
aws connect update-contact-attributes \
  --initial-contact-id 11111111-2222-3333-4444-12345678910 \
  --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \
  --attributes greetingPlayed=false

```

This command produces no output.

For more information, see [Use Amazon Connect Contact Attributes](#) in the *Amazon Connect Administrator Guide*.

- For API details, see [UpdateContactAttributes](#) in *AWS CLI Command Reference*.

update-user-hierarchy

The following code example shows how to use `update-user-hierarchy`.

AWS CLI

To update a user's hierarchy

The following `update-user-hierarchy` example updates the agent hierarchy for the specified Amazon Connect user.

```
aws connect update-user-hierarchy \  
  --hierarchy-group-id 12345678-a1b2-c3d4-e5f6-123456789abc \  
  --user-id 87654321-2222-1234-1234-111234567891 \  
  --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see [Configure Agent Settings](#) in the *Amazon Connect Administrator Guide*.

- For API details, see [UpdateUserHierarchy](#) in *AWS CLI Command Reference*.

update-user-identity-info

The following code example shows how to use `update-user-identity-info`.

AWS CLI

To update a user's identity information

The following `update-user-identity-info` example updates the identity information for the specified Amazon Connect user.

```
aws connect update-user-identity-info \  
  --identity-info FirstName=Mary,LastName=Major,Email=marym@example.com \  
  --user-id 87654321-2222-1234-1234-111234567891 \  
  --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see [Configure Agent Settings](#) in the *Amazon Connect Administrator Guide*.

- For API details, see [UpdateUserIdentityInfo](#) in *AWS CLI Command Reference*.

update-user-phone-config

The following code example shows how to use `update-user-phone-config`.

AWS CLI

To update a user's phone configuration

The following `update-user-phone-config` example updates the phone configuration for the specified user.

```
aws connect update-user-phone-config \  
  --phone-config  
  PhoneType=SOFT_PHONE,AutoAccept=false,AfterContactWorkTimeLimit=60,DeskPhoneNumber=  
+18005551212 \  
  --user-id 12345678-4444-3333-2222-111122223333 \  
  --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see [Configure Agent Settings](#) in the *Amazon Connect Administrator Guide*.

- For API details, see [UpdateUserPhoneConfig](#) in *AWS CLI Command Reference*.

update-user-routing-profile

The following code example shows how to use `update-user-routing-profile`.

AWS CLI

To update a user's routing profile

The following `update-user-routing-profile` example updates the routing profile for the specified Amazon Connect user.

```
aws connect update-user-routing-profile \  
  --routing-profile-id 12345678-1111-3333-2222-4444EXAMPLE \  
  --user-id 87654321-2222-1234-1234-111234567891 \  
  --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see [Configure Agent Settings](#) in the *Amazon Connect Administrator Guide*.

- For API details, see [UpdateUserRoutingProfile](#) in *AWS CLI Command Reference*.

update-user-security-profiles

The following code example shows how to use `update-user-security-profiles`.

AWS CLI

To update a user's security profiles

The following `update-user-security-profiles` example updates the security profile for the specified Amazon Connect user.

```
aws connect update-user-security-profiles \  
  --security-profile-ids 12345678-1234-1234-1234-1234567892111 \  
  --user-id 87654321-2222-1234-1234-111234567891 \  
  --instance-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see [Assign Permissions: Security Profiles](#) in the *Amazon Connect Administrator Guide*.

- For API details, see [UpdateUserSecurityProfiles](#) in *AWS CLI Command Reference*.

AWS Cost and Usage Report examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Cost and Usage Report.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

delete-report-definition

The following code example shows how to use `delete-report-definition`.

AWS CLI

To delete an AWS Cost and Usage Report

This example deletes an AWS Cost and Usage Report.

Command:

```
aws cur --region us-east-1 delete-report-definition --report-name "ExampleReport"
```

- For API details, see [DeleteReportDefinition](#) in *AWS CLI Command Reference*.

describe-report-definitions

The following code example shows how to use `describe-report-definitions`.

AWS CLI

To retrieve a list of AWS Cost and Usage Reports

This example describes a list of AWS Cost and Usage Reports owned by an account.

Command:

```
aws cur --region us-east-1 describe-report-definitions --max-items 5
```

Output:

```
{
  "ReportDefinitions": [
    {
      "ReportName": "ExampleReport",
```

```

    "Compression": "ZIP",
    "S3Region": "us-east-1",
    "Format": "textORcsv",
    "S3Prefix": "exampleprefix",
    "S3Bucket": "example-s3-bucket",
    "TimeUnit": "DAILY",
    "AdditionalArtifacts": [
        "REDSHIFT",
        "QUICKSIGHT"
    ],
    "AdditionalSchemaElements": [
        "RESOURCES"
    ]
  }
]
}
```

- For API details, see [DescribeReportDefinitions](#) in *AWS CLI Command Reference*.

put-report-definition

The following code example shows how to use `put-report-definition`.

AWS CLI

To create an AWS Cost and Usage Reports

The following `put-report-definition` example creates a daily AWS Cost and Usage Report that you can upload into Amazon Redshift or Amazon QuickSight.

```
aws cur put-report-definition --report-definition file://report-definition.json
```

Contents of `report-definition.json`:

```

{
  "ReportName": "ExampleReport",
  "TimeUnit": "DAILY",
  "Format": "textORcsv",
  "Compression": "ZIP",
  "AdditionalSchemaElements": [
    "RESOURCES"
  ],
}
```

```
"S3Bucket": "example-s3-bucket",
"S3Prefix": "exampleprefix",
"S3Region": "us-east-1",
"AdditionalArtifacts": [
  "REDSHIFT",
  "QUICKSIGHT"
]
```

- For API details, see [PutReportDefinition](#) in *AWS CLI Command Reference*.

Cost Explorer Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Cost Explorer Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

get-cost-and-usage

The following code example shows how to use `get-cost-and-usage`.

AWS CLI

To retrieve the S3 usage of an account for the month of September 2017

The following `get-cost-and-usage` example retrieves the S3 usage of an account for the month of September 2017.

```
aws ce get-cost-and-usage \  
  --time-period Start=2017-09-01,End=2017-10-01 \  
  --granularity MONTHLY \  
  --metrics "BlendedCost" "UnblendedCost" "UsageQuantity" \  
  --group-by Type=DIMENSION,Key=SERVICE Type=TAG,Key=Environment \  
  --filter file://filters.json
```

Contents of filters.json:

```
{  
  "Dimensions": {  
    "Key": "SERVICE",  
    "Values": [  
      "Amazon Simple Storage Service"  
    ]  
  }  
}
```

Output:

```
{  
  "GroupDefinitions": [  
    {  
      "Type": "DIMENSION",  
      "Key": "SERVICE"  
    },  
    {  
      "Type": "TAG",  
      "Key": "Environment"  
    }  
  ],  
  "ResultsByTime": [  
    {  
      "Estimated": false,  
      "TimePeriod": {  
        "Start": "2017-09-01",  
        "End": "2017-10-01"  
      },  
      "Total": {},  
      "Groups": [  
        {  
          "Keys": [  

```

get-dimension-values

The following code example shows how to use `get-dimension-values`.

AWS CLI

To retrieve the tags for the dimension SERVICE, with a value of "Elastic"

This example retrieves the tags for the dimension SERVICE, with a value of "Elastic" for January 01 2017 through May 18 2017.

Command:

```
aws ce get-dimension-values --search-string Elastic --time-period
Start=2017-01-01,End=2017-05-18 --dimension SERVICE
```

Output:

```
{
  "TotalSize": 6,
  "DimensionValues": [
    {
      "Attributes": {},
      "Value": "Amazon ElastiCache"
    },
    {
      "Attributes": {},
      "Value": "EC2 - Other"
    },
    {
      "Attributes": {},
      "Value": "Amazon Elastic Compute Cloud - Compute"
    },
    {
      "Attributes": {},
      "Value": "Amazon Elastic Load Balancing"
    },
    {
      "Attributes": {},
      "Value": "Amazon Elastic MapReduce"
    },
    {
      "Attributes": {},
```

```

        "Value": "Amazon Elasticsearch Service"
    }
],
"ReturnSize": 6
}

```

- For API details, see [GetDimensionValues](#) in *AWS CLI Command Reference*.

get-reservation-coverage

The following code example shows how to use `get-reservation-coverage`.

AWS CLI

To retrieve the reservation coverage for EC2 t2.nano instances in the us-east-1 region

This example retrieves the reservation coverage for EC2 t2.nano instances in the us-east-1 region for July-September of 2017.

Command:

```
aws ce get-reservation-coverage --time-period Start=2017-07-01,End=2017-10-01 --
group-by Type=Dimension,Key=REGION --filter file://filters.json
```

filters.json:

```

{
  "And": [
    {
      "Dimensions": {
        "Key": "INSTANCE_TYPE",
        "Values": [
          "t2.nano"
        ]
      },
      "Dimensions": {
        "Key": "REGION",
        "Values": [
          "us-east-1"
        ]
      }
    }
  ]
}

```

```

    }
  ]
}

```

Output:

```

{
  "TotalSize": 6,
  "DimensionValues": [
    {
      "Attributes": {},
      "Value": "Amazon ElastiCache"
    },
    {
      "Attributes": {},
      "Value": "EC2 - Other"
    },
    {
      "Attributes": {},
      "Value": "Amazon Elastic Compute Cloud - Compute"
    },
    {
      "Attributes": {},
      "Value": "Amazon Elastic Load Balancing"
    },
    {
      "Attributes": {},
      "Value": "Amazon Elastic MapReduce"
    },
    {
      "Attributes": {},
      "Value": "Amazon Elasticsearch Service"
    }
  ],
  "ReturnSize": 6
}

```

- For API details, see [GetReservationCoverage](#) in *AWS CLI Command Reference*.

get-reservation-purchase-recommendation

The following code example shows how to use `get-reservation-purchase-recommendation`.

AWS CLI

To retrieve the reservation recommendations for Partial Upfront EC2 RIs with a three year term

The following `get-reservation-purchase-recommendation` example retrieves recommendations for Partial Upfront EC2 instances with a three-year term, based on the last 60 days of EC2 usage.

```
aws ce get-reservation-purchase-recommendation \  
  --service "Amazon Redshift" \  
  --lookback-period-in-days SIXTY_DAYS \  
  --term-in-years THREE_YEARS \  
  --payment-option PARTIAL_UPFRONT
```

Output:

```
{  
  "Recommendations": [],  
  "Metadata": {  
    "GenerationTimestamp": "2018-08-08T15:20:57Z",  
    "RecommendationId": "00d59dde-a1ad-473f-8ff2-iexample3330b"  
  }  
}
```

- For API details, see [GetReservationPurchaseRecommendation](#) in *AWS CLI Command Reference*.

get-reservation-utilization

The following code example shows how to use `get-reservation-utilization`.

AWS CLI

To retrieve the reservation utilization for your account

The following `get-reservation-utilization` example retrieves the RI utilization for all `t2.nano` instance types from 2018-03-01 to 2018-08-01 for the account.

```
aws ce get-reservation-utilization \  
  --time-period Start=2018-03-01,End=2018-08-01 \  
  --filter file://filters.json
```

Contents of `filters.json`:

```
{
  "Dimensions": {
    "Key": "INSTANCE_TYPE",
    "Values": [
      "t2.nano"
    ]
  }
}
```

Output:

```
{
  "Total": {
    "TotalAmortizedFee": "0",
    "UtilizationPercentage": "0",
    "PurchasedHours": "0",
    "NetRISavings": "0",
    "TotalActualHours": "0",
    "AmortizedRecurringFee": "0",
    "UnusedHours": "0",
    "TotalPotentialRISavings": "0",
    "OnDemandCostOfRIHoursUsed": "0",
    "AmortizedUpfrontFee": "0"
  },
  "UtilizationsByTime": []
}
```

- For API details, see [GetReservationUtilization](#) in *AWS CLI Command Reference*.

get-tags

The following code example shows how to use `get-tags`.

AWS CLI

To retrieve keys and values for a cost allocation tag

This example retrieves all cost allocation tags with a key of "Project" and a value that contains "secretProject".

Command:

```
aws ce get-tags --search-string secretProject --time-period
Start=2017-01-01,End=2017-05-18 --tag-key Project
```

Output:

```
{
  "ReturnSize": 2,
  "Tags": [
    "secretProject1",
    "secretProject2"
  ],
  "TotalSize": 2
}
```

- For API details, see [GetTags](#) in *AWS CLI Command Reference*.

Firehose examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firehose.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

list-delivery-streams

The following code example shows how to use `list-delivery-streams`.

AWS CLI

To list the available delivery streams

The following `list-delivery-streams` example lists the available delivery streams in your AWS account.

```
aws firehose list-delivery-streams
```

Output:

```
{
  "DeliveryStreamNames": [
    "my-stream"
  ],
  "HasMoreDeliveryStreams": false
}
```

For more information, see [Creating an Amazon Kinesis Data Firehose Delivery Stream](#) in the *Amazon Kinesis Data Firehose Developer Guide*.

- For API details, see [ListDeliveryStreams](#) in *AWS CLI Command Reference*.

put-record-batch

The following code example shows how to use `put-record-batch`.

AWS CLI

To write multiple records to a stream

The following `put-record-batch` example writes three records to a stream. The data is encoded in Base64 format.

```
aws firehose put-record-batch \
  --delivery-stream-name my-stream \
  --records file://records.json
```

Contents of `myfile.json`:

```
[
```

```

    {"Data": "Rm1yc3QgdGhpbmc="},
    {"Data": "U2Vjb25kIHRoaW5n"},
    {"Data": "VGhpcmQgdGhpbmc="}
  ]

Amazon Data Lifecycle Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Data Lifecycle Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-default-role

The following code example shows how to use `create-default-role`.

AWS CLI

To create the required IAM role for Amazon DLM

The following `dlm create-default-role` example creates the `AWSDataLifecycleManagerDefaultRole` default role for managing snapshots.

```
aws dlm create-default-role \  
  --resource-type snapshot
```

This command produces no output.

For more information, see [Default service roles for Amazon Data Lifecycle Manager](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [CreateDefaultRole](#) in *AWS CLI Command Reference*.

create-lifecycle-policy

The following code example shows how to use `create-lifecycle-policy`.

AWS CLI

To create a lifecycle policy

The following `create-lifecycle-policy` example creates a lifecycle policy that creates a daily snapshot of volumes at the specified time. The specified tags are added to the snapshots, and tags are also copied from the volume and added to the snapshots. If creating a new snapshot exceeds the specified maximum count, the oldest snapshot is deleted.

```
aws dlm create-lifecycle-policy \  
  --description "My first policy" \  
  --state ENABLED \  
  --execution-role-arn arn:aws:iam::12345678910:role/  
AWSDataLifecycleManagerDefaultRole \  
  --policy-details file://policyDetails.json
```

Contents of policyDetails.json:

```
{
  "ResourceTypes": [
    "VOLUME"
  ],
  "TargetTags": [
    {
      "Key": "costCenter",
      "Value": "115"
    }
  ],
  "Schedules": [
    {
      "Name": "DailySnapshots",
      "CopyTags": true,
      "TagsToAdd": [
        {
          "Key": "type",
          "Value": "myDailySnapshot"
        }
      ],
      "CreateRule": {
        "Interval": 24,
        "IntervalUnit": "HOURS",
        "Times": [
          "03:00"
        ]
      },
      "RetainRule": {
        "Count": 5
      }
    }
  ]
}
```

Output:

```
{
  "PolicyId": "policy-0123456789abcdef0"
}
```

- For API details, see [CreateLifecyclePolicy](#) in *AWS CLI Command Reference*.

delete-lifecycle-policy

The following code example shows how to use delete-lifecycle-policy.

AWS CLI

To delete a lifecycle policy

The following example deletes the specified lifecycle policy.:

```
aws dlm delete-lifecycle-policy --policy-id policy-0123456789abcdef0
```

- For API details, see [DeleteLifecyclePolicy](#) in *AWS CLI Command Reference*.

get-lifecycle-policies

The following code example shows how to use get-lifecycle-policies.

AWS CLI

To get a summary of your lifecycle policies

The following get-lifecycle-policies example lists all of your lifecycle policies.

```
aws dlm get-lifecycle-policies
```

Output:

```
{
  "Policies": [
    {
      "PolicyId": "policy-0123456789abcdef0",
      "Description": "My first policy",
      "State": "ENABLED"
    }
  ]
}
```

- For API details, see [GetLifecyclePolicies](#) in *AWS CLI Command Reference*.

get-lifecycle-policy

The following code example shows how to use `get-lifecycle-policy`.

AWS CLI

To describe a lifecycle policy

The following `get-lifecycle-policy` example displays details for the specified lifecycle policy.

```
aws dlm get-lifecycle-policy \  
  --policy-id policy-0123456789abcdef0
```

Output:

```
{  
  "Policy": {  
    "PolicyId": "policy-0123456789abcdef0",  
    "Description": "My policy",  
    "State": "ENABLED",  
    "ExecutionRoleArn": "arn:aws:iam::123456789012:role/  
AWSDataLifecycleManagerDefaultRole",  
    "DateCreated": "2019-08-08T17:45:42Z",  
    "DateModified": "2019-08-08T17:45:42Z",  
    "PolicyDetails": {  
      "PolicyType": "EBS_SNAPSHOT_MANAGEMENT",  
      "ResourceTypes": [  
        "VOLUME"  
      ],  
      "TargetTags": [  
        {  
          "Key": "costCenter",  
          "Value": "115"  
        }  
      ],

```

- For API details, see [GetLifecyclePolicy](#) in *AWS CLI Command Reference*.

update-lifecycle-policy

The following code example shows how to use update-lifecycle-policy.

AWS CLI

Example 1: To enable a lifecycle policy

The following update-lifecycle-policy example enables the specified lifecycle policy.

```

aws dlm update-lifecycle-policy \
  --policy-id policy-0123456789abcdef0 \
  --state ENABLED

```

Example 2: To disable a lifecycle policy

The following update-lifecycle-policy example disables the specified lifecycle policy.

```

aws dlm update-lifecycle-policy \
  --policy-id policy-0123456789abcdef0 \
  --state DISABLED

```

Example 3: To update the details for lifecycle policy

The following `update-lifecycle-policy` example updates the target tags for the specified lifecycle policy.

```
aws dlm update-lifecycle-policy \  
  --policy-id policy-0123456789abcdef0 \  
  --policy-details file://policyDetails.json
```

Contents of `policyDetails.json`. Other details not referenced in this file are not changed by the command.

```
{  
  "TargetTags": [  
    {  
      "Key": "costCenter",  
      "Value": "120"  
    },  
    {  
      "Key": "project",  
      "Value": "lima"  
    }  
  ]  
}
```

- For API details, see [UpdateLifecyclePolicy](#) in *AWS CLI Command Reference*.

AWS Data Pipeline examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Data Pipeline.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

activate-pipeline

The following code example shows how to use `activate-pipeline`.

AWS CLI

To activate a pipeline

This example activates the specified pipeline:

```
aws datapipeline activate-pipeline --pipeline-id df-00627471S0VYZEXAMPLE
```

To activate the pipeline at a specific date and time, use the following command:

```
aws datapipeline activate-pipeline --pipeline-id df-00627471S0VYZEXAMPLE --start-timestamp 2015-04-07T00:00:00Z
```

- For API details, see [ActivatePipeline](#) in *AWS CLI Command Reference*.

add-tags

The following code example shows how to use `add-tags`.

AWS CLI

To add a tag to a pipeline

This example adds the specified tag to the specified pipeline:

```
aws datapipeline add-tags --pipeline-id df-00627471S0VYZEXAMPLE --tags key=environment,value=production key=owner,value=sales
```

To view the tags, use the `describe-pipelines` command. For example, the tags added in the example command appear as follows in the output for `describe-pipelines`:

```
{
  ...
  "tags": [
    {
      "value": "production",
      "key": "environment"
    },
    {
      "value": "sales",
      "key": "owner"
    }
  ]
  ...
}
```

- For API details, see [AddTags](#) in *AWS CLI Command Reference*.

create-pipeline

The following code example shows how to use create-pipeline.

AWS CLI

To create a pipeline

This example creates a pipeline:

```
aws datapipeline create-pipeline --name my-pipeline --unique-id my-pipeline-token
```

The following is example output:

```
{
  "pipelineId": "df-00627471S0VYZEXAMPLE"
}
```

- For API details, see [CreatePipeline](#) in *AWS CLI Command Reference*.

deactivate-pipeline

The following code example shows how to use deactivate-pipeline.

AWS CLI

To deactivate a pipeline

This example deactivates the specified pipeline:

```
aws datapipeline deactivate-pipeline --pipeline-id df-00627471S0VYZEXAMPLE
```

To deactivate the pipeline only after all running activities finish, use the following command:

```
aws datapipeline deactivate-pipeline --pipeline-id df-00627471S0VYZEXAMPLE --no-cancel-active
```

- For API details, see [DeactivatePipeline](#) in *AWS CLI Command Reference*.

delete-pipeline

The following code example shows how to use delete-pipeline.

AWS CLI

To delete a pipeline

This example deletes the specified pipeline:

```
aws datapipeline delete-pipeline --pipeline-id df-00627471S0VYZEXAMPLE
```

- For API details, see [DeletePipeline](#) in *AWS CLI Command Reference*.

describe-pipelines

The following code example shows how to use describe-pipelines.

AWS CLI

To describe your pipelines

This example describes the specified pipeline:

```
aws datapipeline describe-pipelines --pipeline-ids df-00627471S0VYZEXAMPLE
```

The following is example output:

```
{
  "pipelineDescriptionList": [
    {
      "fields": [
        {
          "stringValue": "PENDING",
          "key": "@pipelineState"
        },
        {
          "stringValue": "my-pipeline",
          "key": "name"
        },
        {
          "stringValue": "2015-04-07T16:05:58",
          "key": "@creationTime"
        },
        {
          "stringValue": "df-00627471S0VYZEXAMPLE",
          "key": "@id"
        },
        {
          "stringValue": "123456789012",
          "key": "pipelineCreator"
        },
        {
          "stringValue": "PIPELINE",
          "key": "@sphere"
        },
        {
          "stringValue": "123456789012",
          "key": "@userId"
        },
        {
          "stringValue": "123456789012",
          "key": "@accountId"
        },
        {
          "stringValue": "my-pipeline-token",
          "key": "uniqueId"
        }
      ],
      "pipelineId": "df-00627471S0VYZEXAMPLE",
    }
  ]
}
```

```

        "name": "my-pipeline",
        "tags": []
    }
]
}

```

- For API details, see [DescribePipelines](#) in *AWS CLI Command Reference*.

get-pipeline-definition

The following code example shows how to use `get-pipeline-definition`.

AWS CLI

To get a pipeline definition

This example gets the pipeline definition for the specified pipeline:

```
aws datapipeline get-pipeline-definition --pipeline-id df-00627471S0VYZEXAMPLE
```

The following is example output:

```

{
  "parameters": [
    {
      "type": "AWS::S3::ObjectKey",
      "id": "myS3OutputLoc",
      "description": "S3 output folder"
    },
    {
      "default": "s3://us-east-1.elasticmapreduce.samples/pig-apache-logs/data",
      "type": "AWS::S3::ObjectKey",
      "id": "myS3InputLoc",
      "description": "S3 input folder"
    },
    {
      "default": "grep -rc \"GET\" ${INPUT1_STAGING_DIR}/* >
${OUTPUT1_STAGING_DIR}/output.txt",
      "type": "String",
      "id": "myShellCmd",
      "description": "Shell command to run"
    }
  ],
}

```

```

"objects": [

}
}

```

- For API details, see [GetPipelineDefinition](#) in *AWS CLI Command Reference*.

list-pipelines

The following code example shows how to use `list-pipelines`.

AWS CLI

To list your pipelines

This example lists your pipelines:

```
aws datapipeline list-pipelines
```

The following is example output:

```
{
  "pipelineIdList": [
    {
      "id": "df-00627471S0VYZEXAMPLE",

```

```

    "name": "my-pipeline"
  },
  {
    "id": "df-09028963KNVMREXAMPLE",
    "name": "ImportDDB"
  },
  {
    "id": "df-0870198233ZYVEXAMPLE",
    "name": "CrossRegionDDB"
  },
  {
    "id": "df-00189603TB4MZEXAMPLE",
    "name": "CopyRedshift"
  }
]
}

```

- For API details, see [ListPipelines](#) in *AWS CLI Command Reference*.

list-runs

The following code example shows how to use `list-runs`.

AWS CLI

Example 1: To list your pipeline runs

The following `list-runs` example lists the runs for the specified pipeline.

```
aws datapipeline list-runs --pipeline-id df-00627471S0VYZEXAMPLE
```

Output:

Name	Scheduled Start	Status	ID
	Started		Ended

1. EC2ResourceObj	2015-04-12T17:33:02	CREATING	
@EC2ResourceObj_2015-04-12T17:33:02			2015-04-12T17:33:10
2. S3InputLocation	2015-04-12T17:33:02	FINISHED	
@S3InputLocation_2015-04-12T17:33:02			2015-04-12T17:33:09
2015-04-12T17:33:09			

```

3. S3OutputLocation          2015-04-12T17:33:02    WAITING_ON_DEPENDENCIES
   @S3OutputLocation_2015-04-12T17:33:02    2015-04-12T17:33:09
4. ShellCommandActivityObj   2015-04-12T17:33:02    WAITING_FOR_RUNNER
   @ShellCommandActivityObj_2015-04-12T17:33:02    2015-04-12T17:33:09

```

Example 2: To list the pipeline runs between the specified dates

The following `list-runs` example uses the `--start-interval` to specify the dates to include in the output.

```
aws datapipeline list-runs --pipeline-id df-01434553B58A2SHZUK05 --start-interval
2017-10-07T00:00:00,2017-10-08T00:00:00
```

- For API details, see [ListRuns](#) in *AWS CLI Command Reference*.

put-pipeline-definition

The following code example shows how to use `put-pipeline-definition`.

AWS CLI

To upload a pipeline definition

This example uploads the specified pipeline definition to the specified pipeline:

```
aws datapipeline put-pipeline-definition --pipeline-id df-00627471S0VYZEXAMPLE --
pipeline-definition file://my-pipeline-definition.json
```

The following is example output:

```
{
  "validationErrors": [],
  "errored": false,
  "validationWarnings": []
}
```

- For API details, see [PutPipelineDefinition](#) in *AWS CLI Command Reference*.

remove-tags

The following code example shows how to use `remove-tags`.

AWS CLI

To remove a tag from a pipeline

This example removes the specified tag from the specified pipeline:

```
aws datapipeline remove-tags --pipeline-id df-00627471S0VYZEXAMPLE --tag-keys
environment
```

- For API details, see [RemoveTags](#) in *AWS CLI Command Reference*.

DataSync examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DataSync.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

update-location-azure-blob

The following code example shows how to use `update-location-azure-blob`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-object-storage` example updates your DataSync location for Microsoft Azure Blob Storage with a new agent.

```
aws datasync update-location-azure-blob \  
  --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-  
abcdef01234567890 \  
  --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/  
agent-1234567890abcdef0 \  
  --sas-configuration '{ \  
    "Token": "sas-token-for-azure-blob-storage-access" \  
  }'
```

This command produces no output.

For more information, see [Replacing your agent](#) in the *AWS DataSync User Guide*.

- For API details, see [UpdateLocationAzureBlob](#) in *AWS CLI Command Reference*.

update-location-hdfs

The following code example shows how to use `update-location-hdfs`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-hdfs` example updates your DataSync HDFS location with a new agent. You only need the `--kerberos-keytab` and `--kerberos-krb5-conf` options if your HDFS cluster uses Kerberos authentication.

```
aws datasync update-location-hdfs \  
  --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-  
abcdef01234567890 \  
  --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/  
agent-1234567890abcdef0 \  
  --kerberos-keytab file://hdfs.keytab \  
  --kerberos-krb5-conf file://krb5.conf
```

Contents of `hdfs.keytab`:

N/A. The content of this file is encrypted and not human readable.

Contents of `krb5.conf`:

```
[libdefaults]
```

```
default_realm = EXAMPLE.COM

default_tkt_etypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96 des3-cbc-sha1
default_tgs_etypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96 des3-cbc-sha1
permitted_etypes = aes256-cts-hmac-sha1-96 aes128-cts-hmac-sha1-96 des3-cbc-sha1

[realms]
EXAMPLE.COM = {
    kdc = kdc1.example.com
    admin_server = krbadmin.example.com
    default_domain = example.com
}

[domain_realm]
.example.com = EXAMPLE.COM
example.com = EXAMPLE.COM

[logging]
kdc = FILE:/var/log/krb5kdc.log
admin_server = FILE:/var/log/kerberos/kadmin.log
default = FILE:/var/log/krb5libs.log
```

This command produces no output.

For more information, see [Replacing your agent](#) in the *AWS DataSync User Guide*.

- For API details, see [UpdateLocationHdfs](#) in *AWS CLI Command Reference*.

update-location-nfs

The following code example shows how to use `update-location-nfs`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-nfs` example updates your DataSync NFS location with a new agent.

```
aws datasync update-location-nfs \  
  --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-  
  abcdef01234567890 \  
  --on-prem-config AgentArns=arn:aws:datasync:us-west-2:123456789012:agent/  
  agent-1234567890abcdef0
```

This command produces no output.

For more information, see [Replacing your agent](#) in the *AWS DataSync User Guide*.

- For API details, see [UpdateLocationNfs](#) in *AWS CLI Command Reference*.

update-location-object-storage

The following code example shows how to use `update-location-object-storage`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-object-storage` example updates your DataSync object storage location with a new agent.

```
aws datasync update-location-object-storage \  
  --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-  
  abcdef01234567890 \  
  --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/  
  agent-1234567890abcdef0 \  
  --secret-key secret-key-for-object-storage
```

This command produces no output.

For more information, see [Replacing your agent](#) in the *AWS DataSync User Guide*.

- For API details, see [UpdateLocationObjectStorage](#) in *AWS CLI Command Reference*.

update-location-smb

The following code example shows how to use `update-location-smb`.

AWS CLI

To update your transfer location with a new agent

The following `update-location-smb` example updates your DataSync SMB location with a new agent.

```
aws datasync update-location-smb \  
  --location-arn arn:aws:datasync:us-west-2:123456789012:location/loc-  
abcdef01234567890 \  
  --agent-arns arn:aws:datasync:us-west-2:123456789012:agent/  
agent-1234567890abcdef0 \  
  --password smb-file-server-password
```

This command produces no output.

For more information, see [Replacing your agent](#) in the *AWS DataSync User Guide*.

- For API details, see [UpdateLocationSmb](#) in *AWS CLI Command Reference*.

DAX examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DAX.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-cluster

The following code example shows how to use `create-cluster`.

AWS CLI

To create a DAX cluster

The following `create-cluster` example creates a DAX cluster with the specified settings.

```
aws dax create-cluster \  
  --cluster-name daxcluster \  
  --node-type dax.r4.large \  
  --replication-factor 3 \  
  --iam-role-arn roleARN \  
  --sse-specification Enabled=true
```

Output:

```
{  
  "Cluster": {  
    "ClusterName": "daxcluster",  
    "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",

      "Port": 8111  
    },  
    "PreferredMaintenanceWindow": "thu:13:00-thu:14:00",  
    "SubnetGroup": "default",  
    "SecurityGroups": [  
      {  
        "SecurityGroupIdentifier": "sg-1af6e36e",  
        "Status": "active"  
      }  
    ],  
    "IamRoleArn": "arn:aws:iam::123456789012:role/  
DAXServiceRoleForDynamoDBAccess",  
    "ParameterGroup": {
```

```

        "ParameterGroupName": "default.dax1.0",
        "ParameterApplyStatus": "in-sync",
        "NodeIdsToReboot": []
    },
    "SSEDescription": {
        "Status": "ENABLED"
    }
}
}

```

For more information, see [Step 3: Create a DAX Cluster](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [CreateCluster](#) in *AWS CLI Command Reference*.

create-parameter-group

The following code example shows how to use `create-parameter-group`.

AWS CLI

To create a parameter group

The following `create-parameter-group` example creates a parameter group with the specified settings.

```

aws dax create-parameter-group \
  --parameter-group-name daxparametergroup \
  --description "A new parameter group"

```

Output:

```

{
  "ParameterGroup": {
    "ParameterGroupName": "daxparametergroup",
    "Description": "A new parameter group"
  }
}

```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [CreateParameterGroup](#) in *AWS CLI Command Reference*.

create-subnet-group

The following code example shows how to use `create-subnet-group`.

AWS CLI

To create a DAX subnet group

The following `create-subnet-group` example creates a subnet group with the specified settings.

```
aws dax create-subnet-group \  
  --subnet-group-name daxSubnetGroup \  
  --subnet-ids subnet-11111111 subnet-22222222
```

Output:

```
{  
  "SubnetGroup": {  
    "SubnetGroupName": "daxSubnetGroup",  
    "VpcId": "vpc-05a1fa8e00c325226",  
    "Subnets": [  
      {  
        "SubnetIdentifier": "subnet-11111111",  
        "SubnetAvailabilityZone": "us-west-2b"  
      },  
      {  
        "SubnetIdentifier": "subnet-22222222",  
        "SubnetAvailabilityZone": "us-west-2c"  
      }  
    ]  
  }  
}
```

For more information, see [Step 2: Create a Subnet Group](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [CreateSubnetGroup](#) in *AWS CLI Command Reference*.

decrease-replication-factor

The following code example shows how to use `decrease-replication-factor`.

AWS CLI

To remove one or more nodes from the cluster

The following `decrease-replication-factor` example decreases the number of nodes in the specified DAX cluster to one.

```
aws dax decrease-replication-factor \  
  --cluster-name daxcluster \  
  --new-replication-factor 1
```

Output:

```
{  
  "Cluster": {  
    "ClusterName": "daxcluster",  
    "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",  
    "TotalNodes": 3,  
    "ActiveNodes": 3,  
    "NodeType": "dax.r4.large",

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DecreaseReplicationFactor](#) in *AWS CLI Command Reference*.

delete-cluster

The following code example shows how to use `delete-cluster`.

AWS CLI

To delete a DAX cluster

The following `delete-cluster` example deletes the specified DAX cluster.

```
aws dax delete-cluster \  
  --cluster-name daxcluster
```

Output:

```
{  
  "Cluster": {  
    "ClusterName": "daxcluster",  
    "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",  
    "TotalNodes": 3,  
    "ActiveNodes": 0,  
    "NodeType": "dax.r4.large",  
    "Status": "deleting",  
    "ClusterDiscoveryEndpoint": {  
      "Address": "dd.eyJ3o9d.clustercfg.dax.usw2.cache.amazonaws.com",  
      "Port": 8111  
    },  
    "PreferredMaintenanceWindow": "fri:06:00-fri:07:00",  
    "SubnetGroup": "default",  
    "SecurityGroups": [  
      {  
        "SecurityGroupIdentifier": "sg-1af6e36e",  
        "Status": "active"  
      }  
    ],  
    "IamRoleArn": "arn:aws:iam::123456789012:role/  
DAXServiceRoleForDynamoDBAccess",  
    "ParameterGroup": {  
      "ParameterGroupName": "default.dax1.0",  
      "ParameterApplyStatus": "in-sync",  
      "NodeIdsToReboot": []  
    },  
    "SSEDescription": {
```

```
        "Status": "ENABLED"
      }
    }
  }
```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteCluster](#) in *AWS CLI Command Reference*.

delete-parameter-group

The following code example shows how to use `delete-parameter-group`.

AWS CLI

To delete a parameter group

The following `delete-parameter-group` example deletes the specified DAX parameter group.

```
aws dax delete-parameter-group \
  --parameter-group-name daxparametergroup
```

Output:

```
{
  "DeletionMessage": "Parameter group daxparametergroup has been deleted."
}
```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteParameterGroup](#) in *AWS CLI Command Reference*.

delete-subnet-group

The following code example shows how to use `delete-subnet-group`.

AWS CLI

To delete a subnet group

The following `delete-subnet-group` example deletes the specified DAX subnet group.

```
aws dax delete-subnet-group \  
  --subnet-group-name daxSubnetGroup
```

Output:

```
{  
  "DeletionMessage": "Subnet group daxSubnetGroup has been deleted."  
}
```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteSubnetGroup](#) in *AWS CLI Command Reference*.

describe-clusters

The following code example shows how to use `describe-clusters`.

AWS CLI**To return information about all provisioned DAX clusters**

The following `describe-clusters` example displays details about all provisioned DAX clusters.

```
aws dax describe-clusters
```

Output:

```
{  
  "Clusters": [  
    {  
      "ClusterName": "daxcluster",  
      "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",  
      "TotalNodes": 1,  
      "ActiveNodes": 1,  
      "NodeType": "dax.r4.large",  
      "Status": "available",  
      "ClusterDiscoveryEndpoint": {  
        "Address":  
"daxcluster.ey3o9d.clustercfg.dax.usw2.cache.amazonaws.com",  
        "Port": 8111  
      }  
    },  
  ],  
}
```

```

    "Nodes": [
      {
        "NodeId": "daxcluster-a",
        "Endpoint": {
          "Address": "daxcluster-
a.ey3o9d.0001.dax.usw2.cache.amazonaws.com",
          "Port": 8111
        },
        "NodeCreateTime": 1576625059.509,
        "AvailabilityZone": "us-west-2c",
        "NodeStatus": "available",
        "ParameterGroupStatus": "in-sync"
      }
    ],
    "PreferredMaintenanceWindow": "thu:13:00-thu:14:00",
    "SubnetGroup": "default",
    "SecurityGroups": [
      {
        "SecurityGroupIdentifier": "sg-1af6e36e",
        "Status": "active"
      }
    ],
    "IamRoleArn": "arn:aws:iam::123456789012:role/
DAXServiceRoleForDynamoDBAccess",
    "ParameterGroup": {
      "ParameterGroupName": "default.dax1.0",
      "ParameterApplyStatus": "in-sync",
      "NodeIdsToReboot": []
    },
    "SSEDescription": {
      "Status": "ENABLED"
    }
  }
]
}

```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeClusters](#) in *AWS CLI Command Reference*.

describe-default-parameters

The following code example shows how to use describe-default-parameters.

AWS CLI

To return the default system parameter information for DAX

The following `describe-default-parameters` example displays the default system parameter information for DAX.

```
aws dax describe-default-parameters
```

Output:

```
{
  "Parameters": [
    {
      "ParameterName": "query-ttl-millis",
      "ParameterType": "DEFAULT",
      "ParameterValue": "300000",
      "NodeTypeSpecificValues": [],
      "Description": "Duration in milliseconds for queries to remain cached",
      "Source": "user",
      "DataType": "integer",
      "AllowedValues": "0-",
      "IsModifiable": "TRUE",
      "ChangeType": "IMMEDIATE"
    },
    {
      "ParameterName": "record-ttl-millis",
      "ParameterType": "DEFAULT",
      "ParameterValue": "300000",
      "NodeTypeSpecificValues": [],
      "Description": "Duration in milliseconds for records to remain valid in
cache (Default: 0 = infinite)",
      "Source": "user",
      "DataType": "integer",
      "AllowedValues": "0-",
      "IsModifiable": "TRUE",
      "ChangeType": "IMMEDIATE"
    }
  ]
}
```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeDefaultParameters](#) in *AWS CLI Command Reference*.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To return all events related to DAX clusters and parameter groups

The following describe-events example displays details of events that are related to DAX clusters and parameter groups.

```
aws dax describe-events
```

Output:

```
{
  "Events": [
    {
      "SourceName": "daxcluster",
      "SourceType": "CLUSTER",
      "Message": "Cluster deleted.",
      "Date": 1576702736.706
    },
    {
      "SourceName": "daxcluster",
      "SourceType": "CLUSTER",
      "Message": "Removed node daxcluster-b.",
      "Date": 1576702691.738
    },
    {
      "SourceName": "daxcluster",
      "SourceType": "CLUSTER",
      "Message": "Removed node daxcluster-a.",
      "Date": 1576702633.498
    },
    {
      "SourceName": "daxcluster",
      "SourceType": "CLUSTER",
      "Message": "Removed node daxcluster-c.",
      "Date": 1576702631.329
    }
  ]
}
```

```
    },
    {
      "SourceName": "daxcluster",
      "SourceType": "CLUSTER",
      "Message": "Cluster created.",
      "Date": 1576626560.057
    }
  ]
}
```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

describe-parameter-groups

The following code example shows how to use `describe-parameter-groups`.

AWS CLI

To describe the parameter groups defined in DAX

The following `describe-parameter-groups` example retrieves details about the parameter groups that are defined in DAX.

```
aws dax describe-parameter-groups
```

Output:

```
{
  "ParameterGroups": [
    {
      "ParameterGroupName": "default.dax1.0",
      "Description": "Default parameter group for dax1.0"
    }
  ]
}
```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeParameterGroups](#) in *AWS CLI Command Reference*.

describe-parameters

The following code example shows how to use describe-parameters.

AWS CLI

To describe the parameters defined in a DAX parameter group

The following describe-parameters example retrieves details about the parameters that are defined in the specified DAX parameter group.

```
aws dax describe-parameters \  
  --parameter-group-name default.dax1.0
```

Output:

```
{  
  "Parameters": [  
    {  
      "ParameterName": "query-ttl-millis",  
      "ParameterType": "DEFAULT",  
      "ParameterValue": "300000",  
      "NodeTypeSpecificValues": [],  
      "Description": "Duration in milliseconds for queries to remain cached",  
      "Source": "user",  
      "DataType": "integer",  
      "AllowedValues": "0-",  
      "IsModifiable": "TRUE",  
      "ChangeType": "IMMEDIATE"  
    },  
    {  
      "ParameterName": "record-ttl-millis",  
      "ParameterType": "DEFAULT",  
      "ParameterValue": "300000",  
      "NodeTypeSpecificValues": [],  
      "Description": "Duration in milliseconds for records to remain valid in  
cache (Default: 0 = infinite)",  
      "Source": "user",  
      "DataType": "integer",  
      "AllowedValues": "0-",  
      "IsModifiable": "TRUE",  
      "ChangeType": "IMMEDIATE"  
    }  
  ]  
}
```

```
]
}
```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeParameters](#) in *AWS CLI Command Reference*.

describe-subnet-groups

The following code example shows how to use describe-subnet-groups.

AWS CLI

To describe subnet groups defined in DAX

The following describe-subnet-groups example retrieves details for the subnet groups defined in DAX.

```
aws dax describe-subnet-groups
```

Output:

```
{
  "SubnetGroups": [
    {
      "SubnetGroupName": "default",
      "Description": "Default CacheSubnetGroup",
      "VpcId": "vpc-ee70a196",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-874953af",
          "SubnetAvailabilityZone": "us-west-2d"
        },
        {
          "SubnetIdentifier": "subnet-bd3d1fc4",
          "SubnetAvailabilityZone": "us-west-2a"
        },
        {
          "SubnetIdentifier": "subnet-72c2ff28",
          "SubnetAvailabilityZone": "us-west-2c"
        },
        {
          "SubnetIdentifier": "subnet-09e6aa42",
```

```

        "SubnetAvailabilityZone": "us-west-2b"
      }
    ]
  }
}

```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeSubnetGroups](#) in *AWS CLI Command Reference*.

increase-replication-factor

The following code example shows how to use `increase-replication-factor`.

AWS CLI

To increase the replication factor for a DAX cluster

The following `increase-replication-factor` example increases the specified DAX cluster's replication factor to 3.

```

aws dax increase-replication-factor \
  --cluster-name daxcluster \
  --new-replication-factor 3

```

Output:

```

{
  "Cluster": {
    "ClusterName": "daxcluster",
    "ClusterArn": "arn:aws:dax:us-west-2:123456789012:cache/daxcluster",
    "TotalNodes": 3,
    "ActiveNodes": 1,
    "NodeType": "dax.r4.large",
    "Status": "modifying",
    "ClusterDiscoveryEndpoint": {
      "Address": "daxcluster.ey3o9d.clustercfg.dax.usw2.cache.amazonaws.com",
      "Port": 8111
    },
    "Nodes": [
      {

```

```

        "NodeId": "daxcluster-a",
        "Endpoint": {
            "Address": "daxcluster-
a.ey3o9d.0001.dax.usw2.cache.amazonaws.com",
            "Port": 8111
        },
        "NodeCreateTime": 1576625059.509,
        "AvailabilityZone": "us-west-2c",
        "NodeStatus": "available",
        "ParameterGroupStatus": "in-sync"
    },
    {
        "NodeId": "daxcluster-b",
        "NodeStatus": "creating"
    },
    {
        "NodeId": "daxcluster-c",
        "NodeStatus": "creating"
    }
],
"PreferredMaintenanceWindow": "thu:13:00-thu:14:00",
"SubnetGroup": "default",
"SecurityGroups": [
    {
        "SecurityGroupIdentifier": "sg-1af6e36e",
        "Status": "active"
    }
],
"IamRoleArn": "arn:aws:iam::123456789012:role/
DAXServiceRoleForDynamoDBAccess",
"ParameterGroup": {
    "ParameterGroupName": "default.dax1.0",
    "ParameterApplyStatus": "in-sync",
    "NodeIdsToReboot": []
},
"SSEDescription": {
    "Status": "ENABLED"
}
}
}

```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [IncreaseReplicationFactor](#) in *AWS CLI Command Reference*.

list-tags

The following code example shows how to use `list-tags`.

AWS CLI

To list tags on a DAX resource

The following `list-tags` example lists the tag keys and values attached to the specified DAX cluster.

```
aws dax list-tags \  
  --resource-name arn:aws:dax:us-west-2:123456789012:cache/daxcluster
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "ClusterUsage",  
      "Value": "prod"  
    }  
  ]  
}
```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListTags](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a DAX resource

The following `tag-resource` example attaches the specified tag key name and associated value to the specified DAX cluster to describe the cluster usage.

```
aws dax tag-resource \  
  --resource-name arn:aws:dax:us-west-2:123456789012:cache/daxcluster
```

```
--resource-name arn:aws:dax:us-west-2:123456789012:cache/daxcluster \  
--tags="Key=ClusterUsage,Value=prod"
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "ClusterUsage",  
      "Value": "prod"  
    }  
  ]  
}
```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a DAX resource

The following `untag-resource` example removes the tag with the specified key name from a DAX cluster.

```
aws dax untag-resource \  
  --resource-name arn:aws:dax:us-west-2:123456789012:cache/daxcluster \  
  --tag-keys="ClusterUsage"
```

Output:

```
{  
  "Tags": []  
}
```

For more information, see [Managing DAX Clusters](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

Detective examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Detective.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

accept-invitation

The following code example shows how to use `accept-invitation`.

AWS CLI

To accept an invitation to become a member account in a behavior graph

The following `accept-invitation` example accepts an invitation to become a member account in behavior graph `arn:aws:detective:us-east-1:111122223333:graph:123412341234`.

```
aws detective accept-invitation \  
  --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

This command produces no output.

For more information, see [Responding to a behavior graph invitation](#) in the *Amazon Detective Administration Guide*.

- For API details, see [AcceptInvitation](#) in *AWS CLI Command Reference*.

create-graph

The following code example shows how to use `create-graph`.

AWS CLI

To enable Amazon Detective and create a new behavior graph

The following `create-graph` example enables Detective for the AWS account that runs the command in the Region where the command is run. A new behavior graph is created that has that account as its administrator account. The command also assigns the value `Finance` to the `Department` tag.

```
aws detective create-graph \  
  --tags '{"Department": "Finance"}'
```

Output:

```
{  
  "GraphArn": "arn:aws:detective:us-  
east-1:111122223333:graph:027c7c4610ea4aacaf0b883093cab899"  
}
```

For more information, see [Enabling Amazon Detective](#) in the *Amazon Detective Administration Guide*.

- For API details, see [CreateGraph](#) in *AWS CLI Command Reference*.

create-members

The following code example shows how to use `create-members`.

AWS CLI

To invite member accounts to a behavior graph

The following `create-members` example invites two AWS accounts to become member accounts in the behavior graph `arn:aws:detective:us-east-1:111122223333:graph:123412341234`. For each account, the request provides the AWS

account ID and the account root user email address. The request includes a custom message to insert into the invitation email.

```
aws detective create-members \  
  --accounts AccountId=444455556666,EmailAddress=mmajor@example.com  
  AccountId=123456789012,EmailAddress=jstiles@example.com \  
  --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234 \  
  --message "This is Paul Santos. I need to add your account to the data we use  
for security investigation in Amazon Detective. If you have any questions, contact  
me at psantos@example.com."
```

Output:

```
{  
  "Members": [  
    {  
      "AccountId": "444455556666",  
      "AdministratorId": "111122223333",  
      "EmailAddress": "mmajor@example.com",  
      "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",  
      "InvitedTime": 1579826107000,  
      "MasterId": "111122223333",

    }  
  ],  
  "UnprocessedAccounts": [ ]  
}
```

For more information, see [Inviting member accounts to a behavior graph](https://docs.aws.amazon.com/detective/latest/adminguide/graph-admin-add-member-accounts.html) in the *Amazon Detective Administration Guide*.

To invite member accounts without sending invitation emails

The following `create-members` example invites two AWS accounts to become member accounts in the behavior graph `arn:aws:detective:us-east-1:111122223333:graph:123412341234`. For each account, the request provides the AWS account ID and the account root user email address. The member accounts do not receive invitation emails.

```
aws detective create-members \  
  --accounts AccountId=444455556666,EmailAddress=mmajor@example.com \  
  AccountId=123456789012,EmailAddress=jstiles@example.com \  
  --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234 \  
  --disable-email-notification
```

Output:

```
{  
  "Members": [  
    {  
      "AccountId": "444455556666",  
      "AdministratorId": "111122223333",  
      "EmailAddress": "mmajor@example.com",  
      "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",  
      "InvitedTime": 1579826107000,  
      "MasterId": "111122223333",  
      "Status": "INVITED",  
      "UpdatedTime": 1579826107000  
    },  
    {  
      "AccountId": "123456789012",  
      "AdministratorId": "111122223333",  
      "EmailAddress": "jstiles@example.com",  
      "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",  
      "InvitedTime": 1579826107000,  
      "MasterId": "111122223333",  
      "Status": "VERIFICATION_IN_PROGRESS",  
      "UpdatedTime": 1579826107000  
    }  
  ],  
  "UnprocessedAccounts": [ ]  
}
```

For more information, see [Inviting member accounts to a behavior graph](https://docs.aws.amazon.com/detective/latest/adminguide/graph-admin-add-member-accounts.html) in the *Amazon Detective Administration Guide*.

- For API details, see [CreateMembers](#) in *AWS CLI Command Reference*.

delete-graph

The following code example shows how to use `delete-graph`.

AWS CLI

To disable Detective and delete the behavior graph

The following `delete-graph` example disables Detective and deletes the specified behavior graph.

```
aws detective delete-graph \  
  --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

This command produces no output.

For more information, see [Disabling Amazon Detective](#) in the *Amazon Detective Administration Guide*.

- For API details, see [DeleteGraph](#) in *AWS CLI Command Reference*.

delete-members

The following code example shows how to use `delete-members`.

AWS CLI

To remove member accounts from a behavior graph

The following `delete-members` example removes two member accounts from the behavior graph `arn:aws:detective:us-east-1:111122223333:graph:123412341234`. To identify the accounts, the request provides the AWS account IDs.

```
aws detective delete-members \  
  --account-ids 444455556666 123456789012 \  
  --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

Output:

```
{
  "AccountIds": [ "444455556666", "123456789012" ],
  "UnprocessedAccounts": [ ]
}
```

For more information, see Removing member accounts from a behavior graph<<https://docs.aws.amazon.com/detective/latest/adminguide/graph-admin-remove-member-accounts.html>> in the *Amazon Detective Administration Guide*.

- For API details, see [DeleteMembers](#) in *AWS CLI Command Reference*.

disassociate-membership

The following code example shows how to use `disassociate-membership`.

AWS CLI**To resign membership from a behavior graph**

The following `disassociate-membership` example removes the AWS account that runs the command from the behavior graph `arn:aws:detective:us-east-1:111122223333:graph:123412341234`.

```
aws detective disassociate-membership \
  --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

For more information, see Removing your account from a behavior graph<<https://docs.aws.amazon.com/detective/latest/adminguide/member-remove-self-from-graph.html>> in the *Amazon Detective Administration Guide*.

- For API details, see [DisassociateMembership](#) in *AWS CLI Command Reference*.

get-members

The following code example shows how to use `get-members`.

AWS CLI**To retrieve information about selected behavior graph member accounts**

The following `get-members` example retrieves information about two member accounts in the behavior graph `arn:aws:detective:us-east-1:111122223333:graph:123412341234`. For the two accounts, the request provides the AWS account IDs.

```
aws detective get-members \  
  --account-ids 444455556666 123456789012 \  
  --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

Output:

```
{  
  "MemberDetails": [  
    {  
      "AccountId": "444455556666",  
      "AdministratorId": "111122223333",  
      "EmailAddress": "mmajor@example.com",  
      "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",  
      "InvitedTime": 1579826107000,  
      "MasterId": "111122223333",  
      "Status": "INVITED",  
      "UpdatedTime": 1579826107000  
    }  
    {  
      "AccountId": "123456789012",  
      "AdministratorId": "111122223333",  
      "EmailAddress": "jstiles@example.com",  
      "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",  
      "InvitedTime": 1579826107000,  
      "MasterId": "111122223333",  
      "Status": "INVITED",  
      "UpdatedTime": 1579826107000  
    }  
  ],  
  "UnprocessedAccounts": [ ]  
}
```

For more information, see [Viewing the list of accounts in a behavior graph](https://docs.aws.amazon.com/detective/latest/adminguide/graph-admin-view-accounts.html) in the *Amazon Detective Administration Guide*.

- For API details, see [GetMembers](#) in *AWS CLI Command Reference*.

list-graphs

The following code example shows how to use `list-graphs`.

AWS CLI

To view a list of behavior graphs that your account is the administrator for

The following `list-graphs` example retrieves the behavior graphs that the calling account is the administrator for within the current Region.

```
aws detective list-graphs
```

Output:

```
{
  "GraphList": [
    {
      "Arn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",
      "CreatedTime": 1579736111000
    }
  ]
}
```

- For API details, see [ListGraphs](#) in *AWS CLI Command Reference*.

list-invitations

The following code example shows how to use `list-invitations`.

AWS CLI

To view a list of behavior graphs that an account is a member of or is invited to

The following `list-invitations` example retrieves the behavior graphs that the calling account has been invited to. The results include only open and accepted invitations. They do not include rejected invitations or removed memberships.

```
aws detective list-invitations
```

Output:

```
{
  "Invitations": [
    {
      "AccountId": "444455556666",
      "AdministratorId": "111122223333",
      "EmailAddress": "mmajor@example.com",
      "GraphArn": "arn:aws:detective:us-east-1:111122223333:graph:123412341234",
      "InvitedTime": 1579826107000,
      "MasterId": "111122223333",
      "Status": "INVITED",
      "UpdateTime": 1579826107000
    }
  ]
}
```

For more information, see [Viewing your list of behavior graph invitations](https://docs.aws.amazon.com/detective/latest/adminguide/member-view-graph-invitations.html) in the *Amazon Detective Administration Guide*.

- For API details, see [ListInvitations](#) in *AWS CLI Command Reference*.

list-members

The following code example shows how to use `list-members`.

AWS CLI

To list the member accounts in a behavior graph

The following `list-members` example retrieves the invited and enabled member accounts for the behavior graph `arn:aws:detective:us-east-1:111122223333:graph:123412341234`. The results do not include member accounts that were removed.

```
aws detective list-members \
  --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

Output:

```
{
  "MemberDetails": [
    {
```

```

    "AccountId": "444455556666",
    "AdministratorId": "111122223333",
    "EmailAddress": "mmajor@example.com",
    "GraphArn": "arn:aws:detective:us-
east-1:111122223333:graph:123412341234",
    "InvitedTime": 1579826107000,
    "MasterId": "111122223333",
    "Status": "INVITED",
    "UpdatedTime": 1579826107000
  },
  {
    "AccountId": "123456789012",
    "AdministratorId": "111122223333",
    "EmailAddress": "jstiles@example.com",
    "GraphArn": "arn:aws:detective:us-
east-1:111122223333:graph:123412341234",
    "InvitedTime": 1579826107000,
    "MasterId": "111122223333",
    "PercentOfGraphUtilization": 2,
    "PercentOfGraphUtilizationUpdatedTime": 1586287843,
    "Status": "ENABLED",
    "UpdatedTime": 1579973711000,
    "VolumeUsageInBytes": 200,
    "VolumeUsageUpdatedTime": 1586287843
  }
]
}

```

For more information, see [Viewing the list of accounts in a behavior graph](#) in the *Amazon Detective Administration Guide*.

- For API details, see [ListMembers](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve the tags assigned to a behavior graph

The following `list-tags-for-resource` example returns the tags assigned to the specified behavior graph.

```
aws detective list-tags-for-resource \  
  --resource-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

Output:

```
{  
  "Tags": {  
    "Department" : "Finance"  
  }  
}
```

For more information, see [Managing tags for a behavior graph](#) in the *Amazon Detective Administration Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

reject-invitation

The following code example shows how to use `reject-invitation`.

AWS CLI

To reject an invitation to become a member account in a behavior graph

The following `reject-invitation` example rejects an invitation to become a member account in the behavior graph `arn:aws:detective:us-east-1:111122223333:graph:123412341234`.

```
aws detective reject-invitation \  
  --graph-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234
```

This command produces no output.

For more information, see [Responding to a behavior graph invitation](https://docs.aws.amazon.com/detective/latest/adminguide/member-invitation-response.html) in the *Amazon Detective Administration Guide*.

- For API details, see [RejectInvitation](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To assign a tag to a resource

The following `tag-resource` example assigns a value for the Department tag to the specified behavior graph.

```
aws detective tag-resource \  
  --resource-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234 \  
  --tags '{"Department":"Finance"}'
```

This command produces no output.

For more information, see [Managing tags for a behavior graph](#) in the *Amazon Detective Administration Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag value from a resource

The following `untag-resource` example removes the Department tag from the specified behavior graph.

```
aws detective untag-resource \  
  --resource-arn arn:aws:detective:us-east-1:111122223333:graph:123412341234 \  
  --tag-keys "Department"
```

This command produces no output.

For more information, see [Managing tags for a behavior graph](#) in the *Amazon Detective Administration Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

Device Farm examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Device Farm.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-device-pool

The following code example shows how to use `create-device-pool`.

AWS CLI

To create a device pool

The following command creates an Android device pool for a project:

```
aws devicefarm create-device-pool --name pool1 --rules file://  
device-pool-rules.json --project-arn "arn:aws:devicefarm:us-  
west-2:123456789012:project:070fc3ca-7ec1-4741-9c1f-d3e044efc506"
```

You can get the project ARN from the output of `create-project` or `list-projects`. The file `device-pool-rules.json` is a JSON document in the current folder that specifies the device platform:

```
[  
  {  
    "attribute": "PLATFORM",
```

```
    "operator": "EQUALS",
    "value": "\"ANDROID\""
  }
]
```

Output:

```
{
  "devicePool": {
    "rules": [
      {
        "operator": "EQUALS",
        "attribute": "PLATFORM",
        "value": "\"ANDROID\""
      }
    ],
    "type": "PRIVATE",
    "name": "pool1",
    "arn": "arn:aws:devicefarm:us-
west-2:123456789012:devicepool:070fc3ca-7ec1-4741-9c1f-
d3e044efc506/2aa8d2a9-5e73-47ca-b929-659cb34b7dcd"
  }
}
```

- For API details, see [CreateDevicePool](#) in *AWS CLI Command Reference*.

create-project

The following code example shows how to use create-project.

AWS CLI

To create a project

The following command creates a new project named my-project:

```
aws devicefarm create-project --name my-project
```

Output:

```
{
```

```
"project": {
  "name": "myproject",
  "arn": "arn:aws:devicefarm:us-
west-2:123456789012:project:070fc3ca-7ec1-4741-9c1f-d3e044efc506",
  "created": 1503612890.057
}
}
```

- For API details, see [CreateProject](#) in *AWS CLI Command Reference*.

create-upload

The following code example shows how to use create-upload.

AWS CLI

To create an upload

The following command creates an upload for an Android app:

```
aws devicefarm create-upload --project-arn "arn:aws:devicefarm:us-
west-2:123456789012:project:070fc3ca-7ec1-4741-9c1f-d3e044efc506" --name app.apk --
type ANDROID_APP
```

You can get the project ARN from the output of create-project or list-projects.

Output:

```
{
  "upload": {
    "status": "INITIALIZED",
    "name": "app.apk",
    "created": 1503614408.769,
    "url": "https://prod-us-west-2-uploads.s3-us-west-2.amazonaws.com/
arn%3Aaws%3Adevicefarm%3Aus-west-2%3A123456789012%3Aproject%3A070fc3ca-
c7e1-4471-91cf-d3e4efc50604/uploads/arn%3Aaws%3Adevicefarm%3Aus-
west-2%3A123456789012%3Aupload%3A070fc3ca-7ec1-4741-9c1f-d3e044efc506/dd72723a-
ae9e-4087-09e6-f4cea3599514/app.apk?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-
Date=20170824T224008Z&X-Amz-SignedHeaders=host&X-Amz-Expires=86400&X-Amz-
Credential=AKIAEXAMPLEPBUMBC3GA%2F20170824%2Fus-west-2%2Fs%2Faws4_request&X-Amz-
Signature=05050370c38894ef5bd09f5d009f36fc8f96fa4bb04e1bba9aca71b8dbe49a0f",
    "type": "ANDROID_APP",
```

```

    "arn": "arn:aws:devicefarm:us-
west-2:123456789012:upload:070fc3ca-7ec1-4741-9c1f-d3e044efc506/dd72723a-
ae9e-4087-09e6-f4cea3599514"
  }
}

```

Use the signed URL in the output to upload a file to Device Farm:

```

curl -T app.apk "https://prod-us-west-2-uploads.s3-us-west-2.amazonaws.com/
arn%3Aaws%3Adevicefarm%3Aus-west-2%3A123456789012%3Aproject%3A070fc3ca-
c7e1-4471-91cf-d3e4efc50604/uploads/arn%3Aaws%3Adevicefarm%3Aus-
west-2%3A123456789012%3Aupload%3A070fc3ca-7ec1-4741-9c1f-d3e044efc506/dd72723a-
ae9e-4087-09e6-f4cea3599514/app.apk?X-Amz-Algorithm=AWS4-HMAC-SHA256&X-Amz-
Date=20170824T224008Z&X-Amz-SignedHeaders=host&X-Amz-Expires=86400&X-Amz-
Credential=AKIAEXAMPLEBUMBC3GA%2F20170824%2Fus-west-2%2Fs%2Faws4_request&X-Amz-
Signature=05050370c38894ef5bd09f5d009f36fc8f96fa4bb04e1bba9aca71b8dbe49a0f"

```

- For API details, see [CreateUpload](#) in *AWS CLI Command Reference*.

get-upload

The following code example shows how to use `get-upload`.

AWS CLI

To view an upload

The following command retrieves information about an upload:

```

aws devicefarm get-upload --arn "arn:aws:devicefarm:us-
west-2:123456789012:upload:070fc3ca-7ec1-4741-9c1f-d3e044efc506/dd72723a-
ae9e-4087-09e6-f4cea3599514"

```

You can get the upload ARN from the output of `create-upload`.

Output:

```

{
  "upload": {
    "status": "SUCCEEDED",
    "name": "app.apk",
    "created": 1505262773.186,

```

```

    "type": "ANDROID_APP",
    "arn": "arn:aws:devicefarm:us-
west-2:123456789012:upload:070fc3ca-7ec1-4741-9c1f-d3e044efc506/dd72723a-
ae9e-4087-09e6-f4cea3599514",
    "metadata": "{\\"device_admin\\":false,\\"activity_name\\":
\\"ccom.example.client.LauncherActivity\\",\\"version_name\\":\\"1.0.2.94\\",\\"screens
\\":[\\"small\\",\\"normal\\",\\"large\\",\\"xlarge\\"],\\"error_type\\":null,\\"sdk_version

\\"native_code\\":[\\"armeabi-v7a\\"],\\"target_sdk_version\\":\\"25\\"}"
  }
}

```

- For API details, see [GetUpload](#) in *AWS CLI Command Reference*.

list-projects

The following code example shows how to use `list-projects`.

AWS CLI

To list projects

The following retrieves a list of projects:

```
aws devicefarm list-projects
```

Output:

```

{
  "projects": [
    {
      "name": "myproject",
      "arn": "arn:aws:devicefarm:us-
west-2:123456789012:project:070fc3ca-7ec1-4741-9c1f-d3e044efc506",
      "created": 1503612890.057
    },
    {
      "name": "otherproject",
      "arn": "arn:aws:devicefarm:us-
west-2:123456789012:project:a5f5b752-8098-49d1-86bf-5f7682c1c77e",
      "created": 1505257519.337
    }
  ]
}

```

```
}
```

- For API details, see [ListProjects](#) in *AWS CLI Command Reference*.

AWS Direct Connect examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Direct Connect.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

accept-direct-connect-gateway-association-proposal

The following code example shows how to use `accept-direct-connect-gateway-association-proposal`.

AWS CLI

To accept a gateway association proposal

The following `accept-direct-connect-gateway-association-proposal` accepts the specified proposal.

```
aws directconnect accept-direct-connect-gateway-association-proposal \  
  --direct-connect-gateway-id 11460968-4ac1-4fd3-bdb2-00599EXAMPLE \  
  --proposal-id cb7f41cb-8128-43a5-93b1-dcaedEXAMPLE \  
  --associated-gateway-owner-account 111122223333
```

```
{
  "directConnectGatewayAssociation": {
    "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
    "directConnectGatewayOwnerAccount": "111122223333",
    "associationState": "associating",
    "associatedGateway": {
      "id": "tgw-02f776b1a7EXAMPLE",
      "type": "transitGateway",
      "ownerAccount": "111122223333",
      "region": "us-east-1"
    },
    "associationId": "6441f8bf-5917-4279-ade1-9708bEXAMPLE",
    "allowedPrefixesToDirectConnectGateway": [
      {
        "cidr": "192.168.1.0/30"
      }
    ]
  }
}
```

For more information, see [Accepting or Rejecting a Transit Gateway Association Proposal](#) in the *AWS Direct Connect User Guide*.

- For API details, see [AcceptDirectConnectGatewayAssociationProposal](#) in *AWS CLI Command Reference*.

allocate-connection-on-interconnect

The following code example shows how to use `allocate-connection-on-interconnect`.

AWS CLI

To create a hosted connection on an interconnect

The following `allocate-connection-on-interconnect` command creates a hosted connection on an interconnect:

```
aws directconnect allocate-connection-on-interconnect --bandwidth 500Mbps --
connection-name mydcinterconnect --owner-account 123456789012 --interconnect-id
dxcon-fgktov66 --vlan 101
```

Output:

```
{
  "partnerName": "TIVIT",
  "vlan": 101,
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-ffzc51m1",
  "connectionState": "ordering",
  "bandwidth": "500Mbps",
  "location": "TIVIT",
  "connectionName": "mydcinterconnect",
  "region": "sa-east-1"
}
```

- For API details, see [AllocateConnectionOnInterconnect](#) in *AWS CLI Command Reference*.

allocate-hosted-connection

The following code example shows how to use `allocate-hosted-connection`.

AWS CLI

To create a hosted connection on an interconnect

The following `allocate-hosted-connection` example creates a hosted connection on the specified interconnect.

```
aws directconnect allocate-hosted-connection \
  --bandwidth 500Mbps \
  --connection-name mydcinterconnect \
  --owner-account 123456789012
-connection-id dxcon-fgktov66
-vlan 101
```

Output:

```
{
  "partnerName": "TIVIT",
  "vlan": 101,
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-ffzc51m1",
  "connectionState": "ordering",
  "bandwidth": "500Mbps",
```

```

    "location": "TIVIT",
    "connectionName": "mydcinterconnect",
    "region": "sa-east-1"
  }

```

- For API details, see [AllocateHostedConnection](#) in *AWS CLI Command Reference*.

allocate-private-virtual-interface

The following code example shows how to use `allocate-private-virtual-interface`.

AWS CLI

To provision a private virtual interface

The following `allocate-private-virtual-interface` command provisions a private virtual interface to be owned by a different customer:

```

aws directconnect allocate-private-virtual-interface --connection-id dxcon-
ffjrnx17 --owner-account 123456789012 --new-private-virtual-interface-allocation
virtualInterfaceName=PrivateVirtualInterface,vlan=1000,asn=65000,authKey=asdf34example,amaz

```

Output:

```

{
  "virtualInterfaceState": "confirming",
  "asn": 65000,
  "vlan": 1000,
  "customerAddress": "192.168.1.2/30",
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-ffjrnx17",
  "virtualInterfaceId": "dxvif-fgy8orxu",
  "authKey": "asdf34example",
  "routeFilterPrefixes": [],
  "location": "TIVIT",
  "customerRouterConfig": "<?xml version=\"1.0\" encoding=\"UTF-8\"?
>\n <logical_connection id=\"dxvif-fgy8orxu\">\n <vlan>1000</
vlan>\n <customer_address>192.168.1.2/30</customer_address>\n
<amazon_address>192.168.1.1/30</amazon_address>\n <bgp_asn>65000</bgp_asn>\n
<bgp_auth_key>asdf34example</bgp_auth_key>\n <amazon_bgp_asn>7224</amazon_bgp_asn>
\n <connection_type>private</connection_type>\n</logical_connection>\n",
  "amazonAddress": "192.168.1.1/30",

```

```

    "virtualInterfaceType": "private",
    "virtualInterfaceName": "PrivateVirtualInterface"
  }

```

- For API details, see [AllocatePrivateVirtualInterface](#) in *AWS CLI Command Reference*.

allocate-public-virtual-interface

The following code example shows how to use `allocate-public-virtual-interface`.

AWS CLI

To provision a public virtual interface

The following `allocate-public-virtual-interface` command provisions a public virtual interface to be owned by a different customer:

```

aws directconnect allocate-public-virtual-interface --connection-id dxcon-
ffjrkx17 --owner-account 123456789012 --new-public-virtual-interface-allocation
  virtualInterfaceName=PublicVirtualInterface,vlan=2000,asn=65000,authKey=asdf34example,amaz
  {cidr=203.0.113.4/30}]

```

Output:

```

{
  "virtualInterfaceState": "confirming",
  "asn": 65000,
  "vlan": 2000,
  "customerAddress": "203.0.113.2/30",
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-ffjrkx17",
  "virtualInterfaceId": "dxvif-fg9xo9vp",
  "authKey": "asdf34example",
  "routeFilterPrefixes": [
    {
      "cidr": "203.0.113.0/30"
    },
    {
      "cidr": "203.0.113.4/30"
    }
  ],
  "location": "TIVIT",

```

```

    "customerRouterConfig": "<?xml version=\"1.0\" encoding=\"UTF-8\"?
>\n<logical_connection id=\"dxvif-fg9xo9vp\">\n  <vlan>2000</
vlan>\n  <customer_address>203.0.113.2/30</customer_address>\n
  <amazon_address>203.0.113.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
  <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>public</connection_type>\n</logical_connection>\n",
    "amazonAddress": "203.0.113.1/30",
    "virtualInterfaceType": "public",
    "virtualInterfaceName": "PublicVirtualInterface"
  }

```

- For API details, see [AllocatePublicVirtualInterface](#) in *AWS CLI Command Reference*.

allocate-transit-virtual-interface

The following code example shows how to use `allocate-transit-virtual-interface`.

AWS CLI

To provision a transit virtual interface to be owned by the specified AWS account

The following `allocate-transit-virtual-interface` example provisions a transit virtual interface for the specified account.

```

aws directconnect allocate-transit-virtual-interface \
  --connection-id dxlag-fEXAMPLE \
  --owner-account 123456789012 \
  --new-transit-virtual-interface-allocation "virtualInterfaceName=Example Transit
Virtual
Interface,vlan=126,asn=65110,mtu=1500,authKey=0xzxcgA9YoW9h58u8SEXAMPLE,amazonAddress=192.16

```

Output:

```

{
  "virtualInterface": {
    "ownerAccount": "123456789012",
    "virtualInterfaceId": "dxvif-fEXAMPLE",
    "location": "loc1",
    "connectionId": "dxlag-fEXAMPLE",
    "virtualInterfaceType": "transit",
    "virtualInterfaceName": "Example Transit Virtual Interface",
    "vlan": 126,

```

```

    "asn": 65110,
    "amazonSideAsn": 7224,
    "authKey": "0xzxgA9YoW9h58u8SEXAMPLE",
    "amazonAddress": "192.168.1.1/30",
    "customerAddress": "192.168.1.2/30",
    "addressFamily": "ipv4",
    "virtualInterfaceState": "confirming",

        "key": "Tag",
        "value": "Example"
      }
    ]
  }
}

```

For more information, see [Creating a Hosted Transit Virtual Interface](#) in the *AWS Direct Connect User Guide*.

- For API details, see [AllocateTransitVirtualInterface](#) in *AWS CLI Command Reference*.

associate-connection-with-lag

The following code example shows how to use `associate-connection-with-lag`.

AWS CLI

To associate a connection with a LAG

The following example associates the specified connection with the specified LAG.

Command:

```
aws directconnect associate-connection-with-lag --lag-id dxlag-fhccu14t --
connection-id dxcon-fg9607vm
```

Output:

```
{
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-fg9607vm",
  "lagId": "dxlag-fhccu14t",
  "connectionState": "requested",
  "bandwidth": "1Gbps",
  "location": "EqDC2",
  "connectionName": "Con2ForLag",
  "region": "us-east-1"
}
```

- For API details, see [AssociateConnectionWithLag](#) in *AWS CLI Command Reference*.

associate-hosted-connection

The following code example shows how to use `associate-hosted-connection`.

AWS CLI

To associate a hosted connection with a LAG

The following example associates the specified hosted connection with the specified LAG.

Command:

```
aws directconnect associate-hosted-connection --parent-connection-id dxlag-fhccu14t
--connection-id dxcon-fg9607vm
```

Output:

```
{
  "partnerName": "TIVIT",
  "vlan": 101,
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-fg9607vm",
  "lagId": "dxlag-fhccu14t",
  "connectionState": "ordering",
  "bandwidth": "500Mbps",
  "location": "TIVIT",
  "connectionName": "mydcinterconnect",
  "region": "sa-east-1"
}
```

- For API details, see [AssociateHostedConnection](#) in *AWS CLI Command Reference*.

associate-virtual-interface

The following code example shows how to use `associate-virtual-interface`.

AWS CLI

To associate a virtual interface with a connection

The following example associates the specified virtual interface with the specified LAG. Alternatively, to associate the virtual interface with a connection, specify the ID of an AWS Direct Connect connection for `--connection-id`; for example, `dxcon-ffnikghc`.

Command:

```
aws directconnect associate-virtual-interface --connection-id dxlag-ffjhj9lx --
virtual-interface-id dxvif-fgputw0j
```

Output:

```
{
  "virtualInterfaceState": "pending",
  "asn": 65000,
  "vlan": 123,
  "customerAddress": "169.254.255.2/30",
  "ownerAccount": "123456789012",
  "connectionId": "dxdlag-ffjhj9lx",
  "addressFamily": "ipv4",
  "virtualGatewayId": "vgw-38e90b51",
  "virtualInterfaceId": "dxvif-fgputw0j",
  "authKey": "0x123pK5_VBqv.UQ3kJ4123_",
  "routeFilterPrefixes": [],
  "location": "CSVA1",
  "bgpPeers": [
    {
      "bgpStatus": "down",
      "customerAddress": "169.254.255.2/30",
      "addressFamily": "ipv4",
      "authKey": "0x123pK5_VBqv.UQ3kJ4123_",
      "bgpPeerState": "deleting",
      "amazonAddress": "169.254.255.1/30",
      "asn": 65000
    },
    {
      "bgpStatus": "down",
      "customerAddress": "169.254.255.2/30",
      "addressFamily": "ipv4",
      "authKey": "0x123pK5_VBqv.UQ3kJ4123_",
      "bgpPeerState": "pending",
      "amazonAddress": "169.254.255.1/30",
      "asn": 65000
    }
  ],
  "customerRouterConfig": "<?xml version='1.0' encoding='UTF-8'?>
  <logical_connection id='dxvif-fgputw0j'>
    <vlan>123</vlan>
    <customer_address>169.254.255.2/30</customer_address>
    <amazon_address>169.254.255.1/30</amazon_address>
    <bgp_asn>65000</bgp_asn>
    <bgp_auth_key>0x123pK5_VBqv.UQ3kJ4123_</bgp_auth_key>
    <amazon_bgp_asn>7224</amazon_bgp_asn>
    <connection_type>private</connection_type>
  </logical_connection>
  ",
  "amazonAddress": "169.254.255.1/30",
  "virtualInterfaceType": "private",

```

```
"virtualInterfaceName": "VIF1A"
}
```

- For API details, see [AssociateVirtualInterface](#) in *AWS CLI Command Reference*.

confirm-connection

The following code example shows how to use `confirm-connection`.

AWS CLI

To confirm the creation of a hosted connection on an interconnect

The following `confirm-connection` command confirms the creation of a hosted connection on an interconnect:

```
aws directconnect confirm-connection --connection-id dxcon-fg2wi7hy
```

Output:

```
{
  "connectionState": "pending"
}
```

- For API details, see [ConfirmConnection](#) in *AWS CLI Command Reference*.

confirm-private-virtual-interface

The following code example shows how to use `confirm-private-virtual-interface`.

AWS CLI

To accept ownership of a private virtual interface

The following `confirm-private-virtual-interface` command accepts ownership of a private virtual interface created by another customer:

```
aws directconnect confirm-private-virtual-interface --virtual-interface-id dxvif-
fgy8orxu --virtual-gateway-id vgw-e4a47df9
```

Output:

```
{
  "virtualInterfaceState": "pending"
}
```

- For API details, see [ConfirmPrivateVirtualInterface](#) in *AWS CLI Command Reference*.

confirm-public-virtual-interface

The following code example shows how to use `confirm-public-virtual-interface`.

AWS CLI**To accept ownership of a public virtual interface**

The following `confirm-public-virtual-interface` command accepts ownership of a public virtual interface created by another customer:

```
aws directconnect confirm-public-virtual-interface --virtual-interface-id dxvif-
fg9xo9vp
```

Output:

```
{
  "virtualInterfaceState": "verifying"
}
```

- For API details, see [ConfirmPublicVirtualInterface](#) in *AWS CLI Command Reference*.

confirm-transit-virtual-interface

The following code example shows how to use `confirm-transit-virtual-interface`.

AWS CLI**To accept ownership of a transit virtual interface**

The following `confirm-transit-virtual-interface` accepts ownership of a transit virtual interface created by another customer.

```
aws directconnect confirm-transit-virtual-interface \  
  --virtual-interface-id dxvif-fEXAMPLE \  
  --direct-connect-gateway-id 4112ccf9-25e9-4111-8237-b6c5dEXAMPLE
```

Output:

```
{  
  "virtualInterfaceState": "pending"  
}
```

For more information, see [Accepting a Hosted Virtual Interface](#) in the *AWS Direct Connect User Guide*.

- For API details, see [ConfirmTransitVirtualInterface](#) in *AWS CLI Command Reference*.

create-bgp-peer

The following code example shows how to use `create-bgp-peer`.

AWS CLI

To create an IPv6 BGP peering session

The following example creates an IPv6 BGP peering session on private virtual interface `dxvif-fg1vuj3d`. The peer IPv6 addresses are automatically allocated by Amazon.

Command:

```
aws directconnect create-bgp-peer --virtual-interface-id dxvif-fg1vuj3d --new-bgp-peer asn=64600,addressFamily=ipv6
```

Output:

```
{  
  "virtualInterface": {  
    "virtualInterfaceState": "available",  
    "asn": 65000,  
    "vlan": 125,  
    "customerAddress": "169.254.255.2/30",  
    "ownerAccount": "123456789012",
```

```

}
}

```

- For API details, see [CreateBgpPeer](#) in *AWS CLI Command Reference*.

create-connection

The following code example shows how to use `create-connection`.

AWS CLI

To create a connection from your network to an AWS Direct Connect location

The following `create-connection` command creates a connection from your network to an AWS Direct Connect location:

```
aws directconnect create-connection --location TIVIT --bandwidth 1Gbps --connection-name "Connection to AWS"
```

Output:

```
{
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-fg31dyv6",
  "connectionState": "requested",
  "bandwidth": "1Gbps",
  "location": "TIVIT",
  "connectionName": "Connection to AWS",
  "region": "sa-east-1"
}
```

- For API details, see [CreateConnection](#) in *AWS CLI Command Reference*.

create-direct-connect-gateway-association-proposal

The following code example shows how to use `create-direct-connect-gateway-association-proposal`.

AWS CLI

To create a proposal to associate the specified transit gateway with the specified Direct Connect gateway

The following `create-direct-connect-gateway-association-proposal` example creates a proposal that associates the specified transit gateway with the specified Direct Connect gateway.

```
aws directconnect create-direct-connect-gateway-association-proposal \  
  --direct-connect-gateway-id 11460968-4ac1-4fd3-bdb2-00599EXAMPLE \  
  --direct-connect-gateway-owner-account 111122223333 \  
  --gateway-id tgw-02f776b1a7EXAMPLE \  
  --add-allowed-prefixes-to-direct-connect-gateway cidr=192.168.1.0/30
```

Output:

```
{  
  "directConnectGatewayAssociationProposal": {  
    "proposalId": "cb7f41cb-8128-43a5-93b1-dcaedEXAMPLE",  
    "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",  
    "directConnectGatewayOwnerAccount": "111122223333",  
    "proposalState": "requested",  
    "associatedGateway": {  
      "id": "tgw-02f776b1a7EXAMPLE",  
      "type": "transitGateway",  
      "ownerAccount": "111122223333",  
      "region": "us-east-1"  
    },  
    "requestedAllowedPrefixesToDirectConnectGateway": [  
      {  
        "cidr": "192.168.1.0/30"  
      }  
    ]  
  }  
}
```

For more information, see [Creating a Transit Gateway Association Proposal](#) in the *AWS Direct Connect User Guide*.

- For API details, see [CreateDirectConnectGatewayAssociationProposal](#) in *AWS CLI Command Reference*.

create-direct-connect-gateway-association

The following code example shows how to use `create-direct-connect-gateway-association`.

AWS CLI

To associate a virtual private gateway with a Direct Connect gateway

The following example associates virtual private gateway `vgw-6efe725e` with Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`. You must run the command in the region in which the virtual private gateway is located.

Command:

```
aws directconnect create-direct-connect-gateway-association --direct-connect-gateway-id 5f294f92-bafb-4011-916d-9b0bexample --virtual-gateway-id vgw-6efe725e
```

Output:

```
{
  "directConnectGatewayAssociation": {
    "associationState": "associating",
    "virtualGatewayOwnerAccount": "123456789012",
    "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bexample",
    "virtualGatewayId": "vgw-6efe725e",
    "virtualGatewayRegion": "us-east-2"
  }
}
```

- For API details, see [CreateDirectConnectGatewayAssociation](#) in *AWS CLI Command Reference*.

create-direct-connect-gateway

The following code example shows how to use `create-direct-connect-gateway`.

AWS CLI

To create a Direct Connect gateway

The following example creates a Direct Connect gateway with the name `DxGateway1`.

Command:

```
aws directconnect create-direct-connect-gateway --direct-connect-gateway-name "DxGateway1"
```

Output:

```
{
```

```
"directConnectGateway": {
  "amazonSideAsn": 64512,
  "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bdexample",
  "ownerAccount": "123456789012",
  "directConnectGatewayName": "DxGateway1",
  "directConnectGatewayState": "available"
}
```

- For API details, see [CreateDirectConnectGateway](#) in *AWS CLI Command Reference*.

create-interconnect

The following code example shows how to use `create-interconnect`.

AWS CLI

To create an interconnect between a partner's network and AWS

The following `create-interconnect` command creates an interconnect between an AWS Direct Connect partner's network and a specific AWS Direct Connect location:

```
aws directconnect create-interconnect --interconnect-name "1G Interconnect to AWS"
--bandwidth 1Gbps --location TIVIT
```

Output:

```
{
  "region": "sa-east-1",
  "bandwidth": "1Gbps",
  "location": "TIVIT",
  "interconnectName": "1G Interconnect to AWS",
  "interconnectId": "dxcon-fgktov66",
  "interconnectState": "requested"
}
```

- For API details, see [CreateInterconnect](#) in *AWS CLI Command Reference*.

create-lag

The following code example shows how to use `create-lag`.

AWS CLI

To create a LAG with new connections

The following example creates a LAG and requests two new AWS Direct Connect connections for the LAG with a bandwidth of 1 Gbps.

Command:

```
aws directconnect create-lag --location CSVA1 --number-of-connections 2 --
connections-bandwidth 1Gbps --lag-name 1GBLag
```

Output:

```
{
  "awsDevice": "CSVA1-23u8t1paz8iks",
  "numberOfConnections": 2,
  "lagState": "pending",
  "ownerAccount": "123456789012",
  "lagName": "1GBLag",
  "connections": [
    {
      "ownerAccount": "123456789012",
      "connectionId": "dxcon-ffqr6x5q",
      "lagId": "dxlag-ffjhj91x",
      "connectionState": "requested",
      "bandwidth": "1Gbps",
      "location": "CSVA1",
      "connectionName": "Requested Connection 1 for Lag dxlag-ffjhj91x",
      "region": "us-east-1"
    },
    {
      "ownerAccount": "123456789012",
      "connectionId": "dxcon-fflqyj95",
      "lagId": "dxlag-ffjhj91x",
      "connectionState": "requested",
      "bandwidth": "1Gbps",
      "location": "CSVA1",
      "connectionName": "Requested Connection 2 for Lag dxlag-ffjhj91x",
      "region": "us-east-1"
    }
  ],
  "lagId": "dxlag-ffjhj91x",
```

```
"minimumLinks": 0,  
"connectionsBandwidth": "1Gbps",  
"region": "us-east-1",  
"location": "CSVA1"  
}
```

To create a LAG using an existing connection

The following example creates a LAG from an existing connection in your account, and requests a second new connection for the LAG with the same bandwidth and location as the existing connection.

Command:

```
aws directconnect create-lag --location EqDC2 --number-of-connections 2 --  
connections-bandwidth 1Gbps --lag-name 2ConnLAG --connection-id dxcon-fgk145dr
```

Output:

```
{  
  "awsDevice": "EqDC2-4h6ce2r1bes6",  
  "numberOfConnections": 2,  
  "lagState": "pending",  
  "ownerAccount": "123456789012",  
  "lagName": "2ConnLAG",  
  "connections": [  
    {  
      "ownerAccount": "123456789012",  
      "connectionId": "dxcon-fh6ljcv0",  
      "lagId": "dxlag-fhccu14t",  
      "connectionState": "requested",  
      "bandwidth": "1Gbps",  
      "location": "EqDC2",  
      "connectionName": "Requested Connection 1 for Lag dxlag-fhccu14t",  
      "region": "us-east-1"  
    },  
    {  
      "ownerAccount": "123456789012",  
      "connectionId": "dxcon-fgk145dr",  
      "lagId": "dxlag-fhccu14t",  
      "connectionState": "down",  
      "bandwidth": "1Gbps",  
      "location": "EqDC2",
```

```

        "connectionName": "VAConn1",
        "region": "us-east-1"
    }
],
"lagId": "dxlag-fhccu14t",
"minimumLinks": 0,
"connectionsBandwidth": "1Gbps",
"region": "us-east-1",
"location": "EqDC2"
}

```

- For API details, see [CreateLag](#) in *AWS CLI Command Reference*.

create-private-virtual-interface

The following code example shows how to use `create-private-virtual-interface`.

AWS CLI

To create a private virtual interface

The following `create-private-virtual-interface` command creates a private virtual interface:

```

aws directconnect create-private-virtual-interface --
connection-id dxcon-ffjrnx17 --new-private-virtual-interface
virtualInterfaceName=PrivateVirtualInterface,vlan=101,asn=65000,authKey=asdf34example,amaz
aba37db6

```

Output:

```

{
  "virtualInterfaceState": "pending",
  "asn": 65000,
  "vlan": 101,
  "customerAddress": "192.168.1.2/30",
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-ffjrnx17",
  "virtualGatewayId": "vgw-aba37db6",
  "virtualInterfaceId": "dxvif-ffhkh74f",
  "authKey": "asdf34example",
  "routeFilterPrefixes": [],

```

```

    "location": "TIVIT",
    "customerRouterConfig": "<?xml version=\"1.0\" encoding=
\\\"UTF-8\\\"?>\\n<logical_connection id=\\\"dxvif-ffhkh74f\\\">\\n  <vlan>101</
vlan>\\n  <customer_address>192.168.1.2/30</customer_address>\\n
  <amazon_address>192.168.1.1/30</amazon_address>\\n  <bgp_asn>65000</bgp_asn>\\n
  <bgp_auth_key>asdf34example</bgp_auth_key>\\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\\n  <connection_type>private</connection_type>\\n</logical_connection>\\n",
    "amazonAddress": "192.168.1.1/30",
    "virtualInterfaceType": "private",
    "virtualInterfaceName": "PrivateVirtualInterface"
  }

```

- For API details, see [CreatePrivateVirtualInterface](#) in *AWS CLI Command Reference*.

create-public-virtual-interface

The following code example shows how to use create-public-virtual-interface.

AWS CLI

To create a public virtual interface

The following create-public-virtual-interface command creates a public virtual interface:

```

aws directconnect create-public-virtual-interface --
connection-id dxcon-ffjrkx17 --new-public-virtual-interface
virtualInterfaceName=PublicVirtualInterface,vlan=2000,asn=65000,authKey=asdf34example,amazonAddress=192.168.1.1/30,{cidr=203.0.113.4/30}

```

Output:

```

{
  "virtualInterfaceState": "verifying",
  "asn": 65000,
  "vlan": 2000,
  "customerAddress": "203.0.113.2/30",
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-ffjrkx17",
  "virtualInterfaceId": "dxvif-fgh0hcrk",
  "authKey": "asdf34example",
  "routeFilterPrefixes": [

```

```

    {
      "cidr": "203.0.113.0/30"
    },
    {
      "cidr": "203.0.113.4/30"
    }
  ],
  "location": "TIVIT",
  "customerRouterConfig": "<?xml version=\"1.0\" encoding=\"UTF-8\"?
>\n<logical_connection id=\"dxvif-fgh0hcrk\">\n  <vlan>2000</
vlan>\n  <customer_address>203.0.113.2/30</customer_address>\n
  <amazon_address>203.0.113.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n
  <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>
\n  <connection_type>public</connection_type>\n</logical_connection>\n",
  "amazonAddress": "203.0.113.1/30",
  "virtualInterfaceType": "public",
  "virtualInterfaceName": "PublicVirtualInterface"
}

```

- For API details, see [CreatePublicVirtualInterface](#) in *AWS CLI Command Reference*.

create-transit-virtual-interface

The following code example shows how to use `create-transit-virtual-interface`.

AWS CLI

To create a transit virtual interface

The following `create-transit-virtual-interface` example creates a transit virtual interface for the specified connection.

```

aws directconnect create-transit-virtual-interface \
  --connection-id dxlag-fEXAMPLE \
  --new-transit-virtual-interface "virtualInterfaceName=Example Transit Virtual
Interface,vlan=126,asn=65110,mtu=1500,authKey=0xxzgA9YoW9h58u8SvEXAMPLE,amazonAddress=192.1
aada-5a1baEXAMPLE,tags=[{key=Tag,value=Example}]"

```

Output:

```

{
  "virtualInterface": {

```

```

"ownerAccount": "1111222233333",
"virtualInterfaceId": "dxvif-fEXAMPLE",
"location": "loc1",

For more information, see [Creating a Transit Virtual Interface to the Direct Connect Gateway](#) in the *AWS Direct Connect User Guide*.

- For API details, see [CreateTransitVirtualInterface](#) in *AWS CLI Command Reference*.

delete-bgp-peer

The following code example shows how to use `delete-bgp-peer`.

AWS CLI

To delete a BGP peer from a virtual interface

The following example deletes the IPv6 BGP peer from virtual interface `dxvif-fg1vuj3d`.

Command:

```
aws directconnect delete-bgp-peer --virtual-interface-id dxvif-fg1vuj3d --asn 64600
--customer-address 2001:db8:1100:2f0:0:1:9cb4:4216/125
```

Output:

```
{
  "virtualInterface": {
    "virtualInterfaceState": "available",
    "asn": 65000,
    "vlan": 125,
    "customerAddress": "169.254.255.2/30",
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-fguhmq1c",
    "addressFamily": "ipv4",
    "virtualGatewayId": "vgw-f9eb0c90",
    "virtualInterfaceId": "dxvif-fg1vuj3d",
    "authKey": "0xC_ukbCerl6EYA0example",
    "routeFilterPrefixes": [],
    "location": "EqDC2",
    "bgpPeers": [

```

```

    {
      "bgpStatus": "down",
      "customerAddress": "169.254.255.2/30",
      "addressFamily": "ipv4",
      "authKey": "0xC_ukbCerl6EYA0uexample",
      "bgpPeerState": "available",
      "amazonAddress": "169.254.255.1/30",
      "asn": 65000
    },
    {
      "bgpStatus": "down",
      "customerAddress": "2001:db8:1100:2f0:0:1:9cb4:4216/125",
      "addressFamily": "ipv6",
      "authKey": "0xS27kAIU_VHPjjAexample",
      "bgpPeerState": "deleting",
      "amazonAddress": "2001:db8:1100:2f0:0:1:9cb4:4211/125",
      "asn": 64600
    }
  ],
  "customerRouterConfig": "<?xml version=\"1.0\" encoding=
  \"UTF-8\"?>\n<logical_connection id=\"dxvif-fg1vuj3d\">\n  <vlan>125</

  "virtualInterfaceName": "Test"
}
}

```

- For API details, see [DeleteBgpPeer](#) in *AWS CLI Command Reference*.

delete-connection

The following code example shows how to use delete-connection.

AWS CLI

To delete a connection

The following delete-connection command deletes the specified connection:

```
aws directconnect delete-connection --connection-id dxcon-fg31dyv6
```

Output:

```
{
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-fg31dyv6",
  "connectionState": "deleted",
  "bandwidth": "1Gbps",
  "location": "TIVIT",
  "connectionName": "Connection to AWS",
  "region": "sa-east-1"
}
```

- For API details, see [DeleteConnection](#) in *AWS CLI Command Reference*.

delete-direct-connect-gateway-association

The following code example shows how to use `delete-direct-connect-gateway-association`.

AWS CLI**To delete a Direct Connect gateway association**

The following `delete-direct-connect-gateway-association` example deletes the Direct Connect gateway association with a transit gateway that has the specified association ID.

```
aws directconnect delete-direct-connect-gateway-association --association-id
be85116d-46eb-4b43-a27a-da0c2ad648de
```

Output:

```
{
  "directConnectGatewayAssociation": {
    "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
    "directConnectGatewayOwnerAccount": "123456789012",
    "associationState": "disassociating",
    "associatedGateway": {
      "id": "tgw-095b3b0b54EXAMPLE",
      "type": "transitGateway",

```

```

        "ownerAccount": "123456789012",
        "region": "us-east-1"
    },
    "associationId": " be85116d-46eb-4b43-a27a-da0c2ad648deEXAMPLE ",
    "allowedPrefixesToDirectConnectGateway": [
        {
            "cidr": "192.0.1.0/28"
        }
    ]
}
}

```

For more information, see [Associating and Disassociating Transit Gateways](#) in the *AWS Direct Connect User Guide*.

- For API details, see [DeleteDirectConnectGatewayAssociation](#) in *AWS CLI Command Reference*.

delete-direct-connect-gateway

The following code example shows how to use `delete-direct-connect-gateway`.

AWS CLI

To delete a Direct Connect gateway

The following example deletes Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`.

Command:

```
aws directconnect delete-direct-connect-gateway --direct-connect-gateway-id
5f294f92-bafb-4011-916d-9b0bexample
```

Output:

```

{
  "directConnectGateway": {
    "amazonSideAsn": 64512,
    "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bexample",
    "ownerAccount": "123456789012",
    "directConnectGatewayName": "DxGateway1",
    "directConnectGatewayState": "deleting"
  }
}

```

```
}
```

- For API details, see [DeleteDirectConnectGateway](#) in *AWS CLI Command Reference*.

delete-interconnect

The following code example shows how to use `delete-interconnect`.

AWS CLI

To delete an interconnect

The following `delete-interconnect` command deletes the specified interconnect:

```
aws directconnect delete-interconnect --interconnect-id dxcon-fgktov66
```

Output:

```
{
  "interconnectState": "deleted"
}
```

- For API details, see [DeleteInterconnect](#) in *AWS CLI Command Reference*.

delete-lag

The following code example shows how to use `delete-lag`.

AWS CLI

To delete a LAG

The following example deletes the specified LAG.

Command:

```
aws directconnect delete-lag --lag-id dxlag-ffrhowd9
```

Output:

```
{
```

```
"awsDevice": "EqDC2-4h6ce2r1bes6",
"numberOfConnections": 0,
"lagState": "deleted",
"ownerAccount": "123456789012",
"lagName": "TestLAG",
"connections": [],
"lagId": "dxlag-ffrhowd9",
"minimumLinks": 0,
"connectionsBandwidth": "1Gbps",
"region": "us-east-1",
"location": "EqDC2"
}
```

- For API details, see [DeleteLag](#) in *AWS CLI Command Reference*.

delete-virtual-interface

The following code example shows how to use `delete-virtual-interface`.

AWS CLI

To delete a virtual interface

The following `delete-virtual-interface` command deletes the specified virtual interface:

```
aws directconnect delete-virtual-interface --virtual-interface-id dxvif-ffhkh74f
```

Output:

```
{
  "virtualInterfaceState": "deleting"
}
```

- For API details, see [DeleteVirtualInterface](#) in *AWS CLI Command Reference*.

describe-connection-loa

The following code example shows how to use `describe-connection-loa`.

AWS CLI

To describe your LOA-CFA for a connection using Linux or Mac OS X

The following example describes your LOA-CFA for connection `dxcon-fh6ayh1d`. The contents of the LOA-CFA are base64-encoded. This command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure. The final part of the command decodes the content using the `base64` utility, and sends the output to a PDF file.

```
aws directconnect describe-connection-loa --connection-id dxcon-fh6ayh1d --output
text --query loa.loaContent|base64 --decode > myLoaCfa.pdf
```

To describe your LOA-CFA for a connection using Windows

The previous example requires the use of the `base64` utility to decode the output. On a Windows computer, you can use `certutil` instead. In the following example, the first command describes your LOA-CFA for connection `dxcon-fh6ayh1d` and uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure to a file called `myLoaCfa.base64`. The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```
aws directconnect describe-connection-loa --connection-id dxcon-fh6ayh1d --output
text --query loa.loaContent > myLoaCfa.base64
```

```
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

For more information about controlling AWS CLI output, see [Controlling Command Output from the AWS Command Line Interface](#) in the *AWS Command Line Interface User Guide*.

- For API details, see [DescribeConnectionLoa](#) in *AWS CLI Command Reference*.

describe-connections-on-interconnect

The following code example shows how to use `describe-connections-on-interconnect`.

AWS CLI

To list connections on an interconnect

The following `describe-connections-on-interconnect` command lists connections that have been provisioned on the given interconnect:

```
aws directconnect describe-connections-on-interconnect --interconnect-id dxcon-
fgktov66
```

Output:

```
{
  "connections": [
    {
      "partnerName": "TIVIT",
      "vlan": 101,
      "ownerAccount": "123456789012",
      "connectionId": "dxcon-ffzc51m1",
      "connectionState": "ordering",
      "bandwidth": "500Mbps",
      "location": "TIVIT",
      "connectionName": "mydcinterconnect",
      "region": "sa-east-1"
    }
  ]
}
```

- For API details, see [DescribeConnectionsOnInterconnect](#) in *AWS CLI Command Reference*.

describe-connections

The following code example shows how to use describe-connections.

AWS CLI

To list all connections in the current region

The following describe-connections command lists all connections in the current region:

```
aws directconnect describe-connections
```

Output:

```
{
  "connections": [
    {
      "awsDevice": "EqDC2-123h49s71dabc",
      "ownerAccount": "123456789012",

```

```
    "connectionId": "dxcon-fguhmq1c",
    "lagId": "dxlag-ffrz71kw",
    "connectionState": "down",
    "bandwidth": "1Gbps",
    "location": "EqDC2",
    "connectionName": "My_Connection",
    "loaIssueTime": 1491568964.0,
    "region": "us-east-1"
  }
]
```

- For API details, see [DescribeConnections](#) in *AWS CLI Command Reference*.

describe-direct-connect-gateway-association-proposals

The following code example shows how to use `describe-direct-connect-gateway-association-proposals`.

AWS CLI

To describe your Direct Connect gateway association proposals

The following `describe-direct-connect-gateway-association-proposals` example displays details about your Direct Connect gateway association proposals.

```
aws directconnect describe-direct-connect-gateway-association-proposals
```

Output:

```
{
  "directConnectGatewayAssociationProposals": [
    {
      "proposalId": "c2ede9b4-bbc6-4d33-923c-bc4feEXAMPLE",
      "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
      "directConnectGatewayOwnerAccount": "111122223333",

describe-direct-connect-gateway-attachments

The following code example shows how to use `describe-direct-connect-gateway-attachments`.

AWS CLI

To describe Direct Connect gateway attachments

The following example describes the virtual interfaces that are attached to Direct Connect gateway `5f294f92-bafb-4011-916d-9b0bexample`.

Command:

```
aws directconnect describe-direct-connect-gateway-attachments --direct-connect-gateway-id 5f294f92-bafb-4011-916d-9b0bexample
```

Output:

```
{
  "directConnectGatewayAttachments": [
    {
      "virtualInterfaceOwnerAccount": "123456789012",
      "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bexample",
      "virtualInterfaceRegion": "us-east-2",
      "attachmentState": "attaching",
      "virtualInterfaceId": "dxvif-fg9zyabc"
    }
  ],
  "nextToken":
  "eyJ2IjoxLCJzIjoxLCJpIjoibEhXd1NpUXF5RzhoL1JyUW52S1V2QT09IiwieYyI6Im5wQjFHQ0RyQUdRS3puNnNXcU"
}
```

- For API details, see [DescribeDirectConnectGatewayAttachments](#) in *AWS CLI Command Reference*.

describe-direct-connect-gateways

The following code example shows how to use `describe-direct-connect-gateways`.

AWS CLI

To describe your Direct Connect gateways

The following example describe all of your Direct Connect gateways.

Command:

```
aws directconnect describe-direct-connect-gateways
```

Output:

```
{
  "directConnectGateways": [
    {
      "amazonSideAsn": 64512,
      "directConnectGatewayId": "cf68415c-f4ae-48f2-87a7-3b52cexample",
      "ownerAccount": "123456789012",
      "directConnectGatewayName": "DxGateway2",
      "directConnectGatewayState": "available"
    },
    {
      "amazonSideAsn": 64512,
      "directConnectGatewayId": "5f294f92-bafb-4011-916d-9b0bdexample",
      "ownerAccount": "123456789012",
      "directConnectGatewayName": "DxGateway1",
      "directConnectGatewayState": "available"
    }
  ]
}
```

- For API details, see [DescribeDirectConnectGateways](#) in *AWS CLI Command Reference*.

describe-hosted-connections

The following code example shows how to use `describe-hosted-connections`.

AWS CLI

To list connections on an interconnect

The following example lists connections that have been provisioned on the given interconnect.

Command:

```
aws directconnect describe-hosted-connections --connection-id dxcon-fgktov66
```

Output:

```
{
  "connections": [
    {
      "partnerName": "TIVIT",
      "vlan": 101,
      "ownerAccount": "123456789012",
      "connectionId": "dxcon-ffzc51m1",
      "connectionState": "ordering",
      "bandwidth": "500Mbps",
      "location": "TIVIT",
      "connectionName": "mydcinterconnect",
      "region": "sa-east-1"
    }
  ]
}
```

- For API details, see [DescribeHostedConnections](#) in *AWS CLI Command Reference*.

describe-interconnect-loa

The following code example shows how to use `describe-interconnect-loa`.

AWS CLI

To describe your LOA-CFA for an interconnect using Linux or Mac OS X

The following example describes your LOA-CFA for interconnect `dxcon-fh6ayh1d`. The contents of the LOA-CFA are base64-encoded. This command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure. The

final part of the command decodes the content using the base64 utility, and sends the output to a PDF file.

```
aws directconnect describe-interconnect-loa --interconnect-id dxcon-fh6ayh1d --output text --query loa.loaContent|base64 --decode > myLoaCfa.pdf
```

To describe your LOA-CFA for an interconnect using Windows

The previous example requires the use of the base64 utility to decode the output. On a Windows computer, you can use `certutil` instead. In the following example, the first command describes your LOA-CFA for interconnect `dxcon-fh6ayh1d` and uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure to a file called `myLoaCfa.base64`. The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```
aws directconnect describe-interconnect-loa --interconnect-id dxcon-fh6ayh1d --output text --query loa.loaContent > myLoaCfa.base64
```

```
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

For more information about controlling AWS CLI output, see [Controlling Command Output from the AWS Command Line Interface](#) in the *AWS Command Line Interface User Guide*.

- For API details, see [DescribeInterconnectLoa](#) in *AWS CLI Command Reference*.

describe-interconnects

The following code example shows how to use `describe-interconnects`.

AWS CLI

To list interconnects

The following `describe-interconnects` command lists the interconnects owned by your AWS account:

```
aws directconnect describe-interconnects
```

Output:

```
{
  "interconnects": [
    {
      "region": "sa-east-1",
      "bandwidth": "1Gbps",
      "location": "TIVIT",
      "interconnectName": "1G Interconnect to AWS",
      "interconnectId": "dxcon-fgktov66",
      "interconnectState": "down"
    }
  ]
}
```

- For API details, see [DescribeInterconnects](#) in *AWS CLI Command Reference*.

describe-lags

The following code example shows how to use `describe-lags`.

AWS CLI

To describe your LAGs

The following command describes all of your LAGs for the current region.

Command:

```
aws directconnect describe-lags
```

Output:

```
{
  "lags": [
    {
      "awsDevice": "EqDC2-19y7z3m17xpuz",
      "numberOfConnections": 2,
      "lagState": "down",
      "ownerAccount": "123456789012",
      "lagName": "DA-LAG",
      "connections": [
        {
```

```

        "ownerAccount": "123456789012",
        "connectionId": "dxcon-ffnikghc",
        "lagId": "dxlag-fgsu9erb",
        "connectionState": "requested",
        "bandwidth": "10Gbps",
        "location": "EqDC2",
        "connectionName": "Requested Connection 1 for Lag dxlag-fgsu9erb",
        "region": "us-east-1"
    },
    {
        "ownerAccount": "123456789012",
        "connectionId": "dxcon-fglgbdea",
        "lagId": "dxlag-fgsu9erb",
        "connectionState": "requested",
        "bandwidth": "10Gbps",
        "location": "EqDC2",
        "connectionName": "Requested Connection 2 for Lag dxlag-fgsu9erb",
        "region": "us-east-1"
    }
],
"lagId": "dxlag-fgsu9erb",
"minimumLinks": 0,
"connectionsBandwidth": "10Gbps",
"region": "us-east-1",
"location": "EqDC2"
}
]
}

```

- For API details, see [DescribeLags](#) in *AWS CLI Command Reference*.

describe-loa

The following code example shows how to use `describe-loa`.

AWS CLI

To describe your LOA-CFA for a connection using Linux or Mac OS X

The following example describes your LOA-CFA for connection `dxcon-fh6ayh1d`. The contents of the LOA-CFA are base64-encoded. This command uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure. The

final part of the command decodes the content using the base64 utility, and sends the output to a PDF file.

```
aws directconnect describe-loa --connection-id dxcon-fh6ayh1d --output text --query
loa.loaContent|base64 --decode > myLoaCfa.pdf
```

To describe your LOA-CFA for a connection using Windows

The previous example requires the use of the base64 utility to decode the output. On a Windows computer, you can use `certutil` instead. In the following example, the first command describes your LOA-CFA for connection `dxcon-fh6ayh1d` and uses the `--output` and `--query` parameters to control the output and extract the contents of the `loaContent` structure to a file called `myLoaCfa.base64`. The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```
aws directconnect describe-loa --connection-id dxcon-fh6ayh1d --output text --query
loa.loaContent > myLoaCfa.base64
```

```
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

For more information about controlling AWS CLI output, see [Controlling Command Output from the AWS Command Line Interface](#) in the *AWS Command Line Interface User Guide*.

- For API details, see [DescribeLoa](#) in *AWS CLI Command Reference*.

describe-locations

The following code example shows how to use `describe-locations`.

AWS CLI

To list AWS Direct Connect partners and locations

The following `describe-locations` command lists AWS Direct Connect partners and locations in the current region:

```
aws directconnect describe-locations
```

Output:

```
{
  "locations": [
    {
      "locationName": "NAP do Brasil, Barueri, Sao Paulo",
      "locationCode": "TNDB"
    },
    {
      "locationName": "Tivit - Site Transamerica (Sao Paulo)",
      "locationCode": "TIVIT"
    }
  ]
}
```

- For API details, see [DescribeLocations](#) in *AWS CLI Command Reference*.

describe-tags

The following code example shows how to use `describe-tags`.

AWS CLI

To describe tags for your AWS Direct Connect resources

The following command describes the tags for the connection `dxcon-abcabc12`.

Command:

```
aws directconnect describe-tags --resource-arns arn:aws:directconnect:us-east-1:123456789012:dxcon/dxcon-abcabc12
```

Output:

```
{
  "resourceTags": [
    {
      "resourceArn": "arn:aws:directconnect:us-east-1:123456789012:dxcon/dxcon-abcabc12",
      "tags": [
        {
          "value": "VAConnection",
          "key": "Name"
        }
      ]
    }
  ]
}
```

```
    ]
  }
]
}
```

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

describe-virtual-gateways

The following code example shows how to use `describe-virtual-gateways`.

AWS CLI

To list virtual private gateways

The following `describe-virtual-gateways` command lists virtual private gateways owned by your AWS account:

```
aws directconnect describe-virtual-gateways
```

Output:

```
{
  "virtualGateways": [
    {
      "virtualGatewayId": "vgw-aba37db6",
      "virtualGatewayState": "available"
    }
  ]
}
```

- For API details, see [DescribeVirtualGateways](#) in *AWS CLI Command Reference*.

describe-virtual-interfaces

The following code example shows how to use `describe-virtual-interfaces`.

AWS CLI

To list all virtual interfaces

The following `describe-virtual-interfaces` command lists the information about all virtual interfaces associated with your AWS account:

```
aws directconnect describe-virtual-interfaces --connection-id dxcon-ffjrkx17
```

Output:

```
{
  "virtualInterfaces": [
    {
      "virtualInterfaceState": "down",
      "asn": 65000,
      "vlan": 101,
      "customerAddress": "192.168.1.2/30",
      "ownerAccount": "123456789012",
      "connectionId": "dxcon-ffjrkx17",
      "virtualGatewayId": "vgw-aba37db6",
      "virtualInterfaceId": "dxvif-ffhkh74f",
      "authKey": "asdf34example",
      "routeFilterPrefixes": [],
      "location": "TIVIT",
      "customerRouterConfig": "<?xml version='1.0' encoding='UTF-8'?'>\n<logical_connection id='dxvif-ffhkh74f'>\n  <vlan>101</vlan>\n  <customer_address>192.168.1.2/30</customer_address>\n  <amazon_address>192.168.1.1/30</amazon_address>\n  <bgp_asn>65000</bgp_asn>\n  <bgp_auth_key>asdf34example</bgp_auth_key>\n  <amazon_bgp_asn>7224</amazon_bgp_asn>\n  <connection_type>private</connection_type>\n</logical_connection>\n",
      "amazonAddress": "192.168.1.1/30",
      "virtualInterfaceType": "private",
      "virtualInterfaceName": "PrivateVirtualInterface"
    },
    {
      "virtualInterfaceState": "verifying",
      "asn": 65000,
      "vlan": 2000,
      "customerAddress": "203.0.113.2/30",
      "ownerAccount": "123456789012",
      "connectionId": "dxcon-ffjrkx17",
      "virtualGatewayId": "",
      "virtualInterfaceId": "dxvif-fgh0hcrk",
      "authKey": "asdf34example",
      "routeFilterPrefixes": [
        {

    "amazonAddress": "203.0.113.1/30",
    "virtualInterfaceType": "public",
    "virtualInterfaceName": "PublicVirtualInterface"
  }
]
}

```

- For API details, see [DescribeVirtualInterfaces](#) in *AWS CLI Command Reference*.

disassociate-connection-from-lag

The following code example shows how to use `disassociate-connection-from-lag`.

AWS CLI

To disassociate a connection from a LAG

The following example disassociates the specified connection from the specified LAG.

Command:

```
aws directconnect disassociate-connection-from-lag --lag-id dxlag-fhccu14t --
connection-id dxcon-fg9607vm
```

Output:

```
{
  "ownerAccount": "123456789012",
```

```
"connectionId": "dxcon-fg9607vm",
"connectionState": "requested",
"bandwidth": "1Gbps",
"location": "EqDC2",
"connectionName": "Con2ForLag",
"region": "us-east-1"
}
```

- For API details, see [DisassociateConnectionFromLag](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to an AWS Direct Connect resource

The following command adds a tag with a key of `Name` and a value of `VACconnection` to the connection `dxcon-abcabc12`. If the command succeeds, no output is returned.

Command:

```
aws directconnect tag-resource --resource-arn arn:aws:directconnect:us-east-1:123456789012:dxcon/dxcon-abcabc12 --tags "key=Name,value=VACconnection"
```

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from an AWS Direct Connect resource

The following command removes the tag with the key `Name` from connection `dxcon-abcabc12`. If the command succeeds, no output is returned.

Command:

```
aws directconnect untag-resource --resource-arn arn:aws:directconnect:us-east-1:123456789012:dxcon/dxcon-abcabc12 --tag-keys Name
```

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-direct-connect-gateway-association

The following code example shows how to use `update-direct-connect-gateway-association`.

AWS CLI

To update the specified attributes of the Direct Connect gateway association

The following `update-direct-connect-gateway-association` example adds the specified CIDR block to a Direct Connect gateway association.

```
aws directconnect update-direct-connect-gateway-association \
  --association-id 820a6e4f-5374-4004-8317-3f64bEXAMPLE \
  --add-allowed-prefixes-to-direct-connect-gateway cidr=192.168.2.0/30
```

Output:

```
{
  "directConnectGatewayAssociation": {
    "directConnectGatewayId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
    "directConnectGatewayOwnerAccount": "111122223333",
    "associationState": "updating",
    "associatedGateway": {
      "id": "tgw-02f776b1a7EXAMPLE",
      "type": "transitGateway",
      "ownerAccount": "111122223333",
      "region": "us-east-1"
    },
    "associationId": "820a6e4f-5374-4004-8317-3f64bEXAMPLE",
    "allowedPrefixesToDirectConnectGateway": [
      {
        "cidr": "192.168.2.0/30"
      },
      {
        "cidr": "192.168.1.0/30"
      }
    ]
  }
}
```

```

    }
  ]
}

```

For more information, see [Working with Direct Connect Gateways](#) in the *AWS Direct Connect User Guide*.

- For API details, see [UpdateDirectConnectGatewayAssociation](#) in *AWS CLI Command Reference*.

update-lag

The following code example shows how to use `update-lag`.

AWS CLI

To update a LAG

The following example changes the name of the specified LAG.

Command:

```
aws directconnect update-lag --lag-id dxlag-ffjhj9lx --lag-name 2ConnLag
```

Output:

```
{
  "awsDevice": "CSVA1-23u8t1paz8iks",
  "numberOfConnections": 2,
  "lagState": "down",
  "ownerAccount": "123456789012",
  "lagName": "2ConnLag",
  "connections": [
    {
      "ownerAccount": "123456789012",
      "connectionId": "dxcon-fflqyj95",
      "lagId": "dxlag-ffjhj9lx",
      "connectionState": "requested",
      "bandwidth": "1Gbps",
      "location": "CSVA1",
      "connectionName": "Requested Connection 2 for Lag dxlag-ffjhj9lx",
      "region": "us-east-1"
    }
  ],
}
```

```
{
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-ffqr6x5q",
  "lagId": "dxlag-ffjhj9lx",
  "connectionState": "requested",
  "bandwidth": "1Gbps",
  "location": "CSVA1",
  "connectionName": "Requested Connection 1 for Lag dxlag-ffjhj9lx",
  "region": "us-east-1"
},
"lagId": "dxlag-ffjhj9lx",
"minimumLinks": 0,
"connectionsBandwidth": "1Gbps",
"region": "us-east-1",
"location": "CSVA1"
}
```

- For API details, see [UpdateLag](#) in *AWS CLI Command Reference*.

update-virtual-interface-attributes

The following code example shows how to use `update-virtual-interface-attributes`.

AWS CLI

To update the MTU of a virtual interface

The following `update-virtual-interface-attributes` example updates the MTU of the specified virtual interface.

```
aws directconnect update-virtual-interface-attributes \
  --virtual-interface-id dxvif-fEXAMPLE \
  --mtu 1500
```

Output:

```
{
  "ownerAccount": "1111222233333",
  "virtualInterfaceId": "dxvif-fEXAMPLE",
  "location": "loc1",
  "connectionId": "dxlag-fEXAMPLE",
```

```

AWS Directory Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Directory Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

describe-directories

The following code example shows how to use `describe-directories`.

AWS CLI

To get details about your directories

The following `describe-directories` example displays details about the specified directory.

```
aws ds describe-directories \  
  --directory-id d-a1b2c3d4e5
```

Output:

```
{  
  "DirectoryDescriptions": [  
    {  
      "DirectoryId": "d-a1b2c3d4e5",
```

```

    "Name": "mydirectory.example.com",
    "ShortName": "mydirectory",
    "Size": "Small",
    "Edition": "Standard",
    "Alias": "d-a1b2c3d4e5",
    "AccessUrl": "d-a1b2c3d4e5.awsapps.com",
    "Stage": "Active",
    "ShareStatus": "Shared",
    "ShareMethod": "HANDSHAKE",
    "ShareNotes": "These are my share notes",
    "LaunchTime": "2019-07-08T15:33:46.327000-07:00",
    "StageLastUpdatedDateTime": "2019-07-08T15:59:12.307000-07:00",
    "Type": "SharedMicrosoftAD",
    "SsoEnabled": false,
    "DesiredNumberOfDomainControllers": 0,
    "OwnerDirectoryDescription": {
      "DirectoryId": "d-b2c3d4e5f6",
      "AccountId": "123456789111",
      "DnsIpAddrs": [
        "203.113.0.248",
        "203.113.0.253"
      ],
      "VpcSettings": {
        "VpcId": "vpc-a1b2c3d4",
        "SubnetIds": [
          "subnet-a1b2c3d4",
          "subnet-d4c3b2a1"
        ],
        "AvailabilityZones": [
          "us-west-2a",
          "us-west-2c"
        ]
      }
    }
  }
}
]
}

```

- For API details, see [DescribeDirectories](#) in *AWS CLI Command Reference*.

describe-trusts

The following code example shows how to use describe-trusts.

AWS CLI

To get details about your trust relationships

The following `describe-trusts` example displays details about the trust relationships for the specified directory.

```
aws ds describe-trusts \  
  --directory-id d-a1b2c3d4e5
```

Output:

```
{  
  "Trusts": [  
    {  
      "DirectoryId": "d-a1b2c3d4e5",  
      "TrustId": "t-9a8b7c6d5e",  
      "RemoteDomainName": "other.example.com",  
      "TrustType": "Forest",  
      "TrustDirection": "Two-Way",  
      "TrustState": "Verified",  
      "CreatedDateTime": "2017-06-20T18:08:45.614000-07:00",  
      "LastUpdatedDateTime": "2019-06-04T10:52:12.410000-07:00",  
      "StateLastUpdatedDateTime": "2019-06-04T10:52:12.410000-07:00",  
      "SelectiveAuth": "Disabled"  
    }  
  ]  
}
```

- For API details, see [DescribeTrusts](#) in *AWS CLI Command Reference*.

AWS DMS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS DMS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

```
--endpoint-identifier src-endpoint \
--s3-settings file://s3-settings.json
```

Contents of s3-settings.json:

```
{
  "BucketName": "my-corp-data",
  "BucketFolder": "sourcedata",
  "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role"
}
```

Output:

```
{
  "Endpoint": {
    "EndpointIdentifier": "src-endpoint",
    "EndpointType": "SOURCE",
    "EngineName": "s3",
    "EngineDisplayName": "Amazon S3",
    "ExtraConnectionAttributes": "bucketFolder=sourcedata;bucketName=my-corp-
data;compressionType=NONE;csvDelimiter=,;csvRowDelimiter=\n;",
    "Status": "active",
    "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:GUVAFG34EECU0J6QVZ56DAHT3U",
    "SslMode": "none",
    "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
    "S3Settings": {
      "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-
role",
      "CsvRowDelimiter": "\n",
      "CsvDelimiter": ",",
      "BucketFolder": "sourcedata",
      "BucketName": "my-corp-data",
      "CompressionType": "NONE",
      "EnableStatistics": true
    }
  }
}
```

For more information, see [Working with AWS DMS Endpoints](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [CreateEndpoint](#) in *AWS CLI Command Reference*.

create-event-subscription

The following code example shows how to use `create-event-subscription`.

AWS CLI

To list event subscriptions

The following `create-event-subscription` example creates an event subscription to an Amazon SNS topic (`my-sns-topic`).

```
aws dms create-event-subscription \  
  --subscription-name my-dms-events \  
  --sns-topic-arn arn:aws:sns:us-east-1:123456789012:my-sns-topic
```

Output:

```
{  
  "EventSubscription": {  
    "CustomerAwsId": "123456789012",  
    "CustSubscriptionId": "my-dms-events",  
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:my-sns-topic",  
    "Status": "creating",  
    "SubscriptionCreationTime": "2020-05-21 21:58:38.598",  
    "Enabled": true  
  }  
}
```

For more information, see [Working with Events and Notifications](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [CreateEventSubscription](#) in *AWS CLI Command Reference*.

create-replication-instance

The following code example shows how to use `create-replication-instance`.

AWS CLI

To create a replication instance

The following `create-replication-instance` example creates a replication instance.

```
aws dms create-replication-instance \  
  --replication-instance-identifier my-repl-instance \  
  --replication-instance-class dms.t2.micro \  
  --allocated-storage 5
```

Output:

```
{  
  "ReplicationInstance": {  
    "ReplicationInstanceIdentifier": "my-repl-instance",  
    "ReplicationInstanceClass": "dms.t2.micro",  
    "ReplicationInstanceStatus": "creating",  
    "AllocatedStorage": 5,  
    "VpcSecurityGroups": [  
      {  
        "VpcSecurityGroupId": "sg-f839b688",  
        "Status": "active"  
      }  
    ],  
    "ReplicationSubnetGroup": {  
      "ReplicationSubnetGroupIdentifier": "default",  
      "ReplicationSubnetGroupDescription": "default",  
      "VpcId": "vpc-136a4c6a",  
      "SubnetGroupStatus": "Complete",  
      "Subnets": [  
        {  
          "SubnetIdentifier": "subnet-da327bf6",  
          "SubnetAvailabilityZone": {  
            "Name": "us-east-1a"  
          },  
          "SubnetStatus": "Active"  
        },  
        {  
          "SubnetIdentifier": "subnet-42599426",  
          "SubnetAvailabilityZone": {  
            "Name": "us-east-1d"  
          },  
          "SubnetStatus": "Active"  
        },  
        {  
          "SubnetIdentifier": "subnet-bac383e0",  
          "SubnetAvailabilityZone": {  
            "Name": "us-east-1c"  
          }  
        }  
      ]  
    }  
  }  
}
```

```

        },
        "SubnetStatus": "Active"
    },
    {
        "SubnetIdentifier": "subnet-6746046b",
        "SubnetAvailabilityZone": {
            "Name": "us-east-1f"
        },
        "SubnetStatus": "Active"
    },
    {
        "SubnetIdentifier": "subnet-d7c825e8",
        "SubnetAvailabilityZone": {
            "Name": "us-east-1e"
        },
        "SubnetStatus": "Active"
    },
    {
        "SubnetIdentifier": "subnet-cbfff283",
        "SubnetAvailabilityZone": {
            "Name": "us-east-1b"
        },
        "SubnetStatus": "Active"
    }
]
},
"PreferredMaintenanceWindow": "sat:12:35-sat:13:05",

"KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/f7bc0f8e-1a3a-4ace-9faa-
e8494fa3921a",
"ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:ZK2VQBUWFDBAWHIXHAYG5G2PKY",
"PubliclyAccessible": true
}
}

```

For more information, see [Working with an AWS DMS Replication Instance](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [CreateReplicationInstance](#) in *AWS CLI Command Reference*.

create-replication-subnet-group

The following code example shows how to use create-replication-subnet-group.

AWS CLI

To create a subnet group

The following create-replication-subnet-group example creates a group consisting of 3 subnets.

```
aws dms create-replication-subnet-group \  
  --replication-subnet-group-identifier my-subnet-group \  
  --replication-subnet-group-description "my subnet group" \  
  --subnet-ids subnet-da327bf6 subnet-bac383e0 subnet-d7c825e8
```

Output:

```
{  
  "ReplicationSubnetGroup": {  
    "ReplicationSubnetGroupIdentifier": "my-subnet-group",  
    "ReplicationSubnetGroupDescription": "my subnet group",  
    "VpcId": "vpc-136a4c6a",  
    "SubnetGroupStatus": "Complete",  
    "Subnets": [  
      {  
        "SubnetIdentifier": "subnet-da327bf6",  
        "SubnetAvailabilityZone": {  
          "Name": "us-east-1a"  
        },  
        "SubnetStatus": "Active"  
      },  
      {  
        "SubnetIdentifier": "subnet-bac383e0",  
        "SubnetAvailabilityZone": {  
          "Name": "us-east-1c"  
        },  
        "SubnetStatus": "Active"  
      },  
      {  
        "SubnetIdentifier": "subnet-d7c825e8",  
        "SubnetAvailabilityZone": {  
          "Name": "us-east-1e"  
        }  
      }  
    ]  
  }  
}
```

```

        },
        "SubnetStatus": "Active"
    }
]
}
}

```

For more information, see [Setting Up a Network for a Replication Instance](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [CreateReplicationSubnetGroup](#) in *AWS CLI Command Reference*.

create-replication-task

The following code example shows how to use `create-replication-task`.

AWS CLI

To create a replication task

The following `create-replication-task` example creates a replication task.

```

aws dms create-replication-task \
  --replication-task-identifier movedata \
  --source-endpoint-arn arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWGWAYUVLKIB732KEVWA \
  --target-endpoint-arn arn:aws:dms:us-
east-1:123456789012:endpoint:E0M4SFKCZEYHZBFGAGZT3QEC5U \
  --replication-instance-arn $RI_ARN \
  --migration-type full-load \
  --table-mappings file://table-mappings.json

```

Contents of `table-mappings.json`:

```

{
  "rules": [
    {
      "rule-type": "selection",
      "rule-id": "1",
      "rule-name": "1",
      "object-locator": {
        "schema-name": "prodrep",
        "table-name": "%"
      }
    }
  ]
}

```

```

        },
        "rule-action": "include",
        "filters": []
    }
]
}

```

Output:

```

{
  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWGWAYUVLKIB732KEVWA",
    "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:E0M4SFKCZEYHZBFGAGZT3QEC5U",
    "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE",
    "MigrationType": "full-load",
    "TableMappings": ...output omitted... ,
    "ReplicationTaskSettings": ...output omitted... ,
    "Status": "creating",
    "ReplicationTaskCreationDate": 1590524772.505,
    "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
  }
}

```

For more information, see [Working with AWS DMS Tasks](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [CreateReplicationTask](#) in *AWS CLI Command Reference*.

delete-connection

The following code example shows how to use `delete-connection`.

AWS CLI**To delete a connection**

The following `delete-connection` example disassociates an endpoint from a replication instance.

```
aws dms delete-connection \  
  --endpoint-arn arn:aws:dms:us-  
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA \  
  --replication-instance-arn arn:aws:dms:us-  
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE
```

Output:

```
{  
  "Connection": {  
    "ReplicationInstanceArn": "arn:aws:dms:us-  
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE",  
    "EndpointArn": "arn:aws:dms:us-  
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",  
    "Status": "deleting",  
    "EndpointIdentifier": "src-database-1",  
    "ReplicationInstanceIdentifier": "my-repl-instance"  
  }  
}
```

For more information, see https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.Creating.html in the *AWS Database Migration Service User Guide*.

- For API details, see [DeleteConnection](#) in *AWS CLI Command Reference*.

delete-endpoint

The following code example shows how to use delete-endpoint.

AWS CLI

To delete an endpoint

The following delete-endpoint example deletes an endpoint.

```
aws dms delete-endpoint \  
  --endpoint-arn arn:aws:dms:us-  
east-1:123456789012:endpoint:0UJJVX04XZ4CYTSEG5XGMN2R3Y
```

Output:

```
{
```

```

    "Endpoint": {
      "EndpointIdentifier": "src-endpoint",
      "EndpointType": "SOURCE",
      "EngineName": "s3",
      "EngineDisplayName": "Amazon S3",
      "ExtraConnectionAttributes": "bucketFolder=sourcedata;bucketName=my-corp-
data;compressionType=NONE;csvDelimiter=,;csvRowDelimiter=\\n;",
      "Status": "deleting",
      "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:0UJJVX04XZ4CYTSEG5XGMN2R3Y",
      "SslMode": "none",
      "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",
      "S3Settings": {
        "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-
role",
        "CsvRowDelimiter": "\\n",
        "CsvDelimiter": ",",
        "BucketFolder": "sourcedata",
        "BucketName": "my-corp-data",
        "CompressionType": "NONE",
        "EnableStatistics": true
      }
    }
  }
}

```

For more information, see [Working with AWS DMS Endpoints](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DeleteEndpoint](#) in *AWS CLI Command Reference*.

delete-event-subscription

The following code example shows how to use delete-event-subscription.

AWS CLI

To delete an event subscription

The following delete-event-subscription example deletes a subscription to an Amazon SNS topic.

```

aws dms delete-event-subscription \
  --subscription-name "my-dms-events"

```

Output:

```
{
  "EventSubscription": {
    "CustomerAwsId": "123456789012",
    "CustSubscriptionId": "my-dms-events",
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:my-sns-topic",
    "Status": "deleting",
    "SubscriptionCreationTime": "2020-05-21 21:58:38.598",
    "Enabled": true
  }
}
```

For more information, see [Working with Events and Notifications](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DeleteEventSubscription](#) in *AWS CLI Command Reference*.

delete-replication-instance

The following code example shows how to use `delete-replication-instance`.

AWS CLI**To delete a replication instance**

The following `delete-replication-instance` example deletes a replication instance.

```
aws dms delete-replication-instance \
  --replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
  "ReplicationInstance": {
    "ReplicationInstanceIdentifier": "my-repl-instance",
    "ReplicationInstanceClass": "dms.t2.micro",
    "ReplicationInstanceStatus": "deleting",

delete-replication-subnet-group

The following code example shows how to use delete-replication-subnet-group.

AWS CLI

To delete a subnet group

The following `delete-replication-subnet-group` example deletes a subnet group.

```
aws dms delete-replication-subnet-group \  
--replication-subnet-group-identifier my-subnet-group
```

Output:

```
(none)
```

For more information, see [Setting Up a Network for a Replication Instance](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DeleteReplicationSubnetGroup](#) in *AWS CLI Command Reference*.

delete-replication-task

The following code example shows how to use `delete-replication-task`.

AWS CLI

To delete a replication task

The following `delete-replication-task` example deletes a replication task.

```
aws dms delete-replication-task \  
--replication-task-arn arn:aws:dms:us-  
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{  
  "ReplicationTask": {  
    "ReplicationTaskIdentifier": "moveit2",  
    "SourceEndpointArn": "arn:aws:dms:us-  
east-1:123456789012:endpoint:6GGI6YPWYGAYUVLKIB732KEVWA",  
    "TargetEndpointArn": "arn:aws:dms:us-

    "ReplicationTaskStartDate": 1590789988.677,
    "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
  }
}

```

For more information, see [Working with AWS DMS Tasks](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DeleteReplicationTask](#) in *AWS CLI Command Reference*.

describe-account-attributes

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe account attributes

The following `describe-account-attributes` example lists the attributes for your AWS account.

```
aws dms describe-account-attributes
```

Output:

```

{
  "AccountQuotas": [
    {
      "AccountQuotaName": "ReplicationInstances",
      "Used": 1,
      "Max": 20
    },
    {

```

```

        "AccountQuotaName": "AllocatedStorage",
        "Used": 5,
        "Max": 10000
    },
    ...remaining output omitted...

],
"UniqueAccountIdentifier": "cqahfbfy5xee"
}

```

- For API details, see [DescribeAccountAttributes](#) in *AWS CLI Command Reference*.

describe-certificates

The following code example shows how to use describe-certificates.

AWS CLI

To list the available certificates

The following describe-certificates example lists the available certificates in your AWS account.

```
aws dms describe-certificates
```

Output:

```

{
  "Certificates": [
    {
      "CertificateIdentifier": "my-cert",
      "CertificateCreationDate": 1543259542.506,
      "CertificatePem": "-----BEGIN CERTIFICATE-----
\nMIID9DCCAtygAwIBAgIBQjANBgkqhkiG9w0BAQ ...U"

      ... remaining output omitted ...

    }
  ]
}

```

For more information, see [Using SSL](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeCertificates](#) in *AWS CLI Command Reference*.

describe-connections

The following code example shows how to use describe-connections.

AWS CLI

To describe connections

The following describe-connections example lists the connections that you have tested between a replication instance and an endpoint.

```
aws dms describe-connections
```

Output:

```
{
  "Connections": [
    {
      "Status": "successful",
      "ReplicationInstanceIdentifier": "test",
      "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:ZW5UAN6P4E77EC7YWHK4RZZ3BE",
      "EndpointIdentifier": "testsrc1",
      "ReplicationInstanceArn": "arn:aws:dms:us-east-1:123456789012:rep:6UTDJGB0US3VI3SUWA66XFJCJQ"
    }
  ]
}
```

For more information, see [Creating Source and Target Endpoints](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeConnections](#) in *AWS CLI Command Reference*.

describe-endpoint-types

The following code example shows how to use describe-endpoint-types.

AWS CLI

To list the available endpoint types

The following `describe-endpoint-types` example lists the MySQL endpoint types that are available.

```
aws dms describe-endpoint-types \  
  --filters "Name=engine-name,Values=mysql"
```

Output:

```
{  
  "SupportedEndpointTypes": [  
    {  
      "EngineName": "mysql",  
      "SupportsCDC": true,  
      "EndpointType": "source",  
      "EngineDisplayName": "MySQL"  
    },  
    {  
      "EngineName": "mysql",  
      "SupportsCDC": true,  
      "EndpointType": "target",  
      "EngineDisplayName": "MySQL"  
    }  
  ]  
}
```

For more information, see [Working with AWS DMS Endpoints](https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html) <https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html>`__ in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeEndpointTypes](#) in *AWS CLI Command Reference*.

describe-endpoints

The following code example shows how to use `describe-endpoints`.

AWS CLI

To describe endpoints

The following describe-endpoints example lists the endpoints in your AWS account.

```
aws dms describe-endpoints
```

Output:

```
{
  "Endpoints": [
    {
      "Username": "dms",
      "Status": "active",
      "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:SF2W0FLWYWKVE0HID2EKLP3SJI",
      "ServerName": "ec2-52-32-48-61.us-west-2.compute.amazonaws.com",
      "EndpointType": "SOURCE",
      "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/94d5c4e7-4e4c-44be-b58a-c8da7adf57cd",
      "DatabaseName": "test",
      "EngineName": "mysql",
      "EndpointIdentifier": "pri100",
      "Port": 8193
    },
    {
      "Username": "admin",
      "Status": "active",
      "EndpointArn": "arn:aws:dms:us-east-1:123456789012:endpoint:TJJZCIH3CJ24TJRU4VC32WEWFR",
      "ServerName": "test.example.com",
      "EndpointType": "SOURCE",
      "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/2431021b-1cf2-a2d4-77b2-59a9e4bce323",
      "DatabaseName": "EMPL",
      "EngineName": "oracle",
      "EndpointIdentifier": "test",
      "Port": 1521
    }
  ]
}
```

For more information, see [Working with AWS DMS Endpoints](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeEndpoints](#) in *AWS CLI Command Reference*.

describe-event-categories

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe event categories

The following `describe-event-categories` example lists the available event categories.

```
aws dms describe-event-categories
```

Output:

```
{
  "EventCategoryGroupList": [
    {
      "SourceType": "replication-instance",
      "EventCategories": [
        "low storage",
        "configuration change",
        "maintenance",
        "deletion",
        "creation",
        "failover",
        "failure"
      ]
    },
    {
      "SourceType": "replication-task",
      "EventCategories": [
        "configuration change",
        "state change",
        "deletion",
        "creation",
        "failure"
      ]
    }
  ]
}
```

For more information, see [Working with Events and Notifications](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeEventCategories](#) in *AWS CLI Command Reference*.

describe-event-subscriptions

The following code example shows how to use describe-event-subscriptions.

AWS CLI

To describe event subscriptions

The following describe-event-subscriptions example lists the event subscriptions to an Amazon SNS topic.

```
aws dms describe-event-subscriptions
```

Output:

```
{
  "EventSubscriptionsList": [
    {
      "CustomerAwsId": "123456789012",
      "CustSubscriptionId": "my-dms-events",
      "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:my-sns-topic",
      "Status": "deleting",
      "SubscriptionCreationTime": "2020-05-21 22:28:51.924",
      "Enabled": true
    }
  ]
}
```

For more information, see [Working with Events and Notifications](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeEventSubscriptions](#) in *AWS CLI Command Reference*.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To list DMS events

The following `describe-events` example lists the events that originated from a replication instance.

```
aws dms describe-events \  
  --source-type "replication-instance"
```

Output:

```
{  
  "Events": [  
    {  
      "SourceIdentifier": "my-repl-instance",  
      "SourceType": "replication-instance",  
      "Message": "Replication application shutdown",  
      "EventCategories": [],  
      "Date": 1590771645.776  
    }  
  ]  
}
```

For more information, see [Working with Events and Notifications](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

describe-orderable-replication-instances

The following code example shows how to use `describe-orderable-replication-instances`.

AWS CLI

To describe orderable replication instances

The following `describe-orderable-replication-instances` example lists replication instance types that you can order.

```
aws dms describe-orderable-replication-instances
```

Output:

```
{
```

```
"OrderableReplicationInstances": [  
  {  
    "EngineVersion": "3.3.2",  
    "ReplicationInstanceClass": "dms.c4.2xlarge",  
    "StorageType": "gp2",  
    "MinAllocatedStorage": 5,  
    "MaxAllocatedStorage": 6144,  
    "DefaultAllocatedStorage": 100,  
    "IncludedAllocatedStorage": 100,  
    "AvailabilityZones": [  
      "us-east-1a",  
      "us-east-1b",  
      "us-east-1c",  
      "us-east-1d",  
      "us-east-1e",  
      "us-east-1f"  
    ]  
  },  
  {  
    "EngineVersion": "3.3.2",  
    "ReplicationInstanceClass": "dms.c4.4xlarge",  
    "StorageType": "gp2",  
    "MinAllocatedStorage": 5,  
    "MaxAllocatedStorage": 6144,  
    "DefaultAllocatedStorage": 100,  
    "IncludedAllocatedStorage": 100,  
    "AvailabilityZones": [  
      "us-east-1a",  
      "us-east-1b",  
      "us-east-1c",  
      "us-east-1d",  
      "us-east-1e",  
      "us-east-1f"  
    ]  
  },  
  ...remaining output omitted...  
]
```

For more information, see [Working with an AWS DMS Replication Instance](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeOrderableReplicationInstances](#) in *AWS CLI Command Reference*.

describe-refresh-schemas-status

The following code example shows how to use `describe-refresh-schemas-status`.

AWS CLI

To list the refresh status for an endpoint

The following `describe-refresh-schemas-status` example returns the status of a previous refresh request.

```
aws dms describe-refresh-schemas-status \  
  --endpoint-arn arn:aws:dms:us-  
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA
```

Output:

```
{  
  "RefreshSchemasStatus": {  
    "EndpointArn": "arn:aws:dms:us-  
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",  
    "ReplicationInstanceArn": "arn:aws:dms:us-  
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE",  
    "Status": "successful",  
    "LastRefreshDate": 1590786544.605  
  }  
}
```

- For API details, see [DescribeRefreshSchemasStatus](#) in *AWS CLI Command Reference*.

describe-replication-instances

The following code example shows how to use `describe-replication-instances`.

AWS CLI

To describe replication instances

The following `describe-replication-instances` example lists the replication instances in your AWS account.

```
aws dms describe-replication-instances
```

Output:

```
{
  "ReplicationInstances": [
    {
      "ReplicationInstanceIdentifier": "my-repl-instance",
      "ReplicationInstanceClass": "dms.t2.micro",
      "ReplicationInstanceStatus": "available",
      "AllocatedStorage": 5,
      "InstanceCreateTime": 1590011235.952,
      "VpcSecurityGroups": [

    }
  ]
}

```

For more information, see [Working with an AWS DMS Replication Instance](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeReplicationInstances](#) in *AWS CLI Command Reference*.

describe-replication-subnet-groups

The following code example shows how to use describe-replication-subnet-groups.

AWS CLI

To display the available subnet groups

The following describe-replication-subnet-groups example lists the available subnet groups.

```

aws dms describe-replication-subnet-groups \
  --filter "Name=replication-subnet-group-id,Values=my-subnet-group"

```

Output:

```

{
  "ReplicationSubnetGroups": [
    {
      "ReplicationSubnetGroupIdentifier": "my-subnet-group",
      "ReplicationSubnetGroupDescription": "my subnet group",
      "VpcId": "vpc-136a4c6a",
      "SubnetGroupStatus": "Complete",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-da327bf6",
          "SubnetAvailabilityZone": {
            "Name": "us-east-1a"
          },
          "SubnetStatus": "Active"
        },
        {
          "SubnetIdentifier": "subnet-bac383e0",

```

```

        "SubnetAvailabilityZone": {
            "Name": "us-east-1c"
        },
        "SubnetStatus": "Active"
    },
    {
        "SubnetIdentifier": "subnet-d7c825e8",
        "SubnetAvailabilityZone": {
            "Name": "us-east-1e"
        },
        "SubnetStatus": "Active"
    }
]
}

```

For more information, see [Setting Up a Network for a Replication Instance](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeReplicationSubnetGroups](#) in *AWS CLI Command Reference*.

describe-replication-task-assessment-results

The following code example shows how to use `describe-replication-task-assessment-results`.

AWS CLI

To list the results of replication task assessmentss

The following `describe-replication-task-assessment-results` example lists the results of a prior task assessment.

```
aws dms describe-replication-task-assessment-results
```

Output:

```
{
  "ReplicationTaskAssessmentResults": [
    {
```

```

        "ReplicationTaskIdentifier": "moveit2",
        "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII",
        "ReplicationTaskLastAssessmentDate": 1590790230.0,
        "AssessmentStatus": "No issues found",
        "AssessmentResultsFile": "moveit2/2020-05-29-22-10"
    }
]
}

```

For more information, see [Creating a Task Assessment Report](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeReplicationTaskAssessmentResults](#) in *AWS CLI Command Reference*.

describe-replication-tasks

The following code example shows how to use describe-replication-tasks.

AWS CLI

To describe a replication task

The following describe-replication-tasks example describes current replication tasks.

```
aws dms describe-replication-tasks
```

Output:

```

{
  "ReplicationTasks": [
    {
      "ReplicationTaskIdentifier": "moveit2",
      "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",

      "TablesErrored": 0,
      "FreshStartDate": 1590619811.528,
      "StartDate": 1590619811.528,
      "StopDate": 1590619842.068
    }
  }
]
}

```

For more information, see [Working with AWS DMS Tasks](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeReplicationTasks](#) in *AWS CLI Command Reference*.

describe-schemas

The following code example shows how to use `describe-schemas`.

AWS CLI

To describe database schemas

The following `describe-schemas` example lists the available tables at an endpoint.

```

aws dms describe-schemas \
  --endpoint-arn "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA"

```

Output:

```
{
  "Schemas": [
    "prodrep"
  ]
}
```

For more information, see [This is the topic title](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [DescribeSchemas](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for a replication instance.

```
aws dms list-tags-for-resource \
  --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
  "TagList": [
    {
      "Key": "Project",
      "Value": "dbMigration"
    },
    {
      "Key": "Environment",
      "Value": "PROD"
    }
  ]
}
```

For more information, see [Tagging Resources](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

modify-endpoint

The following code example shows how to use `modify-endpoint`.

AWS CLI

To modify an endpoint

The following `modify-endpoint` example adds an extra connection attribute to an endpoint.

```
aws dms modify-endpoint \  
  --endpoint-arn "arn:aws:dms:us-  
east-1:123456789012:endpoint:GUVAFG34EECU0J6QVZ56DAHT3U" \  
  --extra-connection-attributes "compressionType=GZIP"
```

Output:

```
{  
  "Endpoint": {  
    "EndpointIdentifier": "src-endpoint",  
    "EndpointType": "SOURCE",  
    "EngineName": "s3",  
    "EngineDisplayName": "Amazon S3",  
    "ExtraConnectionAttributes":  
"compressionType=GZIP;csvDelimiter=,;csvRowDelimiter=\\n;",  
    "Status": "active",  
    "EndpointArn": "arn:aws:dms:us-  
east-1:123456789012:endpoint:GUVAFG34EECU0J6QVZ56DAHT3U",  
    "SslMode": "none",  
    "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-role",  
    "S3Settings": {  
      "ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3-access-  
role",  
      "CsvRowDelimiter": "\\n",  
      "CsvDelimiter": ",",  
      "BucketFolder": "",  
      "BucketName": "",  
      "CompressionType": "GZIP",  
      "EnableStatistics": true  
    }  
  }  
}
```

```
}  
}
```

For more information, see [Working with AWS DMS Endpoints](https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html) <https://docs.aws.amazon.com/dms/latest/userguide/CHAP_Endpoints.html>`__ in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyEndpoint](#) in *AWS CLI Command Reference*.

modify-event-subscription

The following code example shows how to use `modify-event-subscription`.

AWS CLI

To modify an event subscription

The following `modify-event-subscription` example changes the source type of an event subscription.

```
aws dms modify-event-subscription \  
  --subscription-name "my-dms-events" \  
  --source-type replication-task
```

Output:

```
{  
  "EventSubscription": {  
    "CustomerAwsId": "123456789012",  
    "CustSubscriptionId": "my-dms-events",  
    "SnsTopicArn": "arn:aws:sns:us-east-1:123456789012:my-sns-topic",  
    "Status": "modifying",  
    "SubscriptionCreationTime": "2020-05-29 17:04:40.262",  
    "SourceType": "replication-task",  
    "Enabled": true  
  }  
}
```

For more information, see [Working with Events and Notifications](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyEventSubscription](#) in *AWS CLI Command Reference*.

modify-replication-instance

The following code example shows how to use `modify-replication-instance`.

AWS CLI

To modify a replication instance

The following `modify-replication-instance` example modifies a replication instance so that it uses a Multi-AZ deployment.

```
aws dms modify-replication-instance \
  --replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE \
  --multi-az
```

Output:

```
{
  "ReplicationInstance": {
    "ReplicationInstanceIdentifier": "my-repl-instance",
    "ReplicationInstanceClass": "dms.t2.micro",
    "ReplicationInstanceStatus": "available",
    "AllocatedStorage": 5,
    "InstanceCreateTime": 1590011235.952,
    ...output omitted...

    "PendingModifiedValues": {
      "MultiAZ": true
    },
    "MultiAZ": false,
    "EngineVersion": "3.3.2",
    "AutoMinorVersionUpgrade": true,
    "KmsKeyId": "arn:aws:kms:us-east-1:123456789012:key/f7bc0f8e-1a3a-4ace-9faa-
e8494fa3921a",
    ...output omitted...
  }
}
```

```
}
```

For more information, see [Working with an AWS DMS Replication Instance](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyReplicationInstance](#) in *AWS CLI Command Reference*.

modify-replication-subnet-group

The following code example shows how to use `modify-replication-subnet-group`.

AWS CLI

To modify a subnet group

The following `modify-replication-subnet-group` example changes the lists of subnets associated with a subnet group.

```
aws dms modify-replication-subnet-group \  
  --replication-subnet-group-identifier my-subnet-group \  
  --subnet-id subnet-da327bf6 subnet-bac383e0
```

Output:

```
{  
  "ReplicationSubnetGroup": {  
    "ReplicationSubnetGroupIdentifier": "my-subnet-group",  
    "ReplicationSubnetGroupDescription": "my subnet group",  
    "VpcId": "vpc-136a4c6a",  
    "SubnetGroupStatus": "Complete",  
    "Subnets": [  
      {  
        "SubnetIdentifier": "subnet-da327bf6",  
        "SubnetAvailabilityZone": {  
          "Name": "us-east-1a"  
        },  
        "SubnetStatus": "Active"  
      },  
      {  
        "SubnetIdentifier": "subnet-bac383e0",  
        "SubnetAvailabilityZone": {  
          "Name": "us-east-1c"  
        }  
      }  
    ]  
  }  
}
```

```

        },
        "SubnetStatus": "Active"
    }
]
}
}

```

For more information, see [Setting Up a Network for a Replication Instance](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyReplicationSubnetGroup](#) in *AWS CLI Command Reference*.

modify-replication-task

The following code example shows how to use `modify-replication-task`.

AWS CLI

To modify a replication task

The following `modify-replication-task` example changes the table mappings for a task.

```

aws dms modify-replication-task \
  --replication-task-arn "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII" \
  --table-mappings file://table-mappings.json

```

Contents of `table-mappings.json`:

```

{
  "rules": [
    {
      "rule-type": "selection",
      "rule-id": "1",
      "rule-name": "1",
      "object-locator": {
        "schema-name": "prodrep",
        "table-name": "ACCT_%"
      },
      "rule-action": "include",
      "filters": []
    }
  ]
}

```

```
]
}
```

Output:

```
{
  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWGWAYUVLKIB732KEVWA",
    "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:E0M4SFKCZEYHZBFGAGZT3QEC5U",
    "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE",
    "MigrationType": "full-load",
    "TableMappings": "...output omitted...",
    "ReplicationTaskSettings": "...output omitted...",
    "Status": "modifying",
    "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
    "ReplicationTaskCreationDate": 1590524772.505,
    "ReplicationTaskStartDate": 1590789424.653,
    "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
  }
}
```

For more information, see [Working with AWS DMS Tasks](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [ModifyReplicationTask](#) in *AWS CLI Command Reference*.

reboot-replication-instance

The following code example shows how to use `reboot-replication-instance`.

AWS CLI

To reboot a replication instance

The following `reboot-replication-instance` example reboots a replication instance.

```
aws dms reboot-replication-instance \
```

```
--replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE
```

Output:

```
{
  "ReplicationInstance": {
    "ReplicationInstanceIdentifier": "my-repl-instance",
    "ReplicationInstanceClass": "dms.t2.micro",
    "ReplicationInstanceStatus": "rebooting",
    "AllocatedStorage": 5,
    "InstanceCreateTime": 1590011235.952,
    ... output omitted ...
  }
}
```

For more information, see [Working with an AWS DMS Replication Instance](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [RebootReplicationInstance](#) in *AWS CLI Command Reference*.

refresh-schemas

The following code example shows how to use `refresh-schemas`.

AWS CLI

To refresh database schemas

The following `refresh-schemas` example requests that AWS DMS refresh the list of schemas at an endpoint.

```
aws dms refresh-schemas \
  --replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE \
  --endpoint-arn "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA"
```

Output:

```
{
  "RefreshSchemasStatus": {
```

```
    "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWGWAYUVLKIB732KEVWA",
    "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE",
    "Status": "refreshing",
    "LastRefreshDate": 1590019949.103
  }
}
```

- For API details, see [RefreshSchemas](#) in *AWS CLI Command Reference*.

reload-tables

The following code example shows how to use `reload-tables`.

AWS CLI

To refresh the list of tables available at an endpoint

The following `reload-tables` example reloads the list of available tables at an endpoint.

```
aws dms reload-tables \
  --replication-task-arn "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII" \
  --tables-to-reload "SchemaName=prodrep,TableName=ACCT_BAL"
```

Output:

```
{
  "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
}
```

- For API details, see [ReloadTables](#) in *AWS CLI Command Reference*.

remove-tags-from-resource

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI

To remove tags from a replication instance

The following `remove-tags-from-resource` example removes tags from a replication instance.

```
aws dms remove-tags-from-resource \  
  --resource-arn arn:aws:dms:us-east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE \  
  --tag-keys Environment Project
```

This command produces no output.

For more information, see [Tagging Resources](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [RemoveTagsFromResource](#) in *AWS CLI Command Reference*.

start-replication-task-assessment

The following code example shows how to use `start-replication-task-assessment`.

AWS CLI

To start a task assessment

The following `start-replication-task-assessment` example starts a replication task assessment.

```
aws dms start-replication-task-assessment \  
  --replication-task-arn arn:aws:dms:us-   
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII
```

Output:

```
{  
  "ReplicationTask": {  
    "ReplicationTaskIdentifier": "moveit2",  
    "SourceEndpointArn": "arn:aws:dms:us-   
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",  
    "TargetEndpointArn": "arn:aws:dms:us-   
east-1:123456789012:endpoint:E0M4SFKCZEYHZBFGAGZT3QEC5U",  
    "ReplicationInstanceArn": "arn:aws:dms:us-   
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE",  
    "MigrationType": "full-load",
```

```

    "TableMappings": ...output omitted...,
    "ReplicationTaskSettings": ...output omitted...,
    "Status": "testing",
    "StopReason": "Stop Reason FULL_LOAD_ONLY_FINISHED",
    "ReplicationTaskCreationDate": 1590524772.505,
    "ReplicationTaskStartDate": 1590789988.677,
    "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
  }
}

```

For more information, see [Creating a Task Assessment Report](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [StartReplicationTaskAssessment](#) in *AWS CLI Command Reference*.

start-replication-task

The following code example shows how to use start-replication-task.

AWS CLI

To start a replication task

The following command-name example lists the available widgets in your AWS account.

```

aws dms start-replication-task \
  --replication-task-arn arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII \
  --start-replication-task-type reload-target

```

Output:

```

{
  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWYGAYUVLKIB732KEVWA",
    "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:E0M4SFKCZEYHZBFGAGZT3QEC5U",
    "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE",

```

```

    "MigrationType": "full-load",
    "TableMappings": ...output omitted... ,
    "ReplicationTaskSettings": ...output omitted... ,
    "Status": "starting",
    "ReplicationTaskCreationDate": 1590524772.505,
    "ReplicationTaskStartDate": 1590619805.212,
    "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
  }
}

```

For more information, see [Working with AWS DMS Tasks](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [StartReplicationTask](#) in *AWS CLI Command Reference*.

stop-replication-task

The following code example shows how to use stop-replication-task.

AWS CLI

To stop a task

The following stop-replication-task example stops a task.

```

aws dms stop-replication-task \
  --replication-task-arn arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII

```

Output:

```

{
  "ReplicationTask": {
    "ReplicationTaskIdentifier": "moveit2",
    "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
    "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:E0M4SFKCZEYHZBFGAGZT3QEC5U",
    "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE",
    "MigrationType": "full-load",

```

```

    "TableMappings": ...output omitted...,
    "ReplicationTaskSettings": ...output omitted...,
    "Status": "stopping",
    "ReplicationTaskCreationDate": 1590524772.505,
    "ReplicationTaskStartDate": 1590789424.653,
    "ReplicationTaskArn": "arn:aws:dms:us-
east-1:123456789012:task:K55IUCGBASJS5VHZJIINA45FII"
  }
}

```

For more information, see [Working with AWS DMS Tasks](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [StopReplicationTask](#) in *AWS CLI Command Reference*.

test-connection

The following code example shows how to use test-connection.

AWS CLI

To test a connection to an endpoint

The following test-connection example tests whether an endpoint can be accessed from a replication instance.

```

aws dms test-connection \
  --replication-instance-arn arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE \
  --endpoint-arn arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA

```

Output:

```

{
  "Connection": {
    "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789012:rep:T30M70UB5NM2LCVZF7JPGJRNUE",
    "EndpointArn": "arn:aws:dms:us-
east-1:123456789012:endpoint:6GGI6YPWWGAYUVLKIB732KEVWA",
    "Status": "testing",
  }
}

```

```
    "EndpointIdentifier": "src-database-1",  
    "ReplicationInstanceIdentifier": "my-repl-instance"  
  }  
}
```

For more information, see [Creating source and target endpoints](#) in the *AWS Database Migration Service User Guide*.

- For API details, see [TestConnection](#) in *AWS CLI Command Reference*.

Amazon DocumentDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon DocumentDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-tags-to-resource

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add one or more tags to a specified resource

The following `add-tags-to-resource` example adds three tags to `sample-cluster`. One tag (`CropB`) has a key name but no value.

```
aws docdb add-tags-to-resource \  
  --resource-name arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster \  
  --tags Key="CropA",Value="Apple" Key="CropB" Key="CropC",Value="Corn"
```

This command produces no output.

For more information, see [Tagging Amazon DocumentDB Resources](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [AddTagsToResource](#) in *AWS CLI Command Reference*.

apply-pending-maintenance-action

The following code example shows how to use `apply-pending-maintenance-action`.

AWS CLI

To have pending maintenance actions take place during the next maintenance window

The following `apply-pending-maintenance-action` example causes all system-update actions to be performed during the next scheduled maintenance window.

```
aws docdb apply-pending-maintenance-action \  
  --resource-identifier arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster \  
  --apply-action system-update \  
  --opt-in-type next-maintenance
```

This command produces no output.

For more information, see [Applying Amazon DocumentDB Updates](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ApplyPendingMaintenanceAction](#) in *AWS CLI Command Reference*.

copy-db-cluster-parameter-group

The following code example shows how to use `copy-db-cluster-parameter-group`.

AWS CLI

To duplicate an existing DB cluster parameter group

The following `copy-db-cluster-parameter-group` example makes a copy of the parameter group `custom-docdb3-6` named `custom-docdb3-6-copy`. When making the copy it adds tags to the new parameter group.

```
aws docdb copy-db-cluster-parameter-group \  
  --source-db-cluster-parameter-group-identifier custom-docdb3-6 \  
  --target-db-cluster-parameter-group-identifier custom-docdb3-6-copy \  
  --target-db-cluster-parameter-group-description "Copy of custom-docdb3-6" \  
  --tags Key="CopyNumber",Value="1" Key="Modifiable",Value="Yes"
```

Output:

```
{  
  "DBClusterParameterGroup": {  
    "DBParameterGroupFamily": "docdb3.6",  
    "DBClusterParameterGroupArn": "arn:aws:rds:us-east-1:12345678901:cluster-  
pg:custom-docdb3-6-copy",  
    "DBClusterParameterGroupName": "custom-docdb3-6-copy",  
    "Description": "Copy of custom-docdb3-6"  
  }  
}
```

For more information, see [Copying an Amazon DocumentDB Cluster Parameter Group](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CopyDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

copy-db-cluster-snapshot

The following code example shows how to use `copy-db-cluster-snapshot`.

AWS CLI

To create a copy of a snapshot

The following `copy-db-cluster-snapshot` example makes a copy of `sample-cluster-snapshot` named `sample-cluster-snapshot-copy`. The copy has all the tags of the original plus a new tag with the key name `CopyNumber`.

```
aws docdb copy-db-cluster-snapshot \  
  --source-db-cluster-snapshot-identifier sample-cluster-snapshot \  
  --target-db-cluster-snapshot-identifier sample-cluster-snapshot-copy \  
  --tags Key="CopyNumber",Value="1" Key="Modifiable",Value="Yes"
```

```
--target-db-cluster-snapshot-identifier sample-cluster-snapshot-copy \  
--copy-tags \  
--tags Key="CopyNumber",Value="1"
```

This command produces no output.

For more information, see [Copying a Cluster Snapshot](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CopyDbClusterSnapshot](#) in *AWS CLI Command Reference*.

create-db-cluster-parameter-group

The following code example shows how to use `create-db-cluster-parameter-group`.

AWS CLI

To create an Amazon DocumentDB cluster parameter group

The following `create-db-cluster-parameter-group` example creates the DB cluster parameter group `sample-parameter-group` using the `docdb3.6` family.

```
aws docdb create-db-cluster-parameter-group \  
  --db-cluster-parameter-group-name sample-parameter-group \  
  --db-parameter-group-family docdb3.6 \  
  --description "Sample parameter group based on docdb3.6"
```

Output:

```
{  
  "DBClusterParameterGroup": {  
    "Description": "Sample parameter group based on docdb3.6",

- For API details, see [CreateDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

create-db-cluster-snapshot

The following code example shows how to use `create-db-cluster-snapshot`.

AWS CLI

To create a manual Amazon DocumentDB cluster snapshot

The following `create-db-cluster-snapshot` example creates an Amazon DB cluster snapshot named `sample-cluster-snapshot`.

```
aws docdb create-db-cluster-snapshot \  
  --db-cluster-identifier sample-cluster \  
  --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{  
  "DBClusterSnapshot": {  
    "MasterUsername": "master-user",  
    "SnapshotCreateTime": "2019-03-18T18:27:14.794Z",  
    "AvailabilityZones": [  
      "us-west-2a",  
      "us-west-2b",  
      "us-west-2c",  
      "us-west-2d",  
      "us-west-2e",  
      "us-west-2f"  
    ],  
    "SnapshotType": "manual",  
    "DBClusterSnapshotArn": "arn:aws:rds:us-west-2:123456789012:cluster-  
snapshot:sample-cluster-snapshot",

  }  
}
```

```
    "StorageEncrypted": false,  
    "VpcId": "vpc-91280df6"  
  }  
}
```

For more information, see [Creating a Manual Cluster Snapshot](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbClusterSnapshot](#) in *AWS CLI Command Reference*.

create-db-cluster

The following code example shows how to use `create-db-cluster`.

AWS CLI

To create an Amazon DocumentDB cluster

The following `create-db-cluster` example creates an Amazon DocumentDB cluster named `sample-cluster` with the preferred maintenance window on Sundays between 20:30 and 11:00.

```
aws docdb create-db-cluster \  
  --db-cluster-identifier sample-cluster \  
  --engine docdb \  
  --master-username master-user \  
  --master-user-password password \  
  --preferred-maintenance-window Sun:20:30-Sun:21:00
```

Output:

```
{  
  "DBCluster": {  
    "DBClusterParameterGroup": "default.docdb3.6",  
    "AssociatedRoles": [],  
    "DBSubnetGroup": "default",  
    "ClusterCreateTime": "2019-03-18T18:06:34.616Z",  
    "Status": "creating",  
    "Port": 27017,  
    "PreferredMaintenanceWindow": "sun:20:30-sun:21:00",  
    "HostedZoneId": "ZNKXH85TT8WVW",  
    "DBClusterMembers": [],  
  }  
}
```

```
"Engine": "docdb",
"DBClusterIdentifier": "sample-cluster",
"PreferredBackupWindow": "10:12-10:42",
"AvailabilityZones": [
  "us-west-2d",
  "us-west-2f",
  "us-west-2e"
],
"MasterUsername": "master-user",
"BackupRetentionPeriod": 1,
"ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
"VpcSecurityGroups": [
  {
    "VpcSecurityGroupId": "sg-77186e0d",
    "Status": "active"
  }
],
"StorageEncrypted": false,
"DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster",

"MultiAZ": false,
"Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
"EngineVersion": "3.6.0"
}
}
```

For more information, see [Creating an Amazon DocumentDB Cluster](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbCluster](#) in *AWS CLI Command Reference*.

create-db-instance

The following code example shows how to use `create-db-instance`.

AWS CLI

To create an Amazon DocumentDB cluster instance

The following `create-db-instance` example code creates the instance `sample-cluster-instance-2` in the Amazon DocumentDB cluster `sample-cluster`.

```
aws docdb create-db-instance \  
  --db-cluster-identifier sample-cluster \  
  --db-instance-class db.r4.xlarge \  
  --db-instance-identifier sample-cluster-instance-2 \  
  --engine docdb
```

Output:

```
{  
  "DBInstance": {  
    "DBInstanceStatus": "creating",  
    "PendingModifiedValues": {  
      "PendingCloudwatchLogsExports": {  
        "LogTypesToEnable": [  
          "audit"  
        ]  
      }  
    },  
    "PubliclyAccessible": false,  
    "PreferredBackupWindow": "00:00-00:30",  
    "PromotionTier": 1,  
    "EngineVersion": "3.6.0",  
    "BackupRetentionPeriod": 3,  
    "DBInstanceIdentifier": "sample-cluster-instance-2",  
    "PreferredMaintenanceWindow": "tue:10:28-tue:10:58",  
    "StorageEncrypted": false,  
    "Engine": "docdb",  
    "DBClusterIdentifier": "sample-cluster",  
    "DBSubnetGroup": {  
      "Subnets": [  
        {  
          "SubnetAvailabilityZone": {  
            "Name": "us-west-2a"  
          },  
          "SubnetStatus": "Active",  
          "SubnetIdentifier": "subnet-4e26d263"  
        },  
        {  
          "SubnetAvailabilityZone": {  
            "Name": "us-west-2c"  
          },  
          "SubnetStatus": "Active",  
          "SubnetIdentifier": "subnet-afc329f4"  
        }  
      ]  
    }  
  }  
}
```

```

    },
    {
      "SubnetAvailabilityZone": {
        "Name": "us-west-2d"
      },
      "SubnetStatus": "Active",
      "SubnetIdentifier": "subnet-53ab3636"
    },
    {
      "SubnetAvailabilityZone": {
        "Name": "us-west-2b"
      },
      "SubnetStatus": "Active",
      "SubnetIdentifier": "subnet-991cb8d0"
    }
  ],
  "DBSubnetGroupDescription": "default",

}
}

```

For more information, see [Adding an Amazon DocumentDB Instance to a Cluster](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbInstance](#) in *AWS CLI Command Reference*.

create-db-subnet-group

The following code example shows how to use `create-db-subnet-group`.

AWS CLI

To create an Amazon DocumentDB subnet group

The following `create-db-subnet-group` example creates an Amazon DocumentDB subnet group named `sample-subnet-group`.

```
aws docdb create-db-subnet-group \  
  --db-subnet-group-description "a sample subnet group" \  
  --db-subnet-group-name sample-subnet-group \  
  --subnet-ids "subnet-29ab1025" "subnet-991cb8d0" "subnet-53ab3636"
```

Output:

```
{  
  "DBSubnetGroup": {  
    "SubnetGroupStatus": "Complete",  
    "DBSubnetGroupName": "sample-subnet-group",  
    "DBSubnetGroupDescription": "a sample subnet group",  
    "VpcId": "vpc-91280df6",  
    "DBSubnetGroupArn": "arn:aws:rds:us-west-2:123456789012:subgrp:sample-  
subnet-group",  
    "Subnets": [  
      {  
        "SubnetStatus": "Active",  
        "SubnetIdentifier": "subnet-53ab3636",  
        "SubnetAvailabilityZone": {  
          "Name": "us-west-2d"  
        }  
      },  
      {  
        "SubnetStatus": "Active",  
        "SubnetIdentifier": "subnet-991cb8d0",  
        "SubnetAvailabilityZone": {  
          "Name": "us-west-2b"  
        }  
      },  
      {  
        "SubnetStatus": "Active",  
        "SubnetIdentifier": "subnet-29ab1025",  
        "SubnetAvailabilityZone": {  
          "Name": "us-west-2c"  
        }  
      }  
    ]  
  }  
}
```

```
    }  
  ]  
}
```

For more information, see [Creating an Amazon DocumentDB Subnet Group](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [CreateDbSubnetGroup](#) in *AWS CLI Command Reference*.

delete-db-cluster-parameter-group

The following code example shows how to use `delete-db-cluster-parameter-group`.

AWS CLI

To delete an Amazon DocumentDB cluster parameter group

The following `delete-db-cluster-parameter-group` example deletes the Amazon DocumentDB parameter group `sample-parameter-group`.

```
aws docdb delete-db-cluster-parameter-group \  
  --db-cluster-parameter-group-name sample-parameter-group
```

This command produces no output.

For more information, see [Deleting an Amazon DocumentDB Cluster Parameter Group](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DeleteDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

delete-db-cluster-snapshot

The following code example shows how to use `delete-db-cluster-snapshot`.

AWS CLI

To delete an Amazon DocumentDB cluster snapshot

The following `delete-db-cluster-snapshot` example deletes the Amazon DocumentDB cluster snapshot `sample-cluster-snapshot`.

```
aws docdb delete-db-cluster-snapshot \  
  --db-cluster-snapshot-identifier sample-cluster-snapshot
```

```
--db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
  "DBClusterSnapshot": {
    "DBClusterIdentifier": "sample-cluster",
    "AvailabilityZones": [
      "us-west-2a",
      "us-west-2b",
      "us-west-2c",
      "us-west-2d"
    ],
    "DBClusterSnapshotIdentifier": "sample-cluster-snapshot",
    "VpcId": "vpc-91280df6",
    "DBClusterSnapshotArn": "arn:aws:rds:us-west-2:123456789012:cluster-
snapshot:sample-cluster-snapshot",
    "EngineVersion": "3.6.0",

    "PercentProgress": 100,
    "StorageEncrypted": false,
    "SnapshotType": "manual",
    "Port": 0
  }
}
```

For more information, see [Deleting a Cluster Snapshot](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DeleteDbClusterSnapshot](#) in *AWS CLI Command Reference*.

delete-db-cluster

The following code example shows how to use `delete-db-cluster`.

AWS CLI

To delete an Amazon DocumentDB cluster

The following `delete-db-cluster` example deletes the Amazon DocumentDB cluster `sample-cluster`. No backup of the cluster is made prior to deleting it. NOTE: You must delete all instances associated with the cluster before you can delete it.

```
aws docdb delete-db-cluster \  
  --db-cluster-identifier sample-cluster \  
  --skip-final-snapshot
```

Output:

```
{  
  "DBCluster": {  
    "DBClusterIdentifier": "sample-cluster",  
    "DBSubnetGroup": "default",  
    "EngineVersion": "3.6.0",

delete-db-subnet-group

The following code example shows how to use `delete-db-subnet-group`.

AWS CLI

To delete an Amazon DocumentDB subnet group

The following `delete-db-subnet-group` example deletes the Amazon DocumentDB subnet group `sample-subnet-group`.

```
aws docdb delete-db-subnet-group \
    --db-subnet-group-name sample-subnet-group
```

This command produces no output.

For more information, see [Deleting an Amazon DocumentDB Subnet Group](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DeleteDbSubnetGroup](#) in *AWS CLI Command Reference*.

describe-db-cluster-parameter-groups

The following code example shows how to use `describe-db-cluster-parameter-groups`.

AWS CLI

To see the details of one or more Amazon DocumentDB cluster parameter groups

The following `describe-db-cluster-parameter-groups` example displays details for the Amazon DocumentDB cluster parameter group `custom3-6-param-grp`.

```
aws docdb describe-db-cluster-parameter-groups \  
  --db-cluster-parameter-group-name custom3-6-param-grp
```

Output:

```
{  
  "DBClusterParameterGroups": [  
    {  
      "DBParameterGroupFamily": "docdb3.6",  
      "DBClusterParameterGroupArn": "arn:aws:rds:us-  
east-1:123456789012:cluster-pg:custom3-6-param-grp",  
      "Description": "Custom docdb3.6 parameter group",  
      "DBClusterParameterGroupName": "custom3-6-param-grp"  
    }  
  ]  
}
```

For more information, see [Viewing Amazon DocumentDB Cluster Parameter Groups](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbClusterParameterGroups](#) in *AWS CLI Command Reference*.

describe-db-cluster-parameters

The following code example shows how to use `describe-db-cluster-parameters`.

AWS CLI

To view the detailed parameter list for an Amazon DocumentDB cluster parameter group.

The following `describe-db-cluster-parameters` example lists the parameters for the Amazon DocumentDB parameter group `custom3-6-param-grp`.

```
aws docdb describe-db-cluster-parameters \  
  --db-cluster-parameter-group-name custom3-6-param-grp
```

Output:

```
{  
  "Parameters": [  
    {  
      "DataType": "string",  
      "ParameterName": "audit_logs",  
      "IsModifiable": true,  
      "ApplyMethod": "pending-reboot",  
      "Source": "system",  
      "ApplyType": "dynamic",  
      "AllowedValues": "enabled,disabled",  
      "Description": "Enables auditing on cluster.",  
      "ParameterValue": "disabled"  
    },  
    {  
      "DataType": "string",  
      "ParameterName": "tls",  
      "IsModifiable": true,  
      "ApplyMethod": "pending-reboot",  
      "Source": "system",  
      "ApplyType": "static",  
      "AllowedValues": "disabled,enabled",  
      "Description": "Config to enable/disable TLS",  
      "ParameterValue": "enabled"  
    },  
    {  
      "DataType": "string",

      "IsModifiable": true,  
      "ApplyMethod": "pending-reboot",  
      "Source": "user",  
      "ApplyType": "dynamic",  
      "AllowedValues": "disabled,enabled",  
      "Description": "Enables TTL Monitoring",  
      "ParameterValue": "enabled"  
    }  
  ]  
}
```

For more information, see [Viewing Amazon DocumentDB Cluster Parameters](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbClusterParameters](#) in *AWS CLI Command Reference*.

describe-db-cluster-snapshot-attributes

The following code example shows how to use `describe-db-cluster-snapshot-attributes`.

AWS CLI

To list an Amazon DocumentDB snapshot attribute names and values

The following `describe-db-cluster-snapshot-attributes` example lists the attribute names and values for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.

```
aws docdb describe-db-cluster-snapshot-attributes \
  --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{
  "DBClusterSnapshotAttributesResult": {
    "DBClusterSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AttributeValues": []
      }
    ],
    "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
  }
}
```

For more information, see [DescribeDBClusterSnapshotAttributes](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbClusterSnapshotAttributes](#) in *AWS CLI Command Reference*.

describe-db-cluster-snapshots

The following code example shows how to use `describe-db-cluster-snapshots`.

AWS CLI

To describe Amazon DocumentDB snapshots

The following `describe-db-cluster-snapshots` example displays details for the Amazon DocumentDB snapshot `sample-cluster-snapshot`.

```
aws docdb describe-db-cluster-snapshots \  
  --db-cluster-snapshot-identifier sample-cluster-snapshot
```

Output:

```
{  
  "DBClusterSnapshots": [  
    {  
      "AvailabilityZones": [  
        "us-west-2a",  
        "us-west-2b",  
        "us-west-2c",  
        "us-west-2d"  
      ],

describe-db-clusters

The following code example shows how to use `describe-db-clusters`.

AWS CLI

To get detailed information about one or more Amazon DocumentDB clusters.

The following `describe-db-clusters` example displays details for the Amazon DocumentDB cluster `sample-cluster`. By omitting the `--db-cluster-identifier` parameter you can get information of up to 100 clusters.

```
aws docdb describe-db-clusters
  --db-cluster-identifier sample-cluster
```

Output:

```
{
  "DBClusters": [
    {
      "DBClusterParameterGroup": "default.docdb3.6",
      "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",

describe-db-engine-versions

The following code example shows how to use `describe-db-engine-versions`.

AWS CLI

To list available Amazon DocumentDB engine versions

The following `describe-db-engine-versions` example lists all available Amazon DocumentDB engine versions.

```
aws docdb describe-db-engine-versions \  
  --engine docdb
```

Output:

```
{  
  "DBEngineVersions": [  
    {  
      "DBEngineVersionDescription": "DocDB version 1.0.200837",  
      "DBParameterGroupFamily": "docdb3.6",

      "ExportableLogTypes": [  
        "audit"  
      ]  
    }  
  ]  
}
```

For more information, see [DescribeDBEngineVersions](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbEngineVersions](#) in *AWS CLI Command Reference*.

describe-db-instances

The following code example shows how to use `describe-db-instances`.

AWS CLI

To find information about provisioned Amazon DocumentDB instances

The following `describe-db-instances` example displays details for about the Amazon DocumentDB instance `sample-cluster-instance`. By omitting the `--db-instance-identifier` parameter you get information on up to 100 instances.

```
aws docdb describe-db-instances \  
  --db-instance-identifier sample-cluster-instance
```

Output:

```
{  
  "DBInstances": [  
    {  
      "Endpoint": {  
        "HostedZoneId": "ZNKXH85TT8WVW",

describe-db-subnet-groups

The following code example shows how to use `describe-db-subnet-groups`.

AWS CLI

To retrieve a list of Amazon DocumentDB subnet descriptions

The following `describe-db-subnet-groups` example describes details for the Amazon DocumentDB subnet named `default`.

```
aws docdb describe-db-subnet-groups \
  --db-subnet-group-name default
```

Output:

```
{
  "DBSubnetGroups": [
    {
      "VpcId": "vpc-91280df6",
      "DBSubnetGroupArn": "arn:aws:rds:us-west-2:123456789012:subgrp:default",
      "Subnets": [
        {

          "SubnetAvailabilityZone": {
            "Name": "us-west-2a"
          }
        },
        {
          "SubnetIdentifier": "subnet-afc329f4",
          "SubnetStatus": "Active",
          "SubnetAvailabilityZone": {
```

```

        "Name": "us-west-2c"
      }
    },
    {
      "SubnetIdentifier": "subnet-53ab3636",
      "SubnetStatus": "Active",
      "SubnetAvailabilityZone": {
        "Name": "us-west-2d"
      }
    },
    {
      "SubnetIdentifier": "subnet-991cb8d0",
      "SubnetStatus": "Active",
      "SubnetAvailabilityZone": {
        "Name": "us-west-2b"
      }
    }
  ],
  "DBSubnetGroupName": "default",
  "SubnetGroupStatus": "Complete",
  "DBSubnetGroupDescription": "default"
}
]
}

```

For more information, see [Describing Subnet Groups](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeDbSubnetGroups](#) in *AWS CLI Command Reference*.

describe-engine-default-cluster-parameters

The following code example shows how to use `describe-engine-default-cluster-parameters`.

AWS CLI

To describe the default engine and system parameter information for Amazon DocumentDB

The following `describe-engine-default-cluster-parameters` example displays details for the default engine and system parameter information for the Amazon DocumentDB parameter group `docdb3.6`.

```
aws docdb describe-engine-default-cluster-parameters \  
--db-parameter-group-family docdb3.6
```

Output:

```
{  
  "EngineDefaults": {  
    "DBParameterGroupFamily": "docdb3.6",  
    "Parameters": [  
      {  
        "ApplyType": "dynamic",  
        "ParameterValue": "disabled",  
        "Description": "Enables auditing on cluster.",  
        "Source": "system",  
        "DataType": "string",  
        "MinimumEngineVersion": "3.6.0",  
        "AllowedValues": "enabled,disabled",  
        "ParameterName": "audit_logs",  
        "IsModifiable": true  
      },  
      {  
        "ApplyType": "static",  
        "ParameterValue": "enabled",  
        "Description": "Config to enable/disable TLS",  
        "Source": "system",  
        "DataType": "string",  
        "MinimumEngineVersion": "3.6.0",  
        "AllowedValues": "disabled,enabled",  
        "ParameterName": "tls",  
        "IsModifiable": true  
      },  
      {  
        "ApplyType": "dynamic",  
        "ParameterValue": "enabled",  
        "Description": "Enables TTL Monitoring",  
        "Source": "system",  
        "DataType": "string",  
        "MinimumEngineVersion": "3.6.0",  
        "AllowedValues": "disabled,enabled",  
        "ParameterName": "ttl_monitor",  
        "IsModifiable": true  
      }  
    ]  
  }  
}
```

```
}  
}
```

For more information, see [DescribeEngineDefaultClusterParameters](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeEngineDefaultClusterParameters](#) in *AWS CLI Command Reference*.

describe-event-categories

The following code example shows how to use `describe-event-categories`.

AWS CLI

To describe all Amazon DocumentDB event categories

The following `describe-event-categories` example lists all categories for the Amazon DocumentDB event source type `db-instance`.

```
aws docdb describe-event-categories \  
  --source-type db-cluster
```

Output:

```
{  
  "EventCategoriesMapList": [  
    {  
      "SourceType": "db-cluster",  
      "EventCategories": [  
        "failover",  
        "maintenance",  
        "notification",  
        "failure"  
      ]  
    }  
  ]  
}
```

For more information, see [Viewing Event Categories](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribeEventCategories](#) in *AWS CLI Command Reference*.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To list Amazon DocumentDB events

The following describe-events example list all the Amazon DocumentDB events for the last 24 hours (1440 minutes).

```
aws docdb describe-events \  
  --duration 1440
```

This command produces no output. Output:

```
{  
  "Events": [  
    {  
      "EventCategories": [  
        "failover"  
      ],

describe-orderable-db-instance-options

The following code example shows how to use `describe-orderable-db-instance-options`.

AWS CLI

To find the Amazon DocumentDB instance options you can order

The following `describe-orderable-db-instance-options` example lists all instance options for Amazon DocumentDB for a region.

```
aws docdb describe-orderable-db-instance-options \  
  --engine docdb \  
  --region us-east-1
```

Output:

```
{  
  "OrderableDBInstanceOptions": [  
    {  
      "Vpc": true,  
      "AvailabilityZones": [  
        {  
          "Name": "us-east-1a"  
        },  
        {  
          "Name": "us-east-1b"  
        },  
        {  
          "Name": "us-east-1c"  
        },  
        {  
          "Name": "us-east-1d"  
        }

describe-pending-maintenance-actions

The following code example shows how to use `describe-pending-maintenance-actions`.

AWS CLI

To list your pending Amazon DocumentDB maintenance actions

The following `describe-pending-maintenance-actions` example lists all your pending Amazon DocumentDB maintenance actions.

```
aws docdb describe-pending-maintenance-actions
```

Output:

```
{
  "PendingMaintenanceActions": []
}
```

For more information, see [Maintaining Amazon DocumentDB](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [DescribePendingMaintenanceActions](#) in *AWS CLI Command Reference*.

failover-db-cluster

The following code example shows how to use `failover-db-cluster`.

AWS CLI

To force an Amazon DocumentDB cluster to failover to a replica

The following `failover-db-cluster` example causes the primary instance in the Amazon DocumentDB cluster `sample-cluster` to failover to a replica.

```
aws docdb failover-db-cluster \  
  --db-cluster-identifier sample-cluster
```

Output:

```
{  
  "DBCluster": {  
    "AssociatedRoles": [],  
    "DBClusterIdentifier": "sample-cluster",  
    "EngineVersion": "3.6.0",

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all the tags on an Amazon DocumentDB resource

The following `list-tags-for-resource` example lists all tags on the Amazon DocumentDB cluster `sample-cluster`.

```
aws docdb list-tags-for-resource \
```

```
--resource-name arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster
```

Output:

```
{
  "TagList": [
    {
      "Key": "A",
      "Value": "ALPHA"
    },
    {
      "Key": "B",
      "Value": ""
    },
    {
      "Key": "C",
      "Value": "CHARLIE"
    }
  ]
}
```

For more information, see [Listing Tags on an Amazon DocumentDB Resource](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

modify-db-cluster-parameter-group

The following code example shows how to use `modify-db-cluster-parameter-group`.

AWS CLI

To modify an Amazon DocumentDB DB cluster parameter group

The following `modify-db-cluster-parameter-group` example modifies the Amazon DocumentDB cluster parameter group `custom3-6-param-grp` by setting the two parameters `audit_logs` and `ttl_monitor` to enabled. The changes are applied at the next reboot.

```
aws docdb modify-db-cluster-parameter-group \
  --db-cluster-parameter-group-name custom3-6-param-grp \
  --parameters
  ParameterName=audit_logs,ParameterValue=enabled,ApplyMethod=pending-reboot \
```

```
ParameterName=ttl_monitor,ParameterValue=enabled,ApplyMethod=pending-reboot
```

Output:

```
{
  "DBClusterParameterGroupName": "custom3-6-param-grp"
}
```

For more information, see [Modifying an Amazon DocumentDB Cluster Parameter Group](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

modify-db-cluster-snapshot-attribute

The following code example shows how to use `modify-db-cluster-snapshot-attribute`.

AWS CLI**Example 1: To add an attribute to an Amazon DocumentDB snapshot**

The following `modify-db-cluster-snapshot-attribute` example adds four attribute values to an Amazon DocumentDB cluster snapshot.

```
aws docdb modify-db-cluster-snapshot-attribute \
  --db-cluster-snapshot-identifier sample-cluster-snapshot \
  --attribute-name restore \
  --values-to-add all 123456789011 123456789012 123456789013
```

Output:

```
{
  "DBClusterSnapshotAttributesResult": {
    "DBClusterSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AttributeValues": [
          "all",
          "123456789011",
          "123456789012",
          "123456789013"
        ]
      }
    ]
  }
}
```

```

    ]
  },
  "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
}

```

Example 2: To remove attributes from an Amazon DocumentDB snapshot

The following `modify-db-cluster-snapshot-attribute` example removes two attribute values from an Amazon DocumentDB cluster snapshot.

```

aws docdb modify-db-cluster-snapshot-attribute \
  --db-cluster-snapshot-identifier sample-cluster-snapshot \
  --attribute-name restore \
  --values-to-remove 123456789012 all

```

Output:

```

{
  "DBClusterSnapshotAttributesResult": {
    "DBClusterSnapshotAttributes": [
      {
        "AttributeName": "restore",
        "AttributeValues": [
          "123456789011",
          "123456789013"
        ]
      }
    ],
    "DBClusterSnapshotIdentifier": "sample-cluster-snapshot"
  }
}

```

For more information, see [ModifyDBClusterSnapshotAttribute](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbClusterSnapshotAttribute](#) in *AWS CLI Command Reference*.

modify-db-cluster

The following code example shows how to use `modify-db-cluster`.

AWS CLI

To modify an Amazon DocumentDB cluster

The following `modify-db-cluster` example modifies the Amazon DocumentDB cluster `sample-cluster` by making the retention period for automatic backups 7 days, and changing the preferred windows for both backups and maintenance. All changes are applied at the next maintenance window.

```
aws docdb modify-db-cluster \  
  --db-cluster-identifier sample-cluster \  
  --no-apply-immediately \  
  --backup-retention-period 7 \  
  --preferred-backup-window 18:00-18:30 \  
  --preferred-maintenance-window sun:20:00-sun:20:30
```

Output:

```
{  
  "DBCluster": {  
    "Endpoint": "sample-cluster.cluster-corcjozrlsfc.us-  
west-2.docdb.amazonaws.com",  
    "DBClusterMembers": [  
      {  
        "DBClusterParameterGroupStatus": "in-sync",  
        "DBInstanceIdentifier": "sample-cluster",  
        "IsClusterWriter": true,  
        "PromotionTier": 1  
      },  
      {  
        "DBClusterParameterGroupStatus": "in-sync",  
        "DBInstanceIdentifier": "sample-cluster2",  
        "IsClusterWriter": false,  
        "PromotionTier": 2  
      }  
    ],  
    "HostedZoneId": "ZNKXH85TT8WVW",  
    "StorageEncrypted": false,  
    "PreferredBackupWindow": "18:00-18:30",  
    "MultiAZ": true,  
    "EngineVersion": "3.6.0",  
    "MasterUsername": "master-user",
```

```

    "ReaderEndpoint": "sample-cluster.cluster-ro-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
    "DBSubnetGroup": "default",

            "VpcSecurityGroupId": "sg-77186e0d",
            "Status": "active"
        }
    ],
    "Port": 27017
}
}

```

For more information, see [Modifying an Amazon DocumentDB Cluster](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbCluster](#) in *AWS CLI Command Reference*.

modify-db-instance

The following code example shows how to use `modify-db-instance`.

AWS CLI

To modify an Amazon DocumentDB instance

The following `modify-db-instance` example modifies the Amazon DocumentDB instance `sample-cluster2` by changing its instance class to `db.r4.4xlarge` and its promotion tier to 5. The changes are applied immediately but can only be seen after the instances status is available.

```
aws docdb modify-db-instance \  
  --db-instance-identifier sample-cluster2 \  
  --apply-immediately \  
  --db-instance-class db.r4.4xlarge \  
  --promotion-tier 5
```

Output:

```
{  
  "DBInstance": {  
    "EngineVersion": "3.6.0",  
    "StorageEncrypted": false,  
    "DBInstanceClass": "db.r4.large",  
    "PreferredMaintenanceWindow": "mon:08:39-mon:09:09",  
    "AutoMinorVersionUpgrade": true,  
    "VpcSecurityGroups": [  
      {  
        "VpcSecurityGroupId": "sg-77186e0d",  
        "Status": "active"  
      }  
    ],  
    "PreferredBackupWindow": "18:00-18:30",  
    "EnabledCloudwatchLogsExports": [  
      "audit"  
    ],  
    "AvailabilityZone": "us-west-2f",  
    "DBInstanceIdentifier": "sample-cluster2",  
    "InstanceCreateTime": "2019-03-15T20:36:06.338Z",

- For API details, see [ModifyDbInstance](#) in *AWS CLI Command Reference*.

modify-db-subnet-group

The following code example shows how to use `modify-db-subnet-group`.

AWS CLI

To modify an Amazon DocumentDB subnet group

The following `modify-db-subnet-group` example modifies the subnet group `sample-subnet-group` by adding the specified subnets and a new description.

```
aws docdb modify-db-subnet-group \  
  --db-subnet-group-name sample-subnet-group \  
  --subnet-ids subnet-b3806e8f subnet-53ab3636 subnet-991cb8d0 \  
  --db-subnet-group-description "New subnet description"
```

Output:

```
{  
  "DBSubnetGroup": {  
    "DBSubnetGroupName": "sample-subnet-group",  
    "SubnetGroupStatus": "Complete",  
    "DBSubnetGroupArn": "arn:aws:rds:us-west-2:123456789012:subgrp:sample-  
subnet-group",  
    "VpcId": "vpc-91280df6",  
    "DBSubnetGroupDescription": "New subnet description",  
    "Subnets": [  
      {  
        "SubnetIdentifier": "subnet-b3806e8f",  
        "SubnetStatus": "Active",  
        "SubnetAvailabilityZone": {  
          "Name": "us-west-2a"  
        }  
      }  
    ]  
  }  
}
```

```

    },
    {
      "SubnetIdentifier": "subnet-53ab3636",
      "SubnetStatus": "Active",
      "SubnetAvailabilityZone": {
        "Name": "us-west-2c"
      }
    },
    {
      "SubnetIdentifier": "subnet-991cb8d0",
      "SubnetStatus": "Active",
      "SubnetAvailabilityZone": {
        "Name": "us-west-2b"
      }
    }
  ]
}

```

For more information, see [Modifying an Amazon DocumentDB Subnet Group](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ModifyDbSubnetGroup](#) in *AWS CLI Command Reference*.

reboot-db-instance

The following code example shows how to use `reboot-db-instance`.

AWS CLI

To reboot an Amazon DocumentDB instance

The following `reboot-db-instance` example reboots the Amazon DocumentDB instance `sample-cluster2`.

```
aws docdb reboot-db-instance \
  --db-instance-identifier sample-cluster2
```

This command produces no output. Output:

```
{
  "DBInstance": {
    "PreferredBackupWindow": "18:00-18:30",
```

```
"DBInstanceIdentifier": "sample-cluster2",
"VpcSecurityGroups": [

    "DBInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:sample-cluster2",
    "DBInstanceStatus": "rebooting"
  }
}

```

For more information, see [Rebooting an Amazon DocumentDB Instance](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RebootDbInstance](#) in *AWS CLI Command Reference*.

remove-tags-from-resource

The following code example shows how to use `remove-tags-from-resource`.

AWS CLI

To remove tags from an Amazon DocumentDB resource

The following `remove-tags-from-resource` example removes the tag with the key named `B` from the Amazon DocumentDB cluster `sample-cluster`.

```
aws docdb remove-tags-from-resource \
```

```
--resource-name arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster \  
--tag-keys B
```

This command produces no output.

