Citrix Cloud

November 14, 2023

Note:

Citrix Virtual Apps Essentials and Citrix Virtual Desktops Essentials have reached End of Sales and End of Life. For more information, see [CTX583004](#).

Citrix Cloud is a platform that hosts and administers Citrix cloud services. It connects to your resources through [connectors](#) on any cloud or infrastructure you choose (on-premises, public cloud, private cloud, or hybrid cloud). It allows you to create, manage, and deploy workspaces with apps and data to your end-users from a single console.

What's new

Visit [Citrix Cloud Updates](#) to stay up-to-date on new and upcoming features in Citrix Cloud and for the following services:

- Citrix Analytics
- Citrix DaaS
- Citrix Workspace

Try Citrix Cloud

Experience a full production environment in a proof-of-concept for one or more Citrix Cloud services. After [signing up for Citrix Cloud](#), you can request service trials right inside the console. When the trial ends, you can convert to a production environment so you retain all your configurations. For more information, see [Citrix Cloud Service Trials](#).

Citrix Cloud service documentation

Looking for information about setting up or managing Citrix Cloud services? Go to [Citrix Cloud Services](#) to find links to the product documentation for all cloud services.

Architectural and deployment resources

[Citrix Tech Zone](#) contains a wealth of information to help you learn more about Citrix Cloud and other Citrix products. Here you'll find reference architectures, diagrams, and technical papers that provide insights for designing, building, and deploying Citrix technologies.

To learn more about key service components in Citrix Cloud, see the following resources:

- [Citrix Workspace conceptual diagram](#): Provides an overview of key areas such as identity, workspace intelligence, and single sign-on.
- [Reference Architectures](#): Provides comprehensive guides for planning your Citrix Workspace implementation, including use cases, recommendations, and related resources.
- [Citrix DaaS reference architectures](#): Provides in-depth guidance for deploying Citrix DaaS (formerly Virtual Apps and Desktops service) with related services.

Education resources

The [Citrix Cloud Learning Series portal](#) offers education modules to get you up and running with Citrix Cloud and its services. You can view all of the modules sequentially, from overviews through planning and building services. Start your cloud journey with the following courses:

- [Fundamentals of Citrix Cloud](#)
- [Intro to Citrix Identity and Authentication](#)
- [Moving from StoreFront to Workspace](#)

The [Citrix Education video library](#) offers online video lessons that walk you through key deployment tasks and troubleshooting the components that you use with Citrix Cloud services. Learn more about tasks like installing Cloud Connectors and registering VDAs, as well as troubleshooting these components.

Service Level Agreement

February 28, 2024

Effective date: October 30, 2020

Citrix Cloud is designed using industry best practices to achieve a high degree of service availability.

This Service Level Agreement (SLA) describes Citrix's commitment for Citrix Cloud Service availability. This SLA is part of the Cloud Software Group end user agreement (EULA) for covered services ("Services").

Citrix's service commitment ("Service Commitment") is to maintain at least 99.9% monthly uptime ("Monthly Uptime") on Services. Monthly Uptime is calculated by subtracting from 100% the percentage of minutes during a full month of a Service in which the Service instance was in the state of "Unavailable." Services and the measure of availability for each are set forth in the table below. Monthly Uptime percentage measurements exclude downtime resulting from:

- Regularly scheduled maintenance windows.
- Customer's failure to follow configuration requirements for the Service as documented on <https://docs.citrix.com>, or abusive behavior, or faulty input.
- Customer's use of a Service after Citrix advised Customer to modify Customer's use of the Service, if Customer did not modify use.
- Caused by any component not managed by Citrix including, but not limited to, Customer controlled physical and virtual machines, Customer installed and maintained operating systems, Customer installed and controlled software, networking equipment or other hardware; Customer defined and controlled security settings, group policies and other configuration policies; public cloud provider failures, Internet Service Provider failures; or other Customer support factors external to Citrix' control.
- Customer's employees, agents, contractors, or vendors, or anyone gaining access by means of Customer's passwords or equipment, or otherwise resulting from Customer's failure to follow appropriate security practices.
- Customer's attempts to perform operations that exceed Service entitlements.
- Service disruption due to Force Majeure, including, but not limited to, natural disasters, war or acts of terrorism, or government actions.

No Service Commitment is offered for any Citrix trial, tech preview, Labs or Beta service.

Citrix offers Service Commitments to customers that:

- Have purchased the Services using a term based subscription (1 year minimum subscription period).
- Have at least a 100 unit subscription (1,000 minimum for Citrix Service Providers), per the license model applicable to the Service, during the claim period.

Citrix Service Providers (CSPs) are eligible on October 1, 2018.

Per Service Availability Measures

Service	Measure for Monthly Uptime
Citrix Analytics for Performance	Time users can access and improve apps and desktops performance.
Citrix Analytics for Security	Time users can detect and mitigate user access and activity risks.
NetScaler Application Delivery Management service	Average time the Service is available across all POPs.

Service	Measure for Monthly Uptime
Citrix Endpoint Management	Time users can access their Citrix delivered mobile apps and enrolled devices through the Service.
Citrix Gateway Service for HDX Proxy	Time users can access their app or desktop session through the Service.
NetScaler Intelligent Traffic Management	Time users can access traffic management functionality through DNS queries or HTTP API calls.
NetScaler SD-WAN Orchestrator	Time users can access their SD-WAN Orchestrator account and manage their SD-WAN network through the Service.
Citrix Secure Private Access	Time users can access their SaaS or internal web app through the Service.
Citrix DaaS	Time users can access their app or desktop session through the Service.
Citrix Workspace	Same as above for component services, but includes availability for each. Credits may be prorated if a claim relates to less than all components.

Note:

Citrix DaaS is the new name for Citrix Virtual Apps service, Citrix Virtual Desktops service, and Citrix Virtual Apps and Desktops service.

Service Commitment and Remedies

In the event Citrix fails to meet the Service Commitment in at least 3 out of any 5 consecutive months on or after the SLA Effective Date, the exclusive remedy is a 10% Service credit on a month-for-month basis, for those months that Citrix fails to meet the Service Commitment, applied to Customer’s next annual Service extension in the immediate renewal period for the same Service and same number of units as impacted.

- Monthly Uptime Percentage: > 99.9%
- Service Credit: 10% off for applicable months (presented to the Customer as a voucher)

To receive the above remedy, the customer must be in compliance with the EULA and the failure must be reported by the customer within thirty (30) days of the end of the last month of the consecutive five-

month period for which a credit claim is to be made. For instructions to report possible violations of this SLA, see [CTX237141](#).

The request must identify the Service(s), define the dates, times and durations of Unavailability, along with supporting logs or records that corroborate the Unavailability, and identify the affected users and their locations, as well any technical support requested or remediation implemented. Only one service credit will be issued per Service, for the applicable number of months, with a maximum of a single 10% service credit for all months of the extension. Customer must present the voucher upon purchase of the extension.

If you purchase the extension through a reseller, you will receive a credit through the reseller. The credit we apply for a direct purchase, or pass to your reseller for an indirect purchase, will be based on the pro-rated, blended suggested retail price of the extension for the same number of units. Citrix does not control resale pricing or resale credits. Credits do not include a right of offset on payments due to Citrix or a reseller. Citrix will occasionally update these terms. When updates occur, Citrix will also revise the publication date at the top of the Service Level Agreement. Any changes apply only to your new Service purchases or Service extensions on or after the current publication date.

How to get help and support

March 19, 2024

This article describes how to troubleshoot and get help if you experience a problem when creating an account or signing in to Citrix Cloud or another Citrix website. This article also includes other self-help resources and guided support options.

Important:

If you experience an issue with signing in to Citrix website or enrolling in multifactor authentication (MFA), review this article first for troubleshooting resources. If these resources don't help you resolve your issue, contact Citrix Customer Service at <https://www.citrix.com/contact/customer-service.html>.

Creating an account

A Citrix account is required to access certain resources on the Citrix website, such as Citrix discussion forums, training courses, certain product downloads, and Citrix Technical Support.

To create a new Citrix account for your company, contact Citrix using one of the following methods:

- Contact [Citrix Customer Service](#).
- Contact a [Citrix Partner](#) or [Citrix Sales office](#) in your area.

If you already have a Citrix account, you can create a Citrix Cloud account and complete the onboarding process by completing the tasks described in [Create a Citrix Cloud account](#).

If you encounter an issue when signing up for Citrix Cloud, contact [Citrix Customer Service](#).

Signing in to Citrix websites and Citrix Cloud

If you're having trouble signing in to a Citrix website with your Citrix account, use the following resources to troubleshoot:

- [CTX228792: Troubleshooting login issues on Citrix websites](#)
- [CTX283814: Sign in issue after setting up Citrix account](#)

I can't set up MFA or I can't authenticate with MFA when signing in to my Citrix account

Refer to the following articles for troubleshooting information:

- [CTX461297: How to Enroll into Multi Factor Authentication \(MFA\)](#)

- [CIX463758: How to recover access to your account](#)

If you still can't sign in with MFA, contact Citrix Customer Service at <https://www.citrix.com/contact/customer-service.html>.

How do I find my Citrix account user name or reset my Citrix password?

Use the following steps to verify your Citrix account user name and reset your password.

1. Visit <https://www.citrix.com/welcome/request-password.html>.
2. To verify your Citrix account user name:
 - a) Under **Find my account by**, select **Email**.
 - b) Enter the email address associated with your Citrix account.
3. To reset your Citrix account password:
 - a) Under **Find my account by**, select **User name**.
 - b) Enter your Citrix account user name.
4. Click **Find my account**.

If Citrix finds your account using your email address, Citrix sends you an email with the user names and company names associated with your email address. If Citrix finds your account using your Citrix user name, Citrix sends you an email with instructions to reset your password.

If you don't receive an email after several minutes, see Citrix emails aren't appearing in my email inbox in this article.

I can't sign in to Citrix Cloud

- Make sure you sign in with the correct account credentials. To verify your account user name, visit <https://citrix.cloud.com/>, select **Forgot your username?**, and enter your email address. Citrix sends you an email with your account username.
- You might need to reset your password. Citrix Cloud prompts you to change your password if you haven't signed in recently or if your password isn't strong enough. For more information, see [Changing your password](#) in this article.
- You might need to sign in using a custom sign-in URL. If your Citrix Cloud account uses [Azure AD](#), [Google Cloud Identity](#) or [SAML](#) to authenticate administrators, select **Sign in with my company credentials** and enter your company's sign-in URL. You can then enter your company credentials to access your company's Citrix Cloud account. If you don't know your company's sign-in URL, contact your company's administrator for assistance.

If you still can't sign in to Citrix Cloud, contact [Citrix Customer Service](#).

Citrix emails aren't appearing in my email inbox

When Citrix sends you emails to verify your identity for MFA, when finding your Citrix account, or when changing your password, the email typically arrives within a few minutes. If you don't receive these emails:

- Check the email address that's registered for your Citrix account and verify that it's correct. If you recently changed your email address, the verification email might be sent to your old address.
- The email might have been accidentally filtered. Check the Spam and Trash folders in your email client. You can also search your email account for emails from donotreplynotifications@citrix.com or cloud@citrix.com.
- Your firewall might have blocked the email. Ensure that the following addresses are listed as trusted senders:
 - donotreplynotifications@citrix.com
 - cloud@citrix.com
 - CustomerService@citrix.com

If you don't receive the email after several minutes or you experience another issue with signing in, contact [Citrix Customer Service](#).

Multifactor authentication for Citrix and Citrix Cloud accounts

Citrix customers are required to sign in to their Citrix account and Citrix Cloud using MFA. Enrolling in MFA occurs when:

- A new customer signs in to their Citrix account for the first time.
- A Citrix customer [onboards a new Citrix Cloud account](#) but hasn't yet enrolled in MFA.
- A new administrator [joins an existing Citrix Cloud account](#).

If you're prompted to enroll in MFA when you sign in to your Citrix account or Citrix Cloud, follow the steps in [CTX461297: How to Enroll into Multi Factor Authentication \(MFA\)](#).

For more information about MFA for Citrix accounts, see [CTX463482: Frequently asked questions when setting up Multi-Factor Authentication \(MFA\) on Citrix properties](#).

Account recovery

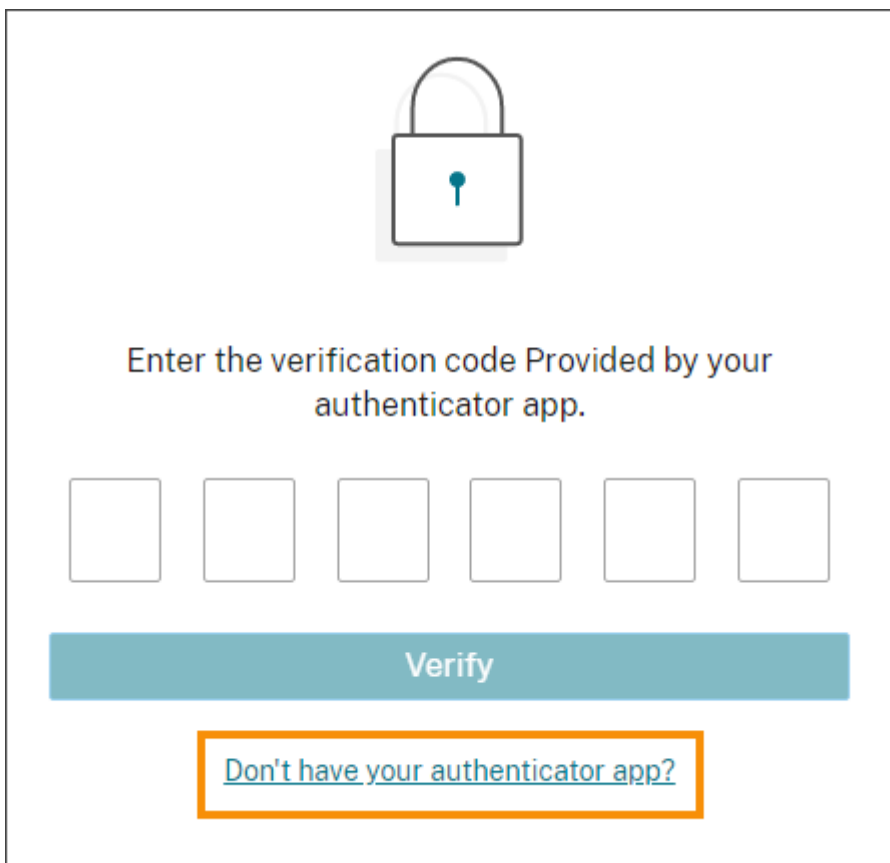

If you need help recovering your Citrix account credentials, see [How do I find my Citrix account user name or reset my Citrix password?](#) in this article.

If you need help recovering access to your Citrix Cloud account, you can use the recovery methods you configured when you enrolled in MFA. These recovery methods include:

- A one-time code that Citrix sends to your recovery email address.
- A backup code from the list that you generated during MFA enrollment.
- A phone call from Citrix Support to your recovery phone number to verify your identity and help you access your account. Setting up a recovery phone number is required during MFA enrollment.

To sign in with a recovery method:

1. From the [Citrix account](#) or [Citrix Cloud](#) sign-in page, enter your user name and password and then select **Sign in**.
2. When prompted for the code from your primary MFA method, select **Use a recovery method**.

Enter the verification code Provided by your authenticator app.

Verify

[Don't have your authenticator app?](#)

3. Select the recovery method you want to use, if applicable. If you have only one other recovery method configured, besides a recovery phone number, Citrix prompts you to use that method automatically.
4. If using your recovery email address, enter the one-time code that Citrix sends and select **Verify**. If you don't receive the code for some time, select **Re-send email**. After verification, Citrix Cloud signs you in.

5. If using a backup code, enter the code when prompted and select **Verify and continue**. Citrix Cloud signs you in and sends you an email to notify you that a backup code has been used and the number of remaining valid backup codes. Note or delete the used backup code to ensure that you don't use it again.
6. If you're not able to use your recovery email or backup codes:
 - a) Select **Contact Citrix Support**.
 - b) Complete the form with the details of your issue. A Citrix Support representative contacts you using your recovery phone number to verify your identity. Afterward, the representative sends you a recovery code you can use to sign in.
 - c) Return to the Citrix Cloud sign-in page and sign in using your Citrix Cloud credentials.
 - d) When prompted for a code, enter the recovery code you received from Citrix Support and select **Verify**.

After you sign in, be sure to update your account recovery methods to avoid future sign-in delays.

Update your MFA settings

You can update your MFA access and recovery settings through your **My settings** page. You can access this page through your Citrix account or through Citrix Cloud.

To access your **My settings** page:

1. Sign in to your Citrix account or to Citrix Cloud.
2. From your Citrix account, visit <https://accounts.cloud.com/core/profile>.
3. In Citrix Cloud, select **My settings** from the top-right menu.

To change your MFA settings, refer to the following sections:

- [Manage your primary MFA method](#)
- [Manage your MFA recovery methods](#)

Changing your password

If you've forgotten your account password, select **Forgot password?** and enter your account username when prompted. Citrix sends an email to the email address on your account with a link to set up a new password. If you don't receive this email after several minutes, or if you need further assistance, contact [Citrix Customer Service](#).

Citrix Cloud might prompt you to reset your password when you attempt to sign in. This prompt occurs if:

- Your password doesn't meet Citrix Cloud's complexity requirements.
- Your password includes dictionary words.
- Your password is listed in a known database of compromised passwords.
- You haven't signed in to Citrix Cloud in the last 60 days.

Passwords must be between 8 and 128 characters long and include:

- At least one number
- At least one upper-case letter
- At least one symbol: ! @ # \$ % ^ * ? + = -

When prompted, select **Reset Password** to create a new strong password for your account.

Cloud service health

The Citrix Cloud Health Dashboard (<https://status.cloud.com>) provides an overview of real-time availability of the Citrix Cloud platform and services in each geographical region. If you experience any issues with Citrix Cloud, check the Cloud Health Dashboard to verify that Citrix Cloud or specific services are operating normally.

For more information about the Cloud Health Dashboard, see [Service health](#).

Citrix Cloud support forums

On the [Citrix Cloud support forums](#) you can get help, provide feedback and improvement suggestions, view conversations from other users, or start your own topics.

Citrix support staff members track these forums and are ready to answer your questions. Other Citrix Cloud community members can also offer help or join the discussion.

You don't need to sign in to read forum topics. However, you must sign in to post or reply to a topic. To sign in, use your existing Citrix account credentials, or use the email address and password you provided when you created your Citrix Cloud account.

Support articles and documentation

Citrix provides substantial product and support content to help you get the most out of Citrix Cloud and resolve issues you might experience with Citrix products.

Citrix Support Knowledge Center

The [Knowledge Center](#) provides troubleshooting content as well as security bulletins and software update notices for all Citrix products. Simply enter a search string to find relevant content. You can filter results based on product and article type.

Citrix Tech Zone

[Citrix Tech Zone](#) contains information to help you learn more about Citrix Cloud and other Citrix products. Here, you can find reference architectures, diagrams, videos, and technical papers that provide insights for designing, building, and deploying Citrix technologies.

User Help Center

The [Citrix User Help Center](#) provides Citrix product documentation just for the end-users in your organization. The User Help Center provides instructions in an easy-to-read format for end-user-facing products such as Citrix Workspace app and Citrix SSO. For end-user documentation for ShareFile, see [Citrix Files apps](#) on the ShareFile product documentation web site.

Technical Support

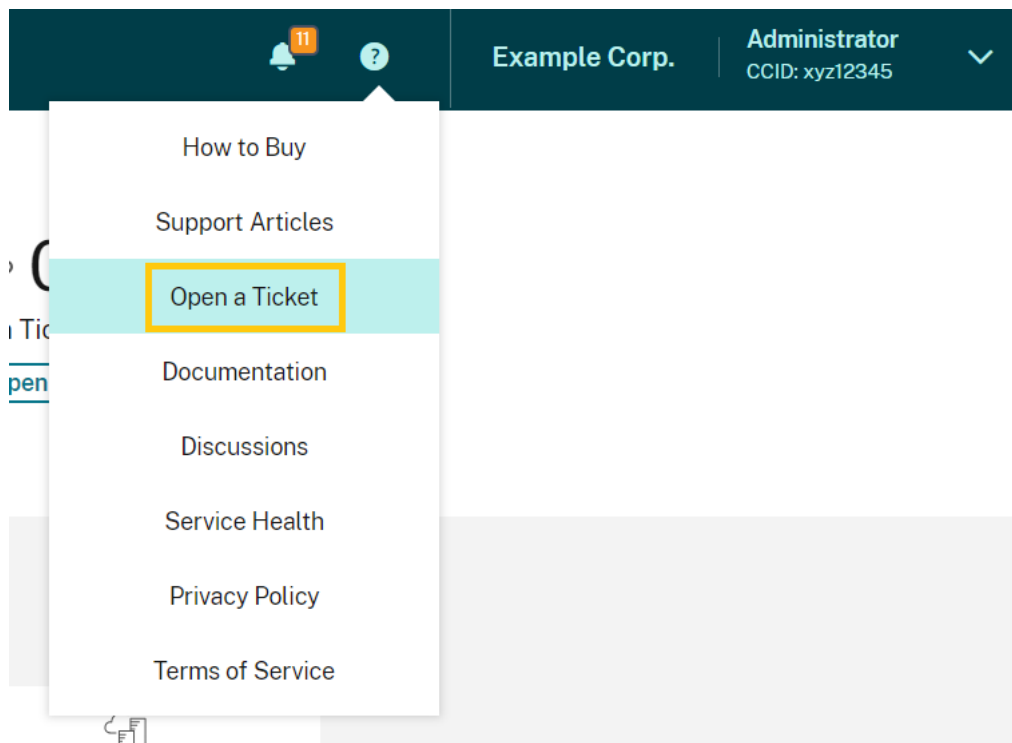

If you're experiencing an issue that requires technical help, you can access the My Support portal to open a support case or chat with a Citrix Technical Support representative.

To access the My Support portal, visit <https://support.citrix.com/case/manage>.

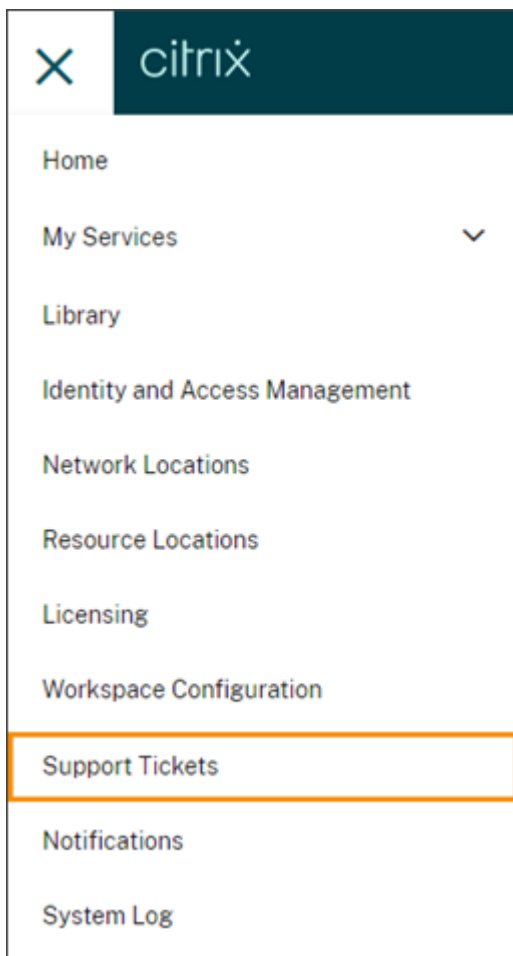

To access the portal from Citrix Cloud, you must have the **Support Tickets** permission. For more information about administrator permissions, see [Modify administrator permissions](#).

From the Citrix Cloud management console, you can access My Support using the following methods:

- From the **Help** icon near the top-right of the screen, select **Open a Ticket**.

- From the Citrix Cloud menu at the top-left of the screen, select **Support Tickets**.

After selecting either of these options, select **Go to My Support** and then sign in with your Citrix account credentials.

After signing in, contact Citrix Technical Support using one of the following methods:

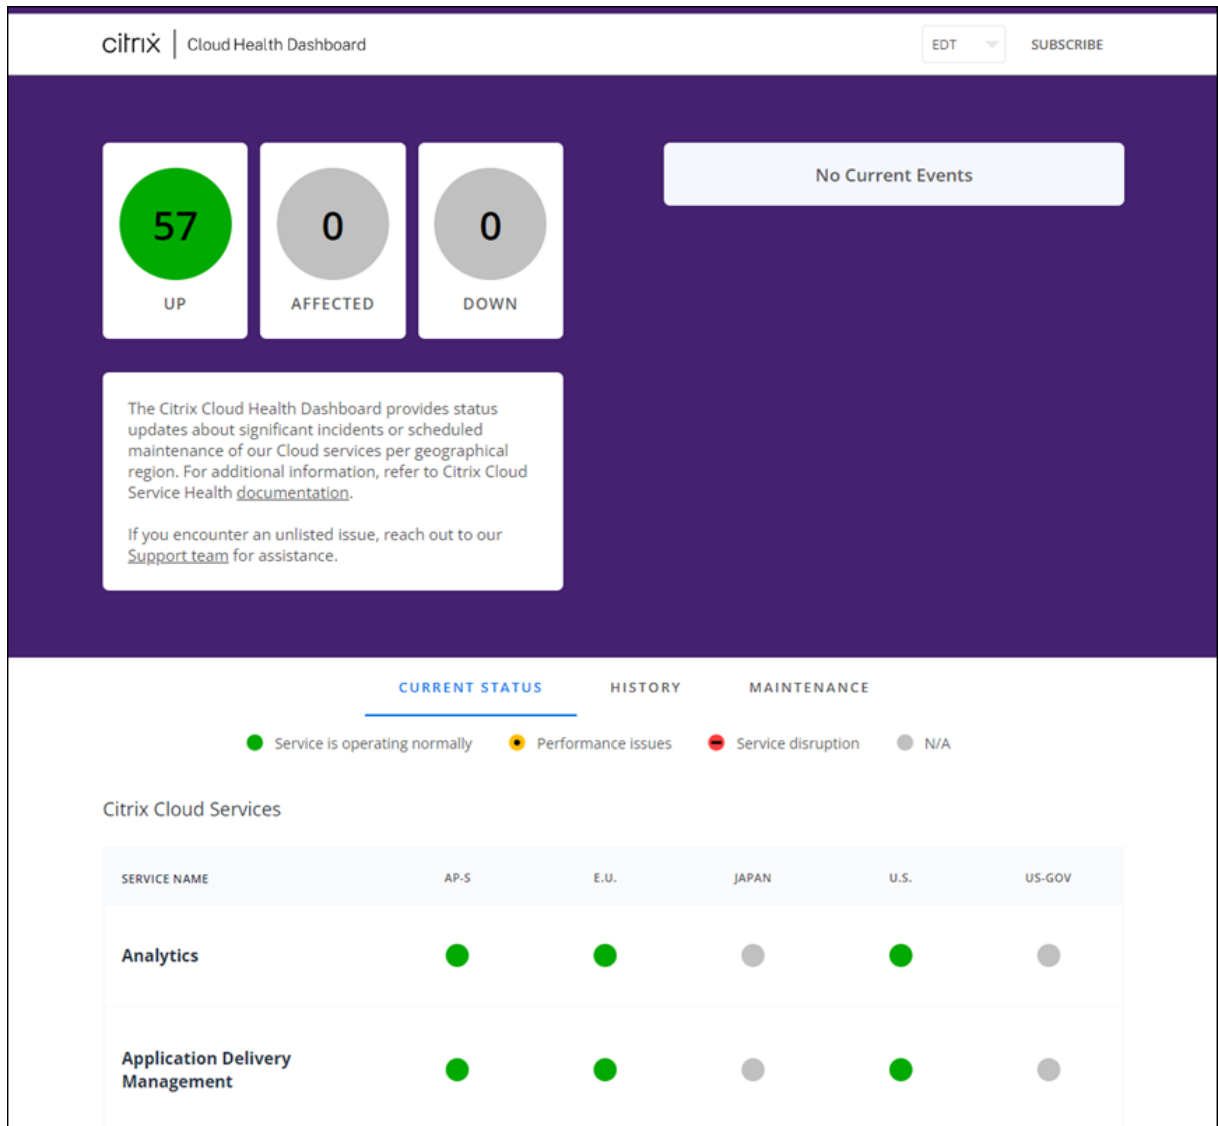

- Start a support case: Select **Open a Case** and then provide the details of the issue you're experiencing.
- By telephone: Select **Contact Support** to view a list of local phone numbers you can use to call Citrix Technical Support.
- Live Chat: Select **Start chat** in the lower-right corner of the page to chat with a Citrix Technical Support representative.

Citrix Cloud service health

November 9, 2023

The Citrix Cloud Health Dashboard provides an overview of real-time availability of the Citrix Cloud platform and services in each geographical region. If you experience any issues with Citrix Cloud, check the Cloud Health Dashboard to verify that Citrix Cloud or specific services are operating normally.

You can access the Cloud Health Dashboard using the following methods:

- Navigate to <https://status.cloud.com> through your web browser.
- Select **Service Health** from the Help menu in Citrix Cloud.

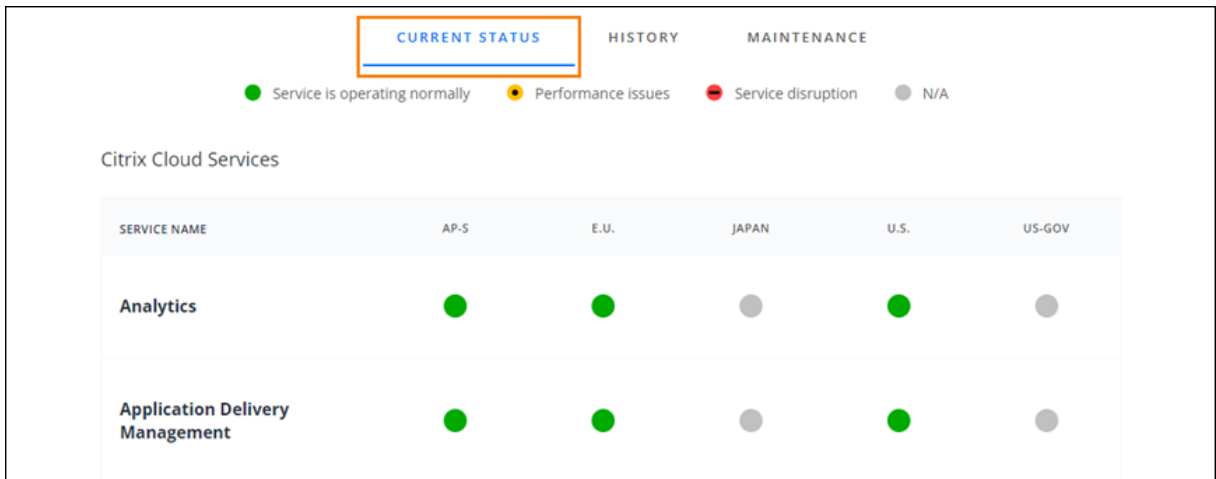

Use the dashboard to learn more about the following conditions:

- The current health status of all Citrix Cloud services, grouped by geographical region
- The health history of each service for the last seven days
- Maintenance windows for specific services

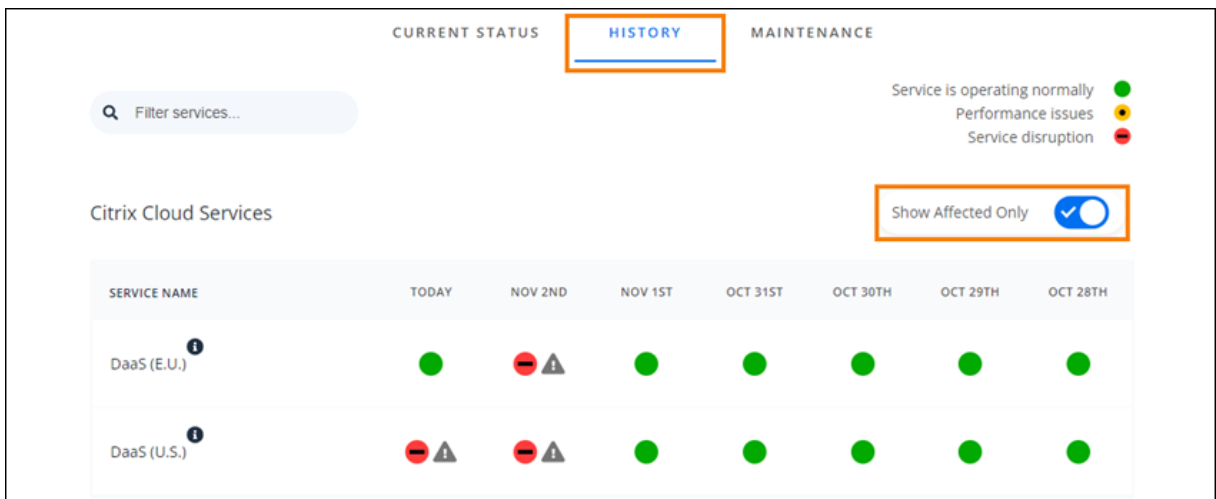

You can also subscribe to notifications about events like maintenance windows and service incidents.

View health and maintenance status

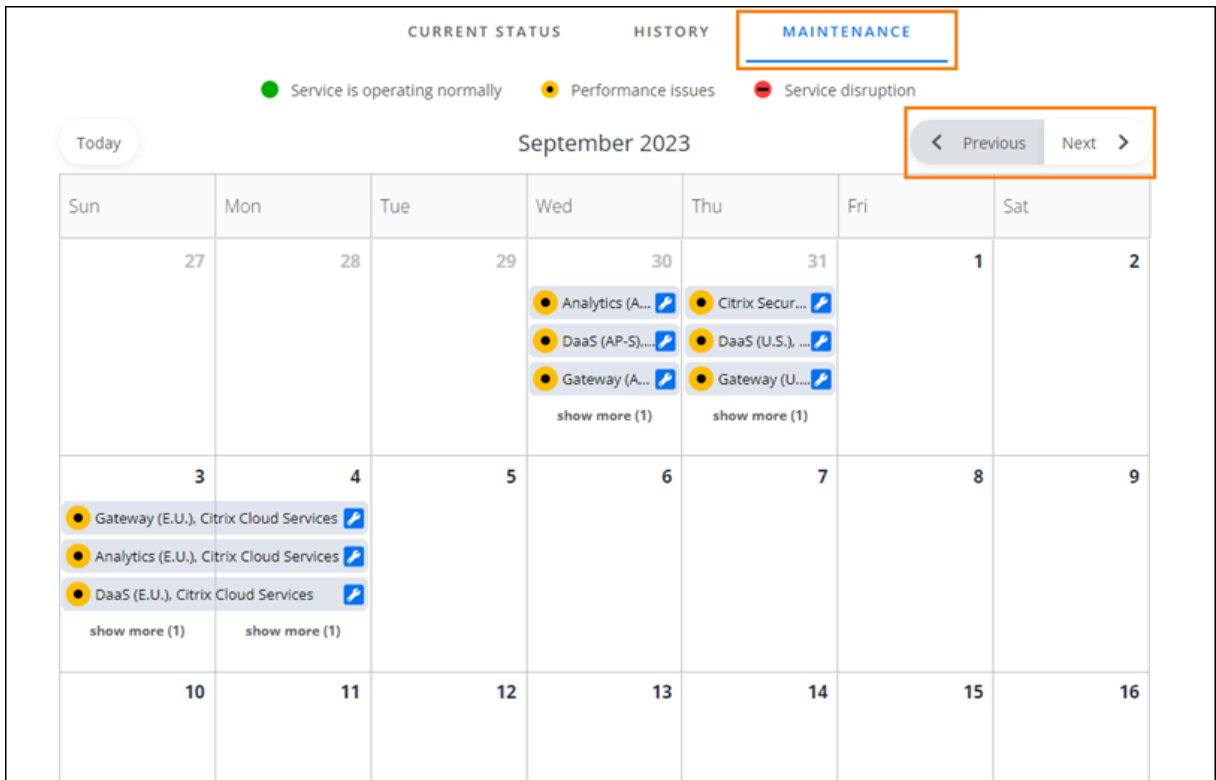

Select **Current Status** to display the current health status of all Citrix Cloud services and platform components in each geographical region.

Select **History** to display the health status of all Citrix Cloud services and platform components for the last seven days. Select **Show Affected Only** to display only the services that have had maintenance or health events in the last seven days.

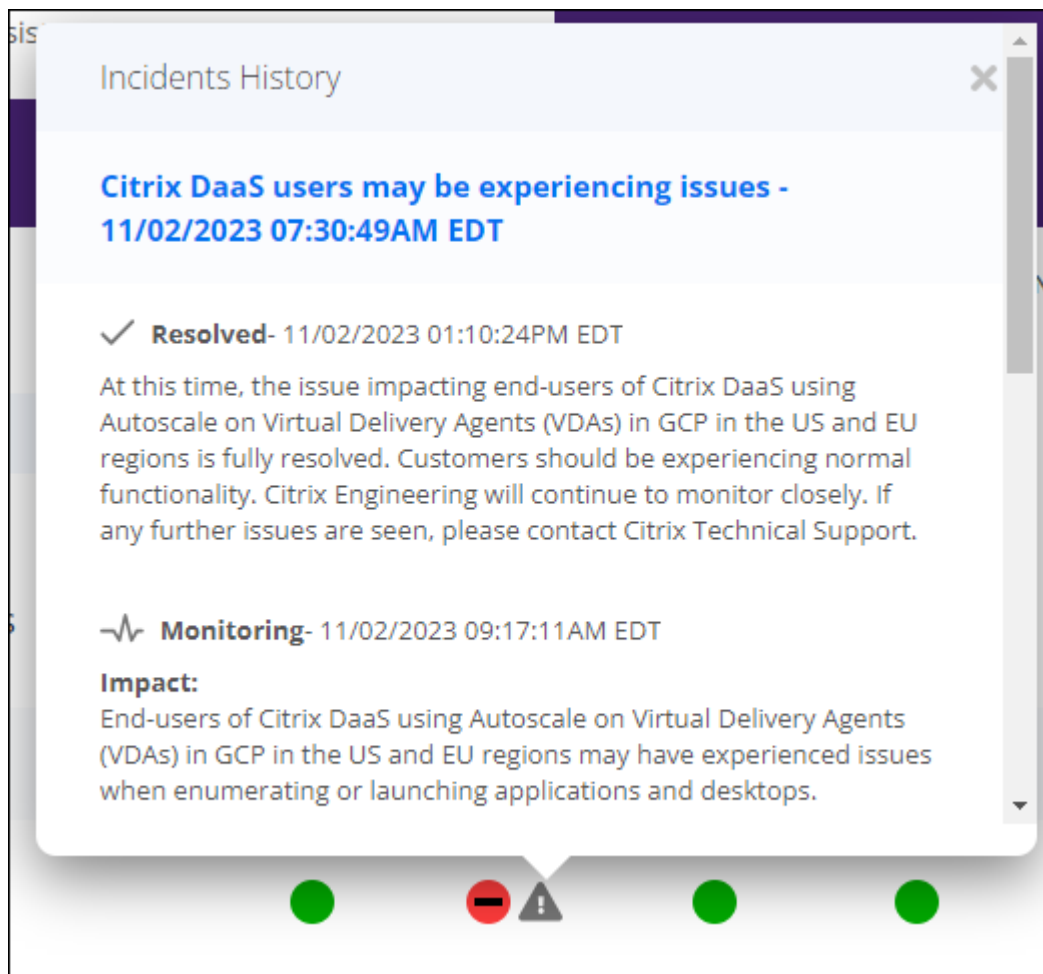

Select **Maintenance** to display a calendar view of service maintenance windows. Select **Next** to view maintenance events that are scheduled for future months. Select **Previous** to return to events for the current month.

View service incident details

To view more detailed information about the service health incident for an affected service:

- From the History view, click the icon next to the service indicator to view more detailed information about the service health incident.

- From the Maintenance view, click the service entry to view the status page for the scheduled maintenance window.

Sun	Mon	Tue	Wed	Thu	Fri	Sat
	27	28	29	30	31	1
			<ul style="list-style-type: none"> Analytics (A...) DaaS (AP-S)... Gateway (A...) show more (1) 	<ul style="list-style-type: none"> Citrix Secur... DaaS (U.S.). ... Gateway (U...) show more (1) 		2

Incident notification frequency

If a service health incident occurs, Citrix considers the following characteristics when posting to status.cloud.com:

- Duration of impact
- Frequency of impact

As the incident is being addressed, Citrix posts the following types of notifications to the Cloud Health Dashboard:

- **Investigating:** This notification indicates that Citrix has identified the issue as urgent and is investigating the issue.
- **Monitoring:** This notification indicates that Citrix has identified the root cause and is mitigating the issue.
- **Resolved:** This notification indicates that Citrix has resolved the issue and the service is restored to a healthy state.

While investigating and monitoring an incident, Citrix posts updates at 60 to 120 minute intervals. These updates may include information such as:

- Additional details about the incident.
- A description of the actions Citrix is taking to resolve the incident.
- An indication that no new changes occurred since the last update.

When an incident is resolved, Citrix posts a final update. This update might indicate the incident has been resolved and the service has been restored to a healthy state.

Subscribe to notifications

You can receive notifications about service health events using the following methods:

- Select **Subscribe** in the upper-right of the dashboard and select the notification method you want to use. You can select from several methods, including email and phone (as a text message).

- Enter the following URLs in your RSS reader to subscribe to the Citrix Cloud Health RSS feed:

- To receive service incident and maintenance notifications in a single feed, subscribe to <https://status.cloud.com/?format=atom>.
- To receive only service incident notifications, subscribe to <https://status.cloud.com/atom/incidents>.
- To receive only maintenance notifications, subscribe to <https://status.cloud.com/atom/maintenances>.

Subscribe to specific services in a region

1. Select **Subscribe** in the upper-right corner of the dashboard and then select the notification method you want to use.
2. Enter the contact details or URL for the chosen subscription method and select **I accept terms & services**. Select **Next**. The **Customizations** page appears with **Selected services** selected by default.
3. On the **Customizations** page, select the services in the regions that you want from the multi-page list.

Customizations

Notify about: All services Selected services

Unsubscribe from notifications

Depending on the subscription method, links to unsubscribe or change your subscription are included in the confirmation message you receive (for example, when subscribing to phone notifications) or in each notification message (for example, when you subscribe to email notifications). For example:

- Phone notification with subscription options:

- Notification email with subscription options

To unsubscribe from all notifications and remove all subscription methods:

1. Locate your subscription confirmation message or an existing notification and select the link to unsubscribe. Some subscription methods might provide a single link to edit or cancel your subscription.
2. Depending on your subscription method, use one of the following options on the **Edit Subscriptions** page:
 - Select **Remove all subscriptions**.

- Select **Unsubscribe**. From the **Unsubscribe methods** page, select **Remove all subscriptions**.

To unsubscribe from all notifications for a specific subscription method:

1. Locate your subscription confirmation message or an existing notification and select the link to unsubscribe. Some subscription methods might provide a single link to edit or cancel your subscription.
2. Depending on your subscription method, use one of the following options on the **Edit Subscriptions** page:
 - Select the subscription method you want to remove. Your subscription is removed immediately.
 - Select **Unsubscribe**. From the **Unsubscribe methods** page, select the subscription method you want to remove. Your subscription is removed immediately.

Change service notifications

1. Locate your subscription confirmation message or an existing notification and select the link to edit your subscription. Some subscription methods might provide a single link to edit or cancel your subscription.
2. From the **Edit Subscriptions page**, select the subscription method that you want to manage.
3. On the **Customizations** page, select the services you want to be notified about or clear the services you no longer want notifications for, as needed.
4. Select **Save**.

System and Connectivity Requirements

May 13, 2024

Citrix Cloud provides administrative functions (through a web browser) and operational requests (from other installed components) that connect to resources within your deployment. This article describes the system requirements, required contactable Internet addresses, and considerations for establishing connectivity between your resources and Citrix Cloud.

System requirements

Citrix Cloud requires the following minimum configuration:

- An Active Directory domain

- Two physical or virtual machines, joined to your domain, for the Citrix Cloud Connector. For more information, see [Citrix Cloud Connector Technical Details](#).
- Physical or virtual machines, joined to your domain, for hosting workloads and other components such as StoreFront. For more information about system requirements for specific services, refer to the Citrix documentation for each service.

For information about scale and size requirements, see [Scale and size considerations for Cloud Connectors](#).

Supported web browsers

- Latest version of Google Chrome
- Latest version of Mozilla Firefox
- Latest version of Microsoft Edge
- Latest version of Apple Safari

Transport Layer Security requirements

Citrix Cloud supports Transport Layer Security (TLS) 1.2 for TCP-based connections between components. Citrix Cloud doesn't allow communication over TLS 1.0 or TLS 1.1.

To access Citrix Cloud, you must use a browser that supports TLS 1.2 and have accepted cipher suites configured. For more information, see [Encryption and key management](#).

Citrix Cloud management console

The Citrix Cloud management console is a web-based console that you can access after signing in at <https://citrix.cloud.com>. The web pages that make up the console might require other resources on the Internet, either when signing in or at a later point when carrying out specific operations.

Proxy configuration

If you're connecting through a proxy server, the management console operates using the same configuration applied to your web browser. The console operates within the user context, so any configuration of proxy servers that require user authentication should work as expected.

Firewall configuration

For the management console to operate, you must have port 443 open for outbound connections. You can test general connectivity by navigating within the console. For more information about required

ports, see [Inbound and outbound ports configuration](#).

Console notifications

The management console uses Pendo to display critical alerts, notifications about new features, and in-product guidance for some features and services. To ensure you can view Pendo content within the management console, Citrix recommends that the address <https://citrix-cloud-content.customer.pendo.io/> is contactable.

Services that display Pendo content include:

- Citrix Analytics
- Citrix DaaS
- Citrix Workspace

Pendo is a third-party sub-processor that Citrix uses to provide cloud and support services to Citrix customers. For a complete list of these sub-processors, see [Sub-Processors for Citrix Cloud & Support Services and Citrix Affiliates](#).

Session time-outs

After an administrator signs in to Citrix Cloud, the management console session times out after 72 hours have elapsed. This time-out occurs regardless of console activity.

Configurable inactivity timeout for console

As a full-access administrator, you can configure the duration of inactivity on the Citrix Cloud console before administrators are automatically signed out. Once configured, the specified timeout period will be applied to all administrators of the Citrix Cloud account.

The screenshot shows the configuration interface for 'Console inactivity time-out'. At the top, the title 'Console inactivity time-out' is on the left, and 'Automatic time-out is enabled. (Recommended)' is on the right with a toggle switch that is turned on. Below the title, there is a descriptive text: 'To increase the security of your account, specify the period of inactivity allowed before administrators are automatically signed out of Citrix Cloud. This setting applies to all administrators on this account.' The configuration consists of two input fields: the first is for 'hour(s)' with a value of '0', and the second is for 'minute(s)' with a value of '10'. Each field has up and down arrow buttons. At the bottom of the configuration area, there is a 'Save' button.

When the feature is enabled, administrators will be logged out after the configured period of inactivity, and the session timeout will reset upon each subsequent login.

When the feature is disabled, there is no inactivity timer, and administrators will be logged out only when the 72-hour session limit is reached.

Note:

- By default this feature is disabled.
- The configurable inactivity timeout is 10 minutes to 12 hours.
- The default inactivity timeout is 60 minutes.

License Server registration with Citrix Cloud

If you are registering your on-premises Citrix License Server with Citrix Cloud to [monitor usage of on-premises deployments](#), ensure that the following addresses are contactable:

- <https://trust.citrixnetworkapi.net> (for retrieving a code)
- <https://trust.citrixworkspacesapi.net/> (for confirming the license server is registered)
- <https://cis.citrix.com> (for data upload)
- <https://core-eastus-release-a.citrixworkspacesapi.net>
- <https://core.citrixworkspacesapi.net>
- ocsp.digicert.com port 80
- crl3.digicert.com port 80
- crl4.digicert.com port 80
- ocsp.entrust.net port 80
- crl.entrust.net port 80

If you are using a proxy server with Citrix License Server, ensure that the proxy server is configured as described in [Configure a proxy server](#) in the Licensing product documentation.

Citrix Cloud Connector

The [Citrix Cloud Connector](#) is a software package that deploys a set of services that run on Microsoft Windows servers. The machine hosting the Cloud Connector resides within the network where the resources that you use with Citrix Cloud reside. The Cloud Connector connects to Citrix Cloud, allowing it to operate and manage your resources as needed.

For requirements for installing the Cloud Connector, see [System requirements](#). To operate, the Cloud Connector requires outbound connectivity on port 443. After installation, the Cloud Connector might have additional access requirements depending on the Citrix Cloud service with which it is being used.

The machine hosting the Cloud Connector must have stable network connectivity with Citrix Cloud. Networking components must support HTTPS and long-lived secure web sockets. If a timeout is configured in the networking components, it must be greater than 2 minutes.

For help with troubleshooting connectivity between the Cloud Connector and Citrix Cloud, use the [Cloud Connector Connectivity Check Utility](#). This utility runs a series of checks on the Cloud Connector machine to verify it can reach Citrix Cloud and related services. If you use a proxy server in your environment, all connectivity checks are tunneled through your proxy server. To download the utility, see [CTX260337](#) in the Citrix Support Knowledge Center.

Cloud Connector common service connectivity requirements

Connecting to the Internet from your data centers requires opening port 443 to outbound connections. However, to operate within environments containing an Internet proxy server or firewall restrictions, further configuration might be needed. For more information, see [Cloud Connector Proxy and Firewall Configuration](#).

The addresses for each service in this article must be contactable to properly operate and consume the service. The following list includes the addresses that are common to most Citrix Cloud services:

- https://*.citrixworkspacesapi.net (provides access to Citrix Cloud APIs that the services use)
- https://*.cloud.com (provides access to the Citrix Cloud sign-in interface)
- https://*.blob.core.windows.net (provides access to Azure Blob Storage, which stores updates for Citrix Cloud Connector)
- https://*.servicebus.windows.net (provides access to Azure Service Bus, which is used for logging and the Active Directory agent)

These addresses are provided only as domain names because Citrix Cloud services are dynamic and their IP addresses are subject to routine changes.

As a best practice, use Group Policy to configure and manage these addresses. Also, configure only the addresses that are applicable to the services that you and your end-users are consuming.

If you are using Citrix Cloud with Citrix License Server to [register your on-premises products](#), see License Server registration with Citrix Cloud in this article for additional required contactable addresses.

Allowed FQDNs for Cloud Connector

To help you ensure that all the required fully qualified domain names (FQDNs) are allowed through your firewall, Citrix provides the following resources:

- [allowlist.json](#)
- [CTX270584: Citrix Gateway Service –Points of Presence \(PoPs\)](#)

When configuring your firewall, consult both of these resources to verify that the FQDNs that your service deployment requires are allowed.

Local Host Cache (High Availability Service) When using Local Host Cache (LHC) in Connectors, ensure that the Connectors can reach the election endpoint of every other connector in the resource location. The election endpoint is on port 80 and can be accessed through the following URL: http://<FQDN_OR_IP_OF_PEER_CONNECTOR>/Citrix/CdsController/ISecondaryBrokerElection.

If Connectors are unable to communicate at this address, multiple brokers are elected during an LHC event, which can result in intermittent virtual app and desktop launch failures. For more information, see [Resource Locations with Multiple Cloud Connectors](#).

Adaptive Authentication When using the Cloud Connector for connectivity to an Adaptive Authentication service, you must allow your Citrix Cloud Connector to access the domain or URL you've reserved for the Adaptive Authentication instance. For example, allow <https://aauth.xyz.com>. For more information, see [Adaptive Authentication](#).

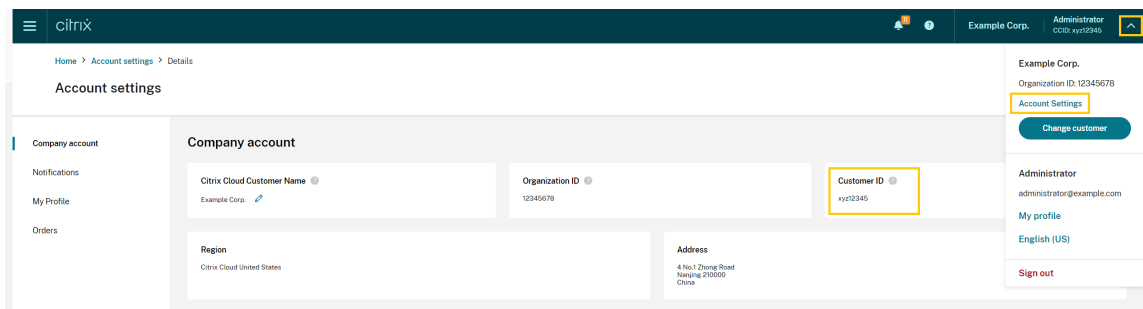

Allowlist.json The allowlist.json file is located at <https://fqdnallowlists.blob.core.windows.net/fqdnallowlist-commercial/allowlist.json> and lists the FQDNs that the Cloud Connector accesses. This list is grouped by product and includes a change log for each group of FQDNs.

Some of these FQDNs are specific to a customer and include templated sections in angular brackets. These templated sections must be replaced with the actual values before use. For example, for [<CUSTOMER_ID>.xendesktop.net](#), you replace [<CUSTOMER_ID>](#) with the actual customer ID for your Citrix Cloud account. You can find the customer ID in the following console locations:

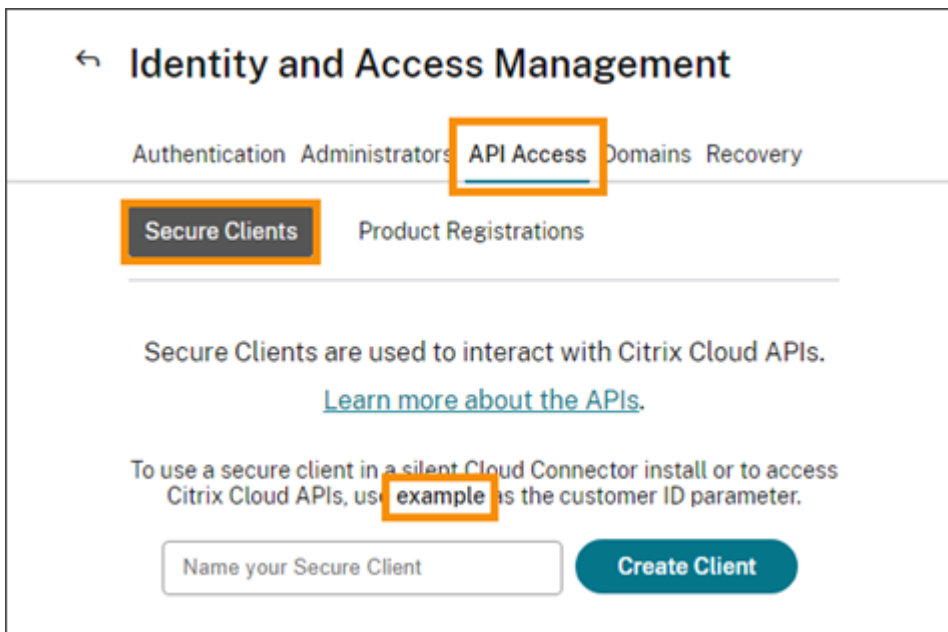

- In the top-right corner of the screen, beneath the customer name for your Citrix Cloud account.

- On the Account Settings page, under **Citrix Cloud Customer ID (CCID)**.

- On the **Secure Clients** tab **Identity and Access Management > API Access > Secure Clients**.

Gateway Service Points of Presence Some of the FQDNs included in the allowlist.json file are also included in [CTX270584: Citrix Gateway Service –Points of Presence \(PoPs\)](#). However, CTX270584 also includes FQDNs that clients access, such as the following:

- global-s.g.nssvc.net
- azure-s.g.nssvc.net

Certificate validation

Cloud Connector binaries and endpoints that the Cloud Connector contacts are protected by X.509 certificates that are verified when the software is installed. To validate these certificates, each Cloud Connector machine must meet certain requirements. For a full list of these requirements, see [Certificate validation requirements](#).

SSL Decryption

Enabling SSL decryption on certain proxies might prevent the Cloud Connector from connecting successfully to Citrix Cloud. For more information about resolving this issue, see [CTX221535](#).

Citrix Connector Appliance for Cloud Services

The [Connector Appliance](#) is an appliance that you can deploy in your hypervisor. The hypervisor hosting the Connector Appliance resides within the network where the resources that you use with Citrix Cloud reside. The Connector Appliance connects to Citrix Cloud, allowing it to operate and manage your resources as needed.

For requirements for installing the Connector Appliance, see [System requirements](#).

To operate, the Connector Appliance requires outbound connectivity on port 443. However, to operate within environments containing an Internet proxy server or firewall restrictions, further configuration might be needed.

To properly operate and consume the Citrix Cloud services, the following addresses must be contactable:

- https://*.cloud.com
- https://*.citrixworkspacesapi.net
- https://*.citrixnetworkapi.net
- https://*.*.nssvc.net

Customers who can't enable all sub-domains can use the following addresses instead

- https://*.g.nssvc.net
- https://*.c.nssvc.net
- https://*.servicebus.windows.net
- <https://iwsprodeastusuniconacr.azurecr.io>
- <https://iwsprodeastusuniconacr.eastus.data.azurecr.io>

Network requirements

Ensure that your Connector Appliance environment has the following configuration:

- Either the network allows the Connector Appliance to use DHCP to get DNS and NTP servers, an IP address, a host name, and a domain name or you can manually set the network settings in the [Connector Appliance console](#).

- The network is not configured to use the link-local IP ranges 169.254.0.1/24, 169.254.64.0/18 or 169.254.192.0/18, which are used internally by the Connector Appliance.
- Either the hypervisor clock is set to Coordinated Universal Time (UTC) and is synchronized with a time server or DHCP provides NTP server information to the Connector Appliance.
- If you use a proxy with Connector Appliance, the proxy must be unauthenticated or use basic authentication.

Citrix Analytics service connectivity

- For in-product messages including new features and critical communications: <https://citrix-cloud-content.customer.pendo.io/>
- Additional requirements: [Prerequisites](#)

For more information about onboarding data sources to the service, see [Supported data sources](#).

Application Delivery Management service connectivity

For complete Internet connectivity requirements, see [Supported ports](#) in the NetScaler product documentation.

Citrix DaaS service connectivity

Citrix resource location / Cloud Connector:

- [Cloud Connector common service connectivity requirements](#)
- [https://\[customerid\].xendesktop.net](https://[customerid].xendesktop.net), where [customerid] is the customer ID parameter displayed on the **Secure Clients** tab (**Identity and Access Management > API Access > Secure Clients**) of the Citrix Cloud management console.
 - Customers using Citrix Virtual Apps Essentials need to use https://*.xendesktop.net instead.
- Customers using [Quick Deploy](#) to install Citrix DaaS need to make these additional addresses contactable:
 - https://*.apps.cloud.com
 - The [AzureCloud service tag](#)
- https://*.*.nssvc.net
 - Customers who can't enable all subdomains can use the following addresses instead:
 - * https://*.g.nssvc.net

- * https://*.c.nssvc.net

For an overview of how the Cloud Connector communicates with the service, refer to the [Citrix DaaS diagram](#) on the Citrix Tech Zone website.

Administration console:

- https://*.citrixworkspacesapi.net (Not required for Rendezvous protocol)
- https://*.citrixnetworkapi.net (Not required for Rendezvous protocol)
- https://*.cloud.com (Not required for Rendezvous protocol)
- [https://\[customerid\].xendesktop.net](https://[customerid].xendesktop.net), where [customerid] is the customer ID parameter displayed on the **Secure Clients** tab (**Identity and Access Management > API Access > Secure Clients**) of the Citrix Cloud management console.
 - Customers using Citrix Virtual Apps Essentials need to use https://*.xendesktop.net instead.
- https://*.*.nssvc.net (Not required for Citrix DaaS Standard for Azure)
 - Customers who can't enable all sub-domains can use the following addresses instead:
 - * https://*.g.nssvc.net
 - * https://*.c.nssvc.net
- For in-product messages including new features and critical communications: <https://citrix-cloud-content.customer.pendo.io/>

Rendezvous protocol

When using the Citrix Gateway Service, the Rendezvous protocol allows VDAs to bypass the Citrix Cloud Connectors to connect directly and securely with the Citrix Cloud control plane.

Regardless of the protocol version you're using, VDAs must be able to contact the addresses for the administration console listed above, unless otherwise noted. For a complete list of the requirements for the Rendezvous protocol, refer to the following sections of the Citrix DaaS product documentation:

- [Rendezvous V1](#)
- [Rendezvous V2](#)

Local Host Cache requirement

If your firewall performs packet inspection and you want to use the Local Host Cache feature, ensure that your firewall accepts XML and SOAP traffic. This feature requires the ability to download MDF files, which occurs when the Cloud Connector synchronizes configuration data with Citrix Cloud. These files are delivered to the Cloud Connector through XML and SOAP traffic. If the firewall blocks this

traffic, the synchronization between the Cloud Connector and Citrix Cloud fails. If an outage occurs, users can't continue working because the configuration data residing on the Cloud Connector is out-of-date.

For more information about this feature, see [Local Host Cache](#) in the Citrix DaaS product documentation.

VDA upgrade requirement

Using the Full Configuration interface of Citrix DaaS, you can upgrade VDAs on a per-catalog or a per-machine basis. You can upgrade them immediately or at a scheduled time. For more information about the VDA upgrade feature, see [Upgrade VDAs using the Full Configuration interface](#).

When using the feature, make sure that you meet the following connectivity requirements:

- The following Azure CDN URLs have been added to the allow list. The feature downloads the VDA installers from the Azure CDN endpoints.
 - Production - United States (US): https://prod-us-vus-storage-endpoint.azureedge.net/*
 - Production - European Union (EU): https://prod-eu-vus-storage-endpoint.azureedge.net/*
 - Production - Asia Pacific South (APS): https://prod-aps-vus-storage-endpoint.azureedge.net/*
 - Production - Japan (JP): https://prod-jp-vus-storage-endpoint.azureedge.net/*
- The feature verifies that the VDA installer is signed by a valid certificate. Make sure that the following URLs have been added to the allow list for certificate validity and revocation check:
 - http://crl3.digicert.com/*
 - http://crl4.digicert.com/*
 - http://ocsp.digicert.com/*
 - http://cacerts.digicert.com/*
- The feature requires VDA Upgrade Agent to work. The VDA Upgrade Agent running on the VDA communicates with Citrix DaaS. Make sure that the following URLs have been added to the allow list:
 - [https://\[customerId\].xendesktop.net/citrix/VdaUpdateService/*](https://[customerId].xendesktop.net/citrix/VdaUpdateService/*), where `[customerId]` is the customer ID parameter displayed on the **Secure Clients** tab (**Identity and Access Management > API Access > Secure Clients**) of the Citrix Cloud management console.
 - http://xendesktop.net/citrix/VdaUpdateService/*

Endpoint Management service connectivity

Citrix resource location / Cloud Connector:

- [Cloud Connector common service connectivity requirements](#)
- Additional requirements: </en-us/citrix-endpoint-management/endpoint-management.html>

Administration console:

- https://*.citrix.com
- https://*.citrixworkspacesapi.net
- https://*.cloud.com
- https://*.blob.core.windows.net
- Additional requirements: </en-us/citrix-endpoint-management/endpoint-management.html>

Citrix Gateway service connectivity

- [Cloud Connector common service connectivity requirements](#)
- https://*.*.nssvc.net
 - Customers who can't enable all subdomains can use the following addresses instead:
 - * https://*.g.nssvc.net
 - * https://*.c.nssvc.net

Important:

SSL interception cannot be performed on Citrix Gateway addresses. Enabling SSL interception on certain proxies might prevent the Cloud Connector from connecting successfully to Citrix Cloud.

NetScaler Intelligent Traffic Management service connectivity

- https://*.cedexis-test.com
- https://*.citm-test.com
- <https://cedexis.com>
- <https://cedexis-radar.net>

SD-WAN Orchestrator service connectivity

For complete Internet connectivity requirements, see [Prerequisites for Citrix SD-WAN Orchestrator service usage](#).

Remote Browser Isolation (formerly Secure Browser) service connectivity

Citrix resource location / Cloud Connector:

[Cloud Connector common service connectivity requirements](#)

Administration console:

- https://*.cloud.com
- https://*.citrixworkspacesapi.net
- <https://browser-release-a.azureedge.net>
- <https://browser-release-b.azureedge.net>

Citrix Secure Private Access service connectivity

- https://*.netscalergateway.net
- https://*.*.nssvc.net
 - Customers who can't enable all subdomains can use the following addresses instead:
 - * https://*.g.nssvc.net
 - * https://*.c.nssvc.net

Citrix Workspace service connectivity

- https://*.cloud.com
- https://*.citrixdata.com
- For in-product messages including new features and critical communications: <https://citrix-cloud-content.customer.pendo.io/>

Global App Configuration service connectivity

<https://discovery.cem.cloud.us>

For more information about this service, refer to the following resources:

- [Customize Workspace app settings](#) - Citrix Workspace product documentation
- [Global App Configuration service](#) - Citrix Developer documentation

Citrix Workspace app connectivity

Add the following URLs to your allow list:

- https://*.cloud.com
- Identity provider address. Refer to instructions in the corresponding identity provider documentation.
- https://*.wsp.cloud.com

For specific URLs, allow access to the following addresses:

- `<yourcustomer>.cloud.com`

Citrix Secure Private Access

- ngspolicy.netscalergateway.net
- config.netscalergateway.net
- app.netscalergateway.net
- <http://tunnel.netscalergateway.net/>

Global App Configuration Service

Refer to Global App Configuration service connectivity in this article.

Authentication

- accounts.cloud.com
- accounts-dsauthweb.cloud.com

Ensure that your identity provider URLs are also accessible from your end user devices.

Citrix Analytics Service

- locus.analytics.cloud.com

Enable access to the appropriate URL from the following list, depending on your location:

- US: citrixanalyticseh.servicebus.windows.net
- EU: citrixanalyticsehu.servicebus.windows.net
- APS: citrixanalyticsehps.servicebus.windows.net

Workspace graphical interface assets

- ctx-ws-assets.cloud.com

Personalization, notifications, and feature rollout

- [customer-**interface**-personalization.us.wsp.cloud.com](https://customer-interface-personalization.us.wsp.cloud.com)
- user-personalization.us.wsp.cloud.com
- admin-notification.us.wsp.cloud.com
- [customer-**interface**-personalization.eu.wsp.cloud.com](https://customer-interface-personalization.eu.wsp.cloud.com)
- user-personalization.eu.wsp.cloud.com
- admin-notification.eu.wsp.cloud.com
- [customer-**interface**-personalization.ap-s.wsp.cloud.com](https://customer-interface-personalization.ap-s.wsp.cloud.com)
- user-personalization.ap-s.wsp.cloud.com
- admin-notification.ap-s.wsp.cloud.com
- feature-rollout.us.wsp.cloud.com
- feature-rollout.eu.wsp.cloud.com
- feature-rollout.ap-s.wsp.cloud.com

Device registration service

- device-registration.us.wsp.cloud.com
- device-registration.eu.wsp.cloud.com
- device-registration.ap-s.wsp.cloud.com

Push notification service

- push-events-signalr.us.wsp.cloud.com
- push-events-signalr.eu.wsp.cloud.com
- push-events-signalr.ap-s.wsp.cloud.com

Citrix Gateway service

- https://*.g.nssvc.net

Workspace single sign-on with Citrix Federated Authentication Service (FAS)

The console and FAS service access the following addresses using the user's account and the Network Service account, respectively.

- FAS administration console, under the user's account:
 - https://*.cloud.com
 - https://*.citrixworkspacesapi.net

- https://*.citrixnetworkapi.net/
- Addresses required by a third party identity provider, if one is used in your environment
- FAS service, under the Network Service account:
 - https://*.citrixworkspacesapi.net
 - https://*.citrixnetworkapi.net/

If your environment includes proxy servers, configure the user proxy with the addresses for the FAS administration console. Also, ensure that the address for the Network Service account is configured as appropriate for your environment.

If you are using Active Directory or Active Directory and a time-based one-time password (TOTP) as your identity provider for the Citrix Workspace app, you must also whitelist login.cloud.com. If you are using other identity providers, allow identity provider URLs separately.

CAS event hub URLs are also geo specific. citrixanalyticseh-alias.servicebus.windows.net

Workspace Environment Management service connectivity

Citrix resource location / Cloud Connector / Agent:

https://*.wem.cloud.com

For complete requirements, see [Connectivity prerequisites](#) in the Workspace Environment Management service documentation.

Plan your deployment

September 21, 2023

For a customer journey perspective, go to the [Citrix Success Center](#). The Success Center provides guidance for the five key stages of your Citrix journey: plan, build, roll out, manage, and optimize. The Success Center articles and guides are a companion to this documentation, offering a broad solution-based perspective.

Service trials and subscriptions

Citrix Cloud offers trials for most cloud services. Trials have the same features and functions as paid services, so they're suitable for a proof-of-concept or pilot deployment. For more information, see [Citrix Cloud Service Trials](#).

In general, paid service entitlements can have a monthly, annual, or termed duration. As the entitlement nears its end, Citrix Cloud sends reminders and provides a grace period so you can renew your entitlement without undue service interruptions. For more information about renewing your entitlements, see [Extend Citrix Cloud service subscriptions](#).

Regions and service presence

Citrix Cloud provides services in three regions: United States, European Union, and Asia Pacific South. When you sign up for Citrix Cloud, you must choose the region that best suits your performance and business needs.

To learn more about selecting a region and the services that are available in each region, see [Geographical Considerations](#).

Citrix Cloud Service Trials

June 7, 2024

Trials for individual Citrix Cloud services are delivered through the Citrix Cloud management console. The functionality in a service trial is the same as the purchased service, so they're suitable for a proof-of-concept (POC) or pilot deployment.

When you're ready to buy Citrix Cloud services, your trial is converted to a production service. There's no need to reconfigure anything or create a separate production account.

Service trial overview

The information in this section applies to most Citrix Cloud service trials. Services with different trial terms are described in separate sections.

	Citrix Cloud Trial
Number of subscribers allowed	25
Maximum length of trial	60 calendar days
Grace period	14 days after trial expiration
Data retention period	90 calendar days after trial expiration
Availability	Restricted availability
Resource location	Customer provided and configured
User session length	Unlimited
Local Microsoft Active Directory integration	Yes
Choice of resource locations	Yes
Deploy to on-premises	Yes
Citrix DaaS (formerly Citrix Virtual Apps and Desktops service)	Full feature set
Endpoint Management	Full feature set
Customizable	Yes

Requesting a service trial

Citrix Cloud trial access is managed on a per-service basis. For some services, you can request a trial as described in Request a service trial in this article. For other services, you must request a demo before you receive trial access, as described in Request a service demo in this article.

Service trial period

For most services, you have 60 days to try out the service after your trial request is approved. You can request a trial for a service only once.

Purchasing service subscriptions

You can buy a service subscription at any time during your trial or during the data retention period. For more information, see Buy Citrix Cloud services.

After you buy a subscription, your trial is converted to a production service. Administrators and users can access the service and any data that you added during the trial remains intact.

Citrix DaaS Standard for Azure

This section describes the following types of trials for Citrix DaaS Standard for Azure (formerly Citrix Virtual Apps and Desktops Standard for Azure):

- **Auto-approved trial:** After you request the trial through the Citrix Cloud management console, the trial is approved automatically and ready to use.
- **Sales-approved trial:** After you contact a Citrix sales representative to request a trial, the sales representative approves the trial. After approval, the trial is ready to use.

	Auto-approved trial	Sales-approved trial
Maximum length of trial	7 calendar days	14 calendar days
Grace period	1 calendar day after trial expiration	14 calendar days after trial expiration
Data retention period	30 calendar days after trial expiration	90 calendar days after trial expiration

Depending on the trial type, you have seven or 14 days to use the service. You can request a trial for the service only once.

Trials include a grace period for accessing the service after the trial period expires. This grace period allows you to buy a subscription to the service or remove any data that you added. After the grace period ends, Citrix blocks access to the service for both administrators and users.

Depending on the trial type, Citrix retains any data that you add to the service for 30 days or 90 days after the trial expires. If you buy a subscription to the service during this retention period, administrators and users can access the service with your data intact.

You can buy a subscription to the service through the [Azure Marketplace](#) or by contacting your Citrix sales representative.

Request a service demo

For some services, you must request a demo from a Citrix sales representative before you can try out the service. Requesting a demo allows you to discuss your organization's cloud service needs with a Citrix sales representative. Also, the sales representative ensures you have all the information needed to use the service successfully.

1. Sign in to your Citrix Cloud account.
2. From the management console, select **Request Demo** for the service that you want. The service's demo request page appears.
3. Complete and submit the form. A Citrix sales representative contacts you to provide more information and walk you through using the service.

Request a service trial

1. Sign in to your Citrix Cloud account.
2. From the management console, select **Request Trial** for the service that you want to try out.

When your trial is approved and ready to use, Citrix sends you an email notification.

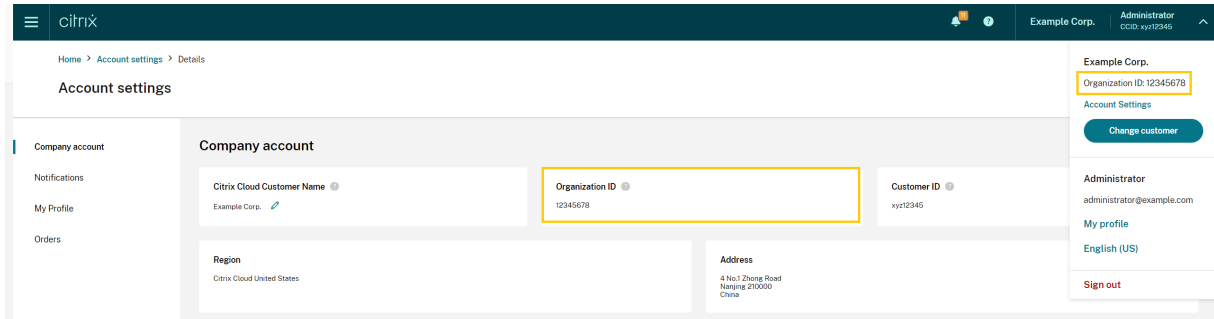

Note:

To provide the best customer experience, Citrix reserves the right to approve trials for a limited number of participants at any given time.

Buy Citrix Cloud services

When you're ready to convert your trial to a production service, visit <https://www.citrix.com/buy/> to find a local Citrix partner.

To buy the service, you need your Organization ID (OrgID). Your OrgID appears on the customer menu in the top-right corner of the Citrix Cloud management console. Your OrgID also appears on the **Account Settings** page.

More information

- [Terms of Service for Citrix Cloud services](#)
- The [Fundamentals of Citrix Cloud](#) course includes a short video that walks you through requesting a trial. The full course also covers the components of the Citrix Cloud platform and its services.

Extend Citrix Cloud service subscriptions

June 7, 2024

This article describes how purchased subscriptions for Citrix Cloud services expire and how you can extend your subscription.

In this article, *monthly subscriptions* refer to services that are purchased on a month-to-month basis. *Annual subscriptions* refer to services that are purchased on a yearly basis. *Multiannual subscriptions* refer to services that are purchased on a multi-yearly basis.

Note:

Citrix Service Providers (CSPs) can extend their subscriptions by submitting a zero-dollar purchase order to their CSP distributor. For more information about CSP product renewals and licensing, refer to the *Citrix Service Provider Licensing Guide for Citrix Cloud*, available through the [Citrix Partner Central](#) web site.

Before expiration

For monthly subscriptions, Citrix Cloud does not send notifications prior to expiration.

For annual and multiannual subscriptions, Citrix Cloud notifies you at certain intervals when your existing subscription approaches expiration. These notifications alert you to extend the subscription and avoid service interruption. The following notifications appear in the Citrix Cloud management console:

- 90 days before expiration: A yellow banner appears, showing the services that need to be extended and their expiration dates. This notification appears in the console every seven days or until the service is extended.
- Seven days before expiration: A red banner appears, showing the services that need to be extended and their expiration dates. This notification appears in the console until the service is extended or the 30-day expiration grace period elapses.

You can dismiss these notifications when they appear; however, they will reappear after seven days.

Citrix also sends you an email notification that includes a list of the services that need to be extended and their expiration dates. Citrix sends this notification at the following intervals:

- 90 days before expiration
- 60 days before expiration
- 30 days before expiration
- Seven days before expiration
- One day before expiration

After expiration: Service block and data retention

If the service subscription is not extended during the grace period, Citrix blocks access to the service in the following manner:

- For expired monthly subscriptions, administrators and users are blocked from access after five days past the expiration date.
- For expired annual and multiannual subscriptions, administrators and users are blocked from access after 30 days past the expiration date.

Citrix retains any data that you added to the service for 90 days after the service expiration date. If you extend your subscription before the 90-day retention period ends, your administrators and users can access the service with your data intact. Your extended subscription starts as follows:

- For monthly subscriptions, the start date of your first month's subscription is the date you purchase the extension. Afterward, your subscription automatically renews on the first day of each subsequent month.
- For annual and multiannual subscriptions, the start date of your extended subscription is the day immediately following the date of expiration. For example, if your subscription expires on

September 30, and you extend the subscription on October 23, the start date of the extended subscription is October 1.

If you don't extend your subscription before the 90-day retention period ends, Citrix resets the service and deletes any data that you added. If you agreed to allow Citrix to manage your cloud deployment (for example, when using Citrix Essentials services or the Azure Quick Deploy option in Citrix DaaS), Citrix performs the following actions after the 90-day retention period ends:

- Removes all customer-related data from Citrix databases.
- Deletes all resources related to Citrix Cloud services, including Citrix-managed VMs, that Citrix provisioned in your cloud environment. For a description of the Citrix-managed components that are included in specific Citrix Cloud services, refer to the service's documentation.

Customer-managed Azure subscriptions

If you are using your own Azure subscription with a Citrix Cloud service, the service installs an app when you connect your Azure subscription to the service. If you don't extend your Citrix Cloud service subscription, Citrix does not remove this app from your Azure subscription after the 90-day retention period ends. You must delete this app to remove the service completely from your Azure subscription. You can delete the app using one of the following methods:

- If administrators are not yet blocked from accessing the service, delete this app from within the service.
- If administrators are blocked from accessing the service, delete this app from within the Azure portal.

Purchase service extensions

To extend your subscription to Citrix Cloud services, contact your Citrix sales representative. To find your sales representative, use the following steps:

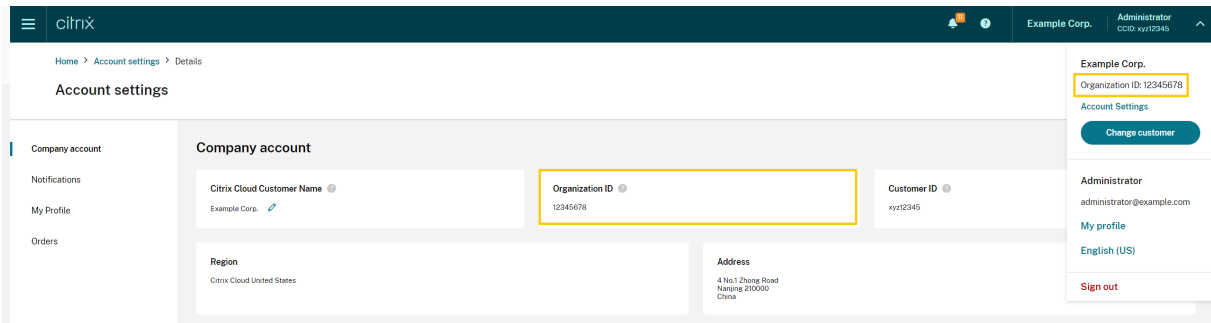

1. Sign in to your Citrix account.
2. Select **Quoting (DOTI)** and then select **Transactions**. Your sales representative and their email address are displayed near the top of this view.

Alternatively, visit the [Citrix Customer Service](#) page for contact information in your geographical region.

To complete the purchase, your sales representative needs the Organization ID for your Citrix Cloud account. To find your Organization ID, sign in to your Citrix Cloud account. Your Organization ID is displayed in the following places:

- In the customer menu, in the upper-right corner of the Citrix Cloud console.

- On the **Account Settings** page.

Geographical Considerations

February 2, 2024

This article discusses the commercial regions that Citrix Cloud uses and the presence of Citrix Cloud commercial services within each region.

For more information about the geographical regions and service presence for Citrix’s public-sector and dedicated cloud platforms, see [Other cloud platforms from Citrix](#).

Choose a region

When your organization is onboarded to Citrix Cloud and you sign in for the first time, you are asked to choose one of the following regions:

- United States
- European Union
- Asia Pacific South

When you select a region, services hosted in that geographic region are used for actions associated with the organization where possible. Pick a region that maps to where most of your users and resources are located.

Select a home region that best suits your performance and business needs.

[Why is this important? Help me decide.](#)

Asia Pacific South

European Union

United States

I've read, understand and agree to the [Terms of Service](#)

Important notes:

- You can choose a region only once, when your organization is onboarded. You cannot change your region later.
- If you are located in one region and use a service in another region, any performance impacts are minimal. Citrix Cloud services are designed to be used on a global basis. For example, customers in the US that have users and connectors in Australia will see minimal impact from latency.
- If Citrix Cloud is not supported in your region, pick a region that is closest to where most of your users and resources are located.

Service presence in each region

Most Citrix Cloud services are globally replicated. The region you select indicates a preference for where connections must be made. However, connections might still be made to other geographical

regions. When a service is globally replicated, all the data of that service is stored in all regions.

Similarly, your data might be processed on a global basis by Citrix [affiliates or subprocessors](#) as necessary to perform the services.

Certain services have dedicated regional instances. Some services have US-based instances only. In these cases, connections and data are contained within the geographic region.

Where a service is not available in the region that you selected for your organization, certain information (such as authentication data) might be transferred between regions as needed.

Service	US	EU	Asia Pacific South	Notes
Citrix Cloud control plane	Yes	Yes	Yes	
Citrix Analytics for Security	Yes	Yes	Yes	
Citrix Analytics for Performance	Yes	Yes	Yes	
Application Delivery Management	Yes	Yes	Yes	See Low-touch onboarding of Citrix ADC instances using Application Delivery Management service connect in this article.
Citrix DaaS (formerly Virtual Apps and Desktops service)	Yes	Yes	Yes	Service uses the Citrix Cloud region.
Citrix DaaS Standard for Azure (formerly Virtual Apps and Desktops Standard for Azure)	Yes	Yes	Yes	Service uses the Citrix Cloud region.

Citrix Cloud

Service	US	EU	Asia Pacific South	Notes
Citrix DaaS Standard for Google Cloud (formerly Virtual Apps and Desktops Standard for Google Cloud)	Yes	No (Uses US region)	No (Uses US region)	
Citrix DaaS Premium for Google Cloud (formerly Virtual Apps and Desktops Premium for Google Cloud)	Yes	No (Uses US region)	No (Uses US region)

License Usage Insights (CSPs only)	Globally replicated	Globally replicated	Globally replicated	
Citrix Gateway Access Nodes/POP	Multiple WW nodes; traffic routed as needed to ensure the best experience	Multiple WW nodes; traffic routed as needed to ensure the best experience	Multiple WW nodes; traffic routed as needed to ensure the best experience	

Note:

Certain regional Services may be delivered with entitlements to non-regional component Services set forth elsewhere in the table above, and may be used at the customer’s election.

Citrix Cloud Services use the customer’s designated region to store Customer Content and Logs,

except with select Logs collected by Citrix sub-processors or for which non-regional storage is necessary for performance of the service, including for support or troubleshooting, monitoring performance, security, auditing, and to allow for cross-region authentication (such as when an EU-based support engineer needs to access a US-based environment). Customer Content and Logs may be accessed on a global basis as necessary to perform the services.

For more information about the data stored by individual services, refer to the [Technical Security Overview](#) for each service.

Low-touch onboarding of Citrix ADC instances using Application Delivery Management service connect

As a part of [Application Delivery Management \(ADM\) service Connect-based low-touch onboarding of ADC instances](#):

- If you are an existing Citrix Cloud customer, the ADM service tenant is created in the same geographical region that you selected when you created your Citrix Cloud account.
- If you are not an existing Citrix Cloud customer, the address mentioned for that customer in the Citrix.com portal is referred. A placeholder ADM service tenant is created in the geographical region that corresponds to the region of this referred address. If you choose to onboard to Citrix Cloud in the future, a new ADM service tenant is created in the same region that you select when you create your Citrix Cloud account. Also, the data is migrated from the placeholder ADM service tenant to the new ADM service tenant.

Endpoint Management service locations

You can select one of the following Endpoint Management service locations from your home region:

- US East
- US West
- EU West
- SE Asia
- Sydney

Secure Internet Access service locations

Traffic is routed to the following Secure Internet Access service locations based on availability and end-user proximity to ensure the best experience.

North America

- Sterling, VA, USA
- Toronto, Canada
- Los Angeles, CA, USA
- Irvine, CA, USA
- Seattle, WA, USA
- Denver, CO, USA
- Charlotte, NC, USA
- Dallas, TX, USA
- Allen, TX, USA
- Miami, FL, USA
- Chicago, IL, USA
- New York, NY, USA
- Boston, MA, USA
- Vancouver, Canada

South America

- Queretaro, Mexico
- Sao Paulo, Brazil
- Buenos Aires, Argentina
- Bogota, Colombia

Asia-Pacific

- Perth, Australia
- Sydney, Australia
- Tokyo, Japan
- Singapore, Singapore
- Mumbai, India
- Delhi, India

Africa

Johannesburg, South Africa

Middle East

- Dubai, United Arab Emirates
- Istanbul, Turkey

Western Europe

- London, UK
- Manchester, UK
- Frankfurt, Germany
- Düsseldorf, Germany
- Mannheim, Germany
- Paris, France

Europe

- Helsinki, Finland
- Amsterdam, Netherlands
- Stockholm, Sweden
- Warsaw, Poland
- Madrid, Spain
- Sofia, Bulgaria
- Zurich, Switzerland
- Milan, Italy

Secure Private Access points of presence

For a list of the points of presence (PoPs) that Secure Private Access uses to ensure continuity and quality of service for customers, see [What are all the Secure Private Access PoP locations?](#) in the Secure Private Access service documentation.

Other cloud platforms from Citrix

In addition to Citrix Cloud, Citrix offers other clouds that are isolated and separate from Citrix Cloud.

Citrix Cloud Government

Citrix Cloud Government allows US government agencies and other public-sector customers in the US to use Citrix cloud services according to regulatory and compliance requirements. Citrix Cloud

Government is a geographical boundary within which Citrix operates, stores, and replicates services and data for delivery of Citrix Cloud Government services. Citrix may use multiple public or private clouds located in one or more states within the US to provide services.

Citrix Cloud Government and offered services are available only in the US region.

For more information, see the [Citrix Cloud Government](#) product documentation.

Citrix Cloud Japan

Citrix Cloud Japan allows Japanese customers to use certain Citrix Cloud services in a dedicated Citrix-managed environment. Citrix Cloud Japan and offered services are available only in Japan.

For more information, see the [Citrix Cloud Japan](#) product documentation.

Secure Deployment Guide for the Citrix Cloud Platform

March 6, 2024

The Secure Deployment Guide for Citrix Cloud provides an overview of security best practices when using Citrix Cloud and describes the information Citrix Cloud collects and manages.

Technical security overviews for services

Consult the following articles for more information about data security within Citrix cloud services:

- [Analytics Technical Security Overview](#)
- [Endpoint Management Technical Security Overview](#)
- [Remote Browser Isolation Technical Security Overview](#)
- [Citrix DaaS technical security overview](#)
- [Citrix DaaS Standard for Azure technical security overview](#)

Guidance for administrators

- Use strong passwords and regularly change your passwords.
- All administrators within a customer account can add and remove other administrators. Ensure that only trusted administrators have access to Citrix Cloud.
- Administrators of a customer have, by default, full access to all services. Some services provide a capability to restrict the access of an administrator. Consult the per-service documentation for more information.

- Two-factor authentication for Citrix Cloud administrators is achieved using the default Citrix identity provider. When administrators sign up for Citrix Cloud or are invited to a Citrix Cloud account, they are required to enroll in multifactor authentication (MFA). If a customer uses Microsoft Azure to authenticate Citrix Cloud administrators, multifactor authentication can be configured as described in [Configure Azure AD Multi-Factor Authentication settings](#) on the Microsoft website.
- By default, Citrix Cloud automatically terminates administrator sessions after 24 hours, regardless of console activity. This time-out cannot be changed.
- Administrator accounts can be associated with a maximum of 100 customer accounts. If an administrator needs to manage more than 100 customer accounts, they must create a separate administrator account with a different email address to manage the additional customer accounts. Alternatively, they can be removed as an administrator from customer accounts that they no longer need to manage.

Password compliance

Citrix Cloud prompts administrators to change their passwords if one of the following conditions exists:

- The current password hasn't been used to sign in for more than 60 days.
- The current password has been listed in a known database of compromised passwords.

New passwords must meet all of the following criteria:

- At least 8 characters long (128 characters maximum)
- Includes at least one upper-case and lower-case letter
- Includes at least one number
- Includes at least one special character: ! @ # \$ % ^ * ? + = -

Rules for changing passwords:

- The current password can't be used as a new password.
- The previous 5 passwords can't be reused.
- The new password can't be similar to the account user name.
- The new password must not be listed in a known database of compromised passwords. Citrix Cloud uses a list provided by <https://haveibeenpwned.com/> to determine if new passwords violate this condition.

Encryption and key management

The Citrix Cloud control plane does not store sensitive customer information. Instead, Citrix Cloud retrieves information such as administrator passwords on-demand (by prompting the administrator

explicitly).

For data-at-rest, Citrix Cloud storage is encrypted using keys that are AES-256 bit or higher. These keys are managed by Citrix.

For data-in-flight, Citrix uses industry standard TLS 1.2 with the strongest cipher suites. Customers cannot control the TLS certificate in use, as Citrix Cloud is hosted on the Citrix-owned cloud.com domain. To access Citrix Cloud, customers must use a browser capable of TLS 1.2, and must have accepted cipher suites configured.

- If accessing the Citrix Cloud control plane from Windows Server 2016, Windows Server 2019, or Windows Server 2022, the following strong ciphers are recommended: TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384, TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256
- If accessing the Citrix Cloud control plane from Windows Server 2012 R2, the strong ciphers are not available, so the following ciphers must be used: TLS_DHE_RSA_WITH_AES_256_GCM_SHA384, TLS_DHE_RSA_WITH_AES_128_GCM_SHA256, TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384, TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256

For more information about how Citrix Cloud services data is protected, see [Citrix Cloud Services Data Protection Overview](#) on the Citrix web site.

For more information about encryption and key management within each cloud service, consult the service's documentation.

For more information about TLS 1.2 configuration, consult the following articles:

- Enforce use of TLS 1.2 on client machines: [CTX245765](#), Error: "The underlying connection was closed: An unexpected error occurred on a send." when querying Monitoring Service's OData endpoint
- [Update and configure the .NET Framework to support TLS 1.2](#) on the Microsoft Docs web site.

Data sovereignty

The Citrix Cloud control plane is hosted in the United States, the European Union, and Australia. Customers do not have control over this.

The customer owns and manages the resource locations that they use with Citrix Cloud. A resource location can be created in any data center, cloud, location, or geographic area the customer desires. All critical business data (such as documents, spreadsheets, and so on) are stored in resource locations and are under customer control.

Other services may have an option to store data in different regions. Consult the [Geographical Considerations](#) topic or the [Technical Security Overviews](#) (listed at the beginning of this article) for each service.

Security issues insight

The website status.cloud.com provides transparency into security issues that have an ongoing impact on the customer. The site logs status and uptime information. There is an option to subscribe for updates to the platform or individual services.

Citrix Cloud Connector

Installing the Cloud Connector

For security and performance reasons, Citrix recommends that customers do not install the Cloud Connector software on a domain controller.

Also, Citrix strongly recommends that the machines on which the Cloud Connector software is installed be inside the customer's private network and not in the DMZ. For network and system requirements and instructions for installing the Cloud Connector, see [Citrix Cloud Connector](#).

Configuring the Cloud Connector

The customer is responsible for keeping the machines on which the Cloud Connector is installed up-to-date with Windows security updates.

Customers can use antivirus alongside the Cloud Connector. Citrix tests with McAfee VirusScan Enterprise + AntiSpyware Enterprise 8.8. Citrix supports customers who use other industry standard AV products.

In the customer's Active Directory (AD) Citrix strongly recommends that the Cloud Connector's machine account be restricted to read-only access. This is the default configuration in Active Directory. Also, the customer can enable AD logging and auditing on the Cloud Connector's machine account to monitor any AD access activity.

Logging on to the machine hosting the Cloud Connector

The Cloud Connector allows sensitive security information to pass through to other platform components in Citrix Cloud services, but also stores the following sensitive information:

- Service keys for communicating with Citrix Cloud
- Hypervisor service credentials for power management in Citrix DaaS (formerly Citrix Virtual Apps and Desktops service)

This sensitive information is encrypted using the Data Protection API (DPAPI) on the Windows server hosting the Cloud Connector. Citrix strongly recommends allowing only the most privileged administrators to log on to Cloud Connector machines (for example, to perform maintenance operations). In general, there is no need for an administrator to log on to these machines to manage any Citrix product. The Cloud Connector is self-managing in that respect.

Do not allow end users to log on to machines hosting the Cloud Connector.

Installing other software on Cloud Connector machines

Customers can install antivirus software and hypervisor tools (if installed on a virtual machine) on the machines where the Cloud Connector is installed. However, Citrix recommends that customers do not install any other software on these machines. Other software creates possible security attack vectors and might reduce the security of the overall Citrix Cloud solution.

Inbound and outbound ports configuration

The Cloud Connector requires outbound port 443 to be open with access to the internet. Citrix strongly recommends that the Cloud Connector have no inbound ports accessible from the Internet.

Customers can locate the Cloud Connector behind a web proxy for monitoring its outbound Internet communications. However, the web proxy must support SSL/TLS encrypted communication.

The Cloud Connector might have other outbound ports with access to the Internet. The Cloud Connector negotiates across a wide range of ports to optimize network bandwidth and performance if other ports are available.

The Cloud Connector must have a wide range of inbound and outbound ports open within the internal network. The following table lists the base set of open ports required.

Client Port	Server Port	Service
49152 -65535/UDP	123/UDP	W32Time
49152 -65535/TCP	135/TCP	RPC Endpoint Mapper
49152 -65535/TCP	464/TCP/UDP	Kerberos password change
49152 -65535/TCP	49152-65535/TCP	RPC for LSA, SAM, Netlogon (*)
49152 -65535/TCP/UDP	389/TCP/UDP	LDAP
49152 -65535/TCP	3268/TCP	LDAP GC
53, 49152 -65535/TCP/UDP	53/TCP/UDP	DNS
49152 -65535/TCP	49152 -65535/TCP	FRS RPC (*)

Client Port	Server Port	Service
49152 -65535/TCP/UDP	88/TCP/UDP	Kerberos
49152 -65535/TCP/UDP	445/TCP	SMB

The Cloud Connector uses LDAP signing and sealing to secure connections to the domain controller. This means that LDAP over SSL (LDAPS) is not required. For more information on LDAP signing, see [How to enable LDAP signing in Windows Server](#) and [Microsoft Guidance for Enabling LDAP Channel Binding and LDAP Signing](#).

Each of the services used within Citrix Cloud extends the list of open ports required. For more information, consult the following resources:

- [Technical Security Overviews](#) for each service (listed at the beginning of this article)
- [Internet Connectivity Requirements](#) for Citrix Cloud services
- [Application Delivery Management service port requirements](#)
- [Endpoint Management port requirements](#)

Monitoring outbound communication

The Cloud Connector communicates outbound to the Internet on port 443, both to Citrix Cloud servers and to Microsoft Azure Service Bus servers.

The Cloud Connector communicates with domain controllers on the local network that are inside the Active Directory forest where the machines hosting the Cloud Connector reside.

During normal operation, the Cloud Connector communicates only with domain controllers in domains that are not disabled on the **Identity and Access Management** page in the Citrix Cloud user interface.

Each service within Citrix Cloud extends the list of servers and internal resources that the Cloud Connector might contact during normal operations. Also, customers cannot control the data that the Cloud Connector sends to Citrix. For more information about services' internal resources and data sent to Citrix, consult the following resources:

- [Technical Security Overviews](#) for each service (listed at the beginning of this article)
- [Internet Connectivity Requirements](#) for Citrix Cloud services

Viewing Cloud Connector logs

Any information relevant or actionable to an administrator is available in the Windows Event Log on the Cloud Connector machine.

View installation logs for the Cloud Connector in the following directories:

- %AppData%\Local\Temp\CitrixLogs\CloudServicesSetup
- %windir%\Temp\CitrixLogs\CloudServicesSetup

Logs of what the Cloud Connector sends to the cloud are found in %ProgramData%\Citrix\WorkspaceCloud\Log.

The logs in the WorkspaceCloud\Log directory are deleted when they exceed a specified size threshold. The administrator can control this size threshold by adjusting the registry key value for HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\CloudServices\AgentAdministration\MaximumLogSpaceMegabytes.

SSL/TLS Configuration

The Windows Server hosting the Cloud Connector must have the ciphers detailed in Encryption and key management enabled.

The Cloud Connector must trust the certification authority (CA) that the Citrix Cloud SSL/TLS certificates and Microsoft Azure Service Bus SSL/TLS certificates use. Citrix and Microsoft might change certificates and CAs in the future, but always use CAs that are part of the standard Windows Trusted Publisher list.

Each service within Citrix Cloud might have different SSL configuration requirements. For more information, consult the Technical Security Overviews for each service (listed at the beginning of this article).

Security compliance

To ensure security compliance, the Cloud Connector self-manages. Do not disable reboots or put other restrictions on the Cloud Connector. These actions prevent the Cloud Connector from updating itself when there is a critical update.

The customer is not required to take any other action to react to security issues. The Cloud Connector automatically applies any security fixes.

Citrix Connector Appliance for Cloud Services

Installing the Connector Appliance

The Connector Appliance is hosted on a hypervisor. This hypervisor must be inside your private network and not in the DMZ.

Ensure that the Connector Appliance is within a firewall that blocks access by default. Use an allow list to allow only expected traffic from the Connector Appliance.

Ensure that the hypervisors that host your Connector Appliances are installed with up-to-date security updates.

For network and system requirements and instructions for installing the Connector Appliance, see [Connector Appliance for Cloud Services](#).

Logging on to the hypervisor hosting a Connector Appliance

The Connector Appliance contains a service key for communicating with Citrix Cloud. Allow only the most privileged administrators to log on to a hypervisor hosting the Connector Appliance (for example, to perform maintenance operations). In general, there is no need for an administrator to log on to these hypervisors to manage any Citrix product. The Connector Appliance is self-managing.

Inbound and outbound ports configuration

The Connector Appliance requires outbound port 443 to be open with access to the internet. Citrix strongly recommends that the Connector Appliance have no inbound ports accessible from the internet.

You can locate the Connector Appliance behind a web proxy for monitoring its outbound internet communications. However, the web proxy must support SSL/TLS encrypted communication.

The Connector Appliance might have other outbound ports with access to the internet. The Connector Appliance negotiates across a wide range of ports to optimize network bandwidth and performance if other ports are available.

The Connector Appliance must have a wide range of inbound and outbound ports open within the internal network. The following table lists the base set of open ports required.

Connection Direction	Connector Appliance Port	External Port	Service
Inbound	443/TCP	Any	Local Web UI
Outbound	49152-65535/UDP	123/UDP	NTP
Outbound	53, 49152-65535/TCP/UDP	53/TCP/UDP	DNS
Outbound	67/UDP	68/UDP	DHCP and broadcast
Outbound	49152 -65535/UDP	123/UDP	W32Time
Outbound	49152 -65535/TCP	464/TCP/UDP	Kerberos password change
Outbound	49152 -65535/TCP/UDP	389/TCP/UDP	LDAP

Connection Direction	Connector Appliance		Service
	Port	External Port	
Outbound	49152 -65535/TCP	3268/TCP	LDAP GC
Outbound	49152 -65535/TCP/UDP	88/TCP/UDP	Kerberos
Outbound	49152 -65535/TCP/UDP	445/TCP	SMB
Outbound	137/UDP	137/UDP	NetBIOS Name Service
Outbound	138/UDP	138/UDP	NetBIOS Datagram
Outbound	139/TCP	139/TCP	NetBIOS Session

Each of the services used within Citrix Cloud extends the list of open ports required. For more information, consult the following resources:

- [Technical Security Overviews](#) for each service (listed at the beginning of this article)
- [System and Connectivity Requirements](#) for Citrix Cloud services

Monitoring outbound communication

The Connector Appliance communicates outbound to the Internet on port 443 to Citrix Cloud servers.

