:0000:0000:0000:0000:0000:0000:0111/128"
      }
    }
  ]

```

For more information, see [Working with IP Match Conditions](#) in the *AWS WAF Developer Guide*.

- For API details, see [UpdateIpSet](#) in *AWS CLI Command Reference*.

update-rule

The following code example shows how to use `update-rule`.

AWS CLI

To update a rule

The following `update-rule` command deletes a Predicate object in a rule. Because the updates value has embedded double quotes, you must surround the entire value with single quotes.

```

aws waf-regional update-rule \
  --rule-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \
  --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \
  --updates
  'Action="DELETE",Predicate={Negated=false,Type="ByteMatch",DataId="MyByteMatchSetID"}'

```

For more information, see [Working with Rules](#) in the *AWS WAF Developer Guide*.

- For API details, see [UpdateRule](#) in *AWS CLI Command Reference*.

update-size-constraint-set

The following code example shows how to use `update-size-constraint-set`.

AWS CLI

To update a size constraint set

The following `update-size-constraint-set` command deletes a `SizeConstraint`` object (filters) in a size constraint set. Because the updates value contains embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-size-constraint-set \  
  --size-constraint-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \  
  --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \  
  --updates  
'Action="DELETE",SizeConstraint={FieldToMatch={Type="QUERY_STRING"},TextTransformation="NON
```

For more information, see [Working with Size Constraint Conditions](#) in the *AWS WAF Developer Guide*.

- For API details, see [UpdateSizeConstraintSet](#) in *AWS CLI Command Reference*.

update-sql-injection-match-set

The following code example shows how to use `update-sql-injection-match-set`.

AWS CLI

To update a SQL Injection Match Set

The following `update-sql-injection-match-set` command deletes a `SqlInjectionMatchTuple` object (filters) in a SQL injection match set. Because the updates value contains embedded double quotes, you must surround the entire value in single quotes. :

```
aws waf-regional update-sql-injection-match-set --sql-injection-match-set-id a123fae4-  
b567-8e90-1234-5ab67ac8ca90 --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 --  
updates  
'Action="DELETE",SqlInjectionMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation
```

For more information, see [Working with SQL Injection Match Conditions](#) in the *AWS WAF Developer Guide*.

- For API details, see [UpdateSqlInjectionMatchSet](#) in *AWS CLI Command Reference*.

update-web-acl

The following code example shows how to use `update-web-acl`.

AWS CLI

To update a web ACL

The following `update-web-acl` command deletes an `ActivatedRule` object in a `WebACL`. Because the `updates` value contains embedded double quotes, you must surround the entire value in single quotes.

```
aws waf-regional update-web-acl \  
  --web-acl-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \  
  --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \  
  --updates Action="DELETE",ActivatedRule='{Priority=1,RuleId="WAFRule-1-  
Example",Action={Type="ALLOW"},Type="ALLOW"}'
```

For more information, see [Working with Web ACLs](#) in the *AWS WAF Developer Guide*.

- For API details, see [UpdateWebAcl](#) in *AWS CLI Command Reference*.

update-xss-match-set

The following code example shows how to use `update-xss-match-set`.

AWS CLI

To update an XSSMatchSet

The following `update-xss-match-set` command deletes an `XssMatchTuple` object (filters) in an `XssMatchSet`. Because the `updates` value contains embedded double quotes, you must surround the entire value with single quotes.

```
aws waf-regional update-xss-match-set \  
  --xss-match-set-id a123fae4-b567-8e90-1234-5ab67ac8ca90 \  
  --change-token 12cs345-67cd-890b-1cd2-c3a4567d89f1 \  
  --updates  
'Action="DELETE",XssMatchTuple={FieldToMatch={Type="QUERY_STRING"},TextTransformation="URL_
```

For more information, see [Working with Cross-site Scripting Match Conditions](#) in the *AWS WAF Developer Guide*.

- For API details, see [UpdateXssMatchSet](#) in *AWS CLI Command Reference*.

AWS WAFV2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS WAFV2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

associate-web-acl

The following code example shows how to use `associate-web-acl`.

AWS CLI

To associate a web ACL with a regional AWS resource

The following `associate-web-acl` example associates the specified web ACL with an Application Load Balancer.

```
aws wafv2 associate-web-acl \  
  --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/  
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/  
app/waf-cli-alb/1ea17125f8b25a2a \  
  --region us-west-2
```

This command produces no output.

For more information, see [Associating or Disassociating a Web ACL with an AWS Resource](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [AssociateWebAcl](#) in *AWS CLI Command Reference*.

check-capacity

The following code example shows how to use check-capacity.

AWS CLI

To obtain the capacity used by a set of rules

The following check-capacity retrieves the capacity requirements for a rule set that contains a rate-based rule statement, and an AND rule statement that contains nested rules.

```
aws wafv2 check-capacity \  
  --scope REGIONAL \  
  --rules file://waf-rule-list.json \  
  --region us-west-2
```

Contents of file://waf-rule-list.json:

```
[  
  {  
    "Name":"basic-rule",  
    "Priority":0,  
    "Statement":{  
      "AndStatement":{  
        "Statements":[  
          {  
            "ByteMatchStatement":{  
              "SearchString":"example.com",  
              "FieldToMatch":{  
                "SingleHeader":{  
                  "Name":"host"  
                }  
              }  
            },  
            "TextTransformations":[  
              {  
                "Priority":0,  
                "Type":"LOWERCASE"  
              }  
            ],  
            "PositionalConstraint":"EXACTLY"  
          }  
        ]  
      }  
    }  
  ]  
]
```

```
    },
    {
      "GeoMatchStatement":{
        "CountryCodes":[
          "US",
          "IN"
        ]
      }
    ]
  },
  "Action":{
    "Allow":{
      }
    },
  "VisibilityConfig":{
    "SampledRequestsEnabled":true,
    "CloudWatchMetricsEnabled":true,
    "MetricName":"basic-rule"
  }
},
{
  "Name":"rate-rule",
  "Priority":1,
  "Statement":{
    "RateBasedStatement":{
      "Limit":1000,
      "AggregateKeyType":"IP"
    }
  },
  "Action":{
    "Block":{
      }
    },
  "VisibilityConfig":{
    "SampledRequestsEnabled":true,
    "CloudWatchMetricsEnabled":true,
    "MetricName":"rate-rule"
  }
}
```

```
]
```

Output:

```
{
  "Capacity":15
}
```

For more information, see [AWS WAF Web ACL Capacity Units \(WCU\)](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [CheckCapacity](#) in *AWS CLI Command Reference*.

create-ip-set

The following code example shows how to use `create-ip-set`.

AWS CLI**To create an IP set for use in your web ACLs and rule groups**

The following `create-ip-set` command creates an IP set with a single address range specification.

```
aws wafv2 create-ip-set \
  --name testip \
  --scope REGIONAL \
  --ip-address-version IPV4 \
  --addresses 198.51.100.0/16
```

Output:

```
{
  "Summary":{
    "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Description":"",
    "Name":"testip",
    "LockToken":"447e55ac-0000-0000-0000-86b67c17f8b5",
    "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
  }
}
```

```
}
```

For more information, see [IP Sets and Regex Pattern Sets](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [CreateIpSet](#) in *AWS CLI Command Reference*.

create-regex-pattern-set

The following code example shows how to use `create-regex-pattern-set`.

AWS CLI

To create a regex pattern set for use in your web ACLs and rule groups

The following `create-regex-pattern-set` command creates a regex pattern set with two regex patterns specified.

```
aws wafv2 create-regex-pattern-set \  
  --name regexPatterSet01 \  
  --scope REGIONAL \  
  --description 'Test web-acl' \  
  --regular-expression-list '[{"RegexString": "/[0-9]*/"}, {"RegexString": "/[a-z]*/"}]'
```

Output:

```
{  
  "Summary": {  
    "ARN": "arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/  
regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
    "Description": "Test web-acl",  
    "Name": "regexPatterSet01",  
    "LockToken": "0bc01e21-03c9-4b98-9433-6229cbf1ef1c",  
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
  }  
}
```

For more information, see [IP Sets and Regex Pattern Sets](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [CreateRegexPatternSet](#) in *AWS CLI Command Reference*.

create-rule-group

The following code example shows how to use `create-rule-group`.

AWS CLI

To create a custom rule group for use in your web ACLs

The following `create-rule-group` command creates a custom rule group for regional use. The rule statements for the group are provided in a JSON-formatted file.

```
aws wafv2 create-rule-group \  
  --name "TestRuleGroup" \  
  --scope REGIONAL \  
  --capacity 250 \  
  --rules file://waf-rule.json \  
  --visibility-config  
  SampledRequestsEnabled=true,CloudWatchMetricsEnabled=true,MetricName=TestRuleGroupMetrics  
  \  
  --region us-west-2
```

Contents of `file://waf-rule.json`:

```
[  
  {  
    "Name":"basic-rule",  
    "Priority":0,  
    "Statement":{  
      "AndStatement":{  
        "Statements":[  
          {  
            "ByteMatchStatement":{  
              "SearchString":"example.com",  
              "FieldToMatch":{  
                "SingleHeader":{  
                  "Name":"host"  
                }  
              },  
              "TextTransformations":[  
                {  
                  "Priority":0,  
                  "Type":"LOWERCASE"  
                }  
              ]  
            }  
          ]  
        }  
      }  
    }  
  ]  
]
```

```

        ],
        "PositionalConstraint":"EXACTLY"
    }
},
{
    "GeoMatchStatement":{
        "CountryCodes":[
            "US",
            "IN"
        ]
    }
}
]
},
"Action":{
    "Allow":{

    }
},
"VisibilityConfig":{
    "SampledRequestsEnabled":true,
    "CloudWatchMetricsEnabled":true,
    "MetricName":"basic-rule"
}
}
]

```

Output:

```

{
    "Summary":{
        "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/
TestRuleGroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "Description":"",
        "Name":"TestRuleGroup",
        "LockToken":"7b3bcec2-374e-4c5a-b2b9-563bf47249f0",
        "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
}

```

For more information, see [Managing Your Own Rule Groups](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [CreateRuleGroup](#) in *AWS CLI Command Reference*.

create-web-acl

The following code example shows how to use `create-web-acl`.

AWS CLI

To create a web ACL

The following `create-web-acl` command creates a web ACL for regional use. The rule statements for the web ACL are provided in a JSON-formatted file.

```
aws wafv2 create-web-acl \
  --name TestWebAcl \
  --scope REGIONAL \
  --default-action Allow={} \
  --visibility-config
  SampledRequestsEnabled=true,CloudWatchMetricsEnabled=true,MetricName=TestWebAclMetrics
  \
  --rules file://waf-rule.json \
  --region us-west-2
```

Contents of `file://waf-rule.json`:

```
[
  {
    "Name":"basic-rule",
    "Priority":0,
    "Statement":{
      "AndStatement":{
        "Statements":[
          {
            "ByteMatchStatement":{
              "SearchString":"example.com",
              "FieldToMatch":{
                "SingleHeader":{
                  "Name":"host"
                }
              },
            },
            "TextTransformations":[
              {
```

```

        "Priority":0,
        "Type":"LOWERCASE"
      }
    ],
    "PositionalConstraint":"EXACTLY"

delete-ip-set

The following code example shows how to use `delete-ip-set`.

AWS CLI

To delete an IP set

The following `delete-ip-set` deletes the specified IP set. This call requires an ID, which you can obtain from the call, `list-ip-sets`, and a lock token, which you can obtain from the calls, `list-ip-sets` and `get-ip-set`.

```
aws wafv2 delete-ip-set \  
  --name test1 \  
  --scope REGIONAL \  
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --lock-token 46851772-db6f-459d-9385-49428812e357
```

This command produces no output.

For more information, see [IP Sets and Regex Pattern Sets](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [DeleteIpSet](#) in *AWS CLI Command Reference*.

delete-logging-configuration

The following code example shows how to use `delete-logging-configuration`.

AWS CLI

To disable logging for a web ACL

The following `delete-logging-configuration` removes any logging configuration from the specified web ACL.

```
aws wafv2 delete-logging-configuration \  
  --web-ACL-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

```
--resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

This command produces no output.

For more information, see [Logging Web ACL Traffic Information](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [DeleteLoggingConfiguration](#) in *AWS CLI Command Reference*.

delete-regex-pattern-set

The following code example shows how to use `delete-regex-pattern-set`.

AWS CLI

To delete a regex pattern set

The following `delete-regex-pattern-set` updates the settings for the specified regex pattern set. This call requires an ID, which you can obtain from the call, `list-regex-pattern-sets`, and a lock token, which you can obtain from the call `list-regex-pattern-sets` or the call `get-regex-pattern-set`.

```
aws wafv2 delete-regex-pattern-set \
  --name regexPatterSet01 \
  --scope REGIONAL \
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --lock-token 0bc01e21-03c9-4b98-9433-6229cbf1ef1c
```

This command produces no output.

For more information, see [IP Sets and Regex Pattern Sets](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [DeleteRegexPatternSet](#) in *AWS CLI Command Reference*.

delete-rule-group

The following code example shows how to use `delete-rule-group`.

AWS CLI

To delete a custom rule group

The following `delete-rule-group` deletes the specified custom rule group. This call requires an ID, which you can obtain from the call `list-rule-groups`, and a lock token, which you can obtain from the call `list-rule-groups` or the call `get-rule-group`.

```
aws wafv2 delete-rule-group \  
  --name TestRuleGroup \  
  --scope REGIONAL \  
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --lock-token 7b3bcec2-0000-0000-0000-563bf47249f0
```

This command produces no output.

For more information, see [Managing Your Own Rule Groups](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [DeleteRuleGroup](#) in *AWS CLI Command Reference*.

delete-web-acl

The following code example shows how to use `delete-web-acl`.

AWS CLI

To delete a web ACL

The following `delete-web-acl` deletes the specified web ACL from your account. A web ACL can only be deleted when it's not associated with any resources. This call requires an ID, which you can obtain from the call `list-web-acls`, and a lock token, which you can obtain from the call `list-web-acls` or the call `get-web-acl`.

```
aws wafv2 delete-web-acl \  
  --name test \  
  --scope REGIONAL \  
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --lock-token ebab4ed2-155e-4c9a-9efb-e4c45665b1f5
```

This command produces no output.

For more information, see [Managing and Using a Web Access Control List \(Web ACL\)](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [DeleteWebAcl](#) in *AWS CLI Command Reference*.

describe-managed-rule-group

The following code example shows how to use describe-managed-rule-group.

AWS CLI

To retrieve the description for a managed rule group

The following describe-managed-rule-group retrieves the description for an AWS managed rule group.

```
aws wafv2 describe-managed-rule-group \  
  --vendor-name AWS \  
  --name AWSManagedRulesCommonRuleSet \  
  --scope REGIONAL
```

Output:

```
{  
  "Capacity": 700,  
  "Rules": [  
    {  
      "Name": "NoUserAgent_HEADER",  
      "Action": {

        "Action": {
            "Block": {}
        }
    },
    {
        "Name": "CrossSiteScripting_QUERYARGUMENTS",
        "Action": {
            "Block": {}
        }
    },
    {
        "Name": "CrossSiteScripting_BODY",
        "Action": {
            "Block": {}
        }
    },
    {
        "Name": "CrossSiteScripting_URI_PATH",
        "Action": {
            "Block": {}
        }
    }
]
}

```

For more information, see [Managed Rule Groups](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [DescribeManagedRuleGroup](#) in *AWS CLI Command Reference*.

disassociate-web-acl

The following code example shows how to use `disassociate-web-acl`.

AWS CLI

To disassociate a web ACL from a regional AWS resource

The following `disassociate-web-acl` example removes any existing web ACL association from the specified Application Load Balancer.

```
aws wafv2 disassociate-web-acl \
```

```
--resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/waf-cli-alb/1ea17125f8b25a2a \
--region us-west-2
```

This command produces no output.

For more information, see [Associating or Disassociating a Web ACL with an AWS Resource](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [DisassociateWebAcl](#) in *AWS CLI Command Reference*.

get-ip-set

The following code example shows how to use `get-ip-set`.

AWS CLI

To retrieve a specific IP set

The following `get-ip-set` retrieves the IP set with the specified name, scope, and ID. You can get the ID for an IP set from the commands `create-ip-set` and `list-ip-sets`.

```
aws wafv2 get-ip-set \
  --name testip \
  --scope REGIONAL \
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
  "IPSet":{
    "Description":"","
    "Name":"testip",
    "IPAddressVersion":"IPV4",
    "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
    "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE1111",
    "Addresses":[
      "192.0.2.0/16"
    ]
  },
  "LockToken":"447e55ac-2396-4c6d-b9f9-86b67c17f8b5"
```

```
}
```

For more information, see [IP Sets and Regexp Pattern Sets](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetIpSet](#) in *AWS CLI Command Reference*.

get-logging-configuration

The following code example shows how to use `get-logging-configuration`.

AWS CLI

To retrieve the logging configurations for a web ACL

The following `get-logging-configuration` retrieves the logging configuration for the specified web ACL.

```
aws wafv2 get-logging-configuration \
  --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222 \
  --region us-west-2
```

Output:

```
{
  "LoggingConfiguration":{
    "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "RedactedFields":[
      {
        "Method":{

        }
      }
    ],
    "LogDestinationConfigs":[
      "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-logs-
custom-transformation"
    ]
  }
}
```

For more information, see [Logging Web ACL Traffic Information](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetLoggingConfiguration](#) in *AWS CLI Command Reference*.

get-rate-based-statement-managed-keys

The following code example shows how to use `get-rate-based-statement-managed-keys`.

AWS CLI

To retrieve a list of IP addresses that are blocked by a rate-based rule

The following `get-rate-based-statement-managed-keys` retrieves the IP addresses currently blocked by a rate-based rule that's being used for a regional application.

```
aws wafv2 get-rate-based-statement-managed-keys \
  --scope REGIONAL \
  --web-acl-name testwebacl2 \
  --web-acl-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --rule-name ratebasedtest
```

Output:

```
{
  "ManagedKeysIPV4":{
    "IPAddressVersion":"IPV4",
    "Addresses":[
      "198.51.100.0/32"
    ]
  },
  "ManagedKeysIPV6":{
    "IPAddressVersion":"IPV6",
    "Addresses":[
    ]
  }
}
```

For more information, see [Rate-Based Rule Statement](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetRateBasedStatementManagedKeys](#) in *AWS CLI Command Reference*.

get-regex-pattern-set

The following code example shows how to use `get-regex-pattern-set`.

AWS CLI

To retrieve a specific regex pattern set

The following `get-regex-pattern-set` retrieves the regex pattern set with the specified name, scope, region, and ID. You can get the ID for a regex pattern set from the commands `create-regex-pattern-set` and `list-regex-pattern-sets`.

```
aws wafv2 get-regex-pattern-set \
  --name regexPatterSet01 \
  --scope REGIONAL \
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --region us-west-2
```

Output:

```
{
  "RegexPatternSet":{
    "Description":"Test web-acl",
    "RegularExpressionList":[
      {
        "RegexString":"/[0-9]*/"
      },
      {
        "RegexString":"/[a-z]*/"
      }
    ],
    "Name":"regexPatterSet01",
    "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/
regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
  },
  "LockToken":"c8abf33f-b6fc-46ae-846e-42f994d57b29"
}
```

For more information, see [IP Sets and Regex Pattern Sets](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetRegexPatternSet](#) in *AWS CLI Command Reference*.

get-rule-group

The following code example shows how to use `get-rule-group`.

AWS CLI

To retrieve a specific custom rule group

The following `get-rule-group` retrieves the custom rule group with the specified name, scope, and ID. You can get the ID for a rule group from the commands `create-rule-group` and `list-rule-groups`.

```
aws wafv2 get-rule-group \
  --name ff \
  --scope REGIONAL \
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
  "RuleGroup":{
    "Capacity":1,
    "Description":"",
    "Rules":[
      {
        "Priority":0,
        "Action":{
          "Block":{

          }
        },
        "VisibilityConfig":{
          "SampledRequestsEnabled":true,
          "CloudWatchMetricsEnabled":true,
          "MetricName":"jj"
        },
        "Name":"jj",
        "Statement":{
          "SizeConstraintStatement":{
            "ComparisonOperator":"LE",
            "TextTransformations":[
              {
                "Priority":0,
```

```

        "Type": "NONE"
      }
    ],
    "FieldToMatch": {
      "UriPath": {
        "Size": 7
      }
    }
  },
  "VisibilityConfig": {
    "SampledRequestsEnabled": true,
    "CloudWatchMetricsEnabled": true,
    "MetricName": "ff"
  },
  "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "ARN": "arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/ff/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "Name": "ff"
},
"LockToken": "485458c9-1830-4234-af31-ec4d52ced1b3"
}

```

For more information, see [Managing Your Own Rule Groups](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetRuleGroup](#) in *AWS CLI Command Reference*.

get-sampled-requests

The following code example shows how to use `get-sampled-requests`.

AWS CLI

To retrieve a sample of web requests for a web ACL

The following `get-sampled-requests` retrieves the sampled web requests for the specified web ACL, rule metric, and time frame.

```
aws wafv2 get-sampled-requests \
```

```
--web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-cli/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
--rule-metric-name AWS-AWSManagedRulesSQLiRuleSet \
--scope=REGIONAL \
--time-window StartTime=2020-02-12T20:00Z,EndTime=2020-02-12T21:10Z \
--max-items 100
```

Output:

```
{
  "TimeWindow": {
    "EndTime": 1581541800.0,
    "StartTime": 1581537600.0
  },
  "SampledRequests": [
    {
      "Action": "BLOCK",
      "Timestamp": 1581541799.564,

get-web-acl-for-resource

The following code example shows how to use `get-web-acl-for-resource`.

AWS CLI

To retrieve the web ACL that's associated with an AWS resource

The following `get-web-acl-for-resource` retrieves the JSON for the web ACL that's associated with the specified resource.

```
aws wafv2 get-web-acl-for-resource \  
  --resource-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/  
  app/waf-cli-alb/1ea17125f8b25a2a
```

Output:

```
{  
  "WebACL":{  
    "Capacity":3,  
    "Description":"","  
    "Rules":[  
      {  
        "Priority":1,  
        "Action":{  
          "Block":{  
  
          }  
        },  
        "VisibilityConfig":{  
          "SampledRequestsEnabled":true,  
          "CloudWatchMetricsEnabled":true,  
          "MetricName":"testrule01"  
        },  
        "Name":"testrule01",  
        "Statement":{  
          "AndStatement":{  
            "Statements":[  
              {  
                "ByteMatchStatement":{  
                  "PositionalConstraint":"EXACTLY",  
                  "TextTransformations":[  
                    {  
                      "Priority":0,  
                      "Type":"NONE"  
                    }  
                  ],  
                  "SearchString":"dGVzdHN0cm1uZw==",  
                  "FieldToMatch":{  
                    "UriPath":{  
  
                    }

get-web-acl

The following code example shows how to use `get-web-acl`.

AWS CLI

To retrieve a web ACL

The following `get-web-acl` retrieves the web ACL with the specified name, scope, and ID. You can get the ID for a web ACL from the commands `create-web-acl` and `list-web-acls`.