For more information, see [Removing Tags from an Amazon DocumentDBResource](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RemoveTagsFromResource](#) in *AWS CLI Command Reference*.

reset-db-cluster-parameter-group

The following code example shows how to use `reset-db-cluster-parameter-group`.

AWS CLI

To reset the specified parameter value to its defaults in an Amazon DocumentDB parameter group

The following `reset-db-cluster-parameter-group` example resets the parameter `ttl_monitor` in the Amazon DocumentDB parameter group `custom3-6-param-grp` to its default value.

```
aws docdb reset-db-cluster-parameter-group \  
  --db-cluster-parameter-group-name custom3-6-param-grp \  
  --parameters ParameterName=ttl_monitor,ApplyMethod=immediate
```

Output:

```
{  
  "DBClusterParameterGroupName": "custom3-6-param-grp"  
}
```

For more information, see title in the *Amazon DocumentDB Developer Guide*.

To reset specified or all parameter values to their defaults in an Amazon DocumentDB parameter group

The following `reset-db-cluster-parameter-group` example resets all parameters in the Amazon DocumentDB parameter group `custom3-6-param-grp` to their default value.

```
aws docdb reset-db-cluster-parameter-group \  
  --db-cluster-parameter-group-name custom3-6-param-grp
```

```
--db-cluster-parameter-group-name custom3-6-param-grp \  
--reset-all-parameters
```

Output:

```
{  
  "DBClusterParameterGroupName": "custom3-6-param-grp"  
}
```

For more information, see [Resetting an Amazon DocumentDB Cluster Parameter Group](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [ResetDbClusterParameterGroup](#) in *AWS CLI Command Reference*.

restore-db-cluster-from-snapshot

The following code example shows how to use `restore-db-cluster-from-snapshot`.

AWS CLI**To restore an Amazon DocumentDB cluster from an automatic or manual snapshot**

The following `restore-db-cluster-from-snapshot` example creates a new Amazon DocumentDB cluster named `sample-cluster-2019-03-16-00-01-restored` from the snapshot `rds:sample-cluster-2019-03-16-00-01`.

```
aws docdb restore-db-cluster-from-snapshot \  
  --db-cluster-identifier sample-cluster-2019-03-16-00-01-restored \  
  --engine docdb \  
  --snapshot-identifier rds:sample-cluster-2019-03-16-00-01
```

Output:

```
{  
  "DBCluster": {  
    "ClusterCreateTime": "2019-03-19T18:45:01.857Z",  
    "HostedZoneId": "ZNKXH85TT8WVW",  
    "Engine": "docdb",  
    "DBClusterMembers": [],  
    "MultiAZ": false,  
    "AvailabilityZones": [  
      "us-west-2a",
```

```

        "us-west-2c",
        "us-west-2b"
    ],
    "StorageEncrypted": false,
    "ReaderEndpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-ro-
corcjzrlsfc.us-west-2.docdb.amazonaws.com",
    "Endpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-

            "VpcSecurityGroupId": "sg-77186e0d"
        }
    ]
}
}

```

For more information, see [Restoring from a Cluster Snapshot](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RestoreDbClusterFromSnapshot](#) in *AWS CLI Command Reference*.

restore-db-cluster-to-point-in-time

The following code example shows how to use `restore-db-cluster-to-point-in-time`.

AWS CLI

To restore an Amazon DocumentDB cluster to a point-in-time from a manual snapshot

The following `restore-db-cluster-to-point-in-time` example uses the `sample-cluster-snapshot` to create a new Amazon DocumentDB cluster, `sample-cluster-pit`, using the latest restorable time.

```
aws docdb restore-db-cluster-to-point-in-time \  
  --db-cluster-identifier sample-cluster-pit \  
  --source-db-cluster-identifier arn:aws:rds:us-  
west-2:123456789012:cluster:sample-cluster \  
  --use-latest-restorable-time
```

Output:

```
{  
  "DBCluster": {  
    "StorageEncrypted": false,  
    "BackupRetentionPeriod": 3,  
    "MasterUsername": "master-user",  
    "HostedZoneId": "ZNKXH85TT8WVW",  
    "PreferredBackupWindow": "00:00-00:30",  
    "MultiAZ": false,  
    "DBClusterIdentifier": "sample-cluster-pit",  
    "DBSubnetGroup": "default",  
    "ClusterCreateTime": "2019-04-03T15:55:21.320Z",  
    "AssociatedRoles": [],  
    "DBClusterParameterGroup": "default.docdb3.6",  
    "DBClusterMembers": [],  
    "Status": "creating",  
    "AvailabilityZones": [  
      "us-west-2a",  
      "us-west-2d",  
      "us-west-2b"  
    ],  
    "ReaderEndpoint": "sample-cluster-pit.cluster-ro-corcjozrlsfc.us-  
west-2.docdb.amazonaws.com",  
    "Port": 27017,  
    "Engine": "docdb",  
    "EngineVersion": "3.6.0",  
    "VpcSecurityGroups": [  
      {  
        "VpcSecurityGroupId": "sg-77186e0d",  
        "Status": "active"  
      }  
    ],  
  },  
}
```

```
    "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
    "Endpoint": "sample-cluster-pit.cluster-corcjozrlsfc.us-
west-2.docdb.amazonaws.com",
    "DbClusterResourceId": "cluster-NLCABBX0SE2QPQ4GOLZIFWEPLM",
    "DBClusterArn": "arn:aws:rds:us-west-2:123456789012:cluster:sample-cluster-
pit"
  }
}
```

For more information, see [Restoring a Snapshot to a Point in Time](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [RestoreDbClusterToPointInTime](#) in *AWS CLI Command Reference*.

start-db-cluster

The following code example shows how to use `start-db-cluster`.

AWS CLI

To start a stopped Amazon DocumentDB cluster

The following `start-db-cluster` example starts the specified Amazon DocumentDB cluster.

```
aws docdb start-db-cluster \
  --db-cluster-identifier sample-cluster
```

Output:

```
{
  "DBCluster": {
    "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
    "HostedZoneId": "ZNKXH85TT8WVW",
    "Engine": "docdb",
    "DBClusterMembers": [],
    "MultiAZ": false,
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1c",
      "us-east-1f"
    ],
    "StorageEncrypted": false,
```

```

    "ReaderEndpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-ro-
corcjzrlsfc.us-east-1.docdb.amazonaws.com",
    "Endpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-
corcjzrlsfc.us-east-1.docdb.amazonaws.com",
    "Port": 27017,
    "PreferredBackupWindow": "00:00-00:30",
    "DBSubnetGroup": "default",
    "DBClusterIdentifier": "sample-cluster-2019-03-16-00-01-restored",
    "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
    "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:sample-
cluster-2019-03-16-00-01-restored",
    "DBClusterParameterGroup": "default.docdb3.6",
    "DbClusterResourceId": "cluster-X0046Q3RH4LWSYNH3NMZKXPISU",
    "MasterUsername": "master-user",
    "EngineVersion": "3.6.0",
    "BackupRetentionPeriod": 3,
    "AssociatedRoles": [],
    "Status": "creating",
    "VpcSecurityGroups": [
      {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
      }
    ]
  }
}

```

For more information, see [Stopping and Starting an Amazon DocumentDB Cluster](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [StartDbCluster](#) in *AWS CLI Command Reference*.

stop-db-cluster

The following code example shows how to use stop-db-cluster.

AWS CLI

To stop a running Amazon DocumentDB cluster

The following stop-db-cluster example stops the specified Amazon DocumentDB cluster.

```
aws docdb stop-db-cluster \
```

```
--db-cluster-identifier sample-cluster
```

Output:

```
{
  "DBCluster": {
    "ClusterCreateTime": "2019-03-19T18:45:01.857Z",
    "HostedZoneId": "ZNKXH85TT8WVW",
    "Engine": "docdb",
    "DBClusterMembers": [],
    "MultiAZ": false,
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1c",
      "us-east-1f"
    ],
    "StorageEncrypted": false,
    "ReaderEndpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-ro-
corcjorzrlsfc.us-east-1.docdb.amazonaws.com",
    "Endpoint": "sample-cluster-2019-03-16-00-01-restored.cluster-
corcjorzrlsfc.us-east-1.docdb.amazonaws.com",
    "Port": 27017,
    "PreferredBackupWindow": "00:00-00:30",
    "DBSubnetGroup": "default",
    "DBClusterIdentifier": "sample-cluster-2019-03-16-00-01-restored",
    "PreferredMaintenanceWindow": "sat:04:30-sat:05:00",
    "DBClusterArn": "arn:aws:rds:us-east-1:123456789012:cluster:sample-
cluster-2019-03-16-00-01-restored",
    "DBClusterParameterGroup": "default.docdb3.6",
    "DbClusterResourceId": "cluster-X0046Q3RH4LWSYNH3NMZKXPISU",
    "MasterUsername": "master-user",
    "EngineVersion": "3.6.0",
    "BackupRetentionPeriod": 3,
    "AssociatedRoles": [],
    "Status": "creating",
    "VpcSecurityGroups": [
      {
        "Status": "active",
        "VpcSecurityGroupId": "sg-77186e0d"
      }
    ]
  }
}
```

For more information, see [Stopping and Starting an Amazon DocumentDB Cluster](#) in the *Amazon DocumentDB Developer Guide*.

- For API details, see [StopDbCluster](#) in *AWS CLI Command Reference*.

DynamoDB examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

batch-get-item

The following code example shows how to use `batch-get-item`.

AWS CLI

To retrieve multiple items from a table

The following `batch-get-items` example reads multiple items from the `MusicCollection` table using a batch of three `GetItem` requests, and requests the number of read capacity units consumed by the operation. The command returns only the `AlbumTitle` attribute.

```
aws dynamodb batch-get-item \  
  --request-items file://request-items.json \  
  --return-consumed-capacity TOTAL
```

Contents of request-items.json:

```
{
  "MusicCollection": {
    "Keys": [
      {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Call Me Today"}
      },
      {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"}
      },
      {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Scared of My Shadow"}
      }
    ],
    "ProjectionExpression": "AlbumTitle"
  }
}
```

Output:

```
{
  "Responses": {
    "MusicCollection": [
      {
        "AlbumTitle": {
          "S": "Somewhat Famous"
        }
      },
      {
        "AlbumTitle": {
          "S": "Blue Sky Blues"
        }
      },
      {
        "AlbumTitle": {
          "S": "Louder Than Ever"
        }
      }
    ]
  }
}
```

```
    },
    "UnprocessedKeys": {},
    "ConsumedCapacity": [
      {
        "TableName": "MusicCollection",
        "CapacityUnits": 1.5
      }
    ]
  }
}
```

For more information, see [Batch Operations](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [BatchGetItem](#) in *AWS CLI Command Reference*.

batch-write-item

The following code example shows how to use `batch-write-item`.

AWS CLI

To add multiple items to a table

The following `batch-write-item` example adds three new items to the `MusicCollection` table using a batch of three `PutItem` requests. It also requests information about the number of write capacity units consumed by the operation and any item collections modified by the operation.

```
aws dynamodb batch-write-item \
  --request-items file://request-items.json \
  --return-consumed-capacity INDEXES \
  --return-item-collection-metrics SIZE
```

Contents of `request-items.json`:

```
{
  "MusicCollection": [
    {
      "PutRequest": {
        "Item": {
          "Artist": {"S": "No One You Know"},
          "SongTitle": {"S": "Call Me Today"},
          "AlbumTitle": {"S": "Somewhat Famous"}
        }
      }
    }
  ]
}
```

```

    }
  },
  {
    "PutRequest": {
      "Item": {
        "Artist": {"S": "Acme Band"},
        "SongTitle": {"S": "Happy Day"},
        "AlbumTitle": {"S": "Songs About Life"}
      }
    }
  },
  {
    "PutRequest": {
      "Item": {
        "Artist": {"S": "No One You Know"},
        "SongTitle": {"S": "Scared of My Shadow"},
        "AlbumTitle": {"S": "Blue Sky Blues"}
      }
    }
  }
]
}

```

Output:

```

{
  "UnprocessedItems": {},
  "ItemCollectionMetrics": {
    "MusicCollection": [
      {
        "ItemCollectionKey": {
          "Artist": {
            "S": "No One You Know"
          }
        },
        "SizeEstimateRangeGB": [
          0.0,
          1.0
        ]
      },
      {
        "ItemCollectionKey": {

```

```

        "Artist": {
            "S": "Acme Band"
        }
    },
    "SizeEstimateRangeGB": [
        0.0,
        1.0
    ]
}
]
},
"ConsumedCapacity": [
    {
        "TableName": "MusicCollection",
        "CapacityUnits": 6.0,
        "Table": {
            "CapacityUnits": 3.0
        },
        "LocalSecondaryIndexes": {
            "AlbumTitleIndex": {
                "CapacityUnits": 3.0
            }
        }
    }
]
}

```

For more information, see [Batch Operations](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [BatchWriteItem](#) in *AWS CLI Command Reference*.

create-backup

The following code example shows how to use create-backup.

AWS CLI

To create a backup for an existing DynamoDB table

The following create-backup example creates a backup of the MusicCollection table.

```

aws dynamodb create-backup \
    --table-name MusicCollection \

```

```
--backup-name MusicCollectionBackup
```

Output:

```
{
  "BackupDetails": {
    "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/
backup/01576616366715-b4e58d3a",
    "BackupName": "MusicCollectionBackup",
    "BackupSizeBytes": 0,
    "BackupStatus": "CREATING",
    "BackupType": "USER",
    "BackupCreationDateTime": 1576616366.715
  }
}
```

For more information, see [On-Demand Backup and Restore for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [CreateBackup](#) in *AWS CLI Command Reference*.

create-global-table

The following code example shows how to use `create-global-table`.

AWS CLI

To create a global table

The following `create-global-table` example creates a global table from two identical tables in the specified, separate AWS Regions.

```
aws dynamodb create-global-table \  
  --global-table-name MusicCollection \  
  --replication-group RegionName=us-east-2 RegionName=us-east-1 \  
  --region us-east-2
```

Output:

```
{
```

```
"GlobalTableDescription": {
  "ReplicationGroup": [
    {
      "RegionName": "us-east-2"
    },
    {
      "RegionName": "us-east-1"
    }
  ],
  "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/
MusicCollection",
  "CreationDateTime": 1576625818.532,
  "GlobalTableStatus": "CREATING",
  "GlobalTableName": "MusicCollection"
}
}
```

For more information, see [DynamoDB Global Tables](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [CreateGlobalTable](#) in *AWS CLI Command Reference*.

create-table

The following code example shows how to use `create-table`.

AWS CLI

Example 1: To create a table with tags

The following `create-table` example uses the specified attributes and key schema to create a table named `MusicCollection`. This table uses provisioned throughput and is encrypted at rest using the default AWS owned CMK. The command also applies a tag to the table, with a key of `Owner` and a value of `blueTeam`.

```
aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S
AttributeName=SongTitle,AttributeType=S \
  --key-schema AttributeName=Artist,KeyType=HASH
AttributeName=SongTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
  --tags Key=Owner,Value=blueTeam
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "ProvisionedThroughput": {
      "NumberOfDecreasesToday": 0,
      "WriteCapacityUnits": 5,
      "ReadCapacityUnits": 5
    },
    "TableSizeBytes": 0,
    "TableName": "MusicCollection",
    "TableStatus": "CREATING",
    "KeySchema": [
      {
        "KeyType": "HASH",
        "AttributeName": "Artist"
      },
      {
        "KeyType": "RANGE",
        "AttributeName": "SongTitle"
      }
    ],
    "ItemCount": 0,
    "CreationDateTime": "2020-05-26T16:04:41.627000-07:00",
    "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
    "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
  }
}
```

For more information, see [Basic Operations for Tables](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To create a table in On-Demand Mode

The following example creates a table called `MusicCollection` using on-demand mode, rather than provisioned throughput mode. This is useful for tables with unpredictable workloads.

```
aws dynamodb create-table \  
  --table-name MusicCollection \  
  --attribute-definitions AttributeName=Artist,AttributeType=S \  
  AttributeName=SongTitle,AttributeType=S \  
  --key-schema AttributeName=Artist,KeyType=HASH \  
  AttributeName=SongTitle,KeyType=RANGE \  
  --billing-mode PAY_PER_REQUEST
```

Output:

```
{  
  "TableDescription": {  
    "AttributeDefinitions": [  
      {  
        "AttributeName": "Artist",  
        "AttributeType": "S"  
      },  
      {  
        "AttributeName": "SongTitle",  
        "AttributeType": "S"  
      }  
    ],  
    "TableName": "MusicCollection",  
    "KeySchema": [  
      {  
        "AttributeName": "Artist",  
        "KeyType": "HASH"  
      },  
      {  
        "AttributeName": "SongTitle",  
        "KeyType": "RANGE"  
      }  
    ],  
    "TableStatus": "CREATING",  
    "CreationDateTime": "2020-05-27T11:44:10.807000-07:00",  
    "ProvisionedThroughput": {  
      "NumberOfDecreasesToday": 0,  
      "ReadCapacityUnits": 0,  
      "WriteCapacityUnits": 0  
    }  
  }  
}
```

```

    },
    "TableSizeBytes": 0,
    "ItemCount": 0,
    "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
    "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "BillingModeSummary": {
      "BillingMode": "PAY_PER_REQUEST"
    }
  }
}

```

For more information, see [Basic Operations for Tables](#) in the *Amazon DynamoDB Developer Guide*.

Example 3: To create a table and encrypt it with a Customer Managed CMK

The following example creates a table named `MusicCollection` and encrypts it using a customer managed CMK.

```

aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S \
  AttributeName=SongTitle,AttributeType=S \
  --key-schema AttributeName=Artist,KeyType=HASH \
  AttributeName=SongTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=5,WriteCapacityUnits=5 \
  --sse-specification Enabled=true,SSEType=KMS,KMSMasterKeyId=abcd1234-abcd-1234-
a123-ab1234a1b234

```

Output:

```

{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],

```

```

    }
  }
}

```

For more information, see [Basic Operations for Tables](#) in the *Amazon DynamoDB Developer Guide*.

Example 4: To create a table with a Local Secondary Index

The following example uses the specified attributes and key schema to create a table named `MusicCollection` with a Local Secondary Index named `AlbumTitleIndex`.

```

aws dynamodb create-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=Artist,AttributeType=S
  AttributeName=SongTitle,AttributeType=S AttributeName=AlbumTitle,AttributeType=S \

```

```

--key-schema AttributeName=Artist,KeyType=HASH
AttributeName=SongTitle,KeyType=RANGE \
--provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
--local-secondary-indexes \
  "[
    {
      \"IndexName\": \"AlbumTitleIndex\",
      \"KeySchema\": [
        {\"AttributeName\": \"Artist\", \"KeyType\": \"HASH\"},
        {\"AttributeName\": \"AlbumTitle\", \"KeyType\": \"RANGE\"}
      ],
      \"Projection\": {
        \"ProjectionType\": \"INCLUDE\",
        \"NonKeyAttributes\": [\"Genre\", \"Year\"]
      }
    }
  ]"

```

Output:

```

{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {

```

```
        "AttributeName": "SongTitle",
        "KeyType": "RANGE"
    }
],
"TableStatus": "CREATING",
"CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
"ProvisionedThroughput": {
    "NumberOfDecreasesToday": 0,
    "ReadCapacityUnits": 10,
    "WriteCapacityUnits": 5
},
"TableSizeBytes": 0,
"ItemCount": 0,
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"LocalSecondaryIndexes": [
    {
        "IndexName": "AlbumTitleIndex",
        "KeySchema": [
            {
                "AttributeName": "Artist",
                "KeyType": "HASH"
            },
            {
                "AttributeName": "AlbumTitle",
                "KeyType": "RANGE"
            }
        ],
        "Projection": {
            "ProjectionType": "INCLUDE",
            "NonKeyAttributes": [
                "Genre",
                "Year"
            ]
        },
        "IndexSizeBytes": 0,
        "ItemCount": 0,
        "IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/index/AlbumTitleIndex"
    }
]
}
}
```

For more information, see [Basic Operations for Tables](#) in the *Amazon DynamoDB Developer Guide*.

Example 5: To create a table with a Global Secondary Index

The following example creates a table named `GameScores` with a Global Secondary Index called `GameTitleIndex`. The base table has a partition key of `UserId` and a sort key of `GameTitle`, allowing you to find an individual user's best score for a specific game efficiently, whereas the GSI has a partition key of `GameTitle` and a sort key of `TopScore`, allowing you to quickly find the overall highest score for a particular game.

```
aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S
  AttributeName=GameTitle,AttributeType=S AttributeName=TopScore,AttributeType=N \
  --key-schema AttributeName=UserId,KeyType=HASH \
    AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --global-secondary-indexes \
    "[
      {
        \"IndexName\": \"GameTitleIndex\",
        \"KeySchema\": [
          {\"AttributeName\": \"GameTitle\", \"KeyType\": \"HASH\"},
          {\"AttributeName\": \"TopScore\", \"KeyType\": \"RANGE\"}
        ],
        \"Projection\": {
          \"ProjectionType\": \"INCLUDE\",
          \"NonKeyAttributes\": [\"UserId\"]
        },
        \"ProvisionedThroughput\": {
          \"ReadCapacityUnits\": 10,
          \"WriteCapacityUnits\": 5
        }
      }
    ]"
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
```

```
    {
      "AttributeName": "GameTitle",
      "AttributeType": "S"
    },
    {
      "AttributeName": "TopScore",
      "AttributeType": "N"
    },
    {
      "AttributeName": "UserId",
      "AttributeType": "S"
    }
  ],
  "TableName": "GameScores",
  "KeySchema": [
    {
      "AttributeName": "UserId",
      "KeyType": "HASH"
    },
    {
      "AttributeName": "GameTitle",
      "KeyType": "RANGE"
    }
  ],
  "TableStatus": "CREATING",
  "CreationDateTime": "2020-05-26T17:28:15.602000-07:00",
  "ProvisionedThroughput": {
    "NumberOfDecreasesToday": 0,
    "ReadCapacityUnits": 10,
    "WriteCapacityUnits": 5
  },
  "TableSizeBytes": 0,
  "ItemCount": 0,
  "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
  "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "GlobalSecondaryIndexes": [
    {
      "IndexName": "GameTitleIndex",
      "KeySchema": [
        {
          "AttributeName": "GameTitle",
          "KeyType": "HASH"
        }
      ]
    }
  ]
}
```

```

        "AttributeName": "TopScore",
        "KeyType": "RANGE"
    }
],
"Projection": {
    "ProjectionType": "INCLUDE",
    "NonKeyAttributes": [
        "UserId"
    ]
},
"IndexStatus": "CREATING",
"ProvisionedThroughput": {
    "NumberOfDecreasesToday": 0,
    "ReadCapacityUnits": 10,
    "WriteCapacityUnits": 5
},
"IndexSizeBytes": 0,
"ItemCount": 0,
"IndexArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/index/GameTitleIndex"
    }
]
}
}

```

For more information, see [Basic Operations for Tables](#) in the *Amazon DynamoDB Developer Guide*.

Example 6: To create a table with multiple Global Secondary Indexes at once

The following example creates a table named GameScores with two Global Secondary Indexes. The GSI schemas are passed via a file, rather than on the command line.

```

aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S
AttributeName=GameTitle,AttributeType=S AttributeName=TopScore,AttributeType=N
AttributeName=Date,AttributeType=S \
  --key-schema AttributeName=UserId,KeyType=HASH
AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --global-secondary-indexes file://gsi.json

```

Contents of `gsi.json`:

```
[
  {
    "IndexName": "GameTitleIndex",
    "KeySchema": [
      {
        "AttributeName": "GameTitle",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "TopScore",
        "KeyType": "RANGE"
      }
    ],
    "Projection": {
      "ProjectionType": "ALL"
    },
    "ProvisionedThroughput": {
      "ReadCapacityUnits": 10,
      "WriteCapacityUnits": 5
    }
  },
  {
    "IndexName": "GameDateIndex",
    "KeySchema": [
      {
        "AttributeName": "GameTitle",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "Date",
        "KeyType": "RANGE"
      }
    ],
    "Projection": {
      "ProjectionType": "ALL"
    },
    "ProvisionedThroughput": {
      "ReadCapacityUnits": 5,
      "WriteCapacityUnits": 5
    }
  }
]
```

```
]
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Date",
        "AttributeType": "S"
      },
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "TopScore",
        "AttributeType": "N"
      },

  }
]
}
}

```

For more information, see [Basic Operations for Tables](#) in the *Amazon DynamoDB Developer Guide*.

Example 7: To create a table with Streams enabled

The following example creates a table called GameScores with DynamoDB Streams enabled. Both new and old images of each item will be written to the stream.

```

aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S
AttributeName=GameTitle,AttributeType=S \
  --key-schema AttributeName=UserId,KeyType=HASH
AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --stream-specification StreamEnabled=TRUE,StreamViewType=NEW_AND_OLD_IMAGES

```

Output:

```

{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      },
      {

```

```

        "AttributeName": "UserId",
        "AttributeType": "S"
    }
],
"TableName": "GameScores",
"KeySchema": [
    {
        "AttributeName": "UserId",
        "KeyType": "HASH"
    },
    {
        "AttributeName": "GameTitle",
        "KeyType": "RANGE"
    }
],
"TableStatus": "CREATING",
"CreationDateTime": "2020-05-27T10:49:34.056000-07:00",
"ProvisionedThroughput": {
    "NumberOfDecreasesToday": 0,
    "ReadCapacityUnits": 10,
    "WriteCapacityUnits": 5
},
"TableSizeBytes": 0,
"ItemCount": 0,
"TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
"TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"StreamSpecification": {
    "StreamEnabled": true,
    "StreamViewType": "NEW_AND_OLD_IMAGES"
},
"LatestStreamLabel": "2020-05-27T17:49:34.056",
"LatestStreamArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/stream/2020-05-27T17:49:34.056"
}
}

```

For more information, see [Basic Operations for Tables](#) in the *Amazon DynamoDB Developer Guide*.

Example 8: To create a table with Keys-Only Stream enabled

The following example creates a table called `GameScores` with DynamoDB Streams enabled. Only the key attributes of modified items are written to the stream.

```
aws dynamodb create-table \  
  --table-name GameScores \  
  --attribute-definitions AttributeName=UserId,AttributeType=S  
  AttributeName=GameTitle,AttributeType=S \  
  --key-schema AttributeName=UserId,KeyType=HASH  
  AttributeName=GameTitle,KeyType=RANGE \  
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \  
  --stream-specification StreamEnabled=TRUE,StreamViewType=KEYS_ONLY
```

Output:

```
{  
  "TableDescription": {  
    "AttributeDefinitions": [  
      {  
        "AttributeName": "GameTitle",  
        "AttributeType": "S"  
      },  
      {  
        "AttributeName": "UserId",  
        "AttributeType": "S"  
      }  
    ],  
    "TableName": "GameScores",  
    "KeySchema": [  
      {  
        "AttributeName": "UserId",  
        "KeyType": "HASH"  
      },  
      {  
        "AttributeName": "GameTitle",  
        "KeyType": "RANGE"  
      }  
    ],  
    "TableStatus": "CREATING",  
    "CreationDateTime": "2023-05-25T18:45:34.140000+00:00",  
    "ProvisionedThroughput": {  
      "NumberOfDecreasesToday": 0,  
      "ReadCapacityUnits": 10,  
      "WriteCapacityUnits": 5  
    },  
    "TableSizeBytes": 0,  
    "ItemCount": 0,  
  }  
}
```

```

    "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
    "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "StreamSpecification": {
      "StreamEnabled": true,
      "StreamViewType": "KEYS_ONLY"
    },
    "LatestStreamLabel": "2023-05-25T18:45:34.140",
    "LatestStreamArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
GameScores/stream/2023-05-25T18:45:34.140",
    "DeletionProtectionEnabled": false
  }
}

```

For more information, see [Change data capture for DynamoDB Streams](#) in the *Amazon DynamoDB Developer Guide*.

Example 9: To create a table with the Standard Infrequent Access class

The following example creates a table called GameScores and assigns the Standard-Infrequent Access (DynamoDB Standard-IA) table class. This table class is optimized for storage being the dominant cost.

```

aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S
AttributeName=GameTitle,AttributeType=S \
  --key-schema AttributeName=UserId,KeyType=HASH
AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \
  --table-class STANDARD_INFREQUENT_ACCESS

```

Output:

```

{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "UserId",
        "AttributeType": "S"
      }
    ]
  }
}

```

```

    }
  ],
  "TableName": "GameScores",
  "KeySchema": [
    {
      "AttributeName": "UserId",
      "KeyType": "HASH"
    },
    {
      "AttributeName": "GameTitle",
      "KeyType": "RANGE"
    }
  ],
  "TableStatus": "CREATING",
  "CreationDateTime": "2023-05-25T18:33:07.581000+00:00",
  "ProvisionedThroughput": {
    "NumberOfDecreasesToday": 0,
    "ReadCapacityUnits": 10,
    "WriteCapacityUnits": 5
  },
  "TableSizeBytes": 0,
  "ItemCount": 0,
  "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
  "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "TableClassSummary": {
    "TableClass": "STANDARD_INFREQUENT_ACCESS"
  },
  "DeletionProtectionEnabled": false
}
}

```

For more information, see [Table classes](#) in the *Amazon DynamoDB Developer Guide*.

Example 10: To Create a table with Delete Protection enabled

The following example creates a table called GameScores and enables deletion protection.

```

aws dynamodb create-table \
  --table-name GameScores \
  --attribute-definitions AttributeName=UserId,AttributeType=S \
  AttributeName=GameTitle,AttributeType=S \
  --key-schema AttributeName=UserId,KeyType=HASH \
  AttributeName=GameTitle,KeyType=RANGE \
  --provisioned-throughput ReadCapacityUnits=10,WriteCapacityUnits=5 \

```

```
--deletion-protection-enabled
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "GameTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "UserId",
        "AttributeType": "S"
      }
    ],
    "TableName": "GameScores",
    "KeySchema": [
      {
        "AttributeName": "UserId",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "GameTitle",
        "KeyType": "RANGE"
      }
    ],
    "TableStatus": "CREATING",
    "CreationDateTime": "2023-05-25T23:02:17.093000+00:00",
    "ProvisionedThroughput": {
      "NumberOfDecreasesToday": 0,
      "ReadCapacityUnits": 10,
      "WriteCapacityUnits": 5
    },
    "TableSizeBytes": 0,
    "ItemCount": 0,
    "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/GameScores",
    "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "DeletionProtectionEnabled": true
  }
}
```

For more information, see [Using deletion protection](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [CreateTable](#) in *AWS CLI Command Reference*.

delete-backup

The following code example shows how to use delete-backup.

AWS CLI

To delete an existing DynamoDB backup

The following delete-backup example deletes the specified existing backup.

```
aws dynamodb delete-backup \  
  --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/  
  backup/01576616366715-b4e58d3a
```

Output:

```
{  
  "BackupDescription": {  
    "BackupDetails": {  
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/  
MusicCollection/backup/01576616366715-b4e58d3a",  
      "BackupName": "MusicCollectionBackup",  
      "BackupSizeBytes": 0,  
      "BackupStatus": "DELETED",  
      "BackupType": "USER",  
      "BackupCreationDateTime": 1576616366.715  
    },  
    "SourceTableDetails": {  
      "TableName": "MusicCollection",  
      "TableId": "b0c04bcc-309b-4352-b2ae-9088af169fe2",  
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/  
MusicCollection",  
      "TableSizeBytes": 0,  
      "KeySchema": [  
        {  
          "AttributeName": "Artist",  
          "KeyType": "HASH"  
        },  
        {  
          "AttributeName": "SongTitle",
```

```

        "KeyType": "RANGE"
      }
    ],
    "TableCreationDateTime": 1576615228.571,
    "ProvisionedThroughput": {
      "ReadCapacityUnits": 5,
      "WriteCapacityUnits": 5
    },
    "ItemCount": 0,
    "BillingMode": "PROVISIONED"
  },
  "SourceTableFeatureDetails": {}
}
}

```

For more information, see [On-Demand Backup and Restore for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteBackup](#) in *AWS CLI Command Reference*.

delete-item

The following code example shows how to use `delete-item`.

AWS CLI

Example 1: To delete an item

The following `delete-item` example deletes an item from the `MusicCollection` table and requests details about the item that was deleted and the capacity used by the request.

```

aws dynamodb delete-item \
  --table-name MusicCollection \
  --key file://key.json \
  --return-values ALL_OLD \
  --return-consumed-capacity TOTAL \
  --return-item-collection-metrics SIZE

```

Contents of `key.json`:

```

{
  "Artist": {"S": "No One You Know"},

```

```
"SongTitle": {"S": "Scared of My Shadow"}
}
```

Output:

```
{
  "Attributes": {
    "AlbumTitle": {
      "S": "Blue Sky Blues"
    },
    "Artist": {
      "S": "No One You Know"
    },
    "SongTitle": {
      "S": "Scared of My Shadow"
    }
  },
  "ConsumedCapacity": {
    "TableName": "MusicCollection",
    "CapacityUnits": 2.0
  },
  "ItemCollectionMetrics": {
    "ItemCollectionKey": {
      "Artist": {
        "S": "No One You Know"
      }
    },
    "SizeEstimateRangeGB": [
      0.0,
      1.0
    ]
  }
}
```

For more information, see [Writing an Item](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To delete an item conditionally

The following example deletes an item from the ProductCatalog table only if its ProductCategory is either Sporting Goods or Gardening Supplies and its price is between 500 and 600. It returns details about the item that was deleted.

```
aws dynamodb delete-item \
```

```
--table-name ProductCatalog \  
--key '{"Id":{"N":"456"}}' \  
--condition-expression "(ProductCategory IN (:cat1, :cat2)) and (#P between :lo  
and :hi)" \  
--expression-attribute-names file://names.json \  
--expression-attribute-values file://values.json \  
--return-values ALL_OLD
```

Contents of names.json:

```
{  
  "#P": "Price"  
}
```

Contents of values.json:

```
{  
  ":cat1": {"S": "Sporting Goods"},  
  ":cat2": {"S": "Gardening Supplies"},  
  ":lo": {"N": "500"},  
  ":hi": {"N": "600"}  
}
```

Output:

```
{  
  "Attributes": {  
    "Id": {  
      "N": "456"  
    },  
    "Price": {  
      "N": "550"  
    },  
    "ProductCategory": {  
      "S": "Sporting Goods"  
    }  
  }  
}
```

For more information, see [Writing an Item](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteItem](#) in *AWS CLI Command Reference*.

delete-table

The following code example shows how to use `delete-table`.

AWS CLI

To delete a table

The following `delete-table` example deletes the `MusicCollection` table.

```
aws dynamodb delete-table \  
  --table-name MusicCollection
```

Output:

```
{  
  "TableDescription": {  
    "TableStatus": "DELETING",  
    "TableSizeBytes": 0,  
    "ItemCount": 0,  
    "TableName": "MusicCollection",  
    "ProvisionedThroughput": {  
      "NumberOfDecreasesToday": 0,  
      "WriteCapacityUnits": 5,  
      "ReadCapacityUnits": 5  
    }  
  }  
}
```

For more information, see [Deleting a Table](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DeleteTable](#) in *AWS CLI Command Reference*.

describe-backup

The following code example shows how to use `describe-backup`.

AWS CLI

To get information about an existing backup of a table

The following `describe-backup` example displays information about the specified existing backup.

```
aws dynamodb describe-backup \  
  --backup-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/  
backup/01576616366715-b4e58d3a
```

Output:

```
{  
  "BackupDescription": {  
    "BackupDetails": {  
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/  
MusicCollection/backup/01576616366715-b4e58d3a",  
      "BackupName": "MusicCollectionBackup",  
      "BackupSizeBytes": 0,  
      "BackupStatus": "AVAILABLE",  
      "BackupType": "USER",  
      "BackupCreationDateTime": 1576616366.715  
    },  
    "SourceTableDetails": {  
      "TableName": "MusicCollection",  
      "TableId": "b0c04bcc-309b-4352-b2ae-9088af169fe2",  
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/  
MusicCollection",  
      "TableSizeBytes": 0,  
      "KeySchema": [  
        {  
          "AttributeName": "Artist",  
          "KeyType": "HASH"  
        },  
        {  
          "AttributeName": "SongTitle",  
          "KeyType": "RANGE"  
        }  
      ],  
      "TableCreationDateTime": 1576615228.571,  
      "ProvisionedThroughput": {  
        "ReadCapacityUnits": 5,  
        "WriteCapacityUnits": 5  
      },  
      "ItemCount": 0,  
      "BillingMode": "PROVISIONED"  
    },  
    "SourceTableFeatureDetails": {}  
  }  
}
```

```
}
```

For more information, see [On-Demand Backup and Restore for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeBackup](#) in *AWS CLI Command Reference*.

describe-continuous-backups

The following code example shows how to use `describe-continuous-backups`.

AWS CLI

To get information about continuous backups for a DynamoDB table

The following `describe-continuous-backups` example displays details about the continuous backup settings for the `MusicCollection` table.

```
aws dynamodb describe-continuous-backups \  
  --table-name MusicCollection
```

Output:

```
{  
  "ContinuousBackupsDescription": {  
    "ContinuousBackupsStatus": "ENABLED",  
    "PointInTimeRecoveryDescription": {  
      "PointInTimeRecoveryStatus": "DISABLED"  
    }  
  }  
}
```

For more information, see [Point-in-Time Recovery for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeContinuousBackups](#) in *AWS CLI Command Reference*.

describe-contributor-insights

The following code example shows how to use `describe-contributor-insights`.

AWS CLI

To view Contributor Insights settings for a DynamoDB table

The following `describe-contributor-insights` example displays the Contributor Insights settings for the `MusicCollection` table and the `AlbumTitle-index` global secondary index.

```
aws dynamodb describe-contributor-insights \  
  --table-name MusicCollection \  
  --index-name AlbumTitle-index
```

Output:

```
{  
  "TableName": "MusicCollection",  
  "IndexName": "AlbumTitle-index",  
  "ContributorInsightsRuleList": [  
    "DynamoDBContributorInsights-PKC-MusicCollection-1576629651520",  
    "DynamoDBContributorInsights-SKC-MusicCollection-1576629651520",  
    "DynamoDBContributorInsights-PKT-MusicCollection-1576629651520",  
    "DynamoDBContributorInsights-SKT-MusicCollection-1576629651520"  
  ],  
  "ContributorInsightsStatus": "ENABLED",  
  "LastUpdateDateTime": 1576629654.78  
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeContributorInsights](#) in *AWS CLI Command Reference*.

describe-endpoints

The following code example shows how to use `describe-endpoints`.

AWS CLI

To view regional endpoint information

The following `describe-endpoints` example displays details about the endpoints for the current AWS Region.

```
aws dynamodb describe-endpoints
```

Output:

```
{
  "Endpoints": [
    {
      "Address": "dynamodb.us-west-2.amazonaws.com",
      "CachePeriodInMinutes": 1440
    }
  ]
}
```

For more information, see [Amazon DynamoDB Endpoints and Quotas](#) in the *AWS General Reference*.

- For API details, see [DescribeEndpoints](#) in *AWS CLI Command Reference*.

describe-global-table-settings

The following code example shows how to use `describe-global-table-settings`.

AWS CLI**To get information about a DynamoDB global table's settings**

The following `describe-global-table-settings` example displays the settings for the `MusicCollection` global table.

```
aws dynamodb describe-global-table-settings \
  --global-table-name MusicCollection
```

Output:

```
{
  "GlobalTableName": "MusicCollection",
  "ReplicaSettings": [
    {
      "RegionName": "us-east-1",
      "ReplicaStatus": "ACTIVE",
      "ReplicaProvisionedReadCapacityUnits": 10,
      "ReplicaProvisionedReadCapacityAutoScalingSettings": {
```

```

        "AutoScalingDisabled": true
    },
    "ReplicaProvisionedWriteCapacityUnits": 5,
    "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
    }
},
{
    "RegionName": "us-east-2",
    "ReplicaStatus": "ACTIVE",
    "ReplicaProvisionedReadCapacityUnits": 10,
    "ReplicaProvisionedReadCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
    },
    "ReplicaProvisionedWriteCapacityUnits": 5,
    "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
    }
}
]
}

```

For more information, see [DynamoDB Global Tables](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeGlobalTableSettings](#) in *AWS CLI Command Reference*.

describe-global-table

The following code example shows how to use `describe-global-table`.

AWS CLI

To display information about a DynamoDB global table

The following `describe-global-table` example displays details about the `MusicCollection` global table.

```
aws dynamodb describe-global-table \
  --global-table-name MusicCollection
```

Output:

```
{
```

```

    "GlobalTableDescription": {
      "ReplicationGroup": [
        {
          "RegionName": "us-east-2"
        },
        {
          "RegionName": "us-east-1"
        }
      ],
      "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/
MusicCollection",
      "CreationDateTime": 1576625818.532,
      "GlobalTableStatus": "ACTIVE",
      "GlobalTableName": "MusicCollection"
    }
  }
}

```

For more information, see [DynamoDB Global Tables](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeGlobalTable](#) in *AWS CLI Command Reference*.

describe-limits

The following code example shows how to use `describe-limits`.

AWS CLI

To view provisioned-capacity limits

The following `describe-limits` example displays provisioned-capacity limits for your account in the current AWS Region.

```
aws dynamodb describe-limits
```

Output:

```

{
  "AccountMaxReadCapacityUnits": 80000,
  "AccountMaxWriteCapacityUnits": 80000,
  "TableMaxReadCapacityUnits": 40000,
  "TableMaxWriteCapacityUnits": 40000
}

```

For more information, see [Limits in DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeLimits](#) in *AWS CLI Command Reference*.

describe-table-replica-auto-scaling

The following code example shows how to use describe-table-replica-auto-scaling.

AWS CLI

To view auto scaling settings across replicas of a global table

The following describe-table-replica-auto-scaling example displays auto scaling settings across replicas of the MusicCollection global table.

```
aws dynamodb describe-table-replica-auto-scaling \  
  --table-name MusicCollection
```

Output:

```
{  
  "TableAutoScalingDescription": {  
    "TableName": "MusicCollection",  
    "TableStatus": "ACTIVE",  
    "Replicas": [  
      {  
        "RegionName": "us-east-1",  
        "GlobalSecondaryIndexes": [],  
        "ReplicaProvisionedReadCapacityAutoScalingSettings": {  
          "MinimumUnits": 5,  
          "MaximumUnits": 40000,  
          "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/  
aws-service-role/dynamodb.application-autoscaling.amazonaws.com/  
AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",  
          "ScalingPolicies": [  
            {  
              "PolicyName": "DynamoDBReadCapacityUtilization:table/  
MusicCollection",  
              "TargetTrackingScalingPolicyConfiguration": {  
                "TargetValue": 70.0  
              }  
            }  
          ]  
        }  
      ]  
    }  
  }
```

```

    },
    "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
      "MinimumUnits": 5,
      "MaximumUnits": 40000,
      "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/
aws-service-role/dynamodb.application-autoscaling.amazonaws.com/
AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",
      "ScalingPolicies": [
        {
          "PolicyName": "DynamoDBWriteCapacityUtilization:table/
MusicCollection",
          "TargetTrackingScalingPolicyConfiguration": {
            "TargetValue": 70.0
          }
        }
      ]
    },
    "ReplicaStatus": "ACTIVE"
  },
  {
    "RegionName": "us-east-2",
    "GlobalSecondaryIndexes": [],
    "ReplicaProvisionedReadCapacityAutoScalingSettings": {

          }
        }
      ]
    },
    "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
      "MinimumUnits": 5,
      "MaximumUnits": 40000,
      "AutoScalingRoleArn": "arn:aws:iam::123456789012:role/
aws-service-role/dynamodb.application-autoscaling.amazonaws.com/
AWSServiceRoleForApplicationAutoScaling_DynamoDBTable",

```

```

        "ScalingPolicies": [
            {
                "PolicyName": "DynamoDBWriteCapacityUtilization:table/
MusicCollection",
                "TargetTrackingScalingPolicyConfiguration": {
                    "TargetValue": 70.0
                }
            }
        ],
        "ReplicaStatus": "ACTIVE"
    }
]
}
}

```

For more information, see [DynamoDB Global Tables](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeTableReplicaAutoScaling](#) in *AWS CLI Command Reference*.

describe-table

The following code example shows how to use `describe-table`.

AWS CLI

To describe a table

The following `describe-table` example describes the `MusicCollection` table.

```
aws dynamodb describe-table \
  --table-name MusicCollection
```

Output:

```
{
  "Table": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {

```

```

        "AttributeName": "SongTitle",
        "AttributeType": "S"
    }
],
"ProvisionedThroughput": {
    "NumberOfDecreasesToday": 0,
    "WriteCapacityUnits": 5,
    "ReadCapacityUnits": 5
},
"TableSizeBytes": 0,
"TableName": "MusicCollection",
"TableStatus": "ACTIVE",
"KeySchema": [
    {
        "KeyType": "HASH",
        "AttributeName": "Artist"
    },
    {
        "KeyType": "RANGE",
        "AttributeName": "SongTitle"
    }
],
"ItemCount": 0,
"CreationDateTime": 1421866952.062
}
}

```

For more information, see [Describing a Table](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeTable](#) in *AWS CLI Command Reference*.

describe-time-to-live

The following code example shows how to use `describe-time-to-live`.

AWS CLI

To view Time to Live settings for a table

The following `describe-time-to-live` example displays Time to Live settings for the `MusicCollection` table.

```
aws dynamodb describe-time-to-live \
```

```
--table-name MusicCollection
```

Output:

```
{
  "TimeToLiveDescription": {
    "TimeToLiveStatus": "ENABLED",
    "AttributeName": "ttl"
  }
}
```

For more information, see [Time to Live](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [DescribeTimeToLive](#) in *AWS CLI Command Reference*.

get-item

The following code example shows how to use `get-item`.

AWS CLI

Example 1: To read an item in a table

The following `get-item` example retrieves an item from the `MusicCollection` table. The table has a hash-and-range primary key (`Artist` and `SongTitle`), so you must specify both of these attributes. The command also requests information about the read capacity consumed by the operation.

```
aws dynamodb get-item \
  --table-name MusicCollection \
  --key file://key.json \
  --return-consumed-capacity TOTAL
```

Contents of `key.json`:

```
{
  "Artist": {"S": "Acme Band"},
  "SongTitle": {"S": "Happy Day"}
}
```

Output:

```
{
  "Item": {
    "AlbumTitle": {
      "S": "Songs About Life"
    },
    "SongTitle": {
      "S": "Happy Day"
    },
    "Artist": {
      "S": "Acme Band"
    }
  },
  "ConsumedCapacity": {
    "TableName": "MusicCollection",
    "CapacityUnits": 0.5
  }
}
```

For more information, see [Reading an Item](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To read an item using a consistent read

The following example retrieves an item from the `MusicCollection` table using strongly consistent reads.

```
aws dynamodb get-item \
  --table-name MusicCollection \
  --key file://key.json \
  --consistent-read \
  --return-consumed-capacity TOTAL
```

Contents of `key.json`:

```
{
  "Artist": {"S": "Acme Band"},
  "SongTitle": {"S": "Happy Day"}
}
```

Output:

```
{
```

```
"Item": {
  "AlbumTitle": {
    "S": "Songs About Life"
  },
  "SongTitle": {
    "S": "Happy Day"
  },
  "Artist": {
    "S": "Acme Band"
  }
},
"ConsumedCapacity": {
  "TableName": "MusicCollection",
  "CapacityUnits": 1.0
}
}
```

For more information, see [Reading an Item](#) in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve specific attributes of an item

The following example uses a projection expression to retrieve only three attributes of the desired item.

```
aws dynamodb get-item \
  --table-name ProductCatalog \
  --key '{"Id": {"N": "102"}}' \
  --projection-expression "#T, #C, #P" \
  --expression-attribute-names file://names.json
```

Contents of `names.json`:

```
{
  "#T": "Title",
  "#C": "ProductCategory",
  "#P": "Price"
}
```

Output:

```
{
  "Item": {
```

```
    "Price": {
      "N": "20"
    },
    "Title": {
      "S": "Book 102 Title"
    },
    "ProductCategory": {
      "S": "Book"
    }
  }
}
```

For more information, see [Reading an Item](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [GetItem](#) in *AWS CLI Command Reference*.

list-backups

The following code example shows how to use `list-backups`.

AWS CLI

Example 1: To list all existing DynamoDB backups

The following `list-backups` example lists all of your existing backups.

```
aws dynamodb list-backups
```

Output:

```
{
  "BackupSummaries": [
    {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
      "BackupName": "MusicCollectionBackup1",
      "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
```

```

        "BackupSizeBytes": 170
    },
    {
        "TableName": "MusicCollection",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
        "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-b2abc345",
        "BackupName": "MusicCollectionBackup2",
        "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
        "BackupStatus": "AVAILABLE",
        "BackupType": "USER",
        "BackupSizeBytes": 400
    }
]
}

```

For more information, see [On-Demand Backup and Restore for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To list user-created backups in a specific time range

The following example lists only backups of the MusicCollection table that were created by the user (not those automatically created by DynamoDB) with a creation date between January 1, 2020 and March 1, 2020.

```

aws dynamodb list-backups \
  --table-name MusicCollection \
  --time-range-lower-bound 1577836800 \
  --time-range-upper-bound 1583020800 \
  --backup-type USER

```

Output:

```

{
  "BackupSummaries": [
    {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",

```

```

        "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
        "BackupName": "MusicCollectionBackup1",
        "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
        "BackupStatus": "AVAILABLE",
        "BackupType": "USER",
        "BackupSizeBytes": 170
    }
]
}

```

For more information, see [On-Demand Backup and Restore for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 3: To limit page size

The following example returns a list of all existing backups, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```

aws dynamodb list-backups \
  --page-size 1

```

Output:

```

{
  "BackupSummaries": [
    {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
      "BackupName": "MusicCollectionBackup1",
      "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupSizeBytes": 170
    },
    {

```

```

        "TableName": "MusicCollection",
        "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
        "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
        "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-b2abc345",
        "BackupName": "MusicCollectionBackup2",
        "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
        "BackupStatus": "AVAILABLE",
        "BackupType": "USER",
        "BackupSizeBytes": 400
    }
]
}

```

For more information, see [On-Demand Backup and Restore for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 4: To limit the number of items returned

The following example limits the number of items returned to 1. The response includes a `NextToken` value with which to retrieve the next page of results.

```

aws dynamodb list-backups \
  --max-items 1

```

Output:

```

{
  "BackupSummaries": [
    {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01234567890123-a1bcd234",
      "BackupName": "MusicCollectionBackup1",
      "BackupCreationDateTime": "2020-02-12T14:41:51.617000-08:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupSizeBytes": 170
    }
  ]
}

```

```

    ],
    "NextToken":
    "abCDeFGhiJKlMnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
  }

```

For more information, see [On-Demand Backup and Restore for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 5: To retrieve the next page of results

The following command uses the `NextToken` value from a previous call to the `list-backups` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```

aws dynamodb list-backups \
  --starting-token
  abCDeFGhiJKlMnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9

```

Output

```

{
  "BackupSummaries": [
    {
      "TableName": "MusicCollection",
      "TableId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
      "BackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/backup/01234567890123-b2abc345",
      "BackupName": "MusicCollectionBackup2",
      "BackupCreationDateTime": "2020-06-26T11:08:35.431000-07:00",
      "BackupStatus": "AVAILABLE",
      "BackupType": "USER",
      "BackupSizeBytes": 400
    }
  ]
}

```

For more information, see [On-Demand Backup and Restore for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListBackups](#) in *AWS CLI Command Reference*.

list-contributor-insights

The following code example shows how to use `list-contributor-insights`.

AWS CLI

Example 1: To view a list of Contributor Insights summaries

The following `list-contributor-insights` example displays a list of Contributor Insights summaries.

```
aws dynamodb list-contributor-insights
```

Output:

```
{
  "ContributorInsightsSummaries": [
    {
      "TableName": "MusicCollection",
      "IndexName": "AlbumTitle-index",
      "ContributorInsightsStatus": "ENABLED"
    },
    {
      "TableName": "ProductCatalog",
      "ContributorInsightsStatus": "ENABLED"
    },
    {
      "TableName": "Forum",
      "ContributorInsightsStatus": "ENABLED"
    },
    {
      "TableName": "Reply",
      "ContributorInsightsStatus": "ENABLED"
    },
    {
      "TableName": "Thread",
      "ContributorInsightsStatus": "ENABLED"
    }
  ]
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To limit the number of items returned

The following example limits the number of items returned to 4. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-contributor-insights \  
  --max-results 4
```

Output:

```
{  
  "ContributorInsightsSummaries": [  
    {  
      "TableName": "MusicCollection",  
      "IndexName": "AlbumTitle-index",  
      "ContributorInsightsStatus": "ENABLED"  
    },  
    {  
      "TableName": "ProductCatalog",  
      "ContributorInsightsStatus": "ENABLED"  
    },  
    {  
      "TableName": "Forum",  
      "ContributorInsightsStatus": "ENABLED"  
    }  
  ],  
  "NextToken":  
  "abCDeFGhiJKlMnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"  
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve the next page of results

The following command uses the `NextToken` value from a previous call to the `list-contributor-insights` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-contributor-insights \  
  --max-results 4 \  
  --next-token "abCDeFGhiJKlMnOPqrSTuvwxYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
```

```
--next-token
abCDeFGhiJKlMnOPqrSTuvwXYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{
  "ContributorInsightsSummaries": [
    {
      "TableName": "Reply",
      "ContributorInsightsStatus": "ENABLED"
    },
    {
      "TableName": "Thread",
      "ContributorInsightsStatus": "ENABLED"
    }
  ]
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListContributorInsights](#) in *AWS CLI Command Reference*.

list-global-tables

The following code example shows how to use `list-global-tables`.

AWS CLI

To list existing DynamoDB global tables

The following `list-global-tables` example lists all of your existing global tables.

```
aws dynamodb list-global-tables
```

Output:

```
{
  "GlobalTables": [
    {
      "GlobalTableName": "MusicCollection",
      "ReplicationGroup": [
```

```
{
  "RegionName": "us-east-2"
},
{
  "RegionName": "us-east-1"
}
]
}
```

For more information, see [DynamoDB Global Tables](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListGlobalTables](#) in *AWS CLI Command Reference*.

list-tables

The following code example shows how to use `list-tables`.

AWS CLI

Example 1: To list tables

The following `list-tables` example lists all of the tables associated with the current AWS account and Region.

```
aws dynamodb list-tables
```

Output:

```
{
  "TableNames": [
    "Forum",
    "ProductCatalog",
    "Reply",
    "Thread"
  ]
}
```

For more information, see [Listing Table Names](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To limit page size

The following example returns a list of all existing tables, but retrieves only one item in each call, performing multiple calls if necessary to get the entire list. Limiting the page size is useful when running list commands on a large number of resources, which can result in a "timed out" error when using the default page size of 1000.

```
aws dynamodb list-tables \  
  --page-size 1
```

Output:

```
{  
  "TableNames": [  
    "Forum",  
    "ProductCatalog",  
    "Reply",  
    "Thread"  
  ]  
}
```

For more information, see [Listing Table Names](#) in the *Amazon DynamoDB Developer Guide*.

Example 3: To limit the number of items returned

The following example limits the number of items returned to 2. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-tables \  
  --max-items 2
```

Output:

```
{  
  "TableNames": [  
    "Forum",  
    "ProductCatalog"  
  ],  
  "NextToken":  
  "abCDeFGhiJKlmnOPqrSTuvwXYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"  
}
```

For more information, see [Listing Table Names](#) in the *Amazon DynamoDB Developer Guide*.

Example 4: To retrieve the next page of results

The following command uses the `NextToken` value from a previous call to the `list-tables` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-tables \  
  --starting-token  
  abcDeFGhiJKlMnOPqrSTuvwXYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{  
  "TableNames": [  
    "Reply",  
    "Thread"  
  ]  
}
```

For more information, see [Listing Table Names](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListTables](#) in *AWS CLI Command Reference*.

list-tags-of-resource

The following code example shows how to use `list-tags-of-resource`.

AWS CLI

Example 1: To list tags of a DynamoDB resource

The following `list-tags-of-resource` example displays tags for the `MusicCollection` table.

```
aws dynamodb list-tags-of-resource \  
  --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "Name",  
      "Value": "MusicCollection"  
    }  
  ]  
}
```

```
{
  {
    "Key": "Owner",
    "Value": "blueTeam"
  },
  {
    "Key": "Environment",
    "Value": "Production"
  }
]
```

For more information, see [Tagging for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To limit the number of tags returned

The following example limits the number of tags returned to 1. The response includes a `NextToken` value with which to retrieve the next page of results.

```
aws dynamodb list-tags-of-resource \
  --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \
  --max-items 1
```

Output:

```
{
  "Tags": [
    {
      "Key": "Owner",
      "Value": "blueTeam"
    }
  ],
  "NextToken":
  "abCDeFGhiJKlMnOPqrSTuvwxYZ1aBCdEFghijK7LM51nOpqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9"
}
```

For more information, see [Tagging for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 3: To retrieve the next page of results

The following command uses the `NextToken` value from a previous call to the `list-tags-of-resource` command to retrieve another page of results. Since the response in this case does not include a `NextToken` value, we know that we have reached the end of the results.

```
aws dynamodb list-tags-of-resource \  
  --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \  
  --starting-token  
abCDeFGhiJKlmnOPqrSTuvwXYZ1aBCdEFghijK7LM51n0pqRSTuv3WxY3ZabC5dEFGhI2Jk3LmnoPQ6RST9
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "Environment",  
      "Value": "Production"  
    }  
  ]  
}
```

For more information, see [Tagging for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [ListTagsOfResource](#) in *AWS CLI Command Reference*.

put-item

The following code example shows how to use `put-item`.

AWS CLI

Example 1: To add an item to a table

The following `put-item` example adds a new item to the *MusicCollection* table.

```
aws dynamodb put-item \  
  --table-name MusicCollection \  
  --item file://item.json \  
  --return-consumed-capacity TOTAL \  
  --return-item-collection-metrics SIZE
```

Contents of `item.json`:

```
{  
  "Artist": {"S": "No One You Know"},  
  "SongTitle": {"S": "Call Me Today"},
```

```
"AlbumTitle": {"S": "Greatest Hits"}
}
```

Output:

```
{
  "ConsumedCapacity": {
    "TableName": "MusicCollection",
    "CapacityUnits": 1.0
  },
  "ItemCollectionMetrics": {
    "ItemCollectionKey": {
      "Artist": {
        "S": "No One You Know"
      }
    },
    "SizeEstimateRangeGB": [
      0.0,
      1.0
    ]
  }
}
```

For more information, see [Writing an Item](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To conditionally overwrite an item in a table

The following `put-item` example overwrites an existing item in the `MusicCollection` table only if that existing item has an `AlbumTitle` attribute with a value of `Greatest Hits`. The command returns the previous value of the item.

```
aws dynamodb put-item \
  --table-name MusicCollection \
  --item file://item.json \
  --condition-expression "#A = :A" \
  --expression-attribute-names file://names.json \
  --expression-attribute-values file://values.json \
  --return-values ALL_OLD
```

Contents of `item.json`:

```
{
```

```
"Artist": {"S": "No One You Know"},
"SongTitle": {"S": "Call Me Today"},
"AlbumTitle": {"S": "Somewhat Famous"}
}
```

Contents of `names.json`:

```
{
  "#A": "AlbumTitle"
}
```

Contents of `values.json`:

```
{
  ":A": {"S": "Greatest Hits"}
}
```

Output:

```
{
  "Attributes": {
    "AlbumTitle": {
      "S": "Greatest Hits"
    },
    "Artist": {
      "S": "No One You Know"
    },
    "SongTitle": {
      "S": "Call Me Today"
    }
  }
}
```

If the key already exists, you should see the following output:

```
A client error (ConditionalCheckFailedException) occurred when calling the PutItem
operation: The conditional request failed.
```

For more information, see [Writing an Item](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [PutItem](#) in *AWS CLI Command Reference*.

query

The following code example shows how to use query.

AWS CLI

Example 1: To query a table

The following query example queries items in the MusicCollection table. The table has a hash-and-range primary key (Artist and SongTitle), but this query only specifies the hash key value. It returns song titles by the artist named "No One You Know".

```
aws dynamodb query \  
  --table-name MusicCollection \  
  --projection-expression "SongTitle" \  
  --key-condition-expression "Artist = :v1" \  
  --expression-attribute-values file://expression-attributes.json \  
  --return-consumed-capacity TOTAL
```

Contents of expression-attributes.json:

```
{  
  ":v1": {"S": "No One You Know"}  
}
```

Output:

```
{  
  "Items": [  
    {  
      "SongTitle": {  
        "S": "Call Me Today"  
      },  
      "SongTitle": {  
        "S": "Scared of My Shadow"  
      }  
    }  
  ],  
  "Count": 2,  
  "ScannedCount": 2,  
  "ConsumedCapacity": {  
    "TableName": "MusicCollection",
```

```
    "CapacityUnits": 0.5
  }
}
```

For more information, see [Working with Queries in DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To query a table using strongly consistent reads and traverse the index in descending order

The following example performs the same query as the first example, but returns results in reverse order and uses strongly consistent reads.

```
aws dynamodb query \
  --table-name MusicCollection \
  --projection-expression "SongTitle" \
  --key-condition-expression "Artist = :v1" \
  --expression-attribute-values file://expression-attributes.json \
  --consistent-read \
  --no-scan-index-forward \
  --return-consumed-capacity TOTAL
```

Contents of `expression-attributes.json`:

```
{
  ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
  "Items": [
    {
      "SongTitle": {
        "S": "Scared of My Shadow"
      }
    },
    {
      "SongTitle": {
        "S": "Call Me Today"
      }
    }
  ]
}
```

```

    ],
    "Count": 2,
    "ScannedCount": 2,
    "ConsumedCapacity": {
      "TableName": "MusicCollection",
      "CapacityUnits": 1.0
    }
  }
}

```

For more information, see [Working with Queries in DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 3: To filter out specific results

The following example queries the MusicCollection but excludes results with specific values in the AlbumTitle attribute. Note that this does not affect the ScannedCount or ConsumedCapacity, because the filter is applied after the items have been read.

```

aws dynamodb query \
  --table-name MusicCollection \
  --key-condition-expression "#n1 = :v1" \
  --filter-expression "NOT (#n2 IN (:v2, :v3))" \
  --expression-attribute-names file://names.json \
  --expression-attribute-values file://values.json \
  --return-consumed-capacity TOTAL

```

Contents of values.json:

```

{
  ":v1": {"S": "No One You Know"},
  ":v2": {"S": "Blue Sky Blues"},
  ":v3": {"S": "Greatest Hits"}
}

```

Contents of names.json:

```

{
  "#n1": "Artist",
  "#n2": "AlbumTitle"
}

```

Output:

```
{
  "Items": [
    {
      "AlbumTitle": {
        "S": "Somewhat Famous"
      },
      "Artist": {
        "S": "No One You Know"
      },
      "SongTitle": {
        "S": "Call Me Today"
      }
    }
  ],
  "Count": 1,
  "ScannedCount": 2,
  "ConsumedCapacity": {
    "TableName": "MusicCollection",
    "CapacityUnits": 0.5
  }
}
```

For more information, see [Working with Queries in DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 4: To retrieve only an item count

The following example retrieves a count of items matching the query, but does not retrieve any of the items themselves.

```
aws dynamodb query \
  --table-name MusicCollection \
  --select COUNT \
  --key-condition-expression "Artist = :v1" \
  --expression-attribute-values file://expression-attributes.json
```

Contents of `expression-attributes.json`:

```
{
  ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
  "Count": 2,
  "ScannedCount": 2,
  "ConsumedCapacity": null
}
```

For more information, see [Working with Queries in DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

Example 5: To query an index

The following example queries the local secondary index AlbumTitleIndex. The query returns all attributes from the base table that have been projected into the local secondary index. Note that when querying a local secondary index or global secondary index, you must also provide the name of the base table using the `table-name` parameter.

```
aws dynamodb query \
  --table-name MusicCollection \
  --index-name AlbumTitleIndex \
  --key-condition-expression "Artist = :v1" \
  --expression-attribute-values file://expression-attributes.json \
  --select ALL_PROJECTED_ATTRIBUTES \
  --return-consumed-capacity INDEXES
```

Contents of expression-attributes.json:

```
{
  ":v1": {"S": "No One You Know"}
}
```

Output:

```
{
  "Items": [
    {
      "AlbumTitle": {
        "S": "Blue Sky Blues"
      },

```

```

    "Artist": {
      "S": "No One You Know"
    },
    "SongTitle": {
      "S": "Scared of My Shadow"
    }
  },
  {
    "AlbumTitle": {
      "S": "Somewhat Famous"
    },
    "Artist": {
      "S": "No One You Know"
    },
    "SongTitle": {
      "S": "Call Me Today"
    }
  }
],
"Count": 2,
"ScannedCount": 2,
"ConsumedCapacity": {
  "TableName": "MusicCollection",
  "CapacityUnits": 0.5,
  "Table": {
    "CapacityUnits": 0.0
  },
  "LocalSecondaryIndexes": {
    "AlbumTitleIndex": {
      "CapacityUnits": 0.5
    }
  }
}
}

```

For more information, see [Working with Queries in DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [Query](#) in *AWS CLI Command Reference*.

restore-table-from-backup

The following code example shows how to use `restore-table-from-backup`.

AWS CLI

To restore a DynamoDB table from an existing backup

The following `restore-table-from-backup` example restores the specified table from an existing backup.

```
aws dynamodb restore-table-from-backup \  
  --target-table-name MusicCollection \  
  --backup-arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection/  
  backup/01576616366715-b4e58d3a
```

Output:

```
{  
  "TableDescription": {  
    "AttributeDefinitions": [  
      {  
        "AttributeName": "Artist",  
        "AttributeType": "S"  
      },  
      {  
        "AttributeName": "SongTitle",  
        "AttributeType": "S"  
      }  
    ],  
    "TableName": "MusicCollection2",  
    "KeySchema": [  
      {  
        "AttributeName": "Artist",  
        "KeyType": "HASH"  
      },  
      {  
        "AttributeName": "SongTitle",  
        "KeyType": "RANGE"  
      }  
    ],  
    "TableStatus": "CREATING",  
    "CreationDateTime": 1576618274.326,  
    "ProvisionedThroughput": {  
      "NumberOfDecreasesToday": 0,  
      "ReadCapacityUnits": 5,  
      "WriteCapacityUnits": 5  
    }  
  }  
}
```

```

    },
    "TableSizeBytes": 0,
    "ItemCount": 0,
    "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection2",
    "TableId": "114865c9-5ef3-496c-b4d1-c4cbdd2d44fb",
    "BillingModeSummary": {
      "BillingMode": "PROVISIONED"
    },
    "RestoreSummary": {
      "SourceBackupArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection/backup/01576616366715-b4e58d3a",
      "SourceTableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
      "RestoreDateTime": 1576616366.715,
      "RestoreInProgress": true
    }
  }
}
}

```

For more information, see [On-Demand Backup and Restore for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [RestoreTableFromBackup](#) in *AWS CLI Command Reference*.

restore-table-to-point-in-time

The following code example shows how to use `restore-table-to-point-in-time`.

AWS CLI

To restore a DynamoDB table to a point in time

The following `restore-table-to-point-in-time` example restores the `MusicCollection` table to the specified point in time.

```

aws dynamodb restore-table-to-point-in-time \
  --source-table-name MusicCollection \
  --target-table-name MusicCollectionRestore \
  --restore-date-time 1576622404.0

```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollectionRestore",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "SongTitle",
        "KeyType": "RANGE"
      }
    ],
    "TableStatus": "CREATING",
    "CreationDateTime": 1576623311.86,
    "ProvisionedThroughput": {
      "NumberOfDecreasesToday": 0,
      "ReadCapacityUnits": 5,
      "WriteCapacityUnits": 5
    },
    "TableSizeBytes": 0,
    "ItemCount": 0,
    "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollectionRestore",
    "TableId": "befd9e0e-1843-4dc6-a147-d6d00e85cb1f",
    "BillingModeSummary": {
      "BillingMode": "PROVISIONED"
    },
    "RestoreSummary": {
      "SourceTableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/
MusicCollection",
      "RestoreDateTime": 1576622404.0,
      "RestoreInProgress": true
    }
  }
}
```

```

    }
  }
}

```

For more information, see [Point-in-Time Recovery for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [RestoreTableToPointInTime](#) in *AWS CLI Command Reference*.

scan

The following code example shows how to use scan.

AWS CLI

To scan a table

The following scan example scans the entire MusicCollection table, and then narrows the results to songs by the artist "No One You Know". For each item, only the album title and song title are returned.

```

aws dynamodb scan \
  --table-name MusicCollection \
  --filter-expression "Artist = :a" \
  --projection-expression "#ST, #AT" \
  --expression-attribute-names file://expression-attribute-names.json \
  --expression-attribute-values file://expression-attribute-values.json

```

Contents of expression-attribute-names.json:

```

{
  "#ST": "SongTitle",
  "#AT": "AlbumTitle"
}

```

Contents of expression-attribute-values.json:

```

{
  ":a": {"S": "No One You Know"}
}

```

Output:

```
{
  "Count": 2,
  "Items": [
    {
      "SongTitle": {
        "S": "Call Me Today"
      },
      "AlbumTitle": {
        "S": "Somewhat Famous"
      }
    },
    {
      "SongTitle": {
        "S": "Scared of My Shadow"
      },
      "AlbumTitle": {
        "S": "Blue Sky Blues"
      }
    }
  ],
  "ScannedCount": 3,
  "ConsumedCapacity": null
}
```

For more information, see [Working with Scans in DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [Scan](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI**To add tags to a DynamoDB resource**

The following tag-resource example adds a tag key/value pair to the MusicCollection table.

```
aws dynamodb tag-resource \
```

```
--resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \  
--tags Key=Owner,Value=blueTeam
```

This command produces no output.

For more information, see [Tagging for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

transact-get-items

The following code example shows how to use `transact-get-items`.

AWS CLI

To retrieve multiple items atomically from one or more tables

The following `transact-get-items` example retrieves multiple items atomically.

```
aws dynamodb transact-get-items \  
--transact-items file://transact-items.json \  
--return-consumed-capacity TOTAL
```

Contents of `transact-items.json`:

```
[  
  {  
    "Get": {  
      "Key": {  
        "Artist": {"S": "Acme Band"},  
        "SongTitle": {"S": "Happy Day"}  
      },  
      "TableName": "MusicCollection"  
    }  
  },  
  {  
    "Get": {  
      "Key": {  
        "Artist": {"S": "No One You Know"},  
        "SongTitle": {"S": "Call Me Today"}  
      },  
      "TableName": "MusicCollection"  
    }  
  }  
]
```

```
    }  
  }  
]
```

Output:

```
{  
  "ConsumedCapacity": [  
    {  
      "TableName": "MusicCollection",  
      "CapacityUnits": 4.0,  
      "ReadCapacityUnits": 4.0  
    }  
  ],  
  "Responses": [  
    {  
      "Item": {  
        "AlbumTitle": {  
          "S": "Songs About Life"  
        },  
        "Artist": {  
          "S": "Acme Band"  
        },  
        "SongTitle": {  
          "S": "Happy Day"  
        }  
      }  
    },  
    {  
      "Item": {  
        "AlbumTitle": {  
          "S": "Somewhat Famous"  
        },  
        "Artist": {  
          "S": "No One You Know"  
        },  
        "SongTitle": {  
          "S": "Call Me Today"  
        }  
      }  
    }  
  ]  
}
```

For more information, see [Managing Complex Workflows with DynamoDB Transactions](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [TransactGetItems](#) in *AWS CLI Command Reference*.

transact-write-items

The following code example shows how to use `transact-write-items`.

AWS CLI

Example 1: To write items atomically to one or more tables

The following `transact-write-items` example updates one item and deletes another. The operation fails if either operation fails, or if either item contains a `Rating` attribute.

```
aws dynamodb transact-write-items \  
  --transact-items file://transact-items.json \  
  --return-consumed-capacity TOTAL \  
  --return-item-collection-metrics SIZE
```

Contents of the `transact-items.json` file:

```
[  
  {  
    "Update": {  
      "Key": {  
        "Artist": {"S": "Acme Band"},  
        "SongTitle": {"S": "Happy Day"}  
      },  
      "UpdateExpression": "SET AlbumTitle = :newval",  
      "ExpressionAttributeValues": {  
        ":newval": {"S": "Updated Album Title"}  
      },  
      "TableName": "MusicCollection",  
      "ConditionExpression": "attribute_not_exists(Rating)"  
    },  
    {  
      "Delete": {  
        "Key": {  
          "Artist": {"S": "No One You Know"},
```

```

        "SongTitle": {"S": "Call Me Today"}
    },
    "TableName": "MusicCollection",
    "ConditionExpression": "attribute_not_exists(Rating)"
}
]

```

Output:

```

{
  "ConsumedCapacity": [
    {
      "TableName": "MusicCollection",
      "CapacityUnits": 10.0,
      "WriteCapacityUnits": 10.0
    }
  ],
  "ItemCollectionMetrics": {
    "MusicCollection": [
      {
        "ItemCollectionKey": {
          "Artist": {
            "S": "No One You Know"
          }
        },
        "SizeEstimateRangeGB": [
          0.0,
          1.0
        ]
      },
      {
        "ItemCollectionKey": {
          "Artist": {
            "S": "Acme Band"
          }
        },
        "SizeEstimateRangeGB": [
          0.0,
          1.0
        ]
      }
    ]
  }
}

```

```
}  
}
```

For more information, see [Managing Complex Workflows with DynamoDB Transactions](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To write items atomically using a client request token

The following command uses a client request token to make the call to `transact-write-items` idempotent, meaning that multiple calls have the same effect as one single call.

```
aws dynamodb transact-write-items \  
  --transact-items file://transact-items.json \  
  --client-request-token abc123
```

Contents of the `transact-items.json` file:

```
[  
  {  
    "Update": {  
      "Key": {  
        "Artist": {"S": "Acme Band"},  
        "SongTitle": {"S": "Happy Day"}  
      },  
      "UpdateExpression": "SET AlbumTitle = :newval",  
      "ExpressionAttributeValues": {  
        ":newval": {"S": "Updated Album Title"}  
      },  
      "TableName": "MusicCollection",  
      "ConditionExpression": "attribute_not_exists(Rating)"  
    },  
    {  
      "Delete": {  
        "Key": {  
          "Artist": {"S": "No One You Know"},  
          "SongTitle": {"S": "Call Me Today"}  
        },  
        "TableName": "MusicCollection",  
        "ConditionExpression": "attribute_not_exists(Rating)"  
      }  
    }  
  ]
```

```
] ]
```

This command produces no output.

For more information, see [Managing Complex Workflows with DynamoDB Transactions](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [TransactWriteItems](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a DynamoDB resource

The following `untag-resource` example removes the tag with the key `Owner` from the `MusicCollection` table.

```
aws dynamodb untag-resource \  
  --resource-arn arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection \  
  --tag-keys Owner
```

This command produces no output.

For more information, see [Tagging for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-continuous-backups

The following code example shows how to use `update-continuous-backups`.

AWS CLI

To update continuous backup settings for a DynamoDB table

The following `update-continuous-backups` example enables point-in-time recovery for the `MusicCollection` table.

```
aws dynamodb update-continuous-backups \  
  --table-name MusicCollection
```

```
--table-name MusicCollection \  
--point-in-time-recovery-specification PointInTimeRecoveryEnabled=true
```

Output:

```
{  
  "ContinuousBackupsDescription": {  
    "ContinuousBackupsStatus": "ENABLED",  
    "PointInTimeRecoveryDescription": {  
      "PointInTimeRecoveryStatus": "ENABLED",  
      "EarliestRestorableDateTime": 1576622404.0,  
      "LatestRestorableDateTime": 1576622404.0  
    }  
  }  
}
```

For more information, see [Point-in-Time Recovery for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateContinuousBackups](#) in *AWS CLI Command Reference*.

update-contributor-insights

The following code example shows how to use `update-contributor-insights`.

AWS CLI

To enable Contributor Insights on a table

The following `update-contributor-insights` example enables Contributor Insights on the `MusicCollection` table and the `AlbumTitle-index` global secondary index.

```
aws dynamodb update-contributor-insights \  
  --table-name MusicCollection \  
  --index-name AlbumTitle-index \  
  --contributor-insights-action ENABLE
```

Output:

```
{  
  "TableName": "MusicCollection",
```

```
"IndexName": "AlbumTitle-index",
"ContributorInsightsStatus": "ENABLING"
}
```

For more information, see [Analyzing Data Access Using CloudWatch Contributor Insights for DynamoDB](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateContributorInsights](#) in *AWS CLI Command Reference*.

update-global-table-settings

The following code example shows how to use `update-global-table-settings`.

AWS CLI

To update provisioned write capacity settings on a DynamoDB global table

The following `update-global-table-settings` example sets the provisioned write capacity of the `MusicCollection` global table to 15.

```
aws dynamodb update-global-table-settings \
  --global-table-name MusicCollection \
  --global-table-provisioned-write-capacity-units 15
```

Output:

```
{
  "GlobalTableName": "MusicCollection",
  "ReplicaSettings": [
    {
      "RegionName": "eu-west-1",
      "ReplicaStatus": "UPDATING",
      "ReplicaProvisionedReadCapacityUnits": 10,
      "ReplicaProvisionedReadCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      },
      "ReplicaProvisionedWriteCapacityUnits": 10,
      "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
        "AutoScalingDisabled": true
      }
    },
    {
```

```
    "RegionName": "us-east-1",
    "ReplicaStatus": "UPDATING",
    "ReplicaProvisionedReadCapacityUnits": 10,
    "ReplicaProvisionedReadCapacityAutoScalingSettings": {
      "AutoScalingDisabled": true
    },
    "ReplicaProvisionedWriteCapacityUnits": 10,
    "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
      "AutoScalingDisabled": true
    }
  },
  {
    "RegionName": "us-east-2",
    "ReplicaStatus": "UPDATING",
    "ReplicaProvisionedReadCapacityUnits": 10,
    "ReplicaProvisionedReadCapacityAutoScalingSettings": {
      "AutoScalingDisabled": true
    },
    "ReplicaProvisionedWriteCapacityUnits": 10,
    "ReplicaProvisionedWriteCapacityAutoScalingSettings": {
      "AutoScalingDisabled": true
    }
  }
]
```

For more information, see [DynamoDB Global Tables](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateGlobalTableSettings](#) in *AWS CLI Command Reference*.

update-global-table

The following code example shows how to use `update-global-table`.

AWS CLI

To update a DynamoDB global table

The following `update-global-table` example adds a replica in the specified Region to the `MusicCollection` global table.

```
aws dynamodb update-global-table \  
  --global-table-name MusicCollection \  
  --region us-east-1
```

```
--replica-updates Create={RegionName=eu-west-1}
```

Output:

```
{
  "GlobalTableDescription": {
    "ReplicationGroup": [
      {
        "RegionName": "eu-west-1"
      },
      {
        "RegionName": "us-east-2"
      },
      {
        "RegionName": "us-east-1"
      }
    ],
    "GlobalTableArn": "arn:aws:dynamodb::123456789012:global-table/
MusicCollection",
    "CreationDateTime": 1576625818.532,
    "GlobalTableStatus": "ACTIVE",
    "GlobalTableName": "MusicCollection"
  }
}
```

For more information, see [DynamoDB Global Tables](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateGlobalTable](#) in *AWS CLI Command Reference*.

update-item

The following code example shows how to use `update-item`.

AWS CLI

Example 1: To update an item in a table

The following `update-item` example updates an item in the `MusicCollection` table. It adds a new attribute (`Year`) and modifies the `AlbumTitle` attribute. All of the attributes in the item, as they appear after the update, are returned in the response.

```
aws dynamodb update-item \
```

```
--table-name MusicCollection \  
--key file://key.json \  
--update-expression "SET #Y = :y, #AT = :t" \  
--expression-attribute-names file://expression-attribute-names.json \  
--expression-attribute-values file://expression-attribute-values.json \  
--return-values ALL_NEW \  
--return-consumed-capacity TOTAL \  
--return-item-collection-metrics SIZE
```

Contents of key.json:

```
{  
  "Artist": {"S": "Acme Band"},  
  "SongTitle": {"S": "Happy Day"}  
}
```

Contents of expression-attribute-names.json:

```
{  
  "#Y": "Year", "#AT": "AlbumTitle"  
}
```

Contents of expression-attribute-values.json:

```
{  
  ":y":{"N": "2015"},  
  ":t":{"S": "Louder Than Ever"}  
}
```

Output:

```
{  
  "Attributes": {  
    "AlbumTitle": {  
      "S": "Louder Than Ever"  
    },  
    "Awards": {  
      "N": "10"  
    },  
    "Artist": {  
      "S": "Acme Band"  
    }  
  }  
}
```

```

    },
    "Year": {
      "N": "2015"
    },
    "SongTitle": {
      "S": "Happy Day"
    }
  },
  "ConsumedCapacity": {
    "TableName": "MusicCollection",
    "CapacityUnits": 3.0
  },
  "ItemCollectionMetrics": {
    "ItemCollectionKey": {
      "Artist": {
        "S": "Acme Band"
      }
    },
    "SizeEstimateRangeGB": [
      0.0,
      1.0
    ]
  }
}

```

For more information, see [Writing an Item](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To update an item conditionally

The following example updates an item in the `MusicCollection` table, but only if the existing item does not already have a `Year` attribute.

```

aws dynamodb update-item \
  --table-name MusicCollection \
  --key file://key.json \
  --update-expression "SET #Y = :y, #AT = :t" \
  --expression-attribute-names file://expression-attribute-names.json \
  --expression-attribute-values file://expression-attribute-values.json \
  --condition-expression "attribute_not_exists(#Y)"

```

Contents of `key.json`:

```
{
```

```
"Artist": {"S": "Acme Band"},
"SongTitle": {"S": "Happy Day"}
}
```

Contents of `expression-attribute-names.json`:

```
{
  "#Y": "Year",
  "#AT": "AlbumTitle"
}
```

Contents of `expression-attribute-values.json`:

```
{
  ":y": {"N": "2015"},
  ":t": {"S": "Louder Than Ever"}
}
```

If the item already has a `Year` attribute, DynamoDB returns the following output.

```
An error occurred (ConditionalCheckFailedException) when calling the UpdateItem
operation: The conditional request failed
```

For more information, see [Writing an Item](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateItem](#) in *AWS CLI Command Reference*.

update-table-replica-auto-scaling

The following code example shows how to use `update-table-replica-auto-scaling`.

AWS CLI

To update auto scaling settings across replicas of a global table

The following `update-table-replica-auto-scaling` example updates write capacity auto scaling settings across replicas of the specified global table.

```
aws dynamodb update-table-replica-auto-scaling \
  --table-name MusicCollection \
  --provisioned-write-capacity-auto-scaling-update file://auto-scaling-policy.json
```

Contents of auto-scaling-policy.json:

```
{
  "MinimumUnits": 10,
  "MaximumUnits": 100,
  "AutoScalingDisabled": false,
  "ScalingPolicyUpdate": {
    "PolicyName": "DynamoDBWriteCapacityUtilization:table/MusicCollection",
    "TargetTrackingScalingPolicyConfiguration": {
      "TargetValue": 80
    }
  }
}
```

Output:

```
{
  "TableAutoScalingDescription": {
    "TableName": "MusicCollection",
    "TableStatus": "ACTIVE",
    "Replicas": [
      {
        "RegionName": "eu-central-1",
        "GlobalSecondaryIndexes": [],
        "ReplicaProvisionedReadCapacityAutoScalingSettings": {
          "MinimumUnits": 5,

update-table

The following code example shows how to use `update-table`.

AWS CLI

Example 1: To modify a table's billing mode

The following `update-table` example increases the provisioned read and write capacity on the `MusicCollection` table.

```

aws dynamodb update-table \
  --table-name MusicCollection \
  --billing-mode PROVISIONED \
  --provisioned-throughput ReadCapacityUnits=15,WriteCapacityUnits=10

```

Output:

```

{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ]
  }
}

```

```

    ],
    "TableName": "MusicCollection",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "SongTitle",
        "KeyType": "RANGE"
      }
    ],
    "TableStatus": "UPDATING",
    "CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
    "ProvisionedThroughput": {
      "LastIncreaseDateTime": "2020-07-28T13:18:18.921000-07:00",
      "NumberOfDecreasesToday": 0,
      "ReadCapacityUnits": 15,
      "WriteCapacityUnits": 10
    },
    "TableSizeBytes": 182,
    "ItemCount": 2,
    "TableArn": "arn:aws:dynamodb:us-west-2:123456789012:table/MusicCollection",
    "TableId": "abcd0123-01ab-23cd-0123-abcdef123456",
    "BillingModeSummary": {
      "BillingMode": "PROVISIONED",
      "LastUpdateToPayPerRequestDateTime": "2020-07-28T13:14:48.366000-07:00"
    }
  }
}

```

For more information, see [Updating a Table](#) in the *Amazon DynamoDB Developer Guide*.

Example 2: To create a global secondary index

The following example adds a global secondary index to the MusicCollection table.

```

aws dynamodb update-table \
  --table-name MusicCollection \
  --attribute-definitions AttributeName=AlbumTitle,AttributeType=S \
  --global-secondary-index-updates file://gsi-updates.json

```

Contents of `gsi-updates.json`:

```
[
  {
    "Create": {
      "IndexName": "AlbumTitle-index",
      "KeySchema": [
        {
          "AttributeName": "AlbumTitle",
          "KeyType": "HASH"
        }
      ],
      "ProvisionedThroughput": {
        "ReadCapacityUnits": 10,
        "WriteCapacityUnits": 10
      },
      "Projection": {
        "ProjectionType": "ALL"
      }
    }
  }
]
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [
      {
        "AttributeName": "Artist",
```

```
        "KeyType": "HASH"
      },
      {
        "AttributeName": "SongTitle",
        "KeyType": "RANGE"
      }
    ],
    "TableStatus": "UPDATING",
    "CreationDateTime": "2020-05-26T15:59:49.473000-07:00",
    "ProvisionedThroughput": {
      "LastIncreaseDateTime": "2020-07-28T12:59:17.537000-07:00",

    }
]
}
}

```

For more information, see [Updating a Table](#) in the *Amazon DynamoDB Developer Guide*.

Example 3: To enable DynamoDB Streams on a table

The following command enables DynamoDB Streams on the MusicCollection table.

```

aws dynamodb update-table \
  --table-name MusicCollection \
  --stream-specification StreamEnabled=true,StreamViewType=NEW_IMAGE

```

Output:

```

{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "SongTitle",

```

```
        "KeyType": "RANGE"
    }
],
"TableStatus": "UPDATING",
"CreationDateTime": "2020-05-26T15:59:49.473000-07:00",

  }
}

```

For more information, see [Updating a Table](#) in the *Amazon DynamoDB Developer Guide*.

Example 4: To enable server-side encryption

The following example enables server-side encryption on the MusicCollection table.

```

aws dynamodb update-table \
  --table-name MusicCollection \

```

```
--sse-specification Enabled=true,SSEType=KMS
```

Output:

```
{
  "TableDescription": {
    "AttributeDefinitions": [
      {
        "AttributeName": "AlbumTitle",
        "AttributeType": "S"
      },
      {
        "AttributeName": "Artist",
        "AttributeType": "S"
      },
      {
        "AttributeName": "SongTitle",
        "AttributeType": "S"
      }
    ],
    "TableName": "MusicCollection",
    "KeySchema": [
      {
        "AttributeName": "Artist",
        "KeyType": "HASH"
      },
      {
        "AttributeName": "SongTitle",
        "KeyType": "RANGE"
      }
    ],
    "TableStatus": "ACTIVE",

update-time-to-live

The following code example shows how to use `update-time-to-live`.

AWS CLI

To update Time to Live settings on a table

The following `update-time-to-live` example enables Time to Live on the specified table.

```

aws dynamodb update-time-to-live \
  --table-name MusicCollection \
  --time-to-live-specification Enabled=true,AttributeName=ttl

```

Output:

```
{
  "TimeToLiveSpecification": {
    "Enabled": true,
    "AttributeName": "ttl"
  }
}
```

For more information, see [Time to Live](#) in the *Amazon DynamoDB Developer Guide*.

- For API details, see [UpdateTimeToLive](#) in *AWS CLI Command Reference*.

DynamoDB Streams examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with DynamoDB Streams.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

describe-stream

The following code example shows how to use `describe-stream`.

AWS CLI

To get information about a DynamoDB stream

The following `describe-stream` command displays information about the specific DynamoDB stream.

```
aws dynamodbstreams describe-stream \  
  --stream-arn arn:aws:dynamodb:us-west-1:123456789012:table/Music/  
stream/2019-10-22T18:02:01.576
```

Output:

```
{  
  "StreamDescription": {  
    "StreamArn": "arn:aws:dynamodb:us-west-1:123456789012:table/Music/  
stream/2019-10-22T18:02:01.576",

get-records

The following code example shows how to use `get-records`.

AWS CLI

To get records from a Dynamodb stream

The following `get-records` command retrieves records using the specified Amazon DynamoDB shard iterator.

```
aws dynamodbstreams get-records \
  --shard-iterator "arn:aws:dynamodb:us-west-1:123456789012:table/Music/
stream/2019-10-22T18:02:01.576|1|

get-shard-iterator

The following code example shows how to use `get-shard-iterator`.

AWS CLI

To get a shard iterator

The following `get-shard-iterator` command retrieves a shard iterator for the specified shard.

```
aws dynamodbstreams get-shard-iterator \  
  --stream-arn arn:aws:dynamodb:us-west-1:12356789012:table/Music/  
stream/2019-10-22T18:02:01.576 \  
  --shard-id shardId-00000001571780995058-40810d86 \  
  --shard-iterator-type LATEST
```

Output:

```
{  
  "ShardIterator": "arn:aws:dynamodb:us-west-1:123456789012:table/Music/  
stream/2019-10-22T18:02:01.576|1|

- For API details, see [GetShardIterator](#) in *AWS CLI Command Reference*.

list-streams

The following code example shows how to use `list-streams`.

AWS CLI

To list DynamoDB streams

The following `list-streams` command lists all existing Amazon DynamoDB streams within the default AWS Region.

```
aws dynamodbstreams list-streams
```

Output:

```
{
  "Streams": [
    {
      "StreamArn": "arn:aws:dynamodb:us-west-1:123456789012:table/Music/stream/2019-10-22T18:02:01.576",
      "TableName": "Music",
      "StreamLabel": "2019-10-22T18:02:01.576"
    }
  ]
}
```

Actions

accept-address-transfer

The following code example shows how to use `accept-address-transfer`.

AWS CLI

To accept an Elastic IP address transferred to your account

The following `accept-address-transfer` example accepts the transfer of the specified Elastic IP address to your account.

```
aws ec2 accept-address-transfer \  
  --address 100.21.184.216
```

Output:

```
{  
  "AddressTransfer": {  
    "PublicIp": "100.21.184.216",  
    "AllocationId": "eipalloc-09ad461b0d03f6aaf",

    "TransferOfferAcceptedTimestamp": "2023-02-22T22:52:54.000Z",  
    "AddressTransferStatus": "accepted"  
  }  
}
```

For more information, see [Transfer Elastic IP addresses](#) in the *Amazon VPC User Guide*.

- For API details, see [AcceptAddressTransfer](#) in *AWS CLI Command Reference*.

accept-reserved-instances-exchange-quote

The following code example shows how to use `accept-reserved-instances-exchange-quote`.

AWS CLI

To perform a Convertible Reserved Instance exchange

This example performs an exchange of the specified Convertible Reserved Instances.

Command:

```
aws ec2 accept-reserved-instances-exchange-quote --reserved-instance-ids 7b8750c3-397e-4da4-bbcb-a45ebexample --target-configurations OfferingId=b747b472-423c-48f3-8cee-679bcexample
```

Output:

```
{
  "ExchangeId": "riex-e68ed3c1-8bc8-4c17-af77-811afexample"
}
```

- For API details, see [AcceptReservedInstancesExchangeQuote](#) in *AWS CLI Command Reference*.

accept-transit-gateway-peering-attachment

The following code example shows how to use `accept-transit-gateway-peering-attachment`.

AWS CLI**To accept a transit gateway peering attachment**

The following `accept-transit-gateway-peering-attachment` example accepts the specified transit gateway peering attachment. The `--region` parameter specifies the Region that the accepter transit gateway is located in.

```
aws ec2 accept-transit-gateway-peering-attachment \
  --transit-gateway-attachment-id tgw-attach-4455667788aabbccd \
  --region us-east-2
```

Output:

```
{
  "TransitGatewayPeeringAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
    "RequesterTgwInfo": {
      "TransitGatewayId": "tgw-123abc05e04123abc",
      "OwnerId": "123456789012",
      "Region": "us-west-2"
    }
  },
}
```

```

    "AcceptorTgwInfo": {
      "TransitGatewayId": "tgw-11223344aabbcc112",
      "OwnerId": "123456789012",
      "Region": "us-east-2"
    },
    "State": "pending",
    "CreationTime": "2019-12-09T11:38:31.000Z"
  }
}

```

For more information, see [Transit Gateway Peering Attachments](#) in the *Transit Gateways Guide*.

- For API details, see [AcceptTransitGatewayPeeringAttachment](#) in *AWS CLI Command Reference*.

accept-transit-gateway-vpc-attachment

The following code example shows how to use `accept-transit-gateway-vpc-attachment`.

AWS CLI

To accept a request to attach a VPC to a transit gateway.

The following `accept-transit-gateway-vpc-attachment` example accepts the request for the specified attachment.

```

aws ec2 accept-transit-gateway-vpc-attachment \
  --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE

```

Output:

```

{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "VpcId": "vpc-07e8ffd50fEXAMPLE",
    "VpcOwnerId": "123456789012",
    "State": "pending",
    "SubnetIds": [
      "subnet-0752213d59EXAMPLE"
    ],
    "CreationTime": "2019-07-10T17:33:46.000Z",
    "Options": {
      "DnsSupport": "enable",

```

```
        "Ipv6Support": "disable"
      }
    }
  }
```

For more information, see [Transit Gateway Attachments to a VPC](#) in the *Transit Gateways Guide*.

- For API details, see [AcceptTransitGatewayVpcAttachment](#) in *AWS CLI Command Reference*.

accept-vpc-endpoint-connections

The following code example shows how to use `accept-vpc-endpoint-connections`.

AWS CLI

To accept an interface endpoint connection request

This example accepts the specified endpoint connection request for the specified endpoint service.

Command:

```
aws ec2 accept-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --
vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```
{
  "Unsuccessful": []
}
```

- For API details, see [AcceptVpcEndpointConnections](#) in *AWS CLI Command Reference*.

accept-vpc-peering-connection

The following code example shows how to use `accept-vpc-peering-connection`.

AWS CLI

To accept a VPC peering connection

This example accepts the specified VPC peering connection request.

Command:

```
aws ec2 accept-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
  "VpcPeeringConnection": {
    "Status": {
      "Message": "Provisioning",
      "Code": "provisioning"
    },
    "Tags": [],
    "AccepterVpcInfo": {
      "OwnerId": "444455556666",
      "VpcId": "vpc-44455566",
      "CidrBlock": "10.0.1.0/28"
    },
    "VpcPeeringConnectionId": "pcx-1a2b3c4d",
    "RequesterVpcInfo": {
      "OwnerId": "444455556666",
      "VpcId": "vpc-111abc45",
      "CidrBlock": "10.0.0.0/28"
    }
  }
}
```

- For API details, see [AcceptVpcPeeringConnection](#) in *AWS CLI Command Reference*.

advertise-byoip-cidr

The following code example shows how to use `advertise-byoip-cidr`.

AWS CLI**To advertise an address range**

The following `advertise-byoip-cidr` example advertises the specified public IPv4 address range.

```
aws ec2 advertise-byoip-cidr \
```

```
--cidr 203.0.113.25/24
```

Output:

```
{
  "ByoipCidr": {
    "Cidr": "203.0.113.25/24",
    "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
    "State": "provisioned"
  }
}
```

- For API details, see [AdvertiseByoipCidr](#) in *AWS CLI Command Reference*.

allocate-address

The following code example shows how to use `allocate-address`.

AWS CLI**Example 1: To allocate an Elastic IP address from Amazon's address pool**

The following `allocate-address` example allocates an Elastic IP address. Amazon EC2 selects the address from Amazon's address pool.

```
aws ec2 allocate-address
```

Output:

```
{
  "PublicIp": "70.224.234.241",
  "AllocationId": "eipalloc-01435ba59eEXAMPLE",
  "PublicIpv4Pool": "amazon",
  "NetworkBorderGroup": "us-west-2",
  "Domain": "vpc"
}
```

For more information, see [Elastic IP addresses](#) in the *Amazon EC2 User Guide*.

Example 2: To allocate an Elastic IP address and associate it with a network border group

The following `allocate-address` example allocates an Elastic IP address and associates it with the specified network border group.

```
aws ec2 allocate-address \  
  --network-border-group us-west-2-lax-1
```

Output:

```
{  
  "PublicIp": "70.224.234.241",  
  "AllocationId": "eipalloc-e03dd489ceEXAMPLE",  
  "PublicIpv4Pool": "amazon",  
  "NetworkBorderGroup": "us-west-2-lax-1",  
  "Domain": "vpc"  
}
```

For more information, see [Elastic IP addresses](#) in the *Amazon EC2 User Guide*.

Example 3: To allocate an Elastic IP address from an address pool that you own

The following `allocate-address` example allocates an Elastic IP address from an address pool that you have brought to your Amazon Web Services account. Amazon EC2 selects the address from the address pool.

```
aws ec2 allocate-address \  
  --public-ipv4-pool ipv4pool-ec2-1234567890abcdef0
```

Output:

```
{  
  "AllocationId": "eipalloc-02463d08ceEXAMPLE",  
  "NetworkBorderGroup": "us-west-2",  
  "CustomerOwnedIp": "18.218.95.81",  
  "CustomerOwnedIpv4Pool": "ipv4pool-ec2-1234567890abcdef0",  
  "Domain": "vpc"  
  "NetworkBorderGroup": "us-west-2",  
}
```

For more information, see [Elastic IP addresses](#) in the *Amazon EC2 User Guide*.

- For API details, see [AllocateAddress](#) in *AWS CLI Command Reference*.

allocate-hosts

The following code example shows how to use `allocate-hosts`.

AWS CLI

Example 1: To allocate a Dedicated Host

The following `allocate-hosts` example allocates a single Dedicated Host in the `eu-west-1a` Availability Zone, onto which you can launch `m5.large` instances. By default, the Dedicated Host accepts only target instance launches, and does not support host recovery.

```
aws ec2 allocate-hosts \  
  --instance-type m5.large \  
  --availability-zone eu-west-1a \  
  --quantity 1
```

Output:

```
{  
  "HostIds": [  
    "h-07879acf49EXAMPLE"  
  ]  
}
```

Example 2: To allocate a Dedicated Host with auto-placement and host recovery enabled

The following `allocate-hosts` example allocates a single Dedicated Host in the `eu-west-1a` Availability Zone with auto-placement and host recovery enabled.

```
aws ec2 allocate-hosts \  
  --instance-type m5.large \  
  --availability-zone eu-west-1a \  
  --auto-placement on \  
  --host-recovery on \  
  --quantity 1
```

Output:

```
{  
  "HostIds": [  
    "h-07879acf49EXAMPLE"  
  ]  
}
```

```
        "h-07879acf49EXAMPLE"  
    ]  
}
```

Example 3: To allocate a Dedicated Host with tags

The following `allocate-hosts` example allocates a single Dedicated Host and applies a tag with a key named `purpose` and a value of `production`.

```
aws ec2 allocate-hosts \  
  --instance-type m5.large \  
  --availability-zone eu-west-1a \  
  --quantity 1 \  
  --tag-specifications 'ResourceType=dedicated-  
host,Tags={Key=purpose,Value=production}'
```

Output:

```
{  
  "HostIds": [  
    "h-07879acf49EXAMPLE"  
  ]  
}
```

For more information, see [Allocating Dedicated Hosts](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [AllocateHosts](#) in *AWS CLI Command Reference*.

allocate-ipam-pool-cidr

The following code example shows how to use `allocate-ipam-pool-cidr`.

AWS CLI

To allocate a CIDR from an IPAM pool

The following `allocate-ipam-pool-cidr` example allocates a CIDR from an IPAM pool.

(Linux):

```
aws ec2 allocate-ipam-pool-cidr \  

```

```
--ipam-pool-id ipam-pool-0533048da7d823723 \  
--netmask-length 24
```

(Windows):

```
aws ec2 allocate-ipam-pool-cidr ^  
--ipam-pool-id ipam-pool-0533048da7d823723 ^  
--netmask-length 24
```

Output:

```
{  
  "IpamPoolAllocation": {  
    "Cidr": "10.0.0.0/24",  
    "IpamPoolAllocationId": "ipam-pool-alloc-018ecc28043b54ba38e2cd99943cebfb",  
    "ResourceType": "custom",  
    "ResourceOwner": "123456789012"  
  }  
}
```

For more information, see [Manually allocate a CIDR to a pool to reserve IP address space](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [AllocateIpamPoolCidr](#) in *AWS CLI Command Reference*.

apply-security-groups-to-client-vpn-target-network

The following code example shows how to use `apply-security-groups-to-client-vpn-target-network`.

AWS CLI

To apply security groups to a target network for a Client VPN endpoint

The following `apply-security-groups-to-client-vpn-target-network` example applies security group `sg-01f6e627a89f4db32` to the association between the specified target network and Client VPN endpoint.

```
aws ec2 apply-security-groups-to-client-vpn-target-network \  
--security-group-ids sg-01f6e627a89f4db32 \  
--vpc-id vpc-0e2110c2f324332e0 \  

```

```
--client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
  "SecurityGroupIds": [
    "sg-01f6e627a89f4db32"
  ]
}
```

For more information, see [Target Networks](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [ApplySecurityGroupsToClientVpnTargetNetwork](#) in *AWS CLI Command Reference*.

assign-ipv6-addresses

The following code example shows how to use `assign-ipv6-addresses`.

AWS CLI**To assign specific IPv6 addresses to a network interface**

This example assigns the specified IPv6 addresses to the specified network interface.

Command:

```
aws ec2 assign-ipv6-addresses --network-interface-id eni-38664473 --ipv6-addresses
2001:db8:1234:1a00:3304:8879:34cf:4071 2001:db8:1234:1a00:9691:9503:25ad:1761
```

Output:

```
{
  "AssignedIpv6Addresses": [
    "2001:db8:1234:1a00:3304:8879:34cf:4071",
    "2001:db8:1234:1a00:9691:9503:25ad:1761"
  ],
  "NetworkInterfaceId": "eni-38664473"
}
```

To assign IPv6 addresses that Amazon selects to a network interface

This example assigns two IPv6 addresses to the specified network interface. Amazon automatically assigns these IPv6 addresses from the available IPv6 addresses in the IPv6 CIDR block range of the subnet.

Command:

```
aws ec2 assign-ipv6-addresses --network-interface-id eni-38664473 --ipv6-address-count 2
```

Output:

```
{
  "AssignedIpv6Addresses": [
    "2001:db8:1234:1a00:3304:8879:34cf:4071",
    "2001:db8:1234:1a00:9691:9503:25ad:1761"
  ],
  "NetworkInterfaceId": "eni-38664473"
}
```

- For API details, see [AssignIpv6Addresses](#) in *AWS CLI Command Reference*.

assign-private-ip-addresses

The following code example shows how to use `assign-private-ip-addresses`.

AWS CLI

To assign a specific secondary private IP address a network interface

This example assigns the specified secondary private IP address to the specified network interface. If the command succeeds, no output is returned.

Command:

```
aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-ip-addresses 10.0.0.82
```

To assign secondary private IP addresses that Amazon EC2 selects to a network interface

This example assigns two secondary private IP addresses to the specified network interface. Amazon EC2 automatically assigns these IP addresses from the available IP addresses in the

CIDR block range of the subnet the network interface is associated with. If the command succeeds, no output is returned.

Command:

```
aws ec2 assign-private-ip-addresses --network-interface-id eni-e5aa89a3 --secondary-private-ip-address-count 2
```

- For API details, see [AssignPrivateIpAddresses](#) in *AWS CLI Command Reference*.

assign-private-nat-gateway-address

The following code example shows how to use `assign-private-nat-gateway-address`.

AWS CLI

To assign private IP addresses to your private NAT gateway

The following `assign-private-nat-gateway-address` example assigns two private IP addresses to the specified private NAT gateway.

```
aws ec2 assign-private-nat-gateway-address \
  --nat-gateway-id nat-1234567890abcdef0 \
  --private-ip-address-count 2
```

Output:

```
{
  "NatGatewayId": "nat-1234567890abcdef0",
  "NatGatewayAddresses": [
    {
      "NetworkInterfaceId": "eni-0065a61b324d1897a",
      "IsPrimary": false,
      "Status": "assigning"
    },
    {
      "NetworkInterfaceId": "eni-0065a61b324d1897a",
      "IsPrimary": false,
      "Status": "assigning"
    }
  ]
}
```

```
}
```

For more information, see [NAT gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [AssignPrivateNatGatewayAddress](#) in *AWS CLI Command Reference*.

associate-address

The following code example shows how to use `associate-address`.

AWS CLI

To associate an Elastic IP addresses in EC2-Classic

This example associates an Elastic IP address with an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```
aws ec2 associate-address --instance-id i-07ffe74c7330ebf53 --public-ip 198.51.100.0
```

To associate an Elastic IP address in EC2-VPC

This example associates an Elastic IP address with an instance in a VPC.

Command:

```
aws ec2 associate-address --instance-id i-0b263919b6498b123 --allocation-id eipalloc-64d5890a
```

Output:

```
{
  "AssociationId": "eipassoc-2bebb745"
}
```

This example associates an Elastic IP address with a network interface.

Command:

```
aws ec2 associate-address --allocation-id eipalloc-64d5890a --network-interface-id eni-1a2b3c4d
```

This example associates an Elastic IP with a private IP address that's associated with a network interface.

Command:

```
aws ec2 associate-address --allocation-id eipalloc-64d5890a --network-interface-id
eni-1a2b3c4d --private-ip-address 10.0.0.85
```

- For API details, see [AssociateAddress](#) in *AWS CLI Command Reference*.

associate-client-vpn-target-network

The following code example shows how to use `associate-client-vpn-target-network`.

AWS CLI

To associate a target network with a Client VPN endpoint

The following `associate-client-vpn-target-network` example associates a subnet with the specified Client VPN endpoint.

```
aws ec2 associate-client-vpn-target-network \
  --subnet-id subnet-0123456789abcabca \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
  "AssociationId": "cvpn-assoc-12312312312312312",
  "Status": {
    "Code": "associating"
  }
}
```

For more information, see [Target Networks](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [AssociateClientVpnTargetNetwork](#) in *AWS CLI Command Reference*.

associate-dhcp-options

The following code example shows how to use `associate-dhcp-options`.

AWS CLI

To associate a DHCP options set with your VPC

This example associates the specified DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 associate-dhcp-options --dhcp-options-id dopt-d9070ebb --vpc-id vpc-a01106c2
```

To associate the default DHCP options set with your VPC

This example associates the default DHCP options set with the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 associate-dhcp-options --dhcp-options-id default --vpc-id vpc-a01106c2
```

- For API details, see [AssociateDhcpOptions](#) in *AWS CLI Command Reference*.

associate-iam-instance-profile

The following code example shows how to use `associate-iam-instance-profile`.

AWS CLI

To associate an IAM instance profile with an instance

This example associates an IAM instance profile named `admin-role` with instance `i-123456789abcde123`.

Command:

```
aws ec2 associate-iam-instance-profile --instance-id i-123456789abcde123 --iam-instance-profile Name=admin-role
```

Output:

```
{
```

```

    "IamInstanceProfileAssociation": {
      "InstanceId": "i-123456789abcde123",
      "State": "associating",
      "AssociationId": "iip-assoc-0e7736511a163c209",
      "IamInstanceProfile": {
        "Id": "AIPAJBLK7RKJKWDXVHIEC",
        "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
      }
    }
  }
}

```

- For API details, see [AssociateIamInstanceProfile](#) in *AWS CLI Command Reference*.

associate-instance-event-window

The following code example shows how to use `associate-instance-event-window`.

AWS CLI

Example 1: To associate one or more instances with an event window

The following `associate-instance-event-window` example associates one or more instances with an event window.

```

aws ec2 associate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"

```

Output:

```

{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [
        "i-1234567890abcdef0",
        "i-0598c7d356eba48d7"
      ],
      "Tags": [],
    }
  }
}

```

```

        "DedicatedHostIds": []
      },
      "State": "creating"
    }
  }
}

```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 2: To associate instance tags with an event window

The following `associate-instance-event-window` example associates instance tags with an event window. Enter an `instance-event-window-id` parameter to specify the event window. To associate instance tags, specify the `association-target` parameter, and for the parameter value, specify one or more tags.

```

aws ec2 associate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"

```

Output:

```

{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [
        {
          "Key": "k2",
          "Value": "v2"
        },
        {
          "Key": "k1",
          "Value": "v1"
        }
      ],
      "DedicatedHostIds": []
    }
  },
}

```

```

    "State": "creating"
  }
}

```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 3: To associate a Dedicated Host with an event window

The following `associate-instance-event-window` example associates a Dedicated Host with an event window. Enter an `instance-event-window-id` parameter to specify the event window. To associate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one of more Dedicated Host IDs.

```

aws ec2 associate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "DedicatedHostIds=h-029fa35a02b99801d"

```

Output:

```

{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": [
        "h-029fa35a02b99801d"
      ]
    },
    "State": "creating"
  }
}

```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see [AssociateInstanceEventWindow](#) in *AWS CLI Command Reference*.

associate-ipam-resource-discovery

The following code example shows how to use `associate-ipam-resource-discovery`.

AWS CLI

To associate a resource discovery with an IPAM

In this example, you are an IPAM delegated admin and a resource discovery has been created and shared with you by another AWS account so that you can use IPAM to manage and monitor resource CIDRs owned by the other account.

Note

To complete this request, you'll need the resource discovery ID which you can get with [describe-ipam-resource-discoveries](#) and the IPAM ID which you can get with [describe-ipams](#). The resource discovery that you are associating must have first been shared with your account using AWS RAM. The `--region` you enter must match the home Region of the IPAM you are associating it with.

The following `associate-ipam-resource-discovery` example associates a resource discovery with an IPAM.

```
aws ec2 associate-ipam-resource-discovery \
  --ipam-id ipam-005f921c17ebd5107 \
  --ipam-resource-discovery-id ipam-res-disco-03e0406de76a044ee \
  --tag-specifications 'ResourceType=ipam-resource-discovery,Tags=[{Key=cost-
center,Value=cc123}]' \
  --region us-east-1
```

Output:

```
{
  {
    "IpamResourceDiscoveryAssociation": {
      "OwnerId": "320805250157",
      "IpamResourceDiscoveryAssociationId": "ipam-res-disco-
assoc-04382a6346357cf82",
      "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::320805250157:ipam-
resource-discovery-association/ipam-res-disco-assoc-04382a6346357cf82",
      "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
```

```

    "IpamId": "ipam-005f921c17ebd5107",
    "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
    "IpamRegion": "us-east-1",
    "IsDefault": false,
    "ResourceDiscoveryStatus": "active",
    "State": "associate-in-progress",
    "Tags": []
  }
}

```

Once you associate a resource discovery, you can monitor and/or manage the IP addresses of resources created by the other accounts. For more information, see [Integrate IPAM with accounts outside of your organization](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [AssociateIpamResourceDiscovery](#) in *AWS CLI Command Reference*.

associate-nat-gateway-address

The following code example shows how to use `associate-nat-gateway-address`.

AWS CLI

To associate an Elastic IP address with a public NAT gateway

The following `associate-nat-gateway-address` example associates the specified Elastic IP address with the specified public NAT gateway. AWS automatically assigns a secondary private IPv4 address.

```

aws ec2 associate-nat-gateway-address \
  --nat-gateway-id nat-1234567890abcdef0 \
  --allocation-ids eipalloc-0be6ecac95EXAMPLE

```

Output:

```

{
  "NatGatewayId": "nat-1234567890abcdef0",
  "NatGatewayAddresses": [
    {
      "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
      "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
      "IsPrimary": false,

```

```
    "Status": "associating"
  }
]
}
```

For more information, see [NAT gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [AssociateNatGatewayAddress](#) in *AWS CLI Command Reference*.

associate-route-table

The following code example shows how to use `associate-route-table`.

AWS CLI

To associate a route table with a subnet

This example associates the specified route table with the specified subnet.

Command:

```
aws ec2 associate-route-table --route-table-id rtb-22574640 --subnet-id
subnet-9d4a7b6c
```

Output:

```
{
  "AssociationId": "rtbassoc-781d0d1a"
}
```

- For API details, see [AssociateRouteTable](#) in *AWS CLI Command Reference*.

associate-subnet-cidr-block

The following code example shows how to use `associate-subnet-cidr-block`.

AWS CLI

To associate an IPv6 CIDR block with a subnet

This example associates an IPv6 CIDR block with the specified subnet.

Command:

```
aws ec2 associate-subnet-cidr-block --subnet-id subnet-5f46ec3b --ipv6-cidr-block
2001:db8:1234:1a00::/64
```

Output:

```
{
  "SubnetId": "subnet-5f46ec3b",
  "Ipv6CidrBlockAssociation": {
    "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
    "AssociationId": "subnet-cidr-assoc-3aa54053",
    "Ipv6CidrBlockState": {
      "State": "associating"
    }
  }
}
```

- For API details, see [AssociateSubnetCidrBlock](#) in *AWS CLI Command Reference*.

associate-transit-gateway-multicast-domain

The following code example shows how to use `associate-transit-gateway-multicast-domain`.

AWS CLI**To associate a transit gateway with a multicast domain**

The following `associate-transit-gateway-multicast-domain` example associates the specified subnet and attachment with the specified multicast domain.

```
aws ec2 associate-transit-gateway-multicast-domain \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
  --transit-gateway-attachment-id tgw-attach-028c1dd0f8f5cbe8e \
  --subnet-ids subnet-000de86e3b49c932a \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{
```

```

    "Associations": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
      "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8f5cbe8e",
      "ResourceId": "vpc-01128d2c240c09bd5",
      "ResourceType": "vpc",
      "Subnets": [
        {
          "SubnetId": "subnet-000de86e3b49c932a",
          "State": "associating"
        }
      ]
    }
  }
}

```

For more information, see [Managing multicast domains](#) in the *Transit Gateways Guide*.

- For API details, see [AssociateTransitGatewayMulticastDomain](#) in *AWS CLI Command Reference*.

associate-transit-gateway-route-table

The following code example shows how to use `associate-transit-gateway-route-table`.

AWS CLI

To associate a transit gateway route table with a transit gateway attachment

The following example associates the specified transit gateway route table with the specified VPC attachment.

```

aws ec2 associate-transit-gateway-route-table \
  --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \
  --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE

```

Output:

```

{
  "Association": {
    "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",
    "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
    "ResourceId": "vpc-0065acced4EXAMPLE",
    "ResourceType": "vpc",
    "State": "associating"
  }
}

```

```
}
}
```

For more information, see [Associate a Transit Gateway Route Table](#) in the *AWS Transit Gateways Guide*.

- For API details, see [AssociateTransitGatewayRouteTable](#) in *AWS CLI Command Reference*.

associate-vpc-cidr-block

The following code example shows how to use `associate-vpc-cidr-block`.

AWS CLI

Example 1: To associate an Amazon-provided IPv6 CIDR block with a VPC

The following `associate-vpc-cidr-block` example associates an IPv6 CIDR block with the specified VPC.:

```
aws ec2 associate-vpc-cidr-block \
  --amazon-provided-ipv6-cidr-block \
  --ipv6-cidr-block-network-border-group us-west-2-lax-1 \
  --vpc-id vpc-8EXAMPLE
```

Output:

```
{
  "Ipv6CidrBlockAssociation": {
    "AssociationId": "vpc-cidr-assoc-0838ce7d9dEXAMPLE",
    "Ipv6CidrBlockState": {
      "State": "associating"
    },
    "NetworkBorderGroup": "us-west-2-lax-1"
  },
  "VpcId": "vpc-8EXAMPLE"
}
```

Example 2: To associate an additional IPv4 CIDR block with a VPC

The following `associate-vpc-cidr-block` example associates the IPv4 CIDR block `10.2.0.0/16` with the specified VPC.

```
aws ec2 associate-vpc-cidr-block \  
  --vpc-id vpc-1EXAMPLE \  
  --cidr-block 10.2.0.0/16
```

Output:

```
{  
  "CidrBlockAssociation": {  
    "AssociationId": "vpc-cidr-assoc-2EXAMPLE",  
    "CidrBlock": "10.2.0.0/16",  
    "CidrBlockState": {  
      "State": "associating"  
    }  
  },  
  "VpcId": "vpc-1EXAMPLE"  
}
```

- For API details, see [AssociateVpcCidrBlock](#) in *AWS CLI Command Reference*.

attach-classic-link-vpc

The following code example shows how to use `attach-classic-link-vpc`.

AWS CLI

To link (attach) an EC2-Classical instance to a VPC

This example links instance `i-1234567890abcdef0` to VPC `vpc-88888888` through the VPC security group `sg-12312312`.

Command:

```
aws ec2 attach-classic-link-vpc --instance-id i-1234567890abcdef0 --vpc-id  
vpc-88888888 --groups sg-12312312
```

Output:

```
{  
  "Return": true  
}
```

- For API details, see [AttachClassicLinkVpc](#) in *AWS CLI Command Reference*.

attach-internet-gateway

The following code example shows how to use `attach-internet-gateway`.

AWS CLI

To attach an internet gateway to your VPC

The following `attach-internet-gateway` example attaches the specified internet gateway to the specific VPC.

```
aws ec2 attach-internet-gateway \  
  --internet-gateway-id igw-0d0fb496b3EXAMPLE \  
  --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see [Internet gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [AttachInternetGateway](#) in *AWS CLI Command Reference*.

attach-network-interface

The following code example shows how to use `attach-network-interface`.

AWS CLI

Example 1: To attach a network interface to an instance

The following `attach-network-interface` example attaches the specified network interface to the specified instance.

```
aws ec2 attach-network-interface \  
  --network-interface-id eni-0dc56a8d4640ad10a \  
  --instance-id i-1234567890abcdef0 \  
  --device-index 1
```

Output:

```
{
  "AttachmentId": "eni-attach-01a8fc87363f07cf9"
}
```

For more information, see [Elastic network interfaces](#) in the *Amazon EC2 User Guide*.

Example 2: To attach a network interface to an instance with multiple network cards

The following `attach-network-interface` example attaches the specified network interface to the specified instance and network card.

```
aws ec2 attach-network-interface \
  --network-interface-id eni-07483b1897541ad83 \
  --instance-id i-01234567890abcdef \
  --network-card-index 1 \
  --device-index 1
```

Output:

```
{
  "AttachmentId": "eni-attach-0fbd7ee87a88cd06c"
}
```

For more information, see [Elastic network interfaces](#) in the *Amazon EC2 User Guide*.

- For API details, see [AttachNetworkInterface](#) in *AWS CLI Command Reference*.

attach-verified-access-trust-provider

The following code example shows how to use `attach-verified-access-trust-provider`.

AWS CLI

To attach a trust provider to an instance

The following `attach-verified-access-trust-provider` example attaches the specified Verified Access trust provider to the specified Verified Access instance.

```
aws ec2 attach-verified-access-trust-provider \
  --verified-access-instance-id vai-0ce000c0b7643abea \
```

```
--verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
  "VerifiedAccessTrustProvider": {
    "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
    "Description": "",
    "TrustProviderType": "user",
    "UserTrustProviderType": "iam-identity-center",
    "PolicyReferenceName": "idc",
    "CreationTime": "2023-08-25T19:00:38",
    "LastUpdatedTime": "2023-08-25T19:00:38"
  },
  "VerifiedAccessInstance": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "Description": "",
    "VerifiedAccessTrustProviders": [
      {
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
        "TrustProviderType": "user",
        "UserTrustProviderType": "iam-identity-center"
      }
    ],
    "CreationTime": "2023-08-25T18:27:56",
    "LastUpdatedTime": "2023-08-25T18:27:56"
  }
}
```

For more information, see [Verified Access instances](#) in the *AWS Verified Access User Guide*.

- For API details, see [AttachVerifiedAccessTrustProvider](#) in *AWS CLI Command Reference*.

attach-volume

The following code example shows how to use `attach-volume`.

AWS CLI

To attach a volume to an instance

This example command attaches a volume (`vol-1234567890abcdef0`) to an instance (`i-01474ef662b89480`) as `/dev/sdf`.

Command:

```
aws ec2 attach-volume --volume-id vol-1234567890abcdef0 --instance-id
i-01474ef662b89480 --device /dev/sdf
```

Output:

```
{
  "AttachTime": "YYYY-MM-DDTHH:MM:SS.000Z",
  "InstanceId": "i-01474ef662b89480",
  "VolumeId": "vol-1234567890abcdef0",
  "State": "attaching",
  "Device": "/dev/sdf"
}
```

- For API details, see [AttachVolume](#) in *AWS CLI Command Reference*.

attach-vpn-gateway

The following code example shows how to use `attach-vpn-gateway`.

AWS CLI**To attach a virtual private gateway to your VPC**

The following `attach-vpn-gateway` example attaches the specified virtual private gateway to the specified VPC.

```
aws ec2 attach-vpn-gateway \
  --vpn-gateway-id vgw-9a4cacf3 \
  --vpc-id vpc-a01106c2
```

Output:

```
{
  "VpcAttachment": {
    "State": "attaching",
    "VpcId": "vpc-a01106c2"
  }
}
```

- For API details, see [AttachVpnGateway](#) in *AWS CLI Command Reference*.

authorize-client-vpn-ingress

The following code example shows how to use `authorize-client-vpn-ingress`.

AWS CLI

To add an authorization rule for a Client VPN endpoint

The following `authorize-client-vpn-ingress` example adds an ingress authorization rule that permits all clients to access the internet (`0.0.0.0/0`).

```
aws ec2 authorize-client-vpn-ingress \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --target-network-cidr 0.0.0.0/0 \
  --authorize-all-groups
```

Output:

```
{
  "Status": {
    "Code": "authorizing"
  }
}
```

For more information, see [Authorization Rules](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [AuthorizeClientVpnIngress](#) in *AWS CLI Command Reference*.

authorize-security-group-egress

The following code example shows how to use `authorize-security-group-egress`.

AWS CLI

To add a rule that allows outbound traffic to a specific address range

This example command adds a rule that grants access to the specified address ranges on TCP port 80.

Command (Linux):

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges='[{"CidrIp=10.0.0.0/16}]'
```

Command (Windows):

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{"CidrIp=10.0.0.0/16}]
```

To add a rule that allows outbound traffic to a specific security group

This example command adds a rule that grants access to the specified security group on TCP port 80.

Command (Linux):

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs='[{"GroupId=sg-4b51a32f}]'
```

Command (Windows):

```
aws ec2 authorize-security-group-egress --group-id sg-1a2b3c4d --ip-permissions
IpProtocol=tcp,FromPort=80,ToPort=80,UserIdGroupPairs=[{"GroupId=sg-4b51a32f}]
```

- For API details, see [AuthorizeSecurityGroupEgress](#) in *AWS CLI Command Reference*.

authorize-security-group-ingress

The following code example shows how to use `authorize-security-group-ingress`.

AWS CLI

Example 1: To add a rule that allows inbound SSH traffic

The following `authorize-security-group-ingress` example adds a rule that allows inbound traffic on TCP port 22 (SSH).

```
aws ec2 authorize-security-group-ingress \  
  --group-id sg-1234567890abcdef0 \  
  --protocol tcp \  
  --port 22 \  
  --source-security-group-id sg-1234567890abcdef0
```

```
--cidr 203.0.113.0/24
```

Output:

```
{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupId": "sgr-01afa97ef3e1bedfc",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 22,
      "ToPort": 22,
      "CidrIpv4": "203.0.113.0/24"
    }
  ]
}
```

Example 2: To add a rule that allows inbound HTTP traffic from another security group

The following `authorize-security-group-ingress` example adds a rule that allows inbound access on TCP port 80 from the source security group `sg-1a2b3c4d`. The source group must be in the same VPC or in a peer VPC (requires a VPC peering connection). Incoming traffic is allowed based on the private IP addresses of instances that are associated with the source security group (not the public IP address or Elastic IP address).

```
aws ec2 authorize-security-group-ingress \
  --group-id sg-1234567890abcdef0 \
  --protocol tcp \
  --port 80 \
  --source-group sg-1a2b3c4d
```

Output:

```
{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupId": "sgr-01f4be99110f638a7",
```

```

    "GroupId": "sg-1234567890abcdef0",
    "GroupOwnerId": "123456789012",
    "IsEgress": false,
    "IpProtocol": "tcp",
    "FromPort": 80,
    "ToPort": 80,
    "ReferencedGroupInfo": {
      "GroupId": "sg-1a2b3c4d",
      "UserId": "123456789012"
    }
  }
]
}

```

Example 3: To add multiple rules in the same call

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add two inbound rules, one that enables inbound access on TCP port 3389 (RDP) and the other that enables ping/ICMP.

```
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions
IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges="[{CidrIp=172.31.0.0/16}]"
IpProtocol=icmp,FromPort=-1,ToPort=-1,IpRanges="[{CidrIp=172.31.0.0/16}]"
```

Output:

```

{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupId": "sgr-00e06e5d3690f29f3",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 3389,
      "ToPort": 3389,
      "CidrIpv4": "172.31.0.0/16"
    },
    {
      "SecurityGroupId": "sgr-0a133dd4493944b87",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",

```

```

        "IsEgress": false,
        "IpProtocol": "tcp",
        "FromPort": -1,
        "ToPort": -1,
        "CidrIpv4": "172.31.0.0/16"
    }
]
}

```

Example 4: To add a rule for ICMP traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows the ICMP message Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4) from anywhere.

```
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges="[[CidrIp=0.0.0.0/0]]"
```

Output:

```

{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupRuleId": "sgr-0de3811019069b787",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "icmp",
      "FromPort": 3,
      "ToPort": 4,
      "CidrIpv4": "0.0.0.0/0"
    }
  ]
}

```

Example 5: To add a rule for IPv6 traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows SSH access (port 22) from the IPv6 range `2001:db8:1234:1a00::/64`.

```
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=tcp,FromPort=22,ToPort=22,Ipv6Ranges="[{CidrIpv6=2001:db8:1234:1a00::/64}]"
```

Output:

```
{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupRuleId": "sgr-0455bc68b60805563",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 22,
      "ToPort": 22,
      "CidrIpv6": "2001:db8:1234:1a00::/64"
    }
  ]
}
```

Example 6: To add a rule for ICMPv6 traffic

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows ICMPv6 traffic from anywhere.

```
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions IpProtocol=icmpv6,Ipv6Ranges="[{CidrIpv6>::/0}]"
```

Output:

```
{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupRuleId": "sgr-04b612d9363ab6327",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "icmpv6",
      "FromPort": -1,
      "ToPort": -1,
      "CidrIpv6": "::/0"
    }
  ]
}
```

```

    }
  ]
}

```

Example 7: Add a rule with a description

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows RDP traffic from the specified IPv4 address range. The rule includes a description to help you identify it later.

```
aws ec2 authorize-security-group-ingress --group-id sg-1234567890abcdef0 --ip-permissions
IpProtocol=tcp,FromPort=3389,ToPort=3389,IpRanges="[{CidrIp=203.0.113.0/24,Description='RDP
access from NY office'}]"
```

Output:

```

{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupRuleId": "sgr-0397bbcc01e974db3",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "tcp",
      "FromPort": 3389,
      "ToPort": 3389,
      "CidrIpv4": "203.0.113.0/24",
      "Description": "RDP access from NY office"
    }
  ]
}

```

Example 8: To add an inbound rule that uses a prefix list

The following `authorize-security-group-ingress` example uses the `ip-permissions` parameter to add an inbound rule that allows all traffic for the CIDR ranges in the specified prefix list.

```
aws ec2 authorize-security-group-ingress --group-id sg-04a351bfe432d4e71 --ip-permissions
IpProtocol=all,PrefixListIds="[{PrefixListId=pl-002dc3ec097de1514}]"
```

Output:

```
{
  "Return": true,
  "SecurityGroupRules": [
    {
      "SecurityGroupRuleId": "sgr-09c74b32f677c6c7c",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "123456789012",
      "IsEgress": false,
      "IpProtocol": "-1",
      "FromPort": -1,
      "ToPort": -1,
      "PrefixListId": "pl-0721453c7ac4ec009"
    }
  ]
}
```

For more information, see [Security groups](#) in the *Amazon VPC User Guide*.

- For API details, see [AuthorizeSecurityGroupIngress](#) in *AWS CLI Command Reference*.

bundle-instance

The following code example shows how to use `bundle-instance`.

AWS CLI**To bundle an instance**

This example bundles instance `i-1234567890abcdef0` to a bucket called `bundletasks`. Before you specify values for your access key IDs, review and follow the guidance in [Best Practices for Managing AWS Access Keys](#).

Command:

```
aws ec2 bundle-instance --instance-id i-1234567890abcdef0 --bucket bundletasks --
prefix winami --owner-akid AK12AJEXAMPLE --owner-sak example123example
```

Output:

```
{
```

```
"BundleTask": {
  "UpdateTime": "2015-09-15T13:30:35.000Z",
  "InstanceId": "i-1234567890abcdef0",
  "Storage": {
    "S3": {
      "Prefix": "winami",
      "Bucket": "bundletasks"
    }
  },
  "State": "pending",
  "StartTime": "2015-09-15T13:30:35.000Z",
  "BundleId": "bun-294e041f"
}
}
```

- For API details, see [BundleInstance](#) in *AWS CLI Command Reference*.

cancel-bundle-task

The following code example shows how to use `cancel-bundle-task`.

AWS CLI

To cancel a bundle task

This example cancels bundle task `bun-2a4e041c`.

Command:

```
aws ec2 cancel-bundle-task --bundle-id bun-2a4e041c
```

Output:

```
{
  "BundleTask": {
    "UpdateTime": "2015-09-15T13:27:40.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "Storage": {
      "S3": {
        "Prefix": "winami",
        "Bucket": "bundletasks"
      }
    },
  },
}
```

```
"State": "cancelling",
"StartTime": "2015-09-15T13:24:35.000Z",
"BundleId": "bun-2a4e041c"
}
}
```

- For API details, see [CancelBundleTask](#) in *AWS CLI Command Reference*.

cancel-capacity-reservation-fleets

The following code example shows how to use `cancel-capacity-reservation-fleets`.

AWS CLI

To cancel a Capacity Reservation Fleet

The following `cancel-capacity-reservation-fleets` example cancels the specified Capacity Reservation Fleet and the capacity it reserves. When you cancel a Fleet, its status changes to `cancelled`, and it can no longer create new Capacity Reservations. Additionally, all of the individual Capacity Reservations in the Fleet are cancelled, and the instances that were previously running in the reserved capacity continue to run normally in shared capacity.

```
aws ec2 cancel-capacity-reservation-fleets \
  --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```
{
  "SuccessfulFleetCancellations": [
    {
      "CurrentFleetState": "cancelling",
      "PreviousFleetState": "active",
      "CapacityReservationFleetId": "crf-abcdef01234567890"
    }
  ],
  "FailedFleetCancellations": []
}
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](#) in the *Amazon EC2 User Guide*.

- For API details, see [CancelCapacityReservationFleets](#) in *AWS CLI Command Reference*.

cancel-capacity-reservation

The following code example shows how to use `cancel-capacity-reservation`.

AWS CLI

To cancel a capacity reservation

The following `cancel-capacity-reservation` example cancels the specified capacity reservation.

```
aws ec2 cancel-capacity-reservation \  
  --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```
{  
  "Return": true  
}
```

For more information, see [Canceling a Capacity Reservation](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CancelCapacityReservation](#) in *AWS CLI Command Reference*.

cancel-conversion-task

The following code example shows how to use `cancel-conversion-task`.

AWS CLI

To cancel an active conversion of an instance or a volume

This example cancels the upload associated with the task ID `import-i-fh95npoc`. If the command succeeds, no output is returned.

Command:

```
aws ec2 cancel-conversion-task --conversion-task-id import-i-fh95npoc
```

- For API details, see [CancelConversionTask](#) in *AWS CLI Command Reference*.

cancel-export-task

The following code example shows how to use `cancel-export-task`.

AWS CLI

To cancel an active export task

This example cancels an active export task with the task ID `export-i-fgelt0i7`. If the command succeeds, no output is returned.

Command:

```
aws ec2 cancel-export-task --export-task-id export-i-fgelt0i7
```

- For API details, see [CancelExportTask](#) in *AWS CLI Command Reference*.

cancel-image-launch-permission

The following code example shows how to use `cancel-image-launch-permission`.

AWS CLI

To cancel having an AMI shared with your Amazon Web Services account

The following `cancel-image-launch-permission` example removes your account from the specified AMI's launch permissions.

```
aws ec2 cancel-image-launch-permission \  
  --image-id ami-0123456789example \  
  --region us-east-1
```

Output:

```
{  
  "Return": true  
}
```

For more information, see [Cancel having an AMI shared with your Amazon Web Services account](#) in the *Amazon EC2 User Guide*.

- For API details, see [CancelImageLaunchPermission](#) in *AWS CLI Command Reference*.

cancel-import-task

The following code example shows how to use `cancel-import-task`.

AWS CLI

To cancel an import task

The following `cancel-import-task` example cancels the specified import image task.

```
aws ec2 cancel-import-task \  
  --import-task-id import-ami-1234567890abcdef0
```

Output:

```
{  
  "ImportTaskId": "import-ami-1234567890abcdef0",  
  "PreviousState": "active",  
  "State": "deleting"  
}
```

- For API details, see [CancelImportTask](#) in *AWS CLI Command Reference*.

cancel-reserved-instances-listing

The following code example shows how to use `cancel-reserved-instances-listing`.

AWS CLI

To cancel a Reserved Instance listing

The following `cancel-reserved-instances-listing` example cancels the specified Reserved Instance listing.

```
aws ec2 cancel-reserved-instances-listing \  
  --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

- For API details, see [CancelReservedInstancesListing](#) in *AWS CLI Command Reference*.

cancel-spot-fleet-requests

The following code example shows how to use `cancel-spot-fleet-requests`.

AWS CLI

Example 1: To cancel a Spot fleet request and terminate the associated instances

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request and terminates the associated On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \  
  --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \  
  --terminate-instances
```

Output:

```
{  
  "SuccessfulFleetRequests": [  
    {  
      "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",  
      "CurrentSpotFleetRequestState": "cancelled_terminating",  
      "PreviousSpotFleetRequestState": "active"  
    }  
  ],  
  "UnsuccessfulFleetRequests": []  
}
```

For more information, see [Cancel a Spot Fleet request](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To cancel a Spot fleet request without terminating the associated instances

The following `cancel-spot-fleet-requests` example cancels a Spot Fleet request without terminating the associated On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \  
  --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \  
  --no-terminate-instances
```

Output:

```
{  
  "SuccessfulFleetRequests": [  
    {  
      "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
```

```
        "CurrentSpotFleetRequestState": "cancelled_running",
        "PreviousSpotFleetRequestState": "active"
    }
],
"UnsuccessfulFleetRequests": []
}
```

For more information, see [Cancel a Spot Fleet request](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CancelSpotFleetRequests](#) in *AWS CLI Command Reference*.

cancel-spot-instance-requests

The following code example shows how to use `cancel-spot-instance-requests`.

AWS CLI

To cancel Spot Instance requests

This example command cancels a Spot Instance request.

Command:

```
aws ec2 cancel-spot-instance-requests --spot-instance-request-ids sir-08b93456
```

Output:

```
{
  "CancelledSpotInstanceRequests": [
    {
      "State": "cancelled",
      "SpotInstanceRequestId": "sir-08b93456"
    }
  ]
}
```

- For API details, see [CancelSpotInstanceRequests](#) in *AWS CLI Command Reference*.

confirm-product-instance

The following code example shows how to use `confirm-product-instance`.

AWS CLI

To confirm the product instance

This example determines whether the specified product code is associated with the specified instance.

Command:

```
aws ec2 confirm-product-instance --product-code 774F4FF8 --instance-id
i-1234567890abcdef0
```

Output:

```
{
  "OwnerId": "123456789012"
}
```

- For API details, see [ConfirmProductInstance](#) in *AWS CLI Command Reference*.

copy-fpga-image

The following code example shows how to use `copy-fpga-image`.

AWS CLI

To copy an Amazon FPGA image

This example copies the specified AFI from the `us-east-1` region to the current region (`eu-west-1`).

Command:

```
aws ec2 copy-fpga-image --name copy-afi --source-fpga-image-id afi-0d123e123bfc85abc
--source-region us-east-1 --region eu-west-1
```

Output:

```
{
  "FpgaImageId": "afi-06b12350a123fbabc"
}
```

- For API details, see [CopyFpgaImage](#) in *AWS CLI Command Reference*.

copy-image

The following code example shows how to use `copy-image`.

AWS CLI

Example 1: To copy an AMI to another Region

The following `copy-image` example command copies the specified AMI from the `us-west-2` Region to the `us-east-1` Region and adds a short description.

```
aws ec2 copy-image \  
  --region us-east-1 \  
  --name ami-name \  
  --source-region us-west-2 \  
  --source-image-id ami-066877671789bd71b \  
  --description "This is my copied image."
```

Output:

```
{  
  "ImageId": "ami-0123456789abcdefg"  
}
```

For more information, see [Copy an AMI](#) in the *Amazon EC2 User Guide*.

Example 2: To copy an AMI to another Region and encrypt the backing snapshot

The following `copy-image` command copies the specified AMI from the `us-west-2` Region to the current Region and encrypts the backing snapshot using the specified KMS key.

```
aws ec2 copy-image \  
  --source-region us-west-2 \  
  --name ami-name \  
  --source-image-id ami-066877671789bd71b \  
  --encrypted \  
  --kms-key-id alias/my-kms-key
```

Output:

```
{
  "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see [Copy an AMI](#) in the *Amazon EC2 User Guide*.

Example 3: To include your user-defined AMI tags when copying an AMI

The following `copy-image` command uses the `--copy-image-tags` parameter to copy your user-defined AMI tags when copying the AMI.

```
aws ec2 copy-image \
  --region us-east-1 \
  --name ami-name \
  --source-region us-west-2 \
  --source-image-id ami-066877671789bd71b \
  --description "This is my copied image."
  --copy-image-tags
```

Output:

```
{
  "ImageId": "ami-0123456789abcdefg"
}
```

For more information, see [Copy an AMI](#) in the *Amazon EC2 User Guide*.

- For API details, see [CopyImage](#) in *AWS CLI Command Reference*.

copy-snapshot

The following code example shows how to use `copy-snapshot`.

AWS CLI

Example 1: To copy a snapshot to another Region

The following `copy-snapshot` example command copies the specified snapshot from the `us-west-2` Region to the `us-east-1` Region and adds a short description.

```
aws ec2 copy-snapshot \
```

```
--region us-east-1 \  
--source-region us-west-2 \  
--source-snapshot-id snap-066877671789bd71b \  
--description "This is my copied snapshot."
```

Output:

```
{  
  "SnapshotId": "snap-066877671789bd71b"  
}
```

For more information, see [Copy an Amazon EBS snapshot](#) in the *Amazon EC2 User Guide*.

Example 2: To copy an unencrypted snapshot and encrypt the new snapshot

The following `copy-snapshot` command copies the specified unencrypted snapshot from the `us-west-2` Region to the current Region and encrypts the new snapshot using the specified KMS key.

```
aws ec2 copy-snapshot \  
  --source-region us-west-2 \  
  --source-snapshot-id snap-066877671789bd71b \  
  --encrypted \  
  --kms-key-id alias/my-kms-key
```

Output:

```
{  
  "SnapshotId": "snap-066877671789bd71b"  
}
```

For more information, see [Copy an Amazon EBS snapshot](#) in the *Amazon EC2 User Guide*.

- For API details, see [CopySnapshot](#) in *AWS CLI Command Reference*.

create-capacity-reservation-fleet

The following code example shows how to use `create-capacity-reservation-fleet`.

AWS CLI

To create a Capacity Reservation Fleet

The following `create-capacity-reservation-fleet` example creates a Capacity Reservation Fleet for the instance type specified in the request, up to the specified total target capacity. The number of instances for which the Capacity Reservation Fleet reserves capacity depends on the total target capacity and instance type weights that you specify in the request. Specify the instance types to use and a priority for each of the designated instance types.

```
aws ec2 create-capacity-reservation-fleet \  
--total-target-capacity 24 \  
--allocation-strategy prioritized \  
--instance-match-criteria open \  
--tenancy default \  
--end-date 2022-12-31T23:59:59.000Z \  
--instance-type-specifications file://instanceTypeSpecification.json
```

Contents of `instanceTypeSpecification.json`:

```
[  
  {  
    "InstanceType": "m5.xlarge",  
    "InstancePlatform": "Linux/UNIX",  
    "Weight": 3.0,  
    "AvailabilityZone": "us-east-1a",  
    "EbsOptimized": true,  
    "Priority" : 1  
  }  
]
```

Output:

```
{  
  "Status": "submitted",  
  "TotalFulfilledCapacity": 0.0,  
  "CapacityReservationFleetId": "crf-abcdef01234567890",  
  "TotalTargetCapacity": 24  
}
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](#) in the *Amazon EC2 User Guide*.

For more information about instance type weight and total target capacity, see [Instance type weight](#) and [Total target capacity](#) in the *Amazon EC2 User Guide*.

For more information about designating priority for specified instance types, see [Allocation strategy](#) and [Instance type priority](#) in the *Amazon EC2 User Guide*.

- For API details, see [CreateCapacityReservationFleet](#) in *AWS CLI Command Reference*.

create-capacity-reservation

The following code example shows how to use create-capacity-reservation.

AWS CLI

Example 1: To create a Capacity Reservation

The following create-capacity-reservation example creates a capacity reservation in the eu-west-1a Availability Zone, into which you can launch three t2.medium instances running a Linux/Unix operating system. By default, the capacity reservation is created with open instance matching criteria and no support for ephemeral storage, and it remains active until you manually cancel it.

```
aws ec2 create-capacity-reservation \  
  --availability-zone eu-west-1a \  
  --instance-type t2.medium \  
  --instance-platform Linux/UNIX \  
  --instance-count 3
```

Output:

```
{  
  "CapacityReservation": {  
    "CapacityReservationId": "cr-1234abcd56EXAMPLE ",  
    "EndDateType": "unlimited",  
    "AvailabilityZone": "eu-west-1a",  
    "InstanceMatchCriteria": "open",  
    "EphemeralStorage": false,  
    "CreateDate": "2019-08-16T09:27:35.000Z",  
    "AvailableInstanceCount": 3,  
    "InstancePlatform": "Linux/UNIX",  
    "TotalInstanceCount": 3,  
    "State": "active",  
    "Tenancy": "default",  
    "EbsOptimized": false,  
    "InstanceType": "t2.medium"
```

```
}  
}
```

Example 2: To create a Capacity Reservation that automatically ends at a specified date/time

The following `create-capacity-reservation` example creates a capacity reservation in the `eu-west-1a` Availability Zone, into which you can launch three `m5.large` instances running a Linux/Unix operating system. This capacity reservation automatically ends on 08/31/2019 at 23:59:59.

```
aws ec2 create-capacity-reservation \  
  --availability-zone eu-west-1a \  
  --instance-type m5.large \  
  --instance-platform Linux/UNIX \  
  --instance-count 3 \  
  --end-date-type limited \  
  --end-date 2019-08-31T23:59:59Z
```

Output:

```
{  
  "CapacityReservation": {  
    "CapacityReservationId": "cr-1234abcd56EXAMPLE ",  
    "EndDateType": "limited",  
    "AvailabilityZone": "eu-west-1a",  
    "EndDate": "2019-08-31T23:59:59.000Z",  
    "InstanceMatchCriteria": "open",  
    "EphemeralStorage": false,  
    "CreateDate": "2019-08-16T10:15:53.000Z",  
    "AvailableInstanceCount": 3,  
    "InstancePlatform": "Linux/UNIX",  
    "TotalInstanceCount": 3,  
    "State": "active",  
    "Tenancy": "default",  
    "EbsOptimized": false,  
    "InstanceType": "m5.large"  
  }  
}
```

Example 3: To create a Capacity Reservation that accepts only targeted instance launches

The following `create-capacity-reservation` example creates a capacity reservation that accepts only targeted instance launches.

```
aws ec2 create-capacity-reservation \  
  --availability-zone eu-west-1a \  
  --instance-type m5.large \  
  --instance-platform Linux/UNIX \  
  --instance-count 3 \  
  --instance-match-criteria targeted
```

Output:

```
{  
  "CapacityReservation": {  
    "CapacityReservationId": "cr-1234abcd56EXAMPLE ",  
    "EndDateType": "unlimited",  
    "AvailabilityZone": "eu-west-1a",  
    "InstanceMatchCriteria": "targeted",  
    "EphemeralStorage": false,  
    "CreateDate": "2019-08-16T10:21:57.000Z",  
    "AvailableInstanceCount": 3,  
    "InstancePlatform": "Linux/UNIX",  
    "TotalInstanceCount": 3,  
    "State": "active",  
    "Tenancy": "default",  
    "EbsOptimized": false,  
    "InstanceType": "m5.large"  
  }  
}
```

For more information, see [Creating a Capacity Reservation](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CreateCapacityReservation](#) in *AWS CLI Command Reference*.

create-carrier-gateway

The following code example shows how to use `create-carrier-gateway`.

AWS CLI

To create a carrier gateway

The following `create-carrier-gateway` example creates a carrier gateway for the specified VPC.

```
aws ec2 create-carrier-gateway \  
  --vpc-id vpc-0c529aEXAMPLE1111
```

Output:

```
{  
  "CarrierGateway": {  
    "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",  
    "VpcId": "vpc-0c529aEXAMPLE1111",  
    "State": "pending",  
    "OwnerId": "123456789012"  
  }  
}
```

For more information, see [Carrier gateways](#) in the *AWS Wavelength User Guide*.

- For API details, see [CreateCarrierGateway](#) in *AWS CLI Command Reference*.

create-client-vpn-endpoint

The following code example shows how to use `create-client-vpn-endpoint`.

AWS CLI

To create a Client VPN endpoint

The following `create-client-vpn-endpoint` example creates a Client VPN endpoint that uses mutual authentication and specifies a value for the client CIDR block.

```
aws ec2 create-client-vpn-endpoint \  
  --client-cidr-block "172.31.0.0/16" \  
  --server-certificate-arn arn:aws:acm:ap-south-1:123456789012:certificate/  
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \  
  --authentication-options Type=certificate-  
authentication,MutualAuthentication={ClientRootCertificateChainArn=arn:aws:acm:ap-  
south-1:123456789012:certificate/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE} \  
  --connection-log-options Enabled=false
```

Output:

```
{
  "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
  "Status": {
    "Code": "pending-associate"
  },
  "DnsName": "cvpn-endpoint-123456789123abcde.prod.clientvpn.ap-
south-1.amazonaws.com"
}
```

For more information, see [Client VPN Endpoints](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [CreateClientVpnEndpoint](#) in *AWS CLI Command Reference*.

create-client-vpn-route

The following code example shows how to use `create-client-vpn-route`.

AWS CLI**To create a route for a Client VPN endpoint**

The following `create-client-vpn-route` example adds a route to the internet (`0.0.0.0/0`) for the specified subnet of the Client VPN endpoint.

```
aws ec2 create-client-vpn-route \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --destination-cidr-block 0.0.0.0/0 \
  --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```
{
  "Status": {
    "Code": "creating"
  }
}
```

For more information, see [Routes](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [CreateClientVpnRoute](#) in *AWS CLI Command Reference*.

create-coip-cidr

The following code example shows how to use `create-coip-cidr`.

AWS CLI

To create a range of customer-owned IP (CoIP) addresses

The following `create-coip-cidr` example creates the specified range of CoIP addresses in the specified CoIP pool.

```
aws ec2 create-coip-cidr \  
  --cidr 15.0.0.0/24 \  
  --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{  
  "CoipCidr": {  
    "Cidr": "15.0.0.0/24",  
    "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",  
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"  
  }  
}
```

For more information, see [Customer-owned IP addresses](#) in the *AWS Outposts User Guide*.

- For API details, see [CreateCoipCidr](#) in *AWS CLI Command Reference*.

create-coip-pool

The following code example shows how to use `create-coip-pool`.

AWS CLI

To create a pool of customer-owned IP (CoIP) addresses

The following `create-coip-pool` example creates a CoIP pool for CoIP addresses in the specified local gateway route table.

```
aws ec2 create-coip-pool \  
  --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

Output:

```
{
  "CoipPool": {
    "PoolId": "ipv4pool-coip-1234567890abcdefg",
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
    "PoolArn": "arn:aws:ec2:us-west-2:123456789012:coip-pool/ipv4pool-
coip-1234567890abcdefg"
  }
}
```

For more information, see [Customer-owned IP addresses](#) in the *AWS Outposts User Guide*.

- For API details, see [CreateCoipPool](#) in *AWS CLI Command Reference*.

create-customer-gateway

The following code example shows how to use `create-customer-gateway`.

AWS CLI**To create a customer gateway**

This example creates a customer gateway with the specified IP address for its outside interface.

Command:

```
aws ec2 create-customer-gateway --type ipsec.1 --public-ip 12.1.2.3 --bgp-asn 65534
```

Output:

```
{
  "CustomerGateway": {
    "CustomerGatewayId": "cgw-0e11f167",
    "IpAddress": "12.1.2.3",
    "State": "available",
    "Type": "ipsec.1",
    "BgpAsn": "65534"
  }
}
```

- For API details, see [CreateCustomerGateway](#) in *AWS CLI Command Reference*.

create-default-subnet

The following code example shows how to use `create-default-subnet`.

AWS CLI

To create a default subnet

This example creates a default subnet in Availability Zone `us-east-2a`.

Command:

```
aws ec2 create-default-subnet --availability-zone us-east-2a
```

```
{
  "Subnet": {
    "AvailabilityZone": "us-east-2a",
    "Tags": [],
    "AvailableIpAddressCount": 4091,
    "DefaultForAz": true,
    "Ipv6CidrBlockAssociationSet": [],
    "VpcId": "vpc-1a2b3c4d",
    "State": "available",
    "MapPublicIpOnLaunch": true,
    "SubnetId": "subnet-1122aabb",
    "CidrBlock": "172.31.32.0/20",
    "AssignIpv6AddressOnCreation": false
  }
}
```

- For API details, see [CreateDefaultSubnet](#) in *AWS CLI Command Reference*.

create-default-vpc

The following code example shows how to use `create-default-vpc`.

AWS CLI

To create a default VPC

This example creates a default VPC.

Command:

```
aws ec2 create-default-vpc
```

Output:

```
{
  "Vpc": {
    "VpcId": "vpc-8eaae5ea",
    "InstanceTenancy": "default",
    "Tags": [],
    "Ipv6CidrBlockAssociationSet": [],
    "State": "pending",
    "DhcpOptionsId": "dopt-af0c32c6",
    "CidrBlock": "172.31.0.0/16",
    "IsDefault": true
  }
}
```

- For API details, see [CreateDefaultVpc](#) in *AWS CLI Command Reference*.

create-dhcp-options

The following code example shows how to use create-dhcp-options.

AWS CLI

To create a set of DHCP options

The following create-dhcp-options example creates a set of DHCP options that specifies the domain name, the domain name servers, and the NetBIOS node type.

```
aws ec2 create-dhcp-options \
  --dhcp-configuration \
    "Key=domain-name-servers,Values=10.2.5.1,10.2.5.2" \
    "Key=domain-name,Values=example.com" \
    "Key=netbios-node-type,Values=2"
```

Output:

```
{
  "DhcpOptions": {
    "DhcpConfigurations": [
```

```
{
  "Key": "domain-name",
  "Values": [
    {
      "Value": "example.com"
    }
  ]
},
{
  "Key": "domain-name-servers",
  "Values": [
    {
      "Value": "10.2.5.1"
    },
    {
      "Value": "10.2.5.2"
    }
  ]
},
{
  "Key": "netbios-node-type",
  "Values": [
    {
      "Value": "2"
    }
  ]
}
],
"DhcpOptionsId": "dopt-06d52773eff4c55f3"
}
```

- For API details, see [CreateDhcpOptions](#) in *AWS CLI Command Reference*.

create-egress-only-internet-gateway

The following code example shows how to use `create-egress-only-internet-gateway`.

AWS CLI

To create an egress-only Internet gateway

This example creates an egress-only Internet gateway for the specified VPC.

Command:

```
aws ec2 create-egress-only-internet-gateway --vpc-id vpc-0c62a468
```

Output:

```
{
  "EgressOnlyInternetGateway": {
    "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
    "Attachments": [
      {
        "State": "attached",
        "VpcId": "vpc-0c62a468"
      }
    ]
  }
}
```

- For API details, see [CreateEgressOnlyInternetGateway](#) in *AWS CLI Command Reference*.

create-fleet

The following code example shows how to use `create-fleet`.

AWS CLI**Example 1: To create an EC2 Fleet that launches Spot Instances as the default purchasing model**

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is `spot`, which results in the fleet launching 2 Spot Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \  
  --cli-input-json file://file_name.json
```

Contents of file_name.json:

```
{
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateId": "lt-0e8c754449b27161c",
        "Version": "1"
      }
    }
  ],
  "TargetCapacitySpecification": {
    "TotalTargetCapacity": 2,
    "DefaultTargetCapacityType": "spot"
  }
}
```

Output:

```
{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

Example 2: To create an EC2 Fleet that launches On-Demand Instances as the default purchasing model

The following `create-fleet` example creates an EC2 Fleet using the minimum parameters required to launch a fleet: a launch template, target capacity, and default purchasing model. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing model is on-demand, which results in the fleet launching 2 On-Demand Instances.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
  --cli-input-json file://file_name.json
```

Contents of file_name.json:

```
{
```

```
"LaunchTemplateConfigs": [  
  {  
    "LaunchTemplateSpecification": {  
      "LaunchTemplateId": "lt-0e8c754449b27161c",  
      "Version": "1"  
    }  
  }  
],  
"TargetCapacitySpecification": {  
  "TotalTargetCapacity": 2,  
  "DefaultTargetCapacityType": "on-demand"  
}  
}
```

Output:

```
{  
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"  
}
```

Example 3: To create an EC2 Fleet that launches On-Demand Instances as the primary capacity

The following `create-fleet` example creates an EC2 Fleet that specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing model is spot. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfil the total target capacity. The purchasing model for the difference is calculated as `TotalTargetCapacity - OnDemandTargetCapacity = DefaultTargetCapacityType`, which results in the fleet launching 1 Spot Instance.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \  
  --cli-input-json file:///file_name.json
```

Contents of file_name.json:

```
{  
  "LaunchTemplateConfigs": [  
    {
```

```
    "LaunchTemplateSpecification": {
      "LaunchTemplateId": "lt-0e8c754449b27161c",
      "Version": "1"
    }
  ],
  "TargetCapacitySpecification": {
    "TotalTargetCapacity": 2,
    "OnDemandTargetCapacity": 1,
    "DefaultTargetCapacityType": "spot"
  }
}
```

Output:

```
{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

Example 4: To create an EC2 Fleet that launches Spot Instances using the lowest-price allocation strategy

If the allocation strategy for Spot Instances is not specified, the default allocation strategy, which is lowest-price, is used. The following `create-fleet` example creates an EC2 Fleet using the lowest-price allocation strategy. The three launch specifications, which override the launch template, have different instance types but the same weighted capacity and subnet. The total target capacity is 2 instances and the default purchasing model is spot. The EC2 Fleet launches 2 Spot Instances using the instance type of the launch specification with the lowest price.

When you create an EC2 Fleet, use a JSON file to specify information about the instances to launch.

```
aws ec2 create-fleet \
  --cli-input-json file:///file_name.jsonContents of file_name.json::

{
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateId": "lt-0e8c754449b27161c",
```

```
    "Version": "1"
  },
  "Overrides": [
    {
      "InstanceType": "c4.large",
      "WeightedCapacity": 1,
      "SubnetId": "subnet-a4f6c5d3"
    },
    {
      "InstanceType": "c3.large",
      "WeightedCapacity": 1,
      "SubnetId": "subnet-a4f6c5d3"
    },
    {
      "InstanceType": "c5.large",
      "WeightedCapacity": 1,
      "SubnetId": "subnet-a4f6c5d3"
    }
  ]
}
],
"TargetCapacitySpecification": {
  "TotalTargetCapacity": 2,
  "DefaultTargetCapacityType": "spot"
}
}
```

Output:

```
{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

- For API details, see [CreateFleet](#) in *AWS CLI Command Reference*.

create-flow-logs

The following code example shows how to use create-flow-logs.

AWS CLI

Example 1: To create a flow log

The following `create-flow-logs` example creates a flow log that captures all rejected traffic for the specified network interface. The flow logs are delivered to a log group in CloudWatch Logs using the permissions in the specified IAM role.

```
aws ec2 create-flow-logs \  
  --resource-type NetworkInterface \  
  --resource-ids eni-11223344556677889 \  
  --traffic-type REJECT \  
  --log-group-name my-flow-logs \  
  --deliver-logs-permission-arn arn:aws:iam::123456789101:role/publishFlowLogs
```

Output:

```
{  
  "ClientToken": "so0eNA2uSHUN1HI0S2cJ305GuIX1CezaRdGtexample",  
  "FlowLogIds": [  
    "fl-12345678901234567"  
  ],  
  "Unsuccessful": []  
}
```

For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

Example 2: To create a flow log with a custom format

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--log-format` parameter specifies a custom format for the flow log records. To run this command on Windows, change the single quotes (') to double quotes (").

```
aws ec2 create-flow-logs \  
  --resource-type VPC \  
  --resource-ids vpc-00112233344556677 \  
  --traffic-type ALL \  
  --log-destination-type s3 \  
  --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/ \  
  --log-format '${version} ${vpc-id} ${subnet-id} ${instance-id} ${srcaddr}  
  ${dstaddr} ${srcport} ${dstport} ${protocol} ${tcp-flags} ${type} ${pkt-srcaddr}  
  ${pkt-dstaddr}'
```

For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

Example 3: To create a flow log with a one-minute maximum aggregation interval

The following `create-flow-logs` example creates a flow log that captures all traffic for the specified VPC and delivers the flow logs to an Amazon S3 bucket. The `--max-aggregation-interval` parameter specifies a maximum aggregation interval of 60 seconds (1 minute).

```
aws ec2 create-flow-logs \  
  --resource-type VPC \  
  --resource-ids vpc-00112233344556677 \  
  --traffic-type ALL \  
  --log-destination-type s3 \  
  --log-destination arn:aws:s3:::flow-log-bucket/my-custom-flow-logs/ \  
  --max-aggregation-interval 60
```

For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

- For API details, see [CreateFlowLogs](#) in *AWS CLI Command Reference*.

create-fpga-image

The following code example shows how to use `create-fpga-image`.

AWS CLI

To create an Amazon FPGA image

This example creates an AFI from the specified tarball in the specified bucket.

Command:

```
aws ec2 create-fpga-image --name my-afi --description test-afi --input-storage-  
location Bucket=my-fpga-bucket,Key=dcp/17_12_22-103226.Developer_CL.tar --logs-  
storage-location Bucket=my-fpga-bucket,Key=logs
```

Output:

```
{  
  "FpgaImageId": "afi-0d123e123bfc85abc",  
  "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc"  
}
```

- For API details, see [CreateFpgaImage](#) in *AWS CLI Command Reference*.

create-image

The following code example shows how to use `create-image`.

AWS CLI

Example 1: To create an AMI from an Amazon EBS-backed instance

The following `create-image` example creates an AMI from the specified instance.

```
aws ec2 create-image \  
  --instance-id i-1234567890abcdef0 \  
  --name "My server" \  
  --description "An AMI for my server"
```

Output:

```
{  
  "ImageId": "ami-abcdef01234567890"  
}
```

For more information about specifying a block device mapping for your AMI, see [Specifying a block device mapping for an AMI](#) in the *Amazon EC2 User Guide*.

Example 2: To create an AMI from an Amazon EBS-backed instance without reboot

The following `create-image` example creates an AMI and sets the `--no-reboot` parameter, so that the instance is not rebooted before the image is created.

```
aws ec2 create-image \  
  --instance-id i-1234567890abcdef0 \  
  --name "My server" \  
  --no-reboot
```

Output:

```
{  
  "ImageId": "ami-abcdef01234567890"  
}
```

For more information about specifying a block device mapping for your AMI, see [Specifying a block device mapping for an AMI](#) in the *Amazon EC2 User Guide*.

Example 3: To tag an AMI and snapshots on creation

The following `create-image` example creates an AMI, and tags the AMI and the snapshots with the same tag `cost-center=cc123`

```
aws ec2 create-image \  
  --instance-id i-1234567890abcdef0 \  
  --name "My server" \  
  --tag-specifications "ResourceType=image,Tags=[{Key=cost-center,Value=cc123}]" \  
  "ResourceType=snapshot,Tags=[{Key=cost-center,Value=cc123}]"
```

Output:

```
{  
  "ImageId": "ami-abcdef01234567890"  
}
```

For more information about tagging your resources on creation, see [Add tags on resource creation](#) in the *Amazon EC2 User Guide*.

- For API details, see [CreateImage](#) in *AWS CLI Command Reference*.

create-instance-connect-endpoint

The following code example shows how to use `create-instance-connect-endpoint`.

AWS CLI

To create an EC2 Instance Connect Endpoint

The following `create-instance-connect-endpoint` example creates an EC2 Instance Connect Endpoint in the specified subnet.

```
aws ec2 create-instance-connect-endpoint \  
  --region us-east-1 \  
  --subnet-id subnet-0123456789example
```

Output:

```
{
  "VpcId": "vpc-0123abcd",
  "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-
connect-endpoint/eice-0123456789example",
  "AvailabilityZone": "us-east-1a",
  "NetworkInterfaceIds": [
    "eni-0123abcd"
  ],
  "PreserveClientIp": true,
  "Tags": [],
  "FipsDnsName": "eice-0123456789example.0123abcd.fips.ec2-instance-connect-
endpoint.us-east-1.amazonaws.com",
  "StateMessage": "",
  "State": "create-complete",
  "DnsName": "eice-0123456789example.0123abcd.ec2-instance-connect-endpoint.us-
east-1.amazonaws.com",
  "SubnetId": "subnet-0123abcd",
  "OwnerId": "111111111111",
  "SecurityGroupIds": [
    "sg-0123abcd"
  ],
  "InstanceConnectEndpointId": "eice-0123456789example",
  "CreatedAt": "2023-04-07T15:43:53.000Z"
}
```

For more information, see [Create an EC2 Instance Connect Endpoint](#) in the *Amazon EC2 User Guide*.

- For API details, see [CreateInstanceConnectEndpoint](#) in *AWS CLI Command Reference*.

create-instance-event-window

The following code example shows how to use create-instance-event-window.

AWS CLI

Example 1: To create an event window with a time range

The following create-instance-event-window example creates an event window with a time range. You can't also specify the cron-expression parameter.

```
aws ec2 create-instance-event-window \
```

```

--region us-east-1 \
--time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8 \
--tag-specifications "ResourceType=instance-event-
window,Tags=[{Key=K1,Value=V1}]" \
--name myEventWindowName

```

Output:

```

{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "StartHour": 2,
        "EndWeekDay": "wednesday",
        "EndHour": 8
      }
    ],
    "Name": "myEventWindowName",
    "State": "creating",
    "Tags": [
      {
        "Key": "K1",
        "Value": "V1"
      }
    ]
  }
}

```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 2: To create an event window with a cron expression

The following `create-instance-event-window` example creates an event window with a cron expression. You can't also specify the `time-range` parameter.

```

aws ec2 create-instance-event-window \
--region us-east-1 \
--cron-expression "*" 21-23 * * 2,3" \
--tag-specifications "ResourceType=instance-event-
window,Tags=[{Key=K1,Value=V1}]" \

```

```
--name myEventWindowName
```

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "State": "creating",
    "Tags": [
      {
        "Key": "K1",
        "Value": "V1"
      }
    ]
  }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see [CreateInstanceEventWindow](#) in *AWS CLI Command Reference*.

create-instance-export-task

The following code example shows how to use `create-instance-export-task`.

AWS CLI

To export an instance

This example command creates a task to export the instance `i-1234567890abcdef0` to the Amazon S3 bucket `myexportbucket`.

Command:

```
aws ec2 create-instance-export-task --description "RHEL5 instance" --instance-id i-1234567890abcdef0 --target-environment vmware --export-to-s3-task DiskImageFormat=vmdk,ContainerFormat=ova,S3Bucket=myexportbucket,S3Prefix=RHEL5
```

Output:

```
{
  "ExportTask": {
    "State": "active",
    "InstanceExportDetails": {
      "InstanceId": "i-1234567890abcdef0",
      "TargetEnvironment": "vmware"
    },
    "ExportToS3Task": {
      "S3Bucket": "myexportbucket",
      "S3Key": "RHEL5export-i-fh8sjjsq.ova",
      "DiskImageFormat": "vmdk",
      "ContainerFormat": "ova"
    },
    "Description": "RHEL5 instance",
    "ExportTaskId": "export-i-fh8sjjsq"
  }
}
```

- For API details, see [CreateInstanceExportTask](#) in *AWS CLI Command Reference*.

create-internet-gateway

The following code example shows how to use `create-internet-gateway`.

AWS CLI

To create an internet gateway

The following `create-internet-gateway` example creates an internet gateway with the tag `Name=my-igw`.

```
aws ec2 create-internet-gateway \
  --tag-specifications ResourceType=internet-gateway,Tags=[{Key=Name,Value=my-igw}]
```

Output:

```
{
  "InternetGateway": {
    "Attachments": [],
    "InternetGatewayId": "igw-0d0fb496b3994d755",
```

```
    "OwnerId": "123456789012",
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-igw"
      }
    ]
  }
}
```

For more information, see [Internet gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [CreateInternetGateway](#) in *AWS CLI Command Reference*.

create-ipam-pool

The following code example shows how to use `create-ipam-pool`.

AWS CLI

To create an IPAM pool

The following `create-ipam-pool` example creates an IPAM pool.

(Linux):

```
aws ec2 create-ipam-pool \
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \
  --address-family ipv4 \
  --auto-import \
  --allocation-min-netmask-length 16 \
  --allocation-max-netmask-length 26 \
  --allocation-default-netmask-length 24 \
  --allocation-resource-tags "Key=Environment,Value=Preprod" \
  --tag-specifications 'ResourceType=ipam-pool,Tags=[{Key=Name,Value="Preprod
pool"}]'
```

(Windows):

```
aws ec2 create-ipam-pool ^
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^
  --address-family ipv4 ^
```

```
--auto-import ^
--allocation-min-netmask-length 16 ^
--allocation-max-netmask-length 26 ^
--allocation-default-netmask-length 24 ^
--allocation-resource-tags "Key=Environment,Value=Preprod" ^
--tag-specifications ResourceType=ipam-pool,Tags=[{Key=Name,Value="Preprod
pool"}]
```

Output:

```
{
  "IpamPool": {
    "OwnerId": "123456789012",
    "IpamPoolId": "ipam-pool-0533048da7d823723",
    "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-0533048da7d823723",
    "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
    "IpamScopeType": "private",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "Locale": "None",
    "PoolDepth": 1,
    "State": "create-in-progress",
    "AutoImport": true,
    "AddressFamily": "ipv4",
    "AllocationMinNetmaskLength": 16,
    "AllocationMaxNetmaskLength": 26,
    "AllocationDefaultNetmaskLength": 24,
    "AllocationResourceTags": [
      {
        "Key": "Environment",
        "Value": "Preprod"
      }
    ],
    "Tags": [
      {
        "Key": "Name",
        "Value": "Preprod pool"
      }
    ]
  }
}
```

For more information, see [Plan for IP address provisioning](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [CreateIpamPool](#) in *AWS CLI Command Reference*.

create-ipam-resource-discovery

The following code example shows how to use `create-ipam-resource-discovery`.

AWS CLI

To create a resource discovery

In this example, you're a delegated IPAM admin who wants to create and share a resource discovery with the IPAM admin in another AWS Organization so that the admin in the other organization can manage and monitor the IP addresses of resources in your organization.

Important

This example includes both the `--region` and `--operating-regions` options because, while they are optional, they must be configured in a particular way to successfully integrate a resource discovery with an IPAM. * `--operating-regions` must match the Regions where you have resources that you want IPAM to discover. If there are Regions where you do not want IPAM to manage the IP addresses (for example for compliance reasons), do not include them. * `--region` must match the home Region of the IPAM you want to associate it with. You must create the resource discovery in the same Region that the IPAM was created in. For example, if the IPAM you are associating with was created in `us-east-1`, include `--region us-east-1` in the request. Both the `--region` and `--operating-regions` options default to the Region you're running the command in if you don't specify them.

In this example, the operating Regions of the IPAM we're integrating with include `us-west-1`, `us-west-2`, and `ap-south-1`. When we create the resource discovery, we want IPAM to discover the resource IP addresses in `us-west-1` and `us-west-2` but not `ap-south-1`. So we are including only `--operating-regions RegionName='us-west-1' RegionName='us-west-2'` in the request.

The following `create-ipam-resource-discovery` example creates an IPAM resource discovery.

```
aws ec2 create-ipam-resource-discovery \  
  --description 'Example-resource-discovery' \  
  --region us-east-1 \  
  --operating-regions RegionName='us-west-1' RegionName='us-west-2'
```

```
--tag-specifications 'ResourceType=ipam-resource-discovery,Tags=[{Key=cost-
center,Value=cc123}]' \
--operating-regions RegionName='us-west-1' RegionName='us-west-2' \
--region us-east-1
```

Output:

```
{
  "IpamResourceDiscovery":{
    "OwnerId": "149977607591",
    "IpamResourceDiscoveryId": "ipam-res-disco-0257046d8aa78b8bc",
    "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-
discovery/ipam-res-disco-0257046d8aa78b8bc",
    "IpamResourceDiscoveryRegion": "us-east-1",
    "Description": "'Example-resource-discovery'",
    "OperatingRegions":[
      {"RegionName": "us-west-1"},
      {"RegionName": "us-west-2"},
      {"RegionName": "us-east-1"}
    ],
    "IsDefault": false,
    "State": "create-in-progress",
    "Tags": [
      {
        "Key": "cost-center",
        "Value": "cc123"
      }
    ]
  }
}
```

Once you create a resource discovery, you may want to share it with another IPAM delegated admin, which you can do with [create-resource-share](#). For more information, see [Integrate IPAM with accounts outside of your organization](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [CreateIpamResourceDiscovery](#) in *AWS CLI Command Reference*.

create-ipam-scope

The following code example shows how to use `create-ipam-scope`.

AWS CLI

To create an IPAM scope

The following `create-ipam-scope` example creates an IPAM scope.

(Linux):

```
aws ec2 create-ipam-scope \  
  --ipam-id ipam-08440e7a3acde3908 \  
  --description "Example description" \  
  --tag-specifications 'ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example  
name value"}]'
```

(Windows):

```
aws ec2 create-ipam-scope ^  
  --ipam-id ipam-08440e7a3acde3908 ^  
  --description "Example description" ^  
  --tag-specifications ResourceType=ipam-scope,Tags=[{Key=Name,Value="Example name  
value"}]
```

Output:

```
{  
  "IpamScope": {  
    "OwnerId": "123456789012",  
    "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",  
    "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-  
scope-01c1ebab2b63bd7e4",  
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",  
    "IpamRegion": "us-east-1",  
    "IpamScopeType": "private",  
    "IsDefault": false,  
    "Description": "Example description",  
    "PoolCount": 0,  
    "State": "create-in-progress",  
    "Tags": [  
      {  
        "Key": "Name",  
        "Value": "Example name value"  
      }  
    ]  
  }  
}
```

For more information, see [Create additional scopes](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [CreateIpamScope](#) in *AWS CLI Command Reference*.

create-ipam

The following code example shows how to use `create-ipam`.

AWS CLI

To create an IPAM

The following `create-ipam` example creates an IPAM.

(Linux):

```
aws ec2 create-ipam \  
  --description "Example description" \  
  --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" \  
  --tag-specifications 'ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]'
```

(Windows):

```
aws ec2 create-ipam ^  
  --description "Example description" ^  
  --operating-regions "RegionName=us-east-2" "RegionName=us-west-1" ^  
  --tag-specifications ResourceType=ipam,Tags=[{Key=Name,Value=ExampleIPAM}]
```

Output:

```
{  
  "Ipam": {  
    "OwnerId": "123456789012",  
    "IpamId": "ipam-036486dfa6af58ee0",  
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",  
    "IpamRegion": "us-east-1",  
    "PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",  
    "PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",  
    "ScopeCount": 2,  
    "OperatingRegions": [  
      {  
        "RegionName": "us-east-2"      }  
    ]  
  }  
}
```

```
    },
    {
      "RegionName": "us-west-1"
    },
    {
      "RegionName": "us-east-1"
    }
  ],
  "State": "create-in-progress",
  "Tags": [
    {
      "Key": "Name",
      "Value": "ExampleIPAM"
    }
  ]
}
```

For more information, see [Create an IPAM](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [CreateIpam](#) in *AWS CLI Command Reference*.

create-key-pair

The following code example shows how to use `create-key-pair`.

AWS CLI

To create a key pair

This example creates a key pair named `MyKeyPair`.

Command:

```
aws ec2 create-key-pair --key-name MyKeyPair
```

The output is an ASCII version of the private key and key fingerprint. You need to save the key to a file.

For more information, see *Using Key Pairs* in the *AWS Command Line Interface User Guide*.

- For API details, see [CreateKeyPair](#) in *AWS CLI Command Reference*.

create-launch-template-version

The following code example shows how to use `create-launch-template-version`.

AWS CLI

To create a launch template version

This example creates a new launch template version based on version 1 of the launch template and specifies a different AMI ID.

Command:

```
aws ec2 create-launch-template-version --launch-template-id lt-0abcd290751193123
--version-description WebVersion2 --source-version 1 --launch-template-data
'{"ImageId":"ami-c998b6b2"}'
```

Output:

```
{
  "LaunchTemplateVersion": {
    "VersionDescription": "WebVersion2",
    "LaunchTemplateId": "lt-0abcd290751193123",
    "LaunchTemplateName": "WebServers",
    "VersionNumber": 2,
    "CreatedBy": "arn:aws:iam::123456789012:root",
    "LaunchTemplateData": {
      "ImageId": "ami-c998b6b2",
      "InstanceType": "t2.micro",
      "NetworkInterfaces": [
        {
          "Ipv6Addresses": [
            {
              "Ipv6Address": "2001:db8:1234:1a00::123"
            }
          ],
          "DeviceIndex": 0,
          "SubnetId": "subnet-7b16de0c",
          "AssociatePublicIpAddress": true
        }
      ]
    },
    "DefaultVersion": false,
    "CreateTime": "2017-12-01T13:35:46.000Z"
  }
}
```

```
}
}
```

- For API details, see [CreateLaunchTemplateVersion](#) in *AWS CLI Command Reference*.

create-launch-template

The following code example shows how to use `create-launch-template`.

AWS CLI

Example 1: To create a launch template

The following `create-launch-template` example creates a launch template that specifies the subnet in which to launch the instance, assigns a public IP address and an IPv6 address to the instance, and creates a tag for the instance.

```
aws ec2 create-launch-template \
  --launch-template-name TemplateForWebServer \
  --version-description WebVersion1 \
  --launch-template-data '{"NetworkInterfaces":
[{"AssociatePublicIpAddress":true,"DeviceIndex":0,"Ipv6AddressCount":1,"SubnetId":"subnet-7b
[{"ResourceType":"instance","Tags":[{"Key":"purpose","Value":"webserver"}]}'
```

Output:

```
{
  "LaunchTemplate": {
    "LatestVersionNumber": 1,
    "LaunchTemplateId": "lt-01238c059e3466abc",
    "LaunchTemplateName": "TemplateForWebServer",
    "DefaultVersionNumber": 1,
    "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
    "CreateTime": "2019-01-27T09:13:24.000Z"
  }
}
```

For more information, see [Launching an Instance from a Launch Template](#) in the *Amazon Elastic Compute Cloud User Guide*. For information about quoting JSON-formatted parameters, see [Quoting Strings](#) in the *AWS Command Line Interface User Guide*.

Example 2: To create a launch template for Amazon EC2 Auto Scaling

The following `create-launch-template` example creates a launch template with multiple tags and a block device mapping to specify an additional EBS volume when an instance launches. Specify a value for `Groups` that corresponds to security groups for the VPC that your Auto Scaling group will launch instances into. Specify the VPC and subnets as properties of the Auto Scaling group.

```
aws ec2 create-launch-template \
  --launch-template-name TemplateForAutoScaling \
  --version-description AutoScalingVersion1 \
  --launch-template-data '{"NetworkInterfaces":
[{"DeviceIndex":0,"AssociatePublicIpAddress":true,"Groups":
["sg-7c227019,sg-903004f8"],"DeleteOnTermination":true}],"ImageId":"ami-
b42209de","InstanceType":"m4.large","TagSpecifications":
[{"ResourceType":"instance","Tags":[{"Key":"environment","Value":"production"},
{"Key":"purpose","Value":"webserver"}]},{"ResourceType":"volume","Tags":
[{"Key":"environment","Value":"production"},{"Key":"cost-
center","Value":"cc123"}]}],"BlockDeviceMappings":[{"DeviceName":"/dev/sda1","Ebs":
{"VolumeSize":100}}]}' --region us-east-1
```

Output:

```
{
  "LaunchTemplate": {
    "LatestVersionNumber": 1,
    "LaunchTemplateId": "lt-0123c79c33a54e0abc",
    "LaunchTemplateName": "TemplateForAutoScaling",
    "DefaultVersionNumber": 1,
    "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
    "CreateTime": "2019-04-30T18:16:06.000Z"
  }
}
```

For more information, see [Creating a Launch Template for an Auto Scaling Group in the *Amazon EC2 Auto Scaling User Guide*](#). For information about quoting JSON-formatted parameters, see [Quoting Strings in the *AWS Command Line Interface User Guide*](#).

Example 3: To create a launch template that specifies encryption of EBS volumes

The following `create-launch-template` example creates a launch template that includes encrypted EBS volumes created from an unencrypted snapshot. It also tags the volumes during creation. If encryption by default is disabled, you must specify the `"Encrypted"` option as

shown in the following example. If you use the "KmsKeyId" option to specify a customer managed CMK, you also must specify the "Encrypted" option even if encryption by default is enabled.

```
aws ec2 create-launch-template \  
  --launch-template-name TemplateForEncryption \  
  --launch-template-data file://config.json
```

Contents of config.json:

```
{  
  "BlockDeviceMappings":[  
    {  
      "DeviceName":"/dev/sda1",  
      "Ebs":{  
        "VolumeType":"gp2",  
        "DeleteOnTermination":true,  
        "SnapshotId":"snap-066877671789bd71b",  
        "Encrypted":true,  
        "KmsKeyId":"arn:aws:kms:us-east-1:012345678910:key/abcd1234-  
a123-456a-a12b-a123b4cd56ef"  
      }  
    }  
  ],  
  "ImageId":"ami-00068cd7555f543d5",  
  "InstanceType":"c5.large",  
  "TagSpecifications":[  
    {  
      "ResourceType":"volume",  
      "Tags":[  
        {  
          "Key":"encrypted",  
          "Value":"yes"  
        }  
      ]  
    }  
  ]  
}
```

Output:

```
{
```

```

    "LaunchTemplate": {
      "LatestVersionNumber": 1,
      "LaunchTemplateId": "lt-0d5bd51bcf8530abc",
      "LaunchTemplateName": "TemplateForEncryption",
      "DefaultVersionNumber": 1,
      "CreatedBy": "arn:aws:iam::123456789012:user/Bob",
      "CreateTime": "2020-01-07T19:08:36.000Z"
    }
  }
}

```

For more information, see [Restoring an Amazon EBS Volume from a Snapshot and Encryption by Default](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [CreateLaunchTemplate](#) in *AWS CLI Command Reference*.

create-local-gateway-route-table-virtual-interface-group-association

The following code example shows how to use `create-local-gateway-route-table-virtual-interface-group-association`.

AWS CLI

To associate a local gateway route table with a virtual interfaces (VIFs) group

The following `create-local-gateway-route-table-virtual-interface-group-association` example creates an association between the specified local gateway route table and VIF group.

```

aws ec2 create-local-gateway-route-table-virtual-interface-group-association \
  --local-gateway-route-table-id lgw-rtb-exampleidabcd1234 \
  --local-gateway-virtual-interface-group-id lgw-vif-grp-exampleid0123abcd

```

Output:

```

{
  "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
    "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-
assoc-exampleid12345678",
    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
    "LocalGatewayId": "lgw-exampleid11223344",
    "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",

```

```
    "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:111122223333:local-
gateway-route-table/lgw-rtb-exampleidabcd1234",
    "OwnerId": "111122223333",
    "State": "pending",
    "Tags": []
  }
}
```

For more information, see [VIF group associations](#) in the *AWS Outposts User Guide*.

- For API details, see [CreateLocalGatewayRouteTableVirtualInterfaceGroupAssociation](#) in *AWS CLI Command Reference*.

create-local-gateway-route-table-vpc-association

The following code example shows how to use `create-local-gateway-route-table-vpc-association`.

AWS CLI

To associate a VPC with a route table

The following `create-local-gateway-route-table-vpc-association` example associates the specified VPC with the specified local gateway route table.

```
aws ec2 create-local-gateway-route-table-vpc-association \
  --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
  --vpc-id vpc-07ef66ac71EXAMPLE
```

Output:

```
{
  "LocalGatewayRouteTableVpcAssociation": {
    "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0ee765bcc8EXAMPLE",
    "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
    "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
    "VpcId": "vpc-07ef66ac71EXAMPLE",
    "State": "associated"
  }
}
```

- For API details, see [CreateLocalGatewayRouteTableVpcAssociation](#) in *AWS CLI Command Reference*.

create-local-gateway-route-table

The following code example shows how to use `create-local-gateway-route-table`.

AWS CLI

To create a local gateway route table

The following `create-local-gateway-route-table` example creates a local gateway route table with the direct VPC routing mode.

```
aws ec2 create-local-gateway-route-table \  
  --local-gateway-id lgw-1a2b3c4d5e6f7g8h9 \  
  --mode direct-vpc-routing
```

Output:

```
{  
  "LocalGatewayRouteTable": {  
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",  
    "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:111122223333:local-gateway-route-table/lgw-rtb-abcdefg1234567890",  
    "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",  
    "OutpostArn": "arn:aws:outposts:us-west-2:111122223333:outpost/op-021345abcdef67890",  
    "OwnerId": "111122223333",  
    "State": "pending",  
    "Tags": [],  
    "Mode": "direct-vpc-routing"  
  }  
}
```

For more information, see [Local gateway route tables](#) in the *AWS Outposts User Guide*.

- For API details, see [CreateLocalGatewayRouteTable](#) in *AWS CLI Command Reference*.

create-local-gateway-route

The following code example shows how to use `create-local-gateway-route`.

AWS CLI

To create a static route for a local gateway route table

The following `create-local-gateway-route` example creates the specified route in the specified local gateway route table.

```
aws ec2 create-local-gateway-route \  
  --destination-cidr-block 0.0.0.0/0 \  
  --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{  
  "Route": {  
    "DestinationCidrBlock": "0.0.0.0/0",  
    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",  
    "Type": "static",  
    "State": "deleted",  
    "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"  
  }  
}
```

- For API details, see [CreateLocalGatewayRoute](#) in *AWS CLI Command Reference*.

create-managed-prefix-list

The following code example shows how to use `create-managed-prefix-list`.

AWS CLI

To create a prefix list

The following `create-managed-prefix-list` example creates an IPv4 prefix list with a maximum of 10 entries, and creates 2 entries in the prefix list.

```
aws ec2 create-managed-prefix-list \  
  --address-family IPv4 \  
  --max-entries 10 \  
  --entries Cidr=10.0.0.0/16,Description=vpc-a Cidr=10.2.0.0/16,Description=vpc-b \  
  --prefix-list-name vpc-cidrs
```

Output:

```
{
  "PrefixList": {
    "PrefixListId": "pl-0123456abcabcabc1",
    "AddressFamily": "IPv4",
    "State": "create-in-progress",
    "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
    "PrefixListName": "vpc-cidrs",
    "MaxEntries": 10,
    "Version": 1,
    "Tags": [],
    "OwnerId": "123456789012"
  }
}
```

For more information, see [Managed prefix lists](#) in the *Amazon VPC User Guide*.

- For API details, see [CreateManagedPrefixList](#) in *AWS CLI Command Reference*.

create-nat-gateway

The following code example shows how to use `create-nat-gateway`.

AWS CLI**Example 1: To create a public NAT gateway**

The following `create-nat-gateway` example creates a public NAT gateway in the specified subnet and associates the Elastic IP address with the specified allocation ID. When you create a public NAT gateway, you must associate an Elastic IP address.

```
aws ec2 create-nat-gateway \
  --subnet-id subnet-0250c25a1fEXAMPLE \
  --allocation-id eipalloc-09ad461b0dEXAMPLE
```

Output:

```
{
  "NatGateway": {
    "CreateTime": "2021-12-01T22:22:38.000Z",
```

```

    "NatGatewayAddresses": [
      {
        "AllocationId": "eipalloc-09ad461b0dEXAMPLE"
      }
    ],
    "NatGatewayId": "nat-0c61bf8a12EXAMPLE",
    "State": "pending",
    "SubnetId": "subnet-0250c25a1fEXAMPLE",
    "VpcId": "vpc-0a60eb65b4EXAMPLE",
    "ConnectivityType": "public"
  }
}

```

For more information, see [NAT gateways](#) in the *Amazon VPC User Guide*.

Example 2: To create a private NAT gateway

The following `create-nat-gateway` example creates a private NAT gateway in the specified subnet. A private NAT gateway does not have an associated Elastic IP address.

```

aws ec2 create-nat-gateway \
  --subnet-id subnet-0250c25a1fEXAMPLE \
  --connectivity-type private

```

Output:

```

{
  "NatGateway": {
    "CreateTime": "2021-12-01T22:26:00.000Z",
    "NatGatewayAddresses": [
      {}
    ],
    "NatGatewayId": "nat-011b568379EXAMPLE",
    "State": "pending",
    "SubnetId": "subnet-0250c25a1fEXAMPLE",
    "VpcId": "vpc-0a60eb65b4EXAMPLE",
    "ConnectivityType": "private"
  }
}

```

For more information, see [NAT gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [CreateNatGateway](#) in *AWS CLI Command Reference*.

create-network-acl-entry

The following code example shows how to use `create-network-acl-entry`.

AWS CLI

To create a network ACL entry

This example creates an entry for the specified network ACL. The rule allows ingress traffic from any IPv4 address (0.0.0.0/0) on UDP port 53 (DNS) into any associated subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 0.0.0.0/0 --rule-action allow
```

This example creates a rule for the specified network ACL that allows ingress traffic from any IPv6 address (::/0) on TCP port 80 (HTTP).

Command:

```
aws ec2 create-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 120 --protocol tcp --port-range From=80,To=80 --ipv6-cidr-block ::/0 --rule-action allow
```

- For API details, see [CreateNetworkAclEntry](#) in *AWS CLI Command Reference*.

create-network-acl

The following code example shows how to use `create-network-acl`.

AWS CLI

To create a network ACL

This example creates a network ACL for the specified VPC.

Command:

```
aws ec2 create-network-acl --vpc-id vpc-a01106c2
```

Output:

```
{
  "NetworkAcl": {
    "Associations": [],
    "NetworkAclId": "acl-5fb85d36",
    "VpcId": "vpc-a01106c2",
    "Tags": [],
    "Entries": [
      {
        "CidrBlock": "0.0.0.0/0",
        "RuleNumber": 32767,
        "Protocol": "-1",
        "Egress": true,
        "RuleAction": "deny"
      },
      {
        "CidrBlock": "0.0.0.0/0",
        "RuleNumber": 32767,
        "Protocol": "-1",
        "Egress": false,
        "RuleAction": "deny"
      }
    ],
    "IsDefault": false
  }
}
```

- For API details, see [CreateNetworkAcl](#) in *AWS CLI Command Reference*.

create-network-insights-access-scope

The following code example shows how to use `create-network-insights-access-scope`.

AWS CLI

To create a Network Access Scope

The following `create-network-insights-access-scope` example creates a Network Access Scope.

```
aws ec2 create-network-insights-access-scope \  
  --cli-input-json file://access-scope-file.json
```

Contents of `access-scope-file.json`:

```
{  
  "MatchPaths": [  
    {  
      "Source": {  
        "ResourceStatement": {  
          "Resources": [  
            "vpc-abcd12e3"  
          ]  
        }  
      }  
    },  
  ],  
  "ExcludePaths": [  
    {  
      "Source": {  
        "ResourceStatement": {  
          "ResourceTypes": [  
            "AWS::EC2::InternetGateway"  
          ]  
        }  
      }  
    }  
  ]  
}
```

Output:

```
{  
  "NetworkInsightsAccessScope": {  
    "NetworkInsightsAccessScopeId": "nis-123456789abc01234",  
    "NetworkInsightsAccessScopeArn": "arn:aws:ec2:us-  
east-1:123456789012:network-insights-access-scope/nis-123456789abc01234",  
    "CreateDate": "2022-01-25T19:20:28.796000+00:00",  
    "UpdatedDate": "2022-01-25T19:20:28.797000+00:00"  
  },  
  "NetworkInsightsAccessScopeContent": {  
    "NetworkInsightsAccessScopeId": "nis-123456789abc01234",
```

```
    "MatchPaths": [
      {
        "Source": {
          "ResourceStatement": {
            "Resources": [
              "vpc-abcd12e3"
            ]
          }
        }
      },
      {
        "ExcludePaths": [
          {
            "Source": {
              "ResourceStatement": {
                "ResourceTypes": [
                  "AWS::EC2::InternetGateway"
                ]
              }
            }
          }
        ]
      }
    ]
  }
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the *Network Access Analyzer Guide*.

- For API details, see [CreateNetworkInsightsAccessScope](#) in *AWS CLI Command Reference*.

create-network-insights-path

The following code example shows how to use `create-network-insights-path`.

AWS CLI

To create a path

The following `create-network-insights-path` example creates a path. The source is the specified internet gateway and the destination is the specified EC2 instance. To determine whether the destination is reachable using the specified protocol and port, analyze the path using the `start-network-insights-analysis` command.

```
aws ec2 create-network-insights-path \  
  --source igw-0797cccdc9d73b0e5 \  
  --destination i-0495d385ad28331c7 \  
  --destination-port 22 \  
  --protocol TCP
```

Output:

```
{  
  "NetworkInsightsPaths": {  
    "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",  
    "NetworkInsightsPathArn": "arn:aws:ec2:us-east-1:123456789012:network-  
insights-path/nip-0b26f224f1d131fa8",  
    "CreateDate": "2021-01-20T22:43:46.933Z",  
    "Source": "igw-0797cccdc9d73b0e5",  
    "Destination": "i-0495d385ad28331c7",  
    "Protocol": "tcp"  
  }  
}
```

For more information, see [Getting started using the AWS CLI](#) in the *Reachability Analyzer Guide*.

- For API details, see [CreateNetworkInsightsPath](#) in *AWS CLI Command Reference*.

create-network-interface-permission

The following code example shows how to use `create-network-interface-permission`.

AWS CLI

To create a network interface permission

This example grants permission to account 123456789012 to attach network interface `eni-1a2b3c4d` to an instance.

Command:

```
aws ec2 create-network-interface-permission --network-interface-id eni-1a2b3c4d --  
aws-account-id 123456789012 --permission INSTANCE-ATTACH
```

Output:

```
{
  "InterfacePermission": {
    "PermissionState": {
      "State": "GRANTED"
    },
    "NetworkInterfacePermissionId": "eni-perm-06fd19020ede149ea",
    "NetworkInterfaceId": "eni-1a2b3c4d",
    "Permission": "INSTANCE-ATTACH",
    "AwsAccountId": "123456789012"
  }
}
```

- For API details, see [CreateNetworkInterfacePermission](#) in *AWS CLI Command Reference*.

create-network-interface

The following code example shows how to use `create-network-interface`.