Each service within Citrix Cloud extends the list of servers and internal resources that the Connector Appliance might contact during normal operations. Also, customers cannot control the data that the Connector Appliance sends to Citrix. For more information about services' internal resources and data sent to Citrix, consult the following resources:

- [Technical Security Overviews](#) for each service (listed at the beginning of this article)
- [System and Connectivity Requirements](#) for Citrix Cloud services

Viewing Connector Appliance logs

You can download a diagnostic report for your Connector Appliance that includes various log files. For more information about getting this report, see [Connector Appliance for Cloud Services](#).

SSL/TLS Configuration

The Connector Appliance does not need any special SSL/TLS configuration.

The Connector Appliance trusts the certification authority (CA) used by Citrix Cloud SSL/TLS certificates. Citrix might change certificates and CAs in the future, but always use CAs that the Connector Appliance trusts.

Each service within Citrix Cloud might have different SSL configuration requirements. For more information, consult the [Technical Security Overviews](#) for each service (listed at the beginning of this article).

Security compliance

To ensure security compliance, the Connector Appliance self-manages and you cannot log in to it through the console.

You are not required to take any other action to react to connector security issues. The Connector Appliance automatically applies any security fixes.

Ensure that the hypervisors that host your Connector Appliances are installed with up-to-date security updates.

In your Active Directory (AD) we recommend that the Connector Appliance machine account be restricted to read-only access. This is the default configuration in Active Directory. Also, the customer can enable AD logging and auditing on the Connector Appliance machine account to monitor any AD access activity.

Guidance for handling compromised accounts

- Audit the list of administrators in Citrix Cloud and remove any who are not trusted.
- Disable any compromised accounts within your company's Active Directory.
- Contact Citrix and request rotating the authorization secrets stored for all the customer's Cloud Connectors. Depending on the severity of the breach, take the following actions:
 - **Low Risk:** Citrix can rotate the secrets over time. The Cloud Connectors continue to function normally. The old authorization secrets become invalid in 2-4 weeks. Monitor the Cloud Connector during this time to ensure that there are no unexpected operations.
 - **Ongoing high risk:** Citrix can revoke all old secrets. The existing Cloud Connectors will no longer function. To resume normal operation, the customer must uninstall and reinstall the Cloud Connector on all applicable machines.

Create a Citrix Cloud account

November 27, 2023

This article walks you through the process of creating a Citrix Cloud account and completing the required tasks for onboarding your account successfully.

Customers with an existing relationship with Citrix and are new to Citrix cloud services can use the tasks in this article to complete the onboarding process.

Sign-up process for new Citrix customers

If you're new to Citrix and Citrix Cloud, you must contact Citrix to create a new Citrix account for your company. Use one of the following contact methods:

- Contact [Citrix Customer Service](#).
- Contact a [Citrix Partner](#) or [Citrix Sales office](#) in your area.

When you contact Citrix, you can discuss your business needs with a Citrix representative. The representative helps you complete the sign-up process and provides you with your Citrix sign-in credentials.

After you receive your Citrix account credentials, you can use the tasks in this article to sign in and get started with Citrix Cloud.

What is a Citrix account?

A Citrix account, also known as a Citrix.com account or My Citrix account, enables you to manage access to the licenses you have purchased. Your Citrix account uses an organization ID (OrgID) as a unique identifier. You can access your Citrix account by logging in at <https://www.citrix.com> with a user name (also known as a web login) or your email address, if one is linked to your account.

Important:

A user name maps to a single, unique Citrix account, but an email address can map to multiple Citrix accounts.

What is an OrgID?

An OrgID is the unique identifier assigned to your Citrix account. Your OrgID is associated with a physical site address, typically your company's business address. Companies usually have a single OrgID. However, in some cases, such as having different branch offices or having different departments managing their assets separately, Citrix may allow a single company to have multiple OrgIDs.

Citrix routinely cleans up certain OrgIDs, merging duplicates in some cases. If your company has OrgIDs that you want to merge with a valid and active OrgID, you can contact Citrix Customer Support with the OrgIDs you want merged.

Note:

Companies have already set up OrgIDs based on how they want to manage their assets, so if you don't know what OrgID you need to use or how many OrgIDs you have, contact the IT department or Citrix administrator in your company. If you need help, contact Citrix Customer Service at <https://www.citrix.com/support/> to locate your OrgID.

What is a Citrix Cloud account?

A Citrix Cloud account enables you to use one or more Citrix cloud services to securely deliver your apps and data. A Citrix Cloud account is identified by a customer ID and is associated with an OrgID. An OrgID can be associated with multiple Citrix Cloud customer IDs, but a customer ID can be associated with only one OrgID.

It's important to use the right Citrix Cloud account, based on how your organization has set up OrgIDs, so that your purchases and administrator access can continue on the same OrgIDs. For example, if a company's design department using OrgID 1234 has been using Virtual Apps and Desktops on-premises and wants to try Citrix Cloud, one of the administrators of OrgID 1234 can sign up for Citrix Cloud on that OrgID using their Citrix account sign-in credentials or an email address associated with that OrgID. When the company decides to purchase a Citrix DaaS subscription, the order can be placed correctly on OrgID 1234.

Important:

Users who have access to a particular Citrix account do not automatically have access to the Citrix Cloud account associated with that Citrix account's OrgID. Because Citrix Cloud access enables users to potentially impact service, it's important to control who accesses the Citrix Cloud account.

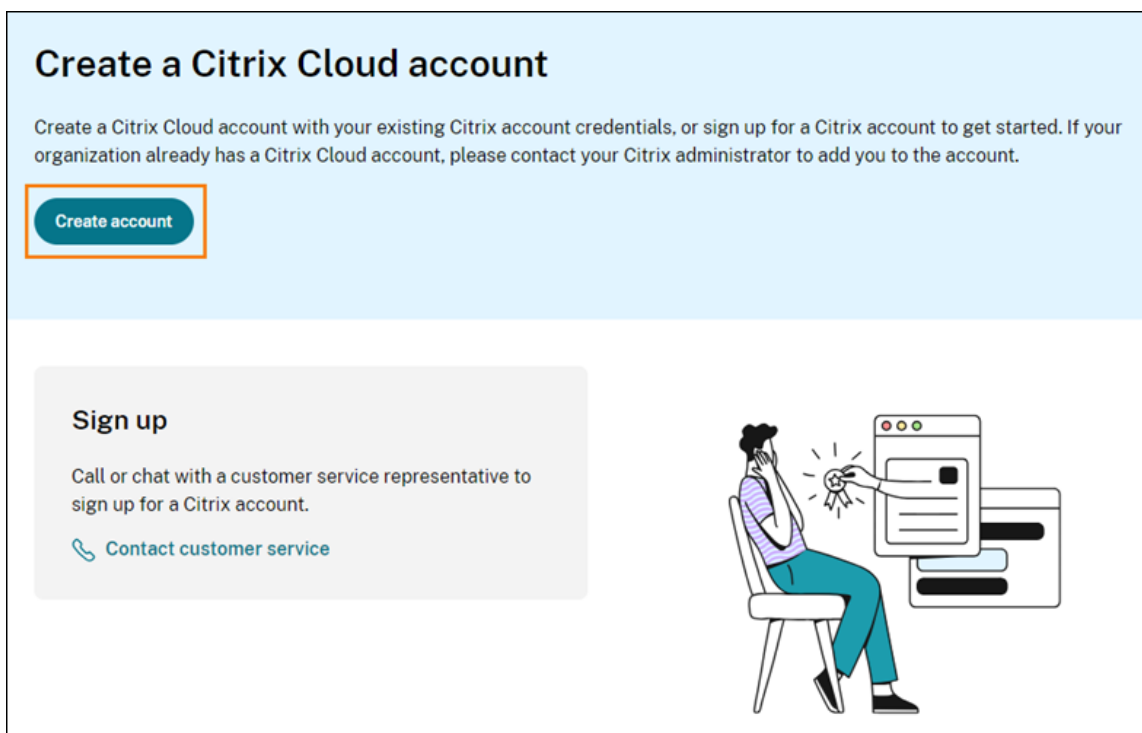

Multifactor authentication

To keep your Citrix Cloud account safe and secure, Citrix requires all customers to enroll in multifactor authentication (MFA). To enroll, you need only a device, such as a computer or mobile device, and an authenticator app installed, such as Citrix SSO. If using a device with an authenticator app isn't possible, you can use an email address instead.

If you're not already enrolled in MFA, Citrix prompts you to enroll when you sign in with your Citrix account credentials. For requirements and instructions, see Step 2: Set up multifactor authentication in this article.

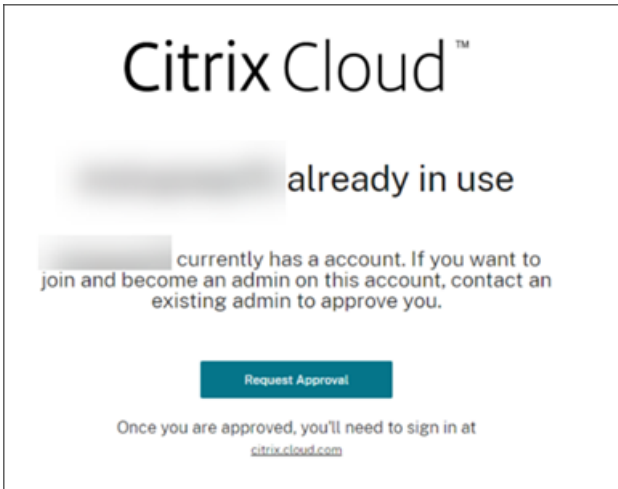

Step 1: Visit the Citrix Cloud web site

1. Using a web browser, visit <https://onboarding.cloud.com>.
2. Select **Create account**.

3. Enter your user name and password or the email address and password associated with your Citrix.com account.

What happens if the account is already in use?

If you see a message indicating a Citrix Cloud account for your organization is already in use, it means that another administrator from your Citrix account has already created the Citrix Cloud account. Before you can access the account, an existing administrator needs to invite you to be an administrator, even if you're already a member of the Citrix account.

Since a Citrix Cloud account allows administrators much greater control on the service, we expect that the first administrator who creates the Citrix Cloud account has to explicitly give access to another administrator, even if the other administrator is already a member of the Citrix account.

To request an invitation to join the Citrix Cloud account, select **Request Approval**. All existing administrators on the account receive an email notifying them of your request. If the existing administrators are no longer with your organization, please contact Citrix Support.

When an administrator receives your approval request, they invite you to be an administrator as described in [Invite individual administrators](#).

When you receive the invitation email, click the **Sign in** link to accept the invitation. When your browser opens, Citrix Cloud prompts you to create a password and sign in to the Citrix Cloud account.

Step 2: Set up multifactor authentication

If you're not enrolled in MFA, Citrix Cloud prompts you to enroll before signing in. You can choose to enroll in MFA using an authenticator app (recommended) or your email address.

Notes:

- Only administrators under the Citrix identity provider can set up MFA through Citrix Cloud. If you use Azure AD to manage Citrix Cloud administrators, you can configure MFA using

the Azure portal. For more information, see [Configure Azure Multi-Factor Authentication settings](#) on the Microsoft web site.

- After you complete the setup process, MFA is used for all customer organizations that you belong to in Citrix Cloud. You can't disable MFA after completing the setup process.
- You can enroll only one device. If you enroll a different device later, Citrix Cloud deletes the current device enrollment and replaces it with the new device. For more information, see [Manage your primary MFA method](#).

Email as an authentication method

If you can't use an authenticator app to access Citrix Cloud, MFA using email is a convenient alternative. However, Citrix strongly recommends that you take precautions to ensure access to your email address is secure.

MFA requirements

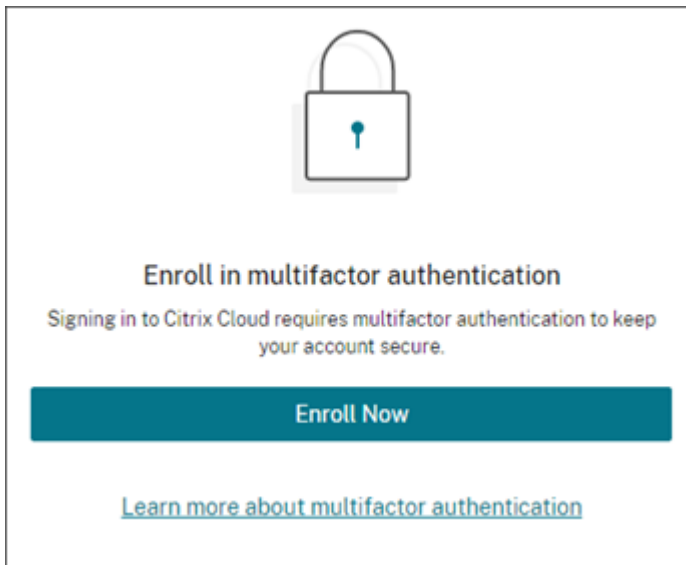

To set up MFA with an authenticator app, you must install an app that follows the [Time-Based One-Time Password](#) standard on your device, such as a smartphone or desktop computer. Depending on the device you're enrolling, the app might need to access your device's camera to scan a QR code. If your device doesn't have a camera, you can enter a key that Citrix Cloud provides.

To set up MFA with an email address, you must use an email address that meets the following requirements:

- The email address is different from the email address you're using for your Citrix account.
- The email address is an address that you can access to receive verification emails from Citrix.

To enroll in multifactor authentication

1. When prompted to enroll in MFA, select **Enroll now**.

2. When prompted, enter your email address and select **Send email**. Citrix Cloud sends you an email with a verification code.
3. Enter the verification code from the email and your Citrix account password. Click **Verify and continue**.
4. Select the authentication method you want to use, either authenticator app or email.
5. If you selected **Authenticator app**, perform the following actions:
 - a) From your authenticator app, scan the QR code or enter the key manually. Your authenticator app displays an entry for Citrix Cloud and generates a 6-digit code.

Set up an authenticator app

Download an authenticator app

1. Go to your phone's app store.
2. Search for "authenticator App."
3. Download an app of your choosing.

Scan the QR code

From your authenticator app, scan the QR below. If you can not scan the QR code, use the key to enter manually.

QR code:	Key:
	

Verify your authenticator app

Your authenticator app will generate a 6-digit code. Please copy the code below.

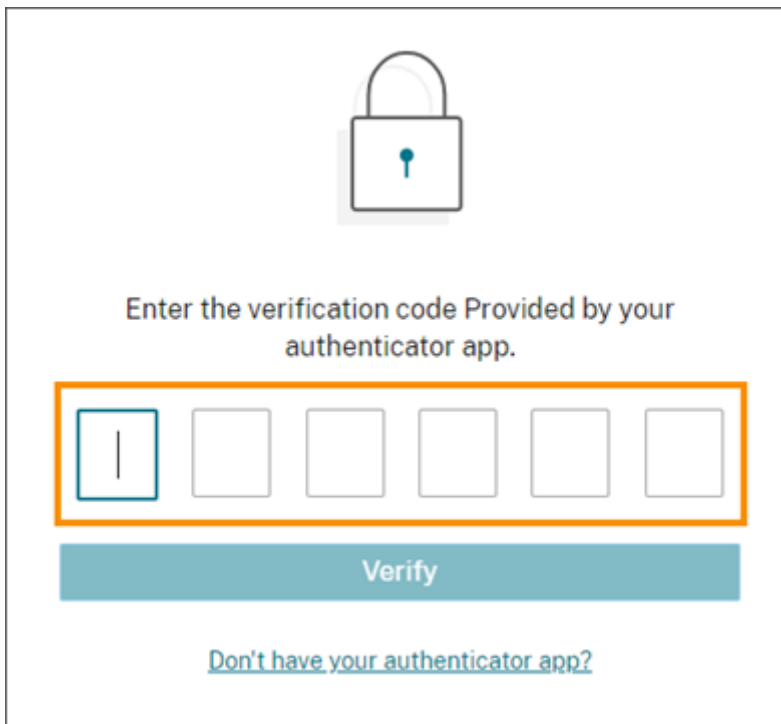

- b) Under **Verify your authenticator app**, enter the code from your authenticator app and select **Verify code**.
6. Click **Next: Recovery Methods**.
 7. Select **Add recovery phone** and enter a recovery phone number that Citrix Support can use to call you and verify your identity. Citrix recommends using a landline phone number. When finished, click **Save recovery phone number**.
 8. Select **Next**.
 9. Select **Add recovery email** and enter an email address that you can access that's different from the one you use with Citrix Cloud. Citrix uses this address to send you a verification code to verify

your identity.

If you don't have a different email address, select **Don't have a recovery email?** to generate a list of backup codes instead. Backup codes aren't recommended because they can be lost easily. If you choose this option, download the codes and keep them in a location where you can access them when needed.

10. Select **Finish** to complete the enrollment.

The next time you sign in with your Citrix Cloud administrator credentials, Citrix Cloud prompts you for the verification code from your chosen MFA method.

Enter the verification code Provided by your authenticator app.

Verify

[Don't have your authenticator app?](#)

Manage your MFA enrollment

To change your device, switch to a different MFA method, or update your recovery methods, see the following articles:

- [Manage your primary MFA method](#)
- [Manage your MFA recovery methods](#)

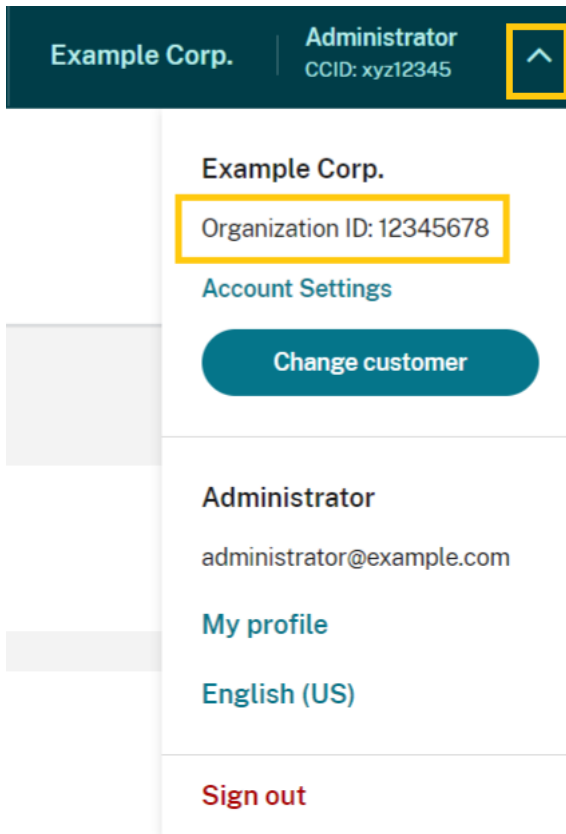

Step 3: Verify your OrgID

Before you start using Citrix Cloud, take a moment to verify your OrgID.

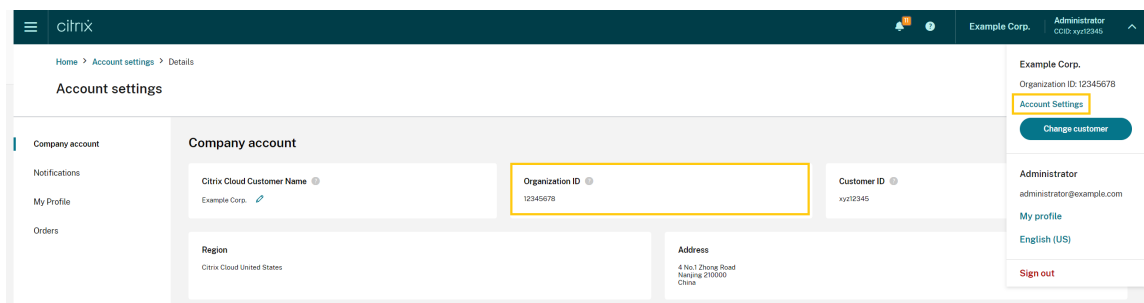

Make sure your account OrgID matches the OrgID that you use to place orders. One of the benefits of Citrix Cloud is that if you try a service and decide to purchase it, then all the configurations you made in the trial are retained in the purchased service, since the purchase occurs in the same account. So, making sure that the trial starts in the right OrgID saves effort when you decide to purchase.

Your OrgID appears in the following locations in the management console:

- In the menu beneath your customer name. Click on your customer name in the top-right corner to reveal the menu.

- On your **Account Settings** page. Select **Account Settings** from the customer menu.

Next steps

After onboarding, you can move on to the following tasks:

- [Add an identity provider](#) to authenticate administrators or workspace users.
- [Add administrators to your Citrix Cloud account](#). Even if your other administrators have access to your Citrix account on Citrix.com, you still need to add them to your Citrix Cloud account.
- [Request cloud service trials](#). Trials are designed to be tested with your choice of on-premises infrastructure or public cloud, your applications, and your Microsoft Active Directory.

Verify your email for Citrix Cloud

September 27, 2023

From time to time, Citrix might ask you to verify your Citrix Cloud account. Some reasons why you might be asked to verify your email:

- You haven't logged in to Citrix Cloud in a while.
- You changed your email address.
- You added a new administrator to your Citrix Cloud account.
- Due to security system updates to Citrix Cloud, you are required to re-verify your Citrix Cloud account.

FAQ

How often will I be asked for verification?

Verifying your account is a one-time event. Citrix Cloud won't ask you for verification every time you sign in or when something in your account changes. If you're asked to verify frequently, contact Citrix Technical Support.

Has something happened to my account?

No, being asked to verify your account doesn't mean that anything is wrong with either your account or any of your Citrix Cloud services. It's simply a part of how Citrix keeps your information safe and secure.

I haven't received a verification email. What do I do?

Perform the following steps:

1. Search your inbox for a verification email from 'Citrix'. The verification email expires after 24 hours. To trigger a new verification email, sign in to Citrix Cloud again. This is a one-time process for each web login.
2. If it's not in your inbox, check your folders. If a spam filter or email rule moved the email, it might be in your spam or junk folders. Check any firewalls.
3. Ensure that you're checking the correct email account. Citrix sends the verification email to the email address currently on file for your account. Often, this is the email address you originally signed up with for Citrix Cloud or the one with which you were invited to join the Citrix Cloud account.
4. Confirm that the email address on record is valid by signing in to your Citrix account at <https://www.citrix.com/account>. If the email is invalid, update your email address and sign in to Citrix Cloud again to trigger a new verification email. For more information, see [CTX126336](#) or [CTX130452](#) in the Citrix Support Knowledge Center.
5. If you still have not received a verification email, contact [Citrix Support](#) to open a support case. For education sites (see **Partner Services Delivery > eLearning > Citrix Training**), open a case with the education team for further investigation. To open a case, request **General Support** on the [Contact Us](#) page.

If you have successfully verified your email but you are still unable to sign in to Citrix Cloud, see [Troubleshooting login issues on Citrix websites](#).

Contact Citrix Support

If you are experiencing an issue that's not covered here, contact [Citrix Support](#) to open a support case.

Connect to Citrix Cloud

September 21, 2023

Connecting your resources to Citrix Cloud involves deploying connectors in your environment and creating *resource locations*.

Resource locations contain the resources required to deliver cloud services to your subscribers. You manage these resources from the Citrix Cloud console. Resource locations contain different resources depending on which Citrix Cloud services you are using and the services that you want to provide to your subscribers.

To create a resource location, install at least two connectors in your domain. Depending on the cloud services you're using, either Cloud Connectors or Connector Appliances are required for enabling communication between Citrix Cloud and your resources. For more information about deploying connectors, see the following articles:

- [Cloud Connector Technical Details](#)
- [Connector Appliance for Cloud Services](#)

Resource types

Resource locations contain different resources depending on which Citrix Cloud services you are using and the services that you want to provide to your subscribers. Different resources use different types of connector. Most services make use of the Citrix Cloud Connector, but some specific services need a Connector Appliance.

Services that use Citrix Cloud Connector

- **Citrix DaaS** (formerly Citrix Virtual Apps and Desktops service) requires the Cloud Connector for publishing apps and desktops and provisioning machine catalogs in your resource locations. For an overview of how the Cloud Connector communicates with this service, refer to the [Citrix DaaS diagram](#) in Citrix Tech Zone.
- **Citrix DaaS Standard for Azure** (formerly Citrix Virtual Apps and Desktops Standard for Azure) requires the Cloud Connector for delivering Citrix-hosted Azure virtual desktops and apps from multi-session machines.
- **Endpoint Management** requires the Cloud Connector for managing app and device policies and delivering apps to users.

Services that use Connector Appliance

- **Image Portability Service** simplifies the management of images across platforms. This feature is useful for managing images between an on-premises resource location and one in a public cloud. The Citrix Virtual Apps and Desktops REST APIs can be used to automate the administration of resources within a Citrix Virtual Apps and Desktops site.

The Image Portability workflow begins when you use Citrix Cloud to initiate the migration of an image from your on-premises location to your public cloud subscription. After preparing your image, Image Portability Service helps you transfer the image to your public cloud subscription and prepare it to run. Finally, Citrix Provisioning or Machine Creation Services provisions the image in your public cloud subscription.

For more information, see [Image Portability Service](#).

- **Citrix Secure Private Access** enables administrators to provide a cohesive experience that integrates single sign-on, remote access, and content inspection into a single solution for end-to-end access control. For more information, see [Secure Private Access with Connector Appliance](#).

There might be other services in preview that also depend on the Connector Appliance.

Location of resources

Your resource location is wherever your resources reside, whether that's a public or private cloud, a branch office, or a data center. If you already have resources in your own cloud or data center, your resources remain where they are. There's no need to move them elsewhere to use them with Citrix Cloud.

Your choice of location might be impacted by the following factors:

- Proximity to subscribers
- Proximity to data
- Scale requirements
- Security attributes

Example of a resource location deployment

- Build your first resource location in your data center for the head office based on subscribers and applications that need to be close to the data.
- Add a second resource location for your global users in a public cloud. Alternatively, build separate resource locations in branch offices to provide the applications best served close to the branch workers.
- Add another resource location on a separate network that provides restricted applications. This provides restricted visibility to other resources and subscribers without the need to adjust the other resource locations.

Resource location limits

You can have a maximum of 50 resource locations in your Citrix Cloud account.

Naming restrictions

Names that you assign to resource locations must conform to the following restrictions:

- Maximum length: 64 characters
- Disallowed characters:
 - #, \$, %, ^, &, ?, +
 - Braces: [], { }
 - Pipes (|)
 - Less-than symbol (<) and greater-than symbol (>)
 - Forward and backward slashes (/ , \)
- Must not match any other resource location name (case-insensitive) in the Citrix Cloud account

Primary resource locations

A primary resource location is a resource location that you designate as “most preferred” for certain communications between your domain and Citrix Cloud. The Cloud Connectors in a primary resource location are used for user logons and provisioning operations. The resource location you select as “primary” should have Cloud Connectors that have the best performance and connectivity to your domain. This enables your users to log on quickly to Citrix Cloud.

For more information, see [Select a primary resource location](#).

Citrix Cloud Connector

November 18, 2023

The Citrix Cloud Connector is a Citrix component that serves as a channel for communication between Citrix Cloud and your resource locations, enabling cloud management without requiring any complex networking or infrastructure configuration. This removes all the hassle of managing delivery infrastructure. It enables you to manage and focus on the resources that provide value to your users.

Note:

Do not install the Remote PowerShell SDK on a Citrix Cloud Connector machine. It can be installed on any domain joined machine within the same resource location.

Citrix recommends that you do not run this SDK’s cmdlets on Cloud Connectors. The SDK’s operation does not involve the Cloud Connectors.

Services that require the Cloud Connector

Citrix DaaS (formerly Citrix Virtual Apps and Desktops service) requires the Cloud Connector. For an overview of how the Cloud Connector communicates with the service, refer to the [Citrix DaaS diagram](#) in Citrix Tech Zone.

Citrix Endpoint Management requires the Cloud Connector for enterprise connectivity to the Endpoint Management service. The Remote Browser Isolation service requires the Cloud Connector for authenticated external web apps.

Cloud Connector functions

- **Active Directory (AD):** Enables AD management, allowing the use of AD forests and domains within your resource locations. It removes the need for adding any additional AD trusts.
- **Virtual apps and desktops publishing:** Enables Citrix DaaS publishing from resources in your resource locations.
- **Endpoint Management:** Enables a mobile device management (MDM) and mobile application management (MAM) environment for managing device and app policies and delivering apps to users.
- **Machine catalog provisioning:** Enables provisioning of machines directly into your resource locations.

Note:

Although operational, functionality might be reduced for the period of time that the connection to Citrix Cloud is unavailable. You can monitor the health of the Cloud Connector from the Citrix Cloud console.

Cloud Connector communication

The Cloud Connector authenticates and encrypts all communication between Citrix Cloud and your resource locations. Once installed, the Cloud Connector initiates communication with Citrix Cloud through an outbound connection. All connections are established from the Cloud Connector to the cloud using the standard HTTPS port (443) and the TCP protocol. No incoming connections are accepted.

Cloud Connector availability and load management

For continuous availability and to manage load, install multiple Cloud Connectors in each of your resource locations. At least two Cloud Connectors in each resource location are required for ensuring a highly available connection with Citrix Cloud. If one Cloud Connector is unavailable for any period of

time, the other Cloud Connectors can maintain the connection. Since each Cloud Connector is stateless, the load can be distributed across all available Cloud Connectors. There is no need to configure this load balancing function. It is completely automated.

As long as there is one Cloud Connector available, there will be no loss in communication with Citrix Cloud. The end user's connection to the resources in the resource location does not rely on a connection to Citrix Cloud, wherever possible. This enables the resource location to provide users access to their resources regardless of a connection being available to Citrix Cloud.

Where to obtain the Cloud Connector

You can download the Cloud Connector software from within Citrix Cloud.

1. Sign in to [Citrix Cloud](#).
2. From the menu in the top-left of the screen, select **Resource Locations**.
3. If you have no existing resource locations, click **Download** on the Resource Locations page. When prompted, save the **cwconnector.exe** file.
4. If you have a resource location but no Cloud Connectors installed in it, click the Cloud Connectors bar and then click **Download**. When prompted, save the **cwconnector.exe** file.

How many Cloud Connectors do I need?

A minimum of two (2) Cloud Connectors are required to create a highly available connection between Citrix Cloud and your resource location. Depending on your environment and the workloads you're supporting, you might need more Cloud Connectors to ensure the best experience for your users.

As a best practice, Citrix recommends using the N+1 redundancy model when determining the number of Cloud Connectors you need to deploy. Determine the number of Cloud Connectors that you need in a resource location based on your environment, workloads, Active Directory configuration, and services. To this number, add at least one more Cloud Connector to provide resiliency. For example, if you determine that you need five Cloud Connectors, add one more to this total and install six Cloud Connectors in your resource location.

For additional scale and sizing guidelines, see [Scale and size considerations for Cloud Connectors](#).

Where to install the Cloud Connector

Review the [system requirements](#) for supported platforms, operating systems, and versions.

Install the Cloud Connector on a dedicated machine running Windows Server 2016, Windows Server 2019, or Windows Server 2022. This machine must be joined to your domain and able to communicate with the resources that you want to manage from Citrix Cloud.

Important:

- Do not install the Cloud Connector, or any other Citrix components, on an Active Directory domain controller.
- Do not install the Cloud Connector on machines that are part of other Citrix deployments (for example, delivery controllers in an on-premises Virtual Apps and Desktops deployment).

For more deployment information, see the following articles:

- [Deployment scenarios for Cloud Connectors in Active Directory](#)
- [Cloud Connector Installation](#)

Citrix Cloud Connector Technical Details

February 19, 2024

The Citrix Cloud Connector is a component that establishes a connection between Citrix Cloud and your resource locations. This article describes deployment requirements and scenarios, Active Directory and FIPS support, and troubleshooting options.

System requirements

The machines hosting the Cloud Connector must meet the following requirements. At least two Cloud Connectors in each resource location are required to ensure high availability. As a best practice, Citrix recommends using the N+1 redundancy model when deploying Cloud Connectors to maintain a highly available connection with Citrix Cloud.

Hardware requirements

Each Cloud Connector requires of minimum of:

- 2 vCPU
- 4 GB memory
- 20 GB disk space

More vCPU memory enables a Cloud Connector to scale up for larger sites. For recommended configurations, see [Scale and size considerations for Cloud Connectors](#).

Operating systems

The following operating systems are supported:

- Windows Server 2022
- Windows Server 2019
- Windows Server 2016

The Cloud Connector is not supported for use with Windows Server Core.

.NET requirements

Microsoft .NET Framework 4.7.2 or later is required. [Download the latest version](#) from the Microsoft website.

Note:

Do not use Microsoft .NET Core with the Cloud Connector. If you use .NET Core instead of .NET Framework, installing the Cloud Connector might fail. Use only .NET Framework with the Cloud Connector.

Server requirements

If you're using Cloud Connectors with Citrix DaaS (formerly Citrix Virtual Apps and Desktops service), refer to [Scale and size considerations for Cloud Connectors](#) for machine configuration guidance.

The following requirements apply to all machines where the Cloud Connector is installed:

- Use dedicated machines for hosting the Cloud Connector. Do not install any other components on these machines.
- The machines are **not** configured as Active Directory domain controllers. Installing the Cloud Connector on a domain controller is not supported.
- Server clock is set to the correct UTC time.
- If you are using the graphical installer, you must have a browser installed and the default system browser set.
- Citrix strongly recommends enabling Windows Update on all machines hosting the Cloud Connector. When configuring Windows Update, configure Windows to automatically download and install updates outside of business hours, but do not allow automatic restarts for at least 4 hours. The Citrix Cloud platform handles machine restarts when it identifies that an update is waiting for a restart, allowing a restart for only one Cloud Connector at a time. You can configure a fallback restart using Group Policy or a system management tool for when the machine must be restarted after an update. For more information, see <https://docs.microsoft.com/en-us/windows/deployment/update/waas-restart>.

Certificate validation requirements

Cloud Connector binaries and endpoints that the Cloud Connector contacts are protected by X.509 certificates issued by widely respected enterprise certificate authorities (CAs). Certificate verification in Public Key Infrastructure (PKI) includes the Certificate Revocation List (CRL). When a client receives a certificate, the client checks whether it trusts the CA that issued the certificates and whether the certificate is on a CRL. If the certificate is on a CRL, the certificate is revoked and cannot be trusted, even though it appears valid.

The CRL servers use HTTP on port 80 instead of HTTPS on port 443. Cloud Connector components, themselves, do not communicate over external port 80. The need for external port 80 is a byproduct of the certificate verification process that the operating system performs.

The X.509 certificates are verified during the Cloud Connector installation. So, all Cloud Connector machines must be configured to trust these certificates to ensure that the Cloud Connector software can be installed successfully.

Citrix Cloud endpoints are protected by certificates issued by DigiCert or by one of the Root Certificate Authorities used by Azure. For more information on the Root CAs used by Azure, see <https://docs.microsoft.com/en-us/azure/security/fundamentals/tls-certificate-changes>.

To validate the certificates, each Cloud Connector machine must meet the following requirements:

- HTTP port 80 is open to the following addresses. This port is used during Cloud Connector installation and during the periodic CRL checks. For more information about how to test for CRL and OCSP connectivity, see <https://www.digicert.com/kb/util/utility-test-ocsp-and-crl-access-from-a-server.htm> on the DigiCert website.
 - <http://cacerts.digicert.com/>
 - <http://dl.cacerts.digicert.com/>
 - <http://crl3.digicert.com>
 - <http://crl4.digicert.com>
 - <http://ocsp.digicert.com>
 - <http://www.d-trust.net>
 - <http://root-c3-ca2-2009.ocsp.d-trust.net>
 - <http://crl.microsoft.com>
 - <http://oneocsp.microsoft.com>
 - <http://ocsp.msocsp.com>
- Communication with the following addresses is enabled:
 - https://*.digicert.com
- The following root certificates are installed:
 - <https://cacerts.digicert.com/DigiCertAssuredIDRootCA.crt>

- <https://cacerts.digicert.com/DigiCertGlobalRootG2.crt>
 - <https://cacerts.digicert.com/DigiCertGlobalRootCA.crt>
 - <https://cacerts.digicert.com/DigiCertTrustedRootG4.crt>
 - <https://cacerts.digicert.com/BaltimoreCyberTrustRoot.crt>
 - https://www.d-trust.net/cgi-bin/D-TRUST_Root_Class_3_CA_2_2009.crt
 - <https://www.microsoft.com/pkiops/certs/Microsoft%20RSA%20Root%20Certificate%20Authority%202017.crt>
 - <https://www.microsoft.com/pkiops/certs/Microsoft%20EV%20ECC%20Root%20Certificate%20Authority%202017.crt>
 - <https://www.microsoft.com/pkiops/certs/Microsoft%20ECC%20Root%20Certificate%20Authority%202017.crt>
- The following intermediate certificates are installed:
 - <https://cacerts.digicert.com/DigiCertTrustedG4CodeSigningRSA4096SHA384.crt>
 - <https://cacerts.digicert.com/DigiCertSHA2AssuredIDCodeSigningCA.crt>

If any certificate is missing, the Cloud Connector installer will download it from <http://cacerts.digicert.com>.

For complete instructions for downloading and installing the certificates, see [CTX223828](#).

Citrix DaaS Utilizing the Cloud Connector for connectivity to DaaS resources necessitates the installation of additional certificates and granting access to extended PKI infrastructure. Each Cloud Connector machine is required to fulfill the following requirements:

- HTTP port 80 is open to the following addresses:
 - crl.*.amazontrust.com
 - ocsp.*.amazontrust.com
 - *.ss2.us
- Communication with the following addresses is enabled
 - https://*.amazontrust.com
 - https://*.ss2.us
- The following root certificates are installed:
 - <https://www.amazontrust.com/repository/AmazonRootCA1.cer>
 - <https://www.amazontrust.com/repository/AmazonRootCA2.cer>
 - <https://www.amazontrust.com/repository/AmazonRootCA3.cer>

- <https://www.amazontrust.com/repository/AmazonRootCA4.cer>
- <https://www.amazontrust.com/repository/SFSRootCAG2.cer>
- The following intermediate certificates are installed:
 - <https://www.amazontrust.com/repository/G2-RootCA4.orig.cer>
 - <https://www.amazontrust.com/repository/R3-ServerCA3A.cer>
 - <https://www.amazontrust.com/repository/SFC2CA-SFSRootCAG2.cer>
 - <https://www.amazontrust.com/repository/SFC2CA-SFSRootCAG2.v2.cer>
 - <https://www.amazontrust.com/repository/G2-RootCA1.orig.cer>
 - <https://www.amazontrust.com/repository/R1-ServerCA1A.cer>
 - <https://www.amazontrust.com/repository/G2-RootCA3.cer>
 - <https://www.amazontrust.com/repository/R3-ServerCA3A.orig.cer>
 - <https://www.amazontrust.com/repository/G2-RootCA2.orig.cer>
 - <https://www.amazontrust.com/repository/G2-RootCA4.cer>
 - <https://www.amazontrust.com/repository/R2-ServerCA2A.cer>
 - <https://www.amazontrust.com/repository/R4-ServerCA4A.cer>
 - <https://www.amazontrust.com/repository/R1-ServerCA1A.orig.cer>
 - <https://www.amazontrust.com/repository/G2-RootCA1.cer>
 - <https://www.amazontrust.com/repository/G2-RootCA2.cer>
 - <https://www.amazontrust.com/repository/G2-RootCA3.orig.cer>
 - <https://www.amazontrust.com/repository/R4-ServerCA4A.orig.cer>
 - <https://www.amazontrust.com/repository/G2-ServerCA0A.cer>
 - <https://www.amazontrust.com/repository/G2-ServerCA0A.orig.cer>
 - <https://www.amazontrust.com/repository/SFSRootCA-SFSRootCAG2.cer>

If any certificate is missing, the Cloud Connector will download it from <https://www.amazontrust.com>

For complete instructions for downloading and installing the certificates, see [CTX223828](#).

Active Directory requirements

- Joined to an Active Directory domain that contains the resources and users that you use to create offerings for your users. For multi-domain environments, see [Deployment scenarios for Cloud Connectors in Active Directory](#) in this article.
- Each Active Directory forest you plan to use with Citrix Cloud must always be reachable by two Cloud Connectors.
- The Cloud Connector must be able to reach domain controllers in both the forest root domain and in the domains that you intend to use with Citrix Cloud. For more information, see the [Active Directory requirements](#) article.

following Microsoft support articles:

- [How to configure domains and trusts](#)
- “Systems services ports” section in [Service overview and network port requirements for Windows](#)
- Use universal security groups instead of global security groups. This configuration ensures that user group membership can be obtained from any domain controller in the forest.

Network requirements

- Connected to a network that can contact the resources you use in your resource location. For more information, see [Cloud Connector Proxy and Firewall Configuration](#).
- Connected to the Internet. For more information, see the following sections in [System and Connectivity Requirements](#):
 - [Cloud Connector common service connectivity requirements](#)
 - [Allowed FQDNs for Cloud Connector](#)

Supported Active Directory functional levels

The Citrix Cloud Connector supports the following forest and domain functional levels in Active Directory.

Forest Functional Level	Domain Functional Level	Supported Domain Controllers
Windows Server 2008 R2	Windows Server 2008 R2	Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2, Windows Server 2016
Windows Server 2008 R2	Windows Server 2012	Windows Server 2012, Windows Server 2012 R2, Windows Server 2016
Windows Server 2008 R2	Windows Server 2012 R2	Windows Server 2012 R2, Windows Server 2016
Windows Server 2008 R2	Windows Server 2016	Windows Server 2016
Windows Server 2012	Windows Server 2012	Windows Server 2012, Windows Server 2012 R2, Windows Server 2016
Windows Server 2012	Windows Server 2012 R2	Windows Server 2012 R2, Windows Server 2016

Forest Functional Level	Domain Functional Level	Supported Domain Controllers
Windows Server 2012	Windows Server 2016	Windows Server 2016
Windows Server 2012 R2	Windows Server 2012 R2	Windows Server 2012 R2, Windows Server 2016
Windows Server 2012 R2	Windows Server 2016	Windows Server 2016
Windows Server 2016	Windows Server 2016	Windows Server 2016, Windows Server 2019, Windows Server 2022

Federal Information Processing Standard (FIPS) support

The Cloud Connector currently supports the FIPS-validated cryptographic algorithms that are used on FIPS-enabled machines. Only the latest version of the Cloud Connector software available in Citrix Cloud includes this support. If you have existing Cloud Connector machines in your environment (installed before November 2018) and you want to enable FIPS mode on these machines, perform the following actions:

1. Uninstall the Cloud Connector software on each machine in your resource location.
2. Enable FIPS mode on each machine.
3. Install the latest version of the Cloud Connector on each FIPS-enabled machine.

Important:

- Do not attempt to upgrade existing Cloud Connector installations to the latest version. Always uninstall the old Cloud Connector first and then install the newer one.
- Do not enable FIPS mode on a machine hosting an older Cloud Connector version. Cloud Connectors older than Version 5.102 do not support FIPS mode. Enabling FIPS mode on a machine with an older Cloud Connector installed prevents Citrix Cloud from performing regular maintenance updates for the Cloud Connector.

For instructions to download the latest version of the Cloud Connector, see [Where to obtain the Cloud Connector](#).

Cloud Connector installed services

This section describes the services that are installed with the Cloud Connector and their system privileges.

During installation, the Citrix Cloud Connector executable installs and sets the necessary service configuration to the default settings required to function. If the default configuration is manually altered,

the Cloud Connector might not perform as expected. In this case, the configuration resets to the default state when the next Cloud Connector update occurs, assuming the services that handle the update process can still function.

Citrix Cloud Agent System facilitates all elevated calls necessary for the other Cloud Connector services to function and does not communicate on the network directly. When a service on the Cloud Connector needs to perform an action requiring Local System permissions, it does so through a pre-defined set of operations that the Citrix Cloud Agent System can perform.

Service Name	Description	Runs As
Citrix Cloud Agent System	Handles the system calls necessary for the on-premises agents. Includes installation, reboots, and registry access. Can only be called by Citrix Cloud Services Agent WatchDog.	Local System
Citrix Cloud Services Agent WatchDog	Monitors and upgrades the on-premises agents (evergreen).	Network Service
Citrix Cloud Services Agent Logger	Provides a support logging framework for the Citrix Cloud Connector services.	Network Service
Citrix Cloud Services AD Provider	Enables Citrix Cloud to facilitate management of resources associated with the Active Directory domain accounts in which it is installed.	Network Service
Citrix Cloud Services Agent Discovery	Enables Citrix Cloud to facilitate management of XenApp and XenDesktop legacy on-premises Citrix products.	Network Service
Citrix Cloud Services Credential Provider	Handles storage and retrieval of encrypted data.	Network Service
Citrix Cloud Services WebRelay Provider	Enables HTTP Requests received from WebRelay Cloud service to be forwarded to On-Premises Web Servers.	Network Service

Service Name	Description	Runs As
Citrix CDF Capture Service	Captures CDF traces from all configured products and components.	Network Service
Citrix Config Synchronizer Service	Copies brokering configuration locally for high availability mode.	Network Service
Citrix Connection Lease Exchange Service	Enables Connection Lease files to be exchanged between Workspace app and Cloud Connector for Service Continuity for Workspace	Network Service
Citrix High Availability Service	Provides continuity of service during outage of central site.	Network Service
Citrix ITSM Adapter Provider	Automates provisioning and management of virtual apps and desktops.	Network Service
Citrix NetScaler CloudGateway	Provides Internet connectivity to on-premises desktops and applications without the need to open in-bound firewall rules or deploying components in the DMZ.	Network Service
Citrix Remote Broker Provider	Enables communication to a remote Broker Service from local VDAs and StoreFront servers.	Network Service
Citrix Remote HCL Server	Proxies communications between the Delivery Controller and the Hypervisors.	Network Service
Citrix WEM Cloud Authentication Service	Provides authentication service for Citrix WEM agents to connect to cloud infrastructure servers.	Network Service
Citrix WEM Cloud Messaging Service	Provides service for Citrix WEM cloud service to receive messages from cloud infrastructure servers.	Network Service

Deployment scenarios for Cloud Connectors in Active Directory

You can use both Cloud Connector and Connector Appliance to connect to Active Directory controllers. The type of connector to use depends on your deployment.

For more information about using Connector Appliances with Active Directory, see [Deployment scenarios for Connector Appliances in Active Directory](#)

Install Cloud Connector within your secure, internal network.

If you have a single domain in a single forest, installing Cloud Connectors in that domain is all you need to establish a resource location. If you have multiple domains in your environment, you must consider where to install the Cloud Connectors so your users can access the resources you make available.

If the trust between the domains is not Parent/Child, you might have to install Cloud Connectors for each separate domain or forest. This configuration might be required to handle resource enumeration when using security groups to assign resources or for registrations for VDAs from either domain.

Note:

The below resource locations form a blueprint that you might have to repeat in other physical locations depending on where your resources are hosted.

Single domain in a single forest with a single set of Cloud Connectors

In this scenario, a single domain contains all the resource and user objects (forest1.local). One set of Cloud Connectors is deployed within a single resource location and joined to the forest1.local domain.

- Trust relationship: None - single domain
- Domains listed in **Identity and Access Management**: forest1.local
- User logons to Citrix Workspace: Supported for all users
- User logons to an on-premises StoreFront: Supported for all users

Note:

If you have a hypervisor instance in a separate domain, you can still deploy a single set of Cloud Connectors as long as the hypervisor instance and the Cloud Connectors are reachable through the same network. Citrix Cloud uses the hosting connection and an available network to establish communication with the hypervisor. So, even though the hypervisor resides in a different domain, you don't need to deploy another set of Cloud Connectors in that domain to ensure that Citrix Cloud can communicate with the hypervisor.

Parent and child domains in a single forest with a single set of Cloud Connectors

In this scenario, a parent domain (forest1.local) and its child domain (user.forest1.local) reside within a single forest. The parent domain acts as the resource domain and the child domain is the user domain. One set of Cloud Connectors is deployed within a single resource location and joined to the forest1.local domain.

- Trust relationship: Parent/child domain trust
- Domains listed in **Identity and Access Management**: forest1.local, user.forest1.local
- User logons to Citrix Workspace: Supported for all users
- User logons to an on-premises StoreFront: Supported for all users

Note:

You might need to restart the Cloud Connectors to ensure Citrix Cloud registers the child domain.

Users and resources in separate forests (with trust) with a single set of Cloud Connectors

In this scenario, one forest (forest1.local) contains your resource domain and one forest (forest2.local) contains your user domain. A one-way trust exists where the forest containing the resource domain trusts the forest containing the user domain. One set of Cloud Connectors is deployed in a single resource location and joined to the forest1.local domain.

- Trust relationship: One-way forest trust
- Domains listed in **Identity and Access Management**: forest1.local
- User logons to Citrix Workspace: Supported for forest1.local users only
- User logons to an on-premises StoreFront: Supported for all users

Note:

The trust relationship between the two forests needs to permit the user in the user forest to be able to log on to machines in the resource forest.

Because Cloud Connectors can't traverse forest-level trusts, the forest2.local domain is not displayed on the **Identity and Access Management** page in the Citrix Cloud console and can't be used by any cloud-side functionality. This carries the following limitations:

- Resources can only be published to users and groups located in forest1.local in Citrix Cloud. However, if you're using StoreFront stores, forest2.local users may be nested into forest1.local security groups to mitigate this issue.
- Citrix Workspace can't authenticate users from the forest2.local domain.
- The Monitor console in Citrix DaaS can't enumerate the users from the forest2.local domain.

To work around these limitations, deploy the Cloud Connectors as described in [Users and resources in separate forests \(with trust\)](#) with a set of Cloud Connectors in each forest.

Users and resources in separate forests (with trust) with a set of Cloud Connectors in each forest

In this scenario, one forest (forest1.local) contains your resource domain and one forest (forest2.local) contains your user domain. A one-way trust exists where the forest containing the resource domain trusts the forest containing the user domain. One set of Cloud Connectors is deployed within the forest1.local domain and a second set is deployed within the forest2.local domain.

- Trust relationship: One-way forest trust
- Domains listed in **Identity and Access Management**: forest1.local, forest2.local
- User logons to Citrix Workspace: Supported for all users
- User logons to an on-premises StoreFront: Supported for all users

In this scenario Connector Appliances can be used in place of Cloud Connectors in user forests with no resources to reduce cost and management overheads, particularly if there are multiple user forests. For more information see [Users and resources in separate forests \(with trust\) with a single set of Connector Appliances for all forests](#)

View the health of the Cloud Connector

The Resource Locations page in Citrix Cloud displays the health status of all the Cloud Connectors in your resource locations. You can also view advanced health check data for each individual Cloud Connector. For more information, see [Cloud Connector advanced health checks](#).

Event messages

The Cloud Connector generates certain event messages that you can view through the Windows Event Viewer. If you want to enable your preferred monitoring software to look for these messages, you can download them as a ZIP archive. The ZIP download includes these messages in the following XML files:

- Citrix.CloudServices.Agent.Core.dll.xml (Connector Agent Provider)
- Citrix.CloudServices.AgentWatchDog.Core.dll.xml (Connector AgentWatchDog Provider)

Download [Cloud Connector event messages](#).

Event logs

By default, event logs are located in the C:\ProgramData\Citrix\WorkspaceCloud\Log directory of the machine hosting the Cloud Connector.

Troubleshooting

The first step in diagnosing any issues with the Cloud Connector is to check the event messages and event logs. If you don't see the Cloud Connector listed in your resource location or it is "not in contact," the event logs provide some initial information.

Cloud Connector connectivity

If the Cloud Connector is "disconnected," the Cloud Connector Connectivity Check Utility can help you verify that the Cloud Connector can reach Citrix Cloud and its related services.

The Cloud Connector Connectivity Check Utility runs on the machine hosting the Cloud Connector. If you use a proxy server in your environment, the utility can help you verify connectivity through your proxy server by tunneling all connectivity checks. If needed, the utility can also add any missing Citrix trusted sites to the Trusted Sites zone in Internet Explorer.

For more information about downloading and using this utility, see [CTX260337](#) in the Citrix Support Knowledge Center.

Installation

If the Cloud Connector is in an "error" state, there might be a problem hosting the Cloud Connector. Install the Cloud Connector on a new machine. If the issue persists, contact Citrix Support. To troubleshoot common issues with installing or using the Cloud Connector, see [CTX221535](#).

Deploying Cloud Connectors as Secure Ticket Authority servers

If using multiple Cloud Connectors as Secure Ticket Authority (STA) servers with Citrix ADC, the ID for each STA server might be displayed as **CWSSTA** in both the ADC management console and the ICA file for application and desktop launches. As a result, STA tickets are not routed correctly and launching sessions fails. This issue can occur if the Cloud Connectors are deployed under separate Citrix Cloud accounts with different customer IDs. In this scenario, a ticketing mismatch occurs between the separate accounts that prevents sessions from being created.

To resolve this issue, ensure the Cloud Connectors that you bind as STA servers belong to the same Citrix Cloud account with the same customer ID. If you need to support multiple customer accounts from

the same ADC deployment, create a Gateway virtual server for each account. For more information, refer to the following articles:

- Creating Gateway virtual servers: [Create virtual servers](#)
- [Configuring the Secure Ticket Authority on Citrix Gateway](#)
- [Deployment Guide: Migrating Citrix Virtual Apps and Desktops from on-premises to Citrix Cloud](#)
- [CTX232640: How do I configure Citrix Gateway to use a Cloud Connector as a STA](#)

Cloud Connector Proxy and Firewall Configuration

March 20, 2024

The Cloud Connector supports connection to the Internet through an unauthenticated web proxy server. Both the installer and the services it installs need connections to Citrix Cloud.

Internet access needs to be available at both of these points.

Connectivity requirements

Use port 443 for HTTP traffic, egress only. For a list of required contactable addresses, see the following resources:

- [System and Connectivity Requirements](#)
- [Cloud Connector common service connectivity requirements](#)

The required contactable addresses for Citrix Cloud are specified as domain names, not IP addresses. Because IP addresses might change, allowing domain names ensures that the connection to Citrix Cloud remains stable.

For a list of required ports, see [Inbound and outbound ports configuration](#).

Important:

- Enabling SSL interception on certain proxies might prevent the Cloud Connector from connecting successfully to Citrix Cloud.
- SSL interception cannot be performed on Citrix Gateway addresses. For more information, see [Citrix Gateway Services connectivity requirements](#).
- SSL interception must not impact the network connectivity or stability. For more information, see [Citrix Cloud Connector](#)
- If you are using a proxy, it is recommended that the following traffic flows bypass the proxy:

- Communication between Connectors (for example, during LHC events).
- Communication between Connectors and VDA (WCF connection).
- Communication between Connectors and Domain Controllers (AD requests).

Furthermore, it is important to note that the connector utilizes the WinHTTP proxy settings. For configuration settings, see [CTX222727](#).

Check Cloud Connector connectivity

The [Cloud Connector Connectivity Check Utility](#) helps you verify connectivity between the Cloud Connector and Citrix Cloud using a series of connectivity checks. If you use a proxy server in your environment, the utility can help you configure proxy settings on the Cloud Connector and test connectivity through the proxy server. When a proxy server is configured, the connectivity tests are tunneled through the proxy server.

Note:

Cloud Connector Connectivity Check utility is for use with commercial Citrix Cloud accounts only. Do not use it with Citrix Cloud Government or Citrix Cloud Japan.

For more information about downloading and using the Cloud Connector Connectivity Check utility, see [CTX260337](#).

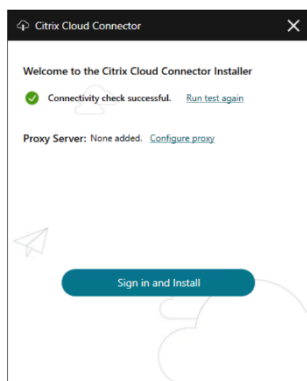

Installer

The installer uses the settings configured for Internet connections. If you can browse the Internet from the machine then the installer should also function.

Services at Runtime

The runtime service operates in the context of a local service. It does not use the settings defined for the user (as described above).

You can configure the proxy settings during the installation process.

After the installer starts, before logging into Citrix Cloud, click **Configure Proxy**. You are prompted to add the proxy information and addresses to bypass the proxy. Both fully qualified domain names (FQDNs) and wildcard addresses are supported when specifying bypass addresses.

Note:

If you are using a proxy server, you must use manual proxy setup. Automatic proxy setup, through either automatic detection or PAC/setup scripts, is not supported.

Cloud Connector Installation

March 6, 2024

You can install the Cloud Connector software interactively or using the command line.

The installation occurs with the privileges of the user who begins the install. The Cloud Connector requires access to the cloud to:

- Authenticate the user that performs the installation
- Validate the installer's permissions
- Download and configure the Cloud Connector services

Information to review before installation

- [System requirements](#): To prepare the machines for hosting the Cloud Connector.
- [Antivirus Exclusions](#) section of the [Endpoint Security and Antivirus Best Practices](#) Tech Zone article: Provides guidelines to help you determine the appropriate balance between security and performance for the Cloud Connectors in your environment. Citrix strongly recommends reviewing these guidelines with your organization's antivirus and security teams, and performing rigorous lab-based testing before applying them to a production environment.

- [System and Connectivity Requirements](#): To ensure all machines hosting the Cloud Connector can communicate with Citrix Cloud.
- [Cloud Connector Proxy and Firewall Configuration](#): If you're installing the Cloud Connector in an environment that has a web proxy or strict firewall rules.
- [Scale and size considerations for Cloud Connectors](#): Provides details of tested maximum capacities and best practice recommendations for configuring machines to host the Cloud Connector.

Installation considerations and guidance

- Don't install the Cloud Connector on an Active Directory domain controller or any other machine critical to your resource location infrastructure. [Regular maintenance](#) on the Cloud Connector performs machine operations that cause an outage to these additional resources.
- Don't download or install other Citrix products on the machines hosting the Cloud Connector.
- Don't upgrade individual components of the Cloud Connector separately.
- Don't download or install the Cloud Connector on machines that belong to other Citrix product deployments (for example, delivery controllers in an on-premises Citrix Virtual Apps and Desktops deployment).
- Don't upgrade a previously installed Cloud Connector with a newer version. Instead, uninstall the old Cloud Connector and then install the new one.
- The Cloud Connector installer is downloaded from Citrix Cloud. So, your browser must allow downloading executable files.
- If you are using the graphical installer, you must have a browser installed and the default system browser set.

Post-deployment guidance

After installation, keep all Cloud Connectors powered on continuously to ensure an always-on connection to Citrix Cloud.

Renaming machines

After installation, don't rename the machine hosting the Cloud Connector. If you need to change the server name later on, perform the following tasks:

1. Remove the machine from the resource location:
 - a) From the Citrix Cloud menu, select **Resource Locations**.
 - b) Locate the resource location you want to manage and then select the **Cloud Connectors** tile.

- c) Locate the machine you want to manage and then click the ellipsis menu. Select **Remove Connector**.
2. Uninstall the Cloud Connector software.
3. Rename the machine.
4. Install the latest version of the Cloud Connector software, as described in this article.

Moving machines to a different domain

After installation, don't move the machine hosting the Cloud Connector into a different domain. If you need to join the machine to a different domain later on, perform the following tasks:

1. Remove the machine from the resource location.
2. Uninstall the Cloud Connector software.
3. Unjoin the machine from its current domain and rejoin the machine to the new domain.
4. Install the latest version of the Cloud Connector software, as described in this article.

Considerations for cloned machines

Each machine hosting the Cloud Connector must have a unique SID and connector ID so that Citrix Cloud can communicate reliably with the machines in your resource location. If you intend to host the Cloud Connector on multiple machines in your resource location and you want to use cloned machines, perform the following steps:

1. Prepare the machine template according to the requirements for your environment.
2. Provision the number of machines that you intend to use as Cloud Connectors.
3. Install the Cloud Connector on each machine, either manually or using the silent installation mode.

Installing the Cloud Connector on a machine template (before cloning) isn't supported. If you clone a machine with the Cloud Connector installed, the Cloud Connector services won't run and the machine can't connect to Citrix Cloud.

Considerations for services

The installation steps in this article describe the process for deploying Cloud Connectors, regardless of the service for which they are used.

When deploying Cloud Connectors for Citrix DaaS, verify that the AD domains where the connectors reside are active and are not showing as "unused" in the Citrix Cloud console. If you specify an unused domain during machine catalog setup in Citrix DaaS, an error might occur. For more information, see

[Add a resource type or activate an unused domain in Citrix Cloud](#) in the Citrix DaaS product documentation.

For additional considerations for other services, consult the service's documentation.

Default resource locations

If you have no resource locations in your Citrix Cloud account and you install Cloud Connectors in your domain, the resource location that Citrix Cloud creates becomes the default resource location. You can have only one default resource location in your account. If needed, you can create additional resource locations in Citrix Cloud and then select the one you want when you install Cloud Connectors in other domains.

Alternatively, you can first create the resource locations you need in the console, before you install Cloud Connectors in your domains. The Cloud Connector installer prompts you to select the resource location you want during installation.

Interactive installation

You can download and install Cloud Connectors using the graphical installer interface. Before you do this, you must create one or more resource locations in the Citrix Cloud management console to deploy Cloud Connectors on. For more information on resource locations, see [Location of resources](#).

To create a resource location

1. Sign in as a Windows administrator to the machine you intend to install Citrix Cloud Connectors on.
2. Visit <https://citrix.cloud.com> and sign in to your administrator account.
3. In the Citrix Cloud console, navigate to **Resource Locations** from the main menu, or select **Edit or Add New** under **Resource Locations** at the top of the page.

4. In Resource Locations, select **+ Resource Location** at the top of the page and save a new, meaningful name for it.

Download the Citrix Cloud Connector software

1. Locate the resource location you want to manage and select **+ Cloud Connectors**.

2. Select **Download** in the window that opens. Save the **cwconnector.exe** file to a local file location on your connector machine.

×

Add a Cloud Connector

The Connector serves as a channel that authenticates and encrypts all communication between Citrix Cloud and your resources.

Download

Refresh

Prerequisite

Deploy

Deploy at least two Windows Server 2012 R2 or Windows Server 2016 machines to your Active Directory.

Installation Guide

Download

Copy the program file to your machines.

...

Install

Launch the file and enter your Citrix Cloud user name and password.

...

Refresh

Once the installation is complete, click **Refresh**.

[Learn more about the Citrix Cloud Connector](#)

Install the Citrix Cloud Connector software

1. Right-click the **cwconnector.exe** installer file and select **Run as administrator**. The installer performs an initial connectivity check to ensure you can connect to Citrix Cloud.
2. (Optional) If required, click **Configure proxy** to add a proxy server. You are prompted to add the proxy information and addresses to bypass the proxy. Both fully qualified domain names (FQDNs) and wildcard addresses are supported when specifying bypass addresses.
3. Click **Sign in and install** to sign in to Citrix Cloud.
4. To install and configure the Cloud Connector, follow the wizard instructions. When the installation finishes, the installer performs a final connectivity check to verify communication between the Cloud Connector and Citrix Cloud.
5. Repeat these steps on other machines you want to use as Citrix Cloud Connectors. For high availability, Citrix recommends that you install at least two Cloud Connectors for every resource location.

Citrix Cloud displays the newly installed Cloud Connector on the **Connectors** page for your resource location.

After installation, Citrix Cloud also registers your domain in **Identity and Access Management > Domains**. For more information, see [Identity and access management](#).

Activate unused domains

If you're creating resource locations and deploying Cloud Connectors for Citrix DaaS, verify that the AD domains that you're using with Citrix DaaS are active and are not considered unused. If you specify an unused domain when setting up machine catalogs in Citrix DaaS, an error could occur.

For more information, see [Add a resource type or activate an unused domain in Citrix Cloud](#) in the Citrix DaaS product documentation.

Create additional resource locations

1. From the Citrix Cloud management console, click the menu button and select **Resource Locations**.
2. Click **+ Resource Location** and enter a meaningful name.
3. Click **Save**. Citrix Cloud displays a tile for the new resource location.
4. Click **Cloud Connectors** and then click **Download** to acquire the Cloud Connector software.
5. On each prepared machine, install the Cloud Connector software using either the installation wizard or the command-line installation. Citrix Cloud prompts you to select the resource location you want to associate with the Cloud Connector.

Installation with multiple customers and existing resource locations

If you're an administrator for multiple customer accounts, Citrix Cloud prompts you to select the customer account you want to associate with the Cloud Connector.

If your customer account has multiple resource locations already, Citrix Cloud prompts you to select the resource location you want to associate with the Cloud Connector.

Command-line installation

Silent or automated installation is supported. However, using the same installer for repeated installations isn't recommended. Download a new Cloud Connector from the Resource Locations page in the Citrix Cloud console.

Requirements

To use the command line installation with Citrix Cloud, you need to supply the following information:

- The customer ID of the Citrix Cloud account for which you are installing the Cloud Connector. This ID appears at the top of the **API Access** tab in **Identity and Access Management**.
- The client ID and secret of the secure API client you want to use to install the Cloud Connector. To acquire these values, you must first create a secure client. The client ID and secret ensures that your access to the Citrix Cloud API is secured appropriately. When you create a secure client, the client operates with the same level of administrator permissions that you have. To install a Cloud Connector, you must use a secure client which was created by a Full Access administrator, which means the secure client that also has full access permissions.
- The resource location ID for the resource location that you want to associate with the Cloud Connector. To retrieve this value, select the **ID** button located beneath the resource location name on the **Resource Locations** page. If you don't supply this value, Citrix Cloud uses the ID of the default resource location.

Create a secure client

When creating a secure client, Citrix Cloud generates a unique client ID and secret. You must supply these values when you invoke the API through the command line.

1. From the Citrix Cloud menu, select **Identity and Access Management** and then select **API Access**.
2. From the **Secure Clients** tab, enter a name for your client and select **Create Client**. Citrix Cloud generates and displays a client ID and secret for the secure client.

3. Select **Download** to download the client ID and secret as a CSV file and store it in a secure location. Alternatively, select **Copy** to manually acquire each value. When finished, select **Close** to return to the console.

Supported parameters

To ensure the security of the secure client details, a JSON configuration file must be provided to the installer. This file must be deleted after the installation has completed. Supported values for the configuration file are:

- **customerName** Required. The customer ID shown on the API Access page in the Citrix Cloud console (within Identity and Access Management).
- **clientId** Required. The secure client ID an administrator can create, located on the API Access page.
- **clientSecret** Required. The secure client secret that can be downloaded after the secure client is created. Located on the API Access page.
- **resourceLocationId** Recommended. The unique identifier for an existing resource location. Select the ID button to retrieve the resource location ID on the Resource Locations page in the Citrix Cloud console. If no value is specified, Citrix Cloud uses the ID of the first resource location in the account.
- **acceptTermsOfService** Required. Must be set to **true**.

Sample configuration file

```
1 {
2
3 "customerName": "*CustomerID*",
4 "clientId": "*ClientID*",
5 "clientSecret": "*ClientSecret*",
6 "resourceLocationId": "*ResourceLocationId*",
7 "acceptTermsOfService": "true"
8 }
9
10 <!--NeedCopy-->
```

Sample command

The following command silently installs the Cloud Connector software using a JSON configuration file:

```
1 CWCCconnector.exe /q /ParametersFilePath:c:\cwccconnector_install_params.
  json
2 <!--NeedCopy-->
```

Use `/q` to specify a silent install.

Use **Start /Wait CWCCConnector.exe /ParametersFilePath:value** to examine a potential error code in the case of a failure. You can use the standard mechanism of running **echo %ErrorLevel%** after the installation completes.

Note:

Using parameters to pass the Client ID and Client Secret is no longer supported, the configuration file must be used for automated installations.

Next steps

1. Set up the Citrix Cloud Connector update schedule. For information on Citrix Cloud Connector updates and managing update schedules, visit [Connector updates](#)
2. Set up an identity provider to authenticate your workspace subscribers. You can change the default Citrix identity provider to your Active Directory or other identity providers in the **Identity and Access Management** console. For more information, visit [To connect your Active Directory to Citrix Cloud](#).

Troubleshooting installation issues

This section details some ways of diagnosing and fixing problems you might encounter during installation. For more guidance about troubleshooting installation issues, see the [Citrix Cloud Connector Troubleshooting Guide](#).

Installation logs

You can troubleshoot issues encountered with installation by first consulting the available log files.

Events that occurred during installation are available in the **Windows Event Viewer**. You can also review Cloud Connector installation logs, which are located at `%LOCALAPPDATA%\Temp\CitrixLogs\CloudServices`. Logs are also added to `%ProgramData%\Citrix\WorkspaceCloud\InstallLogs` after installation.

Exit codes

The following exit codes might be returned depending on the success or failure of the installation process:

- 1603 - An unexpected error occurred
- 2 - A prerequisite check failed
- 0 - Installation completed successfully

Installation error

If you install the Citrix Cloud Connector software by double-clicking the installer, you might receive the following error message:

Can't reach this page.

This error can occur even if you are logged in to the machine as an administrator to install the Citrix Cloud Connector. To avoid this error, run the Citrix Cloud Connector software as an administrator by right-clicking the installer and selecting Run as administrator.

Connectivity failures

To ensure that the Cloud Connector can communicate with Citrix Cloud, confirm that the following Citrix services are in a **Started** state:

- Citrix Cloud AD Provider
- Citrix Cloud Agent Logger
- Citrix Cloud Agent System
- Citrix Cloud Agent Watchdog
- Citrix Cloud Credential Provider
- Citrix Config Synchronizer Service
- Citrix High Availability Service
- Citrix NetScaler CloudGateway
- Citrix Remote Broker Provider
- Citrix Remote HCL Server
- Citrix Session Manager Proxy

For more information about these services, see [Installed Services](#).

If you continue to experience connectivity failures, use the Cloud Connector Connectivity Check Utility available from the Citrix Support Knowledge Center. For more information, see [CTX260337](#) on the Knowledge Center website.

The tool can be used to perform the following tasks:

- Test whether Citrix Cloud and its related services are reachable.
- Check for commonly misconfigured settings.
- Configure proxy settings on the Citrix Cloud Connector.

For more information on how to resolve a failed connectivity check, see [CTX224133: Cloud Connector Connectivity Check Failed](#).

Cloud Connector advanced health checks

November 27, 2023

Before and after updates, Cloud Connector performs health checks to ensure that updates cause no unnecessary downtime for providers. You can see the connectivity and health status of the Connector and of each service or provider on the Connector.

View Connector health check data

1. From the Citrix Cloud menu, select **Resource Locations**.
2. Select the Connector for which you want to view health check data.
3. On the Connectors page, go to the ellipsis menu next to the Connector and select **View Connector data**.

The Connector Data page appears, showing the following information.

- **Service Connection Status.** This area of the Connector data page shows:
 - Whether your Connector is connected to the Cloud
 - For the Connector and its components, the currently installed version and the target version to be installed in the next update
- **Service connection history.** 24 status indicators show the health status of the Connector over time. By default, service connection history shows status for the previous 24 hours, in one-hour intervals. To see more history, select **24 days** from the drop-down menu. The view shows status for the previous 24 days, in one-day intervals.
 - A green dot indicates healthy status during the time interval.
 - A red dot indicates a failure or exception status during the time interval. Hover over the dot for more information.
 - A wrench icon indicates that an update occurred during the time interval. Hover over the wrench icon for more information.
 - A gray dot indicates that no health status information was received during the time interval.

- **Services.** This area lists each service running on the Connector.
 - The dot next to each service indicates the current status of the service.
 - Use **Alerts On** and **Alerts Off** to control whether you are notified of alerts from the service. If alerts are set to On, failures in the service cause a failure in the overall Connector connection status.
 - Select **View Details** to view details of health status the service over time.
- **Connector Metrics.** This area shows Connector usage of memory usage, CPU, network data, and disks space for the previous 24 hours or 24 days. Use the drop-down menu in the **Service connection history** area to control the time period shown.

View service details

To view connection status history and metric for each service:

1. Use the drop-down menu in the **Service connection history** section to select the time period. You can view the previous 24 hours, in one-hour intervals, or the previous 24 days, in one-day intervals.
2. On the Connector Data page, select **View Details** next to the service.

The page that appears shows:

- 24 status indicators that show the health status of the service over time.
 - A green dot indicates healthy status during the time interval.
 - A red dot indicates a failure or exception status during the time interval. Hover over the dot for more information.
 - A wrench icon indicates that an update occurred during the time interval. Hover over the wrench icon for more information.
 - A gray dot indicates that no health status information was received during the time interval.

- Charts that show memory and processor usage for the service during the specified time period.

Connector notifications

October 31, 2022

Your connectors generate notifications within 2 hours of a warning or error condition occurring. You can see new notifications on the bell icon in the Citrix Cloud header.

Click this icon to view the notifications or select **Notifications** from the console menu.

For more information, see [Notifications](#).

Cloud Connector

The following table lists the notifications that Cloud Connector can raise:

Alert message	Alert Type	Details	Resolution
Connector <i>CONNECTOR_NAME</i> is offline and out of date after failing to perform regular maintenance. Outdated connectors will impact service availability and prevent maintenance.	Error	If a connector has been offline for a long time and later comes back online, it might be an old version that cannot be updated to the latest version. Outdated connectors cannot perform maintenance and may impact the maintenance process of other connectors in the environment.	How to Update an Outdated Cloud Connector
Connector <i>CONNECTOR_NAME</i> is not in sync with UTC time. Connectors in this state may impact service availability, functionality, or performance.	Error		How Do I Synchronize the Cloud Connector Time
Maintenance on connector <i>CONNECTOR_NAME</i> has failed. Failed maintenance on this connector will prevent maintenance for other connectors in the environment. Connectors with failed maintenance may impact service availability, functionality or performance.	Error	A connector upgrade or other maintenance operation has failed on this connector.	How Do I Resolve a Failed Cloud Connector Maintenance

Alert message	Alert Type	Details	Resolution
Connector <i>CONNECTOR_NAME</i> has been offline for <i>NUMBER</i> or more hours. Offline connectors will impact service availability and prevent maintenance.	Warning	If the connector has been uncontactable for a certain number of hours, it is considered offline.	How Do I Restore an Offline Cloud Connector to an Online State
Connector <i>CONNECTOR_NAME</i> has failed a recent connectivity check. A failed connectivity check may impact service availability or functionality.	Warning	A connectivity check has failed with error code <i>HEALTH_CHECK_CODE</i> . This connector was unable to contact certain web or IP addresses that are listed in the notification message.	Cloud Connector Connectivity Check Failed
Connector <i>CONNECTOR_NAME</i> is experiencing high CPU utilization. Connectors operating with constrained resources may impact service availability, functionality, or performance.	Warning	This connector has exceeded 80% CPU utilization over a one hour sample period.	How Do I Resolve a Cloud Connector Resource Availability Alert
Connector <i>CONNECTOR_NAME</i> is low on free disk space. Connectors operating with constrained disk space will impact service performance and maintenance.	Warning	This connector has less than 2 GB free disk space.	How Do I Resolve a Cloud Connector Resource Availability Alert

Alert message	Alert Type	Details	Resolution
Connector <i>CONNECTOR_NAME</i> has detected a critical process or service is no longer running. This state may impact service availability, functionality, or performance.	Warning		

Log Collection for Citrix Cloud Connector

September 21, 2023

CDF logs are used for troubleshooting purposes within Citrix products. Citrix Support uses CDF traces to identify issues with application and desktop brokering, user authentication, Virtual Delivery Agent (VDA) registration. This article discusses how to capture Cloud Connector data that can be used to troubleshoot and resolve issues you might experience in your environment.

Important notes:

- Enable logging on all Cloud Connector machines in your resource locations.
- To ensure that you're capturing the full spectrum of data, Citrix recommends using the CD-FControl capturing tool that resides on the VDA. For more information, see [CTX111961](#) in the Citrix Support Knowledge Center. For more information about log collection for Citrix Workspace app, [CTX141751](#).
- To submit CDF traces to Citrix, you must have an open Citrix Support case. Citrix Support technicians can't review CDF traces that are not attached to an existing support case.

Step 1: Recreate the issue

In this step, recreate the issue you're experiencing in your environment. If the issue is related to app launches or brokering, recreate the launch failure. If the issue is related to VDA registration, recreate the VDA registration attempt by manually restarting the Citrix Desktop Service on the VDA machine.

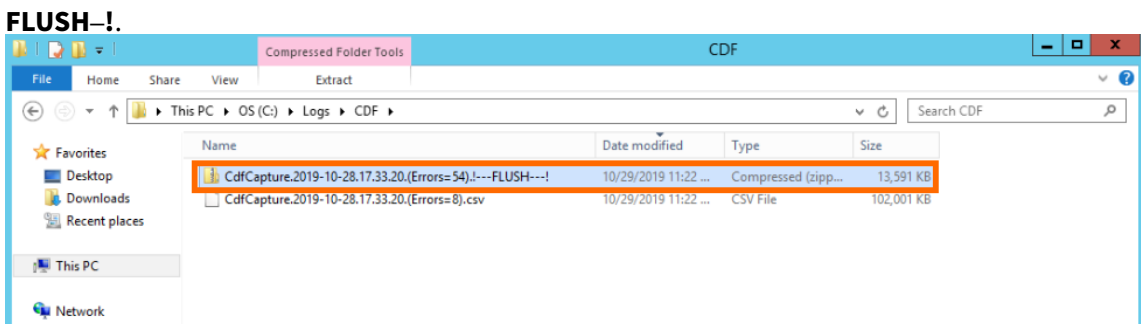

Step 2: Collect CDF traces

In this step, you collect CDF flush traces from each Cloud Connector in your resource location.

1. Access the Cloud Connector machine by initiating an RDP connection using a Domain Admin or Local Administrator account.
2. On the Cloud Connector machine, open the File Explorer and navigate to `C:\logs`.

3. Run **Flush CDF**. An icon appears briefly on the Taskbar of the Cloud Connector machine and then disappears.
4. From the File Explorer, navigate to `C:\logs\CDF` and identify the most recent folder ending in **!-FLUSH-!**.

5. Perform Steps 1-5 on every Cloud Connector machine in your resource location and combine all Cloud Connector flush traces into a single ZIP archive. If you don't create a ZIP archive of the flush traces from all your Cloud Connector machines, you will need to submit them one at a time to Citrix.

Step 3: Submit data to Citrix

In this step, you attach your traces to your Citrix support case and submit them for review.

1. Visit <https://cis.citrix.com/> and sign in using your Citrix.com credentials.
2. Select **Diagnostics**.
3. Select **Tools** and then select **Upload Data**.

4. In **Case Number**, enter the Citrix Support case number of the existing support case. Citrix Support technicians can't review CDF traces appropriately without a case number attached to the data upload.

5. In **Description** (optional), you can enter a brief description or leave this field blank.
6. Select **Upload File** and select the ZIP archive you created earlier. If you didn't create a ZIP archive of flush traces from all your Cloud Connector machines, repeat Steps 3-6 to attach each flush trace you want to submit.

After you submit your flush traces, Citrix Insight Services processes them and attaches them to the support case you specified. This process can take up to 24 hours, depending on the size of the files.

Select a primary resource location

September 21, 2023

If you have multiple resource locations in your domain, you can choose one to be the “primary” or “most preferred” location for Citrix Cloud. The primary resource location provides the best performance and connectivity between Citrix Cloud and your domain, enabling users to sign in quickly.

When you select a primary resource location, the Cloud Connectors in that resource location are used for user logons and provisioning operations where possible. If the Cloud Connectors in the primary

resource location are unavailable, these operations are performed using another Cloud Connector in the domain. Logons using a User Principal Name (UPN) might not contain the domain name and might not use the primary resource location.

Note:

To ensure that Cloud Connectors are always available in any resource location, install at least two Cloud Connectors in each resource location.

To decide which resource location you want to use for your primary resource location, consider the following:

- Does the resource location have the best connectivity to your domain?
- Is the resource location the closest to the geographical region in which you use the Citrix Cloud management console? For example, if your Citrix Cloud console is at <https://us.cloud.com>, the resource location you choose would be the closest one to the US region.

To select a primary resource location

1. From the Citrix Cloud management console, click the menu button and select **Identity and Access Management**.
2. Click **Domains** and then expand the domain containing the resource location you want to use.
3. Click **Set Primary Resource Location** and then select the resource location you want to designate as primary.
4. Click **Save**. Citrix Cloud displays “Primary” next to the resource location you selected.

Note:

Be sure to save your selections in one domain before expanding a different domain. When you expand a domain and then expand another domain, the previously expanded domain collapses and discards any unsaved selections.

Select a different primary resource location

1. From the Citrix Cloud management console, click the menu button and select **Identity and Access Management**.
2. Click **Domains** and then expand the domain that contains the primary resource location you want to change.
3. Click **Change Primary Resource Location** and then select the resource location you want to use.
4. Click **Save**.

Reset a primary resource location

Resetting the primary resource location allows you to remove the “Primary” designation from a resource location without selecting a different one. When you remove the “Primary” designation, any of the Cloud Connectors in the domain can handle user logon operations. As a result, some users might experience slower logons.

1. From the Citrix Cloud management console, click the menu button and choose **Identity and Access Management**.
2. Choose **Domains** and then expand the domain that contains the primary resource location you want to change.
3. Choose **Change Primary Resource Location** and then choose **Reset**. A notification appears, warning you that logon performance might be affected.
4. Select **I understand the potential impact to subscribers** and then click **Confirm Reset**.

Connector Appliance for Cloud Services

November 28, 2023

The Connector Appliance is a Citrix component hosted in your hypervisor. It serves as a channel for communication between Citrix Cloud and your resource locations, enabling cloud management without requiring any complex networking or infrastructure configuration. Connector Appliance enables you to manage and focus on the resources that provide value to your users.

The Connector Appliance provides the following functions:

- **Connecting Active Directory to Citrix Cloud** enables AD management, allowing the use of AD forests and domains within your resource locations. It removes the need for adding any additional AD trusts. For more information, see [Active Directory with Connector Appliance](#).
- **Image Portability Service** simplifies the management of images across platforms. This feature is useful for managing images between an on-premises resource location and one in a public cloud. The Citrix Virtual Apps and Desktops REST APIs can be used to automate the administration of resources within a Citrix Virtual Apps and Desktops site.

The Image Portability workflow begins when you use Citrix Cloud to initiate the migration of an image from your on-premises location to your public cloud subscription. After preparing your image, the Image Portability Service helps you transfer the image to your public cloud subscription and prepare it to run. Finally, Citrix Provisioning or Machine Creation Services provisions the image in your public cloud subscription.

For more information, see [Image Portability Service](#).

- **Citrix Secure Private Access** enables administrators to provide a cohesive experience that integrates single sign-on, remote access, and content inspection into a single solution for end-to-end access control. For more information, see [Secure Private Access with Connector Appliance](#).

There might be other services in preview that also depend on the Connector Appliance.

The Connector Appliance platform is part of Citrix Cloud Platform and Citrix Identity Platform and can process data, including the following information:

- IP addresses or FQDNs
- Device, user, and resource location identifiers
- Timestamps
- Event data
- User and group details from Active Directory (for example, used for authenticating and searching for users and groups)

Details of specific information processed by the Connector Appliance are available in the *Data Collected by Citrix Cloud Platform* table in the [Citrix Cloud Services Data Protection Overview](#).

Connector Appliance availability and load management

For continuous availability and to manage load, install multiple Connector Appliances in each of your resource locations. Citrix recommends at least two Connector Appliances in each resource location. If one Connector Appliance is unavailable for any time, the other Connector Appliances can maintain the connection. Since each Connector Appliance is stateless, the load can be distributed across all available Connector Appliances. There is no need to configure this load balancing function. It is automated. If at least one Connector Appliance is available, there is no loss in communication with Citrix Cloud.

If you have only one connector configured for a resource location, Citrix Cloud shows a warning on both the **Resource Locations** and the **Connectors** page.

Connector Appliance updates

The Connector Appliance is updated automatically. You are not required to take any actions to update your connector.

You can configure your resource location to apply updates either immediately as they become available or during a specific maintenance window.

For more information about configuring updates, see [Connector updates](#)

As part of the update, the Connector Appliance becomes temporarily unavailable. Updates are applied to only one Connector Appliance in a resource location at a time. For this reason, register at

least two Connector Appliances in each resource location to ensure that at least one Connector Appliance is always available.

Connector Appliance communication

The Connector Appliance authenticates and encrypts all communication between Citrix Cloud and your resource locations. Once installed, the Connector Appliance initiates communication with Citrix Cloud through an outbound connection. All connections are established from the Connector Appliance to the cloud using the standard HTTPS port (443) and the TCP protocol. No incoming connections are allowed.

The following table lists the ports that the Connector Appliance requires access to:

Service	Port	Supported Domain Protocol	Configuration details
DNS	53	TCP/UDP	This port must be open to the local setup
NTP	123	UDP	This port must be open to the local setup
HTTPS	443	TCP	Connector Appliance requires outbound access to this port

To configure the Connector Appliance, IT administrators must be able to access the administration interface on port 443 (HTTPS) of the Connector Appliance.

Note:

You must include `https://` at the start of the IP address.

The Connector Appliance can communicate with both on-premises systems in your resource location and with external systems. If you define one or more web proxies during Connector Appliance registration, only traffic from the Connector Appliance to external systems is routed through this web proxy. If your on-premises system is located in a private address space, traffic from Connector Appliance to this system is not routed through the web proxy.

The Connector Appliance defines private address spaces as the following IPv4 address ranges:

- 10.0.0.0 –10.255.255.255
- 172.16.0.0 –172.31.255.255
- 192.168.0.0 –192.168.255.255

Internet connectivity requirements

Connecting to the Internet from your data centers requires opening port 443 to outbound connections. However, to operate within environments containing an Internet proxy server or firewall restrictions, further configuration might be needed.

To properly operate and consume the Citrix Cloud services, the following addresses must be contactable with unmodified HTTPS connections:

- https://*.cloud.com
- https://*.citrixworkspacesapi.net
- https://*.citrixnetworkapi.net
- https://*.nssvc.net
 - Customers who can't enable all subdomains can use the following addresses instead:
 - * https://*.g.nssvc.net
 - * https://*.c.nssvc.net
- https://*.servicebus.windows.net
- <https://iwsprodeastusuniconacr.azurecr.io>
- <https://iwsprodeastusuniconacr.eastus.data.azurecr.io>

Network requirements

Ensure that your environment has the following configuration:

- Either the network allows the Connector Appliance to use DHCP to get DNS and NTP servers, an IP address, a host name, and a domain name or you can manually set the network settings in the Connector Appliance console.
- The network is not configured to use the link-local IP ranges 169.254.0.1/24, 169.254.64.0/18 or 169.254.192.0/18, which are used internally by the Connector Appliance.
- Either the hypervisor clock is set to Coordinated Universal Time (UTC) and is synchronized with a time server or DHCP provides NTP server information to the Connector Appliance.
- If you use a proxy with Connector Appliance, the proxy must be unauthenticated or use basic authentication.

System requirements

The Connector Appliance is supported on the following hypervisors:

- Citrix Hypervisor 8.2 CU1 LTSR
- VMware ESXi version 7 update 2

- Hyper-V on Windows Server 2016, Windows Server 2019, or Windows Server 2022.
- Nutanix AHV
- Microsoft Azure
- AWS
- Google Cloud Platform

Your hypervisor must provide the following minimum capabilities:

- 20 GB root disk
- 2 vCPUs
- 4 GB memory
- An IPv4 network

You can host multiple Connector Appliances on the same hypervisor host. The number of Connector Appliances on the same host is only constrained by the hypervisor and hardware limitations.

Note:

Cloning, suspending, and taking snapshots of the Connector Appliance VM are not supported.

Obtain the Connector Appliance

Download the Connector Appliance software from within Citrix Cloud.

1. Sign in to Citrix Cloud.
2. From the menu in the top left of the screen, select **Resource Locations**.
3. If you do not already have a resource location, click the plus icon (+) or select **Add a Resource Location**.
4. In the resource location where you want to register the Connector Appliance, click the **Connector Appliances** plus icon (+).

The **Add a Connector Appliance** task opens.

Add a Connector Appliance ✕

^ Install Connector Appliance

Step 1. Install Connector Appliance

We recommend two Connector Appliances per resource location for high availability.
[Learn more](#)

→ Hypervisor [View minimum requirements](#)

Citrix Hypervisor ▼ Download Image

Use of this component is subject to the [Citrix EUSA](#) covering the service(s) with which you will be using this component.

Step 2. Enter your 8-digit code to confirm connector details and then register as a product in Citrix Cloud.

After downloading and installing the connector, follow prompts to generate the 8-digit registration code.

- Confirm Details

Register

Cancel

- From the **Hypervisor** list in **Step 1**, choose the type of hypervisor or cloud provider that you use to host your Connector Appliance.
 - For on-premises hypervisors and cloud environments, you can download the Connector Appliance within Citrix Cloud:
 - Click **Download Image**.

b) Review the Citrix End User Service Agreement and, if you agree, select **Agree and Continue**.

c) When prompted, save the provided Connector Appliance file.

The file name extension of the Connector Appliance file depends on the hypervisor that you choose.

- For some cloud environments, you can get the Connector Appliance from the marketplace:
 - AWS
 - Microsoft Azure
 - Google Cloud

6. Keep the **Install Connector Appliance** task open. After installing the Connector Appliance, you input your registration code into **Step 2**.

You can also get to the **Install Connector Appliance** task from the **Connectors** page. Select the plus icon (+) to add a connector and choose to add a Connector Appliance.

Install Connector Appliance on your hypervisor

- Citrix Hypervisor
- VMware ESXi
- Hyper-V
- Nutanix AHV
- Microsoft Azure
- Google Cloud Platform
- AWS

Citrix Hypervisor

This section describes how to import the Connector Appliance to a Citrix Hypervisor server by using XenCenter.

1. Connect to your Citrix Hypervisor server or pool by using XenCenter on a system that has access to the downloaded Connector Appliance XVA file.
2. Select **File > Import**.
3. Specify or browse to the path where the Connector Appliance XVA file is located. Click **Next**.
4. Select the Citrix Hypervisor server where you want to host the Connector Appliance. Alternatively, you can select the pool to host the Connector Appliance in and Citrix Hypervisor chooses a suitable available server. Click **Next**.
5. Specify the storage repository to use for your Connector Appliance. Click **Import**.

6. Click **Add** to add a virtual network interface. From the **Network** list, select the network for the Connector Appliance to use. Click **Next**.
7. Review the options to use to deploy the Connector Appliance. If any are incorrect, use **Previous** to change these options.
8. Ensure that **Start the new VM(s) automatically as soon as the import is complete** is selected. Click **Finish**.

After the Connector Appliance is deployed and has successfully started up, its console displays a landing page that contains the Connector Appliance IP address. Use this IP address to connect to the Connector Appliance administration page and complete the registration process.

By default, the Connector Appliance uses DHCP to set its network configuration. If DHCP is not available in your environment, you must set the network configuration at the Connector Appliance console before you can access the Connector Appliance management console. For more information, see [Set the network configuration by using the Connector Appliance console](#).

Next step: Register your Connector Appliance with Citrix Cloud.

VMware ESXi

This section describes how to deploy Connector Appliance on a VMware ESXi host by using the VMware vSphere Client.

1. Connect to your ESXi host by using the vSphere Client on a system that has access to the downloaded Connector Appliance OVA file.
2. Select **File > Deploy OVF Template....**
3. Specify or browse to the path where the Connector Appliance OVA file is located. Click **Next**.
4. Review the template details. Click **Next**.
5. You can specify a unique name for your Connector Appliance instance. By default, the name is set to **Connector Appliance**. Ensure that you choose a name that distinguishes this instance of the Connector Appliance from other instances hosted on this ESXi host. Click **Next**.
6. Specify the destination storage for your Connector Appliance. Click **Next**.
7. Choose the format to store the virtual disks in. Click **Next**.
8. Review the options to use to deploy the Connector Appliance. If any are incorrect, use **Back** to change these options.
9. Select **Power on after deployment**. Click **Finish**.

After the Connector Appliance is deployed and has successfully started up, its console displays a landing page that contains the Connector Appliance IP address. Use this IP address to connect to the Connector Appliance administration page and complete the registration process.

By default, the Connector Appliance uses DHCP to set its network configuration. If DHCP is not available in your environment, you must set the network configuration at the Connector Appliance console

before you can access the Connector Appliance UI. For more information, see [Set the network configuration by using the Connector Appliance console](#).

Next step: Register your Connector Appliance with Citrix Cloud.

Hyper-V

This section describes how to deploy Connector Appliance on a Hyper-V host. You can deploy the VM by using the Hyper-V Manager or by using the included PowerShell script.

Deploy the Connector Appliance by using the Hyper-V Manager

1. Connect to your Hyper-V host.
2. Copy or download the Connector Appliance ZIP file to the Hyper-V host.
3. Extract the contents of the ZIP file. The ZIP file contains a PowerShell script and the connector-appliance.vhdx file.
4. Copy the VHDX file to where you want to keep your VM disks. For example, `C:\ConnectorApplianceVMs`.
5. Open Hyper-V Manager.
6. Right-click on your server name and select **New > Virtual Machine**.
7. In the **New Virtual Machine Wizard**, on the **Specify Name and Location** panel, enter a unique name to identify your Connector Appliance. Click **Next**.
8. On the **Specify Generation** panel, select **Generation 1**. Click **Next**.
9. On the **Assign Memory** panel, configure the following settings and then click **Next**:
 - a) Assign 4 GB of RAM.
 - b) Disable dynamic memory.
10. On the **Configure Networking** panel, select a switch from the list (for example, Default Switch). Click **Next**.
11. On the **Connect Virtual Hard Disk** panel, select **Use an existing virtual hard disk**.
12. Browse to the location of the connector-appliance.vhdx file and select it. Click **Next**.
13. On the **Summary** panel, review the values you have chosen and click **Finish** to create the VM.
14. On the **Virtual Machines** panel, right-click on the Connector Appliance VM and select **Settings**.
15. In the **Settings** window, select **Hardware > Processors** and perform the following actions:
 - a) In **Number of virtual processors**, change the value to **2**.

- b) Click **Apply**.
 - c) Click **OK**.
16. On the **Virtual Machines** panel, right-click on the Connector Appliance VM and select **Start**.
 17. Right-click on the Connector Appliance VM and select **Connect** to open the console.

After the Connector Appliance is deployed and has successfully started up, connect to the console using the Hyper-V Manager. The console displays a landing page that contains the Connector Appliance IP address. Use this IP address to connect to the Connector Appliance administration page and complete the registration process.

By default, the Connector Appliance uses DHCP to set its network configuration. If DHCP is not available in your environment, you must set the network configuration at the Connector Appliance console before you can access the Connector Appliance UI. For more information, see [Set the network configuration by using the Connector Appliance console](#).

Next step: Register your Connector Appliance with Citrix Cloud.

Deploy the Connector Appliance by using a PowerShell script The connector-appliance.zip file contains a PowerShell script that creates and starts a new VM.

Note:

To run this unsigned PowerShell script, you might have to change the execution policies on the Hyper-V system. For more information, see <https://go.microsoft.com/fwlink/?LinkID=135170>. Alternatively, you can use the provided script as the basis to create or amend your own local script.

1. Connect to your Hyper-V host.
2. Copy or download the Connector Appliance ZIP file to the Hyper-V host.
3. Extract the contents of the ZIP file: A PowerShell script and a VHDX file.
4. In a PowerShell console, change the current directory to where the ZIP file contents are located and run the following command:

```
1 .\connector-appliance-install.ps1
2 <!--NeedCopy-->
```

5. When prompted, type a name for your VM or select **Enter** to accept the default value of **Connector Appliance**.
6. When prompted, type a destination for the root disk or press Enter to use the system default directory for VHDXs.
7. When prompted, type a file name for the root disk or select **Enter** to accept the default value of connector-appliance.vhdx.

8. When prompted, select the switch to use. Select **Enter**.
9. Review the summary of the VM import information. If the information is correct, select **Enter** to continue. The script creates and starts the Connector Appliance VM.

After the Connector Appliance is deployed and has successfully started up, its console displays a landing page that contains the Connector Appliance IP address. Use this IP address to connect to the Connector Appliance and complete the registration process.

Next step: Register your Connector Appliance with Citrix Cloud.

Nutanix AHV

This section describes how to deploy Connector Appliance from the `connector-appliance.vhdx` file onto a Nutanix AHV host by using the Nutanix Prism web console.

1. On the main menu of the Nutanix Prism web console, select the **Storage** view.
2. Click **+ Storage Container** to create a storage container to hold the Connector Appliance image file. Alternatively, you can use an existing storage container.
3. Upload the `connector-appliance.vhdx` file to your storage container.
 - a) On the main menu of the web console, select **Settings**.
 - b) Select the **Image Configuration** tab and click **+ Upload Image**
 - c) In **Create Image**, specify a **Name** for your image.
 - d) From the **Image Type** list, select **DISK**.
 - e) From the **Storage Container** list, select the storage container you created.
 - f) Select **Upload a file**.
 - g) Click **Choose file** and navigate to the `connector-appliance.vhdx` file on your local system.
 - h) Click **Save**.
4. Wait until the image is created and its state shows as **ACTIVE** in the **Image Configuration** page.
5. Select the **Network Configuration** tab.
6. Click **+ Create Network** to create a network for the Connector Appliance to use.
7. In the **Create Network** page, specify the following information:
 - The network name.
 - The network VLAN ID.
8. On the main menu of the web console, select the **VM** view.
9. Click **+ Create VM** to create a Connector Appliance instance.

10. In **Create VM**, specify the following information:
 - The VM name
 - The number of vCPUs
 - The amount of memory in GiB
11. Select to use **Legacy BIOS**.
12. Click **+ Add New Disk** to add a disk to the VM.
13. In **Add Disk**, complete the following information:
 - a) For **Type**, select **DISK**.
 - b) For **Operation**, select **Clone from Image Service**.
 - c) For **Bus Type**, select **SCSI**
 - d) For **Image**, select the image you created when you uploaded the Connector Appliance file.
14. Click **Add** to finish adding the disk.
15. In **Create VM**, click **+ Add New NIC**.
16. In **Create NIC**, select the network to add the VM to.
17. For **Network Connection State**, select **Connected**.
18. Click **Add** to finish adding the NIC.
19. Click **Save** to create the VM.

By default, the new VM is powered off.
20. In the **VM** view, select the VM and click **Power on**.
21. Wait for the VM to start up. This process can take several minutes.

After the Connector Appliance is deployed and has successfully started up, you can find the Connector Appliance IP address in one of the following places:

- In the **VM** view of the Nutanix Prism web console.
- In the Connector Appliance console.

Use this IP address to connect to the Connector Appliance administration page and complete the registration process.

Next step: Register your Connector Appliance with Citrix Cloud.

Microsoft Azure

This section describes how to deploy Connector Appliance in Microsoft Azure. You can deploy the Connector Appliance from the Azure Marketplace or from the downloaded disk image by using the included PowerShell script.

Deploy the Connector Appliance from the Azure Marketplace To deploy the Connector Appliance from the Azure Marketplace complete the following steps:

1. Go to the Connector Appliance in the Azure Marketplace. ([Azure Marketplace](#))
Alternatively, you can search for “Connector Appliance for Cloud Services” in the marketplace search.
2. Click **Get It Now** and then **Create**.
3. On the **Create Citrix Connector Appliance for Cloud Services** page, complete the following information:
 - Select the **Subscription** to use.
 - Select the **Resource group** to use.
 - Select the **Region** to locate the Connector Appliance in.
 - Specify a **VM name**.
 - Select a **Virtual network** to add the Connector Appliance to. This network is used to access Citrix Cloud, the local resources, and the Connector Appliance administration page. This network cannot be changed later.
 - Specify a value for **Subnet**.

Click **Next : Tags >**.

4. On the **Tags** tab, add required tags if needed.

Click **Next : Review + create >**.

5. After you have reviewed the deployment details, click **Create**.

After the Connector Appliance is deployed and has successfully started up, its console displays a landing page that contains the Connector Appliance IP address. Use this IP address to connect to the Connector Appliance administration page and complete the registration process.

Next step: Register your Connector Appliance with Citrix Cloud.

Deploy the Connector Appliance VM by using a PowerShell script The `connector-appliance-azure.zip` file contains a PowerShell script that creates and starts a new VM. You can use the provided script as the basis to create or amend your own local script.

Before running the script ensure that you have the following prerequisites:

- Install the Az PowerShell module into your local PowerShell environment.
- Run the PowerShell script in the directory where the VHD file is located.

Complete the following steps:

1. Copy or download the Connector Appliance ZIP file to your Windows system.

2. Extract the contents of the ZIP file: A PowerShell script and a VHD file.
3. Open a PowerShell console as Administrator.
4. Change the current directory to where the ZIP file contents are located and run the following command:

```
1 .\connector-appliance-upload-Azure.ps1
```

5. A dialog appears, prompting you to log into Microsoft Azure. Enter your credentials.
6. When prompted by the PowerShell script, select the subscription to use. Press Enter.
7. Follow the prompts in the script, which guide you through uploading the image and creating a virtual machine.
8. After you have created the first VM, the script asks if you want to create another VM from the uploaded image.
 - Type **y** to create another VM.
 - Type **n** to exit the script.