```
aws wafv2 get-web-acl \  
  --name test01 \  
  --scope REGIONAL \  
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{  
  "WebACL":{  
    "Capacity":3,  
    "Description":"","  
    "Rules":[  
      {  
        "Priority":1,  
        "Action":{  
          "Block":{  
  
          }  
        },  
        "VisibilityConfig":{  
          "SampledRequestsEnabled":true,  
          "CloudWatchMetricsEnabled":true,  
          "MetricName":"testrule01"  
        },  
        "Name":"testrule01",  
        "Statement":{  
          "AndStatement":{  
            "Statements":[  
              {  
                "ByteMatchStatement":{  
                  "PositionalConstraint":"EXACTLY",  
                  "TextTransformations":[
```

```

        {
            "Priority":0,
            "Type":"NONE"
        }
    ],
    "SearchString":"dGVzdHN0cmlyZw==",
    "FieldToMatch":{
        "UriPath":{

        }
    }
}
},
{
    "SizeConstraintStatement":{
        "ComparisonOperator":"EQ",
        "TextTransformations":[
            {
                "Priority":0,
                "Type":"NONE"
            }
        ],
        "FieldToMatch":{
            "QueryString":{

            }
        },
        "Size":0
    }
}
]
}
}
},
"VisibilityConfig":{
    "SampledRequestsEnabled":true,
    "CloudWatchMetricsEnabled":true,
    "MetricName":"test01"
},
"DefaultAction":{
    "Allow":{

    }
}

```

```

    },
    "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "ARN": "arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

list-available-managed-rule-groups

The following code example shows how to use `list-available-managed-rule-groups`.

AWS CLI

To retrieve the managed rule groups

The following `list-available-managed-rule-groups` returns the list of all managed rule groups that are currently available for use in your web ACLs.

```
aws wafv2 list-available-managed-rule-groups \
  --scope REGIONAL
```

Output:

```

{
  "ManagedRuleGroups": [
    {
      "VendorName": "AWS",
      "Name": "AWSManagedRulesCommonRuleSet",
      "Description": "Contains rules that are generally applicable to web applications. This provides protection against exploitation of a wide range of vulnerabilities, including those described in OWASP publications and common Common Vulnerabilities and Exposures (CVE).",
    },
    {
      "VendorName": "AWS",
      "Name": "AWSManagedRulesAdminProtectionRuleSet",
    }
  ]
}

```

```
    "Description": "Contains rules that allow you to block external access
to exposed admin pages. This may be useful if you are running third-party software
or would like to reduce the risk of a malicious actor gaining administrative access
to your application."
  },
  {
    "VendorName": "AWS",
    "Name": "AWSManagedRulesKnownBadInputsRuleSet",
    "Description": "Contains rules that allow you to block request patterns
that are known to be invalid and are associated with exploitation or discovery of
vulnerabilities. This can help reduce the risk of a malicious actor discovering a
vulnerable application."
  },
  {
    "VendorName": "AWS",
    "Name": "AWSManagedRulesSQLiRuleSet",
    "Description": "Contains rules that allow you to block request patterns
associated with exploitation of SQL databases, like SQL injection attacks. This can
help prevent remote injection of unauthorized queries."
  },
  {
    "VendorName": "AWS",
    "Name": "AWSManagedRulesLinuxRuleSet",
    "Description": "Contains rules that block request patterns associated
with exploitation of vulnerabilities specific to Linux, including LFI attacks. This
can help prevent attacks that expose file contents or execute code for which the
attacker should not have had access."
  },
  {
    "VendorName": "AWS",
    "Name": "AWSManagedRulesUnixRuleSet",
    "Description": "Contains rules that block request patterns associated
with exploiting vulnerabilities specific to POSIX/POSIX-like OS, including LFI
attacks. This can help prevent attacks that expose file contents or execute code
for which access should not been allowed."
  },
  {
    "VendorName": "AWS",
    "Name": "AWSManagedRulesWindowsRuleSet",
    "Description": "Contains rules that block request patterns associated
with exploiting vulnerabilities specific to Windows, (e.g., PowerShell commands).
This can help prevent exploits that allow attacker to run unauthorized commands or
execute malicious code."
  },
  },
```

```

    {
      "VendorName": "AWS",
      "Name": "AWSManagedRulesPHPRuleSet",
      "Description": "Contains rules that block request patterns associated
with exploiting vulnerabilities specific to the use of the PHP, including injection
of unsafe PHP functions. This can help prevent exploits that allow an attacker to
remotely execute code or commands."
    },
    {
      "VendorName": "AWS",
      "Name": "AWSManagedRulesWordPressRuleSet",

list-ip-sets

The following code example shows how to use `list-ip-sets`.

AWS CLI

To retrieve a list of IP sets

The following `list-ip-sets` retrieves all IP sets for the account that have regional scope.

```
aws wafv2 list-ip-sets \
  --scope REGIONAL
```

Output:

```
{
  "IPSets":[
    {
      "ARN":"arn:aws:wafv2:us-west-2:123456789012:regional/ipset/testip/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "Description":"",
      "Name":"testip",
      "LockToken":"0674c84b-0304-47fe-8728-c6bff46af8fc",
      "Id":"a1b2c3d4-5678-90ab-cdef-EXAMPLE11111  "
    }
  ],
  "NextMarker":"testip"
}
```

For more information, see [IP Sets and Regex Pattern Sets](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListIpSets](#) in *AWS CLI Command Reference*.

list-logging-configurations

The following code example shows how to use `list-logging-configurations`.

AWS CLI**To retrieve a list of all logging configurations for a region**

The following `list-logging-configurations` retrieves the all logging configurations for web ACLs that are scoped for regional use in the `us-west-2` region.

```
aws wafv2 list-logging-configurations \
  --scope REGIONAL \
  --region us-west-2
```

Output:

```
{
  "LoggingConfigurations":[
    {
```

```

        "ResourceArn": "arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
test-2/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "RedactedFields": [
            {
                "QueryString": {
                    }
            }
        ],
        "LogDestinationConfigs": [
            "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-
logs-test"
        ]
    },
    {
        "ResourceArn": "arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
test/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "RedactedFields": [
            {
                "Method": {
                    }
            }
        ],
        "LogDestinationConfigs": [
            "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-
logs-custom-transformation"
        ]
    }
]
}

```

For more information, see [Logging Web ACL Traffic Information](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListLoggingConfigurations](#) in *AWS CLI Command Reference*.

list-regex-pattern-sets

The following code example shows how to use `list-regex-pattern-sets`.

AWS CLI

To retrieve a list of regex pattern sets

The following `list-regex-pattern-sets` retrieves all regex pattern sets for the account that are defined in the region `us-west-2`.

```
aws wafv2 list-regex-pattern-sets \  
--scope REGIONAL \  
--region us-west-2
```

Output:

```
{  
  "NextMarker": "regexPatterSet01",  
  "RegexPatternSets": [  
    {  
      "ARN": "arn:aws:wafv2:us-west-2:123456789012:regional/regexpatternset/  
regexPatterSet01/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
      "Description": "Test web-acl",  
      "Name": "regexPatterSet01",  
      "LockToken": "f17743f7-0000-0000-0000-19a8b93bfb01",  
      "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
    }  
  ]  
}
```

For more information, see [IP Sets and Regex Pattern Sets](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListRegexPatternSets](#) in *AWS CLI Command Reference*.

`list-resources-for-web-acl`

The following code example shows how to use `list-resources-for-web-acl`.

AWS CLI

To retrieve the resources associated with a web ACL

The following `list-resources-for-web-acl` retrieves the API Gateway REST API resources that are currently associated with the specified web ACL in the region `us-west-2`.

```
aws wafv2 list-resources-for-web-acl \  
  --web-acl-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/TestWebAcl/  
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --resource-type API_GATEWAY \  
  --region us-west-2
```

Output:

```
{  
  "ResourceArns": [  
    "arn:aws:apigateway:us-west-2::/restapis/EXAMPLE111/stages/testing"  
  ]  
}
```

For more information, see [Associating or Disassociating a Web ACL with an AWS Resource](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListResourcesForWebAcl](#) in *AWS CLI Command Reference*.

list-rule-groups

The following code example shows how to use `list-rule-groups`.

AWS CLI

To retrieve a list of custom rule groups

The following `list-rule-groups` retrieves all custom rule groups that are defined for the account for the specified scope and region location.

```
aws wafv2 list-rule-groups \  
  --scope REGIONAL \  
  --region us-west-2
```

Output:

```
{  
  "RuleGroups": [  
    {  
      "ARN": "arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/  
TestRuleGroup/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
```

```

        "Description": "",
        "Name": "TestRuleGroup",
        "LockToken": "1eb5ec48-0000-0000-0000-ee9b906c541e",
        "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    {
        "ARN": "arn:aws:wafv2:us-west-2:123456789012:regional/rulegroup/test/
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "Description": "",
        "Name": "test",
        "LockToken": "b0f4583e-998b-4880-9069-3fbe45738b43",
        "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    }
],
"NextMarker": "test"
}

```

For more information, see [Managing Your Own Rule Groups](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListRuleGroups](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve all tags for an AWS WAF resource

The following `list-tags-for-resource` retrieves the list of all tag key, value pairs for the specified web ACL.

```

aws wafv2 list-tags-for-resource \
  --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/testwebacl2/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

```

Output:

```

{
  "NextMarker": "",
  "TagInfoForResource": {

```

```
    "ResourceARN": "arn:aws:wafv2:us-west-2:123456789012:regional/webacl/
testwebacl2/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "TagList": [
        ]
    }
}
```

For more information, see [Getting Started with AWS WAF](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-web-acls

The following code example shows how to use `list-web-acls`.

AWS CLI

To retrieve the web ACLs for a scope

The following `list-web-acls` retrieves all web ACLs that are defined for the account for the specified scope.

```
aws wafv2 list-web-acls \
  --scope REGIONAL
```

Output:

```
{
  "NextMarker": "Testt",
  "WebACLs": [
    {
      "ARN": "arn:aws:wafv2:us-west-2:123456789012:regional/webacl/Testt/
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "Description": "sssss",
      "Name": "Testt",
      "LockToken": "7f36cb30-74ef-4cff-8cd4-a77e1aba1746",
      "Id": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    }
  ]
}
```

For more information, see [Managing and Using a Web Access Control List \(Web ACL\)](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListWebAcls](#) in *AWS CLI Command Reference*.

put-logging-configuration

The following code example shows how to use `put-logging-configuration`.

AWS CLI

To add a logging configuration to a web ACL

The following `put-logging-configuration` adds the Amazon Kinesis Data Firehose logging configuration `aws-waf-logs-custom-transformation` to the specified web ACL, with no fields redacted from the logs.

```
aws wafv2 put-logging-configuration \  
  --logging-configuration ResourceArn=arn:aws:wafv2:us-  
west-2:123456789012:regional/webacl/test-cli/a1b2c3d4-5678-90ab-  
cdef-EXAMPLE11111,LogDestinationConfigs=arn:aws:firehose:us-  
west-2:123456789012:deliverystream/aws-waf-logs-custom-transformation \  
  --region us-west-2
```

Output:

```
{  
  "LoggingConfiguration":{  
    "ResourceArn":"arn:aws:wafv2:us-west-2:123456789012:regional/webacl/test-  
cli/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
    "LogDestinationConfigs":[  
      "arn:aws:firehose:us-west-2:123456789012:deliverystream/aws-waf-logs-  
custom-transformation"  
    ]  
  }  
}
```

For more information, see [Logging Web ACL Traffic Information](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [PutLoggingConfiguration](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to an AWS WAF resource

The following `tag-resource` example adds a tag with a key of `Name` and value set to `AWSWAF` to the specified web ACL.

```
aws wafv2 tag-resource \  
  --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/  
  apiGatewayWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --tags Key=Name,Value=AWSWAF
```

This command produces no output.

For more information, see [Getting Started with AWS WAF](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from an AWS WAF resource

The following `untag-resource` example removes the tag with the key `KeyName` from the specified web ACL.

```
aws wafv2 untag-resource \  
  --resource-arn arn:aws:wafv2:us-west-2:123456789012:regional/webacl/  
  apiGatewayWebAcl/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --tag-keys "KeyName"
```

This command produces no output.

For more information, see [Getting Started with AWS WAF](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-ip-set

The following code example shows how to use `update-ip-set`.

AWS CLI

To modify the settings for an existing IP set

The following `update-ip-set` updates the settings for the specified IP set. This call requires an ID, which you can obtain from the call, `list-ip-sets`, and a lock token which you can obtain from the calls, `list-ip-sets` and `get-ip-set`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-ip-set \  
  --name testip \  
  --scope REGIONAL \  
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --addresses 198.51.100.0/16 \  
  --lock-token 447e55ac-2396-4c6d-b9f9-86b67c17f8b5
```

Output:

```
{  
  "NextLockToken": "0674c84b-0304-47fe-8728-c6bff46af8fc"  
}
```

For more information, see [IP Sets and Regex Pattern Sets](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [UpdateIpSet](#) in *AWS CLI Command Reference*.

update-regex-pattern-set

The following code example shows how to use `update-regex-pattern-set`.

AWS CLI

To modify the settings for an existing regex pattern set

The following `update-regex-pattern-set` updates the settings for the specified regex pattern set. This call requires an ID, which you can obtain from the call, `list-regex-pattern-sets`, and a lock token which you can obtain from the calls, `list-regex-pattern-sets` and `get-regex-pattern-set`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-regex-pattern-set \  
  --name ExampleRegex \  
  --scope REGIONAL \  
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --regular-expression-list RegexString="^.+ $" \  
  --lock-token ed207e9c-82e9-4a77-aadd-81e6173ab7eb
```

Output:

```
{  
  "NextLockToken": "12ebc73e-fa68-417d-a9b8-2bdd761a4fa5"  
}
```

For more information, see [IP Sets and Regex Pattern Sets](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [UpdateRegexPatternSet](#) in *AWS CLI Command Reference*.

update-rule-group

The following code example shows how to use `update-rule-group`.

AWS CLI

To update a custom rule group

The following `update-rule-group` changes the visibility configuration for an existing custom rule group. This call requires an ID, which you can obtain from the call, `list-rule-groups`, and a lock token which you can obtain from the calls, `list-rule-groups` and `get-rule-group`. This call also returns a lock token that you can use for a subsequent update.

```
aws wafv2 update-rule-group \  
  --name TestRuleGroup \  
  --scope REGIONAL \  
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --lock-token ed207e9c-82e9-4a77-aadd-81e6173ab7eb
```

```

--lock-token 7b3bcec2-0000-0000-0000-563bf47249f0 \
--visibility-config
SampledRequestsEnabled=false,CloudWatchMetricsEnabled=false,MetricName=TestMetricsForRuleGr
\
--region us-west-2

```

Output:

```

{
  "NextLockToken": "1eb5ec48-0000-0000-0000-ee9b906c541e"
}

```

For more information, see [Managing Your Own Rule Groups](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [UpdateRuleGroup](#) in *AWS CLI Command Reference*.

update-web-acl

The following code example shows how to use `update-web-acl`.

AWS CLI**To update a web ACL**

The following `update-web-acl` changes settings for an existing web ACL. This call requires an ID, which you can obtain from the call, `list-web-acls`, and a lock token and other settings, which you can obtain from the call `get-web-acl`. This call also returns a lock token that you can use for a subsequent update.

```

aws wafv2 update-web-acl \
  --name TestWebAcl \
  --scope REGIONAL \
  --id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --lock-token 2294b3a1-0000-0000-0000-a3ae04329de9 \
  --default-action Block={} \
  --visibility-config
SampledRequestsEnabled=false,CloudWatchMetricsEnabled=false,MetricName=NewMetricTestWebAcl
\
  --rules file://waf-rule.json \
  --region us-west-2

```

Output:

```
{
  "NextLockToken": "714a0cfb-0000-0000-0000-2959c8b9a684"
}
```

For more information, see [Managing and Using a Web Access Control List \(Web ACL\)](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [UpdateWebAcl](#) in *AWS CLI Command Reference*.

Amazon WorkDocs examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkDocs.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

abort-document-version-upload

The following code example shows how to use `abort-document-version-upload`.

AWS CLI

To stop a document version upload

This example stops a previously initiated document version upload.

Command:

```
aws workdocs abort-document-version-upload --document-id
feaba64d4efdf271c2521b60a2a44a8f057e84beaabbe22f01267313209835f2 --version-id
1536773972914-ddb67663e782e7ce8455ebc962217cf9f9e47b5a9a702e5c84dccc417da9313
```

Output:

```
None
```

- For API details, see [AbortDocumentVersionUpload](#) in *AWS CLI Command Reference*.

activate-user

The following code example shows how to use `activate-user`.

AWS CLI**To activate a user**

This example activates an inactive user.

Command:

```
aws workdocs activate-user --user-id
"S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
{
  "User": {
    "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
    "Username": "exampleUser",
    "EmailAddress": "exampleUser@site.awsapps.com",
    "GivenName": "Example",
    "Surname": "User",
    "OrganizationId": "d-926726012c",
    "RootFolderId":
"75f67c183aa1217409ac87576a45c03a5df5e6d8c51c35c01669970538e86cd0",

      }
    }
  }
}
}
}

```

- For API details, see [ActivateUser](#) in *AWS CLI Command Reference*.

add-resource-permissions

The following code example shows how to use `add-resource-permissions`.

AWS CLI

To add permissions for a resource

This example adds permissions to the resource for the specified principals.

Command:

```

aws workdocs add-resource-permissions --resource-id
d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --principals
Id=anonymous,Type=ANONYMOUS,Role=VIEWER

```

Output:

```

{
  "ShareResults": [
    {
      "PrincipalId": "anonymous",
      "Role": "VIEWER",
      "Status": "SUCCESS",
      "ShareId":
"d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65",
      "StatusMessage": ""
    }
  ]
}

```

```

    }
  ]
}

```

- For API details, see [AddResourcePermissions](#) in *AWS CLI Command Reference*.

create-comment

The following code example shows how to use `create-comment`.

AWS CLI

To add a new comment

This example adds a new comment to the specified document version.

Command:

```

aws workdocs create-comment --document-id
15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id
1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
text "This is a comment."

```

Output:

```

{
  "Comment": {
    "CommentId": "1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
    "ThreadId": "1534799058197-

      "Surname": "User",
      "Status": "ACTIVE"
    },
    "CreatedTimestamp": 1534799058.197,
    "Status": "PUBLISHED",
    "Visibility": "PUBLIC"
  }
}

```

```
}  
}
```

- For API details, see [CreateComment](#) in *AWS CLI Command Reference*.

create-custom-metadata

The following code example shows how to use `create-custom-metadata`.

AWS CLI

To create custom metadata

This example creates custom metadata for the specified document.

Command:

```
aws workdocs create-custom-metadata --resource-id  
d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --custom-metadata  
KeyName1=example,KeyName2=example2
```

Output:

```
None
```

- For API details, see [CreateCustomMetadata](#) in *AWS CLI Command Reference*.

create-folder

The following code example shows how to use `create-folder`.

AWS CLI

To create a folder

This example creates a folder.

Command:

```
aws workdocs create-folder --name documents --parent-folder-id  
1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

```
{
  "Metadata": {
    "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
    "Name": "documents",
    "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
    "ParentFolderId":
"1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
    "CreatedTimestamp": 1534450467.622,
    "ModifiedTimestamp": 1534450467.622,
    "ResourceState": "ACTIVE",
    "Signature": "",
    "Size": 0,
    "LatestVersionSize": 0
  }
}
```

- For API details, see [CreateFolder](#) in *AWS CLI Command Reference*.

create-labels

The following code example shows how to use `create-labels`.

AWS CLI**To create labels**

This example creates a series of labels for a document.

Command:

```
aws workdocs create-labels --resource-id
d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --labels
"documents" "examples" "my_documents"
```

Output:

```
None
```

- For API details, see [CreateLabels](#) in *AWS CLI Command Reference*.

create-notification-subscription

The following code example shows how to use `create-notification-subscription`.

AWS CLI

To create a notification subscription

The following `create-notification-subscription` example configures a notification subscription for the specified Amazon WorkDocs organization.

```
aws workdocs create-notification-subscription \  
  --organization-id d-123456789c \  
  --protocol HTTPS \  
  --subscription-type ALL \  
  --notification-endpoint "https://example.com/example"
```

Output:

```
{  
  "Subscription": {  
    "SubscriptionId": "123ab4c5-678d-901e-f23g-45h6789j0123",  
    "EndPoint": "https://example.com/example",  
    "Protocol": "HTTPS"  
  }  
}
```

For more information, see [Subscribe to Notifications](#) in the *Amazon WorkDocs Developer Guide*.

- For API details, see [CreateNotificationSubscription](#) in *AWS CLI Command Reference*.

create-user

The following code example shows how to use `create-user`.

AWS CLI

To create a new user

This example creates a new user in a Simple AD or Microsoft AD directory.

Command:

```
aws workdocs create-user --organization-id d-926726012c --username exampleUser2
--email-address exampleUser2@site.awsapps.com --given-name example2Name --surname
example2Surname --password examplePa$$w0rd
```

Output:

```
{
  "User": {
    "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
    "Username": "exampleUser2",
    "EmailAddress": "exampleUser2@site.awsapps.com",
    "GivenName": "example2Name",
    "Surname": "example2Surname",
    "OrganizationId": "d-926726012c",
    "RootFolderId":
"35b886cb17198cbd547655e58b025dff0cf34aaed638be52009567e23dc67390",
    "RecycleBinFolderId":
"9858c3e9ed4c2460dde9aadb4c69fde998070dd46e5e985bd08ec6169ea249ff",
    "Status": "ACTIVE",
    "Type": "MINIMALUSER",
    "CreatedTimestamp": 1535478836.584,
    "ModifiedTimestamp": 1535478836.584,
    "Storage": {
      "StorageUtilizedInBytes": 0,
      "StorageRule": {
        "StorageAllocatedInBytes": 0,
        "StorageType": "QUOTA"
      }
    }
  }
}
```

- For API details, see [CreateUser](#) in *AWS CLI Command Reference*.

deactivate-user

The following code example shows how to use deactivate-user.