AWS CLI

Example 1: To specify an IPv4 address for a network interface

The following `create-network-interface` example creates a network interface for the specified subnet with the specified primary IPv4 address.

```
aws ec2 create-network-interface \
  --subnet-id subnet-00a24d0d67acf6333 \
  --description "my network interface" \
  --groups sg-09dfba7ed20cda78b \
  --private-ip-address 10.0.8.17
```

Output:

```
{
  "NetworkInterface": {
    "AvailabilityZone": "us-west-2a",
    "Description": "my network interface",
    "Groups": [
      {
        "GroupName": "my-security-group",
        "GroupId": "sg-09dfba7ed20cda78b"
      }
    ]
  }
}
```

```

    }
  ],
  "InterfaceType": "interface",
  "Ipv6Addresses": [],
  "MacAddress": "06:6a:0f:9a:49:37",
  "NetworkInterfaceId": "eni-0492b355f0cf3b3f8",
  "OwnerId": "123456789012",
  "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
  "PrivateIpAddress": "10.0.8.17",
  "PrivateIpAddresses": [
    {
      "Primary": true,
      "PrivateDnsName": "ip-10-0-8-17.us-west-2.compute.internal",
      "PrivateIpAddress": "10.0.8.17"
    }
  ],
  "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",
  "RequesterManaged": false,
  "SourceDestCheck": true,
  "Status": "pending",

  "TagSet": [],
  "VpcId": "vpc-02723a0feeeb9d57b"
}
}

```

Example 2: To create a network interface with an IPv4 address and an IPv6 address

The following `create-network-interface` example creates a network interface for the specified subnet with an IPv4 address and an IPv6 address that are selected by Amazon EC2.

```

aws ec2 create-network-interface \
  --subnet-id subnet-00a24d0d67acf6333 \
  --description "my dual stack network interface" \
  --ipv6-address-count 1 \
  --groups sg-09dfba7ed20cda78b

```

Output:

```

{
  "NetworkInterface": {
    "AvailabilityZone": "us-west-2a",

```

```
"Description": "my dual stack network interface",
"Groups": [
  {
    "GroupName": "my-security-group",
    "GroupId": "sg-09dfba7ed20cda78b"
  }
],
"InterfaceType": "interface",
"Ipv6Addresses": [
  {
    "Ipv6Address": "2600:1f13:cfe:3650:a1dc:237c:393a:4ba7",
    "IsPrimaryIpv6": false
  }
],
"MacAddress": "06:b8:68:d2:b2:2d",
"NetworkInterfaceId": "eni-05da417453f9a84bf",
"OwnerId": "123456789012",
"PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
"PrivateIpAddress": "10.0.8.18",
"PrivateIpAddresses": [
  {
    "Primary": true,
    "PrivateDnsName": "ip-10-0-8-18.us-west-2.compute.internal",
    "PrivateIpAddress": "10.0.8.18"
  }
],
"RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",

"Ipv6Address": "2600:1f13:cfe:3650:a1dc:237c:393a:4ba7"
}
}
```

Example 3: To create a network interface with connection tracking configuration options

The following `create-network-interface` example creates a network interface and configures the idle connection tracking timeouts.

```
aws ec2 create-network-interface \
```

```
--subnet-id subnet-00a24d0d67acf6333 \  
--groups sg-02e57dbcfe0331c1b \  
--connection-tracking-specification TcpEstablishedTimeout=86400,UdpTimeout=60
```

Output:

```
{  
  "NetworkInterface": {  
    "AvailabilityZone": "us-west-2a",  
    "ConnectionTrackingConfiguration": {  
      "TcpEstablishedTimeout": 86400,  
      "UdpTimeout": 60  
    },  
    "Description": "",  
    "Groups": [  
      {  
        "GroupName": "my-security-group",  
        "GroupId": "sg-02e57dbcfe0331c1b"  
      }  
    ],  
    "InterfaceType": "interface",  
    "Ipv6Addresses": [],  
    "MacAddress": "06:4c:53:de:6d:91",  
    "NetworkInterfaceId": "eni-0c133586e08903d0b",  
    "OwnerId": "123456789012",  
    "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",  
    "PrivateIpAddress": "10.0.8.94",  
    "PrivateIpAddresses": [  
      {  
        "Primary": true,  
        "PrivateDnsName": "ip-10-0-8-94.us-west-2.compute.internal",  
        "PrivateIpAddress": "10.0.8.94"  
      }  
    ],  
    "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",  
    "RequesterManaged": false,  
    "SourceDestCheck": true,  
    "Status": "pending",  
    "SubnetId": "subnet-00a24d0d67acf6333",  
    "TagSet": [],  
    "VpcId": "vpc-02723a0feeeb9d57b"  
  }  
}
```

Example 4: To create an Elastic Fabric Adapter

The following `create-network-interface` example creates an EFA.

```
aws ec2 create-network-interface \  
  --interface-type efa \  
  --subnet-id subnet-00a24d0d67acf6333 \  
  --description "my efa" \  
  --groups sg-02e57dbcf0331c1b
```

Output:

```
{  
  "NetworkInterface": {  
    "AvailabilityZone": "us-west-2a",  
    "Description": "my efa",  
    "Groups": [  
      {  
        "GroupName": "my-efa-sg",  
        "GroupId": "sg-02e57dbcf0331c1b"  
      }  
    ],  
    "InterfaceType": "efa",  
    "Ipv6Addresses": [],  
    "MacAddress": "06:d7:a4:f7:4d:57",  
    "NetworkInterfaceId": "eni-034acc2885e862b65",  
    "OwnerId": "123456789012",  
    "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",  
    "PrivateIpAddress": "10.0.8.180",  
    "PrivateIpAddresses": [  
      {  
        "Primary": true,  
        "PrivateDnsName": "ip-10-0-8-180.us-west-2.compute.internal",  
        "PrivateIpAddress": "10.0.8.180"  
      }  
    ],  
    "RequesterId": "AIDA4Z3Y7GSXTMEXAMPLE",  
    "RequesterManaged": false,  
    "SourceDestCheck": true,  
    "Status": "pending",  
    "SubnetId": "subnet-00a24d0d67acf6333",  
    "TagSet": [],  
    "VpcId": "vpc-02723a0feeb9d57b"
```

```
}  
}
```

For more information, see [Elastic network interfaces](#) in the *Amazon EC2 User Guide*.

- For API details, see [CreateNetworkInterface](#) in *AWS CLI Command Reference*.

create-placement-group

The following code example shows how to use `create-placement-group`.

AWS CLI

To create a placement group

This example command creates a placement group with the specified name.

Command:

```
aws ec2 create-placement-group --group-name my-cluster --strategy cluster
```

To create a partition placement group

This example command creates a partition placement group named `HDFS-Group-A` with five partitions.

Command:

```
aws ec2 create-placement-group --group-name HDFS-Group-A --strategy partition --  
partition-count 5
```

- For API details, see [CreatePlacementGroup](#) in *AWS CLI Command Reference*.

create-replace-root-volume-task

The following code example shows how to use `create-replace-root-volume-task`.

AWS CLI

Example 1: To restore a root volume to its initial launch state

The following `create-replace-root-volume-task` example restores the root volume of instance `i-0123456789abcdefa` to its initial launch state.

```
aws ec2 create-replace-root-volume-task \  
  --instance-id i-0123456789abcdefa
```

Output:

```
{  
  "ReplaceRootVolumeTask":  
  {  
    "InstanceId": "i-0123456789abcdefa",  
    "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",  
    "TaskState": "pending",  
    "StartTime": "2022-03-14T15:06:38Z",  
    "Tags": []  
  }  
}
```

For more information, see [Replace a root volume](#) in the *Amazon Elastic Compute Cloud User Guide*.

Example 2: To restore a root volume to a specific snapshot

The following `create-replace-root-volume-task` example restores the root volume of instance `i-0123456789abcdefa` to snapshot `snap-0abcdef1234567890`.

```
aws ec2 create-replace-root-volume-task \  
  --instance-id i-0123456789abcdefa \  
  --snapshot-id snap-0abcdef1234567890
```

Output:

```
{  
  "ReplaceRootVolumeTask":  
  {  
    "InstanceId": "i-0123456789abcdefa",  
    "ReplaceRootVolumeTaskId": "replacevol-0555566667777abcd",  
    "TaskState": "pending",  
    "StartTime": "2022-03-14T15:16:28Z",  
    "Tags": []  
  }  
}
```

```
}
```

For more information, see [Replace a root volume](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [CreateReplaceRootVolumeTask](#) in *AWS CLI Command Reference*.

create-reserved-instances-listing

The following code example shows how to use `create-reserved-instances-listing`.

AWS CLI

To list a Reserved Instance in the Reserved Instance Marketplace

The following `create-reserved-instances-listing` example creates a listing for the specified Reserved Instance in the Reserved Instance Marketplace.

```
aws ec2 create-reserved-instances-listing \  
  --reserved-instances-id 5ec28771-05ff-4b9b-aa31-9e57dexample \  
  --instance-count 3 \  
  --price-schedules CurrencyCode=USD,Price=25.50 \  
  --client-token 550e8400-e29b-41d4-a716-446655440000
```

- For API details, see [CreateReservedInstancesListing](#) in *AWS CLI Command Reference*.

create-restore-image-task

The following code example shows how to use `create-restore-image-task`.

AWS CLI

To restore an AMI from an S3 bucket

The following `create-restore-image-task` example restores an AMI from an S3 bucket. Use the values for `S3ObjectKey` and `Bucket` from the `describe-store-image-tasks` output, specify the object key of the AMI and the name of the S3 bucket to which the AMI was copied, and specify the name for the restored AMI. The name must be unique for AMIs in the Region for this account. The restored AMI will receive a new AMI ID.

```
aws ec2 create-restore-image-task \  
  --image-name my-ami
```

```
--object-key ami-1234567890abcdef0.bin \  
--bucket my-ami-bucket \  
--name "New AMI Name"
```

Output:

```
{  
  "ImageId": "ami-0eab20fe36f83e1a8"  
}
```

For more information about storing and restoring an AMI using S3, see [Store and restore an AMI using S3](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-store-restore.html) <<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-store-restore.html>> in the *Amazon EC2 User Guide*.

- For API details, see [CreateRestoreImageTask](#) in *AWS CLI Command Reference*.

create-route-table

The following code example shows how to use `create-route-table`.

AWS CLI

To create a route table

This example creates a route table for the specified VPC.

Command:

```
aws ec2 create-route-table --vpc-id vpc-a01106c2
```

Output:

```
{  
  "RouteTable": {  
    "Associations": [],  
    "RouteTableId": "rtb-22574640",  
    "VpcId": "vpc-a01106c2",  
    "PropagatingVgws": [],  
    "Tags": [],  
    "Routes": [  
      {
```

```
        "GatewayId": "local",
        "DestinationCidrBlock": "10.0.0.0/16",
        "State": "active"
    }
]
}
}
```

- For API details, see [CreateRouteTable](#) in *AWS CLI Command Reference*.

create-route

The following code example shows how to use `create-route`.

AWS CLI

To create a route

This example creates a route for the specified route table. The route matches all IPv4 traffic (`0.0.0.0/0`) and routes it to the specified Internet gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-route --route-table-id rtb-22574640 --destination-cidr-block
0.0.0.0/0 --gateway-id igw-c0a643a9
```

This example command creates a route in route table `rtb-g8ff4ea2`. The route matches traffic for the IPv4 CIDR block `10.0.0.0/16` and routes it to VPC peering connection, `pcx-111aaa22`. This route enables traffic to be directed to the peer VPC in the VPC peering connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-route --route-table-id rtb-g8ff4ea2 --destination-cidr-block
10.0.0.0/16 --vpc-peering-connection-id pcx-1a2b3c4d
```

This example creates a route in the specified route table that matches all IPv6 traffic (`::/0`) and routes it to the specified egress-only Internet gateway.

Command:

```
aws ec2 create-route --route-table-id rtb-dce620b8 --destination-ipv6-cidr-block ::/0 --egress-only-internet-gateway-id eigw-01eadbd45ecd7943f
```

- For API details, see [CreateRoute](#) in *AWS CLI Command Reference*.

create-security-group

The following code example shows how to use `create-security-group`.

AWS CLI

To create a security group for EC2-Classical

This example creates a security group named `MySecurityGroup`.

Command:

```
aws ec2 create-security-group --group-name MySecurityGroup --description "My security group"
```

Output:

```
{
  "GroupId": "sg-903004f8"
}
```

To create a security group for EC2-VPC

This example creates a security group named `MySecurityGroup` for the specified VPC.

Command:

```
aws ec2 create-security-group --group-name MySecurityGroup --description "My security group" --vpc-id vpc-1a2b3c4d
```

Output:

```
{
  "GroupId": "sg-903004f8"
}
```

For more information, see *Using Security Groups in the AWS Command Line Interface User Guide*.

- For API details, see [CreateSecurityGroup](#) in *AWS CLI Command Reference*.

create-snapshot

The following code example shows how to use `create-snapshot`.

AWS CLI

To create a snapshot

This example command creates a snapshot of the volume with a volume ID of `vol-1234567890abcdef0` and a short description to identify the snapshot.

Command:

```
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description "This is my root volume snapshot"
```

Output:

```
{
  "Description": "This is my root volume snapshot",
  "Tags": [],
  "Encrypted": false,
  "VolumeId": "vol-1234567890abcdef0",
  "State": "pending",
  "VolumeSize": 8,
  "StartTime": "2018-02-28T21:06:01.000Z",
  "Progress": "",
  "OwnerId": "012345678910",
  "SnapshotId": "snap-066877671789bd71b"
}
```

To create a snapshot with tags

This example command creates a snapshot and applies two tags: `purpose=prod` and `costcenter=123`.

Command:

```
aws ec2 create-snapshot --volume-id vol-1234567890abcdef0 --description 'Prod
backup' --tag-specifications 'ResourceType=snapshot,Tags=[{Key=purpose,Value=prod},
{Key=costcenter,Value=123}]'
```

Output:

```
{
  "Description": "Prod backup",
  "Tags": [
    {
      "Value": "prod",
      "Key": "purpose"
    },
    {
      "Value": "123",
      "Key": "costcenter"
    }
  ],
  "Encrypted": false,
  "VolumeId": "vol-1234567890abcdef0",
  "State": "pending",
  "VolumeSize": 8,
  "StartTime": "2018-02-28T21:06:06.000Z",
  "Progress": "",
  "OwnerId": "012345678910",
  "SnapshotId": "snap-09ed24a70bc19bbe4"
}
```

- For API details, see [CreateSnapshot](#) in *AWS CLI Command Reference*.

create-snapshots

The following code example shows how to use create-snapshots.

AWS CLI

Example 1: To create a multi-volume snapshot

The following create-snapshots example creates snapshots of all volumes attached to the specified instance.

```
aws ec2 create-snapshots \
```

```
--instance-specification InstanceId=i-1234567890abcdef0 \  
--description "This is snapshot of a volume from my-instance"
```

Output:

```
{  
  "Snapshots": [  
    {  
      "Description": "This is a snapshot of a volume from my-instance",  
      "Tags": [],  
      "Encrypted": false,  
      "VolumeId": "vol-0a01d2d5a34697479",  
      "State": "pending",  
      "VolumeSize": 16,  
      "StartTime": "2019-08-05T16:58:19.000Z",  
      "Progress": "",  
      "OwnerId": "123456789012",  
      "SnapshotId": "snap-07f30e3909aa0045e"  
    },  
    {  
      "Description": "This is a snapshot of a volume from my-instance",  
      "Tags": [],  
      "Encrypted": false,  
      "VolumeId": "vol-02d0d4947008cb1a2",  
      "State": "pending",  
      "VolumeSize": 20,  
      "StartTime": "2019-08-05T16:58:19.000Z",  
      "Progress": "",  
      "OwnerId": "123456789012",  
      "SnapshotId": "snap-0ec20b602264aad48"  
    },  
    ...  
  ]  
}
```

Example 2: To create a multi-volume snapshot with tags from the source volume

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and copies the tags from each volume to its corresponding snapshot.

```
aws ec2 create-snapshots \  
  --instance-specification InstanceId=i-1234567890abcdef0 \  
  --copy-tags-from-source volume \  
  --instance-specification InstanceId=i-1234567890abcdef0 \  
  --copy-tags-from-source volume \  
  --description "This is snapshot of a volume from my-instance"
```

```
--description "This is snapshot of a volume from my-instance"
```

Output:

```
{
  "Snapshots": [
    {
      "Description": "This is a snapshot of a volume from my-instance",
      "Tags": [
        {
          "Key": "Name",
          "Value": "my-volume"
        }
      ],
      "Encrypted": false,
      "VolumeId": "vol-02d0d4947008cb1a2",
      "State": "pending",
      "VolumeSize": 20,
      "StartTime": "2019-08-05T16:53:04.000Z",
      "Progress": "",
      "OwnerId": "123456789012",
      "SnapshotId": "snap-053bfaeb821a458dd"
    }
    ...
  ]
}
```

Example 3: To create a multi-volume snapshot not including the root volume

The following `create-snapshots` example creates a snapshot of all volumes attached to the specified instance except for the root volume.

```
aws ec2 create-snapshots \
  --instance-specification InstanceId=i-1234567890abcdef0,ExcludeBootVolume=true
```

See example 1 for sample output.

Example 4: To create a multi-volume snapshot and add tags

The following `create-snapshots` example creates snapshots of all volumes attached to the specified instance and adds two tags to each snapshot.

```
aws ec2 create-snapshots \  
  --instance-specification InstanceId=i-1234567890abcdef0 \  
  --tag-specifications 'ResourceType=snapshot,Tags=[{Key=Name,Value=backup},  
{Key=costcenter,Value=123}]'
```

See example 1 for sample output.

- For API details, see [CreateSnapshots](#) in *AWS CLI Command Reference*.

create-spot-datafeed-subscription

The following code example shows how to use `create-spot-datafeed-subscription`.

AWS CLI

To create a Spot Instance data feed

The following `create-spot-datafeed-subscription` example creates a Spot Instance data feed.

```
aws ec2 create-spot-datafeed-subscription \  
  --bucket my-bucket \  
  --prefix spot-data-feed
```

Output:

```
{  
  "SpotDatafeedSubscription": {  
    "Bucket": "my-bucket",  
    "OwnerId": "123456789012",  
    "Prefix": "spot-data-feed",  
    "State": "Active"  
  }  
}
```

The data feed is stored in the Amazon S3 bucket that you specified. The file names for this data feed have the following format.

```
my-bucket.s3.amazonaws.com/spot-data-feed/123456789012.YYYY-MM-DD-HH.n.abcd1234.gz
```

For more information, see [Spot Instance data feed](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CreateSpotDatafeedSubscription](#) in *AWS CLI Command Reference*.

create-store-image-task

The following code example shows how to use `create-store-image-task`.

AWS CLI

To store an AMI in an S3 bucket

The following `create-store-image-task` example stores an AMI in an S3 bucket. Specify the ID of the AMI and the name of the S3 bucket in which to store the AMI.

```
aws ec2 create-store-image-task \  
  --image-id ami-1234567890abcdef0 \  
  --bucket my-ami-bucket
```

Output:

```
{  
  "ObjectKey": "ami-1234567890abcdef0.bin"  
}
```

For more information, see [Store and restore an AMI using S3](#) in the *Amazon EC2 User Guide*.

- For API details, see [CreateStoreImageTask](#) in *AWS CLI Command Reference*.

create-subnet-cidr-reservation

The following code example shows how to use `create-subnet-cidr-reservation`.

AWS CLI

To create a subnet CIDR reservation

The following `create-subnet-cidr-reservation` example creates a subnet CIDR reservation for the specified subnet and CIDR range.

```
aws ec2 create-subnet-cidr-reservation \  
  --subnet-id subnet-1234567890abcdef0 \  
  --cidr-range 10.0.0.0/24
```

```
--subnet-id subnet-03c51e2eEXAMPLE \  
--reservation-type prefix \  
--cidr 10.1.0.20/26
```

Output:

```
{  
  "SubnetCidrReservation": {  
    "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",  
    "SubnetId": "subnet-03c51e2e6cEXAMPLE",  
    "Cidr": "10.1.0.16/28",  
    "ReservationType": "prefix",  
    "OwnerId": "123456789012"  
  }  
}
```

For more information, see [Subnet CIDR reservations](#) in the *Amazon VPC User Guide*.

- For API details, see [CreateSubnetCidrReservation](#) in *AWS CLI Command Reference*.

create-subnet

The following code example shows how to use create-subnet.

AWS CLI

Example 1: To create a subnet with an IPv4 CIDR block only

The following create-subnet example creates a subnet in the specified VPC with the specified IPv4 CIDR block.

```
aws ec2 create-subnet \  
  --vpc-id vpc-081ec835f3EXAMPLE \  
  --cidr-block 10.0.0.0/24 \  
  --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv4-only-  
subnet}]
```

Output:

```
{  
  "Subnet": {  
    "AvailabilityZone": "us-west-2a",
```

```

    "AvailabilityZoneId": "usw2-az2",
    "AvailableIpAddressCount": 251,
    "CidrBlock": "10.0.0.0/24",
    "DefaultForAz": false,
    "MapPublicIpOnLaunch": false,
    "State": "available",
    "SubnetId": "subnet-0e99b93155EXAMPLE",
    "VpcId": "vpc-081ec835f3EXAMPLE",
    "OwnerId": "123456789012",
    "AssignIpv6AddressOnCreation": false,
    "Ipv6CidrBlockAssociationSet": [],
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-ipv4-only-subnet"
      }
    ],
    "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0e99b93155EXAMPLE"
  }
}

```

Example 2: To create a subnet with both IPv4 and IPv6 CIDR blocks

The following `create-subnet` example creates a subnet in the specified VPC with the specified IPv4 and IPv6 CIDR blocks.

```

aws ec2 create-subnet \
  --vpc-id vpc-081ec835f3EXAMPLE \
  --cidr-block 10.0.0.0/24 \
  --ipv6-cidr-block 2600:1f16:cfe:3660::/64 \
  --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv4-ipv6-
subnet}]

```

Output:

```

{
  "Subnet": {
    "AvailabilityZone": "us-west-2a",
    "AvailabilityZoneId": "usw2-az2",
    "AvailableIpAddressCount": 251,
    "CidrBlock": "10.0.0.0/24",
    "DefaultForAz": false,

```

```

    "MapPublicIpOnLaunch": false,
    "State": "available",
    "SubnetId": "subnet-0736441d38EXAMPLE",
    "VpcId": "vpc-081ec835f3EXAMPLE",
    "OwnerId": "123456789012",
    "AssignIpv6AddressOnCreation": false,
    "Ipv6CidrBlockAssociationSet": [
      {
        "AssociationId": "subnet-cidr-assoc-06c5f904499fcc623",
        "Ipv6CidrBlock": "2600:1f13:cfe:3660::/64",
        "Ipv6CidrBlockState": {
          "State": "associating"
        }
      }
    ],
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-ipv4-ipv6-subnet"
      }
    ],
    "SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-0736441d38EXAMPLE"
  }
}

```

Example 3: To create a subnet with an IPv6 CIDR block only

The following `create-subnet` example creates a subnet in the specified VPC, with the specified IPv6 CIDR block.

```

aws ec2 create-subnet \
  --vpc-id vpc-081ec835f3EXAMPLE \
  --ipv6-native \
  --ipv6-cidr-block 2600:1f16:115:200::/64 \
  --tag-specifications ResourceType=subnet,Tags=[{Key=Name,Value=my-ipv6-only-
subnet}]

```

Output:

```

{
  "Subnet": {
    "AvailabilityZone": "us-west-2a",

```

```
"AvailabilityZoneId": "usw2-az2",
"AvailableIpAddressCount": 0,
"DefaultForAz": false,
"MapPublicIpOnLaunch": false,
"State": "available",
"SubnetId": "subnet-03f720e7deEXAMPLE",
"VpcId": "vpc-081ec835f3EXAMPLE",
"OwnerId": "123456789012",
"AssignIpv6AddressOnCreation": true,
"Ipv6CidrBlockAssociationSet": [
  {
    "AssociationId": "subnet-cidr-assoc-01ef639edde556709",
    "Ipv6CidrBlock": "2600:1f13:cfe:3660::/64",
    "Ipv6CidrBlockState": {
      "State": "associating"
    }
  }
],
"Tags": [
  {
    "Key": "Name",
    "Value": "my-ipv6-only-subnet"
  }
],
"SubnetArn": "arn:aws:ec2:us-west-2:123456789012:subnet/
subnet-03f720e7deEXAMPLE"
}
```

For more information, see [VPCs and subnets](#) in the *Amazon VPC User Guide*.

- For API details, see [CreateSubnet](#) in *AWS CLI Command Reference*.

create-tags

The following code example shows how to use `create-tags`.

AWS CLI

Example 1: To add a tag to a resource

The following `create-tags` example adds the tag `Stack=production` to the specified image, or overwrites an existing tag for the AMI where the tag key is `Stack`.

```
aws ec2 create-tags \  
  --resources ami-1234567890abcdef0 \  
  --tags Key=Stack,Value=production
```

For more information, see [This is the topic title](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To add tags to multiple resources

The following `create-tags` example adds (or overwrites) two tags for an AMI and an instance. One of the tags has a key (`webserver`) but no value (value is set to an empty string). The other tag has a key (`stack`) and a value (`Production`).

```
aws ec2 create-tags \  
  --resources ami-1a2b3c4d i-1234567890abcdef0 \  
  --tags Key=webserver,Value=   Key=stack,Value=Production
```

For more information, see [This is the topic title](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 3: To add tags containing special characters

The following `create-tags` example adds the tag `[Group]=test` for an instance. The square brackets (`[` and `]`) are special characters, and must be escaped. The following examples also use the line continuation character appropriate for each environment.

If you are using Windows, surround the element that has special characters with double quotes (`"`), and then precede each double quote character with a backslash (`\`) as follows:

```
aws ec2 create-tags ^  
  --resources i-1234567890abcdef0 ^  
  --tags Key=\"[Group]\",Value=test
```

If you are using Windows PowerShell, surround the element the value that has special characters with double quotes (`"`), precede each double quote character with a backslash (`\`), and then surround the entire key and value structure with single quotes (`'`) as follows:

```
aws ec2 create-tags `  
  --resources i-1234567890abcdef0 `  
  --tags 'Key=\"[Group]\",Value=test'
```

If you are using Linux or OS X, surround the element that has special characters with double quotes ("), and then surround the entire key and value structure with single quotes (') as follows:

```
aws ec2 create-tags \  
  --resources i-1234567890abcdef0 \  
  --tags 'Key="[Group]",Value=test'
```

For more information, see [This is the topic title](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [CreateTags](#) in *AWS CLI Command Reference*.

create-traffic-mirror-filter-rule

The following code example shows how to use `create-traffic-mirror-filter-rule`.

AWS CLI

To create a filter rule for incoming TCP traffic

The following `create-traffic-mirror-filter-rule` example creates a rule that you can use to mirror all incoming TCP traffic. Before you run this command, use `create-traffic-mirror-filter` to create the the Traffic Mirror filter.

```
aws ec2 create-traffic-mirror-filter-rule \  
  --description "TCP Rule" \  
  --destination-cidr-block 0.0.0.0/0 \  
  --protocol 6 \  
  --rule-action accept \  
  --rule-number 1 \  
  --source-cidr-block 0.0.0.0/0 \  
  --traffic-direction ingress \  
  --traffic-mirror-filter-id tmf-04812ff784b25ae67
```

Output:

```
{  
  "TrafficMirrorFilterRule": {  
    "DestinationCidrBlock": "0.0.0.0/0",  
    "TrafficMirrorFilterId": "tmf-04812ff784b25ae67",  
    "TrafficMirrorFilterRuleId": "tmfr-02d20d996673f3732",  
    "SourceCidrBlock": "0.0.0.0/0",
```

```

    "TrafficDirection": "ingress",
    "Description": "TCP Rule",
    "RuleNumber": 1,
    "RuleAction": "accept",
    "Protocol": 6
  },
  "ClientToken": "4752b573-40a6-4eac-a8a4-a72058761219"
}

```

For more information, see [Create a Traffic Mirror Filter](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [CreateTrafficMirrorFilterRule](#) in *AWS CLI Command Reference*.

create-traffic-mirror-filter

The following code example shows how to use `create-traffic-mirror-filter`.

AWS CLI

To create a Traffic Mirror Filter

The following `create-traffic-mirror-filter` example creates a Traffic Mirror filter. After you create the filter, use `create-traffic-mirror-filter-rule` to add rules to the filter.

```

aws ec2 create-traffic-mirror-filter \
  --description "TCP Filter"

```

Output:

```

{
  "ClientToken": "28908518-100b-4987-8233-8c744EXAMPLE",
  "TrafficMirrorFilter": {
    "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
    "Description": "TCP Filter",
    "EgressFilterRules": [],
    "IngressFilterRules": [],
    "Tags": [],
    "NetworkServices": []
  }
}

```

For more information, see [Create a Traffic Mirror Filter](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [CreateTrafficMirrorFilter](#) in *AWS CLI Command Reference*.

create-traffic-mirror-session

The following code example shows how to use `create-traffic-mirror-session`.

AWS CLI

To create a Traffic Mirror Session

The following `create-traffic-mirror-session` command creates a traffic mirror sessions for the specified source and target for 25 bytes of the packet.

```
aws ec2 create-traffic-mirror-session \  
  --description "example session" \  
  --traffic-mirror-target-id tmt-07f75d8feeEXAMPLE \  
  --network-interface-id eni-070203f901EXAMPLE \  
  --session-number 1 \  
  --packet-length 25 \  
  --traffic-mirror-filter-id tmf-04812ff784EXAMPLE
```

Output:

```
{  
  "TrafficMirrorSession": {  
    "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",  
    "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",  
    "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",  
    "NetworkInterfaceId": "eni-070203f901EXAMPLE",  
    "OwnerId": "111122223333",  
    "PacketLength": 25,  
    "SessionNumber": 1,  
    "VirtualNetworkId": 7159709,  
    "Description": "example session",  
    "Tags": []  
  },  
  "ClientToken": "5236cffc-ee13-4a32-bb5b-388d9da09d96"  
}
```

For more information, see [Create a Traffic Mirror Session](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [CreateTrafficMirrorSession](#) in *AWS CLI Command Reference*.

create-traffic-mirror-target

The following code example shows how to use create-traffic-mirror-target.

AWS CLI

To create a a Network Load Balancer Traffic Mirror target

The following create-traffic-mirror-target example creates a Network Load Balancer Traffic Mirror target.

```
aws ec2 create-traffic-mirror-target \  
  --description "Example Network Load Balancer Target" \  
  --network-load-balancer-arn arn:aws:elasticloadbalancing:us-  
east-1:111122223333:loadbalancer/net/NLB/7cdec873EXAMPLE
```

Output:

```
{  
  "TrafficMirrorTarget": {  
    "Type": "network-load-balancer",  
    "Tags": [],  
    "Description": "Example Network Load Balancer Target",  
    "OwnerId": "111122223333",  
    "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-  
east-1:724145273726:loadbalancer/net/NLB/7cdec873EXAMPLE",  
    "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE"  
  },  
  "ClientToken": "d5c090f5-8a0f-49c7-8281-72c796a21f72"  
}
```

To create a network Traffic Mirror target

The following create-traffic-mirror-target example creates a network interface Traffic Mirror target.

```
aws ec2 create-traffic-mirror-target --description "Network interface target" --network-  
interface-id eni-eni-01f6f631eEXAMPLE
```

Output:

```
{
```

```

"ClientToken": "5289a345-0358-4e62-93d5-47ef3061d65e",
"TrafficMirrorTarget": {
  "Description": "Network interface target",
  "NetworkInterfaceId": "eni-01f6f631eEXAMPLE",
  "TrafficMirrorTargetId": "tmt-02dcdb2abEXAMPLE",
  "OwnerId": "111122223333",
  "Type": "network-interface",
  "Tags": []
}
}

```

For more information, see [Create a Traffic Mirror Target](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [CreateTrafficMirrorTarget](#) in *AWS CLI Command Reference*.

create-transit-gateway-connect-peer

The following code example shows how to use `create-transit-gateway-connect-peer`.

AWS CLI

To create a Transit Gateway Connect peer

The following `create-transit-gateway-connect-peer` example creates a Connect peer.

```

aws ec2 create-transit-gateway-connect-peer \
  --transit-gateway-attachment-id tgw-attach-0f0927767cEXAMPLE \
  --peer-address 172.31.1.11 \
  --inside-cidr-blocks 169.254.6.0/29

```

Output:

```

{
  "TransitGatewayConnectPeer": {
    "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
    "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
    "State": "pending",
    "CreationTime": "2021-10-13T03:35:17.000Z",
    "ConnectPeerConfiguration": {
      "TransitGatewayAddress": "10.0.0.234",
      "PeerAddress": "172.31.1.11",
      "InsideCidrBlocks": [

```

```

        "169.254.6.0/29"
    ],
    "Protocol": "gre",
    "BgpConfigurations": [
        {
            "TransitGatewayAsn": 64512,
            "PeerAsn": 64512,
            "TransitGatewayAddress": "169.254.6.2",
            "PeerAddress": "169.254.6.1",
            "BgpStatus": "down"
        },
        {
            "TransitGatewayAsn": 64512,
            "PeerAsn": 64512,
            "TransitGatewayAddress": "169.254.6.3",
            "PeerAddress": "169.254.6.1",
            "BgpStatus": "down"
        }
    ]
}
}
}
}
}

```

For more information, see [Transit gateway Connect attachments and Transit Gateway Connect peers](#) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayConnectPeer](#) in *AWS CLI Command Reference*.

create-transit-gateway-connect

The following code example shows how to use `create-transit-gateway-connect`.

AWS CLI

To create a transit gateway Connect attachment

The following `create-transit-gateway-connect` example creates a Connect attachment, with the "gre" protocol, for the specified attachment.

```

aws ec2 create-transit-gateway-connect \
  --transport-transit-gateway-attachment-id tgw-attach-0a89069f57EXAMPLE \
  --options "Protocol=gre"

```

Output:

```
{
  "TransitGatewayConnect": {
    "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
    "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
    "State": "pending",
    "CreationTime": "2021-03-09T19:59:17+00:00",
    "Options": {
      "Protocol": "gre"
    }
  }
}
```

For more information, see [Transit gateway Connect attachments and Transit Gateway Connect peers](#) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayConnect](#) in *AWS CLI Command Reference*.

create-transit-gateway-multicast-domain

The following code example shows how to use `create-transit-gateway-multicast-domain`.

AWS CLI**Example 1: To create an IGMP multicast domain**

The following `create-transit-gateway-multicast-domain` example creates a multicast domain for the specified transit gateway. With static sources disabled, any instances in subnets associated with the multicast domain can send multicast traffic. If at least one member uses the IGMP protocol, you must enable IGMPv2 support.

```
aws ec2 create-transit-gateway-multicast-domain \
  --transit-gateway-id tgw-0bf0bffefaEXAMPLE \
  --options StaticSourcesSupport=disable,Igmpv2Support=enable
```

Output:

```
{
  "TransitGatewayMulticastDomain": {
```

```

    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c9e29e2a7EXAMPLE",
    "TransitGatewayId": "tgw-0bf0bfffefaEXAMPLE",
    "TransitGatewayMulticastDomainArn": "arn:aws:ec2:us-
west-2:123456789012:transit-gateway-multicast-domain/tgw-mcast-
domain-0c9e29e2a7EXAMPLE",
    "OwnerId": "123456789012",
    "Options": {
      "Icmpv2Support": "enable",
      "StaticSourcesSupport": "disable",
      "AutoAcceptSharedAssociations": "disable"
    },
    "State": "pending",
    "CreationTime": "2021-09-29T22:17:13.000Z"
  }
}

```

Example 2: To create a static multicast domain

The following `create-transit-gateway-multicast-domain` example creates a multicast domain for the specified transit gateway. With static sources enabled, you must statically add sources.

```

aws ec2 create-transit-gateway-multicast-domain \
  --transit-gateway-id tgw-0bf0bfffefaEXAMPLE \
  --options StaticSourcesSupport=enable,Icmpv2Support=disable

```

Output:

```

{
  "TransitGatewayMulticastDomain": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
    "TransitGatewayId": "tgw-0bf0bfffefaEXAMPLE",
    "TransitGatewayMulticastDomainArn": "arn:aws:ec2:us-
west-2:123456789012:transit-gateway-multicast-domain/tgw-mcast-
domain-000fb24d04EXAMPLE",
    "OwnerId": "123456789012",
    "Options": {
      "Icmpv2Support": "disable",
      "StaticSourcesSupport": "enable",
      "AutoAcceptSharedAssociations": "disable"
    },
    "State": "pending",
  }
}

```

```
    "CreationTime": "2021-09-29T22:20:19.000Z"
  }
}
```

For more information, see [Managing multicast domains](#) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayMulticastDomain](#) in *AWS CLI Command Reference*.

create-transit-gateway-peering-attachment

The following code example shows how to use `create-transit-gateway-peering-attachment`.

AWS CLI

To create a transit gateway peering attachment

The following `create-transit-gateway-peering-attachment` example creates a peering attachment request between the two specified transit gateways.

```
aws ec2 create-transit-gateway-peering-attachment \
  --transit-gateway-id tgw-123abc05e04123abc \
  --peer-transit-gateway-id tgw-11223344aabbcc112 \
  --peer-account-id 123456789012 \
  --peer-region us-east-2
```

Output:

```
{
  "TransitGatewayPeeringAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
    "RequesterTgwInfo": {
      "TransitGatewayId": "tgw-123abc05e04123abc",
      "OwnerId": "123456789012",
      "Region": "us-west-2"
    },
    "AcceptorTgwInfo": {
      "TransitGatewayId": "tgw-11223344aabbcc112",
      "OwnerId": "123456789012",
      "Region": "us-east-2"
    },
    "State": "initiatingRequest",
```

```
    "CreationTime": "2019-12-09T11:38:05.000Z"
  }
}
```

For more information, see [Transit Gateway Peering Attachments](#) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayPeeringAttachment](#) in *AWS CLI Command Reference*.

create-transit-gateway-policy-table

The following code example shows how to use `create-transit-gateway-policy-table`.

AWS CLI

To create a transit gateway policy table

The following `create-transit-gateway-policy-table` example creates a transit gateway policy table for the specified transit gateway.

```
aws ec2 create-transit-gateway-policy-table \
  --transit-gateway-id tgw-067f8505c18f0bd6e
```

Output:

```
{
  "TransitGatewayPolicyTable": {
    "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
    "TransitGatewayId": "tgw-067f8505c18f0bd6e",
    "State": "pending",
    "CreationTime": "2023-11-28T16:36:43+00:00"
  }
}
```

For more information, see [Transit gateway policy tables](#) in the *Transit Gateway User Guide*.

- For API details, see [CreateTransitGatewayPolicyTable](#) in *AWS CLI Command Reference*.

create-transit-gateway-prefix-list-reference

The following code example shows how to use `create-transit-gateway-prefix-list-reference`.

AWS CLI

To create a reference to a prefix list

The following `create-transit-gateway-prefix-list-reference` example creates a reference to the specified prefix list in the specified transit gateway route table.

```
aws ec2 create-transit-gateway-prefix-list-reference \  
  --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \  
  --prefix-list-id pl-111111222222223333 \  
  --transit-gateway-attachment-id tgw-attach-aaaaaabbbbb11111
```

Output:

```
{  
  "TransitGatewayPrefixListReference": {  
    "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",  
    "PrefixListId": "pl-111111222222223333",  
    "PrefixListOwnerId": "123456789012",  
    "State": "pending",  
    "Blackhole": false,

      "TransitGatewayAttachmentId": "tgw-attach-aaaaaabbbbb11111",  
      "ResourceType": "vpc",  
      "ResourceId": "vpc-112233445566aabbcc"  
    }  
  }  
}
```

For more information, see [Prefix list references](#) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayPrefixListReference](#) in *AWS CLI Command Reference*.

create-transit-gateway-route-table

The following code example shows how to use `create-transit-gateway-route-table`.

AWS CLI

To create a Transit Gateway Route Table

The following `create-transit-gateway-route-table` example creates a route table for the specified transit gateway.

```
aws ec2 create-transit-gateway-route-table \  
  --transit-gateway-id tgw-0262a0e521EXAMPLE
```

Output:

```
{  
  "TransitGatewayRouteTable": {  
    "TransitGatewayRouteTableId": "tgw-rtb-0960981be7EXAMPLE",  
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",  
    "State": "pending",  
    "DefaultAssociationRouteTable": false,  
    "DefaultPropagationRouteTable": false,  
    "CreationTime": "2019-07-10T19:01:46.000Z"  
  }  
}
```

For more information, see [Create a transit gateway route table](#) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayRouteTable](#) in *AWS CLI Command Reference*.

create-transit-gateway-route

The following code example shows how to use `create-transit-gateway-route`.

AWS CLI

To create a transit gateway route

The following `create-transit-gateway-route` example creates a route, with the specified destination, for the specified route table.

```
aws ec2 create-transit-gateway-route \  
  --destination-cidr-block 10.0.2.0/24 \  
  --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \  
  --transit-gateway-attachment-id tgw-attach-0b5968d3b6EXAMPLE
```

Output:

```
{  
  "Route": {  
    "DestinationCidrBlock": "10.0.2.0/24",
```

```

    "TransitGatewayAttachments": [
      {
        "ResourceId": "vpc-0065acced4EXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
        "ResourceType": "vpc"
      }
    ],
    "Type": "static",
    "State": "active"
  }
}

```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayRoute](#) in *AWS CLI Command Reference*.

create-transit-gateway-vpc-attachment

The following code example shows how to use `create-transit-gateway-vpc-attachment`.

AWS CLI

Example 1: To associate a transit gateway with a VPC

The following `create-transit-gateway-vpc-attachment` example creates a transit gateway attachment to the specified VPC.

```

aws ec2 create-transit-gateway-vpc-attachment \
  --transit-gateway-id tgw-0262a0e521EXAMPLE \
  --vpc-id vpc-07e8ffd50f49335df \
  --subnet-id subnet-0752213d59EXAMPLE

```

Output:

```

{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "VpcId": "vpc-07e8ffd50fEXAMPLE",
    "VpcOwnerId": "111122223333",
    "State": "pending",
    "SubnetIds": [

```

```

        "subnet-0752213d59EXAMPLE"
    ],
    "CreationTime": "2019-07-10T17:33:46.000Z",
    "Options": {
        "DnsSupport": "enable",
        "Ipv6Support": "disable"
    }
}
}

```

For more information, see [Create a transit gateway attachment to a VPC](#) in the *Transit Gateways Guide*.

Example 2: To associate a transit gateway with multiple subnets in a VPC

The following `create-transit-gateway-vpc-attachment` example creates a transit gateway attachment to the specified VPC and subnets.

```

aws ec2 create-transit-gateway-vpc-attachment \
  --transit-gateway-id tgw-02f776b1a7EXAMPLE \
  --vpc-id vpc-3EXAMPLE \
  --subnet-ids "subnet-dEXAMPLE" "subnet-6EXAMPLE"

```

Output:

```

{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0e141e0bebEXAMPLE",
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
    "VpcId": "vpc-3EXAMPLE",
    "VpcOwnerId": "111122223333",
    "State": "pending",
    "SubnetIds": [
      "subnet-6EXAMPLE",
      "subnet-dEXAMPLE"
    ],
    "CreationTime": "2019-12-17T20:07:52.000Z",
    "Options": {
      "DnsSupport": "enable",
      "Ipv6Support": "disable"
    }
  }
}

```

```
}

```

For more information, see [Create a transit gateway attachment to a VPC](#) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGatewayVpcAttachment](#) in *AWS CLI Command Reference*.

create-transit-gateway

The following code example shows how to use `create-transit-gateway`.

AWS CLI

To create a transit gateway

The following `create-transit-gateway` example creates a transit gateway.

```
aws ec2 create-transit-gateway \
  --description MyTGW \
  --options
  AmazonSideAsn=64516,AutoAcceptSharedAttachments=enable,DefaultRouteTableAssociation=enable,
```

Output:

```
{
  "TransitGateway": {
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "TransitGatewayArn": "arn:aws:ec2:us-east-2:111122223333:transit-gateway/tgw-0262a0e521EXAMPLE",
    "State": "pending",
    "OwnerId": "111122223333",
    "Description": "MyTGW",
    "CreationTime": "2019-07-10T14:02:12.000Z",
    "Options": {
      "AmazonSideAsn": 64516,
      "AutoAcceptSharedAttachments": "enable",
      "DefaultRouteTableAssociation": "enable",
      "AssociationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
      "DefaultRouteTablePropagation": "enable",
      "PropagationDefaultRouteTableId": "tgw-rtb-018774adf3EXAMPLE",
      "VpnEcmpSupport": "enable",
      "DnsSupport": "enable"
    }
  }
}
```

```
}
}
```

For more information, see [Create a transit gateway](#) in the *Transit Gateways Guide*.

- For API details, see [CreateTransitGateway](#) in *AWS CLI Command Reference*.

create-verified-access-endpoint

The following code example shows how to use `create-verified-access-endpoint`.

AWS CLI

To create a Verified Access endpoint

The following `create-verified-access-endpoint` example creates a Verified Access endpoint for the specified Verified Access group. The specified network interface and security group must belong to the same VPC.

```
aws ec2 create-verified-access-endpoint \
  --verified-access-group-id vagr-0dbe967baf14b7235 \
  --endpoint-type network-interface \
  --attachment-type vpc \
  --domain-certificate-arn arn:aws:acm:us-east-2:123456789012:certificate/
eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE \
  --application-domain example.com \
  --endpoint-domain-prefix my-ava-app \
  --security-group-ids sg-004915970c4c8f13a \
  --network-interface-options
NetworkInterfaceId=eni-0aec70418c8d87a0f,Protocol=https,Port=443 \
  --tag-specifications ResourceType=verified-access-
endpoint,Tags=[{Key=Name,Value=my-va-endpoint}]
```

Output:

```
{
  "VerifiedAccessEndpoint": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
    "ApplicationDomain": "example.com",
    "EndpointType": "network-interface",
```

```

    "AttachmentType": "vpc",
    "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/
eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
    "EndpointDomain": "my-ava-
app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-
east-2.amazonaws.com",
    "SecurityGroupIds": [
        "sg-004915970c4c8f13a"
    ],
    "NetworkInterfaceOptions": {
        "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
        "Protocol": "https",
        "Port": 443
    },
    "Status": {
        "Code": "pending"
    },
    "Description": "",
    "CreationTime": "2023-08-25T20:54:43",
    "LastUpdatedTime": "2023-08-25T20:54:43",
    "Tags": [
        {
            "Key": "Name",
            "Value": "my-va-endpoint"
        }
    ]
}

```

For more information, see [Verified Access endpoints](#) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessEndpoint](#) in *AWS CLI Command Reference*.

create-verified-access-group

The following code example shows how to use create-verified-access-group.

AWS CLI

To create a Verified Access group

The following create-verified-access-group example creates a Verified Access group for the specified Verified Access instance.

```
aws ec2 create-verified-access-group \  
  --verified-access-instance-id vai-0ce000c0b7643abea \  
  --tag-specifications ResourceType=verified-access-  
group,Tags=[{Key=Name,Value=my-va-group}]
```

Output:

```
{  
  "VerifiedAccessGroup": {  
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",  
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",  
    "Description": "",  
    "Owner": "123456789012",  
    "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-  
access-group/vagr-0dbe967baf14b7235",  
    "CreationTime": "2023-08-25T19:55:19",  
    "LastUpdatedTime": "2023-08-25T19:55:19",  
    "Tags": [  
      {  
        "Key": "Name",  
        "Value": "my-va-group"  
      }  
    ]  
  }  
}
```

For more information, see [Verified Access groups](#) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessGroup](#) in *AWS CLI Command Reference*.

create-verified-access-instance

The following code example shows how to use `create-verified-access-instance`.

AWS CLI

To create a Verified Access instance

The following `create-verified-access-instance` example creates a Verified Access instance with a Name tag.

```
aws ec2 create-verified-access-instance \  
  --verified-access-instance-id vai-0ce000c0b7643abea \  
  --tag-specifications ResourceType=verified-access-  
instance,Tags=[{Key=Name,Value=my-va-instance}]
```

```
--tag-specifications ResourceType=verified-access-
instance,Tags=[{Key=Name,Value=my-va-instance}]
```

Output:

```
{
  "VerifiedAccessInstance": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "Description": "",
    "VerifiedAccessTrustProviders": [],
    "CreationTime": "2023-08-25T18:27:56",
    "LastUpdatedTime": "2023-08-25T18:27:56",
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-va-instance"
      }
    ]
  }
}
```

For more information, see [Verified Access instances](#) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessInstance](#) in *AWS CLI Command Reference*.

create-verified-access-trust-provider

The following code example shows how to use `create-verified-access-trust-provider`.

AWS CLI

To create a Verified Access trust provider

The following `create-verified-access-trust-provider` example sets up a Verified Access trust provider using AWS Identity Center.

```
aws ec2 create-verified-access-trust-provider \
  --trust-provider-type user \
  --user-trust-provider-type iam-identity-center \
  --policy-reference-name idc \
  --tag-specifications ResourceType=verified-access-trust-
provider,Tags=[{Key=Name,Value=my-va-trust-provider}]
```

Output:

```
{
  "VerifiedAccessTrustProvider": {
    "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
    "Description": "",
    "TrustProviderType": "user",
    "UserTrustProviderType": "iam-identity-center",
    "PolicyReferenceName": "idc",
    "CreationTime": "2023-08-25T18:40:36",
    "LastUpdatedTime": "2023-08-25T18:40:36",
    "Tags": [
      {
        "Key": "Name",
        "Value": "my-va-trust-provider"
      }
    ]
  }
}
```

For more information, see [Trust providers for Verified Access](#) in the *AWS Verified Access User Guide*.

- For API details, see [CreateVerifiedAccessTrustProvider](#) in *AWS CLI Command Reference*.

create-volume

The following code example shows how to use `create-volume`.

AWS CLI**To create an empty General Purpose SSD (gp2) volume**

The following `create-volume` example creates an 80 GiB General Purpose SSD (gp2) volume in the specified Availability Zone. Note that the current Region must be `us-east-1`, or you can add the `--region` parameter to specify the Region for the command.

```
aws ec2 create-volume \
  --volume-type gp2 \
  --size 80 \
  --availability-zone us-east-1a
```

Output:

```
{
  "AvailabilityZone": "us-east-1a",
  "Tags": [],
  "Encrypted": false,
  "VolumeType": "gp2",
  "VolumeId": "vol-1234567890abcdef0",
  "State": "creating",
  "Iops": 240,
  "SnapshotId": "",
  "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",
  "Size": 80
}
```

If you do not specify a volume type, the default volume type is gp2.

```
aws ec2 create-volume \
  --size 80 \
  --availability-zone us-east-1a
```

Example 2: To create a Provisioned IOPS SSD (io1) volume from a snapshot

The following `create-volume` example creates a Provisioned IOPS SSD (io1) volume with 1000 provisioned IOPS in the specified Availability Zone using the specified snapshot.

```
aws ec2 create-volume \
  --volume-type io1 \
  --iops 1000 \
  --snapshot-id snap-066877671789bd71b \
  --availability-zone us-east-1a
```

Output:

```
{
  "AvailabilityZone": "us-east-1a",
  "Tags": [],
  "Encrypted": false,
  "VolumeType": "io1",
  "VolumeId": "vol-1234567890abcdef0",
  "State": "creating",
}
```

```
"Iops": 1000,  
"SnapshotId": "snap-066877671789bd71b",  
"CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",  
"Size": 500  
}
```

Example 3: To create an encrypted volume

The following `create-volume` example creates an encrypted volume using the default CMK for EBS encryption. If encryption by default is disabled, you must specify the `--encrypted` parameter as follows.

```
aws ec2 create-volume \  
  --size 80 \  
  --encrypted \  
  --availability-zone us-east-1a
```

Output:

```
{  
  "AvailabilityZone": "us-east-1a",  
  "Tags": [],  
  "Encrypted": true,  
  "VolumeType": "gp2",  
  "VolumeId": "vol-1234567890abcdef0",  
  "State": "creating",  
  "Iops": 240,  
  "SnapshotId": "",  
  "CreateTime": "YYYY-MM-DDTHH:MM:SS.000Z",  
  "Size": 80  
}
```

If encryption by default is enabled, the following example command creates an encrypted volume, even without the `--encrypted` parameter.

```
aws ec2 create-volume \  
  --size 80 \  
  --availability-zone us-east-1a
```

If you use the `--kms-key-id` parameter to specify a customer managed CMK, you must specify the `--encrypted` parameter even if encryption by default is enabled.

```
aws ec2 create-volume \  
  --volume-type gp2 \  
  --size 80 \  
  --encrypted \  
  --kms-key-id 0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE \  
  --availability-zone us-east-1a
```

Example 4: To create a volume with tags

The following `create-volume` example creates a volume and adds two tags.

```
aws ec2 create-volume \  
  --availability-zone us-east-1a \  
  --volume-type gp2 \  
  --size 80 \  
  --tag-specifications 'ResourceType=volume,Tags=[{Key=purpose,Value=production},  
{Key=cost-center,Value=cc123}]'
```

- For API details, see [CreateVolume](#) in *AWS CLI Command Reference*.

create-vpc-endpoint-connection-notification

The following code example shows how to use `create-vpc-endpoint-connection-notification`.

AWS CLI

To create an endpoint connection notification

This example creates a notification for a specific endpoint service that alerts you when interface endpoints have connected to your service and when endpoints have been accepted for your service.

Command:

```
aws ec2 create-vpc-endpoint-connection-notification --connection-notification-arn  
arn:aws:sns:us-east-2:123456789012:VpceNotification --connection-events Connect  
Accept --service-id vpce-svc-1237881c0d25a3abc
```

Output:

```
{
  "ConnectionNotification": {
    "ConnectionNotificationState": "Enabled",
    "ConnectionNotificationType": "Topic",
    "ServiceId": "vpce-svc-1237881c0d25a3abc",
    "ConnectionEvents": [
      "Accept",
      "Connect"
    ],
    "ConnectionNotificationId": "vpce-nfn-008776de7e03f5abc",
    "ConnectionNotificationArn": "arn:aws:sns:us-
east-2:123456789012:VpceNotification"
  }
}
```

- For API details, see [CreateVpcEndpointConnectionNotification](#) in *AWS CLI Command Reference*.

create-vpc-endpoint-service-configuration

The following code example shows how to use `create-vpc-endpoint-service-configuration`.

AWS CLI

Example 1: To create an endpoint service configuration for an interface endpoint

The following `create-vpc-endpoint-service-configuration` example creates a VPC endpoint service configuration using the Network Load Balancer `nlb-vpce`. This example also specifies that requests to connect to the service through an interface endpoint must be accepted.

```
aws ec2 create-vpc-endpoint-service-configuration \
  --network-load-balancer-arns arn:aws:elasticloadbalancing:us-
east-1:123456789012:loadbalancer/net/nlb-vpce/e94221227f1ba532 \
  --acceptance-required
```

Output:

```
{
  "ServiceConfiguration": {
```

```

    "ServiceType": [
      {
        "ServiceType": "Interface"
      }
    ],
    "NetworkLoadBalancerArns": [
      "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/net/
nlb-vpce/e94221227f1ba532"
    ],
    "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-03d5ebb7d9579a2b3",
    "ServiceState": "Available",
    "ServiceId": "vpce-svc-03d5ebb7d9579a2b3",
    "AcceptanceRequired": true,
    "AvailabilityZones": [
      "us-east-1d"
    ],
    "BaseEndpointDnsNames": [
      "vpce-svc-03d5ebb7d9579a2b3.us-east-1.vpce.amazonaws.com"
    ]
  }
}

```

Example 2: To create an endpoint service configuration for a Gateway Load Balancer endpoint

The following `create-vpc-endpoint-service-configuration` example creates a VPC endpoint service configuration using the Gateway Load Balancer `GWLBService`. Requests to connect to the service through a Gateway Load Balancer endpoint are automatically accepted.

```

aws ec2 create-vpc-endpoint-service-configuration \
  --gateway-load-balancer-arns arn:aws:elasticloadbalancing:us-
east-1:123456789012:loadbalancer/gwy/GWLBService/123123123123abcc \
  --no-acceptance-required

```

Output:

```

{
  "ServiceConfiguration": {
    "ServiceType": [
      {
        "ServiceType": "GatewayLoadBalancer"
      }
    ]
  }
}

```

```

    ],
    "ServiceId": "vpce-svc-123123a1c43abc123",
    "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123",
    "ServiceState": "Available",
    "AvailabilityZones": [
      "us-east-1d"
    ],
    "AcceptanceRequired": false,
    "ManagesVpcEndpoints": false,
    "GatewayLoadBalancerArns": [
      "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/gwy/
      GWLBService/123123123123abcc"
    ]
  }
}

```

For more information, see [VPC endpoint services](#) in the *Amazon VPC User Guide*.

- For API details, see [CreateVpcEndpointServiceConfiguration](#) in *AWS CLI Command Reference*.

create-vpc-endpoint

The following code example shows how to use `create-vpc-endpoint`.

AWS CLI

Example 1: To create a gateway endpoint

The following `create-vpc-endpoint` example creates a gateway VPC endpoint between VPC `vpc-1a2b3c4d` and Amazon S3 in the `us-east-1` region, and associates route table `rtb-11aa22bb` with the endpoint.

```

aws ec2 create-vpc-endpoint \
  --vpc-id vpc-1a2b3c4d \
  --service-name com.amazonaws.us-east-1.s3 \
  --route-table-ids rtb-11aa22bb

```

Output:

```

{
  "VpcEndpoint": {
    "PolicyDocument": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Sid\":\"\",
    \"Effect\":\"Allow\",\"Principal\":\"*\",\"Action\":\"*\",\"Resource\":\"*\"}]}",

```

```

    "VpcId": "vpc-1a2b3c4d",
    "State": "available",
    "ServiceName": "com.amazonaws.us-east-1.s3",
    "RouteTableIds": [
      "rtb-11aa22bb"
    ],
    "VpcEndpointId": "vpc-1a2b3c4d",
    "CreationTimestamp": "2015-05-15T09:40:50Z"
  }
}

```

For more information, see [Creating a gateway endpoint](#) in the *AWSPrivateLink Guide*.

Example 2: To create an interface endpoint

The following `create-vpc-endpoint` example creates an interface VPC endpoint between VPC `vpc-1a2b3c4d` and Amazon S3 in the `us-east-1` region. The command creates the endpoint in subnet `subnet-1a2b3c4d`, associates it with security group `sg-1a2b3c4d`, and adds a tag with a key of "Service" and a Value of "S3".

```

aws ec2 create-vpc-endpoint \
  --vpc-id vpc-1a2b3c4d \
  --vpc-endpoint-type Interface \
  --service-name com.amazonaws.us-east-1.s3 \
  --subnet-ids subnet-7b16de0c \
  --security-group-id sg-1a2b3c4d \
  --tag-specifications ResourceType=vpc-endpoint,Tags=[{Key=service,Value=S3}]

```

Output:

```

{
  "VpcEndpoint": {
    "VpcEndpointId": "vpce-1a2b3c4d5e6f1a2b3",
    "VpcEndpointType": "Interface",
    "VpcId": "vpc-1a2b3c4d",
    "ServiceName": "com.amazonaws.us-east-1.s3",
    "State": "pending",
    "RouteTableIds": [],
    "SubnetIds": [
      "subnet-1a2b3c4d"
    ],
    "Groups": [

```

```

        {
            "GroupId": "sg-1a2b3c4d",
            "GroupName": "default"
        }
    ],
    "PrivateDnsEnabled": false,
    "RequesterManaged": false,
    "NetworkInterfaceIds": [
        "eni-0b16f0581c8ac6877"
    ],
    "DnsEntries": [
        {
            "DnsName": "*.vpce-1a2b3c4d5e6f1a2b3-9hnenorg.s3.us-
east-1.vpce.amazonaws.com",
            "HostedZoneId": "Z7HUB22UULQXV"
        },
        {
            "DnsName": "*.vpce-1a2b3c4d5e6f1a2b3-9hnenorg-us-east-1c.s3.us-
east-1.vpce.amazonaws.com",
            "HostedZoneId": "Z7HUB22UULQXV"
        }
    ],
    "CreationTimestamp": "2021-03-05T14:46:16.030000+00:00",
    "Tags": [
        {
            "Key": "service",
            "Value": "S3"
        }
    ],
    "OwnerId": "123456789012"
}
}

```

For more information, see [Creating an interface endpoint](#) in the *User Guide for AWSPrivateLink*.

Example 3: To create a Gateway Load Balancer endpoint

The following `create-vpc-endpoint` example creates a Gateway Load Balancer endpoint between VPC `vpc-111122223333aabbcc` and a service that is configured using a Gateway Load Balancer.

```

aws ec2 create-vpc-endpoint \
    --service-name com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123 \

```

```
--vpc-endpoint-type GatewayLoadBalancer \  
--vpc-id vpc-111122223333aabbcc \  
--subnet-ids subnet-0011aabbcc2233445
```

Output:

```
{  
  "VpcEndpoint": {  
    "VpcEndpointId": "vpce-aabbaabbaabbaabba",  
    "VpcEndpointType": "GatewayLoadBalancer",  
    "VpcId": "vpc-111122223333aabbcc",  
    "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123123a1c43abc123",  
    "State": "pending",  
    "SubnetIds": [  
      "subnet-0011aabbcc2233445"  
    ],  
    "RequesterManaged": false,  
    "NetworkInterfaceIds": [  
      "eni-01010120203030405"  
    ],  
    "CreationTimestamp": "2020-11-11T08:06:03.522Z",  
    "OwnerId": "123456789012"  
  }  
}
```

For more information, see [Gateway Load Balancer endpoints](#) in the *User Guide for AWS PrivateLink*.

- For API details, see [CreateVpcEndpoint](#) in *AWS CLI Command Reference*.

create-vpc-peering-connection

The following code example shows how to use `create-vpc-peering-connection`.

AWS CLI

To create a VPC peering connection between your VPCs

This example requests a peering connection between your VPCs `vpc-1a2b3c4d` and `vpc-11122233`.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id
vpc-11122233
```

Output:

```
{
  "VpcPeeringConnection": {
    "Status": {
      "Message": "Initiating Request to 444455556666",
      "Code": "initiating-request"
    },
    "Tags": [],
    "RequesterVpcInfo": {
      "OwnerId": "444455556666",
      "VpcId": "vpc-1a2b3c4d",
      "CidrBlock": "10.0.0.0/28"
    },
    "VpcPeeringConnectionId": "pcx-111aaa111",
    "ExpirationTime": "2014-04-02T16:13:36.000Z",
    "AccepterVpcInfo": {
      "OwnerId": "444455556666",
      "VpcId": "vpc-11122233"
    }
  }
}
```

To create a VPC peering connection with a VPC in another account

This example requests a peering connection between your VPC (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id
vpc-11122233 --peer-owner-id 123456789012
```

To create a VPC peering connection with a VPC in a different region

This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) in your account in the us-west-2 region.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id
vpc-11122233 --peer-region us-west-2
```

This example requests a peering connection between your VPC in the current region (vpc-1a2b3c4d), and a VPC (vpc-11122233) that belongs AWS account 123456789012 that's in the us-west-2 region.

Command:

```
aws ec2 create-vpc-peering-connection --vpc-id vpc-1a2b3c4d --peer-vpc-id
vpc-11122233 --peer-owner-id 123456789012 --peer-region us-west-2
```

- For API details, see [CreateVpcPeeringConnection](#) in *AWS CLI Command Reference*.

create-vpc

The following code example shows how to use create-vpc.

AWS CLI

Example 1: To create a VPC

The following create-vpc example creates a VPC with the specified IPv4 CIDR block and a Name tag.

```
aws ec2 create-vpc \
  --cidr-block 10.0.0.0/16 \
  --tag-specification ResourceType=vpc,Tags=[{Key=Name,Value=MyVpc}]
```

Output:

```
{
  "Vpc": {
    "CidrBlock": "10.0.0.0/16",
    "DhcpOptionsId": "dopt-5EXAMPLE",
    "State": "pending",
    "VpcId": "vpc-0a60eb65b4EXAMPLE",
    "OwnerId": "123456789012",
    "InstanceTenancy": "default",
    "Ipv6CidrBlockAssociationSet": [],
```

```

    "CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-07501b79ecEXAMPLE",
        "CidrBlock": "10.0.0.0/16",
        "CidrBlockState": {
          "State": "associated"
        }
      }
    ],
    "IsDefault": false,
    "Tags": [
      {
        "Key": "Name",
        "Value": "MyVpc"
      }
    ]
  }
}

```

Example 2: To create a VPC with dedicated tenancy

The following `create-vpc` example creates a VPC with the specified IPv4 CIDR block and dedicated tenancy.

```

aws ec2 create-vpc \
  --cidr-block 10.0.0.0/16 \
  --instance-tenancy dedicated

```

Output:

```

{
  "Vpc": {
    "CidrBlock": "10.0.0.0/16",
    "DhcpOptionsId": "dopt-19edf471",
    "State": "pending",
    "VpcId": "vpc-0a53287fa4EXAMPLE",
    "OwnerId": "111122223333",
    "InstanceTenancy": "dedicated",
    "Ipv6CidrBlockAssociationSet": [],
    "CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-00b24cc1c2EXAMPLE",
        "CidrBlock": "10.0.0.0/16",

```

```

        "CidrBlockState": {
            "State": "associated"
        }
    },
    "IsDefault": false
}

```

Example 3: To create a VPC with an IPv6 CIDR block

The following `create-vpc` example creates a VPC with an Amazon-provided IPv6 CIDR block.

```

aws ec2 create-vpc \
  --cidr-block 10.0.0.0/16 \
  --amazon-provided-ipv6-cidr-block

```

Output:

```

{
  "Vpc": {
    "CidrBlock": "10.0.0.0/16",
    "DhcpOptionsId": "dopt-dEXAMPLE",
    "State": "pending",
    "VpcId": "vpc-0fc5e3406bEXAMPLE",
    "OwnerId": "123456789012",
    "InstanceTenancy": "default",
    "Ipv6CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-068432c60bEXAMPLE",
        "Ipv6CidrBlock": "",
        "Ipv6CidrBlockState": {
          "State": "associating"
        }
      },
      {
        "Ipv6Pool": "Amazon",
        "NetworkBorderGroup": "us-west-2"
      }
    ],
    "CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-0669f8f9f5EXAMPLE",
        "CidrBlock": "10.0.0.0/16",
        "CidrBlockState": {

```

```

        "State": "associated"
      }
    }
  ],
  "IsDefault": false
}
}

```

Example 4: To create a VPC with a CIDR from an IPAM pool

The following `create-vpc` example creates a VPC with a CIDR from an Amazon VPC IP Address Manager (IPAM) pool.

Linux and macOS:

```

aws ec2 create-vpc \
  --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 \
  --tag-specifications ResourceType=vpc,Tags='[{"Key=Environment,Value="Preprod"}, {"Key=Owner,Value="Build Team"}]'

```

Windows:

```

aws ec2 create-vpc ^
  --ipv4-ipam-pool-id ipam-pool-0533048da7d823723 ^
  --tag-specifications ResourceType=vpc,Tags=[{"Key=Environment,Value="Preprod"}, {"Key=Owner,Value="Build Team"}]

```

Output:

```

{
  "Vpc": {
    "CidrBlock": "10.0.1.0/24",
    "DhcpOptionsId": "dopt-2afccf50",
    "State": "pending",
    "VpcId": "vpc-010e1791024eb0af9",
    "OwnerId": "123456789012",
    "InstanceTenancy": "default",
    "Ipv6CidrBlockAssociationSet": [],
    "CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-0a77de1d803226d4b",

```

```
        "CidrBlock": "10.0.1.0/24",
        "CidrBlockState": {
            "State": "associated"
        }
    },
    "IsDefault": false,
    "Tags": [
        {
            "Key": "Environment",
            "Value": "Preprod"
        },
        {
            "Key": "Owner",
            "Value": "Build Team"
        }
    ]
}
```

For more information, see [Create a VPC that uses an IPAM pool CIDR](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [CreateVpc](#) in *AWS CLI Command Reference*.

create-vpn-connection-route

The following code example shows how to use `create-vpn-connection-route`.

AWS CLI

To create a static route for a VPN connection

This example creates a static route for the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 create-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-
cidr-block 11.12.0.0/16
```

- For API details, see [CreateVpnConnectionRoute](#) in *AWS CLI Command Reference*.

create-vpn-connection

The following code example shows how to use `create-vpn-connection`.

AWS CLI

Example 1: To create a VPN connection with dynamic routing

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway, and applies tags to the VPN connection. The output includes the configuration information for your customer gateway device, in XML format.

```
aws ec2 create-vpn-connection \  
  --type ipsec.1 \  
  --customer-gateway-id cgw-001122334455aabbc \  
  --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \  
  --tag-specification 'ResourceType=vpn-connection,Tags=[{Key=Name,Value=BGP-  
VPN}]'
```

Output:

```
{  
  "VpnConnection": {  
    "CustomerGatewayConfiguration": "...configuration information...",  
    "CustomerGatewayId": "cgw-001122334455aabbc",  
    "Category": "VPN",  
    "State": "pending",  
    "VpnConnectionId": "vpn-123123123123abcab",  
    "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",  
    "Options": {  
      "EnableAcceleration": false,  
      "StaticRoutesOnly": false,  
      "LocalIpv4NetworkCidr": "0.0.0.0/0",  
      "RemoteIpv4NetworkCidr": "0.0.0.0/0",  
      "TunnelInsideIpVersion": "ipv4",  
      "TunnelOptions": [  
        {},  
        {}  
      ]  
    },  
    "Routes": [],  
    "Tags": [  

```

```

    {
      "Key": "Name",
      "Value": "BGP-VPN"
    }
  ]
}

```

For more information, see [How AWS Site-to-Site VPN works](#) in the *AWS Site-to-Site VPN User Guide*.

Example 2: To create a VPN connection with static routing

The following `create-vpn-connection` example creates a VPN connection between the specified virtual private gateway and the specified customer gateway. The options specify static routing. The output includes the configuration information for your customer gateway device, in XML format.

```

aws ec2 create-vpn-connection \
  --type ipsec.1 \
  --customer-gateway-id cgw-001122334455aabbc \
  --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
  --options "{\"StaticRoutesOnly\":true}"

```

Output:

```

{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "..configuration information...",
    "CustomerGatewayId": "cgw-001122334455aabbc",
    "Category": "VPN",
    "State": "pending",
    "VpnConnectionId": "vpn-123123123123abcab",
    "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
    "Options": {
      "EnableAcceleration": false,
      "StaticRoutesOnly": true,
      "LocalIpv4NetworkCidr": "0.0.0.0/0",
      "RemoteIpv4NetworkCidr": "0.0.0.0/0",
      "TunnelInsideIpVersion": "ipv4",
      "TunnelOptions": [
        {}
      ]
    }
  }
}

```

```

        {}
      ]
    },
    "Routes": [],
    "Tags": []
  }
}

```

For more information, see [How AWS Site-to-Site VPN works](#) in the *AWS Site-to-Site VPN User Guide*.

Example 3: To create a VPN connection and specify your own inside CIDR and pre-shared key

The following `create-vpn-connection` example creates a VPN connection and specifies the inside IP address CIDR block and a custom pre-shared key for each tunnel. The specified values are returned in the `CustomerGatewayConfiguration` information.

```

aws ec2 create-vpn-connection \
  --type ipsec.1 \
  --customer-gateway-id cgw-001122334455aabbcc \
  --vpn-gateway-id vgw-1a1a1a1a1a1a2b2b2 \
  --options
  TunnelOptions='[{"TunnelInsideCidr": "169.254.12.0/30", "PreSharedKey": "ExamplePreSharedKey1"},
  {"TunnelInsideCidr": "169.254.13.0/30", "PreSharedKey": "ExamplePreSharedKey2"}]'

```

Output:

```

{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "..configuration information...",
    "CustomerGatewayId": "cgw-001122334455aabbcc",
    "Category": "VPN",
    "State": "pending",
    "VpnConnectionId": "vpn-123123123123abcab",
    "VpnGatewayId": "vgw-1a1a1a1a1a1a2b2b2",
    "Options": {
      "EnableAcceleration": false,
      "StaticRoutesOnly": false,
      "LocalIpv4NetworkCidr": "0.0.0.0/0",
      "RemoteIpv4NetworkCidr": "0.0.0.0/0",
      "TunnelInsideIpVersion": "ipv4",
      "TunnelOptions": [

```

```

        {
            "OutsideIpAddress": "203.0.113.3",
            "TunnelInsideCidr": "169.254.12.0/30",
            "PreSharedKey": "ExamplePreSharedKey1"
        },
        {
            "OutsideIpAddress": "203.0.113.5",
            "TunnelInsideCidr": "169.254.13.0/30",
            "PreSharedKey": "ExamplePreSharedKey2"
        }
    ]
},
"Routes": [],
"Tags": []
}
}

```

For more information, see [How AWS Site-to-Site VPN works](#) in the *AWS Site-to-Site VPN User Guide*.

Example 4: To create a VPN connection that supports IPv6 traffic

The following `create-vpn-connection` example creates a VPN connection that supports IPv6 traffic between the specified transit gateway and specified customer gateway. The tunnel options for both tunnels specify that AWS must initiate the IKE negotiation.

```

aws ec2 create-vpn-connection \
  --type ipsec.1 \
  --transit-gateway-id tgw-12312312312312312 \
  --customer-gateway-id cgw-001122334455aabbcc \
  --options TunnelInsideIpVersion=ipv6,TunnelOptions=[{StartupAction=start},
  {StartupAction=start}]

```

Output:

```

{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "..configuration information...",
    "CustomerGatewayId": "cgw-001122334455aabbcc",
    "Category": "VPN",
    "State": "pending",
    "VpnConnectionId": "vpn-111111111122222222",

```

```
"TransitGatewayId": "tgw-12312312312312312",
"Options": {
  "EnableAcceleration": false,
  "StaticRoutesOnly": false,
  "LocalIpv6NetworkCidr": "::/0",
  "RemoteIpv6NetworkCidr": "::/0",
  "TunnelInsideIpVersion": "ipv6",
  "TunnelOptions": [
    {
      "OutsideIpAddress": "203.0.113.3",
      "StartupAction": "start"
    },
    {
      "OutsideIpAddress": "203.0.113.5",
      "StartupAction": "start"
    }
  ]
},
"Routes": [],
"Tags": []
}
}
```

For more information, see [How AWS Site-to-Site VPN works](#) in the *AWS Site-to-Site VPN User Guide*.

- For API details, see [CreateVpnConnection](#) in *AWS CLI Command Reference*.

create-vpn-gateway

The following code example shows how to use `create-vpn-gateway`.

AWS CLI

To create a virtual private gateway

This example creates a virtual private gateway.

Command:

```
aws ec2 create-vpn-gateway --type ipsec.1
```

Output:

```
{
  "VpnGateway": {
    "AmazonSideAsn": 64512,
    "State": "available",
    "Type": "ipsec.1",
    "VpnGatewayId": "vgw-9a4cacf3",
    "VpcAttachments": []
  }
}
```

To create a virtual private gateway with a specific Amazon-side ASN

This example creates a virtual private gateway and specifies the Autonomous System Number (ASN) for the Amazon side of the BGP session.

Command:

```
aws ec2 create-vpn-gateway --type ipsec.1 --amazon-side-asn 65001
```

Output:

```
{
  "VpnGateway": {
    "AmazonSideAsn": 65001,
    "State": "available",
    "Type": "ipsec.1",
    "VpnGatewayId": "vgw-9a4cacf3",
    "VpcAttachments": []
  }
}
```

- For API details, see [CreateVpnGateway](#) in *AWS CLI Command Reference*.

delete-carrier-gateway

The following code example shows how to use `delete-carrier-gateway`.

AWS CLI

To delete your carrier gateway

The following `delete-carrier-gateway` example deletes the specified carrier gateway.

```
aws ec2 delete-carrier-gateway \  
  --carrier-gateway-id cagw-0465cdEXAMPLE1111
```

Output:

```
{  
  "CarrierGateway": {  
    "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",  
    "VpcId": "vpc-0c529aEXAMPLE1111",  
    "State": "deleting",  
    "OwnerId": "123456789012"  
  }  
}
```

For more information, see [Carrier gateways](#) in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see [DeleteCarrierGateway](#) in *AWS CLI Command Reference*.

`delete-client-vpn-endpoint`

The following code example shows how to use `delete-client-vpn-endpoint`.

AWS CLI

To delete a Client VPN endpoint

The following `delete-client-vpn-endpoint` example deletes the specified Client VPN endpoint.

```
aws ec2 delete-client-vpn-endpoint \  
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{  
  "Status": {  
    "Code": "deleting"  
  }  
}
```

For more information, see [Client VPN Endpoints](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DeleteClientVpnEndpoint](#) in *AWS CLI Command Reference*.

delete-client-vpn-route

The following code example shows how to use `delete-client-vpn-route`.

AWS CLI

To delete a route for a Client VPN endpoint

The following `delete-client-vpn-route` example deletes the `0.0.0.0/0` route for the specified subnet of a Client VPN endpoint.

```
aws ec2 delete-client-vpn-route \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --destination-cidr-block 0.0.0.0/0 \
  --target-vpc-subnet-id subnet-0123456789abcabca
```

Output:

```
{
  "Status": {
    "Code": "deleting"
  }
}
```

For more information, see [Routes](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DeleteClientVpnRoute](#) in *AWS CLI Command Reference*.

delete-coip-cidr

The following code example shows how to use `delete-coip-cidr`.

AWS CLI

To delete a range of customer-owned IP (CoIP) addresses

The following `delete-coip-cidr` example deletes the specified range of CoIP addresses in the specified CoIP pool.

```
aws ec2 delete-coip-cidr \  
  --cidr 14.0.0.0/24 \  
  --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{  
  "CoipCidr": {  
    "Cidr": "14.0.0.0/24",  
    "CoipPoolId": "ipv4pool-coip-1234567890abcdefg",  
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890"  
  }  
}
```

For more information, see [Customer-owned IP addresses](#) in the *AWS Outposts User Guide*.

- For API details, see [DeleteCoipCidr](#) in *AWS CLI Command Reference*.

delete-coip-pool

The following code example shows how to use `delete-coip-pool`.

AWS CLI

To delete a pool of customer-owned IP (CoIP) addresses

The following `delete-coip-pool` example deletes a CoIP pool of CoIP addresses.

```
aws ec2 delete-coip-pool \  
  --coip-pool-id ipv4pool-coip-1234567890abcdefg
```

Output:

```
{  
  "CoipPool": {  
    "PoolId": "ipv4pool-coip-1234567890abcdefg",  
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",  
    "PoolArn": "arn:aws:ec2:us-west-2:123456789012:coip-pool/ipv4pool-coip-1234567890abcdefg"  
  }  
}
```

For more information, see [Customer-owned IP addresses](#) in the *AWS Outposts User Guide*.

- For API details, see [DeleteCoipPool](#) in *AWS CLI Command Reference*.

delete-customer-gateway

The following code example shows how to use `delete-customer-gateway`.

AWS CLI

To delete a customer gateway

This example deletes the specified customer gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-customer-gateway --customer-gateway-id cgw-0e11f167
```

- For API details, see [DeleteCustomerGateway](#) in *AWS CLI Command Reference*.

delete-dhcp-options

The following code example shows how to use `delete-dhcp-options`.

AWS CLI

To delete a DHCP options set

This example deletes the specified DHCP options set. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-dhcp-options --dhcp-options-id dopt-d9070ebb
```

- For API details, see [DeleteDhcpOptions](#) in *AWS CLI Command Reference*.

delete-egress-only-internet-gateway

The following code example shows how to use `delete-egress-only-internet-gateway`.

AWS CLI

To delete an egress-only Internet gateway

This example deletes the specified egress-only Internet gateway.

Command:

```
aws ec2 delete-egress-only-internet-gateway --egress-only-internet-gateway-id
eigw-01eadbd45ecd7943f
```

Output:

```
{
  "ReturnCode": true
}
```

- For API details, see [DeleteEgressOnlyInternetGateway](#) in *AWS CLI Command Reference*.

delete-fleets

The following code example shows how to use delete-fleets.

AWS CLI

Example 1: To delete an EC2 Fleet and terminate the associated instances

The following delete-fleets example deletes the specified EC2 Fleet and terminates the associated On-Demand Instances and Spot Instances.

```
aws ec2 delete-fleets \
  --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
  --terminate-instances
```

Output:

```
{
  "SuccessfulFleetDeletions": [
    {
      "CurrentFleetState": "deleted_terminating",
      "PreviousFleetState": "active",
      "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
    }
  ]
}
```

```

    }
  ],
  "UnsuccessfulFleetDeletions": []
}

```

For more information, see [Delete an EC2 Fleet](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To delete an EC2 Fleet without terminating the associated instances

The following `delete-fleets` example deletes the specified EC2 Fleet without terminating the associated On-Demand Instances and Spot Instances.

```

aws ec2 delete-fleets \
  --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
  --no-terminate-instances

```

Output:

```

{
  "SuccessfulFleetDeletions": [
    {
      "CurrentFleetState": "deleted_running",
      "PreviousFleetState": "active",
      "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
    }
  ],
  "UnsuccessfulFleetDeletions": []
}

```

For more information, see [Delete an EC2 Fleet](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DeleteFleets](#) in *AWS CLI Command Reference*.

delete-flow-logs

The following code example shows how to use `delete-flow-logs`.

AWS CLI

To delete a flow log

The following `delete-flow-logs` example deletes the specified flow log.

```
aws ec2 delete-flow-logs --flow-log-id fl-11223344556677889
```

Output:

```
{
  "Unsuccessful": []
}
```

- For API details, see [DeleteFlowLogs](#) in *AWS CLI Command Reference*.

delete-fpga-image

The following code example shows how to use `delete-fpga-image`.

AWS CLI

To delete an Amazon FPGA image

This example deletes the specified AFI.

Command:

```
aws ec2 delete-fpga-image --fpga-image-id afi-06b12350a123fbabc
```

Output:

```
{
  "Return": true
}
```

- For API details, see [DeleteFpgaImage](#) in *AWS CLI Command Reference*.

delete-instance-connect-endpoint

The following code example shows how to use `delete-instance-connect-endpoint`.

AWS CLI

To delete an EC2 Instance Connect Endpoint

The following `delete-instance-connect-endpoint` example deletes the specified EC2 Instance Connect Endpoint.

```
aws ec2 delete-instance-connect-endpoint \  
  --instance-connect-endpoint-id eice-03f5e49b83924bbc7
```

Output:

```
{  
  "InstanceConnectEndpoint": {  
    "OwnerId": "111111111111",  
    "InstanceConnectEndpointId": "eice-0123456789example",  
    "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-  
connect-endpoint/eice-0123456789example",  
    "State": "delete-in-progress",  
    "StateMessage": "",  
    "NetworkInterfaceIds": [],  
    "VpcId": "vpc-0123abcd",  
    "AvailabilityZone": "us-east-1d",  
    "CreatedAt": "2023-02-07T12:05:37+00:00",  
    "SubnetId": "subnet-0123abcd"  
  }  
}
```

For more information, see [Remove EC2 Instance Connect Endpoint](#) in the *Amazon EC2 User Guide*.

- For API details, see [DeleteInstanceConnectEndpoint](#) in *AWS CLI Command Reference*.

delete-instance-event-window

The following code example shows how to use `delete-instance-event-window`.

AWS CLI

Example 1: To delete an event window

The following `delete-instance-event-window` example deletes an event window.

```
aws ec2 delete-instance-event-window \  
  --region us-east-1 \  
  --event-window-id ew-0123456789example
```

```
--instance-event-window-id iew-0abcdef1234567890
```

Output:

```
{
  "InstanceEventWindowState": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "State": "deleting"
  }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 2: To force delete an event window

The following `delete-instance-event-window` example force deletes an event window if the event window is currently associated with targets.

```
aws ec2 delete-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --force-delete
```

Output:

```
{
  "InstanceEventWindowState": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "State": "deleting"
  }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see [DeleteInstanceEventWindow](#) in *AWS CLI Command Reference*.

delete-internet-gateway

The following code example shows how to use `delete-internet-gateway`.

AWS CLI

To delete an internet gateway

The following `delete-internet-gateway` example deletes the specified internet gateway.

```
aws ec2 delete-internet-gateway \  
  --internet-gateway-id igw-0d0fb496b3EXAMPLE
```

This command produces no output.

For more information, see [Internet gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [DeleteInternetGateway](#) in *AWS CLI Command Reference*.

`delete-ipam-pool`

The following code example shows how to use `delete-ipam-pool`.

AWS CLI

To delete an IPAM pool

In this example, you're a IPAM delegated admin who wants to delete an IPAM pool that you no longer need, but the pool has a CIDR provisioned to it. You cannot delete a pool if it has CIDRs provisioned to it unless you use the `--cascade` option, so you'll use `--cascade`.

To complete this request:

You'll need the IPAM pool ID which you can get with [describe-ipam-pools](#). The `--region` must be the IPAM home Region.

The following `delete-ipam-pool` example deletes an IPAM pool in your AWS account.

```
aws ec2 delete-ipam-pool \  
  --ipam-pool-id ipam-pool-050c886a3ca41cd5b \  
  --cascade \  
  --region us-east-1
```

Output:

```
{
```

```
"IpamPool": {
  "OwnerId": "320805250157",
  "IpamPoolId": "ipam-pool-050c886a3ca41cd5b",
  "IpamPoolArn": "arn:aws:ec2::320805250157:ipam-pool/ipam-
pool-050c886a3ca41cd5b",
  "IpamScopeArn": "arn:aws:ec2::320805250157:ipam-scope/ipam-
scope-0a158dde35c51107b",
  "IpamScopeType": "private",
  "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",
  "IpamRegion": "us-east-1",
  "Locale": "None",
  "PoolDepth": 1,
  "State": "delete-in-progress",
  "Description": "example",
  "AutoImport": false,
  "AddressFamily": "ipv4",
  "AllocationMinNetmaskLength": 0,
  "AllocationMaxNetmaskLength": 32
}
```

For more information, see [Delete a pool](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DeleteIpamPool](#) in *AWS CLI Command Reference*.

delete-ipam-resource-discovery

The following code example shows how to use `delete-ipam-resource-discovery`.

AWS CLI

To delete a resource discovery

In this example, you're a IPAM delegated admin who wants to delete a non-default resource discovery that you created to share with another IPAM admin during the process of integrating IPAM with accounts outside of your organization.

To complete this request:

The `--region` must be the Region where you created the resource discovery. You cannot delete a default resource discovery if `"IsDefault": true`. A default resource discovery is one that is created automatically in the account that creates an IPAM. To delete a default resource discovery, you have to delete the IPAM.

The following `delete-ipam-resource-discovery` example deletes a resource discovery.

```
aws ec2 delete-ipam-resource-discovery \  
  --ipam-resource-discovery-id ipam-res-disco-0e39761475298ee0f \  
  --region us-east-1
```

Output:

```
{  
  "IpamResourceDiscovery": {  
    "OwnerId": "149977607591",  
    "IpamResourceDiscoveryId": "ipam-res-disco-0e39761475298ee0f",  
    "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-  
discovery/ipam-res-disco-0e39761475298ee0f",  
    "IpamResourceDiscoveryRegion": "us-east-1",  
    "OperatingRegions": [  
      {  
        "RegionName": "us-east-1"  
      }  
    ],  
    "IsDefault": false,  
    "State": "delete-in-progress"  
  }  
}
```

For more information about resource discoveries, see [Work with resource discoveries](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DeleteIpamResourceDiscovery](#) in *AWS CLI Command Reference*.

delete-ipam-scope

The following code example shows how to use `delete-ipam-scope`.

AWS CLI

To delete an IPAM scope

The following `delete-ipam-scope` example deletes an IPAM.

```
aws ec2 delete-ipam-scope \  
  --ipam-scope-id ipam-scope-01c1ebab2b63bd7e4
```

Output:

```
{
  "IpamScope": {
    "OwnerId": "123456789012",
    "IpamScopeId": "ipam-scope-01c1ebab2b63bd7e4",
    "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-01c1ebab2b63bd7e4",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "IpamScopeType": "private",
    "IsDefault": false,
    "Description": "Example description",
    "PoolCount": 0,
    "State": "delete-in-progress"
  }
}
```

For more information, see [Delete a scope](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DeleteIpamScope](#) in *AWS CLI Command Reference*.

delete-ipam

The following code example shows how to use `delete-ipam`.

AWS CLI**To delete an IPAM**

The following `delete-ipam` example deletes an IPAM.

```
aws ec2 delete-ipam \
  --ipam-id ipam-036486dfa6af58ee0
```

Output:

```
{
  "Ipam": {
    "OwnerId": "123456789012",
    "IpamId": "ipam-036486dfa6af58ee0",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-036486dfa6af58ee0",
```

```
"IpamRegion": "us-east-1",
"PublicDefaultScopeId": "ipam-scope-071b8042b0195c183",
"PrivateDefaultScopeId": "ipam-scope-0807405dece705a30",
"ScopeCount": 2,
"OperatingRegions": [
  {
    "RegionName": "us-east-1"
  },
  {
    "RegionName": "us-east-2"
  },
  {
    "RegionName": "us-west-1"
  }
],
"State": "delete-in-progress"
}
}
```

For more information, see [Delete an IPAM](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [Deletelpam](#) in *AWS CLI Command Reference*.

delete-key-pair

The following code example shows how to use `delete-key-pair`.

AWS CLI

To delete a key pair

The following `delete-key-pair` example deletes the specified key pair.

```
aws ec2 delete-key-pair \
  --key-name my-key-pair
```

Output:

```
{
  "Return": true,
  "KeyPairId": "key-03c8d3aceb53b507"
}
```

For more information, see [Create and delete key pairs](#) in the *AWS Command Line Interface User Guide*.

- For API details, see [DeleteKeyPair](#) in *AWS CLI Command Reference*.

delete-launch-template-versions

The following code example shows how to use `delete-launch-template-versions`.

AWS CLI

To delete a launch template version

This example deletes the specified launch template version.

Command:

```
aws ec2 delete-launch-template-versions --launch-template-id lt-0abcd290751193123 --versions 1
```

Output:

```
{
  "UnsuccessfullyDeletedLaunchTemplateVersions": [],
  "SuccessfullyDeletedLaunchTemplateVersions": [
    {
      "LaunchTemplateName": "TestVersion",
      "VersionNumber": 1,
      "LaunchTemplateId": "lt-0abcd290751193123"
    }
  ]
}
```

- For API details, see [DeleteLaunchTemplateVersions](#) in *AWS CLI Command Reference*.

delete-launch-template

The following code example shows how to use `delete-launch-template`.

AWS CLI

To delete a launch template

This example deletes the specified launch template.

Command:

```
aws ec2 delete-launch-template --launch-template-id lt-0abcd290751193123
```

Output:

```
{
  "LaunchTemplate": {
    "LatestVersionNumber": 2,
    "LaunchTemplateId": "lt-0abcd290751193123",
    "LaunchTemplateName": "TestTemplate",
    "DefaultVersionNumber": 2,
    "CreatedBy": "arn:aws:iam::123456789012:root",
    "CreateTime": "2017-11-23T16:46:25.000Z"
  }
}
```

- For API details, see [DeleteLaunchTemplate](#) in *AWS CLI Command Reference*.

delete-local-gateway-route-table-virtual-interface-group-association

The following code example shows how to use `delete-local-gateway-route-table-virtual-interface-group-association`.

AWS CLI

To disassociate a local gateway route table from a virtual interfaces (VIFs) group

The following `delete-local-gateway-route-table-virtual-interface-group-association` example deletes the association between the specified local gateway route table and VIF group.

```
aws ec2 delete-local-gateway-route-table-virtual-interface-group-association \
  --local-gateway-route-table-virtual-interface-group-association-id lgw-vif-grp-
  assoc-exampleid12345678
```

Output:

```
{
```

```

    "LocalGatewayRouteTableVirtualInterfaceGroupAssociation": {
      "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-
assoc-exampleid12345678",
      "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-exampleid0123abcd",
      "LocalGatewayId": "lgw-exampleid11223344",
      "LocalGatewayRouteTableId": "lgw-rtb-exampleidabcd1234",
      "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:111122223333:local-
gateway-route-table/lgw-rtb-exampleidabcd1234",
      "OwnerId": "111122223333",
      "State": "disassociating",
      "Tags": []
    }
  }
}

```

For more information, see [VIF group associations](#) in the *AWS Outposts User Guide*.

- For API details, see [DeleteLocalGatewayRouteTableVirtualInterfaceGroupAssociation](#) in *AWS CLI Command Reference*.

delete-local-gateway-route-table-vpc-association

The following code example shows how to use `delete-local-gateway-route-table-vpc-association`.

AWS CLI

To disassociate a local gateway route table from a VPC

The following `delete-local-gateway-route-table-vpc-association` example deletes the association between the specified local gateway route table and VPC.

```

aws ec2 delete-local-gateway-route-table-vpc-association \
  --local-gateway-route-table-vpc-association-id vpc-example0123456789

```

Output:

```

{
  "LocalGatewayRouteTableVpcAssociation": {
    "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-abcd1234wxyz56789",
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
    "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:555555555555:local-
gateway-route-table/lgw-rtb-abcdefg1234567890",
  }
}

```

```
    "LocalGatewayId": "lgw-exampleid01234567",
    "VpcId": "vpc-example0123456789",
    "OwnerId": "555555555555",
    "State": "disassociating"
  }
}
```

For more information, see [VPC associations](#) in the *AWS Outposts User Guide*.

- For API details, see [DeleteLocalGatewayRouteTableVpcAssociation](#) in *AWS CLI Command Reference*.

delete-local-gateway-route-table

The following code example shows how to use `delete-local-gateway-route-table`.

AWS CLI

To delete a local gateway route table

The following `delete-local-gateway-route-table` example creates a local gateway route table with the direct VPC routing mode.

```
aws ec2 delete-local-gateway-route-table \
  --local-gateway-route-table-id lgw-rtb-abcdefg1234567890
```

Output:

```
{
  "LocalGatewayRouteTable": {
    "LocalGatewayRouteTableId": "lgw-rtb-abcdefg1234567890",
    "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:111122223333:local-gateway-route-table/lgw-rtb-abcdefg1234567890",
    "LocalGatewayId": "lgw-1a2b3c4d5e6f7g8h9",
    "OutpostArn": "arn:aws:outposts:us-west-2:111122223333:outpost/op-021345abcdef67890",
    "OwnerId": "111122223333",
    "State": "deleting",
    "Tags": [],
    "Mode": "direct-vpc-routing"
  }
}
```

For more information, see [Local gateway route tables](#) in the *AWS Outposts User Guide*.

- For API details, see [DeleteLocalGatewayRouteTable](#) in *AWS CLI Command Reference*.

delete-local-gateway-route

The following code example shows how to use `delete-local-gateway-route`.

AWS CLI

To delete a route from a local gateway route table

The following `delete-local-gateway-route` example deletes the specified route from the specified local gateway route table.

```
aws ec2 delete-local-gateway-route \
  --destination-cidr-block 0.0.0.0/0 \
  --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE
```

Output:

```
{
  "Route": {
    "DestinationCidrBlock": "0.0.0.0/0",
    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
    "Type": "static",
    "State": "deleted",
    "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
  }
}
```

- For API details, see [DeleteLocalGatewayRoute](#) in *AWS CLI Command Reference*.

delete-managed-prefix-list

The following code example shows how to use `delete-managed-prefix-list`.

AWS CLI

To delete a prefix list

The following `delete-managed-prefix-list` example deletes the specified prefix list.

```
aws ec2 delete-managed-prefix-list \  
  --prefix-list-id pl-0123456abcabcabc1
```

Output:

```
{  
  "PrefixList": {  
    "PrefixListId": "pl-0123456abcabcabc1",  
    "AddressFamily": "IPv4",  
    "State": "delete-in-progress",  
    "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/  
pl-0123456abcabcabc1",  
    "PrefixListName": "test",  
    "MaxEntries": 10,  
    "Version": 1,  
    "OwnerId": "123456789012"  
  }  
}
```

For more information, see [Managed prefix lists](#) in the *Amazon VPC User Guide*.

- For API details, see [DeleteManagedPrefixList](#) in *AWS CLI Command Reference*.

delete-nat-gateway

The following code example shows how to use `delete-nat-gateway`.

AWS CLI

To delete a NAT gateway

This example deletes NAT gateway `nat-04ae55e711cec5680`.

Command:

```
aws ec2 delete-nat-gateway --nat-gateway-id nat-04ae55e711cec5680
```

Output:

```
{  
  "NatGatewayId": "nat-04ae55e711cec5680"  
}
```

- For API details, see [DeleteNatGateway](#) in *AWS CLI Command Reference*.

delete-network-acl-entry

The following code example shows how to use `delete-network-acl-entry`.

AWS CLI

To delete a network ACL entry

This example deletes ingress rule number 100 from the specified network ACL. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100
```

- For API details, see [DeleteNetworkAclEntry](#) in *AWS CLI Command Reference*.

delete-network-acl

The following code example shows how to use `delete-network-acl`.

AWS CLI

To delete a network ACL

This example deletes the specified network ACL. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-acl --network-acl-id acl-5fb85d36
```

- For API details, see [DeleteNetworkAcl](#) in *AWS CLI Command Reference*.

delete-network-insights-access-scope-analysis

The following code example shows how to use `delete-network-insights-access-scope-analysis`.

AWS CLI

To delete a Network Access Scope analysis

The following `delete-network-insights-access-scope-analysis` example deletes the specified Network Access Scope analysis.

```
aws ec2 delete-network-insights-access-scope-analysis \  
  --network-insights-access-scope-analysis-id nisa-01234567891abcdef
```

Output:

```
{  
  "NetworkInsightsAccessScopeAnalysisId": "nisa-01234567891abcdef"  
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the *Network Access Analyzer Guide*.

- For API details, see [DeleteNetworkInsightsAccessScopeAnalysis](#) in *AWS CLI Command Reference*.

delete-network-insights-access-scope

The following code example shows how to use `delete-network-insights-access-scope`.

AWS CLI

To delete a Network Access Scope

The following `delete-network-insights-access-scope` example deletes the specified Network Access Scope.

```
aws ec2 delete-network-insights-access-scope \  
  --network-insights-access-scope-id nis-123456789abc01234
```

Output:

```
{  
  "NetworkInsightsAccessScopeId": "nis-123456789abc01234"  
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the *Network Access Analyzer Guide*.

- For API details, see [DeleteNetworkInsightsAccessScope](#) in *AWS CLI Command Reference*.

delete-network-insights-analysis

The following code example shows how to use `delete-network-insights-analysis`.

AWS CLI

To delete a path analysis

The following `delete-network-insights-analysis` example deletes the specified analysis.

```
aws ec2 delete-network-insights-analysis \  
  --network-insights-analysis-id nia-02207aa13eb480c7a
```

Output:

```
{  
  "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a"  
}
```

For more information, see [Getting started using the AWS CLI](#) in the *Reachability Analyzer Guide*.

- For API details, see [DeleteNetworkInsightsAnalysis](#) in *AWS CLI Command Reference*.

delete-network-insights-path

The following code example shows how to use `delete-network-insights-path`.

AWS CLI

To delete a path

The following `delete-network-insights-path` example deletes the specified path. Before you can delete a path, you must delete all its analyses using the `delete-network-insights-analysis` command.

```
aws ec2 delete-network-insights-path \  
  --network-insights-path-id nia-02207aa13eb480c7a
```

```
--network-insights-path-id nip-0b26f224f1d131fa8
```

Output:

```
{
  "NetworkInsightsPathId": "nip-0b26f224f1d131fa8"
}
```

For more information, see [Getting started using the AWS CLI](#) in the *Reachability Analyzer Guide*.

- For API details, see [DeleteNetworkInsightsPath](#) in *AWS CLI Command Reference*.

delete-network-interface-permission

The following code example shows how to use `delete-network-interface-permission`.

AWS CLI

To delete a network interface permission

This example deletes the specified network interface permission.

Command:

```
aws ec2 delete-network-interface-permission --network-interface-permission-id eni-
perm-06fd19020ede149ea
```

Output:

```
{
  "Return": true
}
```

- For API details, see [DeleteNetworkInterfacePermission](#) in *AWS CLI Command Reference*.

delete-network-interface

The following code example shows how to use `delete-network-interface`.

AWS CLI

To delete a network interface

This example deletes the specified network interface. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-network-interface --network-interface-id eni-e5aa89a3
```

- For API details, see [DeleteNetworkInterface](#) in *AWS CLI Command Reference*.

delete-placement-group

The following code example shows how to use `delete-placement-group`.

AWS CLI

To delete a placement group

This example command deletes the specified placement group.

Command:

```
aws ec2 delete-placement-group --group-name my-cluster
```

- For API details, see [DeletePlacementGroup](#) in *AWS CLI Command Reference*.

delete-queued-reserved-instances

The following code example shows how to use `delete-queued-reserved-instances`.

AWS CLI

To delete a queued purchase

The following `delete-queued-reserved-instances` example deletes the specified Reserved Instance, which was queued for purchase.

```
aws ec2 delete-queued-reserved-instances \  
  --reserved-instances-ids af9f760e-6f91-4559-85f7-4980eexample
```

Output:

```
{
```

```
"SuccessfulQueuedPurchaseDeletions": [  
  {  
    "ReservedInstancesId": "af9f760e-6f91-4559-85f7-4980eexample"  
  }  
],  
"FailedQueuedPurchaseDeletions": []  
}
```

- For API details, see [DeleteQueuedReservedInstances](#) in *AWS CLI Command Reference*.

delete-route-table

The following code example shows how to use `delete-route-table`.

AWS CLI

To delete a route table

This example deletes the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-route-table --route-table-id rtb-22574640
```

- For API details, see [DeleteRouteTable](#) in *AWS CLI Command Reference*.

delete-route

The following code example shows how to use `delete-route`.

AWS CLI

To delete a route

This example deletes the specified route from the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-route --route-table-id rtb-22574640 --destination-cidr-block  
0.0.0.0/0
```

- For API details, see [DeleteRoute](#) in *AWS CLI Command Reference*.

delete-security-group

The following code example shows how to use delete-security-group.

AWS CLI

[EC2-Classic] To delete a security group

This example deletes the security group named MySecurityGroup. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-security-group --group-name MySecurityGroup
```

[EC2-VPC] To delete a security group

This example deletes the security group with the ID sg-903004f8. Note that you can't reference a security group for EC2-VPC by name. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-security-group --group-id sg-903004f8
```

For more information, see *Using Security Groups in the AWS Command Line Interface User Guide*.

- For API details, see [DeleteSecurityGroup](#) in *AWS CLI Command Reference*.

delete-snapshot

The following code example shows how to use delete-snapshot.

AWS CLI

To delete a snapshot

This example command deletes a snapshot with the snapshot ID of snap-1234567890abcdef0. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-snapshot --snapshot-id snap-1234567890abcdef0
```

- For API details, see [DeleteSnapshot](#) in *AWS CLI Command Reference*.

delete-spot-datafeed-subscription

The following code example shows how to use `delete-spot-datafeed-subscription`.

AWS CLI**To cancel a Spot Instance data feed subscription**

This example command deletes a Spot data feed subscription for the account. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-spot-datafeed-subscription
```

- For API details, see [DeleteSpotDatafeedSubscription](#) in *AWS CLI Command Reference*.

delete-subnet-cidr-reservation

The following code example shows how to use `delete-subnet-cidr-reservation`.

AWS CLI**To delete a subnet CIDR reservation**

The following `delete-subnet-cidr-reservation` example deletes the specified subnet CIDR reservation.

```
aws ec2 delete-subnet-cidr-reservation \  
  --subnet-cidr-reservation-id scr-044f977c4eEXAMPLE
```

Output:

```
{  
  "DeletedSubnetCidrReservation": {
```

```
    "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",
    "SubnetId": "subnet-03c51e2e6cEXAMPLE",
    "Cidr": "10.1.0.16/28",
    "ReservationType": "prefix",
    "OwnerId": "123456789012"
  }
}
```

For more information, see [Subnet CIDR reservations](#) in the *Amazon VPC User Guide*.

- For API details, see [DeleteSubnetCidrReservation](#) in *AWS CLI Command Reference*.

delete-subnet

The following code example shows how to use `delete-subnet`.

AWS CLI

To delete a subnet

This example deletes the specified subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-subnet --subnet-id subnet-9d4a7b6c
```

- For API details, see [DeleteSubnet](#) in *AWS CLI Command Reference*.

delete-tags

The following code example shows how to use `delete-tags`.

AWS CLI

Example 1: To delete a tag from a resource

The following `delete-tags` example deletes the tag `Stack=Test` from the specified image. When you specify both a value and a key name, the tag is deleted only if the tag's value matches the specified value.

```
aws ec2 delete-tags \  
  --resources ami-1234567890abcdef0 \  
  --tags Stack=Test
```

```
--tags Key=Stack,Value=Test
```

It's optional to specify the value for a tag. The following `delete-tags` example deletes the tag with the key name `purpose` from the specified instance, regardless of the tag value for the tag.

```
aws ec2 delete-tags \  
  --resources i-1234567890abcdef0 \  
  --tags Key=purpose
```

If you specify the empty string as the tag value, the tag is deleted only if the tag's value is the empty string. The following `delete-tags` example specifies the empty string as the tag value for the tag to delete.

```
aws ec2 delete-tags \  
  --resources i-1234567890abcdef0 \  
  --tags Key=Name,Value=
```

Example 2: To delete a tag from multiple resources

The following `delete-tags` example deletes the tag ```Purpose=Test``` from both an instance and an AMI. As shown in the previous example, you can omit the tag value from the command.

```
aws ec2 delete-tags \  
  --resources i-1234567890abcdef0 ami-1234567890abcdef0 \  
  --tags Key=Purpose
```

- For API details, see [DeleteTags](#) in *AWS CLI Command Reference*.

delete-traffic-mirror-filter-rule

The following code example shows how to use `delete-traffic-mirror-filter-rule`.

AWS CLI

To delete a traffic mirror filter rule

The following `delete-traffic-mirror-filter-rule` example deletes the specified traffic mirror filter rule.

```
aws ec2 delete-traffic-mirror-filter-rule \  
  --traffic-mirror-filter-rule-id <id>
```

```
--traffic-mirror-filter-rule-id tmfr-081f71283bEXAMPLE
```

Output:

```
{  
  "TrafficMirrorFilterRuleId": "tmfr-081f71283bEXAMPLE"  
}
```

For more information, see [Modify Your Traffic Mirror Filter Rules](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [DeleteTrafficMirrorFilterRule](#) in *AWS CLI Command Reference*.

delete-traffic-mirror-filter

The following code example shows how to use `delete-traffic-mirror-filter`.

AWS CLI**To delete a traffic mirror filter**

The following `delete-traffic-mirror-filter` example deletes the specified traffic mirror filter.

```
aws ec2 delete-traffic-mirror-filter \  
  --traffic-mirror-filter-id tmf-0be0b25fcdEXAMPLE
```

Output:

```
{  
  "TrafficMirrorFilterId": "tmf-0be0b25fcdEXAMPLE"  
}
```

For more information, see [Delete a Traffic Mirror Filter](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [DeleteTrafficMirrorFilter](#) in *AWS CLI Command Reference*.

delete-traffic-mirror-session

The following code example shows how to use `delete-traffic-mirror-session`.

AWS CLI

To delete a traffic mirror session

The following `delete-traffic-mirror-session` example deletes the specified traffic mirror-session.

```
aws ec2 delete-traffic-mirror-session \  
  --traffic-mirror-session-id tms-0af3141ce5EXAMPLE
```

Output:

```
{  
  "TrafficMirrorSessionId": "tms-0af3141ce5EXAMPLE"  
}
```

For more information, see [Delete a Traffic Mirror Session](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [DeleteTrafficMirrorSession](#) in *AWS CLI Command Reference*.

delete-traffic-mirror-target

The following code example shows how to use `delete-traffic-mirror-target`.

AWS CLI

To delete a traffic mirror target

The following `delete-traffic-mirror-target` example deletes the specified traffic mirror target.

```
aws ec2 delete-traffic-mirror-target \  
  --traffic-mirror-target-id tmt-060f48ce9EXAMPLE
```

Output:

```
{  
  "TrafficMirrorTargetId": "tmt-060f48ce9EXAMPLE"  
}
```

For more information, see [Delete a Traffic Mirror Target](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [DeleteTrafficMirrorTarget](#) in *AWS CLI Command Reference*.

delete-transit-gateway-connect-peer

The following code example shows how to use `delete-transit-gateway-connect-peer`.

AWS CLI

To delete a Transit Gateway Connect peer

The following `delete-transit-gateway-connect-peer` example deletes the specified Connect peer.

```
aws ec2 delete-transit-gateway-connect-peer \  
  --transit-gateway-connect-peer-id tgw-connect-peer-0666adbac4EXAMPLE
```

Output:

```
{  
  "TransitGatewayConnectPeer": {  
    "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",  
    "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",  
    "State": "deleting",  
    "CreationTime": "2021-10-13T03:35:17.000Z",  
    "ConnectPeerConfiguration": {  
      "TransitGatewayAddress": "10.0.0.234",  
      "PeerAddress": "172.31.1.11",  
      "InsideCidrBlocks": [  
        "169.254.6.0/29"  
      ],  
      "Protocol": "gre",  
      "BgpConfigurations": [  
        {  
          "TransitGatewayAsn": 64512,  
          "PeerAsn": 64512,  
          "TransitGatewayAddress": "169.254.6.2",  
          "PeerAddress": "169.254.6.1",  
          "BgpStatus": "down"  
        },  
        {  
          "TransitGatewayAsn": 64512,  
          "PeerAsn": 64512,
```

```

        "TransitGatewayAddress": "169.254.6.3",
        "PeerAddress": "169.254.6.1",
        "BgpStatus": "down"
      }
    ]
  }
}

```

For more information, see [Transit gateway Connect attachments and Transit Gateway Connect peers](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayConnectPeer](#) in *AWS CLI Command Reference*.

delete-transit-gateway-connect

The following code example shows how to use delete-transit-gateway-connect.

AWS CLI

To delete a transit gateway Connect attachment

The following delete-transit-gateway-connect example deletes the specified Connect attachment.

```

aws ec2 delete-transit-gateway-connect \
  --transit-gateway-attachment-id tgw-attach-037012e5dcEXAMPLE

```

Output:

```

{
  "TransitGatewayConnect": {
    "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",
    "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
    "State": "deleting",
    "CreationTime": "2021-03-09T19:59:17+00:00",
    "Options": {
      "Protocol": "gre"
    }
  }
}

```

For more information, see [Transit gateway Connect attachments and Transit Gateway Connect peers](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayConnect](#) in *AWS CLI Command Reference*.

delete-transit-gateway-multicast-domain

The following code example shows how to use `delete-transit-gateway-multicast-domain`.

AWS CLI

To delete a transit gateway multicast domain

The following `delete-transit-gateway-multicast-domain` example deletes the specified multicast domain.

```
aws ec2 delete-transit-gateway-multicast-domain \  
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{  
  "TransitGatewayMulticastDomain": {  
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-02bb79002bEXAMPLE",  
    "TransitGatewayId": "tgw-0d88d2d0d5EXAMPLE",  
    "State": "deleting",  
    "CreationTime": "2019-11-20T22:02:03.000Z"  
  }  
}
```

For more information, see [Managing multicast domains](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayMulticastDomain](#) in *AWS CLI Command Reference*.

delete-transit-gateway-peering-attachment

The following code example shows how to use `delete-transit-gateway-peering-attachment`.

AWS CLI

To delete a transit gateway peering attachment

The following `delete-transit-gateway-peering-attachment` example deletes the specified transit gateway peering attachment.

```
aws ec2 delete-transit-gateway-peering-attachment \  
  --transit-gateway-attachment-id tgw-attach-4455667788aabbccd
```

Output:

```
{  
  "TransitGatewayPeeringAttachment": {  
    "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",  
    "RequesterTgwInfo": {  
      "TransitGatewayId": "tgw-123abc05e04123abc",  
      "OwnerId": "123456789012",  
      "Region": "us-west-2"  
    },  
    "AcceptorTgwInfo": {  
      "TransitGatewayId": "tgw-11223344aabbcc112",  
      "OwnerId": "123456789012",  
      "Region": "us-east-2"  
    },  
    "State": "deleting",  
    "CreationTime": "2019-12-09T11:38:31.000Z"  
  }  
}
```

For more information, see [Transit Gateway Peering Attachments](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayPeeringAttachment](#) in *AWS CLI Command Reference*.

delete-transit-gateway-policy-table

The following code example shows how to use `delete-transit-gateway-policy-table`.

AWS CLI

To delete a transit gateway policy table

The following `delete-transit-gateway-policy-table` example deletes the specified transit gateway policy table.

```
aws ec2 delete-transit-gateway-policy-table \  
  --transit-gateway-policy-table-id tgw-policy-table-123456789012
```

```
--transit-gateway-policy-table-id tgw-ptb-0a16f134b78668a81
```

Output:

```
{
  "TransitGatewayPolicyTables": [
    {
      "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
      "TransitGatewayId": "tgw-067f8505c18f0bd6e",
      "State": "deleting",
      "CreationTime": "2023-11-28T16:36:43+00:00",
      "Tags": []
    }
  ]
}
```

For more information, see [Transit gateway policy tables](#) in the *Transit Gateway User Guide*.

- For API details, see [DeleteTransitGatewayPolicyTable](#) in *AWS CLI Command Reference*.

delete-transit-gateway-prefix-list-reference

The following code example shows how to use `delete-transit-gateway-prefix-list-reference`.

AWS CLI

To delete a prefix list reference

The following `delete-transit-gateway-prefix-list-reference` example deletes the specified prefix list reference.

```
aws ec2 delete-transit-gateway-prefix-list-reference \
  --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
  --prefix-list-id pl-11111122222222333
```

Output:

```
{
  "TransitGatewayPrefixListReference": {
    "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
```

```

    "PrefixListId": "pl-11111122222222333",
    "PrefixListOwnerId": "123456789012",
    "State": "deleting",
    "Blackhole": false,
    "TransitGatewayAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",
      "ResourceType": "vpc",
      "ResourceId": "vpc-112233445566aabbcc"
    }
  }
}

```

For more information, see [Prefix list references](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayPrefixListReference](#) in *AWS CLI Command Reference*.

delete-transit-gateway-route-table

The following code example shows how to use `delete-transit-gateway-route-table`.

AWS CLI

To delete a transit gateway route table

The following `delete-transit-gateway-route-table` example deletes the specified transit gateway route table.

```

aws ec2 delete-transit-gateway-route-table \
  --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE

```

Output:

```

{
  "TransitGatewayRouteTable": {
    "TransitGatewayRouteTableId": "tgw-rtb-0b6f6aaa01EXAMPLE",
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",
    "State": "deleting",
    "DefaultAssociationRouteTable": false,
    "DefaultPropagationRouteTable": false,
    "CreationTime": "2019-07-17T20:27:26.000Z"
  }
}

```

For more information, see [Delete a transit gateway route table](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayRouteTable](#) in *AWS CLI Command Reference*.

delete-transit-gateway-route

The following code example shows how to use delete-transit-gateway-route.

AWS CLI

To delete a CIDR block from a route table

The following delete-transit-gateway-route example deletes the CIDR block from the specified transit gateway route table.

```
aws ec2 delete-transit-gateway-route \
  --transit-gateway-route-table-id tgw-rtb-0b6f6aaa01EXAMPLE \
  --destination-cidr-block 10.0.2.0/24
```

Output:

```
{
  "Route": {
    "DestinationCidrBlock": "10.0.2.0/24",
    "TransitGatewayAttachments": [
      {
        "ResourceId": "vpc-0065acced4EXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-0b5968d3b6EXAMPLE",
        "ResourceType": "vpc"
      }
    ],
    "Type": "static",
    "State": "deleted"
  }
}
```

For more information, see [Delete a static route](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayRoute](#) in *AWS CLI Command Reference*.

delete-transit-gateway-vpc-attachment

The following code example shows how to use delete-transit-gateway-vpc-attachment.

AWS CLI

To delete a transit gateway VPC attachment

The following `delete-transit-gateway-vpc-attachment` example deletes the specified VPC attachment.

```
aws ec2 delete-transit-gateway-vpc-attachment \  
  --transit-gateway-attachment-id tgw-attach-0d2c54bdbEXAMPLE
```

Output:

```
{  
  "TransitGatewayVpcAttachment": {  
    "TransitGatewayAttachmentId": "tgw-attach-0d2c54bdb3EXAMPLE",  
    "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",  
    "VpcId": "vpc-0065acced4f61c651",  
    "VpcOwnerId": "111122223333",  
    "State": "deleting",  
    "CreationTime": "2019-07-17T16:04:27.000Z"  
  }  
}
```

For more information, see [Delete a VPC attachment](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGatewayVpcAttachment](#) in *AWS CLI Command Reference*.

delete-transit-gateway

The following code example shows how to use `delete-transit-gateway`.

AWS CLI

To delete a transit gateway

The following `delete-transit-gateway` example deletes the specified transit gateway.

```
aws ec2 delete-transit-gateway \  
  --transit-gateway-id tgw-01f04542b2EXAMPLE
```

Output:

```
{
  "TransitGateway": {
    "TransitGatewayId": "tgw-01f04542b2EXAMPLE",
    "State": "deleting",
    "OwnerId": "123456789012",

}
```

For more information, see [Delete a transit gateway](#) in the *Transit Gateways Guide*.

- For API details, see [DeleteTransitGateway](#) in *AWS CLI Command Reference*.

delete-verified-access-endpoint

The following code example shows how to use `delete-verified-access-endpoint`.

AWS CLI

To delete a Verified Access endpoint

The following `delete-verified-access-endpoint` example deletes the specified Verified Access endpoint.

```
aws ec2 delete-verified-access-endpoint \
  --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```
{
```

```
"VerifiedAccessEndpoint": {
  "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
  "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
  "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",

}
}
```

For more information, see [Verified Access endpoints](#) in the *AWS Verified Access User Guide*.

- For API details, see [DeleteVerifiedAccessEndpoint](#) in *AWS CLI Command Reference*.

delete-verified-access-group

The following code example shows how to use `delete-verified-access-group`.

AWS CLI

To delete a Verified Access group

The following `delete-verified-access-group` example deletes the specified Verified Access group.

```
aws ec2 delete-verified-access-group \  
  --verified-access-group-id vagr-0dbe967baf14b7235
```

Output:

```
{  
  "VerifiedAccessGroup": {  
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",  
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",  
    "Description": "Testing Verified Access",

    "LastUpdatedTime": "2023-08-25T22:49:03",  
    "DeletionTime": "2023-08-26T00:58:31"  
  }  
}
```

For more information, see [Verified Access groups](#) in the *AWS Verified Access User Guide*.

- For API details, see [DeleteVerifiedAccessGroup](#) in *AWS CLI Command Reference*.

delete-verified-access-instance

The following code example shows how to use `delete-verified-access-instance`.

AWS CLI

To delete a Verified Access instance

The following `delete-verified-access-instance` example deletes the specified Verified Access instance.

```
aws ec2 delete-verified-access-instance \  
  --verified-access-instance-id vai-0ce000c0b7643abea
```

Output:

```
{  
  "VerifiedAccessInstance": {  
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
```

```
"Description": "Testing Verified Access",
"VerifiedAccessTrustProviders": [],
"CreationTime": "2023-08-25T18:27:56",
"LastUpdatedTime": "2023-08-26T01:00:18"
}
}
```

For more information, see [Verified Access instances](#) in the *AWS Verified Access User Guide*.

- For API details, see [DeleteVerifiedAccessInstance](#) in *AWS CLI Command Reference*.

delete-verified-access-trust-provider

The following code example shows how to use `delete-verified-access-trust-provider`.

AWS CLI

To delete a Verified Access trust provider

The following `delete-verified-access-trust-provider` example deletes the specified Verified Access trust provider.

```
aws ec2 delete-verified-access-trust-provider \
  --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{
  "VerifiedAccessTrustProvider": {
    "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
    "Description": "Testing Verified Access",
    "TrustProviderType": "user",
    "UserTrustProviderType": "iam-identity-center",
    "PolicyReferenceName": "idc",
    "CreationTime": "2023-08-25T18:40:36",
    "LastUpdatedTime": "2023-08-25T18:40:36"
  }
}
```

For more information, see [Trust providers for Verified Access](#) in the *AWS Verified Access User Guide*.

- For API details, see [DeleteVerifiedAccessTrustProvider](#) in *AWS CLI Command Reference*.

delete-volume

The following code example shows how to use `delete-volume`.

AWS CLI

To delete a volume

This example command deletes an available volume with the volume ID of `vol-049df61146c4d7901`. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-volume --volume-id vol-049df61146c4d7901
```

- For API details, see [DeleteVolume](#) in *AWS CLI Command Reference*.

delete-vpc-endpoint-connection-notifications

The following code example shows how to use `delete-vpc-endpoint-connection-notifications`.

AWS CLI

To delete an endpoint connection notification

This example deletes the specified endpoint connection notification.

Command:

```
aws ec2 delete-vpc-endpoint-connection-notifications --connection-notification-ids vpce-nfn-008776de7e03f5abc
```

Output:

```
{
  "Unsuccessful": []
}
```

- For API details, see [DeleteVpcEndpointConnectionNotifications](#) in *AWS CLI Command Reference*.

delete-vpc-endpoint-service-configurations

The following code example shows how to use `delete-vpc-endpoint-service-configurations`.

AWS CLI

To delete an endpoint service configuration

This example deletes the specified endpoint service configuration.

Command:

```
aws ec2 delete-vpc-endpoint-service-configurations --service-ids vpce-  
svc-03d5ebb7d9579a2b3
```

Output:

```
{  
  "Unsuccessful": []  
}
```

- For API details, see [DeleteVpcEndpointServiceConfigurations](#) in *AWS CLI Command Reference*.

delete-vpc-endpoints

The following code example shows how to use `delete-vpc-endpoints`.

AWS CLI

To delete an endpoint

This example deletes endpoints `vpce-aa22bb33` and `vpce-1a2b3c4d`. If the command is partially successful or unsuccessful, a list of unsuccessful items is returned. If the command succeeds, the returned list is empty.

Command:

```
aws ec2 delete-vpc-endpoints --vpc-endpoint-ids vpce-aa22bb33 vpce-1a2b3c4d
```

Output:

```
{
  "Unsuccessful": []
}
```

- For API details, see [DeleteVpcEndpoints](#) in *AWS CLI Command Reference*.

delete-vpc-peering-connection

The following code example shows how to use `delete-vpc-peering-connection`.

AWS CLI

To delete a VPC peering connection

This example deletes the specified VPC peering connection.

Command:

```
aws ec2 delete-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
  "Return": true
}
```

- For API details, see [DeleteVpcPeeringConnection](#) in *AWS CLI Command Reference*.

delete-vpc

The following code example shows how to use `delete-vpc`.

AWS CLI

To delete a VPC

This example deletes the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpc --vpc-id vpc-a01106c2
```

- For API details, see [DeleteVpc](#) in *AWS CLI Command Reference*.

delete-vpn-connection-route

The following code example shows how to use `delete-vpn-connection-route`.

AWS CLI

To delete a static route from a VPN connection

This example deletes the specified static route from the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-connection-route --vpn-connection-id vpn-40f41529 --destination-cidr-block 11.12.0.0/16
```

- For API details, see [DeleteVpnConnectionRoute](#) in *AWS CLI Command Reference*.

delete-vpn-connection

The following code example shows how to use `delete-vpn-connection`.

AWS CLI

To delete a VPN connection

This example deletes the specified VPN connection. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-connection --vpn-connection-id vpn-40f41529
```

- For API details, see [DeleteVpnConnection](#) in *AWS CLI Command Reference*.

delete-vpn-gateway

The following code example shows how to use `delete-vpn-gateway`.

AWS CLI

To delete a virtual private gateway

This example deletes the specified virtual private gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 delete-vpn-gateway --vpn-gateway-id vgw-9a4cacf3
```

- For API details, see [DeleteVpnGateway](#) in *AWS CLI Command Reference*.

deprovision-byoip-cidr

The following code example shows how to use `deprovision-byoip-cidr`.

AWS CLI

To remove an IP address range from use

The following example removes the specified address range from use with AWS.

```
aws ec2 deprovision-byoip-cidr \  
  --cidr 203.0.113.25/24
```

Output:

```
{  
  "ByoipCidr": {  
    "Cidr": "203.0.113.25/24",  
    "State": "pending-deprovision"  
  }  
}
```

- For API details, see [DeprovisionByoipCidr](#) in *AWS CLI Command Reference*.

deprovision-ipam-pool-cidr

The following code example shows how to use `deprovision-ipam-pool-cidr`.

AWS CLI

To deprovision an IPAM pool CIDR

The following `deprovision-ipam-pool-cidr` example deprovisions a CIDR provisioned to an IPAM pool.

(Linux):

```
aws ec2 deprovision-ipam-pool-cidr \  
  --ipam-pool-id ipam-pool-02ec043a19bbe5d08 \  
  --cidr 11.0.0.0/16
```

(Windows):

```
aws ec2 deprovision-ipam-pool-cidr ^  
  --ipam-pool-id ipam-pool-02ec043a19bbe5d08 ^  
  --cidr 11.0.0.0/16
```

Output:

```
{  
  "IpamPoolCidr": {  
    "Cidr": "11.0.0.0/16",  
    "State": "pending-deprovision"  
  }  
}
```

For more information, see [Deprovision pool CIDRs](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DeprovisionIpamPoolCidr](#) in *AWS CLI Command Reference*.

deregister-image

The following code example shows how to use `deregister-image`.

AWS CLI

To deregister an AMI

This example deregisters the specified AMI. If the command succeeds, no output is returned.

Command:

```
aws ec2 deregister-image --image-id ami-4fa54026
```

- For API details, see [DeregisterImage](#) in *AWS CLI Command Reference*.

deregister-instance-event-notification-attributes

The following code example shows how to use `deregister-instance-event-notification-attributes`.

AWS CLI**Example 1: To remove all tags from event notifications**

The following `deregister-instance-event-notification-attributes` example removes `IncludeAllTagsOfInstance=true`, which has the effect of setting `IncludeAllTagsOfInstance` to `false`.

```
aws ec2 deregister-instance-event-notification-attributes \  
  --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```
{  
  "InstanceTagAttribute": {  
    "InstanceTagKeys": [],  
    "IncludeAllTagsOfInstance": true  
  }  
}
```

For more information, see [Scheduled events for your instances](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To remove specific tags from event notifications

The following `deregister-instance-event-notification-attributes` example removes the specified tag from the tags included in event notifications. To describe the remaining tags included in event notifications, use `describe-instance-event-notification-attributes`.

```
aws ec2 deregister-instance-event-notification-attributes \  
  --instance-tag-attribute InstanceTagKeys="tag-key2"
```

Output:

```
{  
  "InstanceTagAttribute": {  
    "InstanceTagKeys": [  
      "tag-key2"  
    ],  
    "IncludeAllTagsOfInstance": false  
  }  
}
```

For more information, see [Scheduled events for your instances](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DeregisterInstanceEventNotificationAttributes](#) in *AWS CLI Command Reference*.

deregister-transit-gateway-multicast-group-members

The following code example shows how to use `deregister-transit-gateway-multicast-group-members`.

AWS CLI**To deregister group members from a multicast group**

This example deregisters the specified network interface group member from the transit gateway multicast group.

```
aws ec2 deregister-transit-gateway-multicast-group-members \  
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE \  
  --group-ip-address 224.0.1.0 \  
  --network-interface-ids eni-0e246d3269EXAMPLE
```

Output:

```
{
```

```

    "DeregisteredMulticastGroupMembers": {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",
      "RegisteredNetworkInterfaceIds": [
        "eni-0e246d3269EXAMPLE"
      ],
      "GroupIpAddress": "224.0.1.0"
    }
  }
}

```

For more information, see [Deregister Members from a Multicast Group](#) in the *AWS Transit Gateways Users Guide*.

- For API details, see [DeregisterTransitGatewayMulticastGroupMembers](#) in *AWS CLI Command Reference*.

deregister-transit-gateway-multicast-group-source

The following code example shows how to use `deregister-transit-gateway-multicast-group-source`.

AWS CLI

To deregister a source from the transit gateway multicast group

This example deregisters the specified network interface group source from the multicast group.

```

aws ec2 register-transit-gateway-multicast-group-sources \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
  --group-ip-address 224.0.1.0 \
  --network-interface-ids eni-07f290fc3c090cbae

```

Output:

```

{
  "DeregisteredMulticastGroupSources": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "DeregisteredNetworkInterfaceIds": [
      "eni-07f290fc3c090cbae"
    ],
    "GroupIpAddress": "224.0.1.0"
  }
}

```

```
}  
}
```

For more information, see [Deregister Sources from a Multicast Group](#) in the *AWS Transit Gateways User Guide*.

- For API details, see [DeregisterTransitGatewayMulticastGroupSource](#) in *AWS CLI Command Reference*.

describe-account-attributes

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe all the attributes for your AWS account

This example describes the attributes for your AWS account.

Command:

```
aws ec2 describe-account-attributes
```

Output:

```
{  
  "AccountAttributes": [  
    {  
      "AttributeName": "vpc-max-security-groups-per-interface",  
      "AttributeValues": [  
        {  
          "AttributeValue": "5"  
        }  
      ]  
    },  
    {  
      "AttributeName": "max-instances",  
      "AttributeValues": [  
        {  
          "AttributeValue": "20"  
        }  
      ]  
    }  
  ]  
}
```

```
    },
    {
      "AttributeName": "supported-platforms",
      "AttributeValues": [
        {
          "AttributeValue": "EC2"
        },
        {
          "AttributeValue": "VPC"
        }
      ]
    },
    {
      "AttributeName": "default-vpc",
      "AttributeValues": [
        {
          "AttributeValue": "none"
        }
      ]
    },
    {
      "AttributeName": "max-elastic-ips",
      "AttributeValues": [
        {
          "AttributeValue": "5"
        }
      ]
    },
    {
      "AttributeName": "vpc-max-elastic-ips",
      "AttributeValues": [
        {
          "AttributeValue": "5"
        }
      ]
    }
  ]
}
```

To describe a single attribute for your AWS account

This example describes the supported-platforms attribute for your AWS account.

Command:

```
aws ec2 describe-account-attributes --attribute-names supported-platforms
```

Output:

```
{
  "AccountAttributes": [
    {
      "AttributeName": "supported-platforms",
      "AttributeValues": [
        {
          "AttributeValue": "EC2"
        },
        {
          "AttributeValue": "VPC"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeAccountAttributes](#) in *AWS CLI Command Reference*.

describe-address-transfers

The following code example shows how to use `describe-address-transfers`.

AWS CLI

To describe an Elastic IP address transfer

The following `describe-address-transfers` example describes the Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 describe-address-transfers \
  --allocation-ids eipalloc-09ad461b0d03f6aaf
```

Output:

```
{
  "AddressTransfers": [
    {
```

```
        "PublicIp": "100.21.184.216",
        "AllocationId": "eipalloc-09ad461b0d03f6aaf",
        "TransferAccountId": "123456789012",
        "TransferOfferExpirationTimestamp": "2023-02-22T22:51:01.000Z",
        "AddressTransferStatus": "pending"
    }
]
}
```

For more information, see [Transfer Elastic IP addresses](#) in the *Amazon VPC User Guide*.

- For API details, see [DescribeAddressTransfers](#) in *AWS CLI Command Reference*.

describe-addresses-attribute

The following code example shows how to use `describe-addresses-attribute`.

AWS CLI

To view the attributes of the domain name associated with an elastic IP address

The following `describe-addresses-attribute` examples return the attributes of the domain name associated with the elastic IP address.

Linux:

```
aws ec2 describe-addresses-attribute \
  --allocation-ids eipalloc-abcdef01234567890 \
  --attribute domain-name
```

Windows:

```
aws ec2 describe-addresses-attribute ^
  --allocation-ids eipalloc-abcdef01234567890 ^
  --attribute domain-name
```

Output:

```
{
  "Addresses": [
    {
      "PublicIp": "192.0.2.0",
```

```
        "AllocationId": "eipalloc-abcdef01234567890",
        "PtrRecord": "example.com."
    }
]
}
```

To view the attributes of an elastic IP address, you must have first associated a domain name with the elastic IP address. For more information, see [Use reverse DNS for email applications](#) in the *Amazon EC2 User Guide* or [modify-address-attribute](#) in the *AWS CLI Command Reference*.

- For API details, see [DescribeAddressesAttribute](#) in *AWS CLI Command Reference*.

describe-addresses

The following code example shows how to use `describe-addresses`.

AWS CLI

Example 1: To retrieve details about all of your Elastic IP addresses

The following `describe addresses` example displays details about your Elastic IP addresses.

```
aws ec2 describe-addresses
```

Output:

```
{
  "Addresses": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "PublicIp": "198.51.100.0",
      "PublicIpv4Pool": "amazon",
      "Domain": "standard"
    },
    {
      "Domain": "vpc",
      "PublicIpv4Pool": "amazon",
      "InstanceId": "i-1234567890abcdef0",
      "NetworkInterfaceId": "eni-12345678",
      "AssociationId": "eipassoc-12345678",
      "NetworkInterfaceOwnerId": "123456789012",
      "PublicIp": "203.0.113.0",
    }
  ]
}
```

```
        "AllocationId": "eipalloc-12345678",
        "PrivateIpAddress": "10.0.1.241"
    }
]
}
```

Example 2: To retrieve details your Elastic IP addresses for EC2-VPC

The following `describe-addresses` example displays details about your Elastic IP addresses for use with instances in a VPC.

```
aws ec2 describe-addresses \
  --filters "Name=domain,Values=vpc"
```

Output:

```
{
  "Addresses": [
    {
      "Domain": "vpc",
      "PublicIpv4Pool": "amazon",
      "InstanceId": "i-1234567890abcdef0",
      "NetworkInterfaceId": "eni-12345678",
      "AssociationId": "eipassoc-12345678",
      "NetworkInterfaceOwnerId": "123456789012",
      "PublicIp": "203.0.113.0",
      "AllocationId": "eipalloc-12345678",
      "PrivateIpAddress": "10.0.1.241"
    }
  ]
}
```

Example 3: To retrieve details about an Elastic IP address specified by allocation ID

The following `describe-addresses` example displays details about the Elastic IP address with the specified allocation ID, which is associated with an instance in EC2-VPC.

```
aws ec2 describe-addresses \
  --allocation-ids eipalloc-282d9641
```

Output:

```
{
  "Addresses": [
    {
      "Domain": "vpc",
      "PublicIpv4Pool": "amazon",
      "InstanceId": "i-1234567890abcdef0",
      "NetworkInterfaceId": "eni-1a2b3c4d",
      "AssociationId": "eipassoc-123abc12",
      "NetworkInterfaceOwnerId": "1234567891012",
      "PublicIp": "203.0.113.25",
      "AllocationId": "eipalloc-282d9641",
      "PrivateIpAddress": "10.251.50.12"
    }
  ]
}
```

Example 4: To retrieve details about an Elastic IP address specified by its VPC private IP address

The following describe-addresses example displays details about the Elastic IP address associated with a particular private IP address in EC2-VPC.

```
aws ec2 describe-addresses \
  --filters "Name=private-ip-address,Values=10.251.50.12"
```

Example 5: To retrieve details about Elastic IP addresses in EC2-Classic

The following describe-addresses example displays details about your Elastic IP addresses for use in EC2-Classic.

```
aws ec2 describe-addresses \
  --filters "Name=domain,Values=standard"
```

Output:

```
{
  "Addresses": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "PublicIp": "203.0.110.25",
      "PublicIpv4Pool": "amazon",

```

```

        "Domain": "standard"
    }
]
}

```

Example 6: To retrieve details about an Elastic IP addresses specified by its public IP address

The following `describe-addresses` example displays details about the Elastic IP address with the value `203.0.110.25`, which is associated with an instance in EC2-Classic.

```

aws ec2 describe-addresses \
  --public-ips 203.0.110.25

```

Output:

```

{
  "Addresses": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "PublicIp": "203.0.110.25",
      "PublicIpv4Pool": "amazon",
      "Domain": "standard"
    }
  ]
}

```

- For API details, see [DescribeAddresses](#) in *AWS CLI Command Reference*.

`describe-aggregate-id-format`

The following code example shows how to use `describe-aggregate-id-format`.

AWS CLI

To describe the longer ID format settings for all resource types in a Region

The following `describe-aggregate-id-format` example describes the overall long ID format status for the current Region. The `Deadline` value indicates that the deadlines for these resources to permanently switch from the short ID format to the long ID format expired. The `UseLongIdsAggregated` value indicates that all IAM users and IAM roles are configured to use long ID format for all resource types.

```
aws ec2 describe-aggregate-id-format
```

Output:

```
{
  "UseLongIdsAggregated": true,
  "Statuses": [
    {
      "Deadline": "2018-08-13T02:00:00.000Z",
      "Resource": "network-interface-attachment",
      "UseLongIds": true
    },
    {
      "Deadline": "2016-12-13T02:00:00.000Z",
      "Resource": "instance",
      "UseLongIds": true
    },
    {
      "Deadline": "2018-08-13T02:00:00.000Z",
      "Resource": "elastic-ip-association",
      "UseLongIds": true
    },
    ...
  ]
}
```

- For API details, see [DescribeAggregateIdFormat](#) in *AWS CLI Command Reference*.

describe-availability-zones

The following code example shows how to use `describe-availability-zones`.

AWS CLI

To describe your Availability Zones

The following example `describe-availability-zones` displays details for the Availability Zones that are available to you. The response includes Availability Zones only for the current Region. In this example, it uses the profiles default `us-west-2` (Oregon) Region.

```
aws ec2 describe-availability-zones
```

Output:

```
{
  "AvailabilityZones": [
    {
      "State": "available",
      "OptInStatus": "opt-in-not-required",
      "Messages": [],
      "RegionName": "us-west-2",
      "ZoneName": "us-west-2a",
      "ZoneId": "usw2-az1",
      "GroupName": "us-west-2",
      "NetworkBorderGroup": "us-west-2"
    },
    {
      "State": "available",
      "OptInStatus": "opt-in-not-required",
      "Messages": [],
      "RegionName": "us-west-2",
      "ZoneName": "us-west-2b",
      "ZoneId": "usw2-az2",
      "GroupName": "us-west-2",
      "NetworkBorderGroup": "us-west-2"
    },
    {
      "State": "available",
      "OptInStatus": "opt-in-not-required",
      "Messages": [],
      "RegionName": "us-west-2",
      "ZoneName": "us-west-2c",
      "ZoneId": "usw2-az3",
      "GroupName": "us-west-2",
      "NetworkBorderGroup": "us-west-2"
    },
    {
      "State": "available",
      "OptInStatus": "opt-in-not-required",
      "Messages": [],
      "RegionName": "us-west-2",
      "ZoneName": "us-west-2d",
      "ZoneId": "usw2-az4",
      "GroupName": "us-west-2",
      "NetworkBorderGroup": "us-west-2"
    },
  ],
}
```

```
    {
      "State": "available",
      "OptInStatus": "opted-in",
      "Messages": [],
      "RegionName": "us-west-2",
      "ZoneName": "us-west-2-lax-1a",
      "ZoneId": "usw2-lax1-az1",
      "GroupName": "us-west-2-lax-1",
      "NetworkBorderGroup": "us-west-2-lax-1"
    }
  ]
}
```

- For API details, see [DescribeAvailabilityZones](#) in *AWS CLI Command Reference*.

describe-aws-network-performance-metric-subscription

The following code example shows how to use `describe-aws-network-performance-metric-subscription`.

AWS CLI

To describe your metric subscriptions

The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```
{
  "Subscriptions": [
    {
      "Source": "us-east-1",
      "Destination": "eu-west-1",
      "Metric": "aggregate-latency",
      "Statistic": "p50",
      "Period": "five-minutes"
    }
  ]
}
```

For more information, see [Manage subscriptions](#) in the *Infrastructure Performance User Guide*.

- For API details, see [DescribeAwsNetworkPerformanceMetricSubscription](#) in *AWS CLI Command Reference*.

describe-aws-network-performance-metric-subscriptions

The following code example shows how to use `describe-aws-network-performance-metric-subscriptions`.

AWS CLI

To describe your metric subscriptions

The following `describe-aws-network-performance-metric-subscriptions` example describes your metric subscriptions.

```
aws ec2 describe-aws-network-performance-metric-subscriptions
```

Output:

```
{
  "Subscriptions": [
    {
      "Source": "us-east-1",
      "Destination": "eu-west-1",
      "Metric": "aggregate-latency",
      "Statistic": "p50",
      "Period": "five-minutes"
    }
  ]
}
```

For more information, see [Manage subscriptions](#) in the *Infrastructure Performance User Guide*.

- For API details, see [DescribeAwsNetworkPerformanceMetricSubscriptions](#) in *AWS CLI Command Reference*.

describe-bundle-tasks

The following code example shows how to use `describe-bundle-tasks`.

AWS CLI

To describe your bundle tasks

This example describes all of your bundle tasks.

Command:

```
aws ec2 describe-bundle-tasks
```

Output:

```
{
  "BundleTasks": [
    {
      "UpdateTime": "2015-09-15T13:26:54.000Z",
      "InstanceId": "i-1234567890abcdef0",
      "Storage": {
        "S3": {
          "Prefix": "winami",
          "Bucket": "bundletasks"
        }
      },
      "State": "bundling",
      "StartTime": "2015-09-15T13:24:35.000Z",
      "Progress": "3%",
      "BundleId": "bun-2a4e041c"
    }
  ]
}
```

- For API details, see [DescribeBundleTasks](#) in *AWS CLI Command Reference*.

describe-byoip-cidrs

The following code example shows how to use `describe-byoip-cidrs`.

AWS CLI

To describe your provisioned address ranges

The following `describe-byoip-cidrs` example displays details about the public IPv4 address ranges that you provisioned for use by AWS.

```
aws ec2 describe-byoip-cidrs
```

Output:

```
{
  "ByoipCidrs": [
    {
      "Cidr": "203.0.113.25/24",
      "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",
      "State": "provisioned"
    }
  ]
}
```

- For API details, see [DescribeByoipCidrs](#) in *AWS CLI Command Reference*.

describe-capacity-reservation-fleets

The following code example shows how to use `describe-capacity-reservation-fleets`.

AWS CLI

To view a Capacity Reservation Fleet

The following `describe-capacity-reservation-fleets` example lists configuration and capacity information for the specified Capacity Reservation Fleet. It also lists details about the individual Capacity Reservations that are inside the Fleet.:

```
aws ec2 describe-capacity-reservation-fleets \
  --capacity-reservation-fleet-ids crf-abcdef01234567890
```

Output:

```
{
  "CapacityReservationFleets": [
    {
      "Status": "active",
      "EndDate": "2022-12-31T23:59:59.000Z",
      "InstanceMatchCriteria": "open",
      "Tags": [],
      "CapacityReservationFleetId": "crf-abcdef01234567890",

```

```
    "Tenancy": "default",
    "InstanceTypeSpecifications": [
      {
        "CapacityReservationId": "cr-1234567890abcdef0",
        "AvailabilityZone": "us-east-1a",
        "FulfilledCapacity": 5.0,
        "Weight": 1.0,
        "CreateDate": "2022-07-02T08:34:33.398Z",
        "InstancePlatform": "Linux/UNIX",
        "TotalInstanceCount": 5,
        "Priority": 1,
        "EbsOptimized": true,
        "InstanceType": "m5.xlarge"
      }
    ],
    "TotalTargetCapacity": 5,
    "TotalFulfilledCapacity": 5.0,
    "CreateTime": "2022-07-02T08:34:33.397Z",
    "AllocationStrategy": "prioritized"
  }
]
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeCapacityReservationFleets](#) in *AWS CLI Command Reference*.

describe-capacity-reservations

The following code example shows how to use `describe-capacity-reservations`.

AWS CLI

Example 1: To describe one or more of your capacity reservations

The following `describe-capacity-reservations` example displays details about all of your capacity reservations in the current AWS Region.

```
aws ec2 describe-capacity-reservations
```

Output:

```
{
  "CapacityReservations": [
    {
      "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
      "EndDateType": "unlimited",
      "AvailabilityZone": "eu-west-1a",
      "InstanceMatchCriteria": "open",
      "Tags": [],
      "EphemeralStorage": false,
      "CreateDate": "2019-08-16T09:03:18.000Z",
      "AvailableInstanceCount": 1,
      "InstancePlatform": "Linux/UNIX",
      "TotalInstanceCount": 1,
      "State": "active",
      "Tenancy": "default",
      "EbsOptimized": true,
      "InstanceType": "a1.medium"
    },
    {
      "CapacityReservationId": "cr-abcdEXAMPLE9876ef ",
      "EndDateType": "unlimited",
      "AvailabilityZone": "eu-west-1a",
      "InstanceMatchCriteria": "open",
      "Tags": [],
      "EphemeralStorage": false,
      "CreateDate": "2019-08-07T11:34:19.000Z",
      "AvailableInstanceCount": 3,
      "InstancePlatform": "Linux/UNIX",
      "TotalInstanceCount": 3,
      "State": "cancelled",
      "Tenancy": "default",
      "EbsOptimized": true,
      "InstanceType": "m5.large"
    }
  ]
}
```

Example 2: To describe one or more of your capacity reservations

The following describe-capacity-reservations example displays details about the specified capacity reservation.

```
aws ec2 describe-capacity-reservations \
```

```
--capacity-reservation-ids cr-1234abcd56EXAMPLE
```

Output:

```
{
  "CapacityReservations": [
    {
      "CapacityReservationId": "cr-1234abcd56EXAMPLE",
      "EndDateType": "unlimited",
      "AvailabilityZone": "eu-west-1a",
      "InstanceMatchCriteria": "open",
      "Tags": [],
      "EphemeralStorage": false,
      "CreateDate": "2019-08-16T09:03:18.000Z",
      "AvailableInstanceCount": 1,
      "InstancePlatform": "Linux/UNIX",
      "TotalInstanceCount": 1,
      "State": "active",
      "Tenancy": "default",
      "EbsOptimized": true,
      "InstanceType": "a1.medium"
    }
  ]
}
```

For more information, see [Viewing a Capacity Reservation](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeCapacityReservations](#) in *AWS CLI Command Reference*.

describe-carrier-gateways

The following code example shows how to use describe-carrier-gateways.

AWS CLI

To describe all carrier gateways

The following describe-carrier-gateways example lists all your carrier gateways.

```
aws ec2 describe-carrier-gateways
```

Output:

```
{
  "CarrierGateways": [
    {
      "CarrierGatewayId": "cagw-0465cdEXAMPLE1111",
      "VpcId": "vpc-0c529aEXAMPLE",
      "State": "available",
      "OwnerId": "123456789012",
      "Tags": [
        {
          "Key": "example",
          "Value": "tag"
        }
      ]
    }
  ]
}
```

For more information, see Carrier gateways<https://docs.aws.amazon.com/vpc/latest/userguide/Carrier_Gateway.html> in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see [DescribeCarrierGateways](#) in *AWS CLI Command Reference*.

describe-classic-link-instances

The following code example shows how to use describe-classic-link-instances.

AWS CLI

To describe linked EC2-Classic instances

This example lists all of your linked EC2-Classic instances.

Command:

```
aws ec2 describe-classic-link-instances
```

Output:

```
{
  "Instances": [
    {
      "InstanceId": "i-1234567890abcdef0",
```

```

        "VpcId": "vpc-88888888",
        "Groups": [
            {
                "GroupId": "sg-11122233"
            }
        ],
        "Tags": [
            {
                "Value": "ClassicInstance",
                "Key": "Name"
            }
        ]
    },
    {
        "InstanceId": "i-0598c7d356eba48d7",
        "VpcId": "vpc-12312312",
        "Groups": [
            {
                "GroupId": "sg-aabbccdd"
            }
        ],
        "Tags": [
            {
                "Value": "ClassicInstance2",
                "Key": "Name"
            }
        ]
    }
]
}

```

This example lists all of your linked EC2-Classic instances, and filters the response to include only instances that are linked to VPC vpc-88888888.

Command:

```
aws ec2 describe-classic-link-instances --filter "Name=vpc-id,Values=vpc-88888888"
```

Output:

```

{
    "Instances": [
        {

```

```

    "InstanceId": "i-1234567890abcdef0",
    "VpcId": "vpc-88888888",
    "Groups": [
      {
        "GroupId": "sg-11122233"
      }
    ],
    "Tags": [
      {
        "Value": "ClassicInstance",
        "Key": "Name"
      }
    ]
  }
]
}

```

- For API details, see [DescribeClassicLinkInstances](#) in *AWS CLI Command Reference*.

describe-client-vpn-authorization-rules

The following code example shows how to use `describe-client-vpn-authorization-rules`.

AWS CLI

To describe the authorization rules for a Client VPN endpoint

The following `describe-client-vpn-authorization-rules` example displays details about the authorization rules for the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-authorization-rules \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```

{
  "AuthorizationRules": [
    {
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "GroupId": "",
      "AccessAll": true,
      "DestinationCidr": "0.0.0.0/0",
    }
  ]
}

```

```
        "Status": {
            "Code": "active"
        }
    ]
}
```

For more information, see [Authorization Rules](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DescribeClientVpnAuthorizationRules](#) in *AWS CLI Command Reference*.

describe-client-vpn-connections

The following code example shows how to use `describe-client-vpn-connections`.

AWS CLI

To describe the connections to a Client VPN endpoint

The following `describe-client-vpn-connections` example displays details about the client connections to the specified Client VPN endpoint.

```
aws ec2 describe-client-vpn-connections \
    --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde
```

Output:

```
{
  "Connections": [
    {
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "Timestamp": "2019-08-12 07:58:34",
      "ConnectionId": "cvpn-connection-0e03eb24267165acd",
      "ConnectionEstablishedTime": "2019-08-12 07:57:14",

      "EgressBytes": "5696",
      "IngressPackets": "332",
      "EgressPackets": "67",
      "ClientIp": "172.31.0.225",
      "CommonName": "client1.domain.tld",
      "Status": {
        "Code": "terminated"
      }
    },
  ],
}
```

```

        "ConnectionEndTime": "2019-08-12 07:58:34"
    },
    {
        "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
        "Timestamp": "2019-08-12 08:02:54",
        "ConnectionId": "cvpn-connection-00668867a40f18253",
        "ConnectionEstablishedTime": "2019-08-12 08:02:53",
        "IngressBytes": "2951",
        "EgressBytes": "2611",
        "IngressPackets": "9",
        "EgressPackets": "6",
        "ClientIp": "172.31.0.226",
        "CommonName": "client1.domain.tld",
        "Status": {
            "Code": "active"
        },
        "ConnectionEndTime": "-"
    }
]
}

```

For more information, see [Client Connections](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DescribeClientVpnConnections](#) in *AWS CLI Command Reference*.

describe-client-vpn-endpoints

The following code example shows how to use `describe-client-vpn-endpoints`.

AWS CLI

To describe your Client VPN endpoints

The following `describe-client-vpn-endpoints` example displays details about all of your Client VPN endpoints.

```
aws ec2 describe-client-vpn-endpoints
```

Output:

```
{
  "ClientVpnEndpoints": [
    {
```

```
"ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",

        }
    }
]
}

```

For more information, see [Client VPN Endpoints](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DescribeClientVpnEndpoints](#) in *AWS CLI Command Reference*.

describe-client-vpn-routes

The following code example shows how to use `describe-client-vpn-routes`.

AWS CLI

To describe the routes for a Client VPN endpoint

The following `describe-client-vpn-routes` example displays details about the routes for the specified Client VPN endpoint.

```

aws ec2 describe-client-vpn-routes \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde

```

Output:

```

{
  "Routes": [
    {
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "DestinationCidr": "10.0.0.0/16",

      "Type": "Nat",
      "Origin": "associate",
      "Status": {
        "Code": "active"
      },
      "Description": "Default Route"
    },
  ],
}

```

```

    {
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "DestinationCidr": "0.0.0.0/0",
      "TargetSubnet": "subnet-0123456789abcabca",
      "Type": "Nat",
      "Origin": "add-route",
      "Status": {
        "Code": "active"
      }
    }
  ]
}

```

For more information, see [Routes](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DescribeClientVpnRoutes](#) in *AWS CLI Command Reference*.

describe-client-vpn-target-networks

The following code example shows how to use `describe-client-vpn-target-networks`.

AWS CLI

To describe the target networks for a Client VPN endpoint

The following `describe-client-vpn-target-networks` example displays details about the target networks for the specified Client VPN endpoint.

```

aws ec2 describe-client-vpn-target-networks \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde

```

Output:

```

{
  "ClientVpnTargetNetworks": [
    {
      "AssociationId": "cvpn-assoc-012e837060753dc3d",
      "VpcId": "vpc-11111222222333333",
      "TargetNetworkId": "subnet-0123456789abcabca",
      "ClientVpnEndpointId": "cvpn-endpoint-123456789123abcde",
      "Status": {
        "Code": "associating"
      }
    },
  ],
}

```

```

        "SecurityGroups": [
            "sg-012345678910abcab"
        ]
    }
]
}

```

For more information, see [Target Networks](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DescribeClientVpnTargetNetworks](#) in *AWS CLI Command Reference*.

describe-coip-pools

The following code example shows how to use `describe-coip-pools`.

AWS CLI

To describe customer-owned IP address pools

The following `describe-coip-pools` example describes the customer-owned IP address pools in your AWS account.

```
aws ec2 describe-coip-pools
```

Output:

```

{
  "CoipPools": [
    {
      "PoolId": "ipv4pool-coip-123a45678bEXAMPLE",
      "PoolCidrs": [
        "0.0.0.0/0"
      ],
      "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
      "PoolArn": "arn:aws:ec2:us-west-2:123456789012:coip-pool/ipv4pool-coip-123a45678bEXAMPLE"
    }
  ]
}

```

For more information, see [Customer-owned IP addresses](#) in the *AWS Outposts User Guide*.

- For API details, see [DescribeCoipPools](#) in *AWS CLI Command Reference*.

describe-conversion-tasks

The following code example shows how to use describe-conversion-tasks.

AWS CLI

To view the status of a conversion task

This example returns the status of a conversion task with the ID import-i-ffvko9js.

Command:

```
aws ec2 describe-conversion-tasks --conversion-task-ids import-i-ffvko9js
```

Output:

```
{
  "ConversionTasks": [
    {
      "ConversionTaskId": "import-i-ffvko9js",
      "ImportInstance": {
        "InstanceId": "i-1234567890abcdef0",
        "Volumes": [
          {
            "Volume": {
              "Id": "vol-049df61146c4d7901",
              "Size": 16
            },
            "Status": "completed",
            "Image": {
              "Size": 1300687360,
              "ImportManifestUrl": "https://s3.amazonaws.com/myimportbucket/411443cd-d620-4f1c-9d66-13144EXAMPLE/RHEL5.vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=140EXAMPLE&Signature=XYNhznHNgCqsjDxL9wRL%2FJvEXAMPLE",
              "Format": "VMDK"
            },
            "BytesConverted": 1300682960,
            "AvailabilityZone": "us-east-1d"
          }
        ]
      },
      "ExpirationTime": "2014-05-14T22:06:23Z",
      "State": "completed"
    }
  ]
}
```

```
    }  
  ]  
}
```

- For API details, see [DescribeConversionTasks](#) in *AWS CLI Command Reference*.

describe-customer-gateways

The following code example shows how to use `describe-customer-gateways`.

AWS CLI

To describe your customer gateways

This example describes your customer gateways.

Command:

```
aws ec2 describe-customer-gateways
```

Output:

```
{  
  "CustomerGateways": [  
    {  
      "CustomerGatewayId": "cgw-b4dc3961",  
      "IpAddress": "203.0.113.12",  
      "State": "available",  
      "Type": "ipsec.1",  
      "BgpAsn": "65000"  
    },  
    {  
      "CustomerGatewayId": "cgw-0e11f167",  
      "IpAddress": "12.1.2.3",  
      "State": "available",  
      "Type": "ipsec.1",  
      "BgpAsn": "65534"  
    }  
  ]  
}
```

To describe a specific customer gateway

This example describes the specified customer gateway.

Command:

```
aws ec2 describe-customer-gateways --customer-gateway-ids cgw-0e11f167
```

Output:

```
{
  "CustomerGateways": [
    {
      "CustomerGatewayId": "cgw-0e11f167",
      "IpAddress": "12.1.2.3",
      "State": "available",
      "Type": "ipsec.1",
      "BgpAsn": "65534"
    }
  ]
}
```

- For API details, see [DescribeCustomerGateways](#) in *AWS CLI Command Reference*.

describe-dhcp-options

The following code example shows how to use describe-dhcp-options.

AWS CLI

Example 1: To describe your DHCP options

The following describe-dhcp-options example retrieves details about your DHCP options.

```
aws ec2 describe-dhcp-options
```

Output:

```
{
  "DhcpOptions": [
    {
      "DhcpConfigurations": [
        {
          "Key": "domain-name",
```

```
        "Values": [
            {
                "Value": "us-east-2.compute.internal"
            }
        ]
    },
    {
        "Key": "domain-name-servers",
        "Values": [
            {
                "Value": "AmazonProvidedDNS"
            }
        ]
    }
],
"DhcpOptionsId": "dopt-19edf471",
"OwnerId": "111122223333"
},
{
    "DhcpConfigurations": [
        {
            "Key": "domain-name",
            "Values": [
                {
                    "Value": "us-east-2.compute.internal"
                }
            ]
        },
        {
            "Key": "domain-name-servers",
            "Values": [
                {
                    "Value": "AmazonProvidedDNS"
                }
            ]
        }
    ]
},
"DhcpOptionsId": "dopt-fEXAMPLE",
"OwnerId": "111122223333"
}
]
}
```

For more information, see [Working with DHCP Option Sets](#) in the *AWS VPC User Guide*.

Example 2: To describe your DHCP options and filter the output

The following `describe-dhcp-options` example describes your DHCP options and uses a filter to return only DHCP options that have `example.com` for the domain name server. The example uses the `--query` parameter to display only the configuration information and ID in the output.

```
aws ec2 describe-dhcp-options \
  --filters Name=key,Values=domain-name-servers Name=value,Values=example.com \
  --query "DhcpOptions[*].[DhcpConfigurations,DhcpOptionsId]"
```

Output:

```
[
  [
    [
      {
        "Key": "domain-name",
        "Values": [
          {
            "Value": "example.com"
          }
        ]
      },
      {
        "Key": "domain-name-servers",
        "Values": [
          {
            "Value": "172.16.16.16"
          }
        ]
      }
    ],
    "dopt-001122334455667ab"
  ]
]
```

For more information, see [Working with DHCP Option Sets](#) in the *AWS VPC User Guide*.

- For API details, see [DescribeDhcpOptions](#) in *AWS CLI Command Reference*.

describe-egress-only-internet-gateways

The following code example shows how to use `describe-egress-only-internet-gateways`.

AWS CLI

To describe your egress-only Internet gateways

This example describes your egress-only Internet gateways.

Command:

```
aws ec2 describe-egress-only-internet-gateways
```

Output:

```
{
  "EgressOnlyInternetGateways": [
    {
      "EgressOnlyInternetGatewayId": "eigw-015e0e244e24dfe8a",
      "Attachments": [
        {
          "State": "attached",
          "VpcId": "vpc-0c62a468"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeEgressOnlyInternetGateways](#) in *AWS CLI Command Reference*.

describe-elastic-gpus

The following code example shows how to use `describe-elastic-gpus`.

AWS CLI

To describe an Elastic GPU

Command:

```
aws ec2 describe-elastic-gpus --elastic-gpu-ids
egpu-12345678901234567890abcdefghijkl
```

- For API details, see [DescribeElasticGpus](#) in *AWS CLI Command Reference*.

describe-export-image-tasks

The following code example shows how to use `describe-export-image-tasks`.

AWS CLI

To monitor an export image task

The following `describe-export-image-tasks` example checks the status of the specified export image task. The resulting image file in Amazon S3 is `my-export-bucket/exports/export-ami-1234567890abcdef0.vmdk`.

```
aws ec2 describe-export-image-tasks \
--export-image-task-ids export-ami-1234567890abcdef0
```

Output for an export image task that is in progress.

```
{
  "ExportImageTasks": [
    {
      "ExportImageTaskId": "export-ami-1234567890abcdef0"
      "Progress": "21",
      "S3ExportLocation": {
        "S3Bucket": "my-export-bucket",
        "S3Prefix": "exports/"
      },
      "Status": "active",
      "StatusMessage": "updating"
    }
  ]
}
```

Output for an export image task that is completed.

```
{
  "ExportImageTasks": [
```

```
{
  "ExportImageTaskId": "export-ami-1234567890abcdef0"
  "S3ExportLocation": {
    "S3Bucket": "my-export-bucket",
    "S3Prefix": "exports/"
  },
  "Status": "completed"
}
]
```

For more information, see [Export a VM from an AMI](#) in the *VM Import/Export User Guide*.

- For API details, see [DescribeExportImageTasks](#) in *AWS CLI Command Reference*.

describe-export-tasks

The following code example shows how to use describe-export-tasks.

AWS CLI

To list details about an instance export task

This example describes the export task with ID export-i-fh8sjjsq.

Command:

```
aws ec2 describe-export-tasks --export-task-ids export-i-fh8sjjsq
```

Output:

```
{
  "ExportTasks": [
    {
      "State": "active",
      "InstanceExportDetails": {
        "InstanceId": "i-1234567890abcdef0",
        "TargetEnvironment": "vmware"
      },
      "ExportToS3Task": {
        "S3Bucket": "myexportbucket",
        "S3Key": "RHEL5export-i-fh8sjjsq.ova",
        "DiskImageFormat": "vmdk",

```

```
        "ContainerFormat": "ova"
      },
      "Description": "RHEL5 instance",
      "ExportTaskId": "export-i-fh8sjjsq"
    }
  ]
}
```

- For API details, see [DescribeExportTasks](#) in *AWS CLI Command Reference*.

describe-fast-launch-images

The following code example shows how to use `describe-fast-launch-images`.

AWS CLI

To describe the details for Windows AMIs that are configured for faster launching

The following `describe-fast-launch-images` example describes the details for each of the AMIs in your account that are configured for faster launching, including the resource type, the snapshot configuration, the launch template details, the maximum number of parallel launches, the AMI owner ID, the state of the fast launch configuration, the reason the state was changed, and the time that the state change occurred.

```
aws ec2 describe-fast-launch-images
```

Output:

```
{
  "FastLaunchImages": [
    {
      "ImageId": "ami-01234567890abcdef",
      "ResourceType": "snapshot",
      "SnapshotConfiguration": {},
      "LaunchTemplate": {
        "LaunchTemplateId": "lt-01234567890abcdef",
        "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-
a8c6215d-94e6-441b-9272-dbd1f87b07e2",
        "Version": "1"
      },
      "MaxParallelLaunches": 6,
      "OwnerId": "0123456789123",
    }
  ]
}
```

```

        "State": "enabled",
        "StateTransitionReason": "Client.UserInitiated",
        "StateTransitionTime": "2022-01-27T22:20:06.552000+00:00"
    }
]
}

```

For more information about configuring a Windows AMI for faster launching, see [Configure your AMI for faster launching](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeFastLaunchImages](#) in *AWS CLI Command Reference*.

describe-fast-snapshot-restores

The following code example shows how to use `describe-fast-snapshot-restores`.

AWS CLI

To describe fast snapshot restores

The following `describe-fast-snapshot-restores` example displays details for all fast snapshot restores with a state of disabled.

```
aws ec2 describe-fast-snapshot-restores \
  --filters Name=state,Values=disabled
```

Output:

```

{
  "FastSnapshotRestores": [
    {
      "SnapshotId": "snap-1234567890abcdef0",
      "AvailabilityZone": "us-west-2c",
      "State": "disabled",
      "StateTransitionReason": "Client.UserInitiated - Lifecycle state
transition",
      "OwnerId": "123456789012",
      "EnablingTime": "2020-01-25T23:57:49.596Z",
      "OptimizingTime": "2020-01-25T23:58:25.573Z",
      "EnabledTime": "2020-01-25T23:59:29.852Z",
      "DisablingTime": "2020-01-26T00:40:56.069Z",
      "DisabledTime": "2020-01-26T00:41:27.390Z"
    }
  ]
}

```

```
    }
  ]
}
```

The following `describe-fast-snapshot-restores` example describes all fast snapshot restores.

```
aws ec2 describe-fast-snapshot-restores
```

- For API details, see [DescribeFastSnapshotRestores](#) in *AWS CLI Command Reference*.

describe-fleet-history

The following code example shows how to use `describe-fleet-history`.

AWS CLI

To describe EC2 Fleet history

The following `describe-fleet-history` example returns the history for the specified EC2 Fleet starting at the specified time. The output is for an EC2 Fleet with two running instances.

```
aws ec2 describe-fleet-history \
  --fleet-id fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \
  --start-time 2020-09-01T00:00:00Z
```

Output:

```
{
  "HistoryRecords": [
    {
      "EventInformation": {
        "EventSubType": "submitted"
      },
      "EventType": "fleetRequestChange",
      "Timestamp": "2020-09-01T18:26:05.000Z"
    },
    {
      "EventInformation": {
        "EventSubType": "active"
      },
    }
  ]
}
```

```

    "EventType": "fleetRequestChange",
    "Timestamp": "2020-09-01T18:26:15.000Z"
  },
  {
    "EventInformation": {
      "EventDescription": "t2.small, ami-07c8bc5c1ce9598c3, ...",
      "EventSubType": "progress"
    },
    "EventType": "fleetRequestChange",
    "Timestamp": "2020-09-01T18:26:17.000Z"
  },
  {
    "EventInformation": {
      "EventDescription": "{\"instanceType\": \"t2.small\", ...}",
      "EventSubType": "launched",
      "InstanceId": "i-083a1c446e66085d2"
    },
    "EventType": "instanceChange",
    "Timestamp": "2020-09-01T18:26:17.000Z"
  },
  {
    "EventInformation": {
      "EventDescription": "{\"instanceType\": \"t2.small\", ...}",
      "EventSubType": "launched",
      "InstanceId": "i-090db02406cc3c2d6"
    },
    "EventType": "instanceChange",
    "Timestamp": "2020-09-01T18:26:17.000Z"
  }
],
"LastEvaluatedTime": "2020-09-01T19:10:19.000Z",
"FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
"StartTime": "2020-08-31T23:53:20.000Z"
}

```

For more information, see [Managing an EC2 Fleet](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeFleetHistory](#) in *AWS CLI Command Reference*.

describe-fleet-instances

The following code example shows how to use `describe-fleet-instances`.

AWS CLI

To describe the running instances for an EC2 Fleet

The following `describe-fleet-instances` example describes the running instances for the specified EC2 Fleet.

```
aws ec2 describe-fleet-instances \
  --fleet-id 12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```
{
  "ActiveInstances": [
    {
      "InstanceId": "i-090db02406cc3c2d6",
      "InstanceType": "t2.small",
      "SpotInstanceRequestId": "sir-a43gtpfk",
      "InstanceHealth": "healthy"
    },
    {
      "InstanceId": "i-083a1c446e66085d2",
      "InstanceType": "t2.small",
      "SpotInstanceRequestId": "sir-iwcit2nj",
      "InstanceHealth": "healthy"
    }
  ],
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

For more information, see [Managing an EC2 Fleet](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeFleetInstances](#) in *AWS CLI Command Reference*.

describe-fleets

The following code example shows how to use `describe-fleets`.

AWS CLI

To describe an EC2 Fleet

The following describe-fleets example describes the specified EC2 Fleet.

```
aws ec2 describe-fleets \  
  --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE
```

Output:

```
{  
  "Fleets": [  
    {  
      "ActivityStatus": "pending_fulfillment",  
      "CreateTime": "2020-09-01T18:26:05.000Z",  
      "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",  
      "FleetState": "active",  
      "ExcessCapacityTerminationPolicy": "termination",  
      "FulfilledCapacity": 0.0,  
      "FulfilledOnDemandCapacity": 0.0,  
      "LaunchTemplateConfigs": [  
        {  
          "LaunchTemplateSpecification": {  
            "LaunchTemplateId": "lt-0e632f2855a979cd5",  
            "Version": "1"  
          }  
        }  
      ],  
      "TargetCapacitySpecification": {  
        "TotalTargetCapacity": 2,  
        "OnDemandTargetCapacity": 0,  
        "SpotTargetCapacity": 2,  
        "DefaultTargetCapacityType": "spot"  
      },  
      "TerminateInstancesWithExpiration": false,  
      "Type": "maintain",  
      "ReplaceUnhealthyInstances": false,  
      "SpotOptions": {  
        "AllocationStrategy": "lowestPrice",  
        "InstanceInterruptionBehavior": "terminate",  
        "InstancePoolsToUseCount": 1  
      },  
      "OnDemandOptions": {  
        "AllocationStrategy": "lowestPrice"  
      }  
    }  
  ]  
}
```

```
]
}
```

For more information, see [Managing an EC2 Fleet](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeFleets](#) in *AWS CLI Command Reference*.

describe-flow-logs

The following code example shows how to use `describe-flow-logs`.

AWS CLI

Example 1: To describe all of your flow logs

The following `describe-flow-logs` example displays details for all of your flow logs.

```
aws ec2 describe-flow-logs
```

Output:

```
{
  "FlowLogs": [
    {
      "CreationTime": "2018-02-21T13:22:12.644Z",
      "DeliverLogsPermissionArn": "arn:aws:iam::123456789012:role/flow-logs-
role",

    ${action} ${tcp-flags} ${log-status}"
  }
]
}

```

Example 2: To describe a subset of your flow logs

The following `describe-flow-logs` example uses a filter to display details for only those flow logs that are in the specified log group in Amazon CloudWatch Logs.

```

aws ec2 describe-flow-logs \
  --filter "Name=log-group-name,Values=MyFlowLogs"

```

- For API details, see [DescribeFlowLogs](#) in *AWS CLI Command Reference*.

`describe-fpga-image-attribute`

The following code example shows how to use `describe-fpga-image-attribute`.

AWS CLI

To describe the attributes of an Amazon FPGA image

This example describes the load permissions for the specified AFI.

Command:

```

aws ec2 describe-fpga-image-attribute --fpga-image-id afi-0d123e123bfc85abc --
attribute loadPermission

```

Output:

```
{
  "FpgaImageAttribute": {
    "FpgaImageId": "afi-0d123e123bfc85abc",
    "LoadPermissions": [
      {
        "UserId": "123456789012"
      }
    ]
  }
}
```

- For API details, see [DescribeFpgaImageAttribute](#) in *AWS CLI Command Reference*.

describe-fpga-images

The following code example shows how to use `describe-fpga-images`.

AWS CLI

To describe Amazon FPGA images

This example describes AFIs that are owned by account 123456789012.

Command:

```
aws ec2 describe-fpga-images --filters Name=owner-id,Values=123456789012
```

Output:

```
{
  "FpgaImages": [
    {
      "UpdateTime": "2017-12-22T12:09:14.000Z",
      "Name": "my-afi",
      "PciId": {
        "SubsystemVendorId": "0xfedd",
        "VendorId": "0x1d0f",
        "DeviceId": "0xf000",
        "SubsystemId": "0x1d51"
      },
      "FpgaImageGlobalId": "agfi-123cb27b5e84a0abc",
    }
  ]
}
```

```
    "Public": false,
    "State": {
      "Code": "available"
    },
    "ShellVersion": "0x071417d3",
    "OwnerId": "123456789012",
    "FpgaImageId": "afi-0d123e123bfc85abc",
    "CreateTime": "2017-12-22T11:43:33.000Z",
    "Description": "my-afi"
  }
]
}
```

- For API details, see [DescribeFpgaImages](#) in *AWS CLI Command Reference*.

describe-host-reservation-offerings

The following code example shows how to use `describe-host-reservation-offerings`.

AWS CLI

To describe Dedicated Host Reservation offerings

This example describes the Dedicated Host Reservations for the M4 instance family that are available to purchase.

Command:

```
aws ec2 describe-host-reservation-offerings --filter Name=instance-family,Values=m4
```

Output:

```
{
  "OfferingSet": [
    {
      "HourlyPrice": "1.499",
      "OfferingId": "hro-03f707bf363b6b324",
      "InstanceFamily": "m4",
      "PaymentOption": "NoUpfront",
      "UpfrontPrice": "0.000",
      "Duration": 31536000
    },
  ],
}
```

```
{
  "HourlyPrice": "1.045",
  "OfferingId": "hro-0ef9181cabdef7a02",
  "InstanceFamily": "m4",
  "PaymentOption": "NoUpfront",
  "UpfrontPrice": "0.000",
  "Duration": 94608000
},
{
  "HourlyPrice": "0.714",
  "OfferingId": "hro-04567a15500b92a51",
  "InstanceFamily": "m4",
  "PaymentOption": "PartialUpfront",
  "UpfrontPrice": "6254.000",
  "Duration": 31536000
},
{
  "HourlyPrice": "0.484",
  "OfferingId": "hro-0d5d7a9d23ed7fbfe",
  "InstanceFamily": "m4",
  "PaymentOption": "PartialUpfront",
  "UpfrontPrice": "12720.000",
  "Duration": 94608000
},
{
  "HourlyPrice": "0.000",
  "OfferingId": "hro-05da4108ca998c2e5",
  "InstanceFamily": "m4",
  "PaymentOption": "AllUpfront",
  "UpfrontPrice": "23913.000",
  "Duration": 94608000
},
{
  "HourlyPrice": "0.000",
  "OfferingId": "hro-0a9f9be3b95a3dc8f",
  "InstanceFamily": "m4",
  "PaymentOption": "AllUpfront",
  "UpfrontPrice": "12257.000",
  "Duration": 31536000
}
]
```

- For API details, see [DescribeHostReservationOfferings](#) in *AWS CLI Command Reference*.

describe-host-reservations

The following code example shows how to use `describe-host-reservations`.

AWS CLI

To describe Dedicated Host Reservations in your account

This example describes the Dedicated Host Reservations in your account.

Command:

```
aws ec2 describe-host-reservations
```

Output:

```
{
  "HostReservationSet": [
    {
      "Count": 1,
      "End": "2019-01-10T12:14:09Z",
      "HourlyPrice": "1.499",
      "InstanceFamily": "m4",
      "OfferingId": "hro-03f707bf363b6b324",
      "PaymentOption": "NoUpfront",
      "State": "active",
      "HostIdSet": [
        "h-013abcd2a00cbd123"
      ],
      "Start": "2018-01-10T12:14:09Z",
      "HostReservationId": "hr-0d418a3a4ffc669ae",
      "UpfrontPrice": "0.000",
      "Duration": 31536000
    }
  ]
}
```

- For API details, see [DescribeHostReservations](#) in *AWS CLI Command Reference*.

describe-hosts

The following code example shows how to use `describe-hosts`.

AWS CLI

To view details about Dedicated Hosts

The following describe-hosts example displays details for the available Dedicated Hosts in your AWS account.

```
aws ec2 describe-hosts --filter "Name=state,Values=available"
```

Output:

```
{
  "Hosts": [
    {
      "HostId": "h-07879acf49EXAMPLE",
      "Tags": [
        {
          "Value": "production",
          "Key": "purpose"
        }
      ],
      "HostProperties": {
        "Cores": 48,
        "TotalVCpus": 96,
        "InstanceType": "m5.large",
        "Sockets": 2
      },
      "Instances": [],
      "State": "available",
      "AvailabilityZone": "eu-west-1a",
      "AvailableCapacity": {
        "AvailableInstanceCapacity": [
          {
            "AvailableCapacity": 48,
            "InstanceType": "m5.large",
            "TotalCapacity": 48
          }
        ],
        "AvailableVCpus": 96
      },
      "HostRecovery": "on",
      "AllocationTime": "2019-08-19T08:57:44.000Z",
      "AutoPlacement": "off"
    }
  ]
}
```

```
    }  
  ]  
}
```

For more information, see [Viewing Dedicated Hosts](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeHosts](#) in *AWS CLI Command Reference*.

describe-iam-instance-profile-associations

The following code example shows how to use `describe-iam-instance-profile-associations`.

AWS CLI

To describe IAM instance profile associations

This example describes all of your IAM instance profile associations.

Command:

```
aws ec2 describe-iam-instance-profile-associations
```

Output:

```
{  
  "IamInstanceProfileAssociations": [  
    {  
      "InstanceId": "i-09eb09efa73ec1dee",  
      "State": "associated",  
      "AssociationId": "iip-assoc-0db249b1f25fa24b8",  
      "IamInstanceProfile": {  
        "Id": "AIPAJVQN4F5WVLGCJDRGM",  
        "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"  
      }  
    },  
    {  
      "InstanceId": "i-0402909a2f4dff14",  
      "State": "associating",  
      "AssociationId": "iip-assoc-0d1ec06278d29f44a",  
      "IamInstanceProfile": {  
        "Id": "AGJAJVQN4F5WVLGCJABCM",  
        "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"  
      }  
    }  
  ]  
}
```

```

    "Arn": "arn:aws:iam::123456789012:instance-profile/user1-role"
  }
}
]
}

```

- For API details, see [DescribeIAMInstanceProfileAssociations](#) in *AWS CLI Command Reference*.

describe-id-format

The following code example shows how to use `describe-id-format`.

AWS CLI

Example 1: To describe the ID format of a resource

The following `describe-id-format` example describes the ID format for security groups.

```
aws ec2 describe-id-format \
  --resource security-group
```

In the following example output, the `Deadline` value indicates that the deadline for this resource type to permanently switch from the short ID format to the long ID format expired at 00:00 UTC on August 15, 2018.

```
{
  "Statuses": [
    {
      "Deadline": "2018-08-15T00:00:00.000Z",
      "Resource": "security-group",
      "UseLongIds": true
    }
  ]
}
```

Example 2: To describe the ID format for all resources

The following `describe-id-format` example describes the ID format for all resource types. All resource types that supported the short ID format were switched to use the long ID format.

```
aws ec2 describe-id-format
```

- For API details, see [DescribeIdFormat](#) in *AWS CLI Command Reference*.

describe-identity-id-format

The following code example shows how to use `describe-identity-id-format`.

AWS CLI

To describe the ID format for an IAM role

The following `describe-identity-id-format` example describes the ID format received by instances created by the IAM role `EC2Role` in your AWS account.

```
aws ec2 describe-identity-id-format \
  --principal-arn arn:aws:iam::123456789012:role/my-iam-role \
  --resource instance
```

The following output indicates that instances created by this role receive IDs in long ID format.

```
{
  "Statuses": [
    {
      "Deadline": "2016-12-15T00:00:00Z",
      "Resource": "instance",
      "UseLongIds": true
    }
  ]
}
```

To describe the ID format for an IAM user

The following `describe-identity-id-format` example describes the ID format received by snapshots created by the IAM user `AdminUser` in your AWS account.

```
aws ec2 describe-identity-id-format \
  --principal-arn arn:aws:iam::123456789012:user/AdminUser \
  --resource snapshot
```

The output indicates that snapshots created by this user receive IDs in long ID format.

```
{
```

```
"Statuses": [  
  {  
    "Deadline": "2016-12-15T00:00:00Z",  
    "Resource": "snapshot",  
    "UseLongIds": true  
  }  
]  
}
```

- For API details, see [DescribeIdentityIdFormat](#) in *AWS CLI Command Reference*.

describe-image-attribute

The following code example shows how to use `describe-image-attribute`.

AWS CLI

To describe the launch permissions for an AMI

This example describes the launch permissions for the specified AMI.

Command:

```
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute  
launchPermission
```

Output:

```
{  
  "LaunchPermissions": [  
    {  
      "UserId": "123456789012"  
    }  
  ],  
  "ImageId": "ami-5731123e",  
}
```

To describe the product codes for an AMI

This example describes the product codes for the specified AMI. Note that this AMI has no product codes.

Command:

```
aws ec2 describe-image-attribute --image-id ami-5731123e --attribute productCodes
```

Output:

```
{
  "ProductCodes": [],
  "ImageId": "ami-5731123e",
}
```

- For API details, see [DescribeImageAttribute](#) in *AWS CLI Command Reference*.

describe-images

The following code example shows how to use `describe-images`.

AWS CLI**Example 1: To describe an AMI**

The following `describe-images` example describes the specified AMI in the specified Region.

```
aws ec2 describe-images \
  --region us-east-1 \
  --image-ids ami-1234567890EXAMPLE
```

Output:

```
{
  "Images": [
    {
      "VirtualizationType": "hvm",
      "Description": "Provided by Red Hat, Inc.",
      "PlatformDetails": "Red Hat Enterprise Linux",
      "EnaSupport": true,
      "Hypervisor": "xen",
      "State": "available",
      "SriovNetSupport": "simple",
      "ImageId": "ami-1234567890EXAMPLE",
      "UsageOperation": "RunInstances:0010",
      "BlockDeviceMappings": [
        {
          "DeviceName": "/dev/sda1",
```

```

        "Ebs": {
            "SnapshotId": "snap-111222333444aaabb",
            "DeleteOnTermination": true,
            "VolumeType": "gp2",
            "VolumeSize": 10,
            "Encrypted": false
        }
    ],
    "Architecture": "x86_64",
    "ImageLocation": "123456789012/RHEL-8.0.0_HVM-20190618-x86_64-1-Hourly2-
GP2",
    "RootDeviceType": "ebs",
    "OwnerId": "123456789012",
    "RootDeviceName": "/dev/sda1",
    "CreationDate": "2019-05-10T13:17:12.000Z",
    "Public": true,
    "ImageType": "machine",
    "Name": "RHEL-8.0.0_HVM-20190618-x86_64-1-Hourly2-GP2"
}
]
}

```

For more information, see [Amazon Machine Images \(AMI\)](#) in the *Amazon EC2 User Guide*.

Example 2: To describe AMIs based on filters

The following `describe-images` example describes Windows AMIs provided by Amazon that are backed by Amazon EBS.

```

aws ec2 describe-images \
  --owners amazon \
  --filters "Name=platform,Values=windows" "Name=root-device-type,Values=ebs"

```

For an example of the output for `describe-images`, see Example 1.

For additional examples using filters, see [Listing and filtering your resources](#) in the *Amazon EC2 User Guide*.

Example 3: To describe AMIs based on tags

The following `describe-images` example describes all AMIs that have the tag `Type=Custom`. The example uses the `--query` parameter to display only the AMI IDs.

```
aws ec2 describe-images \  
  --filters "Name=tag:Type,Values=Custom" \  
  --query 'Images[*].[ImageId]' \  
  --output text
```

Output:

```
ami-1234567890EXAMPLE  
ami-0abcdef1234567890
```

For additional examples using tag filters, see [Working with tags](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeImages](#) in *AWS CLI Command Reference*.

describe-import-image-tasks

The following code example shows how to use `describe-import-image-tasks`.

AWS CLI

To monitor an import image task

The following `describe-import-image-tasks` example checks the status of the specified import image task.

```
aws ec2 describe-import-image-tasks \  
  --import-task-ids import-ami-1234567890abcdef0
```

Output for an import image task that is in progress.

```
{  
  "ImportImageTasks": [  
    {  
      "ImportTaskId": "import-ami-1234567890abcdef0",  
      "Progress": "28",  
      "SnapshotDetails": [  
        {  
          "DiskImageSize": 705638400.0,  
          "Format": "ova",  
          "Status": "completed",
```

```

        "UserBucket": {
            "S3Bucket": "my-import-bucket",
            "S3Key": "vms/my-server-vm.ova"
        }
    ],
    "Status": "active",
    "StatusMessage": "converting"
}
]
}

```

Output for an import image task that is completed. The ID of the resulting AMI is provided by `ImageId`.

```

{
  "ImportImageTasks": [
    {
      "ImportTaskId": "import-ami-1234567890abcdef0",
      "ImageId": "ami-1234567890abcdef0",
      "SnapshotDetails": [
        {
          "DiskImageSize": 705638400.0,
          "Format": "ova",
          "SnapshotId": "snap-1234567890abcdef0",
          "Status": "completed",
          "UserBucket": {
            "S3Bucket": "my-import-bucket",
            "S3Key": "vms/my-server-vm.ova"
          }
        }
      ],
      "Status": "completed"
    }
  ]
}

```

- For API details, see [DescribeImportImageTasks](#) in *AWS CLI Command Reference*.

describe-import-snapshot-tasks

The following code example shows how to use `describe-import-snapshot-tasks`.

AWS CLI

To monitor an import snapshot task

The following `describe-import-snapshot-tasks` example checks the status of the specified import snapshot task.

```
aws ec2 describe-import-snapshot-tasks \  
  --import-task-ids import-snap-1234567890abcdef0
```

Output for an import snapshot task that is in progress:

```
{  
  "ImportSnapshotTasks": [  
    {  
      "Description": "My server VMDK",  
      "ImportTaskId": "import-snap-1234567890abcdef0",  
      "SnapshotTaskDetail": {  
        "Description": "My server VMDK",  
        "DiskImageSize": "705638400.0",  
        "Format": "VMDK",  
        "Progress": "42",  
        "Status": "active",  
        "StatusMessage": "downloading/converting",  
        "UserBucket": {  
          "S3Bucket": "my-import-bucket",  
          "S3Key": "vms/my-server-vm.vmdk"  
        }  
      }  
    }  
  ]  
}
```

Output for an import snapshot task that is completed. The ID of the resulting snapshot is provided by `SnapshotId`.

```
{  
  "ImportSnapshotTasks": [  
    {  
      "Description": "My server VMDK",  
      "ImportTaskId": "import-snap-1234567890abcdef0",  
      "SnapshotTaskDetail": {
```

```

    "Description": "My server VMDK",
    "DiskImageSize": "705638400.0",
    "Format": "VMDK",
    "SnapshotId": "snap-1234567890abcdef0"
    "Status": "completed",
    "UserBucket": {
      "S3Bucket": "my-import-bucket",
      "S3Key": "vms/my-server-vm.vmdk"
    }
  }
}
]
}

```

- For API details, see [DescribeImportSnapshotTasks](#) in *AWS CLI Command Reference*.

describe-instance-attribute

The following code example shows how to use `describe-instance-attribute`.

AWS CLI

To describe the instance type

This example describes the instance type of the specified instance.

Command:

```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute
instanceType
```

Output:

```
{
  "InstanceId": "i-1234567890abcdef0"
  "InstanceType": {
    "Value": "t1.micro"
  }
}
```

To describe the `disableApiTermination` attribute

This example describes the `disableApiTermination` attribute of the specified instance.

Command:

```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute
disableApiTermination
```

Output:

```
{
  "InstanceId": "i-1234567890abcdef0"
  "DisableApiTermination": {
    "Value": "false"
  }
}
```

To describe the block device mapping for an instance

This example describes the `blockDeviceMapping` attribute of the specified instance.

Command:

```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute
blockDeviceMapping
```

Output:

```
{
  "InstanceId": "i-1234567890abcdef0"
  "BlockDeviceMappings": [
    {
      "DeviceName": "/dev/sda1",
      "Ebs": {
        "Status": "attached",
        "DeleteOnTermination": true,
        "VolumeId": "vol-049df61146c4d7901",
        "AttachTime": "2013-05-17T22:42:34.000Z"
      }
    },
    {
      "DeviceName": "/dev/sdf",
      "Ebs": {
```

```

        "Status": "attached",
        "DeleteOnTermination": false,
        "VolumeId": "vol-049df61146c4d7901",
        "AttachTime": "2013-09-10T23:07:00.000Z"
    }
  ],
}

```

- For API details, see [DescribeInstanceAttribute](#) in *AWS CLI Command Reference*.

describe-instance-connect-endpoints

The following code example shows how to use `describe-instance-connect-endpoints`.

AWS CLI

To describe an EC2 Instance Connect Endpoint

The following `describe-instance-connect-endpoints` example describes the specified EC2 Instance Connect Endpoint.

```

aws ec2 describe-instance-connect-endpoints \
  --region us-east-1 \
  --instance-connect-endpoint-ids eice-0123456789example

```

Output:

```

{
  "InstanceConnectEndpoints": [
    {
      "OwnerId": "111111111111",
      "InstanceConnectEndpointId": "eice-0123456789example",
      "InstanceConnectEndpointArn": "arn:aws:ec2:us-east-1:111111111111:instance-connect-endpoint/eice-0123456789example",
      "State": "create-complete",
      "StateMessage": "",
      "DnsName": "eice-0123456789example.b67b86ba.ec2-instance-connect-endpoint.us-east-1.amazonaws.com",
      "NetworkInterfaceIds": [
        "eni-0123456789example"
      ],
    }
  ],
}

```

```
        "VpcId": "vpc-0123abcd",
        "AvailabilityZone": "us-east-1d",
        "CreatedAt": "2023-02-07T12:05:37+00:00",
        "SubnetId": "subnet-0123abcd",
        "Tags": []
    }
]
```

For more information, see [Create an EC2 Instance Connect Endpoint](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeInstanceConnectEndpoints](#) in *AWS CLI Command Reference*.

describe-instance-credit-specifications

The following code example shows how to use `describe-instance-credit-specifications`.

AWS CLI

To describe the credit option for CPU usage of one or more instances

The following `describe-instance-credit-specifications` example describes the CPU credit option for the specified instance.

```
aws ec2 describe-instance-credit-specifications \
  --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "InstanceCreditSpecifications": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "CpuCredits": "unlimited"
    }
  ]
}
```

For more information, see [Work with burstable performance instances](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeInstanceCreditSpecifications](#) in *AWS CLI Command Reference*.

describe-instance-event-notification-attributes

The following code example shows how to use `describe-instance-event-notification-attributes`.

AWS CLI

To describe the tags for scheduled event notifications

The following `describe-instance-event-notification-attributes` example describes the tags to appear in scheduled event notifications.

```
aws ec2 describe-instance-event-notification-attributes
```

Output:

```
{
  "InstanceTagAttribute": {
    "InstanceTagKeys": [],
    "IncludeAllTagsOfInstance": true
  }
}
```

For more information, see [Scheduled events for your instances](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeInstanceEventNotificationAttributes](#) in *AWS CLI Command Reference*.

describe-instance-event-windows

The following code example shows how to use `describe-instance-event-windows`.

AWS CLI

Example 1: To describe all event windows

The following `describe-instance-event-windows` example describes all event windows in the specified Region.

```
aws ec2 describe-instance-event-windows \
  --region us-east-1
```

Output:

```
{
  "InstanceEventWindows": [
    {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
        "InstanceIds": [
          "i-1234567890abcdef0",
          "i-0598c7d356eba48d7"
        ],
        "Tags": [],
        "DedicatedHostIds": []
      },
      "State": "active",
      "Tags": []
    }
    ...
  ],
  "NextToken": "9d624e0c-388b-4862-a31e-a85c64fc1d4a"
}
```

Example 2: To describe a specific event window

The following describe-instance-event-windows example describes a specific event by using the instance-event-window parameter to describe a specific event window.

```
aws ec2 describe-instance-event-windows \
  --region us-east-1 \
  --instance-event-window-ids iew-0abcdef1234567890
```

Output:

```
{
  "InstanceEventWindows": [
    {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
```

```

    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [
        "i-1234567890abcdef0",
        "i-0598c7d356eba48d7"
      ],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "active",
    "Tags": []
  }
}

```

Example 3: To describe event windows that match one or more filters

The following `describe-instance-event-windows` example describes event windows that match one or more filters using the `filter` parameter. The `instance-id` filter is used to describe all of the event windows that are associated with the specified instance. When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the tags of the instance or Dedicated Host ID (if the instance is a Dedicated Host).

```

aws ec2 describe-instance-event-windows \
  --region us-east-1 \
  --filters Name=instance-id,Values=i-1234567890abcdef0 \
  --max-results 100 \
  --next-token <next-token-value>

```

Output:

```

{
  "InstanceEventWindows": [
    {
      "InstanceEventWindowId": "iew-0dbc0adb66f235982",
      "TimeRanges": [
        {
          "StartWeekDay": "sunday",
          "StartHour": 2,
          "EndWeekDay": "sunday",
          "EndHour": 8
        }
      ]
    }
  ]
}

```

```

    ],
    "Name": "myEventWindowName",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": [
        "h-0140d9a7ecbd102dd"
      ]
    },
    "State": "active",
    "Tags": []
  }
]
}

```

In the example output, the instance is on a Dedicated Host, which is associated with the event window.

