get-read-set-metadata

The following code example shows how to use `get-read-set-metadata`.

AWS CLI

To view a read set

The following `get-read-set-metadata` example gets details about a read set's files.

```

aws omics get-read-set-metadata \
  --sequence-store-id 1234567890 \

```

```
--id 1234567890
```

Output:

```
{
  "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890/
readSet/1234567890",
  "creationTime": "2022-11-23T21:55:00.515Z",
  "fileType": "FASTQ",
  "files": {
    "source1": {
      "contentLength": 310054739,
      "partSize": 104857600,
      "totalParts": 3
    },
    "source2": {
      "contentLength": 307846621,
      "partSize": 104857600,

  "status": "ACTIVE",
  "subjectId": "fastq-subject"
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReadSetMetadata](#) in *AWS CLI Command Reference*.

get-read-set

The following code example shows how to use `get-read-set`.

AWS CLI

To download a read set

The following `get-read-set` example downloads part 3 of a read set as `1234567890.3.bam`.

```
aws omics get-read-set \  
  --sequence-store-id 1234567890 \  
  --id 1234567890 \  
  --part-number 3 1234567890.3.bam
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReadSet](#) in *AWS CLI Command Reference*.

get-reference-import-job

The following code example shows how to use `get-reference-import-job`.

AWS CLI

To view a reference import job

The following `get-reference-import-job` example gets details about a reference import job.

```
aws omics get-reference-import-job \  
  --reference-store-id 1234567890 \  
  --id 1234567890
```

Output:

```
{  
  "creationTime": "2022-11-22T22:25:41.124Z",  
  "id": "1234567890",  
  "referenceStoreId": "1234567890",

    {  
      "name": "assembly-38",  
      "sourceFile": "s3://omics-artifacts-01d6xmpl4e72dd32/  
Homo_sapiens_assembly38.fasta",
```

```
        "status": "IN_PROGRESS",
        "statusMessage": "The source job is currently in progress."
    }
  ],
  "status": "IN_PROGRESS",
  "statusMessage": "The job is currently in progress."
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReferenceImportJob](#) in *AWS CLI Command Reference*.

get-reference-metadata

The following code example shows how to use `get-reference-metadata`.

AWS CLI

To view a reference

The following `get-reference-metadata` example gets details about a reference.

```
aws omics get-reference-metadata \
  --reference-store-id 1234567890 \
  --id 1234567890
```

Output:

```
{
  "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/
reference/1234567890",
  "creationTime": "2022-11-22T22:27:09.033Z",
  "files": {
    "index": {
      "contentLength": 160928,
      "partSize": 104857600,
      "totalParts": 1
    },
    "source": {
      "contentLength": 3249912778,
      "partSize": 104857600,
      "totalParts": 31
    }
  }
}
```

```
  },
  "id": "1234567890",
  "md5": "7ff134953dcca8c8997453bbb80b6b5e",
  "name": "assembly-38",
  "referenceStoreId": "1234567890",
  "status": "ACTIVE",
  "updateTime": "2022-11-22T22:27:09.033Z"
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReferenceMetadata](#) in *AWS CLI Command Reference*.

get-reference-store

The following code example shows how to use `get-reference-store`.

AWS CLI

To view a reference store

The following `get-reference-store` example gets details about a reference store.

```
aws omics get-reference-store \
  --id 1234567890
```

Output:

```
{
  "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
  "creationTime": "2022-09-23T23:27:20.364Z",
  "id": "1234567890",
  "name": "my-rstore-0"
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReferenceStore](#) in *AWS CLI Command Reference*.

get-reference

The following code example shows how to use `get-reference`.

AWS CLI

To download a genome reference

The following `get-reference` example downloads part 1 of a genome as `hg38.1.fa`.

```
aws omics get-reference \  
  --reference-store-id 1234567890 \  
  --id 1234567890 \  
  --part-number 1 hg38.1.fa
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetReference](#) in *AWS CLI Command Reference*.

get-run-group

The following code example shows how to use `get-run-group`.

AWS CLI

To view a run group

The following `get-run-group` example gets details about a run group.

```
aws omics get-run-group \  
  --id 1234567
```

Output:

```
{  
  "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",  
  "creationTime": "2022-12-01T00:58:42.915219Z",  
  "id": "1234567",  
  "maxCpus": 20,  
  "maxDuration": 600,  
  "name": "cram-convert",  
  "tags": {}  
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetRunGroup](#) in *AWS CLI Command Reference*.

get-run-task

The following code example shows how to use `get-run-task`.

AWS CLI

To view a task

The following `get-run-task` example gets details about a workflow task.

```
aws omics get-run-task \  
  --id 1234567 \  
  --task-id 1234567
```

Output:

```
{  
  "cpus": 1,  
  "creationTime": "2022-11-30T23:13:00.718651Z",  
  "logStream": "arn:aws:logs:us-west-2:123456789012:log-group:/aws/omics/  
WorkflowLog:log-stream:run/1234567/task/1234567",  
  "memory": 15,  
  "name": "CramToBamTask",  
  "startTime": "2022-11-30T23:17:47.016Z",  
  "status": "COMPLETED",  
  "stopTime": "2022-11-30T23:18:21.503Z",  
  "taskId": "1234567"  
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetRunTask](#) in *AWS CLI Command Reference*.

get-run

The following code example shows how to use `get-run`.

AWS CLI

To view a workflow run

The following `get-run` example gets details about a workflow run.

```
aws omics get-run \  
  --id 1234567
```

Output:

```
{  
  "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",

```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetRun](#) in *AWS CLI Command Reference*.

get-sequence-store

The following code example shows how to use `get-sequence-store`.

AWS CLI

To view a sequence store

The following `get-sequence-store` example gets details about a sequence store with ID 1234567890.

```
aws omics get-sequence-store \  
  --id 1234567890
```

Output:

```
{  
  "arn": "arn:aws:omics:us-east-1:123456789012:sequenceStore/1234567890",  
  "creationTime": "2022-11-23T19:55:48.376Z",  
  "id": "1234567890",  
  "name": "my-seq-store"  
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [GetSequenceStore](#) in *AWS CLI Command Reference*.

get-share

The following code example shows how to use `get-share`.

AWS CLI

To retrieve the metadata about a share of a HealthOmics analytics data

The following `get-share` example retrieves the metadata for a cross-account share of analytics data.

```
aws omics get-share \  
  --share-id "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a"
```

Output:

```
{  
  "share": {  
    "shareId": "495c21bedc889d07d0ab69d710a6841e-dd75ab7a1a9c384fa848b5bd8e5a7e0a",  
    "name": "my_Share-123",  
    "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/omics_dev_var_store",  
    "principalSubscriber": "123456789012",  
    "ownerId": "555555555555",  
    "status": "PENDING"  
  }  
}
```

For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [GetShare](#) in *AWS CLI Command Reference*.

get-variant-import-job

The following code example shows how to use `get-variant-import-job`.

AWS CLI

To view a variant import job

The following `get-variant-import-job` example gets details about a variant import job.

```
aws omics get-variant-import-job \  
  --job-id edd7b8ce-xmpl-47e2-bc99-258cac95a508
```

Output:

```
{  
  "creationTime": "2022-11-23T22:42:50.037812Z",  
  "destinationName": "my_var_store",

get-variant-store

The following code example shows how to use `get-variant-store`.

AWS CLI

To view a variant store

The following `get-variant-store` example gets details about a variant store.

```
aws omics get-variant-store \
  --name my_var_store
```

Output:

```

{
  "creationTime": "2022-11-23T22:09:07.534499Z",
  "id": "02dexmplcfdd",
  "name": "my_var_store",

get-workflow

The following code example shows how to use `get-workflow`.

AWS CLI

To view a workflow

The following `get-workflow` example gets details about a workflow with ID 1234567.

```
aws omics get-workflow \
  --id 1234567
```

Output:

```
{
  "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",

list-annotation-import-jobs

The following code example shows how to use `list-annotation-import-jobs`.

AWS CLI

To get a list of annotation import jobs

The following `list-annotation-import-jobs` gets a list of annotation import jobs.

```
aws omics list-annotation-import-jobs
```

Output:

```

{
  "annotationImportJobs": [
    {
      "creationTime": "2022-11-30T01:39:41.478294Z",

    }
]
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListAnnotationImportJobs](#) in *AWS CLI Command Reference*.

list-annotation-store-versions

The following code example shows how to use `list-annotation-store-versions`.

AWS CLI

To list all the versions of an annotation store.

The following `list-annotation-store-versions` example lists all versions that exist of an annotation store.

```
aws omics list-annotation-store-versions \
  --name my_annotation_store
```

Output:

```
{
  "annotationStoreVersions": [
    {
      "storeId": "4934045d1c6d",
      "id": "2a3f4a44aa7b",
      "status": "CREATING",
      "versionArn": "arn:aws:omics:us-west-2:555555555555:annotationStore/

    "statusMessage": "",
    "versionSizeBytes": 0
  }
}
```

For more information, see [Creating new versions of annotation stores](#) in the *AWS HealthOmics User Guide*.

- For API details, see [ListAnnotationStoreVersions](#) in *AWS CLI Command Reference*.

list-annotation-stores

The following code example shows how to use `list-annotation-stores`.

AWS CLI

To get a list of annotation stores

The following `list-annotation-stores` example gets a list of annotation stores.

```
aws omics list-annotation-stores
```

Output:

```
{
  "annotationStores": [
```

```
{
  "creationTime": "2022-11-23T22:48:39.226492Z",
  "id": "0a91xmplc71f",
  "name": "my_ann_store",
  "reference": {
    "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890"
  },

  "updateTime": "2022-11-23T22:53:27.372840Z"
}
]
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListAnnotationStores](#) in *AWS CLI Command Reference*.

list-multipart-read-set-uploads

The following code example shows how to use `list-multipart-read-set-uploads`.

AWS CLI

To list all multipart read set uploads and their statuses.

The following `list-multipart-read-set-uploads` example lists all multipart read set uploads and their statuses.

```
aws omics list-multipart-read-set-uploads \
  --sequence-store-id 0123456789
```

Output:

```
{
  "uploads":
  [
```

```
{
  "sequenceStoreId": "0123456789",
  "uploadId": "8749584421",
  "sourceFileType": "FASTQ",
  "subjectId": "mySubject",
  "sampleId": "mySample",
  "generatedFrom": "1000 Genomes",
  "name": "HG00146",

  "description": "BAM for HG00147",
  "creationTime": "2023-11-29T19:23:47.007866+00:00"
}
]
```

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [ListMultipartReadSetUploads](#) in *AWS CLI Command Reference*.

list-read-set-activation-jobs

The following code example shows how to use `list-read-set-activation-jobs`.

AWS CLI

To get a list of read set activation jobs

The following `list-read-set-activation-jobs` example gets a list of activation jobs for a sequence store with id 1234567890.

```
aws omics list-read-set-activation-jobs \  
  --sequence-store-id 1234567890
```

Output:

```
{  
  "activationJobs": [  
    {  
      "completionTime": "2022-12-06T22:33:42.828Z",  
      "creationTime": "2022-12-06T22:32:45.213Z",  
      "id": "1234567890",  
      "sequenceStoreId": "1234567890",  
      "status": "COMPLETED"  
    },  
    {  
      "creationTime": "2022-12-06T22:35:10.100Z",  
      "id": "1234567890",  
      "sequenceStoreId": "1234567890",  
      "status": "IN_PROGRESS"  
    }  
  ]  
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReadSetActivationJobs](#) in *AWS CLI Command Reference*.

list-read-set-export-jobs

The following code example shows how to use `list-read-set-export-jobs`.

AWS CLI

To gets a list of read set export jobs

The following `list-read-set-export-jobs` example gets a list of export jobs for a sequence store with id 1234567890.

```
aws omics list-read-set-export-jobs \  
  --sequence-store-id 1234567890
```

Output:

```
{  
  "exportJobs": [  
    {

list-read-set-import-jobs

The following code example shows how to use `list-read-set-import-jobs`.

AWS CLI

To get a list of read set import jobs

The following `list-read-set-import-jobs` example gets a list of import jobs for a sequence store with id 1234567890.

```
aws omics list-read-set-import-jobs \  
  --sequence-store-id 1234567890
```

Output:

```
{  
  "importJobs": [  
    {  
      "completionTime": "2022-11-29T18:17:49.244Z",  
      "creationTime": "2022-11-29T17:32:47.700Z",  
      "id": "1234567890",  
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-  
serviceRole-W801XMPL7QZ",  
      "sequenceStoreId": "1234567890",  
      "status": "COMPLETED"  
    },  
    {  
      "completionTime": "2022-11-23T22:01:34.090Z",  
      "creationTime": "2022-11-23T21:52:43.289Z",  
      "id": "1234567890",  
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-  
serviceRole-W801XMPL7QZ",  
      "sequenceStoreId": "1234567890",  
      "status": "COMPLETED_WITH_FAILURES"  
    }  
  ]  
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReadSetImportJobs](#) in *AWS CLI Command Reference*.

list-read-set-upload-parts

The following code example shows how to use `list-read-set-upload-parts`.

AWS CLI

To list all parts in a requested multipart upload for a sequence store.

The following `list-read-set-upload-parts` example list all parts in a requested multipart upload for a sequence store.

```
aws omics list-read-set-upload-parts \  
  --sequence-store-id 0123456789 \  
  --upload-id 1122334455 \  
  --part-source SOURCE1
```

Output:

```
{  
  "parts": [  
    {  
      "partNumber": 1,  
      "partSize": 94371840,  
      "file": "SOURCE1",  
      "checksum":  
      "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",  
      "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"  
    },  
    {  
      "partNumber": 2,  
      "partSize": 10471840,  
      "file": "SOURCE1",  
      "checksum":  
      "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635",  
      "lastUpdatedTime": "2023-02-02T20:14:47.533000+00:00"  
    }  
  ]  
}
```

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [ListReadSetUploadParts](#) in *AWS CLI Command Reference*.

list-read-sets

The following code example shows how to use `list-read-sets`.

AWS CLI

To get a list of read sets

The following `list-read-sets` example gets a list of read sets for a sequence store with id 1234567890.

```
aws omics list-read-sets \  
  --sequence-store-id 1234567890
```

Output:

```
{  
  "readSets": [  
    {  
      "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890/  
readSet/1234567890",  
      "creationTime": "2022-11-23T21:55:00.515Z",  
      "fileType": "FASTQ",  
      "id": "1234567890",  
      "name": "HG00146",  
      "referenceArn": "arn:aws:omics:us-  
west-2:123456789012:referenceStore/1234567890/reference/1234567890",  
      "sampleId": "fastq-sample",  
      "sequenceStoreId": "1234567890",  
      "status": "ACTIVE",  
      "subjectId": "fastq-subject"  
    }  
  ]  
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReadSets](#) in *AWS CLI Command Reference*.

list-reference-import-jobs

The following code example shows how to use `list-reference-import-jobs`.

AWS CLI

To get a list of reference import jobs

The following `list-reference-import-jobs` example gets a list of reference import jobs for a reference store with id 1234567890.

```
aws omics list-reference-import-jobs \  
  --reference-store-id 1234567890
```

Output:

```
{  
  "importJobs": [  
    {  
      "completionTime": "2022-11-23T19:54:58.204Z",  
      "creationTime": "2022-11-23T19:53:20.729Z",  
      "id": "1234567890",  
      "referenceStoreId": "1234567890",  
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-  
serviceRole-W801XMPL7QZ",  
      "status": "COMPLETED"  
    },  
    {  
      "creationTime": "2022-11-23T20:34:03.250Z",  
      "id": "1234567890",  
      "referenceStoreId": "1234567890",  
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-  
serviceRole-W801XMPL7QZ",  
      "status": "IN_PROGRESS"  
    }  
  ]  
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReferenceImportJobs](#) in *AWS CLI Command Reference*.

list-reference-stores

The following code example shows how to use `list-reference-stores`.

AWS CLI

To get a list of reference stores

The following `list-reference-stores` example gets a list of reference stores.

```
aws omics list-reference-stores
```

Output:

```
{
  "referenceStores": [
    {
      "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890",
      "creationTime": "2022-11-22T22:13:25.947Z",
      "id": "1234567890",
      "name": "my-ref-store"
    }
  ]
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReferenceStores](#) in *AWS CLI Command Reference*.

list-references

The following code example shows how to use `list-references`.

AWS CLI

To get a list of references

The following `list-references` example gets a list of genome references for a reference store with id 1234567890.

```
aws omics list-references \
  --reference-store-id 1234567890
```

Output:

```
{
  "references": [
    {
      "arn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/
reference/1234567890",
```

```
    "creationTime": "2022-11-22T22:27:09.033Z",
    "id": "1234567890",
    "md5": "7ff134953dcca8c8997453bbb80b6b5e",
    "name": "assembly-38",
    "referenceStoreId": "1234567890",
    "status": "ACTIVE",
    "updateTime": "2022-11-22T22:27:09.033Z"
  }
]
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListReferences](#) in *AWS CLI Command Reference*.

list-run-groups

The following code example shows how to use `list-run-groups`.

AWS CLI

To get a list of run groups

The following `list-run-groups` example gets a list of run groups.

```
aws omics list-run-groups
```

Output:

```
{
  "items": [
    {
      "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",
      "creationTime": "2022-12-01T00:58:42.915219Z",
      "id": "1234567",
      "maxCpus": 20,
      "maxDuration": 600,
      "name": "cram-convert"
    }
  ]
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListRunGroups](#) in *AWS CLI Command Reference*.

list-run-tasks

The following code example shows how to use `list-run-tasks`.

AWS CLI

To get a list of tasks

The following `list-run-tasks` example gets a list of tasks for a workflow run.

```
aws omics list-run-tasks \  
  --id 1234567
```

Output:

```
{  
  "items": [  
    {  
      "cpus": 1,  
      "creationTime": "2022-11-30T23:13:00.718651Z",  
      "memory": 15,  
      "name": "CramToBamTask",  
      "startTime": "2022-11-30T23:17:47.016Z",  
      "status": "COMPLETED",  
      "stopTime": "2022-11-30T23:18:21.503Z",  
      "taskId": "1234567"  
    },  
    {  
      "cpus": 1,  
      "creationTime": "2022-11-30T23:18:32.315606Z",  
      "memory": 4,  
      "name": "ValidateSamFile",  
      "startTime": "2022-11-30T23:23:40.165Z",  
      "status": "COMPLETED",  
      "stopTime": "2022-11-30T23:24:14.766Z",  
      "taskId": "1234567"  
    }  
  ]  
}
```

```
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListRunTasks](#) in *AWS CLI Command Reference*.

list-runs

The following code example shows how to use `list-runs`.

AWS CLI

To get a list of workflow runs

The following `list-runs` example gets a list of workflow runs.

```
aws omics list-runs
```

Output:

```
{
  "items": [
    {
      "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
      "creationTime": "2022-12-02T23:20:01.202074Z",

  },
  {
    "arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
    "creationTime": "2022-12-05T17:57:08.444817Z",
    "id": "1234567",
    "name": "cram-to-bam",
    "status": "STARTING",
    "workflowId": "1234567"
  }
]
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListRuns](#) in *AWS CLI Command Reference*.

list-sequence-stores

The following code example shows how to use `list-sequence-stores`.

AWS CLI

To get a list of sequence stores

The following `list-sequence-stores` example gets a list of sequence stores.

```
aws omics list-sequence-stores
```

Output:

```
{
  "sequenceStores": [
    {
      "arn": "arn:aws:omics:us-west-2:123456789012:sequenceStore/1234567890",
      "creationTime": "2022-11-23T01:24:33.629Z",
      "id": "1234567890",
      "name": "my-seq-store"
    }
  ]
}
```

```
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListSequenceStores](#) in *AWS CLI Command Reference*.

list-shares

The following code example shows how to use `list-shares`.

AWS CLI

To list the available shares of a HealthOmics analytics data

The following `list-shares` example lists all shares that have been created for a resource-owner.

```
aws omics list-shares \  
  --resource-owner SELF
```

Output:

```
{  
  "shares": [  
    {  
      "shareId": "595c1cbd-a008-4eca-a887-954d30c91c6e",  
      "name": "myShare",  
      "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/  
store_1",  
      "principalSubscriber": "123456789012",  
      "ownerId": "555555555555",  
      "status": "PENDING"  
    },  
    {  
      "shareId": "39b65d0d-4368-4a19-9814-b0e31d73c10a",  
      "name": "myShare3456",  
      "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/  
store_2",  
      "principalSubscriber": "123456789012",  
      "ownerId": "555555555555",  
      "status": "ACTIVE"  
    }  
  ],  
}
```

```
{
  "shareId": "203152f5-eef9-459d-a4e0-a691668d44ef",
  "name": "myShare4",
  "resourceArn": "arn:aws:omics:us-west-2:555555555555:variantStore/
store_3",
  "principalSubscriber": "123456789012",
  "ownerId": "555555555555",
  "status": "ACTIVE"
}
]
```

For more information, see [Cross-account sharing](#) in the *AWS HealthOmics User Guide*.

- For API details, see [ListShares](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To get a list of tags

The following `list-tags-for-resource` example gets a list of tags for a workflow with id 1234567.

```
aws omics list-tags-for-resource \
  --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567
```

Output:

```
{
  "tags": {
    "department": "analytics"
  }
}
```

For more information, see [Tagging resources in Amazon Omics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-variant-import-jobs

The following code example shows how to use `list-variant-import-jobs`.

AWS CLI

To get a list of variant import jobs

The following `list-variant-import-jobs` example gets a list of variant import jobs.

```
aws omics list-variant-import-jobs
```

Output:

```
{
  "variantImportJobs": [
    {
      "creationTime": "2022-11-23T22:47:02.514002Z",
      "destinationName": "my_var_store",
      "id": "69cb65d6-xmpl-4a4a-9025-4565794b684e",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W801XMPL7QZ",
      "runLeftNormalization": false,
      "status": "COMPLETED",
      "updateTime": "2022-11-23T22:49:17.976597Z"
    },
    {
      "creationTime": "2022-11-23T22:42:50.037812Z",
      "destinationName": "my_var_store",
      "id": "edd7b8ce-xmpl-47e2-bc99-258cac95a508",
      "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-
serviceRole-W801XMPL7QZ",
      "runLeftNormalization": false,
      "status": "COMPLETED",
      "updateTime": "2022-11-23T22:45:26.009880Z"
    }
  ]
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListVariantImportJobs](#) in *AWS CLI Command Reference*.

list-variant-stores

The following code example shows how to use `list-variant-stores`.

AWS CLI

To get a list of variant stores

The following `list-variant-stores` example gets a list of variant stores.

```
aws omics list-variant-stores
```

Output:

```
{
  "variantStores": [
    {
      "creationTime": "2022-11-23T22:09:07.534499Z",
      "id": "02dexplcfdd",
      "name": "my_var_store",
      "reference": {
        "referenceArn": "arn:aws:omics:us-west-2:123456789012:referenceStore/1234567890/reference/1234567890"
      },
      "status": "CREATING",
      "storeArn": "arn:aws:omics:us-west-2:123456789012:variantStore/my_var_store",
      "storeSizeBytes": 0,

    }
  ]
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListVariantStores](#) in *AWS CLI Command Reference*.

list-workflows

The following code example shows how to use `list-workflows`.

AWS CLI

To get a list of workflows

The following `list-workflows` example gets a list of workflows.

```
aws omics list-workflows
```

Output:

```
{
  "items": [
    {
      "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",

      "status": "ACTIVE",
      "type": "PRIVATE"
    },
    {
      "arn": "arn:aws:omics:us-west-2:123456789012:workflow/1234567",
      "creationTime": "2022-11-30T22:33:16.225368Z",
      "digest":
"sha256:c54bxmp1742dcc26f7fa1f10e37550ddd8f251f418277c0a58e895b801ed28cf",
      "id": "1234567",
      "name": "cram-converter",
      "status": "ACTIVE",
      "type": "PRIVATE"
    }
  ]
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [ListWorkflows](#) in *AWS CLI Command Reference*.

start-annotation-import-job

The following code example shows how to use `start-annotation-import-job`.

AWS CLI

To import annotations

The following `start-annotation-import-job` example imports annotations from Amazon S3.

```
aws omics start-annotation-import-job \  
  --destination-name tsv_ann_store \  
  --no-run-left-normalization \  
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-  
W801XMPL7QZ \  
  --items source=s3://omics-artifacts-01d6xmpl4e72dd32/targetedregions.bed.gz
```

Output:

```
{  
  "jobId": "984162c7-xmpl-4d23-ab47-286f7950bfbf"  
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [StartAnnotationImportJob](#) in *AWS CLI Command Reference*.

start-read-set-activation-job

The following code example shows how to use `start-read-set-activation-job`.

AWS CLI

To activate an archived read set

The following `start-read-set-activation-job` example activates two read sets.

```
aws omics start-read-set-activation-job \  
  --read-set-ids rs1 rs2
```

```
--sequence-store-id 1234567890 \  
--sources readSetId=1234567890 readSetId=1234567890
```

Output:

```
{  
  "creationTime": "2022-12-06T22:35:10.100Z",  
  "id": "1234567890",  
  "sequenceStoreId": "1234567890",  
  "status": "SUBMITTED"  
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [StartReadSetActivationJob](#) in *AWS CLI Command Reference*.

start-read-set-export-job

The following code example shows how to use `start-read-set-export-job`.

AWS CLI

To export a read set

The following `start-read-set-export-job` example exports two read sets to Amazon S3.

```
aws omics start-read-set-export-job \  
  --sequence-store-id 1234567890 \  
  --sources readSetId=1234567890 readSetId=1234567890 \  
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-  
W801XMPL7QZ  
\  
  --destination s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/
```

Output:

```
{  
  "creationTime": "2022-12-06T22:37:18.612Z",  
  "destination": "s3://omics-artifacts-01d6xmpl4e72dd32/read-set-export/",  
  "id": "1234567890",  
  "sequenceStoreId": "1234567890",  
}
```

```
"status": "SUBMITTED"
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [StartReadSetExportJob](#) in *AWS CLI Command Reference*.

start-read-set-import-job

The following code example shows how to use `start-read-set-import-job`.

AWS CLI

To import a read set

The following `start-read-set-import-job` example imports a read set.

```
aws omics start-read-set-import-job \
  --sequence-store-id 1234567890 \
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ \
  --sources file://readset-sources.json
```

`readset-sources.json` is a JSON document with the following content.

```
[
  {
    "sourceFiles":
    {
      "source1": "s3://omics-artifacts-01d6xmpl4e72dd32/
HG00100.chrom20.ILLUMINA.bwa.GBR.low_coverage.20101123.bam"
    },
    "sourceFileType": "BAM",
    "subjectId": "bam-subject",
    "sampleId": "bam-sample",
    "referenceArn": "arn:aws:omics:us-
west-2:123456789012:referenceStore/1234567890/reference/1234567890",
    "name": "HG00100"
  }
]
```

Output:

```
{
  "creationTime": "2022-11-23T01:36:38.158Z",
  "id": "1234567890",
  "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ",
  "sequenceStoreId": "1234567890",
  "status": "SUBMITTED"
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [StartReadSetImportJob](#) in *AWS CLI Command Reference*.

start-reference-import-job

The following code example shows how to use `start-reference-import-job`.

AWS CLI

To import a reference genome

The following `start-reference-import-job` example imports a reference genome from Amazon S3.

```
aws omics start-reference-import-job \
  --reference-store-id 1234567890 \
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ \
  --sources sourceFile=s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.fasta,name=assembly-38
```

Output:

```
{
  "creationTime": "2022-11-22T22:25:41.124Z",
  "id": "1234567890",
  "referenceStoreId": "1234567890",
  "roleArn": "arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ",
  "status": "SUBMITTED"
}
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [StartReferenceImportJob](#) in *AWS CLI Command Reference*.

start-run

The following code example shows how to use `start-run`.

AWS CLI

To run a workflow

The following `start-run` example runs a workflow with ID 1234567.

```
aws omics start-run \  
  --workflow-id 1234567 \  
  --role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-  
W801XMPL7QZ \  
  --name 'cram-to-bam' \  
  --output-uri s3://omics-artifacts-01d6xmpl4e72dd32/workflow-output/ \  
  --run-group-id 1234567 \  
  --priority 1 \  
  --storage-capacity 10 \  
  --log-level ALL \  
  --parameters file://workflow-inputs.json
```

`workflow-inputs.json` is a JSON document with the following content.

```
{  
  "sample_name": "NA12878",  
  "input_cram": "s3://omics-artifacts-01d6xmpl4e72dd32/NA12878.cram",  
  "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/  
Homo_sapiens_assembly38.dict",  
  "ref_fasta": "s3://omics-artifacts-01d6xmpl4e72dd32/  
Homo_sapiens_assembly38.fasta",  
  "ref_fasta_index": "omics-artifacts-01d6xmpl4e72dd32/  
Homo_sapiens_assembly38.fasta.fai"  
}
```

Output:

```
{
```

```
"arn": "arn:aws:omics:us-west-2:123456789012:run/1234567",
"id": "1234567",
"status": "PENDING",
"tags": {}
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

To load source files from Amazon Omics

You can also load source files from Amazon Omics storage, by using service-specific URIs. The following example workflow-inputs.json file uses Amazon Omics URIs for read set and reference genome sources.

```
{
  "sample_name": "NA12878",
  "input_cram": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/
readSet/1234567890/source1",
  "ref_dict": "s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.dict",
  "ref_fasta": "omics://123456789012.storage.us-west-2.amazonaws.com/1234567890/
reference/1234567890",
  "ref_fasta_index": "omics://123456789012.storage.us-
west-2.amazonaws.com/1234567890/reference/1234567890/index"
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [StartRun](#) in *AWS CLI Command Reference*.

start-variant-import-job

The following code example shows how to use `start-variant-import-job`.

AWS CLI

To import a variant file

The following `start-variant-import-job` example imports a VCF format variant file.

```
aws omics start-variant-import-job \
  --destination-name my_var_store \
  --no-run-left-normalization \
```

```
--role-arn arn:aws:iam::123456789012:role/omics-service-role-serviceRole-
W801XMPL7QZ \
--items source=s3://omics-artifacts-01d6xmpl4e72dd32/
Homo_sapiens_assembly38.known_indels.vcf.gz
```

Output:

```
{
  "jobId": "edd7b8ce-xmpl-47e2-bc99-258cac95a508"
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [StartVariantImportJob](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example adds a department tag to a workflow with id 1234567.

```
aws omics tag-resource \
--resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \
--tags department=analytics
```

For more information, see [Tagging resources in Amazon Omics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes the department tag from a workflow.

```
aws omics untag-resource \  
  --resource-arn arn:aws:omics:us-west-2:123456789012:workflow/1234567 \  
  --tag-keys department
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-annotation-store

The following code example shows how to use `update-annotation-store`.

AWS CLI

To update an annotation store

The following `update-annotation-store` example updates the description of an annotation store named `my_vcf_store`.

```
aws omics update-annotation-store \  
  --name my_vcf_store \  
  --description "VCF annotation store"
```

Output:

```
{  
  "creationTime": "2022-12-05T18:00:56.101860Z",  
  "description": "VCF annotation store",  
  "id": "bd6axmpl2444",  
  "name": "my_vcf_store",  
  "reference": {  
    "referenceArn": "arn:aws:omics:us-  
west-2:123456789012:referenceStore/1234567890/reference/1234567890"  
  },  
  "status": "ACTIVE",  
  "storeFormat": "VCF",  
  "updateTime": "2022-12-05T18:13:16.100051Z"  
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [UpdateAnnotationStore](#) in *AWS CLI Command Reference*.

update-run-group

The following code example shows how to use `update-run-group`.

AWS CLI

To update a run group

The following `update-run-group` example updates the settings of a run group with id 1234567.

```
aws omics update-run-group \  
  --id 1234567 \  
  --max-cpus 10
```

Output:

```
{  
  "arn": "arn:aws:omics:us-west-2:123456789012:runGroup/1234567",  
  "creationTime": "2022-12-01T00:58:42.915219Z",  
  "id": "1234567",  
  "maxCpus": 10,  
  "maxDuration": 600,  
  "name": "cram-convert",  
  "tags": {}  
}
```

For more information, see [Omics Workflows](#) in the *Amazon Omics Developer Guide*.

- For API details, see [UpdateRunGroup](#) in *AWS CLI Command Reference*.

update-variant-store

The following code example shows how to use `update-variant-store`.

AWS CLI

To update a variant store

The following `update-variant-store` example updates the description of a variant store named `my_var_store`.

```
aws omics update-variant-store \  
  --name my_var_store \  
  --description "variant store"
```

Output:

```
{  
  "creationTime": "2022-11-23T22:09:07.534499Z",  
  "description": "variant store",  
  "id": "02dexplcfd",  
  "name": "my_var_store",  
  "reference": {  
    "referenceArn": "arn:aws:omics:us-  
west-2:123456789012:referenceStore/1234567890/reference/1234567890"  
  },  
  "status": "ACTIVE",  
  "updateTime": "2022-12-05T18:23:37.686402Z"  
}
```

For more information, see [Omics Analytics](#) in the *Amazon Omics Developer Guide*.

- For API details, see [UpdateVariantStore](#) in *AWS CLI Command Reference*.

update-workflow

The following code example shows how to use `update-workflow`.

AWS CLI

To update a workflow

The following `update-workflow` example updates the description of a workflow with ID `1234567`.

```
aws omics update-workflow \  
  --id 1234567 \  
  --description "copy workflow"
```

For more information, see [Omics Storage](#) in the *Amazon Omics Developer Guide*.

- For API details, see [UpdateWorkflow](#) in *AWS CLI Command Reference*.

upload-read-set-part

The following code example shows how to use `upload-read-set-part`.

AWS CLI

To upload a read set part.

The following `upload-read-set-part` example uploads a specified part of a read set.

```
aws omics upload-read-set-part \  
  --sequence-store-id 0123456789 \  
  --upload-id 1122334455 \  
  --part-source SOURCE1 \  
  --part-number 1 \  
  --payload /path/to/file/read_1_part_1.fastq.gz
```

Output:

```
{  
  "checksum": "984979b9928ae8d8622286c4a9cd8e99d964a22d59ed0f5722e1733eb280e635"  
}
```

For more information, see [Direct upload to a sequence store](#) in the *AWS HealthOmics User Guide*.

- For API details, see [UploadReadSetPart](#) in *AWS CLI Command Reference*.

IAM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-client-id-to-open-id-connect-provider

The following code example shows how to use `add-client-id-to-open-id-connect-provider`.

AWS CLI

To add a client ID (audience) to an Open-ID Connect (OIDC) provider

The following `add-client-id-to-open-id-connect-provider` command adds the client ID `my-application-ID` to the OIDC provider named `server.example.com`.

```
aws iam add-client-id-to-open-id-connect-provider \  
  --client-id my-application-ID \  
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/  
server.example.com
```

This command produces no output.

To create an OIDC provider, use the `create-open-id-connect-provider` command.

For more information, see [Creating OpenID Connect \(OIDC\) identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [AddClientIdToOpenIdConnectProvider](#) in *AWS CLI Command Reference*.

add-role-to-instance-profile

The following code example shows how to use `add-role-to-instance-profile`.

AWS CLI

To add a role to an instance profile

The following `add-role-to-instance-profile` command adds the role named `S3Access` to the instance profile named `Webserver`.

```
aws iam add-role-to-instance-profile \  
  --role-name S3Access \  
  --instance-profile-name Webserver
```

This command produces no output.

To create an instance profile, use the `create-instance-profile` command.

For more information, see [Using an IAM role to grant permissions to applications running on Amazon EC2 instances](#) in the *AWS IAM User Guide*.

- For API details, see [AddRoleToInstanceProfile](#) in *AWS CLI Command Reference*.

add-user-to-group

The following code example shows how to use `add-user-to-group`.

AWS CLI

To add a user to an IAM group

The following `add-user-to-group` command adds an IAM user named `Bob` to the IAM group named `Admins`.

```
aws iam add-user-to-group \  
  --user-name Bob \  
  --group-name Admins
```

This command produces no output.

For more information, see [Adding and removing users in an IAM user group](#) in the *AWS IAM User Guide*.

- For API details, see [AddUserToGroup](#) in *AWS CLI Command Reference*.

attach-group-policy

The following code example shows how to use `attach-group-policy`.

AWS CLI

To attach a managed policy to an IAM group

The following `attach-group-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM group named `Finance`.

```
aws iam attach-group-policy \  
  --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \  
  --group-name Finance
```

This command produces no output.

For more information, see [Managed policies and inline policies](#) in the *AWS IAM User Guide*.

- For API details, see [AttachGroupPolicy](#) in *AWS CLI Command Reference*.

attach-role-policy

The following code example shows how to use `attach-role-policy`.

AWS CLI

To attach a managed policy to an IAM role

The following `attach-role-policy` command attaches the AWS managed policy named `ReadOnlyAccess` to the IAM role named `ReadOnlyRole`.

```
aws iam attach-role-policy \  
  --policy-arn arn:aws:iam::aws:policy/ReadOnlyAccess \  
  --role-name ReadOnlyRole
```

This command produces no output.

For more information, see [Managed policies and inline policies](#) in the *AWS IAM User Guide*.

- For API details, see [AttachRolePolicy](#) in *AWS CLI Command Reference*.

attach-user-policy

The following code example shows how to use `attach-user-policy`.

AWS CLI

To attach a managed policy to an IAM user

The following `attach-user-policy` command attaches the AWS managed policy named `AdministratorAccess` to the IAM user named `Alice`.

```
aws iam attach-user-policy \  
  --policy-arn arn:aws:iam::aws:policy/AdministratorAccess \  
  --user-name Alice
```

This command produces no output.

For more information, see [Managed policies and inline policies](#) in the *AWS IAM User Guide*.

- For API details, see [AttachUserPolicy](#) in *AWS CLI Command Reference*.

change-password

The following code example shows how to use `change-password`.

AWS CLI

To change the password for your IAM user

To change the password for your IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains your old and new passwords. Using this method, you can use strong passwords with non-alphanumeric characters. It can be difficult to use passwords with non-alphanumeric characters when you pass them as command line parameters. To use the `--cli-input-json` parameter, start by using the `change-password` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam change-password \  
  --generate-cli-skeleton > change-password.json
```

The previous command creates a JSON file called `change-password.json` that you can use to fill in your old and new passwords. For example, the file might look like the following.

```
{  
  "OldPassword": "3s0K_;xh4~8XXI",
```

```
"NewPassword": "]35d/{pB9Fo9wJ"}
}
```

Next, to change your password, use the `change-password` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `change-password` command uses the `--cli-input-json` parameter with a JSON file called `change-password.json`.

```
aws iam change-password \
  --cli-input-json file://change-password.json
```

This command produces no output.

This command can be called by IAM users only. If this command is called using AWS account (root) credentials, the command returns an `InvalidUserType` error.

For more information, see [How an IAM user changes their own password](#) in the *AWS IAM User Guide*.

- For API details, see [ChangePassword](#) in *AWS CLI Command Reference*.

create-access-key

The following code example shows how to use `create-access-key`.

AWS CLI

To create an access key for an IAM user

The following `create-access-key` command creates an access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam create-access-key \
  --user-name Bob
```

Output:

```
{
  "AccessKey": {
    "UserName": "Bob",
```

```
"Status": "Active",  
"CreateDate": "2015-03-09T18:39:23.411Z",  
"SecretAccessKey": "wJalrXUtnFEMI/K7MDENG/bPxrFiCYzEXAMPLEKEY",  
"AccessKeyId": "AKIAIOSFODNN7EXAMPLE"  
}  
}
```

Store the secret access key in a secure location. If it is lost, it cannot be recovered, and you must create a new access key.

For more information, see [Managing access keys for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [CreateAccessKey](#) in *AWS CLI Command Reference*.

create-account-alias

The following code example shows how to use `create-account-alias`.

AWS CLI

To create an account alias

The following `create-account-alias` command creates the alias `examplecorp` for your AWS account.

```
aws iam create-account-alias \  
  --account-alias examplecorp
```

This command produces no output.

For more information, see [Your AWS account ID and its alias](#) in the *AWS IAM User Guide*.

- For API details, see [CreateAccountAlias](#) in *AWS CLI Command Reference*.

create-group

The following code example shows how to use `create-group`.

AWS CLI

To create an IAM group

The following `create-group` command creates an IAM group named Admins.

```
aws iam create-group \  
  --group-name Admins
```

Output:

```
{  
  "Group": {  
    "Path": "/",  
    "CreateDate": "2015-03-09T20:30:24.940Z",  
    "GroupId": "AIDGPMS9R04H3FEXAMPLE",  
    "Arn": "arn:aws:iam::123456789012:group/Admins",  
    "GroupName": "Admins"  
  }  
}
```

For more information, see [Creating IAM user groups](#) in the *AWS IAM User Guide*.

- For API details, see [CreateGroup](#) in *AWS CLI Command Reference*.

create-instance-profile

The following code example shows how to use `create-instance-profile`.

AWS CLI

To create an instance profile

The following `create-instance-profile` command creates an instance profile named Webserver.

```
aws iam create-instance-profile \  
  --instance-profile-name Webserver
```

Output:

```
{  
  "InstanceProfile": {  
    "InstanceProfileId": "AIPAJMBC7DLSPEXAMPLE",
```

```
    "Roles": [],
    "CreateDate": "2015-03-09T20:33:19.626Z",
    "InstanceProfileName": "Webserver",
    "Path": "/",
    "Arn": "arn:aws:iam::123456789012:instance-profile/Webserver"
  }
}
```

To add a role to an instance profile, use the `add-role-to-instance-profile` command.

For more information, see [Using an IAM role to grant permissions to applications running on Amazon EC2 instances](#) in the *AWS IAM User Guide*.

- For API details, see [CreateInstanceProfile](#) in *AWS CLI Command Reference*.

create-login-profile

The following code example shows how to use `create-login-profile`.

AWS CLI

To create a password for an IAM user

To create a password for an IAM user, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the password. Using this method, you can create a strong password with non-alphanumeric characters. It can be difficult to create a password with non-alphanumeric characters when you pass it as a command line parameter.

To use the `--cli-input-json` parameter, start by using the `create-login-profile` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-login-profile \
  --generate-cli-skeleton > create-login-profile.json
```

The previous command creates a JSON file called `create-login-profile.json` that you can use to fill in the information for a subsequent `create-login-profile` command. For example:

```
{
  "UserName": "Bob",
  "Password": "&1-3a6u:RA0djs",
  "PasswordResetRequired": true
}
```

```
}
```

Next, to create a password for an IAM user, use the `create-login-profile` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-login-profile` command uses the `--cli-input-json` parameter with a JSON file called `create-login-profile.json`.

```
aws iam create-login-profile \  
  --cli-input-json file://create-login-profile.json
```

Output:

```
{  
  "LoginProfile": {  
    "UserName": "Bob",  
    "CreateDate": "2015-03-10T20:55:40.274Z",  
    "PasswordResetRequired": true  
  }  
}
```

If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

To change the password for a user that already has one, use `update-login-profile`. To set a password policy for the account, use the `update-account-password-policy` command.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

For more information, see [Managing passwords for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [CreateLoginProfile](#) in *AWS CLI Command Reference*.

create-open-id-connect-provider

The following code example shows how to use `create-open-id-connect-provider`.

AWS CLI

To create an OpenID Connect (OIDC) provider

To create an OpenID Connect (OIDC) provider, we recommend using the `--cli-input-json` parameter to pass a JSON file that contains the required parameters. When you create an OIDC provider, you must pass the URL of the provider, and the URL must begin with `https://`. It can be difficult to pass the URL as a command line parameter, because the colon (`:`) and forward slash (`/`) characters have special meaning in some command line environments. Using the `--cli-input-json` parameter gets around this limitation.

To use the `--cli-input-json` parameter, start by using the `create-open-id-connect-provider` command with the `--generate-cli-skeleton` parameter, as in the following example.

```
aws iam create-open-id-connect-provider \  
  --generate-cli-skeleton > create-open-id-connect-provider.json
```

The previous command creates a JSON file called `create-open-id-connect-provider.json` that you can use to fill in the information for a subsequent `create-open-id-connect-provider` command. For example:

```
{  
  "Url": "https://server.example.com",  
  "ClientIDList": [  
    "example-application-ID"  
  ],  
  "ThumbprintList": [  
    "c3768084dfb3d2b68b7897bf5f565da8eEXAMPLE"  
  ]  
}
```

Next, to create the OpenID Connect (OIDC) provider, use the `create-open-id-connect-provider` command again, this time passing the `--cli-input-json` parameter to specify your JSON file. The following `create-open-id-connect-provider` command uses the `--cli-input-json` parameter with a JSON file called `create-open-id-connect-provider.json`.

```
aws iam create-open-id-connect-provider \  
  --cli-input-json file://create-open-id-connect-provider.json
```

Output:

```
{
```

```
"OpenIDConnectProviderArn": "arn:aws:iam::123456789012:oidc-provider/
server.example.com"
}
```

For more information about OIDC providers, see [Creating OpenID Connect \(OIDC\) identity providers](#) in the *AWS IAM User Guide*.

For more information about obtaining thumbprints for an OIDC provider, see [Obtaining the thumbprint for an OpenID Connect Identity Provider](#) in the *AWS IAM User Guide*.

- For API details, see [CreateOpenIdConnectProvider](#) in *AWS CLI Command Reference*.

create-policy-version

The following code example shows how to use `create-policy-version`.

AWS CLI

To create a new version of a managed policy

This example creates a new v2 version of the IAM policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` and makes it the default version.

```
aws iam create-policy-version \
  --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \
  --policy-document file://NewPolicyVersion.json \
  --set-as-default
```

Output:

```
{
  "PolicyVersion": {
    "CreateDate": "2015-06-16T18:56:03.721Z",
    "VersionId": "v2",
    "IsDefaultVersion": true
  }
}
```

For more information, see [Versioning IAM policies](#) in the *AWS IAM User Guide*.

- For API details, see [CreatePolicyVersion](#) in *AWS CLI Command Reference*.

create-policy

The following code example shows how to use create-policy.

AWS CLI

Example 1: To create a customer managed policy

The following command creates a customer managed policy named my-policy.

```
aws iam create-policy \  
  --policy-name my-policy \  
  --policy-document file://policy
```

The file policy is a JSON document in the current folder that grants read only access to the shared folder in an Amazon S3 bucket named my-bucket.

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": [  
        "s3:Get*",  
        "s3:List*"  
      ],  
      "Resource": [  
        "arn:aws:s3:::my-bucket/shared/*"  
      ]  
    }  
  ]  
}
```

Output:

```
{  
  "Policy": {  
    "PolicyName": "my-policy",  
    "CreateDate": "2015-06-01T19:31:18.620Z",  
    "AttachmentCount": 0,  
    "IsAttachable": true,
```

```
"PolicyId": "ZXR6A36LTYANPAI7NJ5UV",
"DefaultVersionId": "v1",
"Path": "/",
"Arn": "arn:aws:iam::0123456789012:policy/my-policy",
"UpdateDate": "2015-06-01T19:31:18.620Z"
}
}
```

For more information on using files as input for string parameters, see [Specify parameter values for the AWS CLI](#) in the *AWS CLI User Guide*.

Example 2: To create a customer managed policy with a description

The following command creates a customer managed policy named `my-policy` with an immutable description:

```
aws iam create-policy \
  --policy-name my-policy \
  --policy-document file://policy.json \
  --description "This policy grants access to all Put, Get, and List actions for
my-bucket"
```

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `my-bucket`.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:ListBucket*",
        "s3:PutBucket*",
        "s3:GetBucket*"
      ],
      "Resource": [
        "arn:aws:s3:::my-bucket"
      ]
    }
  ]
}
```

Output:

```
{
  "Policy": {
    "PolicyName": "my-policy",
    "PolicyId": "ANPAWGSUGIDPEXAMPLE",
    "Arn": "arn:aws:iam::123456789012:policy/my-policy",
    "Path": "/",
    "DefaultVersionId": "v1",
    "AttachmentCount": 0,
    "PermissionsBoundaryUsageCount": 0,
    "IsAttachable": true,
    "CreateDate": "2023-05-24T22:38:47+00:00",
    "UpdateDate": "2023-05-24T22:38:47+00:00"
  }
}
```

For more information on Identity-based Policies, see [Identity-based policies and resource-based policies](#) in the *AWS IAM User Guide*.

Example 3: To Create a customer managed policy with tags

The following command creates a customer managed policy named `my-policy` with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-policy \
  --policy-name my-policy \
  --policy-document file://policy.json \
  --tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
  "Value": "Seattle"}'
```

The file `policy.json` is a JSON document in the current folder that grants access to all Put, List, and Get actions for an Amazon S3 bucket named `my-bucket`.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
```

```
    "Action": [
      "s3:ListBucket*",
      "s3:PutBucket*",
      "s3:GetBucket*"
    ],
    "Resource": [
      "arn:aws:s3:::my-bucket"
    ]
  }
]
```

Output:

```
{
  "Policy": {
    "PolicyName": "my-policy",
    "PolicyId": "ANPAWGSUGIDPEXAMPLE",
    "Arn": "arn:aws:iam::12345678012:policy/my-policy",
    "Path": "/",
    "DefaultVersionId": "v1",
    "AttachmentCount": 0,
    "PermissionsBoundaryUsageCount": 0,
    "IsAttachable": true,
    "CreateDate": "2023-05-24T23:16:39+00:00",
    "UpdateDate": "2023-05-24T23:16:39+00:00",
    "Tags": [
      {
        "Key": "Department",
        "Value": "Accounting"
      },
      {
        "Key": "Location",
        "Value": "Seattle"
      }
    ]
  }
}
```

For more information on Tagging policies, see [Tagging customer managed policies](#) in the *AWS IAM User Guide*.

- For API details, see [CreatePolicy](#) in *AWS CLI Command Reference*.

create-role

The following code example shows how to use `create-role`.

AWS CLI

Example 1: To create an IAM role

The following `create-role` command creates a role named `Test-Role` and attaches a trust policy to it.

```
aws iam create-role \  
  --role-name Test-Role \  
  --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

Output:

```
{  
  "Role": {  
    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",  
    "RoleId": "AKIAIOSFODNN7EXAMPLE",  
    "CreateDate": "2013-06-07T20:43:32.821Z",  
    "RoleName": "Test-Role",  
    "Path": "/",  
    "Arn": "arn:aws:iam::123456789012:role/Test-Role"  
  }  
}
```

The trust policy is defined as a JSON document in the `Test-Role-Trust-Policy.json` file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To attach a permissions policy to a role, use the `put-role-policy` command.

For more information, see [Creating IAM roles](#) in the *AWS IAM User Guide*.

Example 2: To create an IAM role with specified maximum session duration

The following `create-role` command creates a role named `Test-Role` and sets a maximum session duration of 7200 seconds (2 hours).

```
aws iam create-role \  
  --role-name Test-Role \  
  --assume-role-policy-document file://Test-Role-Trust-Policy.json
```

```
--role-name Test-Role \  
--assume-role-policy-document file://Test-Role-Trust-Policy.json \  
--max-session-duration 7200
```

Output:

```
{  
  "Role": {  
    "Path": "/",  
    "RoleName": "Test-Role",  
    "RoleId": "AKIAIOSFODNN7EXAMPLE",  
    "Arn": "arn:aws:iam::12345678012:role/Test-Role",  
    "CreateDate": "2023-05-24T23:50:25+00:00",  
    "AssumeRolePolicyDocument": {  
      "Version": "2012-10-17",  
      "Statement": [  
        {  
          "Sid": "Statement1",  
          "Effect": "Allow",  
          "Principal": {  
            "AWS": "arn:aws:iam::12345678012:root"  
          },  
          "Action": "sts:AssumeRole"  
        }  
      ]  
    }  
  }  
}
```

For more information, see [Modifying a role maximum session duration \(AWS API\)](#) in the *AWS IAM User Guide*.

Example 3: To create an IAM Role with tags

The following command creates an IAM Role Test-Role with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-role \  

```

```
--role-name Test-Role \  
--assume-role-policy-document file://Test-Role-Trust-Policy.json \  
--tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",  
"Value": "Seattle"}'
```

Output:

```
{  
  "Role": {  
    "Path": "/",  
    "RoleName": "Test-Role",  
    "RoleId": "AKIAIOSFODNN7EXAMPLE",  
    "Arn": "arn:aws:iam::123456789012:role/Test-Role",  
    "CreateDate": "2023-05-25T23:29:41+00:00",  
    "AssumeRolePolicyDocument": {  
      "Version": "2012-10-17",  
      "Statement": [  
        {  
          "Sid": "Statement1",  
          "Effect": "Allow",  
          "Principal": {  
            "AWS": "arn:aws:iam::123456789012:root"  
          },  
          "Action": "sts:AssumeRole"  
        }  
      ]  
    },  
    "Tags": [  
      {  
        "Key": "Department",  
        "Value": "Accounting"  
      },  
      {  
        "Key": "Location",  
        "Value": "Seattle"  
      }  
    ]  
  }  
}
```

For more information, see [Tagging IAM roles](#) in the *AWS IAM User Guide*.

- For API details, see [CreateRole](#) in *AWS CLI Command Reference*.

create-saml-provider

The following code example shows how to use `create-saml-provider`.

AWS CLI

To create a SAML provider

This example creates a new SAML provider in IAM named `MySAMLProvider`. It is described by the SAML metadata document found in the file `SAMLMetaData.xml`.

```
aws iam create-saml-provider \  
  --saml-metadata-document file://SAMLMetaData.xml \  
  --name MySAMLProvider
```

Output:

```
{  
  "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/MySAMLProvider"  
}
```

For more information, see [Creating IAM SAML identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [CreateSAMLProvider](#) in *AWS CLI Command Reference*.

create-service-linked-role

The following code example shows how to use `create-service-linked-role`.

AWS CLI

To create a service-linked role

The following `create-service-linked-role` example creates a service-linked role for the specified AWS service and attaches the specified description.

```
aws iam create-service-linked-role \  
  --aws-service-name lex.amazonaws.com \  
  --description "My service-linked role to support Lex"
```

Output:

```
{
  "Role": {
    "Path": "/aws-service-role/lex.amazonaws.com/",
    "RoleName": "AWSServiceRoleForLexBots",
    "RoleId": "AROAI234567890EXAMPLE",
    "Arn": "arn:aws:iam::1234567890:role/aws-service-role/lex.amazonaws.com/
AWSServiceRoleForLexBots",
    "CreateDate": "2019-04-17T20:34:14+00:00",
    "AssumeRolePolicyDocument": {
      "Version": "2012-10-17",
      "Statement": [
        {
          "Action": [
            "sts:AssumeRole"
          ],
          "Effect": "Allow",
          "Principal": {
            "Service": [
              "lex.amazonaws.com"
            ]
          }
        }
      ]
    }
  }
}
```

For more information, see [Using service-linked roles](#) in the *AWS IAM User Guide*.

- For API details, see [CreateServiceLinkedRole](#) in *AWS CLI Command Reference*.

create-service-specific-credential

The following code example shows how to use `create-service-specific-credential`.

AWS CLI

Create a set of service-specific credentials for a user

The following `create-service-specific-credential` example creates a username and password that can be used to access only the configured service.

```
aws iam create-service-specific-credential \
```

```
--user-name sofia \  
--service-name codecommit.amazonaws.com
```

Output:

```
{  
  "ServiceSpecificCredential": {  
    "CreateDate": "2019-04-18T20:45:36+00:00",  
    "ServiceName": "codecommit.amazonaws.com",  
    "ServiceUserName": "sofia-at-123456789012",  
    "ServicePassword": "k1zPZM6uVxMQ3oxqgoY1NuJPyRTZ1vREs76zTQE3eJk=",  
    "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",  
    "UserName": "sofia",  
    "Status": "Active"  
  }  
}
```

For more information, see [Create Git credentials for HTTPS connections to CodeCommit](#) in the *AWS CodeCommit User Guide*.

- For API details, see [CreateServiceSpecificCredential](#) in *AWS CLI Command Reference*.

create-user

The following code example shows how to use `create-user`.

AWS CLI

Example 1: To create an IAM user

The following `create-user` command creates an IAM user named Bob in the current account.

```
aws iam create-user \  
--user-name Bob
```

Output:

```
{  
  "User": {  
    "UserName": "Bob",  
    "Path": "/",
```

```
    "CreateDate": "2023-06-08T03:20:41.270Z",
    "UserId": "AIDAIOSFODNN7EXAMPLE",
    "Arn": "arn:aws:iam::123456789012:user/Bob"
  }
}
```

For more information, see [Creating an IAM user in your AWS account](#) in the *AWS IAM User Guide*.

Example 2: To create an IAM user at a specified path

The following `create-user` command creates an IAM user named Bob at the specified path.

```
aws iam create-user \
  --user-name Bob \
  --path /division_abc/subdivision_xyz/
```

Output:

```
{
  "User": {
    "Path": "/division_abc/subdivision_xyz/",
    "UserName": "Bob",
    "UserId": "AIDAIOSFODNN7EXAMPLE",
    "Arn": "arn:aws:iam::12345678012:user/division_abc/subdivision_xyz/Bob",
    "CreateDate": "2023-05-24T18:20:17+00:00"
  }
}
```

For more information, see [IAM identifiers](#) in the *AWS IAM User Guide*.

Example 3: To Create an IAM User with tags

The following `create-user` command creates an IAM user named Bob with tags. This example uses the `--tags` parameter flag with the following JSON-formatted tags: `'{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location", "Value": "Seattle"}'`. Alternatively, the `--tags` flag can be used with tags in the shorthand format: `'Key=Department,Value=Accounting Key=Location,Value=Seattle'`.

```
aws iam create-user \
  --user-name Bob \
```

```
--tags '{"Key": "Department", "Value": "Accounting"}' '{"Key": "Location",
"Value": "Seattle"}'
```

Output:

```
{
  "User": {
    "Path": "/",
    "UserName": "Bob",
    "UserId": "AIDAIOSFODNN7EXAMPLE",
    "Arn": "arn:aws:iam::12345678012:user/Bob",
    "CreateDate": "2023-05-25T17:14:21+00:00",
    "Tags": [
      {
        "Key": "Department",
        "Value": "Accounting"
      },
      {
        "Key": "Location",
        "Value": "Seattle"
      }
    ]
  }
}
```

For more information, see [Tagging IAM users](#) in the *AWS IAM User Guide*.

Example 3: To create an IAM user with a set permissions boundary

The following `create-user` command creates an IAM user named Bob with the permissions boundary of `AmazonS3FullAccess`.

```
aws iam create-user \  
  --user-name Bob \  
  --permissions-boundary arn:aws:iam::aws:policy/AmazonS3FullAccess
```

Output:

```
{
  "User": {
    "Path": "/",
    "UserName": "Bob",
```

```
"UserId": "AIDAIOSFODNN7EXAMPLE",
"Arn": "arn:aws:iam::12345678012:user/Bob",
"CreateDate": "2023-05-24T17:50:53+00:00",
"PermissionsBoundary": {
  "PermissionsBoundaryType": "Policy",
  "PermissionsBoundaryArn": "arn:aws:iam::aws:policy/AmazonS3FullAccess"
}
}
```

For more information, see [Permissions boundaries for IAM entities](#) in the *AWS IAM User Guide*.

- For API details, see [CreateUser](#) in *AWS CLI Command Reference*.

create-virtual-mfa-device

The following code example shows how to use `create-virtual-mfa-device`.

AWS CLI

To create a virtual MFA device

This example creates a new virtual MFA device called `BobsMFADevice`. It creates a file that contains bootstrap information called `QRCode.png` and places it in the `C:/` directory. The bootstrap method used in this example is `QRCodePNG`.

```
aws iam create-virtual-mfa-device \
  --virtual-mfa-device-name BobsMFADevice \
  --outfile C:/QRCode.png \
  --bootstrap-method QRCodePNG
```

Output:

```
{
  "VirtualMFADevice": {
    "SerialNumber": "arn:aws:iam::210987654321:mfa/BobsMFADevice"
  }
}
```

For more information, see [Using multi-factor authentication \(MFA\) in AWS](#) in the *AWS IAM User Guide*.

- For API details, see [CreateVirtualMfaDevice](#) in *AWS CLI Command Reference*.

deactivate-mfa-device

The following code example shows how to use `deactivate-mfa-device`.

AWS CLI

To deactivate an MFA device

This command deactivates the virtual MFA device with the ARN `arn:aws:iam::210987654321:mfa/BobsMFADevice` that is associated with the user Bob.

```
aws iam deactivate-mfa-device \  
  --user-name Bob \  
  --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice
```

This command produces no output.

For more information, see [Using multi-factor authentication \(MFA\) in AWS](#) in the *AWS IAM User Guide*.

- For API details, see [DeactivateMfaDevice](#) in *AWS CLI Command Reference*.

decode-authorization-message

The following code example shows how to use `decode-authorization-message`.

AWS CLI

To decode a authorization failure message

The following `decode-authorization-message` example decodes the message returned by the EC2 console when attempting to launch an instance without the required permissions.

```
aws sts decode-authorization-message \  
  --encoded-message lxzA8VEjEvu-s0TTt3PgYCXik9Yak0qsrfJGRZR98xNcyWAxwRq14xIvd-  
npzbgTevuufCTbjeBAaDARg9cbTK1rJbg3awM33o-Vy3ebPErE2-  
mWR9hVYdvX-0zKgV0WF9pWjZaJSMqxB-aLXo-I_8TTvBq88x8IFPbMArNdpu0IjxDjzf22PF3S0E3XvIQ-  
_PE00aUqHCCcsSrFtvxm6yQD1nbm6VTIVrfa0Bzy8lsoMo7SjIaJ2r5vph6SY5vCCwg6o2JKe3hIHTa8zRrDbZSFMkcX  
Xx9AYAAIr6bhcis7C__bZh4d1AAWooHFGKgfoJcWGwgdzgbu9hWyVvKTpeot5hsb8qANYjJRCpXTKpi6PZfdijIkwb6g
```

The output is formatted as a single-line string of JSON text that you can parse with any JSON text processor.

```
{
  "DecodedMessage": "{\"allowed\":false,\"explicitDeny\":false,\"matchedStatements\
\":{\\"items\":[],\"failures\":{\\"items\":[],\"context\":{\\"principal\

}
```

For more information, see [How can I decode an authorization failure message after receiving an "UnauthorizedOperation" error during an EC2 instance launch?](#) in *AWS re:Post*.

- For API details, see [DecodeAuthorizationMessage](#) in *AWS CLI Command Reference*.

delete-access-key

The following code example shows how to use delete-access-key.

AWS CLI

To delete an access key for an IAM user

The following delete-access-key command deletes the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam delete-access-key \
  --access-key-id AKIDPMS9R04H3FEXAMPLE \
```

```
--user-name Bob
```

This command produces no output.

To list the access keys defined for an IAM user, use the `list-access-keys` command.

For more information, see [Managing access keys for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteAccessKey](#) in *AWS CLI Command Reference*.

delete-account-alias

The following code example shows how to use `delete-account-alias`.

AWS CLI

To delete an account alias

The following `delete-account-alias` command removes the alias `mycompany` for the current account.

```
aws iam delete-account-alias \  
  --account-alias mycompany
```

This command produces no output.

For more information, see [Your AWS account ID and its alias](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteAccountAlias](#) in *AWS CLI Command Reference*.

delete-account-password-policy

The following code example shows how to use `delete-account-password-policy`.

AWS CLI

To delete the current account password policy

The following `delete-account-password-policy` command removes the password policy for the current account.

```
aws iam delete-account-password-policy
```

This command produces no output.

For more information, see [Setting an account password policy for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteAccountPasswordPolicy](#) in *AWS CLI Command Reference*.

delete-group-policy

The following code example shows how to use `delete-group-policy`.

AWS CLI

To delete a policy from an IAM group

The following `delete-group-policy` command deletes the policy named `ExamplePolicy` from the group named `Admins`.

```
aws iam delete-group-policy \  
  --group-name Admins \  
  --policy-name ExamplePolicy
```

This command produces no output.

To see the policies attached to a group, use the `list-group-policies` command.

For more information, see [Managing IAM policies](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteGroupPolicy](#) in *AWS CLI Command Reference*.

delete-group

The following code example shows how to use `delete-group`.

AWS CLI

To delete an IAM group

The following `delete-group` command deletes an IAM group named `MyTestGroup`.

```
aws iam delete-group \  
  --group-name MyTestGroup
```

This command produces no output.

For more information, see [Deleting an IAM user group](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteGroup](#) in *AWS CLI Command Reference*.

delete-instance-profile

The following code example shows how to use delete-instance-profile.

AWS CLI

To delete an instance profile

The following delete-instance-profile command deletes the instance profile named ExampleInstanceProfile.

```
aws iam delete-instance-profile \  
  --instance-profile-name ExampleInstanceProfile
```

This command produces no output.

For more information, see [Using instance profiles](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteInstanceProfile](#) in *AWS CLI Command Reference*.

delete-login-profile

The following code example shows how to use delete-login-profile.

AWS CLI

To delete a password for an IAM user

The following delete-login-profile command deletes the password for the IAM user named Bob.

```
aws iam delete-login-profile \  
  --user-name Bob
```

This command produces no output.

For more information, see [Managing passwords for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteLoginProfile](#) in *AWS CLI Command Reference*.

delete-open-id-connect-provider

The following code example shows how to use `delete-open-id-connect-provider`.

AWS CLI

To delete an IAM OpenID Connect identity provider

This example deletes the IAM OIDC provider that connects to the provider `example.oidcprovider.com`.

```
aws iam delete-open-id-connect-provider \  
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/  
  example.oidcprovider.com
```

This command produces no output.

For more information, see [Creating OpenID Connect \(OIDC\) identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteOpenIdConnectProvider](#) in *AWS CLI Command Reference*.

delete-policy-version

The following code example shows how to use `delete-policy-version`.

AWS CLI

To delete a version of a managed policy

This example deletes the version identified as `v2` from the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy-version \  
  --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \  
  --version-id v2
```

This command produces no output.

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [DeletePolicyVersion](#) in *AWS CLI Command Reference*.

delete-policy

The following code example shows how to use delete-policy.

AWS CLI

To delete an IAM policy

This example deletes the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam delete-policy \  
  --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

This command produces no output.

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [DeletePolicy](#) in *AWS CLI Command Reference*.

delete-role-permissions-boundary

The following code example shows how to use delete-role-permissions-boundary.

AWS CLI

To delete a permissions boundary from an IAM role

The following delete-role-permissions-boundary example deletes the permissions boundary for the specified IAM role. To apply a permissions boundary to a role, use the `put-role-permissions-boundary` command.

```
aws iam delete-role-permissions-boundary \  
  --role-name lambda-application-role
```

This command produces no output.

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteRolePermissionsBoundary](#) in *AWS CLI Command Reference*.

delete-role-policy

The following code example shows how to use `delete-role-policy`.

AWS CLI

To remove a policy from an IAM role

The following `delete-role-policy` command removes the policy named `ExamplePolicy` from the role named `Test-Role`.

```
aws iam delete-role-policy \  
  --role-name Test-Role \  
  --policy-name ExamplePolicy
```

This command produces no output.

For more information, see [Modifying a role](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteRolePolicy](#) in *AWS CLI Command Reference*.

delete-role

The following code example shows how to use `delete-role`.

AWS CLI

To delete an IAM role

The following `delete-role` command removes the role named `Test-Role`.

```
aws iam delete-role \  
  --role-name Test-Role
```

This command produces no output.

Before you can delete a role, you must remove the role from any instance profile (`remove-role-from-instance-profile`), detach any managed policies (`detach-role-policy`) and delete any inline policies that are attached to the role (`delete-role-policy`).

For more information, see [Creating IAM roles](#) and [Using instance profiles](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteRole](#) in *AWS CLI Command Reference*.

delete-saml-provider

The following code example shows how to use `delete-saml-provider`.

AWS CLI

To delete a SAML provider

This example deletes the IAM SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFSPROVIDER`.

```
aws iam delete-saml-provider \  
--saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFSPROVIDER
```

This command produces no output.

For more information, see [Creating IAM SAML identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteSAMLProvider](#) in *AWS CLI Command Reference*.

delete-server-certificate

The following code example shows how to use `delete-server-certificate`.

AWS CLI

To delete a server certificate from your AWS account

The following `delete-server-certificate` command removes the specified server certificate from your AWS account.

```
aws iam delete-server-certificate \  
--server-certificate-name myUpdatedServerCertificate
```

This command produces no output.

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see [Managing server certificates in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteServerCertificate](#) in *AWS CLI Command Reference*.

delete-service-linked-role

The following code example shows how to use `delete-service-linked-role`.

AWS CLI

To delete a service-linked role

The following `delete-service-linked-role` example deletes the specified service-linked role that you no longer need. The deletion happens asynchronously. You can check the status of the deletion and confirm when it is done by using the `get-service-linked-role-deletion-status` command.

```
aws iam delete-service-linked-role \  
  --role-name AWSServiceRoleForLexBots
```

Output:

```
{  
  "DeletionTaskId": "task/aws-service-role/lex.amazonaws.com/  
  AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE"  
}
```

For more information, see [Using service-linked roles](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteServiceLinkedRole](#) in *AWS CLI Command Reference*.

delete-service-specific-credential

The following code example shows how to use `delete-service-specific-credential`.

AWS CLI

Example 1: Delete a service-specific credential for the requesting user

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the user making the request. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

```
aws iam delete-service-specific-credential \  
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

Example 2: Delete a service-specific credential for a specified user

The following `delete-service-specific-credential` example deletes the specified service-specific credential for the specified user. The `service-specific-credential-id` is provided when you create the credential and you can retrieve it by using the `list-service-specific-credentials` command.

```
aws iam delete-service-specific-credential \  
  --user-name sofia \  
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

This command produces no output.

For more information, see [Create Git credentials for HTTPS connections to CodeCommit](#) in the *AWS CodeCommit User Guide*.

- For API details, see [DeleteServiceSpecificCredential](#) in *AWS CLI Command Reference*.

delete-signing-certificate

The following code example shows how to use `delete-signing-certificate`.

AWS CLI

To delete a signing certificate for an IAM user

The following `delete-signing-certificate` command deletes the specified signing certificate for the IAM user named Bob.

```
aws iam delete-signing-certificate \  
  --user-name Bob \  
  --certificate-id TA7SMP42TDN5Z260BPJE7EXAMPLE
```

This command produces no output.

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see [Manage signing certificates](#) in the *Amazon EC2 User Guide*.

- For API details, see [DeleteSigningCertificate](#) in *AWS CLI Command Reference*.

delete-ssh-public-key

The following code example shows how to use `delete-ssh-public-key`.

AWS CLI

To delete an SSH public keys attached to an IAM user

The following `delete-ssh-public-key` command deletes the specified SSH public key attached to the IAM user `sofia`.

```
aws iam delete-ssh-public-key \  
  --user-name sofia \  
  --ssh-public-key-id APKA123456789EXAMPLE
```

This command produces no output.

For more information, see [Use SSH keys and SSH with CodeCommit](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteSshPublicKey](#) in *AWS CLI Command Reference*.

delete-user-permissions-boundary

The following code example shows how to use `delete-user-permissions-boundary`.

AWS CLI

To delete a permissions boundary from an IAM user

The following `delete-user-permissions-boundary` example deletes the permissions boundary attached to the IAM user named `intern`. To apply a permissions boundary to a user, use the `put-user-permissions-boundary` command.

```
aws iam delete-user-permissions-boundary \  
  --user-name intern
```

This command produces no output.

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteUserPermissionsBoundary](#) in *AWS CLI Command Reference*.

delete-user-policy

The following code example shows how to use `delete-user-policy`.

AWS CLI

To remove a policy from an IAM user

The following `delete-user-policy` command removes the specified policy from the IAM user named Bob.

```
aws iam delete-user-policy \  
  --user-name Bob \  
  --policy-name ExamplePolicy
```

This command produces no output.

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see [Creating an IAM user in your AWS account](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteUserPolicy](#) in *AWS CLI Command Reference*.

delete-user

The following code example shows how to use `delete-user`.

AWS CLI

To delete an IAM user

The following `delete-user` command removes the IAM user named Bob from the current account.

```
aws iam delete-user \  
  --user-name Bob
```

This command produces no output.

For more information, see [Deleting an IAM user](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteUser](#) in *AWS CLI Command Reference*.

delete-virtual-mfa-device

The following code example shows how to use `delete-virtual-mfa-device`.

AWS CLI

To remove a virtual MFA device

The following `delete-virtual-mfa-device` command removes the specified MFA device from the current account.

```
aws iam delete-virtual-mfa-device \  
  --serial-number arn:aws:iam::123456789012:mfa/MFATest
```

This command produces no output.

For more information, see [Deactivating MFA devices](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteVirtualMfaDevice](#) in *AWS CLI Command Reference*.

detach-group-policy

The following code example shows how to use `detach-group-policy`.

AWS CLI

To detach a policy from a group

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterAccessPolicy` from the group called `Testers`.

```
aws iam detach-group-policy \  
  --group-name Testers \  
  --policy-arn arn:aws:iam::123456789012:policy/TesterAccessPolicy
```

This command produces no output.

For more information, see [Managing IAM user groups](#) in the *AWS IAM User Guide*.

- For API details, see [DetachGroupPolicy](#) in *AWS CLI Command Reference*.

detach-role-policy

The following code example shows how to use `detach-role-policy`.

AWS CLI

To detach a policy from a role

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy` from the role called `FedTesterRole`.

```
aws iam detach-role-policy \  
  --role-name FedTesterRole \  
  --policy-arn arn:aws:iam::123456789012:policy/FederatedTesterAccessPolicy
```

This command produces no output.

For more information, see [Modifying a role](#) in the *AWS IAM User Guide*.

- For API details, see [DetachRolePolicy](#) in *AWS CLI Command Reference*.

detach-user-policy

The following code example shows how to use `detach-user-policy`.

AWS CLI

To detach a policy from a user

This example removes the managed policy with the ARN `arn:aws:iam::123456789012:policy/TesterPolicy` from the user `Bob`.

```
aws iam detach-user-policy \  
  --user-name Bob \  
  --policy-arn arn:aws:iam::123456789012:policy/TesterPolicy
```

This command produces no output.

For more information, see [Changing permissions for an IAM user](#) in the *AWS IAM User Guide*.

- For API details, see [DetachUserPolicy](#) in *AWS CLI Command Reference*.

enable-mfa-device

The following code example shows how to use `enable-mfa-device`.

AWS CLI

To enable an MFA device

After you use the `create-virtual-mfa-device` command to create a new virtual MFA device, you can assign the MFA device to a user. The following `enable-mfa-device` example assigns the MFA device with the serial number `arn:aws:iam::210987654321:mfa/BobsMFADevice` to the user Bob. The command also synchronizes the device with AWS by including the first two codes in sequence from the virtual MFA device.

```
aws iam enable-mfa-device \  
  --user-name Bob \  
  --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \  
  --authentication-code1 123456 \  
  --authentication-code2 789012
```

This command produces no output.

For more information, see [Enabling a virtual multi-factor authentication \(MFA\) device](#) in the *AWS IAM User Guide*.

- For API details, see [EnableMfaDevice](#) in *AWS CLI Command Reference*.

generate-credential-report

The following code example shows how to use `generate-credential-report`.

AWS CLI

To generate a credential report

The following example attempts to generate a credential report for the AWS account.

```
aws iam generate-credential-report
```

Output:

```
{
  "State": "STARTED",
  "Description": "No report exists. Starting a new report generation task"
}
```

For more information, see [Getting credential reports for your AWS account](#) in the *AWS IAM User Guide*.

- For API details, see [GenerateCredentialReport](#) in *AWS CLI Command Reference*.

generate-organizations-access-report

The following code example shows how to use `generate-organizations-access-report`.

AWS CLI**Example 1: To generate an access report for a root in an organization**

The following `generate-organizations-access-report` example starts a background job to create an access report for the specified root in an organization. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \
  --entity-path o-4fxmpl1t198/r-c3xb
```

Output:

```
{
  "JobId": "a8b6c06f-aaa4-8xmp-28bc-81da71836359"
}
```

Example 2: To generate an access report for an account in an organization

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID 123456789012 in the organization o-4fxmpl1t198. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \  
  --entity-path o-4fxmpl1t198/r-c3xb/123456789012
```

Output:

```
{  
  "JobId": "14b6c071-75f6-2xmp-fb77-faf6fb4201d2"  
}
```

Example 3: To generate an access report for an account in an organizational unit in an organization

The following `generate-organizations-access-report` example starts a background job to create an access report for account ID 234567890123 in organizational unit `ou-c3xb-lmu7j2yg` in the organization `o-4fxmpl1t198`. You can display the report after it's created by running the `get-organizations-access-report` command.

```
aws iam generate-organizations-access-report \  
  --entity-path o-4fxmpl1t198/r-c3xb/ou-c3xb-lmu7j2yg/234567890123
```

Output:

```
{  
  "JobId": "2eb6c2e6-0xmp-ec04-1425-c937916a64af"  
}
```

To get details about roots and organizational units in your organization, use the `organizations list-roots` and `organizations list-organizational-units-for-parent` commands.

For more information, see [Refining permissions in AWS using last accessed information](#) in the *AWS IAM User Guide*.

- For API details, see [GenerateOrganizationsAccessReport](#) in *AWS CLI Command Reference*.

generate-service-last-accessed-details

The following code example shows how to use `generate-service-last-accessed-details`.

AWS CLI

Example 1: To generate a service access report for a custom policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with a custom policy named `intern-boundary`. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \  
  --arn arn:aws:iam::123456789012:policy/intern-boundary
```

Output:

```
{  
  "JobId": "2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc"  
}
```

Example 2: To generate a service access report for the AWS managed AdministratorAccess policy

The following `generate-service-last-accessed-details` example starts a background job to generate a report that lists the services accessed by IAM users and other entities with the AWS managed `AdministratorAccess` policy. You can display the report after it is created by running the `get-service-last-accessed-details` command.

```
aws iam generate-service-last-accessed-details \  
  --arn arn:aws:iam::aws:policy/AdministratorAccess
```

Output:

```
{  
  "JobId": "78b6c2ba-d09e-6xmp-7039-ecde30b26916"  
}
```

For more information, see [Refining permissions in AWS using last accessed information](#) in the *AWS IAM User Guide*.

- For API details, see [GenerateServiceLastAccessedDetails](#) in *AWS CLI Command Reference*.

get-access-key-last-used

The following code example shows how to use `get-access-key-last-used`.

AWS CLI

To retrieve information about when the specified access key was last used

The following example retrieves information about when the access key ABCDEXAMPLE was last used.

```
aws iam get-access-key-last-used \
  --access-key-id ABCDEXAMPLE
```

Output:

```
{
  "UserName": "Bob",
  "AccessKeyLastUsed": {
    "Region": "us-east-1",
    "ServiceName": "iam",
    "LastUsedDate": "2015-06-16T22:45:00Z"
  }
}
```

For more information, see [Managing access keys for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [GetAccessKeyLastUsed](#) in *AWS CLI Command Reference*.

get-account-authorization-details

The following code example shows how to use `get-account-authorization-details`.

AWS CLI

To list an AWS accounts IAM users, groups, roles, and policies

The following `get-account-authorization-details` command returns information about all IAM users, groups, roles, and policies in the AWS account.

```
aws iam get-account-authorization-details
```

Output:

```
{
  "RoleDetailList": [
    {
      "AssumeRolePolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
          {
            "Sid": "",
            "Effect": "Allow",
            "Principal": {

For more information, see [AWS security audit guidelines](#) in the *AWS IAM User Guide*.

- For API details, see [GetAccountAuthorizationDetails](#) in *AWS CLI Command Reference*.

get-account-password-policy

The following code example shows how to use `get-account-password-policy`.

AWS CLI

To see the current account password policy

The following `get-account-password-policy` command displays details about the password policy for the current account.

```
aws iam get-account-password-policy
```

Output:

```
{
  "PasswordPolicy": {
    "AllowUsersToChangePassword": false,
    "RequireLowercaseCharacters": false,
    "RequireUppercaseCharacters": false,
    "MinimumPasswordLength": 8,
    "RequireNumbers": true,
    "RequireSymbols": true
  }
}
```

If no password policy is defined for the account, the command returns a `NoSuchEntity` error.

For more information, see [Setting an account password policy for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [GetAccountPasswordPolicy](#) in *AWS CLI Command Reference*.

get-account-summary

The following code example shows how to use `get-account-summary`.

AWS CLI

To get information about IAM entity usage and IAM quotas in the current account

The following `get-account-summary` command returns information about the current IAM entity usage and current IAM entity quotas in the account.

```
aws iam get-account-summary
```

Output:

```
{
  "SummaryMap": {
```

```
"UsersQuota": 5000,  
"GroupsQuota": 100,  
"InstanceProfiles": 6,  
"SigningCertificatesPerUserQuota": 2,  
"AccountAccessKeysPresent": 0,  
"RolesQuota": 250,  
"RolePolicySizeQuota": 10240,  
"AccountSigningCertificatesPresent": 0,  
"Users": 27,  
"ServerCertificatesQuota": 20,  
"ServerCertificates": 0,  
"AssumeRolePolicySizeQuota": 2048,  
"Groups": 7,  
"MFADevicesInUse": 1,  
"Roles": 3,  
"AccountMFAEnabled": 1,  
"MFADevices": 3,  
"GroupsPerUserQuota": 10,  
"GroupPolicySizeQuota": 5120,  
"InstanceProfilesQuota": 100,  
"AccessKeysPerUserQuota": 2,  
"Providers": 0,  
"UserPolicySizeQuota": 2048  
}  
}
```

For more information about entity limitations, see [IAM and AWS STS quotas](#) in the *AWS IAM User Guide*.

- For API details, see [GetAccountSummary](#) in *AWS CLI Command Reference*.

get-context-keys-for-custom-policy

The following code example shows how to use `get-context-keys-for-custom-policy`.

AWS CLI

Example 1: To list the context keys referenced by one or more custom JSON policies provided as a parameter on the command line

The following `get-context-keys-for-custom-policy` command parses each supplied policy and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the policy simulator commands

`simulate-custom-policy` and `simulate-custom-policy`. You can also retrieve the list of context keys used by all policies associated by an IAM user or role by using the `get-context-keys-for-custom-policy` command. Parameter values that begin with `file://` instruct the command to read the file and use the contents as the value for the parameter instead of the file name itself.

```
aws iam get-context-keys-for-custom-policy \
  --policy-input-list '{"Version":"2012-10-17","Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"arn:aws:dynamodb:us-
west-2:123456789012:table/${aws:username}","Condition":{"DateGreaterThan":
{"aws:CurrentTime":"2015-08-16T12:00:00Z"}}}}'
```

Output:

```
{
  "ContextKeyNames": [
    "aws:username",
    "aws:CurrentTime"
  ]
}
```

Example 2: To list the context keys referenced by one or more custom JSON policies provided as a file input

The following `get-context-keys-for-custom-policy` command is the same as the previous example, except that the policies are provided in a file instead of as a parameter. Because the command expects a JSON list of strings, and not a list of JSON structures, the file must be structured as follows, although you can collapse it into one one.

```
[
  "Policy1",
  "Policy2"
]
```

So for example, a file that contains the policy from the previous example must look like the following. You must escape each embedded double-quote inside the policy string by preceding it with a backslash `"`.

```
[ "{\"Version\": \"2012-10-17\", \"Statement\": {\"Effect\": \"Allow\", \"Action
\": \"dynamodb:*\", \"Resource\": \"arn:aws:dynamodb:us-west-2:128716708097:table/
```

```
{aws:username}\", \"Condition\": {\"DateGreaterThan\": {\"aws:CurrentTime\":  
  \"2015-08-16T12:00:00Z\"}}}}" ]
```

This file can then be submitted to the following command.

```
aws iam get-context-keys-for-custom-policy \  
  --policy-input-list file://policyfile.json
```

Output:

```
{  
  "ContextKeyNames": [  
    "aws:username",  
    "aws:CurrentTime"  
  ]  
}
```

For more information, see [Using the IAM Policy Simulator \(AWS CLI and AWS API\)](#) in the *AWS IAM User Guide*.

- For API details, see [GetContextKeysForCustomPolicy](#) in *AWS CLI Command Reference*.

get-context-keys-for-principal-policy

The following code example shows how to use `get-context-keys-for-principal-policy`.

AWS CLI

To list the context keys referenced by all policies associated with an IAM principal

The following `get-context-keys-for-principal-policy` command retrieves all policies that are attached to the user `saanvi` and any groups she is a member of. It then parses each and lists the context keys used by those policies. Use this command to identify which context key values you must supply to successfully use the `simulate-custom-policy` and `simulate-principal-policy` commands. You can also retrieve the list of context keys used by an arbitrary JSON policy by using the `get-context-keys-for-custom-policy` command.

```
aws iam get-context-keys-for-principal-policy \  
  --policy-source-arn arn:aws:iam::123456789012:user/saanvi
```

Output:

```
{
  "ContextKeyNames": [
    "aws:username",
    "aws:CurrentTime"
  ]
}
```

For more information, see [Using the IAM Policy Simulator \(AWS CLI and AWS API\)](#) in the *AWS IAM User Guide*.

- For API details, see [GetContextKeysForPrincipalPolicy](#) in *AWS CLI Command Reference*.

get-credential-report

The following code example shows how to use `get-credential-report`.

AWS CLI**To get a credential report**

This example opens the returned report and outputs it to the pipeline as an array of text lines.

```
aws iam get-credential-report
```

Output:

```
{
  "GeneratedTime": "2015-06-17T19:11:50Z",
  "ReportFormat": "text/csv"
}
```

For more information, see [Getting credential reports for your AWS account](#) in the *AWS IAM User Guide*.

- For API details, see [GetCredentialReport](#) in *AWS CLI Command Reference*.

get-group-policy

The following code example shows how to use `get-group-policy`.

AWS CLI

To get information about a policy attached to an IAM group

The following `get-group-policy` command gets information about the specified policy attached to the group named `Test-Group`.

```
aws iam get-group-policy \  
  --group-name Test-Group \  
  --policy-name S3-ReadOnly-Policy
```

Output:

```
{  
  "GroupName": "Test-Group",  
  "PolicyDocument": {  
    "Statement": [  
      {  
        "Action": [  
          "s3:Get*",  
          "s3:List*"  
        ],  
        "Resource": "*",  
        "Effect": "Allow"  
      }  
    ]  
  },  
  "PolicyName": "S3-ReadOnly-Policy"  
}
```

For more information, see [Managing IAM policies](#) in the *AWS IAM User Guide*.

- For API details, see [GetGroupPolicy](#) in *AWS CLI Command Reference*.

get-group

The following code example shows how to use `get-group`.

AWS CLI

To get an IAM group

This example returns details about the IAM group `Admins`.

```
aws iam get-group \  
  --group-name Admins
```

Output:

```
{  
  "Group": {  
    "Path": "/",  
    "CreateDate": "2015-06-16T19:41:48Z",  
    "GroupId": "AIDGPMS9R04H3FEXAMPLE",  
    "Arn": "arn:aws:iam::123456789012:group/Admins",  
    "GroupName": "Admins"  
  },  
  "Users": []  
}
```

For more information, see [IAM Identities \(users, user groups, and roles\)](#) in the *AWS IAM User Guide*.

- For API details, see [GetGroup](#) in *AWS CLI Command Reference*.

get-instance-profile

The following code example shows how to use `get-instance-profile`.

AWS CLI

To get information about an instance profile

The following `get-instance-profile` command gets information about the instance profile named `ExampleInstanceProfile`.

```
aws iam get-instance-profile \  
  --instance-profile-name ExampleInstanceProfile
```

Output:

```
{  
  "InstanceProfile": {  
    "InstanceProfileId": "AID2MAB8DPLSRHEXAMPLE",  
    "Roles": [  
      {  
        "RoleId": "AID2MAB8DPLSRHEXAMPLE",  
        "RoleName": "ExampleRole",  
        "AssumeRolePolicyDocument": {  
          "Statement": [  
            {  
              "Action": "sts:AssumeRole",  
              "Effect": "Allow",  
              "Principal": {  
                "AWS": "arn:aws:iam::123456789012:root"  
              }  
            }  
          ]  
        }  
      }  
    ]  
  }  
}
```

```
    {
      "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
      "RoleId": "AIDGPMS9R04H3FEXAMPLE",
      "CreateDate": "2013-01-09T06:33:26Z",
      "RoleName": "Test-Role",
      "Path": "/",
      "Arn": "arn:aws:iam::336924118301:role/Test-Role"
    }
  ],
  "CreateDate": "2013-06-12T23:52:02Z",
  "InstanceProfileName": "ExampleInstanceProfile",
  "Path": "/",
  "Arn": "arn:aws:iam::336924118301:instance-profile/ExampleInstanceProfile"
}
```

For more information, see [Using instance profiles](#) in the *AWS IAM User Guide*.

- For API details, see [GetInstanceProfile](#) in *AWS CLI Command Reference*.

get-login-profile

The following code example shows how to use `get-login-profile`.

AWS CLI

To get password information for an IAM user

The following `get-login-profile` command gets information about the password for the IAM user named Bob.

```
aws iam get-login-profile \
  --user-name Bob
```

Output:

```
{
  "LoginProfile": {
    "UserName": "Bob",
    "CreateDate": "2012-09-21T23:03:39Z"
  }
}
```

The `get-login-profile` command can be used to verify that an IAM user has a password. The command returns a `NoSuchEntity` error if no password is defined for the user.

You cannot view a password using this command. If the password is lost, you can reset the password (`update-login-profile`) for the user. Alternatively, you can delete the login profile (`delete-login-profile`) for the user and then create a new one (`create-login-profile`).

For more information, see [Managing passwords for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [GetLoginProfile](#) in *AWS CLI Command Reference*.

get-mfa-device

The following code example shows how to use `get-mfa-device`.

AWS CLI

To retrieve information about a FIDO security key

The following `get-mfa-device` command example retrieves information about the specified FIDO security key.

```
aws iam get-mfa-device \  
  --serial-number arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-  
EXAMPLEBN5FHTECLFG7EXAMPLE
```

Output:

```
{  
  "UserName": "alice",  
  "SerialNumber": "arn:aws:iam::123456789012:u2f/user/alice/fidokeyname-  
EXAMPLEBN5FHTECLFG7EXAMPLE",  
  "EnableDate": "2023-09-19T01:49:18+00:00",  
  "Certifications": {  
    "FIDO": "L1"  
  }  
}
```

For more information, see [Using multi-factor authentication \(MFA\) in AWS](#) in the *AWS IAM User Guide*.

- For API details, see [GetMfaDevice](#) in *AWS CLI Command Reference*.

get-open-id-connect-provider

The following code example shows how to use `get-open-id-connect-provider`.

AWS CLI

To return information about the specified OpenID Connect provider

This example returns details about the OpenID Connect provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/server.example.com`.

```
aws iam get-open-id-connect-provider \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com
```

Output:

```
{
  "Url": "server.example.com"
  "CreateDate": "2015-06-16T19:41:48Z",
  "ThumbprintList": [
    "12345abcdefghijk67890lmnopqrst987example"
  ],
  "ClientIDList": [
    "example-application-ID"
  ]
}
```

For more information, see [Creating OpenID Connect \(OIDC\) identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [GetOpenIdConnectProvider](#) in *AWS CLI Command Reference*.

get-organizations-access-report

The following code example shows how to use `get-organizations-access-report`.

AWS CLI

To retrieve an access report

The following `get-organizations-access-report` example displays a previously generated access report for an AWS Organizations entity. To generate a report, use the `generate-organizations-access-report` command.

```
aws iam get-organizations-access-report \  
  --job-id a8b6c06f-aaa4-8xmp-28bc-81da71836359
```

Output:

```
{  
  "JobStatus": "COMPLETED",  
  "JobCreationDate": "2019-09-30T06:53:36.187Z",  
  "JobCompletionDate": "2019-09-30T06:53:37.547Z",  
  "NumberOfServicesAccessible": 188,  
  "NumberOfServicesNotAccessed": 171,  
  "AccessDetails": [  
    {  
      "ServiceName": "Alexa for Business",  
      "ServiceNamespace": "a4b",  
      "TotalAuthenticatedEntities": 0  
    },  
    ...  
  ]  
}
```

For more information, see [Refining permissions in AWS using last accessed information](#) in the *AWS IAM User Guide*.

- For API details, see [GetOrganizationsAccessReport](#) in *AWS CLI Command Reference*.

get-policy-version

The following code example shows how to use `get-policy-version`.

AWS CLI

To retrieve information about the specified version of the specified managed policy

This example returns the policy document for the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyManagedPolicy`.

```
aws iam get-policy-version \  
  --policy-arn arn:aws:iam::123456789012:policy/MyManagedPolicy
```

```
--policy-arn arn:aws:iam::123456789012:policy/MyPolicy \  
--version-id v2
```

Output:

```
{  
  "PolicyVersion": {  
    "Document": {  
      "Version": "2012-10-17",  
      "Statement": [  
        {  
          "Effect": "Allow",  
          "Action": "iam:*",  
          "Resource": "*" }  
      ]  
    },  
    "VersionId": "v2",  
    "IsDefaultVersion": true,  
    "CreateDate": "2023-04-11T00:22:54+00:00"  
  }  
}
```

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [GetPolicyVersion](#) in *AWS CLI Command Reference*.

get-policy

The following code example shows how to use `get-policy`.

AWS CLI**To retrieve information about the specified managed policy**

This example returns details about the managed policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam get-policy \  
--policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{
  "Policy": {
    "PolicyName": "MySamplePolicy",
    "CreateDate": "2015-06-17T19:23:32Z",
    "AttachmentCount": 0,
    "IsAttachable": true,
    "PolicyId": "Z27SI6FQMGNQ2EXAMPLE1",
    "DefaultVersionId": "v1",
    "Path": "/",
    "Arn": "arn:aws:iam::123456789012:policy/MySamplePolicy",
    "UpdateDate": "2015-06-17T19:23:32Z"
  }
}
```

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [GetPolicy](#) in *AWS CLI Command Reference*.

get-role-policy

The following code example shows how to use `get-role-policy`.

AWS CLI

To get information about a policy attached to an IAM role

The following `get-role-policy` command gets information about the specified policy attached to the role named `Test-Role`.

```
aws iam get-role-policy \
  --role-name Test-Role \
  --policy-name ExamplePolicy
```

Output:

```
{
  "RoleName": "Test-Role",
  "PolicyDocument": {
    "Statement": [
      {
        "Action": [
          "s3:ListBucket",
```

```
        "s3:Put*",
        "s3:Get*",
        "s3:*MultipartUpload*"
    ],
    "Resource": "*",
    "Effect": "Allow",
    "Sid": "1"
  }
]
}
"PolicyName": "ExamplePolicy"
}
```

For more information, see [Creating IAM roles](#) in the *AWS IAM User Guide*.

- For API details, see [GetRolePolicy](#) in *AWS CLI Command Reference*.

get-role

The following code example shows how to use `get-role`.

AWS CLI

To get information about an IAM role

The following `get-role` command gets information about the role named `Test-Role`.

```
aws iam get-role \
  --role-name Test-Role
```

Output:

```
{
  "Role": {
    "Description": "Test Role",
    "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
    "MaxSessionDuration": 3600,
    "RoleId": "AROA1234567890EXAMPLE",
    "CreateDate": "2019-11-13T16:45:56Z",
    "RoleName": "Test-Role",
    "Path": "/",
    "RoleLastUsed": {
```

```
        "Region": "us-east-1",
        "LastUsedDate": "2019-11-13T17:14:00Z"
    },
    "Arn": "arn:aws:iam::123456789012:role/Test-Role"
}
}
```

The command displays the trust policy attached to the role. To list the permissions policies attached to a role, use the `list-role-policies` command.

For more information, see [Creating IAM roles](#) in the *AWS IAM User Guide*.

- For API details, see [GetRole](#) in *AWS CLI Command Reference*.

get-saml-provider

The following code example shows how to use `get-saml-provider`.

AWS CLI

To retrieve the SAML provider metadocument

This example retrieves the details about the SAML 2.0 provider whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS`. The response includes the metadata document that you got from the identity provider to create the AWS SAML provider entity as well as the creation and expiration dates.

```
aws iam get-saml-provider \
  --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
  "SAMLMetadataDocument": "...SAMLMetadataDocument-XML...",
  "CreateDate": "2017-03-06T22:29:46+00:00",
  "ValidUntil": "2117-03-06T22:29:46.433000+00:00",
  "Tags": [
    {
      "Key": "DeptID",
      "Value": "123456"
    },
    {
```

```

        "Key": "Department",
        "Value": "Accounting"
    }
]
}

```

For more information, see [Creating IAM SAML identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [GetSamlProvider](#) in *AWS CLI Command Reference*.

get-server-certificate

The following code example shows how to use `get-server-certificate`.

AWS CLI

To get details about a server certificate in your AWS account

The following `get-server-certificate` command retrieves all of the details about the specified server certificate in your AWS account.

```

aws iam get-server-certificate \
  --server-certificate-name myUpdatedServerCertificate

```

Output:

```

{
  "ServerCertificate": {
    "ServerCertificateMetadata": {
      "Path": "/",
      "ServerCertificateName": "myUpdatedServerCertificate",
      "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:server-certificate/myUpdatedServerCertificate",
      "UploadDate": "2019-04-22T21:13:44+00:00",
      "Expiration": "2019-10-15T22:23:16+00:00"
    },
    "CertificateBody": "-----BEGIN CERTIFICATE-----

}
}

```

To list the server certificates available in your AWS account, use the `list-server-certificates` command.

For more information, see [Managing server certificates in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [GetServerCertificate](#) in *AWS CLI Command Reference*.

get-service-last-accessed-details-with-entities

The following code example shows how to use `get-service-last-accessed-details-with-entities`.

AWS CLI

To retrieve a service access report with details for a service

The following `get-service-last-accessed-details-with-entities` example retrieves a report that contains details about IAM users and other entities that accessed the specified service. To generate a report, use the `generate-service-last-accessed-details` command. To get a list of services accessed with namespaces, use `get-service-last-accessed-details`.

```
aws iam get-service-last-accessed-details-with-entities \  
  --job-id 78b6c2ba-d09e-6xmp-7039-ecde30b26916 \  
  --service-namespace lambda
```

Output:

```
{  
  "JobStatus": "COMPLETED",  
  "JobCreationDate": "2019-10-01T03:55:41.756Z",  
  "JobCompletionDate": "2019-10-01T03:55:42.533Z",  
  "EntityDetailsList": [  
    {  
      "EntityInfo": {  
        "Arn": "arn:aws:iam::123456789012:user/admin",  
        "Name": "admin",  
        "Type": "USER",  
        "Id": "AIDAI02XMPLNQEEXAMPLE",  
        "Path": "/"  
      },  
      "LastAuthenticated": "2019-09-30T23:02:00Z"  
    },  
    {  
      "EntityInfo": {  
        "Arn": "arn:aws:iam::123456789012:user/developer",  
        "Name": "developer",  
        "Type": "USER",  
        "Id": "AIDAIBEYXMPL2YEXAMPLE",  
        "Path": "/"  
      },  
      "LastAuthenticated": "2019-09-16T19:34:00Z"  
    }  
  ]  
}
```

For more information, see [Refining permissions in AWS using last accessed information](#) in the *AWS IAM User Guide*.

- For API details, see [GetServiceLastAccessedDetailsWithEntities](#) in *AWS CLI Command Reference*.

get-service-last-accessed-details

The following code example shows how to use `get-service-last-accessed-details`.

AWS CLI

To retrieve a service access report

The following `get-service-last-accessed-details` example retrieves a previously generated report that lists the services accessed by IAM entities. To generate a report, use the `generate-service-last-accessed-details` command.

```
aws iam get-service-last-accessed-details \
  --job-id 2eb6c2b8-7b4c-3xmp-3c13-03b72c8cdfdc
```

Output:

```
{
  "JobStatus": "COMPLETED",
  "JobCreationDate": "2019-10-01T03:50:35.929Z",
  "ServicesLastAccessed": [
    ...
    {
      "ServiceName": "AWS Lambda",
      "LastAuthenticated": "2019-09-30T23:02:00Z",
      "ServiceNamespace": "lambda",
      "LastAuthenticatedEntity": "arn:aws:iam::123456789012:user/admin",
      "TotalAuthenticatedEntities": 6
    },
  ]
}
```

For more information, see [Refining permissions in AWS using last accessed information](#) in the *AWS IAM User Guide*.

- For API details, see [GetServiceLastAccessedDetails](#) in *AWS CLI Command Reference*.

get-service-linked-role-deletion-status

The following code example shows how to use `get-service-linked-role-deletion-status`.

AWS CLI

To check the status of a request to delete a service-linked role

The following `get-service-linked-role-deletion-status` example displays the status of a previously request to delete a service-linked role. The delete operation occurs asynchronously. When you make the request, you get a `DeletionTaskId` value that you provide as a parameter for this command.

```
aws iam get-service-linked-role-deletion-status \
  --deletion-task-id task/aws-service-role/lex.amazonaws.com/
  AWSServiceRoleForLexBots/1a2b3c4d-1234-abcd-7890-abcdeEXAMPLE
```

Output:

```
{
  "Status": "SUCCEEDED"
}
```

For more information, see [Using service-linked roles](#) in the *AWS IAM User Guide*.

- For API details, see [GetServiceLinkedRoleDeletionStatus](#) in *AWS CLI Command Reference*.

get-ssh-public-key

The following code example shows how to use `get-ssh-public-key`.

AWS CLI

Example 1: To retrieve an SSH public key attached to an IAM user in SSH encoded form

The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user `sofia`. The output is in SSH encoding.

```
aws iam get-ssh-public-key \
  --user-name sofia \
  --ssh-public-key-id APKA123456789EXAMPLE \
```

```
--encoding SSH
```

Output:

```
{
  "SSHPublicKey": {
    "UserName": "sofia",
    "SSHPublicKeyId": "APKA123456789EXAMPLE",
    "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
    "SSHPublicKeyBody": "ssh-rsa <<long encoded SSH string>>",
    "Status": "Inactive",
    "UploadDate": "2019-04-18T17:04:49+00:00"
  }
}
```

Example 2: To retrieve an SSH public key attached to an IAM user in PEM encoded form

The following `get-ssh-public-key` command retrieves the specified SSH public key from the IAM user `sofia`. The output is in PEM encoding.

```
aws iam get-ssh-public-key \
  --user-name sofia \
  --ssh-public-key-id APKA123456789EXAMPLE \
  --encoding PEM
```

Output:

```
{
  "SSHPublicKey": {
    "UserName": "sofia",
    "SSHPublicKeyId": "APKA123456789EXAMPLE",
    "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",
    "SSHPublicKeyBody": "'-----BEGIN PUBLIC KEY-----\n<<long encoded PEM string>>\n-----END PUBLIC KEY-----\n'",
    "Status": "Inactive",
    "UploadDate": "2019-04-18T17:04:49+00:00"
  }
}
```

For more information, see [Use SSH keys and SSH with CodeCommit](#) in the *AWS IAM User Guide*.

- For API details, see [GetSshPublicKey](#) in *AWS CLI Command Reference*.

get-user-policy

The following code example shows how to use `get-user-policy`.

AWS CLI

To list policy details for an IAM user

The following `get-user-policy` command lists the details of the specified policy that is attached to the IAM user named Bob.

```
aws iam get-user-policy \  
  --user-name Bob \  
  --policy-name ExamplePolicy
```

Output:

```
{  
  "UserName": "Bob",  
  "PolicyName": "ExamplePolicy",  
  "PolicyDocument": {  
    "Version": "2012-10-17",  
    "Statement": [  
      {  
        "Action": "*",  
        "Resource": "*",  
        "Effect": "Allow"  
      }  
    ]  
  }  
}
```

To get a list of policies for an IAM user, use the `list-user-policies` command.

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [GetUserPolicy](#) in *AWS CLI Command Reference*.

get-user

The following code example shows how to use `get-user`.

AWS CLI

To get information about an IAM user

The following `get-user` command gets information about the IAM user named Paulo.

```
aws iam get-user \  
  --user-name Paulo
```

Output:

```
{  
  "User": {  
    "UserName": "Paulo",  
    "Path": "/",  
    "CreateDate": "2019-09-21T23:03:13Z",  
    "UserId": "AIDA123456789EXAMPLE",  
    "Arn": "arn:aws:iam::123456789012:user/Paulo"  
  }  
}
```

For more information, see [Managing IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [GetUser](#) in *AWS CLI Command Reference*.

list-access-keys

The following code example shows how to use `list-access-keys`.

AWS CLI

To list the access key IDs for an IAM user

The following `list-access-keys` command lists the access keys IDs for the IAM user named Bob.

```
aws iam list-access-keys \  
  --user-name Bob
```

Output:

```
{
```

```
"AccessKeyMetadata": [  
  {  
    "UserName": "Bob",  
    "Status": "Active",  
    "CreateDate": "2013-06-04T18:17:34Z",  
    "AccessKeyId": "AKIAIOSFODNN7EXAMPLE"  
  },  
  {  
    "UserName": "Bob",  
    "Status": "Inactive",  
    "CreateDate": "2013-06-06T20:42:26Z",  
    "AccessKeyId": "AKIAI44QH8DHBEXAMPLE"  
  }  
]  
}
```

You cannot list the secret access keys for IAM users. If the secret access keys are lost, you must create new access keys using the `create-access-keys` command.

For more information, see [Managing access keys for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [ListAccessKeys](#) in *AWS CLI Command Reference*.

list-account-aliases

The following code example shows how to use `list-account-aliases`.

AWS CLI

To list account aliases

The following `list-account-aliases` command lists the aliases for the current account.

```
aws iam list-account-aliases
```

Output:

```
{  
  "AccountAliases": [  
    "mycompany"  
  ]  
}
```

For more information, see [Your AWS account ID and its alias](#) in the *AWS IAM User Guide*.

- For API details, see [ListAccountAliases](#) in *AWS CLI Command Reference*.

list-attached-group-policies

The following code example shows how to use `list-attached-group-policies`.

AWS CLI

To list all managed policies that are attached to the specified group

This example returns the names and ARNs of the managed policies that are attached to the IAM group named `Admins` in the AWS account.

```
aws iam list-attached-group-policies \  
  --group-name Admins
```

Output:

```
{  
  "AttachedPolicies": [  
    {  
      "PolicyName": "AdministratorAccess",  
      "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"  
    },  
    {  
      "PolicyName": "SecurityAudit",  
      "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"  
    }  
  ],  
  "IsTruncated": false  
}
```

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [ListAttachedGroupPolicies](#) in *AWS CLI Command Reference*.

list-attached-role-policies

The following code example shows how to use `list-attached-role-policies`.

AWS CLI

To list all managed policies that are attached to the specified role

This command returns the names and ARNs of the managed policies attached to the IAM role named `SecurityAuditRole` in the AWS account.

```
aws iam list-attached-role-policies \  
  --role-name SecurityAuditRole
```

Output:

```
{  
  "AttachedPolicies": [  
    {  
      "PolicyName": "SecurityAudit",  
      "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"  
    }  
  ],  
  "IsTruncated": false  
}
```

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [ListAttachedRolePolicies](#) in *AWS CLI Command Reference*.

list-attached-user-policies

The following code example shows how to use `list-attached-user-policies`.

AWS CLI

To list all managed policies that are attached to the specified user

This command returns the names and ARNs of the managed policies for the IAM user named `Bob` in the AWS account.

```
aws iam list-attached-user-policies \  
  --user-name Bob
```

Output:

```
{
  "AttachedPolicies": [
    {
      "PolicyName": "AdministratorAccess",
      "PolicyArn": "arn:aws:iam::aws:policy/AdministratorAccess"
    },
    {
      "PolicyName": "SecurityAudit",
      "PolicyArn": "arn:aws:iam::aws:policy/SecurityAudit"
    }
  ],
  "IsTruncated": false
}
```

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [ListAttachedUserPolicies](#) in *AWS CLI Command Reference*.

list-entities-for-policy

The following code example shows how to use `list-entities-for-policy`.

AWS CLI

To list all users, groups, and roles that the specified managed policy is attached to

This example returns a list of IAM groups, roles, and users who have the policy `arn:aws:iam::123456789012:policy/TestPolicy` attached.

```
aws iam list-entities-for-policy \
  --policy-arn arn:aws:iam::123456789012:policy/TestPolicy
```

Output:

```
{
  "PolicyGroups": [
    {
      "GroupName": "Admins",
      "GroupId": "AGPACKCEVSQ6C2EXAMPLE"
    }
  ],
}
```

```
"PolicyUsers": [
  {
    "UserName": "Alice",
    "UserId": "AIDACKCEVSQ6C2EXAMPLE"
  }
],
"PolicyRoles": [
  {
    "RoleName": "DevRole",
    "RoleId": "AR0ADBQP57FF2AEXAMPLE"
  }
],
"IsTruncated": false
}
```

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [ListEntitiesForPolicy](#) in *AWS CLI Command Reference*.

list-group-policies

The following code example shows how to use `list-group-policies`.

AWS CLI

To list all inline policies that are attached to the specified group

The following `list-group-policies` command lists the names of inline policies that are attached to the IAM group named `Admins` in the current account.

```
aws iam list-group-policies \
  --group-name Admins
```

Output:

```
{
  "PolicyNames": [
    "AdminRoot",
    "ExamplePolicy"
  ]
}
```

For more information, see [Managing IAM policies](#) in the *AWS IAM User Guide*.

- For API details, see [ListGroupPolicies](#) in *AWS CLI Command Reference*.

list-groups-for-user

The following code example shows how to use `list-groups-for-user`.

AWS CLI

To list the groups that an IAM user belongs to

The following `list-groups-for-user` command displays the groups that the IAM user named Bob belongs to.

```
aws iam list-groups-for-user \  
  --user-name Bob
```

Output:

```
{  
  "Groups": [  
    {  
      "Path": "/",  
      "CreateDate": "2013-05-06T01:18:08Z",  
      "GroupId": "AKIAIOSFODNN7EXAMPLE",  
      "Arn": "arn:aws:iam::123456789012:group/Admin",  
      "GroupName": "Admin"  
    },  
    {  
      "Path": "/",  
      "CreateDate": "2013-05-06T01:37:28Z",  
      "GroupId": "AKIAI44QH8DHBEXAMPLE",  
      "Arn": "arn:aws:iam::123456789012:group/s3-Users",  
      "GroupName": "s3-Users"  
    }  
  ]  
}
```

For more information, see [Managing IAM user groups](#) in the *AWS IAM User Guide*.

- For API details, see [ListGroupsForUser](#) in *AWS CLI Command Reference*.

list-groups

The following code example shows how to use `list-groups`.

AWS CLI

To list the IAM groups for the current account

The following `list-groups` command lists the IAM groups in the current account.

```
aws iam list-groups
```

Output:

```
{
  "Groups": [
    {
      "Path": "/",
      "CreateDate": "2013-06-04T20:27:27.972Z",
      "GroupId": "AIDACKCEVSQ6C2EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/Admins",
      "GroupName": "Admins"
    },
    {
      "Path": "/",
      "CreateDate": "2013-04-16T20:30:42Z",
      "GroupId": "AIDGPM9R04H3FEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:group/S3-Admins",
      "GroupName": "S3-Admins"
    }
  ]
}
```

For more information, see [Managing IAM user groups](#) in the *AWS IAM User Guide*.

- For API details, see [ListGroups](#) in *AWS CLI Command Reference*.

list-instance-profile-tags

The following code example shows how to use `list-instance-profile-tags`.

AWS CLI

To list the tags attached to an instance profile

The following `list-instance-profile-tags` command retrieves the list of tags associated with the specified instance profile.

```
aws iam list-instance-profile-tags \  
  --instance-profile-name deployment-role
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "DeptID",  
      "Value": "123456"  
    },  
    {  
      "Key": "Department",  
      "Value": "Accounting"  
    }  
  ]  
}
```

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [ListInstanceProfileTags](#) in *AWS CLI Command Reference*.

list-instance-profiles-for-role

The following code example shows how to use `list-instance-profiles-for-role`.

AWS CLI

To list the instance profiles for an IAM role

The following `list-instance-profiles-for-role` command lists the instance profiles that are associated with the role `Test-Role`.

```
aws iam list-instance-profiles-for-role \  
  --role-name Test-Role
```

Output:

```
{
  "InstanceProfiles": [
    {
      "InstanceId": "AIDGPM59R04H3FEXAMPLE",
      "Roles": [
        {
          "AssumeRolePolicyDocument": "<URL-encoded-JSON>",
          "RoleId": "AIDACKCEVSQ6C2EXAMPLE",
          "CreateDate": "2013-06-07T20:42:15Z",
          "RoleName": "Test-Role",
          "Path": "/",
          "Arn": "arn:aws:iam::123456789012:role/Test-Role"
        }
      ],
      "CreateDate": "2013-06-07T21:05:24Z",
      "InstanceProfileName": "ExampleInstanceProfile",
      "Path": "/",
      "Arn": "arn:aws:iam::123456789012:instance-profile/
ExampleInstanceProfile"
    }
  ]
}
```

For more information, see [Using instance profiles](#) in the *AWS IAM User Guide*.

- For API details, see [ListInstanceProfilesForRole](#) in *AWS CLI Command Reference*.

list-instance-profiles

The following code example shows how to use `list-instance-profiles`.

AWS CLI**To lists the instance profiles for the account**

The following `list-instance-profiles` command lists the instance profiles that are associated with the current account.

```
aws iam list-instance-profiles
```

Output:

```
{
  "InstanceProfiles": [
    {
      "Path": "/",
      "InstanceProfileName": "example-dev-role",
      "InstanceProfileId": "AIPAIXEU4NUHUPEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:instance-profile/example-dev-role",
      "CreateDate": "2023-09-21T18:17:41+00:00",
      "Roles": [
        {
          "Path": "/",
          "RoleName": "example-dev-role",
          "RoleId": "AR0AJ520TH4H7LEXAMPLE",
          "Arn": "arn:aws:iam::123456789012:role/example-dev-role",
          "CreateDate": "2023-09-21T18:17:40+00:00",
          "AssumeRolePolicyDocument": {
            "Version": "2012-10-17",
            "Statement": [
              {
                "Effect": "Allow",
                "Principal": {
                  "Service": "ec2.amazonaws.com"
                },
                "Action": "sts:AssumeRole"
              }
            ]
          }
        }
      ]
    }
  ],
  {
    "Path": "/",
    "InstanceProfileName": "example-s3-role",
    "InstanceProfileId": "AIPAJVJVNRIQFREXAMPLE",
    "Arn": "arn:aws:iam::123456789012:instance-profile/example-s3-role",
    "CreateDate": "2023-09-21T18:18:50+00:00",

        "RoleId": "AR0AINUBC507XLEXAMPLE",
        "Arn": "arn:aws:iam::123456789012:role/example-s3-role",
        "CreateDate": "2023-09-21T18:18:49+00:00",
```

```
    "AssumeRolePolicyDocument": {
      "Version": "2012-10-17",
      "Statement": [
        {
          "Effect": "Allow",
          "Principal": {
            "Service": "ec2.amazonaws.com"
          },
          "Action": "sts:AssumeRole"
        }
      ]
    }
  ]
}
```

For more information, see [Using instance profiles](#) in the *AWS IAM User Guide*.

- For API details, see [ListInstanceProfiles](#) in *AWS CLI Command Reference*.

list-mfa-device-tags

The following code example shows how to use `list-mfa-device-tags`.

AWS CLI

To list the tags attached to an MFA device

The following `list-mfa-device-tags` command retrieves the list of tags associated with the specified MFA device.

```
aws iam list-mfa-device-tags \
  --serial-number arn:aws:iam::123456789012:mfa/alice
```

Output:

```
{
  "Tags": [
    {
      "Key": "DeptID",
```

```
        "Value": "123456"
      },
      {
        "Key": "Department",
        "Value": "Accounting"
      }
    ]
  }
}
```

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [ListMfaDeviceTags](#) in *AWS CLI Command Reference*.

list-mfa-devices

The following code example shows how to use `list-mfa-devices`.

AWS CLI

To list all MFA devices for a specified user

This example returns details about the MFA device assigned to the IAM user Bob.

```
aws iam list-mfa-devices \
  --user-name Bob
```

Output:

```
{
  "MFADevices": [
    {
      "UserName": "Bob",
      "SerialNumber": "arn:aws:iam::123456789012:mfa/Bob",
      "EnableDate": "2019-10-28T20:37:09+00:00"
    },
    {
      "UserName": "Bob",
      "SerialNumber": "GAKT12345678",
      "EnableDate": "2023-02-18T21:44:42+00:00"
    },
    {
      "UserName": "Bob",
```

```

        "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey1-7XNL7NFNLZ123456789EXAMPLE",
        "EnableDate": "2023-09-19T02:25:35+00:00"
    },
    {
        "UserName": "Bob",
        "SerialNumber": "arn:aws:iam::123456789012:u2f/user/Bob/
fidosecuritykey2-VDRQTDBBN5123456789EXAMPLE",
        "EnableDate": "2023-09-19T01:49:18+00:00"
    }
]
}

```

For more information, see [Using multi-factor authentication \(MFA\) in AWS](#) in the *AWS IAM User Guide*.

- For API details, see [ListMfaDevices](#) in *AWS CLI Command Reference*.

list-open-id-connect-provider-tags

The following code example shows how to use `list-open-id-connect-provider-tags`.

AWS CLI

To list the tags attached to an OpenID Connect (OIDC)-compatible identity provider

The following `list-open-id-connect-provider-tags` command retrieves the list of tags associated with the specified OIDC identity provider.

```

aws iam list-open-id-connect-provider-tags \
    --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
server.example.com

```

Output:

```

{
  "Tags": [
    {
      "Key": "DeptID",
      "Value": "123456"
    },
    {

```

```
        "Key": "Department",
        "Value": "Accounting"
    }
]
}
```

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [ListOpenIdConnectProviderTags](#) in *AWS CLI Command Reference*.

list-open-id-connect-providers

The following code example shows how to use `list-open-id-connect-providers`.

AWS CLI

To list information about the OpenID Connect providers in the AWS account

This example returns a list of ARNS of all the OpenID Connect providers that are defined in the current AWS account.

```
aws iam list-open-id-connect-providers
```

Output:

```
{
  "OpenIDConnectProviderList": [
    {
      "Arn": "arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com"
    }
  ]
}
```

For more information, see [Creating OpenID Connect \(OIDC\) identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [ListOpenIdConnectProviders](#) in *AWS CLI Command Reference*.

list-policies-granting-service-access

The following code example shows how to use `list-policies-granting-service-access`.

AWS CLI

To list the policies that grant a principal access to the specified service

The following `list-policies-granting-service-access` example retrieves the list of policies that grant the IAM user `sofia` access to AWS CodeCommit service.

```
aws iam list-policies-granting-service-access \
  --arn arn:aws:iam::123456789012:user/sofia \
  --service-namespaces codecommit
```

Output:

```
{
  "PoliciesGrantingServiceAccess": [
    {
      "ServiceNamespace": "codecommit",
      "Policies": [
        {
          "PolicyName": "Grant-Sofia-Access-To-CodeCommit",
          "PolicyType": "INLINE",
          "EntityType": "USER",
          "EntityName": "sofia"
        }
      ]
    }
  ],
  "IsTruncated": false
}
```

For more information, see [Using IAM with CodeCommit: Git credentials, SSH keys, and AWS access keys](#) in the *AWS IAM User Guide*.

- For API details, see [ListPoliciesGrantingServiceAccess](#) in *AWS CLI Command Reference*.

list-policies

The following code example shows how to use `list-policies`.

AWS CLI

To list managed policies that are available to your AWS account

This example returns a collection of the first two managed policies available in the current AWS account.

```
aws iam list-policies \  
  --max-items 3
```

Output:

```
{  
  "Policies": [  
    {  
      "PolicyName": "AWSCloudTrailAccessPolicy",  
      "PolicyId": "ANPAXQE2B5PJ7YEXAMPLE",  
      "Arn": "arn:aws:iam::123456789012:policy/AWSCloudTrailAccessPolicy",  
      "Path": "/",  
      "DefaultVersionId": "v1",  
      "AttachmentCount": 0,  
      "PermissionsBoundaryUsageCount": 0,  
      "IsAttachable": true,  
      "CreateDate": "2019-09-04T17:43:42+00:00",  
      "UpdateDate": "2019-09-04T17:43:42+00:00"  
    },  
    {  
      "PolicyName": "AdministratorAccess",  
      "PolicyId": "ANPAIWMBCKSKIEE64ZLYK",  
      "Arn": "arn:aws:iam::aws:policy/AdministratorAccess",  
      "Path": "/",  
      "DefaultVersionId": "v1",  
      "AttachmentCount": 6,  
      "PermissionsBoundaryUsageCount": 0,  
      "IsAttachable": true,  
      "CreateDate": "2015-02-06T18:39:46+00:00",  
      "UpdateDate": "2015-02-06T18:39:46+00:00"  
    },  
    {  
      "PolicyName": "PowerUserAccess",  
      "PolicyId": "ANPAJYRXTHIB4F0VS3ZXS",  
      "Arn": "arn:aws:iam::aws:policy/PowerUserAccess",  
      "Path": "/",  
      "DefaultVersionId": "v5",  
      "AttachmentCount": 1,  
      "PermissionsBoundaryUsageCount": 0,  
      "IsAttachable": true,  
    }  
  ]  
}
```

```
        "CreateDate": "2015-02-06T18:39:47+00:00",
        "UpdateDate": "2023-07-06T22:04:00+00:00"
    }
],
"NextToken": "EXAMPLErZXIi0iBudWxsLCAiYm90b190cnVuY2F0ZV9hbW91bnQi0iA4fQ=="
}
```

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [ListPolicies](#) in *AWS CLI Command Reference*.

list-policy-tags

The following code example shows how to use `list-policy-tags`.

AWS CLI

To list the tags attached to a managed policy

The following `list-policy-tags` command retrieves the list of tags associated with the specified managed policy.

```
aws iam list-policy-tags \
  --policy-arn arn:aws:iam::123456789012:policy/billing-access
```

Output:

```
{
  "Tags": [
    {
      "Key": "DeptID",
      "Value": "123456"
    },
    {
      "Key": "Department",
      "Value": "Accounting"
    }
  ]
}
```

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [ListPolicyTags](#) in *AWS CLI Command Reference*.

list-policy-versions

The following code example shows how to use `list-policy-versions`.

AWS CLI

To list information about the versions of the specified managed policy

This example returns the list of available versions of the policy whose ARN is `arn:aws:iam::123456789012:policy/MySamplePolicy`.

```
aws iam list-policy-versions \  
  --policy-arn arn:aws:iam::123456789012:policy/MySamplePolicy
```

Output:

```
{  
  "IsTruncated": false,  
  "Versions": [  
    {  
      "VersionId": "v2",  
      "IsDefaultVersion": true,  
      "CreateDate": "2015-06-02T23:19:44Z"  
    },  
    {  
      "VersionId": "v1",  
      "IsDefaultVersion": false,  
      "CreateDate": "2015-06-02T22:30:47Z"  
    }  
  ]  
}
```

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [ListPolicyVersions](#) in *AWS CLI Command Reference*.

list-role-policies

The following code example shows how to use `list-role-policies`.

AWS CLI

To list the policies attached to an IAM role

The following `list-role-policies` command lists the names of the permissions policies for the specified IAM role.

```
aws iam list-role-policies \  
  --role-name Test-Role
```

Output:

```
{  
  "PolicyNames": [  
    "ExamplePolicy"  
  ]  
}
```

To see the trust policy attached to a role, use the `get-role` command. To see the details of a permissions policy, use the `get-role-policy` command.

For more information, see [Creating IAM roles](#) in the *AWS IAM User Guide*.

- For API details, see [ListRolePolicies](#) in *AWS CLI Command Reference*.

list-role-tags

The following code example shows how to use `list-role-tags`.

AWS CLI

To list the tags attached to a role

The following `list-role-tags` command retrieves the list of tags associated with the specified role.

```
aws iam list-role-tags \  
  --role-name production-role
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "Department",  
      "Value": "Accounting"  
    }  
  ]  
}
```

```
    },
    {
      "Key": "DeptID",
      "Value": "12345"
    }
  ],
  "IsTruncated": false
}
```

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [ListRoleTags](#) in *AWS CLI Command Reference*.

list-roles

The following code example shows how to use `list-roles`.

AWS CLI

To list IAM roles for the current account

The following `list-roles` command lists IAM roles for the current account.

```
aws iam list-roles
```

Output:

```
{
  "Roles": [
    {
      "Path": "/",
      "RoleName": "ExampleRole",
      "RoleId": "AR0AJ520TH4H7LEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:role/ExampleRole",
      "CreateDate": "2017-09-12T19:23:36+00:00",
      "AssumeRolePolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
          {
            "Sid": "",
            "Effect": "Allow",
            "Principal": {
              "Service": "ec2.amazonaws.com"
            }
          }
        ]
      }
    }
  ]
}
```

```

        },
        "Action": "sts:AssumeRole"
    }
]
},
"MaxSessionDuration": 3600
},
{
    "Path": "/example_path/",
    "RoleName": "ExampleRoleWithPath",
    "RoleId": "AROAI4QRP7UFT7EXAMPLE",
    "Arn": "arn:aws:iam::123456789012:role/example_path/
ExampleRoleWithPath",
    "CreateDate": "2023-09-21T20:29:38+00:00",
    "AssumeRolePolicyDocument": {
        "Version": "2012-10-17",
        "Statement": [
            {
                "Sid": "",
                "Effect": "Allow",
                "Principal": {
                    "Service": "ec2.amazonaws.com"
                },
                "Action": "sts:AssumeRole"
            }
        ]
    },
    "MaxSessionDuration": 3600
}
]
}

```

For more information, see [Creating IAM roles](#) in the *AWS IAM User Guide*.

- For API details, see [ListRoles](#) in *AWS CLI Command Reference*.

list-saml-provider-tags

The following code example shows how to use `list-saml-provider-tags`.

AWS CLI

To list the tags attached to a SAML provider

The following `list-saml-provider-tags` command retrieves the list of tags associated with the specified SAML provider.

```
aws iam list-saml-provider-tags \  
  --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "DeptID",  
      "Value": "123456"  
    },  
    {  
      "Key": "Department",  
      "Value": "Accounting"  
    }  
  ]  
}
```

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [ListSamlProviderTags](#) in *AWS CLI Command Reference*.

list-saml-providers

The following code example shows how to use `list-saml-providers`.

AWS CLI

To list the SAML providers in the AWS account

This example retrieves the list of SAML 2.0 providers created in the current AWS account.

```
aws iam list-saml-providers
```

Output:

```
{  
  "SAMLProviderList": [  
    {  
      "Name": "ADFS",  
      "CreateDate": "2017-01-01T00:00:00Z",  
      "LastModifiedDate": "2017-01-01T00:00:00Z",  
      "Status": "Active",  
      "Type": "SAML20"  
    }  
  ]  
}
```

```
{
  "Arn": "arn:aws:iam::123456789012:saml-provider/SAML-ADFS",
  "ValidUntil": "2015-06-05T22:45:14Z",
  "CreateDate": "2015-06-05T22:45:14Z"
}
]
```

For more information, see [Creating IAM SAML identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [ListSAMLProviders](#) in *AWS CLI Command Reference*.

list-server-certificate-tags

The following code example shows how to use `list-server-certificate-tags`.

AWS CLI

To list the tags attached to a server certificate

The following `list-server-certificate-tags` command retrieves the list of tags associated with the specified server certificate.

```
aws iam list-server-certificate-tags \
  --server-certificate-name ExampleCertificate
```

Output:

```
{
  "Tags": [
    {
      "Key": "DeptID",
      "Value": "123456"
    },
    {
      "Key": "Department",
      "Value": "Accounting"
    }
  ]
}
```

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [ListServerCertificateTags](#) in *AWS CLI Command Reference*.

list-server-certificates

The following code example shows how to use `list-server-certificates`.

AWS CLI

To list the server certificates in your AWS account

The following `list-server-certificates` command lists all of the server certificates stored and available for use in your AWS account.

```
aws iam list-server-certificates
```

Output:

```
{
  "ServerCertificateMetadataList": [
    {
      "Path": "/",
      "ServerCertificateName": "myUpdatedServerCertificate",
      "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:server-certificate/myUpdatedServerCertificate",
      "UploadDate": "2019-04-22T21:13:44+00:00",
      "Expiration": "2019-10-15T22:23:16+00:00"
    },
    {
      "Path": "/cloudfront/",
      "ServerCertificateName": "MyTestCert",
      "ServerCertificateId": "ASCAEXAMPLE456EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:server-certificate/Org1/Org2/MyTestCert",
      "UploadDate": "2015-04-21T18:14:16+00:00",
      "Expiration": "2018-01-14T17:52:36+00:00"
    }
  ]
}
```

For more information, see [Managing server certificates in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [ListServerCertificates](#) in *AWS CLI Command Reference*.

list-service-specific-credential

The following code example shows how to use `list-service-specific-credential`.

AWS CLI

Example 1: List the service-specific credentials for a user

The following `list-service-specific-credentials` example displays all service-specific credentials assigned to the specified user. Passwords are not included in the response.

```
aws iam list-service-specific-credentials \  
  --user-name sofia
```

Output:

```
{  
  "ServiceSpecificCredential": {  
    "CreateDate": "2019-04-18T20:45:36+00:00",  
    "ServiceName": "codecommit.amazonaws.com",  
    "ServiceUserName": "sofia-at-123456789012",  
    "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",  
    "UserName": "sofia",  
    "Status": "Active"  
  }  
}
```

Example 2: List the service-specific credentials for a user filtered to a specified service

The following `list-service-specific-credentials` example displays the service-specific credentials assigned to the user making the request. The list is filtered to include only those credentials for the specified service. Passwords are not included in the response.

```
aws iam list-service-specific-credentials \  
  --service-name codecommit.amazonaws.com
```

Output:

```
{  
  "ServiceSpecificCredential": {  
    "CreateDate": "2019-04-18T20:45:36+00:00",
```

```
    "ServiceName": "codecommit.amazonaws.com",
    "ServiceUserName": "sofia-at-123456789012",
    "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",
    "UserName": "sofia",
    "Status": "Active"
  }
}
```

For more information, see [Create Git credentials for HTTPS connections to CodeCommit](#) in the *AWS CodeCommit User Guide*.

- For API details, see [ListServiceSpecificCredential](#) in *AWS CLI Command Reference*.

list-service-specific-credentials

The following code example shows how to use `list-service-specific-credentials`.

AWS CLI

To retrieve a list of credentials

The following `list-service-specific-credentials` example lists the credentials generated for HTTPS access to AWS CodeCommit repositories for a user named `developer`.

```
aws iam list-service-specific-credentials \
  --user-name developer \
  --service-name codecommit.amazonaws.com
```

Output:

```
{
  "ServiceSpecificCredentials": [
    {
      "UserName": "developer",
      "Status": "Inactive",
      "ServiceUserName": "developer-at-123456789012",
      "CreateDate": "2019-10-01T04:31:41Z",
      "ServiceSpecificCredentialId": "ACCAQFODXMPL4YFHP7DZE",
      "ServiceName": "codecommit.amazonaws.com"
    },
    {
      "UserName": "developer",
```

```

        "Status": "Active",
        "ServiceUserName": "developer+1-at-123456789012",
        "CreateDate": "2019-10-01T04:31:45Z",
        "ServiceSpecificCredentialId": "ACCAQFOX MPL6VW57M7AJP",
        "ServiceName": "codecommit.amazonaws.com"
    }
]
}

```

For more information, see [Create Git credentials for HTTPS connections to CodeCommit](#) in the *AWS CodeCommit User Guide*.

- For API details, see [ListServiceSpecificCredentials](#) in *AWS CLI Command Reference*.

list-signing-certificates

The following code example shows how to use `list-signing-certificates`.

AWS CLI

To list the signing certificates for an IAM user

The following `list-signing-certificates` command lists the signing certificates for the IAM user named Bob.

```
aws iam list-signing-certificates \
    --user-name Bob
```

Output:

```

{
  "Certificates": [
    {
      "UserName": "Bob",
      "Status": "Inactive",
      "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----
END CERTIFICATE-----",
      "CertificateId": "TA7SMP42TDN5Z260BPJE7EXAMPLE",
      "UploadDate": "2013-06-06T21:40:08Z"
    }
  ]
}

```

For more information, see [Manage signing certificates](#) in the *Amazon EC2 User Guide*.

- For API details, see [ListSigningCertificates](#) in *AWS CLI Command Reference*.

list-ssh-public-keys

The following code example shows how to use `list-ssh-public-keys`.

AWS CLI

To list the SSH public keys attached to an IAM user

The following `list-ssh-public-keys` example lists the SSH public keys attached to the IAM user `sofia`.

```
aws iam list-ssh-public-keys \  
  --user-name sofia
```

Output:

```
{  
  "SSHPublicKeys": [  
    {  
      "UserName": "sofia",  
      "SSHPublicKeyId": "APKA1234567890EXAMPLE",  
      "Status": "Inactive",  
      "UploadDate": "2019-04-18T17:04:49+00:00"  
    }  
  ]  
}
```

For more information, see [Use SSH keys and SSH with CodeCommit](#) in the *AWS IAM User Guide*

- For API details, see [ListSshPublicKeys](#) in *AWS CLI Command Reference*.

list-user-policies

The following code example shows how to use `list-user-policies`.

AWS CLI

To list policies for an IAM user

The following `list-user-policies` command lists the policies that are attached to the IAM user named Bob.

```
aws iam list-user-policies \  
  --user-name Bob
```

Output:

```
{  
  "PolicyNames": [  
    "ExamplePolicy",  
    "TestPolicy"  
  ]  
}
```

For more information, see [Creating an IAM user in your AWS account](#) in the *AWS IAM User Guide*.

- For API details, see [ListUserPolicies](#) in *AWS CLI Command Reference*.

list-user-tags

The following code example shows how to use `list-user-tags`.

AWS CLI

To list the tags attached to a user

The following `list-user-tags` command retrieves the list of tags associated with the specified IAM user.

```
aws iam list-user-tags \  
  --user-name alice
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "Department",  
      "Value": "Accounting"  
    },  
    {
```

```
        "Key": "DeptID",
        "Value": "12345"
    }
],
"IsTruncated": false
}
```

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [ListUserTags](#) in *AWS CLI Command Reference*.

list-users

The following code example shows how to use `list-users`.

AWS CLI

To list IAM users

The following `list-users` command lists the IAM users in the current account.

```
aws iam list-users
```

Output:

```
{
  "Users": [
    {
      "UserName": "Adele",
      "Path": "/",
      "CreateDate": "2013-03-07T05:14:48Z",
      "UserId": "AKIAI44QH8DHBEXAMPLE",
      "Arn": "arn:aws:iam::123456789012:user/Adele"
    },
    {
      "UserName": "Bob",
      "Path": "/",
      "CreateDate": "2012-09-21T23:03:13Z",
      "UserId": "AKIAIOSFODNN7EXAMPLE",
      "Arn": "arn:aws:iam::123456789012:user/Bob"
    }
  ]
}
```

For more information, see [Listing IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [ListUsers](#) in *AWS CLI Command Reference*.

list-virtual-mfa-devices

The following code example shows how to use `list-virtual-mfa-devices`.

AWS CLI

To list virtual MFA devices

The following `list-virtual-mfa-devices` command lists the virtual MFA devices that have been configured for the current account.

```
aws iam list-virtual-mfa-devices
```

Output:

```
{
  "VirtualMFADevices": [
    {
      "SerialNumber": "arn:aws:iam::123456789012:mfa/ExampleMFADevice"
    },
    {
      "SerialNumber": "arn:aws:iam::123456789012:mfa/Fred"
    }
  ]
}
```

For more information, see [Enabling a virtual multi-factor authentication \(MFA\) device](#) in the *AWS IAM User Guide*.

- For API details, see [ListVirtualMfaDevices](#) in *AWS CLI Command Reference*.

put-group-policy

The following code example shows how to use `put-group-policy`.

AWS CLI

To add a policy to a group

The following `put-group-policy` command adds a policy to the IAM group named Admins.

```
aws iam put-group-policy \  
  --group-name Admins \  
  --policy-document file://AdminPolicy.json \  
  --policy-name AdminRoot
```

This command produces no output.

The policy is defined as a JSON document in the `AdminPolicy.json` file. (The file name and extension do not have significance.)

For more information, see [Managing IAM policies](#) in the *AWS IAM User Guide*.

- For API details, see [PutGroupPolicy](#) in *AWS CLI Command Reference*.

put-role-permissions-boundary

The following code example shows how to use `put-role-permissions-boundary`.

AWS CLI

Example 1: To apply a permissions boundary based on a custom policy to an IAM role

The following `put-role-permissions-boundary` example applies the custom policy named `intern-boundary` as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \  
  --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \  
  --role-name lambda-application-role
```

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM role

The following `put-role-permissions-boundary` example applies the AWS managed `PowerUserAccess` policy as the permissions boundary for the specified IAM role.

```
aws iam put-role-permissions-boundary \  
  --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \  
  --role-name lambda-application-role
```

```
--role-name x-account-admin
```

This command produces no output.

For more information, see [Modifying a role](#) in the *AWS IAM User Guide*.

- For API details, see [PutRolePermissionsBoundary](#) in *AWS CLI Command Reference*.

put-role-policy

The following code example shows how to use `put-role-policy`.

AWS CLI

To attach a permissions policy to an IAM role

The following `put-role-policy` command adds a permissions policy to the role named `Test-Role`.

```
aws iam put-role-policy \  
  --role-name Test-Role \  
  --policy-name ExamplePolicy \  
  --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

To attach a trust policy to a role, use the `update-assume-role-policy` command.

For more information, see [Modifying a role](#) in the *AWS IAM User Guide*.

- For API details, see [PutRolePolicy](#) in *AWS CLI Command Reference*.

put-user-permissions-boundary

The following code example shows how to use `put-user-permissions-boundary`.

AWS CLI

Example 1: To apply a permissions boundary based on a custom policy to an IAM user

The following `put-user-permissions-boundary` example applies a custom policy named `intern-boundary` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \  
  --permissions-boundary arn:aws:iam::123456789012:policy/intern-boundary \  
  --user-name intern
```

This command produces no output.

Example 2: To apply a permissions boundary based on an AWS managed policy to an IAM user

The following `put-user-permissions-boundary` example applies the AWS managed policy named `PowerUserAccess` as the permissions boundary for the specified IAM user.

```
aws iam put-user-permissions-boundary \  
  --permissions-boundary arn:aws:iam::aws:policy/PowerUserAccess \  
  --user-name developer
```

This command produces no output.

For more information, see [Adding and removing IAM identity permissions](#) in the *AWS IAM User Guide*.

- For API details, see [PutUserPermissionsBoundary](#) in *AWS CLI Command Reference*.

put-user-policy

The following code example shows how to use `put-user-policy`.

AWS CLI

To attach a policy to an IAM user

The following `put-user-policy` command attaches a policy to the IAM user named Bob.

```
aws iam put-user-policy \  
  --user-name Bob \  
  --policy-name ExamplePolicy \  
  --policy-document file://AdminPolicy.json
```

This command produces no output.

The policy is defined as a JSON document in the *AdminPolicy.json* file. (The file name and extension do not have significance.)

For more information, see [Adding and removing IAM identity permissions](#) in the *AWS IAM User Guide*.

- For API details, see [PutUserPolicy](#) in *AWS CLI Command Reference*.

remove-client-id-from-open-id-connect-provider

The following code example shows how to use `remove-client-id-from-open-id-connect-provider`.

AWS CLI

To remove the specified client ID from the list of client IDs registered for the specified IAM OpenID Connect provider

This example removes the client ID `My-TestApp-3` from the list of client IDs associated with the IAM OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com`.

```
aws iam remove-client-id-from-open-id-connect-provider
  --client-id My-TestApp-3 \
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/
example.oidcprovider.com
```

This command produces no output.

For more information, see [Creating OpenID Connect \(OIDC\) identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [RemoveClientIdFromOpenIdConnectProvider](#) in *AWS CLI Command Reference*.

remove-role-from-instance-profile

The following code example shows how to use `remove-role-from-instance-profile`.

AWS CLI

To remove a role from an instance profile

The following `remove-role-from-instance-profile` command removes the role named `Test-Role` from the instance profile named `ExampleInstanceProfile`.

```
aws iam remove-role-from-instance-profile \  
  --instance-profile-name ExampleInstanceProfile \  
  --role-name Test-Role
```

For more information, see [Using instance profiles](#) in the *AWS IAM User Guide*.

- For API details, see [RemoveRoleFromInstanceProfile](#) in *AWS CLI Command Reference*.

remove-user-from-group

The following code example shows how to use `remove-user-from-group`.

AWS CLI

To remove a user from an IAM group

The following `remove-user-from-group` command removes the user named `Bob` from the IAM group named `Admins`.

```
aws iam remove-user-from-group \  
  --user-name Bob \  
  --group-name Admins
```

This command produces no output.

For more information, see [Adding and removing users in an IAM user group](#) in the *AWS IAM User Guide*.

- For API details, see [RemoveUserFromGroup](#) in *AWS CLI Command Reference*.

reset-service-specific-credential

The following code example shows how to use `reset-service-specific-credential`.

AWS CLI

Example 1: Reset the password for a service-specific credential attached to the user making the request

The following `reset-service-specific-credential` example generates a new cryptographically strong password for the specified service-specific credential attached to the user making the request.

```
aws iam reset-service-specific-credential \  
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{  
  "ServiceSpecificCredential": {  
    "CreateDate": "2019-04-18T20:45:36+00:00",  
    "ServiceName": "codecommit.amazonaws.com",  
    "ServiceUserName": "sofia-at-123456789012",  
    "ServicePassword": "+oaFsNk7tLco+C/obP9Ghhc0zGcK0ayTmE3LnAmAmH4=",  
    "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",  
    "UserName": "sofia",  
    "Status": "Active"  
  }  
}
```

Example 2: Reset the password for a service-specific credential attached to a specified user

The following `reset-service-specific-credential` example generates a new cryptographically strong password for a service-specific credential attached to the specified user.

```
aws iam reset-service-specific-credential \  
  --user-name sofia \  
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE
```

Output:

```
{  
  "ServiceSpecificCredential": {  
    "CreateDate": "2019-04-18T20:45:36+00:00",  
    "ServiceName": "codecommit.amazonaws.com",  
    "ServiceUserName": "sofia-at-123456789012",  
    "ServicePassword": "+oaFsNk7tLco+C/obP9Ghhc0zGcK0ayTmE3LnAmAmH4=",  
    "ServiceSpecificCredentialId": "ACCAEXAMPLE123EXAMPLE",  
    "UserName": "sofia",
```

```
    "Status": "Active"
  }
}
```

For more information, see [Create Git credentials for HTTPS connections to CodeCommit](#) in the *AWS CodeCommit User Guide*.

- For API details, see [ResetServiceSpecificCredential](#) in *AWS CLI Command Reference*.

resync-mfa-device

The following code example shows how to use `resync-mfa-device`.

AWS CLI

To synchronize an MFA device

The following `resync-mfa-device` example synchronizes the MFA device that is associated with the IAM user Bob and whose ARN is `arn:aws:iam::123456789012:mfa/BobsMFADevice` with an authenticator program that provided the two authentication codes.

```
aws iam resync-mfa-device \
  --user-name Bob \
  --serial-number arn:aws:iam::210987654321:mfa/BobsMFADevice \
  --authentication-code1 123456 \
  --authentication-code2 987654
```

This command produces no output.

For more information, see [Using multi-factor authentication \(MFA\) in AWS](#) in the *AWS IAM User Guide*.

- For API details, see [ResyncMfaDevice](#) in *AWS CLI Command Reference*.

set-default-policy-version

The following code example shows how to use `set-default-policy-version`.

AWS CLI

To set the specified version of the specified policy as the policy's default version.

This example sets the v2 version of the policy whose ARN is `arn:aws:iam::123456789012:policy/MyPolicy` as the default active version.

```
aws iam set-default-policy-version \  
  --policy-arn arn:aws:iam::123456789012:policy/MyPolicy \  
  --version-id v2
```

For more information, see [Policies and permissions in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [SetDefaultPolicyVersion](#) in *AWS CLI Command Reference*.

set-security-token-service-preferences

The following code example shows how to use `set-security-token-service-preferences`.

AWS CLI

To set the global endpoint token version

The following `set-security-token-service-preferences` example configures Amazon STS to use version 2 tokens when you authenticate against the global endpoint.

```
aws iam set-security-token-service-preferences \  
  --global-endpoint-token-version v2Token
```

This command produces no output.

For more information, see [Managing AWS STS in an AWS Region](#) in the *AWS IAM User Guide*.

- For API details, see [SetSecurityTokenServicePreferences](#) in *AWS CLI Command Reference*.

simulate-custom-policy

The following code example shows how to use `simulate-custom-policy`.

AWS CLI

Example 1: To simulate the effects of all IAM policies associated with an IAM user or role

The following `simulate-custom-policy` shows how to provide both the policy and define variable values and simulate an API call to see if it is allowed or denied. The following example shows a policy that enables database access only after a specified date and time. The simulation

succeeds because the simulated actions and the specified `aws:CurrentTime` variable all match the requirements of the policy.

```
aws iam simulate-custom-policy \
  --policy-input-list '{"Version":"2012-10-17","Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
{"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}' \
  --action-names dynamodb:CreateBackup \
  --context-entries
"ContextKeyName='aws:CurrentTime',ContextKeyValues='2019-04-25T11:00:00Z',ContextKeyType=da
```

Output:

```
{
  "EvaluationResults": [
    {
      "EvalActionName": "dynamodb:CreateBackup",
      "EvalResourceName": "*",
      "EvalDecision": "allowed",
      "MatchedStatements": [
        {
          "SourcePolicyId": "PolicyInputList.1",
          "StartPosition": {
            "Line": 1,
            "Column": 38
          },
          "EndPosition": {
            "Line": 1,
            "Column": 167
          }
        }
      ],
      "MissingContextValues": []
    }
  ]
}
```

Example 2: To simulate a command that is prohibited by the policy

The following `simulate-custom-policy` example shows the results of simulating a command that is prohibited by the policy. In this example, the provided date is before that required by the policy's condition.

```
aws iam simulate-custom-policy \
  --policy-input-list '{"Version":"2012-10-17","Statement":
{"Effect":"Allow","Action":"dynamodb:*","Resource":"*","Condition":
{"DateGreaterThan":{"aws:CurrentTime":"2018-08-16T12:00:00Z"}}}' \
  --action-names dynamodb>CreateBackup \
  --context-entries
"ContextKeyName='aws:CurrentTime',ContextKeyValues='2014-04-25T11:00:00Z',ContextKeyType=da
```

Output:

```
{
  "EvaluationResults": [
    {
      "EvalActionName": "dynamodb>CreateBackup",
      "EvalResourceName": "*",
      "EvalDecision": "implicitDeny",
      "MatchedStatements": [],
      "MissingContextValues": []
    }
  ]
}
```

For more information, see [Testing IAM policies with the IAM policy simulator](#) in the *AWS IAM User Guide*.

- For API details, see [SimulateCustomPolicy](#) in *AWS CLI Command Reference*.

simulate-principal-policy

The following code example shows how to use `simulate-principal-policy`.

AWS CLI

Example 1: To simulate the effects of an arbitrary IAM policy

The following `simulate-principal-policy` shows how to simulate a user calling an API action and determining whether the policies associated with that user allow or deny the action. In the following example, the user has a policy that allows only the `codecommit:ListRepositories` action.

```
aws iam simulate-principal-policy \
```

```
--policy-source-arn arn:aws:iam::123456789012:user/alejandro \  
--action-names codecommit:ListRepositories
```

Output:

```
{  
  "EvaluationResults": [  
    {  
      "EvalActionName": "codecommit:ListRepositories",  
      "EvalResourceName": "*",  
      "EvalDecision": "allowed",  
      "MatchedStatements": [  
        {  
          "SourcePolicyId": "Grant-Access-To-CodeCommit-ListRepo",  
          "StartPosition": {  
            "Line": 3,  
            "Column": 19  
          },  
          "EndPosition": {  
            "Line": 9,  
            "Column": 10  
          }  
        }  
      ],  
      "MissingContextValues": []  
    }  
  ]  
}
```

Example 2: To simulate the effects of a prohibited command

The following `simulate-custom-policy` example shows the results of simulating a command that is prohibited by one of the user's policies. In the following example, the user has a policy that permits access to a DynamoDB database only after a certain date and time. The simulation has the user attempting to access the database with an `aws:CurrentTime` value that is earlier than the policy's condition permits.

```
aws iam simulate-principal-policy \  
  --policy-source-arn arn:aws:iam::123456789012:user/alejandro \  
  --action-names dynamodb:CreateBackup \  
  --context-entries  
  "ContextKeyName='aws:CurrentTime',ContextKeyValues='2018-04-25T11:00:00Z',ContextKeyType=da
```

Output:

```
{
  "EvaluationResults": [
    {
      "EvalActionName": "dynamodb:CreateBackup",
      "EvalResourceName": "*",
      "EvalDecision": "implicitDeny",
      "MatchedStatements": [],
      "MissingContextValues": []
    }
  ]
}
```

For more information, see [Testing IAM policies with the IAM policy simulator](#) in the *AWS IAM User Guide*.

- For API details, see [SimulatePrincipalPolicy](#) in *AWS CLI Command Reference*.

tag-instance-profile

The following code example shows how to use tag-instance-profile.

AWS CLI**To add a tag to an instance profile**

The following tag-instance-profile command adds a tag with a Department name to the specified instance profile.

```
aws iam tag-instance-profile \
  --instance-profile-name deployment-role \
  --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [TagInstanceProfile](#) in *AWS CLI Command Reference*.

tag-mfa-device

The following code example shows how to use tag-mfa-device.

AWS CLI

To add a tag to an MFA device

The following `tag-mfa-device` command adds a tag with a Department name to the specified MFA device.

```
aws iam tag-mfa-device \  
  --serial-number arn:aws:iam::123456789012:mfa/alice \  
  --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [TagMfaDevice](#) in *AWS CLI Command Reference*.

tag-open-id-connect-provider

The following code example shows how to use `tag-open-id-connect-provider`.

AWS CLI

To add a tag to an OpenID Connect (OIDC)-compatible identity provider

The following `tag-open-id-connect-provider` command adds a tag with a Department name to the specified OIDC identity provider.

```
aws iam tag-open-id-connect-provider \  
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/  
server.example.com \  
  --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [TagOpenIdConnectProvider](#) in *AWS CLI Command Reference*.

tag-policy

The following code example shows how to use `tag-policy`.

AWS CLI

To add a tag to a customer managed policy

The following `tag-policy` command adds a tag with a Department name to the specified customer managed policy.

```
aws iam tag-policy \  
  --policy-arn arn:aws:iam::123456789012:policy/billing-access \  
  --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [TagPolicy](#) in *AWS CLI Command Reference*.

tag-role

The following code example shows how to use `tag-role`.

AWS CLI

To add a tag to a role

The following `tag-role` command adds a tag with a Department name to the specified role.

```
aws iam tag-role --role-name my-role \  
  --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [TagRole](#) in *AWS CLI Command Reference*.

tag-saml-provider

The following code example shows how to use `tag-saml-provider`.

AWS CLI

To add a tag to a SAML provider

The following `tag-saml-provider` command adds a tag with a Department name to the specified SAML provider.

```
aws iam tag-saml-provider \  
  --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \  
  --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [TagSamlProvider](#) in *AWS CLI Command Reference*.

tag-server-certificate

The following code example shows how to use `tag-server-certificate`.

AWS CLI

To add a tag to a server certificate

The following `tag-saml-provider` command adds a tag with a Department name to the specified sever certificate.

```
aws iam tag-server-certificate \  
  --server-certificate-name ExampleCertificate \  
  --tags '[{"Key": "Department", "Value": "Accounting"}]'
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [TagServerCertificate](#) in *AWS CLI Command Reference*.

tag-user

The following code example shows how to use `tag-user`.

AWS CLI

To add a tag to a user

The following `tag-user` command adds a tag with the associated Department to the specified user.

```
aws iam tag-user \  
  --user-name alice \  
  --tags '{"Key": "Department", "Value": "Accounting"}'
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [TagUser](#) in *AWS CLI Command Reference*.

untag-instance-profile

The following code example shows how to use `untag-instance-profile`.

AWS CLI

To remove a tag from an instance profile

The following `untag-instance-profile` command removes any tag with the key name 'Department' from the specified instance profile.

```
aws iam untag-instance-profile \  
  --instance-profile-name deployment-role \  
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [UntagInstanceProfile](#) in *AWS CLI Command Reference*.

untag-mfa-device

The following code example shows how to use `untag-mfa-device`.

AWS CLI

To remove a tag from an MFA device

The following `untag-mfa-device` command removes any tag with the key name 'Department' from the specified MFA device.

```
aws iam untag-mfa-device \  
  --serial-number arn:aws:iam::123456789012:mfa/alice \  
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [UntagMfaDevice](#) in *AWS CLI Command Reference*.

untag-open-id-connect-provider

The following code example shows how to use `untag-open-id-connect-provider`.

AWS CLI

To remove a tag from an OIDC identity provider

The following `untag-open-id-connect-provider` command removes any tag with the key name 'Department' from the specified OIDC identity provider.

```
aws iam untag-open-id-connect-provider \  
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/  
server.example.com \  
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [UntagOpenIdConnectProvider](#) in *AWS CLI Command Reference*.

untag-policy

The following code example shows how to use `untag-policy`.

AWS CLI

To remove a tag from a customer managed policy

The following `untag-policy` command removes any tag with the key name 'Department' from the specified customer managed policy.

```
aws iam untag-policy \  
  --policy-arn arn:aws:iam::452925170507:policy/billing-access \  
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [UntagPolicy](#) in *AWS CLI Command Reference*.

untag-role

The following code example shows how to use `untag-role`.

AWS CLI

To remove a tag from a role

The following `untag-role` command removes any tag with the key name 'Department' from the specified role.

```
aws iam untag-role \  
  --role-name my-role \  
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [UntagRole](#) in *AWS CLI Command Reference*.

untag-saml-provider

The following code example shows how to use `untag-saml-provider`.

AWS CLI

To remove a tag from a SAML provider

The following `untag-saml-provider` command removes any tag with the key name 'Department' from the specified instance profile.

```
aws iam untag-saml-provider \  
  --saml-provider-arn arn:aws:iam::123456789012:saml-provider/ADFS \  
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [UntagSamlProvider](#) in *AWS CLI Command Reference*.

untag-server-certificate

The following code example shows how to use `untag-server-certificate`.

AWS CLI

To remove a tag from a server certificate

The following `untag-server-certificate` command removes any tag with the key name 'Department' from the specified server certificate.

```
aws iam untag-server-certificate \  
  --server-certificate-name ExampleCertificate \  
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [UntagServerCertificate](#) in *AWS CLI Command Reference*.

untag-user

The following code example shows how to use `untag-user`.

AWS CLI

To remove a tag from a user

The following `untag-user` command removes any tag with the key name 'Department' from the specified user.

```
aws iam untag-user \  
  --user-name alice \  
  --tag-keys Department
```

This command produces no output.

For more information, see [Tagging IAM resources](#) in the *AWS IAM User Guide*.

- For API details, see [UntagUser](#) in *AWS CLI Command Reference*.

update-access-key

The following code example shows how to use `update-access-key`.

AWS CLI

To activate or deactivate an access key for an IAM user

The following `update-access-key` command deactivates the specified access key (access key ID and secret access key) for the IAM user named Bob.

```
aws iam update-access-key \  
  --access-key-id AKIAIOSFODNN7EXAMPLE \  
  --status Inactive \  
  --user-name Bob
```

This command produces no output.

Deactivating the key means that it cannot be used for programmatic access to AWS. However, the key is still available and can be reactivated.

For more information, see [Managing access keys for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateAccessKey](#) in *AWS CLI Command Reference*.

update-account-password-policy

The following code example shows how to use `update-account-password-policy`.

AWS CLI

To set or change the current account password policy

The following `update-account-password-policy` command sets the password policy to require a minimum length of eight characters and to require one or more numbers in the password.

```
aws iam update-account-password-policy \  
  --minimum-password-length 8 \  
  --require-numbers
```

This command produces no output.

Changes to an account's password policy affect any new passwords that are created for IAM users in the account. Password policy changes do not affect existing passwords.

For more information, see [Setting an account password policy for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateAccountPasswordPolicy](#) in *AWS CLI Command Reference*.

update-assume-role-policy

The following code example shows how to use `update-assume-role-policy`.

AWS CLI

To update the trust policy for an IAM role

The following `update-assume-role-policy` command updates the trust policy for the role named `Test-Role`.

```
aws iam update-assume-role-policy \  
  --role-name Test-Role \  
  --policy-document file://Test-Role-Trust-Policy.json
```

This command produces no output.

The trust policy is defined as a JSON document in the `Test-Role-Trust-Policy.json` file. (The file name and extension do not have significance.) The trust policy must specify a principal.

To update the permissions policy for a role, use the `put-role-policy` command.

For more information, see [Creating IAM roles](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateAssumeRolePolicy](#) in *AWS CLI Command Reference*.

update-group

The following code example shows how to use `update-group`.

AWS CLI

To rename an IAM group

The following `update-group` command changes the name of the IAM group `Test` to `Test-1`.

```
aws iam update-group \  
  --group-name Test \  
  --new-group-name Test-1
```

This command produces no output.

For more information, see [Renaming an IAM user group](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateGroup](#) in *AWS CLI Command Reference*.

update-login-profile

The following code example shows how to use `update-login-profile`.

AWS CLI

To update the password for an IAM user

The following `update-login-profile` command creates a new password for the IAM user named `Bob`.

```
aws iam update-login-profile \  
  --user-name Bob \  
  --password <password>
```

This command produces no output.

To set a password policy for the account, use the `update-account-password-policy` command. If the new password violates the account password policy, the command returns a `PasswordPolicyViolation` error.

If the account password policy allows them to, IAM users can change their own passwords using the `change-password` command.

Store the password in a secure place. If the password is lost, it cannot be recovered, and you must create a new one using the `create-login-profile` command.

For more information, see [Managing passwords for IAM users](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateLoginProfile](#) in *AWS CLI Command Reference*.

update-open-id-connect-provider-thumbprint

The following code example shows how to use `update-open-id-connect-provider-thumbprint`.

AWS CLI

To replace the existing list of server certificate thumbprints with a new list

This example updates the certificate thumbprint list for the OIDC provider whose ARN is `arn:aws:iam::123456789012:oidc-provider/example.oidcprovider.com` to use a new thumbprint.

```
aws iam update-open-id-connect-provider-thumbprint \  
  --open-id-connect-provider-arn arn:aws:iam::123456789012:oidc-provider/  
example.oidcprovider.com \  
  --thumbprint-list 7359755EXAMPLEabc3060bce3EXAMPLEec4542a3
```

This command produces no output.

For more information, see [Creating OpenID Connect \(OIDC\) identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateOpenIdConnectProviderThumbprint](#) in *AWS CLI Command Reference*.

update-role-description

The following code example shows how to use `update-role-description`.

AWS CLI

To change an IAM role's description

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role`.

```
aws iam update-role-description \  
  --role-name production-role \  
  --description 'Main production role'
```

Output:

```
{  
  "Role": {  
    "Path": "/",  
    "RoleName": "production-role",  
    "RoleId": "AROA1234567890EXAMPLE",  
    "Arn": "arn:aws:iam::123456789012:role/production-role",  
    "CreateDate": "2017-12-06T17:16:37+00:00",  
    "AssumeRolePolicyDocument": {  
      "Version": "2012-10-17",  
      "Statement": [  
        {  
          "Effect": "Allow",  
          "Principal": {  
            "AWS": "arn:aws:iam::123456789012:root"  
          },  
          "Action": "sts:AssumeRole",  
          "Condition": {}  
        }  
      ]  
    },  
    "Description": "Main production role"  
  }  
}
```

For more information, see [Modifying a role](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateRoleDescription](#) in *AWS CLI Command Reference*.

update-role

The following code example shows how to use `update-role`.

AWS CLI

To change an IAM role's description or session duration

The following `update-role` command changes the description of the IAM role `production-role` to `Main production role` and sets the maximum session duration to 12 hours.

```
aws iam update-role \  
  --role-name production-role \  
  --description 'Main production role' \  
  --max-session-duration 43200
```

This command produces no output.

For more information, see [Modifying a role](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateRole](#) in *AWS CLI Command Reference*.

update-saml-provider

The following code example shows how to use `update-saml-provider`.

AWS CLI

To update the metadata document for an existing SAML provider

This example updates the SAML provider in IAM whose ARN is `arn:aws:iam::123456789012:saml-provider/SAMLADFS` with a new SAML metadata document from the file `SAMLMetaData.xml`.

```
aws iam update-saml-provider \  
  --saml-metadata-document file://SAMLMetaData.xml \  
  --saml-provider-arn arn:aws:iam::123456789012:saml-provider/SAMLADFS
```

Output:

```
{
  "SAMLProviderArn": "arn:aws:iam::123456789012:saml-provider/SAMLADFS"
}
```

For more information, see [Creating IAM SAML identity providers](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateSamlProvider](#) in *AWS CLI Command Reference*.

update-server-certificate

The following code example shows how to use `update-server-certificate`.

AWS CLI

To change the path or name of a server certificate in your AWS account

The following `update-server-certificate` command changes the name of the certificate from `myServerCertificate` to `myUpdatedServerCertificate`. It also changes the path to `/cloudfront/` so that it can be accessed by the Amazon CloudFront service. This command produces no output. You can see the results of the update by running the `list-server-certificates` command.

```
aws-iam update-server-certificate \
  --server-certificate-name myServerCertificate \
  --new-server-certificate-name myUpdatedServerCertificate \
  --new-path /cloudfront/
```

This command produces no output.

For more information, see [Managing server certificates in IAM](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateServerCertificate](#) in *AWS CLI Command Reference*.

update-service-specific-credential

The following code example shows how to use `update-service-specific-credential`.

AWS CLI

Example 1: To update the status of the requesting user's service-specific credential

The following `update-service-specific-credential` example changes the status for the specified credential for the user making the request to Inactive.

```
aws iam update-service-specific-credential \  
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \  
  --status Inactive
```

This command produces no output.

Example 2: To update the status of a specified user's service-specific credential

The following `update-service-specific-credential` example changes the status for the credential of the specified user to Inactive.

```
aws iam update-service-specific-credential \  
  --user-name sofia \  
  --service-specific-credential-id ACCAEXAMPLE123EXAMPLE \  
  --status Inactive
```

This command produces no output.

For more information, see [Create Git Credentials for HTTPS Connections to CodeCommit](#) in the *AWS CodeCommit User Guide*

- For API details, see [UpdateServiceSpecificCredential](#) in *AWS CLI Command Reference*.

update-signing-certificate

The following code example shows how to use `update-signing-certificate`.

AWS CLI

To activate or deactivate a signing certificate for an IAM user

The following `update-signing-certificate` command deactivates the specified signing certificate for the IAM user named Bob.

```
aws iam update-signing-certificate \  
  --certificate-id TA7SMP42TDN5Z260BPJE7EXAMPLE \  
  --status Inactive \  
  --user-name Bob
```

To get the ID for a signing certificate, use the `list-signing-certificates` command.

For more information, see [Manage signing certificates](#) in the *Amazon EC2 User Guide*.

- For API details, see [UpdateSigningCertificate](#) in *AWS CLI Command Reference*.

update-ssh-public-key

The following code example shows how to use `update-ssh-public-key`.

AWS CLI

To change the status of an SSH public key

The following `update-ssh-public-key` command changes the status of the specified public key to `Inactive`.

```
aws iam update-ssh-public-key \  
  --user-name sofia \  
  --ssh-public-key-id APKA1234567890EXAMPLE \  
  --status Inactive
```

This command produces no output.

For more information, see [Use SSH keys and SSH with CodeCommit](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateSshPublicKey](#) in *AWS CLI Command Reference*.

update-user

The following code example shows how to use `update-user`.

AWS CLI

To change an IAM user's name

The following `update-user` command changes the name of the IAM user Bob to Robert.

```
aws iam update-user \  
  --user-name Bob \  
  --new-user-name Robert
```

This command produces no output.

For more information, see [Renaming an IAM user group](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateUser](#) in *AWS CLI Command Reference*.

upload-server-certificate

The following code example shows how to use `upload-server-certificate`.

AWS CLI

To upload a server certificate to your AWS account

The following `upload-server-certificate` command uploads a server certificate to your AWS account. In this example, the certificate is in the file `public_key_cert_file.pem`, the associated private key is in the file `my_private_key.pem`, and the the certificate chain provided by the certificate authority (CA) is in the `my_certificate_chain_file.pem` file. When the file has finished uploading, it is available under the name `myServerCertificate`. Parameters that begin with `file://` tells the command to read the contents of the file and use that as the parameter value instead of the file name itself.

```
aws iam upload-server-certificate \  
  --server-certificate-name myServerCertificate \  
  --certificate-body file://public_key_cert_file.pem \  
  --private-key file://my_private_key.pem \  
  --certificate-chain file://my_certificate_chain_file.pem
```

Output:

```
{  
  "ServerCertificateMetadata": {  
    "Path": "/",  
    "ServerCertificateName": "myServerCertificate",  
    "ServerCertificateId": "ASCAEXAMPLE123EXAMPLE",  
    "Arn": "arn:aws:iam::1234567989012:server-certificate/myServerCertificate",  
    "UploadDate": "2019-04-22T21:13:44+00:00",  
    "Expiration": "2019-10-15T22:23:16+00:00"  
  }  
}
```

For more information, see [Creating, Uploading, and Deleting Server Certificates](#) in the *Using IAM* guide.

- For API details, see [UploadServerCertificate](#) in *AWS CLI Command Reference*.

upload-signing-certificate

The following code example shows how to use `upload-signing-certificate`.

AWS CLI

To upload a signing certificate for an IAM user

The following `upload-signing-certificate` command uploads a signing certificate for the IAM user named Bob.

```
aws iam upload-signing-certificate \  
  --user-name Bob \  
  --certificate-body file://certificate.pem
```

Output:

```
{  
  "Certificate": {  
    "UserName": "Bob",  
    "Status": "Active",  
    "CertificateBody": "-----BEGIN CERTIFICATE-----<certificate-body>-----END  
CERTIFICATE-----",  
    "CertificateId": "TA7SMP42TDN5Z260BPJE7EXAMPLE",  
    "UploadDate": "2013-06-06T21:40:08.121Z"  
  }  
}
```

The certificate is in a file named *certificate.pem* in PEM format.

For more information, see [Creating and Uploading a User Signing Certificate](#) in the *Using IAM* guide.

- For API details, see [UploadSigningCertificate](#) in *AWS CLI Command Reference*.

upload-ssh-public-key

The following code example shows how to use `upload-ssh-public-key`.

AWS CLI

To upload an SSH public key and associate it with a user

The following `upload-ssh-public-key` command uploads the public key found in the file `sshkey.pub` and attaches it to the user `sofia`.

```
aws iam upload-ssh-public-key \  
  --user-name sofia \  
  --ssh-public-key-body file://sshkey.pub
```

Output:

```
{  
  "SSHPublicKey": {  
    "UserName": "sofia",  
    "SSHPublicKeyId": "APKA1234567890EXAMPLE",  
    "Fingerprint": "12:34:56:78:90:ab:cd:ef:12:34:56:78:90:ab:cd:ef",  
    "SSHPublicKeyBody": "ssh-rsa <<long string generated by ssh-keygen  
command>>",  
    "Status": "Active",  
    "UploadDate": "2019-04-18T17:04:49+00:00"  
  }  
}
```

For more information about how to generate keys in a format suitable for this command, see [SSH and Linux, macOS, or Unix: Set up the public and private keys for Git and CodeCommit](#) or [SSH and Windows: Set up the public and private keys for Git and CodeCommit](#) in the *AWS CodeCommit User Guide*.

- For API details, see [UploadSshPublicKey](#) in *AWS CLI Command Reference*.

IAM Access Analyzer examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with IAM Access Analyzer.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

apply-archive-rule

The following code example shows how to use `apply-archive-rule`.

AWS CLI

To apply an archive rule to existing findings that meet the archive rule criteria

The following `apply-archive-rule` example applies an archive rule to existing findings that meet the archive rule criteria.

```
aws accessanalyzer apply-archive-rule \  
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/  
UnusedAccess-ConsoleAnalyzer-organization \  
  --rule-name MyArchiveRule
```

This command produces no output.

For more information, see [Archive rules](#) in the *AWS IAM User Guide*.

- For API details, see [ApplyArchiveRule](#) in *AWS CLI Command Reference*.

cancel-policy-generation

The following code example shows how to use `cancel-policy-generation`.

AWS CLI

To cancel the requested policy generation

The following `cancel-policy-generation` example cancels the requested policy generation job id.

```
aws accessanalyzer cancel-policy-generation \  
  --job-id 923a56b0-ebb8-4e80-8a3c-a11ccfbcd6f2
```

This command produces no output.

For more information, see [IAM Access Analyzer policy generation](#) in the *AWS IAM User Guide*.

- For API details, see [CancelPolicyGeneration](#) in *AWS CLI Command Reference*.

check-access-not-granted

The following code example shows how to use `check-access-not-granted`.

AWS CLI

To check whether the specified access isn't allowed by a policy

The following `check-access-not-granted` example checks whether the specified access isn't allowed by a policy.

```
aws accessanalyzer check-access-not-granted \  
  --policy-document file://myfile.json \  
  --access actions="s3:DeleteBucket","s3:GetBucketLocation" \  
  --policy-type IDENTITY_POLICY
```

Contents of `myfile.json`:

```
{  
  "Version": "2012-10-17",  
  "Statement": [  
    {  
      "Effect": "Allow",  
      "Action": [  
        "s3:GetObject",  
        "s3:ListBucket"  
      ],  
      "Resource": [  
        "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
```

```

        "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
    ]
}

```

Output:

```

{
  "result": "PASS",
  "message": "The policy document does not grant access to perform the listed
actions."
}

```

For more information, see [Previewing access with IAM Access Analyzer APIs](#) in the *AWS IAM User Guide*.

- For API details, see [CheckAccessNotGranted](#) in *AWS CLI Command Reference*.

check-no-new-access

The following code example shows how to use `check-no-new-access`.

AWS CLI**To check whether new access is allowed for an updated policy when compared to the existing policy**

The following `check-no-new-access` example checks whether new access is allowed for an updated policy when compared to the existing policy.

```

aws accessanalyzer check-no-new-access \
  --existing-policy-document file://existing-policy.json \
  --new-policy-document file://new-policy.json \
  --policy-type IDENTITY_POLICY

```

Contents of `existing-policy.json`:

```

{
  "Version": "2012-10-17",
  "Statement": [

```

```
{
  "Effect": "Allow",
  "Action": [
    "s3:GetObject",
    "s3:ListBucket"
  ],
  "Resource": [
    "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
    "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
  ]
}
```

Contents of new-policy.json:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject",
        "s3:GetObjectAcl",
        "s3:ListBucket"
      ],
      "Resource": [
        "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
        "arn:aws:s3:::DOC-EXAMPLE-BUCKET/*"
      ]
    }
  ]
}
```

Output:

```
{
  "result": "FAIL",
  "message": "The modified permissions grant new access compared to your existing policy.",
  "reasons": [
    {
      "description": "New access in the statement with index: 0.",
```

```

        "statementIndex": 0
      }
    ]
  }

```

For more information, see [Previewing access with IAM Access Analyzer APIs](#) in the *AWS IAM User Guide*.

- For API details, see [CheckNoNewAccess](#) in *AWS CLI Command Reference*.

create-access-preview

The following code example shows how to use create-access-preview.

AWS CLI

To create an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions

The following create-access-preview example creates an access preview that allows you to preview IAM Access Analyzer findings for your resource before deploying resource permissions in your AWS account.