After the Connector Appliance is deployed and has successfully started up, its console displays a landing page that contains the Connector Appliance IP address. Use this IP address to connect to the Connector Appliance administration page and complete the registration process.

Next step: Register your Connector Appliance with Citrix Cloud.

AWS

This section describes how to deploy Connector Appliance in AWS. Connector Appliance is available as an AMI in the AWS marketplace and we recommend that you install the Connector Appliance from the AMI. Alternatively, you can deploy a downloaded disk image by using the AWS UI or by using the included PowerShell script.

Networking prerequisites To deploy the Connector Appliance on AWS, ensure that you have access to Citrix Cloud from the subnet in which the Connector Appliance is created.

We recommend using a private IP address for the appliance, which requires specific configuration to provide access to Citrix Cloud. To achieve this configuration, complete the following steps in the

AWS Management Console:

1. Create the NAT gateway.
 - a) In the top navigation bar, select **Services > VPC > NAT Gateways**.
 - b) On the top right, click **Create NAT Gateway**. Enter the following information:

- Enter **Name**.
 - Select **subnet** from the list.
 - Set **Connectivity type** as **Public**.
 - Select an **Elastic IP allocation ID** from the list. If there is no available Elastic IP, click **Allocate Elastic IP** and follow the instructions to create one.
- c) Click **Create NAT Gateway**.
2. Create a route table entry including the NAT gateway.
- a) In the top navigation bar, select **Services > VPC > Route Tables**.
- b) On the top right, click **Create route table**. Enter the following information:
- Enter **Name**.
 - From the list, select the VPC that contains the subnet you selected when creating the NAT gateway.
- c) Click **Create route table**.
- d) In the **Routes** tab of the route table you created, click **Edit routes > Add route**.
- e) Input the **Destination** and **Target** for the new route entry.
- Set the destination as 0.0.0.0/0.
 - For the target, select the **NAT Gateway** you created from the list.
- f) Click **Save change**.
3. Attach the subnet to be used for the Connector Appliance to this route table.
- a) In the top navigation bar, **Select Services > VPC > Route Tables**.
- b) Select the route table that contains the NAT gateway.
- c) In the display page, go to the **Subnet Associations** tab.
- d) Click **Edit subnet associations**.
- e) Select the subnet or subnets to attach to the route table.
- f) Click **Save Associations**.

Deploy the Connector Appliance from the AWS Marketplace Before beginning, ensure you meet the following prerequisites:

- You have permissions to operate EC2 resources.
- You have completed the configuration in Networking prerequisites.
- (Optional) You can create a security group that restricts which IP addresses are permitted to access your Connector Appliance.

Complete the following steps:

1. Log in to the **AWS Management Console**.
2. Find the Connector Appliance AMI in the AWS marketplace. You can do this in one of the following ways:
 - Follow the marketplace link provided in Citrix Cloud. ([AWS Marketplace](#))
 - Search for the AMI in the AWS Management Console:
 - a) Go to **Services > Compute > EC2 > AMIs**
 - b) Ensure that you are in the US East (Ohio) region.
 - c) In **Public images**, search for “Citrix Connector Appliance” or for the AMI ID “ami-026eaf9b3b232577f”.
3. Verify that you have the correct AMI by checking the AMI ID (ami-026eaf9b3b232577f) and owner ID (414337923189).
4. Copy the AMI to your subscription:
 - a) Go to **Actions > Copy AMI**.
 - b) In the **Copy AMI** dialog, you can select the **Destination Region** that you require.
 - c) Click **Copy AMI**
5. From your copied AMI summary page, click **Launch instance from AMI**.
6. In the **Launch an instance** dialog, complete the following steps:
 - a) Select the number of instances to create. For resiliency, we recommend that you have two or more Connector Appliances in each resource location.
 - b) Specify a name for the instance.
 - c) For the **Instance type**, select **t2.medium**. The instance type must have at least 4 GB and 2 CPUs.
 - d) For the **Key pair (login)**, select **Proceed without a key pair**. SSH login to the Connector Appliance is not permitted, so a key pair is not needed.
 - e) For the **Network settings**, in the **Firewall (security group)** section, configure the following settings:
 - i. Choose whether to **Create security group** or **Select existing security group**.
 - ii. Deselect **Allow SSH traffic from the internet**
 - iii. Select **Allow HTTPs traffic from the internet**
 - iv. Select **Allow HTTP traffic from the internet**

Click **Launch instance**.

7. After the instance is created, in the **Success** section, click the instance ID link to view your Connector Appliance instance.

Alternatively, you can click the **View All Instances** button on this page or go to **Services > EC2 > Instances** in the AWS Management Console to see a list of your instances.

8. When your **Instance state** has changed to **Running**, go into the instance details and use the **Private IPv4 address** to connect to the Connector Appliance administration page and complete the registration process.

You might need to use a bastion host to go to the Connector Appliance administration page at the internal IP address from your browser and complete the registration process.

By default, the Connector Appliance uses DHCP to set its network configuration. You can edit this network configuration using the Connector Appliance web interface. For more information, see [Configuring network settings on the Connector Appliance administration page](#).

Next step: Register your Connector Appliance with Citrix Cloud.

Deploy the Connector Appliance by using the AWS UI Before beginning, ensure you meet the following prerequisites:

- You have permissions to operate S3 and EC2 resources.
- You have created a service role and policy that has VM import access. For more information, see <https://docs.aws.amazon.com/vm-import/latest/userguide/required-permissions.html#vmimport-role>.

Note:

To create a service role, you must create an S3 bucket. When creating the policy, set the S3 bucket you have created with VM import access.

- You have access to AWS CloudShell. It is only available in certain regions. For the list of regions where AWS CloudShell is supported, see <https://docs.aws.amazon.com/cloudshell/latest/userguide/supported-aws-regions.html>.
- You have completed the configuration in Networking prerequisites.

Complete the following steps:

1. On your local system, extract the contents of `connector-appliance-aws.zip`.
2. Log in to the **AWS Management Console**.
3. Create a storage bucket by completing the following steps. (Alternatively, you can skip these steps and use an existing storage bucket.)
 - a) In the top navigation bar, select **Services > S3 > Create bucket**.

- b) Enter a unique name for your bucket. For naming conventions for buckets in Amazon S3, see <https://docs.aws.amazon.com/AmazonS3/latest/userguide/bucketnamingrules.html>.
 - c) Select the region for your bucket. Ensure that you choose the same region as your AWS Region, because you cannot use the files in the bucket if these regions are different.
 - d) Keep the remaining settings set to the defaults, then click **Create bucket**.
4. Click the name of the bucket that you have created. Click **Upload > Add files**, then select the `connector-appliance.vhd` file. Keep the remaining settings set to the defaults then click **Upload**.
 5. Click the file you uploaded. Click **Copy S3 URI**.
 6. Click the **AWS CloudShell icon** in the top navigation bar and run the following commands:
 - a) Create a task to convert your VHD file to a snapshot:

```
1 aws ec2 import-snapshot --disk-container Format=VHD,Url="<S3_URI>"
```

Replace the placeholder value with your S3 URI that you copied from the previous step. For example, `aws ec2 import-snapshot --disk-container Format=VHD, Url="s3://my-aws-bucket/connector-appliance.vhd"`.

This command is complete when the following command returns a JSON string containing `"Status": "completed"`. Make note of the `ImportTaskId` value in the JSON output.

- b) Run the following command:

```
1 aws ec2 describe-import-snapshot-tasks --import-task-ids <ImportTaskId>
```

Replace the placeholder value with the `ImportTaskId` copied from the previous step. For example, `aws ec2 describe-import-snapshot-tasks --import-task-ids import-snap-0273h2836153itg5`.

7. On the **AWS Management Console**, in the top navigation bar, select **Services > EC2**.
8. From the menu on the left of the screen, click **Snapshots**.
9. Right-click on the snapshot that you created and click **Create Image**.
10. In the pane that opens, complete the following steps:
 - a) Enter a name for your AMI.
 - b) Select **Hardware-assisted virtualization**.

Click **Create**.

11. From the menu on the left of the screen, click **AMIs**.
12. Right-click on the AMI that you created and click **Launch**.
13. In the pane that opens, complete the following steps:
 - a) Choose the instance type.
 - b) (Optional) Customize the network on the **Configure Instance** tab.
 - c) (Optional) Attach another volume on the **Add Storage** tab.
 - d) Set security group rules on the **Configure Security Group** tab.

After you have reviewed the instance launch, click **Review and Launch**.

After the Connector Appliance is deployed and has successfully started up, go to **Services > EC2 > Instances** and select the instance you have created. Use the **Private IPv4 address** to connect to the Connector Appliance administration page and complete the registration process. You might need to use a bastion host to go to the Connector Appliance administration page at the internal IP address from your browser to continue the installation process.

By default, the Connector Appliance uses DHCP to set its network configuration. You can edit this network configuration using the Connector Appliance web interface. For more information, see [Configuring network settings on the Connector Appliance administration page](#).

Next step: Register your Connector Appliance with Citrix Cloud.

Deploy the Connector Appliance by using a PowerShell script The `connector-appliance-aws.zip` file contains a PowerShell script that creates and starts a new VM. Before running the script ensure that you have the following prerequisites:

- You have either AWS.Tools, AWSPowerShell.NetCore or AWSPowerShell installed on your system. For more information, see <https://docs.aws.amazon.com/powershell/latest/userguide/pstools-getting-set-up.html>.
- You have created a service role and policy that has VM import access. Both the service role and the policy must be named `vmimport` for this PowerShell script to work. For more information, see <https://docs.aws.amazon.com/vm-import/latest/userguide/required-permissions.html#mimport-role>.

Note:

To create a service role, you must create an S3 bucket. When creating the policy, set the S3 bucket you have created with VM import access.

- You have created an Amazon EC2 security group.
- You have S3 permissions and API access.

- You have completed the configuration in Networking prerequisites.

Complete the following steps:

1. On your local system, extract the contents of `connector-appliance-aws.zip` to a folder.
2. In PowerShell, run the following commands:

- a) To be able to run an AWS cmdlet in your local environment, run the following command to add a new profile to the AWS SDK store:

```
1 Set-AWSCredential -AccessKey <access_key_ID> -SecretKey <secret_key> -StoreAs MyProfile
```

Replace the placeholder values with your access key and secret key. Provide a unique profile name. In the example we have provided, it is `MyProfile`.

- b) Set the profile to the default:

```
1 Initialize-AWSDefaultConfiguration -ProfileName MyProfile
```

- c) Change the current directory to the folder where the extracted files are located and run the following command:

```
1 .\connector-appliance-upload-aws.ps1
```

3. Follow the prompts in the script, which guide you through selecting the region for your Connector Appliance deployment, uploading the image to your chosen bucket, and entering a name for your VM.
 - You must use the bucket with VM import access that you created earlier.
 - When asked to select the VPC to use, select the VPC where the NAT gateway and route tables are configured.
 - When asked to select the subnet to use, select the subnet attached to the route table containing the NAT gateway.

For more information, see Networking prerequisites.

After the Connector Appliance is deployed and has successfully started up, the script displays the private IP address of the Connector Appliance. You might need to use a bastion host to go to the Connector Appliance administration page at the internal IP address from your browser and complete the registration process.

By default, the Connector Appliance uses DHCP to set its network configuration. You can edit this network configuration using the Connector Appliance web interface. For more information, see [Configuring network settings on the Connector Appliance administration page](#).

Next step: Register your Connector Appliance with Citrix Cloud.

Google Cloud Platform

This section describes how to deploy Connector Appliance on the Google Cloud Platform. You can install the Connector Appliance from the Google Cloud Marketplace. Alternatively, you can deploy a downloaded disk image by using the Google Cloud Platform Console or by using the included PowerShell script.

The file `connector-appliance-gcp.zip` contains:

- `connector-appliance.tar.gz`, which is a disk image of the Connector Appliance
- `connector-appliance-upload-gcp.ps1`, which is a PowerShell script that can be used to automatically deploy the Connector Appliance

Deploy the Connector Appliance from the Google Cloud marketplace

1. Log in to your Google account.
2. Follow the marketplace link provided in Citrix Cloud. ([Google Cloud Marketplace](#))
Alternatively, you can search for “Connector Appliance for Cloud Services” in the marketplace search.
3. Click **Launch**.
4. On the **New Citrix Connector Appliance for Cloud Services deployment** page, complete the following information:
 - Specify a **Deployment name** for the deployment job.
 - Select the **Zone** to locate the Connector Appliance in.
 - Select the **Machine family**, **Series**, and **Machine type** to use.
 - Select the **Boot disk type** and **Boot disk size in GB** to use.
 - In the **Networking** section, specify the networking interface to be used by the Connector Appliance. If you want to be able to connect to the administration page from a public network, specify an **External IP**.

Click **Deploy**. You are directed to the **Deployment Manager** page.

Note:

After the Connector Appliance is deployed and has successfully started up, you receive an email to confirm that the Connector Appliance is deployed on Google Cloud Platform.

5. On the **Deployment Manager** page, click on the instance name. Alternatively, you can search for the Connector Appliance instance that you created in the **Compute Engine**.
6. If you previously specified an **External IP** when setting up the networking interface for your Connector Appliance, copy the **External IP address** in the **Network interfaces** section in the

Details tab. Use this IP address to connect to the Connector Appliance administration page and complete the registration process. Alternatively, you can use the **Primary internal IP address** to visit the Connector Appliance administration page from another machine that is in the same subnet as your Connector Appliance.

Next step: Register your Connector Appliance with Citrix Cloud.

Deploy the Connector Appliance by using the Google Cloud Platform console

1. On your local system, extract the contents of `connector-appliance-gcp.zip`.
2. In your Google Cloud Platform project, create a storage bucket. (Alternatively, you can use an existing storage bucket.)
 - a) From the main menu, select **Cloud Storage**.
 - b) On the main pane, select **Create bucket**.
 - c) Specify a name for your bucket.
 - d) Configure the data storage and access settings that you require. You can leave these settings as the defaults.
 - e) Click **Create**.
3. Inside your storage bucket, select **Upload files** and choose the file `connector-appliance.tar.gz`. Wait while the file uploads.
4. Select the uploaded file to view its details. Copy the value of **gsutil URI** to the clipboard.
5. Open the Cloud Shell by clicking the **Activate Cloud Shell** icon in the header bar.
6. In your Cloud Shell, run the following command to create an image:

```
1 gcloud compute images create "Image name" --guest-os-features=
  MULTI_IP_SUBNET --source-uri="gsutil URI of uploaded connector-
  appliance.tar.gz file"
```

7. From the main menu, select **Compute Engine > VM Instances**.
8. Select **Create Instance**. In the pane that opens, specify the following information:
 - a) In the **Name** field, specify a name for the Connector Appliance instance.
 - b) Choose a region to locate the Connector Appliance in.
 - c) Choose the machine configuration.
 - d) In the **Boot disk** section, click **Change**.
 - e) In the section that opens, go to the **Custom images** tab.
 - f) From the **Image** list, select the image you created.
 - g) Click **Select**.
 - h) In the **Firewall** section, enable HTTPS traffic to allow access to the Connector Appliance administration page.

- i) Specify any additional configuration required. For example, you might not want to use the default networking configuration.

Click **Create**.

9. In the **VM Instances** section, select your newly created VM to view its details.

After the Connector Appliance is deployed and has successfully started up, the **VM Instances** section displays the Connector Appliance IP addresses.

If the Connector Appliance has an external IP address, you can use this IP address to go to the Connector Appliance administration page from your browser and complete the registration process.

If the Connector Appliance has only an internal IP address, use a bastion host to go to the Connector Appliance administration page from your browser and complete the registration process. For more information, see <https://cloud.google.com/compute/docs/connect/ssh-using-bastion-host>.

Next step: Register your Connector Appliance with Citrix Cloud.

Deploy the Connector Appliance by using a PowerShell script To use the provided PowerShell script to deploy the Connector Appliance, you must have the Google Cloud SDK installed on your system.

1. On your local system, extract the contents of `connector-appliance-gcp.zip` to a folder.
2. In PowerShell, change the directory to the folder where the extracted files are located.
3. Run the command `.\connector-appliance-upload-GCP.ps1`.
4. In the browser window that opens, authenticate with the Google Cloud SDK with an account that has access to the project you want to deploy the Connector Appliance to.
5. In Google Cloud Tools for PowerShell, when prompted by the PowerShell script, select the project to use. Press Enter.
6. Follow the prompts in the script, which guide you through uploading the disk, creating an image, and creating a virtual machine.
7. After you have created the first VM, the script asks if you want to create another VM from the uploaded image.
 - Type `y` to create another VM.
 - Type `n` to exit the script.

After the Connector Appliance is deployed and has successfully started up, the script displays the internal IP address of the Connector Appliance. Alternatively, you can go to the Google Cloud Platform console to find the Connector Appliance internal IP address. The **Compute Engine > VM Instances** section displays the Connector Appliance IP address.

Use a bastion host to go to the Connector Appliance administration page at the internal IP address from your browser and complete the registration process. For more information, see <https://cloud.google.com/compute/docs/connect/ssh-using-bastion-host>.

Next step: Register your Connector Appliance with Citrix Cloud.

Register your Connector Appliance with Citrix Cloud

Register a Connector Appliance with Citrix Cloud to provide a channel for communication between Citrix Cloud and your resource locations.

After you install your Connector Appliance on the hypervisor and start it, the console displays the IP address of the Connector Appliance. The console also displays an SSL fingerprint that you can use to validate your connection to the Connector Appliance UI.

```
Citrix
-----

Connector Appliance for Cloud Services 4.0.4.282
Downloaded from Citrix - https://citrix.cloud.com

Please go to:
https://10.71.57.66
to manage your deployment

SSL Fingerprint: D5:0F:32:6D:57:4E:29:EF:41:65:62:0E:60:4B:4D:4F:C3:36:D0:B0
_
```

1. Copy the Connector Appliance IP address to your browser address bar.

Note:

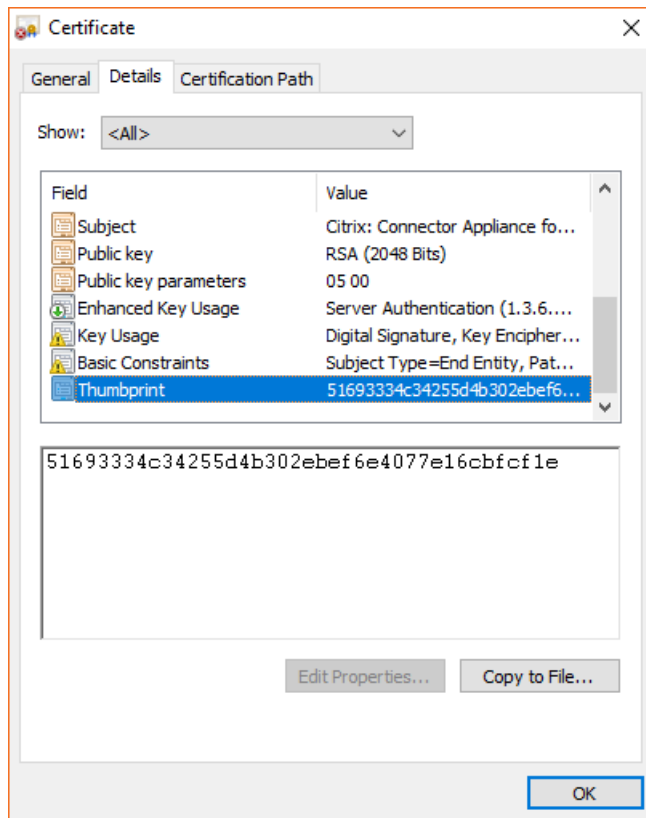

You may have to include `https://` at the start of the IP address.

The Connector Appliance UI uses a self-signed certificate, which is valid for five years. As a result, you might see a message about the connection not being secure. To verify the connection to your Connector Appliance, you can compare the SSL fingerprint in the console with the fingerprint the browser receives from the webpage.

For example, in the Google Chrome browser, complete the following steps:

- a) Click the **Not Secure** marker next to the address bar.
- b) Select **Certificate**. The **Certificate** window opens.
- c) Go to the **Details** tab and find the **Thumbprint** field.

If the value of the **Thumbprint** field and the SSL fingerprint provided in the console match, you can confirm that your browser is connecting directly to the Connector Appliance UI.

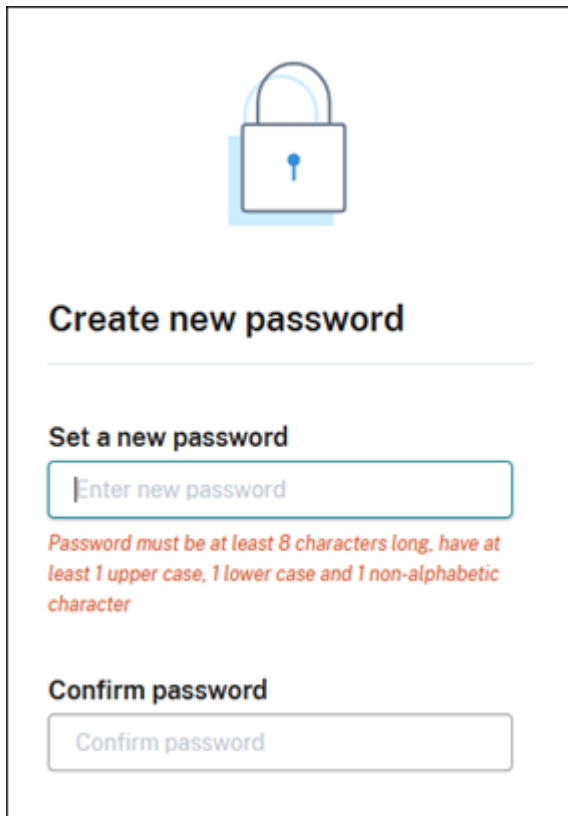

You can replace this self-signed certificate with one of your own that is signed by your organization or generated by using your organization's chain of trust. For more information, see [Managing certificates](#).

2. If your browser requires an extra step to confirm that you want to continue to the site, complete this step now.

The **Create new password** webpage opens.

3. Create a password for your Connector Appliance UI and click **Set password**.

Create new password

Set a new password

Enter new password

Password must be at least 8 characters long, have at least 1 upper case, 1 lower case and 1 non-alphabetic character

Confirm password

Confirm password

The password you set must meet the following requirements:

- 8 or more characters long
- Contains both upper and lower case letters
- Contains at least one non-alphabetic character

Ensure that you store this password in a safe place for future use.

4. Sign in with the password you set. The **Connector administration** page opens.

The screenshot shows the 'Connector administration' interface. At the top, there's a 'Connector summary' section with a green checkmark indicating the connector is 'Healthy - ready to register with Citrix Cloud'. A 'Register connector' button is visible. Below this, there are fields for 'IP address', 'Netmask', 'DNS', and 'NTP'. The 'Connector name' field is also present. The next section is 'Active Directory domains', which includes a sub-section for adding or deleting connections to Active Directory forests, with a '+ Add Active Directory domain' button. The final section is 'Proxy servers', which includes a sub-section for adding or deleting proxy servers for resiliency. It features three input fields: 'Proxy IP address and Port', 'Username (optional)', and 'Password (optional)'. At the bottom of this section are 'Cancel' and 'Save' buttons.

5. (Optional) If you use one or more web proxies, you can add the proxy addresses in the **Proxy servers** section. Both unauthenticated and authenticated proxies are supported. To add an unauthenticated proxy, provide a valid **Proxy IP Address and Port**. To add an authenticated proxy, provide a valid **Username** and **Password** as well.

Note:

Only basic proxy authentication is supported. Other forms of authentication are not supported.

Only traffic to external systems is routed through the web proxy. For more information, see Connector Appliance communication.

6. (Optional) If your network uses TLS intercepting web proxies to access the internet you may require your Connector to trust its Root Certificate Authority to successfully communicate with the cloud.
- Under **Root certificate authorities**, select **Add certificate**.
 - Copy the contents of the certificate in PEM format:

```
1 -----BEGIN CERTIFICATE-----
2 <certificate-base64-bytes>
3 -----END CERTIFICATE-----
4 <!--NeedCopy-->
```

- c) In **Full Certificate Details**, paste the certificate contents.
- d) Select **Add Certificate**.

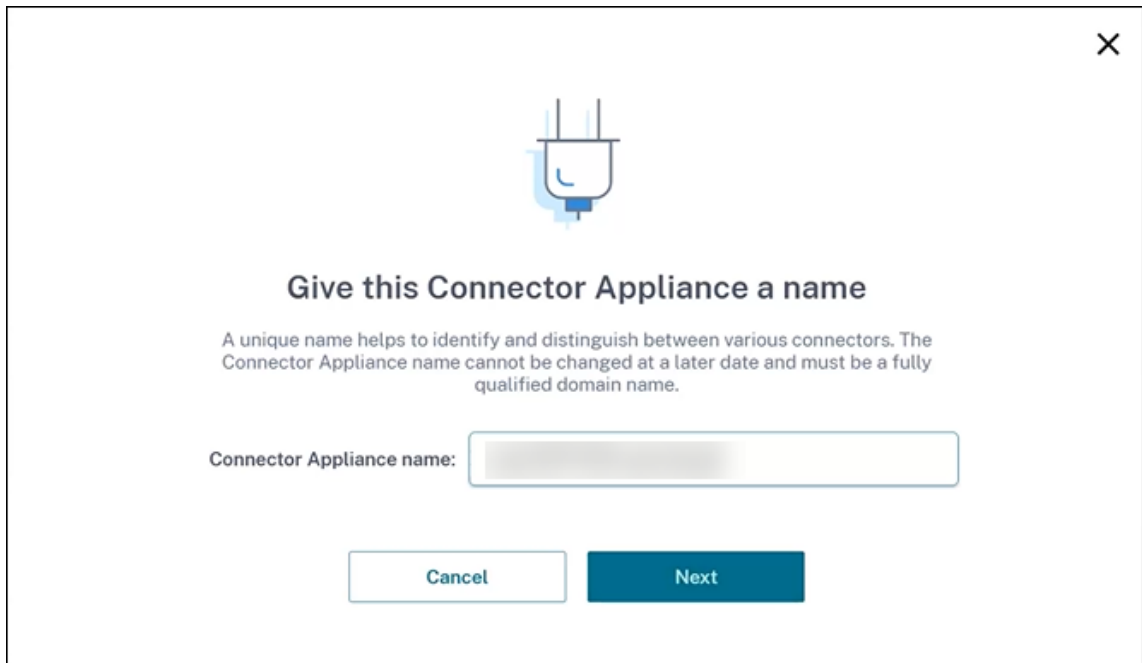

To add a RootCA using the Connector Appliance APIs, see [Managing root certificate authorities](#) in the Citrix Developer documentation.

Note:

Certificates which are expired or will expire in the next 30 days will show a warning.

- 7. Click **Register Connector** to open the registration task.
- 8. Choose a name for your Connector Appliance. This name can help you distinguish between the various Connector Appliances that exist in your resource location. After you register your Connector Appliance, the name cannot be changed.

Enter the name in the **Connector Appliance name** field and click **Next**.

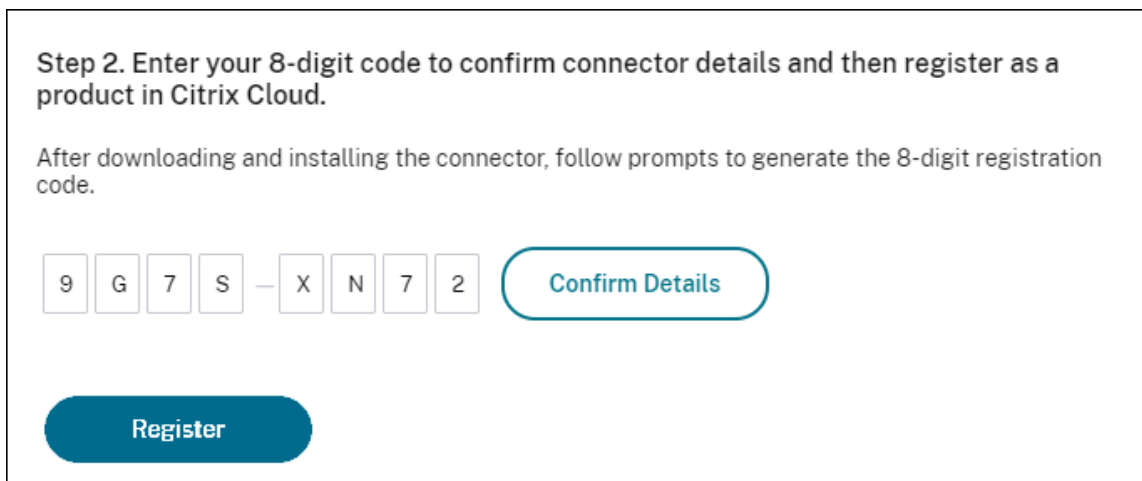

The webpage provides a code to use to register with Citrix Cloud. This code expires in 15 minutes.

9. Use the **Copy** button to copy the code to the clipboard.
10. Return to the **Resource Locations** webpage.
11. Paste the code into **Step 2** of the **Install Connector Appliance** task. Click **Confirm Details**.

Citrix Cloud verifies that the Connector Appliance is present and can be contacted. If the registration code has expired, you are prompted to generate a new code.

12. Click **Register**.

The page shows whether the registration was successful. If the registration failed, you are prompted to try again.

13. Click **Close**.

The **Connector Appliance administration page** also enables you to download a diagnostic report for the Connector Appliance. For more information, see [Generating a diagnostic report](#).

After registering your Connector Appliance

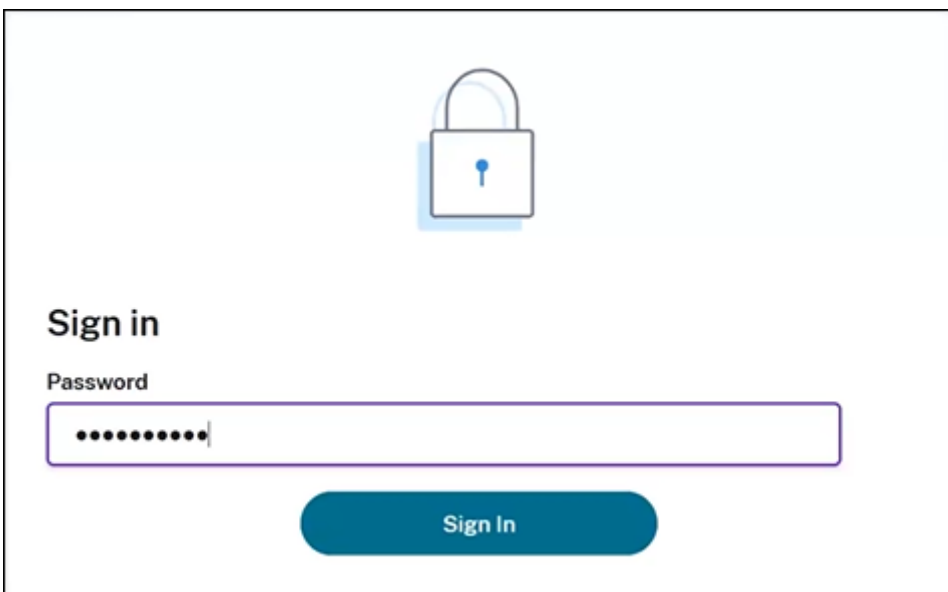

For each resource location, we advise that you install and register two or more Connector Appliances. This configuration ensures continuous availability and enables the connectors to balance the load.

You cannot directly manage your Connector Appliance.

The Connector Appliance is updated automatically. You are not required to take any actions to update your connector. You can specify the time and day that you want Connector Appliance updates to be applied in your resource location. For more information, see [Connector updates](#).

Do not clone, suspend, or take a snapshot of your Connector Appliance VMs. These actions are not supported.

You are only presented with the **Create new password** page the first time that you connect to the Connector Appliance UI. Ensure that you store this password in a safe place for future use. This password cannot be reset. If you forget the password, you must reinstall the Connector Appliance. On subsequent connections to the UI, you are asked to input the password you set when registering the Connector Appliance.

The image shows a sign-in interface. At the top center is a blue padlock icon. Below it, the text "Sign in" is displayed in a bold, dark font. Underneath "Sign in" is the label "Password" in a smaller font. Below the label is a rectangular input field with a purple border, containing ten black dots representing a masked password. At the bottom center of the form is a blue, rounded rectangular button with the text "Sign In" in white.

Generating a diagnostic report

You can generate and download a diagnostic report from the **Connector Appliance administration page**.

1. From the Connector Appliance console in your hypervisor, copy the IP address to your browser address bar.
2. Enter the password that you set when you registered your Connector Appliance.
3. In the **Diagnostic report** section of the page, click **Download Report**.

The diagnostic reports are provided in a `.zip` file.

Verify your network connection

You can check your network connection from the **Connector Appliance administration page** by using the **TCP Capture** diagnostic check.

1. On the **Connector Appliance administration page**, click your account name in the header bar and select **Network Diagnostics**.
2. (Optional) In the **TCP Capture** section, enter the target IP address, host name, or port to restrict the TCP capture.
3. From the **Trace Duration** menu, select the duration for which you want your trace to run.
4. (Optional) Enable **Packet Tracing** to capture the contents of the packets.

When packet tracing is disabled, the TCP capture functionality uses a best-effort approach to capture the headers for diagnosis. This best-effort approach captures the first 94 bytes of each packet. However, as headers are not a fixed size, this approach might not capture all of the header.

5. Click **Start trace**.
6. Wait until the trace has completed. After the trace has completed, you can download a trace report or start a new trace.
 - Click **Download** to download the trace report. The trace report is provided in a `.pcap` file.
 - Click **Start new trace** to begin another trace.

Connecting Active Directory to Citrix Cloud

You can use Connector Appliance to connect a resource location to forests which do not contain Citrix Virtual Apps and Desktops resources. For example, in the case of Citrix Secure Private Access cus-

tomers or Citrix Virtual Apps and Desktops customers with some forests only used for user authentication.

For more information, see [Active Directory with Connector Appliance](#).

Validating your Kerberos configuration

If you use Kerberos for single sign-on, you can verify that the configuration on your Active Directory controller is correct from the **Connector Appliance administration** page. The **Kerberos validation** feature enables you to validate a Kerberos realm-only mode configuration or a Kerberos Constrained Delegation (KCD) mode configuration.

Validate Kerberos realm-only configuration:

1. Go to the **Connector Appliance administration** page.
2. From the Connector Appliance console in your hypervisor, copy the IP address to your browser address bar.
3. Enter the password that you set when you registered your Connector Appliance.
4. To validate your realm-only Kerberos configuration select the **Kerberos Validation Realm-Only** in the **Active Directory domains** section.
5. Specify the **Active Directory Domain**.
 - If you're validating a Kerberos realm-only mode configuration, you can specify any Active Directory domain. This mode doesn't depend on being joined to the domain.
6. Specify the **Service FQDN**. The default service name is assumed to be "https". If you specify "computer.example.com", this value is considered the same as "<https://computer.example.com>".
7. Specify the **Username**.
8. Specify the **Password**.
9. Click **Test Kerberos**.

Kerberos Validation

Kerberos Realm-Only Mode

Validate the configuration on the Active Directory controller in realm-only mode. [Learn more](#)

Password

[Test Kerberos](#)

Validate Kerberos Constrained Delegation (KCD) configuration:

1. Go to the **Connector Appliance administration** page.
2. To validate **Kerberos Constrained Delegation (KCD)** mode for domains to which the Connector Appliance has been joined, select **Kerberos validation** from the ellipsis menu (...) of the relevant domain.
3. Specify the **Active Directory Domain**.
 - If you're validating a Kerberos Constrained Delegation configuration, you must select from a list of joined domains.
4. Specify the **Service FQDN**. The default service name is assumed to be "https". For example, specify "computer.example.com", this value is considered the same as "<https://computer.example.com%28%80%9D>".
5. Specify the **Username**.
 - For the Kerberos Constrained Delegation mode, you can also validate the kerberos setup using service accounts by selecting the **Service Accounts** tab.
6. Click **Test Kerberos**.

Kerberos Validation

Kerberos Constrained Delegation

Validate the configuration on the Active Directory controller with Kerberos Constrained Delegation (KCD).

Use of Kerberos validation might require specific setup on the Active Directory controller. To use KCD on a Connector Appliance, you must first join the domain and then set up KCD. [Learn more](#)

[Test Kerberos](#)

If the Kerberos configuration is correct, you see the message “Successfully validated Kerberos setup”. If the Kerberos configuration is not correct, you see an error message that provides information about how the validation failed.

For more information about Kerberos, see the [Microsoft documentation](#).

Network settings for your Connector Appliance

By default, the IP address and network settings of your Connector Appliance are automatically assigned by using DHCP.

After registering your Connector Appliance by using DHCP, you can edit its network settings in the **Connector Appliance administration page**.

However, if DHCP is not available in your environment or if you do not have access to the **Connector Appliance administration page**, you can set the network configuration directly on the Connector Appliance console.

Configuring network settings on the Connector Appliance administration page

After registering your Connector Appliance by using DHCP, you can edit its network settings in the **Connector Appliance administration page**.

To manually configure your network settings:

1. In the **Connector Summary** section, select **Edit network settings**.
2. In the **Network settings** dialog, choose **Configure your own network settings**.
3. Enter the **IP address**, **Subnet mask**, and **Default gateway**.

4. Add one or more **DNS servers**.
5. Add one or more **NTP servers**.
6. Click **Save**.

When you save changes to your network settings, the Connector Appliance restarts. During the restart, the Connector Appliance is temporarily unavailable. You are logged out of the **Connector Appliance administration page** and the URL of this page changes. You can find the new URL in the Connector Appliance console or by looking at the network information in your hypervisor.

To change your network configuration to use automatically assigned values:

1. In the **Connector Summary** section, select **Edit network settings**.
2. In the **Network settings** dialog, choose **Obtain IP address automatically**.
3. Click **Save**.

When you save changes to your network settings, the Connector Appliance restarts. During the restart, the Connector Appliance is temporarily unavailable. You are logged out of the **Connector Appliance administration page** and the URL of this page changes. You can find the new URL in the Connector Appliance console or by looking at the network information in your hypervisor.

Set the network configuration by using the Connector Appliance console

By default, the IP address and network settings of your Connector Appliance are automatically assigned by using DHCP. However, if DHCP is not available in your environment or if you do not have access to the **Connector Appliance administration page**, you can set the network configuration directly on the Connector Appliance console.

To set the network configuration:

1. In your hypervisor, restart the Connector Appliance.
2. While the Connector Appliance starts up, watch the console for the message `Welcome to GRUB!`.
3. When you see this message, press **Esc** to enter the GRUB menu.
4. To edit the boot parameters, press **e**.

You see a view that looks like the following image:

```
GNU GRUB version 2.04

setparams 'Root A'

    set root="(hd0,gpt3)"
    linux /boot/bzImage ro root=PARTUUID=708a030c-5ad2-429b-9fb5-fcc1fe\
098c20 quiet oops=panic console=tty0 console=ttyS0

Minimum Emacs-like screen editing is supported. TAB lists
completions. Press Ctrl-x or F10 to boot, Ctrl-c or F2 for
a command-line or ESC to discard edits and return to the GRUB menu.
```

5. Edit the line that begins with `linux` to include your required network configuration.

- To specify DHCP networking, append `network=dhcp` to the end of the line.
- To specify static networking, append the following parameters to the end of the line:

```
1  network=static:ip=<static_ip_address>;netmask=<netmask>;route
   =<default_gateway>;dns=<dns_server_1>,<dns_server_2>;ntp=<
   ntp_server_1>,<ntp_server_2>
2  <!--NeedCopy-->
```

Replace the placeholder values with the values for your configuration.

6. Press **Ctrl+X** to start the Connector Appliance with the new configuration.

Change the administrator user password for the Connector Appliance

1. From the user menu in the top-right of the console, select **Change password**.

The change password page is displayed.

2. Enter your current password and then enter and confirm the new password. The new password you set must meet the following requirements:

- 8 or more characters long
- Contains both upper and lower case letters
- Contains at least one non-alphabetic character
- Must not be the same as current password

3. Select **Change password** to save your changes.

Citrix Cloud signs you out automatically and redirects you to the sign-in page.

Active Directory with Connector Appliance

November 28, 2023

You can use Connector Appliance to connect a resource location to forests which do not contain Citrix Virtual Apps and Desktops resources. For example, in the case of Citrix Secure Private Access customers or Citrix Virtual Apps and Desktops customers with some forests only used for user authentication.

When using multi-domain Active Directory with Connector Appliance, the following restrictions apply:

- Connector Appliance cannot be used in place of Cloud Connectors in forests that contain VDAs.

Requirements

Active Directory requirements

- Joined to an Active Directory domain that contains the resources and users that you use to create offerings for your users. For more information, see [Deployment scenarios for Connector Appliances in Active Directory](#) in this article.
- Each Active Directory forest that you plan to use with Citrix Cloud must always be reachable by two Connector Appliances.
- The Connector Appliance must be able to reach domain controllers in both the forest root domain and in the domains that you intend to use with Citrix Cloud. For more information, see the following Microsoft support articles:
 - [How to configure domains and trusts](#)
 - “Systems services ports” section in [Service overview and network port requirements for Windows](#)
- Use universal security groups instead of global security groups. This configuration ensures that user group membership can be obtained from any domain controller in the forest.

Network requirements

- Connected to a network that can contact the resources you use in your resource location.
- Connected to the Internet. For more information, see [System and Connectivity Requirements](#).

In addition to the ports listed in [Connector Appliance communication](#), the Connector Appliance requires an outbound connection to the Active Directory domain via these ports:

Service	Port	Supported Domain Protocol
Kerberos	88	TCP/UDP
End Point Mapper (DCE/RPC Locator Service)	135	TCP
NetBIOS Name Service	137	UDP
NetBIOS Datagram	138	UDP
NetBIOS Session	139	TCP
LDAP	389	TCP/UDP
SMB over TCP	445	TCP
Kerberos kpasswd	464	TCP/UDP
Global Catalog	3268	TCP
Dynamic RPC Ports	49152–65535	TCP

The Connector Appliance uses LDAP signing to secure connections to the domain controller. This means that LDAP over SSL (LDAPS) is not required. For more information on LDAP signing, see [How to enable LDAP signing in Windows Server](#) and [Microsoft Guidance for Enabling LDAP Channel Binding and LDAP Signing](#).

Supported Active Directory functional levels

Connector Appliance has been tested and is supported with the following forest and domain functional levels in Active Directory.

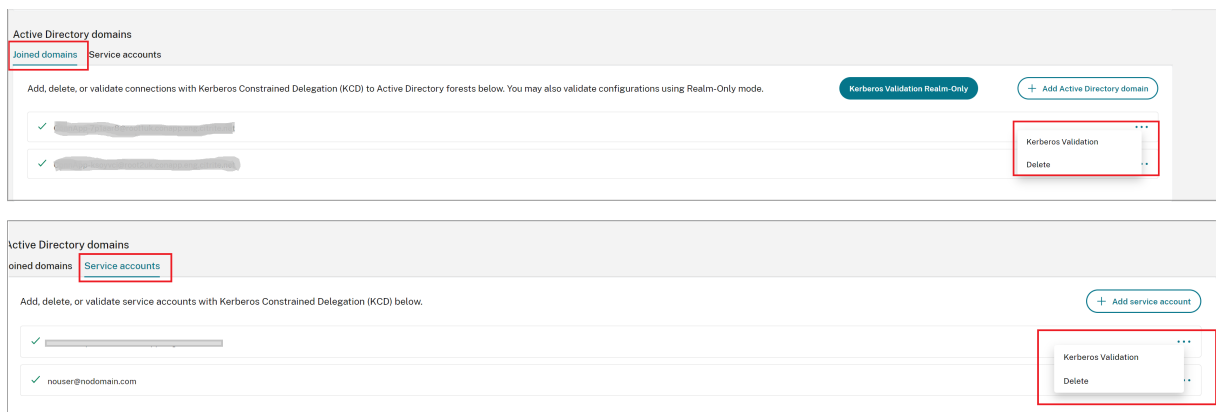

Forest Functional Level	Domain Functional Level	Supported Domain Controllers
Windows Server 2016	Windows Server 2016	Windows Server 2019

Other combinations of domain controller, forest functional level, and domain functional level have not been tested with the Connector Appliance. However, these combinations are expected to work and are also supported.

Connect an Active Directory domain to Citrix Cloud by using Connector Appliance

When you connect to the Connector Appliance administration webpage, the Active Directory domains section displays two tabs.

- **Joined Domains** –Used for joining the Connector Appliance to AD Domains by creating a machine account for the appliance in the Domain. Kerberos can be validated by clicking the ellipsis menu on the right-hand side of the joined domain. Machine account presence in the domain is required.
- **Service Accounts** –Used as part of a Secure Private access (SPA) solution to achieve Kerberos SSO using a service account instead of the machine account created by joining the domain. Kerberos can be validated by clicking the ellipsis menu on the right-hand side of the service account. Having a specific domain associated with the machine isn't mandatory. However, even if the Connector Appliance isn't connected to the domain, it can still connect to the domain controller.

To configure Active Directory to connect to Citrix Cloud through the Connector Appliance, complete the following steps.

1. Install a Connector Appliance in your resource location.
You can follow the information in the [Connector Appliance product documentation](#).
2. Connect to the Connector Appliance administration webpage in your browser by using the IP address provided in the Connector Appliance console.
3. In the **Active Directory domains** section, navigate to the **Joined domains** tab.
4. Click **+ Add Active Directory domain**, a new pop-up window displays to enter the domain name.

The Connector Appliance checks the domain. If the check is successful, the **Join Active Directory** dialog opens. This new window allows you to input the user name and password to join the domain.

5. Click **Add**.
6. Provide the user name and password of an Active Directory user with join permission for the domain.
7. The Connector Appliance suggests a machine name. You can choose to override the suggested name and provide your own machine name that is up to 15 characters in length.

This machine name is created in the Active Directory domain when the Connector Appliance joins it.
8. Click **Join**.

The domain is now listed in the **Active Directory domains** section of the Connector Appliance UI.
9. To add more **Active Directory domains**, select **+ Add Active Directory domain** and repeat the preceding steps.
10. Go to the domains page in **Citrix Cloud Console** and select **Connector Appliance** to service your domains.
11. If you have not already registered your Connector Appliance, continue with the steps as described in [Register your Connector Appliance with Citrix Cloud](#).

If you receive an error when joining the domain, verify that your environment fulfills the Active Directory requirements and the network requirements.

What's next

- You can add more domains to this Connector Appliance.

Note:

The Connector Appliance is tested with up to 10 forests.

- For resilience, add each domain to more than one Connector Appliance in each resource location.

Viewing your Active Directory configuration

You can view the configuration of the Active Directory domains and Connector Appliances in your resource locations in the following places:

- In Citrix Cloud:
 1. In the menu, go to the **Identity and Access Management** page.

2. Go to the **Domains** tab.

Your Active Directory domains are listed with the resource locations that they are part of.

- In the Connector Appliance webpage:
 1. Connect to the Connector Appliance webpage by using the IP address provided in the Connector Appliance console.
 2. Log in with the password you created when you first registered.
 3. In the **Active Directory domains** section of the page, you can see the list of Active Directory domains this Connector Appliance is joined to.

Removing an Active Directory domain from a Connector Appliance

To leave an Active Directory domain, complete the following steps:

1. Connect to the Connector Appliance webpage by using the IP address provided in the Connector Appliance console.
2. Log in with the password you created when you first registered.
3. In the **Active Directory domains** section of the page, find the domain you want to leave in the list of joined Active Directory domains.
4. Note the name of the machine account created by your Connector Appliance.
5. Click the delete icon (trashcan) next to the domain. A confirmation dialog appears.
6. Click **Continue** to confirm the action.
7. Go to your Active Directory controller.
8. Delete the machine account created by your Connector Appliance from the controller.

Deployment scenarios for using Connector Appliance with Active Directory

You can use both Cloud Connector and Connector Appliance to connect to Active Directory controllers. The type of connector to use depends on your deployment.

For more information about using Cloud Connectors with Active Directory, see [Deployment scenarios for Cloud Connectors in Active Directory](#)

Use the Connector Appliance to connect your resource location to the Active Directory forest in the following situations:

- You are setting up Secure Private Access. For more information, see [Secure Private Access with Connector Appliance](#).
- You have one or more forests that are only used for user authentication
- You want to reduce the number of connectors required to support multiple forests
- You need a Connector Appliance for other use cases

Only users in one or more forests with a single set of Connector Appliances for all forests

This scenario applies to Workspace Standard customers or customers using Connector Appliance for Secure Private Access.

In this scenario, there are several forests that contain only user objects (`forest1.local`, `forest2.local`). These forests do not contain resources. One set of Connector Appliances is deployed within a resource location and joined to the domains for each of these forests.

- Trust relationship: None
- Domains listed in **Identity and Access Management**: `forest1.local`, `forest2.local`
- User logons to Citrix Workspace: Supported for all users
- User logons to an on-premises StoreFront: Supported for all users

Users and resources in separate forests (with trust) with a single set of Connector Appliances for all forests

This scenario applies to Citrix Virtual Apps and Desktops customers with multiple forests.

In this scenario, some forests (`resourceforest1.local`, `resourceforest2.local`) contain your resources (for example, VDAs) and some forests (`userforest1.local`, `userforest2.local`) contain only your users. A trust exists between these forests that allows users to log on to resources.

One set of Cloud Connectors is deployed within the `resourceforest1.local` forest. A separate set of Cloud Connectors is deployed within the `resourceforest2.local` forest.

One set of Connector Appliances is deployed within the `userforest1.local` forest and the same set is deployed within the `userforest2.local` forest.

- Trust relationship: Bi-directional forest trust, or uni-directional trust from the resource forests to the user forests
- Domains listed in **Identity and Access Management**: `resourceforest1.local`, `resourceforest2.local`, `userforest1.local`, `userforest2.local`
- User logons to Citrix Workspace: Supported for all users
- User logons to an on-premises StoreFront: Supported for all users

Connector updates

July 24, 2023

Periodically, Citrix releases updates to increase the performance, security, and reliability of the Cloud Connector or Connector Appliance. By default, Citrix Cloud installs updates on each connector, one at a time, as soon as these updates become available. To ensure updates are installed timely without unduly affecting your users' Citrix Cloud experience, you can control connector updates as follows:

- Schedule updates for a preferred time of day and a preferred day of the week.
- Perform a one-time delay, so the connectors you specify update two weeks later than scheduled.
- If an update fails due to an issue on the host machine, restart the update after the issue has been addressed.

Also, you can verify your connectors are up-to-date by comparing the current connector version in your resource location with the target version in Citrix Cloud.

Note:

This article describes how to schedule connector updates using the Citrix Cloud management console. For information about scheduling connector updates using Citrix Cloud APIs, see [Citrix Cloud - Maintenance Schedules](#) in the Citrix Developer documentation.

Preferred time of day

When you specify a preferred time of day, Citrix Cloud installs updates 24 hours after they become available, at your preferred time. For example, if your preferred time of day is 2:00 AM US Pacific time and an update becomes available on Tuesday, Citrix Cloud waits for 24 hours and then installs the update at 2:00 AM the next day.

Preferred day of the week

When you specify a preferred day of the week, Citrix Cloud waits for seven days before installing updates on your preferred day. This seven-day waiting period gives you enough time to choose whether to install the update on demand or wait for Citrix Cloud to install it on your preferred day. Depending on the day of the week you select and the day on which updates become available, Citrix Cloud might wait to install updates for up to 13 days.

Example of an 8-day waiting period

On Monday, you configure Tuesdays at 6:00 PM as your preferred day for updates. Later that day, Citrix Cloud notifies you that there's an update available and displays the **Update** button. If you don't initiate the update, Citrix Cloud waits for seven days and then installs the update the next day, on Tuesday at 6:00 PM.

Example of a 13-day waiting period

You configured Mondays at 6:00 PM as your preferred time of day for updates. On Tuesday, Citrix Cloud notifies you that there's an update available and displays the **Update** button. If you don't initiate the update, Citrix Cloud waits for seven days and then installs the update six days later, on Monday at 6:00 PM.

Update notifications and on-demand updates

When updates are available, Citrix Cloud informs you with an alert in your [Notifications](#). Also, each connector displays the date and time when the update will be installed.

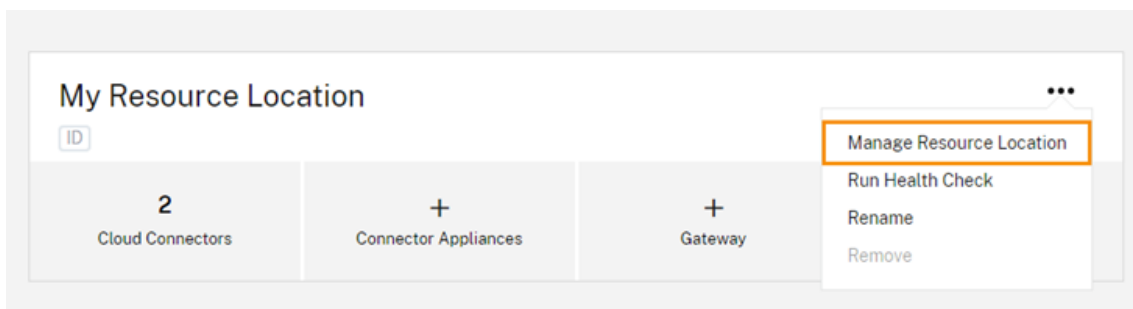

After Citrix Cloud notifies you of an available update, each connector displays an **Update** button so you can install the update sooner than your preferred time or day. After you select **Update** for each connector, Citrix Cloud queues the updates and installs them one at a time. You can't cancel updates after you initiate them.

After the update finishes, Citrix Cloud displays the date of the last update. If some updates cannot be completed, a notification is sent informing you.

Choose an update schedule

Use the steps in this section to schedule connector updates through the Citrix Cloud management console. For information about scheduling updates using Citrix Cloud APIs, see [Citrix Cloud - Maintenance Schedules](#) in the Citrix Developer documentation.

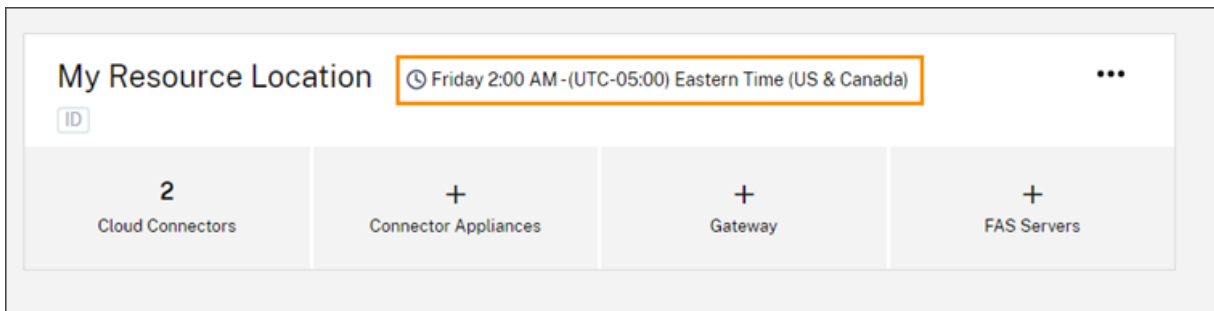

1. From the Citrix Cloud menu, select **Resource Locations**.
2. Locate the resource location you want to modify and, from the ellipsis menu, select **Manage Resource Location**.

3. Under **Choose your update method**, select **Set a maintenance start time** and choose the preferred day, time, and time zone for installing updates.

- To specify only a preferred time of day, select the hour and time zone that you want updates to be installed. Citrix Cloud installs updates 24 hours after they become available, at your preferred time.
- To specify a preferred day of the week, select the hour, day, and time zone. Citrix Cloud waits for seven days after updates become available before installing them on your preferred day.

After you configure your update schedule, Citrix Cloud displays it next to the resource location name.

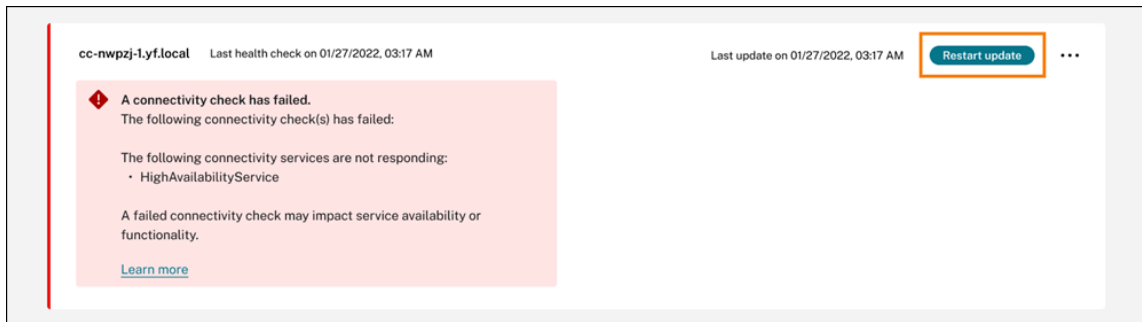

The start time you select is applied to all connectors regardless of the time zone in which they are located. If you have connectors in different time zones, Citrix Cloud installs updates at your selected time and time zone. For example, if you schedule updates for 2:00 AM in the US Pacific time zone, and you have connectors in London, Citrix Cloud starts to install the update on those connectors at 2:00 AM US Pacific time.

Restart updates

If the connector experiences an issue during update installation, the installation pauses until the issue is resolved. Because updates are installed on each connector, one at a time, a paused update on one connector can prevent updates on all remaining Cloud Connectors in your Citrix Cloud account. After the issue is resolved, you can restart the update.

1. From the Citrix Cloud menu, select **Resource Locations**.
2. Locate the resource location you want to manage and select the **Cloud Connectors** or **Connector Appliances** tile.
3. Locate the connector you want to manage and select **Restart updates**.

Delay updates

You can delay a scheduled update so it occurs two weeks later for the connectors you specify. You can delay a scheduled update only once. After you delay the update once, you can't delay it again. Also, you can't change the default two-week period.

1. From the Citrix Cloud menu, select **Resource Locations**.
2. Locate the resource location you want to manage and select the **Cloud Connectors** or **Connector Appliances** tile.
3. Locate the connector you want to manage and select **Delay updates**.

The scheduled date changes to a date two weeks later than the originally scheduled date.

Unscheduled updates

Even if you schedule updates for a later date and time, Citrix Cloud might still install an update as soon as possible after it becomes available. Unscheduled updates occur when:

- The update can't be installed at the preferred time within 48 hours of its availability. For example, if your preferred time is 2:00 AM and the connector is offline for three days following the update release, Citrix Cloud installs the update immediately when the connector is back online.
- The update contains a fix for a critical security or feature issue.

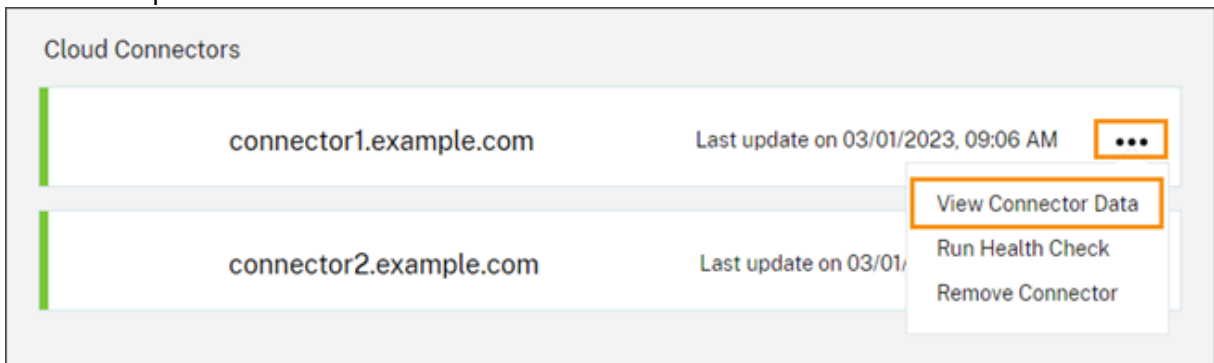

Compare Cloud Connector versions

You can check to see which version of the Cloud Connector is running in your resource location and whether it's the latest version. This information helps you verify that the Cloud Connector is updating successfully.

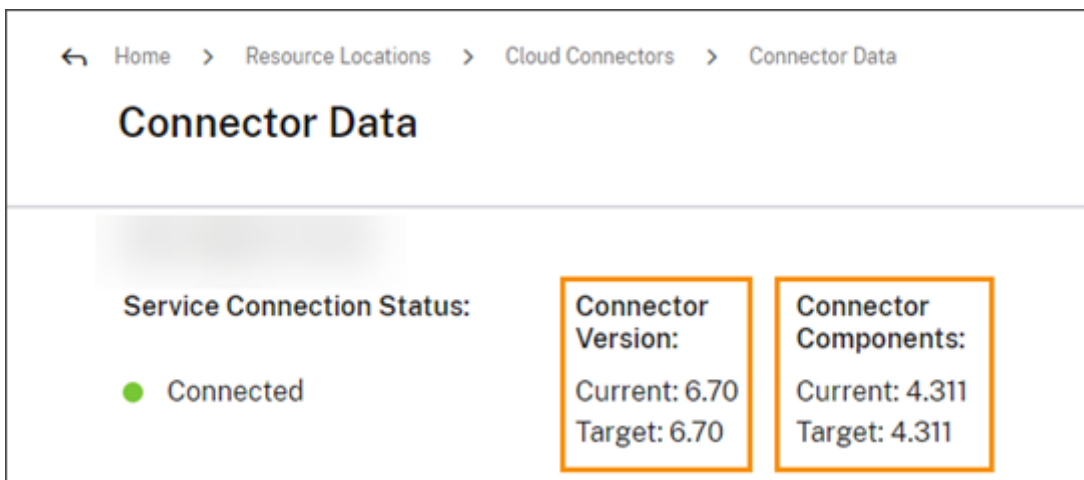

Note:

This information is not available for Connector Appliances.

From the **Resource Locations** page, select the **Cloud Connectors** tile for the resource location you want to manage. Locate the Cloud Connector you want to examine and select **View Connector Data** from the ellipsis menu.

The **Current** version number is the version of the Cloud Connector software currently running on the Cloud Connector machine. The **Target** version number is the latest version of the Cloud Connector software that Citrix released. If the machine was updated successfully, the Current and Target version numbers match.

Troubleshooting update failures

Conflicting software installed on your Cloud Connector machine or unexpected errors during maintenance can result in the Cloud Connector failing to update and service outages. For information on dealing with a failed update following Cloud Connector maintenance, visit [Resolve a Failed Cloud Connector Maintenance](#).

If the Cloud Connector isn't updating successfully, you can start troubleshooting issues by verifying the following conditions:

- The Cloud Connector is powered on and connected to Citrix Cloud using the [Cloud Connector Connectivity Check](#) utility.
- Proxy and firewalls are configured correctly.
- Required Windows services are in the Started state.
- Advanced logging is enabled on the Cloud Connector.

For instructions for troubleshooting Cloud Connector update failures, see [CTX270718](#) in the Citrix Support Knowledge Center.

For troubleshooting assistance, you can send Citrix Cloud Connector logs to Citrix. For information, see [Log Collection for Citrix Cloud Connector](#).

Identity and access management

January 23, 2024

Identity and Access Management defines the identity providers and accounts used for Citrix Cloud administrators and workspace subscribers.

Identity providers

Identity providers supported for Citrix Cloud can be used to authenticate Citrix Cloud administrators, workspace subscribers, or both.

Identity provider	Administrator Authentication	Subscriber Authentication
Citrix identity provider	Yes	No
On-premises Active Directory	No	Yes
Active Directory plus token	No	Yes
Azure Active Directory	Yes	Yes
Citrix Gateway	No	Yes
Google Cloud Identity	Yes	Yes
Okta	No	Yes
SAML 2.0	Yes (AD groups only)	Yes

By default, Citrix Cloud uses the Citrix identity provider to manage your Citrix Cloud account. Citrix identity provider authenticates Citrix Cloud administrators only.

Citrix identity provider

Citrix Cloud includes the built-in Citrix identity provider to authenticate administrators when they sign in. In the Citrix Cloud console, the Citrix identity provider is labeled Citrix Identity.

If you use a different identity provider for administrator authentication, Citrix recommends having at least one full access administrator under the **Citrix identity provider**. This condition ensures that:

- You won't be locked out of your Citrix Cloud account if your primary identity provider becomes unavailable.
- You can access your Citrix Cloud account to perform certain operations that can't be completed when signed in under another identity provider, such as Azure AD. For example, If Azure AD is your selected identity provider, and you need to reinitiate the connection between your Azure AD and Citrix Cloud, you can perform this task after signing in using the Citrix identity provider.

Remove the Citrix identity provider

The Citrix identity provider is connected by default for all new Citrix Cloud accounts. If you choose not to use the Citrix identity provider, you can remove the connection, if needed. For example, you might choose to remove this connection to confirm with your organization's policies for security and administrator management.

Removing this connection disables the Citrix identity provider so it can't be used to authenticate Citrix Cloud administrators.

Before you can remove the Citrix identity provider connection, you must have another identity provider configured in Citrix Cloud. Citrix Cloud doesn't allow you to remove this connection without the presence of another configured identity provider.

Important

If you lose access to your chosen identity provider, you must contact Citrix Support to recover your Citrix Cloud account. This process might require several days to complete.

To remove the Citrix identity provider connection:

1. From the Citrix Cloud menu, select **Identity and Access Management**.
2. On the **Authentication** tab, locate the Citrix identity provider.
3. Click the ellipsis menu and select **Delete identity provider**.

4. When prompted to confirm the removal, select **I understand that deleting this identity provider also deletes the configuration data for this identity provider in Citrix Cloud.**
5. Click **Delete identity provider.**

Citrix Federated Authentication Service

Citrix Cloud also supports using the Citrix Federated Authentication Service to provide single sign-on access for workspace subscribers. For more information, refer to the following articles:

- Connect FAS to Citrix Cloud: [Enable single sign-on for workspaces with Citrix Federated Authentication Service](#)
- Citrix Tech Zone:
 - [Reference Architecture: Federated Authentication Service](#)
 - [Tech Insight: Federated Authentication Service](#)

Administrators

Administrators use their identity to access Citrix Cloud, perform management activities, and install the Citrix Cloud Connector.

A Citrix identity mechanism provides authentication for administrators using an email address and password. Administrators can also use their My Citrix credentials to sign in to Citrix Cloud.

Multifactor authentication

Citrix Cloud provides multifactor authentication methods for both administrators and workspace subscribers.

For administrators, multifactor authentication is required when signing in to Citrix Cloud. Administrators can enroll their device when they onboard their Citrix Cloud account or after accepting an invitation from another administrator. For more information, see the following articles:

- [Set up multifactor authentication](#)
- [Manage your primary MFA method](#)
- [Manage your MFA recovery methods](#)

For workspace subscribers, multifactor authentication is enabled when administrators configure the Active Directory plus token authentication method. Active Directory plus token is the default identity provider for Citrix Workspace. After configuration, subscribers enroll their device for multifactor authentication. For more information, see the following articles:

- [Enable Active Directory plus token authentication](#)
- [Enroll a device for two-factor authentication](#)
- [Re-enroll a device](#)

Alternatively, you can use Azure AD multifactor authentication for both Citrix Cloud administrators and workspace subscribers. For more information about deployment methods, see [Microsoft Azure MFA deployment methods](#).

Add new administrators

During the account onboarding process, an initial administrator is created. As the initial administrator, you can add other administrators to your Citrix Cloud account. These new administrators can use their existing Citrix account credentials or set up a new account if needed. You can also fine-tune the access permissions of the administrators that you add. Setting these permissions allows you to align the level of access with the administrator's role in your organization.

For more information about adding administrators and setting access permissions, see [Manage administrator access](#).

Reset your password

If you forget or want to reset your password, click **Forgot your username or password?** on the Citrix Cloud sign in page. After you enter your email address or username to find your account, Citrix sends you an email with a link to reset your password.

Citrix requires you to reset your password under certain conditions to help you keep your account password safe and secure. For more information about these conditions, see [Changing your password](#).

Note:

Add customerservice@citrix.com to your list of allowed email addresses to ensure that Citrix Cloud emails don't land in your spam or trash folders.

Remove administrators

You can remove administrators from your Citrix Cloud account on the **Administrators** tab. When you remove an administrator, they can no longer sign-in to Citrix Cloud.

If an administrator is logged in when you remove the account, the administrator remains active for a maximum of one minute. Afterward, access to Citrix Cloud is denied.

Note:

- If there's only one administrator in the account, you can't remove that administrator. Citrix Cloud requires at least one administrator for each customer account.
- Citrix Cloud Connectors are not linked to administrator accounts. So, Cloud Connectors continue operating even if you remove the administrator who installed them.

Subscribers

A subscriber's identity defines the services to which they have access in Citrix Cloud. This identity comes from Active Directory domain accounts provided from the domains within the resource location. Assigning a subscriber to a Library offering authorizes the subscriber to access that offering.

Administrators can control which domains are used to provide these identities on the **Domains** tab. If you plan to use domains from multiple forests, install at least two Citrix Cloud Connectors in each forest. Citrix recommends at least two Citrix Cloud Connectors to maintain a high availability environment. For more information about deploying Cloud Connectors in Active Directory, see [Deployment scenarios for Cloud Connectors in Active Directory](#).

Note:

- Disabling domains prevents new identities only from being selected. It does not prevent subscribers from using identities that are already allocated.
- Each Citrix Cloud Connector can enumerate and use all the domains from the single forest in which it is installed.

Manage subscriber usage

You can add subscribers to offerings using individual accounts or Active Directory groups. Using Active Directory groups does not require management through Citrix Cloud after you assign the group to an offering.

When an administrator removes an individual subscriber or group of subscribers from an offering, those subscribers can no longer access the service. For more information about removing subscribers from specific services, refer to the service's documentation on the [Citrix Product Documentation](#) website.

Primary resource locations

A primary resource location is a resource location that you designate as "most preferred" for communications between your domain and Citrix Cloud. For your primary resource locations, select the resource location that has Citrix Cloud Connectors that have the best performance and connectivity to

your domain. Making this resource location your primary resource location enables your users to log on quickly to Citrix Cloud.

For more information, see [Select a primary resource location](#).

More information

- Learn more about supported identity providers with the [Introduction to Citrix Identity and Authentication](#) education course on the Citrix Training web site.

 - [Tech Brief: Workspace Identity](#)
 - [Tech Brief: Workspace Single Sign-On](#)
 - [Tech Insight: Mobile SSO](#)

Manage administrator access to Citrix Cloud

March 19, 2024

Administrators are managed from the Citrix Cloud console. Depending on the identity provider you use to authenticate administrators, you can add administrators individually or using groups.

All administrators are required to use tokens as a second factor of authentication when signing in to Citrix Cloud. After you add an administrator, they can enroll their device in multifactor authentication and generate tokens using any app that follows the [Time-Based One-Time Password](#) standard, such as Citrix SSO.

Add new administrators

Citrix Cloud supports the following identity providers for authenticating administrators:

- Citrix identity provider: The default identity provider in Citrix Cloud. Supports adding individual administrators only.
- Azure AD: Supports adding administrators individually and through AAD groups. Administrators in AAD groups are limited to custom access roles only. For more information, see [Manage administrator groups](#).
- SAML 2.0: Supports adding administrators through AD groups only. For more information, see [Connect SAML as an identity provider to Citrix Cloud](#)

Adding new administrators uses the following workflow:

1. Select the identity provider that you want to use for authenticating administrators.
2. Depending on the identity provider, invite individual administrators or select the groups that the administrators belong to.
3. Specify the access permissions that align with the administrators' roles in your organization. For more information, see [Modify administrator permissions](#) in this article.

Invite individual administrators

Adding individual administrators involves inviting them to join your Citrix Cloud account. When you add an administrator, Citrix sends them an invitation email. Before the administrator can sign in, they must accept the invitation. Administrators that you add through groups don't receive invitations and can sign in immediately after you add them.

Invitation emails are sent from cloud@citrix.com and explain how to access the account. The invitation is valid for five consecutive days from the day that you send it. After five days have elapsed, the invitation link expires. If the invited administrator uses the expired link, Citrix Cloud displays a message indicating the link is not valid.

Citrix Cloud also displays the status of the invitation so you can see whether the administrator accepted it and signed in to Citrix Cloud.

The screenshot shows a table of administrators in Citrix Cloud. The 'Status' column is highlighted with an orange box. The table includes columns for Type, Display Name, Email, Status, Access, and Identity Provider. There are three rows of data, each with a checkbox on the left and a three-dot menu on the right.

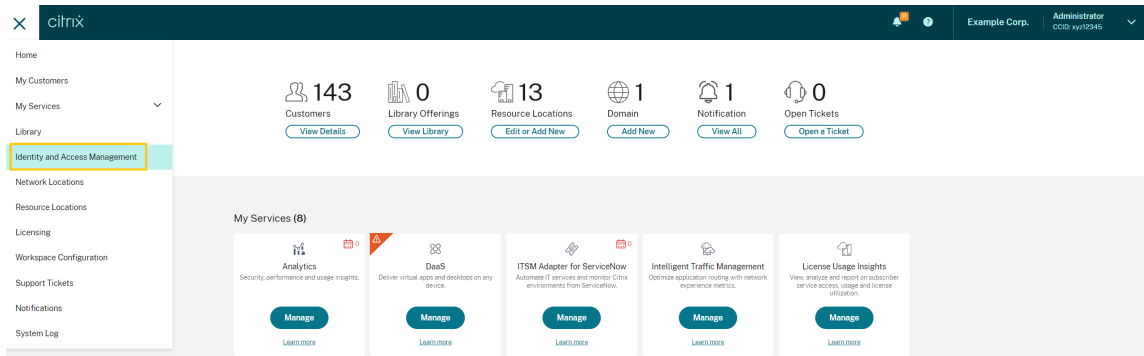

<input type="checkbox"/>	Type↓	Display Name	Email	Status	Access	Identity Provider	
<input type="checkbox"/>	User	[Redacted]	[Redacted]	Invite Sent	Custom	Citrix Cloud	...
<input type="checkbox"/>	User	[Redacted]	[Redacted]	Expired	Full	Citrix Cloud	...
<input type="checkbox"/>	User	[Redacted]	[Redacted]	Active	Full	Citrix Cloud	...

Note

Administrator accounts can be associated with up to 100 customer accounts. If an administrator needs to manage more than 100 customer accounts, they must create a separate administrator account with a different email address to manage the additional customers. Alternatively, you can remove the administrator from customer accounts that they no longer need to manage.

To invite an administrator

1. Sign in to Citrix Cloud and then select **Identity and Access Management** from the menu.

2. On the **Identity and Access Management** page, select **Administrators**. The console shows all the current administrators in the account.

The screenshot shows the 'Identity and Access Management' page with the 'Administrators' tab selected and highlighted with an orange box. The page displays a table of administrators, similar to the one in the first screenshot, with a 'Bulk Actions' dropdown menu at the top right.

<input type="checkbox"/>	Type↓	Display Name	Email	Status	Access	Identity Provider	
<input type="checkbox"/>	User	Ralph Thomas	rthomas@example.com	Active	Full	Citrix Cloud	...

3. Select **Add administrator/group**.
4. In **Administrator details**, select the identity provider you want to use. If using Azure AD, Citrix Cloud might prompt you to sign in first.
5. If **Citrix Identity** is selected, enter the user's email address and then select **Next**.
6. If **Azure Active Directory** is selected, type the name of the user you want to add and then click **Next**. Inviting AAD guest users is not supported.
7. In **Set access**, configure the appropriate permissions for the administrator. **Full access** (selected by default) allows control of all Citrix Cloud functions and subscribed services. **Custom access** allows control of the functions and services that you select.
8. Review the administrator details. Select **Back** to make any changes.
9. Select **Send invitation**. Citrix Cloud sends an invitation to the user you specified and adds the administrator to the list.

Resend an invitation

To resend the invitation, select **Resend Invite Email** from the ellipsis menu at the far-right of the console. Resending an invitation doesn't affect the five-day time limit before the invitation expires.

Resend an invitation with a new sign-in link

If the original invitation email expires, you can send a new one to the administrator. Perform the following steps:

1. Delete the administrator from Citrix Cloud: On the **Administrators** page, locate the administrator in the list and then select **Delete Administrator** from the ellipsis menu.
2. Wait several minutes to ensure Citrix Cloud completes the deletion. In some cases, inviting the administrator again immediately after deletion could result in sending an invitation with a faulty sign-in link.
3. Invite the administrator again as described in To invite an administrator.

Accept an administrator invitation

If you are invited to a Citrix Cloud account, Citrix sends you an email that includes the organization ID and the customer name of the account.

To accept the invitation, click **Sign In**. Afterwards, a browser window opens. If you don't already have a Citrix Cloud account, the browser displays a page where you can create your password. If you already have an account, Citrix Cloud prompts you to use your existing password to sign in.

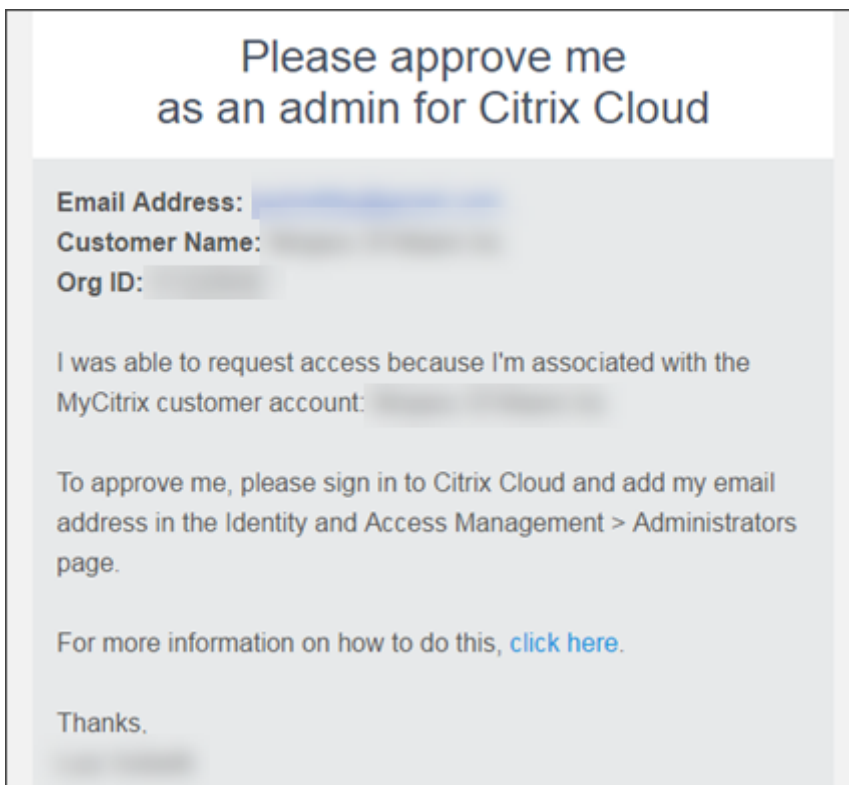

During sign-in, you might be prompted to enroll in multifactor authentication. For enrollment instructions, see [Set up multifactor authentication](#).

Add administrator groups

You can add administrators using AD groups (for SAML authentication) or Azure AD groups (for Azure AD authentication). For more information, see [Manage administrator groups](#).

Approve requests to join Citrix Cloud

From time to time, you might receive an approval request from Citrix Cloud on behalf of someone in your organization who would like to join your Citrix Cloud account as an administrator.

To approve these requests, you invite the person requesting access to be an administrator, as described in [Invite individual administrators](#) in this article. You must use the same email address that appears in the approval request email.

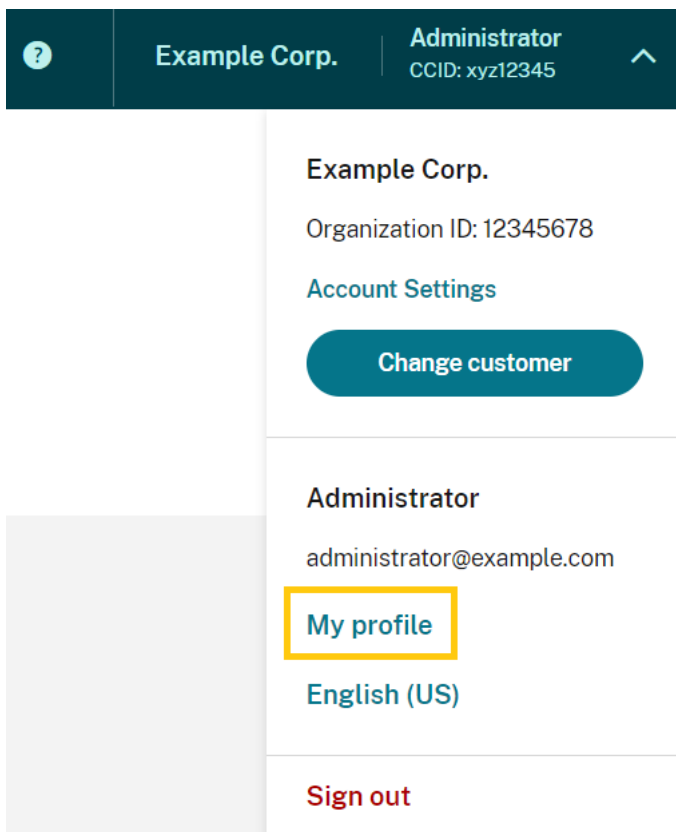

After receiving the invitation, the person requesting access clicks the **Sign in** link to accept the invitation. The person can then create a password for Citrix Cloud and sign in to your account.

For more information about how approval requests are generated, see [What happens if the account is already in use?](#).

Change your email address

You can change your own email address in Citrix Cloud. Your new address must be different from your recovery email address for multifactor authentication (MFA). When changing your email address, Citrix Cloud sends you a verification email to the new address. After verification, Citrix Cloud signs you out so the change can be completed. After a few minutes, you can sign in again with your new email address.

1. From the top-right menu, select **My settings**.

2. In **Email address**, select **Change email**.
3. Enter the new email address and then select **Send verification email**.

4. Enter the 6-digit verification code from the email and then select **Verify and complete**.
5. Select **Yes, change my email address** to confirm the change.

After confirming your changes, Citrix Cloud signs you out. After a few minutes you can sign in again with your new email address.

Modify administrator permissions

When you add administrators to your Citrix Cloud account, you define the administrator permissions that are appropriate for their role in your organization. By default, new administrators are assigned *full access permissions* to all Citrix Cloud account functions and available services. If you want to limit access to certain areas of the management console or specific services, you can define *custom access permissions*.

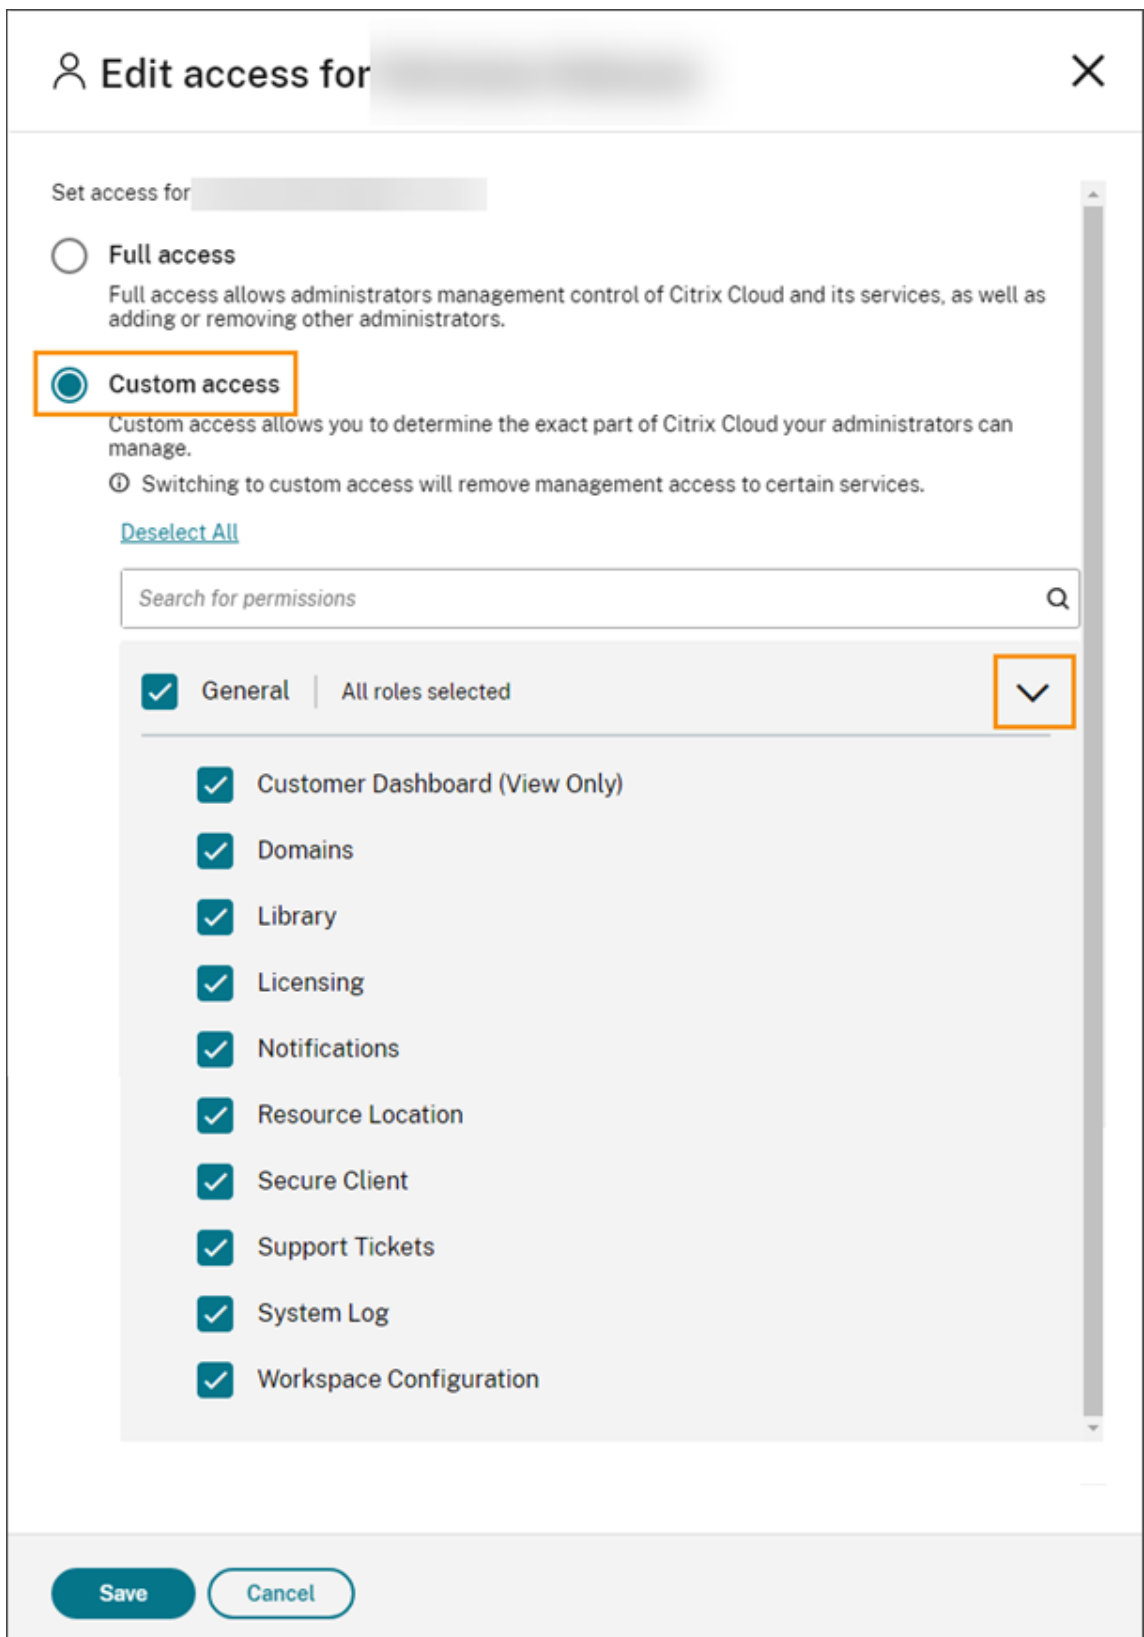

Only Citrix Cloud administrators with full access can define permissions for other administrators.

To change existing administrator permissions:

1. Sign in to Citrix Cloud at <https://citrix.cloud.com>.
2. From the Citrix Cloud menu, select **Identity and Access Management** and then select **Administrators**.
3. Select the identity provider you want to manage: Citrix Identity (default), Active Directory (if using SAML as your identity provider) or Azure AD (if connected).
4. Locate the administrator or group you want to manage, click the ellipsis button, and select **Edit access**.

5. To allow or disallow specific permissions, select **Custom access**. To allow access to all Citrix Cloud functions, select **Full access**.
6. To locate service permissions quickly, start typing in the search box. Citrix Cloud displays matching permissions as you type. For example, if you start typing “read only,” permissions with “read only” in the title are displayed. Searching permissions is case-insensitive.
7. To define custom access permissions for the Citrix Cloud management console, expand **General**.

8. To define custom access permissions for a specific service, expand the service.

9. For each permission, select or clear the check mark as needed.
10. Select **Save**.

Console permissions

This section describes the custom access permissions that are available for the Citrix Cloud management console. For more information about the custom access permissions for a specific service, consult the service's documentation.

- **Customer Dashboard (View Only):** For Citrix Service Providers (CSPs) only. Grants view access to the [Customer Dashboard](#).
- **Domains:** Grants access to the **Identity and Access Management > Domains** tab. Administrators can add an Active Directory domain by downloading the Citrix Cloud Connector software from this tab and installing it on a server in the domain.
- **Library:** Grants access to the **Library** console page. Depending on the services that administrators have permission to access, administrators can [assign to users to delivery groups](#) for Citrix DaaS, [add Intune managed apps](#) from Endpoint Management, or [allow read-only administrators to view app details](#) for Secure Private Access.
- **Licensing:** Grants access to the **Cloud Services** and **Licensed Deployments** tabs of the **Licensing** console page.
- **Notifications:** Grants access to the **Notifications** console page. Administrators can view and dismiss Citrix Cloud notifications.
- **Resource Locations:** Grants access to the **Resource Locations** console page. Administrators can add new resource locations and [add FAS servers for Citrix Workspace single sign-on](#). They can also [manage connector updates](#).
- **Secure Client:** Grants access to the **Identity and Access Management > API Access > Secure Clients** tab. Administrators can create and manage their own secure clients for use with [Citrix Cloud APIs](#). This permission doesn't include access to the **Identity and Access Management > API Access > Product Registrations** tab. Only full access administrators can access the **Product Registrations** tab.
- **Support Tickets:** Grants access to the **Support Tickets** console menu option and the **Open a Ticket** Help menu option. Selecting either of these options sends the administrator to the [My Support](#) portal. For more information, see [Technical Support](#).
- **System Log:** Grants access to the **System Log** console page. Administrators can [view system log events](#) and export events to a CSV file.
- **Workspace Configuration:** Grants access to the **Workspace Configuration** console page. Administrators can change authentication methods, customize workspace appearance and behavior, enable and disable services, and configure site aggregation. For more information, see the [Citrix Workspace](#) product documentation.

- **Workspace OAuth Clients (preview):** Grants access to the **Identity and Access Management > API Access > Workspace API** tab. Administrators can create and manage their own OAuth client to interact with Citrix Workspace platform APIs. OAuth clients are used exclusively for Workspace APIs and include the option to create private clients that expire automatically.

Note:

It is recommended to assign the **Workspace OAuth clients** custom role with caution. The access privileges associated with this role might enable administrators to access end user's resources (VDAs or applications) on the Workspace platform. It is also important to note that administrators with **Full access** will automatically have access permissions equivalent to that of an administrator with the **Workspace OAuth clients** permission.

Manage your primary MFA method

To sign in to Citrix Cloud with multifactor authentication (MFA), you can use an authenticator app or you can use your email address. This section describes how to change your device enrollment for MFA or switch to a different MFA method.

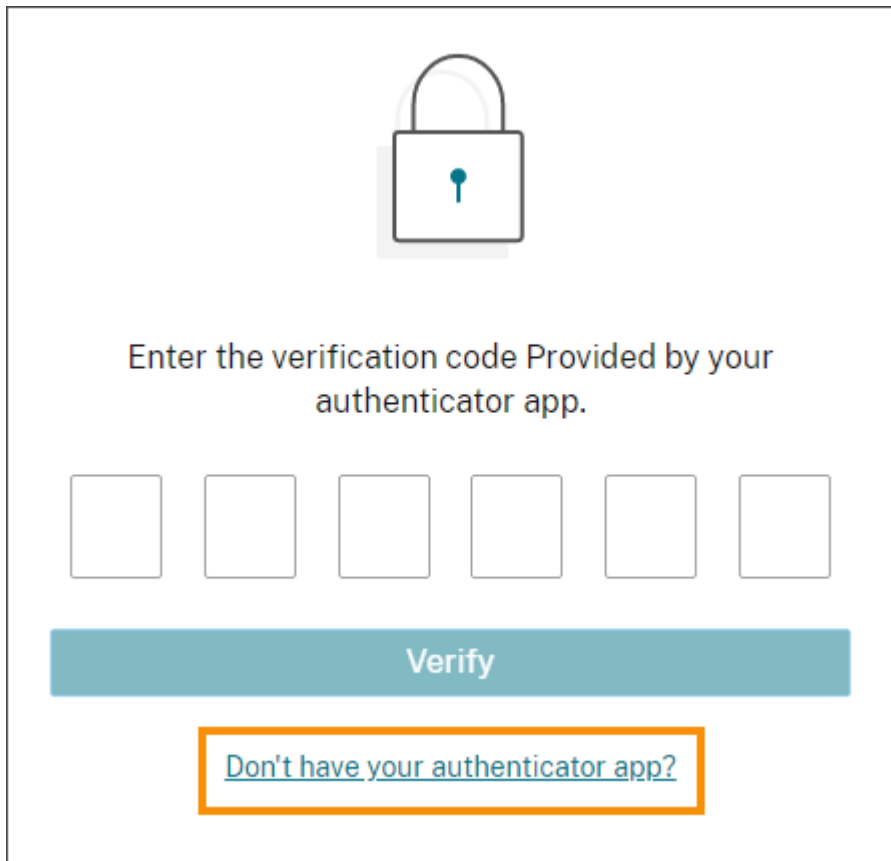

Change your device for MFA

If you lose your enrolled device, want to use a different device with Citrix Cloud, or reset your authenticator app, you can re-enroll in Citrix Cloud MFA.

Notes

- Changing your device deletes the current device enrollment and generates a new authenticator app key.
- If you are re-enrolling with the same authenticator app from your original enrollment, delete the Citrix Cloud entry from your authenticator app before you re-enroll. The codes displayed in this entry will no longer work after you complete re-enrollment. If you don't delete this entry before or after re-enrollment, your authenticator app displays two Citrix Cloud entries with differing codes which can cause confusion when signing in to Citrix Cloud.
- If you are re-enrolling with a new device and don't have an authenticator app, download and install one from your device's app store. For a smoother experience, Citrix recommends installing an authenticator app before you re-enroll your device.

1. Sign in to Citrix Cloud and enter the code from your authenticator app.

Enter the verification code Provided by your authenticator app.

[Don't have your authenticator app?](#)

If you don't have your authenticator app, click **Don't have your authenticator app?** and select a recovery method to help you sign in. Depending on the recovery method selected, enter the recovery code you received or an unused backup code and select **Verify**.

2. If you are an administrator for multiple customer organizations, select any customer organization.
3. From the top-right menu, select **My settings**.

4. In **Authenticator app**, select **Add new device**.

5. When prompted to confirm changing your device, select **Yes, change my device**.
6. Verify your identity by entering a verification code from your authenticator app. If you don't have an authenticator app, select **Use a recovery method** to verify your identity with the recovery method of your choice. Depending on the recovery method you select, enter the verification code or recovery code you receive or an unused backup code. Select **Verify and continue**.
7. If you are using the device you originally enrolled and your original authenticator app, delete the existing Citrix Cloud entry from your authenticator app.
8. If you are enrolling a new device and don't have an authenticator app, download one from your device's app store.
9. From your authenticator app, scan the QR code with your device or enter the key manually.
10. Enter the 6-digit verification code from your authenticator app and select **Verify code**.

After you change your device, Citrix strongly recommends checking that the verification methods in

your My Profile page are up-to-date.

Change your MFA method

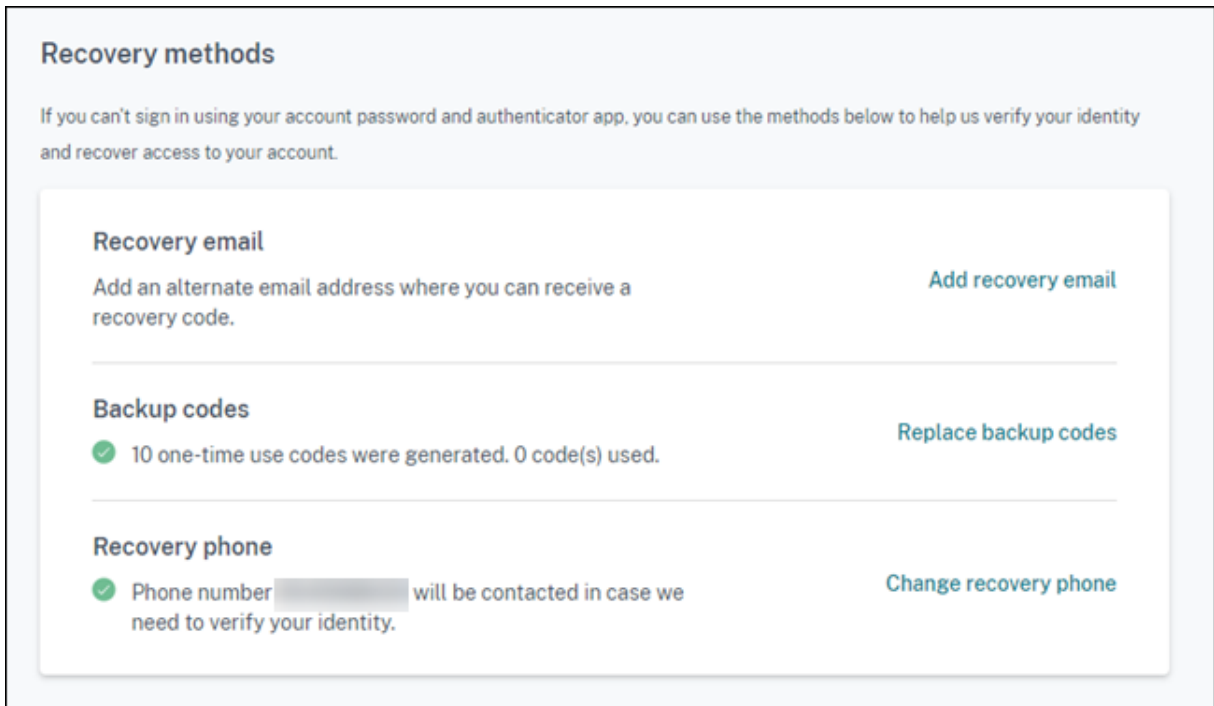

If you enrolled in MFA using an authenticator app and you want to switch to using your email address, be aware that changing your authentication method deletes your device enrollment. If you want to go back to using an authenticator app for MFA, you'll need to re-enroll your device.

1. From the top-right menu of the Citrix Cloud console, select **My settings**.
2. Under **Multifactor Authentication (MFA)**, select the authentication method you want to switch to.
3. If switching to email MFA:
 - a) Select **Yes, change to email** to confirm you want to change your MFA method.
 - b) Enter the code from your authenticator app or use a recovery method to confirm your identity.
 - c) Select **Verify and continue** to complete the change.
4. If switching to an authenticator app:
 - a) When prompted, enter the verification code that Citrix Cloud sends to your email address and select **Verify and continue**. Alternatively, use a recovery method to confirm your identity.
 - b) Using your authenticator app, scan the QR code with your device's camera or enter the alphanumeric key.
 - c) Under **Verify your authenticator app**, enter the 6-digit code from your authenticator app.
 - d) Click **Verify code** to complete the device enrollment.

Manage your MFA recovery methods

Important:

To ensure your Citrix Cloud account remains secure, keep your verification methods up-to-date with accurate information. If you lose access to your authenticator app or MFA email address, these verification methods are the only way you can recover access to your account.