For event window constraints, see [Considerations](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeInstanceEventWindows](#) in *AWS CLI Command Reference*.

describe-instance-status

The following code example shows how to use `describe-instance-status`.

AWS CLI

To describe the status of an instance

The following `describe-instance-status` example describes the current status of the specified instance.

```
aws ec2 describe-instance-status \
  --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "InstanceStatuses": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "InstanceState": {
```

```
        "Code": 16,
        "Name": "running"
    },
    "AvailabilityZone": "us-east-1d",
    "SystemStatus": {
        "Status": "ok",
        "Details": [
            {
                "Status": "passed",
                "Name": "reachability"
            }
        ]
    },
    "InstanceState": {
        "Status": "ok",
        "Details": [
            {
                "Status": "passed",
                "Name": "reachability"
            }
        ]
    }
}
]
```

For more information, see [Monitor the status of your instances](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeInstanceStatus](#) in *AWS CLI Command Reference*.

describe-instance-topology

The following code example shows how to use `describe-instance-topology`.

AWS CLI

To describe the instance topology of all your instances

The following `describe-instance-topology` example describes the topology of all your instances that match the supported instance types for this command.

```
aws ec2 describe-instance-topology \  
  --region us-west-2
```

Output:

```
{
  "Instances": [
    {
      "InstanceId": "i-1111111111example",
      "InstanceType": "p4d.24xlarge",
      "GroupName": "my-ml-cpg",
      "NetworkNodes": [
        "nn-1111111111example",
        "nn-2222222222example",
        "nn-3333333333example"
      ],
      "ZoneId": "usw2-az2",
      "AvailabilityZone": "us-west-2a"
    },
    {
      "InstanceId": "i-2222222222example",
      "InstanceType": "p4d.24xlarge",
      "NetworkNodes": [
        "nn-1111111111example",
        "nn-2222222222example",
        "nn-3333333333example"
      ],
      "ZoneId": "usw2-az2",
      "AvailabilityZone": "us-west-2a"
    },
    {
      "InstanceId": "i-3333333333example",
      "InstanceType": "trn1.32xlarge",
      "NetworkNodes": [
        "nn-1212121212example",
        "nn-1211122211example",
        "nn-1311133311example"
      ],
      "ZoneId": "usw2-az4",
      "AvailabilityZone": "us-west-2d"
    },
    {
      "InstanceId": "i-4444444444example",
      "InstanceType": "trn1.2xlarge",
      "NetworkNodes": [
        "nn-1111111111example",
        "nn-5434334334example",

```

```
        "nn-1235301234example"  
      ],  
      "ZoneId": "usw2-az2",  
      "AvailabilityZone": "us-west-2a"  
    }  
  ],  
  "NextToken": "SomeEncryptedToken"  
}
```

For more information, including more examples, see [Amazon EC2 instance topology](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeInstanceTopology](#) in *AWS CLI Command Reference*.

describe-instance-type-offerings

The following code example shows how to use `describe-instance-type-offerings`.

AWS CLI

Example 1: To list the instance types offered in a Region

The following `describe-instance-type-offerings` example lists the instance types offered in the Region configured as the default Region for the AWS CLI.

```
aws ec2 describe-instance-type-offerings
```

To list the instance types offered in a different Region, specify the Region using the `--region` parameter.

```
aws ec2 describe-instance-type-offerings \  
  --region us-east-2
```

Output:

```
{  
  "InstanceTypeOfferings": [  
    {  
      "InstanceType": "m5.2xlarge",  
      "LocationType": "region",  
      "Location": "us-east-2"    }  
  ]  
}
```

```
    },  
    {  
      "InstanceType": "t3.micro",  
      "LocationType": "region",  
      "Location": "us-east-2"  
    },  
    ...  
  ]  
}
```

Example 2: To list the instance types offered in an Availability Zone

The following `describe-instance-type-offerings` example lists the instance types offered in the specified Availability Zone. The Availability Zone must be in the specified Region.

```
aws ec2 describe-instance-type-offerings \  
  --location-type availability-zone \  
  --filters Name=location,Values=us-east-2a \  
  --region us-east-2
```

Example 3: To check whether an instance type is supported

The following `describe-instance-type-offerings` command indicates whether the `c5.xlarge` instance type is supported in the specified Region.

```
aws ec2 describe-instance-type-offerings \  
  --filters Name=instance-type,Values=c5.xlarge \  
  --region us-east-2
```

The following `describe-instance-type-offerings` example lists all C5 instance types that are supported in the specified Region.

```
aws ec2 describe-instance-type-offerings \  
  --filters Name=instance-type,Values=c5* \  
  --query "InstanceTypeOfferings[].InstanceType" \  
  --region us-east-2
```

Output:

```
[
```

```
"c5d.12xlarge",  
"c5d.9xlarge",  
"c5n.xlarge",  
"c5.xlarge",  
"c5d.metal",  
"c5n.metal",  
"c5.large",  
"c5d.2xlarge",  
"c5n.4xlarge",  
"c5.2xlarge",  
"c5n.large",  
"c5n.9xlarge",  
"c5d.large",  
"c5.18xlarge",  
"c5d.18xlarge",  
"c5.12xlarge",  
"c5n.18xlarge",  
"c5.metal",  
"c5d.4xlarge",  
"c5.24xlarge",  
"c5d.xlarge",  
"c5n.2xlarge",  
"c5d.24xlarge",  
"c5.9xlarge",  
"c5.4xlarge"
```

```
]
```

- For API details, see [DescribeInstanceTypeOfferings](#) in *AWS CLI Command Reference*.

describe-instance-types

The following code example shows how to use `describe-instance-types`.

AWS CLI

Example 1: To describe an instance type

The following `describe-instance-types` example displays details for the specified instance type.

```
aws ec2 describe-instance-types \  
  --instance-types t2.micro
```

Output:

```
{
  "InstanceTypes": [
    {
      "InstanceType": "t2.micro",
      "CurrentGeneration": true,
      "FreeTierEligible": true,
      "SupportedUsageClasses": [
        "on-demand",
        "spot"
      ],
      "SupportedRootDeviceTypes": [
        "ebs"
      ],
      "BareMetal": false,
      "Hypervisor": "xen",
      "ProcessorInfo": {
        "SupportedArchitectures": [
          "i386",
          "x86_64"
        ],
        "SustainedClockSpeedInGhz": 2.5
      },
      "VCpuInfo": {
        "DefaultVCpus": 1,
        "DefaultCores": 1,
        "DefaultThreadsPerCore": 1,
        "ValidCores": [
          1
        ],
        "ValidThreadsPerCore": [
          1
        ]
      },
      "MemoryInfo": {
        "SizeInMiB": 1024
      },
      "InstanceStorageSupported": false,
      "EbsInfo": {
        "EbsOptimizedSupport": "unsupported",
        "EncryptionSupport": "supported"
      },
      "NetworkInfo": {
```

```

        "NetworkPerformance": "Low to Moderate",
        "MaximumNetworkInterfaces": 2,
        "Ipv4AddressesPerInterface": 2,
        "Ipv6AddressesPerInterface": 2,
        "Ipv6Supported": true,
        "EnaSupport": "unsupported"
    },
    "PlacementGroupInfo": {
        "SupportedStrategies": [
            "partition",
            "spread"
        ]
    },
    "HibernationSupported": false,
    "BurstablePerformanceSupported": true,
    "DedicatedHostsSupported": false,
    "AutoRecoverySupported": true
}
]
}

```

For more information, see [Instance Types](#) in *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To filter the available instance types

You can specify a filter to scope the results to instance types that have a specific characteristic. The following `describe-instance-types` example lists the instance types that support hibernation.

```

aws ec2 describe-instance-types \
  --filters Name=hibernation-supported,Values=true --query
  'InstanceTypes[*].InstanceType'

```

Output:

```

[
  "m5.8xlarge",
  "r3.large",
  "c3.8xlarge",
  "r5.large",
  "m4.4xlarge",
  "c4.large",

```

```
"m5.xlarge",  
"m4.xlarge",  
"c3.large",  
"c4.8xlarge",  
"c4.4xlarge",  
"c5.xlarge",  
"c5.12xlarge",  
"r5.4xlarge",  
"c5.4xlarge"  
]
```

For more information, see [Instance Types](#) in *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [DescribeInstanceTypes](#) in *AWS CLI Command Reference*.

describe-instances

The following code example shows how to use `describe-instances`.

AWS CLI

Example 1: To describe an instance

The following `describe-instances` example describes the specified instance.

```
aws ec2 describe-instances \  
--instance-ids i-1234567890abcdef0
```

Output:

```
{  
  "Reservations": [  
    {  
      "Groups": [],  
      "Instances": [  
        {

```

Example 2: To filter for instances with the specified type

The following `describe-instances` example uses filters to scope the results to instances of the specified type.

```
aws ec2 describe-instances \
  --filters Name=instance-type,Values=m5.large
```

For example output, see Example 1.

For more information, see [List and filter using the CLI](#) in the *Amazon EC2 User Guide*.

Example 3: To filter for instances with the specified type and Availability Zone

The following `describe-instances` example uses multiple filters to scope the results to instances with the specified type that are also in the specified Availability Zone.

```
aws ec2 describe-instances \
  --filters Name=instance-type,Values=t2.micro,t3.micro Name=availability-
  zone,Values=us-east-2c
```

For example output, see Example 1.

Example 4: To filter for instances with the specified type and Availability Zone using a JSON file

The following `describe-instances` example uses a JSON input file to perform the same filtering as the previous example. When filters get more complicated, they can be easier to specify in a JSON file.

```
aws ec2 describe-instances \  
  --filters file://filters.json
```

Contents of `filters.json`:

```
[  
  {  
    "Name": "instance-type",  
    "Values": ["t2.micro", "t3.micro"]  
  },  
  {  
    "Name": "availability-zone",  
    "Values": ["us-east-2c"]  
  }  
]
```

For example output, see Example 1.

Example 5: To filter for instances with the specified Owner tag

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag key (Owner), regardless of the tag value.

```
aws ec2 describe-instances \  
  --filters "Name=tag-key,Values=Owner"
```

For example output, see Example 1.

Example 6: To filter for instances with the specified my-team tag value

The following `describe-instances` example uses tag filters to scope the results to instances that have a tag with the specified tag value (my-team), regardless of the tag key.

```
aws ec2 describe-instances \  
  --filters "Name=tag-value,Values=my-team"
```

For example output, see Example 1.

Example 7: To filter for instances with the specified Owner tag and my-team value

The following `describe-instances` example uses tag filters to scope the results to instances that have the specified tag (`Owner=my-team`).

```
aws ec2 describe-instances \  
  --filters "Name=tag:Owner,Values=my-team"
```

For example output, see Example 1.

Example 8: To display only instance and subnet IDs for all instances

The following `describe-instances` examples use the `--query` parameter to display only the instance and subnet IDs for all instances, in JSON format.

Linux and macOS:

```
aws ec2 describe-instances \  
  --query 'Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}' \  
  --output json
```

Windows:

```
aws ec2 describe-instances ^  
  --query "Reservations[*].Instances[*].{Instance:InstanceId,Subnet:SubnetId}" ^  
  --output json
```

Output:

```
[  
  {  
    "Instance": "i-057750d42936e468a",  
    "Subnet": "subnet-069beee9b12030077"  
  },  
  {  
    "Instance": "i-001efd250faaa6ffa",  
    "Subnet": "subnet-0b715c6b7db68927a"  
  },  
  {  
    "Instance": "i-027552a73f021f3bd",  
    "Subnet": "subnet-0250c25a1f4e15235"  
  }  
]
```

```
...
]
```

Example 9: To filter instances of the specified type and only display their instance IDs

The following `describe-instances` example uses filters to scope the results to instances of the specified type and the `--query` parameter to display only the instance IDs.

```
aws ec2 describe-instances \
  --filters "Name=instance-type,Values=t2.micro" \
  --query "Reservations[*].Instances[*].[InstanceId]" \
  --output text
```

Output:

```
i-031c0dc19de2fb70c
i-00d8bfff789a736b75
i-0b715c6b7db68927a
i-0626d4edd54f1286d
i-00b8ae04f9f99908e
i-0fc71c25d2374130c
```

Example 10: To filter instances of the specified type and only display their instance IDs, Availability Zone, and the specified tag value

The following `describe-instances` examples display the instance ID, Availability Zone, and the value of the Name tag for instances that have a tag with the name `tag-key`, in table format.

Linux and macOS:

```
aws ec2 describe-instances \
  --filters Name=tag-key,Values=Name \
  --query 'Reservations[*].Instances[*].
{Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key==`Name`]|
[0].Value}' \
  --output table
```

Windows:

```
aws ec2 describe-instances ^
```

```

--filters Name=tag-key,Values=Name ^
--query "Reservations[*].Instances[*].
{Instance:InstanceId,AZ:Placement.AvailabilityZone,Name:Tags[?Key=='Name']|
[0].Value}" ^
--output table

```

Output:

```

-----
|                               DescribeInstances                               |
+-----+-----+-----+
|      AZ      |      Instance      |      Name      |
+-----+-----+-----+
| us-east-2b  | i-057750d42936e468a | my-prod-server |
| us-east-2a  | i-001efd250faaa6ffa | test-server-1   |
| us-east-2a  | i-027552a73f021f3bd | test-server-2   |
+-----+-----+-----+

```

Example 11: To describe instances in a partition placement group

The following `describe-instances` example describes the specified instance. The output includes the placement information for the instance, which contains the placement group name and the partition number for the instance.

```

aws ec2 describe-instances \
  --instance-ids i-0123a456700123456 \
  --query "Reservations[*].Instances[*].Placement"

```

Output:

```

[
  [
    {
      "AvailabilityZone": "us-east-1c",
      "GroupName": "HDFS-Group-A",
      "PartitionNumber": 3,
      "Tenancy": "default"
    }
  ]
]

```

For more information, see [Describing instances in a placement group](#) in the *Amazon EC2 User Guide*.

Example 12: To filter to instances with the specified placement group and partition number

The following `describe-instances` example filters the results to only those instances with the specified placement group and partition number.

```
aws ec2 describe-instances \  
  --filters "Name=placement-group-name,Values=HDFS-Group-A" "Name=placement-  
partition-number,Values=7"
```

The following shows only the relevant information from the output.

```
"Instances": [  
  {  
    "InstanceId": "i-0123a456700123456",  
    "InstanceType": "r4.large",  
    "Placement": {  
      "AvailabilityZone": "us-east-1c",  
      "GroupName": "HDFS-Group-A",  
      "PartitionNumber": 7,  
      "Tenancy": "default"  
    }  
  },  
  {  
    "InstanceId": "i-9876a543210987654",  
    "InstanceType": "r4.large",  
    "Placement": {  
      "AvailabilityZone": "us-east-1c",  
      "GroupName": "HDFS-Group-A",  
      "PartitionNumber": 7,  
      "Tenancy": "default"  
    }  
  },  
],
```

For more information, see [Describing instances in a placement group](#) in the *Amazon EC2 User Guide*.

Example 13: To filter to instances that are configured to allow access to tags from instance metadata

The following `describe-instances` example filters the results to only those instances that are configured to allow access to instance tags from instance metadata.

```
aws ec2 describe-instances \  
  --filters "Name=metadata-options.instance-metadata-tags,Values=enabled" \  
  --query "Reservations[*].Instances[*].InstanceId" \  
  --output text
```

The following shows the expected output.

```
i-1234567890abcdefg  
i-abcdefg1234567890  
i-1111111111aaaaaaaa  
i-aaaaaaaa1111111111
```

For more information, see [Work with instance tags in instance metadata](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeInstances](#) in *AWS CLI Command Reference*.

describe-internet-gateways

The following code example shows how to use `describe-internet-gateways`.

AWS CLI

To describe an internet gateway

The following `describe-internet-gateways` example describes the specified internet gateway.

```
aws ec2 describe-internet-gateways \  
  --internet-gateway-ids igw-0d0fb496b3EXAMPLE
```

Output:

```
{  
  "InternetGateways": [  
    {  
      "Attachments": [  

```

```
        {
            "State": "available",
            "VpcId": "vpc-0a60eb65b4EXAMPLE"
        }
    ],
    "InternetGatewayId": "igw-0d0fb496b3EXAMPLE",
    "OwnerId": "123456789012",
    "Tags": [
        {
            "Key": "Name",
            "Value": "my-igw"
        }
    ]
}
]
```

For more information, see [Internet gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [DescribeInternetGateways](#) in *AWS CLI Command Reference*.

describe-ipam-pools

The following code example shows how to use `describe-ipam-pools`.

AWS CLI

To view the details for an IPAM pool

The following `describe-ipam-pools` example shows the details for pools.

(Linux):

```
aws ec2 describe-ipam-pools \
    --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-
scope-02fc38cd4c48e7d38
```

(Windows):

```
aws ec2 describe-ipam-pools ^
    --filters Name=owner-id,Values=123456789012 Name=ipam-scope-id,Values=ipam-
scope-02fc38cd4c48e7d38
```

Output:

```
{
  "IpamPools": [
    {
      "OwnerId": "123456789012",
      "IpamPoolId": "ipam-pool-02ec043a19bbe5d08",
      "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-02ec043a19bbe5d08",
      "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
      "IpamScopeType": "private",
      "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
      "IpamRegion": "us-east-1",
      "Locale": "None",
      "PoolDepth": 1,
      "State": "create-complete",
      "AutoImport": true,
      "AddressFamily": "ipv4",
      "AllocationMinNetmaskLength": 16,
      "AllocationMaxNetmaskLength": 26,
      "AllocationDefaultNetmaskLength": 24,
      "AllocationResourceTags": [
        {
          "Key": "Environment",
          "Value": "Preprod"
        }
      ],
      "Tags": [
        {
          "Key": "Name",
          "Value": "Preprod pool"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeIpamPools](#) in *AWS CLI Command Reference*.

describe-ipam-resource-discoveries

The following code example shows how to use `describe-ipam-resource-discoveries`.

AWS CLI

Example 1: View complete details of resource discoveries

In this example, you're a delegated IPAM admin who wants to create and share a resource discovery with the IPAM admin in another AWS Organization so that the admin can manage and monitor the IP addresses of resources in your organization.

This example may be useful if:

You tried to create a resource discovery, but you got an error that you've reached your limit of 1. You realize that you may have already created a resource discovery and you want to view it in your account. You have resources in a Region that are not being discovered by the IPAM. You want to view the `--operating-regions` defined for the resource and ensure that you've added the right Region as an operating Region so that the resources there can be discovered.

The following `describe-ipam-resource-discoveries` example lists the details of the resource discovery in your AWS account. You can have one resource discovery per AWS Region.

```
aws ec2 describe-ipam-resource-discoveries \
  --region us-east-1
```

Output:

```
{
  "IpamResourceDiscoveries": [
    {
      "OwnerId": "149977607591",
      "IpamResourceDiscoveryId": "ipam-res-disco-0f8bdee9067137c0d",
      "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-
discovery/ipam-res-disco-0f8bdee9067137c0d",
      "IpamResourceDiscoveryRegion": "us-east-1",
      "OperatingRegions": [
        {
          "RegionName": "us-east-1"
        }
      ],
      "IsDefault": false,
      "State": "create-complete",
      "Tags": []
    }
  ]
}
```

```
}
```

For more information, see [Integrate IPAM with accounts outside of your organization](#) in the *Amazon VPC IPAM User Guide*.

Example 2: View only resource discovery IDs

The following `describe-ipam-resource-discoveries` example lists the ID of the resource discovery in your AWS account. You can have one resource discovery per AWS Region.

```
aws ec2 describe-ipam-resource-discoveries \
  --query "IpamResourceDiscoveries[*].IpamResourceDiscoveryId" \
  --output text
```

Output:

```
ipam-res-disco-0481e39b242860333
```

For more information, see [Integrate IPAM with accounts outside of your organization](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DescribeIpamResourceDiscoveries](#) in *AWS CLI Command Reference*.

describe-ipam-resource-discovery-associations

The following code example shows how to use `describe-ipam-resource-discovery-associations`.

AWS CLI

To view all resource discovery associations with your IPAM

In this example, you're a IPAM delegated admin who has associated resource discoveries with your IPAM to integrate other accounts with your IPAM. You've noticed that your IPAM is not discovering the resources in the operating Regions of the resource discovery as expected. You want to check the status and state of the resource discovery to ensure that the account that created it is still active and the resource discovery is still being shared.

The `--region` must be the home Region of your IPAM.

The following `describe-ipam-resource-discovery-associations` example lists the resource discovery associations in your AWS account.

```
aws ec2 describe-ipam-resource-discovery-associations \  
  --region us-east-1
```

Output:

```
{  
  "IpamResourceDiscoveryAssociations": [  
    {  
      "OwnerId": "320805250157",  
      "IpamResourceDiscoveryAssociationId": "ipam-res-disco-  
assoc-05e6b45eca5bf5cf7",  
      "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::320805250157:ipam-  
resource-discovery-association/ipam-res-disco-  
assoc-05e6b45eca5bf5cf7",  
      "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",  
      "IpamId": "ipam-005f921c17ebd5107",  
      "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",  
      "IpamRegion": "us-east-1",  
      "IsDefault": true,  
      "ResourceDiscoveryStatus": "active",  
      "State": "associate-complete",  
      "Tags": []  
    },  
    {  
      "OwnerId": "149977607591",  
      "IpamResourceDiscoveryAssociationId": "ipam-res-disco-  
assoc-0dfd21ae189ab5f62",  
      "IpamResourceDiscoveryAssociationArn": "arn:aws:ec2::149977607591:ipam-  
resource-discovery-association/ipam-res-disco-  
assoc-0dfd21ae189ab5f62",  
      "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",  
      "IpamId": "ipam-005f921c17ebd5107",  
      "IpamArn": "arn:aws:ec2::149977607591:ipam/ipam-005f921c17ebd5107",  
      "IpamRegion": "us-east-1",  
      "IsDefault": false,  
      "ResourceDiscoveryStatus": "active",  
      "State": "create-complete",  
      "Tags": []  
    }  
  ]  
}
```

In this example, after running this command, you notice that you have one non-default resource discovery ("IsDefault": false ``) that is ``"ResourceDiscoveryStatus":

"not-found" and "State": "create-complete". The resource discovery owner's account has been closed. If, in another case, you notice that is "ResourceDiscoveryStatus": "not-found" and "State": "associate-complete", this indicates that one of the following has happened:

The resource discovery was deleted by the resource discovery owner. The resource discovery owner unshared the resource discovery.

For more information, see [Integrate IPAM with accounts outside of your organization](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DescribeIpamResourceDiscoveryAssociations](#) in *AWS CLI Command Reference*.

describe-ipam-scopes

The following code example shows how to use describe-ipam-scopes.

AWS CLI

To view the details for an IPAM scope

The following describe-ipam-scopes example shows the details for scopes.

```
aws ec2 describe-ipam-scopes \
  --filters Name=owner-id,Values=123456789012 Name=ipam-
  id,Values=ipam-08440e7a3acde3908
```

Output:

```
{
  "IpamScopes": [
    {
      "OwnerId": "123456789012",
      "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",
      "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
      "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
      "IpamRegion": "us-east-1",
      "IpamScopeType": "private",
      "IsDefault": true,
      "PoolCount": 2,
```

```

    "State": "create-complete",
    "Tags": []
  },
  {
    "OwnerId": "123456789012",
    "IpamScopeId": "ipam-scope-0b9eed026396dbc16",
    "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-0b9eed026396dbc16",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "IpamScopeType": "public",
    "IsDefault": true,
    "PoolCount": 0,
    "State": "create-complete",
    "Tags": []
  },
  {
    "OwnerId": "123456789012",
    "IpamScopeId": "ipam-scope-0f1aff29486355c22",
    "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-0f1aff29486355c22",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "IpamScopeType": "private",
    "IsDefault": false,
    "Description": "Example description",
    "PoolCount": 0,
    "State": "create-complete",
    "Tags": [
      {
        "Key": "Name",
        "Value": "Example name value"
      }
    ]
  }
]
}

```

- For API details, see [DescribeIpamScopes](#) in *AWS CLI Command Reference*.

describe-ipams

The following code example shows how to use `describe-ipams`.

AWS CLI

To view the details for an IPAM

The following `describe-ipams` example shows the details of an IPAM.

```
aws ec2 describe-ipams \  
  --filters Name=owner-id,Values=123456789012
```

Output:

```
{  
  "Ipams": [  
    {  
      "OwnerId": "123456789012",  
      "IpamId": "ipam-08440e7a3acde3908",  
      "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",  
      "IpamRegion": "us-east-1",  
      "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",  
      "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",  
      "ScopeCount": 3,  
      "OperatingRegions": [  
        {  
          "RegionName": "us-east-1"  
        },  
        {  
          "RegionName": "us-east-2"  
        },  
        {  
          "RegionName": "us-west-1"  
        }  
      ],  
      "State": "create-complete",  
      "Tags": [  
        {  
          "Key": "Name",  
          "Value": "ExampleIPAM"  
        }  
      ]  
    }  
  ]  
}
```

- For API details, see [DescribeIpam](#) in *AWS CLI Command Reference*.

describe-ipv6-pools

The following code example shows how to use `describe-ipv6-pools`.

AWS CLI

To describe your IPv6 address pools

The following `describe-ipv6-pools` example displays details for all of your IPv6 address pools.

```
aws ec2 describe-ipv6-pools
```

Output:

```
{
  "Ipv6Pools": [
    {
      "PoolId": "ipv6pool-ec2-012345abc12345abc",
      "PoolCidrBlocks": [
        {
          "Cidr": "2001:db8:123::/48"
        }
      ],
      "Tags": [
        {
          "Key": "pool-1",
          "Value": "public"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeIpv6Pools](#) in *AWS CLI Command Reference*.

describe-key-pairs

The following code example shows how to use `describe-key-pairs`.

AWS CLI

To display a key pair

The following `describe-key-pairs` example displays information about the specified key pair.

```
aws ec2 describe-key-pairs \  
  --key-names my-key-pair
```

Output:

```
{  
  "KeyPairs": [  
    {  
      "KeyPairId": "key-0b94643da6EXAMPLE",  
      "KeyFingerprint":  
"1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca:9f:f5:f1:6f",  
      "KeyName": "my-key-pair",  
      "KeyType": "rsa",  
      "Tags": [],  
      "CreateTime": "2022-05-27T21:51:16.000Z"  
    }  
  ]  
}
```

For more information, see [Describe public keys](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeKeyPairs](#) in *AWS CLI Command Reference*.

describe-launch-template-versions

The following code example shows how to use `describe-launch-template-versions`.

AWS CLI

To describe launch template versions

This example describes the versions of the specified launch template.

Command:

```
aws ec2 describe-launch-template-versions --launch-template-id lt-068f72b72934aff71
```

Output:

```
{
  "LaunchTemplateVersions": [
    {
      "LaunchTemplateId": "lt-068f72b72934aff71",
      "LaunchTemplateName": "Webservers",
      "VersionNumber": 3,
      "CreatedBy": "arn:aws:iam::123456789102:root",
      "LaunchTemplateData": {
        "KeyName": "kp-us-east",
        "ImageId": "ami-6057e21a",
        "InstanceType": "t2.small",
        "NetworkInterfaces": [
          {
            "SubnetId": "subnet-7b16de0c",
            "DeviceIndex": 0,
            "Groups": [
              "sg-7c227019"
            ]
          }
        ]
      },
      "DefaultVersion": false,
      "CreateTime": "2017-11-20T13:19:54.000Z"
    },
    {
      "LaunchTemplateId": "lt-068f72b72934aff71",

        }
      ]
    },
    "DefaultVersion": true,
    "CreateTime": "2017-11-20T12:52:33.000Z"
  }
]
}

```

- For API details, see [DescribeLaunchTemplateVersions](#) in *AWS CLI Command Reference*.

describe-launch-templates

The following code example shows how to use describe-launch-templates.

AWS CLI

To describe launch templates

This example describes your launch templates.

Command:

```
aws ec2 describe-launch-templates
```

Output:

```
{
  "LaunchTemplates": [
    {
      "LatestVersionNumber": 2,
      "LaunchTemplateId": "lt-0e06d290751193123",

      "CreatedBy": "arn:aws:sts::123456789012:assumed-role/AdminRole/i-03ee35176e2e5aabc",
      "CreateTime": "2017-12-01T08:19:48.000Z"
    }
  ]
}
```

- For API details, see [DescribeLaunchTemplates](#) in *AWS CLI Command Reference*.

describe-local-gateway-route-table-virtual-interface-group-associations

The following code example shows how to use `describe-local-gateway-route-table-virtual-interface-group-associations`.

AWS CLI

To describe associations between virtual interface groups and local gateway route tables

The following `describe-local-gateway-route-table-virtual-interface-group-associations` example describes the associations between virtual interface groups and local gateway route tables in your AWS account.

```
aws ec2 describe-local-gateway-route-table-virtual-interface-group-associations
```

Output:

```
{
  "LocalGatewayRouteTableVirtualInterfaceGroupAssociations": [
    {
      "LocalGatewayRouteTableVirtualInterfaceGroupAssociationId": "lgw-vif-grp-assoc-07145b276bEXAMPLE",
      "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
      "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
      "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
      "LocalGatewayRouteTableArn": "arn:aws:ec2:us-west-2:123456789012:local-gateway-route-table/lgw-rtb-059615ef7dEXAMPLE",
      "OwnerId": "123456789012",
      "State": "associated",
      "Tags": []
    }
  ]
}
```

For more information, see [Working with local gateways](#) in the *AWS Outposts User Guide*.

- For API details, see [DescribeLocalGatewayRouteTableVirtualInterfaceGroupAssociations](#) in *AWS CLI Command Reference*.

describe-local-gateway-route-table-vpc-associations

The following code example shows how to use `describe-local-gateway-route-table-vpc-associations`.

AWS CLI

To describe the associations between VPCs and local gateway route tables

The following `describe-local-gateway-route-table-vpc-associations` example displays information about the specified association between VPCs and local gateway route tables.

```
aws ec2 describe-local-gateway-route-table-vpc-associations \
  --local-gateway-route-table-vpc-association-ids lgw-vpc-assoc-0e0f27af15EXAMPLE
```

Output:

```
{
  "LocalGatewayRouteTableVpcAssociation": {
    "LocalGatewayRouteTableVpcAssociationId": "lgw-vpc-assoc-0e0f27af1EXAMPLE",
    "LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE",
    "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
    "VpcId": "vpc-0efe9bde08EXAMPLE",
    "State": "associated"
  }
}
```

For more information, see [Local gateway route tables](#) in the *Outposts User Guide*.

- For API details, see [DescribeLocalGatewayRouteTableVpcAssociations](#) in *AWS CLI Command Reference*.

describe-local-gateway-route-tables

The following code example shows how to use `describe-local-gateway-route-tables`.

AWS CLI

To describe your Local Gateway Route Tables

The following `describe-local-gateway-route-tables` example displays details about the local gateway route tables.

```
aws ec2 describe-local-gateway-route-tables
```

Output:

```
{
  "LocalGatewayRouteTables": [
    {
      "LocalGatewayRouteTableId": "lgw-rtb-059615ef7deEXAMPLE",
      "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",
      "OutpostArn": "arn:aws:outposts:us-west-2:111122223333:outpost/
op-0dc11b66edEXAMPLE",
      "State": "available"
    }
  ]
}
```

- For API details, see [DescribeLocalGatewayRouteTables](#) in *AWS CLI Command Reference*.

`describe-local-gateway-virtual-interface-groups`

The following code example shows how to use `describe-local-gateway-virtual-interface-groups`.

AWS CLI

To describe local gateway virtual interface groups

The following `describe-local-gateway-virtual-interface-groups` example describes the local gateway virtual interface groups in your AWS account.

```
aws ec2 describe-local-gateway-virtual-interface-groups
```

Output:

```
{
  "LocalGatewayVirtualInterfaceGroups": [
    {
```

```

    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
    "LocalGatewayVirtualInterfaceIds": [
      "lgw-vif-01a23bc4d5EXAMPLE",
      "lgw-vif-543ab21012EXAMPLE"
    ],
    "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
    "OwnerId": "123456789012",
    "Tags": []
  }
]
}

```

For more information, see [Working with local gateways](#) in the *AWS Outposts User Guide*.

- For API details, see [DescribeLocalGatewayVirtualInterfaceGroups](#) in *AWS CLI Command Reference*.

describe-local-gateway-virtual-interfaces

The following code example shows how to use `describe-local-gateway-virtual-interfaces`.

AWS CLI

To describe local gateway virtual interfaces

The following `describe-local-gateway-virtual-interfaces` example describes the local gateway virtual interfaces in your AWS account.

```
aws ec2 describe-local-gateway-virtual-interfaces
```

Output:

```

{
  "LocalGatewayVirtualInterfaces": [
    {
      "LocalGatewayVirtualInterfaceId": "lgw-vif-01a23bc4d5EXAMPLE",
      "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
      "Vlan": 2410,
      "LocalAddress": "0.0.0.0/0",
      "PeerAddress": "0.0.0.0/0",
    }
  ]
}

```

```

        "LocalBgpAsn": 65010,
        "PeerBgpAsn": 65000,
        "OwnerId": "123456789012",
        "Tags": []
    },
    {
        "LocalGatewayVirtualInterfaceId": "lgw-vif-543ab21012EXAMPLE",
        "LocalGatewayId": "lgw-0ab1c23d4eEXAMPLE",
        "Vlan": 2410,
        "LocalAddress": "0.0.0.0/0",
        "PeerAddress": "0.0.0.0/0",
        "LocalBgpAsn": 65010,
        "PeerBgpAsn": 65000,
        "OwnerId": "123456789012",
        "Tags": []
    }
]
}

```

For more information, see [Working with local gateways](#) in the *AWS Outposts User Guide*.

- For API details, see [DescribeLocalGatewayVirtualInterfaces](#) in *AWS CLI Command Reference*.

describe-local-gateways

The following code example shows how to use `describe-local-gateways`.

AWS CLI

To describe your Local Gateways

The following `describe-local-gateways` example displays details for the local gateways that are available to you.

```
aws ec2 describe-local-gateways
```

Output:

```

{
  "LocalGateways": [
    {
      "LocalGatewayId": "lgw-09b493aa7cEXAMPLE",

```

```

        "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0dc11b66ed59f995a",
        "OwnerId": "123456789012",
        "State": "available"
    }
]
}

```

- For API details, see [DescribeLocalGateways](#) in *AWS CLI Command Reference*.

describe-managed-prefix-lists

The following code example shows how to use `describe-managed-prefix-lists`.

AWS CLI

To describe managed prefix lists

The following `describe-managed-prefix-lists` example describes the prefix lists owned by AWS account 123456789012.

```

aws ec2 describe-managed-prefix-lists \
  --filters Name=owner-id,Values=123456789012

```

Output:

```

{
  "PrefixLists": [
    {
      "PrefixListId": "pl-11223344556677aab",
      "AddressFamily": "IPv6",
      "State": "create-complete",
      "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-11223344556677aab",
      "PrefixListName": "vpc-ipv6-cidrs",
      "MaxEntries": 25,
      "Version": 1,
      "Tags": [],
      "OwnerId": "123456789012"
    },
    {
      "PrefixListId": "pl-0123456abcabcabc1",

```

```
    "AddressFamily": "IPv4",
    "State": "active",
    "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
    "PrefixListName": "vpc-cidrs",
    "MaxEntries": 10,
    "Version": 1,
    "Tags": [],
    "OwnerId": "123456789012"
  }
]
}
```

For more information, see [Managed prefix lists](#) in the *Amazon VPC User Guide*.

- For API details, see [DescribeManagedPrefixLists](#) in *AWS CLI Command Reference*.

describe-moving-addresses

The following code example shows how to use `describe-moving-addresses`.

AWS CLI

To describe your moving addresses

This example describes all of your moving Elastic IP addresses.

Command:

```
aws ec2 describe-moving-addresses
```

Output:

```
{
  "MovingAddressStatuses": [
    {
      "PublicIp": "198.51.100.0",
      "MoveStatus": "MovingToVpc"
    }
  ]
}
```

This example describes all addresses that are moving to the EC2-VPC platform.

Command:

```
aws ec2 describe-moving-addresses --filters Name=moving-status,Values=MovingToVpc
```

- For API details, see [DescribeMovingAddresses](#) in *AWS CLI Command Reference*.

describe-nat-gateways

The following code example shows how to use describe-nat-gateways.

AWS CLI

Example 1: To describe a public NAT gateway

The following describe-nat-gateways example describes the specified public NAT gateway.

```
aws ec2 describe-nat-gateways \
  --nat-gateway-id nat-01234567890abcdef
```

Output:

```
{
  "NatGateways": [
    {
      "CreateTime": "2023-08-25T01:56:51.000Z",
      "NatGatewayAddresses": [
        {
          "AllocationId": "eipalloc-0790180cd2EXAMPLE",
          "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
          "PrivateIp": "10.0.0.211",
          "PublicIp": "54.85.121.213",
          "AssociationId": "eipassoc-04d295cc9b8815b24",
          "IsPrimary": true,
          "Status": "succeeded"
        },
        {
          "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
          "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
          "PrivateIp": "10.0.0.74",
```

```

        "PublicIp": "3.211.231.218",
        "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
        "IsPrimary": false,
        "Status": "succeeded"
    }
],
"NatGatewayId": "nat-01234567890abcdef",
"State": "available",
"SubnetId": "subnet-655eab5f08EXAMPLE",
"VpcId": "vpc-098eb5ef58EXAMPLE",
"Tags": [
    {
        "Key": "Name",
        "Value": "public-nat"
    }
],
"ConnectivityType": "public"
}
]
}

```

Example 2: To describe a private NAT gateway

The following `describe-nat-gateways` example describes the specified private NAT gateway.

```

aws ec2 describe-nat-gateways \
  --nat-gateway-id nat-1234567890abcdef0

```

Output:

```

{
  "NatGateways": [
    {
      "CreateTime": "2023-08-25T00:50:05.000Z",
      "NatGatewayAddresses": [
        {
          "NetworkInterfaceId": "eni-0065a61b324d1897a",
          "PrivateIp": "10.0.20.240",
          "IsPrimary": true,
          "Status": "succeeded"
        }
      ],
    }
  ],
}

```

```

        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "PrivateIp": "10.0.20.33",
            "IsPrimary": false,
            "Status": "succeeded"
        },
        {
            "NetworkInterfaceId": "eni-0065a61b324d1897a",
            "PrivateIp": "10.0.20.197",
            "IsPrimary": false,
            "Status": "succeeded"
        }
    ],
    "NatGatewayId": "nat-1234567890abcdef0",
    "State": "available",
    "SubnetId": "subnet-08fc749671EXAMPLE",
    "VpcId": "vpc-098eb5ef58EXAMPLE",
    "Tags": [
        {
            "Key": "Name",
            "Value": "private-nat"
        }
    ],
    "ConnectivityType": "private"
}
]
}

```

For more information, see [NAT gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [DescribeNatGateways](#) in *AWS CLI Command Reference*.

describe-network-acls

The following code example shows how to use `describe-network-acls`.

AWS CLI

To describe your network ACLs

The following `describe-network-acls` example retrieves details about your network ACLs.

```
aws ec2 describe-network-acls
```

Output:

```
{
  "NetworkAcls": [
    {
      "Associations": [
        {
          "NetworkAclAssociationId": "aclassoc-0c1679dc41EXAMPLE",
          "NetworkAclId": "acl-0ea1f54ca7EXAMPLE",
          "SubnetId": "subnet-0931fc2fa5EXAMPLE"
        }
      ],
      "Entries": [
        {
          "CidrBlock": "0.0.0.0/0",
          "Egress": true,
          "Protocol": "-1",
          "RuleAction": "allow",
          "RuleNumber": 100
        },
        {
          "CidrBlock": "0.0.0.0/0",
          "Egress": true,
          "Protocol": "-1",
          "RuleAction": "deny",
          "RuleNumber": 32767
        },

describe-network-insights-access-scope-analyses

The following code example shows how to use `describe-network-insights-access-scope-analyses`.

AWS CLI

To describe Network Insights access scope analyses

The following `describe-network-insights-access-scope-analyses` example describes the access scope analysis in your AWS account.

```
aws ec2 describe-network-insights-access-scope-analyses \
  --region us-east-1
```

Output:

```
{
  "NetworkInsightsAccessScopeAnalyses": [
    {
      "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111",
      "NetworkInsightsAccessScopeAnalysisArn": "arn:aws:ec2:us-
east-1:123456789012:network-insights-access-scope-analysis/nisa-123456789111",
      "NetworkInsightsAccessScopeId": "nis-123456789222",
      "Status": "succeeded",
      "StartDate": "2022-01-25T19:45:36.842000+00:00",
      "FindingsFound": "true",
      "Tags": []
    }
  ]
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the *Network Access Analyzer Guide*.

- For API details, see [DescribeNetworkInsightsAccessScopeAnalyses](#) in *AWS CLI Command Reference*.

describe-network-insights-access-scopes

The following code example shows how to use `describe-network-insights-access-scopes`.

AWS CLI

To describe Network Insights access scopes

The following `describe-network-insights-access-scopes` example describes the access-scope analyses in your AWS account.

```
aws ec2 describe-network-insights-access-scopes \
```

```
--region us-east-1
```

Output:

```
{
  "NetworkInsightsAccessScopes": [
    {
      "NetworkInsightsAccessScopeId": "nis-123456789111",
      "NetworkInsightsAccessScopeArn": "arn:aws:ec2:us-
east-1:123456789012:network-insights-access-scope/nis-123456789111",

      "UpdatedDate": "2021-11-29T21:12:41.416000+00:00",
      "Tags": []
    }
  ]
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the *Network Access Analyzer Guide*.

- For API details, see [DescribeNetworkInsightsAccessScopes](#) in *AWS CLI Command Reference*.

describe-network-insights-analyses

The following code example shows how to use `describe-network-insights-analyses`.

AWS CLI

To view the results of a path analysis

The following `describe-network-insights-analyses` example describes the specified analysis. In this example, the source is an internet gateway, the destination is an EC2 instance, and the protocol is TCP. The analysis succeeded (Status is succeeded) and the path is not reachable (NetworkPathFound is false). The explanation code ENI_SG_RULES_MISMATCH indicates that the security group for the instance does not contain a rule that allows traffic on the destination port.

```
aws ec2 describe-network-insights-analyses \
  --network-insights-analysis-ids nia-02207aa13eb480c7a
```

Output:

```

{
  "NetworkInsightsAnalyses": [
    {
      "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
      "NetworkInsightsAnalysisArn": "arn:aws:ec2:us-
east-1:123456789012:network-insights-analysis/nia-02207aa13eb480c7a",

- For API details, see [DescribeNetworkInsightsAnalyses](#) in *AWS CLI Command Reference*.

describe-network-insights-paths

The following code example shows how to use `describe-network-insights-paths`.

AWS CLI

To describe a path

The following `describe-network-insights-paths` example describes the specified path.

```
aws ec2 describe-network-insights-paths \  
  --network-insights-path-ids nip-0b26f224f1d131fa8
```

Output:

```
{  
  "NetworkInsightsPaths": [  
    {  
      "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",  
      "NetworkInsightsPathArn": "arn:aws:ec2:us-east-1:123456789012:network-  
insights-path/nip-0b26f224f1d131fa8",  
      "CreateDate": "2021-01-20T22:43:46.933Z",  
      "Source": "igw-0797cccdc9d73b0e5",  
      "Destination": "i-0495d385ad28331c7",  
      "Protocol": "tcp"  
    }  
  ]  
}
```

For more information, see [Getting started using the AWS CLI](#) in the *Reachability Analyzer Guide*.

- For API details, see [DescribeNetworkInsightsPaths](#) in *AWS CLI Command Reference*.

describe-network-interface-attribute

The following code example shows how to use `describe-network-interface-attribute`.

AWS CLI

To describe the attachment attribute of a network interface

This example command describes the attachment attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute attachment
```

Output:

```
{
  "NetworkInterfaceId": "eni-686ea200",
  "Attachment": {
    "Status": "attached",
    "DeviceIndex": 0,
    "AttachTime": "2015-05-21T20:02:20.000Z",
    "InstanceId": "i-1234567890abcdef0",
    "DeleteOnTermination": true,
    "AttachmentId": "eni-attach-43348162",
    "InstanceOwnerId": "123456789012"
  }
}
```

To describe the description attribute of a network interface

This example command describes the description attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --attribute description
```

Output:

```
{
  "NetworkInterfaceId": "eni-686ea200",
  "Description": {
    "Value": "My description"
  }
}
```

```
}  
}
```

To describe the groupSet attribute of a network interface

This example command describes the groupSet attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --  
attribute groupSet
```

Output:

```
{  
  "NetworkInterfaceId": "eni-686ea200",  
  "Groups": [  
    {  
      "GroupName": "my-security-group",  
      "GroupId": "sg-903004f8"  
    }  
  ]  
}
```

To describe the sourceDestCheck attribute of a network interface

This example command describes the sourceDestCheck attribute of the specified network interface.

Command:

```
aws ec2 describe-network-interface-attribute --network-interface-id eni-686ea200 --  
attribute sourceDestCheck
```

Output:

```
{  
  "NetworkInterfaceId": "eni-686ea200",  
  "SourceDestCheck": {  
    "Value": true  
  }  
}
```

- For API details, see [DescribeNetworkInterfaceAttribute](#) in *AWS CLI Command Reference*.

describe-network-interface-permissions

The following code example shows how to use describe-network-interface-permissions.

AWS CLI

To describe your network interface permissions

This example describes all of your network interface permissions.

Command:

```
aws ec2 describe-network-interface-permissions
```

Output:

```
{
  "NetworkInterfacePermissions": [
    {
      "PermissionState": {
        "State": "GRANTED"
      },
      "NetworkInterfacePermissionId": "eni-perm-06fd19020ede149ea",
      "NetworkInterfaceId": "eni-b909511a",
      "Permission": "INSTANCE-ATTACH",
      "AwsAccountId": "123456789012"
    }
  ]
}
```

- For API details, see [DescribeNetworkInterfacePermissions](#) in *AWS CLI Command Reference*.

describe-network-interfaces

The following code example shows how to use describe-network-interfaces.

AWS CLI

To describe your network interfaces

This example describes all your network interfaces.

Command:

```
aws ec2 describe-network-interfaces
```

Output:

```
{
  "NetworkInterfaces": [
    {
      "Status": "in-use",
      "MacAddress": "02:2f:8f:b0:cf:75",
      "SourceDestCheck": true,
      "VpcId": "vpc-a01106c2",

    "OwnerId": "123456789012",
    "TagSet": [],
    "PrivateIpAddress": "10.0.1.149"
}
]
}

```

This example describes network interfaces that have a tag with the key Purpose and the value Prod.

Command:

```
aws ec2 describe-network-interfaces --filters Name=tag:Purpose,Values=Prod
```

Output:

```

{
  "NetworkInterfaces": [
    {
      "Status": "available",
      "MacAddress": "12:2c:bd:f9:bf:17",
      "SourceDestCheck": true,
      "VpcId": "vpc-8941ebec",

      "Value": "Prod",
      "Key": "Purpose"
    }
  ],
  "PrivateIpAddress": "10.0.1.55"
}
]
```

- For API details, see [DescribeNetworkInterfaces](#) in *AWS CLI Command Reference*.

describe-placement-groups

The following code example shows how to use describe-placement-groups.

AWS CLI

To describe your placement groups

This example command describes all of your placement groups.

Command:

```
aws ec2 describe-placement-groups
```

Output:

```
{
  "PlacementGroups": [
    {
      "GroupName": "my-cluster",
      "State": "available",
      "Strategy": "cluster"
    },
    ...
  ]
}
```

- For API details, see [DescribePlacementGroups](#) in *AWS CLI Command Reference*.

describe-prefix-lists

The following code example shows how to use `describe-prefix-lists`.

AWS CLI**To describe prefix lists**

This example lists all available prefix lists for the region.

Command:

```
aws ec2 describe-prefix-lists
```

Output:

```
{
  "PrefixLists": [
    {
      "PrefixListName": "com.amazonaws.us-east-1.s3",
      "Cidrs": [
        "54.231.0.0/17"
      ],
      "PrefixListId": "pl-63a5400a"
    }
  ]
}
```

```
]
}
```

- For API details, see [DescribePrefixLists](#) in *AWS CLI Command Reference*.

describe-principal-id-format

The following code example shows how to use `describe-principal-id-format`.

AWS CLI

To describe the ID format for IAM users and roles with long ID format enabled

The following `describe-principal-id-format` example describes the ID format for the root user, all IAM roles, and all IAM users with long ID format enabled.

```
aws ec2 describe-principal-id-format \
  --resource instance
```

Output:

```
{
  "Principals": [
    {
      "Arn": "arn:aws:iam::123456789012:root",
      "Statuses": [
        {
          "Deadline": "2016-12-15T00:00:00.000Z",
          "Resource": "reservation",
          "UseLongIds": true
        },
        {
          "Deadline": "2016-12-15T00:00:00.000Z",
          "Resource": "instance",
          "UseLongIds": true
        },
        {
          "Deadline": "2016-12-15T00:00:00.000Z",
          "Resource": "volume",
          "UseLongIds": true
        }
      ]
    }
  ]
}
```

```
    },  
    ...  
  ]  
}
```

- For API details, see [DescribePrincipalIdFormat](#) in *AWS CLI Command Reference*.

describe-public-ipv4-pools

The following code example shows how to use `describe-public-ipv4-pools`.

AWS CLI

To describe your public IPv4 address pools

The following `describe-public-ipv4-pools` example displays details about the address pools that were created when you provisioned public IPv4 address ranges using Bring Your Own IP Addresses (BYOIP).

```
aws ec2 describe-public-ipv4-pools
```

Output:

```
{  
  "PublicIpv4Pools": [  
    {  
      "PoolId": "ipv4pool-ec2-1234567890abcdef0",  
      "PoolAddressRanges": [  
        {  
          "FirstAddress": "203.0.113.0",  
          "LastAddress": "203.0.113.255",  
          "AddressCount": 256,  
          "AvailableAddressCount": 256  
        }  
      ],  
      "TotalAddressCount": 256,  
      "TotalAvailableAddressCount": 256  
    }  
  ]  
}
```

- For API details, see [DescribePublicIpv4Pools](#) in *AWS CLI Command Reference*.

describe-regions

The following code example shows how to use `describe-regions`.

AWS CLI

Example 1: To describe all of your enabled Regions

The following `describe-regions` example describes all of the Regions that are enabled for your account.

```
aws ec2 describe-regions
```

Output:

```
{
  "Regions": [
    {
      "Endpoint": "ec2.eu-north-1.amazonaws.com",
      "RegionName": "eu-north-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.ap-south-1.amazonaws.com",
      "RegionName": "ap-south-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-3.amazonaws.com",
      "RegionName": "eu-west-3",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-2.amazonaws.com",
      "RegionName": "eu-west-2",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-1.amazonaws.com",
      "RegionName": "eu-west-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
```

```
    "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
    "RegionName": "ap-northeast-3",
    "OptInStatus": "opt-in-not-required"
  },
  {
    "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
    "RegionName": "ap-northeast-2",
    "OptInStatus": "opt-in-not-required"
  },
  {
    "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
    "RegionName": "ap-northeast-1",
    "OptInStatus": "opt-in-not-required"
  },
  {
    "Endpoint": "ec2.sa-east-1.amazonaws.com",
    "RegionName": "sa-east-1",
    "OptInStatus": "opt-in-not-required"
  },
  {
    "Endpoint": "ec2.ca-central-1.amazonaws.com",
    "RegionName": "ca-central-1",
    "OptInStatus": "opt-in-not-required"
  },
  {
    "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
    "RegionName": "ap-southeast-1",
    "OptInStatus": "opt-in-not-required"
  },
  {
    "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
    "RegionName": "ap-southeast-2",
    "OptInStatus": "opt-in-not-required"
  },
  {
    "Endpoint": "ec2.eu-central-1.amazonaws.com",
    "RegionName": "eu-central-1",
    "OptInStatus": "opt-in-not-required"
  },
  {
    "Endpoint": "ec2.us-east-1.amazonaws.com",
    "RegionName": "us-east-1",
    "OptInStatus": "opt-in-not-required"
  },
},
```

```
{
  "Endpoint": "ec2.us-east-2.amazonaws.com",
  "RegionName": "us-east-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.us-west-1.amazonaws.com",
  "RegionName": "us-west-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.us-west-2.amazonaws.com",
  "RegionName": "us-west-2",
  "OptInStatus": "opt-in-not-required"
}
]
```

For more information, see [Regions and Zones](#) in the *Amazon EC2 User Guide*.

Example 2: To describe enabled Regions with an endpoint whose name contains a specific string

The following `describe-regions` example describes all Regions that you have enabled that have the string "us" in the endpoint.

```
aws ec2 describe-regions \
  --filters "Name=endpoint,Values=*us*"
```

Output:

```
{
  "Regions": [
    {
      "Endpoint": "ec2.us-east-1.amazonaws.com",
      "RegionName": "us-east-1"
    },
    {
      "Endpoint": "ec2.us-east-2.amazonaws.com",
      "RegionName": "us-east-2"
    },
    {
      "Endpoint": "ec2.us-west-1.amazonaws.com",
```

```
        "RegionName": "us-west-1"
      },
      {
        "Endpoint": "ec2.us-west-2.amazonaws.com",
        "RegionName": "us-west-2"
      }
    ]
  }
}
```

For more information, see [Regions and Zones](#) in the *Amazon EC2 User Guide*.

Example 3: To describe all Regions

The following `describe-regions` example describes all available Regions, including Regions that are disabled.

```
aws ec2 describe-regions \
  --all-regions
```

Output:

```
{
  "Regions": [
    {
      "Endpoint": "ec2.eu-north-1.amazonaws.com",
      "RegionName": "eu-north-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.ap-south-1.amazonaws.com",
      "RegionName": "ap-south-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-3.amazonaws.com",
      "RegionName": "eu-west-3",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-west-2.amazonaws.com",
      "RegionName": "eu-west-2",
      "OptInStatus": "opt-in-not-required"
    }
  ],
}
```

```
{
  "Endpoint": "ec2.eu-west-1.amazonaws.com",
  "RegionName": "eu-west-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-northeast-3.amazonaws.com",
  "RegionName": "ap-northeast-3",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.me-south-1.amazonaws.com",
  "RegionName": "me-south-1",
  "OptInStatus": "not-opted-in"
},
{
  "Endpoint": "ec2.ap-northeast-2.amazonaws.com",
  "RegionName": "ap-northeast-2",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-northeast-1.amazonaws.com",
  "RegionName": "ap-northeast-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.sa-east-1.amazonaws.com",
  "RegionName": "sa-east-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ca-central-1.amazonaws.com",
  "RegionName": "ca-central-1",
  "OptInStatus": "opt-in-not-required"
},
{
  "Endpoint": "ec2.ap-east-1.amazonaws.com",
  "RegionName": "ap-east-1",
  "OptInStatus": "not-opted-in"
},
{
  "Endpoint": "ec2.ap-southeast-1.amazonaws.com",
  "RegionName": "ap-southeast-1",
  "OptInStatus": "opt-in-not-required"
}
```

```
    },
    {
      "Endpoint": "ec2.ap-southeast-2.amazonaws.com",
      "RegionName": "ap-southeast-2",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.eu-central-1.amazonaws.com",
      "RegionName": "eu-central-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.us-east-1.amazonaws.com",
      "RegionName": "us-east-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.us-east-2.amazonaws.com",
      "RegionName": "us-east-2",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.us-west-1.amazonaws.com",
      "RegionName": "us-west-1",
      "OptInStatus": "opt-in-not-required"
    },
    {
      "Endpoint": "ec2.us-west-2.amazonaws.com",
      "RegionName": "us-west-2",
      "OptInStatus": "opt-in-not-required"
    }
  ]
}
```

For more information, see [Regions and Zones](#) in the *Amazon EC2 User Guide*.

Example 4: To list the Region names only

The following `describe-regions` example uses the `--query` parameter to filter the output and return only the names of the Regions as text.

```
aws ec2 describe-regions \
  --all-regions \
```

```
--query "Regions[].{Name:RegionName}" \  
--output text
```

Output:

```
eu-north-1  
ap-south-1  
eu-west-3  
eu-west-2  
eu-west-1  
ap-northeast-3  
ap-northeast-2  
me-south-1  
ap-northeast-1  
sa-east-1  
ca-central-1  
ap-east-1  
ap-southeast-1  
ap-southeast-2  
eu-central-1  
us-east-1  
us-east-2  
us-west-1  
us-west-2
```

For more information, see [Regions and Zones](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeRegions](#) in *AWS CLI Command Reference*.

describe-replace-root-volume-tasks

The following code example shows how to use `describe-replace-root-volume-tasks`.

AWS CLI

Example 1: To view information about a specific root volume replacement task

The following `describe-replace-root-volume-tasks` example describes root volume replacement task `replacevol-0111122223333abcd`.

```
aws ec2 describe-replace-root-volume-tasks \  
--replace-root-volume-task-ids replacevol-0111122223333abcd
```

Output:

```
{
  "ReplaceRootVolumeTasks": [
    {
      "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
      "Tags": [],
      "InstanceId": "i-0123456789abcdefa",
      "TaskState": "succeeded",
      "StartTime": "2022-03-14T15:16:28Z",
      "CompleteTime": "2022-03-14T15:16:52Z"
    }
  ]
}
```

For more information, see [Replace a root volume](#) in the *Amazon Elastic Compute Cloud User Guide*.

Example 2: To view information about all root volume replacement tasks for a specific instance

The following `describe-replace-root-volume-tasks` example describes all of the root volume replacement tasks for instance `i-0123456789abcdefa`.

```
aws ec2 describe-replace-root-volume-tasks \
  --filters Name=instance-id,Values=i-0123456789abcdefa
```

Output:

```
{
  "ReplaceRootVolumeTasks": [
    {
      "ReplaceRootVolumeTaskId": "replacevol-0111122223333abcd",
      "Tags": [],
      "InstanceId": "i-0123456789abcdefa",
      "TaskState": "succeeded",
      "StartTime": "2022-03-14T15:06:38Z",
      "CompleteTime": "2022-03-14T15:07:03Z"
    },
    {
      "ReplaceRootVolumeTaskId": "replacevol-0444455555555abcd",
      "Tags": [],

```

```
        "InstanceId": "i-0123456789abcdefa",
        "TaskState": "succeeded",
        "StartTime": "2022-03-14T15:16:28Z",
        "CompleteTime": "2022-03-14T15:16:52Z"
    }
]
}
```

For more information, see [Replace a root volume](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [DescribeReplaceRootVolumeTasks](#) in *AWS CLI Command Reference*.

describe-reserved-instances-listings

The following code example shows how to use `describe-reserved-instances-listings`.

AWS CLI

To describe a Reserved Instance listing

The following `describe-reserved-instances-listings` example retrieves information about the specified Reserved Instance listing.

```
aws ec2 describe-reserved-instances-listings \
    --reserved-instances-listing-id 5ec28771-05ff-4b9b-aa31-9e57dexample
```

This command produces no output.

- For API details, see [DescribeReservedInstancesListings](#) in *AWS CLI Command Reference*.

describe-reserved-instances-modifications

The following code example shows how to use `describe-reserved-instances-modifications`.

AWS CLI

To describe Reserved Instances modifications

This example command describes all the Reserved Instances modification requests that have been submitted for your account.

Command:

```
aws ec2 describe-reserved-instances-modifications
```

Output:

```
{
  "ReservedInstancesModifications": [
    {
      "Status": "fulfilled",
      "ModificationResults": [
        {
          "ReservedInstancesId": "93bbca2-62f1-4d9d-b225-16bada29e6c7",
          "TargetConfiguration": {
            "AvailabilityZone": "us-east-1b",
            "InstanceType": "m1.large",
            "InstanceCount": 3
          }
        },
        {
          "ReservedInstancesId": "1ba8e2e3-aabb-46c3-bcf5-3fe2fda922e6",
          "TargetConfiguration": {
            "AvailabilityZone": "us-east-1d",
            "InstanceType": "m1.xlarge",
            "InstanceCount": 1
          }
        }
      ],
      "EffectiveDate": "2015-08-12T17:00:00.000Z",
      "CreateDate": "2015-08-12T17:52:52.630Z",
      "UpdateDate": "2015-08-12T18:08:06.698Z",
      "ClientToken": "c9adb218-3222-4889-8216-0cf0e52dc37e",
      "ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-ab31-0f13aaf46687",
      "ReservedInstancesIds": [
        {
          "ReservedInstancesId": "b847fa93-e282-4f55-b59a-1342f5bd7c02"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeReservedInstancesModifications](#) in *AWS CLI Command Reference*.

describe-reserved-instances-offerings

The following code example shows how to use `describe-reserved-instances-offerings`.

AWS CLI

To describe Reserved Instances offerings

This example command describes all Reserved Instances available for purchase in the region.

Command:

```
aws ec2 describe-reserved-instances-offerings
```

Output:

```
{
  "ReservedInstancesOfferings": [
    {
      "OfferingType": "Partial Upfront",
      "AvailabilityZone": "us-east-1b",
      "InstanceTenancy": "default",
      "PricingDetails": [],
      "ProductDescription": "Red Hat Enterprise Linux",
      "UsagePrice": 0.0,
      "RecurringCharges": [
        {
          "Amount": 0.088,
          "Frequency": "Hourly"
        }
      ],
      "Marketplace": false,
      "CurrencyCode": "USD",
      "FixedPrice": 631.0,
      "Duration": 94608000,
      "ReservedInstancesOfferingId": "9a06095a-bdc6-47fe-a94a-2a382f016040",
      "InstanceType": "c1.medium"
    },
    {
      "OfferingType": "PartialUpfront",
```

```

    "AvailabilityZone": "us-east-1b",
    "InstanceTenancy": "default",
    "PricingDetails": [],
    "ProductDescription": "Linux/UNIX",
    "UsagePrice": 0.0,
    "RecurringCharges": [
      {
        "Amount": 0.028,
        "Frequency": "Hourly"
      }
    ],
    "Marketplace": false,
    "CurrencyCode": "USD",
    "FixedPrice": 631.0,
    "Duration": 94608000,
    "ReservedInstancesOfferingId": "bfbefc6c-0d10-418d-b144-7258578d329d",
    "InstanceType": "c1.medium"
  },
  ...
}

```

To describe your Reserved Instances offerings using options

This example lists Reserved Instances offered by AWS with the following specifications: t1.micro instance types, Windows (Amazon VPC) product, and Heavy Utilization offerings.

Command:

```
aws ec2 describe-reserved-instances-offerings --no-include-marketplace --instance-type "t1.micro" --product-description "Windows (Amazon VPC)" --offering-type "no upfront"
```

Output:

```

{
  "ReservedInstancesOfferings": [
    {
      "OfferingType": "No Upfront",
      "AvailabilityZone": "us-east-1b",
      "InstanceTenancy": "default",
      "PricingDetails": [],
      "ProductDescription": "Windows",
      "UsagePrice": 0.0,

```

```

    "RecurringCharges": [
      {
        "Amount": 0.015,
        "Frequency": "Hourly"
      }
    ],
    "Marketplace": false,
    "CurrencyCode": "USD",
    "FixedPrice": 0.0,
    "Duration": 31536000,
    "ReservedInstancesOfferingId": "c48ab04c-fe69-4f94-8e39-a23842292823",
    "InstanceType": "t1.micro"
  },
  ...
  {
    "OfferingType": "No Upfront",
    "AvailabilityZone": "us-east-1d",
    "InstanceTenancy": "default",
    "PricingDetails": [],
    "ProductDescription": "Windows (Amazon VPC)",
    "UsagePrice": 0.0,
    "RecurringCharges": [
      {
        "Amount": 0.015,
        "Frequency": "Hourly"
      }
    ],
    "Marketplace": false,
    "CurrencyCode": "USD",
    "FixedPrice": 0.0,
    "Duration": 31536000,
    "ReservedInstancesOfferingId": "3a98bf7d-2123-42d4-b4f5-8dbec4b06dc6",
    "InstanceType": "t1.micro"
  }
]
}

```

- For API details, see [DescribeReservedInstancesOfferings](#) in *AWS CLI Command Reference*.

describe-reserved-instances

The following code example shows how to use `describe-reserved-instances`.

AWS CLI

To describe your Reserved Instances

This example command describes the Reserved Instances that you own.

Command:

```
aws ec2 describe-reserved-instances
```

Output:

```
{
  "ReservedInstances": [
    {
      "ReservedInstancesId": "b847fa93-e282-4f55-b59a-1342fexample",
      "OfferingType": "No Upfront",
      "AvailabilityZone": "us-west-1c",
      "End": "2016-08-14T21:34:34.000Z",
      "ProductDescription": "Linux/UNIX",
      "UsagePrice": 0.00,
      "RecurringCharges": [
        {
          "Amount": 0.104,
          "Frequency": "Hourly"
        }
      ],
      "Start": "2015-08-15T21:34:35.086Z",
      "State": "active",
      "FixedPrice": 0.0,
      "CurrencyCode": "USD",
      "Duration": 31536000,
      "InstanceTenancy": "default",
      "InstanceType": "m3.medium",
      "InstanceCount": 2
    },
    ...
  ]
}
```

To describe your Reserved Instances using filters

This example filters the response to include only three-year, t2.micro Linux/UNIX Reserved Instances in us-west-1c.

Command:

```
aws ec2 describe-reserved-instances --filters Name=duration,Values=94608000
Name=instance-type,Values=t2.micro Name=product-description,Values=Linux/UNIX
Name=availability-zone,Values=us-east-1e
```

Output:

```
{
  "ReservedInstances": [
    {
      "ReservedInstancesId": "f127bd27-edb7-44c9-a0eb-0d7e09259af0",
      "OfferingType": "All Upfront",
      "AvailabilityZone": "us-east-1e",
      "End": "2018-03-26T21:34:34.000Z",
      "ProductDescription": "Linux/UNIX",
      "UsagePrice": 0.00,
      "RecurringCharges": [],
      "Start": "2015-03-27T21:34:35.848Z",
      "State": "active",
      "FixedPrice": 151.0,
      "CurrencyCode": "USD",
      "Duration": 94608000,
      "InstanceTenancy": "default",
      "InstanceType": "t2.micro",
      "InstanceCount": 1
    }
  ]
}
```

For more information, see *Using Amazon EC2 Instances in the AWS Command Line Interface User Guide*.

- For API details, see [DescribeReservedInstances](#) in *AWS CLI Command Reference*.

describe-route-tables

The following code example shows how to use describe-route-tables.

AWS CLI

To describe your route tables

The following `describe-route-tables` example retrieves the details about your route tables

```
aws ec2 describe-route-tables
```

Output:

```
{
  "RouteTables": [
    {
      "Associations": [
        {
          "Main": true,
          "RouteTableAssociationId": "rtbassoc-0df3f54e06EXAMPLE",
          "RouteTableId": "rtb-09ba434c1bEXAMPLE"
        }
      ],
      "PropagatingVgws": [],
      "RouteTableId": "rtb-09ba434c1bEXAMPLE",
      "Routes": [
        {
          "DestinationCidrBlock": "10.0.0.0/16",
          "GatewayId": "local",
          "Origin": "CreateRouteTable",
          "State": "active"
        },

describe-scheduled-instance-availability

The following code example shows how to use `describe-scheduled-instance-availability`.

AWS CLI

To describe an available schedule

This example describes a schedule that occurs every week on Sunday, starting on the specified date.

Command:

```

aws ec2 describe-scheduled-instance-availability --recurrence
Frequency=Weekly,Interval=1,OccurrenceDays=[1] --first-slot-start-time-range
EarliestTime=2016-01-31T00:00:00Z,LatestTime=2016-01-31T04:00:00Z

```

Output:

```

{
  "ScheduledInstanceAvailabilitySet": [
    {
      "AvailabilityZone": "us-west-2b",
      "TotalScheduledInstanceHours": 1219,
      "PurchaseToken": "eyJ2IjoiMSIsInMiOiJEsImMiOi...",
    }
  ]
}

```

```

    "MinTermDurationInDays": 366,
    "AvailableInstanceCount": 20,
    "Recurrence": {
      "OccurrenceDaySet": [
        1
      ],
      "Interval": 1,
      "Frequency": "Weekly",
      "OccurrenceRelativeToEnd": false
    },
    "Platform": "Linux/UNIX",
    "FirstSlotStartTime": "2016-01-31T00:00:00Z",
    "MaxTermDurationInDays": 366,
    "SlotDurationInHours": 23,
    "NetworkPlatform": "EC2-VPC",
    "InstanceType": "c4.large",
    "HourlyPrice": "0.095"
  },
  ...
]
}

```

To narrow the results, you can add filters that specify the operating system, network, and instance type.

Command:

```
--filters Name=platform,Values=Linux/UNIX Name=network-platform,Values=EC2-VPC
Name=instance-type,Values=c4.large
```

- For API details, see [DescribeScheduledInstanceAvailability](#) in *AWS CLI Command Reference*.

describe-scheduled-instances

The following code example shows how to use `describe-scheduled-instances`.

AWS CLI

To describe your Scheduled Instances

This example describes the specified Scheduled Instance.

Command:

```
aws ec2 describe-scheduled-instances --scheduled-instance-ids
sci-1234-1234-1234-1234-123456789012
```

Output:

```
{
  "ScheduledInstanceSet": [
    {
      "AvailabilityZone": "us-west-2b",
      "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
      "HourlyPrice": "0.095",
      "CreateDate": "2016-01-25T21:43:38.612Z",
      "Recurrence": {
        "OccurrenceDaySet": [
          1
        ],
        "Interval": 1,
        "Frequency": "Weekly",
        "OccurrenceRelativeToEnd": false,
        "OccurrenceUnit": ""
      },
      "Platform": "Linux/UNIX",
      "TermEndDate": "2017-01-31T09:00:00Z",
      "InstanceCount": 1,
      "SlotDurationInHours": 32,
      "TermStartDate": "2016-01-31T09:00:00Z",
      "NetworkPlatform": "EC2-VPC",
      "TotalScheduledInstanceHours": 1696,
      "NextSlotStartTime": "2016-01-31T09:00:00Z",
      "InstanceType": "c4.large"
    }
  ]
}
```

This example describes all your Scheduled Instances.

Command:

```
aws ec2 describe-scheduled-instances
```

- For API details, see [DescribeScheduledInstances](#) in *AWS CLI Command Reference*.

describe-security-group-references

The following code example shows how to use `describe-security-group-references`.

AWS CLI

To describe security group references

This example describes the security group references for `sg-bbbb2222`. The response indicates that security group `sg-bbbb2222` is being referenced by a security group in VPC `vpc-aaaaaaaa`.

Command:

```
aws ec2 describe-security-group-references --group-id sg-bbbbb22222
```

Output:

```
{
  "SecurityGroupsReferenceSet": [
    {
      "ReferencingVpcId": "vpc-aaaaaaaa ",
      "GroupId": "sg-bbbbb22222",
      "VpcPeeringConnectionId": "pcx-b04deed9"
    }
  ]
}
```

- For API details, see [DescribeSecurityGroupReferences](#) in *AWS CLI Command Reference*.

describe-security-group-rules

The following code example shows how to use `describe-security-group-rules`.

AWS CLI

Example 1: To describe the security group rules for a security group

The following `describe-security-group-rules` example describes the security group rules of a specified security group. Use the `filters` option to scope the results to a specific security group.

```
aws ec2 describe-security-group-rules \
  --filters Name="group-id",Values="sg-1234567890abcdef0"
```

Output:

```
{
  "SecurityGroupRules": [
    {
      "SecurityGroupRuleId": "sgr-abcdef01234567890",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "111122223333",
      "IsEgress": false,
      "IpProtocol": "-1",
      "FromPort": -1,
      "ToPort": -1,
      "ReferencedGroupInfo": {
        "GroupId": "sg-1234567890abcdef0",
        "UserId": "111122223333"
      },
      "Tags": []
    },
    {
      "SecurityGroupRuleId": "sgr-bcdef01234567890a",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "111122223333",
      "IsEgress": true,
      "IpProtocol": "-1",
      "FromPort": -1,
      "ToPort": -1,
      "CidrIpv6": "::/0",
      "Tags": []
    },
    {
      "SecurityGroupRuleId": "sgr-cdef01234567890ab",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "111122223333",
      "IsEgress": true,
      "IpProtocol": "-1",
      "FromPort": -1,
      "ToPort": -1,
      "CidrIpv4": "0.0.0.0/0",
      "Tags": []
    }
  ]
}
```

```
]
}
```

Example 2: To describe a security group rule

The following `describe-security-group-rules` example describes the specified security group rule.

```
aws ec2 describe-security-group-rules \
  --security-group-rule-ids sgr-cdef01234567890ab
```

Output:

```
{
  "SecurityGroupRules": [
    {
      "SecurityGroupId": "sgr-cdef01234567890ab",
      "GroupId": "sg-1234567890abcdef0",
      "GroupOwnerId": "111122223333",
      "IsEgress": true,
      "IpProtocol": "-1",
      "FromPort": -1,
      "ToPort": -1,
      "CidrIpv4": "0.0.0.0/0",
      "Tags": []
    }
  ]
}
```

For more information, see [Security group rules](#) in the *Amazon VPC User Guide*.

- For API details, see [DescribeSecurityGroupRules](#) in *AWS CLI Command Reference*.

describe-security-groups

The following code example shows how to use `describe-security-groups`.

AWS CLI

Example 1: To describe a security group

The following `describe-security-groups` example describes the specified security group.

```
aws ec2 describe-security-groups \  
  --group-ids sg-903004f8
```

Output:

```
{  
  "SecurityGroups": [  
    {  
      "IpPermissionsEgress": [  
        {  
          "IpProtocol": "-1",  
          "IpRanges": [  
            {  
              "CidrIp": "0.0.0.0/0"  
            }  
          ],  
          "UserIdGroupPairs": [],  
          "PrefixListIds": []  
        }  
      ],  
      "Description": "My security group",  
      "Tags": [  
        {  
          "Value": "SG1",  
          "Key": "Name"  
        }  
      ],  
      "IpPermissions": [  
        {  
          "IpProtocol": "-1",  
          "IpRanges": [],  
          "UserIdGroupPairs": [  
            {  
              "UserId": "123456789012",  
              "GroupId": "sg-903004f8"  
            }  
          ],  
          "PrefixListIds": []  
        }  
      ],  
      {  
        "PrefixListIds": [],  
        "FromPort": 22,  
        "IpRanges": [  

```

```
        {
            "Description": "Access from NY office",
            "CidrIp": "203.0.113.0/24"
        },
        {
            "ToPort": 22,
            "IpProtocol": "tcp",
            "UserIdGroupPairs": []
        }
    ],
    "GroupName": "MySecurityGroup",
    "VpcId": "vpc-1a2b3c4d",
    "OwnerId": "123456789012",
    "GroupId": "sg-903004f8",
}
]
```

Example 2: To describe security groups that have specific rules

The following `describe-security-groups` example uses filters to scope the results to security groups that have a rule that allows SSH traffic (port 22) and a rule that allows traffic from all addresses (`0.0.0.0/0`). The example uses the `--query` parameter to display only the names of the security groups. Security groups must match all filters to be returned in the results; however, a single rule does not have to match all filters. For example, the output returns a security group with a rule that allows SSH traffic from a specific IP address and another rule that allows HTTP traffic from all addresses.

```
aws ec2 describe-security-groups \
  --filters Name=ip-permission.from-port,Values=22 Name=ip-permission.to-
port,Values=22 Name=ip-permission.cidr,Values='0.0.0.0/0' \
  --query "SecurityGroups[*].[GroupName]" \
  --output text
```

Output:

```
default
my-security-group
web-servers
launch-wizard-1
```

Example 3: To describe security groups based on tags

The following `describe-security-groups` example uses filters to scope the results to security groups that include `test` in the security group name, and that have the tag `Test=To-delete`. The example uses the `--query` parameter to display only the names and IDs of the security groups.

```
aws ec2 describe-security-groups \
  --filters Name=group-name,Values=*test* Name=tag:Test,Values=To-delete \
  --query "SecurityGroups[*].{Name:GroupName, ID:GroupId}"
```

Output:

```
[
  {
    "Name": "testfornewinstance",
    "ID": "sg-33bb22aa"
  },
  {
    "Name": "newgrouptest",
    "ID": "sg-1a2b3c4d"
  }
]
```

For additional examples using tag filters, see [Working with tags](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeSecurityGroups](#) in *AWS CLI Command Reference*.

`describe-snapshot-attribute`

The following code example shows how to use `describe-snapshot-attribute`.

AWS CLI

To describe the snapshot attributes for a snapshot

The following `describe-snapshot-attribute` example lists the accounts with which a snapshot is shared.

```
aws ec2 describe-snapshot-attribute \
  --snapshot-id snap-01234567890abcdef \
```

```
--attribute createVolumePermission
```

Output:

```
{
  "SnapshotId": "snap-01234567890abcdef",
  "CreateVolumePermissions": [
    {
      "UserId": "123456789012"
    }
  ]
}
```

For more information, see [Share an Amazon EBS snapshot](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [DescribeSnapshotAttribute](#) in *AWS CLI Command Reference*.

describe-snapshot-tier-status

The following code example shows how to use `describe-snapshot-tier-status`.

AWS CLI

To view archival information about an archived snapshot

The following `describe-snapshot-tier-status` example provides archival information about an archived snapshot.

```
aws ec2 describe-snapshot-tier-status \
  --filters "Name=snapshot-id, Values=snap-01234567890abcdef"
```

Output:

```
{
  "SnapshotTierStatuses": [
    {
      "Status": "completed",
      "ArchivalCompleteTime": "2021-09-15T17:33:16.147Z",
      "LastTieringProgress": 100,
      "Tags": [],
      "VolumeId": "vol-01234567890abcdef",
    }
  ]
}
```

```

        "LastTieringOperationState": "archival-completed",
        "StorageTier": "archive",
        "OwnerId": "123456789012",
        "SnapshotId": "snap-01234567890abcdef",
        "LastTieringStartTime": "2021-09-15T16:44:37.574Z"
    }
]
}

```

For more information, see [View archived snapshots](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [DescribeSnapshotTierStatus](#) in *AWS CLI Command Reference*.

describe-snapshots

The following code example shows how to use describe-snapshots.

AWS CLI

Example 1: To describe a snapshot

The following describe-snapshots example describes the specified snapshot.

```

aws ec2 describe-snapshots \
  --snapshot-ids snap-1234567890abcdef0

```

Output:

```

{
  "Snapshots": [
    {
      "Description": "This is my snapshot",
      "Encrypted": false,
      "VolumeId": "vol-049df61146c4d7901",
      "State": "completed",
      "VolumeSize": 8,
      "StartTime": "2019-02-28T21:28:32.000Z",
      "Progress": "100%",
      "OwnerId": "012345678910",
      "SnapshotId": "snap-01234567890abcdef",
      "Tags": [
        {

```

```
        "Key": "Stack",
        "Value": "test"
      }
    ]
  }
}
```

For more information, see [Amazon EBS snapshots](#) in the *Amazon EC2 User Guide*.

Example 2: To describe snapshots based on filters

The following `describe-snapshots` example uses filters to scope the results to snapshots owned by your AWS account that are in the pending state. The example uses the `--query` parameter to display only the snapshot IDs and the time the snapshot was started.

```
aws ec2 describe-snapshots \
  --owner-ids self \
  --filters Name=status,Values=pending \
  --query "Snapshots[*].{ID:SnapshotId,Time:StartTime}"
```

Output:

```
[
  {
    "ID": "snap-1234567890abcdef0",
    "Time": "2019-08-04T12:48:18.000Z"
  },
  {
    "ID": "snap-066877671789bd71b",
    "Time": "2019-08-04T02:45:16.000Z"
  },
  ...
]
```

The following `describe-snapshots` example uses filters to scope the results to snapshots created from the specified volume. The example uses the `--query` parameter to display only the snapshot IDs.

```
aws ec2 describe-snapshots \
  --filters Name=volume-id,Values=049df61146c4d7901 \
  --query "Snapshots[*].[SnapshotId]" \
```

```
--output text
```

Output:

```
snap-1234567890abcdef0  
snap-08637175a712c3fb9  
...
```

For additional examples using filters, see [Listing and filtering your resources](#) in the *Amazon EC2 User Guide*.

Example 3: To describe snapshots based on tags

The following `describe-snapshots` example uses tag filters to scope the results to snapshots that have the tag `Stack=Prod`.

```
aws ec2 describe-snapshots \  
  --filters Name=tag:Stack,Values=prod
```

For an example of the output for `describe-snapshots`, see Example 1.

For additional examples using tag filters, see [Working with tags](#) in the *Amazon EC2 User Guide*.

Example 4: To describe snapshots based on age

The following `describe-snapshots` example uses JMESPath expressions to describe all snapshots created by your AWS account before the specified date. It displays only the snapshot IDs.

```
aws ec2 describe-snapshots \  
  --owner-ids 012345678910 \  
  --query "Snapshots[?(StartTime<='2020-03-31')].[SnapshotId]"
```

For additional examples using filters, see [Listing and filtering your resources](#) in the *Amazon EC2 User Guide*.

Example 5: To view only archived snapshots

The following `describe-snapshots` example lists only snapshots that are stored in the archive tier.

```
aws ec2 describe-snapshots \  
  --filters Name=archive-tier,Values=true
```

```
--filters "Name=storage-tier,Values=archive"
```

Output:

```
{
  "Snapshots": [
    {
      "Description": "Snap A",
      "Encrypted": false,
      "VolumeId": "vol-01234567890aaaaaa",
      "State": "completed",
      "VolumeSize": 8,
      "StartTime": "2021-09-07T21:00:00.000Z",
      "Progress": "100%",
      "OwnerId": "123456789012",
      "SnapshotId": "snap-01234567890aaaaaa",
      "StorageTier": "archive",
      "Tags": []
    },
  ]
}
```

For more information, see [View archived snapshots](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [DescribeSnapshots](#) in *AWS CLI Command Reference*.

describe-spot-datafeed-subscription

The following code example shows how to use `describe-spot-datafeed-subscription`.

AWS CLI**To describe Spot Instance datafeed subscription for an account**

This example command describes the data feed for the account.

Command:

```
aws ec2 describe-spot-datafeed-subscription
```

Output:

```
{
  "SpotDatafeedSubscription": {
    "OwnerId": "123456789012",
    "Prefix": "spotdata",
    "Bucket": "my-s3-bucket",
    "State": "Active"
  }
}
```

- For API details, see [DescribeSpotDatafeedSubscription](#) in *AWS CLI Command Reference*.

describe-spot-fleet-instances

The following code example shows how to use `describe-spot-fleet-instances`.

AWS CLI

To describe the Spot Instances associated with a Spot fleet

This example command lists the Spot instances associated with the specified Spot fleet.

Command:

```
aws ec2 describe-spot-fleet-instances --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
  "ActiveInstances": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "InstanceType": "m3.medium",
      "SpotInstanceRequestId": "sir-08b93456"
    },
    ...
  ],
  "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

- For API details, see [DescribeSpotFleetInstances](#) in *AWS CLI Command Reference*.

describe-spot-fleet-request-history

The following code example shows how to use `describe-spot-fleet-request-history`.

AWS CLI

To describe Spot fleet history

This example command returns the history for the specified Spot fleet starting at the specified time.

Command:

```
aws ec2 describe-spot-fleet-request-history --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE --start-time 2015-05-26T00:00:00Z
```

The following example output shows the successful launches of two Spot Instances for the Spot fleet.

Output:

```
{
  "HistoryRecords": [
    {
      "Timestamp": "2015-05-26T23:17:20.697Z",
      "EventInformation": {
        "EventSubType": "submitted"

describe-spot-fleet-requests

The following code example shows how to use `describe-spot-fleet-requests`.

AWS CLI

To describe your Spot fleet requests

This example describes all of your Spot fleet requests.

Command:

```
aws ec2 describe-spot-fleet-requests
```

Output:

```

{
  "SpotFleetRequestConfigs": [
    {
      "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
      "SpotFleetRequestConfig": {
        "TargetCapacity": 20,
        "LaunchSpecifications": [

```

```
    {
      "EbsOptimized": false,
      "NetworkInterfaces": [
        {
          "SubnetId": "subnet-a61dafcf",
          "DeviceIndex": 0,
          "DeleteOnTermination": false,
          "AssociatePublicIpAddress": true,
          "SecondaryPrivateIpAddressCount": 0
        }
      ],
      "InstanceType": "cc2.8xlarge",
      "ImageId": "ami-1a2b3c4d"
    },
    {
      "EbsOptimized": false,
      "NetworkInterfaces": [
        {
          "SubnetId": "subnet-a61dafcf",
          "DeviceIndex": 0,
          "DeleteOnTermination": false,
          "AssociatePublicIpAddress": true,
          "SecondaryPrivateIpAddressCount": 0
        }

}

```

- For API details, see [DescribeSpotFleetRequests](#) in *AWS CLI Command Reference*.

describe-spot-instance-requests

The following code example shows how to use `describe-spot-instance-requests`.

AWS CLI

Example 1: To describe a Spot Instance request

The following `describe-spot-instance-requests` example describes the specified Spot Instance request.

```
aws ec2 describe-spot-instance-requests \  
  --spot-instance-request-ids sir-08b93456
```

Output:

```
{  
  "SpotInstanceRequests": [  
    {  
      "CreateTime": "2018-04-30T18:14:55.000Z",  
      "InstanceId": "i-1234567890abcdef1",  
      "LaunchSpecification": {  
        "InstanceType": "t2.micro",  
        "ImageId": "ami-003634241a8fcdec0",  
        "KeyName": "my-key-pair",  
        "SecurityGroups": [  
          {  
            "GroupName": "default",  
            "GroupId": "sg-e38f24a7"  
          }  
        ],  
        "BlockDeviceMappings": [  
          {  
            "DeviceName": "/dev/sda1",  
            "Ebs": {  
              "DeleteOnTermination": true,  
              "SnapshotId": "snap-0e54a519c999adbbd",  
              "VolumeSize": 8,  
              "VolumeType": "standard",  
              "Encrypted": false  
            }  
          }  
        ],  
        "NetworkInterfaces": [  
          {  
            "DeleteOnTermination": true,  
            "DeviceIndex": 0,  
            "SubnetId": "subnet-049df61146c4d7901"  
          }  
        ],  
        "Placement": {  
          "AvailabilityZone": "us-east-2b",  
          "Tenancy": "default"  
        }  
      }  
    ]  
  }
```

```

        "Monitoring": {
            "Enabled": false
        }
    },
    "LaunchedAvailabilityZone": "us-east-2b",
    "ProductDescription": "Linux/UNIX",
    "SpotInstanceRequestId": "sir-08b93456",
    "SpotPrice": "0.010000",
    "State": "active",
    "Status": {
        "Code": "fulfilled",
        "Message": "Your Spot request is fulfilled.",
        "UpdateTime": "2018-04-30T18:16:21.000Z"
    },
    "Tags": [],
    "Type": "one-time",
    "InstanceInterruptionBehavior": "terminate"
    }
]
}

```

Example 2: To describe Spot Instance requests based on filters

The following `describe-spot-instance-requests` example uses filters to scope the results to Spot Instance requests with the specified instance type in the specified Availability Zone. The example uses the `--query` parameter to display only the instance IDs.

```

aws ec2 describe-spot-instance-requests \
  --filters Name=launch.instance-type,Values=m3.medium Name=launched-availability-
zone,Values=us-east-2a \
  --query "SpotInstanceRequests[*].[InstanceId]" \
  --output text

```

Output:

```

i-057750d42936e468a
i-001efd250faaa6ffa
i-027552a73f021f3bd
...

```

For additional examples using filters, see [Listing and filtering your resources](#) in the *Amazon Elastic Compute Cloud User Guide*.

Example 3: To describe Spot Instance requests based on tags

The following `describe-spot-instance-requests` example uses tag filters to scope the results to Spot Instance requests that have the tag `cost-center=cc123`.

```
aws ec2 describe-spot-instance-requests \  
  --filters Name=tag:cost-center,Values=cc123
```

For an example of the output for `describe-spot-instance-requests`, see Example 1.

For additional examples using tag filters, see [Working with tags](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeSpotInstanceRequests](#) in *AWS CLI Command Reference*.

`describe-spot-price-history`

The following code example shows how to use `describe-spot-price-history`.

AWS CLI

To describe Spot price history

This example command returns the Spot Price history for `m1.xlarge` instances for a particular day in January.

Command:

```
aws ec2 describe-spot-price-history --instance-types m1.xlarge --start-time  
  2014-01-06T07:08:09 --end-time 2014-01-06T08:09:10
```

Output:

```
{  
  "SpotPriceHistory": [  
    {  
      "Timestamp": "2014-01-06T07:10:55.000Z",  
      "ProductDescription": "SUSE Linux",  
      "InstanceType": "m1.xlarge",  
      "SpotPrice": "0.087000",  
      "AvailabilityZone": "us-west-1b"  
    },  
    {
```

```

        "Timestamp": "2014-01-06T07:10:55.000Z",
        "ProductDescription": "SUSE Linux",
        "InstanceType": "m1.xlarge",
        "SpotPrice": "0.087000",
        "AvailabilityZone": "us-west-1c"
    },
    {
        "Timestamp": "2014-01-06T05:42:36.000Z",
        "ProductDescription": "SUSE Linux (Amazon VPC)",
        "InstanceType": "m1.xlarge",
        "SpotPrice": "0.087000",
        "AvailabilityZone": "us-west-1a"
    },
    ...
}

```

To describe Spot price history for Linux/UNIX Amazon VPC

This example command returns the Spot Price history for m1.xlarge, Linux/UNIX Amazon VPC instances for a particular day in January.

Command:

```
aws ec2 describe-spot-price-history --instance-types m1.xlarge --product-
description "Linux/UNIX (Amazon VPC)" --start-time 2014-01-06T07:08:09 --end-time
2014-01-06T08:09:10
```

Output:

```

{
  "SpotPriceHistory": [
    {
      "Timestamp": "2014-01-06T04:32:53.000Z",
      "ProductDescription": "Linux/UNIX (Amazon VPC)",
      "InstanceType": "m1.xlarge",
      "SpotPrice": "0.080000",
      "AvailabilityZone": "us-west-1a"
    },
    {
      "Timestamp": "2014-01-05T11:28:26.000Z",
      "ProductDescription": "Linux/UNIX (Amazon VPC)",
      "InstanceType": "m1.xlarge",
      "SpotPrice": "0.080000",
    }
  ]
}

```

```

        "AvailabilityZone": "us-west-1c"
    }
]
}

```

- For API details, see [DescribeSpotPriceHistory](#) in *AWS CLI Command Reference*.

describe-stale-security-groups

The following code example shows how to use `describe-stale-security-groups`.

AWS CLI

To describe stale security groups

This example describes stale security group rules for `vpc-11223344`. The response shows that `sg-5fa68d3a` in your account has a stale ingress SSH rule that references `sg-279ab042` in the peer VPC, and that `sg-fe6fba9a` in your account has a stale egress SSH rule that references `sg-ef6fba8b` in the peer VPC.

Command:

```
aws ec2 describe-stale-security-groups --vpc-id vpc-11223344
```

Output:

```

{
  "StaleSecurityGroupSet": [
    {
      "VpcId": "vpc-11223344",
      "StaleIpPermissionsEgress": [
        {
          "ToPort": 22,
          "FromPort": 22,
          "UserIdGroupPairs": [
            {
              "VpcId": "vpc-7a20e51f",
              "GroupId": "sg-ef6fba8b",
              "VpcPeeringConnectionId": "pcx-b04deed9",
              "PeeringStatus": "active"
            }
          ]
        }
      ]
    }
  ],
}

```

```

        "IpProtocol": "tcp"
      }
    ],
    "GroupName": "MySG1",
    "StaleIpPermissions": [],
    "GroupId": "sg-fe6fba9a",
    "Description": "MySG1"
  },
  {
    "VpcId": "vpc-11223344",
    "StaleIpPermissionsEgress": [],
    "GroupName": "MySG2",
    "StaleIpPermissions": [
      {
        "ToPort": 22,
        "FromPort": 22,
        "UserIdGroupPairs": [
          {
            "VpcId": "vpc-7a20e51f",
            "GroupId": "sg-279ab042",
            "Description": "Access from pcx-b04deed9",
            "VpcPeeringConnectionId": "pcx-b04deed9",
            "PeeringStatus": "active"
          }
        ]
      },
      {
        "IpProtocol": "tcp"
      }
    ],
    "GroupId": "sg-5fa68d3a",
    "Description": "MySG2"
  }
]
}

```

- For API details, see [DescribeStaleSecurityGroups](#) in *AWS CLI Command Reference*.

describe-store-image-tasks

The following code example shows how to use describe-store-image-tasks.

AWS CLI

To describe the progress of an AMI store task

The following `describe-store-image-tasks` example describes the progress of an AMI store task.

```
aws ec2 describe-store-image-tasks
```

Output:

```
{
  "AmiId": "ami-1234567890abcdef0",
  "Bucket": "my-ami-bucket",
  "ProgressPercentage": 17,
  "S3ObjectKey": "ami-1234567890abcdef0.bin",
  "StoreTaskState": "InProgress",
  "StoreTaskFailureReason": null,
  "TaskStartTime": "2022-01-01T01:01:01.001Z"
}
```

For more information about storing and restoring an AMI using S3, see [Store and restore an AMI using S3](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-store-restore.html) <<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-store-restore.html>> in the *Amazon EC2 User Guide*.

- For API details, see [DescribeStoreImageTasks](#) in *AWS CLI Command Reference*.

describe-subnets

The following code example shows how to use `describe-subnets`.

AWS CLI

Example 1: To describe all your subnets

The following `describe-subnets` example displays the details of your subnets.

```
aws ec2 describe-subnets
```

Output:

```
{
  "Subnets": [
    {
      "AvailabilityZone": "us-east-1d",
      "AvailabilityZoneId": "use1-az2",

```

```
    "AvailableIpAddressCount": 4089,
    "CidrBlock": "172.31.80.0/20",
    "DefaultForAz": true,
    "MapPublicIpOnLaunch": false,
    "MapCustomerOwnedIpOnLaunch": true,
    "State": "available",
    "SubnetId": "subnet-0bb1c79de3EXAMPLE",
    "VpcId": "vpc-0ee975135dEXAMPLE",
    "OwnerId": "111122223333",
    "AssignIpv6AddressOnCreation": false,
    "Ipv6CidrBlockAssociationSet": [],
    "CustomerOwnedIpv4Pool": "pool-2EXAMPLE",
    "SubnetArn": "arn:aws:ec2:us-east-2:111122223333:subnet/
subnet-0bb1c79de3EXAMPLE",
    "EnableDns64": false,
    "Ipv6Native": false,
    "PrivateDnsNameOptionsOnLaunch": {
      "HostnameType": "ip-name",
      "EnableResourceNameDnsARecord": false,
      "EnableResourceNameDnsAAAARecord": false
    }
  },
  {
    "AvailabilityZone": "us-east-1d",
    "AvailabilityZoneId": "use1-az2",
    "AvailableIpAddressCount": 4089,
    "CidrBlock": "172.31.80.0/20",
    "DefaultForAz": true,
    "MapPublicIpOnLaunch": true,
    "MapCustomerOwnedIpOnLaunch": false,
    "State": "available",
    "SubnetId": "subnet-8EXAMPLE",
    "VpcId": "vpc-3EXAMPLE",
    "OwnerId": "111122223333",
    "AssignIpv6AddressOnCreation": false,
    "Ipv6CidrBlockAssociationSet": [],
    "Tags": [
      {
        "Key": "Name",
        "Value": "MySubnet"
      }
    ],
    "SubnetArn": "arn:aws:ec2:us-east-1:111122223333:subnet/
subnet-8EXAMPLE",
```

```

        "EnableDns64": false,
        "Ipv6Native": false,
        "PrivateDnsNameOptionsOnLaunch": {
            "HostnameType": "ip-name",
            "EnableResourceNameDnsARecord": false,
            "EnableResourceNameDnsAAAARecord": false
        }
    }
]
}

```

For more information, see [Working with VPCs and Subnets](#) in the *AWS VPC User Guide*.

Example 2: To describe the subnets of a specific VPC

The following describe-subnets example uses a filter to retrieve details for the subnets of the specified VPC.

```

aws ec2 describe-subnets \
  --filters "Name=vpc-id,Values=vpc-3EXAMPLE"

```

Output:

```

{
  "Subnets": [
    {
      "AvailabilityZone": "us-east-1d",
      "AvailabilityZoneId": "use1-az2",
      "AvailableIpAddressCount": 4089,
      "CidrBlock": "172.31.80.0/20",
      "DefaultForAz": true,
      "MapPublicIpOnLaunch": true,
      "MapCustomerOwnedIpOnLaunch": false,
      "State": "available",
      "SubnetId": "subnet-8EXAMPLE",
      "VpcId": "vpc-3EXAMPLE",
      "OwnerId": "1111222233333",
      "AssignIpv6AddressOnCreation": false,
      "Ipv6CidrBlockAssociationSet": [],
      "Tags": [
        {
          "Key": "Name",
          "Value": "MySubnet"
        }
      ]
    }
  ]
}

```

```

    }
  ],
  "SubnetArn": "arn:aws:ec2:us-east-1:111122223333:subnet/
subnet-8EXAMPLE",
  "EnableDns64": false,
  "Ipv6Native": false,
  "PrivateDnsNameOptionsOnLaunch": {
    "HostnameType": "ip-name",
    "EnableResourceNameDnsARecord": false,
    "EnableResourceNameDnsAAAARecord": false
  }
}
]
}

```

For more information, see [Working with VPCs and Subnets](#) in the *AWS VPC User Guide*.

Example 3: To describe the subnets with a specific tag

The following `describe-subnets` example uses a filter to retrieve the details of those subnets with the tag `CostCenter=123` and the `--query` parameter to display the subnet IDs of the subnets with this tag.

```

aws ec2 describe-subnets \
  --filters "Name=tag:CostCenter,Values=123" \
  --query "Subnets[*].SubnetId" \
  --output text

```

Output:

```

subnet-0987a87c8b37348ef
subnet-02a95061c45f372ee
subnet-03f720e7de2788d73

```

For more information, see [Working with VPCs and Subnets](#) in the *Amazon VPC User Guide*.

- For API details, see [DescribeSubnets](#) in *AWS CLI Command Reference*.

describe-tags

The following code example shows how to use `describe-tags`.

AWS CLI

Example 1: To describe all tags for a single resource

The following describe-tags example describes the tags for the specified instance.

```
aws ec2 describe-tags \  
  --filters "Name=resource-id,Values=i-1234567890abcdef8"
```

Output:

```
{  
  "Tags": [  
    {  
      "ResourceType": "instance",  
      "ResourceId": "i-1234567890abcdef8",  
      "Value": "Test",  
      "Key": "Stack"  
    },  
    {  
      "ResourceType": "instance",  
      "ResourceId": "i-1234567890abcdef8",  
      "Value": "Beta Server",  
      "Key": "Name"  
    }  
  ]  
}
```

Example 2: To describe all tags for a resource type

The following describe-tags example describes the tags for your volumes.

```
aws ec2 describe-tags \  
  --filters "Name=resource-type,Values=volume"
```

Output:

```
{  
  "Tags": [  
    {  
      "ResourceType": "volume",  
      "ResourceId": "vol-1234567890abcdef0",  
      "Value": "Project1",  
    }  
  ]  
}
```

```

        "Key": "Purpose"
    },
    {
        "ResourceType": "volume",
        "ResourceId": "vol-049df61146c4d7901",
        "Value": "Logs",
        "Key": "Purpose"
    }
]
}

```

Example 3: To describe all your tags

The following describe-tags example describes the tags for all your resources.

```
aws ec2 describe-tags
```

Example 4: To describe the tags for your resources based on a tag key

The following describe-tags example describes the tags for your resources that have a tag with the key Stack.

```
aws ec2 describe-tags \
  --filters Name=key,Values=Stack
```

Output:

```

{
  "Tags": [
    {
      "ResourceType": "volume",
      "ResourceId": "vol-027552a73f021f3b",
      "Value": "Production",
      "Key": "Stack"
    },
    {
      "ResourceType": "instance",
      "ResourceId": "i-1234567890abcdef8",
      "Value": "Test",
      "Key": "Stack"
    }
  ]
}

```

```
}
```

Example 5: To describe the tags for your resources based on a tag key and tag value

The following `describe-tags` example describes the tags for your resources that have the tag `Stack=Test`.

```
aws ec2 describe-tags \  
  --filters Name=key,Values=Stack Name=value,Values=Test
```

Output:

```
{  
  "Tags": [  
    {  
      "ResourceType": "image",  
      "ResourceId": "ami-3ac336533f021f3bd",  
      "Value": "Test",  
      "Key": "Stack"  
    },  
    {  
      "ResourceType": "instance",  
      "ResourceId": "i-1234567890abcdef8",  
      "Value": "Test",  
      "Key": "Stack"  
    }  
  ]  
}
```

The following `describe-tags` example uses alternate syntax to describe resources with the tag `Stack=Test`.

```
aws ec2 describe-tags \  
  --filters "Name=tag:Stack,Values=Test"
```

The following `describe-tags` example describes the tags for all your instances that have a tag with the key `Purpose` and no value.

```
aws ec2 describe-tags \  
  --filters "Name=resource-type,Values=instance" "Name=key,Values=Purpose"  
  "Name=value,Values="
```

Output:

```
{
  "Tags": [
    {
      "ResourceType": "instance",
      "ResourceId": "i-1234567890abcdef5",
      "Value": null,
      "Key": "Purpose"
    }
  ]
}
```

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

describe-traffic-mirror-filters

The following code example shows how to use `describe-traffic-mirror-filters`.

AWS CLI**To view your traffic mirror filters**

The following `describe-traffic-mirror-filters` example displays details for all of your traffic mirror filters.

```
aws ec2 describe-traffic-mirror-filters
```

Output:

```
{
  "TrafficMirrorFilters": [
    {
      "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
      "IngressFilterRules": [
        {
          "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",
          "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",
          "TrafficDirection": "ingress",
          "RuleNumber": 100,
          "RuleAction": "accept",
          "Protocol": 6,
```

```

        "DestinationCidrBlock": "10.0.0.0/24",
        "SourceCidrBlock": "10.0.0.0/24",
        "Description": "TCP Rule"
    }
],
"EgressFilterRules": [],
"NetworkServices": [],
>Description": "Example filter",
"Tags": []
}
]
}

```

For more information, see [View your traffic mirror filters](#) in the *Traffic Mirroring Guide*.

- For API details, see [DescribeTrafficMirrorFilters](#) in *AWS CLI Command Reference*.

describe-traffic-mirror-sessions

The following code example shows how to use describe-traffic-mirror-sessions.

AWS CLI

To describe a Traffic Mirror Session

The following describe-traffic-mirror-sessions example displays details of the your Traffic Mirror sessions.

```
aws ec2 describe-traffic-mirror-sessions
```

Output:

```

{
  "TrafficMirrorSessions": [
    {
      "Tags": [],
      "VirtualNetworkId": 42,
      "OwnerId": "111122223333",
      "Description": "TCP Session",
      "NetworkInterfaceId": "eni-0a471a5cf3EXAMPLE",
      "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",
      "TrafficMirrorFilterId": "tmf-083e18f985EXAMPLE",
      "PacketLength": 20,
    }
  ]
}

```

```

    "SessionNumber": 1,
    "TrafficMirrorSessionId": "tms-0567a4c684EXAMPLE"
  },
  {
    "Tags": [
      {
        "Key": "Name",
        "Value": "tag test"
      }
    ],
    "VirtualNetworkId": 13314501,
    "OwnerId": "111122223333",
    "Description": "TCP Session",
    "NetworkInterfaceId": "eni-0a471a5cf3EXAMPLE",
    "TrafficMirrorTargetId": "tmt-03665551cbEXAMPLE",
    "TrafficMirrorFilterId": "tmf-06c787846cEXAMPLE",
    "SessionNumber": 2,
    "TrafficMirrorSessionId": "tms-0060101cf8EXAMPLE"
  }
]
}

```

For more information, see [View Traffic Mirror Session Details](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [DescribeTrafficMirrorSessions](#) in *AWS CLI Command Reference*.

describe-traffic-mirror-targets

The following code example shows how to use describe-traffic-mirror-targets.

AWS CLI

To describe a traffic mirror target

The following describe-traffic-mirror-targets example displays information about the specified traffic mirror target.

```
aws ec2 describe-traffic-mirror-targets \
  --traffic-mirror-target-ids tmt-0dabe9b0a6EXAMPLE
```

Output:

```
{
```

```
"TrafficMirrorTargets": [  
  {  
    "TrafficMirrorTargetId": "tmt-0dabe9b0a6EXAMPLE",  
    "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-  
east-1:111122223333:loadbalancer/net/NLB/7cdec873fEXAMPLE",  
    "Type": "network-load-balancer",  
    "Description": "Example Network Load Balancer target",  
    "OwnerId": "111122223333",  
    "Tags": []  
  }  
]
```

For more information, see [Traffic mirror targets](#) in the *Amazon VPC Traffic Mirroring Guide*.

- For API details, see [DescribeTrafficMirrorTargets](#) in *AWS CLI Command Reference*.

describe-transit-gateway-attachments

The following code example shows how to use `describe-transit-gateway-attachments`.

AWS CLI

To view your transit gateway attachments

The following `describe-transit-gateway-attachments` example displays details for your transit gateway attachments.

```
aws ec2 describe-transit-gateway-attachments
```

Output:

```
{  
  "TransitGatewayAttachments": [  
    {  
      "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",  
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",

]
}

```

For more information, see [Work with transit gateways](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayAttachments](#) in *AWS CLI Command Reference*.

describe-transit-gateway-connect-peers

The following code example shows how to use `describe-transit-gateway-connect-peers`.

AWS CLI

To describe a Transit Gateway Connect peer

The following `describe-transit-gateway-connect-peers` example describes the specified Connect peer.

```

aws ec2 describe-transit-gateway-connect-peers \
  --transit-gateway-connect-peer-ids tgw-connect-peer-0666adbac4EXAMPLE

```

Output:

```

{
  "TransitGatewayConnectPeers": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-0f0927767cEXAMPLE",
      "TransitGatewayConnectPeerId": "tgw-connect-peer-0666adbac4EXAMPLE",
      "State": "available",
      "CreationTime": "2021-10-13T03:35:17.000Z",
      "ConnectPeerConfiguration": {

```

```

            "PeerAddress": "169.254.6.1",
            "BgpStatus": "down"
        }
    ],
    "Tags": []
}
]
}

```

For more information, see [Transit gateway Connect attachments and Transit Gateway Connect peers](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayConnectPeers](#) in *AWS CLI Command Reference*.

describe-transit-gateway-connects

The following code example shows how to use describe-transit-gateway-connects.

AWS CLI

To describe a transit gateway Connect attachment

The following describe-transit-gateway-connects example describes the specified Connect attachment.

```
aws ec2 describe-transit-gateway-connects \  
  --transit-gateway-attachment-ids tgw-attach-037012e5dcEXAMPLE
```

Output:

```
{  
  "TransitGatewayConnects": [  
    {  
      "TransitGatewayAttachmentId": "tgw-attach-037012e5dcEXAMPLE",  
      "TransportTransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",  
      "TransitGatewayId": "tgw-02f776b1a7EXAMPLE",  
      "State": "available",  
      "CreationTime": "2021-03-09T19:59:17+00:00",  
      "Options": {  
        "Protocol": "gre"  
      },  
      "Tags": []  
    }  
  ]  
}
```

For more information, see [Transit gateway Connect attachments and Transit Gateway Connect peers](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayConnects](#) in *AWS CLI Command Reference*.

describe-transit-gateway-multicast-domains

The following code example shows how to use `describe-transit-gateway-multicast-domains`.

AWS CLI**To describe your transit gateway multicast domains**

The following `describe-transit-gateway-multicast-domains` example displays details for all of your transit gateway multicast domains.

```
aws ec2 describe-transit-gateway-multicast-domains
```

Output:

```
{
  "TransitGatewayMulticastDomains": [
    {
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-000fb24d04EXAMPLE",
      "TransitGatewayId": "tgw-0bf0bfffefaEXAMPLE",
      "TransitGatewayMulticastDomainArn": "arn:aws:ec2:us-
east-1:123456789012:transit-gateway-multicast-domain/tgw-mcast-
domain-000fb24d04EXAMPLE",
      "OwnerId": "123456789012",
      "Options": {
        "Icmpv2Support": "disable",
        "StaticSourcesSupport": "enable",
        "AutoAcceptSharedAssociations": "disable"
      },
      "State": "available",
      "CreationTime": "2019-12-10T18:32:50+00:00",
      "Tags": [
        {
          "Key": "Name",
          "Value": "mc1"
        }
      ]
    }
  ]
}
```

For more information, see [Managing multicast domains](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayMulticastDomains](#) in *AWS CLI Command Reference*.

describe-transit-gateway-peering-attachments

The following code example shows how to use `describe-transit-gateway-peering-attachments`.

AWS CLI

To describe your transit gateway peering attachments

The following `describe-transit-gateway-peering-attachments` example displays details for all of your transit gateway peering attachments.

```
aws ec2 describe-transit-gateway-peering-attachments
```

Output:

```
{
  "TransitGatewayPeeringAttachments": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
      "RequesterTgwInfo": {
        "TransitGatewayId": "tgw-123abc05e04123abc",
        "OwnerId": "123456789012",
        "Region": "us-west-2"
      },
      "AcceptorTgwInfo": {
        "TransitGatewayId": "tgw-11223344aabbcc112",
        "OwnerId": "123456789012",
        "Region": "us-east-2"
      },
      "State": "pendingAcceptance",
      "CreationTime": "2019-12-09T11:38:05.000Z",
      "Tags": []
    }
  ]
}
```

For more information, see [Transit Gateway Peering Attachments](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayPeeringAttachments](#) in *AWS CLI Command Reference*.

describe-transit-gateway-policy-tables

The following code example shows how to use `describe-transit-gateway-policy-tables`.

AWS CLI

To describe a transit gateway policy table

The following `describe-transit-gateway-policy-tables` example describes the specified transit gateway policy table.

```
aws ec2 describe-transit-gateway-policy-tables \
```

```
--transit-gateway-policy-table-ids tgw-ptb-0a16f134b78668a81
```

Output:

```
{
  "TransitGatewayPolicyTables": [
    {
      "TransitGatewayPolicyTableId": "tgw-ptb-0a16f134b78668a81",
      "TransitGatewayId": "tgw-067f8505c18f0bd6e",
      "State": "available",
      "CreationTime": "2023-11-28T16:36:43+00:00",
      "Tags": []
    }
  ]
}
```

For more information, see [Transit gateway policy tables](#) in the *Transit Gateway User Guide*.

- For API details, see [DescribeTransitGatewayPolicyTables](#) in *AWS CLI Command Reference*.

describe-transit-gateway-route-tables

The following code example shows how to use `describe-transit-gateway-route-tables`.

AWS CLI

To describe your transit gateway route tables

The following `describe-transit-gateway-route-tables` example displays details for your transit gateway route tables.

```
aws ec2 describe-transit-gateway-route-tables
```

Output:

```
{
  "TransitGatewayRouteTables": [
    {
      "TransitGatewayRouteTableId": "tgw-rtb-0ca78a549EXAMPLE",
      "TransitGatewayId": "tgw-0bc994abffEXAMPLE",
      "State": "available",
      "DefaultAssociationRouteTable": true,
    }
  ]
}
```

```

        "DefaultPropagationRouteTable": true,
        "CreationTime": "2018-11-28T14:24:49.000Z",
        "Tags": []
    },
    {
        "TransitGatewayRouteTableId": "tgw-rtb-0e8f48f148EXAMPLE",
        "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
        "State": "available",
        "DefaultAssociationRouteTable": true,
        "DefaultPropagationRouteTable": true,
        "CreationTime": "2018-11-28T14:24:00.000Z",
        "Tags": []
    }
]
}

```

For more information, see [View transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayRouteTables](#) in *AWS CLI Command Reference*.

describe-transit-gateway-vpc-attachments

The following code example shows how to use `describe-transit-gateway-vpc-attachments`.

AWS CLI

To describe your transit gateway VPC attachments

The following `describe-transit-gateway-vpc-attachments` example displays details for your transit gateway VPC attachments.

```
aws ec2 describe-transit-gateway-vpc-attachments
```

Output:

```

{
  "TransitGatewayVpcAttachments": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-0a08e88308EXAMPLE",
      "TransitGatewayId": "tgw-0043d72bb4EXAMPLE",
      "VpcId": "vpc-0f501f7ee8EXAMPLE",
      "VpcOwnerId": "111122223333",
    }
  ]
}

```

```

    "State": "available",
    "SubnetIds": [
      "subnet-045d586432EXAMPLE",
      "subnet-0a0ad478a6EXAMPLE"
    ],
    "CreationTime": "2019-02-13T11:04:02.000Z",
    "Options": {
      "DnsSupport": "enable",
      "Ipv6Support": "disable"
    },
    "Tags": [
      {
        "Key": "Name",
        "Value": "attachment name"
      }
    ]
  }
]
}

```

For more information, see [View your VPC attachments](#) in the *Transit Gateways Guide*.

- For API details, see [DescribeTransitGatewayVpcAttachments](#) in *AWS CLI Command Reference*.

describe-transit-gateways

The following code example shows how to use describe-transit-gateways.

AWS CLI

To describe your transit gateways

The following describe-transit-gateways example retrieves details about your transit gateways.

```
aws ec2 describe-transit-gateways
```

Output:

```

{
  "TransitGateways": [
    {
      "TransitGatewayId": "tgw-0262a0e521EXAMPLE",

```

```
    "TransitGatewayArn": "arn:aws:ec2:us-east-2:111122223333:transit-
gateway/tgw-0262a0e521EXAMPLE",
    "State": "available",
    "OwnerId": "111122223333",
    "Description": "MyTGW",
    "CreationTime": "2019-07-10T14:02:12.000Z",
    "Options": {

describe-verified-access-endpoints

The following code example shows how to use `describe-verified-access-endpoints`.

AWS CLI

To describe a Verified Access endpoint

The following `delete-verified-access-endpoints` example describes the specified Verified Access endpoint.

```
aws ec2 describe-verified-access-endpoints \  
  --verified-access-endpoint-ids vae-066fac616d4d546f2
```

Output:

```
{  
  "VerifiedAccessEndpoints": [  
    {  
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",  
      "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",

For more information, see [Verified Access endpoints](#) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessEndpoints](#) in *AWS CLI Command Reference*.

describe-verified-access-groups

The following code example shows how to use `describe-verified-access-groups`.

AWS CLI

To describe a Verified Access group

The following `describe-verified-access-groups` example describes the specified Verified Access group.

```
aws ec2 describe-verified-access-groups \
  --verified-access-group-ids vagr-0dbe967baf14b7235
```

Output:

```
{
  "VerifiedAccessGroups": [
    {
      "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
```

```

    "Owner": "123456789012",

      {
        "Key": "Name",
        "Value": "my-va-group"
      }
    ]
  }
]
}

```

For more information, see [Verified Access groups](#) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessGroups](#) in *AWS CLI Command Reference*.

describe-verified-access-instance-logging-configurations

The following code example shows how to use `describe-verified-access-instance-logging-configurations`.

AWS CLI

To describe the logging configuration for a Verified Access instance

The following `describe-verified-access-instance-logging-configurations` example describes the logging configuration for the specified Verified Access instance.

```
aws ec2 describe-verified-access-instance-logging-configurations \
  --verified-access-instance-ids vai-0ce000c0b7643abea
```

Output:

```

{
  "LoggingConfigurations": [
    {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "AccessLogs": {
        "S3": {

```

```

        "Enabled": false
    },
    "CloudWatchLogs": {
        "Enabled": true,
        "DeliveryStatus": {
            "Code": "success"
        },
        "LogGroup": "my-log-group"
    },
    "KinesisDataFirehose": {
        "Enabled": false
    },
    "LogVersion": "ocsf-1.0.0-rc.2",
    "IncludeTrustContext": false
}
]
}

```

For more information, see [Verified Access logs](#) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessInstanceLoggingConfigurations](#) in *AWS CLI Command Reference*.

describe-verified-access-instances

The following code example shows how to use `describe-verified-access-instances`.

AWS CLI

To describe a Verified Access instance

The following `describe-verified-access-instances` example describes the specified Verified Access instance.

```
aws ec2 describe-verified-access-instances \
  --verified-access-instance-ids vai-0ce000c0b7643abea
```

Output:

```
{
  "VerifiedAccessInstances": [
```

```

    {
      "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
      "Description": "Testing Verified Access",
      "VerifiedAccessTrustProviders": [
        {
          "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
          "TrustProviderType": "user",
          "UserTrustProviderType": "iam-identity-center"
        }
      ],
      "CreationTime": "2023-08-25T18:27:56",
      "LastUpdatedTime": "2023-08-25T19:03:32",
      "Tags": [
        {
          "Key": "Name",
          "Value": "my-ava-instance"
        }
      ]
    }
  ]
}

```

For more information, see [Verified Access instances](#) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessInstances](#) in *AWS CLI Command Reference*.

describe-verified-access-trust-providers

The following code example shows how to use `describe-verified-access-trust-providers`.

AWS CLI

To describe a Verified Access trust provider

The following `describe-verified-access-trust-providers` example describes the specified Verified Access trust provider.

```

aws ec2 describe-verified-access-trust-providers \
  --verified-access-trust-provider-ids vatp-0bb32de759a3e19e7

```

Output:

```
{
  "VerifiedAccessTrustProviders": [
    {
      "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",
      "Description": "Testing Verified Access",
      "TrustProviderType": "user",
      "UserTrustProviderType": "iam-identity-center",
      "PolicyReferenceName": "idc",
      "CreationTime": "2023-08-25T19:00:38",
      "LastUpdatedTime": "2023-08-25T19:03:32",
      "Tags": [
        {
          "Key": "Name",
          "Value": "my-va-trust-provider"
        }
      ]
    }
  ]
}
```

For more information, see [Trust providers for Verified Access](#) in the *AWS Verified Access User Guide*.

- For API details, see [DescribeVerifiedAccessTrustProviders](#) in *AWS CLI Command Reference*.

describe-volume-attribute

The following code example shows how to use `describe-volume-attribute`.

AWS CLI

To describe a volume attribute

This example command describes the `autoEnableIo` attribute of the volume with the ID `vol-049df61146c4d7901`.

Command:

```
aws ec2 describe-volume-attribute --volume-id vol-049df61146c4d7901 --attribute
autoEnableIO
```

Output:

```
{
  "AutoEnableIO": {
    "Value": false
  },
  "VolumeId": "vol-049df61146c4d7901"
}
```

- For API details, see [DescribeVolumeAttribute](#) in *AWS CLI Command Reference*.

describe-volume-status

The following code example shows how to use `describe-volume-status`.

AWS CLI

To describe the status of a single volume

This example command describes the status for the volume `vol-1234567890abcdef0`.

Command:

```
aws ec2 describe-volume-status --volume-ids vol-1234567890abcdef0
```

Output:

```
{
  "VolumeStatuses": [
    {
      "VolumeStatus": {
        "Status": "ok",
        "Details": [
          {
            "Status": "passed",
            "Name": "io-enabled"
          },
          {
            "Status": "not-applicable",
            "Name": "io-performance"
          }
        ]
      },
      "AvailabilityZone": "us-east-1a",
    }
  ]
}
```

```
        "VolumeId": "vol-1234567890abcdef0",
        "Actions": [],
        "Events": []
    }
]
}
```

To describe the status of impaired volumes

This example command describes the status for all volumes that are impaired. In this example output, there are no impaired volumes.

Command:

```
aws ec2 describe-volume-status --filters Name=volume-status.status,Values=impaired
```

Output:

```
{
  "VolumeStatuses": []
}
```

If you have a volume with a failed status check (status is impaired), see [Working with an Impaired Volume](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeVolumeStatus](#) in *AWS CLI Command Reference*.

describe-volumes-modifications

The following code example shows how to use `describe-volumes-modifications`.

AWS CLI

To describe the modification status for a volume

The following `describe-volumes-modifications` example describes the volume modification status of the specified volume.

```
aws ec2 describe-volumes-modifications \
  --volume-ids vol-1234567890abcdef0
```

Output:

```
{
  "VolumeModification": {
    "TargetSize": 150,
    "TargetVolumeType": "io1",
    "ModificationState": "optimizing",
    "VolumeId": "vol-1234567890abcdef0",
    "TargetIops": 100,
    "StartTime": "2019-05-17T11:27:19.000Z",
    "Progress": 70,
    "OriginalVolumeType": "io1",
    "OriginalIops": 100,
    "OriginalSize": 100
  }
}
```

- For API details, see [DescribeVolumesModifications](#) in *AWS CLI Command Reference*.

describe-volumes

The following code example shows how to use `describe-volumes`.

AWS CLI**Example 1: To describe a volume**

The following `describe-volumes` example describes the specified volumes in the current Region.

```
aws ec2 describe-volumes \
  --volume-ids vol-049df61146c4d7901 vol-1234567890abcdef0
```

Output:

```
{
  "Volumes": [
    {
      "AvailabilityZone": "us-east-1a",
      "Attachments": [
        {
```

```

        "AttachTime": "2013-12-18T22:35:00.000Z",
        "InstanceId": "i-1234567890abcdef0",
        "VolumeId": "vol-049df61146c4d7901",
        "State": "attached",
        "DeleteOnTermination": true,
        "Device": "/dev/sda1"
    }
],
"Encrypted": true,
"KmsKeyId": "arn:aws:kms:us-east-2a:123456789012:key/8c5b2c63-b9bc-45a3-
a87a-5513eEXAMPLE,
"VolumeType": "gp2",
"VolumeId": "vol-049df61146c4d7901",
"State": "in-use",
"Iops": 100,
"SnapshotId": "snap-1234567890abcdef0",
"CreateTime": "2019-12-18T22:35:00.084Z",
"Size": 8
},
{
    "AvailabilityZone": "us-east-1a",
    "Attachments": [],
    "Encrypted": false,
    "VolumeType": "gp2",
    "VolumeId": "vol-1234567890abcdef0",
    "State": "available",
    "Iops": 300,
    "SnapshotId": "",
    "CreateTime": "2020-02-27T00:02:41.791Z",
    "Size": 100
}
]
}

```

Example 2: To describe volumes that are attached to a specific instance

The following describe-volumes example describes all volumes that are both attached to the specified instance and set to delete when the instance terminates.

```

aws ec2 describe-volumes \
  --region us-east-1 \
  --filters Name=attachment.instance-id,Values=i-1234567890abcdef0
Name=attachment.delete-on-termination,Values=true

```

For an example of the output for `describe-volumes`, see Example 1.

Example 3: To describe available volumes in a specific Availability Zone

The following `describe-volumes` example describes all volumes that have a status of available and are in the specified Availability Zone.

```
aws ec2 describe-volumes \  
  --filters Name=status,Values=available Name=availability-zone,Values=us-east-1a
```

For an example of the output for `describe-volumes`, see Example 1.

Example 4: To describe volumes based on tags

The following `describe-volumes` example describes all volumes that have the tag key Name and a value that begins with Test. The output is then filtered with a query that displays only the tags and IDs of the volumes.

```
aws ec2 describe-volumes \  
  --filters Name=tag:Name,Values=Test* \  
  --query "Volumes[*].{ID:VolumeId,Tag:Tags}"
```

Output:

```
[  
  {  
    "Tag": [  
      {  
        "Value": "Test2",  
        "Key": "Name"  
      }  
    ],  
    "ID": "vol-1234567890abcdef0"  
  },  
  {  
    "Tag": [  
      {  
        "Value": "Test1",  
        "Key": "Name"  
      }  
    ],  
  },  
]
```

```
    "ID": "vol-049df61146c4d7901"  
  }  
]
```

For additional examples using tag filters, see [Working with tags](#) in the *Amazon EC2 User Guide*.

- For API details, see [DescribeVolumes](#) in *AWS CLI Command Reference*.

describe-vpc-attribute

The following code example shows how to use `describe-vpc-attribute`.

AWS CLI

To describe the `enableDnsSupport` attribute

This example describes the `enableDnsSupport` attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is `true`, the Amazon DNS server resolves DNS hostnames for your instances to their corresponding IP addresses; otherwise, it does not.

Command:

```
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsSupport
```

Output:

```
{  
  "VpcId": "vpc-a01106c2",  
  "EnableDnsSupport": {  
    "Value": true  
  }  
}
```

To describe the `enableDnsHostnames` attribute

This example describes the `enableDnsHostnames` attribute. This attribute indicates whether the instances launched in the VPC get DNS hostnames. If this attribute is `true`, instances in the VPC get DNS hostnames; otherwise, they do not.

Command:

```
aws ec2 describe-vpc-attribute --vpc-id vpc-a01106c2 --attribute enableDnsHostnames
```

Output:

```
{
  "VpcId": "vpc-a01106c2",
  "EnableDnsHostnames": {
    "Value": true
  }
}
```

- For API details, see [DescribeVpcAttribute](#) in *AWS CLI Command Reference*.

describe-vpc-classic-link-dns-support

The following code example shows how to use `describe-vpc-classic-link-dns-support`.

AWS CLI**To describe ClassicLink DNS support for your VPCs**

This example describes the ClassicLink DNS support status of all of your VPCs.

Command:

```
aws ec2 describe-vpc-classic-link-dns-support
```

Output:

```
{
  "Vpcs": [
    {
      "VpcId": "vpc-88888888",
      "ClassicLinkDnsSupported": true
    },
    {
      "VpcId": "vpc-1a2b3c4d",
      "ClassicLinkDnsSupported": false
    }
  ]
}
```

- For API details, see [DescribeVpcClassicLinkDnsSupport](#) in *AWS CLI Command Reference*.

describe-vpc-classic-link

The following code example shows how to use `describe-vpc-classic-link`.

AWS CLI

To describe the ClassicLink status of your VPCs

This example lists the ClassicLink status of `vpc-88888888`.

Command:

```
aws ec2 describe-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```
{
  "Vpcs": [
    {
      "ClassicLinkEnabled": true,
      "VpcId": "vpc-88888888",
      "Tags": [
        {
          "Value": "classiclinkvpc",
          "Key": "Name"
        }
      ]
    }
  ]
}
```

This example lists only VPCs that are enabled for Classiclink (the filter value of `is-classic-link-enabled` is set to `true`).

Command:

```
aws ec2 describe-vpc-classic-link --filter "Name=is-classic-link-enabled,Values=true"
```

- For API details, see [DescribeVpcClassicLink](#) in *AWS CLI Command Reference*.

describe-vpc-endpoint-connection-notifications

The following code example shows how to use `describe-vpc-endpoint-connection-notifications`.

AWS CLI

To describe endpoint connection notifications

The following `describe-vpc-endpoint-connection-notifications` example describes all of your endpoint connection notifications.

```
aws ec2 describe-vpc-endpoint-connection-notifications
```

Output:

```
{
  "ConnectionNotificationSet": [
    {
      "ConnectionNotificationState": "Enabled",
      "ConnectionNotificationType": "Topic",
      "ConnectionEvents": [
        "Accept",
        "Reject",
        "Delete",
        "Connect"
      ],
      "ConnectionNotificationId": "vpce-nfn-04bcb952bc8af7abc",
      "ConnectionNotificationArn": "arn:aws:sns:us-
east-1:123456789012:VpceNotification",
      "VpcEndpointId": "vpce-0324151a02f327123"
    }
  ]
}
```

- For API details, see [DescribeVpcEndpointConnectionNotifications](#) in *AWS CLI Command Reference*.

describe-vpc-endpoint-connections

The following code example shows how to use `describe-vpc-endpoint-connections`.

AWS CLI

To describe VPC endpoint connections

This example describes the interface endpoint connections to your endpoint service and filters the results to display endpoints that are PendingAcceptance.

Command:

```
aws ec2 describe-vpc-endpoint-connections --filters Name=vpc-endpoint-  
state,Values=pendingAcceptance
```

Output:

```
{  
  "VpcEndpointConnections": [  
    {  
      "VpcEndpointId": "vpce-0abed31004e618123",  
      "ServiceId": "vpce-svc-0abced088d20def56",  
      "CreationTimestamp": "2017-11-30T10:00:24.350Z",  
      "VpcEndpointState": "pendingAcceptance",  
      "VpcEndpointOwner": "123456789012"  
    }  
  ]  
}
```

- For API details, see [DescribeVpcEndpointConnections](#) in *AWS CLI Command Reference*.

describe-vpc-endpoint-service-configurations

The following code example shows how to use describe-vpc-endpoint-service-configurations.

AWS CLI

To describe endpoint service configurations

The following describe-vpc-endpoint-service-configurations example describes your endpoint service configurations.

```
aws ec2 describe-vpc-endpoint-service-configurations
```

Output:

```
{
  "ServiceConfigurations": [
    {
      "ServiceType": [
        {
          "ServiceType": "GatewayLoadBalancer"
        }
      ],
      "ServiceId": "vpce-svc-012d33a1c4321cab",
      "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-
svc-012d33a1c4321cab",
      "ServiceState": "Available",
      "AvailabilityZones": [
        "us-east-1d"
      ],
      "AcceptanceRequired": false,
      "ManagesVpcEndpoints": false,
      "GatewayLoadBalancerArns": [
        "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/
gwy/GWLBService/123210844e429123"
      ],
      "Tags": []
    },
    {
      "ServiceType": [
        {
          "ServiceType": "Interface"
        }
      ],
      "ServiceId": "vpce-svc-123cab125efa123",
      "ServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-123cab125efa123",
      "ServiceState": "Available",
      "AvailabilityZones": [
        "us-east-1a"
      ],
      "AcceptanceRequired": true,
      "ManagesVpcEndpoints": false,
      "NetworkLoadBalancerArns": [
        "arn:aws:elasticloadbalancing:us-east-1:123456789012:loadbalancer/

- For API details, see [DescribeVpcEndpointServiceConfigurations](#) in *AWS CLI Command Reference*.

describe-vpc-endpoint-service-permissions

The following code example shows how to use `describe-vpc-endpoint-service-permissions`.

AWS CLI

To describe endpoint service permissions

This example describes the permissions for the specified endpoint service.

Command:

```
aws ec2 describe-vpc-endpoint-service-permissions --service-id vpce-
svc-03d5ebb7d9579a2b3
```

Output:

```
{
  "AllowedPrincipals": [
    {
      "PrincipalType": "Account",
      "Principal": "arn:aws:iam::123456789012:root"
    }
  ]
}
```

```
]
}
```

- For API details, see [DescribeVpcEndpointServicePermissions](#) in *AWS CLI Command Reference*.

describe-vpc-endpoint-services

The following code example shows how to use `describe-vpc-endpoint-services`.

AWS CLI

Example 1: To describe all VPC endpoint services

The following "describe-vpc-endpoint-services" example lists all VPC endpoint services for an AWS Region.

```
aws ec2 describe-vpc-endpoint-services
```

Output:

```
{
  "ServiceDetails": [
    {
      "ServiceType": [
        {
          "ServiceType": "Gateway"
        }
      ],
      "AcceptanceRequired": false,
      "ServiceName": "com.amazonaws.us-east-1.dynamodb",
      "VpcEndpointPolicySupported": true,
      "Owner": "amazon",
      "AvailabilityZones": [
        "us-east-1a",
        "us-east-1b",
        "us-east-1c",
        "us-east-1d",
        "us-east-1e",
        "us-east-1f"
      ],
      "BaseEndpointDnsNames": [
        "dynamodb.us-east-1.amazonaws.com"
      ]
    }
  ]
}
```

```
    ]
  },
  {
    "ServiceType": [
      {
        "ServiceType": "Interface"
      }
    ],
    "PrivateDnsName": "ec2.us-east-1.amazonaws.com",
    "ServiceName": "com.amazonaws.us-east-1.ec2",
    "VpcEndpointPolicySupported": false,
    "Owner": "amazon",
    "AvailabilityZones": [
      "us-east-1a",
      "us-east-1b",
      "us-east-1c",
      "us-east-1d",
      "us-east-1e",
      "us-east-1f"
    ],
    "AcceptanceRequired": false,
    "BaseEndpointDnsNames": [
      "ec2.us-east-1.vpce.amazonaws.com"
    ]
  },
  {
    "ServiceType": [
      {
        "ServiceType": "Interface"
      }
    ],

    "com.amazonaws.us-east-1.kinesis-streams",
    "com.amazonaws.us-east-1.s3",
    "com.amazonaws.us-east-1.ssm"
]
}

```

For more information, see [View available AWS service names](#) in the *User Guide for AWSPrivateLink*.

Example 2: To describe the details about an endpoint service

The following "describe-vpc-endpoint-services" example lists the details of the Amazon S3 interface endpoint service

```

aws ec2 describe-vpc-endpoint-services \
  --filter "Name=service-type,Values=Interface" Name=service-
name,Values=com.amazonaws.us-east-1.s3

```

Output:

```

{
  "ServiceDetails": [
    {
      "ServiceName": "com.amazonaws.us-east-1.s3",
      "ServiceId": "vpce-svc-081d84efcdEXAMPLE",
      "ServiceType": [
        {
          "ServiceType": "Interface"
        }
      ],
      "AvailabilityZones": [
        "us-east-1a",
        "us-east-1b",
        "us-east-1c",

```

```

        "us-east-1d",
        "us-east-1e",
        "us-east-1f"
    ],
    "Owner": "amazon",
    "BaseEndpointDnsNames": [
        "s3.us-east-1.vpce.amazonaws.com"
    ],
    "VpcEndpointPolicySupported": true,
    "AcceptanceRequired": false,
    "ManagesVpcEndpoints": false,
    "Tags": []
  }
],
"ServiceNames": [
  "com.amazonaws.us-east-1.s3"
]
}

```

For more information, see [View available AWS service names](#) in the *User Guide for AWSPrivateLink*.

- For API details, see [DescribeVpcEndpointServices](#) in *AWS CLI Command Reference*.

describe-vpc-endpoints

The following code example shows how to use `describe-vpc-endpoints`.

AWS CLI

To describe your VPC endpoints

The following `describe-vpc-endpoints` example displays details for all of your VPC endpoints.

```
aws ec2 describe-vpc-endpoints
```

Output:

```
{
  "VpcEndpoints": [
    {
```

```

    "PolicyDocument": "{\n\"Version\": \"2008-10-17\", \"Statement\": [{\n\"Effect
\": \"Allow\", \"Principal\": \"*\", \"Action\": \"*\", \"Resource\": \"*\"}]}",

]
}

```

For more information, see [VPC endpoints](#) in the *Amazon VPC User Guide*.

- For API details, see [DescribeVpcEndpoints](#) in *AWS CLI Command Reference*.

describe-vpc-peering-connections

The following code example shows how to use `describe-vpc-peering-connections`.

AWS CLI

To describe your VPC peering connections

This example describes all of your VPC peering connections.

Command:

```
aws ec2 describe-vpc-peering-connections
```

Output:

```
{
  "VpcPeeringConnections": [
    {
      "Status": {
        "Message": "Active",
        "Code": "active"
      },
      "Tags": [
        {
          "Value": "Peering-1",
          "Key": "Name"
        }
      ],
      "AccepterVpcInfo": {
        "OwnerId": "111122223333",
        "VpcId": "vpc-1a2b3c4d",
        "CidrBlock": "10.0.1.0/28"
      },
      "VpcPeeringConnectionId": "pcx-11122233",
      "RequesterVpcInfo": {
        "PeeringOptions": {
          "AllowEgressFromLocalVpcToRemoteClassicLink": false,
          "AllowEgressFromLocalClassicLinkToRemoteVpc": false
        },
        "OwnerId": "444455556666",
        "VpcId": "vpc-123abc45",
        "CidrBlock": "192.168.0.0/16"
      }
    }
  ]
}
```

```

    }
  },
  {
    "Status": {
      "Message": "Pending Acceptance by 444455556666",
      "Code": "pending-acceptance"
    },
    "Tags": [],
    "RequesterVpcInfo": {
      "PeeringOptions": {
        "AllowEgressFromLocalVpcToRemoteClassicLink": false,
        "AllowEgressFromLocalClassicLinkToRemoteVpc": false
      },
      "OwnerId": "444455556666",
      "VpcId": "vpc-11aa22bb",
      "CidrBlock": "10.0.0.0/28"
    },
    "VpcPeeringConnectionId": "pcx-abababab",
    "ExpirationTime": "2014-04-03T09:12:43.000Z",
    "AcceptorVpcInfo": {
      "OwnerId": "444455556666",
      "VpcId": "vpc-33cc44dd"
    }
  }
]
}

```

To describe specific VPC peering connections

This example describes all of your VPC peering connections that are in the pending-acceptance state.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=status-code,Values=pending-acceptance
```

This example describes all of your VPC peering connections that have the tag Owner=Finance.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=tag:Owner,Values=Finance
```

This example describes all of the VPC peering connections you requested for the specified VPC, vpc-1a2b3c4d.

Command:

```
aws ec2 describe-vpc-peering-connections --filters Name=requester-vpc-info.vpc-id,Values=vpc-1a2b3c4d
```

- For API details, see [DescribeVpcPeeringConnections](#) in *AWS CLI Command Reference*.

describe-vpcs

The following code example shows how to use describe-vpcs.

AWS CLI

Example 1: To describe all of your VPCs

The following describe-vpcs example retrieves details about your VPCs.

```
aws ec2 describe-vpcs
```

Output:

```
{
  "Vpcs": [
    {
      "CidrBlock": "30.1.0.0/16",
      "DhcpOptionsId": "dopt-19edf471",
      "State": "available",
      "VpcId": "vpc-0e9801d129EXAMPLE",
      "OwnerId": "111122223333",
      "InstanceTenancy": "default",
      "CidrBlockAssociationSet": [
        {
          "AssociationId": "vpc-cidr-assoc-062c64cfafEXAMPLE",
          "CidrBlock": "30.1.0.0/16",
          "CidrBlockState": {
            "State": "associated"
          }
        }
      ]
    }
  ],
}
```

```
    "IsDefault": false,
    "Tags": [
      {
        "Key": "Name",
        "Value": "Not Shared"
      }
    ]
  },
  {
    "CidrBlock": "10.0.0.0/16",
    "DhcpOptionsId": "dopt-19edf471",
    "State": "available",
    "VpcId": "vpc-06e4ab6c6cEXAMPLE",
    "OwnerId": "222222222222",
    "InstanceTenancy": "default",
    "CidrBlockAssociationSet": [
      {
        "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
        "CidrBlock": "10.0.0.0/16",
        "CidrBlockState": {
          "State": "associated"
        }
      }
    ],
    "IsDefault": false,
    "Tags": [
      {
        "Key": "Name",
        "Value": "Shared VPC"
      }
    ]
  }
]
```

Example 2: To describe a specified VPC

The following `describe-vpcs` example retrieves details for the specified VPC.

```
aws ec2 describe-vpcs \
  --vpc-ids vpc-06e4ab6c6cEXAMPLE
```

Output:

```
{
  "Vpcs": [
    {
      "CidrBlock": "10.0.0.0/16",
      "DhcpOptionsId": "dopt-19edf471",
      "State": "available",
      "VpcId": "vpc-06e4ab6c6cEXAMPLE",
      "OwnerId": "111122223333",
      "InstanceTenancy": "default",
      "CidrBlockAssociationSet": [
        {
          "AssociationId": "vpc-cidr-assoc-00b17b4eddEXAMPLE",
          "CidrBlock": "10.0.0.0/16",
          "CidrBlockState": {
            "State": "associated"
          }
        }
      ],
      "IsDefault": false,
      "Tags": [
        {
          "Key": "Name",
          "Value": "Shared VPC"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeVpcs](#) in *AWS CLI Command Reference*.

describe-vpn-connections

The following code example shows how to use `describe-vpn-connections`.

AWS CLI

Example 1: To describe your VPN connections

The following `describe-vpn-connections` example describes all of your Site-to-Site VPN connections.

```
aws ec2 describe-vpn-connections
```

Output:

```
{
  "VpnConnections": [
    {
      "CustomerGatewayConfiguration": "...configuration information...",
      "CustomerGatewayId": "cgw-01234567abcde1234",
      "Category": "VPN",
      "State": "available",
      "Type": "ipsec.1",
      "VpnConnectionId": "vpn-1122334455aabbccd",
      "TransitGatewayId": "tgw-00112233445566aab",
      "Options": {
        "EnableAcceleration": false,
        "StaticRoutesOnly": true,
        "LocalIpv4NetworkCidr": "0.0.0.0/0",
        "RemoteIpv4NetworkCidr": "0.0.0.0/0",
        "TunnelInsideIpVersion": "ipv4"
      },
      "Routes": [],
      "Tags": [
        {
          "Key": "Name",
          "Value": "CanadaVPN"
        }
      ],
      "VgwTelemetry": [
        {
          "AcceptedRouteCount": 0,
          "LastStatusChange": "2020-07-29T10:35:11.000Z",
          "OutsideIpAddress": "203.0.113.3",
          "Status": "DOWN",
          "StatusMessage": ""
        },
        {
          "AcceptedRouteCount": 0,
          "LastStatusChange": "2020-09-02T09:09:33.000Z",
          "OutsideIpAddress": "203.0.113.5",
          "Status": "UP",
          "StatusMessage": ""
        }
      ]
    }
  ]
}
```

```
    ]
  }
]
}
```

For more information, see [How AWS Site-to-Site VPN works](#) in the *AWS Site-to-Site VPN User Guide*.

Example 2: To describe your available VPN connections

The following `describe-vpn-connections` example describes your Site-to-Site VPN connections with a state of available.

```
aws ec2 describe-vpn-connections \
  --filters "Name=state,Values=available"
```

For more information, see [How AWS Site-to-Site VPN works](#) in the *AWS Site-to-Site VPN User Guide*.

- For API details, see [DescribeVpnConnections](#) in *AWS CLI Command Reference*.

describe-vpn-gateways

The following code example shows how to use `describe-vpn-gateways`.

AWS CLI

To describe your virtual private gateways

This example describes your virtual private gateways.

Command:

```
aws ec2 describe-vpn-gateways
```

Output:

```
{
  "VpnGateways": [
    {
      "State": "available",
      "Type": "ipsec.1",
```

```
    "VpnGatewayId": "vgw-f211f09b",
    "VpcAttachments": [
      {
        "State": "attached",
        "VpcId": "vpc-98eb5ef5"
      }
    ]
  },
  {
    "State": "available",
    "Type": "ipsec.1",
    "VpnGatewayId": "vgw-9a4cacf3",
    "VpcAttachments": [
      {
        "State": "attaching",
        "VpcId": "vpc-a01106c2"
      }
    ]
  }
]
```

- For API details, see [DescribeVpnGateways](#) in *AWS CLI Command Reference*.

detach-classic-link-vpc

The following code example shows how to use `detach-classic-link-vpc`.

AWS CLI

To unlink (detach) an EC2-Classic instance from a VPC

This example unlinks instance `i-0598c7d356eba48d7` from VPC `vpc-88888888`.

Command:

```
aws ec2 detach-classic-link-vpc --instance-id i-0598c7d356eba48d7 --vpc-id
vpc-88888888
```

Output:

```
{
```

```
"Return": true
}
```

- For API details, see [DetachClassicLinkVpc](#) in *AWS CLI Command Reference*.

detach-internet-gateway

The following code example shows how to use `detach-internet-gateway`.

AWS CLI

To detach an internet gateway from your VPC

The following `detach-internet-gateway` example detaches the specified internet gateway from the specific VPC.

```
aws ec2 detach-internet-gateway \
  --internet-gateway-id igw-0d0fb496b3EXAMPLE \
  --vpc-id vpc-0a60eb65b4EXAMPLE
```

This command produces no output.

For more information, see [Internet gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [DetachInternetGateway](#) in *AWS CLI Command Reference*.

detach-network-interface

The following code example shows how to use `detach-network-interface`.

AWS CLI

To detach a network interface from your instance

This example detaches the specified network interface from the specified instance. If the command succeeds, no output is returned.

Command:

```
aws ec2 detach-network-interface --attachment-id eni-attach-66c4350a
```

- For API details, see [DetachNetworkInterface](#) in *AWS CLI Command Reference*.

detach-verified-access-trust-provider

The following code example shows how to use `detach-verified-access-trust-provider`.

AWS CLI

To detach a trust provider from an instance

The following `detach-verified-access-trust-provider` example detaches the specified Verified Access trust provider from the specified Verified Access instance.

```
aws ec2 detach-verified-access-trust-provider \  
  --verified-access-instance-id vai-0ce000c0b7643abea \  
  --verified-access-trust-provider-id vatp-0bb32de759a3e19e7
```

Output:

```
{  
  "VerifiedAccessTrustProvider": {  
    "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",  
    "Description": "Testing Verified Access",

  }  
}
```

For more information, see [Verified Access instances](#) in the *AWS Verified Access User Guide*.

- For API details, see [DetachVerifiedAccessTrustProvider](#) in *AWS CLI Command Reference*.

detach-volume

The following code example shows how to use `detach-volume`.

AWS CLI

To detach a volume from an instance

This example command detaches the volume (`vol-049df61146c4d7901`) from the instance it is attached to.

Command:

```
aws ec2 detach-volume --volume-id vol-1234567890abcdef0
```

Output:

```
{
  "AttachTime": "2014-02-27T19:23:06.000Z",
  "InstanceId": "i-1234567890abcdef0",
  "VolumeId": "vol-049df61146c4d7901",
  "State": "detaching",
  "Device": "/dev/sdb"
}
```

- For API details, see [DetachVolume](#) in *AWS CLI Command Reference*.

detach-vpn-gateway

The following code example shows how to use `detach-vpn-gateway`.

AWS CLI

To detach a virtual private gateway from your VPC

This example detaches the specified virtual private gateway from the specified VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 detach-vpn-gateway --vpn-gateway-id vgw-9a4cacf3 --vpc-id vpc-a01106c2
```

- For API details, see [DetachVpnGateway](#) in *AWS CLI Command Reference*.

disable-address-transfer

The following code example shows how to use `disable-address-transfer`.

AWS CLI

To disable an Elastic IP address transfer

The following `disable-address-transfer` example disables Elastic IP address transfer for the specified Elastic IP address.

```
aws ec2 disable-address-transfer \  
  --allocation-id eipalloc-09ad461b0d03f6aaf
```

Output:

```
{  
  "AddressTransfer": {  
    "PublicIp": "100.21.184.216",  
    "AllocationId": "eipalloc-09ad461b0d03f6aaf",  
    "AddressTransferStatus": "disabled"  
  }  
}
```

For more information, see [Transfer Elastic IP addresses](#) in the *Amazon VPC User Guide*.

- For API details, see [DisableAddressTransfer](#) in *AWS CLI Command Reference*.

disable-aws-network-performance-metric-subscription

The following code example shows how to use `disable-aws-network-performance-metric-subscription`.

AWS CLI

To disable a metric subscription

The following `disable-aws-network-performance-metric-subscription` example disables the monitoring of aggregate network latency between the specified source and destination Regions.

```
aws ec2 disable-aws-network-performance-metric-subscription \  
  --source-region us-east-1 --destination-region us-west-2
```

```
--source us-east-1 \  
--destination eu-west-1 \  
--metric aggregate-latency \  
--statistic p50
```

Output:

```
{  
  "Output": true  
}
```

For more information, see [Manage subscriptions](#) in the *Infrastructure Performance User Guide*.

- For API details, see [DisableAwsNetworkPerformanceMetricSubscription](#) in *AWS CLI Command Reference*.

disable-ebs-encryption-by-default

The following code example shows how to use `disable-ebs-encryption-by-default`.

AWS CLI

To disable EBS encryption by default

The following `disable-ebs-encryption-by-default` example disables EBS encryption by default for your AWS account in the current Region.

```
aws ec2 disable-ebs-encryption-by-default
```

Output:

```
{  
  "EbsEncryptionByDefault": false  
}
```

- For API details, see [DisableEbsEncryptionByDefault](#) in *AWS CLI Command Reference*.

disable-fast-launch

The following code example shows how to use `disable-fast-launch`.

AWS CLI

To discontinue fast launching for an image

The following `disable-fast-launch` example discontinues fast launching on the specified AMI, and cleans up existing pre-provisioned snapshots.

```
aws ec2 disable-fast-launch \  
  --image-id ami-01234567890abcdef
```

Output:

```
{  
  "ImageId": "ami-01234567890abcdef",  
  "ResourceType": "snapshot",  
  "SnapshotConfiguration": {},  
  "LaunchTemplate": {  
    "LaunchTemplateId": "lt-01234567890abcdef",  
    "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-  
a8c6215d-94e6-441b-9272-dbd1f87b07e2",  
    "Version": "1"  
  },  
  "MaxParallelLaunches": 6,  
  "OwnerId": "0123456789123",  
  "State": "disabling",  
  "StateTransitionReason": "Client.UserInitiated",  
  "StateTransitionTime": "2022-01-27T22:47:29.265000+00:00"  
}
```

For more information about configuring a Windows AMI for faster launching, see [Configure your AMI for faster launching](#) in the *Amazon EC2 User Guide*.

- For API details, see [DisableFastLaunch](#) in *AWS CLI Command Reference*.

`disable-fast-snapshot-restores`

The following code example shows how to use `disable-fast-snapshot-restores`.

AWS CLI

To disable fast snapshot restore

The following `disable-fast-snapshot-restores` example disables fast snapshot restore for the specified snapshot in the specified Availability Zone.

```
aws ec2 disable-fast-snapshot-restores \
  --availability-zones us-east-2a \
  --source-snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
  "Successful": [
    {
      "SnapshotId": "snap-1234567890abcdef0"
      "AvailabilityZone": "us-east-2a",
      "State": "disabling",
      "StateTransitionReason": "Client.UserInitiated",
      "OwnerId": "123456789012",
      "EnablingTime": "2020-01-25T23:57:49.602Z"
    }
  ],
  "Unsuccessful": []
}
```

- For API details, see [DisableFastSnapshotRestores](#) in *AWS CLI Command Reference*.

disable-image-block-public-access

The following code example shows how to use `disable-image-block-public-access`.

AWS CLI

To disable block public access for AMIs in the specified Region

The following `disable-image-block-public-access` example disables block public access for AMIs at the account level in the specified Region.

```
aws ec2 disable-image-block-public-access \
  --region us-east-1
```

Output:

```
{
  "ImageBlockPublicAccessState": "unblocked"
}
```

For more information, see [Block public access to your AMIs](#) in the *Amazon EC2 User Guide*.

- For API details, see [DisableImageBlockPublicAccess](#) in *AWS CLI Command Reference*.

disable-image-deprecation

The following code example shows how to use `disable-image-deprecation`.

AWS CLI

To cancel the deprecation of an AMI

The following `disable-image-deprecation` example cancels the deprecation of an AMI, which removes the `DeprecationTime` field from the `describe-images` output. You must be the AMI owner to perform this procedure.

```
aws ec2 disable-image-deprecation \
  --image-id ami-1234567890abcdef0
```

Output:

```
{
  "RequestID": "11aabb229-4eac-35bd-99ed-be587EXAMPLE",
  "Return": "true"
}
```

For more information, see [Deprecate an AMI <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami>](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami) in the *Amazon EC2 User Guide*.

- For API details, see [DisableImageDeprecation](#) in *AWS CLI Command Reference*.

disable-image

The following code example shows how to use `disable-image`.

AWS CLI

To disable an AMI

The following `disable-image` example disables the specified AMI.

```
aws ec2 disable-image \  
  --image-id ami-1234567890abcdef0
```

Output:

```
{  
  "Return": "true"  
}
```

For more information, see [Disable an AMI](#) in the *Amazon EC2 User Guide*.

- For API details, see [DisableImage](#) in *AWS CLI Command Reference*.

disable-ipam-organization-admin-account

The following code example shows how to use `disable-ipam-organization-admin-account`.

AWS CLI

To disable the delegated IPAM admin

In certain scenarios, you'll integrate IPAM with AWS Organizations. When you do that, the AWS Organizations management account delegates an AWS Organizations member account as the IPAM admin.

In this example, you are the AWS Organizations management account that delegated the IPAM admin account and you want to disable that account from being the IPAM admin.

You can use any AWS Region for `--region` when making this request. You don't have to use the Region where you originally delegated the admin, where the IPAM was created, or an IPAM operating Region. If you disable the delegated admin account, you can re-enable it at any time or delegate a new account as IPAM admin.

The following `disable-ipam-organization-admin-account` example disables the delegated IPAM admin in your AWS account.

```
aws ec2 disable-ipam-organization-admin-account \  
  --delegated-admin-account-id 320805250157 \  
  --region us-east-1
```

```
--region ap-south-1
```

Output:

```
{
  "Success": true
}
```

For more information, see [Integrate IPAM with accounts in an AWS Organization](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DisableIpamOrganizationAdminAccount](#) in *AWS CLI Command Reference*.

disable-serial-console-access

The following code example shows how to use `disable-serial-console-access`.

AWS CLI

To disable access to the EC2 serial console for your account

The following `disable-serial-console-access` example disables account access to the serial console.

```
aws ec2 disable-serial-console-access
```

Output:

```
{
  "SerialConsoleAccessEnabled": false
}
```

For more information, see [EC2 Serial Console](#) in the *Amazon EC2 User Guide*.

- For API details, see [DisableSerialConsoleAccess](#) in *AWS CLI Command Reference*.

disable-transit-gateway-route-table-propagation

The following code example shows how to use `disable-transit-gateway-route-table-propagation`.

AWS CLI

To disable a transit gateway attachment to propagate routes to the specified propagation route table

The following `disable-transit-gateway-route-table-propagation` example disables the specified attachment to propagate routes to the specified propagation route table.

```
aws ec2 disable-transit-gateway-route-table-propagation \  
  --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE \  
  --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```
{  
  "Propagation": {  
    "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",  
    "ResourceId": "vpc-4d7de228",  
    "ResourceType": "vpc",  
    "TransitGatewayRouteTableId": "tgw-rtb-0a823edbdeEXAMPLE",  
    "State": "disabled"  
  }  
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [DisableTransitGatewayRouteTablePropagation](#) in *AWS CLI Command Reference*.

disable-vgw-route-propagation

The following code example shows how to use `disable-vgw-route-propagation`.

AWS CLI

To disable route propagation

This example disables the specified virtual private gateway from propagating static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 disable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id
vgw-9a4cacf3
```

- For API details, see [DisableVgwRoutePropagation](#) in *AWS CLI Command Reference*.

disable-vpc-classic-link-dns-support

The following code example shows how to use `disable-vpc-classic-link-dns-support`.

AWS CLI

To disable ClassicLink DNS support for a VPC

This example disables ClassicLink DNS support for `vpc-88888888`.

Command:

```
aws ec2 disable-vpc-classic-link-dns-support --vpc-id vpc-88888888
```

Output:

```
{
  "Return": true
}
```

- For API details, see [DisableVpcClassicLinkDnsSupport](#) in *AWS CLI Command Reference*.

disable-vpc-classic-link

The following code example shows how to use `disable-vpc-classic-link`.

AWS CLI

To disable ClassicLink for a VPC

This example disables ClassicLink for `vpc-88888888`.

Command:

```
aws ec2 disable-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```
{
  "Return": true
}
```

- For API details, see [DisableVpcClassicLink](#) in *AWS CLI Command Reference*.

disassociate-address

The following code example shows how to use `disassociate-address`.

AWS CLI**To disassociate an Elastic IP addresses in EC2-Classic**

This example disassociates an Elastic IP address from an instance in EC2-Classic. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-address --public-ip 198.51.100.0
```

To disassociate an Elastic IP address in EC2-VPC

This example disassociates an Elastic IP address from an instance in a VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-address --association-id eipassoc-2bebb745
```

- For API details, see [DisassociateAddress](#) in *AWS CLI Command Reference*.

disassociate-client-vpn-target-network

The following code example shows how to use `disassociate-client-vpn-target-network`.

AWS CLI**To disassociate a network from a Client VPN endpoint**

The following `disassociate-client-vpn-target-network` example disassociates the target network that's associated with the `cvpn-assoc-12312312312312312` association ID for the specified Client VPN endpoint.

```
aws ec2 disassociate-client-vpn-target-network \  
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \  
  --association-id cvpn-assoc-12312312312312312
```

Output:

```
{  
  "AssociationId": "cvpn-assoc-12312312312312312",  
  "Status": {  
    "Code": "disassociating"  
  }  
}
```

For more information, see [Target Networks](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [DisassociateClientVpnTargetNetwork](#) in *AWS CLI Command Reference*.

disassociate-iam-instance-profile

The following code example shows how to use `disassociate-iam-instance-profile`.

AWS CLI

To disassociate an IAM instance profile

This example disassociates an IAM instance profile with the association ID `iip-assoc-05020b59952902f5f`.

Command:

```
aws ec2 disassociate-iam-instance-profile --association-id iip-  
assoc-05020b59952902f5f
```

Output:

```
{  
  "IamInstanceProfileAssociation": {
```

```

    "InstanceId": "i-123456789abcde123",
    "State": "disassociating",
    "AssociationId": "iip-assoc-05020b59952902f5f",
    "IamInstanceProfile": {
      "Id": "AIPAI5IVIHMFFYY2DKV5Y",
      "Arn": "arn:aws:iam::123456789012:instance-profile/admin-role"
    }
  }
}

```

- For API details, see [DisassociateIamInstanceProfile](#) in *AWS CLI Command Reference*.

disassociate-instance-event-window

The following code example shows how to use `disassociate-instance-event-window`.

AWS CLI

Example 1: To disassociate one or more instances from an event window

The following `disassociate-instance-event-window` example disassociates one or more instances from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate instances, specify the `association-target` parameter, and for the parameter values, specify one or more instance IDs.

```

aws ec2 disassociate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"

```

Output:

```

{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
    }
  },
}

```

```

    "State": "creating"
  }
}

```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 2: To disassociate instance tags from an event window

The following `disassociate-instance-event-window` example disassociates instance tags from an event window. Specify the `instance-event-window-id` parameter to specify the event window. To disassociate instance tags, specify the `association-target` parameter, and for the parameter values, specify one or more tags.

```

aws ec2 disassociate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"

```

Output:

```

{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}

```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 3: To disassociate a Dedicated Host from an event window

The following `disassociate-instance-event-window` example disassociates a Dedicated Host from an event window. Specify the `instance-event-window-id` parameter to specify

the event window. To disassociate a Dedicated Host, specify the `association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```
aws ec2 disassociate-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --association-target DedicatedHostIds=h-029fa35a02b99801d
```

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see [DisassociateInstanceEventWindow](#) in *AWS CLI Command Reference*.

disassociate-ipam-resource-discovery

The following code example shows how to use `disassociate-ipam-resource-discovery`.

AWS CLI

To disassociate a resource discovery from an IPAM

In this example, you are an IPAM delegated admin account and you want to disassociate an IPAM resource discovery from your IPAM. You ran the `describe` command and noticed that the `"ResourceDiscoveryStatus": "not-found"` and you want to disassociate it from your IPAM to make room for other associations.

The following `disassociate-ipam-resource-discovery` example disassociates an IPAM resource discovery in your AWS account.

```
aws ec2 disassociate-ipam-resource-discovery \  
  --ipam-resource-discovery-association-id ipam-res-disco-assoc-04382a6346357cf82 \  
  \  
  --region us-east-1
```

Output:

```
{  
  "IpamResourceDiscoveryAssociation": {  
    "OwnerId": "320805250157",  
    "IpamResourceDiscoveryAssociationId": "ipam-res-disco-  
assoc-04382a6346357cf82",  
    "IpamResourceDiscoveryAssociationArn":  
    "arn:aws:ec2::320805250157:ipam-resource-discovery-association/ipam-res-disco-  
assoc-04382a6346357cf82",  
    "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",  
    "IpamId": "ipam-005f921c17ebd5107",  
    "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",  
    "IpamRegion": "us-east-1",  
    "IsDefault": false,  
    "ResourceDiscoveryStatus": "not-found",  
    "State": "disassociate-in-progress"  
  }  
}
```

For more information, see [Integrate IPAM with accounts outside of your organization](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [DisassociateIpamResourceDiscovery](#) in *AWS CLI Command Reference*.

disassociate-nat-gateway-address

The following code example shows how to use `disassociate-nat-gateway-address`.

AWS CLI

To disassociate an Elastic IP address from a public NAT gateway

The following `disassociate-nat-gateway-address` example disassociates the specified Elastic IP address from the specified public NAT gateway.

```
aws ec2 disassociate-nat-gateway-address \
  --nat-gateway-id nat-1234567890abcdef0 \
  --association-ids eipassoc-0f96bdca17EXAMPLE
```

Output:

```
{
  "NatGatewayId": "nat-1234567890abcdef0",
  "NatGatewayAddresses": [
    {
      "AllocationId": "eipalloc-0be6ecac95EXAMPLE",
      "NetworkInterfaceId": "eni-09cc4b2558794f7f9",
      "PrivateIp": "10.0.0.74",
      "PublicIp": "3.211.231.218",
      "AssociationId": "eipassoc-0f96bdca17EXAMPLE",
      "IsPrimary": false,
      "Status": "disassociating"
    }
  ]
}
```

For more information, see [NAT gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [DisassociateNatGatewayAddress](#) in *AWS CLI Command Reference*.

disassociate-route-table

The following code example shows how to use `disassociate-route-table`.

AWS CLI

To disassociate a route table

This example disassociates the specified route table from the specified subnet. If the command succeeds, no output is returned.

Command:

```
aws ec2 disassociate-route-table --association-id rtbassoc-781d0d1a
```

- For API details, see [DisassociateRouteTable](#) in *AWS CLI Command Reference*.

disassociate-subnet-cidr-block

The following code example shows how to use `disassociate-subnet-cidr-block`.

AWS CLI

To disassociate an IPv6 CIDR block from a subnet

This example disassociates an IPv6 CIDR block from a subnet using the association ID for the CIDR block.

Command:

```
aws ec2 disassociate-subnet-cidr-block --association-id subnet-cidr-assoc-3aa54053
```

Output:

```
{
  "SubnetId": "subnet-5f46ec3b",
  "Ipv6CidrBlockAssociation": {
    "Ipv6CidrBlock": "2001:db8:1234:1a00::/64",
    "AssociationId": "subnet-cidr-assoc-3aa54053",
    "Ipv6CidrBlockState": {
      "State": "disassociating"
    }
  }
}
```

- For API details, see [DisassociateSubnetCidrBlock](#) in *AWS CLI Command Reference*.

disassociate-transit-gateway-multicast-domain

The following code example shows how to use `disassociate-transit-gateway-multicast-domain`.

AWS CLI

To disassociate subnets from a multicast domain

The following `disassociate-transit-gateway-multicast-domain` example disassociates a subnet from the specified multicast domain.

```
aws ec2 disassociate-transit-gateway-multicast-domain \  
  --transit-gateway-attachment-id tgw-attach-070e571cd1EXAMPLE \  
  --subnet-id subnet-000de86e3bEXAMPLE \  
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{  
  "Associations": [  
    {  
      "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef7EXAMPLE",  
      "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",  
      "ResourceId": "vpc-7EXAMPLE",  
      "ResourceType": "vpc",  
      "Subnets": [  
        {  
          "SubnetId": "subnet-000de86e3bEXAMPLE",  
          "State": "disassociating"  
        }  
      ]  
    }  
  ]  
}
```

For more information, see [Working with multicast](#) in the *Transit Gateways Guide*'.

- For API details, see [DisassociateTransitGatewayMulticastDomain](#) in *AWS CLI Command Reference*.

disassociate-transit-gateway-route-table

The following code example shows how to use `disassociate-transit-gateway-route-table`.

AWS CLI

To disassociate a transit gateway route table from a resource attachment

The following `disassociate-transit-gateway-route-table` example disassociates the specified attachment from the transit gateway route table.

```
aws ec2 disassociate-transit-gateway-route-table \  
  --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE \  
  --transit-gateway-attachment-id tgw-attach-08e0bc912cEXAMPLE
```

Output:

```
{  
  "Association": {  
    "TransitGatewayRouteTableId": "tgw-rtb-002573ed1eEXAMPLE",  
    "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",  
    "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",  
    "ResourceType": "direct-connect-gateway",  
    "State": "disassociating"  
  }  
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [DisassociateTransitGatewayRouteTable](#) in *AWS CLI Command Reference*.

disassociate-vpc-cidr-block

The following code example shows how to use `disassociate-vpc-cidr-block`.

AWS CLI

To disassociate an IPv6 CIDR block from a VPC

This example disassociates an IPv6 CIDR block from a VPC using the association ID for the CIDR block.

Command:

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-eca54085
```

Output:

```
{  
  "Ipv6CidrBlockAssociation": {  
    "Ipv6CidrBlock": "2001:db8:1234:1a00::/56",  
    "AssociationId": "vpc-cidr-assoc-eca54085",  
  }  
}
```

```
    "Ipv6CidrBlockState": {
      "State": "disassociating"
    }
  },
  "VpcId": "vpc-a034d6c4"
}
```

To disassociate an IPv4 CIDR block from a VPC

This example disassociates an IPv4 CIDR block from a VPC.

Command:

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-0287ac6b
```

Output:

```
{
  "CidrBlockAssociation": {
    "AssociationId": "vpc-cidr-assoc-0287ac6b",
    "CidrBlock": "172.18.0.0/16",
    "CidrBlockState": {
      "State": "disassociating"
    }
  },
  "VpcId": "vpc-27621243"
}
```

- For API details, see [DisassociateVpcCidrBlock](#) in *AWS CLI Command Reference*.

enable-address-transfer

The following code example shows how to use `enable-address-transfer`.

AWS CLI

To enable an Elastic IP address transfer

The following `enable-address-transfer` example enables Elastic IP address transfer for the specified Elastic IP address to the specified account.

```
aws ec2 enable-address-transfer \
```

```
--allocation-id eipalloc-09ad461b0d03f6aaf \  
--transfer-account-id 123456789012
```

Output:

```
{  
  "AddressTransfer": {  
    "PublicIp": "100.21.184.216",  
    "AllocationId": "eipalloc-09ad461b0d03f6aaf",  
    "TransferAccountId": "123456789012",  
    "TransferOfferExpirationTimestamp": "2023-02-22T20:51:01.000Z",  
    "AddressTransferStatus": "pending"  
  }  
}
```

For more information, see [Transfer Elastic IP addresses](#) in the *Amazon VPC User Guide*.

- For API details, see [EnableAddressTransfer](#) in *AWS CLI Command Reference*.

enable-aws-network-performance-metric-subscription

The following code example shows how to use `enable-aws-network-performance-metric-subscription`.

AWS CLI**To enable a metric subscription**

The following `enable-aws-network-performance-metric-subscription` example enables the monitoring of aggregate network latency between the specified source and destination Regions.

```
aws ec2 enable-aws-network-performance-metric-subscription \  
  --source us-east-1 \  
  --destination eu-west-1 \  
  --metric aggregate-latency \  
  --statistic p50
```

Output:

```
{
```

```
"Output": true
}
```

For more information, see [Manage subscriptions](#) in the *Infrastructure Performance User Guide*.

- For API details, see [EnableAwsNetworkPerformanceMetricSubscription](#) in *AWS CLI Command Reference*.

enable-ebs-encryption-by-default

The following code example shows how to use `enable-ebs-encryption-by-default`.

AWS CLI

To enable EBS encryption by default

The following `enable-ebs-encryption-by-default` example enables EBS encryption by default for your AWS account in the current Region.

```
aws ec2 enable-ebs-encryption-by-default
```

Output:

```
{
  "EbsEncryptionByDefault": true
}
```

- For API details, see [EnableEbsEncryptionByDefault](#) in *AWS CLI Command Reference*.

enable-fast-launch

The following code example shows how to use `enable-fast-launch`.

AWS CLI

To start fast launching for an image

The following `enable-fast-launch` example starts fast launching on the specified AMI and sets the maximum number of parallel instances to launch to 6. The type of resource to use to pre-provision the AMI is set to `snapshot`, which is also the default value.

```
aws ec2 enable-fast-launch \
  --image-id ami-01234567890abcdef \
  --max-parallel-launches 6 \
  --resource-type snapshot
```

Output:

```
{
  "ImageId": "ami-01234567890abcdef",
  "ResourceType": "snapshot",
  "SnapshotConfiguration": {
    "TargetResourceCount": 10
  },
  "LaunchTemplate": {},
  "MaxParallelLaunches": 6,
  "OwnerId": "0123456789123",
  "State": "enabling",
  "StateTransitionReason": "Client.UserInitiated",
  "StateTransitionTime": "2022-01-27T22:16:03.199000+00:00"
}
```

For more information about configuring a Windows AMI for faster launching, see [Configure your AMI for faster launching](#) in the *Amazon EC2 User Guide*.

- For API details, see [EnableFastLaunch](#) in *AWS CLI Command Reference*.

enable-fast-snapshot-restores

The following code example shows how to use `enable-fast-snapshot-restores`.

AWS CLI

To enable fast snapshot restore

The following `enable-fast-snapshot-restores` example enables fast snapshot restore for the specified snapshot in the specified Availability Zones.

```
aws ec2 enable-fast-snapshot-restores \
  --availability-zones us-east-2a us-east-2b \
  --source-snapshot-ids snap-1234567890abcdef0
```

Output:

```
{
  "Successful": [
    {
      "SnapshotId": "snap-1234567890abcdef0"
      "AvailabilityZone": "us-east-2a",
      "State": "enabling",
      "StateTransitionReason": "Client.UserInitiated",
      "OwnerId": "123456789012",
      "EnablingTime": "2020-01-25T23:57:49.602Z"
    },
    {
      "SnapshotId": "snap-1234567890abcdef0"
      "AvailabilityZone": "us-east-2b",
      "State": "enabling",
      "StateTransitionReason": "Client.UserInitiated",
      "OwnerId": "123456789012",
      "EnablingTime": "2020-01-25T23:57:49.596Z"
    }
  ],
  "Unsuccessful": []
}
```

- For API details, see [EnableFastSnapshotRestores](#) in *AWS CLI Command Reference*.

enable-image-block-public-access

The following code example shows how to use `enable-image-block-public-access`.

AWS CLI**To enable block public access for AMIs in the specified Region**

The following `enable-image-block-public-access` example enables block public access for AMIs at the account level in the specified Region.

```
aws ec2 enable-image-block-public-access \
  --region us-east-1 \
  --image-block-public-access-state block-new-sharing
```

Output:

```
{
  "ImageBlockPublicAccessState": "block-new-sharing"
}
```

For more information, see [Block public access to your AMIs](#) in the *Amazon EC2 User Guide*.

- For API details, see [EnableImageBlockPublicAccess](#) in *AWS CLI Command Reference*.

enable-image-deprecation

The following code example shows how to use `enable-image-deprecation`.

AWS CLI

Example 1: To deprecate an AMI

The following `enable-image-deprecation` example deprecates an AMI on a specific date and time. If you specify a value for seconds, Amazon EC2 rounds the seconds to the nearest minute. You must be the AMI owner to perform this procedure.

```
aws ec2 enable-image-deprecation \
  --image-id ami-1234567890abcdef0 \
  --deprecate-at "2022-10-15T13:17:12.000Z"
```

Output:

```
{
  "RequestID": "59dbff89-35bd-4eac-99ed-be587EXAMPLE",
  "Return": "true"
}
```

For more information, see [Deprecate an AMI <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami>](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ami-deprecate.html#deprecate-ami) in the *Amazon EC2 User Guide*.

- For API details, see [EnableImageDeprecation](#) in *AWS CLI Command Reference*.

enable-image

The following code example shows how to use `enable-image`.

AWS CLI

To enable an AMI

The following `enable-image` example enables the specified AMI.

```
aws ec2 enable-image \  
  --image-id ami-1234567890abcdef0
```

Output:

```
{  
  "Return": "true"  
}
```

For more information, see [Disable an AMI](#) in the *Amazon EC2 User Guide*.

- For API details, see [EnableImage](#) in *AWS CLI Command Reference*.

`enable-ipam-organization-admin-account`

The following code example shows how to use `enable-ipam-organization-admin-account`.

AWS CLI

To integrate with AWS Organizations and delegate a member account as the IPAM account

The following `enable-ipam-organization-admin-account` example integrates IPAM with AWS Organizations and delegates a member account as the IPAM account.

```
aws ec2 enable-ipam-organization-admin-account \  
  --delegated-admin-account-id 320805250157
```

Output:

```
{  
  "Success": true  
}
```

For more information, see [Integrate IPAM with AWS Organizations](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [EnablepamOrganizationAdminAccount](#) in *AWS CLI Command Reference*.

enable-reachability-analyzer-organization-sharing

The following code example shows how to use `enable-reachability-analyzer-organization-sharing`.

AWS CLI

To enable trusted access for Reachability Analyzer

The following `enable-reachability-analyzer-organization-sharing` example enables trusted access for Reachability Analyzer.

```
aws ec2 enable-reachability-analyzer-organization-sharing
```

This command produces no output.

For more information, see [Cross-account analyses](#) in the *Reachability Analyzer User Guide*.

- For API details, see [EnableReachabilityAnalyzerOrganizationSharing](#) in *AWS CLI Command Reference*.

enable-serial-console-access

The following code example shows how to use `enable-serial-console-access`.

AWS CLI

To enable access to the serial console for your account

The following `enable-serial-console-access` example enables account access to the serial console.

```
aws ec2 enable-serial-console-access
```

Output:

```
{
  "SerialConsoleAccessEnabled": true
}
```

For more information, see [EC2 Serial Console](#) in the *Amazon EC2 User Guide*.

- For API details, see [EnableSerialConsoleAccess](#) in *AWS CLI Command Reference*.

enable-transit-gateway-route-table-propagation

The following code example shows how to use `enable-transit-gateway-route-table-propagation`.

AWS CLI

To enable a transit gateway attachment to propagate routes to the specified propagation route table

The following `enable-transit-gateway-route-table-propagation` example enables the specified attachment to propagate routes to the specified propagation route table.

```
aws ec2 enable-transit-gateway-route-table-propagation \  
  --transit-gateway-route-table-id tgw-rtb-0a823eddbdeEXAMPLE \  
  --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE
```

Output:

```
{  
  "Propagation": {  
    "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",  
    "ResourceId": "vpc-4d7de228",  
    "ResourceType": "vpc",  
    "TransitGatewayRouteTableId": "tgw-rtb-0a823eddbdeEXAMPLE",  
    "State": "disabled"  
  }  
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [EnableTransitGatewayRouteTablePropagation](#) in *AWS CLI Command Reference*.

enable-vgw-route-propagation

The following code example shows how to use `enable-vgw-route-propagation`.

AWS CLI

To enable route propagation

This example enables the specified virtual private gateway to propagate static routes to the specified route table. If the command succeeds, no output is returned.

Command:

```
aws ec2 enable-vgw-route-propagation --route-table-id rtb-22574640 --gateway-id
vgw-9a4cacf3
```

- For API details, see [EnableVgwRoutePropagation](#) in *AWS CLI Command Reference*.

enable-volume-io

The following code example shows how to use `enable-volume-io`.

AWS CLI

To enable I/O for a volume

This example enables I/O on volume `vol-1234567890abcdef0`.

Command:

```
aws ec2 enable-volume-io --volume-id vol-1234567890abcdef0
```

Output:

```
{
  "Return": true
}
```

- For API details, see [EnableVolumelo](#) in *AWS CLI Command Reference*.

enable-vpc-classic-link-dns-support

The following code example shows how to use `enable-vpc-classic-link-dns-support`.

AWS CLI

To enable ClassicLink DNS support for a VPC

This example enables ClassicLink DNS support for vpc-88888888.

Command:

```
aws ec2 enable-vpc-classic-link-dns-support --vpc-id vpc-88888888
```

Output:

```
{
  "Return": true
}
```

- For API details, see [EnableVpcClassicLinkDnsSupport](#) in *AWS CLI Command Reference*.

enable-vpc-classic-link

The following code example shows how to use enable-vpc-classic-link.

AWS CLI

To enable a VPC for ClassicLink

This example enables vpc-88888888 for ClassicLink.

Command:

```
aws ec2 enable-vpc-classic-link --vpc-id vpc-88888888
```

Output:

```
{
  "Return": true
}
```

- For API details, see [EnableVpcClassicLink](#) in *AWS CLI Command Reference*.

export-client-vpn-client-certificate-revocation-list

The following code example shows how to use `export-client-vpn-client-certificate-revocation-list`.

AWS CLI

To export a client certificate revocation list

The following `export-client-vpn-client-certificate-revocation-list` example exports the client certificate revocation list for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-certificate-revocation-list \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \
  --output text
```

Output:

```

- For API details, see [ExportClientVpnClientCertificateRevocationList](#) in *AWS CLI Command Reference*.

export-client-vpn-client-configuration

The following code example shows how to use `export-client-vpn-client-configuration`.

AWS CLI

To export the client configuration

The following `export-client-vpn-client-configuration` example exports the client configuration for the specified Client VPN endpoint. In this example, the output is returned in text format to make it easier to read.

```
aws ec2 export-client-vpn-client-configuration \  
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \  
  --output text
```

Output:

- For API details, see [ExportClientVpnClientConfiguration](#) in *AWS CLI Command Reference*.

export-image

The following code example shows how to use `export-image`.

AWS CLI

To export a VM from an AMI

The following `export-image` example exports the specified AMI to the specified bucket in the specified format.

```
aws ec2 export-image \
  --image-id ami-1234567890abcdef0 \
  --disk-image-format VMDK \
  --s3-export-location S3Bucket=my-export-bucket,S3Prefix=exports/
```

Output:

```
{
  "DiskImageFormat": "vmdk",
  "ExportImageTaskId": "export-ami-1234567890abcdef0"
  "ImageId": "ami-1234567890abcdef0",
  "RoleName": "vmimport",
  "Progress": "0",
  "S3ExportLocation": {
    "S3Bucket": "my-export-bucket",
    "S3Prefix": "exports/"
  },
  "Status": "active",
  "StatusMessage": "validating"
```

```
}
```

- For API details, see [ExportImage](#) in *AWS CLI Command Reference*.

get-associated-ipv6-pool-cidrs

The following code example shows how to use `get-associated-ipv6-pool-cidrs`.

AWS CLI

To get the associations for an IPv6 address pool

The following `get-associated-ipv6-pool-cidrs` example gets the associations for the specified IPv6 address pool.

```
aws ec2 get-associated-ipv6-pool-cidrs \
  --pool-id ipv6pool-ec2-012345abc12345abc
```

Output:

```
{
  "Ipv6CidrAssociations": [
    {
      "Ipv6Cidr": "2001:db8:1234:1a00::/56",
      "AssociatedResource": "vpc-111111222222333ab"
    }
  ]
}
```

- For API details, see [GetAssociatedIpv6PoolCidrs](#) in *AWS CLI Command Reference*.

get-aws-network-performance-data

The following code example shows how to use `get-aws-network-performance-data`.

AWS CLI

To get network performance data

The following `get-aws-network-performance-data` example retrieves data about the network performance between the specified Regions in the specified time period.

```
aws ec2 get-aws-network-performance-data \  
  --start-time 2022-10-26T12:00:00.000Z \  
  --end-time 2022-10-26T12:30:00.000Z \  
  --data-queries Id=my-query,Source=us-east-1,Destination=eu-  
west-1,Metric=aggregate-latency,Statistic=p50,Period=five-minutes
```

Output:

```
{  
  "DataResponses": [  
    {  
      "Id": "my-query",  
      "Source": "us-east-1",  
      "Destination": "eu-west-1",  
      "Metric": "aggregate-latency",  
      "Statistic": "p50",  
      "Period": "five-minutes",

        "Status": "OK"
    }
]
}
```

For more information, see [Monitor network performance](#) in the *Infrastructure Performance User Guide*.

- For API details, see [GetAwsNetworkPerformanceData](#) in *AWS CLI Command Reference*.

get-capacity-reservation-usage

The following code example shows how to use `get-capacity-reservation-usage`.

AWS CLI

To view capacity reservation usage across AWS accounts

The following `get-capacity-reservation-usage` example displays usage information for the specified capacity reservation.

```
aws ec2 get-capacity-reservation-usage \
    --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```
{
  "CapacityReservationId": "cr-1234abcd56EXAMPLE ",
  "InstanceUsages": [
    {
      "UsedInstanceCount": 1,
      "AccountId": "123456789012"
    }
  ],
  "AvailableInstanceCount": 4,
  "TotalInstanceCount": 5,
  "State": "active",
  "InstanceType": "t2.medium"
}
```

For more information, see [Viewing Shared Capacity Reservation Usage](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [GetCapacityReservationUsage](#) in *AWS CLI Command Reference*.

get-coip-pool-usage

The following code example shows how to use `get-coip-pool-usage`.

AWS CLI

To get customer-owned IP address pool usage

The following `get-coip-pool-usage` example gets the usage details for the specified customer-owned IP address pool.

```
aws ec2 get-coip-pool-usage \
  --pool-id ipv4pool-coip-123a45678bEXAMPLE
```

Output:

```
{
  "CoipPoolId": "ipv4pool-coip-123a45678bEXAMPLE",
  "CoipAddressUsages": [
    {
      "CoIp": "0.0.0.0"
    }
  ],
}
```

```
{
  "AllocationId": "eipalloc-123ab45c6dEXAMPLE",
  "AwsAccountId": "123456789012",
  "CoIp": "0.0.0.0"
},
{
  "AllocationId": "eipalloc-123ab45c6dEXAMPLE",
  "AwsAccountId": "123456789111",
  "CoIp": "0.0.0.0"
}
],
"LocalGatewayRouteTableId": "lgw-rtb-059615ef7dEXAMPLE"
}
```

For more information, see [Customer-owned IP addresses](#) in the *AWS Outposts User Guide*.

- For API details, see [GetCoipPoolUsage](#) in *AWS CLI Command Reference*.

get-console-output

The following code example shows how to use `get-console-output`.

AWS CLI

Example 1: To get the console output

The following `get-console-output` example gets the console output for the specified Linux instance.

```
aws ec2 get-console-output \
  --instance-id i-1234567890abcdef0
```

Output:

```
{
  "InstanceId": "i-1234567890abcdef0",
  "Timestamp": "2013-07-25T21:23:53.000Z",
  "Output": "..."
}
```

For more information, see [Instance console output](#) in the *Amazon EC2 User Guide*.

Example 2: To get the latest console output

The following `get-console-output` example gets the latest console output for the specified Linux instance.

```
aws ec2 get-console-output \  
  --instance-id i-1234567890abcdef0 \  
  --latest \  
  --output text
```

Output:

```
i-1234567890abcdef0 [ 0.000000] Command line: root=LABEL=/ console=tty1  
console=ttyS0 selinux=0 nvme_core.io_timeout=4294967295  
[ 0.000000] x86/fpu: Supporting XSAVE feature 0x001: 'x87 floating point

DataSourceEc2. Up 21.50 seconds  
Amazon Linux AMI release 2018.03  
Kernel 4.14.26-46.32.amzn1.x
```

For more information, see [Instance console output](#) in the *Amazon EC2 User Guide*.

- For API details, see [GetConsoleOutput](#) in *AWS CLI Command Reference*.

get-console-screenshot

The following code example shows how to use `get-console-screenshot`.

AWS CLI

To retrieve a screenshot of a running instance

The following `get-console-screenshot` example retrieves a screenshot of the specified instance in `.jpg` format. The screenshot is returned as a Base64-encoded string.

```
aws ec2 get-console-screenshot \  
  --instance-id i-1234567890abcdef0
```

Output:

```
{
  "ImageData": "997987/8kgj49ikjhewkwe0008084EXAMPLE",
  "InstanceId": "i-1234567890abcdef0"
}
```

- For API details, see [GetConsoleScreenshot](#) in *AWS CLI Command Reference*.

get-default-credit-specification

The following code example shows how to use `get-default-credit-specification`.

AWS CLI**To describe the default credit option**

The following `get-default-credit-specification` example describes the default credit option for T2 instances.

```
aws ec2 get-default-credit-specification \
  --instance-family t2
```

Output:

```
{
  "InstanceFamilyCreditSpecification": {
    "InstanceFamily": "t2",
    "CpuCredits": "standard"
  }
}
```

- For API details, see [GetDefaultCreditSpecification](#) in *AWS CLI Command Reference*.

get-ebs-default-kms-key-id

The following code example shows how to use `get-ebs-default-kms-key-id`.

AWS CLI**To describe your default CMK for EBS encryption**

The following `get-ebs-default-kms-key-id` example describes the default CMK for EBS encryption for your AWS account.

```
aws ec2 get-ebs-default-kms-key-id
```

The output shows the default CMK for EBS encryption, which is an AWS managed CMK with the alias `alias/aws/ebs`.

```
{
  "KmsKeyId": "alias/aws/ebs"
}
```

The following output shows a custom CMK for EBS encryption.

```
{
  "KmsKeyId": "arn:aws:kms:us-
west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"
}
```

- For API details, see [GetEbsDefaultKmsKeyId](#) in *AWS CLI Command Reference*.

get-ebs-encryption-by-default

The following code example shows how to use `get-ebs-encryption-by-default`.

AWS CLI

To describe whether EBS encryption by default is enabled

The following `get-ebs-encryption-by-default` example indicates whether EBS encryption by default is enabled for your AWS account in the current Region.

```
aws ec2 get-ebs-encryption-by-default
```

The following output indicates that EBS encryption by default is disabled.

```
{
  "EbsEncryptionByDefault": false
}
```

The following output indicates that EBS encryption by default is enabled.

```
{
  "EbsEncryptionByDefault": true
}
```

- For API details, see [GetEbsEncryptionByDefault](#) in *AWS CLI Command Reference*.

get-flow-logs-integration-template

The following code example shows how to use `get-flow-logs-integration-template`.

AWS CLI

To create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena

The following `get-flow-logs-integration-template` examples create a CloudFormation template to automate the integration of VPC flow logs with Amazon Athena.

Linux:

```
aws ec2 get-flow-logs-integration-template \
  --flow-log-id fl-1234567890abcdef0 \
  --config-delivery-s3-destination-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET \
  --integrate-services
  AthenaIntegrations='[{IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-
BUCKET,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
}{IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-
BUCKET,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
```

Windows:

```
aws ec2 get-flow-logs-integration-template ^
  --flow-log-id fl-1234567890abcdef0 ^
  --config-delivery-s3-destination-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET ^
  --integrate-services
  AthenaIntegrations=[{IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-
BUCKET,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
}{IntegrationResultS3DestinationArn=arn:aws:s3:::DOC-EXAMPLE-
BUCKET,PartitionLoadFrequency=none,PartitionStartDate=2021-07-21T00:40:00,PartitionEndDate=2
```

Output:

```
{
  "Result": "https://DOC-EXAMPLE-BUCKET.s3.us-east-2.amazonaws.com/
VPCFlowLogsIntegrationTemplate_f1-1234567890abcdef0_Wed%20Jul
%2021%2000%3A57%3A56%20UTC%202021.yml"
}
```

For information on using CloudFormation templates, see [Working with AWS CloudFormation templates](#) in the *AWS CloudFormation User Guide*.

For information on using Amazon Athena and flow logs, see [Query flow logs using Amazon Athena](#) in the *Amazon Virtual Private Cloud User Guide*.

- For API details, see [GetFlowLogsIntegrationTemplate](#) in *AWS CLI Command Reference*.

get-groups-for-capacity-reservation

The following code example shows how to use `get-groups-for-capacity-reservation`.

AWS CLI**To list the resource groups with a Capacity Reservation**

The following `get-groups-for-capacity-reservation` example lists the resource groups to which the specified Capacity Reservation was added.

```
aws ec2 get-groups-for-capacity-reservation \
  --capacity-reservation-id cr-1234abcd56EXAMPLE
```

Output:

```
{
  "CapacityReservationsGroup": [
    {
      "GroupArn": "arn:aws:resource-groups:us-west-2:123456789012:group/my-
resource-group",
      "OwnerId": "123456789012"
    }
  ]
}
```

For more information, see [Working with Capacity Reservations](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [GetGroupsForCapacityReservation](#) in *AWS CLI Command Reference*.

get-host-reservation-purchase-preview

The following code example shows how to use `get-host-reservation-purchase-preview`.

AWS CLI

To get a purchase preview for a Dedicated Host Reservation

This example provides a preview of the costs for a specified Dedicated Host Reservation for the specified Dedicated Host in your account.

Command:

```
aws ec2 get-host-reservation-purchase-preview --offering-id hro-03f707bf363b6b324 --host-id-set h-013abcd2a00cbd123
```

Output:

```
{
  "TotalHourlyPrice": "1.499",
  "Purchase": [
    {
      "HourlyPrice": "1.499",
      "InstanceFamily": "m4",
      "PaymentOption": "NoUpfront",
      "HostIdSet": [
        "h-013abcd2a00cbd123"
      ],
      "UpfrontPrice": "0.000",
      "Duration": 31536000
    }
  ],
  "TotalUpfrontPrice": "0.000"
}
```

- For API details, see [GetHostReservationPurchasePreview](#) in *AWS CLI Command Reference*.

get-image-block-public-access-state

The following code example shows how to use `get-image-block-public-access-state`.

AWS CLI

To get the block public access state for AMIs in the specified Region

The following `get-image-block-public-access-state` example gets the block public access state for AMIs at the account level in the specified Region.

```
aws ec2 get-image-block-public-access-state \  
  --region us-east-1
```

Output:

```
{  
  "ImageBlockPublicAccessState": "block-new-sharing"  
}
```

For more information, see [Block public access to your AMIs](#) in the *Amazon EC2 User Guide*.

- For API details, see [GetImageBlockPublicAccessState](#) in *AWS CLI Command Reference*.

get-instance-types-from-instance-requirements

The following code example shows how to use `get-instance-types-from-instance-requirements`.

AWS CLI

To preview the instance types that match specified attributes

The following `get-instance-types-from-instance-requirements` example first generates a list of all of the possible attributes that can be specified using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to customize the attributes for which to preview matched instance types.

To generate all possible attributes and save the output directly to a JSON file, use the following command.

```
aws ec2 get-instance-types-from-instance-requirements \  
--region us-east-1 \  
--generate-cli-skeleton input > attributes.json
```

Output:

```
{  
  "DryRun": true,  
  "ArchitectureTypes": [  
    "x86_64_mac"  
  ],  
  "VirtualizationTypes": [  
    "paravirtual"  
  ],  
  "InstanceRequirements": {  
    "VCpuCount": {  
      "Min": 0,  
      "Max": 0  
    },  
    "MemoryMiB": {  
      "Min": 0,  
      "Max": 0  
    },  
    "CpuManufacturers": [  
      "intel"  
    ],  
    "MemoryGiBPerVCpu": {  
      "Min": 0.0,  
      "Max": 0.0  
    },  
    "ExcludedInstanceTypes": [  
      ""  
    ],  
    "InstanceGenerations": [  
      "current"  
    ],  
    "SpotMaxPricePercentageOverLowestPrice": 0,  
    "OnDemandMaxPricePercentageOverLowestPrice": 0,  
    "BareMetal": "included",  
    "BurstablePerformance": "excluded",  
    "RequireHibernateSupport": true,  
    "NetworkInterfaceCount": {  
      "Min": 0,  
      "Max": 0  
    }  
  }  
}
```

```
        "Max": 0
    },
    "LocalStorage": "required",
    "LocalStorageTypes": [
        "hdd"
    ],
    "TotalLocalStorageGB": {
        "Min": 0.0,
        "Max": 0.0
    },
    "BaselineEbsBandwidthMbps": {
        "Min": 0,
        "Max": 0
    },
    "AcceleratorTypes": [
        "inference"
    ],
    "AcceleratorCount": {
        "Min": 0,
        "Max": 0
    },
    "AcceleratorManufacturers": [
        "xilinx"
    ],
    "AcceleratorNames": [
        "t4"
    ],
    "AcceleratorTotalMemoryMiB": {
        "Min": 0,
        "Max": 0
    }
}
},
"MaxResults": 0,
"NextToken": ""
}
```

Configure the JSON file. You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VcpuCount`, and `MemoryMiB`. You can omit the other attributes. When omitted, default values are used. For a description of each attribute and their default values, see `get-instance-types-from-instance-requirements` <<https://docs.aws.amazon.com/cli/latest/reference/ec2/get-instance-types-from-instance-requirements.html>>.

Preview the instance types that have the attributes specified in `attributes.json`. Specify the name and path to your JSON file by using the `--cli-input-json` parameter. In the following request, the output is formatted as a table.