AWS CLI

To deactivate a user

This example deactivates an active user.

Command:

```
aws workdocs deactivate-user --user-id
"S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
None
```

- For API details, see [DeactivateUser](#) in *AWS CLI Command Reference*.

delete-comment

The following code example shows how to use `delete-comment`.

AWS CLI

To delete a specified comment from a document version

This example deletes the specified comment from the specified document version.

Command:

```
aws workdocs delete-comment --document-id
15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id
1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
comment-id 1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5
```

Output:

```
None
```

- For API details, see [DeleteComment](#) in *AWS CLI Command Reference*.

delete-custom-metadata

The following code example shows how to use `delete-custom-metadata`.

AWS CLI

To delete custom metadata from a resource

This example deletes all custom metadata from the specified resource.

Command:

```
aws workdocs delete-custom-metadata --resource-id
d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --delete-all
```

Output:

```
None
```

- For API details, see [DeleteCustomMetadata](#) in *AWS CLI Command Reference*.

delete-document

The following code example shows how to use `delete-document`.

AWS CLI

To delete a document

This example deletes the specified document.

Command:

```
aws workdocs delete-document --document-id
b83ed5e5b167b65ef69de9d597627ff1a0d4f07a45e67f1fab7d26b54427de0a
```

Output:

```
None
```

- For API details, see [DeleteDocument](#) in *AWS CLI Command Reference*.

delete-folder-contents

The following code example shows how to use `delete-folder-contents`.

AWS CLI

To delete the contents of a folder

This example deletes the contents of the specified folder.

Command:

```
aws workdocs delete-folder-contents --folder-id
26fa8aa4ba2071447c194f7b150b07149dbdb9e1c8a301872dcd93a4735ce65d
```

Output:

```
None
```

- For API details, see [DeleteFolderContents](#) in *AWS CLI Command Reference*.

delete-folder

The following code example shows how to use delete-folder.

AWS CLI

To delete a folder

This example deletes the specified folder.

Command:

```
aws workdocs delete-folder --folder-id
26fa8aa4ba2071447c194f7b150b07149dbdb9e1c8a301872dcd93a4735ce65d
```

Output:

```
None
```

- For API details, see [DeleteFolder](#) in *AWS CLI Command Reference*.

delete-labels

The following code example shows how to use delete-labels.

AWS CLI

To delete labels

This example deletes the specified labels from a document.

Command:

```
aws workdocs delete-labels --resource-id
d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --labels
"documents" "examples"
```

Output:

```
None
```

- For API details, see [DeleteLabels](#) in *AWS CLI Command Reference*.

delete-notification-subscription

The following code example shows how to use delete-notification-subscription.

AWS CLI

To delete a notification subscription

The following delete-notification-subscription example deletes the specified notification subscription.

```
aws workdocs delete-notification-subscription \
--subscription-id 123ab4c5-678d-901e-f23g-45h6789j0123 \
--organization-id d-123456789c
```

This command produces no output.

For more information, see [Subscribe to Notifications](#) in the *Amazon WorkDocs Developer Guide*.

- For API details, see [DeleteNotificationSubscription](#) in *AWS CLI Command Reference*.

delete-user

The following code example shows how to use delete-user.

AWS CLI

To delete a user

This example deletes a user.

Command:

```
aws workdocs delete-user --user-id
"S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c"
```

Output:

```
None
```

- For API details, see [DeleteUser](#) in *AWS CLI Command Reference*.

describe-activities

The following code example shows how to use describe-activities.

AWS CLI

To get a list of user activities

This example returns a list of the latest user activities for the specified organization, with a limit set for the latest two activities.

Command:

```
aws workdocs describe-activities --organization-id d-926726012c --limit 2
```

Output:

```
{
  "UserActivities": [
    {
      "Type": "DOCUMENT_VERSION_DOWNLOADED",
      "TimeStamp": 1534800122.17,

- For API details, see [DescribeActivities](#) in *AWS CLI Command Reference*.

describe-comments

The following code example shows how to use `describe-comments`.

AWS CLI

To list all comments for a specified document version

This example lists all the comments for the specified document version.

Command:

```
aws workdocs describe-comments --document-id
15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id
1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920
```

Output:

```
{
  "Comments": [
    {
      "CommentId": "1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
      "ThreadId": "1534799058197-
c7f5c84de9115875bbca93e0367bbebac609541d461636b760849b88b1609dd5",
      "Text": "This is a comment.",
      "Contributor": {
        "Username": "arn:aws:iam::123456789123:user/exampleUser",
        "Type": "USER"
      },
      "CreatedTimestamp": 1534799058.197,
      "Status": "PUBLISHED",
      "Visibility": "PUBLIC"
    }
  ]
}
```

- For API details, see [DescribeComments](#) in *AWS CLI Command Reference*.

describe-document-versions

The following code example shows how to use `describe-document-versions`.

AWS CLI

To retrieve a document's versions

This example retrieves the document versions for the specified document, including initialized versions and a URL for the source document.

Command:

```
aws workdocs describe-document-versions --document-id
d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --fields SOURCE
```

Output:

```
{
  "DocumentVersions": [
    {
      "Id":
      "1534452029587-15e129dfc187505c407588df255be83de2920d733859f1d2762411d22a83e3ef",

- For API details, see [DescribeDocumentVersions](#) in *AWS CLI Command Reference*.

describe-folder-contents

The following code example shows how to use `describe-folder-contents`.

AWS CLI

To describe the contents of a folder

This example describes all the active contents of the specified folder, including its documents and subfolders, sorted by date in ascending order.

Command:

```

aws workdocs describe-folder-contents --folder-id
1e9e93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678 --sort DATE --
order ASCENDING --type ALL

```

Output:

```
{
  "Folders": [
    {
      "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",

      "ResourceState": "ACTIVE"
    }
  ]
}
```

```
]
}
```

- For API details, see [DescribeFolderContents](#) in *AWS CLI Command Reference*.

describe-groups

The following code example shows how to use `describe-groups`.

AWS CLI

To retrieve a list of groups

The following `describe-groups` example lists the groups associated with the specified Amazon WorkDocs organization.

```
aws workdocs describe-groups \
  --search-query "e" \
  --organization-id d-123456789c
```

Output:

```
{
  "Groups": [
    {
      "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444&d-123456789c",
      "Name": "Example Group 1"
    },
    {
      "Id": "S-1-1-11-1122222222-2222233333-3333334444-5555&d-123456789c",
      "Name": "Example Group 2"
    }
  ]
}
```

For more information, see [Getting Started with Amazon WorkDocs](#) in the *Amazon WorkDocs Administration Guide*.

- For API details, see [DescribeGroups](#) in *AWS CLI Command Reference*.

describe-notification-subscriptions

The following code example shows how to use `describe-notification-subscriptions`.

AWS CLI

To retrieve a list of notification subscriptions

The following `describe-notification-subscriptions` example retrieves the notification subscriptions for the specified Amazon WorkDocs organization.

```
aws workdocs describe-notification-subscriptions \  
  --organization-id d-123456789c
```

Output:

```
{  
  "Subscriptions": [  
    {  
      "SubscriptionId": "123ab4c5-678d-901e-f23g-45h6789j0123",  
      "EndPoint": "https://example.com/example",  
      "Protocol": "HTTPS"  
    }  
  ]  
}
```

For more information, see [Subscribe to Notifications](#) in the *Amazon WorkDocs Developer Guide*.

- For API details, see [DescribeNotificationSubscriptions](#) in *AWS CLI Command Reference*.

describe-resource-permissions

The following code example shows how to use `describe-resource-permissions`.

AWS CLI

To get a list of permissions for a resource

This example returns a list of the permissions for the specified resource (document or folder).

Command:

```
aws workdocs describe-resource-permissions --resource-id
15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3
```

Output:

```
{
  "Principals": [
    {
      "Id": "anonymous",
      "Type": "ANONYMOUS",
      "Roles": [
        {
          "Role": "VIEWER",
          "Type": "DIRECT"
        }
      ]
    },
    {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
      "Type": "USER",
      "Roles": [
        {
          "Role": "OWNER",
          "Type": "DIRECT"
        }
      ]
    },
    {
      "Id": "d-926726012c",
      "Type": "ORGANIZATION",
      "Roles": [
        {
          "Role": "VIEWER",
          "Type": "INHERITED"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeResourcePermissions](#) in *AWS CLI Command Reference*.

describe-users

The following code example shows how to use describe-users.

AWS CLI

To retrieve details for specified users

This example retrieves details for all the users in the specified organization.

Command:

```
aws workdocs describe-users --organization-id d-926726012c
```

Output:

```
{
  "Users": [
    {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",

      "Type": "MINIMALUSER",
```

```
        "CreatedTimestamp": 1535478836.584,  
        "ModifiedTimestamp": 1535478836.584  
    }  
]  
}
```

- For API details, see [DescribeUsers](#) in *AWS CLI Command Reference*.

get-document-path

The following code example shows how to use `get-document-path`.

AWS CLI

To retrieve a document's path information

This example retrieves the path information (hierarchy from the root folder) for the specified document, and includes the names of the parent folders.

Command:

```
aws workdocs get-document-path --document-id  
d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65 --fields NAME
```

Output:

```
{  
  "Path": {  
    "Components": [  
      {  
        "Id":  
"a43d29cbb8e7c4d25cfee8b803a504b0dc63e760b55ad0c611c6b87691eb6ff3",  
        "Name": "/"  
      },  
      {  
        "Id":  
"1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",  
        "Name": "Top Level Folder"  
      },  
      {  
        "Id":  
"d90d93c1fe44bad0c8471e973ebaab339090401a95e777cffa58e977d2983b65",
```

```

        "Name": "exampleDoc.docx"
      }
    ]
  }
}

```

- For API details, see [GetDocumentPath](#) in *AWS CLI Command Reference*.

get-document-version

The following code example shows how to use `get-document-version`.

AWS CLI

To retrieve version metadata for a specified document

This example retrieves version metadata for the specified document, including a source URL and custom metadata.

Command:

```

aws workdocs get-document-version --document-id
15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id

}
}

```

- For API details, see [GetFolderPath](#) in *AWS CLI Command Reference*.

get-folder

The following code example shows how to use `get-folder`.

AWS CLI

To retrieve the metadata for a folder

This example retrieves the metadata for the specified folder.

Command:

```
aws workdocs get-folder --folder-id
50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08
```

Output:

```

{
  "Metadata": {
    "Id": "50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08",
    "Name": "exampleFolder",
    "CreatorId": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
    "ParentFolderId":
    "1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678",
    "CreatedTimestamp": 1534450467.622,
    "ModifiedTimestamp": 1534451113.504,
    "ResourceState": "ACTIVE",

```

```
"Signature": "1a23456b78901c23d4ef56gh7EXAMPLE",
"Size": 23019,
"LatestVersionSize": 11537
}
}
```

- For API details, see [GetFolder](#) in *AWS CLI Command Reference*.

get-resources

The following code example shows how to use `get-resources`.

AWS CLI

To retrieve shared resources

The following `get-resources` example retrieves the resources shared with the specified Amazon WorkDocs user.

```
aws workdocs get-resources \
  --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333" \
  --collection-type SHARED_WITH_ME
```

Output:

```
{
  "Folders": [],
  "Documents": []
}
```

For more information, see [Sharing Files and Folders](#) in the *Amazon WorkDocs User Guide*.

- For API details, see [GetResources](#) in *AWS CLI Command Reference*.

initiate-document-version-upload

The following code example shows how to use `initiate-document-version-upload`.

AWS CLI

To initiate a document version upload

The following `initiate-document-upload` example creates a new document object and version object.

```
aws workdocs initiate-document-version-upload \
  --name exampledocname \
  --parent-folder-id
eacd546d952531c633452ed67cac23161aa0d5df2e8061223a59e8f67e7b6189
```

Output:

```
{
  "Metadata": {

```

- For API details, see [InitiateDocumentVersionUpload](#) in *AWS CLI Command Reference*.

remove-all-resource-permissions

The following code example shows how to use `remove-all-resource-permissions`.

AWS CLI

To remove all permissions from a specified resource

This example removes all permissions from the specified resource.

Command:

```
aws workdocs remove-all-resource-permissions --resource-id  
1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

```
None
```

- For API details, see [RemoveAllResourcePermissions](#) in *AWS CLI Command Reference*.

remove-resource-permission

The following code example shows how to use `remove-resource-permission`.

AWS CLI

To remove permissions from a resource

This example removes permissions from the resource for the specified principal.

Command:

```
aws workdocs remove-resource-permission --resource-id  
1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678 --principal-id  
anonymous
```

Output:

None

- For API details, see [RemoveResourcePermission](#) in *AWS CLI Command Reference*.

update-document-version

The following code example shows how to use `update-document-version`.

AWS CLI**To change a document version status to Active**

This example changes the status of the document version to Active.

Command:

```
aws workdocs update-document-version --document-id
15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --version-id
1521672507741-9f7df0ea5dd0b121c4f3564a0c7c0b4da95cd12c635d3c442af337a88e297920 --
version-status ACTIVE
```

Output:

None

- For API details, see [UpdateDocumentVersion](#) in *AWS CLI Command Reference*.

update-document

The following code example shows how to use `update-document`.

AWS CLI**To update a document**

This example updates a document's name and parent folder.

Command:

```
aws workdocs update-document --document-id
15df51e0335cfcc6a2e4de9dd8be9f22ee40545ad9176f54758dcf903be982d3 --name updatedDoc
--parent-folder-id 50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08
```

Output:

```
None
```

- For API details, see [UpdateDocument](#) in *AWS CLI Command Reference*.

update-folder

The following code example shows how to use `update-folder`.

AWS CLI

To update a folder

This example updates a folder's name and parent folder.

Command:

```
aws workdocs update-folder --folder-id
50893c0af679524d1a0e0651130ed6d073e1a05f95bd12c42dcde5d35634ed08 --name
exampleFolder1 --parent-folder-id
1ece93e5fe75315c7407c4967918b4fd9da87ddb2a588e67b7fdaf4a98fde678
```

Output:

```
None
```

- For API details, see [UpdateFolder](#) in *AWS CLI Command Reference*.

update-user

The following code example shows how to use `update-user`.

AWS CLI

To update a user

This example updates the time zone for the specified user.

Command:

```
aws workdocs update-user --user-id
"S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c" --time-zone-id
"America/Los_Angeles"
```

Output:

```
{
  "User": {
    "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333&d-926726012c",
    "Username": "exampleUser",
    "EmailAddress": "exampleUser@site.awsapps.com",

      }
    }
  }
}
```

- For API details, see [UpdateUser](#) in *AWS CLI Command Reference*.

Amazon WorkMail examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkMail.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

associate-delegate-to-resource

The following code example shows how to use `associate-delegate-to-resource`.

AWS CLI

To add a delegate to a resource

The following `associate-delegate-to-resource` command adds a delegate to a resource.

```
aws workmail associate-delegate-to-resource \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --resource-id r-68bf2d3b1c0244aab7264c24b9217443 \  
  --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [AssociateDelegateToResource](#) in *AWS CLI Command Reference*.

associate-member-to-group

The following code example shows how to use `associate-member-to-group`.

AWS CLI

To add a member to a group

The following `associate-member-to-group` command adds the specified member to a group.

```
aws workmail associate-member-to-group \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --group-id S-1-1-11-1122222222-2222233333-3333334444-4444 \  
  --member-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [AssociateMemberToGroup](#) in *AWS CLI Command Reference*.

create-alias

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias

The following `create-alias` command creates an alias for the specified entity (user or group).

```
aws workmail create-alias \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \  
  --alias exampleAlias@site.awsapps.com
```

This command produces no output.

- For API details, see [CreateAlias](#) in *AWS CLI Command Reference*.

create-group

The following code example shows how to use `create-group`.

AWS CLI

To create a new group

The following `create-group` command creates a new group for the specified organization.

```
aws workmail create-group \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --group-name my-new-group
```

```
--name exampleGroup1
```

Output:

```
{
  "GroupId": "S-1-1-11-1122222222-2222233333-3333334444-4444"
}
```

- For API details, see [CreateGroup](#) in *AWS CLI Command Reference*.

create-resource

The following code example shows how to use `create-resource`.

AWS CLI

To create a new resource

The following `create-resource` command creates a new resource (meeting room) for the specified organization.

```
aws workmail create-resource \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
  --name exampleRoom1 \
  --type ROOM
```

Output:

```
{
  "ResourceId": "r-7afe0efbade843a58cdc10251fce992c"
}
```

- For API details, see [CreateResource](#) in *AWS CLI Command Reference*.

create-user

The following code example shows how to use `create-user`.

AWS CLI

To create a new user

The following `create-user` command creates a new user.

```
aws workmail create-user \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --name exampleName \  
  --display-name exampleDisplayName \  
  --password examplePa$$w0rd
```

Output:

```
{  
  "UserId": "S-1-1-11-1111111111-2222222222-3333333333-3333"  
}
```

- For API details, see [CreateUser](#) in *AWS CLI Command Reference*.

delete-access-control-rule

The following code example shows how to use `delete-access-control-rule`.

AWS CLI

To delete an access control rule

The following `delete-access-control-rule` example deletes the specified access control rule from the specified Amazon WorkMail organization.

```
aws workmail delete-access-control-rule \  
  --organization-id m-n1pq2345678r901st2u3vx45x6789yza \  
  --name "myRule"
```

This command produces no output.

For more information, see [Working with Access Control Rules](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [DeleteAccessControlRule](#) in *AWS CLI Command Reference*.

delete-alias

The following code example shows how to use `delete-alias`.

AWS CLI

To delete an alias

The following `delete-alias` command deletes the alias for the specified entity (user or group).

```
aws workmail delete-alias \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \  
  --alias exampleAlias@site.awsapps.com
```

This command produces no output.

- For API details, see [DeleteAlias](#) in *AWS CLI Command Reference*.

delete-group

The following code example shows how to use `delete-group`.

AWS CLI

To delete an existing group

The following `delete-group` command deletes an existing group from Amazon WorkMail.

```
aws workmail delete-group \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

This command produces no output.

- For API details, see [DeleteGroup](#) in *AWS CLI Command Reference*.

delete-mailbox-permissions

The following code example shows how to use `delete-mailbox-permissions`.

AWS CLI

To delete mailbox permissions

The following `delete-mailbox-permissions` command deletes mailbox permissions that were previously granted to a user or group. The entity represents the user that owns the mailbox, and the grantee represents the user or group for whom to delete permissions.

```
aws workmail delete-mailbox-permissions \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \  
  --grantee-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [DeleteMailboxPermissions](#) in *AWS CLI Command Reference*.

delete-resource

The following code example shows how to use `delete-resource`.

AWS CLI

To delete an existing resource

The following `delete-resource` command deletes an existing resource from Amazon WorkMail.

```
aws workmail delete-resource \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --resource-id r-7afe0efbade843a58cdc10251fce992c
```

This command produces no output.

- For API details, see [DeleteResource](#) in *AWS CLI Command Reference*.

delete-user

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` command deletes the specified user from Amazon WorkMail and all subsequent systems.

```
aws workmail delete-user \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [DeleteUser](#) in *AWS CLI Command Reference*.

deregister-from-work-mail

The following code example shows how to use `deregister-from-work-mail`.

AWS CLI

To disable an existing entity

The following `deregister-from-work-mail` command disables an existing entity (user, group, or resource) from using Amazon WorkMail.

```
aws workmail deregister-from-work-mail \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [DeregisterFromWorkMail](#) in *AWS CLI Command Reference*.

describe-group

The following code example shows how to use `describe-group`.

AWS CLI

To retrieve information for a group

The following `describe-group` command retrieves information about the specified group.

```
aws workmail describe-group \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

Output:

```
{
  "GroupId": "S-1-1-11-1122222222-2222233333-3333334444-4444",
  "Name": "exampleGroup1",
  "State": "ENABLED"
}
```

- For API details, see [DescribeGroup](#) in *AWS CLI Command Reference*.

describe-organization

The following code example shows how to use `describe-organization`.

AWS CLI**To retrieve information for an organization**

The following `describe-organization` command retrieves information for the specified Amazon WorkMail organization.

```
aws workmail describe-organization \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
  "OrganizationId": "m-d281d0a2fd824be5b6cd3d3ce909fd27",
  "Alias": "alias",
  "State": "Active",
  "DirectoryId": "d-926726012c",
  "DirectoryType": "VpcDirectory",
  "DefaultMailDomain": "site.awsapps.com",
  "CompletedDate": 1522693605.468,
  "ARN": "arn:aws:workmail:us-west-2:111122223333:organization/m-
n1pq2345678r901st2u3vx45x6789yza"
}
```

For more information, see [Working with Organizations](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [DescribeOrganization](#) in *AWS CLI Command Reference*.

describe-resource

The following code example shows how to use `describe-resource`.

AWS CLI

To retrieve information for a resource

The following `describe-resource` command retrieves information about the specified resource.

```
aws workmail describe-resource \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --resource-id r-7afe0efbade843a58cdc10251fce992c
```

Output:

```
{  
  "ResourceId": "r-7afe0efbade843a58cdc10251fce992c",  
  "Name": "exampleRoom1",  
  "Type": "ROOM",  
  "BookingOptions": {  
    "AutoAcceptRequests": true,  
    "AutoDeclineRecurringRequests": false,  
    "AutoDeclineConflictingRequests": true  
  },  
  "State": "ENABLED"  
}
```

- For API details, see [DescribeResource](#) in *AWS CLI Command Reference*.

describe-user

The following code example shows how to use `describe-user`.

AWS CLI

To retrieve user information

The following `describe-user` command retrieves information about the specified user.

```
aws workmail describe-user \  
  --user-id u-7afe0efbade843a58cdc10251fce992c
```

```
--organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
--user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{  
  "UserId": "S-1-1-11-1111111111-2222222222-3333333333-3333",  
  "Name": "exampleUser1",  
  "Email": "exampleUser1@site.awsapps.com",  
  "DisplayName": "",  
  "State": "ENABLED",  
  "UserRole": "USER",  
  "EnabledDate": 1532459261.827  
}
```

- For API details, see [DescribeUser](#) in *AWS CLI Command Reference*.

disassociate-delegate-from-resource

The following code example shows how to use `disassociate-delegate-from-resource`.

AWS CLI

To remove a member from a resource

The following `disassociate-delegate-from-resource` command removes the specified member from a resource.

```
aws workmail disassociate-delegate-from-resource \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --resource-id r-68bf2d3b1c0244aab7264c24b9217443 \  
  --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [DisassociateDelegateFromResource](#) in *AWS CLI Command Reference*.

disassociate-member-from-group

The following code example shows how to use `disassociate-member-from-group`.