```

aws accessanalyzer create-access-preview \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
  ConsoleAnalyzer-account \
  --configurations file://myfile.json

```

Contents of myfile.json:

```

{
  "arn:aws:s3:::DOC-EXAMPLE-BUCKET": {
    "s3Bucket": {
      "bucketPolicy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":[\"arn:aws:iam::111122223333:root\"]},\"Action\":[\"s3:PutObject\",\"s3:PutObjectAcl\"],\"Resource\":[\"arn:aws:s3:::DOC-EXAMPLE-BUCKET/*\"]}]}",
      "bucketPublicAccessBlock": {
        "ignorePublicAcls": true,
        "restrictPublicBuckets": true
      },
      "bucketAclGrants": [

```

```
{
  "grantee": {
    "id":
"79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
  },
  "permission": "READ"
}
]
```

Output:

```
{
  "id": "3c65eb13-6ef9-4629-8919-a32043619e6b"
}
```

For more information, see [Previewing access with IAM Access Analyzer APIs](#) in the *AWS IAM User Guide*.

- For API details, see [CreateAccessPreview](#) in *AWS CLI Command Reference*.

create-analyzer

The following code example shows how to use `create-analyzer`.

AWS CLI**To create an analyzer**

The following `create-analyzer` example creates an analyzer in your AWS account.

```
aws accessanalyzer create-analyzer \
  --analyzer-name example \
  --type ACCOUNT
```

Output:

```
{
  "arn": "arn:aws:access-analyzer:us-east-2:111122223333:analyzer/example"
```

```
}
```

For more information, see [Getting started with AWS Identity and Access Management Access Analyzer findings](#) in the *AWS IAM User Guide*.

- For API details, see [CreateAnalyzer](#) in *AWS CLI Command Reference*.

create-archive-rule

The following code example shows how to use `create-archive-rule`.

AWS CLI

To create an archive rule for the specified analyzer

The following `create-archive-rule` example creates an archive rule for the specified analyzer in your AWS account.

```
aws accessanalyzer create-archive-rule \  
  --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \  
  --rule-name MyRule \  
  --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":  
  ["AWS::IAM::Role"]}]'
```

This command produces no output.

For more information, see [Archive rules](#) in the *AWS IAM User Guide*.

- For API details, see [CreateArchiveRule](#) in *AWS CLI Command Reference*.

delete-analyzer

The following code example shows how to use `delete-analyzer`.

AWS CLI

To delete the specified analyzer

The following `delete-analyzer` example deletes the specified analyzer in your AWS account.

```
aws accessanalyzer delete-analyzer \  
  --analyzer-name example
```

This command produces no output.

For more information, see [Archive rules](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteAnalyzer](#) in *AWS CLI Command Reference*.

delete-archive-rule

The following code example shows how to use `delete-archive-rule`.

AWS CLI

To delete the specified archive rule

The following `delete-archive-rule` example deletes the specified archive rule in your AWS account.

```
aws accessanalyzer delete-archive-rule \  
  --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \  
  --rule-name MyRule
```

This command produces no output.

For more information, see [Archive rules](#) in the *AWS IAM User Guide*.

- For API details, see [DeleteArchiveRule](#) in *AWS CLI Command Reference*.

get-access-preview

The following code example shows how to use `get-access-preview`.

AWS CLI

To retrieves information about an access preview for the specified analyzer

The following `get-access-preview` example retrieves information about an access preview for the specified analyzer in your AWS account.

```
aws accessanalyzer get-access-preview \  
  --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \  
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/  
ConsoleAnalyzer-account
```

Output:

```
{
  "accessPreview": {
    "id": "3c65eb13-6ef9-4629-8919-a32043619e6b",
    "analyzerArn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
    "configurations": {
      "arn:aws:s3:::DOC-EXAMPLE-BUCKET": {
        "s3Bucket": {
          "bucketPolicy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\n\"Effect\":\n\"Allow\", \"Principal\":{\n\"AWS\":[\n\"arn:aws:iam::111122223333:root\"
]}\n\"Action\":[\n\"s3:PutObject\", \"s3:PutObjectAcl\"], \"Resource\":\n\"arn:aws:s3:::DOC-
EXAMPLE-BUCKET/*\"}]}",
          "bucketAclGrants": [
            {
              "permission": "READ",
              "grantee": {
                "id":
"79a59df900b949e55d96a1e698fbacedfd6e09d98eacf8f8d5218e7cd47ef2be"
              }
            }
          ],
          "bucketPublicAccessBlock": {
            "ignorePublicAcls": true,
            "restrictPublicBuckets": true
          }
        }
      }
    },
    "createdAt": "2024-02-17T00:18:44+00:00",
    "status": "COMPLETED"
  }
}
```

For more information, see [Previewing access with IAM Access Analyzer APIs](#) in the *AWS IAM User Guide*.

- For API details, see [GetAccessPreview](#) in *AWS CLI Command Reference*.

get-analyzed-resource

The following code example shows how to use `get-analyzed-resource`.

AWS CLI

To retrieve information about a resource that was analyzed

The following `get-analyzed-resource` example retrieves information about a resource that was analyzed in your AWS account.

```
aws accessanalyzer get-analyzed-resource \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
  ConsoleAnalyzer-account \
  --resource-arn arn:aws:s3:::DOC-EXAMPLE-BUCKET
```

Output:

```
{
  "resource": {
    "analyzedAt": "2024-02-15T18:01:53.002000+00:00",
    "isPublic": false,
    "resourceArn": "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
    "resourceOwnerAccount": "111122223333",
    "resourceType": "AWS::S3::Bucket"
  }
}
```

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [GetAnalyzedResource](#) in *AWS CLI Command Reference*.

get-analyzer

The following code example shows how to use `get-analyzer`.

AWS CLI

To retrieve information about the specified analyzer

The following `get-analyzer` example retrieves information about the specified analyzer in your AWS account.

```
aws accessanalyzer get-analyzer \
  --analyzer-name ConsoleAnalyzer-account
```

Output:

```
{
  "analyzer": {
    "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
    "createdAt": "2019-12-03T07:28:17+00:00",
    "lastResourceAnalyzed": "arn:aws:sns:us-west-2:111122223333:config-topic",
    "lastResourceAnalyzedAt": "2024-02-15T18:01:53.003000+00:00",
    "name": "ConsoleAnalyzer-account",
    "status": "ACTIVE",
    "tags": {
      "auto-delete": "no"
    },
    "type": "ACCOUNT"
  }
}
```

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [GetAnalyzer](#) in *AWS CLI Command Reference*.

get-archive-rule

The following code example shows how to use `get-archive-rule`.

AWS CLI**To retrieve information about an archive rule**

The following `get-archive-rule` example retrieves information about an archive rule in your AWS account.

```
aws accessanalyzer get-archive-rule \
  --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \
  --rule-name MyArchiveRule
```

Output:

```
{
```

```
"archiveRule": {
  "createdAt": "2024-02-15T00:49:27+00:00",
  "filter": {
    "resource": {
      "contains": [
        "Cognito"
      ]
    },
    "resourceType": {
      "eq": [
        "AWS::IAM::Role"
      ]
    }
  },
  "ruleName": "MyArchiveRule",
  "updatedAt": "2024-02-15T00:49:27+00:00"
}
}
```

For more information, see [Archive rules](#) in the *AWS IAM User Guide*.

- For API details, see [GetArchiveRule](#) in *AWS CLI Command Reference*.

get-finding-v2

The following code example shows how to use `get-finding-v2`.

AWS CLI

To retrieve information about the specified finding

The following `get-finding-v2` example retrieves information about the specified finding in your AWS account.

```
aws accessanalyzer get-finding-v2 \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
  ConsoleAnalyzer-organization \
  --id 0910eedb-381e-4e95-adda-0d25c19e6e90
```

Output:

```
{
```

```

    "findingDetails": [
      {
        "externalAccessDetails": {
          "action": [
            "sts:AssumeRoleWithWebIdentity"
          ],
          "condition": {
            "cognito-identity.amazonaws.com:aud": "us-
west-2:EXAMPLE0-0000-0000-0000-000000000000"
          },
          "isPublic": false,
          "principal": {
            "Federated": "cognito-identity.amazonaws.com"
          }
        }
      }
    ],
    "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
    "status": "ACTIVE",
    "error": null,
    "createdAt": "2021-02-26T21:17:50.905000+00:00",
    "resourceType": "AWS::IAM::Role",
    "findingType": "ExternalAccess",
    "resourceOwnerAccount": "111122223333",
    "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
    "id": "0910eedb-381e-4e95-adda-0d25c19e6e90",
    "updatedAt": "2021-02-26T21:17:50.905000+00:00"
  }
}

```

For more information, see [Reviewing findings](#) in the *AWS IAM User Guide*.

- For API details, see [GetFindingV2](#) in *AWS CLI Command Reference*.

get-finding

The following code example shows how to use `get-finding`.

AWS CLI

To retrieve information about the specified finding

The following `get-finding` example retrieves information about the specified finding in your AWS account.

```
aws accessanalyzer get-finding \  
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/  
ConsoleAnalyzer-organization \  
  --id 0910eedb-381e-4e95-adda-0d25c19e6e90
```

Output:

```
{  
  "finding": {  
    "id": "0910eedb-381e-4e95-adda-0d25c19e6e90",  
    "principal": {  
      "Federated": "cognito-identity.amazonaws.com"  
    },  
    "action": [  
      "sts:AssumeRoleWithWebIdentity"  
    ],  
    "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",  
    "isPublic": false,  
    "resourceType": "AWS::IAM::Role",  
    "condition": {  
      "cognito-identity.amazonaws.com:aud": "us-  
west-2:EXAMPLE0-0000-0000-0000-000000000000"  
    },  
    "createdAt": "2021-02-26T21:17:50.905000+00:00",  
    "analyzedAt": "2024-02-16T18:17:47.888000+00:00",  
    "updatedAt": "2021-02-26T21:17:50.905000+00:00",  
    "status": "ACTIVE",  
    "resourceOwnerAccount": "111122223333"  
  }  
}
```

For more information, see [Reviewing findings](#) in the *AWS IAM User Guide*.

- For API details, see [GetFinding](#) in *AWS CLI Command Reference*.

get-generated-policy

The following code example shows how to use `get-generated-policy`.

AWS CLI

To retrieve the policy that was generated using the `StartPolicyGeneration` API`

The following `get-generated-policy` example retrieves the policy that was generated using the `StartPolicyGeneration` API in your AWS account.

```
aws accessanalyzer get-generated-policy \
  --job-id c557dc4a-0338-4489-95dd-739014860ff9
```

Output:

```
{
  "generatedPolicyResult": {
    "generatedPolicies": [
      {
        "policy": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\n\"Sid\":\n\"SupportedServiceSid0\", \"Effect\": \"Allow\", \"Action\":

  }
}
```

For more information, see [IAM Access Analyzer policy generation](#) in the *AWS IAM User Guide*.

- For API details, see [GetGeneratedPolicy](#) in *AWS CLI Command Reference*.

list-access-preview-findings

The following code example shows how to use `list-access-preview-findings`.

AWS CLI

To retrieve a list of access preview findings generated by the specified access preview

The following `list-access-preview-findings` example retrieves a list of access preview findings generated by the specified access preview in your AWS account.

```
aws accessanalyzer list-access-preview-findings \
  --access-preview-id 3c65eb13-6ef9-4629-8919-a32043619e6b \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account
```

Output:

```
{
  "findings": [
    {
      "id": "e22fc158-1c87-4c32-9464-e7f405ce8d74",
      "principal": {
        "AWS": "111122223333"
      },
      "action": [
        "s3:PutObject",
        "s3:PutObjectAcl"
      ],
    }
  ],
}
```

```

    "condition": {},
    "resource": "arn:aws:s3:::DOC-EXAMPLE-BUCKET",
    "isPublic": false,
    "resourceType": "AWS::S3::Bucket",
    "createdAt": "2024-02-17T00:18:46+00:00",
    "changeType": "NEW",
    "status": "ACTIVE",
    "resourceOwnerAccount": "111122223333",
    "sources": [
      {
        "type": "POLICY"
      }
    ]
  }
]
}

```

For more information, see [Previewing access with IAM Access Analyzer APIs](#) in the *AWS IAM User Guide*.

- For API details, see [ListAccessPreviewFindings](#) in *AWS CLI Command Reference*.

list-access-previews

The following code example shows how to use `list-access-previews`.

AWS CLI

To retrieve a list of access previews for the specified analyzer

The following `list-access-previews` example retrieves a list of access previews for the specified analyzer in your AWS account.

```

aws accessanalyzer list-access-previews \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
  ConsoleAnalyzer-account

```

Output:

```

{
  "accessPreviews": [
    {

```

```

        "id": "3c65eb13-6ef9-4629-8919-a32043619e6b",
        "analyzerArn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
        "createdAt": "2024-02-17T00:18:44+00:00",
        "status": "COMPLETED"
    }
]
}

```

For more information, see [Previewing access with IAM Access Analyzer APIs](#) in the *AWS IAM User Guide*.

- For API details, see [ListAccessPreviews](#) in *AWS CLI Command Reference*.

list-analyzed-resources

The following code example shows how to use `list-analyzed-resources`.

AWS CLI

To list the available widgets

The following `list-analyzed-resources` example lists the available widgets in your AWS account.

```

aws accessanalyzer list-analyzed-resources \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account \
  --resource-type AWS::IAM::Role

```

Output:

```

{
  "analyzedResources": [
    {
      "resourceArn": "arn:aws:sns:us-west-2:111122223333:Validation-Email",
      "resourceOwnerAccount": "111122223333",
      "resourceType": "AWS::SNS::Topic"
    },
    {
      "resourceArn": "arn:aws:sns:us-west-2:111122223333:admin-alerts",
      "resourceOwnerAccount": "111122223333",

```

```
    "resourceType": "AWS::SNS::Topic"
  },
  {
    "resourceArn": "arn:aws:sns:us-west-2:111122223333:config-topic",
    "resourceOwnerAccount": "111122223333",
    "resourceType": "AWS::SNS::Topic"
  },
  {
    "resourceArn": "arn:aws:sns:us-west-2:111122223333:inspector-topic",
    "resourceOwnerAccount": "111122223333",
    "resourceType": "AWS::SNS::Topic"
  }
]
}
```

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [ListAnalyzedResources](#) in *AWS CLI Command Reference*.

list-analyzers

The following code example shows how to use `list-analyzers`.

AWS CLI

To retrieve a list of analyzers

The following `list-analyzers` example retrieves a list of analyzers in your AWS account.

```
aws accessanalyzer list-analyzers
```

Output:

```
{
  "analyzers": [
    {
      "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/UnusedAccess-ConsoleAnalyzer-organization",
      "createdAt": "2024-02-15T00:46:40+00:00",
      "name": "UnusedAccess-ConsoleAnalyzer-organization",
      "status": "ACTIVE",
```

```

    "tags": {
      "auto-delete": "no"
    },
    "type": "ORGANIZATION_UNUSED_ACCESS"
  },
  {
    "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-organization",
    "createdAt": "2020-04-25T07:43:28+00:00",
    "lastResourceAnalyzed": "arn:aws:s3::DOC-EXAMPLE-BUCKET",
    "lastResourceAnalyzedAt": "2024-02-15T21:51:56.517000+00:00",
    "name": "ConsoleAnalyzer-organization",
    "status": "ACTIVE",
    "tags": {
      "auto-delete": "no"
    },
    "type": "ORGANIZATION"
  },
  {
    "arn": "arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
ConsoleAnalyzer-account",
    "createdAt": "2019-12-03T07:28:17+00:00",
    "lastResourceAnalyzed": "arn:aws:sns:us-west-2:111122223333:config-
topic",
    "lastResourceAnalyzedAt": "2024-02-15T18:01:53.003000+00:00",
    "name": "ConsoleAnalyzer-account",
    "status": "ACTIVE",
    "tags": {
      "auto-delete": "no"
    },
    "type": "ACCOUNT"
  }
]
}

```

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [ListAnalyzers](#) in *AWS CLI Command Reference*.

list-archive-rules

The following code example shows how to use `list-archive-rules`.

AWS CLI

To retrieve a list of archive rules created for the specified analyzer

The following `list-archive-rules` example retrieves a list of archive rules created for the specified analyzer in your AWS account.

```
aws accessanalyzer list-archive-rules \  
  --analyzer-name UnusedAccess-ConsoleAnalyzer-organization
```

Output:

```
{  
  "archiveRules": [  
    {  
      "createdAt": "2024-02-15T00:49:27+00:00",  
      "filter": {  
        "resource": {  
          "contains": [  
            "Cognito"  
          ]  
        },  
        "resourceType": {  
          "eq": [  
            "AWS::IAM::Role"  
          ]  
        }  
      },  
      "ruleName": "MyArchiveRule",  
      "updatedAt": "2024-02-15T00:49:27+00:00"  
    },  
    {  
      "createdAt": "2024-02-15T23:27:45+00:00",  
      "filter": {  
        "findingType": {  
          "eq": [  
            "UnusedIAMUserAccessKey"  
          ]  
        }  
      },  
      "ruleName": "ArchiveRule-56125a39-e517-4ff8-afb1-ef06f58db612",  
      "updatedAt": "2024-02-15T23:27:45+00:00"  
    }  
  ]  
}
```

```
]
}
```

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [ListArchiveRules](#) in *AWS CLI Command Reference*.

list-findings-v2

The following code example shows how to use `list-findings-v2`.

AWS CLI

To retrieve a list of findings generated by the specified analyzer

The following `list-findings-v2` example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains Cognito.

```
aws accessanalyzer list-findings-v2 \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
  ConsoleAnalyzer-account \
  --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
  ["AWS::IAM::Role"]}]'
```

Output:

```
{
  "findings": [
    {
      "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
      "createdAt": "2021-02-26T21:17:24.710000+00:00",
      "id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
      "resource": "arn:aws:iam::111122223333:role/
  Cognito_testpoolUnauth_Role",
      "resourceType": "AWS::IAM::Role",
      "resourceOwnerAccount": "111122223333",
      "status": "ACTIVE",
      "updatedAt": "2021-02-26T21:17:24.710000+00:00",
      "findingType": "ExternalAccess"
    },
  ],
}
```

```

    {
      "analyzedAt": "2024-02-16T18:17:47.888000+00:00",
      "createdAt": "2021-02-26T21:17:50.905000+00:00",
      "id": "ce0e221a-85b9-4d52-91ff-d7678075442f",
      "resource": "arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role",
      "resourceType": "AWS::IAM::Role",
      "resourceOwnerAccount": "111122223333",
      "status": "ACTIVE",
      "updatedAt": "2021-02-26T21:17:50.905000+00:00",
      "findingType": "ExternalAccess"
    }
  ]
}

```

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [ListFindingsV2](#) in *AWS CLI Command Reference*.

list-findings

The following code example shows how to use `list-findings`.

AWS CLI

To retrieve a list of findings generated by the specified analyzer

The following `list-findings` example retrieves a list of findings generated by the specified analyzer in your AWS account. This example filters the results to include only IAM roles whose name contains Cognito.

```

aws accessanalyzer list-findings \
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/
  ConsoleAnalyzer-account \
  --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":
  ["AWS::IAM::Role"]}}'

```

Output:

```

{
  "findings": [
    {

```

```

    "id": "597f3bc2-3adc-4c18-9879-5c4b23485e46",
    "principal": {
      "Federated": "cognito-identity.amazonaws.com"
    },
    "action": [
      "sts:AssumeRoleWithWebIdentity"
    ],
    "resource": "arn:aws:iam::111122223333:role/
Cognito_testpoolUnauth_Role",
    "isPublic": false,
    "resourceType": "AWS::IAM::Role",
    "condition": {
      "cognito-identity.amazonaws.com:aud": "us-

    "status": "ACTIVE",
    "resourceOwnerAccount": "111122223333"
  }
]

```

```
}
```

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [ListFindings](#) in *AWS CLI Command Reference*.

list-policy-generations

The following code example shows how to use `list-policy-generations`.

AWS CLI

To list all of the policy generations requested in the last seven days

The following `list-policy-generations` example lists all of the policy generations requested in the last seven days in your AWS account.

```
aws accessanalyzer list-policy-generations
```

Output:

```
{
  "policyGenerations": [
    {
      "completedOn": "2024-02-14T23:43:38+00:00",
      "jobId": "923a56b0-ebb8-4e80-8a3c-a11ccfbcd6f2",
      "principalArn": "arn:aws:iam::111122223333:role/Admin",
      "startedOn": "2024-02-14T23:43:02+00:00",
      "status": "CANCELED"
    },
    {
      "completedOn": "2024-02-14T22:47:01+00:00",
      "jobId": "c557dc4a-0338-4489-95dd-739014860ff9",
      "principalArn": "arn:aws:iam::111122223333:role/Admin",
      "startedOn": "2024-02-14T22:44:41+00:00",
      "status": "SUCCEEDED"
    }
  ]
}
```

For more information, see [IAM Access Analyzer policy generation](#) in the *AWS IAM User Guide*.

- For API details, see [ListPolicyGenerations](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To retrieve a list of tags applied to the specified resource

The following `list-tags-for-resource` example retrieves a list of tags applied to the specified resource in your AWS account.

```
aws accessanalyzer list-tags-for-resource \  
  --resource-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/  
  ConsoleAnalyzer-account
```

Output:

```
{  
  "tags": {  
    "Zone-of-trust": "Account",  
    "Name": "ConsoleAnalyzer"  
  }  
}
```

For more information, see [IAM Access Analyzer policy generation](#) in the *AWS IAM User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

start-policy-generation

The following code example shows how to use `start-policy-generation`.

AWS CLI

To start a policy generation request

The following `start-policy-generation` example starts a policy generation request in your AWS account.

```
aws accessanalyzer start-policy-generation \
  --policy-generation-details '{"principalArn":"arn:aws:iam::111122223333:role/
Admin"}' \
  --cloud-trail-details file://myfile.json
```

Contents of `myfile.json`:

```
{
  "accessRole": "arn:aws:iam::111122223333:role/service-role/
AccessAnalyzerMonitorServiceRole",
  "startTime": "2024-02-13T00:30:00Z",
  "trails": [
    {
      "allRegions": true,
      "cloudTrailArn": "arn:aws:cloudtrail:us-west-2:111122223333:trail/my-
trail"
    }
  ]
}
```

Output:

```
{
  "jobId": "c557dc4a-0338-4489-95dd-739014860ff9"
}
```

For more information, see [IAM Access Analyzer policy generation](#) in the *AWS IAM User Guide*.

- For API details, see [StartPolicyGeneration](#) in *AWS CLI Command Reference*.

start-resource-scan

The following code example shows how to use `start-resource-scan`.

AWS CLI

To immediately start a scan of the policies applied to the specified resource

The following `start-resource-scan` example immediately starts a scan of the policies applied to the specified resource in your AWS account.

```
aws accessanalyzer start-resource-scan \  
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/  
ConsoleAnalyzer-account \  
  --resource-arn arn:aws:iam::111122223333:role/Cognito_testpoolAuth_Role
```

This command produces no output.

For more information, see [IAM Access Analyzer policy generation](#) in the *AWS IAM User Guide*.

- For API details, see [StartResourceScan](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add a tag to the specified resource

The following tag-resource example adds a tag to the specified resource in your AWS account.

```
aws accessanalyzer tag-resource \  
  --resource-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/  
ConsoleAnalyzer-account \  
  --tags Environment=dev,Purpose=testing
```

This command produces no output.

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from the specified resources

The following `untag-resource` example removes tags from the specified resource in your AWS account.

```
aws accessanalyzer untag-resource \  
  --resource-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/  
ConsoleAnalyzer-account \  
  --tag-keys Environment Purpose
```

This command produces no output.

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-archive-rule

The following code example shows how to use `update-archive-rule`.

AWS CLI

To update the criteria and values for the specified archive rule

The following `update-archive-rule` example updates the criteria and values for the specified archive rule in your AWS account.

```
aws accessanalyzer update-archive-rule \  
  --analyzer-name UnusedAccess-ConsoleAnalyzer-organization \  
  --rule-name MyArchiveRule \  
  --filter '{"resource": {"contains": ["Cognito"]}, "resourceType": {"eq":  
["AWS::IAM::Role"]}]'
```

This command produces no output.

For more information, see [Archive rules](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateArchiveRule](#) in *AWS CLI Command Reference*.

update-findings

The following code example shows how to use `update-findings`.

AWS CLI

To update the status for the specified findings

The following `update-findings` example updates the status for the specified findings in your AWS account.

```
aws accessanalyzer update-findings \  
  --analyzer-arn arn:aws:access-analyzer:us-west-2:111122223333:analyzer/  
UnusedAccess-ConsoleAnalyzer-organization \  
  --ids 4f319ac3-2e0c-4dc4-bf51-7013a086b6ae 780d586a-2cce-4f72-aff6-359d450e7500  
 \  
  --status ARCHIVED
```

This command produces no output.

For more information, see [Using AWS Identity and Access Management Access Analyzer](#) in the *AWS IAM User Guide*.

- For API details, see [UpdateFindings](#) in *AWS CLI Command Reference*.

validate-policy

The following code example shows how to use `validate-policy`.

AWS CLI

To request the validation of a policy and returns a list of findings

The following `validate-policy` example requests the validation of a policy and returns a list of findings. The policy in the example is a role trust policy for an Amazon Cognito role used for web identity federation. The findings generated from the trust policy relate to an empty `Sid` element value and a mismatched policy principal due to the incorrect assume role action being used, `sts:AssumeRole`. The correct assume role action for use with Cognito is `sts:AssumeRoleWithWebIdentity`.

```
aws accessanalyzer validate-policy \  
  --policy-document file://myfile.json \  
  --policy-type RESOURCE_POLICY
```

Contents of `myfile.json`:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "",
      "Effect": "Allow",
      "Principal": {
        "Federated": "cognito-identity.amazonaws.com"
      },
      "Action": [
        "sts:AssumeRole",
        "sts:TagSession"
      ],
      "Condition": {
        "StringEquals": {
          "cognito-identity.amazonaws.com:aud": "us-west-2_EXAMPLE"
        }
      }
    }
  ]
}
```

Output:

```
{
  "findings": [
    {
      "findingDetails": "Add a value to the empty string in the Sid element.",
      "findingType": "SUGGESTION",

Image Builder examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Image Builder.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-component

The following code example shows how to use `create-component`.

AWS CLI

To create a component

The following `create-component` example creates a component that uses a JSON document file and references a component document in YAML format that is uploaded to an Amazon S3 bucket.

```
aws imagebuilder create-component \  
  --cli-input-json file://create-component.json
```

Contents of `create-component.json`:

```
{  
  "name": "MyExampleComponent",  
  "semanticVersion": "2019.12.02",  
  "description": "An example component that builds, validates and tests an image",  
  "changeDescription": "Initial version.",  
  "platform": "Windows",  
  "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"  
}
```

Output:

```
{
```

```
"requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
"componentBuildVersionArn": "arn:aws:imagebuilder:us-
west-2:123456789012:component/examplecomponent/2019.12.02/1"
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [CreateComponent](#) in *AWS CLI Command Reference*.

create-distribution-configuration

The following code example shows how to use create-distribution-configuration.

AWS CLI

To create a distribution configuration

The following create-distribution-configuration example creates a distribution configuration using a JSON file.

```
aws imagebuilder create-distribution-configuration \
  --cli-input-json file:/create-distribution-configuration.json
```

Contents of create-distribution-configuration.json:

```
{
  "name": "MyExampleDistribution",
  "description": "Copies AMI to eu-west-1",
  "distributions": [
    {
      "region": "us-west-2",
      "amiDistributionConfiguration": {
        "name": "Name {{imagebuilder:buildDate}}",
        "description": "An example image name with parameter references",
        "amiTags": {
          "KeyName": "{{ssm:parameter_name}}"
        },
        "launchPermission": {
          "userIds": [
            "123456789012"
          ]
        }
      }
    }
  ]
}
```

```

    ]
  }
},
{
  "region": "eu-west-1",
  "amiDistributionConfiguration": {
    "name": "My {{imagebuilder:buildVersion}} image
{{imagebuilder:buildDate}}",
    "amiTags": {
      "KeyName": "Value"
    },
    "launchPermission": {
      "userIds": [
        "123456789012"
      ]
    }
  }
}
]
}

```

Output:

```

{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
  "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution"
}

```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [CreateDistributionConfiguration](#) in *AWS CLI Command Reference*.

create-image-pipeline

The following code example shows how to use `create-image-pipeline`.

AWS CLI**To create an image pipeline**

The following `create-image-pipeline` example creates an image pipeline using a JSON file.

```
aws imagebuilder create-image-pipeline \  
  --cli-input-json file://create-image-pipeline.json
```

Contents of `create-image-pipeline.json`:

```
{  
  "name": "MyWindows2016Pipeline",  
  "description": "Builds Windows 2016 Images",  
  "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/  
mybasicrecipe/2019.12.03",  
  "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-  
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",  
  "distributionConfigurationArn": "arn:aws:imagebuilder:us-  
west-2:123456789012:distribution-configuration/myexampledistribution",  
  "imageTestsConfiguration": {  
    "imageTestsEnabled": true,  
    "timeoutMinutes": 60  
  },  
  "schedule": {  
    "scheduleExpression": "cron(0 0 * * SUN)",  
    "pipelineExecutionStartCondition":  
"EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"  
  },  
  "status": "ENABLED"  
}
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
  "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/  
mywindows2016pipeline"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [CreateImagePipeline](#) in *AWS CLI Command Reference*.

create-image-recipe

The following code example shows how to use `create-image-recipe`.

AWS CLI

To create a recipe

The following `create-image-recipe` example creates an image recipe using a JSON file. Components are installed in the order in which they are specified.

```
aws imagebuilder create-image-recipe \  
  --cli-input-json file://create-image-recipe.json
```

Contents of `create-image-recipe.json`:

```
{  
  "name": "MyBasicRecipe",  
  "description": "This example image recipe creates a Windows 2016 image.",  
  "semanticVersion": "2019.12.03",  
  "components":  
  [  
    {  
      "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/  
myexamplecomponent/2019.12.02/1"  
    },  
    {  
      "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/  
myimportedcomponent/1.0.0/1"  
    }  
  ],  
  "parentImage": "arn:aws:imagebuilder:us-west-2:aws:image/windows-server-2016-  
english-full-base-x86/xxxx.x.x"  
}
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
  "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/  
mybasicrecipe/2019.12.03"
```

```
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [CreateImageRecipe](#) in *AWS CLI Command Reference*.

create-image

The following code example shows how to use `create-image`.

AWS CLI

To create an image

The following `create-image` example creates an image.

```
aws imagebuilder create-image \  
  --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/  
mybasicrecipe/2019.12.03 \  
  --infrastructure-configuration-arn arn:aws:imagebuilder:us-  
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
  "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/  
mybasicrecipe/2019.12.03/1"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [CreateImage](#) in *AWS CLI Command Reference*.

create-infrastructure-configuration

The following code example shows how to use `create-infrastructure-configuration`.

AWS CLI

To create an infrastructure configuration

The following `create-infrastructure-configuration` example creates an infrastructure configuration using a JSON file.

```
aws imagebuilder create-infrastructure-configuration \  
  --cli-input-json file://create-infrastructure-configuration.json
```

Contents of `create-infrastructure-configuration.json`:

```
{  
  "name": "MyExampleInfrastructure",  
  "description": "An example that will retain instances of failed builds",  
  "instanceTypes": [  
    "m5.large", "m5.xlarge"  
  ],  
  "instanceProfileName": "EC2InstanceProfileForImageBuilder",  
  "securityGroupIds": [  
    "sg-a1b2c3d4"  
  ],  
  "subnetId": "subnet-a1b2c3d4",  
  "logging": {  
    "s3Logs": {  
      "s3BucketName": "bucket-name",  
      "s3KeyPrefix": "bucket-path"  
    }  
  },  
  "keyPair": "key-pair-name",  
  "terminateInstanceOnFailure": false,  
  "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-topic-name"  
}
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
  "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-  
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [CreateInfrastructureConfiguration](#) in *AWS CLI Command Reference*.

delete-component

The following code example shows how to use delete-component.

AWS CLI

To delete a component

The following delete-component example deletes a component build version by specifying its ARN.

```
aws imagebuilder delete-component \  
  --component-build-version-arn arn:aws:imagebuilder:us-  
west-2:123456789012:component/myexamplecomponent/2019.12.02/1
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "componentBuildVersionArn": "arn:aws:imagebuilder:us-  
west-2:123456789012:component/myexamplecomponent/2019.12.02/1"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [DeleteComponent](#) in *AWS CLI Command Reference*.

delete-image-pipeline

The following code example shows how to use delete-image-pipeline.

AWS CLI

To delete an image pipeline

The following `delete-image-pipeline` example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-image-pipeline \  
  --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/  
  my-example-pipeline
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/  
  mywindows2016pipeline"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [DeleteImagePipeline](#) in *AWS CLI Command Reference*.

delete-image-recipe

The following code example shows how to use `delete-image-recipe`.

AWS CLI

To delete an image recipe

The following `delete-image-recipe` example deletes an image recipe by specifying its ARN.

```
aws imagebuilder delete-image-recipe \  
  --image-recipe-arn arn:aws:imagebuilder:us-east-1:123456789012:image-recipe/  
  mybasicrecipe/2019.12.03
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/  
  mybasicrecipe/2019.12.03"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [DeleteImageRecipe](#) in *AWS CLI Command Reference*.

delete-image

The following code example shows how to use `delete-image`.

AWS CLI

To delete an image

The following `delete-image` example deletes an image build version by specifying its ARN.

```
aws imagebuilder delete-image \  
  --image-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/my-  
example-image/2019.12.02/1
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/  
mybasicrecipe/2019.12.03/1"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [DeleteImage](#) in *AWS CLI Command Reference*.

delete-infrastructure-configuration

The following code example shows how to use `delete-infrastructure-configuration`.

AWS CLI

To delete an infrastructure configuration

The following `delete-infrastructure-configuration` example deletes an image pipeline by specifying its ARN.

```
aws imagebuilder delete-infrastructure-configuration \  
  --infrastructure-configuration-arn arn:aws:imagebuilder:us-  
east-1:123456789012:infrastructure-configuration/myexampleinfrastructure
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-  
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [DeleteInfrastructureConfiguration](#) in *AWS CLI Command Reference*.

get-component-policy

The following code example shows how to use `get-component-policy`.

AWS CLI

To get component policy details

The following `get-component-policy` example lists the details of a component policy by specifying its ARN.

```
aws imagebuilder get-component-policy \  
  --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/my-  
example-component/2019.12.03/1
```

Output:

```
{

get-component

The following code example shows how to use `get-component`.

AWS CLI

To get component details

The following `get-component` example lists the details of a component by specifying its ARN.

```
aws imagebuilder get-component \
  --component-build-version-arn arn:aws:imagebuilder:us-
west-2:123456789012:component/component-name/1.0.0/1
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "component": {
    "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-
name/1.0.0/1",
    "name": "component-name",
    "version": "1.0.0",
    "type": "TEST",
    "platform": "Linux",
    "owner": "123456789012",
    "data": "name: HelloWorldTestingDocument\ndescription: This is hello world
testing document.\nschemaVersion: 1.0\n\nphases:\n - name: test\n   steps:\n
- name: HelloWorldStep\n       action: ExecuteBash\n       inputs:\n
commands:\n         - echo \"Hello World! Test.\"\n",
    "encrypted": true,
    "dateCreated": "2020-01-27T20:43:30.306Z",
    "tags": {}
  }
}
```

```
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

get-distribution-configuration

The following code example shows how to use `get-distribution-configuration`.

AWS CLI

To get the details of a distribution configuration

The following `get-distribution-configuration` example displays the details of a distribution configuration by specifying its ARN.

```
aws imagebuilder get-distribution-configuration \
  --distribution-configuration-arn arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexempldistribution
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "distributionConfiguration": {
    "arn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-
configuration/myexempldistribution",
    "name": "MyExampleDistribution",
    "description": "Copies AMI to eu-west-1 and exports to S3",
    "distributions": [
      {
        "region": "us-west-2",
        "amiDistributionConfiguration": {
          "name": "Name {{imagebuilder:buildDate}}",
          "description": "An example image name with parameter
references",
          "amiTags": {
            "KeyName": "{{ssm:parameter_name}}"
          },
          "launchPermission": {
            "userIds": [
```

```

        "123456789012"
    ]
  }
},
{
  "region": "eu-west-1",
  "amiDistributionConfiguration": {
    "name": "My {{imagebuilder:buildVersion}} image
{{imagebuilder:buildDate}}",
    "amiTags": {
      "KeyName": "Value"
    },
    "launchPermission": {
      "userIds": [
        "123456789012"
      ]
    }
  }
},
],
"dateCreated": "2020-02-19T18:40:10.529Z",
"tags": {}
}
}

```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [GetDistributionConfiguration](#) in *AWS CLI Command Reference*.

get-image-pipeline

The following code example shows how to use `get-image-pipeline`.

AWS CLI

To get image pipeline details

The following `get-image-pipeline` example lists the details of an image pipeline by specifying its ARN.

```
aws imagebuilder get-image-pipeline \
```

```
--image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "imagePipeline": {
    "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
    "name": "MyWindows2016Pipeline",
    "description": "Builds Windows 2016 Images",
    "platform": "Windows",
    "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/
mybasicrecipe/2019.12.03",
    "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
    "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
    "imageTestsConfiguration": {
      "imageTestsEnabled": true,
      "timeoutMinutes": 60
    },
    "schedule": {
      "scheduleExpression": "cron(0 0 * * SUN)",
      "pipelineExecutionStartCondition":
"EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"
    },
    "status": "ENABLED",
    "dateCreated": "2020-02-19T19:04:01.253Z",
    "dateUpdated": "2020-02-19T19:04:01.253Z",
    "tags": {}
  }
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [GetImagePipeline](#) in *AWS CLI Command Reference*.

get-image-policy

The following code example shows how to use `get-image-policy`.

AWS CLI

To get image policy details

The following `get-image-policy` example lists the details of an image policy by specifying its ARN.

```
aws imagebuilder get-image-policy \  
  --image-arn arn:aws:imagebuilder:us-west-2:123456789012:image/my-example-  
image/2019.12.03/1
```

Output:

```
{  
  "Policy": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\": \"Allow\",  
\"Principal\": { \"AWS\": [ \"123456789012\" ] }, \"Action\": [ \"imagebuilder:GetImage\",  
\"imagebuilder:ListImages\" ], \"Resource\": [ \"arn:aws:imagebuilder:us-  
west-2:123456789012:image/my-example-image/2019.12.03/1\" ] } ] }"
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [GetImagePolicy](#) in *AWS CLI Command Reference*.

get-image-recipe-policy

The following code example shows how to use `get-image-recipe-policy`.

AWS CLI

To get image recipe policy details

The following `get-image-recipe-policy` example lists the details of an image recipe policy by specifying its ARN.

```
aws imagebuilder get-image-recipe-policy \  
  --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/my-  
example-image-recipe/2019.12.03/1
```

Output:

```
{
  "Policy": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\":
\"Allow\", \"Principal\": { \"AWS\": [ \"123456789012\" ] }, \"Action\":
[ \"imagebuilder:GetImageRecipe\", \"imagebuilder:ListImageRecipes\" ], \"Resource\":
[ \"arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/my-example-image-
recipe/2019.12.03/1\" ] } ] }"
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [GetImageRecipePolicy](#) in *AWS CLI Command Reference*.

get-image

The following code example shows how to use `get-image`.

AWS CLI

To get image details

The following `get-image` example lists the details of an image by specifying its ARN.

```
aws imagebuilder get-image \
  --image-build-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "image": {
    "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1",

get-infrastructure-configuration

The following code example shows how to use `get-infrastructure-configuration`.

AWS CLI

To get infrastructure configuration details

The following `get-infrastructure-configuration` example lists the details of an infrastructure configuration by specifying its ARN.

```

aws imagebuilder get-infrastructure-configuration \
  --infrastructure-configuration-arn arn:aws:imagebuilder:us-
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure

```

Output:

```

{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "infrastructureConfiguration": {
    "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-
configuration/myexampleinfrastructure",

```

```
    "name": "MyExampleInfrastructure",
    "description": "An example that will retain instances of failed builds",
    "instanceTypes": [
      "m5.large",
      "m5.xlarge"
    ],
    "instanceProfileName": "EC2InstanceProfileForImageBuilder",
    "securityGroupIds": [
      "sg-a48c95ef"
    ],
    "subnetId": "subnet-a48c95ef",
    "logging": {
      "s3Logs": {
        "s3BucketName": "bucket-name",
        "s3KeyPrefix": "bucket-path"
      }
    },
    "keyPair": "Name",
    "terminateInstanceOnFailure": false,
    "snsTopicArn": "arn:aws:sns:us-west-2:123456789012:sns-name",
    "dateCreated": "2020-02-19T19:11:51.858Z",
    "tags": {}
  }
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [GetInfrastructureConfiguration](#) in *AWS CLI Command Reference*.

import-component

The following code example shows how to use `import-component`.

AWS CLI

To import a component

The following `import-component` example imports a preexisting script using a JSON file.

```
aws imagebuilder import-component \  
  --cli-input-json file://import-component.json
```

Contents of `import-component.json`:

```
{
  "name": "MyImportedComponent",
  "semanticVersion": "1.0.0",
  "description": "An example of how to import a component",
  "changeDescription": "First commit message.",
  "format": "SHELL",
  "platform": "Windows",
  "type": "BUILD",
  "uri": "s3://s3-bucket-name/s3-bucket-path/component.yaml"
}
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
  "componentBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myimportedcomponent/1.0.0/1"
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [ImportComponent](#) in *AWS CLI Command Reference*.

`list-component-build-versions`

The following code example shows how to use `list-component-build-versions`.

AWS CLI

To list component build versions

The following `list-component-build-versions` example lists the component build versions with a specific semantic version.

```
aws imagebuilder list-component-build-versions --component-version-arn
arn:aws:imagebuilder:us-west-2:123456789012:component/myexamplecomponent/2019.12.02
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "componentSummaryList": [
    {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/myexamplecomponent/2019.12.02/1",
      "name": "MyExampleComponent",
      "version": "2019.12.02",
      "platform": "Windows",
      "type": "BUILD",
      "owner": "123456789012",
      "description": "An example component that builds, validates and tests an image",
      "changeDescription": "Initial version.",
      "dateCreated": "2020-02-19T18:53:45.940Z",
      "tags": {
        "KeyName": "KeyValue"
      }
    }
  ]
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListComponentBuildVersions](#) in *AWS CLI Command Reference*.

list-components

The following code example shows how to use `list-components`.

AWS CLI

To list all of the component semantic versions

The following `list-components` example lists all of the component semantic versions to which you have access. You can optionally filter on whether to list components owned by you, by Amazon, or that have been shared with you by other accounts.

```
aws imagebuilder list-components
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "componentVersionList": [
    {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:component/component-
name/1.0.0",
      "name": "component-name",
      "version": "1.0.0",
      "platform": "Linux",
      "type": "TEST",
      "owner": "123456789012",
      "dateCreated": "2020-01-27T20:43:30.306Z"
    }
  ]
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListComponents](#) in *AWS CLI Command Reference*.

list-distribution-configurations

The following code example shows how to use `list-distribution-configurations`.

AWS CLI

To list distributions

The following `list-distribution-configurations` example lists all of your distributions.

```
aws imagebuilder list-distribution-configurations
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "distributionConfigurationSummaryList": [
    {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:distribution-
configuration/myexampledistribution",
      "name": "MyExampleDistribution",
```

```

        "description": "Copies AMI to eu-west-1 and exports to S3",
        "dateCreated": "2020-02-19T18:40:10.529Z",
        "tags": {
            "KeyName": "KeyValue"
        }
    ]
}

```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListDistributionConfigurations](#) in *AWS CLI Command Reference*.

list-image-build-versions

The following code example shows how to use `list-image-build-versions`.

AWS CLI

To list image build versions

The following `list-image-build-versions` example lists all of the image build versions with a semantic version.

```

aws imagebuilder list-image-build-versions \
  --image-version-arn arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03

```

Output:

```

{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "imageSummaryList": [
    {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/7",
      "name": "MyBasicRecipe",
      "version": "2019.12.03/7",
      "platform": "Windows",
      "state": {
        "status": "FAILED",

```

```

        "reason": "Can't start SSM Automation for arn
arn:aws:imagebuilder:us-west-2:123456789012:image/mybasicrecipe/2019.12.03/7 during
building. Parameter \"iamInstanceProfileName\" has a null value."
    },
    "owner": "123456789012",

list-image-pipeline-images

The following code example shows how to use `list-image-pipeline-images`.

AWS CLI

To list image pipeline pipeline images

The following `list-image-pipeline-images` example lists all images that were created by a specific image pipeline.

```

aws imagebuilder list-image-pipeline-images \
  --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline

```

Output:

```

{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "imagePipelineList": [
    {

```

```

    "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",

list-image-recipes

The following code example shows how to use `list-image-recipes`.

AWS CLI

To list image recipes

The following `list-image-recipes` example lists all of your image recipes.

```
aws imagebuilder list-image-recipes
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "imageRecipeSummaryList": [
    {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/mybasicrecipe/2019.12.03",

    }
  }
]
}

```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListImageRecipes](#) in *AWS CLI Command Reference*.

list-images

The following code example shows how to use `list-images`.

AWS CLI

To list images

The following `list-images` example lists all of the semantic versions you have access to.

```
aws imagebuilder list-images
```

Output:

```

{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "imageVersionList": [
    {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03",
      "name": "MyBasicRecipe",
      "version": "2019.12.03",
      "platform": "Windows",

```

```

        "owner": "123456789012",
        "dateCreated": "2020-02-14T21:29:18.810Z"
    }
]
}

```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListImages](#) in *AWS CLI Command Reference*.

list-infrastructure-configurations

The following code example shows how to use `list-infrastructure-configurations`.

AWS CLI

To list infrastructure configurations

The following `list-infrastructure-configurations` example lists all of your infrastructure configurations.

```
aws imagebuilder list-infrastructure-configurations
```

Output:

```

{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
  "infrastructureConfigurationSummaryList": [
    {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",
      "name": "MyExampleInfrastructure",
      "description": "An example that will retain instances of failed builds",
      "dateCreated": "2020-02-19T19:11:51.858Z",
      "tags": {}
    },
    {
      "arn": "arn:aws:imagebuilder:us-west-2:123456789012:infrastructure-configuration/infrastructureconfiguration-name-a1b2c3d45678",
      "name": "infrastructureConfiguration-name-a1b2c3d45678",
      "dateCreated": "2019-12-16T18:19:01.038Z",

```

```
        "tags": {
            "KeyName": "KeyValue"
        }
    ]
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListInfrastructureConfigurations](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a specific resource

The following `list-tags-for-resource` example lists all of the tags for a specific resource.

```
aws imagebuilder list-tags-for-resource \
  --resource-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline
```

Output:

```
{
  "tags": {
    "KeyName": "KeyValue"
  }
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-component-policy

The following code example shows how to use `put-component-policy`.

AWS CLI

To apply a resource policy to a component

The following `put-component-policy` command applies a resource policy to a build component to enable cross-account sharing of build components. We recommend you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-component-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-component-policy \  
  --component-arn arn:aws:imagebuilder:us-west-2:123456789012:component/  
examplecomponent/2019.12.02/1 \  
  --policy '{ "Version": "2012-10-17", "Statement": [ { "Effect":  
"Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":  
[ "imagebuilder:GetComponent", "imagebuilder:ListComponents" ],  
"Resource": [ "arn:aws:imagebuilder:us-west-2:123456789012:component/  
examplecomponent/2019.12.02/1" ] } ] }'
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "componentArn": "arn:aws:imagebuilder:us-west-2:123456789012:component/  
examplecomponent/2019.12.02/1"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [PutComponentPolicy](#) in *AWS CLI Command Reference*.

put-image-policy

The following code example shows how to use `put-image-policy`.

AWS CLI

To apply a resource policy to an image

The following `put-image-policy` command applies a resource policy to an image to enable cross-account sharing of images. We recommend you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-image-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-policy \  
  --image-arn arn:aws:imagebuilder:us-west-2:123456789012:image/example-  
image/2019.12.02/1 \  
  --policy '{ "Version": "2012-10-17", "Statement": [ { "Effect": "Allow",  
"Principal": { "AWS": [ "123456789012" ] }, "Action": [ "imagebuilder:GetImage",  
"imagebuilder:ListImages" ], "Resource": [ "arn:aws:imagebuilder:us-  
west-2:123456789012:image/example-image/2019.12.02/1" ] } ] }'
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "imageArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/example-  
image/2019.12.02/1"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [PutImagePolicy](#) in *AWS CLI Command Reference*.

put-image-recipe-policy

The following code example shows how to use `put-image-recipe-policy`.

AWS CLI

To apply a resource policy to an image recipe

The following `put-image-recipe-policy` command applies a resource policy to an image recipe to enable cross-account sharing of image recipes. We recommend that you use the RAM CLI command `create-resource-share`. If you use the EC2 Image Builder CLI command `put-image-recipe-policy`, you must also use the RAM CLI command `promote-resource-share-create-from-policy` in order for the resource to be visible to all principals with whom the resource is shared.

```
aws imagebuilder put-image-recipe-policy \  
  --image-recipe-arn arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/  
example-image-recipe/2019.12.02 \  
  --policy '{ "Version": "2012-10-17", "Statement": [ { "Effect":  
"Allow", "Principal": { "AWS": [ "123456789012" ] }, "Action":  
[ "imagebuilder:GetImageRecipe", "imagebuilder:ListImageRecipes" ], "Resource":  
[ "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/example-image-  
recipe/2019.12.02" ] } ] }'
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
  "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/  
example-image-recipe/2019.12.02/1"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [PutImageRecipePolicy](#) in *AWS CLI Command Reference*.

start-image-pipeline-execution

The following code example shows how to use `start-image-pipeline-execution`.

AWS CLI

To start an image pipeline manually

The following `start-image-pipeline-execution` example manually starts an image pipeline.

```
aws imagebuilder start-image-pipeline-execution \  
  --image-pipeline-arn arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/  
mywindows2016pipeline
```

Output:

```
{
```

```
"requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"clientToken": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
"imageBuildVersionArn": "arn:aws:imagebuilder:us-west-2:123456789012:image/
mybasicrecipe/2019.12.03/1"
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [StartImagePipelineExecution](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a resource

The following `tag-resource` example adds and tags a resource to EC2 Image Builder using a JSON file.

```
aws imagebuilder tag-resource \
  --cli-input-json file://tag-resource.json
```

Contents of `tag-resource.json`:

```
{
  "resourceArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/
mywindows2016pipeline",
  "tags": {
    "KeyName": "KeyValue"
  }
}
```

This command produces no output.

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes a tag from a resource using a JSON file.

```
aws imagebuilder untag-resource \  
  --cli-input-json file://tag-resource.json
```

Contents of `untag-resource.json`:

```
{  
  "resourceArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/  
mywindows2016pipeline",  
  "tagKeys": [  
    "KeyName"  
  ]  
}
```

This command produces no output.

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-distribution-configuration

The following code example shows how to use `update-distribution-configuration`.

AWS CLI

To update a distribution configuration

The following `update-distribution-configuration` example updates a distribution configuration using a JSON file.

```
aws imagebuilder update-distribution-configuration \  
  --cli-input-json file://update-distribution-configuration.json
```

```
--cli-input-json file://update-distribution-configuration.json
```

Contents of `update-distribution-configuration.json`:

```
{
  "distributionConfigurationArn": "arn:aws:imagebuilder:us-
west-2:123456789012:distribution-configuration/myexampledistribution",
  "description": "Copies AMI to eu-west-2 and exports to S3",
  "distributions": [
    {
      "region": "us-west-2",
      "amiDistributionConfiguration": {
        "name": "Name {{imagebuilder:buildDate}}",
        "description": "An example image name with parameter references"
      }
    },
    {
      "region": "eu-west-2",
      "amiDistributionConfiguration": {
        "name": "My {{imagebuilder:buildVersion}} image
{{imagebuilder:buildDate}}"
      }
    }
  ]
}
```

Output:

```
{
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [UpdateDistributionConfiguration](#) in *AWS CLI Command Reference*.

update-image-pipeline

The following code example shows how to use `update-image-pipeline`.

AWS CLI

To update an image pipeline

The following `update-image-pipeline` example updates an image pipeline using a JSON file.

```
aws imagebuilder update-image-pipeline \  
  --cli-input-json file://update-image-pipeline.json
```

Contents of `update-image-pipeline.json`:

```
{  
  "imagePipelineArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-pipeline/  
mywindows2016pipeline",  
  "imageRecipeArn": "arn:aws:imagebuilder:us-west-2:123456789012:image-recipe/  
mybasicrecipe/2019.12.03",  
  "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-  
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",  
  "distributionConfigurationArn": "arn:aws:imagebuilder:us-  
west-2:123456789012:distribution-configuration/myexampledistribution",  
  "imageTestsConfiguration": {  
    "imageTestsEnabled": true,  
    "timeoutMinutes": 120  
  },  
  "schedule": {  
    "scheduleExpression": "cron(0 0 * * MON)",  
    "pipelineExecutionStartCondition":  
"EXPRESSION_MATCH_AND_DEPENDENCY_UPDATES_AVAILABLE"  
  },  
  "status": "DISABLED"  
}
```

Output:

```
{  
  "requestId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
}
```

For more information, see [Setting Up and Managing an EC2 Image Builder Image Pipeline Using the AWS CLI](#) in the *EC2 Image Builder Users Guide*.

- For API details, see [UpdateImagePipeline](#) in *AWS CLI Command Reference*.

update-infrastructure-configuration

The following code example shows how to use update-infrastructure-configuration.

AWS CLI

To update an infrastructure configuration

The following update-infrastructure-configuration example updates an infrastructure configuration using a JSON file.

```
aws imagebuilder update-infrastructure-configuration \  
  --cli-input-json file:/update-infrastructure-configuration.json
```

Contents of update-infrastructure-configuration.json:

```
{  
  "infrastructureConfigurationArn": "arn:aws:imagebuilder:us-  
west-2:123456789012:infrastructure-configuration/myexampleinfrastructure",

Incident Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-replication-set

The following code example shows how to use `create-replication-set`.

AWS CLI

To create the replication set

The following `create-replication-set` example creates the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account. This example uses the `us-east-1` and `us-east-2` Regions while creating the replication set.

```
aws ssm-incidents create-replication-set \
```

```
--regions '{"us-east-1": {"sseKmsKeyId": "arn:aws:kms:us-east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"}, "us-east-2": {"sseKmsKeyId": "arn:aws:kms:us-east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"}}'
```

Output:

```
{
  "replicationSetArns": [
    "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-bb3f-413c-08df53673b57"
  ]
}
```

For more information, see [Using the Incident Manager replication set](#) in the *Incident Manager User Guide*.

- For API details, see [CreateReplicationSet](#) in *AWS CLI Command Reference*.

create-response-plan

The following code example shows how to use create-response-plan.

AWS CLI

To create a response plan

The following create-response-plan example creates a response plan with the specified details.

```
aws ssm-incidents create-response-plan \
  --chat-channel '{"chatbotSns": ["arn:aws:sns:us-east-1:111122223333:Standard_User"]}' \
  --display-name "Example response plan" \
  --incident-template '{"impact": 5, "title": "example-incident"}' \
  --name "example-response" \
  --actions '[{"ssmAutomation": {"documentName": "AWSIncidents-CriticalIncidentRunbookTemplate", "documentVersion": "$DEFAULT", "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-incidents.amazonaws.com/AWSServiceRoleForIncidentManager", "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"}}]' \
  --engagements '["arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"]'
```

Output:

```
{
  "arn": "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
}
```

For more information, see [Incident preparation](#) in the *Incident Manager User Guide*.

- For API details, see [CreateResponsePlan](#) in *AWS CLI Command Reference*.

create-timeline-event

The following code example shows how to use `create-timeline-event`.

AWS CLI**Example 1: To create a custom timeline event**

The following `create-timeline-event` example creates a custom timeline event at the specified time on the specified incident.

```
aws ssm-incidents create-timeline-event \
  --event-data "\"example timeline event\"" \
  --event-time 2022-10-01T20:30:00.000 \
  --event-type "Custom Event" \
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
```

Output:

```
{
  "eventId": "c0bcc885-a41d-eb01-b4ab-9d2deEXAMPLE",
  "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```

Example 2: To create a timeline event with an incident note

The following `create-timeline-event` example creates a timeline event that is listed in the 'Incident notes' panel.

```
aws ssm-incidents create-timeline-event \
```

```
--event-data "\"New Note\"" \
--event-type "Note" \
--incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE" \
--event-time 2023-06-20T12:06:00.000 \
--event-references ' [{"resource": "arn:aws:ssm-incidents::111122223333:incident-
record/Test/6cc46130-ca6c-3b38-68f1-f6abeEXAMPLE"} ]'
```

Output:

```
{
  "eventId": "a41dc885-c0bc-b4ab-eb01-de9d2EXAMPLE",
  "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4EXAMPLE"
}
```

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [CreateTimelineEvent](#) in *AWS CLI Command Reference*.

delete-incident-record

The following code example shows how to use `delete-incident-record`.

AWS CLI

To delete an incident record

The following `delete-incident-record` example deletes the specified incident record.

```
aws ssm-incidents delete-incident-record \
  --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-
Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see [Incident tracking](#) in the *Incident Manager User Guide*.

- For API details, see [DeleteIncidentRecord](#) in *AWS CLI Command Reference*.

delete-replication-set

The following code example shows how to use `delete-replication-set`.

AWS CLI

To delete the replication set

The following `delete-replication-set` example deletes the replication set from your Amazon Web Services account. Deleting the replication set also deletes all Incident Manager data. This can't be undone.

```
aws ssm-incidents delete-replication-set \  
  --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-  
bb3f-413c-08df53673b57"
```

This command produces no output.

For more information, see [Using the Incident Manager replication set](#) in the *Incident Manager User Guide*.

- For API details, see [DeleteReplicationSet](#) in *AWS CLI Command Reference*.

`delete-resource-policy`

The following code example shows how to use `delete-resource-policy`.

AWS CLI

To delete a resource policy

The following `delete-resource-policy` example deletes a resource policy from a response plan. This will revoke access from the principal or organization that the response plan was shared with.

```
aws ssm-incidents delete-resource-policy \  
  --policy-id "be8b57191f0371f1c6827341aa3f0a03" \  
  --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-  
Response-Plan"
```

This command produces no output.

For more information, see [Working with shared contacts and response plans](#) in the *Incident Manager User Guide*.

- For API details, see [DeleteResourcePolicy](#) in *AWS CLI Command Reference*.

delete-response-plan

The following code example shows how to use `delete-response-plan`.

AWS CLI

To delete a response plan

The following `delete-response-plan` example deletes the specified response plan.

```
aws ssm-incidents delete-response-plan \  
  --arn "arn:aws:ssm-incidents::111122223333:response-plan/example-response"
```

This command produces no output.

For more information, see [Incident preparation](#) in the *Incident Manager User Guide*.

- For API details, see [DeleteResponsePlan](#) in *AWS CLI Command Reference*.

delete-timeline-event

The following code example shows how to use `delete-timeline-event`.

AWS CLI

To delete a timeline event

The following `delete-timeline-event` example deletes a custom timeline event from the specified incident record.

```
aws ssm-incidents delete-timeline-event \  
  --event-id "c0bcc885-a41d-eb01-b4ab-9d2de193643c" \  
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/  
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

This command produces no output.

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [DeleteTimelineEvent](#) in *AWS CLI Command Reference*.

get-incident-record

The following code example shows how to use `get-incident-record`.

AWS CLI

To get an incident record

The following `get-incident-record` example gets details about the specified incident record.

```
aws ssm-incidents get-incident-record \  
  --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{  
  "incidentRecord": {  
    "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",  
    "automationExecutions": [],  
    "creationTime": "2021-05-21T18:16:57.579000+00:00",  
    "dedupeString": "c4bcc812-85e7-938d-2b78-17181176ee1a",  
    "impact": 5,  
    "incidentRecordSource": {  
      "createdBy": "arn:aws:iam::111122223333:user/draliatp",  
      "invokedBy": "arn:aws:iam::111122223333:user/draliatp",  
      "source": "aws.ssm-incidents.custom"  
    },  
    "lastModifiedBy": "arn:aws:iam::111122223333:user/draliatp",

    "notificationTargets": [],  
    "status": "OPEN",  
    "title": "Example-Incident"  
  }  
}
```

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [GetIncidentRecord](#) in *AWS CLI Command Reference*.

get-replication-set

The following code example shows how to use `get-replication-set`.

AWS CLI

To get the replication set

The following `get-replication-set` example gets the details of the replication set Incident Manager uses to replicate and encrypt data in your Amazon Web Services account.

```
aws ssm-incidents get-replication-set \  
  --arn "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-  
bb3f-413c-08df53673b57"
```

Output:

```
{  
  "replicationSet": {  
    "createdBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",  
    "createdTime": "2021-05-14T17:57:22.010000+00:00",  
    "deletionProtected": false,  
    "lastModifiedBy": "arn:aws:sts::111122223333:assumed-role/Admin/username",  
    "lastModifiedTime": "2021-05-14T17:57:22.010000+00:00",  
    "regionMap": {  
      "us-east-1": {  
        "sseKmsKeyId": "DefaultKey",  
        "status": "ACTIVE"  
      },  
      "us-east-2": {  
        "sseKmsKeyId": "DefaultKey",  
        "status": "ACTIVE",  
        "statusMessage": "Tagging inaccessible"  
      }  
    },  
    "status": "ACTIVE"  
  }  
}
```

For more information, see [Using the Incident Manager replication set](#) in the *Incident Manager User Guide*.

- For API details, see [GetReplicationSet](#) in *AWS CLI Command Reference*.

get-resource-policies

The following code example shows how to use `get-resource-policies`.

AWS CLI

To list resource policies for a response plan

The following command-name example lists the resource policies associated with the specified response plan.

```
aws ssm-incidents get-resource-policies \
--resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```
{
  "resourcePolicies": [
    {
      "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"d901b37a-dbb0-458a-8842-75575c464219-external-principals\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::222233334444:root\"},\"Action\":[\"ssm-incidents:GetResponsePlan\",\"ssm-incidents:StartIncident\",\"ssm-incidents:UpdateIncidentRecord\",\"ssm-incidents:GetIncidentRecord\",\"ssm-incidents:CreateTimelineEvent\",\"ssm-incidents:UpdateTimelineEvent\",\"ssm-incidents:GetTimelineEvent\",\"ssm-incidents:ListTimelineEvents\",\"ssm-incidents:UpdateRelatedItems\",\"ssm-incidents:ListRelatedItems\"]},\"Resource\":[\"arn:aws:ssm-incidents:*:111122223333:response-plan/Example-Response-Plan\",\"arn:aws:ssm-incidents:*:111122223333:incident-record/Example-Response-Plan/*\"]}]}",
      "policyId": "be8b57191f0371f1c6827341aa3f0a03",
      "ramResourceShareRegion": "us-east-1"
    }
  ]
}
```

For more information, see [Working with shared contacts and response plans](#) in the *Incident Manager User Guide*.

- For API details, see [GetResourcePolicies](#) in *AWS CLI Command Reference*.

get-response-plan

The following code example shows how to use `get-response-plan`.

AWS CLI

To get details of a response plan

The following command-name example gets details about a specified response plan in your AWS account.

```
aws ssm-incidents get-response-plan \
  --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```
{
  "actions": [
    {
      "ssmAutomation": {
        "documentName": "AWSIncidents-CriticalIncidentRunbookTemplate",
        "documentVersion": "$DEFAULT",
        "roleArn": "arn:aws:iam::111122223333:role/aws-service-role/ssm-
incidents.amazonaws.com/AWSServiceRoleForIncidentManager",
        "targetAccount": "RESPONSE_PLAN_OWNER_ACCOUNT"
      }
    }
  ],
  "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-
Plan",
  "chatChannel": {
    "chatbotSns": [
      "arn:aws:sns:us-east-1:111122223333:Standard_User"
    ]
  },
  "displayName": "Example response plan",
  "engagements": [
    "arn:aws:ssm-contacts:us-east-1:111122223333:contact/example"
  ],
  "incidentTemplate": {
    "impact": 5,
    "title": "Example-Incident"
  },
}
```

```
"name": "Example-Response-Plan"
}
```

For more information, see [Incident preparation](#) in the *Incident Manager User Guide*.

- For API details, see [GetResponsePlan](#) in *AWS CLI Command Reference*.

get-timeline-event

The following code example shows how to use `get-timeline-event`.

AWS CLI

To get details of a timeline event

The following `get-timeline-event` example returns details of the specified timeline event.

```
aws ssm-incidents get-timeline-event \
  --event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
  "event": {
    "eventData": "\"Incident Started\"",
    "eventId": "20bcc812-8a94-4cd7-520c-0ff742111424",
    "eventTime": "2021-05-21T18:16:57+00:00",
    "eventType": "Custom Event",
    "eventUpdatedTime": "2021-05-21T18:16:59.944000+00:00",
    "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
  }
}
```

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [GetTimelineEvent](#) in *AWS CLI Command Reference*.

list-incident-records

The following code example shows how to use `list-incident-records`.

AWS CLI

To list incident records

The following command-name example lists the incident records in your Amazon Web Services account.

```
aws ssm-incidents list-incident-records
```

Output:

```
{
  "incidentRecordSummaries": [
    {
      "arn": "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308",
      "creationTime": "2021-05-21T18:16:57.579000+00:00",
      "impact": 5,
      "incidentRecordSource": {
        "createdBy": "arn:aws:iam::111122223333:user/draliatp",
        "invokedBy": "arn:aws:iam::111122223333:user/draliatp",
        "source": "aws.ssm-incidents.custom"
      },
      "status": "OPEN",
      "title": "Example-Incident"
    }
  ]
}
```

For more information, see [Incident list](#) in the *Incident Manager User Guide*.

- For API details, see [ListIncidentRecords](#) in *AWS CLI Command Reference*.

list-related-items

The following code example shows how to use `list-related-items`.

AWS CLI

To list related items

The following `list-related-items` example lists the related items of the specified incident.

```
aws ssm-incidents list-related-items \
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{
  "relatedItems": [
    {
      "identifier": {
        "type": "OTHER",
        "value": {
          "url": "https://console.aws.amazon.com/systems-manager/opsitems/
oi-8ef82158e190/workbench?region=us-east-1"
        }
      },
      "title": "Example related item"
    },
    {
      "identifier": {
        "type": "PARENT",
        "value": {
          "arn": "arn:aws:ssm:us-east-1:111122223333:opsitem/
oi-8084126392ac"
        }
      },
      "title": "parentItem"
    }
  ]
}
```

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [ListRelatedItems](#) in *AWS CLI Command Reference*.

list-replication-sets

The following code example shows how to use `list-replication-sets`.

AWS CLI

To list the replication set

The following `list-replication-set` example lists the replication set Incident Manager uses to replicate and encrypt data in your AWS account.

```
aws ssm-incidents list-replication-sets
```

Output:

```
{
  "replicationSetArns": [
    "arn:aws:ssm-incidents::111122223333:replication-set/c4bcb603-4bf9-
    bb3f-413c-08df53673b57"
  ]
}
```

For more information, see [Using the Incident Manager replication set](#) in the *Incident Manager User Guide*.

- For API details, see [ListReplicationSets](#) in *AWS CLI Command Reference*.

list-response-plans

The following code example shows how to use `list-response-plans`.

AWS CLI

To list the available response plans

The following `list-response-plans` example lists the available response plans in your Amazon Web Services account.

```
aws ssm-incidents list-response-plans
```

Output:

```
{
  "responsePlanSummaries": [
    {
      "arn": "arn:aws:ssm-incidents::111122223333:response-plan/Example-
      Response-Plan",
      "displayName": "Example response plan",
      "name": "Example-Response-Plan"
    }
  ]
}
```

```
    }  
  ]  
}
```

For more information, see [Incident preparation](#) in the *Incident Manager User Guide*.

- For API details, see [ListResponsePlans](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a response plan

The following `list-tags-for-resource` example lists the tags associated with the specified response plan.

```
aws ssm-incidents list-tags-for-resource \  
    --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-  
Response-Plan"
```

Output:

```
{  
  "tags": {  
    "group1": "1"  
  }  
}
```

For more information, see [Tagging](#) in the *Incident Manager User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-timeline-events

The following code example shows how to use `list-timeline-events`.

AWS CLI

To list timeline events of an incident

The following command-name example lists the timeline events of the specified incident.

```
aws ssm-incidents list-timeline-events \  
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/  
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"
```

Output:

```
{  
  "eventSummaries": [  
    {  
      "eventId": "8cbcc889-35e1-a42d-2429-d6f100799915",  
      "eventTime": "2021-05-21T22:36:13.766000+00:00",  
      "eventType": "SSM Incident Record Update",  
      "eventUpdatedTime": "2021-05-21T22:36:13.766000+00:00",  
      "incidentRecordArn": "arn:aws:ssm-incidents::111122223333:incident-  
record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"  
    },  
    {

put-resource-policy

The following code example shows how to use `put-resource-policy`.

AWS CLI

To share a response plan and incidents

The following command-name example adds a resource policy to the `Example-Response-Plan` that shares the response plan and associated incidents with the specified principal.

```

aws ssm-incidents put-resource-policy \
  --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-
Response-Plan" \
  --policy "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"ExampleResourcePolciy\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":
\"arn:aws:iam::222233334444:root\"},\"Action\":[\"ssm-incidents:GetResponsePlan
\",\"ssm-incidents:StartIncident\",\"ssm-incidents:UpdateIncidentRecord
\",\"ssm-incidents:GetIncidentRecord\",\"ssm-incidents:CreateTimelineEvent
\",\"ssm-incidents:UpdateTimelineEvent\",\"ssm-incidents:GetTimelineEvent
\",\"ssm-incidents:ListTimelineEvents\",\"ssm-incidents:UpdateRelatedItems

```

```
\",\"ssm-incidents:ListRelatedItems\"],\"Resource\":[\"arn:aws:ssm-incidents:*:111122223333:response-plan/Example-Response-Plan\", \"arn:aws:ssm-incidents:*:111122223333:incident-record/Example-Response-Plan/*\"]}]}"
```

Output:

```
{  
  "policyId": "be8b57191f0371f1c6827341aa3f0a03"  
}
```

For more information, see [Working with shared contacts and response plans](#) in the *Incident Manager User Guide*.

- For API details, see [PutResourcePolicy](#) in *AWS CLI Command Reference*.

start-incident

The following code example shows how to use `start-incident`.

AWS CLI

To start an incident

The following `start-incident` example starts an incident using the specified response plan.

```
aws ssm-incidents start-incident \  
  --response-plan-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan"
```

Output:

```
{  
  "incidentRecordArn": "arn:aws:ssm-incidents::682428703967:incident-record/Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308"  
}
```

For more information, see [Incident creation](#) in the *Incident Manager User Guide*.

- For API details, see [StartIncident](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a response plan

The following `tag-resource` example tags a specified response plan with the provided tag key-value pair.

```
aws ssm-incidents tag-resource \  
  --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-  
Response-Plan" \  
  --tags '{"group1":"1"}'
```

This command produces no output.

For more information, see [Tagging](#) in the *Incident Manager User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a response plan

The following `untag-resource` example removes the specified tags from the response plan.

```
aws ssm-incidents untag-resource \  
  --resource-arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-  
Response-Plan" \  
  --tag-keys '["group1"]'
```

This command produces no output.

For more information, see [Tagging](#) in the *Incident Manager User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-deletion-protection

The following code example shows how to use update-deletion-protection.

AWS CLI

To update replication set deletion protection

The following update-deletion-protection example updates the deletion protection in your account to protect you from deleting the last Region in your replication set.

```
aws ssm-incidents update-deletion-protection \  
  --arn "arn:aws:ssm-incidents::111122223333:replication-set/  
a2bcc5c9-0f53-8047-7fef-c20749989b40" \  
  --deletion-protected
```

This command produces no output.

For more information, see [Using the Incident Manager replication set](#) in the *Incident Manager User Guide*.

- For API details, see [UpdateDeletionProtection](#) in *AWS CLI Command Reference*.

update-incident-record

The following code example shows how to use update-incident-record.

AWS CLI

To update an incident record

The following command-name example resolves the specified incident.

```
aws ssm-incidents update-incident-record \  
  --arn "arn:aws:ssm-incidents::111122223333:incident-record/Example-Response-  
Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \  
  --status "RESOLVED"
```

This command produces no output.

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [UpdateIncidentRecord](#) in *AWS CLI Command Reference*.

update-related-items

The following code example shows how to use `update-related-items`.

AWS CLI

To update an incidents related item

The following `update-related-item` example removes a related item from the specified incident record.

```
aws ssm-incidents update-related-items \  
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/  
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \  
  --related-items-update '{"itemToRemove": {"type": "OTHER", "value": {"url":  
"https://console.aws.amazon.com/systems-manager/opsitems/oi-8ef82158e190/workbench?  
region=us-east-1"}}}'
```

This command produces no output.

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [UpdateRelatedItems](#) in *AWS CLI Command Reference*.

update-replication-set

The following code example shows how to use `update-replication-set`.

AWS CLI

To update a replication set

The following `command-name` example deletes the `us-east-2` Region from the replication set.

```
aws ssm-incidents update-replication-set \  
  --arn "arn:aws:ssm-incidents::111122223333:replication-set/  
a2bcc5c9-0f53-8047-7fef-c20749989b40" \  
  --actions '[{"deleteRegionAction": {"regionName": "us-east-2"}}]'
```

This command produces no output.

For more information, see [Using the Incident Manager replication set](#) in the *Incident Manager User Guide*.

- For API details, see [UpdateReplicationSet](#) in *AWS CLI Command Reference*.

update-response-plan

The following code example shows how to use `update-response-plan`.

AWS CLI

To update a response plan

The following `update-response-plan` example removes a chat channel from the specified response plan.

```
aws ssm-incidents update-response-plan \  
  --arn "arn:aws:ssm-incidents::111122223333:response-plan/Example-Response-Plan" \  
  \  
  --chat-channel '{"empty":{}}'
```

This command produces no output.

For more information, see [Incident preparation](#) in the *Incident Manager User Guide*.

- For API details, see [UpdateResponsePlan](#) in *AWS CLI Command Reference*.

update-timeline-event

The following code example shows how to use `update-timeline-event`.

AWS CLI

To update a timeline event

The following `update-timeline-event` example updates the time that the event occurred.

```
aws ssm-incidents update-timeline-event \  
  --event-id 20bcc812-8a94-4cd7-520c-0ff742111424 \  
  --incident-record-arn "arn:aws:ssm-incidents::111122223333:incident-record/  
Example-Response-Plan/6ebcc812-85f5-b7eb-8b2f-283e4d844308" \  
  --event-time "2021-05-21T18:10:57+00:00"
```

This command produces no output.

For more information, see [Incident details](#) in the *Incident Manager User Guide*.

- For API details, see [UpdateTimelineEvent](#) in *AWS CLI Command Reference*.

Incident Manager Contacts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Incident Manager Contacts.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

accept-page

The following code example shows how to use `accept-page`.

AWS CLI

To accept a page during and engagement

The following `accept-page` example uses an accept code sent to the contact channel to accept a page.

```
aws ssm-contacts accept-page \  
  --page-id "arn:aws:ssm-contacts:us-east-2:682428703967:page/  
akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3" \  
  --accept-type READ \  
  --accept-code 425440
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [AcceptPage](#) in *AWS CLI Command Reference*.

activate-contact-channel

The following code example shows how to use `activate-contact-channel`.

AWS CLI

Activate a contact's contact channel

The following `activate-contact-channel` example activates a contact channel and makes it usable as part of an incident.

```
aws ssm-contacts activate-contact-channel \
  --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-
channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d" \
  --activation-code "466136"
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [ActivateContactChannel](#) in *AWS CLI Command Reference*.

command-name

The following code example shows how to use `command-name`.

AWS CLI

To delete a contact

The following `command-name` example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```
aws ssm-contacts delete-contact \
  --contact-id "arn:aws:ssm-contacts:us-east-1:682428703967:contact/alejrr"
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [CommandName](#) in *AWS CLI Command Reference*.

create-contact-channel

The following code example shows how to use `create-contact-channel`.

AWS CLI

To create a contact channel

Creates a contact channel of type SMS for the contact Akua Mansa. Contact channels can be created of type SMS, EMAIL, or VOICE.

```
aws ssm-contacts create-contact-channel \
  --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \
  --name "akuas sms-test" \
  --type SMS \
  --delivery-address '{"SimpleAddress": "+15005550199"}'
```

Output:

```
{
  "ContactChannelArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact-
channel/akuam/02f506b9-ea5d-4764-af89-2daa793ff024"
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [CreateContactChannel](#) in *AWS CLI Command Reference*.

create-contact

The following code example shows how to use `create-contact`.

AWS CLI

To create a contact

The following `create-contact` example creates a contact in your environment with a blank plan. The plan can be updated after creating contact channels. Use the `create-contact-channel` command with the output ARN of this command. After you have created contact channels for this contact use `update-contact` to update the plan.

```
aws ssm-contacts create-contact \  
  --alias "akuam" \  
  --display-name "Akua Mansa" \  
  --type PERSONAL \  
  --plan '{"Stages": []}'
```

Output:

```
{  
  "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"  
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [CreateContact](#) in *AWS CLI Command Reference*.

deactivate-contact-channel

The following code example shows how to use `deactivate-contact-channel`.

AWS CLI

To deactivate a contact channel

The following `deactivate-contact-channel` example deactivates a contact channel. Deactivating a contact channel means the contact channel will no longer be paged during an incident. You can also reactivate a contact channel at any time using the `activate-contact-channel` command.

```
aws ssm-contacts deactivate-contact-channel \  
  --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-  
channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [DeactivateContactChannel](#) in *AWS CLI Command Reference*.

delete-contact-channel

The following code example shows how to use `delete-contact-channel`.

AWS CLI

To delete a contact channel

The following `delete-contact-channel` example deletes a contact channel. Deleting a contact channel ensures the contact channel will not be paged during an incident.

```
aws ssm-contacts delete-contact-channel \  
  --contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-  
channel/akuam/13149bad-52ee-45ea-ae1e-45857f78f9b2"
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [DeleteContactChannel](#) in *AWS CLI Command Reference*.

delete-contact

The following code example shows how to use `delete-contact`.

AWS CLI

To delete a contact

The following `delete-contact` example deletes a contact. The contact will no longer be reachable from any escalation plan that refers to them.

```
aws ssm-contacts delete-contact \  
  --contact-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact/alejrr"
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [DeleteContact](#) in *AWS CLI Command Reference*.

describe-engagement

The following code example shows how to use describe-engagement.

AWS CLI

To describe the details of an engagement

The following describe-engagement example lists the details of an engagement to a contact or escalation plan. The subject and content are sent to the contact channels.

```
aws ssm-contacts describe-engagement \  
  --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/  
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
```

Output:

```
{  
  "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/  
example_escalation",  
  "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/  
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356",  
  "Sender": "cli",  
  "Subject": "cli-test",  
  "Content": "Testing engagements via CLI",  
  "PublicSubject": "cli-test",  
  "PublicContent": "Testing engagements va CLI",  
  "StartTime": "2021-05-18T18:25:41.151000+00:00"  
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [DescribeEngagement](#) in *AWS CLI Command Reference*.

describe-page

The following code example shows how to use describe-page.

AWS CLI

To list the details of a page to a contact channel

The following describe-page example lists details of a page to a contact channel. The page will include the subject and content provided.

```
aws ssm-contacts describe-page \  
  --page-id "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/ad0052bd-  
e606-498a-861b-25726292eb93"
```

Output:

```
{  
  "PageArn": "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/ad0052bd-  
e606-498a-861b-25726292eb93",  
  "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/  
akuam/78a29753-3674-4ac5-9f83-0468563567f0",  
  "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",  
  "Sender": "cli",  
  "Subject": "cli-test",  
  "Content": "Testing engagements via CLI",  
  "PublicSubject": "cli-test",  
  "PublicContent": "Testing engagements va CLI",  
  "SentTime": "2021-05-18T18:43:29.301000+00:00",  
  "ReadTime": "2021-05-18T18:43:55.708000+00:00",  
  "DeliveryTime": "2021-05-18T18:43:55.265000+00:00"  
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [DescribePage](#) in *AWS CLI Command Reference*.

get-contact-channel

The following code example shows how to use get-contact-channel.

AWS CLI

To list the details of a contact channel

The following get-contact-channel example lists the details of a contact channel.

```
aws ssm-contacts get-contact-channel \  
  --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-  
channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d"
```

Output:

```
{
  "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
  "ContactChannelArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
  "Name": "akuas sms",
  "Type": "SMS",
  "DeliveryAddress": {
    "SimpleAddress": "+15005550199"
  },
  "ActivationStatus": "ACTIVATED"
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [GetContactChannel](#) in *AWS CLI Command Reference*.

get-contact-policy

The following code example shows how to use `get-contact-policy`.

AWS CLI**To list the resource policies of a contact**

The following `get-contact-policy` example lists the resource policies associated with the specified contact.

```
aws ssm-contacts get-contact-policy \
  --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```
{
  "ContactArn": "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam",
  "Policy": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":\"SharePolicyForDocumentationDrAlia\",\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"222233334444\"},\"Action\":[\"ssm-contacts:GetContact\",\"ssm-contacts:StartEngagement\",\"ssm-contacts:DescribeEngagement\",\"ssm-contacts:ListPagesByEngagement\",\"ssm-contacts:StopEngagement\"],\"Resource\":[\"arn:aws:ssm-contacts:*:111122223333:contact/akuam\",\"arn:aws:ssm-contacts:*:111122223333:engagement/akuam/*\"]}]}"
```

```
}
```

For more information, see [Working with shared contacts and response plans](#) in the *Incident Manager User Guide*.

- For API details, see [GetContactPolicy](#) in *AWS CLI Command Reference*.

get-contact

The following code example shows how to use `get-contact`.

AWS CLI

Example 1: To describe a contact plan

The following `get-contact` example describes a contact.

```
aws ssm-contacts get-contact \
  --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
  "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam",
  "Alias": "akuam",
  "DisplayName": "Akua Mansa",
  "Type": "PERSONAL",
  "Plan": {
    "Stages": [
      {
        "DurationInMinutes": 5,
        "Targets": [
          {
            "ChannelTargetInfo": {
              "ContactChannelId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65",
              "RetryIntervalInMinutes": 1
            }
          }
        ]
      }
    ],
    "DurationInMinutes": 5,
```

```

        "Targets": [
            {
                "ChannelTargetInfo": {
                    "ContactChannelId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad",
                    "RetryIntervalInMinutes": 1
                }
            }
        ],
        {

            "Targets": [
                {
                    "ChannelTargetInfo": {
                        "ContactChannelId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/77d4f447-f619-4954-afff-85551e369c2a",
                        "RetryIntervalInMinutes": 1
                    }
                }
            ]
        }
    ]
}

```

Example 2: To describe an escalation plan

The following `get-contact` example describes an escalation plan.

```

aws ssm-contacts get-contact \
--contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation"

```

Output:

```

{
    "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
    "Alias": "example_escalation",
    "DisplayName": "Example Escalation",
    "Type": "ESCALATION",
    "Plan": {

```

```
    "Stages": [
      {
        "DurationInMinutes": 5,
        "Targets": [
          {
            "ContactTargetInfo": {
              "ContactId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact/akuam",
              "IsEssential": true
            }
          }
        ]
      },
      {
        "DurationInMinutes": 5,
        "Targets": [
          {
            "ContactTargetInfo": {
              "ContactId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact/alejr",
              "IsEssential": false
            }
          }
        ]
      },
      {
        "DurationInMinutes": 0,
        "Targets": [
          {
            "ContactTargetInfo": {
              "ContactId": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact/anasi",
              "IsEssential": false
            }
          }
        ]
      }
    ]
  }
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [GetContact](#) in *AWS CLI Command Reference*.

list-contact-channels

The following code example shows how to use `list-contact-channels`.

AWS CLI

To list the contact channels of a contact

The following `list-contact-channels` example lists the available contact channels of the specified contact.

```
aws ssm-contacts list-contact-channels \
  --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
  [
    {
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
      "Name": "akuas email",
      "Type": "EMAIL",
      "DeliveryAddress": {
        "SimpleAddress": "akuam@example.com"
      },
      "ActivationStatus": "NOT_ACTIVATED"
    },
    {
      "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
      "Name": "akuas sms",
      "Type": "SMS",
      "DeliveryAddress": {
        "SimpleAddress": "+15005550100"
      },
      "ActivationStatus": "ACTIVATED"
    }
  ]
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [ListContactChannels](#) in *AWS CLI Command Reference*.

list-contacts

The following code example shows how to use `list-contacts`.

AWS CLI

To list all escalation plans and contacts

The following `list-contacts` example lists the contacts and escalation plans in your account.

```
aws ssm-contacts list-contacts
```

Output:

```
{
  "Contacts": [
    {
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
      "Alias": "akuam",
      "DisplayName": "Akua Mansa",
      "Type": "PERSONAL"
    },
    {
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
alejr",
      "Alias": "alejr",
      "DisplayName": "Alejandro Rosalez",
      "Type": "PERSONAL"
    },
    {
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
anasi",
      "Alias": "anasi",
      "DisplayName": "Ana Carolina Silva",
      "Type": "PERSONAL"
    },
    {
```

```

        "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
        "Alias": "example_escalation",
        "DisplayName": "Example Escalation",
        "Type": "ESCALATION"
    }
]
}

```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [ListContacts](#) in *AWS CLI Command Reference*.

list-engagements

The following code example shows how to use `list-engagements`.

AWS CLI

To list all engagements

The following `list-engagements` example lists engagements to escalation plans and contacts. You can also list engagements for a single incident.

```
aws ssm-contacts list-engagements
```

Output:

```

{
  "Engagements": [
    {
      "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/91792571-0b53-4821-9f73-d25d13d9e529",

        "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
example_escalation",
        "Sender": "cli",
        "StartTime": "2021-05-18T18:25:41.151000+00:00"
    },
    {
        "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/607ced0e-e8fa-4ea7-8958-a237b8803f8f",
        "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
        "Sender": "cli",
        "StartTime": "2021-05-18T18:20:58.093000+00:00"
    }
]
}

```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [ListEngagements](#) in *AWS CLI Command Reference*.

list-page-receipts

The following code example shows how to use `list-page-receipts`.

AWS CLI

To list page receipts

The following command-name example lists whether a page was received or not by a contact.

```

aws ssm-contacts list-page-receipts \
  --page-id "arn:aws:ssm-contacts:us-east-2:111122223333:page/
akuam/94ea0c7b-56d9-46c3-b84a-a37c8b067ad3"

```

Output:

```
{
  "Receipts": [
    {
      "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
      "ReceiptType": "DELIVERED",
      "ReceiptInfo": "425440",
      "ReceiptTime": "2021-05-18T20:42:57.485000+00:00"
    },
    {
      "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
      "ReceiptType": "READ",
      "ReceiptInfo": "425440",
      "ReceiptTime": "2021-05-18T20:42:57.907000+00:00"
    },
    {
      "ContactChannelArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:contact-channel/akuam/fc7405c4-46b2-48b7-87b2-93e2f225b90d",
      "ReceiptType": "SENT",
      "ReceiptInfo": "SM6656c19132f1465f9c9c1123a5dde7c9",
      "ReceiptTime": "2021-05-18T20:40:52.962000+00:00"
    }
  ]
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [ListPageReceipts](#) in *AWS CLI Command Reference*.

list-pages-by-contact

The following code example shows how to use `list-pages-by-contact`.

AWS CLI

To list pages by contact

The following `list-pages-by-contact` example lists all pages to the specified contact.

```
aws ssm-contacts list-pages-by-contact \
  --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam"
```

Output:

```
{
  "Pages": [
    {
      "PageArn": "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/
ad0052bd-e606-498a-861b-25726292eb93",
      "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
      "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
      "Sender": "cli",
      "SentTime": "2021-05-18T18:43:29.301000+00:00",
      "DeliveryTime": "2021-05-18T18:43:55.265000+00:00",
      "ReadTime": "2021-05-18T18:43:55.708000+00:00"
    }
  ]
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [ListPagesByContact](#) in *AWS CLI Command Reference*.

list-pages-by-engagement

The following code example shows how to use `list-pages-by-engagement`.

AWS CLI**To list pages to contact channels started from an engagement.**

The following `list-pages-by-engagement` example lists the pages that occurred while engaging the defined engagement plan.

```
aws ssm-contacts list-pages-by-engagement \
  --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/
akuam/78a29753-3674-4ac5-9f83-0468563567f0"
```

Output:

```
{
  "Pages": [
```

```
{
  "PageArn": "arn:aws:ssm-contacts:us-east-2:111122223333:page/akuam/
ad0052bd-e606-498a-861b-25726292eb93",
  "EngagementArn": "arn:aws:ssm-contacts:us-
east-2:111122223333:engagement/akuam/78a29753-3674-4ac5-9f83-0468563567f0",
  "ContactArn": "arn:aws:ssm-contacts:us-east-2:111122223333:contact/
akuam",
  "Sender": "cli",
  "SentTime": "2021-05-18T18:40:27.245000+00:00"
}
]
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [ListPagesByEngagement](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a contact

The following `list-tags-for-resource` example lists the tags of the specified contact.

```
aws ssm-contacts list-tags-for-resource \
  --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam"
```

Output:

```
{
  "Tags": [
    {
      "Key": "group1",
      "Value": "1"
    }
  ]
}
```

For more information, see [Tagging](#) in the *Incident Manager User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-contact-policy

The following code example shows how to use `put-contact-policy`.

AWS CLI

To share a contact and engagements

The following `put-contact-policy` example adds a resource policy to the contact Akua that shares the contact and related engagements with the principal.

```
aws ssm-contacts put-contact-policy \  
  --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akua" \  
  --policy "{\"Version\":\"2012-10-17\",\"Statement\":[{\n\"Sid\":\n\"ExampleResourcePolicy\",\"Action\":[\"ssm-contacts:GetContact\",\"ssm-contacts:StartEngagement\",\"ssm-contacts:DescribeEngagement\",\"ssm-contacts:ListPagesByEngagement\",\"ssm-contacts:StopEngagement\"],\n\"Principal\":{\"AWS\":\"222233334444\"},\"Effect\":\"Allow\",\"Resource\":[\"arn:aws:ssm-contacts:*:111122223333:contact/akua\",\"arn:aws:ssm-contacts:*:111122223333:engagement/akua/*\"]}]}"
```

This command produces no output.

For more information, see [Working with shared contacts and response plans](#) in the *Incident Manager User Guide*.

- For API details, see [PutContactPolicy](#) in *AWS CLI Command Reference*.

send-activation-code

The following code example shows how to use `send-activation-code`.

AWS CLI

To send an activation code

The following `send-activation-code` example sends an activation code and message to the specified contact channel.

```
aws ssm-contacts send-activation-code \  
  --contact-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akua" \  
  --channel "channel" \  
  --message "message" \  
  --subject "subject"
```

```
--contact-channel-id "arn:aws:ssm-contacts:us-east-1:111122223333:contact-channel/akuam/8ddae2d1-12c8-4e45-b852-c8587266c400"
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [SendActivationCode](#) in *AWS CLI Command Reference*.

start-engagement

The following code example shows how to use start-engagement.

AWS CLI

Example 1: To page a contact's contact channels

The following start-engagement pages contact's contact channels. Sender, subject, public-subject, and public-content are all free from fields. Incident Manager sends the subject and content to the provided VOICE or EMAIL contact channels. Incident Manager sends the public-subject and public-content to the provided SMS contact channels. Sender is used to track who started the engagement.

```
aws ssm-contacts start-engagement \  
  --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam" \  
  --sender "cli" \  
  --subject "cli-test" \  
  --content "Testing engagements via CLI" \  
  --public-subject "cli-test" \  
  --public-content "Testing engagements va CLI"
```

Output:

```
{  
  "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/  
akuam/607ced0e-e8fa-4ea7-8958-a237b8803f8f"  
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

Example 2: To page a contact in the provided escalation plan.

The following `start-engagement` engages contact's through an escalation plan. Each contact is paged according to their engagement plan.

```
aws ssm-contacts start-engagement \  
  --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/  
example_escalation" \  
  --sender "cli" \  
  --subject "cli-test" \  
  --content "Testing engagements via CLI" \  
  --public-subject "cli-test" \  
  --public-content "Testing engagements va CLI"
```

Output:

```
{  
  "EngagementArn": "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/  
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"  
}
```

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [StartEngagement](#) in *AWS CLI Command Reference*.

stop-engagement

The following code example shows how to use `stop-engagement`.

AWS CLI

To stop an engagement

The following `stop-engagement` example stops an engagement from paging further contacts and contact channels.

```
aws ssm-contacts stop-engagement \  
  --engagement-id "arn:aws:ssm-contacts:us-east-2:111122223333:engagement/  
example_escalation/69e40ce1-8dbb-4d57-8962-5fbe7fc53356"
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [StopEngagement](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To tag a contact

The following `tag-resource` example tags a specified contact with the provided tag key value pair.

```
aws ssm-contacts tag-resource \  
  --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \  
  --tags '[{"Key":"group1","Value":"1"}]'
```

This command produces no output.

For more information, see [Tagging](#) in the *Incident Manager User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a contact

The following `untag-resource` example removes the `group1` tag from the specified contact.

```
aws ssm-contacts untag-resource \  
  --resource-arn "arn:aws:ssm-contacts:us-east-1:111122223333:contact/akuam" \  
  --tag-keys "group1"
```

This command produces no output.

For more information, see [Tagging](#) in the *Incident Manager User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-contact-channel

The following code example shows how to use `update-contact-channel`.

AWS CLI

To update a contact channel

The following `update-contact-channel` example updates the name and delivery address of a contact channel.

```
aws ssm-contacts update-contact-channel \  
  --contact-channel-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact-  
channel/akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad" \  
  --name "akuas voice channel" \  
  --delivery-address '{"SimpleAddress": "+15005550198"}'
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [UpdateContactChannel](#) in *AWS CLI Command Reference*.

update-contact

The following code example shows how to use `update-contact`.

AWS CLI

To update the engagement plan of contact

The following `update-contact` example updates the engagement plan of the contact Akua to include the three types of contacts channels. This is done after creating contact channels for Akua.

```
aws ssm-contacts update-contact \  
  --contact-id "arn:aws:ssm-contacts:us-east-2:111122223333:contact/akuam" \  
  --plan '{"Stages": [{"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo":  
{"ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-  
channel/akuam/beb25840-5ac8-4644-95cc-7a8de390fa65", "RetryIntervalInMinutes":  
1 }]}], {"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo":  
{"ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/  
akuam/49f3c24d-5f9f-4638-ae25-3f49e04229ad", "RetryIntervalInMinutes": 1}]}}],
```

```
{"DurationInMinutes": 5, "Targets": [{"ChannelTargetInfo": {"ContactChannelId": "arn:aws:ssm-contacts:us-east-2:111122223333:contact-channel/akuam/77d4f447-f619-4954-afff-85551e369c2a", "RetryIntervalInMinutes": 1 }]}]}
```

This command produces no output.

For more information, see [Contacts](#) in the *Incident Manager User Guide*.

- For API details, see [UpdateContact](#) in *AWS CLI Command Reference*.

Amazon Inspector examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Inspector.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-attributes-to-findings

The following code example shows how to use `add-attributes-to-findings`.

AWS CLI

To add attributes to findings

The following `add-attribute-to-finding` command assigns an attribute with the key of `example` and value of `example` to the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-811VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU`:

```
aws inspector add-attributes-to-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-811VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU --attributes key=Example,value=example
```

Output:

```
{
  "failedItems": {}
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see [AddAttributesToFindings](#) in *AWS CLI Command Reference*.

create-assessment-target

The following code example shows how to use create-assessment-target.

AWS CLI

To create an assessment target

The following create-assessment-target command creates an assessment target named ExampleAssessmentTarget using the resource group with the ARN of arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv:

```
aws inspector create-assessment-target --assessment-target-name
ExampleAssessmentTarget --resource-group-arn arn:aws:inspector:us-
west-2:123456789012:resourcegroup/0-AB6DMKnv
```

Output:

```
{
  "assessmentTargetArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX"
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [CreateAssessmentTarget](#) in *AWS CLI Command Reference*.

create-assessment-template

The following code example shows how to use `create-assessment-template`.

AWS CLI

To create an assessment template

The following `create-assessment-template` command creates an assessment template called `ExampleAssessmentTemplate` for the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX`:

```
aws inspector create-assessment-template --assessment-target-arn
arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX --assessment-template-
name ExampleAssessmentTemplate --duration-in-seconds 180 --rules-package-arns
arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p --user-attributes-
for-findings key=ExampleTag,value=examplevalue
```

Output:

```
{
  "assessmentTemplateArn": "arn:aws:inspector:us-west-2:123456789012:target/0-
nvgVhaxX/template/0-it5r2S4T"
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [CreateAssessmentTemplate](#) in *AWS CLI Command Reference*.

create-resource-group

The following code example shows how to use `create-resource-group`.

AWS CLI

To create a resource group

The following `create-resource-group` command creates a resource group using the tag key of `Name` and value of `example`:

```
aws inspector create-resource-group --resource-group-tags key=Name,value=example
```

Output:

```
{
  "resourceGroupArn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-AB6DMKnv"
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [CreateResourceGroup](#) in *AWS CLI Command Reference*.

delete-assessment-run

The following code example shows how to use `delete-assessment-run`.

AWS CLI**To delete an assessment run**

The following `delete-assessment-run` command deletes the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe`:

```
aws inspector delete-assessment-run --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-11LMTAVe
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [DeleteAssessmentRun](#) in *AWS CLI Command Reference*.

delete-assessment-target

The following code example shows how to use `delete-assessment-target`.

AWS CLI**To delete an assessment target**

The following `delete-assessment-target` command deletes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
aws inspector delete-assessment-target --assessment-target-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [DeleteAssessmentTarget](#) in *AWS CLI Command Reference*.

delete-assessment-template

The following code example shows how to use `delete-assessment-template`.

AWS CLI

To delete an assessment template

The following `delete-assessment-template` command deletes the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`:

```
aws inspector delete-assessment-template --assessment-template-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [DeleteAssessmentTemplate](#) in *AWS CLI Command Reference*.

describe-assessment-runs

The following code example shows how to use `describe-assessment-runs`.

AWS CLI

To describe assessment runs

The following `describe-assessment-run` command describes an assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`:

```
aws inspector describe-assessment-runs --assessment-run-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
  "assessmentRuns": [
    {
      "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/

      },
      {
        "state": "COMPLETED",
        "stateChangedAt": 1458680301.4
      }
    ],
    "userAttributesForFindings": []
  }
],
"failedItems": {}
}

```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [DescribeAssessmentRuns](#) in *AWS CLI Command Reference*.

describe-assessment-targets

The following code example shows how to use `describe-assessment-targets`.

AWS CLI

To describe assessment targets

The following `describe-assessment-targets` command describes the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
aws inspector describe-assessment-targets --assessment-target-arns
arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
  "assessmentTargets": [
    {
      "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq",
```

```

        "createdAt": 1458074191.459,
        "name": "ExampleAssessmentTarget",
        "resourceGroupArn": "arn:aws:inspector:us-
west-2:123456789012:resourcegroup/0-PyGXopAI",
        "updatedAt": 1458074191.459
    }
  ],
  "failedItems": {}
}

```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [DescribeAssessmentTargets](#) in *AWS CLI Command Reference*.

describe-assessment-templates

The following code example shows how to use describe-assessment-templates.

AWS CLI

To describe assessment templates

The following describe-assessment-templates command describes the assessment template with the ARN of arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw:

```
aws inspector describe-assessment-templates --assessment-template-arns
arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw
```

Output:

```

{
  "assessmentTemplates": [
    {
      "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw",
      "assessmentTargetArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq",
      "createdAt": 1458074191.844,
      "durationInSeconds": 3600,
      "name": "ExampleAssessmentTemplate",
      "rulesPackageArns": [

```

```
        "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-X1KXtawP"  
    ],  
    "userAttributesForFindings": []  
  }  
],  
"failedItems": {}  
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [DescribeAssessmentTemplates](#) in *AWS CLI Command Reference*.

describe-cross-account-access-role

The following code example shows how to use `describe-cross-account-access-role`.

AWS CLI

To describe the cross account access role

The following `describe-cross-account-access-role` command describes the IAM role that enables Amazon Inspector to access your AWS account:

```
aws inspector describe-cross-account-access-role
```

Output:

```
{  
    "registeredAt": 1458069182.826,  
    "roleArn": "arn:aws:iam::123456789012:role/inspector",  
    "valid": true  
}
```

For more information, see Setting up Amazon Inspector in the *Amazon Inspector* guide.

- For API details, see [DescribeCrossAccountAccessRole](#) in *AWS CLI Command Reference*.

describe-findings

The following code example shows how to use `describe-findings`.

AWS CLI

To describe findings

The following `describe-findings` command describes the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4`:

```
aws inspector describe-findings --finding-arns arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4
```

Output:

```
{
  "failedItems": {},
  "findings": [
    {
      "arn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
      "assetAttributes": {
        "ipv4Addresses": [],
        "schemaVersion": 1
      },
      "assetType": "ec2-instance",
      "attributes": [],
      "confidence": 10,
      "createdAt": 1458680301.37,
      "description": "Amazon Inspector did not find any potential security issues during this assessment.",
      "indicatorOfCompromise": false,
      "numericSeverity": 0,
      "recommendation": "No remediation needed.",
      "schemaVersion": 1,
      "service": "Inspector",
      "serviceAttributes": {
        "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
        "rulesPackageArn": "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-X1KXtawP",
        "schemaVersion": 1
      },
      "severity": "Informational",
    }
  ]
}
```

```
        "title": "No potential security issues found",
        "updatedAt": 1458680301.37,
        "userAttributes": []
      }
    ]
  }
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see [DescribeFindings](#) in *AWS CLI Command Reference*.

describe-resource-groups

The following code example shows how to use `describe-resource-groups`.

AWS CLI

To describe resource groups

The following `describe-resource-groups` command describes the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI`:

```
aws inspector describe-resource-groups --resource-group-arns arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI
```

Output:

```
{
  "failedItems": {},
  "resourceGroups": [
    {
      "arn": "arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-PyGXopAI",
      "createdAt": 1458074191.098,
      "tags": [
        {
          "key": "Name",
          "value": "example"
        }
      ]
    }
  ]
}
```

```
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [DescribeResourceGroups](#) in *AWS CLI Command Reference*.

describe-rules-packages

The following code example shows how to use `describe-rules-packages`.

AWS CLI

To describe rules packages

The following `describe-rules-packages` command describes the rules package with the ARN of `arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p`:

```
aws inspector describe-rules-packages --rules-package-arns arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p
```

Output:

```
{
  "failedItems": {},
  "rulesPackages": [
    {
      "arn": "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p",
      "description": "The rules in this package help verify whether the EC2 instances in your application are exposed to Common Vulnerabilities and Exposures (CVEs). Attacks can exploit unpatched vulnerabilities to compromise the confidentiality, integrity, or availability of your service or data. The CVE system provides a reference for publicly known information security vulnerabilities and exposures. For more information, see [https://cve.mitre.org/](https://cve.mitre.org/). If a particular CVE appears in one of the produced Findings at the end of a completed Inspector assessment, you can search [https://cve.mitre.org/](https://cve.mitre.org/) using the CVE's ID (for example, \"CVE-2009-0021\") to find detailed information about this CVE, its severity, and how to mitigate it. ",
      "name": "Common Vulnerabilities and Exposures",
      "provider": "Amazon Web Services, Inc.",
      "version": "1.1"
    }
  ]
}
```

```
    }
  ]
}
```

For more information, see Amazon Inspector Rules Packages and Rules in the *Amazon Inspector* guide.

- For API details, see [DescribeRulesPackages](#) in *AWS CLI Command Reference*.

get-telemetry-metadata

The following code example shows how to use `get-telemetry-metadata`.

AWS CLI

To get the telemetry metadata

The following `get-telemetry-metadata` command generates information about the data that is collected for the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE`:

```
aws inspector get-telemetry-metadata --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
  "telemetryMetadata": [
    {
      "count": 2,
      "dataSize": 345,
      "messageType": "InspectorDuplicateProcess"
    },
    {
      "count": 3,
      "dataSize": 255,
      "messageType": "InspectorTimeEventMsg"
    },
    {
      "count": 4,
      "dataSize": 1082,
      "messageType": "InspectorNetworkInterface"
    }
  ]
}
```

  },
  {
    "count": 1,
    "dataSize": 612,
    "messageType": "InspectorLoadImageInProgress"
  }
]
```

```
}
```

- For API details, see [GetTelemetryMetadata](#) in *AWS CLI Command Reference*.

list-assessment-run-agents

The following code example shows how to use `list-assessment-run-agents`.

AWS CLI

To list assessment run agents

The following `list-assessment-run-agents` command lists the agents of the assessment run with the specified ARN.

```
aws inspector list-assessment-run-agents \
  --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
  template/0-4r1V2mAw/run/0-MKkpXXPE
```

Output:

```
{
  "assessmentRunAgents": [
    {
      "agentHealth": "HEALTHY",
      "agentHealthCode": "HEALTHY",
      "agentId": "i-49113b93",
      "assessmentRunArn": "arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-4r1V2mAw/run/0-MKkpXXPE",
      "telemetryMetadata": [
        {
          "count": 2,
          "dataSize": 345,

For more information, see [AWS Agents](#) in the *Amazon Inspector User Guide*.

- For API details, see [ListAssessmentRunAgents](#) in *AWS CLI Command Reference*.

list-assessment-runs

The following code example shows how to use `list-assessment-runs`.

AWS CLI

To list assessment runs

The following `list-assessment-runs` command lists all existing assessment runs.

```
aws inspector list-assessment-runs
```

Output:

```
{
  "assessmentRunArns": [
    "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE",
    "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-v5D6fI3v"
  ]
}
```

For more information, see [Amazon Inspector Assessment Templates and Assessment Runs](#) in the *Amazon Inspector User Guide*.

- For API details, see [ListAssessmentRuns](#) in *AWS CLI Command Reference*.

list-assessment-targets

The following code example shows how to use `list-assessment-targets`.

AWS CLI

To list assessment targets

The following `list-assessment-targets` command lists all existing assessment targets:

```
aws inspector list-assessment-targets
```

Output:

```
{
  "assessmentTargetArns": [
    "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq"
  ]
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [ListAssessmentTargets](#) in *AWS CLI Command Reference*.

list-assessment-templates

The following code example shows how to use `list-assessment-templates`.

AWS CLI

To list assessment templates

The following `list-assessment-templates` command lists all existing assessment templates:

```
aws inspector list-assessment-templates
```

Output:

```
{
  "assessmentTemplateArns": [
    "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw",
    "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-
Uza6ihLh"
  ]
}
```

```
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [ListAssessmentTemplates](#) in *AWS CLI Command Reference*.

list-event-subscriptions

The following code example shows how to use `list-event-subscriptions`.

AWS CLI

To list event subscriptions

The following `list-event-subscriptions` command lists all the event subscriptions for the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`:

```
aws inspector list-event-subscriptions --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0
```

Output:

```
{
  "subscriptions": [
    {
      "eventSubscriptions": [
        {
          "event": "ASSESSMENT_RUN_COMPLETED",
          "subscribedAt": 1459455440.867
        }
      ],
      "resourceArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0",
      "topicArn": "arn:aws:sns:us-west-2:123456789012:exampletopic"
    }
  ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [ListEventSubscriptions](#) in *AWS CLI Command Reference*.

list-findings

The following code example shows how to use `list-findings`.

AWS CLI

To list findings

The following `list-findings` command lists all of the generated findings:

```
aws inspector list-findings
```

Output:

```
{
  "findingArns": [
    "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-MKkpXXPE/finding/0-HwPnsDm4",
    "arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/
template/0-4r1V2mAw/run/0-v5D6fI3v/finding/0-tyvmqBLy"
  ]
}
```

For more information, see Amazon Inspector Findings in the *Amazon Inspector* guide.

- For API details, see [ListFindings](#) in *AWS CLI Command Reference*.

list-rules-packages

The following code example shows how to use `list-rules-packages`.

AWS CLI

To list rules packages

The following `list-rules-packages` command lists all available Inspector rules packages:

```
aws inspector list-rules-packages
```

Output:

```
{
  "rulesPackageArns": [
    "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-9hgA516p",
    "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-H5hpSawc",
    "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-JJ0tZiqQ",
    "arn:aws:inspector:us-west-2:758058086616:rulespackage/0-vg5GGHSD"
  ]
}
```

For more information, see Amazon Inspector Rules Packages and Rules in the *Amazon Inspector* guide.

- For API details, see [ListRulesPackages](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI**To list tags for resource**

The following `list-tags-for-resource` command lists all tags associated with the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu`:

```
aws inspector list-tags-for-resource --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-gcwFliYu
```

Output:

```
{
  "tags": [
    {
      "key": "Name",
      "value": "Example"
    }
  ]
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

preview-agents

The following code example shows how to use `preview-agents`.

AWS CLI

To preview agents

The following `preview-agents` command previews the agents installed on the EC2 instances that are part of the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq`:

```
aws inspector preview-agents --preview-agents-arn arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq
```

Output:

```
{
  "agentPreviews": [
    {
      "agentId": "i-49113b93"
    }
  ]
}
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [PreviewAgents](#) in *AWS CLI Command Reference*.

register-cross-account-access-role

The following code example shows how to use `register-cross-account-access-role`.

AWS CLI

To register the cross account access role

The following `register-cross-account-access-role` command registers the IAM role with the ARN of `arn:aws:iam::123456789012:role/inspector` that Amazon Inspector uses to list your EC2 instances at the start of the assessment run of when you call the `preview-agents` command:

```
aws inspector register-cross-account-access-role --role-arn
arn:aws:iam::123456789012:role/inspector
```

For more information, see *Setting up Amazon Inspector* in the *Amazon Inspector* guide.

- For API details, see [RegisterCrossAccountAccessRole](#) in *AWS CLI Command Reference*.

remove-attributes-from-findings

The following code example shows how to use `remove-attributes-from-findings`.

AWS CLI

To remove attributes from findings

The following `remove-attributes-from-finding` command removes the attribute with the key of `Example` and value of `example` from the finding with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-0kFIPusq/template/0-811VIE0D/run/0-Z02cjjug/finding/0-T8yM9mEU`:

```
aws inspector remove-attributes-from-findings --finding-arns arn:aws:inspector:us-
west-2:123456789012:target/0-0kFIPusq/template/0-811VIE0D/run/0-Z02cjjug/finding/0-
T8yM9mEU --attribute-keys key=Example,value=example
```

Output:

```
{
  "failedItems": {}
}
```

For more information, see *Amazon Inspector Findings* in the *Amazon Inspector* guide.

- For API details, see [RemoveAttributesFromFindings](#) in *AWS CLI Command Reference*.

set-tags-for-resource

The following code example shows how to use `set-tags-for-resource`.

AWS CLI

To set tags for a resource

The following `set-tags-for-resource` command sets the tag with the key of `Example` and value of `example` to the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0`:

```
aws inspector set-tags-for-resource --resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 --tags key=Example,value=example
```

For more information, see *Amazon Inspector Assessment Templates and Assessment Runs* in the *Amazon Inspector* guide.

- For API details, see [SetTagsForResource](#) in *AWS CLI Command Reference*.

start-assessment-run

The following code example shows how to use `start-assessment-run`.

AWS CLI

To start an assessment run

The following `start-assessment-run` command starts the assessment run named `examplerrun` using the assessment template with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T`:

```
aws inspector start-assessment-run --assessment-run-name examplerrun --assessment-template-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T
```

Output:

```
{
  "assessmentRunArn": "arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-j0o0oxyY"
```

```
}
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [StartAssessmentRun](#) in *AWS CLI Command Reference*.

stop-assessment-run

The following code example shows how to use `stop-assessment-run`.

AWS CLI

To stop an assessment run

The following `stop-assessment-run` command stops the assessment run with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-j0oroxyY`:

```
aws inspector stop-assessment-run --assessment-run-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-it5r2S4T/run/0-j0oroxyY
```

For more information, see Amazon Inspector Assessment Templates and Assessment Runs in the *Amazon Inspector* guide.

- For API details, see [StopAssessmentRun](#) in *AWS CLI Command Reference*.

subscribe-to-event

The following code example shows how to use `subscribe-to-event`.

AWS CLI

To subscribe to an event

The following example enables the process of sending Amazon SNS notifications about the `ASSESSMENT_RUN_COMPLETED` event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`

```
aws inspector subscribe-to-event \  
  --event ASSESSMENT_RUN_COMPLETED \  
  --topic-arn arn:aws:sns:us-west-2:123456789012:exampletopic
```

```
--resource-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/  
template/0-7sbz2Kz0 \  
--topic-arn arn:aws:sns:us-west-2:123456789012:exampletopic
```

This command produces no output.

For more information, see [Amazon Inspector Assessment Templates and Assessment Runs](#) in the *Amazon Inspector* guide.

- For API details, see [SubscribeToEvent](#) in *AWS CLI Command Reference*.

unsubscribe-from-event

The following code example shows how to use `unsubscribe-from-event`.

AWS CLI

To unsubscribe from an event

The following `unsubscribe-from-event` command disables the process of sending Amazon SNS notifications about the `ASSESSMENT_RUN_COMPLETED` event to the topic with the ARN of `arn:aws:sns:us-west-2:123456789012:exampletopic`:

```
aws inspector unsubscribe-from-event --event ASSESSMENT_RUN_COMPLETED --resource-arn  
arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX/template/0-7sbz2Kz0 --  
topic arn:aws:sns:us-west-2:123456789012:exampletopic
```

For more information, see [Amazon Inspector Assessment Templates and Assessment Runs](#) in the *Amazon Inspector* guide.

- For API details, see [UnsubscribeFromEvent](#) in *AWS CLI Command Reference*.

update-assessment-target

The following code example shows how to use `update-assessment-target`.

AWS CLI

To update an assessment target

The following `update-assessment-target` command updates the assessment target with the ARN of `arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX` and

the name of Example, and the resource group with the ARN of `arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-yNbgL5Pt`:

```
aws inspector update-assessment-target --assessment-target-arn arn:aws:inspector:us-west-2:123456789012:target/0-nvgVhaxX --assessment-target-name Example --resource-group-arn arn:aws:inspector:us-west-2:123456789012:resourcegroup/0-yNbgL5Pt
```

For more information, see Amazon Inspector Assessment Targets in the *Amazon Inspector* guide.

- For API details, see [UpdateAssessmentTarget](#) in *AWS CLI Command Reference*.

AWS IoT examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

accept-certificate-transfer

The following code example shows how to use `accept-certificate-transfer`.

AWS CLI

To accept a device certificate transferred from a different AWS account

The following `accept-certificate-transfer` example accepts a device certificate transferred from another AWS account. The certificate is identified by its ID.

```
aws iot accept-certificate-transfer \  
  --certificate-id  
  488b6a7f2acdeb00a77384e63c4e40b18bEXAMPLEe57b7272ba44c45e3448142
```

This command does not produce any output.

For more information, see [Transfer a certificate to another account](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [AcceptCertificateTransfer](#) in *AWS CLI Command Reference*.

add-thing-to-billing-group

The following code example shows how to use `add-thing-to-billing-group`.

AWS CLI

Example 1: To add a thing by name to a billing group

The following `add-thing-to-billing-group` example adds the thing named `MyLightBulb` to the billing group named `GroupOne`.

```
aws iot add-thing-to-billing-group \  
  --billing-group-name GroupOne \  
  --thing-name MyLightBulb
```

This command produces no output.

Example 2: To add a thing by ARN to a billing group

The following `add-thing-to-billing-group` example adds a thing with a specified ARN to a billing group with the specified ARN. Specifying an ARN is helpful if you work with multiple AWS Regions or accounts. It can help ensure that you are adding to the right Region and account.

```
aws iot add-thing-to-thing-group \  
  --billing-group-arn "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne" \  
  --thing-arn "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb"
```

This command produces no output.

For more information, see [Billing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [AddThingToBillingGroup](#) in *AWS CLI Command Reference*.

add-thing-to-thing-group

The following code example shows how to use `add-thing-to-thing-group`.

AWS CLI

To add a thing to a group

The following `add-thing-to-thing-group` example adds the specified thing to the specified thing group.

```
aws iot add-thing-to-thing-group \  
  --thing-name MyLightBulb \  
  --thing-group-name LightBulbs
```

This command produces no output.

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [AddThingToThingGroup](#) in *AWS CLI Command Reference*.

associate-targets-with-job

The following code example shows how to use `associate-targets-with-job`.

AWS CLI

To associate a thing group with a continuous job

The following `associate-targets-with-job` example associates the specified thing group with the specified continuous job.

```
aws iot associate-targets-with-job \  
  --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \  
  --job-id "example-job-04"
```

Output:

```
{
  "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-04",
  "jobId": "example-job-04",
  "description": "example continuous job"
}
```

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [AssociateTargetsWithJob](#) in *AWS CLI Command Reference*.

attach-policy

The following code example shows how to use `attach-policy`.

AWS CLI

Example 1: To attach a policy to a thing group

The following `attach-policy` example attaches the specified policy to a thing group identified by its ARN.

```
aws iot attach-policy \
  --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
  --policy-name "UpdateDeviceCertPolicy"
```

This command does not produce any output.

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

Example 2: To attach a policy to a certificate

The following `attach-policy` example attaches the policy `UpdateDeviceCertPolicy` to the principal specified by a certificate.

```
aws iot attach-policy \
  --policy-name UpdateDeviceCertPolicy \
  --target "arn:aws:iot:us-
west-2:123456789012:cert/4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"
```

This command does not produce any output.

For more information, see [Attach an AWS IoT Policy to a Device Certificate](#) in the *AWS IoT Developers Guide*.

- For API details, see [AttachPolicy](#) in *AWS CLI Command Reference*.

attach-security-profile

The following code example shows how to use `attach-security-profile`.

AWS CLI

To associate a security profile with all unregistered devices

The following `attach-security-profile` example associates the AWS IoT Device Defender security profile named `Testprofile` with all unregistered devices in the `us-west-2` region for this AWS account.

```
aws iot attach-security-profile \  
  --security-profile-name Testprofile \  
  --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/  
unregistered-things"
```

This command produces no output.

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [AttachSecurityProfile](#) in *AWS CLI Command Reference*.

attach-thing-principal

The following code example shows how to use `attach-thing-principal`.

AWS CLI

To attach a certificate to your thing

The following `attach-thing-principal` example attaches a certificate to the `MyTemperatureSensor` thing. The certificate is identified by an ARN. You can find the ARN for a certificate in the AWS IoT console.

```
aws iot attach-thing-principal \  
  --certificate-arn arn:aws:iot:us-west-2:123456789012:certificate:  
MyCertificate
```

```
--thing-name MyTemperatureSensor \  
--principal arn:aws:iot:us-  
west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](#) in the *AWS IoT Developers Guide*.

- For API details, see [AttachThingPrincipal](#) in *AWS CLI Command Reference*.

cancel-audit-mitigation-actions-task

The following code example shows how to use `cancel-audit-mitigation-actions-task`.

AWS CLI

To cancel an audit mitigation actions task

The following `cancel-audit-mitigation-actions-task` example cancels the application of mitigation actions for the specified task. You cannot cancel tasks that are already completed.

```
aws iot cancel-audit-mitigation-actions-task  
--task-id "myActionsTaskId"
```

This command produces no output.

For more information, see [CancelAuditMitigationActionsTask \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [CancelAuditMitigationActionsTask](#) in *AWS CLI Command Reference*.

cancel-audit-task

The following code example shows how to use `cancel-audit-task`.

AWS CLI

To cancel an audit task

The following `cancel-audit-task` example cancels an audit task with the specified task ID. You cannot cancel a task that is complete.

```
aws iot cancel-audit-task \  
  --task-id a3aea009955e501a31b764abe1bebd3d
```

This command produces no output.

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [CancelAuditTask](#) in *AWS CLI Command Reference*.

cancel-certificate-transfer

The following code example shows how to use `cancel-certificate-transfer`.

AWS CLI

To cancel the transfer a certificate to a different AWS account

The following `cancel-certificate-transfer` example cancels the transfer of the specified certificate transfer. The certificate is identified by a certificate ID. You can find the ID for a certificate in the AWS IoT console.

```
aws iot cancel-certificate-transfer \  
  --certificate-id  
  f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78add5e605d630e05c7fc8
```

This command produces no output.

For more information, see [Transfer a certificate to another account](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [CancelCertificateTransfer](#) in *AWS CLI Command Reference*.

cancel-job-execution

The following code example shows how to use `cancel-job-execution`.

AWS CLI

To cancel a job execution on a device

The following `cancel-job-execution` example cancels the execution of the specified job on a device. If the job is not in the QUEUED state, you must add the `--force` parameter.

```
aws iot cancel-job-execution \  
  --job-id "example-job-03" \  
  --thing-name "MyRPi"
```

This command produces no output.

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [CancelJobExecution](#) in *AWS CLI Command Reference*.

cancel-job

The following code example shows how to use `cancel-job`.

AWS CLI

To cancel a job

The following `cancel-job` example cancels the specified job.

```
aws iot cancel-job \  
  --job-id "example-job-03"
```

Output:

```
{  
  "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-03",  
  "jobId": "example-job-03",  
  "description": "example job test"  
}
```

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [CancelJob](#) in *AWS CLI Command Reference*.

clear-default-authorizer

The following code example shows how to use `clear-default-authorizer`.

AWS CLI

To clear the default authorizer

The following `clear-default-authorizer` example clears the currently configured default custom authorizer. After you run this command, there is no default authorizer. When you use a custom authorizer, you must specify it by name in the HTTP request headers.

```
aws iot clear-default-authorizer
```

This command produces no output.

For more information, see [ClearDefaultAuthorizer](#) in the *AWS IoT API Reference*.

- For API details, see [ClearDefaultAuthorizer](#) in *AWS CLI Command Reference*.

confirm-topic-rule-destination

The following code example shows how to use `confirm-topic-rule-destination`.

AWS CLI

To confirm a topic rule destination

The following `confirm-topic-rule-destination` example confirms a topic rule destination with a confirmation token received at an HTTP endpoint.

```
aws iot confirm-topic-rule-destination \  
  --confirmation-token "AYADeIcmtq-  
ZkxfpiWlQqHWM5ucAXwABABVhd3MtY3J5cHRvLXB1YmxpYy1rZXkAREFyY1E0Um1GeDg0V21BZWZ1VjZtZWFRVUJJUkt  
aywpPqg8YEsa11D4B40aJ2s1wEHKMybiF1Ro0ZzYisI0IvslzQY5UmCkqq3tV-3f7-

V19V9m6Iw2xfbw_____wAAAAEAAAAAAAAAAAAAAAAAAEAAAB1hw4SokgUcxiJ3gT06n50NLJVpzyQR1UmPIj5sShqXEQGcC  
iufgrzTePl8RZY0Wr006Aj9DiVzJZx-1iD6Pu-  
G6PUw1ka07Knzs2B4AD0qfrHUF4pYRTvyUgBnMGUCMQC8ZRmhKqntd_c6Kgrow3bMUDbvNqo2qZr8Z8Jm2rZgseR01An  
PIetJ803Z4I1I1F8xX1cdPGP-PV1d0XFemyL8g"
```

This command produces no output.

For more information, see [Confirming a topic rule destination](#) in the *AWS IoT Developer Guide*.

- For API details, see [ConfirmTopicRuleDestination](#) in *AWS CLI Command Reference*.

create-audit-suppression

The following code example shows how to use `create-audit-suppression`.

AWS CLI

To create an audit finding suppression

The following `create-audit-suppression` example creates an audit finding suppression for a policy named "virtualMachinePolicy" that has been flagged for being overly permissive.

```
aws iot create-audit-suppression \  
  --check-name IOT_POLICY_OVERLY_PERMISSIVE_CHECK \  
  --resource-identifier  
policyVersionIdentifier={"policyName"="virtualMachinePolicy","policyVersionId"="1"} \  
 \  
  --no-suppress-indefinitely \  
  --expiration-date 2020-10-20
```

This command produces no output.

For more information, see [Audit finding suppressions](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateAuditSuppression](#) in *AWS CLI Command Reference*.

create-authorizer

The following code example shows how to use `create-authorizer`.

AWS CLI

To create a custom authorizer

The following `create-authorizer` example creates a custom authorizer that uses the specified Lambda function as part of a custom authentication service.

```
aws iot create-authorizer \  
  --authorizer-name "CustomAuthorizer" \  
  --authorizer-function-arn "arn:aws:lambda:us-  
west-2:123456789012:function:CustomAuthorizerFunction" \  
  --token-key-name "MyAuthToken" \  
  --status ACTIVE \  
  --token-signing-public-keys FIRST_KEY="-----BEGIN PUBLIC KEY-----  
MIIBIjANBgkqhkiG9w0BAQEFAA0CAQ8AMIIBCgKCAQEA1uJOB4lQPgG/1M6ZfIwo

```

```
+GqsNvAQ9Jy1wI2VrEa10fL8f1DB/BJLm7zjpfPOHDJQgID0XnZwA1NnZc0hCwIx
50g2LW20y9R/dmqtDmJiVP97Z4GykxPvwlyHrUXY0iW1R3AR/Ac1NhCTGZMwVDB1
1QIDAQAB
-----END PUBLIC KEY-----"
```

Output:

```
{
  "authorizerName": "CustomAuthorizer",
  "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
}
```

For more information, see [CreateAuthorizer](#) in the *AWS IoT API Reference*.

- For API details, see [CreateAuthorizer](#) in *AWS CLI Command Reference*.

create-billing-group

The following code example shows how to use `create-billing-group`.

AWS CLI

To create a billing group

The following `create-billing-group` example creates a simple billing group named `GroupOne`.

```
aws iot create-billing-group \
  --billing-group-name GroupOne
```

Output:

```
{
  "billingGroupName": "GroupOne",
  "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
  "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562"
}
```

For more information, see [Billing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateBillingGroup](#) in *AWS CLI Command Reference*.

create-certificate-from-csr

The following code example shows how to use `create-certificate-from-csr`.

AWS CLI

To create a device certificate from a certificate signing request (CSR)

The following `create-certificate-from-csr` example creates a device certificate from a CSR. You can use the `openssl` command to create a CSR.

```
aws iot create-certificate-from-csr \  
  --certificate-signing-request=file://certificate.csr
```

Output:

```
{  
  "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/  
c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbbee1428d216d54d53ac9",  
  "certificateId":  
"c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbbee1428d216d54d53ac9",  
  "certificatePem": "<certificate-text>"  
}
```

For more information, see [CreateCertificateFromCSR](#) in the *AWS IoT API Reference*.

- For API details, see [CreateCertificateFromCsr](#) in *AWS CLI Command Reference*.

create-custom-metric

The following code example shows how to use `create-custom-metric`.

AWS CLI

To create a custom metric published by your devices to Device Defender

The following `create-custom-metric` example creates a custom metric that measures battery percentage.

```
aws iot create-custom-metric \  
  --metric-name "batteryPercentage" \  
  --metric-type "number" \  
  --metric-unit "Percentage"
```

```
--display-name "Remaining battery percentage." \  
--region us-east-1 \  
--client-request-token "02ccb92b-33e8-4dfa-a0c1-35b181ed26b0"
```

Output:

```
{  
  "metricName": "batteryPercentage",  
  "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/  
batteryPercentage"  
}
```

For more information, see [Custom metrics](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [CreateCustomMetric](#) in *AWS CLI Command Reference*.

create-dimension

The following code example shows how to use create-dimension.

AWS CLI

To create a dimension

The following create-dimension creates a dimension with a single topic filter called TopicFilterForAuthMessages.

```
aws iot create-dimension \  
  --name TopicFilterForAuthMessages \  
  --type TOPIC_FILTER \  
  --string-values device/+/auth
```

Output:

```
{  
  "name": "TopicFilterForAuthMessages",  
  "arn": "arn:aws:iot:eu-west-2:123456789012:dimension/TopicFilterForAuthMessages"  
}
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [CreateDimension](#) in *AWS CLI Command Reference*.

create-domain-configuration

The following code example shows how to use `create-domain-configuration`.

AWS CLI

To create a domain configuration

The following `create-domain-configuration` example creates an AWS-managed domain configuration with a service type of DATA.

```
aws iot create-domain-configuration \  
  --domain-configuration-name "additionalDataDomain" \  
  --service-type "DATA"
```

Output:

```
{  
  "domainConfigurationName": "additionalDataDomain",  
  "domainConfigurationArn": "arn:aws:iot:us-  
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"  
}
```

For more information, see [Configurable Endpoints](#) in the *AWS IoT Developer Guide*.

- For API details, see [CreateDomainConfiguration](#) in *AWS CLI Command Reference*.

create-dynamic-thing-group

The following code example shows how to use `create-dynamic-thing-group`.

AWS CLI

To create a dynamic thing group

The following `create-dynamic-thing-group` example creates a dynamic thing group that contains any thing with a temperature attribute that is greater than 60 degrees. You must enable AWS IoT fleet indexing before you can use dynamic thing groups.

```
aws iot create-dynamic-thing-group \  
  --thing-group-name "RoomTooWarm" \  
  --query-string "attributes.temperature>60"
```

Output:

```
{
  "thingGroupName": "RoomTooWarm",
  "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/RoomTooWarm",
  "thingGroupId": "9d52492a-fc87-43f4-b6e2-e571d2ffcad1",
  "indexName": "AWS_Things",
  "queryString": "attributes.temperature>60",
  "queryVersion": "2017-09-30"
}
```

For more information, see [Dynamic Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateDynamicThingGroup](#) in *AWS CLI Command Reference*.

create-job

The following code example shows how to use `create-job`.

AWS CLI**Example 1: To create a job**

The following `create-job` example creates a simple AWS IoT job that sends a JSON document to the MyRaspberryPi device.

```
aws iot create-job \
  --job-id "example-job-01" \
  --targets "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi" \
  --document file://example-job.json \
  --description "example job test" \
  --target-selection SNAPSHOT
```

Output:

```
{
  "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
  "jobId": "example-job-01",
  "description": "example job test"
}
```

Example 2: To create a continuous job

The following `create-job` example creates a job that continues to run after the things specified as targets have completed the job. In this example, the target is a thing group, so when new devices are added to the group, the continuous job runs on those new things.

```
aws iot create-job --job-id "example-job-04" --targets "arn:aws:iot:us-west-2:123456789012:thinggroup/DeadBulbs" --document file://example-job.json --description "example continuous job" --target-selection CONTINUOUS
```

Output:

```
{
  "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-04",
  "jobId": "example-job-04",
  "description": "example continuous job"
}
```

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [CreateJob](#) in *AWS CLI Command Reference*.

create-keys-and-certificate

The following code example shows how to use `create-keys-and-certificate`.

AWS CLI

To create an RSA key pair and issue an X.509 certificate

The following `create-keys-and-certificate` creates a 2048-bit RSA key pair and issues an X.509 certificate using the issued public key. Because this is the only time that AWS IoT provides the private key for this certificate, be sure to keep it in a secure location.

```
aws iot create-keys-and-certificate \
  --certificate-pem-outfile "myTest.cert.pem" \
  --public-key-outfile "myTest.public.key" \
  --private-key-outfile "myTest.private.key"
```

Output:

```
{
```

```

    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
    "certificateId":
    "9894ba17925e663f1d29c23af4582b8e3b7619c31f3fbd93adcb51ae54b83dc2",
    "certificatePem": "

```

For more information, see [Create and Register an AWS IoT Device Certificate](#) in the **AWS IoT Developer Guide**.

- For API details, see [CreateKeysAndCertificate](#) in *AWS CLI Command Reference*.

create-mitigation-action

The following code example shows how to use create-mitigation-action.

AWS CLI

To create a mitigation action

The following `create-mitigation-action` example defines a mitigation action named `AddThingsToQuarantineGroup1Action` that, when applied, moves things into the thing group named `QuarantineGroup1`. This action overrides dynamic thing groups.

```
aws iot create-mitigation-action --cli-input-json file::params.json
```

Contents of `params.json`:

```
{
  "actionName": "AddThingsToQuarantineGroup1Action",
  "actionParams": {
    "addThingsToThingGroupParams": {
      "thingGroupNames": [
        "QuarantineGroup1"
      ],
      "overrideDynamicGroups": true
    }
  },
  "roleArn": "arn:aws:iam::123456789012:role/service-role/MoveThingsToQuarantineGroupRole"
}
```

Output:

```
{
  "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroup1Action",
  "actionId": "992e9a63-a899-439a-aa50-4e20c52367e1"
}
```

For more information, see [CreateMitigationAction \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [CreateMitigationAction](#) in *AWS CLI Command Reference*.

`create-ota-update`

The following code example shows how to use `create-ota-update`.

AWS CLI

To create an OTA update for use with Amazon FreeRTOS

The following `create-ota-update` example creates an AWS IoT OTAUpdate on a target group of things or groups. This is part of an Amazon FreeRTOS over-the-air update which makes it possible for you to deploy new firmware images to a single device or a group of devices.

```
aws iot create-ota-update \  
  --cli-input-json file://create-ota-update.json
```

Contents of `create-ota-update.json`:

```
{  
  "otaUpdateId": "ota12345",  
  "description": "A critical update needed right away.",  
  "targets": [  
    "device1",  
    "device2",  
    "device3",  
    "device4"  
  ],  
  "targetSelection": "SNAPSHOT",  
  "awsJobExecutionsRolloutConfig": {  
    "maximumPerMinute": 10  
  },  
  "files": [  
    {  
      "fileName": "firmware.bin",  
      "fileLocation": {  
        "stream": {  
          "streamId": "004",  
          "fileId": 123  
        }  
      },  
      "codeSigning": {  
        "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"  
      }  
    }  
  ]  
  "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role"  
}
```

Output:

```
{
  "otaUpdateId": "ota12345",
  "awsIotJobId": "job54321",
  "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/itsaupdate",
  "awsIotJobArn": "arn:aws:iot:us-west-2:123456789012:job/itsajob",
  "otaUpdateStatus": "CREATE_IN_PROGRESS"
}
```

For more information, see [CreateOTAUpdate](#) in the *AWS IoT API Reference*.

- For API details, see [CreateOtaUpdate](#) in *AWS CLI Command Reference*.

create-policy-version

The following code example shows how to use `create-policy-version`.

AWS CLI**To update a policy with a new version**

The following `create-policy-version` example updates a policy definition, creating a new policy version. This example also makes the new version the default.

```
aws iot create-policy-version \
  --policy-name UpdateDeviceCertPolicy \
  --policy-document file://policy.json \
  --set-as-default
```

Contents of `policy.json`:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "iot:UpdateCertificate",
      "Resource": "*"
    }
  ]
}
```

Output:

```
{
  "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
  "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\": \"Allow\", \"Action\": \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
  "policyVersionId": "2",
  "isDefaultVersion": true
}
```

For more information, see [AWS IoT Policies](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreatePolicyVersion](#) in *AWS CLI Command Reference*.

create-policy

The following code example shows how to use `create-policy`.

AWS CLI**To create an AWS IoT policy**

The following `create-policy` example creates an AWS IoT policy named `TemperatureSensorPolicy`. The `policy.json` file contains statements that allow AWS IoT policy actions.

```
aws iot create-policy \
  --policy-name TemperatureSensorPolicy \
  --policy-document file://policy.json
```

Contents of `policy.json`:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "iot:Publish",
        "iot:Receive"
      ],
      "Resource": [
```

```

        "arn:aws:iot:us-west-2:123456789012:topic/topic_1",
        "arn:aws:iot:us-west-2:123456789012:topic/topic_2"
    ]
},
{
    "Effect": "Allow",

create-provisioning-claim

The following code example shows how to use `create-provisioning-claim`.

AWS CLI

To create a provisioning claim

The following `create-provisioning-claim` example creates a provisioning claim from a provisioning template.

```
aws iot create-provisioning-claim \
```

```
--template-name MyTestProvisioningTemplate
```

Output:

```
{
  "certificateId":
    "78de02184b2ce80cf8fb709bda59e62b19fb83513590483eb0434589476ab09f",

create-provisioning-template-version

The following code example shows how to use `create-provisioning-template-version`.

AWS CLI

To create a provisioning template version

The following example creates a version for the specified provisioning template. The body of the new version is supplied in the file `template.json`.

```
aws iot create-provisioning-template-version \  
  --template-name widget-template \  
  --template-body file://template.json
```

Contents of `template.json`:

```
{  
  "Parameters" : {  
    "DeviceLocation": {  
      "Type": "String"  
    }  
  },  
  "Mappings": {  
    "LocationTable": {  
      "Seattle": {  
        "LocationUrl": "https://example.aws"  
      }  
    }  
  },  
  "Resources" : {  
    "thing" : {  
      "Type" : "AWS::IoT::Thing",  
      "Properties" : {  
        "AttributePayload" : {  
          "version" : "v1",  
          "serialNumber" : "serialNumber"  
        }  
      }  
    }  
  }  
}
```

```

        },
        "ThingName" : {"Fn::Join":["",["ThingPrefix_",
{"Ref":"SerialNumber"}]]},
        "ThingTypeName" : {"Fn::Join":["",["ThingTypePrefix_",

        "ThingGroups" : "DO_NOTHING"
    }
},
"certificate" : {
    "Type" : "AWS::IoT::Certificate",
    "Properties" : {
        "CertificateId": {"Ref": "AWS::IoT::Certificate::Id"},
        "Status" : "Active"
    }
},
"policy" : {
    "Type" : "AWS::IoT::Policy",
    "Properties" : {
        "PolicyDocument" : {
            "Version": "2012-10-17",
            "Statement": [{
                "Effect": "Allow",
                "Action":["iot:Publish"],
                "Resource": ["arn:aws:iot:us-east-1:123456789012:topic/foo/
bar"]
            }]
        }
    }
},
"DeviceConfiguration": {
    "FallbackUrl": "https://www.example.com/test-site",
    "LocationUrl": {
        "Fn::FindInMap": ["LocationTable",{"Ref": "DeviceLocation"},
"LocationUrl"]}
    }
}
}

```

```
}
```

Output:

```
{
  "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-
template",
  "templateName": "widget-template",

create-provisioning-template

The following code example shows how to use `create-provisioning-template`.

AWS CLI**To create a provisioning template**

The following `create-provisioning-template` example creates a provisioning template as defined by the file `template.json`.

```
aws iot create-provisioning-template \
  --template-name widget-template \
  --description "A provisioning template for widgets" \
  --provisioning-role-arn arn:aws:iam::123456789012:role/Provision_role \
  --template-body file://template.json
```

Contents of `template.json`:

```
{
  "Parameters" : {
    "DeviceLocation": {
      "Type": "String"
    }
  },
  "Mappings": {
```

```

    "LocationTable": {
      "Seattle": {
        "LocationUrl": "https://example.aws"
      }
    },
    "Resources" : {
      "thing" : {
        "Type" : "AWS::IoT::Thing",
        "Properties" : {
          "AttributePayload" : {
            "version" : "v1",
            "serialNumber" : "serialNumber"
          },
          "ThingName" : {"Fn::Join":["",["ThingPrefix_",
{"Ref":"SerialNumber"}]]},
          "ThingTypeName" : {"Fn::Join":["",["ThingTypePrefix_",
{"Ref":"SerialNumber"}]]},
          "ThingGroups" : ["widgets", "WA"],
          "BillingGroup": "BillingGroup"
        },
        "OverrideSettings" : {
          "AttributePayload" : "MERGE",
          "ThingTypeName" : "REPLACE",
          "ThingGroups" : "DO_NOTHING"
        }
      },
      "certificate" : {
        "Type" : "AWS::IoT::Certificate",
        "Properties" : {
          "CertificateId": {"Ref": "AWS::IoT::Certificate::Id"},
          "Status" : "Active"
        }
      },
      "policy" : {
        "Type" : "AWS::IoT::Policy",
        "Properties" : {
          "PolicyDocument" : {
            "Version": "2012-10-17",
            "Statement": [{
              "Effect": "Allow",
              "Action":["iot:Publish"],
              "Resource": ["arn:aws:iot:us-east-1:504350838278:topic/foo/
bar"]
            }
          ]
        }
      }
    }
  }

```

```

    }
  }
},
"DeviceConfiguration": {
  "FallbackUrl": "https://www.example.com/test-site",
  "LocationUrl": {
    "Fn::FindInMap": ["LocationTable", {"Ref": "DeviceLocation"},
"LocationUrl"]}
  }
}
}
}

```

Output:

```

{
  "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/widget-
template",
  "templateName": "widget-template",
  "defaultVersionId": 1
}

```

For more information, see [AWS IoT Secure Tunneling](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [CreateProvisioningTemplate](#) in *AWS CLI Command Reference*.

create-role-alias

The following code example shows how to use `create-role-alias`.

AWS CLI**To create a role alias**

The following `create-role-alias` example creates a role alias called `LightBulbRole` for the specified role.

```

aws iot create-role-alias \
  --role-alias LightBulbRole \
  --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001

```

Output:

```
{
  "roleAlias": "LightBulbRole",
  "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"
}
```

For more information, see [CreateRoleAlias](#) in the *AWS IoT API Reference*.

- For API details, see [CreateRoleAlias](#) in *AWS CLI Command Reference*.

create-scheduled-audit

The following code example shows how to use `create-scheduled-audit`.

AWS CLI

To create a scheduled audit

The following `create-scheduled-audit` example creates a scheduled audit that runs weekly, on Wednesday, to check if CA certificates or device certificates are expiring.

```
aws iot create-scheduled-audit \
  --scheduled-audit-name WednesdayCertCheck \
  --frequency WEEKLY \
  --day-of-week WED \
  --target-check-names CA_CERTIFICATE_EXPIRING_CHECK
  DEVICE_CERTIFICATE_EXPIRING_CHECK
```

Output:

```
{
  "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
  WednesdayCertCheck"
}
```

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [CreateScheduledAudit](#) in *AWS CLI Command Reference*.

create-security-profile

The following code example shows how to use `create-security-profile`.

AWS CLI

To create a security profile

The following `create-security-profile` example creates a security profile that checks if cellular bandwidth exceeds a threshold or if more than 10 authorization failures occur within a five-minute period.

```
aws iot create-security-profile \
  --security-profile-name PossibleIssue \
  --security-profile-description "Check to see if authorization fails 10 times in
  5 minutes or if cellular bandwidth exceeds 128" \
  --behaviors "[{"name":"CellularBandwidth","metric":"aws:message-byte-size
  \","criteria":{"comparisonOperator":"greater-than","value":{"count":128},
  "consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}},{"name
  \":"Authorization","metric":"aws:num-authorization-failures","criteria":
  {"comparisonOperator":"less-than","value":{"count":10},"durationSeconds
  \":300,"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}]]"
```

Output:

```
{
  "securityProfileName": "PossibleIssue",
  "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
  PossibleIssue"
}
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [CreateSecurityProfile](#) in *AWS CLI Command Reference*.

create-stream

The following code example shows how to use `create-stream`.

AWS CLI

To create a stream for delivering one or more large files in chunks over MQTT

The following `create-stream` example creates a stream for delivering one or more large files in chunks over MQTT. A stream transports data bytes in chunks or blocks packaged as MQTT messages from a source like S3. You can have one or more files associated with a stream.

```
aws iot create-stream \  
  --cli-input-json file://create-stream.json
```

Contents of create-stream.json:

```
{  
  "streamId": "stream12345",  
  "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",  
  "files": [  
    {  
      "fileId": 123,  
      "s3Location": {  
        "bucket": "codesign-ota-bucket",  
        "key": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"  
      }  
    }  
  ],  
  "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"  
}
```

Output:

```
{  
  "streamId": "stream12345",  
  "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",  
  "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",  
  "streamVersion": "1"  
}
```

For more information, see [CreateStream](#) in the *AWS IoT API Reference*.

- For API details, see [CreateStream](#) in *AWS CLI Command Reference*.

create-thing-group

The following code example shows how to use create-thing-group.

AWS CLI

Example 1: To create a thing group

The following `create-thing-group` example creates a thing group named `LightBulbs` with a description and two attributes.

```
aws iot create-thing-group \  
  --thing-group-name LightBulbs \  
  --thing-group-properties "thingGroupDescription=\"Generic bulb group\  
attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"
```

Output:

```
{  
  "thingGroupName": "LightBulbs",  
  "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs",  
  "thingGroupId": "9198bf9f-1e76-4a88-8e8c-e7140142c331"  
}
```

Example 2: To create a thing group that's part of a parent group

The following `create-thing-group` creates a thing group named `HalogenBulbs` that has a parent thing group named `LightBulbs`.

```
aws iot create-thing-group \  
  --thing-group-name HalogenBulbs \  
  --parent-group-name LightBulbs
```

Output:

```
{  
  "thingGroupName": "HalogenBulbs",  
  "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs",  
  "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e"  
}
```

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateThingGroup](#) in *AWS CLI Command Reference*.

create-thing-type

The following code example shows how to use `create-thing-type`.

AWS CLI

To define a thing type

The following `create-thing-type` example defines a thing type and associated attributes.

```
aws iot create-thing-type \  
  --thing-type-name "LightBulb" \  
  --thing-type-properties "thingTypeDescription=light bulb type,  
searchableAttributes=wattage,model"
```

Output:

```
{  
  "thingTypeName": "LightBulb",  
  "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",  
  "thingTypeId": "ce3573b0-0a3c-45a7-ac93-4e0ce14cd190"  
}
```

For more information, see [Thing Types](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateThingType](#) in *AWS CLI Command Reference*.

create-thing

The following code example shows how to use `create-thing`.

AWS CLI

Example 1: To create a thing record in the registry

The following `create-thing` example creates an entry for a device in the AWS IoT thing registry.

```
aws iot create-thing \  
  --thing-name SampleIoTThing
```

Output:

```
{  
  "thingName": "SampleIoTThing",
```

```
"thingArn": "arn:aws:iot:us-west-2: 123456789012:thing/SampleIoTThing",
"thingId": " EXAMPLE1-90ab-cdef-fedc-ba987EXAMPLE "
}
```

Example 2: To define a thing that is associated with a thing type

The following `create-thing` example create a thing that has the specified thing type and its attributes.

```
aws iot create-thing \
  --thing-name "MyLightBulb" \
  --thing-type-name "LightBulb" \
  --attribute-payload '{"attributes": {"wattage": "75", "model": "123"}}'
```

Output:

```
{
  "thingName": "MyLightBulb",
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
  "thingId": "40da2e73-c6af-406e-b415-15acae538797"
}
```

For more information, see [How to Manage Things with the Registry](#) and [Thing Types](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateThing](#) in *AWS CLI Command Reference*.

create-topic-rule-destination

The following code example shows how to use `create-topic-rule-destination`.

AWS CLI

To create a topic rule destination

The following `create-topic-rule-destination` example creates a topic rule destination for an HTTP endpoint.

```
aws iot create-topic-rule-destination \
  --destination-configuration httpUrlConfiguration={confirmationUrl=https://
example.com}
```

Output:

```
{
  "topicRuleDestination": {
    "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "status": "IN_PROGRESS",
    "statusReason": "Awaiting confirmation. Confirmation message sent on
2020-07-09T22:47:54.154Z; no response received from the endpoint.",
    "httpUrlProperties": {
      "confirmationUrl": "https://example.com"
    }
  }
}
```

For more information, see [Creating a topic rule destination](#) in the *AWS IoT Developer Guide*.

- For API details, see [CreateTopicRuleDestination](#) in *AWS CLI Command Reference*.

create-topic-rule

The following code example shows how to use `create-topic-rule`.

AWS CLI**To create a rule that sends an Amazon SNS alert**

The following `create-topic-rule` example creates a rule that sends an Amazon SNS message when soil moisture level readings, as found in a device shadow, are low.

```
aws iot create-topic-rule \
  --rule-name "LowMoistureRule" \
  --topic-rule-payload file://plant-rule.json
```

The example requires the following JSON code to be saved to a file named `plant-rule.json`:

```
{
  "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE
state.reported.moisture = 'low'\n",
  "description": "Sends an alert whenever soil moisture level readings are too
low.",
  "ruleDisabled": false,
```

```
"awsIotSqlVersion": "2016-03-23",
"actions": [{
  "sns": {
    "targetArn": "arn:aws:sns:us-
west-2:123456789012:MyRPIlowMoistureTopic",
    "roleArn": "arn:aws:iam::123456789012:role/service-role/
MyRPIlowMoistureTopicRole",
    "messageFormat": "RAW"
  }
}]
}
```

This command produces no output.

For more information, see [Creating an AWS IoT Rule](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateTopicRule](#) in *AWS CLI Command Reference*.

delete-account-audit-configuration

The following code example shows how to use `delete-account-audit-configuration`.

AWS CLI

To disable all audit checks for your AWS account

The following `delete-account-audit-configuration` example restores the default settings for AWS IoT Device Defender for this account, disabling all audit checks and clearing configuration data. It also deletes any scheduled audits for this account. **Use this command with caution.**

```
aws iot delete-account-audit-configuration \
  --delete-scheduled-audits
```

This command produces no output.

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteAccountAuditConfiguration](#) in *AWS CLI Command Reference*.

delete-audit-suppression

The following code example shows how to use `delete-audit-suppression`.

AWS CLI

To delete an audit finding suppression

The following `delete-audit-suppression` example deletes an audit finding suppression for `DEVICE_CERTIFICATE_EXPIRING_CHECK`.

```
aws iot delete-audit-suppression \  
  --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \  
  --resource-identifier deviceCertificateId="c7691e<shortened>"
```

This command produces no output.

For more information, see [Audit finding suppressions](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteAuditSuppression](#) in *AWS CLI Command Reference*.

delete-authorizer

The following code example shows how to use `delete-authorizer`.

AWS CLI

To delete a custom authorizer

The following `delete-authorizer` example deletes the authorizer named `CustomAuthorizer`. A custom authorizer must be in the `INACTIVE` state before you can delete it.

```
aws iot delete-authorizer \  
  --authorizer-name CustomAuthorizer
```

This command produces no output.

For more information, see [DeleteAuthorizer](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteAuthorizer](#) in *AWS CLI Command Reference*.

delete-billing-group

The following code example shows how to use `delete-billing-group`.

AWS CLI

To delete a billing group

The following `delete-billing-group` example deletes the specified billing group. You can delete a billing group even if it contains one or more things.

```
aws iot delete-billing-group \  
  --billing-group-name BillingGroupTwo
```

This command does not produce any output.

For more information, see [Billing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteBillingGroup](#) in *AWS CLI Command Reference*.

`delete-ca-certificate`

The following code example shows how to use `delete-ca-certificate`.

AWS CLI

To delete a CA certificate

The following `delete-ca-certificate` example deletes the CA certificate with the specified certificate ID.

```
aws iot delete-ca-certificate \  
  --certificate-id  
  f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

This command produces no output.

For more information, see [DeleteCACertificate](#) in the *AWS IoT API Reference*.

- For API details, see [DeleteCaCertificate](#) in *AWS CLI Command Reference*.

`delete-certificate`

The following code example shows how to use `delete-certificate`.

AWS CLI

To delete a device certificate

The following `delete-certificate` example deletes the device certificate with the specified ID.

```
aws iot delete-certificate \  
  --certificate-id  
  c0c57bbc8baaf4631a9a0345c957657f5e710473e3ddbbee1428d216d54d53ac9
```

This command produces no output.

For more information, see [DeleteCertificate](#) in the *AWS IoT API Reference*.

- For API details, see [DeleteCertificate](#) in *AWS CLI Command Reference*.

`delete-custom-metric`

The following code example shows how to use `delete-custom-metric`.

AWS CLI

To delete a custom metric

The following `delete-custom-metric` example deletes a custom metric.

```
aws iot delete-custom-metric \  
  --metric-name batteryPercentage \  
  --region us-east-1
```

Output:

```
HTTP 200
```

For more information, see [Custom metrics](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [DeleteCustomMetric](#) in *AWS CLI Command Reference*.

`delete-dimension`

The following code example shows how to use `delete-dimension`.

AWS CLI

To delete a dimension

The following `delete-dimension` example deletes a dimension called `TopicFilterForAuthMessages`.

```
aws iot delete-dimension \  
  --name TopicFilterForAuthMessages
```

This command produces no output.

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteDimension](#) in *AWS CLI Command Reference*.

`delete-domain-configuration`

The following code example shows how to use `delete-domain-configuration`.

AWS CLI

To delete a domain configuration

The following `delete-domain-configuration` example deletes a domain configuration named `additionalDataDomain` from your AWS account.

```
aws iot delete-domain-configuration \  
  --domain-configuration-name "additionalDataDomain" \  
  --domain-configuration-status "OK"
```

This command produces no output.

For more information, see [Configurable Endpoints](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteDomainConfiguration](#) in *AWS CLI Command Reference*.

`delete-dynamic-thing-group`

The following code example shows how to use `delete-dynamic-thing-group`.

AWS CLI

To delete a dynamic thing group

The following `delete-dynamic-thing-group` example deletes the specified dynamic thing group.

```
aws iot delete-dynamic-thing-group \  
  --thing-group-name "RoomTooWarm"
```

This command produces no output.

For more information, see [Dynamic Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteDynamicThingGroup](#) in *AWS CLI Command Reference*.

delete-job-execution

The following code example shows how to use `delete-job-execution`.

AWS CLI

To delete a job execution

The following `delete-job-execution` example deletes the job execution of the specified job on a device. Use `describe-job-execution` to get the execution number.

```
aws iot delete-job-execution  
  --job-id "example-job-02"  
  --thing-name "MyRaspberryPi"  
  --execution-number 1
```

This command produces no output.

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteJobExecution](#) in *AWS CLI Command Reference*.

delete-job

The following code example shows how to use `delete-job`.

AWS CLI

To delete a job

The following `delete-job` example deletes the specified job. By specifying the `--force` option, the job is deleted even if the status is `IN_PROGRESS`.

```
aws iot delete-job \  
  --job-id "example-job-04" \  
  --force
```

This command produces no output.

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteJob](#) in *AWS CLI Command Reference*.

delete-mitigation-action

The following code example shows how to use `delete-mitigation-action`.

AWS CLI

To delete a mitigation action

The following `delete-mitigation-action` example deletes the specified mitigation action.

```
aws iot delete-mitigation-action \  
  --action-name AddThingsToQuarantineGroup1Action
```

This command produces no output.

For more information, see [DeleteMitigationAction \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteMitigationAction](#) in *AWS CLI Command Reference*.

delete-ota-update

The following code example shows how to use `delete-ota-update`.

AWS CLI

To delete an OTA update

The following `delete-ota-update` example deletes the specified OTA update.

```
aws iot delete-ota-update \  
  --ota-update-id ota12345 \  
  --delete-stream \  
  --force-delete-aws-job
```

This command produces no output.

For more information, see [DeleteOTAUpdate](#) in the *AWS IoT API Reference*.

- For API details, see [DeleteOtaUpdate](#) in *AWS CLI Command Reference*.

delete-policy-version

The following code example shows how to use `delete-policy-version`.

AWS CLI

To delete a version of policy

The following `delete-policy-version` example deletes version 2 of the specified policy from your AWS account.

```
aws iot delete-policy-version \  
  --policy-name UpdateDeviceCertPolicy \  
  --policy-version-id 2
```

This command produces no output.

For more information, see [AWS IoT Policies](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeletePolicyVersion](#) in *AWS CLI Command Reference*.

delete-policy

The following code example shows how to use `delete-policy`.

AWS CLI

To delete a policy

The following `delete-policy` example deletes the specified policy from your AWS account.

```
aws iot delete-policy --policy-name UpdateDeviceCertPolicy
```

This command produces no output.

For more information, see [AWS IoT Policies](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeletePolicy](#) in *AWS CLI Command Reference*.

delete-provisioning-template-version

The following code example shows how to use `delete-provisioning-template-version`.

AWS CLI

To delete a provisioning template version

The following `delete-provisioning-template-version` example deletes version 2 of the specified provisioning template.

```
aws iot delete-provisioning-template-version \  
  --version-id 2 \  
  --template-name "widget-template"
```

This command produces no output.

For more information, see [AWS IoT Secure Tunneling](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [DeleteProvisioningTemplateVersion](#) in *AWS CLI Command Reference*.

delete-provisioning-template

The following code example shows how to use `delete-provisioning-template`.

AWS CLI

To delete a provisioning template

The following `delete-provisioning-template` example deletes the specified provisioning template.

```
aws iot delete-provisioning-template \  
  --template-name widget-template
```

This command produces no output.

For more information, see [AWS IoT Secure Tunneling](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [DeleteProvisioningTemplate](#) in *AWS CLI Command Reference*.

delete-registration-code

The following code example shows how to use `delete-registration-code`.

AWS CLI

To delete your registration cod

The following `delete-registration-code` example deletes an AWS IoT account-specific registration code.

```
aws iot delete-registration-code
```

This command produces no output.

For more information, see [Use Your Own Certificate](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteRegistrationCode](#) in *AWS CLI Command Reference*.

delete-role-alias

The following code example shows how to use `delete-role-alias`.

AWS CLI

To delete an AWS IoT role alias

The following `delete-role-alias` example deletes an AWS IoT role alias named `LightBulbRole`.

```
aws iot delete-role-alias \  
  --role-alias-name LightBulbRole
```

```
--role-alias LightBulbRole
```

This command produces no output.

For more information, see [Authorizing Direct Calls to AWS Services](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteRoleAlias](#) in *AWS CLI Command Reference*.

delete-scheduled-audit

The following code example shows how to use `delete-scheduled-audit`.

AWS CLI

To delete a scheduled audit

The following `delete-scheduled-audit` example deletes the AWS IoT Device Defender scheduled audit named `AWSIoTDeviceDefenderDailyAudit`.

```
aws iot delete-scheduled-audit \  
  --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

This command produces no output.

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteScheduledAudit](#) in *AWS CLI Command Reference*.

delete-security-profile

The following code example shows how to use `delete-security-profile`.

AWS CLI

To delete a security profile

The following `delete-security-profile` example deletes a security profile named `PossibleIssue`.

```
aws iot delete-security-profile \  
  --security-profile-name PossibleIssue
```

This command produces no output.

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteSecurityProfile](#) in *AWS CLI Command Reference*.

delete-stream

The following code example shows how to use `delete-stream`.

AWS CLI

To delete a stream

The following `delete-stream` example deletes the specified stream.

```
aws iot delete-stream \  
  --stream-id stream12345
```

This command produces no output.

For more information, see [DeleteStream](#) in the *AWS IoT API Reference*.

- For API details, see [DeleteStream](#) in *AWS CLI Command Reference*.

delete-thing-group

The following code example shows how to use `delete-thing-group`.

AWS CLI

To delete a thing group

The following `delete-thing-group` example deletes the specified thing group. You cannot delete a thing group if it contains child thing groups.

```
aws iot delete-thing-group \  
  --thing-group-name DefectiveBulbs
```

This command produces no output.

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThingGroup](#) in *AWS CLI Command Reference*.

delete-thing-type

The following code example shows how to use delete-thing-type.

AWS CLI

Example 1: To delete a thing type

The following delete-thing-type example deletes a deprecated thing type.

```
aws iot delete-thing-type \  
  --thing-type-name "obsoleteThingType"
```

This command produces no output.

For more information, see [Thing Types](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThingType](#) in *AWS CLI Command Reference*.

delete-thing

The following code example shows how to use delete-thing.

AWS CLI

To display detailed information about a thing

The following delete-thing example deletes a thing from the AWS IoT registry for your AWS account.

```
aws iot delete-thing --thing-name "FourthBulb"
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThing](#) in *AWS CLI Command Reference*.

delete-topic-rule-destination

The following code example shows how to use delete-topic-rule-destination.

AWS CLI

To delete a topic rule destination

The following `delete-topic-rule-destination` example deletes the specified topic rule destination.

```
aws iot delete-topic-rule-destination \  
  --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/  
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

This command produces no output.

For more information, see [Deleting a topic rule destination](#) in the *AWS IoT Developer Guide*.

- For API details, see [DeleteTopicRuleDestination](#) in *AWS CLI Command Reference*.

delete-topic-rule

The following code example shows how to use `delete-topic-rule`.

AWS CLI

To delete a rule

The following `delete-topic-rule` example deletes the specified rule.

```
aws iot delete-topic-rule \  
  --rule-name "LowMoistureRule"
```

This command produces no output.

For more information, see [Deleting a Rule](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteTopicRule](#) in *AWS CLI Command Reference*.

delete-v2-logging-level

The following code example shows how to use `delete-v2-logging-level`.

AWS CLI

To delete the logging level for a thing group

The following `delete-v2-logging-level` example deletes the logging level for the specified thing group.

```
aws iot delete-v2-logging-level \  
  --target-type THING_GROUP \  
  --target-name LightBulbs
```

This command produces no output.

- For API details, see [DeleteV2LoggingLevel](#) in *AWS CLI Command Reference*.

deprecate-thing-type

The following code example shows how to use `deprecate-thing-type`.

AWS CLI

Example 1: To deprecate a thing type

The following `deprecate-thing-type` example deprecates a thing type so that users can't associate any new things with it.

```
aws iot deprecate-thing-type \  
  --thing-type-name "obsoleteThingType"
```

This command produces no output.

Example 2: To reverse the deprecation of a thing type

The following `deprecate-thing-type` example reverses the deprecation of a thing type, which makes it possible for users to associate new things with it again.

```
aws iot deprecate-thing-type \  
  --thing-type-name "obsoleteThingType" \  
  --undo-deprecate
```

This command produces no output.

For more information, see [Thing Types](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeprecateThingType](#) in *AWS CLI Command Reference*.

describe-account-audit-configuration

The following code example shows how to use describe-account-audit-configuration.

AWS CLI

To view current audit configuration settings

The following describe-account-audit-configuration example lists the current settings for your AWS IoT Device Defender audit configuration.

```
aws iot describe-account-audit-configuration
```

Output:

```
{
  "roleArn": "arn:aws:iam::123456789012:role/service-role/
AWSIoTDeviceDefenderAudit_1551201085996",
  "auditNotificationTargetConfigurations": {
    "SNS": {
      "targetArn": "arn:aws:sns:us-west-2:123456789012:ddaudits",
      "roleArn": "arn:aws:iam::123456789012:role/service-role/
AWSIoTDeviceDefenderAudit",
      "enabled": true
    }
  },
  "auditCheckConfigurations": {
    "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {

    },
    "CONFLICTING_CLIENT_IDS_CHECK": {
      "enabled": true
    },
    "DEVICE_CERTIFICATE_EXPIRING_CHECK": {
      "enabled": true
    },
    "DEVICE_CERTIFICATE_SHARED_CHECK": {
      "enabled": true
    },
    "IOT_POLICY_OVERLY_PERMISSIVE_CHECK": {
```

```

        "enabled": true
    },
    "LOGGING_DISABLED_CHECK": {
        "enabled": true
    },
    "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK": {
        "enabled": true
    },
    "REVOKED_DEVICE_CERTIFICATE_STILL_ACTIVE_CHECK": {
        "enabled": true
    },
    "UNAUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK": {
        "enabled": true
    }
}
}
}

```

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeAccountAuditConfiguration](#) in *AWS CLI Command Reference*.

describe-audit-finding

The following code example shows how to use `describe-audit-finding`.

AWS CLI

To list details for an audit finding

The following `describe-audit-finding` example lists the details for the specified AWS IoT Device Defender audit finding. An audit can produce multiple findings. Use the `list-audit-findings` command to get a list of the findings from an audit to get the `findingId`.

```

aws iot describe-audit-finding \
  --finding-id "ef4826b8-e55a-44b9-b460-5c485355371b"

```

Output:

```

{
  "finding": {
    "findingId": "ef4826b8-e55a-44b9-b460-5c485355371b",

```

```

    "taskId": "873ed69c74a9ec8fa9b8e88e9abc4661",
    "checkName": "IOT_POLICY_OVERLY_PERMISSIVE_CHECK",

"ALLOWS_BROAD_ACCESS_TO_IOT_DATA_PLANE_ACTIONS"
  }
}

```

For more information, see [Check Audit Results \(Audit Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeAuditFinding](#) in *AWS CLI Command Reference*.

describe-audit-mitigation-actions-task

The following code example shows how to use `describe-audit-mitigation-actions-task`.

AWS CLI

To show the details of an audit mitigation actions task

The following `describe-audit-mitigation-actions-task` example shows the details for the specified task, where the `ResetPolicyVersionAction` was applied to a finding. The results include when the task started and ended, how many findings were targeted (and the outcome), and the definition of the action that is applied as part of this task.

```

aws iot describe-audit-mitigation-actions-task \
  --task-id ResetPolicyTask01

```

Output:

```
{
  "taskStatus": "COMPLETED",
  "startTime": "2019-12-10T15:13:19.457000-08:00",
  "endTime": "2019-12-10T15:13:19.947000-08:00",

      "id": "1ea0b415-bef1-4a01-bd13-72fb63c59afb",
      "roleArn": "arn:aws:iam::123456789012:role/service-role/
ReplacePolicyVersionRole",
      "actionParams": {
        "replaceDefaultPolicyVersionParams": {
          "templateName": "BLANK_POLICY"
        }
      }
    }
  ]
}
```

For more information, see [DescribeAuditMitigationActionsTask \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeAuditMitigationActionsTask](#) in *AWS CLI Command Reference*.

describe-audit-suppression

The following code example shows how to use describe-audit-suppression.

AWS CLI

To get details about an audit finding suppression

The following describe-audit-suppression example lists details about an audit finding suppression.

```
aws iot describe-audit-task \  
  --task-id "787ed873b69cb4d6cdbae6ddd06996c5"
```

Output:

```
{  
  "taskStatus": "COMPLETED",  
  "taskType": "SCHEDULED_AUDIT_TASK",  
  "taskStartTime": 1596168096.157,  
  "taskStatistics": {  
    "totalChecks": 1,  
    "InProgressChecks": 0,  
    "waitingForDataCollectionChecks": 0,  
    "compliantChecks": 0,  
    "nonCompliantChecks": 1,  
    "failedChecks": 0,  
    "canceledChecks": 0  
  },  
  "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",  
  "auditDetails": {  
    "DEVICE_CERTIFICATE_EXPIRING_CHECK": {  
      "checkRunStatus": "COMPLETED_NON_COMPLIANT",  
      "checkCompliant": false,  
      "totalResourcesCount": 195,  
      "nonCompliantResourcesCount": 2  
    }  
  }  
}
```

For more information, see [Audit finding suppressions](#) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeAuditSuppression](#) in *AWS CLI Command Reference*.

describe-audit-task

The following code example shows how to use `describe-audit-task`.

AWS CLI

To get information about an audit instance

The following `describe-audit-task` example gets information about an instance of an AWS IoT Device Defender audit. If the audit is complete, summary statistics for the run are included in the results.

```
aws iot describe-audit-task \  
  --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```
{  
  "taskStatus": "COMPLETED",  
  "taskType": "ON_DEMAND_AUDIT_TASK",  
  "taskStartTime": 1560356923.434,  
  "taskStatistics": {  
    "totalChecks": 3,  
    "inProgressChecks": 0,  
    "waitingForDataCollectionChecks": 0,  
    "compliantChecks": 3,  
    "nonCompliantChecks": 0,  
    "failedChecks": 0,  
    "canceledChecks": 0  
  },  
  "auditDetails": {  
    "CA_CERTIFICATE_EXPIRING_CHECK": {  
      "checkRunStatus": "COMPLETED_COMPLIANT",  
      "checkCompliant": true,  
      "totalResourcesCount": 0,  
      "nonCompliantResourcesCount": 0  
    },  
    "DEVICE_CERTIFICATE_EXPIRING_CHECK": {  
      "checkRunStatus": "COMPLETED_COMPLIANT",  
      "checkCompliant": true,  
      "totalResourcesCount": 6,  
      "nonCompliantResourcesCount": 0  
    }  
  }  
}
```

```

    },
    "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK": {
      "checkRunStatus": "COMPLETED_COMPLIANT",
      "checkCompliant": true,
      "totalResourcesCount": 0,
      "nonCompliantResourcesCount": 0
    }
  }
}

```

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeAuditTask](#) in *AWS CLI Command Reference*.

describe-authorizer

The following code example shows how to use `describe-authorizer`.

AWS CLI

To get information about a custom authorizer

The following `describe-authorizer` example displays details for the specified custom authorizer.

```

aws iot describe-authorizer \
  --authorizer-name CustomAuthorizer

```

Output:

```

{
  "authorizerDescription": {
    "authorizerName": "CustomAuthorizer",
    "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer",
    "authorizerFunctionArn": "arn:aws:lambda:us-
west-2:123456789012:function:CustomAuthorizerFunction",
    "tokenKeyName": "MyAuthToken",
    "tokenSigningPublicKeys": {
      "FIRST_KEY": "-----BEGIN PUBLIC KEY-----

    },
    "status": "ACTIVE",
    "creationDate": 1571245658.069,
    "lastModifiedDate": 1571245658.069
  }
}

```

For more information, see [DescribeAuthorizer](#) in the *AWS IoT API Reference*.

- For API details, see [DescribeAuthorizer](#) in *AWS CLI Command Reference*.

describe-billing-group

The following code example shows how to use `describe-billing-group`.

AWS CLI

To get information about a billing group

The following `describe-billing-group` example gets information for the specified billing group.

```
aws iot describe-billing-group --billing-group-name GroupOne
```

Output:

```

{
  "billingGroupName": "GroupOne",
  "billingGroupId": "103de383-114b-4f51-8266-18f209ef5562",
  "billingGroupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne",
  "version": 1,
  "billingGroupProperties": {},
  "billingGroupMetadata": {
    "creationDate": 1560199355.378
  }
}

```

For more information, see [Billing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeBillingGroup](#) in *AWS CLI Command Reference*.

describe-ca-certificate

The following code example shows how to use describe-ca-certificate.

AWS CLI

To get details about a CA certificate

The following describe-ca-certificate example displays the details for the specified CA certificate.

```
aws iot describe-ca-certificate \
  --certificate-id
  f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

Output:

```
{
  "certificateDescription": {
    "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/

describe-certificate

The following code example shows how to use describe-certificate.

AWS CLI

To get information about a certificate

The following describe-certificate example displays the details for the specified certificate.

```
aws iot describe-certificate \
  --certificate-id
  "4f0ba725787aa94d67d2fca420eca022242532e8b3c58e7465c7778b443fd65e"

For more information, see [DescribeCertificate](#) in the *AWS IoT API Reference*.

- For API details, see [DescribeCertificate](#) in *AWS CLI Command Reference*.

describe-custom-metric

The following code example shows how to use `describe-custom-metric`.

AWS CLI

To get information about a Device Defender custom metric

The following `describe-custom-metric` example gets information about a custom metric named `myCustomMetric`.

```
aws iot describe-custom-metric \  
  --metric-name myCustomMetric
```

Output:

```
{  
  "metricName": "myCustomMetric",  
  "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/myCustomMetric",  
  "metricType": "number",  
  "displayName": "My custom metric",  
  "creationDate": 2020-11-17T23:02:12.879000-09:00,  
  "lastModifiedDate": 2020-11-17T23:02:12.879000-09:00  
}
```

For more information, see [Custom metrics](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [DescribeCustomMetric](#) in *AWS CLI Command Reference*.

describe-default-authorizer

The following code example shows how to use `describe-default-authorizer`.

AWS CLI

To get information about the default custom authorizer

The following `describe-default-authorizer` example displays details for the default custom authorizer.

```
aws iot describe-default-authorizer
```

Output:

```
{  
  "authorizerName": "CustomAuthorizer",  
  "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/  
CustomAuthorizer"  
}
```

For more information, see [DescribeDefaultAuthorizer](#) in the *AWS IoT API Reference*.

- For API details, see [DescribeDefaultAuthorizer](#) in *AWS CLI Command Reference*.

describe-dimension

The following code example shows how to use describe-dimension.

AWS CLI

To get information about a dimension

The following describe-dimension example gets information about a dimension named TopicFilterForAuthMessages.

```
aws iot describe-dimension \  
  --name TopicFilterForAuthMessages
```

Output:

```
{  
  "name": "TopicFilterForAuthMessages",  
  "arn": "arn:aws:iot:eu-west-2:123456789012:dimension/  
TopicFilterForAuthMessages",  
  "type": "TOPIC_FILTER",  
  "stringValues": [  
    "device/+/auth"  
  ],  
  "creationDate": 1578620223.255,  
  "lastModifiedDate": 1578620223.255  
}
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeDimension](#) in *AWS CLI Command Reference*.

describe-domain-configuration

The following code example shows how to use describe-domain-configuration.

AWS CLI

To describe a domain configuration

The following describe-domain-configuration example displays details about the specified domain configuration.