```
aws ec2 get-instance-types-from-instance-requirements \
  --cli-input-json file://attributes.json \
  --output table
```

Contents of `attributes.json` file:

```
{
  "ArchitectureTypes": [
    "x86_64"
  ],
  "VirtualizationTypes": [
    "hvm"
  ],
  "InstanceRequirements": {
    "VCpuCount": {
      "Min": 4,
      "Max": 6
    },
    "MemoryMiB": {
      "Min": 2048
    },
    "InstanceGenerations": [
      "current"
    ]
  }
}
```

Output:

```
-----
|GetInstanceTypesFromInstanceRequirements|
+-----+
||           InstanceTypes           ||
|+-----+|
||           InstanceType           ||
|+-----+|
||  c4.xlarge                        ||
```

```

|| c5.xlarge           ||
|| c5a.xlarge         ||
|| c5ad.xlarge        ||
|| c5d.xlarge         ||
|| c5n.xlarge         ||
|| d2.xlarge          ||
...

```

For more information about attribute-based instance type selection, see [How attribute-based instance type selection works](#) in the *Amazon EC2 User Guide*.

- For API details, see [GetInstanceTypesFromInstanceRequirements](#) in *AWS CLI Command Reference*.

get-instance-uefi-data

The following code example shows how to use `get-instance-uefi-data`.

AWS CLI

To retrieve UEFI data from an instance

The following `get-instance-uefi-data` example retrieves UEFI data from an instance. If the output is empty, the instance does not contain UEFI data.

```
aws ec2 get-instance-uefi-data \
  --instance-id i-0123456789example
```

Output:

```
{
  "InstanceId": "i-0123456789example",
  "UefiData": "QU1aTlVFRkkf+uLXAAAAAHj5a7fZ9+3dBzxXb/."
  <snipped>
  AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAD4L/J/A0Dshho="
}
```

For more information, see [UEFI Secure Boot](#) in the *Amazon EC2 User Guide*.

- For API details, see [GetInstanceUefiData](#) in *AWS CLI Command Reference*.

get-ipam-address-history

The following code example shows how to use `get-ipam-address-history`.

AWS CLI

To get the history of a CIDR

The following `get-ipam-address-history` example gets the history of a CIDR.

(Linux):

```
aws ec2 get-ipam-address-history \  
  --cidr 10.0.0.0/16 \  
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \  
  --start-time 2021-12-08T01:00:00.000Z \  
  --end-time 2021-12-10T01:00:00.000Z
```

(Windows):

```
aws ec2 get-ipam-address-history ^  
  --cidr 10.0.0.0/16 ^  
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^  
  --start-time 2021-12-08T01:00:00.000Z ^  
  --end-time 2021-12-10T01:00:00.000Z
```

Output:

```
{  
  "HistoryRecords": [  
    {  
      "ResourceOwnerId": "123456789012",  
      "ResourceRegion": "us-west-1",

    "SampledStartTime": "2021-12-08T19:54:59.019000+00:00"
  }
]
}

```

For more information, see [View the history of IP addresses](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [GetIpamAddressHistory](#) in *AWS CLI Command Reference*.

get-ipam-discovered-accounts

The following code example shows how to use `get-ipam-discovered-accounts`.

AWS CLI

To view the accounts discovered by an IPAM

In this scenario, you're a IPAM delegated admin who wants to view the AWS accounts that own resources that the IPAM is discovering.

The `--discovery-region` is the IPAM operating Region you want to view the monitored account statuses in. For example, if you have three IPAM operating Regions, you may want to

make this request three times to view the timestamps specific to discovery in each of those particular Regions.

The following `get-ipam-discovered-accounts` example lists the AWS accounts that own resources that the IPAM is discovering.

```
aws ec2 get-ipam-discovered-accounts \
  --ipam-resource-discovery-id ipam-res-disco-0365d2977fc1672fe \
  --discovery-region us-east-1
```

Output:

```
{
  "IpamDiscoveredAccounts": [
    {
      "AccountId": "149977607591",
      "DiscoveryRegion": "us-east-1",
      "LastAttemptedDiscoveryTime": "2024-02-09T19:04:31.379000+00:00",
      "LastSuccessfulDiscoveryTime": "2024-02-09T19:04:31.379000+00:00"
    }
  ]
}
```

For more information, see [Integrate IPAM with accounts outside of your organization](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [GetIpamDiscoveredAccounts](#) in *AWS CLI Command Reference*.

get-ipam-discovered-public-addresses

The following code example shows how to use `get-ipam-discovered-public-addresses`.

AWS CLI

To view discovered public IP addresses

In this example, you are an IPAM delegated admin and you want to view the IP addresses of resources discovered by IPAM. You can get the resource discovery ID with [describe-ipam-resource-discoveries](#).

The following `get-ipam-discovered-public-addresses` example shows the discovered public IP addresses for a resource discovery.

```
aws ec2 get-ipam-discovered-public-addresses \  
  --ipam-resource-discovery-id ipam-res-disco-0f4ef577a9f37a162 \  
  --address-region us-east-1 \  
  --region us-east-1
```

Output:

```
{  
  "IpamDiscoveredPublicAddresses": [  
    {  
      "IpamResourceDiscoveryId": "ipam-res-disco-0f4ef577a9f37a162",  
      "AddressRegion": "us-east-1",  
      "Address": "54.208.155.7",

get-ipam-discovered-resource-cidrs

The following code example shows how to use `get-ipam-discovered-resource-cidrs`.

AWS CLI

To view the IP address CIDRs discovered by an IPAM

In this example, you're a IPAM delegated admin who wants to view details related to the IP address CIDRs for resources that the IPAM is discovering.

To complete this request:

The resource discovery you choose must be associated with the IPAM. The `--resource-region` is the AWS Region where resource was created.

The following `get-ipam-discovered-resource-cidrs` example lists the IP addresses for resources that the IPAM is discovering.

```
aws ec2 get-ipam-discovered-resource-cidrs \
  --ipam-resource-discovery-id ipam-res-disco-0365d2977fc1672fe \
  --resource-region us-east-1
```

Output:

```
{
```

```

{
  "IpamDiscoveredResourceCidrs": [
    {
      "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
      "ResourceRegion": "us-east-1",
      "ResourceId": "vpc-0c974c95ca7ceef4a",
      "ResourceOwnerId": "149977607591",
      "ResourceCidr": "172.31.0.0/16",
      "ResourceType": "vpc",
      "ResourceTags": [],
      "IpUsage": 0.375,
      "VpcId": "vpc-0c974c95ca7ceef4a",
      "SampleTime": "2024-02-09T19:15:16.529000+00:00"
    },
    {
      "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
      "ResourceRegion": "us-east-1",
      "ResourceId": "subnet-07fe028119082a8c1",
      "ResourceOwnerId": "149977607591",
      "ResourceCidr": "172.31.0.0/20",
      "ResourceType": "subnet",
      "ResourceTags": [],
      "IpUsage": 0.0012,
      "VpcId": "vpc-0c974c95ca7ceef4a",
      "SampleTime": "2024-02-09T19:15:16.529000+00:00"
    },
    {
      "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
      "ResourceRegion": "us-east-1",
      "ResourceId": "subnet-0a96893763984cc4e",
      "ResourceOwnerId": "149977607591",
      "ResourceCidr": "172.31.64.0/20",
      "ResourceType": "subnet",
      "ResourceTags": [],
      "IpUsage": 0.0012,
      "VpcId": "vpc-0c974c95ca7ceef4a",
      "SampleTime": "2024-02-09T19:15:16.529000+00:00"
    }
  ]
}

```

get-ipam-pool-allocations

The following code example shows how to use `get-ipam-pool-allocations`.

AWS CLI

To get the CIDRs allocated from an IPAM pool

The following `get-ipam-pool-allocations` example gets the CIDRs allocated from an IPAM pool.

(Linux):

```
aws ec2 get-ipam-pool-allocations \  
  --ipam-pool-id ipam-pool-0533048da7d823723 \  
  --filters Name=ipam-pool-allocation-id,Values=ipam-pool-  
alloc-0e6186d73999e47389266a5d6991e6220
```

(Windows):

```
aws ec2 get-ipam-pool-allocations ^  
  --ipam-pool-id ipam-pool-0533048da7d823723 ^  
  --filters Name=ipam-pool-allocation-id,Values=ipam-pool-  
alloc-0e6186d73999e47389266a5d6991e6220
```

Output:

```
{  
  "IpamPoolAllocations": [  
    {  
      "Cidr": "10.0.0.0/16",  
      "IpamPoolAllocationId": "ipam-pool-  
alloc-0e6186d73999e47389266a5d6991e6220",  
      "ResourceType": "custom",  
      "ResourceOwner": "123456789012"  
    }  
  ]  
}
```

- For API details, see [GetIpamPoolAllocations](#) in *AWS CLI Command Reference*.

get-ipam-pool-cidrs

The following code example shows how to use `get-ipam-pool-cidrs`.

AWS CLI

To get the CIDRs provisioned to an IPAM pool

The following `get-ipam-pool-cidrs` example gets the CIDRs provisioned to an IPAM pool.

(Linux):

```
aws ec2 get-ipam-pool-cidrs \  
  --ipam-pool-id ipam-pool-0533048da7d823723 \  
  --filters 'Name=cidr,Values=10.*'
```

(Windows):

```
aws ec2 get-ipam-pool-cidrs ^  
  --ipam-pool-id ipam-pool-0533048da7d823723 ^  
  --filters Name=cidr,Values=10.*
```

Output:

```
{  
  "IpamPoolCidr": {  
    "Cidr": "10.0.0.0/24",  
    "State": "provisioned"  
  }  
}
```

- For API details, see [GetIpamPoolCidrs](#) in *AWS CLI Command Reference*.

get-ipam-resource-cidrs

The following code example shows how to use `get-ipam-resource-cidrs`.

AWS CLI

To get the CIDRs allocated to a resource

The following `get-ipam-resource-cidrs` example gets the CIDRs allocated to a resource.

(Linux):

```
aws ec2 get-ipam-resource-cidrs \  
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \  
  --filters Name=management-state,Values=unmanaged
```

(Windows):

```
aws ec2 get-ipam-resource-cidrs ^  
  --ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^  
  --filters Name=management-state,Values=unmanaged
```

Output:

```
{  
  "IpamResourceCidrs": [  
    {  
      "IpamId": "ipam-08440e7a3acde3908",  
      "IpamScopeId": "ipam-scope-02fc38cd4c48e7d38",  
      "ResourceRegion": "us-east-2",  
      "ResourceOwnerId": "123456789012",  
      "ResourceId": "vpc-621b8709",  
      "ResourceName": "Default AWS VPC",  
      "ResourceCidr": "172.33.0.0/16",  
      "ResourceType": "vpc",  
      "ResourceTags": [  
        {  
          "Key": "Environment",  
          "Value": "Test"  
        },  
        {  
          "Key": "Name",  
          "Value": "Default AWS VPC"  
        }  
      ],  
      "IpUsage": 0.0039,  
      "ComplianceStatus": "unmanaged",  
      "ManagementState": "unmanaged",  
      "OverlapStatus": "nonoverlapping",  
      "VpcId": "vpc-621b8709"  
    }  
  ]  
}
```

```
}
```

For more information, see [Monitor CIDR usage by resource](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [GetIpamResourceCidrs](#) in *AWS CLI Command Reference*.

get-launch-template-data

The following code example shows how to use `get-launch-template-data`.

AWS CLI

To get instance data for a launch template

This example gets data about the specified instance and uses the `--query` option to return the contents in `LaunchTemplateData`. You can use the output as a base to create a new launch template or launch template version.

Command:

```
aws ec2 get-launch-template-data --instance-id i-0123d646e8048babc --query  
'LaunchTemplateData'
```

Output:

```
{  
  "Monitoring": {},  
  "ImageId": "ami-8c1be5f6",  
  "BlockDeviceMappings": [  
    {  
      "DeviceName": "/dev/xvda",  
      "Ebs": {  
        "DeleteOnTermination": true  
      }  
    }  
  ],  
  "EbsOptimized": false,  
  "Placement": {  
    "Tenancy": "default",  
    "GroupName": "",  
    "AvailabilityZone": "us-east-1a"  
  },  
}
```

```

    "InstanceType": "t2.micro",
    "NetworkInterfaces": [
      {
        "Description": "",
        "NetworkInterfaceId": "eni-35306abc",
        "PrivateIpAddresses": [
          {
            "Primary": true,
            "PrivateIpAddress": "10.0.0.72"
          }
        ],
        "SubnetId": "subnet-7b16de0c",
        "Groups": [
          "sg-7c227019"
        ],
        "Ipv6Addresses": [
          {
            "Ipv6Address": "2001:db8:1234:1a00::123"
          }
        ],
        "PrivateIpAddress": "10.0.0.72"
      }
    ]
  }
}

```

- For API details, see [GetLaunchTemplateData](#) in *AWS CLI Command Reference*.

get-managed-prefix-list-associations

The following code example shows how to use `get-managed-prefix-list-associations`.

AWS CLI

To get prefix list associations

The following `get-managed-prefix-list-associations` example gets the resources that are associated with the specified prefix list.

```

aws ec2 get-managed-prefix-list-associations \
  --prefix-list-id pl-0123456abcabc1

```

Output:

```
{
  "PrefixListAssociations": [
    {
      "ResourceId": "sg-0abc123456abc12345",
      "ResourceOwner": "123456789012"
    }
  ]
}
```

For more information, see [Managed prefix lists](#) in the *Amazon VPC User Guide*.

- For API details, see [GetManagedPrefixListAssociations](#) in *AWS CLI Command Reference*.

get-managed-prefix-list-entries

The following code example shows how to use `get-managed-prefix-list-entries`.

AWS CLI

To get the entries for a prefix list

The following `get-managed-prefix-list-entries` gets the entries for the specified prefix list.

```
aws ec2 get-managed-prefix-list-entries \
  --prefix-list-id pl-0123456abcabc1
```

Output:

```
{
  "Entries": [
    {
      "Cidr": "10.0.0.0/16",
      "Description": "vpc-a"
    },
    {
      "Cidr": "10.2.0.0/16",
      "Description": "vpc-b"
    }
  ]
}
```

For more information, see [Managed prefix lists](#) in the *Amazon VPC User Guide*.

- For API details, see [GetManagedPrefixListEntries](#) in *AWS CLI Command Reference*.

get-network-insights-access-scope-analysis-findings

The following code example shows how to use `get-network-insights-access-scope-analysis-findings`.

AWS CLI

To get the findings of Network Insights access scope analysis

The following `get-network-insights-access-scope-analysis-findings` example gets the selected scope analysis findings in your AWS account.

```
aws ec2 get-network-insights-access-scope-analysis-findings \
  --region us-east-1 \
  --network-insights-access-scope-analysis-id nis \
  --nis-123456789111
```

Output:

```
{
  "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
  "AnalysisFindings": [
    {
      "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
      "NetworkInsightsAccessScopeId": "nis-123456789111",
      "FindingComponents": [
        {
          "SequenceNumber": 1,

    ]
}, [etc]
]
}
]
}
}

```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the *Network Access Analyzer Guide*.

- For API details, see [GetNetworkInsightsAccessScopeAnalysisFindings](#) in *AWS CLI Command Reference*.

get-network-insights-access-scope-content

The following code example shows how to use `get-network-insights-access-scope-content`.

AWS CLI

To get Network Insights access scope content

The following `get-network-insights-access-scope-content` example gets the content of the selected scope analysis ID in your AWS account.

```
aws ec2 get-network-insights-access-scope-content \
  --region us-east-1 \
  --network-insights-access-scope-id nis-123456789222
```

Output:

```
{
  "NetworkInsightsAccessScopeContent": {
    "NetworkInsightsAccessScopeId": "nis-123456789222",
    "MatchPaths": [
      {
        "Source": {
          "ResourceStatement": {
            "ResourceTypes": [
              "AWS::EC2::NetworkInterface"
            ]
          }
        },
        "Destination": {
          "ResourceStatement": {
            "ResourceTypes": [
              "AWS::EC2::InternetGateway"
            ]
          }
        }
      }
    ]
  }
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the *Network Access Analyzer Guide*.

- For API details, see [GetNetworkInsightsAccessScopeContent](#) in *AWS CLI Command Reference*.

get-password-data

The following code example shows how to use `get-password-data`.

AWS CLI

To get the encrypted password

This example gets the encrypted password.

Command:

```
aws ec2 get-password-data --instance-id i-1234567890abcdef0
```

Output:

```
{
  "InstanceId": "i-1234567890abcdef0",
  "Timestamp": "2013-08-07T22:18:38.000Z",
  "PasswordData": "gSlJFq+VpcZXqy+iktXMF6NyxQ4qCrT4+ga0uN0enX1MmgXPTj7XEXAMPLE

DPGzKrF5yL1f3etP2L4ZR6CvG7K1hx7VK0QVN32Dajw=="
}
```

To get the decrypted password

This example gets the decrypted password.

Command:

```
aws ec2 get-password-data --instance-id i-1234567890abcdef0 --priv-launch-key C:
\Keys\MyKeyPair.pem
```

Output:

```
{
  "InstanceId": "i-1234567890abcdef0",
  "Timestamp": "2013-08-30T23:18:05.000Z",
  "PasswordData": "&ViJ652e*u"
}
```

- For API details, see [GetPasswordData](#) in *AWS CLI Command Reference*.

get-reserved-instances-exchange-quote

The following code example shows how to use `get-reserved-instances-exchange-quote`.

AWS CLI

To get a quote for exchanging a Convertible Reserved Instance

This example gets the exchange information for the specified Convertible Reserved Instances.

Command:

```
aws ec2 get-reserved-instances-exchange-quote --reserved-instance-ids
7b8750c3-397e-4da4-bbcb-a45ebexample --target-configurations OfferingId=6fea5434-
b379-434c-b07b-a7abexample
```

Output:

```
{
  "CurrencyCode": "USD",
  "ReservedInstanceValueSet": [
    {
      "ReservedInstanceId": "7b8750c3-397e-4da4-bbcb-a45ebexample",

    "RemainingUpfrontValue": "0.000000",
    "HourlyPrice": "0.027800",
    "RemainingTotalValue": "730.556200"
  },
  "TargetConfigurationValueRollup": {
    "RemainingUpfrontValue": "424.983828",
    "HourlyPrice": "0.016000",
    "RemainingTotalValue": "845.447828"
  }
}
}

```

- For API details, see [GetReservedInstancesExchangeQuote](#) in *AWS CLI Command Reference*.

get-security-groups-for-vpc

The following code example shows how to use `get-security-groups-for-vpc`.

AWS CLI

To view security groups that can be associated with network interfaces in a specified VPC.

The following `get-security-groups-for-vpc` example shows the security groups that can be associated with network interfaces in the VPC.

```

aws ec2 get-security-groups-for-vpc \
  --vpc-id vpc-6c31a611 \
  --region us-east-1

```

Output:

```

{
  "SecurityGroupForVpcs": [
    {
      "Description": "launch-wizard-36 created 2022-08-29T15:59:35.338Z",
      "GroupName": "launch-wizard-36",
      "OwnerId": "470889052923",

    }
}
```

- For API details, see [GetSecurityGroupsForVpc](#) in *AWS CLI Command Reference*.

get-serial-console-access-status

The following code example shows how to use `get-serial-console-access-status`.

AWS CLI

To view the status of account access to the serial console

The following `get-serial-console-access-status` example determines whether serial console access is enabled for your account.

```
aws ec2 get-serial-console-access-status
```

Output:

```
{
  "SerialConsoleAccessEnabled": true
}
```

For more information, see [EC2 Serial Console](#) in the *Amazon EC2 User Guide*.

- For API details, see [GetSerialConsoleAccessStatus](#) in *AWS CLI Command Reference*.

get-spot-placement-scores

The following code example shows how to use `get-spot-placement-scores`.

AWS CLI

To calculate the Spot placement score for specified requirements

The following `get-spot-placement-scores` example first generates a list of all of the possible parameters that can be specified for the Spot placement score configuration using the `--generate-cli-skeleton` parameter, and saves the list to a JSON file. Then, the JSON file is used to configure the requirements to use to calculate the Spot placement score.

To generate all possible parameters that can be specified for the Spot placement score configuration, and save the output directly to a JSON file.

```
aws ec2 get-spot-placement-scores \  
  --region us-east-1 \  
  --generate-cli-skeleton input > attributes.json
```

Output:

```
{  
  "InstanceTypes": [  
    ""  
  ],  
  "TargetCapacity": 0,  
  "TargetCapacityUnitType": "vcpu",

}

```

Configure the JSON file. You must provide a value for `TargetCapacity`. For a description of each parameter and their default values, see [Calculate the Spot placement score \(AWS CLI\)](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-placement-score.html#calculate-sps-cli) <<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/spot-placement-score.html#calculate-sps-cli>>.

Calculate the Spot placement score for the requirements specified in `attributes.json`. Specify the name and path to your JSON file by using the `--cli-input-json` parameter.

```

aws ec2 get-spot-placement-scores \
  --region us-east-1 \
  --cli-input-json file://attributes.json

```

Output if `SingleAvailabilityZone` is set to `false` or omitted (if omitted, it defaults to `false`). A scored list of Regions is returned.

```

"Recommendation": [
  {
    "Region": "us-east-1",
    "Score": 7
  },
  {
    "Region": "us-west-1",
    "Score": 5
  },
  ...

```

Output if `SingleAvailabilityZone` is set to `true`. A scored list of `SingleAvailability Zones` is returned.

```
"Recommendation": [  
  {  
    "Region": "us-east-1",  
    "AvailabilityZoneId": "use1-az1"

    "AvailabilityZoneId": "usw2-az3"  
    "Score": 6  
  },  
  ...  
]
```

For more information about calculating a Spot placement score, and for example configurations, see [Calculate a Spot placement score](#) in the *Amazon EC2 User Guide*.

- For API details, see [GetSpotPlacementScores](#) in *AWS CLI Command Reference*.

get-subnet-cidr-reservations

The following code example shows how to use `get-subnet-cidr-reservations`.

AWS CLI

To get information about a subnet CIDR reservation

The following `get-subnet-cidr-reservations` example displays information about the specified subnet CIDR reservation.

```
aws ec2 get-subnet-cidr-reservations \  
  --subnet-id subnet-03c51e2e6cEXAMPLE
```

Output:

```
{  
  "SubnetIpv4CidrReservations": [  
    {  
      "SubnetCidrReservationId": "scr-044f977c4eEXAMPLE",  
      "SubnetId": "subnet-03c51e2e6cEXAMPLE",  
    }  
  ]  
}
```

```

        "Cidr": "10.1.0.16/28",
        "ReservationType": "prefix",
        "OwnerId": "123456789012"
    }
],
"SubnetIpv6CidrReservations": []
}

```

For more information, see [Subnet CIDR reservations](#) in the *Amazon VPC User Guide*.

- For API details, see [GetSubnetCidrReservations](#) in *AWS CLI Command Reference*.

get-transit-gateway-attachment-propagations

The following code example shows how to use `get-transit-gateway-attachment-propagations`.

AWS CLI

To list the route tables to which the specified resource attachment propagates routes

The following `get-transit-gateway-attachment-propagations` example lists the route table to which the specified resource attachment propagates routes.

```

aws ec2 get-transit-gateway-attachment-propagations \
  --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE

```

Output:

```

{
  "TransitGatewayAttachmentPropagations": [
    {
      "TransitGatewayRouteTableId": "tgw-rtb-0882c61b97EXAMPLE",
      "State": "enabled"
    }
  ]
}

```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [GetTransitGatewayAttachmentPropagations](#) in *AWS CLI Command Reference*.

get-transit-gateway-multicast-domain-associations

The following code example shows how to use `get-transit-gateway-multicast-domain-associations`.

AWS CLI

To view the information about the transit gateway multicast domain associations

The following `get-transit-gateway-multicast-domain-associations` example returns the associations for the specified multicast domain.

```
aws ec2 get-transit-gateway-multicast-domain-associations \  
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef7EXAMPLE
```

Output:

```
{  
  "MulticastDomainAssociations": [  
    {  
      "TransitGatewayAttachmentId": "tgw-attach-028c1dd0f8EXAMPLE",

      }  
    },  
    {  
      "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",  
      "ResourceId": "vpc-7EXAMPLE",  
      "ResourceType": "vpc",  
      "Subnet": {  
        "SubnetId": "subnet-4EXAMPLE",  
        "State": "associated"  
      }  
    },  
    {  
      "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",  
      "ResourceId": "vpc-7EXAMPLE",  
      "ResourceType": "vpc",  
      "Subnet": {  
        "SubnetId": "subnet-5EXAMPLE",  
        "State": "associated"  
      }  
    }  
  ]  
}
```

```

        "State": "associated"
      }
    },
    {
      "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
      "ResourceId": "vpc-7EXAMPLE",
      "ResourceType": "vpc",
      "Subnet": {
        "SubnetId": "subnet-aEXAMPLE",
        "State": "associated"
      }
    },
    {
      "TransitGatewayAttachmentId": "tgw-attach-070e571cd1EXAMPLE",
      "ResourceId": "vpc-7EXAMPLE",
      "ResourceType": "vpc",
      "Subnet": {
        "SubnetId": "subnet-fEXAMPLE",
        "State": "associated"
      }
    }
  ]
}

```

For more information, see [Managing multicast domains](#) in the *Transit Gateways Guide*.

- For API details, see [GetTransitGatewayMulticastDomainAssociations](#) in *AWS CLI Command Reference*.

get-transit-gateway-prefix-list-references

The following code example shows how to use `get-transit-gateway-prefix-list-references`.

AWS CLI

To get prefix list references in a transit gateway route table

The following `get-transit-gateway-prefix-list-references` example gets the prefix list references for the specified transit gateway route table, and filters by the ID of a specific prefix list.

```
aws ec2 get-transit-gateway-prefix-list-references \
```

```
--transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \  
--filters Name=prefix-list-id,Values=pl-1111112222222333
```

Output:

```
{  
  "TransitGatewayPrefixListReferences": [  
    {  
      "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",  
      "PrefixListId": "pl-1111112222222333",  
      "PrefixListOwnerId": "123456789012",  
      "State": "available",  
      "Blackhole": false,  
      "TransitGatewayAttachment": {  
        "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",  
        "ResourceType": "vpc",  
        "ResourceId": "vpc-112233445566aabbcc"  
      }  
    }  
  ]  
}
```

For more information, see [Prefix list references](#) in the *Transit Gateways Guide*.

- For API details, see [GetTransitGatewayPrefixListReferences](#) in *AWS CLI Command Reference*.

get-transit-gateway-route-table-associations

The following code example shows how to use `get-transit-gateway-route-table-associations`.

AWS CLI

To get information about the associations for the specified transit gateway route table

The following `get-transit-gateway-route-table-associations` example displays information about the associations for the specified transit gateway route table.

```
aws ec2 get-transit-gateway-route-table-associations \  
  --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE
```

Output:

```
{
  "Associations": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
      "ResourceId": "vpc-4d7de228",
      "ResourceType": "vpc",
      "State": "associating"
    }
  ]
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [GetTransitGatewayRouteTableAssociations](#) in *AWS CLI Command Reference*.

get-transit-gateway-route-table-propagations

The following code example shows how to use `get-transit-gateway-route-table-propagations`.

AWS CLI

To display information about the route table propagations for the specified transit gateway route table

The following `get-transit-gateway-route-table-propagations` example returns the route table propagations for the specified route table.

```
aws ec2 get-transit-gateway-route-table-propagations \
  --transit-gateway-route-table-id tgw-rtb-002573ed1eEXAMPLE
```

Output:

```
{
  "TransitGatewayRouteTablePropagations": [
    {
      "TransitGatewayAttachmentId": "tgw-attach-01f8100bc7EXAMPLE",
      "ResourceId": "vpc-3EXAMPLE",
      "ResourceType": "vpc",
      "State": "enabled"
    }
  ]
}
```

```

    },
    {
      "TransitGatewayAttachmentId": "tgw-attach-08e0bc912cEXAMPLE",
      "ResourceId": "11460968-4ac1-4fd3-bdb2-00599EXAMPLE",
      "ResourceType": "direct-connect-gateway",
      "State": "enabled"
    },
    {
      "TransitGatewayAttachmentId": "tgw-attach-0a89069f57EXAMPLE",
      "ResourceId": "8384da05-13ce-4a91-aada-5a1baEXAMPLE",
      "ResourceType": "direct-connect-gateway",
      "State": "enabled"
    }
  ]
}

```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [GetTransitGatewayRouteTablePropagations](#) in *AWS CLI Command Reference*.

get-verified-access-endpoint-policy

The following code example shows how to use `get-verified-access-endpoint-policy`.

AWS CLI

To get the Verified Access policy of an endpoint

The following `get-verified-access-endpoint-policy` example gets the Verified Access policy of the specified endpoint.

```
aws ec2 get-verified-access-endpoint-policy \
  --verified-access-endpoint-id vae-066fac616d4d546f2
```

Output:

```
{
  "PolicyEnabled": true,
  "PolicyDocument": "permit(principal,action,resource)\nwhen
{\n  context.identity.groups.contains(\"finance\") &&\n
context.identity.email_verified == true\n};"
```

```
}
```

For more information, see [Verified Access policies](#) in the *AWS Verified Access User Guide*.

- For API details, see [GetVerifiedAccessEndpointPolicy](#) in *AWS CLI Command Reference*.

get-verified-access-group-policy

The following code example shows how to use `get-verified-access-group-policy`.

AWS CLI

To get the Verified Access policy of a group

The following `get-verified-access-group-policy` example gets the Verified Access policy of the specified group.

```
aws ec2 get-verified-access-group-policy \  
  --verified-access-group-id vagr-0dbe967baf14b7235
```

Output:

```
{  
  "PolicyEnabled": true,  
  "PolicyDocument": "permit(principal,action,resource)\nwhen  
{\n  context.identity.groups.contains(\"finance\") &&\n  context.identity.email_verified == true\n};"  
}
```

For more information, see [Verified Access groups](#) in the *AWS Verified Access User Guide*.

- For API details, see [GetVerifiedAccessGroupPolicy](#) in *AWS CLI Command Reference*.

get-vpn-connection-device-sample-configuration

The following code example shows how to use `get-vpn-connection-device-sample-configuration`.

AWS CLI

To download a sample configuration file

The following `get-vpn-connection-device-sample-configuration` example downloads the specified sample configuration file. To list the gateway devices with a sample configuration file, call the `get-vpn-connection-device-types` command.

```
aws ec2 get-vpn-connection-device-sample-configuration \  
  --vpn-connection-id vpn-123456789abc01234 \  
  --vpn-connection-device-type-id 5fb390ba
```

Output:

```
{  
  "VpnConnectionDeviceSampleConfiguration": "contents-of-the-sample-configuration-  
file"  
}
```

For more information, see [Download the configuration file](#) in the *AWS Site-to-Site VPN User Guide*.

- For API details, see [GetVpnConnectionDeviceSampleConfiguration](#) in *AWS CLI Command Reference*.

get-vpn-connection-device-types

The following code example shows how to use `get-vpn-connection-device-types`.

AWS CLI

To list gateway devices with a sample configuration file

The following `get-vpn-connection-device-types` example lists the gateway devices from Palo Alto Networks that have sample configuration files.

```
aws ec2 get-vpn-connection-device-types \  
  --query "VpnConnectionDeviceTypes[?Vendor==`Palo Alto Networks`]"
```

Output:

```
[  
  {  
    "VpnConnectionDeviceTypeId": "754a6372",  
    "Vendor": "Palo Alto Networks",
```

```

    "Platform": "PA Series",
    "Software": "PANOS 4.1.2+"
  },
  {
    "VpnConnectionDeviceTypeId": "9612cbed",
    "Vendor": "Palo Alto Networks",
    "Platform": "PA Series",
    "Software": "PANOS 4.1.2+ (GUI)"
  },
  {
    "VpnConnectionDeviceTypeId": "5fb390ba",
    "Vendor": "Palo Alto Networks",
    "Platform": "PA Series",
    "Software": "PANOS 7.0+"
  }
]

```

For more information, see [Download the configuration file](#) in the *AWS Site-to-Site VPN user Guide*.

- For API details, see [GetVpnConnectionDeviceTypes](#) in *AWS CLI Command Reference*.

import-client-vpn-client-certificate-revocation-list

The following code example shows how to use `import-client-vpn-client-certificate-revocation-list`.

AWS CLI

To import a client certificate revocation list

The following `import-client-vpn-client-certificate-revocation-list` example imports a client certificate revocation list to the Client VPN endpoint by specifying the location of the file on the local computer.

```

aws ec2 import-client-vpn-client-certificate-revocation-list \
  --certificate-revocation-list file:///path/to/crl.pem \
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde

```

Output:

```
{
```

```
"Return": true
}
```

For more information, see [Client Certificate Revocation Lists](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [ImportClientVpnClientCertificateRevocationList](#) in *AWS CLI Command Reference*.

import-image

The following code example shows how to use `import-image`.

AWS CLI

To import a VM image file as an AMI

The following `import-image` example imports the specified OVA.

```
aws ec2 import-image \  
  --disk-containers Format=ova,UserBucket="{S3Bucket=my-import-bucket,S3Key=vms/my-  
server-vm.ova}"
```

Output:

```
{  
  "ImportTaskId": "import-ami-1234567890abcdef0",  
  "Progress": "2",  
  "SnapshotDetails": [  
    {  
      "DiskImageSize": 0.0,  
      "Format": "ova",  
      "UserBucket": {  
        "S3Bucket": "my-import-bucket",  
        "S3Key": "vms/my-server-vm.ova"  
      }  
    }  
  ],  
  "Status": "active",  
  "StatusMessage": "pending"  
}
```

- For API details, see [ImportImage](#) in *AWS CLI Command Reference*.

import-key-pair

The following code example shows how to use `import-key-pair`.

AWS CLI

To import a public key

First, generate a key pair with the tool of your choice. For example, use this `ssh-keygen` command:

Command:

```
ssh-keygen -t rsa -C "my-key" -f ~/.ssh/my-key
```

Output:

```
Generating public/private rsa key pair.  
Enter passphrase (empty for no passphrase):  
Enter same passphrase again:  
Your identification has been saved in /home/ec2-user/.ssh/my-key.  
Your public key has been saved in /home/ec2-user/.ssh/my-key.pub.  
...
```

This example command imports the specified public key.

Command:

```
aws ec2 import-key-pair --key-name "my-key" --public-key-material fileb://~/.ssh/my-key.pub
```

Output:

```
{  
  "KeyName": "my-key",  
  "KeyFingerprint": "1f:51:ae:28:bf:89:e9:d8:1f:25:5d:37:2d:7d:b8:ca"  
}
```

- For API details, see [ImportKeyPair](#) in *AWS CLI Command Reference*.

import-snapshot

The following code example shows how to use `import-snapshot`.

AWS CLI

To import a snapshot

The following `import-snapshot` example imports the specified disk as a snapshot.

```
aws ec2 import-snapshot \  
  --description "My server VMDK" \  
  --disk-container Format=VMDK,UserBucket={S3Bucket=my-import-bucket,S3Key=vms/my-server-vm.vmdk}
```

Output:

```
{  
  "Description": "My server VMDK",  
  "ImportTaskId": "import-snap-1234567890abcdef0",  
  "SnapshotTaskDetail": {  
    "Description": "My server VMDK",  
    "DiskImageSize": "0.0",  
    "Format": "VMDK",  
    "Progress": "3",  
    "Status": "active",  
    "StatusMessage": "pending"  
    "UserBucket": {  
      "S3Bucket": "my-import-bucket",  
      "S3Key": "vms/my-server-vm.vmdk"  
    }  
  }  
}
```

- For API details, see [ImportSnapshot](#) in *AWS CLI Command Reference*.

list-images-in-recycle-bin

The following code example shows how to use `list-images-in-recycle-bin`.

AWS CLI

To list the images in the Recycle Bin

The following `list-images-in-recycle-bin` example lists all of the images that are currently retained in the Recycle Bin.

```
aws ec2 list-images-in-recycle-bin
```

Output:

```
{
  "Images": [
    {
      "RecycleBinEnterTime": "2022-03-14T15:35:08.000Z",
      "Description": "Monthly AMI One",
      "RecycleBinExitTime": "2022-03-15T15:35:08.000Z",
      "Name": "AMI_01",
      "ImageId": "ami-0111222333444abcd"
    }
  ]
}
```

For more information, see [Recover AMIs from the Recycle Bin](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [ListImagesInRecycleBin](#) in *AWS CLI Command Reference*.

`list-snapshots-in-recycle-bin`

The following code example shows how to use `list-snapshots-in-recycle-bin`.

AWS CLI

To view snapshots in the Recycle Bin

The following `list-snapshots-in-recycle-bin` example lists information about snapshots in the Recycle Bin, including the snapshot ID, a description of the snapshot, The ID of the volume from which the snapshot was created, the date and time when the snapshot was deleted and it entered the Recycle Bin, and the date and time when the retention period expires.

```
aws ec2 list-snapshots-in-recycle-bin \
  --snapshot-id snap-01234567890abcdef
```

Output:

```
{
  "SnapshotRecycleBinInfo": [
    {
      "Description": "Monthly data backup snapshot",
      "RecycleBinEnterTime": "2022-12-01T13:00:00.000Z",
      "RecycleBinExitTime": "2022-12-15T13:00:00.000Z",
      "VolumeId": "vol-abcdef09876543210",
      "SnapshotId": "snap-01234567890abcdef"
    }
  ]
}
```

For more information about Recycle Bin for Amazon EBS, see [Recover snapshots from the Recycle Bin](#) in the *Amazon EC2 User Guide*.

- For API details, see [ListSnapshotsInRecycleBin](#) in *AWS CLI Command Reference*.

modify-address-attribute

The following code example shows how to use `modify-address-attribute`.

AWS CLI**To modify the domain name attribute associated with an elastic IP address**

The following `modify-address-attribute` examples modify the domain name attribute of an elastic IP address.

Linux:

```
aws ec2 modify-address-attribute \
  --allocation-id eipalloc-abcdef01234567890 \
  --domain-name example.com
```

Windows:

```
aws ec2 modify-address-attribute ^
  --allocation-id eipalloc-abcdef01234567890 ^
  --domain-name example.com
```

Output:

```
{
  "Addresses": [
    {
      "PublicIp": "192.0.2.0",
      "AllocationId": "eipalloc-abcdef01234567890",
      "PtrRecord": "example.net."
      "PtrRecordUpdate": {
        "Value": "example.com.",
        "Status": "PENDING"
      }
    }
  ]
}
```

To monitor the pending change and to view the modified attributes of an elastic IP address, see [describe-addresses-attribute](#) in the *AWS CLI Command Reference*.

- For API details, see [ModifyAddressAttribute](#) in *AWS CLI Command Reference*.

modify-availability-zone-group

The following code example shows how to use `modify-availability-zone-group`.

AWS CLI**To enable a zone group**

The following `modify-availability-zone-group` example enables the specified zone group.

```
aws ec2 modify-availability-zone-group \
  --group-name us-west-2-lax-1 \
  --opt-in-status opted-in
```

Output:

```
{
  "Return": true
}
```

For more information, see [Regions and Zones](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyAvailabilityZoneGroup](#) in *AWS CLI Command Reference*.

modify-capacity-reservation-fleet

The following code example shows how to use `modify-capacity-reservation-fleet`.

AWS CLI

Example 1: To modify the total target capacity of a Capacity Reservation Fleet

The following `modify-capacity-reservation-fleet` example modifies the total target capacity of the specified Capacity Reservation Fleet. When you modify the total target capacity of a Capacity Reservation Fleet, the Fleet automatically creates new Capacity Reservations, or modifies or cancels existing Capacity Reservations in the Fleet to meet the new total target capacity. You can't attempt additional modifications to a Fleet while it is in the modifying state.

```
aws ec2 modify-capacity-reservation-fleet \  
  --capacity-reservation-fleet-id crf-01234567890abcdef \  
  --total-target-capacity 160
```

Output:

```
{  
  "Return": true  
}
```

Example 2: To modify the end date of a Capacity Reservation Fleet

The following `modify-capacity-reservation-fleet` example modifies the end date of the specified Capacity Reservation Fleet. When you modify the end date for the Fleet, the end dates for all of the individual Capacity Reservations are updated accordingly. You can't attempt additional modifications to a Fleet while it is in the modifying state.

```
aws ec2 modify-capacity-reservation-fleet \  
  --capacity-reservation-fleet-id crf-01234567890abcdef \  
  --end-date 2022-07-04T23:59:59.000Z
```

Output:

```
{
  "Return": true
}
```

For more information about Capacity Reservation Fleets, see [Capacity Reservation Fleets](#) in the *Amazon EC2 User Guide*.

- For API details, see [ModifyCapacityReservationFleet](#) in *AWS CLI Command Reference*.

modify-capacity-reservation

The following code example shows how to use `modify-capacity-reservation`.

AWS CLI**Example 1: To change the number of instances reserved by an existing capacity reservation**

The following `modify-capacity-reservation` example changes the number of instances for which the capacity reservation reserves capacity.

```
aws ec2 modify-capacity-reservation \
  --capacity-reservation-id cr-1234abcd56EXAMPLE \
  --instance-count 5
```

Output:

```
{
  "Return": true
}
```

Example 2: To change the end date and time for an existing capacity reservation

The following `modify-capacity-reservation` example modifies an existing capacity reservation to end at the specified date and time.

```
aws ec2 modify-capacity-reservation \
  --capacity-reservation-id cr-1234abcd56EXAMPLE \
  --end-date-type limited \
  --end-date 2019-08-31T23:59:59Z
```

For more information, see [Modifying a Capacity Reservation](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyCapacityReservation](#) in *AWS CLI Command Reference*.

modify-client-vpn-endpoint

The following code example shows how to use `modify-client-vpn-endpoint`.

AWS CLI

To modify a Client VPN endpoint

The following `modify-client-vpn-endpoint` example enables client connection logging for the specified Client VPN endpoint.

```
aws ec2 modify-client-vpn-endpoint \  
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \  
  --connection-log-options Enabled=true,CloudwatchLogGroup=ClientVPNLogs
```

Output:

```
{  
  "Return": true  
}
```

For more information, see [Client VPN Endpoints](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [ModifyClientVpnEndpoint](#) in *AWS CLI Command Reference*.

modify-default-credit-specification

The following code example shows how to use `modify-default-credit-specification`.

AWS CLI

To modify the default credit option

The following `modify-default-credit-specification` example modifies the default credit option for T2 instances.

```
aws ec2 modify-default-credit-specification \  
  --credit-specification T2Unlimited
```

```
--instance-family t2 \  
--cpu-credits unlimited
```

Output:

```
{  
  "InstanceFamilyCreditSpecification": {  
    "InstanceFamily": "t2",  
    "CpuCredits": "unlimited"  
  }  
}
```

- For API details, see [ModifyDefaultCreditSpecification](#) in *AWS CLI Command Reference*.

modify-ebs-default-kms-key-id

The following code example shows how to use `modify-ebs-default-kms-key-id`.

AWS CLI**To set your default CMK for EBS encryption**

The following `modify-ebs-default-kms-key-id` example sets the specified CMK as the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 modify-ebs-default-kms-key-id \  
--kms-key-id alias/my-cmk
```

Output:

```
{  
  "KmsKeyId": "arn:aws:kms:us-  
west-2:123456789012:key/0ea3fef3-80a7-4778-9d8c-1c0c6EXAMPLE"  
}
```

- For API details, see [ModifyEbsDefaultKmsKeyId](#) in *AWS CLI Command Reference*.

modify-fleet

The following code example shows how to use `modify-fleet`.

AWS CLI

To scale an EC2 Fleet

The following `modify-fleet` example modifies the target capacity of the specified EC2 Fleet. If the specified value is greater than the current capacity, the EC2 Fleet launches additional instances. If the specified value is less than the current capacity, the EC2 Fleet cancels any open requests and if the termination policy is `terminate`, the EC2 fleet terminates any instances that exceed the new target capacity.

```
aws ec2 modify-fleet \  
  --fleet-ids fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE \  
  --target-capacity-specification TotalTargetCapacity=5
```

Output:

```
{  
  "Return": true  
}
```

For more information, see [Managing an EC2 Fleet](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyFleet](#) in *AWS CLI Command Reference*.

modify-fpga-image-attribute

The following code example shows how to use `modify-fpga-image-attribute`.

AWS CLI

To modify the attributes of an Amazon FPGA image

This example adds load permissions for account ID 123456789012 for the specified AFI.

Command:

```
aws ec2 modify-fpga-image-attribute --attribute loadPermission --fpga-image-id  
  afi-0d123e123bfc85abc --load-permission Add=[{UserId=123456789012}]
```

Output:

```
{
  "FpgaImageAttribute": {
    "FpgaImageId": "afi-0d123e123bfc85abc",
    "LoadPermissions": [
      {
        "UserId": "123456789012"
      }
    ]
  }
}
```

- For API details, see [ModifyFpgaImageAttribute](#) in *AWS CLI Command Reference*.

modify-hosts

The following code example shows how to use `modify-hosts`.

AWS CLI

Example 1: To enable auto-placement for a Dedicated Host

The following `modify-hosts` example enables auto-placement for a Dedicated Host so that it accepts any untargeted instance launches that match its instance type configuration.

```
aws ec2 modify-hosts \
  --host-id h-06c2f189b4EXAMPLE \
  --auto-placement on
```

Output:

```
{
  "Successful": [
    "h-06c2f189b4EXAMPLE"
  ],
  "Unsuccessful": []
}
```

Example 2: To enable host recovery for a Dedicated Host

The following `modify-hosts` example enables host recovery for the specified Dedicated Host.

```
aws ec2 modify-hosts \  
  --host-id h-06c2f189b4EXAMPLE \  
  --host-recovery on
```

Output:

```
{  
  "Successful": [  
    "h-06c2f189b4EXAMPLE"  
  ],  
  "Unsuccessful": []  
}
```

For more information, see [Modifying Dedicated Host Auto-Placement](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyHosts](#) in *AWS CLI Command Reference*.

modify-id-format

The following code example shows how to use `modify-id-format`.

AWS CLI

To enable the longer ID format for a resource

The following `modify-id-format` example enables the longer ID format for the instance resource type.

```
aws ec2 modify-id-format \  
  --resource instance \  
  --use-long-ids
```

To disable the longer ID format for a resource

The following `modify-id-format` example disables the longer ID format for the instance resource type.

```
aws ec2 modify-id-format \  
  --resource instance \  
  --use-long-ids
```

```
--no-use-long-ids
```

The following `modify-id-format` example enables the longer ID format for all supported resource types that are within their opt-in period.

```
aws ec2 modify-id-format \  
  --resource all-current \  
  --use-long-ids
```

- For API details, see [ModifyIdFormat](#) in *AWS CLI Command Reference*.

modify-identity-id-format

The following code example shows how to use `modify-identity-id-format`.

AWS CLI

To enable an IAM role to use longer IDs for a resource

The following `modify-identity-id-format` example enables the IAM role `EC2Role` in your AWS account to use long ID format for the `instance` resource type.

```
aws ec2 modify-identity-id-format \  
  --principal-arn arn:aws:iam::123456789012:role/EC2Role \  
  --resource instance \  
  --use-long-ids
```

To enable an IAM user to use longer IDs for a resource

The following `modify-identity-id-format` example enables the IAM user `AdminUser` in your AWS account to use the longer ID format for the `volume` resource type.

```
aws ec2 modify-identity-id-format \  
  --principal-arn arn:aws:iam::123456789012:user/AdminUser \  
  --resource volume \  
  --use-long-ids
```

The following `modify-identity-id-format` example enables the IAM user `AdminUser` in your AWS account to use the longer ID format for all supported resource types that are within their opt-in period.

```
aws ec2 modify-identity-id-format \  
  --principal-arn arn:aws:iam::123456789012:user/AdminUser \  
  --resource all-current \  
  --use-long-ids
```

- For API details, see [ModifyIdentityIdFormat](#) in *AWS CLI Command Reference*.

modify-image-attribute

The following code example shows how to use `modify-image-attribute`.

AWS CLI

Example 1: To make an AMI public

The following `modify-instance-attribute` example makes the specified AMI public.

```
aws ec2 modify-image-attribute \  
  --image-id ami-5731123e \  
  --launch-permission "Add=[{Group=all}]"
```

This command produces no output.

Example 2: To make an AMI private

The following `modify-instance-attribute` example makes the specified AMI private.

```
aws ec2 modify-image-attribute \  
  --image-id ami-5731123e \  
  --launch-permission "Remove=[{Group=all}]"
```

This command produces no output.

Example 3: To grant launch permission to an AWS account

The following `modify-instance-attribute` example grants launch permissions to the specified AWS account.

```
aws ec2 modify-image-attribute \  
  --image-id ami-5731123e \  
  --launch-permission "Add=[{UserId=123456789012}]"
```

This command produces no output.

Example 4: To remove launch permission from an AWS account

The following `modify-instance-attribute` example removes launch permissions from the specified AWS account.

```
aws ec2 modify-image-attribute \  
  --image-id ami-5731123e \  
  --launch-permission "Remove=[{UserId=123456789012}]"
```

- For API details, see [ModifyImageAttribute](#) in *AWS CLI Command Reference*.

modify-instance-attribute

The following code example shows how to use `modify-instance-attribute`.

AWS CLI

Example 1: To modify the instance type

The following `modify-instance-attribute` example modifies the instance type of the specified instance. The instance must be in the stopped state.

```
aws ec2 modify-instance-attribute \  
  --instance-id i-1234567890abcdef0 \  
  --instance-type "{\"Value\": \"m1.small\"}"
```

This command produces no output.

Example 2: To enable enhanced networking on an instance

The following `modify-instance-attribute` example enables enhanced networking for the specified instance. The instance must be in the stopped state.

```
aws ec2 modify-instance-attribute \  
  --instance-id i-1234567890abcdef0 \  
  --sriov-net-support simple
```

This command produces no output.

Example 3: To modify the sourceDestCheck attribute

The following `modify-instance-attribute` example sets the `sourceDestCheck` attribute of the specified instance to `true`. The instance must be in a VPC.

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --source-dest-check "{\"Value\": true}"
```

This command produces no output.

Example 4: To modify the `deleteOnTermination` attribute of the root volume

The following `modify-instance-attribute` example sets the `deleteOnTermination` attribute for the root volume of the specified Amazon EBS-backed instance to `false`. By default, this attribute is `true` for the root volume.

Command:

```
aws ec2 modify-instance-attribute \
  --instance-id i-1234567890abcdef0 \
  --block-device-mappings "[{\"DeviceName\": \"/dev/sda1\", \"Ebs\": {\"DeleteOnTermination\": false}}]"
```

This command produces no output.

Example 5: To modify the user data attached to an instance

The following `modify-instance-attribute` example adds the contents of the file `UserData.txt` as the `UserData` for the specified instance.

Contents of original file `UserData.txt`:

```
#!/bin/bash
yum update -y
service httpd start
chkconfig httpd on
```

The contents of the file must be base64 encoded. The first command converts the text file to base64 and saves it as a new file.

Linux/macOS version of the command:

```
base64 UserData.txt > UserData.base64.txt
```

This command produces no output.

Windows version of the command:

```
certutil -encode UserData.txt tmp.b64 && findstr /v /c:- tmp.b64 >
UserData.base64.txt
```

Output:

```
Input Length = 67
Output Length = 152
CertUtil: -encode command completed successfully.
```

Now you can reference that file in the CLI command that follows:

```
aws ec2 modify-instance-attribute \
  --instance-id=i-09b5a14dbca622e76 \
  --attribute userData --value file://UserData.base64.txt
```

This command produces no output.

For more information, see [User Data and the AWS CLI](#) in the *EC2 User Guide*.

- For API details, see [ModifyInstanceAttribute](#) in *AWS CLI Command Reference*.

modify-instance-capacity-reservation-attributes

The following code example shows how to use `modify-instance-capacity-reservation-attributes`.

AWS CLI

Example 1: To modify an instance's capacity reservation targeting settings

The following `modify-instance-capacity-reservation-attributes` example modifies a stopped instance to target a specific capacity reservation.

```
aws ec2 modify-instance-capacity-reservation-attributes \
  --instance-id i-EXAMPLE8765abcd4e \
  --capacity-reservation-specification
  'CapacityReservationTarget={CapacityReservationId= cr-1234abcd56EXAMPLE }'
```

Output:

```
{
  "Return": true
}
```

Example 2: To modify an instance's capacity reservation targeting settings

The following `modify-instance-capacity-reservation-attributes` example modifies a stopped instance that targets the specified capacity reservation to launch in any capacity reservation that has matching attributes (instance type, platform, Availability Zone) and that has open instance matching criteria.

```
aws ec2 modify-instance-capacity-reservation-attributes \
  --instance-id i-EXAMPLE8765abcd4e \
  --capacity-reservation-specification 'CapacityReservationPreference=open'
```

Output:

```
{
  "Return": true
}
```

For more information, see [Modifying an Instance's Capacity Reservation Settings](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyInstanceCapacityReservationAttributes](#) in *AWS CLI Command Reference*.

modify-instance-credit-specification

The following code example shows how to use `modify-instance-credit-specification`.

AWS CLI**To modify the credit option for CPU usage of an instance**

This example modifies the credit option for CPU usage of the specified instance in the specified region to "unlimited". Valid credit options are "standard" and "unlimited".

Command:

```
aws ec2 modify-instance-credit-specification --instance-credit-specification
"InstanceId=i-1234567890abcdef0,CpuCredits=unlimited"
```

Output:

```
{
  "SuccessfulInstanceCreditSpecifications": [
    {
      "InstanceId": "i-1234567890abcdef0"
    }
  ],
  "UnsuccessfulInstanceCreditSpecifications": []
}
```

- For API details, see [ModifyInstanceCreditSpecification](#) in *AWS CLI Command Reference*.

modify-instance-event-start-time

The following code example shows how to use `modify-instance-event-start-time`.

AWS CLI

To modify the event start time for an instance

The following `modify-instance-event-start-time` command shows how to modify the event start time for the specified instance. Specify the event ID by using the `--instance-event-id` parameter. Specify the new date and time by using the `--not-before` parameter.

```
aws ec2 modify-instance-event-start-time --instance-id i-1234567890abcdef0
--instance-event-id instance-event-0abcdef1234567890 --not-before
2019-03-25T10:00:00.000
```

Output:

```
"Event": {
  "InstanceEventId": "instance-event-0abcdef1234567890",
  "Code": "system-reboot",
  "Description": "scheduled reboot",
  "NotAfter": "2019-03-25T12:00:00.000Z",
  "NotBefore": "2019-03-25T10:00:00.000Z",
```

```
"NotBeforeDeadline": "2019-04-22T21:00:00.000Z"  
}
```

For more information, see [Working with Instances Scheduled for Reboot](#) in the *Amazon Elastic Compute Cloud User Guide*

- For API details, see [ModifyInstanceEventStartTime](#) in *AWS CLI Command Reference*.

modify-instance-event-window

The following code example shows how to use `modify-instance-event-window`.

AWS CLI

Example 1: To modify the time range of an event window

The following `modify-instance-event-window` example modifies the time range of an event window. Specify the `time-range` parameter to modify the time range. You can't also specify the `cron-expression` parameter.

```
aws ec2 modify-instance-event-window \  
  --region us-east-1 \  
  --instance-event-window-id iew-0abcdef1234567890  
  --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8
```

Output:

```
{  
  "InstanceEventWindow": {  
    "InstanceEventWindowId": "iew-0abcdef1234567890",  
    "TimeRanges": [  
      {  
        "StartWeekDay": "monday",  
        "StartHour": 2,  
        "EndWeekDay": "wednesday",  
        "EndHour": 8  
      }  
    ],  
    "Name": "myEventWindowName",  
    "AssociationTarget": {  
      "InstanceIds": [  

```

```

        "i-0abcdef1234567890",
        "i-0be35f9acb8ba01f0"
    ],
    "Tags": [],
    "DedicatedHostIds": []
},
"State": "creating",
"Tags": [
    {
        "Key": "K1",
        "Value": "V1"
    }
]
}
}

```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 2: To modify a set of time ranges for an event window

The following `modify-instance-event-window` example modifies the time range of an event window. Specify the `time-range` parameter to modify the time range. You can't also specify the `cron-expression` parameter.

```

aws ec2 modify-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --time-range '[{"StartWeekDay": "monday", "StartHour": 2, "EndWeekDay":
"wednesday", "EndHour": 8},
    {"StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday",
"EndHour": 8}]'

```

Output:

```

{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "StartHour": 2,

```

```

        "EndWeekDay": "wednesday",
        "EndHour": 8
    },
    {
        "StartWeekDay": "thursday",
        "StartHour": 2,
        "EndWeekDay": "friday",
        "EndHour": 8
    }
],
"Name": "myEventWindowName",
"AssociationTarget": {
    "InstanceIds": [
        "i-0abcdef1234567890",
        "i-0be35f9acb8ba01f0"
    ],
    "Tags": [],
    "DedicatedHostIds": []
},
"State": "creating",
"Tags": [
    {
        "Key": "K1",
        "Value": "V1"
    }
]
}
}

```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

Example 3: To modify the cron expression of an event window

The following `modify-instance-event-window` example modifies the cron expression of an event window. Specify the `cron-expression` parameter to modify the cron expression. You can't also specify the `time-range` parameter.

```

aws ec2 modify-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --cron-expression "* 21-23 * * 2,3"

```

Output:

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [
        "i-0abcdef1234567890",
        "i-0be35f9acb8ba01f0"
      ],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating",
    "Tags": [
      {
        "Key": "K1",
        "Value": "V1"
      }
    ]
  }
}
```

For event window constraints, see [Considerations](#) in the Scheduled Events section of the *Amazon EC2 User Guide*.

- For API details, see [ModifyInstanceEventWindow](#) in *AWS CLI Command Reference*.

modify-instance-maintenance-options

The following code example shows how to use `modify-instance-maintenance-options`.

AWS CLI**Example 1: To disable the recovery behavior of an instance**

The following `modify-instance-maintenance-options` example disables simplified automatic recovery for a running or stopped instance.

```
aws ec2 modify-instance-maintenance-options \
  --instance-id i-0abcdef1234567890 \
```

```
--auto-recovery disabled
```

Output:

```
{
  "InstanceId": "i-0abcdef1234567890",
  "AutoRecovery": "disabled"
}
```

For more information, see [Recover your instance](#) in the *Amazon EC2 User Guide for Linux Instances*.

Example 2: To set the recovery behavior of an instance to default

The following `modify-instance-maintenance-options` example sets the automatic recovery behavior to default which enables simplified automatic recovery for supported instance types.

```
aws ec2 modify-instance-maintenance-options \
  --instance-id i-0abcdef1234567890 \
  --auto-recovery default
```

Output:

```
{
  "InstanceId": "i-0abcdef1234567890",
  "AutoRecovery": "default"
}
```

For more information, see [Recover your instance](#) in the *Amazon EC2 User Guide for Linux Instances*.

- For API details, see [ModifyInstanceMaintenanceOptions](#) in *AWS CLI Command Reference*.

modify-instance-metadata-options

The following code example shows how to use `modify-instance-metadata-options`.

AWS CLI**Example 1: To enable IMDSv2**

The following `modify-instance-metadata-options` example configures the use of IMDSv2 on the specified instance.

```
aws ec2 modify-instance-metadata-options \  
  --instance-id i-1234567898abcdef0 \  
  --http-tokens required \  
  --http-endpoint enabled
```

Output:

```
{  
  "InstanceId": "i-1234567898abcdef0",  
  "InstanceMetadataOptions": {  
    "State": "pending",  
    "HttpTokens": "required",  
    "HttpPutResponseHopLimit": 1,  
    "HttpEndpoint": "enabled"  
  }  
}
```

For more information, see [Instance metadata and user data](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To disable instance metadata

The following `modify-instance-metadata-options` example disables the use of all versions of instance metadata on the specified instance.

```
aws ec2 modify-instance-metadata-options \  
  --instance-id i-1234567898abcdef0 \  
  --http-endpoint disabled
```

Output:

```
{  
  "InstanceId": "i-1234567898abcdef0",  
  "InstanceMetadataOptions": {  
    "State": "pending",  
    "HttpTokens": "required",  
    "HttpPutResponseHopLimit": 1,  
    "HttpEndpoint": "disabled"  
  }  
}
```

```
}
```

For more information, see [Instance metadata and user data](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 3: To enable instance metadata IPv6 endpoint for your instance

The following `modify-instance-metadata-options` example shows you how to turn on the IPv6 endpoint for the instance metadata service.

```
aws ec2 modify-instance-metadata-options \
  --instance-id i-1234567898abcdef0 \
  --http-protocol-ipv6 enabled \
  --http-endpoint enabled
```

Output:

```
{
  "InstanceId": "i-1234567898abcdef0",
  "InstanceMetadataOptions": {
    "State": "pending",
    "HttpTokens": "required",
    "HttpPutResponseHopLimit": 1,
    "HttpEndpoint": "enabled",
    "HttpProtocolIpv6": "enabled"
  }
}
```

By default, the IPv6 endpoint is disabled. This is true even if you have launched an instance into an IPv6-only subnet. The IPv6 endpoint for IMDS is only accessible on instances built on the Nitro System. For more information, see [Instance metadata and user data](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyInstanceMetadataOptions](#) in *AWS CLI Command Reference*.

modify-instance-placement

The following code example shows how to use `modify-instance-placement`.

AWS CLI

Example 1: To remove an instance's affinity with a Dedicated Host

The following `modify-instance-placement` example removes an instance's affinity with a Dedicated Host and enables it to launch on any available Dedicated Host in your account that supports its instance type.

```
aws ec2 modify-instance-placement \  
  --instance-id i-0e6ddf6187EXAMPLE \  
  --affinity default
```

Output:

```
{  
  "Return": true  
}
```

Example 2: To establish affinity between an instance and the specified Dedicated Host

The following `modify-instance-placement` example establishes a launch relationship between an instance and a Dedicated Host. The instance is only able to run on the specified Dedicated Host.

```
aws ec2 modify-instance-placement \  
  --instance-id i-0e6ddf6187EXAMPLE \  
  --affinity host \  
  --host-id i-0e6ddf6187EXAMPLE
```

Output:

```
{  
  "Return": true  
}
```

For more information, see [Modifying Instance Tenancy and Affinity](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 3: To move an instance to a placement group

The following `modify-instance-placement` example moves an instance to a placement group, stop the instance, modify the instance placement, and then restart the instance.

```
aws ec2 stop-instances \  
  --instance-ids i-0e6ddf6187EXAMPLE
```

```
--instance-ids i-0123a456700123456

aws ec2 modify-instance-placement \
  --instance-id i-0123a456700123456 \
  --group-name MySpreadGroup

aws ec2 start-instances \
  --instance-ids i-0123a456700123456
```

For more information, see [Changing the Placement Group for an Instance](#) in the *Amazon Elastic Compute Cloud Users Guide*.

Example 4: To remove an instance from a placement group

The following `modify-instance-placement` example removes an instance from a placement group by stopping the instance, modifying the instance placement, and then restarting the instance. The following example specifies an empty string ("") for the placement group name to indicate that the instance is not to be located in a placement group.

Stop the instance:

```
aws ec2 stop-instances \
  --instance-ids i-0123a456700123456
```

Modify the placement (Windows Command Prompt, Linux, and macOS):

```
aws ec2 modify-instance-placement \
  --instance-id i-0123a456700123456 \
  --group-name ""
```

Modify the placement (Windows PowerShell):

```
aws ec2 modify-instance-placement `
  --instance-id i-0123a456700123456 `
  --group-name ""
```

Restart the instance:

```
aws ec2 start-instances \
  --instance-ids i-0123a456700123456
```

Output:

```
{
  "Return": true
}
```

For more information, see [Modifying Instance Tenancy and Affinity](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [ModifyInstancePlacement](#) in *AWS CLI Command Reference*.

modify-ipam-pool

The following code example shows how to use `modify-ipam-pool`.

AWS CLI**To modify an IPAM pool**

The following `modify-ipam-pool` example modifies an IPAM pool.

(Linux):

```
aws ec2 modify-ipam-pool \
  --ipam-pool-id ipam-pool-0533048da7d823723 \
  --add-allocation-resource-tags "Key=Owner,Value=Build Team" \
  --clear-allocation-default-netmask-length \
  --allocation-min-netmask-length 14
```

(Windows):

```
aws ec2 modify-ipam-pool ^
  --ipam-pool-id ipam-pool-0533048da7d823723 ^
  --add-allocation-resource-tags "Key=Owner,Value=Build Team" ^
  --clear-allocation-default-netmask-length ^
  --allocation-min-netmask-length 14
```

Output:

```
{
  "IpamPool": {
```

```

    "OwnerId": "123456789012",
    "IpamPoolId": "ipam-pool-0533048da7d823723",
    "IpamPoolArn": "arn:aws:ec2::123456789012:ipam-pool/ipam-
pool-0533048da7d823723",
    "IpamScopeArn": "arn:aws:ec2::123456789012:ipam-scope/ipam-
scope-02fc38cd4c48e7d38",
    "IpamScopeType": "private",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "Locale": "None",
    "PoolDepth": 1,
    "State": "modify-complete",
    "AutoImport": true,
    "AddressFamily": "ipv4",
    "AllocationMinNetmaskLength": 14,
    "AllocationMaxNetmaskLength": 26,
    "AllocationResourceTags": [
      {
        "Key": "Environment",
        "Value": "Preprod"
      },
      {
        "Key": "Owner",
        "Value": "Build Team"
      }
    ]
  }
}

```

For more information, see [Edit a pool](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [ModifyIpamPool](#) in *AWS CLI Command Reference*.

modify-ipam-resource-cidr

The following code example shows how to use `modify-ipam-resource-cidr`.

AWS CLI

To modify the CIDR allocated to a resource

The following `modify-ipam-resource-cidr` example modifies a resource CIDR.

(Linux):

```
aws ec2 modify-ipam-resource-cidr \  
  --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 \  
  --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 \  
  --resource-id vpc-010e1791024eb0af9 \  
  --resource-cidr 10.0.1.0/24 \  
  --resource-region us-east-1 \  
  --monitored
```

(Windows):

```
aws ec2 modify-ipam-resource-cidr ^  
  --current-ipam-scope-id ipam-scope-02fc38cd4c48e7d38 ^  
  --destination-ipam-scope-id ipam-scope-0da34c61fd189a141 ^  
  --resource-id vpc-010e1791024eb0af9 ^  
  --resource-cidr 10.0.1.0/24 ^  
  --resource-region us-east-1 ^  
  --monitored
```

Output:

```
{  
  "IpamResourceCidr": {  
    "IpamId": "ipam-08440e7a3acde3908",  
    "IpamScopeId": "ipam-scope-0da34c61fd189a141",  
    "IpamPoolId": "ipam-pool-0533048da7d823723",  
    "ResourceRegion": "us-east-1",  
    "ResourceOwnerId": "123456789012",  
    "ResourceId": "vpc-010e1791024eb0af9",  
    "ResourceCidr": "10.0.1.0/24",  
    "ResourceType": "vpc",  
    "ResourceTags": [  
      {  
        "Key": "Environment",  
        "Value": "Preprod"  
      },  
      {  
        "Key": "Owner",  
        "Value": "Build Team"  
      }  
    ],  
    "IpUsage": 0.0,  
    "ComplianceStatus": "noncompliant",
```

```
    "ManagementState": "managed",
    "OverlapStatus": "overlapping",
    "VpcId": "vpc-010e1791024eb0af9"
  }
}
```

For more information on moving resources, see [Move resource CIDRs between scopes](#) in the *Amazon VPC IPAM User Guide*.

For more information on changing monitoring states, see [Change the monitoring state of resource CIDRs](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [ModifyIpamResourceCidr](#) in *AWS CLI Command Reference*.

modify-ipam-resource-discovery

The following code example shows how to use `modify-ipam-resource-discovery`.

AWS CLI

To modify the operating regions of a resource discovery

In this example, you're an IPAM delegated admin who wants to modify the operating regions of a resource discovery.

To complete this request:

You cannot modify a default resource discovery and you must be the owner of the resource discovery. You need the resource discovery ID, which you can get with [describe-ipam-resource-discoveries](#).

The following `modify-ipam-resource-discovery` example modifies a non-default resource discovery in your AWS account.

```
aws ec2 modify-ipam-resource-discovery \
  --ipam-resource-discovery-id ipam-res-disco-0f4ef577a9f37a162 \
  --add-operating-regions RegionName='us-west-1' \
  --remove-operating-regions RegionName='us-east-2' \
  --region us-east-1
```

Output:

```
{
  "IpamResourceDiscovery": {
    "OwnerId": "149977607591",
    "IpamResourceDiscoveryId": "ipam-res-disco-0365d2977fc1672fe",
    "IpamResourceDiscoveryArn": "arn:aws:ec2::149977607591:ipam-resource-
discovery/ipam-res-disco-0365d2977fc1672fe",
    "IpamResourceDiscoveryRegion": "us-east-1",
    "Description": "Example",
    "OperatingRegions": [
      {
        "RegionName": "us-east-1"
      },
      {
        "RegionName": "us-west-1"
      }
    ],
    "IsDefault": false,
    "State": "modify-in-progress"
  }
}
```

For more information, see [Work with resource discoveries](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [ModifyIpamResourceDiscovery](#) in *AWS CLI Command Reference*.

modify-ipam-scope

The following code example shows how to use `modify-ipam-scope`.

AWS CLI

To modify the description of a scope

In this scenario, you're an IPAM delegated admin who wants to modify the description of an IPAM scope.

To complete this request, you'll need the scope ID, which you can get with [describe-ipam-scopes](#).

The following `modify-ipam-scope` example updates the description of the scope.

```
aws ec2 modify-ipam-scope \
  --ipam-scope-id ipam-scope-0d3539a30b57dcdd1 \
```

```
--description example \  
--region us-east-1
```

Output:

```
{  
  "IpamScope": {  
    "OwnerId": "320805250157",  
    "IpamScopeId": "ipam-scope-0d3539a30b57dcdd1",  
    "IpamScopeArn": "arn:aws:ec2::320805250157:ipam-scope/ipam-  
scope-0d3539a30b57dcdd1",  
    "IpamArn": "arn:aws:ec2::320805250157:ipam/ipam-005f921c17ebd5107",  
    "IpamRegion": "us-east-1",  
    "IpamScopeType": "public",  
    "IsDefault": true,  
    "Description": "example",  
    "PoolCount": 1,  
    "State": "modify-in-progress"  
  }  
}
```

For more information about scopes, see [How IPAM works](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [ModifyIpamScope](#) in *AWS CLI Command Reference*.

modify-ipam

The following code example shows how to use `modify-ipam`.

AWS CLI

To modify an IPAM

The following `modify-ipam` example modifies an IPAM by adding an Operating Region.

(Linux):

```
aws ec2 modify-ipam \  
  --ipam-id ipam-08440e7a3acde3908 \  
  --add-operating-regions RegionName=us-west-2
```

(Windows):

```
aws ec2 modify-ipam ^
  --ipam-id ipam-08440e7a3acde3908 ^
  --add-operating-regions RegionName=us-west-2
```

Output:

```
{
  "Ipam": {
    "OwnerId": "123456789012",
    "IpamId": "ipam-08440e7a3acde3908",
    "IpamArn": "arn:aws:ec2::123456789012:ipam/ipam-08440e7a3acde3908",
    "IpamRegion": "us-east-1",
    "PublicDefaultScopeId": "ipam-scope-0b9eed026396dbc16",
    "PrivateDefaultScopeId": "ipam-scope-02fc38cd4c48e7d38",
    "ScopeCount": 3,
    "OperatingRegions": [
      {
        "RegionName": "us-east-1"
      },
      {
        "RegionName": "us-east-2"
      },
      {
        "RegionName": "us-west-1"
      },
      {
        "RegionName": "us-west-2"
      }
    ],
    "State": "modify-in-progress"
  }
}
```

- For API details, see [ModifyIpam](#) in *AWS CLI Command Reference*.

modify-launch-template

The following code example shows how to use `modify-launch-template`.

AWS CLI

To change the default launch template version

This example specifies version 2 of the specified launch template as the default version.

Command:

```
aws ec2 modify-launch-template --launch-template-id lt-0abcd290751193123 --default-version 2
```

Output:

```
{
  "LaunchTemplate": {
    "LatestVersionNumber": 2,
    "LaunchTemplateId": "lt-0abcd290751193123",
    "LaunchTemplateName": "WebServers",
    "DefaultVersionNumber": 2,
    "CreatedBy": "arn:aws:iam::123456789012:root",
    "CreateTime": "2017-12-01T13:35:46.000Z"
  }
}
```

- For API details, see [ModifyLaunchTemplate](#) in *AWS CLI Command Reference*.

modify-managed-prefix-list

The following code example shows how to use `modify-managed-prefix-list`.

AWS CLI

To modify a prefix list

The following `modify-managed-prefix-list` example adds an entry to the specified prefix list.

```
aws ec2 modify-managed-prefix-list \
  --prefix-list-id pl-0123456abcabcabc1 \
  --add-entries Cidr=10.1.0.0/16,Description=vpc-c \
  --current-version 1
```

Output:

```
{
```

```
"PrefixList": {
  "PrefixListId": "pl-0123456abcabcabc1",
  "AddressFamily": "IPv4",
  "State": "modify-in-progress",
  "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
  "PrefixListName": "vpc-cidrs",
  "MaxEntries": 10,
  "Version": 1,
  "OwnerId": "123456789012"
}
```

For more information, see [Managed prefix lists](#) in the *Amazon VPC User Guide*.

- For API details, see [ModifyManagedPrefixList](#) in *AWS CLI Command Reference*.

modify-network-interface-attribute

The following code example shows how to use `modify-network-interface-attribute`.

AWS CLI

To modify the attachment attribute of a network interface

This example command modifies the attachment attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --
attachment AttachmentId=eni-attach-43348162,DeleteOnTermination=false
```

To modify the description attribute of a network interface

This example command modifies the description attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --
description "My description"
```

To modify the groupSet attribute of a network interface

This example command modifies the groupSet attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --groups sg-903004f8 sg-1a2b3c4d
```

To modify the sourceDestCheck attribute of a network interface

This example command modifies the sourceDestCheck attribute of the specified network interface.

Command:

```
aws ec2 modify-network-interface-attribute --network-interface-id eni-686ea200 --no-source-dest-check
```

- For API details, see [ModifyNetworkInterfaceAttribute](#) in *AWS CLI Command Reference*.

modify-private-dns-name-options

The following code example shows how to use modify-private-dns-name-options.

AWS CLI

To modify the options for instance hostnames

The following modify-private-dns-name-options example disables the option to respond to DNS queries for instance hostnames with DNS A records.

```
aws ec2 modify-private-dns-name-options \
  --instance-id i-1234567890abcdef0 \
  --no-enable-resource-name-dns-a-record
```

Output:

```
{
  "Return": true
}
```

For more information, see [Amazon EC2 instance hostname types](#) in the *Amazon EC2 User Guide*.

- For API details, see [ModifyPrivateDnsNameOptions](#) in *AWS CLI Command Reference*.

modify-reserved-instances

The following code example shows how to use `modify-reserved-instances`.

AWS CLI

To modify Reserved Instances

This example command moves a Reserved Instance to another Availability Zone in the same region.

Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids b847fa93-e282-4f55-
b59a-1342f5bd7c02 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-
Classic,InstanceCount=10
```

Output:

```
{
  "ReservedInstancesModificationId": "rimod-d3ed4335-b1d3-4de6-ab31-0f13aaf46687"
}
```

To modify the network platform of Reserved Instances

This example command converts EC2-Classic Reserved Instances to EC2-VPC.

Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids f127bd27-edb7-44c9-
a0eb-0d7e09259af0 --target-configurations AvailabilityZone=us-west-1c,Platform=EC2-
VPC,InstanceCount=5
```

Output:

```
{
  "ReservedInstancesModificationId": "rimod-82fa9020-668f-4fb6-945d-61537009d291"
}
```

```
}
```

For more information, see *Modifying Your Reserved Instances* in the *Amazon EC2 User Guide*.

To modify the instance size of Reserved Instances

This example command modifies a Reserved Instance that has 10 m1.small Linux/UNIX instances in us-west-1c so that 8 m1.small instances become 2 m1.large instances, and the remaining 2 m1.small become 1 m1.medium instance in the same Availability Zone. Command:

```
aws ec2 modify-reserved-instances --reserved-instances-ids
1ba8e2e3-3556-4264-949e-63ee671405a9 --target-configurations AvailabilityZone=us-
west-1c,Platform=EC2-Classic,InstanceCount=2,InstanceType=m1.large
AvailabilityZone=us-west-1c,Platform=EC2-
Classic,InstanceCount=1,InstanceType=m1.medium
```

Output:

```
{
  "ReservedInstancesModificationId": "rimod-acc5f240-080d-4717-b3e3-1c6b11fa00b6"
}
```

For more information, see *Modifying the Instance Size of Your Reservations* in the *Amazon EC2 User Guide*.

- For API details, see [ModifyReservedInstances](#) in *AWS CLI Command Reference*.

modify-security-group-rules

The following code example shows how to use `modify-security-group-rules`.

AWS CLI

To modify a security group rules to update the rule description, the IP protocol, and the CidrIpv4 address range

The following `modify-security-group-rules` example updates the description, the IP protocol, and the IPV4 CIDR range of a specified security group rule. Use the `security-group-rules` parameter to enter the updates for the specified security group rules. `-1` specifies all protocols.

```
aws ec2 modify-security-group-rules \  
  --group-id sg-1234567890abcdef0 \  
  --security-group-rules SecurityGroupId=sg-  
abcdef01234567890,SecurityGroupRule='{Description=test,IpProtocol=-1,CidrIpv4=0.0.0.0/0}'
```

Output:

```
{  
  "Return": true  
}
```

For more information about security group rules, see [Security group rules](#) in the *Amazon EC2 User Guide*.

- For API details, see [ModifySecurityGroupRules](#) in *AWS CLI Command Reference*.

modify-snapshot-attribute

The following code example shows how to use `modify-snapshot-attribute`.

AWS CLI

Example 1: To modify a snapshot attribute

The following `modify-snapshot-attribute` example updates the `createVolumePermission` attribute for the specified snapshot, removing volume permissions for the specified user.

```
aws ec2 modify-snapshot-attribute \  
  --snapshot-id snap-1234567890abcdef0 \  
  --attribute createVolumePermission \  
  --operation-type remove \  
  --user-ids 123456789012
```

Example 2: To make a snapshot public

The following `modify-snapshot-attribute` example makes the specified snapshot public.

```
aws ec2 modify-snapshot-attribute \  
  --snapshot-id snap-1234567890abcdef0 \  
  --attribute createVolumePermission \  
  --operation-type public
```

```
--operation-type add \  
--group-names all
```

- For API details, see [ModifySnapshotAttribute](#) in *AWS CLI Command Reference*.

modify-snapshot-tier

The following code example shows how to use `modify-snapshot-tier`.

AWS CLI

Example 1: To archive a snapshot

The following `modify-snapshot-tier` example archives the specified snapshot.

```
aws ec2 modify-snapshot-tier \  
  --snapshot-id snap-01234567890abcdef \  
  --storage-tier archive
```

Output:

```
{  
  "SnapshotId": "snap-01234567890abcdef",  
  "TieringStartTime": "2021-09-15T16:44:37.574Z"  
}
```

The `TieringStartTime` response parameter indicates the date and time at which the archive process was started, in UTC time format (YYYY-MM-DDTHH:MM:SSZ).

For more information about snapshot archiving, see [Archive Amazon EBS snapshots](#) in the *Amazon EC2 User Guide*.

- For API details, see [ModifySnapshotTier](#) in *AWS CLI Command Reference*.

modify-spot-fleet-request

The following code example shows how to use `modify-spot-fleet-request`.

AWS CLI

To modify a Spot fleet request

This example command updates the target capacity of the specified Spot fleet request.

Command:

```
aws ec2 modify-spot-fleet-request --target-capacity 20 --spot-fleet-request-id
sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
  "Return": true
}
```

This example command decreases the target capacity of the specified Spot fleet request without terminating any Spot Instances as a result.

Command:

```
aws ec2 modify-spot-fleet-request --target-capacity 10 --excess-capacity-
termination-policy NoTermination --spot-fleet-request-ids sfr-73fbd2ce-
aa30-494c-8788-1cee4EXAMPLE
```

Output:

```
{
  "Return": true
}
```

- For API details, see [ModifySpotFleetRequest](#) in *AWS CLI Command Reference*.

modify-subnet-attribute

The following code example shows how to use `modify-subnet-attribute`.

AWS CLI

To change a subnet's public IPv4 addressing behavior

This example modifies `subnet-1a2b3c4d` to specify that all instances launched into this subnet are assigned a public IPv4 address. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --map-public-ip-on-launch
```

To change a subnet's IPv6 addressing behavior

This example modifies subnet-1a2b3c4d to specify that all instances launched into this subnet are assigned an IPv6 address from the range of the subnet.

Command:

```
aws ec2 modify-subnet-attribute --subnet-id subnet-1a2b3c4d --assign-ipv6-address-on-creation
```

For more information, see IP Addressing in Your VPC in the *AWS Virtual Private Cloud User Guide*.

- For API details, see [ModifySubnetAttribute](#) in *AWS CLI Command Reference*.

modify-traffic-mirror-filter-network-services

The following code example shows how to use `modify-traffic-mirror-filter-network-services`.

AWS CLI**To add network services to a Traffic Mirror filter**

The following `modify-traffic-mirror-filter-network-services` example adds the Amazon DNS network services to the specified filter.

```
aws ec2 modify-traffic-mirror-filter-network-services \
  --traffic-mirror-filter-id tmf-04812ff784EXAMPLE \
  --add-network-service amazon-dns
```

Output:

```
{
  "TrafficMirrorFilter": {
    "Tags": [
```

```

        {
            "Key": "Name",
            "Value": "Production"
        }
    ],
    "EgressFilterRules": [],
    "NetworkServices": [
        "amazon-dns"
    ],
    "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
    "IngressFilterRules": [
        {
            "SourceCidrBlock": "0.0.0.0/0",
            "RuleNumber": 1,
            "DestinationCidrBlock": "0.0.0.0/0",
            "Description": "TCP Rule",
            "Protocol": 6,
            "TrafficDirection": "ingress",
            "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
            "RuleAction": "accept",
            "TrafficMirrorFilterRuleId": "tmf-04812ff784EXAMPLE"
        }
    ]
}
}
}

```

For more information, see [Modify Traffic Mirror Filter Network Services](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [ModifyTrafficMirrorFilterNetworkServices](#) in *AWS CLI Command Reference*.

modify-traffic-mirror-filter-rule

The following code example shows how to use `modify-traffic-mirror-filter-rule`.

AWS CLI

To modify a traffic mirror filter rule

The following `modify-traffic-mirror-filter-rule` example modifies the description of the specified traffic mirror filter rule.

```
aws ec2 modify-traffic-mirror-filter-rule \
```

```
--traffic-mirror-filter-rule-id tmfr-0ca76e0e08EXAMPLE \  
--description "TCP Rule"
```

Output:

```
{  
  "TrafficMirrorFilterRule": {  
    "TrafficMirrorFilterRuleId": "tmfr-0ca76e0e08EXAMPLE",  
    "TrafficMirrorFilterId": "tmf-0293f26e86EXAMPLE",  
    "TrafficDirection": "ingress",  
    "RuleNumber": 100,  
    "RuleAction": "accept",  
    "Protocol": 6,  
    "DestinationCidrBlock": "10.0.0.0/24",  
    "SourceCidrBlock": "10.0.0.0/24",  
    "Description": "TCP Rule"  
  }  
}
```

For more information, see [Modify Your Traffic Mirror Filter Rules](#) in the *AWS Traffic Mirroring Guide*.

- For API details, see [ModifyTrafficMirrorFilterRule](#) in *AWS CLI Command Reference*.

modify-traffic-mirror-session

The following code example shows how to use `modify-traffic-mirror-session`.

AWS CLI

To modify a traffic mirror session

The following `modify-traffic-mirror-session` example changes the traffic mirror session description and the number of packets to mirror.

```
aws ec2 modify-traffic-mirror-session \  
  --description "Change packet length" \  
  --traffic-mirror-session-id tms-08a33b1214EXAMPLE \  
  --remove-fields "packet-length"
```

Output:

```
{
  "TrafficMirrorSession": {
    "TrafficMirrorSessionId": "tms-08a33b1214EXAMPLE",
    "TrafficMirrorTargetId": "tmt-07f75d8feeEXAMPLE",
    "TrafficMirrorFilterId": "tmf-04812ff784EXAMPLE",
    "NetworkInterfaceId": "eni-070203f901EXAMPLE",
    "OwnerId": "111122223333",
    "SessionNumber": 1,
    "VirtualNetworkId": 7159709,
    "Description": "Change packet length",
    "Tags": []
  }
}
```

For more information, see [Modify your traffic mirror session](#) in the *Traffic Mirroring Guide*.

- For API details, see [ModifyTrafficMirrorSession](#) in *AWS CLI Command Reference*.

modify-transit-gateway-prefix-list-reference

The following code example shows how to use `modify-transit-gateway-prefix-list-reference`.

AWS CLI

To modify a reference to a prefix list

The following `modify-transit-gateway-prefix-list-reference` example modifies the prefix list reference in the specified route table by changing the attachment to which traffic is routed.

```
aws ec2 modify-transit-gateway-prefix-list-reference \
  --transit-gateway-route-table-id tgw-rtb-0123456789abcd123 \
  --prefix-list-id pl-11111122222222333 \
  --transit-gateway-attachment-id tgw-attach-aabbccddaabbccaab
```

Output:

```
{
  "TransitGatewayPrefixListReference": {
    "TransitGatewayRouteTableId": "tgw-rtb-0123456789abcd123",
```

```

    "PrefixListId": "pl-11111122222222333",
    "PrefixListOwnerId": "123456789012",
    "State": "modifying",
    "Blackhole": false,
    "TransitGatewayAttachment": {
      "TransitGatewayAttachmentId": "tgw-attach-aabbccddaabbccaab",
      "ResourceType": "vpc",
      "ResourceId": "vpc-112233445566aabbcc"
    }
  }
}

```

For more information, see [Prefix list references](#) in the *Transit Gateways Guide*.

- For API details, see [ModifyTransitGatewayPrefixListReference](#) in *AWS CLI Command Reference*.

modify-transit-gateway-vpc-attachment

The following code example shows how to use `modify-transit-gateway-vpc-attachment`.

AWS CLI

To modify a transit gateway VPC attachment

The following `modify-transit-gateway-vpc-attachment` example adds a subnet to the specified transit gateway VPC attachment.

```

aws ec2 modify-transit-gateway-vpc-attachment \
  --transit-gateway-attachment-id tgw-attach-09fbd47ddfEXAMPLE \
  --add-subnet-ids subnet-0e51f45802EXAMPLE

```

Output:

```

{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-09fbd47ddfEXAMPLE",
    "TransitGatewayId": "tgw-0560315ccfEXAMPLE",
    "VpcId": "vpc-5eccc927",
    "VpcOwnerId": "111122223333",
    "State": "modifying",
    "SubnetIds": [
      "subnet-0e51f45802EXAMPLE",
    ]
  }
}

```

```

        "subnet-1EXAMPLE"
    ],
    "CreationTime": "2019-08-08T16:47:38.000Z",
    "Options": {
        "DnsSupport": "enable",
        "Ipv6Support": "disable"
    }
}
}

```

For more information, see [Transit gateway attachments to a VPC](#) in the *Transit Gateways Guide*.

- For API details, see [ModifyTransitGatewayVpcAttachment](#) in *AWS CLI Command Reference*.

modify-transit-gateway

The following code example shows how to use `modify-transit-gateway`.

AWS CLI

To modify a transit gateway

The following `modify-transit-gateway` example modifies the specified transit gateway by enabling ECMP support for VPN attachments.

```

aws ec2 modify-transit-gateway \
  --transit-gateway-id tgw-111111222222aaaaa \
  --options VpnEcmpSupport=enable

```

Output:

```

{
  "TransitGateway": {
    "TransitGatewayId": "tgw-111111222222aaaaa",
    "TransitGatewayArn": "64512",
    "State": "modifying",
    "OwnerId": "123456789012",
    "CreationTime": "2020-04-30T08:41:37.000Z",
    "Options": {
      "AmazonSideAsn": 64512,
      "AutoAcceptSharedAttachments": "disable",
      "DefaultRouteTableAssociation": "enable",

```

```

        "AssociationDefaultRouteTableId": "tgw-rtb-0123456789abcd123",
        "DefaultRouteTablePropagation": "enable",
        "PropagationDefaultRouteTableId": "tgw-rtb-0123456789abcd123",
        "VpnEcmpSupport": "enable",
        "DnsSupport": "enable"
    }
}
}

```

For more information, see [Transit gateways](#) in the *Transit Gateways Guide*.

- For API details, see [ModifyTransitGateway](#) in *AWS CLI Command Reference*.

modify-verified-access-endpoint-policy

The following code example shows how to use `modify-verified-access-endpoint-policy`.

AWS CLI

To configure the Verified Access policy for an endpoint

The following `modify-verified-access-endpoint-policy` example adds the specified Verified Access policy to the specified Verified Access endpoint.

```

aws ec2 modify-verified-access-endpoint-policy \
  --verified-access-endpoint-id vae-066fac616d4d546f2 \
  --policy-enabled \
  --policy-document file://policy.txt

```

Contents of `policy.txt`:

```

permit(principal,action,resource)
when {
  context.identity.groups.contains("finance") &&
  context.identity.email.verified == true
};

```

Output:

```

{
  "PolicyEnabled": true,

```

```
"PolicyDocument": "permit(principal,action,resource)\nwhen
{\n  context.identity.groups.contains(\"finance\") &&\n
context.identity.email_verified == true\n};"
}
```

For more information, see [Verified Access policies](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessEndpointPolicy](#) in *AWS CLI Command Reference*.

modify-verified-access-endpoint

The following code example shows how to use `modify-verified-access-endpoint`.

AWS CLI

To modify the configuration of a Verified Access endpoint

The following `modify-verified-access-endpoint` example adds the specified description to the specified Verified Access endpoint.

```
aws ec2 modify-verified-access-endpoint \
  --verified-access-endpoint-id vae-066fac616d4d546f2 \
  --description "Testing Verified Access"
```

Output:

```
{
  "VerifiedAccessEndpoint": {
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessEndpointId": "vae-066fac616d4d546f2",
    "ApplicationDomain": "example.com",
    "EndpointType": "network-interface",
    "AttachmentType": "vpc",
    "DomainCertificateArn": "arn:aws:acm:us-east-2:123456789012:certificate/
eb065ea0-26f9-4e75-a6ce-0a1a7EXAMPLE",
    "EndpointDomain": "my-ava-
app.edge-00c3372d53b1540bb.vai-0ce000c0b7643abea.prod.verified-access.us-
east-2.amazonaws.com",
    "SecurityGroupIds": [
      "sg-004915970c4c8f13a"
    ],
  },
}
```

```
    "NetworkInterfaceOptions": {
      "NetworkInterfaceId": "eni-0aec70418c8d87a0f",
      "Protocol": "https",
      "Port": 443
    },
    "Status": {
      "Code": "updating"
    },
    "Description": "Testing Verified Access",
    "CreationTime": "2023-08-25T20:54:43",
    "LastUpdatedTime": "2023-08-25T22:46:32"
  }
}
```

For more information, see [Verified Access endpoints](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessEndpoint](#) in *AWS CLI Command Reference*.

modify-verified-access-group-policy

The following code example shows how to use `modify-verified-access-group-policy`.

AWS CLI

To configure a Verified Access policy for a group

The following `modify-verified-access-group-policy` example adds the specified Verified Access policy to the specified Verified Access group.

```
aws ec2 modify-verified-access-group-policy \
  --verified-access-group-id vagr-0dbe967baf14b7235 \
  --policy-enabled \
  --policy-document file://policy.txt
```

Contents of `policy.txt`:

```
permit(principal,action,resource)
when {
  context.identity.groups.contains("finance") &&
  context.identity.email.verified == true
};
```

Output:

```
{
  "PolicyEnabled": true,
  "PolicyDocument": "permit(principal,action,resource)\nwhen
{\n  context.identity.groups.contains(\"finance\") &&\n
context.identity.email_verified == true\n};"
}
```

For more information, see [Verified Access groups](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessGroupPolicy](#) in *AWS CLI Command Reference*.

modify-verified-access-group

The following code example shows how to use `modify-verified-access-group`.

AWS CLI**To modify the configuration of a Verified Access group**

The following `modify-verified-access-group` example adds the specified description to the specified Verified Access group.

```
aws ec2 modify-verified-access-group \
  --verified-access-group-id vagr-0dbe967baf14b7235 \
  --description "Testing Verified Access"
```

Output:

```
{
  "VerifiedAccessGroup": {
    "VerifiedAccessGroupId": "vagr-0dbe967baf14b7235",
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",
    "Description": "Testing Verified Access",
    "Owner": "123456789012",
    "VerifiedAccessGroupArn": "arn:aws:ec2:us-east-2:123456789012:verified-
access-group/vagr-0dbe967baf14b7235",
    "CreationTime": "2023-08-25T19:55:19",
    "LastUpdatedTime": "2023-08-25T22:17:25"
  }
}
```

For more information, see [Verified Access groups](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessGroup](#) in *AWS CLI Command Reference*.

modify-verified-access-instance-logging-configuration

The following code example shows how to use `modify-verified-access-instance-logging-configuration`.

AWS CLI

To enable logging for a Verified Access instance

The following `modify-verified-access-instance-logging-configuration` example enables access logging for the specified Verified Access instance. The logs will be delivered to the specified CloudWatch Logs log group.

```
aws ec2 modify-verified-access-instance-logging-configuration \  
  --verified-access-instance-id vai-0ce000c0b7643abea \  
  --access-logs CloudWatchLogs={Enabled=true,LogGroup=my-log-group}
```

Output:

```
{  
  "LoggingConfiguration": {  
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",  
    "AccessLogs": {  
      "S3": {  
        "Enabled": false  
      },  
      "CloudWatchLogs": {  
        "Enabled": true,  
        "DeliveryStatus": {  
          "Code": "success"  
        },  
        "LogGroup": "my-log-group"  
      },  
      "KinesisDataFirehose": {  
        "Enabled": false  
      },  
      "LogVersion": "ocsf-1.0.0-rc.2",  
      "IncludeTrustContext": false  
    }  
  }  
}
```

```
    }  
  }  
}
```

For more information, see [Verified Access logs](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessInstanceLoggingConfiguration](#) in *AWS CLI Command Reference*.

modify-verified-access-instance

The following code example shows how to use `modify-verified-access-instance`.

AWS CLI

To modify the configuration of a Verified Access instance

The following `modify-verified-access-instance` example adds the specified description to the specified Verified Access instance.

```
aws ec2 modify-verified-access-instance \  
  --verified-access-instance-id vai-0ce000c0b7643abea \  
  --description "Testing Verified Access"
```

Output:

```
{  
  "VerifiedAccessInstance": {  
    "VerifiedAccessInstanceId": "vai-0ce000c0b7643abea",  
    "Description": "Testing Verified Access",  
    "VerifiedAccessTrustProviders": [  
      {  
        "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",  
        "TrustProviderType": "user",  
        "UserTrustProviderType": "iam-identity-center"  
      }  
    ],  
    "CreationTime": "2023-08-25T18:27:56",  
    "LastUpdatedTime": "2023-08-25T22:41:04"  
  }  
}
```

For more information, see [Verified Access instances](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessInstance](#) in *AWS CLI Command Reference*.

modify-verified-access-trust-provider

The following code example shows how to use `modify-verified-access-trust-provider`.

AWS CLI

To modify the configuration of a Verified Access trust provider

The following `modify-verified-access-trust-provider` example adds the specified description to the specified Verified Access trust provider.

```
aws ec2 modify-verified-access-trust-provider \  
  --verified-access-trust-provider-id vatp-0bb32de759a3e19e7 \  
  --description "Testing Verified Access"
```

Output:

```
{  
  "VerifiedAccessTrustProvider": {  
    "VerifiedAccessTrustProviderId": "vatp-0bb32de759a3e19e7",  
    "Description": "Testing Verified Access",  
    "TrustProviderType": "user",  
    "UserTrustProviderType": "iam-identity-center",  
    "PolicyReferenceName": "idc",  
    "CreationTime": "2023-08-25T19:00:38",  
    "LastUpdatedTime": "2023-08-25T19:18:21"  
  }  
}
```

For more information, see [Trust providers for Verified Access](#) in the *AWS Verified Access User Guide*.

- For API details, see [ModifyVerifiedAccessTrustProvider](#) in *AWS CLI Command Reference*.

modify-volume-attribute

The following code example shows how to use `modify-volume-attribute`.

AWS CLI

To modify a volume attribute

This example sets the `autoEnableIo` attribute of the volume with the ID `vol-1234567890abcdef0` to `true`. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-volume-attribute --volume-id vol-1234567890abcdef0 --auto-enable-io
```

- For API details, see [ModifyVolumeAttribute](#) in *AWS CLI Command Reference*.

modify-volume

The following code example shows how to use `modify-volume`.

AWS CLI

Example 1: To modify a volume by changing its size

The following `modify-volume` example changes the size of the specified volume to 150GB.

Command:

```
aws ec2 modify-volume --size 150 --volume-id vol-1234567890abcdef0
```

Output:

```
{
  "VolumeModification": {
    "TargetSize": 150,
    "TargetVolumeType": "io1",
    "ModificationState": "modifying",
    "VolumeId": " vol-1234567890abcdef0",
    "TargetIops": 100,
    "StartTime": "2019-05-17T11:27:19.000Z",
    "Progress": 0,
    "OriginalVolumeType": "io1",
    "OriginalIops": 100,
    "OriginalSize": 100
  }
}
```

```
}
```

Example 2: To modify a volume by changing its type, size, and IOPS value

The following `modify-volume` example changes the volume type to Provisioned IOPS SSD, sets the target IOPS rate to 10000, and sets the volume size to 350GB.

```
aws ec2 modify-volume \  
  --volume-type io1 \  
  --iops 10000 \  
  --size 350 \  
  --volume-id vol-1234567890abcdef0
```

Output:

```
{  
  "VolumeModification": {  
    "TargetSize": 350,  
    "TargetVolumeType": "io1",  
    "ModificationState": "modifying",  
    "VolumeId": "vol-0721c1a9d08c93bf6",  
    "TargetIops": 10000,  
    "StartTime": "2019-05-17T11:38:57.000Z",  
    "Progress": 0,  
    "OriginalVolumeType": "gp2",  
    "OriginalIops": 150,  
    "OriginalSize": 50  
  }  
}
```

- For API details, see [ModifyVolume](#) in *AWS CLI Command Reference*.

modify-vpc-attribute

The following code example shows how to use `modify-vpc-attribute`.

AWS CLI

To modify the `enableDnsSupport` attribute

This example modifies the `enableDnsSupport` attribute. This attribute indicates whether DNS resolution is enabled for the VPC. If this attribute is `true`, the Amazon DNS server resolves DNS

hostnames for your instances to their corresponding IP addresses; otherwise, it does not. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-support "{\"Value\n\":false}"
```

To modify the `enableDnsHostnames` attribute

This example modifies the `enableDnsHostnames` attribute. This attribute indicates whether instances launched in the VPC get DNS hostnames. If this attribute is `true`, instances in the VPC get DNS hostnames; otherwise, they do not. If the command succeeds, no output is returned.

Command:

```
aws ec2 modify-vpc-attribute --vpc-id vpc-a01106c2 --enable-dns-hostnames "{\"Value\n\":false}"
```

- For API details, see [ModifyVpcAttribute](#) in *AWS CLI Command Reference*.

modify-vpc-endpoint-connection-notification

The following code example shows how to use `modify-vpc-endpoint-connection-notification`.

AWS CLI

To modify an endpoint connection notification

This example changes the SNS topic for the specified endpoint connection notification.

Command:

```
aws ec2 modify-vpc-endpoint-connection-notification --connection-notification-id vpce-nfn-008776de7e03f5abc --connection-events Accept Reject --connection-notification-arn arn:aws:sns:us-east-2:123456789012:mytopic
```

Output:

```
{
  "ReturnValue": true
}
```

- For API details, see [ModifyVpcEndpointConnectionNotification](#) in *AWS CLI Command Reference*.

modify-vpc-endpoint-service-configuration

The following code example shows how to use `modify-vpc-endpoint-service-configuration`.

AWS CLI

To modify an endpoint service configuration

This example changes the acceptance requirement for the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-configuration --service-id vpce-
svc-09222513e6e77dc86 --no-acceptance-required
```

Output:

```
{
  "ReturnValue": true
}
```

- For API details, see [ModifyVpcEndpointServiceConfiguration](#) in *AWS CLI Command Reference*.

modify-vpc-endpoint-service-payer-responsibility

The following code example shows how to use `modify-vpc-endpoint-service-payer-responsibility`.

AWS CLI

To modify the payer responsibility

The following `modify-vpc-endpoint-service-payer-responsibility` example modifies the payer responsibility of the specified endpoint service.

```
aws ec2 modify-vpc-endpoint-service-payer-responsibility \  
  --service-id vpce-svc-071afff70666e61e0 \  
  --payer-responsibility ServiceOwner
```

This command produces no output.

- For API details, see [ModifyVpcEndpointServicePayerResponsibility](#) in *AWS CLI Command Reference*.

modify-vpc-endpoint-service-permissions

The following code example shows how to use `modify-vpc-endpoint-service-permissions`.

AWS CLI

To modify endpoint service permissions

This example adds permission for an AWS account to connect to the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-  
svc-03d5ebb7d9579a2b3 --add-allowed-principals '["arn:aws:iam::123456789012:root"]'
```

Output:

```
{  
  "ReturnValue": true  
}
```

This example adds permission for a specific IAM user (admin) to connect to the specified endpoint service.

Command:

```
aws ec2 modify-vpc-endpoint-service-permissions --service-id vpce-  
svc-03d5ebb7d9579a2b3 --add-allowed-principals '["arn:aws:iam::123456789012:user/  
admin"]'
```

- For API details, see [ModifyVpcEndpointServicePermissions](#) in *AWS CLI Command Reference*.

modify-vpc-endpoint

The following code example shows how to use `modify-vpc-endpoint`.

AWS CLI

To modify a gateway endpoint

This example modifies gateway endpoint `vpce-1a2b3c4d` by associating route table `rtb-aaa222bb` with the endpoint, and resetting the policy document.

Command:

```
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-1a2b3c4d --add-route-table-ids
rtb-aaa222bb --reset-policy
```

Output:

```
{
  "Return": true
}
```

To modify an interface endpoint

This example modifies interface endpoint `vpce-0fe5b17a0707d6fa5` by adding subnet `subnet-d6fcaa8d` to the endpoint.

Command:

```
aws ec2 modify-vpc-endpoint --vpc-endpoint-id vpce-0fe5b17a0707d6fa5 --add-subnet-id
subnet-d6fcaa8d
```

Output:

```
{
  "Return": true
}
```

- For API details, see [ModifyVpcEndpoint](#) in *AWS CLI Command Reference*.

modify-vpc-peering-connection-options

The following code example shows how to use `modify-vpc-peering-connection-options`.

AWS CLI

To enable communication over a VPC peering connection from your local ClassicLink connection

In this example, for peering connection `pcx-aaaabbbb`, the owner of the requester VPC modifies the VPC peering connection options to enable a local ClassicLink connection to communicate with the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --requester-peering-connection-options AllowEgressFromLocalClassicLinkToRemoteVpc=true
```

Output:

```
{
  "RequesterPeeringConnectionOptions": {
    "AllowEgressFromLocalClassicLinkToRemoteVpc": true
  }
}
```

To enable communication over a VPC peering connection from your local VPC to a remote ClassicLink connection

In this example, the owner of the accepter VPC modifies the VPC peering connection options to enable the local VPC to communicate with the ClassicLink connection in the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --accepter-peering-connection-options AllowEgressFromLocalVpcToRemoteClassicLink=true
```

Output:

```
{
  "AccepterPeeringConnectionOptions": {
    "AllowEgressFromLocalVpcToRemoteClassicLink": true
  }
}
```

To enable DNS resolution support for the VPC peering connection

In this example, the owner of the requester VPC modifies the VPC peering connection options for `pcx-aaaabbbb` to enable the local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.

Command:

```
aws ec2 modify-vpc-peering-connection-options --vpc-peering-connection-id pcx-aaaabbbb --requester-peering-connection-options AllowDnsResolutionFromRemoteVpc=true
```

Output:

```
{
  "RequesterPeeringConnectionOptions": {
    "AllowDnsResolutionFromRemoteVpc": true
  }
}
```

- For API details, see [ModifyVpcPeeringConnectionOptions](#) in *AWS CLI Command Reference*.

modify-vpc-tenancy

The following code example shows how to use `modify-vpc-tenancy`.

AWS CLI

To modify the tenancy of a VPC

This example modifies the tenancy of VPC `vpc-1a2b3c4d` to `default`.

Command:

```
aws ec2 modify-vpc-tenancy --vpc-id vpc-1a2b3c4d --instance-tenancy default
```

Output:

```
{
  "Return": true
}
```

- For API details, see [ModifyVpnTenancy](#) in *AWS CLI Command Reference*.

modify-vpn-connection-options

The following code example shows how to use `modify-vpn-connection-options`.

AWS CLI**To modify your VPN connection options**

The following `modify-vpn-connection-options` example modifies the local IPv4 CIDR on the customer gateway side of the specified VPN connection.

```
aws ec2 modify-vpn-connection-options \
  --vpn-connection-id vpn-1122334455aabbccd \
  --local-ipv4-network-cidr 10.0.0.0/16
```

Output:

```
{
  "VpnConnections": [
    {
      "CustomerGatewayConfiguration": "...configuration information...",
      "CustomerGatewayId": "cgw-01234567abcde1234",
      "Category": "VPN",
      "State": "modifying",
      "Type": "ipsec.1",
      "VpnConnectionId": "vpn-1122334455aabbccd",
      "TransitGatewayId": "tgw-00112233445566aab",
      "Options": {
        "EnableAcceleration": false,
        "StaticRoutesOnly": true,
        "LocalIpv4NetworkCidr": "10.0.0.0/16",
        "RemoteIpv4NetworkCidr": "0.0.0.0/0",
        "TunnelInsideIpVersion": "ipv4"
      }
    }
  ]
}
```

```

    },
    "Routes": [],
    "Tags": [
      {
        "Key": "Name",
        "Value": "CanadaVPN"
      }
    ],
    "VgwTelemetry": [
      {
        "AcceptedRouteCount": 0,
        "LastStatusChange": "2020-07-29T10:35:11.000Z",
        "OutsideIpAddress": "203.0.113.3",
        "Status": "DOWN",
        "StatusMessage": ""
      },
      {
        "AcceptedRouteCount": 0,
        "LastStatusChange": "2020-09-02T09:09:33.000Z",
        "OutsideIpAddress": "203.0.113.5",
        "Status": "UP",
        "StatusMessage": ""
      }
    ]
  }
]
}

```

For more information, see [Modifying Site-to-Site VPN connection options](#) in the *AWS Site-to-Site VPN User Guide*.

- For API details, see [ModifyVpnConnectionOptions](#) in *AWS CLI Command Reference*.

modify-vpn-connection

The following code example shows how to use `modify-vpn-connection`.

AWS CLI

To modify a VPN connection

The following `modify-vpn-connection` example changes the target gateway for VPN connection `vpn-12345678901234567` to virtual private gateway `vgw-11223344556677889`:

```
aws ec2 modify-vpn-connection \  
  --vpn-connection-id vpn-12345678901234567 \  
  --vpn-gateway-id vgw-11223344556677889
```

Output:

```
{  
  "VpnConnection": {  
    "CustomerGatewayConfiguration": "...configuration information...",  
    "CustomerGatewayId": "cgw-aabbccdde1122334",  
    "Category": "VPN",  
    "State": "modifying",  
    "Type": "ipsec.1",  
    "VpnConnectionId": "vpn-12345678901234567",  
    "VpnGatewayId": "vgw-11223344556677889",  
    "Options": {  
      "StaticRoutesOnly": false  
    },  
    "VgwTelemetry": [  
      {  
        "AcceptedRouteCount": 0,  
        "LastStatusChange": "2019-07-17T07:34:00.000Z",  
        "OutsideIpAddress": "18.210.3.222",  
        "Status": "DOWN",  
        "StatusMessage": "IPSEC IS DOWN"  
      },  
      {  
        "AcceptedRouteCount": 0,  
        "LastStatusChange": "2019-07-20T21:20:16.000Z",  
        "OutsideIpAddress": "34.193.129.33",  
        "Status": "DOWN",  
        "StatusMessage": "IPSEC IS DOWN"  
      }  
    ]  
  }  
}
```

- For API details, see [ModifyVpnConnection](#) in *AWS CLI Command Reference*.

modify-vpn-tunnel-certificate

The following code example shows how to use `modify-vpn-tunnel-certificate`.

AWS CLI

To rotate a VPN tunnel certificate

The following `modify-vpn-tunnel-certificate` example rotates the certificate for the specified tunnel for a VPN connection

```
aws ec2 modify-vpn-tunnel-certificate \  
  --vpn-tunnel-outside-ip-address 203.0.113.17 \  
  --vpn-connection-id vpn-12345678901234567
```

Output:

```
{  
  "VpnConnection": {  
    "CustomerGatewayConfiguration": "...configuration information...",  
    "CustomerGatewayId": "cgw-aabbccdde1122334",  
    "Category": "VPN",  
    "State": "modifying",  
    "Type": "ipsec.1",  
    "VpnConnectionId": "vpn-12345678901234567",  
    "VpnGatewayId": "vgw-11223344556677889",  
    "Options": {  
      "StaticRoutesOnly": false  
    },  
    "VgwTelemetry": [  
      {  
        "AcceptedRouteCount": 0,  
        "LastStatusChange": "2019-09-11T17:27:14.000Z",  
        "OutsideIpAddress": "203.0.113.17",  
        "Status": "DOWN",  
        "StatusMessage": "IPSEC IS DOWN",  
        "CertificateArn": "arn:aws:acm:us-east-1:123456789101:certificate/  
c544d8ce-20b8-4fff-98b0-example"  
      },  
      {  
        "AcceptedRouteCount": 0,  
        "LastStatusChange": "2019-09-11T17:26:47.000Z",  
        "OutsideIpAddress": "203.0.114.18",  
        "Status": "DOWN",  
        "StatusMessage": "IPSEC IS DOWN",  
        "CertificateArn": "arn:aws:acm:us-  
east-1:123456789101:certificate/5ab64566-761b-4ad3-b259-example"      }  
    ]  
  }  
}
```

```

    }
  ]
}
}

```

- For API details, see [ModifyVpnTunnelCertificate](#) in *AWS CLI Command Reference*.

modify-vpn-tunnel-options

The following code example shows how to use `modify-vpn-tunnel-options`.

AWS CLI

To modify the tunnel options for a VPN connection

The following `modify-vpn-tunnel-options` example updates the Diffie-Hellman groups that are permitted for the specified tunnel and VPN connection.

```

aws ec2 modify-vpn-tunnel-options \
  --vpn-connection-id vpn-12345678901234567 \
  --vpn-tunnel-outside-ip-address 203.0.113.17 \
  --tunnel-options Phase1DHGroupNumbers=[{Value=14},{Value=15},{Value=16},
{Value=17},{Value=18}],Phase2DHGroupNumbers=[{Value=14},{Value=15},{Value=16},
{Value=17},{Value=18}]

```

Output:

```

{
  "VpnConnection": {
    "CustomerGatewayConfiguration": "...configuration information...",
    "CustomerGatewayId": "cgw-aabbccdde1122334",
    "Category": "VPN",
    "State": "available",
    "Type": "ipsec.1",
    "VpnConnectionId": "vpn-12345678901234567",
    "VpnGatewayId": "vgw-11223344556677889",
    "Options": {
      "StaticRoutesOnly": false,
      "TunnelOptions": [
        {
          "OutsideIpAddress": "203.0.113.17",
          "Phase1DHGroupNumbers": [

```

```
        {
            "Value": 14
        },
        {
            "Value": 15
        },
        {
            "Value": 16
        },
        {
            "Value": 17
        },
        {
            "Value": 18
        }
    ],
    "Phase2DHGroupNumbers": [
        {
            "Value": 14
        },
        {
            "Value": 15
        },
        {
            "Value": 16
        },
        {
            "Value": 17
        },
        {
            "Value": 18
        }
    ]
},
{
    "OutsideIpAddress": "203.0.114.19"
}
],
},
"VgwTelemetry": [
    {
        "AcceptedRouteCount": 0,
        "LastStatusChange": "2019-09-10T21:56:54.000Z",
        "OutsideIpAddress": "203.0.113.17",
```

```

        "Status": "DOWN",
        "StatusMessage": "IPSEC IS DOWN"
    },
    {
        "AcceptedRouteCount": 0,
        "LastStatusChange": "2019-09-10T21:56:43.000Z",
        "OutsideIpAddress": "203.0.114.19",
        "Status": "DOWN",
        "StatusMessage": "IPSEC IS DOWN"
    }
]
}
}

```

- For API details, see [ModifyVpnTunnelOptions](#) in *AWS CLI Command Reference*.

monitor-instances

The following code example shows how to use `monitor-instances`.

AWS CLI

To enable detailed monitoring for an instance

This example command enables detailed monitoring for the specified instance.

Command:

```
aws ec2 monitor-instances --instance-ids i-1234567890abcdef0
```

Output:

```

{
  "InstanceMonitorings": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "Monitoring": {
        "State": "pending"
      }
    }
  ]
}

```

```
}
```

- For API details, see [MonitorInstances](#) in *AWS CLI Command Reference*.

move-address-to-vpc

The following code example shows how to use `move-address-to-vpc`.

AWS CLI

To move an address to EC2-VPC

This example moves Elastic IP address 54.123.4.56 to the EC2-VPC platform.

Command:

```
aws ec2 move-address-to-vpc --public-ip 54.123.4.56
```

Output:

```
{  
  "Status": "MoveInProgress"  
}
```

- For API details, see [MoveAddressToVpc](#) in *AWS CLI Command Reference*.

move-byoip-cidr-to-ipam

The following code example shows how to use `move-byoip-cidr-to-ipam`.

AWS CLI

To transfer a BYOIP CIDR to IPAM

The following `move-byoip-cidr-to-ipam` example transfers a BYOIP CIDR to IPAM.

(Linux):

```
aws ec2 move-byoip-cidr-to-ipam \  
  --region us-west-2 \  
  \
```

```
--ipam-pool-id ipam-pool-0a03d430ca3f5c035 \  
--ipam-pool-owner 111111111111 \  
--cidr 130.137.249.0/24
```

(Windows):

```
aws ec2 move-byoip-cidr-to-ipam ^  
  --region us-west-2 ^  
  --ipam-pool-id ipam-pool-0a03d430ca3f5c035 ^  
  --ipam-pool-owner 111111111111 ^  
  --cidr 130.137.249.0/24
```

Output:

```
{  
  "ByoipCidr": {  
    "Cidr": "130.137.249.0/24",  
    "State": "pending-transfer"  
  }  
}
```

For more information, see [Tutorial: Transfer an existing BYOIP IPv4 CIDR to IPAM](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [MoveByoipCidrToIpam](#) in *AWS CLI Command Reference*.

network-insights-access-scope

The following code example shows how to use `network-insights-access-scope`.

AWS CLI

To create Network Insights access scopes

The following `create-network-insights-access-scope` example creates a network insights access scope in your AWS account.

```
aws ec2 create-network-insights-access-scope \  
  --cli-input-json file://access-scope-file.json
```

Contents of `access-scope-file.json`:

```
{
  {
    "MatchPaths": [
      {
        "Source": {
          "ResourceStatement": {
            "Resources": [
              "vpc-abcd12e3"
            ]
          }
        }
      }
    ],
    "ExcludePaths": [
      {
        "Source": {
          "ResourceStatement": {
            "ResourceTypes": [
              "AWS::EC2::InternetGateway"
            ]
          }
        }
      }
    ]
  }
}
```

Output:

```
{
  "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789111"
}{
  "NetworkInsightsAccessScope": {
    "NetworkInsightsAccessScopeId": "nis-123456789222",
    "NetworkInsightsAccessScopeArn": "arn:aws:ec2:us-
east-1:123456789222:network-insights-access-scope/nis-123456789222",
    "CreateDate": "2022-01-25T19:20:28.796000+00:00",
    "UpdateDate": "2022-01-25T19:20:28.797000+00:00"
  },
  "NetworkInsightsAccessScopeContent": {
    "NetworkInsightsAccessScopeId": "nis-04c0c0fbca737c404",
    "MatchPaths": [
      {
```

```

        "Source": {
            "ResourceStatement": {
                "Resources": [
                    "vpc-abcd12e3"
                ]
            }
        }
    ],
    "ExcludePaths": [
        {
            "Source": {
                "ResourceStatement": {
                    "ResourceTypes": [
                        "AWS::EC2::InternetGateway"
                    ]
                }
            }
        }
    ]
}

```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the *Network Access Analyzer Guide*.

- For API details, see [NetworkInsightsAccessScope](#) in *AWS CLI Command Reference*.

provision-byoip-cidr

The following code example shows how to use `provision-byoip-cidr`.

AWS CLI

To provision an address range

The following `provision-byoip-cidr` example provisions a public IP address range for use with AWS.

```

aws ec2 provision-byoip-cidr \
  --cidr 203.0.113.25/24 \
  --cidr-authorization-context Message="$text_message",Signature="$signed_message"

```

Output:

```
{
  "ByoipCidr": {
    "Cidr": "203.0.113.25/24",
    "State": "pending-provision"
  }
}
```

For more information about creating the messages strings for the authorization context, see [Bring Your Own IP Addresses](#) in the *Amazon EC2 User Guide*.

- For API details, see [ProvisionByoipCidr](#) in *AWS CLI Command Reference*.

provision-ipam-pool-cidr

The following code example shows how to use `provision-ipam-pool-cidr`.

AWS CLI**To provision a CIDR to an IPAM pool**

The following `provision-ipam-pool-cidr` example provisions a CIDR to an IPAM pool.

(Linux):

```
aws ec2 provision-ipam-pool-cidr \
  --ipam-pool-id ipam-pool-0533048da7d823723 \
  --cidr 10.0.0.0/24
```

(Windows):

```
aws ec2 provision-ipam-pool-cidr ^
  --ipam-pool-id ipam-pool-0533048da7d823723 ^
  --cidr 10.0.0.0/24
```

Output:

```
{
  "IpamPoolCidr": {
```

```
    "Cidr": "10.0.0.0/24",
    "State": "pending-provision"
  }
}
```

For more information, see [Provision CIDRs to a pool](#) in the *Amazon VPC IPAM User Guide*.

- For API details, see [ProvisionIpamPoolCidr](#) in *AWS CLI Command Reference*.

purchase-host-reservation

The following code example shows how to use `purchase-host-reservation`.

AWS CLI

To purchase a Dedicated Host Reservation

This example purchases the specified Dedicated Host Reservation offering for the specified Dedicated Host in your account.

Command:

```
aws ec2 purchase-host-reservation --offering-id hro-03f707bf363b6b324 --host-id-set
h-013abcd2a00cbd123
```

Output:

```
{
  "TotalHourlyPrice": "1.499",
  "Purchase": [
    {
      "HourlyPrice": "1.499",
      "InstanceFamily": "m4",
      "PaymentOption": "NoUpfront",
      "HostIdSet": [
        "h-013abcd2a00cbd123"
      ],
      "HostReservationId": "hr-0d418a3a4ffc669ae",
      "UpfrontPrice": "0.000",
      "Duration": 31536000
    }
  ],
}
```

```
"TotalUpfrontPrice": "0.000"  
}
```

- For API details, see [PurchaseHostReservation](#) in *AWS CLI Command Reference*.

purchase-reserved-instances-offering

The following code example shows how to use `purchase-reserved-instances-offering`.

AWS CLI

To purchase a Reserved Instance offering

This example command illustrates a purchase of a Reserved Instances offering, specifying an offering ID and instance count.

Command:

```
aws ec2 purchase-reserved-instances-offering --reserved-instances-offering-id  
ec06327e-dd07-46ee-9398-75b5fexample --instance-count 3
```

Output:

```
{  
  "ReservedInstancesId": "af9f760e-6f91-4559-85f7-4980eexample"  
}
```

- For API details, see [PurchaseReservedInstancesOffering](#) in *AWS CLI Command Reference*.

purchase-scheduled-instances

The following code example shows how to use `purchase-scheduled-instances`.

AWS CLI

To purchase a Scheduled Instance

This example purchases a Scheduled Instance.

Command:

```
aws ec2 purchase-scheduled-instances --purchase-requests file://purchase-
request.json
```

Purchase-request.json:

```
[
  {
    "PurchaseToken": "eyJ2IjoiMSIsInMiOjEsImMiOi...",
    "InstanceCount": 1
  }
]
```

Output:

```
{
  "ScheduledInstanceSet": [
    {
      "AvailabilityZone": "us-west-2b",
      "ScheduledInstanceId": "sci-1234-1234-1234-1234-123456789012",
      "HourlyPrice": "0.095",
      "CreateDate": "2016-01-25T21:43:38.612Z",
      "Recurrence": {
        "OccurrenceDaySet": [
          1
        ],
        "Interval": 1,
        "Frequency": "Weekly",
        "OccurrenceRelativeToEnd": false,
        "OccurrenceUnit": ""
      },
      "Platform": "Linux/UNIX",
      "TermEndDate": "2017-01-31T09:00:00Z",
      "InstanceCount": 1,
      "SlotDurationInHours": 32,
      "TermStartDate": "2016-01-31T09:00:00Z",
      "NetworkPlatform": "EC2-VPC",
      "TotalScheduledInstanceHours": 1696,
      "NextSlotStartTime": "2016-01-31T09:00:00Z",
      "InstanceType": "c4.large"
    }
  ]
}
```

- For API details, see [PurchaseScheduledInstances](#) in *AWS CLI Command Reference*.

reboot-instances

The following code example shows how to use `reboot-instances`.

AWS CLI

To reboot an Amazon EC2 instance

This example reboots the specified instance. If the command succeeds, no output is returned.

Command:

```
aws ec2 reboot-instances --instance-ids i-1234567890abcdef5
```

For more information, see *Reboot Your Instance* in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [RebootInstances](#) in *AWS CLI Command Reference*.

register-image

The following code example shows how to use `register-image`.

AWS CLI

Example 1: To register an AMI using a manifest file

The following `register-image` example registers an AMI using the specified manifest file in Amazon S3.

```
aws ec2 register-image \  
  --name my-image \  
  --image-location my-s3-bucket/myimage/image.manifest.xml
```

Output:

```
{  
  "ImageId": "ami-1234567890EXAMPLE"  
}
```

For more information, see [Amazon Machine Images \(AMI\)](#) in the *Amazon EC2 User Guide*.

Example 2: To register an AMI using a snapshot of a root device

The following `register-image` example registers an AMI using the specified snapshot of an EBS root volume as device `/dev/xvda`. The block device mapping also includes an empty 100 GiB EBS volume as device `/dev/xvdf`.

```
aws ec2 register-image \  
  --name my-image \  
  --root-device-name /dev/xvda \  
  --block-device-mappings DeviceName=/dev/  
xvda,Ebs={SnapshotId=snap-0db2cf683925d191f} DeviceName=/dev/  
xvdf,Ebs={VolumeSize=100}
```

Output:

```
{  
  "ImageId": "ami-1a2b3c4d5eEXAMPLE"  
}
```

For more information, see [Amazon Machine Images \(AMI\)](#) in the *Amazon EC2 User Guide*.

- For API details, see [RegisterImage](#) in *AWS CLI Command Reference*.

register-instance-event-notification-attributes

The following code example shows how to use `register-instance-event-notification-attributes`.

AWS CLI

Example 1: To include all tags in event notifications

The following `register-instance-event-notification-attributes` example includes all tags in event notifications.

```
aws ec2 register-instance-event-notification-attributes \  
  --instance-tag-attribute IncludeAllTagsOfInstance=true
```

Output:

```
{
  "InstanceTagAttribute": {
    "InstanceTagKeys": [],
    "IncludeAllTagsOfInstance": true
  }
}
```

For more information, see [Scheduled events for your instances](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

Example 2: To include specific tags in event notifications

The following `register-instance-event-notification-attributes` example includes the specified tags in event notifications. You cannot specify tags if `IncludeAllTagsOfInstance` is `true`.

```
aws ec2 register-instance-event-notification-attributes \
  --instance-tag-attribute InstanceTagKeys="tag-key1","tag-key2"
```

Output:

```
{
  "InstanceTagAttribute": {
    "InstanceTagKeys": [
      "tag-key1",
      "tag-key2"
    ],
    "IncludeAllTagsOfInstance": false
  }
}
```

For more information, see [Scheduled events for your instances](#) in the *Amazon Elastic Compute Cloud User Guide for Linux Instances*.

- For API details, see [RegisterInstanceEventNotificationAttributes](#) in *AWS CLI Command Reference*.

register-transit-gateway-multicase-group-sources

The following code example shows how to use `register-transit-gateway-multicase-group-sources`.

AWS CLI

To register a source with a transit gateway multicast group.

The following `register-transit-gateway-multicast-group-sources` example registers the specified network interface group source with a multicast group.

```
aws ec2 register-transit-gateway-multicast-group-sources \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \
  --group-ip-address 224.0.1.0 \
  --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```
{
  "RegisteredMulticastGroupSources": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "RegisteredNetworkInterfaceIds": [
      "eni-07f290fc3c090cbae"
    ],
    "GroupIpAddress": "224.0.1.0"
  }
}
```

For more information, see [Register Sources with a Multicast Group](#) in the *AWS Transit Gateways User Guide*.

- For API details, see [RegisterTransitGatewayMulticastGroupSources](#) in *AWS CLI Command Reference*.

register-transit-gateway-multicast-group-members

The following code example shows how to use `register-transit-gateway-multicast-group-members`.

AWS CLI

To view the information about the transit gateway multicast domain associations

The following `register-transit-gateway-multicast-group-members` example returns the associations for the specified multicast domain.

```
aws ec2 register-transit-gateway-multicast-group-members \  
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \  
  --group-ip-address 224.0.1.0 \  
  --network-interface-ids eni-0e246d32695012e81
```

Output:

```
{  
  "RegisteredMulticastGroupMembers": {  
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",  
    "RegisteredNetworkInterfaceIds": [  
      "eni-0e246d32695012e81"  
    ],  
    "GroupIpAddress": "224.0.1.0"  
  }  
}
```

For more information, see [Managing multicast domains](#) in the *Transit Gateways User Guide*.

- For API details, see [RegisterTransitGatewayMulticastGroupMembers](#) in *AWS CLI Command Reference*.

register-transit-gateway-multicast-group-sources

The following code example shows how to use `register-transit-gateway-multicast-group-sources`.

AWS CLI

To register a source with a transit gateway multicast group.

The following `register-transit-gateway-multicast-group-sources` example registers the specified network interface group source with a multicast group.

```
aws ec2 register-transit-gateway-multicast-group-sources \  
  --transit-gateway-multicast-domain-id tgw-mcast-domain-0c4905cef79d6e597 \  
  --group-ip-address 224.0.1.0 \  
  --network-interface-ids eni-07f290fc3c090cbae
```

Output:

```
{
  "RegisteredMulticastGroupSources": {
    "TransitGatewayMulticastDomainId": "tgw-mcast-domain-0c4905cef79d6e597",
    "RegisteredNetworkInterfaceIds": [
      "eni-07f290fc3c090cbae"
    ],
    "GroupIpAddress": "224.0.1.0"
  }
}
```

For more information, see [Managing multicast domains](#) in the *Transit Gateways Guide*.

- For API details, see [RegisterTransitGatewayMulticastGroupSources](#) in *AWS CLI Command Reference*.

reject-transit-gateway-peering-attachment

The following code example shows how to use `reject-transit-gateway-peering-attachment`.

AWS CLI

To reject a transit gateway peering attachment

The following `reject-transit-gateway-peering-attachment` example rejects the specified transit gateway peering attachment request. The `--region` parameter specifies the Region that the accepter transit gateway is located in.

```
aws ec2 reject-transit-gateway-peering-attachment \
  --transit-gateway-attachment-id tgw-attach-4455667788aabbccd \
  --region us-east-2
```

Output:

```
{
  "TransitGatewayPeeringAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-4455667788aabbccd",
    "RequesterTgwInfo": {
      "TransitGatewayId": "tgw-123abc05e04123abc",
      "OwnerId": "123456789012",
      "Region": "us-west-2"
    }
  }
}
```

```

    },
    "AccepterTgwInfo": {
      "TransitGatewayId": "tgw-11223344aabbcc112",
      "OwnerId": "123456789012",
      "Region": "us-east-2"
    },
    "State": "rejecting",
    "CreationTime": "2019-12-09T11:50:31.000Z"
  }
}

```

For more information, see [Transit Gateway Peering Attachments](#) in the *Transit Gateways Guide*.

- For API details, see [RejectTransitGatewayPeeringAttachment](#) in *AWS CLI Command Reference*.

reject-transit-gateway-vpc-attachment

The following code example shows how to use `reject-transit-gateway-vpc-attachment`.

AWS CLI

To reject a transit gateway VPC attachment

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```

aws ec2 reject-transit-gateway-vpc-attachment \
  --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE

```

Output:

```

{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "VpcId": "vpc-07e8ffd50fEXAMPLE",
    "VpcOwnerId": "111122223333",
    "State": "pending",
    "SubnetIds": [
      "subnet-0752213d59EXAMPLE"
    ],
    "CreationTime": "2019-07-10T17:33:46.000Z",
  }
}

```

```
    "Options": {
      "DnsSupport": "enable",
      "Ipv6Support": "disable"
    }
  }
}
```

For more information, see [Transit gateway attachments to a VPC](#) in the *Transit Gateways Guide*.

- For API details, see [RejectTransitGatewayVpcAttachment](#) in *AWS CLI Command Reference*.

reject-transit-gateway-vpc-attachments

The following code example shows how to use `reject-transit-gateway-vpc-attachments`.

AWS CLI

To reject a transit gateway VPC attachment

The following `reject-transit-gateway-vpc-attachment` example rejects the specified transit gateway VPC attachment.

```
aws ec2 reject-transit-gateway-vpc-attachment \
  --transit-gateway-attachment-id tgw-attach-0a34fe6b4fEXAMPLE
```

Output:

```
{
  "TransitGatewayVpcAttachment": {
    "TransitGatewayAttachmentId": "tgw-attach-0a34fe6b4fEXAMPLE",
    "TransitGatewayId": "tgw-0262a0e521EXAMPLE",
    "VpcId": "vpc-07e8ffd50fEXAMPLE",
    "VpcOwnerId": "111122223333",
    "State": "pending",
    "SubnetIds": [
      "subnet-0752213d59EXAMPLE"
    ],
    "CreationTime": "2019-07-10T17:33:46.000Z",
    "Options": {
      "DnsSupport": "enable",
      "Ipv6Support": "disable"
    }
  }
}
```

```
}  
}
```

For more information, see [Transit gateway attachments to a VPC](#) in the *Transit Gateways Guide*.

- For API details, see [RejectTransitGatewayVpcAttachments](#) in *AWS CLI Command Reference*.

reject-vpc-endpoint-connections

The following code example shows how to use `reject-vpc-endpoint-connections`.

AWS CLI

To reject an interface endpoint connection request

This example rejects the specified endpoint connection request for the specified endpoint service.

Command:

```
aws ec2 reject-vpc-endpoint-connections --service-id vpce-svc-03d5ebb7d9579a2b3 --  
vpc-endpoint-ids vpce-0c1308d7312217abc
```

Output:

```
{  
  "Unsuccessful": []  
}
```

- For API details, see [RejectVpcEndpointConnections](#) in *AWS CLI Command Reference*.

reject-vpc-peering-connection

The following code example shows how to use `reject-vpc-peering-connection`.

AWS CLI

To reject a VPC peering connection

This example rejects the specified VPC peering connection request.

Command:

```
aws ec2 reject-vpc-peering-connection --vpc-peering-connection-id pcx-1a2b3c4d
```

Output:

```
{
  "Return": true
}
```

- For API details, see [RejectVpcPeeringConnection](#) in *AWS CLI Command Reference*.

release-address

The following code example shows how to use `release-address`.

AWS CLI

To release an Elastic IP addresses for EC2-Classic

This example releases an Elastic IP address for use with instances in EC2-Classic. If the command succeeds, no output is returned.

Command:

```
aws ec2 release-address --public-ip 198.51.100.0
```

To release an Elastic IP address for EC2-VPC

This example releases an Elastic IP address for use with instances in a VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 release-address --allocation-id eipalloc-64d5890a
```

- For API details, see [ReleaseAddress](#) in *AWS CLI Command Reference*.

release-hosts

The following code example shows how to use `release-hosts`.

AWS CLI

To release a Dedicated host from your account

To release a Dedicated host from your account. Instances that are on the host must be stopped or terminated before the host can be released.

Command:

```
aws ec2 release-hosts --host-id=h-0029d6e3cacf1b3da
```

Output:

```
{
  "Successful": [
    "h-0029d6e3cacf1b3da"
  ],
  "Unsuccessful": []
}
```

- For API details, see [ReleaseHosts](#) in *AWS CLI Command Reference*.

release-ipam-pool-allocation

The following code example shows how to use `release-ipam-pool-allocation`.

AWS CLI

To release an IPAM pool allocation

In this example, you're an IPAM delegated admin who tried to delete an IPAM pool but received an error that you cannot delete the pool while the pool has allocations. You are using this command to release a pool allocation.

Note the following:

You can only use this command for custom allocations. To remove an allocation for a resource without deleting the resource, set its monitored state to false using [modify-ipam-resource-cidr](#). To complete this request, you'll need the IPAM pool ID, which you can get with [describe-ipam-pools](#). You'll also need the allocation ID, which you can get with [get-ipam-pool-](#)

[allocations](#). If you do not want to remove allocations one by one, you can use the `--cascade` option when you delete an IPAM pool to automatically release any allocations in the pool before deleting it. There are a number of prerequisites before running this command. For more information, see [Release an allocation](#) in the *Amazon VPC IPAM User Guide*. The `--region` in which you run this command must be the locale of the IPAM pool where the allocation is.

The following `release-ipam-pool-allocation` example releases an IPAM pool allocation.

```
aws ec2 release-ipam-pool-allocation \
  --ipam-pool-id ipam-pool-07bdd12d7c94e4693 \
  --cidr 10.0.0.0/23 \
  --ipam-pool-allocation-id ipam-pool-alloc-0e66a1f730da54791b99465b79e7d1e89 \
  --region us-west-1
```

Output:

```
{
  "Success": true
}
```

Once you release an allocation, you may want to run [delete-ipam-pool](#).

- For API details, see [ReleaseIpamPoolAllocation](#) in *AWS CLI Command Reference*.

replace-iam-instance-profile-association

The following code example shows how to use `replace-iam-instance-profile-association`.

AWS CLI

To replace an IAM instance profile for an instance

This example replaces the IAM instance profile represented by the association `iip-assoc-060bae234aac2e7fa` with the IAM instance profile named `AdminRole`.

```
aws ec2 replace-iam-instance-profile-association \
  --iam-instance-profile Name=AdminRole \
  --association-id iip-assoc-060bae234aac2e7fa
```

Output:

```
{
  "IamInstanceProfileAssociation": {
    "InstanceId": "i-087711ddaf98f9489",
    "State": "associating",
    "AssociationId": "iip-assoc-0b215292fab192820",
    "IamInstanceProfile": {
      "Id": "AIPAJLNLDX3AMYZWNWYYAY",
      "Arn": "arn:aws:iam::123456789012:instance-profile/AdminRole"
    }
  }
}
```

- For API details, see [ReplacelamInstanceProfileAssociation](#) in *AWS CLI Command Reference*.

replace-network-acl-association

The following code example shows how to use `replace-network-acl-association`.

AWS CLI

To replace the network ACL associated with a subnet

This example associates the specified network ACL with the subnet for the specified network ACL association.

Command:

```
aws ec2 replace-network-acl-association --association-id aclassoc-e5b95c8c --
network-acl-id acl-5fb85d36
```

Output:

```
{
  "NewAssociationId": "aclassoc-3999875b"
}
```

- For API details, see [ReplaceNetworkAclAssociation](#) in *AWS CLI Command Reference*.

replace-network-acl-entry

The following code example shows how to use `replace-network-acl-entry`.

AWS CLI

To replace a network ACL entry

This example replaces an entry for the specified network ACL. The new rule 100 allows ingress traffic from 203.0.113.12/24 on UDP port 53 (DNS) into any associated subnet.

Command:

```
aws ec2 replace-network-acl-entry --network-acl-id acl-5fb85d36 --ingress --rule-number 100 --protocol udp --port-range From=53,To=53 --cidr-block 203.0.113.12/24 --rule-action allow
```

- For API details, see [ReplaceNetworkAclEntry](#) in *AWS CLI Command Reference*.

replace-route-table-association

The following code example shows how to use `replace-route-table-association`.

AWS CLI

To replace the route table associated with a subnet

This example associates the specified route table with the subnet for the specified route table association.

Command:

```
aws ec2 replace-route-table-association --association-id rtbassoc-781d0d1a --route-table-id rtb-22574640
```

Output:

```
{
  "NewAssociationId": "rtbassoc-3a1f0f58"
}
```

- For API details, see [ReplaceRouteTableAssociation](#) in *AWS CLI Command Reference*.

replace-route

The following code example shows how to use `replace-route`.

AWS CLI

To replace a route

This example replaces the specified route in the specified route table. The new route matches the specified CIDR and sends the traffic to the specified virtual private gateway. If the command succeeds, no output is returned.

Command:

```
aws ec2 replace-route --route-table-id rtb-22574640 --destination-cidr-block 10.0.0.0/16 --gateway-id vgw-9a4cacf3
```

- For API details, see [ReplaceRoute](#) in *AWS CLI Command Reference*.

replace-transit-gateway-route

The following code example shows how to use `replace-transit-gateway-route`.

AWS CLI

To replace the specified route in the specified transit gateway route table

The following `replace-transit-gateway-route` example replaces the route in the specified transit gateway route table.

```
aws ec2 replace-transit-gateway-route \
  --destination-cidr-block 10.0.2.0/24 \
  --transit-gateway-attachment-id tgw-attach-09b52ccdb5EXAMPLE \
  --transit-gateway-route-table-id tgw-rtb-0a823edbdeEXAMPLE
```

Output:

```
{
  "Route": {
    "DestinationCidrBlock": "10.0.2.0/24",
    "TransitGatewayAttachments": [
      {
        "ResourceId": "vpc-4EXAMPLE",
        "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",
        "ResourceType": "vpc"
      }
    ]
  }
}
```

```
    }  
  ],  
  "Type": "static",  
  "State": "active"  
}  
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [ReplaceTransitGatewayRoute](#) in *AWS CLI Command Reference*.

report-instance-status

The following code example shows how to use `report-instance-status`.

AWS CLI

To report status feedback for an instance

This example command reports status feedback for the specified instance.

Command:

```
aws ec2 report-instance-status --instances i-1234567890abcdef0 --status impaired --  
reason-codes unresponsive
```

- For API details, see [ReportInstanceStatus](#) in *AWS CLI Command Reference*.

request-spot-fleet

The following code example shows how to use `request-spot-fleet`.

AWS CLI

To request a Spot fleet in the subnet with the lowest price

This example command creates a Spot fleet request with two launch specifications that differ only by subnet. The Spot fleet launches the instances in the specified subnet with the lowest price. If the instances are launched in a default VPC, they receive a public IP address by default. If the instances are launched in a nondefault VPC, they do not receive a public IP address by default.

Note that you can't specify different subnets from the same Availability Zone in a Spot fleet request.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```
{
  "SpotPrice": "0.04",
  "TargetCapacity": 2,
  "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
  "LaunchSpecifications": [
    {
      "ImageId": "ami-1a2b3c4d",
      "KeyName": "my-key-pair",
      "SecurityGroups": [
        {
          "GroupId": "sg-1a2b3c4d"
        }
      ],
      "InstanceType": "m3.medium",
      "SubnetId": "subnet-1a2b3c4d, subnet-3c4d5e6f",
      "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
      }
    }
  ]
}
```

Output:

```
{
  "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

To request a Spot fleet in the Availability Zone with the lowest price

This example command creates a Spot fleet request with two launch specifications that differ only by Availability Zone. The Spot fleet launches the instances in the specified Availability Zone with the lowest price. If your account supports EC2-VPC only, Amazon EC2 launches the Spot

instances in the default subnet of the Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the Availability Zone.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```
{
  "SpotPrice": "0.04",
  "TargetCapacity": 2,
  "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
  "LaunchSpecifications": [
    {
      "ImageId": "ami-1a2b3c4d",
      "KeyName": "my-key-pair",
      "SecurityGroups": [
        {
          "GroupId": "sg-1a2b3c4d"
        }
      ],
      "InstanceType": "m3.medium",
      "Placement": {
        "AvailabilityZone": "us-west-2a, us-west-2b"
      },
      "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
      }
    }
  ]
}
```

To launch Spot instances in a subnet and assign them public IP addresses

This example command assigns public addresses to instances launched in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```
{
  "SpotPrice": "0.04",
  "TargetCapacity": 2,
  "IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
  "LaunchSpecifications": [
    {
      "ImageId": "ami-1a2b3c4d",
      "KeyName": "my-key-pair",
      "InstanceType": "m3.medium",
      "NetworkInterfaces": [
        {
          "DeviceIndex": 0,
          "SubnetId": "subnet-1a2b3c4d",
          "Groups": [ "sg-1a2b3c4d" ],
          "AssociatePublicIpAddress": true
        }
      ],
      "IamInstanceProfile": {
        "Arn": "arn:aws:iam::880185128111:instance-profile/my-iam-role"
      }
    }
  ]
}
```

To request a Spot fleet using the diversified allocation strategy

This example command creates a Spot fleet request that launches 30 instances using the diversified allocation strategy. The launch specifications differ by instance type. The Spot fleet distributes the instances across the launch specifications such that there are 10 instances of each type.

Command:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

Config.json:

```
{
  "SpotPrice": "0.70",
  "TargetCapacity": 30,
```

```
"AllocationStrategy": "diversified",
"IamFleetRole": "arn:aws:iam::123456789012:role/my-spot-fleet-role",
"LaunchSpecifications": [
  {
    "ImageId": "ami-1a2b3c4d",
    "InstanceType": "c4.2xlarge",
    "SubnetId": "subnet-1a2b3c4d"
  },
  {
    "ImageId": "ami-1a2b3c4d",
    "InstanceType": "m3.2xlarge",
    "SubnetId": "subnet-1a2b3c4d"
  },
  {
    "ImageId": "ami-1a2b3c4d",
    "InstanceType": "r3.2xlarge",
    "SubnetId": "subnet-1a2b3c4d"
  }
]
}
```

For more information, see Spot Fleet Requests in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [RequestSpotFleet](#) in *AWS CLI Command Reference*.

request-spot-instances

The following code example shows how to use `request-spot-instances`.

AWS CLI

To request Spot Instances

This example command creates a one-time Spot Instance request for five instances in the specified Availability Zone. If your account supports EC2-VPC only, Amazon EC2 launches the instances in the default subnet of the specified Availability Zone. If your account supports EC2-Classic, Amazon EC2 launches the instances in EC2-Classic in the specified Availability Zone.

Command:

```
aws ec2 request-spot-instances --spot-price "0.03" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```
{
  "ImageId": "ami-1a2b3c4d",
  "KeyName": "my-key-pair",
  "SecurityGroupIds": [ "sg-1a2b3c4d" ],
  "InstanceType": "m3.medium",
  "Placement": {
    "AvailabilityZone": "us-west-2a"
  },
  "IamInstanceProfile": {
    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  }
}
```

Output:

```
{
  "SpotInstanceRequests": [
    {
      "Status": {
        "UpdateTime": "2014-03-25T20:54:21.000Z",
        "Code": "pending-evaluation",
        "Message": "Your Spot request has been submitted for review, and is
pending evaluation."
      },
      "ProductDescription": "Linux/UNIX",
      "SpotInstanceRequestId": "sir-df6f405d",
      "State": "open",
      "LaunchSpecification": {
        "Placement": {
          "AvailabilityZone": "us-west-2a"
        },
        "ImageId": "ami-1a2b3c4d",
        "KeyName": "my-key-pair",
        "SecurityGroups": [
          {
            "GroupName": "my-security-group",
            "GroupId": "sg-1a2b3c4d"
          }
        ],
        "Monitoring": {
          "Enabled": false
        }
      }
    }
  ]
}
```

```

        },
        "IamInstanceProfile": {
            "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
        },
        "InstanceType": "m3.medium"
    },
    "Type": "one-time",
    "CreateTime": "2014-03-25T20:54:20.000Z",
    "SpotPrice": "0.050000"
},
...
]
}

```

This example command creates a one-time Spot Instance request for five instances in the specified subnet. Amazon EC2 launches the instances in the specified subnet. If the VPC is a nondefault VPC, the instances do not receive a public IP address by default.

Command:

```
aws ec2 request-spot-instances --spot-price "0.050" --instance-count 5 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```

{
  "ImageId": "ami-1a2b3c4d",
  "SecurityGroupIds": [ "sg-1a2b3c4d" ],
  "InstanceType": "m3.medium",
  "SubnetId": "subnet-1a2b3c4d",
  "IamInstanceProfile": {
    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  }
}

```

Output:

```

{
  "SpotInstanceRequests": [
    {
      "Status": {
        "UpdateTime": "2014-03-25T22:21:58.000Z",

```

```

        "Code": "pending-evaluation",
        "Message": "Your Spot request has been submitted for review, and is
pending evaluation."
    },
    "ProductDescription": "Linux/UNIX",
    "SpotInstanceRequestId": "sir-df6f405d",
    "State": "open",
    "LaunchSpecification": {
        "Placement": {
            "AvailabilityZone": "us-west-2a"
        }
        "ImageId": "ami-1a2b3c4d"
        "SecurityGroups": [
            {
                "GroupName": "my-security-group",
                "GroupID": "sg-1a2b3c4d"
            }
        ]
        "SubnetId": "subnet-1a2b3c4d",
        "Monitoring": {
            "Enabled": false
        },
        "IamInstanceProfile": {
            "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
        },
        "InstanceType": "m3.medium",
    },
    "Type": "one-time",
    "CreateTime": "2014-03-25T22:21:58.000Z",
    "SpotPrice": "0.050000"
},
...
]
}

```

This example assigns a public IP address to the Spot Instances that you launch in a nondefault VPC. Note that when you specify a network interface, you must include the subnet ID and security group ID using the network interface.

Command:

```
aws ec2 request-spot-instances --spot-price "0.050" --instance-count 1 --type "one-time" --launch-specification file://specification.json
```

Specification.json:

```
{
  "ImageId": "ami-1a2b3c4d",
  "KeyName": "my-key-pair",
  "InstanceType": "m3.medium",
  "NetworkInterfaces": [
    {
      "DeviceIndex": 0,
      "SubnetId": "subnet-1a2b3c4d",
      "Groups": [ "sg-1a2b3c4d" ],
      "AssociatePublicIpAddress": true
    }
  ],
  "IamInstanceProfile": {
    "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
  }
}
```

- For API details, see [RequestSpotInstances](#) in *AWS CLI Command Reference*.

reset-address-attribute

The following code example shows how to use `reset-address-attribute`.

AWS CLI

To reset the domain name attribute associated with an elastic IP address

The following `reset-address-attribute` examples reset the domain name attribute of an elastic IP address.

Linux:

```
aws ec2 reset-address-attribute \
  --allocation-id eipalloc-abcdef01234567890 \
  --attribute domain-name
```

Windows:

```
aws ec2 reset-address-attribute ^
  --allocation-id eipalloc-abcdef01234567890 ^
```

```
--attribute domain-name
```

Output:

```
{
  "Addresses": [
    {
      "PublicIp": "192.0.2.0",
      "AllocationId": "eipalloc-abcdef01234567890",
      "PtrRecord": "example.com."
      "PtrRecordUpdate": {
        "Value": "example.net.",
        "Status": "PENDING"
      }
    }
  ]
}
```

To monitor the pending change, see [describe-addresses-attribute](#) in the *AWS CLI Command Reference*.

- For API details, see [ResetAddressAttribute](#) in *AWS CLI Command Reference*.

reset-ebs-default-kms-key-id

The following code example shows how to use `reset-ebs-default-kms-key-id`.

AWS CLI

To reset your default CMK for EBS encryption

The following `reset-ebs-default-kms-key-id` example resets the default CMK for EBS encryption for your AWS account in the current Region.

```
aws ec2 reset-ebs-default-kms-key-id
```

Output:

```
{
  "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/8c5b2c63-b9bc-45a3-a87a-5513eEXAMPLE"
}
```

- For API details, see [ResetEbsDefaultKmsKeyId](#) in *AWS CLI Command Reference*.

reset-fpga-image-attribute

The following code example shows how to use `reset-fpga-image-attribute`.

AWS CLI

To reset the attributes of an Amazon FPGA image

This example resets the load permissions for the specified AFI.

Command:

```
aws ec2 reset-fpga-image-attribute --fpga-image-id afi-0d123e123bfc85abc --attribute loadPermission
```

Output:

```
{
  "Return": true
}
```

- For API details, see [ResetFpgaImageAttribute](#) in *AWS CLI Command Reference*.

reset-image-attribute

The following code example shows how to use `reset-image-attribute`.

AWS CLI

To reset the launchPermission attribute

This example resets the `launchPermission` attribute for the specified AMI to its default value. By default, AMIs are private. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-image-attribute --image-id ami-5731123e --attribute launchPermission
```

- For API details, see [ResetImageAttribute](#) in *AWS CLI Command Reference*.

reset-instance-attribute

The following code example shows how to use `reset-instance-attribute`.

AWS CLI

To reset the `sourceDestCheck` attribute

This example resets the `sourceDestCheck` attribute of the specified instance. The instance must be in a VPC. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute
sourceDestCheck
```

To reset the `kernel` attribute

This example resets the `kernel` attribute of the specified instance. The instance must be in the stopped state. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute
kernel
```

To reset the `ramdisk` attribute

This example resets the `ramdisk` attribute of the specified instance. The instance must be in the stopped state. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-instance-attribute --instance-id i-1234567890abcdef0 --attribute
ramdisk
```

- For API details, see [ResetInstanceAttribute](#) in *AWS CLI Command Reference*.

reset-network-interface-attribute

The following code example shows how to use `reset-network-interface-attribute`.

AWS CLI

To reset a network interface attribute

The following `reset-network-interface-attribute` example resets the value of the source/destination checking attribute to `true`.

```
aws ec2 reset-network-interface-attribute \  
  --network-interface-id eni-686ea200 \  
  --source-dest-check
```

This command produces no output.

- For API details, see [ResetNetworkInterfaceAttribute](#) in *AWS CLI Command Reference*.

reset-snapshot-attribute

The following code example shows how to use `reset-snapshot-attribute`.

AWS CLI

To reset a snapshot attribute

This example resets the create volume permissions for snapshot `snap-1234567890abcdef0`. If the command succeeds, no output is returned.

Command:

```
aws ec2 reset-snapshot-attribute --snapshot-id snap-1234567890abcdef0 --attribute  
createVolumePermission
```

- For API details, see [ResetSnapshotAttribute](#) in *AWS CLI Command Reference*.

restore-address-to-classic

The following code example shows how to use `restore-address-to-classic`.

AWS CLI

To restore an address to EC2-Classic

This example restores Elastic IP address 198.51.100.0 to the EC2-Classic platform.

Command:

```
aws ec2 restore-address-to-classic --public-ip 198.51.100.0
```

Output:

```
{
  "Status": "MoveInProgress",
  "PublicIp": "198.51.100.0"
}
```

- For API details, see [RestoreAddressToClassic](#) in *AWS CLI Command Reference*.

restore-image-from-recycle-bin

The following code example shows how to use `restore-image-from-recycle-bin`.

AWS CLI

To restore an image from the Recycle Bin

The following `restore-image-from-recycle-bin` example restores AMI `ami-0111222333444abcd` from the Recycle Bin.

```
aws ec2 restore-image-from-recycle-bin \
  --image-id ami-0111222333444abcd
```

Output:

```
{
  "Return": true
}
```

For more information, see [Recover AMIs from the Recycle Bin](#) in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [RestoreImageFromRecycleBin](#) in *AWS CLI Command Reference*.

restore-managed-prefix-list-version

The following code example shows how to use `restore-managed-prefix-list-version`.

AWS CLI

us-west-2**To restore a prefix list version**

The following `restore-managed-prefix-list-version` restores the entries from version 1 of the specified prefix list.

```
aws ec2 restore-managed-prefix-list-version \
  --prefix-list-id pl-0123456abcabcabc1 \
  --current-version 2 \
  --previous-version 1
```

Output:

```
{
  "PrefixList": {
    "PrefixListId": "pl-0123456abcabcabc1",
    "AddressFamily": "IPv4",
    "State": "restore-in-progress",
    "PrefixListArn": "arn:aws:ec2:us-west-2:123456789012:prefix-list/
pl-0123456abcabcabc1",
    "PrefixListName": "vpc-cidrs",
    "MaxEntries": 10,
    "Version": 2,
    "OwnerId": "123456789012"
  }
}
```

For more information, see [Managed prefix lists](#) in the *Amazon VPC User Guide*.

- For API details, see [RestoreManagedPrefixListVersion](#) in *AWS CLI Command Reference*.

restore-snapshot-from-recycle-bin

The following code example shows how to use `restore-snapshot-from-recycle-bin`.

AWS CLI

To restore snapshots from the Recycle Bin

The following `restore-snapshot-from-recycle-bin` example restores a snapshot from the Recycle Bin. When you restore a snapshot from the Recycle Bin, the snapshot is immediately available for use, and it is removed from the Recycle Bin. You can use a restored snapshot in the same way that you use any other snapshot in your account.

```
aws ec2 restore-snapshot-from-recycle-bin \  
  --snapshot-id snap-01234567890abcdef
```

This command produces no output.

For more information about Recycle Bin for Amazon EBS, see [Recover snapshots from the Recycle Bin](#) in the *Amazon EC2 User Guide*.

- For API details, see [RestoreSnapshotFromRecycleBin](#) in *AWS CLI Command Reference*.

restore-snapshot-tier

The following code example shows how to use `restore-snapshot-tier`.

AWS CLI

Example 1: To permanently restore an archived snapshot

The following `restore-snapshot-tier` example permanently restores the specified snapshot. Specify the `--snapshot-id` and include the `permanent-restore` option.

```
aws ec2 restore-snapshot-tier \  
  --snapshot-id snap-01234567890abcdef \  
  --permanent-restore
```

Output:

```
{  
  "SnapshotId": "snap-01234567890abcdef",  
  "IsPermanentRestore": true  
}
```

For more information about snapshot archiving, see [Archive Amazon EBS snapshots <https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html>](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html) in the *Amazon EC2 User Guide*.

Example 2: To temporarily restore an archived snapshot

The following `restore-snapshot-tier` example temporarily restores the specified snapshot. Omit the `--permanent-restore` option. Specify the `--snapshot-id` and, for `temporary-restore-days`, specify the number of days for which to restore the snapshot. `temporary-restore-days` must be specified in days. The allowed range is 1 to 180. If you do not specify a value, it defaults to 1 day.

```
aws ec2 restore-snapshot-tier \  
  --snapshot-id snap-01234567890abcdef \  
  --temporary-restore-days 5
```

Output:

```
{  
  "SnapshotId": "snap-01234567890abcdef",  
  "RestoreDuration": 5,  
  "IsPermanentRestore": false  
}
```

For more information about snapshot archiving, see [Archive Amazon EBS snapshots](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html) <<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html>> in the *Amazon EC2 User Guide*.

Example 3: To modify the restore period

The following `restore-snapshot-tier` example changes the restore period for the specified snapshot to 10 days.

```
aws ec2 restore-snapshot-tier \  
  --snapshot-id snap-01234567890abcdef  
  --temporary-restore-days 10
```

Output:

```
{  
  "SnapshotId": "snap-01234567890abcdef",  
  "RestoreDuration": 10,  
  "IsPermanentRestore": false  
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html>> in the *Amazon EC2 User Guide*.

Example 4: To modify the restore type

The following `restore-snapshot-tier` example changes the restore type for the specified snapshot from temporary to permanent.

```
aws ec2 restore-snapshot-tier \  
  --snapshot-id snap-01234567890abcdef \  
  --permanent-restore
```

Output:

```
{  
  "SnapshotId": "snap-01234567890abcdef",  
  "IsPermanentRestore": true  
}
```

For more information about snapshot archiving, see Archive Amazon EBS snapshots <<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/snapshot-archive.html>> in the *Amazon EC2 User Guide*.

- For API details, see [RestoreSnapshotTier](#) in *AWS CLI Command Reference*.

revoke-client-vpn-ingress

The following code example shows how to use `revoke-client-vpn-ingress`.

AWS CLI

To revoke an authorization rule for a Client VPN endpoint

The following `revoke-client-vpn-ingress` example revokes a rule for internet access (`0.0.0.0/0`) for all groups.

```
aws ec2 revoke-client-vpn-ingress \  
  --client-vpn-endpoint-id cvpn-endpoint-123456789123abcde \  
  --target-network-cidr 0.0.0.0/0 --revoke-all-groups
```

Output:

```
{
  "Status": {
    "Code": "revoking"
  }
}
```

For more information, see [Authorization Rules](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [RevokeClientVpnIngress](#) in *AWS CLI Command Reference*.

revoke-security-group-egress

The following code example shows how to use `revoke-security-group-egress`.

AWS CLI

Example 1: To remove the rule that allows outbound traffic to a specific address range

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified address ranges on TCP port 80.

```
aws ec2 revoke-security-group-egress \
  --group-id sg-026c12253ce15eff7 \
  --ip-permissions
  [{IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=10.0.0.0/16}]}
```

This command produces no output.

For more information, see [Security groups](#) in the *Amazon EC2 User Guide*.

Example 2: To remove the rule that allows outbound traffic to a specific security group

The following `revoke-security-group-egress` example command removes the rule that grants access to the specified security group on TCP port 80.

```
aws ec2 revoke-security-group-egress \
  --group-id sg-026c12253ce15eff7 \
  --ip-permissions '[{"IpProtocol": "tcp", "FromPort": 443, "ToPort":
  443, "UserIdGroupPairs": [{"GroupId": "sg-06df23a01ff2df86d"}]}'
```

This command produces no output.

For more information, see [Security groups](#) in the *Amazon EC2 User Guide*.

- For API details, see [RevokeSecurityGroupEgress](#) in *AWS CLI Command Reference*.

revoke-security-group-ingress

The following code example shows how to use `revoke-security-group-ingress`.

AWS CLI

Example 1: To remove a rule from a security group

The following `revoke-security-group-ingress` example removes TCP port 22 access for the `203.0.113.0/24` address range from the specified security group for a default VPC.

```
aws ec2 revoke-security-group-ingress \  
  --group-name mySecurityGroup \  
  --protocol tcp \  
  --port 22 \  
  --cidr 203.0.113.0/24
```

This command produces no output if it succeeds.

For more information, see [Security groups](#) in the *Amazon EC2 User Guide*.

Example 2: To remove a rule using the IP permissions set

The following `revoke-security-group-ingress` example uses the `ip-permissions` parameter to remove an inbound rule that allows the ICMP message Destination Unreachable: Fragmentation Needed and Don't Fragment was Set (Type 3, Code 4).

```
aws ec2 revoke-security-group-ingress \  
  --group-id sg-026c12253ce15eff7 \  
  --ip-permissions \  
  IpProtocol=icmp,FromPort=3,ToPort=4,IpRanges=[{CidrIp=0.0.0.0/0}]
```

This command produces no output if it succeeds.

For more information, see [Security groups](#) in the *Amazon EC2 User Guide*.

- For API details, see [RevokeSecurityGroupIngress](#) in *AWS CLI Command Reference*.

run-instances

The following code example shows how to use `run-instances`.

AWS CLI

Example 1: To launch an instance into a default subnet

The following `run-instances` example launches a single instance of type `t2.micro` into the default subnet for the current Region and associates it with the default subnet for the default VPC for the Region. The key pair is optional if you do not plan to connect to your instance using SSH (Linux) or RDP (Windows).

```
aws ec2 run-instances \  
  --image-id ami-0abcdef1234567890 \  
  --instance-type t2.micro \  
  --key-name MyKeyPair
```

Output:

```
{  
  "Instances": [  
    {  
      "AmiLaunchIndex": 0,  
      "ImageId": "ami-0abcdef1234567890",  
      "InstanceId": "i-1231231230abcdef0",  
      "InstanceType": "t2.micro",  
      "KeyName": "MyKeyPair",  
      "LaunchTime": "2018-05-10T08:05:20.000Z",  
      "Monitoring": {  
        "State": "disabled"  
      },  
      "Placement": {  
        "AvailabilityZone": "us-east-2a",

```

Example 2: To launch an instance into a non-default subnet and add a public IP address

The following `run-instances` example requests a public IP address for an instance that you're launching into a nondefault subnet. The instance is associated with the specified security group.

```
aws ec2 run-instances \
```

```
--image-id ami-0abcdef1234567890 \  
--instance-type t2.micro \  
--subnet-id subnet-08fc749671b2d077c \  
--security-group-ids sg-0b0384b66d7d692f9 \  
--associate-public-ip-address \  
--key-name MyKeyPair
```

For an example of the output for `run-instances`, see Example 1.

Example 3: To launch an instance with additional volumes

The following `run-instances` example uses a block device mapping, specified in `mapping.json`, to attach additional volumes at launch. A block device mapping can specify EBS volumes, instance store volumes, or both EBS volumes and instance store volumes.

```
aws ec2 run-instances \  
  --image-id ami-0abcdef1234567890 \  
  --instance-type t2.micro \  
  --subnet-id subnet-08fc749671b2d077c \  
  --security-group-ids sg-0b0384b66d7d692f9 \  
  --key-name MyKeyPair \  
  --block-device-mappings file://mapping.json
```

Contents of `mapping.json`. This example adds `/dev/sdh` an empty EBS volume with a size of 100 GiB.

```
[  
  {  
    "DeviceName": "/dev/sdh",  
    "Ebs": {  
      "VolumeSize": 100  
    }  
  }  
]
```

Contents of `mapping.json`. This example adds `ephemeral1` as an instance store volume.

```
[  
  {  
    "DeviceName": "/dev/sdc",  
    "VirtualName": "ephemeral1"  
  }  
]
```

```
}  
]
```

For an example of the output for `run-instances`, see Example 1.

For more information about block device mappings, see [Block device mapping](#) in the *Amazon EC2 User Guide*.

Example 4: To launch an instance and add tags on creation

The following `run-instances` example adds a tag with a key of `webserver` and value of `production` to the instance. The command also applies a tag with a key of `cost-center` and a value of `cc123` to any EBS volume that's created (in this case, the root volume).

```
aws ec2 run-instances \  
  --image-id ami-0abcdef1234567890 \  
  --instance-type t2.micro \  
  --count 1 \  
  --subnet-id subnet-08fc749671b2d077c \  
  --key-name MyKeyPair \  
  --security-group-ids sg-0b0384b66d7d692f9 \  
  --tag-specifications  
  'ResourceType=instance,Tags=[{Key=webserver,Value=production}]'  
  'ResourceType=volume,Tags=[{Key=cost-center,Value=cc123}]'
```

For an example of the output for `run-instances`, see Example 1.

Example 5: To launch an instance with user data

The following `run-instances` example passes user data in a file called `my_script.txt` that contains a configuration script for your instance. The script runs at launch.

```
aws ec2 run-instances \  
  --image-id ami-0abcdef1234567890 \  
  --instance-type t2.micro \  
  --count 1 \  
  --subnet-id subnet-08fc749671b2d077c \  
  --key-name MyKeyPair \  
  --security-group-ids sg-0b0384b66d7d692f9 \  
  --user-data file://my_script.txt
```

For an example of the output for `run-instances`, see Example 1.

For more information about instance user data, see [Working with instance user data](#) in the *Amazon EC2 User Guide*.

Example 6: To launch a burstable performance instance

The following `run-instances` example launches a `t2.micro` instance with the `unlimited` credit option. When you launch a T2 instance, if you do not specify `--credit-specification`, the default is the standard credit option. When you launch a T3 instance, the default is the `unlimited` credit option.

```
aws ec2 run-instances \  
  --image-id ami-0abcdef1234567890 \  
  --instance-type t2.micro \  
  --count 1 \  
  --subnet-id subnet-08fc749671b2d077c \  
  --key-name MyKeyPair \  
  --security-group-ids sg-0b0384b66d7d692f9 \  
  --credit-specification CpuCredits=unlimited
```

For an example of the output for `run-instances`, see Example 1.

For more information about burstable performance instances, see [Burstable performance instances](#) in the *Amazon EC2 User Guide*.

- For API details, see [RunInstances](#) in *AWS CLI Command Reference*.

run-scheduled-instances

The following code example shows how to use `run-scheduled-instances`.

AWS CLI

To launch a Scheduled Instance

This example launches the specified Scheduled Instance in a VPC.

Command:

```
aws ec2 run-scheduled-instances --scheduled-instance-id  
sci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-specification  
file://launch-specification.json
```

Launch-specification.json:

```
{
  "ImageId": "ami-12345678",
  "KeyName": "my-key-pair",
  "InstanceType": "c4.large",
  "NetworkInterfaces": [
    {
      "DeviceIndex": 0,
      "SubnetId": "subnet-12345678",
      "AssociatePublicIpAddress": true,
      "Groups": ["sg-12345678"]
    }
  ],
  "IamInstanceProfile": {
    "Name": "my-iam-role"
  }
}
```

Output:

```
{
  "InstanceIdSet": [
    "i-1234567890abcdef0"
  ]
}
```

This example launches the specified Scheduled Instance in EC2-Classic.

Command:

```
aws ec2 run-scheduled-instances --scheduled-instance-id
sci-1234-1234-1234-1234-123456789012 --instance-count 1 --launch-specification
file://launch-specification.json
```

Launch-specification.json:

```
{
  "ImageId": "ami-12345678",
  "KeyName": "my-key-pair",
  "SecurityGroupIds": ["sg-12345678"],
```

```
"InstanceType": "c4.large",
"Placement": {
  "AvailabilityZone": "us-west-2b"
}
"IamInstanceProfile": {
  "Name": "my-iam-role"
}
}
```

Output:

```
{
  "InstanceIdSet": [
    "i-1234567890abcdef0"
  ]
}
```

- For API details, see [RunScheduledInstances](#) in *AWS CLI Command Reference*.

search-local-gateway-routes

The following code example shows how to use `search-local-gateway-routes`.

AWS CLI

To search for routes in a local gateway route table

The following `search-local-gateway-routes` example searches for static routes in the specified local gateway route table.

```
aws ec2 search-local-gateway-routes \
  --local-gateway-route-table-id lgw-rtb-059615ef7dEXAMPLE \
  --filters "Name=type,Values=static"
```

Output:

```
{
  "Route": {
    "DestinationCidrBlock": "0.0.0.0/0",
    "LocalGatewayVirtualInterfaceGroupId": "lgw-vif-grp-07145b276bEXAMPLE",
    "Type": "static",
```

```

    "State": "deleted",
    "LocalGatewayRouteTableId": "lgw-rtb-059615ef7EXAMPLE"
  }
}

```

- For API details, see [SearchLocalGatewayRoutes](#) in *AWS CLI Command Reference*.

search-transit-gateway-multicast-groups

The following code example shows how to use `search-transit-gateway-multicast-groups`.

AWS CLI

To search one or more transit gateway multicast groups and return the group membership information

The following `search-transit-gateway-multicast-groups` example returns the group membership of the specified multicast group.

```

aws ec2 search-transit-gateway-multicast-groups \
  --transit-gateway-multicast-domain-id tgw-mcast-domain-000fb24d04EXAMPLE

```

Output:

```

{
  "MulticastGroups": [
    {
      "GroupIpAddress": "224.0.1.0",
      "TransitGatewayAttachmentId": "tgw-attach-0372e72386EXAMPLE",
      "SubnetId": "subnet-0187aff814EXAMPLE",
      "ResourceId": "vpc-0065acced4EXAMPLE",
      "ResourceType": "vpc",
      "NetworkInterfaceId": "eni-03847706f6EXAMPLE",
      "GroupMember": false,
      "GroupSource": true,
      "SourceType": "static"
    }
  ]
}

```

For more information, see [Managing multicast groups](#) in the *Transit Gateways Guide*.

- For API details, see [SearchTransitGatewayMulticastGroups](#) in *AWS CLI Command Reference*.

search-transit-gateway-routes

The following code example shows how to use `search-transit-gateway-routes`.

AWS CLI

To search for routes in the specified transit gateway route table

The following `search-transit-gateway-routes` example returns all the routes that are of type `static` in the specified route table.

```
aws ec2 search-transit-gateway-routes \  
  --transit-gateway-route-table-id tgw-rtb-0a823eddbdeEXAMPLE \  
  --filters "Name=type,Values=static"
```

Output:

```
{  
  "Routes": [  
    {  
      "DestinationCidrBlock": "10.0.2.0/24",  
      "TransitGatewayAttachments": [  
        {  
          "ResourceId": "vpc-4EXAMPLE",  
          "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",  
          "ResourceType": "vpc"  
        }  
      ],  
      "Type": "static",  
      "State": "active"  
    },  
    {  
      "DestinationCidrBlock": "10.1.0.0/24",  
      "TransitGatewayAttachments": [  
        {  
          "ResourceId": "vpc-4EXAMPLE",  
          "TransitGatewayAttachmentId": "tgw-attach-09b52ccdb5EXAMPLE",  
          "ResourceType": "vpc"  
        }  
      ],  
    }  
  ],  
}
```

```
        "Type": "static",
        "State": "active"
    }
],
"AdditionalRoutesAvailable": false
}
```

For more information, see [Transit gateway route tables](#) in the *Transit Gateways Guide*.

- For API details, see [SearchTransitGatewayRoutes](#) in *AWS CLI Command Reference*.

send-diagnostic-interrupt

The following code example shows how to use `send-diagnostic-interrupt`.

AWS CLI

To send a diagnostic interrupt

The following `send-diagnostic-interrupt` example sends a diagnostic interrupt to the specified instance.

```
aws ec2 send-diagnostic-interrupt \
  --instance-id i-1234567890abcdef0
```

This command produces no output.

- For API details, see [SendDiagnosticInterrupt](#) in *AWS CLI Command Reference*.

start-instances

The following code example shows how to use `start-instances`.

AWS CLI

To start an Amazon EC2 instance

This example starts the specified Amazon EBS-backed instance.

Command:

```
aws ec2 start-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "StartingInstances": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "CurrentState": {
        "Code": 0,
        "Name": "pending"
      },
      "PreviousState": {
        "Code": 80,
        "Name": "stopped"
      }
    }
  ]
}
```

For more information, see *Stop and Start Your Instance* in the *Amazon Elastic Compute Cloud User Guide*.

- For API details, see [StartInstances](#) in *AWS CLI Command Reference*.

start-network-insights-access-scope-analysis

The following code example shows how to use `start-network-insights-access-scope-analysis`.

AWS CLI**To start a Network Insights access scope analysis**

The following `start-network-insights-access-scope-analysis` example starts the scope analysis in your AWS account.

```
aws ec2 start-network-insights-access-scope-analysis \
  --region us-east-1 \
  --network-insights-access-scope-id nis-123456789111
```

Output:

```
{
```

```
"NetworkInsightsAccessScopeAnalysis": {
  "NetworkInsightsAccessScopeAnalysisId": "nisa-123456789222",
  "NetworkInsightsAccessScopeAnalysisArn": "arn:aws:ec2:us-
east-1:123456789012:network-insights-access-scope-analysis/nisa-123456789222",
  "NetworkInsightsAccessScopeId": "nis-123456789111",
  "Status": "running",
  "StartDate": "2022-01-26T00:47:06.814000+00:00"
}
}
```

For more information, see [Getting started with Network Access Analyzer using the AWS CLI](#) in the *Network Access Analyzer Guide*.

- For API details, see [StartNetworkInsightsAccessScopeAnalysis](#) in *AWS CLI Command Reference*.

start-network-insights-analysis

The following code example shows how to use `start-network-insights-analysis`.

AWS CLI

To analyze a path

The following `start-network-insights-analysis` example analyzes the path between the source and destination. To view the results of the path analysis, use the `describe-network-insights-analyses` command.

```
aws ec2 start-network-insights-analysis \
  --network-insights-path-id nip-0b26f224f1d131fa8
```

Output:

```
{
  "NetworkInsightsAnalysis": {
    "NetworkInsightsAnalysisId": "nia-02207aa13eb480c7a",
    "NetworkInsightsAnalysisArn": "arn:aws:ec2:us-east-1:123456789012:network-
insights-analysis/nia-02207aa13eb480c7a",
    "NetworkInsightsPathId": "nip-0b26f224f1d131fa8",
    "StartDate": "2021-01-20T22:58:37.495Z",
    "Status": "running"
  }
}
```

```
}
```

For more information, see [Getting started using the AWS CLI](#) in the *Reachability Analyzer Guide*.

- For API details, see [StartNetworkInsightsAnalysis](#) in *AWS CLI Command Reference*.

start-vpc-endpoint-service-private-dns-verification

The following code example shows how to use `start-vpc-endpoint-service-private-dns-verification`.

AWS CLI

To initiate the DNS verification process

The following `start-vpc-endpoint-service-private-dns-verification` example initiates the DNS verification process for the specified endpoint service.

```
aws ec2 start-vpc-endpoint-service-private-dns-verification \  
  --service-id vpce-svc-071afff70666e61e0
```

This command produces no output.

For more information, see [Manage DNS names](#) in the *AWS PrivateLink User Guide*.

- For API details, see [StartVpcEndpointServicePrivateDnsVerification](#) in *AWS CLI Command Reference*.

stop-instances

The following code example shows how to use `stop-instances`.

AWS CLI

Example 1: To stop an Amazon EC2 instance

The following `stop-instances` example stops the specified Amazon EBS-backed instance.

```
aws ec2 stop-instances \  
  --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "StoppingInstances": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "CurrentState": {
        "Code": 64,
        "Name": "stopping"
      },
      "PreviousState": {
        "Code": 16,
        "Name": "running"
      }
    }
  ]
}
```

For more information, see [Stop and Start Your Instance](#) in the *Amazon Elastic Compute Cloud User Guide*.

Example 2: To hibernate an Amazon EC2 instance

The following `stop-instances` example hibernates Amazon EBS-backed instance if the instance is enabled for hibernation and meets the hibernation prerequisites. After the instance is put into hibernation the instance is stopped.

```
aws ec2 stop-instances \
  --instance-ids i-1234567890abcdef0 \
  --hibernate
```

Output:

```
{
  "StoppingInstances": [
    {
      "CurrentState": {
        "Code": 64,
        "Name": "stopping"
      },
      "InstanceId": "i-1234567890abcdef0",
      "PreviousState": {
```

```

        "Code": 16,
        "Name": "running"
      }
    ]
  }
}

```

For more information, see [Hibernate your On-Demand Linux instance](#) in the *Amazon Elastic Cloud Compute User Guide*.

- For API details, see [StopInstances](#) in *AWS CLI Command Reference*.

terminate-client-vpn-connections

The following code example shows how to use `terminate-client-vpn-connections`.

AWS CLI

To terminate a connection to a Client VPN endpoint

The following `terminate-client-vpn-connections` example terminates the specified connection to the Client VPN endpoint.

```

aws ec2 terminate-client-vpn-connections \
  --client-vpn-endpoint-id vpn-endpoint-123456789123abcde \
  --connection-id cvpn-connection-04edd76f5201e0cb8

```

Output:

```

{
  "ClientVpnEndpointId": "vpn-endpoint-123456789123abcde",
  "ConnectionStatuses": [
    {
      "ConnectionId": "cvpn-connection-04edd76f5201e0cb8",
      "PreviousStatus": {
        "Code": "active"
      },
      "CurrentStatus": {
        "Code": "terminating"
      }
    }
  ]
}

```

```
}
```

For more information, see [Client Connections](#) in the *AWS Client VPN Administrator Guide*.

- For API details, see [TerminateClientVpnConnections](#) in *AWS CLI Command Reference*.

terminate-instances

The following code example shows how to use `terminate-instances`.

AWS CLI

To terminate an Amazon EC2 instance

This example terminates the specified instance.

Command:

```
aws ec2 terminate-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "TerminatingInstances": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "CurrentState": {
        "Code": 32,
        "Name": "shutting-down"
      },
      "PreviousState": {
        "Code": 16,
        "Name": "running"
      }
    }
  ]
}
```

For more information, see *Using Amazon EC2 Instances* in the *AWS Command Line Interface User Guide*.

- For API details, see [TerminateInstances](#) in *AWS CLI Command Reference*.

unassign-ipv6-addresses

The following code example shows how to use `unassign-ipv6-addresses`.

AWS CLI

To unassign an IPv6 address from a network interface

This example unassigns the specified IPv6 address from the specified network interface.

Command:

```
aws ec2 unassign-ipv6-addresses --ipv6-addresses
2001:db8:1234:1a00:3304:8879:34cf:4071 --network-interface-id eni-23c49b68
```

Output:

```
{
  "NetworkInterfaceId": "eni-23c49b68",
  "UnassignedIpv6Addresses": [
    "2001:db8:1234:1a00:3304:8879:34cf:4071"
  ]
}
```

- For API details, see [UnassignIpv6Addresses](#) in *AWS CLI Command Reference*.

unassign-private-ip-addresses

The following code example shows how to use `unassign-private-ip-addresses`.

AWS CLI

To unassign a secondary private IP address from a network interface

This example unassigns the specified private IP address from the specified network interface. If the command succeeds, no output is returned.

Command:

```
aws ec2 unassign-private-ip-addresses --network-interface-id eni-e5aa89a3 --private-
ip-addresses 10.0.0.82
```

- For API details, see [UnassignPrivateIpAddresses](#) in *AWS CLI Command Reference*.

unassign-private-nat-gateway-address

The following code example shows how to use `unassign-private-nat-gateway-address`.

AWS CLI

To unassign a private IP address from your private NAT gateway

The following `unassign-private-nat-gateway-address` example unassigns the specified IP address from the specified private NAT gateway.

```
aws ec2 unassign-private-nat-gateway-address \
  --nat-gateway-id nat-1234567890abcdef0 \
  --private-ip-addresses 10.0.20.197
```

Output:

```
{
  "NatGatewayId": "nat-0ee3edd182361f662",
  "NatGatewayAddresses": [
    {
      "NetworkInterfaceId": "eni-0065a61b324d1897a",
      "PrivateIp": "10.0.20.197",
      "IsPrimary": false,
      "Status": "unassigning"
    }
  ]
}
```

For more information, see [NAT gateways](#) in the *Amazon VPC User Guide*.

- For API details, see [UnassignPrivateNatGatewayAddress](#) in *AWS CLI Command Reference*.

unmonitor-instances

The following code example shows how to use `unmonitor-instances`.

AWS CLI

To disable detailed monitoring for an instance

This example command disables detailed monitoring for the specified instance.

Command:

```
aws ec2 unmonitor-instances --instance-ids i-1234567890abcdef0
```

Output:

```
{
  "InstanceMonitorings": [
    {
      "InstanceId": "i-1234567890abcdef0",
      "Monitoring": {
        "State": "disabling"
      }
    }
  ]
}
```

- For API details, see [UnmonitorInstances](#) in *AWS CLI Command Reference*.

update-security-group-rule-descriptions-egress

The following code example shows how to use `update-security-group-rule-descriptions-egress`.

AWS CLI

To update the description of an outbound security group rule

The following `update-security-group-rule-descriptions-egress` example updates the description for the security group rule for the specified port and IPv4 address range. The description 'Outbound HTTP access to server 2' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-egress \
  --group-id sg-02f0d35a850ba727f \
  --ip-permissions
  IpProtocol=tcp,FromPort=80,ToPort=80,IpRanges=[{CidrIp=203.0.113.0/24,Description="Outbound
  HTTP access to server 2"}]
```

Output:

```
{
  "Return": true
}
```

For more information, see [Security group rules](#) in the *Amazon EC2 User Guide*.

- For API details, see [UpdateSecurityGroupRuleDescriptionsEgress](#) in *AWS CLI Command Reference*.

update-security-group-rule-descriptions-ingress

The following code example shows how to use `update-security-group-rule-descriptions-ingress`.

AWS CLI**Example 1: To update the description of an inbound security group rule with a CIDR source**

The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and IPv4 address range. The description 'SSH access from ABC office' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-ingress \
  --group-id sg-02f0d35a850ba727f \
  --ip-permissions
  IpProtocol=tcp,FromPort=22,ToPort=22,IpRanges='[{"CidrIp=203.0.113.0/16,Description="SSH
  access from corpnet"}]'
```

Output:

```
{
  "Return": true
}
```

For more information, see [Security group rules](#) in the *Amazon EC2 User Guide*.

Example 2: To update the description of an inbound security group rule with a prefix list source

The following `update-security-group-rule-descriptions-ingress` example updates the description for the security group rule for the specified port and prefix list. The description 'SSH access from ABC office' replaces any existing description for the rule.

```
aws ec2 update-security-group-rule-descriptions-ingress \  
  --group-id sg-02f0d35a850ba727f \  
  --ip-permissions  
  IpProtocol=tcp,FromPort=22,ToPort=22,PrefixListIds='[{"PrefixListId=pl-12345678,Description=  
  access from corpnet"}]'
```

Output:

```
{  
  "Return": true  
}
```

For more information, see [Security group rules](#) in the *Amazon EC2 User Guide*.

- For API details, see [UpdateSecurityGroupRuleDescriptionsIngress](#) in *AWS CLI Command Reference*.

withdraw-byoip-cidr

The following code example shows how to use `withdraw-byoip-cidr`.

AWS CLI

To stop advertising an address range

The following `withdraw-byoip-cidr` example stops advertising the specified address range.

```
aws ec2 withdraw-byoip-cidr  
  --cidr 203.0.113.25/24
```

Output:

```
{  
  "ByoipCidr": {  
    "Cidr": "203.0.113.25/24",  
    "StatusMessage": "ipv4pool-ec2-1234567890abcdef0",  
    "State": "advertised"  
  }  
}
```

```
}  
}
```

- For API details, see [WithdrawByoipCidr](#) in *AWS CLI Command Reference*.

Amazon EC2 Instance Connect examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EC2 Instance Connect.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

send-ssh-public-key

The following code example shows how to use `send-ssh-public-key`.

AWS CLI

To send a an SSH public key to an instance

The following `send-ssh-public-key` example sends the specified SSH public key to the specified instance. The key is used to authenticate the specified user.

```
aws ec2-instance-connect send-ssh-public-key \  
  --instance-id i-1234567890abcdef0 \  
  --instance-os-user ec2-user \  
  --availability-zone us-east-2b \  
  --public-key-path /path/to/public-key
```

```
--ssh-public-key file://path/my-rsa-key.pub
```

This command produces no output.

- For API details, see [SendSshPublicKey](#) in *AWS CLI Command Reference*.

Amazon ECR examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECR.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

batch-check-layer-availability

The following code example shows how to use `batch-check-layer-availability`.

AWS CLI

To check the availability of a layer

The following `batch-check-layer-availability` example checks the availability of a layer with the digest

`sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed`
in the `cluster-autoscaler` repository.

```
aws ecr batch-check-layer-availability \  
  --repository-name cluster-autoscaler \  
  --digest sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

```
--layer-digests
sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```
{
  "layers": [
    {
      "layerDigest":
"sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed",
      "layerAvailability": "AVAILABLE",
      "layerSize": 2777,
      "mediaType": "application/vnd.docker.container.image.v1+json"
    }
  ],
  "failures": []
}
```

- For API details, see [BatchCheckLayerAvailability](#) in *AWS CLI Command Reference*.

batch-delete-image

The following code example shows how to use `batch-delete-image`.

AWS CLI**Example 1: To delete an image**

The following `batch-delete-image` example deletes an image with the tag `precise` in the specified repository in the default registry for an account.

```
aws ecr batch-delete-image \
  --repository-name ubuntu \
  --image-ids imageTag=precise
```

Output:

```
{
  "failures": [],
  "imageIds": [
    {
      "imageTag": "precise",
```

```
        "imageDigest":
          "sha256:19665f1e6d1e504117a1743c0a3d3753086354a38375961f2e665416ef4b1b2f"
        }
      ]
    }
  }
```

Example 2: To delete multiple images

The following `batch-delete-image` example deletes all images tagged with `prod` and `team1` in the specified repository.

```
aws ecr batch-delete-image \
  --repository-name MyRepository \
  --image-ids imageTag=prod imageTag=team1
```

Output:

```
{
  "imageIds": [
    {
      "imageDigest": "sha256:123456789012",
      "imageTag": "prod"
    },
    {
      "imageDigest": "sha256:567890121234",
      "imageTag": "team1"
    }
  ],
  "failures": []
}
```

For more information, see [Deleting an Image](#) in the *Amazon ECR User Guide*.

- For API details, see [BatchDeleteImage](#) in *AWS CLI Command Reference*.

batch-get-image

The following code example shows how to use `batch-get-image`.

AWS CLI

Example 1: To get an image

The following `batch-get-image` example gets an image with the tag `v1.13.6` in a repository called `cluster-autoscaler` in the default registry for an account.

```
aws ecr batch-get-image \
  --repository-name cluster-autoscaler \
  --image-ids imageTag=v1.13.6
```

Output:

```
{
  "images": [
    {
      "registryId": "012345678910",
      "repositoryName": "cluster-autoscaler",
      "imageId": {
        "imageDigest":
"sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
        "imageTag": "v1.13.6"
      },
      "imageManifest": "{\n  \"schemaVersion\": 2,\n

      "repositoryName": "MyRepository",  
      "imageId": {  
        "imageDigest": "sha256:123456789012",  
        "imageTag": "team1"  
      },  
      "imageManifest": "manifestExample2"  
    }  
  ],  
  "failures": []  
}
```

For more information, see [Images](#) in the *Amazon ECR User Guide*.

- For API details, see [BatchGetImage](#) in *AWS CLI Command Reference*.

complete-layer-upload

The following code example shows how to use `complete-layer-upload`.

AWS CLI

To complete an image layer upload

The following `complete-layer-upload` example completes an image layer upload to the `layer-test` repository.

```
aws ecr complete-layer-upload \  
  --repository-name layer-test \  
  --upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \  
  --layer-digests 6cb64b8a-9378-0e33-2ab1-  
b780fab8a9e9:48074e6d3a68b39aad8ccc002cdad912d4148c0f92b3729323e
```

Output:

```
{  
  "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",  
  "layerDigest":  
    "sha256:9a77f85878aa1906f2020a0ecdf7a7e962d57e882250acd773383224b3fe9a02",  
  "repositoryName": "layer-test",  
  "registryId": "130757420319"  
}
```

- For API details, see [CompleteLayerUpload](#) in *AWS CLI Command Reference*.

create-repository

The following code example shows how to use `create-repository`.

AWS CLI

Example 1: To create a repository

The following `create-repository` example creates a repository inside the specified namespace in the default registry for an account.

```
aws ecr create-repository \  
  --namespace-name my-namespace
```

```
--repository-name project-a/nginx-web-app
```

Output:

```
{
  "repository": {
    "registryId": "123456789012",
    "repositoryName": "sample-repo",
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/project-a/nginx-web-app"
  }
}
```

For more information, see [Creating a Repository](#) in the *Amazon ECR User Guide*.

Example 2: To create a repository configured with image tag immutability

The following `create-repository` example creates a repository configured for tag immutability in the default registry for an account.

```
aws ecr create-repository \
  --repository-name sample-repo \
  --image-tag-mutability IMMUTABLE
```

Output:

```
{
  "repository": {
    "registryId": "123456789012",
    "repositoryName": "sample-repo",
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/sample-repo",
    "imageTagMutability": "IMMUTABLE"
  }
}
```

For more information, see [Image Tag Mutability](#) in the *Amazon ECR User Guide*.

Example 3: To create a repository configured with a scanning configuration

The following `create-repository` example creates a repository configured to perform a vulnerability scan on image push in the default registry for an account.

```
aws ecr create-repository \  
  --repository-name sample-repo \  
  --image-scanning-configuration scanOnPush=true
```

Output:

```
{  
  "repository": {  
    "registryId": "123456789012",  
    "repositoryName": "sample-repo",  
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/sample-  
repo",  
    "imageScanningConfiguration": {  
      "scanOnPush": true  
    }  
  }  
}
```

For more information, see [Image Scanning](#) in the *Amazon ECR User Guide*.

- For API details, see [CreateRepository](#) in *AWS CLI Command Reference*.

delete-lifecycle-policy

The following code example shows how to use `delete-lifecycle-policy`.

AWS CLI

To delete the lifecycle policy for a repository

The following `delete-lifecycle-policy` example deletes the lifecycle policy for the `hello-world` repository.

```
aws ecr delete-lifecycle-policy \  
  --repository-name hello-world
```

Output:

```
{  
  "registryId": "012345678910",
```

```

    "repositoryName": "hello-world",
    "lifecyclePolicyText": "{\"rules\": [{\"rulePriority\": 1, \"description\": \"Remove
untagged images.\", \"selection\": {\"tagStatus\": \"untagged\", \"countType\":
\"sinceImagePushed\", \"countUnit\": \"days\", \"countNumber\": 10}, \"action\": {\"type
\": \"expire\"}}]}",
    "lastEvaluatedAt": 0.0
}

```

- For API details, see [DeleteLifecyclePolicy](#) in *AWS CLI Command Reference*.

delete-repository-policy

The following code example shows how to use `delete-repository-policy`.

AWS CLI

To delete the repository policy for a repository

The following `delete-repository-policy` example deletes the repository policy for the `cluster-autoscaler` repository.

```

aws ecr delete-repository-policy \
  --repository-name cluster-autoscaler

```

Output:

```

{
  "registryId": "012345678910",
  "repositoryName": "cluster-autoscaler",
  "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n
  \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :
  \"*\",\n    \"Action\" : [ \"ecr:BatchCheckLayerAvailability\", \"ecr:BatchGetImage
  \", \"ecr:GetDownloadUrlForLayer\" ]\n  } ]\n}"
}

```

- For API details, see [DeleteRepositoryPolicy](#) in *AWS CLI Command Reference*.

delete-repository

The following code example shows how to use `delete-repository`.

AWS CLI

To delete a repository

The following `delete-repository` example command force deletes the specified repository in the default registry for an account. The `--force` flag is required if the repository contains images.

```
aws ecr delete-repository \  
  --repository-name ubuntu \  
  --force
```

Output:

```
{  
  "repository": {  
    "registryId": "123456789012",  
    "repositoryName": "ubuntu",  
    "repositoryArn": "arn:aws:ecr:us-west-2:123456789012:repository/ubuntu"  
  }  
}
```

For more information, see [Deleting a Repository](#) in the *Amazon ECR User Guide*.

- For API details, see [DeleteRepository](#) in *AWS CLI Command Reference*.

describe-image-scan-findings

The following code example shows how to use `describe-image-scan-findings`.

AWS CLI

To describe the scan findings for an image

The following `describe-image-scan-findings` example returns the image scan findings for an image using the image digest in the specified repository in the default registry for an account.

```
aws ecr describe-image-scan-findings \  
  --repository-name sample-repo \  
  --image-id  
  imageDigest=sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6
```

Output:

```
{
  "imageScanFindings": {
    "findings": [
      {
        "name": "CVE-2019-5188",
        "description": "A code execution vulnerability exists in the directory rehashing functionality of E2fsprogs e2fsck 1.45.4. A specially crafted ext4 directory can cause an out-of-bounds write on the stack, resulting in code execution. An attacker can corrupt a partition to trigger this vulnerability.",
        "uri": "http://people.ubuntu.com/~ubuntu-security/cve/CVE-2019-5188",

  }
}
```

```
  },
  "imageScanStatus": {
    "status": "COMPLETE",
    "description": "The scan was completed successfully."
  }
}
```

For more information, see [Image Scanning](#) in the *Amazon ECR User Guide*.