AWS CLI

To remove a member from a group

The following `disassociate-member-from-group` command removes the specified member from a group.

```
aws workmail disassociate-member-from-group \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --group-id S-1-1-11-1122222222-2222233333-3333334444-4444 \  
  --member-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

This command produces no output.

- For API details, see [DisassociateMemberFromGroup](#) in *AWS CLI Command Reference*.

get-access-control-effect

The following code example shows how to use `get-access-control-effect`.

AWS CLI

To get the effect of access control rules

The following `get-access-control-effect` example retrieves the effect of the specified Amazon WorkMail organization's access control rules for the specified IP address, access protocol action, and user ID.

```
aws workmail get-access-control-effect \  
  --organization-id m-n1pq2345678r901st2u3vx45x6789yza \  
  --ip-address "192.0.2.0" \  
  --action "WindowsOutlook" \  
  --user-id "S-1-1-11-1111111111-2222222222-3333333333-3333"
```

Output:

```
{  
  "Effect": "DENY",  
  "MatchedRules": [  
    "myRule"  
  ]  
}
```

```
}
```

For more information, see [Working with Access Control Rules](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [GetAccessControlEffect](#) in *AWS CLI Command Reference*.

get-mailbox-details

The following code example shows how to use `get-mailbox-details`.

AWS CLI

To get a user's mailbox details

The following `get-mailbox-details` command retrieves details about the specified user's mailbox.

```
aws workmail get-mailbox-details \  
  --organization-id m-n1pq2345678r901st2u3vx45x6789yza \  
  --user-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{  
  "MailboxQuota": 51200,  
  "MailboxSize": 0.03890800476074219  
}
```

For more information, see [Managing User Accounts](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [GetMailboxDetails](#) in *AWS CLI Command Reference*.

list-access-control-rules

The following code example shows how to use `list-access-control-rules`.

AWS CLI

To list access control rules

The following `list-access-control-rules` example lists the access control rules for the specified Amazon WorkMail organization.

```
aws workmail list-access-control-rules \  
  --organization-id m-n1pq2345678r901st2u3vx45x6789yza
```

Output:

```
{  
  "Rules": [  
    {  
      "Name": "default",  
      "Effect": "ALLOW",  
      "Description": "Default WorkMail Rule",  
      "DateCreated": 0.0,  
      "DateModified": 0.0  
    },  
    {  
      "Name": "myRule",  
      "Effect": "DENY",  
      "Description": "my rule",  
      "UserIds": [  
        "S-1-1-11-1111111111-2222222222-3333333333-3333"  
      ],  
      "DateCreated": 1581635628.0,  
      "DateModified": 1581635628.0  
    }  
  ]  
}
```

For more information, see [Working with Access Control Rules](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [ListAccessControlRules](#) in *AWS CLI Command Reference*.

list-aliases

The following code example shows how to use `list-aliases`.

AWS CLI

To list aliases for a member

The following `list-aliases` command lists aliases for the specified member (user or group).

```
aws workmail list-aliases \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{  
  "Aliases": [  
    "exampleAlias@site.awsapps.com",  
    "exampleAlias1@site.awsapps.com"  
  ]  
}
```

- For API details, see [ListAliases](#) in *AWS CLI Command Reference*.

`list-group-members`

The following code example shows how to use `list-group-members`.

AWS CLI

To list group members

The following `list-group-members` command lists the members of the specified group.

```
aws workmail list-group-members \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --group-id S-1-1-11-1122222222-2222233333-3333334444-4444
```

Output:

```
{  
  "Members": [  
    {  
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",  
      "Name": "exampleUser1",  
      "Type": "USER",  
      "State": "ENABLED",  
      "EnabledDate": 1532459261.827  
    }  
  ]  
}
```

```
]
}
```

- For API details, see [ListGroupMembers](#) in *AWS CLI Command Reference*.

list-groups

The following code example shows how to use `list-groups`.

AWS CLI

To retrieve a list of groups

The following `list-groups` command retrieves summaries of the groups in the specified organization.

```
aws workmail list-groups \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
  "Groups": [
    {
      "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444",
      "Name": "exampleGroup1",
      "State": "DISABLED"
    },
    {
      "Id": "S-4-4-44-1122222222-2222233333-3333334444-4444",
      "Name": "exampleGroup2",
      "State": "ENABLED"
    }
  ]
}
```

- For API details, see [ListGroups](#) in *AWS CLI Command Reference*.

list-mailbox-permissions

The following code example shows how to use `list-mailbox-permissions`.

AWS CLI

To retrieve mailbox permissions

The following `list-mailbox-permissions` command retrieves the mailbox permissions associated with the specified entity's mailbox.

```
aws workmail list-mailbox-permissions \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333
```

Output:

```
{  
  "Permissions": [  
    {  
      "GranteeId": "S-1-1-11-1122222222-2222233333-3333334444-4444",  
      "GranteeType": "USER",  
      "PermissionValues": [  
        "FULL_ACCESS"  
      ]  
    }  
  ]  
}
```

- For API details, see [ListMailboxPermissions](#) in *AWS CLI Command Reference*.

list-organizations

The following code example shows how to use `list-organizations`.

AWS CLI

To retrieve a list of organizations

The following `list-organizations` command retrieves summaries of non-deleted organizations.

```
aws workmail list-organizations
```

Output:

```
{
  "OrganizationSummaries": [
    {
      "OrganizationId": "m-d281d0a2fd824be5b6cd3d3ce909fd27",
      "Alias": "exampleAlias",
      "State": "Active"
    }
  ]
}
```

- For API details, see [ListOrganizations](#) in *AWS CLI Command Reference*.

list-resource-delegates

The following code example shows how to use `list-resource-delegates`.

AWS CLI

To list the delegates for a resource

The following `list-resource-delegates` command retrieves the delegates associated with the specified resource.

```
aws workmail list-resource-delegates \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \
  --resource-id r-68bf2d3b1c0244aab7264c24b9217443
```

Output:

```
{
  "Delegates": [
    {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
      "Type": "USER"
    }
  ]
}
```

- For API details, see [ListResourceDelegates](#) in *AWS CLI Command Reference*.

list-resources

The following code example shows how to use `list-resources`.

AWS CLI

To retrieve a list of resources

The following `list-resources` command retrieves summaries of the resources for the specified organization.

```
aws workmail list-resources \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
  "Resources": [
    {
      "Id": "r-7afe0efbade843a58cdc10251fce992c",
      "Name": "exampleRoom1",
      "Type": "ROOM",
      "State": "ENABLED"
    }
  ]
}
```

- For API details, see [ListResources](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for the specified Amazon WorkMail organization.

```
aws workmail list-tags-for-resource \
```

```
--resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-
n1pq2345678r901st2u3vx45x6789yza
```

Output:

```
{
  "Tags": [
    {
      "Key": "priority",
      "Value": "1"
    }
  ]
}
```

For more information, see [Tagging an Organization](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-users

The following code example shows how to use `list-users`.

AWS CLI

To retrieve a list of users

The following `list-users` command retrieves summaries of the users in the specified organization.

```
aws workmail list-users \
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27
```

Output:

```
{
  "Users": [
    {
      "Id": "S-1-1-11-1111111111-2222222222-3333333333-3333",
      "Email": "exampleUser1@site.awsapps.com",
      "Name": "exampleUser1",
      "State": "ENABLED",
    }
  ]
}
```

```

        "UserRole": "USER",
        "EnabledDate": 1532459261.827
    },
    {
        "Id": "S-1-1-11-1122222222-2222233333-3333334444-4444",
        "Name": "exampleGuestUser",
        "State": "DISABLED",
        "UserRole": "SYSTEM_USER"
    }
]
}

```

- For API details, see [ListUsers](#) in *AWS CLI Command Reference*.

put-access-control-rule

The following code example shows how to use `put-access-control-rule`.

AWS CLI

To put a new access control rule

The following `put-access-control-rule` example denies the specified user access to the specified Amazon WorkMail organization.

```

aws workmail put-access-control-rule \
  --name "myRule" \
  --effect "DENY" \
  --description "my rule" \
  --user-ids "S-1-1-11-1111111111-2222222222-3333333333-3333" \
  --organization-id m-n1pq2345678r901st2u3vx45x6789yza

```

This command produces no output.

For more information, see [Working with Access Control Rules](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [PutAccessControlRule](#) in *AWS CLI Command Reference*.

put-mailbox-permissions

The following code example shows how to use `put-mailbox-permissions`.

AWS CLI

To set mailbox permissions

The following `put-mailbox-permissions` command sets full access permissions for the specified grantee (user or group). The entity represents the owner of the mailbox.

```
aws workmail put-mailbox-permissions \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333 \  
  --grantee-id S-1-1-11-1122222222-2222233333-3333334444-4444 \  
  --permission-values FULL_ACCESS
```

This command produces no output.

- For API details, see [PutMailboxPermissions](#) in *AWS CLI Command Reference*.

register-to-work-mail

The following code example shows how to use `register-to-work-mail`.

AWS CLI

To register an existing or disabled entity

The following `register-to-work-mail` command enables the specified existing entity (user, group, or resource) to use Amazon WorkMail.

```
aws workmail register-to-work-mail \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --entity-id S-1-1-11-1122222222-2222233333-3333334444-4444 \  
  --email exampleGroup1@site.awsapps.com
```

This command produces no output.

- For API details, see [RegisterToWorkMail](#) in *AWS CLI Command Reference*.

reset-password

The following code example shows how to use `reset-password`.

AWS CLI

To reset a user's password

The following `reset-password` command resets the password for the specified user.

```
aws workmail reset-password \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --user-id S-1-1-11-1111111111-2222222222-3333333333-3333 \  
  --password examplePa$$w0rd
```

This command produces no output.

- For API details, see [ResetPassword](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To apply a tag to a resource

The following `tag-resource` example applies a tag with key "priority" and value "1" to the specified Amazon WorkMail organization.

```
aws workmail tag-resource \  
  --resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-  
n1pq2345678r901st2u3vx45x6789yza \  
  --tags "Key=priority,Value=1"
```

This command produces no output.

For more information, see [Tagging an Organization](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a resource

The following `untag-resource` example removes the specified tag from the specified Amazon WorkMail organization.

```
aws workmail untag-resource \  
  --resource-arn arn:aws:workmail:us-west-2:111122223333:organization/m-  
n1pq2345678r901st2u3vx45x6789yza \  
  --tag-keys "priority"
```

This command produces no output.

For more information, see [Tagging an Organization](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-mailbox-quota

The following code example shows how to use `update-mailbox-quota`.

AWS CLI

To update a user's mailbox quota

The following `update-mailbox-quota` command changes the specified user's mailbox quota.

```
aws workmail update-mailbox-quota \  
  --organization-id m-n1pq2345678r901st2u3vx45x6789yza \  
  --user-id S-1-1-11-1111111111-2222222222-3333333333-3333 \  
  --mailbox-quota 40000
```

This command produces no output.

For more information, see [Managing User Accounts](#) in the *Amazon WorkMail Administrator Guide*.

- For API details, see [UpdateMailboxQuota](#) in *AWS CLI Command Reference*.

update-primary-email-address

The following code example shows how to use `update-primary-email-address`.

AWS CLI

To update a primary email address

The following `update-primary-email-address` command updates the primary email address of the specified entity (user, group, or resource).

```
aws workmail update-primary-email-address \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --entity-id S-1-1-11-1111111111-2222222222-3333333333-3333 \  
  --email exampleUser2@site.awsapps.com
```

This command produces no output.

- For API details, see [UpdatePrimaryEmailAddress](#) in *AWS CLI Command Reference*.

update-resource

The following code example shows how to use `update-resource`.

AWS CLI

To update a resource

The following `update-resource` command updates the name of the specified resource.

```
aws workmail update-resource \  
  --organization-id m-d281d0a2fd824be5b6cd3d3ce909fd27 \  
  --resource-id r-7afe0efbade843a58cdc10251f992c \  
  --name exampleRoom2
```

This command produces no output.

- For API details, see [UpdateResource](#) in *AWS CLI Command Reference*.

Amazon WorkMail Message Flow examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon WorkMail Message Flow.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

get-raw-message-content

The following code example shows how to use `get-raw-message-content`.

AWS CLI

To get the raw content of an email message

The following `get-raw-message-content` example gets the raw content of an in-transit email message and sends it to a text file named `test`.

```
aws workmailmessageflow get-raw-message-content \  
  --message-id a1b2cd34-ef5g-6h7j-k18m-npq9012345rs \  
  test
```

Contents of file `test` after command runs:

```
Subject: Hello World  
From: =?UTF-8?Q?marymajor_marymajor?= <marymajor@example.com>  
To: =?UTF-8?Q?mateojackson=40example=2Enet?= <mateojackson@example.net>

WorkSpaces examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with WorkSpaces.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-tags

The following code example shows how to use `create-tags`.

AWS CLI

To add tags to a Workspace

The following `create-tags` example adds the specified tags to the specified Workspace.

```
aws workspaces create-tags \  
  --resource-id ws-dk1xzt417 \  
  --tags Key=Department,Value=Finance
```

This command produces no output.

For more information, see [Tag WorkSpaces resources](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [CreateTags](#) in *AWS CLI Command Reference*.

create-workspaces

The following code example shows how to use `create-workspaces`.

AWS CLI

Example 1: To create an AlwaysOn WorkSpace

The following `create-workspaces` example creates an AlwaysOn WorkSpace for the specified user, using the specified directory and bundle.

```
aws workspaces create-workspaces \
  --workspaces DirectoryId=d-926722edaf,UserName=Mateo,BundleId=wsb-0zsvgp8fc
```

Output:

```
{
  "FailedRequests": [],
  "PendingRequests": [
    {
      "WorkspaceId": "ws-kcqms853t",
      "DirectoryId": "d-926722edaf",
      "UserName": "Mateo",
      "State": "PENDING",
      "BundleId": "wsb-0zsvgp8fc"
    }
  ]
}
```

Example 2: To create an AutoStop WorkSpace

The following `create-workspaces` example creates an AutoStop WorkSpace for the specified user, using the specified directory and bundle.

```
aws workspaces create-workspaces \
  --workspaces
  DirectoryId=d-926722edaf,UserName=Mary,BundleId=wsb-0zsvgp8fc,WorkspaceProperties={RunningM
```

Output:

```
{
  "FailedRequests": [],
  "PendingRequests": [
    {
      "WorkspaceId": "ws-dk1x zr417",
```

```

        "DirectoryId": "d-926722edaf",
        "UserName": "Mary",
        "State": "PENDING",
        "BundleId": "wsb-0zsvgp8fc"
    }
]
}

```

Example 3: To create a user-decoupled WorkSpace

The following `create-workspaces` example creates a user-decoupled WorkSpace by setting the username to `[UNDEFINED]`, and specifying a WorkSpace name, directory ID, and bundle ID.

```

aws workspaces create-workspaces \
  --workspaces
  DirectoryId=d-926722edaf,UserName='"[UNDEFINED]"',WorkspaceName=MaryWorkspace1,BundleId=wsb-0zsvgp8fc

```

Output:

```

{
  "FailedRequests": [],
  "PendingRequests": [
    {
      "WorkspaceId": "ws-abcd1234",
      "DirectoryId": "d-926722edaf",
      "UserName": "[UNDEFINED]",
      "State": "PENDING",
      "BundleId": "wsb-0zsvgp8fc",
      "WorkspaceName": "MaryWorkspace1"
    }
  ]
}

```

For more information, see [Launch a virtual desktop](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [CreateWorkspaces](#) in *AWS CLI Command Reference*.

delete-tags

The following code example shows how to use `delete-tags`.

AWS CLI

To delete a tag from a WorkSpace

The following `delete-tags` example deletes the specified tag from the specified WorkSpace.

```
aws workspaces delete-tags \  
  --resource-id ws-dk1x zr417 \  
  --tag-keys Department
```

This command produces no output.

For more information, see [Tag WorkSpaces resources](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [DeleteTags](#) in *AWS CLI Command Reference*.

deregister-workspace-directory

The following code example shows how to use `deregister-workspace-directory`.

AWS CLI

To deregister a directory

The following `deregister-workspace-directory` example deregisters the specified directory.

```
aws workspaces deregister-workspace-directory \  
  --directory-id d-926722edaf
```

This command produces no output.

For more information, see [Register a directory with WorkSpaces](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [DeregisterWorkspaceDirectory](#) in *AWS CLI Command Reference*.

describe-tags

The following code example shows how to use `describe-tags`.

AWS CLI

To describe the tags for a Workspace

The following `describe-tags` example describes the tags for the specified Workspace.

```
aws workspaces describe-tags \  
  --resource-id ws-dk1x zr417
```

Output:

```
{  
  "TagList": [  
    {  
      "Key": "Department",  
      "Value": "Finance"  
    }  
  ]  
}
```

For more information, see [Tag WorkSpaces resources](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

describe-workspace-bundles

The following code example shows how to use `describe-workspace-bundles`.

AWS CLI

To list the bundles provided by Amazon

The following `describe-workspace-bundles` example lists the names and IDs of the bundles provided by Amazon, in table format and sorted by name.

```
aws workspaces describe-workspace-bundles \  
  --owner AMAZON \  
  --query "Bundles[*].[Name, BundleId]"
```

Output:

```
[
  [
    "Standard with Amazon Linux 2",
    "wsb-clj85qzj1"
  ],
  [
    "Performance with Windows 10 (Server 2016 based)",
    "wsb-gm4d5tx2v"
  ],
  [
    "PowerPro with Windows 7",
    "wsb-1pzkp0bx4"
  ],
  [
    "Power with Amazon Linux 2",
    "wsb-2bs6k5lgn"
  ],
  [
    "Graphics with Windows 10 (Server 2019 based)",
    "wsb-03gyjnfyy"
  ],
  ...
]
```

For more information, see [WorkSpaces bundles and images](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [DescribeWorkspaceBundles](#) in *AWS CLI Command Reference*.

describe-workspace-directories

The following code example shows how to use `describe-workspace-directories`.

AWS CLI

To describe a registered directory

The following `describe-workspace-directories` example describes the specified registered directory.

```
aws workspaces describe-workspace-directories \
  --directory-ids d-926722edaf
```

Output:

```
{
  "Directories": [
    {
      "DirectoryId": "d-926722edaf",
      "Alias": "d-926722edaf",
      "DirectoryName": "example.com",
      "RegistrationCode": "WSpdx+9RJ8JT",
      "SubnetIds": [
        "subnet-9d19c4c6",
        "subnet-500d5819"
      ],
      "DnsIpAddresses": [
        "172.16.1.140",
        "172.16.0.30"
      ],
      "CustomerUserName": "Administrator",
      "IamRoleId": "arn:aws:iam::123456789012:role/workspaces_DefaultRole",
      "DirectoryType": "SIMPLE_AD",
      "WorkspaceSecurityGroupId": "sg-0d89e927e5645d7c5",
      "State": "REGISTERED",
      "WorkspaceCreationProperties": {
        "EnableWorkDocs": false,
        "EnableInternetAccess": false,
        "UserEnabledAsLocalAdministrator": true,
        "EnableMaintenanceMode": true
      },
      "WorkspaceAccessProperties": {
        "DeviceTypeWindows": "ALLOW",
        "DeviceTypeOsx": "ALLOW",
        "DeviceTypeWeb": "DENY",
        "DeviceTypeIos": "ALLOW",
        "DeviceTypeAndroid": "ALLOW",
        "DeviceTypeChromeOs": "ALLOW",
        "DeviceTypeZeroClient": "ALLOW",
        "DeviceTypeLinux": "DENY"
      },
      "Tenancy": "SHARED",
      "SelfservicePermissions": {
        "RestartWorkspace": "ENABLED",
        "IncreaseVolumeSize": "DISABLED",
        "ChangeComputeType": "DISABLED",
        "SwitchRunningMode": "DISABLED",

```

```
        "RebuildWorkspace": "DISABLED"
      }
    }
  ]
}
```

For more information, see [Manage directories for WorkSpaces](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [DescribeWorkspaceDirectories](#) in *AWS CLI Command Reference*.

describe-workspaces-connection-status

The following code example shows how to use `describe-workspaces-connection-status`.

AWS CLI

To describe the connection status of a Workspace

The following `describe-workspaces-connection-status` example describes the connection status of the specified Workspace.

```
aws workspaces describe-workspaces-connection-status \
  --workspace-ids ws-dk1x zr417
```

Output:

```
{
  "WorkspacesConnectionStatus": [
    {
      "WorkspaceId": "ws-dk1x zr417",
      "ConnectionState": "CONNECTED",
      "ConnectionStateCheckTimestamp": 1662526214.744
    }
  ]
}
```

For more information, see [Administer your WorkSpaces](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [DescribeWorkspacesConnectionStatus](#) in *AWS CLI Command Reference*.

describe-workspaces

The following code example shows how to use describe-workspaces.

AWS CLI

To describe a Workspace

The following describe-workspaces example describes the specified Workspace.

```
aws workspaces describe-workspaces \  
  --workspace-ids ws-dk1x zr417
```

Output:

```
{  
  "Workspaces": [  
    {  
      "WorkspaceId": "ws-dk1x zr417",  
      "DirectoryId": "d-926722edaf",  
      "UserName": "Mary",  
      "IpAddress": "172.16.0.175",  
      "State": "STOPPED",  
      "BundleId": "wsb-0zsvgp8fc",  
      "SubnetId": "subnet-500d5819",  
      "ComputerName": "WSAMZN-RBSLTDD9",  
      "WorkspaceProperties": {  
        "RunningMode": "AUTO_STOP",  
        "RunningModeAutoStopTimeoutInMinutes": 60,  
        "RootVolumeSizeGib": 80,  
        "UserVolumeSizeGib": 10,  
        "ComputeTypeName": "VALUE"  
      },  
      "ModificationStates": []  
    }  
  ]  
}
```

For more information, see [Administer your WorkSpaces](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [DescribeWorkspaces](#) in *AWS CLI Command Reference*.

migrate-workspace

The following code example shows how to use `migrate-workspace`.

AWS CLI

To migrate a Workspace

The following `migrate-workspace` example migrates the specified Workspace to the specified bundle.

```
aws workspaces migrate-workspace \  
  --source-workspace-id ws-dk1x zr417 \  
  --bundle-id wsb-j4d ky1gs4
```

Output:

```
{  
  "SourceWorkspaceId": "ws-dk1x zr417",  
  "TargetWorkspaceId": "ws-x5h11b kp5"  
}
```

For more information, see [Migrate a Workspace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [MigrateWorkspace](#) in *AWS CLI Command Reference*.

modify-workspace-creation-properties

The following code example shows how to use `modify-workspace-creation-properties`.