```
aws iot describe-domain-configuration \  
  --domain-configuration-name "additionalDataDomain"
```

Output:

```
{  
  "domainConfigurationName": "additionalDataDomain",  
  "domainConfigurationArn": "arn:aws:iot:us-  
east-1:758EXAMPLE143:domainconfiguration/additionalDataDomain/norpw",  
  "domainName": "d055exampleed74y71zfd-ats.beta.us-east-1.iot.amazonaws.com",  
  "serverCertificates": [],  
  "domainConfigurationStatus": "ENABLED",  
  "serviceType": "DATA",  
  "domainType": "AWS_MANAGED",  
  "lastStatusChangeDate": 1601923783.774  
}
```

For more information, see [Configurable Endpoints](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeDomainConfiguration](#) in *AWS CLI Command Reference*.

describe-endpoint

The following code example shows how to use describe-endpoint.

AWS CLI

Example 1: To get your current AWS endpoint

The following describe-endpoint example retrieves the default AWS endpoint to which all commands are applied.

```
aws iot describe-endpoint
```

Output:

```
{  
  "endpointAddress": "abc123defghijk.iot.us-west-2.amazonaws.com"  
}
```

For more information, see [DescribeEndpoint](#) in the *AWS IoT Developer Guide*.

Example 2: To get your ATS endpoint

The following `describe-endpoint` example retrieves the Amazon Trust Services (ATS) endpoint.

```
aws iot describe-endpoint \  
  --endpoint-type iot:Data-ATS
```

Output:

```
{  
  "endpointAddress": "abc123defghijk-ats.iot.us-west-2.amazonaws.com"  
}
```

For more information, see [X.509 Certificates and AWS IoT](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeEndpoint](#) in *AWS CLI Command Reference*.

describe-event-configurations

The following code example shows how to use `describe-event-configurations`.

AWS CLI

To show which event types are published

The following `describe-event-configurations` example lists the configuration that controls which events are generated when something is added, updated, or deleted.

```
aws iot describe-event-configurations
```

Output:

```
{  
  "eventConfigurations": {  
    "CA_CERTIFICATE": {  
      "Enabled": false  
    },  
    "CERTIFICATE": {  
      "Enabled": false  
    },  
  },  
}
```

```
"JOB": {
  "Enabled": false
},
"JOB_EXECUTION": {
  "Enabled": false
},
"POLICY": {
  "Enabled": false
},
"THING": {
  "Enabled": false
},
"THING_GROUP": {
  "Enabled": false
},
"THING_GROUP_HIERARCHY": {
  "Enabled": false
},
"THING_GROUP_MEMBERSHIP": {
  "Enabled": false
},
"THING_TYPE": {
  "Enabled": false
},
"THING_TYPE_ASSOCIATION": {
  "Enabled": false
}
}
```

For more information, see [Event Messages](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeEventConfigurations](#) in *AWS CLI Command Reference*.

describe-index

The following code example shows how to use `describe-index`.

AWS CLI

To retrieve the current status of the thing index

The following `describe-index` example retrieves the current status of the thing index.

```
aws iot describe-index \  
  --index-name "AWS_Things"
```

Output:

```
{  
  "indexName": "AWS_Things",  
  "indexStatus": "ACTIVE",  
  "schema": "REGISTRY_AND_SHADOW_AND_CONNECTIVITY_STATUS"  
}
```

For more information, see [Managing Thing Indexing](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeIndex](#) in *AWS CLI Command Reference*.

describe-job-execution

The following code example shows how to use `describe-job-execution`.

AWS CLI

To get execution details for a job on a device

The following `describe-job-execution` example gets execution details for the specified job.

```
aws iot describe-job-execution \  
  --job-id "example-job-01" \  
  --thing-name "MyRaspberryPi"
```

Output:

```
{  
  "execution": {  
    "jobId": "example-job-01",  
    "status": "QUEUED",  
    "statusDetails": {},  
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi",  
    "queuedAt": 1560787023.636,  
    "lastUpdatedAt": 1560787023.636,  
    "executionNumber": 1,  
    "versionNumber": 1  
  }  
}
```

```
}
```

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeJobExecution](#) in *AWS CLI Command Reference*.

describe-job

The following code example shows how to use `describe-job`.

AWS CLI

To get detailed status for a job

The following `describe-job` example gets detailed status for the job whose ID is `example-job-01`.

```
aws iot describe-job \  
  --job-id "example-job-01"
```

Output:

```
{  
  "job": {  
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",  
    "jobId": "example-job-01",  
    "targetSelection": "SNAPSHOT",  
    "status": "IN_PROGRESS",  
    "targets": [  
      "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi"  
    ],  
    "description": "example job test",  
    "presignedUrlConfig": {},  
    "jobExecutionsRolloutConfig": {},  
    "createdAt": 1560787022.733,  
    "lastUpdatedAt": 1560787026.294,  
    "jobProcessDetails": {  
      "numberOfCanceledThings": 0,  
      "numberOfSucceededThings": 0,  
      "numberOfFailedThings": 0,  
      "numberOfRejectedThings": 0,  
      "numberOfQueuedThings": 1,  
    }  
  }  
}
```

```

        "numberOfInProgressThings": 0,
        "numberOfRemovedThings": 0,
        "numberOfTimedOutThings": 0
    },
    "timeoutConfig": {}
}
}

```

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeJob](#) in *AWS CLI Command Reference*.

describe-mitigation-action

The following code example shows how to use `describe-mitigation-action`.

AWS CLI

To view the details for a defined mitigation action

The following `describe-mitigation-action` example displays details for the specified mitigation action.

```

aws iot describe-mitigation-action \
  --action-name AddThingsToQuarantineGroupAction

```

Output:

```

{
  "actionName": "AddThingsToQuarantineGroupAction",
  "actionType": "ADD_THINGS_TO_THING_GROUP",
  "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroupAction",
  "actionId": "2fd2726d-98e1-4abf-b10f-09465ccd6bfa",
  "roleArn": "arn:aws:iam::123456789012:role/service-role/MoveThingsToQuarantineGroupRole",
  "actionParams": {
    "addThingsToThingGroupParams": {
      "thingGroupNames": [
        "QuarantineGroup1"
      ],
      "overrideDynamicGroups": true
    }
  }
}

```

```
  },
  "creationDate": "2019-12-10T11:09:35.999000-08:00",
  "lastModifiedDate": "2019-12-10T11:09:35.999000-08:00"
}
```

For more information, see [DescribeMitigationAction \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeMitigationAction](#) in *AWS CLI Command Reference*.

describe-provisioning-template-version

The following code example shows how to use `describe-provisioning-template-version`.

AWS CLI

To describe a provisioning template version

The following `describe-provisioning-template-version` example describes a provisioning template version.

```
aws iot describe-provisioning-template-version \
  --template-name MyTestProvisioningTemplate \
  --version-id 1
```

Output:

```
{
  "versionId": 1,
  "creationDate": 1589308310.574,
  "templateBody": "{
    \"Parameters\":{
      \"SerialNumber\":{
        \"Type\": \"String\"
      },
      \"AWS::IoT::Certificate::Id\":{
        \"Type\": \"String\"
      }
    },
    \"Resources\":{
      \"certificate\":{
        \"Properties\":{
```

```

        \\"CertificateId\\":{
            \\"Ref\\":\\"AWS::IoT::Certificate::Id\\"
        },
        \\"Status\\":\\"Active\\"
    },
    \\"Type\\":\\"AWS::IoT::Certificate\\"
},
\\"policy\\":{
    \\"Properties\\":{
        \\"PolicyName\\":\\"MyIotPolicy\\"
    },
    \\"Type\\":\\"AWS::IoT::Policy\\"
},
\\"thing\\":{
    \\"OverrideSettings\\":{
        \\"AttributePayload\\":\\"MERGE\\",
        \\"ThingGroups\\":\\"DO_NOTHING\\",
        \\"ThingTypeName\\":\\"REPLACE\\"
    },
    \\"Properties\\":{
        \\"AttributePayload\\":{},
        \\"ThingGroups\\":[],
        \\"ThingName\\":{
            \\"Fn::Join\\":[
                \\"\\",
                [
                    \\"DemoGroup_\\",
                    {\\"Ref\\":\\"SerialNumber\\"}
                ]
            ]
        },
        \\"ThingTypeName\\":\\"VirtualThings\\"
    },
    \\"Type\\":\\"AWS::IoT::Thing\\"
}
}
},
"setDefaultVersion": true
}

```

For more information, see [Provisioning devices that don't have device certificates using fleet provisioning](#) in the *AWS IoT Core Developers Guide*.

- For API details, see [DescribeProvisioningTemplateVersion](#) in *AWS CLI Command Reference*.

describe-provisioning-template

The following code example shows how to use describe-provisioning-template.

AWS CLI

To describe a provisioning template

The following describe-provisioning-template example describes a provisioning template.

```
aws iot describe-provisioning-template \  
  --template-name MyTestProvisioningTemplate
```

Output:

```
{  
  "templateArn": "arn:aws:iot:us-west-2:57EXAMPLE833:provisioningtemplate/  
MyTestProvisioningTemplate",  
  "templateName": "MyTestProvisioningTemplate",  
  "creationDate": 1589308310.574,  
  "lastModifiedDate": 1589308345.539,  
  "defaultVersionId": 1,  
  "templateBody": "{  
    \"Parameters\":{  
      \"SerialNumber\":{  
        \"Type\":\"String\"  
      },  
      \"AWS::IoT::Certificate::Id\":{  
        \"Type\":\"String\"  
      }  
    },  
    \"Resources\":{  
      \"certificate\":{  
        \"Properties\":{  
          \"CertificateId\":{  
            \"Ref\":\"AWS::IoT::Certificate::Id\"  
          },  
          \"Status\":\"Active\"  
        },  
        \"Type\":\"AWS::IoT::Certificate\"  
      },  
      \"policy\":{
```

```

        \ "Properties\":{
            \ "PolicyName\":\ "MyIotPolicy\ "
        },
        \ "Type\":\ "AWS::IoT::Policy\ "
    },
    \ "thing\":{
        \ "OverrideSettings\":{
            \ "AttributePayload\":\ "MERGE\ ",
            \ "ThingGroups\":\ "DO_NOTHING\ ",
            \ "ThingTypeName\":\ "REPLACE\ "
        },
        \ "Properties\":{
            \ "AttributePayload\":{ },
            \ "ThingGroups\":[ ],
            \ "ThingName\":{
                \ "Fn::Join\":[
                    \ "\ ",
                    [
                        \ "DemoGroup_\ ",
                        { \ "Ref\":\ "SerialNumber\ " }
                    ]
                ]
            },
            \ "ThingTypeName\":\ "VirtualThings\ "
        },
        \ "Type\":\ "AWS::IoT::Thing\ "
    }
}
},
"enabled": true,
"provisioningRoleArn": "arn:aws:iam::571032923833:role/service-role/IoT_access"
}

```

For more information, see [Provisioning devices that don't have device certificates using fleet provisioning](#) in the *AWS IoT Core Developers Guide*.

- For API details, see [DescribeProvisioningTemplate](#) in *AWS CLI Command Reference*.

describe-role-alias

The following code example shows how to use `describe-role-alias`.

AWS CLI

To get information about an AWS IoT role alias

The following `describe-role-alias` example displays details for the specified role alias.

```
aws iot describe-role-alias \  
  --role-alias LightBulbRole
```

Output:

```
{  
  "roleAliasDescription": {  
    "roleAlias": "LightBulbRole",  
    "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/  
LightBulbRole",  
    "roleArn": "arn:aws:iam::123456789012:role/light_bulb_role_001",  
    "owner": "123456789012",  
    "credentialDurationSeconds": 3600,  
    "creationDate": 1570558643.221,  
    "lastModifiedDate": 1570558643.221  
  }  
}
```

For more information, see [DescribeRoleAlias](#) in the *AWS IoT API Reference*.

- For API details, see [DescribeRoleAlias](#) in *AWS CLI Command Reference*.

describe-scheduled-audit

The following code example shows how to use `describe-scheduled-audit`.

AWS CLI

To get information about a scheduled audit

The following `describe-scheduled-audit` example gets detailed information about an AWS IoT Device Defender scheduled audit named `AWSIoTDeviceDefenderDailyAudit`.

```
aws iot describe-scheduled-audit \  
  --scheduled-audit-name AWSIoTDeviceDefenderDailyAudit
```

Output:

```
{
  "frequency": "DAILY",
  "targetCheckNames": [
    "AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK",
    "CONFLICTING_CLIENT_IDS_CHECK",
    "DEVICE_CERTIFICATE_SHARED_CHECK",
    "IOT_POLICY_OVERLY_PERMISSIVE_CHECK",
    "REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK",
    "UNAUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK"
  ],
  "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
  "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSIoTDeviceDefenderDailyAudit"
}
```

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeScheduledAudit](#) in *AWS CLI Command Reference*.

describe-security-profile

The following code example shows how to use describe-security-profile.

AWS CLI

To get information about a security profile

The following describe-security-profile example gets information about the AWS IoT Device Defender security profile named PossibleIssue.

```
aws iot describe-security-profile \
  --security-profile-name PossibleIssue
```

Output:

```
{
  "securityProfileName": "PossibleIssue",
  "securityProfileArn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
PossibleIssue",
  "securityProfileDescription": "check to see if authorization fails 10 times in 5
minutes or if cellular bandwidth exceeds 128",
  "behaviors": [
```

```

    {
      "name": "CellularBandwidth",
      "metric": "aws:message-byte-size",
      "criteria": {
        "comparisonOperator": "greater-than",
        "value": {
          "count": 128
        },
        "consecutiveDatapointsToAlarm": 1,
        "consecutiveDatapointsToClear": 1
      }
    },
    {
      "name": "Authorization",
      "metric": "aws:num-authorization-failures",
      "criteria": {
        "comparisonOperator": "greater-than",
        "value": {
          "count": 10
        },
        "durationSeconds": 300,
        "consecutiveDatapointsToAlarm": 1,
        "consecutiveDatapointsToClear": 1
      }
    }
  ],
  "version": 1,
  "creationDate": 1560278102.528,
  "lastModifiedDate": 1560278102.528
}

```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeSecurityProfile](#) in *AWS CLI Command Reference*.

describe-stream

The following code example shows how to use `describe-stream`.

AWS CLI

To get information about a stream

The following `describe-stream` example displays the details about the specified stream.

```
aws iot describe-stream \  
  --stream-id stream12345
```

Output:

```
{  
  "streamInfo": {  
    "streamId": "stream12345",  
    "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",  
    "streamVersion": 1,  
    "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",  
    "files": [  
      {  
        "fileId": "123",  
        "s3Location": {  
          "bucket": "codesign-ota-bucket",  
          "key": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"  
        }  
      }  
    ],  
    "createdAt": 1557863215.995,  
    "lastUpdatedAt": 1557863215.995,  
    "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_stream_role"  
  }  
}
```

For more information, see [DescribeStream](#) in the *AWS IoT API Reference*.

- For API details, see [DescribeStream](#) in *AWS CLI Command Reference*.

describe-thing-group

The following code example shows how to use `describe-thing-group`.

AWS CLI

To get information about a thing group

The following `describe-thing-group` example gets information about the thing group named `HalogenBulbs`.

```
aws iot describe-thing-group \  
  --thing-group-name HalogenBulbs
```

```
--thing-group-name HalogenBulbs
```

Output:

```
{
  "thingGroupName": "HalogenBulbs",
  "thingGroupId": "f4ec6b84-b42b-499d-9ce1-4dbd4d4f6f6e",
  "thingGroupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs",
  "version": 1,
  "thingGroupProperties": {},
  "thingGroupMetadata": {
    "parentGroupName": "LightBulbs",
    "rootToParentThingGroups": [
      {
        "groupName": "LightBulbs",
        "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/
LightBulbs"
      }
    ],
    "creationDate": 1559927609.897
  }
}
```

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeThingGroup](#) in *AWS CLI Command Reference*.

describe-thing-type

The following code example shows how to use `describe-thing-type`.

AWS CLI

To get information about a thing type

The following `describe-thing-type` example displays information about the specified thing type defined in your AWS account.

```
aws iot describe-thing-type \
  --thing-type-name "LightBulb"
```

Output:

```
{
  "thingTypeName": "LightBulb",
  "thingTypeId": "ce3573b0-0a3c-45a7-ac93-4e0ce14cd190",
  "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
  "thingTypeProperties": {
    "thingTypeDescription": "light bulb type",
    "searchableAttributes": [
      "model",
      "wattage"
    ]
  },
  "thingTypeMetadata": {
    "deprecated": false,
    "creationDate": 1559772562.498
  }
}
```

For more information, see [Thing Types](#) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeThingType](#) in *AWS CLI Command Reference*.

describe-thing

The following code example shows how to use describe-thing.

AWS CLI

To display detailed information about a thing

The following describe-thing example display information about a thing (device) that is defined in the AWS IoT registry for your AWS account.

```
aws iot describe-thing --thing-name "MyLightBulb"
```

Output:

```
{
  "defaultClientId": "MyLightBulb",
  "thingName": "MyLightBulb",
  "thingId": "40da2e73-c6af-406e-b415-15acae538797",
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
  "thingTypeName": "LightBulb",
  "attributes": {
```

```
    "model": "123",
    "wattage": "75"
  },
  "version": 1
}
```

For more information, see [How to Manage Things with the Registry](#) in the *AWS IoT Developers Guide*.

- For API details, see [DescribeThing](#) in *AWS CLI Command Reference*.

detach-policy

The following code example shows how to use `detach-policy`.

AWS CLI

Example 1: To detach an AWS IoT policy from a thing group

The following `detach-policy` example detaches the specified policy from a thing group and, by extension, from all things in that group and any of the group's child groups.

```
aws iot detach-policy \
  --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs" \
  --policy-name "MyFirstGroup_Core-policy"
```

This command produces no output.

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

Example 2: To detach an AWS IoT policy from a device certificate

The following `detach-policy` example detaches the `TemperatureSensorPolicy` policy from a device certificate identified by ARN.

```
aws iot detach-policy \
  --policy-name TemperatureSensorPolicy \
  --target arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

This command produces no output.

- For API details, see [DetachPolicy](#) in *AWS CLI Command Reference*.

detach-security-profile

The following code example shows how to use `detach-security-profile`.

AWS CLI

To disassociate a security profile from a target

The following `detach-security-profile` example removes the association between the AWS IoT Device Defender security profile named `Testprofile` and the all registered things target.

```
aws iot detach-security-profile \  
  --security-profile-name Testprofile \  
  --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/  
registered-things"
```

This command produces no output.

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [DetachSecurityProfile](#) in *AWS CLI Command Reference*.

detach-thing-principal

The following code example shows how to use `detach-thing-principal`.

AWS CLI

To detach a certificate/principal from a thing

The following `detach-thing-principal` example removes a certificate that represents a principal from the specified thing.

```
aws iot detach-thing-principal \  
  --thing-name "MyLightBulb" \  
  --principal "arn:aws:iot:us-  
west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36"
```

This command produces no output.

For more information, see [How to Manage Things with the Registry](#) in the *AWS IoT Developers Guide*.

- For API details, see [DetachThingPrincipal](#) in *AWS CLI Command Reference*.

disable-topic-rule

The following code example shows how to use `disable-topic-rule`.

AWS CLI

To disable a topic rule

The following `disable-topic-rule` example disables the specified topic rule.

```
aws iot disable-topic-rule \  
  --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see [Viewing Your Rules](#) in the *AWS IoT Developer Guide*.

- For API details, see [DisableTopicRule](#) in *AWS CLI Command Reference*.

enable-topic-rule

The following code example shows how to use `enable-topic-rule`.

AWS CLI

To enable a topic rule

The following `enable-topic-rule` example enables (or re-enables) the specified topic rule.

```
aws iot enable-topic-rule \  
  --rule-name "MyPlantPiMoistureAlertRule"
```

This command produces no output.

For more information, see [Viewing Your Rules](#) in the *AWS IoT Developer Guide*.

- For API details, see [EnableTopicRule](#) in *AWS CLI Command Reference*.

get-behavior-model-training-summaries

The following code example shows how to use `get-behavior-model-training-summaries`.

AWS CLI

To list a Device Defender's ML Detect Security Profile training model's status

The following `get-behavior-model-training-summaries` example lists model training status for the configured behaviors in the chosen Security Profile. For each behavior, the name, model status, and percentage of datapoints collected are listed.

```
aws iot get-behavior-model-training-summaries \  
  --security-profile-name MySecuirtyProfileName
```

Output:

```
{  
  "summaries": [  
    {  
      "securityProfileName": "MySecuirtyProfileName",  
      "behaviorName": "Messages_sent_ML_behavior",  
      "modelStatus": "PENDING_BUILD",  
      "datapointsCollectionPercentage": 0.0  
    },  
    {  
      "securityProfileName": "MySecuirtyProfileName",  
      "behaviorName": "Messages_received_ML_behavior",  
      "modelStatus": "PENDING_BUILD",  
      "datapointsCollectionPercentage": 0.0  
    },  
    {  
      "securityProfileName": "MySecuirtyProfileName",  
      "behaviorName": "Authorization_failures_ML_behavior",  
      "modelStatus": "PENDING_BUILD",  
      "datapointsCollectionPercentage": 0.0  
    },  
    {  
      "securityProfileName": "MySecuirtyProfileName",  
      "behaviorName": "Message_size_ML_behavior",  
      "modelStatus": "PENDING_BUILD",  
      "datapointsCollectionPercentage": 0.0  
    },  
    {  
      "securityProfileName": "MySecuirtyProfileName",  
      "behaviorName": "Connection_attempts_ML_behavior",  
      "modelStatus": "PENDING_BUILD",  
      "datapointsCollectionPercentage": 0.0  
    }  
  ]  
}
```

```

        "datapointsCollectionPercentage": 0.0
    },
    {
        "securityProfileName": "MySPNoAlerts",
        "behaviorName": "Disconnects_ML_behavior",
        "modelStatus": "PENDING_BUILD",
        "datapointsCollectionPercentage": 0.0
    }
]
}

```

For more information, see [GetBehaviorModelTrainingSummaries \(Detect Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [GetBehaviorModelTrainingSummaries](#) in *AWS CLI Command Reference*.

get-cardinality

The following code example shows how to use `get-cardinality`.

AWS CLI

To return the approximate count of unique values that match the query

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 3 attributes.

```

# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
Racks=(Rack1 Rack1 Rack2 Rack2 Rack3 Rack4 Rack5 Rack6 Rack6 Rack6)
IsNormal=(true true true true true true false false false false)
for ((i=0; i<10 ; i++))
do
    thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
attributes="{temperature=${Temperatures[i]},rackId=${Racks[i]},stateNormal=
${IsNormal[i]}}")
    aws iot describe-thing --thing-name "TempSensor$i"
done

```

Example output of the setup script:

```

{
    "version": 1,

```

```
"thingName": "TempSensor0",
"defaultClientId": "TempSensor0",
"attributes": {
  "rackId": "Rack1",
  "stateNormal": "true",
  "temperature": "70"
},
"thingArn": "arn:aws:iot:us-east-1:123456789012:thing/TempSensor0",
"thingId": "example1-90ab-cdef-fedc-ba987example"
}
```

The following `get-cardinality` example queries the 10 sensors created by the setup script and returns the number of racks that have temperature sensors reporting abnormal temperature values. If the temperature value is below 60 or above 80, the temperature sensor is in an abnormal state.

```
aws iot get-cardinality \
  --aggregation-field "attributes.rackId" \
  --query-string "thingName:TempSensor* AND attributes.stateNormal:false"
```

Output:

```
{
  "cardinality": 2
}
```

For more information, see [Querying for Aggregate Data](https://docs.aws.amazon.com/iot/latest/developerguide/index-aggregate.html) in the *AWS IoT Developer Guide*.

- For API details, see [GetCardinality](#) in *AWS CLI Command Reference*.

get-effective-policies

The following code example shows how to use `get-effective-policies`.

AWS CLI

To list the policies that effect a thing

The following `get-effective-policies` example lists the policies that effect the specified thing, including policies attached to any groups to which it belongs.

```
aws iot get-effective-policies \
  --thing-name TemperatureSensor-001 \
  --principal arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

Output:

```
{
  "effectivePolicies": [
    {
      "policyName": "TemperatureSensorPolicy",
      "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TemperatureSensorPolicy",
      "policyDocument": "{
        \"Version\": \"2012-10-17\",
        \"Statement\": [
          {
            \"Effect\": \"Allow\",
            \"Action\": [
              \"iot:Publish\",
              \"iot:Receive\"
            ],
            \"Resource\": [
              \"arn:aws:iot:us-west-2:123456789012:topic/topic_1\",
              \"arn:aws:iot:us-west-2:123456789012:topic/topic_2\"
            ]
          },
          {
            \"Effect\": \"Allow\",
            \"Action\": [
              \"iot:Subscribe\"
            ],
            \"Resource\": [

]
}
```

For more information, see [Get Effective Policies for a Thing](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetEffectivePolicies](#) in *AWS CLI Command Reference*.

get-indexing-configuration

The following code example shows how to use `get-indexing-configuration`.

AWS CLI

To get the thing indexing configuration

The following `get-indexing-configuration` example gets the current configuration data for AWS IoT fleet indexing.

```
aws iot get-indexing-configuration
```

Output:

```
{
  "thingIndexingConfiguration": {
    "thingIndexingMode": "OFF",
    "thingConnectivityIndexingMode": "OFF"
  },
  "thingGroupIndexingConfiguration": {
    "thingGroupIndexingMode": "OFF"
  }
}
```

For more information, see [Managing Thing Indexing](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetIndexingConfiguration](#) in *AWS CLI Command Reference*.

get-job-document

The following code example shows how to use `get-job-document`.

AWS CLI

To retrieve the document for a job

The following `get-job-document` example displays details about the document for the job whose ID is `example-job-01`.

```
aws iot get-job-document \
  --job-id "example-job-01"
```

Output:

```
{
  "document": "\n{\n  \"operation\": \"customJob\", \n  \"otherInfo\": \n\"someValue\"\n}\n"
}
```

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [GetJobDocument](#) in *AWS CLI Command Reference*.

get-logging-options

The following code example shows how to use `get-logging-options`.

AWS CLI

To get the logging options

The following `get-logging-options` example gets the current logging options for your AWS account.

```
aws iot get-logging-options
```

Output:

```
{
  "roleArn": "arn:aws:iam::123456789012:role/service-role/iotLoggingRole",
  "logLevel": "ERROR"
}
```

For more information, see title in the *AWS IoT Developer Guide*.

- For API details, see [GetLoggingOptions](#) in *AWS CLI Command Reference*.

get-ota-update

The following code example shows how to use `get-ota-update`.

AWS CLI**To retrieve information about an OTA Update**

The following `get-ota-update` example displays details about the specified OTA Update.

```
aws iot get-ota-update \
  --ota-update-id ota12345
```

Output:

```
{
  "otaUpdateInfo": {
    "otaUpdateId": "ota12345",
    "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/itsaupdate",
    "creationDate": 1557863215.995,
    "lastModifiedDate": 1557863215.995,
    "description": "A critical update needed right away.",
    "targets": [
      "device1",
      "device2",
      "device3",
      "device4"
    ],
    "targetSelection": "SNAPSHOT",
    "protocols": ["HTTP"],
    "awsJobExecutionsRolloutConfig": {
```

```

        "maximumPerMinute": 10
    },
    "otaUpdateFiles": [
        {
            "fileName": "firmware.bin",
            "fileLocation": {
                "stream": {
                    "streamId": "004",
                    "fileId": 123
                }
            },
            "codeSigning": {
                "awsSignerJobId": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
            }
        }
    ],
    "roleArn": "arn:aws:iam:123456789012:role/service-role/my_ota_role",
    "otaUpdateStatus": "CREATE_COMPLETE",
    "awsIotJobId": "job54321",
    "awsIotJobArn": "arn:aws:iot:us-west-2:123456789012:job/job54321",
    "errorInfo": {
    }
}
}

```

For more information, see [GetOTAUpdate](#) in the *AWS IoT API Reference*.

- For API details, see [GetOtaUpdate](#) in *AWS CLI Command Reference*.

get-percentiles

The following code example shows how to use `get-percentiles`.

AWS CLI

To group the aggregated values that match the query into percentile groupings

You can use the following setup script to create 10 things representing 10 temperature sensors. Each new thing has 1 attribute.

```

# Bash script. If in other shells, type `bash` before running
Temperatures=(70 71 72 73 74 75 47 97 98 99)
for ((i=0; i<10 ; i++))

```

```
do
  thing=$(aws iot create-thing --thing-name "TempSensor$i" --attribute-payload
  attributes="{temperature=${Temperatures[i]}}")
  aws iot describe-thing --thing-name "TempSensor$i"
done
```

Example output of the setup script:

```
{
  "version": 1,
  "thingName": "TempSensor0",
  "defaultClientId": "TempSensor0",
  "attributes": {
    "temperature": "70"
  },
  "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/TempSensor0",
  "thingId": "example1-90ab-cdef-fedc-ba987example"
}
```

The following `get-percentiles` example queries the 10 sensors created by the setup script and returns a value for each percentile group specified. The percentile group "10" contains the aggregated field value that occurs in approximately 10 percent of the values that match the query. In the following output, `{"percent": 10.0, "value": 67.7}` means approximately 10.0% of the temperature values are below 67.7.

```
aws iot get-percentiles \
  --aggregation-field "attributes.temperature" \
  --query-string "thingName:TempSensor*" \
  --percents 10 25 50 75 90
```

Output:

```
{
  "percentiles": [
    {
      "percent": 10.0,
      "value": 67.7
    },
    {
      "percent": 25.0,
      "value": 71.25
    }
  ]
}
```

```
    },
    {
      "percent": 50.0,
      "value": 73.5
    },
    {
      "percent": 75.0,
      "value": 91.5
    },
    {
      "percent": 90.0,
      "value": 98.1
    }
  ]
}
```

For more information, see [Querying for Aggregate Data](#) in the *AWS IoT Developer Guide*.

- For API details, see [GetPercentiles](#) in *AWS CLI Command Reference*.

get-policy-version

The following code example shows how to use `get-policy-version`.

AWS CLI

To get information about a specific version of a policy

The following `get-policy-version` example gets information about the first version of the specified policy.

```
aws iot get-policy \
  --policy-name UpdateDeviceCertPolicy
  --policy-version-id "1"
```

Output:

```
{
  "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
  "policyName": "UpdateDeviceCertPolicy",
  "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\": \"Allow\", \"Action\": \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
```

```
"policyVersionId": "1",
"isDefaultVersion": false,
"creationDate": 1559925941.924,
"lastModifiedDate": 1559926175.458,
"generationId":
"5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}
```

For more information, see [AWS IoT Policies](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetPolicyVersion](#) in *AWS CLI Command Reference*.

get-policy

The following code example shows how to use `get-policy`.

AWS CLI

To get information about the default version of a policy

The following `get-policy` example retrieves information about the default version of the specified policy.

```
aws iot get-policy \
  --policy-name UpdateDeviceCertPolicy
```

Output:

```
{
  "policyName": "UpdateDeviceCertPolicy",
  "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy",
  "policyDocument": "{ \"Version\": \"2012-10-17\", \"Statement\": [ { \"Effect\": \"Allow\", \"Action\": \"iot:UpdateCertificate\", \"Resource\": \"*\" } ] }",
  "defaultVersionId": "2",
  "creationDate": 1559925941.924,
  "lastModifiedDate": 1559925941.924,
  "generationId":
  "5066f1b6712ce9d2a1e56399771649a272d6a921762fead080e24fe52f24e042"
}
```

For more information, see [AWS IoT Policies](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetPolicy](#) in *AWS CLI Command Reference*.

get-registration-code

The following code example shows how to use `get-registration-code`.

AWS CLI

To get your AWS account-specific registration code

The following `get-registration-code` example retrieves your AWS account-specific registration code.

```
aws iot get-registration-code
```

Output:

```
{
  "registrationCode":
  "15c51ae5e36ba59ba77042df1115862076bea4bd15841c838fcb68d5010a614c"
}
```

For more information, see [Use Your Own Certificate](#) in the *AWS IoT Developer Guide*.

- For API details, see [GetRegistrationCode](#) in *AWS CLI Command Reference*.

get-statistics

The following code example shows how to use `get-statistics`.

AWS CLI

To search the device index for aggregate data

The following `get-statistics` example returns the number of things that have a property called `connectivity.connected` set to `false` (that is, the number of devices that are not connected) in their device shadow.

```
aws iot get-statistics \
  --index-name AWS_Things \
  --query-string "connectivity.connected:false"
```

Output:

```
{
  "statistics": {
    "count": 6
  }
}
```

For more information, see [Getting Statistics About Your Device Fleet](#) in the *AWS IoT Developer Guide*.

- For API details, see [GetStatistics](#) in *AWS CLI Command Reference*.

get-topic-rule-destination

The following code example shows how to use `get-topic-rule-destination`.

AWS CLI**To get a topic rule destination**

The following `get-topic-rule-destination` example gets information about a topic rule destination.

```
aws iot get-topic-rule-destination \
  --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```
{
  "topicRuleDestination": {
    "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "status": "DISABLED",
    "httpUrlProperties": {
      "confirmationUrl": "https://example.com"
    }
  }
}
```

For more information, see [Working with topic rule destinations](#) in the *AWS IoT Developer Guide*.

- For API details, see [GetTopicRuleDestination](#) in *AWS CLI Command Reference*.

get-topic-rule

The following code example shows how to use `get-topic-rule`.

AWS CLI

To get information about a rule

The following `get-topic-rule` example gets information about the specified rule.

```
aws iot get-topic-rule \  
  --rule-name MyRPiLowMoistureAlertRule
```

Output:

```
{  
  "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/MyRPiLowMoistureAlertRule",  
  "rule": {  
    "ruleName": "MyRPiLowMoistureAlertRule",  
    "sql": "SELECT * FROM '$aws/things/MyRPi/shadow/update/accepted' WHERE  
state.reported.moisture = 'low'\n          ",  
    "description": "Sends an alert whenever soil moisture level readings are too  
low.",  
    "createdAt": 1558624363.0,  
    "actions": [  
      {  
        "sns": {  
          "targetArn": "arn:aws:sns:us-  
west-2:123456789012:MyRPiLowMoistureTopic",  
          "roleArn": "arn:aws:iam::123456789012:role/service-role/  
MyRPiLowMoistureTopicRole",  
          "messageFormat": "RAW"  
        }  
      }  
    ],  
    "ruleDisabled": false,  
    "awsIotSqlVersion": "2016-03-23"  
  }  
}
```

For more information, see [Viewing Your Rules](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetTopicRule](#) in *AWS CLI Command Reference*.

get-v2-logging-options

The following code example shows how to use `get-v2-logging-options`.

AWS CLI

To list the current logging options

The following `get-v2-logging-options` example lists the current logging options for AWS IoT.

```
aws iot get-v2-logging-options
```

Output:

```
{
  "roleArn": "arn:aws:iam::094249569039:role/service-role/iotLoggingRole",
  "defaultLogLevel": "WARN",
  "disableAllLogs": false
}
```

For more information, see title in the *AWS IoT Developer Guide*.

- For API details, see [GetV2LoggingOptions](#) in *AWS CLI Command Reference*.

list-active-violations

The following code example shows how to use `list-active-violations`.

AWS CLI

To list the active violations

The following `list-active-violations` example lists all violations for the specified security profile.

```
aws iot list-active-violations \
  --security-profile-name Testprofile
```

Output:

```
{
  "activeViolations": [
    {
      "violationId": "174db59167fa474c80a652ad1583fd44",
      "thingName": "iotconsole-1560269126751-1",
      "securityProfileName": "Testprofile",
      "behavior": {
        "name": "Authorization",
        "metric": "aws:num-authorization-failures",
        "criteria": {
          "comparisonOperator": "greater-than",
          "value": {
            "count": 10
          },
          "durationSeconds": 300,
          "consecutiveDatapointsToAlarm": 1,
          "consecutiveDatapointsToClear": 1
        }
      },
      "lastViolationValue": {
        "count": 0
      },
      "lastViolationTime": 1560293700.0,
      "violationStartTime": 1560279000.0
    },
    {
      "violationId": "c8a9466a093d3b7b35cd44ca58bdbeab",

  }
]
}
```

- For API details, see [ListActiveViolations](#) in *AWS CLI Command Reference*.

list-attached-policies

The following code example shows how to use `list-attached-policies`.

AWS CLI

Example 1: To list the policies attached to a group

The following `list-attached-policies` example lists the policies that are attached to the specified group.

```
aws iot list-attached-policies \
  --target "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
```

Output:

```
{
  "policies": [
    {
      "policyName": "UpdateDeviceCertPolicy",
      "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
UpdateDeviceCertPolicy"
    }
  ]
}
```

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

Example 2: To list the policies attached to a device certificate

The following `list-attached-policies` example lists the AWS IoT policies attached to the device certificate. The certificate is identified by its ARN.

```
aws iot list-attached-policies \  
  --target arn:aws:iot:us-  
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142
```

Output:

```
{  
  "policies": [  
    {  
      "policyName": "TemperatureSensorPolicy",  
      "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/  
TemperatureSensorPolicy"  
    }  
  ]  
}
```

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListAttachedPolicies](#) in *AWS CLI Command Reference*.

list-audit-findings

The following code example shows how to use `list-audit-findings`.

AWS CLI

Example 1: To list all findings from an audit

The following `list-audit-findings` example lists all findings from an AWS IoT Device Defender audit with a specified task ID.

```
aws iot list-audit-findings \  
  --task-id a3aea009955e501a31b764abe1bebd3d
```

Output:

```
{  
  "findings": []
```

```
}
```

Example 2: To list findings for an audit check type

The following `list-audit-findings` example shows findings from AWS IoT Device Defender audits that ran between June 5, 2019 and June 19, 2019 in which devices are sharing a device certificate. When you specify a check name, you must provide a start and end time.

```
aws iot list-audit-findings \  
  --check-name DEVICE_CERTIFICATE_SHARED_CHECK \  
  --start-time 1559747125 \  
  --end-time 1560962028
```

Output:

```
{  
  "findings": [  
    {  
      "taskId": "eeef61068b0eb03c456d746c5a26ee04",  
      "checkName": "DEVICE_CERTIFICATE_SHARED_CHECK",  
      "taskStartTime": 1560161017.172,  
      "findingTime": 1560161017.592,  
      "severity": "CRITICAL",  
      "nonCompliantResource": {  
        "resourceType": "DEVICE_CERTIFICATE",  
        "resourceIdentifier": {  
          "deviceCertificateId":  
"b193ab7162c0fadca83246d24fa090300a1236fe58137e121b011804d8ac1d6b"  
        }  
      },  
      "relatedResources": [  
        {  
          "resourceType": "CLIENT_ID",  
          "resourceIdentifier": {  
            "clientId": "ZipxgAII"  
          },  
          "additionalInfo": {  
            "CONNECTION_TIME": "1560086374068"  
          }  
        },  
        {  
          "resourceType": "CLIENT_ID",  
          "resourceIdentifier": {
```

```

        "clientId": "ZipxgAII"

list-audit-mitigation-actions-executions

The following code example shows how to use `list-audit-mitigation-actions-executions`.

AWS CLI

To list the details of an audit mitigation action execution

An audit mitigation action task applies a mitigation action to one or more findings from an AWS IoT Device Defender audit. The following `list-audit-mitigation-actions-executions` example lists the details for the mitigation action task with the specified `taskId` and for the specified finding.

```

aws iot list-audit-mitigation-actions-executions \
  --task-id myActionsTaskId \
  --finding-id 0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464

```

Output:

```

{
  "actionsExecutions": [
    {
      "taskId": "myActionsTaskId",
      "findingId": "0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464",
      "actionName": "ResetPolicyVersionAction",
      "actionId": "1ea0b415-bef1-4a01-bd13-72fb63c59afb",
    }
  ]
}

```

```

        "status": "COMPLETED",
        "startTime": "2019-12-10T15:19:13.279000-08:00",
        "endTime": "2019-12-10T15:19:13.337000-08:00"
    }
]
}

```

For more information, see [ListAuditMitigationActionsExecutions \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListAuditMitigationActionsExecutions](#) in *AWS CLI Command Reference*.

list-audit-mitigation-actions-tasks

The following code example shows how to use `list-audit-mitigation-actions-tasks`.

AWS CLI

To list audit mitigation action tasks

The following `list-audit-mitigation-actions-tasks` example lists the mitigation actions that were applied to findings within the specified time period.

```

aws iot list-audit-mitigation-actions-tasks \
  --start-time 1594157400 \
  --end-time 1594157430

```

Output:

```

{
  "tasks": [
    {
      "taskId": "0062f2d6-3999-488f-88c7-bef005414103",
      "startTime": "2020-07-07T14:30:15.172000-07:00",
      "taskStatus": "COMPLETED"
    }
  ]
}

```

For more information, see [ListAuditMitigationActionsTasks \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListAuditMitigationActionsTasks](#) in *AWS CLI Command Reference*.

list-audit-suppressions

The following code example shows how to use `list-audit-suppressions`.

AWS CLI

To list all audit finding suppressions

The following `list-audit-suppressions` example lists all active audit finding suppressions.

```
aws iot list-audit-suppressions
```

Output:

```
{
  "suppressions": [
    {
      "checkName": "DEVICE_CERTIFICATE_EXPIRING_CHECK",
      "resourceIdentifier": {
        "deviceCertificateId": "c7691e<shortened>"
      },
      "expirationDate": 1597881600.0,
      "suppressIndefinitely": false
    }
  ]
}
```

For more information, see [Audit finding suppressions](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListAuditSuppressions](#) in *AWS CLI Command Reference*.

list-audit-tasks

The following code example shows how to use `list-audit-tasks`.

AWS CLI

To list all findings from an audit

The following `list-audit-tasks` example lists the audit tasks that ran between June 5, 2019 and June 12, 2019.

```
aws iot list-audit-tasks \  
  --start-time 1559747125 \  
  --end-time 1560357228
```

Output:

```
{  
  "tasks": [  
    {  
      "taskId": "a3aea009955e501a31b764abe1bebd3d",  
      "taskStatus": "COMPLETED",  
      "taskType": "ON_DEMAND_AUDIT_TASK"  
    },  
    {  
      "taskId": "f76b4b5102b632cd9ae38a279c266da1",  
      "taskStatus": "COMPLETED",  
      "taskType": "SCHEDULED_AUDIT_TASK"  
    },  
    {  
      "taskId": "51d9967d9f9ff4d26529505f6d2c444a",  
      "taskStatus": "COMPLETED",  
      "taskType": "SCHEDULED_AUDIT_TASK"  
    },  
    {  
      "taskId": "eef61068b0eb03c456d746c5a26ee04",  
      "taskStatus": "COMPLETED",  
      "taskType": "SCHEDULED_AUDIT_TASK"  
    },  
    {  
      "taskId": "041c49557b7c7b04c079a49514b55589",  
      "taskStatus": "COMPLETED",  
      "taskType": "SCHEDULED_AUDIT_TASK"  
    },  
    {  
      "taskId": "82c7f2afac1562d18a4560be73998acc",  
      "taskStatus": "COMPLETED",  
      "taskType": "SCHEDULED_AUDIT_TASK"  
    },  
    {  
      "taskId": "bade6b5efd2e1b1569822f6021b39cf5",
```

```
    "taskStatus": "COMPLETED",
    "taskType": "SCHEDULED_AUDIT_TASK"
  },
  {
    "taskId": "c23f6233ba2d35879c4bb2810fb5ffd6",
    "taskStatus": "COMPLETED",
    "taskType": "SCHEDULED_AUDIT_TASK"
  },
  {
    "taskId": "ac9086b7222a2f5e2e17bb6fd30b3aeb",
    "taskStatus": "COMPLETED",
    "taskType": "SCHEDULED_AUDIT_TASK"
  }
]
}
```

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListAuditTasks](#) in *AWS CLI Command Reference*.

list-authorizers

The following code example shows how to use `list-authorizers`.

AWS CLI

To list your custom authorizer

The following `list-authorizers` example lists the custom authorizers in your AWS account.

```
aws iot list-authorizers
```

Output:

```
{
  "authorizers": [
    {
      "authorizerName": "CustomAuthorizer",
      "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
    },
    {
```

```
        "authorizerName": "CustomAuthorizer2",
        "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer2"
    },
    {
        "authorizerName": "CustomAuthorizer3",
        "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer3"
    }
]
}
```

For more information, see [ListAuthorizers](#) in the *AWS IoT API Reference*.

- For API details, see [ListAuthorizers](#) in *AWS CLI Command Reference*.

list-billing-groups

The following code example shows how to use `list-billing-groups`.

AWS CLI

To list the billing groups for your AWS account and region

The following `list-billing-groups` example lists all billing groups that are defined for your AWS account and AWS Region.

```
aws iot list-billing-groups
```

Output:

```
{
  "billingGroups": [
    {
      "groupName": "GroupOne",
      "groupArn": "arn:aws:iot:us-west-2:123456789012:billinggroup/GroupOne"
    }
  ]
}
```

For more information, see [Billing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListBillingGroups](#) in *AWS CLI Command Reference*.

list-ca-certificates

The following code example shows how to use `list-ca-certificates`.

AWS CLI

To list the CA certificates registered in your AWS account

The following `list-ca-certificates` example lists the CA certificates registered in your AWS account.

```
aws iot list-ca-certificates
```

Output:

```
{
  "certificates": [
    {
      "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/
f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
      "certificateId":
"f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",
      "status": "INACTIVE",
      "creationDate": 1569365372.053
    }
  ]
}
```

For more information, see [Use Your Own Certificate](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListCaCertificates](#) in *AWS CLI Command Reference*.

list-certificates-by-ca

The following code example shows how to use `list-certificates-by-ca`.

AWS CLI

To list all device certificates signed with a CA certificate

The following `list-certificates-by-ca` example lists all device certificates in your AWS account that are signed with the specified CA certificate.

```
aws iot list-certificates-by-ca \
  --ca-certificate-id
  f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467
```

Output:

```
{
  "certificates": [
    {
      "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
      "certificateId":
"488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
      "status": "ACTIVE",
      "creationDate": 1569363250.557
    }
  ]
}
```

For more information, see [ListCertificatesByCA](#) in the *AWS IoT API Reference*.

- For API details, see [ListCertificatesByCa](#) in *AWS CLI Command Reference*.

list-certificates

The following code example shows how to use `list-certificates`.

AWS CLI

Example 1: To list the certificates registered in your AWS account

The following `list-certificates` example lists all certificates registered in your account. If you have more than the default paging limit of 25, you can use the `nextMarker` response value from this command and supply it to the next command to get the next batch of results. Repeat until `nextMarker` returns without a value.

```
aws iot list-certificates
```

Output:

```
{
  "certificates": [
    {
      "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",
      "certificateId": "604c48437a57b7d5fc5d137c5be75011c6ee67c9a6943683a1acb4b1626bac36",

  "status": "ACTIVE",
  "creationDate": 1541022751.983
}
]
```

- For API details, see [ListCertificates](#) in *AWS CLI Command Reference*.

list-custom-metrics

The following code example shows how to use `list-custom-metrics`.

AWS CLI

To list your custom metrics

The following `list-custom-metrics` example lists all of your custom metrics.

```
aws iot list-custom-metrics \
  --region us-east-1
```

Output:

```
{
  "metricNames": [
    "batteryPercentage"
  ]
}
```

For more information, see [Custom metrics](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [ListCustomMetrics](#) in *AWS CLI Command Reference*.

list-dimensions

The following code example shows how to use `list-dimensions`.

AWS CLI

To list the dimensions for your AWS account

The following `list-dimensions` example lists all AWS IoT Device Defender dimensions that are defined in your AWS account.

```
aws iot list-dimensions
```

Output:

```
{
  "dimensionNames": [
    "TopicFilterForAuthMessages",
    "TopicFilterForActivityMessages"
  ]
}
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListDimensions](#) in *AWS CLI Command Reference*.

list-domain-configurations

The following code example shows how to use `list-domain-configurations`.

AWS CLI

To list domain configurations

The following `list-domain-configurations` example lists the domain configurations in your AWS account that have the specified service type.

```
aws iot list-domain-configurations \
  --service-type "DATA"
```

Output:

```
{
  "domainConfigurations":
```

```
[
  {
    "domainConfigurationName": "additionalDataDomain",
    "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh",
    "serviceType": "DATA"
  },
  {
    "domainConfigurationName": "iot:Jobs",
    "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:Jobs",
    "serviceType": "JOBS"
  },
  {
    "domainConfigurationName": "iot:Data-ATS",
    "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:Data-ATS",
    "serviceType": "DATA"
  },
  {
    "domainConfigurationName": "iot:CredentialProvider",
    "domainConfigurationArn": "arn:aws:iot:us-
west-2:123456789012:domainconfiguration/iot:CredentialProvider",
    "serviceType": "CREDENTIAL_PROVIDER"
  }
]
```

For more information, see [Configurable Endpoints](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListDomainConfigurations](#) in *AWS CLI Command Reference*.

list-indices

The following code example shows how to use `list-indices`.

AWS CLI

To list the configured search indices

The following `list-indices` example lists all configured search indices in your AWS account. If you have not enabled thing indexing, you might not have any indices.

```
aws iot list-indices
```

Output:

```
{
  "indexNames": [
    "AWS_Things"
  ]
}
```

For more information, see [Managing Thing Indexing](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListIndices](#) in *AWS CLI Command Reference*.

list-job-executions-for-job

The following code example shows how to use `list-job-executions-for-job`.

AWS CLI

To list the jobs in your AWS account

The following `list-job-executions-for-job` example lists all job executions for a job in your AWS account, specified by the `jobId`.

```
aws iot list-job-executions-for-job \
  --job-id my-ota-job
```

Output:

```
{
  "executionSummaries": [
    {
      "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/my_thing",
      "jobExecutionSummary": {
        "status": "QUEUED",
        "queuedAt": "2022-03-07T15:58:42.195000-08:00",
        "lastUpdatedAt": "2022-03-07T15:58:42.195000-08:00",
        "executionNumber": 1,
        "retryAttempt": 0
      }
    }
  ]
}
```

```
    }
  }
]
```

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListJobExecutionsForJob](#) in *AWS CLI Command Reference*.

list-job-executions-for-thing

The following code example shows how to use `list-job-executions-for-thing`.

AWS CLI

To list the jobs that were executed for a thing

The following `list-job-executions-for-thing` example lists all jobs that were executed for the thing named `MyRaspberryPi`.

```
aws iot list-job-executions-for-thing \
  --thing-name "MyRaspberryPi"
```

Output:

```
{
  "executionSummaries": [
    {
      "jobId": "example-job-01",
      "jobExecutionSummary": {
        "status": "QUEUED",
        "queuedAt": 1560787023.636,
        "lastUpdatedAt": 1560787023.636,
        "executionNumber": 1
      }
    }
  ]
}
```

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListJobExecutionsForThing](#) in *AWS CLI Command Reference*.

list-jobs

The following code example shows how to use `list-jobs`.

AWS CLI

To list the jobs in your AWS account

The following `list-jobs` example lists all jobs in your AWS account, sorted by the job status.

```
aws iot list-jobs
```

Output:

```
{
  "jobs": [
    {
      "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
      "jobId": "example-job-01",
      "targetSelection": "SNAPSHOT",
      "status": "IN_PROGRESS",
      "createdAt": 1560787022.733,
      "lastUpdatedAt": 1560787026.294
    }
  ]
}
```

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListJobs](#) in *AWS CLI Command Reference*.

list-mitigation-actions

The following code example shows how to use `list-mitigation-actions`.

AWS CLI

To list all defined mitigation actions

The following `list-mitigation-actions` example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.

```
aws iot list-mitigation-actions
```

Output:

```
{
  "actionIdentifiers": [
    {
      "actionName": "DeactivateCACertAction",
      "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/DeactivateCACertAction",
      "creationDate": "2019-12-10T11:12:47.574000-08:00"
    },
    {
      "actionName": "ResetPolicyVersionAction",
      "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/ResetPolicyVersionAction",
      "creationDate": "2019-12-10T11:11:48.920000-08:00"
    },
    {
      "actionName": "PublishFindingToSNSAction",
      "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/PublishFindingToSNSAction",
      "creationDate": "2019-12-10T11:10:49.546000-08:00"
    },
    {
      "actionName": "AddThingsToQuarantineGroupAction",
      "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/AddThingsToQuarantineGroupAction",
      "creationDate": "2019-12-10T11:09:35.999000-08:00"
    },
    {
      "actionName": "UpdateDeviceCertAction",
      "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/UpdateDeviceCertAction",
      "creationDate": "2019-12-10T11:08:44.263000-08:00"
    },
    {
      "actionName": "SampleMitigationAction",
      "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/SampleMitigationAction",
      "creationDate": "2019-12-10T11:03:41.840000-08:00"
    }
  ]
}
```

```
}
```

For more information, see [ListMitigationActions \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListMitigationActions](#) in *AWS CLI Command Reference*.

list-mitigations-actions

The following code example shows how to use `list-mitigations-actions`.

AWS CLI

To list all defined mitigation actions

The following `list-mitigations-actions` example lists all defined mitigation actions for your AWS account and Region. For each action, the name, ARN, and creation date are listed.

```
aws iot list-mitigation-actions
```

Output:

```
{
  "actionIdentifiers": [
    {
      "actionName": "DeactivateCACertAction",
      "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/DeactivateCACertAction",
      "creationDate": "2019-12-10T11:12:47.574000-08:00"
    },
    {
      "actionName": "ResetPolicyVersionAction",
      "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/ResetPolicyVersionAction",
      "creationDate": "2019-12-10T11:11:48.920000-08:00"
    },
    {
      "actionName": "PublishFindingToSNSAction",
      "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/PublishFindingToSNSAction",
      "creationDate": "2019-12-10T11:10:49.546000-08:00"
    },
    {
```

```

        "actionName": "AddThingsToQuarantineGroupAction",
        "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
        "creationDate": "2019-12-10T11:09:35.999000-08:00"
    },
    {
        "actionName": "UpdateDeviceCertAction",
        "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
UpdateDeviceCertAction",
        "creationDate": "2019-12-10T11:08:44.263000-08:00"
    },
    {
        "actionName": "SampleMitigationAction",
        "actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
SampleMitigationAction",
        "creationDate": "2019-12-10T11:03:41.840000-08:00"
    }
]
}

```

For more information, see [ListMitigationActions \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListMitigationsActions](#) in *AWS CLI Command Reference*.

list-ota-updates

The following code example shows how to use `list-ota-updates`.

AWS CLI

To list OTA Updates for the account

The following `list-ota-updates` example lists the available OTA updates.

```
aws iot list-ota-updates
```

Output:

```

{
  "otaUpdates": [
    {
      "otaUpdateId": "itsaupdate",

```

```
        "otaUpdateArn": "arn:aws:iot:us-west-2:123456789012:otaupdate/itsaupdate",
        "creationDate": 1557863215.995
    }
]
}
```

For more information, see [ListOTAUpdates](#) in the *AWS IoT API Reference*.

- For API details, see [ListOtaUpdates](#) in *AWS CLI Command Reference*.

list-outgoing-certificates

The following code example shows how to use `list-outgoing-certificates`.

AWS CLI

To list certificates being transferred to a different AWS account

The following `list-outgoing-certificates` example lists all device certificates that are in the process of being transferred to a different AWS account using the `transfer-certificate` command.

```
aws iot list-outgoing-certificates
```

Output:

```
{
  "outgoingCertificates": [
    {
      "certificateArn": "arn:aws:iot:us-west-2:030714055129:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
      "certificateId": "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
      "transferredTo": "030714055129",
      "transferDate": 1569427780.441,
      "creationDate": 1569363250.557
    }
  ]
}
```

For more information, see [ListOutgoingCertificates](#) in the *AWS IoT API Reference*.

- For API details, see [ListOutgoingCertificates](#) in *AWS CLI Command Reference*.

list-policies

The following code example shows how to use `list-policies`.

AWS CLI

To list the policies defined in your AWS account

The following `list-policies` example lists all policies defined in your AWS account.

```
aws iot list-policies
```

Output:

```
{
  "policies": [
    {
      "policyName": "UpdateDeviceCertPolicy",
      "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/UpdateDeviceCertPolicy"
    },
    {
      "policyName": "PlantIoTPolicy",
      "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/PlantIoTPolicy"
    },
    {
      "policyName": "MyPiGroup_Core-policy",
      "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/MyPiGroup_Core-policy"
    }
  ]
}
```

For more information, see [AWS IoT Policies](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListPolicies](#) in *AWS CLI Command Reference*.

list-policy-versions

The following code example shows how to use `list-policy-versions`.

AWS CLI

Example 1: To see all versions of a policy

The following `list-policy-versions` example lists all versions of the specified policy and their creation dates.

```
aws iot list-policy-versions \  
  --policy-name LightBulbPolicy
```

Output:

```
{  
  "policyVersions": [  
    {  
      "versionId": "2",  
      "isDefaultVersion": true,  
      "createDate": 1559925941.924  
    },  
    {  
      "versionId": "1",  
      "isDefaultVersion": false,  
      "createDate": 1559925941.924  
    }  
  ]  
}
```

For more information, see [AWS IoT Policies](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListPolicyVersions](#) in *AWS CLI Command Reference*.

list-principal-things

The following code example shows how to use `list-principal-things`.

AWS CLI

To list the things attached with a principal

The following `list-principal-things` example lists the things attached to the principal specified by an ARN.

```
aws iot list-principal-things \  
  --principal arn:aws:iot:us-  
west-2:123456789012:cert/2e1eb273792174ec2b9bf4e9b37e6c6c692345499506002a35159767055278e8
```

Output:

```
{  
  "things": [  
    "DeskLamp",  
    "TableLamp"  
  ]  
}
```

For more information, see [ListPrincipalThings](#) in the *AWS IoT API Reference*.

- For API details, see [ListPrincipalThings](#) in *AWS CLI Command Reference*.

list-provisioning-template-versions

The following code example shows how to use `list-provisioning-template-versions`.

AWS CLI

To list provisioning template versions

The following `list-provisioning-template-versions` example lists the available versions of the specified provisioning template.

```
aws iot list-provisioning-template-versions \  
  --template-name "widget-template"
```

Output:

```
{  
  "versions": [  
    {  
      "versionId": 1,  
      "creationDate": 1574800471.339,  
      "isDefaultVersion": true  
    },  
    {
```

```
        "versionId": 2,  
        "creationDate": 1574801192.317,  
        "isDefaultVersion": false  
      }  
    ]  
  }  
}
```

For more information, see [AWS IoT Secure Tunneling](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [ListProvisioningTemplateVersions](#) in *AWS CLI Command Reference*.

list-provisioning-templates

The following code example shows how to use `list-provisioning-templates`.

AWS CLI

To list provisioning templates

The following `list-provisioning-templates` example lists all of the provisioning templates in your AWS account.

```
aws iot list-provisioning-templates
```

Output:

```
{  
  "templates": [  
    {  
      "templateArn": "arn:aws:iot:us-east-1:123456789012:provisioningtemplate/  
widget-template",  
      "templateName": "widget-template",  
      "description": "A provisioning template for widgets",  
      "creationDate": 1574800471.367,  
      "lastModifiedDate": 1574801192.324,  
      "enabled": false  
    }  
  ]  
}
```

For more information, see [AWS IoT Secure Tunneling](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [ListProvisioningTemplates](#) in *AWS CLI Command Reference*.

list-role-aliases

The following code example shows how to use `list-role-aliases`.

AWS CLI

To list the AWS IoT role aliases in your AWS account

The following `list-role-aliases` example lists the AWS IoT role aliases in your AWS account.

```
aws iot list-role-aliases
```

Output:

```
{
  "roleAliases": [
    "ResidentAlias",
    "ElectricianAlias"
  ]
}
```

For more information, see [ListRoleAliases](#) in the *AWS IoT API Reference*.

- For API details, see [ListRoleAliases](#) in *AWS CLI Command Reference*.

list-scheduled-audits

The following code example shows how to use `list-scheduled-audits`.

AWS CLI

To list the scheduled audits for your AWS account

The following `list-scheduled-audits` example lists any audits scheduled for your AWS account.

```
aws iot list-scheduled-audits
```

Output:

```
{
  "scheduledAudits": [
    {
      "scheduledAuditName": "AWSIoTDeviceDefenderDailyAudit",
      "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSIoTDeviceDefenderDailyAudit",
      "frequency": "DAILY"
    },
    {
      "scheduledAuditName": "AWSDeviceDefenderWeeklyAudit",
      "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/
AWSDeviceDefenderWeeklyAudit",
      "frequency": "WEEKLY",
      "dayOfWeek": "SUN"
    }
  ]
}
```

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListScheduledAudits](#) in *AWS CLI Command Reference*.

list-security-profiles-for-target

The following code example shows how to use `list-security-profiles-for-target`.

AWS CLI

To list the security profiles attached to a target

The following `list-security-profiles-for-target` example lists the AWS IoT Device Defender security profiles that are attached to unregistered devices.

```
aws iot list-security-profiles-for-target \
  --security-profile-target-arn "arn:aws:iot:us-west-2:123456789012:all/
unregistered-things"
```

Output:

```
{
  "securityProfileTargetMappings": [
    {
```

```
    "securityProfileIdentifier": {
      "name": "Testprofile",
      "arn": "arn:aws:iot:us-west-2:123456789012:securityprofile/
Testprofile"
    },
    "target": {
      "arn": "arn:aws:iot:us-west-2:123456789012:all/unregistered-things"
    }
  }
]
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListSecurityProfilesForTarget](#) in *AWS CLI Command Reference*.

list-security-profiles

The following code example shows how to use `list-security-profiles`.

AWS CLI

To list the security profiles for your AWS account

The following `list-security-profiles` example lists all AWS IoT Device Defender security profiles that are defined in your AWS account.

```
aws iot list-security-profiles
```

Output:

```
{
  "securityProfileIdentifiers": [
    {
      "name": "Testprofile",
      "arn": "arn:aws:iot:us-west-2:123456789012:securityprofile/Testprofile"
    }
  ]
}
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListSecurityProfiles](#) in *AWS CLI Command Reference*.

list-streams

The following code example shows how to use `list-streams`.

AWS CLI

To list the streams in the account

The following `list-streams` example lists all of the streams in your AWS account.

```
aws iot list-streams
```

Output:

```
{
  "streams": [
    {
      "streamId": "stream12345",
      "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
      "streamVersion": 1,
      "description": "This stream is used for Amazon FreeRTOS OTA Update
12345."
    },
    {
      "streamId": "stream54321",
      "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream54321",
      "streamVersion": 1,
      "description": "This stream is used for Amazon FreeRTOS OTA Update
54321."
    }
  ]
}
```

For more information, see [ListStreams](#) in the *AWS IoT API Reference*.

- For API details, see [ListStreams](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To display the tags and their values associated with a resource

The following `list-tags-for-resource` example displays the tags and values associated with the thing group `LightBulbs`.

```
aws iot list-tags-for-resource \  
  --resource-arn "arn:aws:iot:us-west-2:094249569039:thinggroup/LightBulbs"
```

Output:

```
{  
  "tags": [  
    {  
      "Key": "Assembly",  
      "Value": "Fact1NW"  
    },  
    {  
      "Key": "MyTag",  
      "Value": "777"  
    }  
  ]  
}
```

For more information, see [Tagging Your AWS IoT Resources](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-targets-for-policy

The following code example shows how to use `list-targets-for-policy`.

AWS CLI

To list the principals associated with an AWS IoT policy

The following `list-targets-for-policy` example lists the device certificates to which the specified policy is attached.

```
aws iot list-targets-for-policy \  
  --policy-name "PolicyName"
```

```
--policy-name UpdateDeviceCertPolicy
```

Output:

```
{
  "targets": [
    "arn:aws:iot:us-west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
    "arn:aws:iot:us-west-2:123456789012:cert/d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be"
  ]
}
```

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListTargetsForPolicy](#) in *AWS CLI Command Reference*.

list-targets-for-security-profile

The following code example shows how to use `list-targets-for-security-profile`.

AWS CLI

To list the targets to which a security profile is applied

The following `list-targets-for-security-profile` example lists the targets to which the AWS IoT Device Defender security profile named `PossibleIssue` is applied.

```
aws iot list-targets-for-security-profile \
  --security-profile-name Testprofile
```

Output:

```
{
  "securityProfileTargets": [
    {
      "arn": "arn:aws:iot:us-west-2:123456789012:all/unregistered-things"
    },
    {
      "arn": "arn:aws:iot:us-west-2:123456789012:all/registered-things"
    }
  ]
}
```

```
}
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListTargetsForSecurityProfile](#) in *AWS CLI Command Reference*.

list-thing-groups-for-thing

The following code example shows how to use `list-thing-groups-for-thing`.

AWS CLI

To list the groups that a thing belongs to

The following `list-thing-groups-for-thing` example lists the groups to which the specified thing belongs.

```
aws iot list-thing-groups-for-thing \  
  --thing-name MyLightBulb
```

Output:

```
{  
  "thingGroups": [  
    {  
      "groupName": "DeadBulbs",  
      "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/DeadBulbs"  
    },  
    {  
      "groupName": "LightBulbs",  
      "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"  
    }  
  ]  
}
```

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListThingGroupsForThing](#) in *AWS CLI Command Reference*.

list-thing-groups

The following code example shows how to use `list-thing-groups`.

AWS CLI

To list the thing groups defined in your AWS account

The following `describe-thing-group` example lists all thing groups defined in your AWS account.

```
aws iot list-thing-groups
```

Output:

```
{
  "thingGroups": [
    {
      "groupName": "HalogenBulbs",
      "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/HalogenBulbs"
    },
    {
      "groupName": "LightBulbs",
      "groupArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/LightBulbs"
    }
  ]
}
```

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListThingGroups](#) in *AWS CLI Command Reference*.

list-thing-principals

The following code example shows how to use `list-thing-principals`.

AWS CLI

To list the principals associated with a thing

The following `list-thing-principals` example lists the principals (X.509 certificates, IAM users, groups, roles, Amazon Cognito identities, or federated identities) associated with the specified thing.

```
aws iot list-thing-principals \
  --thing-name MyRaspberryPi
```

Output:

```
{
  "principals": [
    "arn:aws:iot:us-west-2:123456789012:cert/33475ac865079a5ffd5ecd44240640349293facc760642d7d8d5dbb6b4c86893"
  ]
}
```

For more information, see [ListThingPrincipals](#) in the *AWS IoT API Reference*.

- For API details, see [ListThingPrincipals](#) in *AWS CLI Command Reference*.

list-thing-types

The following code example shows how to use `list-thing-types`.

AWS CLI**To list the defined thing types**

The following `list-thing-types` example displays a list of thing types defined in your AWS account.

```
aws iot list-thing-types
```

Output:

```
{
  "thingTypes": [
    {
      "thingTypeName": "LightBulb",
      "thingTypeArn": "arn:aws:iot:us-west-2:123456789012:thingtype/LightBulb",
      "thingTypeProperties": {
        "thingTypeDescription": "light bulb type",
        "searchableAttributes": [
          "model",
          "wattage"
        ]
      },
      "thingTypeMetadata": {
```

```
        "deprecated": false,  
        "creationDate": 1559772562.498  
      }  
    ]  
  }  
}
```

For more information, see [Thing Types](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListThingTypes](#) in *AWS CLI Command Reference*.

list-things-in-billing-group

The following code example shows how to use `list-things-in-billing-group`.

AWS CLI

To list the things in a billing group

The following `list-things-in-billing-group` example lists the things that are in the specified billing group.

```
aws iot list-things-in-billing-group \  
  --billing-group-name GroupOne
```

Output:

```
{  
  "things": [  
    "MyOtherLightBulb",  
    "MyLightBulb"  
  ]  
}
```

For more information, see [Billing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListThingsInBillingGroup](#) in *AWS CLI Command Reference*.

list-things-in-thing-group

The following code example shows how to use `list-things-in-thing-group`.

AWS CLI

To list the things that belong to a group

The following `list-things-in-thing-group` example lists the things that belong to the specified thing group.

```
aws iot list-things-in-thing-group \  
  --thing-group-name LightBulbs
```

Output:

```
{  
  "things": [  
    "MyLightBulb"  
  ]  
}
```

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListThingsInThingGroup](#) in *AWS CLI Command Reference*.

list-things

The following code example shows how to use `list-things`.

AWS CLI

Example 1: To list all things in the registry

The following `list-things` example lists the things (devices) that are defined in the AWS IoT registry for your AWS account.

```
aws iot list-things
```

Output:

```
{  
  "things": [  
    {  
      "thingName": "ThirdBulb",  
      "thingTypeName": "LightBulb",  
    }  
  ]  
}
```

```
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/ThirdBulb",
    "attributes": {
      "model": "123",
      "wattage": "75"
    },
    "version": 2
  },
  {
    "thingName": "MyOtherLightBulb",
    "thingTypeName": "LightBulb",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb",
    "attributes": {
      "model": "123",
      "wattage": "75"
    },
    "version": 3
  },
  {
    "thingName": "MyLightBulb",
    "thingTypeName": "LightBulb",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
    "attributes": {
      "model": "123",
      "wattage": "75"
    },
    "version": 1
  },
  {
    "thingName": "SampleIoTThing",
    "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/SampleIoTThing",
    "attributes": {},
    "version": 1
  }
]
```

Example 2: To list the defined things that have a specific attribute

The following `list-things` example displays a list of things that have an attribute named `wattage`.

```
aws iot list-things \  
  --attribute-name wattage
```

Output:

```
{
  "things": [
    {
      "thingName": "MyLightBulb",
      "thingTypeName": "LightBulb",
      "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyLightBulb",
      "attributes": {
        "model": "123",
        "wattage": "75"
      },
      "version": 1
    },
    {
      "thingName": "MyOtherLightBulb",
      "thingTypeName": "LightBulb",
      "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyOtherLightBulb",
      "attributes": {
        "model": "123",
        "wattage": "75"
      },
      "version": 3
    }
  ]
}
```

For more information, see [How to Manage Things with the Registry](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListThings](#) in *AWS CLI Command Reference*.

list-topic-rule-destinations

The following code example shows how to use `list-topic-rule-destinations`.

AWS CLI**To list your topic rule destinations**

The following `list-topic-rule-destinations` example lists all topic rule destinations that you have defined in the current AWS Region.

```
aws iot list-topic-rule-destinations
```

Output:

```
{
  "destinationSummaries": [
    {
      "arn": "arn:aws:iot:us-west-2:123456789012:ruledestination/http/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "status": "ENABLED",
      "httpUrlSummary": {
        "confirmationUrl": "https://example.com"
      }
    }
  ]
}
```

For more information, see [Working with topic rule destinations](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListTopicRuleDestinations](#) in *AWS CLI Command Reference*.

list-topic-rules

The following code example shows how to use `list-topic-rules`.

AWS CLI

To list your rules

The following `list-topic-rules` example lists all rules that you have defined.

```
aws iot list-topic-rules
```

Output:

```
{
  "rules": [
    {
      "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/
MyRPiLowMoistureAlertRule",
      "ruleName": "MyRPiLowMoistureAlertRule",
      "topicPattern": "$aws/things/MyRPi/shadow/update/accepted",

```

```
        "createdAt": 1558624363.0,
        "ruleDisabled": false
    },
    {
        "ruleArn": "arn:aws:iot:us-west-2:123456789012:rule/
MyPlantPiMoistureAlertRule",
        "ruleName": "MyPlantPiMoistureAlertRule",
        "topicPattern": "$aws/things/MyPlantPi/shadow/update/accepted",
        "createdAt": 1541458459.0,
        "ruleDisabled": false
    }
]
}
```

For more information, see [Viewing Your Rules](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListTopicRules](#) in *AWS CLI Command Reference*.

list-v2-logging-levels

The following code example shows how to use `list-v2-logging-levels`.

AWS CLI

To list logging levels

The following `list-v2-logging-levels` example lists the configured logging levels. If logging levels were not set, a `NotConfiguredException` occurs when you run this command.

```
aws iot list-v2-logging-levels
```

Output:

```
{
  "logTargetConfigurations": [
    {
      "logTarget": {
        "targetType": "DEFAULT"
      },
      "logLevel": "ERROR"
    }
  ]
}
```

```
}
```

- For API details, see [ListV2LoggingLevels](#) in *AWS CLI Command Reference*.

list-violation-events

The following code example shows how to use `list-violation-events`.

AWS CLI

To list the security profile violations during a time period

The following `list-violation-events` example lists violations that occurred between June 5, 2019 and June 12, 2019 for all AWS IoT Device Defender security profiles for the current AWS account and AWS Region.

```
aws iot list-violation-events \  
  --start-time 1559747125 \  
  --end-time 1560351925
```

Output:

```
{  
  "violationEvents": [  
    {  
      "violationId": "174db59167fa474c80a652ad1583fd44",  
      "thingName": "iotconsole-1560269126751-1",  
      "securityProfileName": "Testprofile",  
      "behavior": {  
        "name": "Authorization",  
        "metric": "aws:num-authorization-failures",  
        "criteria": {  
          "comparisonOperator": "greater-than",  
          "value": {  
            "count": 10  
          },  
          "durationSeconds": 300,  
          "consecutiveDatapointsToAlarm": 1,  
          "consecutiveDatapointsToClear": 1  
        }  
      },  
      "metricValue": {
```

```
        "count": 0
    },
    "violationEventType": "in-alarm",
    "violationEventTime": 1560279000.0
},
{
    "violationId": "c8a9466a093d3b7b35cd44ca58bdbbeab",
    "thingName": "TvnQoEoU",
    "securityProfileName": "Testprofile",
    "behavior": {
        "name": "CellularBandwidth",
        "metric": "aws:message-byte-size",
        "criteria": {
            "comparisonOperator": "greater-than",
            "value": {

                },
                "durationSeconds": 300,
                "consecutiveDatapointsToAlarm": 1,
                "consecutiveDatapointsToClear": 1
            }
        },
        "metricValue": {
            "count": 0
        },
        "violationEventType": "in-alarm",
        "violationEventTime": 1560276600.0
    }
]
}

```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [ListViolationEvents](#) in *AWS CLI Command Reference*.

register-ca-certificate

The following code example shows how to use register-ca-certificate.

AWS CLI

To register a certificate authority (CA) certificate

The following `register-ca-certificate` example registers a CA certificate. The command supplies the CA certificate and a key verification certificate that proves you own the private key associated with the CA certificate.

```
aws iot register-ca-certificate \  
  --ca-certificate file://rootCA.pem \  
  --verification-cert file://verificationCert.pem
```

Output:

```
{  
  "certificateArn": "arn:aws:iot:us-west-2:123456789012:cacert/  
f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467",  
  "certificateId":  
  "f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467"  
}
```

For more information, see [RegisterCACertificate](#) in the *AWS IoT API Reference*.

- For API details, see [RegisterCaCertificate](#) in *AWS CLI Command Reference*.

register-certificate

The following code example shows how to use `register-certificate`.

AWS CLI

To register a self signed device certificate

The following `register-certificate` example registers the `deviceCert.pem` device certificate signed by the `rootCA.pem` CA certificate. The CA certificate must be registered before you use it to register a self-signed device certificate. The self-signed certificate must be signed by the same CA certificate you pass to this command.

```
aws iot register-certificate \  
  --certificate-pem file://deviceCert.pem \  
  --ca-certificate-pem file://rootCA.pem
```

Output:

```
{
```

```

    "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142",
    "certificateId":
    "488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142"
}

```

For more information, see [RegisterCertificate](#) in the *AWS IoT API Reference*.

- For API details, see [RegisterCertificate](#) in *AWS CLI Command Reference*.

register-thing

The following code example shows how to use register-thing.

AWS CLI

To register a thing

The following register-thing example registers a thing using a provisioning template.

```

aws iot register-thing \
  --template-body '{"Parameters":{"ThingName":
{"Type":"String"},"AWS::IoT::Certificate::Id":{"Type":"String"},"Resources":
{"certificate":{"Properties":{"CertificateId":
{"Ref":"AWS::IoT::Certificate::Id"},"Status":"Active"},"Type":"AWS::IoT::Certificate"},"poli
{"Properties":{"PolicyName":"MyIotPolicy"},"Type":"AWS::IoT::Policy"},"thing":
{"OverrideSettings":
{"AttributePayload":"MERGE","ThingGroups":"DO_NOTHING","ThingTypeName":"REPLACE"},"Propertie
{"AttributePayload":{},"ThingGroups":[],"ThingName":
{"Ref":"ThingName"},"ThingTypeName":"VirtualThings"},"Type":"AWS::IoT::Thing"}}}' \
  --parameters '{"ThingName":"Register-thing-
trial-1","AWS::IoT::Certificate::Id":"799a9ea048a1e6aea42b55EXAMPLEf8697b4bafcd77a318a3068e3

```

Output:

```

{
  "certificatePem": "-----BEGIN CERTIFICATE-----

For more information, see [Provisioning by trusted user](#) in the *AWS IoT Core Developers Guide*.

- For API details, see [RegisterThing](#) in *AWS CLI Command Reference*.

reject-certificate-transfer

The following code example shows how to use `reject-certificate-transfer`.

AWS CLI

To reject a certificate transfer

The following `reject-certificate-transfer` example rejects the transfer of the specified device certificate from another AWS account.

```
aws iot reject-certificate-transfer \  
  --certificate-id  
  f0f33678c7c9a046e5cc87b2b1a58dfa0beec26db78add5e605d630e05c7fc8
```

This command produces no output.

For more information, see [Transfer a certificate to another account](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [RejectCertificateTransfer](#) in *AWS CLI Command Reference*.

remove-thing-from-billing-group

The following code example shows how to use `remove-thing-from-billing-group`.

AWS CLI

To remove a thing from a billing group

The following `remove-thing-from-billing-group` example removes the specified thing from a billing group.

```
aws iot remove-thing-from-billing-group \  
  --billing-group-name GroupOne \  
  --thing-name MyOtherLightBulb
```

This command produces no output.

For more information, see [Billing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [RemoveThingFromBillingGroup](#) in *AWS CLI Command Reference*.

remove-thing-from-thing-group

The following code example shows how to use `remove-thing-from-thing-group`.

AWS CLI

To remove a thing from a thing group

The following `remove-thing-from-thing-group` example removes the specified thing from a thing group.

```
aws iot remove-thing-from-thing-group \  
  --thing-name bulb7 \  
  --thing-group-name DeadBulbs
```

This command produces no output.

For more information, see Thing Groups <<https://docs.aws.amazon.com/iot/latest/developerguide/thing-groups.html>> in the *AWS IoT Developer Guide*.

- For API details, see [RemoveThingFromThingGroup](#) in *AWS CLI Command Reference*.

replace-topic-rule

The following code example shows how to use `replace-topic-rule`.

AWS CLI

To update a topic's rule definition

The following `replace-topic-rule` example updates the specified rule to send an SNS alert when soil moisture level readings are too low.

```
aws iot replace-topic-rule \  
  --rule-name MyRPiLowMoistureAlertRule \  
  --topic-rule-payload "{\"sql\": \"SELECT * FROM '$aws/things/MyRPi/shadow/  
update/accepted' WHERE state.reported.moisture = 'low'\", \"description\": \"Sends  
an alert when soil moisture level readings are too low.\", \"actions\": [{\"sns  
\": {\"targetArn\": \"arn:aws:sns:us-west-2:123456789012:MyRPiLowMoistureTopic\",  
\"roleArn\": \"arn:aws:iam::123456789012:role/service-role/MyRPiLowMoistureTopicRole  
\", \"messageFormat\": \"RAW\"}}], \"ruleDisabled\": false, \"awsIotSqlVersion\":  
\"2016-03-23\"}"
```

This command produces no output.

For more information, see [Creating an AWS IoT Rule](#) in the *AWS IoT Developer Guide*.

- For API details, see [ReplaceTopicRule](#) in *AWS CLI Command Reference*.

search-index

The following code example shows how to use `search-index`.

AWS CLI

To query the thing index

The following search-index example queries the AWS_Things index for things that have a type of LightBulb.

```
aws iot search-index \  
  --index-name "AWS_Things" \  
  --query-string "thingTypeName:LightBulb"
```

Output:

```
{  
  "things": [  
    {  
      "thingName": "MyLightBulb",  
      "thingId": "40da2e73-c6af-406e-b415-15acae538797",  
      "thingTypeName": "LightBulb",  
      "thingGroupNames": [  
        "LightBulbs",  
        "DeadBulbs"  
      ],  
      "attributes": {  
        "model": "123",  
        "wattage": "75"  
      },  
      "connectivity": {  
        "connected": false  
      }  
    },  
    {  
      "thingName": "ThirdBulb",  
      "thingId": "615c8455-33d5-40e8-95fd-3ee8b24490af",  
      "thingTypeName": "LightBulb",  
      "attributes": {  
        "model": "123",  
        "wattage": "75"  
      },  
      "connectivity": {  
        "connected": false  
      }  
    }  
  ],  
}
```

```
{
  "thingName": "MyOtherLightBulb",
  "thingId": "6dae0d3f-40c1-476a-80c4-1ed24ba6aa11",
  "thingTypeName": "LightBulb",
  "attributes": {
    "model": "123",
    "wattage": "75"
  },
  "connectivity": {
    "connected": false
  }
}
]
```

For more information, see [Managing Thing Indexing](#) in the *AWS IoT Developer Guide*.

- For API details, see [SearchIndex](#) in *AWS CLI Command Reference*.

set-default-authorizer

The following code example shows how to use `set-default-authorizer`.

AWS CLI

To set a default authorizer

The following `set-default-authorizer` example sets the custom authorizer named `CustomAuthorizer` as the default authorizer.

```
aws iot set-default-authorizer \
  --authorizer-name CustomAuthorizer
```

Output:

```
{
  "authorizerName": "CustomAuthorizer",
  "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/
CustomAuthorizer"
}
```

For more information, see [CreateDefaultAuthorizer](#) in the *AWS IoT API Reference*.

- For API details, see [SetDefaultAuthorizer](#) in *AWS CLI Command Reference*.

set-default-policy-version

The following code example shows how to use `set-default-policy-version`.

AWS CLI

To set the default version for a policy

The following `set-default-policy-version` example sets the default version to 2 for the policy named `UpdateDeviceCertPolicy`.

```
aws iot set-default-policy-version \  
  --policy-name UpdateDeviceCertPolicy \  
  --policy-version-id 2
```

This command produces no output.

- For API details, see [SetDefaultPolicyVersion](#) in *AWS CLI Command Reference*.

set-v2-logging-level

The following code example shows how to use `set-v2-logging-level`.

AWS CLI

To set the logging level for a thing group

The following `set-v2-logging-level` example sets the logging level to log warnings for the specified thing group.

```
aws iot set-v2-logging-level \  
  --log-target "{\"targetType\":\"THING_GROUP\",\"targetName\":\"LightBulbs\"}" \  
  --log-level WARN
```

This command produces no output.

- For API details, see [SetV2LoggingLevel](#) in *AWS CLI Command Reference*.

set-v2-logging-options

The following code example shows how to use `set-v2-logging-options`.

AWS CLI

To set the logging options

The following `set-v2-logging-options` example sets the default logging verbosity level to `ERROR` and specifies the ARN to use for logging.

```
aws iot set-v2-logging-options \  
  --default-log-level ERROR \  
  --role-arn "arn:aws:iam::094249569039:role/service-role/iotLoggingRole"
```

This command produces no output.

- For API details, see [SetV2LoggingOptions](#) in *AWS CLI Command Reference*.

start-audit-mitigation-actions-task

The following code example shows how to use `start-audit-mitigation-actions-task`.

AWS CLI

To apply a mitigation action to the findings from an audit

The following `start-audit-mitigation-actions-task` example applies the `ResetPolicyVersionAction` action (which clears the policy) to the specified single finding.

```
aws iot start-audit-mitigation-actions-task \  
  --task-id "myActionsTaskId" \  
  --target "findingIds=[\"0edbaaec-2fe1-4cf5-abc9-d4c3e51f7464\"]" \  
  --audit-check-to-actions-mapping  
  "IOT_POLICY_OVERLY_PERMISSIVE_CHECK=[\"ResetPolicyVersionAction\"]" \  
  --client-request-token "adhadhahda"
```

Output:

```
{  
  "taskId": "myActionsTaskId"
```

```
}
```

For more information, see [StartAuditMitigationActionsTask \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [StartAuditMitigationActionsTask](#) in *AWS CLI Command Reference*.

start-on-demand-audit-task

The following code example shows how to use `start-on-demand-audit-task`.

AWS CLI

To start an audit right away

The following `start-on-demand-audit-task` example starts an AWS IoT Device Defender audit and performs three certificate checks.

```
aws iot start-on-demand-audit-task \  
  --target-check-names CA_CERTIFICATE_EXPIRING_CHECK \  
  DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK
```

Output:

```
{  
  "taskId": "a3aea009955e501a31b764abe1bebd3d"  
}
```

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [StartOnDemandAuditTask](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To specify a tag key and value for a resource

The following `tag-resource` example applies the tag with a key `Assembly` and the value `Fact1NW` to the thing group `LightBulbs`.

```
aws iot tag-resource \  
  --tags Key=Assembly,Value="Fact1NW" \  
  --resource-arn "arn:aws:iot:us-west-2:094249569039:thinggroup/LightBulbs"
```

This command produces no output.

For more information, see [Tagging Your AWS IoT Resources](#) in the *AWS IoT Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

test-authorization

The following code example shows how to use test-authorization.

AWS CLI

To test your AWS IoT policies

The following test-authorization example tests the AWS IoT policies associated with the specified principal.

```
aws iot test-authorization \  
  --auth-infos actionType=CONNECT,resources=arn:aws:iot:us-  
east-1:123456789012:client/client1 \  
  --principal arn:aws:iot:us-west-2:123456789012:cert/  
aab1068f7f43ac3e3cae4b3a8aa3f308d2a750e6350507962e32c1eb465d9775
```

Output:

```
{  
  "authResults": [  
    {  
      "authInfo": {  
        "actionType": "CONNECT",  
        "resources": [  
          "arn:aws:iot:us-east-1:123456789012:client/client1"  
        ]  
      },  
      "allowed": {  
        "policies": [  
          {  
            "policyName": "TestPolicyAllowed",
```

```

        "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyAllowed"
    }
  ]
},
"denied": {
  "implicitDeny": {
    "policies": [
      {
        "policyName": "TestPolicyDenied",
        "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyDenied"
      }
    ]
  },
  "explicitDeny": {
    "policies": [
      {
        "policyName": "TestPolicyExplicitDenied",
        "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/
TestPolicyExplicitDenied"
      }
    ]
  }
},
"authDecision": "IMPLICIT_DENY",
"missingContextValues": []
}
]
}

```

For more information, see [TestAuthorization](#) in the *AWS IoT API Reference*.

- For API details, see [TestAuthorization](#) in *AWS CLI Command Reference*.

test-invoke-authorizer

The following code example shows how to use `test-invoke-authorizer`.

AWS CLI

To test your custom authorizer

The following `test-invoke-authorizer` example tests your custom authorizer.

```
aws iot test-invoke-authorizer \
  --authorizer-name IoTAuthorizer \
  --token allow \
  --token-signature "mE0GvaHqy9nER/
FdgtJX5lXYEJ3b3vE7t1gEszc0TKGgLKWXTnPk2AbKn0AZ8lGyoN5dVtWDWVmr25m7+
+zjbYIMk2TBvyGXh0mvKFBPkdgyA43KL6SiZy0cTq1PMcQDsP7VX2rXr7CTowCxSNKphGXdQe0/
I5dQ+J06KUaHwCmupt0/MejKtaNwiia064j6wpr0AUwG5S1IYFuRd0X
+wfo8pb0DubAIX1Ua705kuhRUcTx4SxUSHEYKmN4IDEvLB6FsIr0B2wvB7y4iPmcajxzG102ExvyCUNctCV9dY1RRGJj
```

Output:

```
{
  "isAuthenticated": true,
  "principalId": "principalId",
  "policyDocuments": [
    {"Version": "2012-10-17", "Statement":
  [{"Action": "iot:Publish", "Effect": "Allow", "Resource": "arn:aws:iot:us-
west-2:123456789012:topic/customauthtesting"}]}]
  },
  "refreshAfterInSeconds": 600,
  "disconnectAfterInSeconds": 3600
}
```

For more information, see [TestInvokeAuthorizer](#) in the *AWS IoT API Reference*.

- For API details, see [TestInvokeAuthorizer](#) in *AWS CLI Command Reference*.

transfer-certificate

The following code example shows how to use `transfer-certificate`.

AWS CLI

To transfer a device certificate to a different AWS account

The following `transfer-certificate` example transfers a device certificate to another AWS account. The certificate and AWS account are identified by ID.

```
aws iot transfer-certificate \
  --certificate-id
488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142 \
  --target-aws-account 030714055129
```

Output:

```
{
  "transferredCertificateArn": "arn:aws:iot:us-
west-2:030714055129:cert/488b6a7f2acdeb00a77384e63c4e40b18b1b3caaae57b7272ba44c45e3448142"
}
```

For more information, see [Transfer a certificate to another account](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [TransferCertificate](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI**To remove a tag key from a resource**

The following `untag-resource` example removes the tag `MyTag` and its value from the thing group `LightBulbs`.

```
command
```

This command produces no output.

For more information, see [Tagging Your AWS IoT Resources](#) in the *AWS IoT Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-account-audit-configuration

The following code example shows how to use `update-account-audit-configuration`.

AWS CLI**Example 1: To enable Amazon SNS notifications for audit notifications**

The following `update-account-audit-configuration` example enables Amazon SNS notifications for AWS IoT Device Defender audit notifications, specifying a target and the role used to write to that target.

```
aws iot update-account-audit-configuration \  
  --audit-notification-target-configurations "SNS={targetArn=\"arn:aws:sns:us-  
west-2:123456789012:ddauids\"},roleArn=\"arn:aws:iam::123456789012:role/service-  
role/AWSIoTDeviceDefenderAudit\"},enabled=true}"
```

This command produces no output.

Example 2: To enable an audit check

The following `update-account-audit-configuration` example enables the AWS IoT Device Defender audit check named `AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK`. You cannot disable an audit check if it is part of the `targetCheckNames` for one or more scheduled audits for the AWS account.

```
aws iot update-account-audit-configuration \  
  --audit-check-configurations  
  "{\"AUTHENTICATED_COGNITO_ROLE_OVERLY_PERMISSIVE_CHECK\":{\"enabled\":true}}"
```

This command produces no output.

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateAccountAuditConfiguration](#) in *AWS CLI Command Reference*.

update-audit-suppression

The following code example shows how to use `update-audit-suppression`.

AWS CLI

To update an audit finding suppression

The following `update-audit-suppression` example updates an audit finding suppression's expiration date to `2020-09-21`.

```
aws iot update-audit-suppression \  
  --check-name DEVICE_CERTIFICATE_EXPIRING_CHECK \  
  --resource-identifier deviceCertificateId=c7691e<shortened> \  
  --no-suppress-indefinitely \  
  --expiration-date 2020-09-21
```

This command produces no output.

For more information, see [Audit finding suppressions](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateAuditSuppression](#) in *AWS CLI Command Reference*.

update-authorizer

The following code example shows how to use `update-authorizer`.

AWS CLI

To update a custom authorizer

The following `update-authorizer` example sets the state of `CustomAuthorizer2` to `INACTIVE`.

```
aws iot update-authorizer \  
  --authorizer-name CustomAuthorizer2 \  
  --status INACTIVE
```

Output:

```
{  
  "authorizerName": "CustomAuthorizer2",  
  "authorizerArn": "arn:aws:iot:us-west-2:123456789012:authorizer/  
CustomAuthorizer2"  
}
```

For more information, see [UpdateAuthorizer](#) in the *AWS IoT API Reference*.

- For API details, see [UpdateAuthorizer](#) in *AWS CLI Command Reference*.

update-billing-group

The following code example shows how to use `update-billing-group`.

AWS CLI

To update information about a billing group

The following `update-billing-group` example updates the description for the specified billing group.

```
aws iot update-billing-group \  
  --billing-group-name GroupOne \  
  --billing-group-properties "billingGroupDescription=\"Primary bulb billing group  
\""
```

Output:

```
{  
  "version": 2  
}
```

For more information, see [Billing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateBillingGroup](#) in *AWS CLI Command Reference*.

update-ca-certificate

The following code example shows how to use `update-ca-certificate`.

AWS CLI

To update a certificate authority (CA) certificate

The following `update-ca-certificate` example sets the specified CA certificate to ACTIVE status.

```
aws iot update-ca-certificate \  
  --certificate-id  
  f4efed62c0142f16af278166f61962501165c4f0536295207426460058cd1467 \  
  --new-status ACTIVE
```

This command produces no output.

For more information, see [UpdateCACertificate](#) in the *AWS IoT API Reference*.

- For API details, see [UpdateCaCertificate](#) in *AWS CLI Command Reference*.

update-certificate

The following code example shows how to use `update-certificate`.

AWS CLI

To update a device certificate

The following `update-certificate` example sets the specified device certificate to INACTIVE status.

```
aws iot update-certificate \  
  --certificate-id  
  d1eb269fb55a628552143c8f96eb3c258fcd5331ea113e766ba0c82bf225f0be \  
  --new-status INACTIVE
```

This command produces no output.

For more information, see [UpdateCertificate](#) in the *AWS IoT API Reference*.

- For API details, see [UpdateCertificate](#) in *AWS CLI Command Reference*.

update-custom-metric

The following code example shows how to use `update-custom-metric`.

AWS CLI

To update a custom metric

The following `update-custom-metric` example updates a custom metric to have a new `display-name`.

```
aws iot update-custom-metric \  
  --metric-name batteryPercentage \  
  --display-name 'remaining battery percentage on device' \  
  --region us-east-1
```

Output:

```
{  
  "metricName": "batteryPercentage",  
  "metricArn": "arn:aws:iot:us-east-1:1234564789012:custommetric/  
batteryPercentage",  
  "metricType": "number",
```

```
"displayName": "remaining battery percentage on device",
"creationDate": "2020-11-17T23:01:35.110000-08:00",
"lastModifiedDate": "2020-11-17T23:02:12.879000-08:00"
}
```

For more information, see [Custom metrics](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [UpdateCustomMetric](#) in *AWS CLI Command Reference*.

update-dimension

The following code example shows how to use update-dimension.

AWS CLI

To update a dimension

The following update-dimension example updates a dimension.

```
aws iot update-dimension \
  --name TopicFilterForAuthMessages \
  --string-values device/${iot:ClientId}/auth
```

Output:

```
{
  "name": "TopicFilterForAuthMessages",
  "lastModifiedDate": 1585866222.317,
  "stringValues": [
    "device/${iot:ClientId}/auth"
  ],
  "creationDate": 1585854500.474,
  "type": "TOPIC_FILTER",
  "arn": "arn:aws:iot:us-west-2:1234564789012:dimension/TopicFilterForAuthMessages"
}
```

For more information, see [Scoping metrics in security profiles using dimensions](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [UpdateDimension](#) in *AWS CLI Command Reference*.

update-domain-configuration

The following code example shows how to use `update-domain-configuration`.

AWS CLI

To update a domain configuration

The following `update-domain-configuration` example disables the specified domain configuration.

```
aws iot update-domain-configuration \  
  --domain-configuration-name "additionalDataDomain" \  
  --domain-configuration-status "DISABLED"
```

Output:

```
{  
  "domainConfigurationName": "additionalDataDomain",  
  "domainConfigurationArn": "arn:aws:iot:us-  
west-2:123456789012:domainconfiguration/additionalDataDomain/dikMh"  
}
```

For more information, see [Configurable Endpoints](#) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateDomainConfiguration](#) in *AWS CLI Command Reference*.

update-dynamic-thing-group

The following code example shows how to use `update-dynamic-thing-group`.

AWS CLI

To update a dynamic thing group

The following `update-dynamic-thing-group` example updates the specified dynamic thing group. It provides a description and updates the query string to change the group membership criteria.

```
aws iot update-dynamic-thing-group \  
  --thing-group-name "RoomTooWarm"
```

```
--thing-group-properties "thingGroupDescription=\"This thing group contains  
rooms warmer than 65F.\" \" \" \  
--query-string "attributes.temperature>65"
```

Output:

```
{  
  "version": 2  
}
```

For more information, see [Dynamic Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateDynamicThingGroup](#) in *AWS CLI Command Reference*.

update-event-configurations

The following code example shows how to use `update-event-configurations`.

AWS CLI

To show which event types are published

The following `update-event-configurations` example updates the configuration to enable messages when the CA certificate is added, updated, or deleted.

```
aws iot update-event-configurations \  
  --event-configurations "{\"CA_CERTIFICATE\":{\"Enabled\":true}}"
```

This command produces no output.

For more information, see [Event Messages](#) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateEventConfigurations](#) in *AWS CLI Command Reference*.

update-indexing-configuration

The following code example shows how to use `update-indexing-configuration`.

AWS CLI

To enable thing indexing

The following `update-indexing-configuration` example enables thing indexing to support searching registry data, shadow data, and thing connectivity status using the `AWS_Things` index.

```
aws iot update-indexing-configuration
  --thing-indexing-configuration
  thingIndexingMode=REGISTRY_AND_SHADOW,thingConnectivityIndexingMode=STATUS
```

This command produces no output.

For more information, see [Managing Thing Indexing](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateIndexingConfiguration](#) in *AWS CLI Command Reference*.

update-job

The following code example shows how to use `update-job`.

AWS CLI

To get detailed status for a job

The following `update-job` example gets detailed status for the job whose ID is `example-job-01`.

```
aws iot describe-job \
  --job-id "example-job-01"
```

Output:

```
{
  "job": {
    "jobArn": "arn:aws:iot:us-west-2:123456789012:job/example-job-01",
    "jobId": "example-job-01",
    "targetSelection": "SNAPSHOT",
    "status": "IN_PROGRESS",
    "targets": [
      "arn:aws:iot:us-west-2:123456789012:thing/MyRaspberryPi"
    ],
    "description": "example job test",
    "presignedUrlConfig": {},
  }
}
```

```

    "jobExecutionsRolloutConfig": {},
    "createdAt": 1560787022.733,
    "lastUpdatedAt": 1560787026.294,
    "jobProcessDetails": {
      "numberOfCanceledThings": 0,
      "numberOfSucceededThings": 0,
      "numberOfFailedThings": 0,
      "numberOfRejectedThings": 0,
      "numberOfQueuedThings": 1,
      "numberOfInProgressThings": 0,
      "numberOfRemovedThings": 0,
      "numberOfTimedOutThings": 0
    },
    "timeoutConfig": {}
  }
}

```

For more information, see [Creating and Managing Jobs \(CLI\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateJob](#) in *AWS CLI Command Reference*.

update-mitigation-action

The following code example shows how to use update-mitigation-action.

AWS CLI

To update a mitigation action

The following update-mitigation-action example updates the specified mitigation action named AddThingsToQuarantineGroupAction, changes the thing group name, and sets overrideDynamicGroups to false. You can verify your changes by using the describe-mitigation-action command.

```

aws iot update-mitigation-action \
  --cli-input-json "{ \"actionName\": \"AddThingsToQuarantineGroupAction\",
  \"actionParams\": { \"addThingsToThingGroupParams\": {\"thingGroupNames\":
  [\"QuarantineGroup2\"],\"overrideDynamicGroups\": false}}}"

```

Output:

```
{
```

```
"actionArn": "arn:aws:iot:us-west-2:123456789012:mitigationaction/
AddThingsToQuarantineGroupAction",
  "actionId": "2fd2726d-98e1-4abf-b10f-09465ccd6bfa"
}
```

For more information, see [UpdateMitigationAction \(Mitigation Action Commands\)](#) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateMitigationAction](#) in *AWS CLI Command Reference*.

update-provisioning-template

The following code example shows how to use `update-provisioning-template`.

AWS CLI

To update a provisioning template

The following `update-provisioning-template` example modifies the description and role arn for the specified provisioning template and enables the template.

```
aws iot update-provisioning-template \
  --template-name widget-template \
  --enabled \
  --description "An updated provisioning template for widgets" \
  --provisioning-role-arn arn:aws:iam::504350838278:role/Provision_role
```

This command produces no output.

For more information, see [AWS IoT Secure Tunneling](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [UpdateProvisioningTemplate](#) in *AWS CLI Command Reference*.

update-role-alias

The following code example shows how to use `update-role-alias`.

AWS CLI

To update a role alias

The following `update-role-alias` example updates the `LightBulbRole` role alias.

```
aws iot update-role-alias \  
  --role-alias LightBulbRole \  
  --role-arn arn:aws:iam::123456789012:role/lightbulbrole-001
```

Output:

```
{  
  "roleAlias": "LightBulbRole",  
  "roleAliasArn": "arn:aws:iot:us-west-2:123456789012:rolealias/LightBulbRole"  
}
```

For more information, see [UpdateRoleAlias](#) in the *AWS IoT API Reference*.

- For API details, see [UpdateRoleAlias](#) in *AWS CLI Command Reference*.

update-scheduled-audit

The following code example shows how to use `update-scheduled-audit`.

AWS CLI

To update a scheduled audit definition

The following `update-scheduled-audit` example changes the target check names for an AWS IoT Device Defender scheduled audit.

```
aws iot update-scheduled-audit \  
  --scheduled-audit-name WednesdayCertCheck \  
  --target-check-names CA_CERTIFICATE_EXPIRING_CHECK  
  DEVICE_CERTIFICATE_EXPIRING_CHECK REVOKED_CA_CERTIFICATE_STILL_ACTIVE_CHECK
```

Output:

```
{  
  "scheduledAuditArn": "arn:aws:iot:us-west-2:123456789012:scheduledaudit/  
  WednesdayCertCheck"  
}
```

For more information, see [Audit Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateScheduledAudit](#) in *AWS CLI Command Reference*.

update-security-profile

The following code example shows how to use update-security-profile.

AWS CLI

To change a security profile

The following update-security-profile example updates both the description and the behaviors for an AWS IoT Device Defender security profile.

```
aws iot update-security-profile \
  --security-profile-name PossibleIssue \
  --security-profile-description "Check to see if authorization fails 12 times in
  5 minutes or if cellular bandwidth exceeds 128" \
  --behaviors "[{\\"name\\":\\"CellularBandwidth\\",\\"metric\\":\\"aws:message-byte-size
  \",\\"criteria\\":{\\"comparisonOperator\\":\\"greater-than\\",\\"value\\":{\\"count\\":128},
  \\"consecutiveDatapointsToAlarm\\":1,\\"consecutiveDatapointsToClear\\":1}},{\\"name
  \":\\"Authorization\\",\\"metric\\":\\"aws:num-authorization-failures\\",\\"criteria\\":
  {\\"comparisonOperator\\":\\"less-than\\",\\"value\\":{\\"count\\":12},\\"durationSeconds
  \":300,\\"consecutiveDatapointsToAlarm\\":1,\\"consecutiveDatapointsToClear\\":1}}]"
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateSecurityProfile](#) in *AWS CLI Command Reference*.

update-stream

The following code example shows how to use `update-stream`.

AWS CLI

To update a stream

The following `update-stream` example updates an existing stream. The stream version is incremented by one.

```
aws iot update-stream \
  --cli-input-json file://update-stream.json
```

Contents of `update-stream.json`:

```
{
  "streamId": "stream12345",
  "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
  "files": [
```

```

    {
      "fileId": 123,
      "s3Location": {
        "bucket": "codesign-ota-bucket",
        "key": "48c67f3c-63bb-4f92-a98a-4ee0fbc2bef6"
      }
    }
  ]
  "roleArn": "arn:aws:iam:us-west-2:123456789012:role/service-role/my_ota_stream_role"
}

```

Output:

```

{
  "streamId": "stream12345",
  "streamArn": "arn:aws:iot:us-west-2:123456789012:stream/stream12345",
  "description": "This stream is used for Amazon FreeRTOS OTA Update 12345.",
  "streamVersion": 2
}

```

For more information, see [UpdateStream](#) in the *AWS IoT API Reference*.

- For API details, see [UpdateStream](#) in *AWS CLI Command Reference*.

update-thing-group

The following code example shows how to use `update-thing-group`.

AWS CLI**To update the definition for a thing group**

The following `update-thing-group` example updates the definition for the specified thing group, changing the description and two attributes.

```

aws iot update-thing-group \
  --thing-group-name HalogenBulbs \
  --thing-group-properties "thingGroupDescription=\"Halogen bulb group\"",
  attributePayload={attributes={Manufacturer=AnyCompany,wattage=60}}"

```

Output:

```
{
  "version": 2
}
```

For more information, see [Thing Groups](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateThingGroup](#) in *AWS CLI Command Reference*.

update-thing-groups-for-thing

The following code example shows how to use `update-thing-groups-for-thing`.

AWS CLI

To change the groups to which a thing belongs

The following `update-thing-groups-for-thing` example removes the thing named `MyLightBulb` from the group named `DeadBulbs` and adds it to the group named `replaceableItems` at the same time.

```
aws iot update-thing-groups-for-thing \
  --thing-name MyLightBulb \
  --thing-groups-to-add "replaceableItems" \
  --thing-groups-to-remove "DeadBulbs"
```

This command produces no output.

For more information, see [Thing Groups](#) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateThingGroupsForThing](#) in *AWS CLI Command Reference*.

update-thing

The following code example shows how to use `update-thing`.

AWS CLI

To associate a thing with a thing type

The following `update-thing` example associates a thing in the AWS IoT registry with a thing type. When you make the association, you provide values for the attributes defined by the thing type.

```
aws iot update-thing \  
  --thing-name "MyOtherLightBulb" \  
  --thing-type-name "LightBulb" \  
  --attribute-payload '{"attributes": {"wattage": "75", "model": "123"}}'
```

This command does not produce output. Use the `describe-thing` command to see the result.

For more information, see [Thing Types](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateThing](#) in *AWS CLI Command Reference*.

update-topic-rule-destination

The following code example shows how to use `update-topic-rule-destination`.

AWS CLI

Example 1: To enable a topic rule destination

The following `update-topic-rule-destination` example enables traffic to a topic rule destination.

```
aws iot update-topic-rule-destination \  
  --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/  
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \  
  --status ENABLED
```

This command produces no output.

For more information, see [Enabling a topic rule destination](#) in the *AWS IoT Developer Guide*.

Example 2: To disable a topic rule destination

The following `update-topic-rule-destination` example disables traffic to a topic rule destination.

```
aws iot update-topic-rule-destination \  
  --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/  
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \  
  --status DISABLED
```

This command produces no output.

For more information, see [Disabling a topic rule destination](#) in the *AWS IoT Developer Guide*.

Example 3: To send a new confirmation message

The following `update-topic-rule-destination` example sends a new confirmation message for a topic rule destination.

```
aws iot update-topic-rule-destination \  
  --arn "arn:aws:iot:us-west-2:123456789012:ruledestination/http/  
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \  
  --status IN_PROGRESS
```

This command produces no output.

For more information, see [Sending a new confirmation message](#) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateTopicRuleDestination](#) in *AWS CLI Command Reference*.

validate-security-profile-behaviors

The following code example shows how to use `validate-security-profile-behaviors`.

AWS CLI

Example 1: To validate the behaviors parameters for a security profile

The following `validate-security-profile-behaviors` example validates a well-formed and correct set of behaviors for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors \  
  --behaviors "[{"name":"CellularBandwidth","metric":"aws:message-byte-size",  
,"criteria":{"comparisonOperator":"greater-than","value":{"count":128},  
"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}}, {"name  
":"Authorization","metric":"aws:num-authorization-failures","criteria":  
{"comparisonOperator":"greater-than","value":{"count":12},"durationSeconds  
":300,"consecutiveDatapointsToAlarm":1,"consecutiveDatapointsToClear":1}]]"
```

Output:

```
{  
  "valid": true,
```

```
"validationErrors": []
}
```

Example 2: To validate incorrect behaviors parameters for a security profile

The following `validate-security-profile-behaviors` example validates a set of behaviors that contains an error for an AWS IoT Device Defender security profile.

```
aws iot validate-security-profile-behaviors \
  --behaviors "[{\\"name\\":\\"CellularBandwidth\\",\\"metric\\":\\"aws:message-byte-size\\",\\"criteria\\":{\\"comparisonOperator\\":\\"greater-than\\",\\"value\\":{\\"count\\":128},\\"consecutiveDatapointsToAlarm\\":1,\\"consecutiveDatapointsToClear\\":1}},{\\"name\\":\\"Authorization\\",\\"metric\\":\\"aws:num-authorization-failures\\",\\"criteria\\":{\\"comparisonOperator\\":\\"greater-than\\",\\"value\\":{\\"count\\":12},\\"durationSeconds\\":300,\\"consecutiveDatapointsToAlarm\\":100000,\\"consecutiveDatapointsToClear\\":1}}]"
```

Output:

```
{
  "valid": false,
  "validationErrors": [
    {
      "errorMessage": "Behavior Authorization is malformed.
consecutiveDatapointsToAlarm 100000 should be in range[1,10]"
    }
  ]
}
```

For more information, see [Detect Commands](#) in the *AWS IoT Developer Guide*.

- For API details, see [ValidateSecurityProfileBehaviors](#) in *AWS CLI Command Reference*.

AWS IoT 1-Click Devices examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT 1-Click Devices.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

- [Actions](#)

Actions

claim-devices-by-claim-code

The following code example shows how to use `claim-devices-by-claim-code`.

AWS CLI

To claim one or more AWS IoT 1-Click devices using a claim code

The following `claim-devices-by-claim-code` example claims the specified AWS IoT 1-Click device using a claim code (instead of a device ID).

```
aws iot1click-devices claim-devices-by-claim-code \  
  --claim-code C-123EXAMPLE
```

Output:

```
{  
  "Total": 9  
  "ClaimCode": "C-123EXAMPLE"  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [ClaimDevicesByClaimCode](#) in *AWS CLI Command Reference*.

describe-device

The following code example shows how to use `describe-device`.

AWS CLI

To describe a device

The following describe-device example describes the specified device.

```
aws iot1click-devices describe-device \  
  --device-id G030PM0123456789
```

Output:

```
{  
  "DeviceDescription": {  
    "Arn": "arn:aws:iot1click:us-west-2:012345678901:devices/G030PM0123456789",  
    "Attributes": {  
      "projectRegion": "us-west-2",  
      "projectName": "AnytownDumpsters",  
      "placementName": "customer217",  
      "deviceTemplateName": "empty-dumpster-request"  
    },  
    "DeviceId": "G030PM0123456789",  
    "Enabled": false,  
    "RemainingLife": 99.9,  
    "Type": "button",  
    "Tags": {}  
  }  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [DescribeDevice](#) in *AWS CLI Command Reference*.

finalize-device-claim

The following code example shows how to use finalize-device-claim.

AWS CLI

To finalize a claim request for an AWS IoT 1-Click device using a device ID

The following finalize-device-claim example finalizes a claim request for the specified AWS IoT 1-Click device using a device ID (instead of a claim code).

```
aws iot1click-devices finalize-device-claim \  
  --device-id G030PM0123456789
```

Output:

```
{  
  "State": "CLAIMED"  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [FinalizeDeviceClaim](#) in *AWS CLI Command Reference*.

get-device-methods

The following code example shows how to use `get-device-methods`.

AWS CLI

To list the available methods for a device

The following `get-device-methods` example lists the available methods for a device.

```
aws iot1click-devices get-device-methods \  
  --device-id G030PM0123456789
```

Output:

```
{  
  "DeviceMethods": [  
    {  
      "MethodName": "getDeviceHealthParameters"  
    },  
    {  
      "MethodName": "setDeviceHealthMonitorCallback"  
    },  
    {  
      "MethodName": "getDeviceHealthMonitorCallback"  
    },  
    {
```

```
        "MethodName": "setOnClickCallback"
      },
      {
        "MethodName": "getOnClickCallback"
      }
    ]
  }
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [GetDeviceMethods](#) in *AWS CLI Command Reference*.

initiate-device-claim

The following code example shows how to use `initiate-device-claim`.

AWS CLI

To initiate a claim request for an AWS IoT 1-Click device using a device ID

The following `initiate-device-claim` example initiates a claim request for the specified AWS IoT 1-Click device using a device ID (instead of a claim code).

```
aws iot1click-devices initiate-device-claim \
  --device-id G030PM0123456789
```

Output:

```
{
  "State": "CLAIM_INITIATED"
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [InitiateDeviceClaim](#) in *AWS CLI Command Reference*.

invoke-device-method

The following code example shows how to use `invoke-device-method`.

AWS CLI

To invoke a device method on a device

The following `invoke-device-method` example invokes the specified method on a device.

```
aws iot1click-devices invoke-device-method \  
  --cli-input-json file://invoke-device-method.json
```

Contents of `invoke-device-method.json`:

```
{  
  "DeviceId": "G030PM0123456789",  
  "DeviceMethod": {  
    "DeviceType": "device",  
    "MethodName": "getDeviceHealthParameters"  
  }  
}
```

Output:

```
{  
  "DeviceMethodResponse": "{\"remainingLife\": 99.8}"  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [InvokeDeviceMethod](#) in *AWS CLI Command Reference*.

list-device-events

The following code example shows how to use `list-device-events`.

AWS CLI

To list a device's events for a specified time range

The following `list-device-events` example lists the specified device's events for the specified time range.

```
aws iot1click-devices list-device-events \  
  --device-id G030PM0123456789 \  
  --from-time-stamp 2019-07-17T15:45:12.880Z --to-time-stamp  
  2019-07-19T15:45:12.880Z
```

Output:

```
{  
  "Events": [  
    {  
      "Device": {  
        "Attributes": {},  
        "DeviceId": "G030PM0123456789",  
        "Type": "button"  
      },  
      "StdEvent": "{\\"clickType\\": \\"SINGLE\\",  
        \\"reportedTime\\": \\"2019-07-18T23:47:55.015Z\\", \\"certificateId\\":  
        \\"fe8798a6c97c62ef8756b80eeefdcf2280f3352f82faa8080c74cc4f4a4d1811\\",  
        \\"remainingLife\\": 99.850000000000001, \\"testMode\\": false}"  
    },  
    {  
      "Device": {  
        "Attributes": {},  
        "DeviceId": "G030PM0123456789",  
        "Type": "button"  
      },  
      "StdEvent": "{\\"clickType\\": \\"DOUBLE\\",  
        \\"reportedTime\\": \\"2019-07-19T00:14:41.353Z\\", \\"certificateId\\":  
        \\"fe8798a6c97c62ef8756b80eeefdcf2280f3352f82faa8080c74cc4f4a4d1811\\",  
        \\"remainingLife\\": 99.8, \\"testMode\\": false}"  
    }  
  ]  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [ListDeviceEvents](#) in *AWS CLI Command Reference*.

list-devices

The following code example shows how to use `list-devices`.

AWS CLI

To list the devices of a specified type

The following `list-devices` example lists the devices of a specified type.

```
aws iot1click-devices list-devices \  
  --device-type button
```

This command produces no output.

Output:

```
{  
  "Devices": [  
    {  
      "remainingLife": 99.9,  
      "attributes": {  
        "arn": "arn:aws:iot1click:us-west-2:123456789012:devices/  
G030PM0123456789",  
        "type": "button",  
        "deviceId": "G030PM0123456789",  
        "enabled": false  
      }  
    }  
  ]  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [ListDevices](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a device

The following `list-tags-for-resource` example list the tags for the specified device.

```
aws iot1click-devices list-tags-for-resource \  
  --resource-arn "arn:aws:iot1click:us-west-2:012345678901:devices/  
G030PM0123456789"
```

Output:

```
{  
  "Tags": {  
    "Driver Phone": "123-555-0199",  
    "Driver": "Jorge Souza"  
  }  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a device AWS resource

The following tag-resource example adds two tags to the specified resource.

```
aws iot1click-devices tag-resource \  
  --cli-input-json file://devices-tag-resource.json
```

Contents of devices-tag-resource.json:

```
{  
  "ResourceArn": "arn:aws:iot1click:us-west-2:123456789012:devices/  
G030PM0123456789",  
  "Tags": {  
    "Driver": "Jorge Souza",  
    "Driver Phone": "123-555-0199"  
  }  
}
```

```
}
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

unclaim-device

The following code example shows how to use unclaim-device.

AWS CLI

To unclaim (deregister) a device from your AWS account

The following unclaim-device example unclaims (deregisters) the specified device from your AWS account.

```
aws iot1click-devices unclaim-device \  
  --device-id G030PM0123456789
```

Output:

```
{  
  "State": "UNCLAIMED"  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [UnclaimDevice](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a device AWS resource

The following `untag-resource` example removes the tags with the names `Driver Phone` and `Driver` from the specified device resource.

```
aws iot1click-devices untag-resource \  
  --resource-arn "arn:aws:iot1click:us-west-2:123456789012:projects/  
AnytownDumpsters" \  
  --tag-keys "Driver Phone" "Driver"
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-device-state

The following code example shows how to use `update-device-state`.

AWS CLI

To update the `enabled` state for a device

The following `update-device-state` sets the state of the specified device to `enabled`.

```
aws iot1click-devices update-device-state \  
  --device-id G030PM0123456789 \  
  --enabled
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [UpdateDeviceState](#) in *AWS CLI Command Reference*.

AWS IoT 1-Click Projects examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT 1-Click Projects.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

associate-device-with-placement

The following code example shows how to use `associate-device-with-placement`.

AWS CLI

To associate an AWS IoT 1-Click device with an existing placement

The following `associate-device-with-placement` example associates the specified AWS IoT 1-Click device with an existing placement.

```
aws iot1click-projects associate-device-with-placement \  
  --project-name AnytownDumpsters \  
  --placement-name customer217 \  
  --device-template-name empty-dumpster-request \  
  --device-id G030PM0123456789
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [AssociateDeviceWithPlacement](#) in *AWS CLI Command Reference*.

create-placement

The following code example shows how to use `create-placement`.

AWS CLI

To create an AWS IoT 1-Click placement for a project

The following `create-placement` example create an AWS IoT 1-Click placement for the specified project.

```
aws iot1click-projects create-placement \  
  --project-name AnytownDumpsters \  
  --placement-name customer217 \  
  --attributes '{"location": "123 Any Street Anytown, USA 10001", "phone":  
  "123-456-7890"}'
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [CreatePlacement](#) in *AWS CLI Command Reference*.

create-project

The following code example shows how to use `create-project`.

AWS CLI

To create an AWS IoT 1-Click project for zero or more placements

The following `create-project` example creates an AWS IoT 1-Click project for a placement.

```
aws iot1click-projects create-project --cli-input-json file://create-project.json
```

Contents of `create-project.json`:

```
{  
  "projectName": "AnytownDumpsters",  
  "description": "All dumpsters in the Anytown region.",  
  "placementTemplate": {  
    "defaultAttributes": {  
      "City" : "Anytown"  
    },  
    "deviceTemplates": {  
      "empty-dumpster-request" : {
```

```
        "deviceType": "button"
      }
    }
  }
}
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [CreateProject](#) in *AWS CLI Command Reference*.

delete-placement

The following code example shows how to use delete-placement.

AWS CLI

To delete a placement from a project

The following delete-placement example deletes the specified placement from a project.

```
aws iot1click-projects delete-placement \
  --project-name AnytownDumpsters \
  --placement-name customer217
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [DeletePlacement](#) in *AWS CLI Command Reference*.

delete-project

The following code example shows how to use delete-project.

AWS CLI

To delete a project from your AWS account

The following delete-project example deletes the specified project from your AWS account.

```
aws iot1click-projects delete-project \  
  --project-name AnytownDumpsters
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [DeleteProject](#) in *AWS CLI Command Reference*.

describe-placement

The following code example shows how to use describe-placement.

AWS CLI

To describe a placement for a project

The following describe-placement example describes a placement for the specified project.

```
aws iot1click-projects describe-placement \  
  --project-name AnytownDumpsters \  
  --placement-name customer217
```

Output:

```
{  
  "placement": {  
    "projectName": "AnytownDumpsters",  
    "placementName": "customer217",  
    "attributes": {  
      "phone": "123-555-0110",  
      "location": "123 Any Street Anytown, USA 10001"  
    },  
    "createdDate": 1563488454,  
    "updatedAt": 1563488454  
  }  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [DescribePlacement](#) in *AWS CLI Command Reference*.

describe-project

The following code example shows how to use `describe-project`.

AWS CLI

To describe an AWS IoT 1-Click project

The following `describe-project` example describes the specified AWS IoT 1-Click project.

```
aws iot1click-projects describe-project \  
  --project-name AnytownDumpsters
```

Output:

```
{  
  "project": {  
    "arn": "arn:aws:iot1click:us-west-2:012345678901:projects/AnytownDumpsters",  
    "projectName": "AnytownDumpsters",  
    "description": "All dumpsters in the Anytown region.",  
    "createdDate": 1563483100,  
    "updatedAt": 1563483100,  
    "placementTemplate": {  
      "defaultAttributes": {  
        "City": "Anytown"  
      },  
      "deviceTemplates": {  
        "empty-dumpster-request": {  
          "deviceType": "button",  
          "callbackOverrides": {}  
        }  
      }  
    },  
    "tags": {}  
  }  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [DescribeProject](#) in *AWS CLI Command Reference*.

disassociate-device-from-placement

The following code example shows how to use `disassociate-device-from-placement`.

AWS CLI

To disassociate a device from a placement

The following `disassociate-device-from-placement` example disassociates the specified device from a placement.

```
aws iot1click-projects disassociate-device-from-placement \  
  --project-name AnytownDumpsters \  
  --placement-name customer217 \  
  --device-template-name empty-dumpster-request
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [DisassociateDeviceFromPlacement](#) in *AWS CLI Command Reference*.

get-devices-in-placement

The following code example shows how to use `get-devices-in-placement`.

AWS CLI

To list all devices in a placement contained in a project

The following `get-devices-in-placement` example lists all devices in a the specified placement contained in the specified project.

```
aws iot1click-projects get-devices-in-placement \  
  --project-name AnytownDumpsters \  
  --placement-name customer217
```

Output:

```
{
  "devices": {
    "empty-dumpster-request": "G030PM0123456789"
  }
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [GetDevicesInPlacement](#) in *AWS CLI Command Reference*.

list-placements

The following code example shows how to use `list-placements`.

AWS CLI

To list all AWS IoT 1-Click placements for a project

The following `list-placements` example lists all AWS IoT 1-Click placements for the specified project.

```
aws iot1click-projects list-placements \
  --project-name AnytownDumpsters
```

Output:

```
{
  "placements": [
    {
      "projectName": "AnytownDumpsters",
      "placementName": "customer217",
      "createdDate": 1563488454,
      "updatedAt": 1563488454
    }
  ]
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [ListPlacements](#) in *AWS CLI Command Reference*.

list-projects

The following code example shows how to use `list-projects`.

AWS CLI

To list all AWS IoT 1-Click projects

The following `list-projects` example list all AWS IoT 1-Click projects in your account.

```
aws iot1click-projects list-projects
```

Output:

```
{
  "projects": [
    {
      "arn": "arn:aws:iot1click:us-west-2:012345678901:projects/
AnytownDumpsters",
      "projectName": "AnytownDumpsters",
      "createdDate": 1563483100,
      "updatedAt": 1563483100,
      "tags": {}
    }
  ]
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [ListProjects](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a project resource

The following `list-tags-for-resource` example list the tags for the specified project resource.

```
aws iot1click-projects list-tags-for-resource \  
  --resource-arn "arn:aws:iot1click:us-west-2:123456789012:projects/  
AnytownDumpsters"
```

Output:

```
{  
  "tags": {  
    "Manager": "Li Juan",  
    "Account": "45215"  
  }  
}
```

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a project resource

The following tag-resource example adds two tags to the specified project resource.

```
aws iot1click-projects tag-resource \  
  --cli-input-json file://devices-tag-resource.json
```

Contents of devices-tag-resource.json:

```
{  
  "resourceArn": "arn:aws:iot1click:us-west-2:123456789012:projects/  
AnytownDumpsters",  
  "tags": {  
    "Account": "45215",  
    "Manager": "Li Juan"  
  }  
}
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use untag-resource.

AWS CLI

To remove tags from a project resource

The following untag-resource example removes the tag with the key name Manager from the specified project.

```
aws iot1click-projects untag-resource \  
  --resource-arn "arn:aws:iot1click:us-west-2:123456789012:projects/  
AnytownDumpsters" \  
  --tag-keys "Manager"
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-placement

The following code example shows how to use update-placement.

AWS CLI

To update the "attributes" key-value pairs of a placement

The following update-placement example update the "attributes" key-value pairs of a placement.

```
aws iot1click-projects update-placement \  

```

```
--cli-input-json file://update-placement.json
```

Contents of `update-placement.json`:

```
{
  "projectName": "AnytownDumpsters",
  "placementName": "customer217",
  "attributes": {
    "phone": "123-456-7890",
    "location": "123 Any Street Anytown, USA 10001"
  }
}
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [UpdatePlacement](#) in *AWS CLI Command Reference*.

update-project

The following code example shows how to use `update-project`.

AWS CLI

To update settings for a project

The following `update-project` example updates the description for a project.

```
aws iot1click-projects update-project \
  --project-name AnytownDumpsters \
  --description "All dumpsters (yard waste, recycling, garbage) in the Anytown
region."
```

This command produces no output.

For more information, see [Using AWS IoT 1-Click with the AWS CLI](#) in the *AWS IoT 1-Click Developer Guide*.

- For API details, see [UpdateProject](#) in *AWS CLI Command Reference*.

AWS IoT Analytics examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Analytics.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

batch-put-message

The following code example shows how to use `batch-put-message`.

AWS CLI

To send a message to a channel

The following `batch-put-message` example sends a message to the specified channel.

```
aws iotanalytics batch-put-message \  
  --cli-binary-format raw-in-base64-out \  
  --cli-input-json file://batch-put-message.json
```

Contents of `batch-put-message.json`:

```
{  
  "channelName": "mychannel",  
  "messages": [  
    {  
      "messageId": "0001",  
      "payload": "eyJhdGVtcGVyYXR1cmUiOiAyMCMCB9"
```

```
    }  
  ]  
}
```

Output:

```
{  
  "batchPutMessageErrorEntries": []  
}
```

For more information, see [BatchPutMessage](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [BatchPutMessage](#) in *AWS CLI Command Reference*.

cancel-pipeline-reprocessing

The following code example shows how to use `cancel-pipeline-reprocessing`.

AWS CLI

To cancel the reprocessing of data through a pipeline

The following `cancel-pipeline-reprocessing` example cancels the reprocessing of data through the specified pipeline.

```
aws iotanalytics cancel-pipeline-reprocessing \  
  --pipeline-name mypipeline \  
  --reprocessing-id "6ad2764f-fb13-4de3-b101-4e74af03b043"
```

This command produces no output.

For more information, see [CancelPipelineReprocessing](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [CancelPipelineReprocessing](#) in *AWS CLI Command Reference*.

create-channel

The following code example shows how to use `create-channel`.

AWS CLI

To create a channel

The following `create-channel` example creates a channel with the specified configuration. A channel collects data from an MQTT topic and archives the raw, unprocessed messages before publishing the data to a pipeline.

```
aws iotanalytics create-channel \  
  --cli-input-json file://create-channel.json
```

Contents of `create-channel.json`:

```
{  
  "channelName": "mychannel",  
  "retentionPeriod": {  
    "unlimited": true  
  },  
  "tags": [  
    {  
      "key": "Environment",  
      "value": "Production"  
    }  
  ]  
}
```

Output:

```
{  
  "channelArn": "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel",  
  "channelName": "mychannel",  
  "retentionPeriod": {  
    "unlimited": true  
  }  
}
```

For more information, see [CreateChannel](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [CreateChannel](#) in *AWS CLI Command Reference*.

create-dataset-content

The following code example shows how to use `create-dataset-content`.

AWS CLI

To create the content of a dataset

The following `create-dataset-content` example creates the content of the specified dataset by applying a `queryAction` (an SQL query) or a `containerAction` (executing a containerized application).

```
aws iotanalytics create-dataset-content \  
  --dataset-name mydataset
```

Output:

```
{  
  "versionId": "d494b416-9850-4670-b885-ca22f1e89d62"  
}
```

For more information, see [CreateDatasetContent](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [CreateDatasetContent](#) in *AWS CLI Command Reference*.

create-dataset

The following code example shows how to use `create-dataset`.

AWS CLI

To create a dataset

The following `create-dataset` example creates a dataset. A dataset stores data retrieved from a data store by applying a `queryAction` (a SQL query) or a `containerAction` (executing a containerized application). This operation creates the skeleton of a dataset. You can populate the dataset manually by calling `CreateDatasetContent` or automatically according to a `trigger` you specify.

```
aws iotanalytics create-dataset \  
  --cli-input-json file://create-dataset.json
```

Contents of `create-dataset.json`:

```
{
  "datasetName": "mydataset",
  "actions": [
    {
      "actionName": "myDatasetAction",
      "queryAction": {
        "sqlQuery": "SELECT * FROM mydatastore"
      }
    }
  ],
  "retentionPeriod": {
    "unlimited": true
  },
  "tags": [
    {
      "key": "Environment",
      "value": "Production"
    }
  ]
}
```

Output:

```
{
  "datasetName": "mydataset",
  "retentionPeriod": {
    "unlimited": true
  },
  "datasetArn": "arn:aws:iotanalytics:us-west-2:123456789012:dataset/mydataset"
}
```

For more information, see [CreateDataset](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [CreateDataset](#) in *AWS CLI Command Reference*.

create-datastore

The following code example shows how to use create-datastore.

AWS CLI

To create a data store

The following `create-datastore` example creates a data store, which is a repository for messages.

```
aws iotanalytics create-datastore \  
  --cli-input-json file://create-datastore.json
```

Contents of `create-datastore.json`:

```
{  
  "datastoreName": "mydatastore",  
  "retentionPeriod": {  
    "numberOfDays": 90  
  },  
  "tags": [  
    {  
      "key": "Environment",  
      "value": "Production"  
    }  
  ]  
}
```

Output:

```
{  
  "datastoreName": "mydatastore",  
  "datastoreArn": "arn:aws:iotanalytics:us-west-2:123456789012:datastore/  
mydatastore",  
  "retentionPeriod": {  
    "numberOfDays": 90,  
    "unlimited": false  
  }  
}
```

For more information, see [CreateDatastore](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [CreateDatastore](#) in *AWS CLI Command Reference*.

create-pipeline

The following code example shows how to use `create-pipeline`.

AWS CLI

Create an IoT Analytics Pipeline

The following `create-pipeline` example creates a pipeline. A pipeline consumes messages from a channel and allows you to process the messages before storing them in a data store. You must specify both a channel and a data store activity and, optionally, as many as 23 additional activities in the `pipelineActivities` array.

```
aws iotanalytics create-pipeline \  
  --cli-input-json file://create-pipeline.json
```

Contents of `create-pipeline.json`:

```
{  
  "pipelineName": "mypipeline",  
  "pipelineActivities": [  
    {  
      "channel": {  
        "name": "myChannelActivity",  
        "channelName": "mychannel",  
        "next": "myMathActivity"  
      }  
    },  
    {  
      "datastore": {  
        "name": "myDatastoreActivity",  
        "datastoreName": "mydatastore"  
      }  
    },  
    {  
      "math": {  
        "name": "myMathActivity",  
        "math": "((temp - 32) * 5.0) / 9.0",  
        "attribute": "tempC",  
        "next": "myDatastoreActivity"  
      }  
    }  
  ],  
  "tags": [  
    {  
      "key": "Environment",  
      "value": "Beta"  
    }  
  ]  
}
```

```
    }  
  ]  
}
```

Output:

```
{  
  "pipelineArn": "arn:aws:iotanalytics:us-west-2:123456789012:pipeline/  
mypipeline",  
  "pipelineName": "mypipeline"  
}
```

For more information, see [CreatePipeline](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [CreatePipeline](#) in *AWS CLI Command Reference*.

delete-channel

The following code example shows how to use `delete-channel`.

AWS CLI

Delete an IoT Analytics Channel

The following `delete-channel` example deletes the specified channel.

```
aws iotanalytics delete-channel \  
  --channel-name mychannel
```

This command produces no output.

For more information, see [DeleteChannel](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DeleteChannel](#) in *AWS CLI Command Reference*.

delete-dataset-content

The following code example shows how to use `delete-dataset-content`.

AWS CLI

To delete dataset content

The following `delete-dataset-content` example deletes the content of the specified dataset.

```
aws iotanalytics delete-dataset-content \  
  --dataset-name mydataset
```

This command produces no output.

For more information, see [DeleteDatasetContent](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DeleteDatasetContent](#) in *AWS CLI Command Reference*.

delete-dataset

The following code example shows how to use `delete-dataset`.

AWS CLI

To delete a dataset

The following `delete-dataset` example deletes the specified dataset. You don't have to delete the content of the dataset before you perform this operation.

```
aws iotanalytics delete-dataset \  
  --dataset-name mydataset
```

This command produces no output.

For more information, see [DeleteDataset](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DeleteDataset](#) in *AWS CLI Command Reference*.

delete-datastore

The following code example shows how to use `delete-datastore`.

AWS CLI

To delete a data store

The following `delete-datastore` example deletes the specified data store.

```
aws iotanalytics delete-datastore \  
  --datastore-name mydatastore
```

This command produces no output.

For more information, see [DeleteDatastore](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DeleteDatastore](#) in *AWS CLI Command Reference*.

delete-pipeline

The following code example shows how to use `delete-pipeline`.

AWS CLI

To delete a pipeline

The following `delete-pipeline` example deletes the specified pipeline.

```
aws iotanalytics delete-pipeline \  
  --pipeline-name mypipeline
```

This command produces no output.

For more information, see [DeletePipeline](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DeletePipeline](#) in *AWS CLI Command Reference*.

describe-channel

The following code example shows how to use `describe-channel`.

AWS CLI

To retrieve information about a channel

The following `describe-channel` example displays details, including statistics, for the specified channel.

```
aws iotanalytics describe-channel \  
  --channel-name mychannel \  
  --include-statistics
```

Output:

```
{
  "statistics": {
    "size": {
      "estimatedSizeInBytes": 402.0,
      "estimatedOn": 1561504380.0
    }
  },
  "channel": {
    "status": "ACTIVE",
    "name": "mychannel",
    "lastUpdateTime": 1557860351.001,
    "creationTime": 1557860351.001,
    "retentionPeriod": {
      "unlimited": true
    },
    "arn": "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel"
  }
}
```

For more information, see [DescribeChannel](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DescribeChannel](#) in *AWS CLI Command Reference*.

describe-dataset

The following code example shows how to use `describe-dataset`.

AWS CLI**To retrieve information about a dataset**

The following `describe-dataset` example displays details for the specified dataset.

```
aws iotanalytics describe-dataset \
  --dataset-name mydataset
```

Output:

```
{
  "dataset": {
```

```
"status": "ACTIVE",
"contentDeliveryRules": [],
"name": "mydataset",
"lastUpdateTime": 1557859240.658,
"triggers": [],
"creationTime": 1557859240.658,
"actions": [
  {
    "actionName": "query_32",
    "queryAction": {
      "sqlQuery": "SELECT * FROM mydatastore",
      "filters": []
    }
  }
],
"retentionPeriod": {
  "numberOfDays": 90,
  "unlimited": false
},
"arn": "arn:aws:iotanalytics:us-west-2:123456789012:dataset/mydataset"
}
```

For more information, see [DescribeDataset](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DescribeDataset](#) in *AWS CLI Command Reference*.

describe-datastore

The following code example shows how to use describe-datastore.

AWS CLI

To retrieve information about a data store

The following describe-datastore example displays details, including statistics, for the specified data store.

```
aws iotanalytics describe-datastore \
  --datastore-name mydatastore \
  --include-statistics
```

Output:

```
{
  "datastore": {
    "status": "ACTIVE",
    "name": "mydatastore",
    "lastUpdateTime": 1557858971.02,
    "creationTime": 1557858971.02,
    "retentionPeriod": {
      "unlimited": true
    },
    "arn": "arn:aws:iotanalytics:us-west-2:123456789012:datastore/mydatastore"
  },
  "statistics": {
    "size": {
      "estimatedSizeInBytes": 397.0,
      "estimatedOn": 1561592040.0
    }
  }
}
```

For more information, see [DescribeDatastore](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DescribeDatastore](#) in *AWS CLI Command Reference*.

describe-logging-options

The following code example shows how to use `describe-logging-options`.

AWS CLI

To retrieve the current logging options

The following `describe-logging-options` example displays the current AWS IoT Analytics logging options.

```
aws iotanalytics describe-logging-options
```

This command produces no output. Output:

```
{
  "loggingOptions": {
    "roleArn": "arn:aws:iam::123456789012:role/service-role/myIoTAnalyticsRole",
    "enabled": true,
  }
}
```

```
    "level": "ERROR"
  }
}
```

For more information, see [DescribeLoggingOptions](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DescribeLoggingOptions](#) in *AWS CLI Command Reference*.

describe-pipeline

The following code example shows how to use `describe-pipeline`.

AWS CLI

To retrieve information about a pipeline

The following `describe-pipeline` example displays details for the specified pipeline.

```
aws iotanalytics describe-pipeline \  
  --pipeline-name mypipeline
```

Output:

```
{  
  "pipeline": {  
    "activities": [  
      {  
        "channel": {  
          "channelName": "mychannel",  
          "name": "mychannel_28",  
          "next": "mydatastore_29"  
        }  
      },  
      {  
        "datastore": {  
          "datastoreName": "mydatastore",  
          "name": "mydatastore_29"  
        }  
      }  
    ],  
    "name": "mypipeline",  
    "lastUpdateTime": 1561676362.515,  
    "creationTime": 1557859124.432,  
  }  
}
```

```
    "reprocessingSummaries": [
      {
        "status": "SUCCEEDED",
        "creationTime": 1561676362.189,
        "id": "6ad2764f-fb13-4de3-b101-4e74af03b043"
      }
    ],
    "arn": "arn:aws:iotanalytics:us-west-2:123456789012:pipeline/mypipeline"
  }
}
```

For more information, see [DescribePipeline](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [DescribePipeline](#) in *AWS CLI Command Reference*.

get-dataset-content

The following code example shows how to use `get-dataset-content`.

AWS CLI

To retrieve the contents of a dataset

The following `get-dataset-content` example retrieves the contents of a dataset as presigned URIs.

```
aws iotanalytics get-dataset-content --dataset-name mydataset
```

Output:

```
{
  "status": {
    "state": "SUCCEEDED"
  },
  "timestamp": 1557863215.995,
  "entries": [
    {
      "dataURI": "https://aws-radiant-
dataset-12345678-1234-1234-1234-123456789012.s3.us-west-2.amazonaws.com/

Algorithm=AWS4-HMAC-SHA256&X-Amz-Date=20190628T173437Z&X-Amz-SignedHeaders=host&X-
Amz-Expires=7200&X-Amz-Credential=...F20190628%2Fus-west-2%2Fs3%2Faws4_request&X-
Amz-Signature=..."
    }
  ]
}
```

```
    }  
  ]  
}
```

For more information, see [GetDatasetContent](#) in the *guide*.

- For API details, see [GetDatasetContent](#) in *AWS CLI Command Reference*.

list-channels

The following code example shows how to use `list-channels`.

AWS CLI

To retrieve a list of channels

The following `list-channels` example displays summary information for the available channels.

```
aws iotanalytics list-channels
```

Output:

```
{  
  "channelSummaries": [  
    {  
      "status": "ACTIVE",  
      "channelName": "mychannel",  
      "creationTime": 1557860351.001,  
      "lastUpdateTime": 1557860351.001  
    }  
  ]  
}
```

For more information, see [ListChannels](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [ListChannels](#) in *AWS CLI Command Reference*.

list-dataset-contents

The following code example shows how to use `list-dataset-contents`.

AWS CLI

To list information about dataset contents

The following `list-dataset-contents` example lists information about dataset contents that have been created.

```
aws iotanalytics list-dataset-contents \  
  --dataset-name mydataset
```

Output:

```
{  
  "datasetContentSummaries": [  
    {  
      "status": {  
        "state": "SUCCEEDED"  
      },  
      "scheduleTime": 1557863215.995,  
      "version": "b10ea2a9-66c1-4d99-8d1f-518113b738d0",  
      "creationTime": 1557863215.995  
    }  
  ]  
}
```

For more information, see [ListDatasetContents](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [ListDatasetContents](#) in *AWS CLI Command Reference*.

list-datasets

The following code example shows how to use `list-datasets`.

AWS CLI

To retrieve information about datasets

The following `list-datasets` example lists summary information about available datasets.

```
aws iotanalytics list-datasets
```

Output:

```
{
  "datasetSummaries": [
    {
      "status": "ACTIVE",
      "datasetName": "mydataset",
      "lastUpdateTime": 1557859240.658,
      "triggers": [],
      "creationTime": 1557859240.658,
      "actions": [
        {
          "actionName": "query_32",
          "actionType": "QUERY"
        }
      ]
    }
  ]
}
```

For more information, see [ListDatasets](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [ListDatasets](#) in *AWS CLI Command Reference*.

list-datastores

The following code example shows how to use `list-datastores`.

AWS CLI

To retrieve a list of data stores

The following `list-datastores` example displays summary information about the available data stores.

```
aws iotanalytics list-datastores
```

Output:

```
{
  "datastoreSummaries": [
    {
      "status": "ACTIVE",
      "datastoreName": "mydatastore",
```

```
        "creationTime": 1557858971.02,  
        "lastUpdateTime": 1557858971.02  
      }  
    ]  
  }
```

For more information, see [ListDatastores](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [ListDatastores](#) in *AWS CLI Command Reference*.

list-pipelines

The following code example shows how to use `list-pipelines`.

AWS CLI

To retrieve a list of pipelines

The following `list-pipelines` example displays a list of available pipelines.

```
aws iotanalytics list-pipelines
```

Output:

```
{  
  "pipelineSummaries": [  
    {  
      "pipelineName": "mypipeline",  
      "creationTime": 1557859124.432,  
      "lastUpdateTime": 1557859124.432,  
      "reprocessingSummaries": []  
    }  
  ]  
}
```

For more information, see [ListPipelines](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [ListPipelines](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example Lists the tags that you have attached to the specified resource.

```
aws iotanalytics list-tags-for-resource \  
  --resource-arn "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel"
```

Output:

```
{  
  "tags": [  
    {  
      "value": "bar",  
      "key": "foo"  
    }  
  ]  
}
```

For more information, see [ListTagsForResource](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-logging-options

The following code example shows how to use `put-logging-options`.

AWS CLI

To set or update logging options

The following `put-logging-options` example sets or updates the AWS IoT Analytics logging options. If you update the value of any `loggingOptions` field, it can take up to one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the `roleArn` field (for example, to correct an invalid policy) it can take up to five minutes for that change to take effect.

```
aws iotanalytics put-logging-options \  
  \
```

```
--cli-input-json file://put-logging-options.json
```

Contents of `put-logging-options.json`:

```
{
  "loggingOptions": {
    "roleArn": "arn:aws:iam::123456789012:role/service-role/myIoTAnalyticsRole",
    "level": "ERROR",
    "enabled": true
  }
}
```

This command produces no output.

For more information, see [PutLoggingOptions](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [PutLoggingOptions](#) in *AWS CLI Command Reference*.

run-pipeline-activity

The following code example shows how to use `run-pipeline-activity`.

AWS CLI

To simulate a pipeline activity

The following `run-pipeline-activity` example simulates the results of running a pipeline activity on a message payload.

```
aws iotanalytics run-pipeline-activity \
  --pipeline-activity file://maths.json \
  --payloads file://payloads.json
```

Contents of `maths.json`:

```
{
  "math": {
    "name": "MyMathActivity",
    "math": "((temp - 32) * 5.0) / 9.0",
    "attribute": "tempC"
  }
}
```

```
}
```

Contents of `payloads.json`:

```
[
  "{\"humidity\": 52, \"temp\": 68 }",
  "{\"humidity\": 52, \"temp\": 32 }"
]
```

Output:

```
{
  "logResult": "",
  "payloads": [
    "eyJodW1pZG10eSI6NTIsInRlbXAiOjY4LCJ0ZW1wQyI6MjB9",
    "eyJodW1pZG10eSI6NTIsInRlbXAiOjMyLCJ0ZW1wQyI6MH0="
  ]
}
```

For more information, see [RunPipelineActivity](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [RunPipelineActivity](#) in *AWS CLI Command Reference*.

sample-channel-data

The following code example shows how to use `sample-channel-data`.

AWS CLI

To retrieve sample messages from a channel

The following `sample-channel-data` example retrieves a sample of messages from the specified channel ingested during the specified timeframe. You can retrieve up to 10 messages.

```
aws iotanalytics sample-channel-data \
  --channel-name mychannel
```

Output:

```
{
```

```
"payloads": [  
  "eyJhdGVtcGVyYXR1cmUiOiAyMCM9",  
  "eyJhZm9vIjogImJhcnIgfQ=="  
]
```

For more information, see [SampleChannelData](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [SampleChannelData](#) in *AWS CLI Command Reference*.

start-pipeline-reprocessing

The following code example shows how to use `start-pipeline-reprocessing`.

AWS CLI

To start pipeline reprocessing

The following `start-pipeline-reprocessing` example starts the reprocessing of raw message data through the specified pipeline.

```
aws iotanalytics start-pipeline-reprocessing \  
  --pipeline-name mypipeline
```

Output:

```
{  
  "reprocessingId": "6ad2764f-fb13-4de3-b101-4e74af03b043"  
}
```

For more information, see [StartPipelineReprocessing](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [StartPipelineReprocessing](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add or modify tags for a resource

The following `tag-resource` example adds to or modifies the tags attached to the specified resource.

```
aws iotanalytics tag-resource \  
  --resource-arn "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel" \  
  --tags "[{"key": "Environment", "value": "Production"}]"
```

This command produces no output.

For more information, see [TagResource](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource

The following `untag-resource` example removes the tags with the specified key names from the specified resource.

```
aws iotanalytics untag-resource \  
  --resource-arn "arn:aws:iotanalytics:us-west-2:123456789012:channel/mychannel" \  
  --tag-keys ["Environment"]
```

This command produces no output.

For more information, see `UntagResource` <https://docs.aws.amazon.com/iotanalytics/latest/APIReference/API_UntagResource.html> in the *AWS IoT Analytics API Reference*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-channel

The following code example shows how to use `update-channel`.

AWS CLI

To modify a channel

The following `update-channel` example modifies the settings for the specified channel.

```
aws iotanalytics update-channel \  
  --cli-input-json file://update-channel.json
```

Contents of `update-channel.json`:

```
{  
  "channelName": "mychannel",  
  "retentionPeriod": {  
    "numberOfDays": 92  
  }  
}
```

This command produces no output.

For more information, see [UpdateChannel](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [UpdateChannel](#) in *AWS CLI Command Reference*.

update-dataset

The following code example shows how to use `update-dataset`.

AWS CLI

To update a dataset

The following `update-dataset` example modifies the settings of the specified dataset.

```
aws iotanalytics update-dataset \  
  --cli-input-json file://update-dataset.json
```

Contents of `update-dataset.json`:

```
{  
  "datasetName": "mydataset",  
  "actions": [  
    {  
      "actionName": "myDatasetUpdateAction",  
      "queryAction": {  
        "sqlQuery": "SELECT * FROM mydatastore"  
      }  
    }  
  ]  
}
```

```
    }
  }
],
"retentionPeriod": {
  "numberOfDays": 92
}
}
```

This command produces no output.

For more information, see `UpdateDataset` <https://docs.aws.amazon.com/iotanalytics/latest/APIReference/API_UpdateDataset.html> in the *AWS IoT Analytics API Reference*.

- For API details, see [UpdateDataset](#) in *AWS CLI Command Reference*.

update-datastore

The following code example shows how to use `update-datastore`.

AWS CLI

To update a data store

The following `update-datastore` example modifies the settings of the specified data store.

```
aws iotanalytics update-datastore \
  --cli-input-json file://update-datastore.json
```

Contents of `update-datastore.json`:

```
{
  "datastoreName": "mydatastore",
  "retentionPeriod": {
    "numberOfDays": 93
  }
}
```

This command produces no output.

For more information, see [UpdateDatastore](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [UpdateDatastore](#) in *AWS CLI Command Reference*.

update-pipeline

The following code example shows how to use update-pipeline.

AWS CLI

To update a pipeline

The following update-pipeline example modifies the settings of the specified pipeline. You must specify both a channel and a data store activity and, optionally, as many as 23 additional activities, in the pipelineActivities array.

```
aws iotanalytics update-pipeline \  
  --cli-input-json file://update-pipeline.json
```

Contents of update-pipeline.json:

```
{  
  "pipelineName": "mypipeline",  
  "pipelineActivities": [  
    {  
      "channel": {  
        "name": "myChannelActivity",  
        "channelName": "mychannel",  
        "next": "myMathActivity"  
      }  
    },  
    {  
      "datastore": {  
        "name": "myDatastoreActivity",  
        "datastoreName": "mydatastore"  
      }  
    },  
    {  
      "math": {  
        "name": "myMathActivity",  
        "math": "(((temp - 32) * 5.0) / 9.0) + 273.15",  
        "attribute": "tempK",  
        "next": "myDatastoreActivity"  
      }  
    }  
  ]  
}
```

```
}
```

This command produces no output.

For more information, see [UpdatePipeline](#) in the *AWS IoT Analytics API Reference*.

- For API details, see [UpdatePipeline](#) in *AWS CLI Command Reference*.

Device Advisor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Device Advisor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-suite-definition

The following code example shows how to use `create-suite-definition`.

AWS CLI

Example 1: To create an IoT Device Advisor test suite

The following `create-suite-definition` example creates a device advisor test suite in the AWS IoT with the specified suite definition configuration.

```
aws iotdeviceadvisor create-suite-definition \  
  --suite-definition-configuration '{ \  
    "name": "Test Suite",
```

```

    "suiteDefinitionName": "TestSuiteName", \
    "devices": [{"thingArn": "arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"}], \
    "intendedForQualification": false, \
    "rootGroup": "{ \"configuration\": {}, \"tests\": [{ \"name\": \"MQTT Connect\",
\"configuration\": { \"EXECUTION_TIMEOUT\": 120 }, \"tests\": [{ \"name\": \"MQTT_Connect\",
\"configuration\": {}, \"test\": { \"id\": \"MQTT_Connect\", \"testCase\": null, \"version
\": \"0.0.0\" } } ] } ] }", \
    "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"'

```

Output:

```

{
  "suiteDefinitionId": "0jtsigio7yenu",
  "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
east-1:123456789012:suitedefinition/0jtsigio7yenu",
  "suiteDefinitionName": "TestSuiteName",
  "createdAt": "2022-12-02T11:38:13.263000-05:00"
}

```

For more information, see [Create a test suite definition](#) in the *AWS IoT Core Developer Guide*.

Example 2: To create an IoT Device Advisor Latest Qualification test suite

The following `create-suite-definition` example creates a device advisor qualification test suite with the latest version in the AWS IoT with the specified suite definition configuration.

```

aws iotdeviceadvisor create-suite-definition \
  --suite-definition-configuration '{ \
    "suiteDefinitionName": "TestSuiteName", \
    "devices": [{"thingArn": "arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"}], \
    "intendedForQualification": true, \
    "rootGroup": "", \
    "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"'

```

Output:

```

{
  "suiteDefinitionId": "txgsuolk2myj",
  "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
east-1:123456789012:suitedefinition/txgsuolk2myj",

```

```
"suiteDefinitionName": "TestSuiteName",  
"createdAt": "2022-12-02T11:38:13.263000-05:00"  
}
```

For more information, see [Create a test suite definition](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [CreateSuiteDefinition](#) in *AWS CLI Command Reference*.

delete-suite-definition

The following code example shows how to use `delete-suite-definition`.

AWS CLI

To delete the IoT Device Advisor test suite

The following `delete-suite-definition` example deletes the device advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor delete-suite-definition \  
  --suite-definition-id 0jtsgio7yenu
```

This command produces no output.

For more information, see [DeleteSuiteDefinition](#) in the *AWS IoT API Reference*.

- For API details, see [DeleteSuiteDefinition](#) in *AWS CLI Command Reference*.

get-endpoint

The following code example shows how to use `get-endpoint`.

AWS CLI

Example 1: To get the information about an IoT Device Advisor Account-level endpoint

The following `get-endpoint` example gets the information about a device advisor Account-level test endpoint.

```
aws iotdeviceadvisor get-endpoint
```

Output:

```
{
  "endpoint": "t6y4c143x9sfo.deviceadvisor.iot.us-east-1.amazonaws.com"
}
```

Example 2: To get the information about an IoT Device Advisor Device-level endpoint

The following `get-endpoint` example gets the information about a device advisor device-level test endpoint with the specified `thing-arn` or `certificate-arn`.

```
aws iotdeviceadvisor get-endpoint \
  --thing-arn arn:aws:iot:us-east-1:123456789012:thing/MyIotThing
```

Output:

```
{
  "endpoint": "tdb7719be5t6y4c143x9sfo.deviceadvisor.iot.us-east-1.amazonaws.com"
}
```

For more information, see [Get a test endpoint](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [GetEndpoint](#) in *AWS CLI Command Reference*.

get-suite-definition

The following code example shows how to use `get-suite-definition`.

AWS CLI

To get the information about an IoT Device Advisor test suite

The following `get-suite-definition` example get the information about a aevice advisor test suite with the specified suite definition ID.

```
aws iotdeviceadvisor get-suite-definition \
  --suite-definition-id qqcsmtyyjabl
```

Output:

```
{
  "suiteDefinitionId": "qqcsmtyyjabl",
```

```

    "suiteDefinitionArn": "arn:aws:iotdeviceadvisor:us-
east-1:123456789012:suitedefinition/qqcsmtyyjabl",
    "suiteDefinitionVersion": "v1",
    "latestVersion": "v1",
    "suiteDefinitionConfiguration": {
      "suiteDefinitionName": "MQTT connection",
      "devices": [],
      "intendedForQualification": false,
      "isLongDurationTest": false,
      "rootGroup": "{\\"configuration\\":{\\},\\"tests\\":[{\\"id\\":\\"uta5d9j1kvwc\\",
\\"name\\":\\"Test group 1\\",\\"configuration\\":{\\},\\"tests\\":[{\\"id\\":\\"awr8pq5vc9yp\\",
\\"name\\":\\"MQTT Connect\\",\\"configuration\\":{\\},\\"test\\":{\\"id\\":\\"MQTT_Connect\\",
\\"testCase\\":null,\\"version\\":\\"0.0.0\\"}]}]}]",
      "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole",
      "protocol": "MqttV3_1_1"
    },
    "createdAt": "2022-11-11T22:28:52.389000-05:00",
    "lastModifiedAt": "2022-11-11T22:28:52.389000-05:00",
    "tags": {}
  }
}

```

For more information, see [Get a test suite definition](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [GetSuiteDefinition](#) in *AWS CLI Command Reference*.

get-suite-run-report

The following code example shows how to use `get-suite-run-report`.

AWS CLI

To get the information about an IoT Device Advisor qualifying test suite run report

The following `get-suite-run-report` example gets the report download link for a successful device advisor qualifying test suite run with the specified suite definition ID and suite run ID.

```

aws iotdeviceadvisor get-suite-run-report \
  --suite-definition-id ztvb5aek4w4x \
  --suite-run-id p6awv83nre6v

```

Output:

```
{
```

```
"qualificationReportDownloadUrl": "https://senate-apn-reports-us-east-1-
prod.s3.amazonaws.com/report.downloadlink"
}
```

For more information, see [Get a qualification report for a successful qualification test suite run](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [GetSuiteRunReport](#) in *AWS CLI Command Reference*.

get-suite-run

The following code example shows how to use `get-suite-run`.

AWS CLI

To get the information about an IoT Device Advisor test suite run status

The following `get-suite-run` example gets the information about a device advisor test suite run status with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor get-suite-run \
  --suite-definition-id qqcsmtyyjabl \
  --suite-run-id nzlfyhaa18oa
```

Output:

```
{
  "suiteDefinitionId": "qqcsmtyyjabl",
  "suiteDefinitionVersion": "v1",
  "suiteRunId": "nzlfyhaa18oa",
  "suiteRunArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suiterun/
qqcsmtyyjabl/nzlfyhaa18oa",
  "suiteRunConfiguration": {
    "primaryDevice": {
      "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIotThing",
      "certificateArn": "arn:aws:iot:us-east-1:123456789012:cert/certFile"
    },
    "parallelRun": false
  },
  "testResult": {
    "groups": [
      {
        "groupId": "uta5d9j1kvwc",
```

```

        "groupName": "Test group 1",
        "tests": [
            {
                "testCaseRunId": "2ve2twrqyr0s",

- For API details, see [GetSuiteRun](#) in *AWS CLI Command Reference*.

list-suite-definitions

The following code example shows how to use `list-suite-definitions`.

AWS CLI

Example 1: To list the IoT Device Advisor test suites you created

The following `list-suite-definitions` example lists up to 25 device advisor test suites you created in AWS IoT. If you have more than 25 test suites, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suites you created.

```
aws iotdeviceadvisor list-suite-definitions
```

Output:

```
{
  "suiteDefinitionInformationList": [
    {
      "suiteDefinitionId": "3hsn88h4p2g5",
      "suiteDefinitionName": "TestSuite1",
      "defaultDevices": [
        {
          "thingArn": "arn:aws:iot:us-east-1:123456789012:thing/
MyIotThing"
        }
      ],
      "intendedForQualification": false,
      "isLongDurationTest": false,
      "protocol": "MqttV3_1_1",
      "createdAt": "2022-11-17T14:15:56.830000-05:00"
    },
    {
      .....
    }
  ],
  "nextToken": "nextTokenValue"
}
```

Example 2: To list the IoT Device Advisor test suites you created with the specified settings

The following `list-suite-definitions` example lists device advisor test suites you created in AWS IoT with the specified `max-result` number. If you have more test suites than the `max` number, the `nextToken` will be shown in the output. If you have `nextToken`, you can use `nextToken` to show the test suites you created that weren't shown before.

```
aws iotdeviceadvisor list-suite-definitions \
  --max-result 1 \
  --next-token "nextTokenValue"
```

Output:

```
{
  "suiteDefinitionInformationList": [
    {
      "suiteDefinitionId": "ztvb5aew4w4x",
```

```

        "suiteDefinitionName": "TestSuite2",
        "defaultDevices": [],
        "intendedForQualification": true,
        "isLongDurationTest": false,
        "protocol": "MqttV3_1_1",
        "createdAt": "2022-11-17T14:15:56.830000-05:00"
    }
],
"nextToken": "nextTokenValue"
}

```

For more information, see [ListSuiteDefinitions](#) in the *AWS IoT API Reference*.

- For API details, see [ListSuiteDefinitions](#) in *AWS CLI Command Reference*.

list-suite-runs

The following code example shows how to use `list-suite-runs`.

AWS CLI

Example 1: To list all information about the specified IoT Device Advisor test suite runs status

The following `list-suite-runs` example lists all information about a device advisor test suite runs status with the specified suite definition ID. If you have more than 25 test suite runs, the "nextToken" will be shown in the output. You can use this "nextToken" to show the rest of the test suite runs.

```

aws iotdeviceadvisor list-suite-runs \
  --suite-definition-id ztvb5aew4w4x

```

Output:

```

{
  "suiteRunsList": [
    {
      "suiteDefinitionId": "ztvb5aew4w4x",
      "suiteDefinitionVersion": "v1",
      "suiteDefinitionName": "TestSuite",
      "suiteRunId": "p6awv89nre6v",

```

```

        "createdAt": "2022-12-01T16:33:14.212000-05:00",
        "startedAt": "2022-12-01T16:33:15.710000-05:00",
        "endAt": "2022-12-01T16:42:03.323000-05:00",
        "status": "PASS",
        "passed": 6,
        "failed": 0
    }
]
}

```

Example 2: To list information about the specified IoT Device Advisor test suite runs status with the specified settings

The following `list-suite-runs` example lists information about a device advisor test suite runs status with the specified suite definition ID and the specified max-result number. If you have more test suite runs than the max number, the "nextToken" will be shown in the output. If you have "nextToken", you can use "nextToken" to show the test suite runs that weren't shown before.

```

aws iotdeviceadvisor list-suite-runs \
  --suite-definition-id qqcsmtyyjam1 \
  --max-result 1 \
  --next-token "nextTokenValue"

```

Output:

```

{
  "suiteRunsList": [
    {
      "suiteDefinitionId": "qqcsmtyyjam1",
      "suiteDefinitionVersion": "v1",
      "suiteDefinitionName": "MQTT connection",
      "suiteRunId": "gz9vm2s6d2jy",
      "createdAt": "2022-12-01T20:10:27.079000-05:00",
      "startedAt": "2022-12-01T20:10:28.003000-05:00",
      "endAt": "2022-12-01T20:10:45.084000-05:00",
      "status": "STOPPED",
      "passed": 0,
      "failed": 0
    }
  ],
  "nextToken": "nextTokenValue"
}

```

```
}
```

For more information, see [ListSuiteRuns](#) in the *AWS IoT API Reference*.

- For API details, see [ListSuiteRuns](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags attached to an IoT Device Advisor resource

The following `list-tags-for-resource` example lists the tags attached to a device advisor resource. The device advisor resource can be a `Suitedefinition-Arn` or a `Suiterun-Arn`.

```
aws iotdeviceadvisor list-tags-for-resource \
  --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/
ba0uyjpg38ny
```

Output:

```
{
  "tags": {
    "TestTagKey": "TestTagValue"
  }
}
```

For more information, see [ListTagsForResource](#) in the *AWS IoT API Reference* and [Resource types defined by AWS IoT Core Device Advisor](#) in the *Service Authorization Reference*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

start-suite-run

The following code example shows how to use `start-suite-run`.

AWS CLI

To start an IoT Device Advisor test suite run

The following `start-suite-run` example lists the available widgets in your AWS account.

```
aws iotdeviceadvisor start-suite-run \  
  --suite-definition-id qqcsmtyyjabl \  
  --suite-definition-version v1 \  
  --suite-run-configuration '{"primaryDevice":{"thingArn": "arn:aws:iot:us-  
east-1:123456789012:thing/MyIoTThing", "certificateArn": "arn:aws:iot:us-  
east-1:123456789012:cert/certFile"}}'
```

Output:

```
{  
  "suiteRunId": "pwmucgw71t9s",  
  "suiteRunArn": "arn:aws:iotdeviceadvisor:us-east-1:123456789012:suiterun/  
qqcsmtyyjabl/pwmucgw71k9s",  
  "createdAt": "2022-12-02T15:43:05.581000-05:00"  
}
```

For more information, see [Start a test suite run](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [StartSuiteRun](#) in *AWS CLI Command Reference*.

stop-suite-run

The following code example shows how to use `stop-suite-run`.

AWS CLI

To stop an IoT Device Advisor test suite that is currently running

The following `stop-suite-run` example stops a device advisor test suite that is currently running with the specified suite definition ID and suite run ID.

```
aws iotdeviceadvisor stop-suite-run \  
  --suite-definition-id qqcsmtyyjabl \  
  --suite-run-id nzlfyhaa18oa
```

This command produces no output.

For more information, see [Stop a test suite run](#) in the *AWS IoT Core Developer Guide*.

- For API details, see [StopSuiteRun](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add to and modify the existing tags of an IoT Device Advisor resource

The following `tag-resource` example adds to and modifies the existing tags of a device advisor resource with the specified resource arn and tags. The device advisor resource can be a `Suitedefinition-Arn` or a `Suiterun-Arn`.

```
aws iotdeviceadvisor tag-resource \  
  --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/  
ba0uyjpg38ny \  
  --tags '{"TagKey": "TagValue"}
```

This command produces no output.

For more information, see [TagResource](#) in the *AWS IoT API Reference* and [Resource types defined by AWS IoT Core Device Advisor](#) in the *Service Authorization Reference*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove the existing tags from an IoT Device Advisor resource

The following `untag-resource` example removes the existing tags from a device advisor resource with the specified resource arn and tag key. The device advisor resource can be a `Suitedefinition-Arn` or a `Suiterun-Arn`.

```
aws iotdeviceadvisor untag-resource \  
  --resource-arn arn:aws:iotdeviceadvisor:us-east-1:123456789012:suitedefinition/  
ba0uyjpg38ny \  
  --tag-keys "TagKey"
```

This command produces no output.

For more information, see [UntagResource](#) in the *AWS IoT API Reference* and [Resource types defined by AWS IoT Core Device Advisor](#) in the *Service Authorization Reference*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-suite-definition

The following code example shows how to use update-suite-definition.

AWS CLI

Example 1: To update an IoT Device Advisor test suite

The following update-suite-definition example updates a device advisor test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```
aws iotdeviceadvisor update-suite-definition \
  --suite-definition-id 3hsn88h4p2g5 \
  --suite-definition-configuration '{ \
    "suiteDefinitionName": "TestSuiteName", \
    "devices": [{"thingArn": "arn:aws:iot:us-east-1:123456789012:thing/MyIotThing"}], \
    "intendedForQualification": false, \
    "rootGroup": "{\ "configuration\": {}, \ "tests\": [{\ "name\": \ "MQTT Connect\ ", \ "configuration\": {\ "EXECUTION_TIMEOUT\ ": 120}, \ "tests\": [{\ "name\": \ "MQTT_Connect\ ", \ "configuration\": {}, \ "test\": {\ "id\": \ "MQTT_Connect\ ", \ "testCase\": null, \ "version\ ": \ "0.0.0\ "}}]}]}", \
    "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole" }
```

Output:

```
{
  "suiteDefinitionId": "3hsn88h4p2g5",
  "suiteDefinitionName": "TestSuiteName",
  "suiteDefinitionVersion": "v3",
  "createdAt": "2022-11-17T14:15:56.830000-05:00",
  "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"
}
```

Example 2: To update an IoT Device Advisor Qualification test suite

The following `update-suite-definition` example updates a device advisor qualification test suite in the AWS IoT with the specified suite definition ID and suite definition configuration.

```
aws iotdeviceadvisor update-suite-definition \  
  --suite-definition-id txgsuolk2myj \  
  --suite-definition-configuration '{  
    "suiteDefinitionName": "TestSuiteName", \  
    "devices": [{"thingArn": "arn:aws:iot:us-east-1:123456789012:thing/  
MyIoTThing"}], \  
    "intendedForQualification": true, \  
    "rootGroup": "", \  
    "devicePermissionRoleArn": "arn:aws:iam::123456789012:role/Myrole"}'
```

Output:

```
{  
  "suiteDefinitionId": "txgsuolk2myj",  
  "suiteDefinitionName": "TestSuiteName",  
  "suiteDefinitionVersion": "v3",  
  "createdAt": "2022-11-17T14:15:56.830000-05:00",  
  "lastUpdatedAt": "2022-12-02T16:02:45.857000-05:00"  
}
```

For more information, see [UpdateSuiteDefinition](#) in the *AWS IoT API Reference*.

- For API details, see [UpdateSuiteDefinition](#) in *AWS CLI Command Reference*.

AWS IoT data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT data.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

Actions

delete-thing-shadow

The following code example shows how to use `delete-thing-shadow`.

AWS CLI

To delete a device's shadow document

The following `delete-thing-shadow` example deletes the entire shadow document for the device named `MyRPi`.

```
aws iot-data delete-thing-shadow \  
  --thing-name MyRPi \  
  "output.txt"
```

The command produces no output on the display, but `output.txt` contains information that confirms the version and timestamp of the shadow document that you deleted.

```
{"version":2,"timestamp":1560270384}
```

For more information, see [Using Shadows](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteThingShadow](#) in *AWS CLI Command Reference*.

get-thing-shadow

The following code example shows how to use `get-thing-shadow`.

AWS CLI

To get a thing shadow document

The following `get-thing-shadow` example gets the thing shadow document for the specified IoT thing.

```
aws iot-data get-thing-shadow \  
  --thing-name MyRPi
```

```
--thing-name MyRPi \  
output.txt
```

The command produces no output on the display, but the following shows the contents of `output.txt`:

```
{  
  "state":{  
    "reported":{  
      "moisture":"low"  
    }  
  },  
  "metadata":{  
    "reported":{  
      "moisture":{  
        "timestamp":1560269319  
      }  
    }  
  },  
  "version":1,"timestamp":1560269405  
}
```

For more information, see [Device Shadow Service Data Flow](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetThingShadow](#) in *AWS CLI Command Reference*.

update-thing-shadow

The following code example shows how to use `update-thing-shadow`.

AWS CLI

To update a thing shadow

The following `update-thing-shadow` example modifies the current state of the device shadow for the specified thing and saves it to the file `output.txt`.

```
aws iot-data update-thing-shadow \  
  --thing-name MyRPi \  
  --payload '{"state":{"reported":{"moisture":"okay"}}}' \  
  "output.txt"
```

The command produces no output on the display, but the following shows the contents of `output.txt`:

```
{
  "state": {
    "reported": {
      "moisture": "okay"
    }
  },
  "metadata": {
    "reported": {
      "moisture": {
        "timestamp": 1560270036
      }
    }
  },
  "version": 2,
  "timestamp": 1560270036
}
```

For more information, see [Device Shadow Service Data Flow](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateThingShadow](#) in *AWS CLI Command Reference*.

AWS IoT Events examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Events.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

batch-put-message

The following code example shows how to use `batch-put-message`.

AWS CLI

To send messages (inputs) to AWS IoT Events

The following `batch-put-message` example sends a set of messages to the AWS IoT Events system. Each message payload is transformed into the input you specify (`inputName`) and ingested into any detectors that monitor that input. If multiple messages are sent, the order in which the messages are processed isn't guaranteed. To guarantee ordering, you must send messages one at a time and wait for a successful response.

```
aws iotevents-data batch-put-message \  
  --cli-input-json file://highPressureMessage.json
```

Contents of `highPressureMessage.json`:

```
{  
  "messages": [  
    {  
      "messageId": "00001",  
      "inputName": "PressureInput",  
      "payload": "{\"motorid\": \"Fulton-A32\", \"sensorData\": {\"pressure\":  
80, \"temperature\": 39} }"  
    }  
  ]  
}
```

Output:

```
{  
  "BatchPutMessageErrorEntries": []  
}
```

For more information, see [BatchPutMessage](#) in the *AWS IoT Events API Reference*.

- For API details, see [BatchPutMessage](#) in *AWS CLI Command Reference*.

batch-update-detector

The following code example shows how to use batch-update-detector.

AWS CLI

To update a detector (instance)

The following batch-update-detector example updates the state, variable values, and timer settings of one or more detectors (instances) of a specified detector model.

```
aws iotevents-data batch-update-detector \  
  --cli-input-json file://budFulton-A32.json
```

Contents of budFulton-A32.json:

```
{  
  "detectors": [  
    {  
      "messageId": "00001",  
      "detectorModelName": "motorDetectorModel",  
      "keyValue": "Fulton-A32",  
      "state": {  
        "stateName": "Normal",  
        "variables": [  
          {  
            "name": "pressureThresholdBreach",  
            "value": "0"  
          }  
        ],  
        "timers": [  
        ]  
      }  
    }  
  ]  
}
```

Output:

```
{  
  "batchUpdateDetectorErrorEntries": []  
}
```

For more information, see [BatchUpdateDetector](#) in the *AWS IoT Events API Reference*.

- For API details, see [BatchUpdateDetector](#) in *AWS CLI Command Reference*.

create-detector-model

The following code example shows how to use `create-detector-model`.

AWS CLI

To create a detector model

The following `create-detector-model` example creates a detector model with its configuration specified by a parameter file.