Add or change your recovery email

1. From the top-right menu, select **My settings**.
2. Under **Recovery methods**, in **Recovery email**, select **Add recovery email** if you haven't yet added a recovery email address. If you've already added a recovery email address, select **Change recovery email**.
3. When prompted, enter the verification code from your authenticator app or the code sent to your email address.
4. Enter the new email address you want to use and then select **Send verification email**. This email address must be different from the email address you use for your Citrix Cloud account. Citrix Cloud sends you a verification email to the email address you entered.
5. Enter the code from the verification email and then click **Verify code and complete**.

Generate new backup codes

You can generate a new set of backup codes at any time. When you use backup codes, Citrix Cloud records the number that have been used in your My Profile page.

After you generate new backup codes, be sure to store them in a safe place.

1. From the top-right menu, select **My settings**.

2. Under **Recovery methods**, in **Backup codes**, select **Generate new backup codes** if you haven't generated backup codes before. If you previously generated backup codes, select **Replace backup codes**.
3. When prompted to replace your backup codes, select **Yes, replace my codes**.
4. Verify your identity by entering a verification code from your authenticator app or the code sent to your email address.
5. Select **Verify and continue**. Citrix Cloud generates and displays a new set of backup codes.
6. Select **Download codes** to download your new codes as a text file. Then, select **I've stored my backup codes**.
7. Select **I've stored my backup codes** to finish replacing your backup codes.

Change your recovery phone number

1. From the top-right menu, select **My settings**.
2. Under **Recovery methods**, in **Recovery phone**, select **Change recovery phone**.
3. Enter the verification code from your authenticator app or the code sent to your email address. Select **Verify and continue**.
4. Enter the new phone number you want to use. Then, re-enter the phone number to confirm.
5. Select **Save recovery phone number**.

Note:

You can modify the permissions of Citrix Endpoint Management (CEM) administrators only after the administrator has accepted an administrator invitation and clicked **Manage** on the CEM tile. Like all Citrix Cloud administrators, CEM administrators have Full access by default.

Manage administrator groups

January 31, 2024

You can add administrators to your Citrix Cloud account using groups in your Active Directory, Azure Active Directory (AD), or Google Cloud Identity. You can then manage service access permissions for all administrators in the group.

AD prerequisites

Citrix Cloud supports AD group authentication through SAML 2.0. Before adding members of your AD administrator groups to Citrix Cloud, you need to configure a connection between Citrix Cloud

and your SAML provider. For more information, see [Connect SAML as an identity provider to Citrix Cloud](#).

If you already have a SAML connection in Citrix Cloud, you must reconnect your SAML provider to Citrix Cloud before adding AD administrator groups. If you don't reconnect SAML, adding AD administrator groups might fail. For more information, see [Using an existing SAML connection for administrator authentication](#).

Azure AD prerequisites

Using Azure AD group authentication requires the latest version of the Azure AD application for connecting your Azure AD to Citrix Cloud. Citrix Cloud acquired this application when you connected your Azure AD for the first time. If you connected your Azure AD to Citrix Cloud before May 2019, Citrix Cloud might not be using the most current application to connect with Azure AD. Citrix Cloud can't display your Azure AD groups if your account isn't using the most current application.

Before using Azure AD groups in Citrix Cloud, perform the following tasks:

1. Verify that you're using the latest application for your Azure AD connection. Citrix Cloud displays a notification if you're not using the most current application.
2. If the application must be updated, reconnect your Azure AD to Citrix Cloud. By reconnecting to your Azure AD, you grant application-level read-only permissions to Citrix Cloud and allow Citrix Cloud to reconnect to your Azure AD on your behalf. During reconnection, a list of these permissions is displayed for your review. For more information about the permissions Citrix Cloud requests, see [Azure Active Directory Permissions for Citrix Cloud](#).

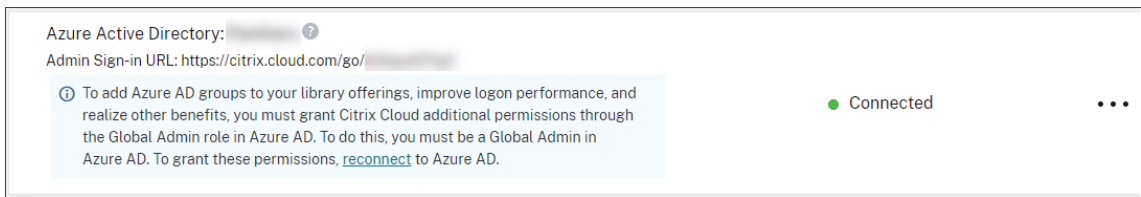

Important:

To complete this task, you must be a Global Admin in Azure AD. Also, you must be signed in to Citrix Cloud using a Full Access administrator account under the Citrix identity provider. If you sign in with your Azure AD credentials, the reconnection fails. If you don't have any administrators using the Citrix identity provider, you can add one temporarily to perform this task and then delete it afterward.

To verify your connection to Azure AD

1. Sign in to Citrix Cloud using a Full Access administrator account under the Citrix identity provider.
2. From the Citrix Cloud menu, select **Identity and Access Management** and then select **Authentication**.

3. Locate **Azure Active Directory**. A notification appears if Citrix Cloud must update the application for your Azure AD connection.

If Citrix Cloud is already using the most current application, no notification appears.

To reconnect to Azure AD

1. From the Azure AD notification in the Citrix Cloud console, click the **reconnect** link. A list of the requested Azure permissions appears.
2. Review the permissions and then select **Accept**.

Google Cloud Identity

Citrix Cloud supports administrator group authentication through Google Cloud Identity. Before adding your administrator groups to Citrix Cloud, you must configure a connection between Citrix Cloud and Google Cloud Identity. For more information, see [Connect Google Cloud Identity as an identity provider to Citrix Cloud](#).

Supported services

The following services support custom access permissions for administrator groups:

- Citrix Analytics
- NetScaler Console
- Citrix DaaS
- Workspace Environment Management service
- License Usage Insights

Supported permissions

You can assign custom access permissions only for supported services and certain features of the Citrix Cloud platform. Full access permissions are not supported.

For Citrix Cloud platform features, the following custom access permissions are supported:

- Domains

- Licensing
- Resource Locations
- Support Tickets
- System Log
- Workspace Configuration

For more information about these permissions, see [Console permissions](#).

Administrator groups don't have access to any other service. They can only manage the supported services for which they have permission to access.

Permission changes for an administrator group member who's already signed in will take effect only after they sign out and sign in again.

Resultant permissions for administrators with Citrix, AD, Azure AD, and Google Cloud identities

When an administrator signs in to Citrix Cloud, only certain permissions might be available if the administrator has both a Citrix identity (the default identity provider in Citrix Cloud) and a single-user or group-based identity through AD, Azure AD, or Google Cloud Identity. The table in this section describes the permissions that are available for each combination of these identities.

Single-user identity refers to AD, Azure AD, or Google Cloud Identity permissions that are granted to the administrator through an individual account. *Group-based identity* refers to AD, Azure AD, or Google Cloud Identity permissions that are granted as a member of a group.

Citrix identity	Single-user AD or Azure AD identity	Group-based AD or Azure AD identity	Single-user or group-based Google Cloud Identity	Permissions available after authentication
X	X			Administrator has cumulative permissions of both identities after successful authentication with either the Citrix identity, the AD identity, or the Azure AD identity.

Citrix Cloud

Citrix identity	Single-user AD or Azure AD identity	Group-based AD or Azure AD identity	Single-user or group-based Google Cloud Identity	Permissions available after authentication
X		X		Each identity is treated as an independent entity. Available permissions depends on whether the administrator authenticates using the Citrix identity or the Azure AD identity.
X			X	Each identity is treated as an independent entity. Available permissions depends on whether the administrator authenticates using the Citrix identity or Google Cloud Identity.
	X	X		Administrator has cumulative permissions of both identities when authenticating to Citrix Cloud with AD or Azure AD.

Citrix Cloud

Citrix identity	Single-user AD or Azure AD identity	Group-based AD or Azure AD identity	Single-user or group-based Google Cloud Identity	Permissions available after authentication
	X		X	Each identity is treated as an independent entity. Available permissions depends on whether the administrator authenticates using the Citrix identity or Google Cloud Identity.
		X	X	Each identity is treated as an independent entity. Available permissions depends on whether the administrator authenticates using the Citrix identity or Google Cloud Identity.

	Single-user AD or Azure AD identity	Group-based AD or Azure AD identity	Single-user or group-based Google Cloud Identity	Permissions available after authentication
Citrix identity	X	X		When authenticating with their Citrix identity, the administrator has cumulative permissions of both the Citrix identity and the single-user Azure AD identity. When authenticating with Azure AD, the administrator has cumulative permissions of all three identities.

Sign-in experience for administrators

After you add a group to Citrix Cloud and define the service permissions, administrators in the group simply sign in by selecting **Sign in with my company credentials** on the Citrix Cloud sign-in page and entering their sign-in URL for the account (for example, <https://citrix.cloud.com/go/mycompany>). Unlike adding individual administrators, administrators in the group aren't explicitly invited, so they won't receive any emails to accept an invitation to be Citrix Cloud administrators.

After signing in, administrators select **Manage** from the service tile to access the service's management console.

Administrators who are granted permissions only as members of groups can access the Citrix Cloud account using the sign-in URL for the Citrix Cloud account.

Administrators who are granted permissions through an individual account and as a member of a group can choose the Citrix Cloud account they want to access. If the administrator is a member of multiple Citrix Cloud accounts, they can select a Citrix Cloud account from the customer picker after authenticating successfully.

Limitations

Access to platform and service features

Custom access permissions for the following Citrix Cloud platform features are not available to members of administrator groups:

- Library
- Notifications
- Secure clients

For more information about available permissions, see Supported permissions in this article.

Citrix DaaS features that rely on Citrix Cloud platform capabilities such as Quick Deploy user assignment are not available.

Impact of multiple groups on application performance

Citrix recommends that a single administrator belongs to no more than 20 groups that have been added to Citrix Cloud. Membership in a larger number of groups might result in reduced application performance.

Impact of multiple groups on authentication

If a group-based administrator is assigned to multiple groups in AD or Azure AD, authentication might fail because the number of groups is too large. This issue occurs due to a limitation in Citrix Cloud's integration with AD and Azure AD. When the administrator attempts to sign in, Citrix Cloud attempts to compress the number of groups that are retrieved. If Citrix Cloud can't apply the compression successfully, all groups can't be retrieved and the authentication fails.

This issue might also affect users who authenticate to Citrix Workspace through AD or Azure AD. If a user belongs to multiple groups, authentication might fail because the number of groups is too large.

To resolve this issue, review the administrator or user account and verify that they belong only to the groups that are required for their role in the organization.

Adding groups fails due to too many assigned role/scope pairs

When adding a group with multiple role/scope pairs, an error might occur that indicates the group can't be created. This error occurs because the number of role/scope pairs that are assigned to the group is too large. To resolve this error, divide the role/scope pairs among two or more groups and assign the administrators to those groups.

Add an administrator group to Citrix Cloud

1. From the Citrix Cloud menu, select **Identity and Access Management** and then select **Administrators**.
2. Select **Add administrator/group**.
3. In **Administrator details**, select the identity provider you want to use. If Azure AD is selected, sign in to your Azure, if needed. Select **Next**.
4. If needed, select the domain you want to use.
5. Search for the group you want to add and select the group.

6. In **Set access**, select the roles you want to assign to the group. You must select at least one role.
7. When you're finished, select **Save**.

Modify service permissions for an administrator group

1. From the Citrix Cloud menu, select **Identity and Access Management** and then select **Administrators**.
2. Locate the administrator group you want to manage and, from the ellipsis menu, select **Edit Access**.

<input type="checkbox"/>	Group	HelpdeskAdmins	N/A	Active	Custom	Azure Active Directory	⋮
<input type="checkbox"/>	Group	Test Group	N/A	Active	Custom	Azure Active Directory	⋮

3. Select or clear the check marks next to one or more role and scope pairs as needed.
4. When you're finished, select **Save**.

Delete an administrator group

1. From the Citrix Cloud menu, select **Identity and Access Management** and then select **Administrators**.
2. Locate the administrator group you want to manage and, from the ellipsis menu, select **Delete Group**.

<input type="checkbox"/>	Group	HelpdeskAdmins	N/A	Active	Custom	Azure Active Directory	⋮
<input type="checkbox"/>	Group	Test Group	N/A	Active	Custom	Azure Active Directory	⋮

A confirmation message appears.

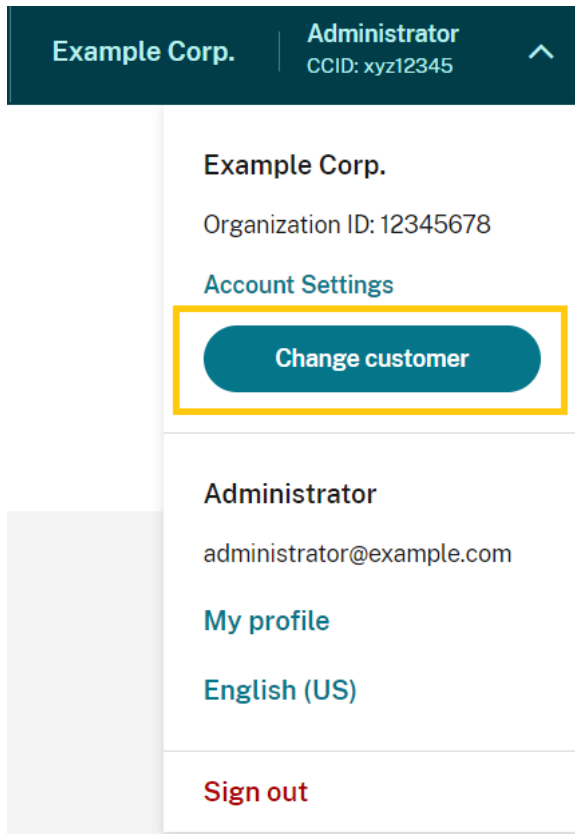

3. Choose **I understand deleting this group will prevent administrators in the group from accessing Citrix Cloud.** to confirm you're aware of the effects of deleting the group.
4. Select **Delete**.

Switch between multiple Citrix Cloud accounts

Note:

This section describes a scenario that affects members of Azure AD administrator groups only.

By default, members of Azure AD administrator groups can't switch between other Citrix Cloud accounts that they can access. For these administrators, the **Change Customer** option, shown in the image below, doesn't appear in the Citrix Cloud user menu.

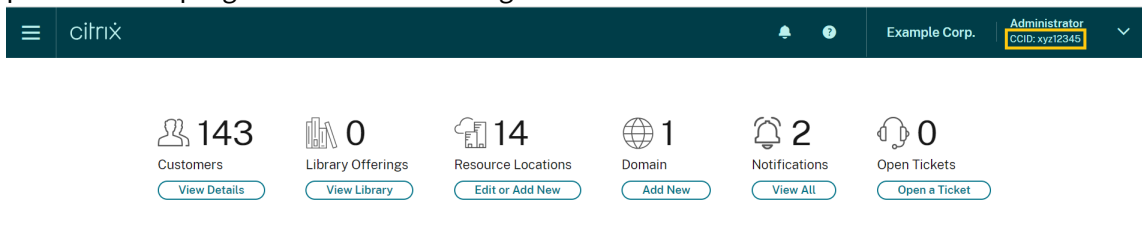

The screenshot shows a user menu for 'Example Corp.' with the role 'Administrator' and CCID 'xyz12345'. The menu items are: 'Example Corp.' (with Organization ID: 12345678), 'Account Settings' (with a highlighted 'Change customer' button), 'Administrator' (with email administrator@example.com), 'My profile', 'English (US)', and 'Sign out'.

To enable this menu option and allow Azure AD group members to switch between other Citrix Cloud accounts, you must link the accounts that you want to change between.

Linking Citrix Cloud accounts involves a hub-and-spoke-approach. Before linking accounts, decide which Citrix Cloud account will act as the account from which the other accounts are accessed (the “hub”) and which accounts you want to have listed in the customer picker (the “spokes”).

Before linking accounts, ensure you meet the following requirements:

- You have full access permissions in Citrix Cloud.
- You have access to the Windows PowerShell Integrated Scripting Environment (ISE).
- You have the customer IDs for the Citrix Cloud accounts you want to link. The customer ID appears in the top-right corner of the management console for each account.

The screenshot shows the Citrix Cloud management console header with the Citrix logo, a notification bell, and a user profile dropdown for 'Example Corp.' with role 'Administrator' and CCID 'xyz12345'. Below the header is a dashboard with six metrics: Customers (143), Library Offerings (0), Resource Locations (14), Domain (1), Notifications (2), and Open Tickets (0). Each metric has a corresponding icon and a 'View Details' or 'Add New' button.

- You have the Citrix CWSAuth bearer token for the Citrix Cloud account you want to link as the hub account. To retrieve this bearer token, follow the instructions in [CTX330675](#). You need to

supply this information when linking your Citrix Cloud accounts.

To link Citrix Cloud accounts

1. Open the PowerShell ISE and paste the following script into the working pane:

```
1 $headers = @{
2   }
3
4 $headers.Add("Accept","application/json")
5 $headers.Add("Content-Type","application/json")
6 $headers.Add("Authorization","CWSAuth bearer=XXXXXXX")
7
8 $uri = "https://trust.citrixworkspacesapi.net/HubCustomerID/links"
9
10 $resp = Invoke-RestMethod -Method Get -Uri $uri -Headers $headers
11 $allLinks = $resp.LinkedCustomers + @("SpokeCustomerID")
12
13 $body = @{
14   "customers"=$allLinks }
15
16 $bodyjson = $body | ConvertTo-Json
17
18 $resp = Invoke-WebRequest -Method Post -Uri $uri -Headers $headers
19   -Body $bodyjson -ContentType 'application/json'
20 Write-Host "Citrix Cloud Status Code: $($resp.RawContent)"
21 <!--NeedCopy-->
```

2. On Line 4, replace `CWSAuth bearer=XXXXXXX` with your CWSAuth value (for example, `CWSAuth bearer=AbCdef123Ghik..`). This value is a long hash that resembles a certificate key.
3. On Line 6, replace `HubCustomerID` with the customer ID of the hub account.
4. On Line 9, replace `SpokeCustomerID` with the customer ID of the spoke account.
5. Run the script.
6. Repeat Steps 3-5 to link additional accounts as spokes.

To unlink Citrix Cloud accounts

1. Open the PowerShell ISE. If the PowerShell ISE is already open, clear the working pane.
2. Paste the following script into the working pane:

```
1 $headers = @{
2   }
3
4 $headers.Add("Accept","application/json")
```

```
5 $headers.Add("Content-Type","application/json")
6 $headers.Add("Authorization","CWSAuth bearer=XXXXXXX")
7
8 $uri = "https://trust.citrixworkspacesapi.net/HubCustomerID/links/
    SpokeCustomerID"
9
10 $resp = Invoke-WebRequest -Method Delete -Uri $uri -Headers
    $headers
11 Write-Host "Response: $($resp.RawContent)"
12 <!--NeedCopy-->
```

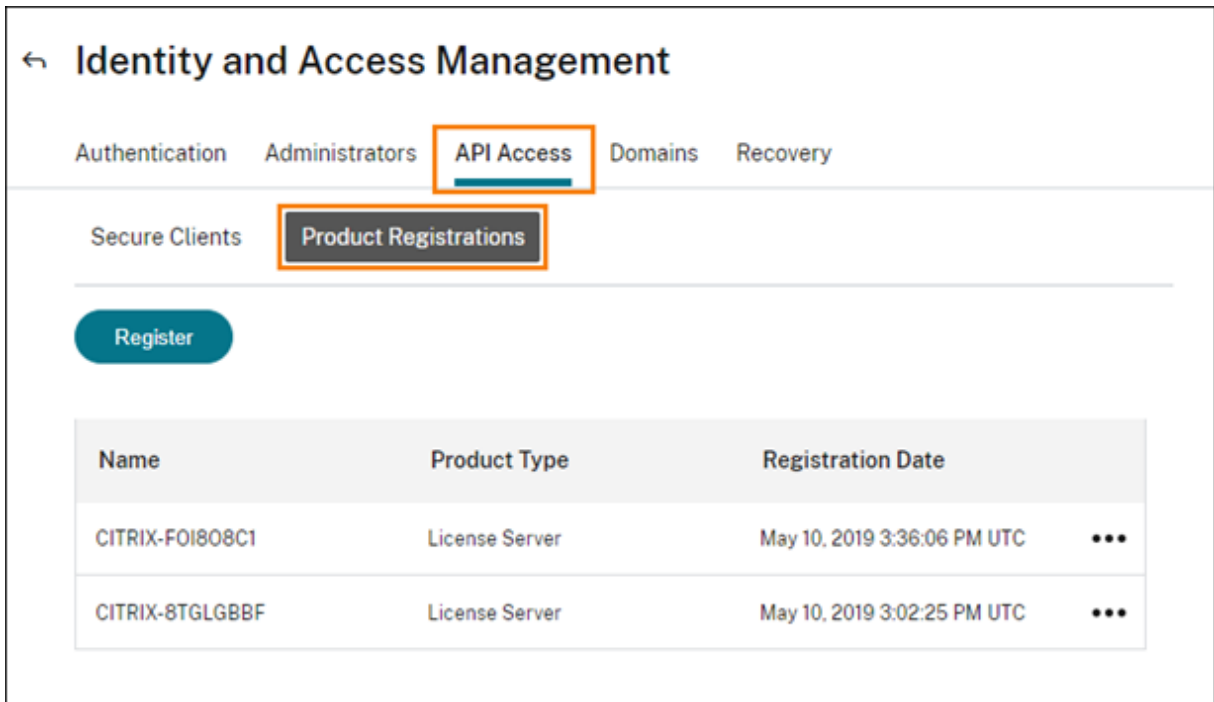

3. On Line 4, replace `CWSAuth bearer=xxxxxxx1` with your `CWSAuth` value (for example, `CWSAuth bearer=AbCdef123Ghik...`). This value is a long hash that resembles a certificate key.
4. On Line 6, replace `HubCustomerID` with the customer ID of the hub account.
5. On Line 6, replace `SpokeCustomerID` with the customer ID of the spoke account.
6. Run the script.
7. Repeat Steps 4-6 to unlink additional accounts.

Register on-premises products with Citrix Cloud

September 21, 2023

You can easily register your on-premises Citrix product using short-code activation through Citrix Cloud. Depending on your product, this 8-digit code might be generated during the product installation process or when you run the product's management console. When the product prompts you to register, the product requests the code from Citrix Cloud and displays it. You can then copy and paste this code or enter it manually in Citrix Cloud.

After registration, the Product Registrations page (**Identity and Access Management > API Access > Product Registrations**) displays the servers where your registered products reside.

On-premises products that you can register with Citrix Cloud include:

- Citrix Connector Appliance for Cloud Services
- Citrix Federated Authentication Service
- Citrix License Server
- Citrix Virtual Apps and Desktops, when registering a site with Citrix Analytics for Performance

Note:

This article describes the steps for registering an on-premises product with Citrix Cloud. For product-specific requirements, refer to the documentation for that product.

Register a product

1. From the Citrix Cloud menu, select **Identity and Access Management**.
2. Select **API Access > Product Registrations** and then select **Register**.

3. Enter the 8-character alphanumeric code for your Citrix product and click **Continue**.
4. Review the registration details and then click **Register**.

Remove a product registration

If you remove servers running a registered Citrix product from your environment, the Product Registrations page still displays the servers. Use the following steps to remove the servers from Citrix Cloud. If needed, you can register the product again later to display the servers on the Product Registrations page.

1. From the Product Registrations page, locate the server you want to remove.
2. Click the ellipsis button and select **Remove registration**.

3. When prompted, select **Remove**.

Connect Active Directory to Citrix Cloud

September 21, 2023

Citrix Cloud supports using your on-premises Active Directory (AD) to authenticate workspace subscribers. Also, some workspace authentication methods require a connection between your AD and Citrix Cloud. For more information, see [Choose or change authentication methods](#).

Citrix Cloud also supports using tokens as a second factor of authentication for subscribers signing in to their workspaces through Active Directory. Workspace subscribers can generate tokens using any app that follows the [Time-Based One-Time Password](#) standard, such as Citrix SSO.

For more information about authenticating workspace subscribers with Active Directory plus tokens, see [Active Directory plus token](#).

Tip:

Learn more about supported identity providers with the [Introduction to Citrix Identity and Authentication](#) education course. The “Planning Citrix Identity and Access Management” module includes short videos that walk you through connecting this identity provider to Citrix Cloud and enabling authentication for Citrix Workspace.

Connecting Active Directory

Connecting your Active Directory to Citrix Cloud involves installing connectors in your domain. You can choose to use either Cloud Connectors or Connector Appliances as your connectors for Active Directory. To choose which type of connector to use for your environment, see the following articles:

- [Deployment scenarios for Cloud Connectors in Active Directory](#)
- [Deployment scenarios for Connector Appliances in Active Directory](#)

Connecting Active Directory through Connector Appliances

You can use Connector Appliance to connect a resource location to forests which do not contain Citrix Virtual Apps and Desktops resources. For example, in the case of Citrix Secure Private Access customers or Citrix Virtual Apps and Desktops customers with some forests only used for user authentication.

For more information, see [Active Directory with Connector Appliance](#)

Connecting Active Directory through Cloud Connectors

At least two Cloud Connectors are required to ensure a highly available connection to Citrix Cloud. For more information, see the following articles:

- [Cloud Connector Technical Details](#): For system requirements and deployment recommendations.
- [Cloud Connector Installation](#): For installation instructions using either the graphical interface or the command line.

Connecting your Active Directory to Citrix Cloud involves the following tasks:

1. [Install Cloud Connectors](#) in your domain. Citrix recommends installing two Cloud Connectors for high availability.
2. If applicable, enable tokens for user devices. Subscribers can enroll only one device at a time.

Important:

If you are deploying Cloud Connectors for use with Citrix DaaS, additional steps might be required to ensure your AD domains are registered and active after Cloud Connector deployment. Verifying that your AD domains are active in Citrix Cloud ensures that machine catalog setup occurs smoothly. For more information about post-deployment steps for Citrix DaaS, see [Add a resource type or activate an unused domain in Citrix Cloud](#) in the Citrix DaaS product documentation.

To connect your Active Directory to Citrix Cloud

1. From the Citrix Cloud menu, select **Identity and Access Management**.
2. From the **Authentication** tab, in **Active Directory**, click the ellipsis menu and select **Connect**.

Identity and Access Management

Authentication Administrators API Access Domains Recovery

Set up the various ways you need your Citrix Cloud administrators and Citrix Workspace subscribers to sign in.

Citrix Identity Admin Sign-in URL: https://citrix.cloud.com	● Connected	...
Azure Active Directory	○ Not Connected	...
Active Directory	○ Not Connected	... Connect
Active Directory + Token	○ Not Connected	...

3. Click **Install Connector** to download the Cloud Connector software.

Connect to Active Directory

Connect to Active Directory by downloading and installing the Citrix Cloud Connector. The cloud connector allows Citrix Cloud to talk to your domains and connect to your Active Directory. [Learn more](#)

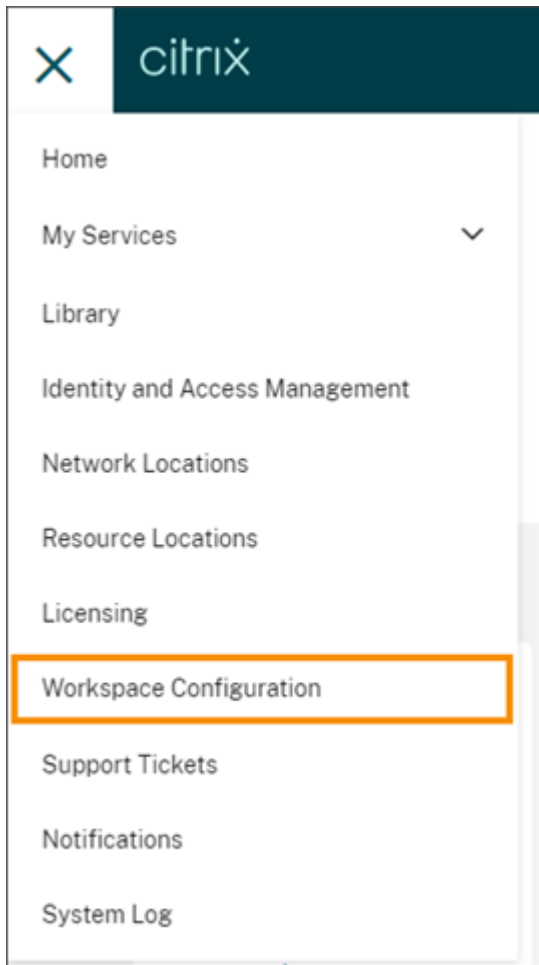

- Deploy 2 machines for high availability**
Deploy at least two supported Windows Server machines in the Active Directory forest containing your Virtual Apps and Desktops site.
- Install Cloud Connector**
Download and install the Cloud Connectors on each machine. We recommend installing the connector on 2 machines to prevent service outages.
- Detect connectors**
When the installation is complete, click the Detect button.

Install Connector Detect

4. Launch the Cloud Connector installer and follow the installation wizard.
5. From the **Connect to Active Directory** page, click **Detect**. After verification, Citrix Cloud displays a message that your Active Directory is connected.
6. Click **Return to Authentication**. The **Active Directory** entry is marked **Enabled** on the **Authentication** tab.

To enable Active Directory plus token authentication

1. Connect Active Directory to Citrix Cloud by using either Connector Appliances or Cloud Connectors.
2. In the Citrix Cloud **Identity and Access Management** section, on the **Authentication** tab, check that the **Active Directory** entry is marked **Enabled**.
3. Click **Next**. The **Configure Token** page appears and the **Single device** option is selected by default.
4. Click **Save and Finish** to complete the configuration. On the **Authentication** tab, the **Active Directory + Token** entry is marked as **Enabled**.
5. Enable token authentication for workspaces:
 - a) From the Citrix Cloud menu, select **Workspace Configuration**.

b) From the **Authentication** tab, select **Active Directory + Token**.

After enabling Active Directory plus token authentication, Workspace subscribers can register their device and use an authenticator app to generate tokens. Subscribers can register only one device at a time. For instructions to register subscribers' devices, see [Two-factor authentication \(optional\)](#).

For options to re-enroll subscribers' devices, see [Re-enroll a device](#).

Connect Azure Active Directory to Citrix Cloud

May 2, 2024

Citrix Cloud supports using Azure Active Directory (AD) to authenticate Citrix Cloud administrators and workspace subscribers.

By using Azure AD with Citrix Cloud, you can:

- Leverage your own Active Directory, so you can control auditing, password policies, and easily disable accounts when needed.
- Configure multifactor authentication for a higher level of security against the possibility of stolen sign-in credentials.
- Use a branded sign-in page, so your users know they're signing in at the right place.
- Use federation to an identity provider of your choice including ADFS, Okta, and Ping, among others.

Azure AD app and permissions

Citrix Cloud includes an Azure AD app that allows Citrix Cloud to connect with Azure AD without the need for you to be logged in to an active Azure AD session. Since the introduction of this app, Citrix released updates that improve performance and support new features and permissions.

If you have an existing Azure AD connection to Citrix Cloud and want to use the latest updated app, you need to update your Azure AD connection in Citrix Cloud. For more information, see [Reconnect to Azure AD for the updated app](#) in this article. If you choose not to update the app, your existing connection continues to function normally.

For more information about the Azure AD apps and permissions that Citrix Cloud uses to connect with your Azure AD, see [Azure Active Directory permissions for Citrix Cloud](#).

Tip:

Learn more about supported identity providers with the [Introduction to Citrix Identity and Authentication](#) education course. The “Planning Citrix Identity and Access Management” module includes short videos that walk you through connecting this identity provider to Citrix Cloud and enabling authentication for Citrix Workspace.

Authentication with multiple Citrix Cloud accounts

This article describes how to connect your Azure AD as an identity provider to a single Citrix Cloud account. If you have multiple Citrix Cloud accounts, you can connect each one to the same Azure AD tenant. Perform the following tasks:

1. Sign in to your Citrix Cloud account and select the appropriate customer ID from the customer picker.
2. If the selected customer is the first one that you're connecting to your Azure AD, follow all the steps in this article for syncing your AD and Azure AD, connecting the customer to Citrix Cloud, and adding administrators.
3. To connect another customer, click the user menu in the top-right corner of the Citrix Cloud console, select **Change customer**, and select the next customer ID you want to connect.
4. Connect the customer to your Azure AD as described in Connect Citrix Cloud to Azure AD in this article.
5. Repeat Steps 3 and 4 for each customer ID.

Prepare your Active Directory and Azure AD

Before you can use Azure AD, be sure you meet the following requirements:

- You have a Microsoft Azure account. Every Azure account comes with Azure AD free of charge. If you don't have an Azure account, sign up at <https://azure.microsoft.com/en-us/free/?v=17.36>.
- You have the Global admin role in Azure AD. This role is required to give Citrix Cloud your consent to connect with Azure AD.
- Administrator accounts have their "mail" property configured in Azure AD. To do this, you can sync accounts from your on-premises Active Directory into Azure AD using Microsoft's [Azure AD Connect](#) tool. Alternatively, you can configure non-synced Azure AD accounts with Office 365 email.

Sync accounts with Azure AD Connect

1. Ensure that the Active Directory accounts have the Email user property configured:
 - a) Open Active Directory Users and Computers.
 - b) In the **Users** folder, locate the account you want to check, right-click and select **Properties**. On the **General** tab, verify the **Email** field has a valid entry. Citrix Cloud requires that administrators added from Azure AD have different email addresses than administrators who sign in using a Citrix-hosted identity.
2. Install and configure Azure AD Connect. For complete instructions, see [Getting started with Azure AD Connect using express settings](#) on the Microsoft Azure website.

Connect Citrix Cloud to Azure AD

When connecting your Citrix Cloud account to your Azure AD, Citrix Cloud needs permission to access your user profile (or the profile of the signed-in user) in addition to the basic profiles of the users in

your Azure AD. Citrix requests this permission so it can acquire your name and email address (as the administrator) and enable you to browse for other users and add them as administrators later. For more information about the app permissions that Citrix Cloud requests, see [Azure Active Directory permissions for Citrix Cloud](#).

Important:

You must be a Global admin in Azure AD to complete this task or ask any Global admin to perform the prerequisites before signing in to Citrix Cloud.

1. Click **Menu** on the top-left corner of the page and select **Identity and Access Management**.
2. Locate Azure Active Directory and select **Connect** from the ellipsis menu.
3. When prompted, enter a short, URL-friendly identifier for your company and click **Connect**. The identifier you choose must be globally unique within Citrix Cloud.
4. When prompted, sign in to the Azure account with which you want to connect. Azure shows you the permissions that Citrix Cloud needs to access the account and acquire the information required for connection. Most of these permissions are read-only and allow Citrix Cloud to gather basic information from your Microsoft Graph such as groups and user profiles. If you integrated Citrix Endpoint Management or XenMobile Server with Microsoft Intune, you must grant Microsoft Intune-related read-write permissions. For more information, see [Azure Active Directory Permissions for Citrix Cloud](#).
5. Click **Accept** to accept the permissions request.

Alternative connection method

You can separate connection flow in the following two phases:

1. Azure AD (Entra ID) app creation in Azure.
2. Citrix Cloud connection to the Azure AD (Entra ID) app in Citrix Cloud.

First, you need to construct a URL that the Global admin can use to add the enterprise apps into the tenant. For more information, see [Construct the URL for granting tenant-wide admin consent](#).

Here is the explanation of the constructed URL.

```
https://login.microsoftonline.com/<tenant url>/adminconsent?client_id=f9c0e999-22e7-409f-bb5e-956986abdf02&redirect_uri=https://portal.azure.com
```

where:

`tenant url` is your tenant URL or ID.

`f9c0e999-22e7-409f-bb5e-956986abdf02` is the client ID for Citrix Cloud.

Add administrators to Citrix Cloud from Azure AD

Citrix Cloud supports adding administrators either individually or as Azure AD groups.

To add individual administrators from Azure AD, see [Manage administrator access](#).

To add Azure AD administrator groups to Citrix Cloud, see [Manage administrator groups](#).

Sign in to Citrix Cloud using Azure AD

After the Azure AD user accounts are connected, users can sign in to Citrix Cloud using one of the following methods:

- Navigate to the administrator sign-in URL that you configured when you initially connected the Azure AD identity provider for your company. Example: <https://citrix.cloud.com/go/mycompany>
- From the Citrix Cloud sign-in page, click **Sign in with my company credentials**, type the identifier you created when you initially connected Azure AD (for example, “mycompany”), and click **Continue**.

Enable Azure AD authentication for workspaces

After you connect Azure AD to Citrix Cloud, you can allow your subscribers to authenticate to their workspaces through Azure AD.

Important:

Before enabling Azure AD workspace authentication, review the [Azure Active Directory](#) section for considerations for using Azure AD with workspaces.

1. In Citrix Cloud, click the menu button in the top-left corner and select **Workspace Configuration**.
2. From the **Authentication** tab, select **Azure Active Directory**.
3. Click **Confirm** to accept the workspace experience changes that will occur when Azure AD authentication is enabled.

Enable advanced Azure AD capabilities

Azure AD provides advanced multifactor authentication, world-class security features, federation to 20 different identity providers, and self-service password change and reset, among many other features. Turning these features on for your Azure AD users enables Citrix Cloud to leverage those capabilities automatically.

To compare Azure AD service level capabilities and pricing, see <https://azure.microsoft.com/en-us/pricing/details/active-directory/>.

Reconnect to Azure AD for the updated app

Citrix Cloud includes an Azure AD app that allows Citrix Cloud to connect with Azure AD without the need for you to be logged in to an active Azure AD session. Since the introduction of this app, Citrix has updated the app as follows:

- In August 2018, the app was updated to improve performance and allow you to be ready for future releases.
- In May 2019, the app was updated to support [adding Azure AD administrator groups](#) to Citrix Cloud.
- In April 2022, the app was updated to use the GroupMember.Read.All permission, which replaces the Group.Read.All permission.

If you connected your Azure AD to Citrix Cloud before these updates were released and you want to use the latest updated app, you need to disconnect your Azure AD from Citrix Cloud and then reconnect it. Using the latest app is optional. If you choose not to update the app, your existing connection still functions normally.

Requirements

Before you reconnect your Azure AD, verify that you meet the following requirements:

- You must be an administrator with full access permissions under the default Citrix identity provider. If you are signed in to Citrix Cloud with your Azure AD credentials, the reconnection fails. If you don't have any administrators using the Citrix identity provider in your account, you can temporarily add one and delete it after reconnecting your Azure AD. For instructions, see [Invite individual administrators](#).
- If you are using Azure AD to authenticate workspace subscribers, select a different identity provider temporarily. Citrix Cloud doesn't allow you to disconnect your Azure AD if it's also used as an authentication method for Citrix Workspace. For more information, see [Choose or change authentication methods](#) in the Citrix Workspace documentation.

To reconnect Azure AD

1. Sign in to Citrix Cloud as an administrator with full access permissions under the Citrix identity provider.

2. From the Citrix Cloud menu, select **Identity and Access Management** and then select **Authentication**.
3. Locate **Azure Active Directory** and select **Disconnect** from the ellipsis menu at the far right of the page.
4. From the ellipsis menu, select **Connect**.

Note:

If you are disconnecting the Azure Active Directory as mentioned in step 3, Citrix Cloud requests the admin to delete all the admin profiles under this Identity Provider.

To bypass this effort, the admin can follow the steps below to reconnect the Azure AD Identity provider.

1. As a Global admin, navigate to Azure and delete the App.
2. Log in to Citrix Cloud and navigate to **Identity and Access Management** and click **Authentication**. From the **Authentication** tab, you can notice that Azure AD is still connected.
3. Add a new Administrator in Citrix Cloud for Azure AD.

This will trigger the recreation of the app and the reconnection without deleting the administrators.

Azure Active Directory Permissions for Citrix Cloud

November 29, 2023

This article describes the permissions that Citrix Cloud requests when connecting and using Azure Active Directory (AD). Depending on how Azure AD is used with the Citrix Cloud account, one or more enterprise applications might be created in the target Azure AD tenant. You can connect multiple Citrix Cloud accounts to one Azure AD tenant and use the same enterprise applications, without creating a set of applications for each account.

Note:

As of April 2022, the Azure AD app that Citrix Cloud uses to connect your Azure AD was updated to use the GroupMember.Read.All permission instead of the Group.Read.All permission. If you have an existing Azure AD connection (before April 2022) and you want the app to use the new permission, you must disconnect and then reconnect your Azure AD to Citrix Cloud. This action ensures your account is using the latest Azure AD app in Citrix Cloud. For more information, see [Reconnect to Azure AD for the upgraded app](#).

If you choose not to update the app, your existing connection still functions normally.

Enterprise applications

The following table lists the Azure AD enterprise applications that Citrix Cloud uses when connecting and using Azure AD and the purpose for which each application is used.

Name	Application ID	Usage
Citrix Cloud	e95c4605-aeab-48d9-9c36-1a262ef8048e	Workspace subscriber login
Citrix Cloud	f9c0e999-22e7-409f-bb5e-956986abdf02	Default connection between Azure AD and Citrix Cloud
Citrix Cloud	1b32f261-b20c-4399-8368-c8f0092b4470	Administrator invitations and logins
Citrix Cloud	5c913119-2257-4316-9994-5e8f3832265b	Default connection between Azure AD and Citrix Cloud with Citrix Endpoint Management
Citrix Cloud	e067934c-b52d-4e92-b1ca-70700bd1124e	Legacy connection between Azure AD and Citrix Cloud with Citrix Endpoint Management

Permissions

The permissions in Citrix Cloud's enterprise applications allow Citrix Cloud to access certain data in your Azure AD tenant. Citrix Cloud uses these data to perform specific functions such as connecting to your Azure AD tenant, enabling administrators to sign in to Citrix Cloud using a dedicated sign-in URL, and connecting your Azure AD tenant with Endpoint Management. Citrix Cloud can only access these data with your consent. These permissions represent the least amount of privilege that Citrix Cloud needs to function with your Azure AD. For more information about Azure AD permissions and consent, see [Permissions and consent in the Microsoft identity platform](#) on the Microsoft Azure documentation web site.

In this article, each set of Azure AD application permissions includes the following information:

- **API Name:** The resource applications from which Citrix Cloud requests permissions. These applications are Microsoft Graph and Windows Azure Active Directory. Citrix Cloud requests the same permissions from both of these resource applications.
- **Type:** The levels of access that Citrix Cloud requests for a given permission. Permissions in a given enterprise application can have one of the following access levels:
 - **Delegated permissions** are used to act on behalf of a signed-in user, such as when querying the profile of the user.

- **Application permissions** are used when the application performs an action without the user's presence, such as querying users within a particular group. This permission type requires consent of a Global Administrator in Azure AD.
- **Claim Value:** The string of information that Azure AD assigns to a given permission. Permissions in a given enterprise application can have one of the following claim values:
 - **User.Read:** Allows Citrix Cloud administrators to add users from the connected Azure AD as administrators on the Citrix Cloud account.
 - **User.ReadBasic.All:** Gathers basic info from the user's profile. It's a subset from User.Read.All but the permission itself remains for backwards compatibility.
 - **User.Read.All:** Citrix Cloud calls [List users](#) in Microsoft Graph to enable browsing and selection of users from the customer's connected Azure AD. For example, users from Azure AD can be given access to a Citrix DaaS resource with the workspace. Citrix Cloud can't use `User.ReadBasic.All` as Citrix Cloud needs to access properties outside of the basic profile such as `onPremisesSecurityIdentifier`.
 - **GroupMember.Read.All:** Citrix Cloud calls [List groups](#) in Microsoft Graph to allow browsing and selection of groups from the customer's connected Azure AD. For example, groups from Azure AD can also be granted access to Citrix DaaS applications.
 - **Directory.Read.All:** Citrix Cloud calls [List memberOf](#) in Microsoft Graph to get the user's group membership as `Groups.Read.All` is not sufficient.
 - **DeviceManagementApps.ReadWrite.All:** Allows Citrix Cloud to read and write the properties, group assignments, status of apps, app configurations, and app protection policies managed by Microsoft Intune.
 - **Directory.AccessAsUser.All:** Allows Citrix Cloud to have the same access to information in the directory as the signed-in user.

Note:

The **Directory.Read.All** is applicable only for **Default connection between Azure AD and Citrix Cloud with Endpoint Management**.

Workspace subscriber login

This Citrix Cloud application (ID: e95c4605-aeab-48d9-9c36-1a262ef8048e) uses the following permissions:

API Name	Claim Value	Permission Name	Type
Microsoft Graph	User.Read	Sign in and read user profile	Delegated

Default connection between Azure AD and Citrix Cloud

This Citrix Cloud application (ID: f9c0e999-22e7-409f-bb5e-956986abdf02) uses the following permissions:

API Name	Claim Value	Permission	Type
Microsoft Graph	GroupMember.Read.All	Read all groups	Delegated
Microsoft Graph	User.ReadBasic.All	Read all users' basic profiles	Delegated
Microsoft Graph	User.Read.All	Read all users' full profiles	Delegated
Microsoft Graph	User.Read	Sign in and read user profile	Delegated
Microsoft Graph	GroupMember.Read.All	Read all groups	Application
Microsoft Graph	User.Read.All	Read all users' full profile	Application
Microsoft Graph	User.Read	Sign in and read user profile	Application

Administrator invitations and logins

This Citrix Cloud application (ID: 1b32f261-b20c-4399-8368-c8f0092b4470) uses the following permissions:

API Name	Claim Value	Permission Name	Type
Microsoft Graph	User.Read	Sign in and read user profile	Delegated
Microsoft Graph	User.ReadBasic.All	Read all users' basic profiles	Delegated

Default connection between Azure AD and Citrix Cloud with Endpoint Management

This Citrix Cloud application (ID: 5c913119-2257-4316-9994-5e8f3832265b) uses the following permissions:

API Name	Claim Value	Permission Name	Type
Microsoft Graph	GroupMember.Read.All	Read all groups	Delegated
Microsoft Graph	User.ReadBasic.All	Read all users' basic profiles	Delegated
Microsoft Graph	User.Read	Sign in and read user profile	Delegated
Microsoft Graph	Directory.Read.All	Read directory data	Application
Microsoft Graph	Directory.Read.All	Read directory data	Delegated
Microsoft Graph	DeviceManagementApps.ReadWrite.All	Read and write Microsoft Intune apps	Delegated
Microsoft Graph	Directory.AccessAsUser.All	Access directory as the signed-in user	Delegated

Legacy connection between Azure AD and Citrix Cloud with Endpoint Management

This Citrix Cloud application (ID: e067934c-b52d-4e92-b1ca-70700bd1124e) uses the following permissions:

API Name	Claim Value	Permission Name	Type
Microsoft Graph	GroupMember.Read.All	Read all groups	Delegated
Microsoft Graph	User.ReadBasic.All	Read all users' basic profiles	Delegated
Microsoft Graph	User.Read	Sign in and read user profile	Delegated
Microsoft Graph	DeviceManagementApps.ReadWrite.All	Read and write Microsoft Intune apps	Delegated
Microsoft Graph	Directory.AccessAsUser.All	Access directory as the signed-in user	Delegated

Connect an on-premises Citrix Gateway as an identity provider to Citrix Cloud

September 21, 2023

Citrix Cloud supports using an on-premises Citrix Gateway as an identity provider to authenticate subscribers signing in to their workspaces.

By using Citrix Gateway authentication, you can:

- Continue authenticating users through your existing Citrix Gateway so they can access the resources in your on-premises Virtual Apps and Desktops deployment through Citrix Workspace.
- Use the Citrix Gateway [authentication, authorization, and auditing \(AAA\) functions](#) with Citrix Workspace.
- Use features such as pass-through authentication, smart cards, secure tokens, conditional access policies, federation, and many others while providing your users access to the resources they need through Citrix Workspace.

Tip:

Learn more about supported identity providers with the [Introduction to Citrix Identity and Authentication](#) education course. The “Planning Citrix Identity and Access Management” module includes short videos that walk you through connecting this identity provider to Citrix Cloud and enabling authentication for Citrix Workspace.

Supported versions

Citrix Gateway authentication is supported for use with the following on-premises product versions:

- Citrix Gateway 12.1 54.13 Advanced edition or later
- Citrix Gateway 13.0 41.20 Advanced edition or later

Prerequisites

Cloud Connectors

You need at least two (2) servers on which to install the Citrix Cloud Connector software. These servers must meet the following requirements:

- Meets the system requirements described in [Cloud Connector Technical Details](#).
- Does not have any other Citrix components installed, is not an Active Directory domain controller, and is not a machine critical to your resource location infrastructure.
- Joined to the domain where your Site resides. If users access your Site’s applications in multiple domains, you must install at least two Cloud Connectors in each domain.
- Connected to a network that can contact your Site.
- Connected to the Internet. For more information, see [System and Connectivity Requirements](#).

- At least two Cloud Connectors are required to ensure a highly available connection with Citrix Cloud. After installation, the Cloud Connectors allow Citrix Cloud to locate and communicate with your Site.

For more information about installing the Cloud Connector, see [Cloud Connector Installation](#).

Active Directory

Before enabling Citrix Gateway authentication, perform the following tasks:

- Verify that your workspace subscribers have user accounts in Active Directory (AD). Subscribers without AD accounts can't sign in to their workspaces successfully.
- Ensure that the user properties in your subscribers' AD accounts are populated. Citrix Cloud requires these properties to establish the user context when subscribers sign in. If these properties aren't populated, subscribers can't sign in to their workspace. These properties include:
 - Email address
 - Display name
 - Common name
 - SAM account name
 - User Principal Name
 - OID
 - SID
- Connect your Active Directory (AD) to your Citrix Cloud account. In this task, you install the Cloud Connector software on the servers you prepared, as described in the Cloud Connectors section. The Cloud Connectors enable Citrix Cloud to communicate with your on-premises environment. For instructions, see [Connect Active Directory to Citrix Cloud](#).
- If you are performing federation with Citrix Gateway authentication, synchronize your AD users to the federation provider. Citrix Cloud requires the AD user attributes for your workspace subscribers so they can sign in successfully.

Requirements

Citrix Gateway advanced policies

Citrix Gateway authentication requires the use of advanced policies on the on-premises Gateway due to deprecation of classic policies. Advanced policies support multifactor authentication (MFA) for Citrix Cloud, including options such as Identity Provider Chaining. If you currently use classic policies, you must create new advanced policies to use Citrix Gateway authentication in Citrix Cloud. You can reuse the Action portion of the classic policy when you create the advanced policy.

Certificates for signature

When configuring the Gateway for authenticating subscribers to Citrix Workspace, the Gateway acts as an OpenID Connect provider. Messages between Citrix Cloud and Gateway conform to the OIDC protocol, which involves digitally signing tokens. Therefore, you must configure a certificate for signing these tokens. This certificate must be issued from a public Certificate Authority (CA). Using a certificate issued by a private CA is not supported as there is no way to provide Citrix Cloud with the private root CA certificate. So, the certificate chain of trust cannot be established. If you configure multiple certificates for signature, these keys are rotated for each message.

Keys must be bound to **vpn global**. Without these keys, subscribers can't access their workspace successfully after signing in.

Clock synchronization

Because digitally signed messages in OIDC carry a timestamp, the Gateway must be synchronized to NTP time. If the clock isn't synchronized, Citrix Cloud assumes that tokens are stale when checking their validity.

Task overview

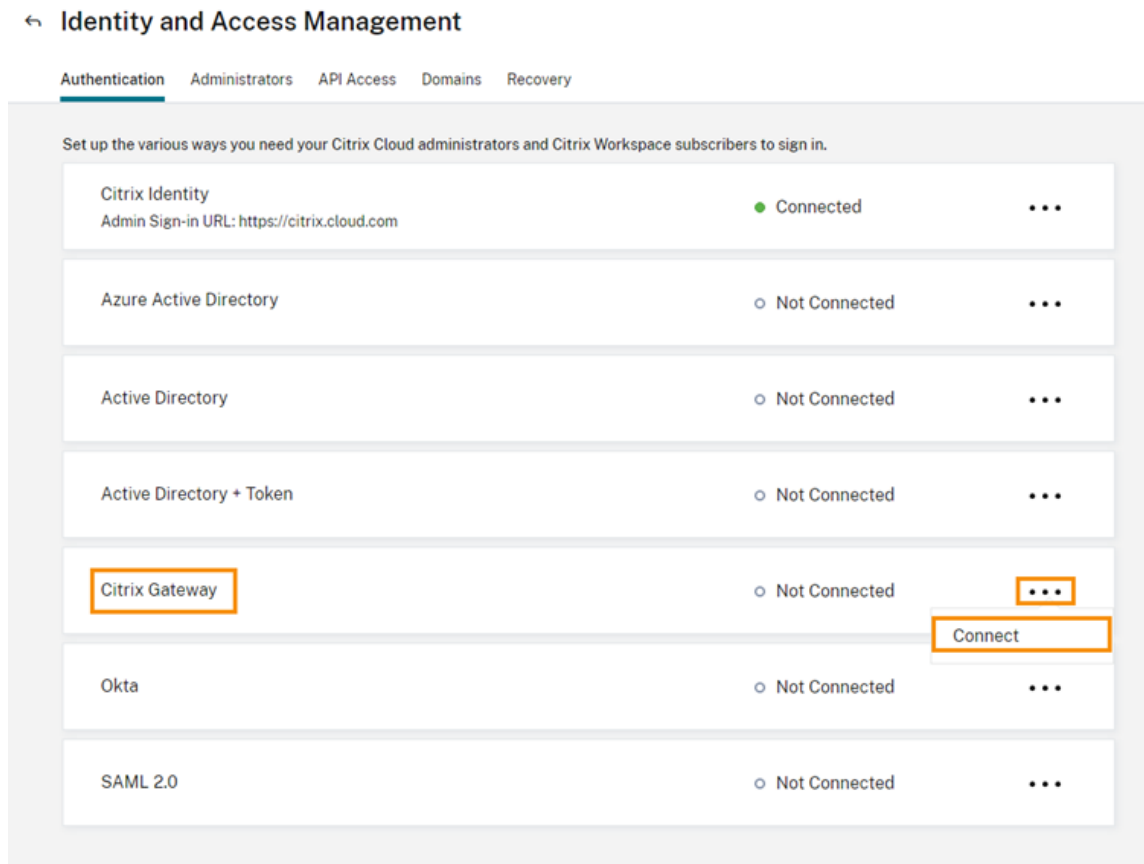

To set up Citrix Gateway authentication, you perform the following tasks:

1. In **Identity and Access Management**, start configuring the connection to your Gateway. In this step, you generate the client ID, secret, and redirect URL for the Gateway.
2. On the Gateway, create an OAuth IdP advanced policy using the generated information from Citrix Cloud. This enables Citrix Cloud to connect with your on-premises Gateway. For instructions, see the following articles:
 - Citrix Gateway 12.1: [Use an on-premises Citrix Gateway as the identity provider for Citrix Cloud](#)
 - Citrix Gateway 13.0: [Use an on-premises Citrix Gateway as the identity provider for Citrix Cloud](#)
3. In **Workspace Configuration**, enable Citrix Gateway authentication for subscribers.

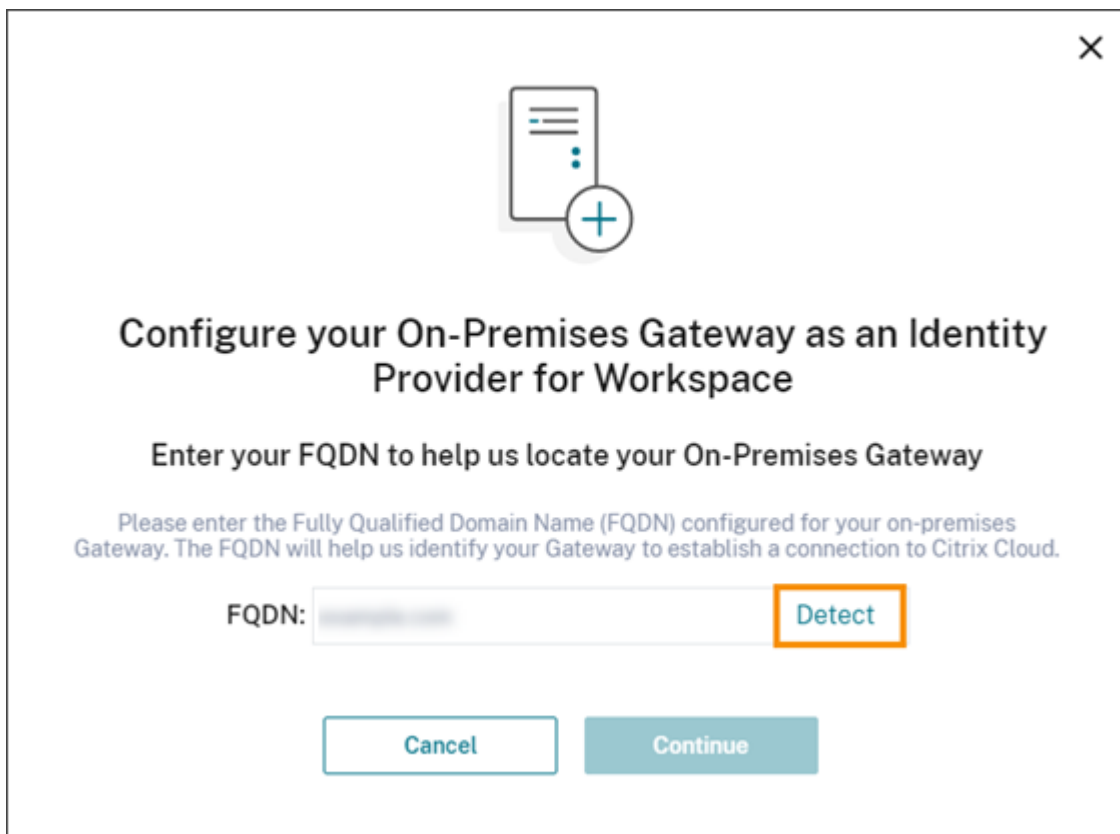

To enable Citrix Gateway authentication for workspace subscribers

1. From the Citrix Cloud menu, select **Identity and Access Management**.

2. From the **Authentication** tab, in **Citrix Gateway**, click the ellipsis menu and select **Connect**.

3. Enter the FQDN of your on-premises Gateway and click **Detect**.

Configure your On-Premises Gateway as an Identity Provider for Workspace

Enter your FQDN to help us locate your On-Premises Gateway

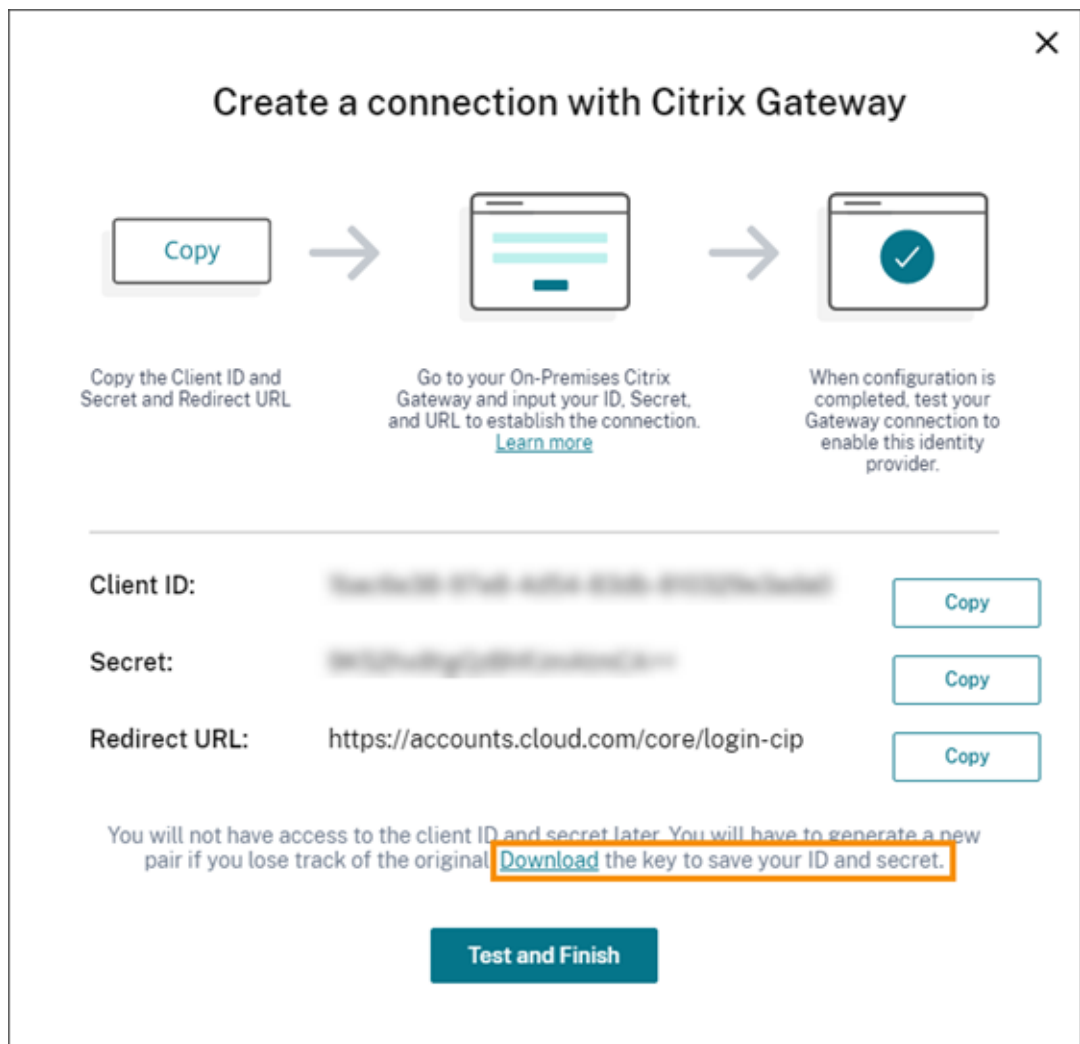

Please enter the Fully Qualified Domain Name (FQDN) configured for your on-premises Gateway. The FQDN will help us identify your Gateway to establish a connection to Citrix Cloud.

FQDN: Detect

Cancel Continue

After Citrix Cloud detects it successfully, click **Continue**.

4. Create a connection with your on-premises Gateway:
 - a) Copy the Client ID, Secret, and Redirect URL that Citrix Cloud displays.

Also, download a copy of this information and save it securely offline for your reference. This information is not available in Citrix Cloud after it's generated.

- b) On the Gateway, create an OAuth IdP advanced policy using the client ID, Secret, and Redirect URL from Citrix Cloud. For instructions, see the following articles:
 - For Citrix Gateway 12.1: [Use an on-premises Citrix Gateway as the identity provider for Citrix Cloud](#)
 - For Citrix Gateway 13.0: [Use an on-premises Citrix Gateway as the identity provider for Citrix Cloud](#)
 - c) Click **Test and Finish**. Citrix Cloud verifies that your Gateway is reachable and configured correctly.
5. Enable Citrix Gateway authentication for workspaces:
- a) From the Citrix Cloud menu, select **Workspace Configuration**.
 - b) From the **Authentication** tab, select **Citrix Gateway**.
 - c) Select **I understand the impact on subscriber experience** and then click **Save**.

Troubleshooting

As a first step, review the Prerequisites and Requirements sections in this article. Verify you have all the required components in your on-premises environment and that you have made all required configurations. If any of these items are missing or misconfigured, workspace authentication with Citrix Gateway does not work.

If you experience an issue establishing a connection between Citrix Cloud and your on-premises Gateway, verify the following items:

- The Gateway FQDN is reachable from the Internet.
- You have entered the Gateway FQDN correctly in Citrix Cloud.
- You have entered the Gateway URL correctly in the `-issuer` parameter of the OAuth IdP policy. Example: `-issuer https://GatewayFQDN.com`. The `issuer` parameter is case sensitive.
- The client ID, secret, and redirect URL values from Citrix Cloud are entered correctly in the Client ID, Client Secret, Redirect URL, and Audience fields of the OAuth IdP policy. Verify that the correct client ID has been entered in the Audience field of the policy.
- The OAuth IdP authentication policy is configured correctly. For instructions, see the following articles:
 - Citrix Gateway 12.1: [Use an on-premises Citrix Gateway as the identity provider for Citrix Cloud](#)
 - Citrix Gateway 13.0: [Use an on-premises Citrix Gateway as the identity provider for Citrix Cloud](#)
- Verify the policy is bound correctly to the AAA authentication server as described in [Binding Authentication Policies](#).

Global catalog servers

In addition to retrieving user account details, Gateway retrieves users' domain name, AD NETBIOS name, and the root AD domain name. To retrieve the AD NETBIOS name, Gateway searches the AD where the user accounts reside. NETBIOS names are not replicated on global catalog servers.

If you use global catalog servers in your AD environment, LDAP actions configured on these servers do not work with Citrix Cloud. Instead, you must configure the individual ADs in the LDAP action. If you have multiple domains or forests, you can configure multiple LDAP policies.

AD search for single sign-on with Kerberos or IdP chaining

If you use Kerberos or an external identity provider that uses SAML or OIDC protocols for subscriber sign-in, verify that AD lookup is configured. Gateway requires AD lookups to retrieve subscribers' AD

user properties and AD configuration properties.

Ensure that you have LDAP policies configured, even if authentication is handled by third party servers. To configure these policies, you add a second authentication factor to your existing login schema profile by performing the following tasks:

1. Create an LDAP authentication server that performs only attribute and group extraction from Active Directory.
2. Create an LDAP advanced authentication policy.
3. Create an Authentication Policy Label.
4. Define the Authentication Policy Label as the next factor, after the primary identity provider.

To add LDAP as a second authentication factor

1. Create the LDAP authentication server:
 - a) Select **System > Authentication > Basic Policies > LDAP > Servers > Add**.
 - b) On the **Create Authentication LDAP Server** page, enter the following information:
 - In **Choose Server Type**, select **LDAP**.
 - In **Name**, enter a friendly name for the server.
 - Select **Server IP** and then enter LDAP server's IP address.
 - In **Security Type**, select your required LDAP security type.
 - In **Server Type**, select **AD**.
 - In **Authentication**, do not select the check box. This check box must be cleared because this authentication server is only for extracting user attributes and groups from Active Directory, not authentication.
 - c) Under **Other Settings**, enter the following information:
 - In **Server Logon Name Attribute**, enter **UserPrincipalName**.
 - In **Group Attribute**, select **memberOf**.
 - In **Sub Attribute Name**, select **cn**.
2. Create the LDAP advanced authentication policy:
 - a) Select **Security > AAA - Application Traffic > Policies > Authentication > Advanced Policies > Policy > Add**.
 - b) On the **Create Authentication Policy** page, enter the following information:
 - In **Name**, enter a friendly name for the policy.
 - In **Action Type**, select **LDAP**.
 - In **Action**, select the LDAP authentication server you created earlier.
 - In **Expression**, enter **TRUE**.
 - c) Click **Create** to save the configuration.
3. Create the Authentication Policy Label:

- a) Select **Security > AAA –Application Traffic > Policies > Authentication > Advanced Policies > Policy Label > Add**.
 - b) In **Name**, enter a friendly name for the authentication policy label.
 - c) In Login Schema, select **LSCHEMA_INT**.
 - d) Under **Policy Binding**, in **Select Policy**, select the LDAP advanced authentication policy you created earlier.
 - e) In **GoTo Expression**, select **END**.
 - f) Click **Bind** to finish the configuration.
4. Define the LDAP Authentication Policy Label as the next factor, after the primary identity provider:
- a) Select **System > Security > AAA - Application Traffic > Virtual Servers**.
 - b) Select the virtual server that contains the binding for your primary identity provider and select **Edit**.
 - c) Under **Advanced Authentication Policies**, select the existing **Authentication Policy** bindings.
 - d) Select the binding for your primary identity provider and then select **Edit Binding**.
 - e) On the **Policy Binding** page, in **Select Next Factor**, select the LDAP Authentication Policy Label you created earlier.
 - f) Click **Bind** to save the configuration.

Default password for multifactor authentication

If you use multifactor authentication (MFA) for workspace subscribers, Gateway uses the last factor's password as the default password for single sign-on. This password is sent to Citrix Cloud when subscribers sign in to their workspace. If LDAP authentication is followed by another factor in your environment, you must configure the LDAP password as the default password that is sent to Citrix Cloud. Enable **SSOCredentials** on the login schema corresponding to the LDAP factor.

Connect Google Cloud Identity as an identity provider to Citrix Cloud

September 21, 2023

Citrix Cloud supports using Google Cloud Identity as an identity provider to authenticate subscribers signing in to their workspaces. By connecting your organization's Google account to Citrix Cloud, you can provide a unified sign-in experience for accessing Citrix Workspace and Google resources.

Requirements for domain-joined and non-domain-joined configuration

You can configure Google Cloud Identity as an identity provider in Citrix Cloud using a machine that's domain-joined or non-domain-joined.

- Domain-joined means machines are joined to a domain in your on-premises Active Directory (AD) and authentication uses the user profiles that are stored there.
- Non-domain-joined means machines aren't joined to an AD domain and authentication uses the user profiles that are stored in your Google Workspace directory (also known as Google-native users).

The following table lists the requirements for each configuration type.

Requirement	Domain-joined	Non-domain-joined	More information
On-premises AD	Yes	No	See Prepare Active Directory and Citrix Cloud Connectors in this article.
Citrix Cloud Connectors deployed in your resource location	Yes	No; Cloud Connectors aren't needed to access non-domain-joined machines.	Prepare Active Directory and Citrix Cloud Connectors in this article.
AD synchronization with Google Cloud	Optional only if using Gateway service and no other services. Otherwise, this task is required.	No	See Sync Active Directory with Google Cloud Identity in this article.
Developer account with access to the Google Cloud Platform console. Used for creating a service account and key, and enabling the Admin SDK API.	Yes	Yes	See Create a service account, Create a service account key, and Configure domain-wide delegation in this article.

Requirement	Domain-joined	Non-domain-joined	More information
An administrator account with access to the Google Workspace Admin console. Used for configuring domain-wide delegation and a read-only API user account.	Yes	Yes	See Configure domain-wide-delegation and Add a read-only API user account in this article.

Authentication with multiple Citrix Cloud accounts

This article describes how to connect Google Cloud Identity as an identity provider to a single Citrix Cloud account. If you have multiple Citrix Cloud accounts, you can connect each one to the same Google Cloud account using the same service account and read-only API user account. Simply sign in to Citrix Cloud and select the appropriate customer ID from the customer picker.

Prepare Active Directory and Citrix Cloud Connectors

If you are using a **domain-joined** machine with Google Cloud Identity, use this section to prepare your on-premises AD. If you are using a non-domain-joined machine, skip this task and continue to [Create a service account](#) in this article.

You need at least two (2) servers in your Active Directory domain on which to install the Citrix Cloud Connector software. Cloud Connectors are required for enabling communication between Citrix Cloud and your [resource location](#). At least two Cloud Connectors are required to ensure a highly available connection with Citrix Cloud. These servers must meet the following requirements:

- Meets the requirements described in [Cloud Connector Technical Details](#).
- Does not have any other Citrix components installed, is not an Active Directory domain controller, and is not a machine critical to your resource location infrastructure.
- Joined to your Active Directory (AD) domain. If your workspace resources and users reside in multiple domains, you must install at least two Cloud Connectors in each domain. For more information, see [Deployment scenarios for Cloud Connectors in Active Directory](#).
- Connected to a network that can contact the resources that users access through Citrix Workspace.
- Connected to the Internet. For more information, see [System and Connectivity Requirements](#).

For more information about installing Cloud Connectors, see [Cloud Connector Installation](#).

Sync Active Directory with Google Cloud Identity

If you are using a **domain-joined** machine with Google Cloud Identity, use this section to prepare your on-premises AD. If you are using a non-domain-joined machine, skip this task and continue to Create a service account in this article.

Synchronizing your AD with Google Cloud Identity is optional if you are using only Citrix Gateway service, with no other services enabled. For these services alone, you can use Google-native users without needing to synchronize with your AD.

If you are using other Citrix Cloud services, synchronizing your AD with Google Cloud Identity is required. Google Cloud must pass the following AD user attributes to Citrix Cloud:

- SecurityIdentifier (SID)
- objectGUID
- userPrincipalName (UPN)

To sync your AD with Google Cloud

1. Download and install the [Google Cloud Directory Sync utility](#) from the Google web site. For more information about this utility, see the [Google Cloud Directory Sync](#) documentation on the Google web site.
2. After installing the utility, launch the Configuration Manager (**Start > Configuration Manager**).
3. Specify the Google domain settings, and LDAP settings as described in [Set up your sync with Configuration Manager](#) of the utility documentation.
4. In **General Settings**, select **Custom Schemas**. Leave the default selections unchanged.
5. Configure a custom schema to apply to all user accounts. Enter the required information using the exact casing and spelling specified in this section.
 - a) Select the **Custom Schemas** tab and then select **Add Schema**.
 - b) Select **Use rules defined in “User Accounts”**.
 - c) In **Schema Name**, enter **citrix-schema**.
 - d) Select **Add Field** and then enter the following information:
 - Under **Schema field template**, in **Schema Field**, select **userPrincipalName**.
 - Under **Google field details**, in **Field Name**, enter **UPN**.
 - e) Repeat Step 4 to create the following fields:
 - objectGUID: Under **Schema field template**, select **objectGUID**. Under **Google field details**, enter **objectGUID**.
 - SID: Under **Schema field template**, select **Custom**. Under **Google field details**, enter **SID**.
 - objectSID: Under **Schema field template**, select **Custom**. Under **Google field details**, enter **objectSID**.

- f) Select **OK** to save your entries.
6. Finish configuring any remaining settings for your organization and verify synchronization settings as described in [Set up your sync with Configuration Manager](#) of the utility documentation.
7. Select **Sync & apply changes** to synchronize your Active Directory with your Google account.

After the sync finishes, the User Information section in Google Cloud displays users' Active Directory information.

Create a service account

To complete this task, you need a Google Cloud Platform developer account.

1. Sign in to <https://console.cloud.google.com>.
2. From the Dashboard sidebar, select **IAM & Admin** and then select **Service Accounts**.
3. Select **Create service account**.
4. Under **Service account details**, enter the service account name and service account ID.
5. Select **Done**.

Create a service account key

1. On the **Service Accounts** page, select the service account you just created.
2. Select the **Keys** tab and then select **Add key > Create new key**.
3. Leave the default JSON key type option selected.
4. Select **Create**. Save the key to a secure location that you can access later. You enter the private key in the Citrix Cloud console when you connect Google Cloud Identity as an identity provider.

Configure domain-wide delegation

1. Enable the Admin SDK API:
 - a) From the Google Cloud Platform menu, select **APIs & Services > Enabled APIs & services**.
 - b) Select **Enable APIs and services** near the top of the console. The API Library home page appears.
 - c) Search for **Admin SDK API** and select it from the results list.
 - d) Select **Enable**.
2. Create an API client for the service account:
 - a) From the Google Cloud Platform menu, select **IAM & Admin > Service Accounts** and then select the service account you created earlier.
 - b) From the service account's **Details** tab, expand **Advanced settings**.

- c) Under **Domain-wide Delegation**, copy the Client ID and then select **View Google Workspace Admin Console**.
- d) If applicable, select the Google Workspace administrator account you want to use. The Google Admin console appears.
- e) From the Google Admin sidebar, select **Security > Access and data control > API controls**.
- f) Under **Domain wide delegation**, click **Manage Domain Wide Delegation**.
- g) Select **Add new**.
- h) In **Client ID** paste the client ID for the service account that you copied in Step C.
- i) In **OAuth scopes**, enter the following scopes in a single comma-delimited line:

```
1 https://www.googleapis.com/auth/admin.directory.user.readonly,  
   https://www.googleapis.com/auth/admin.directory.group.  
   readonly,https://www.googleapis.com/auth/admin.directory.  
   domain.readonly  
2 <!--NeedCopy-->
```

- j) Select **Authorize**.

Add a read-only API user account

In this task, you create a Google Workspace user account that has read-only API access for Citrix Cloud. This account is not used for any other purpose and has no other privileges.

1. From the Google Admin menu, select **Directory > Users**.
2. Select **Add new user** and enter the appropriate user information.
3. Select **Add new user** to save the account information.
4. Create a custom role for the read-only user account:
 - a) From the Google Admin menu, select **Account > Admin roles**.
 - b) Select **Create new role**.
 - c) Enter a name for the new role. Example: API-ReadOnly
 - d) Select **Continue**.
 - e) Under **Admin API privileges**, select the following privileges:
 - Users > Read
 - Groups > Read
 - Domain Management
 - f) Select **Continue** and then select **Create role**.
5. Assign the custom role to the read-only user account you created earlier:
 - a) From the custom role details page, in the **Admins** pane, select **Assign users**.
 - b) Start typing the name of the read-only user account and select it from the user list.

- c) Select **Assign role**.
- d) To verify the role assignment, return to the Users page (**Directory > Users**) and select the read-only user account. The custom role assignment is displayed under **Admin roles and privileges**.

Connect Google Cloud Identity to Citrix Cloud

1. Sign in to Citrix Cloud at <https://citrix.cloud.com>.
2. From the Citrix Cloud menu, select **Identity and Access Management**.
3. Locate **Google Cloud Identity** and then select **Connect** from the ellipsis menu.
4. When prompted, enter a short, URL-friendly identifier for your company and select **Save and Continue**. The identifier you choose must be globally unique within Citrix Cloud.
5. Select **Import File** and then select the JSON file you saved when you created the key for the service account. This action imports your private key and the email address for the Google Cloud service account that you created.
6. In **Impersonated User**, enter the name of the read-only API user account.
7. Select **Next**. Citrix Cloud verifies your Google account details and tests the connection.
8. Review the associated domains that are listed. If they're correct, select **Confirm** to save your configuration.

Add administrators to Citrix Cloud

You can add individual Citrix Cloud administrators and administrator groups through Google Cloud. For more information, see the following articles:

- For individual administrators: [Manage administrator access to Citrix Cloud](#)
- For administrator groups: [Manage administrator groups](#)

After you add administrators to Citrix Cloud, they can sign in using one of the following methods:

- Navigate to the administrator sign-in URL that you configured when you initially configured Google Cloud as an identity provider. Example: <https://citrix.cloud.com/go/mycompany>
- From the Citrix Cloud sign-in page, select **Sign in with my company credentials**, enter the unique identifier for your company (for example, “mycompany”), and click **Continue**.

Enable Google Cloud Identity for workspace authentication

1. From the Citrix Cloud menu, select **Workspace Configuration > Authentication**.
2. Select **Google Cloud Identity**. When prompted, select **I understand the impact on the subscriber experience** and then click **Save**.

Connect Okta as an identity provider to Citrix Cloud

November 27, 2023

Citrix Cloud supports using Okta as an identity provider to authenticate subscribers signing in to their workspaces. By connecting your Okta organization to Citrix Cloud, you can provide a common sign-in experience for your subscribers to access resources in Citrix Workspace.

After enabling Okta authentication in Workspace Configuration, subscribers have a different sign-in experience. Selecting Okta authentication provides federated sign-in, not single sign-on. Subscribers sign in to workspaces from an Okta sign-in page, but they may have to authenticate a second time when opening an app or desktop from Citrix DaaS (formerly Citrix Virtual Apps and Desktops service). To enable single sign-on and prevent a second logon prompt, you need to use the Citrix Federated Authentication Service with Citrix Cloud. For more information, see [Connect Citrix Federated Authentication Service to Citrix Cloud](#).

Prerequisites

Cloud Connectors or Connector Appliances

Either Cloud Connectors or Connector Appliances are required for enabling communication between Citrix Cloud and your [resource location](#). At least two Cloud Connectors or Connector Appliances are required to ensure a highly available connection with Citrix Cloud. You need at least two Connectors joined to your Active Directory domain. These can be either [Cloud Connectors](#) or [Connector Appliances](#).

The connectors must meet the following requirements:

- Meet the requirements described in their respective documentation
- Joined to your Active Directory (AD) domain. If your workspace users reside in multiple domains, the [Connector Appliance multi-domain feature](#) can be used to join multiple domains.
- Connected to a network that can contact the resources that users access through Citrix Workspace.
- Connected to the Internet. For more information, see [System and Connectivity Requirements](#).

For more information about installing Cloud Connectors, see [Cloud Connector Installation](#).

For more information about installing Connector Appliances, see [Connector Appliance Installation](#).

Okta domain

When connecting Okta to Citrix Cloud, you must supply the Okta domain for your organization. Citrix supports the following Okta domains:

- okta.com
- okta-eu.com
- oktapreview.com

You can also use Okta custom domains with Citrix Cloud. Review the important considerations for using custom domains in [Customize the Okta URL domain](#) on the Okta web site.

For more information about locating the custom domain for your organization, see [Finding Your Okta Domain](#) on the Okta web site.

Okta OIDC web application

To use Okta as an identity provider, you must first create an Okta OIDC web application with client credentials you can use with Citrix Cloud. After you create and configure the application, note the Client ID and Client Secret. You supply these values to Citrix Cloud when you connect your Okta organization.

To create and configure this application, see the following sections in this article:

- [Create an Okta OIDC web app integration](#)
- [Configure the Okta OIDC web application](#)

Workspace URL

When creating the Okta application, you must supply your Workspace URL from Citrix Cloud. To locate the Workspace URL, select **Workspace Configuration** from the Citrix Cloud menu. The Workspace URL is shown on the **Access** tab.

Important:

If you [modify the workspace URL](#) later on, you must update the Okta application configuration with the new URL. Otherwise, your subscribers might experience issues with logging off from their workspace.

Okta API token

Using Okta as an identity provider with Citrix Cloud requires an API token for your Okta organization. Create this token using a Read-Only Administrator account in your Okta organization. This token must be able to read the users and groups in your Okta organization.

To create the API token, see [Create an Okta API token](#) in this article. For more information about API tokens, see [Create an API Token](#) on the Okta website.

Important:

When you create the API token, make a note of the token value (for example, copy the value temporarily to a plain text document). Okta displays this value only once, so you might create the token just before you perform the steps in Connect Citrix Cloud to your Okta organization.

Sync accounts with the Okta AD agent

To use Okta as an identity provider, you must first integrate your on-premises AD with Okta. To do this, you install the Okta AD agent in your domain and add your AD to your Okta organization. For guidance for deploying the Okta AD agent, see [Get started with Active Directory integration](#) on the Okta web site.

Afterward, you import your AD users and groups to Okta. When importing, include the following values associated with your AD accounts:

- Email
- SID
- UPN
- OID

Note:

If you are using Citrix Gateway service with Workspace, you don't need to synchronize your AD accounts with your Okta organization.

To synchronize your AD users and groups with your Okta organization:

1. Install and configure the Okta AD agent. For complete instructions, refer to the following articles on the Okta website:
 - [Install the Okta Active Directory agent](#)
 - [Configure Active Directory import and account settings](#)
 - [Configure Active Directory provisioning settings](#)
2. Add your AD users and groups to Okta by performing a manual import or an automated import. For more information about Okta import methods and instructions, refer to [Manage Active Directory users and groups](#) on the Okta website.

Create an Okta OIDC web app integration

1. From the Okta management console, under **Applications**, select **Applications**.
2. Select **Create App Integration**.

3. In **Sign in method**, select **OIDC - OpenID Connect**.
4. In **Application type**, select **Web Application**. Select **Next**.
5. In **App Integration Name**, enter a friendly name for the app integration.
6. In **Grant type**, select **Authorization Code** (selected by default).
7. In **Sign-in redirect URIs**, enter `https://accounts.cloud.com/core/login-okta`.
8. In **Sign-out redirect URIs**, enter your Workspace URL from Citrix Cloud.
9. Under **Assignments**, in **Controlled access**, select whether to assign the app integration to everyone in your organization, only groups that you specify, or to assign access later.
10. Select **Save**. After you save the app integration, the console displays the application configuration page.
11. In the **Client Credentials** section, copy the **Client ID** and **Client Secret** values. You use these values when you connect Citrix Cloud to your Okta organization.

Configure the Okta OIDC web application

In this step, you configure your Okta OIDC web application with the settings required for Citrix Cloud. Citrix Cloud requires these settings to authenticate your subscribers through Okta when they sign in to their workspaces.

1. (Optional) Update client permissions for the implicit grant type. You might choose to perform this step if you prefer to allow the least amount of privilege for this grant type.
 - a) From the Okta application configuration page, on the **General** tab, scroll to the **General Settings** section and select **Edit**.
 - b) In the **Application** section, in **Grant type**, under **Client acting on behalf of a user**, clear the **Allow Access Token with implicit grant type** setting.
 - c) Select **Save**.
2. Add application attributes. These attributes are case-sensitive.
 - a) From the Okta console menu, select **Directory > Profile Editor**.
 - b) Select the Okta **User (default)** profile. Okta displays the **User** profile page.
 - c) Under **Attributes**, select **Add attribute**.
 - d) Enter the following information:
 - Display Name: cip_email
 - Variable Name: cip_email
 - Description: AD User Email
 - Attribute Length: Select **Greater than** and then enter **1**.
 - Attribute Required: Yes
 - e) Select **Save and Add Another**.
 - f) Enter the following information:

- Display Name: cip_sid
 - Variable Name: cip_sid
 - Description: AD User Security Identifier
 - Attribute Length: Select **Greater than** and then enter **1**.
 - Attribute Required: Yes
- g) Select **Save and Add Another**.
- h) Enter the following information:
- Display Name: cip_upn
 - Variable Name: cip_upn
 - Description: AD User Principal Name
 - Attribute Length: Select **Greater than** and then enter **1**.
 - Attribute Required: Yes
- i) Select **Save and Add Another**.
- j) Enter the following information:
- Display Name: cip_oid
 - Variable Name: cip_oid
 - Description: AD User GUID
 - Attribute Length: Select **Greater than** and then enter **1**.
 - Attribute Required: Yes
- k) Select **Save**.
3. Edit attribute mappings for the application:
- a) From the Okta console, select **Directory > Profile Editor**.
- b) Locate the **active_directory** profile for your AD. This profile might be labelled using the format `myDomain User`, where `myDomain` is the name of your integrated AD domain.
- c) Select **Mappings**. The User Profile Mappings page for your AD domain appears and the tab for mapping your AD to Okta User is selected.
- d) In the **Okta User User Profile** column, locate the attributes you created in Step 2 and map as follows:
- For `cip_email`, select `email` from the User Profile column for your domain. When selected, the mapping appears as `appuser.email`.
 - For `cip_sid`, select `objectSid` from the User Profile column for your domain. When selected, the mapping appears as `appuser.objectSid`.
 - For `cip_upn`, select `userName` from the User Profile column for your domain. When selected, the mapping appears as `appuser.userName`.
 - For `cip_oid`, select `externalId` from the User Profile column for your domain. When selected, the mapping appears as `appuser.externalId`.
- e) Select **Save Mappings**.
- f) Select **Apply updates now**. Okta starts a job to apply the mappings.

- g) Sync Okta with your AD.
 - i. From the Okta console, select **Directory > Directory Integrations**.
 - ii. Select your integrated AD.
 - iii. Select the **Provisioning** tab.
 - iv. Under **Settings**, select **To Okta**.
 - v. Scroll to the **Okta Attribute Mappings** section and then select **Force Sync**.

Create an Okta API token

1. Sign in to the Okta console using a Read-Only Administrator account.
2. From the Okta console menu, select **Security > API**.
3. Select the **Tokens** tab and then select **Create Token**.
4. Enter a name for the token.
5. Select **Create Token**.
6. Copy the token value. You supply this value when you connect your Okta organization to Citrix Cloud.

Connect Citrix Cloud to your Okta organization

1. Sign in to Citrix Cloud at <https://citrix.cloud.com>.
2. From the Citrix Cloud menu, select **Identity and Access Management**.
3. Locate **Okta** and select **Connect** from the ellipsis menu.
4. In **Okta URL**, enter your Okta domain.
5. In **Okta API Token**, enter the API token for your Okta organization.
6. In **Client ID** and **Client Secret**, enter the client ID and secret from the OIDC web app integration you created earlier. To copy these values from the Okta console, select **Applications** and locate your Okta application. Under **Client Credentials**, use the **Copy to Clipboard** button for each value.
7. Click **Test and Finish**. Citrix Cloud verifies your Okta details and tests the connection.

After the connection is verified successfully, you can enable Okta authentication for workspace subscribers.

Enable Okta authentication for workspaces

1. From the Citrix Cloud menu, select **Workspace Configuration > Authentication**.
2. Select **Okta**.
3. When prompted, select **I understand the impact on the subscriber experience**.
4. Select **Save**.

After switching to Okta authentication, Citrix Cloud temporarily disables workspaces for a few minutes. When workspaces are re-enabled, your subscribers can sign in using Okta.

Connect SAML as an identity provider to Citrix Cloud

February 27, 2024

Citrix Cloud supports using SAML (Security Assertion Markup Language) as an identity provider to authenticate Citrix Cloud administrators and subscribers signing in to their workspaces. You can use the SAML 2.0 provider of your choice with your on-premises Active Directory (AD).

About this article

This article describes the required steps for configuring a connection between Citrix Cloud and your SAML provider. Some of these steps describe actions that you perform in your SAML provider's administration console. The specific commands you use to perform these actions might vary from the commands described in the article, depending on your chosen SAML provider. These SAML provider commands are provided as examples only. Refer to your SAML provider's documentation for more information about the corresponding commands for your SAML provider.

SAML provider configurations

Citrix provides the following configuration guides to ensure your SAML provider interacts smoothly with Citrix Cloud:

- SAML with Active Directory Federated Services (ADFS): See [Configure SAML authentication in Citrix Cloud using ADFS](#).
- SAML with Azure Active Directory identities: See [Sign in to workspaces with SAML using Azure Active Directory identities](#).
- Citrix Cloud SAML SSO app for Azure AD: See [Tutorial: Azure Active Directory single sign-on \(SSO\) integration with Citrix Cloud SAML SSO](#) on the Microsoft Azure AD app documentation website.

- SAML with Citrix Workspace custom domains: See [Sign in to workspaces with SAML using custom domains](#)
- SAML with Okta: See [Configure Okta as a SAML provider for workspace authentication](#)

Supported SAML providers

SAML providers that support the official SAML 2.0 specification are supported for use with Citrix Cloud.

Citrix has tested the following SAML providers for authenticating Citrix Cloud administrators and for authenticating Citrix Workspace subscribers using Single Sign-on (SSO) and Single Logout (SLO). SAML providers that don't appear in this list are also supported.

- Microsoft ADFS
- Microsoft Azure AD
- Duo
- Okta
- OneLogin
- PingOne SSO
- PingFederate

When testing these providers, Citrix used the following settings to configure the SAML connection in the Citrix Cloud console:

- Binding Mechanism: HTTP Post
- SAML Response: Sign Either Response or Assertion
- Authentication Context: Unspecified, Exact

The values for these settings are configured by default when you configure your SAML connection in Citrix Cloud. Citrix recommends using these settings when configuring the connection with your chosen SAML provider.

For more information about these settings, see [Add SAML provider metadata to Citrix Cloud](#) in this article.

Support for scoped Entity IDs

This article describes how to configure SAML authentication using a single SAML application and Citrix Cloud's default generic Entity ID.

If your SAML authentication requirements include the need for multiple SAML applications within a single SAML provider, refer to [Configure a SAML application with a scoped Entity ID in Citrix Cloud](#).

Prerequisites

Using SAML authentication with Citrix Cloud has the following requirements:

- SAML provider that supports SAML 2.0.
- On-premises AD domain.
- Two Cloud Connectors deployed to a resource location and joined to your on-premises AD domain. The Cloud Connectors are used to ensure Citrix Cloud can communicate with your resource location.
- AD integration with your SAML provider.

Cloud Connectors

You need at least two (2) servers on which to install the Citrix Cloud Connector software. Citrix recommends at least two servers for Cloud Connector high availability. These servers must meet the following requirements:

- Meets the system requirements described in [Cloud Connector Technical Details](#).
- Does not have any other Citrix components installed, is not an AD domain controller, and is not a machine critical to your resource location infrastructure.
- Joined to the domain where your resources reside. If users access resources in multiple domains, you need to install at least two Cloud Connectors in each domain.
- Connected to a network that can contact the resources that subscribers access through Citrix Workspace.
- Connected to the Internet. For more information, see [System and Connectivity Requirements](#).

For more information about installing the Cloud Connector, see [Cloud Connector Installation](#).

Active Directory

Before configuring SAML authentication, perform the following tasks:

- Verify that your workspace subscribers have user accounts in your AD. Subscribers without AD accounts can't sign in to their workspaces successfully when SAML authentication is configured.
- Connect your AD to your Citrix Cloud account by deploying Cloud Connectors in your on-premises AD.
- Synchronize your AD users to the SAML provider. Citrix Cloud requires the AD user attributes for your workspace subscribers so they can sign in successfully.

AD user attributes The following attributes are required for all Active Directory user objects and must be populated:

- Common name
- SAM account name
- User Principal Name (UPN)
- Object GUID
- SID

Citrix Cloud uses the Object GUID and SID attributes from your AD to establish the user context when subscribers sign in to Citrix Workspace. If either of these properties isn't populated, subscribers can't sign in.

The following attributes aren't required for using SAML authentication with Citrix Cloud, but Citrix recommends populating them to ensure the best user experience:

- Email address
- Display Name

Citrix Cloud uses the Display Name attribute to show subscribers' names correctly in Citrix Workspace. If this attribute isn't populated, subscribers can still sign in, but their names might not be displayed as expected.

SAML integration with Active Directory

Before enabling SAML authentication, you must integrate your on-premises AD with your SAML provider. This integration allows the SAML provider to pass the following required AD user attributes to Citrix Cloud in the SAML assertion:

- objectSID (SID)
- objectGUID (OID)
- userPrincipalName (UPN)
- Mail (email)
- Display Name (displayName)

You can configure a subset of these attributes, provided either the SID or UPN attributes are included in the SAML assertion. Citrix Cloud retrieves the other attributes from your AD as needed.

Note:

To ensure the best performance, Citrix recommends configuring all of the attributes mentioned in this section.

Although the precise integration steps vary among SAML providers, the integration process typically includes the following tasks:

1. Install a synchronization agent in your AD domain to establish a connection between your domain and your SAML provider. If you're using ADFS as your SAML provider, this step isn't required.
2. Create custom attributes and map them to the required AD user attributes mentioned earlier in this section. For reference, the general steps for this task are described in [Create and map custom SAML attributes](#) in this article.
3. Synchronize your AD users to your SAML provider.

For more information about integrating your AD with your SAML provider, consult your SAML provider's product documentation.

Administrator authentication with SAML 2.0

Citrix Cloud supports using SAML 2.0 to authenticate members of administrator groups in AD. For more information about adding administrator groups to Citrix Cloud, see [Manage administrator groups](#).

Using an existing SAML connection for administrator authentication

If you already have a SAML 2.0 connection in Citrix Cloud and want to use it to authenticate administrators, you must first disconnect SAML 2.0 in **Identity and Access Management** and then reconfigure the connection. If you're using your SAML connection to authenticate Citrix Workspace subscribers, you must also disable the SAML authentication method in **Workspace Configuration**. After reconfiguring the SAML connection, you can add administrator groups to Citrix Cloud.

If you attempt to add administrator groups without first disconnecting and reconnecting SAML 2.0, the **Active Directory** identity option described in [Add an administrator group to Citrix Cloud](#) doesn't appear.

Task overview for setting up a new SAML connection

To set up a new SAML 2.0 connection in Citrix Cloud, you perform the following tasks:

1. In **Identity and Access Management**, connect your on-premises AD to Citrix Cloud as described in [Connect Active Directory to Citrix Cloud](#).
2. Integrate your SAML provider with your on-premises AD as described in [SAML integration with Active Directory](#) in this article.
3. Configure the sign-in URL that administrators can use to sign in to Citrix Cloud.
4. In **Identity and Access Management**, configure SAML authentication in Citrix Cloud. This task involves configuring your SAML provider with the SAML metadata from Citrix Cloud and then configuring Citrix Cloud with the metadata from your SAML provider to create the SAML connection.

Task overview for using an existing SAML connection for Citrix Cloud administrators

If you already have a SAML 2.0 connection in Citrix Cloud and want to use it for administrator authentication, perform the following tasks:

1. If applicable, disable SAML 2.0 workspace authentication: In **Workspace Configuration > Authentication**, select a different authentication method and then select **Confirm** when prompted.
2. Disconnect your existing SAML 2.0 connection: In **Identity and Access Management > Authentication**, locate the SAML connection. From the ellipsis menu at the far right, select **Disconnect**. Select **Yes, disconnect** to confirm the action.
3. Reconnect SAML 2.0 and configure the connection: From the ellipsis menu for **SAML 2.0**, select **Connect**.
4. When prompted, enter a unique identifier for the sign-in URL that administrators will use to sign in.
5. Configure the SAML connection as described in [Configure the SAML provider metadata](#) in this article.

After configuring your SAML connection, you can add your AD administrator groups to Citrix Cloud as described in [Manage administrator groups](#). You can also reenable SAML for workspace subscribers as described in this article.

Create and map custom SAML attributes

If you already have custom attributes for the SID, UPN, OID, email, and displayName attributes configured in your SAML provider, you don't have to perform this task. Proceed to [Create a SAML connector application](#) and use your existing custom SAML attributes in Step 5.

Note:

The steps in this section describe actions that you perform in your SAML provider's administration console. The specific commands you use to perform these actions might vary from the commands described in this section, depending on your chosen SAML provider. The SAML provider commands in this section are provided as examples only. Refer to your SAML provider's documentation for more information about the corresponding commands for your SAML provider.

1. Sign in to the administration console of your SAML provider and select the option for creating custom user attributes. For example, depending on your SAML provider's console, you might select **Users > Custom User Fields > New User Field**.
2. Add attributes for the following AD properties. Name the attributes using the default values shown.

AD Property	Required or optional	Default value
userPrincipalName	Required if not adding an attribute for SID (recommended).	<code>cip_upn</code>
objectSID	Required if not adding an attribute for UPN.	<code>cip_sid</code>
objectGUID	Optional for authentication	<code>cip_oid</code>
mail	Optional for authentication	<code>cip_email</code>
displayName	Required by the Workspace UI	<code>displayName</code>
givenName	Required by the Workspace UI	<code>firstName</code>
sn	Required by the Workspace UI	<code>lastName</code>
AD Forest	Optional for authentication	<code>cip_forest</code>
AD Domain	Optional for authentication	<code>cip_domain</code>

3. Select the AD that you connected with Citrix Cloud. For example, depending on your SAML provider's console, you might select **Users > Directories**.
4. Select the option for adding directory attributes. For example, depending on your SAML provider's console, you might select **Directory Attributes**.
5. Select the option for adding attributes and map the following AD attributes to the custom user attributes you created in Step 2:
 - If you added the attribute for SID in Step 2 (for example, `cip_sid`), select **objectSid** and map to the attribute that you created.
 - If you added the attribute for UPN in Step 2 (for example, `cip_upn`), select **userPrincipalName** and map to the attribute that you created.
 - If you added the attribute for ObjectGUID in Step 2 (for example, `cip_oid`), select **ObjectGUID** and map to the attribute that you created.
 - If you added the attribute for Mail in Step 2 (for example, `cip_email`), select **mail** and map to the attribute that you created.
 - If you added the attribute for Display Name in Step 2 (for example, `displayName`), select **displayName** and map to the attribute that you created.

Configure the administrator sign-in URL

1. Sign in to Citrix Cloud at <https://citrix.cloud.com>.
2. From the Citrix Cloud menu, select **Identity and Access Management**.

3. Locate **SAML 2.0** and select **Connect** from the ellipsis menu.
4. When prompted, enter a short, URL-friendly identifier for your company and select **Save and continue**. The **Configure SAML** page appears.
5. Proceed to the next section to configure the SAML connection to Citrix Cloud.

Configure the SAML provider metadata

In this task, you create a connector application using SAML metadata from Citrix Cloud. After you configure the SAML application, you use the SAML metadata from your connector application to configure the SAML connection to Citrix Cloud.

Note:

Some steps in this section describe actions that you perform in your SAML provider's administration console. The specific commands you use to perform these actions might vary from the commands described in this section, depending on your chosen SAML provider. The SAML provider commands in this section are provided as examples only. Refer to your SAML provider's documentation for more information about the corresponding commands for your SAML provider.

Create a SAML connector application

1. From your SAML provider's administration console, add an application for an identity provider with attributes and sign response. For example, depending on your provider's console, you might select **Applications > Applications > Add App** and then select **SAML Test Connector (IdP w/ attr w/ sign response)**.
2. If applicable, enter a display name and save the app.
3. From the **Configure SAML** screen in Citrix Cloud, in **SAML Metadata**, select **Download**. The metadata XML file appears in another browser tab.