AWS CLI

To modify a Workspace creation property of a directory

The following `modify-workspace-creation-properties` example enables the `EnableInternetAccess` property for the specified directory. This enables automatic assignment of public IP addresses for the WorkSpaces created for the directory.

```
aws workspaces modify-workspace-creation-properties \  
  --resource-id d-926722edaf \  
  --enable-internet-access
```

```
--workspace-creation-properties EnableInternetAccess=true
```

This command produces no output.

For more information, see [Update directory details for your WorkSpaces](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [ModifyWorkspaceCreationProperties](#) in *AWS CLI Command Reference*.

modify-workspace-properties

The following code example shows how to use `modify-workspace-properties`.

AWS CLI

To modify the running mode of a Workspace

The following `modify-workspace-properties` example sets the running mode of the specified Workspace to `AUTO_STOP`.

```
aws workspaces modify-workspace-properties \  
  --workspace-id ws-dk1x zr417 \  
  --workspace-properties RunningMode=AUTO_STOP
```

This command produces no output.

For more information, see [Modify a Workspace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [ModifyWorkspaceProperties](#) in *AWS CLI Command Reference*.

modify-workspace-state

The following code example shows how to use `modify-workspace-state`.

AWS CLI

To modify the state of a Workspace

The following `modify-workspace-state` example sets the state of the specified Workspace to `ADMIN_MAINTENANCE`.

```
aws workspaces modify-workspace-state \  
  --workspace-id ws-dk1x zr417 \  
  --workspace-state ADMIN_MAINTENANCE
```

```
--workspace-id ws-dk1xzir417 \  
--workspace-state ADMIN_MAINTENANCE
```

This command produces no output.

For more information, see [Workspace maintenance](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [ModifyWorkspaceState](#) in *AWS CLI Command Reference*.

reboot-workspaces

The following code example shows how to use `reboot-workspaces`.

AWS CLI

To reboot a WorkSpace

The following `reboot-workspaces` example reboots the specified WorkSpace.

```
aws workspaces reboot-workspaces \  
--reboot-workspace-requests ws-dk1xzir417
```

Output:

```
{  
  "FailedRequests": []  
}
```

For more information, see [Reboot a WorkSpace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [RebootWorkspaces](#) in *AWS CLI Command Reference*.

rebuild-workspaces

The following code example shows how to use `rebuild-workspaces`.

AWS CLI

To rebuild a WorkSpace

The following `rebuild-workspaces` example rebuilds the specified `WorkSpace`.

```
aws workspaces rebuild-workspaces \  
  --rebuild-workspace-requests ws-dk1x zr417
```

Output:

```
{  
  "FailedRequests": []  
}
```

For more information, see [Rebuild a WorkSpace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [RebuildWorkspaces](#) in *AWS CLI Command Reference*.

register-workspace-directory

The following code example shows how to use `register-workspace-directory`.

AWS CLI

To register a directory

The following `register-workspace-directory` example registers the specified directory for use with Amazon WorkSpaces.

```
aws workspaces register-workspace-directory \  
  --directory-id d-926722edaf \  
  --no-enable-work-docs
```

This command produces no output.

For more information, see [Register a directory with WorkSpaces](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [RegisterWorkspaceDirectory](#) in *AWS CLI Command Reference*.

restore-workspace

The following code example shows how to use `restore-workspace`.

AWS CLI

To restore a Workspace

The following `restore-workspace` example restores the specified Workspace.

```
aws workspaces restore-workspace \  
  --workspace-id ws-dk1x zr417
```

This command produces no output.

For more information, see [Restore a Workspace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [RestoreWorkspace](#) in *AWS CLI Command Reference*.

start-workspaces

The following code example shows how to use `start-workspaces`.

AWS CLI

To start an AutoStop Workspace

The following `start-workspaces` example starts the specified Workspace. The Workspace must have a running mode of AutoStop.

```
aws workspaces start-workspaces \  
  --start-workspace-requests WorkspaceId=ws-dk1x zr417
```

Output:

```
{  
  "FailedRequests": []  
}
```

For more information, see [Stop and start an AutoStop Workspace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [StartWorkspaces](#) in *AWS CLI Command Reference*.

stop-workspaces

The following code example shows how to use stop-workspaces.

AWS CLI

To stop an AutoStop Workspace

The following stop-workspaces example stops the specified Workspace. The Workspace must have a running mode of AutoStop.

```
aws workspaces stop-workspaces \  
  --stop-workspace-requests WorkspaceId=ws-dk1x zr417
```

Output:

```
{  
  "FailedRequests": []  
}
```

For more information, see [Stop and start an AutoStop Workspace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [StopWorkspaces](#) in *AWS CLI Command Reference*.

terminate-workspaces

The following code example shows how to use terminate-workspaces.

AWS CLI

To terminate a Workspace

The following terminate-workspaces example terminates the specified workspace.

```
aws workspaces terminate-workspaces \  
  --terminate-workspace-requests ws-dk1x zr417
```

Output:

```
{
```

```
"FailedRequests": []  
}
```

For more information, see [Delete a Workspace](#) in the *Amazon WorkSpaces Administration Guide*.

- For API details, see [TerminateWorkspaces](#) in *AWS CLI Command Reference*.

X-Ray examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with X-Ray.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

batch-traces-get

The following code example shows how to use `batch-traces-get`.

AWS CLI

To get a list of traces

The following `batch-get-traces` example retrieves a list of traces specified by an ID. The full trace includes a document for each segment, compiled from all of the segment documents received with the same trace ID.

```
aws xray batch-get-traces \
```

```
--trace-ids 1-5d82881a-0a9126e92a73e971eed891b9
```

Output:

```
{
  "Traces": [
    {
      "Id": "1-5d82881a-0a9126e92a73e971eed891b9",
      "Duration": 0.232,
      "Segments": [
        {
          "Id": "54aff5735b12dd28",
          "Document": "{\"id\":\"54aff5735b12dd28\",\"name\":

  }  
}
```

For more information, see [Using the AWS X-Ray API with the AWS CLI](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [BatchTracesGet](#) in *AWS CLI Command Reference*.

create-group

The following code example shows how to use create-group.

AWS CLI

To create a group

The following create-group example creates a group resource named AdminGroup. The group gets a filter expression that defines the criteria of the group as a segment related to a specific service causing a fault or an error.

```
aws xray create-group \  
  --group-name "AdminGroup" \  
  --filter-expression "service(\"mydomain.com\") {fault OR error}"
```

Output:

```
{  
  "GroupName": "AdminGroup",  
  "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/AdminGroup/123456789",  
  "FilterExpression": "service(\"mydomain.com\") {fault OR error}"  
}
```

For more information, see [Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [CreateGroup](#) in *AWS CLI Command Reference*.

create-sampling-rule

The following code example shows how to use create-sampling-rule.

AWS CLI

To create a sampling rule

The following `create-sampling-rule` example creates a rule to control sampling behavior for instrumented applications. The rules are provided by a JSON file. The majority of the sampling rule fields are required to create the rule.

```
aws xray create-sampling-rule \  
  --cli-input-json file://9000-base-scorekeep.json
```

Contents of `9000-base-scorekeep.json`:

```
{  
  "SamplingRule": {  
    "RuleName": "base-scorekeep",  
    "ResourceARN": "*",  
    "Priority": 9000,  
    "FixedRate": 0.1,  
    "ReservoirSize": 5,  
    "ServiceName": "Scorekeep",  
    "ServiceType": "*",  
    "Host": "*",  
    "HTTPMethod": "*",  
    "URLPath": "*",  
    "Version": 1  
  }  
}
```

Output:

```
{  
  "SamplingRuleRecord": {  
    "SamplingRule": {  
      "RuleName": "base-scorekeep",  
      "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/base-scorekeep",  
      "ResourceARN": "*",  
      "Priority": 9000,  
      "FixedRate": 0.1,  
      "ReservoirSize": 5,  
      "ServiceName": "Scorekeep",
```

```
        "ServiceType": "*",
        "Host": "*",
        "HTTPMethod": "*",
        "URLPath": "*",
        "Version": 1,
        "Attributes": {}
    },
    "CreatedAt": 1530574410.0,
    "ModifiedAt": 1530574410.0
}
}
```

For more information, see [Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [CreateSamplingRule](#) in *AWS CLI Command Reference*.

delete-group

The following code example shows how to use `delete-group`.

AWS CLI

To delete a group

The following `delete-group` example deletes the specified group resource.

```
aws xray delete-group \
  --group-name "AdminGroup" \
  --group-arn "arn:aws:xray:us-east-2:123456789012:group/AdminGroup/123456789"
```

This command produces no output.

For more information, see [Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [DeleteGroup](#) in *AWS CLI Command Reference*.

delete-sampling-rule

The following code example shows how to use `delete-sampling-rule`.

AWS CLI

To delete a sampling rule

The following `delete-sampling-rule` example deletes the specified sampling rule. You can specify the group by using either the group name or group ARN.

```
aws xray delete-sampling-rule \  
  --rule-name polling-scorekeep
```

Output:

```
{  
  "SamplingRuleRecord": {  
    "SamplingRule": {  
      "RuleName": "polling-scorekeep",  
      "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/polling-  
scorekeep",  
      "ResourceARN": "*",  
      "Priority": 5000,  
      "FixedRate": 0.003,  
      "ReservoirSize": 0,  
      "ServiceName": "Scorekeep",  
      "ServiceType": "*",  
      "Host": "*",  
      "HTTPMethod": "GET",  
      "URLPath": "/api/state/*",  
      "Version": 1,  
      "Attributes": {}  
    },  
    "CreatedAt": 1530574399.0,  
    "ModifiedAt": 1530574399.0  
  }  
}
```

For more information, see [Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [DeleteSamplingRule](#) in *AWS CLI Command Reference*.

get-encryption-config

The following code example shows how to use `get-encryption-config`.

AWS CLI

To retrieve the encryption configuration

The following `get-encryption-config` example retrieves the current encryption configuration for your AWS X-Ray data.

```
aws xray get-encryption-config
```

Output:

```
{
  "EncryptionConfig": {
    "KeyId": "ae4aa6d49-a4d8-9df9-a475-4ff6d7898456",
    "Status": "ACTIVE",
    "Type": "NONE"
  }
}
```

For more information, see [Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [GetEncryptionConfig](#) in *AWS CLI Command Reference*.

get-group

The following code example shows how to use `get-group`.

AWS CLI

To retrieve a group

The following `get-group` example displays details for the specified group resource. The details include the group name, the group ARN, and the filter expression that defines the criteria for that group. Groups can also be retrieved by ARN.

```
aws xray get-group \
  --group-name "AdminGroup"
```

Output:

```
{
```

```
"Group": [  
  {  
    "GroupName": "AdminGroup",  
    "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/  
AdminGroup/123456789",  
    "FilterExpression": "service(\"mydomain.com\") {fault OR error}"  
  }  
]
```

For more information, see [Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [GetGroup](#) in *AWS CLI Command Reference*.

get-groups

The following code example shows how to use `get-groups`.

AWS CLI

To retrieve all groups

The following example displays details for all active group.

```
aws xray get-groups
```

Output:

```
{  
  "Groups": [  
    {  
      "GroupName": "AdminGroup",  
      "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/  
AdminGroup/123456789",  
      "FilterExpression": "service(\"example.com\") {fault OR error}"  
    },  
    {  
      "GroupName": "SDETGroup",  
      "GroupARN": "arn:aws:xray:us-west-2:123456789012:group/  
SDETGroup/987654321",  
      "FilterExpression": "responsetime > 2"  
    }  
  ]  
}
```

```
]
}
```

For more information, see [Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [GetGroups](#) in *AWS CLI Command Reference*.

get-sampling-rules

The following code example shows how to use `get-sampling-rules`.

AWS CLI

To retrieve all sampling rules

The following `get-sampling-rules` example displays details for all available sampling rules.:

```
aws xray get-sampling-rules
```

Output:

```
{
  "SamplingRuleRecords": [
    {
      "SamplingRule": {
        "RuleName": "Default",
        "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/Default",
        "ResourceARN": "*",
        "Priority": 10000,
        "FixedRate": 0.01,
        "ReservoirSize": 0,
        "ServiceName": "*",
        "ServiceType": "*",
        "Host": "*",
        "HTTPMethod": "*",
        "URLPath": "*",
        "Version": 1,
        "Attributes": {}
      },
      "CreatedAt": 0.0,
      "ModifiedAt": 1530558121.0
    },
  ],
}
```

```
{
  "SamplingRule": {
    "RuleName": "base-scorekeep",
    "RuleARN": "arn:aws:xray:us-east-1::sampling-rule/base-scorekeep",
    "ResourceARN": "*",

    "Attributes": {}
  },
  "CreatedAt": 1530918163.0,
  "ModifiedAt": 1530918163.0
}
]
```

For more information, see [Using Sampling Rules with the X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [GetSamplingRules](#) in *AWS CLI Command Reference*.

get-sampling-targets

The following code example shows how to use `get-sampling-targets`.

AWS CLI

To request a sampling quota

The following `get-sampling-targets` example requests a sampling quota for rules that the service is using to sample requests. The response from AWS X-Ray includes a quota that can be used instead of borrowing from the reservoir.

```
aws xray get-sampling-targets \  
  --sampling-statistics-documents '[ { "RuleName": "base-scorekeep", "ClientID":  
  "ABCDEF1234567890ABCDEF10", "Timestamp": "2018-07-07T00:20:06", "RequestCount": 110,  
  "SampledCount": 20, "BorrowCount": 10 }, { "RuleName": "polling-scorekeep", 31,  
  "BorrowCount": 0 } ]'
```

Output:

```
{  
  "SamplingTargetDocuments": [  
    {  
      "RuleName": "base-scorekeep",  
      "FixedRate": 0.1,  
      "ReservoirQuota": 2,  
      "ReservoirQuotaTTL": 1530923107.0,  
      "Interval": 10  
    },  
    {  
      "RuleName": "polling-scorekeep",  
      "FixedRate": 0.003,  
      "ReservoirQuota": 0,  
      "ReservoirQuotaTTL": 1530923107.0,  
      "Interval": 10  
    }  
  ],  
  "LastRuleModification": 1530920505.0,  
}
```

```
"UnprocessedStatistics": []
}
```

For more information, see [Using Sampling Rules with the X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [GetSamplingTargets](#) in *AWS CLI Command Reference*.

get-service-graph

The following code example shows how to use `get-service-graph`.

AWS CLI

To get a service graph

The following example displays a document within a specified time period that describes services processing incoming requests, and the downstream services that they call as a result.:

```
aws xray get-service-graph \
  --start-time 1568835392.0
  --end-time 1568835446.0
```

Output:

```
{
  "Services": [
    {
      "ReferenceId": 0,
      "Name": "Scorekeep",
      "Names": [
        "Scorekeep"
      ],
      "Root": true,
      "Type": "AWS::ElasticBeanstalk::Environment",

```

For more information, see [Using the AWS X-Ray API with the AWS CLI](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [GetServiceGraph](#) in *AWS CLI Command Reference*.

get-trace-summaries

The following code example shows how to use `get-trace-summaries`.

AWS CLI

To get a trace summary

The following `get-trace-summaries` example retrieves IDs and metadata for traces available within a specified time frame.

```

aws xray get-trace-summaries \
  --start-time 1568835392.0 \
  --end-time 1568835446.0

```

Output:

```

[
  "http://scorekeep-env-1.123456789.us-east-2.elasticbeanstalk.com/api/move/
VSAE93HF/GSSD2NTB/DP0PCC09",

```

```
"http://scorekeep-env-1.123456789.us-east-2.elasticbeanstalk.com/api/
move/4MQNA5NN/L99KK2RF/null"
]
```

For more information, see [Using the AWS X-Ray API with the AWS CLI](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [GetTraceSummaries](#) in *AWS CLI Command Reference*.

put-encryption-config

The following code example shows how to use `put-encryption-config`.

AWS CLI

To update the encryption configuration

The following `put-encryption-config` example updates the encryption configuration for AWS X-Ray data to use the default AWS managed KMS key `aws/xray`.

```
aws xray put-encryption-config \
  --type KMS \
  --key-id alias/aws/xray
```

Output:

```
{
  "EncryptionConfig": {
    "KeyId": "arn:aws:kms:us-west-2:123456789012:key/c234g4e8-39e9-4gb0-84e2-
b0ea215cbba5",
    "Status": "UPDATING",
    "Type": "KMS"
  }
}
```

For more information, see [Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [PutEncryptionConfig](#) in *AWS CLI Command Reference*.

put-trace-segments

The following code example shows how to use `put-trace-segments`.

AWS CLI

To upload a segment

The following `put-trace-segments` example uploads segment documents to AWS X-Ray. The segment document is consumed as a list of JSON segment documents.

```
aws xray put-trace-segments \
  --trace-segment-documents "{\"id\":\"20312a0e2b8809f4\",\"name
  \": \"DynamoDB\", \"trace_id\": \"1-5832862d-a43aafded3334a971fe312db\",
  \"start_time\": 1.479706157195E9, \"end_time\": 1.479706157202E9, \"parent_id\":
  \"79736b962fe3239e\", \"http\": {\"response\": {\"content_length\": 60, \"status
  \": 200}}, \"inferred\": true, \"aws\": {\"consistent_read\": false, \"table_name
  \": \"scorekeep-session-xray\", \"operation\": \"GetItem\", \"request_id\":
  \"SCAU230M6M8F038UASGC7785ARVV4KQNS05AEMVJF66Q9ASUAAJG\", \"resource_names\":
  [\"scorekeep-session-xray\"]}, \"origin\": \"AWS::DynamoDB::Table\"}"
```

Output:

```
{
  "UnprocessedTraceSegments": []
}
```

For more information, see [Sending Trace Data to AWS X-Ray](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [PutTraceSegments](#) in *AWS CLI Command Reference*.

update-group

The following code example shows how to use `update-group`.

AWS CLI

To update a group

The following `update-group` example updates the criteria by which to accept traces into the group named `AdminGroup`. You can specify the desired group by using either the group name or group ARN.

```
aws xray update-group \  
  --group-name "AdminGroup" \  
  --group-arn "arn:aws:xray:us-west-2:123456789012:group/AdminGroup/123456789" \  
  --filter-expression "service(\"mydomain.com\") {fault}"
```

Output:

```
{  
  "GroupName": "AdminGroup",  
  "GroupARN": "arn:aws:xray:us-east-2:123456789012:group/AdminGroup/123456789",  
  "FilterExpression": "service(\"mydomain.com\") {fault}"  
}
```

For more information, see [Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [UpdateGroup](#) in *AWS CLI Command Reference*.

update-sampling-rule

The following code example shows how to use `update-sampling-rule`.

AWS CLI

To update a sampling rule

The following `update-sampling-rule` example modifies a sampling rule's configuration. The rules are consumed from a JSON file. Only the fields being updated are required.

```
aws xray update-sampling-rule \  
  --cli-input-json file://1000-default.json
```

Contents of `1000-default.json`:

```
{  
  "SamplingRuleUpdate": {  
    "RuleName": "Default",  
    "FixedRate": 0.01,  
    "ReservoirSize": 0  
  }  
}
```

```
}
```

Output:

```
{
  "SamplingRuleRecords": [
    {
      "SamplingRule": {
        "RuleName": "Default",
        "RuleARN": "arn:aws:xray:us-west-2:123456789012:sampling-rule/
Default",
        "ResourceARN": "*",
        "Priority": 10000,
        "FixedRate": 0.01,
        "ReservoirSize": 0,
        "ServiceName": "*",
        "ServiceType": "*",
        "Host": "*",
        "HTTPMethod": "*",
        "URLPath": "*",
        "Version": 1,
        "Attributes": {}
      },
      "CreatedAt": 0.0,
      "ModifiedAt": 1529959993.0
    }
  ]
}
```

For more information, see [Configuring Sampling, Groups, and Encryption Settings with the AWS X-Ray API](#) in the *AWS X-Ray Developer Guide*.

- For API details, see [UpdateSamplingRule](#) in *AWS CLI Command Reference*.

AWS CLI with Bash script code examples

The code examples in this topic show you how to use the AWS Command Line Interface with Bash script with AWS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Cross-service examples are sample applications that work across multiple AWS services.

Examples

- [Actions and scenarios using AWS CLI with Bash script](#)

Actions and scenarios using AWS CLI with Bash script

The following code examples show how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with AWS services.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Services

BatchGetItem

The following code example shows how to use BatchGetItem.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#####
# function dynamodb_batch_get_item
#
# This function gets a batch of items from a DynamoDB table.
#
# Parameters:
#     -i item -- Path to json file containing the keys of the items to get.
#
# Returns:
#     The items as json output.
#
# And:
#     0 - If successful.
#     1 - If it fails.
#####
function dynamodb_batch_get_item() {
    local item response
    local option OPTARG # Required to use getopt command in a function.
```

```
#####
# Function usage explanation
#####
function usage() {
    echo "function dynamodb_batch_get_item"
    echo "Get a batch of items from a DynamoDB table."
    echo " -i item -- Path to json file containing the keys of the items to get."
    echo ""
}

while getopts "i:h" option; do
    case "${option}" in
        i) item="${OPTARG}" ;;
        h)
            usage
            return 0
            ;;
        \?)
            echo "Invalid parameter"
            usage
            return 1
            ;;
    esac
done
export OPTIND=1

if [[ -z "$item" ]]; then
    errecho "ERROR: You must provide an item with the -i parameter."
    usage

CreateTable

The following code example shows how to use CreateTable.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#####
# function dynamodb_create_table
#
# This function creates an Amazon DynamoDB table.
```

```

#
# Parameters:
#   -n table_name  -- The name of the table to create.
#   -a attribute_definitions -- JSON file path of a list of attributes and their
types.
#   -k key_schema  -- JSON file path of a list of attributes and their key types.
#   -p provisioned_throughput -- Provisioned throughput settings for the table.
#
# Returns:
#   0 - If successful.
#   1 - If it fails.
#####
function dynamodb_create_table() {
    local table_name attribute_definitions key_schema provisioned_throughput response
    local option OPTARG # Required to use getopt command in a function.

#####
# Function usage explanation

Scenarios

Get started with tables, items, and queries

The following code example shows how to:

- Create a table that can hold movie data.
- Put, get, and update a single movie in the table.
- Write movie data to the table from a sample JSON file.
- Query for movies that were released in a given year.
- Scan for movies that were released in a range of years.
- Delete a movie from the table, then delete the table.

AWS CLI with Bash script

```

#####
# function dynamodb_create_table
#
# This function creates an Amazon DynamoDB table.