```
aws iotevents create-detector-model \
  --cli-input-json file://motorDetectorModel.json
```

Contents of `motorDetectorModel.json`:

```
{
  "detectorModelName": "motorDetectorModel",
  "detectorModelDefinition": {
    "states": [
      {
        "stateName": "Normal",
        "onEnter": {
          "events": [
            {
              "eventName": "init",
              "condition": "true",
              "actions": [
                {
                  "setVariable": {
                    "variableName": "pressureThresholdBreached",
                    "value": "0"
                  }
                }
              ]
            }
          ]
        }
      ]
    ],
    "onInput": {
```

```

        "transitionEvents": [
            {
                "eventName": "Overpressurized",
                "condition": "$input.PressureInput.sensorData.pressure
> 70",
                "actions": [
                    {
                        "setVariable": {
                            "variableName": "pressureThresholdBreach",
                            "value":
"$variable.pressureThresholdBreach + 3"
                        }
                    }
                ],
                "nextState": "Dangerous"
            }
        ],
    },
    {
        "stateName": "Dangerous",
        "onEnter": {
            "events": [
                {
                    "eventName": "Pressure Threshold Breached",
                    "condition": "$variable.pressureThresholdBreach >
1",
                    "actions": [
                        {
                            "sns": {
                                "targetArn": "arn:aws:sns:us-
east-1:123456789012:underPressureAction"
                            }
                        }
                    ]
                }
            ]
        },
        "onInput": {
            "events": [
                {
                    "eventName": "Overpressurized",
                    "condition": "$input.PressureInput.sensorData.pressure
> 70",

```

```

        "actions": [
            {
                "setVariable": {
                    "variableName": "pressureThresholdBreached",
                    "value": "3"
                }
            }
        ],
    },

    "detectorModelVersion": "1"
  }
}

```

For more information, see [CreateDetectorModel](#) in the *AWS IoT Events API Reference*.

- For API details, see [CreateDetectorModel](#) in *AWS CLI Command Reference*.

create-input

The following code example shows how to use create-input.

AWS CLI

To create an input

The following create-input example creates an input.

```
aws iotevents create-input \  
  --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{  
  "inputName": "PressureInput",  
  "inputDescription": "Pressure readings from a motor",  
  "inputDefinition": {  
    "attributes": [  
      { "jsonPath": "sensorData.pressure" },  
      { "jsonPath": "motorid" }  
    ]  
  }  
}
```

Output:

```
{  
  "inputConfiguration": {  
    "status": "ACTIVE",  
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",  
    "lastUpdateTime": 1560795312.542,  
    "creationTime": 1560795312.542,  
    "inputName": "PressureInput",  
    "inputDescription": "Pressure readings from a motor"  
  }  
}
```

For more information, see [CreateInput](#) in the *AWS IoT Events API Reference*.

- For API details, see [CreateInput](#) in *AWS CLI Command Reference*.

delete-detector-model

The following code example shows how to use `delete-detector-model`.

AWS CLI

To delete a detector model

The following `delete-detector-model` example deletes the specified detector model. Any active instances of the detector model are also deleted.

```
aws iotevents delete-detector-model \  
  --detector-model-name motorDetectorModel
```

This command produces no output.

For more information, see [DeleteDetectorModel](#) in the *AWS IoT Events API Reference*.

- For API details, see [DeleteDetectorModel](#) in *AWS CLI Command Reference*.

delete-input

The following code example shows how to use `delete-input`.

AWS CLI

To delete an input

The following `delete-input` example deletes the specified input.

```
aws iotevents delete-input \  
  --input-name PressureInput
```

This command produces no output.

For more information, see [DeleteInput](#) in the *AWS IoT Events API Reference*.

- For API details, see [DeleteInput](#) in *AWS CLI Command Reference*.

describe-detector-model

The following code example shows how to use `describe-detector-model`.

AWS CLI

To get information about a detector model

The following `describe-detector-model` example displays details for the specified detector model. Because the `version` parameter is not specified, information about the latest version is returned.

```
aws iotevents describe-detector-model \
  --detector-model-name motorDetectorModel
```

Output:

```
{
  "detectorModel": {
    "detectorModelConfiguration": {
      "status": "ACTIVE",
      "lastUpdateTime": 1560796816.077,
      "roleArn": "arn:aws:iam:123456789012:role/IoTEventsRole",
      "creationTime": 1560796816.077,
      "detectorModelArn": "arn:aws:iotevents:us-
west-2:123456789012:detectorModel/motorDetectorModel",
      "key": "motorid",
      "detectorModelName": "motorDetectorModel",
      "detectorModelVersion": "1"
    },
    "detectorModelDefinition": {
      "states": [
        {
          "onInput": {
            "transitionEvents": [

}

```

For more information, see [DescribeDetectorModel](#) in the *AWS IoT Events API Reference*.

- For API details, see [DescribeDetectorModel](#) in *AWS CLI Command Reference*.

describe-detector

The following code example shows how to use describe-detector.

AWS CLI

To get information about a detector (instance).

The following describe-detector example displays details for the specified detector (instance).

```

aws iotevents-data describe-detector \
  --detector-model-name motorDetectorModel \
  --key-value "Fulton-A32"

```

Output:

```

{
  "detector": {
    "lastUpdateTime": 1560797852.776,
    "creationTime": 1560797852.775,

```

```
    "state": {
      "variables": [
        {
          "name": "pressureThresholdBreached",
          "value": "3"
        }
      ],
      "stateName": "Dangerous",
      "timers": []
    },
    "keyValue": "Fulton-A32",
    "detectorModelName": "motorDetectorModel",
    "detectorModelVersion": "1"
  }
}
```

For more information, see [DescribeDetector](#) in the *AWS IoT Events API Reference*.

- For API details, see [DescribeDetector](#) in *AWS CLI Command Reference*.

describe-input

The following code example shows how to use `describe-input`.

AWS CLI

To get information about an input

The following `describe-input` example displays details for the specified input.

```
aws iotevents describe-input \
  --input-name PressureInput
```

Output:

```
{
  "input": {
    "inputConfiguration": {
      "status": "ACTIVE",
      "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/
PressureInput",
      "lastUpdateTime": 1560795312.542,
      "creationTime": 1560795312.542,

```

```
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    },
    "inputDefinition": {
        "attributes": [
            {
                "jsonPath": "sensorData.pressure"
            },
            {
                "jsonPath": "motorid"
            }
        ]
    }
}
```

For more information, see [DescribeInput](#) in the *AWS IoT Events API Reference*.

- For API details, see [DescribeInput](#) in *AWS CLI Command Reference*.

describe-logging-options

The following code example shows how to use `describe-logging-options`.

AWS CLI

To get information about logging settings

The following `describe-logging-options` example retrieves the current settings of the AWS IoT Events logging options.

```
aws iotevents describe-logging-options
```

Output:

```
{
  "loggingOptions": {
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
    "enabled": false,
    "level": "ERROR"
  }
}
```

For more information, see [DescribeLoggingOptions](#) in the *AWS IoT Events API Reference*.

- For API details, see [DescribeLoggingOptions](#) in *AWS CLI Command Reference*.

list-detector-model-versions

The following code example shows how to use `list-detector-model-versions`.

AWS CLI

To get information about versions of a detector model

The following `list-detector-model-versions` example Lists all the versions of a detector model. Only the metadata associated with each detector model version is returned.

```
aws iotevents list-detector-model-versions \  
  --detector-model-name motorDetectorModel
```

Output:

```
{  
  "detectorModelVersionSummaries": [  
    {  
      "status": "ACTIVE",  
      "lastUpdateTime": 1560796816.077,  
      "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",  
      "creationTime": 1560796816.077,  
      "detectorModelArn": "arn:aws:iotevents:us-  
west-2:123456789012:detectorModel/motorDetectorModel",  
      "detectorModelName": "motorDetectorModel",  
      "detectorModelVersion": "1"  
    }  
  ]  
}
```

For more information, see [ListDetectorModelVersions](#) in the *AWS IoT Events API Reference*.

- For API details, see [ListDetectorModelVersions](#) in *AWS CLI Command Reference*.

list-detector-models

The following code example shows how to use `list-detector-models`.

AWS CLI

To get a list of your detector models

The following `list-detector-models` example Lists the detector models you have created. Only the metadata associated with each detector model is returned.

```
aws iotevents list-detector-models
```

Output:

```
{
  "detectorModelSummaries": [
    {
      "detectorModelName": "motorDetectorModel",
      "creationTime": 1552072424.212
      "detectorModelDescription": "Detect overpressure in a motor."
    }
  ]
}
```

For more information, see [ListDetectorModels](#) in the *AWS IoT Events API Reference*.

- For API details, see [ListDetectorModels](#) in *AWS CLI Command Reference*.

list-detectors

The following code example shows how to use `list-detectors`.

AWS CLI

To get a list of detectors for a detector model

The following `list-detectors` example lists the detectors (the instances of a detector model) in your account.

```
aws iotevents-data list-detectors \
  --detector-model-name motorDetectorModel
```

Output:

```
{
```

```
"detectorSummaries": [
  {
    "lastUpdateTime": 1558129925.2,
    "creationTime": 1552073155.527,
    "state": {
      "stateName": "Normal"
    },
    "keyValue": "Fulton-A32",
    "detectorModelName": "motorDetectorModel",
    "detectorModelVersion": "1"
  }
]
```

For more information, see [ListDetectors](#) in the *AWS IoT Events API Reference*.

- For API details, see [ListDetectors](#) in *AWS CLI Command Reference*.

list-inputs

The following code example shows how to use `list-inputs`.

AWS CLI

To list inputs

The following `list-inputs` example lists the inputs you have created in your account.

```
aws iotevents list-inputs
```

This command produces no output. Output:

```
{
  {
    "status": "ACTIVE",
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "lastUpdateTime": 1551742986.768,
    "creationTime": 1551742986.768,
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor"
  }
}
```

For more information, see [ListInputs](#) in the *AWS IoT Events API Reference*.

- For API details, see [ListInputs](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags assigned to a resource.

The following `list-tags-for-resource` example lists the tag key names and values you have assigned to the resource.

```
aws iotevents list-tags-for-resource \  
  --resource-arn "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput"
```

Output:

```
{  
  "tags": [  
    {  
      "value": "motor",  
      "key": "deviceType"  
    }  
  ]  
}
```

For more information, see [ListTagsForResource](#) in the *AWS IoT Events API Reference*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-logging-options

The following code example shows how to use `put-logging-options`.

AWS CLI

To set logging options

The following `put-logging-options` example sets or updates the AWS IoT Events logging options. If you update the value of any `loggingOptions`` field, it can take up to

one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the `roleArn` field (for example, to correct an invalid policy) it can take up to five minutes for that change to take effect.

```
aws iotevents put-logging-options \  
  --cli-input-json file://logging-options.json
```

Contents of `logging-options.json`:

```
{  
  "loggingOptions": {  
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",  
    "level": "DEBUG",  
    "enabled": true,  
    "detectorDebugOptions": [  
      {  
        "detectorModelName": "motorDetectorModel",  
        "keyValue": "Fulton-A32"  
      }  
    ]  
  }  
}
```

This command produces no output.

For more information, see [PutLoggingOptions](#) in the *AWS IoT Events API Reference*.

- For API details, see [PutLoggingOptions](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to a resource

The following `tag-resource` example adds or modifies (if key `deviceType` already exists) the tag attached the specified resource.

```
aws iotevents tag-resource \  
  --cli-input-json file://pressureInput.tag.json
```

Contents of `pressureInput.tag.json`:

```
{
  "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
  "tags": [
    {
      "key": "deviceType",
      "value": "motor"
    }
  ]
}
```

This command produces no output.

For more information, see [TagResource](#) in the *AWS IoT Events API Reference*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource

The following `untag-resource` example removes the tag with the specified key name from the specified resource.

```
aws iotevents untag-resource \
  --resource-arn arn:aws:iotevents:us-west-2:123456789012:input/PressureInput \
  --tagkeys deviceType
```

This command produces no output.

For more information, see [UntagResource](#) in the *AWS IoT Events API Reference*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-detector-model

The following code example shows how to use `update-detector-model`.

AWS CLI

To update a detector model

The following `update-detector-model` example updates the specified detector model. Detectors (instances) spawned by the previous version are deleted and then re-created as new inputs arrive.

```
aws iotevents update-detector-model \  
  --cli-input-json file://motorDetectorModel.update.json
```

Contents of `motorDetectorModel.update.json`:

```
{  
  "detectorModelName": "motorDetectorModel",  
  "detectorModelDefinition": {  
    "states": [  
      {  
        "stateName": "Normal",  
        "onEnter": {  
          "events": [  
            {  
              "eventName": "init",  
              "condition": "true",  
              "actions": [  
                {  
                  "setVariable": {  
                    "variableName": "pressureThresholdBreach",  
                    "value": "0"  
                  }  
                }

update-input

The following code example shows how to use `update-input`.

AWS CLI

To update an input

The following `update-input` example updates the specified input with a new description and definition.

```
aws iotevents update-input \
  --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
  "inputName": "PressureInput",
```

```
"inputDescription": "Pressure readings from a motor",
"inputDefinition": {
  "attributes": [
    { "jsonPath": "sensorData.pressure" },
    { "jsonPath": "motorid" }
  ]
}
```

Output:

```
{
  "inputConfiguration": {
    "status": "ACTIVE",
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "lastUpdateTime": 1560795976.458,
    "creationTime": 1560795312.542,
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor"
  }
}
```

For more information, see [UpdateInput](#) in the *AWS IoT Events API Reference*.

- For API details, see [UpdateInput](#) in *AWS CLI Command Reference*.

AWS IoT Events-Data examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Events-Data.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

batch-put-message

The following code example shows how to use `batch-put-message`.

AWS CLI

To send messages (inputs) to AWS IoT Events

The following `batch-put-message` example sends a set of messages to the AWS IoT Events system. Each message payload is transformed into the input you specify (`inputName`) and ingested into any detectors that monitor that input. If multiple messages are sent, the order in which the messages are processed isn't guaranteed. To guarantee ordering, you must send messages one at a time and wait for a successful response.

```
aws iotevents-data batch-put-message \  
  --cli-binary-format raw-in-base64-out \  
  --cli-input-json file://highPressureMessage.json
```

Contents of `highPressureMessage.json`:

```
{  
  "messages": [  
    {  
      "messageId": "00001",  
      "inputName": "PressureInput",  
      "payload": "{\"motorid\": \"Fulton-A32\", \"sensorData\": {\"pressure\":  
80, \"temperature\": 39} }"  
    }  
  ]  
}
```

Output:

```
{  
  "BatchPutMessageErrorEntries": []  
}
```

For more information, see [BatchPutMessage](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [BatchPutMessage](#) in *AWS CLI Command Reference*.

batch-update-detector

The following code example shows how to use batch-update-detector.

AWS CLI

To update a detector (instance)

The following batch-update-detector example updates the state, variable values, and timer settings of one or more detectors (instances) of a specified detector model.

```
aws iotevents-data batch-update-detector \  
  --cli-input-json file://budFulton-A32.json
```

Contents of budFulton-A32.json:

```
{  
  "detectors": [  
    {  
      "messageId": "00001",  
      "detectorModelName": "motorDetectorModel",  
      "keyValue": "Fulton-A32",  
      "state": {  
        "stateName": "Normal",  
        "variables": [  
          {  
            "name": "pressureThresholdBreach",  
            "value": "0"  
          }  
        ],  
        "timers": [  
        ]  
      }  
    }  
  ]  
}
```

Output:

```
{
  "batchUpdateDetectorErrorEntries": []
}
```

For more information, see [BatchUpdateDetector](#) in the *AWS IoT Events Developer Guide*.*

- For API details, see [BatchUpdateDetector](#) in *AWS CLI Command Reference*.

create-detector-model

The following code example shows how to use `create-detector-model`.

AWS CLI

To create a detector model

The following `create-detector-model` example creates a detector model.

```
aws iotevents create-detector-model \
  --cli-input-json file://motorDetectorModel.json
```

Contents of `motorDetectorModel.json`:

```
{
  "detectorModelName": "motorDetectorModel",
  "detectorModelDefinition": {
    "states": [
      {
        "stateName": "Normal",
        "onEnter": {

    "detectorModelVersion": "1"
  }
}

```

For more information, see [CreateDetectorModel](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [CreateDetectorModel](#) in *AWS CLI Command Reference*.

create-input

The following code example shows how to use create-input.

AWS CLI

To create an input

The following `create-input` example creates an input.

```
aws iotevents create-input \  
  --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{  
  "inputName": "PressureInput",  
  "inputDescription": "Pressure readings from a motor",  
  "inputDefinition": {  
    "attributes": [  
      { "jsonPath": "sensorData.pressure" },  
      { "jsonPath": "motorid" }  
    ]  
  }  
}
```

Output:

```
{  
  "inputConfiguration": {  
    "status": "ACTIVE",  
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",  
    "lastUpdateTime": 1560795312.542,  
    "creationTime": 1560795312.542,  
    "inputName": "PressureInput",  
    "inputDescription": "Pressure readings from a motor"  
  }  
}
```

For more information, see [CreateInput](#) in the *AWS IoT Events Developer Guide*.*.

- For API details, see [CreateInput](#) in *AWS CLI Command Reference*.

delete-detector-model

The following code example shows how to use `delete-detector-model`.

AWS CLI

To delete a detector model

The following `delete-detector-model` example deletes a detector model. Any active instances of the detector model are also deleted.

```
aws iotevents delete-detector-model \  
  --detector-model-name motorDetectorModel*
```

This command produces no output.

For more information, see [DeleteDetectorModel](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [DeleteDetectorModel](#) in *AWS CLI Command Reference*.

delete-input

The following code example shows how to use `delete-input`.

AWS CLI

To delete an input

The following `delete-input` example deletes an input.

```
aws iotevents delete-input \  
  --input-name PressureInput
```

This command produces no output.

For more information, see [DeleteInput](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [DeleteInput](#) in *AWS CLI Command Reference*.

describe-detector-model

The following code example shows how to use `describe-detector-model`.

AWS CLI

To get information about a detector model

The following `describe-detector-model` example describes a detector model. If the `version` parameter is not specified, the command returns information about the latest version.

```
aws iotevents describe-detector-model \
  --detector-model-name motorDetectorModel
```

Output:

```
{
  "detectorModel": {
    "detectorModelConfiguration": {
      "status": "ACTIVE",
      "lastUpdateTime": 1560796816.077,

        },
        "condition": "true"
    ]
}
    ]
}
    ],
    "initialStateName": "Normal"
}
}
}

```

For more information, see [DescribeDetectorModel](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [DescribeDetectorModel](#) in *AWS CLI Command Reference*.

describe-detector

The following code example shows how to use describe-detector.

AWS CLI

To get information about a detector (instance)

The following describe-detector example returns information about the specified detector (instance).

```

aws iotevents-data describe-detector \
  --detector-model-name motorDetectorModel \
  --key-value "Fulton-A32"

```

Output:

```

{
  "detector": {
    "lastUpdateTime": 1560797852.776,
    "creationTime": 1560797852.775,

```

```
    "state": {
      "variables": [
        {
          "name": "pressureThresholdBreached",
          "value": "3"
        }
      ],
      "stateName": "Dangerous",
      "timers": []
    },
    "keyValue": "Fulton-A32",
    "detectorModelName": "motorDetectorModel",
    "detectorModelVersion": "1"
  }
}
```

For more information, see [DescribeDetector](#) in the *AWS IoT Events Developer Guide*.*

- For API details, see [DescribeDetector](#) in *AWS CLI Command Reference*.

describe-input

The following code example shows how to use `describe-input`.

AWS CLI

To get information about an input

The following `describe-input` example retrieves the details of an input.

```
aws iotevents describe-input \
  --input-name PressureInput
```

Output:

```
{
  "input": {
    "inputConfiguration": {
      "status": "ACTIVE",
      "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/
PressureInput",
      "lastUpdateTime": 1560795312.542,
      "creationTime": 1560795312.542,

```

```
        "inputName": "PressureInput",
        "inputDescription": "Pressure readings from a motor"
    },
    "inputDefinition": {
        "attributes": [
            {
                "jsonPath": "sensorData.pressure"
            },
            {
                "jsonPath": "motorid"
            }
        ]
    }
}
```

For more information, see [DescribeInput](#) in the *AWS IoT Events Developer Guide*.*.

- For API details, see [DescribeInput](#) in *AWS CLI Command Reference*.

describe-logging-options

The following code example shows how to use `describe-logging-options`.

AWS CLI

To get information about logging settings

The following `describe-logging-options` example retrieves the current AWS IoT Events logging options.

```
aws iotevents describe-logging-options
```

Output:

```
{
  "loggingOptions": {
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
    "enabled": false,
    "level": "ERROR"
  }
}
```

For more information, see [DescribeLoggingOptions](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [DescribeLoggingOptions](#) in *AWS CLI Command Reference*.

list-detector-model-versions

The following code example shows how to use `list-detector-model-versions`.

AWS CLI

To get information about versions of a detector model

The following `list-detector-model-versions` example lists all the versions of a detector model. Only the metadata associated with each detector model version is returned.

```
aws iotevents list-detector-model-versions \  
  --detector-model-name motorDetectorModel
```

Output:

```
{  
  "detectorModelVersionSummaries": [  
    {  
      "status": "ACTIVE",  
      "lastUpdateTime": 1560796816.077,  
      "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",  
      "creationTime": 1560796816.077,  
      "detectorModelArn": "arn:aws:iotevents:us-  
west-2:123456789012:detectorModel/motorDetectorModel",  
      "detectorModelName": "motorDetectorModel",  
      "detectorModelVersion": "1"  
    }  
  ]  
}
```

For more information, see [ListDetectorModelVersions](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [ListDetectorModelVersions](#) in *AWS CLI Command Reference*.

list-detector-models

The following code example shows how to use `list-detector-models`.

AWS CLI

To get a list of your detector models

The following `list-detector-models` example lists the detector models you have created. Only the metadata associated with each detector model is returned.

```
aws iotevents list-detector-models
```

Output:

```
{
  "detectorModelSummaries": [
    {
      "detectorModelName": "motorDetectorModel",
      "creationTime": 1552072424.212
      "detectorModelDescription": "Detect overpressure in a motor."
    }
  ]
}
```

For more information, see [ListDetectorModels](#) in the *AWS IoT Events Developer Guide*.*

- For API details, see [ListDetectorModels](#) in *AWS CLI Command Reference*.

list-detectors

The following code example shows how to use `list-detectors`.

AWS CLI

To get a list of detectors for a detector model

The following `list-detectors` example lists detectors (the instances of a detector model).

```
aws iotevents-data list-detectors \
  --detector-model-name motorDetectorModel
```

Output:

```
{
  "detectorSummaries": [
```

```
    {
      "lastUpdateTime": 1558129925.2,
      "creationTime": 1552073155.527,
      "state": {
        "stateName": "Normal"
      },
      "keyValue": "Fulton-A32",
      "detectorModelName": "motorDetectorModel",
      "detectorModelVersion": "1"
    }
  ]
}
```

For more information, see [ListDetectors](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [ListDetectors](#) in *AWS CLI Command Reference*.

list-inputs

The following code example shows how to use `list-inputs`.

AWS CLI

To list inputs

The following `list-inputs` example lists the inputs that you've created.

```
aws iotevents list-inputs
```

Output:

```
{
  "status": "ACTIVE",
  "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
  "lastUpdateTime": 1551742986.768,
  "creationTime": 1551742986.768,
  "inputName": "PressureInput",
  "inputDescription": "Pressure readings from a motor"
}
```

For more information, see [ListInputs](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [ListInputs](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags assigned to a resource

The following `list-tags-for-resource` example lists the tags (metadata) you have assigned to the resource.

```
aws iotevents list-tags-for-resource \  
  --resource-arn "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput"
```

Output:

```
{  
  "tags": [  
    {  
      "value": "motor",  
      "key": "deviceType"  
    }  
  ]  
}
```

For more information, see [ListTagsForResource](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-logging-options

The following code example shows how to use `put-logging-options`.

AWS CLI

To set logging options

The following `list-tags-for-resource` example sets or updates the AWS IoT Events logging options. If you update the value of any `loggingOptions` field, it takes up to one minute for the change to take effect. Also, if you change the policy attached to the role you specified in the `roleArn` field (for example, to correct an invalid policy) it takes up to five minutes for that change to take effect.

```
aws iotevents put-logging-options \  
  --cli-input-json file://logging-options.json
```

Contents of logging-options.json:

```
{  
  "loggingOptions": {  
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",  
    "level": "DEBUG",  
    "enabled": true,  
    "detectorDebugOptions": [  
      {  
        "detectorModelName": "motorDetectorModel",  
        "keyValue": "Fulton-A32"  
      }  
    ]  
  }  
}
```

This command produces no output.

For more information, see [PutLoggingOptions](#) in the *AWS IoT Events Developer Guide**

- For API details, see [PutLoggingOptions](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a resource

The following tag-resource example adds to or modifies the tags of the given resource. Tags are metadata that can be used to manage a resource.

```
aws iotevents tag-resource \  
  --cli-input-json file://pressureInput.tag.json
```

Contents of pressureInput.tag.json:

```
{
```

```
"resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
"tags": [
  {
    "key": "deviceType",
    "value": "motor"
  }
]
}
```

This command produces no output.

For more information, see [TagResource](#) in the *AWS IoT Events Developer Guide*.*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource

The following `untag-resource` example removes the specified tags from the resource.

```
aws iotevents untag-resource \
  --cli-input-json file://pressureInput.untag.json
```

Contents of `pressureInput.untag.json`:

```
{
  "resourceArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
  "tagKeys": [
    "deviceType"
  ]
}
```

This command produces no output.

For more information, see [UntagResource](#) in the *AWS IoT Events Developer Guide*.*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-detector-model

The following code example shows how to use `update-detector-model`.

AWS CLI

To update a detector model

The following `update-detector-model` example updates a detector model. Detectors (instances) spawned by the previous version are deleted and then re-created as new inputs arrive.

```
aws iotevents update-detector-model \  
  --cli-input-json file://motorDetectorModel.update.json
```

Contents of `motorDetectorModel.update.json`:

```
{  
  "detectorModelName": "motorDetectorModel",  
  "detectorModelDefinition": {  
    "states": [  
      {  
        "stateName": "Normal",  
        "onEnter": {  
          "events": [  
            {  
              "eventName": "init",  
              "condition": "true",  
              "actions": [  
                {  
                  "setVariable": {  
                    "variableName": "pressureThresholdBreach",  
                    "value": "0"  
                  }  
                }  
              ]  
            }  
          ]  
        },  
        "onInput": {  
          "transitionEvents": [  
            {  
              "eventName": "Overpressurized",
```

```
    "condition": "$input.PressureInput.sensorData.pressure > 70",
    "actions": [
      {
        "setVariable": {
          "variableName": "pressureThresholdBreachd",
          "value": "$variable.pressureThresholdBreachd + 3"
        }
      }
    ],
    "nextState": "Dangerous"
  }
]
},
{
  "stateName": "Dangerous",
  "onEnter": {
    "events": [
      {
        "eventName": "Pressure Threshold Breached",
        "condition": "$variable.pressureThresholdBreachd > 1",
        "actions": [
          {
            "sns": {
              "targetArn": "arn:aws:sns:us-
east-1:123456789012:underPressureAction"
            }
          }
        ]
      }
    ]
  },
  "onInput": {
    "events": [
      {
        "eventName": "Overpressurized",
        "condition": "$input.PressureInput.sensorData.pressure > 70",
        "actions": [
          {
            "setVariable": {
              "variableName": "pressureThresholdBreachd",
              "value": "3"
            }
          }
        ]
      }
    ]
  }
}
```

```
    ]
  },
  {
    "eventName": "Pressure Okay",
    "condition": "$input.PressureInput.sensorData.pressure <= 70",
    "actions": [
      {
        "setVariable": {
          "variableName": "pressureThresholdBreach",
          "value": "$variable.pressureThresholdBreach - 1"
        }
      }
    ]
  }
],
"transitionEvents": [
  {
    "eventName": "BackToNormal",
    "condition": "$input.PressureInput.sensorData.pressure <= 70 &&
$variable.pressureThresholdBreach <= 1",

{
  "detectorModelConfiguration": {
    "status": "ACTIVATING",
    "lastUpdateTime": 1560799387.719,
    "roleArn": "arn:aws:iam::123456789012:role/IoTEventsRole",
    "creationTime": 1560799387.719,
    "detectorModelArn": "arn:aws:iotevents:us-west-2:123456789012:detectorModel/
motorDetectorModel",
    "key": "motorid",
    "detectorModelName": "motorDetectorModel",
    "detectorModelVersion": "2"
  }
}
```

For more information, see [UpdateDetectorModel](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [UpdateDetectorModel](#) in *AWS CLI Command Reference*.

update-input

The following code example shows how to use `update-input`.

AWS CLI

To update an input

The following `update-input` example updates an input.

```
aws iotevents update-input \
  --cli-input-json file://pressureInput.json
```

Contents of `pressureInput.json`:

```
{
  "inputName": "PressureInput",
  "inputDescription": "Pressure readings from a motor",
```

```
"inputDefinition": {
  "attributes": [
    { "jsonPath": "sensorData.pressure" },
    { "jsonPath": "motorid" }
  ]
}
```

Output:

```
{
  "inputConfiguration": {
    "status": "ACTIVE",
    "inputArn": "arn:aws:iotevents:us-west-2:123456789012:input/PressureInput",
    "lastUpdateTime": 1560795976.458,
    "creationTime": 1560795312.542,
    "inputName": "PressureInput",
    "inputDescription": "Pressure readings from a motor"
  }
}
```

For more information, see [UpdateInput](#) in the *AWS IoT Events Developer Guide**.

- For API details, see [UpdateInput](#) in *AWS CLI Command Reference*.

AWS IoT Greengrass examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

associate-role-to-group

The following code example shows how to use `associate-role-to-group`.

AWS CLI

To associate a role with a Greengrass group

The following `associate-role-to-group` example associates the specified IAM role with a Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services. For example, your group role might grant permissions required for CloudWatch Logs integration.

```
aws greengrass associate-role-to-group \  
  --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b \  
  --role-arn arn:aws:iam::123456789012:role/GG-Group-Role
```

Output:

```
{  
  "AssociatedAt": "2019-09-10T20:03:30Z"  
}
```

For more information, see [Configure the Group Role](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [AssociateRoleToGroup](#) in *AWS CLI Command Reference*.

associate-service-role-to-account

The following code example shows how to use `associate-service-role-to-account`.

AWS CLI

To associate a service role with your AWS account

The following `associate-service-role-to-account` example associates an IAM service role, specified by its ARN, with AWS IoT Greengrass in your AWS account. You must have

previously created the service role in IAM, and you must associate a policy document with it that allows AWS IoT Greengrass to assume this role.

```
aws greengrass associate-service-role-to-account \
  --role-arn "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
```

Output:

```
{
  "AssociatedAt": "2019-06-25T18:12:45Z"
}
```

For more information, see [Greengrass Service Role](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [AssociateServiceRoleToAccount](#) in *AWS CLI Command Reference*.

create-connector-definition-version

The following code example shows how to use `create-connector-definition-version`.

AWS CLI

To create a connector definition version

The following `create-connector-definition-version` example creates a connector definition version and associates it with the specified connector definition. All connectors in a version define values for their parameters.

```
aws greengrass create-connector-definition-version \
  --connector-definition-id "55d0052b-0d7d-44d6-b56f-21867215e118" \
  --connectors "[{\\"Id\\": \\"MyTwilioNotificationsConnector\\",
  \\"ConnectorArn\\": \\"arn:aws:greengrass:us-west-2::/connectors/
  TwilioNotifications/versions/2\\", \\"Parameters\\": {\\"TWILIO_ACCOUNT_SID
  \\": \\"AC1a8d4204890840d7fc482aab38090d57\\", \\"TwilioAuthTokenSecretArn\\":
  \\"arn:aws:secretsmanager:us-west-2:123456789012:secret:greengrass-TwilioAuthToken-
  ntSlp6\\", \\"TwilioAuthTokenSecretArn-ResourceId\\": \\"TwilioAuthToken\\",
  \\"DefaultFromPhoneNumber\\": \\"4254492999\\"}]]"
```

Output:

```
{
```

```

    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/55d0052b-0d7d-44d6-b56f-21867215e118/versions/33f709a0-c825-49cb-9eea-
dc8964fbd635",
    "CreationTimestamp": "2019-06-24T20:46:30.134Z",
    "Id": "55d0052b-0d7d-44d6-b56f-21867215e118",
    "Version": "33f709a0-c825-49cb-9eea-dc8964fbd635"
}

```

- For API details, see [CreateConnectorDefinitionVersion](#) in *AWS CLI Command Reference*.

create-connector-definition

The following code example shows how to use `create-connector-definition`.

AWS CLI

To create a connector definition

The following `create-connector-definition` example creates a connector definition and an initial connector definition version. The initial version contains one connector. All connectors in a version define values for their parameters.

```

aws greengrass create-connector-definition \
  --name MySNSConnector \
  --initial-version "{\"Connectors\": [{\"Id\": \"MySNSConnector\", \"ConnectorArn\": \"arn:aws:greengrass:us-west-2:/connectors/SNS/versions/1\", \"Parameters\": {\"DefaultSNSArn\": \"arn:aws:sns:us-west-2:123456789012:GGConnectorTopic\"}}]}"

```

Output:

```

{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
  "CreationTimestamp": "2019-06-19T19:30:01.300Z",
  "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
  "LastUpdatedTimestamp": "2019-06-19T19:30:01.300Z",
  "LatestVersion": "63c57963-c7c2-4a26-a7e2-7bf478ea2623",

- For API details, see [CreateConnectorDefinition](#) in *AWS CLI Command Reference*.

create-core-definition-version

The following code example shows how to use `create-core-definition-version`.

AWS CLI

To create a core definition version

The following `create-core-definition-version` example creates a core definition version and associates it with the specified core definition. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition-version` command.

Create the AWS IoT thing that corresponds to the core device:

```
aws iot create-thing \  
  --thing-name "MyCoreDevice"
```

Output:

```
{  
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",  
  "thingName": "MyCoreDevice",  
  "thingId": "cb419a19-9099-4515-9cec-e9b0e760608a"  
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```
aws iot create-keys-and-certificate \  
  --set-as-active \  
  --certificate-pem-outfile "myCore.cert.pem" \  
  \
```

```
--public-key-outfile "myCore.public.key" \
--private-key-outfile "myCore.private.key"
```

Output:

```
{
  "certificateArn": "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
  "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCakGgAwIBATgIUCGq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
CERTIFICATE-----\n",
  "keyPair": {
    "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
PUBLIC KEY-----\n",
    "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbmXDCnOK4rMCxDR...fvY4+te\n-----END
RSA PRIVATE KEY-----\n"
  },
  "certificateId":
  "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```
aws iot create-policy \
  --policy-name "Core_Devices" \
  --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":"
  \"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
  \",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":"
  [\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],
  \"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource
  \":[\"*\"]}]}"
```

Output:

```
{
  "policyName": "Core_Devices",
  "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/Core_Devices",
  "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":"
  \"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect
```

```

\", \"iot:Receive\"], \"Resource\": [\"*\"]}, {\"Effect\": \"Allow\", \"Action\":
[\"iot:GetThingShadow\", \"iot:UpdateThingShadow\", \"iot>DeleteThingShadow\"],
\"Resource\": [\"*\"]}, {\"Effect\": \"Allow\", \"Action\": [\"greengrass:*\"], \"Resource
\": [\"*\"]}]}",
  "policyVersionId": "1"
}

```

Attach the policy to the certificate:

```

aws iot attach-policy \
  --policy-name "Core_Devices" \
  --target "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"

```

This command produces no output.

Attach the thing to the certificate:

```

aws iot attach-thing-principal \
  --thing-name "MyCoreDevice" \
  --principal "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"

```

This command produces no output.

Create the core definition version:

```

aws greengrass create-core-definition-version \
  --core-definition-id "582efe12-b05a-409e-9a24-a2ba1bcc4a12" \
  --cores "[{\"Id\": \"MyCoreDevice\", \"ThingArn\": \"arn:aws:iot:us-
west-2:123456789012:thing/MyCoreDevice\", \"CertificateArn\": \"arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz
\", \"SyncShadow\": true}]"

```

Output:

```

{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12/versions/3fdc1190-2ce5-44de-b98b-
eec8f9571014",
  "Version": "3fdc1190-2ce5-44de-b98b-eec8f9571014",
  "CreationTimestamp": "2019-09-18T00:15:09.838Z",

```

```
"Id": "582efe12-b05a-409e-9a24-a2ba1bcc4a12"
}
```

For more information, see [Configure the AWS IoT Greengrass Core](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateCoreDefinitionVersion](#) in *AWS CLI Command Reference*.

create-core-definition

The following code example shows how to use `create-core-definition`.

AWS CLI

Example 1: To create an empty core definition

The following `create-core-definition` example creates an empty (no initial version) Greengrass core definition. Before the core is usable, you must use the `create-core-definition-version` command to provide the other parameters for the core.

```
aws greengrass create-core-definition \
  --name cliGroup_Core
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/
b5c08008-54cb-44bd-9eec-c121b04283b5",
  "CreationTimestamp": "2019-06-25T18:23:22.106Z",
  "Id": "b5c08008-54cb-44bd-9eec-c121b04283b5",
  "LastUpdatedTimestamp": "2019-06-25T18:23:22.106Z",
  "Name": "cliGroup_Core"
}
```

Example 2: To create a core definition with an initial version

The following `create-core-definition` example creates a core definition that contains an initial core definition version. The version can contain one core only. Before you can create a core, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands, which return the `ThingArn` and `CertificateArn` required for the `create-core-definition` command.

Create the AWS IoT thing that corresponds to the core device:

```
aws iot create-thing \
  --thing-name "MyCoreDevice"
```

Output:

```
{
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice",
  "thingName": "MyCoreDevice",
  "thingId": "cb419a19-9099-4515-9cec-e9b0e760608a"
}
```

Create public and private keys and the core device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command.

```
aws iot create-keys-and-certificate \
  --set-as-active \
  --certificate-pem-outfile "myCore.cert.pem" \
  --public-key-outfile "myCore.public.key" \
  --private-key-outfile "myCore.private.key"
```

Output:

```
{
  "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz",
  "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
CERTIFICATE-----\n",
  "keyPair": {
    "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAAqKpRgnn6yq26U3y...wIDAQAB\n-----END
PUBLIC KEY-----\n",
    "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAAqKpRgnn6yq26U3yt5YFZquyukfRjBMXDcNOK4rMCxDR...fvY4+te\n-----END
RSA PRIVATE KEY-----\n"
  },
  "certificateId":
  "123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

```
}

```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy should be more restrictive.

```
aws iot create-policy \
  --policy-name "Core_Devices" \
  --policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":"
  "\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect\","
  "\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":"
  "\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot>DeleteThingShadow\"},\","
  "\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource\":"
  "\"*\"]}]}"
```

Output:

```
{
  "policyName": "Core_Devices",
  "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/Core_Devices",
  "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":"
  "\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect\","
  "\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":"
  "\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot>DeleteThingShadow\"},\","
  "\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource\":"
  "\"*\"]}]}",
  "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
  --policy-name "Core_Devices" \
  --target "arn:aws:iot:us-
west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Attach the thing to the certificate:

```
aws iot attach-thing-principal \
  --thing-name "MyCoreDevice" \
```

```
--principal "arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz"
```

This command produces no output.

Create the core definition:

```
aws greengrass create-core-definition \
  --name "MyCores" \
  --initial-version "{ \"Cores\": [{ \"Id\": \"MyCoreDevice\", \"ThingArn\": \"arn:aws:iot:us-west-2:123456789012:thing/MyCoreDevice\", \"CertificateArn\": \"arn:aws:iot:us-west-2:123456789012:cert/123a15ec415668c2349a76170b64ac0878231c1e21ec83c10e92a1EXAMPLExyz\", \"SyncShadow\": true } ] }"
```

Output:

```
{
  "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12/versions/cc87b5b3-8f4b-465d-944c-1d6de5dbfcdb",
  "Name": "MyCores",
  "LastUpdatedTimestamp": "2019-09-18T00:11:06.197Z",
  "LatestVersion": "cc87b5b3-8f4b-465d-944c-1d6de5dbfcdb",
  "CreationTimestamp": "2019-09-18T00:11:06.197Z",
  "Id": "582efe12-b05a-409e-9a24-a2ba1bcc4a12",
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/582efe12-b05a-409e-9a24-a2ba1bcc4a12"
}
```

For more information, see [Configure the AWS IoT Greengrass Core](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateCoreDefinition](#) in *AWS CLI Command Reference*.

create-deployment

The following code example shows how to use create-deployment.

AWS CLI

To create a deployment for a version of a Greengrass group

The following `create-deployment` example deploys the specified version of a Greengrass group.

```
aws greengrass create-deployment \  
  --deployment-type NewDeployment \  
  --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \  
  --group-version-id "dc40c1e9-e8c8-4d28-a84d-a9cad5f599c9"
```

Output:

```
{  
  "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/  
groups/ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca/deployments/bfceb608-4e97-45bc-  
af5c-460144270308",  
  "DeploymentId": "bfceb608-4e97-45bc-af5c-460144270308"  
}
```

For more information, see [Getting Started with Connectors \(CLI\)](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateDeployment](#) in *AWS CLI Command Reference*.

create-device-definition-version

The following code example shows how to use `create-device-definition-version`.

AWS CLI

To create a device definition version

The following `create-device-definition-version` example creates a device definition version and associates it with the specified device definition. The version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device:

```
aws iot create-thing \  
  --thing-name "InteriorTherm"
```

Output:

```
{
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/InteriorTherm",
  "thingName": "InteriorTherm",
  "thingId": "01d4763c-78a6-46c6-92be-7add080394bf"
}
```

Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command:

```
aws iot create-keys-and-certificate \
  --set-as-active \
  --certificate-pem-outfile "myDevice.cert.pem" \
  --public-key-outfile "myDevice.public.key" \
  --private-key-outfile "myDevice.private.key"
```

Output:

```
{
  "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
  "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCakGgAwIBATgIUCGq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
CERTIFICATE-----\n",
  "keyPair": {
    "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
PUBLIC KEY-----\n",
    "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjbmXDCnOK4rMCxDR...fvY4+te\n-----END
RSA PRIVATE KEY-----\n"
  },
  "certificateId":
  "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:

```
aws iot create-policy \
```

```
--policy-name "GG_Devices" \
--policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource\":[\"*\"]}]}"
```

Output:

```
{
  "policyName": "GG_Devices",
  "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/GG_Devices",
  "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow\",\"Action\":[\"iot:Publish\",\"iot:Subscribe\",\"iot:Connect\",\"iot:Receive\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"iot:GetThingShadow\",\"iot:UpdateThingShadow\",\"iot:DeleteThingShadow\"],\"Resource\":[\"*\"]},{\"Effect\":\"Allow\",\"Action\":[\"greengrass:*\"],\"Resource\":[\"*\"]}]}",
  "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
--policy-name "GG_Devices" \
--target "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

Attach the thing to the certificate

```
aws iot attach-thing-principal \
--thing-name "InteriorTherm" \
--principal "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

After you create and configure the IoT thing as shown above, use the `ThingArn` and `CertificateArn` from the first two commands in the following example.

```
aws greengrass create-device-definition-version \
--device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \
```

```
--devices "[{\\"Id\\":\\"InteriorTherm\\",\\"ThingArn\\":\\"arn:aws:iot:us-west-2:123456789012:thing/InteriorTherm\\",\\"CertificateArn\\":\\"arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92\\",\\"SyncShadow\\":true},{\\"Id\\":\\"ExteriorTherm\\",\\"ThingArn\\":\\"arn:aws:iot:us-west-2:123456789012:thing/ExteriorTherm\\",\\"CertificateArn\\":\\"arn:aws:iot:us-west-2:123456789012:cert/6c52ce1b47bde88a637e9ccdd45fe4e4c2c0a75a6866f8f63d980ee22fa51e02\\",\\"SyncShadow\\":true}]"
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/versions/83c13984-6fed-447e-84d5-5b8aa45d5f71",
  "Version": "83c13984-6fed-447e-84d5-5b8aa45d5f71",
  "CreationTimestamp": "2019-09-11T00:15:09.838Z",
  "Id": "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
}
```

- For API details, see [CreateDeviceDefinitionVersion](#) in *AWS CLI Command Reference*.

create-device-definition

The following code example shows how to use create-device-definition.

AWS CLI**To create a device definition**

The following create-device-definition example creates a device definition that contains an initial device definition version. The initial version defines two devices. Before you can create a Greengrass device, you must first create and provision the corresponding AWS IoT thing. This process includes the following `iot` commands that you must run to get the required information for the Greengrass command:

Create the AWS IoT thing that corresponds to the device:

```
aws iot create-thing \
  --thing-name "InteriorTherm"
```

Output:

```
{
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/InteriorTherm",
  "thingName": "InteriorTherm",
  "thingId": "01d4763c-78a6-46c6-92be-7add080394bf"
}
```

Create public and private keys and the device certificate for the thing. This example uses the `create-keys-and-certificate` command and requires write permissions to the current directory. Alternatively, you can use the `create-certificate-from-csr` command:

```
aws iot create-keys-and-certificate \
  --set-as-active \
  --certificate-pem-outfile "myDevice.cert.pem" \
  --public-key-outfile "myDevice.public.key" \
  --private-key-outfile "myDevice.private.key"
```

Output:

```
{
  "certificateArn": "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92",
  "certificatePem": "-----BEGIN CERTIFICATE-----
\nMIIDWTCAkGgAwIBATgIUCgq6EGqou6zFqWgIZRndgQEFW+gwDQYJKoZIhvc...KdGewQS\n-----END
CERTIFICATE-----\n",
  "keyPair": {
    "PublicKey": "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBzrqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAqKpRgnn6yq26U3y...wIDAQAB\n-----END
PUBLIC KEY-----\n",
    "PrivateKey": "-----BEGIN RSA PRIVATE KEY-----
\nMIIEowIABAKCAQEAqKpRgnn6yq26U3yt5YFZquyukfRjBMXDcNOK4rMCxDR...fvY4+te\n-----END
RSA PRIVATE KEY-----\n"
  },
  "certificateId":
  "66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
}
```

Create an AWS IoT policy that allows `iot` and `greengrass` actions. For simplicity, the following policy allows actions on all resources, but your policy can be more restrictive:

```
aws iot create-policy \
```

```
--policy-name "GG_Devices" \
--policy-document "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\": \"Allow\", \"Action\": [\"iot:Publish\", \"iot:Subscribe\", \"iot:Connect\", \"iot:Receive\"], \"Resource\": [\"*\"]}, {\"Effect\": \"Allow\", \"Action\": [\"iot:GetThingShadow\", \"iot:UpdateThingShadow\", \"iot:DeleteThingShadow\"], \"Resource\": [\"*\"]}, {\"Effect\": \"Allow\", \"Action\": [\"greengrass:*\"], \"Resource\": [\"*\"]}]}"
```

Output:

```
{
  "policyName": "GG_Devices",
  "policyArn": "arn:aws:iot:us-west-2:123456789012:policy/GG_Devices",
  "policyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\": \"Allow\", \"Action\": [\"iot:Publish\", \"iot:Subscribe\", \"iot:Connect\", \"iot:Receive\"], \"Resource\": [\"*\"]}, {\"Effect\": \"Allow\", \"Action\": [\"iot:GetThingShadow\", \"iot:UpdateThingShadow\", \"iot:DeleteThingShadow\"], \"Resource\": [\"*\"]}, {\"Effect\": \"Allow\", \"Action\": [\"greengrass:*\"], \"Resource\": [\"*\"]}]}",
  "policyVersionId": "1"
}
```

Attach the policy to the certificate:

```
aws iot attach-policy \
  --policy-name "GG_Devices" \
  --target "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

Attach the thing to the certificate

```
aws iot attach-thing-principal \
  --thing-name "InteriorTherm" \
  --principal "arn:aws:iot:us-west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92"
```

After you create and configure the IoT thing as shown above, use the ThingArn and CertificateArn from the first two commands in the following example.

```
aws greengrass create-device-definition \
```

```
--name "Sensors" \
--initial-version "{ \"Devices\": [{ \"Id\": \"InteriorTherm
\", \"ThingArn\": \"arn:aws:iot:us-west-2:123456789012:thing/
InteriorTherm\", \"CertificateArn\": \"arn:aws:iot:us-
west-2:123456789012:cert/66a415ec415668c2349a76170b64ac0878231c1e21ec83c10e92a18bd568eb92\",
\", \"SyncShadow\": true}, { \"Id\": \"ExteriorTherm\", \"ThingArn\": \"arn:aws:iot:us-
west-2:123456789012:thing/ExteriorTherm\", \"CertificateArn\": \"arn:aws:iot:us-
west-2:123456789012:cert/6c52ce1b47bde88a637e9ccdd45fe4e4c2c0a75a6866f8f63d980ee22fa51e02\",
\", \"SyncShadow\": true} ] } }
```

Output:

```
{
  "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/devices/f9ba083d-5ad4-4534-9f86-026a45df1ccd/

}
```

- For API details, see [CreateDeviceDefinition](#) in *AWS CLI Command Reference*.

create-function-definition-version

The following code example shows how to use `create-function-definition-version`.

AWS CLI

To create a version of the function definition

The following `create-function-definition-version` example creates a new version of the specified function definition. This version specifies a single function whose ID is `Hello-World-function`, allows access to the file system, and specifies a maximum memory size and timeout period.

```
aws greengrass create-function-definition-version \
```

```
--cli-input-json "{\"FunctionDefinitionId\": \"e626e8c9-3b8f-4bf3-9cdc-
d26ecdeb9fa3\", \"Functions\": [{\"Id\": \"Hello-World-function\", \"FunctionArn\":
\"arn:aws:lambda:us-
west-2:123456789012:function:Greengrass_HelloWorld_Counter:gghw-alias\"},
{\"FunctionConfiguration\": {\"Environment\": {\"AccessSysfs\": true}, \"Executable\":
\"greengrassHelloWorldCounter.function_handler\", \"MemorySize\": 16000, \"Pinned\":
false, \"Timeout\": 25}}]}"
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/functions/e626e8c9-3b8f-4bf3-9cdc-d26ecdeb9fa3/
versions/74abd1cc-637e-4abe-8684-9a67890f4043",
  "CreationTimestamp": "2019-06-25T22:03:43.376Z",
  "Id": "e626e8c9-3b8f-4bf3-9cdc-d26ecdeb9fa3",
  "Version": "74abd1cc-637e-4abe-8684-9a67890f4043"
}
```

- For API details, see [CreateFunctionDefinitionVersion](#) in *AWS CLI Command Reference*.

create-function-definition

The following code example shows how to use `create-function-definition`.

AWS CLI

To create a Lambda function definition

The following `create-function-definition` example creates a Lambda function definition and an initial version by providing a list of Lambda functions (in this case, a list of just one function named `TempMonitorFunction`) and their configurations. Before you can create the function definition, you need the Lambda function ARN. To create the function and its alias, use Lambda's `create-function` and `publish-version` commands. Lambda's `create-function` command requires the ARN of the execution role, even though AWS IoT Greengrass doesn't use that role because permissions are specified in the Greengrass group role. You can use the IAM `create-role` command to create an empty role to get an ARN to use with Lambda's `create-function` or you can use an existing execution role.

```
aws greengrass create-function-definition \
```

```
--name MyGreengrassFunctions \
--initial-version "{\"Functions\": [{\"Id\": \"TempMonitorFunction\",
\"FunctionArn\": \"arn:aws:lambda:us-
west-2:123456789012:function:TempMonitor:GG_TempMonitor\", \"FunctionConfiguration
\": {\"Executable\": \"temp_monitor.function_handler\", \"MemorySize\": 16000,
\"Timeout\": 5}}]}}"
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
functions/3b0d0080-87e7-48c6-b182-503ec743a08b",
  "CreationTimestamp": "2019-06-19T22:24:44.585Z",
  "Id": "3b0d0080-87e7-48c6-b182-503ec743a08b",
  "LastUpdatedTimestamp": "2019-06-19T22:24:44.585Z",
  "LatestVersion": "67f918b9-efb4-40b0-b87c-de8c9faf085b",
  "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/versions/67f918b9-
efb4-40b0-b87c-de8c9faf085b",
  "Name": "MyGreengrassFunctions"
}
```

For more information, see [How to Configure Local Resource Access Using the AWS Command Line Interface](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateFunctionDefinition](#) in *AWS CLI Command Reference*.

create-group-certificate-authority

The following code example shows how to use `create-group-certificate-authority`.

AWS CLI**To create a certificate authority (CA) for a group**

The following `create-group-certificate-authority` example creates or rotates a CA for the specified group.

```
aws greengrass create-group-certificate-authority \
--group-id "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1"
```

Output:

```
{
  "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/groups/8eaadd72-ce4b-4f15-892a-0cc4f3a343f1/certificateauthorities/
d31630d674c4437f6c5dbc0dca56312a902171ce2d086c38e509c8EXAMPLEecc5"
}
```

For more information, see [AWS IoT Greengrass Security](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateGroupCertificateAuthority](#) in *AWS CLI Command Reference*.

create-group-version

The following code example shows how to use `create-group-version`.

AWS CLI

To create a version of a Greengrass group

The following `create-group-version` example creates a group version and associates it with the specified group. The version references the core, resource, connector, function, and subscription versions that contain the entities to include in this group version. You must create these entities before you can create the group version.

To create a resource definition with an initial version, use the `create-resource-definition` command. To create a connector definition with an initial version, use the `create-connector-definition` command. To create a function definition with an initial version, use the `create-function-definition` command. To create a subscription definition with an initial version, use the `create-subscription-definition` command. To retrieve the ARN of the latest core definition version, use the `get-group-version` command and specify the ID of the latest group version.

```
aws greengrass create-group-version \
  --group-id "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca" \
  --core-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/cores/6a630442-8708-4838-ad36-eb98849d975e/
versions/6c87151b-1fb4-4cb2-8b31-6ee715d8f8ba" \
  --resource-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/
a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1" \
```

```

--connector-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/connectors/55d0052b-0d7d-44d6-b56f-21867215e118/versions/78a3331b-895d-489b-8823-17b4f9f418a0" \
--function-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/functions/3b0d0080-87e7-48c6-b182-503ec743a08b/versions/67f918b9-efb4-40b0-b87c-de8c9faf085b" \
--subscription-definition-version-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/subscriptions/9d611d57-5d5d-44bd-a3b4-fecbbdd69112/versions/aa645c47-ac90-420d-9091-8c7ffa4f103f"

```

Output:

```

{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca/versions/e10b0459-4345-4a09-88a4-1af1f5d34638",
  "CreationTimestamp": "2019-06-20T18:42:47.020Z",
  "Id": "ce2e7d01-3240-4c24-b8e6-f6f6e7a9eeca",
  "Version": "e10b0459-4345-4a09-88a4-1af1f5d34638"
}

```

For more information, see [Overview of the AWS IoT Greengrass Group Object Model](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateGroupVersion](#) in *AWS CLI Command Reference*.

create-group

The following code example shows how to use create-group.

AWS CLI

To create a Greengrass group

The following create-group example creates a group named cli-created-group.

```

aws greengrass create-group \
  --name cli-created-group

```

Output:

```

{

```

```

    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
groups/4e22bd92-898c-436b-ade5-434d883ff749",
    "CreationTimestamp": "2019-06-25T18:07:17.688Z",
    "Id": "4e22bd92-898c-436b-ade5-434d883ff749",
    "LastUpdatedTimestamp": "2019-06-25T18:07:17.688Z",
    "Name": "cli-created-group"
}

```

For more information, see [Overview of the AWS IoT Greengrass Group Object Model](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateGroup](#) in *AWS CLI Command Reference*.

create-logger-definition-version

The following code example shows how to use `create-logger-definition-version`.

AWS CLI

To create a logger definition version

The following `create-logger-definition-version` example creates a logger definition version and associates it with a logger definition. The version defines four logging configurations: 1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, 3) system component logs in Amazon CloudWatch Logs, and 4) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```

aws greengrass create-logger-definition-version \
  --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0" \
  --loggers "[{\\"Id\\":\\"1\\",\\"Component\\":\\"GreengrassSystem\\",\\"Level\\":\\"ERROR\\",\\"Space\\":10240,\\"Type\\":\\"FileSystem\\"},{\\"Id\\":\\"2\\",\\"Component\\":\\"Lambda\\",\\"Level\\":\\"INFO\\",\\"Space\\":10240,\\"Type\\":\\"FileSystem\\"},{\\"Id\\":\\"3\\",\\"Component\\":\\"GreengrassSystem\\",\\"Level\\":\\"WARN\\",\\"Type\\":\\"AWSCloudWatch\\"},{\\"Id\\":\\"4\\",\\"Component\\":\\"Lambda\\",\\"Level\\":\\"INFO\\",\\"Type\\":\\"AWSCloudWatch\\"}]"

```

Output:

```
{
```

```

"Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/loggers/
a454b62a-5d56-4ca9-bdc4-8254e1662cb0/versions/49aedb1e-01a3-4d39-9871-3a052573f1ea",
"Version": "49aedb1e-01a3-4d39-9871-3a052573f1ea",
"CreationTimestamp": "2019-07-24T00:04:48.523Z",
"Id": "a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
}

```

For more information, see [Monitoring with AWS IoT Greengrass Logs](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateLoggerDefinitionVersion](#) in *AWS CLI Command Reference*.

create-logger-definition

The following code example shows how to use `create-logger-definition`.

AWS CLI

To create a logger definition

The following `create-logger-definition` example creates a logger definition that contains an initial logger definition version. The initial version defines three logging configurations:

1) system component logs on the file system of the core device, 2) user-defined Lambda function logs on the file system of the core device, and 3) user-defined Lambda function logs in Amazon CloudWatch Logs. Note: For CloudWatch Logs integration, your group role must grant appropriate permissions.

```

aws greengrass create-logger-definition \
  --name "LoggingConfigs" \
  --initial-version "{\"Loggers\":{\"Id\":\"1\",\"Component\":\"GreengrassSystem
\", \"Level\":\"ERROR\", \"Space\":10240, \"Type\":\"FileSystem\"}, {\"Id\":
\"2\", \"Component\":\"Lambda\", \"Level\":\"INFO\", \"Space\":10240, \"Type\":
\"FileSystem\"}, {\"Id\":\"3\", \"Component\":\"Lambda\", \"Level\":\"INFO\", \"Type\":
\"AWSCloudWatch\"}}}"

```

Output:

```

{
  "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/loggers/a454b62a-5d56-4ca9-bdc4-8254e1662cb0/versions/de1d9854-1588-4525-
b25e-b378f60f2322",

```

```

    "Name": "LoggingConfigs",
    "LastUpdatedTimestamp": "2019-07-23T23:52:17.165Z",
    "LatestVersion": "de1d9854-1588-4525-b25e-b378f60f2322",
    "CreationTimestamp": "2019-07-23T23:52:17.165Z",
    "Id": "a454b62a-5d56-4ca9-bdc4-8254e1662cb0",
    "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
loggers/a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
}

```

For more information, see [Monitoring with AWS IoT Greengrass Logs](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateLoggerDefinition](#) in *AWS CLI Command Reference*.

create-resource-definition-version

The following code example shows how to use `create-resource-definition-version`.

AWS CLI

To create a version of a resource definition

The following `create-resource-definition-version` example creates a new version of a `TwilioAuthToken`.

```

aws greengrass create-resource-definition-version \
  --resource-definition-id "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38" \
  --resources "[{"Id": \"TwilioAuthToken\", \"Name\": \"MyTwilioAuthToken
\", \"ResourceDataContainer\": {\"SecretsManagerSecretResourceData\": {\"ARN\":
\"arn:aws:secretsmanager:us-west-2:123456789012:secret:greengrass-TwilioAuthToken-
ntS1p6\"}}}]]"

```

Output:

```

{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/b3bcada0-5fb6-42df-
bf0b-1ee4f15e769e",
  "CreationTimestamp": "2019-06-24T21:17:25.623Z",
  "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",
  "Version": "b3bcada0-5fb6-42df-bf0b-1ee4f15e769e"
}

```

- For API details, see [CreateResourceDefinitionVersion](#) in *AWS CLI Command Reference*.

create-resource-definition

The following code example shows how to use `create-resource-definition`.

AWS CLI

To create a resource definition

The following `create-resource-definition` example creates a resource definition that contains a list of resources to be used in a Greengrass group. In this example, an initial version of the resource definition is included by providing a list of resources. The list includes one resource for a Twilio authorization token and the ARN for a secret stored in AWS Secrets Manager. You must create the secret before you can create the resource definition.

```
aws greengrass create-resource-definition \  
  --name MyGreengrassResources \  
  --initial-version "{\"Resources\": [{\"Id\": \"TwilioAuthToken\  
\", \"Name\": \"MyTwilioAuthToken\", \"ResourceDataContainer\":  
  {\"SecretsManagerSecretResourceData\": {\"ARN\": \"arn:aws:secretsmanager:us-  
west-2:123456789012:secret:greengrass-TwilioAuthToken-ntSlp6\"}}}]}"
```

Output:

```
{  
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/  
resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",  
  "CreationTimestamp": "2019-06-19T21:51:28.212Z",  
  "Id": "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38",  
  "LastUpdatedTimestamp": "2019-06-19T21:51:28.212Z",  
  "LatestVersion": "a5f94d0b-f6bc-40f4-bb78-7a1c5fe13ba1",  
  "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/  
definition/resources/c8bb9ebc-c3fd-40a4-9c6a-568d75569d38/versions/a5f94d0b-  
f6bc-40f4-bb78-7a1c5fe13ba1",  
  "Name": "MyGreengrassResources"  
}
```

For more information, see [How to Configure Local Resource Access Using the AWS Command Line Interface](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateResourceDefinition](#) in *AWS CLI Command Reference*.

create-software-update-job

The following code example shows how to use `create-software-update-job`.

AWS CLI

To create a software update job for a core

The following `create-software-update-job` example creates an over-the-air (OTA) update job to update the AWS IoT Greengrass Core software on the core whose name is `MyFirstGroup_Core`. This command requires an IAM role that allows access to software update packages in Amazon S3 and includes `iot.amazonaws.com` as a trusted entity.

```
aws greengrass create-software-update-job \  
  --update-targets-architecture armv7l \  
  --update-targets ["arn:aws:iot:us-west-2:123456789012:thing/MyFirstGroup_Core \  
  \"] \  
  --update-targets-operating-system raspbian \  
  --software-to-update core \  
  --s3-url-signer-role arn:aws:iam::123456789012:role/OTA_signer_role \  
  --update-agent-log-level WARN
```

Output:

```
{  
  "IotJobId": "GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",  
  "IotJobArn": "arn:aws:iot:us-west-2:123456789012:job/  
GreengrassUpdateJob_30b353e3-3af7-4786-be25-4c446663c09e",  
  "PlatformSoftwareVersion": "1.9.3"  
}
```

For more information, see [OTA Updates of AWS IoT Greengrass Core Software](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateSoftwareUpdateJob](#) in *AWS CLI Command Reference*.

create-subscription-definition-version

The following code example shows how to use `create-subscription-definition-version`.

AWS CLI

To create a new version of a subscription definition

The following `create-subscription-definition-version` example creates a new version of a subscription definition that contains three subscriptions: a trigger notification, a temperature input, and an output status.

```
aws greengrass create-subscription-definition-version \
  --subscription-definition-id "9d611d57-5d5d-44bd-a3b4-feccbdd69112" \
  --subscriptions "[{\\"Id\\": \\"TriggerNotification\\", \\"Source\\":
  \\"arn:aws:lambda:us-west-2:123456789012:function:TempMonitor:GG_TempMonitor
  \\", \\"Subject\\": \\"twilio/txt\\", \\"Target\\": \\"arn:aws:greengrass:us-west-2:/:
  connectors/TwilioNotifications/versions/1\\"},{\\"Id\\": \\"TemperatureInput\\", \\"Source
  \\": \\"cloud\\", \\"Subject\\": \\"temperature/input\\", \\"Target\\": \\"arn:aws:lambda:us-
  west-2:123456789012:function:TempMonitor:GG_TempMonitor\\"},{\\"Id\\": \\"OutputStatus
  \\", \\"Source\\": \\"arn:aws:greengrass:us-west-2:/:connectors/TwilioNotifications/
  versions/1\\"},{\\"Subject\\": \\"twilio/message/status\\", \\"Target\\": \\"cloud\\"}]]"
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/

```

- For API details, see [CreateSubscriptionDefinitionVersion](#) in *AWS CLI Command Reference*.

create-subscription-definition

The following code example shows how to use `create-subscription-definition`.

AWS CLI

To create a subscription definition

The following `create-subscription-definition` example creates a subscription definition and specifies its initial version. The initial version contains three subscriptions: one for the

MQTT topic to which the connector subscribes, one to allow a function to receive temperature readings from AWS IoT, and one to allow AWS IoT to receive status information from the connector. The example provides the ARN for the Lambda function alias that was created earlier by using Lambda's `create-alias` command.

```
aws greengrass create-subscription-definition \
  --initial-version "{\"Subscriptions\": [{\"Id\":
  \"TriggerNotification\", \"Source\": \"arn:aws:lambda:us-
  west-2:123456789012:function:TempMonitor:GG_TempMonitor\", \"Subject\":
  \"twilio/txt\", \"Target\": \"arn:aws:greengrass:us-west-2::/connectors/
  TwilioNotifications/versions/1\"},{\"Id\": \"TemperatureInput\", \"Source\":
  \"cloud\", \"Subject\": \"temperature/input\", \"Target\": \"arn:aws:lambda:us-
  west-2:123456789012:function:TempMonitor:GG_TempMonitor\"},{\"Id\": \"OutputStatus
  \", \"Source\": \"arn:aws:greengrass:us-west-2::/connectors/TwilioNotifications/
  versions/1\", \"Subject\": \"twilio/message/status\", \"Target\": \"cloud\"}]}"
```

Output:

```
{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
  subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112",
  "CreationTimestamp": "2019-06-19T22:34:26.677Z",
  "Id": "9d611d57-5d5d-44bd-a3b4-feccbdd69112",
  "LastUpdatedTimestamp": "2019-06-19T22:34:26.677Z",
  "LatestVersion": "aa645c47-ac90-420d-9091-8c7ffa4f103f",
  "LatestVersionArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
  definition/subscriptions/9d611d57-5d5d-44bd-a3b4-feccbdd69112/versions/aa645c47-
  ac90-420d-9091-8c7ffa4f103f"
}
```

For more information, see [Getting Started with Connectors \(CLI\)](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [CreateSubscriptionDefinition](#) in *AWS CLI Command Reference*.

delete-connector-definition

The following code example shows how to use `delete-connector-definition`.

AWS CLI

To delete a connector definition

The following `delete-connector-definition` example deletes the specified Greengrass connector definition. If you delete a connector definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-connector-definition \  
  --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

This command produces no output.

- For API details, see [DeleteConnectorDefinition](#) in *AWS CLI Command Reference*.

delete-core-definition

The following code example shows how to use `delete-core-definition`.

AWS CLI

To delete a core definition

The following `delete-core-definition` example deletes the specified Greengrass core definition, including all versions. If you delete a core that is associated with a Greengrass group, that group can't be deployed successfully.

```
aws greengrass delete-core-definition \  
  --core-definition-id "ff36cc5f-9f98-4994-b468-9d9b6dc52abd"
```

This command produces no output.

- For API details, see [DeleteCoreDefinition](#) in *AWS CLI Command Reference*.

delete-device-definition

The following code example shows how to use `delete-device-definition`.

AWS CLI

To delete a device definition

The following `delete-device-definition` example deletes the specified device definition, including all of its versions. If you delete a device definition version that is used by a group version, the group version cannot be deployed successfully.

```
aws greengrass delete-device-definition \  
  --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd"
```

This command produces no output.

- For API details, see [DeleteDeviceDefinition](#) in *AWS CLI Command Reference*.

delete-function-definition

The following code example shows how to use delete-function-definition.

AWS CLI

To delete a function definition

The following delete-function-definition example deletes the specified Greengrass function definition. If you delete a function definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-function-definition \  
  --function-definition-id "fd4b906a-dff3-4c1b-96eb-52ebfcfac06a"
```

This command produces no output.

- For API details, see [DeleteFunctionDefinition](#) in *AWS CLI Command Reference*.

delete-group

The following code example shows how to use delete-group.

AWS CLI

To delete a group

The following delete-group example deletes the specified Greengrass group.

```
aws greengrass delete-group \  
  --group-id "4e22bd92-898c-436b-ade5-434d883ff749"
```

This command produces no output.

- For API details, see [DeleteGroup](#) in *AWS CLI Command Reference*.

delete-logger-definition

The following code example shows how to use `delete-logger-definition`.

AWS CLI

To delete a logger definition

The following `delete-logger-definition` example deletes the specified logger definition, including all logger definition versions. If you delete a logger definition version that is used by a group version, the group version cannot be deployed successfully.

```
aws greengrass delete-logger-definition \  
  --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0"
```

This command produces no output.

For more information, see [Monitoring with AWS IoT Greengrass Logs](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [DeleteLoggerDefinition](#) in *AWS CLI Command Reference*.

delete-resource-definition

The following code example shows how to use `delete-resource-definition`.

AWS CLI

To delete a resource definition

The following `delete-resource-definition` example deletes the specified resource definition, including all resource versions. If you delete a resource definition that is used by a group, that group can't be deployed successfully.

```
aws greengrass delete-resource-definition \  
  --resource-definition-id "ad8c101d-8109-4b0e-b97d-9cc5802ab658"
```

This command produces no output.

- For API details, see [DeleteResourceDefinition](#) in *AWS CLI Command Reference*.

delete-subscription-definition

The following code example shows how to use `delete-subscription-definition`.

AWS CLI

To delete a subscription definition

The following `delete-subscription-definition` example deletes the specified Greengrass subscription definition. If you delete a subscription that is being used by a group, that group can't be deployed successfully.

```
aws greengrass delete-subscription-definition \  
  --subscription-definition-id "cd6f1c37-d9a4-4e90-be94-01a7404f5967"
```

This command produces no output.

- For API details, see [DeleteSubscriptionDefinition](#) in *AWS CLI Command Reference*.

disassociate-role-from-group

The following code example shows how to use `disassociate-role-from-group`.

AWS CLI

To disassociate the role from a Greengrass group

The following `disassociate-role-from-group` example disassociates the IAM role from the specified Greengrass group.

```
aws greengrass disassociate-role-from-group \  
  --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b
```

Output:

```
{  
  "DisassociatedAt": "2019-09-10T20:05:49Z"
```

```
}
```

For more information, see [Configure the Group Role](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [DisassociateRoleFromGroup](#) in *AWS CLI Command Reference*.

disassociate-service-role-from-account

The following code example shows how to use `disassociate-service-role-from-account`.

AWS CLI

To disassociate a service role from your AWS account

The following `disassociate-service-role-from-account` example removes the service role that is associated with your AWS account. If you are not using the service role in any AWS Region, use the `delete-role-policy` command to detach the `AWSGreengrassResourceAccessRolePolicy` managed policy from the role, and then use the `delete-role` command to delete the role.

```
aws greengrass disassociate-service-role-from-account
```

Output:

```
{
  "DisassociatedAt": "2019-06-25T22:12:55Z"
}
```

For more information, see [Greengrass Service Role](#) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see [DisassociateServiceRoleFromAccount](#) in *AWS CLI Command Reference*.

get-associated-role

The following code example shows how to use `get-associated-role`.

AWS CLI

To get the role associated with a Greengrass group

The following `get-associated-role` example gets the IAM role that's associated with the specified Greengrass group. The group role is used by local Lambda functions and connectors to access AWS services.

```
aws greengrass get-associated-role \  
  --group-id 2494ee3f-7f8a-4e92-a78b-d205f808b84b
```

Output:

```
{  
  "RoleArn": "arn:aws:iam::123456789012:role/GG-Group-Role",  
  "AssociatedAt": "2019-09-10T20:03:30Z"  
}
```

For more information, see [Configure the Group Role](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [GetAssociatedRole](#) in *AWS CLI Command Reference*.

get-bulk-deployment-status

The following code example shows how to use `get-bulk-deployment-status`.

AWS CLI

To check the status of your bulk deployment

The following `get-bulk-deployment-status` example retrieves status information for the specified bulk deployment operation. In this example, the file that specified the groups to be deployed has an invalid input record.

```
aws greengrass get-bulk-deployment-status \  
  --bulk-deployment-id "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
```

Output:

```
{  
  "BulkDeploymentMetrics": {  
    "InvalidInputRecords": 1,  
    "RecordsProcessed": 1,  
    "RetryAttempts": 0  
  },  
}
```

```
"BulkDeploymentStatus": "Completed",
"CreatedAt": "2019-06-25T16:11:33.265Z",
"tags": {}
}
```

For more information, see [Create Bulk Deployments for Groups](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [GetBulkDeploymentStatus](#) in *AWS CLI Command Reference*.

get-connectivity-info

The following code example shows how to use `get-connectivity-info`.

AWS CLI

To get the connectivity information for a Greengrass core

The following `get-connectivity-info` example displays the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata.

```
aws greengrass get-connectivity-info \
  --thing-name "MyGroup_Core"
```

Output:

```
{
  "ConnectivityInfo": [
    {
      "Metadata": "",
      "PortNumber": 8883,
      "HostAddress": "127.0.0.1",
      "Id": "AUTOIP_127.0.0.1_0"
    },
    {
      "Metadata": "",
      "PortNumber": 8883,
      "HostAddress": "192.168.1.3",
      "Id": "AUTOIP_192.168.1.3_1"
    },
    {
```

```

        "Metadata": "",
        "PortNumber": 8883,
        "HostAddress": ":::1",
        "Id": "AUTOIP_:::1_2"
    },
    {
        "Metadata": "",
        "PortNumber": 8883,
        "HostAddress": "fe80::1e69:ed93:f5b:f6d",
        "Id": "AUTOIP_fe80::1e69:ed93:f5b:f6d_3"
    }
]
}

```

- For API details, see [GetConnectivityInfo](#) in *AWS CLI Command Reference*.

get-connector-definition-version

The following code example shows how to use `get-connector-definition-version`.

AWS CLI

To retrieve information about a specific version of a connector definition

The following `get-connector-definition-version` example retrieves information about the specified version of the specified connector definition. To retrieve the IDs of all versions of the connector definition, use the `list-connector-definition-versions` command. To retrieve the ID of the last version added to the connector definition, use the `get-connector-definition` command and check the `LatestVersion` property.

```

aws greengrass get-connector-definition-version \
  --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8" \
  --connector-definition-version-id "63c57963-c7c2-4a26-a7e2-7bf478ea2623"

```

Output:

```

{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-c7c2-4a26-

  "CreationTimestamp": "2019-06-19T19:30:01.300Z",

```

```

    "Definition": {
      "Connectors": [
        {
          "ConnectorArn": "arn:aws:greengrass:us-west-2::/connectors/SNS/
versions/1",
          "Id": "MySNSConnector",
          "Parameters": {
            "DefaultSNSArn": "arn:aws:sns:us-
west-2:123456789012:GGConnectorTopic"
          }
        }
      ]
    },
    "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",
    "Version": "63c57963-c7c2-4a26-a7e2-7bf478ea2623"
  }
}

```

For more information, see [Integrate with Services and Protocols Using Greengrass Connectors](#) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see [GetConnectorDefinitionVersion](#) in *AWS CLI Command Reference*.

get-connector-definition

The following code example shows how to use `get-connector-definition`.

AWS CLI

To retrieve information about a connector definition

The following `get-connector-definition` example retrieves information about the specified connector definition. To retrieve the IDs of your connector definitions, use the `list-connector-definitions` command.

```

aws greengrass get-connector-definition \
  --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"

```

Output:

```

{

}

```

For more information, see [Integrate with Services and Protocols Using Greengrass Connectors](#) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see [GetConnectorDefinition](#) in *AWS CLI Command Reference*.

get-core-definition-version

The following code example shows how to use `get-core-definition-version`.

AWS CLI

To retrieve details about a specific version of the Greengrass core definition

The following `get-core-definition-version` example retrieves information about the specified version of the specified core definition. To retrieve the IDs of all versions of the core definition, use the `list-core-definition-versions` command. To retrieve the ID of the last version added to the core definition, use the `get-core-definition` command and check the `LatestVersion` property.

```

aws greengrass get-core-definition-version \
  --core-definition-id "c906ed39-a1e3-4822-a981-7b9bd57b4b46" \
  --core-definition-version-id "42aeeac3-fd9d-4312-a8fd-ffa9404a20e0"

```

Output:

```

{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/cores/

  }

```

- For API details, see [GetCoreDefinitionVersion](#) in *AWS CLI Command Reference*.

get-core-definition

The following code example shows how to use `get-core-definition`.

AWS CLI

To retrieve details for a Greengrass core definition

The following `get-core-definition` example retrieves information about the specified core definition. To retrieve the IDs of your core definitions, use the `list-core-definitions` command.

```

aws greengrass get-core-definition \
  --core-definition-id "c906ed39-a1e3-4822-a981-7b9bd57b4b46"

```

Output:

get-deployment-status

The following code example shows how to use `get-deployment-status`.

AWS CLI

To retrieve the status of a deployment

The following `get-deployment-status` example retrieves the status for the specified deployment of the specified Greengrass group. To get the deployment ID, use the `list-deployments` command and specify the group ID.

```
aws greengrass get-deployment-status \
  --group-id "1013db12-8b58-45ff-acc7-704248f66731" \
  --deployment-id "1065b8a0-812b-4f21-9d5d-e89b232a530f"
```

Output:

```
{
  "DeploymentStatus": "Success",
  "DeploymentType": "NewDeployment",
  "UpdatedAt": "2019-06-18T17:04:44.761Z"
}
```

- For API details, see [GetDeploymentStatus](#) in *AWS CLI Command Reference*.

get-device-definition-version

The following code example shows how to use `get-device-definition-version`.

AWS CLI

To get a device definition version

The following `get-device-definition-version` example retrieves information about the specified version of the specified device definition. To retrieve the IDs of all versions of the device definition, use the `list-device-definition-versions` command. To retrieve the ID of the last version added to the device definition, use the `get-device-definition` command and check the `LatestVersion` property.

```
aws greengrass get-device-definition-version \
  --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \
  --device-definition-version-id "83c13984-6fed-447e-84d5-5b8aa45d5f71"
```

Output:

get-function-definition-version

The following code example shows how to use `get-function-definition-version`.

AWS CLI

To retrieve details about a specific version of a Lambda function

The following `get-function-definition-version` retrieves information about the specified version of the specified function definition. To retrieve the IDs of all versions of the function definition, use the `list-function-definition-versions` command. To retrieve the ID of the last version added to the function definition, use the `get-function-definition` command and check the `LatestVersion` property.

```
aws greengrass get-function-definition-version \  
  --function-definition-id "063f5d1a-1dd1-40b4-9b51-56f8993d0f85" \  
  --function-definition-version-id "9748fda7-1589-4fcc-ac94-f5559e88678b"
```

Output:

```
{  
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/

get-function-definition

The following code example shows how to use `get-function-definition`.

AWS CLI

To retrieve a function definition

The following `get-function-definition` example displays details for the specified function definition. To retrieve the IDs of your function definitions, use the `list-function-definitions` command.

```

aws greengrass get-function-definition \
  --function-definition-id "063f5d1a-1dd1-40b4-9b51-56f8993d0f85"

```

Output:

```

{
  "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/definition/
functions/063f5d1a-1dd1-40b4-9b51-56f8993d0f85",

get-group-certificate-authority

The following code example shows how to use `get-group-certificate-authority`.

AWS CLI

To retrieve the CA associated with a Greengrass group

The following `get-group-certificate-authority` example retrieves the certificate authority (CA) that is associated with the specified Greengrass group. To get the certificate authority ID, use the `list-group-certificate-authorities` command and specify the group ID.

```
aws greengrass get-group-certificate-authority \
  --group-id "1013db12-8b58-45ff-acc7-704248f66731" \
  --certificate-authority-id
  "f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6"
```

Output:

```
{
  "GroupCertificateAuthorityArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1013db12-8b58-45ff-acc7-704248f66731/certificateauthorities/f0430e1736ea8ed30cc5d5de9af67a7e3586bad9ae4d89c2a44163f65fdd8cf6",

get-group-certificate-configuration

The following code example shows how to use `get-group-certificate-configuration`.

AWS CLI

To retrieve the configuration for the certificate authority used by the Greengrass group

The following `get-group-certificate-configuration` example retrieves the configuration for the certificate authority (CA) used by the specified Greengrass group.

```
aws greengrass get-group-certificate-configuration \  
  --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{  
  "CertificateAuthorityExpiryInMilliseconds": 2524607999000,  
  "CertificateExpiryInMilliseconds": 604800000,  
  "GroupId": "1013db12-8b58-45ff-acc7-704248f66731"  
}
```

- For API details, see [GetGroupCertificateConfiguration](#) in *AWS CLI Command Reference*.

get-group-version

The following code example shows how to use `get-group-version`.

AWS CLI

To retrieve information about a version of a Greengrass group

The following `get-group-version` example retrieves information about the specified version of the specified group. To retrieve the IDs of all versions of the group, use the `list-group-versions` command. To retrieve the ID of the last version added to the group, use the `get-group` command and check the `LatestVersion` property.

```
aws greengrass get-group-version \  
  --group-id "1013db12-8b58-45ff-acc7-704248f66731" \  
  --group-version-id "115136b3-cfd7-4462-b77f-8741a4b00e5e"
```

get-service-role-for-account

The following code example shows how to use `get-service-role-for-account`.

AWS CLI

To retrieve the details for the service role that is attached to your account

The following `get-service-role-for-account` example retrieves information about the service role that is attached to your AWS account.

```
aws greengrass get-service-role-for-account
```

Output:

```
{
  "AssociatedAt": "2018-10-18T15:59:20Z",
  "RoleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see [Greengrass Service Role](#) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see [GetServiceRoleForAccount](#) in *AWS CLI Command Reference*.

get-subscription-definition-version

The following code example shows how to use `get-subscription-definition-version`.

AWS CLI

To retrieve information about a specific version of a subscription definition

The following `get-subscription-definition-version` example retrieves information about the specified version of the specified subscription definition. To retrieve the IDs of all versions of the subscription definition, use the `list-subscription-definition-versions` command. To retrieve the ID of the last version added to the subscription definition, use the `get-subscription-definition` command and check the `LatestVersion` property.

```
aws greengrass get-subscription-definition-version \
  --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152" \
  --subscription-definition-version-id "88ae8699-12ac-4663-ba3f-4d7f0519140b"
```

Output:

get-thing-runtime-configuration

The following code example shows how to use `get-thing-runtime-configuration`.

AWS CLI

To retrieve the runtime configuration of a Greengrass core

The following `get-thing-runtime-configuration` example retrieves the runtime configuration of a Greengrass core. Before you can retrieve the runtime configuration, you must use the `update-thing-runtime-configuration` command to create a runtime configuration for the core.

```

aws greengrass get-thing-runtime-configuration \
  --thing-name SampleGreengrassCore

```

Output:

```

{
  "RuntimeConfiguration": {
    "TelemetryConfiguration": {
      "ConfigurationSyncStatus": "OutOfSync",
      "Telemetry": "On"
    }
  }
}

```

For more information, see [Configuring telemetry settings](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [GetThingRuntimeConfiguration](#) in *AWS CLI Command Reference*.

list-bulk-deployment-detailed-reports

The following code example shows how to use `list-bulk-deployment-detailed-reports`.

AWS CLI

To list information about individual deployments in a bulk deployment

The following `list-bulk-deployment-detailed-reports` example displays information about the individual deployments in a bulk deployment operation, including status.

```
aws greengrass list-bulk-deployment-detailed-reports \
  --bulk-deployment-id 42ce9c42-489b-4ed4-b905-8996aa50ef9d
```

Output:

```
{
  "Deployments": [
    {
      "DeploymentType": "NewDeployment",
      "DeploymentStatus": "Success",
      "DeploymentId": "123456789012:a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",

}
```

For more information, see [Create Bulk Deployments for Groups](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [ListBulkDeploymentDetailedReports](#) in *AWS CLI Command Reference*.

list-bulk-deployments

The following code example shows how to use `list-bulk-deployments`.

AWS CLI

To list bulk deployments

The following `list-bulk-deployments` example lists all bulk deployments.

```
aws greengrass list-bulk-deployments
```

Output:

```
{
  "BulkDeployments": [
    {
      "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/bulk/deployments/870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
      "BulkDeploymentId": "870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
      "CreatedAt": "2019-06-25T16:11:33.265Z"
    }
  ]
}
```

For more information, see [Create Bulk Deployments for Groups](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [ListBulkDeployments](#) in *AWS CLI Command Reference*.

list-connector-definition-versions

The following code example shows how to use `list-connector-definition-versions`.

AWS CLI

To list the versions that are available for a connector definition

The following `list-connector-definition-versions` example lists the versions that are available for the specified connector definition. Use the `list-connector-definitions` command to get the connector definition ID.

```
aws greengrass list-connector-definition-versions \  
  --connector-definition-id "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8"
```

Output:

```
{  
  "Versions": [  
    {  
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/  
definition/connectors/b5c4ebfd-f672-49a3-83cd-31c7216a7bb8/versions/63c57963-  
c7c2-4a26-a7e2-7bf478ea2623",  
      "CreationTimestamp": "2019-06-19T19:30:01.300Z",  
      "Id": "b5c4ebfd-f672-49a3-83cd-31c7216a7bb8",  
      "Version": "63c57963-c7c2-4a26-a7e2-7bf478ea2623"  
    }  
  ]  
}
```

For more information, see [Integrate with Services and Protocols Using Greengrass Connectors](#) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see [ListConnectorDefinitionVersions](#) in *AWS CLI Command Reference*.

list-connector-definitions

The following code example shows how to use `list-connector-definitions`.

AWS CLI

To list the Greengrass connectors that are defined

The following `list-connector-definitions` example lists all of the Greengrass connectors that are defined for your AWS account.

```
aws greengrass list-connector-definitions
```

Output:

```
{
  "Definitions": [
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

For more information, see [Integrate with Services and Protocols Using Greengrass Connectors](#) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see [ListConnectorDefinitions](#) in *AWS CLI Command Reference*.

list-core-definition-versions

The following code example shows how to use `list-core-definition-versions`.

AWS CLI

To list the versions of a Greengrass core definition

The following `list-core-definitions` example lists all versions of the specified Greengrass core definition. You can use the `list-core-definitions` command to get the version ID.

```
aws greengrass list-core-definition-versions \
```

```
--core-definition-id "eaf280cb-138c-4d15-af36-6f681a1348f7"
```

Output:

```
{
  "Versions": [
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

list-deployments

The following code example shows how to use `list-deployments`.

AWS CLI

To list the deployments for a Greengrass group

The following `list-deployments` example lists the deployments for the specified Greengrass group. You can use the `list-groups` command to look up your group ID.

```
aws greengrass list-deployments \
  --group-id "1013db12-8b58-45ff-acc7-704248f66731"
```

Output:

```
{
  "Deployments": [
    {
      "CreatedAt": "2019-06-18T17:04:32.702Z",
      "DeploymentId": "1065b8a0-812b-4f21-9d5d-e89b232a530f",
      "DeploymentType": "NewDeployment",

}

```

- For API details, see [ListResourceDefinitions](#) in *AWS CLI Command Reference*.

list-subscription-definition-versions

The following code example shows how to use `list-subscription-definition-versions`.

AWS CLI

To list the versions of a subscription definition

The following `list-subscription-definition-versions` example lists all versions of the specified subscription. You can use the `list-subscription-definitions` command to look up the subscription ID.

```
aws greengrass list-subscription-definition-versions \
  --subscription-definition-id "70e49321-83d5-45d2-bc09-81f4917ae152"
```

Output:

```

{
  "Versions": [
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/
greengrass/definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152/
versions/88ae8699-12ac-4663-ba3f-4d7f0519140b",
      "CreationTimestamp": "2019-06-18T17:03:52.499Z",
      "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
      "Version": "88ae8699-12ac-4663-ba3f-4d7f0519140b"
    },
    {

```

```

        "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/

        "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",
        "Version": "7e320ba3-c369-4069-a2f0-90acb7f219d6"
    }
]
}

```

- For API details, see [ListSubscriptionDefinitionVersions](#) in *AWS CLI Command Reference*.

list-subscription-definitions

The following code example shows how to use `list-subscription-definitions`.

AWS CLI

To get a list subscription definitions

The following `list-subscription-definitions` example lists all of the AWS IoT Greengrass subscriptions that are defined in your AWS account.

```
aws greengrass list-subscription-definitions
```

Output:

```

{
  "Definitions": [
    {
      "Arn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/subscriptions/70e49321-83d5-45d2-bc09-81f4917ae152",
      "CreationTimestamp": "2019-06-18T17:03:52.392Z",
      "Id": "70e49321-83d5-45d2-bc09-81f4917ae152",

    }
]
}

```

- For API details, see [ListSubscriptionDefinitions](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags attached to a resource

The following `list-tags-for-resource` example lists the tags and their values that are attached to the specified resource.

```

aws greengrass list-tags-for-resource \
  --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658"

```

Output:

```
{
  "tags": {
    "ResourceSubType": "USB",
    "ResourceType": "Device"
  }
}
```

For more information, see [Tagging Your Greengrass Resources](#) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

reset-deployments

The following code example shows how to use `reset-deployments`.

AWS CLI

To clean up deployment information for a Greengrass group

The following `reset-deployments` example cleans up deployment information for the specified Greengrass group. When you add the `--force` option, the deployment information is reset without waiting for the core device to respond.

```
aws greengrass reset-deployments \
  --group-id "1402daf9-71cf-4cfe-8be0-d5e80526d0d8" \
  --force
```

Output:

```
{
  "DeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/groups/1402daf9-71cf-4cfe-8be0-d5e80526d0d8/deployments/7dd4e356-9882-46a3-9e28-6d21900c011a",
  "DeploymentId": "7dd4e356-9882-46a3-9e28-6d21900c011a"
}
```

For more information, see [Reset Deployments](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [ResetDeployments](#) in *AWS CLI Command Reference*.

start-bulk-deployment

The following code example shows how to use `start-bulk-deployment`.

AWS CLI

To start a bulk deployment operation

The following `start-bulk-deployment` example starts a bulk deployment operation, using a file stored in an S3 bucket to specify the groups to be deployed.

```
aws greengrass start-bulk-deployment \
  --cli-input-json "{\"InputFileUri\":\"https://gg-group-deployment1.s3-us-
west-2.amazonaws.com/MyBulkDeploymentInputFile.txt\", \"ExecutionRoleArn\":
  \"arn:aws:iam::123456789012:role/ggCreateDeploymentRole\", \"AmznClientToken\":
  \"yourAmazonClientToken\"}"
```

Output:

```
{
  "BulkDeploymentArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/
bulk/deployments/870fb41b-6288-4e0c-bc76-a7ba4b4d3267",
  "BulkDeploymentId": "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
}
```

For more information, see [Create Bulk Deployments for Groups](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [StartBulkDeployment](#) in *AWS CLI Command Reference*.

stop-bulk-deployment

The following code example shows how to use `stop-bulk-deployment`.

AWS CLI

To stop a bulk deployment

The following `stop-bulk-deployment` example stops the specified bulk deployment. If you try to stop a bulk deployment that is complete, you receive an error:
`InvalidInputException: Cannot change state of finished execution.`

```
aws greengrass stop-bulk-deployment \  
  --bulk-deployment-id "870fb41b-6288-4e0c-bc76-a7ba4b4d3267"
```

This command produces no output.

For more information, see [Create Bulk Deployments for Groups](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [StopBulkDeployment](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To apply tags to a resource

The following `tag-resource` example applies two tags, `ResourceType` and `ResourceSubType`, to the specified Greengrass resource. This operation can both add new tags and values or update the value for existing tags. Use the `untag-resource` command to remove a tag.

```
aws greengrass tag-resource \  
  --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/  
definition/resources/ad8c101d-8109-4b0e-b97d-9cc5802ab658" \  
  --tags "ResourceType=Device,ResourceSubType=USB"
```

This command produces no output.

For more information, see [Tagging Your Greengrass Resources](#) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag and its value from a resource

The following `untag-resource` example removes the tag whose key is `Category` from the specified Greengrass group. If the key `Category` does not exist for the specified resource, no error is returned.

```
aws greengrass untag-resource \  
  --resource-arn "arn:aws:greengrass:us-west-2:123456789012:/greengrass/  
groups/1013db12-8b58-45ff-acc7-704248f66731" \  
  --tag-keys "Category"
```

This command produces no output.

For more information, see [Tagging Your Greengrass Resources](#) in the **AWS IoT Greengrass Developer Guide**.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-connectivity-info

The following code example shows how to use `update-connectivity-info`.

AWS CLI

To update the connectivity information for a Greengrass core

The following `update-connectivity-info` example changes the endpoints that devices can use to connect to the specified Greengrass core. Connectivity information is a list of IP addresses or domain names, with corresponding port numbers and optional customer-defined metadata. You might need to update connectivity information when the local network changes.

```
aws greengrass update-connectivity-info \  
  --thing-name "MyGroup_Core" \  
  --connectivity-info "[{\"Metadata\":\"\",\"PortNumber\":8883,\"HostAddress\":  
\"127.0.0.1\",\"Id\":\"localhost_127.0.0.1_0\"},{\"Metadata\":\"\",\"PortNumber  
\":8883,\"HostAddress\":\"192.168.1.3\",\"Id\":\"localIP_192.168.1.3\"}]"
```

Output:

```
{  
  "Version": "312de337-59af-4cf9-a278-2a23bd39c300"  
}
```

- For API details, see [UpdateConnectivityInfo](#) in *AWS CLI Command Reference*.

update-connector-definition

The following code example shows how to use `update-connector-definition`.

AWS CLI

To update the name for a connector definition

The following `update-connector-definition` example updates the name for the specified connector definition. If you want to update the details for the connector, use the `create-connector-definition-version` command to create a new version.

```
aws greengrass update-connector-definition \  
  --connector-definition-id "55d0052b-0d7d-44d6-b56f-21867215e118" \  
  --name "GreengrassConnectors2019"
```

For more information, see [Integrate with Services and Protocols Using Connectors](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [UpdateConnectorDefinition](#) in *AWS CLI Command Reference*.

update-core-definition

The following code example shows how to use `update-core-definition`.

AWS CLI

To update a core definition

The following `update-core-definition` example changes the name of the specified core definition. You can update only the name property of a core definition.

```
aws greengrass update-core-definition \  
  --core-definition-id "582efe12-b05a-409e-9a24-a2ba1bcc4a12" \  
  --name "MyCoreDevices"
```

This command produces no output.

For more information, see [Configure the AWS IoT Greengrass Core](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [UpdateCoreDefinition](#) in *AWS CLI Command Reference*.

update-device-definition

The following code example shows how to use `update-device-definition`.

AWS CLI

To update a device definition

The following `update-device-definition` example changes the name of the specified device definition. You can only update the name property of a device definition.

```
aws greengrass update-device-definition \  
  --device-definition-id "f9ba083d-5ad4-4534-9f86-026a45df1ccd" \  
  --name "TemperatureSensors"
```

This command produces no output.

- For API details, see [UpdateDeviceDefinition](#) in *AWS CLI Command Reference*.

update-function-definition

The following code example shows how to use `update-function-definition`.

AWS CLI

To update the name for a function definition

The following `update-function-definition` example updates the name for the specified function definition. If you want to update the details for the function, use the `create-function-definition-version` command to create a new version.

```
aws greengrass update-function-definition \  
  --function-definition-id "e47952bd-dea9-4e2c-a7e1-37bbe8807f46" \  
  --name ObsoleteFunction
```

This command produces no output.

For more information, see [Run Local Lambda Functions](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [UpdateFunctionDefinition](#) in *AWS CLI Command Reference*.

update-group-certificate-configuration

The following code example shows how to use `update-group-certificate-configuration`.

AWS CLI

To update the expiry of a group's certificates

The following `update-group-certificate-configuration` example sets a 10-day expiry for the certificates generated for the specified group.

```
aws greengrass update-group-certificate-configuration \  
  --group-id "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1" \  
  --certificate-expiry-in-milliseconds 864000000
```

Output:

```
{  
  "CertificateExpiryInMilliseconds": 864000000,  
  "CertificateAuthorityExpiryInMilliseconds": 2524607999000,  
  "GroupId": "8eaadd72-ce4b-4f15-892a-0cc4f3a343f1"  
}
```

For more information, see [AWS IoT Greengrass Security](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [UpdateGroupCertificateConfiguration](#) in *AWS CLI Command Reference*.

update-group

The following code example shows how to use `update-group`.

AWS CLI

To update the group name

The following `update-group` example updates the name of the specified Greengrass group. If you want to update the details for the group, use the `create-group-version` command to create a new version.

```
aws greengrass update-group \  
  --group-id "1402daf9-71cf-4cfe-8be0-d5e80526d0d8" \  
  --name TestGroup4of6
```

For more information, see [Configure AWS IoT Greengrass on AWS IoT](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [UpdateGroup](#) in *AWS CLI Command Reference*.

update-logger-definition

The following code example shows how to use `update-logger-definition`.

AWS CLI

To update a logger definition

The following `update-logger-definition` example changes the name of the specified logger definition. You can only update the name property of a logger definition.

```
aws greengrass update-logger-definition \  
  --logger-definition-id "a454b62a-5d56-4ca9-bdc4-8254e1662cb0" \  
  --name "LoggingConfigsForSensors"
```

This command produces no output.

For more information, see [Monitoring with AWS IoT Greengrass Logs](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [UpdateLoggerDefinition](#) in *AWS CLI Command Reference*.

update-resource-definition

The following code example shows how to use `update-resource-definition`.

AWS CLI

To update the name for a resource definition

The following `update-resource-definition` example updates the name for the specified resource definition. If you want to change the details for the resource, use the `create-resource-definition-version` command to create a new version.

```
aws greengrass update-resource-definition \  
  --resource-definition-id "c8bb9ebc-c3fd-40a4-9c6a-568d75569d38" \  
  --name GreengrassConnectorResources
```

This command produces no output.

For more information, see [Access Local Resources with Lambda Functions and Connectors](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [UpdateResourceDefinition](#) in *AWS CLI Command Reference*.

update-subscription-definition

The following code example shows how to use `update-subscription-definition`.

AWS CLI

To update the name for a subscription definition

The following `update-subscription-definition` example updates the name for the specified subscription definition. If you want to change details for the subscription, use the `create-subscription-definition-version` command to create a new version.

```
aws greengrass update-subscription-definition \  
  --subscription-definition-id "fa81bc84-3f59-4377-a84b-5d0134da359b" \  
  --name "ObsoleteSubscription"
```

This command produces no output.

For more information, see title in the *guide*.

- For API details, see [UpdateSubscriptionDefinition](#) in *AWS CLI Command Reference*.

update-thing-runtime-configuration

The following code example shows how to use `update-thing-runtime-configuration`.

AWS CLI

To turn on telemetry in the runtime configuration of a Greengrass core

The following `update-thing-runtime-configuration` example updates the runtime configuration of a Greengrass core to turn on telemetry.

```
aws greengrass update-thing-runtime-configuration \  
  --thing-name SampleGreengrassCore \  
  --telemetry-configuration {"Telemetry\":"On\"}
```

This command produces no output.

For more information, see [Configuring telemetry settings](#) in the *AWS IoT Greengrass Developer Guide*.

- For API details, see [UpdateThingRuntimeConfiguration](#) in *AWS CLI Command Reference*.

AWS IoT Greengrass V2 examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Greengrass V2.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

associate-service-role-to-account

The following code example shows how to use `associate-service-role-to-account`.

AWS CLI

To associate the Greengrass service role to your AWS account

The following `associate-service-role-to-account` example associates a service role with AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 associate-service-role-to-account \  
  --role-arn arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole
```

Output:

```
{  
  "associatedAt": "2022-01-19T19:21:53Z"  
}
```

For more information, see [Greengrass service role](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [AssociateServiceRoleToAccount](#) in *AWS CLI Command Reference*.

batch-associate-client-device-with-core-device

The following code example shows how to use `batch-associate-client-device-with-core-device`.

AWS CLI

To associate client devices with a core device

The following `batch-associate-client-device-with-core-device` example associates two client devices with a core device.

```
aws greengrassv2 batch-associate-client-device-with-core-device \  
  --core-device-thing-name MyGreengrassCore \  
  --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```
{  
  "errorEntries": []  
}
```

For more information, see [Interact with local IoT devices](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [BatchAssociateClientDeviceWithCoreDevice](#) in *AWS CLI Command Reference*.

batch-disassociate-client-device-from-core-device

The following code example shows how to use `batch-disassociate-client-device-from-core-device`.

AWS CLI

To disassociate client devices from a core device

The following `batch-disassociate-client-device-from-core-device` example disassociates two client devices from a core device.

```
aws greengrassv2 batch-disassociate-client-device-from-core-device \  
  --core-device-thing-name MyGreengrassCore \  
  --entries thingName=MyClientDevice1 thingName=MyClientDevice2
```

Output:

```
{  
  "errorEntries": []  
}
```

For more information, see [Interact with local IoT devices](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [BatchDisassociateClientDeviceFromCoreDevice](#) in *AWS CLI Command Reference*.

cancel-deployment

The following code example shows how to use `cancel-deployment`.

AWS CLI

To cancel a deployment

The following `cancel-deployment` example stops a continuous deployment to a thing group.

```
aws greengrassv2 cancel-deployment \  
  --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{  
  "message": "SUCCESS"  
}
```

For more information, see [Cancel deployments](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [CancelDeployment](#) in *AWS CLI Command Reference*.

create-component-version

The following code example shows how to use `create-component-version`.

AWS CLI

Example 1: To create a component version from a recipe

The following `create-component-version` example creates a version of a Hello World component from a recipe file.

```
aws greengrassv2 create-component-version \  
  --inline-recipe fileb://com.example.HelloWorld-1.0.0.json
```

Contents of `com.example.HelloWorld-1.0.0.json`:

```
{  
  "RecipeFormatVersion": "2020-01-25",  
  "ComponentName": "com.example.HelloWorld",  
  "ComponentVersion": "1.0.0",  
  "ComponentDescription": "My first AWS IoT Greengrass component.",  
  "ComponentPublisher": "Amazon",  
  "ComponentConfiguration": {  
    "DefaultConfiguration": {  
      "Message": "world"  
    }  
  },  
  "Manifests": [  
    {  
      "ComponentName": "com.example.HelloWorld",  
      "ComponentVersion": "1.0.0",  
      "RecipeFormatVersion": "2020-01-25",  
      "RecipePath": "fileb://com.example.HelloWorld-1.0.0.json"  
    }  
  ]  
}
```

```

    {
      "Platform": {
        "os": "linux"
      },
      "Lifecycle": {
        "Run": "echo 'Hello {configuration:/Message}'"
      }
    }
  ]
}

```

Output:

```

{
  "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0",
  "componentName": "com.example.HelloWorld",
  "componentVersion": "1.0.0",
  "creationTimestamp": "2021-01-07T16:24:33.650000-08:00",
  "status": {
    "componentState": "REQUESTED",
    "message": "NONE",
    "errors": {}
  }
}

```

For more information, see [Create custom components](#) and [Upload components to deploy](#) in the *AWS IoT Greengrass V2 Developer Guide*.

Example 2: To create a component version from an AWS Lambda function

The following `create-component-version` example creates a version of a Hello World component from an AWS Lambda function.

```

aws greengrassv2 create-component-version \
  --cli-input-json file://lambda-function-component.json

```

Contents of `lambda-function-component.json`:

```

{
  "lambdaFunction": {

```

```
    "lambdaArn": "arn:aws:lambda:us-  
west-2:123456789012:function>HelloWorldPythonLambda:1",  
    "componentName": "com.example>HelloWorld",  
    "componentVersion": "1.0.0",  
    "componentLambdaParameters": {  
      "eventSources": [  
        {  
          "topic": "hello/world/+",  
          "type": "IOT_CORE"  
        }  
      ]  
    }  
  }  
}
```

Output:

```
{  
  "arn": "arn:aws:greengrass:us-  
west-2:123456789012:components:com.example>HelloWorld:versions:1.0.0",  
  "componentName": "com.example>HelloWorld",  
  "componentVersion": "1.0.0",  
  "creationTimestamp": "2021-01-07T17:05:27.347000-08:00",  
  "status": {  
    "componentState": "REQUESTED",  
    "message": "NONE",  
    "errors": {}  
  }  
}
```

For more information, see [Run AWS Lambda functions](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [CreateComponentVersion](#) in *AWS CLI Command Reference*.

create-deployment

The following code example shows how to use create-deployment.

AWS CLI

Example 1: To create a deployment

The following create-deployment example deploys the AWS IoT Greengrass Command Line Interface to a core device.

```
aws greengrassv2 create-deployment \  
  --cli-input-json file://cli-deployment.json
```

Contents of `cli-deployment.json`:

```
{  
  "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",  
  "deploymentName": "Deployment for MyGreengrassCore",  
  "components": {  
    "aws.greengrass.Cli": {  
      "componentVersion": "2.0.3"  
    }  
  },  
  "deploymentPolicies": {  
    "failureHandlingPolicy": "DO_NOTHING",  
    "componentUpdatePolicy": {  
      "timeoutInSeconds": 60,  
      "action": "NOTIFY_COMPONENTS"  
    },  
    "configurationValidationPolicy": {  
      "timeoutInSeconds": 60  
    }  
  },  
  "iotJobConfiguration": {}  
}
```

Output:

```
{  
  "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
}
```

For more information, see [Create deployments](#) in the *AWS IoT Greengrass V2 Developer Guide*.

Example 2: To create a deployment that updates component configurations

The following create-deployment example deploys the AWS IoT Greengrass nucleus component to a group of core devices. This deployment applies the following configuration updates for the nucleus component:

Reset the target devices' proxy settings to their default no proxy settings. Reset the target devices' MQTT settings to their defaults. Sets the JVM options for the nucleus' JVM. Sets the logging level for the nucleus.

```
aws greengrassv2 create-deployment \  
  --cli-input-json file://nucleus-deployment.json
```

Contents of nucleus-deployment.json:

```
{  
  "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/  
MyGreengrassCoreGroup",  
  "deploymentName": "Deployment for MyGreengrassCoreGroup",  
  "components": {  
    "aws.greengrass.Nucleus": {  
      "componentVersion": "2.0.3",  
      "configurationUpdate": {  
        "reset": [  
          "/networkProxy",  
          "/mqtt"  
        ],  
        "merge": "{\"jvmOptions\":\"-Xmx64m\",\"logging\":{\"level\":\"WARN  
\"}}"  
      }  
    }  
  },  
  "deploymentPolicies": {  
    "failureHandlingPolicy": "ROLLBACK",  
    "componentUpdatePolicy": {  
      "timeoutInSeconds": 60,  
      "action": "NOTIFY_COMPONENTS"  
    },  
    "configurationValidationPolicy": {  
      "timeoutInSeconds": 60  
    }  
  },  
  "iotJobConfiguration": {}  
}
```

Output:

```
{
```

```
"deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
"iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222"
}
```

For more information, see [Create deployments](#) and [Update component configurations](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [CreateDeployment](#) in *AWS CLI Command Reference*.

delete-component

The following code example shows how to use `delete-component`.

AWS CLI

To delete a component version

The following `delete-component` example deletes a Hello World component.

```
aws greengrassv2 delete-component \
  --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example>HelloWorld:versions:1.0.0
```

This command produces no output.

For more information, see [Manage components](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [DeleteComponent](#) in *AWS CLI Command Reference*.

delete-core-device

The following code example shows how to use `delete-core-device`.

AWS CLI

To delete a core device

The following `delete-core-device` example deletes an AWS IoT Greengrass core device.

```
aws greengrassv2 delete-core-device \
  --core-device-thing-name MyGreengrassCore
```

This command produces no output.

For more information, see [Uninstall the AWS IoT Greengrass Core software](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [DeleteCoreDevice](#) in *AWS CLI Command Reference*.

describe-component

The following code example shows how to use describe-component.

AWS CLI

To describe a component version

The following describe-component example describes a Hello World component.

```
aws greengrassv2 describe-component \  
  --arn arn:aws:greengrass:us-  
west-2:123456789012:components:com.example>HelloWorld:versions:1.0.0
```

Output:

```
{  
  "arn": "arn:aws:greengrass:us-  
west-2:123456789012:components:com.example>HelloWorld:versions:1.0.0",  
  "componentName": "com.example>HelloWorld",  
  "componentVersion": "1.0.0",  
  "creationTimestamp": "2021-01-07T17:12:11.133000-08:00",  
  "publisher": "Amazon",  
  "description": "My first AWS IoT Greengrass component.",  
  "status": {  
    "componentState": "DEPLOYABLE",  
    "message": "NONE",  
    "errors": {}  
  },  
  "platforms": [  
    {  
      "attributes": {  
        "os": "linux"  
      }  
    }  
  ]  
}
```

```
}
```

For more information, see [Manage components](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [DescribeComponent](#) in *AWS CLI Command Reference*.

disassociate-service-role-from-account

The following code example shows how to use `disassociate-service-role-from-account`.

AWS CLI

To disassociate the Greengrass service role from your AWS account

The following `disassociate-service-role-from-account` example disassociates the Greengrass service role from AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 disassociate-service-role-from-account
```

Output:

```
{
  "disassociatedAt": "2022-01-19T19:26:09Z"
}
```

For more information, see [Greengrass service role](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [DisassociateServiceRoleFromAccount](#) in *AWS CLI Command Reference*.

get-component-version-artifact

The following code example shows how to use `get-component-version-artifact`.

AWS CLI

To get a URL to download a component artifact

The following `get-component-version-artifact` example gets a URL to download the local debug console component's JAR file.

```
aws greengrassv2 get-component-version-artifact \
```

```
--arn arn:aws:greengrass:us-west-2:aws:components:aws.greengrass.LocalDebugConsole:versions:2.0.3 \
--artifact-name "Uvt6ZEzQ9TKiAuLbfXBX_APdY0TWks3uc46tHFHTzBM=/aws.greengrass.LocalDebugConsole.jar"
```

Output:

```
{
  "preSignedUrl": "https://evergreencomponentmanageme-
artifactbucket7410c9ef-g18n1iya8kwr.s3.us-west-2.amazonaws.com/public/
aws.greengrass.LocalDebugConsole/2.0.3/s3/ggv2-component-releases-prod-pdx/
EvergreenHttpDebugView/2ffc496ba41b39568968b22c582b4714a937193ee7687a45527238e696672521/
aws.greengrass.LocalDebugConsole/aws.greengrass.LocalDebugConsole.jar?X-Amz-
Security-Token=KwfLKSdEXAMPLE..."
}
```

For more information, see [Manage components](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetComponentVersionArtifact](#) in *AWS CLI Command Reference*.

get - component

The following code example shows how to use `get - component`.

AWS CLI

Example 1: To download a component's recipe in YAML format (Linux, macOS, or Unix)

The following `get - component` example downloads a Hello World component's recipe to a file in YAML format. This command does the following:

Uses the `--output` and `--query` parameters to control the command's output. These parameters extract the recipe blob from the command's output. For more information about controlling output, see [Controlling Command Output](#) in the *AWS Command Line Interface User Guide*. Uses the `base64` utility. This utility decodes the extracted blob to the original text. The blob that is returned by a successful `get - component` command is base64-encoded text. You must decode this blob to obtain the original text. Saves the decoded text to a file. The final section of the command (`> com.example.HelloWorld-1.0.0.json`) saves the decoded text to a file.

```
aws greengrassv2 get-component \
```

```

--arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0 \
--recipe-output-format YAML \
--query recipe \
--output text | base64 --decode > com.example.HelloWorld-1.0.0.json

```

For more information, see [Manage components](#) in the *AWS IoT Greengrass V2 Developer Guide*.

Example 2: To download a component's recipe in YAML format (Windows CMD)

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command uses the `certutil` utility.

```

aws greengrassv2 get-component ^
  --arn arn:aws:greengrass:us-
west-2:675946970638:components:com.example.HelloWorld:versions:1.0.0 ^
  --recipe-output-format YAML ^
  --query recipe ^
  --output text > com.example.HelloWorld-1.0.0.yaml.b64

certutil -decode com.example.HelloWorld-1.0.0.yaml.b64
com.example.HelloWorld-1.0.0.yaml

```

For more information, see [Manage components](#) in the *AWS IoT Greengrass V2 Developer Guide*.

Example 3: To download a component's recipe in YAML format (Windows PowerShell)

The following `get-component` example downloads a Hello World component's recipe to a file in YAML format. This command uses the `certutil` utility.

```

aws greengrassv2 get-component `
  --arn arn:aws:greengrass:us-
west-2:675946970638:components:com.example.HelloWorld:versions:1.0.0 `
  --recipe-output-format YAML `
  --query recipe `
  --output text > com.example.HelloWorld-1.0.0.yaml.b64

certutil -decode com.example.HelloWorld-1.0.0.yaml.b64
com.example.HelloWorld-1.0.0.yaml

```

For more information, see [Manage components](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetComponent](#) in *AWS CLI Command Reference*.

get-connectivity-info

The following code example shows how to use `get-connectivity-info`.

AWS CLI

To get the connectivity information for a Greengrass core device

The following `get-connectivity-info` example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```
aws greengrassv2 get-connectivity-info \  
  --thing-name MyGreengrassCore
```

Output:

```
{  
  "connectivityInfo": [  
    {  
      "id": "localIP_192.0.2.0",  
      "hostAddress": "192.0.2.0",  
      "portNumber": 8883  
    }  
  ]  
}
```

For more information, see [Manage core device endpoints](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetConnectivityInfo](#) in *AWS CLI Command Reference*.

get-core-device

The following code example shows how to use `get-core-device`.

AWS CLI

To get a core device

The following `get-core-device` example gets information about an AWS IoT Greengrass core device.

```
aws greengrassv2 get-core-device \  
  --core-device-thing-name MyGreengrassCore
```

Output:

```
{  
  "coreDeviceThingName": "MyGreengrassCore",  
  "coreVersion": "2.0.3",  
  "platform": "linux",  
  "architecture": "amd64",  
  "status": "HEALTHY",  
  "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00",  
  "tags": {}  
}
```

For more information, see [Check core device status](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetCoreDevice](#) in *AWS CLI Command Reference*.

get-deployment

The following code example shows how to use `get-deployment`.

AWS CLI

To get a deployment

The following `get-deployment` example gets information about the deployment of the AWS IoT Greengrass nucleus component to a group of core devices.

```
aws greengrassv2 get-deployment \  
  --deployment-id a1b2c3d4-5678-90ab-cdef-EXAMPLE11111
```

Output:

```
{  
  "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/  
MyGreengrassCoreGroup",  
  "revisionId": "14",
```

```

"deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
"deploymentName": "Deployment for MyGreengrassCoreGroup",
"deploymentStatus": "ACTIVE",
"iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
"iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-cdef-
EXAMPLE22222",
"components": {
  "aws.greengrass.Nucleus": {
    "componentVersion": "2.0.3",
    "configurationUpdate": {
      "merge": "{\"jvmOptions\":\"-Xmx64m\",\"logging\":{\"level\":\"WARN
\"}}\",
      "reset": [
        "/networkProxy",
        "/mqtt"
      ]
    }
  }
},
"deploymentPolicies": {
  "failureHandlingPolicy": "ROLLBACK",
  "componentUpdatePolicy": {
    "timeoutInSeconds": 60,
    "action": "NOTIFY_COMPONENTS"
  },
  "configurationValidationPolicy": {
    "timeoutInSeconds": 60
  }
},
"iotJobConfiguration": {},
"creationTimestamp": "2021-01-07T17:21:20.691000-08:00",
"isLatestForTarget": false,
"tags": {}
}

```

For more information, see [Deploy components to devices](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetDeployment](#) in *AWS CLI Command Reference*.

get-service-role-for-account

The following code example shows how to use `get-service-role-for-account`.

AWS CLI

To get the Greengrass service role for your AWS account

The following `get-service-role-for-account` example gets the service role that's associated with AWS IoT Greengrass for your AWS account.

```
aws greengrassv2 get-service-role-for-account
```

Output:

```
{
  "associatedAt": "2022-01-19T19:21:53Z",
  "roleArn": "arn:aws:iam::123456789012:role/service-role/Greengrass_ServiceRole"
}
```

For more information, see [Greengrass service role](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [GetServiceRoleForAccount](#) in *AWS CLI Command Reference*.

list-client-devices-associated-with-core-device

The following code example shows how to use `list-client-devices-associated-with-core-device`.

AWS CLI

To list the client devices associated with a core device

The following `list-client-devices-associated-with-core-device` example lists all client devices associated with a core device.

```
aws greengrassv2 list-client-devices-associated-with-core-device \
  --core-device-thing-name MyTestGreengrassCore
```

Output:

```
{
  "associatedClientDevices": [
```

```
{
  "thingName": "MyClientDevice2",
  "associationTimestamp": "2021-07-12T16:33:55.843000-07:00"
},
{
  "thingName": "MyClientDevice1",
  "associationTimestamp": "2021-07-12T16:33:55.843000-07:00"
}
]
```

For more information, see [Interact with local IoT devices](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListClientDevicesAssociatedWithCoreDevice](#) in *AWS CLI Command Reference*.

list-component-versions

The following code example shows how to use `list-component-versions`.

AWS CLI

To list the versions of a component

The following `list-component-versions` example lists all versions of a Hello World component.

```
aws greengrassv2 list-component-versions \
  --arn arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld
```

Output:

```
{
  "componentVersions": [
    {
      "componentName": "com.example.HelloWorld",
      "componentVersion": "1.0.1",
      "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.1"
    },
```

```
    {
      "componentName": "com.example.HelloWorld",
      "componentVersion": "1.0.0",
      "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.0"
    }
  ]
}
```

For more information, see [Manage components](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListComponentVersions](#) in *AWS CLI Command Reference*.

list-components

The following code example shows how to use `list-components`.

AWS CLI

To list components

The following `list-components` example lists each component and its latest version defined in your AWS account in the current Region.

```
aws greengrassv2 list-components
```

Output:

```
{
  "components": [
    {
      "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld",
      "componentName": "com.example.HelloWorld",
      "latestVersion": {
        "arn": "arn:aws:greengrass:us-
west-2:123456789012:components:com.example.HelloWorld:versions:1.0.1",
        "componentVersion": "1.0.1",
        "creationTimestamp": "2021-01-08T16:51:07.352000-08:00",
        "description": "My first AWS IoT Greengrass component.",
        "publisher": "Amazon",
        "platforms": [
```

```
    {
      "attributes": {
        "os": "linux"
      }
    }
  ]
}
```

For more information, see [Manage components](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListComponents](#) in *AWS CLI Command Reference*.

list-core-devices

The following code example shows how to use `list-core-devices`.

AWS CLI

To list core devices

The following `list-core-devices` example lists the AWS IoT Greengrass core devices in your AWS account in the current Region.

```
aws greengrassv2 list-core-devices
```

Output:

```
{
  "coreDevices": [
    {
      "coreDeviceThingName": "MyGreengrassCore",
      "status": "HEALTHY",
      "lastStatusUpdateTimestamp": "2021-01-08T04:57:58.838000-08:00"
    }
  ]
}
```

For more information, see [Check core device status](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListCoreDevices](#) in *AWS CLI Command Reference*.

list-deployments

The following code example shows how to use `list-deployments`.

AWS CLI

To list deployments

The following `list-deployments` example lists the latest revision of each deployment defined in your AWS account in the current Region.

```
aws greengrassv2 list-deployments
```

Output:

```
{
  "deployments": [
    {
      "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/MyGreengrassCoreGroup",
      "revisionId": "14",
      "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",
      "deploymentName": "Deployment for MyGreengrassCoreGroup",
      "creationTimestamp": "2021-01-07T17:21:20.691000-08:00",
      "deploymentStatus": "ACTIVE",
      "isLatestForTarget": false
    },
    {
      "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/MyGreengrassCore",
      "revisionId": "1",
      "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",
      "deploymentName": "Deployment for MyGreengrassCore",
      "creationTimestamp": "2021-01-06T16:10:42.407000-08:00",
      "deploymentStatus": "COMPLETED",
      "isLatestForTarget": false
    }
  ]
}
```

For more information, see [Deploy components to devices](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListDeployments](#) in *AWS CLI Command Reference*.

list-effective-deployments

The following code example shows how to use `list-effective-deployments`.

AWS CLI

To list deployment jobs

The following `list-effective-deployments` example lists the deployments that apply to an AWS IoT Greengrass core device.

```
aws greengrassv2 list-effective-deployments \  
  --core-device-thing-name MyGreengrassCore
```

Output:

```
{  
  "effectiveDeployments": [  
    {  
      "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111",  
      "deploymentName": "Deployment for MyGreengrassCore",  
      "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE33333",  
      "targetArn": "arn:aws:iot:us-west-2:123456789012:thing/  
MyGreengrassCore",  
      "coreDeviceExecutionStatus": "COMPLETED",  
      "reason": "SUCCESSFUL",  
      "creationTimestamp": "2021-01-06T16:10:42.442000-08:00",  
      "modifiedTimestamp": "2021-01-08T17:21:27.830000-08:00"  
    },  
    {  
      "deploymentId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE22222",  
      "deploymentName": "Deployment for MyGreengrassCoreGroup",  
      "iotJobId": "a1b2c3d4-5678-90ab-cdef-EXAMPLE44444",  
      "iotJobArn": "arn:aws:iot:us-west-2:123456789012:job/a1b2c3d4-5678-90ab-  
cdef-EXAMPLE44444",  
      "targetArn": "arn:aws:iot:us-west-2:123456789012:thinggroup/  
MyGreengrassCoreGroup",  
      "coreDeviceExecutionStatus": "SUCCEEDED",  
    }  
  ]  
}
```

```
        "reason": "SUCCESSFUL",
        "creationTimestamp": "2021-01-07T17:19:20.394000-08:00",
        "modifiedTimestamp": "2021-01-07T17:21:20.721000-08:00"
    }
]
}
```

For more information, see [Check core device status](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListEffectiveDeployments](#) in *AWS CLI Command Reference*.

list-installed-components

The following code example shows how to use `list-installed-components`.

AWS CLI

To list components installed on a core device

The following `list-installed-components` example lists the components that are installed on an AWS IoT Greengrass core device.

```
aws greengrassv2 list-installed-components \
    --core-device-thing-name MyGreengrassCore
```

Output:

```
{
  "installedComponents": [
    {
      "componentName": "aws.greengrass.Cli",
      "componentVersion": "2.0.3",
      "lifecycleState": "RUNNING",
      "isRoot": true
    },
    {
      "componentName": "aws.greengrass.Nucleus",
      "componentVersion": "2.0.3",
      "lifecycleState": "FINISHED",
      "isRoot": true
    }
  ]
}
```

```
]
}
```

For more information, see [Check core device status](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListInstalledComponents](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a resource

The following `list-tags-for-resource` example lists all tags for an AWS IoT Greengrass core device.

```
aws greengrassv2 list-tags-for-resource \
  --resource-arn arn:aws:greengrass:us-
west-2:123456789012:coreDevices:MyGreengrassCore
```

Output:

```
{
  "tags": {
    "Owner": "richard-roe"
  }
}
```

For more information, see [Tag your resources](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a resource

The following `tag-resource` example adds an owner tag to an AWS IoT Greengrass core device. You can use this tag to control access to the core device based on who owns it.

```
aws greengrassv2 tag-resource \  
  --resource-arn arn:aws:greengrass:us-  
west-2:123456789012:coreDevices:MyGreengrassCore \  
  --tags Owner=richard-roe
```

This command produces no output.

For more information, see [Tag your resources](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes an owner tag from an AWS IoT Greengrass core device.

```
aws iotsitewise untag-resource \  
  --resource-arn arn:aws:greengrass:us-  
west-2:123456789012:coreDevices:MyGreengrassCore \  
  --tag-keys Owner
```

This command produces no output.

For more information, see [Tag your resources](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-connectivity-info

The following code example shows how to use `update-connectivity-info`.

AWS CLI

To update connectivity information for a Greengrass core device

The following `update-connectivity-info` example gets the connectivity information for a Greengrass core device. Client devices use this information to connect to the MQTT broker that runs on this core device.

```
aws greengrassv2 update-connectivity-info \  
  --thing-name MyGreengrassCore \  
  --cli-input-json file://core-device-connectivity-info.json
```

Contents of `core-device-connectivity-info.json`:

```
{  
  "connectivityInfo": [  
    {  
      "hostAddress": "192.0.2.0",  
      "portNumber": 8883,  
      "id": "localIP_192.0.2.0"  
    }  
  ]  
}
```

Output:

```
{  
  "version": "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111"  
}
```

For more information, see [Manage core device endpoints](#) in the *AWS IoT Greengrass V2 Developer Guide*.

- For API details, see [UpdateConnectivityInfo](#) in *AWS CLI Command Reference*.

AWS IoT Jobs SDK release examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Jobs SDK release.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

describe-job-execution

The following code example shows how to use `describe-job-execution`.

AWS CLI

To get the details of a job execution

The following `describe-job-execution` example retrieves the details of the latest execution of the specified job and thing.

```
aws iot-jobs-data describe-job-execution \  
  --job-id SampleJob \  
  --thing-name MotionSensor1 \  
  --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{  
  "execution": {  
    "approximateSecondsBeforeTimedOut": 88,  
    "executionNumber": 2939653338,  
    "jobId": "SampleJob",  
    "lastUpdatedAt": 1567701875.743,  
    "queuedAt": 1567701902.444,  
    "status": "QUEUED",  
    "thingName": "MotionSensor1 ",  
    "versionNumber": 3  
  }  
}
```

For more information, see [Devices and Jobs](#) in the *AWS IoT Developer Guide*.

- For API details, see [DescribeJobExecution](#) in *AWS CLI Command Reference*.

get-pending-job-executions

The following code example shows how to use `get-pending-job-executions`.

AWS CLI

To get a list of all jobs that are not in a terminal status for a thing

The following `get-pending-job-executions` example displays a list of all jobs that aren't in a terminal state for the specified thing.

```
aws iot-jobs-data get-pending-job-executions \  
  --thing-name MotionSensor1 \  
  --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{  
  "InProgressJobs": [  
  ],  
  "queuedJobs": [  
    {  
      "executionNumber": 2939653338,  
      "jobId": "SampleJob",  
      "lastUpdatedAt": 1567701875.743,  
      "queuedAt": 1567701902.444,  
      "versionNumber": 3  
    }  
  ]  
}
```

For more information, see [Devices and Jobs](#) in the *AWS IoT Developer Guide*.

- For API details, see [GetPendingJobExecutions](#) in *AWS CLI Command Reference*.

start-next-pending-job-execution

The following code example shows how to use `start-next-pending-job-execution`.

AWS CLI

To get and start the next pending job execution for a thing

The following `start-next-pending-job-execution` example retrieves and starts the next job execution whose status is `IN_PROGRESS` or `QUEUED` for the specified thing.

```
aws iot-jobs-data start-next-pending-job-execution \  
  --thing-name MotionSensor1 \  
  --endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{  
  "execution": {  
    "approximateSecondsBeforeTimedOut": 88,  
    "executionNumber": 2939653338,  
    "jobId": "SampleJob",  
    "lastUpdatedAt": 1567714853.743,  
    "queuedAt": 1567701902.444,  
    "startedAt": 1567714871.690,  
    "status": "IN_PROGRESS",  
    "thingName": "MotionSensor1 ",  
    "versionNumber": 3  
  }  
}
```

For more information, see [Devices and Jobs](#) in the *AWS IoT Developer Guide*.

- For API details, see [StartNextPendingJobExecution](#) in *AWS CLI Command Reference*.

update-job-execution

The following code example shows how to use `update-job-execution`.

AWS CLI

To update the status of a job execution

The following `update-job-execution` example updates the status of the specified job and thing.

```
aws iot-jobs-data update-job-execution \  
  --job-id SampleJob \  
  --thing-name MotionSensor1 \  
  --status IN_PROGRESS
```

```
--job-id SampleJob \  
--thing-name MotionSensor1 \  
--status REMOVED \  
--endpoint-url https://1234567890abcd.jobs.iot.us-west-2.amazonaws.com
```

Output:

```
{  
  "executionState": {  
    "status": "REMOVED",  
    "versionNumber": 3  
  },  
}
```

For more information, see [Devices and Jobs](#) in the *AWS IoT Developer Guide*.

- For API details, see [UpdateJobExecution](#) in *AWS CLI Command Reference*.

AWS IoT SiteWise examples using AWS CLI

Actions

associate-assets

The following code example shows how to use `associate-assets`.

AWS CLI

To associate a child asset to a parent asset

The following `associate-assets` example associates a wind turbine asset to a wind farm asset, where the wind turbine asset model exists as a hierarchy in the wind farm asset model.

```
aws iotsitewise associate-assets \  
  --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \  
  --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE \  
  --child-asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

This command produces no output.

For more information, see [Associating assets](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [AssociateAssets](#) in *AWS CLI Command Reference*.

batch-associate-project-assets

The following code example shows how to use `batch-associate-project-assets`.

AWS CLI

To associate an asset to a project

The following `batch-associate-project-assets` example associates a wind farm asset to a project.

```
aws iotsitewise batch-associate-project-assets \  
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE \  
  --asset-ids a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

This command produces no output.

For more information, see [Adding assets to projects](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [BatchAssociateProjectAssets](#) in *AWS CLI Command Reference*.

batch-disassociate-project-assets

The following code example shows how to use `batch-disassociate-project-assets`.

AWS CLI

To disassociate an asset from a project

The following `batch-disassociate-project-assets` example disassociates a wind farm asset from a project.

```
aws iotsitewise batch-disassociate-project-assets \  
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeEXAMPLE \  
  --asset-ids a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

This command produces no output.

For more information, see [Adding assets to projects](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [BatchDisassociateProjectAssets](#) in *AWS CLI Command Reference*.

batch-put-asset-property-value

The following code example shows how to use `batch-put-asset-property-value`.

AWS CLI

To send data to asset properties

The following `batch-put-asset-property-value` example sends power and temperature data to the asset properties identified by property aliases.

```
aws iotsitewise batch-put-asset-property-value \  
  --cli-input-json file://batch-put-asset-property-value.json
```

Contents of `batch-put-asset-property-value.json`:

```
{  
  "entries": [  
    {  
      "entryId": "1575691200-company-windfarm-3-turbine-7-power",  
      "propertyAlias": "company-windfarm-3-turbine-7-power",  
      "propertyValues": [  
        {  
          "value": {  
            "doubleValue": 4.92          }  
        }  
      ]  
    }  
  ]  
}
```

```

    },
    "timestamp": {
      "timeInSeconds": 1575691200
    },
    "quality": "GOOD"
  }
]
},
{
  "entryId": "1575691200-company-windfarm-3-turbine-7-temperature",
  "propertyAlias": "company-windfarm-3-turbine-7-temperature",
  "propertyValues": [
    {
      "value": {
        "integerValue": 38
      },
      "timestamp": {
        "timeInSeconds": 1575691200
      }
    }
  ]
}
]
}
}

```

Output:

```

{
  "errorEntries": []
}

```

For more information, see [Ingesting data using the AWS IoT SiteWise API](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [BatchPutAssetPropertyValue](#) in *AWS CLI Command Reference*.

create-access-policy

The following code example shows how to use `create-access-policy`.

AWS CLI**Example 1: To grant a user administrative access to a portal**

The following `create-access-policy` example creates an access policy that grants a user administrative access to a web portal for a wind farm company.

```
aws iotsitewise create-access-policy \  
  --cli-input-json file://create-portal-administrator-access-policy.json
```

Contents of `create-portal-administrator-access-policy.json`:

```
{  
  "accessPolicyIdentity": {  
    "user": {  
      "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbbEXAMPLE"  
    }  
  },  
  "accessPolicyPermission": "ADMINISTRATOR",  
  "accessPolicyResource": {  
    "portal": {  
      "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE"  
    }  
  }  
}
```

Output:

```
{  
  "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE",  
  "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/  
a1b2c3d4-5678-90ab-cdef-cccccEXAMPLE"  
}
```

For more information, see [Adding or removing portal administrators](#) in the *AWS IoT SiteWise User Guide*.

Example 2: To grant a user read-only access to a project

The following `create-access-policy` example creates an access policy that grants a user read-only access to a wind farm project.

```
aws iotsitewise create-access-policy \  
  --cli-input-json file://create-project-viewer-access-policy.json
```

Contents of create-project-viewer-access-policy.json:

```
{
  "accessPolicyIdentity": {
    "user": {
      "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"
    }
  },
  "accessPolicyPermission": "VIEWER",
  "accessPolicyResource": {
    "project": {
      "id": "a1b2c3d4-5678-90ab-cdef-eeeeEXAMPLE"
    }
  }
}
```

Output:

```
{
  "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE",
  "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE"
}
```

For more information, see [Assigning project viewers](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [CreateAccessPolicy](#) in *AWS CLI Command Reference*.

create-asset-model

The following code example shows how to use create-asset-model.

AWS CLI

To create an asset model

The following create-asset-model example creates an asset model that defines a wind turbine with the following properties:

Serial number - The serial number of a wind turbine
Generated power - The generated power data stream from a wind turbine
Temperature C - The temperature data stream from a wind

turbine in CelsiusTemperature F - The mapped temperature data points from Celsius to Fahrenheit

```
aws iotsitewise create-asset-model \  
  --cli-input-json file://create-wind-turbine-model.json
```

Contents of create-wind-turbine-model.json:

```
{  
  "assetModelName": "Wind Turbine Model",  
  "assetModelDescription": "Represents a wind turbine",  
  "assetModelProperties": [  
    {  
      "name": "Serial Number",  
      "dataType": "STRING",  
      "type": {  
        "attribute": {}  
      }  
    },  
    {  
      "name": "Generated Power",  
      "dataType": "DOUBLE",  
      "unit": "kW",  
      "type": {  
        "measurement": {}  
      }  
    },  
    {  
      "name": "Temperature C",  
      "dataType": "DOUBLE",  
      "unit": "Celsius",  
      "type": {  
        "measurement": {}  
      }  
    },  
    {  
      "name": "Temperature F",  
      "dataType": "DOUBLE",  
      "unit": "Fahrenheit",  
      "type": {  
        "transform": {  
          "expression": "temp_c * 9 / 5 + 32",  
          "variables": [  

```

```

        {
            "name": "temp_c",
            "value": {
                "propertyId": "Temperature C"
            }
        }
    ]
}
},
{
    "name": "Total Generated Power",
    "dataType": "DOUBLE",
    "unit": "kW",
    "type": {
        "metric": {
            "expression": "sum(power)",
            "variables": [
                {
                    "name": "power",
                    "value": {
                        "propertyId": "Generated Power"
                    }
                }
            ],
            "window": {
                "tumbling": {
                    "interval": "1h"
                }
            }
        }
    }
}
]
}

```

Output:

```

{
    "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
    "assetModelStatus": {

```

```
    "state": "CREATING"
  }
}
```

For more information, see [Defining asset models](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [CreateAssetModel](#) in *AWS CLI Command Reference*.

create-asset

The following code example shows how to use `create-asset`.

AWS CLI

To create an asset

The following `create-asset` example creates a wind turbine asset from a wind turbine asset model.

```
aws iotsitewise create-asset \
  --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE \
  --asset-name "Wind Turbine 1"
```

Output:

```
{
  "assetId": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
  "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",
  "assetStatus": {
    "state": "CREATING"
  }
}
```

For more information, see [Creating assets](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [CreateAsset](#) in *AWS CLI Command Reference*.

create-dashboard

The following code example shows how to use `create-dashboard`.

AWS CLI

To create a dashboard

The following `create-dashboard` example creates a dashboard with a line chart that displays total generated power for a wind farm.

```
aws iotsitewise create-dashboard \  
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE \  
  --dashboard-name "Wind Farm" \  
  --dashboard-definition file://create-wind-farm-dashboard.json
```

Contents of `create-wind-farm-dashboard.json`:

```
{  
  "widgets": [  
    {  
      "type": "monitor-line-chart",  
      "title": "Generated Power",  
      "x": 0,  
      "y": 0,  
      "height": 3,  
      "width": 3,  
      "metrics": [  
        {  
          "label": "Power",  
          "type": "iotsitewise",  
          "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",  
          "propertyId": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"  
        }  
      ]  
    }  
  ]  
}
```

Output:

```
{  
  "dashboardId": "a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE",  
  "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/  
a1b2c3d4-5678-90ab-cdef-ffffffEXAMPLE"  
}
```

For more information, see [Creating dashboards \(CLI\)](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [CreateDashboard](#) in *AWS CLI Command Reference*.

create-gateway

The following code example shows how to use `create-gateway`.

AWS CLI

To create a gateway

The following `create-gateway` example creates a gateway that runs on AWS IoT Greengrass.

```
aws iotsitewise create-gateway \  
  --gateway-name ExampleCorpGateway \  
  --gateway-platform greengrass={groupArn=arn:aws:greengrass:us-  
west-2:123456789012:/greengrass/groups/a1b2c3d4-5678-90ab-cdef-1b1b1EXAMPLE}
```

Output:

```
{  
  "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",  
  "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/  
a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE"  
}
```

For more information, see [Configuring a gateway](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [CreateGateway](#) in *AWS CLI Command Reference*.

create-portal

The following code example shows how to use `create-portal`.

AWS CLI

To create a portal

The following `create-portal` example creates a web portal for a wind farm company. You can create portals only in the same Region where you enabled AWS Single Sign-On.

```
aws iotsitewise create-portal \  
  --portal-name WindFarmPortal \  
  --portal-description "A portal that contains wind farm projects for Example  
Corp." \  
  --portal-contact-email support@example.com \  
  --role-arn arn:aws:iam::123456789012:role/service-role/  
MySiteWiseMonitorServiceRole
```

Output:

```
{  
  "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",  
  "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/

  "portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-  
aaaaaEXAMPLE.app.iotsitewise.aws",  
  "portalStatus": {  
    "state": "CREATING"  
  },  
  "ssoApplicationId": "ins-a1b2c3d4-EXAMPLE"  
}
```

For more information, see [Getting started with AWS IoT SiteWise Monitor](#) in the *AWS IoT SiteWise User Guide* and [Enabling AWS SSO](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [CreatePortal](#) in *AWS CLI Command Reference*.

create-project

The following code example shows how to use `create-project`.

AWS CLI

To create a project

The following `create-project` example creates a wind farm project.

```
aws iotsitewise create-project \  
  --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE \  
  --project-name "Wind Farm 1" \  
  --project-description "Contains asset visualizations for Wind Farm #1 for  
Example Corp."
```

Output:

```
{
  "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE",
  "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/
a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE"
}
```

For more information, see [Creating projects](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [CreateProject](#) in *AWS CLI Command Reference*.

delete-access-policy

The following code example shows how to use `delete-access-policy`.

AWS CLI**To revoke a user's access to a project or portal**

The following `delete-access-policy` example deletes an access policy that grants a user administrative access to a portal.

```
aws iotsitewise delete-access-policy \
  --access-policy-id a1b2c3d4-5678-90ab-cdef-ccccEXAMPLE
```

This command produces no output.

For more information, see [Adding or removing portal administrators](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DeleteAccessPolicy](#) in *AWS CLI Command Reference*.

delete-asset-model

The following code example shows how to use `delete-asset-model`.

AWS CLI**To delete an asset model**

The following `delete-asset-model` example deletes a wind turbine asset model.

```
aws iotsitewise delete-asset-model \  
  --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{  
  "assetModelStatus": {  
    "state": "DELETING"  
  }  
}
```

For more information, see [Deleting asset models](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DeleteAssetModel](#) in *AWS CLI Command Reference*.

delete-asset

The following code example shows how to use `delete-asset`.

AWS CLI

To delete an asset

The following `delete-asset` example deletes a wind turbine asset.

```
aws iotsitewise delete-asset \  
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```
{  
  "assetStatus": {  
    "state": "DELETING"  
  }  
}
```

For more information, see [Deleting assets](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DeleteAsset](#) in *AWS CLI Command Reference*.

delete-dashboard

The following code example shows how to use `delete-dashboard`.

AWS CLI

To delete a dashboard

The following `delete-dashboard` example deletes a wind turbine dashboard.

```
aws iotsitewise delete-dashboard \  
  --dashboard-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE
```

This command produces no output.

For more information, see [Deleting dashboards](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [DeleteDashboard](#) in *AWS CLI Command Reference*.

delete-gateway

The following code example shows how to use `delete-gateway`.

AWS CLI

To delete a gateway

The following `delete-gateway` example deletes a gateway.

```
aws iotsitewise delete-gateway \  
  --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
```

This command produces no output.

For more information, see [Ingesting data using a gateway](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DeleteGateway](#) in *AWS CLI Command Reference*.

delete-portal

The following code example shows how to use `delete-portal`.

AWS CLI

To delete a portal

The following `delete-portal` example deletes a web portal for a wind farm company.

```
aws iotsitewise delete-portal \  
  --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{  
  "portalStatus": {  
    "state": "DELETING"  
  }  
}
```

For more information, see [Deleting a portal](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DeletePortal](#) in *AWS CLI Command Reference*.

delete-project

The following code example shows how to use `delete-project`.

AWS CLI

To delete a project

The following `delete-project` example deletes a wind farm project.

```
aws iotsitewise delete-project \  
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE
```

This command produces no output.

For more information, see [Deleting projects](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [DeleteProject](#) in *AWS CLI Command Reference*.

describe-access-policy

The following code example shows how to use `describe-access-policy`.

AWS CLI

To describe an access policy

The following `describe-access-policy` example describes an access policy that grants a user administrative access to a web portal for a wind farm company.

```
aws iotsitewise describe-access-policy \  
  --access-policy-id a1b2c3d4-5678-90ab-cdef-ccccEXAMPLE
```

Output:

```
{  
  "accessPolicyId": "a1b2c3d4-5678-90ab-cdef-ccccEXAMPLE",  
  "accessPolicyArn": "arn:aws:iotsitewise:us-west-2:123456789012:access-policy/  
a1b2c3d4-5678-90ab-cdef-ccccEXAMPLE",  
  "accessPolicyIdentity": {  
    "user": {  
      "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbbEXAMPLE"  
    }  
  },  
  "accessPolicyResource": {  
    "portal": {  
      "id": "a1b2c3d4-5678-90ab-cdef-aaaaEXAMPLE"  
    }  
  },  
  "accessPolicyPermission": "ADMINISTRATOR",  
  "accessPolicyCreationDate": "2020-02-20T22:35:15.552880124Z",  
  "accessPolicyLastUpdateDate": "2020-02-20T22:35:15.552880124Z"  
}
```

For more information, see [Adding or removing portal administrators](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeAccessPolicy](#) in *AWS CLI Command Reference*.

describe-asset-model

The following code example shows how to use `describe-asset-model`.

AWS CLI

To describe an asset model

The following `describe-asset-model` example describes a wind farm asset model.

```
aws iotsitewise describe-asset-model \  
  --asset-model-id a1b2c3d4-5678-90ab-cdef-22222EXAMPLE
```

Output:

```
{  
  "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",  
  "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/  
a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",  
  "assetModelName": "Wind Farm Model",  
  "assetModelDescription": "Represents a wind farm that comprises many wind  
turbines",  
  "assetModelProperties": [  
    {  
      "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",

}

```

For more information, see [Describing a specific asset model](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeAssetModel](#) in *AWS CLI Command Reference*.

describe-asset-property

The following code example shows how to use describe-asset-property.

AWS CLI

To describe an asset property

The following `describe-asset-property` example describes a wind farm asset's total generated power property.

```
aws iotsitewise describe-asset-property \  
  --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \  
  --property-id a1b2c3d4-5678-90ab-cdef-99999EXAMPLE
```

Output:

```
{  
  "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",  
  "assetName": "Wind Farm 1",  
  "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",  
  "assetProperty": {  
    "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",  
    "name": "Total Generated Power",  
    "notification": {  
      "topic": "$aws/sitewise/asset-models/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE/assets/a1b2c3d4-5678-90ab-cdef-44444EXAMPLE/properties/a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",

          {  
            "name": "power",  
            "value": {  
              "propertyId": "a1b2c3d4-5678-90ab-cdef-66666EXAMPLE",  
              "hierarchyId": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE"  
            }  
          }  
        ],  
        "window": {  
          "tumbling": {  
            "interval": "1h"  
          }  
        }  
      }  
    }  
  }  
}
```

```
}  
}
```

For more information, see [Describing a specific asset property](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeAssetProperty](#) in *AWS CLI Command Reference*.

describe-asset

The following code example shows how to use `describe-asset`.

AWS CLI

To describe an asset

The following `describe-asset` example describes a wind farm asset.

```
aws iotsitewise describe-asset \  
  --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE
```

Output:

```
{  
  "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",  
  "assetArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/  
a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",  
  "assetName": "Wind Farm 1",  
  "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",  
  "assetProperties": [  
    {  
      "id": "a1b2c3d4-5678-90ab-cdef-88888EXAMPLE",  
      "name": "Region",  
      "dataType": "STRING"  
    },  
    {  
      "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",  
      "name": "Total Generated Power",  
      "dataType": "DOUBLE",  
      "unit": "kW"  
    }  
  ],  
}
```

```

    "assetHierarchies": [
      {
        "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
        "name": "Wind Turbines"
      }
    ],
    "assetCreationDate": 1575672453.0,
    "assetLastUpdateDate": 1575672453.0,
    "assetStatus": {
      "state": "ACTIVE"
    }
  }
}

```

For more information, see [Describing a specific asset](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeAsset](#) in *AWS CLI Command Reference*.

describe-dashboard

The following code example shows how to use describe-dashboard.

AWS CLI

To describe a dashboard

The following describe-dashboard example describes the specified wind farm dashboard.

```

aws iotsitewise describe-dashboard \
  --dashboard-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE

```

Output:

```

{
  "dashboardId": "a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
  "dashboardArn": "arn:aws:iotsitewise:us-west-2:123456789012:dashboard/a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
  "dashboardName": "Wind Farm",
  "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE",
  "dashboardDefinition": "{\"widgets\": [{\"type\": \"monitor-line-chart\", \"title\": \"Generated Power\", \"x\": 0, \"y\": 0, \"height\": 3, \"width\": 3, \"metrics\": [{\"label\": \"Power\", \"type\": \"iotsitewise\", \"assetId\": \"a1b2c3d4-5678-90ab-cdef-44444EXAMPLE\", \"propertyId\": \"a1b2c3d4-5678-90ab-cdef-99999EXAMPLE\"}]}]}",
  "dashboardCreationDate": "2020-05-01T20:32:12.228476348Z",
}

```

```
"dashboardLastUpdateDate": "2020-05-01T20:32:12.228476348Z"
}
```

For more information, see [Viewing dashboards](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [DescribeDashboard](#) in *AWS CLI Command Reference*.

describe-gateway-capability-configuration

The following code example shows how to use `describe-gateway-capability-configuration`.

AWS CLI

To describe a gateway capability

The following `describe-gateway-capability-configuration` example describes an OPC-UA source capability.

```
aws iotsitewise describe-gateway-capability-configuration \
  --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
  --capability-namespace "iotsitewise:opcuacollector:1"
```

Output:

```
{
  "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
  "capabilityNamespace": "iotsitewise:opcuacollector:1",
  "capabilityConfiguration": "{\"sources\": [{\"name\": \"Wind Farm #1\",
  \"endpoint\": {\"certificateTrust\": {\"type\": \"TrustAny\"}, \"endpointUri\": \"opc.tcp://203.0.113.0:49320\", \"securityPolicy\": \"BASIC256\",
  \"messageSecurityMode\": \"SIGN_AND_ENCRYPT\", \"identityProvider\": {\"type\": \"Username\", \"usernameSecretArn\": \"arn:aws:secretsmanager:us-east-1:123456789012:secret:greenrass-factory1-auth-3QNDmM\"}, \"nodeFilterRules\": []}, \"measurementDataStreamPrefix\": \"\"}]}",
  "capabilitySyncStatus": "IN_SYNC"
}
```

For more information, see [Configuring data sources](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeGatewayCapabilityConfiguration](#) in *AWS CLI Command Reference*.

describe-gateway

The following code example shows how to use `describe-gateway`.

AWS CLI

To describe a gateway

The following `describe-gateway` example describes a gateway.

```
aws iotsitewise describe-gateway \  
  --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE
```

Output:

```
{  
  "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",  
  "gatewayName": "ExampleCorpGateway",  
  "gatewayArn": "arn:aws:iotsitewise:us-west-2:123456789012:gateway/  
a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",  
  "gatewayPlatform": {  
    "greengrass": {  
      "groupArn": "arn:aws:greengrass:us-west-2:123456789012:/greengrass/  
groups/a1b2c3d4-5678-90ab-cdef-1b1b1EXAMPLE"  
    }  
  },  
  "gatewayCapabilitySummaries": [  
    {  
      "capabilityNamespace": "iotsitewise:opcuacollector:1",  
      "capabilitySyncStatus": "IN_SYNC"  
    }  
  ],  
  "creationDate": 1588369971.457,  
  "lastUpdateDate": 1588369971.457  
}
```

For more information, see [Ingesting data using a gateway](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeGateway](#) in *AWS CLI Command Reference*.

describe-logging-options

The following code example shows how to use `describe-logging-options`.

AWS CLI

To retrieve the current AWS IoT SiteWise logging options

The following `describe-logging-options` example retrieves the current AWS IoT SiteWise logging options for your AWS account in the current Region.

```
aws iotsitewise describe-logging-options
```

Output:

```
{
  "loggingOptions": {
    "level": "INFO"
  }
}
```

For more information, see [Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribeLoggingOptions](#) in *AWS CLI Command Reference*.

describe-portal

The following code example shows how to use `describe-portal`.

AWS CLI

To describe a portal

The following `describe-portal` example describes a web portal for a wind farm company.

```
aws iotsitewise describe-portal \
  --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{
  "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
  "portalArn": "arn:aws:iotsitewise:us-west-2:123456789012:portal/
a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
  "portalName": "WindFarmPortal",
}
```

```
"portalDescription": "A portal that contains wind farm projects for Example Corp.",
"portalClientId": "E-a1b2c3d4e5f6_a1b2c3d4e5f6EXAMPLE",
"portalStartUrl": "https://a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE.app.iotsitewise.aws",
"portalContactEmail": "support@example.com",
"portalStatus": {
  "state": "ACTIVE"
},
"portalCreationDate": "2020-02-04T23:01:52.90248068Z",
"portalLastUpdateDate": "2020-02-04T23:01:52.90248078Z",
"roleArn": "arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole"
}
```

For more information, see [Administering your portals](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DescribePortal](#) in *AWS CLI Command Reference*.

describe-project

The following code example shows how to use `describe-project`.

AWS CLI

To describe a project

The following `describe-project` example describes a wind farm project.

```
aws iotsitewise describe-project \
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE
```

Output:

```
{
  "projectId": "a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE",
  "projectArn": "arn:aws:iotsitewise:us-west-2:123456789012:project/a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE",
  "projectName": "Wind Farm 1",
  "portalId": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
  "projectDescription": "Contains asset visualizations for Wind Farm #1 for Example Corp.",
  "projectCreationDate": "2020-02-20T21:58:43.362246001Z",
  "projectLastUpdateDate": "2020-02-20T21:58:43.362246095Z"
```

```
}
```

For more information, see [Viewing project details](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [DescribeProject](#) in *AWS CLI Command Reference*.

disassociate-assets

The following code example shows how to use `disassociate-assets`.

AWS CLI

To disassociate a child asset from a parent asset

The following `disassociate-assets` example disassociates a wind turbine asset from a wind farm asset.

```
aws iotsitewise disassociate-assets \  
  --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \  
  --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE \  
  --child-asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

This command produces no output.

For more information, see [Associating assets](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [DisassociateAssets](#) in *AWS CLI Command Reference*.

get-asset-property-aggregates

The following code example shows how to use `get-asset-property-aggregates`.

AWS CLI

To retrieve an asset property's aggregated average and count values

The following `get-asset-property-aggregates` example retrieves a wind turbine asset's average total power and count of total power data points for a 1 hour period in time.

```
aws iotsitewise get-asset-property-aggregates \  
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \  
  --
```

```
--property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \  
--start-date 1580849400 \  
--end-date 1580853000 \  
--aggregate-types AVERAGE COUNT \  
--resolution 1h
```

Output:

```
{  
  "aggregatedValues": [  
    {  
      "timestamp": 1580850000.0,  
      "quality": "GOOD",  
      "value": {  
        "average": 8723.46538886233,  
        "count": 12.0  
      }  
    }  
  ]  
}
```

For more information, see [Querying asset property aggregates](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [GetAssetPropertyAggregates](#) in *AWS CLI Command Reference*.

get-asset-property-value-history

The following code example shows how to use `get-asset-property-value-history`.

AWS CLI

To retrieve an asset property's historical values

The following `get-asset-property-value-history` example retrieves a wind turbine asset's total power values for a 20 minute period in time.

```
aws iotsitewise get-asset-property-value-history \  
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \  
  --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \  
  --start-date 1580851800 \  
  --end-date 1580853000
```

Output:

```
{
  "assetPropertyValueHistory": [
    {
      "value": {
        "doubleValue": 7217.787046814844
      },
      "timestamp": {
        "timeInSeconds": 1580852100,
        "offsetInNanos": 0
      },
      "quality": "GOOD"
    },
    {
      "value": {
        "doubleValue": 6941.242811875451
      },
      "timestamp": {
        "timeInSeconds": 1580852400,
        "offsetInNanos": 0
      },
      "quality": "GOOD"
    },
    {
      "value": {
        "doubleValue": 6976.797662266717
      },
      "timestamp": {
        "timeInSeconds": 1580852700,
        "offsetInNanos": 0
      },
      "quality": "GOOD"
    },
    {
      "value": {
        "doubleValue": 6890.8677520453875
      },
      "timestamp": {
        "timeInSeconds": 1580853000,
        "offsetInNanos": 0
      },
      "quality": "GOOD"
    }
  ]
}
```

```
]
}
```

For more information, see [Querying historical asset property values](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [GetAssetPropertyValueHistory](#) in *AWS CLI Command Reference*.

get-asset-property-value

The following code example shows how to use `get-asset-property-value`.

AWS CLI

To retrieve an asset property's current value

The following `get-asset-property-value` example retrieves a wind turbine asset's current total power.

```
aws iotsitewise get-asset-property-value \
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
  --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE
```

Output:

```
{
  "propertyValue": {
    "value": {
      "doubleValue": 6890.8677520453875
    },
    "timestamp": {
      "timeInSeconds": 1580853000,
      "offsetInNanos": 0
    },
    "quality": "GOOD"
  }
}
```

For more information, see [Querying current asset property values](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [GetAssetPropertyValue](#) in *AWS CLI Command Reference*.

list-access-policies

The following code example shows how to use `list-access-policies`.

AWS CLI

To list all access policies

The following `list-access-policies` example lists all access policies for a user who is a portal administrator.

```
aws iotsitewise list-access-policies \  
  --identity-type USER \  
  --identity-id a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE
```

Output:

```
{  
  "accessPolicySummaries": [  
    {  
      "id": "a1b2c3d4-5678-90ab-cdef-ccccEXAMPLE",  
      "identity": {  
        "user": {  
          "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"  
        }  
      },  
      "resource": {  
        "portal": {  
          "id": "a1b2c3d4-5678-90ab-cdef-aaaaEXAMPLE"  
        }  
      },  
      "permission": "ADMINISTRATOR"  
    }  
  ]  
}
```

For more information, see [Administering your portals](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListAccessPolicies](#) in *AWS CLI Command Reference*.

list-asset-models

The following code example shows how to use `list-asset-models`.

AWS CLI

To list all asset models

The following `list-asset-models` example lists all asset models that are defined in your AWS account in the current Region.

```
aws iotsitewise list-asset-models
```

Output:

```
{
  "assetModelSummaries": [
    {
      "id": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
      "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
      "name": "Wind Farm Model",
      "description": "Represents a wind farm that comprises many wind turbines",
      "creationDate": 1575671284.0,
      "lastUpdateDate": 1575671988.0,
      "status": {
        "state": "ACTIVE"
      }
    },
    {
      "id": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "name": "Wind Turbine Model",
      "description": "Represents a wind turbine manufactured by Example Corp",
      "creationDate": 1575671207.0,
      "lastUpdateDate": 1575686273.0,
      "status": {
        "state": "ACTIVE"
      }
    }
  ]
}
```

For more information, see [Listing all asset models](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListAssetModels](#) in *AWS CLI Command Reference*.

list-assets

The following code example shows how to use `list-assets`.

AWS CLI

Example 1: To list all top-level assets

The following `list-assets` example lists all assets that are top-level in the asset hierarchy tree and defined in your AWS account in the current Region.

```
aws iotsitewise list-assets \  
  --filter TOP_LEVEL
```

Output:

```
{  
  "assetSummaries": [  
    {  
      "id": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",  
      "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/  
a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",  
      "name": "Wind Farm 1",  
      "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",  
      "creationDate": 1575672453.0,  
      "lastUpdateDate": 1575672453.0,  
      "status": {  
        "state": "ACTIVE"  
      },  
      "hierarchies": [  
        {  
          "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",  
          "name": "Wind Turbines"  
        }  
      ]  
    }  
  ]  
}
```

For more information, see [Listing assets](#) in the *AWS IoT SiteWise User Guide*.

Example 2: To list all assets based on an asset model

The following `list-assets` example lists all assets based on an asset model and defined in your AWS account in the current Region.

```
aws iotsitewise list-assets \  
  --asset-model-id a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{  
  "assetSummaries": [  
    {  
      "id": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",  
      "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/  
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",  
      "name": "Wind Turbine 1",  
      "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",  
      "creationDate": 1575671550.0,  
      "lastUpdateDate": 1575686308.0,  
      "status": {  
        "state": "ACTIVE"  
      },  
      "hierarchies": []  
    }  
  ]  
}
```

For more information, see [Listing assets](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListAssets](#) in *AWS CLI Command Reference*.

list-associated-assets

The following code example shows how to use `list-associated-assets`.

AWS CLI

To list all assets associated to an asset in a specific hierarchy

The following `list-associated-assets` example lists all wind turbine assets associated to the specified wind farm asset.

```
aws iotsitewise list-associated-assets \  
  --asset-id a1b2c3d4-5678-90ab-cdef-44444EXAMPLE \  
  --hierarchy-id a1b2c3d4-5678-90ab-cdef-77777EXAMPLE
```

Output:

```
{  
  "assetSummaries": [  
    {  
      "id": "a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",  
      "arn": "arn:aws:iotsitewise:us-west-2:123456789012:asset/  
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE",  
      "name": "Wind Turbine 1",  
      "assetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",  
      "creationDate": 1575671550.0,  
      "lastUpdateDate": 1575686308.0,  
      "status": {  
        "state": "ACTIVE"  
      },  
      "hierarchies": []  
    }  
  ]  
}
```

For more information, see [Listing assets associated to a specific asset](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListAssociatedAssets](#) in *AWS CLI Command Reference*.

list-dashboards

The following code example shows how to use `list-dashboards`.

AWS CLI

To list all dashboards in a project

The following `list-dashboards` example lists all dashboards that are defined in a project.

```
aws iotsitewise list-dashboards \  
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE
```

Output:

```
{
  "dashboardSummaries": [
    {
      "id": "a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE",
      "name": "Wind Farm",
      "creationDate": "2020-05-01T20:32:12.228476348Z",
      "lastUpdateDate": "2020-05-01T20:32:12.228476348Z"
    }
  ]
}
```

For more information, see [Viewing dashboards](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [ListDashboards](#) in *AWS CLI Command Reference*.

list-gateways

The following code example shows how to use `list-gateways`.

AWS CLI**To list all gateways**

The following `list-gateways` example lists all gateways that are defined in your AWS account in the current Region.

```
aws iotsitewise list-gateways
```

Output:

```
{
  "gatewaySummaries": [
    {
      "gatewayId": "a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE",
      "gatewayName": "ExampleCorpGateway",
      "gatewayCapabilitySummaries": [
        {
          "capabilityNamespace": "iotsitewise:opcuacollector:1",
          "capabilitySyncStatus": "IN_SYNC"
        }
      ]
    }
  ]
}
```

```
    }
  ],
  "creationDate": 1588369971.457,
  "lastUpdateDate": 1588369971.457
}
]
```

For more information, see [Ingesting data using a gateway](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListGateways](#) in *AWS CLI Command Reference*.

list-portals

The following code example shows how to use `list-portals`.

AWS CLI

To list all portals

The following `list-portals` example lists all portals that are defined in your AWS account in the current Region.

```
aws iotsitewise list-portals
```

Output:

```
{
  "portalSummaries": [
    {
      "id": "a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE",
      "name": "WindFarmPortal",
      "description": "A portal that contains wind farm projects for Example Corp.",
      "startUrl": "https://a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE.app.iotsitewise.aws",
      "creationDate": "2020-02-04T23:01:52.90248068Z",
      "lastUpdateDate": "2020-02-04T23:01:52.90248078Z",
      "roleArn": "arn:aws:iam::123456789012:role/service-role/MySiteWiseMonitorServiceRole"
    }
  ]
}
```

```
}
```

For more information, see [Administering your portals](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListPortals](#) in *AWS CLI Command Reference*.

list-project-assets

The following code example shows how to use `list-project-assets`.

AWS CLI

To list all assets associated to a project

The following `list-project-assets` example lists all assets that are associated to a wind farm project.

```
aws iotsitewise list-projects \  
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeEXAMPLE
```

Output:

```
{  
  "assetIds": [  
    "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE"  
  ]  
}
```

For more information, see [Adding assets to projects](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [ListProjectAssets](#) in *AWS CLI Command Reference*.

list-projects

The following code example shows how to use `list-projects`.

AWS CLI

To list all projects in a portal

The following `list-projects` example lists all projects that are defined in a portal.

```
aws iotsitewise list-projects \  
  --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE
```

Output:

```
{  
  "projectSummaries": [  
    {  
      "id": "a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE",  
      "name": "Wind Farm 1",  
      "description": "Contains asset visualizations for Wind Farm #1 for  
Example Corp.",  
      "creationDate": "2020-02-20T21:58:43.362246001Z",  
      "lastUpdateDate": "2020-02-20T21:58:43.362246095Z"  
    }  
  ]  
}
```

For more information, see [Viewing project details](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [ListProjects](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for a resource

The following `list-tags-for-resource` example lists all tags for a wind turbine asset.

```
aws iotsitewise list-tags-for-resource \  
  --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/  
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE
```

Output:

```
{  
  "tags": {
```

```
    "Owner": "richard-roe"  
  }  
}
```

For more information, see [Tagging your resources](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-logging-options

The following code example shows how to use `put-logging-options`.

AWS CLI

To specify the level of logging

The following `put-logging-options` example enables INFO level logging in AWS IoT SiteWise. Other levels include DEBUG and OFF.

```
aws iotsitewise put-logging-options \  
  --logging-options level=INFO
```

This command produces no output.

For more information, see [Monitoring AWS IoT SiteWise with Amazon CloudWatch Logs](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [PutLoggingOptions](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a resource

The following `tag-resource` example adds an owner tag to a wind turbine asset. This lets you control access to the asset based on who owns it.

```
aws iotsitewise tag-resource \  
  --tag-key Owner
```

```
--resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
--tags Owner=richard-roe
```

This command produces no output.

For more information, see [Tagging your resources](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` example removes an owner tag from a wind turbine asset.

```
aws iotsitewise untag-resource \
  --resource-arn arn:aws:iotsitewise:us-west-2:123456789012:asset/
a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
  --tag-keys Owner
```

This command produces no output.

For more information, see [Tagging your resources](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-access-policy

The following code example shows how to use `update-access-policy`.

AWS CLI

To grant a project viewer ownership of a project

The following `update-access-policy` example updates an access policy that grants a project viewer ownership of a project.

```
aws iotsitewise update-access-policy \  
  --access-policy-id a1b2c3d4-5678-90ab-cdef-dddddEXAMPLE \  
  --cli-input-json file://update-project-viewer-access-policy.json
```

Contents of `update-project-viewer-access-policy.json`:

```
{  
  "accessPolicyIdentity": {  
    "user": {  
      "id": "a1b2c3d4e5-a1b2c3d4-5678-90ab-cdef-bbbbbEXAMPLE"  
    }  
  },  
  "accessPolicyPermission": "ADMINISTRATOR",  
  "accessPolicyResource": {  
    "project": {  
      "id": "a1b2c3d4-5678-90ab-cdef-eeeeeeEXAMPLE"  
    }  
  }  
}
```

This command produces no output.

For more information, see [Assigning project owners](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [UpdateAccessPolicy](#) in *AWS CLI Command Reference*.

update-asset-model

The following code example shows how to use `update-asset-model`.

AWS CLI

To update an asset model

The following `update-asset-model` example updates a wind farm asset model's description. This example includes the model's existing IDs and definitions, because `update-asset-model` overwrites the existing model with the new model.

```
aws iotsitewise update-asset-model \  
  --cli-input-json file://update-wind-farm-model.json
```

Contents of update-wind-farm-model.json:

```

{
  "assetModelName": "Wind Farm Model",
  "assetModelDescription": "Represents a wind farm that comprises many wind
turbines",
  "assetModelProperties": [
    {
      "id": "a1b2c3d4-5678-90ab-cdef-88888EXAMPLE",
      "name": "Region",
      "dataType": "STRING",
      "type": {
        "attribute": {}
      }
    },
    {
      "id": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE",
      "name": "Total Generated Power",
      "dataType": "DOUBLE",
      "unit": "kW",
      "type": {
        "metric": {
          "expression": "sum(power)",
          "variables": [
            {
              "name": "power",
              "value": {
                "hierarchyId": "a1b2c3d4-5678-90ab-
cdef-77777EXAMPLE",
                "propertyId": "a1b2c3d4-5678-90ab-cdef-66666EXAMPLE"
              }
            }
          ]
        },
        "window": {
          "tumbling": {
            "interval": "1h"
          }
        }
      }
    }
  ],
  "assetModelHierarchies": [
    {

```

```

        "id": "a1b2c3d4-5678-90ab-cdef-77777EXAMPLE",
        "name": "Wind Turbines",
        "childAssetModelId": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
    }
]
}

```

Output:

```

{
  "assetModelId": "a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
  "assetModelArn": "arn:aws:iotsitewise:us-west-2:123456789012:asset-model/a1b2c3d4-5678-90ab-cdef-22222EXAMPLE",
  "assetModelStatus": {
    "state": "CREATING"
  }
}

```

For more information, see [Updating asset models](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UpdateAssetModel](#) in *AWS CLI Command Reference*.

update-asset-property

The following code example shows how to use `update-asset-property`.

AWS CLI

Example 1: To update an asset property's alias

The following `update-asset-property` example updates a wind turbine asset's power property alias.

```

aws iotsitewise update-asset-property \
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \
  --property-id a1b2c3d4-5678-90ab-cdef-55555EXAMPLE \
  --property-alias "/examplecorp/windfarm/1/turbine/1/power" \
  --property-notification-state DISABLED

```

This command produces no output.

For more information, see [Mapping industrial data streams to asset properties](#) in the *AWS IoT SiteWise User Guide*.

Example 2: To enable asset property notifications

The following `update-asset-property` example enables asset property update notifications for a wind turbine asset's power property. Property value updates are published to the MQTT topic `$aws/sitewise/asset-models/<assetModelId>/assets/<assetId>/properties/<propertyId>`, where each ID is replaced by the property, asset, and model ID of the asset property.

```
aws iotsitewise update-asset-property \  
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \  
  --property-id a1b2c3d4-5678-90ab-cdef-66666EXAMPLE \  
  --property-notification-state ENABLED \  
  --property-alias "/examplecorp/windfarm/1/turbine/1/power"
```

This command produces no output.

For more information, see [Interacting with other services](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UpdateAssetProperty](#) in *AWS CLI Command Reference*.

update-asset

The following code example shows how to use `update-asset`.

AWS CLI

To update an asset's name

The following `update-asset` example updates a wind turbine asset's name.

```
aws iotsitewise update-asset \  
  --asset-id a1b2c3d4-5678-90ab-cdef-33333EXAMPLE \  
  --asset-name "Wind Turbine 2"
```

Output:

```
{  
  "assetStatus": {
```

```
    "state": "UPDATING"
  }
}
```

For more information, see [Updating assets](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UpdateAsset](#) in *AWS CLI Command Reference*.

update-dashboard

The following code example shows how to use `update-dashboard`.

AWS CLI

To update a dashboard

The following `update-dashboard` example changes the title of a dashboard's line chart that displays total generated power for a wind farm.

```
aws iotsitewise update-dashboard \
  --project-id a1b2c3d4-5678-90ab-cdef-fffffEXAMPLE \
  --dashboard-name "Wind Farm" \
  --dashboard-definition file://update-wind-farm-dashboard.json
```

Contents of `update-wind-farm-dashboard.json`:

```
{
  "widgets": [
    {
      "type": "monitor-line-chart",
      "title": "Total Generated Power",
      "x": 0,
      "y": 0,
      "height": 3,
      "width": 3,
      "metrics": [
        {
          "label": "Power",
          "type": "iotsitewise",
          "assetId": "a1b2c3d4-5678-90ab-cdef-44444EXAMPLE",
          "propertyId": "a1b2c3d4-5678-90ab-cdef-99999EXAMPLE"
        }
      ]
    }
  ]
}
```

```

    ]
  }
]
}

```

This command produces no output.

For more information, see [Creating dashboards \(CLI\)](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UpdateDashboard](#) in *AWS CLI Command Reference*.

update-gateway-capability-configuration

The following code example shows how to use `update-gateway-capability-configuration`.

AWS CLI

To update a gateway capability

The following `update-gateway-capability-configuration` example configures an OPC-UA source with the following properties:

Trusts any certificate. Uses the Basic256 algorithm to secure messages. Uses the SignAndEncrypt mode to secure connections. Uses authentication credentials stored in an AWS Secrets Manager secret.

```

aws iotsitewise update-gateway-capability-configuration \
  --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
  --capability-namespace "iotsitewise:opcuacollector:1" \
  --capability-configuration file://opc-ua-capability-configuration.json

```

Contents of `opc-ua-capability-configuration.json`:

```

{
  "sources": [
    {
      "name": "Wind Farm #1",
      "endpoint": {
        "certificateTrust": {
          "type": "TrustAny"
        },
        "endpointUri": "opc.tcp://203.0.113.0:49320",

```

```

        "securityPolicy": "BASIC256",
        "messageSecurityMode": "SIGN_AND_ENCRYPT",
        "identityProvider": {
            "type": "Username",
            "usernameSecretArn": "arn:aws:secretsmanager:us-
west-2:123456789012:secret:greenrass-windfarm1-auth-1ABCDE"
        },
        "nodeFilterRules": []
    },
    "measurementDataStreamPrefix": ""
}
]
}

```

Output:

```

{
  "capabilityNamespace": "iotsitewise:opcuacollector:1",
  "capabilitySyncStatus": "OUT_OF_SYNC"
}

```

For more information, see [Configuring data sources](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UpdateGatewayCapabilityConfiguration](#) in *AWS CLI Command Reference*.

update-gateway

The following code example shows how to use `update-gateway`.

AWS CLI**To update a gateway's name**

The following `update-gateway` example updates a gateway's name.

```

aws iotsitewise update-gateway \
  --gateway-id a1b2c3d4-5678-90ab-cdef-1a1a1EXAMPLE \
  --gateway-name ExampleCorpGateway1

```

This command produces no output.

For more information, see [Ingesting data using a gateway](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UpdateGateway](#) in *AWS CLI Command Reference*.

update-portal

The following code example shows how to use `update-portal`.

AWS CLI

To update a portal's details

The following `update-portal` example updates a web portal for a wind farm company.

```
aws iotsitewise update-portal \  
  --portal-id a1b2c3d4-5678-90ab-cdef-aaaaaEXAMPLE \  
  --portal-name WindFarmPortal \  
  --portal-description "A portal that contains wind farm projects for Example  
Corp." \  
  --portal-contact-email support@example.com \  
  --role-arn arn:aws:iam::123456789012:role/MySiteWiseMonitorServiceRole
```

Output:

```
{  
  "portalStatus": {  
    "state": "UPDATING"  
  }  
}
```

For more information, see [Administering your portals](#) in the *AWS IoT SiteWise User Guide*.

- For API details, see [UpdatePortal](#) in *AWS CLI Command Reference*.

update-project

The following code example shows how to use `update-project`.