- For API details, see [DescribeImageScanFindings](#) in *AWS CLI Command Reference*.

describe-images

The following code example shows how to use `describe-images`.

AWS CLI

To describe an image in a repository

The following `describe-images` example displays details about an image in the `cluster-autoscaler` repository with the tag `v1.13.6`.

```
aws ecr describe-images \
  --repository-name cluster-autoscaler \
  --image-ids imageTag=v1.13.6
```

Output:

```
{
  "imageDetails": [
    {
      "registryId": "012345678910",
      "repositoryName": "cluster-autoscaler",
      "imageDigest":
"sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",
      "imageTags": [
        "v1.13.6"
      ],
      "imageSizeInBytes": 48318255,
      "imagePushedAt": 1565128275.0
    }
  ]
}
```

```
}
```

- For API details, see [DescribeImages](#) in *AWS CLI Command Reference*.

describe-repositories

The following code example shows how to use `describe-repositories`.

AWS CLI

To describe the repositories in a registry

This example describes the repositories in the default registry for an account.

Command:

```
aws ecr describe-repositories
```

Output:

```
{
  "repositories": [
    {
      "registryId": "012345678910",
      "repositoryName": "ubuntu",
      "repositoryArn": "arn:aws:ecr:us-west-2:012345678910:repository/ubuntu"
    },

    }
  ]
}
```

- For API details, see [DescribeRepositories](#) in *AWS CLI Command Reference*.

get-authorization-token

The following code example shows how to use `get-authorization-token`.

AWS CLI

To get an authorization token for your default registry

The following `get-authorization-token` example command gets an authorization token for your default registry.

```
aws ecr get-authorization-token
```

Output:

```
{
  "authorizationData": [
    {
      "authorizationToken": "QVdT0kN...",
      "expiresAt": 1448875853.241,
      "proxyEndpoint": "https://123456789012.dkr.ecr.us-west-2.amazonaws.com"
    }
  ]
}
```

- For API details, see [GetAuthorizationToken](#) in *AWS CLI Command Reference*.

get-download-url-for-layer

The following code example shows how to use `get-download-url-for-layer`.

AWS CLI

To get the download URL of a layer

The following `get-download-url-for-layer` example displays the download URL of a layer with the digest

sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
in the `cluster-autoscaler` repository.

```
aws ecr get-download-url-for-layer \
  --repository-name cluster-autoscaler \
  --layer-digest
sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed
```

Output:

```
{
  "downloadUrl": "https://prod-us-west-2-starport-layer-bucket.s3.us-
west-2.amazonaws.com/e501-012345678910-9cb60dc0-7284-5643-3987-

Amz-Credential=AKIA32P3D2JDNMVAJLGF%2F20190814%2Fus-west-2%2Fs3%2Faws4_request&X-
Amz-Signature=9161345894947a1672467a0da7a1550f2f7157318312fe4941b59976239c3337",
  "layerDigest":
  "sha256:6171c7451a50945f8ddd72f7732cc04d7a0d1f48138a426b2e64387fdeb834ed"
}
```

- For API details, see [GetDownloadUrlForLayer](#) in *AWS CLI Command Reference*.

get-lifecycle-policy-preview

The following code example shows how to use `get-lifecycle-policy-preview`.

AWS CLI**To retrieve details for a lifecycle policy preview**

The following `get-lifecycle-policy-preview` example retrieves the result of a lifecycle policy preview for the specified repository in the default registry for an account.

Command:

```
aws ecr get-lifecycle-policy-preview \
  --repository-name "project-a/amazon-ecs-sample"
```

Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{\n  \"rules\": [\n    {\n\n      \"rulePriority\": 1,\n      \"description\": \"Expire images older than 14\n      days\",\n      \"selection\": {\n        \"tagStatus\": \"untagged\",\n\n        \"countType\": \"sinceImagePushed\",\n        \"countUnit\n      \": \"days\",\n      \"countNumber\": 14\n    },\n  ],\n}
```

```

  \"action\": {\n
    ]\n}\n",
    "status": "COMPLETE",
    "previewResults": [],
    "summary": {\n
      "expiringImageTotalCount": 0
    }
  }
}

```

For more information, see [Lifecycle Policies](#) in the *Amazon ECR User Guide*.

- For API details, see [GetLifecyclePolicyPreview](#) in *AWS CLI Command Reference*.

get-lifecycle-policy

The following code example shows how to use `get-lifecycle-policy`.

AWS CLI

To retrieve a lifecycle policy

The following `get-lifecycle-policy` example displays details of the lifecycle policy for the specified repository in the default registry for the account.

```

aws ecr get-lifecycle-policy \
  --repository-name "project-a/amazon-ecs-sample"

```

Output:

```

{
  "registryId": "123456789012",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{\n\"rules\":[\n{\n\"rulePriority\":1,\n\"description\":\n\"Expire images older than 14 days\",\n\"selection\":{\n\"tagStatus\":\n\"untagged\",\n\"countType\":\n\"sinceImagePushed\",\n\"countUnit\":\n\"days\",\n\"countNumber\":14},\n\"action\":{\n\"type\":\n\"expire\"}}]\n}",
  "lastEvaluatedAt": 1504295007.0
}

```

For more information, see [Lifecycle Policies](#) in the *Amazon ECR User Guide*.

- For API details, see [GetLifecyclePolicy](#) in *AWS CLI Command Reference*.

get-login-password

The following code example shows how to use `get-login-password`.

AWS CLI

To retrieve a password to authenticate to a registry

The following `get-login-password` displays a password that you can use with a container client of your choice to authenticate to any Amazon ECR registry that your IAM principal has access to.

```
aws ecr get-login-password
```

Output:

```
<password>
```

To use with the Docker CLI, pipe the output of the `get-login-password` command to the `docker login` command. When retrieving the password, ensure that you specify the same Region that your Amazon ECR registry exists in.

```
aws ecr get-login-password \
  --region <region> \
| docker login \
  --username AWS \
  --password-stdin <aws_account_id>.dkr.ecr.<region>.amazonaws.com
```

For more information, see [Registry Authentication](#) in the *Amazon ECR User Guide*.

- For API details, see [GetLoginPassword](#) in *AWS CLI Command Reference*.

get-login

The following code example shows how to use `get-login`.

AWS CLI

To retrieve a Docker login command to your default registry

This example prints a command that you can use to log in to your default Amazon ECR registry.

Command:

```
aws ecr get-login
```

Output:

```
docker login -u AWS -p <password> -e none https://  
<aws_account_id>.dkr.ecr.<region>.amazonaws.com
```

To log in to another account's registry

This example prints one or more commands that you can use to log in to Amazon ECR registries associated with other accounts.

Command:

```
aws ecr get-login --registry-ids 012345678910 023456789012
```

Output:

```
docker login -u <username> -p <token-1> -e none <endpoint-1>  
docker login -u <username> -p <token-2> -e none <endpoint-2>
```

- For API details, see [GetLogin](#) in *AWS CLI Command Reference*.

get-repository-policy

The following code example shows how to use `get-repository-policy`.

AWS CLI**To retrieve the repository policy for a repository**

The following `get-repository-policy` example displays details about the repository policy for the `cluster-autoscaler` repository.

```
aws ecr get-repository-policy \  
  --repository-name cluster-autoscaler
```

Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "cluster-autoscaler",
  "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n    \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :\n    \"*\",\n    \"Action\" : [ \"ecr:BatchCheckLayerAvailability\", \"ecr:BatchGetImage\",\n    \"ecr:GetDownloadUrlForLayer\" ]\n  } ]\n}"
```

- For API details, see [GetRepositoryPolicy](#) in *AWS CLI Command Reference*.

initiate-layer-upload

The following code example shows how to use `initiate-layer-upload`.

AWS CLI

To initiate an image layer upload

The following `initiate-layer-upload` example initiates an image layer upload to the `layer-test` repository.

```
aws ecr initiate-layer-upload \
  --repository-name layer-test
```

Output:

```
{
  "partSize": 10485760,
  "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9"
}
```

- For API details, see [InitiateLayerUpload](#) in *AWS CLI Command Reference*.

list-images

The following code example shows how to use `list-images`.

AWS CLI

To list the images in a repository

The following `list-images` example displays a list of the images in the `cluster-autoscaler` repository.

```
aws ecr list-images \  
  --repository-name cluster-autoscaler
```

Output:

```
{  
  "imageIds": [  
    {  
      "imageDigest":  
"sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",  
      "imageTag": "v1.13.8"  
    },  
    {  
      "imageDigest":  
"sha256:99c6fb4377e9a420a1eb3b410a951c9f464eff3b7dbc76c65e434e39b94b6570",  
      "imageTag": "v1.13.7"  
    },  
    {  
      "imageDigest":  
"sha256:4a1c6567c38904384ebc64e35b7eeddd8451110c299e3368d2210066487d97e5",  
      "imageTag": "v1.13.6"  
    }  
  ]  
}
```

- For API details, see [ListImages](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for repository

The following `list-tags-for-resource` example displays a list of the tags associated with the `hello-world` repository.

```
aws ecr list-tags-for-resource \  
  --repository-name hello-world
```

```
--resource-arn arn:aws:ecr:us-west-2:012345678910:repository/hello-world
```

Output:

```
{
  "tags": [
    {
      "Key": "Stage",
      "Value": "Integ"
    }
  ]
}
```

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-image-scanning-configuration

The following code example shows how to use `put-image-scanning-configuration`.

AWS CLI

To update the image scanning configuration for a repository

The following `put-image-scanning-configuration` example updates the image scanning configuration for the specified repository.

```
aws ecr put-image-scanning-configuration \
  --repository-name sample-repo \
  --image-scanning-configuration scanOnPush=true
```

Output:

```
{
  "registryId": "012345678910",
  "repositoryName": "sample-repo",
  "imageScanningConfiguration": {
    "scanOnPush": true
  }
}
```

For more information, see [Image Scanning](#) in the *Amazon ECR User Guide*.

- For API details, see [PutImageScanningConfiguration](#) in *AWS CLI Command Reference*.

put-image-tag-mutability

The following code example shows how to use `put-image-tag-mutability`.

AWS CLI

To update the image tag mutability setting for a repository

The following `put-image-tag-mutability` example configures the specified repository for tag immutability. This prevents all image tags within the repository from being overwritten.

```
aws ecr put-image-tag-mutability \  
  --repository-name hello-repository \  
  --image-tag-mutability IMMUTABLE
```

Output:

```
{  
  "registryId": "012345678910",  
  "repositoryName": "sample-repo",  
  "imageTagMutability": "IMMUTABLE"  
}
```

For more information, see [Image Tag Mutability](#) in the *Amazon ECR User Guide*.

- For API details, see [PutImageTagMutability](#) in *AWS CLI Command Reference*.

put-image

The following code example shows how to use `put-image`.

AWS CLI

To retag an image with its manifest

The following `put-image` example creates a new tag in the `hello-world` repository with an existing image manifest.

```
aws ecr put-image \  
  --repository-name hello-world
```

```
--repository-name hello-world \  
--image-tag 2019.08 \  
--image-manifest file://hello-world.manifest.json
```

Contents of hello-world.manifest.json:

- For API details, see [PutImage](#) in *AWS CLI Command Reference*.

put-lifecycle-policy

The following code example shows how to use `put-lifecycle-policy`.

AWS CLI

To create a lifecycle policy

The following `put-lifecycle-policy` example creates a lifecycle policy for the specified repository in the default registry for an account.

```

aws ecr put-lifecycle-policy \
  --repository-name "project-a/amazon-ecs-sample" \
  --lifecycle-policy-text "file://policy.json"

```

Contents of `policy.json`:

```

{
  "rules": [
    {
      "rulePriority": 1,
      "description": "Expire images older than 14 days",
      "selection": {
        "tagStatus": "untagged",
        "countType": "sinceImagePushed",
        "countUnit": "days",
        "countNumber": 14
      },
      "action": {
        "type": "expire"
      }
    }
  ]
}

```

```
]
}
```

Output:

```
{
  "registryId": "<aws_account_id>",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{\"rules\": [{\"rulePriority\": 1, \"description\": \"Expire images older than 14 days\", \"selection\": {\"tagStatus\": \"untagged\", \"countType\": \"sinceImagePushed\", \"countUnit\": \"days\", \"countNumber\": 14}, \"action\": {\"type\": \"expire\"}}]}"
}
```

For more information, see [Lifecycle Policies](#) in the *Amazon ECR User Guide*.

- For API details, see [PutLifecyclePolicy](#) in *AWS CLI Command Reference*.

set-repository-policy

The following code example shows how to use `set-repository-policy`.

AWS CLI**To set the repository policy for a repository**

The following `set-repository-policy` example attaches a repository policy contained in a file to the `cluster-autoscaler` repository.

```
aws ecr set-repository-policy \
  --repository-name cluster-autoscaler \
  --policy-text file://my-policy.json
```

Contents of `my-policy.json`:

```
{
  "Version" : "2008-10-17",
  "Statement" : [
    {
      "Sid" : "allow public pull",
      "Effect" : "Allow",
      "Principal" : "*",
```

```

        "Action" : [
            "ecr:BatchCheckLayerAvailability",
            "ecr:BatchGetImage",
            "ecr:GetDownloadUrlForLayer"
        ]
    }
]
}

```

Output:

```

{
  "registryId": "012345678910",
  "repositoryName": "cluster-autoscaler",
  "policyText": "{\n  \"Version\" : \"2008-10-17\",\n  \"Statement\" : [ {\n\n    \"Sid\" : \"allow public pull\",\n    \"Effect\" : \"Allow\",\n    \"Principal\" :\n    \"*\",\n    \"Action\" : [ \"ecr:BatchCheckLayerAvailability\", \"ecr:BatchGetImage\n    \", \"ecr:GetDownloadUrlForLayer\" ]\n  } ]\n}"
}

```

- For API details, see [SetRepositoryPolicy](#) in *AWS CLI Command Reference*.

start-image-scan

The following code example shows how to use `start-image-scan`.

AWS CLI**To start an image vulnerability scan**

The following `start-image-scan` example starts an image scan for and specified by the image digest in the specified repository.

```

aws ecr start-image-scan \
  --repository-name sample-repo \
  --image-id
imageDigest=sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6

```

Output:

```

{

```

```
"registryId": "012345678910",
"repositoryName": "sample-repo",
"imageId": {
  "imageDigest":
"sha256:74b2c688c700ec95a93e478cdb959737c148df3fbf5ea706abe0318726e885e6"
},
"imageScanStatus": {
  "status": "IN_PROGRESS"
}
}
```

For more information, see [Image Scanning](#) in the *Amazon ECR User Guide*.

- For API details, see [StartImageScan](#) in *AWS CLI Command Reference*.

start-lifecycle-policy-preview

The following code example shows how to use start-lifecycle-policy-preview.

AWS CLI

To create a lifecycle policy preview

The following start-lifecycle-policy-preview example creates a lifecycle policy preview defined by a JSON file for the specified repository.

```
aws ecr start-lifecycle-policy-preview \
  --repository-name "project-a/amazon-ecs-sample" \
  --lifecycle-policy-text "file://policy.json"
```

Contents of policy.json:

```
{
  "rules": [
    {
      "rulePriority": 1,
      "description": "Expire images older than 14 days",
      "selection": {
        "tagStatus": "untagged",
        "countType": "sinceImagePushed",
        "countUnit": "days",
        "countNumber": 14
      }
    },
  ],
}
```

```

        "action": {
            "type": "expire"
        }
    ]
}

```

Output:

```

{
  "registryId": "012345678910",
  "repositoryName": "project-a/amazon-ecs-sample",
  "lifecyclePolicyText": "{\n  \"rules\": [\n    {\n      \"rulePriority\": 1,\n      \"description\": \"Expire images older than 14 days\",\n      \"selection\": {\n        \"tagStatus\": \"untagged\",\n        \"countType\": \"sinceImagePushed\",\n        \"countUnit\": \"days\",\n        \"countNumber\": 14\n      },\n      \"action\": {\n        \"type\": \"expire\"\n      }\n    }\n  ]\n}\n",
  "status": "IN_PROGRESS"
}

```

- For API details, see [StartLifecyclePolicyPreview](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a repository

The following tag-resource example sets a tag with key Stage and value Integ on the hello-world repository.

```

aws ecr tag-resource \
  --resource-arn arn:aws:ecr:us-west-2:012345678910:repository/hello-world \
  --tags Key=Stage,Value=Integ

```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a repository

The following `untag-resource` example removes the tag with the key `Stage` from the `hello-world` repository.

```
aws ecr untag-resource \  
  --resource-arn arn:aws:ecr:us-west-2:012345678910:repository/hello-world \  
  --tag-keys Stage
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

upload-layer-part

The following code example shows how to use `upload-layer-part`.

AWS CLI

To upload a layer part

This following `upload-layer-part` uploads an image layer part to the `layer-test` repository.

```
aws ecr upload-layer-part \  
  --repository-name layer-test \  
  --upload-id 6cb64b8a-9378-0e33-2ab1-b780fab8a9e9 \  
  --part-first-byte 0 \  
  --part-last-byte 8323314 \  
  --layer-part-blob file:///var/lib/docker/image/overlay2/layerdb/sha256/  
ff986b10a018b48074e6d3a68b39aad8ccc002cdad912d4148c0f92b3729323e/layer.b64
```

Output:

```
{  
  "uploadId": "6cb64b8a-9378-0e33-2ab1-b780fab8a9e9",
```

```
"registryId": "012345678910",  
"lastByteReceived": 8323314,  
"repositoryName": "layer-test"  
}
```

- For API details, see [UploadLayerPart](#) in *AWS CLI Command Reference*.

Amazon ECS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon ECS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-capacity-provider

The following code example shows how to use `create-capacity-provider`.

AWS CLI

To create a capacity provider

The following `create-capacity-provider` example creates a capacity provider that uses an Auto Scaling group named `MyASG`, has managed scaling and managed termination protection enabled. This configuration is used for Amazon ECS cluster auto scaling.

```
aws ecs create-capacity-provider \
```

```
--name "MyCapacityProvider" \
--auto-scaling-group-provider "autoScalingGroupArn=arn:aws:autoscaling:us-
east-1:123456789012:autoScalingGroup:57ffcb94-11f0-4d6d-
bf60-3bac5EXAMPLE:autoScalingGroupName/
MyASG,managedScaling={status=ENABLED,targetCapacity=100},managedTerminationProtection=ENABLED"
```

Output:

```
{
  "capacityProvider": {
    "capacityProviderArn": "arn:aws:ecs:us-east-1:123456789012:capacity-provider/
MyCapacityProvider",
    "name": "MyCapacityProvider",
    "status": "ACTIVE",
    "autoScalingGroupProvider": {
      "autoScalingGroupArn": "arn:aws:autoscaling:us-
east-1:123456789012:autoScalingGroup:57ffcb94-11f0-4d6d-
bf60-3bac5EXAMPLE:autoScalingGroupName/MyASG",
      "managedScaling": {
        "status": "ENABLED",
        "targetCapacity": 100,
        "minimumScalingStepSize": 1,
        "maximumScalingStepSize": 10000,
        "instanceWarmupPeriod": 300
      },
      "managedTerminationProtection": "ENABLED"
    },
    "tags": []
  }
}
```

For more information, see [Amazon ECS cluster auto scaling](#) in the *Amazon ECS Developer Guide*.

- For API details, see [CreateCapacityProvider](#) in *AWS CLI Command Reference*.

create-cluster

The following code example shows how to use `create-cluster`.

AWS CLI

Example 1: To create a new cluster

The following `create-cluster` example creates a cluster.

```
aws ecs create-cluster \  
  --cluster-name MyCluster
```

Output:

```
{  
  "cluster": {  
    "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",  
    "clusterName": "MyCluster",  
    "status": "ACTIVE",  
    "registeredContainerInstancesCount": 0,  
    "pendingTasksCount": 0,  
    "runningTasksCount": 0,  
    "activeServicesCount": 0,  
    "statistics": [],  
    "tags": []  
  }  
}
```

For more information, see [Creating a Cluster](#) in the *Amazon ECS Developer Guide*.

Example 2: To create a new cluster using capacity providers

The following `create-cluster` example creates a cluster and associates two existing capacity providers with it. The `create-capacity-provider` command is used to create a capacity provider. Specifying a default capacity provider strategy is optional, but recommended. In this example, we create a cluster named `MyCluster` and associate the `MyCapacityProvider1` and `MyCapacityProvider2` capacity providers with it. A default capacity provider strategy is specified that spreads the tasks evenly across both capacity providers.

```
aws ecs create-cluster --cluster-name MyCluster --capacity-providers  
MyCapacityProvider1 MyCapacityProvider2 --default-capacity-  
provider-strategy capacityProvider=MyCapacityProvider1,weight=1  
capacityProvider=MyCapacityProvider2,weight=1
```

Output:

```
{  
  "cluster": {  
    "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",  
    "clusterName": "MyCluster",
```

```

      ]
    }
  ],
  "attachmentsStatus": "UPDATE_IN_PROGRESS"
}

```

For more information, see [Cluster capacity providers](#) in the *Amazon ECS Developer Guide*.

Example 3: To create a new cluster with multiple tags

The following `create-cluster` example creates a cluster with multiple tags. For more information about adding tags using shorthand syntax, see [Using Shorthand Syntax with the AWS Command Line Interface](#) in the *AWS CLI User Guide*.

```

aws ecs create-cluster \
  --cluster-name MyCluster \
  --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3

```

Output:

```

{
  "cluster": {
    "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
    "clusterName": "MyCluster",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "pendingTasksCount": 0,

```

```
    "runningTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [
      {
        "key": "key1",
        "value": "value1"
      },
      {
        "key": "key2",
        "value": "value2"
      },
      {
        "key": "key3",
        "value": "value3"
      }
    ]
  }
}
```

For more information, see [Creating a Cluster](#) in the *Amazon ECS Developer Guide*.

- For API details, see [CreateCluster](#) in *AWS CLI Command Reference*.

create-service

The following code example shows how to use `create-service`.

AWS CLI

Example 1: To create a service with a Fargate task

The following `create-service` example shows how to create a service using a Fargate task.

```
aws ecs create-service \
  --cluster MyCluster \
  --service-name MyService \
  --task-definition sample-fargate:1 \
  --desired-count 2 \
  --launch-type FARGATE \
  --platform-version LATEST \
  --network-configuration
  "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321],assignPublicIp
  \
```

```
--tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

Output:

```
{
  "service": {
    "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
    "serviceName": "MyService",

```

Example 2: To create a service using the EC2 launch type

The following `create-service` example shows how to create a service called `ecs-simple-service` with a task that uses the EC2 launch type. The service uses the `sleep360` task definition and it maintains 1 instantiation of the task.

```
aws ecs create-service \  
  --cluster MyCluster \  
  --service-name ecs-simple-service \  
  --task-definition sleep360:2 \  
  --desired-count 1
```

Output:

```
{  
  "service": {  
    "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/ecs-  
simple-service",  
    "serviceName": "ecs-simple-service",

}
}

```

Example 3: To create a service that uses an external deployment controller

The following `create-service` example creates a service that uses an external deployment controller.

```

aws ecs create-service \
  --cluster MyCluster \
  --service-name MyService \
  --deployment-controller type=EXTERNAL \
  --desired-count 1

```

Output:

```

{
  "service": {
    "serviceArn": "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
    "serviceName": "MyService",

    "loadBalancers": [],
    "serviceRegistries": [],
    "status": "ACTIVE",
    "desiredCount": 1,
    "runningCount": 0,
    "pendingCount": 0,
    "launchType": "EC2",
    "deploymentConfiguration": {
      "maximumPercent": 200,
      "minimumHealthyPercent": 100
    }
  }
}

```

```

    },
    "taskSets": [],
    "deployments": [],
    "roleArn": "arn:aws:iam::123456789012:role/aws-service-role/
ecs.amazonaws.com/AWSServiceRoleForECS",
    "events": [],
    "createdAt": 1557128207.101,
    "placementConstraints": [],
    "placementStrategy": [],
    "schedulingStrategy": "REPLICA",
    "deploymentController": {
      "type": "EXTERNAL"
    },
    "enableECSManagedTags": false,
    "propagateTags": "NONE"
  }
}

```

Example 4: To create a new service behind a load balancer

The following `create-service` example shows how to create a service that is behind a load balancer. You must have a load balancer configured in the same Region as your container instance. This example uses the `--cli-input-json` option and a JSON input file called `ecs-simple-service-elb.json` with the following content:

```

{
  "serviceName": "ecs-simple-service-elb",
  "taskDefinition": "ecs-demo",
  "loadBalancers": [
    {
      "loadBalancerName": "EC2Contai-EcsElast-123456789012",
      "containerName": "simple-demo",
      "containerPort": 80
    }
  ],
  "desiredCount": 10,
  "role": "ecsServiceRole"
}

```

Command:

```
aws ecs create-service \
```

```
--cluster MyCluster \  
--service-name ecs-simple-service-elb \  
--cli-input-json file://ecs-simple-service-elb.json
```

Output:

```
{  
  "service": {  
    "status": "ACTIVE",

create-task-set

The following code example shows how to use create-task-set.

AWS CLI

To create a task set

The following create-task-set example creates a task set in a service that uses an external deployment controller.

```
aws ecs create-task-set \  
  --cluster MyCluster \  
  --service MyService \  
  --task-definition MyTaskDefinition:2 \  
  --network-configuration  
  "awsvpcConfiguration={subnets=[subnet-12344321],securityGroups=[sg-12344321]}"
```

Output:

```
{  
  "taskSet": {  
    "id": "ecs-svc/1234567890123456789",  
    "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/  
MyService/ecs-svc/1234567890123456789",  
    "status": "ACTIVE",  
    "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/  
MyTaskDefinition:2",  
    "computedDesiredCount": 0,  
    "pendingCount": 0,  
    "runningCount": 0,  
    "createdAt": 1557128360.711,  
    "updatedAt": 1557128360.711,  
    "launchType": "EC2",  
    "networkConfiguration": {  
      "awsvpcConfiguration": {  
        "subnets": [  
          "subnet-12344321"  
        ],  
      },  
    },  
  },  
}
```

```

        "securityGroups": [
            "sg-12344321"
        ],
        "assignPublicIp": "DISABLED"
    }
},
"loadBalancers": [],
"serviceRegistries": [],
"scale": {
    "value": 0.0,
    "unit": "PERCENT"
},
"stabilityStatus": "STABILIZING",

}
}

```

- For API details, see [CreateTaskSet](#) in *AWS CLI Command Reference*.

delete-account-setting

The following code example shows how to use `delete-account-setting`.

AWS CLI

To delete the account settings for a specific IAM user or IAM role

The following example `delete-account-setting` deletes the account settings for the specific IAM user or IAM role.

```

aws ecs delete-account-setting \
  --name serviceLongArnFormat \
  --principal-arn arn:aws:iam::123456789012:user/MyUser

```

Output:

```

{
  "setting": {
    "name": "serviceLongArnFormat",
    "value": "enabled",
    "principalArn": "arn:aws:iam::123456789012:user/MyUser"
  }
}

```

```
}
```

For more information, see [Amazon Resource Names \(ARNs\) and IDs](#) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteAccountSetting](#) in *AWS CLI Command Reference*.

delete-attributes

The following code example shows how to use `delete-attributes`.

AWS CLI

To delete one or more custom attributes from an Amazon ECS resource

The following `delete-attributes` deletes an attribute with the name `stack` from a container instance.

```
aws ecs delete-attributes \  
  --attributes name=stack,targetId=arn:aws:ecs:us-west-2:130757420319:container-  
instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```
{  
  "attributes": [  
    {  
      "name": "stack",  
      "targetId": "arn:aws:ecs:us-west-2:130757420319:container-  
instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",  
      "value": "production"  
    }  
  ]  
}
```

- For API details, see [DeleteAttributes](#) in *AWS CLI Command Reference*.

delete-capacity-provider

The following code example shows how to use `delete-capacity-provider`.

AWS CLI

Example 1: To delete a capacity provider using the Amazon Resource Name (ARN)

The following `delete-capacity-provider` example deletes a capacity provider by specifying the Amazon Resource Name (ARN) of the capacity provider. The ARN as well as the status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```
aws ecs delete-capacity-provider \  
  --capacity-provider arn:aws:ecs:us-west-2:123456789012:capacity-provider/  
  ExampleCapacityProvider
```

Output:

```
{  
  "capacityProvider": {  
    "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-  
provider/ExampleCapacityProvider",  
    "name": "ExampleCapacityProvider",  
    "status": "ACTIVE",  
    "autoScalingGroupProvider": {  
      "autoScalingGroupArn": "arn:aws:autoscaling:us-  
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-  
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",  
      "managedScaling": {  
        "status": "ENABLED",  
        "targetCapacity": 100,  
        "minimumScalingStepSize": 1,  
        "maximumScalingStepSize": 10000  
      },  
      "managedTerminationProtection": "DISABLED"  
    },  
    "updateStatus": "DELETE_IN_PROGRESS",  
    "tags": []  
  }  
}
```

For more information, see [Cluster capacity providers](#) in the *Amazon ECS Developer Guide*.

Example 2: To delete a capacity provider using the name

The following `delete-capacity-provider` example deletes a capacity provider by specifying the short name of the capacity provider. The short name as well as the status of the capacity provider deletion can be retrieved using the `describe-capacity-providers` command.

```
aws ecs delete-capacity-provider \  
  --capacity-provider ExampleCapacityProvider
```

Output:

```
{  
  "capacityProvider": {  
    "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-  
provider/ExampleCapacityProvider",  
    "name": "ExampleCapacityProvider",  
    "status": "ACTIVE",  
    "autoScalingGroupProvider": {  
      "autoScalingGroupArn": "arn:aws:autoscaling:us-  
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-  
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",  
      "managedScaling": {  
        "status": "ENABLED",  
        "targetCapacity": 100,  
        "minimumScalingStepSize": 1,  
        "maximumScalingStepSize": 10000  
      },  
      "managedTerminationProtection": "DISABLED"  
    },  
    "updateStatus": "DELETE_IN_PROGRESS",  
    "tags": []  
  }  
}
```

For more information, see [Cluster capacity providers](#) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteCapacityProvider](#) in *AWS CLI Command Reference*.

delete-cluster

The following code example shows how to use `delete-cluster`.

AWS CLI

To delete an empty cluster

The following `delete-cluster` example deletes the specified empty cluster.

```
aws ecs delete-cluster --cluster MyCluster
```

Output:

```
{
  "cluster": {
    "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
    "status": "INACTIVE",
    "clusterName": "MyCluster",
    "registeredContainerInstancesCount": 0,
    "pendingTasksCount": 0,
    "runningTasksCount": 0,
    "activeServicesCount": 0
    "statistics": [],
    "tags": []
  }
}
```

For more information, see [Deleting a Cluster](#) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteCluster](#) in *AWS CLI Command Reference*.

delete-service

The following code example shows how to use `delete-service`.

AWS CLI

To delete a service

The following `ecs delete-service` example deletes the specified service from a cluster. You can include the `--force` parameter to delete a service even if it has not been scaled to zero tasks.

```
aws ecs delete-service --cluster MyCluster --service MyService1 --force
```

For more information, see [Deleting a Service](#) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteService](#) in *AWS CLI Command Reference*.

delete-task-definitions

The following code example shows how to use `delete-task-definitions`.

AWS CLI

To delete a task definition

The following `delete-task-definitions` example deletes an INACTIVE task definition.

```
aws ecs delete-task-definitions \  
  --task-definition curltest:1
```

Output:

```
{  
  "taskDefinitions": [  
    {  
      "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/

For more information, see [Amazon ECS Task Definitions](#) in the *Amazon ECS Developer Guide*.

- For API details, see [DeleteTaskDefinitions](#) in *AWS CLI Command Reference*.

delete-task-set

The following code example shows how to use `delete-task-set`.

AWS CLI

To delete a task set

The following `delete-task-set` example shows how to delete a task set. You can include the `--force` parameter to delete a task set even if it has not been scaled to zero.

```
aws ecs delete-task-set \  
  --cluster MyCluster \  
  --service MyService \  
  --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-  
svc/1234567890123456789 \  
  --force
```

Output:

```
{  
  "taskSet": {  
    "id": "ecs-svc/1234567890123456789",  
    "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/  
MyService/ecs-svc/1234567890123456789",  
    "status": "DRAINING",

- For API details, see [DeleteTaskSet](#) in *AWS CLI Command Reference*.

deregister-container-instance

The following code example shows how to use `deregister-container-instance`.

AWS CLI

To deregister a container instance from a cluster

The following `deregister-container-instance` example deregisters a container instance from the specified cluster. If there are still tasks running in the container instance, you must either stop those tasks before deregistering, or use the `--force` option.

```

aws ecs deregister-container-instance \
  --cluster arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \
  --container-instance arn:aws:ecs:us-west-2:123456789012:container-instance/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
  --force

```

Output:

```

{
  "containerInstance": {
    "remainingResources": [
      {
        "integerValue": 1024,
        "doubleValue": 0.0,

For more information, see [Deregister a Container Instance](#) in the *ECS Developer Guide*.

- For API details, see [DeregisterContainerInstance](#) in *AWS CLI Command Reference*.

deregister-task-definition

The following code example shows how to use `deregister-task-definition`.

AWS CLI

To deregister a task definition

The following `deregister-task-definition` example deregisters the first revision of the `curler` task definition in your default region.

```
aws ecs deregister-task-definition --task-definition curler:1
```

Note that in the resulting output, the task definition status shows `INACTIVE`:

```
{
  "taskDefinition": {
    "status": "INACTIVE",
    "family": "curler",
    "volumes": [],
    "taskDefinitionArn": "arn:aws:ecs:us-west-2:123456789012:task-definition/
curler:1",
```

```
    "containerDefinitions": [
      {
        "environment": [],
        "name": "curler",
        "mountPoints": [],
        "image": "curl:latest",
        "cpu": 100,
        "portMappings": [],
        "entryPoint": [],
        "memory": 256,
        "command": [
          "curl -v http://example.com/"
        ],
        "essential": true,
        "volumesFrom": []
      }
    ],
    "revision": 1
  }
}
```

For more information, see [Amazon ECS Task Definitions](#) in the *Amazon ECS Developer Guide*.

- For API details, see [DeregisterTaskDefinition](#) in *AWS CLI Command Reference*.

describe-capacity-providers

The following code example shows how to use describe-capacity-providers.

AWS CLI

Example 1: To describe all capacity providers

The following describe-capacity-providers example retrieves details about all capacity providers.

```
aws ecs describe-capacity-providers
```

Output:

```
{
  "capacityProviders": [
```

```

    {
      "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/MyCapacityProvider",
      "name": "MyCapacityProvider",
      "status": "ACTIVE",
      "autoScalingGroupProvider": {
        "autoScalingGroupArn": "arn:aws:autoscaling:us-
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",
        "managedScaling": {
          "status": "ENABLED",
          "targetCapacity": 100,
          "minimumScalingStepSize": 1,
          "maximumScalingStepSize": 1000
        },
        "managedTerminationProtection": "ENABLED"
      },
      "tags": []
    },
    {
      "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/FARGATE",
      "name": "FARGATE",
      "status": "ACTIVE",
      "tags": []
    },
    {
      "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-
provider/FARGATE_SPOT",
      "name": "FARGATE_SPOT",
      "status": "ACTIVE",
      "tags": []
    }
  ]
}

```

For more information, see [Cluster capacity providers](#) in the *Amazon ECS Developer Guide*.

Example 2: To describe a specific capacity providers

The following `describe-capacity-providers` example retrieves details about a specific capacity provider. Using the `--include TAGS` parameter will add the tags associated with the capacity provider to the output.

```
aws ecs describe-capacity-providers \  
  --capacity-providers MyCapacityProvider \  
  --include TAGS
```

Output:

```
{  
  "capacityProviders": [  
    {  
      "capacityProviderArn": "arn:aws:ecs:us-west-2:123456789012:capacity-  
provider/MyCapacityProvider",  
      "name": "MyCapacityProvider",  
      "status": "ACTIVE",  
      "autoScalingGroupProvider": {  
        "autoScalingGroupArn": "arn:aws:autoscaling:us-  
west-2:123456789012:autoScalingGroup:a1b2c3d4-5678-90ab-cdef-  
EXAMPLE11111:autoScalingGroupName/MyAutoScalingGroup",  
        "managedScaling": {  
          "status": "ENABLED",  
          "targetCapacity": 100,  
          "minimumScalingStepSize": 1,  
          "maximumScalingStepSize": 1000  
        },  
        "managedTerminationProtection": "ENABLED"  
      },  
      "tags": [  
        {  
          "key": "environment",  
          "value": "production"  
        }  
      ]  
    }  
  ]  
}
```

For more information, see [Cluster capacity providers](#) in the *Amazon ECS Developer Guide*.

- For API details, see [DescribeCapacityProviders](#) in *AWS CLI Command Reference*.

describe-clusters

The following code example shows how to use `describe-clusters`.

AWS CLI

Example 1: To describe a cluster

The following `describe-clusters` example retrieves details about the specified cluster.

```
aws ecs describe-clusters \  
  --cluster default
```

Output:

```
{  
  "clusters": [  
    {  
      "status": "ACTIVE",  
      "clusterName": "default",  
      "registeredContainerInstancesCount": 0,  
      "pendingTasksCount": 0,  
      "runningTasksCount": 0,  
      "activeServicesCount": 1,  
      "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/default"  
    }  
  ],  
  "failures": []  
}
```

For more information, see [Amazon ECS Clusters](#) in the *Amazon ECS Developer Guide*.

Example 2: To describe a cluster with the attachment option

The following `describe-clusters` example specifies the `ATTACHMENTS` option. It retrieves details about the specified cluster and a list of resources attached to the cluster in the form of attachments. When using a capacity provider with a cluster, the resources, either `AutoScaling` plans or scaling policies, will be represented as `asp` or `as_policy` `ATTACHMENTS`.

```
aws ecs describe-clusters \  
  --include ATTACHMENTS \  
  --clusters sampleCluster
```

Output:

```
{
```

```
"clusters": [
  {
    "clusterArn": "arn:aws:ecs:af-south-1:123456789222:cluster/
sampleCluster",
    "clusterName": "sampleCluster",
    "status": "ACTIVE",

    "runningTasksCount": 0,
    "pendingTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [],
    "settings": [],
    "capacityProviders": [
      "sampleCapacityProvider"
    ],
    "defaultCapacityProviderStrategy": [],
    "attachments": [
      {
        "id": "a1b2c3d4-5678-901b-cdef-EXAMPLE22222",
        "type": "as_policy",
        "status": "CREATED",
        "details": [
          {
            "name": "capacityProviderName",
            "value": "sampleCapacityProvider"
          },
          {
            "name": "scalingPolicyName",
            "value": "ECSManagedAutoScalingPolicy-3048e262-
fe39-4eaf-826d-6f975d303188"
          }
        ]
      }
    ],
    "attachmentsStatus": "UPDATE_COMPLETE"
  }
],
"failures": []
}
```

For more information, see [Amazon ECS Clusters](#) in the *Amazon ECS Developer Guide*.

- For API details, see [DescribeClusters](#) in *AWS CLI Command Reference*.

describe-container-instances

The following code example shows how to use `describe-container-instances`.

AWS CLI

To describe container instance

The following `describe-container-instances` example retrieves details for a container instance in the update cluster, using the container instance UUID as an identifier.

```
aws ecs describe-container-instances \
  --cluster update \
  --container-instances a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
  "failures": [],
  "containerInstances": [
    {
      "status": "ACTIVE",
      "registeredResources": [
        {

describe-services

The following code example shows how to use `describe-services`.

AWS CLI

To describe a service

The following `describe-services` example retrieves details for the `my-http-service` service in the default cluster.

```
aws ecs describe-services --services my-http-service
```

Output:

```

{
  "services": [
    {
      "status": "ACTIVE",
      "taskDefinition": "arn:aws:ecs:us-west-2:123456789012:task-definition/

describe-task-sets

The following code example shows how to use `describe-task-sets`.

AWS CLI

To describe a task set

The following `describe-task-sets` example describes a task set in a service that uses an external deployer.

```
aws ecs describe-task-sets \  
  --cluster MyCluster \  
  --service MyService \  
  --task-sets arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-  
svc/1234567890123456789
```

Output:

```
{  
  "taskSets": [  
    {

- For API details, see [DescribeTaskSets](#) in *AWS CLI Command Reference*.

describe-tasks

The following code example shows how to use describe-tasks.

AWS CLI

Example 1: To describe a single task tasks

The following describe-tasks example retrieves the details of a task in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full ARN of the task.

```

aws ecs describe-tasks \
  --cluster MyCluster \
  --tasks arn:aws:ecs:us-east-1:123456789012:task/
MyCluster/4d590253bb114126b7afa7b58EXAMPLE

```

Output:

```

{
  "tasks": [
    {
      "attachments": [],
      "attributes": [
        {
          "name": "ecs.cpu-architecture",
          "value": "x86_64"
        }
      ],
      "availabilityZone": "us-east-1b",
      "clusterArn": "arn:aws:ecs:us-east-1:123456789012:cluster/MyCluster",
      "connectivity": "CONNECTED",
      "connectivityAt": "2021-08-11T12:21:26.681000-04:00",

```

```

For more information, see [Amazon ECS Task Definitions](#) in the *Amazon ECS Developer Guide*.

Example 2: To describe multiple tasks

The following `describe-tasks` example retrieves the details of multiple tasks in a cluster. You can specify the task by using either the ID or full ARN of the task. This example uses the full IDs of the tasks.

```

aws ecs describe-tasks \
  --cluster MyCluster \
  --tasks "74de0355a10a4f979ac495c14EXAMPLE" "d789e94343414c25b9f6bd59eEXAMPLE"

```

Output:

```

{
  "tasks": [
    {
      "attachments": [

execute-command

The following code example shows how to use `execute-command`.

AWS CLI

To run an interactive `/bin/sh` command

The following `execute-command` example runs an interactive `/bin/sh` command against a container named `MyContainer` for a task with an id of `arn:aws:ecs:us-east-1:123456789012:task/MyCluster/d789e94343414c25b9f6bd59eEXAMPLE`.

```
aws ecs execute-command \  
  --cluster MyCluster \  
  --task arn:aws:ecs:us-east-1:123456789012:task/MyCluster/  
d789e94343414c25b9f6bd59eEXAMPLE \  
  --container MyContainer \  
  --interactive \  
  --command "/bin/sh"
```

This command produces no output.

For more information, see [Using Amazon ECS Exec for debugging](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ExecuteCommand](#) in *AWS CLI Command Reference*.

list-account-settings

The following code example shows how to use `list-account-settings`.

AWS CLI

Example 1: To view the account settings for an account

The following `list-account-settings` example displays the effective account settings for an account.

```
aws ecs list-account-settings --effective-settings
```

Output:

```
{
  "settings": [
    {
      "name": "containerInstanceLongArnFormat",
      "value": "enabled",
      "principalArn": "arn:aws:iam::123456789012:root"
    },
    {
      "name": "serviceLongArnFormat",
      "value": "enabled",
      "principalArn": "arn:aws:iam::123456789012:root"
    },
    {
      "name": "taskLongArnFormat",
      "value": "enabled",
      "principalArn": "arn:aws:iam::123456789012:root"
    }
  ]
}
```

Example 2: To view the account settings for a specific IAM user or IAM role

The following `list-account-settings` example displays the account settings for the specified IAM user or IAM role.

```
aws ecs list-account-settings --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{
  "settings": [
```

```
{
  "name": "serviceLongArnFormat",
  "value": "enabled",
  "principalArn": "arn:aws:iam::123456789012:user/MyUser"
}
]
```

For more information, see [Amazon Resource Names \(ARNs\) and IDs](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListAccountSettings](#) in *AWS CLI Command Reference*.

list-attributes

The following code example shows how to use `list-attributes`.

AWS CLI

To list the container instances that contain a specific attribute

The following example lists the attributes for container instances that have the `stack=production` attribute in the default cluster.

```
aws ecs list-attributes \
  --target-type container-instance \
  --attribute-name stack \
  --attribute-value production \
  --cluster default
```

Output:

```
{
  "attributes": [
    {
      "name": "stack",
      "targetId": "arn:aws:ecs:us-west-2:130757420319:container-
instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
      "value": "production"
    }
  ]
}
```

For more information, see [Amazon ECS Container Agent Configuration](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListAttributes](#) in *AWS CLI Command Reference*.

list-clusters

The following code example shows how to use `list-clusters`.

AWS CLI

To list your available clusters

The following `list-clusters` example lists all of the available clusters.

```
aws ecs list-clusters
```

Output:

```
{
  "clusterArns": [
    "arn:aws:ecs:us-west-2:123456789012:cluster/MyECSCluster1",
    "arn:aws:ecs:us-west-2:123456789012:cluster/AnotherECSCluster"
  ]
}
```

For more information, see [Amazon ECS Clusters](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListClusters](#) in *AWS CLI Command Reference*.

list-container-instances

The following code example shows how to use `list-container-instances`.

AWS CLI

To list the container instances in a cluster

The following `list-container-instances` example lists all of the available container instances in a cluster.

```
aws ecs list-container-instances --cluster MyCluster
```

Output:

```
{
  "containerInstanceArns": [
    "arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "arn:aws:ecs:us-west-2:123456789012:container-instance/MyCluster/
a1b2c3d4-5678-90ab-cdef-22222EXAMPLE"
  ]
}
```

For more information, see [Amazon ECS Container Instances](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListContainerInstances](#) in *AWS CLI Command Reference*.

list-services-by-namespace

The following code example shows how to use `list-services-by-namespace`.

AWS CLI**To list the services in a namespace**

The following `list-services-by-namespace` example lists all of the services configured for the specified namespace in your default Region.

```
aws ecs list-services-by-namespace \
  --namespace service-connect
```

Output:

```
{
  "serviceArns": [
    "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService",
    "arn:aws:ecs:us-west-2:123456789012:service/tutorial/service-connect-nginx-
service"
  ]
}
```

For more information, see [Service Connect](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListServicesByNamespace](#) in *AWS CLI Command Reference*.

list-services

The following code example shows how to use `list-services`.

AWS CLI

To list the services in a cluster

The following `list-services` example shows how to list the services running in a cluster.

```
aws ecs list-services --cluster MyCluster
```

Output:

```
{
  "serviceArns": [
    "arn:aws:ecs:us-west-2:123456789012:service/MyCluster/MyService"
  ]
}
```

For more information, see [Services](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListServices](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for a specific cluster.

```
aws ecs list-tags-for-resource \
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster
```

Output:

```
{
  "tags": [
    {
```

```
    "key": "key1",
    "value": "value1"
  },
  {
    "key": "key2",
    "value": "value2"
  },
  {
    "key": "key3",
    "value": "value3"
  }
]
}
```

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-task-definition-families

The following code example shows how to use `list-task-definition-families`.

AWS CLI

Example 1: To list the registered task definition families

The following `list-task-definition-families` example lists all of the registered task definition families.

```
aws ecs list-task-definition-families
```

Output:

```
{
  "families": [
    "node-js-app",
    "web-timer",
    "hpcc",
    "hpcc-c4-8xlarge"
  ]
}
```

Example 2: To filter the registered task definition families

The following `list-task-definition-families` example lists the task definition revisions that start with "hpcc".

```
aws ecs list-task-definition-families --family-prefix hpcc
```

Output:

```
{
  "families": [
    "hpcc",
    "hpcc-c4-8xlarge"
  ]
}
```

For more information, see [Task Definition Parameters](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListTaskDefinitionFamilies](#) in *AWS CLI Command Reference*.

list-task-definitions

The following code example shows how to use `list-task-definitions`.

AWS CLI

Example 1: To list the registered task definitions

The following `list-task-definitions` example lists all of the registered task definitions.

```
aws ecs list-task-definitions
```

Output:

```
{
  "taskDefinitionArns": [
    "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep300:2",
    "arn:aws:ecs:us-west-2:123456789012:task-definition/sleep360:1",
    "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:3",
    "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:4",
    "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:5",
    "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:6"
  ]
}
```

```
}
```

Example 2: To list the registered task definitions in a family

The following `list-task-definitions` example lists the task definition revisions of a specified family.

```
aws ecs list-task-definitions --family-prefix wordpress
```

Output:

```
{
  "taskDefinitionArns": [
    "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:3",
    "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:4",
    "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:5",
    "arn:aws:ecs:us-west-2:123456789012:task-definition/wordpress:6"
  ]
}
```

For more information, see [Amazon ECS Task Definitions](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListTaskDefinitions](#) in *AWS CLI Command Reference*.

list-tasks

The following code example shows how to use `list-tasks`.

AWS CLI

Example 1: To list the tasks in a cluster

The following `list-tasks` example lists all of the tasks in a cluster.

```
aws ecs list-tasks --cluster default
```

Output:

```
{
  "taskArns": [
```

```
    "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-
cdef-11111EXAMPLE",
    "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-
cdef-22222EXAMPLE"
  ]
}
```

Example 2: To list the tasks on a particular container instance

The following `list-tasks` example lists the tasks on a container instance, using the container instance UUID as a filter.

```
aws ecs list-tasks --cluster default --container-instance a1b2c3d4-5678-90ab-
cdef-33333EXAMPLE
```

Output:

```
{
  "taskArns": [
    "arn:aws:ecs:us-west-2:123456789012:task/a1b2c3d4-5678-90ab-
cdef-44444EXAMPLE"
  ]
}
```

For more information, see [Amazon ECS Task Definitions](#) in the *Amazon ECS Developer Guide*.

- For API details, see [ListTasks](#) in *AWS CLI Command Reference*.

put-account-setting-default

The following code example shows how to use `put-account-setting-default`.

AWS CLI

To modify the default account settings

The following `put-account-setting-default` example modifies the default account setting for all IAM users or roles on your account. These changes apply to the entire AWS account unless an IAM user or role explicitly overrides these settings for themselves.

```
aws ecs put-account-setting-default --name serviceLongArnFormat --value enabled
```

Output:

```
{
  "setting": {
    "name": "serviceLongArnFormat",
    "value": "enabled",
    "principalArn": "arn:aws:iam::123456789012:root"
  }
}
```

For more information, see [Amazon Resource Names \(ARNs\) and IDs](#) in the *Amazon ECS Developer Guide*.

- For API details, see [PutAccountSettingDefault](#) in *AWS CLI Command Reference*.

put-account-setting

The following code example shows how to use `put-account-setting`.

AWS CLI**To modify the account setting for your IAM user account**

The following `put-account-setting` example enables the `serviceLongArnFormat` account setting for your IAM user account.

```
aws ecs put-account-setting --name serviceLongArnFormat --value enabled
```

Output:

```
{
  "setting": {
    "name": "serviceLongArnFormat",
    "value": "enabled",
    "principalArn": "arn:aws:iam::130757420319:user/your_username"
  }
}
```

For more information, see [Modifying Account Settings](#) in the *Amazon ECS Developer Guide*.

- For API details, see [PutAccountSetting](#) in *AWS CLI Command Reference*.

put-account-settings

The following code example shows how to use `put-account-settings`.

AWS CLI

To modify the account settings for an IAM user or IAM role

The following `put-account-setting` example modifies the account settings for the specified IAM user or IAM role.

```
aws ecs put-account-setting \  
  --name serviceLongArnFormat \  
  --value enabled \  
  --principal-arn arn:aws:iam::123456789012:user/MyUser
```

Output:

```
{  
  "setting": {  
    "name": "serviceLongArnFormat",  
    "value": "enabled",  
    "principalArn": "arn:aws:iam::123456789012:user/MyUser"  
  }  
}
```

- For API details, see [PutAccountSettings](#) in *AWS CLI Command Reference*.

put-attributes

The following code example shows how to use `put-attributes`.

AWS CLI

To create an attribute and associate it with an Amazon ECS resource

The following `put-attributes` applies an attribute with the name `stack` and the value `production` to a container instance.

```
aws ecs put-attributes \  
  --attributes name=stack,value=production,targetId=arn:aws:ecs:us-  
west-2:130757420319:container-instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34
```

Output:

```
{
  "attributes": [
    {
      "name": "stack",
      "targetId": "arn:aws:ecs:us-west-2:130757420319:container-
instance/1c3be8ed-df30-47b4-8f1e-6e68ebd01f34",
      "value": "production"
    }
  ]
}
```

- For API details, see [PutAttributes](#) in *AWS CLI Command Reference*.

put-cluster-capacity-providers

The following code example shows how to use `put-cluster-capacity-providers`.

AWS CLI**Example 1: To add an existing capacity provider to a cluster**

The following `put-cluster-capacity-providers` example adds an existing capacity provider to a cluster. The `create-capacity-provider` command is used to create a capacity provider. The `describe-clusters` command is used to describe the current capacity providers and the default capacity provider strategy associated with a cluster. When adding a new capacity provider to a cluster, you must specify all existing capacity providers in addition to the new capacity provider you want to associate with the cluster. You must also specify the default capacity provider strategy to associate with the cluster. In this example, the `MyCluster` cluster has the `MyCapacityProvider1` capacity provider associated with it and you want to add the `MyCapacityProvider2` capacity provider and include it in the default capacity provider strategy so tasks are spread evenly across both capacity providers.

```
aws ecs put-cluster-capacity-providers \
  --cluster MyCluster \
  --capacity-providers MyCapacityProvider1 MyCapacityProvider2 \
  --default-capacity-provider-strategy
capacityProvider=MyCapacityProvider1,weight=1
capacityProvider=MyCapacityProvider2,weight=1
```

Output:

```
{
  "cluster": {
    "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
    "clusterName": "MyCluster",
    "status": "ACTIVE",
    "registeredContainerInstancesCount": 0,
    "runningTasksCount": 0,
    "pendingTasksCount": 0,
    "activeServicesCount": 0,
    "statistics": [],
    "tags": [],
    "settings": [
      {
        "name": "containerInsights",
        "value": "enabled"
      }
    ],
    "capacityProviders": [
      "MyCapacityProvider1",
      "MyCapacityProvider2"
    ],
    "defaultCapacityProviderStrategy": [
      {
        "capacityProvider": "MyCapacityProvider1",
        "weight": 1,
        "base": 0
      },
      {
        "capacityProvider": "MyCapacityProvider2",
        "weight": 1,
        "base": 0
      }
    ],
    "attachments": [
      {
        "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
        "type": "as_policy",
        "status": "ACTIVE",
        "details": [
          {
            "name": "capacityProviderName",
            "value": "MyCapacityProvider1"
          }
        ]
      }
    ]
  }
}
```

```

        },
        {
            "name": "scalingPolicyName",
            "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"
        }
    ]
},
{
    "id": "ae592060-2382-4663-9476-b015c685593c",
    "type": "as_policy",
    "status": "ACTIVE",
    "details": [
        {
            "name": "capacityProviderName",
            "value": "MyCapacityProvider2"
        },
        {
            "name": "scalingPolicyName",
            "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
        }
    ]
}
],
"attachmentsStatus": "UPDATE_IN_PROGRESS"
}
}

```

For more information, see [Cluster capacity providers](#) in the *Amazon ECS Developer Guide*.

Example 2: To remove a capacity provider from a cluster

The following `put-cluster-capacity-providers` example removes a capacity provider from a cluster. The `describe-clusters` command is used to describe the current capacity providers associated with a cluster. When removing a capacity provider from a cluster, you must specify the capacity providers you want to remain associated with the cluster as well as the default capacity provider strategy to associate with the cluster. In this example, the cluster has the `MyCapacityProvider1` and `MyCapacityProvider2` capacity providers associated with it and you want to remove the `MyCapacityProvider2` capacity provider, so you specify only `MyCapacityProvider1` in the command along with the updated default capacity provider strategy.

```
aws ecs put-cluster-capacity-providers \  
  --cluster MyCluster \  
  --capacity-providers MyCapacityProvider1 \  
  --default-capacity-provider-strategy  
capacityProvider=MyCapacityProvider1,weight=1,base=0
```

Output:

```
{  
  "cluster": {  
    "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",  
    "clusterName": "MyCluster",  
    "status": "ACTIVE",  
    "registeredContainerInstancesCount": 0,  
    "runningTasksCount": 0,  
    "pendingTasksCount": 0,  
    "activeServicesCount": 0,  
    "statistics": [],  
    "tags": [],  
    "settings": [  
      {  
        "name": "containerInsights",  
        "value": "enabled"  
      }  
    ],  
    "capacityProviders": [  
      "MyCapacityProvider1"  
    ],  
    "defaultCapacityProviderStrategy": [  
      "capacityProvider": "MyCapacityProvider1",  
      "weight": 1,  
      "base": 0  
    ],  
    "attachments": [  
      {  
        "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",  
        "type": "as_policy",  
        "status": "ACTIVE",  
        "details": [  
          {  
            "name": "capacityProviderName",  
            "value": "MyCapacityProvider1"  
          }  
        ],  
      }  
    ],  
  }  
}
```

```

        {
            "name": "scalingPolicyName",
            "value": "ECManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"
        }
    ]
},
{
    "id": "ae592060-2382-4663-9476-b015c685593c",
    "type": "as_policy",
    "status": "DELETING",
    "details": [
        {
            "name": "capacityProviderName",
            "value": "MyCapacityProvider2"
        },
        {
            "name": "scalingPolicyName",
            "value": "ECManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
        }
    ]
}
],
"attachmentsStatus": "UPDATE_IN_PROGRESS"
}
}

```

For more information, see [Cluster capacity providers](#) in the *Amazon ECS Developer Guide*.

Example 3: To remove all capacity providers from a cluster

The following `put-cluster-capacity-providers` example removes all existing capacity providers from the cluster.

```

aws ecs put-cluster-capacity-providers \
  --cluster MyCluster \
  --capacity-providers [] \
  --default-capacity-provider-strategy []

```

Output:

```
{
```

```
"cluster": {
  "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",
  "clusterName": "MyCluster",
  "status": "ACTIVE",
  "registeredContainerInstancesCount": 0,
  "runningTasksCount": 0,
  "pendingTasksCount": 0,
  "activeServicesCount": 0,
  "statistics": [],
  "tags": [],
  "settings": [
    {
      "name": "containerInsights",
      "value": "enabled"
    }
  ],
  "capacityProviders": [],
  "defaultCapacityProviderStrategy": [],
  "attachments": [
    {
      "id": "0fb0c8f4-6edd-4de1-9b09-17e470ee1918",
      "type": "as_policy",
      "status": "DELETING",
      "details": [
        {
          "name": "capacityProviderName",
          "value": "MyCapacityProvider1"
        },
        {
          "name": "scalingPolicyName",
          "value": "ECManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE11111"
        }
      ]
    },
    {
      "id": "ae592060-2382-4663-9476-b015c685593c",
      "type": "as_policy",
      "status": "DELETING",
      "details": [
        {
          "name": "capacityProviderName",
          "value": "MyCapacityProvider2"
        }
      ]
    }
  ]
}
```

```

        {
            "name": "scalingPolicyName",
            "value": "ECSManagedAutoScalingPolicy-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222"
        }
    ]
}
],
"attachmentsStatus": "UPDATE_IN_PROGRESS"
}
}

```

For more information, see [Cluster capacity providers](#) in the *Amazon ECS Developer Guide*.

- For API details, see [PutClusterCapacityProviders](#) in *AWS CLI Command Reference*.

register-task-definition

The following code example shows how to use `register-task-definition`.

AWS CLI

Example 1: To register a task definition with a JSON file

The following `register-task-definition` example registers a task definition to the specified family. The container definitions are saved in JSON format at the specified file location.

```
aws ecs register-task-definition \
  --cli-input-json file://<path_to_json_file>/sleep360.json
```

Contents of `sleep360.json`:

```

{
  "containerDefinitions": [
    {
      "name": "sleep",
      "image": "busybox",
      "cpu": 10,
      "command": [
        "sleep",
        "360"
      ],
    }
  ],
}

```

```
        "memory": 10,
        "essential": true
    }
],
"family": "sleep360"
}
```

Output:

```
{
  "taskDefinition": {
    "status": "ACTIVE",
    "family": "sleep360",
    "placementConstraints": [],
    "compatibilities": [
      "EXTERNAL",
      "EC2"
    ],
    "volumes": [],
    "taskDefinitionArn": "arn:aws:ecs:us-east-1:123456789012:task-definition/sleep360:1",
    "containerDefinitions": [
      {
        "environment": [],
        "name": "sleep",
        "mountPoints": [],
        "image": "busybox",
        "cpu": 10,
        "portMappings": [],
        "command": [
          "sleep",
          "360"
        ],
        "memory": 10,
        "essential": true,
        "volumesFrom": []
      }
    ],
    "revision": 1
  }
}
```

For more information, see [Example task definitions](#) in the *Amazon ECS Developer Guide*.

Example 2: To register a task definition with a JSON string parameter

The following `register-task-definition` example registers a task definition using container definitions provided as a JSON string parameter with escaped double quotes.

```
aws ecs register-task-definition \  
  --family sleep360 \  
  --container-definitions "[{\"name\":\"sleep\",\"image\":\"busybox\",\"cpu\":10,\  
  \"/>"command\":[\"sleep\",\"360\"],\"memory\":10,\"essential\":true}]"
```

The output is identical to the previous example.

For more information, see [Creating a Task Definition](#) in the *Amazon ECS Developer Guide*.

- For API details, see [RegisterTaskDefinition](#) in *AWS CLI Command Reference*.

run-task

The following code example shows how to use `run-task`.

AWS CLI

To run a task on your default cluster

The following `run-task` example runs a task on the default cluster and uses a client token.

```
aws ecs run-task \  
  --cluster default \  
  --task-definition sleep360:1 \  
  --client-token 550e8400-e29b-41d4-a716-446655440000
```

Output:

```
{  
  "tasks": [  
    {  
      "attachments": [],  
      "attributes": [  
        {  
          "name": "ecs.cpu-architecture",  
          "value": "x86_64"  
        }  
      ],  
    }  
  ],  
}
```

```

start-task

The following code example shows how to use `start-task`.

AWS CLI

To start a new task

The following `start-task` starts a task using the latest revision of the `sleep360` task definition on the specified container instance in the default cluster.

```
aws ecs start-task \  
  --task-definition sleep360 \  
  --container-instances 765936fadbdd46b5991a4bd70c2a43d4
```

Output:

```
{  
  "tasks": [  
    {  
      "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/

- For API details, see [StartTask](#) in *AWS CLI Command Reference*.

stop-task

The following code example shows how to use stop-task.

AWS CLI

To stop a task

The following stop-task stops the specified task from running in the default cluster.

```
aws ecs stop-task \  
  --task 666fdccc2e2d4b6894dd422f4eeee8f8
```

Output:

```
{
```

```
"task": {
  "taskArn": "arn:aws:ecs:us-west-2:130757420319:task/
default/666fdccc2e2d4b6894dd422f4eeee8f8",

  "group": "family:sleep360",
  "launchType": "EC2",
  "attachments": [],
  "tags": []
}
}
```

- For API details, see [StopTask](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a resource

The following `tag-resource` example adds a single tag to the specified resource.

```
aws ecs tag-resource \  
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \  
  --tags key=key1,value=value1
```

This command produces no output.

To add multiple tags to a resource

The following `tag-resource` example adds multiple tags to the specified resource.

```
aws ecs tag-resource \  
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \  
  --tags key=key1,value=value1 key=key2,value=value2 key=key3,value=value3
```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes the listed tags from the specified resource.

```
aws ecs untag-resource \  
  --resource-arn arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster \  
  --tag-keys key1,key2
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-cluster-settings

The following code example shows how to use `update-cluster-settings`.

AWS CLI

To modify the settings for your cluster

The following `update-cluster-settings` example enables CloudWatch Container Insights for the default cluster.

```
aws ecs update-cluster-settings \  
  --cluster default \  
  --settings name=containerInsights,value=enabled
```

Output:

```
{  
  "cluster": {  
    "clusterArn": "arn:aws:ecs:us-west-2:123456789012:cluster/MyCluster",  
    "clusterName": "default",  
    "status": "ACTIVE",  
    "registeredContainerInstancesCount": 0,  
    "runningTasksCount": 0,  
    "pendingTasksCount": 0,  
    "activeServicesCount": 0,  
    "statistics": [],  
    "tags": [],  
    "settings": [  
      {  
        "name": "containerInsights",  
        "value": "enabled"  
      }  
    ]  
  }  
}
```

For more information, see [Modifying Account Settings](#) in the *Amazon ECS Developer Guide*.

- For API details, see [UpdateClusterSettings](#) in *AWS CLI Command Reference*.

update-container-agent

The following code example shows how to use `update-container-agent`.

AWS CLI

To update the container agent on an Amazon ECS container instance

The following `update-container-agent` example updates the container agent on the specified container instance in the default cluster.

```
aws ecs update-container-agent --cluster default --container-instance
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{
  "containerInstance": {
    "status": "ACTIVE",
    ...
    "agentUpdateStatus": "PENDING",
    "versionInfo": {
      "agentVersion": "1.0.0",
      "agentHash": "4023248",
      "dockerVersion": "DockerVersion: 1.5.0"
    }
  }
}
```

For more information, see [Updating the Amazon ECS Container Agent](#) in the *Amazon ECS Developer Guide*.

- For API details, see [UpdateContainerAgent](#) in *AWS CLI Command Reference*.

update-container-instances-state

The following code example shows how to use `update-container-instances-state`.

AWS CLI

To update the state of a container instance

The following `update-container-instances-state` updates the state of the specified container instance to DRAINING which will remove it from the cluster is it registered to.

```
aws ecs update-container-instances-state \
```

```
--container-instances 765936fadbdd46b5991a4bd70c2a43d4 \  
--status DRAINING
```

Output:

```
{  
  "containerInstances": [  
    {  
      "containerInstanceArn": "arn:aws:ecs:us-west-2:130757420319:container-

update-service-primary-task-set

The following code example shows how to use `update-service-primary-task-set`.

AWS CLI

To update the primary task set for a service

The following `update-service-primary-task-set` example updates the primary task set for the specified service.

```

aws ecs update-service-primary-task-set \
  --cluster MyCluster \
  --service MyService \
  --primary-task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/
MyService/ecs-svc/1234567890123456789

```

Output:

```

{
  "taskSet": {
    "id": "ecs-svc/1234567890123456789",
    "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/

}
}
```

- For API details, see [UpdateServicePrimaryTaskSet](#) in *AWS CLI Command Reference*.

update-service

The following code example shows how to use `update-service`.

AWS CLI

Example 1: To change the task definition used in a service

The following `update-service` example updates the `my-http-service` service to use the `amazon-ecs-sample` task definition.

```
aws ecs update-service --service my-http-service --task-definition amazon-ecs-sample
```

Example 2: To change the number of tasks in a service

The following `update-service` example updates the desired task count of the service `my-http-service` to 3.

```
aws ecs update-service --service my-http-service --desired-count 3
```

For more information, see [Updating a Service](#) in the *Amazon ECS Developer Guide*.

- For API details, see [UpdateService](#) in *AWS CLI Command Reference*.

update-task-set

The following code example shows how to use `update-task-set`.

AWS CLI

To update a task set

The following `update-task-set` example updates a task set to adjust the scale.

```
aws ecs update-task-set \  
  --cluster MyCluster \  
  --service MyService \  
  --task-set arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/MyService/ecs-  
svc/1234567890123456789 \  
  --scale value=50,unit=PERCENT
```

Output:

```
{  
  "taskSet": {  
    "id": "ecs-svc/1234567890123456789",  
    "taskSetArn": "arn:aws:ecs:us-west-2:123456789012:task-set/MyCluster/

}  
}
```

- For API details, see [UpdateTaskSet](#) in *AWS CLI Command Reference*.

Amazon EFS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EFS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-file-system

The following code example shows how to use `create-file-system`.

AWS CLI

To create an encrypted file system

The following `create-file-system` example creates an encrypted file system using the default CMK. It also adds the tag `Name=my-file-system`.

```
aws efs create-file-system \  
  --performance-mode generalPurpose \  
  --throughput-mode bursting \  
  --encrypted \  
  --tags Key=Name,Value=my-file-system
```

Output:

```
{  
  "OwnerId": "123456789012",  
  "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",

- For API details, see [CreateFileSystem](#) in *AWS CLI Command Reference*.

create-mount-target

The following code example shows how to use `create-mount-target`.

AWS CLI

To create a mount target

The following `create-mount-target` example creates a mount target for the specified file system.

```
aws efs create-mount-target \  
  --file-system-id fs-c7a0456e \  
  --subnet-id subnet-02bf4c428bexample \  
  --security-groups sg-068f739363example
```

Output:

```
{  
  "OwnerId": "123456789012",  
  "MountTargetId": "fsmt-f9a14450",  
  "FileSystemId": "fs-c7a0456e",  
  "SubnetId": "subnet-02bf4c428bexample",  
  "LifecycleState": "creating",  
  "IpAddress": "10.0.1.24",  
  "NetworkInterfaceId": "eni-02d542216aexample",  
  "AvailabilityZoneId": "use2-az2",  
  "AvailabilityZoneName": "us-east-2b",  
  "VpcId": "vpc-0123456789abcdef0"  
}
```

For more information, see [Creating mount targets](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [CreateMountTarget](#) in *AWS CLI Command Reference*.

delete-file-system

The following code example shows how to use `delete-file-system`.

AWS CLI

To delete a file system

The following `delete-file-system` example deletes the specified file system.

```
aws efs delete-file-system \  
  --file-system-id fs-c7a0456e
```

This command produces no output.

For more information, see [Deleting an Amazon EFS file system](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [DeleteFileSystem](#) in *AWS CLI Command Reference*.

delete-mount-target

The following code example shows how to use `delete-mount-target`.

AWS CLI

To delete a mount target

The following `delete-mount-target` example deletes the specified mount target.

```
aws efs delete-mount-target \  
  --mount-target-id fsmt-f9a14450
```

This command produces no output.

For more information, see [Creating mount targets](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [DeleteMountTarget](#) in *AWS CLI Command Reference*.

describe-file-systems

The following code example shows how to use `describe-file-systems`.

AWS CLI

To describe a file system

The following `describe-file-systems` example describes the specified file system.

```
aws efs describe-file-systems \  
  --file-system-id fs-c7a0456e
```

Output:

```
{  
  "FileSystems": [  
    {  
      "OwnerId": "123456789012",  
      "CreationToken": "console-d7f56c5f-e433-41ca-8307-9d9c0example",  
      "FileSystemId": "fs-c7a0456e",  
      "FileSystemArn": "arn:aws:elasticfilesystem:us-west-2:123456789012:file-  
system/fs-48499b4d",  
      "CreationTime": 1595286880.0,  
      "LifecycleState": "available",  
      "Name": "my-file-system",  
      "NumberOfMountTargets": 3,  
      "SizeInBytes": {  
        "Value": 6144,  
        "Timestamp": 1600991437.0,  
        "ValueInIA": 0,  
        "ValueInStandard": 6144  
      },  
      "PerformanceMode": "generalPurpose",  
      "Encrypted": true,  
      "KmsKeyId": "arn:aws:kms:us-west-2:123456789012:key/a59b3472-e62c-42e4-  
adcf-30d92example",  
      "ThroughputMode": "bursting",  
      "Tags": [  
        {  
          "Key": "Name",  
          "Value": "my-file-system"  
        }  
      ]  
    }  
  ]  
}
```

For more information, see [Managing Amazon EFS file systems](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [DescribeFileSystems](#) in *AWS CLI Command Reference*.

describe-mount-targets

The following code example shows how to use `describe-mount-targets`.

AWS CLI

To describe a mount target

The following `describe-mount-targets` example describes the specified mount target.

```
aws efs describe-mount-targets \  
  --mount-target-id fsmt-f9a14450
```

Output:

```
{  
  "MountTargets": [  
    {  
      "OwnerId": "123456789012",  
      "MountTargetId": "fsmt-f9a14450",  
      "FileSystemId": "fs-c7a0456e",  
      "SubnetId": "subnet-02bf4c428bexample",  
      "LifeCycleState": "creating",  
      "IpAddress": "10.0.1.24",  
      "NetworkInterfaceId": "eni-02d542216aexample",  
      "AvailabilityZoneId": "use2-az2",  
      "AvailabilityZoneName": "us-east-2b",  
      "VpcId": "vpc-0123456789abcdef0"  
    }  
  ]  
}
```

For more information, see [Creating mount targets](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [DescribeMountTargets](#) in *AWS CLI Command Reference*.

describe-tags

The following code example shows how to use `describe-tags`.

AWS CLI

To describe the tags for a file system

The following `describe-tags` example describes the tags for the specified file system.

```
aws efs describe-tags \  
  --file-system-id fs-c7a0456e
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "Name",  
      "Value": "my-file-system"  
    },  
    {  
      "Key": "Department",  
      "Value": "Business Intelligence"  
    }  
  ]  
}
```

For more information, see [Managing file system tags](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve the tags for a resource

The following `list-tags-for-resource` example retrieves the tags associated with the specified file system.

```
aws efs list-tags-for-resource \  
  --resource-id fs-c7a0456e
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "Name",  
      "Value": "my-file-system"  
    },  
    {  
      "Key": "Department",  
      "Value": "Business Intelligence"  
    }  
  ]  
}
```

For more information, see [Managing file system tags](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a resource

The following tag-resource example adds the tag Department=Business Intelligence to the specified file system.

```
aws efs tag-resource \  
  --resource-id fs-c7a0456e \  
  --tags Key=Department,Value="Business Intelligence"
```

This command produces no output.

For more information, see [Managing file system tags](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes the tag with the `Department` tag key from the specified file system.

```
aws efs untag-resource \  
  --resource-id fs-c7a0456e \  
  --tag-keys Department
```

This command produces no output.

For more information, see [Managing file system tags](#) in the *Amazon Elastic File System User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

Amazon EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EKS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

Actions

associate-encryption-config

The following code example shows how to use `associate-encryption-config`.

AWS CLI

To associates an encryption configuration to an existing cluster

The following `associate-encryption-config` example enable's encryption on an existing EKS clusters that do not already have encryption enabled.

```
aws eks associate-encryption-config \
  --cluster-name my-eks-cluster \
  --encryption-config '[{"resources":["secrets"],"provider":
{"keyArn":"arn:aws:kms:region-code:account:key/key"}}]'
```

Output:

```
{
  "update": {
    "id": "3141b835-8103-423a-8e68-12c2521ffa4d",
    "status": "InProgress",
    "type": "AssociateEncryptionConfig",
    "params": [
      {
        "type": "EncryptionConfig",
        "value": "[{"resources":["secrets"],"provider":{"keyArn":
\\\"arn:aws:kms:region-code:account:key/key\\\"}]}"
      }
    ],
    "createdAt": "2024-03-14T11:01:26.297000-04:00",
    "errors": []
  }
}
```

For more information, see [Enabling secret encryption on an existing cluster](#) in the *Amazon EKS User Guide*.

- For API details, see [AssociateEncryptionConfig](#) in *AWS CLI Command Reference*.

associate-identity-provider-config

The following code example shows how to use `associate-identity-provider-config`.

AWS CLI

Associate identity provider to your Amazon EKS Cluster

The following `associate-identity-provider-config` example associates an identity provider to your Amazon EKS Cluster.

```
aws eks associate-identity-provider-config \
  --cluster-name my-eks-cluster \
  --oidc 'identityProviderConfigName=my-identity-provider,issuerUrl=https://
oidc.eks.us-east-2.amazonaws.com/
id/38D6A4619A0A69E342B113ED7F1A7652,clientId=kubernetes,usernameClaim=email,usernamePrefix=
username-prefix,groupsClaim=my-claim,groupsPrefix=my-groups-
prefix,requiredClaims={Claim1=value1,Claim2=value2}' \
  --tags env=dev
```

Output:

```
{
  "update": {
    "id": "8c6c1bef-61fe-42ac-a242-89412387b8e7",
    "status": "InProgress",
    "type": "AssociateIdentityProviderConfig",
    "params": [
      {
        "type": "IdentityProviderConfig",
        "value": "[{\"type\":\"oidc\",\"name\":\"my-identity-provider\"}]"
      }
    ],
    "createdAt": "2024-04-11T13:46:49.648000-04:00",
    "errors": []
  },
  "tags": {
    "env": "dev"
  }
}
```

For more information, see [Authenticate users for your cluster from an OpenID Connect identity provider - Associate an OIDC identity provider](#) in the *Amazon EKS User Guide*.

- For API details, see [AssociateIdentityProviderConfig](#) in *AWS CLI Command Reference*.

create-addon

The following code example shows how to use create-addon.

AWS CLI

Example 1: To create an Amazon EKS add-on with default compatible version for the respective EKS cluster version

The following create-addon example command creates an Amazon EKS add-on with default compatible version for the respective EKS cluster version.

```
aws eks create-addon \  
  --cluster-name my-eks-cluster \  
  --addon-name my-eks-addon \  
  --service-account-role-arn arn:aws:iam::111122223333:role/role-name
```

Output:

```
{  
  "addon": {  
    "addonName": "my-eks-addon",  
    "clusterName": "my-eks-cluster",  
    "status": "CREATING",  
    "addonVersion": "v1.15.1-eksbuild.1",  
    "health": {  
      "issues": []  
    },  
    "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/1ec71ee1-b9c2-8915-4e17-e8be0a55a149",  
    "createdAt": "2024-03-14T12:20:03.264000-04:00",  
    "modifiedAt": "2024-03-14T12:20:03.283000-04:00",  
    "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",  
    "tags": {}  
  }  
}
```

For more information, see [Managing Amazon EKS add-ons - Creating an add-on](#) in the *Amazon EKS User Guide*.

Example 2: To create an Amazon EKS add-on with specific add-on version

The following `create-addon` example command creates an Amazon EKS add-on with specific add-on version.

```
aws eks create-addon \  
  --cluster-name my-eks-cluster \  
  --addon-name my-eks-addon \  
  --service-account-role-arn arn:aws:iam::111122223333:role/role-name \  
  --addon-version v1.16.4-eksbuild.2
```

Output:

```
{  
  "addon": {  
    "addonName": "my-eks-addon",  
    "clusterName": "my-eks-cluster",  
    "status": "CREATING",  
    "addonVersion": "v1.16.4-eksbuild.2",  
    "health": {  
      "issues": []  
    },  
    "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/34c71ee6-7738-6c8b-c6bd-3921a176b5ff",  
    "createdAt": "2024-03-14T12:30:24.507000-04:00",  
    "modifiedAt": "2024-03-14T12:30:24.521000-04:00",  
    "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",  
    "tags": {}  
  }  
}
```

For more information, see [Managing Amazon EKS add-ons - Creating an add-on](#) in the *Amazon EKS User Guide*.

Example 3: To create an Amazon EKS add-on with custom configuration values and resolve conflicts details

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolves conflicts details.

```
aws eks create-addon \
  --cluster-name my-eks-cluster \
  --addon-name my-eks-addon \
  --service-account-role-arn arn:aws:iam::111122223333:role/role-name \
  --addon-version v1.16.4-eksbuild.2 \
  --configuration-values '{"resources":{"limits":{"cpu":"100m"}}}' \
  --resolve-conflicts OVERWRITE
```

Output:

```
{
  "addon": {
    "addonName": "my-eks-addon",
    "clusterName": "my-eks-cluster",
    "status": "CREATING",
    "addonVersion": "v1.16.4-eksbuild.2",
    "health": {
      "issues": []
    },
    "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/a6c71ee9-0304-9237-1be8-25af1b0f1ffb",
    "createdAt": "2024-03-14T12:35:58.313000-04:00",
    "modifiedAt": "2024-03-14T12:35:58.327000-04:00",
    "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "tags": {},
    "configurationValues": "{\"resources\":{\"limits\":{\"cpu\":\"100m\"}}}"
  }
}
```

For more information, see [Managing Amazon EKS add-ons - Creating an add-on](#) in the *Amazon EKS User Guide*.

Example 4: To create an Amazon EKS add-on with custom JSON configuration values file

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```
aws eks create-addon \
  --cluster-name my-eks-cluster \
  --addon-name my-eks-addon \
  --service-account-role-arn arn:aws:iam::111122223333:role/role-name \
  --addon-version v1.16.4-eksbuild.2 \
```

```
--configuration-values 'file://configuration-values.json' \
--resolve-conflicts OVERWRITE \
--tags '{"eks-addon-key-1": "value-1" , "eks-addon-key-2": "value-2"}'
```

Contents of configuration-values.json:

```
{
  "resources": {
    "limits": {
      "cpu": "150m"
    }
  },
  "env": {
    "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
  }
}
```

Output:

```
{
  "addon": {
    "addonName": "my-eks-addon",
    "clusterName": "my-eks-cluster",
    "status": "CREATING",
    "addonVersion": "v1.16.4-eksbuild.2",
    "health": {
      "issues": []
    },
    "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/d8c71ef8-fbd8-07d0-fb32-6a7be19eeced",
    "createdAt": "2024-03-14T13:10:51.763000-04:00",
    "modifiedAt": "2024-03-14T13:10:51.777000-04:00",
    "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "tags": {
      "eks-addon-key-1": "value-1",
      "eks-addon-key-2": "value-2"
    },
    "configurationValues": "{\n  \"resources\": {\n    \"limits\": {\n      \"cpu\": \"150m\"\n    }\n  },\n  \"env\": {\n    \"AWS_VPC_K8S_CNI_LOGLEVEL\": \"ERROR\"\n  }\n}"
  }
}
```

For more information, see [Managing Amazon EKS add-ons - Creating an add-on](#) in the *Amazon EKS User Guide*.

Example 5: To create an Amazon EKS add-on with custom YAML configuration values file

The following `create-addon` example command creates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```
aws eks create-addon \  
  --cluster-name my-eks-cluster \  
  --addon-name my-eks-addon \  
  --service-account-role-arn arn:aws:iam::111122223333:role/role-name \  
  --addon-version v1.16.4-eksbuild.2 \  
  --configuration-values 'file://configuration-values.yaml' \  
  --resolve-conflicts OVERWRITE \  
  --tags '{"eks-addon-key-1": "value-1" , "eks-addon-key-2": "value-2"}'
```

Contents of `configuration-values.yaml`:

```
resources:  
  limits:  
    cpu: '100m'  
env:  
  AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'
```

Output:

```
{  
  "addon": {  
    "addonName": "my-eks-addon",  
    "clusterName": "my-eks-cluster",  
    "status": "CREATING",  
    "addonVersion": "v1.16.4-eksbuild.2",  
    "health": {  
      "issues": []  
    },  
    "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-addon/d4c71efb-3909-6f36-a548-402cd4b5d59e",  
    "createdAt": "2024-03-14T13:15:45.220000-04:00",  
    "modifiedAt": "2024-03-14T13:15:45.237000-04:00",  
    "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",  
    "tags": {  
      "eks-addon-key-3": "value-3",  
    }  
  }  
}
```

```
        "eks-addon-key-4": "value-4"
    },
    "configurationValues": "resources:\n    limits:\n        cpu: '100m'\n    nenv:\n    AWS_VPC_K8S_CNI_LOGLEVEL: 'INFO'"
}
}
```

For more information, see [Managing Amazon EKS add-ons - Creating an add-on](#) in the *Amazon EKS User Guide*.

- For API details, see [CreateAddon](#) in *AWS CLI Command Reference*.

create-cluster

The following code example shows how to use `create-cluster`.

AWS CLI

To create a new cluster

This example command creates a cluster named `prod` in your default region.

Command:

```
aws eks create-cluster --name prod \
--role-arn arn:aws:iam::012345678910:role/eks-service-role-
AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI \
--resources-vpc-config subnetIds=subnet-6782e71e,subnet-
e7e761ac,securityGroupIds=sg-6979fe18
```

Output:

```
{
  "cluster": {
    "name": "prod",
    "arn": "arn:aws:eks:us-west-2:012345678910:cluster/prod",
    "createdAt": 1527808069.147,
    "version": "1.10",
    "roleArn": "arn:aws:iam::012345678910:role/eks-service-role-
AWSServiceRoleForAmazonEKS-J7ONKE3BQ4PI",
    "resourcesVpcConfig": {
      "subnetIds": [
        "subnet-6782e71e",
```

```

        "subnet-e7e761ac"
      ],
      "securityGroupIds": [
        "sg-6979fe18"
      ],
      "vpcId": "vpc-950809ec"
    },
    "status": "CREATING",
    "certificateAuthority": {}
  }
}

```

To create a new cluster with private endpoint access and logging enabled

This example command creates a cluster named `example` in your default region with public endpoint access disabled, private endpoint access enabled, and all logging types enabled.

Command:

```

aws eks create-cluster --name example --kubernetes-version 1.12 \
--role-arn arn:aws:iam::012345678910:role/example-cluster-ServiceRole-1XWBQWYSFRE2Q \
--resources-vpc-config
  subnetIds=subnet-0a188dccd2f9a632f,subnet-09290d93da4278664,subnet-0f21dd86e0e91134a,subnet-
 \
--logging '{"clusterLogging":[{"types":

create-fargate-profile

The following code example shows how to use `create-fargate-profile`.

AWS CLI

Example 1: Create EKS Fargate Profile for a selector with a namespace

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace.

```
aws eks create-fargate-profile \  
  --cluster-name my-eks-cluster \  
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \  
  --fargate-profile-name my-fargate-profile \  
  --selectors '[{"namespace": "default"}]'
```

Output:

```
{  
  "fargateProfile": {  
    "fargateProfileName": "my-fargate-profile",  
    "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-  
eks-cluster/my-fargate-profile/a2c72bca-318e-abe8-8ed1-27c6d4892e9e",  
    "clusterName": "my-eks-cluster",  
    "createdAt": "2024-03-19T12:38:47.368000-04:00",  
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",  
    "subnets": [  
      "subnet-09d912bb63ef21b9a",  
      "subnet-04ad87f71c6e5ab4d",  
      "subnet-0e2907431c9988b72"  
    ],  
    "selectors": [  
      {  
        "namespace": "default"  
      }  
    ],  
    "status": "CREATING",  
    "tags": {}  
  }  
}
```

For more information, see [AWS Fargate profile - Creating a Fargate profile](#) in the *Amazon EKS User Guide*.

Example 2: Create EKS Fargate Profile for a selector with a namespace and labels

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with a namespace and labels.

```
aws eks create-fargate-profile \  
  --cluster-name my-eks-cluster \  
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \  
  --fargate-profile-name my-fargate-profile \  
  --selectors '[{"namespace": "default", "labels": {"key": "value"}}]'
```

```
--fargate-profile-name my-fargate-profile \  
--selectors '[{"namespace": "default", "labels": {"labelname1":  
"labelvalue1"}}]'
```

Output:

```
{  
  "fargateProfile": {  
    "fargateProfileName": "my-fargate-profile",  
    "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-  
eks-cluster/my-fargate-profile/88c72bc7-e8a4-fa34-44e4-2f1397224bb3",  
    "clusterName": "my-eks-cluster",  
    "createdAt": "2024-03-19T12:33:48.125000-04:00",  
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",  
    "subnets": [  
      "subnet-09d912bb63ef21b9a",  
      "subnet-04ad87f71c6e5ab4d",  
      "subnet-0e2907431c9988b72"  
    ],  
    "selectors": [  
      {  
        "namespace": "default",  
        "labels": {  
          "labelname1": "labelvalue1"  
        }  
      }  
    ],  
    "status": "CREATING",  
    "tags": {}  
  }  
}
```

For more information, see [AWS Fargate profile - Creating a Fargate profile](#) in the *Amazon EKS User Guide*.

Example 3: Create EKS Fargate Profile for a selector with a namespace and labels, along with IDs of subnets to launch a Pod into.

The following `create-fargate-profile` example create EKS Fargate Profile for a selector with a namespace and labels, along with IDs of subnets to launch a Pod into.

```
aws eks create-fargate-profile \  
--cluster-name my-eks-cluster \  

```

```
--pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
--fargate-profile-name my-fargate-profile \
--selectors '[{"namespace": "default", "labels": {"labelname1":
"labelvalue1"}}]' \
--subnets ["subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d",
"subnet-0e2907431c9988b72"]'
```

Output:

```
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-
eks-cluster/my-fargate-profile/e8c72bc8-e87b-5eb6-57cb-ed4fe57577e3",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-03-19T12:35:58.640000-04:00",
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "subnets": [
      "subnet-09d912bb63ef21b9a",
      "subnet-04ad87f71c6e5ab4d",
      "subnet-0e2907431c9988b72"
    ],
    "selectors": [
      {
        "namespace": "default",
        "labels": {
          "labelname1": "labelvalue1"
        }
      }
    ],
    "status": "CREATING",
    "tags": {}
  }
}
```

For more information, see [AWS Fargate profile - Creating a Fargate profile](#) in the *Amazon EKS User Guide*.

Example 4: Create EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into.

```
aws eks create-fargate-profile \
  --cluster-name my-eks-cluster \
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
  --fargate-profile-name my-fargate-profile \
  --selectors '[{"namespace": "default1", "labels": {"labelname1": "labelvalue1",
"labelname2": "labelvalue2"}}, {"namespace": "default2", "labels": {"labelname1":
"labelvalue1", "labelname2": "labelvalue2"}}]' \
  --subnets ["subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d",
"subnet-0e2907431c9988b72"] \
  --tags '{"eks-fargate-profile-key-1": "value-1" , "eks-fargate-profile-key-2":
"value-2"}'
```

Output:

```
{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-
eks-cluster/my-fargate-profile/4cc72bbf-b766-8ee6-8d29-e62748feb3cd",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-03-19T12:15:55.271000-04:00",
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "subnets": [
      "subnet-09d912bb63ef21b9a",
      "subnet-04ad87f71c6e5ab4d",
      "subnet-0e2907431c9988b72"
    ],
    "selectors": [
      {
        "namespace": "default1",
        "labels": {
          "labelname2": "labelvalue2",
          "labelname1": "labelvalue1"
        }
      },
      {
        "namespace": "default2",
        "labels": {
          "labelname2": "labelvalue2",
          "labelname1": "labelvalue1"
        }
      }
    ]
  },
}
```

```

    "status": "CREATING",
    "tags": {
      "eks-fargate-profile-key-2": "value-2",
      "eks-fargate-profile-key-1": "value-1"
    }
  }
}

```

For more information, see [AWS Fargate profile - Creating a Fargate profile](#) in the *Amazon EKS User Guide*.

Example 5: Create EKS Fargate Profile with a wildcard selector for namespaces and labels, along with IDs of subnets to launch a Pod into

The following `create-fargate-profile` example creates an EKS Fargate Profile for a selector with multiple namespace and labels, along with IDs of subnets to launch a Pod into.

```

aws eks create-fargate-profile \
  --cluster-name my-eks-cluster \
  --pod-execution-role-arn arn:aws:iam::111122223333:role/role-name \
  --fargate-profile-name my-fargate-profile \
  --selectors '[{"namespace": "prod*", "labels": {"labelname*?": "*value1"}}, {"namespace": "*dev*", "labels": {"labelname*?": "*value*"}}]' \
  --subnets ["subnet-09d912bb63ef21b9a", "subnet-04ad87f71c6e5ab4d", "subnet-0e2907431c9988b72"] \
  --tags '{"eks-fargate-profile-key-1": "value-1" , "eks-fargate-profile-key-2": "value-2"}'

```

Output:

```

{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",
    "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-eks-cluster/my-fargate-profile/e8c72bd6-5966-0bfe-b77b-1802893e5a6f",
    "clusterName": "my-eks-cluster",
    "createdAt": "2024-03-19T13:05:20.550000-04:00",
    "podExecutionRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "subnets": [
      "subnet-09d912bb63ef21b9a",
      "subnet-04ad87f71c6e5ab4d",
      "subnet-0e2907431c9988b72"
    ]
  }
}

```

```
    ],
    "selectors": [
      {
        "namespace": "prod*",
        "labels": {
          "labelname*?": "*value1"
        }
      },
      {
        "namespace": "*dev*",
        "labels": {
          "labelname*?": "*value*"
        }
      }
    ],
    "status": "CREATING",

- For API details, see [CreateFargateProfile](#) in *AWS CLI Command Reference*.

create-nodegroup

The following code example shows how to use create-nodegroup.

AWS CLI

Example 1: Creates a managed node group for an Amazon EKS cluster

The following create-nodegroup example creates a managed node group for an Amazon EKS cluster.

```
aws eks create-nodegroup \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --node-role arn:aws:iam::111122223333:role/role-name \
```

```
--subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d"
"subnet-09d912bb63ef21b9a" \
--scaling-config minSize=1,maxSize=3,desiredSize=1 \
--region us-east-2
```

Output:

```
{
  "nodegroup": {
    "nodegroupName": "my-eks-nodegroup",
    "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-
cluster/my-eks-nodegroup/bac7550f-b8b8-5fbb-4f3e-7502a931119e",
    "clusterName": "my-eks-cluster",
    "version": "1.26",
    "releaseVersion": "1.26.12-20240329",
    "createdAt": "2024-04-04T13:19:32.260000-04:00",

    },
    "tags": {}
  }
}
```

For more information, see [Creating a managed node group](#) in the *Amazon EKS User Guide*.

Example 2: Creates a managed node group for an Amazon EKS cluster with custom instance-types and disk-size

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster with custom instance-types and disk-size.

```
aws eks create-nodegroup \  
  --cluster-name my-eks-cluster \  
  --nodegroup-name my-eks-nodegroup \  
  --node-role arn:aws:iam::111122223333:role/role-name \  
  --subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d" \  
  "subnet-09d912bb63ef21b9a" \  
  --scaling-config minSize=1,maxSize=3,desiredSize=1 \  
  --capacity-type ON_DEMAND \  
  --instance-types 'm5.large' \  
  --disk-size 50 \  
  --region us-east-2
```

Output:

```
{  
  "nodegroup": {  
    "nodegroupName": "my-eks-nodegroup",  
    "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-  
cluster/my-eks-nodegroup/c0c7551b-e4f9-73d9-992c-a450fdb82322",

        "subnet-09d912bb63ef21b9a"
    ],
    "amiType": "AL2_x86_64",
    "nodeRole": "arn:aws:iam::111122223333:role/role-name",
    "diskSize": 50,
    "health": {
        "issues": []
    },
    "updateConfig": {
        "maxUnavailable": 1
    },
    "tags": {}
}
}

```

For more information, see [Creating a managed node group](#) in the *Amazon EKS User Guide*.

Example 3: Creates a managed node group for an Amazon EKS cluster with custom instance-types, disk-size, ami-type, capacity-type, update-config, labels, taints and tags.

The following `create-nodegroup` example creates a managed node group for an Amazon EKS cluster with custom instance-types, disk-size, ami-type, capacity-type, update-config, labels, taints and tags.

```

aws eks create-nodegroup \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --node-role arn:aws:iam::111122223333:role/role-name \
  --subnets "subnet-0e2907431c9988b72" "subnet-04ad87f71c6e5ab4d"
"subnet-09d912bb63ef21b9a" \
  --scaling-config minSize=1,maxSize=5,desiredSize=4 \
  --instance-types 't3.large' \
  --disk-size 50 \
  --ami-type AL2_x86_64 \
  --capacity-type SPOT \
  --update-config maxUnavailable=2 \
  --labels '{"my-eks-nodegroup-label-1": "value-1" , "my-eks-nodegroup-label-2":
"value-2"}' \
  --taints '{"key": "taint-key-1" , "value": "taint-value-1", "effect":
"NO_EXECUTE"}' \

```

```
--tags '{"my-eks-nodegroup-key-1": "value-1" , "my-eks-nodegroup-key-2":  
"value-2"}'
```

Output:

```
{  
  "nodegroup": {  
    "nodegroupName": "my-eks-nodegroup",  
    "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-

```

For more information, see [Creating a managed node group](#) in the *Amazon EKS User Guide*.

- For API details, see [CreateNodegroup](#) in *AWS CLI Command Reference*.

delete-addon

The following code example shows how to use `delete-addon`.

AWS CLI

Example 1. To delete an Amazon EKS add-on but preserve the add-on software on the EKS Cluster

The following `delete-addon` example command deletes an Amazon EKS add-on but preserve the add-on software on the EKS Cluster.

```
aws eks delete-addon \
  --cluster-name my-eks-cluster \
  --addon-name my-eks-addon \
  --preserve
```

Output:

```
{
  "addon": {
    "addonName": "my-eks-addon",
    "clusterName": "my-eks-cluster",
    "status": "DELETING",
    "addonVersion": "v1.9.3-eksbuild.7",
```

```

    "health": {
      "issues": []
    },
    "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-
addon/a8c71ed3-944e-898b-9167-c763856af4b8",
    "createdAt": "2024-03-14T11:49:09.009000-04:00",
    "modifiedAt": "2024-03-14T12:03:49.776000-04:00",
    "tags": {}
  }
}

```

For more information, see [Managing Amazon EKS add-ons - Deleting an add-on](#) in the *Amazon EKS*.

Example 2. To delete an Amazon EKS add-on and also delete the add-on software from the EKS Cluster

The following `delete-addon` example command deletes an Amazon EKS add-on and also delete the add-on software from the EKS Cluster.

```

aws eks delete-addon \
  --cluster-name my-eks-cluster \
  --addon-name my-eks-addon

```

Output:

```

{
  "addon": {
    "addonName": "my-eks-addon",
    "clusterName": "my-eks-cluster",
    "status": "DELETING",
    "addonVersion": "v1.15.1-eksbuild.1",
    "health": {
      "issues": []
    },
    "addonArn": "arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/my-eks-
addon/bac71ed1-ec43-3bb6-88ea-f243cdb58954",
    "createdAt": "2024-03-14T11:45:31.983000-04:00",

    "serviceAccountRoleArn": "arn:aws:iam::111122223333:role/role-name",
    "tags": {}
  }
}

```

```
}
```

For more information, see [Managing Amazon EKS add-ons - Deleting an add-on](#) in the *Amazon EKS*.

- For API details, see [DeleteAddon](#) in *AWS CLI Command Reference*.

delete-cluster

The following code example shows how to use `delete-cluster`.

AWS CLI

Delete an Amazon EKS cluster control plane

The following `delete-cluster` example deletes an Amazon EKS cluster control plane.

```
aws eks delete-cluster \  
  --name my-eks-cluster
```

Output:

```
{  
  "cluster": {  
    "name": "my-eks-cluster",  
    "arn": "arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster",

For more information, see [Deleting an Amazon EKS cluster](#) in the *Amazon EKS User Guide*.

- For API details, see [DeleteCluster](#) in *AWS CLI Command Reference*.

delete-fargate-profile

The following code example shows how to use delete-fargate-profile.

AWS CLI

Example 1: Create EKS Fargate Profile for a selector with a namespace

The following delete-fargate-profile example creates an EKS Fargate Profile for a selector with a namespace.

```

aws eks delete-fargate-profile \
  --cluster-name my-eks-cluster \
  --fargate-profile-name my-fargate-profile

```

Output:

```

{
  "fargateProfile": {
    "fargateProfileName": "my-fargate-profile",

```

```

    "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-

  }
}

```

For more information, see [AWS Fargate profile - Deleting a Fargate](#) in the *Amazon EKS User Guide*.

- For API details, see [DeleteFargateProfile](#) in *AWS CLI Command Reference*.

delete-nodegroup

The following code example shows how to use `delete-nodegroup`.

AWS CLI

Example 1: Delete a managed node group for an Amazon EKS cluster

The following `delete-nodegroup` example deletes a managed node group for an Amazon EKS cluster.

```

aws eks delete-nodegroup \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup

```

Output:

```
{
  "nodegroup": {
    "nodegroupName": "my-eks-nodegroup",
    "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-

    }
  }
}
```

- For API details, see [DeleteNodegroup](#) in *AWS CLI Command Reference*.

deregister-cluster

The following code example shows how to use `deregister-cluster`.

AWS CLI

To deregisters a connected cluster to remove it from the Amazon EKS control plane

The following `deregister-cluster` example deregisters a connected cluster to remove it from the Amazon EKS control plane.

```
aws eks deregister-cluster \
  --name my-eks-anywhere-cluster
```

Output:

```
{
  "cluster": {
    "name": "my-eks-anywhere-cluster",
    "arn": "arn:aws:eks:us-east-2:111122223333:cluster/my-eks-anywhere-cluster",
    "createdAt": "2024-04-12T12:38:37.561000-04:00",
    "status": "DELETING",
    "tags": {},

      "activationId": "dfb5ad28-13c3-4e26-8a19-5b2457638c74",
      "activationExpiry": "2024-04-15T12:38:37.082000-04:00",
      "provider": "EKS_ANYWHERE",
      "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSCoordinatorAgentRole"
    }
  }
}
```

```
}

```

For more information, see [Deregistering a cluster](#) in the *Amazon EKS User Guide*.

- For API details, see [DeregisterCluster](#) in *AWS CLI Command Reference*.

describe-addon-versions

The following code example shows how to use `describe-addon-versions`.

AWS CLI

Example 1: List all the available addons for EKS Cluster

The following `describe-addon-versions` example list all the available AWS addons.

```
aws eks describe-addon-versions \
  --query 'sort_by(addons &owner)[].{publisher: publisher, owner: owner,
  addonName: addonName, type: type}' \
  --output table

```

Output:

```
-----
|                                     DescribeAddonVersions
|                                     |

describe-addon

The following code example shows how to use describe-addon.

AWS CLI

Describe actively running EKS addon in your Amazon EKS cluster

The following describe-addon example actively running EKS addon in your Amazon EKS cluster.

```
aws eks describe-addon \  
  --cluster-name my-eks-cluster \  
  --addon-name vpc-cni
```

Output:

```
{  
  "addon": {  
    "addonName": "vpc-cni",
```

```

    "clusterName": "my-eks-cluster",
    "status": "ACTIVE",

describe-fargate-profile

The following code example shows how to use `describe-fargate-profile`.

AWS CLI

Describe a Fargate profile

The following `describe-fargate-profile` example describes a Fargate profile.

```
aws eks describe-fargate-profile \  
  --cluster-name my-eks-cluster \  
  --fargate-profile-name my-fargate-profile
```

Output:

```
{  
  "fargateProfile": {  
    "fargateProfileName": "my-fargate-profile",  
    "fargateProfileArn": "arn:aws:eks:us-east-2:111122223333:fargateprofile/my-

  }
}
}

```

- For API details, see [DescribeFargateProfile](#) in *AWS CLI Command Reference*.

describe-identity-provider-config

The following code example shows how to use `describe-identity-provider-config`.

AWS CLI

Describe an identity provider configuration associated to your Amazon EKS Cluster

The following `describe-identity-provider-config` example describes an identity provider configuration associated to your Amazon EKS Cluster.

```

aws eks describe-identity-provider-config \
  --cluster-name my-eks-cluster \
  --identity-provider-config type=oidc,name=my-identity-provider

```

Output:

```

{
  "identityProviderConfig": {
    "oidc": {
      "identityProviderConfigName": "my-identity-provider",
      "identityProviderConfigArn": "arn:aws:eks:us-

        "Claim1": "value1",

```

```
        "Claim2": "value2"
      },
      "tags": {
        "env": "dev"
      },
      "status": "ACTIVE"
    }
  }
}
```

For more information, see [Authenticate users for your cluster from an OpenID Connect identity provider](#) in the *Amazon EKS User Guide*.

- For API details, see [DescribeIdentityProviderConfig](#) in *AWS CLI Command Reference*.

describe-nodegroup

The following code example shows how to use `describe-nodegroup`.

AWS CLI

Describe a managed node group for an Amazon EKS cluster

The following `describe-nodegroup` example describes a managed node group for an Amazon EKS cluster.

```
aws eks describe-nodegroup \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup
```

Output:

```
{
  "nodegroup": {
    "nodegroupName": "my-eks-nodegroup",
    "nodegroupArn": "arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-eks-nodegroup/a8c75f2f-df78-a72f-4063-4b69af3de5b1",

},
"tags": {}
}
}
```

- For API details, see [DescribeNodegroup](#) in *AWS CLI Command Reference*.

describe-update

The following code example shows how to use describe-update.

AWS CLI

Example 1: To describe an update for a cluster

The following describe-update example describes an update for a cluster named.

```
aws eks describe-update \  
  --name my-eks-cluster \  
  --update-id 10bddb13-a71b-425a-b0a6-71cd03e59161
```

Output:

```
{  
  "update": {  
    "id": "10bddb13-a71b-425a-b0a6-71cd03e59161",  
    "status": "Successful",  
    "type": "EndpointAccessUpdate",  
    "params": [  
      {  
        "type": "EndpointPublicAccess",  
        "value": "false"  
      },  
      {  
        "type": "EndpointPrivateAccess",  
        "value": "true"  
      }  
    ],  
    "createdAt": "2024-03-14T10:01:26.297000-04:00",  
    "errors": []  
  }  
}
```

For more information, see [Updating an Amazon EKS cluster Kubernetes version](#) in the *Amazon EKS User Guide*.

Example 2: To describe an update for a cluster

The following describe-update example describes an update for a cluster named.

```
aws eks describe-update \  
  --name my-eks-cluster \  
  --update-id e4994991-4c0f-475a-a040-427e6da52966
```

Output:

```
{
  "update": {
    "id": "e4994991-4c0f-475a-a040-427e6da52966",
    "status": "Successful",
    "type": "AssociateEncryptionConfig",
    "params": [
      {
        "type": "EncryptionConfig",
        "value": "[{\"resources\":[\"secrets\"],\"provider\":{\"keyArn\":
\\\"arn:aws:kms:region-code:account:key/key\\\"}]]\"
      }
    ],
    "createdAt": "2024-03-14T11:01:26.297000-04:00",
    "errors": []
  }
}
```

For more information, see [Updating an Amazon EKS cluster Kubernetes version](#) in the *Amazon EKS User Guide*.

Example 3: To describe an update for a cluster

The following describe-update example describes an update for a cluster named.

```
aws eks describe-update \
  --name my-eks-cluster \
  --update-id b5f0ba18-9a87-4450-b5a0-825e6e84496f
```

Output:

```
{
  "update": {
    "id": "b5f0ba18-9a87-4450-b5a0-825e6e84496f",
    "status": "Successful",
    "type": "VersionUpdate",
    "params": [
      {
        "type": "Version",
        "value": "1.29"
      },
      {

```

```

        "type": "PlatformVersion",
        "value": "eks.1"
      }
    ],
    "createdAt": "2024-03-14T12:05:26.297000-04:00",
    "errors": []
  }
}

```

For more information, see [Updating an Amazon EKS cluster Kubernetes version](#) in the *Amazon EKS User Guide*.

- For API details, see [DescribeUpdate](#) in *AWS CLI Command Reference*.

disassociate-identity-provider-config

The following code example shows how to use `disassociate-identity-provider-config`.

AWS CLI

Disassociate identity provider to your Amazon EKS Cluster

The following `disassociate-identity-provider-config` example disassociates an identity provider to your Amazon EKS Cluster.

```

aws eks disassociate-identity-provider-config \
  --cluster-name my-eks-cluster \
  --identity-provider-config 'type=oidc,name=my-identity-provider'

```

Output:

```

{
  "update": {
    "id": "5f78d14e-c57b-4857-a3e4-cf664ae20949",
    "status": "InProgress",
    "type": "DisassociateIdentityProviderConfig",
    "params": [
      {
        "type": "IdentityProviderConfig",
        "value": "[]"
      }
    ]
  },

```

```
    "createdAt": "2024-04-11T13:53:43.314000-04:00",
    "errors": []
  }
}
```

For more information, see [Authenticate users for your cluster from an OpenID Connect identity provider - Disassociate an OIDC identity provider from your cluster](#) in the *Amazon EKS User Guide*.

- For API details, see [DisassociateIdentityProviderConfig](#) in *AWS CLI Command Reference*.

get-token

The following code example shows how to use `get-token`.

AWS CLI

Example 1: Get an authentication token for an Amazon EKS Cluster named ``my-eks-cluster``

The following `get-token` example gets an authentication token for an Amazon EKS Cluster named `my-eks-cluster`.

```
aws eks get-token \
  --cluster-name my-eks-cluster
```

Output:

```
{
  "kind": "ExecCredential",
  "apiVersion": "client.authentication.k8s.io/v1beta1",
  "spec": {},
  "status": {
    "expirationTimestamp": "2024-04-11T20:59:56Z",
    "token": "k8s-aws-v1.EXAMPLE_TOKEN_DATA_STRING..."
  }
}
```

Example 2: Gets an authentication token for an Amazon EKS Cluster named ``my-eks-cluster`` by assuming this roleARN for credentials when signing the token

The following `get-token` example gets an authentication token for an Amazon EKS Cluster named `my-eks-cluster` by assuming this roleARN for credentials when signing the token.

```
aws eks get-token \  
  --cluster-name my-eks-cluster \  
  --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-  
cluster-ServiceRole-j1k7AfTIQtnM
```

Output:

```
{  
  "kind": "ExecCredential",  
  "apiVersion": "client.authentication.k8s.io/v1beta1",  
  "spec": {},  
  "status": {  
    "expirationTimestamp": "2024-04-11T21:05:26Z",  
    "token": "k8s-aws-v1.EXAMPLE_TOKEN_DATA_STRING..."  
  }  
}
```

- For API details, see [GetToken](#) in *AWS CLI Command Reference*.

list-addons

The following code example shows how to use `list-addons`.

AWS CLI

List all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster``

The following `list-addons` example lists all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster`.

```
aws eks list-addons \  
  --cluster-name my-eks-cluster
```

Output:

```
{  
  "addons": [  
    "kube-proxy",  
    "vpc-cni"  
  ]  
}
```

- For API details, see [ListAddons](#) in *AWS CLI Command Reference*.

list-clusters

The following code example shows how to use `list-clusters`.

AWS CLI

To list all the installed add-ons in your Amazon EKS cluster named ``my-eks-cluster``

The following `list-clusters` example lists all the installed add-ons in your Amazon EKS cluster named `my-eks-cluster`.

```
aws eks list-clusters
```

Output:

```
{
  "clusters": [
    "prod",
    "qa",
    "stage",
    "my-eks-cluster"
  ]
}
```

- For API details, see [ListClusters](#) in *AWS CLI Command Reference*.

list-fargate-profiles

The following code example shows how to use `list-fargate-profiles`.

AWS CLI

To list all the fargate profiles in your Amazon EKS cluster named ``my-eks-cluster``

The following `list-fargate-profiles` example lists all the fargate profiles in your Amazon EKS cluster named `my-eks-cluster`.

```
aws eks list-fargate-profiles \
```

```
--cluster-name my-eks-cluster
```

Output:

```
{
  "fargateProfileNames": [
    "my-fargate-profile"
  ]
}
```

- For API details, see [ListFargateProfiles](#) in *AWS CLI Command Reference*.

list-identity-provider-configs

The following code example shows how to use `list-identity-provider-configs`.

AWS CLI**List identity providers associated to an Amazon EKS Cluster**

The following `list-identity-provider-configs` example lists identity provider associated to an Amazon EKS Cluster.

```
aws eks list-identity-provider-configs \
  --cluster-name my-eks-cluster
```

Output:

```
{
  "identityProviderConfigs": [
    {
      "type": "oidc",
      "name": "my-identity-provider"
    }
  ]
}
```

For more information, see [Authenticate users for your cluster from an OpenID Connect identity provider](#) in the *Amazon EKS User Guide*.

- For API details, see [ListIdentityProviderConfigs](#) in *AWS CLI Command Reference*.

list-nodegroups

The following code example shows how to use `list-nodegroups`.

AWS CLI

List all the node groups in an Amazon EKS cluster

The following `list-nodegroups` example list all the node groups in an Amazon EKS cluster.

```
aws eks list-nodegroups \
  --cluster-name my-eks-cluster
```

Output:

```
{
  "nodegroups": [
    "my-eks-managed-node-group",
    "my-eks-nodegroup"
  ]
}
```

- For API details, see [ListNodegroups](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

Example 1: To list all the tags for an Amazon EKS Cluster ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Cluster ARN.

```
aws eks list-tags-for-resource \
  --resource-arn arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster
```

Output:

```
{
  "tags": {
```

```

    "aws:cloudformation:stack-name": "eksctl-my-eks-cluster-cluster",
    "alpha.eksctl.io/cluster-name": "my-eks-cluster",
    "karpenter.sh/discovery": "my-eks-cluster",
    "aws:cloudformation:stack-id": "arn:aws:cloudformation:us-
east-2:111122223333:stack/eksctl-my-eks-cluster-cluster/e752ea00-e217-11ee-
beae-0a9599c8c7ed",
    "auto-delete": "no",
    "eksctl.cluster.k8s.io/v1alpha1/cluster-name": "my-eks-cluster",
    "EKS-Cluster-Name": "my-eks-cluster",
    "alpha.eksctl.io/cluster-oidc-enabled": "true",
    "aws:cloudformation:logical-id": "ControlPlane",
    "alpha.eksctl.io/eksctl-version": "0.173.0-dev
+a7ee89342.2024-03-01T03:40:57Z",
    "Name": "eksctl-my-eks-cluster-cluster/ControlPlane"
  }
}

```

Example 2: To list all the tags for an Amazon EKS Node group ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Node group ARN.

```

aws eks list-tags-for-resource \
  --resource-arn arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-
eks-managed-node-group/60c71ed2-2cfb-020f-a5f4-ad32477f198c

```

Output:

```

{
  "tags": {

  }
}

```

Example 3: To list all the tags on an Amazon EKS Fargate profile ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Fargate profile ARN.

```

aws eks list-tags-for-resource \
  --resource-arn arn:aws:eks:us-east-2:111122223333:fargateprofile/my-eks-cluster/
my-fargate-profile/d6c76780-e541-0725-c816-36754cab734b

```

Output:

```

{
  "tags": {
    "eks-fargate-profile-key-2": "value-2",
    "eks-fargate-profile-key-1": "value-1"
  }
}

```

Example 4: To list all the tags for an Amazon EKS Add-on ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS Add-on ARN.

```

aws eks list-tags-for-resource \
  --resource-arn arn:aws:eks:us-east-2:111122223333:addon/my-eks-cluster/vpc-
cni/0ec71efc-98dd-3203-60b0-4b939b2a5e5f

```

Output:

```

{
  "tags": {

```

```
    "eks-addon-key-2": "value-2",  
    "eks-addon-key-1": "value-1"  
  }  
}
```

Example 5: To list all the tags for an Amazon EKS OIDC identity provider ARN

The following `list-tags-for-resource` example lists all the tags for an Amazon EKS OIDC identity provider ARN.

```
aws eks list-tags-for-resource \  
  --resource-arn arn:aws:eks:us-east-2:111122223333:identityproviderconfig/my-eks-  
cluster/oidc/my-identity-provider/8ac76722-78e4-cec1-ed76-d49eea058622
```

Output:

```
{  
  "tags": {  
    "my-identity-provider": "test"  
  }  
}
```

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-update

The following code example shows how to use `list-update`.

AWS CLI

Example 1: To lists the updates associated with an Amazon EKS Cluster name

The following `list-updates` example lists all the update IDs for an Amazon EKS Cluster name.

```
aws eks list-updates \  
  --name my-eks-cluster
```

Output:

```
{
```

```
"updateIds": [  
  "5f78d14e-c57b-4857-a3e4-cf664ae20949",  
  "760e5a3f-adad-48c7-88d3-7ac283c09c26",  
  "cd4ec863-bc55-47d5-a377-3971502f529b",  
  "f12657ce-e869-4f17-b158-a82ab8b7d937"  
]  
}
```

Example 2: To list all the update IDs for an Amazon EKS Node group

The following `list-updates` example lists all the update IDs for an Amazon EKS Node group.

```
aws eks list-updates \  
  --name my-eks-cluster \  
  --nodegroup-name my-eks-managed-node-group
```

Output:

```
{  
  "updateIds": [  
    "8c6c1bef-61fe-42ac-a242-89412387b8e7"  
  ]  
}
```

Example 3: To list all the update IDs on an Amazon EKS Add-one

The following `list-updates` example lists all the update IDs for an Amazon EKS Add-on.

```
aws eks list-updates \  
  --name my-eks-cluster \  
  --addon-name vpc-cni
```

Output:

```
{  
  "updateIds": [  
    "9cdba8d4-79fb-3c83-afe8-00b508d33268"  
  ]  
}
```

- For API details, see [ListUpdate](#) in *AWS CLI Command Reference*.

list-updates

The following code example shows how to use `list-updates`.

AWS CLI

To list the updates for a cluster

This example command lists the current updates for a cluster named `example` in your default region.

Command:

```
aws eks list-updates --name example
```

Output:

```
{
  "updateIds": [
    "10bddb13-a71b-425a-b0a6-71cd03e59161"
  ]
}
```

- For API details, see [ListUpdates](#) in *AWS CLI Command Reference*.

register-cluster

The following code example shows how to use `register-cluster`.

AWS CLI

Example 1: Register an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS

The following `register-cluster` example registers an external EKS_ANYWHERE Kubernetes cluster to Amazon EKS.

```
aws eks register-cluster \
  --name my-eks-anywhere-cluster \
  --connector-config 'roleArn=arn:aws:iam::111122223333:role/
AmazonEKSCoordinatorAgentRole,provider=EKS_ANYWHERE'
```

Output:

```
{
  "cluster": {
    "name": "my-eks-anywhere-cluster",
    "arn": "arn:aws:eks:us-east-2:111122223333:cluster/my-eks-anywhere-cluster",
    "createdAt": "2024-04-12T12:38:37.561000-04:00",
    "status": "PENDING",
    "tags": {},
    "connectorConfig": {
      "activationId": "xxxxxxxxACTIVATION_IDxxxxxxxx",
      "activationCode": "xxxxxxxxACTIVATION_CODExxxxxxxx",
      "activationExpiry": "2024-04-15T12:38:37.082000-04:00",
      "provider": "EKS_ANYWHERE",
      "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSCheckpointAgentRole"
    }
  }
}
```

For more information, see [Connecting an external cluster](#) in the *Amazon EKS User Guide*.

Example 2: Register any external Kubernetes cluster to Amazon EKS

The following `register-cluster` example registers an external `EKS_ANYWHERE` Kubernetes cluster to Amazon EKS.

```
aws eks register-cluster \
  --name my-eks-anywhere-cluster \
  --connector-config 'roleArn=arn:aws:iam::111122223333:role/
AmazonEKSCheckpointAgentRole,provider=OTHER'
```

Output:

```
{
  "cluster": {
    "name": "my-onprem-k8s-cluster",
    "arn": "arn:aws:eks:us-east-2:111122223333:cluster/my-onprem-k8s-cluster",
    "createdAt": "2024-04-12T12:42:10.861000-04:00",
    "status": "PENDING",
    "tags": {},
    "connectorConfig": {
      "activationId": "xxxxxxxxACTIVATION_IDxxxxxxxx",
      "activationCode": "xxxxxxxxACTIVATION_CODExxxxxxxx",
      "activationExpiry": "2024-04-15T12:42:10.339000-04:00",

```

```
        "provider": "OTHER",
        "roleArn": "arn:aws:iam::111122223333:role/AmazonEKSCollectorAgentRole"
    }
}
```

For more information, see [Connecting an external cluster](#) in the *Amazon EKS User Guide*.

- For API details, see [RegisterCluster](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

Example 1: To add the specified tags to an Amazon EKS Cluster

The following `tag-resource` example adds the specified tags to an Amazon EKS Cluster.

```
aws eks tag-resource \  
  --resource-arn arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster \  
  --tag 'my-eks-cluster-test-1=test-value-1,my-eks-cluster-dev-1=dev-value-2'
```

This command produces no output.

Example 2: To add the specified tags to an Amazon EKS Node group

The following `tag-resource` example adds the specified tags to an Amazon EKS Node group.

```
aws eks tag-resource \  
  --resource-arn arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-eks-managed-node-group/60c71ed2-2cfb-020f-a5f4-ad32477f198c \  
  --tag 'my-eks-nodegroup-test-1=test-value-1,my-eks-nodegroup-dev-1=dev-value-2'
```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To deletes the specified tags from an Amazon EKS Cluster

The following `untag-resource` example deletes the specified tags from an Amazon EKS Cluster.

```
aws eks untag-resource \  
  --resource-arn arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster \  
  --tag-keys "my-eks-cluster-test-1" "my-eks-cluster-dev-1"
```

This command produces no output.

Example 2: To deletes the specified tags from an Amazon EKS Node group

The following `untag-resource` example deletes the specified tags from an Amazon EKS Node group.

```
aws eks untag-resource \  
  --resource-arn arn:aws:eks:us-east-2:111122223333:nodegroup/my-eks-cluster/my-  
eks-managed-node-group/60c71ed2-2cfb-020f-a5f4-ad32477f198c \  
  --tag-keys "my-eks-nodegroup-test-1" "my-eks-nodegroup-dev-1"
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-addon

The following code example shows how to use `update-addon`.

AWS CLI

Example 1. To update an Amazon EKS add-on with service account role ARN

The following `update-addon` example command updates an Amazon EKS add-on with service account role ARN.

```
aws eks update-addon \  
  --cluster-name my-eks-cluster \  
  --addon-name vpc-cni \  
  --service-account-role-arn arn:aws:iam::111122223333:role/my-eks-vpc-cni-role
```

```
--service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-Yfakrq0C1UTm
```

Output:

```
{
  "update": {
    "id": "c00d2de2-c2e4-3d30-929e-46b8edec2ce4",
    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [
      {
        "type": "ServiceAccountRoleArn",
        "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-Yfakrq0C1UTm"
      }
    ],
    "updatedAt": "2024-04-12T16:04:55.614000-04:00",
    "errors": []
  }
}
```

For more information, see [Managing Amazon EKS add-ons - Updating an add-on](#) in the *Amazon EKS User Guide*.

Example 2. To update an Amazon EKS add-on with specific add-on version

The following update-addon example command updates an Amazon EKS add-on with specific add-on version.

```
aws eks update-addon \
  --cluster-name my-eks-cluster \
  --addon-name vpc-cni \
  --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-Yfakrq0C1UTm \
  --addon-version v1.16.4-eksbuild.2
```

Output:

```
{
  "update": {
    "id": "f58dc0b0-2b18-34bd-bc6a-e4abc0011f36",
```

```

    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [
      {
        "type": "AddonVersion",
        "value": "v1.16.4-eksbuild.2"
      },
      {
        "type": "ServiceAccountRoleArn",
        "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-Yfakrq0C1UTm"
      }
    ],
    "createdAt": "2024-04-12T16:07:16.550000-04:00",
    "errors": []
  }
}

```

For more information, see [Managing Amazon EKS add-ons - Updating an add-on](#) in the *Amazon EKS User Guide*.

Example 3. To update an Amazon EKS add-on with custom configuration values and resolve conflicts details

The following update-addon example command updates an Amazon EKS add-on with custom configuration values and resolve conflicts details.

```

aws eks update-addon \
  --cluster-name my-eks-cluster \
  --addon-name vpc-cni \
  --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-Yfakrq0C1UTm \
  --addon-version v1.16.4-eksbuild.2 \
  --configuration-values '{"resources": {"limits":{"cpu":"100m"}, "requests":
{"cpu":"50m"}}}' \
  --resolve-conflicts PRESERVE

```

Output:

```

{
  "update": {
    "id": "cd9f2173-a8d8-3004-a90f-032f14326520",

```

```

    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [
      {
        "type": "AddonVersion",
        "value": "v1.16.4-eksbuild.2"
      },
      {
        "type": "ServiceAccountRoleArn",
        "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-Yfakrq0C1UTm"
      },
      {
        "type": "ResolveConflicts",
        "value": "PRESERVE"
      },
      {
        "type": "ConfigurationValues",
        "value": "{\"resources\": {\"limits\": {\"cpu\": \"100m\"}, \"requests
\": {\"cpu\": \"50m\"}}}"
      }
    ],
    "createdAt": "2024-04-12T16:16:27.363000-04:00",
    "errors": []
  }
}

```

For more information, see [Managing Amazon EKS add-ons - Updating an add-on](#) in the *Amazon EKS User Guide*.

Example 4. To update an Amazon EKS add-on with custom JSON configuration values file

The following update-addon example command updates an Amazon EKS add-on with custom JSON configuration values and resolve conflicts details.

```

aws eks update-addon \
  --cluster-name my-eks-cluster \
  --addon-name vpc-cni \
  --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-Yfakrq0C1UTm \
  --addon-version v1.17.1-eksbuild.1 \
  --configuration-values 'file://configuration-values.json' \
  --resolve-conflicts PRESERVE

```

Contents of configuration-values.json:

```
{
  "resources": {
    "limits": {
      "cpu": "100m"
    },
    "requests": {
      "cpu": "50m"
    }
  },
  "env": {
    "AWS_VPC_K8S_CNI_LOGLEVEL": "ERROR"
  }
}
```

Output:

```
{
  "update": {
    "id": "6881a437-174f-346b-9a63-6e91763507cc",
    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [
      {
        "type": "AddonVersion",
        "value": "v1.17.1-eksbuild.1"
      },
      {
        "type": "ServiceAccountRoleArn",
        "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-Yfakrq0C1UTm"
      },
      {
        "type": "ResolveConflicts",
        "value": "PRESERVE"
      },
      {
        "type": "ConfigurationValues",
        "value": "{\n  \"resources\": {\n    \"limits\": {\n
      \"cpu\": \"100m\"\n    },\n    \"requests\": {\n      \"cpu\": \"50m
      \"\n    }\n  },\n  \"env\": {\n    \"AWS_VPC_K8S_CNI_LOGLEVEL\": \"ERROR
      \"\n  }\n}"
      }
    ]
  }
}
```

```

    }
  ],
  "createdAt": "2024-04-12T16:22:55.519000-04:00",
  "errors": []
}
}

```

For more information, see [Managing Amazon EKS add-ons - Updating an add-on](#) in the *Amazon EKS User Guide*.

Example 5. To update an Amazon EKS add-on with custom YAML configuration values file

The following update-addon example command updates an Amazon EKS add-on with custom YAML configuration values and resolve conflicts details.

```

aws eks update-addon \
  --cluster-name my-eks-cluster \
  --addon-name vpc-cni \
  --service-account-role-arn arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-Yfakrq0C1UTm \
  --addon-version v1.18.0-eksbuild.1 \
  --configuration-values 'file://configuration-values.yaml' \
  --resolve-conflicts PRESERVE

```

Contents of configuration-values.yaml:

```

resources:
  limits:
    cpu: '100m'
  requests:
    cpu: '50m'
env:
  AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'

```

Output:

```

{
  "update": {
    "id": "a067a4c9-69d0-3769-ace9-d235c5b16701",
    "status": "InProgress",
    "type": "AddonUpdate",
    "params": [

```

```

    {
      "type": "AddonVersion",
      "value": "v1.18.0-eksbuild.1"
    },
    {
      "type": "ServiceAccountRoleArn",
      "value": "arn:aws:iam::111122223333:role/eksctl-my-eks-cluster-
addon-vpc-cni-Role1-Yfakrq0C1UTm"
    },
    {
      "type": "ResolveConflicts",
      "value": "PRESERVE"
    },
    {
      "type": "ConfigurationValues",
      "value": "resources:\n      limits:\n          cpu: '100m'\n
requests:\n      cpu: '50m'\nenv:\n      AWS_VPC_K8S_CNI_LOGLEVEL: 'DEBUG'"
    }
  ],
  "createdAt": "2024-04-12T16:25:07.212000-04:00",
  "errors": []
}
}

```

For more information, see [Managing Amazon EKS add-ons - Updating an add-on](#) in the *Amazon EKS User Guide*.

- For API details, see [UpdateAddon](#) in *AWS CLI Command Reference*.

update-cluster-config

The following code example shows how to use `update-cluster-config`.

AWS CLI

To update cluster endpoint access

This example command updates a cluster to disable endpoint public access and enable private endpoint access.

Command:

```
aws eks update-cluster-config --name example \
```

```
--resources-vpc-config endpointPublicAccess=false,endpointPrivateAccess=true
```

Output:

```
{
  "update": {
    "id": "ec883c93-2e9e-407c-a22f-8f6fa6e67d4f",
    "status": "InProgress",
    "type": "EndpointAccessUpdate",
    "params": [
      {
        "type": "EndpointPublicAccess",
        "value": "false"
      },
      {
        "type": "EndpointPrivateAccess",
        "value": "true"
      }
    ],
    "createdAt": 1565806986.506,
    "errors": []
  }
}
```

To enable logging for a cluster

This example command enables all cluster control plane logging types for a cluster named example.

Command:

```
aws eks update-cluster-config --name example \
--logging '{"clusterLogging":[{"types":
["api","audit","authenticator","controllerManager","scheduler"],"enabled":true}]}'
```

Output:

```
{
  "update": {
    "id": "7551c64b-1d27-4b1e-9f8e-c45f056eb6fd",
    "status": "InProgress",
    "type": "LoggingUpdate",
```

```

    "params": [
      {
        "type": "ClusterLogging",
        "value": "{\"clusterLogging\": [{\"types\": [\"api\", \"audit\",
\\\"authenticator\\\", \"controllerManager\\\", \"scheduler\\\"], \"enabled\": true}]}"
      }
    ],
    "createdAt": 1565807210.37,
    "errors": []
  }
}

```

- For API details, see [UpdateClusterConfig](#) in *AWS CLI Command Reference*.

update-cluster-version

The following code example shows how to use `update-cluster-version`.

AWS CLI

To updates an Amazon EKS cluster named `my-eks-cluster` to the specified Kubernetes version

The following `update-cluster-version` example updates an Amazon EKS cluster to the specified Kubernetes version.

```

aws eks update-cluster-version \
  --name my-eks-cluster \
  --kubernetes-version 1.27

```

Output:

```

{
  "update": {
    "id": "e4091a28-ea14-48fd-a8c7-975aeb469e8a",
    "status": "InProgress",
    "type": "VersionUpdate",
    "params": [
      {
        "type": "Version",
        "value": "1.27"
      }
    ],
  }
}

```

```
    {
      "type": "PlatformVersion",
      "value": "eks.16"
    }
  ],
  "createdAt": "2024-04-12T16:56:01.082000-04:00",
  "errors": []
}
```

For more information, see [Updating an Amazon EKS cluster Kubernetes version](#) in the *Amazon EKS User Guide*.

- For API details, see [UpdateClusterVersion](#) in *AWS CLI Command Reference*.

update-kubeconfig

The following code example shows how to use `update-kubeconfig`.

AWS CLI

Example 1: Configures your kubectl by creating or updating the kubeconfig so that you can connect to an Amazon EKS Cluster named `my-eks-cluster``

The following `update-kubeconfig` example configures your kubectl by creating or updating the kubeconfig so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

```
aws eks update-kubeconfig \
  --name my-eks-cluster
```

Output:

```
Updated context arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster in /Users/
xxx/.kube/config
```

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster](#) in the *Amazon EKS User Guide*.

Example 2: Configures your kubectl by creating or updating the kubeconfig (with `role-arn` option to assume a role for cluster authentication) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster``

The following `update-kubeconfig` example configures your `kubectl` by creating or updating the kubeconfig (with `role-arn` option to assume a role for cluster authentication) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

```
aws eks update-kubeconfig \  
  --name my-eks-cluster \  
  --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-  
cluster-ServiceRole-j1k7AfTIQtnM
```

Output:

```
Updated context arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster in /Users/  
xxx/.kube/config
```

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster](#) in the *Amazon EKS User Guide*.

Example 3: Configures your `kubectl` by creating or updating the kubeconfig (with `role-arn` option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following `update-kubeconfig` example configures your `kubectl` by creating or updating the kubeconfig (with `role-arn` option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`.

```
aws eks update-kubeconfig \  
  --name my-eks-cluster \  
  --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-  
cluster-ServiceRole-j1k7AfTIQtnM \  
  --alias stage-eks-cluster \  
  --user-alias john
```

Output:

```
Updated context stage-eks-cluster in /Users/dubaria/.kube/config
```

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster](#) in the *Amazon EKS User Guide*.

Example 4: Print kubeconfig file entries for review and configures your kubectl so that you can connect to an Amazon EKS Cluster named `my-eks-cluster`

The following update-kubeconfig example configures your kubectl by creating or updating the kubeconfig (with role-arn option to assume a role for cluster authentication along with custom cluster alias and user-alias) so that you can connect to an Amazon EKS Cluster named my-eks-cluster.

```
aws eks update-kubeconfig \  
  --name my-eks-cluster \  
  --role-arn arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-  
cluster-ServiceRole-j1k7AfTIQtnM \  
  --alias stage-eks-cluster \  
  --user-alias john \  
  --verbose
```

Output:

```
Updated context stage-eks-cluster in /Users/dubaria/.kube/config  
Entries:  
  
context:  
cluster: arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster  
user: john  
name: stage-eks-cluster  
  
name: john  
user:  
exec:  
  apiVersion: client.authentication.k8s.io/v1beta1  
  args:  
  - --region  
  - us-east-2  
  - eks  
  - get-token  
  - --cluster-name  
  - my-eks-cluster  
  - --output  
  - json  
  - --role  
  - arn:aws:iam::111122223333:role/eksctl-EKS-Linux-Cluster-v1-24-cluster-  
ServiceRole-j1k7AfTIQtnM
```

```

command: aws

cluster:
certificate-authority-data: xxx_CA_DATA_xxx
server: https://DALSJ343KE23J3RN45653DSKJTT647TYD.y14.us-east-2.eks.amazonaws.com
name: arn:aws:eks:us-east-2:111122223333:cluster/my-eks-cluster

```

For more information, see [Creating or updating a kubeconfig file for an Amazon EKS cluster](#) in the *Amazon EKS User Guide*.

- For API details, see [UpdateKubeconfig](#) in *AWS CLI Command Reference*.

update-nodegroup-config

The following code example shows how to use `update-nodegroup-config`.

AWS CLI

Example 1: Update a managed node group to add new labels and taint to EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to add new labels and taint to EKS worker node for an Amazon EKS cluster.

```

aws eks update-nodegroup-config \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --labels 'add0rUpdateLabels={my-eks-nodegroup-label-1=value-1,my-eks-nodegroup-label-2=value-2}' \
  --taints 'add0rUpdateTaints=[{key=taint-key-1,value=taint-value-1,effect=NO_EXECUTE}]'

```

Output:

```

{
  "update": {
    "id": "e66d21d3-bd8b-3ad1-a5aa-b196dc08c7c1",
    "status": "InProgress",
    "type": "ConfigUpdate",
    "params": [
      {
        "type": "LabelsToAdd",

```

```

        "value": "{\"my-eks-nodegroup-label-2\": \"value-2\", \"my-eks-
nodegroup-label-1\": \"value-1\"}"
      },
      {
        "type": "TaintsToAdd",
        "value": "[{\"effect\": \"NO_EXECUTE\", \"value\": \"taint-value-1\",
\\\"key\\\": \"taint-key-1\"}]"
      }
    ],
    "createdAt": "2024-04-08T12:05:19.161000-04:00",
    "errors": []
  }
}

```

For more information, see [Updating a managed node group](#) in the *Amazon EKS User Guide*.

Example 2: Update a managed node group to remove labels and taint for the EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to remove labels and taint for the EKS worker node for an Amazon EKS cluster.

```

aws eks update-nodegroup-config \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --labels 'removeLabels=my-eks-nodegroup-label-1, my-eks-nodegroup-label-2' \
  --taints 'removeTaints=[{key=taint-key-1,value=taint-
value-1,effect=NO_EXECUTE}]'

```

Output:

```

{
  "update": {
    "id": "67a08692-9e59-3ace-a916-13929f44cec3",
    "status": "InProgress",
    "type": "ConfigUpdate",
    "params": [
      {
        "type": "LabelsToRemove",
        "value": "[\"my-eks-nodegroup-label-1\", \"my-eks-nodegroup-
label-2\"]"
      }
    ],
  },
}

```

```

    {
      "type": "TaintsToRemove",
      "value": "[{\"effect\":\"NO_EXECUTE\"},{\"value\":\"taint-value-1\"},
\\\"key\\\":\\\"taint-key-1\\\"}]"
    }
  ],
  "createdAt": "2024-04-08T12:17:31.817000-04:00",
  "errors": []
}
}

```

For more information, see [Updating a managed node group](#) in the *Amazon EKS User Guide*.

Example 3: Update a managed node group to remove and add labels and taint for the EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to remove and add labels and taint for the EKS worker node for an Amazon EKS cluster.

```

aws eks update-nodegroup-config \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --labels 'addOrUpdateLabels={my-eks-nodegroup-new-label-1=new-value-1,my-eks-
nodegroup-new-label-2=new-value-2},removeLabels=my-eks-nodegroup-label-1, my-eks-
nodegroup-label-2' \
  --taints 'addOrUpdateTaints=[{key=taint-new-key-1,value=taint-new-
value-1,effect=PREFER_NO_SCHEDULE}],removeTaints=[{key=taint-key-1,value=taint-
value-1,effect=NO_EXECUTE}]'

```

Output:

```

{
  "update": {
    "id": "4a9c8c45-6ac7-3115-be71-d6412a2339b7",
    "status": "InProgress",
    "type": "ConfigUpdate",
    "params": [
      {
        "type": "LabelsToAdd",
        "value": "{\"my-eks-nodegroup-new-label-1\":\"new-value-1\",\"my-
eks-nodegroup-new-label-2\":\"new-value-2\"}"
      },
    ],
  },
}

```

```

    {
      "type": "LabelsToRemove",
      "value": "[\"my-eks-nodegroup-label-1\", \"my-eks-nodegroup-
label-2\"]"
    },
    {
      "type": "TaintsToAdd",
      "value": "[{\"effect\": \"PREFER_NO_SCHEDULE\", \"value\": \"taint-new-
value-1\", \"key\": \"taint-new-key-1\"}]"
    },
    {
      "type": "TaintsToRemove",
      "value": "[{\"effect\": \"NO_EXECUTE\", \"value\": \"taint-value-1\",
\"key\": \"taint-key-1\"}]"
    }
  ],
  "createdAt": "2024-04-08T12:30:55.486000-04:00",
  "errors": []
}
}

```

For more information, see [Updating a managed node group](#) in the *Amazon EKS User Guide*.

Example 4: Update a managed node group to update scaling-config and update-config for the EKS worker node for an Amazon EKS cluster

The following `update-nodegroup-config` example updates a managed node group to update scaling-config and update-config for the EKS worker node for an Amazon EKS cluster.

```

aws eks update-nodegroup-config \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --scaling-config minSize=1,maxSize=5,desiredSize=2 \
  --update-config maxUnavailable=2

```

Output:

```

{
  "update": {
    "id": "a977160f-59bf-3023-805d-c9826e460aea",
    "status": "InProgress",
    "type": "ConfigUpdate",

```

```
    "params": [
      {
        "type": "MinSize",
        "value": "1"
      },
      {
        "type": "MaxSize",
        "value": "5"
      },
      {
        "type": "DesiredSize",
        "value": "2"
      },
      {
        "type": "MaxUnavailable",
        "value": "2"
      }
    ],
    "createdAt": "2024-04-08T12:35:17.036000-04:00",
    "errors": []
  }
}
```

For more information, see [Updating a managed node group](#) in the *Amazon EKS User Guide*.

- For API details, see [UpdateNodegroupConfig](#) in *AWS CLI Command Reference*.

update-nodegroup-version

The following code example shows how to use `update-nodegroup-version`.

AWS CLI

Example 1: Update the Kubernetes version or AMI version of an Amazon EKS managed node group

The following `update-nodegroup-version` example updates the Kubernetes version or AMI version of an Amazon EKS managed node group to the latest available version for your Kubernetes cluster.

```
aws eks update-nodegroup-version \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
```

```
--no-force
```

Output:

```
{
  "update": {
    "id": "a94ebfc3-6bf8-307a-89e6-7dbaa36421f7",
    "status": "InProgress",
    "type": "VersionUpdate",
    "params": [
      {
        "type": "Version",
        "value": "1.26"
      },
      {
        "type": "ReleaseVersion",
        "value": "1.26.12-20240329"
      }
    ],
    "createdAt": "2024-04-08T13:16:00.724000-04:00",
    "errors": []
  }
}
```

For more information, see [Updating a managed node group](#) in the *Amazon EKS User Guide*.

Example 2: Update the Kubernetes version or AMI version of an Amazon EKS managed node group

The following `update-nodegroup-version` example updates the Kubernetes version or AMI version of an Amazon EKS managed node group to the specified AMI release version.

```
aws eks update-nodegroup-version \
  --cluster-name my-eks-cluster \
  --nodegroup-name my-eks-nodegroup \
  --kubernetes-version '1.26' \
  --release-version '1.26.12-20240307' \
  --no-force
```

Output:

```
{
```

```
"update": {
  "id": "4db06fe1-088d-336b-bdcd-3fdb94995fb7",
  "status": "InProgress",
  "type": "VersionUpdate",
  "params": [
    {
      "type": "Version",
      "value": "1.26"
    },
    {
      "type": "ReleaseVersion",
      "value": "1.26.12-20240307"
    }
  ],
  "createdAt": "2024-04-08T13:13:58.595000-04:00",
  "errors": []
}
}
```

For more information, see [Updating a managed node group](https://docs.aws.amazon.com/eks/latest/userguide/update-managed-node-group.html) - <https://docs.aws.amazon.com/eks/latest/userguide/update-managed-node-group.html> in the *Amazon EKS User Guide*.

- For API details, see [UpdateNodegroupVersion](#) in *AWS CLI Command Reference*.

Elastic Beanstalk examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Beanstalk.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

abort-environment-update

The following code example shows how to use `abort-environment-update`.

AWS CLI

To abort a deployment

The following command aborts a running application version deployment for an environment named `my-env`:

```
aws elasticbeanstalk abort-environment-update --environment-name my-env
```

- For API details, see [AbortEnvironmentUpdate](#) in *AWS CLI Command Reference*.

check-dns-availability

The following code example shows how to use `check-dns-availability`.

AWS CLI

To check the availability of a CNAME

The following command checks the availability of the subdomain `my-cname.elasticbeanstalk.com`:

```
aws elasticbeanstalk check-dns-availability --cname-prefix my-cname
```

Output:

```
{
  "Available": true,
  "FullyQualifiedCNAME": "my-cname.elasticbeanstalk.com"
}
```

- For API details, see [CheckDnsAvailability](#) in *AWS CLI Command Reference*.

create-application-version

The following code example shows how to use `create-application-version`.

AWS CLI

To create a new application version

The following command creates a new version, "v1" of an application named "MyApp":

```
aws elasticbeanstalk create-application-version --application-name MyApp
--version-label v1 --description MyAppv1 --source-bundle S3Bucket="my-
bucket",S3Key="sample.war" --auto-create-application
```

The application will be created automatically if it does not already exist, due to the auto-create-application option. The source bundle is a .war file stored in an s3 bucket named "my-bucket" that contains the Apache Tomcat sample application.

Output:

```
{
  "ApplicationVersion": {
    "ApplicationName": "MyApp",
    "VersionLabel": "v1",
    "Description": "MyAppv1",
    "DateCreated": "2015-02-03T23:01:25.412Z",
    "DateUpdated": "2015-02-03T23:01:25.412Z",
    "SourceBundle": {
      "S3Bucket": "my-bucket",
      "S3Key": "sample.war"
    }
  }
}
```

- For API details, see [CreateApplicationVersion](#) in *AWS CLI Command Reference*.

create-application

The following code example shows how to use create-application.

AWS CLI

To create a new application

The following command creates a new application named "MyApp":

```
aws elasticbeanstalk create-application --application-name MyApp --description "my application"
```

The `create-application` command only configures the application's name and description. To upload source code for the application, create an initial version of the application using `create-application-version`. `create-application-version` also has an `auto-create-application` option that lets you create the application and the application version in one step.

Output:

```
{
  "Application": {
    "ApplicationName": "MyApp",
    "ConfigurationTemplates": [],
    "DateUpdated": "2015-02-12T18:32:21.181Z",
    "Description": "my application",
    "DateCreated": "2015-02-12T18:32:21.181Z"
  }
}
```

- For API details, see [CreateApplication](#) in *AWS CLI Command Reference*.

create-configuration-template

The following code example shows how to use `create-configuration-template`.

AWS CLI

To create a configuration template

The following command creates a configuration template named `my-app-v1` from the settings applied to an environment with the id `e-rpqsewtp2j`:

```
aws elasticbeanstalk create-configuration-template --application-name my-app --template-name my-app-v1 --environment-id e-rpqsewtp2j
```

Output:

```
{
```

```
"ApplicationName": "my-app",
"TemplateName": "my-app-v1",
"DateCreated": "2015-08-12T18:40:39Z",
"DateUpdated": "2015-08-12T18:40:39Z",
"SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

- For API details, see [CreateConfigurationTemplate](#) in *AWS CLI Command Reference*.

create-environment

The following code example shows how to use `create-environment`.

AWS CLI

To create a new environment for an application

The following command creates a new environment for version "v1" of a java application named "my-app":

```
aws elasticbeanstalk create-environment --application-name my-app --environment-name
my-env --cname-prefix my-app --version-label v1 --solution-stack-name "64bit Amazon
Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
```

Output:

```
{
  "ApplicationName": "my-app",
  "EnvironmentName": "my-env",
  "VersionLabel": "v1",
  "Status": "Launching",
  "EnvironmentId": "e-izqpassy4h",
  "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8",
  "CNAME": "my-app.elasticbeanstalk.com",
  "Health": "Grey",
  "Tier": {
    "Type": "Standard",
    "Name": "WebServer",
    "Version": " "
  },
  "DateUpdated": "2015-02-03T23:04:54.479Z",
```

```
"DateCreated": "2015-02-03T23:04:54.479Z"  
}
```

v1 is the label of an application version previously uploaded with `create-application-version`.

To specify a JSON file to define environment configuration options

The following `create-environment` command specifies that a JSON file with the name `myoptions.json` should be used to override values obtained from the solution stack or the configuration template:

```
aws elasticbeanstalk create-environment --environment-name sample-env --application-  
name sampleapp --option-settings file://myoptions.json
```

`myoptions.json` is a JSON object defining several settings:

```
[  
  {  
    "Namespace": "aws:elb:healthcheck",  
    "OptionName": "Interval",  
    "Value": "15"  
  },  
  {  
    "Namespace": "aws:elb:healthcheck",  
    "OptionName": "Timeout",  
    "Value": "8"  
  },  
  {  
    "Namespace": "aws:elb:healthcheck",  
    "OptionName": "HealthyThreshold",  
    "Value": "2"  
  },  
  {  
    "Namespace": "aws:elb:healthcheck",  
    "OptionName": "UnhealthyThreshold",  
    "Value": "3"  
  }  
]
```

For more information, see *Option Values* in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [CreateEnvironment](#) in *AWS CLI Command Reference*.

create-storage-location

The following code example shows how to use `create-storage-location`.

AWS CLI

To create a storage location

The following command creates a storage location in Amazon S3:

```
aws elasticbeanstalk create-storage-location
```

Output:

```
{
  "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012"
}
```

- For API details, see [CreateStorageLocation](#) in *AWS CLI Command Reference*.

delete-application-version

The following code example shows how to use `delete-application-version`.

AWS CLI

To delete an application version

The following command deletes an application version named `22a0-stage-150819_182129` for an application named `my-app`:

```
aws elasticbeanstalk delete-application-version --version-label 22a0-
stage-150819_182129 --application-name my-app
```

- For API details, see [DeleteApplicationVersion](#) in *AWS CLI Command Reference*.

delete-application

The following code example shows how to use `delete-application`.

AWS CLI

To delete an application

The following command deletes an application named `my-app`:

```
aws elasticbeanstalk delete-application --application-name my-app
```

- For API details, see [DeleteApplication](#) in *AWS CLI Command Reference*.

`delete-configuration-template`

The following code example shows how to use `delete-configuration-template`.

AWS CLI

To delete a configuration template

The following command deletes a configuration template named `my-template` for an application named `my-app`:

```
aws elasticbeanstalk delete-configuration-template --template-name my-template --application-name my-app
```

- For API details, see [DeleteConfigurationTemplate](#) in *AWS CLI Command Reference*.

`delete-environment-configuration`

The following code example shows how to use `delete-environment-configuration`.

AWS CLI

To delete a draft configuration

The following command deletes a draft configuration for an environment named `my-env`:

```
aws elasticbeanstalk delete-environment-configuration --environment-name my-env --application-name my-app
```

- For API details, see [DeleteEnvironmentConfiguration](#) in *AWS CLI Command Reference*.

describe-application-versions

The following code example shows how to use `describe-application-versions`.

AWS CLI

To view information about an application version

The following command retrieves information about an application version labeled `v2`:

```
aws elasticbeanstalk describe-application-versions --application-name my-app --
version-label "v2"
```

Output:

```
{
  "ApplicationVersions": [
    {
      "ApplicationName": "my-app",
      "VersionLabel": "v2",
      "Description": "update cover page",
      "DateCreated": "2015-07-23T01:32:26.079Z",
      "DateUpdated": "2015-07-23T01:32:26.079Z",
      "SourceBundle": {
        "S3Bucket": "elasticbeanstalk-us-west-2-015321684451",
        "S3Key": "my-app/5026-stage-150723_224258.war"
      }
    },
    {
      "ApplicationName": "my-app",
      "VersionLabel": "v1",
      "Description": "initial version",
      "DateCreated": "2015-07-23T22:26:10.816Z",
      "DateUpdated": "2015-07-23T22:26:10.816Z",
      "SourceBundle": {
        "S3Bucket": "elasticbeanstalk-us-west-2-015321684451",
        "S3Key": "my-app/5026-stage-150723_222618.war"
      }
    }
  ]
}
```

- For API details, see [DescribeApplicationVersions](#) in *AWS CLI Command Reference*.

describe-applications

The following code example shows how to use describe-applications.

AWS CLI

To view a list of applications

The following command retrieves information about applications in the current region:

```
aws elasticbeanstalk describe-applications
```

Output:

```
{
  "Applications": [
    {
      "ApplicationName": "ruby",
      "ConfigurationTemplates": [],
      "DateUpdated": "2015-08-13T21:05:44.376Z",
      "Versions": [
        "Sample Application"
      ],
      "DateCreated": "2015-08-13T21:05:44.376Z"
    },
    {
      "ApplicationName": "pythonsample",
      "Description": "Application created from the EB CLI using \"eb init\"",
      "Versions": [
        "Sample Application"
      ],
      "DateCreated": "2015-08-13T19:05:43.637Z",
      "ConfigurationTemplates": [],
      "DateUpdated": "2015-08-13T19:05:43.637Z"
    },
    {
      "ApplicationName": "nodejs-example",
      "ConfigurationTemplates": [],
      "DateUpdated": "2015-08-06T17:50:02.486Z",
      "Versions": [
        "add elasticache",
        "First Release"
      ],
      "DateCreated": "2015-08-06T17:50:02.486Z"
    }
  ]
}
```

```

    }
  ]
}

```

- For API details, see [DescribeApplications](#) in *AWS CLI Command Reference*.

describe-configuration-options

The following code example shows how to use `describe-configuration-options`.

AWS CLI

To view configuration options for an environment

The following command retrieves descriptions of all available configuration options for an environment named `my-env`:

```
aws elasticbeanstalk describe-configuration-options --environment-name my-env --
application-name my-app
```

Output (abbreviated):

```
{
  "Options": [
    {
      "Name": "JVMOptions",
      "UserDefined": false,
      "DefaultValue": "Xms=256m,Xmx=256m,XX:MaxPermSize=64m,JVM Options=",
      "ChangeSeverity": "RestartApplicationServer",
      "Namespace": "aws:cloudformation:template:parameter",
      "ValueType": "KeyValueList"
    },
    {
      "Name": "Interval",
      "UserDefined": false,
      "DefaultValue": "30",
      "ChangeSeverity": "NoInterruption",
      "Namespace": "aws:elb:healthcheck",
      "MaxValue": 300,
      "MinValue": 5,
      "ValueType": "Scalar"
    }
  ],
}
```

```

    ...
    {
      "Name": "LowerThreshold",
      "UserDefined": false,
      "DefaultValue": "2000000",
      "ChangeSeverity": "NoInterruption",
      "Namespace": "aws:autoscaling:trigger",
      "MinValue": 0,
      "ValueType": "Scalar"
    },
    {
      "Name": "ListenerEnabled",
      "UserDefined": false,
      "DefaultValue": "true",
      "ChangeSeverity": "Unknown",
      "Namespace": "aws:elb:listener",
      "ValueType": "Boolean"
    }
  ]
}

```

Available configuration options vary per platform and configuration version. For more information about namespaces and supported options, see *Option Values* in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [DescribeConfigurationOptions](#) in *AWS CLI Command Reference*.

describe-configuration-settings

The following code example shows how to use `describe-configuration-settings`.

AWS CLI

To view configurations settings for an environment

The following command retrieves configuration settings for an environment named `my-env`:

```
aws elasticbeanstalk describe-configuration-settings --environment-name my-env --
application-name my-app
```

Output (abbreviated):

```
{
```

```

"ConfigurationSettings": [
  {
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "Description": "Environment created from the EB CLI using \"eb create
\",
    "DeploymentStatus": "deployed",
    "DateCreated": "2015-08-13T19:16:25Z",
    "OptionSettings": [
      {
        "OptionName": "Availability Zones",
        "ResourceName": "AWSEBAutoScalingGroup",
        "Namespace": "aws:autoscaling:asg",
        "Value": "Any"
      },
      {
        "OptionName": "Cooldown",
        "ResourceName": "AWSEBAutoScalingGroup",
        "Namespace": "aws:autoscaling:asg",
        "Value": "360"
      },
      ...
      {
        "OptionName": "ConnectionDrainingTimeout",
        "ResourceName": "AWSEBLoadBalancer",
        "Namespace": "aws:elb:policies",
        "Value": "20"
      },
      {
        "OptionName": "ConnectionSettingIdleTimeout",
        "ResourceName": "AWSEBLoadBalancer",
        "Namespace": "aws:elb:policies",
        "Value": "60"
      }
    ],
    "DateUpdated": "2015-08-13T23:30:07Z",
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8
Java 8"
  }
]
}

```

For more information about namespaces and supported options, see [Option Values](#) in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [DescribeConfigurationSettings](#) in *AWS CLI Command Reference*.

describe-environment-health

The following code example shows how to use `describe-environment-health`.

AWS CLI

To view environment health

The following command retrieves overall health information for an environment named `my-env`:

```
aws elasticbeanstalk describe-environment-health --environment-name my-env --attribute-names All
```

Output:

```
{
  "Status": "Ready",
  "EnvironmentName": "my-env",
  "Color": "Green",
  "ApplicationMetrics": {
    "Duration": 10,
    "Latency": {
      "P99": 0.004,
      "P75": 0.002,
      "P90": 0.003,
      "P95": 0.004,
      "P85": 0.003,
      "P10": 0.001,
      "P999": 0.004,
      "P50": 0.001
    },
    "RequestCount": 45,
    "StatusCodes": {
      "Status3xx": 0,
      "Status2xx": 45,
      "Status5xx": 0,
      "Status4xx": 0
    }
  }
}
```

```
    }
  },
  "RefreshedAt": "2015-08-20T21:09:18Z",
  "HealthStatus": "Ok",
  "InstancesHealth": {
    "Info": 0,
    "Ok": 1,
    "Unknown": 0,
    "Severe": 0,
    "Warning": 0,
    "Degraded": 0,
    "NoData": 0,
    "Pending": 0
  },
  "Causes": []
}
```

Health information is only available for environments with enhanced health reporting enabled. For more information, see [Enhanced Health Reporting and Monitoring](#) in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [DescribeEnvironmentHealth](#) in *AWS CLI Command Reference*.

describe-environment-resources

The following code example shows how to use `describe-environment-resources`.

AWS CLI

To view information about the AWS resources in your environment

The following command retrieves information about resources in an environment named `my-env`:

```
aws elasticbeanstalk describe-environment-resources --environment-name my-env
```

Output:

```
{
  "EnvironmentResources": {
    "EnvironmentName": "my-env",
    "AutoScalingGroups": [
```

```

        {
            "Name": "awseb-e-qu3fyyjyjs-stack-AWSEBAutoScalingGroup-
QSB2Z088SXZT"
        }
    ],
    "Triggers": [],
    "LoadBalancers": [
        {
            "Name": "awseb-e-q-AWSEBLoa-1EEPZ0K98BIF0"
        }
    ],
    "Queues": [],
    "Instances": [
        {
            "Id": "i-0c91c786"
        }
    ],
    "LaunchConfigurations": [
        {
            "Name": "awseb-e-qu3fyyjyjs-stack-
AWSEBAutoScalingLaunchConfiguration-1UUVQIBC96TQ2"
        }
    ]
}
}
}

```

- For API details, see [DescribeEnvironmentResources](#) in *AWS CLI Command Reference*.

describe-environments

The following code example shows how to use `describe-environments`.

AWS CLI

To view information about an environment

The following command retrieves information about an environment named `my-env`:

```
aws elasticbeanstalk describe-environments --environment-names my-env
```

Output:

```
{
```

```
"Environments": [  
  {  
    "ApplicationName": "my-app",  
    "EnvironmentName": "my-env",  
    "VersionLabel": "7f58-stage-150812_025409",  
    "Status": "Ready",  
    "EnvironmentId": "e-rpqsewtp2j",  
    "EndpointURL": "awseb-e-w-AWSEBLoa-1483140XB0Q4L-109QXY8121.us-  
west-2.elb.amazonaws.com",  
    "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8  
Java 8",  
    "CNAME": "my-env.elasticbeanstalk.com",  
    "Health": "Green",  
    "AbortableOperationInProgress": false,  
    "Tier": {  
      "Version": " ",  
      "Type": "Standard",

    },  
    "DateUpdated": "2015-08-12T18:16:55.019Z",  
    "DateCreated": "2015-08-07T20:48:49.599Z"  
  }  
]
```

- For API details, see [DescribeEnvironments](#) in *AWS CLI Command Reference*.

describe-events

The following code example shows how to use `describe-events`.

AWS CLI

To view events for an environment

The following command retrieves events for an environment named `my-env`:

```
aws elasticbeanstalk describe-events --environment-name my-env
```

Output (abbreviated):

```
{
```

```

"Events": [
  {
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "Message": "Environment health has transitioned from Info to Ok.",
    "EventDate": "2015-08-20T07:06:53.535Z",
    "Severity": "INFO"
  },
  {
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "Severity": "INFO",
    "RequestId": "b7f3960b-4709-11e5-ba1e-07e16200da41",
    "Message": "Environment update completed successfully.",
    "EventDate": "2015-08-20T07:06:02.049Z"
  },
  ...
  {
    "ApplicationName": "my-app",
    "EnvironmentName": "my-env",
    "Severity": "INFO",
    "RequestId": "ca8dfbf6-41ef-11e5-988b-651aa638f46b",
    "Message": "Using elasticbeanstalk-us-west-2-012445113685 as Amazon S3
storage bucket for environment data.",

    "Message": "createEnvironment is starting.",
    "EventDate": "2015-08-13T19:16:26.581Z"
  }
]
}

```

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

describe-instances-health

The following code example shows how to use `describe-instances-health`.

AWS CLI

To view environment health

The following command retrieves health information for instances in an environment named `my-env`:

```
aws elasticbeanstalk describe-instances-health --environment-name my-env --
attribute-names All
```

Output:

```
{
  "InstanceHealthList": [
    {
      "InstanceId": "i-08691cc7",
      "ApplicationMetrics": {
        "Duration": 10,
        "Latency": {
          "P99": 0.006,
          "P75": 0.002,
          "P90": 0.004,
          "P95": 0.005,
          "P85": 0.003,
          "P10": 0.0,
          "P999": 0.006,
          "P50": 0.001
        },
        "RequestCount": 48,
        "StatusCodes": {
          "Status3xx": 0,
          "Status2xx": 47,
          "Status5xx": 0,
          "Status4xx": 1
        }
      },
      "System": {
        "LoadAverage": [
          0.0,
          0.02,

        ],
        "CPUUtilization": {
```

```
        "SoftIRQ": 0.1,  
        "IOWait": 0.2,  
        "System": 0.3,  
        "Idle": 97.8,  
        "User": 1.5,  
        "IRQ": 0.0,  
        "Nice": 0.1  
    }  
},  
"Color": "Green",  
"HealthStatus": "Ok",  
"LaunchedAt": "2015-08-13T19:17:09Z",  
"Causes": []  
}  
],  
"RefreshedAt": "2015-08-20T21:09:08Z"  
}
```

Health information is only available for environments with enhanced health reporting enabled. For more information, see [Enhanced Health Reporting and Monitoring](#) in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [DescribeInstancesHealth](#) in *AWS CLI Command Reference*.

list-available-solution-stacks

The following code example shows how to use `list-available-solution-stacks`.

AWS CLI

To view solution stacks

The following command lists solution stacks for all currently available platform configurations and any that you have used in the past:

```
aws elasticbeanstalk list-available-solution-stacks
```

Output (abbreviated):

```
{  
  "SolutionStacks": [  
    {
```

```

    "64bit Amazon Linux 2015.03 v2.0.0 running Node.js",
    "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.6",
    "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.5",
    "64bit Amazon Linux 2015.03 v2.0.0 running PHP 5.4",
    "64bit Amazon Linux 2015.03 v2.0.0 running Python 3.4",
    "64bit Amazon Linux 2015.03 v2.0.0 running Python 2.7",
    "64bit Amazon Linux 2015.03 v2.0.0 running Python",

Docker)",
    "64bit Debian jessie v2.0.0 running GlassFish 4.0 Java 7 (Preconfigured -
Docker)",
    "64bit Debian jessie v2.0.0 running Go 1.4 (Preconfigured - Docker)",
    "64bit Debian jessie v2.0.0 running Go 1.3 (Preconfigured - Docker)",
    "64bit Debian jessie v2.0.0 running Python 3.4 (Preconfigured - Docker)",
  ],
  "SolutionStackDetails": [
    {
      "PermittedFileTypes": [
        "zip"
      ],
      "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Node.js"
    },
    ...
  ]
}

```

- For API details, see [ListAvailableSolutionStacks](#) in *AWS CLI Command Reference*.

rebuild-environment

The following code example shows how to use `rebuild-environment`.

AWS CLI

To rebuild an environment

The following command terminates and recreates the resources in an environment named `my-env`:

```
aws elasticbeanstalk rebuild-environment --environment-name my-env
```

- For API details, see [RebuildEnvironment](#) in *AWS CLI Command Reference*.

request-environment-info

The following code example shows how to use `request-environment-info`.

AWS CLI

To request tailed logs

The following command requests logs from an environment named `my-env`:

```
aws elasticbeanstalk request-environment-info --environment-name my-env --info-type tail
```

After requesting logs, retrieve their location with `retrieve-environment-info`.

- For API details, see [RequestEnvironmentInfo](#) in *AWS CLI Command Reference*.

restart-app-server

The following code example shows how to use `restart-app-server`.

AWS CLI

To restart application servers

The following command restarts application servers on all instances in an environment named `my-env`:

```
aws elasticbeanstalk restart-app-server --environment-name my-env
```

- For API details, see [RestartAppServer](#) in *AWS CLI Command Reference*.

retrieve-environment-info

The following code example shows how to use `retrieve-environment-info`.

AWS CLI

To retrieve tailed logs

The following command retrieves a link to logs from an environment named `my-env`:

```
aws elasticbeanstalk retrieve-environment-info --environment-name my-env --info-type tail
```

Output:

```
{
  "EnvironmentInfo": [
    {
      "SampleTimestamp": "2015-08-20T22:23:17.703Z",
      "Message": "https://elasticbeanstalk-us-west-2-0123456789012.s3.amazonaws.com/resources/environments/logs/tail/e-fyqyju3yjs/i-09c1c867/TailLogs-1440109397703.out?AWSAccessKeyId=AKGPT4J56IAJ2EUBL5CQ&Expires=1440195891&Signature=n%2BEa10V6A2HI0x4Rcfb7LT16bBM%3D",
      "InfoType": "tail",
      "Ec2InstanceId": "i-09c1c867"
    }
  ]
}
```

View the link in a browser. Prior to retrieval, logs must be requested with `request-environment-info`.

- For API details, see [RetrieveEnvironmentInfo](#) in *AWS CLI Command Reference*.

swap-environment-cnames

The following code example shows how to use `swap-environment-cnames`.

AWS CLI

To swap environment CNAMEs

The following command swaps the assigned subdomains of two environments:

```
aws elasticbeanstalk swap-environment-cnames --source-environment-name my-env-blue
--destination-environment-name my-env-green
```

- For API details, see [SwapEnvironmentCnames](#) in *AWS CLI Command Reference*.

terminate-environment

The following code example shows how to use `terminate-environment`.

AWS CLI

To terminate an environment

The following command terminates an Elastic Beanstalk environment named `my-env`:

```
aws elasticbeanstalk terminate-environment --environment-name my-env
```

Output:

```
{
  "ApplicationName": "my-app",
  "EnvironmentName": "my-env",
  "Status": "Terminating",
  "EnvironmentId": "e-fh2eravpns",
  "EndpointURL": "awseb-e-f-AWSEBLoa-1I9XUMP4-8492WNUP202574.us-
west-2.elb.amazonaws.com",
  "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java
8",
  "CNAME": "my-env.elasticbeanstalk.com",
  "Health": "Grey",
  "AbortableOperationInProgress": false,
  "Tier": {
```

```
    "Version": " ",
    "Type": "Standard",
    "Name": "WebServer"
  },
  "DateUpdated": "2015-08-12T19:05:54.744Z",
  "DateCreated": "2015-08-12T18:52:53.622Z"
}
```

- For API details, see [TerminateEnvironment](#) in *AWS CLI Command Reference*.

update-application-version

The following code example shows how to use `update-application-version`.

AWS CLI

To change an application version's description

The following command updates the description of an application version named `22a0-stage-150819_185942`:

```
aws elasticbeanstalk update-application-version --version-label 22a0-
stage-150819_185942 --application-name my-app --description "new description"
```

Output:

```
{
  "ApplicationVersion": {
    "ApplicationName": "my-app",
    "VersionLabel": "22a0-stage-150819_185942",
    "Description": "new description",
    "DateCreated": "2015-08-19T18:59:17.646Z",
    "DateUpdated": "2015-08-20T22:53:28.871Z",
    "SourceBundle": {
      "S3Bucket": "elasticbeanstalk-us-west-2-0123456789012",
      "S3Key": "my-app/22a0-stage-150819_185942.war"
    }
  }
}
```

- For API details, see [UpdateApplicationVersion](#) in *AWS CLI Command Reference*.

update-application

The following code example shows how to use update-application.

AWS CLI

To change an application's description

The following command updates the description of an application named my-app:

```
aws elasticbeanstalk update-application --application-name my-app --description "my Elastic Beanstalk application"
```

Output:

```
{
  "Application": {
    "ApplicationName": "my-app",
    "Description": "my Elastic Beanstalk application",
    "Versions": [
      "2fba-stage-150819_234450",
      "bf07-stage-150820_214945",
      "93f8",
      "fd7c-stage-150820_000431",
      "22a0-stage-150819_185942"
    ],
    "DateCreated": "2015-08-13T19:15:50.449Z",
    "ConfigurationTemplates": [],
    "DateUpdated": "2015-08-20T22:34:56.195Z"
  }
}
```

- For API details, see [UpdateApplication](#) in *AWS CLI Command Reference*.

update-configuration-template

The following code example shows how to use update-configuration-template.

AWS CLI

To update a configuration template

The following command removes the configured CloudWatch custom health metrics configuration `ConfigDocument` from a saved configuration template named `my-template`:

```
aws elasticbeanstalk update-configuration-template --template-name my-template --application-name my-app --options-to-remove Namespace=aws:elasticbeanstalk:healthreporting:system,OptionName=ConfigDocument
```

Output:

```
{
  "ApplicationName": "my-app",
  "TemplateName": "my-template",
  "DateCreated": "2015-08-20T22:39:31Z",
  "DateUpdated": "2015-08-20T22:43:11Z",
  "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java 8"
}
```

For more information about namespaces and supported options, see [Option Values](#) in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [UpdateConfigurationTemplate](#) in *AWS CLI Command Reference*.

update-environment

The following code example shows how to use `update-environment`.

AWS CLI

To update an environment to a new version

The following command updates an environment named `"my-env"` to version `"v2"` of the application to which it belongs:

```
aws elasticbeanstalk update-environment --environment-name my-env --version-label v2
```

This command requires that the `"my-env"` environment already exists and belongs to an application that has a valid application version with the label `"v2"`.

Output:

```
{
```

```
"ApplicationName": "my-app",
"EnvironmentName": "my-env",
"VersionLabel": "v2",
"Status": "Updating",
"EnvironmentId": "e-szqipays4h",
"EndpointURL": "awseb-e-i-AWSEBLoa-1RD LX6TC9VUA0-0123456789.us-
west-2.elb.amazonaws.com",
"SolutionStackName": "64bit Amazon Linux running Tomcat 7",
"CNAME": "my-env.elasticbeanstalk.com",
"Health": "Grey",
"Tier": {
  "Version": " ",
  "Type": "Standard",
  "Name": "WebServer"
},
"DateUpdated": "2015-02-03T23:12:29.119Z",
"DateCreated": "2015-02-03T23:04:54.453Z"
}
```

To set an environment variable

The following command sets the value of the "PARAM1" variable in the "my-env" environment to "ParamValue":

```
aws elasticbeanstalk update-environment --environment-name my-env --option-settings
Namespace=aws:elasticbeanstalk:application:environment,OptionName=PARAM1,Value=ParamValue
```

The `option-settings` parameter takes a namespace in addition to the name and value of the variable. Elastic Beanstalk supports several namespaces for options in addition to environment variables.

To configure option settings from a file

The following command configures several options in the `aws:elb:loadbalancer` namespace from a file:

```
aws elasticbeanstalk update-environment --environment-name my-env --option-settings
file://options.json
```

`options.json` is a JSON object defining several settings:

```
[
```

```

{
  "Namespace": "aws:elb:healthcheck",
  "OptionName": "Interval",
  "Value": "15"
},
{
  "Namespace": "aws:elb:healthcheck",
  "OptionName": "Timeout",
  "Value": "8"
},
{
  "Namespace": "aws:elb:healthcheck",
  "OptionName": "HealthyThreshold",
  "Value": "2"
},
{
  "Namespace": "aws:elb:healthcheck",
  "OptionName": "UnhealthyThreshold",
  "Value": "3"
}
]

```

Output:

```

{
  "ApplicationName": "my-app",
  "EnvironmentName": "my-env",
  "VersionLabel": "7f58-stage-150812_025409",
  "Status": "Updating",
  "EnvironmentId": "e-wtp2rqpsej",
  "EndpointURL": "awseb-e-w-AWSEBLoa-14XB83101Q4L-104QXY80921.sa-
east-1.elb.amazonaws.com",
  "SolutionStackName": "64bit Amazon Linux 2015.03 v2.0.0 running Tomcat 8 Java
8",
  "CNAME": "my-env.elasticbeanstalk.com",
  "Health": "Grey",
  "AbortableOperationInProgress": true,
  "Tier": {
    "Version": " ",
    "Type": "Standard",
    "Name": "WebServer"
  },
  "DateUpdated": "2015-08-12T18:15:23.804Z",

```

```
"DateCreated": "2015-08-07T20:48:49.599Z"
}
```

For more information about namespaces and supported options, see [Option Values](#) in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [UpdateEnvironment](#) in *AWS CLI Command Reference*.

validate-configuration-settings

The following code example shows how to use `validate-configuration-settings`.

AWS CLI

To validate configuration settings

The following command validates a CloudWatch custom metrics config document:

```
aws elasticbeanstalk validate-configuration-settings --application-name my-app --
environment-name my-env --option-settings file://options.json
```

`options.json` is a JSON document that includes one or more configuration settings to `validate`:

```
[
  {
    "Namespace": "aws:elasticbeanstalk:healthreporting:system",
    "OptionName": "ConfigDocument",
    "Value": "{\"CloudWatchMetrics\": {\"Environment\":
{\\\"ApplicationLatencyP99.9\\\": null,\\\"InstancesSevere\\\": 60,
\\\"ApplicationLatencyP90\\\": 60,\\\"ApplicationLatencyP99\\\": null,
\\\"ApplicationLatencyP95\\\": 60,\\\"InstancesUnknown\\\": 60,\\\"ApplicationLatencyP85\\\":
60,\\\"InstancesInfo\\\": null,\\\"ApplicationRequests2xx\\\": null,\\\"InstancesDegraded
\\\": null,\\\"InstancesWarning\\\": 60,\\\"ApplicationLatencyP50\\\": 60,
\\\"ApplicationRequestsTotal\\\": null,\\\"InstancesNoData\\\": null,\\\"InstancesPending
\\\": 60,\\\"ApplicationLatencyP10\\\": null,\\\"ApplicationRequests5xx\\\": null,
\\\"ApplicationLatencyP75\\\": null,\\\"Instances0k\\\": 60,\\\"ApplicationRequests3xx\\\":
null,\\\"ApplicationRequests4xx\\\": null},\\\"Instance\\\": {\\\"ApplicationLatencyP99.9\\\":
null,\\\"ApplicationLatencyP90\\\": 60,\\\"ApplicationLatencyP99\\\": null,
\\\"ApplicationLatencyP95\\\": null,\\\"ApplicationLatencyP85\\\": null,\\\"CPUUser\\\": 60,
\\\"ApplicationRequests2xx\\\": null,\\\"CPUIdle\\\": null,\\\"ApplicationLatencyP50\\\":
```

```

    null,\"ApplicationRequestsTotal\": 60,\"RootFilesystemUtil\": null,
    \"LoadAverage1min\": null,\"CPUirq\": null,\"CPUNice\": 60,\"CPUiowait\": 60,
    \"ApplicationLatencyP10\": null,\"LoadAverage5min\": null,\"ApplicationRequests5xx
    \": null,\"ApplicationLatencyP75\": 60,\"CPUSystem\": 60,\"ApplicationRequests3xx\":
    60,\"ApplicationRequests4xx\": null,\"InstanceHealth\": null,\"CPUSoftirq\": 60}},
    \"Version\": 1}
  }
]

```

If the options that you specify are valid for the specified environment, Elastic Beanstalk returns an empty Messages array:

```

{
  "Messages": []
}

```

If validation fails, the response will include information about the error:

```

{
  "Messages": [
    {
      "OptionName": "ConfigDocumet",
      "Message": "Invalid option specification (Namespace:
      'aws:elasticbeanstalk:healthreporting:system', OptionName: 'ConfigDocumet'):
      Unknown configuration setting.",
      "Namespace": "aws:elasticbeanstalk:healthreporting:system",
      "Severity": "error"
    }
  ]
}

```

For more information about namespaces and supported options, see Option Values in the *AWS Elastic Beanstalk Developer Guide*.

- For API details, see [ValidateConfigurationSettings](#) in *AWS CLI Command Reference*.

Elastic Load Balancing - Version 1 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing - Version 1.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-tags

The following code example shows how to use add-tags.

AWS CLI

To add a tag to a load balancer

This example adds tags to the specified load balancer.

Command:

```
aws elb add-tags --load-balancer-name my-load-balancer --tags
"Key=project,Value=lima" "Key=department,Value=digital-media"
```

- For API details, see [AddTags](#) in *AWS CLI Command Reference*.

apply-security-groups-to-load-balancer

The following code example shows how to use apply-security-groups-to-load-balancer.

AWS CLI

To associate a security group with a load balancer in a VPC

This example associates a security group with the specified load balancer in a VPC.

Command:

```
aws elb apply-security-groups-to-load-balancer --load-balancer-name my-load-balancer
--security-groups sg-fc448899
```

Output:

```
{
  "SecurityGroups": [
    "sg-fc448899"
  ]
}
```

- For API details, see [ApplySecurityGroupsToLoadBalancer](#) in *AWS CLI Command Reference*.

attach-load-balancer-to-subnets

The following code example shows how to use `attach-load-balancer-to-subnets`.

AWS CLI

To attach subnets to a load balancer

This example adds the specified subnet to the set of configured subnets for the specified load balancer.

Command:

```
aws elb attach-load-balancer-to-subnets --load-balancer-name my-load-balancer --
subnets subnet-0ecac448
```

Output:

```
{
  "Subnets": [
    "subnet-15aaab61",
    "subnet-0ecac448"
  ]
}
```

```
}
```

- For API details, see [AttachLoadBalancerToSubnets](#) in *AWS CLI Command Reference*.

configure-health-check

The following code example shows how to use `configure-health-check`.

AWS CLI

To specify the health check settings for your backend EC2 instances

This example specifies the health check settings used to evaluate the health of your backend EC2 instances.

Command:

```
aws elb configure-health-check --load-balancer-name my-load-balancer --health-check
  Target=HTTP:80/png,Interval=30,UnhealthyThreshold=2,HealthyThreshold=2,Timeout=3
```

Output:

```
{
  "HealthCheck": {
    "HealthyThreshold": 2,
    "Interval": 30,
    "Target": "HTTP:80/png",
    "Timeout": 3,
    "UnhealthyThreshold": 2
  }
}
```

- For API details, see [ConfigureHealthCheck](#) in *AWS CLI Command Reference*.

create-app-cookie-stickiness-policy

The following code example shows how to use `create-app-cookie-stickiness-policy`.

AWS CLI

To generate a stickiness policy for your HTTPS load balancer

This example generates a stickiness policy that follows the sticky session lifetimes of the application-generated cookie.

Command:

```
aws elb create-app-cookie-stickiness-policy --load-balancer-name my-load-balancer --policy-name my-app-cookie-policy --cookie-name my-app-cookie
```

- For API details, see [CreateAppCookieStickinessPolicy](#) in *AWS CLI Command Reference*.

create-lb-cookie-stickiness-policy

The following code example shows how to use `create-lb-cookie-stickiness-policy`.

AWS CLI

To generate a duration-based stickiness policy for your HTTPS load balancer

This example generates a stickiness policy with sticky session lifetimes controlled by the specified expiration period.

Command:

```
aws elb create-lb-cookie-stickiness-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy --cookie-expiration-period 60
```

- For API details, see [CreateLbCookieStickinessPolicy](#) in *AWS CLI Command Reference*.

create-load-balancer-listeners

The following code example shows how to use `create-load-balancer-listeners`.

AWS CLI

To create HTTP listeners for a load balancer

This example creates a listener for your load balancer at port 80 using the HTTP protocol.

Command:

```
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --  
listeners "Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"
```

To create HTTPS listeners for a load balancer

This example creates a listener for your load balancer at port 443 using the HTTPS protocol.

Command:

```
aws elb create-load-balancer-listeners --load-balancer-name my-load-balancer --  
listeners  
"Protocol=HTTPS,LoadBalancerPort=443,InstanceProtocol=HTTP,InstancePort=80"
```

- For API details, see [CreateLoadBalancerListeners](#) in *AWS CLI Command Reference*.

create-load-balancer-policy

The following code example shows how to use `create-load-balancer-policy`.

AWS CLI

To create a policy that enables Proxy Protocol on a load balancer

This example creates a policy that enables Proxy Protocol on the specified load balancer.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-  
name my-ProxyProtocol-policy --policy-type-name ProxyProtocolPolicyType --policy-  
attributes AttributeName=ProxyProtocol,AttributeValue=true
```

To create an SSL negotiation policy using the recommended security policy

This example creates an SSL negotiation policy for the specified HTTPS load balancer using the recommended security policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-  
balancer --policy-name my-SSLNegotiation-policy --policy-type-name
```

```
SSLNegotiationPolicyType --policy-attributes AttributeName=Reference-Security-
Policy,AttributeValue=ELBSecurityPolicy-2015-03
```

To create an SSL negotiation policy using a custom security policy

This example creates an SSL negotiation policy for your HTTPS load balancer using a custom security policy by enabling the protocols and the ciphers.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-
name my-SSLNegotiation-policy --policy-type-name SSLNegotiationPolicyType --policy-
attributes AttributeName=Protocol-SSLv3,AttributeValue=true AttributeName=Protocol-
TLSv1.1,AttributeValue=true AttributeName=DHE-RSA-AES256-SHA256,AttributeValue=true
AttributeName=Server-Defined-Cipher-Order,AttributeValue=true
```

To create a public key policy

This example creates a public key policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-balancer --policy-
name my-PublicKey-policy --policy-type-name PublicKeyPolicyType --policy-attributes
AttributeName=PublicKey,AttributeValue=MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAwAYUjnfY
+dS74kj//c6x7R0tusUaeQCTgIUkayttRDWchuqo1pHC1u
+n5xxXnBBE2ejbb2WRsKIQ5rXEeixsjFpFsojpSQKkzhVGI6mJVZBJDVKSHmswnwLBdofLhzvllpovBPTHe
+o4haAWvDBALJU0pkSI1FecPHcs2hwx14zHoXy1e2k36A64nXW43wtfx5qcVSIxtCE0jnYRg7RPvybaGfQ
+v6Iaxb/+7J5kEvZhTFQId+bSiJImF1FSUT1W1xwzBZPUbcUkkXDj45vC2s3Z8E
+Lk7a3uZhvsQHLZnrFuWjBWGWvZ/MhZYgEXAMPLE
```

To create a backend server authentication policy

This example creates a backend server authentication policy that enables authentication on your backend instance using a public key policy.

Command:

```
aws elb create-load-balancer-policy --load-balancer-name my-load-
balancer --policy-name my-authentication-policy --policy-type-
```

```
name BackendServerAuthenticationPolicyType --policy-attributes
Attribute=PublicKeyPolicyName,AttributeValue=my-PublicKey-policy
```

- For API details, see [CreateLoadBalancerPolicy](#) in *AWS CLI Command Reference*.

create-load-balancer

The following code example shows how to use `create-load-balancer`.

AWS CLI

To create an HTTP load balancer

This example creates a load balancer with an HTTP listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners
"Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --subnets
subnet-15aaab61 --security-groups sg-a61988c3
```

Output:

```
{
  "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"
}
```

This example creates a load balancer with an HTTP listener in EC2-Classic.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners
"Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --
availability-zones us-west-2a us-west-2b
```

Output:

```
{
  "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

```
}
```

To create an HTTPS load balancer

This example creates a load balancer with an HTTPS listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners  
"Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"  
"Protocol=HTTPS,LoadBalancerPort=443,InstanceProtocol=HTTP,InstancePort=80,SSLCertificateId  
certificate/my-server-cert" --subnets subnet-15aaab61 --security-groups sg-a61988c3
```

Output:

```
{  
  "DNSName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com"  
}
```

This example creates a load balancer with an HTTPS listener in EC2-Classic.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners  
"Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80"  
"Protocol=HTTPS,LoadBalancerPort=443,InstanceProtocol=HTTP,InstancePort=80,SSLCertificateId  
certificate/my-server-cert" --availability-zones us-west-2a us-west-2b
```

Output:

```
{  
  "DNSName": "my-load-balancer-123456789.us-west-2.elb.amazonaws.com"  
}
```

To create an internal load balancer

This example creates an internal load balancer with an HTTP listener in a VPC.

Command:

```
aws elb create-load-balancer --load-balancer-name my-load-balancer --listeners
"Protocol=HTTP,LoadBalancerPort=80,InstanceProtocol=HTTP,InstancePort=80" --scheme
internal --subnets subnet-a85db0df --security-groups sg-a61988c3
```

Output:

```
{
  "DNSName": "internal-my-load-balancer-123456789.us-west-2.elb.amazonaws.com"
}
```

- For API details, see [CreateLoadBalancer](#) in *AWS CLI Command Reference*.

delete-load-balancer-listeners

The following code example shows how to use `delete-load-balancer-listeners`.

AWS CLI

To delete a listener from your load balancer

This example deletes the listener for the specified port from the specified load balancer.

Command:

```
aws elb delete-load-balancer-listeners --load-balancer-name my-load-balancer --load-
balancer-ports 80
```

- For API details, see [DeleteLoadBalancerListeners](#) in *AWS CLI Command Reference*.

delete-load-balancer-policy

The following code example shows how to use `delete-load-balancer-policy`.

AWS CLI

To delete a policy from your load balancer

This example deletes the specified policy from the specified load balancer. The policy must not be enabled on any listener.

Command:

```
aws elb delete-load-balancer-policy --load-balancer-name my-load-balancer --policy-name my-duration-cookie-policy
```

- For API details, see [DeleteLoadBalancerPolicy](#) in *AWS CLI Command Reference*.

delete-load-balancer

The following code example shows how to use `delete-load-balancer`.

AWS CLI**To delete a load balancer**

This example deletes the specified load balancer.

Command:

```
aws elb delete-load-balancer --load-balancer-name my-load-balancer
```

- For API details, see [DeleteLoadBalancer](#) in *AWS CLI Command Reference*.

deregister-instances-from-load-balancer

The following code example shows how to use `deregister-instances-from-load-balancer`.

AWS CLI**To deregister instances from a load balancer**

This example deregisters the specified instance from the specified load balancer.

Command:

```
aws elb deregister-instances-from-load-balancer --load-balancer-name my-load-balancer --instances i-d6f6fae3
```

Output:

```
{
  "Instances": [
    {
      "InstanceId": "i-207d9717"
    },
    {
      "InstanceId": "i-afefb49b"
    }
  ]
}
```

- For API details, see [DeregisterInstancesFromLoadBalancer](#) in *AWS CLI Command Reference*.

describe-account-limits

The following code example shows how to use `describe-account-limits`.

AWS CLI

To describe your Classic Load Balancer limits

The following `describe-account-limits` example displays details about the Classic Load Balancer limits for your AWS account.

```
aws elb describe-account-limits
```

Output:

```
{
  "Limits": [
    {
      "Name": "classic-load-balancers",
      "Max": "20"
    },
    {
      "Name": "classic-listeners",
      "Max": "100"
    },
    {
      "Name": "classic-registered-instances",
      "Max": "1000"
    }
  ]
}
```

```
    }  
  ]  
}
```

- For API details, see [DescribeAccountLimits](#) in *AWS CLI Command Reference*.

describe-instance-health

The following code example shows how to use `describe-instance-health`.

AWS CLI

To describe the health of the instances for a load balancer

This example describes the health of the instances for the specified load balancer.

Command:

```
aws elb describe-instance-health --load-balancer-name my-load-balancer
```

Output:

```
{  
  "InstanceStates": [  
    {  
      "InstanceId": "i-207d9717",  
      "ReasonCode": "N/A",  
      "State": "InService",  
      "Description": "N/A"  
    },  
    {  
      "InstanceId": "i-afefb49b",  
      "ReasonCode": "N/A",  
      "State": "InService",  
      "Description": "N/A"  
    }  
  ]  
}
```

To describe the health of an instance for a load balancer

This example describes the health of the specified instance for the specified load balancer.

Command:

```
aws elb describe-instance-health --load-balancer-name my-load-balancer --instances
i-7299c809
```

The following is an example response for an instance that is registering.

Output:

```
{
  "InstanceStates": [
    {
      "InstanceId": "i-7299c809",
      "ReasonCode": "ELB",
      "State": "OutOfService",
      "Description": "Instance registration is still in progress."
    }
  ]
}
```

The following is an example response for an unhealthy instance.

Output:

```
{
  "InstanceStates": [
    {
      "InstanceId": "i-7299c809",
      "ReasonCode": "Instance",
      "State": "OutOfService",
      "Description": "Instance has failed at least the UnhealthyThreshold number
of health checks consecutively."
    }
  ]
}
```

- For API details, see [DescribeInstanceHealth](#) in *AWS CLI Command Reference*.

describe-load-balancer-attributes

The following code example shows how to use `describe-load-balancer-attributes`.

AWS CLI

To describe the attributes of a load balancer

This example describes the attributes of the specified load balancer.

Command:

```
aws elb describe-load-balancer-attributes --load-balancer-name my-load-balancer
```

Output:

```
{
  "LoadBalancerAttributes": {
    "ConnectionDraining": {
      "Enabled": false,
      "Timeout": 300
    },
    "CrossZoneLoadBalancing": {
      "Enabled": true
    },
    "ConnectionSettings": {
      "IdleTimeout": 30
    },
    "AccessLog": {
      "Enabled": false
    }
  }
}
```

- For API details, see [DescribeLoadBalancerAttributes](#) in *AWS CLI Command Reference*.

describe-load-balancer-policies

The following code example shows how to use `describe-load-balancer-policies`.

AWS CLI

To describe all policies associated with a load balancer

This example describes all of the policies associated with the specified load balancer.

Command:

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer
```

Output:

```
{
  "PolicyDescriptions": [
    {
      "PolicyAttributeDescriptions": [
        {
          "AttributeName": "ProxyProtocol",
          "AttributeValue": "true"
        }
      ],
      "PolicyName": "my-ProxyProtocol-policy",
      "PolicyTypeName": "ProxyProtocolPolicyType"
    },
    {
      "PolicyAttributeDescriptions": [
        {
          "AttributeName": "CookieName",
          "AttributeValue": "my-app-cookie"
        }
      ],
      "PolicyName": "my-app-cookie-policy",
      "PolicyTypeName": "AppCookieStickinessPolicyType"
    },
    {
      "PolicyAttributeDescriptions": [
        {
          "AttributeName": "CookieExpirationPeriod",
          "AttributeValue": "60"
        }
      ],
      "PolicyName": "my-duration-cookie-policy",
      "PolicyTypeName": "LBCookieStickinessPolicyType"
    },
    .
    .
    .
  ]
}
```

To describe a specific policy associated with a load balancer

This example describes the specified policy associated with the specified load balancer.

Command:

```
aws elb describe-load-balancer-policies --load-balancer-name my-load-balancer --  
policy-name my-authentication-policy
```

Output:

```
{  
  "PolicyDescriptions": [  
    {  
      "PolicyAttributeDescriptions": [  
        {  
          "AttributeName": "PublicKeyPolicyName",  
          "AttributeValue": "my-PublicKey-policy"  
        }  
      ],  
      "PolicyName": "my-authentication-policy",  
      "PolicyTypeName": "BackendServerAuthenticationPolicyType"  
    }  
  ]  
}
```

- For API details, see [DescribeLoadBalancerPolicies](#) in *AWS CLI Command Reference*.

describe-load-balancer-policy-types

The following code example shows how to use `describe-load-balancer-policy-types`.

AWS CLI

To describe the load balancer policy types defined by Elastic Load Balancing

This example describes the load balancer policy types that you can use to create policy configurations for your load balancer.

Command:

```
aws elb describe-load-balancer-policy-types
```

Output:

```
{
  "PolicyTypeDescriptions": [
    {
      "PolicyAttributeTypeDescriptions": [
        {
          "Cardinality": "ONE",
          "AttributeName": "ProxyProtocol",
          "AttributeType": "Boolean"
        }
      ],
      "PolicyTypeName": "ProxyProtocolPolicyType",
      "Description": "Policy that controls whether to include the IP address and
port of the originating request for TCP messages. This policy operates on TCP/SSL
listeners only"
    },
    {
      "PolicyAttributeTypeDescriptions": [
        {
          "Cardinality": "ONE",
          "AttributeName": "PublicKey",
          "AttributeType": "String"
        }
      ],
      "PolicyTypeName": "PublicKeyPolicyType",
      "Description": "Policy containing a list of public keys to
accept when authenticating the back-end server(s). This policy cannot be
applied directly to back-end servers or listeners but must be part of a
BackendServerAuthenticationPolicyType."
    },
    {
      "PolicyAttributeTypeDescriptions": [
        {
          "Cardinality": "ONE",
          "AttributeName": "CookieName",
          "AttributeType": "String"
        }
      ],
      "PolicyTypeName": "AppCookieStickinessPolicyType",
      "Description": "Stickiness policy with session lifetimes controlled by the
lifetime of the application-generated cookie. This policy can be associated only
with HTTP/HTTPS listeners."
    },
  ],
}
```

```

    {
      "PolicyAttributeTypeDescriptions": [
        {
          "Cardinality": "ZERO_OR_ONE",
          "AttributeName": "CookieExpirationPeriod",
          "AttributeType": "Long"
        }
      ],
      "PolicyTypeName": "LBCookieStickinessPolicyType",
      "Description": "Stickiness policy with session lifetimes controlled by
the browser (user-agent) or a specified expiration period. This policy can be
associated only with HTTP/HTTPS listeners."
    },
    {
      "PolicyAttributeTypeDescriptions": [
        .
        .
        .
      ],
      "PolicyTypeName": "SSLNegotiationPolicyType",
      "Description": "Listener policy that defines the ciphers and protocols
that will be accepted by the load balancer. This policy can be associated only with
HTTPS/SSL listeners."
    },
    {
      "PolicyAttributeTypeDescriptions": [
        {
          "Cardinality": "ONE_OR_MORE",
          "AttributeName": "PublicKeyPolicyName",
          "AttributeType": "PolicyName"
        }
      ],
      "PolicyTypeName": "BackendServerAuthenticationPolicyType",
      "Description": "Policy that controls authentication to back-end server(s)
and contains one or more policies, such as an instance of a PublicKeyPolicyType.
This policy can be associated only with back-end servers that are using HTTPS/SSL."
    }
  ]
}

```

- For API details, see [DescribeLoadBalancerPolicyTypes](#) in *AWS CLI Command Reference*.

describe-load-balancers

The following code example shows how to use describe-load-balancers.