Note:

If needed, you can also download this file from <https://saml.cloud.com/saml/metadata.xml>. This endpoint might be more friendly to some identity providers when importing and monitoring the SAML provider metadata.

4. Enter the following details for the connector application:
 - In the **Audience** field, enter <https://saml.cloud.com>.
 - In the **Recipient** field, enter <https://saml.cloud.com/saml/acs>.
 - In the field for ACS URL validator, enter <https://saml.cloud.com/saml/acs>.
 - In the field for ACS URL, enter <https://saml.cloud.com/saml/acs>.

5. Add your custom SAML attributes as parameter values in the application:

Create this field	Assign this custom attribute
cip_sid	The custom attribute you created for SID. Example: cip_sid
cip_upn	The custom attribute you created for UPN. Example: cip_upn
cip_oid	The custom attribute you created for ObjectGUID. Example: cip_oid
cip_email	The custom attribute you created for Mail. Example: cip_email
displayName	The custom attribute you created for Display Name. Example: displayName

6. Add your Workspace subscribers as users to allow them to access the application.

Add SAML provider metadata to Citrix Cloud

1. Acquire the SAML metadata from your SAML provider. The following image is an example of what this file might look like:

```
<?xml version="1.0"?>
<EntityDescriptor xmlns="urn:oasis:names:tc:SAML:2.0:metadata" entityID="
https://app. .com/saml/metadata/8c733cbd-c579-41d4-b4e1-4ff034893d19">
  <IDPSSODescriptor xmlns:ds="http://www.w3.org/2000/09/xmldsig#" protocolSupportEnumeration=
"urn:oasis:names:tc:SAML:2.0:protocol">
    <KeyDescriptor use="signing">
      <KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
        <ds:X509Data>
          <ds:X509Certificate>MIID2DCCA
          +w3PpA==</ds:X509Certificate>
        </ds:X509Data>
      </ds:KeyInfo>
    </KeyDescriptor>
    <SingleLogoutService Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-Redirect" Location="
https://citrixidentity-dev. .com/trust/saml2/http-redirect/slo/1097253"/>
    <NameIDFormat>urn:oasis:names:tc:SAML:1.1:nameid-format:emailAddress</NameIDFormat>
    <SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-Redirect" Location="
https://citrixidentity-dev. .com/trust/saml2/http-redirect/sso/8c733cbd-c579-41d4-b4e1-4ff034893d19"/>
    <SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-POST" Location="
https://citrixidentity-dev. .com/trust/saml2/http-post/sso/8c733cbd-c579-41d4-b4e1-4ff034893d19"/>
    <SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:bindings:SOAP" Location="
https://citrixidentity-dev. .com/trust/saml2/soap/sso/8c733cbd-c579-41d4-b4e1-4ff034893d19"/>
  </IDPSSODescriptor>
</EntityDescriptor>
```

2. In the **Configure SAML** screen in Citrix Cloud, enter the following values from your SAML provider's metadata file:

- In **Identity Provider Entity ID**, enter the **entityID** value from the **EntityDescriptor** element in the metadata.

```
<EntityDescriptor xmlns="urn:oasis:names:tc:SAML:2.0:metadata" entityID="
https://app. .com/saml/metadata/8c733cbd-c579-41d4-b4e1-4ff034893d19">
```

- In **Sign Authentication Request**, select **Yes** to allow Citrix Cloud to sign authentication requests, certifying they came from Citrix Cloud and not a malicious actor. Select **No** if you prefer to add the Citrix ACS URL to an allow list that your SAML provider uses for posting SAML responses safely.
- In **SSO Service URL**, enter the URL for the binding mechanism you want to use. You can use either HTTP-POST or HTTP-Redirect binding. In the metadata file, locate the **SingleSignOnService** elements with Binding values of either **HTTP-POST** or **HTTP-Redirect**.

```
<SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-Redirect" Location="
https://citrixidentity-dev. .com/trust/saml2/http-redirect/sso/8c733cbd-c579-41d4-b4e1-4ff034893d19"/>
<SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-POST" Location="
https://citrixidentity-dev. .com/trust/saml2/http-post/sso/8c733cbd-c579-41d4-b4e1-4ff034893d19"/>
```

- In **Binding Mechanism**, select the mechanism that matches the binding for the SSO Service URL you chose from the metadata file. By default, **HTTP Post** is selected.
 - In **SAML Response**, select the signing method your SAML provider uses for the SAML Response and SAML Assertion. By default, **Sign Either Response or Assertion** is selected. Citrix Cloud rejects any responses that aren't signed as specified in this field.
3. In your SAML provider's administration console, perform the following actions:
 - Select **SHA-256** for the SAML signing algorithm.
 - Download the X.509 certificate as a Base64-encoded PEM, CRT, or CER file.
 4. On the **Configure SAML** page in Citrix Cloud, in **X.509 Certificate**, select **Upload File** and select the certificate file you downloaded in the previous step.
 5. Select **Continue** to complete the upload.
 6. In **Authentication Context**, select the context you want to use and how strictly you want Citrix Cloud to enforce this context. Select **Minimum** to request authentication at the selected context without enforcing authentication at that context. Select **Exact** to request authentication at the selected context and enforce authentication only at that context. If your SAML provider doesn't support authentication contexts or you choose not to use them, select **Unspecified** and **Minimum**. By default, **Unspecified** and **Exact** are selected.
 7. For **Logout URL** (optional), decide whether or not you want users signing out of Citrix Workspace or Citrix Cloud to also sign out of all web applications that they previously signed in to through the SAML provider.
 - If you want users to stay signed in to their web applications after signing out of Citrix Workspace or Citrix Cloud, leave the **Logout URL** field blank.
 - If you want users to sign out of all web applications after signing out of Citrix Workspace or Citrix Cloud, enter the SingleLogout (SLO) endpoint from your SAML provider. If you're using Microsoft ADFS or Azure Active Directory as your SAML provider, the SLO endpoint is the same as the single sign-on (SSO) endpoint.

SSO Service URL: ⓘ	<code>https://login.microsoftonline.com/3eae[REDACTED]498/saml2</code>
Logout URL (optional): ⓘ	<code>https://login.microsoftonline.com/3eae[REDACTED]498/saml2</code>

8. Verify that the following default attribute values in Citrix Cloud match the corresponding attribute values configured in your SAML provider. For Citrix Cloud to find these attributes within the SAML assertion, the values entered here must match those in your SAML provider. If you

didn't configure a certain attribute in your SAML provider, you can use the default value in Citrix Cloud or leave the field blank, unless noted otherwise.

- **Attribute name for User Display Name:** Default value is `displayName`.
- **Attribute name for User Given Name:** Default value is `firstName`.
- **Attribute name for User Family Name:** Default value is `lastName`.
- **Attribute name for Security Identifier (SID):** You must enter this attribute name from your SAML provider if you didn't create an attribute for UPN. The default value is `cip_sid`.
- **Attribute name for User Principal Name (UPN):** You must enter this attribute name from your SAML provider if you didn't create an attribute for SID. The default value is `cip_upn`.
- **Attribute name for Email:** Default value is `cip_email`.
- **Attribute name for AD Object Identifier (OID):** Default value is `cip_oid`.
- **Attribute name for AD Forest:** Default value is `cip_forest`.
- **Attribute name for AD Domain:** Default value is `cip_domain`.

9. Select **Test and Finish** to verify you configured the connection successfully.

Add administrators to Citrix Cloud from AD

For instructions for adding and managing AD groups in Citrix Cloud, see [Manage administrator groups](#).

Enable SAML authentication for workspaces

1. From the Citrix Cloud menu, select **Workspace Configuration**.
2. Select the **Authentication** tab
3. Select **SAML 2.0**.

Troubleshooting

Attribute errors

Attribute errors might arise under any of the following conditions:

- The required attributes in your SAML configuration are not encoded correctly.
- The `cip_sid` and `cip_upn` attributes are missing from SAML assertion.
- The `cip_sid` or `cip_oid` attributes are missing from the SAML assertion and Citrix Cloud can't retrieve them from Active Directory due to a connectivity issue.

When an attribute error occurs, Citrix Cloud displays an error message that includes the faulty attributes.

To resolve this type of error:

1. Ensure that your SAML provider sends the required attributes with the correct encoding, as shown in the following table. At a minimum, either the SID or UPN attribute must be included.

Attribute	Encoding	Required
cip_email	Must be in String format (<code>user@domain</code>)	
cip_oid	Must be in Base64 or String format	
cip_sid	Must be in Base64 or String format	Yes, if not using <code>cip_upn</code>
cip_upn	Must be String format (<code>user@domain</code>)	Yes, if not using <code>cip_sid</code>

2. Verify the Cloud Connectors are online and healthy so Citrix Cloud can retrieve any missing attributes that it needs. For more information, see [Cloud Connector advanced health checks](#).

Unexpected errors

Citrix Cloud might experience an unexpected error when:

- A user initiates a SAML request using an IDP-initiated flow. For example, the request is made by selecting a tile through the identity provider's app portal instead of navigating directly to the workspace URL (`customer.cloud.com`).
- The SAML certificate is invalid or has expired.
- The authentication context is invalid.
- SAML assertion and response signature is mismatched.

When this error occurs, Citrix Cloud displays a generic error message.

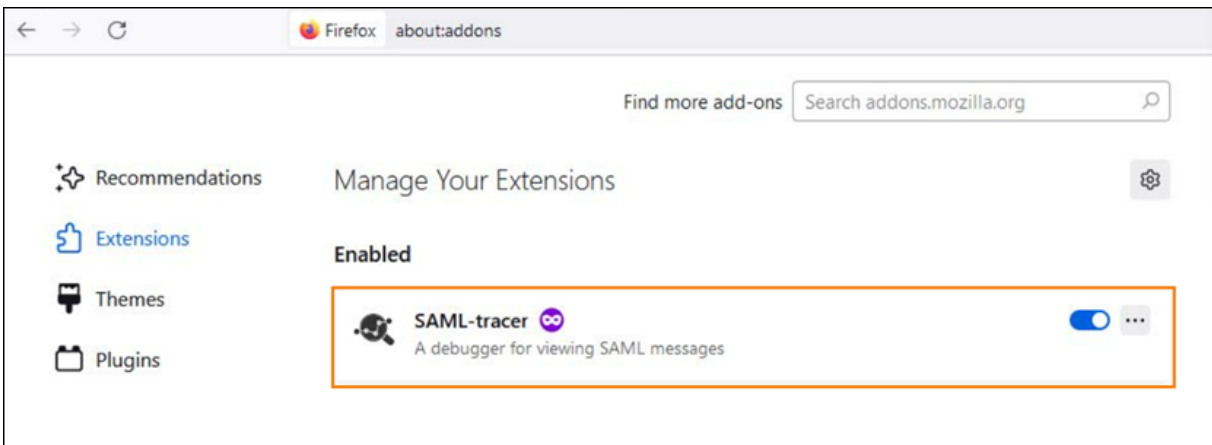

If this error results from navigating to Citrix Cloud through an identity provider’s app portal, you can use the following workaround:

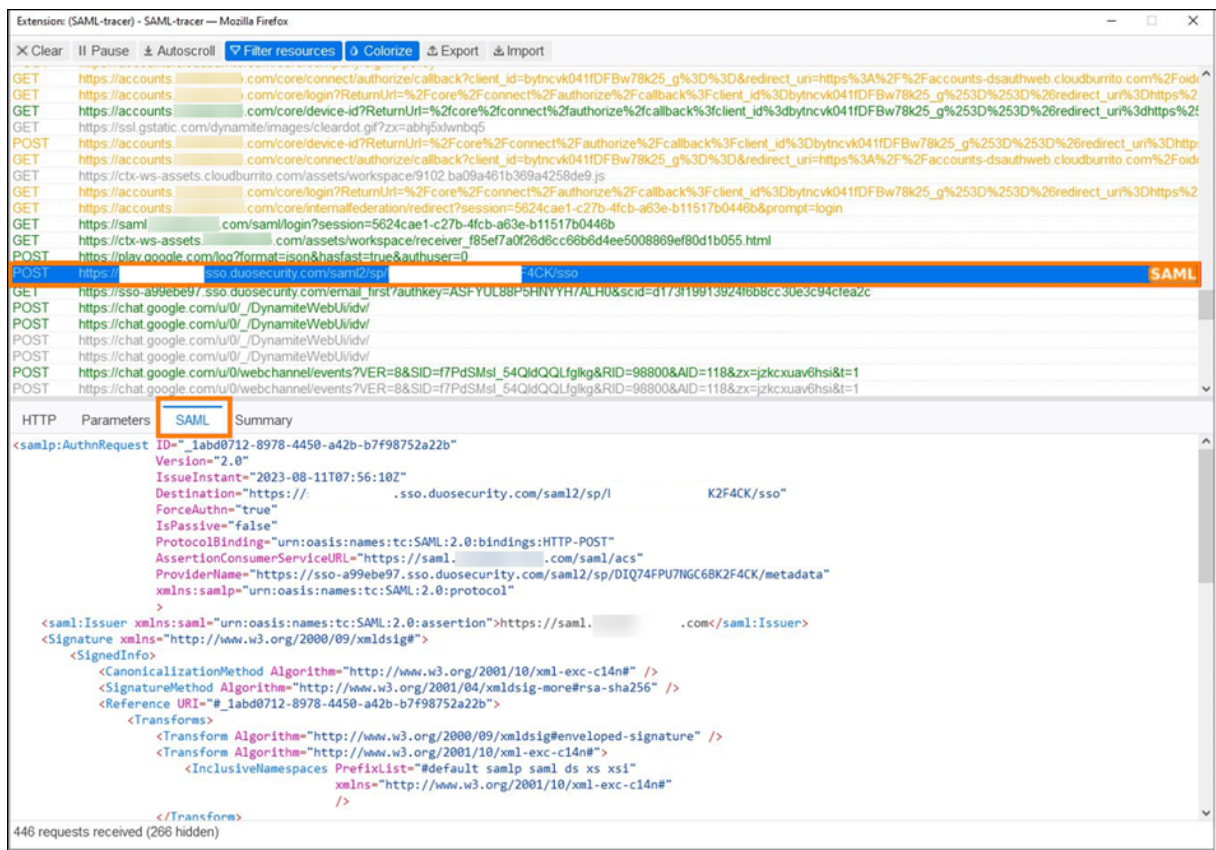

1. Create a bookmark app in the identity provider’s app portal that references your workspace URL (for example, <https://customer.cloud.com>).
2. Assign users to both the SAML app and the bookmark app.
3. Change the visibility settings of the SAML app and the bookmark app so that the bookmark app is visible and the SAML app is hidden in the app portal.
4. Disable the **Federated Identity Provider Sessions** setting in Workspace Configuration to remove additional password prompts. For instructions, see [Federated identity provider sessions](#) in the Citrix Workspace product documentation.

Debugging recommendations

Citrix recommends the use of the SAML-tracer browser extension for all SAML debugging. This extension is available for most common web browsers. The extension decodes Base64-encoded requests and responses into SAML XML, which renders them human-readable.

This tool allows you, as an administrator, to check the value of SAML attributes that are sent for the user and to look for the presence of signatures in SAML requests and responses. In the event you need assistance with a SAML-related issue, Citrix Support requests the SAML-tracer file to understand the issue and resolve your support case.

Configure a SAML application with a scoped Entity ID in Citrix Cloud

December 1, 2023

Author:

Mark Dear

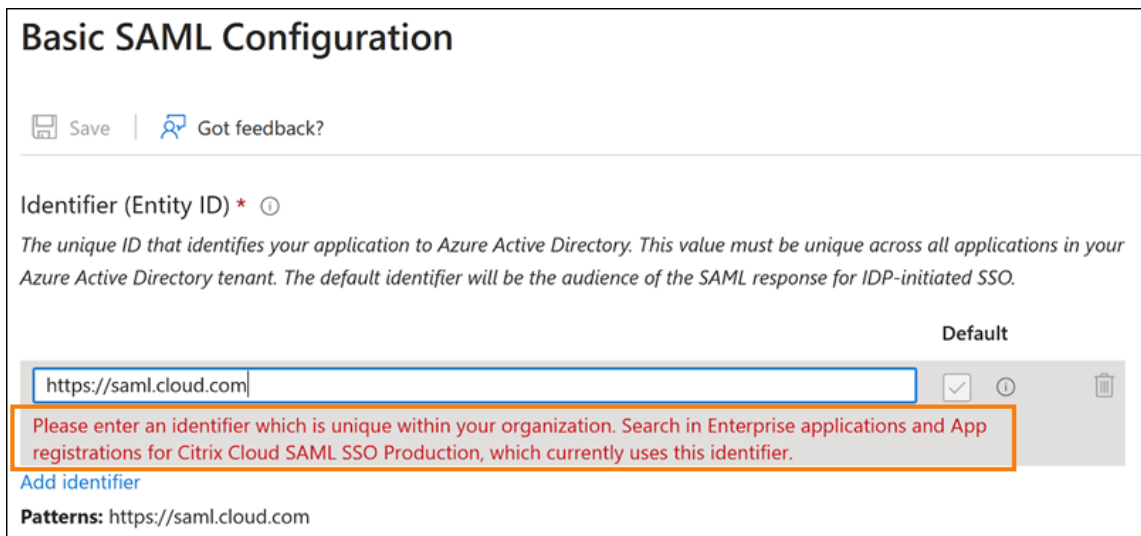

This article describes how to provision multiple SAML applications within the same SAML provider.

Some SAML providers, such as Azure Active Directory (AD), Active Directory Federation Services (ADFS), PingFederate, and PingSSO, prohibit reusing the same Service Provider (SP) Entity ID within

multiple SAML applications. As a result, administrators who create two or more different SAML applications within the same SAML provider can't link them to the same, or differing, Citrix Cloud tenants. Attempting to create a second SAML application using the same SP Entity ID, such as <https://saml.cloud.com>, when an existing SAML application is already using it triggers an error at the SAML provider, indicating the Entity ID is already in use.

The following images illustrate this error:

- In Azure Active Directory:

- In PingFederate:

The scoped Entity ID feature in Citrix Cloud addresses this limitation so you can create more than one SAML application within the SAML provider (such as an Azure AD tenant) and link it to a single Citrix Cloud tenant.

What is an Entity ID?

A SAML Entity ID is a unique identifier that is used to identify a specific entity in the SAML authentication and authorization protocol. Typically, the Entity ID is a URL or URI that's assigned to the entity

and used in SAML messages and metadata. Each SAML application that you create within your SAML provider is considered a unique entity.

Within a SAML connection between Citrix Cloud and Azure AD, for example, Citrix Cloud is the Service Provider (SP) and Azure AD is the SAML provider. Both have an Entity ID that must be configured on the opposite side of the SAML connection. This means Citrix Cloud's Entity ID must be configured within Azure AD, and Azure AD's Entity ID must be configured within Citrix Cloud.

The following Entity IDs are examples of a generic Entity ID and a scoped Entity ID in Citrix Cloud:

- Generic: <https://saml.cloud.com>
- Scoped: <https://saml.cloud.com/67338f11-4996-4980-8339-535f76d0c8fb>

Generic and scoped SP Entity IDs by region

Existing SAML connections in Citrix Cloud (created before November 2023) use the same generic Entity ID for each SAML connection and Citrix Cloud tenant. Only new Citrix Cloud SAML connections provide the option of using a scoped Entity ID.

If you elect to use scoped Entity IDs for new connections, any existing SAML connections continue to function using their original generic Entity IDs.

The following table lists the generic and scoped SP Entity IDs for each Citrix Cloud region:

Citrix Cloud region	Generic SP Entity ID	Scoped Entity ID
United States, European Union, Asia Pacific-South	https://saml.cloud.com	https://saml.cloud.com/67338f11-4996-4980-8339-535f76d0c8fb
Japan	https://saml.citrixcloud.jp	https://saml.citrixcloud.jp/db642d4c-ad2c-4304-adcf-f96b6aa16c29
Government	https://saml.cloud.us	https://saml.cloud.us/20f1cf66-cfe9-4dd3-865c-9c59a6710820

Generating unique SP Entity IDs for new and existing SAML connections

When you create a new SAML connection, Citrix Cloud generates a unique ID (GUID). To generate a scoped Entity ID, you enable the **Configure scoped SAML Entity ID** setting when you create the new

connection.

If you want to update an existing SAML connection to use scoped Entity IDs, you must disconnect and then reconnect your SAML provider from the **Identity and Access Management > Authentication** page in Citrix Cloud. Citrix Cloud doesn't allow you to edit existing SAML connections directly. However, you can clone the configuration and modify the clone.

Important:

Closing the SAML connection process before completing it discards the Entity ID that Citrix Cloud automatically generates. When you restart the SAML connection process, Citrix Cloud generates a new scoped Entity ID GUID. Use this new scoped Entity ID when you configure the SAML provider. If you're updating an existing SAML connection to use scoped Entity IDs, you must update the SAML application for that connection with the scoped Entity ID that Citrix Cloud generates.

Frequently asked questions about scoped Entity IDs

Can I create more than one Azure AD SAML application within the same Azure AD tenant and link it to one or more Citrix Cloud tenants?

Citrix Cloud's scoped Entity ID feature addresses the limitation of preventing duplicate Entity IDs that some SAML providers impose. With this feature, you can provision more than one SAML application within your Azure AD tenant and configure each one with a scoped Entity ID from a single Citrix Cloud tenant.

Can I still link the same Azure AD SAML application to multiple Citrix Cloud tenants?

This scenario is a common one among Citrix Cloud customers and Citrix continues to support it. To implement this scenario, you must meet the following requirements:

- Use a generic Entity ID, such as <https://saml.cloud.com>.
- Don't enable scoped Entity IDs for your SAML connection.

How do I decide whether or not to use a scoped Entity ID within my SAML provider?

Scoped Entity IDs in Citrix Cloud offer the flexibility to use a generic or a scoped Entity ID, depending on your requirements. Consider the number of SAML applications you need and the number of Citrix Cloud tenants you have. Also, consider whether or not each tenant might share an existing SAML application or require its own scoped SAML application.

Important:

If your SAML provider already allows you to create multiple SAML applications with the same Entity ID (such as <https://saml.cloud.com>), you don't need to enable scoped Entity IDs or make any changes to your existing SAML configuration. You don't need to update any settings either in Citrix Cloud or in your SAML application.

Affected SAML providers

The following table lists the SAML providers that allow or limit the use of duplicate Entity IDs.

SAML Provider	Supports duplicate Entity IDs
Azure AD (cloud)	No
ADFS (on-premises)	No
PingFederate (on-premises)	No
PingOneSSO (cloud)	No
Okta (cloud)	Yes
Duo (cloud)	Yes
OneLogin (cloud)	Yes

Affected use cases

The following table indicates whether a generic or scoped Entity ID is supported based on the SAML applications that your use case requires and whether your SAML provider supports duplicate Entity IDs.

Use case requirement	SAML provider supports duplicate Entity IDs?	Supported configuration
Only one SAML application	Yes	Generic or scoped Entity ID
Only one SAML application	No	Generic or scoped Entity ID
Two or more SAML applications	Yes	Generic or scoped Entity ID
Two or more SAML applications	No	Scoped Entity ID
Workspace custom URL and SAML application pairs	Yes	Generic or scoped Entity ID

Use case requirement	SAML provider supports duplicate Entity IDs?	Supported configuration
Workspace custom URL and SAML application pairs	No	Scoped Entity ID
Link the same SAML application to multiple Citrix Cloud tenants	Yes	Generic Entity ID
Link the same SAML application to multiple Citrix Cloud tenants	No	Generic Entity ID

Configure the primary SAML connection with a scoped Entity ID

In this task, you create a SAML connection in Citrix Cloud using a scoped Entity ID for the primary SAML application (SAML App 1).

1. From the Citrix Cloud menu, select **Identity and Access Management**.
2. On the **Authentication** tab, locate **SAML 2.0** and select **Connect** from the ellipsis menu.
3. When prompted to create your unique sign-in URL, enter a short URL-friendly identifier for your company (for example, <https://citrix.cloud.com/go/mycompany>) and select **Save and continue**. This identifier must be unique across Citrix Cloud.
4. Under **Configure SAML Identity Provider**, select **Configure scoped SAML Entity ID**. Citrix Cloud automatically generates scoped Entity IDs and populates the fields for Entity ID, Assertion Consumer Service, and Logout URL.
5. Under **Configure a SAML Connection to Citrix Cloud**, enter the connection details from your SAML provider.
6. Accept the default SAML attribute mappings.
7. Select **Test and Finish**.

Configure the primary SAML connection with a generic Entity ID

In this task, you create a SAML connection in Citrix Cloud using the default, generic Entity ID for the primary SAML application (SAML App 1).

1. From the Citrix Cloud menu, select **Identity and Access Management**.
2. On the **Authentication** tab, locate **SAML 2.0** and select **Connect** from the ellipsis menu.
3. When prompted to create your unique sign-in URL, enter a short URL-friendly identifier for your company (for example, <https://citrix.cloud.com/go/mycompany>) and select **Save and continue**. This identifier must be unique across Citrix Cloud.
4. Under **Configure SAML Identity Provider**, verify that **Configure scoped SAML Entity ID** is disabled.

5. Under **Configure a SAML Connection to Citrix Cloud**, enter the connection details from your SAML provider.
6. In **Service Provider SAML Metadata**, click **Download** to acquire a copy of the generic SAML metadata, if needed.
7. Accept the default SAML attribute mappings.
8. Select **Test and Finish**.

Configure a SAML connection using Citrix Workspace custom domains

This section includes for configuring a SAML connection using a custom Workspace URL with either a scoped or generic Entity ID.

The tasks in this section are applicable only if you have an existing custom Workspace URL that you're using with SAML. If you're not using a custom Workspace URL with SAML authentication, you can skip the tasks in this section.

For more information, refer to the following articles:

- [Configure a custom domain](#)
- [Sign in to workspaces with SAML using custom domains](#)

Configure a SAML connection with a Workspace custom URL and a generic Entity ID

In this task, the **Configure scoped Entity ID** setting is disabled.

1. From the Citrix Cloud menu, select **Workspace Authentication**.
2. In **Custom Workspace URL**, select **Edit** from the ellipsis menu.
3. Select **Use both [customerName].cloud.com URL and custom domain URL**.
4. Enter the generic Entity ID, SSO URL and optional SLO URL for SAML App 2 and upload the signing certificate that you downloaded earlier from your SAML provider.
5. If needed, in **Service Provider SAML Metadata for custom domain**, click **Download** to acquire a copy of the generic SAML metadata for the Workspace custom URL SAML application.
6. Click **Save**.

Configure a SAML connection with a Workspace custom URL and a scoped Entity ID

In this task, the **Configure scoped Entity ID** setting is enabled.

1. From the Citrix Cloud menu, select **Workspace Authentication**.
2. In **Custom Workspace URL**, select **Edit** from the ellipsis menu.
3. Select **Use both [customerName].cloud.com URL and custom domain URL**.

4. Enter the scoped Entity ID, SSO URL, and optional SLO URL for SAML App 2 and upload the SAML signing certificate that you downloaded earlier from your SAML provider.
5. Click **Save**.

After you save the configuration, Citrix Cloud generates the scoped SAML metadata containing the correct GUID. If needed, you can obtain a copy of the scoped metadata for the Workspace custom URL SAML application.

1. On the **Identity and Access Management** page, locate the SAML connection and select **View** from the ellipsis menu.
2. In **Service Provider SAML Metadata for custom domain**, click **Download**.

View the SAML configuration of both the primary and custom Workspace URL SAML applications

When viewing the configuration details for your scoped SAML connection, Citrix Cloud displays the scoped Entity ID settings for both the primary SAML application and the Workspace custom domain SAML application.

For example, when scoped Entity IDs are enabled, the **Service Provider Entity ID** and **Service Provider Entity ID for custom domain** fields contain the scoped Entity IDs that Citrix Cloud generates.

SAML Identity Provider Configuration

You can update existing SAML applications within your SAML provider by appending the scoped Entity ID to the existing Entity ID value.

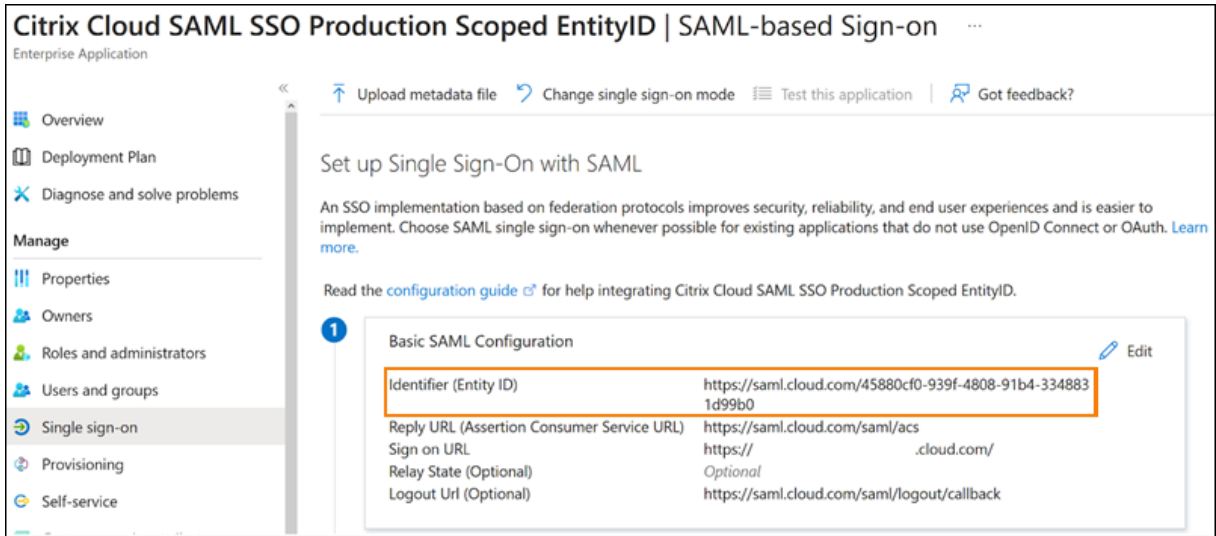

SAML provider configuration with scoped Entity IDs

After configuring the SAML connection in Citrix Cloud with scoped Entity IDs, you can add the scoped Entity ID to your SAML provider.

This section includes configuration examples from Azure AD and PingFederate.

Azure AD SAML configuration with scoped Entity ID

In this example, the scoped Entity ID from Citrix Cloud is entered in the **Identifier** field in Azure AD.

PingFederate SAML configuration with scoped Entity ID

In this example, the scoped Entity ID and the generic Entity ID from Citrix Cloud are populated in the **Partner's Entity ID** field and the **Base URL** field, respectively.

Summary	
SP Connection	
Connection Type	
Connection Role	SP
Browser SSO Profiles	true
Protocol	SAML 2.0
Connection Template	No Template
WS-Trust STS	false
Outbound Provisioning	false
Connection Options	
Browser SSO	true
IdP Discovery	false
Attribute Query	false
General Info	
Partner's Entity ID (Connection ID)	https://saml.cloud.com/dea0781e-be43-4056-994f-f356ec486981
Connection Name	CitrixCloudProdScopedEntityID
Base URL	https://saml.cloud.com

Troubleshooting

Citrix recommends using the SAML-tracer browser extension to troubleshoot any issues with your SAML configuration. This extension decodes Base64-encoded requests and responses into SAML XML, rendering the information human-readable. You can use the SAML-tracer extension to examine both the SSO and SLO SAML requests that Citrix Cloud (the Service Provider) generates and sends to your SAML provider (the identity provider). The extension can show whether the Entity ID scope (GUID) is included in both requests.

1. From the Extensions panel in your web browser, install and enable the SAML-tracer extension.
2. Perform a SAML sign-in and sign-out operation and capture the entire flow with the SAML-tracer extension.
3. Locate the following line within either the SAML SSO request or SLO request.

```
1 <saml:Issuer xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion">  
    https://saml.cloud.com/cfee4a86-97a8-49cf-9bb6-fd15ab075b92</  
    saml:Issuer>  
2 <!--NeedCopy-->
```

4. Verify that the Entity ID matches the configured Entity ID in your SAML provider application.
5. Verify that the scoped Entity ID is present in the **Issuer** field and verify that it's configured correctly in your SAML provider.
6. Export and save the SAML-tracer JSON output. If you're working with Citrix Support to resolve an issue, upload the output to your Citrix support case.

Azure AD troubleshooting

Issue: Signing out of Azure AD fails when SLO is configured. Azure AD displays the following error to the user:

Sign in

Sorry, but we're having trouble with signing you out.

AADSTS50068: Signout failed. The initiating application is not a participant in the current session.

If scoped Entity IDs are enabled for the SAML connection in Citrix Cloud, the scoped Entity ID must be sent in both the SSO and SLO requests.

Cause: The scoped entity is configured but the Entity ID is missing from the SLO request. Verify the scoped Entity ID is present in the SLO request in the SAML-tracer output.

On-premises PingFederate troubleshooting

Issue: Signing in or signing out of PingFederate fails after enabling the scoped Entity ID setting.

Cause: The PingFederate administrator added the scoped Entity ID to the SP connection base URL.

To correct this issue, add the scoped Entity ID to the **Partner's EntityID** field only. Adding the scoped Entity ID to the base URL results in a malformed SAML endpoint. If the Citrix Cloud base URL is incorrectly updated, all other SAML endpoint relative URLs that are derived from the base URL produce sign-in failures.

The following endpoints are examples of malformed Citrix Cloud SAML endpoints that might appear in the SAML-tracer output:

- <https://saml.cloud.com/<GUID>/saml/acs>
- <https://saml.cloud.com/<GUID>/saml/logout/callback>

The following image shows a misconfigured PingFederate SAML application. The correctly configured field is shown in green. The incorrectly configured field is shown in red.

SAML using Azure AD and AAD identities for workspace authentication

February 27, 2024

Author:

Mark Dear

This article describes how you can configure SAML for workspace authentication using Azure Active Directory (AD) identities instead of AD identities. Use this configuration if your Azure AD users can't enumerate Windows 365 Cloud PCs or Azure AD domain-joined VDAs after signing in to Citrix Workspace with the default SAML behavior. After completing the configuration, your users can sign in to Citrix Workspace using SAML authentication to access both HDX apps and desktops through Citrix DaaS and Windows 365 Cloud PCs through Azure.

The default behavior for Citrix Cloud and SAML authentication to Citrix Workspace is to assert against an AD user identity. For the configuration described in this article, using Azure AD Connect to import your AD identities to your Azure AD is required. The AD identities contain the user's SID, which Citrix Workspace can send to Citrix DaaS and allows the HDX resources to be enumerated and launched. Because the Azure AD version of users' identities is used, users can also enumerate and launch Azure resources like Windows 365 Cloud PCs from within Citrix Workspace.

Important:

Enumeration refers to the list of resources that users see after they sign in to Citrix Workspace. The resources that a given user is allowed to access depends on their user identity and which resources are associated with that identity in Citrix DaaS. There is an associated article that provides instructions on utilizing Azure AD and AD identities as the SAML provider for authenticating into Workspace. You can find detailed instructions in [SAML using Azure AD and AD identities for Workspace authentication](#)

Feature scope

This article applies to users who use the following combination of Citrix Cloud and Azure features:

- SAML for workspace authentication
- Citrix DaaS and HDX resource enumeration of resources published using AD domain-joined VDAs
- Azure AD domain-joined VDA resource enumeration
- Azure hybrid domain-joined VDA resource enumeration
- W365 Cloud PC enumeration and launch

Important:

Do not use this AAD SAML flow for SAML login to Citrix Cloud as this requires the Citrix Cloud admin user to be a member of an AD group and therefore an AD user identity should be used. You can find detailed instructions in [SAML using Azure AD and AD identities for Workspace authentication](#)

What's best: AD identities or Azure AD identities?

To determine whether your workspace users should authenticate using either SAML AD or SAML Azure AD identities:

1. Decide which combination of resources you intend to make available to your users in Citrix Workspace.
2. Use the following table to determine which type of user identity is appropriate for each resource type.

Resource type (VDA)	User identity when signing in to Citrix Workspace	Needs SAML identity using Azure AD?	FAS provides single sign-on (SSO) to VDA?
AD joined	AD, Azure AD imported from AD (contains SID)	No. Use default SAML.	Yes
Hybrid joined	AD, Azure AD imported from AD (contains SID)	No. Use default SAML.	Yes, for AD as an identity provider. FAS isn't required if Azure AD is selected for VDA.
Azure AD joined	Azure AD native user, Azure AD imported from AD (contains SID)	Yes, use SAML through Azure AD.	SSO works with Azure AD modern authentication. FAS isn't required.
Windows 365 Cloud PCs	Azure AD native user, Azure AD imported from AD (contains SID)	Yes, use SAML through Azure AD.	SSO works with Azure AD modern authentication. FAS isn't required.
AD joined, Azure AD joined, Windows 365 Cloud PCs	Azure AD imported from AD (contains SID)	Yes, use SAML through Azure AD.	Yes, for AD joined. No, for Azure AD joined and Windows 365 Cloud PCs.

More information

- Citrix DaaS documentation:
 - [Machine identities](#)
 - [Citrix HDX Plus for Windows 365](#)
- Citrix FAS documentation: [Install and configure](#)
- Microsoft Azure documentation: [What is Azure AD Connect?](#)

Requirements

- Your Azure AD tenant must be connected to your Citrix Cloud tenant. In the Citrix Cloud console, you can find your Azure AD connection by selecting **Identity and Access Management > Authentication**.

- The workspace authentication method must be set to **SAML 2.0**. Don't use Azure AD as the authentication method. To change the workspace authentication method, go to **Workspace Configuration > Authentication** in the Citrix Cloud console.
- The UPN suffix `@yourdomain.com` must be imported and verified within Azure AD as a custom domain name. In the Azure portal, this is located under **Azure Active Directory > Custom Domain Names**.
- Azure AD user identities must be imported from AD using Microsoft Azure AD Connect. This ensures user identities are correctly imported and have the correct UPN suffix. Azure AD users with `@yourtenant.onmicrosoft.com` UPN suffixes aren't supported.
- Citrix FAS must be deployed and connected to the Citrix Cloud tenant and resource location. FAS provides single sign-on to HDX desktops and applications that are launched from Citrix Workspace. You don't have to configure AD shadow accounts because the UPN `user@customerdomain` for both the AD and Azure AD user identities must match. FAS generates the necessary user certificates with the correct UPN and performs a smart card sign-in when HDX resources are launched.

Configure the custom Azure AD Enterprise SAML application

By default, the behavior for SAML sign-in to workspaces is to assert against an AD user identity. The **cip_directory** SAML attribute is a hardcoded string value that's the same for all subscribers and acts as a switch. Citrix Cloud and Citrix Workspace detect this attribute during sign-in and trigger SAML to assert against the Azure AD version of the user identity. Using the **azuread** parameter with this attribute overrides the default SAML behavior, triggering the use of SAML in Azure AD instead.

Although the steps in this section are for Azure AD, you can create a similar SAML application using a different SAML 2.0 provider (for example, ADFS, Duo, Okta, OneLogin, PingOneSSO, and so on), provided you perform the same tasks. Your SAML provider must allow you to configure a hardcoded SAML attribute (**cip_directory = azuread**) within the SAML application. Simply create the same SAML attribute mappings as described in this section.

1. Sign in to the Azure portal.
2. From the portal menu, select **Azure Active Directory**.
3. From the left pane, under **Manage**, select **Enterprise Applications**.
4. From the command bar in the working pane, select **New Application**.
5. From the command bar, select **Create your own application**. Don't use the Citrix Cloud SAML SSO enterprise application template. The template doesn't allow you to modify the list of claims and SAML attributes.
6. Enter a name for the application and then select **Integrate any other application you don't find in the gallery (Non-gallery)**. Click **Create**. The application overview page appears.
7. From the left pane, select **Single sign-on**. From the working pane, select **SAML**.
8. In the **Basic SAML Configuration** section, select **Edit** and configure the following settings:
 - a) In the **Identifier (Entity ID)** section, select **Add identifier** and then enter the value associated with the region in which your Citrix Cloud tenant is located:
 - For European Union, United States, and Asia-Pacific South regions, enter <https://saml.cloud.com>.
 - For the Japan region, enter <https://saml.citrixcloud.jp>.
 - For the Citrix Cloud Government region, enter <https://saml.cloud.us>.
 - b) In the **Reply URL (Assertion Consumer Service URL)** section, select **Add reply URL** and then enter the value associated with the region in which your Citrix Cloud tenant is located:
 - For European Union, United States, and Asia-Pacific South regions, enter <https://saml.cloud.com/saml/acs>.
 - For the Japan region, enter <https://saml.citrixcloud.jp/saml/acs>.
 - For the Citrix Cloud Government region, enter <https://saml.cloud.us/saml/acs>.

- c) In the **Logout URL (Optional)** section, enter the value associated with the region in which your Citrix Cloud tenant is located:
- For European Union, United States, and Asia-Pacific South regions, enter <https://saml.cloud.com/saml/logout/callback>.
 - For the Japan region, enter <https://saml.citrixcloud.jp/saml/logout/callback>.
 - For the Citrix Cloud Government region, enter <https://saml.cloud.us/saml/logout/callback>.
- d) From the command bar, select **Save**.
9. In the **Attributes & Claims** section, select **Edit** to configure the following claims. These claims appear in the SAML assertion within the SAML response.
- a) For the **Unique User Identifier (Name ID)** claim, leave the default value of `userprincipalname`.
- b) From the command bar, select **Add new claim**.
- c) In **Name**, enter `cip_directory`.
- d) In **Source**, leave **Attribute** selected.
- e) In **Source attribute**, enter `azuread`. This value appears in quotation marks after you enter it.

The screenshot shows the 'Manage claim' configuration page. The breadcrumb is 'Home > Attributes & Claims >'. The title is 'Manage claim'. The command bar includes 'Save', 'Discard changes', and 'Got feedback?'. The form fields are:

- Name ***: `cip_directory` (with a green checkmark)
- Namespace**: `Enter a namespace URI` (with a green checkmark)
- Choose name format**: (collapsed)
- Source ***: Attribute, Transformation, Directory schema extension (Preview)
- Source attribute ***: `azuread` (with a dropdown menu showing 'azuread' and '"azuread"')
- Claim conditions**: (collapsed)
- Advanced SAML claims options**: (collapsed)

- f) From the command bar, select **Save**.
- g) Create additional claims with the following values in the **Name** and **Source attribute** fields:

Name	Source attribute
cip_fed_upn	user.userprincipalname
displayName	user.displayname
firstName	user.givenname
lastName	user.surname

The screenshot shows the 'Manage claim' configuration interface. The 'Name' field is set to 'cip_fed_upn'. The 'Namespace' field is empty with the placeholder 'Enter a namespace URI'. The 'Source' is set to 'Attribute'. The 'Source attribute' dropdown is open, showing 'user.userprincipalname' as the selected option. Other options in the dropdown include 'user.userprincipalname' and '"user.userprincipalname"'. The interface also includes 'Save', 'Discard changes', and 'Got feedback?' buttons.

Important:

You can create these additional claims by either repeating Steps b-f for each claim or by modifying the default claims in the **Additional claims** section that already have the source attributes listed in the table above. The default claims include the namespace <http://schemas.xmlsoap.org/ws/2005/05/identity/claims>.

If you modify the default claims, you must remove the namespace from each claim. If you create new claims, you must delete the claims that include the namespace. If claims with this namespace are included in the resulting SAML assertion, the assertion will be invalid and will include incorrect SAML attribute names.

- h) In the **Additional claims** section, for any remaining claims with the <http://schemas.xmlsoap.org/ws/2005/05/identity/claims> namespace, click the ellipsis (...) button and click **Delete**.

Additional claims			
Claim name	Type	Value	
cip_fed_upn	SAML	user.userprincipalname	...
givenname	SAML	user.givenname	...
http://schemas.xmlsoap.org/ws/2005/05/identity/claims/emailadd...	SAML	user.mail	Delete
surname	SAML	user.surname	...

When finished, the **Attributes & Claims** section appears as illustrated below:

Attributes & Claims		Edit
cip_directory	"azuread"	
cip_fed_upn	user.userprincipalname	
displayName	user.displayname	
firstName	user.givenname	
lastName	user.surname	
Unique User Identifier	user.userprincipalname	

- Obtain a copy of the Citrix Cloud SAML signing certificate using this [third party online tool](#).
- Enter <https://saml.cloud.com/saml/metadata> into the URL field and click **Load**.

Troubleshooting

1. Verify your SAML assertions contain the correct user attributes using a SAML networking tool, such as the SAML-tracer browser extension.
2. Locate the SAML response shown in yellow and compare to this example:

POST	https://chat.google.com/u/0/webchannel/events?VER=8&SID=	
POST	https://login.microsoftonline.com/kmsi	
POST	https://saml. .com/saml/acs	SAML
GET	https://login.microsoftonline.com/favicon.ico	
GET	https://accounts .com/core/internalfederation/return?validate=4b2eb6560	

3. Click on the **SAML** tab in the bottom pane to decode the SAML response and view as XML.
4. Scroll to the bottom of the response and verify that the SAML assertion contains the correct SAML attributes and user values.

```

  </Attribute>
</AttributeStatement>
```

If your subscribers still can't sign in to their workspace, contact Citrix Support and provide the following information:

- SAML-tracer capture
- Date and time the sign-in to Citrix Workspace failed
- The affected user name
- The caller IP address of the client computer that you used to sign in to Citrix Workspace. You can use a tool like <https://whatismyip.com> to get this IP address.

SAML using Azure AD and AD identities for Workspace authentication

May 10, 2024

Author:

Mark Dear

This article describes how you can configure SAML for workspace authentication using Active Directory (AD) identities. The default behavior for Citrix Cloud and SAML authentication to Citrix Workspace or Citrix Cloud, regardless of the SAML provider used, is to assert against an AD user identity. For the configuration described in this article, using Azure AD Connect to import your AD identities to your Azure AD is required.

Important:

It is crucial to determine the appropriate SAML flow for your Workspace end users, as it directly impacts their sign-in process and resource visibility. The chosen identity influences the types of

resources accessible to a Workspace end user.

There is an associated article that provides instructions on utilizing Azure AD as the SAML provider for authenticating into Workspace using AAD identities. You can find detailed instructions in [SAML using Azure AD and AAD identities for workspace authentication](#).

Usually, Workspace end users typically need to open apps and desktops provided by AD domain joined VDAs. It is essential to carefully review the use cases outlined in both articles before deciding on the most suitable SAML flow for your organization. If uncertain, Citrix recommends using the **AD SAML flow** and following the instructions in this article, as it aligns with the most common DaaS scenario.

Feature scope

This article applies to users who use the following combination of Citrix Cloud and Azure features:

- SAML for workspace authentication using AD identities
- SAML for Citrix Cloud admin login using AD identities
- Citrix DaaS and HDX resource enumeration of resources published using AD domain-joined VDAs
- AD domain-joined VDA resource enumeration

What's best: AD identities or Azure AD identities?

To determine whether your workspace users should authenticate using either SAML AD or SAML Azure AD identities:

1. Decide which combination of resources you intend to make available to your users in Citrix Workspace.
2. Use the following table to determine which type of user identity is appropriate for each resource type.

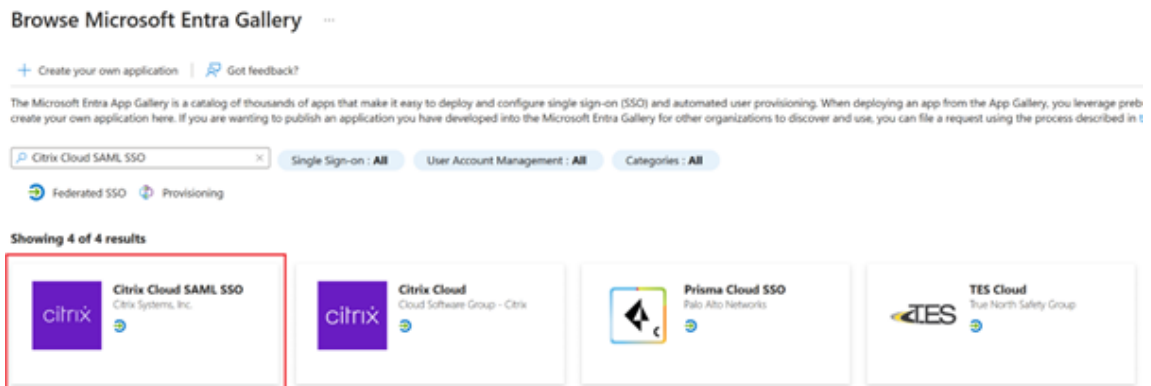

Resource type (VDA)	User identity when signing in to Citrix Workspace	Needs SAML identity using Azure AD?	FAS provides single sign-on (SSO) to VDA?
AD joined	AD, Azure AD imported from AD (contains SID)	No. Use default SAML.	Yes

Configure the custom Azure AD Enterprise SAML application

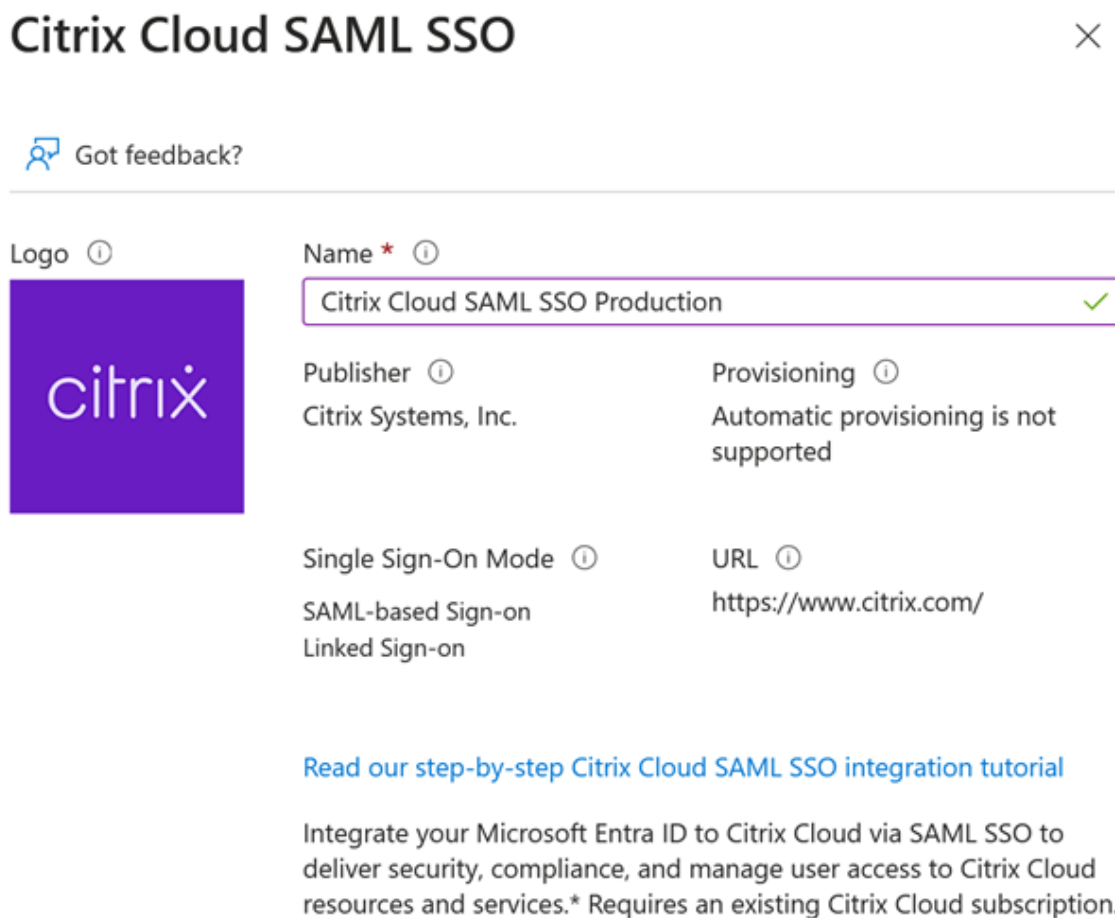

By default, the behavior for SAML sign-in to workspaces is to assert against an AD user identity.

1. Sign in to the Azure portal.

2. From the portal menu, select **Azure Active Directory**.
3. From the left pane, under **Manage**, select **Enterprise Applications**.
4. In the search box, enter `Citrix Cloud SAML SSO` to locate the Citrix SAML application template.

5. Enter a suitable name for the SAML application such as `Citrix Cloud SAML SSO Production`

6. From the left navigation pane, select **Single sign-on** and from the working pane, click **SAML**.

7. In the **Basic SAML Configuration** section, click **Edit** and configure the following settings:
- In the **Identifier (Entity ID)** section, select **Add identifier** and then enter the value associated with the region in which your Citrix Cloud tenant is located:
 - For Europe, United States, and Asia-Pacific South regions, enter <https://saml.cloud.com>.
 - For the Japan region, enter <https://saml.citrixcloud.jp>.
 - For the Citrix Cloud Government region, enter <https://saml.cloud.us>.
 - In the **Reply URL (Assertion Consumer Service URL)** section, select **Add reply URL** and then enter the value associated with the region in which your Citrix Cloud tenant is located:
 - For Europe, United States, and Asia-Pacific South regions, enter <https://saml.cloud.com/saml/acs>.
 - For the Japan region, enter <https://saml.citrixcloud.jp/saml/acs>.
 - For the Citrix Cloud Government region, enter <https://saml.cloud.us/saml/acs>.
 - In the **Sign on URL** section, enter your Workspace URL.
 - In the **Logout URL (Optional)** section, enter the value associated with the region in which your Citrix Cloud tenant is located:
 - For Europe, United States, and Asia-Pacific South regions, enter <https://saml.cloud.com/saml/logout/callback>.
 - For the Japan region, enter <https://saml.citrixcloud.jp/saml/logout/callback>.
 - For the Citrix Cloud Government region, enter <https://saml.cloud.us/saml/logout/callback>.
 - From the command bar, click **Save**. The **Basic SAML Configuration** section appears as follows:

Basic SAML Configuration		 Edit
Identifier (Entity ID)	https://saml.cloud.com	
Reply URL (Assertion Consumer Service URL)	https://saml.cloud.com/saml/acs	
Sign on URL	https://.cloud.com	
Relay State (Optional)	<i>Optional</i>	
Logout Url (Optional)	https://saml.cloud.com/saml/logout/callback	

8. In the **Attributes & Claims** section, click **Edit** to configure the following claims. These claims appear in the SAML assertion within the SAML response. After SAML app creation, configure the following attributes.

Attributes & Claims	
⚠ Fill out required fields in Step 1	
givenname	user.givenname
surname	user.surname
emailaddress	user.mail
name	user.userprincipalname
cip_upn	user.userprincipalname
cip_email	user.mail
cip_sid	user.onpremisesecurityidentifier
cip_oid	"ObjectGUID_MUST_BE_CONFIGURED"
displayName	user.displayname
Unique User Identifier	user.userprincipalname

- For the **Unique User Identifier (Name ID)** claim, leave the default value of `user.userprincipalname`.
- For **cip_upn** claim, leave the default value of `user.userprincipalname`.
- For **cip_email** claim, leave the default value of `user.mail`.
- For **cip_sid** claim, leave the default value of `user.onpremisesecurityidentifier`.
- For **cip_oid** claim, edit the existing claim and select **Source attribute**. Search for the string `object` and select `user.onpremisesimmutableid`.

Troubleshooting

1. Verify your SAML assertions contain the correct user attributes using a SAML networking tool, such as the SAML-tracer browser extension.

1. Locate the SAML response shown in yellow and compare to this example:

POST	https://chat.google.com/u/0/webchannel/events?VER=8&SID=	
POST	https://login.microsoftonline.com/kmsi	
POST	https://saml. .com/saml/acs	SAML
GET	https://login.microsoftonline.com/favicon.ico	
GET	https://accounts .com/core/internalfederation/return?validate=4b2eb6560	

2. Click on the **SAML** tab in the bottom pane to decode the SAML response and view as XML.
3. Scroll to the bottom of the response and verify that the SAML assertion contains the correct SAML attributes and user values.

```

```

If your subscribers still can't sign in to their workspace or they can't see their Citrix HDX Plus for Windows 365 desktops, contact Citrix Support and provide the following information:

- SAML-tracer capture
- Date and time the sign-in to Citrix Workspace failed
- The affected user name
- The caller IP address of the client computer that you used to sign in to Citrix Workspace. You can use a tool like <https://whatismyip.com> to get this IP address.

Configure Simplified SAML for use with Native and Guest SAML Users

June 7, 2024

Author:

Mark Dear, Javier Lopez Santacruz

It is essential you understand whether “Simplified SAML” is appropriate for your authentication use case before following this article. Read the use case descriptions and FAQ thoroughly before deciding to implement this particular special case SAML solution. Before proceeding, make sure you fully understand the scenarios where Simplified SAML is appropriate and which types of identities you need to use. Most SAML use cases can be achieved by following other SAML articles and by sending all four `cip_*` attributes for authentication.

Note:

Using “Simplified SAML” increases the load placed on the Citrix Cloud connectors as they have to lookup the user email, SID and OID for each Workspace end user logon instead of these values being provided by the SAML assertion. Sending all four cip_* attributes in the SAML assertion is preferable from a Citrix Cloud connector performance perspective if Simplified SAML is not actually required.

Prerequisites

- A SAML application specifically configured for use with Simplified SAML that only sends **cip_upn** for authentication within the SAML assertion.
- FrontEnd users within your SAML provider.
- A resource location containing a pair of Citrix Cloud connectors joined to the AD forest and domain where the AD shadow accounts are created.
- Alternative UPN suffixes added to the backend AD forest where the AD shadow accounts are created.
- Backend AD shadow accounts with matching UPNs.
- DaaS or CVAD resources mapped to the AD shadow account users.
- One or more FAS servers linked to the same resource location.

FAQ

Why should I use Simplified SAML ?

It is very common for large organisations to invite contractors and temporary employees into their identity platform. The goal is to grant the contractor temporary access to Citrix Workspace using the user’s existing identity such as a contractor email address, or an email address outside of your organisation. Simplified SAML allows the use of native or guest frontend identities that do not exist inside the AD domain where DaaS resources are published.

What is Simplified SAML?

Typically, when signing into Citrix Workspace, four SAML attributes cip_* and their corresponding AD user attributes are used to authenticate the end user. These four SAML attributes are expected to be present in the SAML assertion and populated using AD user attributes. Simplified SAML refers to the fact that only the cip_upn SAML attribute is required for authentication to succeed.

AD Attribute	Default Attribute Name in the SAML Assertion
userPrincipalName	cip_upn
Mail	cip_email
objectSID	cip_sid
objectGUID	cip_oid

The other three AD user attributes objectSID, objectGUID, and mail required for authentication are obtained using the Citrix Cloud connectors joined to the AD domain where the AD shadow account exists. They no longer need to be included in the SAML assertion during a SAML sign-in flow for Workspace or Citrix Cloud.

AD Attribute	Default Attribute Name in the SAML Assertion
userPrincipalName	cip_upn

Important:

It is still necessary to send the **displayName** for all SAML flows including Simplified SAML. The **displayName** is required by the Workspace UI to correctly show the Workspace user’s full name.

What is a native SAML user identity?

A native SAML user is a user identity that only exists within your SAML provider directory, e.g. Entra ID or Okta. These identities do not contain on-prem user attributes as they are not created via AD syncing tools like Entra ID connect. They require matching AD backend shadow accounts to be able to enumerate and launch DaaS resources, the native SAML user must be mapped to a corresponding account within Active Directory.

What is an AD backed SAML user identity?

An AD backed SAML user is a user identity that exists within your SAML provider directory like Entra ID or Okta and also within your on premise AD forest. These identities contain on-prem user attributes as they are created via AD syncing tools like Entra ID connect. AD backend shadow accounts are not required for these users as they contain on premise SIDs and OIDs and so can enumerate and launch DaaS resources.

The screenshot shows the user profile for 'Employee User' in Citrix Cloud. At the top, a summary bar displays the user's name, principal name, type (Member), and a red box highlights the 'On-premises sync' status as 'Yes'. Below this are navigation tabs for Overview, Monitoring, and Properties. The Properties section is divided into Identity, Contact Information, and On-premises. The On-premises section, highlighted with a red box, contains the following details:

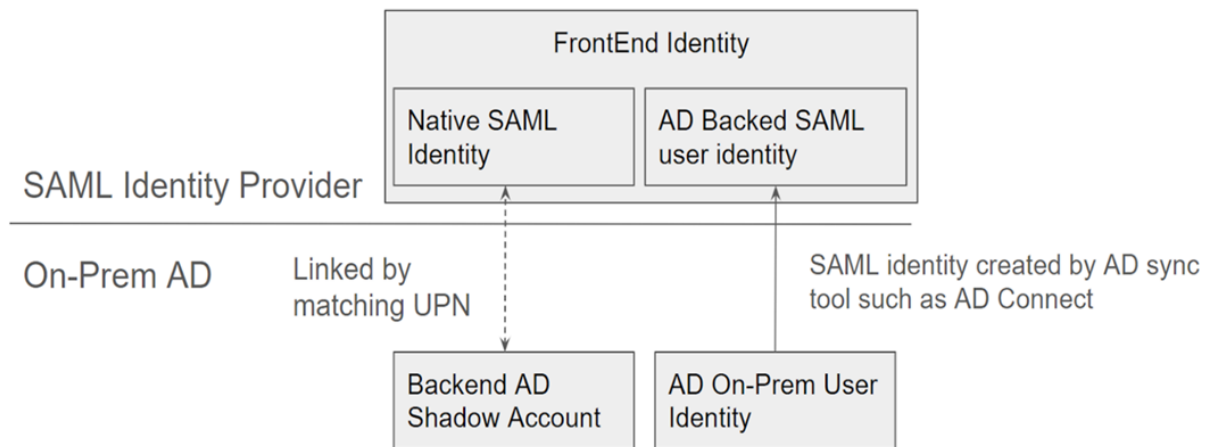

On-premises	
On-premises sync enabled	Yes
On-premises last sync date time	19 Apr 2024, 09:23
On-premises distinguished name	CN=Employee User,CN=Users,DC=,DC=com
Extension attributes

On-premises SAM account name	employeeuser
On-premises security identifier	S-1-5-21-11321
On-premises user principal name	employeeuser@.com
On-premises domain name	.com

What is a FrontEnd Identity?

A frontend identity is the identity used to sign-in to both the SAML provider and Workspace. Frontend identities have different user attributes depending on how they were created within the SAML provider.

1. Native SAML user identity
2. AD backed SAML user identity

Your SAML provider may have a mixture of these two types of identities. For example, if you have both contractors and permanent employees within your identity platform, the Simplified SAML will work for both types of Frontend identities but is only mandatory if you have some accounts that are of type native SAML user identity.

What is a Backend AD shadow account?

A backend AD shadow account is an AD account used by DaaS, which is mapped to a corresponding frontend identity within your SAML provider.

Why are Backend AD shadow accounts needed?

In order to enumerate DaaS or CVAD resources published using AD domain joined VDAs, AD accounts within the Active Directory forest that the VDAs are joined to are required. Map resources within your DaaS delivery group to shadow account users, and to AD groups containing shadow accounts within the AD domain which you joined your VDAs to.

Important:

Only native SAML users with no AD Domain attributes require matching AD shadow accounts. If your FrontEnd Identities are imported from Active Directory then you do not need to use Simpli-

fied SAML, and do not need to create Backend AD shadow accounts.

How do we link the FrontEnd Identity to the corresponding Backend AD shadow account?

The method used to link the FrontEnd identity and the Backend identity is by using matching UPNs. The two linked identities should have identical UPNs so that Workspace can tell that they represent the same end user that needs to sign in to Workspace, and to enumerate and launch DaaS resources.

Is Citrix FAS needed for Simplified SAML?

Yes. FAS is required for SSON to the VDA during launch when using any federated authentication method to sign in to Workspace.

What is the “SID mismatch problem” and when can it occur?

The “SID mismatch problem” is caused when the SAML assertion contains a SID for a FrontEnd user, which does not match the SID of the AD Shadow Account user. This can happen when the account signing into your SAML provider has an on premise SID, which is not the same as the shadow account user’s SID. This can only occur when the Frontend identity is provisioned by AD synchronisation tools like Entra ID connect and from a different AD Forest than where the shadow account was created.

Simplified SAML prevents the “SID mismatch problem” from occurring. The correct SID is always fetched for the shadow account user via the Citrix Cloud connectors joined to the backend AD domain. The shadow account user lookup is performed using the UPN of the FrontEnd user, which is then matched to its corresponding backend shadow account user.

Example of the SID Mismatch Problem:

FrontEnd user was created by Entra ID connect and is synced from **AD forest 1**.

S-1-5-21-0000000000-0000000000-0000000001-0001

Backend shadow account user was created within **AD forest 2** and mapped to DaaS resources

S-1-5-21-0000000000-0000000000-0000000002-0002

The SAML assertion contains all four `cip_*` attributes and `cip_sid` contains the value S-1-5-21-0000000000-0000000000-0000000001-0001, which does not match the shadow account’s SID and triggers an error.

Configure Simplified SAML using Entra ID for external guest accounts

1. Sign-in to the Azure portal.
2. From the portal menu, select **Entra ID**.

3. From the left pane, under **Manage**, select **Enterprise Applications**.
4. Select **Create your own application**.
5. Enter a suitable name for the SAML application such as `Citrix Cloud SAML SSO Production Simplified SAML`.

Create your own application ×

 Got feedback?

If you are developing your own application, using Application Proxy, or want to integrate an application that is not in the gallery, you can create your own application here.

What's the name of your app?

Citrix Cloud SAML SSO Production Simplified SAML UPN Only ✓

What are you looking to do with your application?

- Configure Application Proxy for secure remote access to an on-premises application
- Register an application to integrate with Microsoft Entra ID (App you're developing)
- Integrate any other application you don't find in the gallery (Non-gallery)

6. From the left navigation pane, select **Single sign-on** and from the working pane, click **SAML**.
7. In the **Basic SAML Configuration** section, click **Edit** and configure the following settings:
 - a) In the **Identifier (Entity ID)** section, select **Add identifier** and then enter the value associated with the region in which your Citrix Cloud tenant is located:
 - For Europe, United States, and Asia-Pacific South regions, enter `https://saml.cloud.com`.
 - For the Japan region, enter `https://saml.citrixcloud.jp`.
 - For the Citrix Cloud Government region, enter `https://saml.cloud.us`.
 - b) In the **Reply URL (Assertion Consumer Service URL)** section, select **Add reply URL** and then enter the value associated with the region in which your Citrix Cloud tenant is located:
 - For Europe, United States, and Asia-Pacific South regions, enter `https://saml.cloud.com/saml/acs`.
 - For the Japan region, enter `https://saml.citrixcloud.jp/saml/acs`.
 - For the Citrix Cloud Government region, enter `https://saml.cloud.us/saml/acs`.

- c) In the **Sign on URL** section, enter your Workspace URL.
- d) In the **Logout URL (Optional)** section, enter the value associated with the region in which your Citrix Cloud tenant is located:
- For Europe, United States, and Asia-Pacific South regions, enter <https://saml.cloud.com/saml/logout/callback>.
 - For the Japan region, enter <https://saml.citrixcloud.jp/saml/logout/callback>.
 - For the Citrix Cloud Government region, enter <https://saml.cloud.us/saml/logout/callback>.
- e) From the command bar, click **Save**. The **Basic SAML Configuration** section appears as follows:

1

Basic SAML Configuration		 Edit
Identifier (Entity ID)	https://saml.cloud.com	
Reply URL (Assertion Consumer Service URL)	https://saml.cloud.com/saml/acs	
Sign on URL	<i>Optional</i>	
Relay State (Optional)	<i>Optional</i>	
Logout Url (Optional)	https://saml.cloud.com/saml/logout/callback	

8. In the **Attributes & Claims** section, click **Edit** to configure the following claims. These claims appear in the SAML assertion within the SAML response. After SAML app creation, configure the following attributes.

2

Attributes & Claims		 Edit
<code>cip_upn</code>	<code>user.userprincipalname</code>	
<code>lastName</code>	<code>user.surname</code>	
<code>firstName</code>	<code>user.givenname</code>	
<code>displayName</code>	<code>user.displayname</code>	
<code>Unique User Identifier</code>	<code>user.userprincipalname</code>	

- a) For the **Unique User Identifier (Name ID)** claim, leave the default value of `user.userprincipalname`.
- b) For **cip_upn** claim, leave the default value of `user.userprincipalname`.
- c) For **displayName**, leave the default value of `user.displayname`.
- d) In the **Additional claims** section, for any remaining claims with the `http://schemas.xmlsoap.org/ws/2005/05/identity/claims` namespace, click the ellipsis (...) button and click **Delete**. No need to include these claims as they are duplicates of the above user attributes.

When finished, the **Attributes & Claims** section appears as illustrated below:

2 Attributes & Claims Edit

cip_upn	user.userprincipalname
lastName	user.surname
firstName	user.givenname
displayName	user.displayname
Unique User Identifier	user.userprincipalname

- e) Obtain a copy of the Citrix Cloud SAML signing certificate using this [third party online tool](#).
- f) Enter <https://saml.cloud.com/saml/metadata> in the URL field and click **Load**.

Configure the Citrix Cloud Simplified SAML Connection

By default, Citrix Cloud will expect cip_upn, cip_email, cip_sid and cip_oid to be present in the SAML assertion and will fail the SAML sign-in if these attributes are not sent. To prevent this, remove the

checks for these attributes when you create your new SAML connection.

1. Create a new SAML connection using the default settings.
2. Navigate to the **SAML Attribute Mappings Configuration** section at the bottom and make changes before saving the new SAML configuration.
3. Remove the SAML attribute name from each of the **cip_email**, **cip_sid**, and **cip_oid** fields.
4. Do not remove **cip_upn** from its field.
5. Do not remove any other attributes from their respective fields. The **displayName** is still needed by the Workspace UI and should not be changed.

Attribute name for Security Identifier (SID): ⓘ

~~cip_sid~~

Attribute name for User Principal Name (UPN): ⓘ

cip_upn

Attribute name for Email: ⓘ

~~cip_email~~

Attribute name for AD Object Identifier (OID): ⓘ

~~cip_oid~~

Configure your AD Shadow Account Resource Location and Connectors

A resource location and connector pair within the backend shadow account AD forest are required. Citrix Cloud requires connectors within this AD forest to look up shadow account user identities and attributes such as **cip_email**, **cip_sid**, and **cip_oid** when only **cip_upn** is provided directly within the SAML assertion.

1. Create a new **Resource Location** which will contain Citrix Cloud connectors joined to the backend shadow account AD forest.

2. Name the Resource Location to match the AD forest, which contains the backend AD shadow accounts you wish to use.
3. Configure a pair of Citrix Cloud connectors within the newly created resource location.

For example

`ccconnector1.shadowaccountforest.com`

`ccconnector2.shadowaccountforest.com`

Configure FAS within the Backend AD Forest

Contractor Frontend users will definitely require FAS. During DaaS launches contractor users will not be able to manually enter windows credentials to complete the launch as they will likely not know the AD shadow account password.

1. Configure one or more FAS servers within the backend AD forest where your shadow accounts were created.
2. Link the FAS servers to the same Resource Location that contains a pair of Citrix Cloud connectors joined to the backend AD forest where your shadow accounts were created.

Configure alternative UPN Suffixes within your AD Domain

Important:

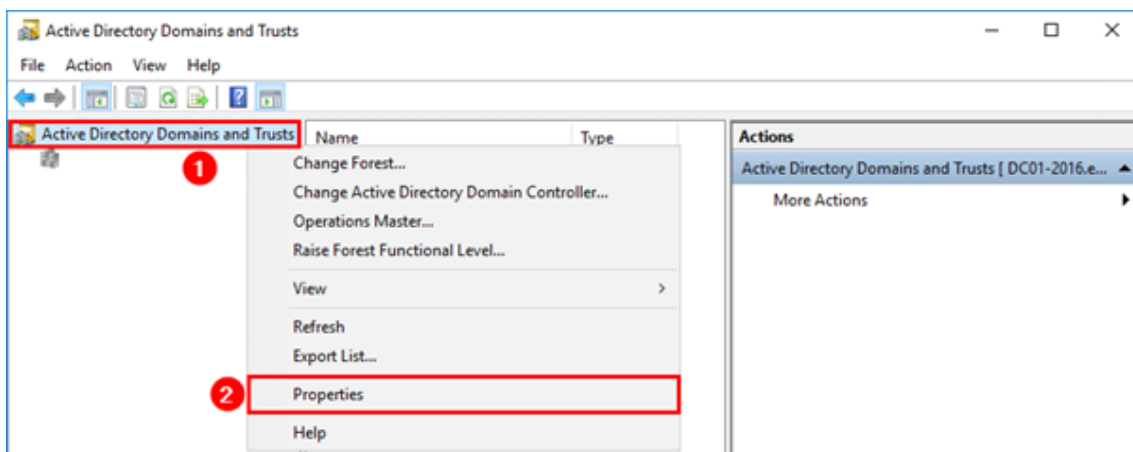

A UPN is not the same as the user's email address. In many cases they are the same value for ease of use, but UPN and email have different internal uses and are defined in different active directory attributes.

The User Principal Name (UPN) suffix is part of the sign-on name in AD. When you create a new account, it will use the implicit UPN suffix of your AD forest by default such as yourforest.com. You will need to add a matching alternative UPN suffix for every external FrontEnd user you wish to invite into your Okta or Azure AD tenants.

For example, if you invite an external user `contractoruser@hotmail.co.uk` and you wish to associate this with a backend AD shadow account `contractoruser@yourforest.com` then add `yourforest.com` as an ALT UPN Suffix within your AD forest.

Add Alternative UPN Suffixes in Active Directory using Active Directory Domains and Trusts UI

1. Sign in to a domain controller within your backend AD forest.
2. Open the **Run dialog**, and then type in `domain.msc`, and then click **OK**.
3. On the Active Directory Domains and Trusts window, right-click **Active Directory Domains and Trusts**, and then select **Properties**.
4. On the **UPN Suffixes** tab, in the Alternative UPN Suffixes box, add an alternative UPN suffix, and then select **Add**.

5. Click **OK**.

Manage your Backend AD Forest's UPN Suffixes using PowerShell

You may need to add a large number of new UPN suffixes to your backend AD forest in order to create the necessary shadow account UPNs. The number of alternative UPN suffixes you will be required to add to your backend AD forest will depend on how many different external users you choose to invite into your SAML Provider tenant.

Here is some PowerShell to achieve this if a large number of new alternative UPN suffixes need to be created.

```
1 # Get the list of existing ALT UPN suffixes within your AD Forest
2 (Get-ADForest).UPNSuffixes
3
4 # Add or remove ALT UPN Suffixes
5 $NewUPNSuffixes = @("yourforest.com","externalusers.com")
```

```

6
7 # Set action to "add" or "remove" depending on the operation you wish
  to perform.
8 $Action = "add"
9 foreach($NewUPNSuffix in $NewUPNSuffixes)
10 {
11
12     Get-ADForest | Set-ADForest -UPNSuffixes @{
13     $Action=$NewUPNSuffix }
14
15 }
16
17 <!--NeedCopy-->

```

Configure an AD Shadow Account within your Backend AD Forest

1. Create a new AD shadow account user.
2. The AD forest implicit UPN such as `yourforest.local` is selected by default for new AD users. Select the appropriate alternative UPN suffix you created earlier. For example, select `yourforest.com` as the shadow account user's UPN Suffix.

The shadow account user's UPN can also be updated through PowerShell.

```

1 Set-ADUser "contractoruser" -UserPrincipalName "
  contractoruser@yourforest.com"
2 <!--NeedCopy-->

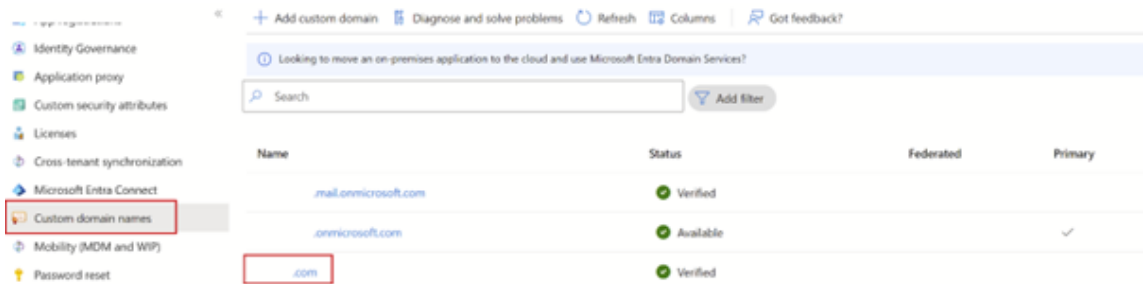

```

3. The shadow account user's UPN should exactly match the external FrontEnd identity user's UPN.
4. Test the FrontEnd user's sign in to Workspace.
5. Verify all expected resources are enumerated in Workspace after the sign-in has succeeded. Resources mapped to the AD shadow account should appear.

Configure the Guest Entra ID User UPN to match the AD Shadow Account UPN

When external guest users are invited to an Entra ID tenant, an auto generated UPN is created indicating that the user is external. The external Entra ID user will be automatically assigned the @Entra IDtenant.onmicrosoft.com UPN suffix, which is unsuitable for use with simplified SAML and will not match your AD shadow account. This will need to be updated to match an imported DNS domain within Entra ID and the alternative UPN suffix you created within your AD forest.

1. Import a Custom Domain into Entra ID that matches the alternative UPN suffix you added to your AD forest.

2. Invite a guest user such as `contractoruser@hotmail.co.uk` and ensure the invited guest user accepts the Microsoft invitation to the Entra ID tenant.

Example external guest user UPN format generated by Microsoft.

`contractoruser_hotmail.co.uk#EXT#@yourEntra IDtenant.onmicrosoft.com`

Important:

Citrix Cloud and Workspace cannot use UPNs containing the # character for SAML authentication.

3. Install the necessary Azure PowerShell Graph modules to allow you to manage Entra ID users.

```
1 Install-Module -Name "Microsoft.Graph" -Force
2 Get-InstalledModule -Name "Microsoft.Graph"
3 <!--NeedCopy-->
```

4. Sign in to your Entra ID tenant using a global admin account and with the `Directory.AccessAsUser.All` scope.

Important:

If you use a less privileged account or do not specify the `Directory.AccessAsUser.All` scope you will not be able to complete Step 4 and update the Guest user's UPN.

```
1 $EntraTenantID = "<yourEntraTenantID>"
2 Connect-MgGraph -Tenant $EntraTenantID -Scopes "Directory.
   AccessAsUser.All"
3 <!--NeedCopy-->
```

5. Get the entire list of external guest users within your Entra ID tenant (optional).

MD	@.onmicrosoft.com	Member	No	.onmicrosoft.com	

```
1 Get-MgUser -filter "userType eq 'Guest'" | Select Id,DisplayName,  
   UserPrincipalName,Mail  
2 <!--NeedCopy-->
```

6. Get the Guest user identity that needs its UPN updated and then update its UPN suffix.

```
1 $GuestUserId = (Get-MgUser -UserId "contractoruser_hotmail.co.uk#  
   EXT#@yourEntra IDtenant.onmicrosoft.com").Id  
2  
3 Update-MgUser -UserId $GuestUserId -UserPrincipalName "  
   contractoruser@yourforest.com"  
4 <!--NeedCopy-->
```

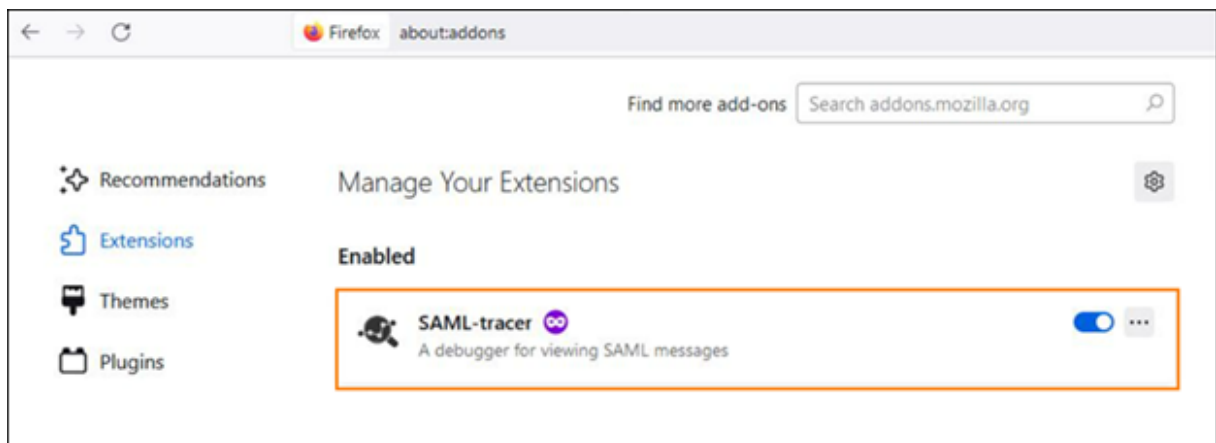

7. Check the Guest user identity can be found using its newly updated UPN.

```
1 Get-MgUser -UserId "contractoruser@yourforest.com"  
2 <!--NeedCopy-->
```

Testing the Simplified SAML Solution

Once all documented steps have been completed in AD, Citrix Cloud and your SAML provider then you need to test the sign-in and verify that the correct list of resources are shown for the guest user within Workspace.

Citrix recommends the use of the SAML-tracer browser extension for all SAML debugging. This extension is available for most common web browsers. The extension decodes Base64-encoded requests and responses into SAML XML, which renders them human-readable.

Example of a Simplified SAML assertion using just cip_upn for authentication captured using SAML tracer.

```

<AttributeStatement>
  <Attribute Name="http://schemas.microsoft.com/identity/claims/tenantid">
    <AttributeValue> </AttributeValue>
  </Attribute>
  <Attribute Name="http://schemas.microsoft.com/identity/claims/objectidentifier">
    <AttributeValue> </AttributeValue>
  </Attribute>
  <Attribute Name="http://schemas.microsoft.com/identity/claims/identityprovider">
    <AttributeValue>https://sts.windows.net/ </AttributeValue>
  </Attribute>
  <Attribute Name="http://schemas.microsoft.com/claims/authnmethodsreferences">
    <AttributeValue>http://schemas.microsoft.com/ws/2008/06/identity/authenticationmethod/ </AttributeValue>
  </Attribute>
  <Attribute Name="cip_upn">
    <AttributeValue> </AttributeValue>
  </Attribute>
  <Attribute Name="lastName">
    <AttributeValue> </AttributeValue>
  </Attribute>
  <Attribute Name="firstName">
    <AttributeValue> </AttributeValue>
  </Attribute>
  <Attribute Name="displayName">
    <AttributeValue> </AttributeValue>
  </Attribute>
</AttributeStatement>

```

FrontEnd Identity Type	Synched from AD	Has Connectors in AD	Needs AD Shadow Account	Login using Attribute
Internal AD Backed User in Shadow Account Forest	Yes	Yes	No	UPN
Internal AD Backed User in Different Forest	Yes	No	Yes	UPN
Internal Native User	No	Not applicable	Yes	UPN
External Guest User	No	Not applicable	Yes	Email

1. Map the correct DaaS resources to AD backed and shadow account users or groups that contain them.
2. Start the SAML tracer browser extension and capture the entire logon and logoff flow.
3. Log into Workspace using the attribute specified in the table for the frontend user type you wish to test.

Guest Entra ID user logon: The contractor user you invited to your Entra ID tenant as a guest user has the email address `contractoruser@hotmail.co.uk`.

Enter the guest user’s **email address** when prompted by Entra ID.

OR

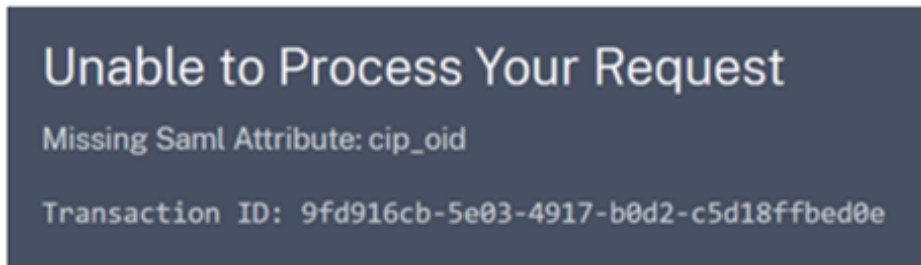

AD backed EntraID user/Native EntraID user logon: These Entra ID users will have UPNs in the format of `adbackeduser@your forest.com` or `nativeuser@your forest.com`.

Enter the user’s **UPN** when prompted by Entra ID.

4. Check the assertion only contains the **cip_upn** attribute for authentication and that it also contains the **displayName** attribute required by the Workspace UI.
5. Check the user can see the required DaaS resources in the UI.

Troubleshooting the Simplified SAML Solution

Missing cip_* Attribute Errors

Cause 1: The SAML attribute is not present in the SAML assertion but Citrix Cloud is configured to expect to receive it. You have failed to remove the unnecessary cip_* attributes from the Citrix Cloud SAML connection within the SAML Attributes section. Disconnect and reconnect SAML to remove references to the unnecessary cip_* attributes.

Cause 2: This error can also occur if there is no corresponding AD shadow account for the Citrix Cloud connectors to look up in your backend AD forest. You may have correctly configured the frontend identity but the backend AD shadow account identity with a matching UPN does not exist or cannot be found.

Logon succeeds but no DaaS resources are shown after the user has logged into Workspace

Cause: This is most likely caused by incorrect frontend to backend identity UPN mappings.

Ensure the 2 UPNs for the frontend and backend identities exactly match and represent the same end user that is logging into Workspace. Check that the DaaS delivery group contains mappings to the correct AD shadow account users or AD groups that contain them.

During Launch of DaaS Resources FAS SSON to the AD domain joined VDAs is failing

When attempting to launch DaaS resources the Workspace end user is prompted to enter their windows credentials within the GINA. Also Event ID 103 is appearing within the windows event logs on your FAS servers.

```
[S103] Server [CC:FASServer] requested UPN [frontenduser@yourforest.com] SID S-1-5-21-000000000-0000000000-0000000000-0000000000-0000000000-0000000000-0000000000-0000000000-0000000001-0002. [correlation: cc#967472c8-4342-489b-9589-044a24ca57d1]
```

Cause: Your simplified SAML deployment is suffering from the “SID mismatch problem”. You have frontend identities which contain SIDs from an AD forest which is different from the backend shadow account AD forest.

Do not send **cip_sid** in the SAML assertion.

Logon fails for AD Backed Users when the same UPN suffix exists in multiple connected AD forests

Citrix Cloud has multiple resource locations and connectors joined to different AD forests. Logon fails when AD backed users imported into Entra ID from a different AD forest than the shadow accountAD forest are used.

AD Forest 1 is synched to Entra ID to create frontend users with UPNs such as `frontenduser@yourforest.com`.

AD Forest 2 contains the backend shadow accounts with UPNs such as `frontenduser@yourforest.com`.

Cause: Your simplified SAML deployment is suffering from the “UPN ambiguity problem”. Citrix Cloud cannot determine which connectors to use to look up the user’s backend identity.

Do not send **cip_sid** in the SAML assertion.

Your user’s UPN exists in more than one AD forest connected to Citrix Cloud.

Configure an On-Premise PingFederate Server as the SAML Provider for Workspaces and Citrix Cloud

March 25, 2024

Author:

Mark Dear

This article was written by collaboration between both Citrix and Ping engineers and has been reviewed by both parties to ensure technical accuracy at the time of writing. Refer to Ping documentation for instructions on how to provision, configure and licence an on premise PingFederate server for use as a SAML provider as this is beyond the scope of this article.

This document was written using PingFederate versions 11.3 and 12.

Prerequisites

This article specifically addresses SAML configuration and ensure that the following conditions are fulfilled.

- You have already provisioned an on-premise PingFederate server within your organization and obtained the necessary license. For more information, see [PingFederate Installation](#).

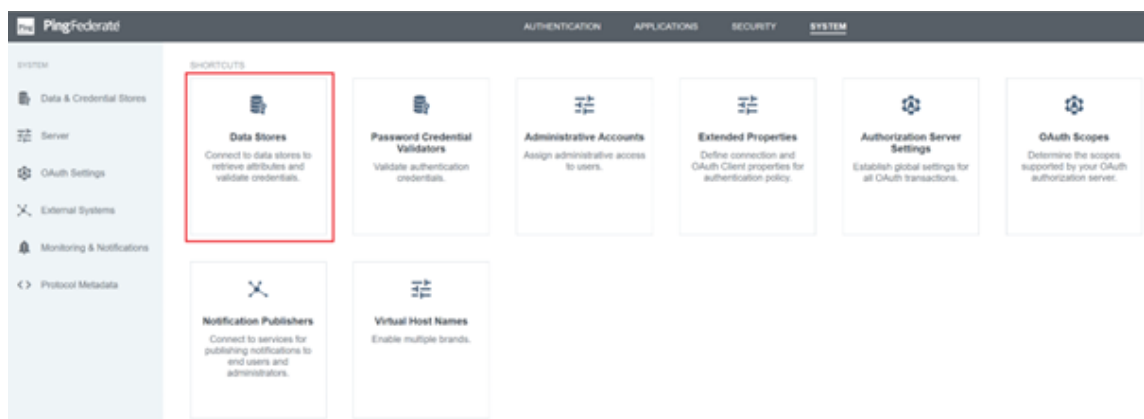

- You need to have installed a supported version of Java on to the PingFederate server. Refer to Ping Identity documentation for the supported Java versions. For more information, see [Java PingFederate Requirement](#).
- You have configured the required networking and firewall rules to allow Citrix Cloud and Workspace to redirect to the on premise PingFederate server during the Workspace/Citrix Cloud admin console SAML logon process. For more information, see [PingFederate Network Requirements](#).
- You have imported a publicly signed x509 certificate onto your PingFederate server that can act as server certificate for the PingFederate server.
- You have imported a publicly signed x509 certificate onto your PingFederate server that can act as a SAML signing certificate for the IdP. This certificate must be uploaded to Citrix Cloud during the SAML connection process.
- You have connected your on-premise Active Directory to PingFederate. For more information, see [PingFederate LDAP Datastore](#)

Note:

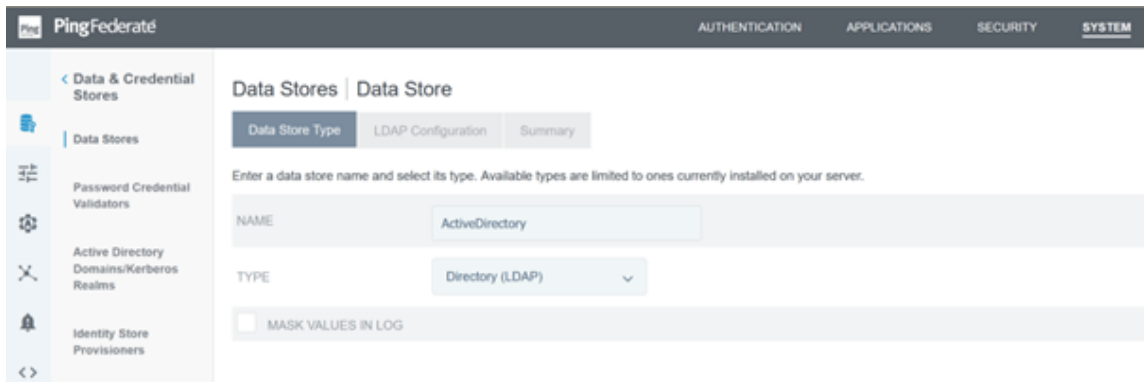

While configuring PingFederate for use with Citrix Cloud and Workspace, refer to PingFederate documentation to understand what individual SAML settings do and to help supplement the instructions provided here.

Configure an Active Directory Connection to your AD domain using a DataStore within PingFederate

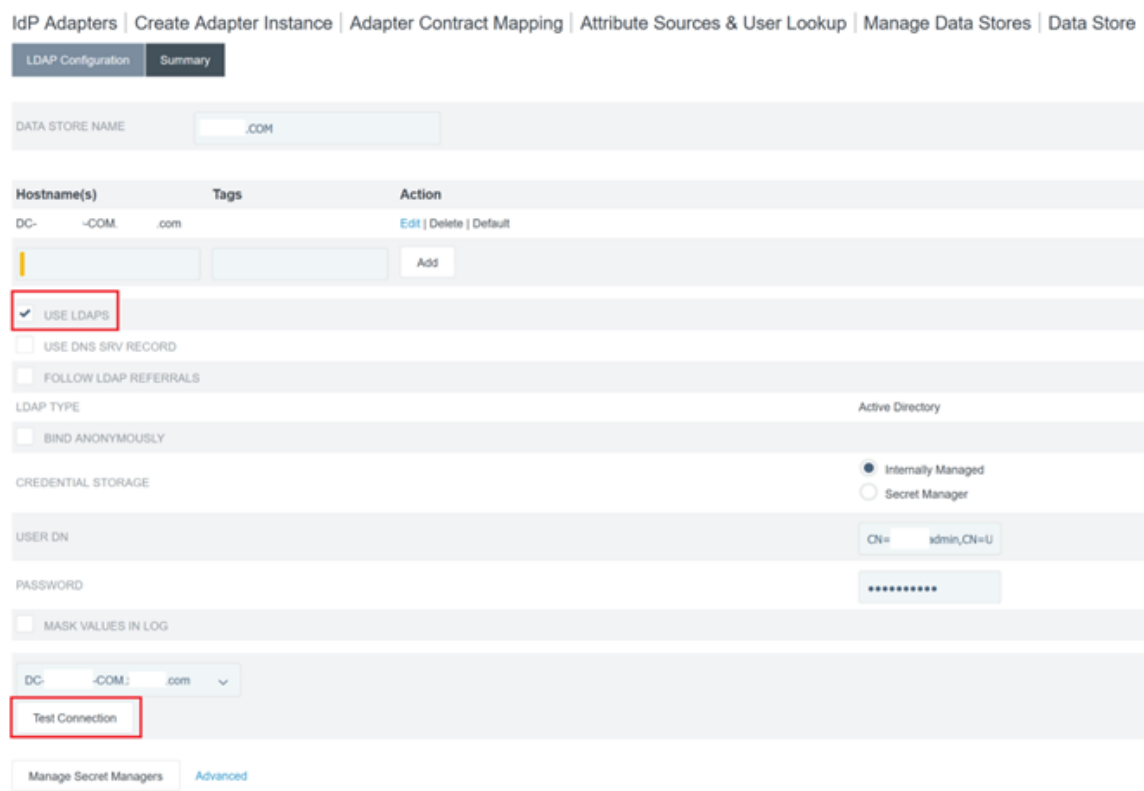

1. Configure an Active Directory connection within Data Stores.

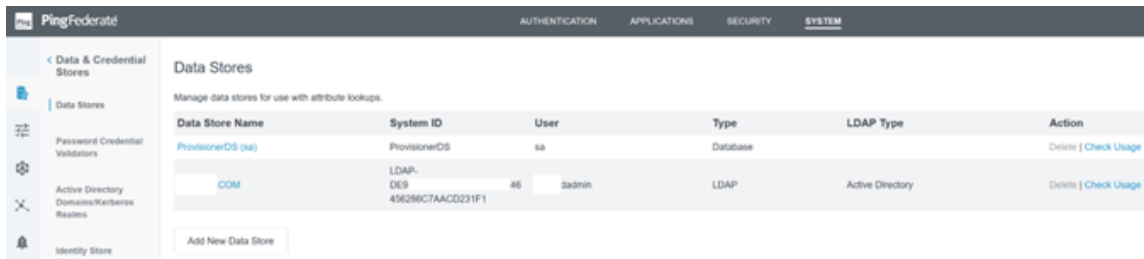

2. Select Type as **Directory (LDAP)**.

3. Configure your domain controllers for LDAPS connections and add your list of domain controller FQDNs within the hostnames field. Then click **Test Connection**.

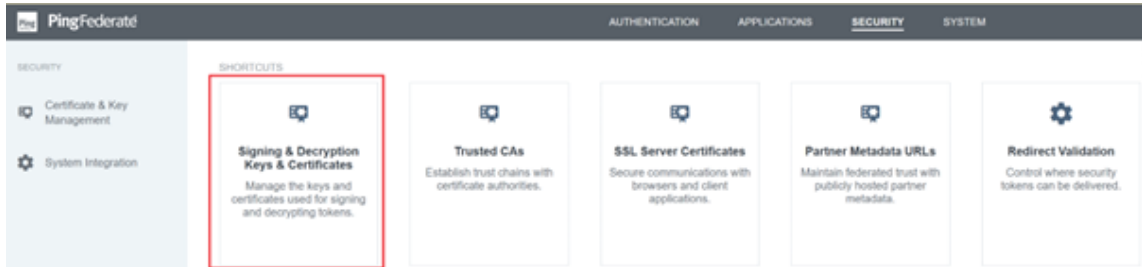

4. Once configured, the Active Directory Connection should resemble the following example:

Upload the Citrix Cloud SAML Signing Certificate

1. Click the **Security** tab
2. Upload the SAML signing certificate you wish PingFederate to use within **Signing & Decryption Keys and Certificates**.

Note:

The certificate used is a publicly signed Digicert pingfederateserver.domain.com certificate in this example.

3. Upload any CA certificates used to sign your PingFederate server SAML signing certificate.

Note:

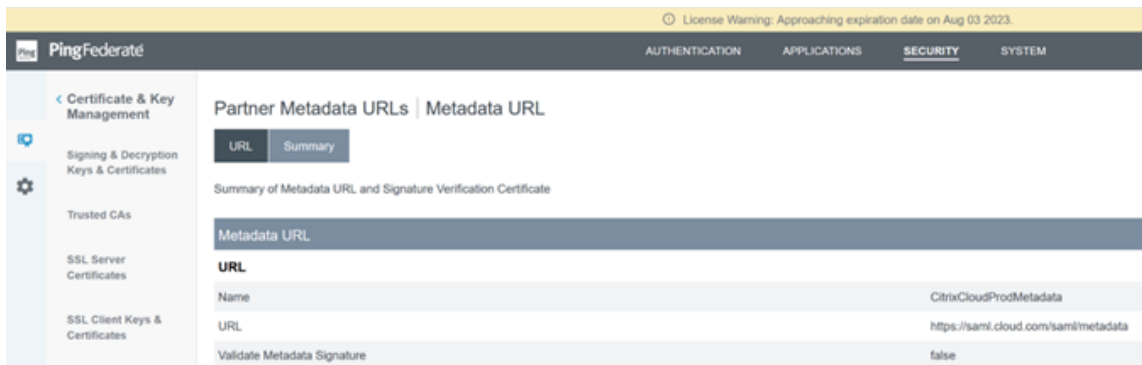

The PingFederate server certificate and SAML signing certificate can be the same SSL cert or you can use different SSL certs. You need to provide a copy of the SAML signing certificate to Citrix Cloud when you configure the SAML connection.

Upload the Citrix Cloud Metadata

1. Provide a name for the Citrix Cloud metadata and enter the metadata URL corresponding to the Citrix Cloud region where your Citrix Cloud tenant is located.