AWS CLI

To update a project's details

The following `update-project` example updates a wind farm project.

```
aws iotsitewise update-project \  
  --project-id a1b2c3d4-5678-90ab-cdef-eeeeEXAMPLE \  
  --project-name "Wind Farm 1" \  
  --project-description "Contains asset visualizations for Wind Farm #1 for  
Example Corp."
```

This command produces no output.

For more information, see [Changing project details](#) in the *AWS IoT SiteWise Monitor Application Guide*.

- For API details, see [UpdateProject](#) in *AWS CLI Command Reference*.

AWS IoT Things Graph examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Things Graph.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

associate-entity-to-thing

The following code example shows how to use `associate-entity-to-thing`.

AWS CLI

To associate a thing with a device

The following `associate-entity-to-thing` example associates a thing with a device. The example uses a motion sensor device that is in the public namespace.

```
aws iotthingsgraph associate-entity-to-thing \  
  --thing-name "MotionSensorName" \  
  --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

This command produces no output.

For more information, see [Creating and Uploading Models](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [AssociateEntityToThing](#) in *AWS CLI Command Reference*.

create-flow-template

The following code example shows how to use `create-flow-template`.

AWS CLI

To create a flow

The following `create-flow-template` example creates a flow (workflow). The value of `MyFlowDefinition` is the GraphQL that models the flow.

```
aws iotthingsgraph create-flow-template \  
  --definition language=GRAPHQL,text="MyFlowDefinition"
```

Output:

```
{  
  "summary": {  
    "createdAt": 1559248067.545,  
    "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",  
    "revisionNumber": 1  
  }  
}
```

For more information, see [Working with Flows](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [CreateFlowTemplate](#) in *AWS CLI Command Reference*.

create-system-instance

The following code example shows how to use create-system-instance.

AWS CLI

To create a system instance

The following create-system-instance example creates a system instance. The value of MySystemInstanceDefinition is the GraphQL that models the system instance.

```
aws iotthingsgraph create-system-instance -\
  -definition language=GRAPHQL,text="MySystemInstanceDefinition" \
  --target CLOUD \
  --flow-actions-role-arn myRoleARN
```

Output:

```
{
  "summary": {
    "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
    "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/default/Room218",
    "status": "NOT_DEPLOYED",
    "target": "CLOUD",
    "createdAt": 1559249315.208,
    "updatedAt": 1559249315.208
  }
}
```

For more information, see [Working with Systems and Flow Configurations](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [CreateSystemInstance](#) in *AWS CLI Command Reference*.

create-system-template

The following code example shows how to use create-system-template.

AWS CLI

To create a system

The following `create-system-template` example creates a system. The value of `MySystemDefinition` is the GraphQL that models the system.

```
aws iotthingsgraph create-system-template \  
  --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```
{  
  "summary": {  
    "createdAt": 1559249776.254,  
    "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",  
    "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/  
MySystem",  
    "revisionNumber": 1  
  }  
}
```

For more information, see [Creating Systems](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [CreateSystemTemplate](#) in *AWS CLI Command Reference*.

delete-flow-template

The following code example shows how to use `delete-flow-template`.

AWS CLI

To delete a flow

The following `delete-flow-template` example deletes a flow (workflow).

```
aws iotthingsgraph delete-flow-template \  
  --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

This command produces no output.

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DeleteFlowTemplate](#) in *AWS CLI Command Reference*.

delete-namespace

The following code example shows how to use delete-namespace.

AWS CLI

To delete a namespace

The following delete-namespace example deletes a namespace.

```
aws iotthingsgraph delete-namespace
```

Output:

```
{
  "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
  "namespaceName": "us-west-2/123456789012/default"
}
```

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DeleteNamespace](#) in *AWS CLI Command Reference*.

delete-system-instance

The following code example shows how to use delete-system-instance.

AWS CLI

To delete a system instance

The following delete-system-instance example deletes a system instance.

```
aws iotthingsgraph delete-system-instance \
  --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

This command produces no output.

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DeleteSystemInstance](#) in *AWS CLI Command Reference*.

delete-system-template

The following code example shows how to use `delete-system-template`.

AWS CLI

To delete a system

The following `delete-system-template` example deletes a system.

```
aws iotthingsgraph delete-system-template \  
  --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

This command produces no output.

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DeleteSystemTemplate](#) in *AWS CLI Command Reference*.

deploy-system-instance

The following code example shows how to use `deploy-system-instance`.

AWS CLI

To deploy a system instance

The following `deploy-system-instance` example deploys a system instance.

```
aws iotthingsgraph deploy-system-instance \  
  --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{  
  "summary": {  
    "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment:Room218",  
    "createdAt": 1559249776.254,  
    "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
```

```
"status": "DEPLOYED_IN_TARGET",
"target": "CLOUD",
"updatedAt": 1559249776.254
}
}
```

For more information, see [Working with Systems and Flow Configurations](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DeploySystemInstance](#) in *AWS CLI Command Reference*.

deprecate-flow-template

The following code example shows how to use `deprecate-flow-template`.

AWS CLI

To deprecate a flow

The following `deprecate-flow-template` example deprecates a flow (workflow).

```
aws iotthingsgraph deprecate-flow-template \
  --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

This command produces no output.

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DeprecateFlowTemplate](#) in *AWS CLI Command Reference*.

deprecate-system-template

The following code example shows how to use `deprecate-system-template`.

AWS CLI

To deprecate a system

The following `deprecate-system-template` example deprecates a system.

```
aws iotthingsgraph deprecate-system-template \
```

```
--id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

This command produces no output.

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DeprecateSystemTemplate](#) in *AWS CLI Command Reference*.

describe-namespace

The following code example shows how to use describe-namespace.

AWS CLI

To get a description of your namespace

The following describe-namespace example gets a description of your namespace.

```
aws iotthingsgraph describe-namespace
```

Output:

```
{
  "namespaceName": "us-west-2/123456789012/default",
  "trackingNamespaceName": "aws",
  "trackingNamespaceVersion": 1,
  "namespaceVersion": 5
}
```

For more information, see [Namespaces](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DescribeNamespace](#) in *AWS CLI Command Reference*.

dissociate-entity-from-thing

The following code example shows how to use dissociate-entity-from-thing.

AWS CLI

To dissociate a thing from a device

The following `dissociate-entity-from-thing` example dissociates a thing from a device.

```
aws iotthingsgraph dissociate-entity-from-thing \  
  --thing-name "MotionSensorName" \  
  --entity-type "DEVICE"
```

This command produces no output.

For more information, see [Creating and Uploading Models](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [DissociateEntityFromThing](#) in *AWS CLI Command Reference*.

get-entities

The following code example shows how to use `get-entities`.

AWS CLI

To get definitions for entities

The following `get-entities` example gets a definition for a device model.

```
aws iotthingsgraph get-entities \  
  --ids "urn:tdm:aws/examples:DeviceModel:MotionSensor"
```

Output:

```
{  
  "descriptions": [  
    {  
      "id": "urn:tdm:aws/examples:DeviceModel:MotionSensor",  
      "type": "DEVICE_MODEL",  
      "createdAt": 1559256190.599,  
      "definition": {  
        "language": "GRAPHQL",  
        "text": "##\n# Specification of motion sensor devices interface.\n##  
\n#type MotionSensor @deviceModel(id: \"urn:tdm:aws/examples:deviceModel:MotionSensor  
\",\n#  capability: \"urn:tdm:aws/examples:capability:MotionSensorCapability\")  
{ignore:void}"  
      }  
    }  
  ]  
}
```

```
]
}
```

For more information, see [Creating and Uploading Models](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetEntities](#) in *AWS CLI Command Reference*.

get-flow-template-revisions

The following code example shows how to use `get-flow-template-revisions`.

AWS CLI

To get revision information about a flow

The following `get-flow-template-revisions` example gets revision information about a flow (workflow).

```
aws iotthingsgraph get-flow-template-revisions \
  --id urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow
```

Output:

```
{
  "summaries": [
    {
      "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
      "revisionNumber": 1,
      "createdAt": 1559247540.292
    }
  ]
}
```

For more information, see [Working with Flows](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetFlowTemplateRevisions](#) in *AWS CLI Command Reference*.

get-flow-template

The following code example shows how to use `get-flow-template`.

AWS CLI

To get a flow definition

The following `get-flow-template` example gets a definition for a flow (workflow).

```
aws iotthingsgraph get-flow-template \
  --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow"
```

Output:

```
{
  "description": {
    "summary": {
      "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",
      "revisionNumber": 1,
      "createdAt": 1559247540.292
    },
    "definition": {
      "language": "GRAPHQL",
      "text": "{\nquery MyFlow($camera: string!, $screen: string!)

    },
    "validatedNamespaceVersion": 5
  }
}
```

For more information, see [Working with Flows](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetFlowTemplate](#) in *AWS CLI Command Reference*.

get-namespace-deletion-status

The following code example shows how to use `get-namespace-deletion-status`.

AWS CLI

To get the status of the namespace deletion task

The following `get-namespace-deletion-status` example gets the status of the namespace deletion task.

```
aws iotthingsgraph get-namespace-deletion-status
```

Output:

```
{
  "namespaceArn": "arn:aws:iotthingsgraph:us-west-2:123456789012",
  "namespaceName": "us-west-2/123456789012/default"
  "status": "SUCCEEDED "
}
```

For more information, see [Namespaces](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetNamespaceDeletionStatus](#) in *AWS CLI Command Reference*.

get-system-instance

The following code example shows how to use `get-system-instance`.

AWS CLI

To get a system instance

The following `get-system-instance` example gets a definition for a system instance.

```
aws iotthingsgraph get-system-instance \
  --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```

{
  "description": {
    "summary": {
      "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room218",
      "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218",
      "status": "NOT_DEPLOYED",
      "target": "CLOUD",
      "createdAt": 1559249315.208,
      "updatedAt": 1559249315.208
    },
    "definition": {
      "language": "GRAPHQL",
      "text": "{\r\nquery Room218 @deployment(id: \"urn:tdm:us-
west-2/123456789012/default:Deployment:Room218\", systemId: \"urn:tdm:us-
west-2/123456789012/default:System:SecurityFlow\") {\r\n  motionSensor(deviceId:
\"MotionSensorName\")\r\n  screen(deviceId: \"ScreenName\")\r\n  camera(deviceId:

bindings[name == 'screen'].deviceId))\r\n  }\r\n  }\r\n  }\r\n  }\r\n  }"
    },
    "metricsConfiguration": {
      "cloudMetricEnabled": false
    },
    "validatedNamespaceVersion": 5,
    "flowActionsRoleArn": "arn:aws:iam::123456789012:role/ThingsGraphRole"
  }
}

```

For more information, see [Working with Systems and Flow Configurations](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetSystemInstance](#) in *AWS CLI Command Reference*.

get-system-template-revisions

The following code example shows how to use `get-system-template-revisions`.

AWS CLI

To get revision information about a system

The following `get-system-template-revisions` example gets revision information about a system.

```
aws iotthingsgraph get-system-template-revisions \  
  --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```
{  
  "summaries": [  
    {  
      "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",  
      "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/  
MySystem",  
      "revisionNumber": 1,  
      "createdAt": 1559247540.656  
    }  
  ]  
}
```

For more information, see [Working with Systems and Flow Configurations](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetSystemTemplateRevisions](#) in *AWS CLI Command Reference*.

get-system-template

The following code example shows how to use `get-system-template`.

AWS CLI

To get a system

The following `get-system-template` example gets a definition for a system.

```
aws iotthingsgraph get-system-template \  
  --id "urn:tdm:us-west-2/123456789012/default:System:MySystem"
```

Output:

```
{  
  "description": {
```

```

    "summary": {
      "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",
      "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/MyFlow",
      "revisionNumber": 1,
      "createdAt": 1559247540.656
    },
    "definition": {
      "language": "GRAPHQL",
      "text": "{\n  type MySystem @systemType(id: \"urn:tdm:us-west-2/123456789012/default:System:MySystem\", description: \"\") {\n    camera: Camera @thing(id: \"urn:tdm:aws/examples:deviceModel:Camera\")\n    screen: Screen @thing(id: \"urn:tdm:aws/examples:deviceModel:Screen\")\n    motionSensor: MotionSensor @thing(id: \"urn:tdm:aws/examples:deviceModel:MotionSensor\")\n    MyFlow: MyFlow @workflow(id: \"urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow\")\n  }\n}"
    },
    "validatedNamespaceVersion": 5
  }
}

```

For more information, see [Working with Systems and Flow Configurations](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetSystemTemplate](#) in *AWS CLI Command Reference*.

get-upload-status

The following code example shows how to use `get-upload-status`.

AWS CLI

To get the status of your entity upload

The following `get-upload-status` example gets the status of your entity upload operation. The value of `MyUploadId` is the ID value returned by the `upload-entity-definitions` operation.

```
aws iotthingsgraph get-upload-status \
  --upload-id "MyUploadId"
```

Output:

```
{
  "namespaceName": "us-west-2/123456789012/default",
  "namespaceVersion": 5,
  "uploadId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",
  "uploadStatus": "SUCCEEDED"
}
```

For more information, see [Modeling Entities](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [GetUploadStatus](#) in *AWS CLI Command Reference*.

list-flow-execution-messages

The following code example shows how to use `list-flow-execution-messages`.

AWS CLI

To get information about events in a flow execution

The following `list-flow-execution-messages` example gets information about events in a flow execution.

```
aws iotthingsgraph list-flow-execution-messages \
  --flow-execution-id "urn:tdm:us-west-2/123456789012/
default:Workflow:SecurityFlow_2019-05-11T19:39:55.317Z_MotionSensor_69b151ad-
a611-42f5-ac21-fe537f9868ad"
```

Output:

```
{
  "messages": [
    {
      "eventType": "EXECUTION_STARTED",
      "messageId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",
      "payload": "Flow execution started",
      "timestamp": 1559247540.656
    }
  ]
}
```

For more information, see [Working with Flows](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [ListFlowExecutionMessages](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for a resource

The following `list-tags-for-resource` example list all tags for an AWS IoT Things Graph resource.

```
aws iotthingsgraph list-tags-for-resource \
  --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
  default/Room218"
```

Output:

```
{
  "tags": [
    {
      "key": "Type",
      "value": "Residential"
    }
  ]
}
```

For more information, see [Tagging Your AWS IoT Things Graph Resources](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

search-entities

The following code example shows how to use `search-entities`.

AWS CLI

To search for entities

The following `search-entities` example searches for all entities of type EVENT.

```
aws iotthingsgraph search-entities \
  --entity-types "EVENT"
```

Output:

```
{
  "descriptions": [
    {
      "id": "urn:tdm:aws/examples:Event:MotionSensorEvent",
      "type": "EVENT",
      "definition": {
        "language": "GRAPHQL",
        "text": "##\n# Description of events emitted by motion
sensor.\n##\n# type MotionSensorEvent @eventType(id: \"urn:tdm:aws/
examples:event:MotionSensorEvent\", \n          payload: \"urn:tdm:aws/
examples:property:MotionSensorStateProperty\") {ignore:void}"
      }
    },
    {
      "id": "urn:tdm:us-west-2/123456789012/
default:Event:CameraClickedEventV2",
      "type": "EVENT",
      "definition": {
        "language": "GRAPHQL",
        "text": "type CameraClickedEventV2 @eventType(id: \"urn:tdm:us-
west-2/123456789012/default:event:CameraClickedEventV2\", \r\npayload:
\"urn:tdm:aws:Property:Boolean\") {ignore:void}"
      }
    },
    {
      "id": "urn:tdm:us-west-2/123456789012/
default:Event:MotionSensorEventV2",
      "type": "EVENT",
      "definition": {
        "language": "GRAPHQL",
        "text": "# Event emitted by the motion sensor.\r\n# type
MotionSensorEventV2 @eventType(id: \"urn:tdm:us-west-2/123456789012/
default:event:MotionSensorEventV2\", \r\npayload: \"urn:tdm:us-west-2/123456789012/
default:property:MotionSensorStateProperty2\") {ignore:void}"
      }
    }
  ],
  "nextToken": "urn:tdm:us-west-2/123456789012/default:Event:MotionSensorEventV2"
```

```
}
```

For more information, see [AWS IoT Things Graph Data Model Reference](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchEntities](#) in *AWS CLI Command Reference*.

search-flow-executions

The following code example shows how to use search-flow-executions.

AWS CLI

To search for flow executions

The following search-flow-executions example search for all executions of a flow in a specified system instance.

```
aws iotthingsgraph search-flow-executions \  
  --system-instance-id "urn:tdm:us-west-2/123456789012/default:Deployment:Room218"
```

Output:

```
{  
  "summaries": [  
    {  
      "createdAt": 1559247540.656,  
      "flowExecutionId": "f6294f1e-b109-4bbe-9073-f451a2dda2da",  
      "flowTemplateId": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",  
      "status": "RUNNING ",  
      "systemInstanceId": "urn:tdm:us-west-2/123456789012/  
default:System:MySystem",  
      "updatedAt": 1559247540.656  
    }  
  ]  
}
```

For more information, see [Working with Systems and Flow Configurations](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchFlowExecutions](#) in *AWS CLI Command Reference*.

search-flow-templates

The following code example shows how to use search-flow-templates.

AWS CLI

To search for flows (or workflows)

The following search-flow-templates example searches for all flows (workflows) that contain the Camera device model.

```
aws iotthingsgraph search-flow-templates \  
  --filters name="DEVICE_MODEL_ID",value="urn:tdm:aws/examples:DeviceModel:Camera"
```

Output:

```
{  
  "summaries": [  
    {  
      "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",  
      "revisionNumber": 1,  
      "createdAt": 1559247540.292  
    },  
    {  
      "id": "urn:tdm:us-west-2/123456789012/default:Workflow:SecurityFlow",  
      "revisionNumber": 3,  
      "createdAt": 1548283099.27  
    }  
  ]  
}
```

For more information, see [Working with Flows](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchFlowTemplates](#) in *AWS CLI Command Reference*.

search-system-instances

The following code example shows how to use search-system-instances.

AWS CLI

To search for system instances

The following `search-system-instances` example searches for all system instances that contain the specified system.

```
aws iotthingsgraph search-system-instances \  
  --filters name="SYSTEM_TEMPLATE_ID",value="urn:tdm:us-west-2/123456789012/  
default:System:SecurityFlow"
```

Output:

```
{  
  "summaries": [  
    {  
      "id": "urn:tdm:us-west-2/123456789012/  
default:Deployment:DeploymentForSample",  
      "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/  
default/DeploymentForSample",  
      "status": "NOT_DEPLOYED",  
      "target": "GREENGRASS",  
      "greengrassGroupName": "ThingsGraphGrnGr",  
      "createdAt": 1555716314.707,  
      "updatedAt": 1555716314.707  
    },  
    {  
      "id": "urn:tdm:us-west-2/123456789012/  
default:Deployment:MockDeployment",  
      "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/  
default/MockDeployment",  
      "status": "DELETED_IN_TARGET",  
      "target": "GREENGRASS",  
      "greengrassGroupName": "ThingsGraphGrnGr",

        "target": "CLOUD",
        "createdAt": 1559249315.208,
        "updatedAt": 1559249315.208
    }
]
}

```

For more information, see [Working with Systems and Flow Configurations](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchSystemInstances](#) in *AWS CLI Command Reference*.

search-system-templates

The following code example shows how to use search-system-templates.

AWS CLI

To search for system

The following search-system-templates example searches for all systems that contain the specified flow.

```
aws iotthingsgraph search-system-templates \  
  --filters name="FLOW_TEMPLATE_ID",value="urn:tdm:us-west-2/123456789012/  
  default:Workflow:SecurityFlow"
```

Output:

```
{  
  "summaries": [  
    {  
      "id": "urn:tdm:us-west-2/123456789012/default:System:SecurityFlow",  
      "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/  
SecurityFlow",  
      "revisionNumber": 1,  
      "createdAt": 1548283099.433  
    }  
  ]  
}
```

For more information, see [Working with Flows](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchSystemTemplates](#) in *AWS CLI Command Reference*.

search-things

The following code example shows how to use search-things.

AWS CLI

To search for things associated with devices and device models

The following search-things example searches for all things that are associated with the HCSR501MotionSensor device.

```
aws iotthingsgraph search-things \  
  --entity-id "urn:tdm:aws/examples:Device:HCSR501MotionSensor"
```

Output:

```
{  
  "things": [  

```

```
{
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/MotionSensor1",
  "thingName": "MotionSensor1"
},
{
  "thingArn": "arn:aws:iot:us-west-2:123456789012:thing/TG_MS",
  "thingName": "TG_MS"
}
]
```

For more information, see [Creating and Uploading Models](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [SearchThings](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To create a tag for a resource

The following tag-resource example creates a tag for the specified resource.

```
aws iotthingsgraph tag-resource \
  --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/
default/Room218" \
  --tags key="Type",value="Residential"
```

This command produces no output.

For more information, see [Tagging Your AWS IoT Things Graph Resources](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

undeploy-system-instance

The following code example shows how to use undeploy-system-instance.

AWS CLI

To undeploy a system instance from its target

The following `undeploy-system-instance` example removes a system instance from its target.

```
aws iotthingsgraph undeploy-system-instance \  
  --id "urn:tdm:us-west-2/123456789012/default:Deployment:Room215"
```

Output:

```
{  
  "summary": {  
    "id": "urn:tdm:us-west-2/123456789012/default:Deployment:Room215",  
    "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/default/  
Room215",  
    "status": "PENDING_DELETE",  
    "target": "GREENGRASS",  
    "greengrassGroupName": "ThingsGraphGrnGr",  
    "createdAt": 1553189694.255,  
    "updatedAt": 1559344549.601,  
    "greengrassGroupId": "01d04b07-2a51-467f-9d03-0c90b3cdcaaf",  
    "greengrassGroupVersionId": "731b371d-d644-4b67-ac64-3934e99b75d7"  
  }  
}
```

For more information, see [Lifecycle Management for AWS IoT Things Graph Entities, Flows, Systems, and Deployments](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [UndeploySystemInstance](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag for a resource

The following `untag-resource` example removes a tag for the specified resource.

```
aws iotthingsgraph untag-resource \  
  --resource-arn "arn:aws:iotthingsgraph:us-west-2:123456789012:Deployment/  
default/Room218" \  
  --tag-keys "Type"
```

This command produces no output.

For more information, see [Tagging Your AWS IoT Things Graph Resources](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-flow-template

The following code example shows how to use `update-flow-template`.

AWS CLI

To update a flow

The following `update-flow-template` example updates a flow (workflow). The value of `MyFlowDefinition` is the GraphQL that models the flow.

```
aws iotthingsgraph update-flow-template \  
  --id "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow" \  
  --definition language=GRAPHQL,text="MyFlowDefinition"
```

Output:

```
{  
  "summary": {  
    "createdAt": 1559248067.545,  
    "id": "urn:tdm:us-west-2/123456789012/default:Workflow:MyFlow",  
    "revisionNumber": 2  
  }  
}
```

For more information, see [Working with Flows](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [UpdateFlowTemplate](#) in *AWS CLI Command Reference*.

update-system-template

The following code example shows how to use `update-system-template`.

AWS CLI

To update a system

The following `update-system-template` example updates a system. The value of `MySystemDefinition` is the GraphQL that models the system.

```
aws iotthingsgraph update-system-template \  
  --id "urn:tdm:us-west-2/123456789012/default:System:MySystem" \  
  --definition language=GRAPHQL,text="MySystemDefinition"
```

Output:

```
{  
  "summary": {  
    "createdAt": 1559249776.254,  
    "id": "urn:tdm:us-west-2/123456789012/default:System:MySystem",  
    "arn": "arn:aws:iotthingsgraph:us-west-2:123456789012:System/default/  
MySystem",  
    "revisionNumber": 2  
  }  
}
```

For more information, see [Creating Systems](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [UpdateSystemTemplate](#) in *AWS CLI Command Reference*.

upload-entity-definitions

The following code example shows how to use `upload-entity-definitions`.

AWS CLI

To upload entity definitions

The following `upload-entity-definitions` example uploads entity definitions to your namespace. The value of `MyEntityDefinitions` is the GraphQL that models the entities.

```
aws iotthingsgraph upload-entity-definitions \  
  --namespace "urn:tdm:us-west-2/123456789012/default:Namespace:MyNamespace" \  
  --definitions "MyEntityDefinitions"
```

```
--document language=GRAPHQL,text="MyEntityDefinitions"
```

Output:

```
{  
  "uploadId": "f6294f1e-b109-4bbe-9073-f451a2dda2da"  
}
```

For more information, see [Modeling Entities](#) in the *AWS IoT Things Graph User Guide*.

- For API details, see [UploadEntityDefinitions](#) in *AWS CLI Command Reference*.

AWS IoT Wireless examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS IoT Wireless.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

associate-aws-account-with-partner-account

The following code example shows how to use `associate-aws-account-with-partner-account`.

AWS CLI

To associate a partner account with your AWS account

The following `associate-aws-account-with-partner-account` example associates the following Sidewalk account credentials with your AWS account.

```
aws iotwireless associate-aws-account-with-partner-account \  
  --sidewalk  
  AmazonId="12345678901234",AppServerPrivateKey="a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
```

Output:

```
{  
  "Sidewalk": {  
    "AmazonId": "12345678901234",  
    "AppServerPrivateKey":  
    "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"  
  }  
}
```

For more information, see [Amazon Sidewalk Integration for AWS IoT Core](#) in the *AWS IoT Developers Guide*.

- For API details, see [AssociateAwsAccountWithPartnerAccount](#) in *AWS CLI Command Reference*.

associate-wireless-device-with-thing

The following code example shows how to use `associate-wireless-device-with-thing`.

AWS CLI

To associate a thing to a wireless device

The following `associate-wireless-device-with-thing` example associates a thing to your wireless device that has the specified ID.

```
aws iotwireless associate-wireless-device-with-thing \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \  
  --thing-arn "arn:aws:iot:us-east-1:123456789012:thing/MyIoTWirelessThing"
```

This command produces no output.

For more information, see [Add your gateways and wireless devices to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [AssociateWirelessDeviceWithThing](#) in *AWS CLI Command Reference*.

associate-wireless-gateway-with-certificate

The following code example shows how to use `associate-wireless-gateway-with-certificate`.

AWS CLI

To associate the certificate with the wireless gateway

The following `associate-wireless-gateway-with-certificate` associates a wireless gateway with a certificate.

```
aws iotwireless associate-wireless-gateway-with-certificate \
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
  --iot-certificate-id
"a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
```

Output:

```
{
  "IotCertificateId":
  "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"
}
```

For more information, see [Add your gateways and wireless devices to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [AssociateWirelessGatewayWithCertificate](#) in *AWS CLI Command Reference*.

associate-wireless-gateway-with-thing

The following code example shows how to use `associate-wireless-gateway-with-thing`.

AWS CLI

To associate a thing to a wireless gateway

The following `associate-wireless-gateway-with-thing` example associates a thing to a wireless gateway.

```
aws iotwireless associate-wireless-gateway-with-thing \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \  
  --thing-arn "arn:aws:iot:us-east-1:123456789012:thing/MyIoTWirelessThing"
```

This command produces no output.

For more information, see [Add your gateways and wireless devices to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [AssociateWirelessGatewayWithThing](#) in *AWS CLI Command Reference*.

create-destination

The following code example shows how to use create-destination.

AWS CLI

To create an IoT wireless destination

The following create-destination example creates a destination for mapping a device message to an AWS IoT rule. Before you run this command, you must have created an IAM role that gives AWS IoT Core for LoRaWAN the permissions necessary to send data to the AWS IoT rule.

```
aws iotwireless create-destination \  
  --name IoTWirelessDestination \  
  --expression-type RuleName \  
  --expression IoTWirelessRule \  
  --role-arn arn:aws:iam::123456789012:role/IoTWirelessDestinationRole
```

Output:

```
{  
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/  
IoTWirelessDestination",  
  "Name": "IoTWirelessDestination"  
}
```

For more information, see [Add destinations to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateDestination](#) in *AWS CLI Command Reference*.

create-device-profile

The following code example shows how to use `create-device-profile`.

AWS CLI

To create a new device profile

The following `create-device-profile` example creates a new IoT wireless device profile.

```
aws iotwireless create-device-profile
```

Output:

```
{
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
  "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateDeviceProfile](#) in *AWS CLI Command Reference*.

create-service-profile

The following code example shows how to use `create-service-profile`.

AWS CLI

To create a new service profile

The following `create-service-profile` example creates a new IoT wireless service profile.

```
aws iotwireless create-service-profile
```

Output:

```
{
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
  "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
}
```

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateServiceProfile](#) in *AWS CLI Command Reference*.

create-wireless-device

The following code example shows how to use `create-wireless-device`.

AWS CLI

To create an IoT wireless device

The following `create-wireless-device` example creates a wireless device resource of the type LoRaWAN.

```
aws iotwireless create-wireless-device \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "Description": "My LoRaWAN wireless device"
  "DestinationName": "IoTWirelessDestination"
  "LoRaWAN": {
    "DeviceProfileId": "ab0c23d3-b001-45ef-6a01-2bc3de4f5333",
    "ServiceProfileId": "fe98dc76-cd12-001e-2d34-5550432da100",
    "OtaaV1_1": {
      "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",
      "JoinEui": "b4c231a359bc2e3d",
      "NwkKey": "01c3f004a2d6efffe32c4eda14bcd2b4"
    },
    "DevEui": "ac12efc654d23fc2"
  },
  "Name": "SampleIoTWirelessThing"
```

```
"Type": LoRaWAN
}
```

Output:

```
{
  "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f",
  "Id": "1ffd32c8-8130-4194-96df-622f072a315f"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateWirelessDevice](#) in *AWS CLI Command Reference*.

create-wireless-gateway-task-definition

The following code example shows how to use `create-wireless-gateway-task-definition`.

AWS CLI

To create a wireless gateway task definition

The following `create-wireless-gateway-task-definition` automatically creates tasks using this task definition for all gateways with the specified current version.

```
aws iotwireless create-wireless-gateway-task-definition \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "AutoCreateTasks": true,
  "Name": "TestAutoUpdate",
  "Update": {
    "UpdateDataSource" : "s3://cupsalphagafirmwarebin/station",
    "UpdateDataRole" : "arn:aws:iam::001234567890:role/SDK_Test_Role",
    "LoRaWAN" : {
      "CurrentVersion" : {
        "PackageVersion" : "1.0.0",
```

```

        "Station" : "2.0.5",
        "Model" : "linux"
    },
    "UpdateVersion" :{
        "PackageVersion" : "1.0.1",
        "Station" : "2.0.5",
        "Model" : "minihub"
    }
}
}
}
}

```

Output:

```

{
  "Id": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9"
}

```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateWirelessGatewayTaskDefinition](#) in *AWS CLI Command Reference*.

create-wireless-gateway-task

The following code example shows how to use `create-wireless-gateway-task`.

AWS CLI**To create the task for a wireless gateway**

The following `create-wireless-gateway-task` example creates a task for a wireless gateway.

```

aws iotwireless create-wireless-gateway-task \
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \
  --wireless-gateway-task-definition-id "aa000102-0304-b0cd-ef56-a1b23cde456a"

```

Output:

```

{

```

```
"WirelessGatewayTaskDefinitionId": "aa204003-0604-30fb-ac82-a4f95aaf450a",  
"Status": "Success"  
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateWirelessGatewayTask](#) in *AWS CLI Command Reference*.

create-wireless-gateway

The following code example shows how to use `create-wireless-gateway`.

AWS CLI

To create a wireless gateway

The following `create-wireless-gateway` example creates a wireless LoRaWAN device gateway.

```
aws iotwireless create-wireless-gateway \  
  --lorawan GatewayEui="a1b2c3d4567890ab",RfRegion="US915" \  
  --name "myFirstLoRaWANGateway" \  
  --description "Using my first LoRaWAN gateway"
```

Output:

```
{  
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessGateway/12345678-  
a1b2-3c45-67d8-e90fa1b2c34d",  
  "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d"  
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [CreateWirelessGateway](#) in *AWS CLI Command Reference*.

delete-destination

The following code example shows how to use `delete-destination`.

AWS CLI

To delete an IoT wireless destination

The following `delete-destination` example deletes the wireless destination resource with the name `IoTWirelessDestination` that you created.

```
aws iotwireless delete-destination \  
  --name "IoTWirelessDestination"
```

This command produces no output.

For more information, see [Add destinations to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteDestination](#) in *AWS CLI Command Reference*.

`delete-device-profile`

The following code example shows how to use `delete-device-profile`.

AWS CLI

To delete a device profile

The following `delete-device-profile` example deletes a device profile with the specified ID that you created.

```
aws iotwireless delete-device-profile \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteDeviceProfile](#) in *AWS CLI Command Reference*.

`delete-service-profile`

The following code example shows how to use `delete-service-profile`.

AWS CLI

To delete a service profile

The following `delete-service-profile` example deletes a service profile with the specified ID that you created.

```
aws iotwireless delete-service-profile \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteServiceProfile](#) in *AWS CLI Command Reference*.

delete-wireless-device

The following code example shows how to use `delete-wireless-device`.

AWS CLI

To delete a wireless device

The following `delete-wireless-device` example deletes a wireless device that has the specified ID.

```
aws iotwireless delete-wireless-device \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteWirelessDevice](#) in *AWS CLI Command Reference*.

delete-wireless-gateway-task-definition

The following code example shows how to use `delete-wireless-gateway-task-definition`.

AWS CLI

To delete a wireless gateway task definition

The following `delete-wireless-gateway-task-definition` example deletes the wireless gateway task definition that you created with the following ID.

```
aws iotwireless delete-wireless-gateway-task-definition \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteWirelessGatewayTaskDefinition](#) in *AWS CLI Command Reference*.

`delete-wireless-gateway-task`

The following code example shows how to use `delete-wireless-gateway-task`.

AWS CLI

To delete a wireless gateway task

The following `delete-wireless-gateway-task` example deletes the wireless gateway task that has the specified ID.

```
aws iotwireless delete-wireless-gateway-task \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteWirelessGatewayTask](#) in *AWS CLI Command Reference*.

`delete-wireless-gateway`

The following code example shows how to use `delete-wireless-gateway`.

AWS CLI

To delete a wireless gateway

The following `delete-wireless-gateway` example deletes a wireless gateway that has the specified ID.

```
aws iotwireless delete-wireless-gateway \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DeleteWirelessGateway](#) in *AWS CLI Command Reference*.

disassociate-aws-account-from-partner-account

The following code example shows how to use `disassociate-aws-account-from-partner-account`.

AWS CLI

To disassociate the partner account from the AWS account

The following `disassociate-aws-account-from-partner-account` example disassociates a partner account from your currently associated AWS account.

```
aws iotwireless disassociate-aws-account-from-partner-account \  
  --partner-account-id "12345678901234" \  
  --partner-type "Sidewalk"
```

This command produces no output.

For more information, see [Add your gateways and wireless devices to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DisassociateAwsAccountFromPartnerAccount](#) in *AWS CLI Command Reference*.

disassociate-wireless-device-from-thing

The following code example shows how to use `disassociate-wireless-device-from-thing`.

AWS CLI

To disassociate the thing from the wireless device

The following `disassociate-wireless-device-from-thing` example disassociates a wireless device from its currently associated thing.

```
aws iotwireless disassociate-wireless-device-from-thing \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Add your gateways and wireless devices to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DisassociateWirelessDeviceFromThing](#) in *AWS CLI Command Reference*.

disassociate-wireless-gateway-from-certificate

The following code example shows how to use `disassociate-wireless-gateway-from-certificate`.

AWS CLI

To disassociate the certificate from the wireless gateway

The following `disassociate-wireless-gateway-from-certificate` disassociates a wireless gateway from its currently associated certificate.

```
aws iotwireless disassociate-wireless-gateway-from-certificate \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Add your gateways and wireless devices to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DisassociateWirelessGatewayFromCertificate](#) in *AWS CLI Command Reference*.

disassociate-wireless-gateway-from-thing

The following code example shows how to use `disassociate-wireless-gateway-from-thing`.

AWS CLI

To disassociate the thing from the wireless gateway

The following `disassociate-wireless-gateway-from-thing` example disassociates a wireless gateway from its currently associated thing.

```
aws iotwireless disassociate-wireless-gateway-from-thing \  
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

This command produces no output.

For more information, see [Add your gateways and wireless devices to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [DisassociateWirelessGatewayFromThing](#) in *AWS CLI Command Reference*.

get-destination

The following code example shows how to use `get-destination`.

AWS CLI

To get information about an IoT wireless destination

The following `get-destination` example gets information about the destination resource with the name `IoTWirelessDestination` that you created.

```
aws iotwireless get-destination \  
  --name "IoTWirelessDestination"
```

Output:

```
{
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination",
  "Name": "IoTWirelessDestination",
  "Expression": "IoTWirelessRule",
  "ExpressionType": "RuleName",
  "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
}
```

For more information, see [Add destinations to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetDestination](#) in *AWS CLI Command Reference*.

get-device-profile

The following code example shows how to use `get-device-profile`.

AWS CLI

To get information about a device profile

The following `get-device-profile` example gets information about the device profile with the specified ID that you created.

```
aws iotwireless get-device-profile \
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

Output:

```
{
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/12345678-
a1b2-3c45-67d8-e90fa1b2c34d",
  "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
  "LoRaWAN": {
    "MacVersion": "1.0.3",
    "MaxDutyCycle": 10,
    "Supports32BitFCnt": false,
    "RegParamsRevision": "RP002-1.0.1",
    "SupportsJoin": true,
    "RfRegion": "US915",
```

```
"MaxEirp": 13,  
"SupportsClassB": false,  
"SupportsClassC": false  
}  
}
```

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetDeviceProfile](#) in *AWS CLI Command Reference*.

get-partner-account

The following code example shows how to use `get-partner-account`.

AWS CLI

To get the partner account information

The following `get-partner-account` example gets information about your Sidewalk account that has the following ID.

```
aws iotwireless get-partner-account \  
  --partner-account-id "12345678901234" \  
  --partner-type "Sidewalk"
```

Output:

```
{  
  "Sidewalk": {  
    "AmazonId": "12345678901234",  
    "Fingerprint":  
    "a123b45c6d78e9f012a34cd5e6a7890b12c3d45e6f78a1b234c56d7e890a1234"  
  },  
  "AccountLinked": false  
}
```

For more information, see [Amazon Sidewalk Integration for AWS IoT Core](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetPartnerAccount](#) in *AWS CLI Command Reference*.

get-service-endpoint

The following code example shows how to use `get-service-endpoint`.

AWS CLI

To get the service endpoint

The following `get-service-endpoint` example gets the account-specific endpoint for CUPS protocol.

```
aws iotwireless get-service-endpoint
```

Output:

```
{
  "ServiceType": "CUPS",
  "ServiceEndpoint": "https://A1RMKZ37ACAG0T.cups.lorawan.us-east-1.amazonaws.com:443",
  "ServerTrust": "-----BEGIN CERTIFICATE-----\n

- For API details, see [GetServiceEndpoint](#) in *AWS CLI Command Reference*.

get-service-profile

The following code example shows how to use `get-service-profile`.

AWS CLI

To get information about a service profile

The following `get-service-profile` example gets information about the service profile with the specified ID that you created.

```
aws iotwireless get-service-profile \
  --id "12345678-a1b2-3c45-67d8-e90fa1b2c34d"
```

Output:

```
{
  "Arn": "arn:aws:iotwireless:us-east-1:651419225604:ServiceProfile/538185bb-
d7e7-4b95-96a0-c51aa4a5b9a0",
  "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",

    "ReportDevStatusMargin": false,
    "MinGwDiversity": 1,
    "RaAllowed": false,
    "DlBucketSize": 4096,
    "DevStatusReqFreq": 24,
```

```
    "TargetPer": 5,  
    "UlRate": 60  
  }  
}
```

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetServiceProfile](#) in *AWS CLI Command Reference*.

get-wireless-device-statistics

The following code example shows how to use `get-wireless-device-statistics`.

AWS CLI

To get operating information about a wireless device

The following `get-wireless-device-statistics` example gets operating information about a wireless device.

```
aws iotwireless get-wireless-device-statistics \  
  --wireless-device-id "1ffd32c8-8130-4194-96df-622f072a315f"
```

Output:

```
{  
  "WirelessDeviceId": "1ffd32c8-8130-4194-96df-622f072a315f"  
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetWirelessDeviceStatistics](#) in *AWS CLI Command Reference*.

get-wireless-device

The following code example shows how to use `get-wireless-device`.

AWS CLI

To get information about the wireless device

The following `get-wireless-device` example lists the available widgets in your AWS account.

```
aws iotwireless get-wireless-device \  
  --identifier "1ffd32c8-8130-4194-96df-622f072a315f" \  
  --identifier-type WirelessDeviceID
```

Output:

```
{  
  "Name": "myLoRaWANDevice",  
  "ThingArn": "arn:aws:iot:us-east-1:123456789012:thing/44b87eb4-9bce-423d-  
b5fc-973f5ecc358b",  
  "DestinationName": "IoTWirelessDestination",  
  "Id": "1ffd32c8-8130-4194-96df-622f072a315f",  
  "ThingName": "44b87eb4-9bce-423d-b5fc-973f5ecc358b",  
  "Type": "LoRaWAN",  
  "LoRaWAN": {  
    "DeviceProfileId": "ab0c23d3-b001-45ef-6a01-2bc3de4f5333",  
    "ServiceProfileId": "fe98dc76-cd12-001e-2d34-5550432da100",  
    "OtaaV1_1": {  
      "AppKey": "3f4ca100e2fc675ea123f4eb12c4a012",  
      "JoinEui": "b4c231a359bc2e3d",  
      "NwkKey": "01c3f004a2d6efffe32c4eda14bcd2b4"  
    },  
    "DevEui": "ac12efc654d23fc2"  
  },  
  "Arn": "arn:aws:iotwireless:us-  
east-1:123456789012:WirelessDevice/1ffd32c8-8130-4194-96df-622f072a315f",  
  "Description": "My LoRaWAN wireless device"  
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetWirelessDevice](#) in *AWS CLI Command Reference*.

get-wireless-gateway-certificate

The following code example shows how to use `get-wireless-gateway-certificate`.

AWS CLI

To get the ID of a certificate associated with a wireless gateway

The following `get-wireless-gateway-certificate` example gets the certificate ID associated with a wireless gateway that has the specified ID.

```
aws iotwireless get-wireless-gateway-certificate \  
  --id "6c44ab31-8b4d-407a-bed3-19b6c7cda551"
```

Output:

```
{  
  "IotCertificateId":  
  "8ea4aeae3db34c78cce75d9abd830356869ead6972997e0603e5fd032c804b6f"  
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetWirelessGatewayCertificate](#) in *AWS CLI Command Reference*.

get-wireless-gateway-firmware-information

The following code example shows how to use `get-wireless-gateway-firmware-information`.

AWS CLI

To get firmware information about a wireless gateway

The following `get-wireless-gateway-firmware-information` example gets firmware version and other information about a wireless gateway.

```
aws iotwireless get-wireless-gateway-firmware-information \  
  --id "3039b406-5cc9-4307-925b-9948c63da25b"
```

Output:

```
{  
  "LoRaWAN" :{
```

```
    "CurrentVersion" :{
      "PackageVersion" : "1.0.0",
      "Station" : "2.0.5",
      "Model" : "linux"
    }
  }
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetWirelessGatewayFirmwareInformation](#) in *AWS CLI Command Reference*.

get-wireless-gateway-statistics

The following code example shows how to use `get-wireless-gateway-statistics`.

AWS CLI

To get operating information about a wireless gateway

The following `get-wireless-gateway-statistics` example gets operating information about a wireless gateway.

```
aws iotwireless get-wireless-gateway-statistics \
  --wireless-gateway-id "3039b406-5cc9-4307-925b-9948c63da25b"
```

Output:

```
{
  "WirelessGatewayId": "3039b406-5cc9-4307-925b-9948c63da25b"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetWirelessGatewayStatistics](#) in *AWS CLI Command Reference*.

get-wireless-gateway-task-definition

The following code example shows how to use `get-wireless-gateway-task-definition`.

AWS CLI

To get information about a wireless gateway task definition

The following `get-wireless-gateway-task-definition` example gets information about the wireless task definition with the specified ID.

```
aws iotwireless get-wireless-gateway-task-definition \  
  --id "b7d3baad-25c7-35e7-a4e1-1683a0d61da9"
```

Output:

```
{  
  "AutoCreateTasks": true,  
  "Name": "TestAutoUpdate",  
  "Update": {  
    "UpdateDataSource" : "s3://cupsalphagafirmwarebin/station",  
    "UpdateDataRole" : "arn:aws:iam::001234567890:role/SDK_Test_Role",  
    "LoRaWAN" : {  
      "CurrentVersion" : {  
        "PackageVersion" : "1.0.0",  
        "Station" : "2.0.5",  
        "Model" : "linux"  
      },  
      "UpdateVersion" : {  
        "PackageVersion" : "1.0.1",  
        "Station" : "2.0.5",  
        "Model" : "minihub"  
      }  
    }  
  }  
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetWirelessGatewayTaskDefinition](#) in *AWS CLI Command Reference*.

`get-wireless-gateway-task`

The following code example shows how to use `get-wireless-gateway-task`.

AWS CLI

To get information about the wireless gateway task

The following `get-wireless-gateway-task` example gets information about the wireless gateway task with the specified ID.

```
aws iotwireless get-wireless-gateway-task \  
  --id "11693a46-6866-47c3-a031-c9a616e7644b"
```

Output:

```
{  
  "WirelessGatewayId": "6c44ab31-8b4d-407a-bed3-19b6c7cda551",  
  "WirelessGatewayTaskDefinitionId": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",  
  "Status": "Success"  
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetWirelessGatewayTask](#) in *AWS CLI Command Reference*.

get-wireless-gateway

The following code example shows how to use `get-wireless-gateway`.

AWS CLI

To get information about a wireless gateway

The following `get-wireless-gateway` example gets information about the wireless gateway `myFirstLoRaWANGateway`.

```
aws iotwireless get-wireless-gateway \  
  --identifier "12345678-a1b2-3c45-67d8-e90fa1b2c34d" \  
  --identifier-type WirelessGatewayId
```

Output:

```
{
```

```
"Description": "My first LoRaWAN gateway",
"ThingArn": "arn:aws:iot:us-east-1:123456789012:thing/a1b2c3d4-5678-90ab-
cdef-12ab345c67de",
"LoRaWAN": {
  "RfRegion": "US915",
  "GatewayEui": "a1b2c3d4567890ab"
},
"ThingName": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
"Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
"Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessGateway/6c44ab31-8b4d-407a-bed3-19b6c7cda551",
"Name": "myFirstLoRaWANGateway"
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [GetWirelessGateway](#) in *AWS CLI Command Reference*.

list-destinations

The following code example shows how to use `list-destinations`.

AWS CLI

To list the wireless destinations

The following `list-destinations` example lists the available destinations registered to your AWS account.

```
aws iotwireless list-destinations
```

Output:

```
{
  "DestinationList": [
    {
      "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination",
      "Name": "IoTWirelessDestination",
      "Expression": "IoTWirelessRule",
```

```

        "Description": "Destination for messages processed using
IoTWirelessRule",
        "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
    },
    {
        "Arn": "arn:aws:iotwireless:us-east-1:123456789012:Destination/
IoTWirelessDestination2",
        "Name": "IoTWirelessDestination2",
        "Expression": "IoTWirelessRule2",
        "RoleArn": "arn:aws:iam::123456789012:role/IoTWirelessDestinationRole"
    }
]
}

```

For more information, see [Add destinations to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListDestinations](#) in *AWS CLI Command Reference*.

list-device-profiles

The following code example shows how to use `list-device-profiles`.

AWS CLI

To list the device profiles

The following `list-device-profiles` example lists the available device profiles registered to your AWS account.

```
aws iotwireless list-device-profiles
```

Output:

```

{
  "DeviceProfileList": [
    {
      "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
      "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:DeviceProfile/12345678-a1b2-3c45-67d8-e90fa1b2c34d"
    },
  ],
}

```

```
{
  "Id": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
  "Arn": "arn:aws:iotwireless:us-east-1:123456789012:DeviceProfile/
a1b2c3d4-5678-90ab-cdef-12ab345c67de"
}
]
```

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListDeviceProfiles](#) in *AWS CLI Command Reference*.

list-partner-accounts

The following code example shows how to use `list-partner-accounts`.

AWS CLI

To list the partner accounts

The following `list-partner-accounts` example lists the available partner accounts associated with your AWS account.

```
aws iotwireless list-partner-accounts
```

Output:

```
{
  "Sidewalk": [
    {
      "AmazonId": "78965678771228",
      "Fingerprint":
"bd96d8ef66dbfd2160eb60e156849e82ad7018b8b73c1ba0b4fc65c32498ee35"
    },
    {
      "AmazonId": "89656787651228",
      "Fingerprint":
"bc5e99e151c07be14be7e6603e4489c53f858b271213a36ebe3370777ba06e9b"
    }
  ]
}
```

```
}
```

For more information, see [Amazon Sidewalk Integration for AWS IoT Core](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListPartnerAccounts](#) in *AWS CLI Command Reference*.

list-service-profiles

The following code example shows how to use `list-service-profiles`.

AWS CLI

To list the service profiles

The following `list-service-profiles` example lists the available service profiles registered to your AWS account.

```
aws iotwireless list-service-profiles
```

Output:

```
{
  "ServiceProfileList": [
    {
      "Id": "12345678-a1b2-3c45-67d8-e90fa1b2c34d",
      "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/538185bb-d7e7-4b95-96a0-c51aa4a5b9a0"
    },
    {
      "Id": "a1b2c3d4-5678-90ab-cdef-12ab345c67de",
      "Arn": "arn:aws:iotwireless:us-east-1:123456789012:ServiceProfile/ea8bc823-5d13-472e-8d26-9550737d8100"
    }
  ]
}
```

For more information, see [Add profiles to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListServiceProfiles](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags assigned to the resource

The following `list-tags-for-resource` example lists the tags assigned to a wireless destination resource.

```
aws iotwireless list-tags-for-resource \  
  --resource-arn "arn:aws:iotwireless:us-east-1:123456789012:Destination/  
IoTWirelessDestination"
```

Output:

```
{  
  "Tags": [  
    {  
      "Value": "MyValue",  
      "Key": "MyTag"  
    }  
  ]  
}
```

For more information, see [Describe your AWS IoT Core for LoRaWAN resources](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-wireless-devices

The following code example shows how to use `list-wireless-devices`.

AWS CLI

To list the available wireless devices

The following `list-wireless-devices` example lists the available wireless devices registered to your AWS account.

```
aws iotwireless list-wireless-devices
```

Output:

```
{
  "WirelessDeviceList": [
    {
      "Name": "myLoRaWANDevice",
      "DestinationName": "IoTWirelessDestination",
      "Id": "1fffd32c8-8130-4194-96df-622f072a315f",
      "Type": "LoRaWAN",
      "LoRaWAN": {
        "DevEui": "ac12efc654d23fc2"
      },
      "Arn": "arn:aws:iotwireless:us-east-1:123456789012:WirelessDevice/1fffd32c8-8130-4194-96df-622f072a315f"
    }
  ]
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListWirelessDevices](#) in *AWS CLI Command Reference*.

list-wireless-gateway-task-definitions

The following code example shows how to use `list-wireless-gateway-task-definitions`.

AWS CLI**To list the wireless gateway task definitions**

The following `list-wireless-gateway-task-definitions` example lists the available wireless gateway task definitions registered to your AWS account.

```
aws iotwireless list-wireless-gateway-task-definitions
```

Output:

```
{
```

```
"TaskDefinitions": [  
  {  
    "Id": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",  
    "LoRaWAN" :  
      {  
        "CurrentVersion" :{  
          "PackageVersion" : "1.0.0",  
          "Station" : "2.0.5",  
          "Model" : "linux"  
        },  
        "UpdateVersion" :{  
          "PackageVersion" : "1.0.1",  
          "Station" : "2.0.5",  
          "Model" : "minihub"  
        }  
      }  
    }  
  ]  
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListWirelessGatewayTaskDefinitions](#) in *AWS CLI Command Reference*.

list-wireless-gateways

The following code example shows how to use `list-wireless-gateways`.

AWS CLI

To list the wireless gateways

The following `list-wireless-gateways` example lists the available wireless gateways in your AWS account.

```
aws iotwireless list-wireless-gateways
```

Output:

```
{  
  "WirelessGatewayList": [  
    {  
      "Id": "b7d3baad-25c7-35e7-a4e1-1683a0d61da9",  
      "LoRaWAN": {  
        "CurrentVersion": {  
          "PackageVersion": "1.0.0",  
          "Station": "2.0.5",  
          "Model": "linux"  
        },  
        "UpdateVersion": {  
          "PackageVersion": "1.0.1",  
          "Station": "2.0.5",  
          "Model": "minihub"  
        }  
      }  
    }  
  ]  
}
```

```

    {
      "Description": "My first LoRaWAN gateway",
      "LoRaWAN": {
        "RfRegion": "US915",
        "GatewayEui": "dac632ebc01d23e4"
      },
      "Id": "3039b406-5cc9-4307-925b-9948c63da25b",
      "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessGateway/3039b406-5cc9-4307-925b-9948c63da25b",
      "Name": "myFirstLoRaWANGateway"
    },
    {
      "Description": "My second LoRaWAN gateway",
      "LoRaWAN": {
        "RfRegion": "US915",
        "GatewayEui": "cda123fffe92ecd2"
      },
      "Id": "3285bdc7-5a12-4991-84ed-dadca65e342e",
      "Arn": "arn:aws:iotwireless:us-
east-1:123456789012:WirelessGateway/3285bdc7-5a12-4991-84ed-dadca65e342e",
      "Name": "mySecondLoRaWANGateway"
    }
  ]
}

```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [ListWirelessGateways](#) in *AWS CLI Command Reference*.

send-data-to-wireless-device

The following code example shows how to use `send-data-to-wireless-device`.

AWS CLI

To send data to the wireless device

The following `send-data-to-wireless-device` example sends a decrypted application data frame to the wireless device.

```

aws iotwireless send-data-to-wireless-device \
  --id "11aa5eae-2f56-4b8e-a023-b28d98494e49" \

```

```
--transmit-mode "1" \  
--payload-data "SGVsbG8gVG8gRGV2c2lt" \  
--wireless-metadata LoRaWAN={FPort=1}
```

Output:

```
{  
  MessageId: "6011dd36-0043d6eb-0072-0008"  
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [SendDataToWirelessDevice](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To specify a tag key and value for a resource

The following `tag-resource` example tags the wireless destination `IoTWirelessDestination` with the key `MyTag` and value `MyValue`.

```
aws iotwireless tag-resource \  
  --resource-arn "arn:aws:iotwireless:us-east-1:651419225604:Destination/  
IoTWirelessDestination" \  
  --tags Key="MyTag",Value="MyValue"
```

This command produces no output.

For more information, see [Describe your AWS IoT Core for LoRaWAN resources](#) in the *AWS IoT Developers Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

test-wireless-device

The following code example shows how to use `test-wireless-device`.

AWS CLI

To test the wireless device

The following `test-wireless-device` example sends uplink data of Hello to a device with specified ID.

```
aws iotwireless test-wireless-device \  
  --id "11aa5eae-2f56-4b8e-a023-b28d98494e49"
```

Output:

```
{  
  Result: "Test succeeded. one message is sent with payload: hello"  
}
```

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [TestWirelessDevice](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove one or more tags from a resource

The following `untag-resource` example removes the tag `MyTag` and its value from the wireless destination `IoTWirelessDestination`.

```
aws iotwireless untag-resource \  
  --resource-arn "arn:aws:iotwireless:us-east-1:123456789012:Destination/  
IoTWirelessDestination" \  
  --tag-keys "MyTag"
```

This command produces no output.

For more information, see [Describe your AWS IoT Core for LoRaWAN resources](#) in the *AWS IoT Developers Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-destination

The following code example shows how to use `update-destination`.

AWS CLI

To update the properties of a destination

The following `update-destination` example updates the `description` property of a wireless destination.

```
aws iotwireless update-destination \  
  --name "IoTWirelessDestination" \  
  --description "Destination for messages processed using IoTWirelessRule"
```

This command produces no output.

For more information, see [Add destinations to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateDestination](#) in *AWS CLI Command Reference*.

update-partner-account

The following code example shows how to use `update-partner-account`.

AWS CLI

To update the properties of a partner account

The following `update-partner-account` updates the `AppServerPrivateKey` for the account that has the specified ID.

```
aws iotwireless update-partner-account \  
  --partner-account-id "78965678771228" \  
  --partner-type "Sidewalk" \  
  --sidewalk  
  AppServerPrivateKey="f798ab4899346a88599180fee9e14fa1ada7b6df989425b7c6d2146dd6c815bb"
```

This command produces no output.

For more information, see [Amazon Sidewalk Integration for AWS IoT Core](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdatePartnerAccount](#) in *AWS CLI Command Reference*.

update-wireless-device

The following code example shows how to use `update-wireless-device`.

AWS CLI

To update the properties of a wireless device

The following `update-wireless-device` example updates the properties of a wireless device registered to your AWS account.

```
aws iotwireless update-wireless-device \  
  --id "1fffd32c8-8130-4194-96df-622f072a315f" \  
  --destination-name IoTWirelessDestination2 \  
  --description "Using my first LoRaWAN device"
```

This command produces no output.

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateWirelessDevice](#) in *AWS CLI Command Reference*.

update-wireless-gateway

The following code example shows how to use `update-wireless-gateway`.

AWS CLI

To update the wireless gateway

The following `update-wireless-gateway` example updates the description of your wireless gateway.

```
aws iotwireless update-wireless-gateway \  
  --id "3285bdc7-5a12-4991-84ed-dadca65e342e" \  
  --description "Using my LoRaWAN gateway"
```

This command produces no output.

For more information, see [Connecting devices and gateways to AWS IoT Core for LoRaWAN](#) in the *AWS IoT Developers Guide*.

- For API details, see [UpdateWirelessGateway](#) in *AWS CLI Command Reference*.

Amazon IVS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

batch-get-channel

The following code example shows how to use `batch-get-channel`.

AWS CLI

To get channel configuration information about multiple channels

The following `batch-get-channel` example lists information about the specified channels.

```
aws ivs batch-get-channel \  
  --arns arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \  
        arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl
```

Output:

```
{
  "channels": [
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "authorized": false,
      "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
      "insecureIngest": false,
      "latencyMode": "LOW",
      "name": "channel-1",
      "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel-1.abcdEFGH.m3u8",

      },
      "tags": {}
    }
  ]
}
```

```

        "type": "STANDARD"
      }
    ]
  }

```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [BatchGetChannel](#) in *AWS CLI Command Reference*.

batch-get-stream-key

The following code example shows how to use `batch-get-stream-key`.

AWS CLI

To get information about multiple stream keys

The following `batch-get-stream-key` example gets information about the specified stream keys.

```

aws ivs batch-get-stream-key \
  --arns arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh \
  arn:aws:ivs:us-west-2:123456789012:stream-key/skSKIJKLmnop

```

Output:

```

{
  "streamKeys": [
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh",
      "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "tags": {}
    },
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKIJKLmnop",
      "value": "sk_us-west-2_abcdABCDefgh_567890ghijkl",
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "tags": {}
    }
  ]
}

```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [BatchGetStreamKey](#) in *AWS CLI Command Reference*.

batch-start-viewer-session-revocation

The following code example shows how to use `batch-start-viewer-session-revocation`.

AWS CLI

To revoke viewer sessions for multiple channel-ARN and viewer-ID pairs

The following `batch-start-viewer-session-revocation` example performs session revocation on multiple channel-ARN and viewer-ID pairs simultaneously. The request may complete normally but return values in the `errors` field if the caller does not have permission to revoke specified session.

```
aws ivs batch-start-viewer-session-revocation \
  --viewer-sessions '[{"channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh1","viewerId":"abcdefg1","viewerSessionVersionsLessThanOrEqualTo":1234567890},
\
  {"channelArn":"arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh2","viewerId":"abcdefg2","viewerSessionVersionsLessThanOrEqualTo":1234567890}]'
```

Output:

```
{
  "errors": [
    {
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh1",
      "viewerId": "abcdefg1",
      "code": "403",
      "message": "not authorized",
    },
    {
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/
abcdABCDefgh2",
      "viewerId": "abcdefg2",
      "code": "403",
      "message": "not authorized",
    }
  ]
}
```

```
]
}
```

For more information, see [Setting Up Private Channels](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [BatchStartViewerSessionRevocation](#) in *AWS CLI Command Reference*.

create-channel

The following code example shows how to use `create-channel`.

AWS CLI

Example 1: To create a channel with no recording

The following `create-channel` example creates a new channel and an associated stream key to start streaming.

```
aws ivs create-channel \
  --name "test-channel" \
  --no-insecure-ingest
```

Output:

```
{
  "channel": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
    "authorized": false,
    "name": "test-channel",
    "latencyMode": "LOW",
    "playbackRestrictionPolicyArn": "",
    "recordingConfigurationArn": "",
    "srt": {
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
      "passphrase":
"AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
    },
    "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
    "insecureIngest": false,
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
```

```

    "preset": "",
    "tags": {},
    "type": "STANDARD"
  },
  "streamKey": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6",
    "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
    "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
    "tags": {}
  }
}

```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

Example 2: To create a channel with recording enabled, using the RecordingConfiguration resource specified by its ARN

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up recording for the channel.

```

aws ivs create-channel \
  --name test-channel-with-recording \
  --insecure-ingest \
  --recording-configuration-arn "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh"

```

Output:

```

{
  "channel": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
    "name": "test-channel-with-recording",
    "latencyMode": "LOW",
    "type": "STANDARD",
    "playbackRestrictionPolicyArn": "",
    "recordingConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh",
    "srt": {
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
      "passphrase":
"BA1C2defGHijklMN03PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
    },
  },
}

```

```

    "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
    "insecureIngest": true,
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
    "preset": "",
    "authorized": false,
    "tags": {},
    "type": "STANDARD"
  },
  "streamKey": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
    "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
    "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
    "tags": {}
  }
}

```

For more information, see [Record to Amazon S3](#) in the *IVS Low-Latency User Guide*.

Example 3: To create a channel with a playback restriction policy specified by its ARN

The following `create-channel` example creates a new channel and an associated stream key to start streaming, and sets up a playback restriction policy for the channel.

```

aws ivs create-channel \
  --name test-channel-with-playback-restriction-policy \
  --insecure-ingest \
  --playback-restriction-policy-arn "arn:aws:ivs:us-west-2:123456789012:playback-
restriction-policy/ABcdef34ghIJ"

```

Output:

```

{
  "channel": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
    "name": "test-channel-with-playback-restriction-policy",
    "latencyMode": "LOW",
    "type": "STANDARD",
    "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
    "recordingConfigurationArn": "",
    "srt": {

```

```

        "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
        "passphrase":
"AB1C2edfGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
    },
    "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
    "insecureIngest": true,
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
    "preset": "",
    "authorized": false,
    "tags": {},
    "type": "STANDARD"
},
"streamKey": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
    "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",
    "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
    "tags": {}
}
}

```

For more information, see [Undesired Content and Viewers](#) in the *IVS Low-Latency User Guide*.

- For API details, see [CreateChannel](#) in *AWS CLI Command Reference*.

create-playback-restriction-policy

The following code example shows how to use create-playback-restriction-policy.

AWS CLI

To create a playback restriction policy

The following create-playback-restriction-policy example creates a new playback restriction policy.

```

aws ivs create-playback-restriction-policy \
  --name "test-playback-restriction-policy" \
  --enable-strict-origin-enforcement \
  --tags "key1=value1, key2=value2" \
  --allowed-countries US MX \
  --allowed-origins https://www.website1.com https://www.website2.com

```

Output:

```
{
  "playbackRestrictionPolicy": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABCdef34ghIJ",
    "allowedCountries": [
      "US",
      "MX"
    ],
    "allowedOrigins": [
      "https://www.website1.com",
      "https://www.website2.com"
    ],
    "enableStrictOriginEnforcement": true,
    "name": "test-playback-restriction-policy",
    "tags": {
      "key1": "value1",
      "key2": "value2"
    }
  }
}
```

For more information, see [Undesired Content and Viewers](#) in the *IVS Low-Latency User Guide*.

- For API details, see [CreatePlaybackRestrictionPolicy](#) in *AWS CLI Command Reference*.

create-recording-configuration

The following code example shows how to use create-recording-configuration.

AWS CLI**To create a RecordingConfiguration resource**

The following create-recording-configuration example creates a RecordingConfiguration resource to enable recording to Amazon S3.

```
aws ivs create-recording-configuration \
  --name "test-recording-config" \
  --recording-reconnect-window-seconds 60 \
  --tags "key1=value1, key2=value2" \
```

```

--rendition-configuration renditionSelection="CUSTOM",renditions="HD" \
--thumbnail-configuration
recordingMode="INTERVAL",targetIntervalSeconds=1,storage="LATEST",resolution="LOWEST_RESOLUTION" \
--destination-configuration s3={bucketName=demo-recording-bucket}

```

Output:

```

{
  "recordingConfiguration": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABcdef34ghIJ",
    "name": "test-recording-config",
    "destinationConfiguration": {
      "s3": {
        "bucketName": "demo-recording-bucket"
      }
    },
    "state": "CREATING",
    "tags": {
      "key1": "value1",
      "key2": "value2"
    },
    "thumbnailConfiguration": {
      "recordingMode": "INTERVAL",
      "targetIntervalSeconds": 1,
      "resolution": "LOWEST_RESOLUTION",
      "storage": [
        "LATEST"
      ]
    },
    "recordingReconnectWindowSeconds": 60,
    "renditionConfiguration": {
      "renditionSelection": "CUSTOM",
      "renditions": [
        "HD"
      ]
    }
  }
}

```

For more information, see [Record to Amazon S3](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateRecordingConfiguration](#) in *AWS CLI Command Reference*.

create-stream-key

The following code example shows how to use `create-stream-key`.

AWS CLI

To create a stream key

The following `create-stream-key` example creates a stream key for a specified ARN (Amazon Resource Name).

```
aws ivs create-stream-key \  
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{  
  "streamKey": {  
    "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",  
    "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",  
    "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",  
    "tags": {}  
  }  
}
```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [CreateStreamKey](#) in *AWS CLI Command Reference*.

delete-channel

The following code example shows how to use `delete-channel`.

AWS CLI

To delete a channel and its associated stream keys

The following `delete-channel` example deletes the channel with the specified ARN (Amazon Resource Name).

```
aws ivs delete-channel \  
  --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

This command produces no output.

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [DeleteChannel](#) in *AWS CLI Command Reference*.

delete-playback-key-pair

The following code example shows how to use `delete-playback-key-pair`.

AWS CLI

To delete a specified playback key pair

The following `delete-playback-key-pair` example returns the fingerprint of the specified key pair.

```
aws ivs delete-playback-key-pair \  
  --arn arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh
```

This command produces no output.

For more information, see [Setting Up Private Channels](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeletePlaybackKeyPair](#) in *AWS CLI Command Reference*.

delete-playback-restriction-policy

The following code example shows how to use `delete-playback-restriction-policy`.

AWS CLI

To delete a playback restriction policy

The following `delete-playback-restriction-policy` example deletes the playback restriction policy with the specified policy ARN (Amazon Resource Name).

```
aws ivs delete-playback-restriction-policy \  
  --arn arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/abcd1234efgh
```

```
--arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/ABCdef34ghIJ"
```

This command produces no output.

For more information, see [Undesired Content and Viewers](#) in the *IVS Low-Latency User Guide*.

- For API details, see [DeletePlaybackRestrictionPolicy](#) in *AWS CLI Command Reference*.

delete-recording-configuration

The following code example shows how to use delete-recording-configuration.

AWS CLI

To delete the RecordingConfiguration resource specified by its ARN

The following delete-recording-configuration example deletes the RecordingConfiguration resource with the specified ARN.

```
aws ivs delete-recording-configuration \  
  --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABCdef34ghIJ"
```

This command produces no output.

For more information, see [Record to Amazon S3](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteRecordingConfiguration](#) in *AWS CLI Command Reference*.

delete-stream-key

The following code example shows how to use delete-stream-key.

AWS CLI

To delete a stream key

The following delete-stream-key example deletes the stream key for a specified ARN (Amazon Resource Name), so it can no longer be used to stream.

```
aws ivs delete-stream-key \  
  --arn "arn:aws:ivs:us-west-2:123456789012:stream-key/ABCdef34ghIJ"
```

```
--arn arn:aws:ivs:us-west-2:123456789012:stream-key/g1H2I3j4k5L6
```

This command produces no output.

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [DeleteStreamKey](#) in *AWS CLI Command Reference*.

get-channel

The following code example shows how to use `get-channel`.

AWS CLI

To get a channel's configuration information

The following `get-channel` example gets the channel configuration for a specified channel ARN (Amazon Resource Name).

```
aws ivs get-channel \  
  --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

Output:

```
{  
  "channel": {  
    "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",  
    "name": "channel-1",  
    "latencyMode": "LOW",  
    "type": "STANDARD",  
    "playbackRestrictionPolicyArn": "",  
    "preset": "",  
    "recordingConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:recording-  
configuration/ABCD12cdEFgh",  
    "srt": {  
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",  
      "passphrase":  
"AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijk1MN5opqrStuVWxyzAbCDEfghIJ"  
    },  
    "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",  
    "insecureIngest": false,  
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/  
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
```

```
    "tags": {}
  }
}
```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [GetChannel](#) in *AWS CLI Command Reference*.

get-playback-key-pair

The following code example shows how to use `get-playback-key-pair`.

AWS CLI

To get a specified playback key pair

The following `get-playback-key-pair` example returns the fingerprint of the specified key pair.

```
aws ivs get-playback-key-pair \
  --arn arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh
```

Output:

```
{
  "keyPair": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
    "name": "my-playback-key",
    "fingerprint": "0a:1b:2c:ab:cd:ef:34:56:70:b1:b2:71:01:2a:a3:72",
    "tags": {}
  }
}
```

For more information, see [Setting Up Private Channels](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetPlaybackKeyPair](#) in *AWS CLI Command Reference*.

get-playback-restriction-policy

The following code example shows how to use `get-playback-restriction-policy`.

AWS CLI

To get a playback restriction policy's configuration information

The following `get-playback-restriction-policy` example gets the playback restriction policy configuration with the specified policy ARN (Amazon Resource Name).

```
aws ivs get-playback-restriction-policy \
  --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
  ABcdef34ghIJ"
```

Output:

```
{
  "playbackRestrictionPolicy": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
  ABcdef34ghIJ",
    "allowedCountries": [
      "US",
      "MX"
    ],
    "allowedOrigins": [
      "https://www.website1.com",
      "https://www.website2.com"
    ],
    "enableStrictOriginEnforcement": true,
    "name": "test-playback-restriction-policy",
    "tags": {
      "key1": "value1",
      "key2": "value2"
    }
  }
}
```

For more information, see [Undesired Content and Viewers](#) in the *IVS Low-Latency User Guide*.

- For API details, see [GetPlaybackRestrictionPolicy](#) in *AWS CLI Command Reference*.

get-recording-configuration

The following code example shows how to use `get-recording-configuration`.

AWS CLI

To get information about a RecordingConfiguration resource

The following `get-recording-configuration` example gets information about the RecordingConfiguration resource for the specified ARN.

```
aws ivs get-recording-configuration \  
  --arn "arn:aws:ivs:us-west-2:123456789012:recording-configuration/ABcdef34ghIJ"
```

Output:

```
{  
  "recordingConfiguration": {  
    "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/  
ABcdef34ghIJ",  
    "destinationConfiguration": {  
      "s3": {  
        "bucketName": "demo-recording-bucket"  
      }  
    },  
    "name": "test-recording-config",  
    "recordingReconnectWindowSeconds": 60,  
    "state": "ACTIVE",  
    "tags": {  
      "key1" : "value1",  
      "key2" : "value2"  
    },  
    "thumbnailConfiguration": {  
      "recordingMode": "INTERVAL",  
      "targetIntervalSeconds": 1,  
      "resolution": "LOWEST_RESOLUTION",  
      "storage": [  
        "LATEST"  
      ]  
    },  
    "renditionConfiguration": {  
      "renditionSelection": "CUSTOM",  
      "renditions": [  
        "HD"  
      ]  
    }  
  }  
}
```

```
}
```

For more information, see [Record to Amazon S3](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetRecordingConfiguration](#) in *AWS CLI Command Reference*.

get-stream-key

The following code example shows how to use `get-stream-key`.

AWS CLI

To get information about a stream

The following `get-stream-key` example gets information about the specified stream key.

```
aws ivs get-stream-key \  
  --arn arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh --region=us-  
west-2
```

Output:

```
{  
  "streamKey": {  
    "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/skSKABCDefgh",  
    "value": "sk_us-west-2_abcdABCDefgh_567890abcdef",  
    "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",  
    "tags": {}  
  }  
}
```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [GetStreamKey](#) in *AWS CLI Command Reference*.

get-stream-session

The following code example shows how to use `get-stream-session`.

AWS CLI

To get metadata for a specified stream

The following `get-stream-session` example gets the metadata configuration for the specified channel ARN (Amazon Resource Name) and the specified stream; if `streamId` is not provided, the most recent stream for the channel is selected.

```
aws ivs get-stream-session \  
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \  
  --stream-id "mystream"
```

Output:

```
{  
  "streamSession": {  
    "streamId": "mystream1",  
    "startTime": "2023-06-26T19:09:28+00:00",  
    "channel": {  
      "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",  
      "name": "mychannel",  
      "latencyMode": "LOW",  
      "type": "STANDARD",  
      "recordingConfigurationArn": "arn:aws:ivs:us-  
west-2:123456789012:recording-configuration/ABCdef34ghIJ",  
      "srt": {  
        "endpoint": "a1b2c3d4e5f6.srt.live-video.net",  
        "passphrase":  
"AB1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"  
      },  
      "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",  
      "playbackUrl": "url-string",  
      "authorized": false,  
      "insecureIngest": false,  
      "preset": ""  
    },  
    "ingestConfiguration": {  
      "video": {  
        "avcProfile": "Baseline",  
        "avcLevel": "4.2",  
        "codec": "avc1.42C02A",  
        "encoder": "Lavf58.45.100",  
        "targetBitrate": 8789062,  
        "targetFramerate": 60,

        "type": "IVS Stream State Change",
        "eventTime": "2023-06-26T19:09:28+00:00"
      }
    ]
  }
}

```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [GetStreamSession](#) in *AWS CLI Command Reference*.

get-stream

The following code example shows how to use `get-stream`.

AWS CLI

To get information about a stream

The following `get-stream` example gets information about the stream for the specified channel.

```

aws ivs get-stream \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh

```

Output:

```

{
  "stream": {
    "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
    "startTime": "2020-05-05T21:55:38Z",
    "state": "LIVE",
    "health": "HEALTHY",
    "streamId": "st-ABCDEFghij01234KLMN5678",
  }
}

```

```
    "viewerCount": 1
  }
}
```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [GetStream](#) in *AWS CLI Command Reference*.

import-playback-key-pair

The following code example shows how to use `import-playback-key-pair`.

AWS CLI

To import the public portion of a new key pair

The following `import-playback-key-pair` example imports the specified public key (specified as a string in PEM format) and returns the arn and fingerprint of the new key pair.

```
aws ivs import-playback-key-pair \
  --name "my-playback-key" \
  --public-key-material "G1lbnQxOTA3BgNVBAMMMFdoeSBhcmUgeW91IGR1..."
```

Output:

```
{
  "keyPair": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
    "name": "my-playback-key",
    "fingerprint": "0a:1b:2c:ab:cd:ef:34:56:70:b1:b2:71:01:2a:a3:72",
    "tags": {}
  }
}
```

For more information, see [Setting Up Private Channels](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ImportPlaybackKeyPair](#) in *AWS CLI Command Reference*.

list-channels

The following code example shows how to use `list-channels`.

AWS CLI

Example 1: To get summary information about all channels

The following `list-channels` example lists all channels for your AWS account.

```
aws ivs list-channels
```

Output:

```
{
  "channels": [
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "name": "channel-1",
      "latencyMode": "LOW",
      "authorized": false,
      "insecureIngest": false,
      "preset": "",
      "playbackRestrictionPolicyArn": "",
      "recordingConfigurationArn": "arn:aws:ivs:us-
west-2:123456789012:recording-configuration/ABCD12cdEFgh",
      "tags": {},
      "type": "STANDARD"
    },
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl",
      "name": "channel-2",
      "latencyMode": "LOW",
      "authorized": false,
      "preset": "",
      "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABcdef34ghIJ",
      "recordingConfigurationArn": "",
      "tags": {},
      "type": "STANDARD"
    }
  ]
}
```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

Example 2: To get summary information about all channels, filtered by the specified RecordingConfiguration ARN

The following `list-channels` example lists all channels for your AWS account, that are associated with the specified RecordingConfiguration ARN.

```
aws ivs list-channels \  
  --filter-by-recording-configuration-arn "arn:aws:ivs:us-  
west-2:123456789012:recording-configuration/ABCD12cdEFgh"
```

Output:

```
{  
  "channels": [  
    {  
      "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",  
      "name": "channel-1",  
      "latencyMode": "LOW",  
      "authorized": false,  
      "insecureIngest": false,  
      "preset": "",  
      "playbackRestrictionPolicyArn": "",  
      "recordingConfigurationArn": "arn:aws:ivs:us-  
west-2:123456789012:recording-configuration/ABCD12cdEFgh",  
      "tags": {},  
      "type": "STANDARD"  
    }  
  ]  
}
```

For more information, see [Record to Amazon S3](#) in the *IVS Low-Latency User Guide*.

Example 3: To get summary information about all channels, filtered by the specified PlaybackRestrictionPolicy ARN

The following `list-channels` example lists all channels for your AWS account, that are associated with the specified PlaybackRestrictionPolicy ARN.

```
aws ivs list-channels \  
  --filter-by-playback-restriction-policy-arn "arn:aws:ivs:us-  
west-2:123456789012:playback-restriction-policy/ABCdef34ghIJ"
```

Output:

```
{
  "channels": [
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:channel/efghEFGHijkl",
      "name": "channel-2",
      "latencyMode": "LOW",
      "authorized": false,
      "preset": "",
      "playbackRestrictionPolicyArn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/ABCdef34ghIJ",
      "recordingConfigurationArn": "",
      "tags": {},
      "type": "STANDARD"
    }
  ]
}
```

For more information, see [Undesired Content and Viewers](#) in the *IVS Low-Latency User Guide*.

- For API details, see [ListChannels](#) in *AWS CLI Command Reference*.

list-playback-key-pairs

The following code example shows how to use `list-playback-key-pairs`.

AWS CLI**To get summary information about all playback key pairs**

The following `list-playback-key-pairs` example returns information about all key pairs.

```
aws ivs list-playback-key-pairs
```

Output:

```
{
  "keyPairs": [
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/abcd1234efgh",
      "name": "test-key-0",
      "tags": {}
    }
  ]
}
```

```
    },
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:playback-key/ijkl5678mnop",
      "name": "test-key-1",
      "tags": {}
    }
  ]
}
```

For more information, see [Setting Up Private Channels](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListPlaybackKeyPairs](#) in *AWS CLI Command Reference*.

list-playback-restriction-policies

The following code example shows how to use `list-playback-restriction-policies`.

AWS CLI

To get summary information about all playback restriction policies

The following `list-playback-restriction-policies` example lists all playback restriction policies for your AWS account.

```
aws ivs list-playback-restriction-policies
```

Output:

```
{
  "playbackRestrictionPolicies": [
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
      "allowedCountries": [
        "US",
        "MX"
      ],
      "allowedOrigins": [
        "https://www.website1.com",
        "https://www.website2.com"
      ],
    }
  ]
}
```

```
        "enableStrictOriginEnforcement": true,
        "name": "test-playback-restriction-policy",
        "tags": {
            "key1": "value1",
            "key2": "value2"
        }
    }
]
```

For more information, see [Undesired Content and Viewers](#) in the *IVS Low-Latency User Guide*.

- For API details, see [ListPlaybackRestrictionPolicies](#) in *AWS CLI Command Reference*.

list-recording-configurations

The following code example shows how to use `list-recording-configurations`.

AWS CLI

To list all the RecordingConfiguration resources created in this account

The following `list-recording-configurations` example gets information about all RecordingConfiguration resources in your account.

```
aws ivs list-recording-configurations
```

Output:

```
{
  "recordingConfigurations": [
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
ABCdef34ghIJ",
      "name": "test-recording-config-1",
      "destinationConfiguration": {
        "s3": {
          "bucketName": "demo-recording-bucket-1"
        }
      },
      "state": "ACTIVE",
      "tags": {}
    },
  ],
}
```

```

    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:recording-configuration/
CD12abcdGHIJ",
      "name": "test-recording-config-2",
      "destinationConfiguration": {
        "s3": {
          "bucketName": "demo-recording-bucket-2"
        }
      },
      "state": "ACTIVE",
      "tags": {}
    }
  ]
}

```

For more information, see [Record to Amazon S3](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListRecordingConfigurations](#) in *AWS CLI Command Reference*.

list-stream-keys

The following code example shows how to use `list-stream-keys`.

AWS CLI

To get a list of stream keys

The following `list-stream-keys` example lists all stream keys for a specified ARN (Amazon Resource Name).

```

aws ivs list-stream-keys \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh

```

Output:

```

{
  "streamKeys": [
    {
      "arn": "arn:aws:ivs:us-west-2:123456789012:stream-key/abcdABCDefgh",
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "tags": {}
    }
  ]
}

```

```

    }
  ]
}

```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [ListStreamKeys](#) in *AWS CLI Command Reference*.

list-stream-sessions

The following code example shows how to use `list-stream-sessions`.

AWS CLI

To get a summary of current and previous streams for a specified channel in the current AWS region

The following `list-stream-sessions` example reports summary information for streams for a specified channel ARN (Amazon Resource Name).

```

aws ivs list-stream-sessions \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
  --max-results 25 \
  --next-token ""

```

Output:

```

{
  "nextToken": "set-2",
  "streamSessions": [
    {
      "startTime": 1641578182,
      "endTime": 1641579982,
      "hasErrorEvent": false,
      "streamId": "mystream"
    }
    ...
  ]
}

```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [ListStreamSessions](#) in *AWS CLI Command Reference*.

list-streams

The following code example shows how to use `list-streams`.

AWS CLI

To get a list of live streams and their state

The following `list-streams` example lists all live streams for your AWS account.

```
aws ivs list-streams
```

Output:

```
{
  "streams": [
    {
      "channelArn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
      "state": "LIVE",
      "health": "HEALTHY",
      "streamId": "st-ABCDefghij01234KLMN5678",
      "viewerCount": 1
    }
  ]
}
```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [ListStreams](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list all tags for an AWS resource (for example: channel, stream key)

The following `list-tags-for-resource` example lists all tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs list-tags-for-resource \
  --resource-arn arn:aws:ivs:us-west-2:12345689012:channel/abcdABCDefgh
```

Output:

```
{
  "tags":
  {
    "key1": "value1",
    "key2": "value2"
  }
}
```

For more information, see [Tagging](#) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-metadata

The following code example shows how to use `put-metadata`.

AWS CLI**To insert metadata into the active stream for a specified channel**

The following `put-metadata` example inserts the given metadata into the stream for the specified channel.

```
aws ivs put-metadata \
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \
  --metadata '{"my": "metadata"}'
```

This command produces no output.

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [PutMetadata](#) in *AWS CLI Command Reference*.

start-viewer-session-revocation

The following code example shows how to use `start-viewer-session-revocation`.

AWS CLI**To revoke a viewer session for a given multiple channel-ARN and viewer-ID pair**

The following `start-viewer-session-revocation` example starts the process of revoking the viewer session associated with a specified channel ARN and viewer ID, up to and including the specified session version number. If the version is not provided, it defaults to 0.

```
aws ivs batch-start-viewer-session-revocation \  
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \  
  --viewer-id abcdefg \  
  --viewer-session-versions-less-than-or-equal-to 1234567890
```

This command produces no output.

For more information, see [Setting Up Private Channels](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [StartViewerSessionRevocation](#) in *AWS CLI Command Reference*.

stop-stream

The following code example shows how to use `stop-stream`.

AWS CLI

To stop a specified stream

The following `stop-stream` example stops the stream on the specified channel.

```
aws ivs stop-stream \  
  --channel-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh
```

This command produces no output.

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

- For API details, see [StopStream](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add or update tags for an AWS resource (for example: channel, stream key)

The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs tag-resource \  
  --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \  
  --tags "tagkey1=tagvalue1, tagkey2=tagvalue2"
```

This command produces no output.

For more information, see [Tagging](#) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags for an AWS resource (for example: channel, stream key)

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name).

```
aws ivs untag-resource \  
  --resource-arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \  
  --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see [Tagging](#) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-channel

The following code example shows how to use `update-channel`.

AWS CLI

Example 1: To update a channel's configuration information

The following `update-channel` example updates the channel configuration for a specified channel ARN to change the channel name. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \  
  --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \  
  --name "channel-1" \  
  --insecure-ingest
```

Output:

```
{  
  "channel": {  
    "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",  
    "name": "channel-1",  
    "latencyMode": "LOW",  
    "type": "STANDARD",  
    "playbackRestrictionPolicyArn": "",  
    "recordingConfigurationArn": "",  
    "srt": {  
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",  
      "passphrase":  
"AB1C2defGHijklMNop3PqQRstUvwxyzABCDefghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"  
    },  
    "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",  
    "insecureIngest": true,  
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/  
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",  
    "preset": "",  
    "authorized": false,  
    "tags": {}  
  }  
}
```

For more information, see [Create a Channel](#) in the *IVS Low-Latency User Guide*.

Example 2: To update a channel's configuration to enable recording

The following `update-channel` example updates the channel configuration for a specified channel ARN to enable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \  
  --arn arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh \  
  --name "channel-1" \  
  --insecure-ingest
```

```
--arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
--no-insecure-ingest \
--recording-configuration-arn "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh"
```

Output:

```
{
  "channel": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
    "name": "test-channel-with-recording",
    "latencyMode": "LOW",
    "type": "STANDARD",
    "playbackRestrictionPolicyArn": "",
    "recordingConfigurationArn": "arn:aws:ivs:us-west-2:123456789012:recording-
configuration/ABCD12cdEFgh",
    "srt": {
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
      "passphrase":
"BA1C2defGHijkLMNo3PqQRstUvwxyzaBCDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
    },
    "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
    "insecureIngest": false,
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
    "preset": "",
    "authorized": false,
    "tags": {}
  }
}
```

For more information, see [Record to Amazon S3](#) in the *IVS Low-Latency User Guide*.

Example 3: To update a channel's configuration to disable recording

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable recording. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
  --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
  --recording-configuration-arn ""
```

Output:

```
{
  "channel": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
    "name": "test-channel-with-recording",
    "latencyMode": "LOW",
    "type": "STANDARD",
    "playbackRestrictionPolicyArn": "",
    "recordingConfigurationArn": "",
    "srt": {
      "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
      "passphrase":
"AB1C2edfGHijklMN03PqQRstUvwxyzABCDEFghh4ijklMN5opqrStuVWXYZAbCDEfghIJ"
    },
    "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
    "insecureIngest": false,
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
    "preset": "",
    "authorized": false,
    "tags": {}
  }
}
```

For more information, see [Record to Amazon S3](#) in the *IVS Low-Latency User Guide*.

Example 4: To update a channel's configuration to enable playback restriction

The following `update-channel` example updates the channel configuration for a specified channel ARN to apply a playback restriction policy. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```
aws ivs update-channel \
  --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
  --no-insecure-ingest \
  --playback-restriction-policy-arn "arn:aws:ivs:us-west-2:123456789012:playback-
restriction-policy/ABcdef34ghIJ"
```

Output:

```
{
```

```

"channel": {
  "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
  "name": "test-channel-with-playback-restriction-policy",
  "latencyMode": "LOW",
  "type": "STANDARD",
  "playbackRestrictionPolicyArn": "arn:aws:ivs:us-
west-2:123456789012:playback-restriction-policy/ABCdef34ghIJ",
  "recordingConfigurationArn": "",
  "srt": {
    "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
    "passphrase":
"AB1C2defGHijklMN03PqQRstUvwxyzaCBDEfghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
  },
  "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
  "insecureIngest": false,
  "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
  "preset": "",
  "authorized": false,
  "tags": {}
}
}

```

For more information, see [Undesired Content and Viewers](#) in the *IVS Low-Latency User Guide*.

Example 5: To update a channel's configuration to disable playback restriction

The following `update-channel` example updates the channel configuration for a specified channel ARN to disable playback restriction. This does not affect an ongoing stream of this channel; you must stop and restart the stream for the changes to take effect.

```

aws ivs update-channel \
  --arn "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh" \
  --playback-restriction-policy-arn ""

```

Output:

```

{
  "channel": {
    "arn": "arn:aws:ivs:us-west-2:123456789012:channel/abcdABCDefgh",
    "name": "test-channel-with-playback-restriction-policy",
    "latencyMode": "LOW",
    "type": "STANDARD",

```

```

    "playbackRestrictionPolicyArn": "",
    "recordingConfigurationArn": "",
    "srt": {
        "endpoint": "a1b2c3d4e5f6.srt.live-video.net",
        "passphrase":
"AB1C2defGHijklMNop3PqQRstUvwxyzABCDeFghh4ijklMN5opqrStuVWxyzAbCDEfghIJ"
    },
    "ingestEndpoint": "a1b2c3d4e5f6.global-contribute.live-video.net",
    "insecureIngest": false,
    "playbackUrl": "https://a1b2c3d4e5f6.us-west-2.playback.live-video.net/api/
video/v1/us-west-2.123456789012.channel.abcdEFGH.m3u8",
    "preset": "",
    "authorized": false,
    "tags": {}
}
}

```

For more information, see [Undesired Content and Viewers](#) in the *IVS Low-Latency User Guide*.

- For API details, see [UpdateChannel](#) in *AWS CLI Command Reference*.

update-playback-restriction-policy

The following code example shows how to use `update-playback-restriction-policy`.

AWS CLI

To update a playback restriction policy

The following `update-playback-restriction-policy` example updates the playback restriction policy with the specified policy ARN to disable strict origin enforcement. This does not affect an ongoing stream of the associated channel; you must stop and restart the stream for the changes to take effect.

```

aws ivs update-playback-restriction-policy \
  --arn "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABCdef34ghIJ" \
  --no-enable-strict-origin-enforcement

```

Output:

```
{
```

```
"playbackRestrictionPolicy": {
  "arn": "arn:aws:ivs:us-west-2:123456789012:playback-restriction-policy/
ABcdef34ghIJ",
  "allowedCountries": [
    "US",
    "MX"
  ],
  "allowedOrigins": [
    "https://www.website1.com",
    "https://www.website2.com"
  ],
  "enableStrictOriginEnforcement": false,
  "name": "test-playback-restriction-policy",
  "tags": {
    "key1": "value1",
    "key2": "value2"
  }
}
```

For more information, see [Undesired Content and Viewers](#) in the *IVS Low-Latency User Guide*.

- For API details, see [UpdatePlaybackRestrictionPolicy](#) in *AWS CLI Command Reference*.

Amazon IVS Chat examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Chat.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-chat-token

The following code example shows how to use `create-chat-token`.

AWS CLI

To create a chat token

The following `create-chat-token` example creates an encrypted chat token that is used to establish an individual WebSocket connection to a room. The token is valid for one minute, and a connection (session) established with the token is valid for the specified duration.

```
aws ivschat create-chat-token \
  --roomIdIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6", \
  --userId "11231234" \
  --capabilities "SEND_MESSAGE", \
  --sessionDurationInMinutes 30
```

Output:

```
{
  "token": "ACEGmnoq#1rstu2...BDFH3vxwy!4hlm!#5",
  "sessionExpirationTime": "2022-03-16T04:44:09+00:00"
  "state": "CREATING",
  "tokenExpirationTime": "2022-03-16T03:45:09+00:00"
}
```

For more information, see [Step 3: Authenticate and Authorize Chat Clients](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateChatToken](#) in *AWS CLI Command Reference*.

create-logging-configuration

The following code example shows how to use `create-logging-configuration`.

AWS CLI

To create a chat LoggingConfiguration resource

The following `create-logging-configuration` example creates a `LoggingConfiguration` resource that allows clients to store and record sent messages.

```
aws ivschat create-logging-configuration \  
  --destination-configuration s3={bucketName=demo-logging-bucket} \  
  --name "test-logging-config" \  
  --tags "key1=value1, key2=value2"
```

Output:

```
{  
  "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/  
ABcdef34ghIJ",  
  "createTime": "2022-09-14T17:48:00.653000+00:00",  
  "destinationConfiguration": {  
    "s3": {  
      "bucketName": "demo-logging-bucket"  
    }  
  },  
  "id": "ABcdef34ghIJ",  
  "name": "test-logging-config",  
  "state": "ACTIVE",  
  "tags": { "key1" : "value1", "key2" : "value2" },  
  "updateTime": "2022-09-14T17:48:01.104000+00:00"  
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateLoggingConfiguration](#) in *AWS CLI Command Reference*.

create-room

The following code example shows how to use `create-room`.

AWS CLI

To create a room

The following `create-room` example creates a new room.

```
aws ivschat create-room \  
  --name "test-room" \  
  --tags "key1=value1, key2=value2"
```

```
--name "test-room-1" \  
--logging-configuration-identifiers "arn:aws:ivschat:us-  
west-2:123456789012:logging-configuration/ABCdef34ghIJ" \  
--maximum-message-length 256 \  
--maximum-message-rate-per-second 5
```

Output:

```
{  
  "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",  
  "id": "g1H2I3j4k5L6",  
  "createTime": "2022-03-16T04:44:09+00:00",  
  "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-  
west-2:123456789012:logging-configuration/ABCdef34ghIJ"],  
  "maximumMessageLength": 256,  
  "maximumMessageRatePerSecond": 5,  
  "name": "test-room-1",  
  "tags": {}  
  "updateTime": "2022-03-16T07:22:09+00:00"  
}
```

For more information, see [Step 2: Create a Chat Room](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateRoom](#) in *AWS CLI Command Reference*.

delete-logging-configuration

The following code example shows how to use delete-logging-configuration.

AWS CLI

To delete a chat LoggingConfiguration resource

The following delete-logging-configuration example deletes the LoggingConfiguration resource for the specified ARN.

```
aws ivschat delete-logging-configuration \  
  --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/  
ABCdef34ghIJ"
```

This command produces no output.

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteLoggingConfiguration](#) in *AWS CLI Command Reference*.

delete-message

The following code example shows how to use `delete-message`.

AWS CLI

To delete messages from a specified room

The following `delete-message` example sends an event to the specified room, which directs clients to delete the specified message: that is, unrender it from view and delete it from the client's chat history.

```
aws ivschat delete-message \  
  --roomIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \  
  --id "ABC123def456" \  
  --reason "Message contains profanity"
```

Output:

```
{  
  "id": "12345689012"  
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteMessage](#) in *AWS CLI Command Reference*.

delete-room

The following code example shows how to use `delete-room`.

AWS CLI

To delete a room

The following `delete-room` example deletes the specified room. Connected clients are disconnected. On success it returns HTTP 204 with an empty response body.

```
aws ivschat delete-room \  
  --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
```

This command produces no output.

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteRoom](#) in *AWS CLI Command Reference*.

disconnect-user

The following code example shows how to use `disconnect-user`.

AWS CLI

To disconnect a user from a room

The following `disconnect-user` example disconnects all connections for the specified user from the specified room. On success it returns HTTP 200 with an empty response body.

```
aws ivschat disconnect-user \  
  --roomId "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \  
  --userId "ABC123def456" \  
  --reason "Violated terms of service"
```

This command produces no output.

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DisconnectUser](#) in *AWS CLI Command Reference*.

get-logging-configuration

The following code example shows how to use `get-logging-configuration`.

AWS CLI

To get information about a LoggingConfiguration resource

The following `get-logging-configuration` example gets information about the LoggingConfiguration resource for the specified ARN.

```
aws ivschat get-logging-configuration \  
  --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/  
ABcdef34ghIJ"
```

Output:

```
{  
  "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/  
ABcdef34ghIJ",  
  "createTime": "2022-09-14T17:48:00.653000+00:00",  
  "destinationConfiguration": {  
    "s3": {  
      "bucketName": "demo-logging-bucket"  
    }  
  },  
  "id": "ABcdef34ghIJ",  
  "name": "test-logging-config",  
  "state": "ACTIVE",  
  "tags": { "key1" : "value1", "key2" : "value2" },  
  "updateTime": "2022-09-14T17:48:01.104000+00:00"  
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetLoggingConfiguration](#) in *AWS CLI Command Reference*.

get-room

The following code example shows how to use `get-room`.

AWS CLI

To get the specified room

The following `get-room` example gets information about the specified room.

```
aws ivschat get-room \  
  --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6"
```

Output:

```
{  
  "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",  
  "createTime": "2022-03-16T04:44:09+00:00",  
  "id": "g1H2I3j4k5L6",  
  "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-  
west-2:123456789012:logging-configuration/ABCdef34ghIJ"],  
  "maximumMessageLength": 256,  
  "maximumMessageRatePerSecond": 5,  
  "name": "test-room-1",  
  "tags": {},  
  "updateTime": "2022-03-16T07:22:09+00:00"  
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetRoom](#) in *AWS CLI Command Reference*.

list-logging-configurations

The following code example shows how to use `list-logging-configurations`.

AWS CLI

To get summary information about all logging configurations for the user in the AWS region where the API request is processed

The following `list-logging-configurations` example lists information about all `LoggingConfiguration` resources for the user in the AWS region where the API request is processed.

```
aws ivschat list-logging-configurations \  
  --max-results 2 \  
  --next-token ""
```

Output:

```
{
  "nextToken": "set-2",
  "loggingConfigurations": [
    {
      "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/
ABcdef34ghIJ",
      "createTime": "2022-09-14T17:48:00.653000+00:00",
      "destinationConfiguration": {
        "s3": {
          "bucketName": "demo-logging-bucket"
        }
      },
      "id": "ABcdef34ghIJ",
      "name": "test-logging-config",
      "state": "ACTIVE",
      "tags": { "key1" : "value1", "key2" : "value2" },
      "updateTime": "2022-09-14T17:48:01.104000+00:00"
    }
    ...
  ]
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListLoggingConfigurations](#) in *AWS CLI Command Reference*.

list-rooms

The following code example shows how to use `list-rooms`.

AWS CLI

To get summary information about all your rooms in the current region

The following `list-rooms` example gets summary information about all the rooms in the AWS region where the request is processed. Results are sorted in descending order of `updateTime`.

```
aws ivschat list-rooms \
  --logging-configuration-identifier "arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABcdef34ghIJ" \
  --max-results 10 \
```

```
--next-token ""
```

Output:

```
{
  "nextToken": "page3",
  "rooms": [
    {
      "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",
      "createTime": "2022-03-16T04:44:09+00:00",
      "id": "g1H2I3j4k5L6",
      "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-
west-2:123456789012:logging-configuration/ABCdef34ghIJ"],
      "name": "test-room-1",
      "tags": {},
      "updateTime": "2022-03-16T07:22:09+00:00"
    }
  ]
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListRooms](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI**To list all tags for an AWS resource (for example: Room)**

The following `list-tags-for-resource` example lists all tags for a specified resource ARN (Amazon Resource Name).

```
aws ivschat list-tags-for-resource \
  --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6
```

Output:

```
{
```

```
"tags":
{
  "key1": "value1",
  "key2": "value2"
}
}
```

For more information, see [Tagging](#) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

send-event

The following code example shows how to use send-event.

AWS CLI

To send an event to a room

The following send-event example sends the given event to the specified room.

```
aws ivschat send-event \
  --roomIdIdentifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \
  --eventName "SystemMessage" \
  --attributes \
    "msgType"="user-notification", \
    "msgText"="This chat room will close in 15 minutes."
```

Output:

```
{
  "id": "12345689012"
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [SendEvent](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add or update tags for an AWS resource (for example: Room)

The following `tag-resource` example adds or updates tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```
aws ivschat tag-resource \  
  --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \  
  --tags "tagkey1=tagkeyvalue1, tagkey2=tagkeyvalue2"
```

This command produces no output.

For more information, see [Tagging](#) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags for an AWS resource (for example: Room)

The following `untag-resource` example removes the specified tags for a specified resource ARN (Amazon Resource Name). On success it returns HTTP 200 with an empty response body.

```
aws ivschat untag-resource \  
  --resource-arn arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6 \  
  --tag-keys "tagkey1, tagkey2"
```

This command produces no output.

For more information, see [Tagging](#) in the *Amazon Interactive Video Service API Reference*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-logging-configuration

The following code example shows how to use `update-logging-configuration`.

AWS CLI

To update a room's logging configuration

The following `update-logging-configuration` example updates a `LoggingConfiguration` resource with the given data.

```
aws ivschat update-logging-configuration \  
  --destination-configuration s3={bucketName=demo-logging-bucket} \  
  --identifier "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/  
ABcdef34ghIJ" \  
  --name "test-logging-config"
```

Output:

```
{  
  "arn": "arn:aws:ivschat:us-west-2:123456789012:logging-configuration/  
ABcdef34ghIJ",  
  "createTime": "2022-09-14T17:48:00.653000+00:00",  
  "destinationConfiguration": {  
    "s3": {  
      "bucketName": "demo-logging-bucket"  
    }  
  },  
  "id": "ABcdef34ghIJ",  
  "name": "test-logging-config",  
  "state": "ACTIVE",  
  "tags": { "key1" : "value1", "key2" : "value2" },  
  "updateTime": "2022-09-14T17:48:01.104000+00:00"  
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [UpdateLoggingConfiguration](#) in *AWS CLI Command Reference*.

update-room

The following code example shows how to use `update-room`.

AWS CLI

To update a room's configuration

The following `update-room` example updates the specified room's configuration with the given data.

```
aws ivschat update-room \  
  --identifier "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6" \  
  --logging-configuration-identifiers "arn:aws:ivschat:us-  
west-2:123456789012:logging-configuration/ABCdef34ghIJ" \  
  --name "chat-room-a" \  
  --maximum-message-length 256 \  
  --maximum-message-rate-per-second 5
```

Output:

```
{  
  "arn": "arn:aws:ivschat:us-west-2:12345689012:room/g1H2I3j4k5L6",  
  "createTime": "2022-03-16T04:44:09+00:00",  
  "id": "g1H2I3j4k5L6",  
  "loggingConfigurationIdentifiers": ["arn:aws:ivschat:us-  
west-2:123456789012:logging-configuration/ABCdef34ghIJ"],  
  "maximumMessageLength": 256,  
  "maximumMessageRatePerSecond": 5,  
  "name": "chat-room-a",  
  "tags": {},  
  "updateTime": "2022-03-16T07:22:09+00:00"  
}
```

For more information, see [Getting Started with Amazon IVS Chat](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [UpdateRoom](#) in *AWS CLI Command Reference*.

Amazon IVS Real-Time Streaming examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon IVS Real-Time Streaming.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-encoder-configuration

The following code example shows how to use create-encoder-configuration.

AWS CLI

To create a composition encoder configuration

The following create-encoder-configuration example creates a composition encoder configuration with the specified properties.

```
aws ivs-realtime create-encoder-configuration \  
  --name test-ec --video bitrate=3500000,framerate=30.0,height=1080,width=1920
```

Output:

```
{  
  "encoderConfiguration": {  
    "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/  
ABabCDcdEFef",  
    "name": "test-ec",  
    "tags": {},  
    "video": {  
      "bitrate": 3500000,  
      "framerate": 30,  
      "height": 1080,  
      "width": 1920  
    }  
  }  
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateEncoderConfiguration](#) in *AWS CLI Command Reference*.

create-participant-token

The following code example shows how to use create-participant-token.

AWS CLI

To create a stage participant token

The following create-participant-token example creates a participant token for the specified stage.

```
aws ivs-realtime create-participant-token \
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
  --user-id bob
```

Output:

```
{
  "participantToken": {
    "expirationTime": "2023-03-07T09:47:43+00:00",
    "participantId": "ABCDEFghij01234KLMN6789",
    "token": "abcd1234defg5678"
  }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateParticipantToken](#) in *AWS CLI Command Reference*.

create-stage

The following code example shows how to use create-stage.

AWS CLI

To create a stage

The following create-stage example creates a stage and stage participant token for a specified user.

```
aws ivs-realtime create-stage \  
  --name stage1 \  
  --participant-token-configurations userId=alice
```

Output:

```
{  
  "participantTokens": [  
    {  
      "participantId": "ABCDEFghij01234KLMN5678",  
      "token": "a1b2c3d4567890ab",  
      "userId": "alice"  
    }  
  ],  
  "stage": {  
    "activeSessionId": "st-a1b2c3d4e5f6g",  
    "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",  
    "name": "stage1",  
    "tags": {}  
  }  
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateStage](#) in *AWS CLI Command Reference*.

create-storage-configuration

The following code example shows how to use `create-storage-configuration`.

AWS CLI**To create a composition storage configuration**

The following `create-storage-configuration` example creates a composition storage configuration with the specified properties.

```
aws ivs-realtime create-storage-configuration \  
  --name "test-sc" --s3 "bucketName=test-bucket-name"
```

Output:

```
{
  "storageConfiguration": {
    "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
ABabCDcdEFef",
    "name": "test-sc",
    "s3": {
      "bucketName": "test-bucket-name"
    },
    "tags": {}
  }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [CreateStorageConfiguration](#) in *AWS CLI Command Reference*.

delete-encoder-configuration

The following code example shows how to use `delete-encoder-configuration`.

AWS CLI

To delete a composition encoder configuration

The following `delete-encoder-configuration` deletes the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-encoder-configuration \
  --arn "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
ABabCDcdEFef"
```

This command produces no output.

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteEncoderConfiguration](#) in *AWS CLI Command Reference*.

delete-stage

The following code example shows how to use `delete-stage`.

AWS CLI

To delete a stage

The following `delete-stage` example deletes the specified stage.

```
aws ivs-realtime delete-stage \  
  --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

This command produces no output.

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteStage](#) in *AWS CLI Command Reference*.

`delete-storage-configuration`

The following code example shows how to use `delete-storage-configuration`.

AWS CLI

To delete a composition storage configuration

The following `delete-storage-configuration` deletes the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime delete-storage-configuration \  
  --arn "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/  
  ABabCDcdEFef"
```

This command produces no output.

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DeleteStorageConfiguration](#) in *AWS CLI Command Reference*.

`disconnect-participant`

The following code example shows how to use `disconnect-participant`.

AWS CLI

To disconnect a stage participant

The following `disconnect-participant` example disconnects the specified participant from the specified stage.

```
aws ivs-realtime disconnect-participant \  
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \  
  --participant-id ABCDEfghij01234KLMN5678
```

This command produces no output.

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [DisconnectParticipant](#) in *AWS CLI Command Reference*.

get-composition

The following code example shows how to use `get-composition`.

AWS CLI

Example 1: To get a composition with default layout settings

The following `get-composition` example gets the composition for the ARN (Amazon Resource Name) specified.

```
aws ivs-realtime get-composition \  
  --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

Output:

```
{  
  "composition": {  
    "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh",  
    "destinations": [  
      {  
        "configuration": {  
          "channel": {  
            "channelArn": "arn:aws:ivs:ap-northeast-1:123456789012:channel/abcABCdefDEg",
```

```

        "encoderConfigurationArn": "arn:aws:ivs:ap-

    "state": "ACTIVE",
    "tags": {}
  }
}
```

For more information, see [Composite Recording \(Real-Time Streaming\)](#) in the *Amazon Interactive Video Service User Guide*.

Example 2: To get a composition with PiP layout

The following get-composition example gets the composition for the ARN (Amazon Resource Name) specified, which uses PiP layout.

```
aws ivs-realtime get-composition \
  --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs"
```

Output:

```
{
  "composition": {
    "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs",
    "destinations": [
      {
        "configuration": {

```

For more information, see [Composite Recording \(Real-Time Streaming\)](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetComposition](#) in *AWS CLI Command Reference*.

get-encoder-configuration

The following code example shows how to use `get-encoder-configuration`.

AWS CLI

To get a composition encoder configuration

The following `get-encoder-configuration` example gets the composition encoder configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime get-encoder-configuration \  
  --arn "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/  
abcdABCDefgh"
```

Output:

```
{  
  "encoderConfiguration": {  
    "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/  
abcdABCDefgh",  
    "name": "test-ec",  
    "tags": {},  
    "video": {  
      "bitrate": 3500000,  
      "framerate": 30,  
      "height": 1080,  
      "width": 1920  
    }  
  }  
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetEncoderConfiguration](#) in *AWS CLI Command Reference*.

get-participant

The following code example shows how to use `get-participant`.

AWS CLI

To get a stage participant

The following `get-participant` example gets the stage participant for a specified participant ID and session ID in the specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-participant \  
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \  
  --session-id st-a1b2c3d4e5f6g \  
  --participant-id abCDEf12GHIj
```

Output:

```
{  
  "participant": {  
    "browserName", "Google Chrome",  
    "browserVersion", "116",  
    "firstJoinTime": "2023-04-26T20:30:34+00:00",  
    "ispName", "Comcast",  
    "osName", "Microsoft Windows 10 Pro",  
    "osVersion", "10.0.19044",  
    "participantId": "abCDEf12GHIj",  
    "published": true,  
    "sdkVersion", "",  
    "state": "DISCONNECTED",  
    "userId": ""  
  }  
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetParticipant](#) in *AWS CLI Command Reference*.

get-stage-session

The following code example shows how to use `get-stage-session`.

AWS CLI

To get a stage session

The following `get-stage-session` example gets the stage session for a specified session ID of a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-stage-session \  
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \  
  --session-id st-a1b2c3d4e5f6g
```

Output:

```
{  
  "stageSession": {  
    "endTime": "2023-04-26T20:36:29+00:00",  
    "sessionId": "st-a1b2c3d4e5f6g",  
    "startTime": "2023-04-26T20:30:29.602000+00:00"  
  }  
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetStageSession](#) in *AWS CLI Command Reference*.

get-stage

The following code example shows how to use `get-stage`.

AWS CLI

To get a stage's configuration information

The following `get-stage` example gets the stage configuration for a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime get-stage \  
  --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{  
  "stage": {  
    "activeSessionId": "st-a1b2c3d4e5f6g",  
    "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
```

```
    "name": "test",
    "tags": {}
  }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetStage](#) in *AWS CLI Command Reference*.

get-storage-configuration

The following code example shows how to use `get-storage-configuration`.

AWS CLI

To get a composition storage configuration

The following `get-storage-configuration` example gets the composition storage configuration specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime get-storage-configuration \
  --name arn "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
abcdABCDefgh"
```

Output:

```
{
  "storageConfiguration": {
    "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/
abcdABCDefgh",
    "name": "test-sc",
    "s3": {
      "bucketName": "test-bucket-name"
    },
    "tags": {}
  }
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [GetStorageConfiguration](#) in *AWS CLI Command Reference*.

list-compositions

The following code example shows how to use `list-compositions`.

AWS CLI

To get a list of compositions

The following `list-compositions` lists all compositions for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-compositions
```

Output:

```
{
  "compositions": [
    {
      "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/
abcdABCDefgh",
      "destinations": [
        {
          "id": "AabBCcdDEefF",
          "startTime": "2023-10-16T23:25:23+00:00",
          "state": "ACTIVE"
        }
      ],
      "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/
defgABCDabcd",
      "startTime": "2023-10-16T23:25:21+00:00",
      "state": "ACTIVE",
      "tags": {}
    },
    {
      "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/
ABcdabCDefgh",
      "destinations": [
        {
          "endTime": "2023-10-16T23:25:00.786512+00:00",
          "id": "aABbcCDdeEFf",
          "startTime": "2023-10-16T23:24:01+00:00",
          "state": "STOPPED"
        }
      ],
    }
  ]
}
```

```

        {
            "endTime": "2023-10-16T23:25:00.786512+00:00",
            "id": "deEFfaABbcCD",
            "startTime": "2023-10-16T23:24:01+00:00",
            "state": "STOPPED"
        }
    ],
    "endTime": "2023-10-16T23:25:00+00:00",
    "stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/
efghabcdABCD",
    "startTime": "2023-10-16T23:24:00+00:00",
    "state": "STOPPED",
    "tags": {}
}
]
}

```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListCompositions](#) in *AWS CLI Command Reference*.

list-encoder-configurations

The following code example shows how to use `list-encoder-configurations`.

AWS CLI

To list composition encoder configurations

The following `list-encoder-configurations` lists all composition encoder configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-encoder-configurations
```

Output:

```

{
  "encoderConfigurations": [
    {
      "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
abcdABCDefgh",
      "name": "test-ec-1",

```

```

        "tags": {}
    },
    {
        "arn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-configuration/
ABCefgEFGabc",
        "name": "test-ec-2",
        "tags": {}
    }
]
}

```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListEncoderConfigurations](#) in *AWS CLI Command Reference*.

list-participant-events

The following code example shows how to use `list-participant-events`.

AWS CLI

To get a list of stage participant events

The following `list-participant-events` example lists all participant events for a specified participant ID and session ID of a specified stage ARN (Amazon Resource Name).

```

aws ivs-realtime list-participant-events \
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
  --session-id st-a1b2c3d4e5f6g \
  --participant-id abCDEf12GHIj

```

Output:

```

{
  "events": [
    {
      "eventTime": "2023-04-26T20:36:28+00:00",
      "name": "LEFT",
      "participantId": "abCDEf12GHIj"
    },
    {
      "eventTime": "2023-04-26T20:36:28+00:00",

```

```

        "name": "PUBLISH_STOPPED",
        "participantId": "abCDEf12GHIj"
    },
    {
        "eventTime": "2023-04-26T20:30:34+00:00",
        "name": "JOINED",
        "participantId": "abCDEf12GHIj"
    },
    {
        "eventTime": "2023-04-26T20:30:34+00:00",
        "name": "PUBLISH_STARTED",
        "participantId": "abCDEf12GHIj"
    }
]
}

```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListParticipantEvents](#) in *AWS CLI Command Reference*.

list-participants

The following code example shows how to use `list-participants`.

AWS CLI

To get a list of stage participants

The following `list-participants` example lists all participants for a specified session ID of a specified stage ARN (Amazon Resource Name).

```

aws ivs-realtime list-participants \
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \
  --session-id st-a1b2c3d4e5f6g

```

Output:

```

{
  "participants": [
    {
      "firstJoinTime": "2023-04-26T20:30:34+00:00",
      "participantId": "abCDEf12GHIj"
    }
  ]
}

```

```
        "published": true,  
        "state": "DISCONNECTED",  
        "userId": ""  
    }  
]  
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListParticipants](#) in *AWS CLI Command Reference*.

list-stage-sessions

The following code example shows how to use `list-stage-sessions`.

AWS CLI

To get a list of stage sessions

The following `list-stage-sessions` example lists all sessions for a specified stage ARN (Amazon Resource Name).

```
aws ivs-realtime list-stage-sessions \  
  --stage-arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh
```

Output:

```
{  
  "stageSessions": [  
    {  
      "endTime": "2023-04-26T20:36:29+00:00",  
      "sessionId": "st-a1b2c3d4e5f6g",  
      "startTime": "2023-04-26T20:30:29.602000+00:00"  
    }  
  ]  
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListStageSessions](#) in *AWS CLI Command Reference*.

list-stages

The following code example shows how to use `list-stages`.

AWS CLI

To get summary information about all stages

The following `list-stages` example lists all stages for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-stages
```

Output:

```
{
  "stages": [
    {
      "activeSessionId": "st-a1b2c3d4e5f6g",
      "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",
      "name": "stage1",
      "tags": {}
    },
    {
      "activeSessionId": "st-a123bcd456efg",
      "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcd1234ABCD",
      "name": "stage2",
      "tags": {}
    },
    {
      "activeSessionId": "st-abcDEF1234ghi",
      "arn": "arn:aws:ivs:us-west-2:123456789012:stage/ABCD1234efgh",
      "name": "stage3",
      "tags": {}
    }
  ]
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListStages](#) in *AWS CLI Command Reference*.

list-storage-configurations

The following code example shows how to use `list-storage-configurations`.

AWS CLI

To list composition storage configurations

The following `list-storage-configurations` lists all composition storage configurations for your AWS account, in the AWS region where the API request is processed.

```
aws ivs-realtime list-storage-configurations
```

Output:

```
{
  "storageConfigurations": [
    {
      "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/abcdABCDefgh",
      "name": "test-sc-1",
      "s3": {
        "bucketName": "test-bucket-1-name"
      },
      "tags": {}
    },
    {
      "arn": "arn:aws:ivs:ap-northeast-1:123456789012:storage-configuration/ABCefgEFGabc",
      "name": "test-sc-2",
      "s3": {
        "bucketName": "test-bucket-2-name"
      },
      "tags": {}
    }
  ]
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [ListStorageConfigurations](#) in *AWS CLI Command Reference*.

start-composition

The following code example shows how to use start-composition.

AWS CLI

Example 1: To start a composition with default layout settings

The following start-composition example starts a composition for the specified stage to be streamed to the specified locations.

```
aws ivs-realtime start-composition \
  --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCdabcd \
  --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg", \
  "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-
configuration/ABabCDcdEFef"}}, \
  {"s3":{"encoderConfigurationArns":["arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"], \
  "storageConfigurationArn":"arn:aws:ivs:ap-northeast-1:123456789012:storage-
configuration/FefABabCDcdE"}}]'
```

Output:

```
{
  "composition": {
    "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh",
    "destinations": [
      {
        "configuration": {
          "channel": {
            "channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg",
            "encoderConfigurationArn": "arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
          },
          "name": ""
        },
        "id": "AabBCcdDEefF",
        "state": "STARTING"
      },
      {
        "configuration": {
```

```

        "name": "",
        "s3": {
            "encoderConfigurationArns": [
                "arn:aws:ivs:arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"
            ],
            "recordingConfiguration": {
                "format": "HLS"
            },
            "storageConfigurationArn": "arn:arn:aws:ivs:ap-
northeast-1:123456789012:storage-configuration/FefABabCDcdE"
        }
    },
    "detail": {
        "s3": {
            "recordingPrefix": "aBcDeFgHhGfE/AbCdEfGhHgFe/GHfabcgefABC/
composite"
        }
    },
    "id": "GHfabcgefABC",
    "state": "STARTING"
}
],
"layout": {
    "grid": {
        "featuredParticipantAttribute": "",
        "gridGap": 2,
        "omitStoppedVideo": false,
        "videoAspectRatio": "VIDEO",
        "videoFillMode": ""
    }
},
"stageArn": "arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCDabcd",
"startTime": "2023-10-16T23:24:00+00:00",
"state": "STARTING",
"tags": {}
}
}

```

For more information, see [Composite Recording \(Real-Time Streaming\)](#) in the *Amazon Interactive Video Service User Guide*.

Example 2: To start a composition with PiP layout

The following `start-composition` example starts a composition for the specified stage to be streamed to the specified locations using PiP layout.

```
aws ivs-realtime start-composition \
  --stage-arn arn:aws:ivs:ap-northeast-1:123456789012:stage/defgABCdabcd \
  --destinations '[{"channel": {"channelArn": "arn:aws:ivs:ap-
northeast-1:123456789012:channel/abcABCdefDEg"}, \
  "encoderConfigurationArn": "arn:aws:ivs:ap-northeast-1:123456789012:encoder-
configuration/ABabCDcdEFef"}], \
  {"s3":{"encoderConfigurationArns":["arn:aws:ivs:ap-
northeast-1:123456789012:encoder-configuration/ABabCDcdEFef"], \
  "storageConfigurationArn":"arn:aws:ivs:ap-northeast-1:123456789012:storage-
configuration/FefABabCDcdE"}}]' \
  --layout pip='{featuredParticipantAttribute="abcdefg}"'
```

Output:

```
{
  "composition": {
    "arn": "arn:aws:ivs:ap-northeast-1:123456789012:composition/wxyzWXYZpqrs",
    "destinations": [
      {

"state": "STARTING",
"tags": {}
}
}

```

For more information, see [Composite Recording \(Real-Time Streaming\)](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [StartComposition](#) in *AWS CLI Command Reference*.

stop-composition

The following code example shows how to use stop-composition.

AWS CLI

To stop a composition

The following `stop-composition` stops the composition specified by the given ARN (Amazon Resource Name).

```
aws ivs-realtime stop-composition \  
  --arn "arn:aws:ivs:ap-northeast-1:123456789012:composition/abcdABCDefgh"
```

This command produces no output.

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [StopComposition](#) in *AWS CLI Command Reference*.

update-stage

The following code example shows how to use `update-stage`.

AWS CLI

To update a stage's configuration

The following `update-stage` example updates a stage for a specified stage ARN to update the stage name.

```
aws ivs-realtime update-stage \  
  --arn arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh \  
  --name stage1a
```

Output:

```
{  
  "stage": {  
    "arn": "arn:aws:ivs:us-west-2:123456789012:stage/abcdABCDefgh",  
    "name": "stage1a"  
  }  
}
```

For more information, see [Enabling Multiple Hosts on an Amazon IVS Stream](#) in the *Amazon Interactive Video Service User Guide*.

- For API details, see [UpdateStage](#) in *AWS CLI Command Reference*.

Amazon Kendra examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Kendra.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-data-source

The following code example shows how to use `create-data-source`.

AWS CLI

To create an Amazon Kendra data source connector

The following `create-data-source` creates and configures an Amazon Kendra data source connector. You can use `describe-data-source` to view the status of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra create-data-source \
```

```

--name "example data source 1" \
--description "Example data source 1 for example index 1 contains the first set
of example documents" \
--tags '{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources",
"Value": "aws"}' \
--role-arn "arn:aws:iam::my-account-id:role/
KendraRoleForS3TemplateConfigDataSource" \
--index-id exampleindex1 \
--language-code "es" \
--schedule "0 0 18 ? * TUE,MON,WED,THU,FRI,SAT *" \
--configuration '{"TemplateConfiguration": {"Template": file://
s3schemaconfig.json}}' \
--type "TEMPLATE" \
--custom-document-enrichment-configuration '{"PostExtractionHookConfiguration":
{"LambdaArn": "arn:aws:iam::my-account-id:function/my-function-ocr-docs",
"S3Bucket": "s3://my-s3-bucket/scanned-image-text-example-docs"}, "RoleArn":
"arn:aws:iam:my-account-id:role/KendraRoleForCDE"}' \
--vpc-configuration '{"SecurityGroupIds": ["sg-1234567890abcdef0"], "SubnetIds":
["subnet-1c234", "subnet-2b134"]}'

```

Output:

```

{
  "Id": "exampledatasource1"
}

```

For more information, see [Getting started with an Amazon Kendra index and data source connector](#) in the *Amazon Kendra Developer Guide*.

- For API details, see [CreateDataSource](#) in *AWS CLI Command Reference*.

create-index

The following code example shows how to use `create-index`.

AWS CLI

To create an Amazon Kendra index

The following `create-index` creates and configures an Amazon Kendra index. You can use `describe-index` to view the status of an index, and read any error messages if the status shows an index "FAILED" to completely create.

```
aws kendra create-index \  
  --name "example index 1" \  
  --description "Example index 1 contains the first set of example documents" \  
  --tags '{"Key": "test resources", "Value": "kendra"}, {"Key": "test resources",  
"Value": "aws"}' \  
  --role-arn "arn:aws:iam::my-account-id:role/KendraRoleForExampleIndex" \  
  --edition "DEVELOPER_EDITION" \  
  --server-side-encryption-configuration '{"KmsKeyId": "my-kms-key-id"}' \  
  --user-context-policy "USER_TOKEN" \  
  --user-token-configurations '{"JsonTokenTypeConfiguration":  
{"GroupAttributeField": "groupNameField", "UserNameAttributeField":  
"userNameField"}}'
```

Output:

```
{  
  "Id": index1  
}
```

For more information, see [Getting started with an Amazon Kendra index and data source connector](#) in the *Amazon Kendra Developer Guide*.

- For API details, see [CreateIndex](#) in *AWS CLI Command Reference*.

describe-data-source

The following code example shows how to use describe-data-source.

AWS CLI

To get information about an Amazon Kendra data source connector

The following describe-data-source gets information about an Amazon Kendra data source connector. You can view the configuration of a data source connector, and read any error messages if the status shows a data source connector "FAILED" to completely create.

```
aws kendra describe-data-source \  
  --id exampledatasource1 \  
  --index-id exampleindex1
```

Output:

```
{
  "Configuration": {
    "TemplateConfiguration": {
      "Template": {
        "connectionConfiguration": {
          "repositoryEndpointMetadata": {
            "BucketName": "my-bucket"
          }
        },
        "repositoryConfigurations": {
          "document": {
            "fieldMappings": [
              {
                "indexFieldName": "_document_title",
                "indexFieldType": "STRING",
                "dataSourceFieldName": "title"
              },
              {
                "indexFieldName": "_last_updated_at",

describe-index

The following code example shows how to use `describe-index`.

AWS CLI

To get information about an Amazon Kendra index

The following `describe-index` gets information about an Amazon Kendra index. You can view the configuration of an index, and read any error messages if the status shows an index "FAILED" to completely create.

```
aws kendra describe-index \  
  --id exampleindex1
```

Output:

```
{  
  "CapacityUnits": {  
    "QueryCapacityUnits": 0,  
    "StorageCapacityUnits": 0  
  },

update-data-source

The following code example shows how to use `update-data-source`.

AWS CLI

To update an Amazon Kendra data source connector

The following `update-data-source` updates the configuration of an Amazon Kendra data source connector. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use `describe-data-source` to view the configuration and status of a data source connector.

```
aws kendra update-data-source \
```

```

--id exampledatasource1 \
--index-id exampleindex1 \
--name "new name for example data source 1" \
--description "new description for example data source 1" \
--role-arn arn:aws:iam::my-account-id:role/KendraNewRoleForExampleDataSource \
--configuration '{"TemplateConfiguration": {"Template": file://
s3schemanewconfig.json}}' \
--custom-document-enrichment-configuration '{"PostExtractionHookConfiguration":
{"LambdaArn": "arn:aws:iam::my-account-id:function/my-function-ocr-docs",
"S3Bucket": "s3://my-s3-bucket/scanned-image-text-example-docs"}, "RoleArn":
"arn:aws:iam:my-account-id:role/KendraNewRoleForCDE"}' \
--language-code "es" \
--schedule "0 0 18 ? * MON,WED,FRI *" \
--vpc-configuration '{"SecurityGroupIds": ["sg-1234567890abcdef0"], "SubnetIds":
["subnet-1c234", "subnet-2b134"]}'

```

This command produces no output.

For more information, see [Getting started with an Amazon Kendra index and data source connector](#) in the *Amazon Kendra Developer Guide*.

- For API details, see [UpdateDataSource](#) in *AWS CLI Command Reference*.

update-index

The following code example shows how to use update-index.

AWS CLI

To update an Amazon Kendra index

The following update-index updates the configuration of an Amazon Kendra index. If the action is successful, the service either sends back no output, the HTTP status code 200, or the AWS CLI return code 0. You can use describe-index to view the configuration and status of an index.

```

aws kendra update-index \
--id enterpriseindex1 \
--name "new name for Enterprise Edition index 1" \
--description "new description for Enterprise Edition index 1" \
--role-arn arn:aws:iam::my-account-id:role/KendraNewRoleForEnterpriseIndex \
--capacity-units '{"QueryCapacityUnits": 2, "StorageCapacityUnits": 1}' \

```

```
--document-metadata-configuration-updates '{"Name": "_document_title",
"Relevance": {"Importance": 6}}, {"Name": "_last_updated_at", "Relevance":
{"Importance": 8}}' \
--user-context-policy "USER_TOKEN" \
--user-token-configurations '{"JsonTokenTypeConfiguration":
{"GroupAttributeField": "groupNameField", "UserNameAttributeField":
"userNameField"}}'
```

This command produces no output.

For more information, see [Getting started with an Amazon Kendra index and data source connector](#) in the *Amazon Kendra Developer Guide*.

- For API details, see [UpdateIndex](#) in *AWS CLI Command Reference*.

Kinesis examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Kinesis.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

add-tags-to-stream

The following code example shows how to use `add-tags-to-stream`.

AWS CLI

To add tags to a data stream

The following `add-tags-to-stream` example assigns a tag with the key `samplekey` and value `example` to the specified stream.

```
aws kinesis add-tags-to-stream \  
  --stream-name samplestream \  
  --tags samplekey=example
```

This command produces no output.

For more information, see [Tagging Your Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [AddTagsToStream](#) in *AWS CLI Command Reference*.

create-stream

The following code example shows how to use `create-stream`.

AWS CLI

To create a data stream

The following `create-stream` example creates a data stream named `samplestream` with 3 shards.

```
aws kinesis create-stream \  
  --stream-name samplestream \  
  --shard-count 3
```

This command produces no output.

For more information, see [Creating a Stream](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [CreateStream](#) in *AWS CLI Command Reference*.

decrease-stream-retention-period

The following code example shows how to use `decrease-stream-retention-period`.

AWS CLI

To decrease data stream retention period

The following `decrease-stream-retention-period` example decreases the retention period (the length of time data records are accessible after they are added to the stream) of a stream named `samplestream` to 48 hours.

```
aws kinesis decrease-stream-retention-period \  
  --stream-name samplestream \  
  --retention-period-hours 48
```

This command produces no output.

For more information, see [Changing the Data Retention Period](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [DecreaseStreamRetentionPeriod](#) in *AWS CLI Command Reference*.

`delete-stream`

The following code example shows how to use `delete-stream`.

AWS CLI

To delete a data stream

The following `delete-stream` example deletes the specified data stream.

```
aws kinesis delete-stream \  
  --stream-name samplestream
```

This command produces no output.

For more information, see [Deleting a Stream](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [DeleteStream](#) in *AWS CLI Command Reference*.

`deregister-stream-consumer`

The following code example shows how to use `deregister-stream-consumer`.

AWS CLI

To deregister a data stream consumer

The following `deregister-stream-consumer` example deregisters the specified consumer from the specified data stream.

```
aws kinesis deregister-stream-consumer \  
  --stream-arn arn:aws:kinesis:us-west-2:123456789012:stream/samplestream \  
  --consumer-name KinesisConsumerApplication
```

This command produces no output.

For more information, see [Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [DeregisterStreamConsumer](#) in *AWS CLI Command Reference*.

describe-limits

The following code example shows how to use `describe-limits`.

AWS CLI

To describe shard limits

The following `describe-limits` example displays the shard limits and usage for the current AWS account.

```
aws kinesis describe-limits
```

Output:

```
{  
  "ShardLimit": 500,  
  "OpenShardCount": 29  
}
```

For more information, see [Resharding a Stream](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [DescribeLimits](#) in *AWS CLI Command Reference*.

describe-stream-consumer

The following code example shows how to use `describe-stream-consumer`.

AWS CLI

To describe a data stream consumer

The following `describe-stream-consumer` example returns the description of the specified consumer, registered with the specified data stream.

```
aws kinesis describe-stream-consumer \  
  --stream-arn arn:aws:kinesis:us-west-2:012345678912:stream/samplestream \  
  --consumer-name KinesisConsumerApplication
```

Output:

```
{  
  "ConsumerDescription": {  
    "ConsumerName": "KinesisConsumerApplication",  
    "ConsumerARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream/  
consumer/KinesisConsumerApplication:1572383852",  
    "ConsumerStatus": "ACTIVE",  
    "ConsumerCreationTimestamp": 1572383852.0,  
    "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream"  
  }  
}
```

For more information, see [Reading Data from Amazon Kinesis Data Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [DescribeStreamConsumer](#) in *AWS CLI Command Reference*.

describe-stream-summary

The following code example shows how to use `describe-stream-summary`.

AWS CLI

To describe a data stream summary

The following `describe-stream-summary` example provides a summarized description (without the shard list) of the specified data stream.

```
aws kinesis describe-stream-summary \  
  --stream-name samplestream
```

Output:

```
{  
  "StreamDescriptionSummary": {  
    "StreamName": "samplestream",  
    "StreamARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream",  
    "StreamStatus": "ACTIVE",  
    "RetentionPeriodHours": 48,  
    "StreamCreationTimestamp": 1572297168.0,  
    "EnhancedMonitoring": [  
      {  
        "ShardLevelMetrics": []  
      }  
    ],  
    "EncryptionType": "NONE",  
    "OpenShardCount": 3,  
    "ConsumerCount": 0  
  }  
}
```

For more information, see [Creating and Managing Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [DescribeStreamSummary](#) in *AWS CLI Command Reference*.

describe-stream

The following code example shows how to use `describe-stream`.

AWS CLI

To describe a data stream

The following `describe-stream` example returns the details of the specified data stream.

```
aws kinesis describe-stream \  
  --stream-name samplestream
```

```
--stream-name samplestream
```

Output:

```
{
  "StreamDescription": {
    "Shards": [
      {
        "ShardId": "shardId-000000000000",

        "ShardLevelMetrics": []
      }
    ],
    "EncryptionType": "NONE",
    "KeyId": null,
    "StreamCreationTimestamp": 1572297168.0
  }
}
```

For more information, see [Creating and Managing Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [DescribeStream](#) in *AWS CLI Command Reference*.

disable-enhanced-monitoring

The following code example shows how to use `disable-enhanced-monitoring`.

AWS CLI

To disable enhanced monitoring for shard-level metrics

The following `disable-enhanced-monitoring` example disables enhanced Kinesis data stream monitoring for shard-level metrics.

```
aws kinesis disable-enhanced-monitoring \
  --stream-name samplestream --shard-level-metrics ALL
```

Output:

```
{
  "StreamName": "samplestream",
  "CurrentShardLevelMetrics": [
    "IncomingBytes",
    "OutgoingRecords",
    "IteratorAgeMilliseconds",
    "IncomingRecords",
    "ReadProvisionedThroughputExceeded",
```

```

        "WriteProvisionedThroughputExceeded",
        "OutgoingBytes"
    ],
    "DesiredShardLevelMetrics": []
}

```

For more information, see [Monitoring Streams in Amazon Kinesis Data Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [DisableEnhancedMonitoring](#) in *AWS CLI Command Reference*.

enable-enhanced-monitoring

The following code example shows how to use `enable-enhanced-monitoring`.

AWS CLI

To enable enhanced monitoring for shard-level metrics

The following `enable-enhanced-monitoring` example enables enhanced Kinesis data stream monitoring for shard-level metrics.

```

aws kinesis enable-enhanced-monitoring \
  --stream-name samplestream \
  --shard-level-metrics ALL

```

Output:

```

{
  "StreamName": "samplestream",
  "CurrentShardLevelMetrics": [],
  "DesiredShardLevelMetrics": [
    "IncomingBytes",
    "OutgoingRecords",
    "IteratorAgeMilliseconds",
    "IncomingRecords",
    "ReadProvisionedThroughputExceeded",
    "WriteProvisionedThroughputExceeded",
    "OutgoingBytes"
  ]
}

```

For more information, see [Monitoring Streams in Amazon Kinesis Data Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [EnableEnhancedMonitoring](#) in *AWS CLI Command Reference*.

get-records

The following code example shows how to use `get-records`.

AWS CLI

To obtain records from a shard

The following `get-records` example gets data records from a Kinesis data stream's shard using the specified shard iterator.

```
aws kinesis get-records \  
  --shard-iterator AAAAAAAAAAF7/0mWD7IuHj1yGv/  
TKuNgx2ukD5xipCY4cy4gU96orWwZwcSXh3K9tAmGYe0ZyLZrvzze0FVf9iN99hUPw/w/  
b0YWYeefNvnf1DYt5XpDJghLKr3DzgzknTmMymDP3R+3wRKeuEw6/kdxY2yKJH0veaiekaVc4N2VwK/  
GvaGP2Hh9Fg7N++q0Adg6fIDQPt4p8RpavDbk+A4sL9SWGE1
```

Output:

```
{  
  "Records": [],  
  "MillisBehindLatest": 80742000  
}
```

For more information, see [Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [GetRecords](#) in *AWS CLI Command Reference*.

get-shard-iterator

The following code example shows how to use `get-shard-iterator`.

AWS CLI

To obtain a shard iterator

The following `get-shard-iterator` example uses the `AT_SEQUENCE_NUMBER` shard iterator type and generates a shard iterator to start reading data records exactly from the position denoted by the specified sequence number.

```
aws kinesis get-shard-iterator \  
  --stream-name samplestream \  
  --shard-id shardId-000000000001 \  
  --shard-iterator-type LATEST
```

Output:

```
{  
  "ShardIterator": "AAAAAAAAAAFEvJjIYI+3jw/4aqqH9FifJ+n48XWTh/  
IFIsbILP6o5eDueD39NXNBfpZ10WL5K6ADXk8w+5H+Qhd9cFA9k268CPXCz/kebq1TGYI7Vy  
+1UkA9BuN3xvATxMBGxRY3zYK05gqgvaIRn9408SqeEqwhigwZxNWxID3Ej7YYYcxQi8Q/fIrCjGAY/  
n2r5Z9G864YpWdfN9upNNQAR/ii0WKs"  
}
```

For more information, see [Developing Consumers Using the Kinesis Data Streams API with the AWS SDK for Java](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [GetShardIterator](#) in *AWS CLI Command Reference*.

increase-stream-retention-period

The following code example shows how to use `increase-stream-retention-period`.

AWS CLI

To increase data stream retention period

The following `increase-stream-retention-period` example increases the retention period (the length of time data records are accessible after they are added to the stream) of the specified stream to 168 hours.

```
aws kinesis increase-stream-retention-period \  
  --stream-name samplestream \  
  --retention-period-hours 168
```

This command produces no output.

For more information, see [Changing the Data Retention Period](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [IncreaseStreamRetentionPeriod](#) in *AWS CLI Command Reference*.

list-shards

The following code example shows how to use `list-shards`.

AWS CLI

To list shards in a data stream

The following `list-shards` example lists all shards in the specified stream starting with the shard whose ID immediately follows the specified `exclusive-start-shard-id` of `shardId-000000000000`.

```
aws kinesis list-shards \  
  --stream-name samplestream \  
  --exclusive-start-shard-id shardId-000000000000
```

Output:

```
{  
  "Shards": [  
    {  
      "ShardId": "shardId-000000000001",  
      "HashKeyRange": {  
        "StartingHashKey": "113427455640312821154458202477256070485",

    ]
}
```

For more information, see [Listing Shards](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [ListShards](#) in *AWS CLI Command Reference*.

list-streams

The following code example shows how to use `list-streams`.

AWS CLI

To list data streams

The following `list-streams` example lists all active data streams in the current account and region.

```
aws kinesis list-streams
```

Output:

```
{
  "StreamNames": [
    "samplestream",
    "samplestream1"
  ]
}
```

For more information, see [Listing Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [ListStreams](#) in *AWS CLI Command Reference*.

list-tags-for-stream

The following code example shows how to use `list-tags-for-stream`.

AWS CLI

To list tags for a data stream

The following `list-tags-for-stream` example lists the tags attached to the specified data stream.

```
aws kinesis list-tags-for-stream \  
  --stream-name samplestream
```

Output:

```
{  
  "Tags": [  
    {  
      "Key": "samplekey",  
      "Value": "example"  
    }  
  ],  
  "HasMoreTags": false  
}
```

For more information, see [Tagging Your Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [ListTagsForStream](#) in *AWS CLI Command Reference*.

merge-shards

The following code example shows how to use `merge-shards`.

AWS CLI

To merge shards

The following `merge-shards` example merges two adjacent shards with IDs of `shardId-000000000000` and `shardId-000000000001` in the specified data stream and combines them into a single shard.

```
aws kinesis merge-shards \  
  --stream-name samplestream \  
  --shard-to-merge shardId-000000000000 \  
  --shard-to-merge shardId-000000000001
```

```
--adjacent-shard-to-merge shardId-000000000001
```

This command produces no output.

For more information, see [Merging Two Shards](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [MergeShards](#) in *AWS CLI Command Reference*.

put-record

The following code example shows how to use `put-record`.

AWS CLI

To write a record into a data stream

The following `put-record` example writes a single data record into the specified data stream using the specified partition key.

```
aws kinesis put-record \  
  --stream-name samplestream \  
  --data sampledatarecord \  
  --partition-key samplepartitionkey
```

Output:

```
{  
  "ShardId": "shardId-000000000009",  
  "SequenceNumber": "49600902273357540915989931256901506243878407835297513618",  
  "EncryptionType": "KMS"  
}
```

For more information, see [Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [PutRecord](#) in *AWS CLI Command Reference*.

put-records

The following code example shows how to use `put-records`.

AWS CLI

To write multiple records into a data stream

The following `put-records` example writes a data record using the specified partition key and another data record using a different partition key in a single call.

```
aws kinesis put-records \  
  --stream-name samplestream \  
  --records Data=blob1,PartitionKey=partitionkey1  
           Data=blob2,PartitionKey=partitionkey2
```

Output:

```
{  
  "FailedRecordCount": 0,  
  "Records": [  
    {  
      "SequenceNumber":  
"49600883331171471519674795588238531498465399900093808706",  
      "ShardId": "shardId-000000000004"  
    },  
    {  
      "SequenceNumber":  
"49600902273357540915989931256902715169698037101720764562",  
      "ShardId": "shardId-000000000009"  
    }  
  ],  
  "EncryptionType": "KMS"  
}
```

For more information, see [Developing Producers Using the Amazon Kinesis Data Streams API with the AWS SDK for Java](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [PutRecords](#) in *AWS CLI Command Reference*.

register-stream-consumer

The following code example shows how to use `register-stream-consumer`.

AWS CLI

To register a data stream consumer

The following `register-stream-consumer` example registers a consumer called `KinesisConsumerApplication` with the specified data stream.

```
aws kinesis register-stream-consumer \  
  --stream-arn arn:aws:kinesis:us-west-2:012345678912:stream/samplestream \  
  --consumer-name KinesisConsumerApplication
```

Output:

```
{  
  "Consumer": {  
    "ConsumerName": "KinesisConsumerApplication",  
    "ConsumerARN": "arn:aws:kinesis:us-west-2:123456789012:stream/samplestream/  
consumer/KinesisConsumerApplication:1572383852",  
    "ConsumerStatus": "CREATING",  
    "ConsumerCreationTimestamp": 1572383852.0  
  }  
}
```

For more information, see [Developing Consumers with Enhanced Fan-Out Using the Kinesis Data Streams API](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [RegisterStreamConsumer](#) in *AWS CLI Command Reference*.

remove-tags-from-stream

The following code example shows how to use `remove-tags-from-stream`.

AWS CLI

To remove tags from a data stream

The following `remove-tags-from-stream` example removes the tag with the specified key from the specified data stream.

```
aws kinesis remove-tags-from-stream \  
  --stream-name samplestream \  
  --tag-keys samplekey
```

This command produces no output.

For more information, see [Tagging Your Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [RemoveTagsFromStream](#) in *AWS CLI Command Reference*.

split-shard

The following code example shows how to use `split-shard`.

AWS CLI

To split shards

The following `split-shard` example splits the specified shard into two new shards using a new starting hash key of 10.

```
aws kinesis split-shard \  
  --stream-name samplestream \  
  --shard-to-split shardId-000000000000 \  
  --new-starting-hash-key 10
```

This command produces no output.

For more information, see [Splitting a Shard](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [SplitShard](#) in *AWS CLI Command Reference*.

start-stream-encryption

The following code example shows how to use `start-stream-encryption`.

AWS CLI

To enable data stream encryption

The following `start-stream-encryption` example enables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis start-stream-encryption \  
  --encryption-type KMS \  
  --stream-name samplestream
```

```
--key-id arn:aws:kms:us-west-2:012345678912:key/a3c4a7cd-728b-45dd-  
b334-4d3eb496e452 \  
--stream-name samplestream
```

This command produces no output.

For more information, see [Data Protection in Amazon Kinesis Data Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [StartStreamEncryption](#) in *AWS CLI Command Reference*.

stop-stream-encryption

The following code example shows how to use stop-stream-encryption.

AWS CLI

To disable data stream encryption

The following stop-stream-encryption example disables server-side encryption for the specified stream, using the specified AWS KMS key.

```
aws kinesis start-stream-encryption \  
  --encryption-type KMS \  
  --key-id arn:aws:kms:us-west-2:012345678912:key/a3c4a7cd-728b-45dd-  
b334-4d3eb496e452 \  
  --stream-name samplestream
```

This command produces no output.

For more information, see [Data Protection in Amazon Kinesis Data Streams](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [StopStreamEncryption](#) in *AWS CLI Command Reference*.

update-shard-count

The following code example shows how to use update-shard-count.

AWS CLI

To update the shard count in a data stream

The following `update-shard-count` example updates the shard count of the specified data stream to 6. This example uses uniform scaling, which creates shards of equal size.

```
aws kinesis update-shard-count \  
  --stream-name samplestream \  
  --scaling-type UNIFORM_SCALING \  
  --target-shard-count 6
```

Output:

```
{  
  "StreamName": "samplestream",  
  "CurrentShardCount": 3,  
  "TargetShardCount": 6  
}
```

For more information, see [Resharding a Stream](#) in the *Amazon Kinesis Data Streams Developer Guide*.

- For API details, see [UpdateShardCount](#) in *AWS CLI Command Reference*.

AWS KMS examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS KMS.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

cancel-key-deletion

The following code example shows how to use `cancel-key-deletion`.

AWS CLI

To cancel the scheduled deletion of a customer managed KMS key

The following `cancel-key-deletion` example cancels the scheduled deletion of a customer managed KMS key.

```
aws kms cancel-key-deletion \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{  
  "KeyId": "arn:aws:kms:us-  
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab"  
}
```

When the `cancel-key-deletion` command succeeds, the scheduled deletion is canceled. However, the key state of the KMS key is `Disabled`, so you can't use the KMS key in cryptographic operations. To restore its functionality, use the `enable-key` command .

For more information, see [Scheduling and canceling key deletion](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [CancelKeyDeletion](#) in *AWS CLI Command Reference*.

connect-custom-key-store

The following code example shows how to use `connect-custom-key-store`.

AWS CLI

To connect a custom key store

The following `connect-custom-key-store` example reconnects the specified custom key store. You can use a command like this one to connect a custom key store for the first time or to reconnect a key store that was disconnected.

You can use this command to connect an AWS CloudHSM key store or an external key store.

```
aws kms connect-custom-key-store \  
  --custom-key-store-id cks-1234567890abcdef0
```

This command does not return any output. To verify that the command was effective, use the `describe-custom-key-stores` command.

For information about connecting an AWS CloudHSM key store, see [Connecting and disconnecting an AWS CloudHSM key store](#) in the *AWS Key Management Service Developer Guide*.

For information about connecting an external key store, see [Connecting and disconnecting an external key store](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ConnectCustomKeyStore](#) in *AWS CLI Command Reference*.

create-alias

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias for a KMS key

The following `create-alias` command creates an alias named `example-alias` for the KMS key identified by key ID `1234abcd-12ab-34cd-56ef-1234567890ab`.

Alias names must begin with `alias/`. Do not use alias names that begin with `alias/aws`; these are reserved for use by AWS.

```
aws kms create-alias \  
  --alias-name alias/example-alias \  
  --target-key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command doesn't return any output. To see the new alias, use the `list-aliases` command.

For more information, see [Using aliases](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [CreateAlias](#) in *AWS CLI Command Reference*.

create-custom-key-store

The following code example shows how to use `create-custom-key-store`.

AWS CLI

Example 1: To create an AWS CloudHSM key store

The following `create-custom-key-store` example creates an AWS CloudHSM key store backed by an AWS CloudHSM cluster using the required parameters. You can also add the `custom-key-store-type` parameter with the default value: `AWS_CLOUDHSM`.

To specify the file input for the `trust-anchor-certificate` command in the AWS CLI, the `file://` prefix is required.

```
aws kms create-custom-key-store \  
  --custom-key-store-name ExampleCloudHSMKeyStore \  
  --cloud-hsm-cluster-id cluster-1a23b4cdefg \  
  --key-store-password kmsPswd \  
  --trust-anchor-certificate file://customerCA.crt
```

Output:

```
{  
  "CustomKeyId": cks-1234567890abcdef0  
}
```

For more information, see [Creating an AWS CloudHSM key store](#) in the *AWS Key Management Service Developer Guide*.

Example 2: To create an external key store with public endpoint connectivity

The following `create-custom-key-store` example creates an external key store (XKS) that communicates with AWS KMS over the internet.

In this example, the `XksProxyUriPath` uses an optional prefix of `example-prefix`.

NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the `XksProxyUriEndpoint` parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \  
  --custom-key-store-name ExamplePublicEndpointXKS \  
  --custom-key-store-type EXTERNAL_KEY_STORE \  
  --xks-proxy-connectivity PUBLIC_ENDPOINT \  
  --xks-proxy-uri-endpoint "https://myproxy.xks.example.com" \  
  --xks-proxy-uri-path "/example-prefix/kms/xks/v1" \  
  --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,  
RawSecretAccessKey=DXjSUawne12fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

Output:

```
{  
  "CustomKeyId": cks-2234567890abcdef0  
}
```

For more information, see [Creating an external key store](#) in the *AWS Key Management Service Developer Guide*.

Example 3: To create an external key store with VPC endpoint service connectivity

The following `create-custom-key-store` example creates an external key store (XKS) that uses an Amazon VPC endpoint service to communicate with AWS KMS.

NOTE: If you use AWS CLI version 1.0, run the following command before specifying a parameter with an HTTP or HTTPS value, such as the `XksProxyUriEndpoint` parameter.

```
aws configure set cli_follow_urlparam false
```

Otherwise, AWS CLI version 1.0 replaces the parameter value with the content found at that URI address.

```
aws kms create-custom-key-store \  
  --custom-key-store-name ExamplePublicEndpointXKS \  
  --custom-key-store-type EXTERNAL_KEY_STORE \  
  --xks-proxy-connectivity VPC_ENDPOINT \  
  --xks-proxy-uri-endpoint "https://myproxy.xks.example.com" \  
  --xks-proxy-uri-path "/example-prefix/kms/xks/v1" \  
  --xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,  
RawSecretAccessKey=DXjSUawne12fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

```

--custom-key-store-name ExampleVPCEndpointXKS \
--custom-key-store-type EXTERNAL_KEY_STORE \
--xks-proxy-connectivity VPC_ENDPOINT_SERVICE \
--xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \
--xks-proxy-uri-path "/kms/xks/v1" \
--xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-east-1.vpce-svc-
example1" \
--xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,
RawSecretAccessKey=DXjSUawne12fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="

```

Output:

```

{
  "CustomKeyId": cks-3234567890abcdef0
}

```

For more information, see [Creating an external key store](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [CreateCustomKeyStore](#) in *AWS CLI Command Reference*.

create-grant

The following code example shows how to use `create-grant`.

AWS CLI

To create a grant

The following `create-grant` example creates a grant that allows the `exampleUser` user to use the `decrypt` command on the `1234abcd-12ab-34cd-56ef-1234567890ab` example KMS key. The retiring principal is the `adminRole` role. The grant uses the `EncryptionContextSubset` grant constraint to allow this permission only when the encryption context in the `decrypt` request includes the `"Department": "IT"` key-value pair.

```

aws kms create-grant \
--key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
--grantee-principal arn:aws:iam::123456789012:user/exampleUser \
--operations Decrypt \
--constraints EncryptionContextSubset={Department=IT} \
--retiring-principal arn:aws:iam::123456789012:role/adminRole

```

Output:

```
{
  "GrantId": "1a2b3c4d2f5e69f440bae30eaec9570bb1fb7358824f9ddfa1aa5a0dab1a59b2",
  "GrantToken": "<grant token here>"
}
```

To view detailed information about the grant, use the `list-grants` command.

For more information, see [Grants in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [CreateGrant](#) in *AWS CLI Command Reference*.

create-key

The following code example shows how to use `create-key`.

AWS CLI**Example 1: To create a customer managed KMS key in AWS KMS**

The following `create-key` example creates a symmetric encryption KMS key.

To create the basic KMS key, a symmetric encryption key, you do not need to specify any parameters. The default values for those parameters create a symmetric encryption key.

Because this command doesn't specify a key policy, the KMS key gets the [default key policy](#) for programmatically created KMS keys. To view the key policy, use the `get-key-policy` command. To change the key policy, use the `put-key-policy` command.

```
aws kms create-key
```

The `create-key` command returns the key metadata, including the key ID and ARN of the new KMS key. You can use these values to identify the KMS key in other AWS KMS operations. The output does not include the tags. To view the tags for a KMS key, use the `list-resource-tags` command.

Output:

```
{
  "KeyMetadata": {
```

```

    "AWSAccountId": "111122223333",
    "Arn": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "CreationDate": "2017-07-05T14:04:55-07:00",
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
    "Description": "",
    "Enabled": true,
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",
    "KeySpec": "SYMMETRIC_DEFAULT",
    "KeyState": "Enabled",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "MultiRegion": false,
    "Origin": "AWS_KMS"
    "EncryptionAlgorithms": [
      "SYMMETRIC_DEFAULT"
    ]
  }
}

```

Note: The `create-key` command does not let you specify an alias. To create an alias for the new KMS key, use the `create-alias` command.

For more information, see [Creating keys](#) in the *AWS Key Management Service Developer Guide*.

Example 2: To create an asymmetric RSA KMS key for encryption and decryption

The following `create-key` example creates a KMS key that contains an asymmetric RSA key pair for encryption and decryption.

```

aws kms create-key \
  --key-spec RSA_4096 \
  --key-usage ENCRYPT_DECRYPT

```

Output:

```

{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2021-04-05T14:04:55-07:00",
    "CustomerMasterKeySpec": "RSA_4096",

```

```

    "Description": "",
    "Enabled": true,
    "EncryptionAlgorithms": [
      "RSAES_OAEP_SHA_1",
      "RSAES_OAEP_SHA_256"
    ],
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",
    "KeySpec": "RSA_4096",
    "KeyState": "Enabled",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "MultiRegion": false,
    "Origin": "AWS_KMS"
  }
}

```

For more information, see [Asymmetric keys in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

Example 3: To create an asymmetric elliptic curve KMS key for signing and verification

To create an asymmetric KMS key that contains an asymmetric elliptic curve (ECC) key pair for signing and verification. The `--key-usage` parameter is required even though `SIGN_VERIFY` is the only valid value for ECC KMS keys.

```

aws kms create-key \
  --key-spec ECC_NIST_P521 \
  --key-usage SIGN_VERIFY

```

Output:

```

{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2019-12-02T07:48:55-07:00",
    "CustomerMasterKeySpec": "ECC_NIST_P521",
    "Description": "",
    "Enabled": true,
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",

```

```

    "KeySpec": "ECC_NIST_P521",
    "KeyState": "Enabled",
    "KeyUsage": "SIGN_VERIFY",
    "MultiRegion": false,
    "Origin": "AWS_KMS",
    "SigningAlgorithms": [
      "ECDSA_SHA_512"
    ]
  }
}

```

For more information, see [Asymmetric keys in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

Example 4: To create an HMAC KMS key

The following create-key example creates a 384-bit HMAC KMS key. The `GENERATE_VERIFY_MAC` value for the `--key-usage` parameter is required even though it's the only valid value for HMAC KMS keys.

```

aws kms create-key \
  --key-spec HMAC_384 \
  --key-usage GENERATE_VERIFY_MAC

```

Output:

```

{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2022-04-05T14:04:55-07:00",
    "CustomerMasterKeySpec": "HMAC_384",
    "Description": "",
    "Enabled": true,
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",

      "HMAC_SHA_384"
    ]
  }
}

```

```

    ],
    "MultiRegion": false,
    "Origin": "AWS_KMS"
  }
}

```

For more information, see [HMAC keys in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

Example 4: To create a multi-Region primary KMS key

The following `create-key` example creates a multi-Region primary symmetric encryption key. Because the default values for all parameters create a symmetric encryption key, only the `--multi-region` parameter is required for this KMS key. In the AWS CLI, to indicate that a Boolean parameter is true, just specify the parameter name.

```

aws kms create-key \
  --multi-region

```

Output:

```

{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-west-2:111122223333:key/mrk-1234abcd12ab34cd56ef12345678990ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2021-09-02T016:15:21-09:00",
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
    "Description": "",
    "Enabled": true,
    "EncryptionAlgorithms": [
      "SYMMETRIC_DEFAULT"
    ],

    "KeyUsage": "ENCRYPT_DECRYPT",
    "MultiRegion": true,
    "MultiRegionConfiguration": {
      "MultiRegionKeyType": "PRIMARY",
      "PrimaryKey": {

```

```

        "Arn": "arn:aws:kms:us-west-2:111122223333:key/
mrk-1234abcd12ab34cd56ef12345678990ab",
        "Region": "us-west-2"
    },
    "ReplicaKeys": []
},
"Origin": "AWS_KMS"
}
}

```

For more information, see [Asymmetric keys in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

Example 5: To create a KMS key for imported key material

The following `create-key` example creates a KMS key with no key material. When the operation is complete, you can import your own key material into the KMS key. To create this KMS key, set the `--origin` parameter to `EXTERNAL`.

```

aws kms create-key \
  --origin EXTERNAL

```

Output:

```

{
  "KeyMetadata": {
    "Arn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "AWSAccountId": "111122223333",
    "CreationDate": "2019-12-02T07:48:55-07:00",
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
    "Description": "",
    "Enabled": false,
    "EncryptionAlgorithms": [
      "SYMMETRIC_DEFAULT"
    ],
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "KeyManager": "CUSTOMER",
    "KeySpec": "SYMMETRIC_DEFAULT",
    "KeyState": "PendingImport",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "MultiRegion": false,
    "Origin": "EXTERNAL"
  }
}

```

```
}  
}
```

For more information, see [Importing key material in AWS KMS keys](#) in the *AWS Key Management Service Developer Guide*.

Example 6: To create a KMS key in an AWS CloudHSM key store

The following `create-key` example creates a KMS key in the specified AWS CloudHSM key store. The operation creates the KMS key and its metadata in AWS KMS and creates the key material in the AWS CloudHSM cluster associated with the custom key store. The `--custom-key-store-id` and `--origin` parameters are required.

```
aws kms create-key \  
  --origin AWS_CLOUDHSM \  
  --custom-key-store-id cks-1234567890abcdef0
```

Output:

```
{  
  "KeyMetadata": {  
    "Arn": "arn:aws:kms:us-  
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",  
    "AWSAccountId": "111122223333",  
    "CloudHsmClusterId": "cluster-1a23b4cdefg",  
    "CreationDate": "2019-12-02T07:48:55-07:00",  
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",  
    "CustomKeyId": "cks-1234567890abcdef0",  
    "Description": "",  
    "Enabled": true,  
    "EncryptionAlgorithms": [  
      "SYMMETRIC_DEFAULT"  
    ],  
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",  
    "KeyManager": "CUSTOMER",  
    "KeySpec": "SYMMETRIC_DEFAULT",  
    "KeyState": "Enabled",  
    "KeyUsage": "ENCRYPT_DECRYPT",  
    "MultiRegion": false,  
    "Origin": "AWS_CLOUDHSM"  
  }  
}
```

For more information, see [AWS CloudHSM key stores](#) in the *AWS Key Management Service Developer Guide*.

Example 7: To create a KMS key in an external key store

The following `create-key` example creates a KMS key in the specified external key store. The `--custom-key-store-id`, `--origin`, and `--xks-key-id` parameters are required in this command.

The `--xks-key-id` parameter specifies the ID of an existing symmetric encryption key in your external key manager. This key serves as the external key material for the KMS key. The value of the `--origin` parameter must be `EXTERNAL_KEY_STORE`. The `custom-key-store-id` parameter must identify an external key store that is connected to its external key store proxy.

```
aws kms create-key \  
  --origin EXTERNAL_KEY_STORE \  
  --custom-key-store-id cks-9876543210fedcba9 \  
  --xks-key-id bb8562717f809024
```

Output:

```
{  
  "KeyMetadata": {  
    "Arn": "arn:aws:kms:us-  
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",  
    "AWSAccountId": "111122223333",  
    "CreationDate": "2022-12-02T07:48:55-07:00",  
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",  
    "CustomKeyId": "cks-9876543210fedcba9",  
    "Description": "",  
    "Enabled": true,  
    "EncryptionAlgorithms": [  
      "SYMMETRIC_DEFAULT"  
    ],  
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",  
    "KeyManager": "CUSTOMER",  
    "KeySpec": "SYMMETRIC_DEFAULT",  
    "KeyState": "Enabled",  
    "KeyUsage": "ENCRYPT_DECRYPT",  
    "MultiRegion": false,  
    "Origin": "EXTERNAL_KEY_STORE",  
    "XksKeyConfiguration": {
```

```
        "Id": "bb8562717f809024"  
      }  
    }  
  }
```

For more information, see [External key stores](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [CreateKey](#) in *AWS CLI Command Reference*.

decrypt

The following code example shows how to use `decrypt`.

AWS CLI

Example 1: To decrypt an encrypted message with a symmetric KMS key (Linux and macOS)

The following `decrypt` command example demonstrates the recommended way to decrypt data with the AWS CLI. This version shows how to decrypt data under a symmetric KMS key.

Provide the ciphertext in a file. In the value of the `--ciphertext-blob` parameter, use the `fileb://` prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see [Loading AWS CLI parameters from a file <https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html>](https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html) in the *AWS Command Line Interface User Guide* and [Best Practices for Local File Parameters<https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/>](https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/) in the *AWS Command Line Tool Blog*. Specify the KMS key to decrypt the ciphertext. The `--key-id` parameter is not required when decrypting with a symmetric KMS key. AWS KMS can get the key ID of the KMS key that was used to encrypt the data from the metadata in the ciphertext. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust. Request the plaintext output as a text value. The `--query` parameter tells the CLI to get only the value of the `Plaintext` field from the output. The `--output` parameter returns the output as text. Base64-decode the plaintext and save it in a file. The following example pipes (`|`) the value of the `Plaintext` parameter to the `Base64` utility, which decodes it. Then, it redirects (`>`) the decoded output to the `ExamplePlaintext` file.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \  
  --ciphertext-blob fileb://ExampleEncryptedFile \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --output text \  
  --query Plaintext | base64 \  
  --decode > ExamplePlaintextFile
```

This command produces no output. The output from the decrypt command is base64-decoded and saved in a file.

For more information, see [Decrypt](#) in the *AWS Key Management Service API Reference*.

Example 2: To decrypt an encrypted message with a symmetric KMS key (Windows command prompt)

The following example is the same as the previous one except that it uses the `certutil` utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt ^  
  --ciphertext-blob fileb://ExampleEncryptedFile ^  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab ^  
  --output text ^  
  --query Plaintext > ExamplePlaintextFile.base64
```

Run the `certutil` command.

```
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```

Output:

```
Input Length = 18  
Output Length = 12  
CertUtil: -decode command completed successfully.
```

For more information, see [Decrypt](#) in the *AWS Key Management Service API Reference*.

Example 3: To decrypt an encrypted message with an asymmetric KMS key (Linux and macOS)

The following decrypt command example shows how to decrypt data encrypted under an RSA asymmetric KMS key.

When using an asymmetric KMS key, the `encryption-algorithm` parameter, which specifies the algorithm used to encrypt the plaintext, is required.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms decrypt \  
  --ciphertext-blob fileb://ExampleEncryptedFile \  
  --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \  
  --encryption-algorithm RSAES_OAEP_SHA_256 \  
  --output text \  
  --query Plaintext | base64 \  
  --decode > ExamplePlaintextFile
```

This command produces no output. The output from the decrypt command is base64-decoded and saved in a file.

For more information, see [Asymmetric keys in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [Decrypt](#) in *AWS CLI Command Reference*.

delete-alias

The following code example shows how to use `delete-alias`.

AWS CLI

To delete an AWS KMS alias

The following `delete-alias` example deletes the alias `alias/example-alias`. The alias name must begin with `alias/`.

```
aws kms delete-alias \  
  --alias-name alias/example-alias
```

```
--alias-name alias/example-alias
```

This command produces no output. To find the alias, use the `list-aliases` command.

For more information, see [Deleting an alias](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [DeleteAlias](#) in *AWS CLI Command Reference*.

delete-custom-key-store

The following code example shows how to use `delete-custom-key-store`.

AWS CLI

To delete a custom key store

The following `delete-custom-key-store` example deletes the specified custom key store.

Deleting an AWS CloudHSM key store has no effect on the associated CloudHSM cluster.

Deleting an external key store has no effect on the associated external key store proxy, external key manager, or external keys.

NOTE: Before you can delete a custom key store, you must schedule the deletion of all KMS keys in the custom key store and then wait for those KMS keys to be deleted. Then, you must disconnect the custom key store. For help finding the KMS keys in your custom key store, see [Delete an AWS CloudHSM key store \(API\)](#) in the *AWS Key Management Service Developer Guide*.

```
delete-custom-key-store \  
  --custom-key-store-id cks-1234567890abcdef0
```

This command does not return any output. To verify that the custom key store is deleted, use the `describe-custom-key-stores` command.

For information about deleting an AWS CloudHSM key stores, see [Deleting an AWS CloudHSM key store](#) in the *AWS Key Management Service Developer Guide*.

For information about deleting external key stores, see [Deleting an external key store](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [DeleteCustomKeyStore](#) in *AWS CLI Command Reference*.

delete-imported-key-material

The following code example shows how to use `delete-imported-key-material`.

AWS CLI

To delete imported key material from a KMS key

The following `delete-imported-key-material` example deletes key material that had been imported into a KMS key.

```
aws kms delete-imported-key-material \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that the key material is deleted, use the `describe-key` command to look for a key state of `PendingImport` or `PendingDeletion`.

For more information, see [Deleting imported key material](https://docs.aws.amazon.com/kms/latest/developerguide/importing-keys-delete-key-material.html) in the *AWS Key Management Service Developer Guide*.

- For API details, see [DeleteImportedKeyMaterial](#) in *AWS CLI Command Reference*.

describe-custom-key-stores

The following code example shows how to use `describe-custom-key-stores`.

AWS CLI

Example 1: To get details about an AWS CloudHSM key store

The following `describe-custom-key-store` example displays details about the specified AWS CloudHSM key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \  
  --custom-key-store-name ExampleCloudHSMKeyStore
```

The output of this command includes useful details about the AWS CloudHSM key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
  "CustomKeyStores": [
    {
      "CloudHsmClusterId": "cluster-1a23b4cdefg",
      "ConnectionState": "CONNECTED",
      "CreationDate": "2022-04-05T14:04:55-07:00",
      "CustomKeyStoreId": "cks-1234567890abcdef0",
      "CustomKeyStoreName": "ExampleExternalKeyStore",
      "TrustAnchorCertificate": "<certificate appears here>"
    }
  ]
}
```

For more information, see [Viewing an AWS CloudHSM key store](#) in the *AWS Key Management Service Developer Guide*.

Example 2: To get details about an external key store with public endpoint connectivity

The following `describe-custom-key-store` example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
  --custom-key-store-id cks-9876543210fedcba9
```

The output of this command includes useful details about the external key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
  "CustomKeyStores": [
    {
      "CustomKeyId": "cks-9876543210fedcba9",
      "CustomKeyName": "ExampleXKS",
      "ConnectionState": "CONNECTED",
      "CreationDate": "2022-12-02T07:48:55-07:00",
      "CustomKeyType": "EXTERNAL_KEY_STORE",
      "XksProxyConfiguration": {
        "AccessKeyId": "ABCDE12345670EXAMPLE",
        "Connectivity": "PUBLIC_ENDPOINT",
        "UriEndpoint": "https://myproxy.xks.example.com",
        "UriPath": "/example-prefix/kms/xks/v1"
      }
    }
  ]
}
```

For more information, see [Viewing an external key store](#) in the *AWS Key Management Service Developer Guide*.

Example 3: To get details about an external key store with VPC endpoint service connectivity

The following `describe-custom-key-store` example displays details about the specified external key store. The command is the same for all types of custom key stores, but the output differs with the key store type and, for an external key store, its connectivity option.

By default, this command displays information about all custom key stores in the account and Region. To display information about a particular custom key store, use the `custom-key-store-name` or `custom-key-store-id` parameter.

```
aws kms describe-custom-key-stores \
  --custom-key-store-id cks-2234567890abcdef0
```

The output of this command includes useful details about the external key store including its connection state (`ConnectionState`). If the connection state is `FAILED`, the output includes a `ConnectionErrorCode` field that describes the problem.

Output:

```
{
  "CustomKeyStores": [
    {
      "CustomKeyId": "cks-3234567890abcdef0",
      "CustomKeyName": "ExampleVPCEExternalKeyStore",
      "ConnectionState": "CONNECTED",
      "CreationDate": "2022-12-22T07:48:55-07:00",
      "CustomKeyType": "EXTERNAL_KEY_STORE",
      "XksProxyConfiguration": {
        "AccessKeyId": "ABCDE12345670EXAMPLE",
        "Connectivity": "VPC_ENDPOINT_SERVICE",
        "UriEndpoint": "https://myproxy-private.xks.example.com",
        "UriPath": "/kms/xks/v1",
        "VpcEndpointServiceName": "com.amazonaws.vpce.us-east-1.vpce-svc-
example1"
      }
    }
  ]
}
```

For more information, see [Viewing an external key store](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [DescribeCustomKeyStores](#) in *AWS CLI Command Reference*.

describe-key

The following code example shows how to use `describe-key`.

AWS CLI

Example 1: To find detailed information about a KMS key

The following `describe-key` example gets detailed information about the AWS managed key for Amazon S3 in the example account and Region. You can use this command to find details about AWS managed keys and customer managed keys.

To specify the KMS key, use the `key-id` parameter. This example uses an alias name value, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```
aws kms describe-key \
  --key-id alias/aws/s3
```

Output:

```
{
  "KeyMetadata": {
    "AWSAccountId": "846764612917",
    "KeyId": "b8a9477d-836c-491f-857e-07937918959b",
    "Arn": "arn:aws:kms:us-west-2:846764612917:key/
b8a9477d-836c-491f-857e-07937918959b",
    "CreationDate": 2017-06-30T21:44:32.140000+00:00,
    "Enabled": true,
    "Description": "Default KMS key that protects my S3 objects when no other
key is defined",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "KeyState": "Enabled",
    "Origin": "AWS_KMS",
    "KeyManager": "AWS",
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
    "EncryptionAlgorithms": [
      "SYMMETRIC_DEFAULT"
    ]
  }
}
```

For more information, see [Viewing keys](#) in the *AWS Key Management Service Developer Guide*.

Example 2: To get details about an RSA asymmetric KMS key

The following describe-key example gets detailed information about an asymmetric RSA KMS key used for signing and verification.

```
aws kms describe-key \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
  "KeyMetadata": {
    "AWSAccountId": "111122223333",
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "Arn": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "CreationDate": "2019-12-02T19:47:14.861000+00:00",
    "CustomerMasterKeySpec": "RSA_2048",
```

```

    "Enabled": false,
    "Description": "",
    "KeyState": "Disabled",
    "Origin": "AWS_KMS",
    "MultiRegion": false,
    "KeyManager": "CUSTOMER",
    "KeySpec": "RSA_2048",
    "KeyUsage": "SIGN_VERIFY",
    "SigningAlgorithms": [
      "RSASSA_PKCS1_V1_5_SHA_256",
      "RSASSA_PKCS1_V1_5_SHA_384",
      "RSASSA_PKCS1_V1_5_SHA_512",
      "RSASSA_PSS_SHA_256",
      "RSASSA_PSS_SHA_384",
      "RSASSA_PSS_SHA_512"
    ]
  }
}

```

Example 3: To get details about a multi-Region replica key

The following describe-key example gets metadata for a multi-Region replica key. This multi-Region key is a symmetric encryption key. The output of a describe-key command for any multi-Region key returns information about the primary key and all of its replicas.