AWS CLI

To describe your load balancers

This example describes all of your load balancers.

Command:

```
aws elb describe-load-balancers
```

To describe one of your load balancers

This example describes the specified load balancer.

Command:

```
aws elb describe-load-balancers --load-balancer-name my-load-balancer
```

The following example response is for an HTTPS load balancer in a VPC.

Output:

```
{
  "LoadBalancerDescriptions": [
    {
      "Subnets": [
        "subnet-15aaab61"
      ],
      "CanonicalHostedZoneNameID": "Z3DZXE0EXAMPLE",
      "CanonicalHostedZoneName": "my-load-balancer-1234567890.us-west-2.elb.amazonaws.com",
      "ListenerDescriptions": [
        {
          "Listener": {
            "InstancePort": 80,
            "LoadBalancerPort": 80,
            "Protocol": "HTTP",
            "InstanceProtocol": "HTTP"
          },
          "PolicyNames": []
        }
      ]
    }
  ]
}
```

```
    },
    {
      "Listener": {
        "InstancePort": 443,
        "SSLCertificateId": "arn:aws:iam::123456789012:server-certificate/

    "GroupName": "my-elb-sg"
  }
}
]
}

```

- For API details, see [DescribeLoadBalancers](#) in *AWS CLI Command Reference*.

describe-tags

The following code example shows how to use describe-tags.

AWS CLI

To describe the tags assigned to a load balancer

This example describes the tags assigned to the specified load balancer.

Command:

```
aws elb describe-tags --load-balancer-name my-load-balancer
```

Output:

```
{
  "TagDescriptions": [
    {
      "Tags": [
        {
          "Value": "lima",
          "Key": "project"
        },
        {
          "Value": "digital-media",
          "Key": "department"
        }
      ],
      "LoadBalancerName": "my-load-balancer"
    }
  ]
}
```

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

detach-load-balancer-from-subnets

The following code example shows how to use `detach-load-balancer-from-subnets`.

AWS CLI**To detach load balancers from subnets**

This example detaches the specified load balancer from the specified subnet.

Command:

```
aws elb detach-load-balancer-from-subnets --load-balancer-name my-load-balancer --
subnets subnet-0ecac448
```

Output:

```
{
  "Subnets": [
    "subnet-15aaab61"
  ]
}
```

- For API details, see [DetachLoadBalancerFromSubnets](#) in *AWS CLI Command Reference*.

disable-availability-zones-for-load-balancer

The following code example shows how to use `disable-availability-zones-for-load-balancer`.

AWS CLI

To disable Availability Zones for a load balancer

This example removes the specified Availability Zone from the set of Availability Zones for the specified load balancer.

Command:

```
aws elb disable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2a
```

Output:

```
{
  "AvailabilityZones": [
    "us-west-2b"
  ]
}
```

- For API details, see [DisableAvailabilityZonesForLoadBalancer](#) in *AWS CLI Command Reference*.

enable-availability-zones-for-load-balancer

The following code example shows how to use `enable-availability-zones-for-load-balancer`.

AWS CLI

To enable Availability Zones for a load balancer

This example adds the specified Availability Zone to the specified load balancer.

Command:

```
aws elb enable-availability-zones-for-load-balancer --load-balancer-name my-load-balancer --availability-zones us-west-2b
```

Output:

```
{
  "AvailabilityZones": [
    "us-west-2a",
    "us-west-2b"
  ]
}
```

- For API details, see [EnableAvailabilityZonesForLoadBalancer](#) in *AWS CLI Command Reference*.

modify-load-balancer-attributes

The following code example shows how to use `modify-load-balancer-attributes`.

AWS CLI

To modify the attributes of a load balancer

This example modifies the `CrossZoneLoadBalancing` attribute of the specified load balancer.

Command:

```
aws elb modify-load-balancer-attributes --load-balancer-name my-load-balancer --load-balancer-attributes "{\"CrossZoneLoadBalancing\":{\"Enabled\":true}}"
```

Output:

```
{
  "LoadBalancerAttributes": {
    "CrossZoneLoadBalancing": {
```

```
        "Enabled": true
      }
    },
    "LoadBalancerName": "my-load-balancer"
  }
```

This example modifies the `ConnectionDraining` attribute of the specified load balancer.

Command:

```
aws elb modify-load-balancer-attributes --load-balancer-name my-load-balancer
--load-balancer-attributes "{\"ConnectionDraining\":{\"Enabled\":true,\"Timeout
\":300}}"
```

Output:

```
{
  "LoadBalancerAttributes": {
    "ConnectionDraining": {
      "Enabled": true,
      "Timeout": 300
    }
  },
  "LoadBalancerName": "my-load-balancer"
}
```

- For API details, see [ModifyLoadBalancerAttributes](#) in *AWS CLI Command Reference*.

register-instances-with-load-balancer

The following code example shows how to use `register-instances-with-load-balancer`.

AWS CLI

To register instances with a load balancer

This example registers the specified instance with the specified load balancer.

Command:

```
aws elb register-instances-with-load-balancer --load-balancer-name my-load-balancer
--instances i-d6f6fae3
```

Output:

```
{
  "Instances": [
    {
      "InstanceId": "i-d6f6fae3"
    },
    {
      "InstanceId": "i-207d9717"
    },
    {
      "InstanceId": "i-afefb49b"
    }
  ]
}
```

- For API details, see [RegisterInstancesWithLoadBalancer](#) in *AWS CLI Command Reference*.

remove-tags

The following code example shows how to use `remove-tags`.

AWS CLI**To remove tags from a load balancer**

This example removes a tag from the specified load balancer.

Command:

```
aws elb remove-tags --load-balancer-name my-load-balancer --tags project
```

- For API details, see [RemoveTags](#) in *AWS CLI Command Reference*.

set-load-balancer-listener-ssl-certificate

The following code example shows how to use `set-load-balancer-listener-ssl-certificate`.

AWS CLI**To update the SSL certificate for an HTTPS load balancer**

This example replaces the existing SSL certificate for the specified HTTPS load balancer.

Command:

```
aws elb set-load-balancer-listener-ssl-certificate --load-balancer-name my-load-balancer --load-balancer-port 443 --ssl-certificate-id arn:aws:iam::123456789012:server-certificate/new-server-cert
```

- For API details, see [SetLoadBalancerListenerSslCertificate](#) in *AWS CLI Command Reference*.

set-load-balancer-policies-for-backend-server

The following code example shows how to use `set-load-balancer-policies-for-backend-server`.

AWS CLI

To replace the policies associated with a port for a backend instance

This example replaces the policies that are currently associated with the specified port.

Command:

```
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names my-ProxyProtocol-policy
```

To remove all policies that are currently associated with a port on your backend instance

This example removes all policies associated with the specified port.

Command:

```
aws elb set-load-balancer-policies-for-backend-server --load-balancer-name my-load-balancer --instance-port 80 --policy-names []
```

To confirm that the policies are removed, use the `describe-load-balancer-policies` command.

- For API details, see [SetLoadBalancerPoliciesForBackendServer](#) in *AWS CLI Command Reference*.

set-load-balancer-policies-of-listener

The following code example shows how to use `set-load-balancer-policies-of-listener`.

AWS CLI

To replace the policies associated with a listener

This example replaces the policies that are currently associated with the specified listener.

Command:

```
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer
--load-balancer-port 443 --policy-names my-SSLNegotiation-policy
```

To remove all policies associated with your listener

This example removes all policies that are currently associated with the specified listener.

Command:

```
aws elb set-load-balancer-policies-of-listener --load-balancer-name my-load-balancer
--load-balancer-port 443 --policy-names []
```

To confirm that the policies are removed from the load balancer, use the `describe-load-balancer-policies` command.

- For API details, see [SetLoadBalancerPoliciesOfListener](#) in *AWS CLI Command Reference*.

Elastic Load Balancing - Version 2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Load Balancing - Version 2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-listener-certificates

The following code example shows how to use `add-listener-certificates`.

AWS CLI

To add a certificate to a secure listener

This example adds the specified certificate to the specified secure listener.

Command:

```
aws elbv2 add-listener-certificates --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 --certificates CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705
```

Output:

```
{
  "Certificates": [
    {
      "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705",
      "IsDefault": false
    }
  ]
}
```

- For API details, see [AddListenerCertificates](#) in *AWS CLI Command Reference*.

add-tags

The following code example shows how to use `add-tags`.

AWS CLI

To add tags to a load balancer

The following `add-tags` example adds the `project` and `department` tags to the specified load balancer.

```
aws elbv2 add-tags \  
  --resource-arns arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \  
  --tags "Key=project,Value=lima" "Key=department,Value=digital-media"
```

- For API details, see [AddTags](#) in *AWS CLI Command Reference*.

create-listener

The following code example shows how to use `create-listener`.

AWS CLI

Example 1: To create an HTTP listener

The following `create-listener` example creates an HTTP listener for the specified Application Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \  
  --load-balancer-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \  
  --protocol HTTP \  
  --port 80 \  
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see [Tutorial: Create an Application Load Balancer using the AWS CLI](#) in the *User Guide for Application Load Balancers*.

Example 2: To create an HTTPS listener

The following `create-listener` example creates an HTTPS listener for the specified Application Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for an HTTPS listener. You can create and manage certificates using AWS Certificate Manager (ACM). Alternatively, you can create a certificate using SSL/TLS tools,

get the certificate signed by a certificate authority (CA), and upload the certificate to AWS Identity and Access Management (IAM).

```
aws elbv2 create-listener \  
  --load-balancer-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \  
  --protocol HTTPS \  
  --port 443 \  
  --certificates CertificateArn=arn:aws:acm:us-  
west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557 \  
  --ssl-policy ELBSecurityPolicy-2016-08 \  
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see [Add an HTTPS listener](#) in the *User Guide for Application Load Balancers*.

Example 3: To create a TCP listener

The following `create-listener` example creates a TCP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \  
  --load-balancer-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e \  
  --protocol TCP \  
  --port 80 \  
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

For more information, see [Tutorial: Create a Network Load Balancer using the AWS CLI](#) in the *User Guide for Network Load Balancers*.

Example 4: To create a TLS listener

The following `create-listener` example creates a TLS listener for the specified Network Load Balancer that forwards requests to the specified target group. You must specify an SSL certificate for a TLS listener.

```
aws elbv2 create-listener \  
  --load-balancer-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \  
  --protocol TLS \  
  --port 443 \  
  --certificates CertificateArn=arn:aws:acm:us-  
west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557 \  
  --ssl-policy ELBSecurityPolicy-2016-08 \  
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

```
--protocol TLS \  
--port 443 \  
--certificates CertificateArn=arn:aws:acm:us-  
west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557 \  
--ssl-policy ELBSecurityPolicy-2016-08 \  
--default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

For more information, see [TLS listeners for your Network Load Balancer](#) in the *User Guide for Network Load Balancers*.

Example 5: To create a UDP listener

The following `create-listener` example creates a UDP listener for the specified Network Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \  
  --load-balancer-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e \  
  --protocol UDP \  
  --port 53 \  
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-tcp-targets/b6bba954d1361c78
```

For more information, see [Tutorial: Create a Network Load Balancer using the AWS CLI](#) in the *User Guide for Network Load Balancers*.

Example 6: To create a listener for the specified gateway and forwarding

The following `create-listener` example creates a listener for the specified Gateway Load Balancer that forwards requests to the specified target group.

```
aws elbv2 create-listener \  
  --load-balancer-arn arn:aws:elasticloadbalancing:us-  
east-1:850631746142:loadbalancer/gwy/my-gateway-load-balancer/e0f9b3d5c7f7d3d6 \  
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-  
east-1:850631746142:targetgroup/my-glb-targets/007ca469fae3bb1615
```

Output:

```
{
```

```

    "Listeners": [
      {
        "ListenerArn": "arn:aws:elasticloadbalancing:us-
east-1:850631746142:listener/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6/
afc127db15f925de",
        "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
east-1:850631746142:loadbalancer/gwy/my-agw-lb-example2/e0f9b3d5c7f7d3d6",
        "DefaultActions": [
          {
            "Type": "forward",
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
east-1:850631746142:targetgroup/test-tg-agw-2/007ca469fae3bb1615",
            "ForwardConfig": {
              "TargetGroups": [
                {
                  "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
east-1:850631746142:targetgroup/test-tg-agw-2/007ca469fae3bb1615"
                }
              ]
            }
          }
        ]
      }
    ]
  }
}

```

For more information, see [Getting started with Gateway Load Balancers using the AWS CLI](#) in the *User Guide for Gateway Load Balancers*.

- For API details, see [CreateListener](#) in *AWS CLI Command Reference*.

create-load-balancer

The following code example shows how to use `create-load-balancer`.

AWS CLI

Example 1: To create an Internet-facing load balancer

The following `create-load-balancer` example creates an Internet-facing Application Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \
```

```
--name my-load-balancer \  
--subnets subnet-b7d581c0 subnet-8360a9e7
```

Output:

```
{  
  "LoadBalancers": [  
    {  
      "Type": "application",  
      "Scheme": "internet-facing",  
      "IpAddressType": "ipv4",  
      "VpcId": "vpc-3ac0fb5f",  
      "AvailabilityZones": [  
        {  
          "ZoneName": "us-west-2a",  
          "SubnetId": "subnet-8360a9e7"  
        },  
        {  
          "ZoneName": "us-west-2b",  
          "SubnetId": "subnet-b7d581c0"  
        }  
      ],  
      "CreatedTime": "2017-08-25T21:26:12.920Z",  
      "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",  
      "DNSName": "my-load-balancer-424835706.us-west-2.elb.amazonaws.com",  
      "SecurityGroups": [  
        "sg-5943793c"  
      ],  
      "LoadBalancerName": "my-load-balancer",  
      "State": {  
        "Code": "provisioning"  
      },  
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"  
    }  
  ]  
}
```

For more information, see [Tutorial: Create an Application Load Balancer using the AWS CLI](#) in the *User Guide for Application Load Balancers*.

Example 2: To create an internal load balancer

The following `create-load-balancer` example creates an internal Application Load Balancer and enables the Availability Zones for the specified subnets.

```
aws elbv2 create-load-balancer \  
  --name my-internal-load-balancer \  
  --scheme internal \  
  --subnets subnet-b7d581c0 subnet-8360a9e7
```

Output:

```
{  
  "LoadBalancers": [  
    {  
      "Type": "application",  
      "Scheme": "internal",  
      "IpAddressType": "ipv4",  
      "VpcId": "vpc-3ac0fb5f",  
      "AvailabilityZones": [  
        {  
          "ZoneName": "us-west-2a",  
          "SubnetId": "subnet-8360a9e7"  
        },  
        {  
          "ZoneName": "us-west-2b",  
          "SubnetId": "subnet-b7d581c0"  
        }  
      ],  
      "CreatedTime": "2016-03-25T21:29:48.850Z",  
      "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",  
      "DNSName": "internal-my-internal-load-balancer-1529930873.us-  
west-2.elb.amazonaws.com",  
      "SecurityGroups": [  
        "sg-5943793c"  
      ],  
      "LoadBalancerName": "my-internal-load-balancer",  
      "State": {  
        "Code": "provisioning"  
      },  
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/app/my-internal-load-balancer/5b49b8d4303115c2"  
    }  
  ]  
}
```

```
}
```

For more information, see [Tutorial: Create an Application Load Balancer using the AWS CLI](#) in the *User Guide for Application Load Balancers*.

Example 3: To create a Network Load Balancer

The following `create-load-balancer` example creates an Internet-facing Network Load Balancer and enables the Availability Zone for the specified subnet. It uses a subnet mapping to associate the specified Elastic IP address with the network interface used by the load balancer nodes for the Availability Zone.

```
aws elbv2 create-load-balancer \  
  --name my-network-load-balancer \  
  --type network \  
  --subnet-mappings SubnetId=subnet-b7d581c0,AllocationId=eipalloc-64d5890a
```

Output:

```
{  
  "LoadBalancers": [  
    {  
      "Type": "network",  
      "Scheme": "internet-facing",  
      "IpAddressType": "ipv4",  
      "VpcId": "vpc-3ac0fb5f",  
      "AvailabilityZones": [  
        {  
          "LoadBalancerAddresses": [  
            {  
              "IpAddress": "35.161.207.171",  
              "AllocationId": "eipalloc-64d5890a"  
            }  
          ],  
          "ZoneName": "us-west-2b",  
          "SubnetId": "subnet-5264e837"  
        }  
      ],  
      "CreatedTime": "2017-10-15T22:41:25.657Z",  
      "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",  
      "DNSName": "my-network-load-balancer-5d1b75f4f1cee11e.elb.us-  
west-2.amazonaws.com",
```

```

        "LoadBalancerName": "my-network-load-balancer",
        "State": {
            "Code": "provisioning"
        },
        "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/my-network-load-balancer/5d1b75f4f1cee11e"
    }
]
}

```

For more information, see [Tutorial: Create a Network Load Balancer using the AWS CLI](#) in the *User Guide for Network Load Balancers*.

Example 4: To create a Gateway Load Balancer

The following `create-load-balancer` example creates a Gateway Load Balancer and enables the Availability Zones for the specified subnets.

```

aws elbv2 create-load-balancer \
  --name my-gateway-load-balancer \
  --type gateway \
  --subnets subnet-dc83f691 subnet-a62583f9

```

Output:

```

{
  "LoadBalancers": [
    {
      "Type": "gateway",
      "VpcId": "vpc-838475fe",
      "AvailabilityZones": [
        {
          "ZoneName": "us-east-1b",
          "SubnetId": "subnet-a62583f9"
        },
        {
          "ZoneName": "us-east-1a",
          "SubnetId": "subnet-dc83f691"
        }
      ],
      "CreatedTime": "2021-07-14T19:33:43.324000+00:00",
      "LoadBalancerName": "my-gateway-load-balancer",
      "State": {

```

```

        "Code": "provisioning"
      },
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
east-1:850631746142:loadbalancer/gwy/my-gateway-load-balancer/dfbb5a7d32cdee79"
    }
  ]
}

```

For more information, see [Getting started with Gateway Load Balancers using the AWS CLI](#) in the *User Guide for Gateway Load Balancers*.

- For API details, see [CreateLoadBalancer](#) in *AWS CLI Command Reference*.

create-rule

The following code example shows how to use `create-rule`.

AWS CLI

Example 1: To create a rule using a path condition and a forward action

The following `create-rule` example creates a rule that forwards requests to the specified target group if the URL contains the specified pattern.

```

aws elbv2 create-rule \
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \
  --priority 5 \
  --conditions file://conditions-pattern.json
  --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067

```

Contents of `conditions-pattern.json`:

```

[
  {
    "Field": "path-pattern",
    "PathPatternConfig": {
      "Values": ["/images/*"]
    }
  }
]

```

Example 2: To create a rule using a host condition and a fixed response

The following `create-rule` example creates a rule that provides a fixed response if the hostname in the host header matches the specified hostname.

```
aws elbv2 create-rule \  
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/  
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \  
  --priority 10 \  
  --conditions file://conditions-host.json \  
  --actions file://actions-fixed-response.json
```

Contents of `conditions-host.json`

```
[  
  {  
    "Field": "host-header",  
    "HostHeaderConfig": {  
      "Values": ["*.example.com"]  
    }  
  }  
]
```

Contents of `actions-fixed-response.json`

```
[  
  {  
    "Type": "fixed-response",  
    "FixedResponseConfig": {  
      "MessageBody": "Hello world",  
      "StatusCode": "200",  
      "ContentType": "text/plain"  
    }  
  }  
]
```

Example 3: To create a rule using a source IP address condition, an authenticate action, and a forward action

The following `create-rule` example creates a rule that authenticates the user if the source IP address matches the specified IP address, and forwards the request to the specified target group if authentication is successful.

```
aws elbv2 create-rule \  
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/  
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \  
  --priority 20 \  
  --conditions file://conditions-source-ip.json \  
  --actions file://actions-authenticate.json
```

Contents of conditions-source-ip.json

```
[  
  {  
    "Field": "source-ip",  
    "SourceIpConfig": {  
      "Values": ["192.0.2.0/24", "198.51.100.10/32"]  
    }  
  }  
]
```

Contents of actions-authenticate.json

```
[  
  {  
    "Type": "authenticate-oidc",  
    "AuthenticateOidcConfig": {  
      "Issuer": "https://idp-issuer.com",  
      "AuthorizationEndpoint": "https://authorization-endpoint.com",

        "prompt": "login"  
      },  
      "OnUnauthenticatedRequest": "deny"  
    },  
    "Order": 2  
  }  
]
```

```
    "Type": "forward",
    "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
east-1:880185128111:targetgroup/cli-test/642a97ecb0e0f26b",
    "Order": 2
  }
]
```

- For API details, see [CreateRule](#) in *AWS CLI Command Reference*.

create-target-group

The following code example shows how to use `create-target-group`.

AWS CLI

Example 1: To create a target group for an Application Load Balancer

The following `create-target-group` example creates a target group for an Application Load Balancer where you register targets by instance ID (the target type is `instance`). This target group uses the HTTP protocol, port 80, and the default health check settings for an HTTP target group.

```
aws elbv2 create-target-group \
  --name my-targets \
  --protocol HTTP \
  --port 80 \
  --target-type instance \
  --vpc-id vpc-3ac0fb5f
```

Output:

```
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
      "TargetGroupName": "my-targets",
      "Protocol": "HTTP",
      "Port": 80,
      "VpcId": "vpc-3ac0fb5f",
      "HealthCheckProtocol": "HTTP",
      "HealthCheckPort": "traffic-port",
```

```

    "HealthCheckEnabled": true,
    "HealthCheckIntervalSeconds": 30,
    "HealthCheckTimeoutSeconds": 5,
    "HealthyThresholdCount": 5,
    "UnhealthyThresholdCount": 2,
    "HealthCheckPath": "/",
    "Matcher": {
      "HttpCode": "200"
    },
    "TargetType": "instance",
    "ProtocolVersion": "HTTP1",
    "IpAddressType": "ipv4"
  }
]
}

```

For more information, see [Create a target group](#) in the *User Guide for Application Load Balancers*.

Example 2: To create a target group to route traffic from an Application Load Balancer to a Lambda function

The following `create-target-group` example creates a target group for an Application Load Balancer where the target is a Lambda function (the target type is `lambda`). Health checks are disabled for this target group by default.

```

aws elbv2 create-target-group \
  --name my-lambda-target \
  --target-type lambda

```

Output:

```

{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-lambda-target/a3003e085dbb8ddc",
      "TargetGroupName": "my-lambda-target",
      "HealthCheckEnabled": false,
      "HealthCheckIntervalSeconds": 35,
      "HealthCheckTimeoutSeconds": 30,
      "HealthyThresholdCount": 5,

```

```

        "UnhealthyThresholdCount": 2,
        "HealthCheckPath": "/",
        "Matcher": {
            "HttpCode": "200"
        },
        "TargetType": "lambda",
        "IpAddressType": "ipv4"
    }
]
}

```

For more information, see [Lambda functions as targets](#) in the *User Guide for Application Load Balancers*.

Example 3: To create a target group for a Network Load Balancer

The following `create-target-group` example creates a target group for a Network Load Balancer where you register targets by IP address (the target type is `ip`). This target group uses the TCP protocol, port 80, and the default health check settings for a TCP target group.

```

aws elbv2 create-target-group \
  --name my-ip-targets \
  --protocol TCP \
  --port 80 \
  --target-type ip \
  --vpc-id vpc-3ac0fb5f

```

Output:

```

{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-ip-targets/b6bba954d1361c78",
      "TargetGroupName": "my-ip-targets",
      "Protocol": "TCP",
      "Port": 80,
      "VpcId": "vpc-3ac0fb5f",
      "HealthCheckEnabled": true,
      "HealthCheckProtocol": "TCP",
      "HealthCheckPort": "traffic-port",
      "HealthCheckIntervalSeconds": 30,
    }
  ]
}

```

```

        "HealthCheckTimeoutSeconds": 10,
        "HealthyThresholdCount": 5,
        "UnhealthyThresholdCount": 2,
        "TargetType": "ip",
        "IpAddressType": "ipv4"
    }
]
}

```

For more information, see [Create a target group](#) in the *User Guide for Network Load Balancers*.

Example 4: To create a target group to route traffic from a Network Load Balancer to an Application Load Balancer

The following `create-target-group` example creates a target group for a Network Load Balancer where you register an Application Load Balancer as a target (the target type is `alb`).

```
aws elbv2 create-target-group --name my-alb-target --protocol TCP --port 80 --target-type alb
--vpc-id vpc-3ac0fb5f
```

Output:

```

{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-alb-target/a3003e085dbb8ddc",
      "TargetGroupName": "my-alb-target",
      "Protocol": "TCP",
      "Port": 80,
      "VpcId": "vpc-838475fe",
      "HealthCheckProtocol": "HTTP",
      "HealthCheckPort": "traffic-port",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 30,
      "HealthCheckTimeoutSeconds": 6,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "HealthCheckPath": "/",
      "Matcher": {
        "HttpCode": "200-399"
      },
      "TargetType": "alb",
    }
  ]
}

```

```

        "IpAddressType": "ipv4"
      }
    ]
  }

```

For more information, see [Create a target group with an Application Load Balancer as the target](#) in the *User Guide for Network Load Balancers*.

Example 5: To create a target group for a Gateway Load Balancer

The following `create-target-group` example creates a target group for a Gateway Load Balancer where the target is an instance, and the target group protocol is GENEVE.

```

aws elbv2 create-target-group \
  --name my-glb-targetgroup \
  --protocol GENEVE \
  --port 6081 \
  --target-type instance \
  --vpc-id vpc-838475fe

```

Output:

```

{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-glb-targetgroup/00c3d57eacd6f40b6f",
      "TargetGroupName": "my-glb-targetgroup",
      "Protocol": "GENEVE",
      "Port": 6081,
      "VpcId": "vpc-838475fe",
      "HealthCheckProtocol": "TCP",
      "HealthCheckPort": "80",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 10,
      "HealthCheckTimeoutSeconds": 5,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "TargetType": "instance"
    }
  ]
}

```

For more information, see [Create a target group <https://docs.aws.amazon.com/elasticloadbalancing/latest/gateway/create-target-group.html>](https://docs.aws.amazon.com/elasticloadbalancing/latest/gateway/create-target-group.html) in the *Gateway Load Balancer User Guide*.

- For API details, see [CreateTargetGroup](#) in *AWS CLI Command Reference*.

delete-listener

The following code example shows how to use `delete-listener`.

AWS CLI

To delete a listener

The following `delete-listener` example deletes the specified listener.

```
aws elbv2 delete-listener \  
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/  
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

- For API details, see [DeleteListener](#) in *AWS CLI Command Reference*.

delete-load-balancer

The following code example shows how to use `delete-load-balancer`.

AWS CLI

To delete a load balancer

The following `delete-load-balancer` example deletes the specified load balancer.

```
aws elbv2 delete-load-balancer \  
  --load-balancer-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

- For API details, see [DeleteLoadBalancer](#) in *AWS CLI Command Reference*.

delete-rule

The following code example shows how to use `delete-rule`.

AWS CLI

To delete a rule

The following `delete-rule` example deletes the specified rule.

```
aws elbv2 delete-rule \  
  --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/  
  app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3
```

- For API details, see [DeleteRule](#) in *AWS CLI Command Reference*.

`delete-target-group`

The following code example shows how to use `delete-target-group`.

AWS CLI

To delete a target group

The following `delete-target-group` example deletes the specified target group.

```
aws elbv2 delete-target-group \  
  --target-group-arn arn:aws:elasticloadbalancing:us-  
  west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

This command produces no output.

For more information, see [Delete a load balancer](#) in the *Application Load Balancer Guide*.

- For API details, see [DeleteTargetGroup](#) in *AWS CLI Command Reference*.

`deregister-targets`

The following code example shows how to use `deregister-targets`.

AWS CLI

Example 1: To deregister a target from a target group

The following `deregister-targets` example removes the specified instance from the specified target group.

```
aws elbv2 deregister-targets \  
  --target-group-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \  
  --targets Id=i-1234567890abcdef0
```

Example 2: To deregister a target registered using port overrides

The following `deregister-targets` example removes an instance from a target group that was registered using port overrides.

```
aws elbv2 deregister-targets \  
  --target-group-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \  
  --targets Id=i-1234567890abcdef0,Port=80 Id=i-1234567890abcdef0,Port=766
```

- For API details, see [DeregisterTargets](#) in *AWS CLI Command Reference*.

describe-account-limits

The following code example shows how to use `describe-account-limits`.

AWS CLI

To describe your Elastic Load Balancing limits

The following `describe-account-limits` example displays the Elastic Load Balancing limits for your AWS account in the current Region.

```
aws elbv2 describe-account-limits
```

Output:

```
{  
  "Limits": [  
    {  
      "Name": "target-groups",  
      "Max": "3000"  
    },  
    {  
      "Name": "targets-per-application-load-balancer",  
      "Max": "1000"  
    }  
  ]  
}
```

```
  },
  {
    "Name": "listeners-per-application-load-balancer",
    "Max": "50"
  },
  {
    "Name": "rules-per-application-load-balancer",
    "Max": "100"
  },
  {
    "Name": "network-load-balancers",
    "Max": "50"
  },
  {
    "Name": "targets-per-network-load-balancer",

      "Max": "100"
    },
    {
      "Name": "targets-per-availability-zone-per-gateway-load-balancer",
      "Max": "300"
    }
  ]
}
```

For more information, see [Quotas](#) in the *AWS General Reference*.

- For API details, see [DescribeAccountLimits](#) in *AWS CLI Command Reference*.

describe-listener-certificates

The following code example shows how to use `describe-listener-certificates`.

AWS CLI

To describe the certificates for a secure listener

This example describes the certificates for the specified secure listener.

Command:

```
aws elbv2 describe-listener-certificates --listener-arn
arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-
balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```
{
  "Certificates": [
    {
      "CertificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/5cc54884-f4a3-4072-80be-05b9ba72f705",
      "IsDefault": false
    },
    {
      "CertificateArn": "arn:aws:acm:us-
west-2:123456789012:certificate/3dcb0a41-bd72-4774-9ad9-756919c40557",
      "IsDefault": false
    },
    {
      "CertificateArn": "arn:aws:acm:us-west-2:123456789012:certificate/
fe59da96-6f58-4a22-8eed-6d0d50477e1d",
      "IsDefault": true
    }
  ]
}
```

- For API details, see [DescribeListenerCertificates](#) in *AWS CLI Command Reference*.

describe-listeners

The following code example shows how to use `describe-listeners`.

AWS CLI

To describe a listener

This example describes the specified listener.

Command:

```
aws elbv2 describe-listeners --listener-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

Output:

```
{
  "Listeners": [
    {
      "Port": 80,
      "Protocol": "HTTP",
      "DefaultActions": [
        {
          "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
          "Type": "forward"
        }
      ],
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
    }
  ]
}
```

To describe the listeners for a load balancer

This example describe the listeners for the specified load balancer.

Command:

```
aws elbv2 describe-listeners --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
  "Listeners": [
    {
      "Port": 443,
      "Protocol": "HTTPS",
      "DefaultActions": [
        {
          "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
          "Type": "forward"
        }
      ],
      "SslPolicy": "ELBSecurityPolicy-2015-05",
      "Certificates": [
        {
          "CertificateArn": "arn:aws:iam::123456789012:server-certificate/my-server-cert"
        }
      ],
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65"
    },
    {
      "Port": 80,
      "Protocol": "HTTP",
      "DefaultActions": [
        {
          "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
          "Type": "forward"
        }
      ],
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "ListenerArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
    }
  ]
}
```

```

    }
  ]
}

```

- For API details, see [DescribeListeners](#) in *AWS CLI Command Reference*.

describe-load-balancer-attributes

The following code example shows how to use `describe-load-balancer-attributes`.

AWS CLI

To describe load balancer attributes

The following `describe-load-balancer-attributes` example displays the attributes of the specified load balancer.

```

aws elbv2 describe-load-balancer-attributes \
  --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188

```

The following example output show the attributes for an Application Load Balancer.

```

{
  "Attributes": [
    {
      "Value": "false",
      "Key": "access_logs.s3.enabled"
    },
    {
      "Value": "",
      "Key": "access_logs.s3.bucket"
    },
    {
      "Value": "",
      "Key": "access_logs.s3.prefix"
    },
    {
      "Value": "60",
      "Key": "idle_timeout.timeout_seconds"
    },
    {

```

```

        "Value": "false",
        "Key": "deletion_protection.enabled"
    },
    {
        "Value": "true",
        "Key": "routing.http2.enabled"
    }
]
}

```

The following example output includes the attributes for a Network Load Balancer.

```

{
  "Attributes": [
    {
      "Value": "false",
      "Key": "access_logs.s3.enabled"
    },
    {
      "Value": "",
      "Key": "access_logs.s3.bucket"
    },
    {
      "Value": "",
      "Key": "access_logs.s3.prefix"
    },
    {
      "Value": "false",
      "Key": "deletion_protection.enabled"
    },
    {
      "Value": "false",
      "Key": "load_balancing.cross_zone.enabled"
    }
  ]
}

```

- For API details, see [DescribeLoadBalancerAttributes](#) in *AWS CLI Command Reference*.

describe-load-balancers

The following code example shows how to use describe-load-balancers.

AWS CLI

To describe a load balancer

This example describes the specified load balancer.

Command:

```
aws elbv2 describe-load-balancers --load-balancer-arns
arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-
balancer/50dc6c495c0c9188
```

Output:

```
{
  "LoadBalancers": [
    {
      "Type": "application",
      "Scheme": "internet-facing",
      "IpAddressType": "ipv4",
      "VpcId": "vpc-3ac0fb5f",
      "AvailabilityZones": [
        {
          "ZoneName": "us-west-2a",
          "SubnetId": "subnet-8360a9e7"
        },
        {
          "ZoneName": "us-west-2b",
          "SubnetId": "subnet-b7d581c0"
        }
      ],
      "CreatedTime": "2016-03-25T21:26:12.920Z",
      "CanonicalHostedZoneId": "Z2P70J7EXAMPLE",
      "DNSName": "my-load-balancer-424835706.us-west-2.elb.amazonaws.com",
      "SecurityGroups": [
        "sg-5943793c"
      ],
      "LoadBalancerName": "my-load-balancer",
      "State": {
        "Code": "active"
      },
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
    }
  ]
}
```

```
]
}
```

To describe all load balancers

This example describes all of your load balancers.

Command:

```
aws elbv2 describe-load-balancers
```

- For API details, see [DescribeLoadBalancers](#) in *AWS CLI Command Reference*.

describe-rules

The following code example shows how to use `describe-rules`.

AWS CLI

Example 1: To describe a rule

The following `describe-rules` example displays details for the specified rule.

```
aws elbv2 describe-rules \  
  --rule-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/  
  app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee
```

Example 2: To describe the rules for a listener

The following `describe-rules` example displays details for the rules for the specified listener. The output includes the default rule and any other rules that you've added.

```
aws elbv2 describe-rules \  
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/  
  my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2
```

- For API details, see [DescribeRules](#) in *AWS CLI Command Reference*.

describe-ssl-policies

The following code example shows how to use `describe-ssl-policies`.

AWS CLI

Example 1: To list the policies used for SSL negotiation by load balancer type

The following `describe-ssl-policies` example displays the names of the policies that you can use for SSL negotiation with an Application Load Balancer. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \  
  --load-balancer-type application \  
  --query SslPolicies[*].Name
```

Output:

```
[  
  "ELBSecurityPolicy-2016-08",  
  "ELBSecurityPolicy-TLS13-1-2-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Res-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",  
  "ELBSecurityPolicy-TLS13-1-1-2021-06",  
  "ELBSecurityPolicy-TLS13-1-0-2021-06",  
  "ELBSecurityPolicy-TLS13-1-3-2021-06",  
  "ELBSecurityPolicy-TLS-1-2-2017-01",  
  "ELBSecurityPolicy-TLS-1-1-2017-01",  
  "ELBSecurityPolicy-TLS-1-2-Ext-2018-06",  
  "ELBSecurityPolicy-FS-2018-06",  
  "ELBSecurityPolicy-2015-05",  
  "ELBSecurityPolicy-TLS-1-0-2015-04",  
  "ELBSecurityPolicy-FS-1-2-Res-2019-08",  
  "ELBSecurityPolicy-FS-1-1-2019-08",  
  "ELBSecurityPolicy-FS-1-2-2019-08",  
  "ELBSecurityPolicy-FS-1-2-Res-2020-10"  
]
```

Example 2: To list the policies that support a specific protocol

The following `describe-ssl-policies` example displays the names of the policies that support the TLS 1.3 protocol. The example uses the `--query` parameter to display only the names of the policies.

```
aws elbv2 describe-ssl-policies \  
  --query SslPolicies[*].Name
```

```
--load-balancer-type application \  
--query SslPolicies[?contains(SslProtocols, 'TLSv1.3')].Name
```

Output:

```
[  
  "ELBSecurityPolicy-TLS13-1-2-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Res-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Ext1-2021-06",  
  "ELBSecurityPolicy-TLS13-1-2-Ext2-2021-06",  
  "ELBSecurityPolicy-TLS13-1-1-2021-06",  
  "ELBSecurityPolicy-TLS13-1-0-2021-06",  
  "ELBSecurityPolicy-TLS13-1-3-2021-06"  
]
```

Example 3: To display the ciphers for a policy

The following `describe-ssl-policies` example displays the names of the ciphers for the specified policy. The example uses the `--query` parameter to display only the cipher names. The first cipher in the list has priority 1, and the remaining ciphers are in priority order.

```
aws elbv2 describe-ssl-policies \  
  --names ELBSecurityPolicy-TLS13-1-2-2021-06 \  
  --query SslPolicies[*].Ciphers[*].Name
```

Output:

```
[  
  "TLS_AES_128_GCM_SHA256",  
  "TLS_AES_256_GCM_SHA384",  
  "TLS_CHACHA20_POLY1305_SHA256",  
  "ECDHE-ECDSA-AES128-GCM-SHA256",  
  "ECDHE-RSA-AES128-GCM-SHA256",  
  "ECDHE-ECDSA-AES128-SHA256",  
  "ECDHE-RSA-AES128-SHA256",  
  "ECDHE-ECDSA-AES256-GCM-SHA384",  
  "ECDHE-RSA-AES256-GCM-SHA384",  
  "ECDHE-ECDSA-AES256-SHA384",  
  "ECDHE-RSA-AES256-SHA384"  
]
```

For more information, see [Security policies](#) in the *User Guide for Application Load Balancers*.

- For API details, see [DescribeSslPolicies](#) in *AWS CLI Command Reference*.

describe-tags

The following code example shows how to use `describe-tags`.

AWS CLI

To describe the tags assigned to a load balancer

This example describes the tags assigned to the specified load balancer.

Command:

```
aws elbv2 describe-tags --resource-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188
```

Output:

```
{
  "TagDescriptions": [
    {
      "ResourceArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "Tags": [
        {
          "Value": "lima",
          "Key": "project"
        },
        {
          "Value": "digital-media",
          "Key": "department"
        }
      ]
    }
  ]
}
```

- For API details, see [DescribeTags](#) in *AWS CLI Command Reference*.

describe-target-group-attributes

The following code example shows how to use `describe-target-group-attributes`.

AWS CLI

To describe target group attributes

The following `describe-target-group-attributes` example displays the attributes of the specified target group.

```
aws elbv2 describe-target-group-attributes \  
  --target-group-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

The output includes the attributes if the protocol is HTTP or HTTPS and the target type is instance or ip.

```
{  
  "Attributes": [  
    {  
      "Value": "false",  
      "Key": "stickiness.enabled"  
    },  
    {  
      "Value": "300",  
      "Key": "deregistration_delay.timeout_seconds"  
    },  
    {  
      "Value": "lb_cookie",  
      "Key": "stickiness.type"  
    },  
    {  
      "Value": "86400",  
      "Key": "stickiness.lb_cookie.duration_seconds"  
    },  
    {  
      "Value": "0",  
      "Key": "slow_start.duration_seconds"  
    }  
  ]  
}
```

The following output includes the attributes if the protocol is HTTP or HTTPS and the target type is `lambda`.

```
{
  "Attributes": [
    {
      "Value": "false",
      "Key": "lambda.multi_value_headers.enabled"
    }
  ]
}
```

The following output includes the attributes if the protocol is TCP, TLS, UDP, or TCP_UDP.

```
{
  "Attributes": [
    {
      "Value": "false",
      "Key": "proxy_protocol_v2.enabled"
    },
    {
      "Value": "300",
      "Key": "deregistration_delay.timeout_seconds"
    }
  ]
}
```

- For API details, see [DescribeTargetGroupAttributes](#) in *AWS CLI Command Reference*.

describe-target-groups

The following code example shows how to use `describe-target-groups`.

AWS CLI

Example 1: To describe a target group

The following `describe-target-groups` example displays details for the specified target group.

```
aws elbv2 describe-target-groups \
```

```
--target-group-arns arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
      "TargetGroupName": "my-targets",
      "Protocol": "HTTP",
      "Port": 80,
      "VpcId": "vpc-3ac0fb5f",
      "HealthCheckProtocol": "HTTP",
      "HealthCheckPort": "traffic-port",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 30,
      "HealthCheckTimeoutSeconds": 5,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "HealthCheckPath": "/",
      "Matcher": {
        "HttpCode": "200"
      },
      "LoadBalancerArns": [
        "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188"
      ],
      "TargetType": "instance",
      "ProtocolVersion": "HTTP1",
      "IpAddressType": "ipv4"
    }
  ]
}
```

Example 2: To describe all target groups for a load balancer

The following `describe-target-groups` example displays details for all target groups for the specified load balancer. The example uses the `--query` parameter to display only the target group names.

```
aws elbv2 describe-target-groups \
```

```
--load-balancer-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \  
--query TargetGroups[*].TargetGroupName
```

Output:

```
[  
  "my-instance-targets",  
  "my-ip-targets",  
  "my-lambda-target"  
]
```

For more information, see [Target groups](#) in the *Application Load Balancers Guide*.

- For API details, see [DescribeTargetGroups](#) in *AWS CLI Command Reference*.

describe-target-health

The following code example shows how to use `describe-target-health`.

AWS CLI

Example 1: To describe the health of the targets for a target group

The following `describe-target-health` example displays health details for the targets of the specified target group. These targets are healthy.

```
aws elbv2 describe-target-health \  
  --target-group-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067
```

Output:

```
{  
  "TargetHealthDescriptions": [  
    {  
      "HealthCheckPort": "80",  
      "Target": {  
        "Id": "i-ceddc4d",  
        "Port": 80  
      },  
      "TargetHealth": {
```

```

        "State": "healthy"
      }
    },
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "healthy"
      }
    }
  ]
}

```

Example 2: To describe the health of a target

The following describe-target-health example displays health details for the specified target. This target is healthy.

```

aws elbv2 describe-target-health \
  --targets Id=i-0f76fade,Port=80 \
  --target-group-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067

```

Output:

```

{
  "TargetHealthDescriptions": [
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "healthy"
      }
    }
  ]
}

```

The following example output is for a target whose target group is not specified in an action for a listener. This target can't receive traffic from the load balancer.

```
{
  "TargetHealthDescriptions": [
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "unused",
        "Reason": "Target.NotInUse",
        "Description": "Target group is not configured to receive traffic
from the load balancer"
      }
    }
  ]
}
```

The following example output is for a target whose target group was just specified in an action for a listener. The target is still being registered.

```
{
  "TargetHealthDescriptions": [
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "initial",
        "Reason": "Elb.RegistrationInProgress",
        "Description": "Target registration is in progress"
      }
    }
  ]
}
```

The following example output is for an unhealthy target.

```
{
  "TargetHealthDescriptions": [
    {
      "HealthCheckPort": "80",
      "Target": {
        "Id": "i-0f76fade",
        "Port": 80
      },
      "TargetHealth": {
        "State": "unhealthy",
        "Reason": "Target.Timeout",
        "Description": "Connection to target timed out"
      }
    }
  ]
}
```

The following example output is for a target that is a Lambda function and health checks are disabled.

```
{
  "TargetHealthDescriptions": [
    {
      "Target": {
        "Id": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
        "AvailabilityZone": "all",
      },
      "TargetHealth": {
        "State": "unavailable",
        "Reason": "Target.HealthCheckDisabled",
        "Description": "Health checks are not enabled for this target"
      }
    }
  ]
}
```

- For API details, see [DescribeTargetHealth](#) in *AWS CLI Command Reference*.

modify-listener

The following code example shows how to use `modify-listener`.

AWS CLI

Example 1: To change the default action to a forward action

The following `modify-listener` example changes the default action (to a **forward** action) for the specified listener.

```
aws elbv2 modify-listener \  
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/  
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \  
  --default-actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

Output:

```
{  
  "Listeners": [  
    {  
      "Protocol": "HTTP",  
      "DefaultActions": [  
        {  
          "TargetGroupArn": "arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f",  
          "Type": "forward"  
        }  
      ],  
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-  
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",  
      "Port": 80,  
      "ListenerArn": "arn:aws:elasticloadbalancing:us-  
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"  
    }  
  ]  
}
```

Example 2: To change the default action to a redirect action

The following `modify-listener` example changes the default action to a **redirect** action for the specified listener.

```
aws elbv2 modify-listener \  
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/  
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 \  
  --default-actions Type=redirect,TargetGroupArn=arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

```
--default-actions Type=redirect,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f
```

Output:

```
{
  "Listeners": [
    {
      "Protocol": "HTTP",
      "DefaultActions": [
        {
          "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-new-targets/2453ed029918f21f",
          "Type": "redirect"
        }
      ],
      "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
      "Port": 80,
      "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2"
    }
  ]
}
```

Example 3: To change the server certificate

This example changes the server certificate for the specified HTTPS listener.

```
aws elbv2 modify-listener \
  --listener-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65 \
  --certificates CertificateArn=arn:aws:iam::123456789012:server-certificate/my-
new-server-cert
```

Output:

```
{
  "Listeners": [
    {
      "Protocol": "HTTPS",
      "DefaultActions": [
        {
```

```

        "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
        "Type": "forward"
    }
],
    "SslPolicy": "ELBSecurityPolicy-2015-05",
    "Certificates": [
        {
            "CertificateArn": "arn:aws:iam::123456789012:server-certificate/
my-new-server-cert"
        }
    ],
    "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188",
    "Port": 443,
    "ListenerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener/app/my-load-balancer/50dc6c495c0c9188/0467ef3c8400ae65"
}
]
}

```

- For API details, see [ModifyListener](#) in *AWS CLI Command Reference*.

modify-load-balancer-attributes

The following code example shows how to use `modify-load-balancer-attributes`.

AWS CLI

To enable deletion protection

This example enables deletion protection for the specified load balancer.

Command:

```

aws elbv2 modify-load-balancer-attributes --load-balancer-arn
arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-
balancer/50dc6c495c0c9188 --attributes Key=deletion_protection.enabled,Value=true

```

Output:

```

{
  "Attributes": [

```

```
{
  "Value": "true",
  "Key": "deletion_protection.enabled"
},
{
  "Value": "false",
  "Key": "access_logs.s3.enabled"
},
{
  "Value": "60",
  "Key": "idle_timeout.timeout_seconds"
},
{
  "Value": "",
  "Key": "access_logs.s3.prefix"
},
{
  "Value": "",
  "Key": "access_logs.s3.bucket"
}
]
```

To change the idle timeout

This example changes the idle timeout value for the specified load balancer.

Command:

```
aws elbv2 modify-load-balancer-attributes --load-balancer-arn
arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-
balancer/50dc6c495c0c9188 --attributes Key=idle_timeout.timeout_seconds,Value=30
```

Output:

```
{
  "Attributes": [
    {
      "Value": "30",
      "Key": "idle_timeout.timeout_seconds"
    },
    {
      "Value": "false",
```

```

    "Key": "access_logs.s3.enabled"
  },
  {
    "Value": "",
    "Key": "access_logs.s3.prefix"
  },
  {
    "Value": "true",
    "Key": "deletion_protection.enabled"
  },
  {
    "Value": "",
    "Key": "access_logs.s3.bucket"
  }
]
}

```

To enable access logs

This example enables access logs for the specified load balancer. Note that the S3 bucket must exist in the same region as the load balancer and must have a policy attached that grants access to the Elastic Load Balancing service.

Command:

```

aws elbv2 modify-load-balancer-attributes --load-balancer-arn
arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-
balancer/50dc6c495c0c9188 --attributes Key=access_logs.s3.enabled,Value=true
Key=access_logs.s3.bucket,Value=my-loadbalancer-logs
Key=access_logs.s3.prefix,Value=myapp

```

Output:

```

{
  "Attributes": [
    {
      "Value": "true",
      "Key": "access_logs.s3.enabled"
    },
    {
      "Value": "my-load-balancer-logs",
      "Key": "access_logs.s3.bucket"
    }
  ],
}

```

```

    {
      "Value": "myapp",
      "Key": "access_logs.s3.prefix"
    },
    {
      "Value": "60",
      "Key": "idle_timeout.timeout_seconds"
    },
    {
      "Value": "false",
      "Key": "deletion_protection.enabled"
    }
  ]
}

```

- For API details, see [ModifyLoadBalancerAttributes](#) in *AWS CLI Command Reference*.

modify-rule

The following code example shows how to use `modify-rule`.

AWS CLI

To modify a rule

The following `modify-rule` example updates the actions and conditions for the specified rule.

```

aws elbv2 modify-rule \
  --actions Type=forward,TargetGroupArn=arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \
  --conditions Field=path-pattern,Values='/images/*'
  --rule-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/9683b2d02a6cabee

```

Output:

```

{
  "Rules": [
    {
      "Priority": "10",
      "Conditions": [
        {
          "Field": "path-pattern",

```

```

        "Values": [
            "/images/*"
        ]
    },
    ],
    "RuleArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/
f2f7dc8efc522ab2/9683b2d02a6cabee",
    "IsDefault": false,
    "Actions": [
        {
            "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
            "Type": "forward"
        }
    ]
}
]
}

```

- For API details, see [ModifyRule](#) in *AWS CLI Command Reference*.

modify-target-group-attributes

The following code example shows how to use `modify-target-group-attributes`.

AWS CLI

To modify the deregistration delay timeout

This example sets the deregistration delay timeout to the specified value for the specified target group.

Command:

```

aws elbv2 modify-target-group-attributes --target-group-arn
arn:aws:elasticloadbalancing:us-west-2:123456789012:targetgroup/my-
targets/73e2d6bc24d8a067 --attributes
Key=deregistration_delay.timeout_seconds,Value=600

```

Output:

```
{
```

```
"Attributes": [  
  {  
    "Value": "false",  
    "Key": "stickiness.enabled"  
  },  
  {  
    "Value": "600",  
    "Key": "deregistration_delay.timeout_seconds"  
  },  
  {  
    "Value": "lb_cookie",  
    "Key": "stickiness.type"  
  },  
  {  
    "Value": "86400",  
    "Key": "stickiness.lb_cookie.duration_seconds"  
  }  
]
```

- For API details, see [ModifyTargetGroupAttributes](#) in *AWS CLI Command Reference*.

modify-target-group

The following code example shows how to use `modify-target-group`.

AWS CLI

To modify the health check configuration for a target group

The following `modify-target-group` example changes the configuration of the health checks used to evaluate the health of the targets for the specified target group. Note that due to the way the CLI parses commas, you must surround the range for the `--matcher` option with single quotes instead of double quotes.

```
aws elbv2 modify-target-group \  
  --target-group-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-https-targets/2453ed029918f21f \  
  --health-check-protocol HTTPS \  
  --health-check-port 443 \  
  --matcher HttpCode='200,299'
```

Output:

```
{
  "TargetGroups": [
    {
      "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-https-targets/2453ed029918f21f",
      "TargetGroupName": "my-https-targets",
      "Protocol": "HTTPS",
      "Port": 443,
      "VpcId": "vpc-3ac0fb5f",
      "HealthCheckProtocol": "HTTPS",
      "HealthCheckPort": "443",
      "HealthCheckEnabled": true,
      "HealthCheckIntervalSeconds": 30,
      "HealthCheckTimeoutSeconds": 5,
      "HealthyThresholdCount": 5,
      "UnhealthyThresholdCount": 2,
      "Matcher": {
        "HttpCode": "200,299"
      },
      "LoadBalancerArns": [
        "arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/
app/my-load-balancer/50dc6c495c0c9188"
      ],
      "TargetType": "instance",
      "ProtocolVersion": "HTTP1",
      "IpAddressType": "ipv4"
    }
  ]
}
```

For more information, see [Target groups](#) in the *Application Load Balancers Guide*.

- For API details, see [ModifyTargetGroup](#) in *AWS CLI Command Reference*.

register-targets

The following code example shows how to use `register-targets`.

AWS CLI**Example 1: To register targets with a target group by instance ID**

The following `register-targets` example registers the specified instances with a target group. The target group must have a target type of `instance`.

```
aws elbv2 register-targets \  
  --target-group-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067 \  
  --targets Id=i-1234567890abcdef0 Id=i-0abcdef1234567890
```

Example 2: To register targets with a target group using port overrides

The following `register-targets` example registers the specified instance with a target group using multiple ports. This enables you to register containers on the same instance as targets in the target group.

```
aws elbv2 register-targets \  
  --target-group-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-internal-targets/3bb63f11dfb0faf9 \  
  --targets Id=i-0598c7d356eba48d7,Port=80 Id=i-0598c7d356eba48d7,Port=766
```

Example 3: To register targets with a target group by IP address

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `ip`.

```
aws elbv2 register-targets \  
  --target-group-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \  
  --targets Id=10.0.1.15 Id=10.0.1.23
```

Example 4: To register a Lambda function as a target

The following `register-targets` example registers the specified IP addresses with a target group. The target group must have a target type of `lambda`. You must grant Elastic Load Balancing permission to invoke the Lambda function.

```
aws elbv2 register-targets \  
  --target-group-arn arn:aws:elasticloadbalancing:us-  
west-2:123456789012:targetgroup/my-tcp-ip-targets/8518e899d173178f \  
  --targets Id=arn:aws:lambda:us-west-2:123456789012:function:my-function
```

- For API details, see [RegisterTargets](#) in *AWS CLI Command Reference*.

remove-listener-certificates

The following code example shows how to use `remove-listener-certificates`.

AWS CLI

To remove a certificate from a secure listener

This example removes the specified certificate from the specified secure listener.

Command:

```
aws elbv2 remove-listener-certificates --listener-arn
arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/
my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2 --certificates
CertificateArn=arn:aws:acm:us-west-2:123456789012:certificate/5cc54884-
f4a3-4072-80be-05b9ba72f705
```

- For API details, see [RemoveListenerCertificates](#) in *AWS CLI Command Reference*.

remove-tags

The following code example shows how to use `remove-tags`.

AWS CLI

To remove tags from a load balancer

The following `remove-tags` example removes the project and department tags from the specified load balancer.

```
aws elbv2 remove-tags \
--resource-arns arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 \
--tag-keys project department
```

- For API details, see [RemoveTags](#) in *AWS CLI Command Reference*.

set-ip-address-type

The following code example shows how to use `set-ip-address-type`.

AWS CLI

To set the address type of a load balancer

This example sets the address type of the specified load balancer to `dualstack`. The load balancer subnets must have associated IPv6 CIDR blocks.

Command:

```
aws elbv2 set-ip-address-type --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --ip-address-type dualstack
```

Output:

```
{
  "IpAddressType": "dualstack"
}
```

- For API details, see [SetIpAddressType](#) in *AWS CLI Command Reference*.

set-rule-priorities

The following code example shows how to use `set-rule-priorities`.

AWS CLI

To set the rule priority

This example sets the priority of the specified rule.

Command:

```
aws elbv2 set-rule-priorities --rule-priorities
RuleArn=arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3,Priority=5
```

Output:

```
{
  "Rules": [
    {
```

```

    "Priority": "5",
    "Conditions": [
      {
        "Field": "path-pattern",
        "Values": [
          "/img/*"
        ]
      }
    ],
    "RuleArn": "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener-
rule/app/my-load-balancer/50dc6c495c0c9188/f2f7dc8efc522ab2/1291d13826f405c3",
    "IsDefault": false,
    "Actions": [
      {
        "TargetGroupArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:targetgroup/my-targets/73e2d6bc24d8a067",
        "Type": "forward"
      }
    ]
  }
]
}

```

- For API details, see [SetRulePriorities](#) in *AWS CLI Command Reference*.

set-security-groups

The following code example shows how to use `set-security-groups`.

AWS CLI

To associate a security group with a load balancer

This example associates the specified security group with the specified load balancer.

Command:

```
aws elbv2 set-security-groups --load-balancer-arn arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --security-
groups sg-5943793c
```

Output:

```
{
  "SecurityGroupIds": [
    "sg-5943793c"
  ]
}
```

- For API details, see [SetSecurityGroups](#) in *AWS CLI Command Reference*.

set-subnets

The following code example shows how to use set-subnets.

AWS CLI

To enable Availability Zones for a load balancer

This example enables the Availability Zone for the specified subnet for the specified load balancer.

Command:

```
aws elbv2 set-subnets --load-balancer-arn arn:aws:elasticloadbalancing:us-west-2:123456789012:loadbalancer/app/my-load-balancer/50dc6c495c0c9188 --subnets subnet-8360a9e7 subnet-b7d581c0
```

Output:

```
{
  "AvailabilityZones": [
    {
      "SubnetId": "subnet-8360a9e7",
      "ZoneName": "us-west-2a"
    },
    {
      "SubnetId": "subnet-b7d581c0",
      "ZoneName": "us-west-2b"
    }
  ]
}
```

- For API details, see [SetSubnets](#) in *AWS CLI Command Reference*.

Elastic Transcoder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Elastic Transcoder.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

cancel-job

The following code example shows how to use `cancel-job`.

AWS CLI

To cancel a job for ElasticTranscoder

This cancels the specified job for ElasticTranscoder.

Command:

```
aws elastictranscoder cancel-job --id 3333333333333-abcde3
```

- For API details, see [CancelJob](#) in *AWS CLI Command Reference*.

create-job

The following code example shows how to use `create-job`.

AWS CLI

To create a job for ElasticTranscoder

The following `create-job` example creates a job for ElasticTranscoder.

```
aws elastictranscoder create-job \  
  --pipeline-id 111111111111-abcde1 \  
  --inputs file://inputs.json \  
  --outputs file://outputs.json \  
  --output-key-prefix "recipes/" \  
  --user-metadata file://user-metadata.json
```

Contents of `inputs.json`:

```
[{  
  "Key": "ETS_example_file.mp4",  
  "FrameRate": "auto",  
  "Resolution": "auto",  
  "AspectRatio": "auto",  
  "Interlaced": "auto",  
  "Container": "mp4"  
}]
```

Contents of `outputs.json`:

```
[  
  {  
    "Key": "webm/ETS_example_file-kindlefirehd.webm",  
    "Rotate": "0",  
    "PresetId": "1351620000001-100250"  
  }  
]
```

Contents of `user-metadata.json`:

```
{  
  "Food type": "Italian",  
  "Cook book": "recipe notebook"  
}
```

Output:

```
{
  "Job": {
    "Status": "Submitted",
    "Inputs": [
      {
        "Container": "mp4",
        "FrameRate": "auto",
        "Key": "ETS_example_file.mp4",
        "AspectRatio": "auto",
        "Resolution": "auto",
        "Interlaced": "auto"
      }
    ],
    "Playlists": [],
    "Outputs": [
      {
        "Status": "Submitted",
        "Rotate": "0",
        "PresetId": "1351620000001-100250",
        "Watermarks": [],
        "Key": "webm/ETS_example_file-kindlefirehd.webm",
        "Id": "1"
      }
    ],
    "PipelineId": "3333333333333-abcde3",
    "OutputKeyPrefix": "recipes/",
    "UserMetadata": {
      "Cook book": "recipe notebook",
      "Food type": "Italian"
    },
    "Output": {

      "PresetId": "1351620000001-100250",
      "Watermarks": [],
      "Key": "webm/ETS_example_file-kindlefirehd.webm",
      "Id": "1"
    },
    "Timing": {
      "SubmitTimeMillis": 1533838012298
    },
    "Input": {
```

```

        "Container": "mp4",
        "FrameRate": "auto",
        "Key": "ETS_example_file.mp4",
        "AspectRatio": "auto",
        "Resolution": "auto",
        "Interlaced": "auto"
    },
    "Id": "1533838012294-example",
    "Arn": "arn:aws:elastictranscoder:us-west-2:123456789012:job/1533838012294-
example"
    }
}

```

- For API details, see [CreateJob](#) in *AWS CLI Command Reference*.

create-pipeline

The following code example shows how to use create-pipeline.

AWS CLI

To create a pipeline for ElasticTranscoder

The following create-pipeline example creates a pipeline for ElasticTranscoder.

```

aws elastictranscoder create-pipeline \
  --name Default \
  --input-bucket salesoffice.example.com-source \
  --role arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role \
  --notifications Progressing="",Completed="",Warning="",Error=arn:aws:sns:us-
east-1:111222333444:ETS_Errors \
  --content-config file://content-config.json \
  --thumbnail-config file://thumbnail-config.json

```

Contents of content-config.json:

```

{
  "Bucket":"salesoffice.example.com-public-promos",
  "Permissions":[
    {
      "GranteeType":"Email",
      "Grantee":"marketing-promos@example.com",

```

```

        "Access":[
            "FullControl"
        ]
    },
    "StorageClass":"Standard"
}

```

Contents of thumbnail-config.json:

```

{
  "Bucket":"salesoffice.example.com-public-promos-thumbnails",
  "Permissions":[
    {
      "GranteeType":"Email",
      "Grantee":"marketing-promos@example.com",
      "Access":[
        "FullControl"
      ]
    }
  ],
  "StorageClass":"ReducedRedundancy"
}

```

Output:

```

{
  "Pipeline": {
    "Status": "Active",
    "ContentConfig": {
      "Bucket": "salesoffice.example.com-public-promos",
      "StorageClass": "Standard",
      "Permissions": [
        {
          "Access": [
            "FullControl"
          ],
          "Grantee": "marketing-promos@example.com",
          "GranteeType": "Email"
        }
      ]
    }
  },
  "Name": "Default",
}

```

```

    "ThumbnailConfig": {
      "Bucket": "salesoffice.example.com-public-promos-thumbnails",
      "StorageClass": "ReducedRedundancy",
      "Permissions": [
        {
          "Access": [
            "FullControl"
          ],
          "Grantee": "marketing-promos@example.com",
          "GranteeType": "Email"
        }
      ]
    },
    "Notifications": {
      "Completed": "",
      "Warning": "",
      "Progressing": "",
      "Error": "arn:aws:sns:us-east-1:123456789012:ETS_Errors"
    },
    "Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
    "InputBucket": "salesoffice.example.com-source",
    "Id": "1533765810590-example",
    "Arn": "arn:aws:elastictranscoder:us-
west-2:123456789012:pipeline/1533765810590-example"
  },
  "Warnings": [
    {
      "Message": "The SNS notification topic for Error events and the pipeline
are in different regions, which increases processing time for jobs in the pipeline
and can incur additional charges. To decrease processing time and prevent cross-
regional charges, use the same region for the SNS notification topic and the
pipeline.",
      "Code": "6006"
    }
  ]
}

```

- For API details, see [CreatePipeline](#) in *AWS CLI Command Reference*.

create-preset

The following code example shows how to use create-preset.

AWS CLI

To create a preset for ElasticTranscoder

The following create-preset example creates a preset for ElasticTranscoder.

```
aws elastictranscoder create-preset \  
  --name DefaultPreset \  
  --description "Use for published videos" \  
  --container mp4 \  
  --video file://video.json \  
  --audio file://audio.json \  
  --thumbnails file://thumbnails.json
```

Contents of video.json:

```
{  
  "Codec": "H.264",  
  "CodecOptions": {  
    "Profile": "main",  
    "Level": "2.2",  
    "MaxReferenceFrames": "3",  
    "MaxBitRate": "",  
    "BufferSize": "",  
    "InterlacedMode": "Progressive",  
    "ColorSpaceConversionMode": "None"  
  },  
  "KeyframesMaxDist": "240",  
  "FixedGOP": "false",  
  "BitRate": "1600",  
  "FrameRate": "auto",  
  "MaxFrameRate": "30",  
  "MaxWidth": "auto",  
  "MaxHeight": "auto",  
  "SizingPolicy": "Fit",  
  "PaddingPolicy": "Pad",  
  "DisplayAspectRatio": "auto",  
  "Watermarks": [  
    {  
      "Id": "company logo",  
      "MaxWidth": "20%",  
      "MaxHeight": "20%",  
      "SizingPolicy": "ShrinkToFit",  
    }  
  ]  
}
```

```
        "HorizontalAlign": "Right",
        "HorizontalOffset": "10px",
        "VerticalAlign": "Bottom",
        "VerticalOffset": "10px",
        "Opacity": "55.5",
        "Target": "Content"
    }
]
```

Contents of audio.json:

```
{
  "Codec": "AAC",
  "CodecOptions": {
    "Profile": "AAC-LC"
  },
  "SampleRate": "44100",
  "BitRate": "96",
  "Channels": "2"
}
```

Contents of thumbnails.json:

```
{
  "Format": "png",
  "Interval": "120",
  "MaxWidth": "auto",
  "MaxHeight": "auto",
  "SizingPolicy": "Fit",
  "PaddingPolicy": "Pad"
}
```

Output:

```
{
  "Preset": {
    "Thumbnails": {
      "SizingPolicy": "Fit",
      "MaxWidth": "auto",
      "Format": "png",
      "PaddingPolicy": "Pad",

```

```
    "Interval": "120",
    "MaxHeight": "auto"
  },
  "Container": "mp4",
  "Description": "Use for published videos",
  "Video": {
    "SizingPolicy": "Fit",
    "MaxWidth": "auto",
    "PaddingPolicy": "Pad",
    "MaxFrameRate": "30",
    "FrameRate": "auto",
    "MaxHeight": "auto",
    "KeyframesMaxDist": "240",
    "FixedGOP": "false",
    "Codec": "H.264",
    "Watermarks": [
      {
        "SizingPolicy": "ShrinkToFit",
        "VerticalOffset": "10px",
        "VerticalAlign": "Bottom",
        "Target": "Content",
        "MaxWidth": "20%",
        "MaxHeight": "20%",
        "HorizontalAlign": "Right",
        "HorizontalOffset": "10px",
        "Opacity": "55.5",
        "Id": "company logo"
      }
    ],
    "CodecOptions": {
      "Profile": "main",
      "MaxBitRate": "32",
      "InterlacedMode": "Progressive",
      "Level": "2.2",
      "ColorSpaceConversionMode": "None",
      "MaxReferenceFrames": "3",
      "BufferSize": "5"
    },
    "BitRate": "1600",
    "DisplayAspectRatio": "auto"
  },
  "Audio": {
    "Channels": "2",
    "CodecOptions": {
```

```
        "Profile": "AAC-LC"
      },
      "SampleRate": "44100",
      "Codec": "AAC",
      "BitRate": "96"
    },
    "Type": "Custom",
    "Id": "1533765290724-example"
    "Arn": "arn:aws:elastictranscoder:us-
west-2:123456789012:preset/1533765290724-example",
    "Name": "DefaultPreset"
  },
  "Warning": ""
}
```

- For API details, see [CreatePreset](#) in *AWS CLI Command Reference*.

delete-pipeline

The following code example shows how to use delete-pipeline.

AWS CLI

To delete the specified ElasticTranscoder pipeline

This deletes the specified ElasticTranscoder pipeline.

Command:

```
aws elastictranscoder delete-pipeline --id 111111111111-abcde1
```

Output:

```
{
  "Success": "true"
}
```

- For API details, see [DeletePipeline](#) in *AWS CLI Command Reference*.

delete-preset

The following code example shows how to use delete-preset.

AWS CLI

To delete the specified ElasticTranscoder preset

This deletes the specified ElasticTranscoder preset.

Command:

```
aws elastictranscoder delete-preset --id 555555555555-abcde5
```

- For API details, see [DeletePreset](#) in *AWS CLI Command Reference*.

list-jobs-by-pipeline

The following code example shows how to use `list-jobs-by-pipeline`.

AWS CLI

To retrieve a list of ElasticTranscoder jobs in the specified pipeline

This example retrieves a list of ElasticTranscoder jobs in the specified pipeline.

Command:

```
aws elastictranscoder list-jobs-by-pipeline --pipeline-id 111111111111-abcde1
```

Output:

```
{
  "Jobs": []
}
```

- For API details, see [ListJobsByPipeline](#) in *AWS CLI Command Reference*.

list-jobs-by-status

The following code example shows how to use `list-jobs-by-status`.

AWS CLI

To retrieve a list of ElasticTranscoder jobs with a status of Complete

This example retrieves a list of ElasticTranscoder jobs with a status of Complete.

Command:

```
aws elastictranscoder list-jobs-by-status --status Complete
```

Output:

```
{
  "Jobs": []
}
```

- For API details, see [ListJobsByStatus](#) in *AWS CLI Command Reference*.

list-pipelines

The following code example shows how to use `list-pipelines`.

AWS CLI

To retrieve a list of ElasticTranscoder pipelines

This example retrieves a list of ElasticTranscoder pipelines.

Command:

```
aws elastictranscoder list-pipelines
```

Output:

```
{
  "Pipelines": [
    {
      "Status": "Active",
      "ContentConfig": {
        "Bucket": "ets-example",
        "Permissions": []
      },
      "Name": "example-pipeline",
      "ThumbnailConfig": {
        "Bucket": "ets-example",

- For API details, see [ListPipelines](#) in *AWS CLI Command Reference*.

list-presets

The following code example shows how to use `list-presets`.

AWS CLI

To retrieve a list of ElasticTranscoder presets

This example retrieves a list of ElasticTranscoder presets.

Command:

```
aws elastictranscoder list-presets --max-items 2
```

Output:

```

{
  "Presets": [
    {
      "Container": "mp4",

```

```
"Name": "KindleFireHD-preset",
"Video": {
  "Resolution": "1280x720",

read-job

The following code example shows how to use `read-job`.

AWS CLI

To retrieve an ElasticTranscoder job

This example retrieves the specified ElasticTranscoder job.

Command:

```
aws elastictranscoder read-job --id 1533838012294-example
```

Output:

```
{
  "Job": {
    "Status": "Progressing",
    "Inputs": [
      {
        "Container": "mp4",

}
}

```

- For API details, see [ReadPreset](#) in *AWS CLI Command Reference*.

update-pipeline-notifications

The following code example shows how to use update-pipeline-notifications.

AWS CLI

To update the notifications of an ElasticTranscoder pipeline

This example updates the notifications of the specified ElasticTranscoder pipeline.

Command:

```
aws elastictranscoder update-pipeline-notifications --id 111111111111-
abcde1 --notifications Progressing=arn:aws:sns:us-west-2:0123456789012:my-
topic,Completed=arn:aws:sns:us-west-2:0123456789012:my-topic,Warning=arn:aws:sns:us-
west-2:0123456789012:my-topic,Error=arn:aws:sns:us-east-1:111222333444:ETS_Errors
```

Output:

```
{
  "Pipeline": {
    "Status": "Active",
    "ContentConfig": {
      "Bucket": "ets-example",
      "StorageClass": "Standard",
      "Permissions": [
        {
          "Access": [
            "FullControl"
          ],
          "Grantee": "marketing-promos@example.com",
          "GranteeType": "Email"
        }
      ]
    },
    "Name": "Default",
    "ThumbnailConfig": {
      "Bucket": "ets-example",
      "StorageClass": "ReducedRedundancy",

    }
}

```

- For API details, see [UpdatePipelineNotifications](#) in *AWS CLI Command Reference*.

update-pipeline-status

The following code example shows how to use `update-pipeline-status`.

AWS CLI

To update the status of an ElasticTranscoder pipeline

This example updates the status of the specified ElasticTranscoder pipeline.

Command:

```
aws elastictranscoder update-pipeline-status --id 111111111111-abcde1 --status Paused
```

Output:

```

{
  "Pipeline": {
    "Status": "Paused",
    "ContentConfig": {
      "Bucket": "ets-example",
      "StorageClass": "Standard",
      "Permissions": [
        {
          "Access": [
            "FullControl"
          ]
        }
      ]
    }
  }
}

```

```

        ],
        "Grantee": "marketing-promos@example.com",
        "GranteeType": "Email"
    }
]
},
"Name": "Default",
"ThumbnailConfig": {
    "Bucket": "ets-example",
    "StorageClass": "ReducedRedundancy",
    "Permissions": [
        {
            "Access": [
                "FullControl"
            ],
            "Grantee": "marketing-promos@example.com",
            "GranteeType": "Email"
        }
    ]
},
"Notifications": {
    "Completed": "",
    "Warning": "",
    "Progressing": "",
    "Error": "arn:aws:sns:us-east-1:803981987763:ETS_Errors"
},
"Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
"InputBucket": "ets-example",
"Id": "111111111111-abcde1",
"Arn": "arn:aws:elastictranscoder:us-
west-2:123456789012:pipeline/111111111111-abcde1"
}
}

```

- For API details, see [UpdatePipelineStatus](#) in *AWS CLI Command Reference*.

update-pipeline

The following code example shows how to use update-pipeline.

AWS CLI

To update an ElasticTranscoder pipeline

The following `update-pipeline` example updates the specified ElasticTranscoder pipeline.

```
aws elastictranscoder update-pipeline \  
  --id 111111111111-abcde1 \  
  --name DefaultExample \  
  --input-bucket salesoffice.example.com-source \  
  --role arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role \  
  --notifications Progressing="",Completed="",Warning="",Error=arn:aws:sns:us-  
east-1:111222333444:ETS_Errors \  
  --content-config file://content-config.json \  
  --thumbnail-config file://thumbnail-config.json
```

Contents of `content-config.json`:

```
{  
  "Bucket": "salesoffice.example.com-public-promos",  
  "Permissions": [  
    {  
      "GranteeType": "Email",  
      "Grantee": "marketing-promos@example.com",  
      "Access": [  
        "FullControl"  
      ]  
    }  
  ],  
  "StorageClass": "Standard"  
}
```

Contents of `thumbnail-config.json`:

```
{  
  "Bucket": "salesoffice.example.com-public-promos-thumbnails",  
  "Permissions": [  
    {  
      "GranteeType": "Email",  
      "Grantee": "marketing-promos@example.com",  
      "Access": [  
        "FullControl"  
      ]  
    }  
  ],  
  "StorageClass": "ReducedRedundancy"
```

```
}
```

Output:

```
{
  "Pipeline": {
    "Status": "Active",
    "ContentConfig": {
      "Bucket": "ets-example",
      "StorageClass": "Standard",
      "Permissions": [
        {
          "Access": [
            "FullControl"
          ],
          "Grantee": "marketing-promos@example.com",
          "GranteeType": "Email"
        }
      ]
    },
    "Name": "DefaultExample",
    "ThumbnailConfig": {
      "Bucket": "ets-example",
      "StorageClass": "ReducedRedundancy",
      "Permissions": [
        {
          "Access": [
            "FullControl"
          ],
          "Grantee": "marketing-promos@example.com",
          "GranteeType": "Email"
        }
      ]
    },
    "Notifications": {
      "Completed": "",
      "Warning": "",
      "Progressing": "",
      "Error": "arn:aws:sns:us-east-1:1112223333444:ETS_Errors"
    },
    "Role": "arn:aws:iam::123456789012:role/Elastic_Transcoder_Default_Role",
    "InputBucket": "ets-example",
    "Id": "33333333333333-abcde3",
  }
}
```

```
    "Arn": "arn:aws:elastictranscoder:us-  
west-2:123456789012:pipeline/333333333333-abcde3"  
  },  
  "Warnings": [  
    {  
      "Message": "The SNS notification topic for Error events and the pipeline  
are in different regions, which increases processing time for jobs in the pipeline  
and can incur additional charges. To decrease processing time and prevent cross-  
regional charges, use the same region for the SNS notification topic and the  
pipeline.",  
      "Code": "6006"  
    }  
  ]  
}
```

- For API details, see [UpdatePipeline](#) in *AWS CLI Command Reference*.

ElastiCache examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with ElastiCache.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-tags-to-resource

The following code example shows how to use `add-tags-to-resource`.

AWS CLI

To add tags to a resource

The following `add-tags-to-resource` example adds up to 10 tags, key-value pairs, to a cluster or snapshot resource.

```
aws elasticache add-tags-to-resource \  
  --resource-name "arn:aws:elasticache:us-east-1:1234567890:cluster:my-mem-  
cluster" \  
  --tags '{"20150202":15, "ElastiCache":"Service"}'
```

Output:

```
{  
  "TagList": [  
    {  
      "Value": "20150202",  
      "Key": "APIVersion"  
    },  
    {  
      "Value": "ElastiCache",  
      "Key": "Service"  
    }  
  ]  
}
```

For more information, see [Monitoring Costs with Cost Allocation Tags](#) in the *ElastiCache User Guide*.

- For API details, see [AddTagsToResource](#) in *AWS CLI Command Reference*.

authorize-cache-security-group-ingress

The following code example shows how to use `authorize-cache-security-group-ingress`.

AWS CLI

To authorize cache security group for ingress

The following `authorize-cache-security-group-ingress` example allows network ingress to a cache security group.

```
aws elasticache authorize-cache-security-group-ingress \  
  --cache-security-group-name "my-sec-grp" \  
  --ec2-security-group-name "my-ec2-sec-grp" \  
  --ec2-security-group-owner-id "1234567890"
```

The command produces no output.

For more information, see [Self-Service Updates in Amazon ElastiCache](#) in the *Elasticache User Guide*.

- For API details, see [AuthorizeCacheSecurityGroupIngress](#) in *AWS CLI Command Reference*.

batch-apply-update-action

The following code example shows how to use batch-apply-update-action.

AWS CLI

To apply a service update

The following batch-apply-update-action example applies a service update to a Redis cluster.

```
aws elasticache batch-apply-update-action \  
  --service-update-name elc-xxxxx406-xxx \  
  --replication-group-ids test-cluster
```

Output:

```
{  
  "ProcessedUpdateActions": [  
    {  
      "ReplicationGroupId": "pat-cluster",  
      "ServiceUpdateName": "elc-xxxxx406-xxx",  
      "UpdateActionStatus": "waiting-to-start"  
    }  
  ],  
  "UnprocessedUpdateActions": []  
}
```

For more information, see [Self-Service Updates in Amazon ElastiCache](#) in the *Elasticache User Guide*.

- For API details, see [BatchApplyUpdateAction](#) in *AWS CLI Command Reference*.

batch-stop-update-action

The following code example shows how to use batch-stop-update-action.

AWS CLI

To stop a service update

The following batch-stop-update-action example applies a service update to a Redis cluster.

```
aws elasticache batch-stop-update-action \  
  --service-update-name elc-xxxxx406-xxx \  
  --replication-group-ids test-cluster
```

Output:

```
{  
  "ProcessedUpdateActions": [  
    {  
      "ReplicationGroupId": "pat-cluster",  
      "ServiceUpdateName": "elc-xxxxx406-xxx",  
      "UpdateActionStatus": "stopping"  
    }  
  ],  
  "UnprocessedUpdateActions": []  
}
```

For more information, see [Self-Service Updates in Amazon ElastiCache](#) in the *Elasticache User Guide*.

- For API details, see [BatchStopUpdateAction](#) in *AWS CLI Command Reference*.

copy-snapshot

The following code example shows how to use copy-snapshot.

AWS CLI

To copy a snapshot

The following `copy-snapshot` example makes a copy of an existing snapshot.

```
aws elasticache copy-snapshot \  
  --source-snapshot-name "my-snapshot" \  
  --target-snapshot-name "my-snapshot-copy"
```

Output:

```
{  
  "Snapshot":{  
    "Engine": "redis",  
    "CacheParameterGroupName": "default.redis3.2",  
    "VpcId": "vpc-3820329f3",  
    "CacheClusterId": "my-redis4",

create-cache-cluster

The following code example shows how to use `create-cache-cluster`.

AWS CLI

To create a cache cluster

The following `create-cache-cluster` example creates a cache cluster using the Redis engine.

```
aws elasticache create-cache-cluster \  
  --cache-cluster-id "cluster-test" \  
  --engine redis \  
  --cache-node-type cache.m5.large \  
  --num-cache-nodes 1
```

Output:

```
{  
  "CacheCluster": {  
    "CacheClusterId": "cluster-test",  
    "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/  
home#client-download:",  
    "CacheNodeType": "cache.m5.large",  
    "Engine": "redis",  
    "EngineVersion": "5.0.5",  
    "CacheClusterStatus": "creating",  
    "NumCacheNodes": 1,  
    "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",  
    "PendingModifiedValues": {},  
    "CacheSecurityGroups": [],  
    "CacheParameterGroup": {  
      "CacheParameterGroupName": "default.redis5.0",  
      "ParameterApplyStatus": "in-sync",  
      "CacheNodeIdsToReboot": []  
    },  
    "CacheSubnetGroupName": "default",  
    "AutoMinorVersionUpgrade": true,  
    "SnapshotRetentionLimit": 0,  
    "SnapshotWindow": "06:30-07:30",  
    "TransitEncryptionEnabled": false,  
    "AtRestEncryptionEnabled": false
```

```
}  
}
```

For more information, see [Creating a Cluster](#) in the *ElastiCache User Guide*.

- For API details, see [CreateCacheCluster](#) in *AWS CLI Command Reference*.

create-cache-parameter-group

The following code example shows how to use `create-cache-parameter-group`.

AWS CLI

To create a cache parameter group

The following `create-cache-parameter-group` example creates a new Amazon ElastiCache cache parameter group.

```
aws elasticache create-cache-parameter-group \  
  --cache-parameter-group-family "redis5.0" \  
  --cache-parameter-group-name "mygroup" \  
  --description "mygroup"
```

Output:

```
{  
  "CacheParameterGroup": {  
    "CacheParameterGroupName": "mygroup",  
    "CacheParameterGroupFamily": "redis5.0",  
    "Description": "my group"  
  }  
}
```

For more information, see [Creating a Parameter Group](#) in the *ElastiCache User Guide*.

- For API details, see [CreateCacheParameterGroup](#) in *AWS CLI Command Reference*.

create-cache-subnet-group

The following code example shows how to use `create-cache-subnet-group`.

AWS CLI

To create a cache subnet group

The following `create-cache-subnet-group` example creates a new cache subnet group.

```
aws elasticache create-cache-subnet-group \  
  --cache-subnet-group-name "mygroup" \  
  --cache-subnet-group-description "my subnet group" \  
  --subnet-ids "subnet-xxxxec4f"
```

Output:

```
{  
  "CacheSubnetGroup": {  
    "CacheSubnetGroupName": "mygroup",  
    "CacheSubnetGroupDescription": "my subnet group",  
    "VpcId": "vpc-a3e97cdb",  
    "Subnets": [  
      {  
        "SubnetIdentifier": "subnet-xxxxec4f",  
        "SubnetAvailabilityZone": {  
          "Name": "us-west-2d"  
        }  
      }  
    ]  
  }  
}
```

For more information, see [Creating a Cache Subnet Group](#) in the *Elasticache User Guide*.

- For API details, see [CreateCacheSubnetGroup](#) in *AWS CLI Command Reference*.

create-global-replication-group

The following code example shows how to use `create-global-replication-group`.

AWS CLI

To create a global replication group

The following `create-global-replication-group` example creates a new global replication group.

```
aws elasticache create-global-replication-group \  
  --global-replication-group-id-suffix my-global-replication-group \  
  --primary-replication-group-id my-primary-cluster
```

Output:

```
{  
  "GlobalReplicationGroup": {  
    "GlobalReplicationGroupId": "sgaui-my-global-replication-group",  
    "GlobalReplicationGroupDescription": " ",  
    "Status": "creating",  
    "CacheNodeType": "cache.r5.large",  
    "Engine": "redis",  
    "EngineVersion": "5.0.6",  
    "Members": [  
      {  
        "ReplicationGroupId": "my-primary-cluster",  
        "ReplicationGroupRegion": "us-west-2",  
        "Role": "PRIMARY",  
        "AutomaticFailover": "enabled",  
        "Status": "associating"  
      }  
    ],  
    "ClusterEnabled": true,  
    "GlobalNodeGroups": [  
      {  
        "GlobalNodeGroupId": "sgaui-my-global-replication-group-0001",  
        "Slots": "0-16383"  
      }  
    ],  
    "AuthTokenEnabled": false,  
    "TransitEncryptionEnabled": false,  
    "AtRestEncryptionEnabled": false  
  }  
}
```

For more information, see [Replication Across AWS Regions Using Global Datastore](#) in the *Elasticache User Guide*.

- For API details, see [CreateGlobalReplicationGroup](#) in *AWS CLI Command Reference*.

create-replication-group

The following code example shows how to use create-replication-group.

AWS CLI

To create a replication group

The following create-replication-group example creates a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group. This operation is valid for Redis only.

```
aws elasticache create-replication-group \  
  --replication-group-id "mygroup" \  
  --replication-group-description "my group" \  
  --engine "redis" \  
  --cache-node-type "cache.m5.large"
```

Output:

```
{  
  "ReplicationGroup": {  
    "ReplicationGroupId": "mygroup",  
    "Description": "my group",  
    "Status": "creating",  
    "PendingModifiedValues": {},  
    "MemberClusters": [  
      "mygroup-001"  
    ],  
    "AutomaticFailover": "disabled",  
    "SnapshotRetentionLimit": 0,  
    "SnapshotWindow": "06:00-07:00",  
    "ClusterEnabled": false,  
    "CacheNodeType": "cache.m5.large",  
    "TransitEncryptionEnabled": false,  
    "AtRestEncryptionEnabled": false  
  }  
}
```

For more information, see [Creating a Redis Replication Group](#) in the *Elasticache User Guide*.

- For API details, see [CreateReplicationGroup](#) in *AWS CLI Command Reference*.

create-snapshot

The following code example shows how to use create-snapshot.

AWS CLI

To create a snapshot

The following create-snapshot example creates a snapshot using the Redis engine.

```
aws elasticache create-snapshot \  
  --snapshot-name mysnapshot \  
  --cache-cluster-id cluster-test
```

Output:

```
{  
  "Snapshot": {  
    "SnapshotName": "mysnapshot",  
    "CacheClusterId": "cluster-test",  
    "SnapshotStatus": "creating",  
    "SnapshotSource": "manual",  
    "CacheNodeType": "cache.m5.large",  
    "Engine": "redis",  
    "EngineVersion": "5.0.5",  
    "NumCacheNodes": 1,  
    "PreferredAvailabilityZone": "us-west-2b",  
    "CacheClusterCreateTime": "2020-03-19T03:12:01.483Z",  
    "PreferredMaintenanceWindow": "sat:13:00-sat:14:00",  
    "Port": 6379,  
    "CacheParameterGroupName": "default.redis5.0",  
    "CacheSubnetGroupName": "default",  
    "VpcId": "vpc-a3e97cdb",  
    "AutoMinorVersionUpgrade": true,  
    "SnapshotRetentionLimit": 0,  
    "SnapshotWindow": "06:30-07:30",  
    "NodeSnapshots": [  
      {  
        "CacheNodeId": "0001",  
        "CacheSize": "",  
        "CacheNodeCreateTime": "2020-03-19T03:12:01.483Z"  
      }  
    ]  
  }  
}
```

```
}  
}
```

For more information, see [Backup and Restore for ElastiCache for Redis](#) in the *ElastiCache User Guide*.

- For API details, see [CreateSnapshot](#) in *AWS CLI Command Reference*.

create-user-group

The following code example shows how to use `create-user-group`.

AWS CLI

To create a user group

The following `create-user-group` example creates a new user group.

```
aws elasticache create-user-group \  
  --user-group-id myusergroup \  
  --engine redis \  
  --user-ids default
```

Output:

```
{  
  "UserGroupId": "myusergroup",  
  "Status": "creating",  
  "Engine": "redis",  
  "UserIds": [  
    "default"  
  ],  
  "ReplicationGroups": [],  
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:usergroup:myusergroup"  
}
```

For more information, see [Authenticating Users with Role-Based Access Control \(RBAC\)](#) in the *ElastiCache User Guide*.

- For API details, see [CreateUserGroup](#) in *AWS CLI Command Reference*.

create-user

The following code example shows how to use create-user.

AWS CLI

To create a user

The following create-user example creates a new user.

```
aws elasticache create-user \  
  --user-id user1 \  
  --user-name myUser \  
  --passwords mYnuUzrpAxXw2rdzx \  
  --engine redis \  
  --access-string "on ~app:* -@all +@read"
```

Output:

```
{  
  "UserId": "user2",  
  "UserName": "myUser",  
  "Status": "active",  
  "Engine": "redis",  
  "AccessString": "on ~app:* -@all +@read +@hash +@bitmap +@geo -setbit -bitfield  
-hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius -  
georadiusbymember",  
  "UserGroupIds": [],  
  "Authentication": {  
    "Type": "password",  
    "PasswordCount": 1  
  },  
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"  
}
```

For more information, see [Authenticating Users with Role-Based Access Control \(RBAC\)](#) in the *Elasticache User Guide*.

- For API details, see [CreateUser](#) in *AWS CLI Command Reference*.

decrease-node-groups-in-global-replication-group

The following code example shows how to use `decrease-node-groups-in-global-replication-group`.

AWS CLI

To decrease the number of node groups in a global replication group

The following `decrease-node-groups-in-global-replication-group` decreases the node group count using the Redis engine.

```
aws elasticache decrease-node-groups-in-global-replication-group \  
  --global-replication-group-id sgaii-test \  
  --node-group-count 1 \  
  --apply-immediately \  
  --global-node-groups-to-retain sgaii-test-0003
```

Output:

```
{  
  "GlobalReplicationGroup":  
  {  
    "GlobalReplicationGroupId": "sgaii-test",  
    "GlobalReplicationGroupDescription": "test",  
    "Status": "modifying",  
    "CacheNodeType": "cache.r5.large",  
    "Engine": "redis",  
    "EngineVersion": "5.0.6",  
    "Members": [  
      {  
        "ReplicationGroupId": "test-2",  
        "ReplicationGroupRegion": "us-east-1",  
        "Role": "SECONDARY",  
        "AutomaticFailover": "enabled",  
        "Status": "associated"  
      },

      "GlobalNodeId": "sgaui-test-0003",
      "Slots": "10923-14052,15418-16383"
    },
    {
      "GlobalNodeId": "sgaui-test-0004",
      "Slots": "450-1815,5462-6826,14053-15417"
    }
  ],
  "AuthTokenEnabled": false,
  "TransitEncryptionEnabled": false,
  "AtRestEncryptionEnabled": false
}
}

```

For more information, see [Replication Across AWS Regions Using Global Datastore](#) in the *Elasticache User Guide*.

- For API details, see [DecreaseNodeGroupsInGlobalReplicationGroup](#) in *AWS CLI Command Reference*.

decrease-replica-count

The following code example shows how to use `decrease-replica-count`.

AWS CLI

To decrease replica count

The following `decrease-replica-count` example dynamically decreases the number of replicas in a Redis (cluster mode disabled) replication group or the number of replica nodes

in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache decrease-replica-count \  
  --replication-group-id my-cluster \  
  --apply-immediately \  
  --new-replica-count 2
```

Output:

```
{  
  "ReplicationGroup": {  
    "ReplicationGroupId": "my-cluster",  
    "Description": " ",  
    "Status": "modifying",  
    "PendingModifiedValues": {},  
    "MemberClusters": [  
      "myrepliac",  
      "my-cluster-001",  
      "my-cluster-002",  
      "my-cluster-003"  
    ],  
    "NodeGroups": [  
      {  
        "NodeGroupId": "0001",  
        "Status": "modifying",

    "AtRestEncryptionEnabled": false
  }
}
```

For more information, see [Changing the Number of Replicas](#) in the *Elasticache User Guide*.

- For API details, see [DecreaseReplicaCount](#) in *AWS CLI Command Reference*.

delete-cache-cluster

The following code example shows how to use `delete-cache-cluster`.

AWS CLI

To delete a cache cluster

The following `delete-cache-cluster` example deletes the specified previously provisioned cluster. The command deletes all associated cache nodes, node endpoints, and the cluster itself. When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the cluster; you can't cancel or revert this operation.

This operation is not valid for the following:

Redis (cluster mode enabled) clusters
A cluster that is the last read replica of a replication group
A node group (shard) that has Multi-AZ mode enabled
A cluster from a Redis (cluster mode enabled) replication group
A cluster that is not in the available state

```
aws elasticache delete-cache-cluster \
  --cache-cluster-id "my-cluster-002"
```

Output:

```
{
  "CacheCluster": {
    "CacheClusterId": "my-cluster-002",
    "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
    "CacheNodeType": "cache.r5.xlarge",
    "Engine": "redis",
    "EngineVersion": "5.0.5",
```

```

    "CacheClusterStatus": "deleting",
    "NumCacheNodes": 1,
    "PreferredAvailabilityZone": "us-west-2a",
    "CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",
    "PreferredMaintenanceWindow": "mon:04:05-mon:05:05",
    "PendingModifiedValues": {},
    "NotificationConfiguration": {
        "TopicArn": "arn:aws:sns:us-west-x:xxxxxxx4152:My_Topic",
        "TopicStatus": "active"
    },
    "CacheSecurityGroups": [],
    "CacheParameterGroup": {
        "CacheParameterGroupName": "mygroup",
        "ParameterApplyStatus": "in-sync",
        "CacheNodeIdsToReboot": []
    },
    "CacheSubnetGroupName": "kxkxk",
    "AutoMinorVersionUpgrade": true,
    "SecurityGroups": [
        {
            "SecurityGroupId": "sg-xxxxxxxxxx9836",
            "Status": "active"
        },
        {
            "SecurityGroupId": "sg-xxxxxxxxxxx7b",
            "Status": "active"
        }
    ],
    "ReplicationGroupId": "my-cluster",
    "SnapshotRetentionLimit": 0,
    "SnapshotWindow": "07:30-08:30",
    "TransitEncryptionEnabled": false,
    "AtRestEncryptionEnabled": false
}
}

```

For more information, see [Deleting a Cluster](#) in the *ElastiCache User Guide*.

- For API details, see [DeleteCacheCluster](#) in *AWS CLI Command Reference*.

delete-cache-parameter-group

The following code example shows how to use `delete-cache-parameter-group`.

AWS CLI

To delete a cache parameter group

The following `delete-cache-parameter-group` example deletes the specified cache parameter group. You can't delete a cache parameter group if it's associated with any cache clusters.

```
aws elasticache delete-cache-parameter-group \  
  --cache-parameter-group-name myparamgroup
```

This command produces no output.

For more information, see [Deleting a Parameter Group](#) in the *Elasticache User Guide*.

- For API details, see [DeleteCacheParameterGroup](#) in *AWS CLI Command Reference*.

delete-cache-subnet-group

The following code example shows how to use `delete-cache-subnet-group`.

AWS CLI

To delete a cache subnet group

The following `delete-cache-subnet-group` example deletes the specified cache subnet group. You can't delete a cache subnet group if it's associated with any clusters.

```
aws elasticache delete-cache-subnet-group \  
  --cache-subnet-group-name "mygroup"
```

This command produces no output.

For more information, see [Deleting a Subnet Group](#) in the *Elasticache User Guide*.

- For API details, see [DeleteCacheSubnetGroup](#) in *AWS CLI Command Reference*.

delete-global-replication-group

The following code example shows how to use `delete-global-replication-group`.

AWS CLI

To delete a global replication group

The following `delete-global-replication-group` example deletes a new global replication group.

```
aws elasticache delete-global-replication-group \  
  --global-replication-group-id my-global-replication-group \  
  --retain-primary-replication-group
```

Output:

```
{  
  "GlobalReplicationGroup": {  
    "GlobalReplicationGroupId": "sgaui-my-grg",  
    "GlobalReplicationGroupDescription": "my-grg",  
    "Status": "deleting",  
    "CacheNodeType": "cache.r5.large",  
    "Engine": "redis",  
    "EngineVersion": "5.0.6",  
    "Members": [  
      {  
        "ReplicationGroupId": "my-cluster-grg",  
        "ReplicationGroupRegion": "us-west-2",  
        "Role": "PRIMARY",  
        "AutomaticFailover": "enabled",  
        "Status": "associated"  
      }  
    ],  
    "ClusterEnabled": false,  
    "AuthTokenEnabled": false,  
    "TransitEncryptionEnabled": false,  
    "AtRestEncryptionEnabled": false  
  }  
}
```

For more information, see [Replication Across AWS Regions Using Global Datastore](#) in the *Elasticache User Guide*.

- For API details, see [DeleteGlobalReplicationGroup](#) in *AWS CLI Command Reference*.

delete-replication-group

The following code example shows how to use delete-replication-group.

AWS CLI

To delete a replication group

The following delete-replication-group example deletes an existing replication group. By default, this operation deletes the entire replication group, including the primary/primaries and all of the read replicas. If the replication group has only one primary, you can optionally delete only the read replicas, while retaining the primary by setting RetainPrimaryCluster=true .

When you receive a successful response from this operation, Amazon ElastiCache immediately begins deleting the selected resources; you cannot cancel or revert this operation. Valid for Redis only.

```
aws elasticache delete-replication-group \  
  --replication-group-id "mygroup"
```

Output:

```
{  
  "ReplicationGroup": {

delete-snapshot

The following code example shows how to use delete-snapshot.

AWS CLI

To delete a snapshot

The following `delete-snapshot` example deleted a snapshot using the Redis engine.

```
aws elasticache delete-snapshot \  
  --snapshot-name mysnapshot
```

Output:

```
{  
  "Snapshot": {  
    "SnapshotName": "my-cluster-snapshot",  
    "ReplicationGroupId": "mycluster",  
    "ReplicationGroupDescription": "mycluster",

    }
]
}
}

```

For more information, see [Backup and Restore for ElastiCache for Redis](#) in the *ElastiCache User Guide*.

- For API details, see [DeleteSnapshot](#) in *AWS CLI Command Reference*.

delete-user-group

The following code example shows how to use `delete-user-group`.

AWS CLI

To delete a user group

The following `delete-user-group` example deletes a user group.

```
aws elasticache delete-user-group \
  --user-group-id myusergroup
```

Output:

```
{
  "UserGroupId": "myusergroup",
  "Status": "deleting",
  "Engine": "redis",
  "UserIds": [
    "default"
  ],
  "ReplicationGroups": [],
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:usergroup:myusergroup"
}
```

For more information, see [Authenticating Users with Role-Based Access Control \(RBAC\)](#) in the *Elasticache User Guide*.

- For API details, see [DeleteUserGroup](#) in *AWS CLI Command Reference*.

delete-user

The following code example shows how to use `delete-user`.

AWS CLI**To delete a user**

The following `delete-user` example deletes a user.

```
aws elasticache delete-user \  
  --user-id user2
```

Output:

```
{
  "UserId": "user1",
  "UserName": "myUser",
  "Status": "deleting",
  "Engine": "redis",
  "AccessString": "on ~* +@all",
  "UserGroupIds": [
    "myusergroup"
  ],
  "Authentication": {
```

```
    "Type": "password",
    "PasswordCount": 1
  },
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
}
```

For more information, see [Authenticating Users with Role-Based Access Control \(RBAC\)](#) in the *Elasticache User Guide*.

- For API details, see [DeleteUser](#) in *AWS CLI Command Reference*.

describe-cache-clusters

The following code example shows how to use `describe-cache-clusters`.

AWS CLI

To describe a cache cluster

The following `describe-cache-clusters` example describes a cache cluster.

```
aws elasticache describe-cache-clusters
```

Output:

```
{
  "CacheClusters": [
    {
      "CacheClusterId": "my-cluster-003",
      "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",

            },
            "LogFormat": "text",
            "Status": "active"
        }
    ]
}
]
}
}

```

For more information, see [Managing Clusters](#) in the *Elasticache User Guide*.

- For API details, see [DescribeCacheClusters](#) in *AWS CLI Command Reference*.

describe-cache-engine-versions

The following code example shows how to use describe-cache-engine-versions.

AWS CLI

To describe a cache engine version

The following describe-cache-engine-versions example returns a list of the available cache engines and their versions.

```
aws elasticache describe-cache-engine-versions \  
  --engine "Redis"
```

Output:

```
{  
  "CacheEngineVersions": [  
    {  
      "Engine": "redis",  
      "EngineVersion": "2.6.13",  
      "CacheParameterGroupFamily": "redis2.6",  
      "CacheEngineDescription": "Redis",  
      "CacheEngineVersionDescription": "redis version 2.6.13"  
    },  
    {  
      "Engine": "redis",  
      "EngineVersion": "2.8.19",  
      "CacheParameterGroupFamily": "redis2.8",  
      "CacheEngineDescription": "Redis",  
      "CacheEngineVersionDescription": "redis version 2.8.19"  
    },  
    {  
      "Engine": "redis",  
      "EngineVersion": "2.8.21",  
      "CacheParameterGroupFamily": "redis2.8",  
      "CacheEngineDescription": "Redis",  
      "CacheEngineVersionDescription": "redis version 2.8.21"  
    },  
    {  
      "Engine": "redis",  
      "EngineVersion": "2.8.22",  
      "CacheParameterGroupFamily": "redis2.8",
```

```
    "CacheEngineDescription": "Redis",
    "CacheEngineVersionDescription": "redis version 2.8.22"
  },
  {

      "CacheEngineVersionDescription": "redis version 5.0.5"
    }
  ]
}
```

- For API details, see [DescribeCacheEngineVersions](#) in *AWS CLI Command Reference*.

describe-cache-parameter-groups

The following code example shows how to use `describe-cache-parameter-groups`.

AWS CLI

To describe a cache parameter group

The following `describe-cache-parameter-groups` example returns a list of cache parameter group descriptions.

```
aws elasticache describe-cache-parameter-groups \  
  --cache-parameter-group-name "mygroup"
```

Output:

```
{  
  "CacheParameterGroups": [  
    {  
      "CacheParameterGroupName": "mygroup",  
      "CacheParameterGroupFamily": "redis5.0",  
      "Description": " "  
    }  
  ]  
}
```

For more information, see [Configuring Engine Parameters Using Parameter Groups](#) in the *Elasticache User Guide*.

- For API details, see [DescribeCacheParameterGroups](#) in *AWS CLI Command Reference*.

describe-cache-parameters

The following code example shows how to use `describe-cache-parameters`.

AWS CLI

To describe cache parameters

The following `"describe-cache-parameters"` example returns the detailed parameter list for the specified cache parameter group.

```
aws elasticache describe-cache-parameters \  
  --cache-parameter-group-name "myparamgroup"
```

Output:

```
{  
  "Parameters": [  
    {  
      "ParameterName": "activedefrag",  
      "ParameterValue": "yes",

describe-cache-subnet-groups

The following code example shows how to use `describe-cache-subnet-groups`.

AWS CLI

To describe cache subnet groups

The following `describe-cache-subnet-groups` example returns a list of subnet groups.

```
aws elasticache describe-cache-subnet-groups
```

Output:

```

{
  "CacheSubnetGroups": [
    {
      "CacheSubnetGroupName": "default",
      "CacheSubnetGroupDescription": "Default CacheSubnetGroup",
      "VpcId": "vpc-a3e97cdb",
      "Subnets": [
        {
          "SubnetIdentifier": "subnet-8d4bacf5",

```

```
        "SubnetAvailabilityZone": {
            "Name": "us-west-2b"
        }
    },
    {
        "SubnetIdentifier": "subnet-dde21380",
        "SubnetAvailabilityZone": {
            "Name": "us-west-2c"
        }
    },
    {
        "SubnetIdentifier": "subnet-6485ec4f",
        "SubnetAvailabilityZone": {
            "Name": "us-west-2d"
        }
    },
    {

describe-engine-default-parameters

The following code example shows how to use `describe-engine-default-parameters`.

AWS CLI

To describe engine default parameters

The following `describe-engine-default-parameters` example returns the default engine and system parameter information for the specified cache engine.

```

aws elasticache describe-engine-default-parameters \
  --cache-parameter-group-family "redis5.0"

```

Output:

```

{
  "EngineDefaults": {
    "Parameters": [
      {

describe-events

The following code example shows how to use describe-events.

AWS CLI

To describe events of a replication group

The following describe-events example returns a list of events for a replication group.

```

aws elasticache describe-events \
  --source-identifier test-cluster \
  --source-type replication-group

```

Output:

```

{
  "Events": [
    {
      "SourceIdentifier": "test-cluster",
      "SourceType": "replication-group",
      "Message": "Automatic failover has been turned on for replication group
test-cluster",
      "Date": "2020-03-18T23:51:34.457Z"
    },
    {
      "SourceIdentifier": "test-cluster",
      "SourceType": "replication-group",
      "Message": "Replication group test-cluster created",
      "Date": "2020-03-18T23:50:31.378Z"
    }
  ]
}

```

For more information, see [Monitoring Events](#) in the *Elasticache User Guide*.

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

describe-global-replication-groups

The following code example shows how to use `describe-global-replication-groups`.

AWS CLI

To describe global replication groups

The following `describe-global-replication-groups` example returns details of a Global datastore.

```
aws elasticache describe-global-replication-groups \  
  --global-replication-group-id my-grg
```

Output:

```
{  
  "GlobalReplicationGroups": [  
    {  
      "GlobalReplicationGroupId": "my-grg",  
      "GlobalReplicationGroupDescription": "my-grg",  
      "Status": "creating",  
      "CacheNodeType": "cache.r5.large",  
      "Engine": "redis",  
      "EngineVersion": "5.0.6",  
      "ClusterEnabled": false,  
      "AuthTokenEnabled": false,  
      "TransitEncryptionEnabled": false,  
      "AtRestEncryptionEnabled": false  
    }  
  ]  
}
```

For more information, see [Replication Across AWS Regions Using Global Datastore](#) in the *Elasticache User Guide*.

- For API details, see [DescribeGlobalReplicationGroups](#) in *AWS CLI Command Reference*.

describe-replication-groups

The following code example shows how to use describe-replication-groups.

AWS CLI

To return a list of replication group details

The following describe-replication-groups example returns the replication groups.

```
aws elasticache describe-replication-groups
```

Output:

```
{
  "ReplicationGroups": [
    {
      "ReplicationGroupId": "my-cluster",
      "Description": "mycluster",
      "Status": "available",
      "PendingModifiedValues": {},
      "MemberClusters": [
        "pat-cluster-001",
        "pat-cluster-002",
        "pat-cluster-003",
        "pat-cluster-004"
      ],
      "NodeGroups": [
        {
          "NodeGroupId": "0001",
          "Status": "available",
          "PrimaryEndpoint": {
            "Address": "my-
cluster.xxxxih.ng.0001.usw2.cache.amazonaws.com",
            "Port": 6379
          },
          "ReaderEndpoint": {
            "Address": "my-cluster-
ro.xxxxih.ng.0001.usw2.cache.amazonaws.com",
            "Port": 6379
          },
          "NodeGroupMembers": [
            {
              "CacheClusterId": "my-cluster-001",
```

```
        "CacheNodeId": "0001",
        "ReadEndpoint": {
            "Address": "pat-
cluster-001.xxxih.0001.usw2.cache.amazonaws.com",
            "Port": 6379
        },
        "PreferredAvailabilityZone": "us-west-2a",
        "CurrentRole": "primary"
    },

describe-reserved-cache-nodes-offerings

The following code example shows how to use `describe-reserved-cache-nodes-offerings`.

AWS CLI

To describe reserved-cache-nodes-offerings

The following `describe-reserved-cache-nodes-offerings` example returns details of a reserved-cache-node options.

```
aws elasticache describe-reserved-cache-nodes-offerings
```

Output:

```
{
  "ReservedCacheNodesOfferings": [
    {
      "ReservedCacheNodesOfferingId": "01ce0a19-a476-41cb-8aee-48eacbcd8e5",
      "CacheNodeType": "cache.t3.small",
      "Duration": 31536000,
      "FixedPrice": 97.0,
      "UsagePrice": 0.0,
      "ProductDescription": "memcached",
      "OfferingType": "Partial Upfront",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": 0.011,
          "RecurringChargeFrequency": "Hourly"
        }
      ]
    },
    {
      "ReservedCacheNodesOfferingId": "0443a27b-4da5-4b90-b92d-929fbd7abed2",
      "CacheNodeType": "cache.m3.2xlarge",
      "Duration": 31536000,
      "FixedPrice": 1772.0,
      "UsagePrice": 0.0,
      "ProductDescription": "redis",
      "OfferingType": "Heavy Utilization",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": 0.25,
          "RecurringChargeFrequency": "Hourly"
        }
      ]
    },
    ...
  ]
}
```

For more information, see [Getting Info About Reserved Node Offerings](#) in the *Elasticache Redis User Guide* or [Getting Info About Reserved Node Offerings](#) in the *Elasticache Memcached User Guide*.

- For API details, see [DescribeReservedCacheNodesOfferings](#) in *AWS CLI Command Reference*.

describe-reserved-cache-nodes

The following code example shows how to use `describe-reserved-cache-nodes`.

AWS CLI

To describe reserved cache nodes

The following `describe-reserved-cache-nodes` example returns information about reserved cache nodes for this account, or about the specified reserved cache node.

```
aws elasticache describe-reserved-cache-nodes
```

Output:

```
{
  "ReservedCacheNodes": [
    {
      "ReservedCacheNodeId": "mynode",
      "ReservedCacheNodesOfferingId": "xxxxxxxxx-xxxxx-xxxxx-xxxx-xxxxxxxxx71",
      "CacheNodeType": "cache.t3.small",
      "StartTime": "2019-12-06T02:50:44.003Z",
      "Duration": 31536000,
      "FixedPrice": 0.0,
      "UsagePrice": 0.0,
      "CacheNodeCount": 1,
      "ProductDescription": "redis",
      "OfferingType": "No Upfront",
      "State": "payment-pending",
      "RecurringCharges": [
        {
          "RecurringChargeAmount": 0.023,
          "RecurringChargeFrequency": "Hourly"
        }
      ],
      "ReservationARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxxxxx52:reserved-instance:mynode"
    }
  ]
}
```

```

    }
  ]
}

```

For more information, see [Managing Costs with Reserved Nodes](#) in the *Elasticache User Guide*.

- For API details, see [DescribeReservedCacheNodes](#) in *AWS CLI Command Reference*.

describe-service-updates

The following code example shows how to use describe-service-updates.

AWS CLI

To describe service updates

The following describe-service-updates example returns details about service updates.

```
aws elasticache describe-service-updates
```

Output:

```

{
  "ServiceUpdates": [
    {
      "ServiceUpdateName": "elc-xxxxxxx7-001",
      "ServiceUpdateReleaseDate": "2019-10-09T16:00:00Z",
      "ServiceUpdateEndDate": "2020-02-09T15:59:59Z",
      "ServiceUpdateSeverity": "important",
      "ServiceUpdateRecommendedApplyByDate": "2019-11-08T15:59:59Z",
      "ServiceUpdateStatus": "available",
      "ServiceUpdateDescription": "Upgrades to improve the security,
reliability, and operational performance of your ElastiCache nodes",
      "ServiceUpdateType": "security-update",
      "Engine": "redis, memcached",
      "EngineVersion": "redis 2.6.13 and onwards, memcached 1.4.5 and
onwards",
      "AutoUpdateAfterRecommendedApplyByDate": false,
      "EstimatedUpdateTime": "30 minutes per node"
    },
    {
      "ServiceUpdateName": "elc-xxxxxxx4-001",
      "ServiceUpdateReleaseDate": "2019-06-11T15:00:00Z",

```

```

    "ServiceUpdateEndDate": "2019-10-01T09:24:00Z",
    "ServiceUpdateSeverity": "important",
    "ServiceUpdateRecommendedApplyByDate": "2019-07-11T14:59:59Z",
    "ServiceUpdateStatus": "expired",

reliability, and operational performance of your ElastiCache nodes",
    "ServiceUpdateType": "security-update",
    "Engine": "redis",
    "EngineVersion": "redis 3.2.6, redis 4.0 and onwards",
    "AutoUpdateAfterRecommendedApplyByDate": false,
    "EstimatedUpdateTime": "30 minutes per node"
  }
]
}

```

- For API details, see [DescribeServiceUpdates](#) in *AWS CLI Command Reference*.

describe-snapshots

The following code example shows how to use describe-snapshots.

AWS CLI

To describe snapshots

The following "describe-snapshots" example returns information about your cluster or replication group snapshots.

```
aws elasticache describe-snapshots
```

Output:

```

{
  "Snapshots": [
    {
      "SnapshotName": "automatic.my-cluster2-002-2019-12-05-06-38",
      "CacheClusterId": "my-cluster2-002",
      "SnapshotStatus": "available",
      "SnapshotSource": "automated",
      "CacheNodeType": "cache.r5.large",
      "Engine": "redis",
      "EngineVersion": "5.0.5",
    }
  ]
}

```

describe-user-groups

The following code example shows how to use describe-user-groups.

AWS CLI

To describe user-groups

The following describe-user-groups example returns a list of user groups.

```
aws elasticache describe-user-groups
```

Output:

```
{
  "UserGroups": [
    {
      "UserGroupId": "myusergroup",
      "Status": "active",
      "Engine": "redis",
      "UserIds": [
        "default"
      ],
      "ReplicationGroups": [],
      "ARN": "arn:aws:elasticache:us-
west-2:xxxxxxxxxx52:usergroup:myusergroup"
    }
  ]
}
```

For more information, see [Authenticating Users with Role-Based Access Control \(RBAC\)](#) in the *Elasticache User Guide*.

- For API details, see [DescribeUserGroups](#) in *AWS CLI Command Reference*.

describe-users

The following code example shows how to use describe-users.

AWS CLI

To describe users

The following describe-users example returns a list of users.

```
aws elasticache describe-users
```

Output:

```
{
  "Users": [
    {
      "UserId": "default",
      "UserName": "default",
      "Status": "active",
      "Engine": "redis",
      "AccessString": "on ~* +@all",
      "UserGroupIds": [
        "myusergroup"
      ],
      "Authentication": {
        "Type": "no-password"
      },
      "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:default"
    },
    {
      "UserId": "user1",
      "UserName": "myUser",
      "Status": "active",
      "Engine": "redis",
      "AccessString": "on ~* +@all",
      "UserGroupIds": [],
      "Authentication": {
        "Type": "password",
        "PasswordCount": 1
      },
      "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user1"
    },
    {
      "UserId": "user2",
      "UserName": "myUser",
      "Status": "active",
      "Engine": "redis",
      "AccessString": "on ~app:* -@all +@read +@hash +@bitmap +@geo -setbit -
bitfield -hset -hsetnx -hmset -hincrby -hincrbyfloat -hdel -bitop -geoadd -georadius
-georadiusbymember",
      "UserGroupIds": [],
      "Authentication": {
        "Type": "password",
        "PasswordCount": 1
      },
    },
  ],
}
```

```

        "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
    }
]
}

```

For more information, see [Authenticating Users with Role-Based Access Control \(RBAC\)](#) in the *Elasticache User Guide*.

- For API details, see [DescribeUsers](#) in *AWS CLI Command Reference*.

disassociate-global-replication-group

The following code example shows how to use `disassociate-global-replication-group`.

AWS CLI

To diassociate a secondary cluster from a global replication group

The following `disassociate-global-replication-group` example removes a secondary cluster from a Global datastore

```

aws elasticache disassociate-global-replication-group \
  --global-replication-group-id my-grg \
  --replication-group-id my-cluster-grg-secondary \
  --replication-group-region us-east-1

```

Output:

```

{
  "GlobalReplicationGroup": {
    "GlobalReplicationGroupId": "my-grg",
    "GlobalReplicationGroupDescription": "my-grg",
    "Status": "modifying",
    "CacheNodeType": "cache.r5.large",
    "Engine": "redis",

increase-node-groups-in-global-replication-group

The following code example shows how to use `increase-node-groups-in-global-replication-group`.

AWS CLI

To increase the number of node groups in a global replication group

The following `increase-node-groups-in-global-replication-group` increases the node group count using the Redis engine.

```

aws elasticache increase-node-groups-in-global-replication-group \
  --global-replication-group-id sgauipat-test-4 \
  --node-group-count 6 \
  --apply-immediately

```

Output:

```

{
  "GlobalReplicationGroup": {

```

```
"GlobalReplicationGroupId": "sgaui-test-4",
"GlobalReplicationGroupDescription": "test-4",

increase-replica-count

The following code example shows how to use `increase-replica-count`.

AWS CLI

To increase replica count

The following `increase-replica-count` example does one of two things. It can dynamically increase the number of replicas in a Redis (cluster mode disabled) replication group. Or it can dynamically increase the number of replica nodes in one or more node groups (shards) of a Redis (cluster mode enabled) replication group. This operation is performed with no cluster downtime.

```
aws elasticache increase-replica-count \
  --replication-group-id "my-cluster" \
  --apply-immediately \
  --new-replica-count 3
```

Output:

```
{
  "ReplicationGroup": {
    "ReplicationGroupId": "my-cluster",
    "Description": " ",
    "Status": "modifying",
    "PendingModifiedValues": {},
    "MemberClusters": [
      "my-cluster-001",
```

```
        "my-cluster-002",
        "my-cluster-003",
        "my-cluster-004"
    ],
    "NodeGroups": [
        {
            "NodeGroupId": "0001",

list-allowed-node-modifications

The following code example shows how to use `list-allowed-node-modifications`.

AWS CLI

To list the allowed node modifications

The following `list-allowed-node-type-modifications` example lists all the available node types that you can scale your Redis cluster's or replication group's current node type to.

```
aws elasticache list-allowed-node-type-modifications \
  --replication-group-id "my-replication-group"
```

Output:

```
{
  "ScaleUpModifications": [
    "cache.m5.12xlarge",
    "cache.m5.24xlarge",
    "cache.m5.4xlarge",
    "cache.r5.12xlarge",
    "cache.r5.24xlarge",
    "cache.r5.2xlarge",
    "cache.r5.4xlarge"
  ],
  "ScaleDownModifications": [
```

```
    "cache.m3.large",
    "cache.m3.medium",
    "cache.m3.xlarge",
    "cache.m4.large",
    "cache.m4.xlarge",
    "cache.m5.2xlarge",
    "cache.m5.large",
    "cache.m5.xlarge",
    "cache.r3.large",
    "cache.r4.large",
    "cache.r4.xlarge",
    "cache.r5.large",
    "cache.t2.medium",
    "cache.t2.micro",
    "cache.t2.small",
    "cache.t3.medium",
    "cache.t3.micro",
    "cache.t3.small"
  ]
}
```

For more information, see [Scaling ElastiCache for Redis Clusters](#) in the *ElastiCache User Guide*.

- For API details, see [ListAllowedNodeTypeModifications](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example lists tags for a resource.

```
aws elasticache list-tags-for-resource \
  --resource-name "arn:aws:elasticache:us-east-1:123456789012:cluster:my-cluster"
```

Output:

```
{
  "TagList": [
    {
```

```
        "Key": "Project",
        "Value": "querySpeedUp"
    },
    {
        "Key": "Environment",
        "Value": "PROD"
    }
]
}
```

For more information, see [Listing Tags Using the AWS CLI](#) in the *ElastiCache User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

modify-cache-cluster

The following code example shows how to use `modify-cache-cluster`.

AWS CLI

To modify cache clusters

The following `modify-cache-cluster` example modifies the settings for the specified cluster.

```
aws elasticache modify-cache-cluster \
  --cache-cluster-id "my-cluster" \
  --num-cache-nodes 1
```

Output:

```
{
  "CacheCluster": {
    "CacheClusterId": "my-cluster",
    "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/
home#client-download:",
    "CacheNodeType": "cache.m5.large",
    "Engine": "redis",
    "EngineVersion": "5.0.5",

    "PreferredMaintenanceWindow": "sat:10:00-sat:11:00",
```

```

    "PendingModifiedValues": {},
    "CacheSecurityGroups": [],
    "CacheParameterGroup": {
        "CacheParameterGroupName": "default.redis5.0",
        "ParameterApplyStatus": "in-sync",
        "CacheNodeIdsToReboot": []
    },
    "CacheSubnetGroupName": "default",
    "AutoMinorVersionUpgrade": true,
    "SnapshotRetentionLimit": 0,
    "SnapshotWindow": "07:00-08:00",
    "TransitEncryptionEnabled": false,
    "AtRestEncryptionEnabled": false
}
}

```

For more information, see [Modifying an ElastiCache Cluster](#) in the *ElastiCache User Guide*.

- For API details, see [ModifyCacheCluster](#) in *AWS CLI Command Reference*.

modify-cache-parameter-group

The following code example shows how to use `modify-cache-parameter-group`.

AWS CLI

To modify a cache parameter group

The following `modify-cache-parameter-group` example modifies the parameters of the specified cache parameter group.

```

aws elasticache modify-cache-parameter-group \
  --cache-parameter-group-name "mygroup" \
  --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"

```

Output:

```

{
  "CacheParameterGroupName": "mygroup"
}

```

For more information, see [Modifying a Parameter Group](#) in the *ElastiCache User Guide*.

- For API details, see [ModifyCacheParameterGroup](#) in *AWS CLI Command Reference*.

modify-cache-subnet-group

The following code example shows how to use `modify-cache-subnet-group`.

AWS CLI

To modify a cache subnet group

The following `modify-cache-subnet-group` example modifies the specified cache subnet group.

```
aws elasticache modify-cache-subnet-group \  
  --cache-subnet-group-name kxkxk \  
  --cache-subnet-group-description "mygroup"
```

Output:

```
{  
  "CacheSubnetGroup": {  
    "CacheSubnetGroupName": "kxkxk",  
    "CacheSubnetGroupDescription": "mygroup",  
    "VpcId": "vpc-xxxxcdb",  
    "Subnets": [  
      {  
        "SubnetIdentifier": "subnet-xxxxbff",  
        "SubnetAvailabilityZone": {  
          "Name": "us-west-2a"  
        }  
      }  
    ]  
  }  
}
```

For more information, see [Modifying a Subnet Group](#) in the *Elasticache User Guide*.

- For API details, see [ModifyCacheSubnetGroup](#) in *AWS CLI Command Reference*.

modify-global-replication-group

The following code example shows how to use `modify-global-replication-group`.

AWS CLI

To modify a global replication group

The following `modify-global-replication-group` modifies the properties of a global replication group, in this case disabling automatic failover, using the Redis engine.

```
aws elasticache modify-global-replication-group \  
  --global-replication-group-id sgau1-pat-group \  
  --apply-immediately \  
  --no-automatic-failover-enabled
```

Output

```
{  
  "GlobalReplicationGroup": {  
    "GlobalReplicationGroupId": "sgau1-test-group",  
    "GlobalReplicationGroupDescription": " ",  
    "Status": "modifying",  
    "CacheNodeType": "cache.r5.large",  
    "Engine": "redis",  
    "EngineVersion": "5.0.6",  
    "ClusterEnabled": false,  
    "AuthTokenEnabled": false,  
    "TransitEncryptionEnabled": false,  
    "AtRestEncryptionEnabled": false  
  }  
}
```

For more information, see [Replication Across AWS Regions Using Global Datastore](#) in the *Elasticache User Guide*.

- For API details, see [ModifyGlobalReplicationGroup](#) in *AWS CLI Command Reference*.

modify-replication-group-shard-configuration

The following code example shows how to use `modify-replication-group-shard-configuration`.

AWS CLI

To modify a replication group shard configuration

The following `modify-replication-group-shard-configuration` decreases the node group count using the Redis engine.

```
aws elasticache modify-replication-group-shard-configuration \  
  --replication-group-id mycluster \  
  --node-group-count 3 \  
  --apply-immediately \  
  --node-groups-to-remove 0002
```

Output

```
{  
  "ReplicationGroup": {  
    "ReplicationGroupId": "mycluster",  
    "Description": "mycluster",  
    "GlobalReplicationGroupInfo": {},  
    "Status": "modifying",

modify-replication-group

The following code example shows how to use `modify-replication-group`.

AWS CLI

To modify a replication group

The following `modify-replication-group` disables Multi-AZ using the Redis engine.

```

aws elasticache modify-replication-group \
  --replication-group-id test-cluster \
  --no-multi-az-enabled \
  --apply-immediately

```

Output

```

{
  "ReplicationGroup": {
    "ReplicationGroupId": "test-cluster",
    "Description": "test-cluster",
    "GlobalReplicationGroupInfo": {
      "GlobalReplicationGroupId": "sgaui-pat-group",
      "GlobalReplicationGroupMemberRole": "PRIMARY"
    }
  },
}

```

```

modify-user-group

The following code example shows how to use `modify-user-group`.

AWS CLI

To modify a user group

The following `modify-user-group` example adds a user to the user group.

```

aws elasticache modify-user-group \
  --user-group-id myusergroup \
  --user-ids-to-add user1

```

Output:

```
{
  "UserGroupId": "myusergroup",
  "Status": "modifying",
  "Engine": "redis",
  "UserIds": [
    "default"
  ],
  "PendingChanges": {
    "UserIdsToAdd": [
      "user1"
    ]
  },
  "ReplicationGroups": [],
  "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:usergroup:myusergroup"
}
```

For more information, see [Authenticating Users with Role-Based Access Control \(RBAC\)](#) in the *Elasticache User Guide*.

- For API details, see [ModifyUserGroup](#) in *AWS CLI Command Reference*.

modify-user

The following code example shows how to use `modify-user`.

AWS CLI**To modify a user**

The following `modify-user` example modifies a user's access string.

```
aws elasticache modify-user \  
  --user-id user2 \  
  --append-access-string "on ~* +@all"
```

Output:

```
{
  "UserId": "user2",
  "UserName": "myUser",
```

```

    "Status": "modifying",
    "Engine": "redis",
    "AccessString": "on ~* +@all",
    "UserGroupIds": [],
    "Authentication": {
        "Type": "password",
        "PasswordCount": 1
    },
    "ARN": "arn:aws:elasticache:us-west-2:xxxxxxxxxx52:user:user2"
}

```

For more information, see [Authenticating Users with Role-Based Access Control \(RBAC\)](#) in the *Elasticache User Guide*.

- For API details, see [ModifyUser](#) in *AWS CLI Command Reference*.

purchase-reserved-cache-nodes-offering

The following code example shows how to use `purchase-reserved-cache-nodes-offering`.

AWS CLI

To purchase a reserved-cache-node-offering

The following `purchase-reserved-cache-nodes-offering` example allows you to purchase a reserved cache node offering.

```

aws elasticache purchase-reserved-cache-nodes-offering \
  --reserved-cache-nodes-offering-id xxxxxxxx-4da5-4b90-b92d-929fbd7abed2

```

Output

```

{
  "ReservedCacheNode": {
    "ReservedCacheNodeId": "ri-2020-06-30-17-59-40-474",
    "ReservedCacheNodesOfferingId": "xxxxxxx-4da5-4b90-b92d-929fbd7abed2",
    "CacheNodeType": "cache.m3.2xlarge",
    "StartTime": "2020-06-30T17:59:40.474000+00:00",
    "Duration": 31536000,
    "FixedPrice": 1772.0,
    "UsagePrice": 0.0,
    "CacheNodeCount": 1,
  }
}

```

```

    "ProductDescription": "redis",
    "OfferingType": "Heavy Utilization",
    "State": "payment-pending",
    "RecurringCharges": [
      {
        "RecurringChargeAmount": 0.25,
        "RecurringChargeFrequency": "Hourly"
      }
    ]
  }
}

```

For more information, see [Getting Info About Reserved Node Offerings](#) in the *Elasticache Redis User Guide* or [Getting Info About Reserved Node Offerings](#) in the *Elasticache Memcached User Guide*.

- For API details, see [PurchaseReservedCacheNodesOffering](#) in *AWS CLI Command Reference*.

reboot-cache-cluster

The following code example shows how to use `reboot-cache-cluster`.

AWS CLI

To reboot a cache cluster

The following `reboot-cache-cluster` example reboots some, or all, of the cache nodes within a provisioned cluster. This operation applies any modified cache parameter groups to the cluster. The reboot operation takes place as soon as possible, and results in a momentary outage to the cluster. During the reboot, the cluster status is set to REBOOTING.

```

aws elasticache reboot-cache-cluster \
  --cache-cluster-id "my-cluster-001" \
  --cache-node-ids-to-reboot "0001"

```

Output:

```

{
  "CacheCluster": {
    "CacheClusterId": "my-cluster-001",
    "ClientDownloadLandingPage": "https://console.aws.amazon.com/elasticache/home#client-download:",
  }
}

```

```
"CacheNodeType": "cache.r5.xlarge",
"Engine": "redis",
"EngineVersion": "5.0.5",
"CacheClusterStatus": "rebooting cache cluster nodes",
"NumCacheNodes": 1,
"PreferredAvailabilityZone": "us-west-2a",
"CacheClusterCreateTime": "2019-11-26T03:35:04.546Z",
"PreferredMaintenanceWindow": "mon:04:05-mon:05:05",
"PendingModifiedValues": {},
"NotificationConfiguration": {

"SecurityGroups": [
  {
    "SecurityGroupId": "sg-xxxxxxxxxxxx836",
    "Status": "active"
  },
  {
    "SecurityGroupId": "sg-xxxxxxx7b",
    "Status": "active"
  }
],
"ReplicationGroupId": "my-cluster",
"SnapshotRetentionLimit": 0,
"SnapshotWindow": "07:30-08:30",
"TransitEncryptionEnabled": false,
"AtRestEncryptionEnabled": false
}
}
```

For more information, see [Rebooting a Cluster <https://docs.aws.amazon.com/AmazonElastiCache/latest/red-ug/Clusters.Rebooting.html>](https://docs.aws.amazon.com/AmazonElastiCache/latest/red-ug/Clusters.Rebooting.html) in the *ElastiCache User Guide*.

- For API details, see [RebootCacheCluster](#) in *AWS CLI Command Reference*.

reset-cache-parameter-group

The following code example shows how to use `reset-cache-parameter-group`.

AWS CLI

To reset a cache parameter group

The following `reset-cache-parameter-group` example modifies the parameters of a cache parameter group to the engine or system default value. You can reset specific parameters by submitting a list of parameter names. To reset the entire cache parameter group, specify the `--reset-all-parameters` and `--cache-parameter-group-name` parameters.

```
aws elasticache reset-cache-parameter-group \  
  --cache-parameter-group-name "mygroup" \  
  --reset-all-parameters
```

Output:

```
{  
  "CacheParameterGroupName": "mygroup"  
}
```

- For API details, see [ResetCacheParameterGroup](#) in *AWS CLI Command Reference*.

start-migration

The following code example shows how to use `start-migration`.

AWS CLI

To start a migration

The following `start-migration` migrates your data from self-hosted Redis on Amazon EC2 to Amazon ElastiCache, using the Redis engine.

```
aws elasticache start-migration \  
  --replication-group-id test \  
  --customer-node-endpoint-list  
  "Address='test.g2xbih.ng.0001.usw2.cache.amazonaws.com',Port=6379"
```

Output

```
{
  "ReplicationGroup": {
    "ReplicationGroupId": "test",
    "Description": "test",
    "GlobalReplicationGroupInfo": {},
    "Status": "modifying",
    "PendingModifiedValues": {},
    "MemberClusters": [

}
}

```

For more information, see [Online Migration to ElastiCache](#) in the *ElastiCache User Guide*.

- For API details, see [StartMigration](#) in *AWS CLI Command Reference*.

test-failover

The following code example shows how to use test-failover.

AWS CLI

To test failover of a node group

The following test-failover example tests automatic failover on the specified node group (called a shard in the console) in a replication group (called a cluster in the console).

```
aws elasticache test-failover /
  --replication-group-id "mycluster" /
  --node-group-id "0001"
```

Output:

```
{
  "ReplicationGroup": {
    "ReplicationGroupId": "mycluster",
    "Description": "My Cluster",
    "Status": "available",
    "PendingModifiedValues": {},
    "MemberClusters": [
      "mycluster-0001-001",
      "mycluster-0001-002",
      "mycluster-0001-003",
      "mycluster-0002-001",
      "mycluster-0002-002",
      "mycluster-0002-003",
      "mycluster-0003-001",
      "mycluster-0003-002",
      "mycluster-0003-003"
    ],
    "NodeGroups": [
      {
        "NodeGroupId": "0001",
        "Status": "available",
        "Slots": "0-5461",
        "NodeGroupMembers": [
          {

- For API details, see [TestFailover](#) in *AWS CLI Command Reference*.

MediaStore examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-container

The following code example shows how to use create-container.

AWS CLI

To create a container

The following create-container example creates a new, empty container.

```
aws mediastore create-container --container-name ExampleContainer
```

Output:

```
{
  "Container": {
    "AccessLoggingEnabled": false,
    "CreationTime": 1563557265,
    "Name": "ExampleContainer",
    "Status": "CREATING",
    "ARN": "arn:aws:mediastore:us-west-2:111122223333:container/
ExampleContainer"
  }
}
```

For more information, see [Creating a Container](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [CreateContainer](#) in *AWS CLI Command Reference*.

delete-container-policy

The following code example shows how to use delete-container-policy.

AWS CLI

To delete a container policy

The following delete-container-policy example deletes the policy that is assigned to the specified container. When the policy is deleted, AWS Elemental MediaStore automatically assigns the default policy to the container.

```
aws mediastore delete-container-policy \  
  --container-name LiveEvents
```

This command produces no output.

For more information, see [DeleteContainerPolicy](#) in the *AWS Elemental MediaStore API reference*.

- For API details, see [DeleteContainerPolicy](#) in *AWS CLI Command Reference*.

delete-container

The following code example shows how to use delete-container.

AWS CLI

To delete a container

The following delete-container example deletes the specified container. You can delete a container only if it has no objects.

```
aws mediastore delete-container \  
  --container-name=ExampleLiveDemo
```

This command produces no output.

For more information, see [Deleting a Container](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DeleteContainer](#) in *AWS CLI Command Reference*.

delete-cors-policy

The following code example shows how to use delete-cors-policy.

AWS CLI

To delete a CORS policy

The following delete-cors-policy example deletes the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```
aws mediastore delete-cors-policy \  
  --container-name ExampleLiveDemo
```

```
--container-name ExampleContainer
```

This command produces no output.

For more information, see [Deleting a CORS Policy](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DeleteCorsPolicy](#) in *AWS CLI Command Reference*.

delete-lifecycle-policy

The following code example shows how to use `delete-lifecycle-policy`.

AWS CLI

To delete an object lifecycle policy

The following `delete-lifecycle-policy` example deletes the object lifecycle policy attached to the specified container. This change can take up to 20 minutes to take effect.

```
aws mediastore delete-lifecycle-policy \  
  --container-name LiveEvents
```

This command produces no output.

For more information, see [Deleting an Object Lifecycle Policy](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DeleteLifecyclePolicy](#) in *AWS CLI Command Reference*.

describe-container

The following code example shows how to use `describe-container`.

AWS CLI

To view the details of a container

The following `describe-container` example displays the details of the specified container.

```
aws mediastore describe-container \  
  --container-name ExampleContainer
```

Output:

```
{
  "Container": {
    "CreationTime": 1563558086,
    "AccessLoggingEnabled": false,
    "ARN": "arn:aws:mediastore:us-west-2:111122223333:container/
ExampleContainer",
    "Status": "ACTIVE",
    "Name": "ExampleContainer",
    "Endpoint": "https://aaabbbcccddee.data.mediastore.us-west-2.amazonaws.com"
  }
}
```

For more information, see [Viewing the Details for a Container](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DescribeContainer](#) in *AWS CLI Command Reference*.

describe-object

The following code example shows how to use `describe-object`.

AWS CLI**To view a list of objects and folders in a specific container**

The following `describe-object` example displays items (objects and folders) stored in a specific container.

```
aws mediastore-data describe-object \
  --endpoint https://aaabbbcccddee.data.mediastore.us-west-2.amazonaws.com \
  --path /folder_name/file1234.jpg
```

Output:

```
{
  "ContentType": "image/jpeg",
  "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
  "ContentLength": "2307346",
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9e99999994dd89ff7f5555555555555555da6d3"
}
```

For more information, see [Viewing the Details of an Object](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DescribeObject](#) in *AWS CLI Command Reference*.

get-container-policy

The following code example shows how to use `get-container-policy`.

AWS CLI

To view a container policy

The following `get-container-policy` example displays the resource-based policy of the specified container.

```
aws mediastore get-container-policy \  
  --container-name ExampleLiveDemo
```

Output:

```
{  
  "Policy": {  
    "Version": "2012-10-17",  
    "Statement": [  
      {  
        "Sid": "PublicReadOverHttps",  
        "Effect": "Allow",  
        "Principal": {  
          "AWS": "arn:aws:iam::111122223333:root"  
        },  
        "Action": [  
          "mediastore:GetObject",  
          "mediastore:DescribeObject"  
        ],  
        "Resource": "arn:aws:mediastore:us-west-2:111122223333:container/  
ExampleLiveDemo/",  
        "Condition": {  
          "Bool": {  
            "aws:SecureTransport": "true"  
          }  
        }  
      }  
    ]  
  }  
}
```

```
    ]
  }
}
```

For more information, see [Viewing a Container Policy](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetContainerPolicy](#) in *AWS CLI Command Reference*.

get-cors-policy

The following code example shows how to use `get-cors-policy`.

AWS CLI

To view a CORS policy

The following `get-cors-policy` example displays the cross-origin resource sharing (CORS) policy that is assigned to the specified container.

```
aws mediastore get-cors-policy \
  --container-name ExampleContainer \
  --region us-west-2
```

Output:

```
{
  "CorsPolicy": [
    {
      "AllowedMethods": [
        "GET",
        "HEAD"
      ],
      "MaxAgeSeconds": 3000,
      "AllowedOrigins": [
        ""
      ],
      "AllowedHeaders": [
        ""
      ]
    }
  ]
}
```

```
}
```

For more information, see [Viewing a CORS Policy](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetCorsPolicy](#) in *AWS CLI Command Reference*.

get-lifecycle-policy

The following code example shows how to use `get-lifecycle-policy`.

AWS CLI

To view an object lifecycle policy

The following `get-lifecycle-policy` example displays the object lifecycle policy attached to the specified container.

```
aws mediastore get-lifecycle-policy \  
  --container-name LiveEvents
```

Output:

```
{  
  "LifecyclePolicy": {  
    "rules": [  
      {  
        "definition": {  
          "path": [  
            {  
              "prefix": "Football/"  
            },  
            {  
              "prefix": "Baseball/"  
            }  
          ],  
          "days_since_create": [  
            {  
              "numeric": [  
                ">",  
                28  
              ]  
            }  
          ]  
        }  
      ]  
    }  
  }
```

```

    ]
  },
  "action": "EXPIRE"
}
]
}
}

```

For more information, see [Viewing an Object Lifecycle Policy](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetLifecyclePolicy](#) in *AWS CLI Command Reference*.

get-object

The following code example shows how to use `get-object`.

AWS CLI

To download an object

The following `get-object` example download an object to the specified endpoint.

```

aws mediastore-data get-object \
  --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \
  --path=/folder_name/README.md README.md

```

Output:

```

{
  "ContentLength": "2307346",
  "ContentType": "image/jpeg",
  "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9e4dd89ff7f5555555555555555da6d3",
  "StatusCode": 200
}

```

To download part of an object

The following `get-object` example downloads a portion an object to the specified endpoint.

```

aws mediastore-data get-object \

```

```
--endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \  
--path /folder_name/README.md \  
--range="bytes=0-100" README2.md
```

Output:

```
{  
  "StatusCode": 206,  
  "ContentRange": "bytes 0-100/2307346",  
  "ContentLength": "101",  
  "LastModified": "Fri, 19 Jul 2019 21:32:20 GMT",  
  "ContentType": "image/jpeg",  
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9e4dd89ff7f5555555555555555da6d3"  
}
```

For more information, see [Downloading an Object](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetObject](#) in *AWS CLI Command Reference*.

list-containers

The following code example shows how to use `list-containers`.

AWS CLI

To view a list of containers

The following `list-containers` example displays a list of all containers that are associated with your account.

```
aws mediastore list-containers
```

Output:

```
{  
  "Containers": [  
    {  
      "CreationTime": 1505317931,  
      "Endpoint": "https://aaabbbcccdddee.data.mediastore.us-  
west-2.amazonaws.com",  
      "Status": "ACTIVE",
```

```

        "ARN": "arn:aws:mediastore:us-west-2:111122223333:container/
ExampleLiveDemo",
        "AccessLoggingEnabled": false,
        "Name": "ExampleLiveDemo"
    },
    {
        "CreationTime": 1506528818,
        "Endpoint": "https://ffffggghhhiiijj.data.mediastore.us-
west-2.amazonaws.com",
        "Status": "ACTIVE",
        "ARN": "arn:aws:mediastore:us-west-2:111122223333:container/
ExampleContainer",
        "AccessLoggingEnabled": false,
        "Name": "ExampleContainer"
    }
]
}

```

For more information, see [Viewing a List of Containers](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [ListContainers](#) in *AWS CLI Command Reference*.

list-items

The following code example shows how to use `list-items`.

AWS CLI

Example 1: To view a list of objects and folders in a specific container

The following `list-items` example displays items (objects and folders) stored in the specified container.

```

aws mediastore-data list-items \
  --endpoint https://aaabbbcccddee.data.mediastore.us-west-2.amazonaws.com

```

Output:

```

{
  "Items": [
    {

```

```

        "ContentType": "image/jpeg",
        "LastModified": 1563571859.379,
        "Name": "filename.jpg",
        "Type": "OBJECT",
        "ETag":
"543ab21abcd1a234ab123456a1a2b12345ab12abc12a1234abc1a2bc12345a12",
        "ContentLength": 3784
    },
    {
        "Type": "FOLDER",
        "Name": "ExampleLiveDemo"
    }
]
}

```

Example 2: To view a list of objects and folders in a specific folder

The following `list-items` example displays items (objects and folders) stored in a specific folder.

```

aws mediastore-data list-items \
  --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com

```

Output:

```

{
  "Items": [
    {
      "ContentType": "image/jpeg",
      "LastModified": 1563571859.379,
      "Name": "filename.jpg",
      "Type": "OBJECT",
      "ETag":
"543ab21abcd1a234ab123456a1a2b12345ab12abc12a1234abc1a2bc12345a12",
      "ContentLength": 3784
    },
    {
      "Type": "FOLDER",
      "Name": "ExampleLiveDemo"
    }
  ]
}

```

For more information, see [Viewing a List of Objects](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [ListItems](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a container

The following `list-tags-for-resource` example displays the tag keys and values assigned to the specified container.

```
aws mediastore list-tags-for-resource \  
  --resource arn:aws:mediastore:us-west-2:1213456789012:container/ExampleContainer
```

Output:

```
{  
  "Tags": [  
    {  
      "Value": "Test",  
      "Key": "Environment"  
    },  
    {  
      "Value": "West",  
      "Key": "Region"  
    }  
  ]  
}
```

For more information, see [ListTagsForResource](#) in the *AWS Elemental MediaStore API Reference*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-container-policy

The following code example shows how to use `put-container-policy`.

AWS CLI

To edit a container policy

The following `put-container-policy` example assigns a different policy to the specified container. In this example, the updated policy is defined in a file named `LiveEventsContainerPolicy.json`.

```
aws mediastore put-container-policy \  
  --container-name LiveEvents \  
  --policy file://LiveEventsContainerPolicy.json
```

This command produces no output.

For more information, see [Editing a Container Policy](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [PutContainerPolicy](#) in *AWS CLI Command Reference*.

put-cors-policy

The following code example shows how to use `put-cors-policy`.

AWS CLI

Example 1: To add a CORS policy

The following `put-cors-policy` example adds a cross-origin resource sharing (CORS) policy to the specified container. The contents of the CORS policy are in the file named `corsPolicy.json`.

```
aws mediastore put-cors-policy \  
  --container-name ExampleContainer \  
  --cors-policy file://corsPolicy.json
```

This command produces no output.

For more information, see [Adding a CORS Policy to a Container](#) in the *AWS Elemental MediaStore User Guide*.

Example 2: To edit a CORS policy

The following `put-cors-policy` example updates the cross-origin resource sharing (CORS) policy that is assigned to the specified container. The contents of the updated CORS policy are in the file named `corsPolicy2.json`.

For more information, see [Editing a CORS Policy](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [PutCorsPolicy](#) in *AWS CLI Command Reference*.

put-lifecycle-policy

The following code example shows how to use `put-lifecycle-policy`.

AWS CLI

To create an object lifecycle policy

The following `put-lifecycle-policy` example attaches an object lifecycle policy to the specified container. This enables you to specify how long the service should store objects in your container. MediaStore deletes objects in the container once they reach their expiration date, as indicated in the policy, which is in the file named `LiveEventsLifecyclePolicy.json`.

```
aws mediastore put-lifecycle-policy \  
  --container-name ExampleContainer \  
  --lifecycle-policy file://ExampleLifecyclePolicy.json
```

This command produces no output.

For more information, see [Adding an Object Lifecycle Policy to a Container](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [PutLifecyclePolicy](#) in *AWS CLI Command Reference*.

put-object

The following code example shows how to use `put-object`.

AWS CLI

To upload an object

The following `put-object` example uploads an object to the specified container. You can specify a folder path where the object will be saved within the container. If the folder already exists, AWS Elemental MediaStore stores the object in the folder. If the folder doesn't exist, the service creates it, and then stores the object in the folder.

```
aws mediastore-data put-object \  
  --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \  
  --body README.md \  
  --path /folder_name/README.md \  
  --cache-control "max-age=6, public" \  
  --content-type binary/octet-stream
```

Output:

```
{  
  "ContentSHA256":  
    "74b5fdb517f423ed750ef214c44adfe2be36e37d861eafe9c842cbe1bf387a9d",  
  "StorageClass": "TEMPORAL",  
  "ETag": "af3e4731af032167a106015d1f2fe934e68b32ed1aa297a9e325f5c64979277b"  
}
```

For more information, see [Uploading an Object](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [PutObject](#) in *AWS CLI Command Reference*.

start-access-logging

The following code example shows how to use `start-access-logging`.

AWS CLI

To enable access logging on a container

The following `start-access-logging` example enable access logging on the specified container.

```
aws mediastore start-access-logging \  
  --container-name LiveEvents
```

This command produces no output.

For more information, see [Enabling Access Logging for a Container](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [StartAccessLogging](#) in *AWS CLI Command Reference*.

stop-access-logging

The following code example shows how to use stop-access-logging.

AWS CLI

To disable access logging on a container

The following stop-access-logging example disables access logging on the specified container.

```
aws mediastore stop-access-logging \  
  --container-name LiveEvents
```

This command produces no output.

For more information, see [Disabling Access Logging for a Container](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [StopAccessLogging](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a container

The following tag-resource example adds tag keys and values to the specified container.

```
aws mediastore tag-resource \  
  --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer \  
  --tags '[{"Key": "Region", "Value": "West"}, {"Key": "Environment", "Value": "Test"}]'
```

This command produces no output.

For more information, see [TagResource](#) in the *AWS Elemental MediaStore API Reference*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a container

The following `untag-resource` example removes the specified tag key and its associated value from a container.

```
aws mediastore untag-resource \  
  --resource arn:aws:mediastore:us-west-2:123456789012:container/ExampleContainer \  
  --tag-keys Region
```

This command produces no output.

For more information, see [UntagResource](#) in the *AWS Elemental MediaStore API Reference*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

Amazon EMR examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-instance-fleet

The following code example shows how to use `add-instance-fleet`.

AWS CLI

To add a task instance fleet to a cluster

This example adds a new task instance fleet to the cluster specified.

Command:

```
aws emr add-instance-fleet --cluster-id 'j-12ABCDEFGHI34JK' --instance-fleet
InstanceFleetType=TASK,TargetSpotCapacity=1,LaunchSpecifications={SpotSpecification='{Timeo
```

Output:

```
{
  "ClusterId": "j-12ABCDEFGHI34JK",
  "InstanceFleetId": "if-23ABCDEFGHI45JJ"
}
```

- For API details, see [AddInstanceFleet](#) in *AWS CLI Command Reference*.

add-steps

The following code example shows how to use `add-steps`.

AWS CLI

1. To add Custom JAR steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps
Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://mybucket/
mytest.jar,Args=arg1,arg2,arg3
```

```
Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://mybucket/mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3
```

Required parameters:

```
Jar
```

Optional parameters:

```
Type, Name, ActionOnFailure, Args
```

Output:

```
{
  "StepIds":[
    "s-XXXXXXXX",
    "s-YYYYYYYY"
  ]
}
```

2. To add Streaming steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/wordcount/input,-output,s3://mybucket/wordcount/output]
```

Required parameters:

```
Type, Args
```

Optional parameters:

```
Name, ActionOnFailure
```

JSON equivalent (contents of step.json):

```
[
```

```
{
  "Name": "JSON Streaming Step",
  "Args": ["-files", "s3://elasticmapreduce/samples/wordcount/wordSplitter.py", "-mapper", "wordSplitter.py", "-reducer", "aggregate", "-input", "s3://elasticmapreduce/samples/wordcount/input", "-output", "s3://mybucket/wordcount/output"],
  "ActionOnFailure": "CONTINUE",
  "Type": "STREAMING"
}
```

NOTE: JSON arguments must include options and values as their own items in the list.

Command (using step.json):

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps file://./step.json
```

Output:

```
{
  "StepIds": [
    "s-XXXXXXXX",
    "s-YYYYYYYY"
  ]
}
```

3. To add a Streaming step with multiple files to a cluster (JSON only)

JSON (multiplefiles.json):

```
[
  {
    "Name": "JSON Streaming Step",
    "Type": "STREAMING",
    "ActionOnFailure": "CONTINUE",
    "Args": [
      "-files",
      "s3://mybucket/mapper.py,s3://mybucket/reducer.py",
      "-mapper",
      "mapper.py",
      "-reducer",
      "reducer.py",
      "-input",
      "s3://mybucket/input",
    ]
  }
]
```

```
        "-output",
        "s3://mybucket/output"]
    }
]
```

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps file://./multiplefiles.json
```

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

```
{
  "StepIds": [
    "s-XXXXXXXX",
  ]
}
```

4. To add Hive steps to a cluster**Command:**

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=HIVE,Name='Hive
program',ActionOnFailure=CONTINUE,Args=[-f,s3://mybucket/myhivescript.q,-
d,INPUT=s3://mybucket/myhiveinput,-d,OUTPUT=s3://mybucket/myhiveoutput,arg1,arg2]
Type=HIVE,Name='Hive steps',ActionOnFailure=TERMINATE_CLUSTER,Args=[-
f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://
elasticmapreduce/samples/hive-ads/tables,-d,OUTPUT=s3://mybucket/hive-ads/
output/2014-04-18/11-07-32,-d,LIBS=s3://elasticmapreduce/samples/hive-ads/libs]
```

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

```
{
  "StepIds": [
    "s-XXXXXXXX",
    "s-YYYYYYYY"
  ]
}
```

5. To add Pig steps to a cluster**Command:**

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=PIG,Name='Pig
program',ActionOnFailure=CONTINUE,Args=[-f,s3://mybucket/mypigscript.pig,-
p,INPUT=s3://mybucket/mypiginput,-p,OUTPUT=s3://mybucket/mypigoutput,arg1,arg2]
Type=PIG,Name='Pig program',Args=[-f,s3://elasticmapreduce/samples/pig-apache/do-
reports2.pig,-p,INPUT=s3://elasticmapreduce/samples/pig-apache/input,-p,OUTPUT=s3://
mybucket/pig-apache/output,arg1,arg2]
```

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

```
{
  "StepIds": [
    "s-XXXXXXXX",
    "s-YYYYYYYY"
  ]
}
```

6. To add Impala steps to a cluster

Command:

```
aws emr add-steps --cluster-id j-XXXXXXXX --steps Type=IMPALA,Name='Impala
program',ActionOnFailure=CONTINUE,Args=--impala-script,s3://myimpala/input,--
console-output-path,s3://myimpala/output
```

Required parameters:

Type, Args

Optional parameters:

Name, ActionOnFailure

Output:

```
{
  "StepIds":[
    "s-XXXXXXXX",
    "s-YYYYYYYY"
  ]
}
```

- For API details, see [AddSteps](#) in *AWS CLI Command Reference*.

add-tags

The following code example shows how to use add-tags.

AWS CLI

1. To add tags to a cluster

Command:

```
aws emr add-tags --resource-id j-xxxxxxx --tags name="John Doe" age=29 sex=male
address="123 East NW Seattle"
```

Output:

None

2. To list tags of a cluster

--Command:

```
aws emr describe-cluster --cluster-id j-XXXXXXYY --query Cluster.Tags
```

Output:

```
[
  {
    "Value": "male",
    "Key": "sex"
  },
  {
    "Value": "123 East NW Seattle",
    "Key": "address"
  },
  {
    "Value": "John Doe",
    "Key": "name"
  },
  {
    "Value": "29",
    "Key": "age"
  }
]
```

- For API details, see [AddTags](#) in *AWS CLI Command Reference*.

create-cluster-examples

The following code example shows how to use `create-cluster-examples`.

AWS CLI

Most of the following examples assume that you specified your Amazon EMR service role and Amazon EC2 instance profile. If you have not done this, you must specify each required IAM role or use the `--use-default-roles` parameter when creating your cluster. For more

information about specifying IAM roles, see [Configure IAM Roles for Amazon EMR Permissions to AWS Services](#) in the *Amazon EMR Management Guide*.

Example 1: To create a cluster

The following `create-cluster` example creates a simple EMR cluster.

```
aws emr create-cluster \  
  --release-label emr-5.14.0 \  
  --instance-type m4.large \  
  --instance-count 2
```

This command produces no output.

Example 2: To create an Amazon EMR cluster with default `ServiceRole` and `InstanceProfile` roles

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration.

```
aws emr create-cluster \  
  --release-label emr-5.14.0 \  
  --service-role EMR_DefaultRole \  
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Example 3: To create an Amazon EMR cluster that uses an instance fleet

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-fleets` configuration, specifying two instance types for each fleet and two EC2 Subnets.

```
aws emr create-cluster \  
  --release-label emr-5.14.0 \  
  --service-role EMR_DefaultRole \  
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole,SubnetIds=['subnet-  
ab12345c','subnet-de67890f'] \  
  --instance-fleets  
  InstanceFleetType=MASTER,TargetOnDemandCapacity=1,InstanceTypeConfigs=['{InstanceType=m4.la  
  InstanceFleetType=CORE,TargetSpotCapacity=11,InstanceTypeConfigs=['{InstanceType=m4.large,B
```

Example 4: To create a cluster with default roles

The following `create-cluster` example uses the `--use-default-roles` parameter to specify the default service role and instance profile.

```
aws emr create-cluster \  
  --release-label emr-5.9.0 \  
  --use-default-roles \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \  
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \  
  --auto-terminate
```

Example 5: To create a cluster and specify the applications to install

The following `create-cluster` example uses the `--applications` parameter to specify the applications that Amazon EMR installs. This example installs Hadoop, Hive and Pig.

```
aws emr create-cluster \  
  --applications Name=Hadoop Name=Hive Name=Pig \  
  --release-label emr-5.9.0 \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \  
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \  
  --auto-terminate
```

Example 6: To create a cluster that includes Spark

The following example installs Spark.

```
aws emr create-cluster \  
  --release-label emr-5.9.0 \  
  --applications Name=Spark \  
  --ec2-attributes KeyName=myKey \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \  
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \  
  --auto-terminate
```

Example 7: To specify a custom AMI to use for cluster instances

The following `create-cluster` example creates a cluster instance based on the Amazon Linux AMI with ID `ami-a518e6df`.

```
aws emr create-cluster \  
  --release-label emr-5.9.0 \  
  --instance-profile emr-5.9.0-ec2-instance-profile \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large \  
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \  
  --auto-terminate
```

```
--name "Cluster with My Custom AMI" \  
--custom-ami-id ami-a518e6df \  
--ebs-root-volume-size 20 \  
--release-label emr-5.9.0 \  
--use-default-roles \  
--instance-count 2 \  
--instance-type m4.large
```

Example 8: To customize application configurations

The following examples use the `--configurations` parameter to specify a JSON configuration file that contains application customizations for Hadoop. For more information, see [Configuring Applications](#) in the *Amazon EMR Release Guide*.

Contents of `configurations.json`:

```
[  
  {  
    "Classification": "mapred-site",  
    "Properties": {  
      "mapred.tasktracker.map.tasks.maximum": 2  
    }  
  },  
  {  
    "Classification": "hadoop-env",  
    "Properties": {},  
    "Configurations": [  
      {  
        "Classification": "export",  
        "Properties": {  
          "HADOOP_DATANODE_HEAPSIZE": 2048,  
          "HADOOP_NAMENODE_OPTS": "-XX:GCTimeRatio=19"  
        }  
      }  
    ]  
  }  
]
```

The following example references `configurations.json` as a local file.

```
aws emr create-cluster \  
--configurations file://configurations.json \  
--release-label emr-5.9.0 \  

```

```
--instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
--auto-terminate
```

The following example references `configurations.json` as a file in Amazon S3.

```
aws emr create-cluster \
--configurations https://s3.amazonaws.com/myBucket/configurations.json \
--release-label emr-5.9.0 \
--instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
--auto-terminate
```

Example 9: To create a cluster with master, core, and task instance groups

The following `create-cluster` example uses `--instance-groups` to specify the type and number of EC2 instances to use for master, core, and task instance groups.

```
aws emr create-cluster \
--release-label emr-5.9.0 \
--instance-groups
Name=Master,InstanceGroupType=MASTER,InstanceType=m4.large,InstanceCount=1
Name=Core,InstanceGroupType=CORE,InstanceType=m4.large,InstanceCount=2
Name=Task,InstanceGroupType=TASK,InstanceType=m4.large,InstanceCount=2
```

Example 10: To specify that a cluster should terminate after completing all steps

The following `create-cluster` example uses `--auto-terminate` to specify that the cluster should shut down automatically after completing all steps.

```
aws emr create-cluster \
--release-label emr-5.9.0 \
--instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
--auto-terminate
```

Example 11: To specify cluster configuration details such as the Amazon EC2 key pair, network configuration, and security groups

The following `create-cluster` example creates a cluster with the Amazon EC2 key pair named `myKey` and a customized instance profile named `myProfile`. Key pairs are used to

authorize SSH connections to cluster nodes, most often the master node. For more information, see [Use an Amazon EC2 Key Pair for SSH Credentials](#) in the *Amazon EMR Management Guide*.

```
aws emr create-cluster \  
  --ec2-attributes KeyName=myKey,InstanceProfile=myProfile \  
  --release-label emr-5.9.0 \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \  
  --auto-terminate
```

The following example creates a cluster in an Amazon VPC subnet.

```
aws emr create-cluster \  
  --ec2-attributes SubnetId=subnet-xxxxx \  
  --release-label emr-5.9.0 \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \  
  --auto-terminate
```

The following example creates a cluster in the us-east-1b availability zone.

```
aws emr create-cluster \  
  --ec2-attributes AvailabilityZone=us-east-1b \  
  --release-label emr-5.9.0 \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies only the Amazon EMR-managed security groups.

```
aws emr create-cluster \  
  --release-label emr-5.9.0 \  
  --service-role myServiceRole \  
  --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-  
  master1,EmrManagedSlaveSecurityGroup=sg-slave1 \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies only additional Amazon EC2 security groups.

```
aws emr create-cluster \
  --release-label emr-5.9.0 \
  --service-role myServiceRole \
  --ec2-attributes InstanceProfile=myRole,AdditionalMasterSecurityGroups=[sg-
addMaster1,sg-addMaster2,sg-addMaster3,sg-
addMaster4],AdditionalSlaveSecurityGroups=[sg-addSlave1,sg-addSlave2,sg-
addSlave3,sg-addSlave4] \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster and specifies the EMR-Managed security groups, as well as additional security groups.

```
aws emr create-cluster \
  --release-label emr-5.9.0 \
  --service-role myServiceRole \
  --ec2-attributes InstanceProfile=myRole,EmrManagedMasterSecurityGroup=sg-
master1,EmrManagedSlaveSecurityGroup=sg-slave1,AdditionalMasterSecurityGroups=[sg-
addMaster1,sg-addMaster2,sg-addMaster3,sg-
addMaster4],AdditionalSlaveSecurityGroups=[sg-addSlave1,sg-addSlave2,sg-
addSlave3,sg-addSlave4] \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example creates a cluster in a VPC private subnet and use a specific Amazon EC2 security group to enable Amazon EMR service access, which is required for clusters in private subnets.

```
aws emr create-cluster \
  --release-label emr-5.9.0 \
  --service-role myServiceRole \
  --ec2-attributes InstanceProfile=myRole,ServiceAccessSecurityGroup=sg-service-
access,EmrManagedMasterSecurityGroup=sg-master,EmrManagedSlaveSecurityGroup=sg-slave
\
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following example specifies security group configuration parameters using a JSON file named `ec2_attributes.json` that is stored locally. NOTE: JSON arguments must include options and values as their own items in the list.

```
aws emr create-cluster \
  --release-label emr-5.9.0 \
  --service-role myServiceRole \
  --ec2-attributes file://ec2_attributes.json \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Contents of `ec2_attributes.json`:

```
[
  {
    "SubnetId": "subnet-xxxxxx",
    "KeyName": "myKey",
    "InstanceProfile": "myRole",
    "EmrManagedMasterSecurityGroup": "sg-master1",
    "EmrManagedSlaveSecurityGroup": "sg-slave1",
    "ServiceAccessSecurityGroup": "sg-service-access",
    "AdditionalMasterSecurityGroups": ["sg-addMaster1", "sg-addMaster2", "sg-
addMaster3", "sg-addMaster4"],
    "AdditionalSlaveSecurityGroups": ["sg-addSlave1", "sg-addSlave2", "sg-
addSlave3", "sg-addSlave4"]
  }
]
```

Example 12: To enable debugging and specify a log URI

The following `create-cluster` example uses the `--enable-debugging` parameter, which allows you to view log files more easily using the debugging tool in the Amazon EMR console. The `--log-uri` parameter is required with `--enable-debugging`.

```
aws emr create-cluster \
  --enable-debugging \
  --log-uri s3://myBucket/myLog \
  --release-label emr-5.9.0 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 13: To add tags when creating a cluster

Tags are key-value pairs that help you identify and manage clusters. The following `create-cluster` example uses the `--tags` parameter to create three tags for a cluster, one with the

key name `name` and the value `Shirley Rodriguez`, a second with the key name `age` and the value `29`, and a third tag with the key name `department` and the value `Analytics`.

```
aws emr create-cluster \  
  --tags name="Shirley Rodriguez" age=29 department="Analytics" \  
  --release-label emr-5.32.0 \  
  --instance-type m5.xlarge \  
  --instance-count 3 \  
  --use-default-roles
```

The following example lists the tags applied to a cluster.

```
aws emr describe-cluster \  
  --cluster-id j-XXXXXXXXYY \  
  --query Cluster.Tags
```

Example 14: To use a security configuration that enables encryption and other security features

The following `create-cluster` example uses the `--security-configuration` parameter to specify a security configuration for an EMR cluster. You can use security configurations with Amazon EMR version 4.8.0 or later.

```
aws emr create-cluster \  
  --instance-type m4.large \  
  --release-label emr-5.9.0 \  
  --security-configuration mySecurityConfiguration
```

Example 15: To create a cluster with additional EBS storage volumes configured for the instance groups

When specifying additional EBS volumes, the following arguments are required: `VolumeType`, `SizeInGB` if `EbsBlockDeviceConfigs` is specified.

The following `create-cluster` example creates a cluster with multiple EBS volumes attached to EC2 instances in the core instance group.

```
aws emr create-cluster \  
  --release-label emr-5.9.0 \  
  --use-default-roles \  
  --instance-groups
```

```

--instance-groups
InstanceGroupType=MASTER,InstanceCount=1,InstanceType=d2.xlarge
'InstanceGroupType=CORE,InstanceCount=2,InstanceType=d2.xlarge,EbsConfiguration={EbsOptimiz
{VolumeSpecification={VolumeType=io1,SizeInGB=100,Iops=100},VolumesPerInstance=4}}]'
\
--auto-terminate

```

The following example creates a cluster with multiple EBS volumes attached to EC2 instances in the master instance group.

```

aws emr create-cluster \
--release-label emr-5.9.0 \
--use-default-roles \
--instance-groups 'InstanceGroupType=MASTER, InstanceCount=1,
InstanceType=d2.xlarge, EbsConfiguration={EbsOptimized=true,
EbsBlockDeviceConfigs=[{VolumeSpecification={VolumeType=io1, SizeInGB=100,
Iops=100}}],
{VolumeSpecification={VolumeType=standard,SizeInGB=50},VolumesPerInstance=3}}]'
InstanceGroupType=CORE,InstanceCount=2,InstanceType=d2.xlarge \
--auto-terminate

```

Example 16: To create a cluster with an automatic scaling policy

You can attach automatic scaling policies to core and task instance groups using Amazon EMR version 4.0 and later. The automatic scaling policy dynamically adds and removes EC2 instances in response to an Amazon CloudWatch metric. For more information, see [Using Automatic Scaling in Amazon EMR](https://docs.aws.amazon.com/emr/latest/ManagementGuide/emr-automatic-scaling.html) in the *Amazon EMR Management Guide*.

When attaching an automatic scaling policy, you must also specify the default role for automatic scaling using `--auto-scaling-role EMR_AutoScaling_DefaultRole`.

The following `create-cluster` example specifies the automatic scaling policy for the CORE instance group using the `AutoScalingPolicy` argument with an embedded JSON structure, which specifies the scaling policy configuration. Instance groups with an embedded JSON structure must have the entire collection of arguments enclosed in single quotes. Using single quotes is optional for instance groups without an embedded JSON structure.

```

aws emr create-cluster
--release-label emr-5.9.0 \
--use-default-roles --auto-scaling-role EMR_AutoScaling_DefaultRole \

```

```
--instance-groups
InstanceGroupType=MASTER,InstanceType=d2.xlarge,InstanceCount=1
'InstanceGroupType=CORE,InstanceType=d2.xlarge,InstanceCount=2,AutoScalingPolicy={Constraints
```

The following example uses a JSON file, `instancegroupconfig.json`, to specify the configuration of all instance groups in a cluster. The JSON file specifies the automatic scaling policy configuration for the core instance group.

```
aws emr create-cluster \
  --release-label emr-5.9.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --instance-groups file://myfolder/instancegroupconfig.json \
  --auto-scaling-role EMR_AutoScaling_DefaultRole
```

Contents of `instancegroupconfig.json`:

```
[
  {
    "InstanceCount": 1,
    "Name": "MyMasterIG",
    "InstanceGroupType": "MASTER",
    "InstanceType": "m4.large"
  },
  {
    "InstanceCount": 2,
    "Name": "MyCoreIG",
    "InstanceGroupType": "CORE",
    "InstanceType": "m4.large",
    "AutoScalingPolicy": {
      "Constraints": {
        "MinCapacity": 2,
        "MaxCapacity": 10
      },
      "Rules": [
        {
          "Name": "Default-scale-out",
          "Description": "Replicates the default scale-out rule in the
console for YARN memory.",
          "Action": {
            "SimpleScalingPolicyConfiguration": {
              "AdjustmentType": "CHANGE_IN_CAPACITY",
```

```

        "ScalingAdjustment": 1,
        "CoolDown": 300
    }
},
"Trigger": {
    "CloudWatchAlarmDefinition": {
        "ComparisonOperator": "LESS_THAN",
        "EvaluationPeriods": 1,
        "MetricName": "YARNMemoryAvailablePercentage",
        "Namespace": "AWS/ElasticMapReduce",
        "Period": 300,
        "Threshold": 15,
        "Statistic": "AVERAGE",
        "Unit": "PERCENT",
        "Dimensions": [
            {
                "Key": "JobFlowId",
                "Value": "${emr.clusterId}"
            }
        ]
    }
}
}
]
}
]

```

Example 17: Add custom JAR steps when creating a cluster

The following `create-cluster` example adds steps by specifying a JAR file stored in Amazon S3. Steps submit work to a cluster. The main function defined in the JAR file executes after EC2 instances are provisioned, any bootstrap actions have executed, and applications are installed. The steps are specified using `Type=CUSTOM_JAR`.

Custom JAR steps require the `Jar=` parameter, which specifies the path and file name of the JAR. Optional parameters are `Type`, `Name`, `ActionOnFailure`, `Args`, and `MainClass`. If main class is not specified, the JAR file should specify `Main-Class` in its manifest file.

```

aws emr create-cluster \
    --steps Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://
myBucket/mytest.jar,Args=arg1,arg2,arg3

```

```
Type=CUSTOM_JAR,Name=CustomJAR,ActionOnFailure=CONTINUE,Jar=s3://myBucket/
mytest.jar,MainClass=mymainclass,Args=arg1,arg2,arg3 \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Example 18: To add streaming steps when creating a cluster

The following `create-cluster` examples add a streaming step to a cluster that terminates after all steps run. Streaming steps require parameters `Type` and `Args`. Streaming steps optional parameters are `Name` and `ActionOnFailure`.

The following example specifies the step inline.

```
aws emr create-cluster \
  --steps Type=STREAMING,Name='Streaming Program',ActionOnFailure=CONTINUE,Args=[-
files,s3://elasticmapreduce/samples/wordcount/wordSplitter.py,-
mapper,wordSplitter.py,-reducer,aggregate,-input,s3://elasticmapreduce/samples/
wordcount/input,-output,s3://mybucket/wordcount/output] \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

The following example uses a locally stored JSON configuration file named `multiplefiles.json`. The JSON configuration specifies multiple files. To specify multiple files within a step, you must use a JSON configuration file to specify the step. JSON arguments must include options and values as their own items in the list.

```
aws emr create-cluster \
  --steps file://./multiplefiles.json \
  --release-label emr-5.9.0 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \
  --auto-terminate
```

Contents of `multiplefiles.json`:

```
[
  {
```

```

    "Name": "JSON Streaming Step",
    "Args": [
        "-files",
        "s3://elasticmapreduce/samples/wordcount/wordSplitter.py",
        "-mapper",
        "wordSplitter.py",
        "-reducer",
        "aggregate",
        "-input",
        "s3://elasticmapreduce/samples/wordcount/input",
        "-output",
        "s3://mybucket/wordcount/output"
    ],
    "ActionOnFailure": "CONTINUE",
    "Type": "STREAMING"
}
]

```

Example 19: To add Hive steps when creating a cluster

The following example add Hive steps when creating a cluster. Hive steps require parameters Type and Args. Hive steps optional parameters are Name and ActionOnFailure.

```

aws emr create-cluster \
  --steps Type=HIVE,Name='Hive
  program',ActionOnFailure=CONTINUE,ActionOnFailure=TERMINATE_CLUSTER,Args=[-
  f,s3://elasticmapreduce/samples/hive-ads/libs/model-build.q,-d,INPUT=s3://
  elasticmapreduce/samples/hive-ads/tables,-d,OUTPUT=s3://mybucket/hive-ads/
  output/2014-04-18/11-07-32,-d,LIBS=s3://elasticmapreduce/samples/hive-ads/libs] \
  --applications Name=Hive \
  --release-label emr-5.3.1 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
  InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large

```

Example 20: To add Pig steps when creating a cluster

The following example adds Pig steps when creating a cluster. Pig steps required parameters are Type and Args. Pig steps optional parameters are Name and ActionOnFailure.

```

aws emr create-cluster \
  --steps Type=PIG,Name='Pig program',ActionOnFailure=CONTINUE,Args=[-f,s3://
  elasticmapreduce/samples/pig-apache/do-reports2.pig,-p,INPUT=s3://elasticmapreduce/
  samples/pig-apache/input,-p,OUTPUT=s3://mybucket/pig-apache/output] \

```

```
--applications Name=Pig \  
--release-label emr-5.3.1 \  
--instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

Example 21: To add bootstrap actions

The following `create-cluster` example runs two bootstrap actions defined as scripts that are stored in Amazon S3.

```
aws emr create-cluster \  
  --bootstrap-actions Path=s3://mybucket/  
myscript1,Name=BootstrapAction1,Args=[arg1,arg2] Path=s3://mybucket/  
myscript2,Name=BootstrapAction2,Args=[arg1,arg2] \  
  --release-label emr-5.3.1 \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large \  
  --auto-terminate
```

Example 22: To enable EMRFS consistent view and customize the `RetryCount` and `RetryPeriod` settings

The following `create-cluster` example specifies the retry count and retry period for EMRFS consistent view. The `Consistent=true` argument is required.

```
aws emr create-cluster \  
  --instance-type m4.large \  
  --release-label emr-5.9.0 \  
  --emrfs Consistent=true,RetryCount=6,RetryPeriod=30
```

The following example specifies the same EMRFS configuration as the previous example, using a locally stored JSON configuration file named `emrfsconfig.json`.

```
aws emr create-cluster \  
  --instance-type m4.large \  
  --release-label emr-5.9.0 \  
  --emrfs file://emrfsconfig.json
```

Contents of `emrfsconfig.json`:

```
{
```

```
"Consistent": true,  
"RetryCount": 6,  
"RetryPeriod": 30  
}
```

Example 23: To create a cluster with Kerberos configured

The following `create-cluster` examples create a cluster using a security configuration with Kerberos enabled, and establishes Kerberos parameters for the cluster using `--kerberos-attributes`.

The following command specifies Kerberos attributes for the cluster inline.

```
aws emr create-cluster \  
  --instance-type m3.xlarge \  
  --release-label emr-5.10.0 \  
  --service-role EMR_DefaultRole \  
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \  
  --security-configuration mySecurityConfiguration \  
  --kerberos-attributes  
  Realm=EC2.INTERNAL,KdcAdminPassword=123,CrossRealmTrustPrincipalPassword=123
```

The following command specifies the same attributes, but references a locally stored JSON file named `kerberos_attributes.json`. In this example, the file is saved in the same directory where you run the command. You can also reference a configuration file saved in Amazon S3.

```
aws emr create-cluster \  
  --instance-type m3.xlarge \  
  --release-label emr-5.10.0 \  
  --service-role EMR_DefaultRole \  
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \  
  --security-configuration mySecurityConfiguration \  
  --kerberos-attributes file://kerberos_attributes.json
```

Contents of `kerberos_attributes.json`:

```
{  
  "Realm": "EC2.INTERNAL",  
  "KdcAdminPassword": "123",  
  "CrossRealmTrustPrincipalPassword": "123",  
}
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--instance-groups` configuration and has a managed scaling policy.

```
aws emr create-cluster \
  --release-label emr-5.30.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
  --managed-scaling-policy
ComputeLimits='{MinimumCapacityUnits=2,MaximumCapacityUnits=4,UnitType=Instances}'
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--log-encryption-kms-key-id` to define KMS key ID utilized for Log encryption.

```
aws emr create-cluster \
  --release-label emr-5.30.0 \
  --log-uri s3://myBucket/myLog \
  --log-encryption-kms-key-id arn:aws:kms:us-east-1:110302272565:key/
dd559181-283e-45d7-99d1-66da348c4d33 \
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large
InstanceGroupType=CORE,InstanceCount=2,InstanceType=m4.large
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--placement-group-configs` configuration to place master nodes in a high-availability (HA) cluster within an EC2 placement group using SPREAD placement strategy.

```
aws emr create-cluster \
  --release-label emr-5.30.0 \
  --service-role EMR_DefaultRole \
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \
  --instance-groups
InstanceGroupType=MASTER,InstanceCount=3,InstanceType=m4.largeInstanceGroupType=CORE,Instan
\
  --placement-group-configs InstanceRole=MASTER
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the `--auto-termination-policy` configuration to place an automatic idle termination threshold for the cluster.

```
aws emr create-cluster \
```

```
--release-label emr-5.34.0 \  
--service-role EMR_DefaultRole \  
--ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \  
--instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
InstanceGroupType=CORE,InstanceCount=1,InstanceType=m4.large \  
--auto-termination-policy IdleTimeout=100
```

The following `create-cluster` example creates an Amazon EMR cluster that uses the "`--os-release-label`" to define an Amazon Linux release for cluster launch

```
aws emr create-cluster \  
  --release-label emr-6.6.0 \  
  --os-release-label 2.0.20220406.1 \  
  --service-role EMR_DefaultRole \  
  --ec2-attributes InstanceProfile=EMR_EC2_DefaultRole \  
  --instance-groups InstanceGroupType=MASTER,InstanceCount=1,InstanceType=m4.large  
  InstanceGroupType=CORE,InstanceCount=1,InstanceType=m4.large
```

Example 24: To specify an EBS root volume attributes: size, iops and throughput for cluster instances created with EMR releases 6.15.0 and later

The following `create-cluster` example creates an Amazon EMR cluster that uses root volume attributes to configure root volumes specifications for the EC2 instances.

```
aws emr create-cluster \  
  --name "Cluster with My Custom AMI" \  
  --custom-ami-id ami-a518e6df \  
  --ebs-root-volume-size 20 \  
  --ebs-root-volume-iops 3000 \  
  --ebs-root-volume-throughput 125 \  
  --release-label emr-6.15.0 \  
  --use-default-roles \  
  --instance-count 2 \  
  --instance-type m4.large
```

- For API details, see [CreateClusterExamples](#) in *AWS CLI Command Reference*.

create-default-roles

The following code example shows how to use `create-default-roles`.

AWS CLI

1. To create the default IAM role for EC2

Command:

```
aws emr create-default-roles
```

Output:

If the role already exists then the command returns nothing.

If the role does not exist then the output will be:

```
[
  {
    "RolePolicy": {
      "Version": "2012-10-17",
      "Statement": [
        {

create-security-configuration

The following code example shows how to use create-security-configuration.

AWS CLI

1. To create a security configuration with in-transit encryption enabled with PEM for certificate provider, and at-rest encryption enabled with SSE-S3 for S3 encryption and AWS-KMS for local disk key provider

Command:

```

aws emr create-security-configuration --name MySecurityConfig --security-
configuration '{
  "EncryptionConfiguration": {
    "EnableInTransitEncryption" : true,
    "EnableAtRestEncryption" : true,
    "InTransitEncryptionConfiguration" : {
      "TLSCertificateConfiguration" : {
        "CertificateProviderType" : "PEM",
        "S3Object" : "s3://mycertstore/artifacts/
MyCerts.zip"
      }
    },
    "AtRestEncryptionConfiguration" : {
      "S3EncryptionConfiguration" : {
        "EncryptionMode" : "SSE-S3"
      }
    }
  },
}

```

```

        "LocalDiskEncryptionConfiguration" : {
            "EncryptionKeyProviderType" : "AwsKms",
            "AwsKmsKey" : "arn:aws:kms:us-
east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
        }
    }
}'

```

Output:

```

{
  "CreationDateTime": 1474070889.129,
  "Name": "MySecurityConfig"
}

```

JSON equivalent (contents of security_configuration.json):

```

{
  "EncryptionConfiguration": {
    "EnableInTransitEncryption": true,
    "EnableAtRestEncryption": true,
    "InTransitEncryptionConfiguration": {
      "TLSCertificateConfiguration": {
        "CertificateProviderType": "PEM",
        "S3Object": "s3://mycertstore/artifacts/MyCerts.zip"
      }
    },
    "AtRestEncryptionConfiguration": {
      "S3EncryptionConfiguration": {
        "EncryptionMode": "SSE-S3"
      },
      "LocalDiskEncryptionConfiguration": {
        "EncryptionKeyProviderType": "AwsKms",
        "AwsKmsKey": "arn:aws:kms:us-
east-1:123456789012:key/12345678-1234-1234-1234-123456789012"
      }
    }
  }
}

```

Command (using security_configuration.json):

```
aws emr create-security-configuration --name "MySecurityConfig" --security-configuration file:///./security_configuration.json
```

Output:

```
{
  "CreationDateTime": 1474070889.129,
  "Name": "MySecurityConfig"
}
```

2. To create a security configuration with Kerberos enabled using cluster-dedicated KDC and cross-realm trust

Command:

```
aws emr create-security-configuration --name MySecurityConfig --security-configuration '{
  "AuthenticationConfiguration": {
    "KerberosConfiguration": {
      "Provider": "ClusterDedicatedKdc",
      "ClusterDedicatedKdcConfiguration": {
        "TicketLifetimeInHours": 24,
        "CrossRealmTrustConfiguration": {
          "Realm": "AD.DOMAIN.COM",
          "Domain": "ad.domain.com",
          "AdminServer": "ad.domain.com",
          "KdcServer": "ad.domain.com"
        }
      }
    }
  }
}'
```

Output:

```
{
  "CreationDateTime": 1490225558.982,
  "Name": "MySecurityConfig"
}
```

JSON equivalent (contents of security_configuration.json):

```
{
  "AuthenticationConfiguration": {
    "KerberosConfiguration": {
      "Provider": "ClusterDedicatedKdc",
      "ClusterDedicatedKdcConfiguration": {
        "TicketLifetimeInHours": 24,
        "CrossRealmTrustConfiguration": {
          "Realm": "AD.DOMAIN.COM",
          "Domain": "ad.domain.com",
          "AdminServer": "ad.domain.com",
          "KdcServer": "ad.domain.com"
        }
      }
    }
  }
}
```

Command (using security_configuration.json):

```
aws emr create-security-configuration --name "MySecurityConfig" --security-configuration file:///./security_configuration.json
```

Output:

```
{
  "CreationDateTime": 1490225558.982,
  "Name": "MySecurityConfig"
}
```

- For API details, see [CreateSecurityConfiguration](#) in *AWS CLI Command Reference*.

delete-security-configuration

The following code example shows how to use delete-security-configuration.

AWS CLI

To delete a security configuration in the current region

Command:

```
aws emr delete-security-configuration --name MySecurityConfig
```

Output:

```
None
```

- For API details, see [DeleteSecurityConfiguration](#) in *AWS CLI Command Reference*.

describe-cluster

The following code example shows how to use `describe-cluster`.

AWS CLI**Command:**

```
aws emr describe-cluster --cluster-id j-XXXXXXXX
```

Output:

For release-label based uniform instance groups cluster:

```
{
  "Cluster": {
    "Status": {
      "Timeline": {
        "ReadyDateTime": 1436475075.199,

            "Name": "hadoop"
        }
    ],
    "BootstrapActions": [],
    "VisibleToAllUsers": false,
    "RequestedAmiVersion": "2.4.2",
    "LogUri": "s3://myLogUri/",
    "AutoTerminate": false,
    "Id": "j-XXXXXXXX"
}
}

```

- For API details, see [DescribeCluster](#) in *AWS CLI Command Reference*.

describe-step

The following code example shows how to use describe-step.

AWS CLI

The following command describes a step with the step ID s-3LZC0QUT43AM in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr describe-step --cluster-id j-3SD91U2E1L2QX --step-id s-3LZC0QUT43AM
```

Output:

```

{
  "Step": {
    "Status": {
      "Timeline": {
        "EndTime": 1433200470.481,
        "CreationDateTime": 1433199926.597,
        "StartTime": 1433200404.959
      },
      "State": "COMPLETED",
      "StateChangeReason": {}
    },
    "Config": {
      "Args": [

```

```

        "s3://us-west-2.elasticmapreduce/libs/hive/hive-script",
        "--base-path",
        "s3://us-west-2.elasticmapreduce/libs/hive/",
        "--install-hive",
        "--hive-versions",
        "0.13.1"
    ],
    "Jar": "s3://us-west-2.elasticmapreduce/libs/script-runner/script-
runner.jar",
    "Properties": {}
},
    "Id": "s-3LZC0QUT43AM",
    "ActionOnFailure": "TERMINATE_CLUSTER",
    "Name": "Setup hive"
}
}

```

- For API details, see [DescribeStep](#) in *AWS CLI Command Reference*.

get

The following code example shows how to use `get`.

AWS CLI

The following downloads the `hadoop-examples.jar` archive from the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr get --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src /
home/hadoop-examples.jar --dest ~
```

- For API details, see [Get](#) in *AWS CLI Command Reference*.

list-clusters

The following code example shows how to use `list-clusters`.

AWS CLI

The following command lists all active EMR clusters in the current region:

```
aws emr list-clusters --active
```

Output:

```
{
  "Clusters": [
    {
      "Status": {
        "Timeline": {
          "ReadyDateTime": 1433200405.353,
          "CreationDateTime": 1433199926.596
        },
        "State": "WAITING",
        "StateChangeReason": {
          "Message": "Waiting after step completed"
        }
      },
      "NormalizedInstanceHours": 6,
      "Id": "j-3SD91U2E1L2QX",
      "Name": "my-cluster"
    }
  ]
}
```

- For API details, see [ListClusters](#) in *AWS CLI Command Reference*.

list-instance-fleets

The following code example shows how to use `list-instance-fleets`.

AWS CLI**To get configuration details of instance fleets in a cluster**

This example lists the details of instance fleets in the cluster specified.

Command:

```
list-instance-fleets --cluster-id 'j-12ABCDEFGH134JK'
```

Output:

```
{
  "InstanceFleets": [
    {
      "Status": {
        "Timeline": {
          "ReadyDateTime": 1488759094.637,
          "CreationDateTime": 1488758719.817
        },
        "State": "RUNNING",
        "StateChangeReason": {
          "Message": ""
        }
      },
      "ProvisionedSpotCapacity": 6,
      "Name": "CORE",
      "InstanceFleetType": "CORE",
      "LaunchSpecifications": {
        "SpotSpecification": {
          "TimeoutDurationMinutes": 60,

list-instances

The following code example shows how to use `list-instances`.

AWS CLI

The following command lists all of the instances in a cluster with the cluster ID `j-3C6XNQ39VR9WL`:

```
aws emr list-instances --cluster-id j-3C6XNQ39VR9WL
```

Output:

```

For a uniform instance group based cluster
{
  "Instances": [
    {
      "Status": {
        "Timeline": {
          "ReadyDateTime": 1433200400.03,
          "CreationDateTime": 1433199960.152
        },
        "State": "RUNNING",
        "StateChangeReason": {}
      }
    }
  ]
}

```

```
    },
    "Ec2InstanceId": "i-f19ecfee",
    "PublicDnsName": "ec2-52-52-41-150.us-west-2.compute.amazonaws.com",
    "PrivateDnsName": "ip-172-21-11-216.us-west-2.compute.internal",
    "PublicIpAddress": "52.52.41.150",
    "Id": "ci-3NNHQ2TWB6Y",
    "PrivateIpAddress": "172.21.11.216"
  },
  {
    "Status": {
      "Timeline": {
        "ReadyDateTime": 1433200400.031,
        "CreationDateTime": 1433199949.102
      },
      "State": "RUNNING",
      "StateChangeReason": {}
    },
    "Ec2InstanceId": "i-1f1ee4c2",
    "PublicDnsName": "ec2-52-63-246-32.us-west-2.compute.amazonaws.com",
    "PrivateDnsName": "ip-172-31-24-130.us-west-2.compute.internal",
    "PublicIpAddress": "52.63.246.32",
    "Id": "ci-GAOCMKNKDCV7",
    "PrivateIpAddress": "172.21.11.215"
  },
  {
    "Status": {
      "Timeline": {
        "ReadyDateTime": 1433200400.031,
        "CreationDateTime": 1433199949.102
      },
      "State": "RUNNING",
      "StateChangeReason": {}
    },
    "Ec2InstanceId": "i-15cfee3",
    "PublicDnsName": "ec2-52-25-246-63.us-west-2.compute.amazonaws.com",
    "PrivateDnsName": "ip-172-31-24-129.us-west-2.compute.internal",
    "PublicIpAddress": "52.25.246.63",
    "Id": "ci-2W3TDFFB47UAD",
    "PrivateIpAddress": "172.21.11.214"
  }
]
}
```

For a fleet based cluster:

```
{
  "Instances": [
    {
      "Status": {
        "Timeline": {
          "ReadyDateTime": 1487810810.878,
          "CreationDateTime": 1487810588.367,
          "EndDateTime": 1488022990.924
        },
        "State": "TERMINATED",
        "StateChangeReason": {
          "Message": "Instance was terminated."
        }
      },
      "Ec2InstanceId": "i-xxxxx",
      "InstanceFleetId": "if-xxxxx",
      "EbsVolumes": [],
      "PublicDnsName": "ec2-xx-xxx-xxx-xxx.compute-1.amazonaws.com",
      "InstanceType": "m3.xlarge",
      "PrivateDnsName": "ip-xx-xx-xxx-xx.ec2.internal",
      "Market": "SPOT",
      "PublicIpAddress": "xx.xx.xxx.xxx",
      "Id": "ci-xxxxx",
      "PrivateIpAddress": "10.47.191.80"
    }
  ]
}
```

- For API details, see [ListInstances](#) in *AWS CLI Command Reference*.

list-security-configurations

The following code example shows how to use `list-security-configurations`.

AWS CLI

To list security configurations in the current region

Command:

```
aws emr list-security-configurations
```

Output:

```
{
  "SecurityConfigurations": [
    {
      "CreationDateTime": 1473889697.417,
      "Name": "MySecurityConfig-1"
    },
    {
      "CreationDateTime": 1473889697.417,
      "Name": "MySecurityConfig-2"
    }
  ]
}
```

- For API details, see [ListSecurityConfigurations](#) in *AWS CLI Command Reference*.

list-steps

The following code example shows how to use `list-steps`.

AWS CLI

The following command lists all of the steps in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr list-steps --cluster-id j-3SD91U2E1L2QX
```

- For API details, see [ListSteps](#) in *AWS CLI Command Reference*.

modify-cluster-attributes

The following code example shows how to use `modify-cluster-attributes`.

AWS CLI

The following command sets the visibility of an EMR cluster with the ID `j-301CDNY0J5XM4` to all users:

```
aws emr modify-cluster-attributes --cluster-id j-301CDNY0J5XM4 --visible-to-all-users
```

- For API details, see [ModifyClusterAttributes](#) in *AWS CLI Command Reference*.

modify-instance-fleet

The following code example shows how to use `modify-instance-fleet`.

AWS CLI

To change the target capacities of an instance fleet

This example changes the On-Demand and Spot target capacities to 1 for the instance fleet specified.

Command:

```
aws emr modify-instance-fleet --cluster-id 'j-12ABCDEFGH134JK' --instance-fleet InstanceFleetId='if-2ABC4DEFGHIJ4',TargetOnDemandCapacity=1,TargetSpotCapacity=1
```

- For API details, see [ModifyInstanceFleet](#) in *AWS CLI Command Reference*.

put

The following code example shows how to use `put`.

AWS CLI

The following command uploads a file named `healthcheck.sh` to the master instance in a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr put --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem --src ~/scripts/healthcheck.sh --dest /home/hadoop/bin/healthcheck.sh
```

- For API details, see [Put](#) in *AWS CLI Command Reference*.

remove-tags

The following code example shows how to use `remove-tags`.

AWS CLI

The following command removes a tag with the key `prod` from a cluster with the cluster ID `j-3SD91U2E1L2QX`:

```
aws emr remove-tags --resource-id j-3SD91U2E1L2QX --tag-keys prod
```

- For API details, see [RemoveTags](#) in *AWS CLI Command Reference*.

schedule-hbase-backup

The following code example shows how to use `schedule-hbase-backup`.

AWS CLI

Note: This command can only be used with HBase on AMI version 2.x and 3.x

1. To schedule a full HBase backup >>>>>> 06ab6d6e13564b5733d75abaf3b599f93cf39a23

Command:

```
aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type full --dir  
s3://myBucket/backup --interval 10 --unit hours --start-time  
2014-04-21T05:26:10Z --consistent
```

Output:

```
None
```

2. To schedule an incremental HBase backup

Command:

```
aws emr schedule-hbase-backup --cluster-id j-XXXXXXYY --type incremental  
--dir s3://myBucket/backup --interval 30 --unit minutes --start-time  
2014-04-21T05:26:10Z --consistent
```

Output:

```
None
```

- For API details, see [ScheduleHbaseBackup](#) in *AWS CLI Command Reference*.

socks

The following code example shows how to use socks.