- <https://saml.cloud.com/saml/metadata> - Commercial EU, US and APS
- <https://saml.citrixcloud.jp/saml/metadata> - Japan
- <https://saml.cloud.us/saml/metadata> - Gouvernement

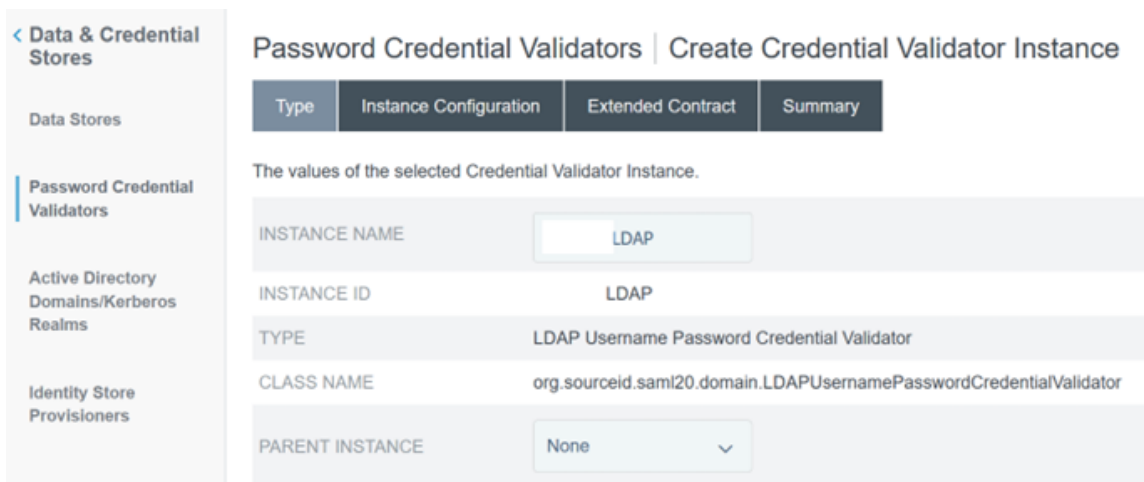

2. Once configured, the Citrix Cloud metadata configuration should resemble the following example.

Configure a password credential validator within PingFederate

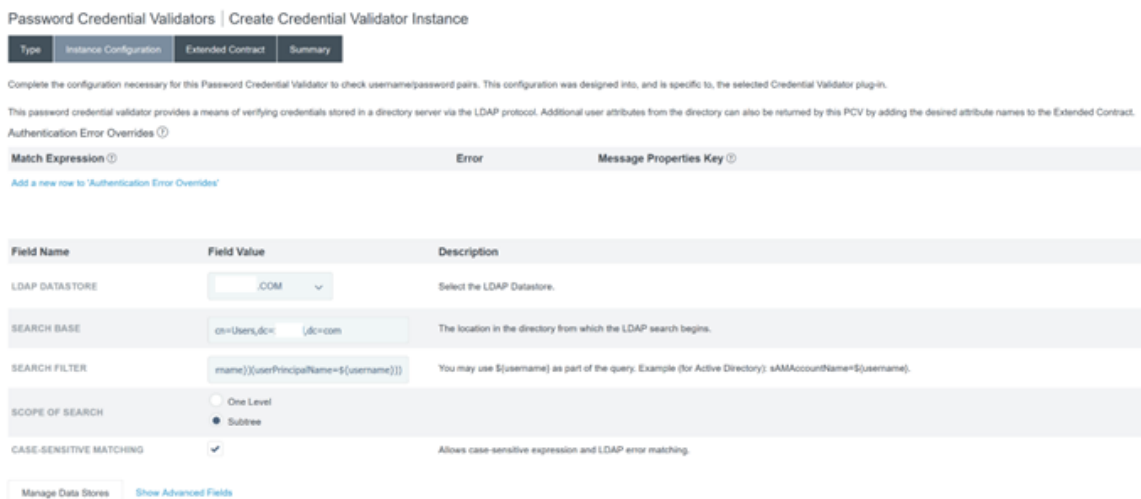

For more information, see [PingFederate Password Credential validator](#)

1. Configure the password credential validator type as LDAP username and password.

2. Configure the **Instance Configuration**. Select the AD domain connection and data store that you configured earlier [Configure an Active Directory Connection to your AD domain using a DataStore within PingFederate](#). Enter a suitable LDAP filter as shown in the example.

```
((sAMAccountName=${ username } )(userPrincipalName=${ username } ))
```

Note: The example filter matches both sAMAccountName and userPrincipalName AD username formats, enabling the end users to sign in to Workspace or Citrix Cloud with either of these. The example filter accommodates both sAMAccountName and userPrincipalName AD username formats, enabling end users to sign in to Workspace or Citrix Cloud using either of these formats.

3. Configure the **Extended Contract**.

Password Credential Validators | Create Credential Validator Instance

- Type
- Instance Configuration
- Extended Contract
- Summary

You can extend the attribute contract of this Password Credential Validator instance.

Core Contract

DN

givenName

mail

username

Extend the Contract Action

Add

4. The **Password Credential Validator** summary should resemble this example.

Password Credential Validators | Create Credential Validator Instance

- Type
- Instance Configuration
- Extended Contract
- Summary

Password Credential Validator configuration summary.

Create Credential Validator Instance

3. Configure the **Extended Contract** with SAML attributes that are passed to Citrix Cloud or Workspaces during SAML logon.

IdP Adapters | Create Adapter Instance

- Type
- IdP Adapter
- Extended Contract
- Adapter Attributes
- Adapter Contract Mapping
- Summary

This adapter type supports the creation of an extended adapter contract after initial deployment of the adapter instance. This adapter contract may be used to fulfill the attribute contract, look up additional attributes from a local data store, or create a persistent name identifier which uniquely identifies the user passed to your SP partners.

Core Contract	
policy.action	
username	
Extend the Contract	
Attribute	Action
cip_email	Edit Delete
cip_oid	Edit Delete
cip_sid	Edit Delete
cip_upn	Edit Delete
displayName	Edit Delete
firstName	Edit Delete
lastName	Edit Delete

4. Configure the **Adapter Attributes**.

IdP Adapters | Create Adapter Instance

- Type
- IdP Adapter
- Extended Contract
- Adapter Attributes
- Adapter Contract Mapping
- Summary

As an IdP, some of your SP partners may choose to receive a pseudonym to uniquely identify a user. From the attributes in this authentication adapter, please select the values that you would like to use in constructing this unique identifier. Optionally, specify here any attributes that must be masked in log files. You may also specify an attribute as the unique user key, which PingFederate will associate to user authentication sessions. For example, this association is used when you enable revocation of authentication sessions after password change or reset in the HTML form adapter.

UNIQUE USER KEY ATTRIBUTE ⓘ

None ▾

Attribute	Pseudonym	Mask Log Values

Configuring the Service Provider Connection (SAML application) for Citrix Cloud or Workspaces

The sample PingFederate configuration provided below assumes the following SAML authentication requirements within your organisation.

- SAML authentication requests sent from Workspace/Citrix Cloud admin console MUST be signed.
- SAML HTTP POST bindings will be used for both SSO and SLO requests.
- Single Logout (SLO) is a requirement within your organisation. When an end user signs out of Workspace or the Citrix Cloud admin console, a SAML SLO request is sent from Citrix Cloud to the SAML provider (IdP) to sign out the user.
- PingFederate requires signed HTTP POST requests to initiate sign out. SAML provider requires Signed SLO requests.

Identity Provider Logout (SLO) Binding Mechanism: ⓘ

HTTP Post ▾

Identity Provider Sign Logout (SLO) Request: ⓘ

Yes No

Identity Provider Logout URL (optional): ⓘ

https://pingfederate.com/idp/SLO.saml2

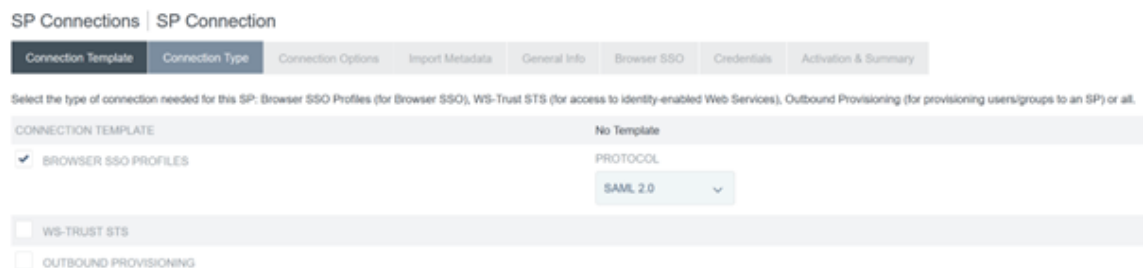

For more information, see [PingFederate SP Management](#)

Procedure

1. Configure the **Connection Template**.

2. Configure the **Connection Type** and select **Browser SSO profiles and SAML 2.0**.

3. Configure the **Connection Options**.

4. Import the Citrix Cloud Metadata. Select URL and the `CitrixCloudProdMetadata` URL you created earlier and click **Load Metadata**

SP Connections | SP Connection

Connection Template | Connection Type | Connection Options | **Import Metadata** | General Info | Browser SSO | Credentials | Activation & Summary

To populate many connection settings automatically, you can upload the partner's metadata file, or specify a URL where PingFederate can download it. To periodically reload the connection settings from the URL, select Enable Automatic Reloading.

Runtime notifications for automatic metadata reloading is turned off. We recommend enabling runtime notifications so administrators are aware of updates and can address accordingly.

METADATA NONE FILE URL

METADATA URL

ENABLE AUTOMATIC RELOADING

5. Configure **General Info**. Set the Service Provider Connection Entity ID, Base URL and Connection Name to the Citrix Cloud SAML endpoint for your Citrix Cloud customer region.

- <https://saml.cloud.com> - Commercial EU, US and APS
- <https://saml.citrixcloud.jp> - Japan
- <https://saml.cloud.us> - Gov

SP Connections | SP Connection

Connection Template | Connection Type | Connection Options | **Import Metadata** | **General Info** | Browser SSO | Credentials | Activation & Summary

This information identifies your partner's unique connection identifier (Connection ID). Connection Name represents the plain-language identifier for this connection. Optionally, you can specify multiple virtual server IDs for your own server to use when communicating with this partner. If set, these virtual server IDs will be used in place of the unique protocol identifier configured for your server in Server Settings. The Base URL may be used to simplify configuration of partner endpoints.

PARTNER'S ENTITY ID (CONNECTION ID)

CONNECTION NAME

VIRTUAL SERVER IDS

APPLICATION NAME

APPLICATION ICON URL

TRANSACTION LOGGING

6. Configure **Protocol Settings**.

SP Connections | SP Connection | **Browser SSO**

SAML Profiles | Assertion Lifetime | **Assertion Creation** | **Protocol Settings** | Summary

A SAML Profile defines what kind of messages may be exchanged between an Identity Provider and a Service Provider, and how the messages are transported (bindings). As an IdP, you configure this information for your SP connection.

Single Sign-On (SSO) Profiles IDP-INITIATED SSO SP-INITIATED SSO

Single Logout (SLO) Profiles IDP-INITIATED SLO SP-INITIATED SLO

7. Use the default **Assertion Lifetime** settings.

SP Connections | SP Connection | Browser SSO

SAML Profiles | Assertion Lifetime | Assertion Creation | Protocol Settings | Summary

When an assertion is issued to the SP, there is a timeframe of validity before and after issuance. Please specify these parameters below.

MINUTES BEFORE

MINUTES AFTER

8. Configure SAML Assertion Creation.

- a) Click **Configure Assertion Creation**

SP Connections | SP Connection | Browser SSO

SAML Profiles | Assertion Lifetime | Assertion Creation | Protocol Settings | Summary

This task provides the configuration for creating SAML assertions to enable SSO access to resources at your SP partner's site.

Assertion Configuration

IDENTITY MAPPING	Standard
ATTRIBUTE CONTRACT	SAML_SUBJECT
ADAPTER INSTANCES	0
AUTHENTICATION POLICY MAPPINGS	0

- b) Select **Standard**.

SP Connections | SP Connection | Browser SSO | Assertion Creation

Identify Mapping | Attribute Contract | Authentication Source Mapping | Summary

Identify mapping is the process in which users authenticated by the SP are associated with user accounts local to the SP. Select the type of name identifier that you will send to the SP. Your selection may affect the way that the SP will look up and associate the user to a specific local account.

- STANDARD:** Send the SP a known attribute value as the name identifier. The SP will often use account mapping to identify the user locally.
- PSEUDONYM:** Send the SP a unique, opaque name identifier that preserves user privacy. The identifier cannot be traced back to the user's identity at this SP and may be used by the SP to make a persistent association between the user and a specific local account. The SP will often use account linking to identify the user locally.
 - INCLUDE ATTRIBUTES IN ADDITION TO THE PSEUDONYM.
- TRANSIENT:** Send the SP an opaque, temporary value as the name identifier.
 - INCLUDE ATTRIBUTES IN ADDITION TO THE TRANSIENT IDENTIFIER.

9. Configure **Attribute Contract**.

SP Connections | SP Connection | Browser SSO | Assertion Creation

Identity Mapping | **Attribute Contract** | Authentication Source Mapping | Summary

An Attribute Contract is a set of user attributes that this server will send in the assertion.

Attribute Contract	Subject Name Format
SAML_SUBJECT	urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified

Extend the Contract	Attribute Name Format	Action
cip_email	urn:oasis:names:tc:SAML:2.0:attrname-format:basic	Edit Delete
cip_oid	urn:oasis:names:tc:SAML:2.0:attrname-format:basic	Edit Delete
cip_sid	urn:oasis:names:tc:SAML:2.0:attrname-format:basic	Edit Delete

RETRIEVE ADDITIONAL ATTRIBUTES FROM MULTIPLE DATA STORES USING ONE MAPPING
 RETRIEVE ADDITIONAL ATTRIBUTES FROM A DATA STORE – INCLUDES OPTIONS TO USE ALTERNATE DATA STORES AND/OR A FAILSAFE MAPPING
 USE ONLY THE ADAPTER CONTRACT VALUES IN THE SAML ASSERTION

12. Configure **Attribute Contract Fulfillment**.

SP Connections | SP Connection | Browser SSO | Assertion Creation | IdP Adapter Mapping

Adapter Instance | Mapping Method | Attribute Contract Fulfillment | Issuance Criteria | Summary

Fulfill your Attribute Contract with values from the authentication adapter or with dynamic text values.

Attribute Contract	Source	Value ⓘ	Actions
SAML_SUBJECT	Adapter	username	None available
cip_email	Adapter	cip_email	None available
cip_oid	Adapter	cip_oid	None available
cip_sid	Adapter	cip_sid	None available
cip_upn	Adapter	cip_upn	None available
displayName	Adapter	displayName	None available
firstName	Adapter	firstName	None available
lastName	Adapter	lastName	None available

13. Configure **Issuance Criteria** as the defaults with no conditions.

SP Connections | SP Connection | Browser SSO | Assertion Creation | IdP Adapter Mapping

Adapter Instance | Mapping Method | Attribute Contract Fulfillment | Issuance Criteria | Summary

PingFederate can evaluate various criteria to determine whether users are authorized to access SP resources. Use this optional screen to configure the criteria for use with this conditional authorization.

Source	Attribute Name	Condition	Value	Error Result	Action
- SELECT -	- SELECT -	- SELECT -			Add

[Show Advanced Criteria](#)

14. The completed **IDP Adapter Mapping** appears as follows:

15. Configure **Protocol Settings**. SAML paths required by Citrix Cloud will be appended to your PingFederate server base URL. It is possible to override the base URL by entering a full path

within the endpoint URL field but this is usually unnecessary and undesirable.

Base URL - <https://youpingfederateserver.domain.com>

- a) Configure the Assertion Consumer Service URL which appends the SAML path to the PingFederate server base URL. EndpointURL - `/saml/acs`

SP Connections | SP Connection | Browser SSO | Protocol Settings

Assertion Consumer Service URL | SLO Service URLs | Allowable SAML Bindings | Signature Policy | Encryption Policy | Summary

As the IdP, you send SAML assertions to the SP's Assertion Consumer Service. The SP may request that the SAML assertion be sent to one of several URLs, via different bindings. Please provide the possible assertion consumer URLs below and select one to be the default.

Default	Index	Binding	Endpoint URL	Action
default	0	POST	/saml/acs	Edit Delete
<input type="checkbox"/>	<input type="text"/>	- SELECT -	<input type="text"/>	<input type="button" value="Add"/>

- b) Configure **SLO Service URL**. EndpointURL - `/saml/logout/callback`

SP Connections | SP Connection | Browser SSO | Protocol Settings

Assertion Consumer Service URL | SLO Service URLs | Allowable SAML Bindings | Signature Policy | Encryption Policy | Summary

As the IdP, you may send SAML logout messages to the SP's Single Logout Service. Depending on the situation, the SP may request that messages be sent to one of several URLs, via different bindings. Please provide the endpoints that you would like to use.

Binding	Endpoint URL	Response URL	Action
POST	/saml/logout/callback	/saml/logout/callback	Edit Delete
- SELECT -	<input type="text"/>	<input type="text"/>	<input type="button" value="Add"/>

Important:

The Citrix Cloud SAML connection requires a PingFederate Logout URL to be configured to match this if you wish to perform SLO when signing out of Workspace or Citrix Cloud. Failing to configure the Logout URL within your SAML connection will cause end users to just sign out of Workspace but not PingFederate.

- a) Configure **Allowable SAML Bindings**.

SP Connections | SP Connection | Browser SSO | Protocol Settings

Assertion Consumer Service URL | SLO Service URLs | Allowable SAML Bindings | Signature Policy | Encryption Policy | Summary

When the SP sends messages, what SAML bindings do you want to allow?

ARTIFACT

POST

REDIRECT

SOAP

- b) Configure **Signature Policy**.

← Configure SAML

Important:

SAML signing settings must be configured consistently on both sides of the SAML connection. Workspace or Citrix Cloud (SP) must be configured to send signed SSO and SLO requests.

- a) PingFederate (IDP) must be configured to perform enforcement of signed requests using the Citrix Cloud SAML signing verification certificate.

- b) Configure the **Encryption Policy**.

SP Connections | SP Connection | Browser SSO | Protocol Settings

Assertion Consumer Service URL	SLO Service URLs	Allowable SAML Bindings	Signature Policy	Encryption Policy	Summary
--------------------------------	------------------	-------------------------	------------------	-------------------	---------

Encryption may be applied to SAML messages for an added layer of protection in transport. If enabled, SAML Response messages may always be signed, regardless of the signature policy.

NONE
 THE ENTIRE ASSERTION
 ONE OR MORE ATTRIBUTES

- SAML_SUBJECT
- CIP_EMAIL
- CIP_OID
- CIP_SID
- CIP_UPN
- DISPLAYNAME
- FIRSTNAME
- LASTNAME

Note:

It is recommended to set Encryption to **NONE** during initial setup and testing so you can debug any issues with missing or incorrect SAML attributes in the assertion. If you require encrypted assertions, it is recommended that you enable encryption after proving that the logon to Workspace or Citrix Cloud is successful and all resources have been successfully enumerated and can be launched. Debugging issues with SAML whilst encryption is enabled will be impossible if you cannot view the plaintext contents of the SAML assertion.

c) Review the **Summary** tab.

SP Connections | SP Connection | Browser SSO | Protocol Settings

Assertion Consumer Service URL	SLO Service URLs	Allowable SAML Bindings	Signature Policy	Encryption Policy	Summary
--------------------------------	------------------	-------------------------	------------------	-------------------	---------

Useful tip:

Use the SP Connection Activation and Summary page to review your SAML application and for debugging purposes as it allows quick and easy configuration changes to be made. The SP Connection Activation and Summary page allows you to navigate to any of the SAML configuration sub sections by clicking on the title of that section. Click on any of the titles highlighted in red to update these settings.

16. The completed **Citrix Cloud SP connection** should appear in the list like this.

17. It is possible to export the SP connection in the form of an XML file. Citrix recommends taking a backup of your SP connection once you have tested it with Citrix Cloud and Workspace.

Update the Identity Provider SAML Signing Certificate

April 29, 2024

Author:
Mark Dear

SAML connections which use signed requests and responses depend on two different SAML signing certificates. One for each side of the SAML connection.

SAML Provider signing certificate

This certificate is provided by your SAML provider and uploaded into Citrix Cloud when you configure the SAML connection.

SAML signing certificates need to be rotated before their expiration date occurs to give Citrix Cloud admins time to prepare for deployment. Certificate rotation is required by both Service Providers and Identity Providers in order to ensure alignment and prevent any downtime.

FAQ

What is the SAML provider certificate used for?

The SAML provider certificate is used to verify the signature of SAML responses sent from the SAML provider to Citrix Cloud during the authentication process.

Where do I obtain a copy of the latest Identity Provider (IdP) signing certificate?

This certificate is provided by your SAML provider such as Azure AD, Okta, PingFederate, or ADFS. Citrix does not control the rotation and update of this certificate. This certificate is uploaded into Citrix Cloud when you initially create the SAML connection. The date of expiry on **IDP Signing Certificates** is usually long lived. They might need replacing every few years and at a lower frequency than the **SP Signing Certificate**

How will I know if my SAML provider signing certificate is about to expire and impact my Citrix Cloud SAML connection?

Citrix Cloud will display warnings 30 days before the date of expiry approaches for your SAML provider signing certificate.

Certificate Expiring Soon: <certExpirationDate>

It will also display an error once the certificate has actually expired as shown below.

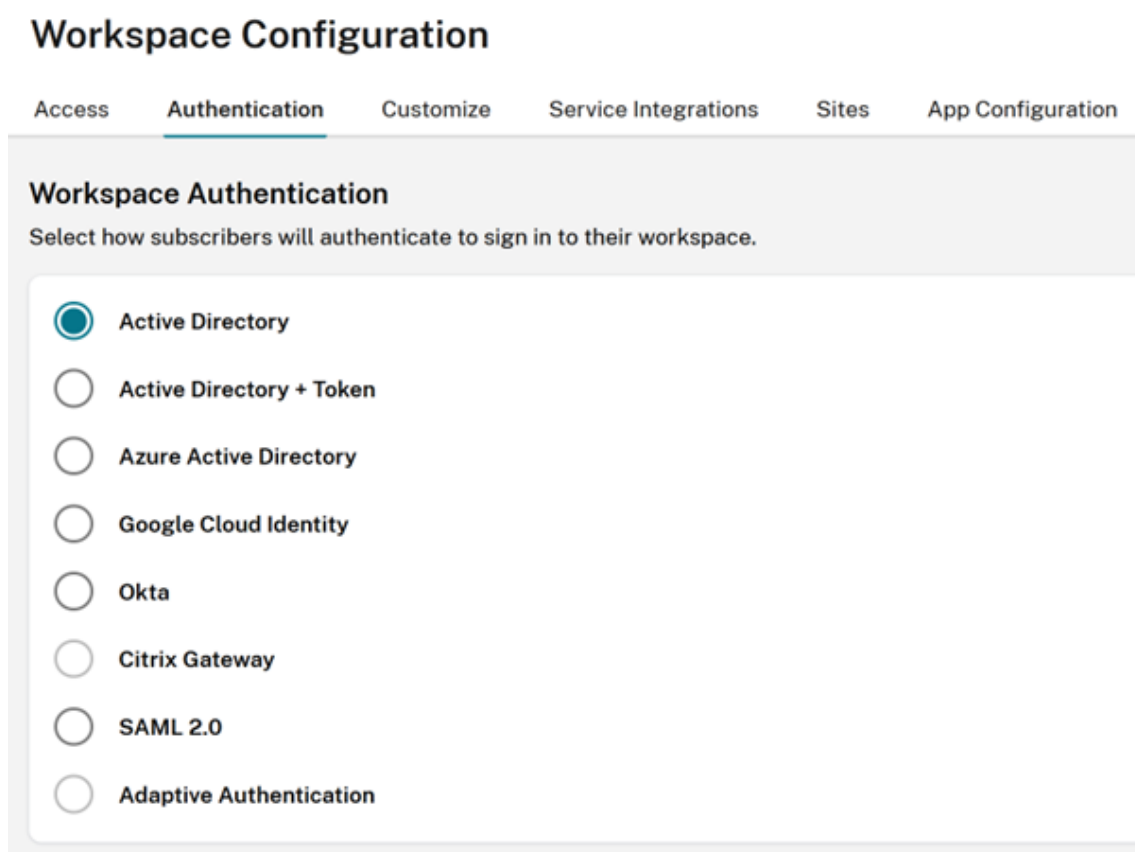

Can I update the SAML provider certificate whilst still using the SAML connection without downtime?

No. It is necessary to perform a SAML disconnect and reconnect during a scheduled maintenance window.

Update the Identity Provider (IdP) Signing Certificate

1. Select an alternative IdP within **Workspace Configuration**, select **Authentication** whilst you perform the SAML disconnect/reconnect operation such as Active Directory.

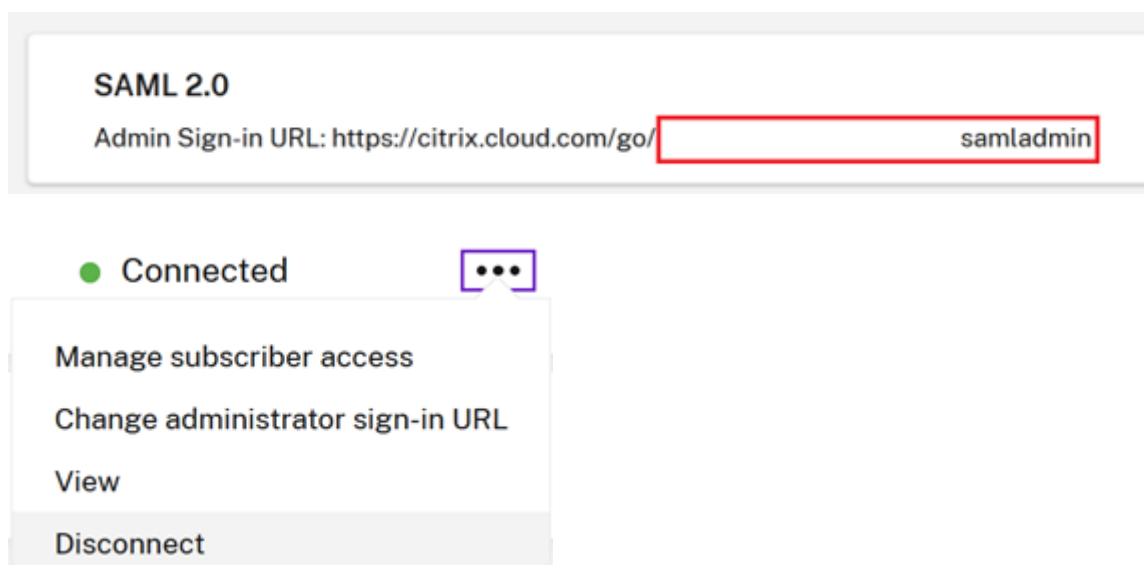

2. Backup your existing GO URL such as <https://citrix.cloud.com/go/<yourgourl>> used for SAML logon to Citrix Cloud.
3. Take a backup of your existing SAML endpoints. These can be copied from the Citrix Cloud console. Backup the following SAML endpoints from within your existing SAML connection.
 - Identity Provider Entity ID
 - Identity Provider SSO Service URL
 - Identity Provider Logout URL

Backup the EntityID, the SSO URL, and the logout URL.

Important:

Ensure you have a copy of both the existing and replacement IDP signing certificate before performing the disconnect. This is so you have the ability to rollback to the old certificate if the new SAML provider certificate is invalid and causes any logon issues. You will not be able to obtain a copy of the old certificate from the Citrix Cloud UI before performing the disconnect. You will need to obtain it from your SAML application.

1. Disconnect SAML within **Identity and Access Management**, navigate to **Authentication**, select the SAML connection, Click the ellipse and select **Disconnect**
2. Reconnect SAML within **Identity and Access Management** and click **Authentication**

3. Accept all of the default SAML connection settings.
4. Reenter all of the SAML application endpoints you backed up earlier or obtain these again for your SAML app from within your SAML provider UI.
 - Identity Provider Entity ID
 - Identity Provider SSO Service URL
 - Identity Provider Logout URL

Important:

If you are using the Scoped EntityID feature, you will also need to update your SAML application with the new scope ID after performing the SAML disconnect/reconnect. For more information on the Scoped EntityID feature, see [Configure a SAML application with a scoped Entity ID in Citrix Cloud](#). Copy the newly generated scope ID from the Citrix Cloud SAML UI and update your SAML application Entity ID with the replacement scope ID.

EntityID should be updated to `https://saml.cloud.com/<new scope ID after`

reconnect>.

Update the Service Provider SAML Signing Certificate

May 2, 2024

Author:

Mark Dear

SAML connections which use signed requests and responses depend on two different SAML signing certificates. One for each side of the SAML connection.

Service Provider signing certificate

This certificate is provided by Citrix periodically and uploaded into your SAML application or obtained via the Citrix Cloud SAML metadata.

SAML signing certificates need to be rotated before their expiration date occurs to give Citrix Cloud admins time to prepare for deployment. Certificate rotation is required by both Service Providers and Identity Providers to ensure alignment and prevent any downtime.

If a selected SAML provider does not support automated rotation of the SP SAML signing certificate, a manual rotation of the SAML signing certificate within your SAML provider must be performed in order to replace the expiring certificate.

Important:

All existing guides within this SAML eDoc section include details of how to configure signing on both sides of the SAML connection. Citrix only recommends signed SAML configurations as these are more secure and are required by some SAML providers for logout (SLO) to succeed.

FAQ

What is SAML signing?

SAML signing certificates are X.509 certificates used to verify data sent between the Service Provider (SP) and SAML provider (IdP). Your SAML provider (IdP) uses the Citrix Cloud SAML signing certificate to verify the signature sent by Citrix Cloud within its SAML authentication request. Citrix Cloud uses the SAML provider signing certificate to verify the SAML response came from a trusted and connected IdP.

What is SAML signed request enforcement?

Just because Citrix Cloud is configured to send signed requests this does not guarantee that the SAML provider will enforce the use of signatures and reject any unsigned incoming SAML requests. Most SAML providers have an option to enforce signed requests meaning if an unsigned request to log into the SAML provider is received then the logon will fail. It is the responsibility of the SAML provider admin to check the status of the IdP configuration. Citrix support does not control or have any visibility of whether signed requests are enforced within your SAML application.

How frequently does Citrix rotate its Service Provider SAML signing certificate?

In order to allow plenty of overlap between the active Service Provider signing certificate and the newly issued one, Citrix rotates the Service Provider signing certificate approximately every 11 months. This is to ensure a valid certificate is available to Citrix Cloud customers 30 days before the existing certificate expires.

What is the Service Provider SAML signing certificate advertisement phase?

During the advertisement phase the current and replacement SAML signing certificates will be present in the Citrix Cloud metadata. Only the active certificate can be used for SAML request verification until the rotation date and time.

Why have I received a notification via email and within the Citrix Cloud admin console indicating that the current Citrix Cloud SAML signing certificate is about to expire and must be replaced?

SAML providers (IdP) require a valid and in date certificate to verify the signature of incoming SAML requests from Service Providers such as Workspace and the Citrix Cloud administrator console. Citrix Cloud customers using SAML for Workspace or Citrix Cloud admin console logon will be contacted to advise them of an imminent SAML signing certificate rotation.

Hi Citrix Cloud Admin

Customer name:

Organization ID:

Source: Citrix Cloud

Type: **Critical**

SAML Certificate Rotation on 2024-03-23 17:00:00 UTC

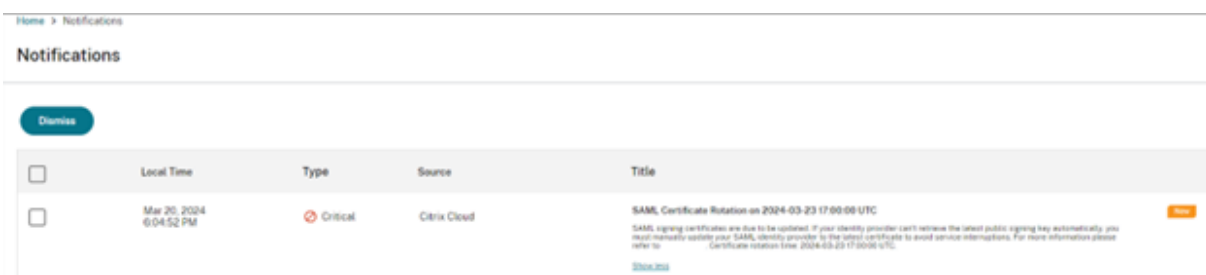

SAML signing certificates are due to be updated. If your identity provider can't retrieve the latest public signing key automatically, you must manually update your SAML identity provider to the latest certificate to avoid service interruptions. For more information please refer to [SAML Certificate Rotation](#). Certificate rotation time: 2024-03-23 17:00:00 UTC.

[View all notifications](#)

To stop receiving Citrix Cloud notification, [Manage Preferences](#) from Account Settings and turn off email notifications.

How do I know if my Citrix Cloud customer is affected by the Citrix Cloud SAML signing certificate rotation or not?

This will affect Citrix Cloud customers with the following SAML configuration.

- Your SAML connection within Citrix Cloud is configured with **Sign Authentication Requests = Yes**
- You have configured your SAML provider such as Azure Active Directory, ADFS, or Okta to reject unsigned SAML requests (signed request enforcement).
- You have Single Logout (SLO) configured within your Citrix Cloud SAML connection and within your SAML provider. Your SAML provider might require SLO requests to be signed such as for Okta and PingFederate.

How do I check the signing configuration of my Citrix Cloud SAML connection?

Navigate to **Identity and Access Management > SAML 2.0 > View** to check if you have **Sign Authentication Requests** enabled within your Citrix Cloud SAML connection. All new SAML connections within Citrix Cloud will default to **Identity Provider Sign Authentication/Logout Requests = Yes** for both logon (SSO) and logout (SLO).

Identity Provider Sign Authentication Request: ⓘ

Yes No

Identity Provider Sign Logout (SLO) Request: ⓘ

Yes No

How do I check whether signing enforcement is configured within my SAML app?

This varies depending on the SAML provider you are using. Some might not even offer this option. AzureAD, ADFS, Okta, and PingFederate all support signing enforcement. It is critical the SAML admin be aware of the capabilities of your SAML provider and its current configuration. Citrix support has no control or visibility of this.

Where do I obtain a copy of the latest Service Provider (SP) signing certificate?

This certificate is provided by Citrix through the Citrix Cloud SAML metadata and is updated periodically during the advertisement phase of the SP signing certificate rotation. This occurs at least once a calendar year.

US, EU, and APS: <https://saml.cloud.com/saml/metadata>

JP: <https://saml.citrixcloud.jp/saml/>

GOV: <https://saml.cloud.us/saml/metadata>

When is it safe to remove the old Citrix Cloud SAML signing certificate if my SAML app supports multiple verification certificates?

Only remove the old Citrix Cloud signing certificate after the certificate rotation date and time given in the email and Citrix Cloud admin console notification.

Use metadata exchange to automatically update the SAML Provider with the latest Citrix Cloud SP SAML Signing Certificate

Using SAML metadata exchange, the SAML provider consumes the Citrix Cloud SAML metadata automatically by monitoring the metadata URL, such as <https://saml.cloud.com/saml/metadata>. If your SAML provider supports SAML metadata exchange, then the SP signing certificate might already be updated automatically.

Verify that your SAML provider supports metadata exchange. Afterward, you can verify whether the update has occurred before the current SAML signing certificate expires.

Important

There is a large amount of variation regarding the SAML features that each third-party SAML provider supports. It is the Citrix Cloud administrator's responsibility to know and understand the capabilities and requirements of the SAML provider you are using. This is necessary to ensure that both the Citrix Cloud SAML connection configuration (SP) and SAML provider (IdP) configuration match. Refer to your SAML provider's documentation to determine if it supports signature verification and whether SAML requests and responses need to be signed.

Manually update the SAML Provider with the latest Citrix Cloud SP SAML Signing Certificate

Important

SP Certificate rotation must be done every time a new certificate is published from Citrix Cloud otherwise SAML logon will be impacted and you will incur downtime.

1. Acquire the latest SAML metadata from Citrix Cloud by viewing your current SAML connection within **Identity and Access Management**, click **Authentication**, select **SAML Connection** and click **View**.

The following image is an example of what this file might look like for Citrix Cloud regions such as US, EU and APS:

<https://saml.cloud.com/saml/metadata>

This XML file does not appear to have any style information associated with it. The document tree is shown below.

```

▼ <md:EntityDescriptor xmlns:md="urn:oasis:names:tc:SAML:2.0:metadata" entityID="https://saml.cloud.com/ID*_618e6dcb-8773-467b-ba46-448e9e53c45c">

          </X509Certificate>
        </X509Data>
      </KeyInfo>
    </md:KeyDescriptor>

```

In this metadata XML file example, there are two x509 Citrix Cloud SAML signing certificates.

- It is possible to extract the x509 certificate from the metadata by uploading the XML file to a third-party tool or providing the metadata URL.
- Navigate to <https://www.rcfed.com/SAMLWSFed/MetadataCertificateExtract>
- Enter the SAML metadata URL that corresponds to your Citrix Cloud customer region:
 - US, EU and APS: <https://saml.cloud.com/saml/metadata>
 - JP: <https://saml.citrixcloud.jp/saml/metadata>
 - GOV: <https://saml.cloud.us/saml/metadata>

- Upload the newly extracted Citrix Cloud SP SAML certificate to your SAML provider. This process will be different for every SAML provider. Verify the proper SP signing certificate rotation procedure using your specific SAML provider documentation.

Depending on your SAML provider, the existing SAML signing certificate might need to be replaced by the new one. In some cases, the SAML provider might support multiple SP signing cer-

tificates at the same time, thus only uploading the new one will be enough. It is recommended you remove the old certificate once it has expired.

Upload a replacement Citrix Cloud SAML signing certificate to your Azure Active Directory SAML application

Before configuring the Azure Active Directory SAML app, see [SAML Request Signature Verification](#) for more information.

1. Navigate to **Azure Active Directory**, select **Enterprise Applications** and click Your SAML App.
2. Locate the SAML certificates section within the SAML application.

Note:

Azure Active Directory SAML apps can have multiple signing verification certificates configured so it is possible to upload a replacement certificate long before the current certificate has expired. The following screenshot shows two valid certificates. One of the certificates is due to expire in the near future. Provided at least one of the uploaded certificates is valid and has not yet expired, a SAML login to Citrix Workspace and Citrix Cloud will continue to succeed and you will not experience an outage.

Important:

Do not remove the existing verification certificate until after the SAML rotation date and time given in the email and Citrix Cloud admin console notification has passed. The new Citrix Cloud certificate becomes active only on the date and time given within those two notifications.

Upload a replacement Citrix Cloud SAML signing certificate to your Okta SAML application

Okta does not support multiple SP SAML signing certificates at the same time. You have no choice but to overwrite the existing Citrix Cloud SP signing certificate you are currently using with the new one. It is recommended you do this in a scheduled maintenance window.

1. Navigate to **Applications**, select **Applications** and search for your Okta SAML App

- From **General**, navigate to **SAML Settings**, click **Edit**, select **Configure SAML**, select **Show Advanced Settings**, and click **Signature Certificate** in order to upload a replacement. Okta does not display the current Citrix Cloud SAML signing certificate in the upload UI. It will only display the replacement certificate after this has been uploaded.

Configure ADFS as a SAML provider for workspace authentication

January 31, 2024

Author:

Mark Dear

This article describes how to configure the relying party trust that Citrix Cloud requires for signing in to Citrix Workspace or Citrix Cloud using SAML.

After you complete the steps in this article, you can configure the SAML connection between your ADFS server and Citrix Cloud as described in [Connect SAML as an identity provider in Citrix Cloud](#). For guidance for entering the correct ADFS values for your SAML connection, see SAML configuration in Citrix Cloud in this article.

Prerequisites

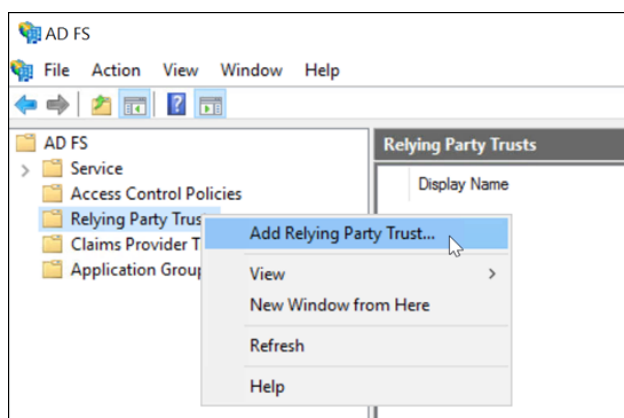

The instructions in this article assume that you have an operating ADFS server deployment with Citrix FAS in your environment. Citrix FAS is required to provide single sign-on to VDAs during session launch.

For more information, refer to the following articles:

- Citrix FAS documentation:
 - [Install and configure](#)
 - [ADFS deployment](#)
- Citrix Tech Zone: [Reference Architecture: Federated Authentication Service](#)

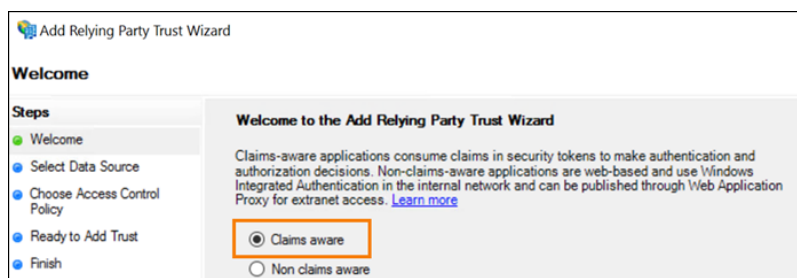

Configure a relying party trust for Citrix Cloud

1. From the AD FS management console, expand the **AD FS** node in the left pane.
2. Right-click **Relying Party Trust** and select **Add Relying Party Trust**.

The Add Relying Party Trust wizard appears.

3. Select **Claims aware** and then select **Next**.

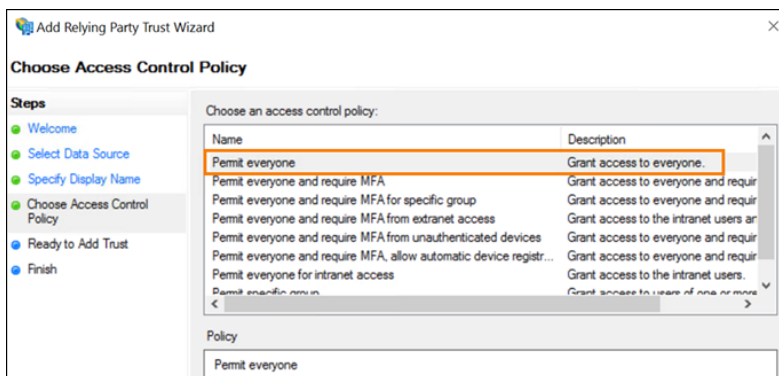

4. In **Federation metadata address**, enter `https://saml.cloud.com/saml/metadata.xml`. Select **Next**.

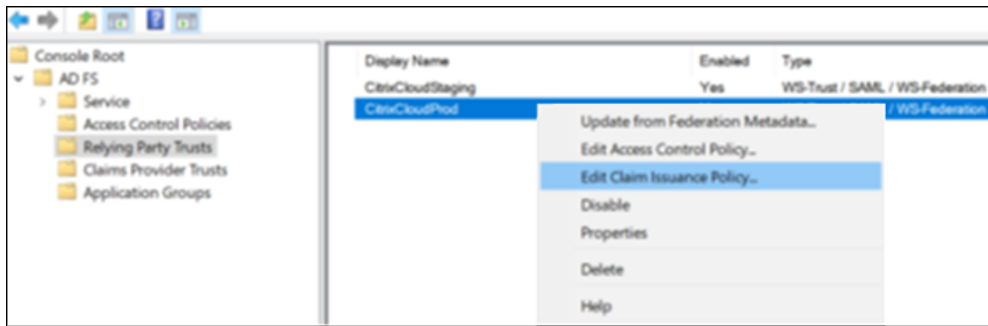

- For the display name, enter **CitrixCloudProd**. Select **Next**.

- For the access control policy, select **Permit everyone**. Select **Next**.

- On the **Ready to Add Trust** screen, select **Next**.
- On the **Finish** screen, select **Configure claims issuance policy for this application**. Select **Next**.

9. Right-click the newly-created relying party trust and select **Edit Claim Issuance Policy**.
10. Click **Add Rule** and then select **Send LDAP Attributes as Claims**. Select **Next**.
11. In **Claim rule name**, enter `CitrixCloud`.
12. In **Attribute store**, select **Active Directory**.
13. Under **Mapping of LDAP attributes to outgoing claim types**, add the following LDAP attributes, exactly as shown:

LDAP attribute	Outgoing Claim Type
User-Principal-Name	Name ID
User-Principal-Name	cip_upn
E-Mail-Addresses	cip_email
objectSID	cip_sid
objectGUID	cip_oid
Display-Name	displayName
Given-Name	firstName
Surname	lastName

Edit Rule - CitrixCloud ✕

You can configure this rule to send the values of LDAP attributes as claims. Select an attribute store from which to extract LDAP attributes. Specify how the attributes will map to the outgoing claim types that will be issued from the rule.

Claim rule name:

Rule template: Send LDAP Attributes as Claims

Attribute store:

Mapping of LDAP attributes to outgoing claim types:

LDAP Attribute (Select or type to add more)	Outgoing Claim Type (Select or type to add more)
User-Principal-Name	Name ID
User-Principal-Name	cip_upn
E-Mail-Addresses	cip_email
objectSID	cip_sid
objectGUID	cip_oid
Display-Name	displayName
Given-Name	firstName
Surname	lastName
▶▶	

14. Select **Finish**.

Modify a Citrix Cloud relying party trust using PowerShell

If you've configured your ADFS server using the default "out of the box" configuration, the steps in this section enable you to update it so it meets the Citrix-recommended configuration. This task is required to resolve an issue where SAML Single Logout from Citrix Cloud or Citrix Workspace fails if the `nameidentifier` attribute isn't included in the claim rule set or isn't the first SAML attribute in the claim rule set.

Note:

You don't need to perform this task if you created your claim rule set using the steps in [Configure a relying party trust for Citrix Cloud](#) in this article.

To complete this task, you replace the existing rule set with a new claim rule set using PowerShell. The ADFS management console doesn't support this type of operation.

1. On the ADFS server, locate the PowerShell ISE. Right-click and select **Run as administrator**.
2. Back up your existing ADFS claim rules to a text file:

```
1 Get-ADFSRelyingPartyTrust -name "CitrixCloudStaging" | Select-Object -ExpandProperty IssuanceTransformRules | Out-File "$env:USERPROFILE\desktop\claimrulesbackup.txt"
2 <!--NeedCopy-->
```

3. Download the claimrules.txt file that Citrix provides at <https://github.com/citrix/sample-scripts/tree/master/citrix-cloud>.
4. Copy the claimrules.txt file to your desktop.
5. Import the required claim rules using the claimrules.txt file:

```
1 Set-ADFSRelyingPartyTrust -Name "CitrixCloudProd" `
2     -MetadataUrl "https://saml.cloud.com/saml/metadata" `
3     -AutoUpdateEnabled $True `
4     -IssuanceTransformRulesFile "$env:USERPROFILE\desktop\claimrules.txt" `
5     -SignedSamlRequestsRequired $True `
6     -SamlResponseSignature "MessageAndAssertion" `
7     -Enabled $True
8 <!--NeedCopy-->
```

Update SAML signing settings for the relying party trust using PowerShell

By default, ADFS relying party trusts have the following settings:

- EncryptClaims: True
- SignedSamlRequestsRequired: False
- SamlResponseSignature: AssertionOnly

For increased security, Citrix recommends using signed SAML requests for both Single Sign-on (SSO) and Single Logout. This section describes how to update the signing settings of an existing relying party trust using PowerShell so they meet the Citrix-recommended configuration.

1. Obtain the current RelyingPartyTrust configuration on your ADFS server.

```
1 Get-ADFSRelyingPartyTrust -TargetName "CitrixCloudProd"
2 <!--NeedCopy-->
```

2. Update the **CitrixCloudProd** relying party trust settings.

```
1 Set-ADFSRelyingPartyTrust -Name "CitrixCloudProd" `
2     -SignedSamlRequestsRequired $True `
3     -SamlResponseSignature "MessageAndAssertion"
```

```
4 <!--NeedCopy-->
```

3. Contact Citrix Support and request to activate the authentication feature **EnableSamlLogout-SigningAndPost** on your Citrix Cloud customer. This causes Citrix Cloud to send SAML Single Logout requests as signed POST requests instead of unsigned Redirect requests when users sign out of Citrix Workspace or Citrix Cloud. Sending signed POST requests is required if the SAML provider requires signed requests for Single Logout and rejects unsigned redirects.

SAML configuration in Citrix Cloud

When you configure the SAML connection in Citrix Cloud (as described in [Add SAML provider metadata to Citrix Cloud](#)), you'll enter the values for ADFS as follows:

In this field in Citrix Cloud	Enter this value
Entity ID	https://adfs.YourDomain.com/adfs/services/trust , where YourDomain.com is your ADFS server domain.
Sign Authentication Request	Yes
SSO Service URL	https://adfs.YourDomain.com/adfs/ls , where YourDomain.com is your ADFS server domain.
Binding Mechanism	HTTP Post
SAML Response	Sign Either Response Or Assertion
Authentication Context	Unspecified, Exact
Logout URL	https://adfs.YourDomain.com/adfs/ls , where YourDomain.com is your ADFS server domain.

Sign in to workspaces with SAML using custom domains

November 9, 2023

Author:

Mark Dear

If you've configured a custom domain in Citrix Workspace (for example, <https://workspaces.yourdomain.com>), additional configuration in Citrix Cloud and your SAML provider might be required, depending on the SAML sign-in scenarios that you want to support in Citrix Cloud.

You might need a pair of SAML applications for this configuration. Citrix Cloud requires different SAML service provider (SP) endpoints, depending on whether the SAML application uses the cloud.com or workspaces.yourdomain.com URLs to perform the sign-in operation.

For more information about configuring custom domains in Citrix Workspace, see [Configure a custom domain](#) in the Citrix Workspace product documentation.

Considerations for deploying one or two SAML applications

To determine whether you need to deploy a single or dual SAML application solution, identify which combination of SAML sign-in scenarios you need your SAML provider to support.

The following sign-in scenarios share the same SAML application (SAML App 1) by default:

- SAML authentication for Citrix Workspace where the Workspace sign-in URL for your region (cloud.com, citrixcloud.jp, cloud.us) is configured in your SAML provider as the SP Entity ID.
- SAML authentication for Citrix Cloud using your unique sign-in URL (for example, <https://citrix.cloud.com/go/mycompany>). In this scenario, administrators are authenticated to Citrix Cloud using SAML, based on their Active Directory (AD) group membership.

Adding SAML authentication for users through a custom domain (for example, <https://workspaces.mycompany.com>) that you configure in Workspace Configuration requires a second SAML application (SAML App 2).

The following table lists the supported combinations of SAML sign-in scenarios and the required SAML apps.

Sign in to Workspace with Workspace URL	Sign in to Workspace with custom domain URL	Sign in to Citrix Cloud using SAML sign-in URL	SAML App 1 required?	SAML App 2 required?
Yes	No	No	Yes - Use cloud.com SAML endpoints	No
No	Yes	No	Yes - Use custom domain SAML endpoints	No

Sign in to Workspace with Workspace URL	Sign in to Workspace with custom domain URL	Sign in to Citrix Cloud using SAML sign-in URL	SAML App 1 required?	SAML App 2 required?
No	No	Yes	Yes - Use cloud.com SAML endpoints	No
Yes	No	Yes	Yes - Use cloud.com SAML endpoints	No
No	No	Yes	Yes - Use the cloud.com SAML endpoints	Yes - Use custom domain SAML endpoints
Yes	Yes	Yes	Yes - Use cloud.com SAML endpoints	Yes - Use custom domain SAML endpoints

Single SAML application configuration

1. In Citrix Cloud, go to **Workspace Configuration > Access** and configure a custom domain. For more information, see [Configure a custom domain](#).
2. In your SAML provider's management console, configure a single SAML application using the custom domain as the SP endpoints.
3. Download the SAML signing certificate for the SAML application. In a later step, you upload this certificate to Citrix Cloud.
4. For the Entity ID, ensure <https://saml.cloud.com> is entered. Depending on your SAML provider, this setting might be labeled **Audience** instead. For all other endpoints, replace <https://saml.cloud.com> with the Workspace custom domain that you configured in Step 1.

The following example illustrates the endpoint configuration for Okta, where **Audience Restriction** contains the Entity ID value:

SAML Settings [Edit](#)

GENERAL

Single Sign On URL	https://[REDACTED].com/saml/acs
Recipient URL	https://[REDACTED].com/saml/acs
Destination URL	https://[REDACTED].com/saml/acs
Audience Restriction	https://saml.cloud.com

The following example illustrates the endpoint configuration for OneLogin, where **Audience** contains the Entity ID value:

SAML Custom Connector (Advanced)

- Info
- Configuration**
- Parameters
- Rules
- SSO
- Access
- Users
- Privileges
- Setup

Audience (EntityID)	https://saml.cloud.com
Recipient	https://[REDACTED].com/saml/acs
ACS (Consumer) URL Validator*	https://[REDACTED].com/saml/acs
*Required.	
ACS (Consumer) URL*	https://[REDACTED].com/saml/acs
*Required	
Single Logout URL	https://[REDACTED].com/saml/logout/callback

- In Citrix Cloud, go to **Identity and Access Management > Authentication** and configure the SAML connection.

6. Go to **Workspace Configuration > Authentication** and select **SAML 2.0**.
7. Go to **Workspace Configuration > Custom Workspace URL > Edit** and select **Use only the custom domain**.
8. Select **Save** to save your changes.
9. To test the configuration, sign in to Citrix Workspace using your custom Workspace URL (<https://workspaces.mycompany.com>).

Dual SAML application configuration

1. In Citrix Cloud, go to **Workspace Configuration > Access** and configure a custom domain. For more information, see [Configure a custom domain](#).
2. In your SAML provider's management console, configure two SAML applications. Configure these applications identically, including identical signing settings for SSO and SLO requests, binding type, and logout settings. If the configurations in these SAML applications don't match, you might experience differences in sign-in and logout behavior when switching between your Workspace URL and your Workspace custom domain.
3. In the first SAML application, configure the following SP endpoints:
 - Entity ID: <https://saml.cloud.com>
 - Assertion Consumer Service: <https://saml.cloud.com/saml/acs>
 - Logout: <https://saml.cloud.com/saml/logout/callback>

The following example shows this endpoint configuration in the Okta management console:

A screenshot of the Okta management console showing SAML Settings for a SAML application. The settings are displayed in a table format under the 'GENERAL' tab. The 'Edit' button is visible in the top right corner.

SAML Settings		Edit
GENERAL		
Single Sign On URL	https://saml.cloud.com/saml/acs	
Recipient URL	https://saml.cloud.com/saml/acs	
Destination URL	https://saml.cloud.com/saml/acs	
Audience Restriction	https://saml.cloud.com	

4. In the second SAML application, configure the following SP endpoints. Use your Workspace custom domain only for the Assertion Consumer Service and Logout endpoints.
 - Entity ID: <https://saml.cloud.com>

- Assertion Consumer Service: <https://workspaces.mycompany.com/saml/acs>
- Logout: <https://workspaces.mycompany.com/saml/logout/callback>

The following example shows this endpoint configuration in the Okta console. Note that **Audience Restriction** contains the Entity ID value.

The screenshot shows the 'SAML Settings' page in the Okta console. The 'GENERAL' section is expanded, showing a table of SAML endpoints. The 'Single Sign On URL', 'Recipient URL', and 'Destination URL' are all set to 'https://.com/saml/acs'. The 'Audience Restriction' is set to 'https://saml.cloud.com'. The 'Audience Restriction' field is highlighted with an orange box, and the first three rows are highlighted with a red box.

Field	Value
Single Sign On URL	https://.com/saml/acs
Recipient URL	https://.com/saml/acs
Destination URL	https://.com/saml/acs
Audience Restriction	https://saml.cloud.com

5. Download the SAML signing certificates for both SAML applications. You upload these to Citrix Cloud in a later step.
6. In the Citrix Cloud management console, configure a SAML connection:
 - a) From the Citrix Cloud menu, select **Identity and Access Management**.
 - b) On the **Authentication** tab, locate **SAML 2.0**, click the ellipsis button, and select **Connect**.
 - c) On the **Configure SAML** page, enter the details of the first SAML application that you created in Step 2.
7. Configure Citrix Workspace to use the new SAML connection:
 - a) From the Citrix Cloud menu, select **Workspace Configuration**.
 - b) On the **Authentication** tab, select **SAML 2.0**.
8. On the **Access** tab, in **Custom Workspace URL**, select **Edit**.
9. On the **Configure for SAML** page, select **Use both customer.cloud.com URL and custom domain URL**.
10. Enter the following information:
 - In **Identity Provider Entity ID for custom domain**, enter the Entity ID from the second SAML application that you created in Step 2.
 - In **SSO service URL for custom domain**, enter the SSO URL from the second SAML application.
 - In **Logout URL for custom domain**, enter the SLO URL from the second SAML application.

- In **Identity Provider Signing Certificate for custom domain**, upload the SAML signing certificate from the second SAML application.

Configuration SAML Connection to Citrix Cloud for Custom Domain:

Select the preferred configuration for SAML authentication. Changes may take up to 10 minutes to go into effect.

Use both .com URL and custom domain URL

[Download the custom domain SAML metadata.](#)

i We suggest that you set up your IdP to automatically pull the latest public signing key from the metadata URL in order to prevent a disruption in service. [Learn more](#)

1. Set up secondary SAML identity-provider application, backed with the same active directory server as the primary SAML application.
2. Enter details for secondary SAML application.

Identity Provider Entity ID for custom domain **SAML App 2**

http://www.okta.com/ 357

Identity Provider SSO service URL for custom domain **SAML App 2**

https:// 357/sso/sr

Identity Provider Logout URL for custom domain (optional) **SAML App 2**

https:// 357/slo/sa

Identity Provider Signing Certificate for custom domain

Identity Provider SAML Signing X.509 Certificate | okta.cer **SAML App 2**

Expires: 05/30/33
CN=

Use only the custom domain URL

11. Select **Save** to save your changes.

View the SAML connection details

After configuration, go to **Identity and Access Management > Authentication**. In **SAML 2.0**, select **Select SAML Provider > View** from the ellipsis menu. The SAML Configuration page displays pairs of SAML endpoints configured for Entity ID, SSO URL, and Logout URL.

SAML Connection to Citrix Cloud Configuration			
Identity Provider Entity ID: ⓘ	http://www.okta.com/	7	SAML App 1
Identity Provider Entity ID for custom domain:	http://www.okta.com/	7 Manage custom domain

Identity Provider Logout URL (optional): ⓘ	https://slo/saml	357	SAML App 1
Logout URL for custom domain (optional):	https://slo/saml	357 Manage custom domain	SAML App 2

All other SAML configuration settings apply to both the first and second SAML applications that you created.

Verify sign-ins to Citrix Workspace

To verify the sign-in and logout behavior you configured, perform the following tests:

- Sign in to Citrix Workspace using your Workspace URL (<https://mycompany.cloud.com>) and your SAML provider.
- Sign in to Citrix Workspace using your Workspace custom domain (<https://workspace.mycompany.com>) and your SAML provider.
- Sign in to Citrix Cloud using your unique sign-in URL (<https://citrix.cloud.com/go/mycompany>) and your SAML provider.

Configure Okta as a SAML provider for workspace authentication

February 27, 2024

Author:

Mark Dear

This article describes the required steps for configuring an Okta SAML application and the connection between Citrix Cloud and your SAML provider. Some of these steps describe actions that you perform in your SAML provider's administration console.

Prerequisites

Before you complete the tasks in this article, ensure that you've met the following prerequisites:

- Citrix Support has enabled the **SendNameIDPolicyInSAMLRequest** feature in Citrix Cloud. This feature is enabled upon request. For more information about these features, see Required cloud features for SAML using Okta.
- You have an Okta organization that uses one of the following Okta domains:
 - okta.com
 - okta-eu.com
 - oktapreview.com
- You have synchronized your Active Directory (AD) with your Okta organization.
- **Sign Authentication Requests** is enabled in your Okta organization.
- **Identity Provider Single Logout (SLO)** is configured within both Citrix Cloud and Okta SAML applications. When SLO is configured, and the end user signs out of Citrix Workspace, they also sign out of Okta and all other service providers that share the Okta SAML application.
- **Identity Provider Sign Logout (SLO) Requests** is enabled within Citrix Cloud.

- **Identity Provider Logout Binding (SLO)** is HTTPPost within Citrix Cloud.

* **Identity Provider SAML Signing X.509 Certificate** | [Upload File](#)

* **Identity Provider Authentication Context:** ⓘ

Identity Provider Logout URL (optional): ⓘ

https://logouturl.okta.com

* **Identity Provider Logout (SLO) Binding Mechanism:** ⓘ

HTTP Post ▼

* **Identity Provider Sign Logout (SLO) Request:** ⓘ

Yes No

Required cloud features for SAML using Okta

Before you complete the tasks in this article, you must contact Citrix Support to enable the **Send-NameIDPolicyInSAMLRequest** feature. This feature enables Citrix Cloud to supply the **NameID** policy as **Unspecified** in the SAML request to your SAML provider. This feature is enabled for use with Okta only.

You can request these features by signing in to your Citrix account and opening a ticket through the [Citrix Support web site](#).

Requirements

This article includes a task in which you create a SAML application in the Okta Admin console. This application requires a SAML signing certificate for your Citrix Cloud region.

Important:

The signing certificate must be encoded in PEM format. Citrix Cloud doesn't accept signing certificates in other encoding formats.

You can extract this certificate from the Citrix Cloud SAML metadata for your region using an extraction tool such as the one located at <https://www.rcfed.com/SAMLWSFed/MetadataCertificateExtract>. Citrix recommends acquiring the Citrix Cloud SAML certificate beforehand so you can supply it when needed.

The steps in this section describe how to acquire the signing certificate using the extraction tool at <https://www.rcfed.com/SAMLWSFed/MetadataCertificateExtract>.

To acquire the Citrix Cloud metadata for your region:

1. In the extraction tool of your choice, enter the metadata URL for your Citrix Cloud region:
 - For European Union, United States, and Asia Pacific-South regions, enter <https://saml.cloud.com/saml/metadata>.
 - For the Japan region, enter <https://saml.citrixcloud.jp/saml/metadata>.
 - For the Citrix Cloud Government region, enter <https://saml.cloud.us/saml/metadata>.
2. Click **Load**. The extracted certificate appears below the URL that you entered.
3. Click **Download** to download the certificate in PEM format.

Sync accounts with the Okta AD agent

To use Okta as a SAML provider, you must first integrate your on-premises AD with Okta. To do this, you install the Okta AD agent in your domain and add your AD to your Okta organization. For guidance for deploying the Okta AD agent, see [Get started with Active Directory integration](#) on the Okta web site.

Afterward, you import your AD users and groups to Okta. When importing, include the following values associated with your AD accounts:

- Email
- SID
- UPN
- OID

To synchronize your AD users and groups with your Okta organization:

1. Install and configure the Okta AD agent. For complete instructions, refer to the following articles on the Okta website:

- [Install the Okta Active Directory agent](#)
 - [Configure Active Directory import and account settings](#)
 - [Configure Active Directory provisioning settings](#)
2. Add your AD users and groups to Okta by performing a manual import or an automated import. For more information about Okta import methods and instructions, refer to [Manage Active Directory users and groups](#) on the Okta website.

Configure an Okta SAML application for workspace authentication

1. Sign in to your Okta organization using an administrator account with permissions to add and configure SAML applications.
2. In the Admin console, select **Applications > Applications > Create App Integration** and then select **SAML 2.0**. Select **Next**.

Create a new app integration

Sign-in method
[Learn More](#)

- OIDC - OpenID Connect**
Token-based OAuth 2.0 authentication for Single Sign-On (SSO) through API endpoints. Recommended if you intend to build a custom app integration with the Okta Sign-In Widget.
- SAML 2.0**
XML-based open standard for SSO. Use if the Identity Provider for your application only supports SAML.
- SWA - Secure Web Authentication**
Okta-specific SSO method. Use if your application doesn't support OIDC or SAML.
- API Services**
Interact with Okta APIs using the scoped OAuth 2.0 access tokens for machine-to-machine authentication.

3. In **App Name**, enter a friendly name for the application. Select **Next**.

Create SAML Integration

1 General Settings 2 Configure SAML 3 Feedback

1 General Settings

App name: Citrix Cloud Prod

App logo (optional): citrix

App visibility:

- Do not display application icon to users
- Do not display application icon in the Okta Mobile app

Cancel Next

4. In the **SAML Settings** section, configure the Citrix Cloud Service Provider (SP) connection:

- a) In **Single sign-on URL**, enter the URL that corresponds to the Citrix Cloud region for your Citrix Cloud customer:
 - If your customer ID is in the European Union, United States, or Asia Pacific-South regions, enter <https://saml.cloud.com/saml/acs>.
 - If your customer ID is in the Japan region, enter <https://saml.citrixcloud.jp/saml/acs>.
 - If your customer ID is in the Citrix Cloud Government region, enter <https://saml.cloud.us/saml/acs>.
- b) Select **Use this for Recipient and Destination URL**.
- c) In **Audience URI (SP Entity ID)**, enter the URL that corresponds to the Citrix Cloud region for your Citrix Cloud customer:
 - If your customer ID is in the European Union, United States, or Asia Pacific-South regions, enter <https://saml.cloud.com>.
 - If your customer ID is in the Japan region, enter <https://saml.citrixcloud.jp>.
 - If your customer ID is in the Citrix Cloud Government region, enter <https://saml.cloud.us>.
- d) In **Name ID Format**, select **Unspecified**. The NameID policy that Citrix Cloud sends within the SAML request must match the NameID format specified within the Okta SAML application. If these items don't match, enabling **Sign Authentication Request** results in an error from Okta.

- e) In **Application username**, select **Okta username**.

As an example of this configuration, the following image illustrates the correct configuration for US, EU, and Asia Pacific-South regions:

The screenshot shows the 'SAML Settings' configuration page. Under the 'General' section, the following settings are visible:

- Single sign-on URL**: `https://saml.cloud.com/saml/acs`. A checkbox labeled 'Use this for Recipient URL and Destination URL' is checked.
- Audience URI (SP Entity ID)**: `https://saml.cloud.com`
- Default RelayState**: (Empty field). A note below states: 'If no value is set, a blank RelayState is sent'.
- Name ID format**: `Unspecified` (selected from a dropdown menu).
- Application username**: `Okta username` (selected from a dropdown menu).
- Update application username on**: `Create and update` (selected from a dropdown menu).

Important:

The **Name ID** setting must be configured as **Unspecified**. Using a different value for this setting causes the SAML sign-in to fail.

- f) Click **Show Advanced Settings** and configure the following settings:
- In **Response**, select **Signed**.
 - In **Assertion Signature**, select **Signed**.
 - In **Signature Algorithm**, select **RSA-SHA256**.
 - In **Assertion Encryption**, select **Unencrypted**.
- g) In **Signature Certificate**, upload the SAML signing certificate for your Citrix Cloud region in PEM format. For instructions for acquiring the SAML signing certificate, see Requirements in this article.
- h) In **Enable Single Logout**, select **Allow application to initiate Single Logout**.
- i) In **Single Logout URL**, enter the URL that corresponds to your Citrix Cloud region:
- For European Union, United States, and Asia Pacific-South regions, enter `https://saml.cloud.com/saml/logout/callback`.

- For the Japan region, enter <https://saml.citrixcloud.jp/saml/saml/logout/callback>.
 - For Citrix Cloud Government, enter <https://saml.cloud.us/saml/logout/callback>.
- j) In **SP Issuer**, enter the value that you entered earlier in **Audience URI (SP Entity ID)** (Step 4c of this task).
- k) In **Signed Requests**, select **Validate SAML requests with signature certificates**.

The following image illustrates the correct configuration for US, EU, and Asia Pacific-South regions:

6. Select **Next**. The Okta configuration statement appears.

3 Help Okta Support understand how you configured this application

Are you a customer or partner?

I'm an Okta customer adding an internal app
 I'm a software vendor. I'd like to integrate my app with Okta

i The optional questions below assist Okta Support in understanding your app integration.

App type **?** This is an internal app that we have created

[Previous](#) [Finish](#)

7. In **Are you a customer or partner?**, select **I'm an Okta customer adding an internal app**.

8. In **App type**, select **This is an internal app that we have created**.
9. Select **Finish** to save your configuration. The profile page for your SAML application appears and displays the contents of the **Sign On** tab.

After configuration, select the **Assignments** tab and assign users and groups to the SAML application.

Licensing for Citrix Cloud

November 8, 2023

Citrix Cloud provides license and usage monitoring for certain cloud services. As well, license and usage monitoring is available for on-premises deployments where Citrix License Server is registered with Citrix Cloud.

Licensing for enterprise customers

Enterprise customers can monitor license assignments and usage for supported cloud services by selecting **Licensing** from the Citrix Cloud menu.

For more information about enterprise license and usage monitoring for cloud services, see [Monitor licenses and active usage for cloud services](#).

Licensing for on-premises deployments

Enterprise customers with an on-premises deployment of Citrix Virtual Apps and Desktops can use Citrix Cloud to stay abreast of licenses and usage for both User/Device and Concurrent licensing models. By registering Citrix License Server with Citrix Cloud, customers can use the **Licensed Deployments** page in Citrix Cloud for the following tasks:

- Monitor the reporting status of registered license servers
- View license assignments and usage trends for deployments that use the User/Device licensing model.
- View peak license usage trends for deployments that use the Concurrent licensing model.

For more information about license and usage monitoring for on-premises Virtual Apps and Desktops deployments, see [Monitor licenses and usage for on-premises deployments](#).

Licensing for Citrix Service Providers (CSP)

Citrix Service Providers can use the following tools to understand and report on product licenses and usage:

- License Usage Insights is a free service in Citrix Cloud that collects and aggregates product usage information across single-tenant and multitenant customers. For more information, see [Licensing for Citrix Service Providers](#).
- The Licensing feature in Citrix Cloud enables customers of CSPs to monitor their licenses and usage for supported Citrix DaaS (formerly Citrix Virtual Apps and Desktops service) products. CSPs can sign in under their customer's Citrix Cloud account to view and export this information as well. For more information, see the following articles:
 - [Customer license and usage monitoring for Citrix DaaS](#)
 - [Customer license and usage monitoring for Citrix DaaS Standard for Azure](#)

Monitor licenses and active usage for cloud services

September 21, 2023

Licensing in Citrix Cloud enables you to stay on top of license consumption for the cloud services you have purchased. Using the summary and detail reports, you can:

- View license availability and assignments at a glance
- View daily and monthly active usage trends for applicable cloud services
- Drill down to see individual license assignment details and usage trends
- Export license usage data to CSV

To view licensing data for your cloud services, select **Licensing** from the console menu.

**Note:**

This article covers Licensing features that are common to all supported Citrix Cloud services. Some aspects of Licensing might be different, depending on the service (for example, license assignment). For more information about licenses and usage for each service, see the following articles:

- [Monitor licenses and active usage for Citrix DaaS \(User/Device\)](#)
- [Monitor licenses and peak usage for Citrix DaaS and Citrix DaaS Standard for Azure \(Concurrent\)](#)
- [Monitor licenses and active usage for Citrix DaaS Standard for Azure \(User/Device only\)](#)
- [Monitor licenses and active usage for Endpoint Management service](#)
- [Monitor bandwidth usage for Gateway service](#)
- [Monitor licenses and usage for Secure Private Access](#)

Supported regions and cloud services

Licensing is available for supported services in the US, EU, and Asia Pacific South regions only.

Licensing is supported for the following cloud services:

- Citrix DaaS (User/Device and Concurrent licensing models) - formerly Citrix Virtual Apps and Desktops service
- Citrix DaaS Standard for Azure (User/Device licensing model) - formerly Citrix Virtual Apps and Desktops Standard for Azure
- Endpoint Management
- Gateway
- Secure Private Access (formerly Secure Workspace Access)

Multi-type licensing for Citrix DaaS

Licensing in Citrix Cloud supports multi-type licensing for Citrix DaaS. If both User/Device and Concurrent licensing models are introduced into a single Citrix Cloud account, Citrix Cloud shows license usage under each licensing mode in the Licensing console page.

Citrix recommends setting up multi-type licensing at the site and delivery group levels before reviewing the Licensing page. Otherwise, the correct information might not appear. For instructions, see [Multi-type licensing](#) in the Citrix DaaS documentation.

If the Licensing console page doesn't display the correct multi-type license usage after successfully using the Web Studio or PowerShell setup methods, you have the following options:

- Wait 30 days and [release any unused licenses](#).
- Contact [Citrix Customer Service](#).

License assignment

In general, users are assigned a license upon first use of the cloud service. Some services might assign licenses differently based on the licensing model they use. For more information about how licenses are assigned for each service, see the Licensing articles referenced at the top of this article.

Licensing summary and details

The Licensing summary provides an at-a-glance view of the following information for each supported service:

- Percentage of total purchased licenses assigned. As the percentage approaches 100%, the percentage goes from green to yellow. If the percentage exceeds 100%, the percentage turns red.
- The ratio of assigned licenses to purchased licenses and the number of available licenses remaining.
- The time remaining before the cloud service subscription expires. If the subscription expires within the next 90 days, a warning message appears.

For some services, this summary might include additional information such as active use. For more information about service-specific details, see the Licensing articles referenced at the top of this article.

Usage trends and license activity

For a detailed view of your cloud service licenses, click **View Usage Details**. You can then see a breakdown of usage trends and consumers of cloud service licenses.

This breakdown includes varying information, depending on the cloud service. For more information about service-specific usage trends and license activity, see the Licensing articles referenced at the top of this article.

Release assigned licenses

In general, an assigned license is eligible for release if the consumer hasn't used the cloud service for 30 consecutive days. When a license is released, the number of remaining licenses increases and the number of assigned licenses decreases accordingly.

For some services, releasing licenses might be different, depending on the licensing model used. For more information about releasing licenses for a specific service, see the Licensing articles referenced at the top of this article.

FAQ

- **Does Citrix prevent cloud service usage if assigned licenses exceed purchased licenses?** No, Citrix does not prevent any service launches if you overuse your cloud license amount. License Usage provides information for understanding your cloud license usage, so Citrix expects that you will monitor your license assignments and stay within your purchased license amount. If, at any point, you believe that you are going to overuse your service, Citrix encourages you to contact your sales representative to discuss your licensing requirements.
- **What licensing information is being captured?** Currently, only license information associated with user logins is captured.
- **Is multi-type licensing supported with Citrix DaaS (for example, using both User/Device and Concurrent User models)?** Yes. See Multi-type licensing in this article for additional information.
- **Is multi-edition licensing supported for Citrix DaaS? For example, can I use both Premium and Advanced editions on the same Citrix Cloud account?** No, this use case is not supported. A Citrix DaaS site can be licensed for only one edition. If you want to use multiple Citrix DaaS instances on the same Citrix Cloud account, they must be the same edition.
- **What is the difference between Monitor reporting (in Director) vs Concurrent licensing insights?** The Monitor report and explanation of concurrent sessions provides a different interpretation and metric than a measure of concurrent licenses in use. In most cases, using the

number of concurrent sessions within Director as a representation or forecast of peak concurrent licenses in use greatly overstates the number of concurrent licenses needed. Do not use the Monitor report in Director as a substitute for a report on concurrent license usage. The two main differences between the reporting tools are:

- **Sampling Time Length:** Licensing has a five-minute sampling period. Every five minutes, Citrix Cloud counts the unique devices currently connected to the service. All the five-minute sampling periods are aggregated to determine peak usage in a 24-hour, monthly, and contract length period. The Monitor report in Director can show intervals of up to two hours depending on how the report is run.
 - **Uniqueness:** Licensing looks for uniqueness amongst devices when sessions are launched. The Monitor report does not account for unique devices.
- **After migrating users to a new instance of a cloud service (for example, I changed the domain name for my organization), why are my licenses in-use counted twice for the same users?**- Citrix Cloud uses the User Principle Name (UPN) to count unique users. If a user accessed the cloud service before and after the migration occurred, Citrix Cloud captures two unique UPNs for the user, each with a different domain name. Therefore, Citrix Cloud counts the same user twice. You can release the older license assignment after 30 days, assuming the user doesn't access the service under the old domain name. Citrix does not prevent any service launches if you overuse your cloud license amount.
 - **Why am I seeing duplicate licenses for the same user or device?**- This is by design of the Workspace app for HTML5 and locally-installed Workspace app. Launches through Workspace app for HTML5 consume a User/Device license. As well, launches through locally-installed Workspace app consume a User/Device license. So, if a user launches apps through Workspace app for HTML5 and then launches through a locally-installed version of Workspace app later, Citrix Cloud shows that the user consumed two licenses. This behavior doesn't affect user connectivity, but can result in inflated device license usage reports in the Licensing console. Citrix does not prevent any service launches if you overuse your cloud license amount.

Monitor licenses and active usage for Citrix DaaS (User/Device)

October 26, 2023

This article describes how you can manage cloud service license assignments and monitor active usage using the Licensing console in Citrix Cloud.

If you purchased Citrix Azure Consumption Fund to use with your service deployment, see [Monitor Citrix Managed Azure resource consumption for Citrix DaaS](#) for more information.

License assignment

Citrix Cloud assigns a license when a unique user or unique device launches an app or desktop for the first time.

Domain name truncation

If you host multiple domains and have users with similar accounts in those domains (for example, `johnsmith@company.com` and `johnsmith@mycompany.com`), you can allow Citrix Cloud to ignore the account domain and consider only the user name of the account (for example, `johnsmith`). This process is known as *domain name truncation*. By default, domain name truncation is disabled.

When domain name truncation is enabled, Citrix Cloud's calculation of unique users changes. Instead of counting `johnsmith@company.com` and `johnsmith@mycompany.com` as two unique users, Citrix Cloud counts only `johnsmith` as a unique user. This calculation change affects the following Licensing data:

- License assignment
- Active use
- License usage trends over time
- Licenses eligible for release

These changes in licensing data are also reflected when you export data to a CSV file from the Licensing console.

Note:

If you host multiple domains with similar accounts where the user name is slightly different (for example, an individual user has the accounts `johnsmith@company.com` and `jsmith@newcompany.com`), domain name truncation has no effect on Citrix Cloud's calculations. Citrix Cloud still counts `johnsmith` and `jsmith` as unique users even if they belong to the same individual.

Enable or disable domain name truncation

By default, domain name truncation is disabled. Domain name truncation has an effect on your User/Device usage data from the moment you enable or disable the feature. For example, if you enable domain name truncation in a given month, the data that Citrix Cloud records in that month is affected. However, historical data for previous months, when the feature was disabled, remains unaffected. Likewise, if you disable domain name truncation in a given month, the data that Citrix Cloud records in that month is affected. However, historical data for the months when the feature was enabled remains intact.

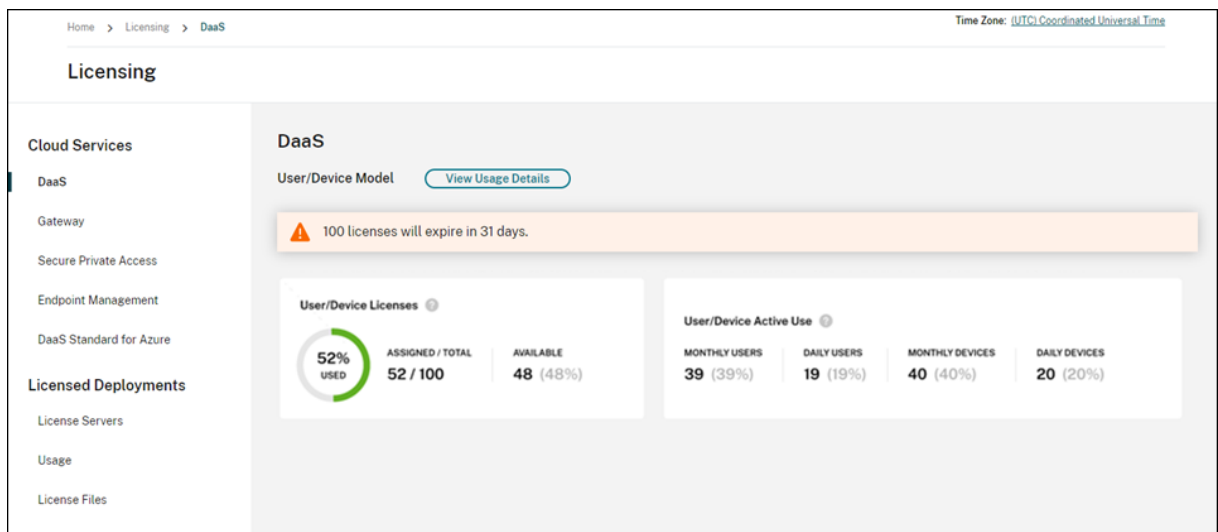

To enable or disable domain name truncation:

1. Click the toggle near the top-right of the Licensing console.

2. When prompted to confirm your action, select **Yes, I understand**.

Licensing summary

The Licensing summary provides an at-a-glance view of the following information:

- Percentage of total purchased licenses that have been assigned. As the percentage approaches 100%, the percentage goes from green to yellow. If the percentage exceeds 100%, the percentage turns red.

The quantity of total purchased licenses is the sum of licenses that have been purchased for Citrix DaaS editions that use the User/Device licensing model.

- The ratio of assigned licenses to purchased licenses and the number of available licenses remaining.
- Active usage statistics on a monthly and daily basis:
 - Monthly active use refers to the number of unique users or devices that have used the service in the last 30 days.
 - Daily active use refers to the number of unique users or devices that have used the service in the last 24 hours.
- The time remaining before the cloud service subscription expires. If the subscription expires within the next 90 days, a warning message appears.

Calculating assigned licenses and active use

To accurately reflect the User/Device licensing model for Citrix DaaS, Citrix Cloud counts the number of unique users and unique devices that have used the service. To measure assigned licenses, Citrix Cloud uses the lesser of these counts. To measure active use, Citrix Cloud uses each count as the quantity of active users and active devices in a given period.

Example of calculating assigned licenses

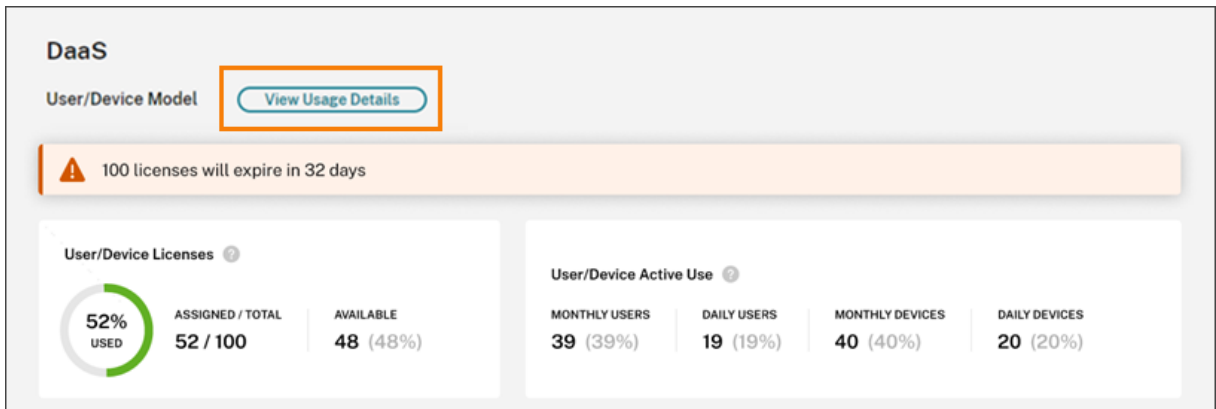

If 100 unique users and 50 unique devices have used the service, Citrix Cloud uses the lesser number (50) to determine the number of assigned licenses. The percentage of licenses used and the number of available licenses are based on these 50 assigned licenses.

Example of calculating active use

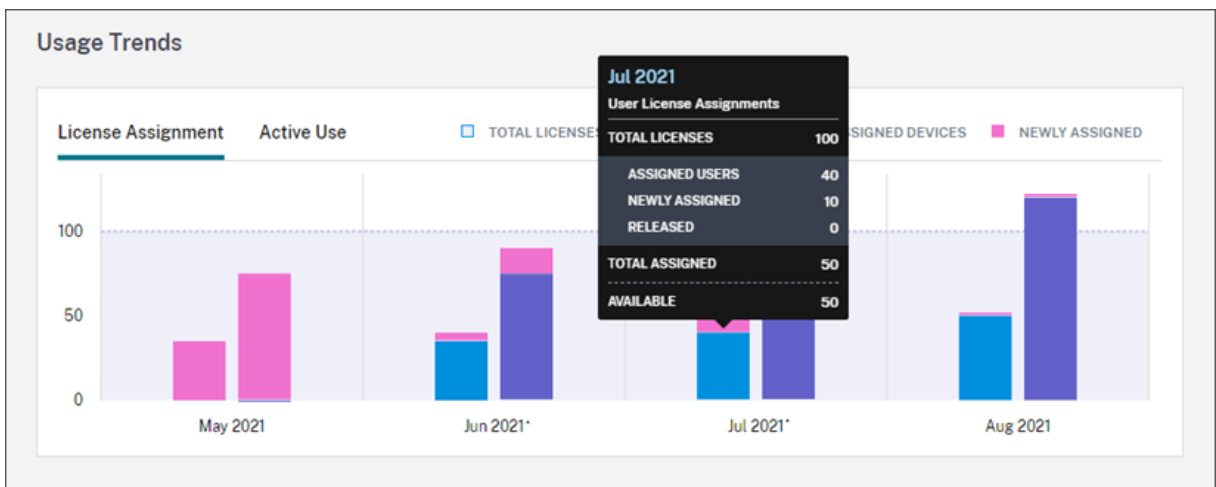

If 10 unique users and 20 unique devices used the service in the last 30 days, Citrix Cloud determines that monthly active use consists of 10 active users and 20 active devices. Likewise, if 30 unique users and 15 unique devices were counted in the last 24 hours, Citrix Cloud determines that daily active use consists of 30 active users and 15 active devices.

Usage trends

For a detailed view of your licenses, click **View Usage Details** at the far right of summary. You can then see a breakdown of usage trends and individual users and devices that are consuming cloud service licenses.

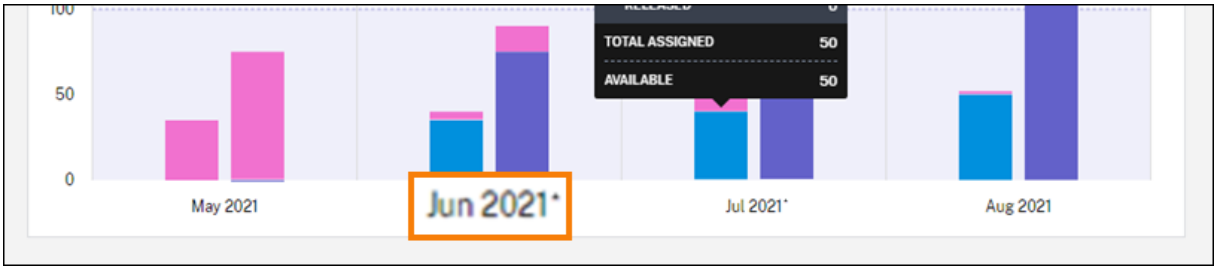

The **Usage Trends** section displays this breakdown as a graph.

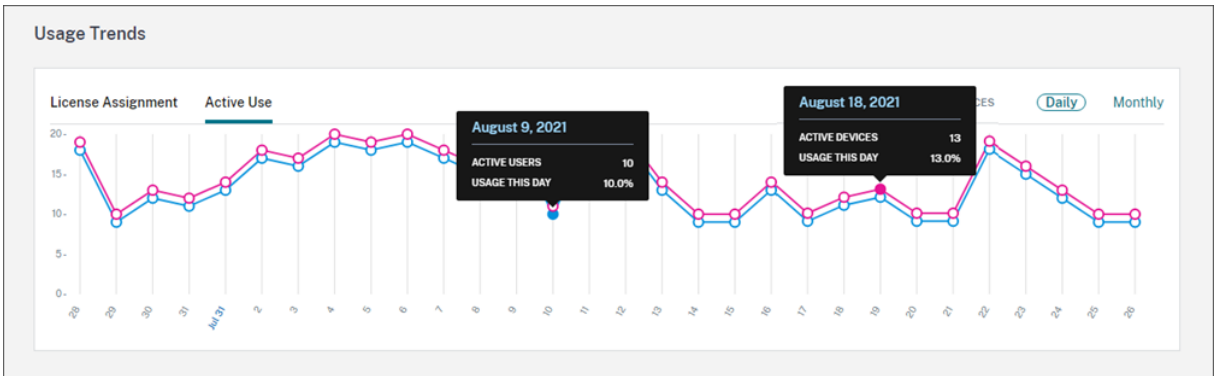

On the **License Assignment** graph, pointing to a bar for a specific month or day shows you the following information:

- **Total Licenses:** Your total purchased licenses for the cloud service across all entitlements.
- **Assigned Users:** The cumulative number of licenses assigned to users up to the current month.
- **Assigned Devices:** The cumulative number of licenses assigned to devices up to the current month. If this number seems particularly high for a given month, this could be the result of app or desktop launches occurring through a web browser. To lower this number, Citrix recommends using a locally-installed Workspace app.
- **Newly Assigned:** The number of new licenses that were assigned for each month. For example, a user accesses the cloud service for the first time in July and is assigned a license. This license is counted as “Newly Assigned” for the month of July.
- **Released:** The number of eligible licenses that were released during each month. For example, if 20 licenses were eligible for release and you released 10 of them in July, the number of released licenses shown for July is 10.

Intervals of time in which domain truncation is enabled are marked with an asterisk.

On the **Active Use** graph, you can view active users and devices over the previous calendar month and calendar year, respectively. Pointing to a specific interval on the graph reveals the number of active users or devices and the usage percentage.

License Activity

The **License Activity** section displays the following information:

- A list of the individual users who have assigned licenses, including associated devices.

License Activity

60 Licensed Users 60 Licensed Devices [Export](#)

[Release Licenses](#) Show only releasable licenses Search by User... << 1 >>

Username	Domain	Devices	Last Login	Date Assigned ↓
<input type="checkbox"/> User23100300	[Redacted]	1 Device	Oct 3, 2023 00:05:57 UTC	Oct 3, 2023
<input type="checkbox"/> User23100212	[Redacted]	1 Device	Oct 2, 2023 12:03:57 UTC	Oct 2, 2023
<input type="checkbox"/> User23100200	[Redacted]	1 Device	Oct 2, 2023 00:09:11 UTC	Oct 2, 2023

- A list of the devices that have assigned licenses, including associated users.

License Activity

60 Licensed Users 60 Licensed Devices [Export](#)

[Release Licenses](#) Show only releasable licenses Search by Device Name... << 1 >>

Device Name	Device ID	Users	Last Login	Date Assigned ↓
<input type="checkbox"/> Device23100900	Device23100900	1 User	Oct 9, 2023 00:06:29 UTC	Oct 9, 2023

<input type="checkbox"/> Device23100800	Device23100800	1 User	Oct 8, 2023 00:06:24 UTC	Oct 8, 2023
<input type="checkbox"/> Device23100712	Device23100712	1 User	Oct 7, 2023 12:01:21 UTC	Oct 7, 2023

- The date when a license was assigned to the user or device.

You can also filter the list to show only licenses that are eligible for release. See [To release assigned licenses](#) in this article.

Release assigned licenses

When a license is assigned, the assignment period is 90 days and the connection to the service is established. If a user or device hasn't launched an app or desktop for 90 days, these licenses are considered as unused licenses and they are released by Citrix Cloud after 90 days. This process is automated with no actions required by the administrator.

After the assignment period (90 days), the administrator is allowed to release the licenses manually in the following scenarios only:

- The user is no longer associated with the company.
- The user is on an extended leave of absence.

The administrators can release the licenses for devices only when the devices are out of service.

Note:

- It is recommended to follow the automated process of releasing the Licenses. However if the administrator intends to release the licenses before the 90-day period apart from the above mentioned reasons, this might violate the Citrix EULA. Before performing this action, contact Citrix.
- The administrator can manually release a single license through the UI. Alternatively, the administrator can choose to release licenses using the cloud licensing API. For more information see, [APIs to manage Citrix cloud licensing](#).

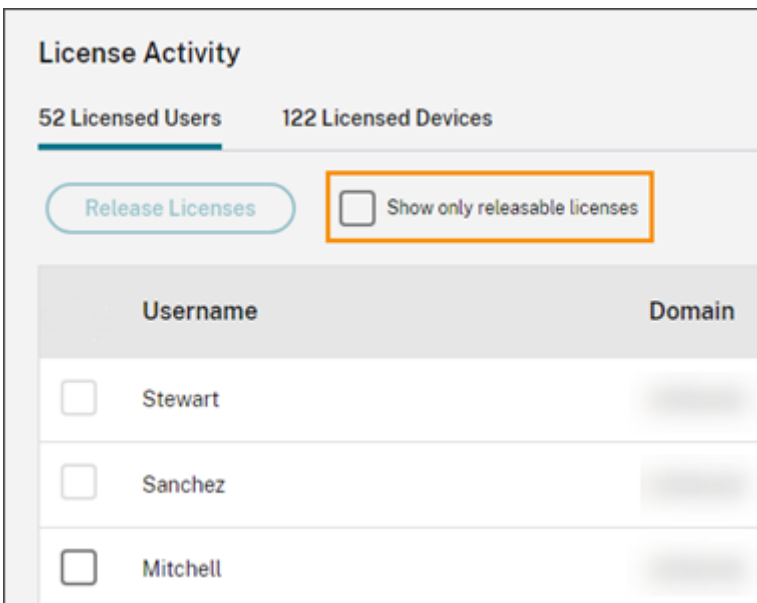

Find releasable licenses

If the user or device hasn't launched an app or desktop for 30 days, Citrix Cloud places the license in releasable state. Releasable licenses appear in the Licensed Users or Licensed Devices list with a dark gray checkbox that can be selected. Licenses that aren't releasable displays a light gray checkbox indicating that license cannot be selected.

The list that appears in the **License Activity** section displays up to 100 assigned licenses at a time. If you have more than 100 licenses, use the page controls to move through the list.

To locate releasable licenses quickly, click **Show only releasable licenses**, next to the **Release Licenses** button. This action hides assigned licenses that aren't yet allowed to be released.

Select releasable licenses

Select the dark gray checkbox next to each license to select it for release. When you select a license from the list, the **Release Licenses** button becomes active.

You can select all releasable licenses one-by-one and click **Release Licenses**.

To release assigned licenses

1. Under **License Activity**, click the **Licensed Users** or **Licensed Devices** tab.
2. If needed, click **Show releasable licenses** to display only the users with licenses that are allowed to be released.
3. Select the users or devices you want to manage and then click **Release Licenses**.
4. Review the users or devices you've selected and then click **Release Licenses**.

Monitor licenses and peak usage for Citrix DaaS (Concurrent User)

September 21, 2023

This article describes the experience for managing Concurrent User licenses for **Citrix DaaS** only.

For information about User/Device licensing for Citrix DaaS, see [Monitor licenses and active use for Citrix DaaS \(User/Device\)](#).

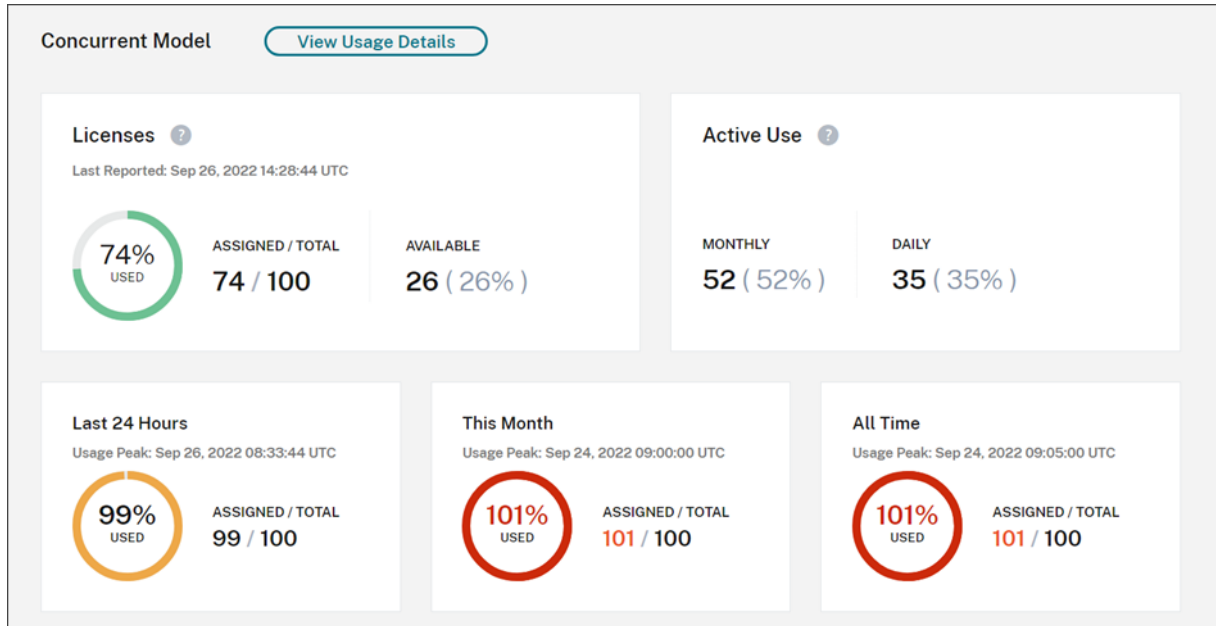

For information about User/Device and Concurrent User licensing for Citrix DaaS Standard for Azure, see [Monitor licenses and usage for Citrix DaaS Standard for Azure](#).

License assignment

Citrix Cloud assigns a license when a user launches an app or desktop on their device. When the user logs off or disconnects from the session, the license is no longer assigned. Because license assignment can change depending on the number of devices accessing apps or desktops at any given time, Citrix Cloud evaluates the number of licenses in use every five minutes.

For more information about the Concurrent User licensing model, see [Concurrent license](#) in the Licensing product documentation.

Licensing summary

The Licensing summary provides an at-a-glance view of the following information:

- Percentage of total purchased licenses currently in use when Citrix Cloud last evaluated the licenses in use. Citrix Cloud calculates this percentage every five minutes based on unique devices with active connections to the service. The quantity of total purchased licenses is the sum of licenses that have been purchased for Citrix DaaS editions that use the Concurrent User licensing model.
- The ratio of currently assigned licenses to total purchased licenses and the number of available licenses remaining. The **Total** figure shown in this ratio represents the total number of licenses that are currently owned (as of the “Last Reported” date and time).
- Peak usage statistics. In calculating peak licenses in use, Citrix Cloud retrieves the the maximum number of licenses used in the following time periods:
 - **Last 24 hours:** The maximum number of licenses used at one time during the last 24-period period.
 - **This Month:** The maximum number of licenses used at one time from the start of the current calendar month.
 - **All Time:** The maximum number of licenses used at one time from the start of the subscription.

The **Total** figure shown for these peak usage periods represents the total number of licenses that were owned at that point in time. If the total number of owned licenses increases or decreases, and there’s a corresponding increase in assigned licenses, the **Total** figure changes to reflect

the new number of owned licenses for that point in time. However, if there is no corresponding usage peak, the **Total** figure does not change.

- Active use statistics. Citrix Cloud displays the total number of unique connections for the following periods:
 - **Monthly:** The total number of connections for the previous calendar month.
 - **Daily:** The total number of connections for the previous 24 hours.These figures are also represented as percentages of the total number of licenses owned during these periods.

Calculating peak licenses in use

To accurately reflect the Concurrent User licensing model, Citrix Cloud counts the number of unique devices accessing the service simultaneously every five minutes. If the count is greater than the current peak usage displayed, Citrix Cloud displays the new peak usage with the date and time that it was reached. If the count is less than the current peak usage, the current peak usage doesn't change.

Important:

If you use Monitor in Director for information about concurrent sessions, be aware that the Monitor report provides a different interpretation of concurrent sessions and does not accurately reflect the number of Concurrent User licenses in use. For more information about the differences between Monitor reports and Licensing reports, see the [FAQ](#).

Calculating monthly active use

At the beginning of each month, Citrix Cloud takes a snapshot of the previous calendar month. Citrix Cloud displays the total number of unique connections that occurred during that calendar month.

Calculating daily active use

At the same time each day, Citrix Cloud takes a snapshot of the previous 24 hours. Citrix Cloud displays the total number of unique connections that occurred during that 24-hour period.

Usage trends and license activity

For a historical view of your licenses, click **View Usage Details**.

The **Usage Trends** section shows you the following information:

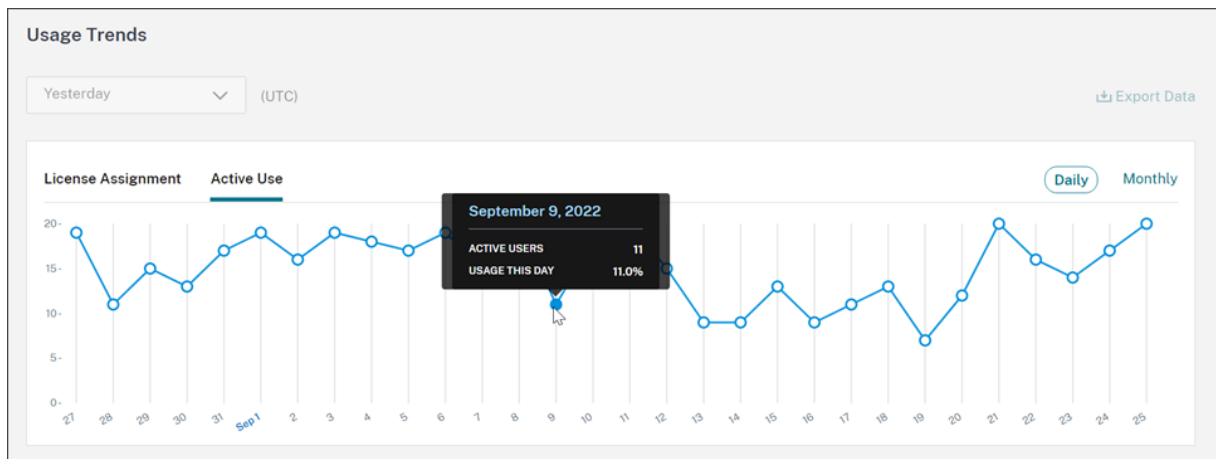

- **License Assignment** displays a chart of the following information:

- **Total Licenses:** Your total purchased Concurrent User licenses.
- **Peak Licenses In Use:** The maximum number of licenses assigned for the date range that you select. By default, Citrix Cloud displays peak usage for each month in the current calendar year. To drill down to monthly or hourly peak usage, select the calendar month or day you want to view from the drop-down menu.