```

aws kms describe-key \
  --key-id arn:aws:kms:ap-northeast-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab

```

Output:

```

{
  "KeyMetadata": {
    "MultiRegion": true,
    "AWSAccountId": "111122223333",
    "Arn": "arn:aws:kms:ap-northeast-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
    "CreationDate": "2021-06-28T21:09:16.114000+00:00",
    "Description": "",
    "Enabled": true,
    "KeyId": "mrk-1234abcd12ab34cd56ef1234567890ab",
    "KeyManager": "CUSTOMER",

```

```

    "KeyState": "Enabled",
    "KeyUsage": "ENCRYPT_DECRYPT",
    "Origin": "AWS_KMS",
    "CustomerMasterKeySpec": "SYMMETRIC_DEFAULT",
    "EncryptionAlgorithms": [
      "SYMMETRIC_DEFAULT"
    ],
    "MultiRegionConfiguration": {
      "MultiRegionKeyType": "PRIMARY",
      "PrimaryKey": {
        "Arn": "arn:aws:kms:us-west-2:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
        "Region": "us-west-2"
      },
      "ReplicaKeys": [
        {
          "Arn": "arn:aws:kms:eu-west-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
          "Region": "eu-west-1"
        },
        {
          "Arn": "arn:aws:kms:ap-northeast-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
          "Region": "ap-northeast-1"
        },
        {
          "Arn": "arn:aws:kms:sa-east-1:111122223333:key/
mrk-1234abcd12ab34cd56ef1234567890ab",
          "Region": "sa-east-1"
        }
      ]
    }
  }
}

```

Example 4: To get details about an HMAC KMS key

The following `describe-key` example gets detailed information about an HMAC KMS key.

```

aws kms describe-key \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab

```

Output:

```
{
  "KeyMetadata": {
    "AWSAccountId": "123456789012",
    "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "Arn": "arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "CreationDate": "2022-04-03T22:23:10.194000+00:00",
    "Enabled": true,
    "Description": "Test key",
    "KeyUsage": "GENERATE_VERIFY_MAC",
    "KeyState": "Enabled",
    "Origin": "AWS_KMS",
    "KeyManager": "CUSTOMER",
    "CustomerMasterKeySpec": "HMAC_256",
    "MacAlgorithms": [
      "HMAC_SHA_256"
    ],
    "MultiRegion": false
  }
}
```

- For API details, see [DescribeKey](#) in *AWS CLI Command Reference*.

disable-key-rotation

The following code example shows how to use `disable-key-rotation`.

AWS CLI

To disable automatic rotation of a KMS key

The following `disable-key-rotation` example disables automatic rotation of a customer managed KMS key. To reenable automatic rotation, use the `enable-key-rotation` command.

```
aws kms disable-key-rotation \
  --key-id arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that automatic rotation is disabled for the KMS key, use the `get-key-rotation-status` command.

For more information, see [Rotating keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [DisableKeyRotation](#) in *AWS CLI Command Reference*.

disable-key

The following code example shows how to use `disable-key`.

AWS CLI

To temporarily disable a KMS key

The following example uses the `disable-key` command to disable a customer managed KMS key. To re-enable the KMS key, use the `enable-key` command.

```
aws kms disable-key \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output.

For more information, see [Enabling and Disabling Keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [DisableKey](#) in *AWS CLI Command Reference*.

disconnect-custom-key-store

The following code example shows how to use `disconnect-custom-key-store`.

AWS CLI

To disconnect a custom key store

The following `disconnect-custom-key-store` example disconnects a custom key store from its AWS CloudHSM cluster. You might disconnect a key store to troubleshoot a problem, to update its settings, or to prevent KMS keys in the keystore from being used in cryptographic operations.

This command is the same for all custom key stores, including AWS CloudHSM key stores and external key stores.

Before running this command, replace the example custom key store ID with a valid one.

```
$ aws kms disconnect-custom-key-store \  
  --custom-key-store-id cks-1234567890abcdef0
```

This command produces no output. verify that the command was effective, use the `describe-custom-key-stores` command.

For more information about disconnecting an AWS CloudHSM key store, see [Connecting and disconnecting an AWS CloudHSM key store](#) in the *AWS Key Management Service Developer Guide*.

For more information about disconnecting an external key store, see [Connecting and disconnecting an external key store](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [DisconnectCustomKeyStore](#) in *AWS CLI Command Reference*.

enable-key-rotation

The following code example shows how to use `enable-key-rotation`.

AWS CLI

To enable automatic rotation of a KMS key

The following `enable-key-rotation` example enables automatic rotation of a customer managed KMS key with a rotation period of 180 days. The KMS key will be rotated one year (approximate 365 days) from the date that this command completes and every year thereafter.

The `--key-id` parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key. The `--rotation-period-in-days` parameter specifies the number of days between each rotation date. Specify a value between 90 and 2560 days. If no value is specified, the default value is 365 days.

```
aws kms enable-key-rotation \  
  --key-id arn:aws:kms:us-  
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab \  
  --rotation-period-in-days 180
```

This command produces no output. To verify that the KMS key is enabled, use the `get-key-rotation-status` command.

For more information, see [Rotating keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [EnableKeyRotation](#) in *AWS CLI Command Reference*.

enable-key

The following code example shows how to use `enable-key`.

AWS CLI

To enable a KMS key

The following `enable-key` example enables a customer managed key. You can use a command like this one to enable a KMS key that you temporarily disabled by using the `disable-key` command. You can also use it to enable a KMS key that is disabled because it was scheduled for deletion and the deletion was canceled.

To specify the KMS key, use the `key-id` parameter. This example uses an key ID value, but you can use a key ID or key ARN value in this command.

Before running this command, replace the example key ID with a valid one.

```
aws kms enable-key \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To verify that the KMS key is enabled, use the `describe-key` command. See the values of the `KeyState` and `Enabled` fields in the `describe-key` output.

For more information, see [Enabling and Disabling Keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [EnableKey](#) in *AWS CLI Command Reference*.

encrypt

The following code example shows how to use `encrypt`.

AWS CLI

Example 1: To encrypt the contents of a file on Linux or MacOS

The following `encrypt` command demonstrates the recommended way to encrypt data with the AWS CLI.

```
aws kms encrypt \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --plaintext fileb://ExamplePlaintextFile \  
  --output text \  
  --query CiphertextBlob | base64 \  
  --decode > ExampleEncryptedFile
```

The command does several things:

Uses the `--plaintext` parameter to indicate the data to encrypt. This parameter value must be base64-encoded. The value of the `plaintext` parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file. If the file is not in the current directory, type the full path to file. For example: `fileb:///var/tmp/ExamplePlaintextFile` or `fileb://C:\Temp\ExamplePlaintextFile`. For more information about reading AWS CLI parameter values from a file, see [Loading Parameters from a File](#) in the *AWS Command Line Interface User Guide* and [Best Practices for Local File Parameters](#) on the AWS Command Line Tool Blog. Uses the `--output` and `--query` parameters to control the command's output. These parameters extract the encrypted data, called the *ciphertext*, from the command's output. For more information about controlling output, see [Controlling Command Output](#) in the *AWS Command Line Interface User Guide*. Uses the `base64` utility to decode the extracted output into binary data. The ciphertext that is returned by a successful `encrypt` command is base64-encoded text. You must decode this text before you can use the AWS CLI to decrypt it. Saves the binary ciphertext to a file. The final part of the command (`> ExampleEncryptedFile`) saves the binary ciphertext to a file to make decryption easier. For an example command that uses the AWS CLI to decrypt data, see the [decrypt examples](#).

Example 2: Using the AWS CLI to encrypt data on Windows

This example is the same as the previous one, except that it uses the `certutil` tool instead of `base64`. This procedure requires two commands, as shown in the following example.

```
aws kms encrypt \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --plaintext fileb://ExamplePlaintextFile \  
  --output text \  
  --query CiphertextBlob > C:\Temp\ExampleEncryptedFile.base64
```

```
certutil -decode C:\Temp\ExampleEncryptedFile.base64 C:\Temp\ExampleEncryptedFile
```

Example 3: Encrypting with an asymmetric KMS key

The following `encrypt` command shows how to encrypt plaintext with an asymmetric KMS key. The `--encryption-algorithm` parameter is required. As in all `encrypt` CLI commands, the `plaintext` parameter must be base64-encoded, or you must use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

```
aws kms encrypt \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --encryption-algorithm RSAES_OAEP_SHA_256 \  
  --plaintext fileb://ExamplePlaintextFile \  
  --output text \  
  --query CiphertextBlob | base64 \  
  --decode > ExampleEncryptedFile
```

This command produces no output.

- For API details, see [Encrypt](#) in *AWS CLI Command Reference*.

generate-data-key-pair-without-plaintext

The following code example shows how to use `generate-data-key-pair-without-plaintext`.

AWS CLI

To generate an ECC NIST P384 asymmetric data key pair

The following `generate-data-key-pair-without-plaintext` example requests an ECC NIST P384 key pair for use outside of AWS.

The command returns a plaintext public key and a copy of the private key encrypted under the specified KMS key. It does not return a plaintext private key. You can safely store the encrypted private key with the encrypted data, and call AWS KMS to decrypt the private key when you need to use it.

To request an ECC NIST P384 asymmetric data key pair, use the `key-pair-spec` parameter with a value of `ECC_NIST_P384`.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a `KeySpec` value of `SYMMETRIC_DEFAULT`.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair-without-plaintext \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --key-pair-spec ECC_NIST_P384
```

Output:

```
{  
  "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdK12aJTzkK6Fbh0tQkM1QJJH3PdtHvS/y  
+hAFFxmiD134doUDzMGmfCEtcAAAHaTCCB2UGCSqGSIb3DQEHbqCCB1...",  
  "PublicKey":  
  "MIIBojANBgkqhkiG9w0BAQEFAAOCAY8AMIIBigKCAYEA3A3eGMyPrvSn7+Ld1JE1oUoQV5HpEuHAVbd0yND  
+NmYDH/mL10SIEuLrcdZ5hrMH4pk83r401...",  
  "KeyId": "arn:aws:kms:us-  
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",  
  "KeySpec": "ECC_NIST_P384"  
}
```

The `PublicKey` and `PrivateKeyCiphertextBlob` are returned in base64-encoded format.

For more information, see [Data key pairs](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [GenerateDataKeyPairWithoutPlaintext](#) in *AWS CLI Command Reference*.

generate-data-key-pair

The following code example shows how to use `generate-data-key-pair`.

AWS CLI

To generate an 2048-bit RSA asymmetric data key pair

The following `generate-data-key-pair` example requests a 2048-bit RSA asymmetric data key pair for use outside of AWS. The command returns a plaintext public key and a plaintext private key for immediate use and deletion, and a copy of the private key encrypted under the specified KMS key. You can safely store the encrypted private key with the encrypted data.

To request a 2048-bit RSA asymmetric data key pair, use the `key-pair-spec` parameter with a value of `RSA_2048`.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a `KeySpec` value of `SYMMETRIC_DEFAULT`.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key-pair \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --key-pair-spec RSA_2048
```

Output:

```
{  
  "PrivateKeyCiphertextBlob": "AQIDAHi6LtupRpdK12aJTzkK6Fbh0tQkM1QJJH3PdtHvS/y  
+hAFFxmiD134doUDzMGmfCEtcAAAHaTCCB2UGCSqGSIB3DQEHBqCCB1...",  
  "PrivateKeyPlaintext": "MIIG/  
QIBADANBgkqhkiG9w0BAQEFAASCBUcwggbjAgEAAoIBgQDcDd4YzI  
+u9Kfv4t2UkTWhShBXkekS4cBVt07I0P42ZgMf+YvU5IgS4ut...",  
  "PublicKey":  
  "MIIB0jANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBigKCAYEA3A3eGMyPrvSn7+Ld1JE1oUoQV5HpEuHAVbd0yND  
+NmYDH/mL10SIEuLrcdZ5hrMH4pk83r40l...",  
  "KeyId": "arn:aws:kms:us-  
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",  
  "KeySpec": "RSA_2048"  
}
```

The `PublicKey`, `PrivateKeyPlaintext`, and `PrivateKeyCiphertextBlob` are returned in base64-encoded format.

For more information, see [Data key pairs](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [GenerateDataKeyPair](#) in *AWS CLI Command Reference*.

generate-data-key-without-plaintext

The following code example shows how to use `generate-data-key-without-plaintext`.

AWS CLI

To generate a 256-bit symmetric data key without a plaintext key

The following `generate-data-key-without-plaintext` example requests an encrypted copy of a 256-bit symmetric data key for use outside of AWS. You can call AWS KMS to decrypt the data key when you are ready to use it.

To request a 256-bit data key, use the `key-spec` parameter with a value of `AES_256`. To request a 128-bit data key, use the `key-spec` parameter with a value of `AES_128`. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a `key-spec` value of `SYMMETRIC_DEFAULT`.

```
aws kms generate-data-key-without-plaintext \
  --key-id "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab" \
  --key-spec AES_256
```

Output:

```
{
  "CiphertextBlob":
  "AQEDAHjRYf5WytIc0C857tFSnBaPn2F8DgfmThbJlGfR8P3WlwAAAH4wfAYJKoZIHvcNAQcGoG8wbQIBADBoBgkqhki
  "KeyId": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
}
```

The `CiphertextBlob` (encrypted data key) is returned in base64-encoded format.

For more information, see [Data keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [GenerateDataKeyWithoutPlaintext](#) in *AWS CLI Command Reference*.

generate-data-key

The following code example shows how to use `generate-data-key`.

AWS CLI

Example 1: To generate a 256-bit symmetric data key

The following `generate-data-key` example requests a 256-bit symmetric data key for use outside of AWS. The command returns a plaintext data key for immediate use and deletion,

and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a 256-bit data key, use the `key-spec` parameter with a value of `AES_256`. To request a 128-bit data key, use the `key-spec` parameter with a value of `AES_128`. For all other data key lengths, use the `number-of-bytes` parameter.

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a `key-spec` value of `SYMMETRIC_DEFAULT`.

```
aws kms generate-data-key \  
  --key-id alias/ExampleAlias \  
  --key-spec AES_256
```

Output:

```
{  
  "Plaintext": "VdzKNHGzUAzJeRBVY+uUmofUGGiDzyB3+i9fVkh3piw=",  
  "KeyId": "arn:aws:kms:us-  
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",  
  "CiphertextBlob":  
  "AQEDAHjRYf5WytIc0C857tFSnBaPn2F8DgfmThbJlGfR8P3WlwAAAH4wfAYJKoZIHvcNAQcGoG8wbQIBADBoBgkqhki  
+YdhV8M1rkBQPeac0ReRVNDt9q1eAt+SHgIRF8P0H+7U="  
}
```

The `Plaintext` (plaintext data key) and the `CiphertextBlob` (encrypted data key) are returned in base64-encoded format.

For more information, see [Data keys](https://docs.aws.amazon.com/kms/latest/developerguide/concepts.html#data-keys) <<https://docs.aws.amazon.com/kms/latest/developerguide/concepts.html#data-keys>> in the *AWS Key Management Service Developer Guide*.

Example 2: To generate a 512-bit symmetric data key

The following `generate-data-key` example requests a 512-bit symmetric data key for encryption and decryption. The command returns a plaintext data key for immediate use and deletion, and a copy of that data key encrypted under the specified KMS key. You can safely store the encrypted data key with the encrypted data.

To request a key length other than 128 or 256 bits, use the `number-of-bytes` parameter. To request a 512-bit data key, the following example uses the `number-of-bytes` parameter with a value of 64 (bytes).

The KMS key you specify must be a symmetric encryption KMS key, that is, a KMS key with a key spec value of `SYMMETRIC_DEFAULT`.

NOTE: The values in the output of this example are truncated for display.

```
aws kms generate-data-key \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --number-of-bytes 64
```

Output:

```
{  
  "CiphertextBlob": "AQIBAHi6LtupRpdK12aJTzkK6Fbh0tQkM1QJJH3PdtHvS/y+hAEnX/  
QQNmMwDfg2koιNMEc8AAACaDCCAmQGCSqGSiB3DQEHBqCCA1UwggJRAgEAMIICSgYJKoZ...",  
  "Plaintext": "ty8Lr0Bk60F07M2Bwt6qbFdNB  
+G00ZLtf5MSEb4a13R2UKWG0p06njAwy2n72VRm2m7z/  
Pm9Wpbvttz6a4lSo9hgPvKhZ5y6RTm40ovEXiVfBveyX3DQxDzRSwbKDPk/...",  
  "KeyId": "arn:aws:kms:us-  
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"  
}
```

The `Plaintext` (plaintext data key) and `CiphertextBlob` (encrypted data key) are returned in base64-encoded format.

For more information, see [Data keys <https://docs.aws.amazon.com/kms/latest/developerguide/concepts.html#data-keys>](https://docs.aws.amazon.com/kms/latest/developerguide/concepts.html#data-keys) in the *AWS Key Management Service Developer Guide*.

- For API details, see [GenerateDataKey](#) in *AWS CLI Command Reference*.

generate-random

The following code example shows how to use `generate-random`.

AWS CLI

Example 1: To generate a 256-bit random byte string (Linux or macOS)

The following `generate-random` example generates a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the `random` file.

When you run this command, you must use the `number-of-bytes` parameter to specify the length of the random value in bytes.

You don't specify a KMS key when you run this command. The random byte string is unrelated to any KMS key.

By default, AWS KMS generates the random number. However, if you specify a custom key store<<https://docs.aws.amazon.com/kms/latest/developerguide/custom-key-store-overview.html>>, the random byte string is generated in the AWS CloudHSM cluster associated with the custom key store.

This example uses the following parameters and values:

It uses the required `--number-of-bytes` parameter with a value of 32 to request a 32-byte (256-bit) string. It uses the `--output` parameter with a value of `text` to direct the AWS CLI to return the output as text, instead of JSON. It uses the `--query` parameter to extract the value of the `Plaintext` property from the response. It pipes (`|`) the output of the command to the `base64` utility, which decodes the extracted output. It uses the redirection operator (`>`) to save decoded byte string to the `ExampleRandom` file. It uses the redirection operator (`>`) to save the binary ciphertext to a file.

```
aws kms generate-random \  
  --number-of-bytes 32 \  
  --output text \  
  --query Plaintext | base64 --decode > ExampleRandom
```

This command produces no output.

For more information, see [GenerateRandom](#) in the *AWS Key Management Service API Reference*.

Example 2: To generate a 256-bit random number (Windows Command Prompt)

The following example uses the `generate-random` command to generate a 256-bit (32-byte), base64-encoded random byte string. The example decodes the byte string and saves it in the `random` file. This example is the same as the previous example, except that it uses the `certutil` utility in Windows to base64-decode the random byte string before saving it in a file.

First, generate a base64-encoded random byte string and saves it in a temporary file, `ExampleRandom.base64`.

```
aws kms generate-random \  
  --number-of-bytes 32 \  
  --output text \  
  --query Plaintext > ExampleRandom.base64
```

Because the output of the `generate-random` command is saved in a file, this example produces no output.

Now use the `certutil -decode` command to decode the base64-encoded byte string in the `ExampleRandom.base64` file. Then, it saves the decoded byte string in the `ExampleRandom` file.

```
certutil -decode ExampleRandom.base64 ExampleRandom
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see [GenerateRandom](#) in the *AWS Key Management Service API Reference*.

- For API details, see [GenerateRandom](#) in *AWS CLI Command Reference*.

get-key-policy

The following code example shows how to use `get-key-policy`.

AWS CLI

To copy a key policy from one KMS key to another KMS key

The following `get-key-policy` example gets the key policy from one KMS key and saves it in a text file. Then, it replaces the policy of a different KMS key using the text file as the policy input.

Because the `--policy` parameter of `put-key-policy` requires a string, you must use the `--output text` option to return the output as a text string instead of JSON.

```
aws kms get-key-policy \
  --policy-name default \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --query Policy \
  --output text > policy.txt

aws kms put-key-policy \
  --policy-name default \
```

```
--key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \  
--policy file://policy.txt
```

This command produces no output.

For more information, see [PutKeyPolicy](#) in the *AWS KMS API Reference*.

- For API details, see [GetKeyPolicy](#) in *AWS CLI Command Reference*.

get-key-rotation-status

The following code example shows how to use `get-key-rotation-status`.

AWS CLI

To retrieve the rotation status for a KMS key.

The following `get-key-rotation-status` example returns information about the rotation status of the specified KMS key, including whether automatic rotation is enabled, the rotation period, and the next scheduled rotation date. You can use this command on customer managed KMS keys and AWS managed KMS keys. However, all AWS managed KMS keys are automatically rotated every year.

```
aws kms get-key-rotation-status \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{  
  "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",  
  "KeyRotationEnabled": true,  
  "NextRotationDate": "2024-02-14T18:14:33.587000+00:00",  
  "RotationPeriodInDays": 365  
}
```

For more information, see [Rotating keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [GetKeyRotationStatus](#) in *AWS CLI Command Reference*.

get-parameters-for-import

The following code example shows how to use `get-parameters-for-import`.

AWS CLI

To get the items required to import key material into a KMS key

The following `get-parameters-for-import` example gets the public key and import token that you need to import key material into a KMS key. When you use the `import-key-material` command, be sure to use the import token and key material encrypted by the public key that were returned in the same `get-parameters-for-import` command. Also, the wrapping algorithm that you specify in this command must be one that you use to encrypt the key material with the public key.

To specify the KMS key, use the `key-id` parameter. This example uses an key ID, but you can use a key ID or key ARN in this command.

```
aws kms get-parameters-for-import \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --wrapping-algorithm RSAES_OAEP_SHA_256 \
  --wrapping-key-spec RSA_2048
```

Output:

```
{
  "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
  "PublicKey": "<public key base64 encoded data>",
  "ImportToken": "<import token base64 encoded data>",
  "ParametersValidTo": 1593893322.32
}
```

For more information, see [Download the public key and import token](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [GetParametersForImport](#) in *AWS CLI Command Reference*.

get-public-key

The following code example shows how to use `get-public-key`.

AWS CLI

Example 1: To download the public key of an asymmetric KMS key

The following `get-public-key` example downloads the public key of an asymmetric KMS key.

In addition to returning the public key, the output includes information that you need to use the public key safely outside of AWS KMS, including the key usage and supported encryption algorithms.

```
aws kms get-public-key \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
  "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
  "PublicKey": "jANBgkqhkiG9w0BAQEFAA0CAg8AMIICCgKCAgEAl5epvg1/
QtJhxSi2g9SDEVg8QV/...",
  "CustomerMasterKeySpec": "RSA_4096",
  "KeyUsage": "ENCRYPT_DECRYPT",
  "EncryptionAlgorithms": [
    "RSAES_OAEP_SHA_1",
    "RSAES_OAEP_SHA_256"
  ]
}
```

For more information about using asymmetric KMS keys in AWS KMS, see [Using Symmetric and Asymmetric Keys](#) in the *AWS Key Management Service API Reference*.

Example 2: To convert a public key to DER format (Linux and macOS)

The following `get-public-key` example downloads the public key of an asymmetric KMS key and saves it in a DER file.

When you use the `get-public-key` command in the AWS CLI, it returns a DER-encoded X.509 public key that is Base64-encoded. This example gets the value of the `PublicKey` property as text. It Base64-decodes the `PublicKey` and saves it in the `public_key.der` file. The output parameter returns the output as text, instead of JSON. The `--query` parameter gets only the `PublicKey` property, not the properties that you need to use the public key safely outside of AWS KMS.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms get-public-key \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --output text \  
  --query PublicKey | base64 --decode > public_key.der
```

This command produces no output.

For more information about using asymmetric KMS keys in AWS KMS, see [Using Symmetric and Asymmetric Keys](#) in the *AWS Key Management Service API Reference*.

- For API details, see [GetPublicKey](#) in *AWS CLI Command Reference*.

import-key-material

The following code example shows how to use `import-key-material`.

AWS CLI

To import key material into a KMS key

The following `import-key-material` example uploads key material into a KMS key that was created with no key material. The key state of the KMS key must be `PendingImport`.

This command uses key material that you encrypted with the public key that the `get-parameters-for-import` command returned. It also uses the import token from the same `get-parameters-for-import` command.

The `expiration-model` parameter indicates that the key material automatically expires on the date and time specified by the `valid-to` parameter. When the key material expires, AWS KMS deletes the key material, the key state of the KMS key changes to `Pending import` and the KMS key becomes unusable. To restore the KMS key, you must reimport the same key material. To use different key material, you must create a new KMS key.

Before running this command, replace the example key ID with a valid key ID or key ARN from your AWS account.

```
aws kms import-key-material \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --encrypted-key-material fileb://EncryptedKeyMaterial.bin \  
  --import-token fileb://ImportToken.bin \  
  --expiration-model KEY_MATERIAL_EXPIRES \  
  --valid-to 2020-01-01T00:00:00Z
```

```
--valid-to 2021-09-21T19:00:00Z
```

This command produces no output.

For more information about importing key material, see [Importing Key Material](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ImportKeyMaterial](#) in *AWS CLI Command Reference*.

list-aliases

The following code example shows how to use `list-aliases`.

AWS CLI

Example 1: To list all aliases in an AWS account and Region

The following example uses the `list-aliases` command to list all aliases in the default Region of the AWS account. The output includes aliases associated with AWS managed KMS keys and customer managed KMS keys.

```
aws kms list-aliases
```

Output:

```
{
  "Aliases": [
    {
      "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/testKey",
      "AliasName": "alias/testKey",
      "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
    },
    {
      "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/FinanceDept",
      "AliasName": "alias/FinanceDept",
      "TargetKeyId": "0987dcba-09fe-87dc-65ba-ab0987654321"
    },
    {
      "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/aws/dynamodb",
      "AliasName": "alias/aws/dynamodb",
      "TargetKeyId": "1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d"
    },
    {
```

```

        "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/aws/ebs",
        "AliasName": "alias/aws/ebs",
        "TargetKeyId": "0987ab65-43cd-21ef-09ab-87654321cdef"
    },
    ...
]
}

```

Example 2: To list all aliases for a particular KMS key

The following example uses the `list-aliases` command and its `key-id` parameter to list all aliases that are associated with a particular KMS key.

Each alias is associated with only one KMS key, but a KMS key can have multiple aliases. This command is very useful because the AWS KMS console lists only one alias for each KMS key. To find all aliases for a KMS key, you must use the `list-aliases` command.

This example uses the key ID of the KMS key for the `--key-id` parameter, but you can use a key ID, key ARN, alias name, or alias ARN in this command.

```
aws kms list-aliases --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```

{
  "Aliases": [
    {
      "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
      "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/oregon-test-key",
      "AliasName": "alias/oregon-test-key"
    },
    {
      "TargetKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
      "AliasArn": "arn:aws:kms:us-west-2:111122223333:alias/project121-test",
      "AliasName": "alias/project121-test"
    }
  ]
}

```

For more information, see [Working with Aliases](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListAliases](#) in *AWS CLI Command Reference*.

list-grants

The following code example shows how to use `list-grants`.

AWS CLI

To view the grants on an AWS KMS key

The following `list-grants` example displays all of the grants on the specified AWS managed KMS key for Amazon DynamoDB in your account. This grant allows DynamoDB to use the KMS key on your behalf to encrypt a DynamoDB table before writing it to disk. You can use a command like this one to view the grants on the AWS managed KMS keys and customer managed KMS keys in the AWS account and Region.

This command uses the `key-id` parameter with a key ID to identify the KMS key. You can use a key ID or key ARN to identify the KMS key. To get the key ID or key ARN of an AWS managed KMS key, use the `list-keys` or `list-aliases` command.

```
aws kms list-grants \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

The output shows that the grant gives Amazon DynamoDB permission to use the KMS key for cryptographic operations, and gives it permission to view details about the KMS key (`DescribeKey`) and to retire grants (`RetireGrant`). The `EncryptionContextSubset` constraint limits these permission to requests that include the specified encryption context pairs. As a result, the permissions in the grant are effective only on specified account and DynamoDB table.

```
{
  "Grants": [
    {
      "Constraints": {
        "EncryptionContextSubset": {
          "aws:dynamodb:subscriberId": "123456789012",
          "aws:dynamodb:tableName": "Services"
        }
      },
      "IssuingAccount": "arn:aws:iam::123456789012:root",
      "Name": "8276b9a6-6cf0-46f1-b2f0-7993a7f8c89a",
      "Operations": [
        "Decrypt",
```

```

        "Encrypt",
        "GenerateDataKey",
        "ReEncryptFrom",
        "ReEncryptTo",
        "RetireGrant",
        "DescribeKey"
    ],
    "GrantId":
    "1667b97d27cf748cf05b487217dd4179526c949d14fb3903858e25193253fe59",
    "KeyId": "arn:aws:kms:us-
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",
    "RetiringPrincipal": "dynamodb.us-west-2.amazonaws.com",
    "GranteePrincipal": "dynamodb.us-west-2.amazonaws.com",
    "CreationDate": "2021-05-13T18:32:45.144000+00:00"
    }
]
}

```

For more information, see [Grants in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListGrants](#) in *AWS CLI Command Reference*.

list-key-policies

The following code example shows how to use `list-key-policies`.

AWS CLI

To get the names of key policies for a KMS key

The following `list-key-policies` example gets the names of the key policies for a customer managed key in the example account and Region. You can use this command to find the names of key policies for AWS managed keys and customer managed keys.

Because the only valid key policy name is `default`, this command is not useful.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```

aws kms list-key-policies \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab

```

Output:

```
{
  "PolicyNames": [
    "default"
  ]
}
```

For more information about AWS KMS key policies, see [Using Key Policies in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListKeyPolicies](#) in *AWS CLI Command Reference*.

list-key-rotations

The following code example shows how to use `list-key-rotations`.

AWS CLI**To retrieve information about all completed key material rotations**

The following `list-key-rotations` example lists information about all completed key material rotations for the specified KMS key.

```
aws kms list-key-rotations \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
  "Rotations": [
    {
      "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
      "RotationDate": "2024-03-02T10:11:36.564000+00:00",
      "RotationType": "AUTOMATIC"
    },
    {
      "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
      "RotationDate": "2024-04-05T15:14:47.757000+00:00",
      "RotationType": "ON_DEMAND"
    }
  ]
}
```

```
  ],
  "Truncated": false
}
```

For more information, see [Rotating keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListKeyRotations](#) in *AWS CLI Command Reference*.

list-keys

The following code example shows how to use `list-keys`.

AWS CLI

To get the KMS keys in an account and Region

The following `list-keys` example gets the KMS keys in an account and Region. This command returns both AWS managed keys and customer managed keys.

```
aws kms list-keys
```

Output:

```
{
  "Keys": [
    {
      "KeyArn": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
      "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
    },
    {
      "KeyArn": "arn:aws:kms:us-
west-2:111122223333:key/0987dcba-09fe-87dc-65ba-ab0987654321",
      "KeyId": "0987dcba-09fe-87dc-65ba-ab0987654321"
    },
    {
      "KeyArn": "arn:aws:kms:us-
east-2:111122223333:key/1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d",
      "KeyId": "1a2b3c4d-5e6f-1a2b-3c4d-5e6f1a2b3c4d"
    }
  ]
}
```

For more information, see [Viewing Keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListKeys](#) in *AWS CLI Command Reference*.

list-resource-tags

The following code example shows how to use `list-resource-tags`.

AWS CLI

To get the tags on a KMS key

The following `list-resource-tags` example gets the tags for a KMS key. To add or replace resource tags on KMS keys, use the `tag-resource` command. The output shows that this KMS key has two resource tags, each of which has a key and value.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms list-resource-tags \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{
  "Tags": [
    {
      "TagKey": "Dept",
      "TagValue": "IT"
    },
    {
      "TagKey": "Purpose",
      "TagValue": "Test"
    }
  ],
  "Truncated": false
}
```

For more information about using tags in AWS KMS, see [Tagging keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListResourceTags](#) in *AWS CLI Command Reference*.

list-retirable-grants

The following code example shows how to use `list-retirable-grants`.

AWS CLI

To view the grants that a principal can retire

The following `list-retirable-grants` example displays all of the grants that the `ExampleAdmin` user can retire on the KMS keys in an AWS account and Region. You can use a command like this one to view the grants that any account principal can retire on KMS keys in the AWS account and Region.

The value of the required `retiring-principal` parameter must be the Amazon Resource Name (ARN) of an account, user, or role.

You cannot specify a service for the value of `retiring-principal` in this command, even though a service can be the retiring principal. To find the grants in which a particular service is the retiring principal, use the `list-grants` command.

The output shows that `ExampleAdmin` user has permission to retire grants on two different KMS keys in the account and region. In addition to the retiring principal, the account has permission to retire any grant in the account.

```
aws kms list-retirable-grants \  
  --retiring-principal arn:aws:iam::111122223333:user/ExampleAdmin
```

Output:

```
{  
  "Grants": [  
    {  
      "KeyId": "arn:aws:kms:us-  
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",  
      "GrantId":  
"156b69c63cb154aa21f59929fff19760717be8d9d82b99df53e18b94a15a5e88e",  
      "Name": "",  
      "CreationDate": 2021-01-14T20:17:36.419000+00:00,  
      "GranteePrincipal": "arn:aws:iam::111122223333:user/ExampleUser",  
      "RetiringPrincipal": "arn:aws:iam::111122223333:user/ExampleAdmin",  
      "IssuingAccount": "arn:aws:iam::111122223333:root",  
      "Operations": [  

```

```

        "Encrypt"
    ],
    "Constraints": {
        "EncryptionContextSubset": {
            "Department": "IT"
        }
    }
},
{
    "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/0987dcba-09fe-87dc-65ba-ab0987654321",
    "GrantId":
"8c94d1f12f5e69f440bae30eaec9570bb1fb7358824f9ddfa1aa5a0dab1a59b2",
    "Name": "",
    "CreationDate": "2021-02-02T19:49:49.638000+00:00",
    "GranteePrincipal": "arn:aws:iam::111122223333:role/ExampleRole",
    "RetiringPrincipal": "arn:aws:iam::111122223333:user/ExampleAdmin",
    "IssuingAccount": "arn:aws:iam::111122223333:root",
    "Operations": [
        "Decrypt"
    ],
    "Constraints": {
        "EncryptionContextSubset": {
            "Department": "IT"
        }
    }
}
],
"Truncated": false
}

```

For more information, see [Grants in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ListRetirableGrants](#) in *AWS CLI Command Reference*.

put-key-policy

The following code example shows how to use put-key-policy.

AWS CLI

To change the key policy for a KMS key

The following `put-key-policy` example changes the key policy for a customer managed key.

To begin, create a key policy and save it in a local JSON file. In this example, the file is `key_policy.json`. You can also specify the key policy as a string value of the `policy` parameter.

The first statement in this key policy gives the AWS account permission to use IAM policies to control access to the KMS key. The second statement gives the `test-user` user permission to run the `describe-key` and `list-keys` commands on the KMS key.

Contents of `key_policy.json`:

```
{
  "Version" : "2012-10-17",
  "Id" : "key-default-1",
  "Statement" : [
    {
      "Sid" : "Enable IAM User Permissions",
      "Effect" : "Allow",
      "Principal" : {
        "AWS" : "arn:aws:iam::111122223333:root"
      },
      "Action" : "kms:*",
      "Resource" : "*"
    },
    {
      "Sid" : "Allow Use of Key",
      "Effect" : "Allow",
      "Principal" : {
        "AWS" : "arn:aws:iam::111122223333:user/test-user"
      },
      "Action" : [
        "kms:DescribeKey",
        "kms:ListKeys"
      ],
      "Resource" : "*"
    }
  ]
}
```

To identify the KMS key, this example uses the key ID, but you can also use a key ARN. To specify the key policy, the command uses the `policy` parameter. To indicate that the policy

is in a file, it uses the required `file://` prefix. This prefix is required to identify files on all supported operating systems. Finally, the command uses the `policy-name` parameter with a value of `default`. If no policy name is specified, the default value is `default`. The only valid value is `default`.

```
aws kms put-key-policy \  
  --policy-name default \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --policy file://key_policy.json
```

This command does not produce any output. To verify that the command was effective, use the `get-key-policy` command. The following example command gets the key policy for the same KMS key. The output parameter with a value of `text` returns a text format that is easy to read.

```
aws kms get-key-policy \  
  --policy-name default \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --output text
```

Output:

```
{  
  "Version" : "2012-10-17",  
  "Id" : "key-default-1",  
  "Statement" : [  
    {  
      "Sid" : "Enable IAM User Permissions",  
      "Effect" : "Allow",  
      "Principal" : {  
        "AWS" : "arn:aws:iam::111122223333:root"  
      },  
      "Action" : "kms:*",  
      "Resource" : "*"   
    },  
    {  
      "Sid" : "Allow Use of Key",  
      "Effect" : "Allow",  
      "Principal" : {  
        "AWS" : "arn:aws:iam::111122223333:user/test-user"  
      },  
    },  
  ],  
}
```

```
        "Action" : [ "kms:Describe", "kms:List" ],
        "Resource" : "*"
    }
]
}
```

For more information, see [Changing a Key Policy](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [PutKeyPolicy](#) in *AWS CLI Command Reference*.

re-encrypt

The following code example shows how to use `re-encrypt`.

AWS CLI

Example 1: To re-encrypt an encrypted message under a different symmetric KMS key (Linux and macOS).

The following `re-encrypt` command example demonstrates the recommended way to re-encrypt data with the AWS CLI.

Provide the ciphertext in a file. In the value of the `--ciphertext-blob` parameter, use the `fileb://` prefix, which tells the CLI to read the data from a binary file. If the file is not in the current directory, type the full path to file. For more information about reading AWS CLI parameter values from a file, see [Loading AWS CLI parameters from a file](https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html) <<https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-parameters-file.html>> in the *AWS Command Line Interface User Guide* and [Best Practices for Local File Parameters](https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/) <<https://aws.amazon.com/blogs/developer/best-practices-for-local-file-parameters/>> in the *AWS Command Line Tool Blog*. Specify the source KMS key, which decrypts the ciphertext. The `--source-key-id` parameter is not required when decrypting with symmetric encryption KMS keys. AWS KMS can get the KMS key that was used to encrypt the data from the metadata in the ciphertext blob. But it's always a best practice to specify the KMS key you are using. This practice ensures that you use the KMS key that you intend, and prevents you from inadvertently decrypting a ciphertext using a KMS key you do not trust. Specify the destination KMS key, which re-encrypts the data. The `--destination-key-id` parameter is always required. This example uses a key ARN, but you can use any valid key identifier. Request the plaintext output as a text value. The `--query` parameter tells the CLI to get only the value of the `Plaintext` field from the output. The `--output` parameter returns the output as text. Base64-decode

the plaintext and save it in a file. The following example pipes (|) the value of the Plaintext parameter to the Base64 utility, which decodes it. Then, it redirects (>) the decoded output to the ExamplePlaintext file.

Before running this command, replace the example key IDs with valid key identifiers from your AWS account.

```
aws kms re-encrypt \  
  --ciphertext-blob fileb://ExampleEncryptedFile \  
  --source-key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --destination-key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \  
  --query CiphertextBlob \  
  --output text | base64 --decode > ExampleReEncryptedFile
```

This command produces no output. The output from the re-encrypt command is base64-decoded and saved in a file.

For more information, see ReEncrypt <https://docs.aws.amazon.com/kms/latest/APIReference/API_ReEncrypt.html> in the *AWS Key Management Service API Reference*.

Example 2: To re-encrypt an encrypted message under a different symmetric KMS key (Windows command prompt).

The following re-encrypt command example is the same as the previous one except that it uses the certutil utility to Base64-decode the plaintext data. This procedure requires two commands, as shown in the following examples.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms re-encrypt ^  
  --ciphertext-blob fileb://ExampleEncryptedFile ^  
  --source-key-id 1234abcd-12ab-34cd-56ef-1234567890ab ^  
  --destination-key-id 0987dcba-09fe-87dc-65ba-ab0987654321 ^  
  --query CiphertextBlob ^  
  --output text > ExampleReEncryptedFile.base64
```

Then use the certutil utility

```
certutil -decode ExamplePlaintextFile.base64 ExamplePlaintextFile
```

Output:

```
Input Length = 18
Output Length = 12
CertUtil: -decode command completed successfully.
```

For more information, see `ReEncrypt` <https://docs.aws.amazon.com/kms/latest/APIReference/API_ReEncrypt.html> in the *AWS Key Management Service API Reference*.

- For API details, see [ReEncrypt](#) in *AWS CLI Command Reference*.

retire-grant

The following code example shows how to use `retire-grant`.

AWS CLI**To retire a grant on a customer master key**

The following `retire-grant` example deletes a grant from a KMS key.

The following example command specifies the `grant-id` and the `key-id` parameters. The value of the `key-id` parameter must be the key ARN of the KMS key.

```
aws kms retire-grant \
  --grant-id 1234a2345b8a4e350500d432bccf8ecd6506710e1391880c4f7f7140160c9af3 \
  --key-id arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To confirm that the grant was retired, use the `list-grants` command.

For more information, see [Retiring and revoking grants](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [RetireGrant](#) in *AWS CLI Command Reference*.

revoke-grant

The following code example shows how to use `revoke-grant`.

AWS CLI

To revoke a grant on a customer master key

The following `revoke-grant` example deletes a grant from a KMS key. The following example command specifies the `grant-id` and the `key-id` parameters. The value of the `key-id` parameter can be the key ID or key ARN of the KMS key.

```
aws kms revoke-grant \  
  --grant-id 1234a2345b8a4e350500d432bccf8ecd6506710e1391880c4f7f7140160c9af3 \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To confirm that the grant was revoked, use the `list-grants` command.

For more information, see [Retiring and revoking grants](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [RevokeGrant](#) in *AWS CLI Command Reference*.

rotate-key-on-demand

The following code example shows how to use `rotate-key-on-demand`.

AWS CLI

To perform on-demand rotation of a KMS key

The following `rotate-key-on-demand` example immediately initiates rotation of the key material for the specified KMS key.

```
aws kms rotate-key-on-demand \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

Output:

```
{  
  "KeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"  
}
```

For more information, see [How to perform on-demand key rotation](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [RotateKeyOnDemand](#) in *AWS CLI Command Reference*.

schedule-key-deletion

The following code example shows how to use `schedule-key-deletion`.

AWS CLI

To schedule the deletion of a customer managed KMS key.

The following `schedule-key-deletion` example schedules the specified customer managed KMS key to be deleted in 15 days.

The `--key-id` parameter identifies the KMS key. This example uses a key ARN value, but you can use either the key ID or the ARN of the KMS key. The `--pending-window-in-days` parameter specifies the length of the 7-30 day waiting period. By default, the waiting period is 30 days. This example specifies a value of 15, which tells AWS to permanently delete the KMS key 15 days after the command completes.

```
aws kms schedule-key-deletion \  
  --key-id arn:aws:kms:us-  
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab \  
  --pending-window-in-days 15
```

The response includes the key ARN, key state, waiting period (`PendingWindowInDays`), and the deletion date in Unix time. To view the deletion date in local time, use the AWS KMS console. KMS keys in the `PendingDeletion` key state cannot be used in cryptographic operations.

```
{  
  "KeyId": "arn:aws:kms:us-  
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab",  
  "DeletionDate": "2022-06-18T23:43:51.272000+00:00",  
  "KeyState": "PendingDeletion",  
  "PendingWindowInDays": 15  
}
```

For more information, see [Deleting keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [ScheduleKeyDeletion](#) in *AWS CLI Command Reference*.

sign

The following code example shows how to use `sign`.

AWS CLI

Example 1: To generate a digital signature for a message

The following `sign` example generates a cryptographic signature for a short message. The output of the command includes a base-64 encoded `Signature` field that you can verify by using the `verify` command.

You must specify a message to sign and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms for your KMS key, use the `describe-key` command.

In AWS CLI 2.0, the value of the `message` parameter must be Base64-encoded. Or, you can save the message in a file and use the `fileb://` prefix, which tells the AWS CLI to read binary data from the file.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of `SIGN_VERIFY`.

```
msg=(echo 'Hello World' | base64)

aws kms sign \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --message fileb://UnsignedMessage \
  --message-type RAW \
  --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256
```

Output:

```
{
  "KeyId": "arn:aws:kms:us-
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
  "Signature": "ABCDEFhpyVYyTxbafE74ccSvEJLJr3zuoV1Hfymz4qv+
fxmxNLA7SE1SiF8lHw80fKZZ3bJ...",
  "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"
```

```
}
```

For more information about using asymmetric KMS keys in AWS KMS, see [Asymmetric keys in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

Example 2: To save a digital signature in a file (Linux and macOS)

The following `sign` example generates a cryptographic signature for a short message stored in a local file. The command also gets the `Signature` property from the response, Base64-decodes it and saves it in the `ExampleSignature` file. You can use the signature file in a `verify` command that verifies the signature.

The `sign` command requires a Base64-encoded message and a signing algorithm that your asymmetric KMS key supports. To get the signing algorithms that your KMS key supports, use the `describe-key` command.

Before running this command, replace the example key ID with a valid key ID from your AWS account. The key ID must represent an asymmetric KMS key with a key usage of `SIGN_VERIFY`.

```
echo 'hello world' | base64 > EncodedMessage

aws kms sign \
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \
  --message fileb://EncodedMessage \
  --message-type RAW \
  --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \
  --output text \
  --query Signature | base64 --decode > ExampleSignature
```

This command produces no output. This example extracts the `Signature` property of the output and saves it in a file.

For more information about using asymmetric KMS keys in AWS KMS, see [Asymmetric keys in AWS KMS](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [Sign](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a KMS key

The following `tag-resource` example adds "Purpose": "Test" and "Dept": "IT" tags to a customer managed KMS key. You can use tags like these to label KMS keys and create categories of KMS keys for permissions and auditing.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command.

```
aws kms tag-resource \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --tags TagKey='Purpose',TagValue='Test' TagKey='Dept',TagValue='IT'
```

This command produces no output. To view the tags on an AWS KMS KMS key, use the `list-resource-tags` command.

For more information about using tags in AWS KMS, see [Tagging keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To delete a tag from a KMS key

The following `untag-resource` example deletes the tag with the "Purpose" key from a customer managed KMS key.

To specify the KMS key, use the `key-id` parameter. This example uses a key ID value, but you can use a key ID or key ARN in this command. Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms untag-resource \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --tag-key 'Purpose'
```

This command produces no output. To view the tags on an AWS KMS key, use the `list-resource-tags` command.

For more information about using tags in AWS KMS, see [Tagging keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-alias

The following code example shows how to use `update-alias`.

AWS CLI

To associate an alias with a different KMS key

The following `update-alias` example associates the alias `alias/test-key` with a different KMS key.

The `--alias-name` parameter specifies the alias. The alias name value must begin with `alias/`. The `--target-key-id` parameter specifies the KMS key to associate with the alias. You don't need to specify the current KMS key for the alias.

```
aws kms update-alias \  
  --alias-name alias/test-key \  
  --target-key-id 1234abcd-12ab-34cd-56ef-1234567890ab
```

This command produces no output. To find the alias, use the `list-aliases` command.

For more information, see [Updating aliases](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [UpdateAlias](#) in *AWS CLI Command Reference*.

update-custom-key-store

The following code example shows how to use `update-custom-key-store`.

AWS CLI

Example 1: To edit the friendly name of a custom key store

The following `update-custom-key-store` example changes the name of the custom key store. This example works for an AWS CloudHSM key store or an external key store.

Use the `custom-key-store-id` to identify the key store. Use the `new-custom-key-store-name` parameter to specify the new friendly name.

To update the friendly name of an AWS CloudHSM key store, you must first disconnect the key store, such as by using the `disconnect-custom-key-store` command. You can update the friendly name of an external key store while it is connected or disconnected. To find the connection state of your custom key store, use the `describe-custom-key-store` command.

```
aws kms update-custom-key-store \  
  --custom-key-store-id cks-1234567890abcdef0 \  
  --new-custom-key-store-name ExampleKeyStore
```

This command does not return any data. To verify that the command worked, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see [Editing AWS CloudHSM key store settings](#) in the *AWS Key Management Service Developer Guide*.

For more information about updating an external key store, see [Editing external key store properties](#) in the *AWS Key Management Service Developer Guide*.

Example 2: To edit the `kmsuser` password of an AWS CloudHSM key store

The following `update-custom-key-store` example updates the value of the `kmsuser` password to the current password for the `kmsuser` in the CloudHSM cluster associated with the specified key store. This command doesn't change the `kmsuser` password in the cluster. It just tells AWS KMS the current password. If KMS doesn't have the current `kmsuser` password, it cannot connect to the AWS CloudHSM key store.

NOTE: Before updating an AWS CloudHSM key store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \  
  --custom-key-store-id cks-1234567890abcdef0 \  
  --key-store-password ExamplePassword
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see [Editing AWS CloudHSM key store settings](#) in the *AWS Key Management Service Developer Guide*.

Example 3: To edit the AWS CloudHSM cluster of an AWS CloudHSM key store

The following example changes the AWS CloudHSM cluster that is associated with an AWS CloudHSM key store to a related cluster, such as a different backup of the same cluster.

NOTE: Before updating an AWS CloudHSM key store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the AWS CloudHSM key store. Use the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \  
  --custom-key-store-id cks-1234567890abcdef0 \  
  --cloud-hsm-cluster-id cluster-1a23b4cdefg
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an AWS CloudHSM key store, see [Editing AWS CloudHSM key store settings](#) in the *AWS Key Management Service Developer Guide*.

Example 4: To edit the proxy authentication credential of an external key store

The following example updates the proxy authentication credential for your external key store. You must specify both the `raw-secret-access-key` and the `access-key-id`, even if you are changing only one of the values. You can use this feature to fix an invalid credential or to change the credential when the external key store proxy rotates it.

Establish the proxy authentication credential for AWS KMS on your external key store. Then use this command to provide the credential to AWS KMS. AWS KMS uses this credential to sign its requests to your external key store proxy.

You can update the proxy authentication credential while the external key store is connected or disconnected. To find the connection state of your custom key store, use the `describe-custom-key-store` command.

```
aws kms update-custom-key-store \  
  --raw-secret-access-key   
  --access-key-id   
  --external-key-store-id   
  --external-key-store-arn   
  --external-key-store-proxy-arn
```

```
--custom-key-store-id cks-1234567890abcdef0 \  
--xks-proxy-authentication-credential "AccessKeyId=ABCDE12345670EXAMPLE,  
RawSecretAccessKey=DXjSUawne12fr6SKC7G25CNxTyWKE5PF9XX6H/u9pSo="
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see [Editing external key store properties](#) in the *AWS Key Management Service Developer Guide*.

Example 5: To edit the proxy connectivity of an external key store

The following example changes the external key store proxy connectivity option from public endpoint connectivity to VPC endpoint service connectivity. In addition to changing the `xks-proxy-connectivity` value, you must change the `xks-proxy-uri-endpoint` value to reflect the private DNS name associated with the VPC endpoint service. You must also add an `xks-proxy-vpc-endpoint-service-name` value.

NOTE: Before updating the proxy connectivity of an external store, you must disconnect it. Use the `disconnect-custom-key-store` command. After the command completes, you can reconnect the external key store by using the `connect-custom-key-store` command.

```
aws kms update-custom-key-store \  
  --custom-key-store-id cks-1234567890abcdef0 \  
  --xks-proxy-connectivity VPC_ENDPOINT_SERVICE \  
  --xks-proxy-uri-endpoint "https://myproxy-private.xks.example.com" \  
  --xks-proxy-vpc-endpoint-service-name "com.amazonaws.vpce.us-east-1.vpce-svc-  
example"
```

This command does not return any output. To verify that the change was effective, use a `describe-custom-key-stores` command.

For more information about updating an external key store, see [Editing external key store properties](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [UpdateCustomKeyStore](#) in *AWS CLI Command Reference*.

update-key-description

The following code example shows how to use `update-key-description`.

AWS CLI

Example 1: To add or change a description to a customer managed KMS key

The following `update-key-description` example adds a description to a customer managed KMS key. You can use the same command to change an existing description.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ARN value, but you can use either the key ID or the key ARN of the KMS key. The `--description` parameter specifies the new description. The value of this parameter replaces the current description of the KMS key, if any.

```
aws kms update-key-description \  
  --key-id arn:aws:kms:us-  
west-2:123456789012:key/1234abcd-12ab-34cd-56ef-1234567890ab \  
  --description "IT Department test key"
```

This command produces no output. To view the description of a KMS key, use the `describe-key` command.

For more information, see [UpdateKeyDescription](#) in the *AWS Key Management Service API Reference*.

Example 2: To delete the description of a customer managed KMS key

The following `update-key-description` example deletes the description to a customer managed KMS key.

The `--key-id` parameter identifies the KMS key in the command. This example uses a key ID value, but you can use either the key ID or the key ARN of the KMS key. The `--description` parameter with an empty string value (`''`) deletes the existing description.

```
aws kms update-key-description \  
  --key-id 0987dcba-09fe-87dc-65ba-ab0987654321 \  
  --description ''
```

This command produces no output. To view the description of a KMS key, use the `describe-key` command.

For more information, see [UpdateKeyDescription](#) in the *AWS Key Management Service API Reference*.

- For API details, see [UpdateKeyDescription](#) in *AWS CLI Command Reference*.

verify

The following code example shows how to use `verify`.

AWS CLI

To verify a digital signature

The following `verify` example verifies a cryptographic signature for a short, Base64-encoded message. The key ID, message, message type, and signing algorithm must be same ones that were used to sign the message. The signature that you specify cannot be base64-encoded. For help decoding the signature that the `sign` command returns, see the `sign` command examples.

The output of the command includes a Boolean `SignatureValid` field that indicates that the signature was verified. If the signature validation fails, the `verify` command fails, too.

Before running this command, replace the example key ID with a valid key ID from your AWS account.

```
aws kms verify \  
  --key-id 1234abcd-12ab-34cd-56ef-1234567890ab \  
  --message fileb://EncodedMessage \  
  --message-type RAW \  
  --signing-algorithm RSASSA_PKCS1_V1_5_SHA_256 \  
  --signature fileb://ExampleSignature
```

Output:

```
{  
  "KeyId": "arn:aws:kms:us-  
west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",  
  "SignatureValid": true,  
  "SigningAlgorithm": "RSASSA_PKCS1_V1_5_SHA_256"  
}
```

For more information about using asymmetric KMS keys in AWS KMS, see [Using asymmetric keys](#) in the *AWS Key Management Service Developer Guide*.

- For API details, see [Verify](#) in *AWS CLI Command Reference*.

Lake Formation examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lake Formation.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

add-lf-tags-to-resource

The following code example shows how to use `add-lf-tags-to-resource`.

AWS CLI

To attach one or more LF-tags to an existing resource

The following `add-lf-tags-to-resource` example attaches given LF-tag to the table resource.

```
aws lakeformation add-lf-tags-to-resource \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
```

```
"CatalogId": "123456789111",
"Resource": {
  "Table": {
    "CatalogId": "123456789111",
    "DatabaseName": "tpc",
    "Name": "dl_tpc_promotion"
  }
},
"LFTags": [{
  "CatalogId": "123456789111",
  "TagKey": "usergroup",
  "TagValues": [
    "analyst"
  ]
}]
}
```

Output:

```
{
  "Failures": []
}
```

For more information, see [Assigning LF-Tags to Data Catalog resources](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [AddLfTagsToResource](#) in *AWS CLI Command Reference*.

batch-grant-permissions

The following code example shows how to use batch-grant-permissions.

AWS CLI

To bulk grant permissions on resources to the principals

The following batch-grant-permissions example bulk grants access on specified resources to the principals.

```
aws lakeformation batch-grant-permissions \
  --cli-input-json file://input.json
```

Contents of input.json:

```
{
  "CatalogId": "123456789111",
  "Entries": [{

  "Resource": {
    "Table": {
      "CatalogId": "123456789111",
      "DatabaseName": "tpc",
      "Name": "dl_tpc_promotion"
    }
  },
  "Permissions": [
    "ALL"
  ],
  "PermissionsWithGrantOption": [
    "ALL"
  ]
},
{
  "Id": "4",
  "Principal": {
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
  },
  "Resource": {
    "DataCellsFilter": {
      "TableCatalogId": "123456789111",
      "DatabaseName": "tpc",
      "TableName": "dl_tpc_item",
      "Name": "developer_item"
    }
  },
  "Permissions": [
    "SELECT"
  ],
  "PermissionsWithGrantOption": []
}
]
```

Output:

```
{
  "Failures": []
}
```

For more information, see [Granting and revoking permissions on Data Catalog resources](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [BatchGrantPermissions](#) in *AWS CLI Command Reference*.

batch-revoke-permissions

The following code example shows how to use `batch-revoke-permissions`.

AWS CLI

To bulk revoke permissions on resources from the principals

The following `batch-revoke-permissions` example bulk revokes access on specified resources from the principals.

```
aws lakeformation batch-revoke-permissions \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "CatalogId": "123456789111",
  "Entries": [{
    "Id": "1",
    "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
developer"
    },
    "Resource": {
      "Table": {
        "CatalogId": "123456789111",
        "DatabaseName": "tpc",
        "Name": "dl_tpc_promotion"
      }
    },
    "Permissions": [
```

```

        "ALL"
      ],
      "PermissionsWithGrantOption": [
        "ALL"
      ]
    },
    {
      "Id": "2",
      "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
business-analyst"
      },
      "Resource": {
        "Table": {
          "CatalogId": "123456789111",
          "DatabaseName": "tpc",
          "Name": "dl_tpc_promotion"
        }
      },
      "Permissions": [
        "ALL"
      ],
      "PermissionsWithGrantOption": [
        "ALL"
      ]
    }
  ]
}

```

Output:

```

{
  "Failures": []
}

```

For more information, see [Granting and revoking permissions on Data Catalog resources](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [BatchRevokePermissions](#) in *AWS CLI Command Reference*.

cancel-transaction

The following code example shows how to use `cancel-transaction`.

AWS CLI

To cancel a transaction

The following `cancel-transaction` example cancels the transaction.

```
aws lakeformation cancel-transaction \  
  --transaction-id='b014d972ca8347b89825e33c5774aec4'
```

This command produces no output.

For more information, see [Reading from and writing to the data lake within transactions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [CancelTransaction](#) in *AWS CLI Command Reference*.

commit-transaction

The following code example shows how to use `commit-transaction`.

AWS CLI

To commit transaction

The following `commit-transaction` example commits the transaction.

```
aws lakeformation commit-transaction \  
  --transaction-id='b014d972ca8347b89825e33c5774aec4'
```

Output:

```
{  
  "TransactionStatus": "committed"  
}
```

For more information, see [Reading from and writing to the data lake within transactions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [CommitTransaction](#) in *AWS CLI Command Reference*.

create-data-cells-filter

The following code example shows how to use `create-data-cells-filter`.

AWS CLI

Example 1: To create data cell filter

The following `create-data-cells-filter` example creates a data cell filter to allow one to grant access to certain columns based on row condition.

```
aws lakeformation create-data-cells-filter \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "TableData": {  
    "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],  
    "DatabaseName": "tpc",  
    "Name": "developer_promotion",  
    "RowFilter": {  
      "FilterExpression": "p_promo_name='ese'"  
    },  
    "TableCatalogId": "123456789111",  
    "TableName": "dl_tpc_promotion"  
  }  
}
```

This command produces no output.

For more information, see [Data filtering and cell-level security in Lake Formation](#) in the *AWS Lake Formation Developer Guide*.

Example 2: To create column filter

The following `create-data-cells-filter` example creates a data filter to allow one to grant access to certain columns.

```
aws lakeformation create-data-cells-filter \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "TableData": {
    "ColumnNames": ["p_channel_details", "p_start_date_sk", "p_promo_name"],
    "DatabaseName": "tpc",
    "Name": "developer_promotion_allrows",
    "RowFilter": {
      "AllRowsWildcard": {}
    },
    "TableCatalogId": "123456789111",
    "TableName": "dl_tpc_promotion"
  }
}
```

This command produces no output.

For more information, see [Data filtering and cell-level security in Lake Formation](#) in the *AWS Lake Formation Developer Guide*.

Example 3: To create data filter with exclude columns

The following `create-data-cells-filter` example creates a data filter to allow one to grant access all except the mentioned columns.

```
aws lakeformation create-data-cells-filter \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "TableData": {
    "ColumnWildcard": {
      "ExcludedColumnNames": ["p_channel_details", "p_start_date_sk"]
    },
    "DatabaseName": "tpc",
    "Name": "developer_promotion_excludecolumn",
    "RowFilter": {
      "AllRowsWildcard": {}
    },
    "TableCatalogId": "123456789111",
    "TableName": "dl_tpc_promotion"
  }
}
```

This command produces no output.

For more information, see [Data filtering and cell-level security in Lake Formation](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [CreateDataCellsFilter](#) in *AWS CLI Command Reference*.

create-lf-tag

The following code example shows how to use `create-lf-tag`.

AWS CLI

To create LF-Tag

The following `create-lf-tag` example creates an LF-Tag with the specified name and values.

```
aws lakeformation create-lf-tag \  
  --catalog-id '123456789111' \  
  --tag-key 'usergroup' \  
  --tag-values '["developer","analyst","campaign"]'
```

This command produces no output.

For more information, see [Managing LF-Tags for metadata access control](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [CreateLfTag](#) in *AWS CLI Command Reference*.

delete-data-cells-filter

The following code example shows how to use `delete-data-cells-filter`.

AWS CLI

To delete data cell filter

The following `delete-data-cells-filter` example deletes given data cell filter.

```
aws lakeformation delete-data-cells-filter \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "TableCatalogId": "123456789111",
  "DatabaseName": "tpc",
  "TableName": "dl_tpc_promotion",
  "Name": "developer_promotion"
}
```

This command produces no output.

For more information, see [Data filtering and cell-level security in Lake Formation](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [DeleteDataCellsFilter](#) in *AWS CLI Command Reference*.

delete-lf-tag

The following code example shows how to use `delete-lf-tag`.

AWS CLI

To delete LF-Tag definition

The following `delete-lf-tag` example deletes LF-Tag definition.

```
aws lakeformation delete-lf-tag \
  --catalog-id '123456789111' \
  --tag-key 'usergroup'
```

This command produces no output.

For more information, see [Managing LF-Tags for metadata access control](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [DeleteLfTag](#) in *AWS CLI Command Reference*.

delete-objects-on-cancel

The following code example shows how to use `delete-objects-on-cancel`.

AWS CLI

To delete object when transaction is cancelled

The following `delete-objects-on-cancel` example deletes the listed s3 object when the transaction is cancelled.

```
aws lakeformation delete-objects-on-cancel \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "CatalogId": "012345678901",  
  "DatabaseName": "tpc",  
  "TableName": "dl_tpc_household_demographics_gov",  
  "TransactionId": "1234d972ca8347b89825e33c5774aec4",  
  "Objects": [{  
    "Uri": "s3://lf-data-lake-012345678901/target/  
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-  
ff26b17504414fe88b302cd795eabd00.parquet",  
    "ETag": "1234ab1fc50a316b149b4e1f21a73800"  
  }]  
}
```

This command produces no output.

For more information, see [Reading from and writing to the data lake within transactions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [DeleteObjectsOnCancel](#) in *AWS CLI Command Reference*.

deregister-resource

The following code example shows how to use `deregister-resource`.

AWS CLI

To deregister data lake storage

The following `deregister-resource` example deregisters the resource as managed by the Lake Formation.

```
aws lakeformation deregister-resource \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123"
}
```

This command produces no output.

For more information, see [Adding an Amazon S3 location to your data lake](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [DeregisterResource](#) in *AWS CLI Command Reference*.

describe-transaction

The following code example shows how to use `describe-transaction`.

AWS CLI

To retrieve a transaction details

The following `describe-transaction` example returns the details of a single transaction.

```
aws lakeformation describe-transaction \
  --transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

Output:

```
{
  "TransactionDescription": {
    "TransactionId": "12345972ca8347b89825e33c5774aec4",
    "TransactionStatus": "committed",
    "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",
    "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"
  }
}
```

For more information, see [Reading from and writing to the data lake within transactions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [DescribeTransaction](#) in *AWS CLI Command Reference*.

extend-transaction

The following code example shows how to use `extend-transaction`.

AWS CLI

To extend a transaction

The following `extend-transaction` example extends the transaction.

```
aws lakeformation extend-transaction \  
  --transaction-id='8cb4b1a7cc8d486fbaca9a64e7d9f5ce'
```

This command produces no output.

For more information, see [Reading from and writing to the data lake within transactions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [ExtendTransaction](#) in *AWS CLI Command Reference*.

get-data-lake-settings

The following code example shows how to use `get-data-lake-settings`.

AWS CLI

To retrieve AWS Lake Formation-managed data lake settings

The following `get-data-lake-settings` example retrieves the list of data lake administrators and other data lake settings.

```
aws lakeformation get-data-lake-settings \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "CatalogId": "123456789111"  
}
```

Output:

```

{
  "DataLakeSettings": {
    "DataLakeAdmins": [{
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
    }],
    "CreateDatabaseDefaultPermissions": [],
    "CreateTableDefaultPermissions": [
      {
        "Principal": {
          "DataLakePrincipalIdentifier": "IAM_ALLOWED_PRINCIPALS"
        },
        "Permissions": [
          "ALL"
        ]
      }
    ],
    "TrustedResourceOwners": [],
    "AllowExternalDataFiltering": true,
    "ExternalDataFilteringAllowList": [{
      "DataLakePrincipalIdentifier": "123456789111"
    }],
    "AuthorizedSessionTagValueList": [
      "Amazon EMR"
    ]
  }
}

```

For more information, see [Changing the default security settings for your data lake](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetDataLakeSettings](#) in *AWS CLI Command Reference*.

get-effective-permissions-for-path

The following code example shows how to use `get-effective-permissions-for-path`.

AWS CLI

To retrieve permissions on resources located at specific path

The following `get-effective-permissions-for-path` example returns the Lake Formation permissions for a specified table or database resource located at a path in Amazon S3.

```
aws lakeformation get-effective-permissions-for-path \  
  --cli-input-json file://input.json
```

Contents of input.json:

```
{  
  "CatalogId": "123456789111",  
  "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111"  
}
```

Output:

```
{  
  "Permissions": [{  
    "Principal": {  
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-  
campaign-manager"  
    },  
    "Resource": {  
      "Database": {  
        "Name": "tpc"  
      }  
    },  
    "Permissions": [  
      "DESCRIBE"  
    ],  
    "PermissionsWithGrantOption": []  
  },  
  {  
    "Principal": {  
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/EMR-  
RuntimeRole"  
    },  
    "Resource": {  
      "Database": {  
        "Name": "tpc"  
      }  
    },  
    "Permissions": [  
      "ALL"  
    ],  
    "PermissionsWithGrantOption": []  
  }  
}
```

```
    },
    {
      "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:saml-
provider/oktaSAMLProvider:user/emr-developer"
      },
      "Resource": {
        "Database": {
          "Name": "tpc"
        }
      },
      "Permissions": [
        "ALL",
        "DESCRIBE"
      ],
      "PermissionsWithGrantOption": []
    },
    {
      "Principal": {
        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
      },
      "Resource": {
        "Database": {
          "Name": "tpc"
        }
      },
      "Permissions": [
        "ALL",
        "ALTER",
        "CREATE_TABLE",
        "DESCRIBE",
        "DROP"
      ],
      "PermissionsWithGrantOption": [
        "ALL",
        "ALTER",
        "CREATE_TABLE",
        "DESCRIBE",
        "DROP"
      ]
    },
    {
      "Principal": {
```

```

        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/LF-
GlueServiceRole"
      },
      "Resource": {
        "Database": {
          "Name": "tpc"
        }
      },
      "Permissions": [
        "CREATE_TABLE"
      ],
      "PermissionsWithGrantOption": []
    }
  ],
  "NextToken":
  "E5S1JDSTZ1eUp6SWpvaU9UQTN0RE0zTXpFeE5Ua3pJbjE5TENKbGVIQnBjbUYwYVc5dUlqcDdJbk5sWTI5dVpITW1P
}

```

For more information, see [Managing Lake Formation permissions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetEffectivePermissionsForPath](#) in *AWS CLI Command Reference*.

get-lf-tag

The following code example shows how to use `get-lf-tag`.

AWS CLI

To retrieve LF-tag definition

The following `get-lf-tag` example retrieves LF-tag definition.

```

aws lakeformation get-lf-tag \
  --catalog-id '123456789111' \
  --tag-key 'usergroup'

```

Output:

```

{
  "CatalogId": "123456789111",
  "TagKey": "usergroup",
  "TagValues": [

```

```
    "analyst",
    "campaign",
    "developer"
  ]
}
```

For more information, see [Managing LF-Tags for metadata access control](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetLfTag](#) in *AWS CLI Command Reference*.

get-query-state

The following code example shows how to use `get-query-state`.

AWS CLI

To retrieve state of a submitted query

The following `get-query-state` example returns the state of a query previously submitted.

```
aws lakeformation get-query-state \
  --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{
  "State": "FINISHED"
}
```

For more information, see [Transactional data operations](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetQueryState](#) in *AWS CLI Command Reference*.

get-query-statistics

The following code example shows how to use `get-query-statistics`.

AWS CLI

To retrieve query statistics

The following `get-query-statistics` example retrieves statistics on the planning and execution of a query.

```
aws lakeformation get-query-statistics \  
  --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{  
  "ExecutionStatistics": {  
    "AverageExecutionTimeMillis": 0,  
    "DataScannedBytes": 0,  
    "WorkUnitsExecutedCount": 0  
  },  
  "PlanningStatistics": {  
    "EstimatedDataToScanBytes": 43235,  
    "PlanningTimeMillis": 2377,  
    "QueueTimeMillis": 440,  
    "WorkUnitsGeneratedCount": 1  
  },  
  "QuerySubmissionTime": "2022-08-11T02:14:38.641870+00:00"  
}
```

For more information, see [Transactional data operations](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetQueryStatistics](#) in *AWS CLI Command Reference*.

get-resource-lf-tags

The following code example shows how to use `get-resource-lf-tags`.

AWS CLI

To list LF-tags

The following `list-lf-tags` example returns list of LF-tags that the requester has permission to view.

```
aws lakeformation list-lf-tags \  
  --cli-input-json file://input.json
```

Contents of input.json:

```
{
  "CatalogId": "123456789111",
  "ResourceShareType": "ALL",
  "MaxResults": 2
}
```

Output:

```
{
  "LFTags": [{
    "CatalogId": "123456789111",
    "TagKey": "category",
    "TagValues": [
      "private",
      "public"
    ]
  },
  {
    "CatalogId": "123456789111",
    "TagKey": "group",
    "TagValues": [
      "analyst",
      "campaign",
      "developer"
    ]
  }
],
  "NextToken": "kIiwiZXhwaXJhdGlvbiI6eyJzZWNVbmRzIjoxNjYwMDY4dCI6ZmFsc2V9"
}
```

For more information, see [Managing LF-Tags for metadata access control](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetResourceLfTags](#) in *AWS CLI Command Reference*.

get-table-objects

The following code example shows how to use `get-table-objects`.

AWS CLI

To list objects of governed table

The following `get-table-objects` example returns the set of Amazon S3 objects that make up the specified governed table.

```
aws lakeformation get-table-objects \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "CatalogId": "012345678901",  
  "DatabaseName": "tpc",  
  "TableName": "dl_tpc_household_demographics_gov",  
  "QueryAsOfTime": "2022-08-10T15:00:00"  
}
```

Output:

```
{  
  "Objects": [{  
    "PartitionValues": [],  
    "Objects": [{  
      "Uri": "s3://lf-data-lake-012345678901/target/  
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-  
ff26b17504414fe88b302cd795eabd00.parquet",  
      "ETag": "12345b1fc50a316b149b4e1f21a73800",  
      "Size": 43235  
    }]  
  }]  
}
```

For more information, see [Reading from and writing to the data lake within transactions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetTableObjects](#) in *AWS CLI Command Reference*.

get-work-unit-results

The following code example shows how to use `get-work-unit-results`.

AWS CLI

To retrieve work units of given query

The following `get-work-unit-results` example returns the work units resulting from the query.

```
aws lakeformation get-work-units \  
  --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b' \  
  --work-unit-id '0' \  
  --work-unit-token 'B2fMSdmQXe9umX8Ux8XCo4=' outfile
```

Output:

```
outfile with Blob content.
```

For more information, see [Transactional data operations](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GetWorkUnitResults](#) in *AWS CLI Command Reference*.

get-work-units

The following code example shows how to use `get-work-units`.

AWS CLI

To retrieve work units

The following `get-work-units` example retrieves the work units generated by the `StartQueryPlanning` operation.

```
aws lakeformation get-work-units \  
  --query-id='1234273f-4a62-4cda-8d98-69615ee8be9b'
```

Output:

```
{  
  "WorkUnitRanges": [{  
    "WorkUnitIdMax": 0,  
    "WorkUnitIdMin": 0,  
    "WorkUnitToken":

grant-permissions

The following code example shows how to use `grant-permissions`.

AWS CLI

Example 1: To grant permissions to the principal on resources using LF-Tags

The following `grant-permissions` example grants ALL permissions to the principal on database resource that matches the LF-Tag policy.

```
aws lakeformation grant-permissions \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "CatalogId": "123456789111",
  "Principal": {
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
  },
  "Resource": {
    "LFTagPolicy": {
      "CatalogId": "123456789111",
      "ResourceType": "DATABASE",
      "Expression": [{"
```

```

        "TagKey": "usergroup",
        "TagValues": [
            "analyst",
            "developer"
        ]
    }
}
    ],
    "Permissions": [
        "ALL"
    ],
    "PermissionsWithGrantOption": [
        "ALL"
    ]
}

```

This command produces no output.

For more information, see [Granting and revoking permissions on Data Catalog resources](#) in the *AWS Lake Formation Developer Guide*.

Example 2: To grant column level permissions to the principal

The following `grant-permissions` example grants permission to select specific column to the principal.

```

aws lakeformation grant-permissions \
  --cli-input-json file://input.json

```

Contents of `input.json`:

```

{
  "CatalogId": "123456789111",
  "Principal": {
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
  },
  "Resource": {
    "TableWithColumns": {
      "CatalogId": "123456789111",
      "ColumnNames": ["p_end_date_sk"],
      "DatabaseName": "tpc",
      "Name": "dl_tpc_promotion"
    }
  }
}

```

```
    }
  },
  "Permissions": [
    "SELECT"
  ],
  "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see [Granting and revoking permissions on Data Catalog resources](#) in the *AWS Lake Formation Developer Guide*.

Example 3: To grant table permissions to the principal

The following `grant-permissions` example grants select permission on all tables of given database to the principal.

```
aws lakeformation grant-permissions \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "CatalogId": "123456789111",
  "Principal": {
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
  },
  "Resource": {
    "Table": {
      "CatalogId": "123456789111",
      "DatabaseName": "tpc",
      "TableWildcard": {}
    }
  },
  "Permissions": [
    "SELECT"
  ],
  "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see [Granting and revoking permissions on Data Catalog resources](#) in the *AWS Lake Formation Developer Guide*.

Example 4: To grant permissions on LF-Tags to the principal

The following `grant-permissions` example grants associate permission on LF-Tags to the principal.

```
aws lakeformation grant-permissions \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "CatalogId": "123456789111",  
  "Principal": {  
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"  
  },  
  "Resource": {  
    "LFTag": {  
      "CatalogId": "123456789111",  
      "TagKey": "category",  
      "TagValues": [  
        "private", "public"  
      ]  
    }  
  },  
  "Permissions": [  
    "ASSOCIATE"  
  ],  
  "PermissionsWithGrantOption": []  
}
```

This command produces no output.

For more information, see [Granting and revoking permissions on Data Catalog resources](#) in the *AWS Lake Formation Developer Guide*.

Example 5: To grant permissions on data locations to the principal

The following `grant-permissions` example grants permission on data location to the principal.

```
aws lakeformation grant-permissions \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "CatalogId": "123456789111",  
  "Principal": {  
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"  
  },  
  "Resource": {  
    "DataLocation": {  
      "CatalogId": "123456789111",  
      "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111"  
    }  
  },  
  "Permissions": [  
    "DATA_LOCATION_ACCESS"  
  ],  
  "PermissionsWithGrantOption": []  
}
```

This command produces no output.

For more information, see [Granting and revoking permissions on Data Catalog resources](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [GrantPermissions](#) in *AWS CLI Command Reference*.

list-data-cells-filter

The following code example shows how to use `list-data-cells-filter`.

AWS CLI

To list data cell filters

The following `list-data-cells-filter` example list data cell filter for given table.

```
aws lakeformation list-data-cells-filter \  
  --cli-input-json file://input.json
```

Contents of input.json:

```
{
  "MaxResults": 2,
  "Table": {
    "CatalogId": "123456789111",
    "DatabaseName": "tpc",
    "Name": "dl_tpc_promotion"
  }
}
```

Output:

```
{
  "DataCellsFilters": [{
    "TableCatalogId": "123456789111",
    "DatabaseName": "tpc",
    "TableName": "dl_tpc_promotion",
    "Name": "developer_promotion",
    "RowFilter": {
      "FilterExpression": "p_promo_name='ese'"
    }
  },
  "ColumnNames": [
    "p_channel_details",
    "p_start_date_sk",
    "p_purpose",
    "p_promo_id",
    "p_promo_name",
    "p_end_date_sk",
    "p_discount_active"
  ]
},
{
  "TableCatalogId": "123456789111",
  "DatabaseName": "tpc",
  "TableName": "dl_tpc_promotion",
  "Name": "developer_promotion_allrows",
  "RowFilter": {
    "FilterExpression": "TRUE",
    "AllRowsWildcard": {}
  },
  "ColumnNames": [
    "p_channel_details",
```

```

        "p_start_date_sk",
        "p_promo_name"
    ]
}
],
"NextToken": "2MDA2MTgwNiwibmFub3MiOjE0MDAwMDAwMH19"
}

```

For more information, see [Data filtering and cell-level security in Lake Formation](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [ListDataCellsFilter](#) in *AWS CLI Command Reference*.

list-permissions

The following code example shows how to use `list-permissions`.

AWS CLI

Example 1: To retrieve list of principal permissions on the resource

The following `list-permissions` example returns a list of principal permissions on the database resources.

```
aws lakeformation list-permissions \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "CatalogId": "123456789111",
  "ResourceType": "DATABASE",
  "MaxResults": 2
}
```

Output:

```
{
  "PrincipalResourcePermissions": [{
    "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
campaign-manager"
    }
  }
]
```

```

    },
    "Resource": {
      "Database": {
        "CatalogId": "123456789111",
        "Name": "tpc"
      }
    },
    "Permissions": [
      "DESCRIBE"
    ],
    "PermissionsWithGrantOption": []
  ]],
  "NextToken":
  "E5S1JDSTZ1eUp6SWpvaU9UQTN0RE0zTXpFeE5Ua3pJbjE5TENKbGVIQnBjbUYwYVc5dUlqcDdJbk5sWTI5dVpITW1P
}

```

For more information, see [Managing Lake Formation permissions](#) in the *AWS Lake Formation Developer Guide*.

Example 2: To retrieve list of principal permissions on the table with data filters

The following `list-permissions` example list the permissions on the table with related data filters granted to the principal.

```

aws lakeformation list-permissions \
  --cli-input-json file://input.json

```

Contents of `input.json`:

```

{
  "CatalogId": "123456789111",
  "Resource": {
    "Table": {
      "CatalogId": "123456789111",
      "DatabaseName": "tpc",
      "Name": "dl_tpc_customer"
    }
  },
  "IncludeRelated": "TRUE",
  "MaxResults": 10
}

```

Output:

```
{
  "PrincipalResourcePermissions": [{
    "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/
Admin"
    },
    "Resource": {
      "Table": {
        "CatalogId": "123456789111",
        "DatabaseName": "customer",
        "Name": "customer_invoice"
      }
    },
    "Permissions": [
      "ALL",
      "ALTER",
      "DELETE",
      "DESCRIBE",
      "DROP",
      "INSERT"
    ],
    "PermissionsWithGrantOption": [
      "ALL",
      "ALTER",
      "DELETE",
      "DESCRIBE",
      "DROP",
      "INSERT"
    ]
  }],
  {
    "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/
Admin"
    },
    "Resource": {
      "TableWithColumns": {
        "CatalogId": "123456789111",
        "DatabaseName": "customer",
        "Name": "customer_invoice",
        "ColumnWildcard": {}
      }
    }
  }
}
```

```

    },
    "Permissions": [
      "SELECT"
    ],
    "PermissionsWithGrantOption": [
      "SELECT"
    ]
  },
  {
    "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:role/
Admin"
    },
    "Resource": {
      "DataCellsFilter": {
        "TableCatalogId": "123456789111",
        "DatabaseName": "customer",
        "TableName": "customer_invoice",
        "Name": "dl_us_customer"
      }
    },
    "Permissions": [
      "DESCRIBE",
      "SELECT",
      "DROP"
    ],
    "PermissionsWithGrantOption": []
  }
],
"NextToken": "VyeUFjY291bnRQZXJtaXNzaW9ucyI6ZmFsc2V9"
}

```

For more information, see [Managing Lake Formation permissions](#) in the *AWS Lake Formation Developer Guide*.

Example 3: To retrieve list of principal permissions on the LF-Tags

The following `list-permissions` example list the permissions on the LF-Tags granted to the principal.

```

aws lakeformation list-permissions \
  --cli-input-json file://input.json

```

Contents of input.json:

```
{
  "CatalogId": "123456789111",
  "Resource": {
    "LFTag": {
      "CatalogId": "123456789111",
      "TagKey": "category",
      "TagValues": [
        "private"
      ]
    }
  },
  "MaxResults": 10
}
```

Output:

```
{
  "PrincipalResourcePermissions": [{
    "Principal": {
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-admin"
    },
    "Resource": {
      "LFTag": {
        "CatalogId": "123456789111",
        "TagKey": "category",
        "TagValues": [
          "*"
        ]
      }
    },
    "Permissions": [
      "DESCRIBE"
    ],
    "PermissionsWithGrantOption": [
      "DESCRIBE"
    ]
  },
  {
    "Principal": {
```

```

        "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-
admin"
      },
      "Resource": {
        "LFTag": {
          "CatalogId": "123456789111",
          "TagKey": "category",
          "TagValues": [
            "*"
          ]
        }
      },
      "Permissions": [
        "ASSOCIATE"
      ],
      "PermissionsWithGrantOption": [
        "ASSOCIATE"
      ]
    }
  ],
  "NextToken": "EJwY21GMGFxOxVJanA3SW50cm1pc3Npb25zIjpmYWxzZX0="
}

```

For more information, see [Managing Lake Formation permissions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [ListPermissions](#) in *AWS CLI Command Reference*.

list-resources

The following code example shows how to use `list-resources`.

AWS CLI

To lists the resources managed by the Lake Formation

The following `list-resources` example lists the resources matching the condition that is managed by the Lake Formation.

```

aws lakeformation list-resources \
  --cli-input-json file://input.json

```

Contents of `input.json`:

```
{
  "FilterConditionList": [{
    "Field": "ROLE_ARN",
    "ComparisonOperator": "CONTAINS",
    "StringValueList": [
      "123456789111"
    ]
  }],
  "MaxResults": 10
}
```

Output:

```
{
  "ResourceInfoList": [{
    "ResourceArn": "arn:aws:s3:::lf-data-lake-123456789111",
    "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole",
    "LastModified": "2022-07-21T02:12:46.669000+00:00"
  },
  {
    "ResourceArn": "arn:aws:s3:::lf-emr-test-123456789111",
    "RoleArn": "arn:aws:iam::123456789111:role/EMRLFS3Role",
    "LastModified": "2022-07-29T16:22:03.211000+00:00"
  }
  ]
}
```

For more information, see [Managing Lake Formation permissions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [ListResources](#) in *AWS CLI Command Reference*.

list-transactions

The following code example shows how to use `list-transactions`.

AWS CLI

To list all transactions details

The following `list-transactions` example returns metadata about transactions and their status.

```
aws lakeformation list-transactions \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "CatalogId": "123456789111",  
  "StatusFilter": "ALL",  
  "MaxResults": 3  
}
```

Output:

```
{  
  "Transactions": [{  
    "TransactionId": "1234569f08804cb790d950d4d0fe485e",  
    "TransactionStatus": "committed",  
    "TransactionStartTime": "2022-08-10T14:32:29.220000+00:00",  
    "TransactionEndTime": "2022-08-10T14:32:33.751000+00:00"  
  },  
  {  
    "TransactionId": "12345972ca8347b89825e33c5774aec4",  
    "TransactionStatus": "committed",  
    "TransactionStartTime": "2022-08-10T14:29:04.046000+00:00",  
    "TransactionEndTime": "2022-08-10T14:29:09.681000+00:00"  
  },  
  {  
    "TransactionId": "12345daf6cb047dbba8ad9b0414613b2",  
    "TransactionStatus": "committed",  
    "TransactionStartTime": "2022-08-10T13:56:51.261000+00:00",  
    "TransactionEndTime": "2022-08-10T13:56:51.547000+00:00"  
  }  
  ],  
  "NextToken": "77X1ebypsI7os+X21hHsZLGNC DK3nNGpwRdFpicS0Hg cX1/  
QMoniUAKcpR3kj3ts3PVdMA=="  
}
```

For more information, see [Reading from and writing to the data lake within transactions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [ListTransactions](#) in *AWS CLI Command Reference*.

put-data-lake-settings

The following code example shows how to use `put-data-lake-settings`.

AWS CLI

To set AWS Lake Formation-managed data lake settings

The following `put-data-lake-settings` example sets the list of data lake administrators and other data lake settings.

```
aws lakeformation put-data-lake-settings \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "DataLakeSettings": {  
    "DataLakeAdmins": [{  
      "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-  
admin"  
    }  
  ],  
  "CreateDatabaseDefaultPermissions": [],  
  "CreateTableDefaultPermissions": [],  
  "TrustedResourceOwners": [],  
  "AllowExternalDataFiltering": true,  
  "ExternalDataFilteringAllowList": [{  
    "DataLakePrincipalIdentifier": "123456789111"  
  }],  
  "AuthorizedSessionTagValueList": ["Amazon EMR"]  
}
```

This command produces no output.

For more information, see [Changing the default security settings for your data lake](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [PutDataLakeSettings](#) in *AWS CLI Command Reference*.

register-resource

The following code example shows how to use `register-resource`.

AWS CLI

Example 1: To register data lake storage using Service Linked Role

The following `register-resource` example registers the resource as managed by the Lake Formation using Service linked role.

```
aws lakeformation register-resource \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123",  
  "UseServiceLinkedRole": true  
}
```

This command produces no output.

For more information, see [Adding an Amazon S3 location to your data lake](#) in the *AWS Lake Formation Developer Guide*.

Example 2: To register data lake storage using custom role

The following `register-resource` example registers the resource as managed by the Lake Formation using custom role.

```
aws lakeformation register-resource \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "ResourceArn": "arn:aws:s3:::lf-emr-athena-result-123",  
  "UseServiceLinkedRole": false,  
  "RoleArn": "arn:aws:iam::123456789111:role/LF-GlueServiceRole"  
}
```

This command produces no output.

For more information, see [Adding an Amazon S3 location to your data lake](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [RegisterResource](#) in *AWS CLI Command Reference*.

remove-lf-tags-from-resource

The following code example shows how to use `remove-lf-tags-from-resource`.

AWS CLI

To remove LF-Tag from a resource

The following `remove-lf-tags-from-resource` example removes the LF-Tag association with the table resource.

```
aws lakeformation remove-lf-tags-from-resource \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "CatalogId": "123456789111",  
  "Resource": {  
    "Table": {  
      "CatalogId": "123456789111",  
      "DatabaseName": "tpc",  
      "Name": "dl_tpc_promotion"  
    }  
  },  
  "LFTags": [{  
    "CatalogId": "123456789111",  
    "TagKey": "usergroup",  
    "TagValues": [  
      "developer"  
    ]  
  }]  
}
```

Output:

```
{
  "Failures": []
}
```

For more information, see [Assigning LF-Tags to Data Catalog resources](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [RemoveLfTagsFromResource](#) in *AWS CLI Command Reference*.

revoke-permissions

The following code example shows how to use `revoke-permissions`.

AWS CLI

To revoke permissions on resources from the principal

The following `revoke-permissions` example revoke principal access to specific table of a given database.

```
aws lakeformation revoke-permissions \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "CatalogId": "123456789111",
  "Principal": {
    "DataLakePrincipalIdentifier": "arn:aws:iam::123456789111:user/lf-developer"
  },
  "Resource": {
    "Table": {
      "CatalogId": "123456789111",
      "DatabaseName": "tpc",
      "Name": "dl_tpc_promotion"
    }
  },
  "Permissions": [
    "ALL"
  ],
  "PermissionsWithGrantOption": []
}
```

This command produces no output.

For more information, see [Granting and revoking permissions on Data Catalog resources](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [RevokePermissions](#) in *AWS CLI Command Reference*.

search-databases-by-lf-tags

The following code example shows how to use search-databases-by-lf-tags.

AWS CLI

To search on database resources by LFTags

The following search-databases-by-lf-tags example search on database resources matching LFTag expression.

```
aws lakeformation search-databases-by-lf-tags \  
  --cli-input-json file://input.json
```

Contents of input.json:

```
{  
  "MaxResults": 1,  
  "CatalogId": "123456789111",  
  "Expression": [{  
    "TagKey": "usergroup",  
    "TagValues": [  
      "developer"  
    ]  
  }]  
}
```

Output:

```
{  
  "DatabaseList": [{  
    "Database": {  
      "CatalogId": "123456789111",  
      "Name": "tpc"  
    },  
  },  
}
```

```
    "LFTags": [{
      "CatalogId": "123456789111",
      "TagKey": "usergroup",
      "TagValues": [
        "developer"
      ]
    }]
  ]
}
```

For more information, see [Viewing the resources that a LF-Tag is assigned to](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [SearchDatabasesByLfTags](#) in *AWS CLI Command Reference*.

search-tables-by-lf-tags

The following code example shows how to use `search-tables-by-lf-tags`.

AWS CLI

To search on table resources by LFTags

The following `search-tables-by-lf-tags` example search on table resources matching LFTag expression.

```
aws lakeformation search-tables-by-lf-tags \
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{
  "MaxResults": 2,
  "CatalogId": "123456789111",
  "Expression": [{
    "TagKey": "usergroup",
    "TagValues": [
      "developer"
    ]
  }]
}
```

Output:

```
{
  "NextToken": "c2VhcmNoQWxsVGFnc0luVGFibGVzIjpmYWxzZX0=",
  "TableList": [{
    "Table": {
      "CatalogId": "123456789111",
      "DatabaseName": "tpc",
      "Name": "dl_tpc_item"
    },
    "LFTagOnDatabase": [{
      "CatalogId": "123456789111",
      "TagKey": "usergroup",
      "TagValues": [
        "developer"
      ]
    }
  ]},
  "LFTagsOnTable": [{
    "CatalogId": "123456789111",
    "TagKey": "usergroup",
    "TagValues": [
      "developer"
    ]
  }
  ],
  "LFTagsOnColumns": [{
    "Name": "i_item_desc",
    "LFTags": [{
      "CatalogId": "123456789111",

      ]
    }]
  }
]
}]
}
```

For more information, see [Viewing the resources that a LF-Tag is assigned to](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [SearchTablesByLfTags](#) in *AWS CLI Command Reference*.

start-query-planning

The following code example shows how to use start-query-planning.

AWS CLI

To process query statement

The following start-query-planning example submits a request to process a query statement.

```
aws lakeformation start-query-planning \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "QueryPlanningContext": {  
    "CatalogId": "012345678901",  
    "DatabaseName": "tpc"  
  },  
  "QueryString": "select * from dl_tpc_household_demographics_gov where  
hd_income_band_sk=9"  
}
```

Output:

```
{  
  "QueryId": "772a273f-4a62-4cda-8d98-69615ee8be9b"  
}
```

For more information, see [Reading from and writing to the data lake within transactions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [StartQueryPlanning](#) in *AWS CLI Command Reference*.

start-transaction

The following code example shows how to use `start-transaction`.

AWS CLI

To start new transaction

The following `start-transaction` example starts a new transaction and returns its transaction ID.

```
aws lakeformation start-transaction \  
  --transaction-type = 'READ_AND_WRITE'
```

Output:

```
{
  "TransactionId": "b014d972ca8347b89825e33c5774aec4"
}
```

For more information, see [Reading from and writing to the data lake within transactions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [StartTransaction](#) in *AWS CLI Command Reference*.

update-lf-tag

The following code example shows how to use `update-lf-tag`.

AWS CLI

To update LF-Tag definition

The following `update-lf-tag` example updates LF-Tag definition.

```
aws lakeformation update-lf-tag \
  --catalog-id '123456789111' \
  --tag-key 'usergroup' \
  --tag-values-to-add ['"admin"']
```

This command produces no output.

For more information, see [Managing LF-Tags for metadata access control](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [UpdateLfTag](#) in *AWS CLI Command Reference*.

update-table-objects

The following code example shows how to use `update-table-objects`.

AWS CLI

To modify objects of governed table

The following `update-table-objects` example adds provided S3 objects to the specified governed table.

```
aws lakeformation update-table-objects \  
  --cli-input-json file://input.json
```

Contents of `input.json`:

```
{  
  "CatalogId": "012345678901",  
  "DatabaseName": "tpc",  
  "TableName": "dl_tpc_household_demographics_gov",  
  "TransactionId": "12347a9f75424b9b915f6ff201d2a190",  
  "WriteOperations": [{  
    "AddObject": {  
      "Uri": "s3://lf-data-lake-012345678901/target/  
dl_tpc_household_demographics_gov/run-unnamed-1-part-block-0-r-00000-snappy-  
ff26b17504414fe88b302cd795eabd00.parquet",  
      "ETag": "1234ab1fc50a316b149b4e1f21a73800",  
      "Size": 42200  
    }  
  }  
}]  
}
```

This command produces no output.

For more information, see [Reading from and writing to the data lake within transactions](#) in the *AWS Lake Formation Developer Guide*.

- For API details, see [UpdateTableObjects](#) in *AWS CLI Command Reference*.

Lambda examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lambda.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

add-layer-version-permission

The following code example shows how to use `add-layer-version-permission`.

AWS CLI

To add permissions to a layer version

The following `add-layer-version-permission` example grants permission for the specified account to use version 1 of the layer `my-layer`.

```
aws lambda add-layer-version-permission \  
  --layer-name my-layer \  
  --statement-id xaccount \  
  --action lambda:GetLayerVersion \  
  --principal 123456789012 \  
  --version-number 1
```

Output:

```
{  
  "RevisionId": "35d87451-f796-4a3f-a618-95a3671b0a0c",  
  "Statement":  
  {  
    "Sid": "xaccount",  
    "Effect": "Allow",  
    "Principal": {  
      "AWS": "arn:aws:iam::210987654321:root"  
    },  
    "Action": "lambda:GetLayerVersion",  
    "Resource": "arn:aws:lambda:us-east-2:123456789012:layer:my-layer:1"  
  }  
}
```

For more information, see [AWS Lambda Layers](#) in the *AWS Lambda Developer Guide*.

- For API details, see [AddLayerVersionPermission](#) in *AWS CLI Command Reference*.

add-permission

The following code example shows how to use `add-permission`.

AWS CLI

To add permissions to an existing Lambda function

The following `add-permission` example grants the Amazon SNS service permission to invoke a function named `my-function`.

```
aws lambda add-permission \  
  --function-name my-function \  
  --action lambda:InvokeFunction \  
  --statement-id sns \  
  --principal sns.amazonaws.com
```

Output:

```
{  
  "Statement":  
  {  
    "Sid": "sns",  
    "Effect": "Allow",  
    "Principal": {  
      "Service": "sns.amazonaws.com"  
    },  
    "Action": "lambda:InvokeFunction",  
    "Resource": "arn:aws:lambda:us-east-2:123456789012:function:my-function"  
  }  
}
```

For more information, see [Using Resource-based Policies for AWS Lambda](#) in the *AWS Lambda Developer Guide*.

- For API details, see [AddPermission](#) in *AWS CLI Command Reference*.

create-alias

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias for a Lambda function

The following `create-alias` example creates an alias named `LIVE` that points to version 1 of the `my-function` Lambda function.

```
aws lambda create-alias \  
  --function-name my-function \  
  --description "alias for live version of function" \  
  --function-version 1 \  
  --name LIVE
```

Output:

```
{  
  "FunctionVersion": "1",  
  "Name": "LIVE",  
  "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",  
  "RevisionId": "873282ed-4cd3-4dc8-a069-d0c647e470c6",  
  "Description": "alias for live version of function"  
}
```

For more information, see [Configuring AWS Lambda Function Aliases](#) in the *AWS Lambda Developer Guide*.

- For API details, see [CreateAlias](#) in *AWS CLI Command Reference*.

create-event-source-mapping

The following code example shows how to use `create-event-source-mapping`.

AWS CLI

To create a mapping between an event source and an AWS Lambda function

The following `create-event-source-mapping` example creates a mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda create-event-source-mapping \  
  --function-name my-function \  
  --event-source-arn sqs:us-west-2:123456789012:queue/my-queue
```

```
--batch-size 5 \  
--event-source-arn arn:aws:sqs:us-west-2:123456789012:mySQSqueue
```

Output:

```
{  
  "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",  
  "StateTransitionReason": "USER_INITIATED",  
  "LastModified": 1569284520.333,  
  "BatchSize": 5,  
  "State": "Creating",  
  "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",  
  "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"  
}
```

For more information, see [AWS Lambda Event Source Mapping](#) in the *AWS Lambda Developer Guide*.

- For API details, see [CreateEventSourceMapping](#) in *AWS CLI Command Reference*.

create-function

The following code example shows how to use `create-function`.

AWS CLI

To create a Lambda function

The following `create-function` example creates a Lambda function named `my-function`.

```
aws lambda create-function \  
  --function-name my-function \  
  --runtime nodejs18.x \  
  --zip-file fileb://my-function.zip \  
  --handler my-function.handler \  
  --role arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-tges6bf4
```

Contents of `my-function.zip`:

This file is a deployment package that contains your function code and any dependencies.

Output:

```
{
  "TracingConfig": {
    "Mode": "PassThrough"
  },
  "CodeSha256": "PFn4S+er27qk+UuZSTKEQfNKG/XNn7QJs90mJgq6oH8=",
  "FunctionName": "my-function",
  "CodeSize": 308,
  "RevisionId": "873282ed-4cd3-4dc8-a069-d0c647e470c6",
  "MemorySize": 128,
  "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
  "Version": "$LATEST",
  "Role": "arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-zgur6bf4",
  "Timeout": 3,
  "LastModified": "2023-10-14T22:26:11.234+0000",
  "Handler": "my-function.handler",
  "Runtime": "nodejs18.x",
  "Description": ""
}
```

For more information, see [AWS Lambda Function Configuration](#) in the *AWS Lambda Developer Guide*.

- For API details, see [CreateFunction](#) in *AWS CLI Command Reference*.

delete-alias

The following code example shows how to use `delete-alias`.

AWS CLI

To delete an alias of a Lambda function

The following `delete-alias` example deletes the alias named `LIVE` from the `my-function` Lambda function.

```
aws lambda delete-alias \
  --function-name my-function \
  --name LIVE
```

This command produces no output.

For more information, see [Configuring AWS Lambda Function Aliases](#) in the *AWS Lambda Developer Guide*.

- For API details, see [DeleteAlias](#) in *AWS CLI Command Reference*.

delete-event-source-mapping

The following code example shows how to use `delete-event-source-mapping`.

AWS CLI

To delete the mapping between an event source and an AWS Lambda function

The following `delete-event-source-mapping` example deletes the mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda delete-event-source-mapping \  
  --uuid a1b2c3d4-5678-90ab-cdef-11111EXAMPLE
```

Output:

```
{  
  "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",  
  "StateTransitionReason": "USER_INITIATED",  
  "LastModified": 1569285870.271,  
  "BatchSize": 5,  
  "State": "Deleting",  
  "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",  
  "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"  
}
```

For more information, see [AWS Lambda Event Source Mapping](#) in the *AWS Lambda Developer Guide*.

- For API details, see [DeleteEventSourceMapping](#) in *AWS CLI Command Reference*.

delete-function-concurrency

The following code example shows how to use `delete-function-concurrency`.

AWS CLI

To remove the reserved concurrent execution limit from a function

The following `delete-function-concurrency` example deletes the reserved concurrent execution limit from the `my-function` function.

```
aws lambda delete-function-concurrency \  
  --function-name my-function
```

This command produces no output.

For more information, see [Reserving Concurrency for a Lambda Function](#) in the *AWS Lambda Developer Guide*.

- For API details, see [DeleteFunctionConcurrency](#) in *AWS CLI Command Reference*.

`delete-function-event-invoke-config`

The following code example shows how to use `delete-function-event-invoke-config`.

AWS CLI

To delete an asynchronous invocation configuration

The following `delete-function-event-invoke-config` example deletes the asynchronous invocation configuration for the GREEN alias of the specified function.

```
aws lambda delete-function-event-invoke-config --function-name my-function:GREEN
```

- For API details, see [DeleteFunctionEventInvokeConfig](#) in *AWS CLI Command Reference*.

`delete-function`

The following code example shows how to use `delete-function`.

AWS CLI

Example 1: To delete a Lambda function by function name

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's name.

```
aws lambda delete-function \  
  --function-name my-function
```

This command produces no output.

Example 2: To delete a Lambda function by function ARN

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's ARN.

```
aws lambda delete-function \  
  --function-name arn:aws:lambda:us-west-2:123456789012:function:my-function
```

This command produces no output.

Example 3: To delete a Lambda function by partial function ARN

The following `delete-function` example deletes the Lambda function named `my-function` by specifying the function's partial ARN.

```
aws lambda delete-function \  
  --function-name 123456789012:function:my-function
```

This command produces no output.

For more information, see [AWS Lambda Function Configuration](#) in the *AWS Lambda Developer Guide*.

- For API details, see [DeleteFunction](#) in *AWS CLI Command Reference*.

delete-layer-version

The following code example shows how to use `delete-layer-version`.

AWS CLI

To delete a version of a Lambda layer

The following `delete-layer-version` example deletes version 2 of the layer named `my-layer`.

```
aws lambda delete-layer-version \  
  --layer-name my-layer \  
  --version-number 2
```

This command produces no output.

For more information, see [AWS Lambda Layers](#) in the *AWS Lambda Developer Guide*.

- For API details, see [DeleteLayerVersion](#) in *AWS CLI Command Reference*.

delete-provisioned-concurrency-config

The following code example shows how to use `delete-provisioned-concurrency-config`.

AWS CLI

To delete a provisioned concurrency configuration

The following `delete-provisioned-concurrency-config` example deletes the provisioned concurrency configuration for the GREEN alias of the specified function.

```
aws lambda delete-provisioned-concurrency-config \  
  --function-name my-function \  
  --qualifier GREEN
```

- For API details, see [DeleteProvisionedConcurrencyConfig](#) in *AWS CLI Command Reference*.

get-account-settings

The following code example shows how to use `get-account-settings`.

AWS CLI

To retrieve details about your account in an AWS Region

The following `get-account-settings` example displays the Lambda limits and usage information for your account.

```
aws lambda get-account-settings
```

Output:

```
{
  "AccountLimit": {
    "CodeSizeUnzipped": 262144000,
    "UnreservedConcurrentExecutions": 1000,
    "ConcurrentExecutions": 1000,
    "CodeSizeZipped": 52428800,
    "TotalCodeSize": 80530636800
  },
  "AccountUsage": {
    "FunctionCount": 4,
    "TotalCodeSize": 9426
  }
}
```

For more information, see [AWS Lambda Limits](#) in the *AWS Lambda Developer Guide*.

- For API details, see [GetAccountSettings](#) in *AWS CLI Command Reference*.

get-alias

The following code example shows how to use `get-alias`.

AWS CLI

To retrieve details about a function alias

The following `get-alias` example displays details for the alias named `LIVE` on the `my-function` Lambda function.

```
aws lambda get-alias \
  --function-name my-function \
  --name LIVE
```

Output:

```
{
  "FunctionVersion": "3",
  "Name": "LIVE",
  "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",
  "RevisionId": "594f41fb-b85f-4c20-95c7-6ca5f2a92c93",
  "Description": "alias for live version of function"
```

```
}
```

For more information, see [Configuring AWS Lambda Function Aliases](#) in the *AWS Lambda Developer Guide*.

- For API details, see [GetAlias](#) in *AWS CLI Command Reference*.

get-event-source-mapping

The following code example shows how to use `get-event-source-mapping`.

AWS CLI

To retrieve details about an event source mapping

The following `get-event-source-mapping` example displays the details for the mapping between an SQS queue and the `my-function` Lambda function.

```
aws lambda get-event-source-mapping \  
  --uuid "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE"
```

Output:

```
{  
  "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",  
  "StateTransitionReason": "USER_INITIATED",  
  "LastModified": 1569284520.333,  
  "BatchSize": 5,  
  "State": "Enabled",  
  "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",  
  "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"  
}
```

For more information, see [AWS Lambda Event Source Mapping](#) in the *AWS Lambda Developer Guide*.

- For API details, see [GetEventSourceMapping](#) in *AWS CLI Command Reference*.

get-function-concurrency

The following code example shows how to use `get-function-concurrency`.

AWS CLI

To view the reserved concurrency setting for a function

The following `get-function-concurrency` example retrieves the reserved concurrency setting for the specified function.

```
aws lambda get-function-concurrency \  
  --function-name my-function
```

Output:

```
{  
  "ReservedConcurrentExecutions": 250  
}
```

- For API details, see [GetFunctionConcurrency](#) in *AWS CLI Command Reference*.

get-function-configuration

The following code example shows how to use `get-function-configuration`.

AWS CLI

To retrieve the version-specific settings of a Lambda function

The following `get-function-configuration` example displays the settings for version 2 of the `my-function` function.

```
aws lambda get-function-configuration \  
  --function-name my-function:2
```

Output:

```
{  
  "FunctionName": "my-function",  
  "LastModified": "2019-09-26T20:28:40.438+0000",  
  "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",  
  "MemorySize": 256,  
  "Version": "2",  
  "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qq",  
  "Timeout": 3,  
}
```

```
"Runtime": "nodejs10.x",
"TracingConfig": {
  "Mode": "PassThrough"
},
"CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJm1KidWoaCgk=",
"Description": "",
"VpcConfig": {
  "SubnetIds": [],
  "VpcId": "",
  "SecurityGroupIds": []
},
"CodeSize": 304,
"FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:2",
"Handler": "index.handler"
}
```

For more information, see [AWS Lambda Function Configuration](#) in the *AWS Lambda Developer Guide*.

- For API details, see [GetFunctionConfiguration](#) in *AWS CLI Command Reference*.

get-function-event-invoke-config

The following code example shows how to use `get-function-event-invoke-config`.

AWS CLI

To view an asynchronous invocation configuration

The following `get-function-event-invoke-config` example retrieves the asynchronous invocation configuration for the BLUE alias of the specified function.

```
aws lambda get-function-event-invoke-config \
  --function-name my-function:BLUE
```

Output:

```
{
  "LastModified": 1577824396.653,
  "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:BLUE",
  "MaximumRetryAttempts": 0,
  "MaximumEventAgeInSeconds": 3600,
}
```

```
"DestinationConfig": {
  "OnSuccess": {},
  "OnFailure": {
    "Destination": "arn:aws:sqs:us-east-2:123456789012:failed-invocations"
  }
}
```

- For API details, see [GetFunctionEventInvokeConfig](#) in *AWS CLI Command Reference*.

get-function

The following code example shows how to use `get-function`.

AWS CLI

To retrieve information about a function

The following `get-function` example displays information about the `my-function` function.

```
aws lambda get-function \
  --function-name my-function
```

Output:

```
{
  "Concurrency": {
    "ReservedConcurrentExecutions": 100
  },
  "Code": {
    "RepositoryType": "S3",
    "Location": "https://awslambda-us-west-2-tasks.s3.us-west-2.amazonaws.com/snapshots/123456789012/my-function..."
  },
  "Configuration": {
    "TracingConfig": {
      "Mode": "PassThrough"
    },
    "Version": "$LATEST",
    "CodeSha256": "5tT2qgzYUHoqwR616pZ2dpkn/0J1FrzJm1KidWaaCgk=",
    "FunctionName": "my-function",
    "VpcConfig": {
```

```

        "SubnetIds": [],
        "VpcId": "",
        "SecurityGroupIds": []
    },
    "MemorySize": 128,
    "RevisionId": "28f0fb31-5c5c-43d3-8955-03e76c5c1075",
    "CodeSize": 304,
    "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
    "Handler": "index.handler",
    "Role": "arn:aws:iam::123456789012:role/service-role/helloWorldPython-role-uy3l9qq",
    "Timeout": 3,
    "LastModified": "2019-09-24T18:20:35.054+0000",
    "Runtime": "nodejs10.x",
    "Description": ""
}
}

```

For more information, see [AWS Lambda Function Configuration](#) in the *AWS Lambda Developer Guide*.

- For API details, see [GetFunction](#) in *AWS CLI Command Reference*.

get-layer-version-by-arn

The following code example shows how to use `get-layer-version-by-arn`.

AWS CLI

To retrieve information about a Lambda layer version

The following `get-layer-version-by-arn` example displays information about the layer version with the specified Amazon Resource Name (ARN).

```

aws lambda get-layer-version-by-arn \
  --arn "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-Python311-SciPy1x:2"

```

Output:

```

{
  "LayerVersionArn": "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-Python311-SciPy1x:2",

```

```

    "Description": "AWS Lambda SciPy layer for Python 3.11 (scipy-1.1.0,
numpy-1.15.4) https://github.com/scipy/scipy/releases/tag/v1.1.0 https://
github.com/numpy/numpy/releases/tag/v1.15.4",
    "CreateDate": "2023-10-12T10:09:38.398+0000",
    "LayerArn": "arn:aws:lambda:us-west-2:123456789012:layer:AWSLambda-Python311-

  }

```

For more information, see [AWS Lambda Layers](#) in the *AWS Lambda Developer Guide*.

- For API details, see [GetLayerVersionByArn](#) in *AWS CLI Command Reference*.

get-layer-version-policy

The following code example shows how to use `get-layer-version-policy`.

AWS CLI

To retrieve the permissions policy for a Lambda layer version

The following `get-layer-version-policy` example displays policy information about version 1 for the layer named `my-layer`.

```

aws lambda get-layer-version-policy \
  --layer-name my-layer \
  --version-number 1

```

Output:

```
{
```

```

    "Policy": {
      "Version": "2012-10-17",
      "Id": "default",
      "Statement": [
        {
          "Sid": "xaccount",
          "Effect": "Allow",
          "Principal": {"AWS": "arn:aws:iam::123456789012:root"},
          "Action": "lambda:GetLayerVersion",
          "Resource": "arn:aws:lambda:us-west-2:123456789012:layer:my-layer:1"
        }
      ],
      "RevisionId": "c68f21d2-cbf0-4026-90f6-1375ee465cd0"
    }
  }
}

```

For more information, see [AWS Lambda Layers](#) in the *AWS Lambda Developer Guide*.

- For API details, see [GetLayerVersionPolicy](#) in *AWS CLI Command Reference*.

get-layer-version

The following code example shows how to use `get-layer-version`.

AWS CLI

To retrieve information about a Lambda layer version

The following `get-layer-version` example displays information for version 1 of the layer named `my-layer`.

```

aws lambda get-layer-version \
  --layer-name my-layer \
  --version-number 1

```

Output:

```

{
  "Content": {
    "Location": "https://awslambda-us-east-2-layers.s3.us-east-2.amazonaws.com/snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?versionId=27iWyA73cCAYqyH...",

```

```

    "CodeSha256": "tv9jJ0+rPbXUUXuRKi7CwHzKtLDkDRJLB3cC3Z/ouXo=",
    "CodeSize": 169
  },
  "LayerArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-layer",
  "LayerVersionArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-layer:1",
  "Description": "My Python layer",
  "CreateDate": "2018-11-14T23:03:52.894+0000",
  "Version": 1,
  "LicenseInfo": "MIT",
  "CompatibleRuntimes": [
    "python3.10",
    "python3.11"
  ]
}

```

For more information, see [AWS Lambda Layers](#) in the *AWS Lambda Developer Guide*.

- For API details, see [GetLayerVersion](#) in *AWS CLI Command Reference*.

get-policy

The following code example shows how to use get-policy.

AWS CLI

To retrieve the resource-based IAM policy for a function, version, or alias

The following get-policy example displays policy information about the my-function Lambda function.

```
aws lambda get-policy \
  --function-name my-function
```

Output:

```

{
  "Policy": {
    "Version": "2012-10-17",
    "Id": "default",
    "Statement": [
      {
        "Sid": "iot-events",

```

```

        "Effect": "Allow",
        "Principal": {"Service": "iotevents.amazonaws.com"},
        "Action": "lambda:InvokeFunction",
        "Resource": "arn:aws:lambda:us-west-2:123456789012:function:my-
function"
    }
]
},
"RevisionId": "93017fc9-59cb-41dc-901b-4845ce4bf668"
}

```

For more information, see [Using Resource-based Policies for AWS Lambda](#) in the *AWS Lambda Developer Guide*.

- For API details, see [GetPolicy](#) in *AWS CLI Command Reference*.

get-provisioned-concurrency-config

The following code example shows how to use `get-provisioned-concurrency-config`.

AWS CLI

To view a provisioned concurrency configuration

The following `get-provisioned-concurrency-config` example displays details for the provisioned concurrency configuration for the BLUE alias of the specified function.

```

aws lambda get-provisioned-concurrency-config \
  --function-name my-function \
  --qualifier BLUE

```

Output:

```

{
  "RequestedProvisionedConcurrentExecutions": 100,
  "AvailableProvisionedConcurrentExecutions": 100,
  "AllocatedProvisionedConcurrentExecutions": 100,
  "Status": "READY",
  "LastModified": "2019-12-31T20:28:49+0000"
}

```

- For API details, see [GetProvisionedConcurrencyConfig](#) in *AWS CLI Command Reference*.

invoke

The following code example shows how to use `invoke`.

AWS CLI

Example 1: To invoke a Lambda function synchronously

The following `invoke` example invokes the `my-function` function synchronously. The `cli-binary-format` option is required if you're using AWS CLI version 2. For more information, see [AWS CLI supported global command line options](#) in the *AWS Command Line Interface User Guide*.

```
aws lambda invoke \  
  --function-name my-function \  
  --cli-binary-format raw-in-base64-out \  
  --payload '{ "name": "Bob" }' \  
  response.json
```

Output:

```
{  
  "ExecutedVersion": "$LATEST",  
  "StatusCode": 200  
}
```

For more information, see [Synchronous Invocation](#) in the *AWS Lambda Developer Guide*.

Example 2: To invoke a Lambda function asynchronously

The following `invoke` example invokes the `my-function` function asynchronously. The `cli-binary-format` option is required if you're using AWS CLI version 2. For more information, see [AWS CLI supported global command line options](#) in the *AWS Command Line Interface User Guide*.

```
aws lambda invoke \  
  --function-name my-function \  
  --invocation-type Event \  
  --cli-binary-format raw-in-base64-out \  
  --payload '{ "name": "Bob" }' \  
  response.json
```

Output:

```
{
  "StatusCode": 202
}
```

For more information, see [Asynchronous Invocation](#) in the *AWS Lambda Developer Guide*.

- For API details, see [Invoke](#) in *AWS CLI Command Reference*.

list-aliases

The following code example shows how to use `list-aliases`.

AWS CLI**To retrieve the list of aliases for a Lambda function**

The following `list-aliases` example displays a list of the aliases for the `my-function` Lambda function.

```
aws lambda list-aliases \
  --function-name my-function
```

Output:

```
{
  "Aliases": [
    {
      "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:BETA",
      "RevisionId": "a410117f-ab16-494e-8035-7e204bb7933b",
      "FunctionVersion": "2",
      "Name": "BETA",
      "Description": "alias for beta version of function"
    },
    {
      "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function:LIVE",
      "RevisionId": "21d40116-f8b1-40ba-9360-3ea284da1bb5",
      "FunctionVersion": "1",
      "Name": "LIVE",
      "Description": "alias for live version of function"
    }
  ]
}
```

```
    }
  ]
}
```

For more information, see [Configuring AWS Lambda Function Aliases](#) in the *AWS Lambda Developer Guide*.

- For API details, see [ListAliases](#) in *AWS CLI Command Reference*.

list-event-source-mappings

The following code example shows how to use `list-event-source-mappings`.

AWS CLI

To list the event source mappings for a function

The following `list-event-source-mappings` example displays a list of the event source mappings for the `my-function` Lambda function.

```
aws lambda list-event-source-mappings \
  --function-name my-function
```

Output:

```
{
  "EventSourceMappings": [
    {
      "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",
      "StateTransitionReason": "USER_INITIATED",
      "LastModified": 1569284520.333,
      "BatchSize": 5,
      "State": "Enabled",
      "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-
function",
      "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"
    }
  ]
}
```

For more information, see [AWS Lambda Event Source Mapping](#) in the *AWS Lambda Developer Guide*.

- For API details, see [ListEventSourceMappings](#) in *AWS CLI Command Reference*.

list-function-event-invoke-configs

The following code example shows how to use `list-function-event-invoke-configs`.

AWS CLI

To view a list of asynchronous invocation configurations

The following `list-function-event-invoke-configs` example lists the asynchronous invocation configurations for the specified function.

```
aws lambda list-function-event-invoke-configs \  
  --function-name my-function
```

Output:

```
{  
  "FunctionEventInvokeConfigs": [  
    {  
      "LastModified": 1577824406.719,  
      "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-  
function:GREEN",  
      "MaximumRetryAttempts": 2,  
      "MaximumEventAgeInSeconds": 1800  
    },  
    {  
      "LastModified": 1577824396.653,  
      "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-  
function:BLUE",  
      "MaximumRetryAttempts": 0,  
      "MaximumEventAgeInSeconds": 3600  
    }  
  ]  
}
```

- For API details, see [ListFunctionEventInvokeConfigs](#) in *AWS CLI Command Reference*.

list-functions

The following code example shows how to use `list-functions`.

AWS CLI

To retrieve a list of Lambda functions

The following `list-functions` example displays a list of all of the functions for the current user.

```
aws lambda list-functions
```

Output:

```
{
  "Functions": [
    {
      "TracingConfig": {
        "Mode": "PassThrough"
      },
      "Version": "$LATEST",

list-layer-versions

The following code example shows how to use `list-layer-versions`.

AWS CLI

To list the versions of an AWS Lambda layer

The following `list-layers-versions` example displays information about the versions for the layer named `my-layer`.

```
aws lambda list-layer-versions \
    --layer-name my-layer
```

Output:

```
{
  "Layers": [
    {
      "LayerVersionArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-
layer:2",
      "Version": 2,
      "Description": "My layer",
      "CreateDate": "2023-11-15T00:37:46.592+0000",
      "CompatibleRuntimes": [
        "python3.10",
```

```
        "python3.11"  
      ]  
    }  
  ]  
}
```

For more information, see [AWS Lambda Layers](#) in the *AWS Lambda Developer Guide*.

- For API details, see [ListLayerVersions](#) in *AWS CLI Command Reference*.

list-layers

The following code example shows how to use `list-layers`.

AWS CLI

To list the layers that are compatible with your function's runtime

The following `list-layers` example displays information about layers that are compatible with the Python 3.11 runtime.

```
aws lambda list-layers \  
  --compatible-runtime python3.11
```

Output:

```
{  
  "Layers": [  
    {  
      "LayerName": "my-layer",  
      "LayerArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-layer",  
      "LatestMatchingVersion": {  
        "LayerVersionArn": "arn:aws:lambda:us-east-2:123456789012:layer:my-  
layer:2",  
        "Version": 2,  
        "Description": "My layer",  
        "CreateDate": "2023-11-15T00:37:46.592+0000",  
        "CompatibleRuntimes": [  
          "python3.10",  
          "python3.11"  
        ]  
      }  
    }  
  ]  
}
```

```
]
}
```

For more information, see [AWS Lambda Layers](#) in the *AWS Lambda Developer Guide*.

- For API details, see [ListLayers](#) in *AWS CLI Command Reference*.

list-provisioned-concurrency-configs

The following code example shows how to use `list-provisioned-concurrency-configs`.

AWS CLI

To get a list of provisioned concurrency configurations

The following `list-provisioned-concurrency-configs` example lists the provisioned concurrency configurations for the specified function.

```
aws lambda list-provisioned-concurrency-configs \
  --function-name my-function
```

Output:

```
{
  "ProvisionedConcurrencyConfigs": [
    {
      "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:GREEN",
      "RequestedProvisionedConcurrentExecutions": 100,
      "AvailableProvisionedConcurrentExecutions": 100,
      "AllocatedProvisionedConcurrentExecutions": 100,
      "Status": "READY",
      "LastModified": "2019-12-31T20:29:00+0000"
    },
    {
      "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-
function:BLUE",
      "RequestedProvisionedConcurrentExecutions": 100,
      "AvailableProvisionedConcurrentExecutions": 100,
      "AllocatedProvisionedConcurrentExecutions": 100,
      "Status": "READY",
      "LastModified": "2019-12-31T20:28:49+0000"
    }
  ]
}
```

```
]
}
```

- For API details, see [ListProvisionedConcurrencyConfigs](#) in *AWS CLI Command Reference*.

list-tags

The following code example shows how to use `list-tags`.

AWS CLI

To retrieve the list of tags for a Lambda function

The following `list-tags` example displays the tags attached to the `my-function` Lambda function.

```
aws lambda list-tags \
  --resource arn:aws:lambda:us-west-2:123456789012:function:my-function
```

Output:

```
{
  "Tags": {
    "Category": "Web Tools",
    "Department": "Sales"
  }
}
```

For more information, see [Tagging Lambda Functions](#) in the *AWS Lambda Developer Guide*.

- For API details, see [ListTags](#) in *AWS CLI Command Reference*.

list-versions-by-function

The following code example shows how to use `list-versions-by-function`.

AWS CLI

To retrieve a list of versions of a function

The following `list-versions-by-function` example displays the list of versions for the `my-function` Lambda function.

```
aws lambda list-versions-by-function \  
  --function-name my-function
```

Output:

```
{  
  "Versions": [  
    {  
      "TracingConfig": {  
        "Mode": "PassThrough"  
      },

```

For more information, see [Configuring AWS Lambda Function Aliases](#) in the *AWS Lambda Developer Guide*.

- For API details, see [ListVersionsByFunction](#) in *AWS CLI Command Reference*.

publish-layer-version

The following code example shows how to use `publish-layer-version`.

AWS CLI

To create a Lambda layer version

The following `publish-layer-version` example creates a new Python library layer version. The command retrieves the layer content a file named `layer.zip` in the specified S3 bucket.

```
aws lambda publish-layer-version \  
  --layer-name my-layer \  
  --description "My Python layer" \  
  --license-info "MIT" \  
  --content S3Bucket=lambda-layers-us-west-2-123456789012,S3Key=layer.zip \  
  --compatible-runtimes python3.10 python3.11
```

Output:

```
{  
  "Content": {  
    "Location": "https://awslambda-us-west-2-layers.s3.us-west-2.amazonaws.com/  
snapshots/123456789012/my-layer-4aaa2fbb-ff77-4b0a-ad92-5b78a716a96a?  
versionId=27iWyA73cCAYqyH...",  
    "CodeSha256": "tv9jJ0+rPbXUUXuRKi7CwHzKtLDkDRJLB3cC3Z/ouXo=",  
    "CodeSize": 169  
  },  
  "LayerArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-layer",  
  "LayerVersionArn": "arn:aws:lambda:us-west-2:123456789012:layer:my-layer:1",

  "LicenseInfo": "MIT",  
  "CompatibleRuntimes": [  
    "python3.10",  
    "python3.11"  
  ]  
}
```

```
]
}
```

For more information, see [AWS Lambda Layers](#) in the *AWS Lambda Developer Guide*.

- For API details, see [PublishLayerVersion](#) in *AWS CLI Command Reference*.

publish-version

The following code example shows how to use `publish-version`.

AWS CLI

To publish a new version of a function

The following `publish-version` example publishes a new version of the `my-function` Lambda function.

```
aws lambda publish-version \  
  --function-name my-function
```

Output:

```
{  
  "TracingConfig": {  
    "Mode": "PassThrough"  
  },  
  "CodeSha256": "dBG9m8SGdm1Ejw/JYX1hhvCrAv5TxvXsbl/RM1r0fT/I=",  
  "FunctionName": "my-function",  
  "CodeSize": 294,  
  "RevisionId": "f31d3d39-cc63-4520-97d4-43cd44c94c20",  
  "MemorySize": 128,  
  "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:3",  
  "Version": "2",  
  "Role": "arn:aws:iam::123456789012:role/service-role/MyTestFunction-role-zgur6bf4",  
  "Timeout": 3,  
  "LastModified": "2019-09-23T18:32:33.857+0000",  
  "Handler": "my-function.handler",  
  "Runtime": "nodejs10.x",  
  "Description": ""  
}
```

For more information, see [Configuring AWS Lambda Function Aliases](#) in the *AWS Lambda Developer Guide*.

- For API details, see [PublishVersion](#) in *AWS CLI Command Reference*.

put-function-concurrency

The following code example shows how to use `put-function-concurrency`.

AWS CLI

To configure a reserved concurrency limit for a function

The following `put-function-concurrency` example configures 100 reserved concurrent executions for the `my-function` function.

```
aws lambda put-function-concurrency \  
  --function-name my-function \  
  --reserved-concurrent-executions 100
```

Output:

```
{  
  "ReservedConcurrentExecutions": 100  
}
```

For more information, see [Reserving Concurrency for a Lambda Function](#) in the *AWS Lambda Developer Guide*.

- For API details, see [PutFunctionConcurrency](#) in *AWS CLI Command Reference*.

put-function-event-invoke-config

The following code example shows how to use `put-function-event-invoke-config`.

AWS CLI

To configure error handling for asynchronous invocation

The following `put-function-event-invoke-config` example sets a maximum event age of one hour and disables retries for the specified function.

```
aws lambda put-function-event-invoke-config \  
  --function-name my-function \  
  --maximum-event-age-in-seconds 3600 \  
  --maximum-retry-attempts 0
```

Output:

```
{  
  "LastModified": 1573686021.479,  
  "FunctionArn": "arn:aws:lambda:us-east-2:123456789012:function:my-function:  
$LATEST",  
  "MaximumRetryAttempts": 0,  
  "MaximumEventAgeInSeconds": 3600,  
  "DestinationConfig": {  
    "OnSuccess": {},  
    "OnFailure": {}  
  }  
}
```

- For API details, see [PutFunctionEventInvokeConfig](#) in *AWS CLI Command Reference*.

put-provisioned-concurrency-config

The following code example shows how to use `put-provisioned-concurrency-config`.

AWS CLI

To allocate provisioned concurrency

The following `put-provisioned-concurrency-config` example allocates 100 provisioned concurrency for the BLUE alias of the specified function.

```
aws lambda put-provisioned-concurrency-config \  
  --function-name my-function \  
  --qualifier BLUE \  
  --provisioned-concurrent-executions 100
```

Output:

```
{  
  "Requested ProvisionedConcurrentExecutions": 100,
```

```
"Allocated ProvisionedConcurrentExecutions": 0,  
"Status": "IN_PROGRESS",  
"LastModified": "2019-11-21T19:32:12+0000"  
}
```

- For API details, see [PutProvisionedConcurrencyConfig](#) in *AWS CLI Command Reference*.

remove-layer-version-permission

The following code example shows how to use `remove-layer-version-permission`.

AWS CLI

To delete layer-version permissions

The following `remove-layer-version-permission` example deletes permission for an account to configure a layer version.

```
aws lambda remove-layer-version-permission \  
  --layer-name my-layer \  
  --statement-id xaccount \  
  --version-number 1
```

This command produces no output.

For more information, see [AWS Lambda Layers](#) in the *AWS Lambda Developer Guide*.

- For API details, see [RemoveLayerVersionPermission](#) in *AWS CLI Command Reference*.

remove-permission

The following code example shows how to use `remove-permission`.

AWS CLI

To remove permissions from an existing Lambda function

The following `remove-permission` example removes permission to invoke a function named `my-function`.

```
aws lambda remove-permission \  
  --function-name my-function \  
  --statement-id xaccount
```

```
--statement-id sns
```

This command produces no output.

For more information, see [Using Resource-based Policies for AWS Lambda](#) in the *AWS Lambda Developer Guide*.

- For API details, see [RemovePermission](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add tags to an existing Lambda function

The following `tag-resource` example adds a tag with the key name `DEPARTMENT` and a value of `Department A` to the specified Lambda function.

```
aws lambda tag-resource \  
  --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \  
  --tags "DEPARTMENT=Department A"
```

This command produces no output.

For more information, see [Tagging Lambda Functions](#) in the *AWS Lambda Developer Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from an existing Lambda function

The following `untag-resource` example removes the tag with the key name `DEPARTMENT` tag from the `my-function` Lambda function.

```
aws lambda untag-resource \  
  --resource arn:aws:lambda:us-west-2:123456789012:function:my-function \  
  --tag-key DEPARTMENT
```

```
--tag-keys DEPARTMENT
```

This command produces no output.

For more information, see [Tagging Lambda Functions](#) in the *AWS Lambda Developer Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-alias

The following code example shows how to use `update-alias`.

AWS CLI

To update a function alias

The following `update-alias` example updates the alias named `LIVE` to point to version 3 of the `my-function` Lambda function.

```
aws lambda update-alias \  
  --function-name my-function \  
  --function-version 3 \  
  --name LIVE
```

Output:

```
{  
  "FunctionVersion": "3",  
  "Name": "LIVE",  
  "AliasArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function:LIVE",  
  "RevisionId": "594f41fb-b85f-4c20-95c7-6ca5f2a92c93",  
  "Description": "alias for live version of function"  
}
```

For more information, see [Configuring AWS Lambda Function Aliases](#) in the *AWS Lambda Developer Guide*.

- For API details, see [UpdateAlias](#) in *AWS CLI Command Reference*.

update-event-source-mapping

The following code example shows how to use `update-event-source-mapping`.

AWS CLI

To update the mapping between an event source and an AWS Lambda function

The following `update-event-source-mapping` example updates the batch size to 8 in the specified mapping.

```
aws lambda update-event-source-mapping \  
  --uuid "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE" \  
  --batch-size 8
```

Output:

```
{  
  "UUID": "a1b2c3d4-5678-90ab-cdef-11111EXAMPLE",  
  "StateTransitionReason": "USER_INITIATED",  
  "LastModified": 1569284520.333,  
  "BatchSize": 8,  
  "State": "Updating",  
  "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",  
  "EventSourceArn": "arn:aws:sqs:us-west-2:123456789012:mySQSqueue"  
}
```

For more information, see [AWS Lambda Event Source Mapping](#) in the *AWS Lambda Developer Guide*.

- For API details, see [UpdateEventSourceMapping](#) in *AWS CLI Command Reference*.

update-function-code

The following code example shows how to use `update-function-code`.

AWS CLI

To update the code of a Lambda function

The following `update-function-code` example replaces the code of the unpublished (\$LATEST) version of the `my-function` function with the contents of the specified zip file.

```
aws lambda update-function-code \  
  --function-name my-function \  
  --zip-file file://my-function.zip
```

```
--zip-file fileb://my-function.zip
```

Output:

```
{
  "FunctionName": "my-function",
  "LastModified": "2019-09-26T20:28:40.438+0000",
  "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",
  "MemorySize": 256,
  "Version": "$LATEST",
  "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qq",
  "Timeout": 3,
  "Runtime": "nodejs10.x",
  "TracingConfig": {
    "Mode": "PassThrough"
  },
  "CodeSha256": "5tT2qgzYUHaqwR716pZ2dpkn/0J1FrzJmlKidWoaCgk=",
  "Description": "",
  "VpcConfig": {
    "SubnetIds": [],
    "VpcId": "",
    "SecurityGroupIds": []
  },
  "CodeSize": 304,
  "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",
  "Handler": "index.handler"
}
```

For more information, see [AWS Lambda Function Configuration](#) in the *AWS Lambda Developer Guide*.

- For API details, see [UpdateFunctionCode](#) in *AWS CLI Command Reference*.

update-function-configuration

The following code example shows how to use `update-function-configuration`.

AWS CLI

To modify the configuration of a function

The following `update-function-configuration` example modifies the memory size to be 256 MB for the unpublished (`$LATEST`) version of the `my-function` function.

```
aws lambda update-function-configuration \  
  --function-name my-function \  
  --memory-size 256
```

Output:

```
{  
  "FunctionName": "my-function",  
  "LastModified": "2019-09-26T20:28:40.438+0000",  
  "RevisionId": "e52502d4-9320-4688-9cd6-152a6ab7490d",  
  "MemorySize": 256,  
  "Version": "$LATEST",  
  "Role": "arn:aws:iam::123456789012:role/service-role/my-function-role-uy3l9qqq",  
  "Timeout": 3,  
  "Runtime": "nodejs10.x",  
  "TracingConfig": {  
    "Mode": "PassThrough"  
  },  
  "CodeSha256": "5tT2qqzYUHaqwR716pZ2dpkn/0J1FrzJmLKidWoaCgk=",  
  "Description": "",  
  "VpcConfig": {  
    "SubnetIds": [],  
    "VpcId": "",  
    "SecurityGroupIds": []  
  },  
  "CodeSize": 304,  
  "FunctionArn": "arn:aws:lambda:us-west-2:123456789012:function:my-function",  
  "Handler": "index.handler"  
}
```

For more information, see [AWS Lambda Function Configuration](#) in the *AWS Lambda Developer Guide*.

- For API details, see [UpdateFunctionConfiguration](#) in *AWS CLI Command Reference*.

update-function-event-invoke-config

The following code example shows how to use `update-function-event-invoke-config`.

AWS CLI

To update an asynchronous invocation configuration

The following `update-function-event-invoke-config` example adds an on-failure destination to the existing asynchronous invocation configuration for the specified function.

```
aws lambda update-function-event-invoke-config \  
  --function-name my-function \  
  --destination-config '{"OnFailure":{"Destination": "arn:aws:sqs:us-  
east-2:123456789012:destination"}}'
```

Output:

```
{  
  "LastModified": 1573687896.493,

License Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with License Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

Actions

create-license-configuration

The following code example shows how to use `create-license-configuration`.

AWS CLI

Example 1: To create a license configuration

The following `create-license-configuration` example creates a license configuration with a hard limit of 10 cores.

```
aws license-manager create-license-configuration --name my-license-configuration \  
  --license-counting-type Core \  
  --license-count 10 \  
  --license-count-hard-limit
```

Output:

```
{  
  "LicenseConfigurationArn": "arn:aws:license-manager:us-  
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE1111"  
}
```

Example 2: To create a license configuration

The following `create-license-configuration` example creates a license configuration with a soft limit of 100 vCPUs. It uses a rule to enable vCPU optimization.

```
aws license-manager create-license-configuration --name my-license-configuration \  
  --license-counting-type vCPU \  
  --license-count 100 \  
  --license-rules "#honorVcpuOptimization=true"
```

Output:

```
{
  "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba41EXAMPLE2222"
}
```

- For API details, see [CreateLicenseConfiguration](#) in *AWS CLI Command Reference*.

delete-license-configuration

The following code example shows how to use `delete-license-configuration`.

AWS CLI

To delete a license configuration

The following `delete-license-configuration` example deletes the specified license configuration.

```
aws license-manager delete-license-configuration \
  --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see [DeleteLicenseConfiguration](#) in *AWS CLI Command Reference*.

get-license-configuration

The following code example shows how to use `get-license-configuration`.

AWS CLI

To get license configuration information

The following `get-license-configuration` example displays details for the specified license configuration.

```
aws license-manager get-license-configuration \
  --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
  "LicenseConfigurationId": "lic-38b658717b87478aaa7c00883EXAMPLE",
  "LicenseConfigurationArn": "arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE",
  "Name": "my-license-configuration",
  "LicenseCountingType": "vCPU",
  "LicenseRules": [],
  "LicenseCountHardLimit": false,
  "ConsumedLicenses": 0,
  "Status": "AVAILABLE",
  "OwnerAccountId": "123456789012",
  "ConsumedLicenseSummaryList": [
    {
      "ResourceType": "EC2_INSTANCE",
      "ConsumedLicenses": 0
    },
    {
      "ResourceType": "EC2_HOST",
      "ConsumedLicenses": 0
    },
    {
      "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
      "ConsumedLicenses": 0
    }
  ],
  "ManagedResourceSummaryList": [
    {
      "ResourceType": "EC2_INSTANCE",
      "AssociationCount": 0
    },
    {
      "ResourceType": "EC2_HOST",
      "AssociationCount": 0
    },
    {
      "ResourceType": "EC2_AMI",
      "AssociationCount": 2
    },
    {
      "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
      "AssociationCount": 0
    }
  ]
}
```

```
]
}
```

- For API details, see [GetLicenseConfiguration](#) in *AWS CLI Command Reference*.

get-service-settings

The following code example shows how to use `get-service-settings`.

AWS CLI

To get the License Manager settings

The following `get-service-settings` example displays the service settings for License Manager in the current Region.

```
aws license-manager get-service-settings
```

The following shows example output if cross-account resource discovery is disabled.

```
{
  "OrganizationConfiguration": {
    "EnableIntegration": false
  },
  "EnableCrossAccountsDiscovery": false
}
```

The following shows example output if cross-account resource discovery is enabled.

```
{
  "S3BucketArn": "arn:aws:s3:::aws-license-manager-service-c22d6279-35c4-47c4-bb",
  "OrganizationConfiguration": {
    "EnableIntegration": true
  },
  "EnableCrossAccountsDiscovery": true
}
```

- For API details, see [GetServiceSettings](#) in *AWS CLI Command Reference*.

list-associations-for-license-configuration

The following code example shows how to use `list-associations-for-license-configuration`.

AWS CLI

To get associations for a license configuration

The following `list-associations-for-license-configuration` example displays detailed information for the associations of the specified license configuration.

```
aws license-manager list-associations-for-license-configuration \
  --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE
```

Output:

```
{
  "LicenseConfigurationAssociations": [
    {
      "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0",
      "ResourceType": "EC2_AMI",
      "ResourceOwnerId": "123456789012",
      "AssociationTime": 1568825118.617
    },
    {
      "ResourceArn": "arn:aws:ec2:us-west-2::image/ami-0abcdef1234567890",
      "ResourceType": "EC2_AMI",
      "ResourceOwnerId": "123456789012",
      "AssociationTime": 1568825118.946
    }
  ]
}
```

- For API details, see [ListAssociationsForLicenseConfiguration](#) in *AWS CLI Command Reference*.

list-license-configurations

The following code example shows how to use `list-license-configurations`.

AWS CLI

Example 1: To list all of your license configurations

The following `list-license-configurations` example lists all your license configurations.

```
aws license-manager list-license-configurations
```

Output:

```
{
  "LicenseConfigurations": [
    {
      "LicenseConfigurationId": "lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
      "LicenseConfigurationArn": "arn:aws:license-manager:us-west-2:123456789012:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE",
      "Name": "my-license-configuration",
      "LicenseCountingType": "Core",
      "LicenseRules": [],
      "LicenseCount": 10,
      "LicenseCountHardLimit": true,
      "ConsumedLicenses": 0,
      "Status": "AVAILABLE",
      "OwnerAccountId": "123456789012",
      "ConsumedLicenseSummaryList": [
        {
          "ResourceType": "EC2_INSTANCE",
          "ConsumedLicenses": 0
        },
        {
          "ResourceType": "EC2_HOST",
          "ConsumedLicenses": 0
        },
        {
          "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
          "ConsumedLicenses": 0
        }
      ],
      "ManagedResourceSummaryList": [
        {
          "ResourceType": "EC2_INSTANCE",
          "AssociationCount": 0
        }
      ]
    }
  ]
}
```

```

    {
      "ResourceType": "EC2_HOST",
      "AssociationCount": 0
    },
    {
      "ResourceType": "EC2_AMI",
      "AssociationCount": 0
    },
    {
      "ResourceType": "SYSTEMS_MANAGER_MANAGED_INSTANCE",
      "AssociationCount": 0
    }
  ]
},
{
  ...
}
]
}

```

Example 2: To list a specific license configuration

The following `list-license-configurations` example lists only the specified license configuration.

```

aws license-manager list-license-configurations \
  --license-configuration-arns arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE

```

- For API details, see [ListLicenseConfigurations](#) in *AWS CLI Command Reference*.

list-license-specifications-for-resource

The following code example shows how to use `list-license-specifications-for-resource`.

AWS CLI

To list the license configurations for a resource

The following `list-license-specifications-for-resource` example lists the license configurations associated with the specified Amazon Machine Image (AMI).

```
aws license-manager list-license-specifications-for-resource \  
  --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0
```

Output:

```
{  
  "LicenseConfigurationArn": "arn:aws:license-manager:us-  
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE"  
}
```

- For API details, see [ListLicenseSpecificationsForResource](#) in *AWS CLI Command Reference*.

list-resource-inventory

The following code example shows how to use `list-resource-inventory`.

AWS CLI

To list resources in the resource inventory

The following `list-resource-inventory` example lists the resources managed using Systems Manager inventory.

```
aws license-manager list-resource-inventory
```

Output:

```
{  
  "ResourceInventoryList": [  
    {  
      "Platform": "Red Hat Enterprise Linux Server",  
      "ResourceType": "EC2Instance",  
      "PlatformVersion": "7.4",  
      "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/  
i-05d3cdfb05bd36376",  
      "ResourceId": "i-05d3cdfb05bd36376",  
      "ResourceOwningAccountId": "1234567890129"  
    },  
    {  
      "Platform": "Amazon Linux",
```

```

        "ResourceType": "EC2Instance",
        "PlatformVersion": "2",
        "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-0b1d036cfd4594808",
        "ResourceId": "i-0b1d036cfd4594808",
        "ResourceOwningAccountId": "1234567890129"
    },
    {
        "Platform": "Microsoft Windows Server 2019 Datacenter",
        "ResourceType": "EC2Instance",
        "PlatformVersion": "10.0.17763",
        "ResourceArn": "arn:aws:ec2:us-west-2:1234567890129:instance/
i-0cdb3b54a2a8246ad",
        "ResourceId": "i-0cdb3b54a2a8246ad",
        "ResourceOwningAccountId": "1234567890129"
    }
]
}

```

- For API details, see [ListResourceInventory](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a license configuration

The following `list-tags-for-resource` example lists the tags for the specified license configuration.

```

aws license-manager list-tags-for-resource \
  --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-
configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE

```

Output:

```

{
  "Tags": [
    {

```

```

        "Key": "project",
        "Value": "lima"
      }
    ]
  }

```

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

list-usage-for-license-configuration

The following code example shows how to use `list-usage-for-license-configuration`.

AWS CLI

To list the licenses in use for a license configuration

The following `list-usage-for-license-configuration` example lists information about the resources using licenses for the specified license configuration. For example, if the license type is vCPU, any instances consume one license per vCPU.

```

aws license-manager list-usage-for-license-configuration \
  --license-configuration-arn arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-38b658717b87478aaa7c00883EXAMPLE

```

Output:

```

{
  "LicenseConfigurationUsageList": [
    {
      "ResourceArn": "arn:aws:ec2:us-west-2:123456789012:instance/
i-04a636d18e83cfac",
      "ResourceType": "EC2_INSTANCE",
      "ResourceStatus": "running",
      "ResourceOwnerId": "123456789012",
      "AssociationTime": 1570892850.519,
      "ConsumedLicenses": 2
    }
  ]
}

```

- For API details, see [ListUsageForLicenseConfiguration](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag a license configuration

The following `tag-resource` example adds the specified tag (key name and value) to the specified license configuration.

```
aws license-manager tag-resource \  
  --tags Key=project,Value=lima \  
  --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-  
configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a license configuration

The following `untag-resource` example removes the specified tag (key name and resource) from the specified license configuration.

```
aws license-manager untag-resource \  
  --tag-keys project \  
  --resource-arn arn:aws:license-manager:us-west-2:123456789012:license-  
configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-license-configuration

The following code example shows how to use `update-license-configuration`.

AWS CLI

To update a license configuration

The following `update-license-configuration` example updates the specified license configuration to remove the hard limit.

```
aws license-manager update-license-configuration \  
  --no-license-count-hard-limit \  
  --license-configuration-arn arn:aws:license-manager:us-  
west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

The following `update-license-configuration` example updates the specified license configuration to change its status to `DISABLED`.

```
aws license-manager update-license-configuration \  
  --license-configuration-status DISABLED  
  --license-configuration-arn arn:aws:license-manager:us-  
west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

This command produces no output.

- For API details, see [UpdateLicenseConfiguration](#) in *AWS CLI Command Reference*.

update-license-specifications-for-resource

The following code example shows how to use `update-license-specifications-for-resource`.

AWS CLI

To update the license configurations for a resource

The following `update-license-specifications-for-resource` example replaces the license configuration associated with the specified Amazon Machine Image (AMI) by removing one license configuration and adding another.

```
aws license-manager update-license-specifications-for-resource \  
  --resource-arn arn:aws:ec2:us-west-2::image/ami-1234567890abcdef0 \  
  --license-configuration-arn arn:aws:license-manager:us-west-2:880185128111:license-configuration:lic-6eb6586f508a786a2ba4f56c1EXAMPLE
```

```
--remove-license-specifications LicenseConfigurationArn=arn:aws:license-
manager:us-west-2:123456789012:license-
configuration:lic-38b658717b87478aaa7c00883EXAMPLE \
--add-license-specifications LicenseConfigurationArn=arn:aws:license-manager:us-
west-2:123456789012:license-configuration:lic-42b6deb06e5399a980d555927EXAMPLE
```

This command produces no output.

- For API details, see [UpdateLicenseSpecificationsForResource](#) in *AWS CLI Command Reference*.

update-service-settings

The following code example shows how to use `update-service-settings`.

AWS CLI

To update the License Manager settings

The following `update-service-settings` example enables cross-account resource discovery for License Manager in the current AWS Region. The Amazon S3 bucket is the Resource Data Sync required for Systems Manager inventory.

```
aws license-manager update-service-settings \
--organization-configuration EnableIntegration=true \
--enable-cross-accounts-discovery \
--s3-bucket-arn arn:aws:s3:::aws-license-manager-service-abcd1234EXAMPLE
```

This command produces no output.

- For API details, see [UpdateServiceSettings](#) in *AWS CLI Command Reference*.

Lightsail examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Lightsail.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

allocate-static-ip

The following code example shows how to use `allocate-static-ip`.

AWS CLI

To create a static IP

The following `allocate-static-ip` example creates the specified static IP, which can be attached to an instance.

```
aws lightsail allocate-static-ip \  
  --static-ip-name StaticIp-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "b5d06d13-2f19-4683-889f-dEXAMPLEed79",

    }  
  ]  
}
```

- For API details, see [AllocateStaticIp](#) in *AWS CLI Command Reference*.

attach-disk

The following code example shows how to use attach-disk.

AWS CLI

To attach a block storage disk to an instance

The following attach-disk example attaches disk Disk-1 to instance WordPress_Multisite-1 with the disk path of /dev/xvdf

```
aws lightsail attach-disk \  
  --disk-name Disk-1 \  
  --disk-path /dev/xvdf \  
  --instance-name WordPress_Multisite-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "10a08267-19ce-43be-b913-6EXAMPLE7e80",  
      "resourceName": "Disk-1",

    "operationDetails": "Disk-1",
    "operationType": "AttachDisk",
    "status": "Started",
    "statusChangedAt": 1571071465.474
  }
]
}

```

- For API details, see [AttachDisk](#) in *AWS CLI Command Reference*.

attach-instances-to-load-balancer

The following code example shows how to use `attach-instances-to-load-balancer`.

AWS CLI

To attach instances to a load balancer

The following `attach-instances-to-load-balancer` example attaches instances MEAN-1, MEAN-2, and MEAN-3 to the load balancer LoadBalancer-1.

```

aws lightsail attach-instances-to-load-balancer \
  --instance-names {"MEAN-1","MEAN-2","MEAN-3"} \
  --load-balancer-name LoadBalancer-1

```

Output:

```

{
  "operations": [
    {
      "id": "8055d19d-abb2-40b9-b527-1EXAMPLE3c7b",
      "resourceName": "LoadBalancer-1",
      "resourceType": "LoadBalancer",

attach-load-balancer-tls-certificate

The following code example shows how to use `attach-load-balancer-tls-certificate`.

AWS CLI

To attach a TLS certificate to a load balancer

The following `attach-load-balancer-tls-certificate` example attaches the load balancer TLS certificate `Certificate2` to the load balancer `LoadBalancer-1`.

```
aws lightsail attach-load-balancer-tls-certificate \  
  --certificate-name Certificate2 \  
  --load-balancer-name LoadBalancer-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "cf1ad6e3-3cbb-4b8a-a7f2-3EXAMPLEa118",

    }
]
}

```

- For API details, see [AttachLoadBalancerTlsCertificate](#) in *AWS CLI Command Reference*.

attach-static-ip

The following code example shows how to use `attach-static-ip`.

AWS CLI

To attach a static IP to an instance

The following `attach-static-ip` example attaches static IP `StaticIp-1` to instance `MEAN-1`.

```

aws lightsail attach-static-ip \
  --static-ip-name StaticIp-1 \
  --instance-name MEAN-1

```

Output:

```

{
  "operations": [
    {
      "id": "45e6fa13-4808-4b8d-9292-bEXAMPLE20b2",
      "resourceName": "StaticIp-1",
      "resourceType": "StaticIp",

        "operationDetails": "StaticIp-1",
        "operationType": "AttachStaticIp",
        "status": "Succeeded",
        "statusChangedAt": 1571072569.376
    }
]
}

```

- For API details, see [AttachStaticIp](#) in *AWS CLI Command Reference*.

close-instance-public-ports

The following code example shows how to use `close-instance-public-ports`.

AWS CLI

To close firewall ports for an instance

The following `close-instance-public-ports` example closes TCP port 22 on instance MEAN-2.

```

aws lightsail close-instance-public-ports \
  --instance-name MEAN-2 \
  --port-info fromPort=22,protocol=TCP,toPort=22

```

Output:

```

{
  "operation": {

```

```
"id": "4f328636-1c96-4649-ae6d-1EXAMPLEf446",
"resourceName": "MEAN-2",
"resourceType": "Instance",
"createdAt": 1571072845.737,
"location": {
  "availabilityZone": "us-west-2a",
  "regionName": "us-west-2"
},
"isTerminal": true,
"operationDetails": "22/tcp",
"operationType": "CloseInstancePublicPorts",
"status": "Succeeded",
"statusChangedAt": 1571072845.737
}
}
```

- For API details, see [CloseInstancePublicPorts](#) in *AWS CLI Command Reference*.

copy-snapshot

The following code example shows how to use copy-snapshot.

AWS CLI

Example 1: To copy a snapshot within the same AWS Region

The following copy-snapshot example copies instance snapshot MEAN-1-1571075291 as instance snapshot MEAN-1-Copy within the same AWS Region us-west-2.

```
aws lightsail copy-snapshot \  
  --source-snapshot-name MEAN-1-1571075291 \  
  --target-snapshot-name MEAN-1-Copy \  
  --source-region us-west-2
```

Output:

```
{
  "operations": [
    {
      "id": "ced16fc1-f401-4556-8d82-1EXAMPLEb982",
      "resourceName": "MEAN-1-Copy",
      "resourceType": "InstanceSnapshot",
```

```

    "createdAt": 1571075581.498,
    "location": {
      "availabilityZone": "all",
      "regionName": "us-west-2"
    },
    "isTerminal": false,
    "operationDetails": "us-west-2:MEAN-1-1571075291",
    "operationType": "CopySnapshot",
    "status": "Started",
    "statusChangedAt": 1571075581.498
  }
]
}

```

For more information, see [Copying snapshots from one AWS Region to another in Amazon Lightsail](#) in the *Lightsail Dev Guide*.

Example 2: To copy a snapshot from one AWS Region to another

The following copy-snapshot example copies instance snapshot MEAN-1-1571075291 as instance snapshot MEAN-1-1571075291-Copy from AWS Region us-west-2 to us-east-1.

```

aws lightsail copy-snapshot \
  --source-snapshot-name MEAN-1-1571075291 \
  --target-snapshot-name MEAN-1-1571075291-Copy \
  --source-region us-west-2 \
  --region us-east-1

```

Output:

```

{
  "operations": [
    {
      "id": "91116b79-119c-4451-b44a-dEXAMPLEd97b",
      "resourceName": "MEAN-1-1571075291-Copy",
      "resourceType": "InstanceSnapshot",
      "createdAt": 1571075695.069,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-east-1"
      },
      "isTerminal": false,
      "operationDetails": "us-west-2:MEAN-1-1571075291",
    }
  ]
}

```

```

        "operationType": "CopySnapshot",
        "status": "Started",
        "statusChangedAt": 1571075695.069
    }
]
}

```

For more information, see [Copying snapshots from one AWS Region to another in Amazon Lightsail](#) in the *Lightsail Dev Guide*.

Example 3: To copy an automatic snapshot within the same AWS Region

The following copy-snapshot example copies automatic snapshot 2019-10-14 of instance WordPress-1 as a manual snapshot WordPress-1-10142019 in the AWS Region us-west-2.

```

aws lightsail copy-snapshot \
  --source-resource-name WordPress-1 \
  --restore-date 2019-10-14 \
  --target-snapshot-name WordPress-1-10142019 \
  --source-region us-west-2

```

Output:

```

{
  "operations": [
    {
      "id": "be3e6754-cd1d-48e6-ad9f-2EXAMPLE1805",
      "resourceName": "WordPress-1-10142019",
      "resourceType": "InstanceSnapshot",
      "createdAt": 1571082412.311,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationDetails": "us-west-2:WordPress-1",
      "operationType": "CopySnapshot",
      "status": "Started",
      "statusChangedAt": 1571082412.311
    }
  ]
}

```

For more information, see [Keeping automatic snapshots of instances or disks in Amazon Lightsail](#) in the *Lightsail Dev Guide*.

Example 4: To copy an automatic snapshot from one AWS Region to another

The following copy-snapshot example copies automatic snapshot 2019-10-14 of instance WordPress-1 as a manual snapshot WordPress-1-10142019 from the AWS Region us-west-2 to us-east-1.

```
aws lightsail copy-snapshot \  
  --source-resource-name WordPress-1 \  
  --restore-date 2019-10-14 \  
  --target-snapshot-name WordPress-1-10142019 \  
  --source-region us-west-2 \  
  --region us-east-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "dffa128b-0b07-476e-b390-bEXAMPLE3775",  
      "resourceName": "WordPress-1-10142019",  
      "resourceType": "InstanceSnapshot",  
      "createdAt": 1571082493.422,  
      "location": {  
        "availabilityZone": "all",  
        "regionName": "us-east-1"  
      },  
      "isTerminal": false,  
      "operationDetails": "us-west-2:WordPress-1",  
      "operationType": "CopySnapshot",  
      "status": "Started",  
      "statusChangedAt": 1571082493.422  
    }  
  ]  
}
```

For more information, see [Keeping automatic snapshots of instances or disks in Amazon Lightsail](#) in the *Lightsail Dev Guide*.

- For API details, see [CopySnapshot](#) in *AWS CLI Command Reference*.

create-disk-from-snapshot

The following code example shows how to use `create-disk-from-snapshot`.

AWS CLI

To create a create a disk from a disk snapshot

The following `create-disk-from-snapshot` example creates a block storage disk named `Disk-2` from the specified block storage disk snapshot. The disk is created in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```
aws lightsail create-disk-from-snapshot \  
  --disk-name Disk-2 \  
  --disk-snapshot-name Disk-1-1566839161 \  
  --availability-zone us-west-2a \  
  --size-in-gb 32
```

Output:

```
{  
  "operations": [  
    {  
      "id": "d42b605d-5ef1-4b4a-8791-7a3e8b66b5e7",  
      "resourceName": "Disk-2",  
      "resourceType": "Disk",  
      "createdAt": 1569624941.471,  
      "location": {  
        "availabilityZone": "us-west-2a",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": false,  
      "operationType": "CreateDiskFromSnapshot",  
      "status": "Started",  
      "statusChangedAt": 1569624941.791  
    }  
  ]  
}
```

For more information, see [Creating a block storage disk from a snapshot in Amazon Lightsail](#) in the *Lightsail Developer Guide*.

- For API details, see [CreateDiskFromSnapshot](#) in *AWS CLI Command Reference*.

create-disk-snapshot

The following code example shows how to use create-disk-snapshot.

AWS CLI

Example 1: To create a snapshot of a disk

The following create-disk-snapshot example creates a snapshot named DiskSnapshot-1 of the specified block storage disk.

```
aws lightsail create-disk-snapshot \  
  --disk-name Disk-1 \  
  --disk-snapshot-name DiskSnapshot-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "fa74c6d2-03a3-4f42-a7c7-792f124d534b",  
      "resourceName": "DiskSnapshot-1",  
      "resourceType": "DiskSnapshot",  
      "createdAt": 1569625129.739,  
      "location": {  
        "availabilityZone": "all",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": false,  
      "operationDetails": "Disk-1",  
      "operationType": "CreateDiskSnapshot",

      },  
    },  
  ],  
}
```

```

        "isTerminal": false,
        "operationDetails": "DiskSnapshot-1",
        "operationType": "CreateDiskSnapshot",
        "status": "Started",
        "statusChangedAt": 1569625129.739
    }
]
}

```

Example 2: To create a snapshot of an instance's system disk

The following `create-disk-snapshot` example creates a snapshot of the specified instance's system disk.

```

aws lightsail create-disk-snapshot \
  --instance-name WordPress-1 \
  --disk-snapshot-name SystemDiskSnapshot-1

```

Output:

```

{
  "operations": [
    {
      "id": "f508cf1c-6597-42a6-a4c3-4aebd75af0d9",

      "resourceType": "Instance",
      "createdAt": 1569625294.685,
      "location": {

```

```

        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
    },
    "isTerminal": false,
    "operationDetails": "SystemDiskSnapshot-1",
    "operationType": "CreateDiskSnapshot",
    "status": "Started",
    "statusChangedAt": 1569625294.685
}
]
}

```

For more information, see [Snapshots in Amazon Lightsail](#) and [Creating a snapshot of an instance root volume in Amazon Lightsail](#) in the *Lightsail Developer Guide*.

- For API details, see [CreateDiskSnapshot](#) in *AWS CLI Command Reference*.

create-disk

The following code example shows how to use `create-disk`.

AWS CLI

To create a block storage disk

The following `create-disk` example creates a block storage disk `Disk-1` in the specified AWS Region and Availability Zone, with 32 GB of storage space.

```

aws lightsail create-disk \
  --disk-name Disk-1 \
  --availability-zone us-west-2a \
  --size-in-gb 32

```

Output:

```

{
  "operations": [
    {
      "id": "1c85e2ec-86ba-4697-b936-77f4d3dc013a",
      "resourceName": "Disk-1",
      "resourceType": "Disk",
      "createdAt": 1569449220.36,
      "location": {

```

```

        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
    },
    "isTerminal": false,
    "operationType": "CreateDisk",
    "status": "Started",
    "statusChangedAt": 1569449220.588
}
]
}

```

- For API details, see [CreateDisk](#) in *AWS CLI Command Reference*.

create-domain-entry

The following code example shows how to use `create-domain-entry`.

AWS CLI

To create a domain entry (DNS record)

The following `create-domain-entry` example creates a DNS record (A) for the apex of the specified domain that points to an instance's IP address.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```

aws lightsail create-domain-entry \
  --region us-east-1 \
  --domain-name example.com \
  --domain-entry name=example.com,type=A,target=192.0.2.0

```

Output:

```

{
  "operation": {
    "id": "5be4494d-56f4-41fc-8730-693dcd0ef9e2",
    "resourceName": "example.com",
    "resourceType": "Domain",
    "createdAt": 1569865296.519,
    "location": {

```

```
        "availabilityZone": "all",
        "regionName": "global"
    },
    "isTerminal": true,
    "operationType": "CreateDomainEntry",
    "status": "Succeeded",
    "statusChangedAt": 1569865296.519
}
}
```

For more information, see [DNS in Amazon Lightsail](#) and [Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail](#) in the *Lightsail Developer Guide*.

- For API details, see [CreateDomainEntry](#) in *AWS CLI Command Reference*.

create-domain

The following code example shows how to use create-domain.

AWS CLI

To create a domain (DNS zone)

The following create-domain example creates a DNS zone for the specified domain.

Note: Lightsail's domain-related API operations are available in only the us-east-1 Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail create-domain \
  --region us-east-1 \
  --domain-name example.com
```

Output:

```
{
  "operation": {
    "id": "64e522c8-9ae1-4c05-9b65-3f237324dc34",
    "resourceName": "example.com",
    "resourceType": "Domain",
    "createdAt": 1569864291.92,
    "location": {
      "availabilityZone": "all",
```

```
        "regionName": "global"
    },
    "isTerminal": true,
    "operationType": "CreateDomain",
    "status": "Succeeded",
    "statusChangedAt": 1569864292.109
}
}
```

For more information, see [DNS in Amazon Lightsail](#) and [Creating a DNS zone to manage your domain's DNS records in Amazon Lightsail](#) in the *Lightsail Developer Guide*.

- For API details, see [CreateDomain](#) in *AWS CLI Command Reference*.

create-instance-snapshot

The following code example shows how to use `create-instance-snapshot`.

AWS CLI

To create a snapshot of an instance

The following `create-instance-snapshot` example creates a snapshot from the specified instance.

```
aws lightsail create-instance-snapshot \
  --instance-name WordPress-1 \
  --instance-snapshot-name WordPress-Snapshot-1
```

Output:

```
{
  "operations": [
    {
      "id": "4c3db559-9dd0-41e7-89c0-2cb88c19786f",

create-instances-from-snapshot

The following code example shows how to use `create-instances-from-snapshot`.

AWS CLI

To create an instance from a snapshot

The following `create-instances-from-snapshot` example creates an instance from the specified instance snapshot, in the specified AWS Region and Availability Zone, using the \$10 USD bundle.

Note: The bundle that you specify must be equal to or greater in specifications than the bundle of the original source instance used to create the snapshot.

```
aws lightsail create-instances-from-snapshot \
  --instance-snapshot-name WordPress-1-1569866208 \
  --instance-names WordPress-2 \
```

```
--availability-zone us-west-2a \  
--bundle-id medium_2_0
```

Output:

```
{  
  "operations": [  
    {  
      "id": "003f8271-b711-464d-b9b8-7f3806cb496e",  
      "resourceName": "WordPress-2",  
      "resourceType": "Instance",  
      "createdAt": 1569865914.908,  
      "location": {  
        "availabilityZone": "us-west-2a",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": false,  
      "operationType": "CreateInstancesFromSnapshot",  
      "status": "Started",  
      "statusChangedAt": 1569865914.908  
    }  
  ]  
}
```

- For API details, see [CreateInstancesFromSnapshot](#) in *AWS CLI Command Reference*.

create-instances

The following code example shows how to use create-instances.

AWS CLI

Example 1: To create a single instance

The following create-instances example creates an instance in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the \$3.50 USD bundle.

```
aws lightsail create-instances \  
  --instance-names Instance-1 \  
  --availability-zone us-west-2a \  
  --blueprint-id wordpress_5_1_1_2 \  
  --bundle-id nano_2_0
```

Output:

```
{
  "operations": [
    {
      "id": "9a77158f-7be3-4d6d-8054-cf5ae2b720cc",
      "resourceName": "Instance-1",
      "resourceType": "Instance",
      "createdAt": 1569447986.061,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "CreateInstance",
      "status": "Started",
      "statusChangedAt": 1569447986.061
    }
  ]
}
```

Example 2: To create multiple instances at one time

The following `create-instances` example creates three instances in the specified AWS Region and Availability Zone, using the WordPress blueprint, and the \$3.50 USD bundle.

```
aws lightsail create-instances \
  --instance-names {"Instance1","Instance2","Instance3"} \
  --availability-zone us-west-2a \
  --blueprint-id wordpress_5_1_1_2 \
  --bundle-id nano_2_0
```

Output:

```
{
  "operations": [
    {
      "id": "5492f015-9d2e-48c6-8eea-b516840e6903",
      "resourceName": "Instance1",
      "resourceType": "Instance",
      "createdAt": 1569448780.054,
      "location": {
        "availabilityZone": "us-west-2a",
```

```
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "CreateInstance",
      "status": "Started",
      "statusChangedAt": 1569448780.054
    },
    {
      "id": "c58b5f46-2676-44c8-b95c-3ad375898515",
      "resourceName": "Instance2",
      "resourceType": "Instance",
      "createdAt": 1569448780.054,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "CreateInstance",
      "status": "Started",
      "statusChangedAt": 1569448780.054
    },
    {
      "id": "a5ad8006-9bee-4499-9eb7-75e42e6f5882",
      "resourceName": "Instance3",
      "resourceType": "Instance",
      "createdAt": 1569448780.054,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "CreateInstance",
      "status": "Started",
      "statusChangedAt": 1569448780.054
    }
  ]
}
```

- For API details, see [CreateInstances](#) in *AWS CLI Command Reference*.

create-key-pair

The following code example shows how to use `create-key-pair`.

AWS CLI

To create a key pair

The following `create-key-pair` example creates a key pair that you can use to authenticate and connect to an instance.

```
aws lightsail create-key-pair \
  --key-pair-name MyPersonalKeyPair
```

The output provides the private key base64 value that you can use to authenticate to instances that use the created key pair. **Note:** Copy and paste the private key base64 value to a safe location because you cannot retrieve it later.

```
{
  "keyPair": {
    "name": "MyPersonalKeyPair",

create-load-balancer-tls-certificate

The following code example shows how to use `create-load-balancer-tls-certificate`.

AWS CLI

To create a TLS certificate for a load balancer

The following `create-load-balancer-tls-certificate` example creates a TLS certificate that is attached to the specified load balancer. The certificate created applies to the specified domains. **Note:** Only two certificates can be created for a load balancer.

```

aws lightsail create-load-balancer-tls-certificate \
  --certificate-alternative-names abc.example.com \
  --certificate-domain-name example.com \
  --certificate-name MySecondCertificate \
  --load-balancer-name MyFirstLoadBalancer

```

Output:

```
{
  "operations": [
    {
      "id": "be663aed-cb46-41e2-9b23-e2f747245bd4",

      "statusChangedAt": 1569867365.219
    }
  ]
}
```

- For API details, see [CreateLoadBalancerTlsCertificate](#) in *AWS CLI Command Reference*.

create-load-balancer

The following code example shows how to use create-load-balancer.

AWS CLI

To create a load balancer

The following `create-load-balancer` example creates a load balancer with a TLS certificate. The TLS certificate applies to the specified domains, and routes traffic to instances on port 80.

```
aws lightsail create-load-balancer \  
  --certificate-alternative-names www.example.com test.example.com \  
  --certificate-domain-name example.com \  
  --certificate-name Certificate-1 \  
  --instance-port 80 \  
  --load-balancer-name LoadBalancer-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "cc7b920a-83d8-4762-a74e-9174fe1540be",  
      "resourceName": "LoadBalancer-1",  
      "resourceType": "LoadBalancer",  
      "createdAt": 1569867169.406,  
      "location": {

}

```

For more information, see [Lightsail load balancers](#) in the *Lightsail Developer Guide*.

- For API details, see [CreateLoadBalancer](#) in *AWS CLI Command Reference*.

create-relational-database-from-snapshot

The following code example shows how to use `create-relational-database-from-snapshot`.

AWS CLI

To create a managed database from a snapshot

The following `create-relational-database-from-snapshot` example creates a managed database from the specified snapshot in the specified AWS Region and Availability Zone, using the \$15 USD standard database bundle. **Note:** The bundle that you specify must be equal to or greater in specifications than the bundle of the original source database used to create the snapshot.

```

aws lightsail create-relational-database-from-snapshot \
  --relational-database-snapshot-name Database-0regon-1-1566839359 \

```

```
--relational-database-name Database-1 \  
--availability-zone us-west-2a \  
--relational-database-bundle-id micro_1_0 \  
--no-publicly-accessible
```

Output:

```
{  
  "operations": [  
    {  
      "id": "ad6d9193-9d5c-4ea1-97ae-8fe6de600b4c",  
      "resourceName": "Database-1",  
      "resourceType": "RelationalDatabase",  
      "createdAt": 1569867916.938,  
      "location": {  
        "availabilityZone": "us-west-2a",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": false,  
      "operationType": "CreateRelationalDatabaseFromSnapshot",  
      "status": "Started",  
      "statusChangedAt": 1569867918.643  
    }  
  ]  
}
```

- For API details, see [CreateRelationalDatabaseFromSnapshot](#) in *AWS CLI Command Reference*.

create-relational-database-snapshot

The following code example shows how to use `create-relational-database-snapshot`.

AWS CLI

To create a snapshot of a managed database

The following `create-relational-database-snapshot` example creates a snapshot of the specified managed database.

```
aws lightsail create-relational-database-snapshot \  
--relational-database-name Database1 \  
--relational-database-snapshot-name RelationalDatabaseSnapshot1
```

Output:

```
{
  "operations": [
    {
      "id": "853667fb-ea91-4c02-8d20-8fc5fd43b9eb",
      "resourceName": "RelationalDatabaseSnapshot1",
      "resourceType": "RelationalDatabaseSnapshot",
      "createdAt": 1569868074.645,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationDetails": "Database1",
      "operationType": "CreateRelationalDatabaseSnapshot",
      "status": "Started",
      "statusChangedAt": 1569868074.645
    },
    {
      "id": "fbafa521-3cac-4be8-9773-1c143780b239",
      "resourceName": "Database1",
      "resourceType": "RelationalDatabase",
      "createdAt": 1569868074.645,

        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationDetails": "RelationalDatabaseSnapshot1",
      "operationType": "CreateRelationalDatabaseSnapshot",
      "status": "Started",
      "statusChangedAt": 1569868074.645
    }
  ]
}
```

- For API details, see [CreateRelationalDatabaseSnapshot](#) in *AWS CLI Command Reference*.

create-relational-database

The following code example shows how to use `create-relational-database`.

AWS CLI

To create a managed database

The following `create-relational-database` example creates a managed database in the specified AWS Region and Availability Zone, using the MySQL 5.6 database engine (`mysql_5_6`), and the \$15 USD standard database bundle (`micro_1_0`). The managed database is pre-populated a master user name, and is not publicly accessible.

```
aws lightsail create-relational-database \  
  --relational-database-name Database-1 \  
  --availability-zone us-west-2a \  
  --relational-database-blueprint-id mysql_5_6 \  
  --relational-database-bundle-id micro_1_0 \  
  --master-database-name dbmaster \  
  --master-username user \  
  --no-publicly-accessible
```

Output:

```
{  
  "operations": [  
    {  
      "id": "b52bedee-73ed-4798-8d2a-9c12df89adcd",  
      "resourceName": "Database-1",  
      "resourceType": "RelationalDatabase",  
      "createdAt": 1569450017.244,  
      "location": {  
        "availabilityZone": "us-west-2a",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": false,  
      "operationType": "CreateRelationalDatabase",  
      "status": "Started",  
      "statusChangedAt": 1569450018.637  
    }  
  ]  
}
```

- For API details, see [CreateRelationalDatabase](#) in *AWS CLI Command Reference*.

delete-auto-snapshot

The following code example shows how to use delete-auto-snapshot.

AWS CLI

To delete an automatic snapshot

The following delete-auto-snapshot example deletes the automatic snapshot 2019-10-10 of instance WordPress-1.

```
aws lightsail delete-auto-snapshot \  
  --resource-name WordPress-1 \  
  --date 2019-10-10
```

Output:

```
{  
  "operations": [  
    {  
      "id": "31c36e09-3d52-46d5-b6d8-7EXAMPLE534a",  
      "resourceName": "WordPress-1",  
      "resourceType": "Instance",  
      "createdAt": 1571088141.501,  
      "location": {  
        "availabilityZone": "us-west-2",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": true,  
      "operationDetails": "DeleteAutoSnapshot-2019-10-10",  
      "operationType": "DeleteAutoSnapshot",  
      "status": "Succeeded"  
    }  
  ]  
}
```

For more information, see [Deleting automatic snapshots of instances or disks in Amazon Lightsail](#) in the *Lightsail Dev Guide*.

- For API details, see [DeleteAutoSnapshot](#) in *AWS CLI Command Reference*.

delete-disk-snapshot

The following code example shows how to use delete-disk-snapshot.