AWS CLI

The following command opens a socks connection with the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr socks --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

- For API details, see [Socks](#) in *AWS CLI Command Reference*.

ssh

The following code example shows how to use ssh.

AWS CLI

The following command opens an ssh connection with the master instance in a cluster with the cluster ID j-3SD91U2E1L2QX:

```
aws emr ssh --cluster-id j-3SD91U2E1L2QX --key-pair-file ~/.ssh/mykey.pem
```

The key pair file option takes a local path to a private key file.

Output:

```
ssh -o StrictHostKeyChecking=no -o ServerAliveInterval=10 -i /home/local/user/.ssh/mykey.pem hadoop@ec2-52-52-41-150.us-west-2.compute.amazonaws.com
Warning: Permanently added 'ec2-52-52-41-150.us-west-2.compute.amazonaws.com,52.52.41.150' (ECDSA) to the list of known hosts.

Run "sudo yum update" to apply all updates.

-----

Welcome to Amazon Elastic MapReduce running Hadoop and Amazon Linux.

Hadoop is installed in /home/hadoop. Log files are in /mnt/var/log/hadoop. Check
/mnt/var/log/hadoop/steps for diagnosing step failures.

The Hadoop UI can be accessed via the following commands:

ResourceManager    lynx http://ip-172-21-11-216:9026/
NameNode           lynx http://ip-172-21-11-216:9101/

-----

[hadoop@ip-172-31-16-216 ~]$
```

- For API details, see [Ssh](#) in *AWS CLI Command Reference*.

Amazon EMR on EKS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon EMR on EKS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

update-role-trust-policy

The following code example shows how to use `update-role-trust-policy`.

AWS CLI

To update the trust policy of an IAM Role to be used with Amazon EMR on EKS

This example command updates the trust policy of a role named `example_iam_role` such that it can be used with Amazon EMR on EKS with `example_namespace` namespace from an EKS cluster named `example_cluster`.

Command:

```
aws emr-containers update-role-trust-policy \  
  --cluster example_cluster \  
  --namespace example_namespace \  
  --role-name example_iam_role
```

Output:

```
If the trust policy has already been updated, then the output will be:  
Trust policy statement already exists for role example_iam_role. No  
changes were made!
```

```
If the trust policy has not been updated yet, then the output will be:  
Successfully updated trust policy of role example_iam_role.
```

- For API details, see [UpdateRoleTrustPolicy](#) in *AWS CLI Command Reference*.

EventBridge examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with EventBridge.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

delete-rule

The following code example shows how to use `delete-rule`.

AWS CLI

To delete a CloudWatch Events rule

This example deletes the rule named `EC2InstanceStateChanges`:

```
aws events delete-rule --name "EC2InstanceStateChanges"
```

- For API details, see [DeleteRule](#) in *AWS CLI Command Reference*.

describe-rule

The following code example shows how to use `describe-rule`.

AWS CLI

To display information about a CloudWatch Events rule

This example displays information about the rule named `DailyLambdaFunction`:

```
aws events describe-rule --name "DailyLambdaFunction"
```

- For API details, see [DescribeRule](#) in *AWS CLI Command Reference*.

disable-rule

The following code example shows how to use `disable-rule`.

AWS CLI

To disable a CloudWatch Events rule

This example disables the rule named `DailyLambdaFunction`. The rule is not deleted:

```
aws events disable-rule --name "DailyLambdaFunction"
```

- For API details, see [DisableRule](#) in *AWS CLI Command Reference*.

enable-rule

The following code example shows how to use `enable-rule`.

AWS CLI

To enable a CloudWatch Events rule

This example enables the rule named `DailyLambdaFunction`, which had been previously disabled:

```
aws events enable-rule --name "DailyLambdaFunction"
```

- For API details, see [EnableRule](#) in *AWS CLI Command Reference*.

list-rule-names-by-target

The following code example shows how to use `list-rule-names-by-target`.

AWS CLI

To display all the rules that have a specified target

This example displays all rules that have the Lambda function named `"MyFunctionName"` as the target:

```
aws events list-rule-names-by-target --target-arn "arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

- For API details, see [ListRuleNamesByTarget](#) in *AWS CLI Command Reference*.

list-rules

The following code example shows how to use `list-rules`.

AWS CLI

To display a list of all CloudWatch Events rules

This example displays all CloudWatch Events rules in the region:

```
aws events list-rules
```

To display a list of CloudWatch Events rules beginning with a certain string.

This example displays all CloudWatch Events rules in the region that have a name starting with "Daily":

```
aws events list-rules --name-prefix "Daily"
```

- For API details, see [ListRules](#) in *AWS CLI Command Reference*.

list-targets-by-rule

The following code example shows how to use `list-targets-by-rule`.

AWS CLI

To display all the targets for a CloudWatch Events rule

This example displays all the targets of the rule named `DailyLambdaFunction`:

```
aws events list-targets-by-rule --rule "DailyLambdaFunction"
```

- For API details, see [ListTargetsByRule](#) in *AWS CLI Command Reference*.

put-events

The following code example shows how to use `put-events`.

AWS CLI

To send a custom event to CloudWatch Events

This example sends a custom event to CloudWatch Events. The event is contained within the `putevents.json` file:

```
aws events put-events --entries file://putevents.json
```

Here are the contents of the `putevents.json` file:

```
[
  {
    "Source": "com.mycompany.myapp",
    "Detail": "{ \"key1\": \"value1\", \"key2\": \"value2\" }",
    "Resources": [
      "resource1",
      "resource2"
    ],
    "DetailType": "myDetailType"
  },
  {
    "Source": "com.mycompany.myapp",
    "Detail": "{ \"key1\": \"value3\", \"key2\": \"value4\" }",
    "Resources": [
      "resource1",
      "resource2"
    ],
    "DetailType": "myDetailType"
  }
]
```

- For API details, see [PutEvents](#) in *AWS CLI Command Reference*.

put-rule

The following code example shows how to use `put-rule`.

AWS CLI

To create CloudWatch Events rules

This example creates a rule that triggers every day at 9:00am (UTC). If you use `put-targets` to add a Lambda function as a target of this rule, you could run the Lambda function every day at the specified time:

```
aws events put-rule --name "DailyLambdaFunction" --schedule-expression "cron(0 9 * * ? *)"
```

This example creates a rule that triggers when any EC2 instance in the region changes state:

```
aws events put-rule --name "EC2InstanceStateChanges" --event-pattern "{\"source\": [\"aws.ec2\"], \"detail-type\": [\"EC2 Instance State-change Notification\"]}" --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example creates a rule that triggers when any EC2 instance in the region is stopped or terminated:

```
aws events put-rule --name "EC2InstanceStateChangeStopOrTerminate" --event-pattern "{\"source\": [\"aws.ec2\"], \"detail-type\": [\"EC2 Instance State-change Notification\"], \"detail\": {\"state\": [\"stopped\", \"terminated\"]}}" --role-arn "arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

- For API details, see [PutRule](#) in *AWS CLI Command Reference*.

put-targets

The following code example shows how to use `put-targets`.

AWS CLI

To add targets for CloudWatch Events rules

This example adds a Lambda function as the target of a rule:

```
aws events put-targets --rule DailyLambdaFunction --targets "Id"="1", "Arn"="arn:aws:lambda:us-east-1:123456789012:function:MyFunctionName"
```

This example sets an Amazon Kinesis stream as the target, so that events caught by this rule are relayed to the stream:

```
aws events put-targets --rule EC2InstanceStateChanges --targets
  "Id"="1", "Arn"="arn:aws:kinesis:us-east-1:123456789012:stream/
MyStream", "RoleArn"="arn:aws:iam::123456789012:role/MyRoleForThisRule"
```

This example sets two Amazon Kinesis streams as targets for one rule:

```
aws events put-targets --rule DailyLambdaFunction --targets
  "Id"="Target1", "Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/
MyStream1", "RoleArn"="arn:aws:iam::379642911888:role/ MyRoleToAccessLambda"
  "Id"="Target2", " Arn"="arn:aws:kinesis:us-east-1:379642911888:stream/
MyStream2", "RoleArn"="arn:aws:iam::379642911888:role/MyRoleToAccessLambda"
```

- For API details, see [PutTargets](#) in *AWS CLI Command Reference*.

remove-targets

The following code example shows how to use `remove-targets`.

AWS CLI

To remove a target for an event

This example removes the Amazon Kinesis stream named `MyStream1` from being a target of the rule `DailyLambdaFunction`. When `DailyLambdaFunction` was created, this stream was set as a target with an ID of `Target1`:

```
aws events remove-targets --rule "DailyLambdaFunction" --ids "Target1"
```

- For API details, see [RemoveTargets](#) in *AWS CLI Command Reference*.

test-event-pattern

The following code example shows how to use `test-event-pattern`.

AWS CLI

To check whether an event pattern matches a specified event

This example tests whether the pattern `"source:com.mycompany.myapp"` matches the specified event. In this example, the output would be `"true"`:

```
aws events test-event-pattern --event-pattern "{\"source\":[\"com.mycompany.myapp\n\"]}" --event "{\"id\":"1","\source\":"com.mycompany.myapp","\detail-type\":"myDetailType","\account\":"123456789012","\region\":"us-east-1","\time\":"2017-04-11T20:11:04Z\"}"
```

- For API details, see [TestEventPattern](#) in *AWS CLI Command Reference*.

Firewall Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Firewall Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

associate-admin-account

The following code example shows how to use `associate-admin-account`.

AWS CLI

To set the Firewall Manager administrator account

The following `associate-admin-account` example sets the administrator account for Firewall Manager.

```
aws fms associate-admin-account \  
  --admin-account 123456789012
```

This command produces no output.

For more information, see [Set the AWS Firewall Manager Administrator Account](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [AssociateAdminAccount](#) in *AWS CLI Command Reference*.

delete-notification-channel

The following code example shows how to use `delete-notification-channel`.

AWS CLI

To remove the SNS topic information for Firewall Manager logs

The following `delete-notification-channel` example removes the SNS topic information.

```
aws fms delete-notification-channel
```

This command produces no output.

For more information, see [Configure Amazon SNS Notifications and Amazon CloudWatch Alarms](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [DeleteNotificationChannel](#) in *AWS CLI Command Reference*.

delete-policy

The following code example shows how to use `delete-policy`.

AWS CLI

To delete a Firewall Manager policy

The following `delete-policy` example removes the policy with the specified ID, along with all of its resources.

```
aws fms delete-policy \  
  --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --delete-all-policy-resources
```

This command produces no output.

For more information, see [Working with AWS Firewall Manager Policies](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [DeletePolicy](#) in *AWS CLI Command Reference*.

disassociate-admin-account

The following code example shows how to use `disassociate-admin-account`.

AWS CLI

To remove the Firewall Manager administrator account

The following `disassociate-admin-account` example removes the current administrator account association from Firewall Manager.

```
aws fms disassociate-admin-account
```

This command produces no output.

For more information, see [Set the AWS Firewall Manager Administrator Account](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [DisassociateAdminAccount](#) in *AWS CLI Command Reference*.

get-admin-account

The following code example shows how to use `get-admin-account`.

AWS CLI

To retrieve the Firewall Manager administrator account

The following `get-admin-account` example retrieves the administrator account.

```
aws fms get-admin-account
```

Output:

```
{
  "AdminAccount": "123456789012",
  "RoleStatus": "READY"
```

```
}
```

For more information, see [AWS Firewall Manager Prerequisites](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetAdminAccount](#) in *AWS CLI Command Reference*.

get-compliance-detail

The following code example shows how to use `get-compliance-detail`.

AWS CLI

To retrieve the compliance information for an account

The following `get-compliance-detail` example retrieves compliance information for the specified policy and member account.

```
aws fms get-compliance-detail \  
  --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --member-account 123456789012
```

Output:

```
{  
  "PolicyComplianceDetail": {  
    "EvaluationLimitExceeded": false,  
    "IssueInfoMap": {},  
    "MemberAccount": "123456789012",  
    "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
    "PolicyOwner": "123456789012",  
    "Violators": []  
  }  
}
```

For more information, see [Viewing Resource Compliance with a Policy](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetComplianceDetail](#) in *AWS CLI Command Reference*.

get-notification-channel

The following code example shows how to use `get-notification-channel`.

AWS CLI

To retrieve the SNS topic information for Firewall Manager logs

The following `get-notification-channel` example retrieves the SNS topic information.

```
aws fms get-notification-channel
```

Output:

```
{
  "SnsTopicArn": "arn:aws:sns:us-west-2:123456789012:us-west-2-fms",
  "SnsRoleName": "arn:aws:iam::123456789012:role/aws-service-role/
fms.amazonaws.com/AWSServiceRoleForFMS"
}
```

For more information, see [Configure Amazon SNS Notifications and Amazon CloudWatch Alarms](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetNotificationChannel](#) in *AWS CLI Command Reference*.

get-policy

The following code example shows how to use `get-policy`.

AWS CLI

To retrieve a Firewall Manager policy

The following `get-policy` example retrieves the policy with the specified ID.

```
aws fms get-policy \
  --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{
  "Policy": {
    "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "PolicyName": "test",
    "PolicyUpdateToken": "1:p+2RpKR4wPFx7mcrL1U0QQ==",
    "SecurityServicePolicyData": {
```

```

        "Type": "SECURITY_GROUPS_COMMON",
        "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_COMMON\",
\\revertManualSecurityGroupChanges\":true,\\exclusiveResourceSecurityGroupManagement
\\:false,\\securityGroups\":[\\id\\:\\sg-045c43ccc9724e63e\\]}\"
    },
    "ResourceType": "AWS::EC2::Instance",
    "ResourceTags": [],
    "ExcludeResourceTags": false,
    "RemediationEnabled": false
},
"PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/d1ac59b8-938e-42b3-
b2e0-7c620422ddc2"
}

```

For more information, see [Working with AWS Firewall Manager Policies](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [GetPolicy](#) in *AWS CLI Command Reference*.

list-compliance-status

The following code example shows how to use `list-compliance-status`.

AWS CLI

To retrieve the policy compliance information for member accounts

The following `list-compliance-status` example retrieves member account compliance information for the specified policy.

```

aws fms list-compliance-status \
  --policy-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

```

Output:

```

{
  "PolicyComplianceStatusList": [
    {
      "PolicyOwner": "123456789012",
      "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "PolicyName": "test",
      "MemberAccount": "123456789012",
    }
  ]
}

```

```
    "EvaluationResults": [
      {
        "ComplianceStatus": "COMPLIANT",
        "ViolatorCount": 0,
        "EvaluationLimitExceeded": false
      },
      {
        "ComplianceStatus": "NON_COMPLIANT",
        "ViolatorCount": 2,
        "EvaluationLimitExceeded": false
      }
    ],
    "LastUpdated": 1576283774.0,
    "IssueInfoMap": {}
  }
]
```

For more information, see [Viewing Resource Compliance with a Policy](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListComplianceStatus](#) in *AWS CLI Command Reference*.

list-member-accounts

The following code example shows how to use `list-member-accounts`.

AWS CLI

To retrieve the member accounts in the organization

The following `list-member-accounts` example lists all of the member accounts that are in the Firewall Manager administrator's organization.

```
aws fms list-member-accounts
```

Output:

```
{
  "MemberAccounts": [
    "222222222222",
    "333333333333",
```

```

    "4444444444444444"
  ]
}

```

For more information, see [AWS Firewall Manager](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListMemberAccounts](#) in *AWS CLI Command Reference*.

list-policies

The following code example shows how to use `list-policies`.

AWS CLI

To retrieve all Firewall Manager policies

The following `list-policies` example retrieves the list of policies for the account. In this example, the output is limited to two results per request. Each call returns a `NextToken` that can be used as the value for the `--starting-token` parameter in the next `list-policies` call to get the next set of results for the list.

```

aws fms list-policies \
  --max-items 2

```

Output:

```

{
  "PolicyList": [
    {
      "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "PolicyName": "test",
      "ResourceType": "AWS::EC2::Instance",
      "SecurityServiceType": "SECURITY_GROUPS_COMMON",
      "RemediationEnabled": false
    },
    {
      "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "PolicyId": "457c9b21-fc94-406c-ae63-21217395ba72",

```

```
        "PolicyName": "test",
        "ResourceType": "AWS::EC2::Instance",
        "SecurityServiceType": "SECURITY_GROUPS_COMMON",
        "RemediationEnabled": false
    }
],
"NextToken": "eyJ0ZXh0VG9rZW4iOiBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQiOiAyfQ=="
}
```

For more information, see [Working with AWS Firewall Manager Policies](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [ListPolicies](#) in *AWS CLI Command Reference*.

put-notification-channel

The following code example shows how to use `put-notification-channel`.

AWS CLI

To set the SNS topic information for Firewall Manager logs

The following `put-notification-channel` example sets the SNS topic information.

```
aws fms put-notification-channel \
  --sns-topic-arn arn:aws:sns:us-west-2:123456789012:us-west-2-fms \
  --sns-role-name arn:aws:iam::123456789012:role/aws-service-role/
fms.amazonaws.com/AWSServiceRoleForFMS
```

This command produces no output.

For more information, see [Configure Amazon SNS Notifications and Amazon CloudWatch Alarms](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [PutNotificationChannel](#) in *AWS CLI Command Reference*.

put-policy

The following code example shows how to use `put-policy`.

AWS CLI

To create a Firewall Manager policy

The following `put-policy` example creates a Firewall Manager security group policy.

```
aws fms put-policy \
  --cli-input-json file://policy.json
```

Contents of `policy.json`:

```
{
  "Policy": {
    "PolicyName": "test",
    "SecurityServicePolicyData": {
      "Type": "SECURITY_GROUPS_USAGE_AUDIT",
      "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_USAGE_AUDIT\",
\\\"deleteUnusedSecurityGroups\\\":false,\\\"coalesceRedundantSecurityGroups\\\":true}"
    },
    "ResourceType": "AWS::EC2::SecurityGroup",
    "ResourceTags": [],
    "ExcludeResourceTags": false,
    "RemediationEnabled": false
  },
  "TagList": [
    {
      "Key": "foo",
      "Value": "foo"
    }
  ]
}
```

Output:

```
{
  "Policy": {
    "PolicyId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "PolicyName": "test",
    "PolicyUpdateToken": "1:X9QGexP7HASDlsFp+G31Iw==",
    "SecurityServicePolicyData": {
      "Type": "SECURITY_GROUPS_USAGE_AUDIT",
      "ManagedServiceData": "{\"type\":\"SECURITY_GROUPS_USAGE_AUDIT\",
\\\"deleteUnusedSecurityGroups\\\":false,\\\"coalesceRedundantSecurityGroups\\\":true,
\\\"optionalDelayForUnusedInMinutes\\\":null}"
    },
    "ResourceType": "AWS::EC2::SecurityGroup",
```

```
    "ResourceTags": [],
    "ExcludeResourceTags": false,
    "RemediationEnabled": false
  },
  "PolicyArn": "arn:aws:fms:us-west-2:123456789012:policy/a1b2c3d4-5678-90ab-cdef-
EXAMPLE11111"
}
```

For more information, see [Working with AWS Firewall Manager Policies](#) in the *AWS WAF, AWS Firewall Manager, and AWS Shield Advanced Developer Guide*.

- For API details, see [PutPolicy](#) in *AWS CLI Command Reference*.

AWS FIS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS FIS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-experiment-template

The following code example shows how to use `create-experiment-template`.

AWS CLI

To create an experiment template

The following `create-experiment-template` example creates an experiment template in your AWS FIS account.

```
aws fis create-experiment-template \  
  --cli-input-json file://myfile.json
```

Contents of `myfile.json`:

```
{  
  "description": "experimentTemplate",  
  "stopConditions": [  
    {  
      "source": "aws:cloudwatch:alarm",  
      "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"  
    }  
  ],  
  "targets": {  
    "Instances-Target-1": {  
      "resourceType": "aws:ec2:instance",  
      "resourceArns": [  
        "arn:aws:ec2:us-west-2:123456789012:instance/i-12a3b4c56d78e9012"  
      ],  
      "selectionMode": "ALL"  
    }  
  },  
  "actions": {  
    "reboot": {  
      "actionId": "aws:ec2:reboot-instances",  
      "description": "reboot",  
      "parameters": {},  
      "targets": {  
        "Instances": "Instances-Target-1"  
      }  
    }  
  },  
  "roleArn": "arn:aws:iam::123456789012:role/myRole"  
}
```

Output:

```
{  
  "experimentTemplate": {
```

```

    "id": "ABCDE1fgHIJkLmNop",
    "description": "experimentTemplate",
    "targets": {
      "Instances-Target-1": {
        "resourceType": "aws:ec2:instance",
        "resourceArns": [
          "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
        ],
        "selectionMode": "ALL"
      }
    },
    "actions": {
      "reboot": {
        "actionId": "aws:ec2:reboot-instances",
        "description": "reboot",
        "parameters": {},
        "targets": {
          "Instances": "Instances-Target-1"
        }
      }
    },
    "stopConditions": [
      {
        "source": "aws:cloudwatch:alarm",
        "value": "arn:aws:cloudwatch:us-west-2:123456789012:alarm:alarmName"
      }
    ],
    "creationTime": 1616434850.659,
    "lastUpdateTime": 1616434850.659,
    "roleArn": "arn:aws:iam::123456789012:role/myRole",
    "tags": {}
  }
}

```

For more information, see [Create an experiment template](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [CreateExperimentTemplate](#) in *AWS CLI Command Reference*.

delete-experiment-template

The following code example shows how to use delete-experiment-template.

AWS CLI

To delete an experiment template

The following `delete-experiment-template` example deletes the specified experiment template.

```
aws fis delete-experiment-template \  
  --id ABCDE1fgHIJkLmNop
```

Output:

```
{  
  "experimentTemplate": {  
    "id": "ABCDE1fgHIJkLmNop",  
    "description": "myExperimentTemplate",  
    "targets": {  
      "Instances-Target-1": {  
        "resourceType": "aws:ec2:instance",  
        "resourceArns": [  
          "arn:aws:ec2:us-west-2:123456789012:instance/  
i-12a3b4c56d78e9012"  
        ],  
        "selectionMode": "ALL"  
      }  
    },  
    "actions": {  
      "testaction": {  
        "actionId": "aws:ec2:stop-instances",  
        "parameters": {},  
        "targets": {  
          "Instances": "Instances-Target-1"  
        }  
      }  
    },  
    "stopConditions": [  
      {  
        "source": "none"  
      }  
    ],  
    "creationTime": 1616017191.124,  
    "lastUpdateTime": 1616017859.607,  
    "roleArn": "arn:aws:iam::123456789012:role/FISRole"
```

```
}  
}
```

For more information, see [Delete an experiment template](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [DeleteExperimentTemplate](#) in *AWS CLI Command Reference*.

get-action

The following code example shows how to use `get-action`.

AWS CLI

To get action details

The following `get-action` example gets the details of the specified action.

```
aws fis get-action \  
  --id aws:ec2:stop-instances
```

Output:

```
{  
  "action": {  
    "id": "aws:ec2:stop-instances",  
    "description": "Stop the specified EC2 instances.",  
    "parameters": {  
      "startInstancesAfterDuration": {  
        "description": "The time to wait before restarting the instances  
(ISO 8601 duration).",  
        "required": false  
      }  
    },  
    "targets": {  
      "Instances": {  
        "resourceType": "aws:ec2:instance"  
      }  
    },  
    "tags": {}  
  }  
}
```

For more information, see [Actions](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [GetAction](#) in *AWS CLI Command Reference*.

get-experiment-template

The following code example shows how to use `get-experiment-template`.

AWS CLI

To get experiment template details

The following `get-experiment-template` example gets the details of the specified experiment template.

```
aws fis get-experiment-template \  
  --id ABCDE1fgHIJkLmNop
```

Output:

```
{  
  "experimentTemplate": {  
    "id": "ABCDE1fgHIJkLmNop",  
    "description": "myExperimentTemplate",  
    "targets": {  
      "Instances-Target-1": {  
        "resourceType": "aws:ec2:instance",  
        "resourceArns": [  
          "arn:aws:ec2:us-west-2:123456789012:instance/  
i-12a3b4c56d78e9012"  
        ],  
        "selectionMode": "ALL"  
      }  
    },  
    "actions": {  
      "testaction": {  
        "actionId": "aws:ec2:stop-instances",  
        "parameters": {},  
        "targets": {  
          "Instances": "Instances-Target-1"  
        }  
      }  
    }  
  },  
}
```

```
    "stopConditions": [
      {
        "source": "none"
      }
    ],
    "creationTime": 1616017191.124,
    "lastUpdateTime": 1616017331.51,
    "roleArn": "arn:aws:iam::123456789012:role/FISRole",
    "tags": {
      "key": "value"
    }
  }
}
```

For more information, see [Experiment templates](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [GetExperimentTemplate](#) in *AWS CLI Command Reference*.

get-experiment

The following code example shows how to use `get-experiment`.

AWS CLI

To get experiment details

The following `get-experiment` example gets the details of the specified experiment.

```
aws fis get-experiment \
  --id ABC12DeFGhI3jKLMNOP
```

Output:

```
{
  "experiment": {
    "id": "ABC12DeFGhI3jKLMNOP",
    "experimentTemplateId": "ABCDE1fgHIJkLmNop",
    "roleArn": "arn:aws:iam::123456789012:role/myRole",
    "state": {
      "status": "completed",
      "reason": "Experiment completed."
    }
  },
}
```

```

    "targets": {
      "Instances-Target-1": {
        "resourceType": "aws:ec2:instance",
        "resourceArns": [
          "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
        ],
        "selectionMode": "ALL"
      }
    },
    "actions": {
      "reboot": {
        "actionId": "aws:ec2:reboot-instances",
        "parameters": {},
        "targets": {
          "Instances": "Instances-Target-1"
        },
        "state": {
          "status": "completed",
          "reason": "Action was completed."
        }
      }
    },
    "stopConditions": [
      {
        "source": "none"
      }
    ],
    "creationTime": 1616432509.662,
    "startTime": 1616432509.962,
    "endTime": 1616432522.307,
    "tags": {}
  }
}

```

For more information, see [Experiments for AWS FIS](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [GetExperiment](#) in *AWS CLI Command Reference*.

list-actions

The following code example shows how to use `list-actions`.

AWS CLI

To list actions

The following `list-actions` example lists the available actions.

```
aws fis list-actions
```

Output:

```
{
  "actions": [
    {
      "id": "aws:ec2:reboot-instances",
      "description": "Reboot the specified EC2 instances.",
      "targets": {
        "Instances": {
          "resourceType": "aws:ec2:instance"
        }
      },
      "tags": {}
    },
    {
      "id": "aws:ec2:stop-instances",
      "description": "Stop the specified EC2 instances.",
      "targets": {
        "Instances": {
          "resourceType": "aws:ec2:instance"
        }
      },
      "tags": {}
    },
    {
      "id": "aws:ec2:terminate-instances",
      "description": "Terminate the specified EC2 instances.",
      "targets": {
        "Instances": {
          "resourceType": "aws:ec2:instance"
        }
      },
      "tags": {}
    },
    {
```

```
    "id": "aws:ecs:drain-container-instances",
    "description": "Drain percentage of underlying EC2 instances on an ECS
cluster.",

      "Instances": {
        "resourceType": "aws:ec2:instance"
      }
    },
  },

```

```
        "tags": {}
      }
    ]
  }
```

For more information, see [Actions](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [ListActions](#) in *AWS CLI Command Reference*.

list-experiment-templates

The following code example shows how to use `list-experiment-templates`.

AWS CLI

To list experiment templates

The following `list-experiment-templates` example lists the experiment templates in your AWS account.

```
aws fis list-experiment-templates
```

Output:

```
{
  "experimentTemplates": [
    {
      "id": "ABCDE1fgHIJkLmNop",
      "description": "myExperimentTemplate",
      "creationTime": 1616017191.124,
      "lastUpdateTime": 1616017191.124,
      "tags": {
        "key": "value"
      }
    }
  ]
}
```

For more information, see [Experiment templates](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [ListExperimentTemplates](#) in *AWS CLI Command Reference*.

list-experiments

The following code example shows how to use `list-experiments`.

AWS CLI

To list experiments

The following `list-experiments` example lists the experiments in your AWS account.

```
aws fis list-experiments
```

Output:

```
{
  "experiments": [
    {
      "id": "ABCdeF1GHiJkLM23NO",
      "experimentTemplateId": "ABCDE1fgHIJkLmNop",
      "state": {
        "status": "running",
        "reason": "Experiment is running."
      },
      "creationTime": 1616017341.197,
      "tags": {
        "key": "value"
      }
    }
  ]
}
```

For more information, see [Experiments](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [ListExperiments](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example lists the tags for the specified resource.

```
aws fis list-tags-for-resource \  
  --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
```

Output:

```
{  
  "tags": {  
    "key1": "value1",  
    "key2": "value2"  
  }  
}
```

For more information, see [Tag your AWS FIS resources](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

start-experiment

The following code example shows how to use `start-experiment`.

AWS CLI

To start an experiment

The following `start-experiment` example starts the specified experiment.

```
aws fis start-experiment \  
  --experiment-template-id ABCDE1fgHIJkLmNop
```

Output:

```
{  
  "experiment": {  
    "id": "ABC12DeFGhI3jKLMNOP",  
    "experimentTemplateId": "ABCDE1fgHIJkLmNop",  
    "roleArn": "arn:aws:iam::123456789012:role/myRole",  
    "state": {  
      "status": "initiating",  
      "reason": "Experiment is initiating."  
    }  
  }  
}
```

```

    },
    "targets": {
      "Instances-Target-1": {
        "resourceType": "aws:ec2:instance",
        "resourceArns": [
          "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
        ],
        "selectionMode": "ALL"
      }
    },
    "actions": {
      "reboot": {
        "actionId": "aws:ec2:reboot-instances",
        "parameters": {},
        "targets": {
          "Instances": "Instances-Target-1"
        },
        "state": {
          "status": "pending",
          "reason": "Initial state"
        }
      }
    },
    "stopConditions": [
      {
        "source": "none"
      }
    ],
    "creationTime": 1616432464.025,
    "startTime": 1616432464.374,
    "tags": {}
  }
}

```

For more information, see [Experiments for AWS FIS](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [StartExperiment](#) in *AWS CLI Command Reference*.

stop-experiment

The following code example shows how to use stop-experiment.

AWS CLI

To stop an experiment

The following stop-experiment example stops the specified experiment from running.

```
aws fis stop-experiment \  
  --id ABC12DeFGhI3jKLMNOP
```

Output:

```
{  
  "experiment": {  
    "id": "ABC12DeFGhI3jKLMNOP",  
    "experimentTemplateId": "ABCDE1fgHIJkLmNop",  
    "roleArn": "arn:aws:iam::123456789012:role/myRole",  
    "state": {  
      "status": "stopping",  
      "reason": "Stopping Experiment."  
    },  
    "targets": {  
      "Instances-Target-1": {  
        "resourceType": "aws:ec2:instance",  
        "resourceArns": [  
          "arn:aws:ec2:us-west-2:123456789012:instance/  
i-12a3b4c56d78e9012"  
        ],  
        "selectionMode": "ALL"  
      }  
    },  
    "actions": {  
      "reboot": {  
        "actionId": "aws:ec2:reboot-instances",  
        "parameters": {},  
        "targets": {  
          "Instances": "Instances-Target-1"  
        },  
        "startAfter": [  
          "wait"  
        ],  
        "state": {  
          "status": "pending",  
          "reason": "Initial state."  
        }  
      }  
    }  
  }  
}
```

```

    }
  },
  "wait": {
    "actionId": "aws:fis:wait",
    "parameters": {
      "duration": "PT5M"
    },
    "state": {
      "status": "running",
      "reason": ""
    }
  }
},
"stopConditions": [
  {
    "source": "none"
  }
],
"creationTime": 1616432680.927,
"startTime": 1616432681.177,
"tags": {}
}
}

```

For more information, see [Experiments for AWS FIS](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [StopExperiment](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a resource

The following tag-resource example tags the specified resource.

```

aws fis tag-resource \
  --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
\
  --tags key1=value1,key2=value2

```

This command produces no output.

For more information, see [Tag your AWS FIS resources](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To untag a resource

The following `untag-resource` example removes the tags from the specified resource.

```
aws fis untag-resource \  
  --resource-arn arn:aws:fis:us-west-2:123456789012:experiment/ABC12DeFGhI3jKLMNOP
```

This command produces no output.

For more information, see [Tag your AWS FIS resources](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-experiment-template

The following code example shows how to use `update-experiment-template`.

AWS CLI

To update an experiment template

The following `update-experiment-template` example updates the description of the specified experiment template.

```
aws fis update-experiment-template \  
  --id ABCDE1fgHIJkLmNop \  
  --description "Updated description"
```

```
---description myExperimentTemplate
```

Output:

```
{
  "experimentTemplate": {
    "id": "ABCDE1fgHIJKLmNop",
    "description": "myExperimentTemplate",
    "targets": {
      "Instances-Target-1": {
        "resourceType": "aws:ec2:instance",
        "resourceArns": [
          "arn:aws:ec2:us-west-2:123456789012:instance/
i-12a3b4c56d78e9012"
        ],
        "selectionMode": "ALL"
      }
    },
    "actions": {
      "testaction": {
        "actionId": "aws:ec2:stop-instances",
        "parameters": {},
        "targets": {
          "Instances": "Instances-Target-1"
        }
      }
    },
    "stopConditions": [
      {
        "source": "none"
      }
    ],
    "creationTime": 1616017191.124,
    "lastUpdateTime": 1616017859.607,
    "roleArn": "arn:aws:iam::123456789012:role/FISRole",
    "tags": {
      "key": "value"
    }
  }
}
```

For more information, see [Update an experiment template](#) in the *AWS Fault Injection Simulator User Guide*.

- For API details, see [UpdateExperimentTemplate](#) in *AWS CLI Command Reference*.

Amazon GameLift examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon GameLift.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-build

The following code example shows how to use create-build.

AWS CLI

Example1: To create a game build from files in an S3 bucket

The following create-build example creates a custom game build resource. It uses zipped files that are stored in an S3 location in an AWS account that you control. This example assumes that you've already created an IAM role that gives Amazon GameLift permission to access the S3 location. Since the request does not specify an operating system, the new build resource defaults to WINDOWS_2012.

```
aws gamelift create-build \  
  --storage-location file://storage-loc.json \  
  --name MegaFrogRaceServer.NA \  
  --build-version 12345.678
```

Contents of storage-loc.json:

```
{
  "Bucket": "MegaFrogRaceServer_NA_build_files"
  "Key": "MegaFrogRaceServer_build_123.zip"
  "RoleArn": "arn:aws:iam::123456789012:role/gamelift"
}
```

Output:

```
{
  "Build": {
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTime": 1496708916.18,
    "Name": "MegaFrogRaceServer.NA",
    "OperatingSystem": "WINDOWS_2012",
    "SizeOnDisk": 479303,
    "Status": "INITIALIZED",
    "Version": "12345.678"
  },
  "StorageLocation": {
    "Bucket": "MegaFrogRaceServer_NA_build_files",
    "Key": "MegaFrogRaceServer_build_123.zip"
  }
}
```

Example2: To create a game build resource for manually uploading files to GameLift

The following `create-build` example creates a new build resource. It also gets a storage location and temporary credentials that allow you to manually upload your game build to the GameLift location in Amazon S3. Once you've successfully uploaded your build, the GameLift service validates the build and updates the new build's status.

```
aws gamelift create-build \
  --name MegaFrogRaceServer.NA \
  --build-version 12345.678 \
  --operating-system AMAZON_LINUX
```

Output:

```
{
  "Build": {
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTime": 1496708916.18,
    "Name": "MegaFrogRaceServer.NA",
    "OperatingSystem": "AMAZON_LINUX",
    "SizeOnDisk": 0,
    "Status": "INITIALIZED",
    "Version": "12345.678"
  },
  "StorageLocation": {
    "Bucket": "gamelift-builds-us-west-2",
    "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
  },
  "UploadCredentials": {
    "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
    "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY",
    "SessionToken": "AgoGb3JpZ2luENZ...EXAMPLETOKEN=="
  }
}
```

For more information, see [Upload a Custom Server Build to GameLift](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [CreateBuild](#) in *AWS CLI Command Reference*.

create-fleet

The following code example shows how to use `create-fleet`.

AWS CLI

Example 1: To create a basic Linux fleet

The following `create-fleet` example creates a minimally configured fleet of on-demand Linux instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```
aws gamelift create-fleet \
  --name MegaFrogRaceServer.NA.v2 \
```

```

--description 'Hosts for v2 North America' \
--build-id build-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
--certificate-configuration 'CertificateType=GENERATED' \
--ec2-instance-type c4.large \
--fleet-type ON_DEMAND \
--runtime-configuration 'ServerProcesses=[{LaunchPath=/local/game/release-na/
MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'

```

Output:

```

{
  "FleetAttributes": {
    "BuildId": "build-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
    "CertificateConfiguration": {
      "CertificateType": "GENERATED"
    },
    "CreationTime": 1496365885.44,
    "Description": "Hosts for v2 North America",
    "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "FleetType": "ON_DEMAND",
    "InstanceType": "c4.large",
    "MetricGroups": ["default"],
    "Name": "MegaFrogRace.NA.v2",
    "NewGameSessionProtectionPolicy": "NoProtection",
    "OperatingSystem": "AMAZON_LINUX",
    "ServerLaunchPath": "/local/game/release-na/MegaFrogRace_Server.exe",
    "Status": "NEW"
  }
}

```

Example 2: To create a basic Windows fleet

The following `create-fleet` example creates a minimally configured fleet of spot Windows instances to host a custom server build. You can complete the configuration by using `update-fleet`.

```

aws gamelift create-fleet \
  --name MegaFrogRace.NA.v2 \
  --description 'Hosts for v2 North America' \
  --build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff \
  --certificate-configuration 'CertificateType=GENERATED' \

```

```
--ec2-instance-type c4.large \
--fleet-type SPOT \
--runtime-configuration 'ServerProcesses=[{LaunchPath=C:\game
\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]'
```

Output:

```
{
  "FleetAttributes": {
    "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",
    "CertificateConfiguration": {
      "CertificateType": "GENERATED"
    },
    "CreationTime": 1496365885.44,
    "Description": "Hosts for v2 North America",
    "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "FleetType": "SPOT",
    "InstanceType": "c4.large",
    "MetricGroups": ["default"],
    "Name": "MegaFrogRace.NA.v2",
    "NewGameSessionProtectionPolicy": "NoProtection",
    "OperatingSystem": "WINDOWS_2012",
    "ServerLaunchPath": "C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe",
    "Status": "NEW"
  }
}
```

Example 3: To create a fully configured fleet

The following `create-fleet` example creates a fleet of Spot Windows instances for a custom server build, with most commonly used configuration settings provided.

```
aws gamelift create-fleet \
--name MegaFrogRace.NA.v2 \
--description 'Hosts for v2 North America' \
--build-id build-2222aaaa-33bb-44cc-55dd-6666eeee77ff \
--certificate-configuration 'CertificateType=GENERATED' \
--ec2-instance-type c4.large \
--ec2-inbound-permissions
'FromPort=33435,ToPort=33435,IpRange=10.24.34.0/23,Protocol=UDP' \
```

```
--fleet-type SPOT \  
--new-game-session-protection-policy FullProtection \  
--runtime-configuration file://runtime-config.json \  
--metric-groups default \  
--instance-role-arn 'arn:aws:iam::444455556666:role/GameLiftS3Access'
```

Contents of runtime-config.json:

```
GameSessionActivationTimeoutSeconds=300,  
MaxConcurrentGameSessionActivations=2,  
ServerProcesses=[  
  {LaunchPath=C:\game\Bin64.Release.Dedicated\MegaFrogRace_Server.exe,Parameters=-  
debug,ConcurrentExecutions=1},  
  {LaunchPath=C:\game\Bin64.Release.Dedicated  
\MegaFrogRace_Server.exe,ConcurrentExecutions=1}]
```

Output:

```
{  
  "FleetAttributes": {  
    "InstanceRoleArn": "arn:aws:iam::444455556666:role/GameLiftS3Access",  
    "Status": "NEW",  
    "InstanceType": "c4.large",  
    "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/  
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",  
    "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",  
    "Description": "Hosts for v2 North America",  
    "FleetType": "SPOT",  
    "OperatingSystem": "WINDOWS_2012",  
    "Name": "MegaFrogRace.NA.v2",  
    "CreationTime": 1569309011.11,  
    "MetricGroups": [  
      "default"  
    ],  
    "BuildId": "build-2222aaaa-33bb-44cc-55dd-6666eeee77ff",  
    "ServerLaunchParameters": "abc",  
    "ServerLaunchPath": "C:\\game\\Bin64.Release.Dedicated\  
\MegaFrogRace_Server.exe",  
    "NewGameSessionProtectionPolicy": "FullProtection",  
    "CertificateConfiguration": {  
      "CertificateType": "GENERATED"  
    }  
  }  
}
```

```
}

```

Example 4: To create a Realtime Servers fleet

The following `create-fleet` example creates a fleet of Spot instances with a Realtime configuration script that has been uploaded to Amazon GameLift. All Realtime servers are deployed onto Linux machines. For the purposes of this example, assume that the uploaded Realtime script includes multiple script files, with the `Init()` function located in the script file called `MainScript.js`. As shown, this file is identified as the launch script in the runtime configuration.

```
aws gamelift create-fleet \
  --name MegaFrogRace.NA.realtime \
  --description 'Mega Frog Race Realtime fleet' \
  --script-id script-1111aaaa-22bb-33cc-44dd-5555eeee66ff \
  --ec2-instance-type c4.large \
  --fleet-type SPOT \
  --certificate-configuration 'CertificateType=GENERATED' --runtime-configuration
'ServerProcesses=[{LaunchPath=/local/game/MainScript.js,Parameters=+map
Winter444,ConcurrentExecutions=5}]'
```

Output:

```
{
  "FleetAttributes": {
    "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "Status": "NEW",
    "CreationTime": 1569310745.212,
    "InstanceType": "c4.large",
    "NewGameSessionProtectionPolicy": "NoProtection",
    "CertificateConfiguration": {
      "CertificateType": "GENERATED"
    },
    "Name": "MegaFrogRace.NA.realtime",
    "ScriptId": "script-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
    "FleetArn": "arn:aws:gamelift:us-west-2:444455556666:fleet/
fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
    "FleetType": "SPOT",
    "MetricGroups": [
      "default"
    ],
    "Description": "Mega Frog Race Realtime fleet",
```

```

    "OperatingSystem": "AMAZON_LINUX"
  }
}

```

- For API details, see [CreateFleet](#) in *AWS CLI Command Reference*.

create-game-session-queue

The following code example shows how to use `create-game-session-queue`.

AWS CLI

Example1: To set up an ordered game session queue

The following `create-game-session-queue` example creates a new game session queue with destinations in two regions. It also configures the queue so that game session requests time out after waiting 10 minutes for placement. Since no latency policies are defined, GameLift attempts to place all game sessions with the first destination listed.

```

aws gamelift create-game-session-queue \
  --name MegaFrogRaceServer-NA \
  --destinations file://destinations.json \
  --timeout-in-seconds 600

```

Contents of `destinations.json`:

```

{
  "Destinations": [
    {
      "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    {
      "DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    }
  ]
}

```

Output:

```

{
  "GameSessionQueues": [
    {
      "Name": "MegaFrogRaceServer-NA",

```

```

    "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:123456789012:gamesessionqueue/MegaFrogRaceServer-NA",
    "TimeoutInSeconds": 600,
    "Destinations": [
      {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"},
      {"DestinationArn": "arn:aws:gamelift:us-west-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"}
    ]
  }
]
}

```

Example2: To set up a game session queue with player latency policies

The following `create-game-session-queue` example creates a new game session queue with two player latency policies. The first policy sets a 100ms latency cap that is enforced during the first minute of a game session placement attempt. The second policy raises the latency cap to 200ms until the placement request times out at 3 minutes.

```

aws gamelift create-game-session-queue \
  --name MegaFrogRaceServer-NA \
  --destinations file://destinations.json \
  --player-latency-policies file://latency-policies.json \
  --timeout-in-seconds 180

```

Contents of `destinations.json`:

```

{
  "Destinations": [
    { "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" },
    { "DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222" }
  ]
}

```

Contents of `latency-policies.json`:

```

{
  "PlayerLatencyPolicies": [

```

```

        {"MaximumIndividualPlayerLatencyMilliseconds": 200},
        {"MaximumIndividualPlayerLatencyMilliseconds": 100, "PolicyDurationSeconds":
60}
    ]
}

```

Output:

```

{
  "GameSessionQueue": {
    "Name": "MegaFrogRaceServer-NA",
    "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:111122223333:gamesessionqueue/MegaFrogRaceServer-NA",
    "TimeoutInSeconds": 600,
    "PlayerLatencyPolicies": [
      {
        "MaximumIndividualPlayerLatencyMilliseconds": 100,
        "PolicyDurationSeconds": 60
      },
      {
        "MaximumIndividualPlayerLatencyMilliseconds": 200
      }
    ]
    "Destinations": [
      {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"},
      {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"}
    ],
  }
}

```

For more information, see [Create a Queue](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [CreateGameSessionQueue](#) in *AWS CLI Command Reference*.

delete-build

The following code example shows how to use delete-build.

AWS CLI

To delete a custom game build

The following `delete-build` example removes a build from your Amazon GameLift account. After the build is deleted, you cannot use it to create new fleets. This operation cannot be undone.

```
aws gamelift delete-build \  
  --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

- For API details, see [DeleteBuild](#) in *AWS CLI Command Reference*.

delete-fleet

The following code example shows how to use `delete-fleet`.

AWS CLI

To delete a fleet that is no longer in use

The following `delete-fleet` example removes a fleet that has been scaled down to zero instances. If the fleet capacity is greater than zero, the request fails with an HTTP 400 error.

```
aws gamelift delete-fleet \  
  --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

This command produces no output.

For more information, see [Manage GameLift Fleets](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DeleteFleet](#) in *AWS CLI Command Reference*.

delete-game-session-queue

The following code example shows how to use `delete-game-session-queue`.

AWS CLI

To delete a game session queue

The following `delete-game-session-queue` example deletes a specified game session queue.

```
aws gamelift delete-game-session-queue \  
  --name MegaFrogRace-NA
```

This command produces no output.

- For API details, see [DeleteGameSessionQueue](#) in *AWS CLI Command Reference*.

describe-build

The following code example shows how to use describe-build.

AWS CLI

To get information on a custom game build

The following describe-build example retrieves properties for a game server build resource.

```
aws gamelift describe-build \  
  --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{  
  "Build": {  
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-  
cdef-EXAMPLE11111",  
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
    "CreationTime": 1496708916.18,  
    "Name": "My_Game_Server_Build_One",  
    "OperatingSystem": "AMAZON_LINUX",  
    "SizeOnDisk": 1304924,  
    "Status": "READY",  
    "Version": "12345.678"  
  }  
}
```

For more information, see [Upload a Custom Server Build to GameLift](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeBuild](#) in *AWS CLI Command Reference*.

describe-ec2-instance-limits

The following code example shows how to use `describe-ec2-instance-limits`.

AWS CLI

To retrieve service limits for an EC2 instance type

The following `describe-ec2-instance-limits` example displays the maximum allowed instances and current instances in use for the specified EC2 instance type in the current Region. The result indicates that only five of the allowed twenty instances are being used.

```
aws gamelift describe-ec2-instance-limits \  
  --ec2-instance-type m5.large
```

Output:

```
{  
  "EC2InstanceLimits": [  
    {  
      "EC2InstanceType": "m5.large",  
      "CurrentInstances": 5,  
      "InstanceLimit": 20  
    }  
  ]  
}
```

For more information, see [Choose Computing Resources](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeEc2InstanceLimits](#) in *AWS CLI Command Reference*.

describe-fleet-attributes

The following code example shows how to use `describe-fleet-attributes`.

AWS CLI

Example1: To view attributes for a list of fleets

The following `describe-fleet-attributes` example retrieves fleet attributes for two specified fleets. As shown, the requested fleets are deployed with the same build, one for On-Demand instances and one for Spot instances, with some minor configuration differences.

```
aws gamelift describe-fleet-attributes \  
  --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-  
EXAMPLE11111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222
```

Output:

```
{  
  "FleetAttributes": [  
    {  
      "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
      "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-  
cdef-EXAMPLE11111",  
      "FleetType": "ON_DEMAND",  
      "InstanceType": "c4.large",  
      "Description": "On-demand hosts for v2 North America",  
      "Name": "MegaFrogRaceServer.NA.v2-od",  
      "CreationTime": 1568836191.995,  
      "Status": "ACTIVE",  
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",  
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-  
cdef-EXAMPLE33333",  
      "ServerLaunchPath": "C:\\\\game\\\\MegaFrogRace_Server.exe",  
      "ServerLaunchParameters": "+gamelift_start_server",  
      "NewGameSessionProtectionPolicy": "NoProtection",  
      "OperatingSystem": "WINDOWS_2012",  
      "MetricGroups": [  
        "default"  
      ],  
      "CertificateConfiguration": {  
        "CertificateType": "DISABLED"  
      }  
    },  
    {  
      "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
      "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-  
cdef-EXAMPLE22222",  
      "FleetType": "SPOT",  
      "InstanceType": "c4.large",  
      "Description": "On-demand hosts for v2 North America",
```

```

    "Name": "MegaFrogRaceServer.NA.v2-spot",
    "CreationTime": 1568838275.379,
    "Status": "ACTIVATING",
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
    "ServerLaunchPath": "C:\\\\game\\\\MegaFrogRace_Server.exe",
    "NewGameSessionProtectionPolicy": "NoProtection",
    "OperatingSystem": "WINDOWS_2012",
    "MetricGroups": [
      "default"
    ],
    "CertificateConfiguration": {
      "CertificateType": "GENERATED"
    }
  }
]
}

```

Example2: To request attributes for all fleets

The following `describe-fleet-attributes` returns fleet attributes for all fleets with any status. This example illustrates the use of pagination parameters to return one fleet at a time.

```

aws gamelift describe-fleet-attributes \
  --limit 1

```

Output:

```

{
  "FleetAttributes": [
    {
      "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "FleetArn": "arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
      "FleetType": "SPOT",
      "InstanceType": "c4.large",
      "Description": "On-demand hosts for v2 North America",
      "Name": "MegaFrogRaceServer.NA.v2-spot",
      "CreationTime": 1568838275.379,
      "Status": "ACTIVATING",
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",

```

```

    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE33333",
    "ServerLaunchPath": "C:\\\\game\\\\MegaFrogRace_Server.exe",
    "NewGameSessionProtectionPolicy": "NoProtection",
    "OperatingSystem": "WINDOWS_2012",
    "MetricGroups": [
        "default"
    ],
    "CertificateConfiguration": {
        "CertificateType": "GENERATED"
    }
}
],
"NextToken":
"eyJhd3NBdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZE1kIj7InMi0iJidWlsZC01NWYxZTZmMS1"
}

```

The output includes a `NextToken` value that you can use when you call the command a second time. Pass the value to the `--next-token` parameter to specify where to pick up the output. The following command returns the second result in the output.

```

aws gamelift describe-fleet-attributes \
  --limit 1 \
  --next-token
eyJhd3NBdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZE1kIj7InMi0iJidWlsZC01NWYxZTZmMS1

```

Repeat until the response doesn't include a `NextToken` value.

For more information, see [Setting Up GameLift Fleets](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetAttributes](#) in *AWS CLI Command Reference*.

describe-fleet-capacity

The following code example shows how to use `describe-fleet-capacity`.

AWS CLI

To view capacity status for a list of fleets

The following `describe-fleet-capacity` example retrieves current capacity for two specified fleets.

```
aws gamelift describe-fleet-capacity \
  --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-
EXAMPLE111111 fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE222222
```

Output:

```
{
  "FleetCapacity": [
    {
      "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE111111",
      "InstanceType": "c5.large",
      "InstanceCounts": {
        "DESIRED": 10,
        "MINIMUM": 1,
        "MAXIMUM": 20,
        "PENDING": 0,
        "ACTIVE": 10,
        "IDLE": 3,
        "TERMINATING": 0
      }
    },
    {
      "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE222222",
      "InstanceType": "c5.large",
      "InstanceCounts": {
        "DESIRED": 13,
        "MINIMUM": 1,
        "MAXIMUM": 20,
        "PENDING": 0,
        "ACTIVE": 15,
        "IDLE": 2,
        "TERMINATING": 2
      }
    }
  ]
}
```

For more information, see [GameLift Metrics for Fleets](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetCapacity](#) in *AWS CLI Command Reference*.

describe-fleet-events

The following code example shows how to use describe-fleet-events.

AWS CLI

To request events for a specified time span

The following describe-fleet-events example displays details of all fleet-related events that occurred during the specified time span.

```
aws gamelift describe-fleet-events \  
  --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-  
EXAMPLE11111 \  
  --start-time 1579647600 \  
  --end-time 1579649400 \  
  --limit 5
```

Output:

```
{  
  "Events": [  
    {  
      "EventId": "a37b6892-5d07-4d3b-8b47-80244ecf66b9",

describe-fleet-port-settings

The following code example shows how to use `describe-fleet-port-settings`.

AWS CLI

To view inbound connection permissions for a fleet

The following `describe-fleet-port-settings` example retrieves connection settings for a specified fleet.

```
aws gamelift describe-fleet-port-settings \  
  --fleet-id arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-  
  EXAMPLE11111
```

Output:

```
{  
  "InboundPermissions": [  
    {  
      "FromPort": 33400,  
      "ToPort": 33500,  
      "IpRange": "0.0.0.0/0",  
      "Protocol": "UDP"  
    },  
    {  
      "FromPort": 1900,  
      "ToPort": 2000,  
      "IpRange": "0.0.0.0/0",  
      "Protocol": "TCP"  
    }  
  ]  
}
```

For more information, see [Setting Up GameLift Fleets](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetPortSettings](#) in *AWS CLI Command Reference*.

describe-fleet-utilization

The following code example shows how to use describe-fleet-utilization.

AWS CLI

Example1: To view usage data for a list of fleets

The following describe-fleet-utilization example retrieves current usage information for one specified fleet.

```
aws gamelift describe-fleet-utilization \  
  --fleet-ids arn:aws:gamelift:us-west-2::fleet/fleet-a1b2c3d4-5678-90ab-cdef-  
  EXAMPLE11111
```

Output:

```
{  
  "FleetUtilization": [  
    {  
      "FleetId": "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
      "ActiveServerProcessCount": 100,  
      "ActiveGameSessionCount": 62,  
      "CurrentPlayerSessionCount": 329,  
      "MaximumPlayerSessionCount": 1000  
    }  
  ]  
}
```

Example2: To request usage data for all fleets

The following describe-fleet-utilization returns fleet usage data for all fleets with any status. This example uses pagination parameters to return data for two fleets at a time.

```
aws gamelift describe-fleet-utilization \  
  --limit 2
```

Output:

```
{
  "FleetUtilization": [
    {
      "FleetId": "fleet-1111aaaa-22bb-33cc-44dd-5555eeee66ff",
      "ActiveServerProcessCount": 100,
      "ActiveGameSessionCount": 13,
      "CurrentPlayerSessionCount": 98,
      "MaximumPlayerSessionCount": 1000
    },
    {
      "FleetId": "fleet-2222bbbb-33cc-44dd-55ee-6666ffff77aa",
      "ActiveServerProcessCount": 100,
      "ActiveGameSessionCount": 62,
      "CurrentPlayerSessionCount": 329,
      "MaximumPlayerSessionCount": 1000
    }
  ],
  "NextToken":
  "eyJhd3NBWY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZEIkJp7InMi0iJidWlsZC01NWYxZTZmMS1"
}
```

Call the command a second time, passing the `NextToken` value as the argument to the `--next-token` parameter to see the next two results.

```
aws gamelift describe-fleet-utilization \
  --limit 2 \
  --next-token
eyJhd3NBWY2NvdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZEIkJp7InMi0iJidWlsZC01NWYxZTZmMS1
```

Repeat until the response no longer includes a `NextToken` value in the output.

For more information, see [GameLift Metrics for Fleets](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeFleetUtilization](#) in *AWS CLI Command Reference*.

describe-game-session-queues

The following code example shows how to use `describe-game-session-queues`.

AWS CLI

To view game session queues

The following `describe-game-session-queues` example retrieves properties for two specified queues.

```
aws gamelift describe-game-session-queues \
  --names MegaFrogRace-NA MegaFrogRace-EU
```

Output:

```
{
  "GameSessionQueues": [{
    "Destinations": [{
      "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
    },
    {
      "DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
    }
  ],
  "Name": "MegaFrogRace-NA",
  "TimeoutInSeconds": 600,
  "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/
MegaFrogRace-NA",
  "PlayerLatencyPolicies": [{
    "MaximumIndividualPlayerLatencyMilliseconds": 200
  },
  {
    "MaximumIndividualPlayerLatencyMilliseconds": 100,
    "PolicyDurationSeconds": 60
  }
  ],
  "FilterConfiguration": {
    "AllowedLocations": ["us-west-2", "ap-south-1", "us-east-1"]
  },
  "PriorityConfiguration": {
    "PriorityOrder": ["LOCATION", "FLEET_TYPE", "DESTINATION"],
    "LocationOrder": ["us-west-2", "ap-south-1", "us-east-1"]
  }
  },
  {
    "Destinations": [{
      "DestinationArn": "arn:aws:gamelift:eu-west-3::fleet/fleet-
a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
```

```

    ]],
    "Name": "MegaFrogRace-EU",
    "TimeoutInSeconds": 600,
    "GameSessionQueueArn": "arn:aws:gamelift:us-west-2::gamesessionqueue/
MegaFrogRace-EU"
  }
]
}

```

For more information, see [Using Multi-Region Queues](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeGameSessionQueues](#) in *AWS CLI Command Reference*.

describe-runtime-configuration

The following code example shows how to use `describe-runtime-configuration`.

AWS CLI

To request the runtime configuration for a fleet

The following `describe-runtime-configuration` example retrieves details about the current runtime configuration for a specified fleet.

```

aws gamelift describe-runtime-configuration \
  --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111

```

Output:

```

{
  "RuntimeConfiguration": {
    "ServerProcesses": [
      {
        "LaunchPath": "C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe",
        "Parameters": "+gamelift_start_server",
        "ConcurrentExecutions": 3
      },
      {
        "LaunchPath": "C:\game\Bin64.Release.Dedicated
\MegaFrogRace_Server.exe",
        "Parameters": "+gamelift_start_server +debug",

```

```
        "ConcurrentExecutions": 1
      }
    ],
    "MaxConcurrentGameSessionActivations": 2147483647,
    "GameSessionActivationTimeoutSeconds": 300
  }
}
```

For more information, see [Run Multiple Processes on a Fleet](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [DescribeRuntimeConfiguration](#) in *AWS CLI Command Reference*.

list-builds

The following code example shows how to use `list-builds`.

AWS CLI

Example1: To get a list of custom game builds

The following `list-builds` example retrieves properties for all game server builds in the current Region. The sample request illustrates how to use the pagination parameters, `Limit` and `NextToken`, to retrieve the results in sequential sets. The first command retrieves the first two builds. Because there are more than two available, the response includes a `NextToken` to indicate that more results are available.

```
aws gamelift list-builds \
  --limit 2
```

Output:

```
{
  "Builds": [
    {
      "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "CreationTime": 1495664528.723,
      "Name": "My_Game_Server_Build_One",
      "OperatingSystem": "WINDOWS_2012",
```

```

        "SizeOnDisk": 8567781,
        "Status": "READY",
        "Version": "12345.678"
    },
    {
        "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-
cdef-EXAMPLE22222",
        "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
        "CreationTime": 1495528748.555,
        "Name": "My_Game_Server_Build_Two",
        "OperatingSystem": "AMAZON_LINUX_2",
        "SizeOnDisk": 8567781,
        "Status": "FAILED",
        "Version": "23456.789"
    }
],
"NextToken":
"eyJhd3NBdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjpw7InMiOiJidWlsZC01NWYxZTZmMS1
}

```

You can then call the command again with the `--next-token` parameter as follows to see the next two builds.

```

aws gamelift list-builds \
  --limit 2
  --next-token
eyJhd3NBdW50SWQiOnsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjpw7InMiOiJidWlsZC01NWYxZTZmMS1

```

Repeat until the response doesn't include a `NextToken` value.

Example2: To get a list of custom game builds in failure status

The following `list-builds` example retrieves properties for all game server builds in the current region that currently have status `FAILED`.

```

aws gamelift list-builds \
  --status FAILED

```

Output:

```
{
```

```
"Builds": [
  {
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
    "CreationTime": 1495528748.555,
    "Name": "My_Game_Server_Build_Two",
    "OperatingSystem": "AMAZON_LINUX_2",
    "SizeOnDisk": 8567781,
    "Status": "FAILED",
    "Version": "23456.789"
  }
]
```

- For API details, see [ListBuilds](#) in *AWS CLI Command Reference*.

list-fleets

The following code example shows how to use `list-fleets`.

AWS CLI

Example1: To get a list of all fleets in a Region

The following `list-fleets` example displays the fleet IDs of all fleets in the current Region. This example uses pagination parameters to retrieve two fleet IDs at a time. The response includes a `next-token` attribute, which indicates that there are more results to retrieve.

```
aws gamelift list-fleets \
  --limit 2
```

Output:

```
{
  "FleetIds": [
    "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222"
  ],
  "NextToken":
    "eyJhd3NBZ2NvdW50SWQiOmsicyI6IjMwMjc3NjAxNjM5OCJ9LCJidWlsZElkIjp7InMiOiJidWlsZC01NWYxZTZmMS"
}
```

```
}
```

You can pass the `NextToken` value from the previous response in the next command, as shown here to get the next two results.

```
aws gamelift list-fleets \  
  --limit 2 \  
  --next-token  
eyJhd3NBW50SWQ0OncicyI6IjMwMjc3NjAxNjM50Cj9LCjIdW1sZE1kIj7InMi0iJidW1sZC00NDRlZjQxZS1
```

Example2: To get a list of all fleets in a Region with a specific build or script

The following `list-builds` example retrieves the IDs of fleets that are deployed with the specified game build. If you're working with Realtime Servers, you can provide a script ID in place of a build ID. Because this example does not specify the `limit` parameter, the results can include up to 16 fleet IDs.

```
aws gamelift list-fleets \  
  --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{  
  "FleetIds": [  
    "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
    "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",  
    "fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE44444"  
  ]  
}
```

- For API details, see [ListFleets](#) in *AWS CLI Command Reference*.

request-upload-credentials

The following code example shows how to use `request-upload-credentials`.

AWS CLI

To refresh access credentials for uploading a build

The following `create-build` example obtains new, valid access credentials for uploading a GameLift build file to an Amazon S3 location. Credentials have a limited life span. You get the build ID from the response to the original `CreateBuild` request.

```
aws gamelift request-upload-credentials \  
  --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{  
  "StorageLocation": {  
    "Bucket": "gamelift-builds-us-west-2",  
    "Key": "123456789012/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
  },  
  "UploadCredentials": {  
    "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",  
    "SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxrFiCYEXAMPLEKEY",  
    "SessionToken": "AgoGb3JpZ21uENZ...EXAMPLETOKEN=="  
  }  
}
```

For more information, see [Upload a Custom Server Build to GameLift](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [RequestUploadCredentials](#) in *AWS CLI Command Reference*.

start-fleet-actions

The following code example shows how to use `start-fleet-actions`.

AWS CLI

To restart fleet automatic scaling activity

The following `start-fleet-actions` example resumes the use of all scaling policies that are defined for the specified fleet but were stopped by calling `stop-fleet-actions`. After starting, the scaling policies immediately begin tracking their respective metrics.

```
aws gamelift start-fleet-actions \  
  --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --actions AUTO_SCALING
```

This command produces no output.

- For API details, see [StartFleetActions](#) in *AWS CLI Command Reference*.

stop-fleet-actions

The following code example shows how to use stop-fleet-actions.

AWS CLI

To stop a fleet's automatic scaling activity

The following stop-fleet-actions example stops the use of all scaling policies that are defined for the specified fleet. After the policies are suspended, fleet capacity remains at the same active instance count unless you adjust it manually.

```
aws gamelift start-fleet-actions \  
  --fleet-id fleet-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --actions AUTO_SCALING
```

This command produces no output.

- For API details, see [StopFleetActions](#) in *AWS CLI Command Reference*.

update-build

The following code example shows how to use update-build.

AWS CLI

To update a custom game build

The following update-build example changes the name and version information that is associated with a specified build resource. The returned build object verifies that the changes were made successfully.

```
aws gamelift update-build \  
  --build-id build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111 \  
  --name MegaFrogRaceServer.NA.east \  
  --build-version 12345.east
```

Output:

```
{
  "Build": {
    "BuildArn": "arn:aws:gamelift:us-west-2::build/build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "BuildId": "build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
    "CreationTime": 1496708916.18,
    "Name": "MegaFrogRaceServer.NA.east",
    "OperatingSystem": "AMAZON_LINUX_2",
    "SizeOnDisk": 1304924,
    "Status": "READY",
    "Version": "12345.east"
  }
}
```

For more information, see [Update Your Build Files](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [UpdateBuild](#) in *AWS CLI Command Reference*.

update-game-session-queue

The following code example shows how to use `update-game-session-queue`.

AWS CLI

To update a game session queue configuration

The following `update-game-session-queue` example adds a new destination and updates the player latency policies for an existing game session queue.

```
aws gamelift update-game-session-queue \
  --name MegaFrogRace-NA \
  --destinations file://destinations.json \
  --player-latency-policies file://latency-policies.json
```

Contents of `destinations.json`:

```
{
  "Destinations": [
    {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
    {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
  ]
}
```

```

    {"DestinationArn": "arn:aws:gamelift:us-east-1::alias/
alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"}
  ]
}

```

Contents of latency-policies.json:

```

{
  "PlayerLatencyPolicies": [
    {"MaximumIndividualPlayerLatencyMilliseconds": 200},
    {"MaximumIndividualPlayerLatencyMilliseconds": 150, "PolicyDurationSeconds":
120},
    {"MaximumIndividualPlayerLatencyMilliseconds": 100, "PolicyDurationSeconds":
120}
  ]
}

```

Output:

```

{
  "GameSessionQueue": {
    "Destinations": [
      {"DestinationArn": "arn:aws:gamelift:us-west-2::fleet/
fleet-1a2b3c4d-5e6f-7a8b-9c0d-1e2f3a4b5c6d"},
      {"DestinationArn": "arn:aws:gamelift:us-east-1::fleet/
fleet-5c6d3c4d-5e6f-7a8b-9c0d-1e2f3a4b5a2b"},
      {"DestinationArn": "arn:aws:gamelift:us-east-1::alias/
alias-11aa22bb-3c4d-5e6f-000a-1111aaaa22bb"}
    ],
    "GameSessionQueueArn": "arn:aws:gamelift:us-
west-2:111122223333:gamesessionqueue/MegaFrogRace-NA",
    "Name": "MegaFrogRace-NA",
    "TimeoutInSeconds": 600,
    "PlayerLatencyPolicies": [
      {"MaximumIndividualPlayerLatencyMilliseconds": 200},
      {"MaximumIndividualPlayerLatencyMilliseconds": 150,
"PolicyDurationSeconds": 120},
      {"MaximumIndividualPlayerLatencyMilliseconds": 100,
"PolicyDurationSeconds": 120}
    ]
  }
}

```

For more information, see [Using Multi-Region Queues](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [UpdateGameSessionQueue](#) in *AWS CLI Command Reference*.

upload-build

The following code example shows how to use upload-build.

AWS CLI

Example1: To upload a Linux game server build

The following upload-build example uploads Linux game server build files from a file directory to the GameLift service and creates a build resource.

```
aws gamelift upload-build \  
  --name MegaFrogRaceServer.NA \  
  --build-version 2.0.1 \  
  --build-root ~/MegaFrogRace_Server/release-na \  
  --operating-system AMAZON_LINUX_2 \  
  --server-sdk-version 4.0.2
```

Output:

```
Uploading ~/MegaFrogRace_Server/release-na: 16.0 KiB / 74.6 KiB (21.45%)  
Uploading ~/MegaFrogRace_Server/release-na: 32.0 KiB / 74.6 KiB (42.89%)  
Uploading ~/MegaFrogRace_Server/release-na: 48.0 KiB / 74.6 KiB (64.34%)  
Uploading ~/MegaFrogRace_Server/release-na: 64.0 KiB / 74.6 KiB (85.79%)  
Uploading ~/MegaFrogRace_Server/release-na: 74.6 KiB / 74.6 KiB (100.00%)  
Successfully uploaded ~/MegaFrogRace_Server/release-na to AWS GameLift  
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Example2: To upload a Windows game server build

The following upload-build example uploads Windows game server build files from a directory to the GameLift service and creates a build record.

```
aws gamelift upload-build \  
  --name MegaFrogRaceServer.NA \  
  --build-version 2.0.1 \  
  --build-root C:\MegaFrogRace_Server\release-na \  
  --operating-system WINDOWS_2012
```

```
--server-sdk-version 4.0.2
```

Output:

```
Uploading C:\MegaFrogRace_Server\release-na: 16.0 KiB / 74.6 KiB (21.45%)
Uploading C:\MegaFrogRace_Server\release-na: 32.0 KiB / 74.6 KiB (42.89%)
Uploading C:\MegaFrogRace_Server\release-na: 48.0 KiB / 74.6 KiB (64.34%)
Uploading C:\MegaFrogRace_Server\release-na: 64.0 KiB / 74.6 KiB (85.79%)
Uploading C:\MegaFrogRace_Server\release-na: 74.6 KiB / 74.6 KiB (100.00%)
Successfully uploaded C:\MegaFrogRace_Server\release-na to AWS GameLift
Build ID: build-a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

For more information, see [Upload a Custom Server Build to GameLift](#) in the *Amazon GameLift Developer Guide*.

- For API details, see [UploadBuild](#) in *AWS CLI Command Reference*.

Global Accelerator examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Global Accelerator.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-custom-routing-endpoints

The following code example shows how to use `add-custom-routing-endpoints`.

AWS CLI

To add a VPC subnet endpoint to an endpoint group for a custom routing accelerator

The following `add-custom-routing-endpoints` example adds a VPC subnet endpoint to an endpoint group for a custom routing accelerator.

```
aws globalaccelerator add-custom-routing-endpoints \  
  --endpoint-group-arn  
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd \  
  --endpoint-configurations "EndpointId=subnet-1234567890abcdef0"
```

Output:

```
{  
  "EndpointDescriptions": [  
    {  
      "EndpointId": "subnet-1234567890abcdef0"  
    }  
  ],  
  
  "EndpointGroupArn": "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd"  
}
```

For more information, see [VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [AddCustomRoutingEndpoints](#) in *AWS CLI Command Reference*.

advertise-byoip-cidr

The following code example shows how to use `advertise-byoip-cidr`.

AWS CLI

To advertise an address range

The following `advertise-byoip-cidr` example requests AWS to advertise an address range that you've provisioned for use with your AWS resources.

```
aws globalaccelerator advertise-byoip-cidr \  
  --
```

```
--cidr 198.51.100.0/24
```

Output:

```
{
  "ByoipCidr": {
    "Cidr": "198.51.100.0/24",
    "State": "PENDING_ADVERTISING"
  }
}
```

For more information, see [Bring Your Own IP Address in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [AdvertiseByoipCidr](#) in *AWS CLI Command Reference*.

allow-custom-routing-traffic

The following code example shows how to use `allow-custom-routing-traffic`.

AWS CLI

To allow traffic to specific Amazon EC2 instance destinations in a VPC subnet for a custom routing accelerator

The following `allow-custom-routing-traffic` example specifies that traffic is allowed to certain Amazon EC2 instance (destination) IP addresses and ports for a VPC subnet endpoint in a custom routing accelerator can receive traffic.

```
aws globalaccelerator allow-custom-routing-traffic \
  --endpoint-group-arn
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
  abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab8888example \
  --endpoint-id subnet-abcd123example \
  --destination-addresses "172.31.200.6" "172.31.200.7" \
  --destination-ports 80 81
```

This command produces no output.

For more information, see [VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [AllowCustomRoutingTraffic](#) in *AWS CLI Command Reference*.

create-accelerator

The following code example shows how to use `create-accelerator`.

AWS CLI

To create an accelerator

The following `create-accelerator` example creates an accelerator with two tags with two BYOIP static IP addresses. You must specify the US-West-2 (Oregon) Region to create or update an accelerator.

```
aws globalaccelerator create-accelerator \  
  --name ExampleAccelerator \  
  --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \  
  --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{  
  "Accelerator": {  
    "AcceleratorArn":  
      "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh",  
    "IpAddressType": "IPV4",  
    "Name": "ExampleAccelerator",  
    "Enabled": true,  
    "Status": "IN_PROGRESS",  
    "IpSets": [  
      {  
        "IpAddresses": [  
          "192.0.2.250",  
          "198.51.100.52"  
        ],  
        "IpFamily": "IPv4"  
      }  
    ],  
    "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",  
    "CreatedTime": 1542394847.0,  
    "LastModifiedTime": 1542394847.0
```

```
}  
}
```

For more information, see [Accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [CreateAccelerator](#) in *AWS CLI Command Reference*.

create-custom-routing-accelerator

The following code example shows how to use `create-custom-routing-accelerator`.

AWS CLI

To create a custom routing accelerator

The following `create-custom-routing-accelerator` example creates a custom routing accelerator with the tags `Name` and `Project`.

```
aws globalaccelerator create-custom-routing-accelerator \  
  --name ExampleCustomRoutingAccelerator \  
  --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project" \  
  --ip-addresses 192.0.2.250 198.51.100.52
```

Output:

```
{  
  "Accelerator": {  
    "AcceleratorArn":  
      "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefg",

create-custom-routing-endpoint-group

The following code example shows how to use `create-custom-routing-endpoint-group`.

AWS CLI

To create an endpoint group for a custom routing accelerator

The following `create-custom-routing-endpoint-group` example creates an endpoint group for a custom routing accelerator.

```

aws globalaccelerator create-custom-routing-endpoint-group \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
  --endpoint-group-region us-east-2 \
  --destination-configurations "FromPort=80,ToPort=81,Protocols=TCP,UDP"

```

Output:

```

{
  "EndpointGroup": {
    "EndpointGroupArn":
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/4321abcd",
    "EndpointGroupRegion": "us-east-2",
    "DestinationDescriptions": [
      {
        "FromPort": 80,
        "ToPort": 81,

```

```

        "Protocols": [
            "TCP",
            "UDP"
        ]
    },
    "EndpointDescriptions": []
}

```

For more information, see [Endpoint groups for custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [CreateCustomRoutingEndpointGroup](#) in *AWS CLI Command Reference*.

create-custom-routing-listener

The following code example shows how to use `create-custom-routing-listener`.

AWS CLI

To create a listener for a custom routing accelerator

The following `create-custom-routing-listener` example creates a listener with a port range from 5000 to 10000 for a custom routing accelerator.

```

aws globalaccelerator create-custom-routing-listener \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
  --port-ranges FromPort=5000,ToPort=10000

```

Output:

```

{
  "Listener": {
    "PortRange": [
      "FromPort": 5000,
      "ToPort": 10000
    ],
    "ListenerArn":
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz"
  }
}

```

```
}
}
```

For more information, see [Listeners for custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [CreateCustomRoutingListener](#) in *AWS CLI Command Reference*.

create-endpoint-group

The following code example shows how to use `create-endpoint-group`.

AWS CLI

To create an endpoint group

The following `create-endpoint-group` example creates an endpoint group with one endpoint.

```
aws globalaccelerator create-endpoint-group \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
  --endpoint-group-region us-east-1 \
  --endpoint-configurations EndpointId=i-1234567890abcdef0,Weight=128
```

Output:

```
{
  "EndpointGroup": {
    "TrafficDialPercentage": 100.0,
    "EndpointDescriptions": [
      {
        "Weight": 128,
        "EndpointId": "i-1234567890abcdef0"
      }
    ],
    "EndpointGroupArn":
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/098765zyxwvu",
    "EndpointGroupRegion": "us-east-1"
  }
}
```

```
}
```

For more information, see [Endpoint groups in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [CreateEndpointGroup](#) in *AWS CLI Command Reference*.

create-listener

The following code example shows how to use `create-listener`.

AWS CLI

To create a listener

The following `create-listener` example creates a listener with two ports.

```
aws globalaccelerator create-listener \  
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh \  
  --port-ranges FromPort=80,ToPort=80 FromPort=81,ToPort=81 \  
  --protocol TCP
```

Output:

```
{  
  "Listener": {  
    "PortRanges": [  
      {  
        "ToPort": 80,  
        "FromPort": 80  
      },  
      {  
        "ToPort": 81,  
        "FromPort": 81  
      }  
    ],  
    "ClientAffinity": "NONE",  
    "Protocol": "TCP",  
    "ListenerArn":  
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/0123vxyz"
```

```
}  
}
```

For more information, see [Listeners in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [CreateListener](#) in *AWS CLI Command Reference*.

deny-custom-routing-traffic

The following code example shows how to use deny-custom-routing-traffic.

AWS CLI

To specify a destination address that cannot receive traffic in a custom routing accelerator

The following deny-custom-routing-traffic example specifies destination address or addresses in a subnet endpoint that cannot receive traffic for a custom routing accelerator. To specify more than one destination address, separate the addresses with a space. There's no response for a successful deny-custom-routing-traffic call.

```
aws globalaccelerator deny-custom-routing-traffic \  
  --endpoint-group-arn  
  "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/ab8888example" \  
  --endpoint-id "subnet-abcd123example" \  
  --destination-addresses "198.51.100.52"
```

This command produces no output.

For more information, see [VPC subnet endpoints for custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DenyCustomRoutingTraffic](#) in *AWS CLI Command Reference*.

deprovision-byoip-cidr

The following code example shows how to use deprovision-byoip-cidr.

AWS CLI

To deprovision an address range

The following `deprovision-byoip-cidr` example releases the specified address range that you provisioned to use with your AWS resources.

```
aws globalaccelerator deprovision-byoip-cidr \  
  --cidr "198.51.100.0/24"
```

Output:

```
{  
  "ByoipCidr": {  
    "Cidr": "198.51.100.0/24",  
    "State": "PENDING_DEPROVISIONING"  
  }  
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DeprovisionByoipCidr](#) in *AWS CLI Command Reference*.

describe-accelerator-attributes

The following code example shows how to use `describe-accelerator-attributes`.

AWS CLI

To describe an accelerator's attributes

The following `describe-accelerator-attributes` example retrieves the attribute details for an accelerator.

```
aws globalaccelerator describe-accelerator-attributes \  
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{  
  "AcceleratorAttributes": {  
    "FlowLogsEnabled": true
```

```
    "FlowLogsS3Bucket": flowlogs-abc
    "FlowLogsS3Prefix": bucketprefix-abc
  }
}
```

For more information, see [Accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeAcceleratorAttributes](#) in *AWS CLI Command Reference*.

describe-accelerator

The following code example shows how to use `describe-accelerator`.

AWS CLI

To describe an accelerator

The following `describe-accelerator` example retrieves the details about the specified accelerator.

```
aws globalaccelerator describe-accelerator \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
  "Accelerator": {
    "AcceleratorArn":
"arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh",
    "IpAddressType": "IPV4",
    "Name": "ExampleAccelerator",
    "Enabled": true,
    "Status": "IN_PROGRESS",
    "IpSets": [
      {
        "IpAddresses": [
          "192.0.2.250",
          "198.51.100.52"
        ]
      }
    ]
  }
}
```

```
        "IpFamily": "IPv4"
      }
    ],
    "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
    "CreatedTime": 1542394847,
    "LastModifiedTime": 1542395013
  }
}
```

For more information, see [Accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeAccelerator](#) in *AWS CLI Command Reference*.

describe-custom-routing-accelerator-attributes

The following code example shows how to use `describe-custom-routing-accelerator-attributes`.

AWS CLI

To describe a custom routing accelerator's attributes

The following `describe-custom-routing-accelerator-attributes` example describes the attributes for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-accelerator-attributes \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
  "AcceleratorAttributes": {
    "FlowLogsEnabled": false
  }
}
```

For more information, see [Custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeCustomRoutingAcceleratorAttributes](#) in *AWS CLI Command Reference*.

describe-custom-routing-accelerator

The following code example shows how to use `describe-custom-routing-accelerator`.

AWS CLI

To describe a custom routing accelerator

The following `describe-custom-routing-accelerator` example retrieves the details about the specified custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-accelerator \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
  "Accelerator": {
    "AcceleratorArn":
    "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh",
    "IpAddressType": "IPv4",
    "Name": "ExampleCustomRoutingAccelerator",
    "Enabled": true,
    "Status": "IN_PROGRESS",
    "IpSets": [
      {
        "IpAddresses": [
          "192.0.2.250",
          "198.51.100.52"
        ],
        "IpFamily": "IPv4"
      }
    ],
    "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
    "CreatedTime": 1542394847,
    "LastModifiedTime": 1542395013
  }
}
```

```
}
```

For more information, see [Custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeCustomRoutingAccelerator](#) in *AWS CLI Command Reference*.

describe-custom-routing-endpoint-group

The following code example shows how to use `describe-custom-routing-endpoint-group`.

AWS CLI

To describe an endpoint group for a custom routing accelerator

The following `describe-custom-routing-endpoint-group` example describes an endpoint group for a custom routing accelerator.

```
aws globalaccelerator describe-custom-routing-endpoint-group \  
  --endpoint-group-arn  
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example
```

Output:

```
{  
  "EndpointGroup": {  
    "EndpointGroupArn":  
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/6789vxyz/endpoint-group/ab88888example",  
    "EndpointGroupRegion": "us-east-2",  
    "DestinationDescriptions": [  
      {  
        "FromPort": 5000,  
        "ToPort": 10000,  
        "Protocols": [  
          "UDP"  
        ]  
      }  
    ],  
    "EndpointDescriptions": [  
      {
```

```

        "EndpointId": "subnet-1234567890abcdef0"
      }
    ]
  }
}

```

For more information, see [Endpoint groups for custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeCustomRoutingEndpointGroup](#) in *AWS CLI Command Reference*.

describe-custom-routing-listener

The following code example shows how to use `describe-custom-routing-listener`.

AWS CLI

To describe a listener for a custom routing accelerator

The following `describe-custom-routing-listener` example describes a listener for a custom routing accelerator.

```

aws globalaccelerator describe-custom-routing-listener \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234

```

Output:

```

{
  "Listener": {
    "PortRanges": [
      "FromPort": 5000,
      "ToPort": 10000
    ],
    "ListenerArn":
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234"
  }
}

```

For more information, see [Listeners for custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeCustomRoutingListener](#) in *AWS CLI Command Reference*.

describe-endpoint-group

The following code example shows how to use `describe-endpoint-group`.

AWS CLI

To describe an endpoint group

The following `describe-endpoint-group` example retrieves details about an endpoint group with the following endpoints: an Amazon EC2 instance, an ALB, and an NLB.

```
aws globalaccelerator describe-endpoint-group \  
  --endpoint-group-arn \  
  arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/  
ab88888example
```

Output:

```
{  
  "EndpointGroup": {  
    "TrafficDialPercentage": 100.0,  
    "EndpointDescriptions": [  
      {  
        "Weight": 128,  
        "EndpointId": "i-1234567890abcdef0"  
      },  
      {  
        "Weight": 128,  
        "EndpointId": "arn:aws:elasticloadbalancing:us-  
east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"  
      },  
      {  
        "Weight": 128,  
        "EndpointId": "arn:aws:elasticloadbalancing:us-  
east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"  
      }  
    ],  
    "EndpointGroupArn":  
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
```

```
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-
group/4321abcd-abcd-4321-abcd-4321abcdefg",
    "EndpointGroupRegion": "us-east-1"
  }
}
```

For more information, see [Endpoint groups in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [DescribeEndpointGroup](#) in *AWS CLI Command Reference*.

describe-listener

The following code example shows how to use `describe-listener`.

AWS CLI

To describe a listener

The following `describe-listener` example describes a listener.

```
aws globalaccelerator describe-listener \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{
  "Listener": {
    "ListenerArn":
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234",
    "PortRanges": [
      {
        "FromPort": 80,
        "ToPort": 80
      }
    ],
    "Protocol": "TCP",
    "ClientAffinity": "NONE"
  }
}
```

Output:

```
{
  "ByoipCidrs": [
    {
      "Cidr": "198.51.100.0/24",
      "State": "READY"
    }
    {
      "Cidr": "203.0.113.25/24",
      "State": "READY"
    }
  ]
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListByoipCidr](#) in *AWS CLI Command Reference*.

list-custom-routing-accelerators

The following code example shows how to use `list-custom-routing-accelerators`.

AWS CLI**To list your custom routing accelerators**

The following `list-custom-routing-accelerators` example lists the custom routing accelerators in an AWS account.

```
aws globalaccelerator list-custom-routing-accelerators
```

Output:

```
{
  "Accelerators": [
    {
      "AcceleratorArn":
        "arn:aws:globalaccelerator::012345678901:accelerator/5555abcd-abcd-5555-
        abcd-5555EXAMPLE1",
      "Name": "TestCustomRoutingAccelerator",
```

list-custom-routing-endpoint-groups

The following code example shows how to use `list-custom-routing-endpoint-groups`.

AWS CLI

To list endpoint groups for a listener in a custom routing accelerator

The following `list-custom-routing-endpoint-groups` example lists the endpoint groups for a listener in a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-endpoint-groups \  
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{  
  "EndpointGroups": [  
    {  
      "EndpointGroupArn":  
"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab8888example",  
      "EndpointGroupRegion": "eu-central-1",  
      "DestinationDescriptions": [  
        {  
          "FromPort": 80,  
          "ToPort": 80,  
          "Protocols": [  
            "TCP",  
            "UDP"  
          ]  
        }  
      ]  
      "EndpointDescriptions": [  
        {  
          "EndpointId": "subnet-abcd123example"  
        }  
      ]  
    }  
  ]  
}
```

For more information, see [Endpoint groups for custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListCustomRoutingEndpointGroups](#) in *AWS CLI Command Reference*.

list-custom-routing-listeners

The following code example shows how to use `list-custom-routing-listeners`.

AWS CLI

To list listeners for custom routing accelerators

The following `list-custom-routing-listeners` example lists the listeners for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-listeners \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{
  "Listeners": [
    {
      "ListenerArn":
      "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/abcdef1234",
      "PortRanges": [
        {
          "FromPort": 5000,
          "ToPort": 10000
        }
      ],
      "Protocol": "TCP"
    }
  ]
}
```

For more information, see [Listeners for custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListCustomRoutingListeners](#) in *AWS CLI Command Reference*.

list-custom-routing-port-mappings-by-destination

The following code example shows how to use `list-custom-routing-port-mappings-by-destination`.

AWS CLI

To list the port mappings for a specific custom routing accelerator destination

The following `list-custom-routing-port-mappings-by-destination` example provides the port mappings for a specific destination EC2 server (at the destination address) for a custom routing accelerator.

```
aws globalaccelerator list-custom-routing-port-mappings-by-destination \  
  --endpoint-id subnet-abcd123example \  
  --destination-address 198.51.100.52
```

Output:

```
{  
  "DestinationPortMappings": [  
    {  
      "AcceleratorArn":  
        "arn:aws:globalaccelerator::402092451327:accelerator/24ea29b8-  
d750-4489-8919-3095f3c4b0a7",  
      "AcceleratorSocketAddresses": [  
        {  
          "IpAddress": "192.0.2.250",  
          "Port": 65514  
        },  
        {  
          "IpAddress": "192.10.100.99",  
          "Port": 65514  
        }  
      ],

- For API details, see [ListCustomRoutingPortMappingsByDestination](#) in *AWS CLI Command Reference*.

list-custom-routing-port-mappings

The following code example shows how to use `list-custom-routing-port-mappings`.

AWS CLI

To list the port mappings in a custom routing accelerator

The following `list-custom-routing-port-mappings` example provides a partial list of the port mappings in a custom routing accelerator.

```

aws globalaccelerator list-custom-routing-port-mappings \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh

```

Output:

```

{
  "PortMappings": [
    {
      "AcceleratorPort": 40480,
      "EndpointGroupArn":
"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/098765zyxwvu",
      "EndpointId": "subnet-1234567890abcdef0",
      "DestinationSocketAddress": {
        "IpAddress": "192.0.2.250",
        "Port": 80
      }
    }
  ]
}

```

```

    },
    "Protocols": [
        "TCP",
        "UDP"
    ],
    "DestinationTrafficState": "ALLOW"
}
{
    "AcceleratorPort": 40481,
    "EndpointGroupArn":
"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz/endpoint-group/098765zyxwvu",
    "EndpointId": "subnet-1234567890abcdef0",
    "DestinationSocketAddress": {
        "IpAddress": "192.0.2.251",
        "Port": 80
    },
    "Protocols": [
        "TCP",
        "UDP"
    ],
    "DestinationTrafficState": "ALLOW"
}
]
}

```

For more information, see [How custom routing accelerators work in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListCustomRoutingPortMappings](#) in *AWS CLI Command Reference*.

list-endpoint-groups

The following code example shows how to use `list-endpoint-groups`.

AWS CLI

To list endpoint groups

The following `list-endpoint-groups` example lists the endpoint groups for a listener. This listener has two endpoint groups.

```
aws globalaccelerator --region us-west-2 list-endpoint-groups \
```

```
--listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh/listener/abcdef1234
```

Output:

```
{  
  "EndpointGroups": [  
    {  
      "EndpointGroupArn":  
"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab88888example",  
      "EndpointGroupRegion": "eu-central-1",  
      "EndpointDescriptions": [],  
      "TrafficDialPercentage": 100.0,  
      "HealthCheckPort": 80,  
      "HealthCheckProtocol": "TCP",  
      "HealthCheckIntervalSeconds": 30,  
      "ThresholdCount": 3  
    }  
    {  
      "EndpointGroupArn":  
"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/abcdef1234/endpoint-group/ab99999example",  
      "EndpointGroupRegion": "us-east-1",  
      "EndpointDescriptions": [],  
      "TrafficDialPercentage": 50.0,  
      "HealthCheckPort": 80,  
      "HealthCheckProtocol": "TCP",  
      "HealthCheckIntervalSeconds": 30,  
      "ThresholdCount": 3  
    }  
  ]  
}
```

For more information, see [Endpoint Groups in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListEndpointGroups](#) in *AWS CLI Command Reference*.

list-listeners

The following code example shows how to use `list-listeners`.

AWS CLI

To list listeners

The following `list-listeners` example lists the listeners for an accelerator.

```
aws globalaccelerator list-listeners \  
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{  
  "Listeners": [  
    {  
      "ListenerArn":  
"arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/abcdef1234",  
      "PortRanges": [  
        {  
          "FromPort": 80,  
          "ToPort": 80  
        }  
      ],  
      "Protocol": "TCP",  
      "ClientAffinity": "NONE"  
    }  
  ]  
}
```

For more information, see [Listeners in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListListeners](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for an accelerator

The following `list-tags-for-resource` example lists the tags for a specific accelerator.

```
aws globalaccelerator list-tags-for-resource \  
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "Project",  
      "Value": "A123456"  
    }  
  ]  
}
```

For more information, see [Tagging in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

provision-byoip-cidr

The following code example shows how to use `provision-byoip-cidr`.

AWS CLI

To provision an address range

The following `provision-byoip-cidr` example provisions the specified address range to use with your AWS resources.

```
aws globalaccelerator provision-byoip-cidr \  
  --cidr 192.0.2.250/24 \  
  --cidr-authorization-context Message="$text_message",Signature="$signed_message"
```

Output:

```
{
```

```
"ByoipCidr": {
  "Cidr": "192.0.2.250/24",
  "State": "PENDING_PROVISIONING"
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [ProvisionByoipCidr](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag an accelerator

The following `tag-resource` example adds tags `Name` and `Project` to an accelerator, along with corresponding values for each.

```
aws globalaccelerator tag-resource \
  --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
  --tags Key="Name",Value="Example Name" Key="Project",Value="Example Project"
```

This command produces no output.

For more information, see [Tagging in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from an accelerator

The following `untag-resource` example removes the tags `Name` and `Project` from an accelerator.

```
aws globalaccelerator untag-resource \  
  --resource-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh \  
  --tag-keys Key="Name" Key="Project"
```

This command produces no output.

For more information, see [Tagging in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-accelerator-attributes

The following code example shows how to use `update-accelerator-attributes`.

AWS CLI

To update an accelerator's attributes

The following `update-accelerator-attributes` example updates an accelerator to enable flow logs. You must specify the `US-West-2` (Oregon) Region to create or update accelerator attributes.

```
aws globalaccelerator update-accelerator-attributes \  
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh \  
  --flow-logs-enabled \  
  --flow-logs-s3-bucket flowlogs-abc \  
  --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```
{  
  "AcceleratorAttributes": {  
    "FlowLogsEnabled": true  
    "FlowLogsS3Bucket": flowlogs-abc  
    "FlowLogsS3Prefix": bucketprefix-abc  
  }  
}
```

```
}
```

For more information, see [Accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateAcceleratorAttributes](#) in *AWS CLI Command Reference*.

update-accelerator

The following code example shows how to use `update-accelerator`.

AWS CLI

To update an accelerator

The following `update-accelerator` example modifies an accelerator to change the accelerator name to `ExampleAcceleratorNew`. You must specify the `US-West-2` (Oregon) Region to create or update accelerators.

```
aws globalaccelerator update-accelerator \  
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh \  
  --name ExampleAcceleratorNew
```

Output:

```
{  
  "Accelerator": {  
    "AcceleratorArn":  
    "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh",  
    "IpAddressType": "IPV4",  
    "Name": "ExampleAcceleratorNew",  
    "Enabled": true,  
    "Status": "IN_PROGRESS",  
    "IpSets": [  
      {  
        "IpAddresses": [  
          "192.0.2.250",  
          "198.51.100.52"  
        ],  
        "IpFamily": "IPv4"  
      }  
    ]  
  }  
}
```

```
    }
  ],
  "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
  "CreatedTime": 1232394847,
  "LastModifiedTime": 1232395654
}
}
```

For more information, see [Accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateAccelerator](#) in *AWS CLI Command Reference*.

update-custom-routing-accelerator-attributes

The following code example shows how to use `update-custom-routing-accelerator-attributes`.

AWS CLI

To update a custom routing accelerator's attributes

The following `update-custom-routing-accelerator-attributes` example updates a custom routing accelerator to enable flow logs.

```
aws globalaccelerator update-custom-routing-accelerator-attributes \
  --accelerator-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
  --flow-logs-enabled \
  --flow-logs-s3-bucket flowlogs-abc \
  --flow-logs-s3-prefix bucketprefix-abc
```

Output:

```
{
  "AcceleratorAttributes": {
    "FlowLogsEnabled": true
    "FlowLogsS3Bucket": flowlogs-abc
    "FlowLogsS3Prefix": bucketprefix-abc
  }
}
```

For more information, see [Custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateCustomRoutingAcceleratorAttributes](#) in *AWS CLI Command Reference*.

update-custom-routing-accelerator

The following code example shows how to use `update-custom-routing-accelerator`.

AWS CLI

To update a custom routing accelerator

The following `update-custom-routing-accelerator` example modifies a custom routing accelerator to change the accelerator name.

```
aws globalaccelerator --region us-west-2 update-custom-routing-accelerator \
  --accelerator-arn arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh \
  --name ExampleCustomRoutingAcceleratorNew
```

Output:

```
{
  "Accelerator": {
    "AcceleratorArn":
"arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh",
    "IpAddressType": "IPV4",
    "Name": "ExampleCustomRoutingAcceleratorNew",
    "Enabled": true,
    "Status": "IN_PROGRESS",
    "IpSets": [
      {
        "IpAddresses": [
          "192.0.2.250",
          "198.51.100.52"
        ],
        "IpFamily": "IPv4"
      }
    ],
    "DnsName": "a1234567890abcdef.awsglobalaccelerator.com",
```

```
    "CreatedTime": 1232394847,  
    "LastModifiedTime": 1232395654  
  }  
}
```

For more information, see [Custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateCustomRoutingAccelerator](#) in *AWS CLI Command Reference*.

update-custom-routing-listener

The following code example shows how to use `update-custom-routing-listener`.

AWS CLI

To update a listener for a custom routing accelerator

The following `update-custom-routing-listener` example updates a listener to change the port range.

```
aws globalaccelerator update-custom-routing-listener \  
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-  
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \  
  --port-ranges FromPort=10000,ToPort=20000
```

Output:

```
{  
  "Listener": {  
    "ListenerArn":  
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-  
abcd-1234abcdefgh/listener/0123vxyz"  
    "PortRanges": [  
      {  
        "FromPort": 10000,  
        "ToPort": 20000  
      }  
    ],  
    "Protocol": "TCP"  
  }  
}
```

For more information, see [Listeners for custom routing accelerators in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateCustomRoutingListener](#) in *AWS CLI Command Reference*.

update-endpoint-group

The following code example shows how to use `update-endpoint-group`.

AWS CLI

To update an endpoint group

The following `update-endpoint-group` example adds three endpoints to an endpoint group: an Elastic IP address, an ALB, and an NLB.

```
aws globalaccelerator update-endpoint-group \
  --endpoint-group-arn
  arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-group/
ab88888example \
  --endpoint-configurations \
    EndpointId=eipalloc-eip01234567890abc,Weight=128 \
    EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/
app/ALBTesting/alb01234567890xyz,Weight=128 \
    EndpointId=arn:aws:elasticloadbalancing:us-east-1:000123456789:loadbalancer/
net/NLBTesting/alb01234567890qrs,Weight=128
```

Output:

```
{
  "EndpointGroup": {
    "TrafficDialPercentage": 100,
    "EndpointDescriptions": [
      {
        "Weight": 128,
        "EndpointId": "eip01234567890abc"
      },
      {
        "Weight": 128,
        "EndpointId": "arn:aws:elasticloadbalancing:us-
east-1:000123456789:loadbalancer/app/ALBTesting/alb01234567890xyz"
      },
    ]
  }
}
```

```

    {
      "Weight": 128,
      "EndpointId": "arn:aws:elasticloadbalancing:us-
east-1:000123456789:loadbalancer/net/NLBTesting/alb01234567890qrs"
    }
  ],
  "EndpointGroupArn":
  "arn:aws:globalaccelerator::123456789012:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/6789vxyz-vxyz-6789-vxyz-6789lmnopqrs/endpoint-
group/4321abcd-abcd-4321-abcd-4321abcdefg",
  "EndpointGroupRegion": "us-east-1"
}
}

```

For more information, see [Endpoint groups in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateEndpointGroup](#) in *AWS CLI Command Reference*.

update-listener

The following code example shows how to use `update-listener`.

AWS CLI

To update a listener

The following `update-listener` example updates a listener to change the port to 100.

```

aws globalaccelerator update-listener \
  --listener-arn arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-
abcd-1234-abcd-1234abcdefgh/listener/0123vxyz \
  --port-ranges FromPort=100,ToPort=100

```

Output:

```

{
  "Listener": {
    "ListenerArn":
    "arn:aws:globalaccelerator::012345678901:accelerator/1234abcd-abcd-1234-
abcd-1234abcdefgh/listener/0123vxyz
    "PortRanges": [

```

```
    {
      "FromPort": 100,
      "ToPort": 100
    }
  ],
  "Protocol": "TCP",
  "ClientAffinity": "NONE"
}
```

For more information, see [Listeners in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [UpdateListener](#) in *AWS CLI Command Reference*.

withdraw-byoip-cidr

The following code example shows how to use `withdraw-byoip-cidr`.

AWS CLI

To withdraw an address range

The following `withdraw-byoip-cidr` example withdraws an address range from AWS Global Accelerator that you previously advertised for use with your AWS resources.

```
aws globalaccelerator withdraw-byoip-cidr \
  --cidr 192.0.2.250/24
```

Output:

```
{
  "ByoipCidr": {
    "Cidr": "192.0.2.250/24",
    "State": "PENDING_WITHDRAWING"
  }
}
```

For more information, see [Bring your own IP address in AWS Global Accelerator](#) in the *AWS Global Accelerator Developer Guide*.

- For API details, see [WithdrawByoipCidr](#) in *AWS CLI Command Reference*.

AWS Glue examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Glue.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

batch-stop-job-run

The following code example shows how to use `batch-stop-job-run`.

AWS CLI

To stop job runs

The following `batch-stop-job-run` example stops a job runs.

```
aws glue batch-stop-job-run \  
  --job-name "my-testing-job" \  
  --job-run-id jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f
```

Output:

```
{  
  "SuccessfulSubmissions": [  
    {  
      "JobName": "my-testing-job",  
      "JobRunId":  
        "jr_852f1de1f29fb62e0ba4166c33970803935d87f14f96cfdee5089d5274a61d3f"    }  
  ]  
}
```

create-connection

The following code example shows how to use `create-connection`.

AWS CLI

To create a connection for AWS Glue data stores

The following `create-connection` example creates a connection in the AWS Glue Data Catalog that provides connection information for a Kafka data store.

```

aws glue create-connection \
  --connection-input '{ \
    "Name":"conn-kafka-custom", \
    "Description":"kafka connection with ssl to custom kafka", \
    "ConnectionType":"KAFKA", \
    "ConnectionProperties":{ \
      "KAFKA_BOOTSTRAP_SERVERS":"<Kafka-broker-server-url>:<SSL-Port>", \
      "KAFKA_SSL_ENABLED":"true", \
      "KAFKA_CUSTOM_CERT": "s3://bucket/prefix/cert-file.pem" \
    }, \
    "PhysicalConnectionRequirements":{ \

```

```
"SubnetId":"subnet-1234", \  
  "SecurityGroupIdList":["sg-1234"], \  
  "AvailabilityZone":"us-east-1a"} \  
}' \  
--region us-east-1 \  
--endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see [Defining Connections in the AWS Glue Data Catalog](#) in the *AWS Glue Developer Guide*.

- For API details, see [CreateConnection](#) in *AWS CLI Command Reference*.

create-database

The following code example shows how to use create-database.

AWS CLI

To create a database

The following create-database example creates a database in the AWS Glue Data Catalog.

```
aws glue create-database \  
  --database-input "{\"Name\":\"tempdb\"}" \  
  --profile my_profile \  
  --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see [Defining a Database in Your Data Catalog](#) in the *AWS Glue Developer Guide*.

- For API details, see [CreateDatabase](#) in *AWS CLI Command Reference*.

create-job

The following code example shows how to use create-job.

AWS CLI

To create a job to transform data

The following `create-job` example creates a streaming job that runs a script stored in S3.

```
aws glue create-job \  
  --name my-testing-job \  
  --role AWSGlueServiceRoleDefault \  
  --command '{ \  
    "Name": "gluestreaming", \  
    "ScriptLocation": "s3://DOC-EXAMPLE-BUCKET/folder/" \  
  }' \  
  --region us-east-1 \  
  --output json \  
  --default-arguments '{ \  
    "--job-language":"scala", \  
    "--class":"GlueApp" \  
  }' \  
  --profile my-profile \  
  --endpoint https://glue.us-east-1.amazonaws.com
```

Contents of `test_script.scala`:

```
import com.amazonaws.services.glue.ChoiceOption  
import com.amazonaws.services.glue.GlueContext  
import com.amazonaws.services.glue.MappingSpec  
import com.amazonaws.services.glue.ResolveSpec  
import com.amazonaws.services.glue.errors.CallSite  
import com.amazonaws.services.glue.util.GlueArgParser  
import com.amazonaws.services.glue.util.Job  
import com.amazonaws.services.glue.util.JsonOptions  
import org.apache.spark.SparkContext  
import scala.collection.JavaConverters._  
  
object GlueApp {  
  def main(sysArgs: Array[String]) {  
    val spark: SparkContext = new SparkContext()  
    val glueContext: GlueContext = new GlueContext(spark)  
    // @params: [JOB_NAME]  
    val args = GlueArgParser.getResolvedOptions(sysArgs,  
Seq("JOB_NAME").toArray)  
    Job.init(args("JOB_NAME"), glueContext, args.asJava)  
    // @type: DataSource  
    // @args: [database = "tempdb", table_name = "s3-source", transformation_ctx  
= "datasource0"]  
    // @return: datasource0
```

```

    // @inputs: []
    val datasource0 = glueContext.getCatalogSource(database = "tempdb",
tableName = "s3-source", redshiftTmpDir = "", transformationContext =
"datasource0").getDynamicFrame()
    // @type: ApplyMapping
    // @args: [mapping = [("sensorid", "int", "sensorid", "int"),
("currenttemperature", "int", "currenttemperature", "int"), ("status", "string",
"status", "string")], transformation_ctx = "applymapping1"]
    // @return: applymapping1
    // @inputs: [frame = datasource0]
    val applymapping1 = datasource0.applyMapping(mappings = Seq(("sensorid",
"int", "sensorid", "int"), ("currenttemperature", "int", "currenttemperature",
"int"), ("status", "string", "status", "string")), caseSensitive = false,
transformationContext = "applymapping1")
    // @type: SelectFields
    // @args: [paths = ["sensorid", "currenttemperature", "status"],
transformation_ctx = "selectfields2"]
    // @return: selectfields2
    // @inputs: [frame = applymapping1]
    val selectfields2 = applymapping1.selectFields(paths = Seq("sensorid",
"currenttemperature", "status"), transformationContext = "selectfields2")
    // @type: ResolveChoice
    // @args: [choice = "MATCH_CATALOG", database = "tempdb", table_name = "my-
s3-sink", transformation_ctx = "resolvechoice3"]
    // @return: resolvechoice3
    // @inputs: [frame = selectfields2]
    val resolvechoice3 = selectfields2.resolveChoice(choiceOption =
Some(ChoiceOption("MATCH_CATALOG")), database = Some("tempdb"), tableName =
Some("my-s3-sink"), transformationContext = "resolvechoice3")
    // @type: DataSink
    // @args: [database = "tempdb", table_name = "my-s3-sink",
transformation_ctx = "datasink4"]
    // @return: datasink4
    // @inputs: [frame = resolvechoice3]
    val datasink4 = glueContext.getCatalogSink(database = "tempdb",
tableName = "my-s3-sink", redshiftTmpDir = "", transformationContext =
"datasink4").writeDynamicFrame(resolvechoice3)
    Job.commit()
}
}

```

Output:

```
{
  "Name": "my-testing-job"
}
```

For more information, see [Authoring Jobs in AWS Glue](#) in the *AWS Glue Developer Guide*.

- For API details, see [CreateJob](#) in *AWS CLI Command Reference*.

create-table

The following code example shows how to use `create-table`.

AWS CLI

Example 1: To create a table for a Kinesis data stream

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kinesis data stream.

```
aws glue create-table \
  --database-name tempdb \
  --table-input '{"Name":"test-kinesis-input", "StorageDescriptor":{ \
    "Columns":[ \
      {"Name":"sensorid", "Type":"int"}, \
      {"Name":"currenttemperature", "Type":"int"}, \
      {"Name":"status", "Type":"string"} \
    ], \
    "Location":"my-testing-stream", \
    "Parameters":{ \
      "typeOfData":"kinesis", "streamName":"my-testing-stream", \
      "kinesisUrl":"https://kinesis.us-east-1.amazonaws.com" \
    }, \
    "SerdeInfo":{ \
      "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"} \
  }, \
  "Parameters":{ \
    "classification":"json"} \
}' \
  --profile my-profile \
  --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see [Defining Tables in the AWS Glue Data Catalog](#) in the *AWS Glue Developer Guide*.

Example 2: To create a table for a Kafka data store

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a Kafka data store.

```
aws glue create-table \
  --database-name tempdb \
  --table-input '{"Name":"test-kafka-input", "StorageDescriptor":{ \
    "Columns":[ \
      {"Name":"sensorid", "Type":"int"}, \
      {"Name":"currenttemperature", "Type":"int"}, \
      {"Name":"status", "Type":"string"} \
    ], \
    "Location":"glue-topic", \
    "Parameters":{ \
      "typeOfData":"kafka","topicName":"glue-topic", \
      "connectionName":"my-kafka-connection" \
    }, \
    "SerdeInfo":{ \
      "SerializationLibrary":"org.apache.hadoop.hive.serde2.OpenCSVSerde"} \
  }, \
  "Parameters":{ \
    "separatorChar":"," \
  }' \
  --profile my-profile \
  --endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see [Defining Tables in the AWS Glue Data Catalog](#) in the *AWS Glue Developer Guide*.

Example 3: To create a table for a AWS S3 data store

The following `create-table` example creates a table in the AWS Glue Data Catalog that describes a AWS Simple Storage Service (AWS S3) data store.

```
aws glue create-table \
```

```
--database-name tempdb \  
--table-input '{"Name":"s3-output", "StorageDescriptor":{ \  
  "Columns":[ \  
    {"Name":"s1", "Type":"string"}, \  
    {"Name":"s2", "Type":"int"}, \  
    {"Name":"s3", "Type":"string"} \  
  ], \  
  "Location":"s3://bucket-path/", \  
  "SerdeInfo":{ \  
    "SerializationLibrary":"org.openx.data.jsonserde.JsonSerDe"} \  
  }, \  
  "Parameters":{ \  
    "classification":"json"} \  
}' \  
--profile my-profile \  
--endpoint https://glue.us-east-1.amazonaws.com
```

This command produces no output.

For more information, see [Defining Tables in the AWS Glue Data Catalog](#) in the *AWS Glue Developer Guide*.

- For API details, see [CreateTable](#) in *AWS CLI Command Reference*.

delete-job

The following code example shows how to use `delete-job`.

AWS CLI

To delete a job

The following `delete-job` example deletes a job that is no longer needed.

```
aws glue delete-job \  
  --job-name my-testing-job
```

Output:

```
{  
  "JobName": "my-testing-job"  
}
```

For more information, see [Working with Jobs on the AWS Glue Console](#) in the *AWS Glue Developer Guide*.

- For API details, see [DeleteJob](#) in *AWS CLI Command Reference*.

get-databases

The following code example shows how to use `get-databases`.

AWS CLI

To list the definitions of some or all of the databases in the AWS Glue Data Catalog

The following `get-databases` example returns information about the databases in the Data Catalog.

```
aws glue get-databases
```

Output:

```
{
  "DatabaseList": [
    {
      "Name": "default",
      "Description": "Default Hive database",
      "LocationUri": "file:/spark-warehouse",
      "CreateTime": 1602084052.0,
      "CreateTableDefaultPermissions": [
        {
          "Principal": {
            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
          },
          "Permissions": [
            "ALL"
          ]
        }
      ],
      "CatalogId": "111122223333"
    },
    {
      "Name": "flights-db",
      "CreateTime": 1587072847.0,
      "CreateTableDefaultPermissions": [
```

```
        {
          "Principal": {
            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
          },
          "Permissions": [
            "ALL"
          ]
        }
      ],
      "CatalogId": "111122223333"
    },
    {
      "Name": "legislators",
      "CreateTime": 1601415625.0,
      "CreateTableDefaultPermissions": [
        {
          "Principal": {
            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
          },
          "Permissions": [
            "ALL"
          ]
        }
      ],
      "CatalogId": "111122223333"
    },
    {
      "Name": "tempdb",
      "CreateTime": 1601498566.0,
      "CreateTableDefaultPermissions": [
        {
          "Principal": {
            "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
          },
          "Permissions": [
            "ALL"
          ]
        }
      ],
      "CatalogId": "111122223333"
    }
  ]
}
```

For more information, see [Defining a Database in Your Data Catalog](#) in the *AWS Glue Developer Guide*.

- For API details, see [GetDatabases](#) in *AWS CLI Command Reference*.

get-job-run

The following code example shows how to use `get-job-run`.

AWS CLI

To get information about a job run

The following `get-job-run` example retrieves information about a job run.

```
aws glue get-job-run \  
  --job-name "Combine legislators data" \  
  --run-id jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e
```

Output:

```
{  
  "JobRun": {  
    "Id": "jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",  
    "Attempt": 0,  
    "JobName": "Combine legislators data",

  }
}
```

For more information, see [Job Runs](#) in the *AWS Glue Developer Guide*.

- For API details, see [GetJobRun](#) in *AWS CLI Command Reference*.

get-job-runs

The following code example shows how to use `get-job-runs`.

AWS CLI

To get information about all job runs for a job

The following `get-job-runs` example retrieves information about job runs for a job.

```
aws glue get-job-runs \
  --job-name "my-testing-job"
```

Output:

```
{
  "JobRuns": [
    {
      "Id":
        "jr_012e176506505074d94d761755e5c62538ee1aad6f17d39f527e9140cf0c9a5e",

For more information, see [Job Runs](#) in the *AWS Glue Developer Guide*.

- For API details, see [GetJobRuns](#) in *AWS CLI Command Reference*.

get-job

The following code example shows how to use `get-job`.

AWS CLI

To retrieve information about a job

The following `get-job` example retrieves information about a job.

```
aws glue get-job \
```

```
--job-name my-testing-job
```

Output:

```
{
  "Job": {
    "Name": "my-testing-job",
    "Role": "Glue_DefaultRole",
    "CreatedOn": 1602805698.167,
    "LastModifiedOn": 1602805698.167,
    "ExecutionProperty": {
      "MaxConcurrentRuns": 1
    },
    "Command": {

      "ScriptLocation": "s3://janetst-bucket-01/Scripts/test_script.scala",
      "PythonVersion": "2"
    },
    "DefaultArguments": {
      "--class": "GlueApp",
      "--job-language": "scala"
    },
    "MaxRetries": 0,
    "AllocatedCapacity": 10,
    "MaxCapacity": 10.0,
    "GlueVersion": "1.0"
  }
}
```

For more information, see [Jobs](#) in the *AWS Glue Developer Guide*.

- For API details, see [GetJob](#) in *AWS CLI Command Reference*.

get-plan

The following code example shows how to use `get-plan`.

AWS CLI

To get the generated code for mapping data from source tables to target tables

The following `get-plan` retrieves the generated code for mapping columns from the data source to the data target.

```

aws glue get-plan --mapping '[ \
  { \
    "SourcePath":"sensorid", \
    "SourceTable":"anything", \
    "SourceType":"int", \
    "TargetPath":"sensorid", \
    "TargetTable":"anything", \
    "TargetType":"int" \
  }, \
  { \
    "SourcePath":"currenttemperature", \
    "SourceTable":"anything", \
    "SourceType":"int", \
    "TargetPath":"currenttemperature", \
    "TargetTable":"anything", \
    "TargetType":"int" \
  }, \
  { \
    "SourcePath":"status", \
    "SourceTable":"anything", \
    "SourceType":"string", \
    "TargetPath":"status", \
    "TargetTable":"anything", \
    "TargetType":"string" \
  }]' \
--source '{ \
  "DatabaseName":"tempdb", \
  "TableName":"s3-source" \
}' \
--sinks '[ \
  { \
    "DatabaseName":"tempdb", \
    "TableName":"my-s3-sink" \
  }]' \
--language "scala"
--endpoint https://glue.us-east-1.amazonaws.com
--output "text"

```

Output:

```

import com.amazonaws.services.glue.ChoiceOption
import com.amazonaws.services.glue.GlueContext
import com.amazonaws.services.glue.MappingSpec

```

```
import com.amazonaws.services.glue.ResolveSpec

// @args: [database = "tempdb", table_name = "my-s3-sink", transformation_ctx =
"datasink4"]
// @return: datasink4
// @inputs: [frame = resolvechoice3]
val datasink4 = glueContext.getCatalogSink(database = "tempdb",
tableName = "my-s3-sink", redshiftTmpDir = "", transformationContext =
"datasink4").writeDynamicFrame(resolvechoice3)
Job.commit()
}
}

```

For more information, see [Editing Scripts in AWS Glue](#) in the *AWS Glue Developer Guide*.

- For API details, see [GetPlan](#) in *AWS CLI Command Reference*.

get-tables

The following code example shows how to use `get-tables`.

AWS CLI

To list the definitions of some or all of the tables in the specified database

The following `get-tables` example returns information about the tables in the specified database.

```
aws glue get-tables --database-name 'tempdb'
```

Output:

```

{
  "TableList": [
    {
      "Name": "my-s3-sink",
      "DatabaseName": "tempdb",
      "CreateTime": 1602730539.0,

```

For more information, see [Defining Tables in the AWS Glue Data Catalog](#) in the *AWS Glue Developer Guide*.

- For API details, see [GetTables](#) in *AWS CLI Command Reference*.

start-crawler

The following code example shows how to use `start-crawler`.

AWS CLI

To start a crawler

The following `start-crawler` example starts a crawler.

```
aws glue start-crawler --name my-crawler
```

Output:

```
None
```

For more information, see [Defining Crawlers](#) in the *AWS Glue Developer Guide*.

- For API details, see [StartCrawler](#) in *AWS CLI Command Reference*.

start-job-run

The following code example shows how to use `start-job-run`.

AWS CLI

To start running a job

The following `start-job-run` example starts a job.

```
aws glue start-job-run \  
  --job-name my-job
```

Output:

```
{  
  "JobRunId":  
  "jr_22208b1f44eb5376a60569d4b21dd20fcb8621e1a366b4e7b2494af764b82ded"  
}
```

For more information, see [Authoring Jobs](#) in the *AWS Glue Developer Guide*.

- For API details, see [StartJobRun](#) in *AWS CLI Command Reference*.

GuardDuty examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with GuardDuty.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

accept-invitation

The following code example shows how to use `accept-invitation`.

AWS CLI

To accept an invitation to become a GuardDuty member account in the current region

The following `accept-invitation` example shows how to accept an invitation to become a GuardDuty member account in the current region.

```
aws guardduty accept-invitation \  
  --detector-id 12abc34d567e8fa901bc2d34eexample \  
  --master-id 123456789111 \  
  --invitation-id d6b94fb03a66ff665f7db8764example
```

This command produces no output.

For more information, see [Managing GuardDuty Accounts by Invitation](#) in the GuardDuty User Guide.

- For API details, see [AcceptInvitation](#) in *AWS CLI Command Reference*.

archive-findings

The following code example shows how to use `archive-findings`.

AWS CLI

To archive findings in the current region

This example shows how to archive findings in the current region.

```
aws guardduty archive-findings \  
  --detector-id 12abc34d567e8fa901bc2d34eexample \  
  --finding-ids d6b94fb03a66ff665f7db8764example 3eb970e0de00c16ec14e6910fexample
```

This command produces no output.

For more information, see [Managing GuardDuty Accounts by Invitation](#) in the *GuardDuty User Guide*.

- For API details, see [ArchiveFindings](#) in *AWS CLI Command Reference*.

create-detector

The following code example shows how to use `create-detector`.

AWS CLI

To enable GuardDuty in the current region

This example shows how to create a new detector, which enables GuardDuty, in the current region.:

```
aws guardduty create-detector \  
  --enable
```

Output:

```
{  
  "DetectorId": "b6b992d6d2f48e64bc59180bfexample"  
}
```

For more information, see [Enable Amazon GuardDuty](#) in the *GuardDuty User Guide*.

- For API details, see [CreateDetector](#) in *AWS CLI Command Reference*.

create-filter

The following code example shows how to use `create-filter`.

AWS CLI

To create a new filter for the current region

This example creates a filter that matches all portscan findings for instance created from a specific image.:

```
aws guardduty create-filter \  
  --enable
```

```
--detector-id b6b992d6d2f48e64bc59180bfexample \  
--action ARCHIVE \  
--name myFilter \  
--finding-criteria '{"Criterion": {"type": {"Eq": ["Recon:EC2/  
Portscan"]},"resource.instanceDetails.imageId": {"Eq": ["ami-0a7a207083example"]}}}'
```

Output:

```
{  
  "Name": "myFilter"  
}
```

For more information, see [Filtering findings](#) in the *GuardDuty User Guide*.

- For API details, see [CreateFilter](#) in *AWS CLI Command Reference*.

create-ip-set

The following code example shows how to use `create-ip-set`.

AWS CLI

To create a trusted IP set

The following `create-ip-set` example creates and activates a trusted IP set in the current region.

```
aws guardduty create-ip-set \  
  --detector-id 12abc34d567e8fa901bc2d34eexample \  
  --name new-ip-set \  
  --format TXT \  
  --location s3://AWSDOC-EXAMPLE-BUCKET/customtrustlist.csv \  
  --activate
```

Output:

```
{  
  "IpSetId": "d4b94fc952d6912b8f3060768example"  
}
```

For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the *GuardDuty User Guide*.

- For API details, see [CreateIpSet](#) in *AWS CLI Command Reference*.

create-members

The following code example shows how to use create-members.

AWS CLI

To associate a new member with your GuardDuty master account in the current region.

This example shows how to associate member accounts to be managed by the current account as the GuardDuty master.

```
aws guardduty create-members
  --detector-id b6b992d6d2f48e64bc59180bfexample \
  --account-details AccountId=111122223333,Email=first+member@example.com
  AccountId=111111111111 ,Email=another+member@example.com
```

Output:

```
{
  "UnprocessedAccounts": []
}
```

For more information, see [Managing multiple accounts](#) in the GuardDuty User Guide.

- For API details, see [CreateMembers](#) in *AWS CLI Command Reference*.

create-publishing-destination

The following code example shows how to use create-publishing-destination.

AWS CLI

To create a publishing destination to export GuardDuty findings in the current region to.

This example shows how to create a publishing destination for GuardDuty findings.

```
aws guardduty create-publishing-destination \
  --detector-id b6b992d6d2f48e64bc59180bfexample \
  --destination-type S3 \
```

```
--destination-properties
DestinationArn=arn:aws:s3:::yourbucket,KmsKeyArn=arn:aws:kms:us-
west-1:111122223333:key/84cee9c5-dea1-401a-ab6d-e1de7example
```

Output:

```
{
  "DestinationId": "46b99823849e1bbc242dfbe3cexample"
}
```

For more information, see [Exporting findings](#) in the *GuardDuty User Guide*.

- For API details, see [CreatePublishingDestination](#) in *AWS CLI Command Reference*.

create-sample-findings

The following code example shows how to use `create-sample-findings`.

AWS CLI

To create sample GuardDuty findings in the current region.

This example shows how to create a sample finding of the provided types.

```
aws guardduty create-sample-findings \
  --detector-id b6b992d6d2f48e64bc59180bfexample \
  --finding-types UnauthorizedAccess:EC2/TorClient UnauthorizedAccess:EC2/TorRelay
```

This command produces no output.

For more information, see [Sample findings](#) in the *GuardDuty User Guide*.

- For API details, see [CreateSampleFindings](#) in *AWS CLI Command Reference*.

create-threat-intel-set

The following code example shows how to use `create-threat-intel-set`.

AWS CLI

To create a new threat intel set in the current region.

This example shows how to upload a threat intel set to GuardDuty and activate it immediately.

```
aws guardduty create-threat-intel-set \  
  --detector-id b6b992d6d2f48e64bc59180bfexample \  
  --name myThreatSet \  
  --format TXT \  
  --location s3://EXAMPLEBUCKET/threatlist.csv \  
  --activate
```

Output:

```
{  
  "ThreatIntelSetId": "20b9a4691aeb33506b808878cexample"  
}
```

For more information, see [Trusted IP and threat lists](#) in the *GuardDuty User Guide*.

- For API details, see [CreateThreatIntelSet](#) in *AWS CLI Command Reference*.

decline-invitations

The following code example shows how to use `decline-invitations`.

AWS CLI

To decline an invitation to have Guardduty managed by another account in the current region.

This example shows how to decline a membership invitation.

```
aws guardduty decline-invitations \  
  --account-ids 111122223333
```

Output:

```
{  
  "UnprocessedAccounts": []  
}
```

For more information, see [Managing GuardDuty accounts by invitation](#) in the *GuardDuty User Guide*.

- For API details, see [DeclineInvitations](#) in *AWS CLI Command Reference*.

delete-detector

The following code example shows how to use `delete-detector`.

AWS CLI

To delete a detector, and disable GuardDuty, in the current region.

This example shows how to delete a detector, if successful, this will disable GuardDuty in the region associated with that detector.

```
aws guardduty delete-detector \  
  --detector-id b6b992d6d2f48e64bc59180bfexample
```

This command produces no output.

For more information, see [Suspending or disabling GuardDuty](#) in the *GuardDuty User Guide*.

- For API details, see [DeleteDetector](#) in *AWS CLI Command Reference*.

delete-filter

The following code example shows how to use `delete-filter`.

AWS CLI

To delete an existing filter in the current region

This example shows how to create delete a filter.

```
aws guardduty delete-filter \  
  --detector-id b6b992d6d2f48e64bc59180bfexample \  
  --filter-name byebyeFilter
```

This command produces no output.

For more information, see [Filtering findings](#) in the *GuardDuty User Guide*.

- For API details, see [DeleteFilter](#) in *AWS CLI Command Reference*.

disable-organization-admin-account

The following code example shows how to use `disable-organization-admin-account`.

AWS CLI

To remove an account as the delegated administrator for GuardDuty within your organization

This example shows how to remove an account as the delegated administrator for GuardDuty.

```
aws guardduty disable-organization-admin-account \  
  --admin-account-id 111122223333
```

This command produces no output.

For more information, see [Managing accounts with AWS organizations](#) in the *GuardDuty User Guide*.

- For API details, see [DisableOrganizationAdminAccount](#) in *AWS CLI Command Reference*.

disassociate-from-master-account

The following code example shows how to use `disassociate-from-master-account`.

AWS CLI

To disassociate from your current master account in the current region

The following `disassociate-from-master-account` example disassociates your account from the current GuardDuty master account in the current AWS region.

```
aws guardduty disassociate-from-master-account \  
  --detector-id d4b040365221be2b54a6264dcexample
```

This command produces no output.

For more information, see [Understanding the Relationship between GuardDuty Master and Member Accounts](#) in the *GuardDuty User Guide*.

- For API details, see [DisassociateFromMasterAccount](#) in *AWS CLI Command Reference*.

get-detector

The following code example shows how to use `get-detector`.

AWS CLI

To retrieve details of a specific detector

The following `get-detector` example displays the configurations details of the specified detector.

```
aws guardduty get-detector \  
  --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{  
  "Status": "ENABLED",  
  "ServiceRole": "arn:aws:iam::111122223333:role/aws-service-role/  
guardduty.amazonaws.com/AWSServiceRoleForAmazonGuardDuty",  
  "Tags": {},  
  "FindingPublishingFrequency": "SIX_HOURS",  
  "UpdatedAt": "2018-11-07T03:24:22.938Z",  
  "CreatedAt": "2017-12-22T22:51:31.940Z"  
}
```

For more information, see [Concepts and Terminology](#) in the GuardDuty User Guide.

- For API details, see [GetDetector](#) in *AWS CLI Command Reference*.

get-findings

The following code example shows how to use `get-findings`.

AWS CLI

Example 1: To retrieve the details of a specific finding

The following `get-findings` example retrieves the full JSON finding details of the specified finding.

```
aws guardduty get-findings \  
  --detector-id 12abc34d567e8fa901bc2d34eexample \  
  --finding-id 1ab92989eaf0e742df4a014d5example
```

Output:

```
{
  "Findings": [
    {
      "Resource": {
        "ResourceType": "AccessKey",
        "AccessKeyDetails": {
          "UserName": "testuser",
          "UserType": "IAMUser",

```

For more information, see [Findings](#) in the GuardDuty User Guide.

- For API details, see [GetFindings](#) in *AWS CLI Command Reference*.

get-ip-set

The following code example shows how to use `get-ip-set`.

AWS CLI

To list get details on a specified trusted IP set

The following `get-ip-set` example shows the status and details of the specified trusted IP set.

```

aws guardduty get-ip-set \
  --detector-id 12abc34d567e8fa901bc2d34eexample \
  --ip-set-id d4b94fc952d6912b8f3060768example

```

Output:

```
{
  "Status": "ACTIVE",
  "Location": "s3://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/
customlist.csv",
  "Tags": {},
  "Format": "TXT",
  "Name": "test-ip-set"
}
```

For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the GuardDuty User Guide.

- For API details, see [GetIpSet](#) in *AWS CLI Command Reference*.

get-master-account

The following code example shows how to use `get-master-account`.

AWS CLI**To retrieve details about your master account in the current region**

The following `get-master-account` example displays the status and details of the master account associated with your detector in the current region.

```
aws guardduty get-master-account \
  --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
  "Master": {
    "InvitationId": "04b94d9704854a73f94e061e8example",
    "InvitedAt": "2020-06-09T22:23:04.970Z",
    "RelationshipStatus": "Enabled",
    "AccountId": "123456789111"
  }
}
```

For more information, see [Understanding the Relationship between GuardDuty Master and Member Accounts](#) in the GuardDuty User Guide.

- For API details, see [GetMasterAccount](#) in *AWS CLI Command Reference*.

list-detectors

The following code example shows how to use `list-detectors`.

AWS CLI

To list the available detectors in the current region

The following `list-detectors` example lists the available detectors in your current AWS region.

```
aws guardduty list-detectors
```

Output:

```
{
  "DetectorIds": [
    "12abc34d567e8fa901bc2d34eexample"
  ]
}
```

For more information, see [Concepts and Terminology](#) in the GuardDuty User Guide.

- For API details, see [ListDetectors](#) in *AWS CLI Command Reference*.

list-findings

The following code example shows how to use `list-findings`.

AWS CLI

Example 1: To list all findings for the current region

The following `list-findings` example displays a list of all findingIds for the current region sorted by severity from highest to lowest.

```
aws guardduty list-findings \  
  --detector-id 12abc34d567e8fa901bc2d34eexample \  
  --sort-criteria '{"AttributeName": "severity", "OrderBy": "DESC"}'
```

Output:

```
{  
  "FindingIds": [  
    "04b8ab50fd29c64fc771b232dexample",  
    "5ab8ab50fd21373735c826d3aexample",  
    "90b93de7aba69107f05bbe60bexample",  
    ...  
  ]  
}
```

For more information, see [Findings](#) in the GuardDuty User Guide.

Example 2: To list findings for the current region matching a specific finding criteria

The following `list-findings` example displays a list of all `findingIds` that match a specified finding type.

```
aws guardduty list-findings \  
  --detector-id 12abc34d567e8fa901bc2d34eexample \  
  --finding-criteria '{"Criterion":{"type": {"Eq":["UnauthorizedAccess:EC2/  
SSHBruteForce"]}}}'
```

Output:

```
{  
  "FindingIds": [  
    "90b93de7aba69107f05bbe60bexample",  
    "6eb9430d7023d30774d6f05e3example",  
    "2eb91a2d060ac9a21963a5848example",  
    "44b8ab50fd2b0039a9e48f570example",  
    "9eb8ab4cd2b7e5b66ba4f5e96example",  
    "e0b8ab3a38e9b0312cc390ceeexample"  
  ]  
}
```

For more information, see [Findings](#) in the GuardDuty User Guide.

Example 3: To list findings for the current region matching a specific set of finding criteria defined within a JSON file

The following `list-findings` example displays a list of all findingIds that are not archived, and involve the IAM user named "testuser", as specified in a JSON file.

```
aws guardduty list-findings \  
  --detector-id 12abc34d567e8fa901bc2d34eexample \  
  --finding-criteria file://myfile.json
```

Contents of `myfile.json`:

```
{  
  "Criterion": {  
    "resource.accessKeyDetails.userName": {  
      "Eq": [  
        "testuser"  
      ]  
    },  
    "service.archived": {  
      "Eq": [  
        "false"  
      ]  
    }  
  }  
}
```

Output:

```
{  
  "FindingIds": [  
    "1ab92989eaf0e742df4a014d5example"  
  ]  
}
```

For more information, see [Findings](#) in the GuardDuty User Guide.

- For API details, see [ListFindings](#) in *AWS CLI Command Reference*.

list-invitations

The following code example shows how to use `list-invitations`.

AWS CLI

To list details on your invitations to become a member account in the current region

The following `list-invitations` example lists details and statuses on your invitations to become a GuardDuty member account in the current region.

```
aws guardduty list-invitations
```

Output:

```
{
  "Invitations": [
    {
      "InvitationId": "d6b94fb03a66ff665f7db8764example",
      "InvitedAt": "2020-06-10T17:56:38.221Z",
      "RelationshipStatus": "Invited",
      "AccountId": "123456789111"
    }
  ]
}
```

For more information, see [Managing GuardDuty Accounts by Invitation](#) in the GuardDuty User Guide.

- For API details, see [ListInvitations](#) in *AWS CLI Command Reference*.

list-ip-sets

The following code example shows how to use `list-ip-sets`.

AWS CLI

To list trusted IP sets in the current region

The following `list-ip-sets` example lists the trusted IP sets in your current AWS region.

```
aws guardduty list-ip-sets \
  --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
  "IpSetIds": [
    "d4b94fc952d6912b8f3060768example"
  ]
}
```

For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the GuardDuty User Guide.

- For API details, see [ListIpSets](#) in *AWS CLI Command Reference*.

list-members

The following code example shows how to use `list-members`.

AWS CLI

To list all members in the current region

The following `list-members` example lists all member accounts and their details for the current region.

```
aws guardduty list-members \
  --detector-id 12abc34d567e8fa901bc2d34eexample
```

Output:

```
{
  "Members": [
    {
      "RelationshipStatus": "Enabled",
      "InvitedAt": "2020-06-09T22:49:00.910Z",
      "MasterId": "123456789111",
      "DetectorId": "7ab8b2f61b256c87f793f6a86example",
      "UpdatedAt": "2020-06-09T23:08:22.512Z",
      "Email": "your+member@example.com",
      "AccountId": "123456789222"
    }
  ]
}
```

For more information, see [Understanding the Relationship between GuardDuty Master and Member Accounts](#) in the GuardDuty User Guide.

- For API details, see [ListMembers](#) in *AWS CLI Command Reference*.

update-ip-set

The following code example shows how to use `update-ip-set`.

AWS CLI

To update a trusted IP set

The following `update-ip-set` example shows how to update the details of a trusted IP set.

```
aws guardduty update-ip-set \  
  --detector-id 12abc34d567e8fa901bc2d34eexample \  
  --ip-set-id d4b94fc952d6912b8f3060768example \  
  --location https://AWSDOC-EXAMPLE-BUCKET.s3-us-west-2.amazonaws.com/  
  customtrustlist2.csv
```

This command produces no output.

For more information, see [Working with Trusted IP Lists and Threat Lists](#) in the GuardDuty User Guide.

- For API details, see [UpdateIpSet](#) in *AWS CLI Command Reference*.

AWS Health examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Health.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

describe-affected-entities

The following code example shows how to use `describe-affected-entities`.

AWS CLI

To list the entities that are affected by a specified AWS Health event

The following `describe-affected-entities` example lists the entities that are affected by the specified AWS Health event. This event is a billing notification for the AWS account.

```
aws health describe-affected-entities \
  --filter "eventArns=arn:aws:health:global::event/BILLING/
  AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-
  EXAMPLE11145" \
  --region us-east-1
```

Output:

```
{
  "entities": [
    {
      "entityArn": "arn:aws:health:global:123456789012:entity/
  EXAMPLEimSMoULmWHpb",
      "eventArn": "arn:aws:health:global::event/BILLING/
  AWS_BILLING_NOTIFICATION/AWS_BILLING_NOTIFICATION_6ce1d874-e995-40e2-99cd-
  EXAMPLE11145",
      "entityValue": "AWS_ACCOUNT",
      "awsAccountId": "123456789012",
      "lastUpdatedTime": 1588356454.08
    }
  ]
}
```

For more information, see [Event log](#) in the *AWS Health User Guide*.

- For API details, see [DescribeAffectedEntities](#) in *AWS CLI Command Reference*.

describe-event-details

The following code example shows how to use describe-event-details.

AWS CLI

To list information about an AWS Health event

The following describe-event-details example lists information about the specified AWS Health event.

```
aws health describe-event-details \
  --event-arns "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/
AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111" \
  --region us-east-1
```

Output:

```
{
  "successfulSet": [
    {
      "event": {
        "arn": "arn:aws:health:us-east-1::event/EC2/

describe-events

The following code example shows how to use `describe-events`.

AWS CLI

Example 1: To list AWS Health events

The following `describe-events` example lists recent AWS Health events.

```
aws health describe-events \  
  --region us-east-1
```

Output:

```
{  
  "events": [  
    {

    }
]
}

```

For more information, see [Getting started with the AWS Personal Health Dashboard](#) in the *AWS Health User Guide*.

Example 2: To list AWS Health events by service and event status code

The following `describe-events` example lists AWS Health events for Amazon Elastic Compute Cloud (Amazon EC2) where the event status is closed.

```

aws health describe-events \
  --filter "services=EC2,eventStatusCodes=closed"

```

Output:

```

{
  "events": [
    {
      "arn": "arn:aws:health:us-east-1::event/EC2/AWS_EC2_OPERATIONAL_ISSUE/
AWS_EC2_OPERATIONAL_ISSUE_VKTXI_EXAMPLE111",

```

```
    "service": "EC2",
    "eventTypeCode": "AWS_EC2_OPERATIONAL_ISSUE",
    "eventTypeCategory": "issue",
    "region": "us-east-1",
    "startTime": 1587462325.096,
    "endTime": 1587464204.774,
    "lastUpdatedTime": 1587464204.865,
    "statusCode": "closed",
    "eventScopeCode": "PUBLIC"
  },
  {

Actions

copy-image-set

The following code example shows how to use `copy-image-set`.

AWS CLI

Example 1: To copy an image set without a destination.

The following `copy-image-set` code example makes a duplicate copy of an image set without a destination.

```
aws medical-imaging copy-image-set \  
  --datastore-id 12345678901234567890123456789012 \  
  --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \  
  --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" } }'
```

Output:

```
{  
  "destinationImageSetProperties": {
```

```

    "latestVersionId": "2",
    "imageSetWorkflowStatus": "COPYING",
    "updatedAt": 1680042357.432,
    "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
    "imageSetState": "LOCKED",
    "createdAt": 1680042357.432
  },
  "sourceImageSetProperties": {
    "latestVersionId": "1",
    "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
    "updatedAt": 1680042357.432,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436
  },
  "datastoreId": "12345678901234567890123456789012"
}

```

Example 2: To copy an image set with a destination.

The following `copy-image-set` code example makes a duplicate copy of an image set with a destination.

```

aws medical-imaging copy-image-set \
  --datastore-id 12345678901234567890123456789012 \
  --source-image-set-id ea92b0d8838c72a3f25d00d13616f87e \
  --copy-image-set-information '{"sourceImageSet": {"latestVersionId": "1" },
"destinationImageSet": { "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
"latestVersionId": "1"} }'

```

Output:

```

{
  "destinationImageSetProperties": {
    "latestVersionId": "2",
    "imageSetWorkflowStatus": "COPYING",
    "updatedAt": 1680042505.135,
    "imageSetId": "b9a06fef182a5f992842f77f8e0868e5",
    "imageSetState": "LOCKED",
    "createdAt": 1680042357.432
  },
  "sourceImageSetProperties": {
    "latestVersionId": "1",

```

```
    "imageSetWorkflowStatus": "COPYING_WITH_READ_ONLY_ACCESS",
    "updatedAt": 1680042505.135,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436
  },
  "datastoreId": "12345678901234567890123456789012"
}
```

For more information, see [Copying an image set](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [CopyImageSet](#) in *AWS CLI Command Reference*.

create-datastore

The following code example shows how to use create-datastore.

AWS CLI

To create a data store

The following create-datastore code example creates a data store with the name my-datastore.

```
aws medical-imaging create-datastore \
  --datastore-name "my-datastore"
```

Output:

```
{
  "datastoreId": "12345678901234567890123456789012",
  "datastoreStatus": "CREATING"
}
```

For more information, see [Creating a data store](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [CreateDatastore](#) in *AWS CLI Command Reference*.

delete-datastore

The following code example shows how to use delete-datastore.

AWS CLI

To delete a data store

The following `delete-datastore` code example deletes a data store.

```
aws medical-imaging delete-datastore \  
  --datastore-id "12345678901234567890123456789012"
```

Output:

```
{  
  "datastoreId": "12345678901234567890123456789012",  
  "datastoreStatus": "DELETING"  
}
```

For more information, see [Deleting a data store](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [DeleteDatastore](#) in *AWS CLI Command Reference*.

delete-image-set

The following code example shows how to use `delete-image-set`.

AWS CLI

To delete an image set

The following `delete-image-set` code example deletes an image set.

```
aws medical-imaging delete-image-set \  
  --datastore-id 12345678901234567890123456789012 \  
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```
{  
  "imageSetWorkflowStatus": "DELETING",  
  "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",  
  "imageSetState": "LOCKED",  
  "datastoreId": "12345678901234567890123456789012"
```

```
}
```

For more information, see [Deleting an image set](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [DeleteImageSet](#) in *AWS CLI Command Reference*.

get-datastore

The following code example shows how to use `get-datastore`.

AWS CLI

To get a data store's properties

The following `get-datastore` code example gets a data store's properties.

```
aws medical-imaging get-datastore \
  --datastore-id 12345678901234567890123456789012
```

Output:

```
{
  "datastoreProperties": {
    "datastoreId": "12345678901234567890123456789012",
    "datastoreName": "TestDatastore123",
    "datastoreStatus": "ACTIVE",
    "datastoreArn": "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012",
    "createdAt": "2022-11-15T23:33:09.643000+00:00",
    "updatedAt": "2022-11-15T23:33:09.643000+00:00"
  }
}
```

For more information, see [Getting data store properties](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetDatastore](#) in *AWS CLI Command Reference*.

get-dicom-import-job

The following code example shows how to use `get-dicom-import-job`.

AWS CLI

To get a dicom import job's properties

The following `get-dicom-import-job` code example gets a dicom import job's properties.

```
aws medical-imaging get-dicom-import-job \  
  --datastore-id "12345678901234567890123456789012" \  
  --job-id "09876543210987654321098765432109"
```

Output:

```
{  
  "jobProperties": {  
    "jobId": "09876543210987654321098765432109",  
    "jobName": "my-job",  
    "jobStatus": "COMPLETED",  
    "datastoreId": "12345678901234567890123456789012",  
    "dataAccessRoleArn": "arn:aws:iam::123456789012:role/  
ImportJobDataAccessRole",  
    "endedAt": "2022-08-12T11:29:42.285000+00:00",  
    "submittedAt": "2022-08-12T11:28:11.152000+00:00",  
    "inputS3Uri": "s3://medical-imaging-dicom-input/dicom_input/",  
    "outputS3Uri": "s3://medical-imaging-output/  
job_output/12345678901234567890123456789012-  
DicomImport-09876543210987654321098765432109/"  
  }  
}
```

For more information, see [Getting import job properties](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetDICOMImportJob](#) in *AWS CLI Command Reference*.

get-image-frame

The following code example shows how to use `get-image-frame`.

AWS CLI

To get image set pixel data

The following `get-image-frame` code example gets an image frame.

```
aws medical-imaging get-image-frame \  
  --datastore-id "12345678901234567890123456789012" \  
  --image-set-id "98765412345612345678907890789012" \  
  --image-frame-information imageFrameId=3abf5d5d7ae72f80a0ec81b2c0de3ef4 \  
  imageframe.jph
```

Note: This code example does not include output because the `GetImageFrame` action returns a stream of pixel data to the `imageframe.jph` file. For information about decoding and viewing image frames, see HTJ2K decoding libraries.

For more information, see [Getting image set pixel data](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetImageFrame](#) in *AWS CLI Command Reference*.

get-image-set-metadata

The following code example shows how to use `get-image-set-metadata`.

AWS CLI

Example 1: To get image set metadata without version

The following `get-image-set-metadata` code example gets metadata for an image set without specifying a version.

Note: `outfile` is a required parameter

```
aws medical-imaging get-image-set-metadata \  
  --datastore-id 12345678901234567890123456789012 \  
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e \  
  studymetadata.json.gz
```

The returned metadata is compressed with gzip and stored in the `studymetadata.json.gz` file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```
{  
  "contentType": "application/json",
```

```
"contentEncoding": "gzip"  
}
```

Example 2: To get image set metadata with version

The following `get-image-set-metadata` code example gets metadata for an image set with a specified version.

Note: `outfile` is a required parameter

```
aws medical-imaging get-image-set-metadata \  
  --datastore-id 12345678901234567890123456789012 \  
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e \  
  --version-id 1 \  
  studymetadata.json.gz
```

The returned metadata is compressed with gzip and stored in the `studymetadata.json.gz` file. To view the contents of the returned JSON object, you must first decompress it.

Output:

```
{  
  "contentType": "application/json",  
  "contentEncoding": "gzip"  
}
```

For more information, see [Getting image set metadata](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetImageSetMetadata](#) in *AWS CLI Command Reference*.

get-image-set

The following code example shows how to use `get-image-set`.

AWS CLI

To get image set properties

The following `get-image-set` code example gets the properties for an image set.

```
aws medical-imaging get-image-set \  
  --datastore-id 12345678901234567890123456789012 \  
  --image-set-id 18f88ac7870584f58d56256646b4d92b \  
  --version-id 1
```

Output:

```
{  
  "versionId": "1",  
  "imageSetWorkflowStatus": "COPIED",  
  "updatedAt": 1680027253.471,  
  "imageSetId": "18f88ac7870584f58d56256646b4d92b",  
  "imageSetState": "ACTIVE",  
  "createdAt": 1679592510.753,  
  "datastoreId": "12345678901234567890123456789012"  
}
```

For more information, see [Getting image set properties](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [GetImageSet](#) in *AWS CLI Command Reference*.

list-datastores

The following code example shows how to use `list-datastores`.

AWS CLI

To list data stores

The following `list-datastores` code example lists available data stores.

```
aws medical-imaging list-datastores
```

Output:

```
{  
  "datastoreSummaries": [  
    {  
      "datastoreId": "12345678901234567890123456789012",
```

```
        "datastoreName": "TestDatastore123",
        "datastoreStatus": "ACTIVE",
        "datastoreArn": "arn:aws:medical-imaging:us-
east-1:123456789012:datastore/12345678901234567890123456789012",
        "createdAt": "2022-11-15T23:33:09.643000+00:00",
        "updatedAt": "2022-11-15T23:33:09.643000+00:00"
    }
]
}
```

For more information, see [Listing data stores](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [ListDatastores](#) in *AWS CLI Command Reference*.

list-dicom-import-jobs

The following code example shows how to use `list-dicom-import-jobs`.

AWS CLI

To list dicom import jobs

The following `list-dicom-import-jobs` code example lists dicom import jobs.

```
aws medical-imaging list-dicom-import-jobs \
  --datastore-id "12345678901234567890123456789012"
```

Output:

```
{
  "jobSummaries": [
    {
      "jobId": "09876543210987654321098765432109",
      "jobName": "my-job",
      "jobStatus": "COMPLETED",
      "datastoreId": "12345678901234567890123456789012",
      "dataAccessRoleArn": "arn:aws:iam::123456789012:role/
ImportJobDataAccessRole",
      "endedAt": "2022-08-12T11:21:56.504000+00:00",
      "submittedAt": "2022-08-12T11:20:21.734000+00:00"
    }
  ]
}
```

```
}
```

For more information, see [Listing import jobs](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [ListDICOMImportJobs](#) in *AWS CLI Command Reference*.

list-image-set-versions

The following code example shows how to use `list-image-set-versions`.

AWS CLI

To list image set versions

The following `list-image-set-versions` code example lists the version history for an image set.

```
aws medical-imaging list-image-set-versions \  
  --datastore-id 12345678901234567890123456789012 \  
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e
```

Output:

```
{  
  "imageSetPropertiesList": [  
    {  
      "ImageSetWorkflowStatus": "UPDATED",  
      "versionId": "4",  
      "updatedAt": 1680029436.304,  
      "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",  
      "imageSetState": "ACTIVE",  
      "createdAt": 1680027126.436  
    },  
    {  
      "ImageSetWorkflowStatus": "UPDATED",  
      "versionId": "3",  
      "updatedAt": 1680029163.325,  
      "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",  
      "imageSetState": "ACTIVE",  
      "createdAt": 1680027126.436  
    },  
    {
```

```

    "ImageSetWorkflowStatus": "COPY_FAILED",
    "versionId": "2",
    "updatedAt": 1680027455.944,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "ACTIVE",
    "message": "INVALID_REQUEST: Series of SourceImageSet and
DestinationImageSet don't match.",
    "createdAt": 1680027126.436
  },
  {
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "ACTIVE",
    "versionId": "1",
    "ImageSetWorkflowStatus": "COPIED",
    "createdAt": 1680027126.436
  }
]
}

```

For more information, see [Listing image set versions](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [ListImageSetVersions](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

Example 1: To list resource tags for a data store

The following `list-tags-for-resource` code example lists tags for a data store.

```

aws medical-imaging list-tags-for-resource \
  --resource-arn "arn:aws:medical-imaging:us-
east-1:123456789012: datastore/12345678901234567890123456789012"

```

Output:

```

{
  "tags":{
    "Deployment":"Development"
  }
}

```

```
}  
}
```

Example 2: To list resource tags for an image set

The following `list-tags-for-resource` code example lists tags for an image set.

```
aws medical-imaging list-tags-for-resource \  
  --resource-arn "arn:aws:medical-imaging:us-  
east-1:123456789012:datastore/12345678901234567890123456789012/  
imageset/18f88ac7870584f58d56256646b4d92b"
```

Output:

```
{  
  "tags":{  
    "Deployment":"Development"  
  }  
}
```

For more information, see [Tagging resources with AWS HealthImaging](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

search-image-sets

The following code example shows how to use `search-image-sets`.

AWS CLI

Example 1: To search image sets with an EQUAL operator

The following `search-image-sets` code example uses the EQUAL operator to search image sets based on a specific value.

```
aws medical-imaging search-image-sets \  
  --datastore-id 12345678901234567890123456789012 \  
  --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```
{
  "filters": [{
    "values": [{"DICOMPatientId" : "SUBJECT08701"}],
    "operator": "EQUAL"
  }]
}
```

Output:

```
{
  "imageSetsMetadataSummaries": [{
    "imageSetId": "09876543210987654321098765432109",
    "createdAt": "2022-12-06T21:40:59.429000+00:00",
    "version": 1,
    "DICOMTags": {
      "DICOMStudyId": "2011201407",
      "DICOMStudyDate": "19991122",
      "DICOMPatientSex": "F",
      "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
      "DICOMPatientBirthDate": "19201120",
      "DICOMStudyDescription": "UNKNOWN",
      "DICOMPatientId": "SUBJECT08701",
      "DICOMPatientName": "Melissa844 Huel628",
      "DICOMNumberOfStudyRelatedInstances": 1,
      "DICOMStudyTime": "140728",
      "DICOMNumberOfStudyRelatedSeries": 1
    },
    "updatedAt": "2022-12-06T21:40:59.429000+00:00"
  }]
}
```

Example 2: To search image sets with a BETWEEN operator using DICOMStudyDate and DICOMStudyTime

The following `search-image-sets` code example searches for image sets with DICOM Studies generated between January 1, 1990 (12:00 AM) and January 1, 2023 (12:00 AM).

Note: `DICOMStudyTime` is optional. If it is not present, 12:00 AM (start of the day) is the time value for the dates provided for filtering.

```
aws medical-imaging search-image-sets \
  --datastore-id 12345678901234567890123456789012 \
```

```
--search-criteria file://search-criteria.json
```

Contents of search-criteria.json

```
{
  "filters": [{
    "values": [{
      "DICOMStudyDateAndTime": {
        "DICOMStudyDate": "19900101",
        "DICOMStudyTime": "000000"
      }
    },
    {
      "DICOMStudyDateAndTime": {
        "DICOMStudyDate": "20230101",
        "DICOMStudyTime": "000000"
      }
    }
  ]},
  "operator": "BETWEEN"
}]
}
```

Output:

```
{
  "imageSetsMetadataSummaries": [{
    "imageSetId": "09876543210987654321098765432109",
    "createdAt": "2022-12-06T21:40:59.429000+00:00",
    "version": 1,
    "DICOMTags": {
      "DICOMStudyId": "2011201407",
      "DICOMStudyDate": "19991122",
      "DICOMPatientSex": "F",
      "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
      "DICOMPatientBirthDate": "19201120",
      "DICOMStudyDescription": "UNKNOWN",
      "DICOMPatientId": "SUBJECT08701",
      "DICOMPatientName": "Melissa844 Huel628",
      "DICOMNumberOfStudyRelatedInstances": 1,
      "DICOMStudyTime": "140728",
      "DICOMNumberOfStudyRelatedSeries": 1
    },
    "updatedAt": "2022-12-06T21:40:59.429000+00:00"
  ]
}
```

```
    ]]  
  }
```

Example 3: To search image sets with a BETWEEN operator using createdAt (time studies were previously persisted)

The following `search-image-sets` code example searches for image sets with DICOM Studies persisted in HealthImaging between the time ranges in UTC time zone.

Note: Provide `createdAt` in example format ("1985-04-12T23:20:50.52Z").

```
aws medical-imaging search-image-sets \  
  --datastore-id 12345678901234567890123456789012 \  
  --search-criteria file://search-criteria.json
```

Contents of `search-criteria.json`

```
{  
  "filters": [{  
    "values": [{  
      "createdAt": "1985-04-12T23:20:50.52Z"  
    },  
    {  
      "createdAt": "2022-04-12T23:20:50.52Z"  
    }],  
    "operator": "BETWEEN"  
  }]  
}
```

Output:

```
{  
  "imageSetsMetadataSummaries": [{  
    "imageSetId": "09876543210987654321098765432109",  
    "createdAt": "2022-12-06T21:40:59.429000+00:00",  
    "version": 1,  
    "DICOMTags": {  
      "DICOMStudyId": "2011201407",  
      "DICOMStudyDate": "19991122",  
      "DICOMPatientSex": "F",  
      "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",  
    }  
  }  
}
```

```

        "DICOMPatientBirthDate": "19201120",
        "DICOMStudyDescription": "UNKNOWN",
        "DICOMPatientId": "SUBJECT08701",
        "DICOMPatientName": "Melissa844 Huel628",
        "DICOMNumberOfStudyRelatedInstances": 1,
        "DICOMStudyTime": "140728",
        "DICOMNumberOfStudyRelatedSeries": 1
    },
    "lastUpdatedAt": "2022-12-06T21:40:59.429000+00:00"
  ]
}

```

Example 4: To search image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field

The following `search-image-sets` code example searches for image sets with an EQUAL operator on DICOMSeriesInstanceUID and BETWEEN on updatedAt and sort response in ASC order on updatedAt field.

Note: Provide updatedAt in example format ("1985-04-12T23:20:50.52Z").

```

aws medical-imaging search-image-sets \
  --datastore-id 12345678901234567890123456789012 \
  --search-criteria file://search-criteria.json

```

Contents of search-criteria.json

```

{
  "filters": [{
    "values": [{
      "updatedAt": "2024-03-11T15:00:05.074000-07:00"
    }, {
      "updatedAt": "2024-03-11T16:00:05.074000-07:00"
    }],
    "operator": "BETWEEN"
  }, {
    "values": [{
      "DICOMSeriesInstanceUID": "1.2.840.99999999.84710745.943275268089"
    }],
    "operator": "EQUAL"
  }],
  "sort": {

```

```
    "sortField": "updatedAt",
    "sortOrder": "ASC"
  }
}
```

Output:

```
{
  "imageSetsMetadataSummaries": [{
    "imageSetId": "09876543210987654321098765432109",
    "createdAt": "2022-12-06T21:40:59.429000+00:00",
    "version": 1,
    "DICOMTags": {
      "DICOMStudyId": "2011201407",
      "DICOMStudyDate": "19991122",
      "DICOMPatientSex": "F",
      "DICOMStudyInstanceUID": "1.2.840.99999999.84710745.943275268089",
      "DICOMPatientBirthDate": "19201120",

    },
    "lastUpdatedAt": "2022-12-06T21:40:59.429000+00:00"
  ]
}
```

For more information, see [Searching image sets](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [SearchImageSets](#) in *AWS CLI Command Reference*.

start-dicom-import-job

The following code example shows how to use `start-dicom-import-job`.

AWS CLI

To start a dicom import job

The following `start-dicom-import-job` code example starts a dicom import job.

```
aws medical-imaging start-dicom-import-job \  
  --job-name "my-job" \  
  --datastore-id "12345678901234567890123456789012" \  
  --input-s3-uri "s3://medical-imaging-dicom-input/dicom_input/" \  
  --output-s3-uri "s3://medical-imaging-output/job_output/" \  
  --data-access-role-arn "arn:aws:iam::123456789012:role/ImportJobDataAccessRole"
```

Output:

```
{  
  "datastoreId": "12345678901234567890123456789012",  
  "jobId": "09876543210987654321098765432109",  
  "jobStatus": "SUBMITTED",  
  "submittedAt": "2022-08-12T11:28:11.152000+00:00"  
}
```

For more information, see [Starting an import job](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [StartDICOMImportJob](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

Example 1: To tag a data store

The following tag-resource code examples tags a data store.

```
aws medical-imaging tag-resource \  
  --resource-arn "arn:aws:medical-imaging:us-  
east-1:123456789012:datastore/12345678901234567890123456789012" \  
  --tags '{"Deployment":"Development}"'
```

This command produces no output.

Example 2: To tag an image set

The following tag-resource code examples tags an image set.

```
aws medical-imaging tag-resource \  
  --resource-arn "arn:aws:medical-imaging:us-  
east-1:123456789012:datastore/12345678901234567890123456789012/  
imageset/18f88ac7870584f58d56256646b4d92b" \  
  --tags '{"Deployment":"Development"}'
```

This command produces no output.

For more information, see [Tagging resources with AWS HealthImaging](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

Example 1: To untag a data store

The following `untag-resource` code example untags a data store.

```
aws medical-imaging untag-resource \  
  --resource-arn "arn:aws:medical-imaging:us-  
east-1:123456789012:datastore/12345678901234567890123456789012" \  
  --tag-keys ["Deployment"]'
```

This command produces no output.

Example 2: To untag an image set

The following `untag-resource` code example untags an image set.

```
aws medical-imaging untag-resource \  
  --resource-arn "arn:aws:medical-imaging:us-  
east-1:123456789012:datastore/12345678901234567890123456789012/  
imageset/18f88ac7870584f58d56256646b4d92b" \  
  --tag-keys ["Deployment"]'
```

This command produces no output.

For more information, see [Tagging resources with AWS HealthImaging](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-image-set-metadata

The following code example shows how to use `update-image-set-metadata`.

AWS CLI

To insert or update an attribute in image set metadata

The following `update-image-set-metadata` code example inserts or updates an attribute in image set metadata.

```
aws medical-imaging update-image-set-metadata \
  --datastore-id 12345678901234567890123456789012 \
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
  --latest-version-id 1 \
  --update-image-set-metadata-updates file://metadata-updates.json
```

Contents of `metadata-updates.json`

```
{
  "DICOMUpdates": {
    "updatableAttributes":
      "eyJTY2h1bWFWZXJzaW9uIjoxLjEsIlBhdGllbnQiOnsiRElDT00iOnsiUGF0aWVudE5hbWUiOiJNWf5NWCJ9fX0="
  }
}
```

Note: `updatableAttributes` is a Base64 encoded JSON string. Here is the unencoded JSON string.

```
{"SchemaVersion":1.1,"Patient":{"DICOM":{"PatientName":"MX^MX"}}
```

Output:

```
{
  "latestVersionId": "2",
  "imageSetWorkflowStatus": "UPDATING",
```

```

    "updatedAt": 1680042257.908,
    "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
    "imageSetState": "LOCKED",
    "createdAt": 1680027126.436,
    "datastoreId": "12345678901234567890123456789012"
  }

```

To remove an attribute from image set metadata

The following `update-image-set-metadata` code example removes an attribute from image set metadata.

```

aws medical-imaging update-image-set-metadata \
  --datastore-id 12345678901234567890123456789012 \
  --image-set-id ea92b0d8838c72a3f25d00d13616f87e \
  --latest-version-id 1 \
  --update-image-set-metadata-updates file://metadata-updates.json

```

Contents of `metadata-updates.json`

```

{
  "DICOMUpdates": {
    "removableAttributes":
    "e1NjaGVtYVZlcnNpb246MS4xLFN0dWR50ntESUNPTTp7U3R1ZH1EZXNjcmlwdGlvbjpDSEVTVH19fQo="
  }
}

```

Note: `removableAttributes` is a Base64 encoded JSON string. Here is the unencoded JSON string. The key and value must match the attribute to be removed.

```
{"SchemaVersion":1.1,"Study":{"DICOM":{"StudyDescription":"CHEST"}}
```

Output:

```

{
  "latestVersionId": "2",
  "imageSetWorkflowStatus": "UPDATING",
  "updatedAt": 1680042257.908,
  "imageSetId": "ea92b0d8838c72a3f25d00d13616f87e",
  "imageSetState": "LOCKED",
  "createdAt": 1680027126.436,

```

For more information, see [Updating image set metadata](#) in the *AWS HealthImaging Developer Guide*.

- For API details, see [UpdateImageSetMetadata](#) in *AWS CLI Command Reference*.

HealthLake examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthLake.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-fhir-datastore

The following code example shows how to use `create-fhir-datastore`.

AWS CLI

To create a FHIR Data Store.

The following `create-fhir-datastore` example demonstrates how to create a new Data Store in Amazon HealthLake.

```
aws healthlake create-fhir-datastore \  
  --region us-east-1 \  
  --datastore-type-version R4 \  
  --datastore-type-version R4 \  
  --datastore-type-version R4 \
```

```
--datastore-name "FhirTestDatastore"
```

Output:

```
{
  "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
(Datastore ID)/r4/",
  "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/
(Datastore ID)",
  "DatastoreStatus": "CREATING",
  "DatastoreId": "(Datastore ID)"
}
```

For more information, see [Creating and monitoring a FHIR Data Store](#) in the *Amazon HealthLake Developer Guide*.

- For API details, see [CreateFhirDatastore](#) in *AWS CLI Command Reference*.

delete-fhir-datastore

The following code example shows how to use `delete-fhir-datastore`.

AWS CLI

To delete a FHIR Data Store

The following `delete-fhir-datastore` example demonstrates how to delete a Data Store and all of its contents in Amazon HealthLake.

```
aws healthlake delete-fhir-datastore \
  --datastore-id (Data Store ID) \
  --region us-east-1
```

Output:

```
{
  "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
(Datastore ID)/r4/",
  "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/
(Datastore ID)",
  "DatastoreStatus": "DELETING",
}
```

```
"DatastoreId": "(Datastore ID)"
}
```

For more information, see [Creating and monitoring a FHIR Data Store](https://docs.aws.amazon.com/healthlake/latest/devguide/working-with-FHIR-healthlake.html) <<https://docs.aws.amazon.com/healthlake/latest/devguide/working-with-FHIR-healthlake.html>> in the *Amazon HealthLake Developer Guide*.

- For API details, see [DeleteFhirDatastore](#) in *AWS CLI Command Reference*.

describe-fhir-datastore

The following code example shows how to use `describe-fhir-datastore`.

AWS CLI

To describe a FHIR Data Store

The following `describe-fhir-datastore` example demonstrates how to find the properties of a Data Store in Amazon HealthLake.

```
aws healthlake describe-fhir-datastore \
  --datastore-id "1f2f459836ac6c513ce899f9e4f66a59" \
  --region us-east-1
```

Output:

```
{
  "DatastoreProperties": {
    "PreloadDataConfig": {
      "PreloadDataType": "SYNTHEA"
    },
    "DatastoreName": "FhirTestDatastore",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/
(Datastore ID)",
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
(Datastore ID)/r4/",
    "DatastoreStatus": "CREATING",
    "DatastoreTypeVersion": "R4",
    "DatastoreId": "(Datastore ID)"
  }
}
```

For more information, see [Creating and monitoring a FHIR Data Stores](#) in the *Amazon HealthLake Developer Guide*.

- For API details, see [DescribeFhirDatastore](#) in *AWS CLI Command Reference*.

describe-fhir-export-job

The following code example shows how to use `describe-fhir-export-job`.

AWS CLI

To describe a FHIR export job

The following `describe-fhir-export-job` example shows how to find the properties of a FHIR export job in Amazon HealthLake.

```
aws healthlake describe-fhir-export-job \  
  --datastore-id (Datastore ID) \  
  --job-id 9b9a51943afaedd0a8c0c26c49135a31
```

Output:

```
{  
  "ExportJobProperties": {  
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",  
    "JobStatus": "IN_PROGRESS",  
    "JobId": "9009813e9d69ba7cf79bcb3468780f16",  
    "SubmitTime": 1609175692.715,  
    "OutputDataConfig": {  
      "S3Uri": "s3://(Bucket Name)/(Prefix  
Name)/59593b2d0367ce252b5e66bf5fd6b574-  
FHIR_EXPORT-9009813e9d69ba7cf79bcb3468780f16/"  
    },  
    "DatastoreId": "(Datastore ID)"  
  }  
}
```

For more information, see [Exporting files from a FHIR Data Store](#) in the *Amazon HealthLake Developer Guide*.

- For API details, see [DescribeFhirExportJob](#) in *AWS CLI Command Reference*.

describe-fhir-import-job

The following code example shows how to use `describe-fhir-import-job`.

AWS CLI

To describe a FHIR import job

The following `describe-fhir-import-job` example shows how to learn the properties of a FHIR import job using Amazon HealthLake.

```
aws healthlake describe-fhir-import-job \  
  --datastore-id (Datastore ID) \  
  --job-id c145fbb27b192af392f8ce6e7838e34f \  
  --region us-east-1
```

Output:

```
{  
  "ImportJobProperties": {  
    "InputDataConfig": {  
      "S3Uri": "s3://(Bucket Name)/(Prefix Name)/"  
      { "arrayitem2": 2 }  
    },  
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",  
    "JobStatus": "COMPLETED",  
    "JobId": "c145fbb27b192af392f8ce6e7838e34f",  
    "SubmitTime": 1606272542.161,  
    "EndTime": 1606272609.497,  
    "DatastoreId": "(Datastore ID)"  
  }  
}
```

For more information, see [Importing files to a FHIR Data Store](#) in the *Amazon HealthLake Developer Guide*.

- For API details, see [DescribeFhirImportJob](#) in *AWS CLI Command Reference*.

list-fhir-datastores

The following code example shows how to use `list-fhir-datastores`.

AWS CLI

To list FHIR Data Stores

The following `list-fhir-datastores` example shows to how to use the command and how users can filter results based on Data Store status in Amazon HealthLake.

```
aws healthlake list-fhir-datastores \
  --region us-east-1 \
  --filter DatastoreStatus=ACTIVE
```

Output:

```
{
  "DatastorePropertiesList": [
    {
      "PreloadDataConfig": {
        "PreloadDataType": "SYNTHEA"
      },
      "DatastoreName": "FhirTestDatastore",
      "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/
<Datastore ID>",
      "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
<Datastore ID>/r4/",
      "DatastoreStatus": "ACTIVE",
      "DatastoreTypeVersion": "R4",
      "CreatedAt": 1605574003.209,
      "DatastoreId": "<Datastore ID>"
    },
    {
      "DatastoreName": "Demo",
      "DatastoreArn": "arn:aws:healthlake:us-east-1:<AWS Account ID>:datastore/
<Datastore ID>",
      "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/
<Datastore ID>/r4/",
      "DatastoreStatus": "ACTIVE",
      "DatastoreTypeVersion": "R4",
      "CreatedAt": 1603761064.881,
      "DatastoreId": "<Datastore ID>"
    }
  ]
}
```

For more information, see [Creating and monitoring a FHIR Data Store](#) in the *Amazon HealthLake Developer Guide*.

- For API details, see [ListFhirDatastores](#) in *AWS CLI Command Reference*.

list-fhir-export-jobs

The following code example shows how to use `list-fhir-export-jobs`.

AWS CLI

To list all FHIR export jobs

The following `list-fhir-export-jobs` example shows how to use the command to view a list of export jobs associated with an account.

```
aws healthlake list-fhir-export-jobs \  
  --datastore-id (Datastore ID) \  
  --submitted-before (DATE like 2024-10-13T19:00:00Z)\ \  
  --submitted-after (DATE like 2020-10-13T19:00:00Z) \  
  --job-name "FHIR-EXPORT" \  
  --job-status SUBMITTED \  
  --max-results (Integer between 1 and 500)
```

Output:

```
{  
  "ExportJobProperties": {  
    "OutputDataConfig": {  
      "S3Uri": "s3://(Bucket Name)/(Prefix Name)/"  
      "S3Configuration": {  
        "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",  
        "KmsKeyId" : "(KmsKey Id)"  
      },  
    },  
  },  
  "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",  
  "JobStatus": "COMPLETED",  
  "JobId": "c145fbb27b192af392f8ce6e7838e34f",  
  "JobName": "FHIR-EXPORT",  
  "SubmitTime": 1606272542.161,  
  "EndTime": 1606272609.497,  
  "DatastoreId": "(Datastore ID)"
```

```

    }
  }
  "NextToken": String

```

For more information, see [Exporting files from a FHIR Data Store](#) in the Amazon HealthLake Developer Guide.

- For API details, see [ListFhirExportJobs](#) in *AWS CLI Command Reference*.

list-fhir-import-jobs

The following code example shows how to use `list-fhir-import-jobs`.

AWS CLI

To list all FHIR import jobs

The following `list-fhir-import-jobs` example shows how to use the command to view a list of all import jobs associated with an account.

```

aws healthlake list-fhir-import-jobs \
  --datastore-id (Datastore ID) \
  --submitted-before (DATE like 2024-10-13T19:00:00Z) \
  --submitted-after (DATE like 2020-10-13T19:00:00Z ) \
  --job-name "FHIR-IMPORT" \
  --job-status SUBMITTED \
  -max-results (Integer between 1 and 500)

```

Output:

```

{
  "ImportJobProperties": {
    "OutputDataConfig": {
      "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
      "S3Configuration": {
        "S3Uri": "s3://(Bucket Name)/(Prefix Name)/",
        "KmsKeyId" : "(KmsKey Id)"
      }
    },
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
    "JobStatus": "COMPLETED",
  }
}

```

```
"JobId": "c145fbb27b192af392f8ce6e7838e34f",
"JobName" "FHIR-IMPORT",
"SubmitTime": 1606272542.161,
"EndTime": 1606272609.497,
"DatastoreId": "(Datastore ID)"
}
}
"NextToken": String
```

For more information, see [Importing files to FHIR Data Store](#) in the Amazon HealthLake Developer Guide.

- For API details, see [ListFhirImportJobs](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a Data Store

The following `list-tags-for-resource` example lists the tags associated with the specified Data Store.:

```
aws healthlake list-tags-for-resource \
  --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datastore/
  fhir/0725c83f4307f263e16fd56b6d8ebdbe" \
  --region us-east-1
```

Output:

```
{
  "tags": {
    "key": "value",
    "key1": "value1"
  }
}
```

For more information, see [Tagging resources in Amazon HealthLake](#) in the Amazon HealthLake Developer Guide.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

start-fhir-export-job

The following code example shows how to use `start-fhir-export-job`.

AWS CLI

To start a FHIR export job

The following `start-fhir-export-job` example shows how to start a FHIR export job using Amazon HealthLake.

```
aws healthlake start-fhir-export-job \  
  --output-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \  
  --datastore-id (Datastore ID) \  
  --data-access-role-arn arn:aws:iam::(AWS Account ID):role/(Role Name)
```

Output:

```
{  
  "DatastoreId": "(Datastore ID)",  
  "JobStatus": "SUBMITTED",  
  "JobId": "9b9a51943afaedd0a8c0c26c49135a31"  
}
```

For more information, see [Exporting files from a FHIR Data Store](#) in the *Amazon HealthLake Developer Guide*.

- For API details, see [StartFhirExportJob](#) in *AWS CLI Command Reference*.

start-fhir-import-job

The following code example shows how to use `start-fhir-import-job`.

AWS CLI

To start a FHIR import job

The following `start-fhir-import-job` example shows how to start a FHIR import job using Amazon HealthLake.

```
aws healthlake start-fhir-import-job \  
  --input-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)/" \  
  --datastore-id (Datastore ID) \  
  --data-access-role-arn "arn:aws:iam::(AWS Account ID):role/(Role Name)" \  
  --region us-east-1
```

Output:

```
{  
  "DatastoreId": "(Datastore ID)",  
  "JobStatus": "SUBMITTED",  
  "JobId": "c145fbb27b192af392f8ce6e7838e34f"  
}
```

For more information, see Importing files to a FHIR Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/import-datastore.html> in the *Amazon HealthLake Developer Guide*.

- For API details, see [StartFhirImportJob](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to Data Store

The following `tag-resource` example shows how to add a tag to a Data Store.

```
aws healthlake tag-resource \  
  --resource-arn "arn:aws:healthlake:us-east-1:691207106566:datastore/  
fhir/0725c83f4307f263e16fd56b6d8ebdbe" \  
  --tags '[{"Key": "key1", "Value": "value1"}]' \  
  --region us-east-1
```

This command produces no output.

For more information, see 'Adding a tag to a Data Store <https://docs.aws.amazon.com/healthlake/latest/devguide/add-a-tag.html>' in the *Amazon HealthLake Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a Data Store.

The following `untag-resource` example shows how to remove tags from a Data Store.

```
aws healthlake untag-resource \  
  --resource-arn "arn:aws:healthlake:us-east-1:674914422125:datastore/fhir/  
b91723d65c6fdeb1d26543a49d2ed1fa" \  
  --tag-keys '["key1"]' \  
  --region us-east-1
```

This command produces no output.

For more information, see [Removing tags from a Data Store](#) in the *Amazon HealthLake Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

HealthOmics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with HealthOmics.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

abort-multipart-read-set-upload

The following code example shows how to use `abort-multipart-read-set-upload`.

AWS CLI

To stop a multipart read set upload

The following `abort-multipart-read-set-upload` example stops a multipart read set upload into your HealthOmics sequence store.

```
aws omics abort-multipart-read-set-upload \  
  --sequence-store-id 0123456789 \  
  --upload-id 1122334455
```

This command produces no output.

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [AbortMultipartReadSetUpload](#) in *AWS CLI Command Reference*.

accept-share

The following code example shows how to use `accept-share`.

AWS CLI

To accept a share of analytics store data

The following `accept-share` example accepts a share of HealthOmics analytics store data.

```
aws omics accept-share \  
  ----share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{  
  "status": "ACTIVATING"  
}
```

For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [AcceptShare](#) in *AWS CLI Command Reference*.

batch-delete-read-set

The following code example shows how to use `batch-delete-read-set`.

AWS CLI

To delete multiple read sets

The following `batch-delete-read-set` example deletes two read sets.

```
aws omics batch-delete-read-set \  
  --sequence-store-id 1234567890 \  
  --ids 1234567890 0123456789
```

If there is an error deleting any of the specified read sets, the service returns an error list.

```
{  
  "errors": [  
    {  
      "code": "",  
      "id": "0123456789",  
      "message": "The specified readset does not exist."  
    }  
  ]  
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [BatchDeleteReadSet](#) in *AWS CLI Command Reference*.

cancel-annotation-import-job

The following code example shows how to use `cancel-annotation-import-job`.

AWS CLI

To cancel an annotation import job

The following `cancel-annotation-import-job` example cancels an annotation import job with ID `04f57618-xmpl-4fd0-9349-e5a85aefb997`.

```
aws omics cancel-annotation-import-job \  
  --job-id 04f57618-xmpl-4fd0-9349-e5a85aefb997
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [CancelAnnotationImportJob](#) in *AWS CLI Command Reference*.

cancel-run

The following code example shows how to use `cancel-run`.

AWS CLI

To cancel a run

The following `cancel-run` example cancels a run with ID `1234567`.

```
aws omics cancel-run \  
  --id 1234567
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [CancelRun](#) in *AWS CLI Command Reference*.

cancel-variant-import-job

The following code example shows how to use `cancel-variant-import-job`.

AWS CLI

To cancel a variant import job

The following `cancel-variant-import-job` example cancels a variant import job with ID `69cb65d6-xmpl-4a4a-9025-4565794b684e`.

```
aws omics cancel-variant-import-job \  
  --job-id 69cb65d6-xmpl-4a4a-9025-4565794b684e
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [CancelVariantImportJob](#) in *AWS CLI Command Reference*.

complete-multipart-read-set-upload

The following code example shows how to use `complete-multipart-read-set-upload`.

AWS CLI

To conclude a multipart upload once you have uploaded all of the components.

The following `complete-multipart-read-set-upload` example concludes a multipart upload into a sequence store once all of the components have been uploaded.

```
aws omics complete-multipart-read-set-upload \  
  --sequence-store-id 0123456789 \  
  --upload-id 1122334455 \  
  --parts '[{"checksum":"gaCBQMe+rpCFZxLpoP6gydBoXaKKDA/  
Vobh5zBD4W4=", "partNumber":1, "partSource":"SOURCE1"}]'
```

Output:

```
{  
  "readSetId": "0000000001"  
  "readSetId": "0000000002"  
  "readSetId": "0000000003"  
}
```

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [CompleteMultipartReadSetUpload](#) in *AWS CLI Command Reference*.

create-annotation-store-version

The following code example shows how to use `create-annotation-store-version`.

AWS CLI

To create a new version of an annotation store

The following `create-annotation-store-version` example creates a new version of an annotation store.

```
aws omics create-annotation-store-version \  
  --name my_annotation_store \  
  --version-name my_version
```

Output:

```
{  
  "creationTime": "2023-07-21T17:15:49.251040+00:00",  
  "id": "3b93cdef69d2",  
  "name": "my_annotation_store",  
  "reference": {  
    "referenceArn": "arn:aws:omics:us-  
west-2:555555555555:referenceStore/6505293348/reference/5987565360"  
  },  
  "status": "CREATING",  
  "versionName": "my_version"  
}
```

For more information, see [Creating new versions of annotation stores](#) in the *AWS HealthOmics User Guide*.

- For API details, see [CreateAnnotationStoreVersion](#) in *AWS CLI Command Reference*.

create-annotation-store

The following code example shows how to use `create-annotation-store`.

AWS CLI

Example 1: To create a VCF annotation store

The following `create-annotation-store` example creates a VCF format annotation store.

```
aws omics create-annotation-store \  
  --name my_ann_store \  
  --store-format VCF \  
  --reference referenceArn=arn:aws:omics:us-  
west-2:123456789012:referenceStore/1234567890/reference/1234567890
```

Output:

```
{
```

```
"creationTime": "2022-11-23T22:48:39.226492Z",
"id": "0a91xmplc71f",
"name": "my_ann_store",
"reference": {
  "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
},
"status": "CREATING",
"storeFormat": "VCF"
}
```

Example 2: To create a TSV annotation store

The following `create-annotation-store` example creates a TSV format annotation store.

```
aws omics create-annotation-store \
  --name tsv_ann_store \
  --store-format TSV \
  --reference referenceArn=arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890 \
  --store-options file://tsv-store-options.json
```

`tsv-store-options.json` configures format options for annotations.

```
{
  "tsvStoreOptions": {
    "annotationType": "CHR_START_END_ZERO_BASE",
    "formatToHeader": {
      "CHR": "chromosome",
      "START": "start",
      "END": "end"
    },
    "schema": [
      {
        "chromosome": "STRING"
      },
      {
        "start": "LONG"
      },
      {
        "end": "LONG"
      }
    ]
  }
}
```

```

        "name": "STRING"
      }
    ]
  }
}

```

Output:

```

{
  "creationTime": "2022-11-30T01:28:08.525586Z",
  "id": "861cxmpl96b0",
  "name": "tsv_ann_store",
  "reference": {
    "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
  },
  "status": "CREATING",
  "storeFormat": "TSV",
  "storeOptions": {
    "tsvStoreOptions": {
      "annotationType": "CHR_START_END_ZERO_BASE",
      "formatToHeader": {
        "CHR": "chromosome",
        "END": "end",
        "START": "start"
      },
      "schema": [
        {
          "chromosome": "STRING"
        },
        {
          "start": "LONG"
        },
        {
          "end": "LONG"
        },
        {
          "name": "STRING"
        }
      ]
    }
  }
}

```

For more information, see [Omics Analytics](#) in the Amazon Omics Developer Guide.

- For API details, see [CreateAnnotationStore](#) in *AWS CLI Command Reference*.

create-multipart-read-set-upload

The following code example shows how to use `create-multipart-read-set-upload`.

AWS CLI

To begin a multipart read set upload.

The following `create-multipart-read-set-upload` example initiates a multipart read set upload.

```
aws omics create-multipart-read-set-upload \  
  --sequence-store-id 0123456789 \  
  --name HG00146 \  
  --source-file-type FASTQ \  
  --subject-id mySubject\  
  --sample-id mySample\  
  --description "FASTQ for HG00146"\  
  --generated-from "1000 Genomes"
```

Output:

```
{  
  "creationTime": "2022-07-13T23:25:20Z",  
  "description": "FASTQ for HG00146",  
  "generatedFrom": "1000 Genomes",  
  "name": "HG00146",  
  "sampleId": "mySample",  
  "sequenceStoreId": "0123456789",  
  "sourceFileType": "FASTQ",  
  "subjectId": "mySubject",  
  "uploadId": "1122334455"  
}
```

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [CreateMultipartReadSetUpload](#) in *AWS CLI Command Reference*.

create-reference-store

The following code example shows how to use `create-reference-store`.

AWS CLI

To create a reference store

The following `create-reference-store` example creates a reference store `my-ref-store`.

```
aws omics create-reference-store \  
  --name my-ref-store
```

Output:

```
{  
  "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",  
  "creationTime": "2022-11-22T22:13:25.947Z",  
  "id": "1234567890",  
  "name": "my-ref-store"  
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [CreateReferenceStore](#) in *AWS CLI Command Reference*.

create-run-group

The following code example shows how to use `create-run-group`.

AWS CLI

To create a run group

The following `create-run-group` example creates a run group named `cram-converter`.

```
aws omics create-run-group \  
  --name cram-converter \  
  --max-cpus 20 \  
  --max-duration 600
```

Output:

```
{
  "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
  "id": "1234567",
  "tags": {}
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [CreateRunGroup](#) in *AWS CLI Command Reference*.

create-sequence-store

The following code example shows how to use `create-sequence-store`.

AWS CLI**To create a sequence store**

The following `create-sequence-store` example creates a sequence store.

```
aws omics create-sequence-store \
  --name my-seq-store
```

Output:

```
{
  "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890",
  "creationTime": "2022-11-23T01:24:33.629Z",
  "id": "1234567890",
  "name": "my-seq-store"
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [CreateSequenceStore](#) in *AWS CLI Command Reference*.

create-share

The following code example shows how to use `create-share`.

AWS CLI

To create a share of a HealthOmics analytics store

The following `create-share` example shows how to create a share of a HealthOmics analytics store that can be accepted by a subscriber outside the account.

```
aws omics create-share \  
  --resource-arn "arn:aws:omics:us-west-2:555555555555:variantStore/  
omics_dev_var_store" \  
  --principal-subscriber "123456789012" \  
  --name "my_Share-123"
```

Output:

```
{  
  "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",  
  "name": "my_Share-123",  
  "status": "PENDING"  
}
```

For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [CreateShare](#) in *AWS CLI Command Reference*.

create-variant-store

The following code example shows how to use `create-variant-store`.

AWS CLI

To create a variant store

The following `create-variant-store` example creates a variant store named `my_var_store`.

```
aws omics create-variant-store \  
  --name my_var_store \  
  --reference referenceArn=arn:aws:omics:us-  
west-2:123456789012:referenceStore/1234567890/reference/1234567890
```

Output:

```
{
  "creationTime": "2022-11-23T22:09:07.534499Z",
  "id": "02dexplcfdd",
  "name": "my_var_store",
  "reference": {
    "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
  },
  "status": "CREATING"
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [CreateVariantStore](#) in *AWS CLI Command Reference*.

create-workflow

The following code example shows how to use `create-workflow`.

AWS CLI

To create a workflow

The following `create-workflow` example creates a WDL workflow.

```
aws omics create-workflow \
  --name cram-converter \
  --engine WDL \
  --definition-zip fileb://workflow-crambam.zip \
  --parameter-template file://workflow-params.json
```

`workflow-crambam.zip` is a ZIP archive containing a workflow definition. `workflow-params.json` defines runtime parameters for the workflow.

```
{
  "ref_fasta" : {
    "description": "Reference genome fasta file",
    "optional": false
  },
  "ref_fasta_index" : {
    "description": "Index of the reference genome fasta file",
```

```
    "optional": false
  },
  "ref_dict" : {
    "description": "dictionary file for 'ref_fasta'",
    "optional": false
  },
  "input_cram" : {
    "description": "The Cram file to convert to BAM",
    "optional": false
  },
  "sample_name" : {
    "description": "The name of the input sample, used to name the output BAM",
    "optional": false
  }
}
```

Output:

```
{
  "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
  "id": "1234567",
  "status": "CREATING",
  "tags": {}
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [CreateWorkflow](#) in *AWS CLI Command Reference*.

delete-annotation-store-versions

The following code example shows how to use delete-annotation-store-versions.

AWS CLI

To delete an annotation store version

The following delete-annotation-store-versions example deletes an annotation store version.

```
aws omics delete-annotation-store-versions \
  --name my_annotation_store \
```

```
--versions my_version
```

Output:

```
{  
  "errors": []  
}
```

For more information, see [Creating new versions of annotation stores](#) in the *AWS HealthOmics User Guide*.

- For API details, see [DeleteAnnotationStoreVersions](#) in *AWS CLI Command Reference*.

delete-annotation-store

The following code example shows how to use `delete-annotation-store`.

AWS CLI**To delete an annotation store**

The following `delete-annotation-store` example deletes an annotation store named `my_vcf_store`.

```
aws omics delete-annotation-store \  
  --name my_vcf_store
```

Output:

```
{  
  "status": "DELETING"  
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteAnnotationStore](#) in *AWS CLI Command Reference*.

delete-reference-store

The following code example shows how to use `delete-reference-store`.

AWS CLI

To delete a reference store

The following `delete-reference-store` example deletes a reference store with ID 1234567890.

```
aws omics delete-reference-store \  
  --id 1234567890
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteReferenceStore](#) in *AWS CLI Command Reference*.

`delete-reference`

The following code example shows how to use `delete-reference`.

AWS CLI

To delete a reference

The following `delete-reference` example deletes a reference.

```
aws omics delete-reference \  
  --reference-store-id 1234567890 \  
  --id 1234567890
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteReference](#) in *AWS CLI Command Reference*.

`delete-run-group`

The following code example shows how to use `delete-run-group`.

AWS CLI

To delete a run group

The following `delete-run-group` example deletes a run group with ID 1234567.

```
aws omics delete-run-group \  
  --id 1234567
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteRunGroup](#) in *AWS CLI Command Reference*.

delete-run

The following code example shows how to use `delete-run`.

AWS CLI

To delete a workflow run

The following `delete-run` example deletes a run with ID 1234567.

```
aws omics delete-run \  
  --id 1234567
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteRun](#) in *AWS CLI Command Reference*.

delete-sequence-store

The following code example shows how to use `delete-sequence-store`.

AWS CLI

To delete a sequence store

The following `delete-sequence-store` example deletes a sequence store with ID 1234567890.

```
aws omics delete-sequence-store \  
  --id 1234567890
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteSequenceStore](#) in *AWS CLI Command Reference*.

delete-share

The following code example shows how to use delete-share.

AWS CLI

To delete a share of HealthOmics analytics data

The following delete-share example deletes a cross-account share of analytics data.

```
aws omics delete-share \  
  --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{  
  "status": "DELETING"  
}
```

For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [DeleteShare](#) in *AWS CLI Command Reference*.

delete-variant-store

The following code example shows how to use delete-variant-store.

AWS CLI

To delete a variant store

The following delete-variant-store example deletes a variant store named my_var_store.

```
aws omics delete-variant-store \  
  --name my_var_store
```

Output:

```
{  
  "status": "DELETING"  
}
```

```
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteVariantStore](#) in *AWS CLI Command Reference*.

delete-workflow

The following code example shows how to use `delete-workflow`.

AWS CLI

To delete a workflow

The following `delete-workflow` example deletes a workflow with ID 1234567.

```
aws omics delete-workflow \  
  --id 1234567
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [DeleteWorkflow](#) in *AWS CLI Command Reference*.

get-annotation-import-job

The following code example shows how to use `get-annotation-import-job`.

AWS CLI

To view an annotation import job

The following `get-annotation-import-job` example gets details about an annotation import job.

```
aws omics get-annotation-import-job \  
  --job-id 984162c7-xmpl-4d23-ab47-286f7950bfbf
```

Output:

```
{  
  "creationTime": "2022-11-30T01:40:11.017746Z",
```

```

"destinationName": "tsv_ann_store",
"id": "984162c7-xmpl-4d23-ab47-286f7950bfbf",
"items": [
  {
    "jobStatus": "COMPLETED",
    "source": "s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz"
  }
],
"roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ",
"runLeftNormalization": false,
"status": "COMPLETED",
"updateTime": "2022-11-30T01:42:39.134009Z"
}

```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetAnnotationImportJob](#) in *AWS CLI Command Reference*.

get-annotation-store-version

The following code example shows how to use `get-annotation-store-version`.

AWS CLI

To retrieve the metadata for an annotation store version

The following `get-annotation-store-version` example retrieves the metadata for the requested annotation store version.

```

aws omics get-annotation-store-version \
  --name my_annotation_store \
  --version-name my_version

```

Output:

```

{
  "storeId": "4934045d1c6d",
  "id": "2a3f4a44aa7b",
  "status": "ACTIVE",
  "versionArn": "arn:aws:omics:us-west-2:555555555555:annotationStore/
my_annotation_store/version/my_version",

```

```
"name": "my_annotation_store",
"versionName": "my_version",
"creationTime": "2023-07-21T17:15:49.251040+00:00",
"updateTime": "2023-07-21T17:15:56.434223+00:00",
"statusMessage": "",
"versionSizeBytes": 0
}
```

For more information, see [Creating new versions of annotation stores](#) in the *AWS HealthOmics User Guide*.

- For API details, see [GetAnnotationStoreVersion](#) in *AWS CLI Command Reference*.

get-annotation-store

The following code example shows how to use `get-annotation-store`.

AWS CLI

To view an annotation store

The following `get-annotation-store` example gets details about an annotation store named `my_ann_store`.

```
aws omics get-annotation-store \
  --name my_ann_store
```

Output:

```
{
  "creationTime": "2022-11-23T22:48:39.226492Z",
  "id": "0a91xmplc71f",
  "name": "my_ann_store",
  "reference": {
    "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
  },
  "status": "CREATING",
  "storeArn": "arn:aws:omics:us-west-2:123456789012:annotationStore/my_ann_store",
  "storeFormat": "VCF",
  "storeSizeBytes": 0,
  "tags": {}
}
```

```
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetAnnotationStore](#) in *AWS CLI Command Reference*.

get-read-set-activation-job

The following code example shows how to use `get-read-set-activation-job`.

AWS CLI

To view a read set activation job

The following `get-read-set-activation-job` example gets details about a read set activation job.

```
aws omics get-read-set-activation-job \  
  --sequence-store-id 1234567890 \  
  --id 1234567890
```

Output:

```
{  
  "completionTime": "2022-12-06T22:33:42.828Z",  
  "creationTime": "2022-12-06T22:32:45.213Z",  
  "id": "1234567890",

- For API details, see [GetReadSetActivationJob](#) in *AWS CLI Command Reference*.

get-read-set-export-job

The following code example shows how to use `get-read-set-export-job`.

AWS CLI

To view a read set export job

The following `get-read-set-export-job` example gets details about a read set export job.

```
aws omics get-read-set-export-job \  
  --sequence-store-id 1234567890 \  
  --id 1234567890
```

Output:

```
{  
  "completionTime": "2022-12-06T22:39:14.491Z",  
  "creationTime": "2022-12-06T22:37:18.612Z",  
  "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",  
  "id": "1234567890",  
  "sequenceStoreId": "1234567890",  
  "status": "COMPLETED",  
  "statusMessage": "The job is submitted and will start soon."  
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReadSetExportJob](#) in *AWS CLI Command Reference*.

get-read-set-import-job

The following code example shows how to use `get-read-set-import-job`.

AWS CLI

To view a read set import job

The following `get-read-set-import-job` example gets details about a read set import job.

```
aws omics get-read-set-import-job \  
  --sequence-store-id 1234567890 \  
  --id 1234567890
```

Output:

```