```

```

#
# Parameters:
#   -n table_name -- The name of the table to create.
#   -a attribute_definitions -- JSON file path of a list of attributes and their
types.
#   -k key_schema -- JSON file path of a list of attributes and their key types.
#   -p provisioned_throughput -- Provisioned throughput settings for the table.
#
# Returns:
#   0 - If successful.
#   1 - If it fails.

Amazon EC2 examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with Amazon EC2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- [Scenarios](#)

Actions

AllocateAddress

The following code example shows how to use AllocateAddress.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#####  
# function ec2_allocate_address  
#
```

```

# This function allocates an Elastic IP address for use with Amazon Elastic Compute
  Cloud (Amazon EC2) instances in a specific AWS Region.
#
# Parameters:
#     -d domain - The domain for the Elastic IP address (either 'vpc' or
  'standard').
#
# Returns:
#     The allocated Elastic IP address, or an error message if the operation
  fails.
# And:
#     0 - If successful.
#     1 - If it fails.
#
#####
function ec2_allocate_address() {
    local domain response

    # Function to display usage information
    function usage() {
        echo "function ec2_allocate_address"
        echo "Allocates an Elastic IP address for use with Amazon Elastic Compute Cloud
  (Amazon EC2) instances in a specific AWS Region."
        echo "  -d domain - The domain for the Elastic IP address (either 'vpc' or
  'standard')."
        echo ""
    }

    # Parse the command-line arguments
    while getopts "d:h" option; do
        case "${option}" in
            d) domain="${OPTARG}" ;;
            h)
                usage
                return 0
                ;;
            \?)
                echo "Invalid parameter"

Scenarios

Get started with instances

The following code example shows how to:

- Create a key pair and security group.
- Select an Amazon Machine Image (AMI) and compatible instance type, then create an instance.
- Stop and restart the instance.
- Associate an Elastic IP address with your instance.
- Connect to your instance with SSH, then clean up resources.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

Run an interactive scenario at a command prompt.

```
#####
# function get_started_with_ec2_instances
#
# Runs an interactive scenario that shows how to get started using EC2 instances.
#
# "EC2 access" permissions are needed to run this code.
#
# Returns:
# 0 - If successful.
# 1 - If an error occurred.
#####
function get_started_with_ec2_instances() {
    # Requires version 4 for mapfile.
    local required_version=4.0

#####
# ec2_describe_instance_types
#
# This function describes EC2 instance types filtered by processor architecture
# and optionally by instance type. It takes the following arguments:
#
# -a, --architecture ARCHITECTURE Specify the processor architecture (e.g., x86_64)

```

```

# -t, --type INSTANCE_TYPE      Comma-separated list of instance types (e.g.,
                                t2.micro)
# -h, --help                    Show the usage help
#
# The function prints the instance type and supported architecture for each
# matching instance type.

HealthImaging examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with HealthImaging.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

ListUsers

The following code example shows how to use ListUsers.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

#####
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
#####
function errecho() {
  printf "%s\n" "$*" 1>&2
}

```

```
#####
# function iam_list_users
#
# List the IAM users in the account.
#
# Returns:
#     The list of users names
# And:
#     0 - If the user already exists.
#     1 - If the user doesn't exist.
#####
function iam_list_users() {
    local option OPTARG # Required to use getopt command in a function.
    local error_code
    # bashsupport disable=BP5008
    function usage() {
        echo "function iam_list_users"
        echo "Lists the AWS Identity and Access Management (IAM) user in the account."
        echo ""
    }

    # Retrieve the calling parameters.
    while getopt "h" option; do
        case "${option}" in
            h)
                usage
                return 0
                ;;
            \?)
                echo "Invalid parameter"
                usage
                return 1
                ;;
        esac
    done
    export OPTIND=1

    local response

    response=$(aws iam list-users \
        --output text \
        --query "Users[].UserName")
    error_code=${?}
}
```

```

    return 1
fi

echo "$response"

return 0
}
```

- For API details, see [ListUsers](#) in *AWS CLI Command Reference*.

Scenarios

Create a user and assume a role

The following code example shows how to create a user and assume a role.

Warning

To avoid security risks, don't use IAM users for authentication when developing purpose-built software or working with real data. Instead, use federation with an identity provider such as [AWS IAM Identity Center](#).

- Create a user with no permissions.
- Create a role that grants permission to list Amazon S3 buckets for the account.
- Add a policy to let the user assume the role.
- Assume the role and list S3 buckets using temporary credentials, then clean up resources.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#####
# function iam_create_user_assume_role
#
# Scenario to create an IAM user, create an IAM role, and apply the role to the
# user.
#
# "IAM access" permissions are needed to run this code.
# "STS assume role" permissions are needed to run this code. (Note: It might be
# necessary to
# create a custom policy).
#
# Returns:
# 0 - If successful.
# 1 - If an error occurred.
#####

Amazon S3 examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with Amazon S3.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)
- [Scenarios](#)

Actions

CopyObject

The following code example shows how to use CopyObject.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#####  
# function errecho  
#  
# This function outputs everything sent to it to STDERR (standard error output).  
#####  
function errecho() {
```

```

    printf "%s\n" "$*" 1>&2
}

#####
# function copy_item_in_bucket
#
# This function creates a copy of the specified file in the same bucket.
#
# Parameters:
#     $1 - The name of the bucket to copy the file from and to.
#     $2 - The key of the source file to copy.
#     $3 - The key of the destination file.
#
# Returns:
#     0 - If successful.
#     1 - If it fails.
#####
function copy_item_in_bucket() {
    local bucket_name=$1
    local source_key=$2
    local destination_key=$3
    local response

    response=$(aws s3api copy-object \
        --bucket "$bucket_name" \
        --copy-source "$bucket_name/$source_key" \
        --key "$destination_key")

    # shellcheck disable=SC2181
    if [[ $? -ne 0 ]]; then
        errecho "ERROR: AWS reports s3api copy-object operation failed.\n$response"
        return 1
    fi
}

```

CreateBucket

The following code example shows how to use CreateBucket.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#####
# function iecho
#
# This function enables the script to display the specified text only if
# the global variable $VERBOSE is set to true.
#####
function iecho() {
    if [[ $VERBOSE == true ]]; then
        echo "$@"
    fi
}

#####
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
#####
function errecho() {
    printf "%s\n" "$*" 1>&2
}

#####
# function create-bucket
#
# This function creates the specified bucket in the specified AWS Region, unless
# it already exists.
#
# Parameters:
#     -b bucket_name -- The name of the bucket to create.
#     -r region_code -- The code for an AWS Region in which to
#                       create the bucket.
#
# Returns:
#     The URL of the bucket that was created.
```

```

# And:
# 0 - If successful.
# 1 - If it fails.

```

- For API details, see [ListObjectsV2](#) in *AWS CLI Command Reference*.

PutObject

The following code example shows how to use PutObject.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```

#####
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
#####
function errecho() {
    printf "%s\n" "$*" 1>&2
}

#####
# function copy_file_to_bucket
#
# This function creates a file in the specified bucket.
#
```

```

# Parameters:
#     $1 - The name of the bucket to copy the file to.
#     $2 - The path and file name of the local file to copy to the bucket.
#     $3 - The key (name) to call the copy of the file in the bucket.
#
# Returns:
#     0 - If successful.
#     1 - If it fails.
#####
function copy_file_to_bucket() {
    local response bucket_name source_file destination_file_name
    bucket_name=$1
    source_file=$2
    destination_file_name=$3

    response=$(aws s3api put-object \
        --bucket "$bucket_name" \
        --body "$source_file" \
        --key "$destination_file_name")

    # shellcheck disable=SC2181
    if [[ ${?} -ne 0 ]]; then
        errecho "ERROR: AWS reports put-object operation failed.\n$response"
        return 1
    fi
}

```

- For API details, see [PutObject](#) in *AWS CLI Command Reference*.

Scenarios

Get started with buckets and objects

The following code example shows how to:

- Create a bucket and upload a file to it.
- Download an object from a bucket.
- Copy an object to a subfolder in a bucket.
- List the objects in a bucket.
- Delete the bucket objects and the bucket.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#####
# function s3_getting_started
#
# This function creates, copies, and deletes S3 buckets and objects.
#
# Returns:
#     0 - If successful.
#     1 - If an error occurred.
#####

AWS STS examples using AWS CLI with Bash script

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Bash script with AWS STS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

AssumeRole

The following code example shows how to use AssumeRole.

AWS CLI with Bash script

Note

There's more on GitHub. Find the complete example and learn how to set up and run in the [AWS Code Examples Repository](#).

```
#####
# function iecho
#
# This function enables the script to display the specified text only if
# the global variable $VERBOSE is set to true.
#####
function iecho() {
    if [[ $VERBOSE == true ]]; then
        echo "$@"
    fi
}

#####
# function errecho
#
# This function outputs everything sent to it to STDERR (standard error output).
#####
function errecho() {
    printf "%s\n" "$*" 1>&2
}

#####
# function sts_assume_role
#
# This function assumes a role in the AWS account and returns the temporary
# credentials.
#
# Parameters:
#     -n role_session_name -- The name of the session.
```

```

#     -r role_arn -- The ARN of the role to assume.
#
# Returns:
#     [access_key_id, secret_access_key, session_token]
#     And:
#     0 - If successful.
#     1 - If an error occurred.
#####
function sts_assume_role() {
    local role_session_name role_arn response
    local option OPTARG # Required to use getopt command in a function.

# bashsupport disable=BP5008

Security in the AWS Command Line Interface

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The [shared responsibility model](#) describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the [AWS Compliance Programs](#). To learn about the compliance programs that apply to AWS Command Line Interface, see [AWS Services in Scope by Compliance Program](#).
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using the AWS Command Line Interface (AWS CLI). The following topics show you how to configure the AWS CLI to meet your security and compliance objectives. You also learn how to use the AWS CLI to help you to monitor and secure your AWS resources.

Topics

- [Data protection in the AWS CLI](#)
- [Identity and Access Management](#)
- [Compliance Validation for this AWS Product or Service](#)
- [Resilience for this AWS Product or Service](#)
- [Infrastructure Security for this AWS Product or Service](#)
- [Enforce a minimum version of TLS](#)

Data protection in the AWS CLI

The AWS [shared responsibility model](#) applies to data protection in AWS Command Line Interface. As described in this model, AWS is responsible for protecting the global infrastructure that runs all

of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the [Data Privacy FAQ](#). For information about data protection in Europe, see the [AWS Shared Responsibility Model and GDPR](#) blog post on the *AWS Security Blog*.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see [Federal Information Processing Standard \(FIPS\) 140-2](#).

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with AWS CLI or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Data encryption

A key feature of any secure service is that information is encrypted when it is not being actively used.

Encryption at rest

The AWS CLI does not itself store any customer data other than the credentials it needs to interact with the AWS services on the user's behalf.

If you use the AWS CLI to invoke an AWS service that transmits customer data to your local computer for storage, then refer to the Security & Compliance chapter in that service's User Guide for information on how that data is stored, protected, and encrypted.

Encryption in transit

By default, all data transmitted from the client computer running the AWS CLI and AWS service endpoints is encrypted by sending everything through a HTTPS/TLS connection.

You don't need to do anything to enable the use of HTTPS/TLS. It is always enabled unless you explicitly disable it for an individual command by using the `--no-verify-ssl` command line option.

Identity and Access Management

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use AWS resources. IAM is an AWS service that you can use with no additional charge.

Topics

- [Audience](#)
- [Authenticating with identities](#)
- [Managing access using policies](#)
- [How AWS services work with IAM](#)
- [Troubleshooting AWS identity and access](#)

Audience

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in AWS.

Service user – If you use AWS services to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more AWS features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in AWS, see [Troubleshooting AWS identity and access](#) or the user guide of the AWS service you are using.

Service administrator – If you're in charge of AWS resources at your company, you probably have full access to AWS. It's your job to determine which AWS features and resources your service users should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with AWS, see the user guide of the AWS service you are using.

IAM administrator – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to AWS. To view example AWS identity-based policies that you can use in IAM, see the user guide of the AWS service you are using.

Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. You must be *authenticated* (signed in to AWS) as the AWS account root user, as an IAM user, or by assuming an IAM role.

You can sign in to AWS as a federated identity by using credentials provided through an identity source. AWS IAM Identity Center (IAM Identity Center) users, your company's single sign-on authentication, and your Google or Facebook credentials are examples of federated identities. When you sign in as a federated identity, your administrator previously set up identity federation using IAM roles. When you access AWS by using federation, you are indirectly assuming a role.

Depending on the type of user you are, you can sign in to the AWS Management Console or the AWS access portal. For more information about signing in to AWS, see [How to sign in to your AWS account](#) in the *AWS Sign-In User Guide*.

If you access AWS programmatically, AWS provides a software development kit (SDK) and a command line interface (CLI) to cryptographically sign your requests by using your credentials. If you don't use AWS tools, you must sign requests yourself. For more information about using the recommended method to sign requests yourself, see [Signing AWS API requests](#) in the *IAM User Guide*.

Regardless of the authentication method that you use, you might be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see [Multi-factor authentication](#) in the *AWS IAM Identity Center User Guide* and [Using multi-factor authentication \(MFA\) in AWS](#) in the *IAM User Guide*.

AWS account root user

When you create an AWS account, you begin with one sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account *root user* and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you don't use the root user for your everyday tasks. Safeguard your root user credentials and use them to perform the tasks that only the root user can perform. For the complete list of tasks that require you to sign in as the root user, see [Tasks that require root user credentials](#) in the *IAM User Guide*.

Federated identity

As a best practice, require human users, including users that require administrator access, to use federation with an identity provider to access AWS services by using temporary credentials.

A *federated identity* is a user from your enterprise user directory, a web identity provider, the AWS Directory Service, the Identity Center directory, or any user that accesses AWS services by using credentials provided through an identity source. When federated identities access AWS accounts, they assume roles, and the roles provide temporary credentials.

For centralized access management, we recommend that you use AWS IAM Identity Center. You can create users and groups in IAM Identity Center, or you can connect and synchronize to a set of users and groups in your own identity source for use across all your AWS accounts and applications. For information about IAM Identity Center, see [What is IAM Identity Center?](#) in the *AWS IAM Identity Center User Guide*.

IAM users and groups

An [IAM user](#) is an identity within your AWS account that has specific permissions for a single person or application. Where possible, we recommend relying on temporary credentials instead of creating IAM users who have long-term credentials such as passwords and access keys. However, if you have specific use cases that require long-term credentials with IAM users, we recommend that you rotate access keys. For more information, see [Rotate access keys regularly for use cases that require long-term credentials](#) in the *IAM User Guide*.

An [IAM group](#) is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named *IAMAdmins* and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see [When to create an IAM user \(instead of a role\)](#) in the *IAM User Guide*.

IAM roles

An [IAM role](#) is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by [switching roles](#). You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see [Using IAM roles](#) in the *IAM User Guide*.

IAM roles with temporary credentials are useful in the following situations:

- **Federated user access** – To assign permissions to a federated identity, you create a role and define permissions for the role. When a federated identity authenticates, the identity is associated with the role and is granted the permissions that are defined by the role. For information about roles for federation, see [Creating a role for a third-party Identity Provider](#) in the *IAM User Guide*. If you use IAM Identity Center, you configure a permission set. To control what your identities can access after they authenticate, IAM Identity Center correlates the permission set to a role in IAM. For information about permission sets, see [Permission sets](#) in the *AWS IAM Identity Center User Guide*.
- **Temporary IAM user permissions** – An IAM user or role can assume an IAM role to temporarily take on different permissions for a specific task.
- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see [Cross account resource access in IAM](#) in the *IAM User Guide*.
- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.
- **Forward access sessions (FAS)** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. When you use some services, you might perform an action that then initiates another action in a different service. FAS uses the permissions of the

principal calling an AWS service, combined with the requesting AWS service to make requests to downstream services. FAS requests are only made when a service receives a request that requires interactions with other AWS services or resources to complete. In this case, you must have permissions to perform both actions. For policy details when making FAS requests, see [Forward access sessions](#).

- **Service role** – A service role is an [IAM role](#) that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see [Creating a role to delegate permissions to an AWS service](#) in the *IAM User Guide*.
- **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your AWS account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.
- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see [Using an IAM role to grant permissions to applications running on Amazon EC2 instances](#) in the *IAM User Guide*.

To learn whether to use IAM roles or IAM users, see [When to create an IAM role \(instead of a user\)](#) in the *IAM User Guide*.

Managing access using policies

You control access in AWS by creating policies and attaching them to AWS identities or resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. AWS evaluates these policies when a principal (user, root user, or role session) makes a request. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see [Overview of JSON policies](#) in the *IAM User Guide*.

Administrators can use AWS JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

By default, users and roles have no permissions. To grant users permission to perform actions on the resources that they need, an IAM administrator can create IAM policies. The administrator can then add the IAM policies to roles, and users can assume the roles.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

Identity-based policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see [Creating IAM policies](#) in the *IAM User Guide*.

Identity-based policies can be further categorized as *inline policies* or *managed policies*. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see [Choosing between managed policies and inline policies](#) in the *IAM User Guide*.

Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM *role trust policies* and Amazon S3 *bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must [specify a principal](#) in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

Access control lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see [Access control list \(ACL\) overview](#) in the *Amazon Simple Storage Service Developer Guide*.

Other policy types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of an entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the `Principal` field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see [Permissions boundaries for IAM entities](#) in the *IAM User Guide*.
- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see [How SCPs work](#) in the *AWS Organizations User Guide*.
- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see [Session policies](#) in the *IAM User Guide*.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see [Policy evaluation logic](#) in the *IAM User Guide*.

How AWS services work with IAM

To get a high-level view of how AWS services work with most IAM features, see [AWS services that work with IAM](#) in the *IAM User Guide*.

To learn how to use a specific AWS service with IAM, see the security section of the relevant service's User Guide.

Troubleshooting AWS identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with AWS and IAM.

Topics

- [I am not authorized to perform an action in AWS](#)
- [I am not authorized to perform iam:PassRole](#)
- [I want to allow people outside of my AWS account to access my AWS resources](#)

I am not authorized to perform an action in AWS

If you receive an error that you're not authorized to perform an action, your policies must be updated to allow you to perform the action.

The following example error occurs when the `mateojackson` IAM user tries to use the console to view details about a fictional `my-example-widget` resource but doesn't have the fictional `aws:GetWidget` permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform:
aws:GetWidget on resource: my-example-widget
```

In this case, the policy for the `mateojackson` user must be updated to allow access to the `my-example-widget` resource by using the `aws:GetWidget` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, your policies must be updated to allow you to pass a role to AWS.

Some AWS services allow you to pass an existing role to that service instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in AWS. However, the action requires the service to have permissions that are granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform:
iam:PassRole
```

In this case, Mary's policies must be updated to allow her to perform the `iam:PassRole` action.

If you need help, contact your AWS administrator. Your administrator is the person who provided you with your sign-in credentials.

I want to allow people outside of my AWS account to access my AWS resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether AWS supports these features, see [How AWS services work with IAM](#).
- To learn how to provide access to your resources across AWS accounts that you own, see [Providing access to an IAM user in another AWS account that you own](#) in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party AWS accounts, see [Providing access to AWS accounts owned by third parties](#) in the *IAM User Guide*.
- To learn how to provide access through identity federation, see [Providing access to externally authenticated users \(identity federation\)](#) in the *IAM User Guide*.

- To learn the difference between using roles and resource-based policies for cross-account access, see [Cross account resource access in IAM](#) in the *IAM User Guide*.

Compliance Validation for this AWS Product or Service

To learn whether an AWS service is within the scope of specific compliance programs, see [AWS services in Scope by Compliance Program](#) and choose the compliance program that you are interested in. For general information, see [AWS Compliance Programs](#).

You can download third-party audit reports using AWS Artifact. For more information, see [Downloading Reports in AWS Artifact](#).

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- [Security and Compliance Quick Start Guides](#) – These deployment guides discuss architectural considerations and provide steps for deploying baseline environments on AWS that are security and compliance focused.
- [Architecting for HIPAA Security and Compliance on Amazon Web Services](#) – This whitepaper describes how companies can use AWS to create HIPAA-eligible applications.

Note

Not all AWS services are HIPAA eligible. For more information, see the [HIPAA Eligible Services Reference](#).

- [AWS Compliance Resources](#) – This collection of workbooks and guides might apply to your industry and location.
- [AWS Customer Compliance Guides](#) – Understand the shared responsibility model through the lens of compliance. The guides summarize the best practices for securing AWS services and map the guidance to security controls across multiple frameworks (including National Institute of Standards and Technology (NIST), Payment Card Industry Security Standards Council (PCI), and International Organization for Standardization (ISO)).
- [Evaluating Resources with Rules](#) in the *AWS Config Developer Guide* – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.

- [AWS Security Hub](#) – This AWS service provides a comprehensive view of your security state within AWS. Security Hub uses security controls to evaluate your AWS resources and to check your compliance against security industry standards and best practices. For a list of supported services and controls, see [Security Hub controls reference](#).
- [Amazon GuardDuty](#) – This AWS service detects potential threats to your AWS accounts, workloads, containers, and data by monitoring your environment for suspicious and malicious activities. GuardDuty can help you address various compliance requirements, like PCI DSS, by meeting intrusion detection requirements mandated by certain compliance frameworks.
- [AWS Audit Manager](#) – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

Resilience for this AWS Product or Service

The AWS global infrastructure is built around AWS Regions and Availability Zones.

AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking.

With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see [AWS Global Infrastructure](#).

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

Infrastructure Security for this AWS Product or Service

This AWS product or service uses managed services, and therefore is protected by the AWS global network security. For information about AWS security services and how AWS protects

infrastructure, see [AWS Cloud Security](#). To design your AWS environment using the best practices for infrastructure security, see [Infrastructure Protection](#) in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access this AWS Product or Service through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [AWS Security Token Service](#) (AWS STS) to generate temporary security credentials to sign requests.

This AWS product or service follows the [shared responsibility model](#) through the specific Amazon Web Services (AWS) services it supports. For AWS service security information, see the [AWS service security documentation page](#) and [AWS services that are in scope of AWS compliance efforts by compliance program](#).

Enforce a minimum version of TLS

To add increased security when communicating with AWS services, you should use TLS 1.2 or later. When you use the AWS CLI, Python is used to set the TLS version.

AWS CLI version 2 uses an internal Python script that's compiled to use a minimum of TLS 1.2 when the service it's talking to supports it. As long as you use version 2 of the AWS CLI, no further steps are needed to enforce this minimum.

Troubleshoot AWS CLI errors

This section covers common errors and troubleshooting steps to follow to resolve your issue. We suggest following the [general troubleshooting](#) first.

Contents

- [General troubleshooting to try first](#)
 - [Check your AWS CLI command formatting](#)
 - [Check the AWS Region your AWS CLI command is using](#)
 - [Confirm that you're running a recent version of the AWS CLI](#)
 - [Use the --debug option](#)
 - [Enable and review the AWS CLI command history logs](#)
 - [Confirm that your AWS CLI is configured](#)
- [Command not found errors](#)
- [The "aws --version" command returns a different version than you installed](#)
- [The "aws --version" command returns a version after uninstalling the AWS CLI](#)
- [The AWS CLI processed a command with an incomplete parameter name](#)
- [Access denied errors](#)
- [Invalid credentials and key errors](#)
- [Signature does not match errors](#)
- [SSL certificate errors](#)
- [Invalid JSON errors](#)
- [Additional resources](#)

General troubleshooting to try first

If you receive an error or encounter an issue with the AWS CLI, we suggest the following general tips to help you troubleshoot.

[Back to top](#)

Check your AWS CLI command formatting

If you receive an error that indicates that a command doesn't exist, or that it doesn't recognize a parameter (`Parameter validation failed`) that the documentation says is available, then your command might be formatted incorrectly. We suggest that you check the following:

- Check your command for spelling and formatting errors.
- Confirm all [quotes and escaping appropriate for your terminal](#) is correct in your command.
- Generate an [AWS CLI skeleton](#) to confirm your command structure.
- For JSON, see the additional [troubleshooting for JSON values](#). If you're having issues with your terminal processing JSON formatting, we suggest skipping past the terminal's quoting rules by using [Blobs to pass JSON data directly to the AWS CLI](#).

For more information on how a specific command should be structured, see the [AWS CLI version 2 reference guide](#).

[Back to top](#)

Check the AWS Region your AWS CLI command is using

Note

You must specify an AWS Region when using the AWS CLI, either explicitly or by setting a default Region. For a list of all of the AWS Regions that you can specify, see [AWS Regions and Endpoints](#) in the *Amazon Web Services General Reference*. The AWS Region designators used by the AWS CLI are the same names that you see in AWS Management Console URLs and service endpoints.

Errors or unexpected results might occur if an AWS service isn't available for your specified AWS Region or your resources are located in a different AWS Region. In order of precedence, the AWS Region is set in the following ways:

- The `--region` command line option.
- The SDK compatible [AWS_REGION](#) environment variable.
- The [AWS_DEFAULT_REGION](#) environment variable.
- The [region](#) profile setting.

Confirm you're using the correct AWS Region for your resources.

[Back to top](#)

Confirm that you're running a recent version of the AWS CLI

If you receive an error that indicates that a command doesn't exist, or that it doesn't recognize a parameter that the [AWS CLI version 2 reference guide](#) says is available, first confirm that your command is correctly formatted. If the formatting is correct, then we recommend that you upgrade to the most recent version of the AWS CLI. Updated versions of the AWS CLI are released almost every business day. New AWS services, features, and parameters are introduced in those new versions of the AWS CLI. The only way to get access to those new services, features, or parameters is to upgrade to a version that was released after that element was first introduced.

How you update your version of the AWS CLI depends on how you originally installed it as described in [the section called "Install/Update"](#).

If you used one of the bundled installers, you might need to remove the existing installation before you download and install the latest version for your operating system.

[Back to top](#)

Use the --debug option

When the AWS CLI reports an error that you don't immediately understand, or produces results that you don't expect, you can get more detail about the error by running the command again with the --debug option. With this option, the AWS CLI outputs details about every step it takes to process your command. The details in the output can help you to determine when the error occurs and provides clues about where it started.

You can send the output to a text file for later review, or to send to AWS Support when asked for it.

When you include the --debug option, some of the details include:

- Looking for credentials
- Parsing the provided parameters
- Constructing the request sent to AWS servers
- The contents of the request sent to AWS
- The contents of the raw response
- The formatted output

Here's an example of a command run with and without the `--debug` option.