AWS CLI

To delete a snapshot of a block storage disk

The following delete-disk-snapshot example deletes the specified snapshot of a block storage disk

```
aws lightsail delete-disk-snapshot \  
  --disk-snapshot-name DiskSnapshot-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "d1e5766d-b81e-4595-ad5d-02afbcccfd5d",  
      "resourceName": "DiskSnapshot-1",  
      "resourceType": "DiskSnapshot",  
      "createdAt": 1569873552.79,  
      "location": {  
        "availabilityZone": "all",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": true,  
      "operationType": "DeleteDiskSnapshot",  
      "status": "Succeeded",  
      "statusChangedAt": 1569873552.79  
    }  
  ]  
}
```

- For API details, see [DeleteDiskSnapshot](#) in *AWS CLI Command Reference*.

delete-disk

The following code example shows how to use delete-disk.

AWS CLI

To delete a block storage disk

The following `delete-disk` example deletes the specified block storage disk.

```
aws lightsail delete-disk \  
  --disk-name Disk-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "6378c70f-4d75-4f7a-ab66-730fca0bb2fc",  
      "resourceName": "Disk-1",  
      "resourceType": "Disk",  
      "createdAt": 1569872887.864,  
      "location": {  
        "availabilityZone": "us-west-2a",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": true,  
      "operationType": "DeleteDisk",  
      "status": "Succeeded",  
      "statusChangedAt": 1569872887.864  
    }  
  ]  
}
```

- For API details, see [DeleteDisk](#) in *AWS CLI Command Reference*.

delete-domain-entry

The following code example shows how to use `delete-domain-entry`.

AWS CLI

To delete a domain entry (DNS record)

The following `delete-domain-entry` example deletes the specified domain entry from an existing domain.

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail delete-domain-entry \  
  --region us-east-1 \  
  --domain-name example.com \  
  --domain-entry name=123.example.com,target=192.0.2.0,type=A
```

Output:

```
{  
  "operation": {  
    "id": "06eacd01-d785-420e-8daa-823150c7dca1",  
    "resourceName": "example.com ",  
    "resourceType": "Domain",  
    "createdAt": 1569874157.005,  
    "location": {  
      "availabilityZone": "all",  
      "regionName": "global"  
    },  
    "isTerminal": true,  
    "operationType": "DeleteDomainEntry",  
    "status": "Succeeded",  
    "statusChangedAt": 1569874157.005  
  }  
}
```

- For API details, see [DeleteDomainEntry](#) in *AWS CLI Command Reference*.

delete-domain

The following code example shows how to use `delete-domain`.

AWS CLI

To delete a domain (DNS zone)

The following `delete-domain` example deletes the specified domain and all of the entries in the domain (DNS records).

Note: Lightsail's domain-related API operations are available in only the `us-east-1` Region. If your CLI profile is configured to use a different Region, you must include the `--region us-east-1` parameter or the command fails.

```
aws lightsail delete-domain \  
  --region us-east-1 \  
  --domain-name example.com
```

Output:

```
{  
  "operation": {  
    "id": "fcef5265-5af1-4a46-a3d7-90b5e18b9b32",  
    "resourceName": "example.com",  
    "resourceType": "Domain",  
    "createdAt": 1569873788.13,  
    "location": {  
      "availabilityZone": "all",  
      "regionName": "global"  
    },  
    "isTerminal": true,  
    "operationType": "DeleteDomain",  
    "status": "Succeeded",  
    "statusChangedAt": 1569873788.13  
  }  
}
```

- For API details, see [DeleteDomain](#) in *AWS CLI Command Reference*.

delete-instance-snapshot

The following code example shows how to use `delete-instance-snapshot`.

AWS CLI

title

The following `delete-instance-snapshot` example deletes the specified snapshot of an instance.

```
aws lightsail delete-instance-snapshot \  
  --instance-id example-instance-id \  
  --snapshot-id example-snapshot-id
```

```
--instance-snapshot-name WordPress-1-Snapshot-1
```

Output:

```
{
  "operations": [
    {
      "id": "14dad182-976a-46c6-bfd4-9480482bf0ea",
      "resourceName": "WordPress-1-Snapshot-1",
      "resourceType": "InstanceSnapshot",
      "createdAt": 1569874524.562,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "isTerminal": true,
      "operationType": "DeleteInstanceSnapshot",
      "status": "Succeeded",
      "statusChangedAt": 1569874524.562
    }
  ]
}
```

- For API details, see [DeleteInstanceSnapshot](#) in *AWS CLI Command Reference*.

delete-instance

The following code example shows how to use `delete-instance`.

AWS CLI**To delete an instance**

The following `delete-instance` example deletes the specified instance.

```
aws lightsail delete-instance \
  --instance-name WordPress-1
```

Output:

```
{
  "operations": [
```

```
{
  "id": "d77345a3-8f80-4d2e-b47d-aaa622718df2",
  "resourceName": "Disk-1",
  "resourceType": "Disk",
  "createdAt": 1569874357.469,
  "location": {
    "availabilityZone": "us-west-2a",
    "regionName": "us-west-2"
  },
  "isTerminal": false,
  "operationDetails": "WordPress-1",
  "operationType": "DetachDisk",
  "status": "Started",
  "statusChangedAt": 1569874357.469
},
{
  "id": "708fa606-2bfd-4e48-a2c1-0b856585b5b1",

  "id": "3187e823-8acb-405d-b098-fad5ceb17bec",
  "resourceName": "WordPress-1",
  "resourceType": "Instance",
  "createdAt": 1569874357.829,
  "location": {
    "availabilityZone": "us-west-2a",
    "regionName": "us-west-2"
  },
  "isTerminal": true,
  "operationType": "DeleteInstance",
  "status": "Succeeded",
  "statusChangedAt": 1569874357.829
}
```

```
]
}
```

- For API details, see [DeleteInstance](#) in *AWS CLI Command Reference*.

delete-key-pair

The following code example shows how to use `delete-key-pair`.

AWS CLI

To delete a key pair

The following `delete-key-pair` example deletes the specified key pair.

```
aws lightsail delete-key-pair \
  --key-pair-name MyPersonalKeyPair
```

Output:

```
{
  "operation": {
    "id": "81621463-df38-4810-b866-6e801a15abbf",
    "resourceName": "MyPersonalKeyPair",
    "resourceType": "KeyPair",
    "createdAt": 1569874626.466,
    "location": {
      "availabilityZone": "all",
      "regionName": "us-west-2"
    },
    "isTerminal": true,
    "operationType": "DeleteKeyPair",
    "status": "Succeeded",
    "statusChangedAt": 1569874626.685
  }
}
```

- For API details, see [DeleteKeyPair](#) in *AWS CLI Command Reference*.

delete-known-host-keys

The following code example shows how to use `delete-known-host-keys`.

AWS CLI

To delete known host keys from an instance

The following `delete-known-host-keys` example deletes the known host key from the specified instance.

```
aws lightsail delete-known-host-keys \  
  --instance-name Instance-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "c61afe9c-45a4-41e6-a97e-d212364da3f5",  
      "resourceName": "Instance-1",  
      "resourceType": "Instance",  
      "createdAt": 1569874760.201,  
      "location": {  
        "availabilityZone": "us-west-2a",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": true,  
      "operationType": "DeleteKnownHostKeys",  
      "status": "Succeeded",  
      "statusChangedAt": 1569874760.201  
    }  
  ]  
}
```

For more information, see [Troubleshooting connection issues with the Amazon Lightsail browser-based SSH or RDP client](#) in the *Lightsail Dev Guide*.

- For API details, see [DeleteKnownHostKeys](#) in *AWS CLI Command Reference*.

`delete-load-balancer-tls-certificate`

The following code example shows how to use `delete-load-balancer-tls-certificate`.

AWS CLI

To delete a TLS certificate for a load balancer

The following `delete-load-balancer-tls-certificate` example deletes the specific TLS certificate from the specified load balancer.

```
aws lightsail delete-load-balancer-tls-certificate \  
  --load-balancer-name MyFirstLoadBalancer \  
  --certificate-name MyFirstCertificate
```

Output:

```
{  
  "operations": [  
    {  
      "id": "50bec274-e45e-4caa-8a69-b763ef636583",  
      "resourceName": "MyFirstCertificate",  
      "resourceType": "LoadBalancerTlsCertificate",  
      "createdAt": 1569874989.48,  
      "location": {  
        "availabilityZone": "all",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": false,  
      "operationType": "DeleteLoadBalancerTlsCertificate",  
      "status": "Started",  
      "statusChangedAt": 1569874989.48  
    },  
    {  
      "id": "78c58cdc-a59a-4b27-8213-500638634a8f",  
      "resourceName": "MyFirstLoadBalancer",  
      "resourceType": "LoadBalancer",  
      "createdAt": 1569874989.48,  
      "location": {

      },  
      "isTerminal": false,  
      "operationType": "DeleteLoadBalancerTlsCertificate",  
      "status": "Started",  
      "statusChangedAt": 1569874989.48  
    }  
  ]  
}
```

- For API details, see [DeleteLoadBalancerTlsCertificate](#) in *AWS CLI Command Reference*.

delete-load-balancer

The following code example shows how to use delete-load-balancer.

AWS CLI

To delete a load balancer

The following delete-load-balancer example deletes the specified load balancer and any associated TLS certificates.

```
aws lightsail delete-load-balancer \  
  --load-balancer-name MyFirstLoadBalancer
```

Output:

```
{  
  "operations": [  
    {  
      "id": "a8c968c7-72a3-4680-a714-af8f03eea535",

      },  
      "isTerminal": false,  
      "operationType": "DeleteLoadBalancerTlsCertificate",
```

```

        "status": "Started",
        "statusChangedAt": 1569875091.938
    },
    {
        "id": "cf64c060-154b-4eb4-ba57-84e2e41563d6",
        "resourceName": "MyFirstLoadBalancer",
        "resourceType": "LoadBalancer",
        "createdAt": 1569875091.94,
        "location": {
            "availabilityZone": "all",
            "regionName": "us-west-2"
        },
        "isTerminal": false,
        "operationType": "DeleteLoadBalancerTlsCertificate",
        "status": "Started",
        "statusChangedAt": 1569875091.94
    }
]
}

```

For more information, see title in the *guide*.

- For API details, see [DeleteLoadBalancer](#) in *AWS CLI Command Reference*.

delete-relational-database-snapshot

The following code example shows how to use `delete-relational-database-snapshot`.

AWS CLI

To delete a snapshot of a managed database

The following `delete-relational-database-snapshot` example deletes the specified snapshot of a managed database.

```
aws lightsail delete-relational-database-snapshot \
  --relational-database-snapshot-name Database-Oregon-1-1566839359
```

Output:

```
{
  "operations": [
```

```

    {
      "id": "b99acae8-735b-4823-922f-30af580e3729",

      "resourceType": "RelationalDatabaseSnapshot",
      "createdAt": 1569875293.58,
      "location": {
        "availabilityZone": "all",
        "regionName": "us-west-2"
      },
      "isTerminal": true,
      "operationType": "DeleteRelationalDatabaseSnapshot",
      "status": "Succeeded",
      "statusChangedAt": 1569875293.58
    }
  ]
}

```

- For API details, see [DeleteRelationalDatabaseSnapshot](#) in *AWS CLI Command Reference*.

delete-relational-database

The following code example shows how to use delete-relational-database.

AWS CLI

To delete a managed database

The following delete-relational-database example deletes the specified managed database.

```
aws lightsail delete-relational-database \
  --relational-database-name Database-1
```

Output:

```

{
  "operations": [
    {
      "id": "3b0c41c1-053d-46f0-92a3-14f76141dc86",

}

```

- For API details, see [DeleteRelationalDatabase](#) in *AWS CLI Command Reference*.

detach-static-ip

The following code example shows how to use `detach-static-ip`.

AWS CLI

To detach a static IP from an instance

The following `detach-static-ip` example detaches static IP `StaticIp-1` from any attached instance.

```
aws lightsail detach-static-ip \  
  --static-ip-name StaticIp-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "2a43d8a3-9f2d-4fe7-bdd0-eEXAMPLE3cf3",  
      "resourceName": "StaticIp-1",  
      "resourceType": "StaticIp",  
      "createdAt": 1571088261.999,  
      "location": {  
        "availabilityZone": "all",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": true,  
      "operationDetails": "MEAN-1",  
      "operationType": "DetachStaticIp",  
      "status": "Succeeded",  
      "statusChangedAt": 1571088261.999  
    },  
    {  
      "id": "41a7d40c-74e8-4d2e-a837-cEXAMPLEf747",  
      "resourceName": "MEAN-1",  
      "resourceType": "Instance",  
      "createdAt": 1571088262.022,  
      "location": {

        "regionName": "us-west-2"  
      },  
      "isTerminal": true,
```

```
        "operationDetails": "StaticIp-1",
        "operationType": "DetachStaticIp",
        "status": "Succeeded",
        "statusChangedAt": 1571088262.022
    }
]
```

- For API details, see [DetachStaticIp](#) in *AWS CLI Command Reference*.

get-active-names

The following code example shows how to use `get-active-names`.

AWS CLI

To get active resource names

The following `get-active-names` example returns the active resource names in the configured AWS Region.

```
aws lightsail get-active-names
```

Output:

```
{
  "activeNames": [
    "WordPress-1",
    "StaticIp-1",
    "MEAN-1",
    "Plesk_Hosting_Stack_on_Ubuntu-1"
  ]
}
```

- For API details, see [GetActiveNames](#) in *AWS CLI Command Reference*.

get-auto-snapshots

The following code example shows how to use `get-auto-snapshots`.

AWS CLI

To get the available automatic snapshots for an instance

The following `get-auto-snapshots` example returns the available automatic snapshots for instance `WordPress-1`.

```
aws lightsail get-auto-snapshots \  
  --resource-name WordPress-1
```

Output:

```
{  
  "resourceName": "WordPress-1",  
  "resourceType": "Instance",  
  "autoSnapshots": [  
    {  
      "date": "2019-10-14",  
      "createdAt": 1571033872.0,  
      "status": "Success",  
      "fromAttachedDisks": []  
    },  
    {  
      "date": "2019-10-13",  
      "createdAt": 1570947473.0,  
      "status": "Success",  
      "fromAttachedDisks": []  
    },  
    {  
      "date": "2019-10-12",  
      "createdAt": 1570861072.0,  
      "status": "Success",  
      "fromAttachedDisks": []  
    },  
    {  
      "date": "2019-10-11",  
      "createdAt": 1570774672.0,  
      "status": "Success",  
      "fromAttachedDisks": []  
    }  
  ]  
}
```

For more information, see [Keeping automatic snapshots of instances or disks in Amazon Lightsail](#) in the *Lightsail Dev Guide*.

- For API details, see [GetAutoSnapshots](#) in *AWS CLI Command Reference*.

get-blueprints

The following code example shows how to use `get-blueprints`.

AWS CLI

To get the blueprints for new instances

The following `get-blueprints` example displays details about all of the available blueprints that can be used to create new instances in Amazon Lightsail.

```
aws lightsail get-blueprints
```

Output:

```
{
  "blueprints": [
    {
      "blueprintId": "wordpress",
      "name": "WordPress",
      "group": "wordpress",
      "type": "app",
      "description": "Bitnami, the leaders in application packaging, and Automattic, the experts behind WordPress, have teamed up to offer this official WordPress image. This image is a pre-configured, ready-to-run image for running WordPress on Amazon Lightsail. WordPress is the world's most popular content management platform. Whether it's for an enterprise or small business website, or a personal or corporate blog, content authors can easily create content using its new Gutenberg editor, and developers can extend the base platform with additional features. Popular plugins like Jetpack, Akismet, All in One SEO Pack, WP Mail, Google Analytics for WordPress, and Amazon Polly are all pre-installed in this image. Let's Encrypt SSL certificates are supported through an auto-configuration script.",

get-bundles

The following code example shows how to use `get-bundles`.

AWS CLI

To get the bundles for new instances

The following `get-bundles` example displays details about all of the available bundles that can be used to create new instances in Amazon Lightsail.

```
aws lightsail get-bundles
```

Output:

```
{
  "bundles": [
    {
      "price": 3.5,
      "cpuCount": 1,
      "diskSizeInGb": 20,

get-cloud-formation-stack-records

The following code example shows how to use `get-cloud-formation-stack-records`.

AWS CLI

To get the CloudFormation stack records and their associated stacks

The following `get-cloud-formation-stack-records` example displays details about the CloudFormation stack records and their associated stacks used to create Amazon EC2 resources from exported Amazon Lightsail snapshots.

```
aws lightsail get-cloud-formation-stack-records
```

Output:

```
{
  "cloudFormationStackRecords": [
    {
      "name": "CloudFormationStackRecord-588a4243-
e2d1-490d-8200-3a7513ecebdf",

get-export-snapshot-record

The following code example shows how to use `get-export-snapshot-record`.

AWS CLI

To get the records of snapshots exported to Amazon EC2

The following `get-export-snapshot-record` example displays details about Amazon Lightsail instance or disk snapshots exported to Amazon EC2.

```
aws lightsail get-export-snapshot-records
```

Output:

```

{
  "exportSnapshotRecords": [
    {
      "name": "ExportSnapshotRecord-d2da10ce-0b3c-4ae1-ab3a-2EXAMPLEa586",

get-instance-metric-data

The following code example shows how to use `get-instance-metric-data`.

AWS CLI

To get metric data for an instance

The following `get-instance-metric-data` example returns the average percent of CPUUtilization every 7200 seconds (2 hours) between 1571342400 and 1571428800 for instance MEAN-1.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-instance-metric-data \  
  --instance-name MEAN-1 \  
  --metric-name CPUUtilization \  
  --period 7200 \  
  --start-time 1571342400 \  
  --end-time 1571428800 \  
  --unit Percent \  
  --statistics Average
```

Output:

```
{  
  "metricName": "CPUUtilization",  
  "metricData": [  
    {  
      "average": 0.26113718770120725,  
      "timestamp": 1571342400.0,  
      "unit": "Percent"  
    },  
    {  
      "average": 0.26861268928111953,  
      "timestamp": 1571392800.0,  
      "unit": "Percent"  
    },  
    {  
      "average": 0.28187475104748777,  
      "timestamp": 1571378400.0,  
      "unit": "Percent"  
    }  
  ],  
}
```

```
{
  "average": 0.2651936960458352,
  "timestamp": 1571421600.0,
  "unit": "Percent"
},

```

```
    }  
  ]  
}
```

- For API details, see [GetInstanceMetricData](#) in *AWS CLI Command Reference*.

get-instance-port-states

The following code example shows how to use `get-instance-port-states`.

AWS CLI

To get firewall information for an instance

The following `get-instance-port-states` example returns the firewall ports configured for instance MEAN-1.

```
aws lightsail get-instance-port-states \  
  --instance-name MEAN-1
```

Output:

```
{  
  "portStates": [  
    {  
      "fromPort": 80,  
      "toPort": 80,  
      "protocol": "tcp",  
      "state": "open"  
    },  
    {  
      "fromPort": 22,  
      "toPort": 22,  
      "protocol": "tcp",  
      "state": "open"  
    },  
    {  
      "fromPort": 443,  
      "toPort": 443,  
      "protocol": "tcp",  
      "state": "open"  
    }  
  ]  
}
```

```
]
}
```

- For API details, see [GetInstancePortStates](#) in *AWS CLI Command Reference*.

get-instance-snapshot

The following code example shows how to use `get-instance-snapshot`.

AWS CLI

To get information about a specified instance snapshot

The following `get-instance-snapshot` example displays details about the specified instance snapshot.

```
aws lightsail get-instance-snapshot \
  --instance-snapshot-name MEAN-1-1571419854
```

Output:

```
{
  "instanceSnapshot": {
    "name": "MEAN-1-1571419854",
    "arn": "arn:aws:lightsail:us-west-2:111122223333:InstanceSnapshot/

get-instance-snapshots

The following code example shows how to use `get-instance-snapshots`.

AWS CLI

To get information about all of your instance snapshots

The following `get-instance-snapshots` example displays details about all of the instance snapshots in the configured AWS Region.

```
aws lightsail get-instance-snapshots
```

Output:

```
{
  "instanceSnapshots": [
    {
      "name": "MEAN-1-1571421498",
      "arn": "arn:aws:lightsail:us-west-2:111122223333:InstanceSnapshot/a20e6ebe-b0ee-4ae4-a750-3EXAMPLEcb0c",

]
}

```

- For API details, see [GetInstanceSnapshots](#) in *AWS CLI Command Reference*.

get-instance-state

The following code example shows how to use `get-instance-state`.

AWS CLI

To get information about the state of an instance

The following `get-instance-state` example returns the state of the specified instance.

```
aws lightsail get-instance-state \  
  --instance-name MEAN-1
```

Output:

```
{  
  "state": {  
    "code": 16,  
    "name": "running"  
  }  
}
```

- For API details, see [GetInstanceState](#) in *AWS CLI Command Reference*.

get-instance

The following code example shows how to use `get-instance`.

AWS CLI**To get information about an instance**

The following `get-instance` example displays details about the instance MEAN-1.

```
aws lightsail get-instance \  
  --instance-name MEAN-1
```

Output:

```
{  
  "instance": {  
    "name": "MEAN-1",  
    "arn": "arn:aws:lightsail:us-west-2:111122223333:Instance/bd470fc5-

get-load-balancers

The following code example shows how to use `get-load-balancers`.

AWS CLI

To get information about all load balancers

The following `get-load-balancers` example displays details about all of the load balancers in the configured AWS Region.

```
aws lightsail get-load-balancers
```

Output:

```
{
  "loadBalancers": [
    {
      "name": "LoadBalancer-1",
      "arn": "arn:aws:lightsail:us-west-2:111122223333:LoadBalancer/40486b2b-1ad0-4152-83e4-cEXAMPLE6f4b",

]
```

- For API details, see [GetLoadBalancers](#) in *AWS CLI Command Reference*.

get-operation

The following code example shows how to use get-operation.

AWS CLI

To get information about a single operation

The following `get-operation` example displays details about the specified operation.

```
aws lightsail get-operation \  
  --operation-id e5700e8a-daf2-4b49-bc01-3EXAMPLE910a
```

Output:

```
{  
  "operation": {  
    "id": "e5700e8a-daf2-4b49-bc01-3EXAMPLE910a",  
    "resourceName": "Instance-1",  
    "resourceType": "Instance",  
    "createdAt": 1571679872.404,  
    "location": {  
      "availabilityZone": "us-west-2a",  
      "regionName": "us-west-2"  
    },  
    "isTerminal": true,  
    "operationType": "CreateInstance",  
    "status": "Succeeded",  
    "statusChangedAt": 1571679890.304  
  }  
}
```

- For API details, see [GetOperation](#) in *AWS CLI Command Reference*.

get-operations-for-resource

The following code example shows how to use `get-operations-for-resource`.

AWS CLI

To get all operations for a resource

The following `get-operations-for-resource` example displays details about all operations for the specified resource.

```
aws lightsail get-operations-for-resource \  
  --resource-id e5700e8a-daf2-4b49-bc01-3EXAMPLE910a
```

```
--resource-name LoadBalancer-1
```

Output:

```
{
  "operations": [
    {

    "statusChangedAt": 1571679087.57
  },
  ...
}
]
```

- For API details, see [GetOperations](#) in *AWS CLI Command Reference*.

get-regions

The following code example shows how to use `get-regions`.

AWS CLI

To get all AWS Regions for Amazon Lightsail

The following `get-regions` example displays details about all of the AWS Regions for Amazon Lightsail.

```
aws lightsail get-regions
```

Output:

```
{
  "regions": [
    {
      "continentCode": "NA",
      "description": "This region is recommended to serve users in the eastern United States",
      "displayName": "Virginia",
      "name": "us-east-1",
      "availabilityZones": [],
      "relationalDatabaseAvailabilityZones": []
    },
    {
      "continentCode": "NA",
      "description": "This region is recommended to serve users in the eastern United States",
      "displayName": "Ohio",

      "availabilityZones": [],
      "relationalDatabaseAvailabilityZones": []
    },
    {
      "continentCode": "NA",
      "description": "This region is recommended to serve users in the northwestern United States, Alaska, and western Canada",
      "displayName": "Oregon",
      "name": "us-west-2",
      "availabilityZones": [],
      "relationalDatabaseAvailabilityZones": []
    }
  ]
}
```

```
    },  
    ...  
  }  
]  
}
```

- For API details, see [GetRegions](#) in *AWS CLI Command Reference*.

get-relational-database-blueprints

The following code example shows how to use `get-relational-database-blueprints`.

AWS CLI

To get the blueprints for new relational databases

The following `get-relational-database-blueprints` example displays details about all of the available relational database blueprints that can be used to create new relational databases in Amazon Lightsail.

```
aws lightsail get-relational-database-blueprints
```

Output:

```
{  
  "blueprints": [  
    {  
      "blueprintId": "mysql_5_6",  
      "engine": "mysql",  
      "engineVersion": "5.6.44",  
      "engineDescription": "MySQL Community Edition",  
      "engineVersionDescription": "MySQL 5.6.44",  
      "isEngineDefault": false  
    },  
    {  
      "blueprintId": "mysql_5_7",  
      "engine": "mysql",  
      "engineVersion": "5.7.26",  
      "engineDescription": "MySQL Community Edition",  
      "engineVersionDescription": "MySQL 5.7.26",  
      "isEngineDefault": true  
    }  
  ]  
}
```

```
    },
    {
      "blueprintId": "mysql_8_0",
      "engine": "mysql",
      "engineVersion": "8.0.16",
      "engineDescription": "MySQL Community Edition",
      "engineVersionDescription": "MySQL 8.0.16",
      "isEngineDefault": false
    },
    {
      "blueprintId": "postgres_9_6",
      "engine": "postgres",
      "engineVersion": "9.6.15",
      "engineDescription": "PostgreSQL",
      "engineVersionDescription": "PostgreSQL 9.6.15-R1",
      "isEngineDefault": false
    },
    {
      "blueprintId": "postgres_10",
      "engine": "postgres",
      "engineVersion": "10.10",
      "engineDescription": "PostgreSQL",
      "engineVersionDescription": "PostgreSQL 10.10-R1",
      "isEngineDefault": false
    },
    {
      "blueprintId": "postgres_11",
      "engine": "postgres",
      "engineVersion": "11.5",
      "engineDescription": "PostgreSQL",
      "engineVersionDescription": "PostgreSQL 11.5-R1",
      "isEngineDefault": true
    }
  ]
}
```

- For API details, see [GetRelationalDatabaseBlueprints](#) in *AWS CLI Command Reference*.

get-relational-database-bundles

The following code example shows how to use `get-relational-database-bundles`.

AWS CLI

To get the bundles for new relational databases

The following `get-relational-database-bundles` example displays details about all of the available relational database bundles that can be used to create new relational databases in Amazon Lightsail. Note that the response does not include inactive bundles because the `--include-inactive` flag is not specified in the command. You cannot use inactive bundles to create new relational databases.

```
aws lightsail get-relational-database-bundles
```

Output:

```
{
  "bundles": [
    {
      "bundleId": "micro_2_0",
      "name": "Micro",
      "price": 15.0,
      "ramSizeInGb": 1.0,

    "isActive": true
  },
  {
    "bundleId": "medium_2_0",
    "name": "Medium",
    "price": 60.0,
    "ramSizeInGb": 4.0,
    "diskSizeInGb": 120,
    "transferPerMonthInGb": 100,
    "cpuCount": 2,
    "isEncrypted": true,
    "isActive": true
  },
  {
    "bundleId": "medium_ha_2_0",
    "name": "Medium with High Availability",
    "price": 120.0,
    "ramSizeInGb": 4.0,
    "diskSizeInGb": 120,
    "transferPerMonthInGb": 100,
    "cpuCount": 2,
    "isEncrypted": true,
    "isActive": true
  },
  {
    "bundleId": "large_2_0",
    "name": "Large",
    "price": 115.0,
    "ramSizeInGb": 8.0,
```

```

        "diskSizeInGb": 240,
        "transferPerMonthInGb": 200,
        "cpuCount": 2,
        "isEncrypted": true,
        "isActive": true
    },
    {
        "bundleId": "large_ha_2_0",
        "name": "Large with High Availability",
        "price": 230.0,
        "ramSizeInGb": 8.0,
        "diskSizeInGb": 240,
        "transferPerMonthInGb": 200,
        "cpuCount": 2,
        "isEncrypted": true,
        "isActive": true
    }
]
}

```

For more information, see [Creating a database in Amazon Lightsail](#) in the *Amazon Lightsail Developer Guide*.

- For API details, see [GetRelationalDatabaseBundles](#) in *AWS CLI Command Reference*.

get-relational-database-events

The following code example shows how to use `get-relational-database-events`.

AWS CLI

To get the events for a relational database

The following `get-relational-database-events` example displays details about events in the last 17 hours (1020 minutes) for the specified relational database.

```

aws lightsail get-relational-database-events \
  --relational-database-name Database-1 \
  --duration-in-minutes 1020

```

Output:

```
{
```

```
"relationalDatabaseEvents": [  
  {  
    "resource": "Database-1",  
    "createdAt": 1571654146.553,  
    "message": "Backing up Relational Database",  
    "eventCategories": [  
      "backup"  
    ]  
  },  
  {  
    "resource": "Database-1",  
    "createdAt": 1571654249.98,  
    "message": "Finished Relational Database backup",  
    "eventCategories": [  
      "backup"  
    ]  
  }  
]
```

- For API details, see [GetRelationalDatabaseEvents](#) in *AWS CLI Command Reference*.

get-relational-database-log-events

The following code example shows how to use `get-relational-database-log-events`.

AWS CLI

To get log events for a relational database

The following `get-relational-database-log-events` example displays details about the specified log between 1570733176 and 1571597176 for relational database Database1. The information returned is configured to start from head.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-relational-database-log-events \  
  --relational-database-name Database1 \  
  --log-stream-name error \  
  --start-from-head \  
  --start-time 1570733176 \  
  --end-time 1571597176
```

Output:

```
{
  "resourceLogEvents": [
    {
      "createdAt": 1570820267.0,
      "message": "2019-10-11 18:57:47 20969 [Warning] IP address '192.0.2.0'

```

- For API details, see [GetRelationalDatabaseLogEvents](#) in *AWS CLI Command Reference*.

get-relational-database-log-streams

The following code example shows how to use `get-relational-database-log-streams`.

AWS CLI

To get the log streams for a relational database

The following `get-relational-database-log-streams` example returns all of the available log streams for the specified relational database.

```
aws lightsail get-relational-database-log-streams \
--relational-database-name Database1
```

Output:

```
{
  "logStreams": [
    "audit",
    "error",
    "general",
    "slowquery"
  ]
}
```

- For API details, see [GetRelationalDatabaseLogStreams](#) in *AWS CLI Command Reference*.

get-relational-database-master-user-password

The following code example shows how to use `get-relational-database-master-user-password`.

AWS CLI

To get the master user password for a relational database

The following `get-relational-database-master-user-password` example returns information about the master user password for the specified relational database.

```
aws lightsail get-relational-database-master-user-password \  
  --relational-database-name Database-1
```

Output:

```
{  
  "masterUserPassword": "VEXAMPLEec.9qvx,_t<)Wkf)kwboM,>2",  
  "createdAt": 1571259453.959  
}
```

- For API details, see [GetRelationalDatabaseMasterUserPassword](#) in *AWS CLI Command Reference*.

get-relational-database-metric-data

The following code example shows how to use `get-relational-database-metric-data`.

AWS CLI

To get metric data for a relational database

The following `get-relational-database-metric-data` example returns the count sum of the metric `DatabaseConnections` over the period of 24 hours (86400 seconds) between 1570733176 and 1571597176 for relational database `Database1`.

We recommend that you use a unix time converter to identify the start and end times.

```
aws lightsail get-relational-database-metric-data \  
  --relational-database-name Database1 \  
  --start-time 1570733176 \  
  --end-time 1571597176
```

```
--metric-name DatabaseConnections \  
--period 86400 \  
--start-time 1570733176 \  
--end-time 1571597176 \  
--unit Count \  
--statistics Sum
```

Output:

```
{  
  "metricName": "DatabaseConnections",  
  "metricData": [  
    {  
      "sum": 1.0,  
      "timestamp": 1571510760.0,  
      "unit": "Count"  
    },  
    {  
      "sum": 1.0,  
      "timestamp": 1570733160.0,  
      "unit": "Count"  
    },  
    {  
      "sum": 1.0,  
      "timestamp": 1570992360.0,  
      "unit": "Count"  
    },  
    {  
      "sum": 0.0,  
      "timestamp": 1571251560.0,  
      "unit": "Count"  
    },  
    {  
      "sum": 721.0,  
      "timestamp": 1570819560.0,  
      "unit": "Count"  
    },  
    {  
      "sum": 1.0,  
      "timestamp": 1571078760.0,  
      "unit": "Count"  
    },  
    {
```

```
    "sum": 2.0,  
    "timestamp": 1571337960.0,  
    "unit": "Count"  
  },  
  {  
    "sum": 684.0,  
    "timestamp": 1570905960.0,  
    "unit": "Count"  
  },  
  {  
    "sum": 0.0,  
    "timestamp": 1571165160.0,  
    "unit": "Count"  
  },  
  {  
    "sum": 1.0,  
    "timestamp": 1571424360.0,  
    "unit": "Count"  
  }  
]  
}
```

get-relational-database-parameters

The following code example shows how to use `get-relational-database-parameters`.

AWS CLI

To get parameters for a relational database

The following `get-relational-database-parameters` example returns information about all of the available parameters for the specified relational database.

```
aws lightsail get-relational-database-parameters \  
  --relational-database-name Database-1
```

Output:

```
{  
  "parameters": [  
    {  
      "name": "db-instance-class",  
      "value": "db.m3.xlarge",  
      "unit": "Count",  
      "timestamp": 1571424360.0,  
      "sum": 1.0,  
      "unit": "Count"  
    },  
    {  
      "name": "db-instance-class",  
      "value": "db.m3.xlarge",  
      "unit": "Count",  
      "timestamp": 1571165160.0,  
      "sum": 0.0,  
      "unit": "Count"  
    },  
    {  
      "name": "db-instance-class",  
      "value": "db.m3.xlarge",  
      "unit": "Count",  
      "timestamp": 1570905960.0,  
      "sum": 684.0,  
      "unit": "Count"  
    },  
    {  
      "name": "db-instance-class",  
      "value": "db.m3.xlarge",  
      "unit": "Count",  
      "timestamp": 1571337960.0,  
      "sum": 2.0,  
      "unit": "Count"  
    }  
  ]  
}
```

```

get-static-ip

The following code example shows how to use `get-static-ip`.

AWS CLI

To get information about a static IP

The following `get-static-ip` example displays details about the specified static IP.

```
aws lightsail get-static-ip \
  --static-ip-name StaticIp-1
```

Output:

```
{
```

```
"staticIp": {
  "name": "StaticIp-1",
  "arn": "arn:aws:lightsail:us-
west-2:111122223333:StaticIp/2257cd76-1f0e-4ac0-82e2-2EXAMPLE23ad",

    "attachedTo": "WordPress-1",
    "isAttached": true
}
]
}

```

- For API details, see [GetStaticIps](#) in *AWS CLI Command Reference*.

is-vpc-peered

The following code example shows how to use `is-vpc-peered`.

AWS CLI

To identify if your Amazon Lightsail virtual private cloud is peered

The following `is-vpc-peered` example returns the peering status of the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```
aws lightsail is-vpc-peered \
  --region us-west-2
```

Output:

```
{
  "isPeered": true
}
```

- For API details, see [IsVpcPeered](#) in *AWS CLI Command Reference*.

open-instance-public-ports

The following code example shows how to use `open-instance-public-ports`.

AWS CLI

To open firewall ports for an instance

The following `open-instance-public-ports` example opens TCP port 22 on the specified instance.

```
aws lightsail open-instance-public-ports \
  --instance-name MEAN-2 \
  --port-info fromPort=22,protocol=TCP,toPort=22
```

Output:

```
{
  "operation": {
    "id": "719744f0-a022-46f2-9f11-6EXAMPLE4642",
    "resourceName": "MEAN-2",
    "resourceType": "Instance",
    "createdAt": 1571072906.849,
    "location": {
      "availabilityZone": "us-west-2a",
      "regionName": "us-west-2"
    },
    "isTerminal": true,
    "operationDetails": "22/tcp",
    "operationType": "OpenInstancePublicPorts",
    "status": "Succeeded",
    "statusChangedAt": 1571072906.849
  }
}
```

- For API details, see [OpenInstancePublicPorts](#) in *AWS CLI Command Reference*.

peer-vpc

The following code example shows how to use `peer-vpc`.

AWS CLI

To peer the Amazon Lightsail virtual private cloud

The following `peer-vpc` example peers the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```
aws lightsail peer-vpc \  
  --region us-west-2
```

Output:

```
{  
  "operation": {  
    "id": "787e846a-54ac-497f-bce2-9EXAMPLE5d91",  
    "resourceName": "vpc-0EXAMPLEa5261efb3",  
    "resourceType": "PeeredVpc",  
    "createdAt": 1571694233.104,  
    "location": {  
      "availabilityZone": "all",  
      "regionName": "us-west-2"  
    },  
    "isTerminal": true,  
    "operationDetails": "vpc-e2b3eb9b",  
    "operationType": "PeeredVpc",  
    "status": "Succeeded",  
    "statusChangedAt": 1571694233.104  
  }  
}
```

- For API details, see [PeerVpc](#) in *AWS CLI Command Reference*.

reboot-instance

The following code example shows how to use `reboot-instance`.

AWS CLI

To reboot an instance

The following `reboot-instance` example reboots the specified instance.

```
aws lightsail reboot-instance \  
  --instance-name MEAN-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "2b679f1c-8b71-4bb4-8e97-8EXAMPLEed93",  
      "resourceName": "MEAN-1",  
      "resourceType": "Instance",  
      "createdAt": 1571694445.49,  
      "location": {  
        "availabilityZone": "us-west-2a",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": true,  
      "operationDetails": "",  
      "operationType": "RebootInstance",  
      "status": "Succeeded",  
      "statusChangedAt": 1571694445.49  
    }  
  ]  
}
```

- For API details, see [RebootInstance](#) in *AWS CLI Command Reference*.

reboot-relational-database

The following code example shows how to use `reboot-relational-database`.

AWS CLI

To reboot a relational database

The following `reboot-relational-database` example reboots the specified relational database.

```
aws lightsail reboot-relational-database \  
  --instance-name MEAN-1
```

```
--relational-database-name Database-1
```

Output:

```
{
  "operations": [
    {
      "id": "e4c980c0-3137-496c-9c91-1EXAMPLEdec2",
      "resourceName": "Database-1",
      "resourceType": "RelationalDatabase",

      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationDetails": "",
      "operationType": "RebootRelationalDatabase",
      "status": "Started",
      "statusChangedAt": 1571694532.91
    }
  ]
}
```

- For API details, see [RebootRelationalDatabase](#) in *AWS CLI Command Reference*.

release-static-ip

The following code example shows how to use `release-static-ip`.

AWS CLI

To delete a static IP

The following `release-static-ip` example deletes the specified static IP.

```
aws lightsail release-static-ip \
  --static-ip-name StaticIp-1
```

Output:

```
{
```

```
"operations": [  
  {  
    "id": "e374c002-dc6d-4c7f-919f-2EXAMPLE13ce",  
    "resourceName": "StaticIp-1",

    "createdAt": 1571694962.003,  
    "location": {  
      "availabilityZone": "all",  
      "regionName": "us-west-2"  
    },  
    "isTerminal": true,  
    "operationType": "ReleaseStaticIp",  
    "status": "Succeeded",  
    "statusChangedAt": 1571694962.003  
  }  
]  
}
```

- For API details, see [ReleaseStaticIp](#) in *AWS CLI Command Reference*.

start-instance

The following code example shows how to use `start-instance`.

AWS CLI

To start an instance

The following `start-instance` example starts the specified instance.

```
aws lightsail start-instance \  
  --instance-name WordPress-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "f88d2a93-7cea-4165-afce-2d688cb18f23",  
      "resourceName": "WordPress-1",  
      "resourceType": "Instance",  
      "createdAt": 1571695583.463,  
      "location": {  
        "availabilityZone": "us-east-1a",  
        "regionName": "us-east-1"  
      },  
      "isTerminal": true,  
      "operationType": "StartInstance",  
      "status": "InProgress",  
      "statusChangedAt": 1571695583.463  
    }  
  ]  
}
```

```
    "location": {
      "availabilityZone": "us-west-2a",
      "regionName": "us-west-2"
    },
    "isTerminal": false,
    "operationType": "StartInstance",
    "status": "Started",
    "statusChangedAt": 1571695583.463
  }
]
```

- For API details, see [StartInstance](#) in *AWS CLI Command Reference*.

start-relational-database

The following code example shows how to use `start-relational-database`.

AWS CLI

To start a relational database

The following `start-relational-database` example starts the specified relational database.

```
aws lightsail start-relational-database \  
  --relational-database-name Database-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "4d5294ec-a38a-4fda-9e37-aEXAMPLE0d24",  
      "resourceName": "Database-1",  
      "resourceType": "RelationalDatabase",  
      "createdAt": 1571695998.822,  
      "location": {  
        "availabilityZone": "us-west-2a",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": false,
```

```
        "operationType": "StartRelationalDatabase",
        "status": "Started",
        "statusChangedAt": 1571695998.822
      }
    ]
  }
}
```

- For API details, see [StartRelationalDatabase](#) in *AWS CLI Command Reference*.

stop-instance

The following code example shows how to use stop-instance.

AWS CLI

To stop an instance

The following stop-instance example stops the specified instance.

```
aws lightsail stop-instance \  
--instance-name WordPress-1
```

Output:

```
{
  "operations": [
    {
      "id": "265357e2-2943-4d51-888a-1EXAMPLE7585",
      "resourceName": "WordPress-1",
      "resourceType": "Instance",
      "createdAt": 1571695471.134,
      "location": {
        "availabilityZone": "us-west-2a",
        "regionName": "us-west-2"
      },
      "isTerminal": false,
      "operationType": "StopInstance",
      "status": "Started",
      "statusChangedAt": 1571695471.134
    }
  ]
}
```

- For API details, see [StopInstance](#) in *AWS CLI Command Reference*.

stop-relational-database

The following code example shows how to use `stop-relational-database`.

AWS CLI

To stop a relational database

The following `stop-relational-database` example stops the specified relational database.

```
aws lightsail stop-relational-database \  
  --relational-database-name Database-1
```

Output:

```
{  
  "operations": [  
    {  
      "id": "cc559c19-4adb-41e4-b75b-5EXAMPLE4e61",  
      "resourceName": "Database-1",  
      "resourceType": "RelationalDatabase",  
      "createdAt": 1571695526.29,  
      "location": {  
        "availabilityZone": "us-west-2a",  
        "regionName": "us-west-2"  
      },  
      "isTerminal": false,  
      "operationType": "StopRelationalDatabase",  
      "status": "Started",  
      "statusChangedAt": 1571695526.29  
    }  
  ]  
}
```

- For API details, see [StopRelationalDatabase](#) in *AWS CLI Command Reference*.

unpeer-vpc

The following code example shows how to use `unpeer-vpc`.

AWS CLI

To unpeer the Amazon Lightsail virtual private cloud

The following `unpeer-vpc` example unpeers the Amazon Lightsail virtual private cloud (VPC) for the specified AWS Region.

```
aws lightsail unpeer-vpc \  
  --region us-west-2
```

Output:

```
{  
  "operation": {  
    "id": "531aca64-7157-47ab-84c6-eEXAMPLEd898",  
    "resourceName": "vpc-0EXAMPLEa5261efb3",  
    "resourceType": "PeeredVpc",  
    "createdAt": 1571694109.945,  
    "location": {  
      "availabilityZone": "all",  
      "regionName": "us-west-2"  
    },  
    "isTerminal": true,  
    "operationDetails": "vpc-e2b3eb9b",  
    "operationType": "UnpeeredVpc",  
    "status": "Succeeded",  
    "statusChangedAt": 1571694109.945  
  }  
}
```

- For API details, see [UnpeerVpc](#) in *AWS CLI Command Reference*.

Macie examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Macie.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

describe-buckets

The following code example shows how to use `describe-buckets`.

AWS CLI

To query data about one or more S3 buckets that Amazon Macie monitors and analyzes for your account

The following `describe-buckets` example queries metadata for all S3 buckets whose names begin with MY-S3 and are in the current AWS Region.

```
aws macie2 describe-buckets \  
  --criteria '{"bucketName":{"prefix":"my-S3"}}'
```

Output:

```
{  
  "buckets": [  
    {  
      "accountId": "123456789012",

}
```

For more information, see [Creating a Flow](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [CreateFlow](#) in *AWS CLI Command Reference*.

delete-flow

The following code example shows how to use delete-flow.

AWS CLI

To delete a flow

The following `delete-flow` example deletes the specified flow.

```
aws mediaconnect delete-flow \  
  --flow-arn arn:aws:mediaconnect:us-  
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{  
  "FlowArn": "arn:aws:mediaconnect:us-  
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",  
  "Status": "DELETING"  
}
```

For more information, see [Deleting a Flow](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [DeleteFlow](#) in *AWS CLI Command Reference*.

describe-flow

The following code example shows how to use `describe-flow`.

AWS CLI

To view the details of a flow

The following `describe-flow` example displays the specified flow's details, such as ARN, Availability Zone, status, source, entitlements, and outputs.

```
aws mediaconnect describe-flow \  
  --flow-arn arn:aws:mediaconnect:us-  
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{  
  "Flow": {  
    "EgressIp": "54.201.4.39",  
    "AvailabilityZone": "us-west-2c",  
    "Status": "ACTIVE",  
    "FlowArn": "arn:aws:mediaconnect:us-  
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
```

```
    "Entitlements": [
      {

- For API details, see [DescribeFlow](#) in *AWS CLI Command Reference*.

grant-flow-entitlements

The following code example shows how to use grant-flow-entitlements.

AWS CLI

To grant an entitlement on a flow

The following grant-flow-entitlements example grants an entitlement to the specified existing flow to share your content with another AWS account.

```

aws mediaconnect grant-flow-entitlements \
  --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
  --entitlements Description='For
AnyCompany',Encryption={"Algorithm=aes128,KeyType=static-
key,RoleArn=arn:aws:iam::111122223333:role/MediaConnect-
ASM,SecretArn=arn:aws:secretsmanager:us-
west-2:111122223333:secret:mySecret1"},Name=AnyCompany_Entitlement,Subscribers=444455556666
Description='For Example Corp',Name=ExampleCorp,Subscribers=777788889999

```

Output:

```

{
  "Entitlements": [
    {
      "Name": "AnyCompany_Entitlement",

```

```

    "EntitlementArn": "arn:aws:mediacconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement",
    "Subscribers": [
        "444455556666"
    ],
    "Description": "For AnyCompany",
    "Encryption": {
        "SecretArn": "arn:aws:secretsmanager:us-
west-2:111122223333:secret:mySecret1",
        "Algorithm": "aes128",
        "RoleArn": "arn:aws:iam::111122223333:role/MediaConnect-ASM",
        "KeyType": "static-key"
    }
},
{
    "Name": "ExampleCorp",
    "EntitlementArn": "arn:aws:mediacconnect:us-
west-2:111122223333:entitlement:1-3333cccc4444dddd-1111aaaa2222:ExampleCorp",
    "Subscribers": [
        "777788889999"
    ],
    "Description": "For Example Corp"
}
],
"FlowArn": "arn:aws:mediacconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame"
}

```

For more information, see [Granting an Entitlement on a Flow](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [GrantFlowEntitlements](#) in *AWS CLI Command Reference*.

list-entitlements

The following code example shows how to use `list-entitlements`.

AWS CLI

To view a list of entitlements

The following `list-entitlements` example displays a list of all entitlements that have been granted to the account.

```
aws mediacconnect list-entitlements
```

Output:

```
{
  "Entitlements": [
    {
      "EntitlementArn": "arn:aws:mediacconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:MyEntitlement",
      "EntitlementName": "MyEntitlement"
    }
  ]
}
```

For more information, see [ListEntitlements](#) in the *AWS Elemental MediaConnect API Reference*.

- For API details, see [ListEntitlements](#) in *AWS CLI Command Reference*.

list-flows

The following code example shows how to use `list-flows`.

AWS CLI

To view a list of flows

The following `list-flows` example displays a list of flows.

```
aws mediacconnect list-flows
```

Output:

```
{
  "Flows": [
    {
      "Status": "STANDBY",
      "SourceType": "OWNED",
      "AvailabilityZone": "us-west-2a",
      "Description": "NYC awards show",
      "Name": "AwardsShow",

```

```

    "FlowArn": "arn:aws:mediacconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow"
  },
  {
    "Status": "STANDBY",
    "SourceType": "OWNED",
    "AvailabilityZone": "us-west-2c",
    "Description": "LA basketball game",
    "Name": "BasketballGame",
    "FlowArn": "arn:aws:mediacconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame"
  }
]
}

```

For more information, see [Viewing a List of Flows](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [ListFlows](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list tags for a MediaConnect resource

The following `list-tags-for-resource` example displays the tag keys and values associated with the specified MediaConnect resource.

```

aws mediacconnect list-tags-for-resource \
  --resource-arn arn:aws:mediacconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame

```

Output:

```

{
  "Tags": {
    "region": "west",
    "stage": "prod"
  }
}

```

```
}
```

For more information, see [ListTagsForResource](#), [TagResource](#), [UntagResource](#) in the *AWS Elemental MediaConnect API Reference*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

remove-flow-output

The following code example shows how to use `remove-flow-output`.

AWS CLI

To remove an output from a flow

The following `remove-flow-output` example removes an output from the specified flow.

```
aws mediaconnect remove-flow-output \
  --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
  --output-arn arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC
```

Output:

```
{
  "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
  "OutputArn": "arn:aws:mediaconnect:us-
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC"
}
```

For more information, see [Removing Outputs from a Flow](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [RemoveFlowOutput](#) in *AWS CLI Command Reference*.

revoke-flow-entitlement

The following code example shows how to use `revoke-flow-entitlement`.

AWS CLI

To revoke an entitlement

The following `revoke-flow-entitlement` example revokes an entitlement on the specified flow.

```
aws mediaconnect revoke-flow-entitlement \  
  --flow-arn arn:aws:mediaconnect:us-  
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \  
  --entitlement-arn arn:aws:mediaconnect:us-  
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement
```

Output:

```
{  
  "FlowArn": "arn:aws:mediaconnect:us-  
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",  
  "EntitlementArn": "arn:aws:mediaconnect:us-  
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement"  
}
```

For more information, see [Revoking an Entitlement](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [RevokeFlowEntitlement](#) in *AWS CLI Command Reference*.

start-flow

The following code example shows how to use `start-flow`.

AWS CLI

To start a flow

The following `start-flow` example starts the specified flow.

```
aws mediaconnect start-flow \  
  --flow-arn arn:aws:mediaconnect:us-  
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

This command produces no output. Output:

```
{
  "FlowArn": "arn:aws:mediacconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",
  "Status": "STARTING"
}
```

For more information, see [Starting a Flow](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [StartFlow](#) in *AWS CLI Command Reference*.

stop-flow

The following code example shows how to use stop-flow.

AWS CLI

To stop a flow

The following stop-flow example stops the specified flow.

```
aws mediacconnect stop-flow \
  --flow-arn arn:aws:mediacconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow
```

Output:

```
{
  "Status": "STOPPING",
  "FlowArn": "arn:aws:mediacconnect:us-
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow"
}
```

For more information, see [Stopping a Flow](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [StopFlow](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To add tags to a MediaConnect resource

The following `tag-resource` example adds a tag with a key name and value to the specified MediaConnect resource.

```
aws mediaconnect tag-resource \  
  --resource-arn arn:aws:mediaconnect:us-  
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame  
  --tags region=west
```

This command produces no output.

For more information, see [ListTagsForResource](#), [TagResource](#), [UntagResource](#) in the *AWS Elemental MediaConnect API Reference*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a MediaConnect resource

The following `untag-resource` example remove the tag with the specified key name and its associated value from a MediaConnect resource.

```
aws mediaconnect untag-resource \  
  --resource-arn arn:aws:mediaconnect:us-  
east-1:123456789012:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BasketballGame \  
  --tag-keys region
```

This command produces no output.

For more information, see [ListTagsForResource](#), [TagResource](#), [UntagResource](#) in the *AWS Elemental MediaConnect API Reference*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-flow-entitlement

The following code example shows how to use update-flow-entitlement.

AWS CLI

To update an entitlement

The following update-flow-entitlement example updates the specified entitlement with a new description and subscriber.

```
aws mediaconnect update-flow-entitlement \
  --flow-arn arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \
  --entitlement-arn arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement
\
  --description 'For AnyCompany Affiliate' \
  --subscribers 777788889999
```

Output:

```
{
  "FlowArn": "arn:aws:mediaconnect:us-
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",
  "Entitlement": {
    "Name": "AnyCompany_Entitlement",
    "Description": "For AnyCompany Affiliate",
    "EntitlementArn": "arn:aws:mediaconnect:us-
west-2:111122223333:entitlement:1-11aa22bb11aa22bb-3333cccc4444:AnyCompany_Entitlement",
    "Encryption": {
      "KeyType": "static-key",
      "Algorithm": "aes128",
      "RoleArn": "arn:aws:iam::111122223333:role/MediaConnect-ASM",
      "SecretArn": "arn:aws:secretsmanager:us-
west-2:111122223333:secret:mySecret1"
    },
    "Subscribers": [
      "777788889999"
    ]
  }
}
```

For more information, see [Updating an Entitlement](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [UpdateFlowEntitlement](#) in *AWS CLI Command Reference*.

update-flow-output

The following code example shows how to use `update-flow-output`.

AWS CLI

To update an output on a flow

The following `update-flow-output` example update an output on the specified flow.

```
aws mediaconnect update-flow-output \  
  --flow-arn arn:aws:mediaconnect:us-  
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame \  
  --output-arn arn:aws:mediaconnect:us-  
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC \  
  --port 3331
```

Output:

```
{  
  "FlowArn": "arn:aws:mediaconnect:us-  
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:BaseballGame",  
  "Output": {  
    "Name": "NYC",  
    "Port": 3331,  
    "Description": "NYC stream",  
    "Transport": {  
      "Protocol": "rtsp-fec",  
      "SmoothingLatency": 100  
    },  
    "OutputArn": "arn:aws:mediaconnect:us-  
east-1:111122223333:output:2-3aBC45dEF67hiJ89-c34de5fG678h:NYC",  
    "Destination": "192.0.2.12"  
  }  
}
```

For more information, see [Updating Outputs on a Flow](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [UpdateFlowOutput](#) in *AWS CLI Command Reference*.

update-flow-source

The following code example shows how to use `update-flow-source`.

AWS CLI

To update the source of an existing flow

The following `update-flow-source` example updates the source of an existing flow.

```
aws mediaconnect update-flow-source \  
  --flow-arn arn:aws:mediaconnect:us-  
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow \  
  --source-arn arn:aws:mediaconnect:us-  
east-1:111122223333:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource \  
  --description 'Friday night show' \  
  --ingest-port 3344 \  
  --protocol rtp-fec \  
  --whitelist-cidr 10.24.34.0/23
```

Output:

```
{  
  "FlowArn": "arn:aws:mediaconnect:us-  
east-1:111122223333:flow:1-23aBC45dEF67hiJ8-12AbC34DE5fG:AwardsShow",  
  "Source": {  
    "IngestIp": "34.210.136.56",  
    "WhitelistCidr": "10.24.34.0/23",  
    "Transport": {  
      "Protocol": "rtp-fec"  
    },  
    "IngestPort": 3344,  
    "Name": "ShowSource",  
    "Description": "Friday night show",  
    "SourceArn": "arn:aws:mediaconnect:us-  
east-1:111122223333:source:3-4aBC56dEF78hiJ90-4de5fG6Hi78Jk:ShowSource"  
  }  
}
```

For more information, see [Updating the Source of a Flow](#) in the *AWS Elemental MediaConnect User Guide*.

- For API details, see [UpdateFlowSource](#) in *AWS CLI Command Reference*.

MediaConvert examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaConvert.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

cancel-job

The following code example shows how to use `cancel-job`.

AWS CLI

To cancel a job that is in a queue

The following `cancel-job` example cancels the job with ID `1234567891234-abc123`. You can't cancel a job that the service has started processing.

```
aws mediaconvert cancel-job \  
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \  
  --region region-name-1 \  
  --id 1234567891234-abc123
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see [Working with AWS Elemental MediaConvert Jobs](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [CancelJob](#) in *AWS CLI Command Reference*.

create-job-template

The following code example shows how to use `create-job-template`.

AWS CLI

To create a job template

The following `create-job-template` example creates a job template with the transcoding settings that are specified in the file `job-template.json` that resides on your system.

```
aws mediaconvert create-job-template \  
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \  
  --region region-name-1 \  
  --name JobTemplate1 \  
  --cli-input-json file://~/job-template.json
```

If you create your job template JSON file by using `get-job-template` and then modifying the file, remove the `JobTemplate` object, but keep the `Settings` child object inside it. Also, make sure to remove the following key-value pairs: `LastUpdated`, `Arn`, `Type`, and `CreatedAt`. You can specify the category, description, name, and queue either in the JSON file or at the command line.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON specification for the job template that you created.

For more information, see [Working with AWS Elemental MediaConvert Job Templates](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [CreateJobTemplate](#) in *AWS CLI Command Reference*.

create-job

The following code example shows how to use `create-job`.

AWS CLI

To create a job

The following `create-job` example creates a transcoding job with the settings that are specified in a file `job.json` that resides on the system that you send the command from. This JSON job specification might specify each setting individually, reference a job template, or reference output presets.

```
aws mediaconvert create-job \  
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \  
  --region region-name-1 \  
  --cli-input-json file://~/job.json
```

You can use the AWS Elemental MediaConvert console to generate the JSON job specification by choosing your job settings, and then choosing **Show job JSON** at the bottom of the **Job** section.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns the JSON job specification that you sent with your request.

For more information, see [Working with AWS Elemental MediaConvert Jobs](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [CreateJob](#) in *AWS CLI Command Reference*.

create-preset

The following code example shows how to use `create-preset`.

AWS CLI

To create a custom output preset

The following `create-preset` example creates a custom output preset based on the output settings that are specified in the file `preset.json`. You can specify the category, description, and name either in the JSON file or at the command line.

```
aws mediaconvert create-preset \  
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \  
  --region region-name-1 \  
  --cli-input-json file://~/preset.json
```

If you create your preset JSON file by using `get-preset` and then modifying the output file, ensure that you remove the following key-value pairs: `LastUpdated`, `Arn`, `Type`, and `CreatedAt`.

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see [Working with AWS Elemental MediaConvert Output Presets](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [CreatePreset](#) in *AWS CLI Command Reference*.

create-queue

The following code example shows how to use `create-queue`.

AWS CLI

To create a custom queue

The following `create-queue` example creates a custom transcoding queue.

```
aws mediaconvert create-queue \  
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \  
  --region region-name-1 \  
  --name Queue1 \  
  --description "Keep this queue empty unless job is urgent."
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

Output:

```
{
  "Queue": {
    "Status": "ACTIVE",
    "Name": "Queue1",
    "LastUpdated": 1518034928,
    "Arn": "arn:aws:mediaconvert:region-name-1:012345678998:queues/Queue1",
    "Type": "CUSTOM",
    "CreatedAt": 1518034928,
    "Description": "Keep this queue empty unless job is urgent."
  }
}
```

For more information, see [Working with AWS Elemental MediaConvert Queues](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [CreateQueue](#) in *AWS CLI Command Reference*.

delete-job-template

The following code example shows how to use `delete-job-template`.

AWS CLI

To delete a job template

The following `delete-job-template` example deletes the specified custom job template.

```
aws mediaconvert delete-job-template \
  --name "DASH Streaming" \
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-job-templates` to confirm that your template was deleted.

For more information, see [Working with AWS Elemental MediaConvert Job Templates](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [DeleteJobTemplate](#) in *AWS CLI Command Reference*.

delete-preset

The following code example shows how to use `delete-preset`.

AWS CLI

To delete a custom on-demand queue

The following `delete-preset` example deletes the specified custom preset.

```
aws mediaconvert delete-preset \  
  --name SimpleMP4 \  
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-presets` to confirm that your preset was deleted.

For more information, see [Working with AWS Elemental MediaConvert Output Presets](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [DeletePreset](#) in *AWS CLI Command Reference*.

delete-queue

The following code example shows how to use `delete-queue`.

AWS CLI

To delete a custom on-demand queue

The following `delete-queue` example deletes the specified custom on-demand queue.

You can't delete your default queue. You can't delete a reserved queue that has an active pricing plan or that contains unprocessed jobs.

```
aws mediaconvert delete-queue \  
  --name Customer1 \  
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Run `aws mediaconvert list-queues` to confirm that your queue was deleted.

For more information, see [Working with AWS Elemental MediaConvert Queues](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [DeleteQueue](#) in *AWS CLI Command Reference*.

describe-endpoints

The following code example shows how to use `describe-endpoints`.

AWS CLI

To get your account-specific endpoint

The following `describe-endpoints` example retrieves the endpoint that you need to send any other request to the service.

```
aws mediaconvert describe-endpoints
```

Output:

```
{
  "Endpoints": [
    {
      "Url": "https://abcd1234.mediaconvert.region-name-1.amazonaws.com"
    }
  ]
}
```

For more information, see [Getting Started with MediaConvert Using the API](#) in the *AWS Elemental MediaConvert API Reference*.

- For API details, see [DescribeEndpoints](#) in *AWS CLI Command Reference*.

get-job-template

The following code example shows how to use `get-job-template`.

AWS CLI

To get details for a job template

The following `get-job-template` example displays the JSON definition of the specified custom job template.

```
aws mediaconvert get-job-template \
  --name "DASH Streaming" \
  --endpoint-url https://abcd1234.mediaconvert.us-east-1.amazonaws.com
```

Output:

```
{
  "JobTemplate": {
    "StatusUpdateInterval": "SECONDS_60",
    "LastUpdated": 1568652998,
    "Description": "Create a DASH streaming ABR stack",
    "CreatedAt": 1568652998,
    "Priority": 0,
    "Name": "DASH Streaming",
    "Settings": {
      ...<truncatedforbrevity>...
    },
    "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:jobTemplates/DASH
Streaming",
    "Type": "CUSTOM"
  }
}
```

For more information, see [Working with AWS Elemental MediaConvert Job Templates](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [GetJobTemplate](#) in *AWS CLI Command Reference*.

get-job

The following code example shows how to use `get-job`.

AWS CLI

To get details for a particular job

The following example requests the information for the job with ID `1234567890987-1ab2c3`, which in this example ended in an error.

```
aws mediaconvert get-job \
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \
  --region region-name-1 \
  --id 1234567890987-1ab2c3
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

If your request is successful, the service returns a JSON file with job information, including job settings, any returned errors, and other job data, as follows:

```
{
  "Job": {
    "Status": "ERROR",
    "Queue": "arn:aws:mediaconvert:region-name-1:012345678998:queues/Queue1",
    "Settings": {
      ...<truncated for brevity>...
    },
    "ErrorMessage": "Unable to open input file [s3://my-input-bucket/file-
name.mp4]: [Failed probe/open: [Failed to read data: AssumeRole failed]]",
    "ErrorCode": 1434,
    "Role": "arn:aws:iam::012345678998:role/MediaConvertServiceRole",
    "Arn": "arn:aws:mediaconvert:us-
west-1:012345678998:jobs/1234567890987-1ab2c3",
    "UserMetadata": {},
    "Timing": {
      "FinishTime": 1517442131,
      "SubmitTime": 1517442103,
      "StartTime": 1517442104
    },
    "Id": "1234567890987-1ab2c3",
    "CreatedAt": 1517442103
  }
}
```

For more information, see [Working with AWS Elemental MediaConvert Jobs](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [GetJob](#) in *AWS CLI Command Reference*.

get-preset

The following code example shows how to use `get-preset`.

AWS CLI

To get details for a particular preset

The following `get-preset` example requests the JSON definition of the specified custom preset.

```
aws mediaconvert get-preset \  
  --name SimpleMP4 \  
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{  
  "Preset": {  
    "Description": "Creates basic MP4 file. No filtering or preprocessing.",  
    "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4",  
    "LastUpdated": 1568843141,  
    "Name": "SimpleMP4",  
    "Settings": {  
      "ContainerSettings": {  
        "Mp4Settings": {  
          "FreeSpaceBox": "EXCLUDE",  
          "CslgAtom": "INCLUDE",  
          "MoovPlacement": "PROGRESSIVE_DOWNLOAD"  
        },  
        "Container": "MP4"  
      },  
      "AudioDescriptions": [  
        {  
          "LanguageCodeControl": "FOLLOW_INPUT",  
          "AudioTypeControl": "FOLLOW_INPUT",  
          "CodecSettings": {

- For API details, see [GetPreset](#) in *AWS CLI Command Reference*.

get-queue

The following code example shows how to use `get-queue`.

AWS CLI

To get details for a queue

The following `get-queue` example retrieves the details of the specified custom queue.

```
aws mediaconvert get-queue \
  --name Customer1 \
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{
  "Queue": {
    "LastUpdated": 1526428502,
    "Type": "CUSTOM",
    "SubmittedJobsCount": 0,
    "Status": "ACTIVE",
    "PricingPlan": "ON_DEMAND",
    "CreatedAt": 1526428502,
    "ProgressingJobsCount": 0,
    "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/Customer1",
    "Name": "Customer1"
  }
}
```

For more information, see [Working with AWS Elemental MediaConvert Queues](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [GetQueue](#) in *AWS CLI Command Reference*.

list-job-templates

The following code example shows how to use `list-job-templates`.

AWS CLI

Example 1: To list your custom job templates

The following `list-job-templates` example lists all custom job templates in the current Region. To list the system job templates, see the next example.

```
aws mediaconvert list-job-templates \  
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{  
  "JobTemplates": [  
    {  
      "Description": "Create a DASH streaming ABR stack",  
      "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:jobTemplates/DASH  
Streaming",  
      "Name": "DASH Streaming",  
      "LastUpdated": 1568653007,  
      "Priority": 0,  
      "Settings": {  
        ...<truncatedforbrevity>...  
      },  
      "Type": "CUSTOM",  
      "StatusUpdateInterval": "SECONDS_60",  
      "CreatedAt": 1568653007  
    },  
    {  
      "Description": "Create a high-res file",  
      "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:jobTemplates/File",  
      "Name": "File",  
      "LastUpdated": 1568653007,  
      "Priority": 0,  
      "Settings": {  
        ...<truncatedforbrevity>...  
      },  
    }  
  ]  
}
```

```

        "Type": "CUSTOM",
        "StatusUpdateInterval": "SECONDS_60",
        "CreatedAt": 1568653023
    }
]
}

```

Example 2: To list the MediaConvert system job templates

The following `list-job-templates` example lists all system job templates.

```

aws mediaconvert list-job-templates \
  --endpoint-url https://abcd1234.mediaconvert.us-east-1.amazonaws.com \
  --list-by SYSTEM

```

Output:

```

{
  "JobTemplates": [
    {
      "CreatedAt": 1568321779,
      "Arn": "arn:aws:mediaconvert:us-east-1:123456789012:jobTemplates/System-
Generic_Mp4_Hev1_Avc_Aac_Sdr_Qvbr",

                "Name": "File Group"
            }
        ]
    },
    "Type": "SYSTEM",
    "LastUpdated": 1568321779

```

```
    },  
    ...<truncatedforbrevity>...  
  ]  
}
```

For more information, see [Working with AWS Elemental MediaConvert Job Templates](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [ListJobTemplates](#) in *AWS CLI Command Reference*.

list-jobs

The following code example shows how to use `list-jobs`.

AWS CLI

To get details for all jobs in a region

The following example requests the information for all of your jobs in the specified region.

```
aws mediaconvert list-jobs \  
  --endpoint-url https://abcd1234.mediaconvert.region-name-1.amazonaws.com \  
  --region region-name-1
```

To get your account-specific endpoint, use `describe-endpoints`, or send the command without the endpoint. The service returns an error and your endpoint.

For more information, see [Working with AWS Elemental MediaConvert Jobs](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [ListJobs](#) in *AWS CLI Command Reference*.

list-presets

The following code example shows how to use `list-presets`.

AWS CLI

Example 1: To list your custom output presets

The following `list-presets` example lists your custom output presets. To list the system presets, see the next example.

```
aws mediaconvert list-presets \  
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{  
  "Presets": [  
    {  
      "Name": "SimpleMP4",  
      "CreatedAt": 1568841521,  
      "Settings": {  
        .....  
      },  
      "Arn": "arn:aws:mediaconvert:us-east-1:003235472598:presets/SimpleMP4",  
      "Type": "CUSTOM",  
      "LastUpdated": 1568843141,  
      "Description": "Creates basic MP4 file. No filtering or preprocessing."  
    },  
    {  
      "Name": "SimpleTS",  
      "CreatedAt": 1568843113,  
      "Settings": {  
        ... truncated for brevity ...  
      },  
      "Arn": "arn:aws:mediaconvert:us-east-1:003235472598:presets/SimpleTS",  
      "Type": "CUSTOM",  
      "LastUpdated": 1568843113,  
      "Description": "Create a basic transport stream."  
    }  
  ]  
}
```

Example 2: To list the system output presets

The following `list-presets` example lists the available MediaConvert system presets. To list your custom presets, see the previous example.

```
aws mediaconvert list-presets \  
  --list-by SYSTEM \  
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```

{
  "Presets": [
    {
      "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/System-
      Avc_16x9_1080p_29_97fps_8500kbps",
      "Name": "System-Avc_16x9_1080p_29_97fps_8500kbps",
      "CreatedAt": 1568321789,
      "Description": "Wifi, 1920x1080, 16:9, 29.97fps, 8500kbps",

- For API details, see [ListPresets](#) in *AWS CLI Command Reference*.

list-queues

The following code example shows how to use `list-queues`.

AWS CLI

To list your queues

The following `list-queues` example lists all of your MediaConvert queues.

```
aws mediaconvert list-queues \  
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{  
  "Queues": [  
    {  
      "PricingPlan": "ON_DEMAND",  
      "Type": "SYSTEM",  
      "Status": "ACTIVE",  
      "CreatedAt": 1503451595,  
      "Name": "Default",  
      "SubmittedJobsCount": 0,  
      "ProgressingJobsCount": 0,  
      "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/Default",  
      "LastUpdated": 1534549158  
    },  
    {  
      "PricingPlan": "ON_DEMAND",  
      "Type": "CUSTOM",  
      "Status": "ACTIVE",  
      "CreatedAt": 1537460025,  
      "Name": "Customer1",  
      "SubmittedJobsCount": 0,  
      "Description": "Jobs we run for our cusotmer.",  
      "ProgressingJobsCount": 0,  
      "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/Customer1",  
      "LastUpdated": 1537460025  
    },  
    {  
      "ProgressingJobsCount": 0,  
      "Status": "ACTIVE",  
      "Name": "transcode-library",  
      "SubmittedJobsCount": 0,  
      "LastUpdated": 1564066204,  
      "ReservationPlan": {
```

```

        "Status": "ACTIVE",
        "ReservedSlots": 1,
        "PurchasedAt": 1564066203,
        "Commitment": "ONE_YEAR",

        "RenewalType": "EXPIRE"
    },
    "PricingPlan": "RESERVED",
    "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:queues/transcode-
library",
    "Type": "CUSTOM",
    "CreatedAt": 1564066204
  }
]
}

```

For more information, see [Working with AWS Elemental MediaConvert Queues](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [ListQueues](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags on a MediaConvert queue, job template, or output preset

The following `list-tags-for-resource` example lists the tags on the specified output preset.

```

aws mediaconvert list-tags-for-resource \
  --arn arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4 \
  --endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com

```

Output:

```

{
  "ResourceTags": {
    "Tags": {
      "customer": "zippyVideo"
    }
  },

```

```

    "Arn": "arn:aws:mediaconvert:us-west-2:123456789012:presets/SimpleMP4"
  }
}

```

For more information, see [Tagging AWS Elemental MediaConvert Queues, Job Templates, and Output Presets](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

update-job-template

The following code example shows how to use `update-job-template`.

AWS CLI

To change a job template

The following `update-job-template` example replaces the JSON definition of the specified custom job template with the JSON definition in the provided file.

```
aws mediaconvert update-job-template --name File1 --endpoint-url https://
abcd1234.mediaconvert.us-west-2.amazonaws.com --cli-input-json file://~/job-template-
update.json
```

Contents of `job-template-update.json`:

```

{
  "Description": "A simple job template that generates a single file output.",
  "Queue": "arn:aws:mediaconvert:us-east-1:012345678998:queues/Default",
  "Name": "SimpleFile",
  "Settings": {
    "OutputGroups": [

"Priority": 0
}

```

The system returns the JSON payload that you send with your request, even when the request results in an error. Therefore, the JSON returned is not necessarily the new definition of the job template.

Because the JSON payload can be long, you might need to scroll up to see any error messages.

For more information, see [Working with AWS Elemental MediaConvert Job Templates](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [UpdateJobTemplate](#) in *AWS CLI Command Reference*.

update-preset

The following code example shows how to use update-preset.

AWS CLI

To change a preset

The following update-preset example replaces the description for the specified preset.

```
aws mediaconvert update-preset \  
--name Customer1 \  
--description "New description text." \  
--endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

This command produces no output. Output:

```
{  
  "Preset": {  
    "Arn": "arn:aws:mediaconvert:us-east-1:003235472598:presets/SimpleMP4",  
    "Settings": {  
      ...<output settings removed for brevity>...  
    },  
    "Type": "CUSTOM",  
    "LastUpdated": 1568938411,  
    "Description": "New description text.",  
    "Name": "SimpleMP4",  
    "CreatedAt": 1568938240  
  }  
}
```

For more information, see [Working with AWS Elemental MediaConvert Output Presets](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [UpdatePreset](#) in *AWS CLI Command Reference*.

update-queue

The following code example shows how to use `update-queue`.

AWS CLI

To change a queue

The following `update-queue` example pauses the specified queue, by changing its status to `PAUSED`.

```
aws mediaconvert update-queue \  
--name Customer1 \  
--status PAUSED \  
--endpoint-url https://abcd1234.mediaconvert.us-west-2.amazonaws.com
```

Output:

```
{  
  "Queue": {  
    "LastUpdated": 1568839845,  
    "Status": "PAUSED",  
    "ProgressingJobsCount": 0,  
    "CreatedAt": 1526428516,  
    "Arn": "arn:aws:mediaconvert:us-west-1:123456789012:queues/Customer1",  
    "Name": "Customer1",  
    "SubmittedJobsCount": 0,  
    "PricingPlan": "ON_DEMAND",  
    "Type": "CUSTOM"  
  }  
}
```

For more information, see [Working with AWS Elemental MediaConvert Queues](#) in the *AWS Elemental MediaConvert User Guide*.

- For API details, see [UpdateQueue](#) in *AWS CLI Command Reference*.

MediaLive examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaLive.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-channel

The following code example shows how to use `create-channel`.

AWS CLI

To create a channel

The following `create-channel` example creates a channel by passing in a JSON file that contains the parameters that you want to specify.

The channel in this example ingests an HLS PULL input that connects to a source that contains video, audio, and embedded captions. The channel creates one HLS output group with an Akamai server as the destination. The output group contains two outputs: one for the H.265 video and AAC audio, and one for the Web-VTT captions, in English only.

The JSON for this example channel includes the minimum required parameters for a channel that uses an HLS PULL input and that produces an HLS output group with Akamai as the destination. The JSON contains these main sections:

`InputAttachments`, which specifies one source for the audio, and one source for the captions. It does not specify a video selector, which means that MediaLive extracts the first video it finds in the source. `Destinations`, which contains the two IP addresses (URLs) for the single output group in this channel. These addresses require passwords. `EncoderSettings`, which contains subsections. `AudioDescriptions`, which specifies that the channel contains one audio output asset, which uses the source from `InputAttachments`, and produces audio in

AAC format.CaptionDescriptions, which specifies that the channel contains one captions output asset, which uses the source from InputAttachments, and produces captions in Web-VTT format.VideoDescriptions, which specifies that the channel contains one video output asset, with the specified resolution.OutputGroups, which specifies the output groups. In this example there is one group named Akamai. The connection is made using HLS PUT. The output group contains two outputs. One output is for the video asset (named Video_high) and the audio asset (named Audio_EN). One output is for the captions asset (named WebVTT_EN).

In this example, some of the parameters contain no value or contain nested empty parameters. For example, OutputSettings for the Video_and_audio output contains several nested parameters that end at an empty parameter M3u8Settings. This parameter must be included, but you can omit one, several, or all its children, which means that the child will take its default value or be null.

All the parameters that apply to this example channel but that aren't specified in this file will either take the default value, be set to null, or take a unique value generated by MediaLive.

```
aws medialive create-channel \  
  --cli-input-json file://channel-in-hls-out-hls-akamai.json
```

Contents of channel-in-hls-out-hls-akamai.json:

                "M3u8Settings": {}
              }
            },
            "NameModifier": "_1"
          }
        },
        "VideoDescriptionName": "Video_high"
      },
      {
        "CaptionDescriptionNames": [
          "WebVTT_EN"
        ],
        "OutputName": "Captions-WebVTT",
        "OutputSettings": {
```

```

        "HlsOutputSettings": {
            "HlsSettings": {
                "StandardHlsSettings": {
                    "M3u8Settings": {}
                }
            },
            "NameModifier": "_2"
        }
    ]
}
],
"TimecodeConfig": {
    "Source": "EMBEDDED"
}
}
}

```

Output:

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

ARN for the channel. The last part of the ARN is the unique channel ID. `EgressEndpoints` is blank in this example channel because it used only for PUSH inputs. When it applies it shows the addresses on MediaLive that content is pushed to. `OutputGroups`, `Outputs`. These show all the parameters for the output group and outputs, including those that you didn't include but that are relevant to this channel. The parameters might be empty (perhaps indicating the parameter or feature is disabled in this channel configuration) or might show the default value that will apply. `LogLevel` is set to the default (DISABLED). `Tags` is set to the default (null). `PipelinesRunningCount` and `State` show the current status of the channel.

For more information, see [Creating a Channel from Scratch](#) in the *AWS Elemental MediaLive User Guide*.

- For API details, see [CreateChannel](#) in *AWS CLI Command Reference*.

create-input

The following code example shows how to use `create-input`.

AWS CLI

To create an input

The following `create-input` example creates an HLS PULL input by passing in a JSON file that contains the parameters that apply to this type of input. The JSON for this example input specifies two sources (addresses) to the input, in order to support redundancy in the ingest. These addresses require passwords.

```
aws medialive create-input \  
  --cli-input-json file://input-hls-pull-news.json
```

Contents of `input-hls-pull-news.json`:

```
{  
  "Name": "local_news",  
  "RequestId": "cli000059",  
  "Sources": [  
    {  
      "Url": "https://203.0.113.13/newschannel/anytownusa.m3u8",  
      "Username": "examplecorp",  
      "PasswordParam": "/medialive/examplecorp1"  
    },  
    {  
      "Url": "https://198.51.100.54/fillervideos/oceanwaves.mp4",  
      "Username": "examplecorp",  
      "PasswordParam": "examplecorp2"  
    }  
  ],  
  "Type": "URL_PULL"  
}
```

Output:

The output repeats back the contents of the JSON file, plus the following values. All parameters are ordered alphabetically.

`Arn` for the input. The last part of the ARN is the unique input ID. `Attached Channels`, which is always empty for a newly created input. `Destinations`, which is empty in this example because it is used only with a PUSH input. `Id` for the input, the same as the ID in the ARN. `MediaConnectFlows`, which is empty in this example because it is used only with an input

of type `MediaConnect.SecurityGroups`, which is empty in this example because it is used only with a `PUSH` input. `State` of this input. `Tags`, which is empty (the default for this parameter).

For more information, see [Creating an Input](#) in the *AWS Elemental MediaLive User Guide*.

- For API details, see [CreateInput](#) in *AWS CLI Command Reference*.

MediaPackage examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaPackage.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

`create-channel`

The following code example shows how to use `create-channel`.

AWS CLI

To create a channel

The following `create-channel` command creates a channel named `sportschannel` in the current account.

```
aws mediapackage create-channel --id sportschannel
```

Output:

```
{
  "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",
  "HlsIngest": {
    "IngestEndpoints": [
      {
        "Id": "6d345804ec3f46c9b454a91d4a80d0e0",
        "Password": "generatedwebdavpassword1",
        "Url": "https://f31c86aed53b815a.mediapackage.us-
west-2.amazonaws.com/in/
v2/6d345804ec3f46c9b454a91d4a80d0e0/6d345804ec3f46c9b454a91d4a80d0e0/channel",
        "Username": "generatedwebdavusername1"
      },
      {
        "Id": "2daa32878af24803b24183727211b8ff",
        "Password": "generatedwebdavpassword2",
        "Url": "https://6ebbe7e04c4b0afa.mediapackage.us-
west-2.amazonaws.com/in/
v2/6d345804ec3f46c9b454a91d4a80d0e0/2daa32878af24803b24183727211b8ff/channel",
        "Username": "generatedwebdavusername2"
      }
    ]
  },
  "Id": "sportschannel",
  "Tags": {
    "region": "west"
  }
}
```

For more information, see [Creating a Channel](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [CreateChannel](#) in *AWS CLI Command Reference*.

create-origin-endpoint

The following code example shows how to use `create-origin-endpoint`.

AWS CLI

To create an origin endpoint

The following `create-origin-endpoint` command creates an origin endpoint named `cmf sports` with the package settings provided in a JSON file and specified endpoint settings.

```
aws mediapackage create-origin-endpoint \  
  --channel-id sportschannel \  
  --id cmafsports \  
  --cmf-package file:///file/path/cmafpkg.json --description "cmf output of  
sports" \  
  --id cmaf_sports \  
  --manifest-name sports_channel \  
  --startover-window-seconds 300 \  
  --tags region=west,media=sports \  
  --time-delay-seconds 10
```

Output:

```
{  
  "Arn": "arn:aws:mediapackage:us-  
west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",  
  "ChannelId": "sportschannel",  
  "CmafPackage": {  
    "HlsManifests": [  
      {  
        "AdMarkers": "PASSTHROUGH",  
        "Id": "cmaf_sports_endpoint",  
        "IncludeIframeOnlyStream": true,  
        "ManifestName": "index",  
        "PlaylistType": "EVENT",  
        "PlaylistWindowSeconds": 300,  
        "ProgramDateTimeIntervalSeconds": 300,  
        "Url": "https://c4af3793bf76b33c.mediapackage.us-  
west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmaf_sports_endpoint/  
index.m3u8"  
      }  
    ],  
    "SegmentDurationSeconds": 2,  
    "SegmentPrefix": "sportschannel"  
  },  
  "Description": "cmf output of sports",  
  "Id": "cmaf_sports",  
  "ManifestName": "sports_channel",  
  "StartoverWindowSeconds": 300,  
  "Tags": {  
    "region": "west",  
    "media": "sports"  
  },  
}
```

```
"TimeDelaySeconds": 10,  
"Url": "",  
"Whitelist": []  
}
```

For more information, see [Creating an Endpoint](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [CreateOriginEndpoint](#) in *AWS CLI Command Reference*.

delete-channel

The following code example shows how to use `delete-channel`.

AWS CLI

To delete a channel

The following `delete-channel` command deletes the channel named `test`.

```
aws mediapackage delete-channel \  
  --id test
```

This command produces no output.

For more information, see [Deleting a Channel](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DeleteChannel](#) in *AWS CLI Command Reference*.

delete-origin-endpoint

The following code example shows how to use `delete-origin-endpoint`.

AWS CLI

To delete an origin endpoint

The following `delete-origin-endpoint` command deletes the origin endpoint named `tester2`.

```
aws mediapackage delete-origin-endpoint \  
  --id tester2
```

For more information, see [Deleting an Endpoint](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DeleteOriginEndpoint](#) in *AWS CLI Command Reference*.

describe-channel

The following code example shows how to use `describe-channel`.

AWS CLI

To describe a channel

The following `describe-channel` command displays all of the details of the channel named `test`.

```
aws mediapackage describe-channel \  
  --id test
```

Output:

```
{  
  "Arn": "arn:aws:mediapackage:us-  
west-2:111222333:channels/584797f1740548c389a273585dd22a63",  
  "HlsIngest": {  
    "IngestEndpoints": [  
      {  
        "Id": "584797f1740548c389a273585dd22a63",  
        "Password": "webdavgeneratedpassword1",  
        "Url": "https://9be9c4405c474882.mediapackage.us-

        "Username": "webdavgeneratedusername2"  
      }  
    ]  
  },  
}
```

```
"Id": "test",
"Tags": {}
}
```

For more information, see [Viewing Channel Details](https://docs.aws.amazon.com/mediapackage/latest/ug/channels-view.html) in the *AWS Elemental MediaPackage User Guide*

- For API details, see [DescribeChannel](#) in *AWS CLI Command Reference*.

describe-origin-endpoint

The following code example shows how to use describe-origin-endpoint.

AWS CLI

To describe an origin endpoint

The following describe-origin-endpoint command displays all of the details of the origin endpoint named cmaf_sports.

```
aws mediapackage describe-origin-endpoint \
  --id cmaf_sports
```

Output:

```
{
  "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",
  "ChannelId": "sportschannel",
  "CmafPackage": {
    "HlsManifests": [

west-2.amazonaws.com/out/v1/1dc6718be36f4f34bb9cd86bc50925e6/cmef_sports_endpoint/
index.m3u8"
      }
    ]
  }
}
```

```
    ],
    "SegmentDurationSeconds": 2,
    "SegmentPrefix": "sportschannel"
  },
  "Id": "cmf_sports",
  "ManifestName": "index",
  "StartoverWindowSeconds": 0,
  "Tags": {
    "region": "west",
    "media": "sports"
  },
  "TimeDelaySeconds": 0,
  "Url": "",
  "Whitelist": []
}
```

For more information, see [Viewing a Single Endpoint](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DescribeOriginEndpoint](#) in *AWS CLI Command Reference*.

list-channels

The following code example shows how to use `list-channels`.

AWS CLI

To list all channels

The following `list-channels` command lists all of the channels that are configured on the current AWS account.

```
aws mediapackage list-channels
```

Output:

```
{
  "Channels": [
    {
      "Arn": "arn:aws:mediapackage:us-
west-2:111222333:channels/584797f1740548c389a273585dd22a63",
      "HlsIngest": {
        "IngestEndpoints": [

            "Username": "webdavgeneratedusername2"
        }
    ]
},
    "Id": "test",
    "Tags": {}
}
]
}

```

For more information, see [Viewing Channel Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [ListChannels](#) in *AWS CLI Command Reference*.

list-origin-endpoints

The following code example shows how to use `list-origin-endpoints`.

AWS CLI

To list all origin-endpoints on a channel

The following `list-origin-endpoints` command lists all of the origin endpoints that are configured on the channel named `test`.

```
aws mediapackage list-origin-endpoints \
  --channel-id test
```

Output:

```
{
  "OriginEndpoints": [
    {
      "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/247cff871f2845d3805129be22f2c0a2",

}
]
}

```

For more information, see [Viewing all Endpoints Associated with a Channel](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [ListOriginEndpoints](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags assigned to a resource

The following `list-tags-for-resource` command lists the tags that are assigned to the specified resource.

```

aws mediapackage list-tags-for-resource \
  --resource-arn arn:aws:mediapackage:us-
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0

```

Output:

```
{
```

```
"Tags": {
  "region": "west"
}
```

For more information, see [Tagging Resources in AWS Elemental MediaPackage](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

rotate-ingest-endpoint-credentials

The following code example shows how to use `rotate-ingest-endpoint-credentials`.

AWS CLI

To rotate ingest credentials

The following `rotate-ingest-endpoint-credentials` command rotates the WebDAV username and password for the specified ingest endpoint.

```
aws mediapackage rotate-ingest-endpoint-credentials \
  --id test \
  --ingest-endpoint-id 584797f1740548c389a273585dd22a63
```

Output:

```
{
  "Arn": "arn:aws:mediapackage:us-west-2:111222333:channels/584797f1740548c389a273585dd22a63",
  "HlsIngest": {
    "IngestEndpoints": [
      {

        "Password": "webdavregeneratedpassword1",
        "Url": "https://9be9c4405c474882.mediapackage.us-west-2.amazonaws.com/in/v2/584797f1740548c389a273585dd22a63/584797f1740548c389a273585dd22a63/channel",
        "Username": "webdavregeneratedusername1"
      },
      {
        "Id": "7d187c8616fd455f88aaa5a9fcf74442",
        "Password": "webdavgeneratedpassword2",

```

```
        "Url": "https://7bf454c57220328d.mediapackage.us-  
west-2.amazonaws.com/in/  
v2/584797f1740548c389a273585dd22a63/7d187c8616fd455f88aaa5a9fcf74442/channel",  
        "Username": "webdavgeneratedusername2"  
    }  
]  
,  
"Id": "test",  
"Tags": {}  
}
```

For more information, see [Rotating Credentials on an Input URL](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [RotateIngestEndpointCredentials](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To add a tag to a resource

The following `tag-resource` commands adds a `region=west` key and value pair to the specified resource.

```
aws mediapackage tag-resource \  
  --resource-arn arn:aws:mediapackage:us-  
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \  
  --tags region=west
```

This command produces no output.

For more information, see [Tagging Resources in AWS Elemental MediaPackage](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a resource

The following `untag-resource` command removes the tag with the key `region` from the specified channel.

```
aws mediapackage untag-resource \  
  --resource-arn arn:aws:mediapackage:us-  
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0 \  
  --tag-keys region
```

For more information, see [Tagging Resources in AWS Elemental MediaPackage](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-channel

The following code example shows how to use `update-channel`.

AWS CLI

To update a channel

The following `update-channel` command updates the channel named `sportschannel` to include the description `24x7 sports`.

```
aws mediapackage update-channel \  
  --id sportschannel \  
  --description "24x7 sports"
```

Output:

```
{  
  "Arn": "arn:aws:mediapackage:us-  
west-2:111222333:channels/6d345804ec3f46c9b454a91d4a80d0e0",  
  "Description": "24x7 sports",  
  "HlsIngest": {  
    "IngestEndpoints": [  
      {  
        "Id": "6d345804ec3f46c9b454a91d4a80d0e0",  
        "Password": "generatedwebdavpassword1",
```

```

        "Url": "https://f31c86aed53b815a.mediapackage.us-

    }
]
},
"Id": "sportschannel",
"Tags": {}
}

```

For more information, see [Editing a Channel](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [UpdateChannel](#) in *AWS CLI Command Reference*.

update-origin-endpoint

The following code example shows how to use update-origin-endpoint.

AWS CLI

To update an origin endpoint

The following update-origin-endpoint command updates the origin endpoint named `cmf_sports`. It changes the time delay to 0 seconds.

```

aws mediapackage update-origin-endpoint \
  --id cmf_sports \
  --time-delay-seconds 0

```

Output:

```

{
  "Arn": "arn:aws:mediapackage:us-
west-2:111222333:origin_endpoints/1dc6718be36f4f34bb9cd86bc50925e6",

```

```
"ChannelId": "sportschannel",

MediaPackage VOD examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaPackage VOD.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-asset

The following code example shows how to use `create-asset`.

AWS CLI

To create an asset

The following `create-asset` example creates an asset named `Chicken_Asset` in the current AWS account. The asset ingests the file `30sec_chicken.smil` to `MediaPackage`.

```
aws mediapackage-vod create-asset \  
  --id chicken_asset \  
  --packaging-group-id hls_chicken_gp \  
  --source-role-arn arn:aws:iam::111122223333:role/EMP_Vod \  
  --source-arn arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil
```

Output:

```
{  
  "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:assets/chicken_asset",  
  "Id": "chicken_asset",  
  "PackagingGroupId": "hls_chicken_gp",  
  "SourceArn": "arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",  
  "SourceRoleArn": "arn:aws:iam::111122223333:role/EMP_Vod",  
  "EgressEndpoints": [  
    {  
      "PackagingConfigurationId": "New_config_1",  
      "Url": "https://c75ea2668ab49d02bca7ae10ef31c59e.egress.mediapackage-  
vod.us-west-2.amazonaws.com/out/"
```

```
v1/6644b55df1744261ab3732a8e5cdaf07/904b06a58c7645e08d57d40d064216ac/
f5b2e633ff4942228095d164c10074f3/index.m3u8"
    },
    {
      "PackagingConfigurationId": "new_hls",
      "Url": " https://c75ea2668ab49d02bca7ae10ef31c59e.egress.mediapackage-
vod.us-west-2.amazonaws.com/out/v1/6644b55df1744261ab3732a8e5cdaf07/

    }
  ]
}
```

For more information, see [Ingest an Asset](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [CreateAsset](#) in *AWS CLI Command Reference*.

create-packaging-configuration

The following code example shows how to use `create-packaging-configuration`.

AWS CLI

To create a packaging configuration

The following `create-packaging-configuration` example creates a packaging configuration named `new_hls` in the packaging group named `hls_chicken`. This example uses a file on disk named `hls_pc.json` to provide the details.

```
aws mediapackage-vod create-packaging-configuration \
  --id new_hls \
  --packaging-group-id hls_chicken \
  --hls-package file://hls_pc.json
```

Contents of `hls_pc.json`:

```
{
  "HlsManifests": [
    {
      "AdMarkers": "NONE",
      "IncludeIframeOnlyStream": false,
      "ManifestName": "string",
      "ProgramDateTimeIntervalSeconds": 60,
```

```

        "RepeatExtXKey":true,
        "StreamSelection":{
            "MaxVideoBitsPerSecond":1000,
            "MinVideoBitsPerSecond":0,
            "StreamOrder":"ORIGINAL"
        }
    ],
    "SegmentDurationSeconds":6,
    "UseAudioRenditionGroup":false
}

```

Output:

```

{
  "Arn":"arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-configurations/new_hls",
  "Id":"new_hls",
  "PackagingGroupId":"hls_chicken",
  "HlsManifests":{
    "SegmentDurationSeconds":6,
    "UseAudioRenditionGroup":false,
    "HlsMarkers":[
      {
        "AdMarkers":"NONE",
        "IncludeIframeOnlyStream":false,
        "ManifestName":"string",
        "ProgramDateTimeIntervalSeconds":60,
        "RepeatExtXKey":true,
        "StreamSelection":{
          "MaxVideoBitsPerSecond":1000,
          "MinVideoBitsPerSecond":0,
          "StreamOrder":"ORIGINAL"
        }
      }
    ]
  }
}

```

For more information, see [Creating a Packaging Configuration](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [CreatePackagingConfiguration](#) in *AWS CLI Command Reference*.

create-packaging-group

The following code example shows how to use `create-packaging-group`.

AWS CLI

To create a packaging group

The following `create-packaging-group` example lists all of the packaging groups that are configured in the current AWS account.

```
aws mediapackage-vod create-packaging-group \  
  --id hls_chicken
```

Output:

```
{  
  "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-groups/  
hls_chicken",  
  "Id": "hls_chicken"  
}
```

For more information, see [Creating a Packaging Group](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [CreatePackagingGroup](#) in *AWS CLI Command Reference*.

delete-asset

The following code example shows how to use `delete-asset`.

AWS CLI

To delete an asset

The following `delete-asset` example deletes the asset named `30sec_chicken`.

```
aws mediapackage-vod delete-asset \  
  --id 30sec_chicken
```

This command produces no output.

For more information, see [Deleting an Asset](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DeleteAsset](#) in *AWS CLI Command Reference*.

delete-packaging-configuration

The following code example shows how to use `delete-packaging-configuration`.

AWS CLI

To delete a packaging configuration

The following `delete-packaging-configuration` example deletes the packaging configuration named CMAF.

```
aws mediapackage-vod delete-packaging-configuration \  
  --id CMAF
```

This command produces no output.

For more information, see [Deleting a Packaging Configuration](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DeletePackagingConfiguration](#) in *AWS CLI Command Reference*.

delete-packaging-group

The following code example shows how to use `delete-packaging-group`.

AWS CLI

To delete a packaging group

The following `delete-packaging-group` example deletes the packaging group named Dash_widevine.

```
aws mediapackage-vod delete-packaging-group \  
  --id Dash_widevine
```

This command produces no output.

For more information, see [Deleting a Packaging Group](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DeletePackagingGroup](#) in *AWS CLI Command Reference*.

describe-asset

The following code example shows how to use describe-asset.

AWS CLI

To describe an asset

The following describe-asset example displays all of the details of the asset named 30sec_chicken.

```
aws mediapackage-vod describe-asset \  
  --id 30sec_chicken
```

Output:

```
{  
  "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:assets/30sec_chicken",  
  "Id": "30sec_chicken",  
  "PackagingGroupId": "Packaging_group_1",  
  "SourceArn": "arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",  
  "SourceRoleArn": "arn:aws:iam::111122223333:role/EMP_Vod",  
  "EgressEndpoints": [  
    {  
      "PackagingConfigurationId": "DASH",  
      "Url": "https://a5f46a44118ba3e3724ef39ef532e701.egress.mediapackage-

aad7962c569946119c2d5a691be5663c/628fb5d8d89e4702958b020af27fde0e/05eb062214064238ad6330a443  
index.m3u8"  }  
]
```

```
    }  
  ]  
}
```

For more information, see [Viewing Asset Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DescribeAsset](#) in *AWS CLI Command Reference*.

describe-packaging-configuration

The following code example shows how to use `describe-packaging-configuration`.

AWS CLI

To describe a packaging configuration

The following `describe-packaging-configuration` example displays all of the details of the packaging configuration named DASH.

```
aws mediapackage-vod describe-packaging-configuration \  
  --id DASH
```

Output:

```
{  
  "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-configurations/  
DASH",  
  "Id": "DASH",  
  "PackagingGroupId": "Packaging_group_1",  
  "DashPackage": [  
    {  
      "SegmentDurationSeconds": "2"  
    },  
    {  
      "DashManifests": {  
        "ManifestName": "index",  
        "MinBufferTimeSeconds": "30",  
        "Profile": "NONE"  
      }  
    }  
  ]  
}
```

For more information, see [Viewing Packaging Configuration Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DescribePackagingConfiguration](#) in *AWS CLI Command Reference*.

describe-packaging-group

The following code example shows how to use `describe-packaging-group`.

AWS CLI

To describe a packaging group

The following `describe-packaging-group` example displays all of the details of the packaging group named `Packaging_group_1`.

```
aws mediapackage-vod describe-packaging-group \
  --id Packaging_group_1
```

Output:

```
{
  "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-groups/
Packaging_group_1",
  "Id": "Packaging_group_1"
}
```

For more information, see [Viewing Packaging Group Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [DescribePackagingGroup](#) in *AWS CLI Command Reference*.

list-assets

The following code example shows how to use `list-assets`.

AWS CLI

To list all assets

The following `list-assets` example lists all of the assets that are configured in the current AWS account.

```
aws mediapackage-vod list-assets
```

Output:

```
{
  "Assets": [
    {
      "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:assets/30sec_chicken",
      "Id": "30sec_chicken",
      "PackagingGroupId": "Packaging_group_1",
      "SourceArn": "arn:aws:s3::111122223333:video-bucket/A/30sec_chicken.smil",
      "SourceRoleArn": "arn:aws:iam::111122223333:role/EMP_Vod"
    }
  ]
}
```

For more information, see [Viewing Asset Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [ListAssets](#) in *AWS CLI Command Reference*.

list-packaging-configurations

The following code example shows how to use `list-packaging-configurations`.

AWS CLI

To list all packaging configurations

The following `list-packaging-configurations` example lists all of the packaging configurations that are configured on the packaging group named `Packaging_group_1`.

```
aws mediapackage-vod list-packaging-configurations \
  --packaging-group-id Packaging_group_1
```

Output:

```
{
  "PackagingConfigurations": [
    {
      "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-configurations/CMAF",

list-packaging-groups

The following code example shows how to use `list-packaging-groups`.

AWS CLI

To list all packaging groups

The following `list-packaging-groups` example lists all of the packaging groups that are configured in the current AWS account.

```
aws mediapackage-vod list-packaging-groups
```

Output:

```
{
  "PackagingGroups": [
    {
      "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
groups/Dash_widevine",
      "Id": "Dash_widevine"
    },
    {
      "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
groups/Encrypted_HLS",
      "Id": "Encrypted_HLS"
    },
    {
      "Arn": "arn:aws:mediapackage-vod:us-west-2:111122223333:packaging-
groups/Packaging_group_1",
      "Id": "Packaging_group_1"
    }
  ]
}
```

For more information, see [Viewing Packaging Group Details](#) in the *AWS Elemental MediaPackage User Guide*.

- For API details, see [ListPackagingGroups](#) in *AWS CLI Command Reference*.

MediaStore Data Plane examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaStore Data Plane.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

delete-object

The following code example shows how to use `delete-object`.

AWS CLI

To delete an object

The following `delete-object` example deletes the specified object.

```
aws mediastore-data delete-object \  
  --endpoint=https://aaabbbcccddee.data.mediastore.us-west-2.amazonaws.com \  
  --path=/folder_name/README.md
```

This command produces no output.

For more information, see [Deleting an Object](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DeleteObject](#) in *AWS CLI Command Reference*.

describe-object

The following code example shows how to use describe-object.

AWS CLI

To view the headers for an object

The following describe-object example displays the headers for an object at the specified path.

```
aws mediastore-data describe-object \  
  --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \  
  --path events/baseball/setup.jpg
```

Output:

```
{  
  "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",  
  "ContentType": "image/jpeg",  
  "ContentLength": "3860266",  
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9e4dd89ff7f5555555555555555da6d3"  
}
```

For more information, see [Viewing the Details of an Object](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [DescribeObject](#) in *AWS CLI Command Reference*.

get-object

The following code example shows how to use get-object.

AWS CLI

Example 1: To download an entire object

The following get-object example downloads the specified object.

```
aws mediastore-data get-object \  
  --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \  
  --path events/baseball/setup.jpg setup.jpg
```

Output:

```
{  
  "ContentType": "image/jpeg",  
  "StatusCode": 200,  
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9e999999999994dd89ff7f555555555555da6d3",  
  "ContentLength": "3860266",  
  "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT"  
}
```

Example 2: To download part of an object

The following `get-object` example downloads the specified part of an object.

```
aws mediastore-data get-object \  
  --endpoint https://aaabbbcccdddee.data.mediastore.us-west-2.amazonaws.com \  
  --path events/baseball/setup.jpg setup.jpg \  
  --range "bytes=0-100"
```

Output:

```
{  
  "StatusCode": 206,  
  "LastModified": "Fri, 19 Jul 2019 21:50:31 GMT",  
  "ContentType": "image/jpeg",  
  "ContentRange": "bytes 0-100/3860266",  
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9e999999999994dd89ff7f555555555555da6d3",  
  "ContentLength": "101"  
}
```

For more information, see [Downloading an Object](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [GetObject](#) in *AWS CLI Command Reference*.

list-items

The following code example shows how to use `list-items`.

AWS CLI

Example 1: To view a list of items (objects and folders) stored in a container

The following `list-items` example displays a list of items (objects and folders) stored in the specified container.

```
aws mediastore-data list-items \  
--endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com
```

Output:

```
{  
  "Items": [  
    {  
      "Type": "OBJECT",  
      "ContentLength": 3784,  
      "Name": "setup.jpg",  
      "ETag":  
      "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",  
      "ContentType": "image/jpeg",  
      "LastModified": 1563571859.379  
    },  
    {  
      "Type": "FOLDER",  
      "Name": "events"  
    }  
  ]  
}
```

Example 2: To view a list of items (objects and folders) stored in a folder

The following `list-items` example displays a list of items (objects and folders) stored in the specified folder.

```
aws mediastore-data list-items \  
--endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \  
--path events/baseball
```

Output:

```
{
```

```

    "Items": [
      {
        "ETag":

put-object

The following code example shows how to use `put-object`.

AWS CLI

Example 1: To upload an object to a container

The following `put-object` example upload an object to the specified container.

```

aws mediastore-data put-object \
  --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \
  --body README.md \
  --path README.md \
  --cache-control "max-age=6, public" \
  --content-type binary/octet-stream

```

Output:

```

{
  "ContentSHA256":
"f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",
  "StorageClass": "TEMPORAL",
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9e4dd89ff7f5555555555555555da6d3"
}

```

```
}
```

Example 2: To upload an object to a folder within a container

The following `put-object` example upload an object to the specified folder within a container.

```
aws mediastore-data put-object \  
  --endpoint https://aaabbbccdddee.data.mediastore.us-west-2.amazonaws.com \  
  --body ReadMe.md \  
  --path /september-events/ReadMe.md \  
  --cache-control "max-age=6, public" \  
  --content-type binary/octet-stream
```

Output:

```
{  
  "ETag": "2aa333bbcc8d8d22d777e999c88d4aa9eeeeee4dd89ff7f555555555555da6d3",  
  "ContentSHA256":  
  "f29bc64a9d3732b4b9035125fdb3285f5b6455778edca72414671e0ca3b2e0de",  
  "StorageClass": "TEMPORAL"  
}
```

For more information, see [Uploading an Object](#) in the *AWS Elemental MediaStore User Guide*.

- For API details, see [PutObject](#) in *AWS CLI Command Reference*.

MediaTailor examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with MediaTailor.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

delete-playback-configuration

The following code example shows how to use `delete-playback-configuration`.

AWS CLI

To delete a configuration

The following `delete-playback-configuration` deletes a configuration named `campaign_short`.

```
aws mediatailor delete-playback-configuration \  
  --name campaign_short
```

This command produces no output.

For more information, see [Deleting a Configuration](#) in the *AWS Elemental MediaTailor User Guide*.

- For API details, see [DeletePlaybackConfiguration](#) in *AWS CLI Command Reference*.

get-playback-configuration

The following code example shows how to use `get-playback-configuration`.

AWS CLI

To describe a configuration

The following `get-playback-configuration` displays all of the details of the configuration named `west_campaign`.

```
aws mediatailor get-playback-configuration \  
  --name west_campaign
```

Output:

```
{
  "AdDecisionServerUrl": "http://your.ads.url",
  "CdnConfiguration": {},
  "DashConfiguration": {
    "ManifestEndpointPrefix":
    "https://170c14299689462897d0cc45fc2000bb.mediatailor.us-west-2.amazonaws.com/v1/

list-playback-configurations

The following code example shows how to use `list-playback-configurations`.

AWS CLI

To list all configurations

The following `list-playback-configurations` displays all of the details of the configuration on the current AWS account.

```
aws mediatailor list-playback-configurations
```

Output:

```
{
  "Items": [
    {
      "AdDecisionServerUrl": "http://your.ads.url",

Actions

copy-snapshot

The following code example shows how to use `copy-snapshot`.

AWS CLI

To copy a snapshot

The following `copy-snapshot` example creates a copy of a snapshot.

```
aws memorydb copy-snapshot \  
  --source-snapshot-name my-cluster-snapshot \  
  --target-snapshot-name my-cluster-snapshot-copy
```

Output

```
{  
  "Snapshot": {  
    "Name": "my-cluster-snapshot-copy",  
    "Status": "creating",  
    "Source": "manual",  
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:snapshot/my-cluster-snapshot-copy",  
    "ClusterConfiguration": {  
      "Name": "my-cluster",  
      "Description": " ",  
      "NodeType": "db.r6g.large",  
      "EngineVersion": "6.2",  
      "MaintenanceWindow": "wed:03:00-wed:04:00",  
      "Port": 6379,  
    }  
  }  
}
```

```
        "ParameterGroupName": "default.memorydb-redis6",
        "SubnetGroupName": "my-sg",
        "VpcId": "vpc-xx2574fc",
        "SnapshotRetentionLimit": 0,
        "SnapshotWindow": "04:30-05:30",
        "NumShards": 2
    }
}
```

For more information, see [Copying a snapshot](#) in the *MemoryDB User Guide*.

- For API details, see [CopySnapshot](#) in *AWS CLI Command Reference*.

create-acl

The following code example shows how to use `create-acl`.

AWS CLI

To create an ACL

The following `create-acl` example creates a new Access control list.

```
aws memorydb create-acl \
  --acl-name "new-acl-1" \
  --user-names "my-user"
```

Output:

```
{
  "ACL": {
    "Name": "new-acl-1",
    "Status": "creating",
    "UserNames": [
      "my-user"
    ],
    "MinimumEngineVersion": "6.2",
    "Clusters": [],
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/new-acl-1"
  }
}
```

For more information, see [Authenticating users with Access Control Lists](#) in the *MemoryDB User Guide*.

- For API details, see [CreateAcl](#) in *AWS CLI Command Reference*.

create-cluster

The following code example shows how to use `create-cluster`.

AWS CLI

To create a cluster

The following `create-cluster` example creates a new cluster.

```
aws memorydb create-cluster \  
  --cluster-name my-new-cluster \  
  --node-type db.r6g.large \  
  --acl-name my-acl \  
  --subnet-group my-sg
```

Output:

```
{  
  "Cluster": {  
    "Name": "my-new-cluster",  
    "Status": "creating",  
    "NumberOfShards": 1,  
    "AvailabilityMode": "MultiAZ",  
    "ClusterEndpoint": {  
      "Port": 6379  
    },  
    "NodeType": "db.r6g.large",  
    "EngineVersion": "6.2",  
    "EnginePatchVersion": "6.2.6",  
    "ParameterGroupName": "default.memorydb-redis6",  
    "ParameterGroupStatus": "in-sync",  
    "SubnetGroupName": "my-sg",  
    "TLSEnabled": true,  
    "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:cluster/my-new-cluster",  
    "SnapshotRetentionLimit": 0,  
    "MaintenanceWindow": "sat:10:00-sat:11:00",  
    "SnapshotWindow": "07:30-08:30",
```

```
    "ACLName": "my-acl",
    "AutoMinorVersionUpgrade": true
  }
}
```

For more information, see [Managing Clusters](#) in the *MemoryDB User Guide*.

- For API details, see [CreateCluster](#) in *AWS CLI Command Reference*.

create-parameter-group

The following code example shows how to use `create-parameter-group`.

AWS CLI

To create a parameter group

The following `create-parameter-group` example creates a parameter group.

```
aws memorydb create-parameter-group \
  --parameter-group-name myRedis6x \
  --family memorydb_redis6 \
  --description "my-parameter-group"
```

Output:

```
{
  "ParameterGroup": {
    "Name": "myredis6x",
    "Family": "memorydb_redis6",
    "Description": "my-parameter-group",
    "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:parametergroup/myredis6x"
  }
}
```

For more information, see [Creating a parameter group](#) in the *MemoryDB User Guide*.

- For API details, see [CreateParameterGroup](#) in *AWS CLI Command Reference*.

create-snapshot

The following code example shows how to use `create-snapshot`.

AWS CLI

To create a snapshot

The following `create-snapshot` example creates a snapshot.

```
aws memorydb create-snapshot \  
  --cluster-name my-cluster \  
  --snapshot-name my-cluster-snapshot
```

Output:

```
{  
  "Snapshot": {  
    "Name": "my-cluster-snapshot1",  
    "Status": "creating",  
    "Source": "manual",  
    "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:snapshot/my-cluster-  
snapshot",  
    "ClusterConfiguration": {  
      "Name": "my-cluster",  
      "Description": "",  
      "NodeType": "db.r6g.large",  
      "EngineVersion": "6.2",  
      "MaintenanceWindow": "wed:03:00-wed:04:00",  
      "Port": 6379,  
      "ParameterGroupName": "default.memorydb-redis6",  
      "SubnetGroupName": "my-sg",  
      "VpcId": "vpc-862xxxxc",  
      "SnapshotRetentionLimit": 0,  
      "SnapshotWindow": "04:30-05:30",  
      "NumShards": 2  
    }  
  }  
}
```

For more information, see [Making manual snapshots](#) in the *MemoryDB User Guide*.

- For API details, see [CreateSnapshot](#) in *AWS CLI Command Reference*.

create-subnet-group

The following code example shows how to use `create-subnet-group`.

AWS CLI

To create a subnet group

The following `create-subnet-group` example creates a subnet group.

```
aws memorydb create-subnet-group \  
  --subnet-group-name mysubnetgroup \  
  --description "my subnet group" \  
  --subnet-ids subnet-5623xxxx
```

Output:

```
{  
  "SubnetGroup": {  
    "Name": "mysubnetgroup",  
    "Description": "my subnet group",  
    "VpcId": "vpc-86257xxx",  
    "Subnets": [  
      {  
        "Identifier": "subnet-5623xxxx",  
        "AvailabilityZone": {  
          "Name": "us-east-1a"  
        }  
      }  
    ],  
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/mysubnetgroup"  
  }  
}
```

For more information, see [Creating a subnet group](#) in the *MemoryDB User Guide*.

- For API details, see [CreateSubnetGroup](#) in *AWS CLI Command Reference*.

create-user

The following code example shows how to use `create-user`.

AWS CLI

To create a user

The following `create-user` example creates a new user.

```
aws memorydb create-user \  
  --user-name user-name-1 \  
  --access-string "~objects:* ~items:* ~public:*" \  
  --authentication-mode \  
    Passwords="enterapasswordhere",Type=password
```

Output:

```
{  
  "User": {  
    "Name": "user-name-1",  
    "Status": "active",  
    "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",  
    "ACLNames": [],  
    "MinimumEngineVersion": "6.2",  
    "Authentication": {  
      "Type": "password",  
      "PasswordCount": 1  
    },  
    "ARN": "arn:aws:memorydb:us-west-2:491658xxxxxx:user/user-name-1"  
  }  
}
```

For more information, see [Authenticating users with Access Control Lists](#) in the *MemoryDB User Guide*.

- For API details, see [CreateUser](#) in *AWS CLI Command Reference*.

delete-acl

The following code example shows how to use `delete-acl`.

AWS CLI

To delete an ACL

The following `delete-acl` example deletes an Access control list.

```
aws memorydb delete-acl \  
  --acl-name "new-acl-1"
```

Output:

```
{
  "ACL": {
    "Name": "new-acl-1",
    "Status": "deleting",
    "UserNames": [
      "pat"
    ],
    "MinimumEngineVersion": "6.2",
    "Clusters": [],
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/new-acl-1"
  }
}
```

For more information, see [Authenticating users with Access Control Lists](#) in the *MemoryDB User Guide*.

- For API details, see [DeleteAcl](#) in *AWS CLI Command Reference*.

delete-cluster

The following code example shows how to use `delete-cluster`.

AWS CLI

To delete a cluster

The following `delete-cluster` example deletes a cluster.

```
aws memorydb delete-cluster \
  --cluster-name my-new-cluster
```

Output:

```
{
  "Cluster": {
    "Name": "my-new-cluster",
    "Status": "deleting",
    "NumberOfShards": 1,
    "ClusterEndpoint": {
      "Address": "clustercfg.my-new-cluster.xxxxx.memorydb.us-
east-1.amazonaws.com",
```

```

        "Port": 6379
    },
    "NodeType": "db.r6g.large",
    "EngineVersion": "6.2",
    "EnginePatchVersion": "6.2.6",
    "ParameterGroupName": "default.memorydb-redis6",
    "ParameterGroupStatus": "in-sync",
    "SubnetGroupName": "my-sg",
    "TLSEnabled": true,
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-new-cluster",
    "SnapshotRetentionLimit": 0,
    "MaintenanceWindow": "sat:10:00-sat:11:00",
    "SnapshotWindow": "07:30-08:30",
    "AutoMinorVersionUpgrade": true
}
}

```

For more information, see [Deleting a cluster](#) in the *MemoryDB User Guide*.

- For API details, see [DeleteCluster](#) in *AWS CLI Command Reference*.

delete-parameter-group

The following code example shows how to use delete-parameter-group.

AWS CLI

To delete a parameter group

The following delete-parameter-group example deletes a parameter group.

```
aws memorydb delete-parameter-group \
  --parameter-group-name myRedis6x
```

Output:

```
{
  "ParameterGroup": {
    "Name": "myredis6x",
    "Family": "memorydb_redis6",
    "Description": "my-parameter-group",
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/myredis6x"
  }
}
```

```
}  
}
```

For more information, see [Deleting a parameter group](#) in the *MemoryDB User Guide*.

- For API details, see [DeleteParameterGroup](#) in *AWS CLI Command Reference*.

delete-snapshot

The following code example shows how to use `delete-snapshot`.

AWS CLI

To delete a snapshot

The following `delete-snapshot` example deletes a snapshot.

```
aws memorydb delete-snapshot \  
  --snapshot-name my-cluster-snapshot
```

Output:

```
{  
  "Snapshot": {  
    "Name": "my-cluster-snapshot",  
    "Status": "deleting",  
    "Source": "manual",  
    "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:snapshot/my-cluster-snapshot",  
    "ClusterConfiguration": {  
      "Name": "my-cluster",  
      "Description": "",  
      "NodeType": "db.r6g.large",  
      "EngineVersion": "6.2",  
      "MaintenanceWindow": "wed:03:00-wed:04:00",  
      "Port": 6379,  
      "ParameterGroupName": "default.memorydb-redis6",  
      "SubnetGroupName": "my-sg",  
      "VpcId": "vpc-862xxxxc",  
      "SnapshotRetentionLimit": 0,  
      "SnapshotWindow": "04:30-05:30",  
      "NumShards": 2
```

```
    }  
  }  
}
```

For more information, see [Deleting a snapshot](#) in the *MemoryDB User Guide*.

- For API details, see [DeleteSnapshot](#) in *AWS CLI Command Reference*.

delete-subnet-group

The following code example shows how to use `delete-subnet-group`.

AWS CLI

To delete a subnet group

The following `delete-subnet-group` example deletes a subnet.

```
aws memorydb delete-subnet-group \  
  --subnet-group-name mysubnetgroup
```

Output:

```
{  
  "SubnetGroup": {  
    "Name": "mysubnetgroup",  
    "Description": "my subnet group",  
    "VpcId": "vpc-86xxxx4fc",  
    "Subnets": [  
      {  
        "Identifier": "subnet-56xxx61b",  
        "AvailabilityZone": {  
          "Name": "us-east-1a"  
        }  
      }  
    ],  
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/mysubnetgroup"  
  }  
}
```

For more information, see [Deleting a subnet group](#) in the *MemoryDB User Guide*.

- For API details, see [DeleteSubnetGroup](#) in *AWS CLI Command Reference*.

delete-user

The following code example shows how to use `delete-user`.

AWS CLI

To delete a user

The following `delete-user` example deletes a user.

```
aws memorydb delete-user \  
  --user-name my-user
```

Output:

```
{  
  "User": {  
    "Name": "my-user",  
    "Status": "deleting",  
    "AccessString": "on ~app:* resetchannels -@all +@read",  
    "ACLNames": [  
      "my-acl"  
    ],  
    "MinimumEngineVersion": "6.2",  
    "Authentication": {  
      "Type": "password",  
      "PasswordCount": 1  
    },  
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"  
  }  
}
```

For more information, see [Authenticating users with Access Control Lists](#) in the *MemoryDB User Guide*.

- For API details, see [DeleteUser](#) in *AWS CLI Command Reference*.

describe-acls

The following code example shows how to use `describe-acls`.

AWS CLI

To return a list of ACLs

The following `describe-acls` returns a list of ACLs.`

```
aws memorydb describe-acls
```

Output:

```
{
  "ACLs": [
    {
      "Name": "open-access",
      "Status": "active",
      "UserNames": [
        "default"
      ],
      "MinimumEngineVersion": "6.2",
      "Clusters": [],
      "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:acl/open-access"
    },
    {
      "Name": "my-acl",
      "Status": "active",
      "UserNames": [],
      "MinimumEngineVersion": "6.2",
      "Clusters": [
        "my-cluster"
      ],
      "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:acl/my-acl"
    }
  ]
}
```

For more information, see [Authenticating users with Access Control Lists](#) in the *MemoryDB User Guide*.

- For API details, see [DescribeAcls](#) in *AWS CLI Command Reference*.

describe-clusters

The following code example shows how to use `describe-clusters`.

AWS CLI

To return a list of clusters

The following `describe-clusters` returns a list of clusters.`

```
aws memorydb describe-clusters
```

Output:

```
{
  "Clusters": [
    {
      "Name": "my-cluster",
      "Status": "available",
      "NumberOfShards": 2,
      "ClusterEndpoint": {
        "Address": "clustercfg.my-cluster.llru6f.memorydb.us-
east-1.amazonaws.com",
        "Port": 6379
      },
      "NodeType": "db.r6g.large",
      "EngineVersion": "6.2",
      "EnginePatchVersion": "6.2.6",
      "ParameterGroupName": "default.memorydb-redis6",
      "ParameterGroupStatus": "in-sync",
      "SecurityGroups": [
        {
          "SecurityGroupId": "sg-0a1434xxxxxc9fae",
          "Status": "active"
        }
      ],
      "SubnetGroupName": "pat-sg",
      "TLSEnabled": true,
      "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:cluster/my-cluster",
      "SnapshotRetentionLimit": 0,
      "MaintenanceWindow": "wed:03:00-wed:04:00",
      "SnapshotWindow": "04:30-05:30",
      "ACLName": "my-acl",
      "AutoMinorVersionUpgrade": true
    }
  ]
}
```

For more information, see [Managing clusters](#) in the *MemoryDB User Guide*.

- For API details, see [DescribeClusters](#) in *AWS CLI Command Reference*.

describe-engine-versions

The following code example shows how to use describe-engine-versions.

AWS CLI

To return a list of engine versions

The following describe-engine-versions ` returns a list of engine versions.

```
aws memorydb describe-engine-versions
```

Output:

```
{
  "EngineVersions": [
    {
      "EngineVersion": "6.2",
      "EnginePatchVersion": "6.2.6",
      "ParameterGroupFamily": "memorydb_redis6"
    }
  ]
}
```

For more information, see [Engine versions and upgrading](#) in the *MemoryDB User Guide*.

- For API details, see [DescribeEngineVersions](#) in *AWS CLI Command Reference*.

describe-events

The following code example shows how to use describe-events.

AWS CLI

To return a list of events

The following describe-events ` returns a list of events.

```
aws memorydb describe-events
```

Output:

```
{
  "Events": [
    {
      "SourceName": "my-cluster",
      "SourceType": "cluster",
      "Message": "Increase replica count started for replication group my-cluster on 2022-07-22T14:09:01.440Z",
      "Date": "2022-07-22T07:09:01.443000-07:00"
    },
    {
      "SourceName": "my-user",
      "SourceType": "user",
      "Message": "Create user my-user operation completed.",
      "Date": "2022-07-22T07:00:02.975000-07:00"
    }
  ]
}
```

For more information, see [Monitoring events](#) in the *MemoryDB User Guide*.

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

describe-parameter-groups

The following code example shows how to use `describe-parameter-groups`.

AWS CLI**To return a list of parameter groups**

The following `describe-parameter-groups` returns a list of parameter groups.`

```
aws memorydb describe-parameter-groups
```

Output:

```
{
  "ParameterGroups": [
    {
      "Name": "default.memorydb-redis6",
      "Family": "memorydb_redis6",
```

```

        "Description": "Default parameter group for memorydb_redis6",
        "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/
default.memorydb-redis6"
    }
]
}

```

For more information, see [Configuring engine parameters using parameter groups](#) in the *MemoryDB User Guide*.

- For API details, see [DescribeParameterGroups](#) in *AWS CLI Command Reference*.

describe-parameters

The following code example shows how to use describe-parameters.

AWS CLI

To return a list of parameters

The following describe-parameters` returns a list of parameters.

```
aws memorydb describe-parameters
```

Output:

```

{
  "Parameters": [
    {
      "Name": "acllog-max-len",
      "Value": "128",
      "Description": "The maximum length of the ACL Log",
      "DataType": "integer",
      "AllowedValues": "1-10000",
      "MinimumEngineVersion": "6.2.4"
    },

describe-subnet-groups

The following code example shows how to use `describe-subnet-groups`.

AWS CLI

To return a list of subnet groups

The following `describe-subnet-groups` returns a list of subnet groups.`

```
aws memorydb describe-subnet-groups
```

Output

```
{
  "SubnetGroups": [
    {
      "Name": "my-sg",
      "Description": "pat-sg",
      "VpcId": "vpc-86xxx4fc",
      "Subnets": [
        {
          "Identifier": "subnet-faxx84a6",
```

```

        "AvailabilityZone": {
            "Name": "us-east-1b"
        }
    },
    {
        "Identifier": "subnet-56xxf61b",
        "AvailabilityZone": {
            "Name": "us-east-1a"
        }
    }
],
"ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:subnetgroup/my-sg"
}
]
}

```

For more information, see [Subnets and subnet groups](#) in the *MemoryDB User Guide*.

- For API details, see [DescribeSubnetGroups](#) in *AWS CLI Command Reference*.

describe-users

The following code example shows how to use `describe-users`.

AWS CLI

To return a list of users

The following `describe-users`` returns a list of users.

```
aws memorydb describe-users
```

Output

```

{
  "Users": [
    {
      "Name": "default",
      "Status": "active",
      "AccessString": "on ~* &* +@all",
      "ACLNames": [
        "open-access"
      ],
    },
  ],
}

```

```

    "MinimumEngineVersion": "6.0",
    "Authentication": {
      "Type": "no-password"
    },
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/default"
  },
  {
    "Name": "my-user",
    "Status": "active",
    "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
    "ACLNames": [],
    "MinimumEngineVersion": "6.2",
    "Authentication": {
      "Type": "password",
      "PasswordCount": 2
    },
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
  }
]
}

```

For more information, see [Authenticating users with Access Control Lists](#) in the *MemoryDB User Guide*.

- For API details, see [DescribeUsers](#) in *AWS CLI Command Reference*.

failover-shard

The following code example shows how to use failover-shard.

AWS CLI

To fail over a shard

The following failover-shard` fails over a shard.

```
aws memorydb failover-shard \
  --cluster-name my-cluster --shard-name 0001
```

Output:

```
{
```

```
"Cluster": {
  "Name": "my-cluster",
  "Status": "available",
  "NumberOfShards": 2,
  "ClusterEndpoint": {
    "Address": "clustercfg.my-cluster.xxxxxx.memorydb.us-
east-1.amazonaws.com",
    "Port": 6379
  },
  "NodeType": "db.r6g.large",
  "EngineVersion": "6.2",
  "EnginePatchVersion": "6.2.6",
  "ParameterGroupName": "default.memorydb-redis6",
  "ParameterGroupStatus": "in-sync",
  "SecurityGroups": [
    {
      "SecurityGroupId": "sg-0a143xxxx45c9fae",
      "Status": "active"
    }
  ],
  "SubnetGroupName": "my-sg",
  "TLSEnabled": true,
  "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster",
  "SnapshotRetentionLimit": 0,
  "MaintenanceWindow": "wed:03:00-wed:04:00",
  "SnapshotWindow": "04:30-05:30",
  "AutoMinorVersionUpgrade": true
}
}
```

For more information, see [Minimizing downtime with MultiAZ](#) in the *MemoryDB User Guide*.

- For API details, see [FailoverShard](#) in *AWS CLI Command Reference*.

list-allowed-node-type-updates

The following code example shows how to use `list-allowed-node-type-updates`.

AWS CLI

To return a list of allowed node type updates

The following `list-allowed-node-type-updates` returns a list of available node type updates.

```
aws memorydb list-allowed-node-type-updates
```

Output:

```
{
  "Cluster": {
    "Name": "my-cluster",
    "Status": "available",
    "NumberOfShards": 2,
    "ClusterEndpoint": {
      "Address": "clustercfg.my-cluster.xxxxxx.memorydb.us-
east-1.amazonaws.com",
      "Port": 6379
    },
    "NodeType": "db.r6g.large",
    "EngineVersion": "6.2",
    "EnginePatchVersion": "6.2.6",
    "ParameterGroupName": "default.memorydb-redis6",
    "ParameterGroupStatus": "in-sync",
    "SecurityGroups": [
      {
        "SecurityGroupId": "sg-0a143xxxx45c9fae",
        "Status": "active"
      }
    ],
    "SubnetGroupName": "my-sg",
    "TLSEnabled": true,
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster",
    "SnapshotRetentionLimit": 0,
    "MaintenanceWindow": "wed:03:00-wed:04:00",
    "SnapshotWindow": "04:30-05:30",
    "AutoMinorVersionUpgrade": true
  }
}
```

For more information, see [Scaling](#) in the *MemoryDB User Guide*.

- For API details, see [ListAllowedNodeTypeUpdates](#) in *AWS CLI Command Reference*.

list-tags

The following code example shows how to use `list-tags`.

AWS CLI

To return a list of tags

The following `list-tags` returns a list of tags.

```
aws memorydb list-tags \  
  --resource-arn arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster
```

Output:

```
{  
  "TagList": [  
    {  
      "Key": "mytag",  
      "Value": "myvalue"  
    }  
  ]  
}
```

For more information, see [Tagging resources](#) in the *MemoryDB User Guide*.

- For API details, see [ListTags](#) in *AWS CLI Command Reference*.

reset-parameter-group

The following code example shows how to use `reset-parameter-group`.

AWS CLI

To reset a parameter group

The following `reset-parameter-group` resets a parameter group.

```
aws memorydb reset-parameter-group \  
  --parameter-group-name my-parameter-group \  
  --all-parameters
```

Output:

```
{
```

```
"ParameterGroup": {
  "Name": "my-parameter-group",
  "Family": "memorydb_redis6",
  "Description": "my parameter group",
  "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:parametergroup/my-parameter-
group"
}
```

For more information, see [Configuring engine parameters using parameter groups](#) in the *MemoryDB User Guide*.

- For API details, see [ResetParameterGroup](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a resource

The following tag-resource` adds a tag to a resource.

```
aws memorydb tag-resource \
  --resource-arn arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster \
  --tags Key="mykey",Value="myvalue"
```

Output:

```
{
  "TagList": [
    {
      "Key": "mytag",
      "Value": "myvalue"
    },
    {
      "Key": "mykey",
      "Value": "myvalue"
    }
  ]
}
```

For more information, see [Tagging resources](#) in the *MemoryDB User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To update an ACL

The following `update-acl`` updates an ACL by adding a user.

```
aws memorydb untag-resource \  
  --resource-arn arn:aws:memorydb:us-east-1:491658xxxxx:cluster/my-cluster \  
  --tag-keys mykey
```

Output:

```
{  
  "TagList": [  
    {  
      "Key": "mytag",  
      "Value": "myvalue"  
    }  
  ]  
}
```

For more information, see [Tagging resources](#) in the *MemoryDB User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-cluster

The following code example shows how to use `update-cluster`.

AWS CLI

To update a cluster

The following `update-cluster` ``` updates the parameter group of a cluster to `my-parameter-group`.

```
aws memorydb update-cluster \  
  --cluster-name my-cluster \  
  --parameter-group-name my-parameter-group
```

Output:

```
{  
  "Cluster": {  
    "Name": "my-cluster",  
    "Status": "available",  
    "NumberOfShards": 2,  
    "AvailabilityMode": "MultiAZ",  
    "ClusterEndpoint": {  
      "Address": "clustercfg.my-cluster.llru6f.memorydb.us-  
east-1.amazonaws.com",  
      "Port": 6379  
    },  
    "NodeType": "db.r6g.large",  
    "EngineVersion": "6.2",  
    "EnginePatchVersion": "6.2.6",  
    "ParameterGroupName": "my-parameter-group",  
    "ParameterGroupStatus": "in-sync",  
    "SecurityGroups": [  
      {  
        "SecurityGroupId": "sg-0a143xxxxxc9fae",  
        "Status": "active"  
      }  
    ],  
    "SubnetGroupName": "pat-sg",  
    "TLSEnabled": true,  
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:cluster/my-cluster",  
    "SnapshotRetentionLimit": 0,  
    "MaintenanceWindow": "wed:03:00-wed:04:00",  
    "SnapshotWindow": "04:30-05:30",  
    "ACLName": "my-acl",  
    "AutoMinorVersionUpgrade": true  
  }  
}
```

For more information, see [Modifying a cluster](#) in the *MemoryDB User Guide*.

- For API details, see [UpdateCluster](#) in *AWS CLI Command Reference*.

update-parameter-group

The following code example shows how to use `update-parameter-group`.

AWS CLI

To update a parameter group

The following `update-parameter-group` updates a parameter group.

```
aws memorydb update-parameter-group \  
  --parameter-group-name my-parameter-group \  
  --parameter-name-values "ParameterName=activedefrag, ParameterValue=no"
```

Output:

```
{  
  "ParameterGroup": {  
    "Name": "my-parameter-group",  
    "Family": "memorydb_redis6",  
    "Description": "my parameter group",  
    "ARN": "arn:aws:memorydb:us-east-1:49165xxxxxx:parametergroup/my-parameter-  
group"  
  }  
}
```

For more information, see [Modifying a parameter group](#) in the *MemoryDB User Guide*.

- For API details, see [UpdateParameterGroup](#) in *AWS CLI Command Reference*.

update-subnet-group

The following code example shows how to use `update-subnet-group`.

AWS CLI

To update a subnet group

The following `update-subnet-group` updates a subnet group's subnet ID.

```
aws memorydb update-subnet-group \  
  --subnet-group-name my-sg \  
  --subnet-ids subnet-01f29d458f3xxxxx
```

Output:

```
{
  "SubnetGroup": {
    "Name": "my-sg-1",
    "Description": "my-sg",
    "VpcId": "vpc-09d2cfc01xxxxxxx",
    "Subnets": [
      {
        "Identifier": "subnet-01f29d458fxxxxxx",
        "AvailabilityZone": {
          "Name": "us-east-1a"
        }
      }
    ],
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:subnetgroup/my-sg"
  }
}
```

For more information, see [Subnets and subnet groups](#) in the *MemoryDB User Guide*.

- For API details, see [UpdateSubnetGroup](#) in *AWS CLI Command Reference*.

update-user

The following code example shows how to use `update-user`.

AWS CLI**To update a user**

The following `update-user` modifies a user's access string.

```
aws memorydb update-user \
  --user-name my-user \
  --access-string "off ~objects:* ~items:* ~public:* resetchannels -@all"
```

Output:

```
{
  "User": {
    "Name": "my-user",
    "Status": "modifying",
```

```
    "AccessString": "off ~objects:* ~items:* ~public:* resetchannels -@all",
    "ACLNames": [
      "myt-acl"
    ],
    "MinimumEngineVersion": "6.2",
    "Authentication": {
      "Type": "password",
      "PasswordCount": 2
    },
    "ARN": "arn:aws:memorydb:us-east-1:491658xxxxxx:user/my-user"
  }
}
```

For more information, see [Authenticating users with Access Control Lists](#) in the *MemoryDB User Guide*.

- For API details, see [UpdateUser](#) in *AWS CLI Command Reference*.

Amazon MSK examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon MSK.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

create-cluster

The following code example shows how to use `create-cluster`.

AWS CLI

To create an Amazon MSK cluster

The following `create-cluster` example creates an MSK cluster named `MessagingCluster` with three broker nodes. A JSON file named `brokernodegroupinfo.json` specifies the three subnets over which you want Amazon MSK to distribute the broker nodes. This example doesn't specify the monitoring level, so the cluster gets the `DEFAULT` level.

```
aws kafka create-cluster \  
  --cluster-name "MessagingCluster" \  
  --broker-node-group-info file://brokernodegroupinfo.json \  
  --kafka-version "2.2.1" \  
  --number-of-broker-nodes 3
```

Contents of `brokernodegroupinfo.json`:

```
{  
  "InstanceType": "kafka.m5.xlarge",  
  "BrokerAZDistribution": "DEFAULT",  
  "ClientSubnets": [  
    "subnet-0123456789111abcd",  
    "subnet-0123456789222abcd",  
    "subnet-0123456789333abcd"  
  ]  
}
```

Output:

```
{  
  "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/  
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",  
  "ClusterName": "MessagingCluster",  
  "State": "CREATING"  
}
```

For more information, see [Create an Amazon MSK Cluster](#) in the *Amazon Managed Streaming for Apache Kafka*.

- For API details, see [CreateCluster](#) in *AWS CLI Command Reference*.

create-configuration

The following code example shows how to use create-configuration.

AWS CLI

To create a custom Amazon MSK configuration

The following create-configuration example creates a custom MSK configuration with the server properties that are specified in the input file.

```
aws kafka create-configuration \  
  --name "CustomConfiguration" \  
  --description "Topic autocreation enabled; Apache ZooKeeper timeout 2000 ms; Log  
rolling 604800000 ms." \  
  --kafka-versions "2.2.1" \  
  --server-properties file://configuration.txt
```

Contents of configuration.txt:

```
auto.create.topics.enable = true  
zookeeper.connection.timeout.ms = 2000  
log.roll.ms = 604800000
```

This command produces no output. Output:

```
{  
  "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/  
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",  
  "CreationTime": "2019-10-09T15:26:05.548Z",  
  "LatestRevision":  
    {  
      "CreationTime": "2019-10-09T15:26:05.548Z",  
      "Description": "Topic autocreation enabled; Apache ZooKeeper timeout  
2000 ms; Log rolling 604800000 ms.",  
      "Revision": 1  
    },  
  "Name": "CustomConfiguration"  
}
```

For more information, see [Amazon MSK Configuration Operations](#) in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see [CreateConfiguration](#) in *AWS CLI Command Reference*.

describe-cluster

The following code example shows how to use `describe-cluster`.

AWS CLI

To describe a cluster

The following `describe-cluster` example describes an Amazon MSK cluster.

```
aws kafka describe-cluster \  
  --cluster-arn arn:aws:kafka:us-east-1:123456789012:cluster/demo-  
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```
{  
  "ClusterInfo": {  
    "BrokerNodeGroupInfo": {  
      "BrokerAZDistribution": "DEFAULT",  
      "ClientSubnets": [  
        "subnet-cbfff283",  
        "subnet-6746046b"  
      ],  
      "InstanceType": "kafka.m5.large",  
      "SecurityGroups": [  
        "sg-f839b688"  
      ],  
      "StorageInfo": {  
        "EbsStorageInfo": {  
          "VolumeSize": 100  
        }  
      }  
    },  
    "ClusterArn": "arn:aws:kafka:us-east-1:123456789012:cluster/demo-

        "InCluster": true
      }
    },
    "EnhancedMonitoring": "DEFAULT",
    "OpenMonitoring": {
      "Prometheus": {
        "JmxExporter": {
          "EnabledInBroker": false
        },
        "NodeExporter": {
          "EnabledInBroker": false
        }
      }
    },
    "NumberOfBrokerNodes": 2,
    "State": "ACTIVE",
    "Tags": {},
    "ZookeeperConnectionString": "z-2.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-1.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-3.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181"
  }
}

```

For more information, see [Listing Amazon MSK Clusters](#) in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see [DescribeCluster](#) in *AWS CLI Command Reference*.

get-bootstrap-brokers

The following code example shows how to use `get-bootstrap-brokers`.

AWS CLI

To get bootstrap brokers

The following `get-bootstrap-brokers` example retrieves the bootstrap broker information for an Amazon MSK cluster.

```
aws kafka get-bootstrap-brokers \  
  --cluster-arn arn:aws:kafka:us-east-1:123456789012:cluster/demo-  
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5
```

Output:

```
{  
  "BootstrapBrokerString": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-  
east-1.amazonaws.com:9092,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-  
east-1.amazonaws.com:9092",  
  "BootstrapBrokerStringTls": "b-1.demo-cluster-1.xuy0sb.c5.kafka.us-  
east-1.amazonaws.com:9094,b-2.demo-cluster-1.xuy0sb.c5.kafka.us-  
east-1.amazonaws.com:9094"  
}
```

For more information, see [Getting the Bootstrap Brokers](#) in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see [GetBootstrapBrokers](#) in *AWS CLI Command Reference*.

list-clusters

The following code example shows how to use `list-clusters`.

AWS CLI

To list the available clusters

The following `list-clusters` example lists the Amazon MSK clusters in your AWS account.

```
aws kafka list-clusters
```

Output:

```
{
```

```
"ClusterInfoList": [
  {
    "BrokerNodeGroupInfo": {
      "BrokerAZDistribution": "DEFAULT",
      "ClientSubnets": [
        "subnet-cbfff283",
        "subnet-6746046b"
      ],
      "InstanceType": "kafka.m5.large",
      "SecurityGroups": [
        "sg-f839b688"
      ],
      "StorageInfo": {
        "EbsStorageInfo": {
          "VolumeSize": 100
        }
      }
    },
    "ClusterArn": "arn:aws:kafka:us-east-1:123456789012:cluster/demo-
cluster-1/6357e0b2-0e6a-4b86-a0b4-70df934c2e31-5",

      },
      "EncryptionInTransit": {
        "ClientBroker": "TLS_PLAINTEXT",
        "InCluster": true
      }
    },
    "EnhancedMonitoring": "DEFAULT",
    "OpenMonitoring": {
      "Prometheus": {
        "JmxExporter": {
          "EnabledInBroker": false
        },
        "NodeExporter": {
          "EnabledInBroker": false
        }
      }
    }
  }
]
```

```

        }
    },
    "NumberOfBrokerNodes": 2,
    "State": "ACTIVE",
    "Tags": {},
    "ZookeeperConnectionString": "z-2.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-1.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181,z-3.demo-cluster-1.xuy0sb.c5.kafka.us-
east-1.amazonaws.com:2181"
    }
]
}

```

For more information, see [Listing Amazon MSK Clusters](#) in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see [ListClusters](#) in *AWS CLI Command Reference*.

update-broker-storage

The following code example shows how to use `update-broker-storage`.

AWS CLI

To update the EBS storage for brokers

The following `update-broker-storage` example updates the amount of EBS storage for all the brokers in the cluster. Amazon MSK sets the target storage amount for each broker to the amount specified in the example. You can get the current version of the cluster by describing the cluster or by listing all of the clusters.

```

aws kafka update-broker-storage \
  --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2" \
  --current-version "K21V3IB1VIZYYH" \
  --target-broker-ebs-volume-info "KafkaBrokerNodeId=ALL,VolumeSizeGB=1100"

```

The output returns an ARN for this `update-broker-storage` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.

```
{
  "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
  "ClusterOperationArn": "arn:aws:kafka:us-west-2:123456789012:cluster-
operation/V123450123/a1b2c3d4-1234-abcd-cdef-22222EXAMPLE-2/a1b2c3d4-abcd-1234-
bcde-33333EXAMPLE"
}
```

For more information, see [Update the EBS Storage for Brokers](#) in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see [UpdateBrokerStorage](#) in *AWS CLI Command Reference*.

update-cluster-configuration

The following code example shows how to use `update-cluster-configuration`.

AWS CLI

To update the configuration of an Amazon MSK cluster

The following `update-cluster-configuration` example updates the configuration of the specified existing MSK cluster. It uses a custom MSK configuration.

```
aws kafka update-cluster-configuration \
  --cluster-arn "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2" \
  --configuration-info file://configuration-info.json \
  --current-version "K21V3IB1VIZYYH"
```

Contents of `configuration-info.json`:

```
{
  "Arn": "arn:aws:kafka:us-west-2:123456789012:configuration/CustomConfiguration/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
  "Revision": 1
}
```

The output returns an ARN for this `update-cluster-configuration` operation. To determine if this operation is complete, use the `describe-cluster-operation` command with this ARN as input.

```
{
  "ClusterArn": "arn:aws:kafka:us-west-2:123456789012:cluster/MessagingCluster/
a1b2c3d4-5678-90ab-cdef-11111EXAMPLE-2",
  "ClusterOperationArn": "arn:aws:kafka:us-west-2:123456789012:cluster-
operation/V123450123/a1b2c3d4-1234-abcd-cdef-22222EXAMPLE-2/a1b2c3d4-abcd-1234-
bcde-33333EXAMPLE"
}
```

For more information, see [Update the Configuration of an Amazon MSK Cluster](#) in the *Amazon Managed Streaming for Apache Kafka Developer Guide*.

- For API details, see [UpdateClusterConfiguration](#) in *AWS CLI Command Reference*.

Network Manager examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Network Manager.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

Actions

associate-customer-gateway

The following code example shows how to use `associate-customer-gateway`.

AWS CLI

To associate a customer gateway

The following `associate-customer-gateway` example associates customer gateway `cgw-11223344556677889` in the specified global network with device `device-07f6fd08867abc123`.

```
aws networkmanager associate-customer-gateway \  
  --customer-gateway-arn arn:aws:ec2:us-west-2:123456789012:customer-gateway/  
cgw-11223344556677889 \  
  --global-network-id global-network-01231231231231231 \  
  --device-id device-07f6fd08867abc123 \  
  --region us-west-2
```

Output:

```
{  
  "CustomerGatewayAssociation": {  
    "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-gateway/  
cgw-11223344556677889",  
    "GlobalNetworkId": "global-network-01231231231231231",  
    "DeviceId": "device-07f6fd08867abc123",  
    "State": "PENDING"  
  }  
}
```

For more information, see [Customer Gateway Associations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [AssociateCustomerGateway](#) in *AWS CLI Command Reference*.

associate-link

The following code example shows how to use `associate-link`.

AWS CLI

To associate a link

The following `associate-link` example associates link `link-11112222aaaabbbb1` with device `device-07f6fd08867abc123`. The link and device are in the specified global network.

```
aws networkmanager associate-link \  
  --global-network-id global-network-01231231231231231 \  
  --link-id link-11112222aaaabbbb1 \  
  --device-id device-07f6fd08867abc123 \  
  --region us-west-2
```

```
--global-network-id global-network-01231231231231231 \  
--device-id device-07f6fd08867abc123 \  
--link-id link-11112222aaaabbbb1 \  
--region us-west-2
```

Output:

```
{  
  "LinkAssociation": {  
    "GlobalNetworkId": "global-network-01231231231231231",  
    "DeviceId": "device-07f6fd08867abc123",  
    "LinkId": "link-11112222aaaabbbb1",  
    "LinkAssociationState": "PENDING"  
  }  
}
```

For more information, see [Device and Link Associations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [AssociateLink](#) in *AWS CLI Command Reference*.

create-core-network

The following code example shows how to use `create-core-network`.

AWS CLI

To create a core network

The following `create-core-network` example creates a core network using an optional description and tags within an AWS Cloud WAN global network.

```
aws networkmanager create-core-network \  
  --global-network-id global-network-0d59060f16a73bc41\  
  --description "Main headquarters location"\  
  --tags Key=Name,Value="New York City office"
```

Output:

```
{
```

```
"CoreNetwork": {
  "GlobalNetworkId": "global-network-0d59060f16a73bc41",
  "CoreNetworkId": "core-network-0fab62fe438d94db6",
  "CoreNetworkArn": "arn:aws:networkmanager::987654321012:core-network/core-
network-0fab62fe438d94db6",
  "Description": "Main headquarters location",
  "CreatedAt": "2022-01-10T19:53:59+00:00",
  "State": "AVAILABLE",
  "Tags": [
    {
      "Key": "Name",
      "Value": "New York City office"
    }
  ]
}
```

For more information, see [Core networks](#) in the *AWS Cloud WAN User Guide*.

- For API details, see [CreateCoreNetwork](#) in *AWS CLI Command Reference*.

create-device

The following code example shows how to use create-device.

AWS CLI

To create a device

The following create-device example creates a device in the specified global network. The device details include a description, the type, vendor, model, and serial number.

```
aws networkmanager create-device
  --global-network-id global-network-01231231231231231 \
  --description "New York office device" \
  --type "office device" \
  --vendor "anycompany" \
  --model "abcabc" \
  --serial-number "1234" \
  --region us-west-2
```

Output:

```
{
  "Device": {
    "DeviceId": "device-07f6fd08867abc123",
    "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231231/device-07f6fd08867abc123",
    "GlobalNetworkId": "global-network-01231231231231231",
    "Description": "New York office device",
    "Type": "office device",
    "Vendor": "anycompany",
    "Model": "abcabc",
    "SerialNumber": "1234",
    "CreatedAt": 1575554005.0,
    "State": "PENDING"
  }
}
```

For more information, see [Working with Devices](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [CreateDevice](#) in *AWS CLI Command Reference*.

create-global-network

The following code example shows how to use `create-global-network`.

AWS CLI

To create a global network

The following `create-global-network` examples creates a new global network. The initial state upon creation is PENDING.

```
aws networkmanager create-global-network
```

Output:

```
{
  "GlobalNetwork": {
    "GlobalNetworkId": "global-network-00a77fc0f722dae74",
    "GlobalNetworkArn": "arn:aws:networkmanager::987654321012:global-network/
global-network-00a77fc0f722dae74",
    "CreatedAt": "2022-03-14T20:31:56+00:00",
```

```
    "State": "PENDING"
  }
}
```

- For API details, see [CreateGlobalNetwork](#) in *AWS CLI Command Reference*.

create-link

The following code example shows how to use `create-link`.

AWS CLI

To create a link

The following `create-link` example creates a link in the specified global network. The link includes a description and details about the link type, bandwidth, and provider. The site ID indicates the site to which the link is associated.

```
aws networkmanager create-link \
  --global-network-id global-network-01231231231231231 \
  --description "VPN Link" \
  --type "broadband" \
  --bandwidth UploadSpeed=10,DownloadSpeed=20 \
  --provider "AnyCompany" \
  --site-id site-444555aaaabbb11223 \
  --region us-west-2
```

Output:

```
{
  "Link": {
    "LinkId": "link-11112222aaaabbbb1",
    "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
    "GlobalNetworkId": "global-network-01231231231231231",
    "SiteId": "site-444555aaaabbb11223",
    "Description": "VPN Link",
    "Type": "broadband",
    "Bandwidth": {
      "UploadSpeed": 10,
      "DownloadSpeed": 20
    }
  }
}
```

```

    },
    "Provider": "AnyCompany",
    "CreatedAt": 1575555811.0,
    "State": "PENDING"
  }
}

```

For more information, see [Working with Links](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [CreateLink](#) in *AWS CLI Command Reference*.

create-site

The following code example shows how to use `create-site`.

AWS CLI

To create a site

The following `create-site` example creates a site in the specified global network. The site details include a description and the location information.

```

aws networkmanager create-site \
  --global-network-id global-network-01231231231231231 \
  --description "New York head office" \
  --location Latitude=40.7128,Longitude=-74.0060 \
  --region us-west-2

```

Output:

```

{
  "Site": {
    "SiteId": "site-444555aaabbb11223",
    "SiteArn": "arn:aws:networkmanager::123456789012:site/global-
network-01231231231231231/site-444555aaabbb11223",
    "GlobalNetworkId": "global-network-01231231231231231",
    "Description": "New York head office",
    "Location": {
      "Latitude": "40.7128",
      "Longitude": "-74.0060"
    },
  },
  "CreatedAt": 1575554300.0,
}

```

```
    "State": "PENDING"
  }
}
```

For more information, see [Working with Sites](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [CreateSite](#) in *AWS CLI Command Reference*.

create-vpc-attachment

The following code example shows how to use `create-vpc-attachment`.

AWS CLI

To create a VPC attachment

The following `create-vpc-attachment` example creates a VPC attachment with IPv6 support in a core network.

```
aws networkmanager create-vpc-attachment \
  --core-network-id core-network-0fab62fe438d94db6 \
  --vpc-arn arn:aws:ec2:us-east-1:987654321012:vpc/vpc-09f37f69e2786eeb8 \
  --subnet-arns arn:aws:ec2:us-east-1:987654321012:subnet/subnet-04ca4e010857e7bb7 \
  --Ipv6Support=true
```

Output:

```
{
  "VpcAttachment": {
    "Attachment": {
      "CoreNetworkId": "core-network-0fab62fe438d94db6",
      "AttachmentId": "attachment-05e1da6eba87a06e6",
      "OwnerAccountId": "987654321012",
      "AttachmentType": "VPC",
      "State": "CREATING",
      "EdgeLocation": "us-east-1",
      "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/
vpc-09f37f69e2786eeb8",
      "Tags": [],
      "CreatedAt": "2022-03-10T20:59:14+00:00",
      "UpdatedAt": "2022-03-10T20:59:14+00:00"
    }
  }
}
```

```
    },
    "SubnetArns": [
      "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-04ca4e010857e7bb7"
    ],
    "Options": {
      "Ipv6Support": true
    }
  }
}
```

For more information, see [Create an attachment](#) in the *Cloud WAN User Guide*.

- For API details, see [CreateVpcAttachment](#) in *AWS CLI Command Reference*.

delete-attachment

The following code example shows how to use delete-attachment.

AWS CLI

To delete an attachment

The following delete-attachment example deletes a Connect attachment.

```
aws networkmanager delete-attachment \
  --attachment-id attachment-01feddaeeae26ab68c
```

Output:

```
{
  "Attachment": {
    "CoreNetworkId": "core-network-0f4b0a9d5ee7761d1",
    "AttachmentId": "attachment-01feddaeeae26ab68c",
    "OwnerAccountId": "987654321012",
    "AttachmentType": "CONNECT",
    "State": "DELETING",
    "EdgeLocation": "us-east-1",
    "ResourceArn": "arn:aws:networkmanager::987654321012:attachment/attachment-02c3964448fedf5aa",
    "CreatedAt": "2022-03-15T19:18:41+00:00",
    "UpdatedAt": "2022-03-15T19:28:59+00:00"
  }
}
```

```
}
```

For more information, see [Delete attachments](#) in the *Cloud WAN User Guide*.

- For API details, see [DeleteAttachment](#) in *AWS CLI Command Reference*.

delete-bucket-analytics-configuration

The following code example shows how to use `delete-bucket-analytics-configuration`.

AWS CLI

To delete an analytics configuration for a bucket

The following `delete-bucket-analytics-configuration` example removes the analytics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-analytics-configuration \  
  --bucket my-bucket \  
  --id 1
```

This command produces no output.

- For API details, see [DeleteBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

delete-bucket-metrics-configuration

The following code example shows how to use `delete-bucket-metrics-configuration`.

AWS CLI

To delete a metrics configuration for a bucket

The following `delete-bucket-metrics-configuration` example removes the metrics configuration for the specified bucket and ID.

```
aws s3api delete-bucket-metrics-configuration \  
  --bucket my-bucket \  
  --id 123
```

This command produces no output.

- For API details, see [DeleteBucketMetricsConfiguration](#) in *AWS CLI Command Reference*.

delete-core-network

The following code example shows how to use `delete-core-network`.

AWS CLI

To delete a core network

The following `delete-core-network` example deletes a core network from a Cloud WAN global network.

```
aws networkmanager delete-core-network \  
  --core-network-id core-network-0fab62fe438d94db6
```

Output:

```
{  
  "CoreNetwork": {  
    "GlobalNetworkId": "global-network-0d59060f16a73bc41",  
    "CoreNetworkId": "core-network-0fab62fe438d94db6",  
    "Description": "Main headquarters location",  
    "CreatedAt": "2021-12-09T18:31:11+00:00",  
    "State": "DELETING",  
    "Segments": [  
      {  
        "Name": "dev",  
        "EdgeLocations": [  
          "us-east-1"  
        ],  
        "SharedSegments": []  
      }  
    ],  
    "Edges": [  
      {  
        "EdgeLocation": "us-east-1",  
        "Asn": 64512,  
        "InsideCidrBlocks": []  
      }  
    ]  
  }  
}
```

```
}
```

For more information, see [Core networks](#) in the *Cloud WAN User Guide*.

- For API details, see [DeleteCoreNetwork](#) in *AWS CLI Command Reference*.

delete-device

The following code example shows how to use `delete-device`.

AWS CLI

To delete a device

The following `delete-device` example deletes the specified device from the specified global network.

```
aws networkmanager delete-device \  
  --global-network-id global-network-01231231231231231 \  
  --device-id device-07f6fd08867abc123 \  
  --region us-west-2
```

Output:

```
{  
  "Device": {  
    "DeviceId": "device-07f6fd08867abc123",  
    "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-  
network-01231231231231231/device-07f6fd08867abc123",  
    "GlobalNetworkId": "global-network-01231231231231231",  
    "Description": "New York office device",  
    "Type": "office device",  
    "Vendor": "anycompany",  
    "Model": "abcabc",  
    "SerialNumber": "1234",  
    "SiteId": "site-444555aaabbb11223",  
    "CreatedAt": 1575554005.0,  
    "State": "DELETING"  
  }  
}
```

For more information, see [Working with Devices](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DeleteDevice](#) in *AWS CLI Command Reference*.

delete-global-network

The following code example shows how to use `delete-global-network`.

AWS CLI

To delete a global network

The following `delete-global-network` example deletes a global network.

```
aws networkmanager delete-global-network \  
  --global-network-id global-network-052bedddccb193b6b
```

Output:

```
{  
  "GlobalNetwork": {  
    "GlobalNetworkId": "global-network-052bedddccb193b6b",  
    "GlobalNetworkArn": "arn:aws:networkmanager::987654321012:global-network/  
global-network-052bedddccb193b6b",  
    "CreatedAt": "2021-12-09T18:19:12+00:00",  
    "State": "DELETING"  
  }  
}
```

- For API details, see [DeleteGlobalNetwork](#) in *AWS CLI Command Reference*.

delete-link

The following code example shows how to use `delete-link`.

AWS CLI

To delete a link

The following `delete-link` example deletes the specified link from the specified global network.

```
aws networkmanager delete-link \  
  --global-network-id global-network-052bedddccb193b6b
```

```
--global-network-id global-network-01231231231231231 \
--link-id link-11112222aaaabbbb1 \
--region us-west-2
```

Output:

```
{
  "Link": {
    "LinkId": "link-11112222aaaabbbb1",
    "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
    "GlobalNetworkId": "global-network-01231231231231231",
    "SiteId": "site-444555aaaabbb11223",
    "Description": "VPN Link",
    "Type": "broadband",
    "Bandwidth": {
      "UploadSpeed": 20,
      "DownloadSpeed": 20
    },
    "Provider": "AnyCompany",
    "CreatedAt": 1575555811.0,
    "State": "DELETING"
  }
}
```

For more information, see [Working with Links](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DeleteLink](#) in *AWS CLI Command Reference*.

delete-public-access-block

The following code example shows how to use `delete-public-access-block`.

AWS CLI

To delete the block public access configuration for a bucket

The following `delete-public-access-block` example removes the block public access configuration on the specified bucket.

```
aws s3api delete-public-access-block \
  --bucket my-bucket
```

This command produces no output.

- For API details, see [DeletePublicAccessBlock](#) in *AWS CLI Command Reference*.

delete-site

The following code example shows how to use `delete-site`.

AWS CLI

To delete a site

The following `delete-site` example deletes the specified site (`site-444555aaabbb11223`) in the specified global network.

```
aws networkmanager delete-site \  
  --global-network-id global-network-01231231231231231 \  
  --site-id site-444555aaabbb11223 \  
  --region us-west-2
```

Output:

```
{  
  "Site": {  
    "SiteId": "site-444555aaabbb11223",  
    "SiteArn": "arn:aws:networkmanager::123456789012:site/global-  
network-01231231231231231/site-444555aaabbb11223",  
    "GlobalNetworkId": "global-network-01231231231231231",  
    "Description": "New York head office",  
    "Location": {  
      "Latitude": "40.7128",  
      "Longitude": "-74.0060"  
    },  
    "CreatedAt": 1575554300.0,  
    "State": "DELETING"  
  }  
}
```

For more information, see [Working with Sites](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DeleteSite](#) in *AWS CLI Command Reference*.

deregister-transit-gateway

The following code example shows how to use `deregister-transit-gateway`.

AWS CLI

To deregister a transit gateway from a global network

The following `deregister-transit-gateway` example deregisters the specified transit gateway from the specified global network.

```
aws networkmanager deregister-transit-gateway \
  --global-network-id global-network-01231231231231231 \
  --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/
  tgw-123abc05e04123abc \
  --region us-west-2
```

Output:

```
{
  "TransitGatewayRegistration": {
    "GlobalNetworkId": "global-network-01231231231231231",
    "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-gateway/
  tgw-123abc05e04123abc",
    "State": {
      "Code": "DELETING"
    }
  }
}
```

For more information, see [Transit Gateway Registrations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DeregisterTransitGateway](#) in *AWS CLI Command Reference*.

describe-global-networks

The following code example shows how to use `describe-global-networks`.

AWS CLI

To describe your global networks

The following `describe-global-networks` example describes all of your global networks in your account.

```
aws networkmanager describe-global-networks \  
  --region us-west-2
```

Output:

```
{  
  "GlobalNetworks": [  
    {  
      "GlobalNetworkId": "global-network-01231231231231231",  
      "GlobalNetworkArn": "arn:aws:networkmanager::123456789012:global-  
network/global-network-01231231231231231",  
      "Description": "Company 1 global network",  
      "CreatedAt": 1575553525.0,  
      "State": "AVAILABLE"  
    }  
  ]  
}
```

- For API details, see [DescribeGlobalNetworks](#) in *AWS CLI Command Reference*.

disassociate-customer-gateway

The following code example shows how to use `disassociate-customer-gateway`.

AWS CLI

To disassociate a customer gateway

The following `disassociate-customer-gateway` example disassociates the specified customer gateway (`cgw-11223344556677889`) from the specified global network.

```
aws networkmanager disassociate-customer-gateway \  
  --global-network-id global-network-01231231231231231 \  
  --customer-gateway-arn arn:aws:ec2:us-west-2:123456789012:customer-gateway/  
cgw-11223344556677889 \  
  --region us-west-2
```

Output:

```
{
  "CustomerGatewayAssociation": {
    "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-gateway/cgw-11223344556677889",
    "GlobalNetworkId": "global-network-01231231231231231",
    "DeviceId": "device-07f6fd08867abc123",
    "State": "DELETING"
  }
}
```

For more information, see [Customer Gateway Associations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DisassociateCustomerGateway](#) in *AWS CLI Command Reference*.

disassociate-link

The following code example shows how to use `disassociate-link`.

AWS CLI

To disassociate a link

The following `disassociate-link` example disassociates the specified link from device `device-07f6fd08867abc123` in the specified global network.

```
aws networkmanager disassociate-link \
  --global-network-id global-network-01231231231231231 \
  --device-id device-07f6fd08867abc123 \
  --link-id link-11112222aaaabbbb1 \
  --region us-west-2
```

Output:

```
{
  "LinkAssociation": {
    "GlobalNetworkId": "global-network-01231231231231231",
    "DeviceId": "device-07f6fd08867abc123",
    "LinkId": "link-11112222aaaabbbb1",
    "LinkAssociationState": "DELETING"
  }
}
```

For more information, see [Device and Link Associations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [DisassociateLink](#) in *AWS CLI Command Reference*.

get-bucket-analytics-configuration

The following code example shows how to use `get-bucket-analytics-configuration`.

AWS CLI

To retrieve the analytics configuration for a bucket with a specific ID

The following `get-bucket-analytics-configuration` example displays the analytics configuration for the specified bucket and ID.

```
aws s3api get-bucket-analytics-configuration \
  --bucket my-bucket \
  --id 1
```

Output:

```
{
  "AnalyticsConfiguration": {
    "StorageClassAnalysis": {},
    "Id": "1"
  }
}
```

- For API details, see [GetBucketAnalyticsConfiguration](#) in *AWS CLI Command Reference*.

get-bucket-metrics-configuration

The following code example shows how to use `get-bucket-metrics-configuration`.

AWS CLI

To retrieve the metrics configuration for a bucket with a specific ID

The following `get-bucket-metrics-configuration` example displays the metrics configuration for the specified bucket and ID.

```
aws s3api get-bucket-metrics-configuration \  
  --bucket my-bucket \  
  --id 123
```

Output:

```
{  
  "MetricsConfiguration": {  
    "Filter": {  
      "Prefix": "logs"  
    },  
    "Id": "123"  
  }  
}
```

- For API details, see [GetBucketMetricsConfiguration](#) in *AWS CLI Command Reference*.

get-customer-gateway-associations

The following code example shows how to use `get-customer-gateway-associations`.

AWS CLI**To get your customer gateway associations**

The following `get-customer-gateway-associations` example gets the customer gateway associations for the specified global network.

```
aws networkmanager get-customer-gateway-associations \  
  --global-network-id global-network-01231231231231231 \  
  --region us-west-2
```

Output:

```
{  
  "CustomerGatewayAssociations": [  
    {  
      "CustomerGatewayArn": "arn:aws:ec2:us-west-2:123456789012:customer-  
gateway/cgw-11223344556677889",  
      "GlobalNetworkId": "global-network-01231231231231231",  
      "DeviceId": "device-07f6fd08867abc123",
```

```
        "State": "AVAILABLE"
      }
    ]
  }
```

- For API details, see [GetCustomerGatewayAssociations](#) in *AWS CLI Command Reference*.

get-devices

The following code example shows how to use `get-devices`.

AWS CLI

To get your devices

The following `get-devices` example gets the devices in the specified global network.

```
aws networkmanager get-devices \
  --global-network-id global-network-01231231231231231 \
  --region us-west-2
```

Output:

```
{
  "Devices": [
    {
      "DeviceId": "device-07f6fd08867abc123",
      "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123",
      "GlobalNetworkId": "global-network-01231231231231231",
      "Description": "NY office device",
      "Type": "office device",
      "Vendor": "anycompany",
      "Model": "abcabc",
      "SerialNumber": "1234",
      "CreatedAt": 1575554005.0,
      "State": "AVAILABLE"
    }
  ]
}
```

- For API details, see [GetDevices](#) in *AWS CLI Command Reference*.

get-link-associations

The following code example shows how to use `get-link-associations`.

AWS CLI

To get your link associations

The following `get-link-associations` example gets the link associations in the specified global network.

```
aws networkmanager get-link-associations \  
  --global-network-id global-network-01231231231231231 \  
  --region us-west-2
```

Output:

```
{  
  "LinkAssociations": [  
    {  
      "GlobalNetworkId": "global-network-01231231231231231",  
      "DeviceId": "device-07f6fd08867abc123",  
      "LinkId": "link-11112222aaaabbbb1",  
      "LinkAssociationState": "AVAILABLE"  
    }  
  ]  
}
```

- For API details, see [GetLinkAssociations](#) in *AWS CLI Command Reference*.

get-links

The following code example shows how to use `get-links`.

AWS CLI

To get your links

The following `get-links` example gets the links in the specified global network.

```
aws networkmanager get-links \  
  --global-network-id global-network-01231231231231231 \  
  --region us-west-2
```

```
--region us-west-2
```

Output:

```
{
  "Links": [
    {
      "LinkId": "link-11112222aaaabbbb1",
      "LinkArn": "arn:aws:networkmanager::123456789012:link/global-
network-01231231231231231/link-11112222aaaabbbb1",
      "GlobalNetworkId": "global-network-01231231231231231",
      "SiteId": "site-444555aaaabbb11223",
      "Description": "VPN Link",
      "Type": "broadband",
      "Bandwidth": {
        "UploadSpeed": 10,
        "DownloadSpeed": 20
      },
      "Provider": "AnyCompany",
      "CreatedAt": 1575555811.0,
      "State": "AVAILABLE"
    }
  ]
}
```

- For API details, see [GetLinks](#) in *AWS CLI Command Reference*.

get-object-retention

The following code example shows how to use `get-object-retention`.

AWS CLI

To retrieve the object retention configuration for an object

The following `get-object-retention` example retrieves the object retention configuration for the specified object.

```
aws s3api get-object-retention \
  --bucket my-bucket-with-object-lock \
  --key doc1.rtf
```

Output:

```
{
  "Retention": {
    "Mode": "GOVERNANCE",
    "RetainUntilDate": "2025-01-01T00:00:00.000Z"
  }
}
```

- For API details, see [GetObjectRetention](#) in *AWS CLI Command Reference*.

get-public-access-block

The following code example shows how to use `get-public-access-block`.

AWS CLI**To set or modify the block public access configuration for a bucket**

The following `get-public-access-block` example displays the block public access configuration for the specified bucket.

```
aws s3api get-public-access-block --bucket my-bucket
```

Output:

```
{
  "PublicAccessBlockConfiguration": {
    "IgnorePublicAcls": true,
    "BlockPublicPolicy": true,
    "BlockPublicAcls": true,
    "RestrictPublicBuckets": true
  }
}
```

- For API details, see [GetPublicAccessBlock](#) in *AWS CLI Command Reference*.

get-sites

The following code example shows how to use `get-sites`.

AWS CLI

To get your sites

The following `get-sites` example gets the sites in the specified global network.

```
aws networkmanager get-sites \  
  --global-network-id global-network-01231231231231231 \  
  --region us-west-2
```

Output:

```
{  
  "Sites": [  
    {  
      "SiteId": "site-444555aaabbb11223",  
      "SiteArn": "arn:aws:networkmanager::123456789012:site/global-  
network-01231231231231231/site-444555aaabbb11223",  
      "GlobalNetworkId": "global-network-01231231231231231",  
      "Description": "NY head office",  
      "Location": {  
        "Latitude": "40.7128",  
        "Longitude": "-74.0060"  
      },  
      "CreatedAt": 1575554528.0,  
      "State": "AVAILABLE"  
    }  
  ]  
}
```

- For API details, see [GetSites](#) in *AWS CLI Command Reference*.

get-transit-gateway-registrations

The following code example shows how to use `get-transit-gateway-registrations`.

AWS CLI

To get your transit gateway registrations

The following `get-transit-gateway-registrations` example gets the transit gateways that are registered to the specified global network.

```
aws networkmanager get-transit-gateway-registrations \  
  --global-network-id global-network-01231231231231231 \  
  --region us-west-2
```

Output:

```
{  
  "TransitGatewayRegistrations": [  
    {  
      "GlobalNetworkId": "global-network-01231231231231231",  
      "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-  
gateway/tgw-123abc05e04123abc",  
      "State": {  
        "Code": "AVAILABLE"  
      }  
    }  
  ]  
}
```

- For API details, see [GetTransitGatewayRegistrations](#) in *AWS CLI Command Reference*.

get-vpc-attachment

The following code example shows how to use `get-vpc-attachment`.

AWS CLI

To get an a VPC attachment

The following `get-vpc-attachment` example returns information about a VPC attachment.

```
aws networkmanager get-vpc-attachment \  
  --attachment-id attachment-03b7ea450134787da
```

Output:

```
{  
  "VpcAttachment": {  
    "Attachment": {  
      "CoreNetworkId": "core-network-0522de1b226a5d7b3",  
      "AttachmentId": "attachment-03b7ea450134787da",  
    }  
  }  
}
```

```
    "OwnerAccountId": "987654321012",
    "AttachmentType": "VPC",
    "State": "CREATING",
    "EdgeLocation": "us-east-1",
    "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-a7c4bbda",
    "Tags": [
      {
        "Key": "Name",
        "Value": "DevVPC"
      }
    ],
    "CreatedAt": "2022-03-11T17:48:58+00:00",
    "UpdatedAt": "2022-03-11T17:48:58+00:00"
  },
  "SubnetArns": [
    "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-202cde6c",
    "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-e5022dba",
    "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-2387ae02",
    "arn:aws:ec2:us-east-1:987654321012:subnet/subnet-cda9dffc"
  ],
  "Options": {
    "Ipv6Support": false
  }
}
```

For more information, see [Attachments](#) in the *Cloud WAN User Guide*.

- For API details, see [GetVpcAttachment](#) in *AWS CLI Command Reference*.

list-bucket-analytics-configurations

The following code example shows how to use `list-bucket-analytics-configurations`.

AWS CLI

To retrieve a list of analytics configurations for a bucket

The following `list-bucket-analytics-configurations` retrieves a list of analytics configurations for the specified bucket.

```
aws s3api list-bucket-analytics-configurations \
  --bucket my-bucket
```

Output:

```
{
  "AnalyticsConfigurationList": [
    {
      "StorageClassAnalysis": {},
      "Id": "1"
    }
  ],
  "IsTruncated": false
}
```

- For API details, see [ListBucketAnalyticsConfigurations](#) in *AWS CLI Command Reference*.

list-bucket-metrics-configurations

The following code example shows how to use `list-bucket-metrics-configurations`.

AWS CLI**To retrieve a list of metrics configurations for a bucket**

The following `list-bucket-metrics-configurations` example retrieves a list of metrics configurations for the specified bucket.