If the date range you select isn't yet finished, Citrix Cloud displays the current peak usage for the latest interval of time. For example, if you drill down to view a calendar day that's still in progress, the maximum number of licenses is displayed for each hour up to the current moment in time. If the maximum number of licenses increases at the next five-minute counting interval, Citrix Cloud updates the peak usage for the current hour.

- **Active Use** displays a chart of the following information:
 - **Daily:** The total number of connections for each day during the previous 30 days.
 - **Monthly:** The total number of connections for each month during the previous calendar year.

Pointing to an interval on the **License Assignment** or **Active Use** charts reveals the details for that interval.

Release licenses

Concurrent User licenses are released automatically when users sign out or disconnect from their session. You don't need to release these licenses manually.

Monitor licenses and usage for Citrix DaaS Standard for Azure

October 26, 2023

This article describes the experience for managing license assignments for both User/Device and Concurrent User licensing models.

Citrix Azure Consumption Fund (User/Device only)

If you purchased Citrix Azure Consumption Fund to use with your service deployment, see [Monitor Citrix Managed Azure resource consumption for Citrix DaaS](#) for more information about consumption reporting for Citrix-managed resources.

License assignment

User/Device licensing model: Citrix Cloud assigns a license when a unique user or unique device launches a desktop for the first time.

Concurrent User licensing model: Citrix Cloud assigns a license when a user launches a desktop on their device. When the user logs off or disconnects from the session, the license is no longer assigned. Because license assignment can change depending on the number of devices accessing desktops at any given time, Citrix Cloud evaluates the number of licenses in use every five minutes.

For more information about the Concurrent licensing model, see [Concurrent licenses](#) in the Licensing product documentation.

Calculating peak licenses in use

To accurately reflect the Concurrent licensing model, Citrix Cloud counts the number of unique devices accessing the service simultaneously every five minutes. If the count is greater than the current peak usage displayed, Citrix Cloud displays the new peak usage with the date and time that it was reached. If the count is less than the current peak usage, the current peak usage doesn't change.

Domain name truncation

This feature is supported for the **User/Device** licensing model only.

If you host multiple domains and have users with similar accounts in those domains (for example, [johnsmith@company.com](#) and [johnsmith@mycompany.com](#)), you can allow Citrix Cloud to ignore the account domain and consider only the user name of the account (for example, johnsmith). This process is known as *domain name truncation*. By default, domain name truncation is disabled.

When domain name truncation is enabled, Citrix Cloud's calculation of unique users changes. Instead of counting [johnsmith@company.com](#) and [johnsmith@mycompany.com](#) as two unique users, Citrix Cloud counts only johnsmith as a unique user. This calculation change affects the following Licensing data:

- License assignment
- Active use
- License usage trends over time
- Licenses eligible for release

These changes in licensing data are also reflected when you export data to a CSV file from the Licensing console.

Note:

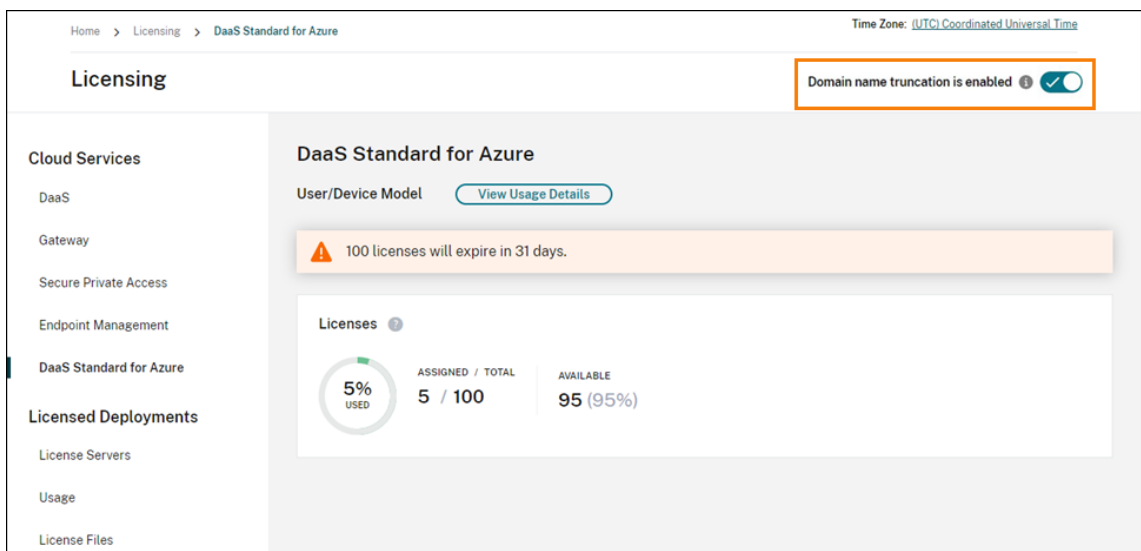

If you host multiple domains with similar accounts where the user name is slightly different (for example, an individual user has the accounts `johnsmith@company.com` and `jsmith@newcompany.com`), domain name truncation has no effect on Citrix Cloud’s calculations. Citrix Cloud still counts johnsmith and jsmith as unique users even if they belong to the same individual.

Enable or disable domain name truncation

By default, domain name truncation is disabled. Domain name truncation has an effect on your User/Device usage data from the moment you enable or disable the feature. For example, if you enable domain name truncation in a given month, the data that Citrix Cloud records in that month is affected. However, historical data for previous months, when the feature was disabled, remains unaffected. Likewise, if you disable domain name truncation in a given month, the data that Citrix Cloud records in that month is affected. However, historical data for the months when the feature was enabled remains intact.

To enable or disable domain name truncation:

1. Click the toggle near the top-right of the Licensing console.

2. When prompted to confirm your action, select **Yes, I understand**.

Licensing summary

Citrix Cloud displays summary views of licenses in use under the User/Device and Concurrent User licensing models.

Summary for users and devices

For the User/Device model, the licensing summary shows the licenses that are in use relative to the total number of licenses that you own.

As the percentage approaches 100%, the percentage goes from green to yellow. If the percentage exceeds 100%, the percentage turns red.

Citrix Cloud also displays the ratio of assigned licenses to purchased licenses and the number of remaining available licenses.

Summary for concurrent users

For the Concurrent model, the licensing summary provides an at-a-glance view of the following information:

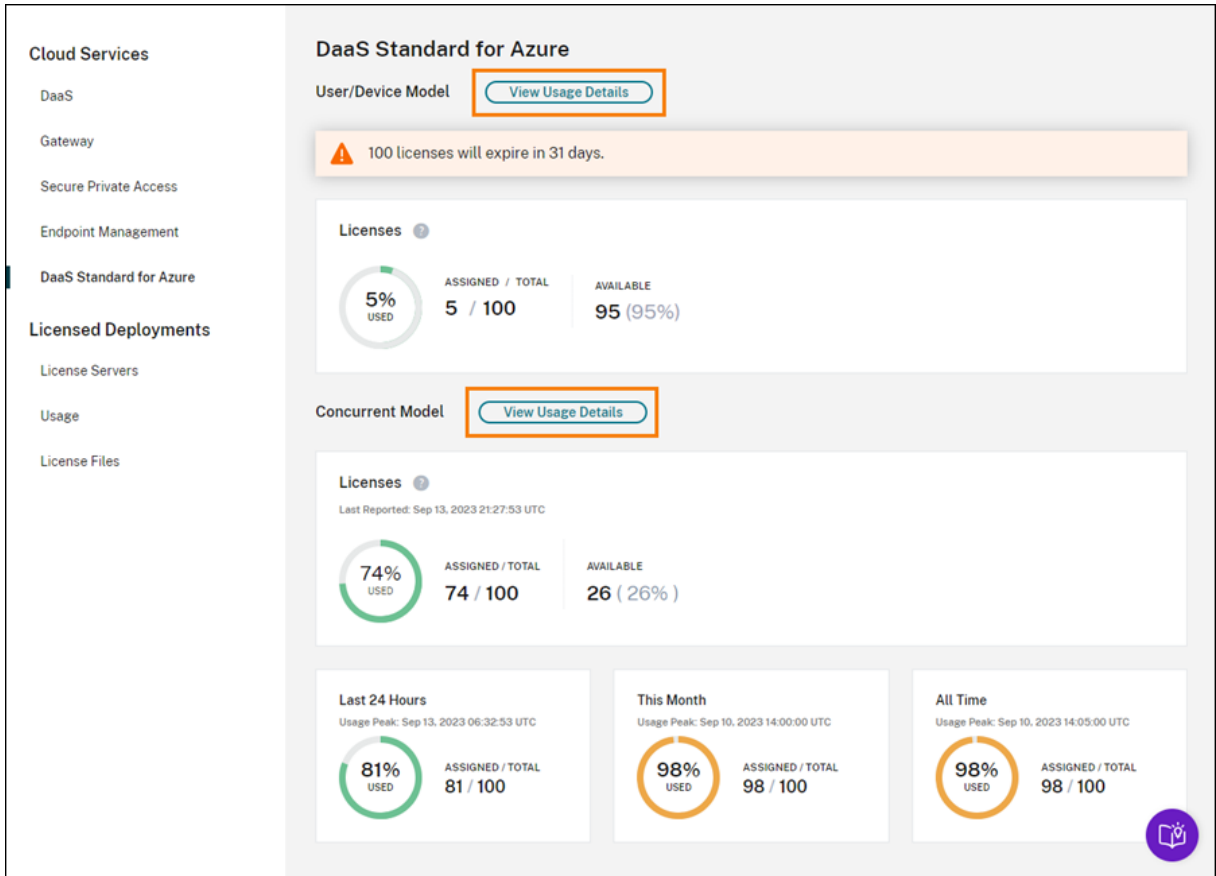

- Percentage of total purchased licenses currently in use when Citrix Cloud last evaluated the licenses in use. Citrix Cloud calculates this percentage every five minutes based on unique devices with active connections to the service. The quantity of total purchased licenses is the sum of licenses that have been purchased for Citrix DaaS Standard for Azure that use the Concurrent licensing model.
- The ratio of currently assigned licenses to total purchased licenses and the number of available licenses remaining. The **Total** figure shown in this ratio represents the total number of licenses that are currently owned (as of the “Last Reported” date and time).
- Peak usage statistics. In calculating peak licenses in use, Citrix Cloud retrieves the the maximum number of licenses used in the following time periods:
 - **Last 24 hours:** The maximum number of licenses used at one time during the last 24-period period.
 - **This Month:** The maximum number of licenses used at one time from the start of the current calendar month.
 - **All Time:** The maximum number of licenses used at one time from the start of the subscription.

The **Total** figure shown for these peak usage periods represents the total number of licenses that were owned at that point in time. If the total number of owned licenses increases or decreases, and there’s a corresponding increase in assigned licenses, the **Total** figure changes to reflect the new number of owned licenses for that point in time. However, if there is no corresponding usage peak, the **Total** figure does not change.

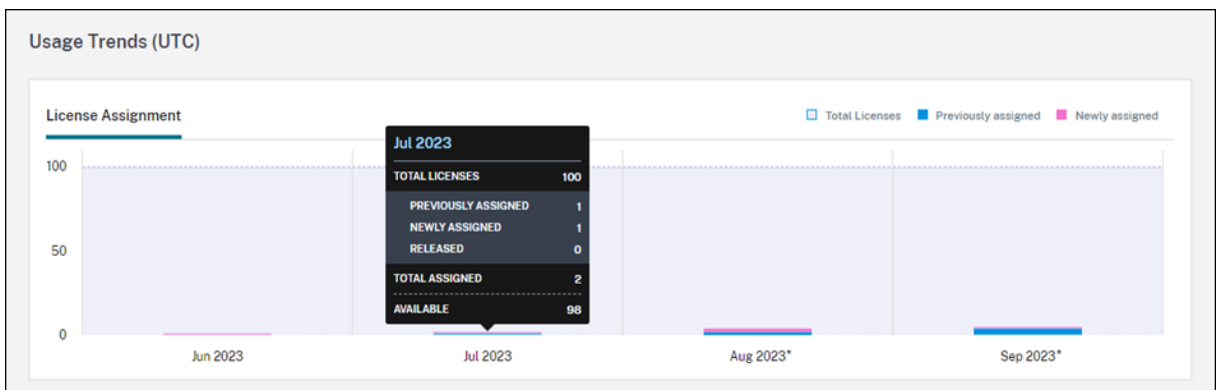

Usage trends

Citrix Cloud displays a breakdown of usage trends for either User/Device or Concurrent User licenses. To view this breakdown, select **View Usage Details** from the licensing summary page.

Trends for users and devices

For User/Devices licenses, the **Usage Trends** section shows you a breakdown of assigned licenses as a chart.

Pointing to an interval on the chart shows you the following information:

- **Total Licenses:** Your total purchased licenses for the cloud service across all entitlements.
- **Previously Assigned:** The number of licenses that were assigned in the previous month. For example, a user accesses the cloud service for the first time in July and is assigned a license. This license is counted as “Newly Assigned” for the month of July. For the month of August, this license is counted as “Previously Assigned.”
- **Newly Assigned:** The number of new licenses that were assigned for each month. For example, a user accesses the cloud service for the first time in July and is assigned a license. This license is counted as “Newly Assigned” for the month of July.

Intervals of time in which domain truncation is enabled are marked with an asterisk.

Intervals of time in which domain truncation is enabled are marked with an asterisk.

Trends for concurrent users

For Concurrent User licenses, the **Usage Trends** section shows you the following information:

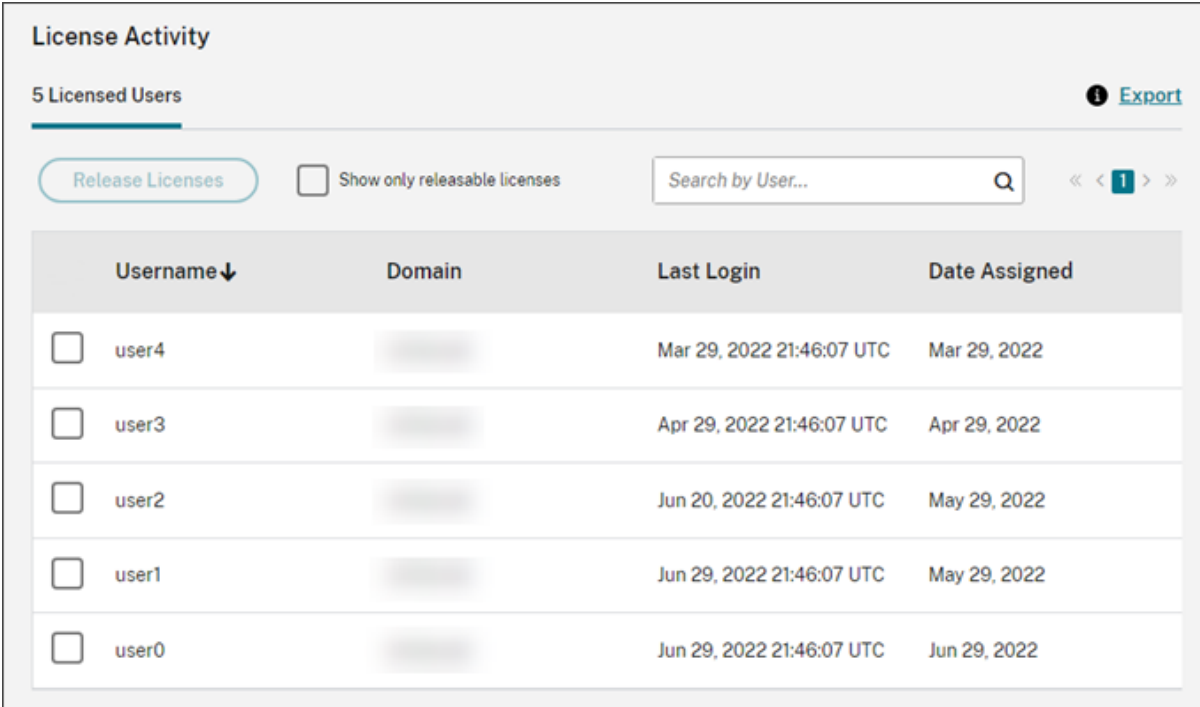

- **Total Licenses:** Your total purchased Concurrent licenses.
- **Peak Licenses In Use:** The maximum number of licenses assigned for the date range that you select. By default, Citrix Cloud displays peak usage for each month in the current calendar year. To drill down to monthly or hourly peak usage, select the calendar month or day you want to view from the drop-down menu.

If the date range you select isn't yet finished, Citrix Cloud displays the current peak usage for the latest interval of time. For example, if you drill down to view a calendar day that's still in progress, the maximum number of licenses is displayed for each hour up to the current moment in time. If the maximum number of licenses increases at the next five-minute counting interval, Citrix Cloud updates the peak usage for the current hour.

Pointing to an interval on the chart reveals the total licenses and peak licenses in use for that interval.

License activity for users and devices

For User/Device licenses, the **License Activity** section displays a list of individual users who have assigned licenses, and the date when a license was assigned to the user. This section is not available for Concurrent licenses.

License Activity

5 Licensed Users 📘 [Export](#)

[Release Licenses](#) Show only releasable licenses « < 1 > »

<input type="checkbox"/> user0		Jun 29, 2022 21:46:07 UTC	Jun 29, 2022

You can also filter the list to show only licenses that are eligible for release. See Release assigned licenses in this article.

Release User/Device licenses

Releasing eligible User/Device licenses varies depending on the service subscription type.

- **Yearly service subscriptions:** If you have a yearly subscription, you can release licenses for users that haven't launched an app or a desktop in the last 30 days. You can release multiple licenses in bulk or individually.
- **Monthly service subscriptions:** If you have a monthly subscription, you can release licenses on the first day of each month, regardless of the inactivity period.

When a license is assigned, the assignment period is 90 days and the connection to the service is established. If a user or device hasn't launched an app or desktop for 90 days, these licenses are considered as unused licenses and they are released by Citrix Cloud after 90 days. This process is automated with no actions required by the administrator.

After the assignment period (90 days), the administrator is allowed to release the licenses manually in the following scenarios only:

- The user is no longer associated with the company.
- The user is on an extended leave of absence.

The administrators can release the licenses for devices only when the devices are out of service.

Note:

- It is recommended to follow the automated process of releasing the Licenses. However if the administrator intends to release the licenses before the 90-day period apart from the above mentioned reasons, this might violate the Citrix EULA. Before performing this action, contact Citrix.
- The administrator can manually release a single license through the UI. Alternatively, the administrator can choose to release licenses using the cloud licensing API. For more information see, [APIs to manage Citrix cloud licensing](#).

Find eligible licenses

If the user or device hasn't launched an app or desktop for 30 days, Citrix Cloud places the license in releasable state. Releasable licenses appear in the Licensed Users or Licensed Devices list with a dark gray checkbox that can be selected. Licenses that aren't releasable displays a light gray checkbox indicating that license cannot be selected.

The list that appears in the **License Activity** section displays up to 100 assigned licenses at a time. If you have more than 100 licenses, use the page controls to move through the list.

To locate eligible licenses quickly, select **Show only releasable licenses**, next to the **Release Licenses** button. This action hides assigned licenses that aren't yet eligible for release.

Select eligible licenses

Select the dark gray checkbox next to each license to select it for release. When you select a license, the **Release Licenses** button becomes active.

You can select all releasable licenses one-by-one and click **Release Licenses**.

Release assigned licenses

1. If needed, click **Show releasable licenses** to display only the users with licenses that are allowed to be released.
2. Select the users you want to manage and then click **Release Licenses**.
3. Review the users you've selected and then click **Release Licenses**.

Release Concurrent User licenses

Concurrent User licenses are released automatically when users sign out or disconnect from their session. You don't need to release these licenses manually.

Monitor licenses and active usage for Endpoint Management

October 26, 2023

License assignment

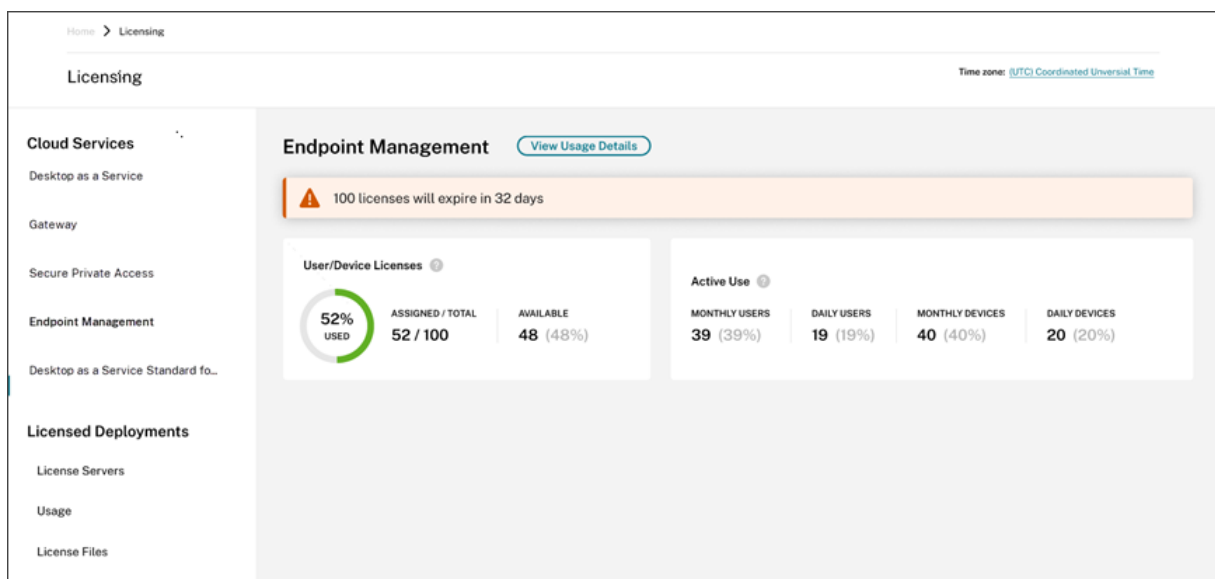

In general, users are assigned a license upon first use of the cloud service. For Endpoint Management, a license is assigned when a user enrolls a device. After a device is enrolled, the device periodically

checks in with Citrix Cloud. Citrix Cloud then uses this “check-in pulse” to calculate monthly usage and helps administrators to remain aware of users’ most recent service usage.

First-time use occurs the first time a user enrolls a device or the first time a “check-in pulse” occurs for the device.

Licenses are assigned on a per-user basis. So, if two users enroll and use the same device, two licenses are assigned.

Licensing summary and details

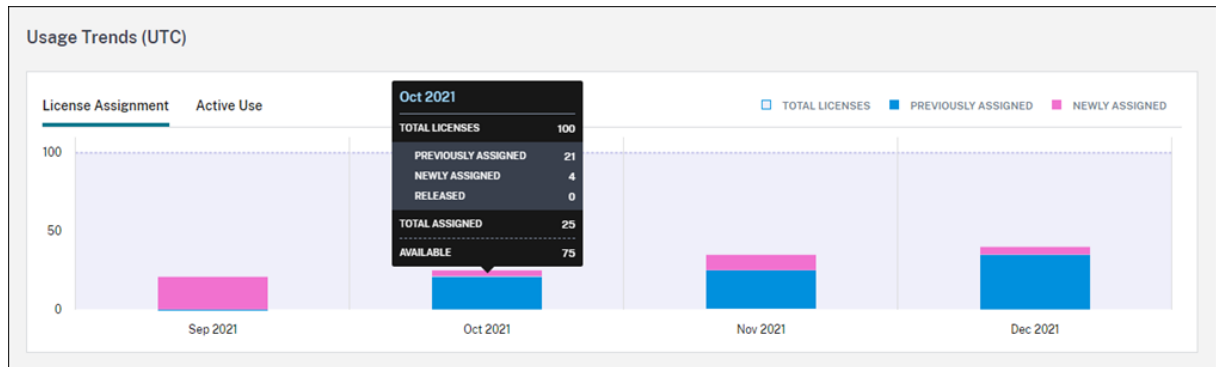

The Licensing summary provides an at-a-glance view of the following information for each supported service:

- Percentage of total purchased licenses assigned. As the percentage approaches 100%, the percentage goes from green to yellow. If the percentage exceeds 100%, the percentage turns red.
- The ratio of assigned licenses to purchased licenses and the number of available licenses remaining.
- Active usage statistics on a monthly and daily basis:
 - Monthly active use refers to the number of unique users that have used the service in the last 30 days.
 - Daily active use refers to the number of unique users that have used the service in the last 24 hours.
- The time remaining before the cloud service subscription expires. If the subscription expires within the next 90 days, a warning message appears.

Usage trends

For a detailed view of your licenses, click **View Usage Details**. You can then see a breakdown of usage trends and individual users and devices that are consuming cloud service licenses.

This breakdown shows you the following information:

- **Total Licenses:** Your total purchased licenses for the cloud service across all entitlements.
- **Previously Assigned:** The cloud service licenses that were already assigned at the beginning of each month. For example, if a user is assigned a license in July, that assignment is counted in the Previously Assigned number for August.
- **Newly Assigned:** The number of cloud service licenses that were assigned during each month. For example, a user who accesses the cloud service for the first time in July is assigned a license. This license is counted in the Newly Assigned number for July.
- **Active Use:** Daily and monthly active usage trends over the previous calendar month and calendar year, respectively.

License Activity

The **License Activity** section displays a list with the following information:

- The individual consumers who have assigned licenses
- The date when licenses were assigned
- The number of enrolled devices and the date of the last check-in for each user

License Activity

Release assigned licenses automatically

Citrix Cloud automatically releases licenses for users that meet **all** of the following conditions for the last 30 days:

- The user hasn't enrolled a new device.
- The user has an existing device that hasn't checked in with Citrix Cloud.

No other action is required to release eligible licenses.

After eligible licenses are released, users can acquire another license by enrolling a device.

Monitor bandwidth usage for Gateway service

September 21, 2023

This article describes bandwidth usage through the Gateway service when used with Citrix DaaS (formerly Citrix Virtual Apps and Desktops service) and Citrix Workspace. Bandwidth consumption for the Gateway service included with the Virtual Apps Essentials service isn't displayed on the **Licensing** page of the Citrix Cloud management console.

Note:

Licensing for the Gateway service helps you understand your bandwidth usage as it relates to using virtual apps and desktops. Citrix doesn't enforce bandwidth usage allotments in your environment. In the event you overuse your bandwidth allotment, Citrix doesn't interfere with production workloads or the operation of the service. If Citrix changes how the policies for the Gateway service and bandwidth usage are enforced, Citrix notifies you before these changes take effect.

Usage summary

The usage summary provides an at-a-glance view of bandwidth usage for each Gateway service subscription and the total overage across all your subscriptions (monthly, annual, and termed).

Citrix Cloud displays the total amount of bandwidth and the amount of bandwidth consumed for each subscription type.

Depending on the subscription type, Citrix Cloud also displays the billing period for the subscription:

- Monthly subscriptions: Citrix Cloud doesn't display the current billing period. For these subscriptions, the billing period starts on the first day of each month and ends on the last day of that month.
- Annual subscriptions: Citrix Cloud displays the starting and ending dates of the billing period. For these subscriptions, the billing period is one year.
- Termed subscriptions: Citrix Cloud displays the starting and ending dates of the billing period. For these subscriptions, the billing period is the length of time for which the subscription was purchased. For example, if a termed subscription for a period of three years is purchased, the starting and ending dates of the billing period correspond to that three-year interval.

If a subscription expires within 90 days, a warning message appears for that subscription.

Overage

Citrix Cloud calculates overage on a monthly basis across all your subscriptions. If you consume more bandwidth than you've purchased, Citrix Cloud displays the excess bandwidth as overage.

If you have multiple subscriptions, Citrix Cloud measures your bandwidth usage against the subscription that has the earliest ending date first. If you exhaust the bandwidth allotment in that subscription, Citrix Cloud measures your bandwidth usage against the subscription with the next earliest ending date. If you exhaust the bandwidth allotment in all your subscriptions, Citrix Cloud displays excess usage as overage.

The Usage Summary page displays total overage for the current month. To view overage over time, select **View overage chart**.

The screenshot shows the 'Gateway' usage summary page. It has three tabs: 'Usage Summary' (selected), 'Monthly Subscription Details', and 'Annual Subscription'. Under the 'Usage Summary' tab, there is a section for 'Overage' with a 'View overage chart' button highlighted by an orange box. Below this, a white box displays 'Total Overage' as '571 GB over available bandwidth' with a red progress bar.

Citrix Cloud displays a chart of your total overage for the last 12 months.

Overage for the current month doesn't carry over to the next month. When the next month begins, total overage resets to zero.

Unused bandwidth

Citrix Cloud automatically resets bandwidth usage for a subscription at the next billing period. If you don't use the full amount of bandwidth during a given subscription period, Citrix Cloud doesn't carry over any unused bandwidth to the next billing period.

For example, if your monthly subscription includes 150 GB of total bandwidth and you use 100 GB of bandwidth in a given month, Citrix Cloud resets usage to zero and displays 150 GB as your total amount of bandwidth at the beginning of the next month. The unused bandwidth isn't added to your total bandwidth allotment.

Usage details

For a detailed view of your subscriptions, select the monthly, annual, or termed subscription details tabs near the top of the console.

For each subscription type, the details tab displays the following information:

- **Total Usage:** The amount of bandwidth consumed out of the total bandwidth available across all subscriptions of a given type. For monthly subscriptions, total usage is shown for the current month. For annual and termed subscriptions, the total usage is cumulative across all of your annual or termed subscriptions.
- **Individual Entitlements:** The total amount of bandwidth consumed for each subscription of a given type. For example, if you have multiple annual subscriptions, this tab shows you the usage breakdown for each annual subscription separately.

The amount of consumed bandwidth is broken down based on access through Citrix DaaS (**VAD Service**) or through your on-premises Virtual Apps and Desktops deployment using [site aggregation in Citrix Workspace](#).

Usage trends

The **Usage Trends** section shows you a breakdown of usage over the last 12 months.

For monthly subscriptions, usage is displayed for each individual month in which it was used.

For annual and termed subscriptions, this section includes the following views:

- **Individual usage:** The bandwidth usage that occurred during each individual month of the current billing period.
- **Cumulative usage:** The bandwidth usage that accumulated at each month during the current billing period.

For all subscription types, pointing to a bar in the Usage Trends chart reveals the bandwidth usage for that point in time, broken down by access.

License activity

The **License Activity** section provides views of the following information:

- **Licensed Users:** Displays a list of individual users who have assigned licenses. This list includes the domain to which each user belongs, the amount of bandwidth used over the last 30 days, and the date when the user last used a service that required bandwidth usage.
- **Top Users:** Displays a list of the top 10 users according to bandwidth usage. This list includes a breakdown of usage for each user over the last 30 days according to access type (Citrix DaaS or on-premises Virtual Apps and Desktops through site aggregation).

Citrix Cloud displays the user’s bandwidth, broken down by access.

View usage details for top users

Select **Top Users**.

Citrix Cloud displays a chart of the bandwidth usage for the top users, broken down by access.

By default, the **Top Users** chart displays the top 10 users who have used the most bandwidth during

the last 30 days. You can change this view to display the top five, top 15, or top 20 users. You can also change the duration to **All time**, which displays the top users over the life of your subscription. To change this view, select an option from each menu.

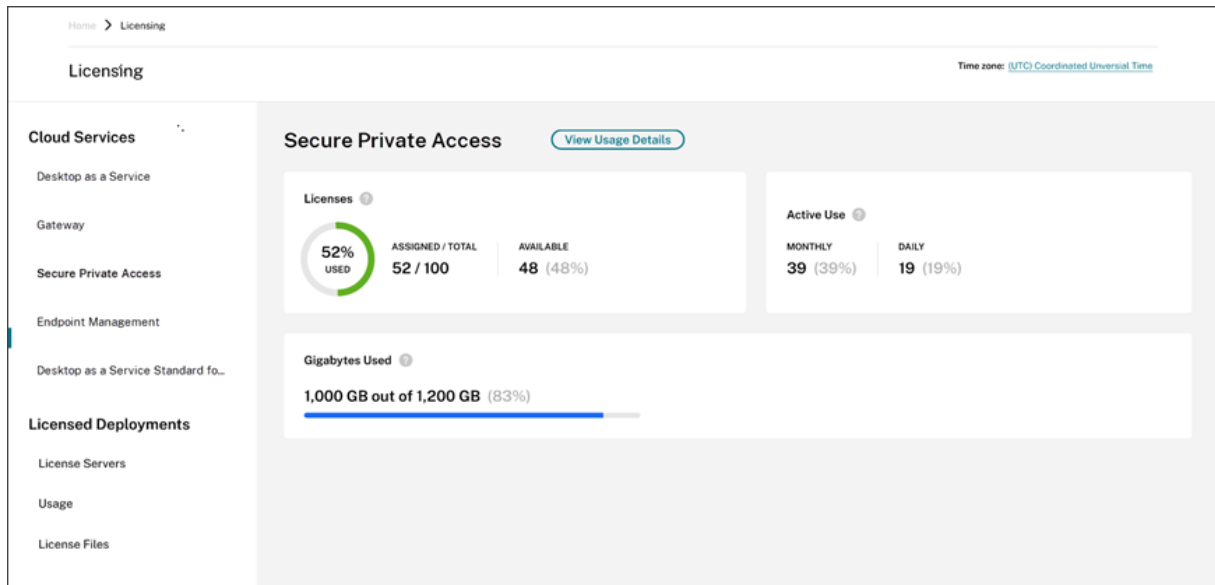

Monitor licenses and usage for Secure Private Access

November 15, 2023

License assignment

A license is assigned when a unique user launches a Web and SaaS apps or TCP and UDP apps for the first time.

Licensing summary

The Licensing summary shows the following information:

- Percentage of total purchased licenses that are assigned.
 - As the percentage approaches 100%, the percentage goes from green to yellow. If the percentage goes beyond 100%, the percentage turns red.
- The ratio of assigned licenses to purchased licenses and the number of licenses that are available for assignment.
- Active usage statistics on a monthly and daily basis:
 - Monthly active use refers to the number of unique users that have used the service in the last 30 days.
 - Daily active use refers to the number of unique users that have used the service in the last 24 hours.
- The amount of bandwidth consumed out of the total amount of bandwidth for all subscriptions.
- The time remaining before the cloud service subscription expires. If the subscription is about to expire within the next 90 days, a warning message appears.

Licenses and bandwidth used

In Secure Private Access Advanced subscriptions, each user has access to 5 GB of bandwidth per month (60 GB per user, per year). In Secure Private Access Standard subscriptions, each user has access to 1 GB of bandwidth per month (12 GB per user, per year). This bandwidth is pooled across the number of licenses and for the subscription period.

For example, if you buy 100 licenses for three years, you have 18000 GB of total bandwidth (6000 GB per year for three years). This bandwidth is spread across all licensed users for the three-year period. If you buy more subscriptions, Citrix Cloud displays the total number of licenses and bandwidth across all your subscriptions.

If you don't use the full amount of bandwidth during the subscription period, Citrix Cloud doesn't carry over any unused bandwidth when you renew. When you use more than your purchased bandwidth the subscription expires, the amount of available bandwidth remains at zero when you renew the subscription.

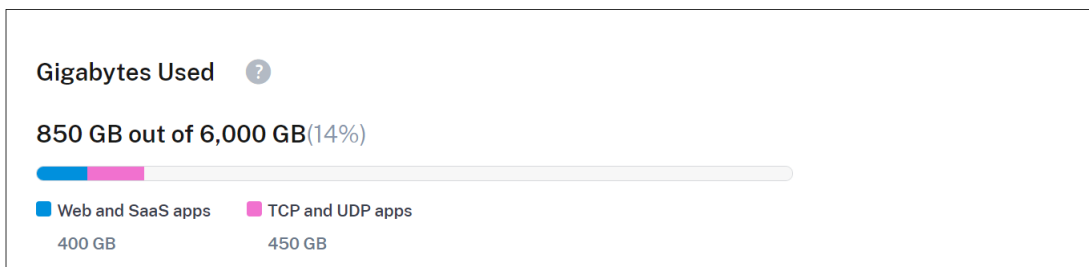

For multiple subscriptions with overlapping terms, the amount of bandwidth associated with each subscription is removed from Licensing when each subscription expires. For example, if you purchased two subscriptions, Citrix Cloud displays the total licenses and total bandwidth across both subscriptions. When the first subscription expires, Citrix Cloud displays only the bandwidth associated with the unexpired subscription.

Usage trends

For a detailed view of your bandwidth usage and licenses, click **View Usage Details**.

Citrix Cloud displays a breakdown of bandwidth consumption based on the type of apps that users have access.

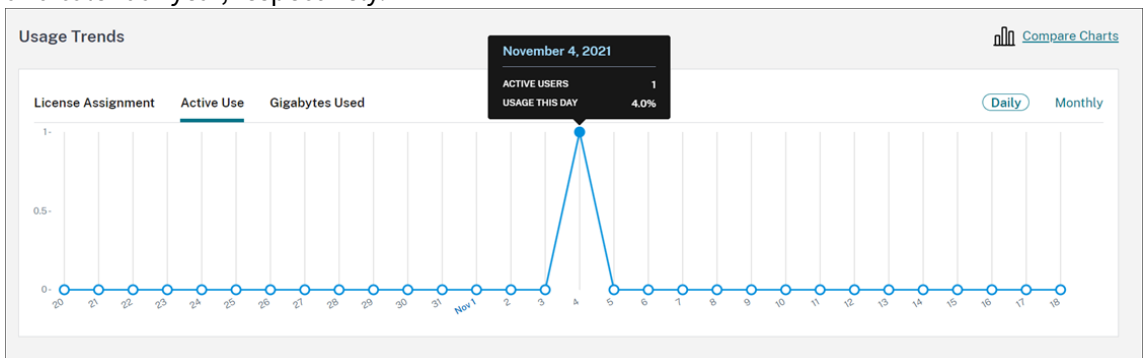

You can also see a breakdown of usage trends and individual users who are consuming cloud service licenses and bandwidth.

This breakdown, under **Usage Trends**, shows you the following information:

- On the **License Assignment** tab:
 - **Total Licenses:** Your total purchased licenses for the cloud service across all entitlements.
 - **Previously Assigned:** The cloud service licenses that were already assigned at the beginning of each month. For example, if a user is assigned a license in July, Citrix Cloud counts that assignment in the Previously Assigned number for August.
 - **Newly Assigned:** The number of licenses that were assigned for each month. For example, when you access the cloud service for the first time in July and is assigned a license. Citrix Cloud counts that license in the Newly Assigned number for July.
- On the **Active Use** tab: Daily and monthly active usage trends over the previous calendar month and calendar year, respectively.

- On the **Gigabytes Used** tab: The amount of bandwidth consumed out of the total bandwidth available. It shows per-user usage and per-application information like Web and SaaS apps and TCP and UDP apps.

To compare license assignment, active use, and bandwidth usage trends, select **Compare Charts**.

Note:

Usage trends are cumulative for the length of the current subscription term. When you renew the subscription, usage trends are reset at the start of the new subscription term.

License Activity

The **License Activity** section also displays the following information:

License Activity			
30 Licensed Users			
Search by User...		Q	< 1-30 of 30 >

Hall	net	Jan 19, 2020 00:00:00 UTC	Jan 6, 2020

- A list of the individual users who have assigned licenses.
- The domain to which the user belongs.
- The date when the user last used the service.
- The date when a license was assigned to the user.

Release assigned licenses

Citrix Cloud automatically releases licenses if you haven't used the service in the last 30 days. No action is required from the Citrix administrator to release the licenses.

When a license is released, the number of remaining licenses increases and the number of assigned licenses decreases accordingly. After a license is released, you can acquire another license by signing in and using the cloud service.

Monitor Citrix Managed Azure resource consumption for Citrix DaaS

September 21, 2023

When you purchase an entitlement to Citrix DaaS (formerly Citrix Virtual Apps and Desktops service), you can also purchase the Citrix Azure Consumption Fund that allows you to use resources in a Citrix Managed Azure subscription. You can use these resources for delivering apps and desktops to your users alongside your on-premises VDAs.

When you buy the Citrix Azure Consumption Fund, you can pay for consumption using one of the following methods:

- Pay-as-you-go: For the Citrix Managed Azure resources that you use during a given month, Citrix bills you during the following month. Citrix Cloud displays your usage as overage.
- Prepaid consumption: You can pre-pay for consumption on a monthly or yearly (termed) basis. For any usage that exceeds your pre-paid consumption, Citrix Cloud displays this usage as overage. For any overage in a given month, Citrix bills you during the following month.

Each consumption unit is valued at \$1.00 USD. The Licensing console in Citrix Cloud helps you track the units that you use.

To estimate consumption costs, use the [Citrix Managed Azure Consumption Calculator](#). To estimate consumption and licensing costs for Citrix DaaS Standard for Azure (formerly Citrix Virtual Apps and Desktops Standard for Azure), use the [Licensing and Consumption Calculator](#).

Supported products

Consumption monitoring is available for the following editions of Citrix DaaS:

- Citrix DaaS Advanced (formerly Virtual Apps Advanced)
- Citrix DaaS Premium (formerly Virtual Apps Premium)
- Citrix DaaS Advanced Plus (formerly Virtual Apps and Desktops Advanced)
- Citrix DaaS Premium (formerly Virtual Apps and Desktops Premium)
- Citrix DaaS Standard for Azure (formerly Virtual Apps and Desktops Standard for Azure)

Consumption summary

The Citrix Managed Consumption section displays a summary of the units that you've used in your Consumption Fund.

Monthly Consumption shows the number of consumption units that you've used for the current month out of the total number of monthly Consumption Fund units that you've purchased. Monthly consumption resets each month. Unused consumption units aren't carried over to the next month.

Term Consumption shows the number of consumption units that you've used out of the total number of term Consumption Fund units that you've purchased. As with monthly consumption units, unused term consumption units aren't carried over to the next year.

Overage Consumption shows the number of consumption units that you've used beyond the number of units in your Azure Consumption Fund. If you use Citrix Managed Azure resources on a pay-as-you-go basis, your consumption appears as overage by default.

How overage is measured

If you use the Azure Consumption Fund on a pay-as-you-go basis, Citrix Cloud displays the number of consumption units that you've used for the current month as overage.

If you prepaid for consumption on either a monthly or yearly basis, Citrix Cloud displays the number of monthly or term consumption units that you've used for the current month or year. If you consume more units than you purchased, Citrix Cloud displays the excess units as overage.

If you prepaid for consumption on both a monthly and a yearly basis, Citrix Cloud measures your consumption against your purchased monthly units first. After those units are consumed, Citrix Cloud measures your consumption against your yearly units. After those units are consumed, Citrix Cloud displays any excess units that you consume as overage.

If you buy additional consumption units and your account has existing overage, the new consumption units are not applied to the overage. The new consumption units are only applied to usage that occurs after those units are purchased.

Consumption details

For a detailed view of your consumption units, click **View Usage Details** at the far right of the summary. The details page displays breakdowns of your consumption and usage trends.

Usage reports

You can download usage information as a CSV file for an interval that you specify. Click **Download Data** to generate and download a CSV file to your local machine.

Data can take up to 72 hours after the end of a day or month to reflect all usage.

The CSV file includes the following sections:

- Report summary that shows the consumption units available before and after the report date range, total usage charges, and pending overage.

Data may take 24 hours to be reflected. Usage and billing data should not be considered final until 72 hours after the end of the calendar month.

Usage trends and consumption activity

The **Usage Trends** section displays a chart of the Citrix Managed Azure resources that you've used. Pointing to a bar on the chart displays the quantity of resources that you consumed for that month, including virtual machines, storage, virtual network resources, and bandwidth.

Select **Monthly Consumption** to view your monthly consumption for the previous 12 months.

Select **Term Consumption** to view your term consumption for each month during the previous year.

If you purchased both monthly and yearly consumption units, select **Compare Charts** at the far right of the chart to view monthly and term consumption trends in a single view.

The **Consumption Activity** section also displays a list of your consumption units for each month.

Consumption Activity				
Month	Used	Owned	Remaining	Overage
Oct 2021	0	1,200	0	0
Sep 2021	831	1,200	0	831
Aug 2021	1,375	1,200	0	1,375
Jul 2021	1,056	1,200	0	1,056

Consumption activity includes the following information:

- **Used:** The number of units that were used during each month.
- **Owned:** The total number of purchased units for each month.
- **Remaining:** The number of purchased units that were unused during each month.
- **Overage:** The number of consumed units that exceeded your purchased units during each month.

Release assigned licenses

The time at which license assignments become eligible for release depends on the Consumption Fund units that you purchased.

You can release inactive licenses after 30 days if:

- You don't use a Citrix Managed Azure subscription with your service deployment.
- You purchased yearly consumption units to use with your service deployment.

You can release inactive licenses during the current month, provided no users or devices launched apps or desktops, if:

- You purchased monthly Consumption Fund units to use with your service deployment.
- You purchased both monthly and yearly Consumption Fund units.

For instructions for releasing eligible licenses, see the following articles:

- Citrix DaaS (User/Device model): [Release assigned licenses](#)
- Citrix DaaS Standard for Azure: [Release assigned licenses](#)

Monitor licenses and usage for on-premises deployments

September 21, 2023

The licensed deployments experience in Citrix Cloud consists of the following functions:

- **Product registration:** Register your existing Citrix License Servers with Citrix Cloud to get additional usage insights and reporting about your deployments.
- **License Server status:** View the status of your Citrix License Servers to understand which ones are successfully reporting usage and when they last reported usage to Citrix Cloud.
- **Usage insights:** View how many licenses are installed and in use across your Citrix License Servers and gain insight into historic license usage trends.

Supported products

Citrix License Server usage insights are available for all Virtual Apps and Desktops editions under the Concurrent and User/Device licensing models.

To view Citrix License Server usage insights, select **Licensing** from the console menu and then select **Licensed Deployments**.

Prerequisites

To use Citrix License Server usage insights, ensure you have the following items:

- A Citrix License Server version 11.15.0.0 or later
- A Citrix Cloud account
- Network access from the Citrix License Server to Citrix Cloud

Connectivity requirements

To register your License Server successfully with Citrix Cloud, ensure that the following addresses are contactable:

- <https://citrix.cloud.com/> (for accessing the admin console to enter the code and view license server status)

- <https://trust.citrixnetworkapi.net> (for retrieving a code)
- <https://trust.citrixworkspacesapi.net/> (for confirming the license server is registered)
- <https://cis.citrix.com> (for data upload)
- <https://core-eastus-release-a.citrixworkspacesapi.net>
- <https://core.citrixworkspacesapi.net>
- ocsp.digicert.com port 80
- crl3.digicert.com port 80
- crl4.digicert.com port 80
- ocsp.entrust.net port 80
- crl.entrust.net port 80

Connect to Citrix Cloud

To enable Citrix License Server usage insights, you perform the following tasks:

1. Enable usage insights for your license servers using the Licensing Manager console. For more information, see [Share usage statistics](#) in the Licensing product documentation.
2. Review the connectivity requirements described in Connectivity requirements in this article and ensure the addresses are contactable. If you are using a proxy server with Citrix License Server, ensure that the proxy server is configured as described in [Step 5 Configure a proxy server](#) in the Licensing product documentation.
3. Register your license server with Citrix Cloud as described in [Register on-premises products with Citrix Cloud](#).

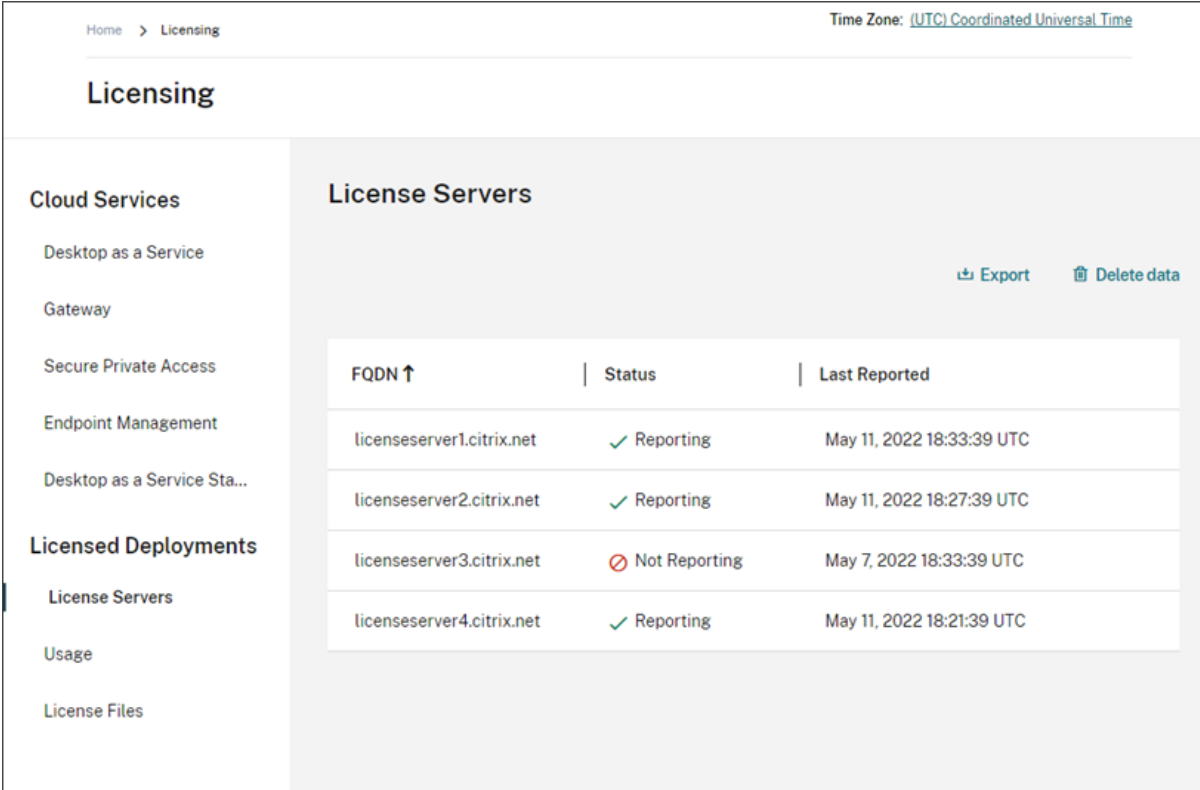

View on-premises product license usage

Citrix License Server usage insights provides visibility into license usage across your entire Citrix estate. You can access usage reporting that helps you:

- Understand how many license servers are deployed and registered, and if they are reporting usage information to Citrix Cloud.
- Get visibility into Concurrent and User/Device license usage for Virtual Apps and Desktops.
- Gain insight into aggregate Concurrent and User/Device license usage across multiple deployments.
- Understand historic license usage and monthly license usage trends.
- View the last login time for specific users.
- Compare the number of licenses installed relative to licenses in use across Citrix License Servers.
- Monitor license overdraft.
- View breakdowns of Concurrent and User/Device license usage.

View license server status

The license server status view shows each of the license servers reporting usage to Citrix Cloud.

The screenshot displays the Citrix Cloud interface for the 'Licensing' section. The page title is 'Licensing' and the time zone is '(UTC) Coordinated Universal Time'. The left sidebar shows navigation options under 'Cloud Services' (Desktop as a Service, Gateway, Secure Private Access, Endpoint Management, Desktop as a Service Sta...) and 'Licensed Deployments' (License Servers, Usage, License Files). The main content area is titled 'License Servers' and includes 'Export' and 'Delete data' buttons. A table lists the following license servers:

FQDN ↑	Status	Last Reported
licenseserver1.citrix.net	✓ Reporting	May 11, 2022 18:33:39 UTC
licenseserver2.citrix.net	✓ Reporting	May 11, 2022 18:27:39 UTC
licenseserver3.citrix.net	⊘ Not Reporting	May 7, 2022 18:33:39 UTC
licenseserver4.citrix.net	✓ Reporting	May 11, 2022 18:21:39 UTC

License servers display the “Reporting” status if they have successfully uploaded usage to Citrix Cloud in the last three days. License servers display the “Not Reporting” status if they previously reported usage in the last 30 days but not reported in the last three days. License servers that haven’t reported usage in the last 30 days are removed from the list.

Impact of license server status on license usage views

The reporting status and Last Reported date of a license server dictates whether or not the usage from a particular license server is included in the usage insights views and reports.

- Current licenses installed and in-use are based exclusively on data from reporting license servers. If a license server is listed as “Not Reporting,” installed and in-use licenses from that license server are not reflected in the usage insights experience.
- The Last Reported date for each license server determines how up-to-date the license usage information is in the usage insights experience. The license usage reports shown are only as current as the Last Reported time for each license server.
- Citrix License Servers configured for usage insights and registered with Citrix Cloud update usage once per day. If needed, you can force an update from the Citrix License Manager manage-

ment console on the license server.

License usage

The Usage tab provides a consolidated view of license usage across your Citrix deployments. Licensing information from each reporting license server is combined into a single view. This view makes it easy to see your complete licensing picture across many different deployments and license servers.

Home > Licensing Time Zone: (UTC) Coordinated Universal Time

Licensing

- License Files

Usage

Use this page to view usage data only from reporting license servers. For license servers that have stopped reporting, check status from the License Servers tab.

Virtual Desktops (Standard)

User/Device Model ? [View Usage Details](#)

Licenses (Aggregate)	IN USE / INSTALLED	AVAILABLE	License Servers ?	XDT_STD_UD
30% USED	23 / 75	52 (70%)	2 View	>

Virtual Apps & Desktops (Premium)

User/Device Model ? [View Usage Details](#)

Licenses (Aggregate)	IN USE / INSTALLED	AVAILABLE	License Servers ?	XDT_PLT_UD
31% USED	31 / 100	69 (69%)	3 View	>

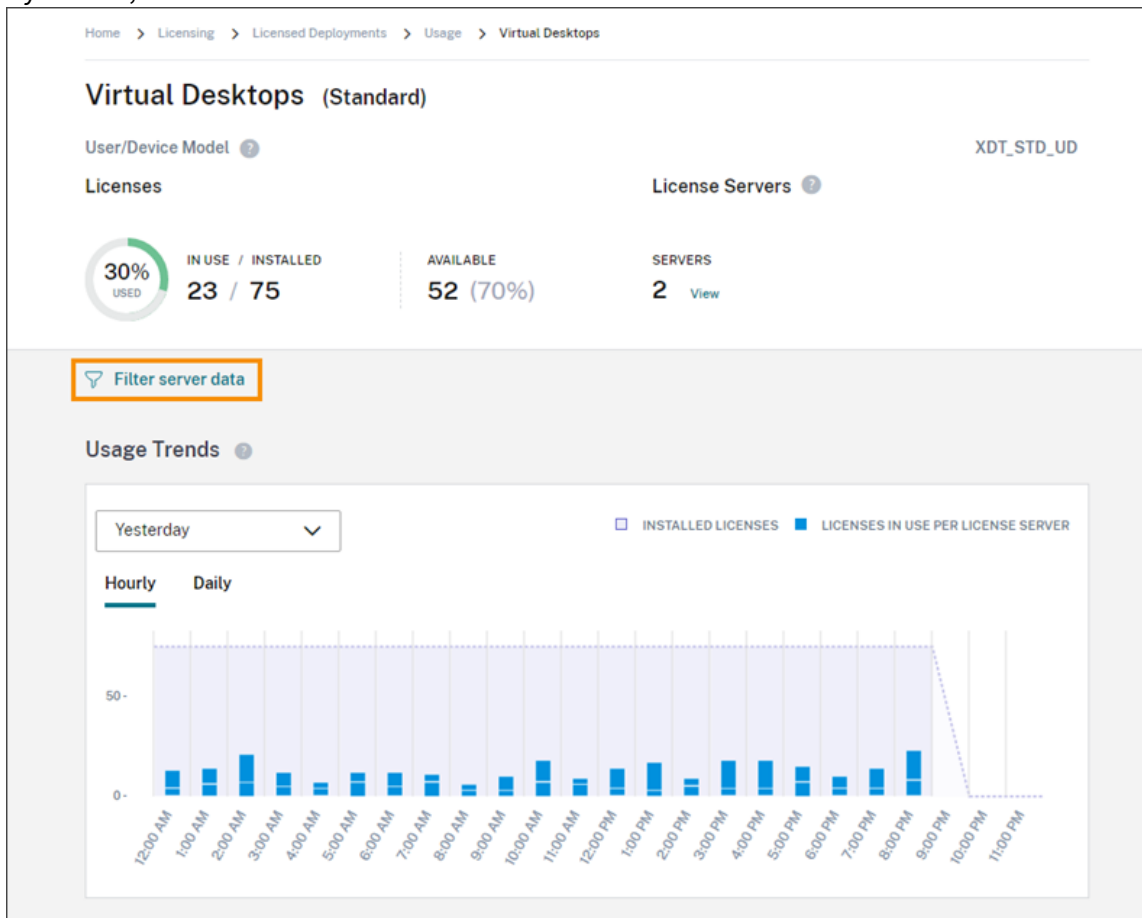

License usage is organized and aggregated across multiple license servers based on product edition and licensing model. A license usage summary card is displayed for each unique license edition found across all reporting license servers. A summary card is displayed for each product edition detected.

Usage per License Server

To view product license usage for each License Server, you can filter the server data.

1. From the **Usage** page, select **View Usage Details** for the product that you want to manage.

- Click **Filter server data** and then select the License Servers for which you want to view usage. By default, all License Servers are selected.

- Select **Apply**.

After you apply the filter, Citrix Cloud displays the usage trends, License Server breakdown, and license activity only for the servers you selected.

Peak license usage for the Concurrent licensing model

The reporting experience for Concurrent licenses is organized around the following data points:

- Installed licenses: The number of licenses installed on each license server.
- Peak licenses in-use: The maximum number of licenses that were used in a specific time frame.

In calculating peak licenses in-use, Citrix Cloud retrieves the the maximum number of licenses used in the following time periods:

- Last 7 days: The maximum number of licenses used at one time during the last seven days.
- This Month: The maximum number of licenses used at one time in the current calendar month.

- **All Time:** The maximum number of licenses used at one time since the license server was registered with Citrix Cloud.

Important:

The data for these time periods might not match the number of licenses in use on the license server. The license server reports only the number of licenses in use at any given time. Citrix Cloud receives these individual data points and calculates the peak for these time periods.

Considerations for interpreting license usage

Citrix licensing supports many usage scenarios and includes detailed information. Keep the following considerations in mind when monitoring usage:

- Usage information is based on licenses installed on each of the reporting license servers. If a license server is running out of available licenses, you can allocate and place additional licenses on the license server to increase the number of available licenses.
- The information available in the Citrix License Server usage insights view includes only the information collected and reported by registered and actively reporting Citrix License Servers. The licensed deployments experience does not represent and may not match the total number of licenses you actually own or purchased.
- The percentage of licenses available is computed based on the number of licenses in use relative to the licenses installed on reporting license servers.

Remove License Server registration

Removing License Server registration completely from Citrix Cloud consists of the following tasks:

1. Remove the registered License Server from Citrix Cloud using the Citrix Licensing Manager console. For complete instructions, see [Remove registration of your License Server](#).
2. Remove any usage data that was previously collected.
3. Verify that Citrix Cloud no longer displays the License Server on the Product Registrations page. If the License Server still appears in the list, remove the server as described in [Remove a product registration](#).

Remove usage data

When you remove a registered License Server from Citrix Cloud, usage data that was previously collected is still stored. If you no longer want to keep this data, you can delete it.

Important:

Deleting usage data is permanent and can't be undone. If you delete usage data but don't remove the registration for your License Server, Citrix Cloud continues to collect usage data.

1. From the Citrix Cloud menu, select **Licensing**.
2. On the **License Servers** tab, select **Delete data**.
3. When prompted, select the check boxes to confirm that you understand the impact of the deletion.
4. Select **Delete server data**.

Licensing for Citrix Service Providers

September 21, 2023

The License Usage Insights service in Citrix Cloud is a free cloud service that helps **Citrix Service Providers (CSP)** understand and report on product licenses and usage. Only CSP partners have access to License Usage Insights.

Note:

Citrix DaaS was formerly Citrix Virtual Apps and Desktops service. Citrix DaaS Standard for Azure was formerly Citrix Virtual Apps and Desktops Standard for Azure. Some displays might contain the former name.

The License Usage Insights service enables you to:

- Automatically collect and aggregate product usage information from Citrix license servers
- Automatically aggregate cloud licensing usage and consumption for single-tenant and multi-tenant customers
- Easily view which users are accessing your Virtual Apps and Desktops deployments each month
- Create customer breakdowns of licensing usage
- Optimize license costs by identifying and tracking a list of free users
- View and understand your historic business with Citrix
- Export Virtual Apps and Desktops and Citrix DaaS license usage, ADC VPX allocations data, and Citrix DaaS Standard for Azure licensing and consumption data to CSV

Additional information

For requirements and setup instructions, see [Get started with License Usage Insights](#).

To view aggregated usage for single tenant customers and multitenant partners, see [Cloud service license usage and reporting for Citrix Service Providers](#).

To view customers' usage of supported services using the Licensing console, see the following articles:

- [Customer license and usage monitoring for Citrix DaaS](#)
- [Customer license and usage monitoring for Citrix DaaS Standard for Azure](#)

Get started with License Usage Insights

September 21, 2023

Supported Citrix products

The License Usage Insights service provides usage information for the following Citrix products:

- Virtual Apps and Desktops (on-premises) product usage
- Citrix DaaS Premium (formerly Virtual Apps Premium and Virtual Apps and Desktops Premium services)
- Citrix DaaS Standard for Azure (formerly Citrix Virtual Apps and Desktops Standard for Azure)
- Citrix ADC VPX allocations

Requirements

To capture license and usage information for Citrix on-premises products, Citrix License Server 11.16.3.0 or later is required. Only Windows-based and VPX-based license servers are supported.

Citrix License Server 11.16.3.0 and later contains key features that are important for Citrix Service Provider (CSP) partners:

- **Optimized usage collection:** License Server contains new functionality that optimizes licensing behavior and tracking to better support CSPs.
- **Call home:** License Server includes Call Home features that automate product usage collection for CSP partners. These features are exclusive to CSP partners and will only be activated when a CSP license is detected on the license server.

Step 1: Update Citrix License Server

If you're running license servers older than Version 11.16.3.0, you must upgrade your license servers before using License Usage Insights. Upgrading in-place is simple and fast. Complete the following tasks:

1. [Download the latest license server](#). For more information about the latest version of Citrix License Server, refer to the [Citrix Licensing documentation](#).
2. [Upgrade](#) your current license server.
3. Repeat the upgrade process for each of your license servers.

Step 2: Sign in to Citrix Cloud with My Citrix credentials

Before signing in, you'll need to sign up for a Citrix Cloud account. Follow the steps described in [Sign up for Citrix Cloud](#).

When creating your account, use the same My Citrix credentials that you use to allocate and download Citrix licenses from citrix.com. Citrix Cloud sends you an email at the address associated with your My Citrix credentials to confirm the account.

When your Citrix Cloud account is ready to use, sign in at <https://citrix.cloud.com> using your email address and password.

Step 3 (optional): Anonymize usernames through the license server

By default, usernames associated with Virtual Apps and Desktops or Citrix DaaS license checkouts are securely phoned home to Citrix.

Usernames are phoned home so CSP partners can take full advantage of License Usage Insights features and the CSP licensing program which supports free users for trial, test, and administrative product use.

User information is limited to a single user@domain entry; no additional personal identifiable data is phoned home. Citrix does not share this information.

Partners sensitive to uploading username information can enable username anonymization. When active, username anonymization converts readable usernames into unique strings using a secure and irreversible algorithm prior to upload.

License Usage Insights uses these unique identifiers to track product usage instead of the actual usernames. This approach allows service providers to take advantage of month-to-month insights without visibility into the actual usernames in the cloud service user interface.

To configure username anonymization

1. On the license server, open the configuration file in a text editor. Typically, the configuration file is located at C:\Program Files\Citrix\Licensing\WebServicesForLicensing\SimpleLicenseServiceConfig.xml.
2. In the **Configurations** section, add the **UsageBasedBillingScramble** setting as follows:

```
1 <?xml version="1.0" encoding="utf-8"?>
2 <Configurations>
3 <EncoreConfiguration>
4 <SamplingPeriod>15</SamplingPeriod>
5 <RetentionTime>180</RetentionTime>
6 <Enabled>true</Enabled>
7 </EncoreConfiguration>
8 <SARenewalConfigOptions>Notify</SARenewalConfigOptions>
9 <UsageBasedBillingScramble>1</UsageBasedBillingScramble>
10 </Configurations>
11 <!--NeedCopy-->
```

3. Save the file.

Step 4: Use the License Usage Insights service

From the Citrix Cloud console, locate the License Usage Insights service and click **Manage**. For an overview of the service's key features, see [Manage product usage, license servers, and notifications](#).

Additional details

When using Citrix License Server with License Usage Insights, consider the following items:

- It might take up to 24 hours for a newly updated license server to appear in the License Usage Insights management console.
- When usage data is uploaded from a license server, it's processed and stored in a secure fashion so License Usage Insights can access it at a later date. This process might take up to 24 hours to complete.
- By default, usernames associated with Virtual Apps and Desktops or Citrix DaaS license check-outs are securely phoned home to Citrix.
- Usernames are phoned home so CSP partners can take full advantage of License Usage Insights features and the CSP licensing program which supports free users for trial, test, and administrative product use.
- User information is limited to a single user@domain entry; no additional personal identifiable data is phoned home. Citrix will never share this information.

Help and support

If you need assistance with License Usage Insights, open a support ticket on the [My Support](#) portal. To access My Support from Citrix Cloud:

1. Sign in to Citrix Cloud.
2. Click the **Help** icon near the top-right of the screen.
3. Select **Open a ticket**.
4. Select **Go to My Support** and sign in with your My Citrix credentials.
5. Complete and submit the form.

A member of Citrix Technical Support will follow up and assist you.

Frequently Asked Questions

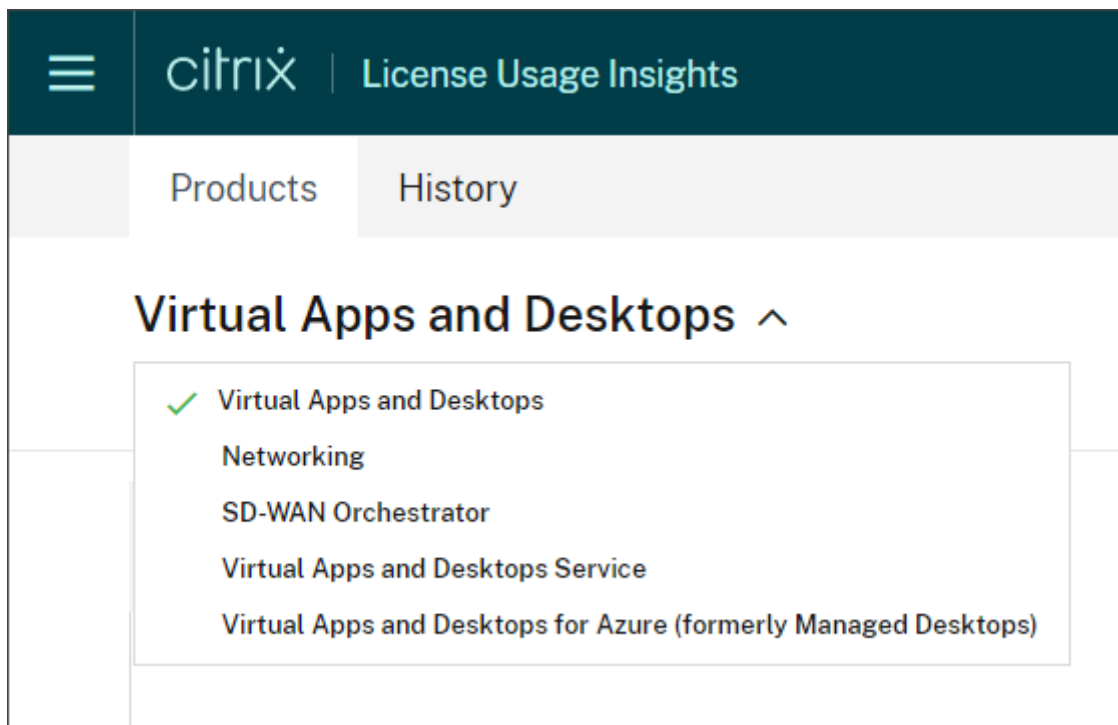

- **What information is being phoned home? Can I view the information my license servers are sending to Citrix?** Yes, you can view a copy of the information that's phoned home to Citrix. For details, see [License server information included in uploads](#).
- **Is License Usage Insights available to Citrix customers or partners that are not Citrix Service Providers?** No. License Usage Insights is only available to Citrix Service Provider partners with an active partner agreement.
- **Can I disable Call Home on the license server?** No. Under the Citrix Service Provider license agreement, all license servers are required to phone home product usage. Partners sensitive to the phone home use case can use the username anonymization feature. For details, see [Anonymize usernames through the license server](#).
- **Will I be billed based on the product usage shown in License Usage Insights?** No. License Usage Insights helps partners understand their product usage so they can report it quickly and accurately to their Citrix distributor. CSP partners will continue to be billed based on the product usage they report to their Citrix distributor. Citrix distributors will continue to own the billing relationship with CSP partners.

Manage product usage, license servers, and notifications

February 27, 2024

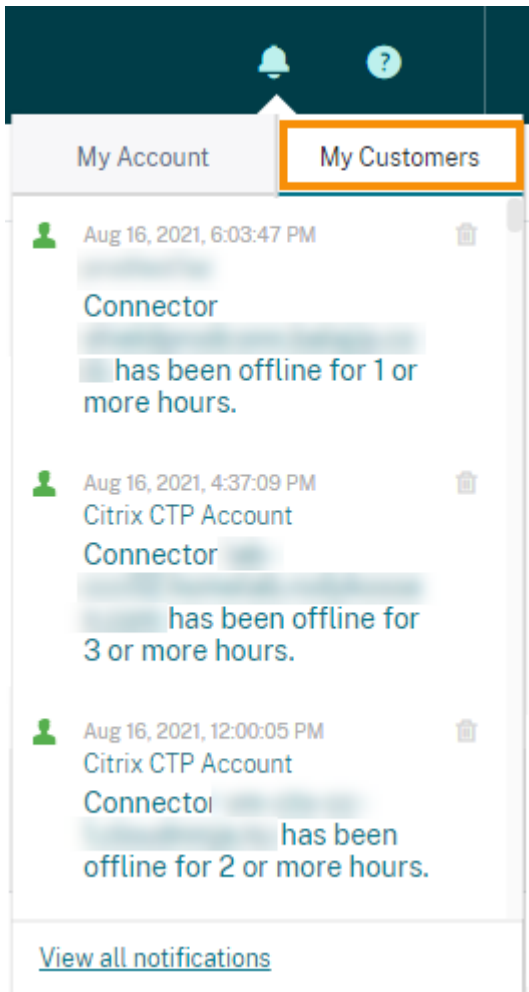

Product selection

To view licensing details for a different product, click the arrow next to the product name and select the product or service you want to view.

Customer notifications

Monitor solution health across multiple customers without having to visit each deployment individually. The Notifications area in Citrix Cloud aggregates notifications across customers on your dashboard so you can ensure alerts are addressed and services keep running.

1. From the Citrix Cloud management console, click the **Notifications** icon and then click **My Customers**. A list of the most recent notifications appears.
2. To view a complete list of customer notifications, click **View all notifications**.

License server status

To be compliant with Citrix Service Provider license guidelines, all active license servers must be updated and reporting. The license server status shows the license servers you have and whether or not they're updated for use with License Usage Insights.

The service displays a list of active license servers using the license allocation data stored in the Citrix back office. If the license server is updated and successfully reporting, License Usage Insights displays the "Reporting" status and includes a timestamp of the most recent upload.

The screenshot shows the Citrix Cloud interface for License Usage Insights. The main heading is 'Virtual Apps and Desktops' with a dropdown arrow. Below it, there are three tabs: 'Server Status' (selected), 'Usage', and 'Users'. A table displays the following data:

Host ID	Status	FQDN	Last Reported Date	Type	Customers
produc-lic	Reporting 2 Messages	produc-lic	Aug 15, 2021 15:49:57	Paid	Acme Worldwide
BLRRCI...	Not Reporting 2 Messages	BLRRCITRXLICP01.AM...	Jul 20, 2021 07:36:02	Paid	0 customers

License server information included in uploads

When Call Home is activated on a license server, the following information is uploaded daily:

- License server version
- License file information:
 - License files installed on the server
 - License file expiration dates
 - Product feature and edition entitlement information
 - License quantities
- License usage:
 - Licenses used in the current calendar month
 - Usernames associated with license checkout
 - Product features and editions activated

View a license server upload

CSP partners can inspect the last uploaded payload on their license server to fully understand all of the details that the license server sends to Citrix. A copy of this payload is stored as a .zip file on the license server. By default, this location is C:\Program Files (x86)\Citrix\Licensing\LS\resource\usage\upload_1456166761.z

Note:

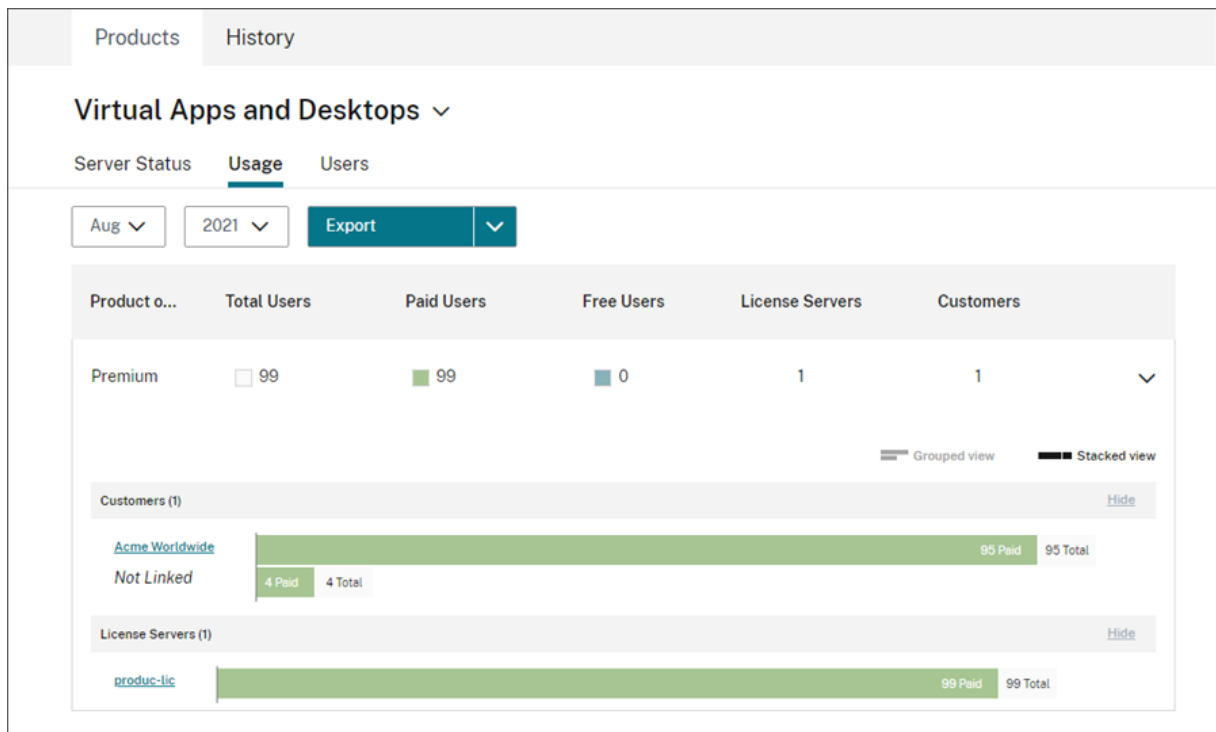

Successful uploads are deleted except for the last one. Unsuccessful uploads linger on the disk until a successful upload occurs. When that happens, all but the last upload are deleted.

Usage collection

Usage collection helps you understand product usage through automated data collection and aggregation. There's no need to deploy additional tools.

License Usage Insights automatically aggregates product usage across all Citrix License Servers to provide a complete view of usage across all deployments. You can also create licensing usage breakdowns by associating specific users with the customers or tenants to whom they belong.

The license servers collect and track product license usage and report it back to Citrix using a secure phone home channel. This automated approach provides you with a constant stream of updated usage data, saving time and helping partners better understand usage trends within their deployments.

Create a customer breakdown of Virtual Apps and Desktops product usage

To break down licensing usage by customer, you must first associate users with the customers or tenants to whom they belong. If you don't have any customers defined in your Customers dashboard, you can add new ones or you can connect with existing Citrix Cloud customers.

1. If applicable, add customers to the Customers dashboard: From the Citrix Cloud management console home page, click **Customers**, click **Add or Invite**, and then follow the onscreen instructions.
2. Click the menu button and then select **My Services > License Usage Insights**.

3. With the **Virtual Apps and Desktops** product selected, click **Users**.
4. Select the users you want to associate and then click **Bulk Actions > Manage Link to Customer**.
5. From the list, select the customer with which you want to associate the users.
6. Click **Save**.
7. To view the per-customer breakdown, click the **Usage** view.

Free user management

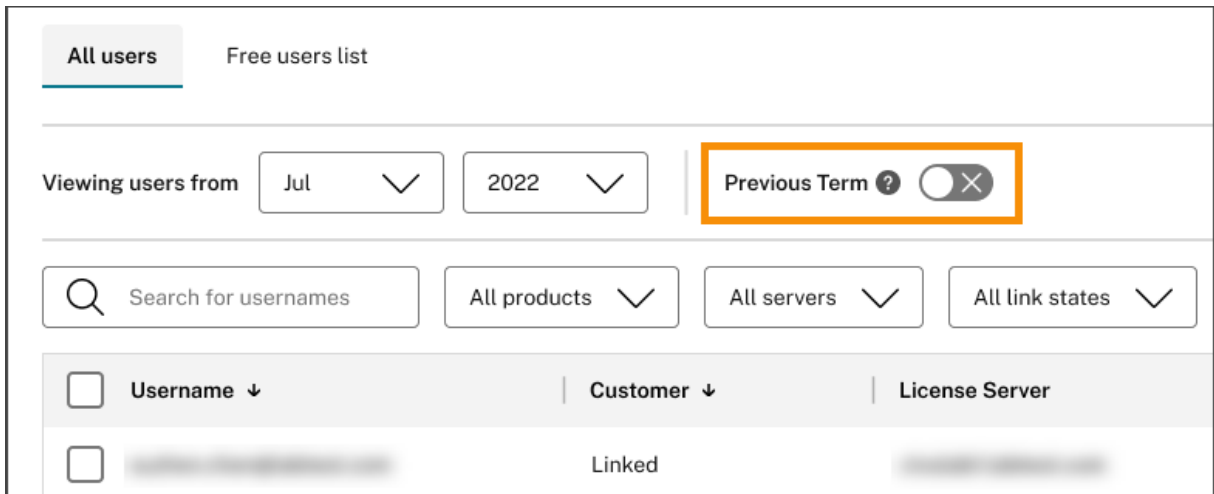

License Usage Insights provides a comprehensive view of product usage across deployments while still allowing you to take full advantage of the Citrix Service Provider license program that supports trial, test, and administrative users.

The screenshot displays the 'Users' management interface for 'Virtual Apps and Desktops'. It features a navigation bar with 'Products' and 'History' tabs, and sub-tabs for 'Server Status', 'Usage', and 'Users'. The 'Users' tab is selected, showing a list of users. The list has columns for 'Username', 'Customer', 'License Server', 'License Server Type', and 'Free User'. The 'Free User' column contains checkboxes, with some checked. Above the list, there are filters for 'Viewing users from' (Jul, 2022), a 'Previous Term' toggle, and search filters for 'All products', 'All servers', and 'All link states'. A 'Reset' button and 'Bulk actions' dropdown are also present.

Username	Customer	License Server	License Server Type	Free User
[Redacted]	Linked	[Redacted]	Paid	<input checked="" type="checkbox"/>
[Redacted]	Linked	[Redacted]	Paid	<input type="checkbox"/>
[Redacted]	Linked	[Redacted]	Paid	<input checked="" type="checkbox"/>

To ensure you are billed appropriately for paid users in a given billing cycle, you can designate certain users as free users during that cycle. During a given month in your current billing cycle, you can select free users at any time, up to the 10th day of the following month. For example, in March, you can select free users at any time until April 10th.

Between the first and 10th days of each month, you can also select free users for the previous billing cycle. During this period, you can turn on the **Previous Term** setting and select the free users for that billing cycle. After the 10th day of the month, Citrix Cloud no longer displays the **Previous Term** setting.

The free users that you select in a given month are accounted for when you are billed for paid users. When you change the status of a free user to a paid user, Citrix records the date of the change and includes that user in the billing cycle during which the change occurred.

User customer tagging

This feature provides breakdown of license usage data for each customer, including support for managing and reporting on both single-tenant and multi-tenant license server architectures. The objects of License Usage Insights are:

- License Server - A 'reporting' or 'not reporting' license server on the list.
- User - A single username found in call home usage data.
- NetScaler - A single NetScaler VPX license allocation (VPX on the VPX List).

Note

User customer tagging feature has the same behavior as free user tagging where a CSP can update customer tagging for the current billing cycle until the 10th of the following month.

Free server tagging

This feature provides flexibility in managing resources within the Citrix Cloud environment by enabling administrators to organize and identify servers based on their specific roles, locations, or any other relevant criteria, without worrying about licensing implications.

Note

A CSP can modify free tagging or customer tagging for the present month exclusively, with changes applicable to both current and forthcoming months.

Server customer tagging

This feature allows for better organization and management of resources within the Citrix Cloud environment, ensuring that servers are tagged according to customer-specific needs. By utilizing server customer tagging, administrators can easily identify and track resources associated with different customers, facilitating more efficient resource allocation and management.

Note

A CSP can modify free tagging or customer tagging for the present month exclusively, with changes applicable to both current and forthcoming months.

Historical trends

You can view a complete historical record of all of your past business with Citrix. Check the usage you reported last month, last year, or over a configurable time period.

Historical views deliver valuable business insight. As a Citrix Service Provider, you can quickly understand how your business with Citrix is trending and which products are seeing the most growth across your customers and subscribers.

Export usage and allocations data

You can export the following types of data as a CSV file from License Usage Insights:

- Virtual Apps and Desktops product usage and user list for a specified month
- Current ADC VPX allocation details

1. Select **Virtual Apps and Desktops** or **Networking** from the product list.

2. If applicable, select the view you want to export. For example, to export Virtual Apps and Desktops usage details, click the **Usage** view.
3. If applicable, select the month and year you want to export.
4. On the right side of the screen, click **Export**.

Access licensing data with APIs

Citrix provides several APIs that you can use to access your licensing data outside of Citrix Cloud. To learn more about these APIs, see [APIs to manage Citrix cloud licensing](#) in the Citrix Developer documentation.

To use these APIs, you must first create a secure client and generate a bearer token. To create a secure client, you must have the **Secure Client** permission in Citrix Cloud. For more information, see [Console permissions](#).

For more information about the required tasks for using Citrix Cloud APIs, see [Get started with Citrix Cloud APIs](#) in the Citrix Developer documentation.

Distributor access to APIs

You can allow your Citrix distributor to access your licensing data through Citrix Cloud APIs without granting them full administrator access to your Citrix Cloud account. You might do this so your distributor can validate your usage reports and ensure accurate billing.

To provide distributor access to your licensing data, you create a custom access administrator with permission only to create secure clients and access the License Usage Insights service. This account has limited access to Citrix Cloud APIs and no access to other Citrix Cloud functions. After the account is created, you can share the account credentials with your distributor so they can sign in to your Citrix Cloud account and create the secure client required for using Citrix Cloud APIs. Alternatively, you can sign in as the custom access administrator, create the secure client, and then share the secure client details with your distributor.

To create the custom access account for your distributor:

1. Create a new administrator account specifically for your Citrix distributor. For instructions, see [Invite individual administrators](#).
2. In **Set Access**, select **Custom access** and then select the following permissions:
 - **General > Secure Client**
 - **License Usage Insights > License Usage Insights: Distributor Access**

To create the secure client:

1. Sign in to Citrix Cloud using the new account's credentials.

2. Create a new secure client as described in [Get started with Citrix Cloud APIs](#).
3. Note the Client ID and Client Secret that Citrix Cloud generates. These details are required inputs for all Citrix Cloud APIs.

Licensing data available to distributors

This section describes the licensing data and APIs your Citrix distributor can access using the secure client details you provide. Use the links below for more details about each API.

Cloud service license usage and reporting for Citrix Service Providers

September 21, 2023

License Usage Insights automatically aggregates cloud service usage to provide a complete view across all single-tenant customers and multitenant partners. You can also export these details for a given month to a CSV file for further analysis.

Supported services

Single-tenant license usage is available for Citrix DaaS Premium (formerly Virtual Apps Premium and Virtual Apps and Desktops Premium).

Multitenant license usage is available for the following services:

- Citrix DaaS (formerly Virtual Apps and Desktops service)
- Citrix DaaS Standard for Azure (formerly Virtual Apps and Desktops Standard for Azure)

Licensing summaries

License Usage Insights provides the following breakdown for single tenant and multitenant usage for Citrix Service Providers (CSP):

- At-a-glance summary grouped by tenant type that includes the total number of customers and the total number of purchased licenses, users, and overassigned licenses across all customers.
- Usage summary for each customer or partner that includes the percentage of total licenses in use, total purchased licenses, users, and number of overassigned licenses.

For multitenant services, you can expand the usage summary to view the customers, OrgID, and total users associated with each partner.

The screenshot displays the Citrix Cloud usage dashboard. At the top, there are filters for 'Aug' and '2021', and an 'Export' button. A search bar is labeled 'Search by customer name...'. Below this, the dashboard is split into 'Single-Tenant Usage' and 'Multi-Tenant Usage' sections. The Single-Tenant Usage section shows 1 customer, 20 licenses, 10 users, and 0% license coverage. The Multi-Tenant Usage section shows 3 customers, 100 licenses, 150 users, and 50% license coverage. A table below these sections lists usage for 'BuckeyeCSP_812085A2-231A-4016-B550-9953CD89632B...' with 150% usage, 100 licenses, and 150 users. A table below that lists customer usage for 'Dataplus', 'Plexzap', and 'Streethex', each with 50 users. At the bottom, there is a section for 'Zathunicon (org id: 20570139)' with 50% usage, 20 licenses, and 10 users.

Single-Tenant Usage				Multi-Tenant Usage			
Total Customers	Total Licenses	Total Users	License Coverage	Total Customers	Total Licenses	Total Users	License Coverage
1	20	10	0	3	100	150	▲ 50

Customer Name (3 customers)	Org ID	Total Users
Dataplus	82961309	50
Plexzap	50986965	50
Streethex	29683097	50

Tenant customers not linked

In some cases, a tenant customer might be listed as “Not Linked.” This state can occur when users from that tenant access a cloud service through the CSP’s workspace URL, rather than the tenant workspace URL.

The screenshot shows a customer record for 'Example Corporation (org id: [redacted])' providing 'Desktop as a Service'. Below the header, there is a table with the heading 'Customer Name (20 customers)'. The first row in the table is 'Not Linked' with an information icon (i) next to it. The rest of the table is blurred.

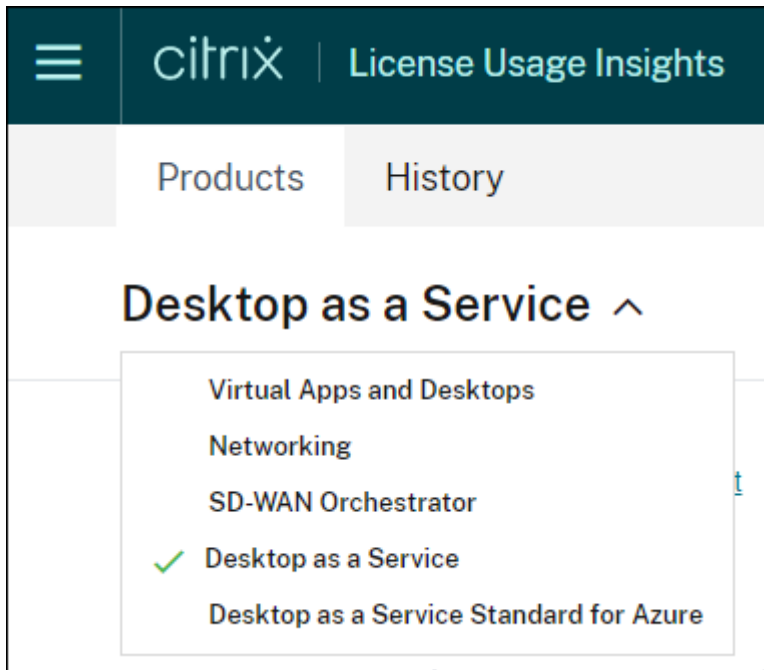

When the tenant user accesses the service through the tenant workspace URL, Citrix Cloud counts the user as belonging to the tenant and the “Not Linked” message is removed.

View and export monthly usage

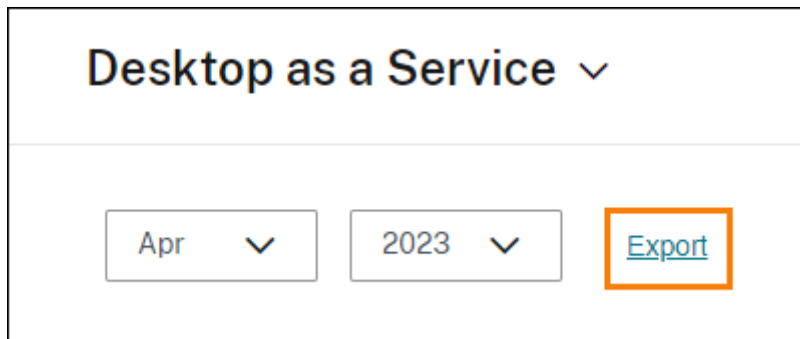

At any time, you can view license usage from previous months for all customers and partners. You can also export this data to a CSV file for further analysis. For Citrix DaaS Standard for Azure, you can also

export monthly consumption data.

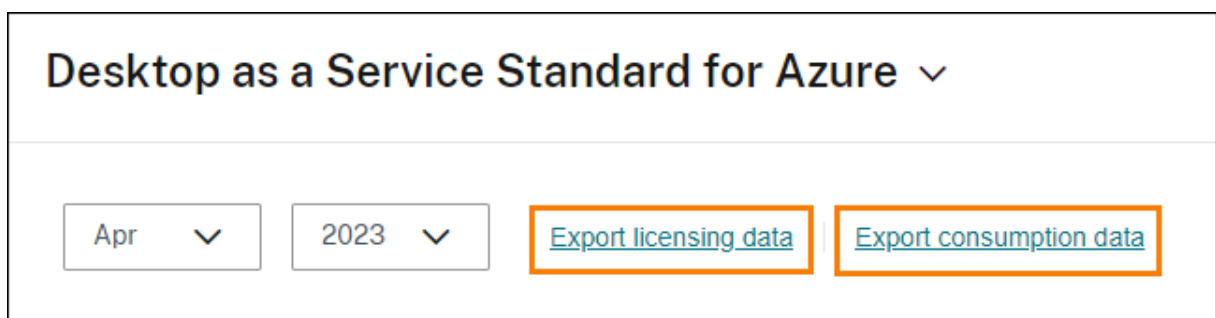

1. From the product menu, select the cloud service you want to view.

For Citrix DaaS, select the month and year you want to view and select **Export**.

For Citrix DaaS Standard for Azure, select the month and year you want to view and then select **Export licensing data** or **Export consumption data**.

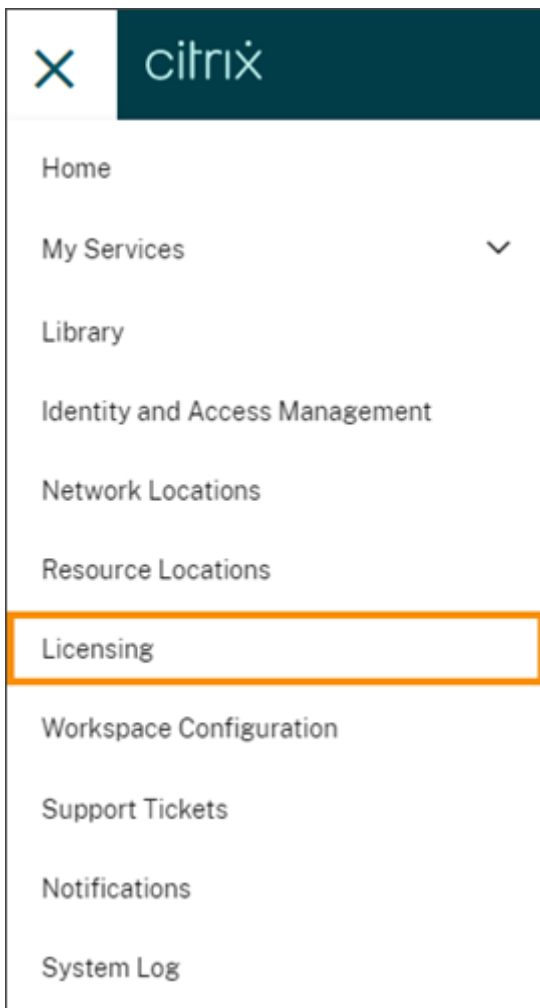

Customer license and usage monitoring for Citrix DaaS

September 21, 2023

Customers of **Citrix Service Providers (CSP)** can easily monitor Citrix DaaS licenses for their users in Citrix Cloud. As a CSP, you can access these details by signing in to your customer's account in Citrix Cloud. To view aggregated license usage information across single-tenant and multitenant customers, see [Cloud service license usage and reporting for Citrix Service Providers](#).

Customers can view their licensing data by selecting **Licensing** from the Citrix Cloud menu.

License assignment

User/Device licensing model: Citrix Cloud assigns a license when a unique customer user launches an app or desktop for the first time within the current month.

Concurrent User licensing model: Citrix Cloud assigns a license when a user launches an app or desktop on their device. When the user logs off or disconnects from the session, the license is no longer assigned. Because license assignment can change depending on the number of devices accessing apps or desktops at any given time, Citrix Cloud evaluates the number of licenses in use every five minutes.

For more information about the Concurrent licensing model, see [Concurrent licenses](#) in the Licensing product documentation.

Licensing summary

Citrix Cloud displays summary views of licenses in use under the User/Device and Concurrent User licensing models.

Summary for users and devices

For the User/Device model, the licensing summary provides an at-a-glance view of the licenses that are in use relative to the total number of licenses that you own.

As the percentage approaches 100%, the percentage goes from green to yellow. If the percentage exceeds 100%, the percentage turns red.

Citrix Cloud also displays the ratio of assigned licenses to purchased licenses and the number of remaining available licenses.

Summary for concurrent users

For the Concurrent User model, the licensing summary provides an at-a-glance view of the following information:

- Percentage of total purchased licenses currently in use when Citrix Cloud last evaluated the licenses in use. Citrix Cloud calculates this percentage every five minutes based on unique devices with active connections to the service. The quantity of total purchased licenses is the sum of licenses that have been purchased for Citrix DaaS that use the Concurrent licensing model.
- The ratio of currently assigned licenses to total purchased licenses and the number of available licenses remaining. The **Total** figure shown in this ratio represents the total number of licenses that are currently owned (as of the “Last Reported” date and time).
- Peak usage statistics. In calculating peak licenses in use, Citrix Cloud retrieves the the maximum number of licenses used in the following time periods:

- **Last 24 hours:** The maximum number of licenses used at one time during the last 24-period period.
- **This Month:** The maximum number of licenses used at one time from the start of the current calendar month.
- **All Time:** The maximum number of licenses used at one time from the start of the subscription.

The **Total** figure shown for these peak usage periods represents the total number of licenses that were owned at that point in time. If the total number of owned licenses increases or decreases, and there's a corresponding increase in assigned licenses, the **Total** figure changes to reflect the new number of owned licenses for that point in time. However, if there is no corresponding usage peak, the **Total** figure does not change.

- Active use statistics. Citrix Cloud displays the total number of unique connections for the following periods:
 - **Monthly:** The total number of connections for the previous calendar month.
 - **Daily:** The total number of connections for the previous 24 hours. These figures are also represented as percentages of the total number of licenses owned during these periods.

Calculating peak licenses in use

To accurately reflect the Concurrent licensing model, Citrix Cloud counts the number of unique devices accessing the service simultaneously every five minutes. If the count is greater than the current peak usage displayed, Citrix Cloud displays the new peak usage with the date and time that it was reached. If the count is less than the current peak usage, the current peak usage doesn't change.

Important:

If you use Monitor in Director for information about concurrent sessions, be aware that the Monitor report provides a different interpretation of concurrent sessions and does not accurately reflect the number of Concurrent User licenses in use. For more information about the differences between Monitor reports and Licensing reports, see the [FAQ](#).

Calculating monthly active use

At the beginning of each month, Citrix Cloud takes a snapshot of the previous calendar month. Citrix Cloud displays the total number of unique connections that occurred during that calendar month.

Calculating daily active use

At the same time each day, Citrix Cloud takes a snapshot of the previous 24 hours. Citrix Cloud displays the total number of unique connections that occurred during that 24-hour period.

Usage trends

Citrix Cloud displays a breakdown of usage trends for either User/Device or Concurrent User licenses. To view this breakdown, select **View Usage Details** from the licensing summary page.

Trends for users and devices

For User/Devices licenses, the **Usage Trends** section shows you a breakdown of assigned licenses as a chart.

Pointing to an interval on the chart shows you the following information:

- **Total Licenses:** Your total purchased licenses for the cloud service across all entitlements.
- **Previously Assigned:** The number of licenses that were assigned in the previous month. For example, a user accesses the cloud service for the first time in July and is assigned a license. This license is counted as “Newly Assigned” for the month of July. For the month of August, this license is counted as “Previously Assigned.”
- **Newly Assigned:** The number of new licenses that were assigned for each month. For example, a user accesses the cloud service for the first time in July and is assigned a license. This license is counted as “Newly Assigned” for the month of July.

Trends for concurrent users

For Concurrent User licenses, the **Usage Trends** section shows you the following information:

- **Total Licenses:** Your total purchased Concurrent licenses.
- **Peak Licenses In Use:** The maximum number of licenses assigned for the date range that you select. By default, Citrix Cloud displays peak usage for each month in the current calendar year. To drill down to monthly or hourly peak usage, select the calendar month or day you want to view from the drop-down menu.

If the date range you select isn't yet finished, Citrix Cloud displays the current peak usage for the latest interval of time. For example, if you drill down to view a calendar day that's still in progress, the maximum number of licenses is displayed for each hour up to the current moment in time. If the maximum number of licenses increases at the next five-minute counting interval, Citrix Cloud updates the peak usage for the current hour.

- **Active Use** displays a chart of the following information:
 - **Daily:** The total number of connections for each day during the previous 30 days.
 - **Monthly:** The total number of connections for each month during the previous calendar year.

Pointing to an interval on the **License Assignment** or **Active Use** charts reveals the details for that interval.

Licensed users

The **License Activity** section displays a list of the individual customer users who have licenses assigned during the current month. This list also displays the domain to which each user belongs, the date when a license was assigned, and the last time the service was used.

Monthly release of licenses

On the first day of each month, assigned licenses from the previous month are released automatically. When this happens, the number of assigned licenses resets to zero and the list of licensed customer users is cleared. Licenses are re-assigned when users launch apps or desktops for the first time within the new month.

Review monthly license history

On the first day of each month, the list of licensed customer users from the previous month, under **License Activity**, is cleared when the number of assigned licenses resets to zero. However, you can access user details from previous months at any time and download them as a CSV file, if needed.

1. In the **License Activity** section, select **View License History** at the far right of the section.
2. Select the month you want to view. A list of the user details for the selected month appears.
3. To export the list, select **Export to CSV** at the far right of the section and then save the file.

Export license details

At any time, customers can export licensed user details to a CSV file for further analysis. The customer can then use the CSV file as needed to analyze the license details.

To export the current month's details, in the **License Activity** section, select **Export to CSV** at the far right of the section and then save the file.