```
$ aws iam list-groups --profile MyTestProfile
{
  "Groups": [
    {
      "Path": "/",
      "GroupName": "MyTestGroup",
      "GroupId": "AGPA0123456789EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/MyTestGroup",
      "CreateDate": "2019-08-12T19:34:04Z"
    }
  ]
}
```

```

[Back to top](#)

Enable and review the AWS CLI command history logs

You can enable the AWS CLI command history logs using the [cli_history](#) file setting. After enabling this setting, the AWS CLI records the history of `aws` commands.

You can list your history using the `aws history list` command, and use the resulting `command_ids` in the `aws history show` command for details. For more information see [aws history](#) in the *AWS CLI reference guide*.

When you include the `--debug` option, some of the details include:

- API calls made to botocore
- Status codes
- HTTP responses
- Headers
- Return codes

You can use this information to confirm parameter data and API calls are behaving in the way you expect, and can then deduce at what step in the process your command is failing.

[Back to top](#)

Confirm that your AWS CLI is configured

Various errors can occur if your `config` and `credentials` files or your IAM user or role is not configured correctly. For more information on resolving errors with `config` and `credentials` files or your IAM user or roles, see [the section called "Access denied errors"](#) and [the section called "Invalid credentials and key errors"](#).

[Back to top](#)

Command not found errors

This error means that the operating system can't find the AWS CLI command. The installation might be incomplete or requires updating.

Possible cause: You're trying to use an AWS CLI feature newer than your installed version, or have incorrect formatting

Example error text:

```
$ aws s3 copy
usage: aws [options] <command> <subcommand> [<subcommand> ...] [parameters]
To see help text, you can run:

    aws help
    aws <command> help
    aws <command> <subcommand> help
aws: error: argument subcommand: Invalid choice, valid choices are:

ls                | website
cp                | mv
....
```

Various errors can occur if your command is formatted incorrectly or you are using an earlier version from before the feature was released. For more information on resolving errors around these two issues, see [the section called “Check your AWS CLI command formatting”](#) and [the section called “Confirm that you're running a recent version of the AWS CLI”](#).

[Back to top](#)

Possible cause: The terminal needs to be restarted after installation

Example error text:

```
$ aws --version
command not found: aws
```

If the aws command cannot be found after first installing or updating the AWS CLI, you might need to restart your terminal for it to recognize any PATH updates.

[Back to top](#)

Possible cause: The AWS CLI did not fully install

Example error text:

```
$ aws --version
command not found: aws
```

If the `aws` command cannot be found after first installing or updating the AWS CLI, it might not have been fully installed. Try reinstalling by following the steps for your platform in [the section called "Install/Update"](#).

[Back to top](#)

Possible cause: The AWS CLI does not have permissions (Linux)

If the `aws` command cannot be found after first installing or updating the AWS CLI on Linux, it might not have execute permissions for the folder it installed in. Run the following command with the PATH to your AWS CLI installation, to provide [chmod](#) permissions to the AWS CLI:

```
$ sudo chmod -R 755 /usr/local/aws-cli/
```

[Back to top](#)

Possible cause: The operating system PATH was not updated during installation

Example error text:

```
$ aws --version
command not found: aws
```

You might need to add the `aws` executable to your operating system's PATH environment variable. To add the AWS CLI to your PATH, use the following instructions for your operating system.

Linux and macOS

1. Find your shell's profile script in your user directory. If you're not sure which shell you have, run `echo $SHELL`.

```
$ ls -a ~
```

```
. .. .bash_logout .bash_profile .bashrc Desktop Documents Downloads
```

- **Bash** – `.bash_profile`, `.profile`, or `.bash_login`
 - **Zsh** – `.zshrc`
 - **Tcsh** – `.tcshrc`, `.cshrc`, or `.login`
2. Add an export command to your profile script. The following command adds your local bin to the current PATH variable.

```
export PATH=/usr/local/bin:$PATH
```

3. Reload the updated profile into your current session.

```
$ source ~/.bash_profile
```

Windows

1. In a Windows Command Prompt, use the `where` command with the `/R` *path* parameter to find the aws file location. The results return all folders containing aws.

```
C:\> where /R c:\ aws  
c:\Program Files\Amazon\AWSCLIV2\aws.exe  
...
```

By default, the AWS CLI version 2 is located in:

```
c:\Program Files\Amazon\AWSCLIV2\aws.exe
```

2. Press the Windows key and enter **environment variables**.
3. From the list of suggestions, choose **Edit environment variables for your account**.
4. Choose **PATH**, and then choose **Edit**.
5. Add the path you found in the first step into the **Variable value** field, for example, **C:
*\Program Files\Amazon\AWSCLIV2\aws.exe***.
6. Choose **OK** twice to apply the new settings.
7. Close any running command prompts and reopen the command prompt window.

[Back to top](#)

The "aws --version" command returns a different version than you installed

Your terminal might be returning a different PATH for the AWS CLI than you expect.

Possible cause: The terminal needs to be restarted after installing

If the aws command shows the wrong version, you might need to restart your terminal for it to recognize any PATH updates. All open terminals needs to be closed, not just your active terminal.

[Back to top](#)

Possible cause: The system needs to be restarted after installing

If the aws command shows the wrong version and restarting the terminal didn't work, you might need to restart your system for it to recognize your PATH updates.

[Back to top](#)

Possible cause: You have multiple versions of the AWS CLI

If you updated the AWS CLI and used a different install method than your pre-existing installation, it might cause multiple versions to be installed. For example, if on Linux or macOS you used pip for your current install, but tried to update using the .pkg install file, this could cause some conflicts especially with your PATH pointing to the old version.

To resolve this, [uninstall all versions of the AWS CLI](#) and perform a clean install.

After uninstalling all versions, follow instructions appropriate for your operating system to install your desired version of the [AWS CLI version 1](#) or [AWS CLI version 2](#).

Note

If this is happening after you installed the AWS CLI version 2 with a pre-existing install of AWS CLI version 1, follow the migration instructions in [the section called "Migration instructions"](#).

[Back to top](#)

The "aws --version" command returns a version after uninstalling the AWS CLI

This often occurs when there is still an AWS CLI installed somewhere on your system.

Possible cause: The terminal needs to be restarted after uninstalling

If the `aws --version` command still works, you might need to restart your terminal for it to recognize any terminal updates.

[Back to top](#)

Possible cause: You have multiple versions of the AWS CLI on your system, or didn't use the same uninstall method that you used to originally install the AWS CLI

The AWS CLI might not uninstall correctly if you uninstalled the AWS CLI using a different method than you used to install it, or if you installed multiple versions. For example, if you used `pip` for your current install, you must use `pip` to uninstall it. To resolve this, uninstall AWS CLI using the same method that you used to install it.

1. Follow the instructions appropriate for your operating system and your original installation method to uninstall the [AWS CLI version 1](#) and [AWS CLI version 2](#).
2. Close all terminals you have open.
3. Open your preferred terminal, enter in the following command and confirm that no version is returned.

```
$ aws --version
command not found: aws
```

If you still have a version listed in the output, the AWS CLI was most likely installed using a different method or there are multiple versions. If you don't know which method you installed the AWS CLI, follow the instructions for each uninstall method for the [AWS CLI version 1](#) and [AWS CLI version 2](#) appropriate to your operating system until no version output is received.

Note

If you used a package manager to install the AWS CLI (`pip`, `apt`, `brew`, etc.), you must use the same package manager to uninstall it. Be sure to follow the

instructions provided by the package manager on how to uninstall all versions of a package.

[Back to top](#)

The AWS CLI processed a command with an incomplete parameter name

Possible cause: You used a recognized abbreviation of the AWS CLI parameter

Since the AWS CLI is built using Python, the AWS CLI uses the Python `argparse` library, including the [allow_abbrev](#) argument. Abbreviations of parameters are recognized by the AWS CLI and processed.

The following [create-change-set](#) command example changes the CloudFormation stack name. The parameter `--change-set-n` is recognized as an abbreviation of `--change-set-name`, and the AWS CLI processes the command.

```
$ aws cloudformation create-change-set --stack-name my-stack --change-set-n my-change-set
```

When your abbreviation could be multiple commands, the parameter will not be recognized as an abbreviation.

The following [create-change-set](#) command example changes the CloudFormation stack name. The parameter `--change-set-` is **not** recognized as an abbreviation, as there are multiple parameters it could be an abbreviation of, such as `--change-set-name` and `--change-set-type`. Therefore the AWS CLI does **not** process the command.

```
$ aws cloudformation create-change-set --stack-name my-stack --change-set- my-change-set
```

Warning

Do not purposefully use parameter abbreviations. They are unreliable and are not backwards compatible. If any new parameters are added to a command that confuse your abbreviations, it will break your commands.

Additionally, if the parameter is a single-value argument, it can cause unexpected behavior with your commands. If multiple instances of a single-value argument is passed, only the last instance will run. In the following example, the parameter `--filters` is a single-valued argument. The parameters `--filters` and `--filter` are specified. The `--filter` parameter is an abbreviation of `--filters`. This cause two instances of `--filters` being applied and only the last `--filter` argument applies.

```
$ aws ec2 describe-vpc-peering-connections \  
  --filters Name=tag:TagName,Values=VpcPeeringConnection \  
  --filter Name=status-code,Values=active
```

Confirm you are using valid parameters before running a command to prevent unexpected behavior.

[Back to top](#)

Access denied errors

Possible cause: The AWS CLI program file doesn't have "run" permission

On Linux or macOS, make sure that the `aws` program has run permissions for the calling user. Typically, the permissions are set to 755.

To add run permission for your user, run the following command, substituting `~/.local/bin/aws` with the path to the program on your computer.

```
$ chmod +x ~/.local/bin/aws
```

[Back to top](#)

Possible cause: Your IAM identity doesn't have permission to perform the operation

Example error text:

```
$ aws s3 ls  
An error occurred (AccessDenied) when calling the ListBuckets operation: Access  
denied.
```

When you run a AWS CLI command, AWS operations are performed on your behalf, using credentials that associate you with an IAM account or role. The policies attached must grant you permission to call the API actions that correspond to the commands that you run with the AWS CLI.

Most commands call a single action with a name that matches the command name. However, custom commands like `aws s3 sync` call multiple APIs. You can see which APIs a command calls by using the `--debug` option.

If you are sure that the user or role has the proper permissions assigned by policy, make sure that your AWS CLI command is using the credentials you expect. See the [next section about credentials](#) to verify that the credentials the AWS CLI is using are the ones that you expect.

For information about assigning IAM permissions, see [Overview of Access Management: Permissions and Policies](#) in the *IAM User Guide*.

[Back to top](#)

Invalid credentials and key errors

Example error text:

```
$ aws s3 ls
```

```
An error occurred (InvalidAccessKeyId) when calling the ListBuckets operation: The AWS
Access Key Id
you provided does not exist in our records.
```

```
$ aws s3 ls
```

```
An error occurred (InvalidClientTokenId) when calling the ListBuckets operation: The
security token
included in the request is invalid.
```

Possible cause: The AWS CLI is reading incorrect credentials or from an unexpected location

The AWS CLI might be reading credentials from a different location than you expect, or your key pair information is incorrect. You can run `aws configure list` to confirm which credentials are used.

The following example shows how to check the credentials used for the default profile.

```
$ aws configure list
  Name                Value                Type    Location
  ----                -
  profile              <not set>           None    None
  access_key           *****XYVA         shared-credentials-file
  secret_key           *****ZAGY         shared-credentials-file
  region               us-west-2           config-file  ~/.aws/config
```

The following example shows how to check the credentials of a named profile.

```
$ aws configure list --profile saanvi
  Name                Value                Type    Location
  ----                -
  profile              saanvi              manual  --profile
  access_key           *****             shared-credentials-file
  secret_key           *****             shared-credentials-file
  region               us-west-2           config-file  ~/.aws/config
```

To confirm your key pair details, check your config and credentials files. For more information on config and credentials files, see [the section called “Configuration and credential file settings”](#). For more information on credentials and authentication, including credentials precedence, see [Authentication and access credentials](#).

[Back to top](#)

Possible cause: Your computer's clock is out of sync

If you are using valid credentials, your clock might be out of sync. On Linux or macOS, run `date` to check the time.

```
$ date
```

If your system clock is not correct within a few minutes, use `ntpd` to sync it.

```
$ sudo service ntpd stop
$ sudo ntpdate time.nist.gov
$ sudo service ntpd start
$ ntpstat
```

On Windows, use the date and time options in the Control Panel to configure your system clock.

[Back to top](#)

Signature does not match errors

Example error text:

```
$ aws s3 ls
```

```
An error occurred (SignatureDoesNotMatch) when calling the ListBuckets operation: The request signature we calculated does not match the signature you provided. Check your key and signing method.
```

When the AWS CLI runs a command, it sends an encrypted request to the AWS servers to perform the appropriate AWS service operations. Your credentials (the access key and secret key) are involved in the encryption and enable AWS to authenticate the person making the request. There are several things that can interfere with the correct operation of this process, as follows.

Possible cause: Your clock is out of sync with the AWS servers

To help protect against [replay attacks](#), the current time can be used during the encryption/decryption process. If the time of the client and server disagree by more than the allowed amount, the process can fail and the request is rejected. This can also happen when you run a command in a virtual machine whose clock is out of sync with the host machine's clock. One possible cause is when the virtual machine hibernates and takes some time after waking up to sync the clock with the host machine.

On Linux or macOS, run `date` to check the time.

```
$ date
```

If your system clock is not correct within a few minutes, use `ntpd` to sync it.

```
$ sudo service ntpd stop
$ sudo ntpdate time.nist.gov
$ sudo service ntpd start
$ ntpstat
```

On Windows, use the date and time options in the Control Panel to configure your system clock.

[Back to top](#)

Possible cause: Your operating system is mishandling AWS keys that contain certain special characters

If your AWS keys include certain special characters, such as -, +, /, or %, some operating system variants process the string improperly and cause the key string to be interpreted incorrectly.

If you process your keys using other tools or scripts, such as tools that build the credentials file on a new instance as part of its creation, those tools and scripts might have their own handling of special characters that causes them to be transformed into something that AWS no longer recognizes.

We suggest regenerating the secret key to get one that does not include the special character causing issues.

[Back to top](#)

SSL certificate errors

Possible cause: The AWS CLI doesn't trust your proxy's certificate

Example error text:

```
$ aws s3 ls
[SSL: CERTIFICATE_ VERIFY_FAILED] certificate verify failed
```

When you use a AWS CLI command, you receive an [SSL: CERTIFICATE_ VERIFY_FAILED] certificate verify failed error message. This is caused by the AWS CLI not trusting your proxy's certificate due to factors such as your proxy's certificate being self-signed, with your company set as the Certification Authority (CA). This prevents the AWS CLI from finding your companies CA root certificate in the local CA registry.

To fix this, instruct the AWS CLI where to find your companies .pem file using the [ca_bundle](#) configuration file setting, [--ca-bundle](#) command line option, or the [AWS_CA_BUNDLE](#) environment variable.

[Back to top](#)

Possible cause: Your configuration isn't pointing to the correct CA root certificate location

Example error text:

```
$ aws s3 ls
SSL validation failed for regionname [Errno 2] No such file or directory
```

This is caused by your Certification Authority (CA) bundle file location being configured incorrectly in the AWS CLI. To fix this, confirm where your companies .pem file is located and update the AWS CLI configuration by using the [ca_bundle](#) configuration file setting, [--ca-bundle](#) command line option, or the [AWS_CA_BUNDLE](#) environment variable.

[Back to top](#)

Possible cause: Your configuration isn't using the correct AWS Region

Example error text:

```
$ aws s3 ls
[SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed
```

Errors or unexpected results might occur if an AWS service isn't available for your specified AWS Region or your resources are located in a different AWS Region. For troubleshooting steps, see [the section called "Check the AWS Region your AWS CLI command is using"](#).

[Back to top](#)

Possible cause: Your TLS version needs to be updated

Example error text:

```
$ aws s3 ls
[SSL: UNSAFE_LEGACY_RENEGOTIATION_DISABLED] unsafe legacy renegotiation disabled
```

The AWS service is using a version of TLS that is incompatible with your device's TLS version. To resolve this issue, update to a supported TLS version. For more information, see [the section called "Enforcing a minimum TLS version"](#).

[Back to top](#)

Invalid JSON errors

Example error text:

```
$ aws dynamodb update-table \  
  --provisioned-throughput '{"ReadCapacityUnits':15,WriteCapacityUnits':10}' \  
  --table-name MyDDBTable  
Error parsing parameter '--provisioned-throughput': Invalid JSON: Expecting property  
name enclosed in  
double quotes: line 1 column 25 (char 24)  
JSON received: {"ReadCapacityUnits":15,WriteCapacityUnits":10}
```

When you use an AWS CLI command, you receive a "Invalid JSON" error message. This is usually an error seen when you enter a command with an expected JSON format and the AWS CLI cannot read your JSON correctly.

Possible cause: You did not enter valid JSON for the AWS CLI to use

Confirm you have valid JSON entered for your command. We suggest using a JSON validator for JSON you're having issues formatting.

For more advanced JSON usage in the command line, consider using a command line JSON processor, like `jq`, to create JSON strings. For more information on `jq`, see the [jq repository](#) on *GitHub*.

[Back to top](#)

Possible cause: Your terminal's quoting rules are preventing valid JSON being sent to the AWS CLI

Before the AWS CLI receives anything from a command, your terminal processes the command using its own quoting and escaping rules. Due to a terminal's formatting rules, some of your JSON content may be stripped before the command is passed to the AWS CLI. When formulating commands, be sure to use your [terminal's quoting rules](#).

To troubleshoot, use the `echo` command to see how the shell is handling your parameters:

```
$ echo {"ReadCapacityUnits":15,"WriteCapacityUnits":10}  
ReadCapacityUnits:15 WriteCapacityUnits:10
```

```
$ echo '{"ReadCapacityUnits":15,"WriteCapacityUnits":10}'  
{"ReadCapacityUnits":15,"WriteCapacityUnits":10}
```

Modify your command until your until valid JSON is returned.

For more in-depth troubleshooting, use the `--debug` parameter to view the debug logs as they'll display exactly what got passed to the AWS CLI:

```
$ aws dynamodb update-table \  
  --provisioned-throughput '{"ReadCapacityUnits":15,WriteCapacityUnits":10}' \  
  --table-name MyDDBTable \  
  --debug  
2022-07-19 22:25:07,741 - MainThread - awscli.clidriver - DEBUG - CLI version: aws-  
cli/1.18.147  
Python/2.7.18 Linux/5.4.196-119.356.amzn2int.x86_64 boto3/1.18.6  
2022-07-19 22:25:07,741 - MainThread - awscli.clidriver - DEBUG - Arguments entered  
to CLI:  
['dynamodb', 'update-table', '--provisioned-throughput',  
'{"ReadCapacityUnits":15,WriteCapacityUnits":10}',  
 '--table-name', 'MyDDBTable', '--debug']
```

Use your terminal's quoting rules to fix any issues your JSON input has when being sent to the AWS CLI. For more information on quoting rules, see [the section called “Quotes with Strings”](#).