```
aws s3api list-bucket-metrics-configurations \
  --bucket my-bucket
```

Output:

```
{
  "IsTruncated": false,
  "MetricsConfigurationList": [
    {
      "Filter": {
        "Prefix": "logs"
      },
      "Id": "123"
    },
    {
      "Filter": {
```

```
        "Prefix": "tmp"
      },
      "Id": "234"
    ]
  ]
}
```

- For API details, see [ListBucketMetricsConfigurations](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To list the tags for a resource

The following `list-tags-for-resource` example lists the tags for the specified device resource (`device-07f6fd08867abc123`).

```
aws networkmanager list-tags-for-resource \
  --resource-arn arn:aws:networkmanager::123456789012:device/global-
network-01231231231231231/device-07f6fd08867abc123 \
  --region us-west-2
```

Output:

```
{
  "TagList": [
    {
      "Key": "Network",
      "Value": "Northeast"
    }
  ]
}
```

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

put-bucket-metrics-configuration

The following code example shows how to use `put-bucket-metrics-configuration`.

AWS CLI

To set a metrics configuration for a bucket

The following `put-bucket-metrics-configuration` example sets a metric configuration with ID 123 for the specified bucket.

```
aws s3api put-bucket-metrics-configuration \  
  --bucket my-bucket \  
  --id 123 \  
  --metrics-configuration '{"Id": "123", "Filter": {"Prefix": "logs"}}'
```

This command produces no output.

- For API details, see [PutBucketMetricsConfiguration](#) in *AWS CLI Command Reference*.

put-object-retention

The following code example shows how to use `put-object-retention`.

AWS CLI

To set an object retention configuration for an object

The following `put-object-retention` example sets an object retention configuration for the specified object until 2025-01-01.

```
aws s3api put-object-retention \  
  --bucket my-bucket-with-object-lock \  
  --key doc1.rtf \  
  --retention '{ "Mode": "GOVERNANCE", "RetainUntilDate": "2025-01-01T00:00:00" }'
```

This command produces no output.

- For API details, see [PutObjectRetention](#) in *AWS CLI Command Reference*.

put-public-access-block

The following code example shows how to use `put-public-access-block`.

AWS CLI

To set the block public access configuration for a bucket

The following `put-public-access-block` example sets a restrictive block public access configuration for the specified bucket.

```
aws s3api put-public-access-block \  
  --bucket my-bucket \  
  --public-access-block-configuration  
  "BlockPublicAcls=true,IgnorePublicAcls=true,BlockPublicPolicy=true,RestrictPublicBuckets=tr
```

This command produces no output.

- For API details, see [PutPublicAccessBlock](#) in *AWS CLI Command Reference*.

register-transit-gateway

The following code example shows how to use `register-transit-gateway`.

AWS CLI

To register a transit gateway in a global network

The following `register-transit-gateway` example registers transit gateway `tgw-123abc05e04123abc` in the specified global network.

```
aws networkmanager register-transit-gateway \  
  --global-network-id global-network-01231231231231231 \  
  --transit-gateway-arn arn:aws:ec2:us-west-2:123456789012:transit-gateway/  
tgw-123abc05e04123abc \  
  --region us-west-2
```

Output:

```
{  
  "TransitGatewayRegistration": {  
    "GlobalNetworkId": "global-network-01231231231231231",  
    "TransitGatewayArn": "arn:aws:ec2:us-west-2:123456789012:transit-gateway/  
tgw-123abc05e04123abc",  
    "State": {  
      "Code": "PENDING"  
    }  
  }  
}
```

For more information, see [Transit Gateway Registrations](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [RegisterTransitGateway](#) in *AWS CLI Command Reference*.

reject-attachment

The following code example shows how to use `reject-attachment`.

AWS CLI

To reject an attachment

The following `reject-attachment` example rejects a VPC attachment request.

```
aws networkmanager reject-attachment \  
  --attachment-id attachment-03b7ea450134787da
```

Output:

```
{  
  "Attachment": {  
    "CoreNetworkId": "core-network-0522de1b226a5d7b3",  
    "AttachmentId": "attachment-03b7ea450134787da",  
    "OwnerAccountId": "987654321012",  
    "AttachmentType": "VPC",  
    "State": "AVAILABLE",  
    "EdgeLocation": "us-east-1",  
    "ResourceArn": "arn:aws:ec2:us-east-1:987654321012:vpc/vpc-a7c4bbda",  
    "CreatedAt": "2022-03-11T17:48:58+00:00",  
    "UpdatedAt": "2022-03-11T17:51:25+00:00"  
  }  
}
```

For more information, see [Attachment acceptance](#) in the *Cloud WAN User Guide*.

- For API details, see [RejectAttachment](#) in *AWS CLI Command Reference*.

start-route-analysis

The following code example shows how to use `start-route-analysis`.

AWS CLI

To start route analysis

The following `start-route-analysis` example starts the analysis between a source and destination, including the optional `include-return-path`.

```
aws networkmanager start-route-analysis \  
  --global-network-id global-network-00aa0aaa0b0aaa000 \  
  --source TransitGatewayAttachmentArn=arn:aws:ec2:us-east-1:503089527312:transit-  
gateway-attachment/tgw-attach-0d4a2d491bf68c093,IpAddress=10.0.0.0 \  
  --destination TransitGatewayAttachmentArn=arn:aws:ec2:us-  
west-1:503089527312:transit-gateway-attachment/tgw-  
attach-002577f30bb181742,IpAddress=11.0.0.0 \  
  --include-return-path
```

Output:

```
{  
  "RouteAnalysis": {  
    "GlobalNetworkId": "global-network-00aa0aaa0b0aaa000"  
    "OwnerId": "111122223333",  
    "RouteAnalysisId": "a1873de1-273c-470c-1a2bc2345678",  
    "StartTimestamp": 1695760154.0,  
    "Status": "RUNNING",

tag-resource

The following code example shows how to use `tag-resource`.

AWS CLI

To apply tags to a resource

The following `tag-resource` example applies the tag `Network=Northeast` to the device `device-07f6fd08867abc123`.

```
aws networkmanager tag-resource \  
  --resource-arn arn:aws:networkmanager::123456789012:device/global-  
network-01231231231231231231231231231231/device-07f6fd08867abc123 \  
  --tags Key=Network,Value=Northeast \  
  --region us-west-2
```

This command produces no output.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove tags from a resource

The following `untag-resource` example removes the tag with the key `Network` from the device `device-07f6fd08867abc123`.

```
aws networkmanager untag-resource \  
  --resource-arn arn:aws:networkmanager::123456789012:device/global-  
network-01231231231231231231231231231231/device-07f6fd08867abc123 ]  
  --tag-keys Network \  
  --region us-west-2
```

This command produces no output.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-device

The following code example shows how to use update-device.

AWS CLI

To update a device

The following update-device example updates device device-07f6fd08867abc123 by specifying a site ID for the device.

```
aws networkmanager update-device \  
  --global-network-id global-network-01231231231231231 \  
  --device-id device-07f6fd08867abc123 \  
  --site-id site-444555aaabbb11223 \  
  --region us-west-2
```

Output:

```
{  
  "Device": {  
    "DeviceId": "device-07f6fd08867abc123",  
    "DeviceArn": "arn:aws:networkmanager::123456789012:device/global-  
network-01231231231231231/device-07f6fd08867abc123",  
    "GlobalNetworkId": "global-network-01231231231231231",  
    "Description": "NY office device",  
    "Type": "Office device",  
    "Vendor": "anycompany",  
    "Model": "abcabc",  
    "SerialNumber": "1234",  
    "SiteId": "site-444555aaabbb11223",  
    "CreatedAt": 1575554005.0,  
    "State": "UPDATING"  
  }  
}
```

For more information, see [Working with Devices](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [UpdateDevice](#) in *AWS CLI Command Reference*.

update-global-network

The following code example shows how to use `update-global-network`.

AWS CLI

To update a global network

The following `update-global-network` example updates the description for global network `global-network-01231231231231231`.

```
aws networkmanager update-global-network \  
  --global-network-id global-network-01231231231231231 \  
  --description "Head offices" \  
  --region us-west-2
```

Output:

```
{  
  "GlobalNetwork": {  
    "GlobalNetworkId": "global-network-01231231231231231",  
    "GlobalNetworkArn": "arn:aws:networkmanager::123456789012:global-network/  
global-network-01231231231231231",  
    "Description": "Head offices",  
    "CreatedAt": 1575553525.0,  
    "State": "UPDATING"  
  }  
}
```

For more information, see [Global Networks](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [UpdateGlobalNetwork](#) in *AWS CLI Command Reference*.

update-link

The following code example shows how to use `update-link`.

AWS CLI

To update a link

The following `update-link` example updates the bandwidth information for link `link-11112222aaaabbbb1`.

```
aws networkmanager update-link \  
  --global-network-id global-network-01231231231231231 \  
  --link-id link-11112222aaaabbbb1 \  
  --bandwidth UploadSpeed=20,DownloadSpeed=20 \  
  --region us-west-2
```

Output:

```
{  
  "Link": {  
    "LinkId": "link-11112222aaaabbbb1",  
    "LinkArn": "arn:aws:networkmanager::123456789012:link/global-  
network-01231231231231231/link-11112222aaaabbbb1",  
    "GlobalNetworkId": "global-network-01231231231231231",  
    "SiteId": "site-444555aaabbb11223",  
    "Description": "VPN Link",  
    "Type": "broadband",  
    "Bandwidth": {  
      "UploadSpeed": 20,  
      "DownloadSpeed": 20  
    },  
    "Provider": "AnyCompany",  
    "CreatedAt": 1575555811.0,  
    "State": "UPDATING"  
  }  
}
```

For more information, see [Working with Links](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [UpdateLink](#) in *AWS CLI Command Reference*.

update-site

The following code example shows how to use `update-site`.

AWS CLI

To update a site

The following `update-site` example updates the description for site `site-444555aaabbb11223` in the specified global network.

```
aws networkmanager update-site \  
  --global-network-id global-network-01231231231231231 \  
  --site-id site-444555aaabbb11223 \  
  --description "New York Office site" \  
  --region us-west-2
```

Output:

```
{  
  "Site": {  
    "SiteId": "site-444555aaabbb11223",  
    "SiteArn": "arn:aws:networkmanager::123456789012:site/global-  
network-01231231231231231/site-444555aaabbb11223",  
    "GlobalNetworkId": "global-network-01231231231231231",  
    "Description": "New York Office site",  
    "Location": {  
      "Latitude": "40.7128",  
      "Longitude": "-74.0060"  
    },  
    "CreatedAt": 1575554528.0,  
    "State": "UPDATING"  
  }  
}
```

For more information, see [Working with Sites](#) in the *Transit Gateway Network Manager Guide*.

- For API details, see [UpdateSite](#) in *AWS CLI Command Reference*.

Nimble Studio examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Nimble Studio.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

get-eula

The following code example shows how to use `get-eula`.

AWS CLI

To get information about your studio

The following `get-eula` example lists the information about an EULA.

```
aws nimble get-eula \  
  --eula-id "EULAid"
```

Output:

```
{  
  "eula": {  
    "content": "https://www.mozilla.org/en-US/MPL/2.0/",  
    "createdAt": "2021-04-20T16:45:23+00:00",  
    "eulaId": "gJZLygd-Srq_5NNbSfiaLg",  
    "name": "Mozilla-FireFox",  
    "updatedAt": "2021-04-20T16:45:23+00:00"  
  }  
}
```

For more information, see [Accept the EULA](#) in the *Amazon Nimble Studio User Guide*.

- For API details, see [GetEula](#) in *AWS CLI Command Reference*.

get-launch-profile-details

The following code example shows how to use `get-launch-profile-details`.

AWS CLI

To list the available widgets

The following `get-launch-profile-details` example lists the details about a launch profile.

```
aws nimble get-launch-profile-details \  
  --studio-id "StudioID" \  
  --launch-profile-id "LaunchProfileID"
```

Output:

```
{  
  "launchProfile": {

- For API details, see [GetStudio](#) in *AWS CLI Command Reference*.

list-eula-acceptances

The following code example shows how to use `list-eula-acceptances`.

AWS CLI

To list the available widgets

The following `list-eula-acceptances` example lists the accepted EULAs in your AWS account.

```
aws nimble list-eula-acceptances \  
  --studio-id "StudioID"
```

Output:

```
{  
  "eulaAcceptances": [

- For API details, see [ListStudios](#) in *AWS CLI Command Reference*.

OpenSearch Service examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with OpenSearch Service.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-elasticsearch-domain

The following code example shows how to use `create-elasticsearch-domain`.

AWS CLI

To create an Amazon Elasticsearch Service domain

The following `create-elasticsearch-domain` command creates a new Amazon Elasticsearch Service domain within a VPC and restricts access to a single user. Amazon ES infers the VPC ID from the specified subnet and security group IDs.

```
aws es create-elasticsearch-domain \
  --domain-name vpc-cli-example \
  --elasticsearch-version 6.2 \
  --elasticsearch-cluster-config
InstanceType=m4.large.elasticsearch,InstanceCount=1 \
  --ebs-options EBSEnabled=true,VolumeType=standard,VolumeSize=10 \
  --access-policies '{"Version": "2012-10-17", "Statement": [ { "Effect":
"Allow", "Principal": {"AWS": "arn:aws:iam::123456789012:root" }, "Action": "es:*",
"Resource": "arn:aws:es:us-west-1:123456789012:domain/vpc-cli-example/*" } ] }' \
```

```
--vpc-options SubnetIds=subnet-1a2a3a4a,SecurityGroupIds=sg-2a3a4a5a
```

Output:

```
{
  "DomainStatus": {
    "ElasticsearchClusterConfig": {
      "DedicatedMasterEnabled": false,
      "InstanceCount": 1,
      "ZoneAwarenessEnabled": false,
      "InstanceType": "m4.large.elasticsearch"
    },
    "DomainId": "123456789012/vpc-cli-example",
    "CognitoOptions": {
      "Enabled": false
    },
    "VPCOptions": {
      "SubnetIds": [
        "subnet-1a2a3a4a"
      ],
      "VPCId": "vpc-3a4a5a6a",
      "SecurityGroupIds": [
        "sg-2a3a4a5a"
      ],
      "AvailabilityZones": [
        "us-west-1c"
      ]
    },
    "Created": true,
    "Deleted": false,
    "EBSOptions": {
      "VolumeSize": 10,
      "VolumeType": "standard",
      "EBSEnabled": true
    },

}
}

```

For more information, see [Creating and Managing Amazon Elasticsearch Service Domains](#) in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see [CreateElasticsearchDomain](#) in *AWS CLI Command Reference*.

describe-elasticsearch-domain-config

The following code example shows how to use `describe-elasticsearch-domain-config`.

AWS CLI

To get domain configuration details

The following `describe-elasticsearch-domain-config` example provides configuration details for a given domain, along with status information for each individual domain component.

```

aws es describe-elasticsearch-domain-config \
  --domain-name cli-example

```

Output:

```

{
  "DomainConfig": {
    "ElasticsearchVersion": {
      "Options": "7.4",
      "Status": {
        "CreationDate": 1589395034.946,
        "UpdateDate": 1589395827.325,
        "UpdateVersion": 8,
        "State": "Active",

```

```

        "PendingDeletion": false
    }
},
"ElasticsearchClusterConfig": {
    "Options": {
        "InstanceType": "c5.large.elasticsearch",
        "InstanceCount": 1,
        "DedicatedMasterEnabled": true,
        "ZoneAwarenessEnabled": false,
        "DedicatedMasterType": "c5.large.elasticsearch",
        "DedicatedMasterCount": 3,

describe-reserved-elasticsearch-instances

The following code example shows how to use `describe-reserved-elasticsearch-instances`.

AWS CLI

To view all reserved instances

The following `describe-elasticsearch-domains` example provides a summary of all instances you have reserved in a region.

```
aws es describe-reserved-elasticsearch-instances
```

Output:

```
{  
  "ReservedElasticsearchInstances": [{  
    "FixedPrice": 100.0,  
    "ReservedElasticsearchInstanceOfferingId":  
    "1a2a3a4a5-1a2a-3a4a-5a6a-1a2a3a4a5a6a",  
    "ReservationName": "my-reservation",  
    "PaymentOption": "PARTIAL_UPFRONT",  
    "UsagePrice": 0.0,  
    "ReservedElasticsearchInstanceId": "9a8a7a6a-5a4a-3a2a-1a0a-9a8a7a6a5a4a",  
    "RecurringCharges": [{  
      "RecurringChargeAmount": 0.603,  
      "RecurringChargeFrequency": "Hourly"  
    }],  
    "State": "payment-pending",  
    "StartTime": 1522872571.229,  
  }],  
}
```

```
    "ElasticsearchInstanceCount": 3,  
    "Duration": 31536000,  
    "ElasticsearchInstanceType": "m4.2xlarge.elasticsearch",  
    "CurrencyCode": "USD"  
  }  
}
```

For more information, see [Reserved Instances](#) in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see [DescribeReservedElasticsearchInstances](#) in *AWS CLI Command Reference*.

list-domain-names

The following code example shows how to use `list-domain-names`.

AWS CLI

To list all domains

The following `list-domain-names` example provides a quick summary of all domains in the region.

```
aws es list-domain-names
```

Output:

```
{  
  "DomainNames": [{  
    "DomainName": "cli-example-1"  
  },  
  {  
    "DomainName": "cli-example-2"  
  }  
]  
}
```

For more information, see [Creating and Managing Amazon Elasticsearch Service Domains](#) in the *Amazon Elasticsearch Service Developer Guide*.

- For API details, see [ListDomainNames](#) in *AWS CLI Command Reference*.

AWS OpsWorks examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS OpsWorks.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

assign-instance

The following code example shows how to use `assign-instance`.

AWS CLI

To assign a registered instance to a layer

The following example assigns a registered instance to a custom layer.

```
aws opsworks --region us-east-1 assign-instance --instance-id 4d6d1710-ded9-42a1-b08e-b043ad7af1e2 --layer-ids 26cf1d32-6876-42fa-bbf1-9cad0b0b938
```

Output: None.

More Information

For more information, see *Assigning a Registered Instance to a Layer* in the *AWS OpsWorks User Guide*.

- For API details, see [AssignInstance](#) in *AWS CLI Command Reference*.

assign-volume

The following code example shows how to use `assign-volume`.

AWS CLI

To assign a registered volume to an instance

The following example assigns a registered Amazon Elastic Block Store (Amazon EBS) volume to an instance. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns when you register the volume with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID. Before you run `assign-volume`, you must first run `update-volume` to assign a mount point to the volume.

```
aws opsworks --region us-east-1 assign-volume --instance-id 4d6d1710-ded9-42a1-b08e-b043ad7af1e2 --volume-id 26cf1d32-6876-42fa-bbf1-9cad0bff938
```

Output: None.

More Information

For more information, see *Assigning Amazon EBS Volumes to an Instance* in the *AWS OpsWorks User Guide*.

- For API details, see [AssignVolume](#) in *AWS CLI Command Reference*.

associate-elastic-ip

The following code example shows how to use `associate-elastic-ip`.

AWS CLI

To associate an Elastic IP address with an instance

The following example associates an Elastic IP address with a specified instance.

```
aws opsworks --region us-east-1 associate-elastic-ip --instance-id dfe18b02-5327-493d-91a4-c5c0c448927f --elastic-ip 54.148.130.96
```

Output: None.

More Information

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see [AssociateElasticIp](#) in *AWS CLI Command Reference*.

attach-elastic-load-balancer

The following code example shows how to use `attach-elastic-load-balancer`.

AWS CLI

To attach a load balancer to a layer

The following example attaches a load balancer, identified by its name, to a specified layer.

```
aws opsworks --region us-east-1 attach-elastic-load-balancer --elastic-load-balancer-name Java-LB --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4
```

Output: None.

More Information

For more information, see Elastic Load Balancing in the *AWS OpsWorks User Guide*.

- For API details, see [AttachElasticLoadBalancer](#) in *AWS CLI Command Reference*.

create-app

The following code example shows how to use `create-app`.

AWS CLI

Example 1: To create an app

The following example creates a PHP app named SimplePHPApp from code stored in a GitHub repository. The command uses the shorthand form of the application source definition.

```
aws opsworks create-app \  
  --region us-east-1 \  
  --source-definition SimplePHPApp
```

```
--stack-id f6673d70-32e6-4425-8999-265dd002fec7 \  
--name SimplePHPApp \  
--type php \  
--app-source Type=git,Url=git://github.com/amazonwebservices/opsworks-demo-php-  
simple-app.git,Revision=version1
```

Output:

```
{  
  "AppId": "6cf5163c-a951-444f-a8f7-3716be75f2a2"  
}
```

Example 2: To create an app with an attached database

The following example creates a JSP app from code stored in .zip archive in a public S3 bucket. It attaches an RDS DB instance to serve as the app's data store. The application and database sources are defined in separate JSON files that are in the directory from which you run the command.

```
aws opsworks create-app \  
  --region us-east-1 \  
  --stack-id 8c428b08-a1a1-46ce-a5f8-feddc43771b8 \  
  --name SimpleJSP \  
  --type java \  
  --app-source file://appsource.json \  
  --data-sources file://datasource.json
```

The application source information is in `appsource.json` and contains the following.

```
{  
  "Type": "archive",  
  "Url": "https://s3.amazonaws.com/opsworks-demo-assets/simplejsp.zip"  
}
```

The database source information is in `datasource.json` and contains the following.

```
[  
  {  
    "Type": "RdsDbInstance",  
    "Arn": "arn:aws:rds:us-west-2:123456789012:db:clitestdb",
```

```

    "DatabaseName": "mydb"
  }
]

```

Note: For an RDS DB instance, you must first use `register-rds-db-instance` to register the instance with the stack. For MySQL App Server instances, set `Type` to `OpsworksMySQLInstance`. These instances are created by AWS OpsWorks, so they do not have to be registered.

Output:

```

{
  "AppId": "26a61ead-d201-47e3-b55c-2a7c666942f8"
}

```

For more information, see *Adding Apps* in the *AWS OpsWorks User Guide*.

- For API details, see [CreateApp](#) in *AWS CLI Command Reference*.

create-deployment

The following code example shows how to use `create-deployment`.

AWS CLI

Example 1: To deploy apps and run stack commands

The following examples show how to use the `create-deployment` command to deploy apps and run stack commands. Notice that the quote (") characters in the JSON object that specifies the command are all preceded by escape characters (\). Without the escape characters, the command might return an invalid JSON error.

The following `create-deployment` example deploys an app to a specified stack.

```

aws opsworks create-deployment \
  --stack-id cfb7e082-ad1d-4599-8e81-de1c39ab45bf \
  --app-id 307be5c8-d55d-47b5-bd6e-7bd417c6c7eb
  --command "{\"Name\": \"deploy\"}"

```

Output:

```
{
  "DeploymentId": "5746c781-df7f-4c87-84a7-65a119880560"
}
```

Example 2: To deploy a Rails App and Migrate the Database

The following `create-deployment` command deploys a Ruby on Rails app to a specified stack and migrates the database.

```
aws opsworks create-deployment \
  --stack-id cfb7e082-ad1d-4599-8e81-de1c39ab45bf \
  --app-id 307be5c8-d55d-47b5-bd6e-7bd417c6c7eb \
  --command "{\"Name\":\"deploy\", \"Args\":{\"migrate\":[\"true\"]}]\""
```

Output:

```
{
  "DeploymentId": "5746c781-df7f-4c87-84a7-65a119880560"
}
```

For more information on deployment, see [Deploying Apps](#) in the *AWS OpsWorks User Guide*.

Example 3: Run a Recipe

The following `create-deployment` command runs a custom recipe, `phpapp::appsetup`, on the instances in a specified stack.

```
aws opsworks create-deployment \
  --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb \
  --command "{\"Name\":\"execute_recipes\", \"Args\":{\"recipes\":[\"phpapp::appsetup\"]}]\""
```

Output:

```
{
  "DeploymentId": "5cbaa7b9-4e09-4e53-aa1b-314fbd106038"
}
```

For more information, see [Run Stack Commands](#) in the *AWS OpsWorks User Guide*.

Example 4: Install Dependencies

The following `create-deployment` command installs dependencies, such as packages or Ruby gems, on the instances in a specified stack.

```
aws opsworks create-deployment \  
  --stack-id 935450cc-61e0-4b03-a3e0-160ac817d2bb \  
  --command "{\"Name\":\"install_dependencies\"}"
```

Output:

```
{  
  "DeploymentId": "aef5b255-8604-4928-81b3-9b0187f962ff"  
}
```

For more information, see [Run Stack Commands](#) in the *AWS OpsWorks User Guide*.

- For API details, see [CreateDeployment](#) in *AWS CLI Command Reference*.

create-instance

The following code example shows how to use `create-instance`.

AWS CLI

To create an instance

The following `create-instance` command creates an `m1.large` Amazon Linux instance named `myinstance1` in a specified stack. The instance is assigned to one layer.

```
aws opsworks --region us-east-1 create-instance --stack-id 935450cc-61e0-4b03-  
a3e0-160ac817d2bb --layer-ids 5c8c272a-f2d5-42e3-8245-5bf3927cb65b --hostname  
myinstance1 --instance-type m1.large --os "Amazon Linux"
```

To use an autogenerated name, call `get-hostname-suggestion`, which generates a hostname based on the theme that you specified when you created the stack. Then pass that name to the `hostname` argument.

Output:

```
{
  "InstanceId": "5f9adeaa-c94c-42c6-aeeef-28a5376002cd"
}
```

More Information

For more information, see *Adding an Instance to a Layer* in the *AWS OpsWorks User Guide*.

- For API details, see [CreateInstance](#) in *AWS CLI Command Reference*.

create-layer

The following code example shows how to use `create-layer`.

AWS CLI

To create a layer

The following `create-layer` command creates a PHP App Server layer named `MyPHPLayer` in a specified stack.

```
aws opsworks create-layer --region us-east-1 --stack-id
f6673d70-32e6-4425-8999-265dd002fec7 --type php-app --name MyPHPLayer --shortname
myphplayer
```

Output:

```
{
  "LayerId": "0b212672-6b4b-40e4-8a34-5a943cf2e07a"
}
```

More Information

For more information, see *How to Create a Layer* in the *AWS OpsWorks User Guide*.

- For API details, see [CreateLayer](#) in *AWS CLI Command Reference*.

create-server

The following code example shows how to use `create-server`.

AWS CLI

To create a server

The following `create-server` example creates a new Chef Automate server named `automate-06` in your default region. Note that defaults are used for most other settings, such as number of backups to retain, and maintenance and backup start times. Before you run a `create-server` command, complete prerequisites in [Getting Started with AWS OpsWorks for Chef Automate](#) in the *AWS Opsworks for Chef Automate User Guide*.

```
aws opsworks-cm create-server \  
  --engine "ChefAutomate" \  
  --instance-profile-arn "arn:aws:iam::012345678901:instance-profile/aws-opsworks-  
cm-ec2-role" \  
  --instance-type "t2.medium" \  
  --server-name "automate-06" \  
  --service-role-arn "arn:aws:iam::012345678901:role/aws-opsworks-cm-service-role"
```

Output:

```
{  
  "Server": {  
    "AssociatePublicIpAddress": true,  
    "BackupRetentionCount": 10,  
    "CreatedAt": 2019-12-29T13:38:47.520Z,  
    "DisableAutomatedBackup": FALSE,  
    "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",  
    "Engine": "ChefAutomate",  
    "EngineAttributes": [  
      {  
        "Name": "CHEF_AUTOMATE_ADMIN_PASSWORD",  
        "Value": "1Example1"  
      }  
    ],  
    "EngineModel": "Single",  
    "EngineVersion": "2019-08",  
    "InstanceProfileArn": "arn:aws:iam::012345678901:instance-profile/aws-  
opsworks-cm-ec2-role",  
    "InstanceType": "t2.medium",  
    "PreferredBackupWindow": "Sun:02:00",  
    "PreferredMaintenanceWindow": "00:00",  
    "SecurityGroupIds": [ "sg-12345678" ],
```

```
"ServerArn": "arn:aws:iam::012345678901:instance/automate-06-1010V4UU2WRM2",
"ServerName": "automate-06",
"ServiceRoleArn": "arn:aws:iam::012345678901:role/aws-opsworks-cm-service-
role",
"Status": "CREATING",
"SubnetIds": [ "subnet-12345678" ]
}
}
```

For more information, see [CreateServer](#) in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [CreateServer](#) in *AWS CLI Command Reference*.

create-stack

The following code example shows how to use `create-stack`.

AWS CLI

To create a stack

The following `create-stack` command creates a stack named CLI Stack.

```
aws opsworks create-stack --name "CLI Stack" --stack-region "us-east-1" --service-
role-arn arn:aws:iam::123456789012:role/aws-opsworks-service-role --default-
instance-profile-arn arn:aws:iam::123456789012:instance-profile/aws-opsworks-ec2-
role --region us-east-1
```

The `service-role-arn` and `default-instance-profile-arn` parameters are required. You typically use the ones that AWS OpsWorks creates for you when you create your first stack. To get the Amazon Resource Names (ARNs) for your account, go to the IAM console, choose Roles in the navigation panel, choose the role or profile, and choose the Summary tab.

Output:

```
{
  "StackId": "f6673d70-32e6-4425-8999-265dd002fec7"
}
```

More Information

For more information, see *Create a New Stack* in the *AWS OpsWorks User Guide*.

- For API details, see [CreateStack](#) in *AWS CLI Command Reference*.

create-user-profile

The following code example shows how to use `create-user-profile`.

AWS CLI

To create a user profile

You import an AWS Identity and Access Manager (IAM) user into AWS OpsWorks by calling `create-user-profile` to create a user profile. The following example creates a user profile for the `cli-user-test` IAM user, who is identified by Amazon Resource Name (ARN). The example assigns the user an SSH username of `myusername` and enables self management, which allows the user to specify an SSH public key.

```
aws opsworks --region us-east-1 create-user-profile --iam-user-arn
arn:aws:iam::123456789102:user/cli-user-test --ssh-username myusername --allow-
self-management
```

Output:

```
{
  "IamUserArn": "arn:aws:iam::123456789102:user/cli-user-test"
}
```

Tip: This command imports an IAM user into AWS OpsWorks, but only with the permissions that are granted by the attached policies. You can grant per-stack AWS OpsWorks permissions by using the `set-permissions` command.

More Information

For more information, see *Importing Users into AWS OpsWorks* in the *AWS OpsWorks User Guide*.

- For API details, see [CreateUserProfile](#) in *AWS CLI Command Reference*.

delete-app

The following code example shows how to use `delete-app`.

AWS CLI

To delete an app

The following example deletes a specified app, which is identified by its app ID. You can obtain an app ID by going to the app's details page on the AWS OpsWorks console or by running the `describe-apps` command.

```
aws opsworks delete-app --region us-east-1 --app-id 577943b9-2ec1-4baf-
a7bf-1d347601edc5
```

Output: None.

More Information

For more information, see *Apps* in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteApp](#) in *AWS CLI Command Reference*.

delete-instance

The following code example shows how to use `delete-instance`.

AWS CLI

To delete an instance

The following `delete-instance` example deletes a specified instance, which is identified by its instance ID. You can find an instance ID by opening the instance's details page in the AWS OpsWorks console, or by running the `describe-instances` command.

If the instance is online, you must first stop the instance by calling `stop-instance`, and then you must wait until the instance has stopped. Run `describe-instances` to check the instance status.

To remove the instance's Amazon EBS volumes or Elastic IP addresses, add the `--delete-volumes` or `--delete-elastic-ip` arguments, respectively.

```
aws opsworks delete-instance \  
  --region us-east-1 \  
  --instance-id i-12345678
```

```
--instance-id 3a21cfac-4a1f-4ce2-a921-b2cfba6f7771
```

This command produces no output.

For more information, see [Deleting AWS OpsWorks Instances](#) in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteInstance](#) in *AWS CLI Command Reference*.

delete-layer

The following code example shows how to use `delete-layer`.

AWS CLI

To delete a layer

The following example deletes a specified layer, which is identified by its layer ID. You can obtain a layer ID by going to the layer's details page on the AWS OpsWorks console or by running the `describe-layers` command.

Note: Before deleting a layer, you must use `delete-instance` to delete all of the layer's instances.

```
aws opsworks delete-layer --region us-east-1 --layer-id a919454e-b816-4598-  
b29a-5796afb498ed
```

Output: None.

More Information

For more information, see [Deleting AWS OpsWorks Instances](#) in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteLayer](#) in *AWS CLI Command Reference*.

delete-stack

The following code example shows how to use `delete-stack`.

AWS CLI

To delete a stack

The following example deletes a specified stack, which is identified by its stack ID. You can obtain a stack ID by clicking **Stack Settings** on the AWS OpsWorks console or by running the `describe-stacks` command.

Note: Before deleting a layer, you must use `delete-app`, `delete-instance`, and `delete-layer` to delete all of the stack's apps, instances, and layers.

```
aws opsworks delete-stack --region us-east-1 --stack-id
154a9d89-7e9e-433b-8de8-617e53756c84
```

Output: None.

More Information

For more information, see Shut Down a Stack in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteStack](#) in *AWS CLI Command Reference*.

delete-user-profile

The following code example shows how to use `delete-user-profile`.

AWS CLI

To delete a user profile and remove an IAM user from AWS OpsWorks

The following example deletes the user profile for a specified AWS Identity and Access Management (IAM) user, who is identified by Amazon Resource Name (ARN). The operation removes the user from AWS OpsWorks, but does not delete the IAM user. You must use the IAM console, CLI, or API for that task.

```
aws opsworks --region us-east-1 delete-user-profile --iam-user-arn
arn:aws:iam::123456789102:user/cli-user-test
```

Output: None.

More Information

For more information, see Importing Users into AWS OpsWorks in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteUserProfile](#) in *AWS CLI Command Reference*.

deregister-elastic-ip

The following code example shows how to use `deregister-elastic-ip`.

AWS CLI

To deregister an Elastic IP address from a stack

The following example deregisters an Elastic IP address, identified by its IP address, from its stack.

```
aws opsworks deregister-elastic-ip --region us-east-1 --elastic-ip 54.148.130.96
```

Output: None.

More Information

For more information, see Deregistering Elastic IP Addresses in the *AWS OpsWorks User Guide*.

- For API details, see [DeregisterElasticIp](#) in *AWS CLI Command Reference*.

deregister-instance

The following code example shows how to use `deregister-instance`.

AWS CLI

To deregister a registered instance from a stack

The following `deregister-instance` command deregisters a registered instance from its stack.

```
aws opsworks --region us-east-1 deregister-instance --instance-id 4d6d1710-ded9-42a1-b08e-b043ad7af1e2
```

Output: None.

More Information

For more information, see Deregistering a Registered Instance in the *AWS OpsWorks User Guide*.

- For API details, see [DeregisterInstance](#) in *AWS CLI Command Reference*.

deregister-rds-db-instance

The following code example shows how to use `deregister-rds-db-instance`.

AWS CLI

To deregister an Amazon RDS DB instance from a stack

The following example deregisters an RDS DB instance, identified by its ARN, from its stack.

```
aws opsworks deregister-rds-db-instance --region us-east-1 --rds-db-instance-arn
arn:aws:rds:us-west-2:123456789012:db:clitestdb
```

Output: None.

More Information

For more information, see *Deregistering Amazon RDS Instances* in the *ASW OpsWorks User Guide*.

instance ID: clitestdb Master usernames: cliuser Master PWD: some23!pwd DB Name: mydb
aws opsworks deregister-rds-db-instance --region us-east-1 --rds-db-instance-arn arn:aws:rds:us-west-2:645732743964:db:clitestdb

- For API details, see [DeregisterRdsDbInstance](#) in *AWS CLI Command Reference*.

deregister-volume

The following code example shows how to use `deregister-volume`.

AWS CLI

To deregister an Amazon EBS volume

The following example deregisters an EBS volume from its stack. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigned when you registered the volume with the stack, not the EC2 volume ID.

```
aws opsworks deregister-volume --region us-east-1 --volume-id 5c48ef52-3144-4bf5-
beaa-fda4deb23d4d
```

Output: None.

More Information

For more information, see *Deregistering Amazon EBS Volumes* in the *AWS OpsWorks User Guide*.

- For API details, see [DeregisterVolume](#) in *AWS CLI Command Reference*.

describe-apps

The following code example shows how to use `describe-apps`.

AWS CLI

To describe apps

The following `describe-apps` command describes the apps in a specified stack.

```
aws opsworks describe-apps \  
  --stack-id 38ee91e2-abdc-4208-a107-0b7168b3cc7a \  
  --region us-east-1
```

Output:

```
{  
  "Apps": [  
    {  
      "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",  
      "AppSource": {  
        "Url": "https://s3-us-west-2.amazonaws.com/opsworks-demo-assets/  
simplejsp.zip",  
        "Type": "archive"  
      },  
      "Name": "SimpleJSP",  
      "EnableSsl": false,  
      "SslConfiguration": {},  
      "AppId": "da1decc1-0dff-43ea-ad7c-bb667cd87c8b",  
      "Attributes": {  
        "RailsEnv": null,  
        "AutoBundleOnDeploy": "true",  
        "DocumentRoot": "ROOT"  
      },  
      "Shortname": "simplejsp",
```

```

        "Type": "other",
        "CreatedAt": "2013-08-01T21:46:54+00:00"
    }
]
}

```

For more information, see *Apps* in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeApps](#) in *AWS CLI Command Reference*.

describe-commands

The following code example shows how to use `describe-commands`.

AWS CLI

To describe commands

The following `describe-commands` command describes the commands in a specified instance.

```

aws opsworks describe-commands \
  --instance-id 8c2673b9-3fe5-420d-9cfa-78d875ee7687 \
  --region us-east-1

```

Output:

```

{
  "Commands": [
    {
      "Status": "successful",
      "CompletedAt": "2013-07-25T18:57:47+00:00",

      "ExitCode": 0
    }
  ]
}

```

For more information, see AWS OpsWorks Lifecycle Events in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeCommands](#) in *AWS CLI Command Reference*.

describe-deployments

The following code example shows how to use describe-deployments.

AWS CLI

To describe deployments

The following describe-deployments command describes the deployments in a specified stack.

```
aws opsworks --region us-east-1 describe-deployments --stack-id 38ee91e2-abdc-4208-
a107-0b7168b3cc7a
```

Output:

```

{
  "Deployments": [
    {
      "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",

```

```

    "Status": "successful",
    "CompletedAt": "2013-07-25T18:57:49+00:00",

    "Duration": 72,
    "CreatedAt": "2013-07-25T18:55:29+00:00"
  }
]
}

```

More Information

For more information, see *Deploying Apps* in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeDeployments](#) in *AWS CLI Command Reference*.

describe-elastic-ips

The following code example shows how to use `describe-elastic-ips`.

AWS CLI

To describe Elastic IP instances

The following `describe-elastic-ips` command describes the Elastic IP addresses in a specified instance.

```
aws opsworks --region us-east-1 describe-elastic-ips --instance-id b62f3e04-
e9eb-436c-a91f-d9e9a396b7b0
```

Output:

```
{
  "ElasticIps": [
    {
      "Ip": "192.0.2.0",
      "Domain": "standard",
      "Region": "us-west-2"
    }
  ]
}
```

More Information

For more information, see Instances in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeElasticIps](#) in *AWS CLI Command Reference*.

describe-elastic-load-balancers

The following code example shows how to use `describe-elastic-load-balancers`.

AWS CLI

To describe a stack's elastic load balancers

The following `describe-elastic-load-balancers` command describes a specified stack's load balancers.

```
aws opsworks --region us-west-2 describe-elastic-load-balancers --stack-id
6f4660e5-37a6-4e42-bfa0-1358ebd9c182
```

Output: This particular stack has one load balancer.

```
{
  "ElasticLoadBalancers": [
    {
      "SubnetIds": [
        "subnet-60e4ea04",
        "subnet-66e1c110"
      ],
      "Ec2InstanceIds": [],
      "ElasticLoadBalancerName": "my-balancer",
      "Region": "us-west-2",
      "LayerId": "344973cb-bf2b-4cd0-8d93-51cd819bab04",
      "AvailabilityZones": [
        "us-west-2a",
        "us-west-2b"
      ],
      "VpcId": "vpc-b319f9d4",
      "StackId": "6f4660e5-37a6-4e42-bfa0-1358ebd9c182",
      "DnsName": "my-balancer-2094040179.us-west-2.elb.amazonaws.com"
    }
  ]
}
```

More Information

For more information, see Apps in the *AWS OpsWorks User Guide*.

describe-instances

The following code example shows how to use `describe-instances`.

AWS CLI

To describe instances

The following `describe-instances` command describes the instances in a specified stack:

```
aws opsworks --region us-east-1 describe-instances --stack-id 8c428b08-a1a1-46ce-
a5f8-feddc43771b8
```

Output: The following output example is for a stack with two instances. The first is a registered EC2 instance, and the second was created by AWS OpsWorks.

```
{
  "Instances": [
    {
      "StackId": "71c7ca72-55ae-4b6a-8ee1-a8dcdded3fa0f",
      "PrivateDns": "ip-10-31-39-66.us-west-2.compute.internal",
      "LayerIds": [
        "26cf1d32-6876-42fa-bbf1-9cadc0bff938"
      ],

More Information

For more information, see Instances in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeInstances](#) in *AWS CLI Command Reference*.

describe-layers

The following code example shows how to use describe-layers.

AWS CLI

To describe a stack's layers

The following describe-layers command describes the layers in a specified stack:

```
aws opsworks --region us-east-1 describe-layers --stack-id 38ee91e2-abdc-4208-
a107-0b7168b3cc7a
```

Output:

```
{
  "Layers": [
    {
      "StackId": "38ee91e2-abdc-4208-a107-0b7168b3cc7a",

More Information

For more information, see Layers in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeLayers](#) in *AWS CLI Command Reference*.

describe-load-based-auto-scaling

The following code example shows how to use `describe-load-based-auto-scaling`.

AWS CLI

To describe a layer's load-based scaling configuration

The following example describes a specified layer's load-based scaling configuration. The layer is identified by its layer ID, which you can find on the layer's details page or by running `describe-layers`.

```
aws opsworks describe-load-based-auto-scaling --region us-east-1 --layer-ids
6bec29c9-c866-41a0-aba5-fa3e374ce2a1
```

Output: The example layer has a single load-based instance.

```
{
  "LoadBasedAutoScalingConfigurations": [
    {
      "DownScaling": {
        "IgnoreMetricsTime": 10,
        "ThresholdsWaitTime": 10,
        "InstanceCount": 1,
        "CpuThreshold": 30.0
      },
      "Enable": true,
      "UpScaling": {
        "IgnoreMetricsTime": 5,
        "ThresholdsWaitTime": 5,
        "InstanceCount": 1,
        "CpuThreshold": 80.0
      },
      "LayerId": "6bec29c9-c866-41a0-aba5-fa3e374ce2a1"
    }
  ]
}
```

More Information

For more information, see *How Automatic Load-based Scaling Works* in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeLoadBasedAutoScaling](#) in *AWS CLI Command Reference*.

describe-my-user-profile

The following code example shows how to use `describe-my-user-profile`.

AWS CLI

To obtain a user's profile

The following example shows how to obtain the profile of the AWS Identity and Access Management (IAM) user that is running the command.

```
aws opsworks --region us-east-1 describe-my-user-profile
```

Output: For brevity, most of the user's SSH public key is replaced by an ellipsis (...).

```
{
  "UserProfile": {
    "IamUserArn": "arn:aws:iam::123456789012:user/myusername",
    "SshPublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAABJQ...3LQ4aX9jpxQw== rsa-
key-20141104",
    "Name": "myusername",
    "SshUsername": "myusername"
  }
}
```

More Information

For more information, see *Importing Users into AWS OpsWorks* in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeMyUserProfile](#) in *AWS CLI Command Reference*.

describe-permissions

The following code example shows how to use `describe-permissions`.

AWS CLI

To obtain a user's per-stack AWS OpsWorks permission level

The following example shows how to obtain an AWS Identity and Access Management (IAM) user's permission level on a specified stack.

```
aws opsworks --region us-east-1 describe-permissions --iam-user-arn
arn:aws:iam::123456789012:user/cli-user-test --stack-id d72553d4-8727-448c-9b00-
f024f0ba1b06
```

Output:

```
{
  "Permissions": [
    {
      "StackId": "d72553d4-8727-448c-9b00-f024f0ba1b06",
      "IamUserArn": "arn:aws:iam::123456789012:user/cli-user-test",
      "Level": "manage",
      "AllowSudo": true,
      "AllowSsh": true
    }
  ]
}
```

More Information

For more information, see *Granting Per-Stack Permissions Levels* in the *AWS OpsWorks User Guide*.

- For API details, see [DescribePermissions](#) in *AWS CLI Command Reference*.

describe-raid-arrays

The following code example shows how to use `describe-raid-arrays`.

AWS CLI

To describe RAID arrays

The following example describes the RAID arrays attached to the instances in a specified stack.

```
aws opsworks --region us-east-1 describe-raid-arrays --stack-id
d72553d4-8727-448c-9b00-f024f0ba1b06
```

Output: The following is the output for a stack with one RAID array.

```
{
  "RaidArrays": [
    {
      "StackId": "d72553d4-8727-448c-9b00-f024f0ba1b06",
      "AvailabilityZone": "us-west-2a",
      "Name": "Created for php-app1",
      "NumberOfDisks": 2,
      "InstanceId": "9f14adbc-ced5-43b6-bf01-e7d0db6cf2f7",
      "RaidLevel": 0,
      "VolumeType": "standard",
      "RaidArrayId": "f2d4e470-5972-4676-b1b8-bae41ec3e51c",
      "Device": "/dev/md0",
      "MountPoint": "/mnt/workspace",
      "CreatedAt": "2015-02-26T23:53:09+00:00",
      "Size": 100
    }
  ]
}
```

For more information, see EBS Volumes in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeRaidArrays](#) in *AWS CLI Command Reference*.

describe-rds-db-instances

The following code example shows how to use `describe-rds-db-instances`.

AWS CLI

To describe a stack's registered Amazon RDS instances

The following example describes the Amazon RDS instances registered with a specified stack.

```
aws opsworks --region us-east-1 describe-rds-db-instances --stack-id
d72553d4-8727-448c-9b00-f024f0ba1b06
```

Output: The following is the output for a stack with one registered RDS instance.

```
{
  "RdsDbInstances": [
    {
      "Engine": "mysql",
      "StackId": "d72553d4-8727-448c-9b00-f024f0ba1b06",
      "MissingOnRds": false,
      "Region": "us-west-2",
      "RdsDbInstanceArn": "arn:aws:rds:us-west-2:123456789012:db:clitestdb",
      "DbPassword": "*****FILTERED*****",
      "Address": "clitestdb.cd1qlk5uwd0k.us-west-2.rds.amazonaws.com",
      "DbUser": "cliuser",
      "DbInstanceIdentifier": "clitestdb"
    }
  ]
}
```

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeRdsDbInstances](#) in *AWS CLI Command Reference*.

describe-stack-provisioning-parameters

The following code example shows how to use `describe-stack-provisioning-parameters`.

AWS CLI

To return the provisioning parameters for a stack

The following `describe-stack-provisioning-parameters` example returns the provisioning parameters for a specified stack. Provisioning parameters include settings such as the agent installation location and public key that OpsWorks uses to manage the agent on instances in a stack.

```
aws opsworks describe-stack-provisioning-parameters \
  --stack-id 62744d97-6faf-4ecb-969b-a086fEXAMPLE
```

Output:

```
{
  "AgentInstallerUrl": "https://opsworks-instance-agent-us-
west-2.s3.amazonaws.com/ID_number/opsworks-agent-installer.tgz",
```

```
"Parameters": {
  "agent_installer_base_url": "https://opsworks-instance-agent-us-
west-2.s3.amazonaws.com",
  "agent_installer_tgz": "opsworks-agent-installer.tgz",
  "assets_download_bucket": "opsworks-instance-assets-us-
west-2.s3.amazonaws.com",
  "charlie_public_key": "-----BEGIN PUBLIC KEY-----PUBLIC_KEY_EXAMPLE\n-----
END PUBLIC KEY-----",
  "instance_service_endpoint": "opsworks-instance-service.us-
west-2.amazonaws.com",
  "instance_service_port": "443",
  "instance_service_region": "us-west-2",
  "instance_service_ssl_verify_peer": "true",
  "instance_service_use_ssl": "true",
  "ops_works_endpoint": "opsworks.us-west-2.amazonaws.com",
  "ops_works_port": "443",
  "ops_works_region": "us-west-2",
  "ops_works_ssl_verify_peer": "true",
  "ops_works_use_ssl": "true",
  "verbose": "false",
  "wait_between_runs": "30"
}
```

For more information, see [Run Stack Commands](#) in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeStackProvisioningParameters](#) in *AWS CLI Command Reference*.

describe-stack-summary

The following code example shows how to use `describe-stack-summary`.

AWS CLI

To describe a stack's configuration

The following `describe-stack-summary` command returns a summary of the specified stack's configuration.

```
aws opsworks --region us-east-1 describe-stack-summary --stack-id 8c428b08-
a1a1-46ce-a5f8-feddc43771b8
```

Output:

```
{
  "StackSummary": {
    "StackId": "8c428b08-a1a1-46ce-a5f8-feddc43771b8",
    "InstancesCount": {
      "Booting": 1
    },
    "Name": "CLITest",
    "AppsCount": 1,
    "LayersCount": 1,
    "Arn": "arn:aws:opsworks:us-west-2:123456789012:stack/8c428b08-a1a1-46ce-a5f8-feddc43771b8/"
  }
}
```

More Information

For more information, see *Stacks* in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeStackSummary](#) in *AWS CLI Command Reference*.

describe-stacks

The following code example shows how to use `describe-stacks`.

AWS CLI

To describe stacks

The following `describe-stacks` command describes an account's stacks.

```
aws opsworks --region us-east-1 describe-stacks
```

Output:

```
{
  "Stacks": [
    {
      "ServiceRoleArn": "arn:aws:iam::444455556666:role/aws-opsworks-service-role",

```

More Information

For more information, see *Stacks* in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeStacks](#) in *AWS CLI Command Reference*.

describe-timebased-auto-scaling

The following code example shows how to use `describe-timebased-auto-scaling`.

AWS CLI

To describe the time-based scaling configuration of an instance

The following example describes a specified instance's time-based scaling configuration. The instance is identified by its instance ID, which you can find on the instance's details page or by running `describe-instances`.

```
aws opsworks describe-time-based-auto-scaling --region us-east-1 --instance-ids
701f2ffe-5d8e-4187-b140-77b75f55de8d
```

Output: The example has a single time-based instance.

```
{
  "TimeBasedAutoScalingConfigurations": [
    {
      "InstanceId": "701f2ffe-5d8e-4187-b140-77b75f55de8d",
      "AutoScalingSchedule": {
        "Monday": {
          "11": "on",
          "10": "on",
          "13": "on",
          "12": "on"
        },
        "Tuesday": {
          "11": "on",
          "10": "on",
          "13": "on",
          "12": "on"
        }
      }
    }
  ]
}
```

```
    }
  }
}
]
```

More Information

For more information, see *How Automatic Time-based Scaling Works* in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeTimebasedAutoScaling](#) in *AWS CLI Command Reference*.

describe-user-profiles

The following code example shows how to use `describe-user-profiles`.

AWS CLI

To describe user profiles

The following `describe-user-profiles` command describes the account's user profiles.

```
aws opsworks --region us-east-1 describe-user-profiles
```

Output:

```
{
  "UserProfiles": [
    {
      "IamUserArn": "arn:aws:iam::123456789012:user/someuser",
      "SshPublicKey": "ssh-rsa AAAAB3NzaC1yc2EAAAABJQAAAQEak0uP7i80q3Cko...",
      "AllowSelfManagement": true,
      "Name": "someuser",
      "SshUsername": "someuser"
    },
    {
      "IamUserArn": "arn:aws:iam::123456789012:user/cli-user-test",
      "AllowSelfManagement": true,
      "Name": "cli-user-test",
      "SshUsername": "myusername"
    }
  ]
}
```

```
    }  
  ]  
}
```

More Information

For more information, see *Managing AWS OpsWorks Users* in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeUserProfiles](#) in *AWS CLI Command Reference*.

describe-volumes

The following code example shows how to use `describe-volumes`.

AWS CLI

To describe a stack's volumes

The following example describes a stack's EBS volumes.

```
aws opsworks --region us-east-1 describe-volumes --stack-id 8c428b08-a1a1-46ce-a5f8-  
feddc43771b8
```

Output:

```
{  
  "Volumes": [  
    {  
      "Status": "in-use",  
      "AvailabilityZone": "us-west-2a",  
      "Name": "CLITest",  
      "InstanceId": "dfe18b02-5327-493d-91a4-c5c0c448927f",  
      "VolumeType": "standard",  
      "VolumeId": "56b66fbd-e1a1-4aff-9227-70f77118d4c5",  
      "Device": "/dev/sdi",  
      "Ec2VolumeId": "vol-295c1638",  
      "MountPoint": "/mnt/myvolume",  
      "Size": 1  
    }  
  ]  
}
```

More Information

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeVolumes](#) in *AWS CLI Command Reference*.

detach-elastic-load-balancer

The following code example shows how to use `detach-elastic-load-balancer`.

AWS CLI

To detach a load balancer from its layer

The following example detaches a load balancer, identified by its name, from its layer.

```
aws opsworks --region us-east-1 detach-elastic-load-balancer --elastic-load-balancer-name Java-LB --layer-id 888c5645-09a5-4d0e-95a8-812ef1db76a4
```

Output: None.

More Information

For more information, see Elastic Load Balancing in the *AWS OpsWorks User Guide*.

- For API details, see [DetachElasticLoadBalancer](#) in *AWS CLI Command Reference*.

disassociate-elastic-ip

The following code example shows how to use `disassociate-elastic-ip`.

AWS CLI

To disassociate an Elastic IP address from an instance

The following example disassociates an Elastic IP address from a specified instance.

```
aws opsworks --region us-east-1 disassociate-elastic-ip --elastic-ip 54.148.130.96
```

Output: None.

More Information

For more information, see Resource Management in the *AWS OpsWorks User Guide*.

- For API details, see [DisassociateElasticIp](#) in *AWS CLI Command Reference*.

get-hostname-suggestion

The following code example shows how to use `get-hostname-suggestion`.

AWS CLI

To get the next hostname for a layer

The following example gets the next generated hostname for a specified layer. The layer used for this example is a Java Application Server layer with one instance. The stack's hostname theme is the default, `Layer_Dependent`.

```
aws opsworks --region us-east-1 get-hostname-suggestion --layer-id
888c5645-09a5-4d0e-95a8-812ef1db76a4
```

Output:

```
{
  "Hostname": "java-app2",
  "LayerId": "888c5645-09a5-4d0e-95a8-812ef1db76a4"
}
```

More Information

For more information, see Create a New Stack in the *AWS OpsWorks User Guide*.

- For API details, see [GetHostnameSuggestion](#) in *AWS CLI Command Reference*.

reboot-instance

The following code example shows how to use `reboot-instance`.

AWS CLI

To reboot an instance

The following example reboots an instance.

```
aws opsworks --region us-east-1 reboot-instance --instance-id
dfe18b02-5327-493d-91a4-c5c0c448927f
```

Output: None.

More Information

For more information, see *Rebooting an Instance* in the *AWS OpsWorks User Guide*.

- For API details, see [RebootInstance](#) in *AWS CLI Command Reference*.

register-elastic-ip

The following code example shows how to use `register-elastic-ip`.

AWS CLI

To register an Elastic IP address with a stack

The following example registers an Elastic IP address, identified by its IP address, with a specified stack.

Note: The Elastic IP address must be in the same region as the stack.

```
aws opsworks register-elastic-ip --region us-east-1 --stack-id
d72553d4-8727-448c-9b00-f024f0ba1b06 --elastic-ip 54.148.130.96
```

Output

```
{
  "ElasticIp": "54.148.130.96"
}
```

More Information

For more information, see *Registering Elastic IP Addresses with a Stack* in the *OpsWorks User Guide*.

- For API details, see [RegisterElasticIp](#) in *AWS CLI Command Reference*.

register-rds-db-instance

The following code example shows how to use `register-rds-db-instance`.

AWS CLI

To register an Amazon RDS instance with a stack

The following example registers an Amazon RDS DB instance, identified by its Amazon Resource Name (ARN), with a specified stack. It also specifies the instance's master username and password. Note that AWS OpsWorks does not validate either of these values. If either one is incorrect, your application will not be able to connect to the database.

```
aws opsworks register-rds-db-instance --region us-east-1 --stack-id
d72553d4-8727-448c-9b00-f024f0ba1b06 --rds-db-instance-arn arn:aws:rds:us-
west-2:123456789012:db:clitestdb --db-user cliuser --db-password some23!pwd
```

Output: None.

More Information

For more information, see *Registering Amazon RDS Instances with a Stack* in the *AWS OpsWorks User Guide*.

- For API details, see [RegisterRdsDbInstance](#) in *AWS CLI Command Reference*.

register-volume

The following code example shows how to use `register-volume`.

AWS CLI

To register an Amazon EBS volume with a stack

The following example registers an Amazon EBS volume, identified by its volume ID, with a specified stack.

```
aws opsworks register-volume --region us-east-1 --stack-id d72553d4-8727-448c-9b00-
f024f0ba1b06 --ec-2-volume-id vol-295c1638
```

Output:

```
{
  "VolumeId": "ee08039c-7cb7-469f-be10-40fb7f0c05e8"
}
```

More Information

For more information, see [Registering Amazon EBS Volumes with a Stack](#) in the *AWS OpsWorks User Guide*.

- For API details, see [RegisterVolume](#) in *AWS CLI Command Reference*.

register

The following code example shows how to use `register`.

AWS CLI

To register instances with a stack

The following examples show a variety of ways to register instances with a stack that were created outside of AWS Opsworks. You can run `register` from the instance to be registered, or from a separate workstation. For more information, see [Registering Amazon EC2 and On-premises Instances](#) in the *AWS OpsWorks User Guide*.

Note: For brevity, the examples omit the `region` argument.

To register an Amazon EC2 instance

To indicate that you are registering an EC2 instance, set the `--infrastructure-class` argument to `ec2`.

The following example registers an EC2 instance with the specified stack from a separate workstation. The instance is identified by its EC2 ID, `i-12345678`. The example uses the workstation's default SSH username and attempts to log in to the instance using authentication techniques that do not require a password, such as a default private SSH key. If that fails, `register` queries for the password.

```
aws opsworks register --infrastructure-class=ec2 --stack-id 935450cc-61e0-4b03-
a3e0-160ac817d2bb i-12345678
```

The following example registers an EC2 instance with the specified stack from a separate workstation. It uses the `--ssh-username` and `--ssh-private-key` arguments to explicitly specify the SSH username and private key file that the command uses to log into the instance. `ec2-user` is the standard username for Amazon Linux instances. Use `ubuntu` for Ubuntu instances.

```
aws opsworks register --infrastructure-class=ec2 --stack-id 935450cc-61e0-4b03-
a3e0-160ac817d2bb --ssh-username ec2-user --ssh-private-key ssh_private_key
i-12345678
```

The following example registers the EC2 instance that is running the `register` command. Log in to the instance with SSH and run `register` with the `--local` argument instead of an instance ID or hostname.

```
aws opsworks register --infrastructure-class ec2 --stack-id 935450cc-61e0-4b03-
a3e0-160ac817d2bb --local
```

To register an on-premises instance

To indicate that you are registering an on-premises instance, set the `--infrastructure-class` argument to `on-premises`.

The following example registers an existing on-premises instance with a specified stack from a separate workstation. The instance is identified by its IP address, `192.0.2.3`. The example uses the workstation's default SSH username and attempts to log in to the instance using authentication techniques that do not require a password, such as a default private SSH key. If that fails, `register` queries for the password.

```
aws opsworks register --infrastructure-class on-premises --stack-id
935450cc-61e0-4b03-a3e0-160ac817d2bb 192.0.2.3
```

The following example registers an on-premises instance with a specified stack from a separate workstation. The instance is identified by its hostname, `host1`. The `--override-...` arguments direct AWS OpsWorks to display `webserver1` as the host name and `192.0.2.3` and `10.0.0.2` as the instance's public and private IP addresses, respectively.

```
aws opsworks register --infrastructure-class on-premises --stack-id
935450cc-61e0-4b03-a3e0-160ac817d2bb --override-hostname webserver1 --override-
public-ip 192.0.2.3 --override-private-ip 10.0.0.2 host1
```

The following example registers an on-premises instance with a specified stack from a separate workstation. The instance is identified by its IP address. `register` logs into the instance using the specified SSH username and private key file.

```
aws opsworks register --infrastructure-class on-premises --stack-id
935450cc-61e0-4b03-a3e0-160ac817d2bb --ssh-username admin --ssh-private-key
ssh_private_key 192.0.2.3
```

The following example registers an existing on-premises instance with a specified stack from a separate workstation. The command logs into the instance using a custom SSH command string that specifies the SSH password and the instance's IP address.

```
aws opsworks register --infrastructure-class on-premises --stack-id
935450cc-61e0-4b03-a3e0-160ac817d2bb --override-ssh "sshpass -p 'mypassword' ssh
your-user@192.0.2.3"
```

The following example registers the on-premises instance that is running the `register` command. Log in to the instance with SSH and run `register` with the `--local` argument instead of an instance ID or hostname.

```
aws opsworks register --infrastructure-class on-premises --stack-id
935450cc-61e0-4b03-a3e0-160ac817d2bb --local
```

Output: The following is typical output for registering an EC2 instance.

```
Warning: Permanently added '52.11.41.206' (ECDSA) to the list of known hosts.

```

More Information

For more information, see [Registering an Instance with an AWS OpsWorks Stack in the AWS OpsWorks User Guide](#).

- For API details, see [Register](#) in *AWS CLI Command Reference*.

set-load-based-auto-scaling

The following code example shows how to use `set-load-based-auto-scaling`.

AWS CLI

To set the load-based scaling configuration for a layer

The following example enables load-based scaling for a specified layer and sets the configuration for that layer. You must use `create-instance` to add load-based instances to the layer.

```
aws opsworks --region us-east-1 set-load-based-auto-scaling --layer-id
523569ae-2faf-47ac-b39e-f4c4b381f36d --enable --up-scaling file://upscale.json --
down-scaling file://downscale.json
```

The example puts the upscaling threshold settings in a separate file in the working directory named `upscale.json`, which contains the following.

```
{
```

```
"InstanceCount": 2,  
"ThresholdsWaitTime": 3,  
"IgnoreMetricsTime": 3,  
"CpuThreshold": 85,  
"MemoryThreshold": 85,  
"LoadThreshold": 85  
}
```

The example puts the downscaling threshold settings in a separate file in the working directory named `downscale.json`, which contains the following.

```
{  
  "InstanceCount": 2,  
  "ThresholdsWaitTime": 3,  
  "IgnoreMetricsTime": 3,  
  "CpuThreshold": 35,  
  "MemoryThreshold": 30,  
  "LoadThreshold": 30  
}
```

Output: None.

More Information

For more information, see *Using Automatic Load-based Scaling* in the *AWS OpsWorks User Guide*.

- For API details, see [SetLoadBasedAutoScaling](#) in *AWS CLI Command Reference*.

set-permission

The following code example shows how to use `set-permission`.

AWS CLI

To grant per-stack AWS OpsWorks permission levels

When you import an AWS Identity and Access Management (IAM) user into AWS OpsWorks by calling `create-user-profile`, the user has only those permissions that are granted by the attached IAM policies. You can grant AWS OpsWorks permissions by modifying a user's policies. However, it is often easier to import a user and then use the `set-permission` command to

grant the user one of the standard permission levels for each stack to which the user will need access.

The following example grants permission for the specified stack for a user, who is identified by Amazon Resource Name (ARN). The example grants the user a Manage permissions level, with sudo and SSH privileges on the stack's instances.

```
aws opsworks set-permission --region us-east-1 --stack-id 71c7ca72-55ae-4b6a-8ee1-
a8dcdded3fa0f --level manage --iam-user-arn arn:aws:iam::123456789102:user/cli-user-
test --allow-ssh --allow-sudo
```

Output: None.

More Information

For more information, see [Granting AWS OpsWorks Users Per-Stack Permissions](#) in the *AWS OpsWorks User Guide*.

- For API details, see [SetPermission](#) in *AWS CLI Command Reference*.

set-time-based-auto-scaling

The following code example shows how to use `set-time-based-auto-scaling`.

AWS CLI

To set the time-based scaling configuration for a layer

The following example sets the time-based configuration for a specified instance. You must first use `create-instance` to add the instance to the layer.

```
aws opsworks --region us-east-1 set-time-based-auto-scaling --instance-id
69b6237c-08c0-4edb-a6af-78f3d01cedf2 --auto-scaling-schedule file://schedule.json
```

The example puts the schedule in a separate file in the working directory named `schedule.json`. For this example, the instance is on for a few hours around midday UTC (Coordinated Universal Time) on Monday and Tuesday.

```
{
  "Monday": {
    "10": "on",
```

```
    "11": "on",
    "12": "on",
    "13": "on"
  },
  "Tuesday": {
    "10": "on",
    "11": "on",
    "12": "on",
    "13": "on"
  }
}
```

Output: None.

More Information

For more information, see *Using Automatic Time-based Scaling* in the *AWS OpsWorks User Guide*.

- For API details, see [SetTimeBasedAutoScaling](#) in *AWS CLI Command Reference*.

start-instance

The following code example shows how to use `start-instance`.

AWS CLI

To start an instance

The following `start-instance` command starts a specified 24/7 instance.

```
aws opsworks start-instance --instance-id f705ee48-9000-4890-8bd3-20eb05825aaf
```

Output: None. Use `describe-instances` to check the instance's status.

Tip You can start every offline instance in a stack with one command by calling `start-stack`.

More Information

For more information, see *Manually Starting, Stopping, and Rebooting 24/7 Instances* in the *AWS OpsWorks User Guide*.

- For API details, see [StartInstance](#) in *AWS CLI Command Reference*.

start-stack

The following code example shows how to use `start-stack`.

AWS CLI

To start a stack's instances

The following example starts all of a stack's 24/7 instances. To start a particular instance, use `start-instance`.

```
aws opsworks --region us-east-1 start-stack --stack-id 8c428b08-a1a1-46ce-a5f8-  
feddc43771b8
```

Output: None.

More Information

For more information, see *Starting an Instance* in the *AWS OpsWorks User Guide*.

- For API details, see [StartStack](#) in *AWS CLI Command Reference*.

stop-instance

The following code example shows how to use `stop-instance`.

AWS CLI

To stop an instance

The following example stops a specified instance, which is identified by its instance ID. You can obtain an instance ID by going to the instance's details page on the AWS OpsWorks console or by running the `describe-instances` command.

```
aws opsworks stop-instance --region us-east-1 --instance-id 3a21cfac-4a1f-4ce2-a921-  
b2cfba6f7771
```

You can restart a stopped instance by calling `start-instance` or by deleting the instance by calling `delete-instance`.

Output: None.

More Information

For more information, see *Stopping an Instance in the AWS OpsWorks User Guide*.

- For API details, see [StopInstance](#) in *AWS CLI Command Reference*.

stop-stack

The following code example shows how to use `stop-stack`.

AWS CLI

To stop a stack's instances

The following example stops all of a stack's 24/7 instances. To stop a particular instance, use `stop-instance`.

```
aws opsworks --region us-east-1 stop-stack --stack-id 8c428b08-a1a1-46ce-a5f8-  
feddc43771b8
```

Output: No output.

More Information

For more information, see *Stopping an Instance in the AWS OpsWorks User Guide*.

- For API details, see [StopStack](#) in *AWS CLI Command Reference*.

unassign-instance

The following code example shows how to use `unassign-instance`.

AWS CLI

To unassign a registered instance from its layers

The following `unassign-instance` command unassigns an instance from its attached layers.

```
aws opsworks --region us-east-1 unassign-instance --instance-id 4d6d1710-ded9-42a1-  
b08e-b043ad7af1e2
```

Output: None.

More Information

For more information, see *Unassigning a Registered Instance in the AWS OpsWorks User Guide*.

- For API details, see [UnassignInstance](#) in *AWS CLI Command Reference*.

unassign-volume

The following code example shows how to use `unassign-volume`.

AWS CLI

To unassign a volume from its instance

The following example unassigns a registered Amazon Elastic Block Store (Amazon EBS) volume from its instance. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns when you register the volume with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID.

```
aws opsworks --region us-east-1 unassign-volume --volume-id 8430177d-52b7-4948-9c62-
e195af4703df
```

Output: None.

More Information

For more information, see *Unassigning Amazon EBS Volumes in the AWS OpsWorks User Guide*.

- For API details, see [UnassignVolume](#) in *AWS CLI Command Reference*.

update-app

The following code example shows how to use `update-app`.

AWS CLI

To update an app

The following example updates a specified app to change its name.

```
aws opsworks --region us-east-1 update-app --app-id 26a61ead-d201-47e3-
b55c-2a7c666942f8 --name NewAppName
```

Output: None.

More Information

For more information, see *Editing Apps* in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateApp](#) in *AWS CLI Command Reference*.

update-elastic-ip

The following code example shows how to use `update-elastic-ip`.

AWS CLI

To update an Elastic IP address name

The following example updates the name of a specified Elastic IP address.

```
aws opsworks --region us-east-1 update-elastic-ip --elastic-ip 54.148.130.96 --name  
NewIPName
```

Output: None.

More Information

For more information, see *Resource Management* in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateElasticIp](#) in *AWS CLI Command Reference*.

update-instance

The following code example shows how to use `update-instance`.

AWS CLI

To update an instance

The following example updates a specified instance's type.

```
aws opsworks --region us-east-1 update-instance --instance-id  
dfe18b02-5327-493d-91a4-c5c0c448927f --instance-type c3.xlarge
```

Output: None.

More Information

For more information, see *Editing the Instance Configuration in the AWS OpsWorks User Guide*.

- For API details, see [UpdateInstance](#) in *AWS CLI Command Reference*.

update-layer

The following code example shows how to use `update-layer`.

AWS CLI

To update a layer

The following example updates a specified layer to use Amazon EBS-optimized instances.

```
aws opsworks --region us-east-1 update-layer --layer-id
888c5645-09a5-4d0e-95a8-812ef1db76a4 --use-efs-optimized-instances
```

Output: None.

More Information

For more information, see *Editing an OpsWorks Layer's Configuration in the AWS OpsWorks User Guide*.

- For API details, see [UpdateLayer](#) in *AWS CLI Command Reference*.

update-my-user-profile

The following code example shows how to use `update-my-user-profile`.

AWS CLI

To update a user's profile

The following example updates the development user's profile to use a specified SSH public key. The user's AWS credentials are represented by the development profile in the credentials file (`~\.aws\credentials`), and the key is in a `.pem` file in the working directory.

```
aws opsworks --region us-east-1 --profile development update-my-user-profile --ssh-
public-key file://development_key.pem
```

Output: None.

More Information

For more information, see *Editing AWS OpsWorks User Settings* in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateMyUserProfile](#) in *AWS CLI Command Reference*.

update-rds-db-instance

The following code example shows how to use `update-rds-db-instance`.

AWS CLI

To update a registered Amazon RDS DB instance

The following example updates an Amazon RDS instance's master password value. Note that this command does not change the RDS instance's master password, just the password that you provide to AWS OpsWorks. If this password does not match the RDS instance's password, your application will not be able to connect to the database.

```
aws opsworks --region us-east-1 update-rds-db-instance --db-password 123456789
```

Output: None.

More Information

For more information, see *Registering Amazon RDS Instances with a Stack* in the *AWS OpsWorks User Guide*.

- For API details, see [UpdateRdsDbInstance](#) in *AWS CLI Command Reference*.

update-volume

The following code example shows how to use `update-volume`.

AWS CLI

To update a registered volume

The following example updates a registered Amazon Elastic Block Store (Amazon EBS) volume's mount point. The volume is identified by its volume ID, which is the GUID that AWS OpsWorks assigns to the volume when you register it with a stack, not the Amazon Elastic Compute Cloud (Amazon EC2) volume ID.:

```
aws opsworks --region us-east-1 update-volume --volume-id 8430177d-52b7-4948-9c62-
e195af4703df --mount-point /mnt/myvol
```

Output: None.

More Information

For more information, see *Assigning Amazon EBS Volumes to an Instance in the AWS OpsWorks User Guide*.

- For API details, see [UpdateVolume](#) in *AWS CLI Command Reference*.

AWS OpsWorks CM examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS OpsWorks CM.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

associate-node

The following code example shows how to use `associate-node`.

AWS CLI

To associate nodes

The following `associate-node` command associates a node named `i-44de882p` with a Chef Automate server named `automate-06`, meaning that the `automate-06` server manages the node, and communicates recipe commands to the node through `chef-client` agent software that is installed on the node by the `associate-node` command. Valid node names are EC2 instance IDs.:

```
aws opsworks-cm associate-node --server-name "automate-06" --node-name
  "i-43de882p" --engine-attributes "Name=CHEF_ORGANIZATION,Value='MyOrganization'
  Name=CHEF_NODE_PUBLIC_KEY,Value='Public_key_contents'"
```

The output returned by the command resembles the following. *Output:*

```
{
  "NodeAssociationStatusToken": "AHUY8wFe4pdXtZC5DiJa5S0Lp5o14DH//
  rHRqHDWXxwVoNBxcEy4V7R0NOFymh7E/1Hum0BPsemPQFE6dcGaiFk"
}
```

More Information

For more information, see *Adding Nodes Automatically in AWS OpsWorks for Chef Automate* in the *AWS OpsWorks User Guide*.

- For API details, see [AssociateNode](#) in *AWS CLI Command Reference*.

create-backup

The following code example shows how to use `create-backup`.

AWS CLI

To create backups

The following `create-backup` command starts a manual backup of a Chef Automate server named `automate-06` in the `us-east-1` region. The command adds a descriptive message to the backup in the `--description` parameter.

```
aws opsworks-cm create-backup \
```

```
--server-name 'automate-06' \  
--description "state of my infrastructure at launch"
```

The output shows you information similar to the following about the new backup.

Output:

```
{  
  "Backups": [  
    {  
      "BackupArn": "string",  
      "BackupId": "automate-06-20160729133847520",  
      "BackupType": "MANUAL",  
      "CreatedAt": "2016-07-29T13:38:47.520Z",  
      "Description": "state of my infrastructure at launch",  
      "Engine": "Chef",  
      "EngineModel": "Single",  
      "EngineVersion": "12",  
      "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/  
automate-06-1010V4UU2WRM2",  
      "InstanceType": "m4.large",  
      "KeyPair": "",  
      "PreferredBackupWindow": "",  
      "PreferredMaintenanceWindow": "",  
      "S3LogUrl": "https://s3.amazonaws.com/<bucket-name>/  
automate-06-20160729133847520",  
      "SecurityGroupIds": [ "sg-1a24c270" ],  
      "ServerName": "automate-06",  
      "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-  
service-role.1114810729735",  
      "Status": "OK",  
      "StatusDescription": "",  
      "SubnetIds": [ "subnet-49436a18" ],  
      "ToolsVersion": "string",  
      "UserArn": "arn:aws:iam::1019881987024:user/opsworks-user"  
    }  
  ],  
}
```

For more information, see [Back Up and Restore an AWS OpsWorks for Chef Automate Server](#) in the *AWS OpsWorks User Guide*.

- For API details, see [CreateBackup](#) in *AWS CLI Command Reference*.

create-server

The following code example shows how to use create-server.

AWS CLI

To create a server

The following create-server example creates a new Chef Automate server named automate-06 in your default region. Note that defaults are used for most other settings, such as number of backups to retain, and maintenance and backup start times. Before you run a create-server command, complete prerequisites in [Getting Started with AWS OpsWorks for Chef Automate](#) in the *AWS Opsworks for Chef Automate User Guide*.

```
aws opsworks-cm create-server \  
  --engine "Chef" \  
  --engine-model "Single" \  
  --engine-version "12" \  
  --server-name "automate-06" \  
  --instance-profile-arn "arn:aws:iam::1019881987024:instance-profile/aws-opsworks-cm-ec2-role" \  
  --instance-type "t2.medium" \  
  --key-pair "amazon-test" \  
  --service-role-arn "arn:aws:iam::044726508045:role/aws-opsworks-cm-service-role"
```

The output shows you information similar to the following about the new server:

```
{  
  "Server": {  
    "BackupRetentionCount": 10,  
    "CreatedAt": 2016-07-29T13:38:47.520Z,  
    "DisableAutomatedBackup": FALSE,  
    "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",  
    "Engine": "Chef",  
    "EngineAttributes": [  
      {  
        "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",  
        "Value": "1Password1"  
      }  
    ],  
    "EngineModel": "Single",  
    "EngineVersion": "12",
```

```

    "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/aws-
opsworks-cm-ec2-role",
    "InstanceType": "t2.medium",
    "KeyPair": "amazon-test",
    "MaintenanceStatus": "",
    "PreferredBackupWindow": "Sun:02:00",
    "PreferredMaintenanceWindow": "00:00",
    "SecurityGroupIds": [ "sg-1a24c270" ],
    "ServerArn": "arn:aws:iam::1019881987024:instance/
automate-06-1010V4UU2WRM2",
    "ServerName": "automate-06",
    "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-
role",
    "Status": "CREATING",
    "StatusReason": "",
    "SubnetIds": [ "subnet-49436a18" ]
  }
}

```

For more information, see [UpdateServer](#) in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [CreateServer](#) in *AWS CLI Command Reference*.

delete-backup

The following code example shows how to use delete-backup.

AWS CLI

To delete backups

The following delete-backup command deletes a manual or automated backup of a Chef Automate server, identified by the backup ID. This command is useful when you are approaching the maximum number of backups that you can save, or you want to minimize your Amazon S3 storage costs.:

```
aws opsworks-cm delete-backup --backup-id "automate-06-2016-11-19T23:42:40.240Z"
```

The output shows whether the backup deletion succeeded.

More Information

For more information, see [Back Up and Restore an AWS OpsWorks for Chef Automate Server](#) in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteBackup](#) in *AWS CLI Command Reference*.

delete-server

The following code example shows how to use `delete-server`.

AWS CLI

To delete servers

The following `delete-server` command deletes a Chef Automate server, identified by the server's name. After the server is deleted, it is no longer returned by `DescribeServer` requests.:

```
aws opsworks-cm delete-server --server-name "automate-06"
```

The output shows whether the server deletion succeeded.

More Information

For more information, see [Delete an AWS OpsWorks for Chef Automate Server](#) in the *AWS OpsWorks User Guide*.

- For API details, see [DeleteServer](#) in *AWS CLI Command Reference*.

describe-account-attributes

The following code example shows how to use `describe-account-attributes`.

AWS CLI

To describe account attributes

The following `describe-account-attributes` command returns information about your account's usage of AWS OpsWorks for Chef Automate resources.:

```
aws opsworks-cm describe-account-attributes
```

The output for each account attribute entry returned by the command resembles the following.

Output:

```
{
  "Attributes": [
    {
      "Maximum": 5,
      "Name": "ServerLimit",
      "Used": 2
    }
  ]
}
```

More Information

For more information, see `DescribeAccountAttributes` in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [DescribeAccountAttributes](#) in *AWS CLI Command Reference*.

describe-backups

The following code example shows how to use `describe-backups`.

AWS CLI

To describe backups

The following `describe-backups` command returns information about all backups associated with your account in your default region.

```
aws opsworks-cm describe-backups
```

The output for each backup entry returned by the command resembles the following.

Output:

```
{
  "Backups": [
    {
      "BackupArn": "string",
```

```

    "BackupId": "automate-06-20160729133847520",
    "BackupType": "MANUAL",
    "CreatedAt": 2016-07-29T13:38:47.520Z,
    "Description": "state of my infrastructure at launch",
    "Engine": "Chef",
    "EngineModel": "Single",
    "EngineVersion": "12",
    "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/
automate-06-1010V4UU2WRM2",
    "InstanceType": "m4.large",
    "KeyPair": "",
    "PreferredBackupWindow": "",
    "PreferredMaintenanceWindow": "",
    "S3LogUrl": "https://s3.amazonaws.com/<bucket-name>/
automate-06-20160729133847520",
    "SecurityGroupIds": [ "sg-1a24c270" ],
    "ServerName": "automate-06",
    "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-
service-role.1114810729735",
    "Status": "Successful",
    "StatusDescription": "",
    "SubnetIds": [ "subnet-49436a18" ],
    "ToolsVersion": "string",
    "UserArn": "arn:aws:iam::1019881987024:user/opsworks-user"
  },
}

```

For more information, see [Back Up and Restore an AWS OpsWorks for Chef Automate Server](#) in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeBackups](#) in *AWS CLI Command Reference*.

describe-events

The following code example shows how to use `describe-events`.

AWS CLI

To describe events

The following `describe-events` example returns information about all events that are associated with the specified Chef Automate server.

```
aws opsworks-cm describe-events \
  --server-name 'automate-06'
```

The output for each event entry returned by the command resembles the following example:

```
{
  "ServerEvents": [
    {
      "CreatedAt": 2016-07-29T13:38:47.520Z,
      "LogUrl": "https://s3.amazonaws.com/<bucket-name>/
automate-06-20160729133847520",
      "Message": "Updates successfully installed.",
      "ServerName": "automate-06"
    }
  ]
}
```

For more information, see [General Troubleshooting Tips](#) in the *AWS OpsWorks User Guide*.

- For API details, see [DescribeEvents](#) in *AWS CLI Command Reference*.

describe-node-association-status

The following code example shows how to use `describe-node-association-status`.

AWS CLI

To describe node association status

The following `describe-node-association-status` command returns the status of a request to associate a node with a Chef Automate server named `automate-06`:

```
aws opsworks-cm describe-node-association-status --server-
name "automate-06" --node-association-status-token "Af1JKl+/
GoKLZJBdDQEx0065CDi57b1Qe9nKM8joSok0pQ9xr8DqApBN9/106sLdSvlfDEKkEx+eoCHvjowHa0s="
```

The output for each account attribute entry returned by the command resembles the following.
Output:

```
{
  "NodeAssociationStatus": "IN_PROGRESS"
```

```
}
```

More Information

For more information, see `DescribeNodeAssociationStatus` in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [DescribeNodeAssociationStatus](#) in *AWS CLI Command Reference*.

describe-servers

The following code example shows how to use `describe-servers`.

AWS CLI

To describe servers

The following `describe-servers` command returns information about all servers that are associated with your account, and in your default region.:

```
aws opsworks-cm describe-servers
```

The output for each server entry returned by the command resembles the following. *Output*:

```
{
  "Servers": [
    {
      "BackupRetentionCount": 8,
      "CreatedAt": "2016-07-29T13:38:47.520Z",
      "DisableAutomatedBackup": FALSE,
      "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
      "Engine": "Chef",
      "EngineAttributes": [
        {
          "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",
          "Value": "1Password1"
        }
      ],
      "EngineModel": "Single",
      "EngineVersion": "12",
      "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/
automate-06-1010V4UU2WRM2",

```

```

    "InstanceType": "m4.large",
    "KeyPair": "",
    "MaintenanceStatus": "SUCCESS",
    "PreferredBackupWindow": "03:00",
    "PreferredMaintenanceWindow": "Mon:09:00",
    "SecurityGroupIds": [ "sg-1a24c270" ],
    "ServerArn": "arn:aws:iam::1019881987024:instance/automate-06-1010V4UU2WRM2",
    "ServerName": "automate-06",
    "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-
role.1114810729735",
    "Status": "HEALTHY",
    "StatusReason": "",
    "SubnetIds": [ "subnet-49436a18" ]
  }
]
}

```

More Information

For more information, see `DescribeServers` in the *AWS OpsWorks for Chef Automate API Guide*.

- For API details, see [DescribeServers](#) in *AWS CLI Command Reference*.

disassociate-node

The following code example shows how to use `disassociate-node`.

AWS CLI

To disassociate nodes

The following `disassociate-node` command disassociates a node named `i-44de882p`, removing the node from management by a Chef Automate server named `automate-06`. Valid node names are EC2 instance IDs.:

```

aws opsworks-cm disassociate-node --server-name "automate-06" --node-name
  "i-43de882p" --engine-attributes "Name=CHEF_ORGANIZATION,Value='MyOrganization'
  Name=CHEF_NODE_PUBLIC_KEY,Value='Public_key_contents'"

```

The output returned by the command resembles the following. *Output*:

```
{
```

```
"NodeAssociationStatusToken": "AHUY8wFe4pdXtZC5DiJa5S0Lp5o14DH//  
rHRqHDWXxwVoNBxcEy4V7R0N0Fymh7E/1Hum0BPsemPQFE6dcGaiFk"  
}
```

More Information

For more information, see [Delete an AWS OpsWorks for Chef Automate Server](#) in the *AWS OpsWorks User Guide*.

- For API details, see [DisassociateNode](#) in *AWS CLI Command Reference*.

restore-server

The following code example shows how to use `restore-server`.

AWS CLI

To restore a server

The following `restore-server` command performs an in-place restoration of a Chef Automate server named `automate-06` in your default region from a backup with an ID of `automate-06-2016-11-22T16:13:27.998Z`. Restoring a server restores connections to the nodes that the Chef Automate server was managing at the time that the specified backup was performed.

```
aws opsworks-cm restore-server --backup-id "automate-06-2016-11-22T16:13:27.998Z" --  
server-name "automate-06"
```

The output is the command ID only. *Output:*

```
(None)
```

More Information

For more information, see [Restore a Failed AWS OpsWorks for Chef Automate Server](#) in the *AWS OpsWorks User Guide*.

- For API details, see [RestoreServer](#) in *AWS CLI Command Reference*.

start-maintenance

The following code example shows how to use `start-maintenance`.

AWS CLI

To start maintenance

The following `start-maintenance` example manually starts maintenance on the specified Chef Automate or Puppet Enterprise server in your default region. This command is useful if an earlier, automated maintenance attempt failed, and the underlying cause of maintenance failure has been resolved.

```
aws opsworks-cm start-maintenance \  
  --server-name 'automate-06'
```

Output:

```
{  
  "Server": {  
    "AssociatePublicIpAddress": true,  
    "BackupRetentionCount": 10,  
    "ServerName": "automate-06",  
    "CreatedAt": 1569229584.842,  
    "CloudFormationStackArn": "arn:aws:cloudformation:us-  
west-2:123456789012:stack/aws-opsworks-cm-instance-automate-06-1606611794746/  
EXAMPLE0-31de-11eb-bdb0-0a5b0a1353b8",  
    "DisableAutomatedBackup": false,  
    "Endpoint": "automate-06-EXAMPLEEvr8gjfk5f.us-west-2.opsworks-cm.io",  
    "Engine": "ChefAutomate",  
    "EngineModel": "Single",  
    "EngineAttributes": [],  
    "EngineVersion": "2020-07",  
    "InstanceProfileArn": "arn:aws:iam::123456789012:instance-profile/aws-  
opsworks-cm-ec2-role",  
    "InstanceType": "m5.large",  
    "PreferredMaintenanceWindow": "Sun:01:00",  
    "PreferredBackupWindow": "Sun:15:00",  
    "SecurityGroupIds": [  
      "sg-EXAMPLE"  
    ],  
    "ServiceRoleArn": "arn:aws:iam::123456789012:role/service-role/aws-opsworks-  
cm-service-role",  
    "Status": "UNDER_MAINTENANCE",  
    "SubnetIds": [  
      "subnet-EXAMPLE"  
    ]  
  }  
}
```

```

    ],
    "ServerArn": "arn:aws:opsworks-cm:us-west-2:123456789012:server/
automate-06/0148382d-66b0-4196-8274-d1a2b6dff8d1"
  }
}

```

For more information, see [System Maintenance \(Puppet Enterprise servers\)](#) or [System Maintenance \(Chef Automate servers\)](#) in the *AWS OpsWorks User Guide*.

- For API details, see [StartMaintenance](#) in *AWS CLI Command Reference*.

update-server-engine-attributes

The following code example shows how to use `update-server-engine-attributes`.

AWS CLI

To update server engine attributes

The following `update-server-engine-attributes` command updates the value of the `CHEF_PIVOTAL_KEY` engine attribute for a Chef Automate server named `automate-06`. It is currently not possible to change the value of other engine attributes.

```

aws opsworks-cm update-server-engine-attributes \
  --attribute-name CHEF_PIVOTAL_KEY \
  --attribute-value "new key value" \
  --server-name "automate-06"

```

The output shows you information similar to the following about the updated server.

```

{
  "Server": {
    "BackupRetentionCount": 2,
    "CreatedAt": 2016-07-29T13:38:47.520Z,
    "DisableAutomatedBackup": FALSE,
    "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",
    "Engine": "Chef",
    "EngineAttributes": [
      {
        "Name": "CHEF_PIVOTAL_KEY",
        "Value": "new key value"
      }
    ]
  }
}

```

```

    }
  ],
  "EngineModel": "Single",
  "EngineVersion": "12",
  "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/
automate-06-1010V4UU2WRM2",
  "InstanceType": "m4.large",
  "KeyPair": "",
  "MaintenanceStatus": "SUCCESS",
  "PreferredBackupWindow": "Mon:09:15",
  "PreferredMaintenanceWindow": "03:00",
  "SecurityGroupIds": [ "sg-1a24c270" ],
  "ServerArn": "arn:aws:iam::1019881987024:instance/
automate-06-1010V4UU2WRM2",
  "ServerName": "automate-06",
  "ServiceRoleArn": "arn:aws:iam::1019881987024:role/aws-opsworks-cm-service-
role.1114810729735",
  "Status": "HEALTHY",
  "StatusReason": "",
  "SubnetIds": [ "subnet-49436a18" ]
}
}

```

For more information, see [UpdateServerEngineAttributes](#) in the *AWS OpsWorks for Chef Automate API Reference*.

- For API details, see [UpdateServerEngineAttributes](#) in *AWS CLI Command Reference*.

update-server

The following code example shows how to use `update-server`.

AWS CLI

To update a server

The following `update-server` command updates the maintenance start time of the specified Chef Automate server in your default region. The `--preferred-maintenance-window` parameter is added to change the start day and time of server maintenance to Mondays at 9:15 a.m. UTC.:

```
aws opsworks-cm update-server \
```

```
--server-name "automate-06" \  
--preferred-maintenance-window "Mon:09:15"
```

The output shows you information similar to the following about the updated server.

```
{  
  "Server": {  
    "BackupRetentionCount": 8,  
    "CreatedAt": 2016-07-29T13:38:47.520Z,  
    "DisableAutomatedBackup": TRUE,  
    "Endpoint": "https://opsworks-cm.us-east-1.amazonaws.com",  
    "Engine": "Chef",  
    "EngineAttributes": [  
      {  
        "Name": "CHEF_DELIVERY_ADMIN_PASSWORD",  
        "Value": "1Password1"  
      }  
    ],  
    "EngineModel": "Single",  
    "EngineVersion": "12",  
    "InstanceProfileArn": "arn:aws:iam::1019881987024:instance-profile/  
automate-06-1010V4UU2WRM2",  
    "InstanceType": "m4.large",  
    "KeyPair": "",

Organizations examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Organizations.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Topics

- [Actions](#)

Actions

accept-handshake

The following code example shows how to use `accept-handshake`.

AWS CLI

To accept a handshake from another account

Bill, the owner of an organization, has previously invited Juan's account to join his organization. The following example shows Juan's account accepting the handshake and thus agreeing to the invitation.

```
aws organizations accept-handshake --handshake-id h-examplehandshakeid111
```

The output shows the following:

```
{
  "Handshake": {
    "Action": "INVITE",
```

```

    "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
    "RequestedTimestamp": 1481656459.257,
    "ExpirationTimestamp": 1482952459.257,
    "Id": "h-examplehandshakeid111",
    "Parties": [
      {
        "Id": "o-exampleorgid",
        "Type": "ORGANIZATION"
      },
      {
        "Id": "juan@example.com",
        "Type": "EMAIL"
      }
    ],
    "Resources": [
      {
        "Resources": [
          {
            "Type": "MASTER_EMAIL",
            "Value": "bill@amazon.com"
          },
          {
            "Type": "MASTER_NAME",
            "Value": "Org Master Account"
          },
          {
            "Type": "ORGANIZATION_FEATURE_SET",
            "Value": "ALL"
          }
        ],
        "Type": "ORGANIZATION",
        "Value": "o-exampleorgid"
      },
      {
        "Type": "EMAIL",
        "Value": "juan@example.com"
      }
    ],
    "State": "ACCEPTED"
  }
}

```

- For API details, see [AcceptHandshake](#) in *AWS CLI Command Reference*.

attach-policy

The following code example shows how to use `attach-policy`.

AWS CLI

To attach a policy to a root, OU, or account

Example 1

The following example shows how to attach a service control policy (SCP) to an OU:

```
aws organizations attach-policy
    --policy-id p-examplepolicyid111
    --target-id ou-examplerootid111-exampleouid111
```

Example 2

The following example shows how to attach a service control policy directly to an account:

```
aws organizations attach-policy
    --policy-id p-examplepolicyid111
    --target-id 333333333333
```

- For API details, see [AttachPolicy](#) in *AWS CLI Command Reference*.

cancel-handshake

The following code example shows how to use `cancel-handshake`.

AWS CLI

To cancel a handshake sent from another account

Bill previously sent an invitation to Susan's account to join his organization. He changes his mind and decides to cancel the invitation before Susan accepts it. The following example shows Bill's cancellation:

```
aws organizations cancel-handshake --handshake-id h-examplehandshakeid111
```

The output includes a handshake object that shows that the state is now CANCELED:

```
{
  "Handshake": {
    "Id": "h-examplehandshakeid111",
    "State": "CANCELED",
    "Action": "INVITE",
    "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
    "Parties": [
      {
        "Id": "o-exampleorgid",
        "Type": "ORGANIZATION"
      },
      {
        "Id": "susan@example.com",
        "Type": "EMAIL"
      }
    ],
    "Resources": [
      {
        "Type": "ORGANIZATION",
        "Value": "o-exampleorgid",
        "Resources": [
          {
            "Type": "MASTER_EMAIL",
            "Value": "bill@example.com"
          },
          {
            "Type": "MASTER_NAME",
            "Value": "Master Account"
          },
          {
            "Type": "ORGANIZATION_FEATURE_SET",
            "Value": "CONSOLIDATED_BILLING"
          }
        ]
      },
      {
        "Type": "EMAIL",
        "Value": "anika@example.com"
      },
      {
        "Type": "NOTES",
```

```
        "Value": "This is a request for Susan's account to  
join Bob's organization."  
      }  
    ],  
    "RequestedTimestamp": 1.47008383521E9,  
    "ExpirationTimestamp": 1.47137983521E9  
  }  
}
```

- For API details, see [CancelHandshake](#) in *AWS CLI Command Reference*.

create-account

The following code example shows how to use create-account.

AWS CLI

To create a member account that is automatically part of the organization

The following example shows how to create a member account in an organization. The member account is configured with the name Production Account and the email address of susan@example.com. Organizations automatically creates an IAM role using the default name of OrganizationAccountAccessRole because the roleName parameter is not specified. Also, the setting that allows IAM users or roles with sufficient permissions to access account billing data is set to the default value of ALLOW because the iamUserAccessToBilling parameter is not specified. Organizations automatically sends Susan a "Welcome to AWS" email:

```
aws organizations create-account --email susan@example.com --account-name  
"Production Account"
```

The output includes a request object that shows that the status is now IN_PROGRESS:

```
{  
  "CreateAccountStatus": {  
    "State": "IN_PROGRESS",  
    "Id": "car-examplecreateaccountrequestid111"  
  }  
}
```

You can later query the current status of the request by providing the Id response value to the describe-create-account-status command as the value for the create-account-request-id parameter.

For more information, see *Creating an AWS Account in Your Organization* in the *AWS Organizations Users Guide*.

- For API details, see [CreateAccount](#) in *AWS CLI Command Reference*.

create-organization

The following code example shows how to use create-organization.

AWS CLI

Example 1: To create a new organization

Bill wants to create an organization using credentials from account 111111111111. The following example shows that the account becomes the master account in the new organization. Because he does not specify a features set, the new organization defaults to all features enabled and service control policies are enabled on the root.

```
aws organizations create-organization
```

The output includes an organization object with details about the new organization:

```
{
  "Organization": {
    "AvailablePolicyTypes": [
      {
        "Status": "ENABLED",
        "Type": "SERVICE_CONTROL_POLICY"
      }
    ],
    "MasterAccountId": "111111111111",
    "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/111111111111",
    "MasterAccountEmail": "bill@example.com",
    "FeatureSet": "ALL",
    "Id": "o-exampleorgid",
    "Arn": "arn:aws:organizations::111111111111:organization/o-
exampleorgid"
```

```
}  
}
```

Example 2: To create a new organization with only consolidated billing features enabled

The following example creates an organization that supports only the consolidated billing features:

```
aws organizations create-organization --feature-set CONSOLIDATED_BILLING
```

The output includes an organization object with details about the new organization:

```
{  
  "Organization": {  
    "Arn": "arn:aws:organizations::111111111111:organization/o-  
exampleorgid",  
    "AvailablePolicyTypes": [],  
    "Id": "o-exampleorgid",  
    "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-  
exampleorgid/111111111111",  
    "MasterAccountEmail": "bill@example.com",  
    "MasterAccountId": "111111111111",  
    "FeatureSet": "CONSOLIDATED_BILLING"  
  }  
}
```

For more information, see *Creating an Organization* in the *AWS Organizations Users Guide*.

- For API details, see [CreateOrganization](#) in *AWS CLI Command Reference*.

create-organizational-unit

The following code example shows how to use `create-organizational-unit`.

AWS CLI

To create an OU in a root or parent OU

The following example shows how to create an OU that is named `AccountingOU`:

```
aws organizations create-organizational-unit --parent-id r-examplerootid111 --name  
AccountingOU
```

The output includes an `OrganizationalUnit` object with details about the new OU:

```
{
  "OrganizationalUnit": {
    "Id": "ou-examplerootid111-exampleoid111",
    "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-
    exemplerooid111-exampleoid111",
    "Name": "AccountingOU"
  }
}
```

- For API details, see [CreateOrganizationalUnit](#) in *AWS CLI Command Reference*.

create-policy

The following code example shows how to use `create-policy`.

AWS CLI

Example 1: To create a policy with a text source file for the JSON policy

The following example shows you how to create an service control policy (SCP) named `AllowAllS3Actions`. The policy contents are taken from a file on the local computer called `policy.json`.

```
aws organizations create-policy --content file://policy.json --name
AllowAllS3Actions, --type SERVICE_CONTROL_POLICY --description "Allows delegation
of all S3 actions"
```

The output includes a policy object with details about the new policy:

```
{
  "Policy": {
    "Content": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":
    \"Allow\",\"Action\":[\"s3:*\"],\"Resource\":[\"*\"]}]}",
    "PolicySummary": {
      "Arn": "arn:aws:organizations::o-exampleorgid:policy/
      service_control_policy/p-examplepolicyid111",
      "Description": "Allows delegation of all S3 actions",
      "Name": "AllowAllS3Actions",
      "Type": "SERVICE_CONTROL_POLICY"
    }
  }
}
```

```

    }
  }
}

```

Example 2: To create a policy with a JSON policy as a parameter

The following example shows you how to create the same SCP, this time by embedding the policy contents as a JSON string in the parameter. The string must be escaped with backslashes before the double quotes to ensure that they are treated as literals in the parameter, which itself is surrounded by double quotes:

```

aws organizations create-policy --content "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":\"Allow\",\"Action\":[\"s3:*\"],\"Resource\":[\"*\"]}]}\" --name AllowAllS3Actions --type SERVICE_CONTROL_POLICY --description \"Allows delegation of all S3 actions\"

```

For more information about creating and using policies in your organization, see *Managing Organization Policies* in the *AWS Organizations User Guide*.

- For API details, see [CreatePolicy](#) in *AWS CLI Command Reference*.

decline-handshake

The following code example shows how to use `decline-handshake`.

AWS CLI

To decline a handshake sent from another account

The following example shows that Susan, an admin who is the owner of account 222222222222, declines an invitation to join Bill's organization. The `DeclineHandshake` operation returns a handshake object, showing that the state is now `DECLINED`:

```

aws organizations decline-handshake --handshake-id h-examplehandshakeid111

```

The output includes a handshake object that shows the new state of `DECLINED`:

```

{
  "Handshake": {
    "Id": "h-examplehandshakeid111",
    "State": "DECLINED",

```

```

    "Resources": [
      {
        "Type": "ORGANIZATION",
        "Value": "o-exampleorgid",
        "Resources": [
          {
            "Type": "MASTER_EMAIL",
            "Value": "bill@example.com"
          },
          {
            "Type": "MASTER_NAME",
            "Value": "Master Account"
          }
        ]
      },
      {
        "Type": "EMAIL",
        "Value": "susan@example.com"
      },
      {
        "Type": "NOTES",
        "Value": "This is an invitation to Susan's account
to join the Bill's organization."
      }
    ],
    "Parties": [
      {
        "Type": "EMAIL",
        "Id": "susan@example.com"
      },
      {
        "Type": "ORGANIZATION",
        "Id": "o-exampleorgid"
      }
    ],
    "Action": "INVITE",
    "RequestedTimestamp": 1470684478.687,
    "ExpirationTimestamp": 1471980478.687,
    "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111"
  }
}

```

- For API details, see [DeclineHandshake](#) in *AWS CLI Command Reference*.

delete-organization

The following code example shows how to use delete-organization.

AWS CLI

To delete an organization

The following example shows how to delete an organization. To perform this operation, you must be an admin of the master account in the organization. The example assumes that you previously removed all the member accounts, OUs, and policies from the organization:

```
aws organizations delete-organization
```

- For API details, see [DeleteOrganization](#) in *AWS CLI Command Reference*.

delete-organizational-unit

The following code example shows how to use delete-organizational-unit.

AWS CLI

To delete an OU

The following example shows how to delete an OU. The example assumes that you previously removed all accounts and other OUs from the OU:

```
aws organizations delete-organizational-unit --organizational-unit-id ou-  
examplerootid111-exampleouid111
```

- For API details, see [DeleteOrganizationalUnit](#) in *AWS CLI Command Reference*.

delete-policy

The following code example shows how to use delete-policy.

AWS CLI

To delete a policy

The following example shows how to delete a policy from an organization. The example assumes that you previously detached the policy from all entities:

```
aws organizations delete-policy --policy-id p-examplepolicyid111
```

- For API details, see [DeletePolicy](#) in *AWS CLI Command Reference*.

describe-account

The following code example shows how to use describe-account.

AWS CLI

To get the details about an account

The following example shows you how to request details about an account:

```
aws organizations describe-account --account-id 555555555555
```

The output shows an account object with the details about the account:

```
{
  "Account": {
    "Id": "555555555555",
    "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/555555555555",
    "Name": "Beta account",
    "Email": "anika@example.com",
    "JoinedMethod": "INVITED",
    "JoinedTimeStamp": 1481756563.134,
    "Status": "ACTIVE"
  }
}
```

- For API details, see [DescribeAccount](#) in *AWS CLI Command Reference*.

describe-create-account-status

The following code example shows how to use describe-create-account-status.

AWS CLI

To get the latest status about a request to create an account

The following example shows how to request the latest status for a previous request to create an account in an organization. The specified `--request-id` comes from the response of the original call to `create-account`. The account creation request shows by the `status` field that Organizations successfully completed the creation of the account.

Command:

```
aws organizations describe-create-account-status --create-account-request-id car-examplecreateaccountrequestid111
```

Output:

```
{
  "CreateAccountStatus": {
    "State": "SUCCEEDED",
    "AccountId": "555555555555",
    "AccountName": "Beta account",
    "RequestedTimestamp": 1470684478.687,
    "CompletedTimestamp": 1470684532.472,
    "Id": "car-examplecreateaccountrequestid111"
  }
}
```

- For API details, see [DescribeCreateAccountStatus](#) in *AWS CLI Command Reference*.

describe-handshake

The following code example shows how to use `describe-handshake`.

AWS CLI

To get information about a handshake

The following example shows you how to request details about a handshake. The handshake ID comes either from the original call to `InviteAccountToOrganization`, or from a call to `ListHandshakesForAccount` or `ListHandshakesForOrganization`:

```
aws organizations describe-handshake --handshake-id h-examplehandshakeid111
```

The output includes a handshake object that has all the details about the requested handshake:

```
{
  "Handshake": {
    "Id": "h-examplehandshakeid111",
    "State": "OPEN",
    "Resources": [
      {
        "Type": "ORGANIZATION",
        "Value": "o-exampleorgid",
        "Resources": [
          {
            "Type": "MASTER_EMAIL",
            "Value": "bill@example.com"
          },
          {
            "Type": "MASTER_NAME",
            "Value": "Master Account"
          }
        ]
      },
      {
        "Type": "EMAIL",
        "Value": "anika@example.com"
      }
    ],
    "Parties": [
      {
        "Type": "ORGANIZATION",
        "Id": "o-exampleorgid"
      },
      {
        "Type": "EMAIL",
        "Id": "anika@example.com"
      }
    ],
    "Action": "INVITE",
    "RequestedTimestamp": 1470158698.046,
    "ExpirationTimestamp": 1471454698.046,
    "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111"
  }
}
```

```
}  
}
```

- For API details, see [DescribeHandshake](#) in *AWS CLI Command Reference*.

describe-organization

The following code example shows how to use `describe-organization`.

AWS CLI

To get information about the current organization

The following example shows you how to request details about an organization:

```
aws organizations describe-organization
```

The output includes an organization object that has the details about the organization:

```
{  
  "Organization": {  
    "MasterAccountArn": "arn:aws:organizations::111111111111:account/o-  
exampleorgid/111111111111",  
    "MasterAccountEmail": "bill@example.com",  
    "MasterAccountId": "111111111111",  
    "Id": "o-exampleorgid",  
    "FeatureSet": "ALL",  
    "Arn": "arn:aws:organizations::111111111111:organization/o-  
exampleorgid",  
    "AvailablePolicyTypes": [  
      {  
        "Status": "ENABLED",  
        "Type": "SERVICE_CONTROL_POLICY"  
      }  
    ]  
  }  
}
```

- For API details, see [DescribeOrganization](#) in *AWS CLI Command Reference*.

describe-organizational-unit

The following code example shows how to use `describe-organizational-unit`.

AWS CLI

To get information about an OU

The following `describe-organizational-unit` example requests details about an OU.

```
aws organizations describe-organizational-unit \  
  --organizational-unit-id ou-examplerootid111-exampleoid111
```

Output:

```
{  
  "OrganizationalUnit": {  
    "Name": "Accounting Group",  
    "Arn": "arn:aws:organizations::123456789012:ou/o-exampleorgid/ou-  
examplerootid111-exampleoid111",  
    "Id": "ou-examplerootid111-exampleoid111"  
  }  
}
```

- For API details, see [DescribeOrganizationalUnit](#) in *AWS CLI Command Reference*.

describe-policy

The following code example shows how to use `describe-policy`.

AWS CLI

To get information about a policy

The following example shows how to request information about a policy:

```
aws organizations describe-policy --policy-id p-examplepolicyid111
```

The output includes a policy object that contains details about the policy:

```
{  
  "Policy": {
```

```

        "Content": "{\n  \"Version\": \"2012-10-17\",\n  \"Statement\": [\n    {\n      \"Effect\": \"Allow\",\n      \"Action\": \"*\",\n      \"Resource\": \"*\n    ]\n  }",
        "PolicySummary": {
          "Arn": "arn:aws:organizations::111111111111:policy/o-
exampleorgid/service_control_policy/p-examplepolicyid111",
          "Type": "SERVICE_CONTROL_POLICY",
          "Id": "p-examplepolicyid111",
          "AwsManaged": false,
          "Name": "AllowAllS3Actions",
          "Description": "Enables admins to delegate S3 permissions"
        }
      }
    }
  }
}

```

- For API details, see [DescribePolicy](#) in *AWS CLI Command Reference*.

detach-policy

The following code example shows how to use detach-policy.

AWS CLI

To detach a policy from a root, OU, or account

The following example shows how to detach a policy from an OU:

```
aws organizations detach-policy --target-id ou-examplerootid111-exampleouid111 --
policy-id p-examplepolicyid111
```

- For API details, see [DetachPolicy](#) in *AWS CLI Command Reference*.

disable-policy-type

The following code example shows how to use disable-policy-type.

AWS CLI

To disable a policy type in a root

The following example shows how to disable the service control policy (SCP) policy type in a root:

```
aws organizations disable-policy-type --root-id r-examplerootid111 --policy-type
SERVICE_CONTROL_POLICY
```

The output shows that the PolicyTypes response element no longer includes SERVICE_CONTROL_POLICY:

```
{
  "Root": {
    "PolicyTypes": [],
    "Name": "Root",
    "Id": "r-examplerootid111",
    "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-
examplerootid111"
  }
}
```

- For API details, see [DisablePolicyType](#) in *AWS CLI Command Reference*.

enable-all-features

The following code example shows how to use enable-all-features.

AWS CLI

To enable all features in an organization

This example shows the administrator asking all the invited accounts in the organization to approve enabled all features in the organization. AWS Organizations sends an email to the address that is registered with every invited member account asking the owner to approve the change to all features by accepting the handshake that is sent. After all invited member accounts accept the handshake, the organization administrator can finalize the change to all features, and those with appropriate permissions can create policies and apply them to roots, OUs, and accounts:

```
aws organizations enable-all-features
```

The output is a handshake object that is sent to all invited member accounts for approval:

```
{
  "Handshake": {
```

```

    "Action": "ENABLE_ALL_FEATURES",
    "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/
enable_all_features/h-examplehandshakeid111",
    "ExpirationTimestamp": 1.483127868609E9,
    "Id": "h-examplehandshakeid111",
    "Parties": [
      {
        "id": "o-exampleorgid",
        "type": "ORGANIZATION"
      }
    ],
    "requestedTimestamp": 1.481831868609E9,
    "resources": [
      {
        "type": "ORGANIZATION",
        "value": "o-exampleorgid"
      }
    ],
    "state": "REQUESTED"
  }
}

```

- For API details, see [EnableAllFeatures](#) in *AWS CLI Command Reference*.

enable-policy-type

The following code example shows how to use `enable-policy-type`.

AWS CLI

To enable the use of a policy type in a root

The following example shows how to enable the service control policy (SCP) policy type in a root:

```
aws organizations enable-policy-type --root-id r-examplerootid111 --policy-type
SERVICE_CONTROL_POLICY
```

The output shows a root object with a `policyTypes` response element showing that SCPs are now enabled:

```
{
```

```

    "Root": {
      "PolicyTypes": [
        {
          "Status": "ENABLED",
          "Type": "SERVICE_CONTROL_POLICY"
        }
      ],
      "Id": "r-examplerootid111",
      "Name": "Root",
      "Arn": "arn:aws:organizations::111111111111:root/o-exampleorgid/r-examplerootid111"
    }
  }
}

```

- For API details, see [EnablePolicyType](#) in *AWS CLI Command Reference*.

invite-account-to-organization

The following code example shows how to use `invite-account-to-organization`.

AWS CLI

To invite an account to join an organization

The following example shows the master account owned by `bill@example.com` inviting the account owned by `juan@example.com` to join an organization:

```

aws organizations invite-account-to-organization --target '{"Type": "EMAIL", "Id": "juan@example.com"}' --notes "This is a request for Juan's account to join Bill's organization."

```

The output includes a handshake structure that shows what is sent to the invited account:

```

{
  "Handshake": {
    "Action": "INVITE",
    "Arn": "arn:aws:organizations::111111111111:handshake/o-exampleorgid/invite/h-examplehandshakeid111",
    "ExpirationTimestamp": 1482952459.257,
    "Id": "h-examplehandshakeid111",
    "Parties": [

```

```

        {
            "Id": "o-exampleorgid",
            "Type": "ORGANIZATION"
        },
        {
            "Id": "juan@example.com",
            "Type": "EMAIL"
        }
    ],
    "RequestedTimestamp": 1481656459.257,
    "Resources": [
        {
            "Resources": [
                {
                    "Type": "MASTER_EMAIL",
                    "Value": "bill@amazon.com"
                },
                {
                    "Type": "MASTER_NAME",
                    "Value": "Org Master Account"
                },
                {
                    "Type": "ORGANIZATION_FEATURE_SET",
                    "Value": "FULL"
                }
            ],
            "Type": "ORGANIZATION",
            "Value": "o-exampleorgid"
        },
        {
            "Type": "EMAIL",
            "Value": "juan@example.com"
        }
    ],
    "State": "OPEN"
}

```

- For API details, see [InviteAccountToOrganization](#) in *AWS CLI Command Reference*.

leave-organization

The following code example shows how to use leave-organization.

AWS CLI

To leave an organization as a member account

The following example shows the administrator of a member account requesting to leave the organization it is currently a member of:

```
aws organizations leave-organization
```

- For API details, see [LeaveOrganization](#) in *AWS CLI Command Reference*.

list-accounts-for-parent

The following code example shows how to use `list-accounts-for-parent`.

AWS CLI

To retrieve a list of all of the accounts in a specified parent root or OU

The following example shows how to request a list of the accounts in an OU:

```
aws organizations list-accounts-for-parent --parent-id ou-examplerootid111-  
exampleouid111
```

The output includes a list of account summary objects.

```
{  
  "Accounts": [  
    {  
      "Arn": "arn:aws:organizations::111111111111:account/o-  
exampleorgid/333333333333",  
      "JoinedMethod": "INVITED",  
      "JoinedTimestamp": 1481835795.536,  
      "Id": "333333333333",  
      "Name": "Development Account",  
      "Email": "juan@example.com",  
      "Status": "ACTIVE"  
    },  
    {  
      "Arn": "arn:aws:organizations::111111111111:account/o-  
exampleorgid/444444444444",  
      "JoinedMethod": "INVITED",
```

```
        "JoinedTimestamp": 1481835812.143,  
        "Id": "44444444444444",  
        "Name": "Test Account",  
        "Email": "anika@example.com",  
        "Status": "ACTIVE"  
    }  
]  
}
```

- For API details, see [ListAccountsForParent](#) in *AWS CLI Command Reference*.

list-accounts

The following code example shows how to use `list-accounts`.

AWS CLI

To retrieve a list of all of the accounts in an organization

The following example shows you how to request a list of the accounts in an organization:

```
aws organizations list-accounts
```

The output includes a list of account summary objects.

```
{  
  "Accounts": [  
    {  
      "Arn": "arn:aws:organizations::111111111111:account/o-  
exampleorgid/111111111111",  
      "JoinedMethod": "INVITED",  
      "JoinedTimestamp": 1481830215.45,  
      "Id": "111111111111",  
      "Name": "Master Account",  
      "Email": "bill@example.com",  
      "Status": "ACTIVE"  
    },  
    {  
      "Arn": "arn:aws:organizations::111111111111:account/o-  
exampleorgid/222222222222",  
      "JoinedMethod": "INVITED",  
      "JoinedTimestamp": 1481835741.044,  
      "Id": "222222222222",  
    }  
  ]  
}
```

```

        "Name": "Production Account",
        "Email": "alice@example.com",
        "Status": "ACTIVE"
    },
    {
        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/333333333333",
        "JoinedMethod": "INVITED",
        "JoinedTimestamp": 1481835795.536,
        "Id": "333333333333",
        "Name": "Development Account",
        "Email": "juan@example.com",
        "Status": "ACTIVE"
    },
    {
        "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/444444444444",
        "JoinedMethod": "INVITED",
        "JoinedTimestamp": 1481835812.143,
        "Id": "444444444444",
        "Name": "Test Account",
        "Email": "anika@example.com",
        "Status": "ACTIVE"
    }
]
}

```

- For API details, see [ListAccounts](#) in *AWS CLI Command Reference*.

list-children

The following code example shows how to use `list-children`.

AWS CLI

To retrieve the child accounts and OUs of a parent OU or root

The following example you how to list the root or OU that contains that account 444444444444:

```
aws organizations list-children --child-type ORGANIZATIONAL_UNIT --parent-id ou-
exampleroottid111-exampleoid111
```

The output shows the two child OUs that are contained by the parent:

```
{
  "Children": [
    {
      "Id": "ou-examplerootid111-exampleouid111",
      "Type": "ORGANIZATIONAL_UNIT"
    },
    {
      "Id": "ou-examplerootid111-exampleouid222",
      "Type": "ORGANIZATIONAL_UNIT"
    }
  ]
}
```

- For API details, see [ListChildren](#) in *AWS CLI Command Reference*.

list-create-account-status

The following code example shows how to use `list-create-account-status`.

AWS CLI

Example 1: To retrieve a list of the account creation requests made in the current organization

The following example shows how to request a list of account creation requests for an organization that have completed successfully:

```
aws organizations list-create-account-status --states SUCCEEDED
```

The output includes an array of objects with information about each request.

```
{
  "CreateAccountStatuses": [
    {
      "AccountId": "4444444444444444",
      "AccountName": "Developer Test Account",
      "CompletedTimeStamp": 1481835812.143,
      "Id": "car-examplecreateaccountrequestid111",
      "RequestedTimeStamp": 1481829432.531,

```

```

        "State": "SUCCEEDED"
      }
    ]
  }

```

Example 2: To retrieve a list of the in progress account creation requests made in the current organization

The following example gets a list of in-progress account creation requests for an organization:

```
aws organizations list-create-account-status --states IN_PROGRESS
```

The output includes an array of objects with information about each request.

```

{
  "CreateAccountStatuses": [
    {
      "State": "IN_PROGRESS",
      "Id": "car-examplecreateaccountrequestid111",
      "RequestedTimeStamp": 1481829432.531,
      "AccountName": "Production Account"
    }
  ]
}

```

- For API details, see [ListCreateAccountStatus](#) in *AWS CLI Command Reference*.

list-handshakes-for-account

The following code example shows how to use `list-handshakes-for-account`.

AWS CLI

To retrieve a list of the handshakes sent to an account

The following example shows how to get a list of all handshakes that are associated with the account of the credentials that were used to call the operation:

```
aws organizations list-handshakes-for-account
```

The output includes a list of handshake structures with information about each handshake including its current state:

```
{
  "Handshake": {
    "Action": "INVITE",
    "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
    "ExpirationTimestamp": 1482952459.257,
    "Id": "h-examplehandshakeid111",
    "Parties": [
      {
        "Id": "o-exampleorgid",
        "Type": "ORGANIZATION"
      },
      {
        "Id": "juan@example.com",
        "Type": "EMAIL"
      }
    ],
    "RequestedTimestamp": 1481656459.257,
    "Resources": [
      {
        "Resources": [
          {
            "Type": "MASTER_EMAIL",
            "Value": "bill@amazon.com"
          },
          {
            "Type": "MASTER_NAME",
            "Value": "Org Master Account"
          },
          {
            "Type": "ORGANIZATION_FEATURE_SET",
            "Value": "FULL"
          }
        ],
        "Type": "ORGANIZATION",
        "Value": "o-exampleorgid"
      },
      {
        "Type": "EMAIL",
        "Value": "juan@example.com"
      }
    ]
  }
}
```

```

    }
    ],
    "State": "OPEN"
  }
}

```

- For API details, see [ListHandshakesForAccount](#) in *AWS CLI Command Reference*.

list-handshakes-for-organization

The following code example shows how to use `list-handshakes-for-organization`.

AWS CLI

To retrieve a list of the handshakes associated with an organization

The following example shows how to get a list of handshakes that are associated with the current organization:

```
aws organizations list-handshakes-for-organization
```

The output shows two handshakes. The first one is an invitation to Juan's account and shows a state of OPEN. The second is an invitation to Anika's account and shows a state of ACCEPTED:

```

{
  "Handshakes": [
    {
      "Action": "INVITE",
      "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
      "ExpirationTimestamp": 1482952459.257,
      "Id": "h-examplehandshakeid111",
      "Parties": [
        {
          "Id": "o-exampleorgid",
          "Type": "ORGANIZATION"
        },
        {
          "Id": "juan@example.com",
          "Type": "EMAIL"
        }
      ]
    },
  ],
}

```

```

    "RequestedTimestamp": 1481656459.257,
    "Resources": [
      {
        "Resources": [
          {
            "Type": "MASTER_EMAIL",
            "Value": "bill@amazon.com"
          },
          {
            "Type": "MASTER_NAME",
            "Value": "Org Master"
          },
          {
            "Type": "ORGANIZATION_FEATURE_SET",
            "Value": "FULL"
          }
        ],
        "Type": "ORGANIZATION",
        "Value": "o-exampleorgid"
      },
      {
        "Type": "EMAIL",
        "Value": "juan@example.com"
      },
      {
        "Type": "NOTES",
        "Value": "This is an invitation to Juan's
account to join Bill's organization."
      }
    ],
    "State": "OPEN"
  },
  {
    "Action": "INVITE",
    "State": "ACCEPTED",
    "Arn": "arn:aws:organizations::111111111111:handshake/o-
exampleorgid/invite/h-examplehandshakeid111",
    "ExpirationTimestamp": 1.471797437427E9,
    "Id": "h-examplehandshakeid222",
    "Parties": [
      {
        "Id": "o-exampleorgid",

```

```

        "Type": "ORGANIZATION"
      },
      {
        "Id": "anika@example.com",
        "Type": "EMAIL"
      }
    ],
    "RequestedTimestamp": 1.469205437427E9,
    "Resources": [
      {
        "Resources": [
          {
            "Type": "MASTER_EMAIL",
            "Value": "bill@example.com"
          },
          {
            "Type": "MASTER_NAME",
            "Value": "Master Account"
          }
        ],
        "Type": "ORGANIZATION",
        "Value": "o-exampleorgid"
      },
      {
        "Type": "EMAIL",
        "Value": "anika@example.com"
      },
      {
        "Type": "NOTES",
        "Value": "This is an invitation to Anika's
account to join Bill's organization."
      }
    ]
  }
]
}

```

- For API details, see [ListHandshakesForOrganization](#) in *AWS CLI Command Reference*.

list-organizational-units-for-parent

The following code example shows how to use `list-organizational-units-for-parent`.

AWS CLI

To retrieve a list of the OUs in a parent OU or root

The following example shows you how to get a list of OUs in a specified root:

```
aws organizations list-organizational-units-for-parent --parent-id r-  
examplerootid111
```

The output shows that the specified root contains two OUs and shows details of each:

```
{  
  "OrganizationalUnits": [  
    {  
      "Name": "AccountingDepartment",  
      "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-  
examplerootid111/ou-examplerootid111-exampleouid111"  
    },  
    {  
      "Name": "ProductionDepartment",  
      "Arn": "arn:aws:organizations::o-exampleorgid:ou/r-  
examplerootid111/ou-examplerootid111-exampleouid222"  
    }  
  ]  
}
```

- For API details, see [ListOrganizationalUnitsForParent](#) in *AWS CLI Command Reference*.

list-parents

The following code example shows how to use `list-parents`.

AWS CLI

To list the parent OUs or roots for an account or child OU

The following example you how to list the root or parent OU that contains that account 444444444444:

```
aws organizations list-parents --child-id 444444444444
```

The output shows that the specified account is in the OU with specified ID:

```
{
  "Parents": [
    {
      "Id": "ou-examplerootid111-exampleoid111",
      "Type": "ORGANIZATIONAL_UNIT"
    }
  ]
}
```

- For API details, see [ListParents](#) in *AWS CLI Command Reference*.

list-policies-for-target

The following code example shows how to use `list-policies-for-target`.

AWS CLI

To retrieve a list of the SCPs attached directly to an account

The following example shows how to get a list of all service control policies (SCPs), as specified by the `Filter` parameter, that are directly attached to an account:

```
aws organizations list-policies-for-target --filter SERVICE_CONTROL_POLICY --target-id 44444444444444
```

The output includes a list of policy structures with summary information about the policies. The list does not include policies that apply to the account because of inheritance from its location in an OU hierarchy:

```
{
  "Policies": [
    {
      "Type": "SERVICE_CONTROL_POLICY",
      "Name": "AllowAllEC2Actions",
      "AwsManaged": false,
      "Id": "p-examplepolicyid222",
      "Arn": "arn:aws:organizations::o-exampleorgid:policy/service_control_policy/p-examplepolicyid222",
      "Description": "Enables account admins to delegate permissions for any EC2 actions to users and roles in their accounts."
    }
  ]
}
```

```
]
}
```

- For API details, see [ListPoliciesForTarget](#) in *AWS CLI Command Reference*.

list-policies

The following code example shows how to use `list-policies`.

AWS CLI

To retrieve a list of all policies in an organization of a certain type

The following example shows you how to get a list of SCPs, as specified by the `filter` parameter:

```
aws organizations list-policies --filter SERVICE_CONTROL_POLICY
```

The output includes a list of policies with summary information:

```
{
  "Policies": [
    {
      "Type": "SERVICE_CONTROL_POLICY",
      "Name": "AllowAllS3Actions",
      "AwsManaged": false,
      "Id": "p-examplepolicyid111",
      "Arn": "arn:aws:organizations::111111111111:policy/service_control_policy/p-examplepolicyid111",
      "Description": "Enables account admins to delegate permissions for any S3 actions to users and roles in their accounts."
    },
    {
      "Type": "SERVICE_CONTROL_POLICY",
      "Name": "AllowAllEC2Actions",
      "AwsManaged": false,
      "Id": "p-examplepolicyid222",
      "Arn": "arn:aws:organizations::111111111111:policy/service_control_policy/p-examplepolicyid222",
      "Description": "Enables account admins to delegate permissions for any EC2 actions to users and roles in their accounts."
    },
    {
```

```

        "AwsManaged": true,
        "Description": "Allows access to every operation",
        "Type": "SERVICE_CONTROL_POLICY",
        "Id": "p-FullAWSAccess",
        "Arn": "arn:aws:organizations::aws:policy/
service_control_policy/p-FullAWSAccess",
        "Name": "FullAWSAccess"
    }
]
}

```

- For API details, see [ListPolicies](#) in *AWS CLI Command Reference*.

list-roots

The following code example shows how to use `list-roots`.

AWS CLI

To retrieve a list of the roots in an organization

This example shows you how to get the list of roots for an organization:

```
aws organizations list-roots
```

The output includes a list of root structures with summary information:

```

{
  "Roots": [
    {
      "Name": "Root",
      "Arn": "arn:aws:organizations::111111111111:root/o-
exampleorgid/r-examplerootid111",
      "Id": "r-examplerootid111",
      "PolicyTypes": [
        {
          "Status": "ENABLED",
          "Type": "SERVICE_CONTROL_POLICY"
        }
      ]
    }
  ]
}

```

```
}

```

- For API details, see [ListRoots](#) in *AWS CLI Command Reference*.

list-targets-for-policy

The following code example shows how to use `list-targets-for-policy`.

AWS CLI

To retrieve a list of the roots, OUs, and accounts that a policy is attached to

The following example shows how to get a list of the roots, OUs, and accounts that the specified policy is attached to:

```
aws organizations list-targets-for-policy --policy-id p-FullAWSAccess
```

The output includes a list of attachment objects with summary information about the roots, OUs, and accounts the policy is attached to:

```
{
  "Targets": [
    {
      "Arn": "arn:aws:organizations::111111111111:root/o-
exampleorgid/r-examplerootid111",
      "Name": "Root",
      "TargetId": "r-examplerootid111",
      "Type": "ROOT"
    },
    {
      "Arn": "arn:aws:organizations::111111111111:account/o-
exampleorgid/333333333333;",
      "Name": "Developer Test Account",
      "TargetId": "333333333333",
      "Type": "ACCOUNT"
    },
    {
      "Arn": "arn:aws:organizations::111111111111:ou/o-
exampleorgid/ou-examplerootid111-exampleoid111",
      "Name": "Accounting",
      "TargetId": "ou-examplerootid111-exampleoid111",
      "Type": "ORGANIZATIONAL_UNIT"
    }
  ]
}
```

```
    ]  
  }  
}
```

- For API details, see [ListTargetsForPolicy](#) in *AWS CLI Command Reference*.

move-account

The following code example shows how to use `move-account`.

AWS CLI

To move an account between roots or OUs

The following example shows you how to move the master account in the organization from the root to an OU:

```
aws organizations move-account --account-id 333333333333 --source-parent-id r-  
examplerootid111 --destination-parent-id ou-examplerootid111-exampleouid111
```

- For API details, see [MoveAccount](#) in *AWS CLI Command Reference*.

remove-account-from-organization

The following code example shows how to use `remove-account-from-organization`.

AWS CLI

To remove an account from an organization as the master account

The following example shows you how to remove an account from an organization:

```
aws organizations remove-account-from-organization --account-id 333333333333
```

- For API details, see [RemoveAccountFromOrganization](#) in *AWS CLI Command Reference*.

update-organizational-unit

The following code example shows how to use `update-organizational-unit`.

AWS CLI

To rename an OU

This example shows you how to rename an OU: In this example, the OU is renamed "AccountingOU":

```
aws organizations update-organizational-unit --organizational-unit-id ou-
exampleroottid111-exampleoid111 --name AccountingOU
```

The output shows the new name:

```
{
  "OrganizationalUnit": {
    "Id": "ou-exampleroottid111-exampleoid111"
    "Name": "AccountingOU",
    "Arn": "arn:aws:organizations::111111111111:ou/o-exampleorgid/ou-
exampleroottid111-exampleoid111"
  }
}
```

- For API details, see [UpdateOrganizationalUnit](#) in *AWS CLI Command Reference*.

update-policy

The following code example shows how to use update-policy.

AWS CLI

Example 1: To rename a policy

The following update-policy example renames a policy and gives it a new description.

```
aws organizations update-policy \
  --policy-id p-examplepolicyid111 \
  --name Renamed-Policy \
  --description "This description replaces the original."
```

The output shows the new name and description.

```
{
  "Policy": {
```

```

    "Content": "{\n  \"Version\": \"2012-10-17\", \n  \"Statement\": {\n\n    \"Effect\": \"Allow\", \n    \"Action\": \"ec2:*\", \n    \"Resource\": \"*\"\n  }\n}\n",
    "PolicySummary": {
      "Id": "p-examplepolicyid111",
      "AwsManaged": false,
      "Arn": "arn:aws:organizations::111111111111:policy/o-exampleorgid/
service_control_policy/p-examplepolicyid111",
      "Description": "This description replaces the original.",
      "Name": "Renamed-Policy",
      "Type": "SERVICE_CONTROL_POLICY"
    }
  }
}

```

Example 2: To replace a policy's JSON text content

The following example shows you how to replace the JSON text of the SCP in the previous example with a new JSON policy text string that allows S3 instead of EC2:

```

aws organizations update-policy \
  --policy-id p-examplepolicyid111 \
  --content "{\"Version\": \"2012-10-17\", \"Statement\": { \"Effect\": \"Allow\",
  \"Action\": \"s3:*\", \"Resource\": \"*\" } }"

```

The output shows the new content:

```

{
  "Policy": {
    "Content": "{ \"Version\": \"2012-10-17\", \"Statement\": { \"Effect\":
  \"Allow\", \"Action\": \"s3:*\", \"Resource\": \"*\" } }",
    "PolicySummary": {
      "Arn": "arn:aws:organizations::111111111111:policy/o-exampleorgid/
service_control_policy/p-examplepolicyid111",
      "AwsManaged": false;
      "Description": "This description replaces the original.",
      "Id": "p-examplepolicyid111",
      "Name": "Renamed-Policy",
      "Type": "SERVICE_CONTROL_POLICY"
    }
  }
}

```

- For API details, see [UpdatePolicy](#) in *AWS CLI Command Reference*.

AWS Outposts examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Outposts.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

get-outpost-instance-types

The following code example shows how to use `get-outpost-instance-types`.

AWS CLI

To get the instance types on your Outpost

The following `get-outpost-instance-types` example gets the instance types for the specified Outpost.

```
aws outposts get-outpost-instance-types \
  --outpost-id op-0ab23c4567EXAMPLE
```

Output:

```
{
  "InstanceTypes": [
```

```
{
  "InstanceType": "c5d.large"
},
{
  "InstanceType": "i3en.24xlarge"
},
{
  "InstanceType": "m5d.large"
},
{
  "InstanceType": "r5d.large"
}
],
"OutpostId": "op-0ab23c4567EXAMPLE",
"OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE"
}
```

For more information, see [Launch an instance on your Outpost](#) in the *AWS Outposts User Guide*.

- For API details, see [GetOutpostInstanceTypes](#) in *AWS CLI Command Reference*.

get-outpost

The following code example shows how to use get-outpost.

AWS CLI

To get Outpost details

The following get-outpost example displays the details for the specified Outpost.

```
aws outposts get-outpost \
  --outpost-id op-0ab23c4567EXAMPLE
```

Output:

```
{
  "Outpost": {
    "OutpostId": "op-0ab23c4567EXAMPLE",
    "OwnerId": "123456789012",
    "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE",
```

```
    "SiteId": "os-0ab12c3456EXAMPLE",
    "Name": "EXAMPLE",
    "LifecycleStatus": "ACTIVE",
    "AvailabilityZone": "us-west-2a",
    "AvailabilityZoneId": "usw2-az1",
    "Tags": {}
  }
}
```

For more information, see [Working with Outposts](#) in the *AWS Outposts User Guide*.

- For API details, see [GetOutpost](#) in *AWS CLI Command Reference*.

list-outposts

The following code example shows how to use `list-outposts`.

AWS CLI

To list Outposts

The following `list-outposts` example lists the Outposts in your AWS account.

```
aws outposts list-outposts
```

Output:

```
{
  "Outposts": [
    {
      "OutpostId": "op-0ab23c4567EXAMPLE",
      "OwnerId": "123456789012",
      "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-0ab23c4567EXAMPLE",
      "SiteId": "os-0ab12c3456EXAMPLE",
      "Name": "EXAMPLE",
      "Description": "example",
      "LifecycleStatus": "ACTIVE",
      "AvailabilityZone": "us-west-2a",
      "AvailabilityZoneId": "usw2-az1",
      "Tags": {
        "Name": "EXAMPLE"
      }
    }
  ]
}
```

```
    },
    {
      "OutpostId": "op-4fe3dc21baEXAMPLE",
      "OwnerId": "123456789012",
      "OutpostArn": "arn:aws:outposts:us-west-2:123456789012:outpost/
op-4fe3dc21baEXAMPLE",
      "SiteId": "os-0ab12c3456EXAMPLE",
      "Name": "EXAMPLE2",
      "LifeCycleStatus": "ACTIVE",
      "AvailabilityZone": "us-west-2a",
      "AvailabilityZoneId": "usw2-az1",
      "Tags": {}
    }
  ]
}
```

For more information, see [Working with Outposts](#) in the *AWS Outposts User Guide*.

- For API details, see [ListOutposts](#) in *AWS CLI Command Reference*.

list-sites

The following code example shows how to use `list-sites`.

AWS CLI

To list sites

The following `list-sites` example lists the available Outpost sites in your AWS account.

```
aws outposts list-sites
```

Output:

```
{
  "Sites": [
    {
      "SiteId": "os-0ab12c3456EXAMPLE",
      "AccountId": "123456789012",
      "Name": "EXAMPLE",
      "Description": "example",
      "Tags": {}
    }
  ]
}
```

```
]
}
```

For more information, see [Working with Outposts](#) in the *AWS Outposts User Guide*.

- For API details, see [ListSites](#) in *AWS CLI Command Reference*.

AWS Payment Cryptography examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-alias

The following code example shows how to use `create-alias`.

AWS CLI

To create an alias for a key

The following `create-alias` example creates an alias for a key.

```
aws payment-cryptography create-alias \  
  --alias-name alias/sampleAlias1 \  
  --key-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaiif1lw2h
```

Output:

```
{
  "Alias": {
    "AliasName": "alias/sampleAlias1",
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaiifllw2h"
  }
}
```

For more information, see [About aliases](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [CreateAlias](#) in *AWS CLI Command Reference*.

create-key

The following code example shows how to use `create-key`.

AWS CLI**To create a key**

The following `create-key` example generates a 2KEY TDES key you can use to generate and verify CVV/CVV2 values.

```
aws payment-cryptography create-key \
  --exportable \
  --key-attributes KeyAlgorithm=TDES_2KEY,
KeyUsage=TR31_C0_CARD_VERIFICATION_KEY,KeyClass=SYMMETRIC_KEY,
KeyModesOfUse={Generate=true,Verify=true}
```

Output:

```
{
  "Key": {
    "CreateTimestamp": "1686800690",
    "Enabled": true,
    "Exportable": true,
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/
kwapwa6qaiifllw2h",
    "KeyAttributes": {
      "KeyAlgorithm": "TDES_2KEY",
```

```
    "KeyClass": "SYMMETRIC_KEY",
    "KeyModesOfUse": {
      "Decrypt": false,
      "DeriveKey": false,
      "Encrypt": false,
      "Generate": true,
      "NoRestrictions": false,
      "Sign": false,
      "Unwrap": false,
      "Verify": true,
      "Wrap": false
    },
    "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"
  },
  "KeyCheckValue": "F2E50F",
  "KeyCheckValueAlgorithm": "ANSI_X9_24",
  "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
  "KeyState": "CREATE_COMPLETE",
  "UsageStartTimestamp": "1686800690"
}
}
```

For more information, see [Generating keys](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [CreateKey](#) in *AWS CLI Command Reference*.

delete-alias

The following code example shows how to use delete-alias.

AWS CLI

To delete an alias

The following delete-alias example deletes an alias. It does not affect the key.

```
aws payment-cryptography delete-alias \
  --alias-name alias/sampleAlias1
```

This command produces no output.

For more information, see [About aliases](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [DeleteAlias](#) in *AWS CLI Command Reference*.

delete-key

The following code example shows how to use delete-key.

AWS CLI

To delete a key

The following delete-key example schedules a key for deletion after 7 days, which is the default waiting period.

```
aws payment-cryptography delete-key \  
  --key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/  
  kwapwa6qaiifllw2h
```

Output:

```
{  
  "Key": {  
    "CreateTimestamp": "1686801198",  
    "DeletePendingTimestamp": "1687405998",  
    "Enabled": true,  
    "Exportable": true,  
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/  
kwapwa6qaiifllw2h",  
    "KeyAttributes": {  
      "KeyAlgorithm": "TDES_2KEY",  
      "KeyClass": "SYMMETRIC_KEY",  
      "KeyModesOfUse": {  
        "Decrypt": false,  
        "DeriveKey": false,  
        "Encrypt": false,  
        "Generate": true,  
        "NoRestrictions": false,  
        "Sign": false,  
        "Unwrap": false,  
        "Verify": true,  
        "Wrap": false  
      },  
      "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"  
    },  
    "KeyCheckValue": "F2E50F",  
    "KeyCheckValueAlgorithm": "ANSI_X9_24",  
  }  
}
```

```

    "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
    "KeyState": "DELETE_PENDING",
    "UsageStartTimestamp": "1686801190"
  }
}

```

For more information, see [Deleting keys](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [DeleteKey](#) in *AWS CLI Command Reference*.

export-key

The following code example shows how to use `export-key`.

AWS CLI

To export a key

The following `export-key` example exports a key.

```

aws payment-cryptography export-key \
  --export-key-identifier arn:aws:payment-cryptography:us-west-2:123456789012:key/
lco3w6gask7zgu2l \
  --key-material '{"Tr34KeyBlock": { \
    "CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-cryptography:us-
west-2:123456789012:key/ftobshq7pvioc5fx", \
    "ExportToken": "export-token-cu4lg26ofcziixny", \
    "KeyBlockFormat": "X9_TR34_2012", \
    "WrappingKeyCertificate": file://wrapping-key-certificate.pem }}'

```

Contents of `wrapping-key-certificate.pem`:

```

LS0tLS1CRUdJTiBDRVJUSUZJQ0FURS0tLS0tCk1JSUV2VENDQXFXZ0F3SUJBZ01SQ1ZZS8xMXFUK2svVz1RUDJQOE1V

```

Output:

```

{
  "WrappedKey": {
    "KeyMaterial":
    "308205A106092A864886F70D010702A08205923082058E020101310D300B06096086480165030402013082031F
    "WrappedKeyMaterialFormat": "TR34_KEY_BLOCK"
  }
}

```

```
}  
}
```

For more information, see [Export keys](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [ExportKey](#) in *AWS CLI Command Reference*.

get-alias

The following code example shows how to use `get-alias`.

AWS CLI

To get an alias

The following `get-alias` example returns the ARN of the key associated with the alias.

```
aws payment-cryptography get-alias \  
  --alias-name alias/sampleAlias1
```

Output:

```
{  
  "Alias": {  
    "AliasName": "alias/sampleAlias1",  
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/  
kwapwa6qaiifllw2h"  
  }  
}
```

For more information, see [About aliases](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [GetAlias](#) in *AWS CLI Command Reference*.

get-key

The following code example shows how to use `get-key`.

AWS CLI

To get the metadata of a key

The following `get-key` example returns the metadata of the key associated with the alias. This operation does not return cryptographic material.

```
aws payment-cryptography get-key \  
  --key-identifier alias/sampleAlias1
```

Output:

```
{  
  "Key": {  
    "CreateTimestamp": "1686800690",  
    "DeletePendingTimestamp": "1687405998",  
    "Enabled": true,  
    "Exportable": true,  
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/  
kwapwa6qaifllw2h",  
    "KeyAttributes": {  
      "KeyAlgorithm": "TDES_2KEY",  
      "KeyClass": "SYMMETRIC_KEY",  
      "KeyModesOfUse": {  
        "Decrypt": false,  
        "DeriveKey": false,  
        "Encrypt": false,  
        "Generate": true,  
        "NoRestrictions": false,  
        "Sign": false,  
        "Unwrap": false,  
        "Verify": true,  
        "Wrap": false  
      },  
      "KeyUsage": "TR31_C0_CARD_VERIFICATION_KEY"  
    },  
    "KeyCheckValue": "F2E50F",  
    "KeyCheckValueAlgorithm": "ANSI_X9_24",  
    "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",  
    "KeyState": "DELETE_PENDING",  
    "UsageStartTimestamp": "1686801190"  
  }  
}
```

For more information, see [Get keys](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [GetKey](#) in *AWS CLI Command Reference*.

get-parameters-for-export

The following code example shows how to use `get-parameters-for-export`.

AWS CLI

To initialize the export process

The following `get-parameters-for-export` example generates a key pair, signs the key, and then returns the certificate and certificate root.

```
aws payment-cryptography get-parameters-for-export \
  --signing-key-algorithm RSA_2048 \
  --key-material-type TR34_KEY_BLOCK
```

Output:

```
{
  "ExportToken": "export-token-ep5cwyzone7oya53",
  "ParametersValidUntilTimestamp": "1687415640",
  "SigningKeyAlgorithm": "RSA_2048",
  "SigningKeyCertificate":

get-parameters-for-import

The following code example shows how to use `get-parameters-for-import`.

AWS CLI

To initialize the import process

The following `get-parameters-for-import` example generates a key pair, signs the key, and then returns the certificate and certificate root.

```
aws payment-cryptography get-parameters-for-import \
  --key-material-type TR34_KEY_BLOCK \
  --wrapping-key-algorithm RSA_2048
```

Output:

```
{
  "ImportToken": "import-token-qgmafpa7nt2kfbb",
  "ParametersValidUntilTimestamp": "1687415640",
  "WrappingKeyAlgorithm": "RSA_2048",

get-public-key-certificate

The following code example shows how to use `get-public-key-certificate`.

AWS CLI

To return the public key

The following `get-public-key-certificate` example returns the public key portion of a key pair.

```

aws payment-cryptography get-public-key-certificate \
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
  kwapwa6qaiifllw2h

```

Output:

import-key

The following code example shows how to use `import-key`.

AWS CLI

To import a TR-34 key

The following `import-key` example imports a TR-34 key.

```
aws payment-cryptography import-key \
  --key-material='{ "Tr34KeyBlock": {" \
    CertificateAuthorityPublicKeyIdentifier": "arn:aws:payment-
cryptography:us-west-2:123456789012:key/rmm5wn2q564njinjm", \

list-aliases

The following code example shows how to use `list-aliases`.

AWS CLI

To get a list of aliases

The following `list-aliases` example shows all of the aliases in your account in this Region.

```
aws payment-cryptography list-aliases
```

Output:

```
{  
  "Aliases": [  
    {  
      "AliasName": "alias/sampleAlias1",  
      "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaifllw2h"  
    },  
    {  
      "AliasName": "alias/sampleAlias2",  
      "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaifllw2h"  
    }  
  ]  
}
```

```
    }  
  ]  
}
```

For more information, see [About aliases](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [ListAliases](#) in *AWS CLI Command Reference*.

list-keys

The following code example shows how to use `list-keys`.

AWS CLI

To get a list of keys

The following `list-keys` example shows all of the keys in your account in this Region.

```
aws payment-cryptography list-keys
```

Output:

```
{  
  "Keys": [  
    {  
      "CreateTimestamp": "1666506840",  
      "Enabled": false,  
      "Exportable": true,  
      "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaifllw2h",  
      "KeyAttributes": {  
        "KeyAlgorithm": "TDES_3KEY",  
        "KeyClass": "SYMMETRIC_KEY",  
        "KeyModesOfUse": {  
          "Decrypt": true,  
          "DeriveKey": false,  
          "Encrypt": true,  
          "Generate": false,  
          "NoRestrictions": false,  
          "Sign": false,  
          "Unwrap": true,  
          "Verify": false,  
          "Wrap": true  
        }  
      }  
    }  
  ]  
}
```

```

        },
        "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
    },
    "KeyCheckValue": "369D",
    "KeyCheckValueAlgorithm": "ANSI_X9_24",
    "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
    "KeyState": "CREATE_COMPLETE",
    "UsageStopTimestamp": "1666938840"
}
]
}

```

For more information, see [List keys](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [ListKeys](#) in *AWS CLI Command Reference*.

list-tags-for-resource

The following code example shows how to use `list-tags-for-resource`.

AWS CLI

To get the list of tags for a key

The following `list-tags-for-resource` example gets the tags for a key.

```

aws payment-cryptography list-tags-for-resource \
  --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/
  kwapwa6qaif1lw2h

```

Output:

```

{
  "Tags": [
    {
      "Key": "BIN",
      "Value": "20151120"
    },
    {
      "Key": "Project",
      "Value": "Production"
    }
  ]
}

```

```
}
```

For more information, see [Managing key tags with API operations](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [ListTagsForResource](#) in *AWS CLI Command Reference*.

restore-key

The following code example shows how to use `restore-key`.

AWS CLI

To restore a key that is scheduled for deletion

The following `restore-key` example cancels the deletion of a key.

```
aws payment-cryptography restore-key \  
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/  
  kwapwa6qaif1lw2h
```

Output:

```
{  
  "Key": {  
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaif1lw2h",  
    "KeyAttributes": {  
      "KeyUsage": "TR31_V2_VISA_PIN_VERIFICATION_KEY",  
      "KeyClass": "SYMMETRIC_KEY",  
      "KeyAlgorithm": "TDES_3KEY",  
      "KeyModesOfUse": {  
        "Encrypt": false,  
        "Decrypt": false,  
        "Wrap": false,  
        "Unwrap": false,  
        "Generate": true,  
        "Sign": false,  
        "Verify": true,  
        "DeriveKey": false,  
        "NoRestrictions": false  
      }  
    }  
  }  
}
```

```

    },
    "KeyCheckValue": "",
    "KeyCheckValueAlgorithm": "ANSI_X9_24",
    "Enabled": false,
    "Exportable": true,
    "KeyState": "CREATE_COMPLETE",
    "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
    "CreateTimestamp": "1686800690",
    "UsageStopTimestamp": "1687405998"
  }
}

```

For more information, see [Deleting keys](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [RestoreKey](#) in *AWS CLI Command Reference*.

start-key-usage

The following code example shows how to use start-key-usage.

AWS CLI

To enable a key

The following start-key-usage example enables a key to be used.

```

aws payment-cryptography start-key-usage \
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
  kwapwa6qaifllw2h

```

Output:

```

{
  "Key": {
    "CreateTimestamp": "1686800690",
    "Enabled": true,
    "Exportable": true,
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
alsuwxug3pgy6xh",
    "KeyAttributes": {
      "KeyAlgorithm": "TDES_3KEY",
      "KeyClass": "SYMMETRIC_KEY",
      "KeyModesOfUse": {

```

```

        "Decrypt": true,
        "DeriveKey": false,
        "Encrypt": true,
        "Generate": false,
        "NoRestrictions": false,
        "Sign": false,
        "Unwrap": true,
        "Verify": false,
        "Wrap": true
    },
    "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
},
"KeyCheckValue": "369D",
"KeyCheckValueAlgorithm": "ANSI_X9_24",
"KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
"KeyState": "CREATE_COMPLETE",
"UsageStartTimestamp": "1686800690"
}
}

```

For more information, see [Enabling and disabling keys](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [StartKeyUsage](#) in *AWS CLI Command Reference*.

stop-key-usage

The following code example shows how to use stop-key-usage.

AWS CLI

To disable a key

The following stop-key-usage example disables a key.

```

aws payment-cryptography stop-key-usage \
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/
  kwapwa6qaifllw2h

```

Output:

```

{
  "Key": {

```

```

    "CreateTimestamp": "1686800690",
    "Enabled": true,
    "Exportable": true,
    "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
alsuwfxug3pgy6xh",
    "KeyAttributes": {
      "KeyAlgorithm": "TDES_3KEY",
      "KeyClass": "SYMMETRIC_KEY",
      "KeyModesOfUse": {
        "Decrypt": true,
        "DeriveKey": false,
        "Encrypt": true,
        "Generate": false,
        "NoRestrictions": false,
        "Sign": false,
        "Unwrap": true,
        "Verify": false,
        "Wrap": true
      },
      "KeyUsage": "TR31_P1_PIN_GENERATION_KEY"
    },
    "KeyCheckValue": "369D",
    "KeyCheckValueAlgorithm": "ANSI_X9_24",
    "KeyOrigin": "AWS_PAYMENT_CRYPTOGRAPHY",
    "KeyState": "CREATE_COMPLETE",
    "UsageStartTimestamp": "1686800690"
  }
}

```

For more information, see [Enabling and disabling keys](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [StopKeyUsage](#) in *AWS CLI Command Reference*.

tag-resource

The following code example shows how to use tag-resource.

AWS CLI

To tag a key

The following tag-resource example tags a key.

```
aws payment-cryptography tag-resource \  
  --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaif1lw2h \  
  --tags Key=sampleTag,Value=sampleValue
```

This command produces no output.

For more information, see [Managing key tags](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [TagResource](#) in *AWS CLI Command Reference*.

untag-resource

The following code example shows how to use `untag-resource`.

AWS CLI

To remove a tag from a key

The following `untag-resource` example removes a tag from a key.

```
aws payment-cryptography untag-resource \  
  --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaif1lw2h \  
  --tag-keys sampleTag
```

This command produces no output.

For more information, see [Managing key tags](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [UntagResource](#) in *AWS CLI Command Reference*.

update-alias

The following code example shows how to use `update-alias`.

AWS CLI

To update an alias

The following `update-alias` example associates the alias with a different key.

```
aws payment-cryptography update-alias \  
  --resource-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaif1lw2h \  
  --alias sampleAlias \  
  --key sampleKey
```

```
--alias-name alias/sampleAlias1 \  
--key-arn arn:aws:payment-cryptography:us-east-2:123456789012:key/  
tqv5yij6wtxx64pi
```

Output:

```
{  
  "Alias": {  
    "AliasName": "alias/sampleAlias1",  
    "KeyArn": "arn:aws:payment-cryptography:us-west-2:123456789012:key/  
tqv5yij6wtxx64pi "  
  }  
}
```

For more information, see [About aliases](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [UpdateAlias](#) in *AWS CLI Command Reference*.

AWS Payment Cryptography Data Plane examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with AWS Payment Cryptography Data Plane.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

decrypt-data

The following code example shows how to use `decrypt-data`.

AWS CLI

To decrypt ciphertext

The following `decrypt-data` example decrypts ciphertext data using a symmetric key. For this operation, the key must have `KeyModesOfUse` set to `Decrypt` and `KeyUsage` set to `TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY`.

```
aws payment-cryptography-data decrypt-data \  
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaifllw2h \  
  --cipher-text 33612AB9D6929C3A828EB6030082B2BD \  
  --decryption-attributes 'Symmetric={Mode=CBC}'
```

Output:

```
{  
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaifllw2h",  
  "KeyCheckValue": "71D7AE",  
  "PlainText": "31323334313233343132333431323334"  
}
```

For more information, see [Decrypt data](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [DecryptData](#) in *AWS CLI Command Reference*.

encrypt-data

The following code example shows how to use `encrypt-data`.

AWS CLI

To encrypt data

The following `encrypt-data` example encrypts plaintext data using a symmetric key. For this operation, the key must have `KeyModesOfUse` set to `Encrypt` and `KeyUsage` set to `TR31_D0_SYMMETRIC_DATA_ENCRYPTION_KEY`.

```
aws payment-cryptography-data encrypt-data \  
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaifllw2h \  
  --plaintext 31323334313233343132333431323334
```

```
--plain-text 31323334313233343132333431323334 \  
--encryption-attributes 'Symmetric={Mode=CBC}'
```

Output:

```
{  
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaif1lw2h",  
  "KeyCheckValue": "71D7AE",  
  "CipherText": "33612AB9D6929C3A828EB6030082B2BD"  
}
```

For more information, see [Encrypt data](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [EncryptData](#) in *AWS CLI Command Reference*.

generate-card-validation-data

The following code example shows how to use `generate-card-validation-data`.

AWS CLI

To generate a CVV

The following `generate-card-validation-data` example generates a CVV/CVV2.

```
aws payment-cryptography-data generate-card-validation-data \  
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaif1lw2h \  
  --primary-account-number=171234567890123 \  
  --generation-attributes CardVerificationValue2={CardExpiryDate=0123}
```

Output:

```
{  
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaif1lw2h",  
  "KeyCheckValue": "CADD1",  
  "ValidationData": "801"  
}
```

For more information, see [Generate card data](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [GenerateCardValidationData](#) in *AWS CLI Command Reference*.

generate-mac

The following code example shows how to use generate-mac.

AWS CLI

To generate a MAC

The following generate-card-validation-data example generates a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key. The key must have KeyUsage set to TR31_M7_HMAC_KEY and KeyModesOfUse to Generate.

```
aws payment-cryptography-data generate-mac \  
  --key-identifier arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaif1lw2h \  
  --message-data  
  "3b313038383439303031303733393431353d32343038323236303030373030303f33" \  
  --generation-attributes Algorithm=HMAC_SHA256
```

Output:

```
{  
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:123456789012:key/  
kwapwa6qaif1lw2h,  
  "KeyCheckValue": "2976E7",  
  "Mac": "ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C"  
}
```

For more information, see [Generate MAC](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [GenerateMac](#) in *AWS CLI Command Reference*.

generate-pin-data

The following code example shows how to use generate-pin-data.

AWS CLI

To generate a PIN

The following `generate-card-validation-data` example generate a new random PIN using the Visa PIN scheme.

```
aws payment-cryptography-data generate-pin-data \  
  --generation-key-identifier arn:aws:payment-cryptography:us-  
east-2:111122223333:key/37y2tsl45p5zjbh2 \  
  --encryption-key-identifier arn:aws:payment-cryptography:us-  
east-2:111122223333:key/ivi5ksfsuplneuyt \  
  --primary-account-number 171234567890123 \  
  --pin-block-format ISO_FORMAT_0 \  
  --generation-attributes VisaPin={PinVerificationKeyIndex=1}
```

Output:

```
{  
  "GenerationKeyArn": "arn:aws:payment-cryptography:us-  
east-2:111122223333:key/37y2tsl45p5zjbh2",  
  "GenerationKeyCheckValue": "7F2363",  
  "EncryptionKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/  
ivi5ksfsuplneuyt",  
  "EncryptionKeyCheckValue": "7CC9E2",  
  "EncryptedPinBlock": "AC17DC148BDA645E",  
  "PinData": {  
    "VerificationValue": "5507"  
  }  
}
```

For more information, see [Generate PIN data](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [GeneratePinData](#) in *AWS CLI Command Reference*.

re-encrypt-data

The following code example shows how to use `re-encrypt-data`.

AWS CLI

To re-encrypt data with a different key

The following `re-encrypt-data` example decrypts cipher text that was encrypted using an AES symmetric key and re-encrypts it using a Derived Unique Key Per Transaction (DUKPT) key.

```
aws payment-cryptography-data re-encrypt-data \
  --incoming-key-identifier arn:aws:payment-cryptography:us-
west-2:111122223333:key/hyv7ymboitd4vfy \
  --outgoing-key-identifier arn:aws:payment-cryptography:us-
west-2:111122223333:key/jl6ythkcvzesbxen \
  --cipher-text
4D2B0BDBA192D5AEFEAA5B3EC28E4A65383C313FFA25140101560F75FE1B99F27192A90980AB9334 \
  --incoming-encryption-attributes
"Dukpt={Mode=ECB,KeySerialNumber=0123456789111111}" \
  --outgoing-encryption-attributes '{"Symmetric": {"Mode": "ECB"}}'
```

Output:

```
{
  "CipherText":
  "F94959DA30EEFF0C035483C6067667CF6796E3C1AD28C2B61F9CFEB772A8DD41C0D6822931E0D3B1",
  "KeyArn": "arn:aws:payment-cryptography:us-west-2:111122223333:key/
jl6ythkcvzesbxen",
  "KeyCheckValue": "2E8CD9"
}
```

For more information, see [Encrypt and decrypt data](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [ReEncryptData](#) in *AWS CLI Command Reference*.

translate-pin-data

The following code example shows how to use `translate-pin-data`.

AWS CLI

To translate PIN data

The following `translate-pin-data` example translates a PIN from PEK TDES encryption using ISO 0 PIN block to an AES ISO 4 PIN Block using the DUKPT algorithm.

```
aws payment-cryptography-data translate-pin-data \
  --encrypted-pin-block "AC17DC148BDA645E" \
  --incoming-translation-
attributes=IsoFormat0='{PrimaryAccountNumber=171234567890123}' \
```

```
--incoming-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/ivi5ksfsuplneuyt \
--outgoing-key-identifier arn:aws:payment-cryptography:us-
east-2:111122223333:key/4pmyquwjs3yj4vwe \
--outgoing-translation-attributes
IsoFormat4="{PrimaryAccountNumber=171234567890123}" \
--outgoing-dukpt-attributes KeySerialNumber="FFFF9876543210E00008"
```

Output:

```
{
  "PinBlock": "1F4209C670E49F83E75CC72E81B787D9",
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
ivi5ksfsuplneuyt
  "KeyCheckValue": "7CC9E2"
}
```

For more information, see [Translate PIN data](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [TranslatePinData](#) in *AWS CLI Command Reference*.

verify-auth-request-cryptogram

The following code example shows how to use `verify-auth-request-cryptogram`.

AWS CLI

To verify an auth request

The following `verify-auth-request-cryptogram` example verifies an Authorization Request Cryptogram (ARQC).

```
aws payment-cryptography-data verify-auth-request-cryptogram \
--auth-request-cryptogram F6E1BD1E6037FB3E \
--auth-response-attributes '{"ArpcMethod1": {"AuthResponseCode": "1111"}}' \
--key-identifier arn:aws:payment-cryptography:us-west-2:111122223333:key/
pboipdfzd4mdklya \
--major-key-derivation-mode "EMV_OPTION_A" \
--session-key-derivation-attributes '{"EmvCommon":
{"ApplicationTransactionCounter": "1234", "PanSequenceNumber":
"01", "PrimaryAccountNumber": "471234567890123"}}' \
--transaction-data "123456789ABCDEF"
```

Output:

```
{
  "AuthResponseValue": "D899B8C6FBF971AA",
  "KeyArn": "arn:aws:payment-cryptography:us-west-2:111122223333:key/
pboipdfzd4mdklya",
  "KeyCheckValue": "985792"
}
```

For more information, see [Verify auth request \(ARQC\) cryptogram](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [VerifyAuthRequestCryptogram](#) in *AWS CLI Command Reference*.

verify-card-validation-data

The following code example shows how to use `verify-card-validation-data`.

AWS CLI**To validate a CVV**

The following `verify-card-validation-data` example validates a CVV/CVV2 for a PAN.

```
aws payment-cryptography-data verify-card-validation-data \
  --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/
tqv5yij6wtxx64pi \
  --primary-account-number=171234567890123 \
  --verification-attributes CardVerificationValue2={CardExpiryDate=0123} \
  --validation-data 801
```

Output:

```
{
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/
tqv5yij6wtxx64pi",
  "KeyCheckValue": "CADD1"
}
```

For more information, see [Verify card data](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [VerifyCardValidationData](#) in *AWS CLI Command Reference*.

verify-mac

The following code example shows how to use `verify-mac`.

AWS CLI

To verify a MAC

The following `verify-mac` example verifies a Hash-Based Message Authentication Code (HMAC) for card data authentication using the algorithm HMAC_SHA256 and an HMAC encryption key.

```
aws payment-cryptography-data verify-mac \  
  --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/  
qno151ghrzunce6 \  
  --message-data  
  "3b343038383439303031303733393431353d32343038323236303030373030303f33" \  
  --verification-attributes='Algorithm=HMAC_SHA256' \  
  --mac ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C
```

Output:

```
{  
  "KeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/  
qno151ghrzunce6,  
  "KeyCheckValue": "2976E7",  
}
```

For more information, see [Verify MAC](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [VerifyMac](#) in *AWS CLI Command Reference*.

verify-pin-data

The following code example shows how to use `verify-pin-data`.

AWS CLI

To verify a PIN

The following `verify-pin-data` example validates a PIN for a PAN.

```
aws payment-cryptography-data verify-pin-data \  
  --key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/  
qno151ghrzunce6 \  
  --message-data  
  "3b343038383439303031303733393431353d32343038323236303030373030303f33" \  
  --verification-attributes='Algorithm=HMAC_SHA256' \  
  --mac ED87F26E961C6D0DDB78DA5038AA2BDDEA0DCE03E5B5E96BDDD494F4A7AA470C
```

```
--verification-key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/37y2tsl45p5zjbh2 \  
--encryption-key-identifier arn:aws:payment-cryptography:us-east-2:111122223333:key/ivi5ksfsuplneuyt \  
--primary-account-number 171234567890123 \  
--pin-block-format ISO_FORMAT_0 \  
--verification-attributes  
VisaPin="{PinVerificationKeyIndex=1,VerificationValue=5507}" \  
--encrypted-pin-block AC17DC148BDA645E
```

Output:

```
{  
  "VerificationKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/37y2tsl45p5zjbh2",  
  "VerificationKeyCheckValue": "7F2363",  
  "EncryptionKeyArn": "arn:aws:payment-cryptography:us-east-2:111122223333:key/ivi5ksfsuplneuyt",  
  "EncryptionKeyCheckValue": "7CC9E2",  
}
```

For more information, see [Verify PIN data](#) in the *AWS Payment Cryptography User Guide*.

- For API details, see [VerifyPinData](#) in *AWS CLI Command Reference*.

Amazon Pinpoint examples using AWS CLI

The following code examples show you how to perform actions and implement common scenarios by using the AWS Command Line Interface with Amazon Pinpoint.

Actions are code excerpts from larger programs and must be run in context. While actions show you how to call individual service functions, you can see actions in context in their related scenarios and cross-service examples.

Scenarios are code examples that show you how to accomplish a specific task by calling multiple functions within the same service.

Each example includes a link to GitHub, where you can find instructions on how to set up and run the code in context.

Actions

create-app

The following code example shows how to use create-app.

AWS CLI

Example 1: To create an application

The following create-app example creates a new application (project).

```
aws pinpoint create-app \  
  --create-application-request Name=ExampleCorp
```

Output:

```
{  
  "ApplicationResponse": {  
    "Arn": "arn:aws:mobiletargeting:us-  
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",  
    "Id": "810c7aab86d42fb2b56c8c966example",  
    "Name": "ExampleCorp",  
    "tags": {}  
  }  
}
```

Example 2: To create an application that is tagged

The following create-app example creates a new application (project) and associates a tag (key and value) with the application.

```
aws pinpoint create-app \  
  --create-application-request Name=ExampleCorp,tags={"Stack"="Test"}
```

Output:

```
{  
  "ApplicationResponse": {  
    "Arn": "arn:aws:mobiletargeting:us-  
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",  
    "Id": "810c7aab86d42fb2b56c8c966example",
```

```
    "Name": "ExampleCorp",
    "tags": {
      "Stack": "Test"
    }
  }
}
```

- For API details, see [CreateApp](#) in *AWS CLI Command Reference*.

create-sms-template

The following code example shows how to use `create-sms-template`.

AWS CLI

Creates a message template for messages that are sent through the SMS channel

The following `create-sms-template` example creates a SMS message template.

```
aws pinpoint create-sms-template \
  --template-name TestTemplate \
  --sms-template-request file://myfile.json \
  --region us-east-1
```

Contents of `myfile.json`:

```
{
  "Body": "hello\n how are you?\n food is good",
  "TemplateDescription": "Test SMS Template"
}
```

Output:

```
{
  "CreateTemplateMessageBody": {
    "Arn": "arn:aws:mobiletargeting:us-east-1:AIDACKCEVSQ6C2EXAMPLE:templates/
TestTemplate/SMS",
    "Message": "Created",
    "RequestID": "8c36b17f-a0b0-400f-ac21-29e9b62a975d"
  }
}
```

For more information, see [Amazon Pinpoint message templates](#) in the *Amazon Pinpoint User Guide*.

- For API details, see [CreateSmsTemplate](#) in *AWS CLI Command Reference*.

delete-app

The following code example shows how to use `delete-app`.

AWS CLI

To delete an application

The following `delete-app` example deletes an application (project).

```
aws pinpoint delete-app \  
  --application-id 810c7aab86d42fb2b56c8c966example
```

Output:

```
{  
  "ApplicationResponse": {  
    "Arn": "arn:aws:mobiletargeting:us-  
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",  
    "Id": "810c7aab86d42fb2b56c8c966example",  
    "Name": "ExampleCorp",  
    "tags": {}  
  }  
}
```

- For API details, see [DeleteApp](#) in *AWS CLI Command Reference*.

get-apns-channel

The following code example shows how to use `get-apns-channel`.

AWS CLI

To retrieve information about the status and settings of the APNs channel for an application

The following `get-apns-channel` example retrieves information about the status and settings of the APNs channel for an application.

```
aws pinpoint get-apns-channel \  
  --application-id 9ab1068eb0a6461c86cce7f27ce0efd7 \  
  --region us-east-1
```

Output:

```
{  
  "APNSChannelResponse": {  
    "ApplicationId": "9ab1068eb0a6461c86cce7f27ce0efd7",  
    "CreationDate": "2019-05-09T21:54:45.082Z",  
    "DefaultAuthenticationMethod": "CERTIFICATE",  
    "Enabled": true,  
    "HasCredential": true,  
    "HasTokenKey": false,  
    "Id": "apns",  
    "IsArchived": false,  
    "LastModifiedDate": "2019-05-09T22:04:01.067Z",  
    "Platform": "APNS",  
    "Version": 2  
  }  
}
```

- For API details, see [GetApnsChannel](#) in *AWS CLI Command Reference*.

get-app

The following code example shows how to use `get-app`.

AWS CLI

To retrieve information about an application (project)

The following `get-app` example retrieves information about an application (project).

```
aws pinpoint get-app \  
  --application-id 810c7aab86d42fb2b56c8c966example \  
  --region us-east-1
```

Output:

```
{
```

```
"ApplicationResponse": {
  "Arn": "arn:aws:mobiletargeting:us-
east-1:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
  "Id": "810c7aab86d42fb2b56c8c966example",
  "Name": "ExampleCorp",
  "tags": {
    "Year": "2019",
    "Stack": "Production"
  }
}
```

- For API details, see [GetApp](#) in *AWS CLI Command Reference*.

get-apps

The following code example shows how to use `get-apps`.

AWS CLI

To retrieve information about all of your applications

The following `get-apps` example retrieves information about all of your applications (projects).

```
aws pinpoint get-apps
```

Output:

```
{
  "ApplicationsResponse": {
    "Item": [
      {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/810c7aab86d42fb2b56c8c966example",
        "Id": "810c7aab86d42fb2b56c8c966example",
        "Name": "ExampleCorp",
        "tags": {
          "Year": "2019",
          "Stack": "Production"
        }
      },
      {
```

```

        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/42d8c7eb0990a57ba1d5476a3example",
        "Id": "42d8c7eb0990a57ba1d5476a3example",
        "Name": "AnyCompany",
        "tags": {}
    },
    {
        "Arn": "arn:aws:mobiletargeting:us-
west-2:AIDACKCEVSQ6C2EXAMPLE:apps/80f5c382b638ffe5ad12376bbexample",
        "Id": "80f5c382b638ffe5ad12376bbexample",
        "Name": "ExampleCorp_Test",
        "tags": {
            "Year": "2019",
            "Stack": "Test"
        }
    }
],
    "NextToken":
    "eyJJdcmVhdGlvbkRhdGUiOiIyMDE5LTA3LTE2VDE0jM40jUzLjkwM1oiLCJBY2NvdW50SWQ0iI1MTIzOTcxODM4Nz"
}
}

```

The presence of the `NextToken` response value indicates that there is more output available. Call the command again and supply that value as the `NextToken` input parameter.

- For API details, see [GetApps](#) in *AWS CLI Command Reference*.

get-campaign

The following code example shows how to use `get-campaign`.

AWS CLI

To retrieve information about the status, configuration, and other settings for a campaign

The following `get-campaign` example retrieves information about the status, configuration, and other settings for a campaign.

```

aws pinpoint get-campaign \
  --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \
  --campaign-id a1e63c6cc0eb43ed826ffcc3cc90b30d \
  --region us-east-1

```

Output:

```

get-email-channel

The following code example shows how to use `get-email-channel`.

AWS CLI

To retrieve information about the status and settings of the Email channel for an application

The following `get-email-channel` example retrieves status and settings of the Email channel for an application.

```
aws pinpoint get-email-channel \  
  --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \  
  --region us-east-1
```

Output:

```
{  
  "EmailChannelResponse": {  
    "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",

  }  
}
```

- For API details, see [GetEmailChannel](#) in *AWS CLI Command Reference*.

get-endpoint

The following code example shows how to use `get-endpoint`.

AWS CLI

To retrieve information about the settings and attributes of a specific endpoint for an application

The following `get-endpoint` example retrieves information about the settings and attributes of a specific endpoint for an application.

```
aws pinpoint get-endpoint \  
  --application-id 611e3e3cdd47474c9c1399a505665b91 \  
  --endpoint-id testendpoint \  
  --region us-east-1
```

Output:

```
{  
  "EndpointResponse": {  
    "Address": "+11234567890",  
    "ApplicationId": "611e3e3cdd47474c9c1399a505665b91",  
    "Attributes": {},  
    "ChannelType": "SMS",  
    "CohortId": "63",  
    "CreationDate": "2019-01-28T23:55:11.534Z",  
    "EffectiveDate": "2021-08-06T00:04:51.763Z",  
    "EndpointStatus": "ACTIVE",  
    "Id": "testendpoint",  
    "Location": {  
      "Country": "USA"  
    },  
    "Metrics": {  
      "SmsDelivered": 1.0  
    },  
    "OptOut": "ALL",  
    "RequestId": "a204b1f2-7e26-48a7-9c80-b49a2143489d",  
    "User": {  
      "UserAttributes": {  
        "Age": [  
          "24"  
        ]  
      },  
      "UserId": "testuser"  
    }  
  }  
}
```

```
}
```

- For API details, see [GetEndpoint](#) in *AWS CLI Command Reference*.

get-gcm-channel

The following code example shows how to use `get-gcm-channel`.

AWS CLI

To retrieve information about the status and settings of the GCM channel for an application

The following `get-gcm-channel` example retrieves information about the status and settings of the GCM channel for an application.

```
aws pinpoint get-gcm-channel \  
  --application-id 6e0b7591a90841d2b5d93fa11143e5a7 \  
  --region us-east-1
```

Output:

```
{  
  "GCMChannelResponse": {  
    "ApplicationId": "6e0b7591a90841d2b5d93fa11143e5a7",  
    "CreationDate": "2019-10-08T18:28:23.182Z",  
    "Enabled": true,  
    "HasCredential": true,  
    "Id": "gcm",  
    "IsArchived": false,  
    "LastModifiedDate": "2019-10-08T18:28:23.182Z",  
    "Platform": "GCM",  
    "Version": 1  
  }  
}
```