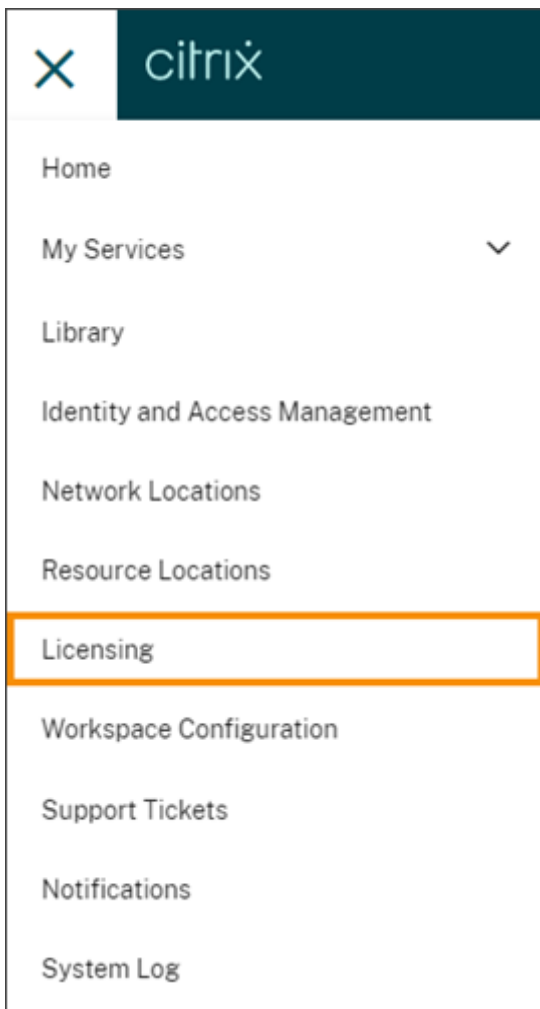

To export the details for previous months, generate a list for a selected month as described in Review monthly license history. Select **Export to CSV** and save the file.

Customer license and usage monitoring for Citrix DaaS Standard for Azure

September 21, 2023

Customers of **Citrix Service Providers (CSP)** can easily monitor Citrix DaaS Standard for Azure licenses for their users in Citrix Cloud. As a CSP, you can access these details by signing in to your customer's account in Citrix Cloud. To view aggregated license usage information across single-tenant and multitenant customers, see [Cloud service license usage and reporting for Citrix Service Providers](#).

Customers can view their licensing data by selecting **Licensing** from the Citrix Cloud menu.

License assignment

User/Device licensing model: Citrix Cloud assigns a license when a unique user or unique device launches a desktop for the first time.

Concurrent User licensing model: Citrix Cloud assigns a license when a user launches a desktop on their device. When the user logs off or disconnects from the session, the license is no longer assigned. Because license assignment can change depending on the number of devices accessing desktops at any given time, Citrix Cloud evaluates the number of licenses in use every five minutes.

For more information about the Concurrent licensing model, see [Concurrent licenses](#) in the Licensing product documentation.

Licensing summary

Citrix Cloud displays summary views of licenses in use under the User/Device and Concurrent User licensing models.

Summary for users and devices

For the User/Device model, the licensing summary provides an at-a-glance view of the licenses that are in use relative to the total number of licenses that you own.

As the percentage approaches 100%, the percentage goes from green to yellow. If the percentage exceeds 100%, the percentage turns red.

Citrix Cloud also displays the ratio of assigned licenses to purchased licenses and the number of remaining available licenses.

Summary for concurrent users

For the Concurrent model, the licensing summary provides an at-a-glance view of the following information:

- Percentage of total purchased licenses currently in use when Citrix Cloud last evaluated the licenses in use. Citrix Cloud calculates this percentage every five minutes based on unique devices with active connections to the service. The quantity of total purchased licenses is the sum of licenses that have been purchased for Citrix DaaS Standard for Azure that use the Concurrent licensing model.
- The ratio of currently assigned licenses to total purchased licenses and the number of available licenses remaining. The **Total** figure shown in this ratio represents the total number of licenses that are currently owned (as of the “Last Reported” date and time).

- Peak usage statistics. In calculating peak licenses in use, Citrix Cloud retrieves the the maximum number of licenses used in the following time periods:
 - **Last 24 hours:** The maximum number of licenses used at one time during the last 24-period period.
 - **This Month:** The maximum number of licenses used at one time from the start of the current calendar month.
 - **All Time:** The maximum number of licenses used at one time from the start of the subscription.

The **Total** figure shown for these peak usage periods represents the total number of licenses that were owned at that point in time. If the total number of owned licenses increases or decreases, and there's a corresponding increase in assigned licenses, the **Total** figure changes to reflect the new number of owned licenses for that point in time. However, if there is no corresponding usage peak, the **Total** figure does not change.

Calculating peak licenses in use

To accurately reflect the Concurrent licensing model, Citrix Cloud counts the number of unique devices accessing the service simultaneously every five minutes. If the count is greater than the current peak usage displayed, Citrix Cloud displays the new peak usage with the date and time that it was reached. If the count is less than the current peak usage, the current peak usage doesn't change.

Usage trends

Citrix Cloud displays a breakdown of usage trends for either User/Device or Concurrent User licenses. To view this breakdown, select **View Usage Details** from the licensing summary page.

Trends for users and devices

For User/Devices licenses, the **Usage Trends** section shows you a breakdown of assigned licenses as a chart.

Pointing to an interval on the chart shows you the following information:

- **Total Licenses:** Your total purchased licenses for the cloud service across all entitlements.
- **Previously Assigned:** The number of licenses that were assigned in the previous month. For example, a user accesses the cloud service for the first time in July and is assigned a license. This license is counted as "Newly Assigned" for the month of July. For the month of August, this license is counted as "Previously Assigned."

- **Newly Assigned:** The number of new licenses that were assigned for each month. For example, a user accesses the cloud service for the first time in July and is assigned a license. This license is counted as “Newly Assigned” for the month of July.

Trends for concurrent users

For Concurrent User licenses, the **Usage Trends** section shows you the following information:

- **Total Licenses:** Your total purchased Concurrent licenses.
- **Peak Licenses In Use:** The maximum number of licenses assigned for the date range that you select. By default, Citrix Cloud displays peak usage for each month in the current calendar year. To drill down to monthly or hourly peak usage, select the calendar month or day you want to view from the drop-down menu.

If the date range you select isn't yet finished, Citrix Cloud displays the current peak usage for the latest interval of time. For example, if you drill down to view a calendar day that's still in progress, the maximum number of licenses is displayed for each hour up to the current moment in time. If the maximum number of licenses increases at the next five-minute counting interval, Citrix Cloud updates the peak usage for the current hour.

Pointing to an interval on the chart reveals the total licenses and peak licenses in use for that interval.

Usage reports

You can download usage information for a standard or specified interval. The information includes meter usage for:

- Azure VMs
- Network connections, such as VNet peering
- Azure storage items, such as managed disks, block blobs, and page blobs

Data can take up to 72 hours after the end of a day/month to reflect all usage.

Under **Usage Reports**, select an interval and then select **Download Data** to generate and download a CSV file to your local machine.

Licensed users

For User/Device licenses, the **License Activity** section displays a list of the individual customer users who have licenses assigned during the current month. This list also displays the domain to which

each user belongs, the date when a license was assigned, and the last time the service was used. This section is not available for Concurrent User licenses.

Monthly release of licenses

On the first day of each month, assigned licenses from the previous month are released automatically. When this happens, the number of assigned licenses resets to zero and the list of licensed customer users is cleared. Licenses are re-assigned when users launch apps or desktops for the first time within the new month.

Review monthly license history

On the first day of each month, the list of licensed customer users from the previous month, under **License Activity**, is cleared when the number of assigned licenses resets to zero. However, you can access user details from previous months at any time and download them as a CSV file, if needed.

1. In the **License Activity** section, select **View License History** at the far right of the section.
2. Select the month you want to view. A list of the user details for the selected month appears.
3. To export the list, select **Export to CSV** at the far right of the section and then save the file.

Export license details

At any time, you can export licensed user details for a single customer to a CSV file for further analysis. You can then use the CSV file as needed to analyze the license details.

To export the current month's details, in the **License Activity** section, select **Export to CSV** at the far right of the section and then save the file.

To export the details for previous months, generate a list for a selected month as described in Review monthly license history. Select **Export to CSV** and save the file.

Assign users and groups to service offerings using Library

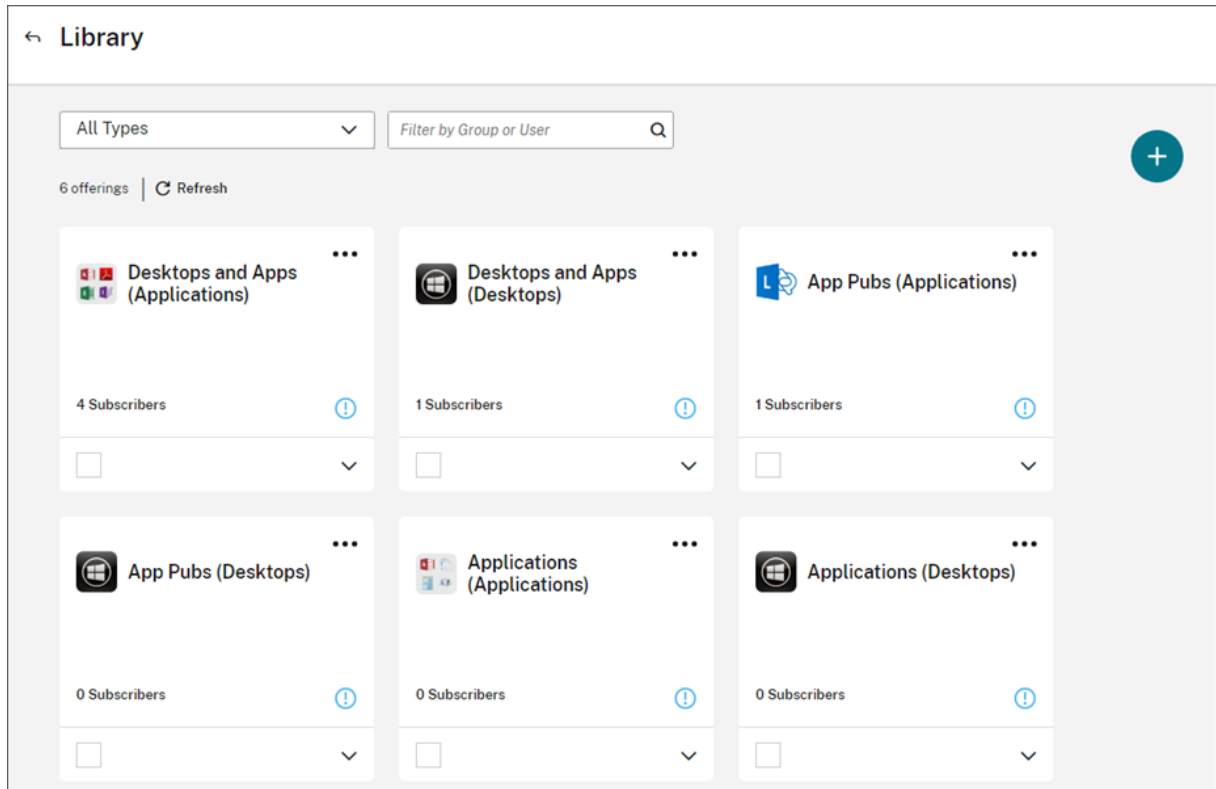

April 8, 2024

Note:

For *Managed by Citrix Cloud* delivery groups, user assignments can now be managed directly in the Web Studio console. For more information, see the [DaaS documentation](#). Previously, the management of these delivery groups was confined to the Library, but now you can use the same

management capabilities in the Web Studio console. This feature is now live for all customers. In June 2024, DaaS-specific use cases within Cloud Library will be fully deprecated.

You can assign resources or other items that you configure in a service to your Active Directory users and groups using the Library. Offerings might consist of applications, desktops, data shares, and web apps that you create through a Citrix service. The Library displays all your offerings in a single view.

Administrator access

To access Library, administrators must meet the following requirements:

- Authenticates through the Citrix identity provider or Azure AD.
- Signs in as an individual administrator, not as a member of an administrator group.
- Has full access to Citrix Cloud or custom access with the Library role selected.

If you have individual and group administrator accounts in Citrix Cloud, your access to Library might depend on the permissions in force when you sign in with each account. For more information, see [Resultant permissions for administrators with Citrix, AD, Azure AD, and Google Cloud identities](#).

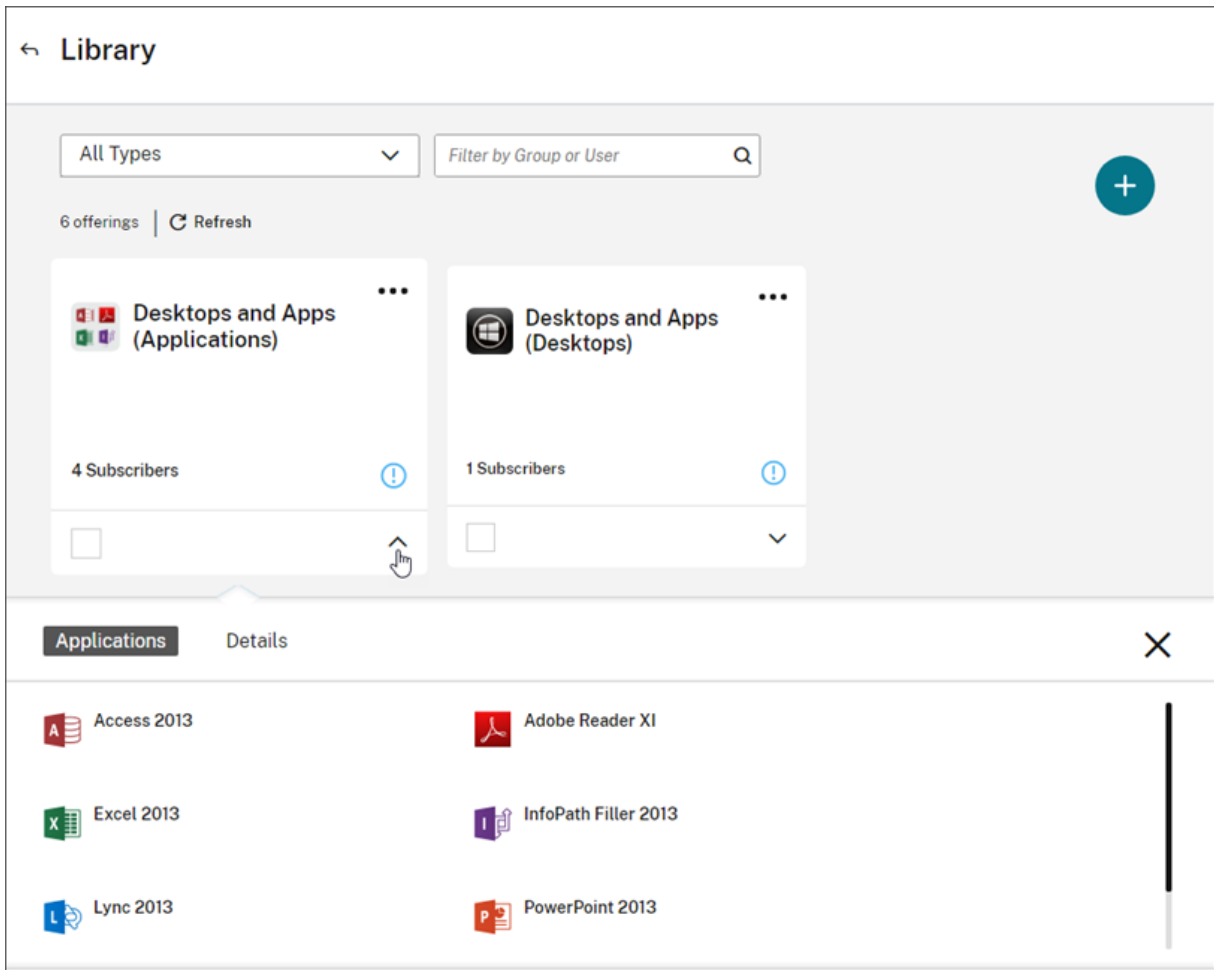

Considerations for using StoreFront with Citrix DaaS

If you are using an on-premises StoreFront with Citrix DaaS, do not use Library to assign resources when creating delivery groups. Instead, use Studio to assign resources to users. If you use Library in this scenario, resources might not be enumerated to users.

When creating a delivery group in Studio, on the **Users** page, do not select **Leave user management to Citrix Cloud**. Instead, select a different option (**Allow any authenticated users to use this delivery group** or **Restrict use of this delivery group to the following users**).

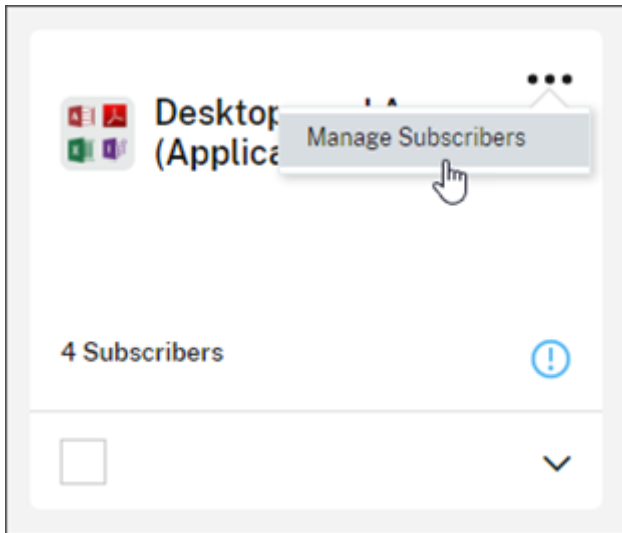

View offering details

To view applications, desktops, policies, and any other related offering information, click the arrow on the offering card.

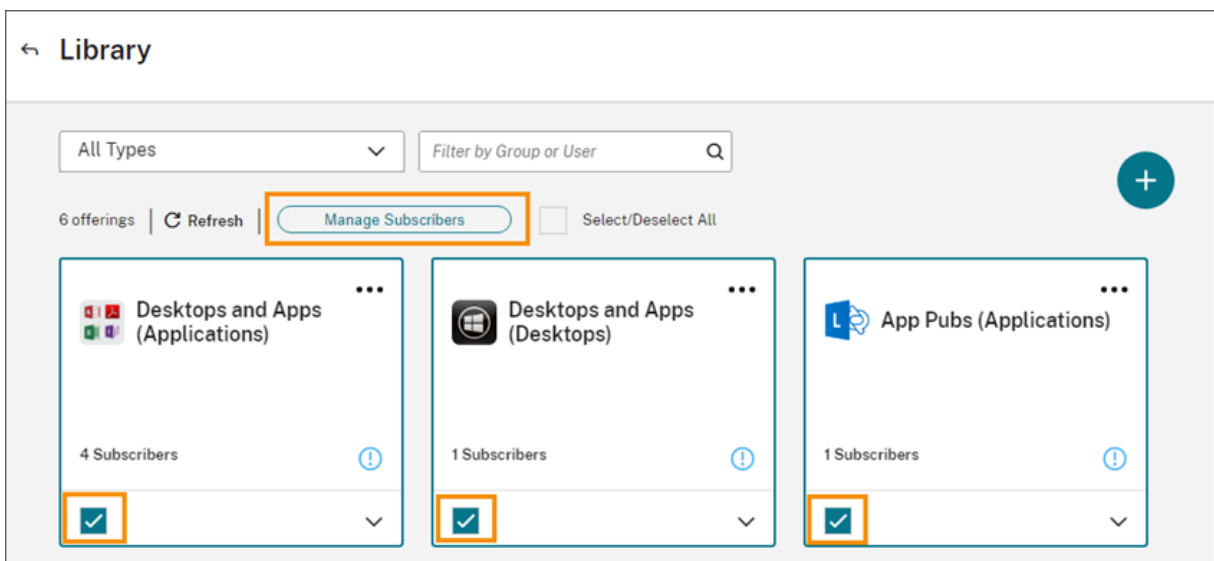

Add or remove subscribers

To manage users or groups for a single offering, click **Manage Subscribers** from the offering card's menu.

To manage subscribers for multiple offerings, select the check mark on each offering and then click **Manage Subscribers**.

To add subscribers to the offering, choose a domain and then select the users or groups you want to add.

To remove a single subscriber, click the trash icon for a user or group. To remove multiple subscribers, select the users or groups and click **Remove Selected**.

Manage subscribers for | Desktops and Apps (Applications) ✕

Step 1: Choose a domain Step 2: Choose a group or user

 Search...

Selected 2 of 4 Subscriber(s) **Remove Selected** Cancel

<input type="checkbox"/>	Type	Subscriber	Status
<input type="checkbox"/>	GROUP	Account Name: [REDACTED] Display Name: [REDACTED] Domain: [REDACTED] UPN: [REDACTED]	✓ Subscribed <input type="checkbox"/>
<input checked="" type="checkbox"/>	USER	Account Name: [REDACTED] Display Name: [REDACTED] Domain: [REDACTED] UPN: [REDACTED]	✓ Subscribed <input type="checkbox"/>
<input checked="" type="checkbox"/>	USER	Account Name: [REDACTED] Display Name: [REDACTED] Domain: [REDACTED] UPN: [REDACTED]	✓ Subscribed <input type="checkbox"/>
<input type="checkbox"/>	USER	Account Name: [REDACTED] Display Name: [REDACTED] Domain: [REDACTED] UPN: [REDACTED]	✓ Subscribed <input type="checkbox"/>

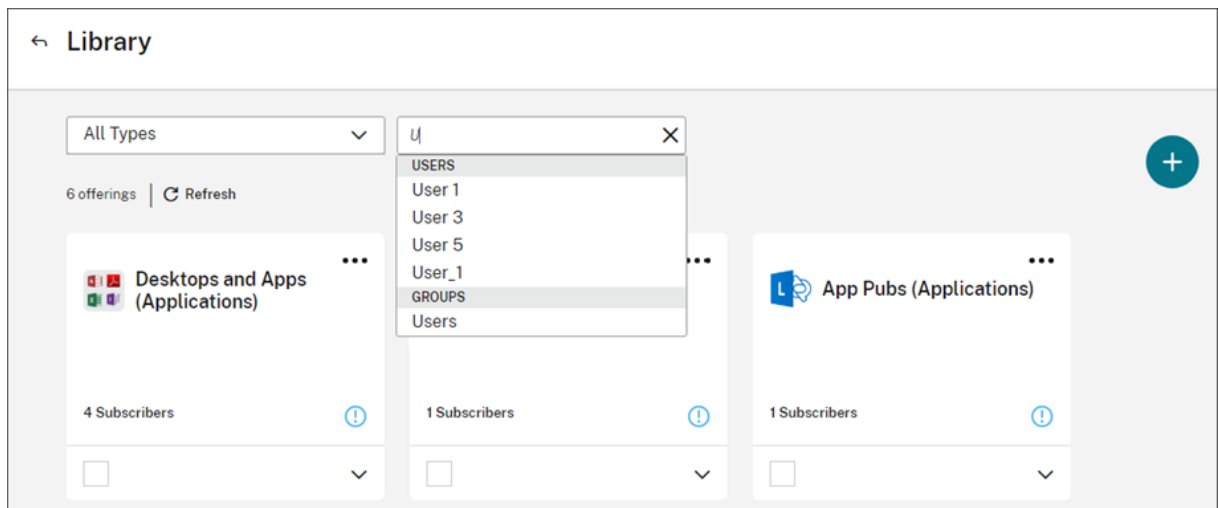

After you add or remove subscribers from an offering, the offering card displays the current number of subscribers.

Filter offerings

By default, the Library displays all offerings. To quickly view offerings for a specific service, select the filter for that service.

You can also search for any user or group that is currently subscribed to an offering in the Library. Citrix Cloud displays only the offerings that pertain to the user or group you select. To see all offerings for all users, click the X to clear the filter.

Custom landing page

March 14, 2024

Many administrators access the Cloud Console to perform specific tasks like managing applications in the Web Studio console or viewing data in DaaS - Monitor.

However, these tasks require multiple clicks and navigating through multiple pages every time the admins log in, which can be time-consuming. This new feature allows admins to set or modify a custom landing page, saving time and providing an enhanced console experience.

Currently, the following pages are available to be configured as a custom landing page, with more expected to be added in the future:

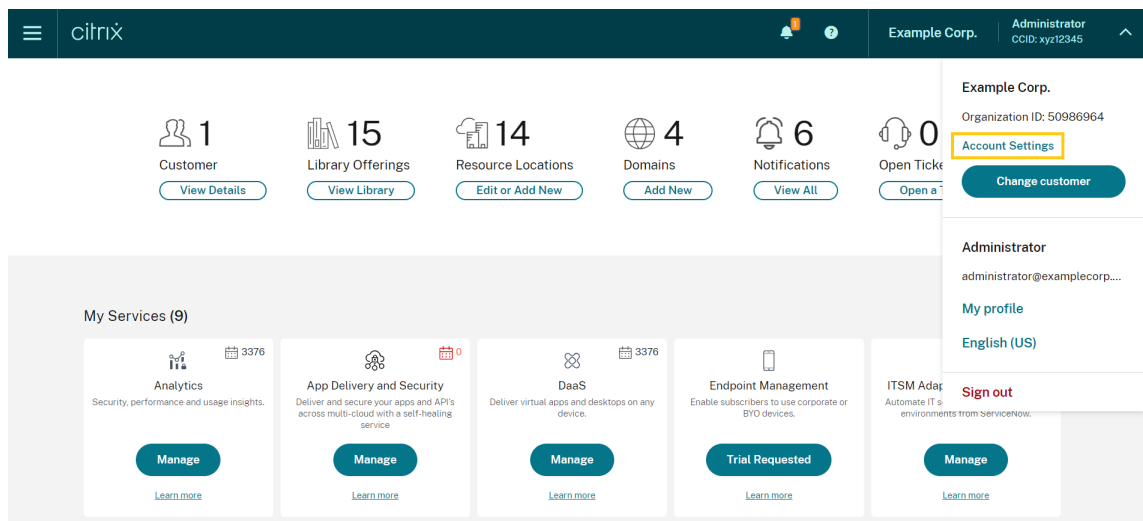

- DaaS
- DaaS-Monitor
- NetScaler Console
- CAS
- CAS Security
- CAS Performance
- WEM
- General

Note:

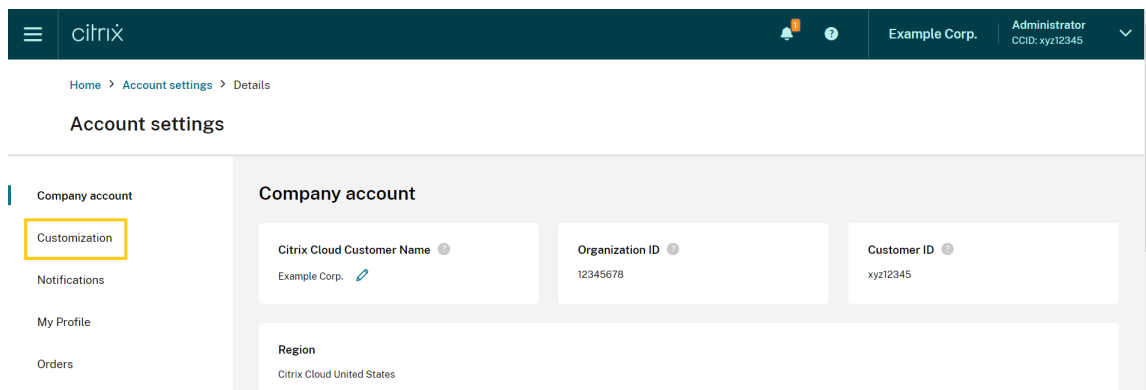

The custom landing page setting is optional, and is set on a per account basis. So each administrator can customize their own experience within Citrix Cloud. All admins (whether custom or full) have access to this feature.

Configure a custom landing page

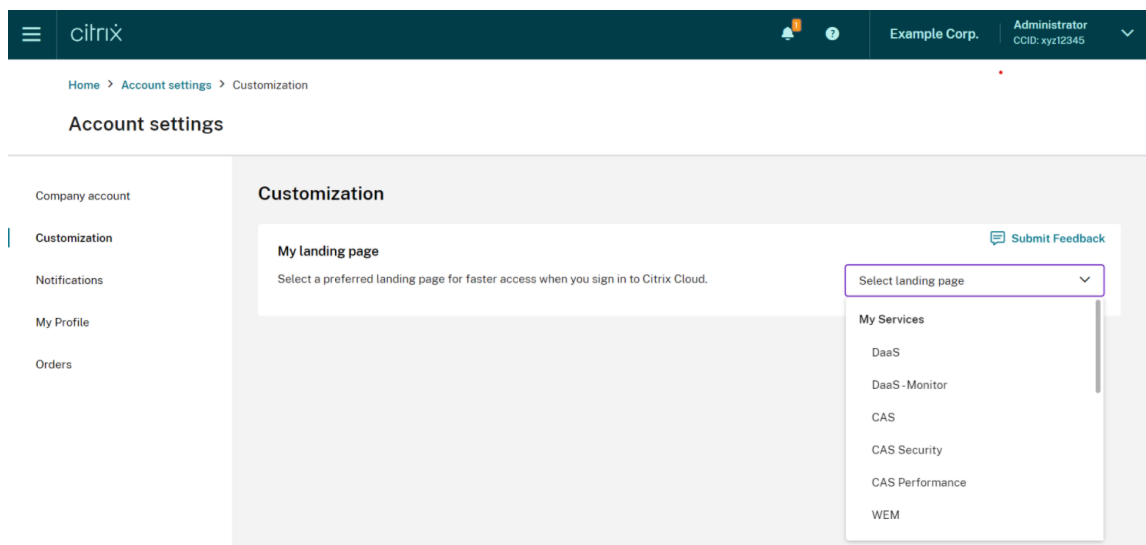

1. Click the profile name and select **Account Settings**.

2. Click **Customization**.

3. Select the service you would like to configure as your custom landing page.

4. Click **Apply**.

Your custom landing page is now set.

Note:

- You can reset your custom landing page to the default Cloud home page anytime by clicking **Reset to default**.
- If you sign in again on the same page where you just signed out, it will take you to your last viewed page instead of your new landing page.

Allow customers to delete Citrix Cloud account and re-onboard

April 8, 2024

Citrix Cloud offers the capability for customers to securely delete their Citrix Cloud account and seamlessly re-onboard when required.

Prerequisites

- If your account has active DaaS entitlements and your DaaS environment is provisioned, contact Citrix Technical Support to execute Fast Decommission before proceeding. See [Studio Console Shows “Enable DaaS” for First Time Use](#) article for details on how to check if your DaaS environment is provisioned.
- Remove all Cloud Connectors and Connector Appliances associated with this account.

Important

Consider the following points before deleting a Citrix Cloud account:

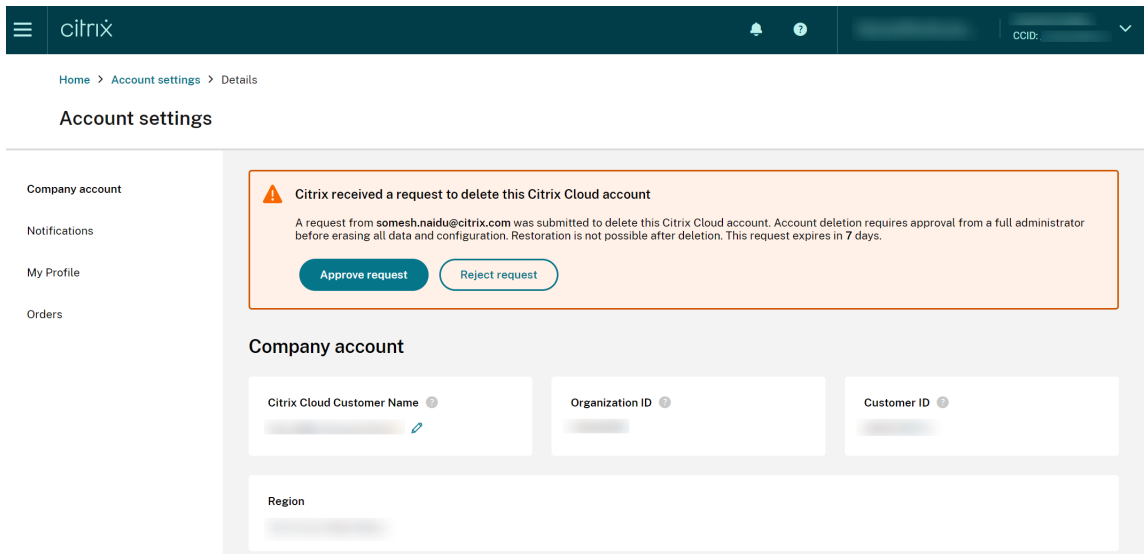

- All customer-related data is removed from Citrix databases.
- All resources related to Citrix Cloud services, including Citrix-managed VMs, that Citrix provisioned in your cloud environment will be deleted. See [Citrix Cloud services](#) for the description of the Citrix-managed components that are included in specific Citrix Cloud services.
- Administrator and user access to Citrix Cloud and services are disabled.
- Administrators or users actively using the service will experience service disruption.
- This action is not reversible. Once the data is deleted, it cannot be recovered.

Steps

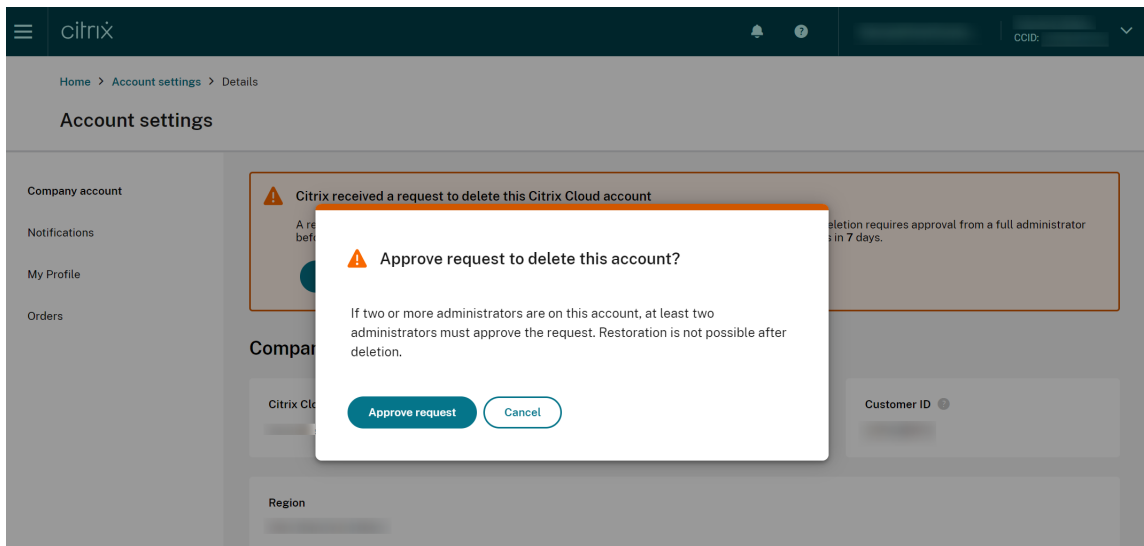

1. Contact [Citrix Customer Service](#) to submit a delete request. A *Full Administrator* on the Citrix Cloud account is required to submit this request.
2. After your request is initiated, login to your Citrix Cloud account. There you'll see the Citrix Cloud account delete workflow.

3. Follow the on-screen guidance to either approve or reject this request.

4. To approve this request for deletion, sign in to the account, navigate to **Account Settings** and click **Approve request** on the approval workflow banner.

To cancel the request for deletion, sign in to the account, navigate to **Account Settings** and click **Reject and remove request** on the delete approval workflow banner.

Note:

- If this account has two or more administrators associated with it, at least two administrators must approve the request.
- This request expires if required approvals are not received within 7 days.

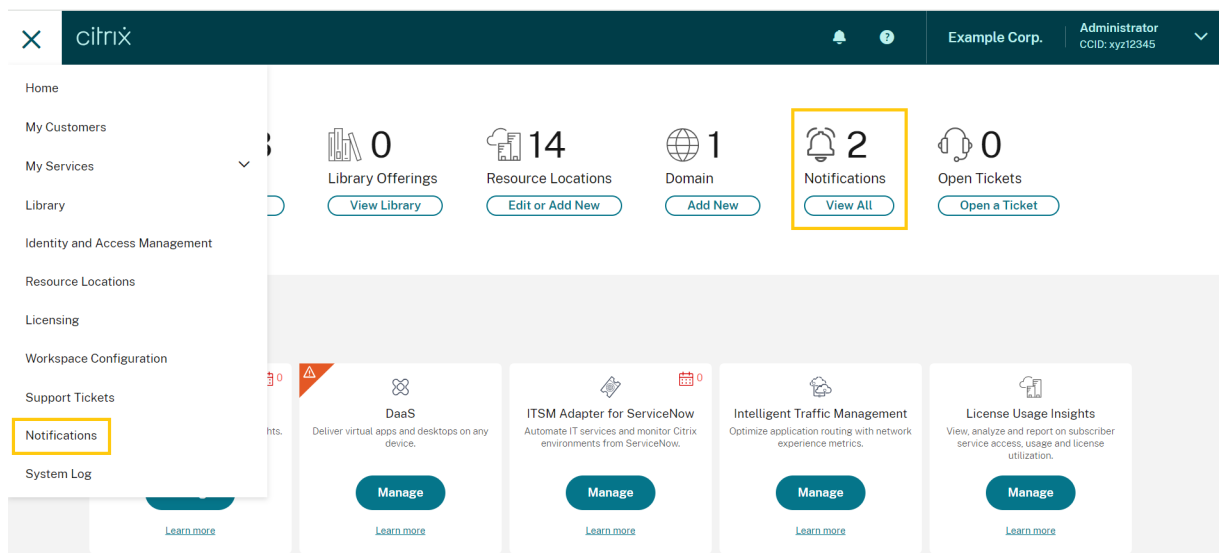

Notifications

September 21, 2023

Notifications provide information about issues or events that might be of interest to administrators, such as new Citrix Cloud features or problems with a machine in a resource location. Notifications can come from any service within Citrix Cloud.

View notifications

The number of notifications appears near the top of the Citrix Cloud console page. For more details, click **View All** under **Notifications** in the console or select **Notifications** from the console menu.

The Notifications page displays the notifications that you receive. The newest notifications at the top of the list.

← Notifications

Dismiss notifications

Notifications are managed on a per-administrator basis. When you dismiss notifications, the dismissal occurs under your own administrator identity in Citrix Cloud. Other administrators can still view and dismiss their own notifications, even if you dismiss all of your notifications.

To dismiss all notifications that you've received, select **Dismiss All** near the top of the page.

To dismiss individual notifications, select each notification and then select **Dismiss**.

Receive email notifications

You can choose to receive notifications by email instead of signing in to view them. By default, email notifications are turned off.

You can also enable email notifications for other stakeholders who don't have administrator access to your Citrix Cloud account, such as members of your organization's security and auditing teams.

When you enable email notifications, Citrix Cloud sends an email for each notification. Notifications are sent as soon as possible. They are not grouped into a single email or batched for sending at a later time.

To enable email notifications for yourself

1. From the Citrix Cloud management console, select **Account Settings**.

2. Select **Notifications**.
3. Turn on the **My email notifications** setting.
4. Under **Manage my notification settings**, select the types of notifications you want to receive. By default, all notification types are selected.
5. Click **Apply** to save your settings.

To enable email notifications for non-administrators

Use the steps in this section to add non-administrators as contacts for email notifications. If you attempt to add an existing administrator as a contact, Citrix Cloud displays an error.

1. From the Citrix Cloud management console, click **Account Settings**.
2. Select **Notifications**.
3. Under **Contact management**, select **Add contact**.
4. Enter the contact's name, email address, and their preferred language.
5. Under **Manage notification settings**, select the notification types to send.
6. Select **Add contact** to save the contact's information.

Modify notification settings

As an administrator, you can change the types of notifications that you receive by selecting or clearing the checkboxes under **Manage my notification settings**. Changing your notifications doesn't affect the notifications that other administrators receive.

You can also modify the notifications that non-administrators receive.

To modify notifications for non-administrators

1. From the Citrix Cloud management console, click **Account Settings**.
2. Select **Notifications**.
3. Under **Contact management**, locate the contact that you want to manage.
4. Point to the contact and then select the pencil icon.
5. Under **Manage notification settings**, select or clear the checkboxes for each notification type.

To modify a contact's email address, you must first delete the contact and then add them as a new contact with their new email address.

Disable email notifications

As an administrator, you can disable your own email notifications at any time by turning off the **My email notifications** setting.

Non-administrators can stop receiving notifications by clicking the unsubscribe link that appears in every notification email. Contacts who have unsubscribed have the **Unsubscribed** notification status in the table in the **Contact management** section.

To disable notifications for non-administrators, you can perform one of the following actions:

- Clear all of the checkboxes in **Manage notification settings** for the contact.
- Delete the contact from the table under **Contact management**.

Delete non-administrator contacts

1. From the Citrix Cloud management console, click **Account Settings**.
2. Select **Notifications**.
3. Under **Contact management**, locate the contact that you want to manage.
4. Point to the contact and then select the trash can icon.

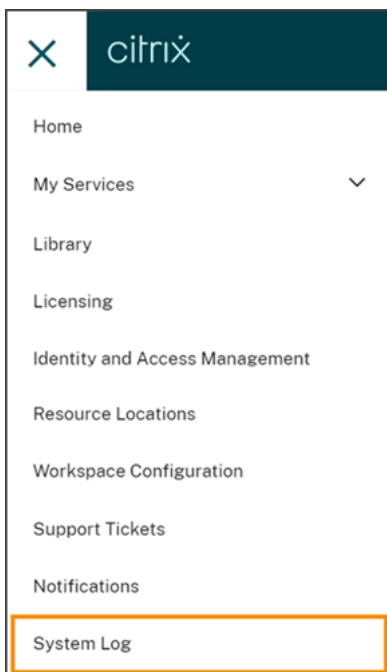

Citrix Cloud removes the contact from the table.

System Log

September 21, 2023

The system log displays a timestamped list of events that occurred in Citrix Cloud. You can export these changes as a CSV file to meet your organization's regulatory compliance requirements or to support security analysis.

To view the system log, select **System Log** from the Citrix Cloud menu.

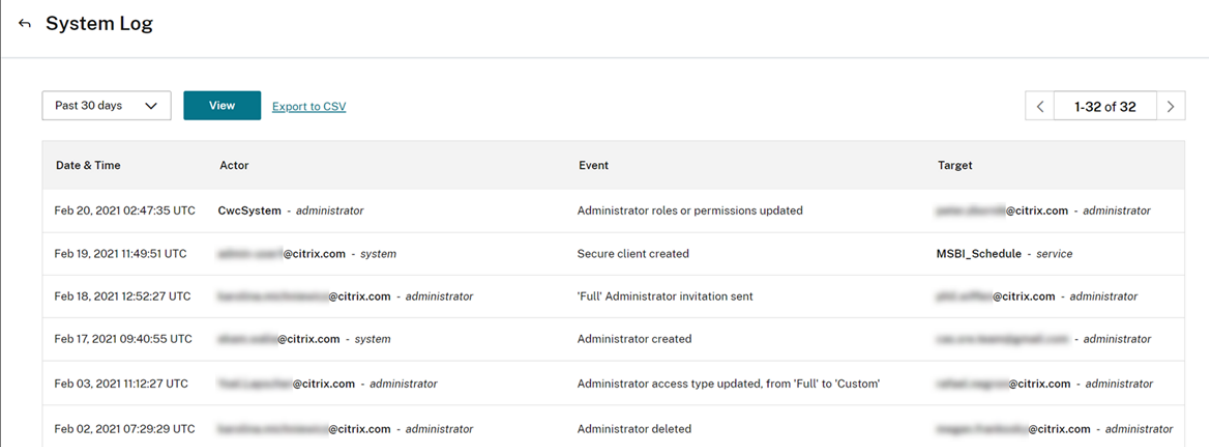

For more information about retention of data in system logs, see [Data retention](#) in this article.

Logged events

The system log captures events for certain Citrix Cloud platform and cloud service operations. For a complete list of these events and descriptions of captured data, see [System Log Events Reference](#).

By default, the system log displays events that occurred in the last 30 days. The most recent events are displayed first.

← System Log

Past 30 days [Export to CSV](#) < 1-32 of 32 >

Date & Time	Actor	Event	Target
Feb 20, 2021 02:47:35 UTC	CwcSystem - administrator	Administrator roles or permissions updated	msb@msb.com - administrator
Feb 19, 2021 11:49:51 UTC	msb@msb.com - system	Secure client created	MSBL_Schedule - service
Feb 18, 2021 12:52:27 UTC	msb@msb.com - administrator	'Full' Administrator invitation sent	msb@msb.com - administrator
Feb 17, 2021 09:40:55 UTC	msb@msb.com - system	Administrator created	msb@msb.com - administrator
Feb 03, 2021 11:12:27 UTC	msb@msb.com - administrator	Administrator access type updated, from 'Full' to 'Custom'	msb@msb.com - administrator
Feb 02, 2021 07:29:29 UTC	msb@msb.com - administrator	Administrator deleted	msb@msb.com - administrator

The displayed list includes the following information:

- Date and time (UTC) when the event occurred.
- Actor that initiated the event, such as an administrator or secure client. Entries with the actor **CwcSystem** indicate that Citrix Cloud performed the operation.
- Brief description of the event, such as editing an administrator or creating a new secure client.
- Target of the event. The target is the system object that was impacted or changed as a result of the event. For example, a user who was added as an administrator.

To view events more than 30 days in the past, filter the list by selecting the time period you want to view and select **View**. You can view events that occurred up to 90 days in the past.

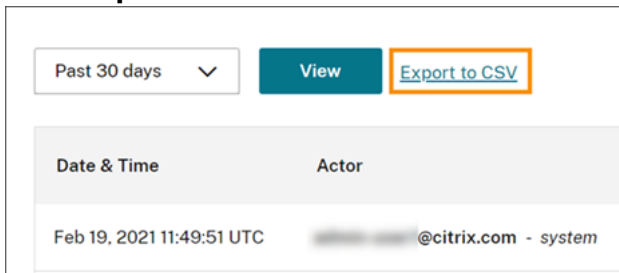

To retrieve older events that occurred during a time period that you specify, you can use the System-Log API. For more information, see [Retrieve events for a specific time period](#) in this article.

Export events

You can export a CSV file of system log events that occurred up to the last 90 days. The name of the downloaded file follows the format of `SystemLog-CustomerName-OrgID-DateTimeStamp.csv`.

1. From the Citrix Cloud menu, select **System Log**.
2. If needed, filter the list to display the time period for which you want to export events.
3. Select **Export to CSV** and save the file.

The CSV file includes the following information:

- UTC timestamp of each event
- Details of the actor who initiated the event, including the name and actor ID.
- Event details such as the type of event and the text of the event
- Details of the target of the event such as the target ID, the name of the administrator or a secure client.

Retrieve events for a specific time period

If you need to retrieve events for specific periods of time, you can use the SystemLog API. Before you use the API, you'll need to create a secure client as described in [Getting Started](#) on the Citrix Developer Docs web site.

For more information about using the SystemLog API, see [Citrix Cloud - SystemLog](#) on the Citrix Developer Docs web site.

Forward system log events

The [Citrix System Log Add-on for Splunk](#) enables you to connect your Splunk instance with Citrix Cloud. With this connection, you can forward system log data to Splunk. For more information, see the [add-on documentation](#) in the Citrix repository in GitHub.

Data retention

Citrix shares responsibility with you, the customer, for retaining the system log data that Citrix Cloud captures.

Citrix retains system log records for 90 days after events are recorded.

You are responsible for downloading the system log records that you want to retain to meet your organization's compliance requirements and for storing these records in a long-term storage solution.

System Log Events Reference

September 21, 2023

To view all System Log events data for your Citrix Cloud account, you can:

- [Download a CSV file of all events](#) that occurred during the previous 30, 60, or 90 days.
- Use the SystemLog API to [retrieve events for a specific time period](#).

See Event data descriptions in this article for descriptions of the data that are captured when you retrieve System Log events. See Cloud components and services that generate events for event-specific values such as event message text, event types, and whether object field data is recorded before and after events occur.

Cloud components and services that generate events

System Log records events for the following Citrix Cloud entities, components, and services:

- [Citrix Cloud platform](#): Events related to Citrix Cloud platform functions such as managing administrators, device resets for Workspace subscribers, Azure AD tenants, and managing domains and network locations.
- [Connectors](#): Events related to registering and updating Citrix Cloud Connectors and Connector Appliances.
- [Licensing](#): Events related to registering on-premises License Servers, managing assigned licenses for cloud services, and exporting licensing data.
- [Secure Private Access service](#): Events related to Secure Private Access service configurations.
- [Citrix Workspace](#): Events related to Workspace Configuration settings.

Event data descriptions

When you download system log events or retrieve them using the SystemLog API, the following data are included:

- **RecordID:** The unique identifier for the event.
- **UtcTimestamp:** The date and UTC time at which the event occurred.
- **CustomerID:** The unique organization identifier of the Citrix Cloud account.
- **EventType:** The identifier for the type of event that was recorded. The event type is recorded using the format `OriginatingService/Actor/Action`. For example, the event type for creating an administrator is `platform/administrator/create`.
- **TargetID:** The ID of the system object that was impacted or changed.
- **TargetDisplayName:** The display name of the system object that was impacted or changed. For example, the name of an administrator that was created.
- **TargetEmail:** The email address of the system object. For example, the email address of an administrator that was created.
- **TargetUserID:** The user ID of the system object that was impacted or changed. For example, when creating an administrator, the target user ID is the user ID of the administrator that was created.
- **TargetType:** The target category for the event.
- **BeforeChanges** and **AfterChanges:** The contents of object fields before and after the event occurred, respectively. For some events, these object fields include:
 - CustomerID
 - User principal
 - UserID
 - Administrator access type, such as Custom or Full
 - CreatedDate
 - UpdatedDate
 - DisplayName
- **AgentID:** The event category.
- **ActorID:** The ID of the system object that initiated the event. For example, for creating an administrator, this is the object ID of the administrator who invited another user to the Citrix Cloud account.
- **ActorDisplayName:** The display name of the person or entity that initiated the event. For example, the name of the administrator who invited another user to the Citrix Cloud account.

- **ActorType:** The service that generated the event.
- **EventMessage:** The brief description of the event that occurred.

System Log events for the Citrix Cloud platform

June 30, 2023

This article describes the event data that System Log captures for the Citrix Cloud platform. For more information about System Log event data, see [System Log Events Reference](#).

To learn more about System Log, see [System Log](#).

Azure AD tenants

Event Message	Event Type	Target Type	Actor Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Azure AD tenant connected	platform/identity/provider/azuread/istrated	type	provider/azuread/istrated	CustomID	Yes	No
Azure AD tenant disconnected	platform/identity/provider/azuread/istrated	type	provider/azuread/istrated	CustomID	Yes	No
Azure AD auth domain name changed	platform/identity/provider/azuread/authdomain	type	provider/azuread/authdomain	CustomID	Yes	No
Azure AD auth domain name change failed	platform/identity/provider/azuread/authdomain	type	provider/azuread/authdomain	CustomID	Yes	No

Citrix Cloud administrators and secure clients

Event Message	Event Type	Target Type	Actor Type	Current object fields recorded before event	Updated object fields recorded after event
Administrator created	platform/administrator/create	administrator	system	No	Yes
Administrator invitation sent	platform/administrator/invite	administrator	administrator	No	Yes
Administrator roles or permissions updated	platform/administrator/update	administrator	administrator	Yes	Yes
Administrator deleted	platform/administrator/delete	administrator	administrator	No	Yes
Secure client created	platform/clientadministrator/create	administrator	system	No	Yes
Secure client deleted	platform/clientadministrator/delete	administrator	administrator	Yes	No
Administrator Group created	platform/administrator/group/create	administrator	administrator	No	Yes
Administrator Group roles or permissions updated	platform/administrator/group/update	administrator	administrator	Yes	Yes
Administrator Group deleted	platform/administrator/group/delete	administrator	administrator	Yes	No

Device reset for Active Directory plus token

Event Message	Event Type	Target Type	Actor Type	Current object fields recorded before event	Updated object fields recorded after event
Subscriber device token reset completed	platform/authentication/subscriber/device/delete	administrator	administrator	No	Yes

Domain management

Event Message	Event Type	Target Type	Actor Type	Current object fields recorded before event	Updated object fields recorded after event
Domain removed	platform/domains/remove	administrator	administrator	No	No

Network locations

Event Message	Event Type	Target ID	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Network location created	sdwan/networklocation/create	The ID of the network location that was created	The name of the administrator who added the network location	No	Yes
Network location updated	sdwan/networklocation/update	The ID of the network location that was modified	The name of the administrator who modified the network location	Yes	Yes

Event Message	Event Type	Target ID	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Network location deleted	sdwan/networklocation	The ID of the network location that was deleted	The name of the administrator who deleted the network location	Yes	No

Resource locations

Event Message	Event Type	Target ID	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Resource Location created	platform/resourceLocation	The name of the resource location that was created	The name of the administrator who created the resource location	Yes	Yes
Resource Location updated	platform/resourceLocation	The name of the resource location that was modified	The name of the administrator who modified the resource location	Yes	Yes
Resource Location deleted	platform/resourceLocation	The name of the resource location that was deleted	The name of the administrator who deleted the resource location	Yes	Yes

System Log events for connectors

May 12, 2023

This article describes the event data that System Log captures for the Citrix Cloud Connector and Connector Appliance for Cloud Services. For more information about System Log event data, see [System Log Events Reference](#).

To learn more about System Log, see [System Log](#).

Connector registration

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Connector Registered	platform/edgeservice/Cloud/Connector	Cloud/Connector or Connector Appliance	The administrator who registered the connector	Yes	Yes
Connector Deleted	platform/edgeservice/Cloud/Connector	Cloud/Connector or Connector Appliance	The administrator who deleted the connector	Yes	Yes

Connector updates

Event Message	Event Type	Target ID	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Resource Location Maintenance Window updated	platform/resource	Location of the resource location that was modified	Fileacewindow administrator who changed the configuration	Yes	Yes
Connector upgrade triggered by administrator	platform/edgeser	Cloud annual upgrade Connector or Connector Appliance	The administrator who initiated the update	No	No
Connector upgrade started	platform/edgeser	Cloud upgrade start Connector or Connector Appliance	Automatic or the administrator who initiated the update	Yes	No
Connector upgrade completed	platform/edgeser	Cloud upgrade complete Connector or Connector Appliance	Automatic or the administrator who initiated the update	No	Yes

Connector public keys

Event Message	Event Type	Target ID	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Public Key added to trust	platform/authentication/created	edgeserverkey	The administrator who performed the operation	No	No

Event Message	Event Type	Target ID	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Public Key removed from trust	platform/authentication/deleted	edge	The serverkey administrator who performed the operation	No	No

System Log events for licensing in Citrix Cloud

March 11, 2022

This article describes the event data that System Log captures for on-premises Citrix Licensing registration with Citrix Cloud. For more information about System Log event data, see [System Log Events Reference](#).

To learn more about System Log, see [System Log](#).

On-premises license servers

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
On-premise license servers deleted	lui/onpremlicensereg/delete	license server	The administrator who deleted the license server	No	No
Failed to delete on-premise license servers	lui/onpremlicensereg/delete	license server	The administrator who tried to delete the license server	No	No

Cloud service licensing

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Citrix Cloud service licenses released	lui/cloudlicense/CloudLicense	CloudLicense	The administrator who released licenses for the cloud service	No	No
Failed to release Citrix Cloud service licenses	lui/cloudlicense/CloudLicense	CloudLicense	The administrator who tried to release licenses for the cloud service	No	No

License Usage Insights for Citrix Service Providers

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Partner on-premise user list data exported	lui/csp/userlistdataExporting	License	The administrator who exported the Partner user list data	No	No
Failed to export partner on-premise user list data	lui/csp/userlistdataExporting	License	The administrator who tried to export the Partner user list data	No	No

License usage for cloud services and on-premises products

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
License usage data exported	lui/cloudlicense/CloudLicenseExport	CloudLicense or Licensing	The administrator who exported license usage data	No	No
Failed to export license usage data	lui/cloudlicense/CloudLicenseExportFailed	CloudLicense or Licensing	Failed administrator who tried to export license usage data	No	No

System Log Events for Secure Private Access

October 4, 2022

This article describes the event data that System Log captures for the Secure Private Access service. For more information about System Log event data, see [System Log Events Reference](#).

To learn more about System Log, see [System Log](#).

Web and SaaS applications

Event Message	Event Type	Target Type	Current object fields recorded before event	Updated object fields recorded after event
Web/SaaS application created	swa/websaasapplicationwebsaasapp	websaasapplication	No	Yes

Event Message	Event Type	Target Type	Current object fields recorded before event	Updated object fields recorded after event
Web/SaaS application updated	swa/websaasapplicationupdate	websaasapplication	Yes	Yes
Web/SaaS application deleted	swa/websaasapplicationdelete	websaasapplication	Yes	No
Web/SaaS application creation failed	swa/websaasapplicationcreatefailed	websaasapplication	No	No
Web/SaaS application update failed	swa/websaasapplicationupdatefailed	websaasapplication	Yes	Yes
Web/SaaS application deletion failed	swa/websaasapplicationdeletefailed	websaasapplication	Yes	Yes

User and group subscriptions

Event Message	Event Type	Target Type	Current object fields recorded before event	Updated object fields recorded after event
User/Group subscription added	swa/websaasapplicationsubscriptions	websaasapplicationsubscribers		Yes
User/Group subscription removed	swa/websaasapplicationunsubscriptions	websaasapplicationsubscribers		Yes
User/Group subscription failed	swa/websaasapplicationsubscriptionsfailed	websaasapplicationsubscribers		No
User/Group unsubscription failed	swa/websaasapplicationunsubscriptionsfailed	websaasapplicationsubscribers		No

Contextual policies

Event Message	Event Type	Target Type	Current object fields recorded before event	Updated object fields recorded after event
Contextual policy created	swa/contextualpolicy/create	contextualpolicy	No	Yes
Contextual policy updated	swa/contextualpolicy/update	contextualpolicy	Yes	Yes
Contextual policy deleted	swa/contextualpolicy/delete	contextualpolicy	Yes	No
Contextual policy creation failed	swa/contextualpolicy/createfailed	contextualpolicy	No	No
Contextual policy update failed	swa/contextualpolicy/updatefailed	contextualpolicy	No	No
Contextual policy deletion failed	swa/contextualpolicy/deletefailed	contextualpolicy	Yes	No

Application domains

Event Message	Event Type	Target Type	Current object fields recorded before event	Updated object fields recorded after event
Application domain created	swa/applicationdomain/create	applicationdomain	No	Yes
Application domain updated	swa/applicationdomain/update	applicationdomain	Yes	Yes
Application domain deleted	swa/applicationdomain/delete	applicationdomain	Yes	No
Application domain creation failed	swa/applicationdomain/createfailed	applicationdomain	No	No
Application domain update failed	swa/applicationdomain/updatefailed	applicationdomain	Yes	No
Application domain deletion failed	swa/applicationdomain/deletefailed	applicationdomain	Yes	No

Browser extension settings

Event Message	Event Type	Target Type	Current object fields recorded before event	Updated object fields recorded after event
Browser Extension settings updated	swa/browserextensionsettings/update	swa/browserextensionsettings/update	Yes	Yes
Browser Extension settings update failed	swa/browserextensionsettings/update	swa/browserextensionsettings/update	Yes	No

Website URL lists and filter categories

Event Message	Event Type	Target Type	Current object fields recorded before event	Updated object fields recorded after event
Enabled website filter lists and categories	swa/website/filterlists/enabled/filtercategories	swa/website/filterlists/enabled/filtercategories	Yes	Yes
Enabled website filter lists and disabled filter categories	swa/website/filterlists/enabled/filtercategories	swa/website/filterlists/enabled/filtercategories	Yes	Yes

System Log events for Citrix Workspace

March 11, 2022

This article describes the event data that System Log captures for Citrix Workspace. For more information about System Log event data, see [System Log Events Reference](#).

To learn more about System Log, see [System Log](#).

Workspace URL

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Workspace URL updated	wxp/url/update	subscriber	The administrator who updated the URL	Yes	Yes
Failed to update Workspace URL	wxp/url/update	failed subscriber	The administrator who attempted to update the URL	Yes	Yes
Workspace URL enabled	wxp/url/enable	subscriber	The administrator who enabled customization of the workspace URL	No	Yes
Failed to enable Workspace URL	wxp/url/enable	failed subscriber	The administrator who attempted to enable customization of the workspace URL	No	Yes

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Workspace URL disabled	wxp/url/disable	subscriber	The administrator who disabled customization of the workspace URL	No	Yes
Failed to disable Workspace URL	wxp/url/disablefailed	subscriber	The administrator who attempted to disable customization of the workspace URL	No	Yes

Workspace authentication

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Workspace identity provider updated	wxp/identityprovider/update	subscriber	The administrator who updated the workspace authentication method	Yes	Yes

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Failed to update Workspace identity provider	wxp/identityprovider/update	subscriber	The administrator who attempted to update the workspace authentication method	Yes	Yes

Citrix Federated Authentication Service

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Workspace Federated Authentication Service (FAS) enabled	wxp/fas/enable	subscriber	The administrator who enabled FAS	No	Yes
Failed to enable Workspace Federated Authentication Service (FAS)	wxp/fas/enable	subscriber	The administrator who tried to enable FAS	No	Yes
Workspace Federated Authentication Service (FAS) disabled	wxp/fas/disable	subscriber	The administrator who disabled FAS	No	Yes

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Failed to disable Workspace Federated Authentication Service (FAS)	wxp/fas/disablefas	subscriber	The administrator who tried to disable FAS	No	Yes

Favorites

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Workspace favorites enabled	wxp/favorites/enable	subscriber	The administrator who enabled favorites	No	Yes
Failed to enable Workspace favorites	wxp/favorites/enable	subscriber	The administrator who tried to enable favorites	No	Yes
Workspace favorites disabled	wxp/favorites/disable	subscriber	The administrator who disabled favorites	No	Yes
Failed to disable Workspace favorites	wxp/favorites/disable	subscriber	The administrator who tried to disable favorites	No	Yes

Change password

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Workspace change password options policy updated	wxp/changepasswordoptions/updated	workspace	The administrator who updated the policy for changing passwords within Citrix Workspace	Yes	Yes
Failed to update Workspace change password options policy	wxp/changepasswordoptions/updated	workspace	The administrator who tried to update the policy for changing passwords within Citrix Workspace	Yes	Yes
Workspace change password options enabled	wxp/changepasswordoptions/enabled	workspace	The administrator who enabled the setting for changing passwords within Citrix Workspace	No	Yes
Failed to enable Workspace change password options	wxp/changepasswordoptions/enabled	workspace	The administrator who tried to enable the setting for changing passwords within Citrix Workspace	No	Yes

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Workspace change password options disabled	wxp/changepasswordoptions/disable	workspace	The administrator who disabled the setting for changing passwords within Citrix Workspace	No	Yes
Failed to disable Workspace change password options	wxp/changepasswordoptions/disable	workspace	The failed administrator who tried to disable the setting for changing passwords within Citrix Workspace	No	Yes

Long-lived tokens

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Workspace long lived token configuration updated	wxp/longlivedtokens/update	workspace	The administrator who updated the token configuration	Yes	Yes

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Failed to update Workspace long lived token configuration	wxp/longlivedtokens/update	subscriber	The administrator who tried to update the token configuration	Yes	Yes

Inactivity timeout for Web

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Workspace sessions Configuration updated	wxp/sessions/update	subscriber	The administrator who updated the idle time for the Inactivity Timeout for Web setting	Yes	Yes
Failed to update Workspace sessions configuration	wxp/sessions/update	subscriber	The administrator who tried to update the idle time for the Inactivity Timeout for Web setting	Yes	Yes

Feature rollout

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Assigned users and groups updated for intelligent Workspace experience	wxp/iws/features/subscriber	usersgroups	The administrator who updated the assigned users and groups for accessing Activity Feed notifications in Citrix Workspace	No	No
Failed to Assign users and groups updated for intelligent Workspace experience	wxp/iws/features/subscriber	usersgroups	The administrator who tried to update the assigned users and groups for accessing Activity Feed notifications in Citrix Workspace	No	No
Intelligent Workspace experience enabled	wxp/iws/features/subscriber	subscriber	The administrator who enabled Activity Feed notifications in Citrix Workspace	No	No

Event Message	Event Type	Target Type	Actor ID	Current object fields recorded before event	Updated object fields recorded after event
Failed to enable intelligent Workspace experience	wxp/iws/features/enable	Failed	The administrator who tried to enable Activity Feed notifications in Citrix Workspace	No	No
Intelligent Workspace experience disabled	wxp/iws/features/disable	Failed	The administrator who disabled Activity Feed notifications in Citrix Workspace	No	No
Failed to disable intelligent Workspace experience	wxp/iws/features/disable	Failed	The administrator who tried to disable Activity Feed notifications in Citrix Workspace	No	No

SDKs and APIs

September 27, 2023

Citrix Cloud provides several APIs that you can use to retrieve information and automate complex and repetitive tasks, including:

- Silently install Citrix Cloud Connector
- Create and consume reports for managing cloud licenses

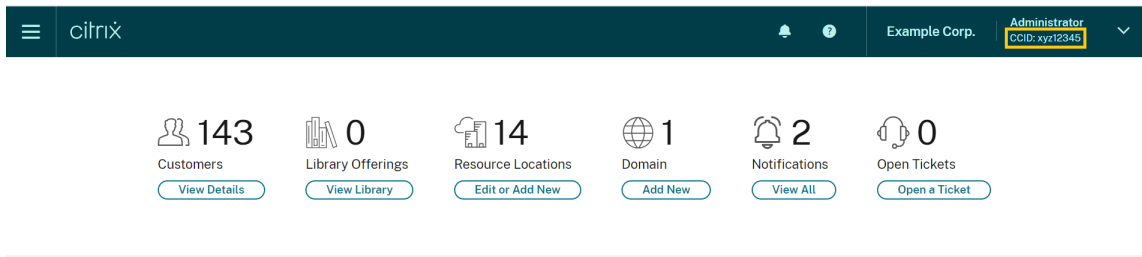

- Determine a customer’s entitlement status
- Send notifications to Citrix Cloud administrators
- Retrieve System Log events
- Retrieve details about your resource locations to use with other APIs

Several Citrix Cloud services also provide SDKs and APIs that allow you to retrieve information, query data, and perform administrative tasks.

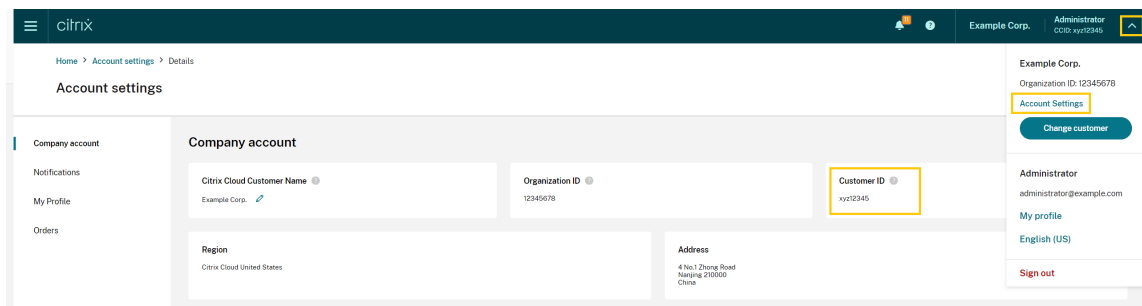

Secure clients

To use Citrix Cloud APIs, you need to create a secure client that accesses Citrix Cloud on your behalf. To create a secure client, you’ll need to supply the customer ID of your Citrix Cloud account. Your customer ID is located in the following places in the management console:

- The top-right corner of the console, underneath your user name.

- Your **Account Settings** page.

- The **API Access** page.

Inherited permissions

Secure clients are tied to a single administrator and a single customer ID in Citrix Cloud. This means your secure clients inherit the same level of permissions that you have under a specific customer ID. So, if you have full access permissions, your secure clients also have full access permissions. If your permissions level is reduced at a later time, the secure clients that you’ve already created automatically inherit your reduced permissions.

For instructions to create secure clients, see [Get started with Citrix Cloud APIs](#) in the Citrix Developer documentation.

Cloud licensing APIs

Enterprise customers can use cloud licensing APIs to perform management tasks like exporting usage data and releasing assigned licenses. Citrix partners can use these APIs to retrieve summary and historical data for on-premises Citrix Virtual Apps and Desktops and Citrix DaaS.

For more information, see [APIs to manage Citrix cloud licensing](#) in the Citrix Developer documentation.

SystemLog API

The SystemLog API allows you to retrieve events that occurred in your Citrix Cloud account for periods of time that you specify. For more information about using this API, see [Citrix Cloud - SystemLog](#) in the Citrix Developer documentation.

Resource Locations API

The Resource Locations API allows you to retrieve information about your resource locations for use with other applications and scripts. For example, let's say that you want to silently install the Citrix Cloud Connector in one of several resource locations in your Citrix Cloud account. You can use this API to retrieve the resource location ID and pass it to your install script.

For more information about using this API, see [Citrix Cloud - Resource Location](#) in the Citrix Developer documentation.

Service Entitlement API

The Service Entitlement API retrieves the services a customer is entitled to use, the days remaining on each entitlement, and the quantity of entitlements that the customer purchased. For more information about using this API, see [Citrix Cloud - Service Entitlement](#) in the Citrix Developer documentation.

Notifications API

The Notifications API allows you to send messages to other Citrix Cloud administrators. Recipients receive your messages through the [Notifications](#) page in the management console.

SDKs and APIs for other services

For more information about the SDKs and APIs that are available for other Citrix Cloud services, see the following articles:

- [Digital workspaces](#): Includes SDKs and APIs for workspace services like Citrix DaaS and Citrix Workspace.
- [App delivery and security](#): Includes SDKs and APIs for networking and app delivery services like Application Delivery Management, Intelligent Traffic Management, and SD-WAN Orchestrator.

More information

To learn more about how Citrix Cloud APIs and secure clients can help you perform complex operations like migrating to the cloud and configuring authentication with push tokens, see the following Tech Zone articles:

- [PoC Guide: nFactor for Citrix Gateway Authentication with Push Token](#)
- [Deployment Guide: Migrating Citrix Virtual Apps and Desktops from VMware vSphere to Citrix Virtual Apps and Desktops service on Microsoft Azure](#)
- [PoC Guide: Automated Configuration Tool](#)

Citrix Cloud for Partners

March 19, 2024

Citrix Cloud includes services, features, and experiences designed for both customers and partners. This section outlines features available to Citrix Partners that help them collaborate with customers on Citrix Cloud services and solutions.

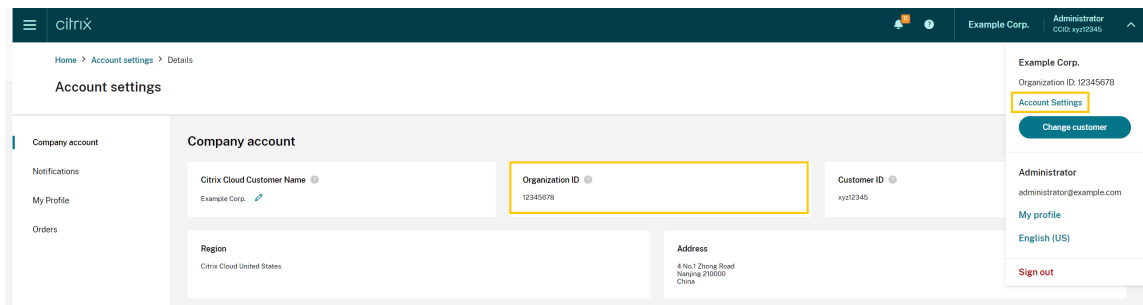

Partner identification

Partners are identified in Citrix Cloud based on their Citrix Organization ID (ORGID). Partners can view the ORGID that's associated with their Citrix Cloud account in the following locations in the Citrix Cloud management console:

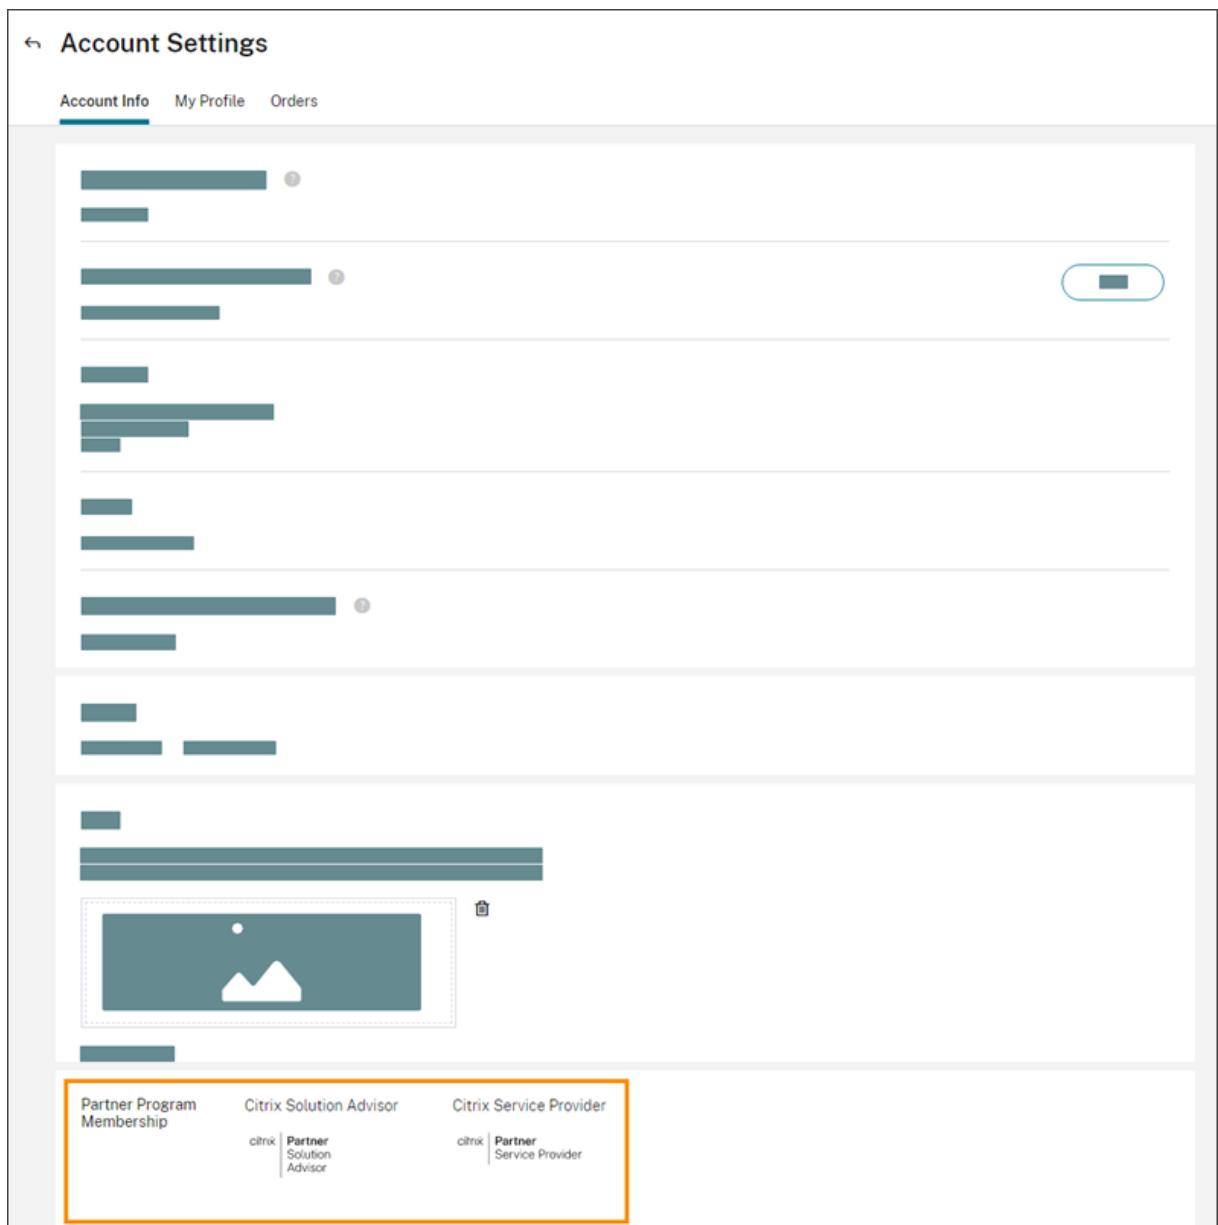

- From the customer menu. Click your customer name from the top-right corner of the console. Your ORGID appears beneath your company name in the menu.

- From the **Account Settings** page. From the customer menu in the top-right corner, select **Account Settings**.

If the ORGID on the account is an active member of a Citrix partner program (such as Citrix Solution Advisor or Citrix Service Provider) the program badge indicates that a Citrix partner owns this account. Partner identification is then used to govern access to additional cloud services or features.

Customer dashboard

The customer dashboard is designed for partners to view the status of multiple Citrix Cloud customers in a consolidated view. For a customer to appear on the dashboard, a connection must be established between the partner and customer. The customer dashboard is available on partner badged Citrix Cloud accounts.

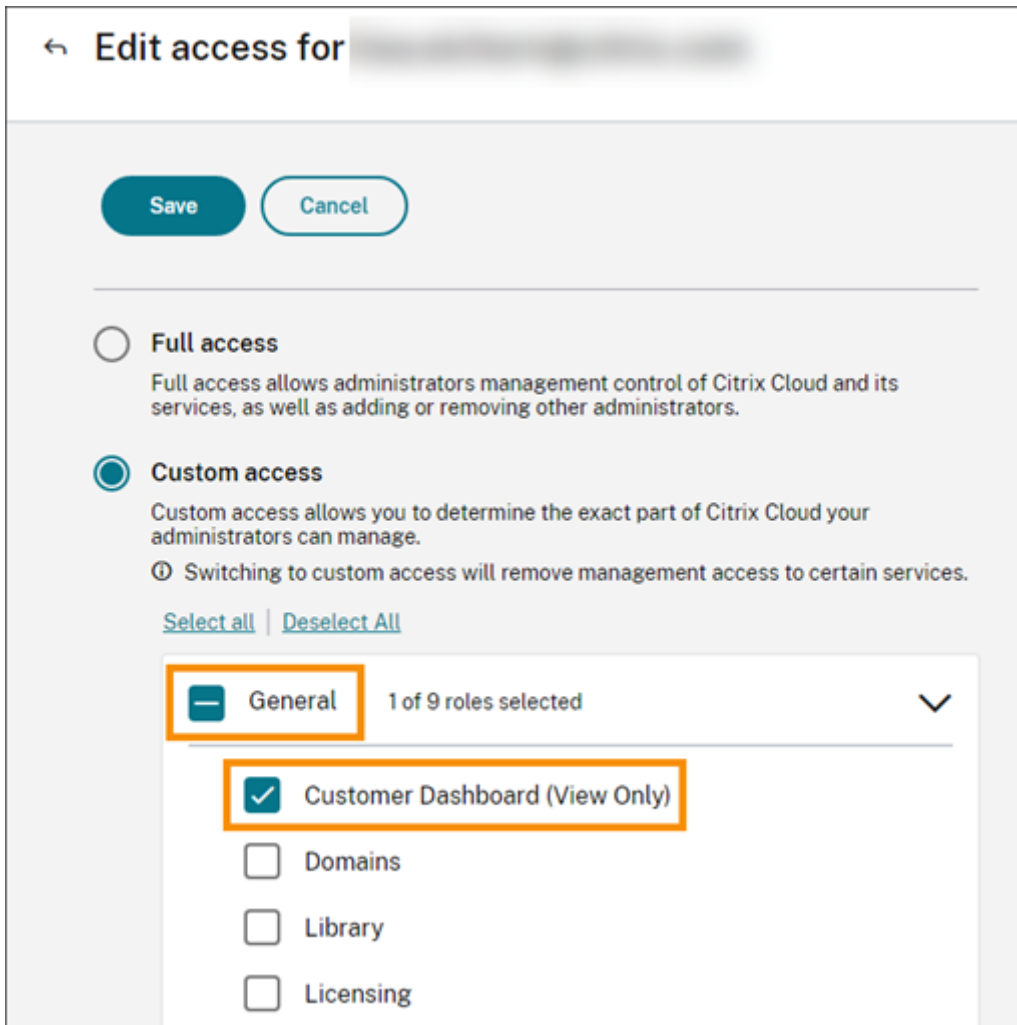

Customer Dashboard

Invite or Add

Search by customer name... Q < 1-36 of 36 >

Customer Name ↑	Trials	Production	Notifications	Open Tickets
Acme Worldwide	8	3	285	... >
Bakfield		3	8	... >
Buckeye Data Co		1		... >

By default, full access administrators can view the customer dashboard. Custom access administrators can view the dashboard if the **Customer Dashboard (View Only)** permission is selected. For more information about administrator permissions in Citrix Cloud, see [Modify administrator permissions](#).

Partner connections with customers

Partners collaborating with customers on Citrix Cloud solutions can establish a trusted link between their accounts. This account level relationship allows a customer to share specific information easily with a partner. By connecting with a partner, a customer grants the partner visibility into information about their Citrix Cloud account and their relationship with Citrix.

Establishing a partner connection enables the following:

- Customer appears on the partner's dashboard
- Partner appears as an active connection in the customer's account settings
- Partner has visibility into Citrix Cloud service entitlements
- Partner has visibility into license usage and active use for Citrix Cloud entitlements

After a partner and customer connect, partner administrators can view the customer's basic account information, orders placed by the customer, and entitlement information, such as services, license

counts, and expiration dates.

Partner connections with customers don't expire.

Connections with multiple partners or customers

Partners can establish connections with multiple customers. Partners can be associated with up to 100 customer accounts. If a partner needs to manage more than 100 customer accounts, they must create a separate partner account with a different email address to manage the additional customers. Alternatively, the partner might consider removing customer account that they no longer need to manage.

Customers can establish connections with multiple partners. There is no limit to the number of customer-to-partner connections.

Connection notifications

Citrix Cloud sends notifications to partners when:

- The partner creates a connection to a customer
- A customer terminates their connection to the partner

Citrix Cloud sends notifications to customers when the partner terminates their connection with the customer.

Partner visibility into service entitlements

When connected to a customer, the partner can view the service entitlement status for that customer. This information includes the status of both trial and non-trial entitlements. Partners can also view the following information:

- Active service trials
- Pending service trial requests
- Expired service trials
- Active service entitlements (services purchased or otherwise entitled or enabled for the customer)
- License count and expiration date for the entitlement

Service Name	Units	Service Type	State	Service Ends
Virtual Apps and Desktops	25	Production	Active	May 31, 2022
Content Collaboration	100	Production	Active	May 31, 2022
Endpoint Management	100	Trial	Expired	Dec 31, 2019
ITSM Adapter	This trial is pending approval.			
Microapps	25	Production	Active	Apr 7, 2025
Secure Internet Access	This trial is pending approval.			

Licensing visibility is limited to viewing summaries of license assignments and historical usage trends.

Create connections with customers

Partners create connections with customers using a unique invitation link. This link is fixed and can't be changed or customized.

Partners can use their invitation link an unlimited number of times to create or recreate connections. Invitation links don't expire.

To create a connection:

1. From the Citrix Cloud menu, select **My Customers**.
2. From the Customer Dashboard, select **Invite or Add**.
3. To connect with an existing Citrix Cloud customer:
 - a) Select **Invite a Citrix Cloud customer** and then select **Continue**.
 - b) Copy the invitation link and send it to the customer.

Invite Customers

Copy the link below and share it with your customers.

To complete the connection a customer administrator needs to click the link, sign in to their Citrix Cloud account and accept the invitation.

<https://us.cloud.com/invitati...> [Copy to clipboard](#)

[Learn more](#) about connecting with customers on Citrix Cloud.

[Close](#)

To complete the connection, the customer clicks the invitation link, signs in to Citrix Cloud, and accepts the invitation.

 Global Services LLC

Global Services LLC would like to learn how you are using Citrix Cloud and help you with your business.

[Read about what type of account information the partner will see.](#)

If you approve this request, click the customers you want to allow partner access, and click Accept to continue.

Example Enterprises Inc.	<input checked="" type="checkbox"/>
Example Capital Group	<input type="checkbox"/>

[Decline All](#) [Accept](#)

4. To connect with a new customer who doesn't yet have a Citrix Cloud account:

- a) Select **Add a customer** and then select **Continue**.

- b) Enter the customer's business contact details and then select **Finish**. Citrix Cloud creates a new account for the customer.

Afterward, the customer receives a notification that the partner was added as an administrator to the new account. The customer can set a password for the new account by using the **Forgot password?** link on the Citrix Cloud sign-in page. After setting their password, the customer can sign in to their account using their business email address and complete the onboarding process as described in [Sign up for Citrix Cloud](#).

Remove partner or customer connections

Either the partner or the customer can terminate a connection at any time.

Remove a connection with a customer

To terminate a connection with a customer, the partner performs the following steps:

1. From the Citrix Cloud menu in the top right corner of the console, select **My Customers**.
2. From the Customer Dashboard, locate the customer you want to manage.
3. Click the ellipsis menu for the customer and then select **Remove Customer Connection**.
4. When prompted to confirm the removal, select **Remove**.

Remove a connection with a partner

To terminate a connection with a partner, the customer performs the following steps:

1. From the user menu in the top left corner, select **Account Settings**.
2. From the **Company Account** page, locate the **Partner Connections** section.
3. Locate the partner you want to manage and then select **Remove**.
4. When prompted to confirm the removal, select **Confirm**.

Licensing trends

Partners can view licensing information for a customer by selecting **View Licensing** from the ellipsis menu in the customer dashboard.

Customer Name ↑	Trials	Production	Notifications	Open Tickets
Acme Worldwide	8	3	285	 
		1		
		3		
		1		

- View Details
- Link Customer's SD-WAN Account
- Manage Services
- View Notifications
- View Licensing**
- Manage Offerings
- Manage Domains
- Remove Customer Connection

Note:

Citrix Partners can view only the Licensing summary view and historical active usage trends. They can't view individual users who consume licenses for a given service.

To view the customer's licensing summary for each service, select the **Usage** tab. For more usage information, select **View Usage Trend** for the service entitlement you want to view.

← **Acme Worldwide**

Services **Usage** Orders Account Info

Desktop as a Service ⋮

User/Device Model

Licenses ?

0% USED

ASSIGNED/TOTAL: **0/100**

AVAILABLE: **100(100%)**

Active Use ?

USERS		DEVICES	
MONTHLY	DAILY	MONTHLY	DAILY
39(39%)	19(19%)	40(40%)	20(20%)

[View Usage Trend](#)

Depending on the service, usage trends include the following information:

- The ratio of assigned licenses to the total purchased
- Monthly and daily active users
- A visual breakdown of license assignments, active use, consumption per entitlement, and over-age.

If needed, partners can export this information as a .csv file.

Bandwidth usage

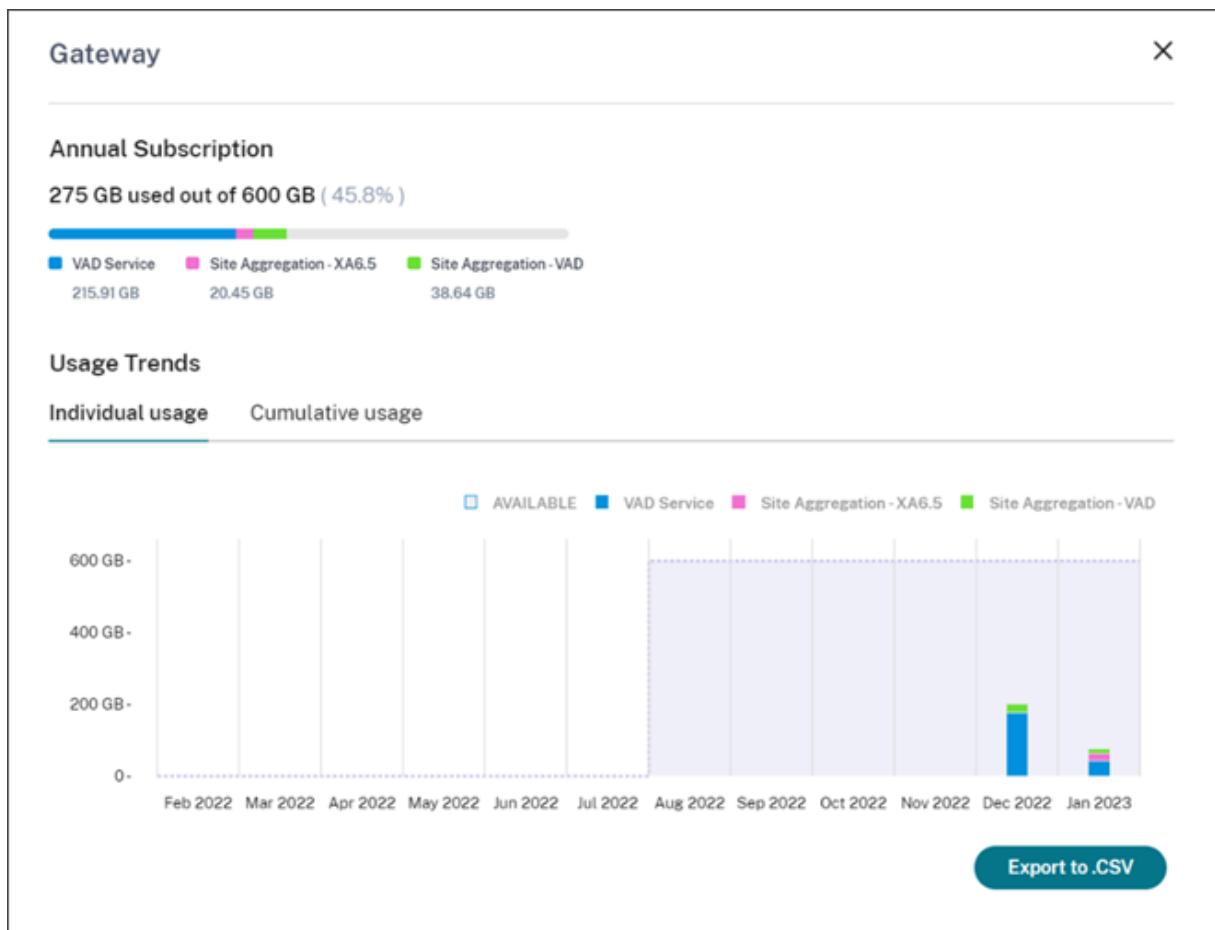

For Citrix Gateway service, the licensing summary consists of the following information:

- Total bandwidth usage across all of the customer’s entitlements.
- Total bandwidth usage broken down by the customer’s monthly, annual, and termed entitlements.
- Total overage for the current month. For more information about how overage is calculated, see [Overage](#).

Select **View Usage Trend** at the far-right side of the page for an entitlement to view the usage summary. Select **View Overage Chart** to view overage over the past 12 months.

Depending on the entitlement, usage trends include the following information:

- The amount of consumed bandwidth among Citrix DaaS (**VAD Service**) and on-premises Virtual Apps and Desktops deployments with [site aggregation](#).
- A visual breakdown of bandwidth usage for each individual month in which it was used. (Monthly entitlements)
- A visual breakdown of **Individual Usage** of bandwidth that occurred during each single month of the billing period. (Annual and Termed entitlements)
- A visual breakdown of **Cumulative Usage** of bandwidth that accumulated at each month in the billing period. (Annual and Termed entitlements)

If needed, partners can export this information as a .csv file.

Customer licensing and usage for Citrix Service Providers

The Licensing feature in Citrix Cloud enables customers of Citrix Service Providers (CSP) to monitor their licenses and usage for supported Citrix DaaS (formerly Citrix Virtual Apps and Desktops) products. CSPs can sign in under their customer's Citrix Cloud account to view and export this information as well. For more information, see the following articles:

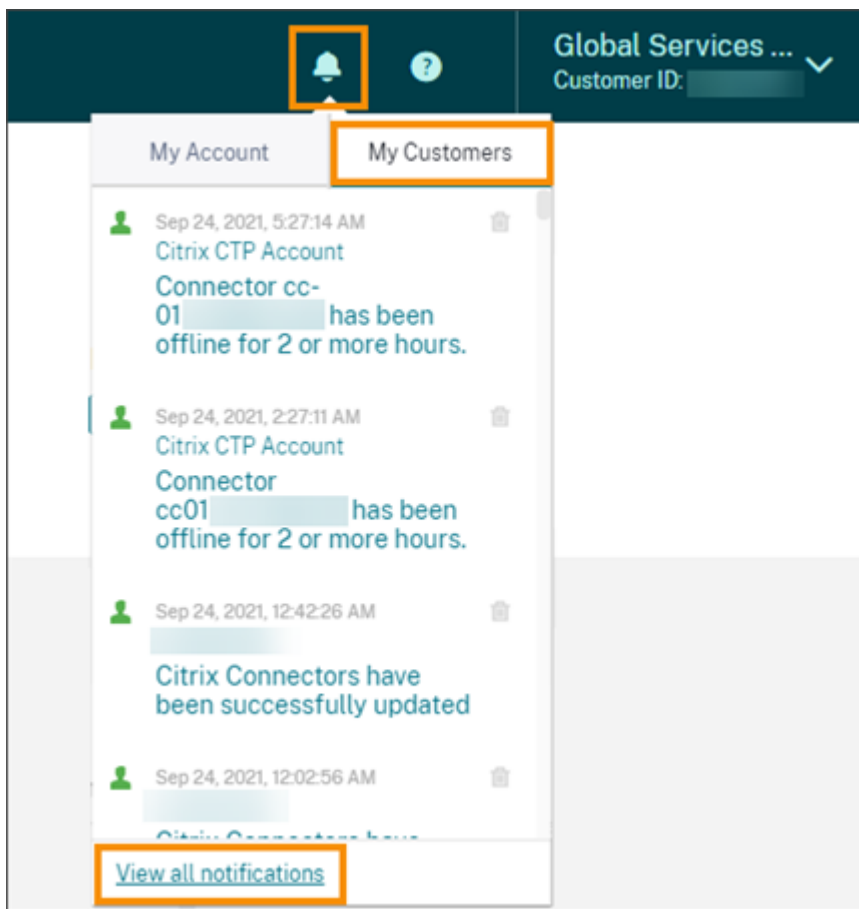

- [Customer license and usage monitoring for Citrix DaaS](#)
- [Customer license and usage monitoring for Citrix DaaS Standard for Azure](#)

Partner visibility into customers' notifications and support tickets

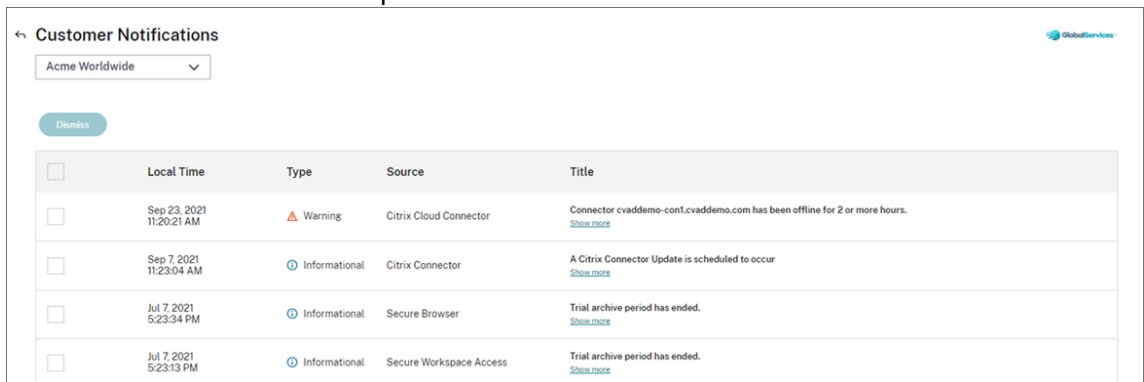

Partners can view notifications for their connected customers. Partners can also filter customer-specific notifications and take action, like dismissing the notification. Dismissed notifications don't show up for the partner. However, customers can still see the notification in their account after they sign in to Citrix Cloud.

To view customer notifications:

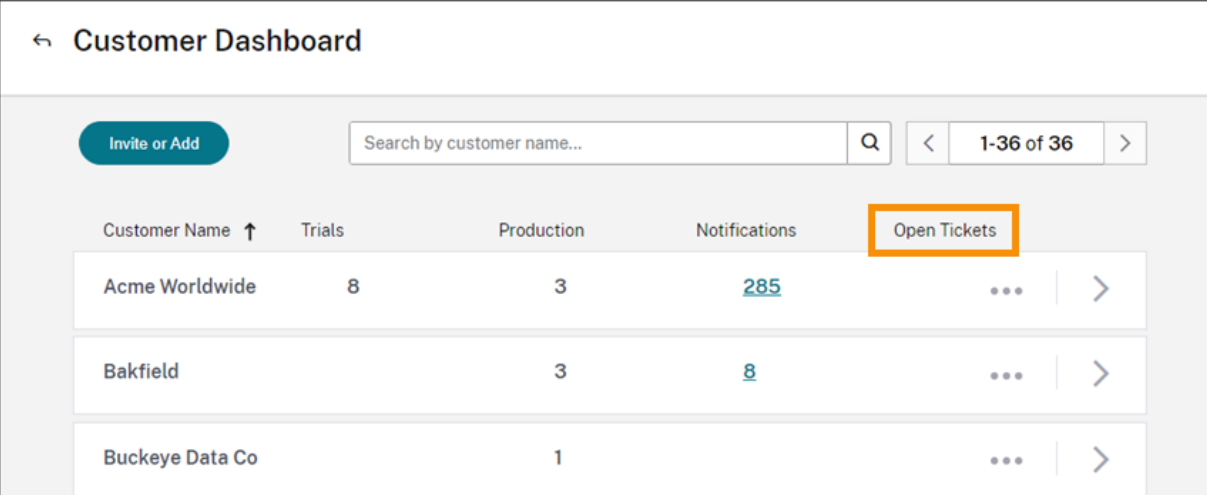

1. Click the bell icon near the top of the management console, select **My Customers**, and then select **View all notifications**.

2. Select a customer from the drop-down menu to view that customer's notifications.

Partners can view the number of support tickets for their customers through the Customer Dashboard.

The screenshot shows the 'Customer Dashboard' interface. At the top left is a back arrow and the title 'Customer Dashboard'. Below this is a navigation bar containing an 'Invite or Add' button, a search bar with the placeholder text 'Search by customer name...', a search icon, and pagination controls showing '1-36 of 36'. The main content area is a table with the following columns: 'Customer Name' (with an upward arrow), 'Trials', 'Production', 'Notifications', and 'Open Tickets' (which is highlighted with an orange border). The table contains three rows of data:

Customer Name ↑	Trials	Production	Notifications	Open Tickets
Acme Worldwide	8	3	285	...
Bakfield		3	8	...
Buckeye Data Co		1		...

Federated domains for Citrix Service Providers

Federated domains enable customer users to use credentials from a domain attached to your CSP resource location to sign in to the workspace. This allows you to provide dedicated workspaces to your customer users with a custom workspace URL, such as *customer.cloud.com*. The resource location is still on your partner Citrix Cloud account. You can provide dedicated workspaces alongside the shared workspace that customers can access using your CSP workspace URL (for example, *csp-partner.cloud.com*). To enable customers to access their dedicated workspace, you add them to the appropriate domains that you manage. After configuring the workspace, customer users can sign in to their workspace and access the apps and desktops that you've made available through Citrix DaaS.

When you remove a customer from a federated domain, the customer's users can no longer access their workspaces using credentials from the partner's domain.

For more information about using federated domains to deliver apps and desktops, see [Citrix DaaS for Citrix Service Providers](#).

Workspace appearance options for Citrix Service Providers

You can configure your workspace colors and logos with custom themes. To learn how to create custom themes, see [Customize the appearance of workspaces](#).

Note

Custom theming is a single-tenant feature. Citrix Service Providers where service provider tenants share a resource location, cloud connectors, and active directory domain (multi-tenant) are not currently supported. Citrix Service Provider tenants that have their own dedicated resource location, cloud connectors and dedicated active directory domain (single-tenant) are fully sup-

ported.

Cloud Services

October 20, 2023

This article lists the cloud services that are offered through Citrix Cloud and links to the product documentation for each service. For descriptions of these services and the offerings in which they are included, see [Service Descriptions for Citrix Services](#).