Note

If you're having issues with getting valid JSON to the AWS CLI, we recommend to bypass a terminal's quoting rules for JSON data input by using Blobs to pass your JSON data directly to the AWS CLI. For more information on Blobs, see [Blob](#).

[Back to top](#)

Migrate from AWS CLI version 1 to version 2

This section contains instructions for updating the AWS CLI version 1 to AWS CLI version 2. The AWS CLI version 2 builds on AWS CLI version 1 and includes features and enhancements based on community feedback.

Before you migrate to version 2, [learn about the differences between the versions](#). The AWS CLI version 2 includes new features and changes that might require you to update your scripts or commands for backwards compatibility.

AWS CLI versions 1 and 2 use the same `aws` command name. If you have both versions installed, your computer uses the first one found in your search path.

If you previously installed AWS CLI version 1, follow our [migration instructions to start using version 2](#).

If you have not previously installed AWS CLI version 1, follow the instructions in [Get started](#).

Topics

- [New features and changes in AWS CLI version 2](#)
- [AWS CLI version 2 migration instructions](#)

New features and changes in AWS CLI version 2

This topic describes new features and changes in behavior between AWS CLI version 1 and AWS CLI version 2. These changes might require you to update your scripts or commands to get the same behavior in version 2 as you did in version 1.

Topics

- [AWS CLI version 2 new features](#)
- [Breaking changes between AWS CLI version 1 and AWS CLI version 2](#)

AWS CLI version 2 new features

The AWS CLI version 2 is the most recent major version of the AWS CLI and supports all of the latest features. Some features introduced in version 2 are not backported to version 1 and you must upgrade to access those features. These features include the following:

Python interpreter not needed

The AWS CLI version 2 doesn't need a separate install of Python. It includes an embedded version.

[Wizards](#)

You can use a wizard with the AWS CLI version 2. The wizard guides you through constructing certain commands.

[IAM Identity Center authentication](#)

If your organization uses AWS IAM Identity Center (IAM Identity Center), your users can sign in to Active Directory, a built-in IAM Identity Center directory, or [another IdP connected to IAM Identity Center](#). Then, they are mapped to an AWS Identity and Access Management (IAM) role that allows you to run AWS CLI commands.

[Auto-prompt](#)

When enabled, the AWS CLI version 2 can prompt you for commands, parameters, and resources when you run an `aws` command.

[Run the AWS CLI from the official Amazon ECR Public or Docker images](#)

The official Docker image for the AWS CLI provides isolation, portability, and security that AWS directly supports and maintains. This way, you can use the AWS CLI version 2 in a container-based environment without having to manage the installation yourself.

[Client-side pager](#)

The AWS CLI version 2 provides the use of a client-side pager program for output. By default, this feature is turned on and returns all output through your operating system's default pager program.

[aws configure import](#)

Import `.csv` credentials generated from the AWS Management Console. A `.csv` file is imported with the profile name matching the IAM user name.

[aws configure list-profiles](#)

Lists the names of all profiles you have configured.

[the section called “YAML stream output format”](#)

The `yaml` and `yaml-stream` format takes advantage of the [YAML](#) format while providing more responsive viewing of large datasets by streaming the data to you. You can start viewing and using YAML data before the entire query downloads.

[New high-level ddb commands for DynamoDB](#)

The AWS CLI version 2 has the high-level Amazon DynamoDB commands [ddb put](#) and [ddb select](#). These commands provide a simplified interface for putting items in DynamoDB tables and searching in a DynamoDB table or index.

[aws logs tail](#)

The AWS CLI version 2 has a custom `aws logs tail` command that tails the logs for an Amazon CloudWatch Logs group. By default, the command returns logs from all associated CloudWatch Logs streams during the past ten minutes.

[Added metadata support for high-level s3 commands](#)

The AWS CLI version 2 adds the `--copy-props` parameter to the high-level `s3` commands. With this parameter, you can configure additional metadata and tags for Amazon Simple Storage Service (Amazon S3).

[AWS_REGION](#)

The AWS CLI version 2 has an AWS SDK-compatible environment variable called `AWS_REGION`. This variable specifies the AWS Region to send requests to. It overrides the `AWS_DEFAULT_REGION` environment variable, which is only applicable in the AWS CLI.

Breaking changes between AWS CLI version 1 and AWS CLI version 2

This section describes all of the changes in behavior between AWS CLI version 1 and AWS CLI version 2. These changes might require you to update your scripts or commands to get the same behavior in version 2 as you did in version 1.

Topics

- [Environment variable added to set text file encoding](#)
- [Binary parameters are passed as base64-encoded strings by default](#)
- [Improved Amazon S3 handling of file properties and tags for multipart copies](#)
- [No automatic retrieval of http:// or https:// URLs for parameters](#)

- [Pager used for all output by default](#)
- [Timestamp output values are standardized to ISO 8601 format](#)
- [Improved handling of CloudFormation deployments that result in no changes](#)
- [Changed default behavior for Regional Amazon S3 endpoint for us-east-1 Region](#)
- [Changed default behavior for Regional AWS STS endpoints](#)
- [ecr get-login removed and replaced with ecr get-login-password](#)
- [AWS CLI version 2 support for plugins is changing](#)
- [Hidden alias support removed](#)
- [The api_versions configuration file setting is not supported](#)
- [AWS CLI version 2 uses only Signature v4 to authenticate Amazon S3 requests](#)
- [AWS CLI version 2 is more consistent with paging parameters](#)
- [AWS CLI version 2 provides more consistent return codes across all commands](#)

Environment variable added to set text file encoding

By default, text files for [the section called “Blob”](#) use the same encoding as the installed locale. Because the AWS CLI version 2 uses an embedded version of Python, the PYTHONUTF8 and PYTHONIOENCODING environment variables are not supported. To set encoding for text files to be different from the locale, use the AWS_CLI_FILE_ENCODING environment variable. The following example sets the AWS CLI to open text files using UTF-8 on Windows.

```
AWS_CLI_FILE_ENCODING=UTF-8
```

For more information, see [Environment variables to configure the AWS CLI](#) .

Binary parameters are passed as base64-encoded strings by default

In the AWS CLI, some commands required [base64](#)-encoded strings, while others required UTF-8-encoded byte strings. In the AWS CLI version 1, passing data between two encoded string types often required some intermediate processing. The AWS CLI version 2 makes handling binary parameters more consistent, which helps pass values from one command to another more reliably.

By default, the AWS CLI version 2 passes all binary input and binary output parameters as the base64-encoded string b1obs (binary large object). For more information, see [the section called “Blob”](#).

To revert to the AWS CLI version 1 behavior, use the [cli_binary_format](#) file configuration or the [--cli-binary-format](#) parameter.

Improved Amazon S3 handling of file properties and tags for multipart copies

When you use the AWS CLI version 1 commands in the `aws s3` namespace to copy a file from one S3 bucket location to another, and that operation uses [multipart copy](#), no file properties from the source object are copied to the destination object.

By default, the corresponding commands in the AWS CLI version 2 transfer all tags and some of the properties from the source to the destination copy. Compared to the AWS CLI version 1, this can result in more AWS API calls being made to the Amazon S3 endpoint. To change the default behavior for `s3` commands in AWS CLI version 2, use the `--copy-props` parameter.

For more information, see [the section called "File properties and tags in multipart copies"](#).

No automatic retrieval of `http://` or `https://` URLs for parameters

The AWS CLI version 2 does not perform a GET operation when a parameter value begins with `http://` or `https://`, and does not use the returned content as the parameter value. As a result, the associated command line option `cli_follow_urlparam` is removed from the AWS CLI version 2.

If you need to retrieve a URL and pass the URL contents into a parameter value, we recommend that you use `curl` or a similar tool to download the contents of the URL to a local file. Then, use the `file://` syntax to read the contents of that file and use it as the parameter value.

For example, the following command no longer tries to retrieve the contents of the page found at `http://www.example.com` and pass those contents as the parameter. Instead, it passes the literal text string `https://example.com` as the parameter.

```
$ aws ssm put-parameter \  
  --value http://www.example.com \  
  --name prod.microservice1.db.secret \  
  --type String 2
```

If you need to retrieve and use the contents of a web URL as a parameter, you can do the following in version 2.

```
$ curl https://my.example.com/mypolicyfile.json -o mypolicyfile.json
```

```
$ aws iam put-role-policy \  
  --policy-document file:///./mypolicyfile.json \  
  --role-name MyRole \  
  --policy-name MyReadOnlyPolicy
```

In the preceding example, the `-o` parameter tells `curl` to save the file in the current folder with the same name as the source file. The second command retrieves the content of that downloaded file and passes the content as the value of `--policy-document`.

Pager used for all output by default

By default, the AWS CLI version 2 returns all output through your operating system's default pager program. This program is the [less](#) program on Linux or macOS, and the [more](#) program on Windows. This can help you navigate a large amount of output from a service by displaying that output one page at a time.

You can configure the AWS CLI version 2 to use a different paging program or none at all. For more information, see [the section called "Client-side pager"](#).

Timestamp output values are standardized to ISO 8601 format

By default, the AWS CLI version 2 returns all timestamp response values in the [ISO 8601 format](#). In AWS CLI version 1, commands returned timestamp values in whatever format was returned by the HTTP API response, which could vary from service to service.

To see timestamps in the format returned by the HTTP API response, use the `wire` value in your config file. For more information, see [cli_timestamp_format](#).

Improved handling of CloudFormation deployments that result in no changes

By default in the AWS CLI version 1, if you deploy a AWS CloudFormation template that results in no changes, the AWS CLI returns a failed error code. This causes problems if you don't consider that to be an error and you want your script to continue. You can work around this in the AWS CLI version 1 by adding the flag `--no-fail-on-empty-changeset`, which returns `0`.

Since this is a common use case, the AWS CLI version 2 defaults to returning a successful exit code of `0` when there is no change caused by a deployment and the operation returns an empty changeset.

To revert to the original behavior, add the flag `--fail-on-empty-changeset`.

Changed default behavior for Regional Amazon S3 endpoint for us-east-1 Region

When you configure the AWS CLI version 1 to use the us-east-1 Region, the AWS CLI uses the global `s3.amazonaws.com` endpoint that is physically hosted in the us-east-1 Region. The AWS CLI version 2 uses the true Regional endpoint `s3.us-east-1.amazonaws.com` when that Region is specified. To force the AWS CLI version 2 to use the global endpoint, you can set the Region for a command to `aws-global`.

Changed default behavior for Regional AWS STS endpoints

By default, the AWS CLI version 2 sends all AWS Security Token Service (AWS STS) API requests to the Regional endpoint for the currently configured AWS Region.

By default, the AWS CLI version 1 sends AWS STS requests to the global AWS STS endpoint. You can control this default behavior in version 1 by using the [sts_regional_endpoints](#) setting.

`aws ecr get-login` removed and replaced with `aws ecr get-login-password`

The AWS CLI version 2 replaces the command `aws ecr get-login` with the `aws ecr get-login-password` command that improves automated integration with container authentication.

The `aws ecr get-login-password` command reduces the risk of exposing your credentials in the process list, shell history, or other log files. It also improves compatibility with the `docker login` command for better automation.

The `aws ecr get-login-password` command is available in the AWS CLI version 1.17.10 and later, and the AWS CLI version 2. The earlier `aws ecr get-login` command is still available in the AWS CLI version 1 for backward compatibility.

With the `aws ecr get-login-password` command, you can replace the following code that retrieves a password.

```
$ (aws ecr get-login --no-include-email)
```

To reduce the risk of exposing the password to the shell history or logs, use the following example command instead. In this example, the password is piped directly to the `docker login` command, where it is assigned to the password parameter by the `--password-stdin` option.

```
$ aws ecr get-login-password | docker login --username AWS --password-stdin MY-REGISTRY-URL
```

For more information, see [aws ecr get-login-password](#) in the *AWS CLI version 2 Reference Guide*.

AWS CLI version 2 support for plugins is changing

Plugin support in the AWS CLI version 2 is completely provisional and is intended to help users migrate from AWS CLI version 1 until a stable, updated plugin interface is released. There are no guarantees that a particular plugin or even the AWS CLI plugin interface will be supported in future versions of the AWS CLI version 2. If you rely on plugins, be sure to lock into a particular version of the AWS CLI and test the functionality of your plugin when you do upgrade.

To enable plugin support, create a [plugins] section in your `~/.aws/config`.

```
[plugins]
cli_legacy_plugin_path = <path-to-plugins>/python3.7/site-packages
<plugin-name> = <plugin-module>
```

In the [plugins] section, define the `cli_legacy_plugin_path` variable and set its value to the Python site packages path where your plugin module is. Then, you can configure a plugin by providing a name for the plugin (`plugin-name`) and the file name of the Python module (`plugin-module`) that contains the source code for your plugin. The AWS CLI loads each plugin by importing its `plugin-module` and calling its `awscli_initialize` function.

Hidden alias support removed

AWS CLI version 2 no longer supports the following hidden aliases that were supported in version 1.

In the following table, the first column displays the service, command, and parameter that work in all versions, including the AWS CLI version 2. The second column displays the alias that no longer works in the AWS CLI version 2.

Working service, command, and parameter	Obsolete alias
cognito-identity create-identity-pool open-id-connect-provider-arns	open-id-connect-provider-arns

Working service, command, and parameter	Obsolete alias
storagegateway describe-tapes tape-arns	tape-ar-ns
storagegateway.describe-tape-archives.tape-arns	tape-ar-ns

opsworks.register-volume.ec2-volume-id	ec-2-volume-id

The `api_versions` configuration file setting is not supported

The AWS CLI version 2 doesn't support calling earlier versions of AWS service APIs by using the `api_versions` configuration file setting. All AWS CLI commands now call the latest version of the service APIs that are currently supported by the endpoint.

AWS CLI version 2 uses only Signature v4 to authenticate Amazon S3 requests

The AWS CLI version 2 doesn't support earlier signature algorithms to cryptographically authenticate service requests sent to Amazon S3 endpoints. This signing happens automatically with every Amazon S3 request and only the [Signature Version 4 Signing Process](#) is supported. You can't configure the signature version. All Amazon S3 bucket presigned URLs now use only SigV4 and have a maximum expiration duration of one week.

AWS CLI version 2 is more consistent with paging parameters

In the AWS CLI version 1, if you specify pagination parameters on the command line, then automatic pagination is turned off as expected. However, when you specify pagination parameters by using a file with the `--cli-input-json` parameter, automatic pagination was not turned off, which could result in unexpected output. The AWS CLI version 2 turns off automatic pagination regardless of how you provide the parameters.

AWS CLI version 2 provides more consistent return codes across all commands

The AWS CLI version 2 is more consistent across all commands and properly returns an appropriate exit code compared to the AWS CLI version 1. We also added exit codes 252, 253, and 254. For more information on exit codes, see [the section called "Return Codes"](#).

If you have a dependency on how the AWS CLI version 1 uses return code values, we recommend checking the exit codes to make sure that you're getting the values you expect.

AWS CLI version 2 migration instructions

This topic provides instructions for migrating from AWS CLI version 1 to AWS CLI version 2.

AWS CLI versions 1 and 2 use the same `aws` command name. If you have both versions installed, your computer uses the first one found in your search path. If you previously installed AWS CLI version 1, we recommend that you do one of the following to use AWS CLI version 2:

- **Recommended** – [Uninstall AWS CLI version 1 and use only AWS CLI version 2.](#)

- [To have both version installed](#), use your operating system's ability to create a symbolic link (symlink) or alias with a different name for one of the two aws commands.

For information on breaking changes between version 1 and version 2, see [the section called "New features and changes"](#).

Replacing version 1 with version 2

Perform the following steps to replace AWS CLI version 1 with AWS CLI version 2.

To replace AWS CLI version 1 with AWS CLI version 2

1. Prepare any existing scripts you have for the migration by confirming any breaking changes between version 1 and version 2 in [the section called "New features and changes"](#).
2. Uninstall the AWS CLI version 1 by following the uninstall instructions for your operating system in [Installing, updating, and uninstalling the AWS CLI version 1](#).
3. Confirm that the AWS CLI is completely uninstalled by using the following command.

```
$ aws --version
```

Complete one of the following based on the output:

- **No version returned:** You've successfully uninstalled the AWS CLI version 1 and can proceed to the next step.
 - **A version is returned:** You still have an install of the AWS CLI version 1. For troubleshooting steps, see [the section called "The "aws --version" command returns a version after uninstalling the AWS CLI"](#). Perform troubleshooting steps until no version output is received.
4. Install the AWS CLI version 2 by following the appropriate install instructions for your operating system in [Install or update to the latest version of the AWS CLI](#).

Side-by-side install

To have both versions installed, use your operating system's ability to create a symbolic link (symlink) or alias with a different name for one of the two aws commands.

1. Install the AWS CLI version 2 by following the appropriate install instructions for your operating system in [Install or update to the latest version of the AWS CLI](#).

2. Use your operating system's ability to create a symlink or alias with a different name for one of the two aws commands, such as using *aws2* for AWS CLI version 2. The following are symlink examples for AWS CLI version 2. Replace the *PATH* with your install location.

Linux and macOS

You can use a [symbolic link](#) or [alias](#) on Linux and macOS.

```
$ alias aws2='PATH'
```

Windows command prompt

[DOSKEY](#) on Windows.

```
C:\> doskey aws2=PATH
```

Uninstall the AWS CLI version 2

This topic describes how to uninstall the AWS Command Line Interface version 2 (AWS CLI version 2).

AWS CLI version 2 uninstallation instructions:

Linux

To uninstall the AWS CLI version 2, run the following commands.

1. Locate the symlink and install paths.

- Use the `which` command to find the symlink. This shows the path you used with the `--bin-dir` parameter.

```
$ which aws
/usr/local/bin/aws
```

- Use the `ls` command to find the directory that the symlink points to. This gives you the path you used with the `--install-dir` parameter.

```
$ ls -l /usr/local/bin/aws
lrwxrwxrwx 1 ec2-user ec2-user 49 Oct 22 09:49 /usr/local/bin/aws -> /usr/local/
aws-cli/v2/current/bin/aws
```

2. Delete the two symlinks in the `--bin-dir` directory. If your user has write permission to these directories, you don't need to use `sudo`.

```
$ sudo rm /usr/local/bin/aws
$ sudo rm /usr/local/bin/aws_completer
```

3. Delete the `--install-dir` directory. If your user has write permission to this directory, you don't need to use `sudo`.

```
$ sudo rm -rf /usr/local/aws-cli
```

4. **(Optional)** Remove the shared AWS SDK and AWS CLI settings information in the `.aws` folder.

⚠ Warning

These configuration and credentials settings are shared across all AWS SDKs and the AWS CLI. If you remove this folder, they cannot be accessed by any AWS SDKs that are still on your system.

The default location of the `.aws` folder differs between platforms, by default the folder is located in `~/.aws/`. If your user has write permission to this directory, you don't need to use `sudo`.

```
$ sudo rm -rf ~/.aws/
```

macOS

To uninstall the AWS CLI version 2, run the following commands, substituting the paths you used to install. The example commands use the default installation paths.

1. Find the folder that contains the symlinks to the main program and the completer.

```
$ which aws
/usr/local/bin/aws
```

2. Using that information, run the following command to find the installation folder that the symlinks point to.

```
$ ls -l /usr/local/bin/aws
lrwxrwxrwx 1 ec2-user ec2-user 49 Oct 22 09:49 /usr/local/bin/aws -> /usr/local/
aws-cli/aws
```

3. Delete the two symlinks in the first folder. If your user already has write permission to these folders, you don't need to use `sudo`.

```
$ sudo rm /usr/local/bin/aws
$ sudo rm /usr/local/bin/aws_completer
```

4. Delete the main installation folder. Use `sudo` to gain write access to the `/usr/local` folder.

```
$ sudo rm -rf /usr/local/aws-cli
```

5. **(Optional)** Remove the shared AWS SDK and AWS CLI settings information in the `.aws` folder.

Warning

These configuration and credentials settings are shared across all AWS SDKs and the AWS CLI. If you remove this folder, they cannot be accessed by any AWS SDKs that are still on your system.

The default location of the `.aws` folder differs between platforms, by default the folder is located in `~/.aws/`. If your user has write permission to this directory, you don't need to use `sudo`.

```
$ sudo rm -rf ~/.aws/
```

Windows

1. Open **Programs and Features** by doing one of the following:
 - Open the **Control Panel**, and then choose **Programs and Features**.
 - Open a command prompt, and then enter the following command.

```
C:\> appwiz.cpl
```

2. Select the entry named **AWS Command Line Interface**, and then choose **Uninstall** to launch the uninstaller.
3. Confirm that you want to uninstall the AWS CLI.
4. **(Optional)** Remove the shared AWS SDK and AWS CLI settings information in the `.aws` folder.

⚠ Warning

These configuration and credentials settings are shared across all AWS SDKs and the AWS CLI. If you remove this folder, they cannot be accessed by any AWS SDKs that are still on your system.

The default location of the `.aws` folder differs between platforms, by default the folder is located in `%UserProfile%\.aws`.

```
$ rmdir %UserProfile%\.aws
```

Troubleshooting AWS CLI install and uninstall errors

If you come across issues after installing or uninstalling the AWS CLI, see [Troubleshoot errors](#) for troubleshooting steps. For the most relevant troubleshooting steps, see [the section called "Command not found errors"](#), [the section called "The "aws --version" command returns a different version than you installed"](#), and [the section called "The "aws --version" command returns a version after uninstalling the AWS CLI"](#).

AWS CLI user guide document history

The following table describes important additions to the *AWS Command Line Interface User Guide*, beginning in January 2019. For notification about updates to this documentation, you can subscribe to the RSS feed.

Change	Description	Date
Updated credential and authentication information.	Updated credential and authentication method instructions and examples. This includes updating relevant Getting started pages and configuration pages. To accommodate this increase in documentation, relevant credential topics were moved to the new Authentication and access credentials section.	March 31, 2023
Token provider configuration with automatic authentication refresh for AWS IAM Identity Center added	The new process to configure the AWS CLI to authenticate users with AWS IAM Identity Center (IAM Identity Center) using the SSO token provider configuration, which can automatically retrieve refreshed authentication tokens.	December 7, 2022
